Vanilla FreeRTOS allows the scheduler to be suspended/resumed by calling `vTaskSuspendAll()` and `xTaskResumeAll()` respectively. While the scheduler is suspended:

- Task switching is disabled but interrupts are left enabled.
- Calling any blocking/yielding function is forbidden, and time slicing is disabled.
- The tick count is frozen (but the tick interrupt will still occur to execute the application tick hook)

On scheduler resumption, `xTaskResumeAll()` will catch up all of the lost ticks and unblock any timed out tasks.

In ESP-IDF FreeRTOS, suspending the scheduler across multiple cores is not possible. Therefore when `vTaskSuspendAll()` is called:

- Task switching is disabled only on the current core but interrupts for the current core are left enabled
- Calling any blocking/yielding function on the current core is forbidden. Time slicing is disabled on the current core.
- If suspending on CPU0, the tick count is frozen. The tick interrupt will still occur to execute the application tick hook.

When resuming the scheduler on CPU0, `xTaskResumeAll()` will catch up all of the lost ticks and unblock any timed out tasks.

**警告:** Given that scheduler suspension on ESP-IDF FreeRTOS will only suspend scheduling on a particular core, scheduler suspension is **NOT** a valid method ensuring mutual exclusion between tasks when accessing shared data. Users should use proper locking primitives such as mutexes or spinlocks if they require mutual exclusion.

### Disabling Interrupts

Vanilla FreeRTOS allows interrupts to be disabled and enabled by calling `taskDISABLE_INTERRUPTS` and `taskENABLE_INTERRUPTS` respectively.

ESP-IDF FreeRTOS provides the same API, however interrupts will only disabled or enabled on the current core.

**警告:** Disabling interrupts is a valid method of achieve mutual exclusion in Vanilla FreeRTOS (and single core systems in general). However, in an SMP system, disabling interrupts is **NOT** a valid method ensuring mutual exclusion. Refer to Critical Sections for more details.

### Startup and Termination

ESP-IDF FreeRTOS **does not** require users to call `vTaskStartScheduler()` to start the scheduler. The startup flow of an ESP-IDF application will already call this automatically. The entry point for user code is a user defined `void app_main(void)` function. For more details regarding the startup of ESP-IDF FreeRTOS applications, see [ESP-IDF FreeRTOS Applications](#).

ESP-IDF FreeRTOS **does not** support scheduler termination. Calling `vTaskEndScheduler()` will simply cause the application to abort.

## 4.16.5 Critical Sections

## API Changes

Vanilla FreeRTOS implements critical sections by disabling interrupts. This prevents preemptive context switches and the servicing of ISRs during a critical section. Thus a task/ISR that enters a critical section is guaranteed to be the sole entity to access a shared resource. Critical sections in Vanilla FreeRTOS have the following API:

- `taskENTER_CRITICAL()` enters a critical section by disabling interrupts
- `taskEXIT_CRITICAL()` exits a critical section by reenabling interrupts
- `taskENTER_CRITICAL_FROM_ISR()` enters a critical section from an ISR by disabling interrupt nesting
- `taskEXIT_CRITICAL_FROM_ISR()` exits a critical section from an ISR by reenabling interrupt nesting

However, in an SMP system, merely disabling interrupts does not constitute a critical section as the presence of other cores means that a shared resource can still be concurrently accessed. Therefore, critical sections in ESP-IDF FreeRTOS are implemented using spinlocks. To accommodate the spinlocks, the ESP-IDF FreeRTOS critical section APIs contain an additional spinlock parameter as shown below:

- Spinlocks are of `portMUX_TYPE` (**not to be confused to FreeRTOS mutexes**)
- `taskENTER_CRITICAL(&mux)` enters a critical from a task context
- `taskEXIT_CRITICAL(&mux)` exits a critical section from a task context
- `taskENTER_CRITICAL_ISR(&mux)` enters a critical section from an interrupt context
- `taskEXIT_CRITICAL_ISR(&mux)` exits a critical section from an interrupt context

---

**备注:** The critical section API can be called recursively (i.e., nested critical sections). Entering a critical section multiple times recursively is valid so long as the critical section is exited the same number of times it was entered. However, given that critical sections can target different spinlocks, users should take care to avoid dead locking when entering critical sections recursively.

---

## Implementation

In ESP-IDF FreeRTOS, the process of a particular core entering and exiting a critical section is as follows:

- For `taskENTER_CRITICAL(&mux)` (or `taskENTER_CRITICAL_ISR(&mux)`)
  1. The core disables its interrupts (or interrupt nesting) up to `configMAX_SYSCALL_INTERRUPT_PRIORITY`
  2. The core then spins on the spinlock using an atomic compare-and-set instruction until it acquires the lock. A lock is acquired when the core is able to set the lock's owner value to the core's ID.
  3. Once the spinlock is acquired, the function returns. The remainder of the critical section runs with interrupts (or interrupt nesting) disabled.
- For `taskEXIT_CRITICAL(&mux)` (or `taskEXIT_CRITICAL_ISR(&mux)`)
  1. The core releases the spinlock by clearing the spinlock's owner value
  2. The core re-enables interrupts (or interrupt nesting)

## Restrictions and Considerations

Given that interrupts (or interrupt nesting) are disabled during a critical section, there are multiple restrictions regarding what can be done within a critical sections. During a critical section, users should keep the following restrictions and considerations in mind:

- Critical sections should be as kept as short as possible
  - The longer the critical section lasts, the longer a pending interrupt can be delayed.
  - A typical critical section should only access a few data structures and/or hardware registers
  - If possible, defer as much processing and/or event handling to the outside of critical sections.
- FreeRTOS API should not be called from within a critical section
- Users should never call any blocking or yielding functions within a critical section

## 4.16.6 Misc

### Floating Point Usage

Usually, when a context switch occurs:

- the current state of a CPU's registers are saved to the stack of task being switch out
- the previously saved state of the CPU's registers are loaded from the stack of the task being switched in

However, ESP-IDF FreeRTOS implements Lazy Context Switching for the FPU (Floating Point Unit) registers of a CPU. In other words, when a context switch occurs on a particular core (e.g., CPU0), the state of the core's FPU registers are not immediately saved to the stack of the task getting switched out (e.g., Task A). The FPU's registers are left untouched until:

- A different task (e.g., Task B) runs on the same core and uses the FPU. This will trigger an exception that will save the FPU registers to Task A's stack.
- Task A get's scheduled to the same core and continues execution. Saving and restoring the FPU's registers is not necessary in this case.

However, given that tasks can be unpinned thus can be scheduled on different cores (e.g., Task A switches to CPU1), it is unfeasible to copy and restore the FPU's registers across cores. Therefore, when a task utilizes the FPU (by using a `float` type in its call flow), ESP-IDF FreeRTOS will automatically pin the task to the current core it is running on. This ensures that all tasks that uses the FPU are always pinned to a particular core.

Furthermore, ESP-IDF FreeRTOS by default does not support the usage of the FPU within an interrupt context given that the FPU's register state is tied to a particular task.

---

**备注:** ESP targets that contain an FPU do not support hardware acceleration for double precision floating point arithmetic (`double`). Instead `double` is implemented via software hence the behavioral restrictions regarding the `float` type do not apply to `double`. Note that due to the lack of hardware acceleration, `double` operations may consume significantly more CPU time in comparison to `float`.

---

### ESP-IDF FreeRTOS Single Core

Although ESP-IDF FreeRTOS is an SMP scheduler, some ESP targets are single core (such as the ESP32-S2 and ESP32-C3). When building ESP-IDF applications for these targets, ESP-IDF FreeRTOS is still used but the number of cores will be set to `1` (i.e., the `CONFIG_FREERTOS_UNICORE` will always be enabled for single core targets).

For multicore targets (such as the ESP32 and ESP32-S3), `CONFIG_FREERTOS_UNICORE` can also be set. This will result in ESP-IDF FreeRTOS only running on CPU0, and all other cores will be inactive.

---

**备注:** Users should bear in mind that enabling `CONFIG_FREERTOS_UNICORE` is **NOT equivalent to running Vanilla FreeRTOS**. The additional API of ESP-IDF FreeRTOS can still be called, and the behavior changes of ESP-IDF FreeRTOS will incur a small amount of overhead even when compiled for only a single core.

---

## 4.17 Hardware Abstraction

Hardware abstraction in ESP-IDF are a group of API that allow users to control peripherals at differing levels of abstraction, as opposed to interfacing with hardware using only the ESP-IDF drivers. ESP-IDF Hardware abstraction will likely be useful for users writing high performance bare-metal drivers, or for those attempting to port an ESP chip to another platform.

This guide is split into the following sections:

1. *Architecture*
2. *LL (Low Level) Layer*
3. *HAL (Hardware Abstraction Layer)*

**警告:** Hardware abstraction API (excluding the driver and `xxx_types.h`) should be considered an experimental feature, thus cannot be considered public API. Hardware abstraction API do not adhere to the API name changing restrictions of ESP-IDF's versioning scheme. In other words, it is possible that Hardware Abstraction API may change in between non-major release versions.

**备注:** Although this document mainly focuses on hardware abstraction of peripherals (e.g., UART, SPI, I2C), certain layers of hardware abstraction extend to other aspects of hardware as well (e.g., some of the CPU's features are partially abstracted).

---

### 4.17.1 Architecture

Hardware abstraction in ESP-IDF is comprised of the following layers, ordered from low level (closer to hardware) to high level (further away from hardware) of abstraction.

- Low Level (LL) Layer
- Hardware Abstraction Layer (HAL)
- Driver Layers

The LL Layer, and HAL are entirely contained within the `hal` component. Each layer is dependent on the layer below it (i.e, driver depends on HAL, HAL depends on LL, LL depends on the register header files).

For a particular peripheral `xxx`, its hardware abstraction will generally consist of the header files described in the table below. Files that are **Target Specific** will have a separate implementation for each target (i.e., a separate copy for each chip). However, the `#include` directive will still be target-independent (i.e., will be the same for different targets) as the build system will automatically include the correct version of the header and source files.

表 21: Hardware Abstraction Header Files

| Include Directive   | Target Specific | Description   |
|---|-----------------|---|
| <code>#include 'soc/xxx_caps.h'</code>  | Y               | This header contains a list of C macros specifying the various capabilities of the ESP32's peripheral xxx. Hardware capabilities of a peripheral include things such as the number of channels, DMA support, hardware FIFO/buffer lengths, etc.   |
| <code>#include "soc/xxx_struct.h"</code><br><code>#include "soc/xxx_reg.h"</code> | Y               | The two headers contain a representation of a peripheral's registers in C structure and C macro format respectively. Users can operate a peripheral at the register level via either of these two header files.   |
| <code>#include "soc/xxx_pins.h"</code>  | Y               | If certain signals of a peripheral are mapped to a particular pin of the ESP32, their mappings are defined in this header as C macros.  |
| <code>#include "soc/xxx_periph.h"</code>  | N               | This header is mainly used as a convenience header file to automatically include <code>xxx_caps.h</code> , <code>xxx_struct.h</code> , and <code>xxx_reg.h</code> .   |
| <code>#include "hal/xxx_types.h"</code>   | N               | This header contains type definitions and macros that are shared among the LL, HAL, and driver layers. Moreover, it is considered public API thus can be included by the application level. The shared types and definitions usually related to non-implementation specific concepts such as the following: <ul style="list-style-type: none"> <li>• Protocol related types/macros such as frames, modes, common bus speeds, etc.</li> <li>• Features/characteristics of an xxx peripheral that are likely to be present on any implementation (implementation-independent) such as channels, operating modes, signal amplification or attenuation intensities, etc.</li> </ul> |
| <code>#include "hal/xxx_ll.h"</code>  | Y               | This header contains the Low Level (LL) Layer of hardware abstraction. LL Layer API are primarily used to abstract away register operations into readable functions.  |
| <code>#include "hal/xxx_hal.h"</code>   | Y               | The Hardware Abstraction Layer (HAL) is used to abstract away peripheral operation steps into functions (e.g., reading a buffer, starting a transmission, handling an event, etc). The HAL is built on top of the LL Layer.   |
| <code>#include "driver/xxx.h"</code>  | N               | The driver layer is the highest level of ESP-IDF's hardware abstraction. Driver layer API are meant to be called from ESP-IDF applications, and internally utilize OS primitives. Thus, driver layer API are event-driven, and can be used in a multi-threaded environment.   |

### 4.17.2 LL (Low Level) Layer

The primary purpose of the LL Layer is to abstract away register field access into more easily understandable functions. LL functions essentially translate various in/out arguments into the register fields of a peripheral in the form of get/set functions. All the necessary bit shifting, masking, offsetting, and endianness of the register fields should be handled by the LL functions.

```
//Inside xxx_ll.h

static inline void xxx_ll_set_baud_rate(xxx_dev_t *hw,
                                       xxx_ll_clk_src_t clock_source,
                                       uint32_t baud_rate) {
    uint32_t src_clk_freq = (source_clk == XXX_SCLK_APB) ? APB_CLK_FREQ : REF_CLK_
↪FREQ;
    uint32_t clock_divider = src_clk_freq / baud;
    // Set clock select field
    hw->clk_div_reg.divider = clock_divider >> 4;
    // Set clock divider field
```

(下页继续)

```

hw->config.clk_sel = (source_clk == XXX_SCLK_APB) ? 0 : 1;
}

static inline uint32_t xxx_ll_get_rx_byte_count(xxx_dev_t *hw) {
    return hw->status_reg.rx_cnt;
}

```

The code snippet above illustrates typical LL functions for a peripheral xxx. LL functions typically have the following characteristics:

- All LL functions are defined as `static inline` so that there is minimal overhead when calling these functions due to compiler optimization.
- The first argument should be a pointer to a `xxx_dev_t` type. The `xxx_dev_t` type is a structure representing the peripheral's registers, thus the first argument is always a pointer to the starting address of the peripheral's registers. Note that in some cases where the peripheral has multiple channels with identical register layouts, `xxx_dev_t *hw` may point to the registers of a particular channel instead.
- LL functions should be short and in most cases are deterministic. In other words, the worst case runtime of the LL function can be determined at compile time. Thus, any loops in LL functions should be finite bounded; however, there are currently a few exceptions to this rule.
- LL functions are not thread safe, it is the responsibility of the upper layers (driver layer) to ensure that registers or register fields are not accessed concurrently.

### 4.17.3 HAL (Hardware Abstraction Layer)

The HAL layer models the operational process of a peripheral as a set of general steps, where each step has an associated function. For each step, the details of a peripheral's register implementation (i.e., which registers need to be set/read) are hidden (abstracted away) by the HAL. By modelling peripheral operation as a set of functional steps, any minor hardware implementation differences of the peripheral between different targets or chip versions can be abstracted away by the HAL (i.e., handled transparently). In other words, the HAL API for a particular peripheral will remain mostly the same across multiple targets/chip versions.

The following HAL function examples are selected from the Watchdog Timer HAL as each function maps to one of the steps in a WDT's operation life cycle, thus illustrating how a HAL abstracts a peripheral's operation into functional steps.

```

// Initialize one of the WDTs
void wdt_hal_init(wdt_hal_context_t *hal, wdt_inst_t wdt_inst, uint32_t prescaler,
↳bool enable_intr);

// Configure a particular timeout stage of the WDT
void wdt_hal_config_stage(wdt_hal_context_t *hal, wdt_stage_t stage, uint32_t
↳timeout, wdt_stage_action_t behavior);

// Start the WDT
void wdt_hal_enable(wdt_hal_context_t *hal);

// Feed (i.e., reset) the WDT
void wdt_hal_feed(wdt_hal_context_t *hal);

// Handle a WDT timeout
void wdt_hal_handle_intr(wdt_hal_context_t *hal);

// Stop the WDT
void wdt_hal_disable(wdt_hal_context_t *hal);

// De-initialize the WDT
void wdt_hal_deinit(wdt_hal_context_t *hal);

```

HAL functions will generally have the following characteristics:

- The first argument to a HAL function has the `xxx_hal_context_t *` type. The HAL context type is used to store information about a particular instance of the peripheral (i.e. the context instance). A HAL context is initialized by the `xxx_hal_init()` function and can store information such as the following:
  - The channel number of this instance
  - Pointer to the peripheral's (or channel's) registers (i.e., a `xxx_dev_t *` type)
  - Information about an ongoing transaction (e.g., pointer to DMA descriptor list in use)
  - Some configuration values for the instance (e.g., channel configurations)
  - Variables to maintain state information regarding the instance (e.g., a flag to indicate if the instance is waiting for transaction to complete)
- HAL functions should not contain any OS primitives such as queues, semaphores, mutexes, etc. All synchronization/concurrency should be handled at higher layers (e.g., the driver).
- Some peripherals may have steps that cannot be further abstracted by the HAL, thus will end up being a direct wrapper (or macro) for an LL function.
- Some HAL functions may be placed in IRAM thus may carry an `IRAM_ATTR` or be placed in a separate `xxx_hal_iram.c` source file.

## 4.18 High-Level Interrupts

The Xtensa architecture has support for 32 interrupts, divided over 7 levels (levels 1 to 7, with 7 being an NMI), plus an assortment of exceptions. On the ESP32, the interrupt mux allows most interrupt sources to be routed to these interrupts using the *interrupt allocator*. Normally, interrupts will be written in C, but ESP-IDF allows high-level interrupts to be written in assembly as well, resulting in very low interrupt latencies.

### 4.18.1 Interrupt Levels

| Level | Symbol                         | Remark  |
|-------|--------------------------------|---|
| 1     | N/A                            | Exception and level 0 interrupts. Handled by ESP-IDF                  |
| 2-3   | N/A                            | Medium level interrupts. Handled by ESP-IDF                           |
| 4     | <code>xt_highint4</code>       | Free to use ( <i>See 1</i> )  |
| 5     | <code>xt_highint5</code>       | Normally used by ESP-IDF debug logic ( <i>See 1</i> )                 |
| NMI   | <code>xt_nmi</code>            | Free to use   |
| dbg   | <code>xt_debugexception</code> | Debug exception. Called on e.g. a BREAK instruction. ( <i>See 2</i> ) |

The following notes give more information about the items in the tables above.

1. ESP-IDF debug logic can be configured to run on `xt_highint4` or `xt_highint5` in `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`. Bluetooth's interrupt can be configured to run on level 4 by enabling `CONFIG_BTDM_CTRL_HLI`. If `CONFIG_BTDM_CTRL_HLI` is enabled, ESP-IDF debug logic must be running on level 5 interrupt.
2. If `CONFIG_BTDM_CTRL_HLI` is enabled, `xt_debugexception` is used to fix *live lock issue* in ESP32 ECO3.

Using these symbols is done by creating an assembly file (suffix `.S`) and defining the named symbols, like this:

```
.section .iram1,"ax"
.global xt_highint5
.type xt_highint5,@function
.align 4
xt_highint5:
... your code here
rsr a0, EXCSAVE_5
rfi 5
```

For a real-life example, see the `esp_system/port/soc/esp32/highint_hdl.S` file; the panic handler interrupt is implemented there.

## 4.18.2 Notes

- Do not call C code from a high-level interrupt; as these interrupts are run from a critical section, this can cause the target to crash. Note that although the panic handler interrupt does call normal C code, this exception is allowed due to the fact that this handler never returns (i.e., the application will not continue to run after the panic handler). so breaking C code execution flow is not a problem.  
When `CONFIG_BTDM_CTRL_HLI` is enabled, C code is also called from a high-level interrupt, this is possible thanks to some additional protection added to it.
- Make sure your assembly code gets linked in. Indeed, as the free-to-use symbols are declared as weak, the linker may discard the file containing the symbol. This will happen if the only symbol defined, or used, from the user file is the `xt_*` free-to-use symbol. To avoid this, in the assembly file containing the `xt_*` symbol, define another symbol, like:

```
.global ld_include_my_isr_file
ld_include_my_isr_file:
```

Here it is called ``ld\_include\_my\_isr\_file`` but can have any name, as long as it is not defined anywhere else in the project.

Then, in the component ``CMakeLists.txt``, add this name as an unresolved symbol to the ld command line arguments:

```
target_link_libraries(${COMPONENT_TARGET} "-u ld_include_my_isr_file")
```

This should cause the linker to always include the file defining ``ld\_include\_my\_isr\_file``, causing the ISR to always be linked in.

This should cause the linker to always include a file defining `ld_include_my_isr_file`, causing the ISR to always be linked in.

- High-level interrupts can be routed and handled using `esp_intr_alloc()` and associated functions. The handler and handler arguments to `esp_intr_alloc()` must be NULL, however.
- In theory, medium priority interrupts could also be handled in this way. ESP-IDF does not support this yet.

If using the legacy Make build system, add the following to component.mk, instead:

```
COMPONENT_ADD_LDFLAGS := -u ld_include_my_isr_file
```

## 4.19 JTAG 调试

本文将介绍如何安装 ESP32 的 OpenOCD 调试环境，以及如何使用 GDB 来调试 ESP32 的应用程序。本文结构如下：

**引言** 介绍本指南主旨。

**工作原理** 介绍 ESP32、JTAG (Joint Test Action Group) 接口、OpenOCD 和 GDB 如何相互连接，从而实现 ESP32 的调试功能。

**选择 JTAG 适配器** 介绍有关 JTAG 硬件适配器的选择及参照标准。

**安装 OpenOCD** 介绍如何安装官方预编译好的 OpenOCD 软件包并验证是否安装成功。

**配置 ESP32 目标板** 介绍如何设置 OpenOCD 软件并安装 JTAG 硬件，两项共同构成调试目标。

**启动调试器** 介绍如何从 *Eclipse* 集成开发环境和命令行终端启动 GDB 调试会话。

**调试范例** 如果您不熟悉 GDB，请查看此小节以获取 *Eclipse* 集成开发环境以及命令行终端提供的调试示例。

**从源码构建 OpenOCD** 介绍如何在 *Windows*、*Linux* 和 *macOS* 操作系统上从源码构建 OpenOCD。

**注意事项和补充内容** 介绍使用 OpenOCD 和 GDB 通过 JTAG 接口调试 ESP32 时的注意事项和补充内容。

### 4.19.1 引言

ESP32 具有两个强大的 Xtensa 内核，支持多种程序架构。ESP-IDF 自带的 FreeRTOS 操作系统支持多核抢占式调度，允许用户以更加直观的方式编写软件。

与此相对地，由于缺乏合适的工具，简便的编程方式也会给程序的调试带来困难，比如找出由两个线程引起的错误，并且这两个线程在单独的 CPU 核上同时运行，那么仅凭 `printf` 语句会花费很长时间来定位该错误。调试此类问题更好（往往也更快）的方法是使用调试器，将其连接到处理器的调试端口。

乐鑫已完成 OpenOCD 移植，以支持 ESP32 处理器和多核 FreeRTOS 架构（此作为大多数 ESP32 应用程序的基础）。此外，乐鑫还提供了一些 OpenOCD 本身并不支持的工具，以进一步丰富调试功能。

本文将介绍如何在 Linux、Windows 和 macOS 环境下为 ESP32 安装 OpenOCD，并使用 GDB 进行软件调试。除部分安装流程有所不同外，所有操作系统的软件用户界面和使用流程都是相同的。

**备注：** 本文使用的图片素材来自于 Ubuntu 16.04 LTS 上 Eclipse Neon 3 软件的截图，不同的操作系统（Windows、macOS 或 Linux）或不同的 Eclipse 软件版本在用户界面上可能会有细微差别。

### 4.19.2 工作原理

通过 JTAG（Joint Test Action Group）接口使用 OpenOCD 调试 ESP32 时所需要的关键软件和硬件包括 **xtensa-esp32-elf-gdb 调试器**、**OpenOCD 片上调试器**和连接到 **ESP32 目标**的 **JTAG 适配器**，如下图“Application Loading and Monitoring”标志所示。

图 32: JTAG 调试 - 概述图

“Application Loading and Monitoring”标志显示一组关键的软件和硬件组件，可用于编译、构建和烧写应用程序到 ESP32 上，以及监视来自 ESP32 的运行诊断信息。

Eclipse 环境集成了 JTAG 调试和应用程序加载、监视的功能，使得软件从编写、编译、加载到调试的迭代过程变得更加快速简单。Eclipse IDE 及其集成的调试软件均适用于 Windows、Linux 和 macOS 平台。

若使用 *ESP-WROVER-KIT* 开发板，由于其板载 FT232H 芯片，仅需一根 USB 线即可连接 PC 与 ESP32。FT232H 提供了两路 USB 通道，一路连接到 JTAG，另一路连接到 UART。

根据用户喜好，除了使用 Eclipse 集成开发环境，还可以直接在命令行终端运行 `debugger` 和 `idf.py build`。

### 4.19.3 选择 JTAG 适配器

上手 JTAG 最快速便捷的方式是使用 *ESP-WROVER-KIT* 开发板，因为它板载了 JTAG 调试接口，无需使用外部 JTAG 硬件适配器和额外线缆来连接 JTAG 与 ESP32。ESP-WROVER-KIT 采用 FT2232H 提供的 JTAG 接口，可以稳定运行在 20 MHz 的时钟频率，外接的适配器很难达到这个速度。

上手 JTAG 最快速便捷的方式是将一根 USB 线连接到 ESP32 的 D+/D- USB 管脚，无需使用外部 JTAG 适配器和额外线缆。

如果您想使用单独的 JTAG 适配器，请确保其与 ESP32 的电平电压和 OpenOCD 软件都兼容。ESP32 使用的是业界标准的 JTAG 接口，它未使用（实际上也并不需要）TRST 信号脚。JTAG 使用的 IO 管脚由 VDD\_3P3\_RTC 电源管脚供电（通常连接到外部 3.3 V 的电源轨），因此 JTAG 硬件适配器的管脚需要能够在该电压范围内正常工作。

在软件方面，OpenOCD 支持相当多数量的 JTAG 适配器，请参阅 [OpenOCD 支持的适配器列表](#)（请注意这一列表并不完整），其中还列出了兼容 SWD 接口的适配器，但请注意，ESP32 目前并不支持 SWD。此外，被硬编码为只支持特定产品线的 JTAG 适配器也无法在 ESP32 上工作，例如仅针对 STM32 系列产品的 ST-LINK 适配器。

JTAG 正常工作至少需要连接的信号线有：TDI、TDO、TCK、TMS 和 GND。一些 JTAG 适配器还需要 ESP32 提供一路电源到适配器的某个管脚上（比如 Vtar），用于设置适配器的工作电压。您也可以选择将 SRST 信号线连接到 ESP32 的 CH\_PD 管脚上，但请注意，目前 OpenOCD 对该信号线提供的支持相当有限。

ESP-Prog 中展示了使用外部电路板进行调试的实例，方法是将其连接到 ESP32 的 JTAG 管脚上。

### 4.19.4 安装 OpenOCD

如果您已经按照 [快速入门](#) 完成了 ESP-IDF 及其 CMake 构建系统的安装，那么 OpenOCD 已经被默认安装到了您的开发系统中。在 [设置开发环境](#) 结束后，您应该能够在终端中运行如下 OpenOCD 命令：

```
openocd --version
```

终端会输出以下信息（实际版本号可能会更新）：

```
Open On-Chip Debugger v0.10.0-esp32-20190708 (2019-07-08-11:04)
Licensed under GNU GPL v2
For bug reports, read
  http://openocd.org/doc/doxygen/bugs.html
```

您还可以检查 OPENOCD\_SCRIPTS 环境变量的值，以确认 OpenOCD 配置文件的路径，Linux 和 macOS 用户可以在终端输入 `echo $OPENOCD_SCRIPTS`，Windows 用户需要输入 `echo %OPENOCD_SCRIPTS%`。如果终端输出了有效路径，则表明您已经正确安装 OpenOCD。

如果无法执行上述步骤，请再次阅读快速入门手册，参考 [设置安装工具](#) 章节。

---

**备注：**另外也可以从源代码编译 OpenOCD 工具，详细信息请参阅 [从源码构建 OpenOCD](#) 章节。

---

### 4.19.5 配置 ESP32 目标板

OpenOCD 安装完成后就可以配置 ESP32 目标（即带 JTAG 接口的 ESP32 板），具体分为以下三个步骤：

- 配置并连接 JTAG 接口
- 运行 OpenOCD
- 上传待调试的应用程序

## 配置并连接 JTAG 接口

此步骤取决于使用的 JTAG 和 ESP32 板，请参考以下两种情况。

### 配置 ESP-WROVER-KIT 上的 JTAG 接口

所有版本的 ESP-WROVER-KIT 板子都内置了 JTAG 调试功能，要使其正常工作，还需要设置相关跳帽来启用 JTAG 功能，设置 SPI 闪存电压和配置 USB 驱动程序。具体步骤请参考以下说明。

### 配置硬件

- 根据 [ESP-WROVER-KIT V4.1 入门指南](#) 文档中 [设置选项](#) 章节所描述的信息，设置 JP8 便可以启用 JTAG 功能。
- 检查 ESP32 上用于 JTAG 通信的引脚是否被接到了其它硬件上，这可能会影响 JTAG 的工作。

表 22: ESP32 引脚和 JTAG 接口信号

| ESP32 引脚      | JTAG 信号 |
|---------------|---------|
| MTDO / GPIO15 | TDO     |
| MTDI / GPIO12 | TDI     |
| MTCK / GPIO13 | TCK     |
| MTMS / GPIO14 | TMS     |
| GND           | GND     |

**配置 USB 驱动** 安装和配置 USB 驱动，这样 OpenOCD 才能够与 ESP-WROVER-KIT 板上的 JTAG 接口通信，并且使用 UART 接口上传待烧写的镜像文件。请根据你的操作系统按照以下步骤进行安装配置。

---

**备注：** ESP-WROVER-KIT 使用了 FT2232 芯片实现了 JTAG 适配器，所以以下说明同样适用于其他基于 FT2232 的 JTAG 适配器。

---

### Windows

1. 使用标准 USB A / micro USB B 线将 ESP-WROVER-KIT 与计算机相连接，并打开板子的电源。
2. 等待 Windows 识别出 ESP-WROVER-KIT 并且为其安装驱动。如果驱动没有被自动安装，请前往 [官网](#) 下载并手动安装。
3. 从 [Zadig 官网](#) 下载 Zadig 工具 (Zadig\_X.X.exe) 并运行。
4. 在 Zadig 工具中，进入“Options”菜单中选中“List All Devices”。
5. 检查设备列表，其中应该包含两条与 ESP-WROVER-KIT 相关的条目：“Dual RS232-HS (Interface 0)”和“Dual RS232-HS (Interface 1)”。驱动的名字应该是“FTDIBUS (vxxxx)”并且 USB ID 为：0403 6010。
6. 第一个设备“Dual RS232-HS (Interface 0)”连接到了 ESP32 的 JTAG 端口，此设备原来的“FTDIBUS (vxxxx)”驱动需要替换成“WinUSB (v6xxxx)”。为此，请选择“Dual RS232-HS (Interface 0)”并将驱动重新安装为“WinUSB (v6xxxx)”，具体可以参考上图。

---

**备注：** 请勿更改第二个设备“Dual RS232-HS (Interface 1)”的驱动，它被连接到 ESP32 的串口 (UART)，用于上传应用程序映像给 ESP32 进行烧写。

---

现在，ESP-WROVER-KIT 的 JTAG 接口应该可以被 OpenOCD 使用了，想要进一步设置调试环境，请前往 [运行 OpenOCD](#) 章节。

### Linux

1. 使用标准 USB A / micro USB B 线将 ESP-WROVER-KIT 与计算机相连接，并打开板子的电源。

图 33: 在 Zadig 工具中配置 JTAG USB 驱动

2. 打开终端，输入 `ls -l /dev/ttyUSB*` 命令检查操作系统是否能够识别板子的 USB 端口。类似识别结果如下：

```
user-name@computer-name:~/esp$ ls -l /dev/ttyUSB*
crw-rw---- 1 root dialout 188, 0 Jul 10 19:04 /dev/ttyUSB0
crw-rw---- 1 root dialout 188, 1 Jul 10 19:04 /dev/ttyUSB1
```

3. 根据 [OpenOCD README 文档](#) 中“Permissions delegation”小节的介绍，设置这两个 USB 端口的访问权限。
4. 注销并重新登录 Linux 系统，然后重新插拔板子的电源使之前的改动生效。在终端再次输入 `ls -l /dev/ttyUSB*` 命令进行验证，查看这两个设备的组所有者是否已经从 `dialout` 更改为 `plugdev`：

```
user-name@computer-name:~/esp$ ls -l /dev/ttyUSB*
crw-rw-r-- 1 root plugdev 188, 0 Jul 10 19:07 /dev/ttyUSB0
crw-rw-r-- 1 root plugdev 188, 1 Jul 10 19:07 /dev/ttyUSB1
```

如果看到类似的输出结果，并且你也是 `plugdev` 组的成员，那么设置工作就完成了。

具有较低编号的 `/dev/ttyUSBn` 接口用于 JTAG 通信，另一路接口被连接到 ESP32 的串口 (UART)，用于上传应用程序映像给 ESP32 进行烧写。

现在，ESP-WROVER-KIT 的 JTAG 接口应该可以被 OpenOCD 使用了，想要进一步设置调试环境，请前往运行 [OpenOCD](#) 章节。

**MacOS** 在 macOS 上，同时使用 FT232 的 JTAG 接口和串口还需另外进行其它操作。当操作系统加载 FTDI 串口驱动的时候，它会对 FT232 芯片的两个通道做相同的操作。但是，这两个通道中只有一个是被用作串口，而另一个用于 JTAG，如果操作系统已经为用于 JTAG 的通道加载了 FTDI 串口驱动的话，OpenOCD 将无法连接到芯片。有两个方法可以解决这个问题：

1. 在启动 OpenOCD 之前手动卸载 FTDI 串口驱动程序，然后启动 OpenOCD，再加载串口驱动程序。
2. 修改 FTDI 驱动程序的配置，使其不会为 FT232 芯片的通道 B 进行自我加载，该通道用于 ESP-WROVER-KIT 板上的 JTAG 通道。

### 手动卸载驱动程序

1. 从 [FTDI 官网](#) 安装驱动。
2. 使用 USB 线连接 ESP-WROVER-KIT。
3. 卸载串口驱动

```
sudo kextunload -b com.FTDI.driver.FTDIUSBSerialDriver
```

有时，您可能还需要卸载苹果的 FTDI 驱动：

- macOS < 10.15:

```
sudo kextunload -b com.apple.driver.AppleUSBFTDI
```

- macOS 10.15:

```
sudo kextunload -b com.apple.DriverKit-AppleUSBFTDI
```

**警告：**对于 FTDI 驱动，如果使用串口的通道不正确，则可能会导致内核崩溃。ESP-WROVER-KIT 将通道 A 用于 JTAG，通道 B 用于串口。

#### 4. 运行 OpenOCD:

```
.. include:: esp32.inc
   :start-after: run-openocd
   :end-before: ---
```

#### 5. 在另一个终端窗口，再一次加载 FTDI 串口驱动:

```
sudo kextload -b com.FTDI.driver.FTDIUSBSerialDriver
```

**备注：**如果你需要重启 OpenOCD，则无需再次卸载 FTDI 驱动程序，只需停止 OpenOCD 并再次启动它。只有在重新连接 ESP-WROVER-KIT 或者切换了电源的情况下才需要再次卸载驱动。

你也可以根据自身需求，将此过程包装进 shell 脚本中。

**修改 FTDI 驱动** 简而言之，这种方法需要修改 FTDI 驱动程序的配置文件，这样可以防止为 FT2232H 的通道 B 自动加载串口驱动。

**备注：**其他板子可能将通道 A 用于 JTAG，因此请谨慎使用此选项。

**警告：**此方法还需要操作系统禁止对驱动进行签名验证，因此可能无法被所有的用户所接受。

#### 1. 使用文本编辑器打开 FTDI 驱动器的配置文件（注意 sudo）：

```
sudo nano /Library/Extensions/FTDIUSBSerialDriver.kext/Contents/Info.plist
```

#### 2. 找到并删除以下几行:

```
<key>FT2232H_B</key>
<dict>
  <key>CFBundleIdentifier</key>
  <string>com.FTDI.driver.FTDIUSBSerialDriver</string>
  <key>IOClass</key>
  <string>FTDIUSBSerialDriver</string>
  <key>IOProviderClass</key>
  <string>IOUSBInterface</string>
  <key>bConfigurationValue</key>
  <integer>1</integer>
  <key>bInterfaceNumber</key>
  <integer>1</integer>
  <key>bcdDevice</key>
  <integer>1792</integer>
```

(下页继续)

```
<key>idProduct</key>
<integer>24592</integer>
<key>idVendor</key>
<integer>1027</integer>
</dict>
```

3. 保存并关闭文件
4. 禁用驱动的签名认证:
  1. 点击苹果的 logo, 选择 “Restart...”
  2. 重启后当听到响铃时, 立即按下键盘上的 **CMD+R** 组合键
  3. 进入恢复模式后, 打开终端
  4. 运行命令:

```
csrutil enable --without kext
```

5. 再一次重启系统

完成这些步骤后, 可以同时使用串口和 JTAG 接口了。

想要进一步设置调试环境, 请前往[运行 OpenOCD](#) 章节。

### 配置其他 JTAG 接口

关于适配 OpenOCD 和 ESP32 的 JTAG 接口选择问题, 请参考[选择 JTAG 适配器](#) 章节, 确保 JTAG 适配器能够与 OpenOCD 和 ESP32 一同工作。然后按照以下三个步骤进行设置, 使其正常工作。

### 配置硬件

1. 找到 JTAG 接口和 ESP32 板上需要相互连接并建立通信的所有管脚或信号。

表 23: ESP32 引脚和 JTAG 接口信号

| ESP32 引脚      | JTAG 信号 |
|---------------|---------|
| MTDO / GPIO15 | TDO     |
| MTDI / GPIO12 | TDI     |
| MTCK / GPIO13 | TCK     |
| MTMS / GPIO14 | TMS     |
| GND           | GND     |

2. 检查 ESP32 上用于 JTAG 通信的管脚是否被连接到了其它硬件上, 这可能会影响 JTAG 的工作。
3. 连接 ESP32 和 JTAG 接口上的管脚或信号。

**配置驱动** 您可能还需要安装软件驱动, 才能使 JTAG 在计算机上正常工作, 请参阅您所使用的 JTAG 适配器的有关文档, 获取相关详细信息。

**连接** 将 JTAG 接口连接到计算机, 打开 ESP32 和 JTAG 接口板上的电源, 然后检查计算机是否可以识别到 JTAG 接口。

如需继续设置调试环境, 请前往[运行 OpenOCD](#) 章节。

### 运行 OpenOCD

配置完目标并将其连接到电脑后, 即可启动 OpenOCD。

打开终端, 按照快速入门指南中的[设置好开发环境](#) 章节进行操作, 然后运行如下命令, 以启动 OpenOCD (该命令适用于 Windows、Linux 和 macOS) :

```
openocd -f board/esp32-wrover-kit-3.3v.cfg
```

**备注：** 上述命令中 `-f` 选项后跟的配置文件专用于板载 ESP32-WROOM-32 模组的 ESP-WROVER-KIT 开发板。基于具体使用的硬件，您可能需要选择不同的配置文件，具体内容请参阅[根据目标芯片配置 OpenOCD](#)。

例如，对于带有用于 JTAG 连接的 FT2232H 或 FT232H 芯片的定制板，或带有 ESP-Prog 的定制板，可使用 `board/esp32c3-ftdi.cfg`。

现在您应该可以看到如下输出（此日志来自板载 ESP32-WROOM-32 模组的 ESP-WROVER-KIT 开发板）：

```
user-name@computer-name:~/esp/esp-idf$ openocd -f board/esp32-wrover-kit-3.3v.cfg
Open On-Chip Debugger v0.10.0-esp32-20190708 (2019-07-08-11:04)
Licensed under GNU GPL v2
For bug reports, read
    http://openocd.org/doc/doxygen/bugs.html
none separate
adapter speed: 20000 kHz
force hard breakpoints
Info : ftdi: if you experience problems at higher adapter clocks, try the command
↳ "ftdi_tdo_sample_edge falling"
Info : clock speed 20000 kHz
Info : JTAG tap: esp32.cpu0 tap/device found: 0x120034e5 (mfg: 0x272 (Tensilica),
↳ part: 0x2003, ver: 0x1)
Info : JTAG tap: esp32.cpu1 tap/device found: 0x120034e5 (mfg: 0x272 (Tensilica),
↳ part: 0x2003, ver: 0x1)
Info : esp32: Debug controller was reset (pwrstat=0x5F, after clear 0x0F).
Info : esp32: Core was reset (pwrstat=0x5F, after clear 0x0F).
```

- 如果出现指示权限错误的错误，请打开 `~/esp/openocd-esp32` 目录，参阅 [OpenOCD README](#) 文件中关于“Permissions delegation”的说明。
- 如果遇到无法找到配置文件的错误，例如 `Can't find board/esp32-wrover-kit-3.3v.cfg`，请检查 `OPENOCD_SCRIPTS` 环境变量是否设置正确，OpenOCD 根据此变量来查找 `-f` 指定的文件，详见[安装 OpenOCD](#)。此外，还需要检查配置文件是否确实位于该路径下。
- 如果出现 JTAG 错误（例如输出为 `...all ones` 或 `...all zeroes`），请检查硬件连接是否正确，除了 ESP32 的管脚之外是否还有其他信号连接到了 JTAG，并查看是否所有器件都已经上电。

### 上传待调试的应用程序

按照正常步骤构建并上传 ESP32 应用程序，具体请参阅[第八步：编译工程](#) 章节。

除此以外，您还可以使用 OpenOCD 通过 JTAG 接口将应用程序镜像烧写到闪存中，命令如下：

```
openocd -f board/esp32-wrover-kit-3.3v.cfg -c "program_esp filename.bin 0x10000
↳ verify exit"
```

其中 OpenOCD 的烧写命令 `program_esp` 格式如下：

```
program_esp <image_file> <offset> [verify] [reset] [exit]
```

- `image_file` - 程序镜像文件存放的路径
- `offset` - 镜像烧写到闪存中的偏移地址
- `verify` - 烧写完成后校验闪存中的内容（可选）
- `reset` - 烧写完成后重启目标（可选）
- `exit` - 烧写完成后退出 OpenOCD（可选）

现在可以调试应用程序了，请按照以下章节中的步骤进行操作。

## 4.19.6 启动调试器

ESP32 的工具链中带有 GNU 调试器（简称 GDB），它和其它工具链软件共同存放于 `xtensa-esp32-elf-gdb` 中。除了直接在命令行终端中调用并操作 GDB 外，也可以在 IDE（例如 Eclipse、Visual Studio Code 等）中进行调用，使用图形用户界面间接操作 GDB，这一方法无需在终端中输入任何命令。

关于以上两种调试器的使用方法，详见以下链接。

- [使用 Eclipse 调试](#)
- [使用命令行调试](#)

建议首先检查调试器能否在 [命令行终端](#) 下正常工作，然后再使用 Eclipse [集成开发环境](#) 进行调试工作。

## 4.19.7 调试范例

本节适用于不熟悉 GDB 的用户，下文将使用 [get-started/blink](#) 下简单的应用程序来演示 [调试会话的工作流程](#)，同时会介绍以下常用的调试操作：

1. [浏览代码，查看堆栈和线程](#)
2. [设置和清除断点](#)
3. [手动暂停目标](#)
4. [单步执行代码](#)
5. [查看并设置内存](#)
6. [观察和设置程序变量](#)
7. [设置条件断点](#)

此外还会提供在 [在命令行终端进行调试](#) 下使用 GDB 调试的案例。

在演示之前，请完成 ESP32 目标板设置并加载 [get-started/blink](#) 至 ESP32 中。

## 4.19.8 从源码构建 OpenOCD

以下文档分别介绍了如何在各操作系统平台上从源码构建 OpenOCD。

### Windows 环境下从源码编译 OpenOCD

---

**备注：**本文介绍了如何从 OpenOCD 源文件构建二进制文件。如果您想要更快速地构建，也可以从 [乐鑫 GitHub](#) 直接下载 OpenOCD 的预构建二进制文件，而无需自己编译（详细信息，请参阅 [安装 OpenOCD](#)）。

---

---

**备注：**本文涉及的命令行操作均在装有 MINGW32 子系统的 MSYS2 shell 环境中进行了验证。

---

**安装依赖的软件包** 安装编译 OpenOCD 所需的软件包：

```
pacman -S --noconfirm --needed autoconf automake git make \  
mingw-w64-i686-gcc \  
mingw-w64-i686-toolchain \  
mingw-w64-i686-libtool \  
mingw-w64-i686-pkg-config \  
mingw-w64-cross-winpthreads-git \  
p7zip
```

**下载 OpenOCD 源码** 支持 ESP32 的 OpenOCD 源码可以从乐鑫官方 GitHub 获取，网址为 <https://github.com/espressif/openocd-esp32>。您可以在 Git 中使用以下命令来拉取源代码：

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码保存在 ~/esp/openocd-esp32 目录下。

**下载 libusb** 构建 OpenOCD 需使用 libusb 库。请执行以下命令来下载特定版本的 libusb，并将其解压至当前目录。

```
wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
```

现在需要导出以下变量，以便将 libusb 库与 OpenOCD 构建相关联。

```
export CPPFLAGS="$CPPFLAGS -I${PWD}/libusb/include/libusb-1.0"
export LDFLAGS="$LDFLAGS -L${PWD}/libusb/MinGW32/.libs/dll"
```

**构建 OpenOCD** 配置和构建 OpenOCD，请参考以下命令：

```
cd ~/esp/openocd-esp32
export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="
↳$CFLAGS -Wno-error"
./bootstrap
./configure --disable-doxxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --
↳build=i686-w64-mingw32 --host=i686-w64-mingw32
make
cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src
cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src
```

构建完成后，OpenOCD 的二进制文件将被保存于 ~/esp/openocd-esp32/src/ 目录下。

您也可以调用 `make install`，将其复制到指定位置。

- 您可以在配置 OpenOCD 时指定这一位置，也可以在调用 `make install` 前设置 `export DESTDIR="/custom/install/dir"`。
- 如果您已经安装过其他开发平台的 OpenOCD，请跳过此步骤，否则原来的 OpenOCD 可能会被覆盖。

#### 备注：

- 如果发生错误，请解决后再次尝试编译，直到 `make` 成功为止。
- 如果 OpenOCD 存在子模块问题，请 `cd` 到 `openocd-esp32` 目录，并输入 `git submodule update --init` 命令。
- 如果 `./configure` 成功运行，JTAG 被使能的信息会被打印在 OpenOCD configuration summary 下面。
- 如果您的设备信息未显示在日志中，请根据 `../openocd-esp32/doc/INSTALL.txt` 文中的描述使用 `./configure` 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 `openocd-esp32/README.Windows`。
- 请记住将 `libusb-1.0.dll` 和 `libwinpthread-1.dll` 从 `~/esp/openocd-esp32/src` 复制到 `OCD_INSTALLDIR/bin`。

一旦 `make` 过程完成，OpenOCD 的可执行文件会被保存到 `~/esp/openocd-esp32/src/openocd` 目录下。

**完整编译过程** OpenOCD 编译过程中所调用的所有命令都已包含在以下代码片段中，您可以将其复制到 shell 脚本中，以便快速执行：

```

pacman -S --noconfirm --needed autoconf automake git make mingw-w64-i686-gcc mingw-
↳w64-i686-toolchain mingw-w64-i686-libtool mingw-w64-i686-pkg-config mingw-w64-
↳cross-winpthreads-git p7zip
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git

wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
export CPPFLAGS="$CPPFLAGS -I${PWD}/libusb/include/libusb-1.0"; export LDFLAGS="
↳$LDFLAGS -L${PWD}/libusb/MinGW32/.libs/dll"

export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="
↳$CFLAGS -Wno-error"
cd ~/esp/openocd-esp32
./bootstrap
./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --
↳build=i686-w64-mingw32 --host=i686-w64-mingw32
make
cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src
cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src

# # optional
# export DESTDIR="$PWD"
# make install
# cp ./src/libusb-1.0.dll $DESTDIR/mingw32/bin
# cp ./src/libwinpthread-1.dll $DESTDIR/mingw32/bin

```

**下一步** 想要进一步配置调试环境，请前往配置 [ESP32 目标板](#) 章节。

### Linux 环境下从源码编译 OpenOCD

除了从 [Espressif 官方](#) 直接下载 OpenOCD 可执行文件，你还可以选择从源码编译得到 OpenOCD。如果想要快速设置 OpenOCD 而不是自行编译，请备份好当前文件，前往 [安装 OpenOCD](#) 章节查阅。

**下载 OpenOCD 源码** 支持 ESP32 的 OpenOCD 源代码可以从乐鑫官方的 GitHub 获得，网址为 <https://github.com/espressif/openocd-esp32>。请使用以下命令来下载源代码：

```

cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git

```

克隆后的源代码被保存在 ~/esp/openocd-esp32 目录中。

**安装依赖的软件包** 安装编译 OpenOCD 所需的软件包。

**备注：**依次安装以下软件包，检查安装是否成功，然后继续下一个软件包的安装。在进行下一步操作之前，要先解决当前报告的问题。

```

sudo apt-get install make
sudo apt-get install libtool
sudo apt-get install pkg-config
sudo apt-get install autoconf
sudo apt-get install automake
sudo apt-get install texinfo
sudo apt-get install libusb-1.0

```

**备注:**

- pkg-config 应为 0.2.3 或以上的版本。
- autoconf 应为 2.6.4 或以上的版本。
- automake 应为 1.9 或以上的版本。
- 当使用 USB-Blaster, ASIX Presto, OpenJTAG 和 FT2232 作为适配器时, 需要下载安装 libFTDI 和 FTD2XX 的驱动。
- 当使用 CMSIS-DAP 时, 需要安装 HIDAPI。

**构建 OpenOCD** 配置和构建 OpenOCD 的流程如下:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

你可以选择最后再执行 `sudo make install`, 如果你已经安装过别的开发平台的 OpenOCD, 请跳过这个步骤, 因为它可能会覆盖掉原来的 OpenOCD。

**备注:**

- 如果发生错误, 请解决后再次尝试编译, 直到 make 成功为止。
- 如果 OpenOCD 存在子模块问题, 请 cd 到 openocd-esp32 目录, 并输入 `git submodule update --init` 命令。
- 如果 ./configure 成功运行, JTAG 被使能的信息会被打印在 OpenOCD configuration summary 下面。
- 如果您的设备信息未显示在日志中, 请根据 `../openocd-esp32/doc/INSTALL.txt` 文中的描述使用 ./configure 启用它。
- 有关编译 OpenOCD 的详细信息, 请参阅 `openocd-esp32/README`。

一旦 make 过程成功结束, OpenOCD 的可执行文件会被保存到 `~/openocd-esp32/bin` 目录中。

**下一步** 想要进一步配置调试环境, 请前往[配置 ESP32 目标板](#) 章节。

**MacOS 环境下从源码编译 OpenOCD**

除了从 [Espressif 官方](#) 直接下载 OpenOCD 可执行文件, 你还可以选择从源码编译得到 OpenOCD。如果想要快速设置 OpenOCD 而不是自行编译, 请备份好当前文件, 前往[安装 OpenOCD](#) 章节查阅。

**下载 OpenOCD 源码** 支持 ESP32 的 OpenOCD 源代码可以从乐鑫官方的 GitHub 获得, 网址为 <https://github.com/espressif/openocd-esp32>。请使用以下命令来下载源代码:

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码被保存在 `~/esp/openocd-esp32` 目录中。

**安装依赖的软件包** 使用 Homebrew 安装编译 OpenOCD 所需的软件包:

```
brew install automake libtool libusb wget gcc@4.9 pkg-config
```

**构建 OpenOCD** 配置和构建 OpenOCD 的流程如下:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

你可以选择最后再执行 `sudo make install`，如果你已经安装过别的开发平台的 OpenOCD，请跳过这个步骤，因为它可能会覆盖掉原来的 OpenOCD。

#### 备注:

- 如果发生错误，请解决后再次尝试编译，直到 `make` 成功为止。
- 如果 OpenOCD 存在子模块问题，请 `cd` 到 `openocd-esp32` 目录，并输入 `git submodule update --init` 命令。
- 如果 `./configure` 成功运行，JTAG 被使能的信息会被打印在 OpenOCD configuration summary 下面。
- 如果您的设备信息未显示在日志中，请根据 `../openocd-esp32/doc/INSTALL.txt` 文中的描述使用 `./configure` 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 `openocd-esp32/README.OSX`。

一旦 `make` 过程成功结束，OpenOCD 的可执行文件会被保存到 `~/esp/openocd-esp32/src/openocd` 目录中。

**下一步** 想要进一步配置调试环境，请前往[配置 ESP32 目标板](#) 章节。

本文档在演示中所使用的 OpenOCD 是预编译好的二进制发行版，在[安装 OpenOCD](#) 章节中有所介绍。

如果要使用本地从源代码编译的 OpenOCD 程序，需要将相应可执行文件的路径修改为 `src/openocd`，并设置 `OPENOCD_SCRIPTS` 环境变量，使得 OpenOCD 能够找到配置文件。Linux 和 macOS 用户可以执行:

```
cd ~/esp/openocd-esp32
export OPENOCD_SCRIPTS=$PWD/tcl
```

Windows 用户可以执行:

```
cd %USERPROFILE%\esp\openocd-esp32
set "OPENOCD_SCRIPTS=%CD%\tcl"
```

针对 Linux 和 macOS 用户，运行本地编译的 OpenOCD 的示例:

```
src/openocd -f board/esp32-wrover-kit-3.3v.cfg
```

Windows 用户的示例如下:

```
src\openocd -f board\esp32-wrover-kit-3.3v.cfg
```

### 4.19.9 注意事项和补充内容

本节列出了上文中提到的所有注意事项和补充内容的链接。

#### 注意事项和补充内容

本节提供了本指南中各部分提到的一些注意事项和补充内容。

**可用的断点和观察点** ESP32 调试器支持 2 个硬件断点和 64 个软件断点。硬件断点是由 ESP32 芯片内部的逻辑电路实现的，能够设置在代码的任何位置：闪存或者 IRAM 的代码区域。除此以外，OpenOCD 实现了两种软件断点：闪存断点（最多 32 个）和 IRAM 断点（最多 32 个）。目前 GDB 无法在闪存中设置软件断点，因此除非解决此限制，否则这些断点只能由 OpenOCD 模拟为硬件断点（详细信息可以参阅[下面](#)）。ESP32 还支持 2 个观察点，所以可以观察 2 个变量的变化或者通过 GDB 命令 `watch myVariable` 来读取变量的值。请注意 `menuconfig` 中的 `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` 选项会使用最后一个观察点，如果你想在 OpenOCD 或者 GDB 中再次尝试使用这个观察点，可能不会得到预期的结果。详情请查看 `menuconfig` 中的帮助文档。

**关于断点的补充知识** 使用软件闪存模拟部分硬件断点的意思就是当使用 GDB 命令 `hb myFunction` 给某个函数设置硬件断点时，如果该函数位于闪存中，并且此时还有可用的硬件断点，那调试器就会使用硬件断点，否则就使用 32 个软件闪存断点中的一个来模拟。这个规则同样适用于 `b myFunction` 之类的命令，在这种情况下，GDB 会自己决定该使用哪种类型的断点。如果 `myFunction` 位于可写区域 (IRAM)，那就会使用软件 IRAM 断点，否则就会像处理 `hb` 命令一样使用硬件断点或者软件闪存断点。

**闪存映射 vs 软件闪存断点** 为了在闪存中设置或者清除软件断点，OpenOCD 需要知道它们在闪存中的地址。为了完成从 ESP32 的地址空间到闪存地址的转换，OpenOCD 使用闪存中程序代码区域的映射。这些映射被保存在程序映像的头部，位于二进制数据（代码段和数据段）之前，并且特定于写入闪存的每一个应用程序的映像。因此，为了支持软件闪存断点，OpenOCD 需要知道待调试的应用程序映像位置。默认情况下，OpenOCD 会在 `0x8000` 处读取分区表并使用第一个找到的应用程序映像的映射，但是也可能存在无法工作的情况，比如分区表不在标准的闪存位置，甚至可能有多个映像：一个出厂映像和两个 OTA 映像，你可能想要调试其中的任意一个。为了涵盖所有可能的调试情况，OpenOCD 支持特殊的命令，用于指定待调试的应用程序映像在闪存中的具体位置。该命令具有以下格式：

```
esp appimage_offset <offset>
```

偏移量应为十六进制格式，如果要恢复默认行为，可以将偏移地址设置为 `-1`。

**备注：**由于 GDB 在连接 OpenOCD 时仅仅请求一次内存映射，所以可以在 TCL 配置文件中指定该命令，或者通过命令行传递给 OpenOCD。对于后者，命令行示例如下：

```
openocd -f board/esp32-wrover-kit-3.3v.cfg -c "init; halt; esp appimage_offset ↵
↵0x210000"
```

另外还可以通过 OpenOCD 的 telnet 会话执行该命令，然后再连接 GDB，不过这种方式似乎没有那么便捷。

**“next”命令无法跳过子程序的原因** 当使用 `next` 命令单步执行代码时，GDB 会在子程序的前面设置一个断点（两个中可用的一个），这样就可以跳过进入子程序内部的细节。如果这两个断点已经在代码的其它位置，那么 `next` 命令将不起作用。在这种情况下，请删掉一个断点以使其中一个变得可用。当两个断点都被使用时，`next` 命令会像 `step` 命令一样工作，调试器就会进入子程序内部。

**OpenOCD 支持的编译时的选项** ESP-IDF 有一些针对 OpenOCD 调试功能的选项可以在编译时进行设置：

- `CONFIG_ESP32_DEBUG_OCDAWARE` 默认会被使能。如果程序抛出了不可修复或者未处理的异常，并且此时已经连接上了 JTAG 调试器（即 OpenOCD 正在运行），那么 ESP-IDF 将会进入调试器工作模式。
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` 默认没有使能。在所有任务堆栈的末尾设置观察点，从 1 号开始索引。这是调试任务堆栈溢出的最准确的方式。

更多有关设置编译时的选项的信息，请参阅[项目配置菜单](#)。

**支持 FreeRTOS** OpenOCD 完全支持 ESP-IDF 自带的 FreeRTOS 操作系统，GDB 会将 FreeRTOS 中的任务当做线程。使用 GDB 命令 `i threads` 可以查看所有的线程，使用命令 `thread n` 可以切换到某个具体任务的堆栈，其中 `n` 是线程的编号。检测 FreeRTOS 的功能可以在配置目标时被禁用。更多详细信息，请参阅[根据目标芯片配置 OpenOCD](#)。

**在 OpenOCD 的配置文件中设置 SPI 闪存的工作电压** ESP32 的 MTDI 引脚是用于 JTAG 通信的四个引脚之一，同时也是 ESP32 的 bootstrapping 引脚。上电时，ESP32 会在 MTDI 引脚上采样二进制电平，据此来设置内部的稳压器，用于给外部的 SPI 闪存芯片供电。如果上电时 MTDI 引脚上的二进制电平为低电平，则稳压器会被设置为 3.3 V；如果 MTDI 引脚为高电平，则稳压器会被设置为 1.8 V。MTDI 引脚通常需要一个上拉电阻或者直接使能内部的弱下拉电阻（详见[ESP32 系列芯片技术规格书](#)），具体取决于所使用的 SPI 芯片的类型。但是一旦连接上 JTAG 后，原来用于实现 bootstrapping 功能的上拉或者下拉电阻都会被覆盖掉。

为了解决这个问题，OpenOCD 的板级配置文件（例如 ESP-WROVER-KIT 开发板的 `board\esp32-wrover-kit-3.3v.cfg`）提供了 `ESP32_FLASH_VOLTAGE` 参数来设置 TDO 信号线在空闲状态下的二进制电平，这样就可以减少由于闪存电压不正确而导致的应用程序启动不良的几率。

查看 JTAG 连接的 ESP32 模组的规格书，检查其 SPI 闪存芯片的供电电压值，然后再相应的设置 `ESP32_FLASH_VOLTAGE`。大多数 WROOM 模块使用 3.3 V 的闪存芯片。早于 ESP32-WROVER-B 的 WROVER 模块使用 1.8 V 闪存芯片，而 ESP32-WROVER-B 和-E 模块使用 3.3 V 闪存芯片。

**优化 JTAG 的速度** 为了实现更高的数据通信速率同时最小化丢包数，建议优化 JTAG 时钟频率的设置，使其达到 JTAG 能稳定运行的最大值。为此，请参考以下建议。

1. 如果 CPU 以 80 MHz 运行，则 JTAG 时钟频率的上限为 20 MHz；如果 CPU 以 160 MHz 或者 240 MHz 运行，则上限为 26 MHz。
2. 根据特定的 JTAG 适配器和连接线缆的长度，你可能需要将 JTAG 的工作频率降低至 20 / 26 MHz 以下。
3. 在某些特殊情况下，如果你看到 DSR/DIR 错误（并且它并不是由 OpenOCD 试图从一个没有物理存储器映射的地址空间读取数据而导致的），请降低 JTAG 的工作频率。
4. ESP-WROVER-KIT 能够稳定运行在 20 / 26 MHz 频率下。

**调试器的启动命令的含义** 在启动时，调试器发出一系列命令来复位芯片并使其在特定的代码行停止运行。这个命令序列（如下所示）支持自定义，用户可以选择在最方便合适的代码行开始调试工作。

- `set remote hardware-watchpoint-limit 2` —限制 GDB 仅使用 ESP32 支持的两个硬件观察点。更多详细信息，请查阅[GDB 配置远程目标](#)。
- `mon reset halt` —复位芯片并使 CPU 停止运行。
- `flushregs` —`monitor (mon)` 命令无法通知 GDB 目标状态已经更改，GDB 会假设在 `mon reset halt` 之前所有的任务堆栈仍然有效。实际上，复位后目标状态将发生变化。执行 `flushregs` 是一种强制 GDB 从目标获取最新状态的方法。
- `thb app_main` —在 `app_main` 处插入一个临时的硬件断点，如果有需要，可以将其替换为其他函数名。
- `c` —恢复程序运行，它将会在 `app_main` 的断点处停止运行。

**根据目标芯片配置 OpenOCD** OpenOCD 有很多种配置文件 (\*.cfg)，它们位于 OpenOCD 安装目录的 `share/openocd/scripts` 子目录中（或者在 OpenOCD 源码目录的 `tcl/scripts` 目录中）。本文主要介绍 `board`，`interface` 和 `target` 这三个目录。

- `interface` 包含了例如 ESPProg、J-Link 这些 JTAG 适配器的配置文件。
- `target` 包含了目标芯片或者模组的配置文件。
- `board` 包含有内置了 JTAG 适配器的开发板的配置文件，这些配置文件会根据实际的 JTAG 适配器和芯片/模组来导入某个具体的 `interface` 和 `target` 的配置。

ESP32 可以使用的配置文件如下表所示：

表 24: ESP32 相关的 OpenOCD 配置文件

| 名字                                      | 描述   |
|---|--|
| board/<br>esp32-wrover-kit-3.3v.cfg     | 板载 3.3V 模组 (ESP32-WROOM-32, ESP32-WROVER-B, ESP32-WROVER-E) 的 ESP-WROVER-KIT 开发板配置文件 |
| board/<br>esp32-wrover-kit-1.8v.cfg     | 板载 1.8V 模组 (ESP32-WROVER) 的 ESP-WROVER-KIT 开发板配置文件                                   |
| board/<br>esp32-ethernet-kit-3v.cfg     | 板载 3.3V 模组 (ESP32-WROVER-B / ESP32-WROVER-E) 的 ESP-Ethernet-KIT 开发板配置文件              |
| target/esp32.cfg                        | ESP32 的目标配置文件, 可以和某个 interface/ 下的配置文件一同使用   |
| target/<br>esp32-solo-1.cfg             | ESP32-SOLO-1 的目标配置文件, 和 esp32.cfg 的差别在于它仅配置一个 CPU                                    |
| interface/ftdi/<br>esp32_devkitj_v1.cfg | 适用于 ESP-WROVER-KIT 和 ESP-Prog 板子的 JTAG 适配器配置文件                                       |

如果你使用的开发板已经有了一份预定义好的配置文件, 你只须将该文件通过 `-f` 参数告诉 OpenOCD。

如果你的开发板不在上述列表中, 你需要使用多个 `-f` 参数来告诉 OpenOCD 你选择的 interface 和 target 配置文件。

**自定义配置文件** OpenOCD 的配置文件是用 TCL 语言编写的, 包含了定制和编写脚本的各种选项。这在非标准调试的场景中非常有用, 更多关于 TCL 脚本的内容请参考 [OpenOCD 参考手册](#)。

**OpenOCD 中的配置变量** 你还可以视情况在导入 target 配置文件之前, 设定如下变量的值。可以写在自定义配置文件中, 或者通过命令行传递。

TCL 语言中为变量赋值的语法是:

```
set VARIABLE_NAME value
```

在命令行中为变量赋值请参考如下示例 (请把 .cfg 配置文件替换成你自己的开发板配置):

```
openocd -c 'set VARIABLE_NAME value' -f board/esp-xxxxx-kit.cfg
```

请切记, 一定要在导入配置文件之前设置这些变量, 否则变量的值将不会生效。为多个变量赋值需要重复多次 `-c` 选项。

表 25: 通用的 ESP 相关的 OpenOCD 变量

| 变量名                | 描述   |
|--------------------|--|
| ESP_RTOS           | 设置成 none 可以关闭 OpenOCD 对 RTOS 的支持, 这样的话, 你将无法在 GDB 中查看到线程列表。这个功能在调试 FreeRTOS 本身的时候会很有用, 可以单步调试调度器的代码。 |
| ESP_FLASH_SIZE     | 设置成 0 可以关闭对 Flash 断点的支持。   |
| ESP_SEMIHOST_BASED | 设置 semihosting 在主机端的默认目录。  |

表 26: ESP32 相关的 OpenOCD 变量

| 名字                  | 描述   |
|---------------------|--|
| ESP32_FLASH_VOLTAGE | 如果 ESP32 模组集成的是 1.8 V 的 Flash, 将该变量设置为 1.8, 详情请参考在 <a href="#">OpenOCD 的配置文件</a> 中设置 SPI 闪存的工作电压 |
| ESP32_ONLYCPU       | 对于多核芯片, 将该值设置为 1 可以仅启用单核调试功能   |

**复位 ESP32** 通过在 GDB 中输入 `mon reset` 或者 `mon reset halt` 来复位板子。

**不要将 JTAG 引脚用于其他功能** 如果除了 ESP32 模组和 JTAG 适配器之外的其他硬件也连接到了 JTAG 引脚，那么 JTAG 的操作可能会受到干扰。ESP32 JTAG 使用以下引脚：

表 27: ESP32 引脚和 JTAG 接口信号

| ESP32 引脚      | JTAG 信号 |
|---------------|---------|
| MTDO / GPIO15 | TDO     |
| MTDI / GPIO12 | TDI     |
| MTCK / GPIO13 | TCK     |
| MTMS / GPIO14 | TMS     |
| GND           | GND     |

如果用户应用程序更改了 JTAG 引脚的配置，JTAG 通信可能会失败。如果 OpenOCD 正确初始化（检测到两个 Tensilica 内核），但在程序运行期间失去了同步并报出大量 DTR/DIR 错误，则应用程序可能将 JTAG 引脚重新配置为其他功能或者用户忘记将 Vtar 连接到 JTAG 适配器。

下面是 GDB 在应用程序进入重新配置 MTDO/GPIO15 作为输入代码后报告的一系列错误摘录：

```
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated
↳an exception!
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated
↳an overrun!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated
↳an exception!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated
↳an overrun!
```

**JTAG 与闪存加密和安全引导** 默认情况下，开启了闪存加密和（或者）安全引导后，系统在首次启动时，引导程序会烧写 eFuse 的某个比特，从而将 JTAG 永久关闭。

Kconfig 配置项 `CONFIG_SECURE_BOOT_ALLOW_JTAG` 可以改变这个默认行为，使得用户即使开启了安全引导或者闪存加密，仍会保留 JTAG 的功能。

然而，因为设置软件断点的需要，OpenOCD 会尝试自动读写 Flash 中的内容，这会带来两个问题：

- 软件断点和闪存加密是不兼容的，目前 OpenOCD 尚不支持对 Flash 中的内容进行加密和解密。
- 如果开启了安全引导功能，设置软件断点会改变被签名的程序的摘要，从而使得签名失效。这也意味着，如果设置了软件断点，系统会在下次重启时的签名验证阶段失败，导致无法启动。

关闭 JTAG 的软件断点功能，可以在启动 OpenOCD 时在命令行额外加一项配置参数 `-c 'set ESP_FLASH_SIZE 0'`，请参考 [OpenOCD 中的配置变量](#)。

**备注：**同样地，当启用该选项，并且调试过程中打了软件断点，之后引导程序将无法校验通过应用程序的签名。

**JTAG 和 ESP32-WROOM-32 AT 固件兼容性问题** ESP32-WROOM 系列模块预装了 AT 固件。该固件将 GPIO12 至 GPIO15 管脚配置为 SPI 从属接口，使得无法使用 JTAG。

要想使用 JTAG，需要编译新的固件，新的固件不能使用专门用于 JTAG 通信的管脚（GPIO12 至 GPIO15），然后将固件烧录到模组中。请参考 [不要将 JTAG 引脚用于其他功能](#)。

**报告 OpenOCD / GDB 的问题** 如果你遇到 OpenOCD 或者 GDB 程序本身的问题，并且在网上没有找到可用的解决方案，请前往 <https://github.com/espressif/openocd-esp32/issues> 新建一个议题。

1. 请在问题报告中提供你使用的配置的详细信息：
  - a. JTAG 适配器类型。
  - b. 用于编译和加载正在调试的应用程序的 ESP-IDF 版本号。
  - c. 用于调试的操作系统的详细信息。
  - d. 操作系统是在本地计算机运行还是在虚拟机上运行？
2. 创建一个能够演示问题的简单示例工程，描述复现该问题的步骤。且这个调试示例不能受到 Wi-Fi 协议栈引入的非确定性行为的影响，因而再次遇到同样问题时，更容易复现。
3. 在启动命令中添加额外的参数来输出调试日志。  
OpenOCD 端：

```
openocd -l openocd_log.txt -d3 -f board/esp32-wrover-kit-3.3v.cfg
```

这种方式会将日志输出到文件，但是它会阻止调试信息打印在终端上。当有大量信息需要输出的时候（比如调试等级提高到 -d3）这是个不错的选择。如果你仍然希望在屏幕上看到调试日志，请改用以下命令：

```
openocd -d3 -f board/esp32-wrover-kit-3.3v.cfg 2>&1 | tee openocd.log
```

Debugger 端：

```
xtensa-esp32-elf-gdb -ex "set remotelogfile gdb_log.txt" <all other options>
```

也可以将命令 `remotelogfile gdb_log.txt` 添加到 `gdbinit` 文件中。

4. 请将 `openocd_log.txt` 和 `gdb_log.txt` 文件附在你的问题报告中。

## 4.19.10 相关文档

### 使用调试器

本节介绍以下几种配置和运行调试器的方法：

- [使用 Eclipse 调试](#)
- [使用命令行调试](#)
- [使用 `idf.py` 进行调试](#)

### 使用 Eclipse 调试

**备注：**建议您首先通过 `idf.py` 或 [命令行](#) 检查调试器是否正常工作，然后再转到使用 [Eclipse](#) 平台。

标准的 Eclipse 安装流程默认安装调试功能，另外您还可以使用插件来调试，比如“GDB Hardware Debugging”。这个插件用起来非常方便，本指南会详细介绍该插件的使用方法。

首先，打开 Eclipse 并转到“Help” > “Install New Software”来安装“GDB Hardware Debugging”插件。

安装完成后，按照以下步骤配置调试会话。请注意，一些配置参数是通用的，有些则针对特定项目。我们会通过配置“blink”示例项目的调试环境来进行展示，请先按照[使用 Eclipse IDE 编译和烧写](#)介绍的方法将该示例项目添加到 Eclipse 的工作空间。示例项目 [get-started/blink](#) 的源代码可以在 ESP-IDF 仓库的 [examples](#) 目录下找到。

1. 在 Eclipse 中，进入 `Run > Debug Configuration`，会出现一个新的窗口。在窗口的左侧窗格中，双击“GDB Hardware Debugging”（或者选择“GDB Hardware Debugging”然后按下“New”按钮）来新建一个配置。
2. 在右边显示的表单中，“Name:”一栏中输入配置的名称，例如：“Blink checking”。
3. 在下面的“Main”选项卡中，点击“Project:”边上的“Browse”按钮，然后选择当前的“blink”项目。
4. 在下一行的“C/C++ Application:”中，点击“Browse”按钮，选择“blink.elf”文件。如果“blink.elf”文件不存在，那么很有可能该项目还没有编译，请参考[使用 Eclipse IDE 编辑和烧写](#)指南中的介绍。
5. 最后，在“Build (if required) before launching”下面点击“Disable auto build”。

上述步骤 1 - 5 的示例输入如下图所示。

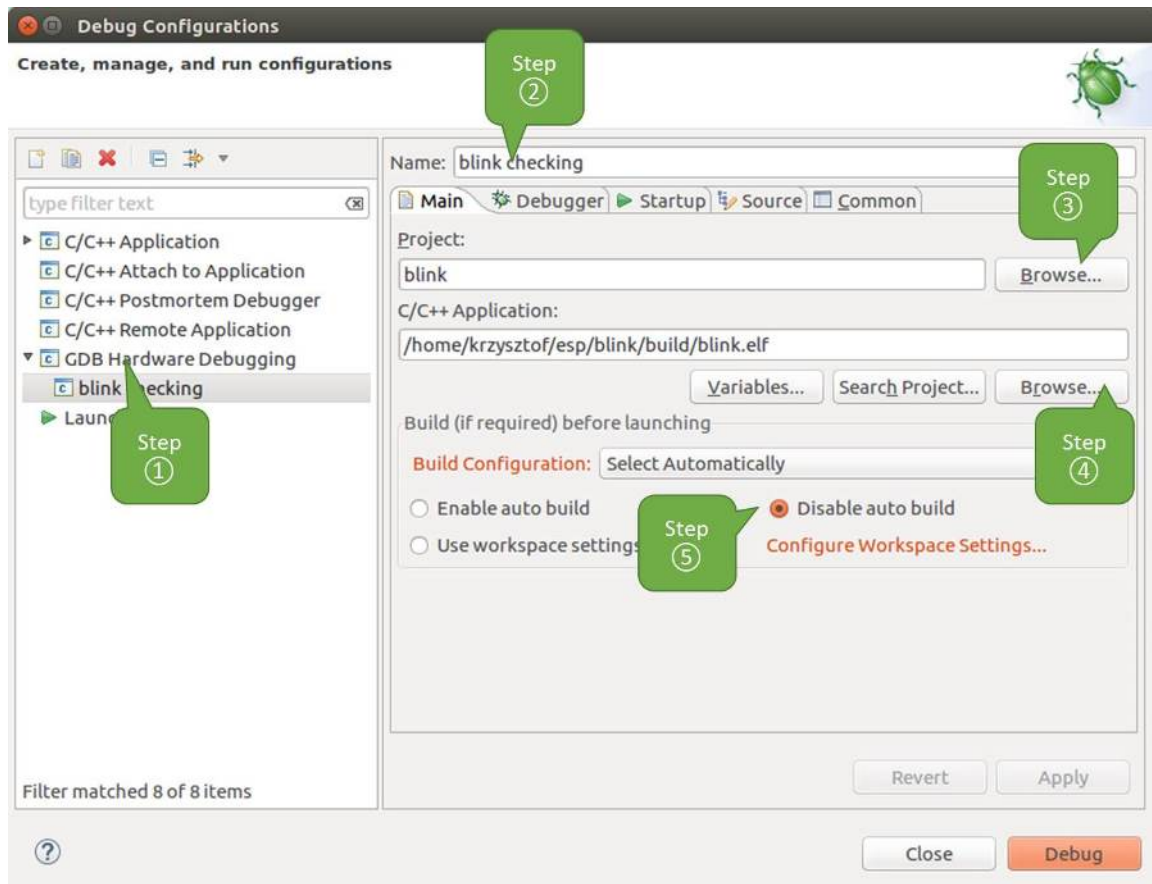

图 34: GDB 硬件调试的配置 - Main 选项卡

6. 点击“Debugger”选项卡，在“GDB Command”栏中输入 `xtensa-esp32-elf-gdb` 来调用调试器。
7. 更改“Remote host”的默认配置，在“Port number”下面输入 3333。  
上述步骤 6 - 7 的示例输入如下图所示。
8. 最后一个需要更改默认配置的选项卡是“Startup”选项卡。在“Initialization Commands”下，取消选中“Reset and Delay (seconds)”和“Halt”，然后在下面一栏中输入以下命令：

```
mon reset halt
flushregs
set remote hardware-watchpoint-limit 2
```

**备注：** 如果您想在启动新的调试会话之前自动更新闪存中的镜像，请在“Initialization Commands”文本框的开头添加以下命令行：

```
mon reset halt
mon program_esp ${workspace_loc:blink/build/blink.bin} 0x10000 verify
```

有关 `program_esp` 命令的说明请参考[上传待调试的应用程序](#) 章节。

9. 在“Load Image and Symbols”下，取消选中“Load image”选项。
10. 在同一个选项卡中继续往下浏览，建立一个初始断点用来在调试器复位后暂停 CPU。插件会根据“Set break point at:”一栏中输入的函数名，在该函数的开头设置断点。选中这一选项，并在相应的字段中输入 `app_main`。
11. 选中“Resume”选项，这会使得程序在每次调用步骤 8 中的 `mon reset halt` 后恢复，然后在 `app_main` 的断点处停止。  
上述步骤 8 - 11 的示例输入如下图所示。

图 35: GDB 硬件调试的配置 - Debugger 选项卡

图 36: GDB 硬件调试的配置 - Startup 选项卡

上面的启动序列看起来有些复杂，如果您对其中的初始化命令不太熟悉，请查阅调试器的[启动命令的含义](#)章节获取更多说明。

- 如果您前面已经完成配置 [ESP32 目标板](#) 中介绍的步骤，那么目标正在运行并准备与调试器进行对话。按下“Debug”按钮就可以直接调试。否则请按下“Apply”按钮保存配置，返回[配置 ESP32 目标板](#)章节进行配置，最后再回到这里开始调试。

一旦所有 1 - 12 的配置步骤都已经完成，Eclipse 就会打开“Debug”视图，如下图所示。

图 37: Eclipse 中的调试视图

如果您不太了解 GDB 的常用方法，请查阅[使用 Eclipse 的调试示例](#)文章中的调试示例章节[调试范例](#)。

### 使用命令行调试

- 为了能够启动调试会话，需要先启动并运行目标，如果还没有完成，请按照[配置 ESP32 目标板](#)中的介绍进行操作。
- 打开一个新的终端会话并前往待调试的项目目录，比如：

```
cd ~/esp/blink
```

- 当启动调试器时，通常需要提供几个配置参数和命令，为了避免每次都在命令行中逐行输入这些命令，您可以新建一个配置文件，并将其命名为 gdbinit:

```
target remote :3333
set remote hardware-watchpoint-limit 2
mon reset halt
flushregs
thb app_main
c
```

将此文件保存在当前目录中。

有关 gdbinit 文件内部的更多详细信息，请参阅[调试器的启动命令的含义](#)章节。

4. 准备好启动 GDB，请在终端中输入以下内容：

```
xtensa-esp32-elf-gdb -x gdbinit build/blink.elf
```

5. 如果前面的步骤已经正确完成，您会看到如下所示的输出日志，在日志的最后会出现 (gdb) 提示符：

```
user-name@computer-name:~/esp/blink$ xtensa-esp32-elf-gdb -x gdbinit build/
↳blink.elf

↳c:43
43      xTaskCreate(&blink_task, "blink_task", 512, NULL, 5, NULL);
(gdb)
```

注意上面日志的倒数第三行显示了调试器已经在 `app_main()` 函数的断点处停止，该断点在 `gdbinit` 文件中设定。由于处理器已经暂停运行，LED 也不会闪烁。如果这也是您看到的现象，您可以开始调试了。

如果您不太了解 GDB 的常用方法，请查阅[使用命令行的调试示例](#)文章中的调试示例章节[调试范例](#)。

**使用 idf.py 进行调试** 您还可以使用 `idf.py` 更方便地执行上述提到的调试命令，可以使用以下命令：

1. `idf.py openocd`  
在终端中运行 **OpenOCD**，其配置信息来源于环境变量或者命令行。默认会使用 `OPENOCD_SCRIPTS` 环境变量中指定的脚本路径，它是由 **ESP-IDF** 项目仓库中的导出脚本 (`export.sh` or `export.bat`) 添加到系统环境变量中的。当然，您可以在命令行中通过 `--openocd-scripts` 参数来覆盖这个变量的值。  
至于当前开发板的 **JTAG** 配置，请使用环境变量 `OPENOCD_COMMANDS` 或命令行参数 `--openocd-commands`。如果这两者都没有被定义，那么 **OpenOCD** 会使用 `-f board/esp32-wrover-kit-3.3v.cfg` 参数来启动。
2. `idf.py gdb`  
根据当前项目的 `elf` 文件自动生成 **GDB** 启动脚本，然后会按照 [使用命令行调试](#) 中所描述的步骤启动 **GDB**。
3. `idf.py gdbtui`  
和步骤 2 相同，但是会在启动 **GDB** 的时候传递 `tui` 参数，这样可以方便在调试过程中查看源代码。
4. `idf.py gdbgui`  
启动 **gdbgui**，在浏览器中打开调试器的前端界面。  
上述这些命令也可以合并到一起使用，`idf.py` 会自动将后台进程（比如 `openocd`）最先运行，交互式进程（比如 **GDB**，`monitor`）最后运行。  
常用的组合命令如下所示：

```
idf.py openocd gdbgui monitor
```

上述命令会将 **OpenOCD** 运行至后台，然后启动 **gdbgui** 打开一个浏览器窗口，显示调试器的前端界面，最后在活动终端打开串口监视器。

## 调试示例

本节将介绍如何在 [Eclipse](#) 和 [命令行](#) 中使用 **GDB** 进行调试的示例。

**使用 Eclipse 的调试示例** 请检查目标板是否已经准备好，并加载了 [get-started/blink](#) 示例代码，然后按照 [使用 Eclipse 调试](#) 中介绍的步骤配置和启动调试器，最后选择让应用程序在 `app_main()` 建立的断点处停止。

## 本小节的示例

1. [浏览代码，查看堆栈和线程](#)
2. [设置和清除断点](#)
3. [手动暂停目标](#)
4. [单步执行代码](#)
5. [查看并设置内存](#)
6. [观察和设置程序变量](#)
7. [设置条件断点](#)

**浏览代码，查看堆栈和线程** 当目标暂停时，调试器会在“**Debug**”窗口中显示线程的列表，程序暂停的代码行在下面的另一个窗口中被高亮显示，如下图所示。此时板子上的 **LED** 停止了闪烁。

暂停的程序所在线程也会被展开，显示函数调用的堆栈，它表示直到目标暂停所在代码行（下图高亮处）为止的相关函数的调用关系。1 号线程下函数调用堆栈的第一行包含了最后一个调用的函数 `app_main()`，根据下一行显示，它又是在函数 `main_task()` 中被调用的。堆栈的每一行还包含调用函数的文件名和行号。通过单击每个堆栈的条目，在下面的窗口中，你将看到此文件的内容。

通过展开线程，你可以浏览整个应用程序。展开 5 号线程，它包含了更长的函数调用堆栈，你可以看到函数调用旁边的数字，比如 `0x4000000c`，它们代表未以源码形式提供的二进制代码所在的内存地址。

无论项目是以源代码还是仅以二进制形式提供，在右边一个窗口中，都可以看到反汇编后的机器代码。

图 38: Eclipse 中的 Debug 视图

图 39: 调试时目标停止

图 40: 浏览函数调用堆栈

回到 1 号线程中的 `app_main()` 函数所在的 `blink.c` 源码文件，下面的示例将会以该文件为例介绍调试的常用功能。调试器可以轻松浏览整个应用程序的代码，这给单步调试代码和设置断点带来了很大的便利，下面将一一展开讨论。

**设置和清除断点** 在调试时，我们希望能够在关键的代码行停止应用程序，然后检查特定的变量、内存、寄存器和外设的状态。为此我们需要使用断点，以便在特定某行代码处快速访问和停止应用程序。

我们在控制 LED 状态发生变化的两处代码行分别设置一个断点。基于以上代码列表，这两处分别为第 33 和 36 代码行。按住键盘上的“Control”键，双击 `blink.c` 文件中的行号 33，并在弹出的对话框中点击“OK”按钮进行确定。如果你不想看到此对话框，双击行号即可。执行同样操作，在第 36 行设置另外一个断点。

图 41: 设置断点

断点的数量和位置信息会显示在右上角的“断点”窗口中。单击“Show Breakpoints Supported by Selected Target”图标可以刷新此列表。除了刚才设置的两个断点外，列表中可能还包含在调试器启动时设置在 `app_main()` 函数处的临时断点。由于最多只允许设置两个断点（详细信息请参阅[可用的断点和观察点](#)），你需要将其删除，否则调试会失败。

单击“Resume”（如果“Resume”按钮是灰色的，请先单击 8 号线程的 `blink_task()` 函数）后处理器将开始继续运行，并在断点处停止。再一次单击“Resume”按钮，使程序再次运行，然后停在第二个断点处，依次类推。

每次单击“Resume”按钮恢复程序运行后，都会看到 LED 切换状态。

更多关于断点的信息，请参阅[可用的断点和观察点](#)和[关于断点的补充知识](#)。

**手动暂停目标** 在调试时，你可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。后者，如果想要返回调试模式，可以通过单击“Suspend”按钮来手动中断程序的运行。

图 42: 设置了三个断点 / 最多允许两个断点

在此之前，请删除所有的断点，然后单击“Resume”按钮。接着单击“Suspend”按钮，应用程序会停止在某个随机的位置，此时 LED 也将停止闪烁。调试器将展开线程并高亮显示停止的代码行。

图 43: 手动暂停目标

在上图所示的情况中，应用程序已经在 `freertos_hooks.c` 文件的第 52 行暂停运行，现在你可以通过单击“Resume”按钮再次将其恢复运行或者进行下面要介绍的调试工作。

**单步执行代码** 我们还可以使用“Step Into (F5)”和“Step Over (F6)”命令单步执行代码，这两者之间的区别是执行“Step Into (F5)”命令会进入调用的子程序，而执行“Step Over (F6)”命令则会直接将子程序看成单个源码行，单步就能将其运行结束。

在继续演示此功能之前，请参照上文所述确保目前只在 `blink.c` 文件的第 36 行设置了一个断点。

按下 F8 键让程序继续运行然后在断点处停止运行，多次按下“Step Over (F6)”按钮，观察调试器是如何单步执行一行代码的。

如果你改用“Step Into (F5)”，那么调试器将会进入调用的子程序内部。

在上述例子中，调试器进入 `gpio_set_level(BLINK_GPIO, 0)` 代码内部，同时代码窗口快速切换到 `gpio.c` 驱动文件。

请参阅“[next](#)”命令无法跳过子程序的原因 文档以了解 `next` 命令的潜在局限。

**查看并设置内存** 要显示或者设置内存的内容，请使用“调试”视图中位于底部的“Memory”选项卡。

在“Memory”选项卡下，我们将在内存地址 `0x3FF44004` 处读取和写入内容。该地址也是 `GPIO_OUT_REG` 寄存器的地址，可以用来控制（设置或者清除）某个 GPIO 的电平。

关于该寄存器的更多详细信息，请参阅 *ESP32 技术参考手册 > IO MUX 和 GPIO Matrix (GPIO, IO\_MUX)* [PDF] 章节。

图 44: 使用“Step Over (F6)”单步执行代码

图 45: 使用“Step Into (F5)”单步执行代码

同样在 blink.c 项目文件中，在两个 gpio\_set\_level 语句的后面各设置一个断点，单击“Memory”选项卡，然后单击“Add Memory Monitor”按钮，在弹出的对话框中输入 0x3FF44004。

按下 F8 按键恢复程序运行，并观察“Monitor”选项卡。

图 46: 观察内存地址 0x3FF44004 处的某个比特被置高

每按一下 F8，你就会看到在内存 0x3FF44004 地址处的一个比特位被翻转（并且 LED 会改变状态）。

图 47: 观察内存地址 0x3FF44004 处的某个比特被置低

要修改内存的数值，请在“Monitor”选项卡中找到待修改的内存地址，如前面观察的结果一样，输入特定比特翻转后的值。当按下回车键后，将立即看到 LED 的状态发生了改变。

**观察和设置程序变量** 常见的调试任务是在程序运行期间检查程序中某个变量的值，为了演示这个功能，更新 blink.c 文件，在 blink\_task 函数的上面添加一个全局变量的声明 `int i`，然后在 `while(1)` 里添加 `i++`，这样每次 LED 改变状态的时候，变量 `i` 都会增加 1。

退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32 中，接着重启调试器。注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，在代码 `i++` 处添加一个断点。

下一步，在“Breakpoints”所在的窗口中，选择“Expressions”选项卡。如果该选项卡不存在，请在顶部菜单栏的 `Window > Show View > Expressions` 中添加这一选项卡。然后在该选项卡中单击“Add new expression”，并输入 `i`。

按下 F8 继续运行程序，每次程序停止时，都会看到变量 `i` 的值在递增。

图 48: 观察程序变量 “i”

如想更改 `i` 的值，可以在“Value”一栏中输入新的数值。按下“Resume (F8)”后，程序将从新输入的数字开始递增 `i`。

**设置条件断点** 接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点，然后让程序停止运行。右击断点打开上下文菜单，选择“Breakpoint Properties”，将“Type:”改选为“Hardware”然后在“Condition:”一栏中输入条件表达式，例如 `i == 2`。

图 49: 设置条件断点

如果当前 `i` 的值小于 2（如果有需要也可以更改这个阈值）并且程序被恢复运行，那么 LED 就会循环闪烁，直到 `i == 2` 条件成立，最后程序停止在该处。

**使用命令行的调试示例** 请检查您的目标板是否已经准备好，并加载了 [get-started/blink](#) 示例代码，然后按照[使用命令行调试](#)中介绍的步骤配置和启动调试器，最后选择让应用程序在 `app_main()` 建立的断点处停止运行

```
Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/./blink.c:43
43      xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5, NULL);
(gdb)
```

### 本小节的示例

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 暂停和恢复应用程序的运行
4. 单步执行代码
5. 查看并设置内存

6. 观察和设置程序变量
7. 设置条件断点

**浏览代码，查看堆栈和线程** 当看到 (gdb) 提示符的时候，应用程序已停止运行，LED 也停止闪烁。

要找到代码暂停的位置，输入 `l` 或者 `list` 命令，调试器会打印出暂停点 (`blink.c` 代码文件的第 43 行) 附近的几行代码

```
(gdb) l
38         }
39     }
40
41     void app_main()
42     {
43         xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, ↵
↵5, NULL);
44     }
(gdb)
```

也可以通过输入 `l 30, 40` 等命令来查看特定行号范围内的代码。

使用 `bt` 或者 `backtrace` 来查看哪些函数最终导致了此代码被调用:

```
(gdb) bt
#0  app_main () at /home/user-name/esp/blink/main/./blink.c:43
#1  0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
↵esp32/./cpu_start.c:339
(gdb)
```

输出的第 0 行表示应用程序暂停之前调用的最后一个函数，即我们之前列出的 `app_main ()`。`app_main ()` 又被位于 `cpu_start.c` 文件第 339 行的 `main_task` 函数调用。

想查看 `cpu_start.c` 文件中 `main_task` 函数的上下文，需要输入 `frame N`，其中 `N=1`，因为根据前面的输出，`main_task` 位于 #1 下:

```
(gdb) frame 1
#1  0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
↵esp32/./cpu_start.c:339
339     app_main();
(gdb)
```

输入 `l` 将显示一段名为 `app_main()` 的代码 (在第 339 行):

```
(gdb) l
334         ;
335     }
336 #endif
337     //Enable allocation in region where the startup stacks were located.
338     heap_caps_enable_nonos_stack_heaps();
339     app_main();
340     vTaskDelete(NULL);
341 }
342
(gdb)
```

通过打印前面的一些行，你会看到我们一直在寻找的 `main_task` 函数:

```
(gdb) l 326, 341
326     static void main_task(void* args)
327     {
328         // Now that the application is about to start, disable boot watchdogs
329         REG_CLR_BIT(TIMG_WDTCONFIG0_REG(0), TIMG_WDT_FLASHBOOT_MOD_EN_S);
```

(下页继续)

(续上页)

```

330     REG_CLR_BIT(RTC_CNTL_WDTCONFIG0_REG, RTC_CNTL_WDT_FLASHBOOT_MOD_EN);
331     #if !CONFIG_FREERTOS_UNICORE
332     // Wait for FreeRTOS initialization to finish on APP CPU, before
↳replacing its startup stack
333     while (port_xSchedulerRunning[1] == 0) {
334         ;
335     }
336     #endif
337     //Enable allocation in region where the startup stacks were located.
338     heap_caps_enable_nonos_stack_heaps();
339     app_main();
340     vTaskDelete(NULL);
341 }
(gdb)

```

如果要查看其他代码，可以输入 `i threads` 命令，则会输出目标板上运行的线程列表：

```

(gdb) i threads
  Id  Target Id      Frame
   8   Thread 1073411336 (dport) 0x400d0848 in dport_access_init_core (arg=
↳<optimized out>)
      at /home/user-name/esp/esp-idf/components/esp32/./dport_access.c:170
   7   Thread 1073408744 (ipc0) xQueueGenericReceive (xQueue=0x3ffae694,
↳pvBuffer=0x0, xTicksToWait=1644638200,
      xJustPeeking=0) at /home/user-name/esp/esp-idf/components/freertos/./queue.
↳c:1452
   6   Thread 1073431096 (Tmr Svc) prvTimerTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos/./timers.c:445
   5   Thread 1073410208 (ipc1 : Running) 0x4000bfea in ?? ()
   4   Thread 1073432224 (dport) dport_access_init_core (arg=0x0)
      at /home/user-name/esp/esp-idf/components/esp32/./dport_access.c:150
   3   Thread 1073413156 (IDLE) prvIdleTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
   2   Thread 1073413512 (IDLE) prvIdleTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
*  1   Thread 1073411772 (main : Running) app_main () at /home/user-name/esp/blink/
↳main/./blink.c:43
(gdb)

```

线程列表显示了每个线程最后一个被调用的函数以及所在的 C 源文件名（如果存在的话）。

您可以通过输入 `thread N` 进入特定的线程，其中 `N` 是线程 ID。我们进入 5 号线程来看一下它是如何工作的：

```

(gdb) thread 5
[Switching to thread 5 (Thread 1073410208)]
#0  0x4000bfea in ?? ()
(gdb)

```

然后查看回溯：

```

(gdb) bt
#0  0x4000bfea in ?? ()
#1  0x40083a85 in vPortCPUReleaseMutex (mux=<optimized out>) at /home/user-name/
↳esp/esp-idf/components/freertos/./port.c:415
#2  0x40083fc8 in vTaskSwitchContext () at /home/user-name/esp/esp-idf/components/
↳freertos/./tasks.c:2846
#3  0x4008532b in _frxt_dispatch ()
#4  0x4008395c in xPortStartScheduler () at /home/user-name/esp/esp-idf/components/
↳freertos/./port.c:222
#5  0x4000000c in ?? ()

```

(下页继续)

```
#6 0x4000000c in ?? ()
#7 0x4000000c in ?? ()
#8 0x4000000c in ?? ()
(gdb)
```

如上所示，回溯可能会包含多个条目，方便查看直至目标停止运行的函数调用顺序。如果找不到某个函数的源码文件，将会使用问号 ?? 替代，这表示该函数是以二进制格式提供的。像 0x4000bfea 这样的值是被调用函数所在的内存地址。

使用诸如 `bt`、`i threads`、`thread N` 和 `list` 命令可以浏览整个应用程序的代码。这给单步调试代码和设置断点带来很大的便利，下面将一一展开来讨论。

**设置和清除断点** 在调试时，我们希望能够在关键的代码行停止应用程序，然后检查特定的变量、内存、寄存器和外设的状态。为此我们需要使用断点，以便在特定某行代码处快速访问和停止应用程序。

我们在控制 LED 状态发生变化的两处代码行分别设置一个断点。基于以上代码列表，这两处分别为第 33 和 36 代码行。使用命令 `break M` 设置断点，其中 `M` 是具体的代码行：

```
(gdb) break 33
Breakpoint 2 at 0x400db6f6: file /home/user-name/esp/blink/main/./blink.c, line 33.
(gdb) break 36
Breakpoint 3 at 0x400db704: file /home/user-name/esp/blink/main/./blink.c, line 36.
```

输入命令 `c`，处理器将运行并在断点处停止。再次输入 `c` 将使其再次运行，并在第二个断点处停止，依此类推：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F6 (active) APP_CPU: PC=0x400D10D8

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:33
33      gpio_set_level(BLINK_GPIO, 0);
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F8 (active) APP_CPU: PC=0x400D10D8
Target halted. PRO_CPU: PC=0x400DB704 (active) APP_CPU: PC=0x400D10D8

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:36
36      gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

只有在输入命令 `c` 恢复程序运行后才能看到 LED 改变状态。

查看已设置断点的数量和位置，请使用命令 `info break`：

```
(gdb) info break
Num   Type           Disp Enb Address          What
2     breakpoint     keep y   0x400db6f6 in blink_task at /home/user-name/esp/
↪blink/main/./blink.c:33
      breakpoint already hit 1 time
3     breakpoint     keep y   0x400db704 in blink_task at /home/user-name/esp/
↪blink/main/./blink.c:36
      breakpoint already hit 1 time
(gdb)
```

请注意，断点序号（在 Num 栏列出）从 2 开始，这是因为在调试器启动时执行 `thb app_main` 命令已经在 `app_main()` 函数处建立了第一个断点。由于它是一个临时断点，已经被自动删除，所以没有被列出。

要删除一个断点，请输入 `delete N` 命令（或者简写成 `d N`），其中 `N` 代表断点序号：

```
(gdb) delete 1
No breakpoint number 1.
(gdb) delete 2
(gdb)
```

更多关于断点的信息，请参阅[可用的断点和观察点](#)和[关于断点的补充知识](#)。

**暂停和恢复应用程序的运行** 在调试时，可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。对于后者，想要返回调试模式，可以通过输入 **Ctrl+C** 手动中断程序的运行。

在此之前，请删除所有的断点，然后输入 **c** 恢复程序运行。接着输入 **Ctrl+C**，应用程序会停止在某个随机的位置，此时 **LED** 也将停止闪烁。调试器会打印如下信息：

```
(gdb) c
Continuing.
^CTarget halted. PRO_CPU: PC=0x400D0C00          APP_CPU: PC=0x400D0C00 (active)
[New Thread 1073433352]

Program received signal SIGINT, Interrupt.
[Switching to Thread 1073413512]
0x400d0c00 in esp_vApplicationIdleHook () at /home/user-name/esp/esp-idf/
↳components/esp32/./freertos_hooks.c:52
52             asm("waiti 0");
(gdb)
```

在上图所示的情况下，应用程序已经在 `freertos_hooks.c` 文件的第 52 行暂停运行，现在您可以通过输入 **c** 再次将其恢复运行或者进行如下所述的一些调试工作。

**备注：**在 `MSYS2` 的 `shell` 中输入 **Ctrl+C** 并不会暂停目标的运行，而是会退出调试器。解决这个问题方法可以通过[使用 Eclipse 来调试](#)或者参考[http://www.mingw.org/wiki/Workaround\\_for\\_GDB\\_Ctrl\\_C\\_Interrupt](http://www.mingw.org/wiki/Workaround_for_GDB_Ctrl_C_Interrupt)里的解决方案。

**单步执行代码** 我们还可以使用 `step` 和 `next` 命令（可以简写成 `s` 和 `n`）单步执行代码，这两者之间的区别是执行“`step`”命令会进入调用的子程序内部，而执行“`next`”命令则会直接将子程序看成单个源码行，单步就能将其运行结束。

在继续演示此功能之前，请使用前面介绍的 `break` 和 `delete` 命令，确保目前只在 `blink.c` 文件的第 36 行设置了一个断点：

```
(gdb) info break
Num      Type           Disp Enb Address      What
3        breakpoint      keep y  0x400db704 in blink_task at /home/user-name/esp/
↳blink/main/./blink.c:36
breakpoint already hit 1 time
(gdb)
```

输入 **c** 恢复程序运行然后等它在断点处停止运行：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB754 (active)  APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:36
36             gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

然后输入 **n** 多次，观察调试器是如何单步执行一行代码的：

```
(gdb) n
Target halted. PRO_CPU: PC=0x400DB756 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB758 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active) APP_CPU: PC=0x400D1128
37         vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) n
Target halted. PRO_CPU: PC=0x400DB75E (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400846FC (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB761 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB746 (active) APP_CPU: PC=0x400D1128
33         gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

如果你输入 `s`，那么调试器将进入子程序：

```
(gdb) s
Target halted. PRO_CPU: PC=0x400DB748 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74B (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04F (active) APP_CPU: PC=0x400D1128
gpio_set_level (gpio_num=GPIO_NUM_4, level=0) at /home/user-name/esp/esp-idf/
↳components/driver/./gpio.c:183
183     GPIO_CHECK(GPIO_IS_VALID_OUTPUT_GPIO(gpio_num), "GPIO output gpio_num error
↳", ESP_ERR_INVALID_ARG);
(gdb)
```

上述例子中，调试器进入 `gpio_set_level(BLINK_GPIO, 0)` 代码内部，同时代码窗口快速切换到 `gpio.c` 驱动文件。

请参阅 [“next”命令无法跳过子程序的原因](#) 文档以了解 `next` 命令的潜在局限。

**查看并设置内存** 使用命令 `x` 可以显示内存的内容，配合其余参数还可以调整所显示内存位置的格式和数量。运行 `help x` 可以查看更多相关细节。与 `x` 命令配合使用的命令是 `set`，它允许你将值写入内存。

为了演示 `x` 和 `set` 的使用，我们将在内存地址 `0x3FF44004` 处读取和写入内容。该地址也是 `GPIO_OUT_REG` 寄存器的地址，可以用来控制（设置或者清除）某个 `GPIO` 的电平。

关于该寄存器的更多详细信息，请参阅 [ESP32 技术参考手册 > IO MUX 和 GPIO Matrix \(GPIO, IO\\_MUX\) \[PDF\]](#) 章节。

同样在 `blink.c` 项目文件中，在两个 `gpio_set_level` 语句的后面各设置一个断点。输入两次 `c` 命令后停止在断点处，然后输入 `x /1wx 0x3FF44004` 来显示 `GPIO_OUT_REG` 寄存器的值：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB75E (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74E (active) APP_CPU: PC=0x400D1128

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:34
34         vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active) APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:37
37         vTaskDelay(1000 / portTICK_PERIOD_MS);
```

(下页继续)

(续上页)

```
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000010
(gdb)
```

如果闪烁的 LED 连接到了 GPIO4，那么每次 LED 改变状态时你会看到第 4 比特被翻转：

```
0x3ff44004: 0x00000000
...
0x3ff44004: 0x00000010
```

现在，当 LED 熄灭时，与之对应地会显示 0x3ff44004: 0x00000000，尝试使用 set 命令向相同的内存地址写入 0x00000010 来将该比特置高：

```
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) set {unsigned int}0x3FF44004=0x000010
```

在输入 set {unsigned int}0x3FF44004=0x000010 命令后，你会立即看到 LED 亮起。

**观察和设置程序变量** 常见的调试任务是在程序运行期间检查程序中某个变量的值，为了能够演示这个功能，更新 blink.c 文件，在 blink\_task 函数的上面添加一个全局变量的声明 int i，然后在 while(1) 里添加 i++，这样每次 LED 改变状态的时候，变量 i 都会增加 1。

退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32 中，接着重启调试器。注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，输入命令 watch i：

```
(gdb) watch i
Hardware watchpoint 2: i
(gdb)
```

这会在所有变量 i 发生改变的代码处插入所谓的“观察点”。现在输入 continue 命令来恢复应用程序的运行并观察它停止：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active) APP_CPU: PC=0x400D0811
[New Thread 1073432196]

Program received signal SIGTRAP, Trace/breakpoint trap.
[Switching to Thread 1073432196]
0x400db751 in blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.
->blink.c:33
33      i++;
(gdb)
```

多次恢复程序运行后，变量 i 的值会增加，现在你可以输入 print i（简写 p i）来查看当前 i 的值：

```
(gdb) p i
$1 = 3
(gdb)
```

要修改 i 的值，请使用 set 命令，如下所示（可以将其打印输出出来查看是否确已修改）：

```
(gdb) set var i = 0
(gdb) p i
$3 = 0
(gdb)
```

最多可以使用两个观察点，详细信息请参阅[可用的断点和观察点](#)。

**设置条件断点** 接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点。请先删除已有的断点，然后尝试如下命令：

```
(gdb) break blink.c:34 if (i == 2)
Breakpoint 3 at 0x400db753: file /home/user-name/esp/blink/main/./blink.c, line 34.
(gdb)
```

以上命令在 `blink.c` 文件的 34 处设置了一个条件断点，当 `i == 2` 条件满足时，程序会停止运行。

如果当前 `i` 的值小于 2 并且程序被恢复运行，那么 LED 就会循环闪烁，直到 `i == 2` 条件成立，最后程序停止在该处：

```
(gdb) set var i = 0
(gdb) c
Continuing.

Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active) APP_CPU: PC=0x400D112C

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:34
34      gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

**获得命令的帮助信息** 目前所介绍的都是些非常基础的命令，目的在于让您快速上手 JTAG 调试。如果想获得特定命令的语法和功能相关的信息，请在 (gdb) 提示符下输入 `help` 和命令名：

```
(gdb) help next
Step program, proceeding through subroutine calls.
Usage: next [N]
Unlike "step", if the current source line calls a subroutine,
this command does not enter the subroutine, but instead steps over
the call, in effect treating it as a single source line.
(gdb)
```

只需输入 `help` 命令，即可获得高级命令列表，帮助你了解更多详细信息。此外，还可以参考一些 GDB 命令速查表，比如 <https://darkdust.net/files/GDB%20Cheat%20Sheet.pdf>。虽然不是所有命令都适用于嵌入式环境，但还是会有所裨益。

**结束调试会话** 输入命令 `q` 可以退出调试器：

```
(gdb) q
A debugging session is active.

    Inferior 1 [Remote target] will be detached.

Quit anyway? (y or n) y
Detaching from program: /home/user-name/esp/blink/build/blink.elf, Remote target
Ending remote debugging.
user-name@computer-name:~/esp/blink$
```

## 4.20 链接器脚本生成机制

### 4.20.1 概述

ESP32 中有多个用于存放代码和数据的内存区域。代码和只读数据默认存放在 flash 中，可写数据存放在 RAM 中。不过有时，用户必须更改默认存放区域。

例如为了提高性能，将关键代码存放到 RAM 中，或者将代码存放到 RTC 存储器中以便在唤醒桩和 ULP 协处理器中使用。

链接器脚本生成机制可以让用户指定代码和数据在 ESP-IDF 组件中的存放区域。组件包含如何存放符号、目标或完整库的信息。在构建应用程序时，组件中的这些信息会被收集、解析并处理；生成的存放规则用于链接应用程序。

### 4.20.2 快速上手

本段将指导如何使用 ESP-IDF 的即用方案，快速将代码和数据放入 RAM 和 RTC 存储器中。

假设用户有：

```

- components/
  - my_component/
    - CMakeLists.txt
    - component.mk
    - Kconfig
    - src/
      - my_src1.c
      - my_src2.c
      - my_src3.c
    - my_linker_fragment_file.lf

```

- 名为 my\_component 的组件，在构建过程中存储为 libmy\_component.a 库文件
- 库文件包含的三个源文件：my\_src1.c、my\_src2.c 和 my\_src3.c，编译后分别为 my\_src1.o、my\_src2.o 和 my\_src3.o
- 在 my\_src1.o 中定义 my\_function1 功能；在 my\_src2.o 中定义 my\_function2 功能
- 在 my\_component 下 Kconfig 中存在布尔类型配置 PERFORMANCE\_MODE (y/n) 和整数类型配置 PERFORMANCE\_LEVEL (范围是 0-3)

#### 创建和指定链接器片段文件

首先，用户需要创建链接器片段文件。链接器片段文件是一个扩展名为 .lf 的文本文件，想要存放的位置信息会写入该文件内。文件创建成功后，需要将其呈现在构建系统中。ESP-IDF 支持的构建系统指南如下：

**Make** 在组件目录的 component.mk 文件中设置 COMPONENT\_ADD\_LDFRAGMENTS 变量的值，使其指向已创建的链接器片段文件。路径可以为绝对路径，也可以为组件目录的相对路径。

```
COMPONENT_ADD_LDFRAGMENTS += my_linker_fragment_file.lf
```

**CMake** 在组件目录的 CMakeLists.txt 文件中，指定 idf\_component\_register 调用引数 LDFRAGMENTS 的值。LDFRAGMENTS 可以为绝对路径，也可作为组件目录的相对路径，指向已创建的链接器片段文件。

```
# 相对于组件的 CMakeLists.txt 的文件路径
idf_component_register(...)
    LDFRAGMENTS "path/to/linker_fragment_file.1f" "path/to/
↳another_linker_fragment_file.1f"
    ...
)
```

### 指定存放区域

可以按照下列粒度指定存放区域：

- 目标文件（.obj 或 .o 文件）
- 符号（函数/变量）
- 库（.a 文件）

**存放目标文件** 假设整个 my\_src1.o 目标文件对性能至关重要，所以最好把该文件放在 RAM 中。另外，my\_src2.o 目标文件包含从深度睡眠唤醒所需的符号，因此需要将其存放到 RTC 存储器中。在链接器片段文件中可以写入以下内容：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1 (noflash)      # 将所有 my_src1 代码和只读数据存放在 IRAM 和 DRAM 中
    my_src2 (rtc)         # 将所有 my_src2 代码、数据和只读数据存放到 RTC 快速 RAM
↳和 RTC 慢速 RAM 中
```

那么 my\_src3.o 放在哪里呢？由于未指定存放区域，my\_src3.o 会存放到默认区域。更多关于默认存放区域的信息，请查看[这里](#)。

**存放符号** 继续上文的例子，假设 object1.o 目标文件定义的功能中，只有 my\_function1 影响到性能；object2.o 目标文件中只有 my\_function2 需要在芯片从深度睡眠中唤醒后运行。要实现该目的，可在链接器片段文件中写入以下内容：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1:my_function1 (noflash)
    my_src2:my_function2 (rtc)
```

my\_src1.o 和 my\_src2.o 中的其他函数以及整个 object3.o 目标文件会存放到默认区域。要指定数据的存放区域，仅需将上文的函数名替换为变量名即可，如：

```
my_src1:my_variable (noflash)
```

**注意：**按照符号粒度存放代码和数据有一定的局限。为确保存放区域合适，您也可以将相关代码和数据集中在源文件中，参考[使用目标文件的存放规则](#)。

**存放整个库** 在这个例子中，假设整个组件库都需存放到 RAM 中，可以写入以下内容存放整个库：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    * (noflash)
```

类似的，写入以下内容可以将整个组件存放到 RTC 存储器中：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    * (rtc)
```

**根据具体配置存放** 假设只有在某个条件为真时，比如 `CONFIG_PERFORMANCE_MODE == y` 时，整个组件库才有特定存放区域，可以写入以下内容实现：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_MODE = y:
        * (noflash)
    else:
        * (default)
```

来看一种更复杂的情况。假设“`CONFIG_PERFORMANCE_LEVEL == 1`”时，只有 `object1.o` 存放到 **RAM** 中；`CONFIG_PERFORMANCE_LEVEL == 2` 时，`object1.o` 和 `object2.o` 会存放到 **RAM** 中；`CONFIG_PERFORMANCE_LEVEL == 3` 时，库中的所有目标文件都会存放到 **RAM** 中。以上三个条件为假时，整个库会存放到 **RTC** 存储器中。虽然这种使用场景很罕见，不过，还是可以通过以下方式实现：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL = 1:
        my_src1 (noflash)
    elif PERFORMANCE_LEVEL = 2:
        my_src1 (noflash)
        my_src2 (noflash)
    elif PERFORMANCE_LEVEL = 3:
        my_src1 (noflash)
        my_src2 (noflash)
        my_src3 (noflash)
    else:
        * (rtc)
```

也可以嵌套条件检查。以下内容与上述片段等效：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL <= 3 && PERFORMANCE_LEVEL > 0:
        if PERFORMANCE_LEVEL >= 1:
            object1 (noflash)
            if PERFORMANCE_LEVEL >= 2:
                object2 (noflash)
            if PERFORMANCE_LEVEL >= 3:
                object2 (noflash)
    else:
        * (rtc)
```

### 默认存放区域

到目前为止，“默认存放区域”在未指定 `rtc` 和 `noflash` 存放规则时才会作为备选方案使用。需要注意的是，`noflash` 或者 `rtc` 标记不仅仅是关键字，实际上还是被称作片段的实体，确切地说是[协议](#)。

与 `rtc` 和 `noflash` 类似，还有一个默认协议，定义了默认存放规则。顾名思义，该协议规定了代码和数据通常存放的区域，即代码和常量存放在 **flash** 中，变量存放在 **RAM** 中。更多关于默认协议的信息，请见[这里](#)。

---

**备注：**使用链接器脚本生成机制的 IDF 组件示例，请参阅 [freertos/CMakeLists.txt](#)。为了提高性能，freertos 使用链接器脚本生成机制，将其目标文件存放到 RAM 中。

---

快速入门指南到此结束，下文将详述这个机制的内核，有助于创建自定义存放区域或修改默认方式。

### 4.20.3 链接器脚本生成机制内核

链接是将 C/C++ 源文件转换成可执行文件的最后一步。链接由工具链的链接器完成，接受指定代码和数据存放区域等信息的链接脚本。链接器脚本生成机制的转换过程类似，区别在于传输给链接器的链接脚本根据 (1) 收集的[链接器片段文件](#)和 (2) [链接器脚本模板](#)动态生成。

---

**备注：**执行链接器脚本生成机制的工具存放在 [tools/ldgen](#) 之下。

---

#### 链接器片段文件

如快速入门指南所述，片段文件是拓展名为 `.lf` 的简单文本文件，内含想要存放区域的信息。不过，这是对片段文件所包含内容的简化版描述。实际上，片段文件内包含的是“片段”。片段是实体，包含多条信息，这些信息放在一起组成了存放规则，说明目标文件各个段在二进制输出文件中的存放位置。片段一共有三种，分别是[段](#)、[协议](#)和[映射](#)。

**语法** 三种片段类型使用同一种语法：

```
[type:name]
key: value
key:
  value
  value
  value
  ...
```

- 类型：片段类型，可以为段、协议或映射。
- 名称：片段名称，指定片段类型的片段名称应唯一。
- 键值：片段内容。每个片段类型可支持不同的键值和不同的键值语法。

---

**备注：**多个片段的类型和名称相同时会引发异常。

---

---

**备注：**片段名称和键值只能使用字母、数字和下划线。

---

#### 条件检查

条件检查使得链接器脚本生成机制可以感知配置。含有配置值的表达式是否为真，决定了使用哪些特定键值。检查使用的是 `kconfiglib` 脚本的 `eval_string`，遵循该脚本要求的语法和局限性，支持：

- 比较
  - 小于 <
  - 小于等于 <=
  - 大于 >
  - 大于等于 >=
  - 等于 =
  - 不等于 !=
- 逻辑
  - 或 ||

- 和 &&
- 取反 !
- **分组**
  - 圆括号 ()

条件检查和其他语言中的 `if...elseif/elif...else` 块作用一样。键值和完整片段都可以进行条件检查。以下两个示例效果相同：

```
# 键值取决于配置
[type:name]
key_1:
    if CONDITION = y:
        value_1
    else:
        value_2
key_2:
    if CONDITION = y:
        value_a
    else:
        value_b
```

```
# 完整片段的定义取决于配置
if CONDITION = y:
    [type:name]
    key_1:
        value_1
    key_2:
        value_a
else:
    [type:name]
    key_1:
        value_2
    key_2:
        value_b
```

## 注释

链接器片段文件中的注释以 # 开头。和在其他语言中一样，注释提供了有用的描述和资料，在处理过程中会被忽略。

**与 ESP-IDF v3.x 链接器脚本片段文件兼容** ESP-IDF v4.0 变更了链接器脚本片段文件使用的一些语法：

- 必须缩进，缩进不当的文件会产生解析异常；旧版本不强制缩进，但之前的文档和示例均遵循了正确的缩进语法
- 条件改用 `if...elif...else` 结构，可以嵌套检查，将完整片段置于条件内
- 映射片段和其他片段类型一样，需有名称

链接器脚本生成器可解析 ESP-IDF v3.x 版本中缩进正确的链接器脚本文件（如 ESP-IDF v3.x 版本中的本文件所示），依然可以向后兼容此前的映射片段语法（可选名称和条件的旧语法），但是会有弃用警告。用户应换成本文档介绍的新语法，因为旧语法将在未来停用。

请注意，ESP-IDF v3.x 不支持使用 ESP-IDF v4.0 新语法的链接器脚本文件。

## 类型 段

段定义了 GCC 编译器输出的一系列目标文件段，可以是默认段（如 `.text`、`.data`），也可以是用户通过 `__attribute__` 关键字定义的段。

‘+’ 表示段列表开始，且当前段为列表中的第一个段。这种表达方式更加推荐。

```
[sections:name]
entries:
  .section+
  .section
  ...
```

示例:

```
# 不推荐的方式
[sections:text]
entries:
  .text
  .text.*
  .literal
  .literal.*

# 推荐的方式, 效果与上面等同
[sections:text]
entries:
  .text+           # 即 .text 和 .text.*
  .literal+       # 即 .literal 和 .literal.*
```

## 协议

协议定义了每个段对应的目标。

```
[scheme:name]
entries:
  sections -> target
  sections -> target
  ...
```

示例:

```
[scheme:noflash]
entries:
  text -> iram0_text           # text 段下的所有条目均归入 iram0_text
  rodata -> dram0_data        # rodata 段下的所有条目均归入 dram0_data
```

## 默认协议

注意, 有一个默认的协议很特殊, 特殊在于包罗存放规则都是根据这个协议中的条目生成的。这意味着, 如果该协议有一条条目是 `text -> flash_text`, 则将为目标 `flash_text` 生成如下的存放规则:

```
*(.literal .literal.* .text .text.*)
```

这些生成的包罗规则将用于未指定映射规则的情况。

默认协议在 [esp\\_system/app.lf](#) 文件中定义。快速上手指南中提到的内置 `noflash` 协议和 `rtc` 协议也在该文件中定义。

## 映射

映射定义了可映射实体（即目标文件、函数名、变量名和库）对应的协议。

```
[mapping]
archive: archive           # 构建后输出的库文件名称 (即 libxxx.a)
entries:
  object:symbol (scheme)   # 符号
  object (scheme)          # 目标
  * (scheme)               # 库
```

有三种存放粒度:

- 符号：指定了目标文件名称和符号名称。符号名称可以是函数名或变量名。
- 目标：只指定目标文件名称。
- 库：指定 `*`，即某个库下面所有目标文件的简化表达法。

为了更好地理解条目的含义，请看一个按目标存放的例子。

```
object (scheme)
```

根据条目定义，将这个协议展开：

```
object (sections -> target,
        sections -> target,
        ...)
```

再根据条目定义，将这个段展开：

```
object (.section,
        .section,
        ... -> target, # 根据目标文件将这里所列出的所有段放在该目标位置

        .section,
        .section,
        ... -> target, # 同样的方法指定其他段

        ...)          # 直至所有段均已展开
```

示例：

```
[mapping:map]
archive: libfreertos.a
entries:
    * (noflash)
```

除了实体和协议，条目中也支持指定如下标志：（注：<> = 参数名称，[] = 可选参数）

#### 1. ALIGN(<alignment>[, pre, post])

根据 `alignment` 中指定的数字对齐存放区域，根据是否指定 `pre` 和 `post`，或两者都指定，在输入段描述（生成于映射条目）的前面和/或后面生成：

#### 2. SORT([<sort\_by\_first>, <sort\_by\_second>])

在输入段描述中输出 `SORT_BY_NAME`，`SORT_BY_ALIGNMENT`，`SORT_BY_INIT_PRIORITY` 或 `SORT`。

`sort_by_first` 和 `sort_by_second` 的值可以是：`name`、`alignment`、`init_priority`。

如果既没指定 `sort_by_first` 也没指定 `sort_by_second`，则输入段会按照名称排序，如果两者都指定了，那么嵌套排序会遵循 <https://sourceware.org/binutils/docs/ld/Input-Section-Wildcards.html> 中的规则。

#### 3. KEEP()

用 `KEEP` 命令包围输入段描述，从而防止链接器丢弃存放区域。更多细节请参考 <https://sourceware.org/binutils/docs/ld/Input-Section-Keep.html>

#### 4. SURROUND(<name>)

在存放区域的前面和后面生成符号，生成的符号遵循 `_<name>_start` 和 `_<name>_end` 的命名方式，例如，如果 `name == sym1`

在添加标志时，协议中需要指定具体的 `section -> target`。对于多个 `section -> target`，使用逗号作为分隔符，例如：

```
# 注意
# A. entity-scheme 后使用分号
# B. section2 -> target2 前使用逗号
# C. 在 scheme1 条目中 定义 section1 -> target1 和 section2 -> target2
entity1 (scheme1);
```

(下页继续)

```
section1 -> target1 KEEP() ALIGN(4, pre, post),
section2 -> target2 SURROUND(sym) ALIGN(4, post) SORT()
```

合并后，如下的映射：

```
[mapping:name]
archive: lib1.a
entries:
  obj1 (noflash);
    rodata -> dram0_data KEEP() SORT() ALIGN(8) SURROUND(my_sym)
```

会在链接器脚本上生成如下输出：

```
. = ALIGN(8)
_my_sym_start = ABSOLUTE(.)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
_my_sym_end = ABSOLUTE(.)
```

注意，正如在 `flag` 描述中提到的，`ALIGN` 和 `SURROUND` 的使用对顺序敏感，因此如果将两者顺序调换后用到相同的映射片段，则会生成：

```
_my_sym_start = ABSOLUTE(.)
. = ALIGN(8)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
_my_sym_end = ABSOLUTE(.)
```

**按符号存放** 按符号存放可通过编译器标志 `-ffunction-sections` 和 `-ffdata-sections` 实现。`ESP-IDF` 默认用这些标志编译。用户若选择移除标志，便不能按符号存放。另外，即便有标志，也会其他限制，具体取决于编译器输出的段。

比如，使用 `-ffunction-sections`，针对每个功能会输出单独的段。段的名称可以预测，即 `.text.{func_name}` 和 `.literal.{func_name}`。但是功能内的字符串并非如此，因为字符串会进入字符串池，或者使用生成的段名称。

使用 `-ffdata-sections`，对全局数据来说编译器可输出 `.data.{var_name}`、`.rodata.{var_name}` 或 `.bss.{var_name}`；因此类型 `I` 映射词条可以适用。但是，功能中声明的静态数据并非如此，生成的段名称是将变量名称和其他信息混合。

### 链接器脚本模板

链接器脚本模板是指定存放规则的存放位置的框架，与其他链接器脚本没有本质区别，但带有特定的标记语法，可以指示存放生成的存放规则的位置。

如需引用一个目标标记下的所有存放规则，请使用以下语法：

```
mapping[target]
```

示例：

以下示例是某个链接器脚本模板的摘录，定义了输出段 `.iram0.text`，该输出段包含一个引用目标 `iram0_text` 的标记。

```
.iram0.text :
{
  /* 标记 IRAM 空间不足 */
  _iram_text_start = ABSOLUTE(.);

  /* 引用 iram0_text */
  mapping[iram0_text]
```

(下页继续)

```

    _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg

```

假设链接器脚本生成器收集到了以下片段定义：

```

[sections:text]
    .text+
    .literal+

[sections:iram]
    .iram1+

[scheme:default]
entries:
    text -> flash_text
    iram -> iram0_text

[scheme:noflash]
entries:
    text -> iram0_text

[mapping:freertos]
archive: libfreertos.a
entries:
    * (noflash)

```

然后生成的链接器脚本的相应摘录如下：

```

.iram0.text :
{
    /* 标记 IRAM 空间不足 */
    _iram_text_start = ABSOLUTE(.);

    /* 处理片段生成的存放规则，存放在模板标记的位置处 */
    *(.iram1 .iram1.*)
    *libfreertos.a:(.literal .text .literal.* .text.*)

    _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg

```

```
*libfreertos.a:(.literal .text .literal.* .text.*)
```

这是根据 `freertos` 映射的 `* (noflash)` 条目生成的规则。`libfreertos.a` 库下所有目标文件的所有 `text` 段会收集到 `iram0_text` 目标下（按照 `noflash` 协议），并放在模板中被 `iram0_text` 标记的地方。

```
*(.iram1 .iram1.*)
```

这是根据默认协议条目 `iram -> iram0_text` 生成的规则。默认协议指定了 `iram -> iram0_text` 条目，因此生成的规则同样也放在被 `iram0_text` 标记的地方。由于该规则是根据默认协议生成的，因此在同一目标下收集的所有规则下排在第一位。

目前使用的链接器脚本模板是 [esp\\_system/ld/esp32/sections.ld.in](#)，生成的脚本存放在构建目录下。

## 4.21 lwIP

ESP-IDF uses the open source [lwIP lightweight TCP/IP stack](#). The ESP-IDF version of lwIP ([esp-lwip](#)) has some modifications and additions compared to the upstream project.

### 4.21.1 Supported APIs

ESP-IDF supports the following lwIP TCP/IP stack functions:

- [BSD Sockets API](#)
- [Netconn API](#) is enabled but not officially supported for ESP-IDF applications

#### Adapted APIs

Some common lwIP “app” APIs are supported indirectly by ESP-IDF:

- DHCP Server & Client are supported indirectly via the [ESP-NETIF](#) functionality
- Simple Network Time Protocol (SNTP) is supported via the [lwip/include/apps/sntp/sntp.h](#) [lwip/lwip/src/include/lwip/apps/sntp.h](#) functions (see also [SNTP Time Synchronization](#))
- ICMP Ping is supported using a variation on the lwIP ping API. See [ICMP Echo](#).
- NetBIOS lookup is available using the standard lwIP API. [protocols/http\\_server/restful\\_server](#) has an option to demonstrate using NetBIOS to look up a host on the LAN.
- mDNS uses a different implementation to the lwIP default mDNS (see [mDNS 服务](#)), but lwIP can look up mDNS hosts using standard APIs such as `gethostbyname()` and the convention `hostname.local`, provided the [CONFIG\\_LWIP\\_DNS\\_SUPPORT\\_MDNS\\_QUERIES](#) setting is enabled.

### 4.21.2 BSD Sockets API

The BSD Sockets API is a common cross-platform TCP/IP sockets API that originated in the Berkeley Standard Distribution of UNIX but is now standardized in a section of the POSIX specification. BSD Sockets are sometimes called POSIX Sockets or Berkeley Sockets.

As implemented in ESP-IDF, lwIP supports all of the common usages of the BSD Sockets API.

#### References

A wide range of BSD Sockets reference material is available, including:

- [Single UNIX Specification BSD Sockets page](#)
- [Berkeley Sockets Wikipedia page](#)

#### Examples

A number of ESP-IDF examples show how to use the BSD Sockets APIs:

- [protocols/sockets/tcp\\_server](#)
- [protocols/sockets/tcp\\_client](#)
- [protocols/sockets/udp\\_server](#)
- [protocols/sockets/udp\\_client](#)
- [protocols/sockets/udp\\_multicast](#)
- [protocols/http\\_request](#) (Note: this is a simplified example of using a TCP socket to send an HTTP request. The [ESP HTTP Client](#) is a much better option for sending HTTP requests.)

#### Supported functions

The following BSD socket API functions are supported. For full details see [lwip/lwip/src/include/lwip/sockets.h](#).

- `socket()`
- `bind()`
- `accept()`
- `shutdown()`
- `getpeername()`

- `getsockopt()` & `setsockopt()` (see [Socket Options](#))
- `close()` (via [虚拟文件系统组件](#))
- `read()`, `readv()`, `write()`, `writew()` (via [虚拟文件系统组件](#))
- `recv()`, `recvmsg()`, `recvfrom()`
- `send()`, `sendmsg()`, `sendto()`
- `select()` (via [虚拟文件系统组件](#))
- `poll()` (Note: on ESP-IDF, `poll()` is implemented by calling `select` internally, so using `select()` directly is recommended if a choice of methods is available.)
- `fcntl()` (see [fcntl](#))

Non-standard functions:

- `ioctl()` (see [ioctls](#))

---

**备注:** Some lwIP application sample code uses prefixed versions of BSD APIs, for example `lwip_socket()` instead of the standard `socket()`. Both forms can be used with ESP-IDF, but using standard names is recommended.

---

## Socket Error Handling

BSD Socket error handling code is very important for robust socket applications. Normally the socket error handling involves the following aspects:

- Detecting the error.
- Getting the error reason code.
- Handle the error according to the reason code.

In lwIP, we have two different scenarios of handling socket errors:

- Socket API returns an error. For more information, see [Socket API Errors](#).
- `select(int maxfdp1, fd_set *readset, fd_set *writeset, fd_set *exceptset, struct timeval *timeout)` has exception descriptor indicating that the socket has an error. For more information, see [select\(\) Errors](#).

## Socket API Errors

### The error detection

- We can know that the socket API fails according to its return value.

### Get the error reason code

- When socket API fails, the return value doesn't contain the failure reason and the application can get the error reason code by accessing `errno`. Different values indicate different meanings. For more information, see [Socket Error Reason Code](#).

Example:

```
int err;
int sockfd;

if (sockfd = socket(AF_INET, SOCK_STREAM, 0) < 0) {
    // the error code is obtained from errno
    err = errno;
    return err;
}
```

## select() Errors

### The error detection

- Socket error when `select()` has exception descriptor

### Get the error reason code

- If the `select` indicates that the socket fails, we can't get the error reason code by accessing `errno`, instead we should call `getsockopt()` to get the failure reason code. Because `select()` has exception descriptor, the error code will not be given to `errno`.

**备注:** `getsockopt` function prototype `int getsockopt(int s, int level, int optname, void *optval, socklen_t *optlen)`. Its function is to get the current value of the option of any type, any state socket, and store the result in `optval`. For example, when you get the error code on a socket, you can get it by `getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen)`.

Example:

```
int err;

if (select(sockfd + 1, NULL, NULL, &exfds, &tval) <= 0) {
    err = errno;
    return err;
} else {
    if (FD_ISSET(sockfd, &exfds)) {
        // select() exception set using getsockopt()
        int optlen = sizeof(int);
        getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen);
        return err;
    }
}
```

**Socket Error Reason Code** Below is a list of common error codes. For more detailed list of standard POSIX/C error codes, please see `newlib errno.h` <<https://github.com/espressif/newlib-esp32/blob/master/newlib/libc/include/sys/errno.h>> and the platform-specific extensions `newlib/platform_include/errno.h`

| Error code      | Description                         |
|-----------------|-------------------------------------|
| ECONNREFUSED    | Connection refused                  |
| EADDRINUSE      | Address already in use              |
| ECONNABORTED    | Software caused connection abort    |
| ENETUNREACH     | Network is unreachable              |
| ENETDOWN        | Network interface is not configured |
| ETIMEDOUT       | Connection timed out                |
| EHOSTDOWN       | Host is down                        |
| EHOSTUNREACH    | Host is unreachable                 |
| EINPROGRESS     | Connection already in progress      |
| EALREADY        | Socket already connected            |
| EDESTADDRREQ    | Destination address required        |
| EPROTONOSUPPORT | Unknown protocol                    |

## Socket Options

The `getsockopt()` and `setsockopt()` functions allow getting/setting per-socket options.

Not all standard socket options are supported by lwIP in ESP-IDF. The following socket options are supported:

**Common options** Used with level argument `SOL_SOCKET`.

- `SO_REUSEADDR` (available if `CONFIG_LWIP_SO_REUSE` is set, behavior can be customized by setting `CONFIG_LWIP_SO_REUSE_RXTOALL`)
- `SO_KEEPALIVE`
- `SO_BROADCAST`

- `SO_ACCEPTCONN`
- `SO_RCVBUF` (available if `CONFIG_LWIP_SO_RCVBUF` is set)
- `SO_SNDBUFSIZE` / `SO_RCVBUFSIZE`
- `SO_ERROR` (this option is only used with `select()`, see *Socket Error Handling*)
- `SO_TYPE`
- `SO_NO_CHECK` (for UDP sockets only)

**IP options** Used with level argument `IPPROTO_IP`.

- `IP_TOS`
- `IP_TTL`
- `IP_PKTINFO` (available if `CONFIG_LWIP_NETBUF_RECVINFO` is set)

For multicast UDP sockets:

- `IP_MULTICAST_IF`
- `IP_MULTICAST_LOOP`
- `IP_MULTICAST_TTL`
- `IP_ADD_MEMBERSHIP`
- `IP_DROP_MEMBERSHIP`

**TCP options** TCP sockets only. Used with level argument `IPPROTO_TCP`.

- `TCP_NODELAY`

Options relating to TCP keepalive probes:

- `TCP_KEEPAKIVE` (int value, TCP keepalive period in milliseconds)
- `TCP_KEEPIKLE` (same as `TCP_KEEPAKIVE`, but the value is in seconds)
- `TCP_KEEPIKTVL` (int value, interval between keepalive probes in seconds)
- `TCP_KEEPCNT` (int value, number of keepalive probes before timing out)

**IPv6 options** IPv6 sockets only. Used with level argument `IPPROTO_IPV6`

- `IPV6_CHECKSUM`
- `IPV6_V6ONLY`

For multicast IPv6 UDP sockets:

- `IPV6_JOIN_GROUP` / `IPV6_ADD_MEMBERSHIP`
- `IPV6_LEAVE_GROUP` / `IPV6_DROP_MEMBERSHIP`
- `IPV6_MULTICAST_IF`
- `IPV6_MULTICAST_HOPS`
- `IPV6_MULTICAST_LOOP`

## **fcntl**

The `fcntl()` function is a standard API for manipulating options related to a file descriptor. In ESP-IDF, the [虚拟文件系统组件](#) layer is used to implement this function.

When the file descriptor is a socket, only the following `fcntl()` values are supported:

- `O_NONBLOCK` to set/clear non-blocking I/O mode. Also supports `O_NDELAY`, which is identical to `O_NONBLOCK`.
- `O_RDONLY`, `O_WRONLY`, `O_RDWR` flags for different read/write modes. These can read via `F_GETFL` only, they cannot be set using `F_SETFL`. A TCP socket will return a different mode depending on whether the connection has been closed at either end or is still open at both ends. UDP sockets always return `O_RDWR`.

## ioctl

The `ioctl()` function provides a semi-standard way to access some internal features of the TCP/IP stack. In ESP-IDF, the [虚拟文件系统组件](#) layer is used to implement this function.

When the file descriptor is a socket, only the following `ioctl()` values are supported:

- `FIONREAD` returns the number of bytes of pending data already received in the socket's network buffer.
- `FIONBIO` is an alternative way to set/clear non-blocking I/O status for a socket, equivalent to `fcntl(fd, F_SETFL, O_NONBLOCK, ...)`.

### 4.21.3 Netconn API

lwIP supports two lower level APIs as well as the BSD Sockets API: the Netconn API and the Raw API.

The lwIP Raw API is designed for single threaded devices and is not supported in ESP-IDF.

The Netconn API is used to implement the BSD Sockets API inside lwIP, and it can also be called directly from ESP-IDF apps. This API has lower resource usage than the BSD Sockets API, in particular it can send and receive data without needing to first copy it into internal lwIP buffers.

---

**重要:** Espressif does not test the Netconn API in ESP-IDF. As such, this functionality is *enabled but not supported*. Some functionality may only work correctly when used from the BSD Sockets API.

---

For more information about the Netconn API, consult [lwip/lwip/src/include/lwip/api.h](#) and [this wiki page which is part of the unofficial lwIP Application Developers Manual](#).

### 4.21.4 lwIP FreeRTOS Task

lwIP creates a dedicated TCP/IP FreeRTOS task to handle socket API requests from other tasks.

A number of configuration items are available to modify the task and the queues ( “mailboxes” ) used to send data to/from the TCP/IP task:

- `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE`
- `CONFIG_LWIP_TCPIP_TASK_STACK_SIZE`
- `CONFIG_LWIP_TCPIP_TASK_AFFINITY`

### 4.21.5 IPv6 Support

Both IPv4 and IPv6 are supported as dual stack and enabled by default (IPv6 may be disabled if it's not needed, see [Minimum RAM usage](#)). IPv6 support is limited to *Stateless Autoconfiguration* only, *Stateful configuration* is not supported in ESP-IDF (not in upstream lwip). IPv6 Address configuration is defined by means of these protocols or services:

- **SLAAC** IPv6 Stateless Address Autoconfiguration (RFC-2462)
- **DHCPv6** Dynamic Host Configuration Protocol for IPv6 (RFC-8415)

None of these two types of address configuration is enabled by default, so the device uses only Link Local addresses or statically defined addresses.

#### Stateless Autoconfiguration Process

To enable address autoconfiguration using Router Advertisement protocol please enable:

- `CONFIG_LWIP_IPV6_AUTOCONFIG`

This configuration option enables IPv6 autoconfiguration for all network interfaces (in contrast to the upstream lwIP, where the autoconfiguration needs to be explicitly enabled for each netif with `netif->ip6_autoconfig_enabled=1`)

## DHCPv6

DHCPv6 in lwIP is very simple and support only stateless configuration. It could be enabled using:

- [CONFIG\\_LWIP\\_IPV6\\_DHCP6](#)

Since the DHCPv6 works only in its stateless configuration, the *Stateless Autoconfiguration Process* has to be enabled, too, by means of [CONFIG\\_LWIP\\_IPV6\\_AUTOCONFIG](#). Moreover, the DHCPv6 needs to be explicitly enabled from the application code using

```
dhcp6_enable_stateless(netif);
```

## DNS servers in IPv6 autoconfiguration

In order to autoconfigure DNS server(s), especially in IPv6 only networks, we have these two options

- Recursive domain name system –this belongs to the Neighbor Discovery Protocol (NDP), uses *Stateless Autoconfiguration Process*. Number of servers must be set [CONFIG\\_LWIP\\_IPV6\\_RDNSS\\_MAX\\_DNS\\_SERVERS](#), this is option is disabled (set to 0) by default.
- DHCPv6 stateless configuration –uses [DHCPv6](#) to configure DNS servers. Note that the this configuration assumes IPv6 Router Advertisement Flags (RFC-5175) to be set to
  - Managed Address Configuration Flag = 0
  - Other Configuration Flag = 1

## 4.21.6 esp-lwip custom modifications

### Additions

The following code is added which is not present in the upstream lwIP release:

**Thread-safe sockets** It is possible to `close()` a socket from a different thread to the one that created it. The `close()` call will block until any function calls currently using that socket from other tasks have returned.

It is, however, not possible to delete a task while it is actively waiting on `select()` or `poll()` APIs. It is always necessary that these APIs exit before destroying the task, as this might corrupt internal structures and cause subsequent crashes of the lwIP. (These APIs allocate globally referenced callback pointers on stack, so that when the task gets destroyed before unrolling the stack, the lwIP would still hold pointers to the deleted stack)

**On demand timers** lwIP IGMP and MLD6 features both initialize a timer in order to trigger timeout events at certain times.

The default lwIP implementation is to have these timers enabled all the time, even if no timeout events are active. This increases CPU usage and power consumption when using automatic light sleep mode. `esp-lwip` default behaviour is to set each timer “on demand” so it is only enabled when an event is pending.

To return to the default lwIP behaviour (always-on timers), disable [CONFIG\\_LWIP\\_TIMERS\\_ONDEMAND](#).

**Lwip timers API** When users are not using WiFi, these APIs provide users with the ability to turn off LwIP timer to reduce power consumption.

The following API functions are supported. For full details see [lwip/lwip/src/include/lwip/timeouts.h](#).

- `sys_timeouts_init()`
- `sys_timeouts_deinit()`

**Abort TCP connections when IP changes** `CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES` is disabled by default. This disables the default lwIP behaviour of keeping TCP connections open if an interface IP changes, in case the interface IP changes back (for example, if an interface connection goes down and comes back up). Enable this option to keep TCP connections open in this case, until they time out normally. This may increase the number of sockets in use if a network interface goes down temporarily.

### Additional Socket Options

- Some standard IPV4 and IPV6 multicast socket options are implemented (see *Socket Options*).
- Possible to set IPV6-only UDP and TCP sockets with `IPV6_V6ONLY` socket option (normal lwIP is TCP only).

### IP layer features

- IPV4 source based routing implementation is different.
- IPV4 mapped IPV6 addresses are supported.

### Limitations

Calling `send()` or `sendto()` repeatedly on a UDP socket may eventually fail with `errno` equal to `ENOMEM`. This is a limitation of buffer sizes in the lower layer network interface drivers. If all driver transmit buffers are full then UDP transmission will fail. Applications sending a high volume of UDP datagrams who don't wish for any to be dropped by the sender should check for this error code and re-send the datagram after a short delay.

Increasing the number of TX buffers in the *Wi-Fi* or *Ethernet* project configuration (as applicable) may also help.

## 4.21.7 Performance Optimization

TCP/IP performance is a complex subject, and performance can be optimized towards multiple goals. The default settings of ESP-IDF are tuned for a compromise between throughput, latency, and moderate memory usage.

### Maximum throughput

Espressif tests ESP-IDF TCP/IP throughput using the *wifi/iperf* example in an RF sealed enclosure.

The *wifi/iperf/sdkconfig.defaults* file for the *iperf* example contains settings known to maximize TCP/IP throughput, usually at the expense of higher RAM usage. To get maximum TCP/IP throughput in an application at the expense of other factors then suggest applying settings from this file into the project *sdkconfig*.

---

**重要:** Suggest applying changes a few at a time and checking the performance each time with a particular application workload.

---

- If a lot of tasks are competing for CPU time on the system, consider that the lwIP task has configurable CPU affinity (`CONFIG_LWIP_TCPIP_TASK_AFFINITY`) and runs at fixed priority `ESP_TASK_TCPIP_PRI0` (18). Configure competing tasks to be pinned to a different core, or to run at a lower priority. See also *Built-In Task Priorities*.
- If using `select()` function with socket arguments only, setting `CONFIG_LWIP_USE_ONLY_LWIP_SELECT` will make `select()` calls faster.
- If there is enough free IRAM, select `CONFIG_LWIP_IRAM_OPTIMIZATION` to improve TX/RX throughput

If using a Wi-Fi network interface, please also refer to *Wi-Fi 缓冲区使用情况*.

### Minimum latency

Except for increasing buffer sizes, most changes which increase throughput will also decrease latency by reducing the amount of CPU time spent in lwIP functions.

- For TCP sockets, lwIP supports setting the standard `TCP_NODELAY` flag to disable Nagle's algorithm.

### Minimum RAM usage

Most lwIP RAM usage is on-demand, as RAM is allocated from the heap as needed. Therefore, changing lwIP settings to reduce RAM usage may not change RAM usage at idle but can change it at peak.

- Reducing `CONFIG_LWIP_MAX_SOCKETS` reduces the maximum number of sockets in the system. This will also cause TCP sockets in the `WAIT_CLOSE` state to be closed and recycled more rapidly (if needed to open a new socket), further reducing peak RAM usage.
- Reducing `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE`, `CONFIG_LWIP_TCP_RECVMBOX_SIZE` and `CONFIG_LWIP_UDP_RECVMBOX_SIZE` reduce memory usage at the expense of throughput, depending on usage.
- Reducing `CONFIG_LWIP_TCP_MSL`, `CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT` reduces the maximum segment lifetime in the system. This will also cause TCP sockets in the `TIME_WAIT`, `FIN_WAIT_2` state to be closed and recycled more rapidly
- Disable `CONFIG_LWIP_IPV6` can save about 39 KB for firmware size and 2KB RAM when system power up and 7KB RAM when TCPIP stack running. If there is no requirement for supporting IPV6 then it can be disabled to save flash and RAM footprint.

If using Wi-Fi, please also refer to [Wi-Fi 缓冲区使用情况](#).

**Peak Buffer Usage** The peak heap memory that lwIP consumes is the **theoretically-maximum memory** that the lwIP driver consumes. Generally, the peak heap memory that lwIP consumes depends on:

- the memory required to create a UDP connection: `lwip_udp_conn`
- the memory required to create a TCP connection: `lwip_tcp_conn`
- the number of UDP connections that the application has: `lwip_udp_con_num`
- the number of TCP connections that the application has: `lwip_tcp_con_num`
- the TCP TX window size: `lwip_tcp_tx_win_size`
- the TCP RX window size: `lwip_tcp_rx_win_size`

**So, the peak heap memory that the LwIP consumes can be calculated with the following formula:**

$$\text{lwip\_dynamic\_peek\_memory} = (\text{lwip\_udp\_con\_num} * \text{lwip\_udp\_conn}) + (\text{lwip\_tcp\_con\_num} * (\text{lwip\_tcp\_tx\_win\_size} + \text{lwip\_tcp\_rx\_win\_size} + \text{lwip\_tcp\_conn}))$$

Some TCP-based applications need only one TCP connection. However, they may choose to close this TCP connection and create a new one when an error (such as a sending failure) occurs. This may result in multiple TCP connections existing in the system simultaneously, because it may take a long time for a TCP connection to close, according to the TCP state machine (refer to RFC793).

## 4.22 OpenThread

**OpenThread** is a IP stack running on the 802.15.4 MAC layer which features mesh network and low power consumption.

### 4.22.1 Mode of the OpenThread stack

OpenThread can run under the following modes on Espressif chips:

### Standalone node

The full OpenThread stack and the application layer runs on the same chip. This mode is available on chips with 15.4 radio such as ESP32-H2.

### Radio Co-Processor (RCP)

The chip will be connected to another host running the OpenThread IP stack. It will send and received 15.4 packets on behalf of the host. This mode is available on chips with 15.4 radio such as ESP32-H2. The underlying transport between the chip and the host can be SPI or UART. For sake of latency, we recommend to use SPI as the underlying transport.

### OpenThread host

For chips without 15.4 radio, it can be connected to an RCP and run OpenThread under host mode. This mode enables OpenThread on Wi-Fi chips such as ESP32, ESP32-S2, ESP32-S3 and ESP32-C3. The following diagram shows how devices work under different modes:

图 50: OpenThread device modes

## 4.2.2.2 How To Write an OpenThread Application

The OpenThread `openthread/ot_cli` example will be a good place to start at. It demonstrates basic OpenThread initialization and simple socket-based server and client.

### Before OpenThread initialization

- s1.1 The main task calls `esp_vfs_eventfd_register()` to initialize the eventfd virtual filesystem. The eventfd file system is used for task notification in the OpenThread driver.
- s1.2 The main task calls `nvs_flash_init()` to initialize the NVS where the Thread network data is stored.
- s1.3 **Optional**, The main task calls `esp_netif_init()` only when it wants to create the network interface for Thread.
- s1.4: The main task calls `esp_event_loop_create()` to create the system Event task and initialize an application event's callback function.

### OpenThread stack initialization

- s2.1: Call `esp_openthread_init()` to initialize the OpenThread stack.

### OpenThread network interface initialization

The whole stage is **optional** and only required if the application wants to create the network interface for Thread. - s3.1: Call `esp_netif_new()` with `ESP_NETIF_DEFAULT_OPENTHREAD` to create the interface. - s3.2: Call `esp_openthread_netif_glue_init()` to create the OpenThread interface handlers. - s3.3: Call `esp_netif_attach()` to attach the handlers to the interface.

### The OpenThread main loop

- s4.3: Call `esp_openthread_launch_mainloop()` to launch the OpenThread main loop. Note that this is a busy loop and will not return until the OpenThread stack is terminated.

### Calling OpenThread APIs

The OpenThread APIs are not thread-safe. When calling OpenThread APIs from other tasks, make sure to hold the lock with `esp_openthread_lock_acquire()` and release the lock with `esp_openthread_lock_release()` afterwards.

### Deinitialization

The following steps are required to deinitialize the OpenThread stack: - Call `esp_netif_destroy()` and `esp_openthread_netif_glue_deinit()` to deinitialize the OpenThread network interface if you have created one. - Call `esp_openthread_deinit()` to deinitialize the OpenThread stack.

## 4.22.3 The OpenThread border router

The OpenThread border router connects the Thread network with other IP networks. It will provide IPv6 connectivity, service registration and commission functionality. To launch an OpenThread border router on a ESP chip, you need to connect an RCP to a Wi-Fi capable chip such as ESP32. Call `esp_openthread_border_router_init()` during the initialization will launch all the border routing functionalities.

You may refer to the `openthread/ot_br` example and the README for further border router details.

## 4.23 存储器类型

ESP32 芯片具有不同类型的存储器和灵活的存储器映射特性，本小节将介绍 ESP-IDF 默认如何使用这些功能。

ESP-IDF 区分了指令总线 (IRAM、IROM、RTC FAST memory) 和数据总线 (DRAM、DROM)。指令存储器是可执行的，只能通过 4 字节对齐字读取或写入。数据存储不可执行，可以通过单独的字节操作访问。有关总线的更多信息，请参阅 [ESP32 技术参考手册 > 系统和存储器 \[PDF\]](#)。

### 4.23.1 DRAM (数据 RAM)

非常量静态数据 (.data 段) 和零初始化数据 (.bss 段) 由链接器放入内部 SRAM 作为数据存储。此区域中的剩余空间可在程序运行时用作堆。

通过应用 `EXT_RAM_ATTR` 宏，零初始化数据也可以放入外部 RAM。使用这个宏需要启用 `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY`。详情请见 [允许.bss 段放入片外存储器](#)。

如果使用蓝牙堆栈，内部 DRAM 区域的可用大小将减少 64 KB (由于起始地址移动到 `0x3FFC0000`)。如果使用内存跟踪功能，该区域的长度还会减少 16 KB 或 32 KB。由于 ROM 引起的一些内存碎片问题，不可能将所有可用的 DRAM 用于静态分配，但是剩余的 DRAM 在运行时仍可用作堆。

常量数据也可能被放入 DRAM，例如当它被用于 non-flash-safe ISR 时（具体请参考[如何将代码放入 IRAM](#)）。

### “noinit” DRAM

可以将 `__NOINIT_ATTR` 宏用作属性，从而将数据放入 `.noinit` 部分。放入该部分的值在启动时不会被初始化，在软件重启后也会保持值不变。

通过使用 `EXT_RAM_NOINIT_ATTR` 宏，`noinit` 数据也可以放入外部 RAM 中。为此，需要启用 `CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY`，可参考[允许.noinit 段放入片外存储器](#)。如果没有启用 `CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY`，`EXT_RAM_NOINIT_ATTR` 会和 `__NOINIT_ATTR` 一样，将数据放入内部 RAM 的 `.noinit` 部分。

示例:

```
__NOINIT_ATTR uint32_t noinit_data;
```

**IRAM (指令 RAM)** ESP-IDF 将内部 SRAM0 的部分区域分配为指令 RAM。可在 [ESP32 技术参考手册 > 系统和存储器 > 内部存储器 \[PDF\]](#) 中查看 IIRAM 区域的定义。该内存中第一个 64 KB 块用于 PRO 和 APP MMU 缓存，其余部分（即从 `0x40080000` 到 `0x400A0000`）用于存储需要从 RAM 运行的应用程序部分。

### 何时需要将代码放入 IRAM

以下情况时应将部分应用程序放入 IRAM:

- 如果在注册中断处理程序时使用了 `ESP_INTR_FLAG_IRAM`，则中断处理程序必须要放入 IRAM。更多信息可参考[IRAM 安全中断处理程序](#)。
- 可将一些时序关键代码放入 IRAM，以减少从 flash 中加载代码造成的相关损失。ESP32 通过 MMU 缓存从 flash 中读取代码和数据。在某些情况下，将函数放入 IRAM 可以减少由缓存未命中造成的延迟，从而显著提高函数的性能。

### 如何将代码放入 IRAM

借助链接器脚本，一些代码会被自动放入 IRAM 区域中。

如果要将某些特定的应用程序代码放入 IRAM，可以使用[链接器脚本生成机制](#)功能并在组件中添加链接器脚本片段文件，在该片段文件中，可以给整个目标源文件或其中的个别函数打上 `noflash` 标签。更多信息可参考[链接器脚本生成机制](#)。

或者，也可以通过使用 `IRAM_ATTR` 宏在源代码中指定需要放入 IRAM 的代码:

```
#include "esp_attr.h"

void IIRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

放入 IRAM 后可能会导致 IRAM 安全中断处理程序出现问题:

- `IRAM_ATTR` 函数中的字符串或常量可能没有自动放入 RAM 中，这时可以使用 `DRAM_ATTR` 属性进行标记，或者也可以使用链接器脚本方法将它们自动放入 RAM 中。

```
void IIRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };
    const static char *MSG = DRAM_STR("I am a string stored in RAM");
}
```

注意，具体哪些数据需要被标记为 `DRAM_ATTR` 可能很难确定。如果没有被标记为 `DRAM_ATTR`，某些变量或表达式有时会被编译器别为常量（即使它们没有被标记为 `const`）并将其放入 `flash` 中。

- GCC 的优化会自动生成跳转表或 `switch/case` 查找表，并将这些表放在 `flash` 中。IDF 默认在编译所有文件时使用 `-fno-jump-tables -fno-tree-switch-conversion` 标志来避免这种情况。

可以为不需要放置在 `IRAM` 中的单个源文件重新启用跳转表优化。关于如何在编译单个源文件时添加 `-fno-jump-tables -fno-tree-switch-conversion` 选项，请参考[组件编译控制](#)。

**IROM（代码从 Flash 中运行）** 如果一个函数没有被显式地声明放在 `IRAM` 或者 `RTC` 存储器中，则它会放在 `flash` 中。允许从 `flash` 中执行代码的 `Flash MMU` 机制可参考 [ESP32 技术参考手册 \\* > 存储器管理和保护单元 \(MMU, MPU\) \[PDF\]](#)。由于 `IRAM` 空间有限，应用程序的大部分二进制代码都需要放入 `IROM` 中。

在启动过程中，从 `IRAM` 中运行的引导加载程序配置 `MMU flash` 缓存，将应用程序的指令代码区域映射到指令空间。通过 `MMU` 访问的 `flash` 使用一些内部 `SRAM` 进行缓存，访问缓存的 `flash` 数据与访问其他类型的内部存储器一样快。

### 4.23.2 RTC FAST memory（RTC 快速存储器）

`RTC FAST memory` 的同一区域既可以作为指令存储器也可以作为数据存储器进行访问。从深度睡眠模式唤醒后必须要运行的代码要放在 `RTC` 存储器中，更多信息请查阅文档[深度睡眠](#)。

`RTC FAST memory` 只可以被 `PRO CPU` 访问。

在单核模式下，除非禁用 `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP` 选项，否则剩余的 `RTC FAST memory` 会被添加到堆中。该部分内存可以和 `DRAM（数据 RAM）` 互换使用，但是访问速度稍慢，且不具备 `DMA` 功能。

除非禁用 `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP` 选项，否则剩余的 `RTC FAST memory` 会被添加到堆中。该部分内存可以和 `DRAM（数据 RAM）` 互换使用，但是访问速度稍慢一点。

### 4.23.3 DROM（数据存储在 flash 中）

默认情况下，链接器将常量数据放入一个映射到 `MMU flash` 缓存的区域中。这与 `IROM（代码从 Flash 中运行）` 部分相同，但此处用于只读数据而不是可执行代码。

唯一没有默认放入 `DROM` 的常量数据是被编译器嵌入到应用程序代码中的字面常量。这些被放置在周围函数的可执行指令中。

`DRAM_ATTR` 属性可以用来强制将常量从 `DRAM` 放入 `DRAM（数据 RAM）` 部分（见上文）。

### 4.23.4 RTC Slow memory（RTC 慢速存储器）

从 `RTC` 存储器运行的代码中使用的全局和静态变量必须放入 `RTC Slow memory` 中。例如 `深度睡眠` 变量可以放在 `RTC Slow memory` 中，而不是 `RTC FAST memory`，或者也可以放入由 `ULP 协处理器编程` 访问的代码和变量。

`RTC_NOINIT_ATTR` 属性宏可以用来将数据放入 `RTC Slow memory`。放入此类型存储器的值从深度睡眠模式中醒来后会保持值不变。

示例:

```
RTC_NOINIT_ATTR uint32_t rtc_noinit_data;
```

### 4.23.5 具备 DMA 功能

大多数的 DMA 控制器（比如 SPI、sdmmc 等）都要求发送/接收缓冲区放在 DRAM 中，并且按字对齐。我们建议将 DMA 缓冲区放在静态变量而不是堆栈中。使用 DMA\_ATTR 宏可以声明该全局/本地的静态变量具备 DMA 功能，例如：

```
DMA_ATTR uint8_t buffer[]="I want to send something";

void app_main()
{
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

或者：

```
void app_main()
{
    DMA_ATTR static uint8_t buffer[] = "I want to send something";
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

也可以通过使用 `MALLOC_CAP_DMA` 标志来动态分配具备 DMA 能力的内存缓冲区。

### 4.23.6 在堆栈中放置 DMA 缓冲区

可以在堆栈中放置 DMA 缓冲区，但建议尽量避免。如果实在有需要的话，请注意以下几点：

- 如果堆栈在 PSRAM 中，则不建议将 DRAM 缓冲区放在堆栈上。如果任务堆栈在 PSRAM 中，则必须执行片外 RAM 中描述的几个步骤。
- 在函数中使用 `WORD_ALIGNED_ATTR` 宏来修饰变量，将其放在适当的位置上，比如：

```
void app_main()
{
    uint8_t stuff;
    WORD_ALIGNED_ATTR uint8_t buffer[]="I want to send something"; //
    ↪ 否则buffer数组会被存储在stuff变量的后面
    // 初始化代码...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8*sizeof(buffer),
    };
    spi_device_transmit( spi, &temp );
    // 其他程序
}
```

## 4.24 分区表

### 4.24.1 概述

每片 ESP32 的 flash 可以包含多个应用程序，以及多种不同类型的数据（例如校准数据、文件系统数据、参数存储数据等）。因此，我们在 flash 的默认偏移地址 0x8000 处烧写一张分区表。

分区表的长度为 0xC00 字节（最多可以保存 95 条分区表条目）。分区表数据后还保存着该表的 MD5 校验和，用于验证分区表的完整性。此外，如果芯片使能了安全启动功能，则该分区表后还会保存签名信息。

分区表中的每个条目都包括以下几个部分：Name（标签）、Type（app、data 等）、SubType 以及在 flash 中的偏移量（分区的加载地址）。

在使用分区表时，最简单的方法就是打开项目配置菜单（idf.py menuconfig），并在 `CONFIG_PARTITION_TABLE_TYPE` 下选择一个预定义的分区表：

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

在以上两种选项中，出厂应用程序均将被烧录至 flash 的 0x10000 偏移地址处。这时，运行 `idf.py partition-table`，即可以打印当前使用分区表的信息摘要。

### 4.24.2 内置分区表

以下是“Single factory app, no OTA”选项的分区表信息摘要：

```
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
```

- flash 的 0x10000 (64 KB) 偏移地址处存放一个标记为“factory”的二进制应用程序，且启动加载器将默认加载这个应用程序。
- 分区表中还定义了两个数据区域，分别用于存储 NVS 库专用分区和 PHY 初始化数据。

以下是“Factory app, two OTA definitions”选项的分区表信息摘要：

```
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000,
otadata, data, ota, 0xd000, 0x2000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
ota_0, app, ota_0, 0x110000, 1M,
ota_1, app, ota_1, 0x210000, 1M,
```

- 分区表中定义了三个应用程序分区，这三个分区的类型都被设置为“app”，但具体 app 类型不同。其中，位于 0x10000 偏移地址处的为出厂应用程序（factory），其余两个为 OTA 应用程序（ota\_0, ota\_1）。
- 新增了一个名为“otadata”的数据分区，用于保存 OTA 升级时需要的数据。启动加载器会查询该分区的数据，以判断该从哪个 OTA 应用程序分区加载程序。如果“otadata”分区为空，则会执行出厂程序。

### 4.24.3 创建自定义分区表

如果在 menuconfig 中选择了“Custom partition table CSV”，则还需要输入该分区表的 CSV 文件在项目中的路径。CSV 文件可以根据需要，描述任意数量的分区信息。

CSV 文件的格式与上面摘要中打印的格式相同，但是在 CSV 文件中并非所有字段都是必需的。例如下面是一个自定义的 OTA 分区表的 CSV 文件：

```
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000
otadata, data, ota, 0xd000, 0x2000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
ota_0, app, ota_0, , 1M
ota_1, app, ota_1, , 1M
nvs_key, data, nvs_keys, , 0x1000
```

- 字段之间的空格会被忽略，任何以 # 开头的行（注释）也会被忽略。
- CSV 文件中的每个非注释行均为一个分区定义。
- 每个分区的 Offset 字段可以为空，gen\_esp32part.py 工具会从分区表位置的后面开始自动计算并填充该分区的偏移地址，同时确保每个分区的偏移地址正确对齐。

### Name 字段

Name 字段可以是任何有意义的名称，但不能超过 16 个字符（之后的内容将被截断）。该字段对 ESP32 并不是特别重要。

### Type 字段

Type 字段可以指定为 app (0x00) 或者 data (0x01)，也可以直接使用数字 0-254（或者十六进制 0x00-0xFE）。注意，0x00-0x3F 不得使用（预留给 esp-idf 的核心功能）。

如果您的应用程序需要以 ESP-IDF 尚未支持的格式存储数据，请在 0x40-0xFE 内添加一个自定义分区类型。

参考 [esp\\_partition\\_type\\_t](#) 关于 app 和 data 分区的枚举定义。

如果用 C++ 编写，那么指定一个应用程序定义的分类型，需要在 [esp\\_partition\\_type\\_t](#) 中使用整数，从而与分区 API 一起使用。例如：

```
static const esp_partition_type_t APP_PARTITION_TYPE_A = (esp_partition_type_t)0x40;
```

注意，启动加载器将忽略 app (0x00) 和 data (0x01) 以外的其他分区类型。

### SubType 字段

SubType 字段长度为 8 bit，内容与具体分区 Type 有关。目前，esp-idf 仅仅规定了“app”和“data”两种分区类型的子类型含义。

参考 [esp\\_partition\\_subtype\\_t](#)，以了解 ESP-IDF 定义的全部子类型列表，包括：

- 当 Type 定义为 app 时，SubType 字段可以指定为 factory (0x00)、ota\_0 (0x10) … ota\_15 (0x1F) 或者 test (0x20)。
  - factory (0x00) 是默认的 app 分区。启动加载器将默认加载该应用程序。但如果存在类型为 data/ota 分区，则启动加载器将加载 data/ota 分区中的数据，进而判断启动哪个 OTA 镜像文件。
    - \* OTA 升级永远都不会更新 factory 分区中的内容。
    - \* 如果您希望在 OTA 项目中预留更多 flash，可以删除 factory 分区，转而使用 ota\_0 分区。
  - ota\_0 (0x10) … ota\_15 (0x1F) 为 OTA 应用程序分区，启动加载器将根据 OTA 数据分区中的数来决定加载哪个 OTA 应用程序分区中的程序。在使用 OTA 功能时，应用程序应至少拥有 2 个 OTA 应用程序分区 (ota\_0 和 ota\_1)。更多详细信息，请参考 [OTA 文档](#)。
  - test (0x20) 为预留的子类型，用于工厂测试流程。如果没有其他有效 app 分区，test 将作为备选启动分区使用。也可以配置启动加载器在每次启动时读取 GPIO，如果 GPIO 被拉低则启动该分区。详细信息请查阅 [从测试固件启动](#)。

- 当 Type 定义为 data 时, SubType 字段可以指定为 ota (0x00)、phy (0x01)、nvs (0x02)、nvs\_keys (0x04) 或者其他组件特定的子类型 (请参考子类型枚举)。
  - ota (0) 即 **OTA 数据分区**, 用于存储当前所选的 OTA 应用程序的信息。这个分区的大小需要设定为 0x2000。更多详细信息, 请参考 [OTA 文档](#)。
  - phy (1) 分区用于存放 PHY 初始化数据, 从而保证可以为每个设备单独配置 PHY, 而非必须采用固件中的统一 PHY 初始化数据。
    - \* 默认配置下, phy 分区并不启用, 而是直接将 phy 初始化数据编译至应用程序中, 从而节省分区表空间 (直接将此分区删掉)。
    - \* 如果需从此分区加载 phy 初始化数据, 请打开项目配置菜单 (idf.py menuconfig), 并且使能 `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION` 选项。此时, 您还需要手动将 phy 初始化数据烧至设备 flash (esp-idf 编译系统并不会自动完成该操作)。
  - nvs (2) 是专门给 **非易失性存储 (NVS) API** 使用的分区。
    - \* 用于存储每台设备的 PHY 校准数据 (注意, 并不是 PHY 初始化数据)。
    - \* 用于存储 Wi-Fi 数据 (如果使用了 `esp_wifi_set_storage(WIFI_STORAGE_FLASH)` 初始化函数)。
    - \* NVS API 还可以用于其他应用程序数据。
    - \* 强烈建议您应为 NVS 分区分配至少 0x3000 字节空间。
    - \* 如果使用 NVS API 存储大量数据, 请增加 NVS 分区的大小 (默认是 0x6000 字节)。
  - nvs\_keys (4) 是 NVS 密钥分区。详细信息, 请参考 [非易失性存储 \(NVS\) API](#) 文档。
    - \* 用于存储加密密钥 (如果启用了 NVS 加密功能)。
    - \* 此分区应至少设定为 4096 字节。
  - ESP-IDF 还支持其它预定义的子类型用于数据存储, 包括 **FAT 文件系统** (`ESP_PARTITION_SUBTYPE_DATA_FAT`), **SPIFFS** (`ESP_PARTITION_SUBTYPE_DATA_SPIFFS`) 等。其它数据子类型已预留给 esp-idf 未来使用。
- 如果分区类型是由应用程序定义的任意值 (0x40-0xFE), 那么 subtype 字段可以是由应用程序选择的任何值 (0x00-0xFE)。

请注意如果用 C++ 编写, 应用程序定义的子类型值需要转换为 `esp_partition_type_t`, 从而与 [分区 API](#) 一起使用。

### Offset 和 Size 字段

分区若偏移地址为空, 则会紧跟着前一个分区之后开始; 若为首个分区, 则将紧跟着分区表开始。

app 分区的偏移地址必须要与 0x10000 (64K) 对齐, 如果将偏移字段留空, `gen_esp32part.py` 工具会自动计算得到一个满足对齐要求的偏移地址。如果 app 分区的偏移地址没有与 0x10000 (64K) 对齐, 则该工具会报错。

app 分区的大小和偏移地址可以采用十进制数、以 0x 为前缀的十六进制数, 且支持 K 或 M 的倍数单位 (分别代表 1024 和 1024\*1024 字节)。

如果您希望允许分区表中的分区采用任意起始偏移量 (`CONFIG_PARTITION_TABLE_OFFSET`), 请将分区表 (CSV 文件) 中所有分区的偏移字段都留空。注意, 此时, 如果您更改了分区表中任意分区的偏移地址, 则其他分区的偏移地址也会跟着改变。这种情况下, 如果您之前还曾设定某个分区采用固定偏移地址, 则可能造成分区表冲突, 从而导致报错。

### Flags 字段

当前仅支持 encrypted 标记。如果 Flags 字段设置为 encrypted, 且已启用 [Flash 加密](#) 功能, 则该分区将会被加密。

---

**备注:** app 分区始终会被加密, 不管 Flags 字段是否设置。

---

#### 4.24.4 生成二进制分区表

烧写到 ESP32 中的分区表采用二进制格式，而不是 CSV 文件本身。此时，[partition\\_table/gen\\_esp32part.py](#) 工具可以实现 CSV 和二进制文件之间的转换。

如果您在项目配置菜单 (`idf.py menuconfig`) 中设置了分区表 CSV 文件的名称，然后构建项目或执行 `idf.py partition-table`。这时，转换将在编译过程中自动完成。

手动将 CSV 文件转换为二进制文件：

```
python gen_esp32part.py input_partitions.csv binary_partitions.bin
```

手动将二进制文件转换为 CSV 文件：

```
python gen_esp32part.py binary_partitions.bin input_partitions.csv
```

在标准输出 (`stdout`) 上，打印二进制分区表的内容（运行 `idf.py partition-table` 时展示的信息摘要也是这样生成的）：

```
python gen_esp32part.py binary_partitions.bin
```

#### 4.24.5 分区大小检查

ESP-IDF 构建系统将自动检查生成的二进制文件大小与可用的分区大小是否匹配，如果二进制文件太大，则会构建失败并报错。

目前会对以下二进制文件进行检查：

- 引导加载程序的二进制文件的大小要适合分区表前的区域大小（分区表前的区域都分配给了引导加载程序），具体请参考[引导加载程序大小](#)。
- 应用程序二进制文件应至少适合一个“app”类型的分区。如果不适合任何应用程序分区，则会构建失败。如果只适合某些应用程序分区，则会打印相关警告。

---

**备注：**即使分区大小检查返回错误并导致构建失败，仍然会生成可以烧录的二进制文件（它们对于可用空间来说过大，因此无法正常工作）。

---

---

**备注：**只有在使用 CMake 构建系统时才会对构建系统二进制文件大小进行检查。如果使用传统的 GNU Make 构建系统时，则可以手动检查文件大小，或在启动时会产生错误记录。

---

#### MD5 校验和

二进制格式的分区表中含有一个 MD5 校验和。这个 MD5 校验和是根据分区表内容计算的，可在设备启动阶段，用于验证分区表的完整性。

用户可通过 `gen_esp32part.py` 的 `--disable-md5sum` 选项或者 `CONFIG_PARTITION_TABLE_MD5` 选项关闭 MD5 校验。对于 *ESP-IDF v3.1* 版本前的[引导加载程序](#)，因为它不支持 MD5 校验，所以无法正常启动并报错 `invalid magic number 0xebeb`，此时用户可以使用此选项关闭 MD5 校验。

#### 4.24.6 烧写分区表

- `idf.py partition-table-flash`：使用 `esptool.py` 工具烧写分区表。
- `idf.py flash`：会烧写所有内容，包括分区表。

在执行 `idf.py partition-table` 命令时，手动烧写分区表的命令也将打印在终端上。

**备注：**分区表的更新并不会擦除根据旧分区表存储的数据。此时，您可以使用 `idf.py erase-flash` 命令或者 `esptool.py erase_flash` 命令来擦除 `flash` 中的所有内容。

### 4.24.7 分区工具 (`parttool.py`)

`partition_table` 组件中有分区工具 `parttool.py`，可以在目标设备上完成分区相关操作。该工具有如下用途：

- 读取分区，将内容存储到文件中 (`read_partition`)
- 将文件中的内容写至分区 (`write_partition`)
- 擦除分区 (`erase_partition`)
- 检索特定分区的名称、偏移、大小和 `flag`（“加密”）标志等信息 (`get_partition_info`)

用户若想通过编程方式完成相关操作，可从另一个 Python 脚本导入并使用分区工具，或者从 Shell 脚本调用分区工具。前者可使用工具的 Python API，后者可使用命令行界面。

#### Python API

首先请确保已导入 `parttool` 模块。

```
import sys
import os

idf_path = os.environ["IDF_PATH"] # 从环境中获取 IDF_PATH 的值
parttool_dir = os.path.join(idf_path, "components", "partition_table") # parttool.
↳py 位于 $IDF_PATH/components/partition_table 下

sys.path.append(parttool_dir) # 使能 Python 寻找 parttool 模块
from parttool import * # 导入 parttool 模块内的所有名称
```

要使用分区工具的 Python API，第一步是创建 `ParttoolTarget`：

```
# 创建 parttool.py 的目标设备，并将目标设备连接到串行端口 /dev/ttyUSB1
target = ParttoolTarget("/dev/ttyUSB1")
```

现在，可使用创建的 `ParttoolTarget` 在目标设备上完成操作：

```
# 擦除名为 'storage' 的分区
target.erase_partition(PartitionName("storage"))

# 读取类型为 'data'、子类型为 'spiffs' 的分区，保存至文件 'spiffs.bin'
target.read_partition(PartitionType("data", "spiffs"), "spiffs.bin")

# 将 'factory.bin' 文件的内容写至 'factory' 分区
target.write_partition(PartitionName("factory"), "factory.bin")

# 打印默认启动分区的大小
storage = target.get_partition_info(PARTITION_BOOT_DEFAULT)
print(storage.size)
```

使用 `PartitionName`、`PartitionType` 或 `PARTITION_BOOT_DEFAULT` 指定要操作的分区。顾名思义，这三个参数可以指向拥有特定名称的分区、特定类型和子类型的分区或默认启动分区。

更多关于 Python API 的信息，请查看分区工具的代码注释。

## 命令行界面

`parttool.py` 的命令行界面具有如下结构：

```
parttool.py [command-args] [subcommand] [subcommand-args]
```

- `command-args` - 执行主命令 (`parttool.py`) 所需的实际参数，多与目标设备有关
- `subcommand` - 要执行的操作
- `subcommand-args` - 所选操作的实际参数

```
# 擦除名为 'storage' 的分区
parttool.py --port "/dev/ttyUSB1" erase_partition --partition-name=storage

# 读取类型为 'data'、子类型为 'spiffs' 的分区，保存到 'spiffs.bin' 文件
parttool.py --port "/dev/ttyUSB1" read_partition --partition-type=data --partition-
↳subtype=spiffs --output "spiffs.bin"

# 将 'factory.bin' 文件中的内容写入到 'factory' 分区
parttool.py --port "/dev/ttyUSB1" write_partition --partition-name=factory --input
↳"factory.bin"

# 打印默认启动分区的大小
parttool.py --port "/dev/ttyUSB1" get_partition_info --partition-boot-default --
↳info size
```

更多信息可用 `-help` 指令查看：

```
# 显示可用的子命令和主命令描述
parttool.py --help

# 显示子命令的描述
parttool.py [subcommand] --help
```

## 4.25 Performance

ESP-IDF ships with default settings that are designed for a trade-off between performance, resource usage, and available functionality.

These guides describe how to optimize a firmware application for a particular aspect of performance. Usually this involves some trade-off in terms of limiting available functions, or swapping one aspect of performance (such as execution speed) for another (such as RAM usage).

### 4.25.1 How to Optimize Performance

1. Decide what the performance-critical aspects of your application are (for example: a particular response time to a certain network operation, a particular startup time limit, particular peripheral data throughput, etc.).
2. Find a way to measure this performance (some methods are outlined in the guides below).
3. Modify the code and project configuration and compare the new measurement to the old measurement.
4. Repeat step 3 until the performance meets the requirements set out in step 1.

### 4.25.2 Guides

#### Maximizing Execution Speed

**Overview** Optimizing execution speed is a key element of software performance. Code that executes faster can also have other positive effects, like reducing overall power consumption. However, improving execution speed may have trade-offs with other aspects of performance such as *Minimizing Binary Size*.

**Choose What To Optimize** If a function in the application firmware is executed once per week in the background, it may not matter if that function takes 10 ms or 100 ms to execute. If a function is executed constantly at 10 Hz, it matters greatly if it takes 10 ms or 100 ms to execute.

Most application firmwares will only have a small set of functions which require optimal performance. Perhaps those functions are executed very often, or have to meet some application requirements for latency or throughput. Optimization efforts should be targeted at these particular functions.

**Measuring Performance** The first step to improving something is to measure it.

**Basic Performance Measurements** If measuring performance relative to an external interaction with the world, you may be able to measure this directly (for example see the examples [wifi/iperf](#) and [ethernet/iperf](#) for measuring general network performance, or you can use an oscilloscope or logic analyzer to measure timing of an interaction with a device peripheral.)

Otherwise, one way to measure performance is to augment the code to take timing measurements:

```
#include "esp_timer.h"

void measure_important_function(void) {
    const unsigned MEASUREMENTS = 5000;
    uint64_t start = esp_timer_get_time();

    for (int retries = 0; retries < MEASUREMENTS; retries++) {
        important_function(); // This is the thing you need to measure
    }

    uint64_t end = esp_timer_get_time();

    printf("%u iterations took %ull milliseconds (%ull microseconds per_
    ↪invocation)\n",
           MEASUREMENTS, (end - start)/1000, (end - start)/MEASUREMENTS);
}
```

Executing the target multiple times can help average out factors like RTOS context switches, overhead of measurements, etc.

- Using `esp_timer_get_time()` generates “wall clock” timestamps with microsecond precision, but has moderate overhead each time the timing functions are called.
- It’s also possible to use the standard Unix `gettimeofday()` and `utime()` functions, although the overhead is slightly higher.
- Otherwise, including `hal/cpu_hal.h` and calling the HAL function `cpu_hal_get_cycle_count()` will return the number of CPU cycles executed. This function has lower overhead than the others. It is good for measuring very short execution times with high precision. The CPU cycles are counted per-core, so only use this method from an interrupt handler, or a task that is pinned to a single core.
- If making “microbenchmarks” (i.e. benchmarking only a very small routine of code that runs in less than 1-2 milliseconds) then flash cache performance can sometimes cause big variations in timing measurements depending on the binary. This happens because binary layout can cause different patterns of cache misses in a particular sequence of execution. If the test code is larger then this effect usually averages out. Executing a small function multiple times when benchmarking can help reduce the impact of flash cache misses. Alternatively, move this code to IRAM (see [Targeted Optimizations](#)).

**External Tracing** The [应用层跟踪库](#) allows measuring code execution with minimal impact on the code itself.

**Tasks** If the option `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS` is enabled then the FreeRTOS API `vTaskGetRunTimeStats()` can be used to retrieve runtime information about the processor time used by each FreeRTOS task.

*SEGGER SystemView* is an excellent tool for visualizing task execution and looking for performance issues or improvements in the system as a whole.

**Improving Overall Speed** The following optimizations will improve the execution of nearly all code - including boot times, throughput, latency, etc:

- Set `CONFIG_ESPTOOLPY_FLASHFREQ` to 80 MHz. This is double the 40 MHz default value and will double the speed at which code is loaded or executed from flash. You should verify that the board or module that connects the ESP32 to the flash chip is rated for 80 MHz operation at the relevant temperature ranges, before changing this setting. The hardware datasheet(s) will have this information.
- Set `CONFIG_ESPTOOLPY_FLASHMODE` to QIO or QOUT mode (Quad I/O). Both will almost double the speed at which code is loaded or executed from flash compared to the default DIO mode. QIO is slightly faster than QOUT if both are supported. Note that both the flash chip model and the electrical connections between the ESP32 and the flash chip must support quad I/O modes or the SoC will not work correctly.
- Set `CONFIG_COMPILER_OPTIMIZATION` to “Optimize for performance (-O2)”. This may slightly increase binary size compared to the default setting, but will almost certainly increase performance of some code. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise are not seen.
- If the application uses PSRAM and is based on ESP32 rev. 3 (ECO3), setting `CONFIG_ESP32_REV_MIN` to 3 will disable PSRAM bug workarounds, reducing the code size and improving overall performance.
- Avoid using floating point arithmetic (`float`). Even though ESP32 has a single precision hardware floating point unit, floating point calculations are always slower than integer calculations. If possible then use fixed point representations, a different method of integer representation, or convert part of the calculation to be integer only before switching to floating point.
- Avoid using double precision floating point arithmetic (`double`). These calculations are emulated in software and are very slow. If possible then use an integer-based representation, or single-precision floating point.

**Reduce Logging Overhead** Although standard output is buffered, it’s possible for an application to be limited by the rate at which it can print data to log output once buffers are full. This is particularly relevant for startup time if a lot of output is logged, but can happen at other times as well. There are multiple ways to solve this problem:

- Reduce the volume of log output by lowering the app `CONFIG_LOG_DEFAULT_LEVEL` (the equivalent boot-loader setting is `CONFIG_BOOTLOADER_LOG_LEVEL`). This also reduces the binary size, and saves some CPU time spent on string formatting.
- Increase the speed of logging output by increasing the `CONFIG_ESP_CONSOLE_UART_BAUDRATE`

**Not Recommended** The following options will also increase execution speed, but are not recommended as they also reduce the debuggability of the firmware application and may increase the severity of any bugs.

- Set `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` to disabled. This also reduces firmware binary size by a small amount. However, it may increase the severity of bugs in the firmware including security-related bugs. If necessary to do this to optimize a particular function, consider adding `#define NDEBUG` in the top of that single source file instead.

**Targeted Optimizations** The following changes will increase the speed of a chosen part of the firmware application:

- Move frequently executed code to IRAM. By default, all code in the app is executed from flash cache. This means that it’s possible for the CPU to have to wait on a “cache miss” while the next instructions are loaded from flash. Functions which are copied into IRAM are loaded once at boot time, and then will always execute at full speed.

IRAM is a limited resource, and using more IRAM may reduce available DRAM, so a strategic approach is needed when moving code to IRAM. See [IRAM \(指令 RAM\)](#) for more information.

- Jump table optimizations can be re-enabled for individual source files that don't need to be placed in IRAM. For hot paths in large switch cases this will improve performance. For instructions on how to add the `-fjump-tables` `-ftree-switch-conversion` options when compiling individual source files, see [组件编译控制](#)

**Improving Startup Time** In addition to the overall performance improvements shown above, the following options can be tweaked to specifically reduce startup time:

- Minimizing the [CONFIG\\_LOG\\_DEFAULT\\_LEVEL](#) and [CONFIG\\_BOOTLOADER\\_LOG\\_LEVEL](#) has a large impact on startup time. To enable more logging after the app starts up, set the [CONFIG\\_LOG\\_MAXIMUM\\_LEVEL](#) as well and then call `esp_log_set_level()` to restore higher level logs. The `system/startup_time` main function shows how to do this.
- If using deep sleep, setting [CONFIG\\_BOOTLOADER\\_SKIP\\_VALIDATE\\_IN\\_DEEP\\_SLEEP](#) allows a faster wake from sleep. Note that if using Secure Boot this represents a security compromise, as Secure Boot validation will not be performed on wake.
- Setting [CONFIG\\_BOOTLOADER\\_SKIP\\_VALIDATE\\_ON\\_POWER\\_ON](#) will skip verifying the binary on every boot from power-on reset. How much time this saves depends on the binary size and the flash settings. Note that this setting carries some risk if the flash becomes corrupt unexpectedly. Read the help text of the [config item](#) for an explanation and recommendations if using this option.
- It's possible to save a small amount of time during boot by disabling RTC slow clock calibration. To do so, set [CONFIG\\_ESP32\\_RTC\\_CLK\\_CAL\\_CYCLES](#) to 0. Any part of the firmware that uses RTC slow clock as a timing source will be less accurate as a result.

The example project `system/startup_time` is pre-configured to optimize startup time. The files `system/startup_time/sdkconfig.defaults` and `system/startup_time/sdkconfig.defaults.esp32` contain all of these settings. You can append these to the end of your project's own `sdkconfig` file to merge the settings, but please read the documentation for each setting first.

**Task Priorities** As ESP-IDF FreeRTOS is a real-time operating system, it's necessary to ensure that high throughput or low latency tasks are granted a high priority in order to run immediately. Priority is set when calling `xTaskCreate()` or `xTaskCreatePinnedToCore()` and can be changed at runtime by calling `vTaskPrioritySet()`.

It's also necessary to ensure that tasks yield CPU (by calling `vTaskDelay()`, `sleep()`, or by blocking on semaphores, queues, task notifications, etc) in order to not starve lower priority tasks and cause problems for the overall system. The [Task Watchdog Timer](#) provides a mechanism to automatically detect if task starvation happens, however note that a Task WDT timeout does not always indicate a problem (sometimes the correct operation of the firmware requires some long-running computation). In these cases tweaking the Task WDT timeout or even disabling the Task WDT may be necessary.

**Built-In Task Priorities** ESP-IDF starts a number of system tasks at fixed priority levels. Some are automatically started during the boot process, some are started only if the application firmware initializes a particular feature. To optimize performance, structure application task priorities so that they are not delayed by system tasks, while also not starving system tasks and impacting other functions of the system.

This may require splitting up a particular task. For example, perform a time-critical operation in a high priority task or an interrupt handler and do the non-time-critical part in a lower priority task.

Header `components/esp_system/include/esp_task.h` contains macros for the priority levels used for built-in ESP-IDF tasks system.

Common priorities are:

- *Main task that executes `app_main` function* has minimum priority (1). This task is pinned to Core 0 by default (*configurable*).

- *High Resolution Timer* system task to manage high precision timer events and execute callbacks has high priority (22, `ESP_TASK_TIMER_Prio`). This task is pinned to Core 0.
  - FreeRTOS Timer Task to handle FreeRTOS timer callbacks is created when the scheduler initializes and has minimum task priority (1, *configurable*). This task is pinned to Core 0.
  - *Event Handling* system task to manage the default system event loop and execute callbacks has high priority (20, `ESP_TASK_EVENT_Prio`) and pinned to Core 0. This configuration is only used if the application calls `esp_event_loop_create_default()`, it's possible to call `esp_event_loop_create()` with a custom task configuration instead.
  - *lwIP* TCP/IP task has high priority (18, `ESP_TASK_TCPIP_Prio`) and is not pinned to any core (*configurable*).
  - *Wi-Fi Driver* task has high priority (23) and is pinned to Core 0 by default (*configurable*).
  - Wi-Fi wpa\_supplicant component may create dedicated tasks while the Wi-Fi Protected Setup (WPS), WPA2 EAP-TLS, Device Provisioning Protocol (DPP) or BSS Transition Management (BTM) features are in use. These tasks all have low priority (2) and are not pinned to any core.
  - *Bluetooth Controller* task has high priority (23, `ESP_TASK_BT_CONTROLLER_Prio`) and is pinned to Core 0 by default (*configurable*). The Bluetooth Controller needs to respond to requests with low latency, so it should always be close to the highest priority task assigned to a single CPU.
  - *NimBLE Bluetooth Host* host task has high priority (21) and is pinned to Core 0 by default (*configurable*).
  - **Bluedroid Bluetooth Host creates multiple tasks when used:**
    - Stack event callback task ( “BTC” ) has high priority (19).
    - Stack BTU layer task has high priority (20).
    - Host HCI host task has high priority (22).
- All Bluedroid Tasks are pinned to the same core, which is Core 0 by default (*configurable*).
- The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config `ETH_MAC_DEFAULT_CONFIG` then the priority is medium-high (15) and the task is not pinned to any core. These settings can be changed by passing a custom `eth_mac_config_t` struct when initializing the Ethernet MAC.
  - If using the *mDNS* component, it creates a task with default low priority 1 (*configurable*) and pinned to CPU0 (*configurable*).
  - If using the *MQTT* component, it creates a task with default priority 5 (*configurable*, depends on `CONFIG_MQTT_USE_CUSTOM_CONFIG`) and not pinned to any core (*configurable*).

**Choosing application task priorities** With a few exceptions (most importantly the lwIP TCP/IP task), in the default configuration most built-in tasks are pinned to Core 0. This makes it quite easy for the application to place high priority tasks on Core 1. Using priority 19 or higher will guarantee an application task can run on Core 1 without being preempted by any built-in task. To further isolate the tasks running on each CPU, configure the *lwIP task* to only run on Core 0 instead of either core (this may reduce total TCP/IP throughput depending on what other tasks are running).

In general, it's not recommended to set task priorities on Core 0 higher than the built-in Wi-Fi/BT operations as starving them of CPU may make the system unstable. Choosing priority 19 and Core 0 will allow lower layer Wi-Fi/BT functionality to run without delays, but still pre-empts the lwIP TCP/IP stack and other less time-critical internal functionality - this is an option for time-critical tasks that don't perform network operations. Any task that does TCP/IP network operations should run at lower priority than the lwIP TCP/IP task (18) to avoid priority inversion issues.

---

**备注:** Setting a task to always run in preference to built-in ESP-IDF tasks does not require pinning to Core 1. The task can be left unpinned - at priority 17 or lower - to optionally run on Core 0 as well, if no higher priority built-in task is running there. Using unpinned tasks can improve the overall CPU utilization, however it makes reasoning about task scheduling more complex.

---

---

**备注:** Task execution is always completely suspended when writing to the built-in SPI flash chip. Only *IRAM 安全中断处理程序* will continue executing.

---

**Improving Interrupt Performance** ESP-IDF supports dynamic *Interrupt allocation* with interrupt preemption. Each interrupt in the system has a priority, and higher priority interrupts will preempt lower priority ones.

Interrupt handlers will execute in preference to any task (provided the task is not inside a critical section). For this reason, it's important to minimize the amount of time spent executing in an interrupt handler.

To obtain the best performance for a particular interrupt handler:

- Assign more important interrupts a higher priority using a flag such as `ESP_INTR_FLAG_LEVEL2` or `ESP_INTR_FLAG_LEVEL3` when calling `esp_intr_alloc()`.
- Assign the interrupt on a CPU where built-in Wi-Fi/BT tasks are not configured to run (this means assigning on Core 1 by default, see *Built-In Task Priorities*). Interrupts are assigned on the same CPU where the `esp_intr_alloc()` function call is made.
- If you're sure the entire interrupt handler can run from IRAM (see *IRAM 安全中断处理程序*) then set the `ESP_INTR_FLAG_IRAM` flag when calling `esp_intr_alloc()` to assign the interrupt. This prevents it being temporarily disabled if the application firmware writes to the internal SPI flash.
- Even if the interrupt handler is not IRAM safe, if it is going to be executed frequently then consider moving the handler function to IRAM anyhow. This minimizes the chance of a flash cache miss when the interrupt code is executed (see *Targeted Optimizations*). It's possible to do this without adding the `ESP_INTR_FLAG_IRAM` flag to mark the interrupt as IRAM-safe, if only part of the handler is guaranteed to be in IRAM.

### Improving Network Speed

- For Wi-Fi, see *如何提高 Wi-Fi 性能* and *Wi-Fi 缓冲区使用情况*
- For lwIP TCP/IP (Wi-Fi and Ethernet), see *Performance Optimization*
- The `wifi/iperf` example contains a configuration that is heavily optimized for Wi-Fi TCP/IP throughput. Append the contents of the files `wifi/iperf/sdkconfig.defaults`, `wifi/iperf/sdkconfig.defaults.esp32` and `wifi/iperf/sdkconfig.ci.99` to your project `sdkconfig` file in order to add all of these options. Note that some of these options may have trade-offs in terms of reduced debuggability, increased firmware size, increased memory usage, or reduced performance of other features. To get the best result, read the documentation pages linked above and use this information to determine exactly which options are best suited for your app.

### Minimizing Binary Size

The ESP-IDF build system compiles all source files in the project and ESP-IDF, but only functions and variables that are actually referenced by the program are linked into the final binary. In some cases, it is necessary to reduce the total size of the firmware binary (for example, in order to fit it into the available flash partition size).

The first step to reducing the total firmware binary size is measuring what is causing the size to increase.

**Measuring Static Sizes** To optimize both firmware binary size and memory usage it's necessary to measure statically allocated RAM ( “data” , “bss” ), code ( “text” ) and read-only data ( “rodata” ) in your project.

Using the `idf.py` sub-commands `size`, `size-components` and `size-files` provides a summary of memory used by the project:

#### Size Summary (idf.py size)

```
$ idf.py size
[...]
  Total sizes:
  DRAM .data size:  14956 bytes
  DRAM .bss size:  15808 bytes
  Used static DRAM: 30764 bytes ( 149972 available, 17.0% used)
  Used static IRAM: 83918 bytes ( 47154 available, 64.0% used)
  Flash code: 559943 bytes
  Flash rodata: 176736 bytes
  Total image size:~ 835553 bytes (.bin may be padded larger)
```

This output breaks down the size of all static memory regions in the firmware binary:

- DRAM `.data` size is statically allocated RAM that is assigned to non-zero values at startup. This uses RAM (DRAM) at runtime and also uses space in the binary file.
- DRAM `.bss` size is statically allocated RAM that is assigned zero at startup. This uses RAM (DRAM) at runtime but doesn't use any space in the binary file.
- Used static DRAM is the total DRAM used by `.data` + `.bss`. The available size is the estimated amount of DRAM which will be available as heap memory at runtime (due to metadata overhead and implementation constraints, and heap allocations done by ESP-IDF during startup, the actual free heap at startup will be lower than this).
- Used static IRAM is the total size of executable code *executed from IRAM*. This uses space in the binary file and also reduces IRAM and/or DRAM (depending on sizes) available as heap memory at runtime. See [Optimizing IRAM Usage](#).
- Flash code is the total size of executable code executed from flash cache (*IROM*). This uses space in the binary file.
- Flash rodata is the total size of read-only data loaded from flash cache (*DROM*). This uses space in the binary file.
- Total image size is the estimated total binary file size, which is the total of all the used memory types except for `.bss`.

**Component Usage Summary (`idf.py size-components`)** The summary output provided by `idf.py size` does not give enough detail to find the main contributor to excessive binary size. To analyze in more detail, use `idf.py size-components`

```
$ idf.py size-components

The first lines of output from `idf.py size-components` are the same as `idf.py size`. After this a table is printed of “per-archive contributions to ELF file”. This means how much each static library archive has contributed to the final binary size.

Generally, one static library archive is built per component, although some are binary libraries included by a particular component (for example, `libnet80211.a` is included by `esp_wifi` component). There are also toolchain libraries such as `libc.a` and `libgcc.a` listed here, these provide Standard C/C++ Library and toolchain built-in functionality.

If your project is simple and only has a “main” component, then all of the project’s code will be shown under `libmain.a`. If your project includes its own components (see [构建系统 \(CMake 版\)](#)), then they will each be shown on a separate line.

The table is sorted in descending order of the total contribution to the binary size.

The columns are as follows:

- DRAM `.data` & `.bss` & other `.data` and `.bss` are the same as for the totals shown above (static variables, these both reduce total available RAM at runtime but `.bss` doesn’t contribute to the binary file size). “other” is a column for any custom section types that also contribute to RAM size (usually this value is 0).
- IRAM - is the same as for the totals shown above (code linked to execute from IRAM, uses space in the binary file and also reduces IRAM that can be dynamically allocated at runtime using `HEAP_CAP_32BIT`).
- D/IRAM - Shows IRAM space which, due to occupying D/IRAM space, is also reducing available DRAM available as heap at runtime.
- Flash code & rodata - these are the same as the totals above, IROM and DROM space accessed from flash cache that contribute to the binary size.

**Source File Usage Summary (`idf.py size-files`)** For even more detail, run `idf.py size-files` to get a summary of the contribution each object file has made to the final binary size. Each object file corresponds to a single source file.

```
$ idf.py size-files
[...]
Total sizes:
  DRAM .data size: 14956 bytes
  DRAM .bss size: 15808 bytes
Used static DRAM: 30764 bytes ( 149972 available, 17.0% used)
Used static IRAM: 83918 bytes ( 47154 available, 64.0% used)
  Flash code: 559943 bytes
```

After the summary of total sizes, a table of “Per-file contributions to ELF file” is printed.

The columns are the same as shown above for `idy.py size-components`, but this time the granularity is the contribution of each individual object file to the binary size.

For example, we can see that the file `x509_crt_bundle.S.o` contributed 64212 bytes to the total firmware size, all as `.rodata` in flash. Therefore we can guess that this application is using the [ESP x509 Certificate Bundle](#) feature and not using this feature would save at least this many bytes from the firmware size.

Some of the object files are linked from binary libraries and therefore you won't find a corresponding source file. To locate which component a source file belongs to, it's generally possible to search in the ESP-IDF source tree or look in the [Linker Map File](#) for the full path.

**Comparing Two Binaries** If making some changes that affect binary size, it's possible to use an ESP-IDF tool to break down the exact differences in size.

This operation isn't part of `idf.py`, it's necessary to run the `idf-size.py` Python tool directly.

To do so, first locate the linker map file in the build directory. It will have the name `PROJECTNAME.map`. The `idf-size.py` tool performs its analysis based on the output of the linker map file.

To compare with another binary, you will also need its corresponding `.map` file saved from the build directory.

For example, to compare two builds: one with the default `CONFIG_COMPILER_OPTIMIZATION` setting “Debug (-Og)” configuration and one with “Optimize for size (-Os)” :

```
$ $(IDF_PATH)/tools/idf_size.py --diff build_Og/https_request.map build_Os/https_
↪request.map
<CURRENT> MAP file: build_Os/https_request.map
<REFERENCE> MAP file: build_Og/https_request.map
Difference is counted as <CURRENT> - <REFERENCE>, i.e. a positive number means
↪that <CURRENT> is larger.
Total sizes of <CURRENT>:
↪<REFERENCE>      Difference
DRAM .data size:  14516 bytes
↪14956            -440
DRAM .bss size:   15792 bytes
↪15808            -16
Used static DRAM: 30308 bytes ( 150428 available, 16.8% used)
↪30764            -456 ( +456 available, +0 total)
Used static IRAM: 78498 bytes ( 52574 available, 59.9% used)
↪83918            -5420 ( +5420 available, +0 total)
Flash code:       509183 bytes
↪559943          -50760
Flash rodata:     170592 bytes
↪176736          -6144
Total image size: ~ 772789 bytes (.bin may be padded larger)
↪835553          -62764
```

We can see from the “Difference” column that changing this one setting caused the whole binary to be over 60 KB smaller and over 5 KB more RAM is available.

It's also possible to use the “diff” mode to output a table of component-level (static library archive) differences:

```
$IDF_PATH/tools/idf_size.py --archives --diff build_Og/https_request.map build_
↪Oshttps_request.map
```

Also at the individual source file level:

```
$IDF_PATH/tools/idf_size.py --files --diff build_Og/https_request.map build_
↪Oshttps_request.map
```

Other options (like writing the output to a file) are available, pass `--help` to see the full list.

**Showing Size When Linker Fails** If too much static memory is used, then the linker will fail with an error such as DRAM segment data does not fit, region ``iram0_0_seg'` overflowed by 44 bytes, or similar.

In these cases, `idf.py size` will not succeed either. However it is possible to run `idf_size.py` manually in order to view the *partial static memory usage* (the memory usage will miss the variables which could not be linked, so there still appears to be some free space.)

The map file argument is `<projectname>.map` in the build directory

```
$IDF_PATH/tools/idf_size.py build/project_name.map
```

It is also possible to view the equivalent of `size-components` or `size-files` output:

```
$IDF_PATH/tools/idf_size.py --archives build/project_name.map
$IDF_PATH/tools/idf_size.py --files build/project_name.map
```

**Linker Map File** *This is an advanced analysis method, but it can be very useful. Feel free to skip ahead to `:ref:reducing-overall-size` and possibly come back to this later.*

The `idf.py size` analysis tools all work by parsing the GNU binutils “linker map file”, which is a summary of everything the linker did when it created (“linked”) the final firmware binary file

Linker map files themselves are plain text files, so it’s possible to read them and find out exactly what the linker did. However, they are also very complex and long - often 100,000 or more lines!

The map file itself is broken into parts and each part has a heading. The parts are:

- `Archive member included to satisfy reference by file (symbol)`. This shows you: for each object file included in the link, what symbol (function or variable) was the linker searching for when it included that object file. If you’re wondering why some object file in particular was included in the binary, this part may give a clue. This part can be used in conjunction with the Cross Reference Table at the end of the file. Note that not every object file shown in this list ends up included in the final binary, some end up in the `Discarded input sections` list instead.
- `Allocating common symbols` - This is a list of (some) global variables along with their sizes. Common symbols have a particular meaning in ELF binary files, but ESP-IDF doesn’t make much use of them.
- `Discarded input sections` - These sections were read by the linker as part of an object file to be linked into the final binary, but then nothing else referred to them so they were discarded from the final binary. For ESP-IDF this list can be very long, as we compile each function and static variable to a unique section in order to minimize the final binary size (specifically ESP-IDF uses compiler options `-ffunction-sections` `-fdata-sections` and linker option `--gc-sections`). Items mentioned in this list *do not* contribute to the final binary.
- `Memory Configuration, Linker script and memory map` These two parts go together. Some of the output comes directly from the linker command line and the Linker Script, both provided by the [构建系统 \(CMake 版\)](#). The linker script is partially generated from the ESP-IDF project using the [链接器脚本生成机制](#) feature.

As the output of the `Linker script and memory map` part of the map unfolds, you can see each symbol (function or static variable) linked into the final binary along with its address (as a 16 digit hex number), its length (also in hex), and the library and object file it was linked from (which can be used to determine the component and the source file).

Following all of the output sections that take up space in the final `.bin` file, the `memory map` also includes some sections in the ELF file that are only used for debugging (ELF sections `.debug_*`, etc.). These don't contribute to the final binary size. You'll notice the address of these symbols is a very low number (starting from `0x0000000000000000` and counting up).

- **Cross Reference Table.** This table shows for each symbol (function or static variable), the list of object file(s) that referred to it. If you're wondering why a particular thing is included in the binary, this will help determine what included it.

---

**备注:** Unfortunately, the `Cross Reference Table` doesn't only include symbols that made it into the final binary. It also includes symbols in discarded sections. Therefore, just because something is shown here doesn't mean that it was included in the final binary - this needs to be checked separately.

---

---

**备注:** Linker map files are generated by the GNU binutils linker `"ld"`, not ESP-IDF. You can find additional information online about the linker map file format. This quick summary is written from the perspective of ESP-IDF build system in particular.

---

**Reducing Overall Size** The following configuration options will reduce the final binary size of almost any ESP-IDF project:

- Set `CONFIG_COMPILER_OPTIMIZATION` to `"Optimize for size (-Os)"`. In some cases, `"Optimize for performance (-O2)"` will also reduce the binary size compared to the default. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise don't happen.
- Reduce the compiled-in log output by lowering the app `CONFIG_LOG_DEFAULT_LEVEL`. If the `CONFIG_LOG_MAXIMUM_LEVEL` is changed from the default then this setting controls the binary size instead. Reducing compiled-in logging reduces the number of strings in the binary, and also the code size of the calls to logging functions.
- Set the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` to `"Silent"`. This avoids compiling in a dedicated assertion string and source file name for each assert that may fail. It's still possible to find the failed assert in the code by looking at the memory address where the assertion failed.
- Besides the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`, you can disable or silent the assertion for HAL component separately by setting `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL`.
- Set `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`. This removes specific error messages for particular internal ESP-IDF error check macros. This may make it harder to debug some error conditions by reading the log output.
- If the binary needs to run on only certain revision(s) of ESP32, increasing `CONFIG_ESP32_REV_MIN` to match can result in a reduced binary size. This will make a large difference if setting ESP32 minimum revision 3, and PSRAM is enabled.
- Don't enable `CONFIG_COMPILER_CXX_EXCEPTIONS`, `CONFIG_COMPILER_CXX_RTTI`, or set the `CONFIG_COMPILER_STACK_CHECK_MODE` to Overall. All of these options are already disabled by default, but they have a large impact on binary size.
- Disabling `CONFIG_ESP_ERR_TO_NAME_LOOKUP` will remove the lookup table to translate user-friendly names for error values (see [错误处理](#)) in error logs, etc. This saves some binary size, but error values will be printed as integers only.
- Setting `CONFIG_ESP_SYSTEM_PANIC` to `"Silent reboot"` will save a small amount of binary size, however this is *only* recommended if no one will use UART output to debug the device.

---

**备注:** In addition to the many configuration items shown here, there are a number of configuration options where changing the option from the default will increase binary size. These are not noted here. Where the increase is significant, this is usually noted in the configuration item help text.

---

**Targeted Optimizations** The following binary size optimizations apply to a particular component or a function:

### Wi-Fi

- Disabling `CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE` will save some Wi-Fi binary size if WPA3 support is not needed. (Note that WPA3 is mandatory for new Wi-Fi device certifications.)
- Disabling `CONFIG_ESP_WIFI_SOFTAP_SUPPORT` will save some Wi-Fi binary size if soft-AP support is not needed.

### ADC

- Disabling ADC calibration features `CONFIG_ADC_CAL_EFUSE_TP_ENABLE`, `CONFIG_ADC_CAL_EFUSE_VREF_ENABLE`, `CONFIG_ADC_CAL_LUT_ENABLE` will save a small amount of binary size if ADC driver is used, at expense of accuracy.

**Bluetooth NimBLE** If using *NimBLE Bluetooth Host* then the following modifications can reduce binary size:

- Set `CONFIG_BTDM_CTRL_BLE_MAX_CONN` to 1 if only one BLE connection is needed.
- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS` to 1 if only one BLE connection is needed.
- Disable either `CONFIG_BT_NIMBLE_ROLE_CENTRAL` or `CONFIG_BT_NIMBLE_ROLE_OBSERVER` if these roles are not needed.
- Reducing `CONFIG_BT_NIMBLE_LOG_LEVEL` can reduce binary size. Note that if the overall log level has been reduced as described above in *Reducing Overall Size* then this also reduces the NimBLE log level.

### lwIP IPv6

- Setting `CONFIG_LWIP_IPV6` to false will reduce the size of the lwIP TCP/IP stack, at the cost of only supporting IPv4.

---

**备注:** IPv6 is required by some components such as `coap` and `ASIO port`. These components will not be available if IPV6 is disabled.

---

**Newlib nano formatting** By default, ESP-IDF uses newlib “full” formatting for I/O (`printf`, `scanf`, etc.)

Enabling the config option `CONFIG_NEWLIB_NANO_FORMAT` will switch newlib to the “nano” formatting mode. This both smaller in code size and a large part of the implementation is compiled into the ESP32 ROM, so it doesn't need to be included in the binary at all.

The exact difference in binary size depends on which features the firmware uses, but 25 KB ~ 50 KB is typical.

Enabling Nano formatting also reduces the stack usage of each function that calls `printf()` or another string formatting function, see *Reducing Stack Sizes*.

“Nano” formatting doesn't support 64-bit integers, or C99 formatting features. For a full list of restrictions, search for `--enable-newlib-nano-formatted-io` in the [Newlib README file](#).

**MBEDTLS features** Under *Component Config* -> *MBEDTLS* there are multiple mbedTLS features which are enabled by default but can be disabled if not needed to save code size.

These include:

- `CONFIG_MBEDTLS_HAVE_TIME`
- `CONFIG_MBEDTLS_ECDSA_DETERMINISTIC`
- `CONFIG_MBEDTLS_SHA512_C`
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1`
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_1`
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SSL_ALPN`

- [CONFIG\\_MBEDTLS\\_CCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_GCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_ECP\\_C](#) (Alternatively: Leave this option enabled but disable some of the elliptic curves listed in the sub-menu.)
- [CONFIG\\_MBEDTLS\\_SSL\\_RENEGOTIATION](#)
- Change [CONFIG\\_MBEDTLS\\_TLS\\_MODE](#) if both Server & Client are not needed
- Consider disabling some ciphersuites listed in the “TLS Key Exchange Methods” sub-menu (i.e. [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_RSA](#))

The help text for each option has some more information.

---

**重要:** It is **strongly not recommended to disable all these mbedTLS options**. Only disable options where you understand the functionality and are certain that it is not needed in the application. In particular:

- Ensure that any TLS server(s) the device connects to can still be used. If the server is controlled by a third party or a cloud service, recommend ensuring that the firmware supports at least two of the supported cipher suites in case one is disabled in a future update.
- Ensure that any TLS client(s) that connect to the device can still connect with supported/recommended cipher suites. Note that future versions of client operating systems may remove support for some features, so it is recommended to enable multiple supported cipher suites or algorithms for redundancy.

If depending on third party clients or servers, always pay attention to announcements about future changes to supported TLS features. If not, the ESP32 device may become inaccessible if support changes.

---

**备注:** Not every combination of mbedTLS compile-time config is tested in ESP-IDF. If you find a combination that fails to compile or function as expected, please report the details on GitHub.

---

**FreeModBus** If using Modbus, enable or disable [CONFIG\\_FMB\\_COMM\\_MODE\\_TCP\\_EN](#), [CONFIG\\_FMB\\_COMM\\_MODE\\_RTU\\_EN](#), [CONFIG\\_FMB\\_COMM\\_MODE\\_ASCII\\_EN](#) as applicable for the necessary functionality.

**VFS** *Virtual filesystem* feature in ESP-IDF allows multiple filesystem drivers and file-like peripheral drivers to be accessed using standard I/O functions (`open`, `read`, `write`, etc.) and C library functions (`fopen`, `fread`, `fwrite`, etc.). When filesystem or file-like peripheral driver functionality is not used in the application this feature can be fully or partially disabled. VFS component provides the following configuration options:

- [CONFIG\\_VFS\\_SUPPORT\\_TERMIOS](#) —can be disabled if the application doesn't use `termios` family of functions. Currently, these functions are implemented only for UART VFS driver. Most applications can disable this option. Disabling this option reduces the code size by about 1.8 kB.
- [CONFIG\\_VFS\\_SUPPORT\\_SELECT](#) — can be disabled if the application doesn't use `select` function with file descriptors. Currently, only the UART and eventfd VFS drivers implement `select` support. Note that when this option is disabled, `select` can still be used for socket file descriptors. Disabling this option reduces the code size by about 2.7 kB.
- [CONFIG\\_VFS\\_SUPPORT\\_DIR](#) —can be disabled if the application doesn't use directory related functions, such as `readdir` (see the description of this option for the complete list). Applications which only open, read and write specific files and don't need to enumerate or create directories can disable this option, reducing the code size by 0.5 kB or more, depending on the filesystem drivers in use.
- [CONFIG\\_VFS\\_SUPPORT\\_IO](#) —can be disabled if the application doesn't use filesystems or file-like peripheral drivers. This disables all VFS functionality, including the three options mentioned above. When this option is disabled, `console` can't be used. Note that the application can still use standard I/O functions with socket file descriptors when this option is disabled. Compared to the default configuration, disabling this option reduces code size by about 9.4 kB.

**Bootloader Size** This document deals with the size of an ESP-IDF app binary only, and not the ESP-IDF [二级引导程序](#).

For a discussion of ESP-IDF bootloader binary size, see [引导加载程序大小](#).

**IRAM Binary Size** If the IRAM section of a binary is too large, this issue can be resolved by reducing IRAM memory usage. See [Optimizing IRAM Usage](#).

### Minimizing RAM Usage

In some cases, a firmware application's available RAM may run low or run out entirely. In these cases, it's necessary to tune the memory usage of the firmware application.

In general, firmware should aim to leave some “headroom” of free internal RAM in order to deal with extraordinary situations or changes in RAM usage in future updates.

**Background** Before optimizing ESP-IDF RAM usage, it's necessary to understand the basics of ESP32 memory types, the difference between static and dynamic memory usage in C, and the way ESP-IDF uses stack and heap. This information can all be found in [Heap Memory Allocation](#).

**Measuring Static Memory Usage** The *idf.py* tool can be used to generate reports about the static memory usage of an application. Refer to [the Binary Size chapter for more information](#).

**Measuring Dynamic Memory Usage** ESP-IDF contains a range of heap APIs for measuring free heap at runtime. See [Heap Memory Debugging](#).

---

**备注:** In embedded systems, heap fragmentation can be a significant issue alongside total RAM usage. The heap measurement APIs provide ways to measure the “largest free block”. Monitoring this value along with the total number of free bytes can give a quick indication of whether heap fragmentation is becoming an issue.

---

### Reducing Static Memory Usage

- Reducing the static memory usage of the application increases the amount of RAM available for heap at runtime, and vice versa.
- Generally speaking, minimizing static memory usage requires monitoring the `.data` and `.bss` sizes. For tools to do this, see [Measuring Static Sizes](#).
- Internal ESP-IDF functions do not make heavy use of static RAM allocation in C. In many instances (including: Wi-Fi library, Bluetooth controller) “static” buffers are still allocated from heap, but the allocation is done once when the feature is initialized and will be freed if the feature is deinitialized. This is done in order to maximize the amount of free memory at different points in the application life-cycle.

To minimize static memory use:

- Declare structures, buffers, or other variables `const` whenever possible. Constant data can be stored in flash not RAM. This may require changing functions in the firmware to take `const *` arguments instead of mutable pointer arguments. These changes can also reduce the stack usage of some functions.
- If using Bluedroid, setting the option `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY` will cause Bluedroid to allocate memory on initialization and free it on deinitialization. This doesn't necessarily reduce the peak memory usage, but changes it from static memory usage to runtime memory usage.

**Reducing Stack Sizes** In FreeRTOS, task stacks are usually allocated from the heap. The stack size for each task is fixed (passed as an argument to `xTaskCreate()`). Each task can use up to its allocated stack size, but using more than this will cause an otherwise valid program to crash with a stack overflow or heap corruption.

Therefore, determining the optimum sizes of each task stack can substantially reduce RAM usage.

To determine optimum task stack sizes:

- Combine tasks. The best task stack size is 0 bytes, achieved by combining a task with another existing task. Anywhere that the firmware can be structured to perform multiple functions sequentially in a single task will increase free memory. In some cases, using a “worker task” pattern where jobs are serialized into a FreeRTOS queue (or similar) and then processed by generic worker tasks may help.
- Consolidate task functions. String formatting functions (like `printf`) are particularly heavy users of stack, so any task which doesn't ever call these can usually have its stack size reduced.
- Enabling *Newlib nano formatting* will reduce the stack usage of any task that calls `printf()` or other C string formatting functions.
- Avoid allocating large variables on the stack. In C, any large struct or array allocated as an “automatic” variable (i.e. default scope of a C declaration) will use space on the stack. Minimize the sizes of these, allocate them statically and/or see if you can save memory by allocating them from the heap only when they are needed.
- Avoid deep recursive function calls. Individual recursive function calls don't always add a lot of stack usage each time they are called, but if each function includes large stack-based variables then the overhead can get quite high.
- At runtime, call the function `uxTaskGetStackHighWaterMark()` with the handle of any task where you think there is unused stack memory. This function returns the minimum lifetime free stack memory in bytes. The easiest time to call this is from the task itself: call `uxTaskGetStackHighWaterMark(NULL)` to get the current task's high water mark after the time that the task has achieved its peak stack usage (i.e. if there is a main loop, execute the main loop a number of times with all possible states and then call `uxTaskGetStackHighWaterMark()`). Often, it's possible to subtract almost the entire value returned here from the total stack size of a task, but allow some safety margin to account for unexpected small increases in stack usage at runtime.
- Call `uxTaskGetSystemState()` at runtime to get a summary of all tasks in the system. This includes their individual stack “high watermark” values.
- When debugger watchpoints are not being used, set the `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` option to trigger an immediate panic if a task writes the word at the end of its assigned stack. This is slightly more reliable than the default `CONFIG_FREERTOS_CHECK_STACKOVERFLOW` option of “Check using canary bytes”, because the panic happens immediately, not on the next RTOS context switch. Neither option is perfect, it's possible in some cases for stack pointer to skip the watchpoint or canary bytes and corrupt another region of RAM, instead.

**Internal Stack Sizes** ESP-IDF allocates a number of internal tasks for housekeeping purposes or operating system functions. Some are created during the startup process, and some are created at runtime when particular features are initialized.

The default stack sizes for these tasks are usually set conservatively high, to allow all common usage patterns. Many of the stack sizes are configurable, and it may be possible to reduce them to match the real runtime stack usage of the task.

---

**重要:** If internal task stack sizes are set too small, ESP-IDF will crash unpredictably. Even if the root cause is task stack overflow, this is not always clear when debugging. It is recommended that internal stack sizes are only reduced carefully (if at all), with close attention to “high water mark” free space under load. If reporting an issue that occurs when internal task stack sizes have been reduced, please always include this information and the specific configuration that is being used.

---

- *Main task that executes `app_main` function* has stack size `CONFIG_ESP_MAIN_TASK_STACK_SIZE`.
- *High Resolution Timer* system task which executes callbacks has stack size `CONFIG_ESP_TIMER_TASK_STACK_SIZE`.
- FreeRTOS Timer Task to handle FreeRTOS timer callbacks has stack size `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`.
- *Event Handling* system task to execute callbacks for the default system event loop has stack size `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`.
- *lwIP* TCP/IP task has stack size `CONFIG_LWIP_TCPIP_TASK_STACK_SIZE`

- *Blueroid Bluetooth Host* have task stack sizes `CONFIG_BT_BTC_TASK_STACK_SIZE`, `CONFIG_BT_BTU_TASK_STACK_SIZE`.
- *NimBLE Bluetooth Host* has task stack size `CONFIG_BT_NIMBLE_TASK_STACK_SIZE`
- The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config `ETH_MAC_DEFAULT_CONFIG` then the task stack size is 4 KB. This setting can be changed by passing a custom `eth_mac_config_t` struct when initializing the Ethernet MAC.
- FreeRTOS idle task stack size is configured by `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE`.
- If using the *mDNS* and/or *MQTT* components, they create tasks with stack sizes configured by `CONFIG_MDNS_TASK_STACK_SIZE` and `CONFIG_MQTT_TASK_STACK_SIZE`, respectively. MQTT stack size can also be configured using `task_stack` field of `esp_mqtt_client_config_t`.

---

**备注:** Aside from built-in system features such as esp-timer, if an ESP-IDF feature is not initialized by the firmware then no associated task is created. In those cases, the stack usage is zero and the stack size configuration for the task is not relevant.

---

**Reducing Heap Usage** For functions that assist in analyzing heap usage at runtime, see [Heap Memory Debugging](#).

Normally, optimizing heap usage consists of analyzing the usage and removing calls to `malloc()` that aren't being used, reducing the corresponding sizes, or freeing previously allocated buffers earlier.

There are some ESP-IDF configuration options that can reduce heap usage at runtime:

- lwIP documentation has a section to configure [Minimum RAM usage](#).
- *Wi-Fi缓冲区使用情况* describes options to either reduce numbers of “static” buffers or reduce the maximum number of “dynamic” buffers in use, in order to minimize memory usage at possible cost of performance. Note that “static” Wi-Fi buffers are still allocated from heap when Wi-Fi is initialized and will be freed if Wi-Fi is deinitialized.
- The Ethernet driver allocates DMA buffers for the internal Ethernet MAC when it is initialized - configuration options are `CONFIG_ETH_DMA_BUFFER_SIZE`, `CONFIG_ETH_DMA_RX_BUFFER_NUM`, `CONFIG_ETH_DMA_TX_BUFFER_NUM`.
- mbedTLS TLS session memory usage can be minimized by enabling the ESP-IDF feature `CONFIG_MBEDTLS_DYNAMIC_BUFFER`.
- In single core mode only, it's possible to use IRAM as byte accessible memory (added to the regular heap) by enabling `CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY`. Note that this option carries a performance penalty and the risk of security issues caused by executable data. If this option is enabled then it's possible to set other options to prefer certain buffers be allocated from this memory: *mbedTLS*, *NimBLE*.
- Reduce `CONFIG_BTDM_CTRL_BLE_MAX_CONN` if using BLE.
- Reduce `CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN` if using Bluetooth Classic.

---

**备注:** There are other configuration options that will increase heap usage at runtime if changed from the defaults. These are not listed here, but the help text for the configuration item will mention if there is some memory impact.

---

**Optimizing IRAM Usage** If the app allocates more static IRAM than is available then the app will fail to build and linker errors such as section ``.iram0.text'` will not fit in region ``.iram0_0_seg'`, IRAM0 segment data does not fit and region ``.iram0_0_seg'` overflowed by 84 bytes will be seen. If this happens, it is necessary to find ways to reduce static IRAM usage in order to link the application.

To analyze the IRAM usage in the firmware binary, use [Measuring Static Sizes](#). If the firmware failed to link, steps to analyze are shown at [Showing Size When Linker Fails](#).

The following options will reduce IRAM usage of some ESP-IDF features:

- Enable `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`. Provided these functions are not (incorrectly) used from ISRs, this option is safe to enable in all configurations.
- Enable `CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNCS_INTO_FLASH`. Enabling this option will place snapshot-related functions, such as `vTaskGetSnapshot` or `uxTaskGetSnapshotAll`, in flash.
- Enable `CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`. Provided these functions are not (incorrectly) used from ISRs, this option is safe to enable in all configurations.
- Enable `CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH`. This option is not safe to use if the ISR ringbuf functions are used from an IRAM interrupt context, e.g. if `CONFIG_UART_ISR_IN_IRAM` is enabled. For the IDF drivers where this is the case you will get an error at run-time when installing the driver in question.
- Disable Wi-Fi options `CONFIG_ESP32_WIFI_IRAM_OPT` and/or `CONFIG_ESP32_WIFI_RX_IRAM_OPT`. Disabling these options will free available IRAM at the cost of Wi-Fi performance.
- `CONFIG_SPI_FLASH_ROM_DRIVER_PATCH` disabling this option will free some IRAM but is only available in some flash configurations (see the configuration item help text).
- If the application uses PSRAM and is based on ESP32 rev. 3 (ECO3), setting `CONFIG_ESP32_REV_MIN` to 3 will disable PSRAM bug workarounds, saving ~10kB or more of IRAM.
- Disabling `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR` prevents posting `esp_event` events from IRAM 安全中断处理程序 but will save some IRAM.
- Disabling `CONFIG_SPI_MASTER_ISR_IN_IRAM` prevents `spi_master` interrupts from being serviced while writing to flash, and may otherwise reduce `spi_master` performance, but will save some IRAM.
- Setting `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` to disable assertion for HAL component will save some IRAM especially for HAL code who calls `HAL_ASSERT` a lot and resides in IRAM.

When compiling for ESP32 revisions older than ECO3 (`CONFIG_ESP32_REV_MIN`), PSRAM cache bug workaround (`CONFIG_SPIRAM_CACHE_WORKAROUND`) option is enabled, and the C library functions normally located in ROM are recompiled with the workaround and placed into IRAM instead. For most applications, it is safe to move many of the C library functions into Flash, reclaiming some IRAM. Corresponding options include:

- `CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM`: affects the functions `longjmp` and `setjmp`.
- `CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM`: affects the functions `abs`, `div`, `labs`, `ldiv`, `quorem`, `fpclassify` and `nan`.
- `CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM`: affects the functions `utoa`, `itoa`, `atoi`, `atol`, `strtol`, and `strtoul`.
- `CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM`: affects the functions `wcrtomb`, `fwwrite`, `wbuf`, `wsetup`, `fputwc`, `wctomb_r`, `ungetc`, `makebuf`, `fflush`, `refill`, and `sccl`.
- `CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM`: affects the functions `asctime`, `asctime_r`, `ctime`, `ctime_r`, `lcltime`, `lcltime_r`, `gmtime`, `gmtime_r`, `strftime`, `mktime`, `tzset_r`, `tzset`, `time`, `gettzinfo`, `systemtime`, `month_lengths`, `timelocal`, `tzvars`, `tzlock`, `tzcalc_limits`, and `strptime`.
- `CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM`: affects the functions `ctype_`, `toupper`, `tolower`, `toascii`, `strupr`, `bzero`, `isalnum`, `isalpha`, `isascii`, `isblank`, `iscntrl`, `isdigit`, `isgraph`, `islower`, `isprint`, `ispunct`, `isspace`, and `isupper`.
- `CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM`: affects the functions `memcpy`, `memchr`, `memmove`, and `memrchr`.
- `CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM`: affects the functions `strcasemp`, `strcasestr`, `strchr`, `strcoll`, `strcpy`, `strcspn`, `strdup`, `strdup_r`, `strlcat`, `strncpy`, `strlen`, `strlwr`, `strncasemp`, `strncat`, `strncmp`, `strncpy`, `strndup`, `strndup_r`, `strrchr`, `strsep`, `strspn`, `strstr`, `strtok_r`, and `strupr`.
- `CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM`: affects the functions `srand`, `rand`, and `rand_r`.
- `CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM`: affects the functions `environ`, `envlock`, and `getenv_r`.
- `CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM`: affects the functions `lock`, `isatty`, `fclose`, `open`, `close`, `creat`, `read`, `rshift`, `sbrk`, `stdio`, `sysbrk`, `sysclose`, `sysopen`, `creat`, `sysread`, `syswrite`, `impure`, `fwalk`, and `findfp`.
- `CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM`: affects the functions `raise` and `system`.

The exact amount of IRAM saved will depend on how much C library code is actually used by the application. In addition to these, the following options may be used to move more of the C library code into Flash, however note that this may result in reduced performance. Also take care to not use corresponding C library functions from interrupts

which may be called while cache is disabled (allocated with `ESP_INTR_FLAG_IRAM` flag), refer to [IRAM 安全中断处理程序](#) for more details. For these reasons, the functions `itoa`, `memcmp`, `memcpy`, `memset`, `strcat`, `strcmp`, and `strlen` are always put in IRAM.

---

**备注:** Moving frequently-called functions from IRAM to flash may increase their execution time.

---

---

**备注:** Other configuration options exist that will increase IRAM usage by moving some functionality into IRAM, usually for performance, but the default option is not to do this. These are not listed here. The IRAM size impact of enabling these options is usually noted in the configuration item help text.

---

## 4.26 RF calibration

ESP32 supports three RF calibration methods during RF initialization:

1. Partial calibration
2. Full calibration
3. No calibration

### 4.26.1 Partial calibration

During RF initialization, the partial calibration method is used by default for RF calibration. It is done based on the full calibration data which is stored in the NVS. To use this method, please go to `menuconfig` and enable `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`.

### 4.26.2 Full calibration

Full calibration is triggered in the following conditions:

1. NVS does not exist.
2. The NVS partition to store calibration data is erased.
3. Hardware MAC address is changed.
4. PHY library version is changed.
5. The RF calibration data loaded from the NVS partition is broken.

It takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. To switch to the full calibration method, go to `menuconfig` and disable `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`. If you use the default method of RF calibration, there are two ways to add the function of triggering full calibration as a last-resort remedy.

1. Erase the NVS partition if you don't mind all of the data stored in the NVS partition is erased. That is indeed the easiest way.
2. Call API `esp_phy_erase_cal_data_in_nvs()` before initializing WiFi and BT/BLE based on some conditions (e.g. an option provided in some diagnostic mode). In this case, only phy namespace of the NVS partition is erased.

### 4.26.3 No calibration

No calibration method is only used when the device wakes up from deep sleep.

### 4.26.4 PHY initialization data

The PHY initialization data is used for RF calibration. There are two ways to get the PHY initialization data.

One is the default initialization data which is located in the header file `components/esp_phy/esp32/include/phy_init_data.h`.

It is embedded into the application binary after compiling and then stored into read-only memory (DROM). To use the default initialization data, please go to `menuconfig` and disable `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`.

Another is the initialization data which is stored in a partition. When using a custom partition table, make sure that PHY data partition is included (type: `data`, subtype: `phy`). With default partition table, this is done automatically. If initialization data is stored in a partition, it has to be flashed there, otherwise runtime error will occur. To switch to the initialization data stored in a partition, go to `menuconfig` and enable `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`.

## 4.27 Secure Boot

---

**重要:** All references in this document are related to Secure Boot V1 (The AES based Secure Boot Scheme). ESP32 Revision 3 onwards, the preferred secure boot scheme is *Secure Boot V2*. Please refer to Secure Boot V2 document for ESP32 Revision 3 or ESP32-S2.

---

Secure Boot is a feature for ensuring only your code can run on the chip. Data loaded from flash is verified on each reset.

Secure Boot is separate from the *Flash Encryption* feature, and you can use secure boot without encrypting the flash contents. However, for a secure environment both should be used simultaneously. See *Secure Boot & Flash Encryption* for more details.

---

**重要:** Enabling secure boot limits your options for further updates of your ESP32. Make sure to read this document thoroughly and understand the implications of enabling secure boot.

---

### 4.27.1 Background

- Most data is stored in flash. Flash access does not need to be protected from physical access in order for secure boot to function, because critical data is stored (non-software-accessible) in Efuses internal to the chip.
- Efuses are used to store the secure bootloader key (in efuse BLOCK2), and also a single Efuse bit (`ABS_DONE_0`) is burned (written to 1) to permanently enable secure boot on the chip. For more details on eFuses, see *ESP32 Technical Reference Manual > eFuse Controller (eFuse)* [PDF].
- To understand the secure boot process, first familiarise yourself with the standard *ESP-IDF boot process*.
- Both stages of the boot process (initial software bootloader load, and subsequent partition & app loading) are verified by the secure boot process, in a “chain of trust” relationship.

### 4.27.2 Secure Boot Process Overview

This is a high level overview of the secure boot process. Step by step instructions are supplied under *How To Enable Secure Boot*. Further in-depth details are supplied under *Technical Details*:

1. The options to enable secure boot are provided in the *Project Configuration Menu*, under “Secure Boot Configuration” .
2. Secure Boot defaults to signing images and partition table data during the build process. The “Secure boot private signing key” config item is a file path to a ECDSA public/private key pair in a PEM format file.

3. The software bootloader image is built by esp-idf with secure boot support enabled and the public key (signature verification) portion of the secure boot signing key compiled in. This software bootloader image is flashed at offset 0x1000.
4. On first boot, the software bootloader follows the following process to enable secure boot:
  - Hardware secure boot support generates a device secure bootloader key (generated via hardware RNG, then stored read/write protected in efuse), and a secure digest. The digest is derived from the key, an IV, and the bootloader image contents.
  - The secure digest is flashed at offset 0x0 in the flash.
  - Depending on Secure Boot Configuration, efuses are burned to disable JTAG and the ROM BASIC interpreter (it is strongly recommended these options are turned on.)
  - Bootloader permanently enables secure boot by burning the ABS\_DONE\_0 efuse. The software bootloader then becomes protected (the chip will only boot a bootloader image if the digest matches.)
5. On subsequent boots the ROM bootloader sees that the secure boot efuse is burned, reads the saved digest at 0x0 and uses hardware secure boot support to compare it with a newly calculated digest. If the digest does not match then booting will not continue. The digest and comparison are performed entirely by hardware, and the calculated digest is not readable by software. For technical details see [Secure Boot Hardware Support](#).
6. When running in secure boot mode, the software bootloader uses the secure boot signing key (the public key of which is embedded in the bootloader itself, and therefore validated as part of the bootloader) to verify the signature appended to all subsequent partition tables and app images before they are booted.

### 4.27.3 Keys

The following keys are used by the secure boot process:

- “secure bootloader key” is a 256-bit AES key that is stored in Efuse block 2. The bootloader can generate this key itself from the internal hardware random number generator, the user does not need to supply it (it is optionally possible to supply this key, see [Re-Flashable Software Bootloader](#)). The Efuse holding this key is read & write protected (preventing software access) before secure boot is enabled.
  - By default, the Efuse Block 2 Coding Scheme is “None” and a 256 bit key is stored in this block. On some ESP32s, the Coding Scheme is set to 3/4 Encoding (CODING\_SCHEME efuse has value 1) and a 192 bit key must be stored in this block.

For more details, see [ESP32 Technical Reference Manual > eFuse Controller \(eFuse\) > System Parameter coding\\_scheme \[PDF\]](#).

The algorithm operates on a 256 bit key in all cases, 192 bit keys are extended by repeating some bits ([details](#)).

- “secure boot signing key” is a standard ECDSA public/private key pair (see [Image Signing Algorithm](#)) in PEM format.
  - The public key from this key pair (for signature verification but not signature creation) is compiled into the software bootloader and used to verify the second stage of booting (partition table, app image) before booting continues. The public key can be freely distributed, it does not need to be kept secret.
  - The private key from this key pair *must be securely kept private*, as anyone who has this key can authenticate to any bootloader that is configured with secure boot and the matching public key.

### 4.27.4 Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See [引导加载程序大小](#).

### 4.27.5 How To Enable Secure Boot

1. Open the [Project Configuration Menu](#), navigate to “Secure Boot Configuration” and select the option “One-time Flash” . (To understand the alternative “Reflashable” choice, see [Re-Flashable Software Bootloader](#).)
2. Select a name for the secure boot signing key. This option will appear after secure boot is enabled. The file can be anywhere on your system. A relative path will be evaluated from the project directory. The file does not need to exist yet.
3. Set other menuconfig options (as desired). Pay particular attention to the “Bootloader Config” options, as you can only flash the bootloader once. Then exit menuconfig and save your configuration

4. The first time you run `make`, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

---

**重要:** A signing key generated this way will use the best random number source available to the OS and its Python installation (`/dev/urandom` on OSX/Linux and `CryptGenRandom()` on Windows). If this random number source is weak, then the private key will be weak.

---

**重要:** For production environments, we recommend generating the keypair using `openssl` or another industry standard encryption program. See [Generating Secure Boot Signing Key](#) for more details.

---

5. Run `idf.py bootloader` to build a secure boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.
6. When you're ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by `make`) and then wait for flashing to complete. **Remember this is a one time flash, you can't change the bootloader after this!**
7. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 4.

---

**备注:** `idf.py flash` doesn't flash the bootloader if secure boot is enabled.

---

8. Reset the ESP32 and it will boot the software bootloader you flashed. The software bootloader will enable secure boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32 to verify that secure boot is enabled and no errors have occurred due to the build configuration.

---

**备注:** Secure boot won't be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

---

---

**备注:** If the ESP32 is reset or powered down during the first boot, it will start the process again on the next boot.

---

9. On subsequent boots, the secure boot hardware will verify the software bootloader has not changed (using the secure bootloader key) and then the software bootloader will verify the signed partition table and app image (using the public key portion of the secure boot signing key).

#### 4.27.6 Re-Flashable Software Bootloader

Configuration “Secure Boot: One-Time Flash” is the recommended configuration for production devices. In this mode, each device gets a unique key that is never stored outside the device.

However, an alternative mode [Secure Boot: Reflashable](#) is also available. This mode allows you to supply a binary key file that is used for the secure bootloader key. As you have the key file, you can generate new bootloader images and secure boot digests for them.

In the `esp-idf` build process, this 256-bit key file is derived from the ECDSA app signing key generated by the user (see the [Generating Secure Boot Signing Key](#) step below). This private key's SHA-256 digest is used as the secure bootloader key in efuse (as-is for Coding Scheme None, or truncate to 192 bytes for 3/4 Encoding). This is a convenience so you only need to generate/protect a single private key.

---

**备注:** Although it's possible, we strongly recommend not generating one secure boot key and flashing it to every device in a production environment. The “One-Time Flash” option is recommended for production environments.

---

To enable a reflashable bootloader:

1. In the *Project Configuration Menu*, select “Bootloader Config” -> `CONFIG_SECURE_BOOT` -> `CONFIG_SECURE_BOOT_V1_ENABLED` -> `CONFIG_SECURE_BOOTLOADER_MODE` -> Reflashable.
2. If necessary, set the `CONFIG_SECURE_BOOTLOADER_KEY_ENCODING` based on the coding scheme used by the device. The coding scheme is shown in the Features line when `esptool.py` connects to the chip, or in the `espefuse.py` summary output.
2. Follow the steps shown above to choose a signing key file, and generate the key file.
3. Run `idf.py bootloader`. A binary key file will be created, derived from the private key that is used for signing. Two sets of flashing steps will be printed - the first set of steps includes an `espefuse.py burn_key secure_boot_v1 path_to/secure-bootloader-key-xxx.bin` command which is used to write the bootloader key to efuse. (Flashing this key is a one-time-only process.) The second set of steps can be used to reflash the bootloader with a pre-calculated digest (generated during the build process).
4. Resume from *Step 6 of the one-time flashing process*, to flash the bootloader and enable secure boot. Watch the console log output closely to ensure there were no errors in the secure boot configuration.

### 4.27.7 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via `espsecure.py generate_signing_key`. This uses the `python-ecdsa` library, which in turn uses Python’s `os.urandom()` as a random number source.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available EC key generation utilities.

For example, to generate a signing key using the `openssl` command line:

```
` openssl ecparam -name prime256v1 -genkey -noout -out
my_secure_boot_signing_key.pem `
```

Remember that the strength of the secure boot system depends on keeping the signing key private.

### 4.27.8 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default `esp-idf` secure boot configuration). The `espsecure.py` command line program can be used to sign app images & partition table data for secure boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system. However, the public (signature verification) key is required because it is compiled into the bootloader (and can be used to verify image signatures during OTA updates).

To extract the public key from the private key:

```
espsecure.py extract_public_key --keyfile PRIVATE_SIGNING_KEY PUBLIC_VERIFICATION_
↪KEY
```

The path to the public signature verification key needs to be specified in the `menuconfig` under “Secure boot public signature verification key” in order to build the secure bootloader.

After the app image and partition table are built, the build system will print signing steps using `espsecure.py`:

```
espsecure.py sign_data --keyfile PRIVATE_SIGNING_KEY BINARY_FILE
```

The above command appends the image signature to the existing binary. You can use the `-output` argument to write the signed binary to a separate file:

```
espsecure.py sign_data --keyfile PRIVATE_SIGNING_KEY --output SIGNED_BINARY_FILE_
↪BINARY_FILE
```

(下页继续)

## 4.27.9 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the secure boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using `espsecure.py`. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all secure boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use secure boot in combination with *flash encryption* to prevent local readout of the flash contents.

## 4.27.10 Technical Details

The following sections contain low-level reference descriptions of various secure boot elements:

### Secure Boot Hardware Support

The first stage of secure boot verification (checking the software bootloader) is done via hardware. The ESP32's Secure Boot support hardware can perform three basic operations:

1. Generate a random sequence of bytes from a hardware random number generator.
2. Generate a digest from data (usually the bootloader image from flash) using a key stored in Efuse block 2. The key in Efuse can (& should) be read/write protected, which prevents software access. For full details of this algorithm see *Secure Bootloader Digest Algorithm*. The digest can only be read back by software if Efuse `ABS_DONE_0` is *not* burned (ie still 0).
3. Generate a digest from data (usually the bootloader image from flash) using the same algorithm as step 2 and compare it to a pre-calculated digest supplied in a buffer (usually read from flash offset 0x0). The hardware returns a true/false comparison without making the digest available to software. This function is available even when Efuse `ABS_DONE_0` is burned.

### Secure Bootloader Digest Algorithm

Starting with an “image” of binary data as input, this algorithm generates a digest as output. The digest is sometimes referred to as an “abstract” in hardware documentation.

For a Python version of this algorithm, see the `espsecure.py` tool in the `components/esptool_py` directory (specifically, the `digest_secure_bootloader` command).

Items marked with (^) are to fulfill hardware restrictions, as opposed to cryptographic restrictions.

1. Read the AES key from efuse block 2, in reversed byte order. If Coding Scheme is set to 3/4 Encoding, extend the 192 bit key to 256 bits using the same algorithm described in *Flash 加密算法*.
2. Prefix the image with a 128 byte randomly generated IV.
3. If the image length is not modulo 128, pad the image to a 128 byte boundary with 0xFF. (^)
4. For each 16 byte plaintext block of the input image: - Reverse the byte order of the plaintext input block (^)  
- Apply AES256 in ECB mode to the plaintext block. - Reverse the byte order of the ciphertext output block. (^) - Append to the overall ciphertext output.
5. Byte-swap each 4 byte word of the ciphertext (^)
6. Calculate SHA-512 of the ciphertext.

Output digest is 192 bytes of data: The 128 byte IV, followed by the 64 byte SHA-512 digest.

## Image Signing Algorithm

Deterministic ECDSA as specified by [RFC 6979](#).

- Curve is NIST256p (openssl calls this curve “prime256v1”, it is also sometimes called secp256r1).
- Hash function is SHA256.
- Key format used for storage is PEM.
  - In the bootloader, the public key (for signature verification) is flashed as 64 raw bytes.
- Image signature is 68 bytes - a 4 byte version word (currently zero), followed by a 64 bytes of signature data. These 68 bytes are appended to an app image or partition table data.

## Manual Commands

Secure boot is integrated into the esp-idf build system, so `make` will automatically sign an app image if secure boot is enabled. `idf.py bootloader` will produce a bootloader digest if `menuconfig` is configured for it.

However, it is possible to use the `espsecure.py` tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --keyfile ./my_signing_key.pem --output ./image_signed.bin
↪image-unsigned.bin
```

Keyfile is the PEM file containing an ECDSA private signing key.

To generate a bootloader digest:

```
espsecure.py digest_secure_bootloader --keyfile ./securebootkey.bin --output ./
↪bootloader-digest.bin build/bootloader/bootloader.bin
```

Keyfile is the 32 byte raw secure boot key for the device.

The output of the `espsecure.py digest_secure_bootloader` command is a single file which contains both the digest and the bootloader appended to it. To flash the combined digest plus bootloader to the device:

```
esptool.py write_flash 0x0 bootloader-digest.bin
```

### 4.27.11 Secure Boot & Flash Encryption

If secure boot is used without *Flash Encryption*, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

### 4.27.12 Signed App Verification Without Hardware Secure Boot

The integrity of apps can be checked even without enabling the hardware secure boot option. This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement. See [How To Enable Signed App Verification](#) for step by step instructions.

An app can be verified on update and, optionally, be verified on boot.

- Verification on update: When enabled, the signature is automatically checked whenever the `esp_ota_ops.h` APIs are used for OTA updates. If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

- Verification on boot: When enabled, the bootloader will be compiled with code to verify that an app is signed before booting it. If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn't add significant security by itself so most users will want to leave it disabled.

### How To Enable Signed App Verification

1. Open *Project Configuration Menu* -> Security features -> Enable *CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT*
2. “Bootloader verifies app signatures” can be enabled, which verifies app on boot.
3. By default, “Sign binaries during build” will be enabled on selecting “Require signed app images” option, which will sign binary files as a part of build process. The file named in “Secure boot private signing key” will be used to sign the image.
4. If you disable “Sign binaries during build” option then you'll have to enter path of a public key file used to verify signed images in “Secure boot public signature verification key”. In this case, private signing key should be generated by following instructions in *Generating Secure Boot Signing Key*; public verification key and signed image should be generated by following instructions in *Remote Signing of Images*.

### 4.27.13 Advanced Features

#### JTAG Debugging

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See *JTAG 与闪存加密和安全引导* for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

## 4.28 Secure Boot V2

---

**重要:** This document is about Secure Boot V2, supported on the following chips: ESP32 (ECO3 onwards), ESP32-S2, ESP32-S3 and ESP32-C3 (ECO3 onwards). Except for ESP32, it is the only supported Secure Boot scheme.

For ESP32 before ECO3, refer to *Secure Boot*. It is recommended that users use Secure Boot V2 if they have a chip version that supports it. Secure Boot V2 is safer and more flexible than Secure Boot V1.

Secure Boot V2 uses RSA based app and bootloader verification. This document can also be used as a reference for signing apps using the RSA scheme without signing the bootloader.

---

Secure Boot V2 and RSA scheme (App Signing Scheme) options are available for ESP32 from ECO3 onwards. To use these options in menuconfig, set *CONFIG\_ESP32\_REV\_MIN* greater than or equal to *Rev 3*.

### 4.28.1 Background

Secure Boot protects a device from running any unauthorized (i.e., unsigned) code by checking that each piece of software that is being booted is signed. On an ESP32, these pieces of software include the second stage bootloader and each application binary. Note that the first stage bootloader does not require signing as it is ROM code thus cannot be changed.

A new RSA based Secure Boot verification scheme (Secure Boot V2) has been introduced on the ESP32 (ECO3 onwards), ESP32-S2, ESP32-S3 and ESP32-C3 (ECO3 onwards).

The Secure Boot process on the ESP32 involves the following steps: 1. When the first stage bootloader loads the second stage bootloader, the second stage bootloader's RSA-PSS signature is verified. If the verification is successful,

the second stage bootloader is executed. 2. When the second stage bootloader loads a particular application image, the application's RSA-PSS signature is verified. If the verification is successful, the application image is executed.

### 4.28.2 Advantages

- The RSA public key is stored on the device. The corresponding RSA private key is kept at a secret place and is never accessed by the device.
- Only one public key can be generated and stored in the chip during manufacturing.
- Same image format and signature verification method is applied for applications and software bootloader.
- No secrets are stored on the device. Therefore, it is immune to passive side-channel attacks (timing or power analysis, etc.)

### 4.28.3 Secure Boot V2 Process

This is an overview of the Secure Boot V2 Process. Instructions how to enable Secure Boot are supplied in section [How To Enable Secure Boot V2](#).

Secure Boot V2 verifies the bootloader image and application binary images using a dedicated *signature block*. Each image has a separately generated signature block which is appended to the end of the image.

Only one signature block can be appended to the bootloader or application image in ESP32 ECO3.

Each signature block contains a signature of the preceding image as well as the corresponding RSA-3072 public key. For more details about the format, refer to [Signature Block Format](#). A digest of the RSA-3072 public key is stored in the eFuse.

The application image is not only verified on every boot but also on each over the air (OTA) update. If the currently selected OTA app image cannot be verified, the bootloader will fall back and look for another correctly signed application image.

The Secure Boot V2 process follows these steps:

1. On startup, the ROM code checks the Secure Boot V2 bit in the eFuse. If Secure Boot is disabled, a normal boot will be executed. If Secure Boot is enabled, the boot will proceed according to the following steps.
2. The ROM code verifies the bootloader's signature block ([Verifying a Signature Block](#)). If this fails, the boot process will be aborted.
3. The ROM code verifies the bootloader image using the raw image data, its corresponding signature block(s), and the eFuse ([Verifying an Image](#)). If this fails, the boot process will be aborted.
4. The ROM code executes the bootloader.
5. The bootloader verifies the application image's signature block ([Verifying a Signature Block](#)). If this fails, the boot process will be aborted.
6. The bootloader verifies the application image using the raw image data, its corresponding signature blocks and the eFuse ([Verifying an Image](#)). If this fails, the boot process will be aborted. If the verification fails but another application image is found, the bootloader will then try to verify that other image using steps 5 to 7. This repeats until a valid image is found or no other images are found.
7. The bootloader executes the verified application image.

### 4.28.4 Signature Block Format

The bootloader and application images are padded to the next 4096 byte boundary, thus the signature has a flash sector of its own. The signature is calculated over all bytes in the image including the padding bytes.

The content of each signature block is shown in the following table:

表 28: Content of a Signature Block

| Offset | Size (bytes) | Description   |
|--------|--------------|---|
| 0      | 1            | Magic byte  |
| 1      | 1            | Version number byte (currently 0x02), 0x01 is for Secure Boot V1.   |
| 2      | 2            | Padding bytes, Reserved. Should be zero.  |
| 4      | 32           | SHA-256 hash of only the image content, not including the signature block.  |
| 36     | 384          | RSA Public Modulus used for signature verification. (value ‘n’ in RFC8017).   |
| 420    | 4            | RSA Public Exponent used for signature verification (value ‘e’ in RFC8017).   |
| 424    | 384          | Pre-calculated R, derived from ‘n’.   |
| 808    | 4            | Pre-calculated M’, derived from ‘n’.  |
| 812    | 384          | RSA-PSS Signature result (section 8.1.1 of RFC8017) of image content, computed using following PSS parameters: SHA256 hash, MFG1 function, 0 length salt, default trailer field (0xBC). |
| 1196   | 4            | CRC32 of the preceding 1095 bytes.  |
| 1200   | 16           | Zero padding to length 1216 bytes.  |

备注: R and M’ are used for hardware-assisted Montgomery Multiplication.

The remainder of the signature sector is erased flash (0xFF) which allows writing other signature blocks after previous signature block.

### 4.28.5 Verifying a Signature Block

A signature block is “valid” if the first byte is 0xe7 and a valid CRC32 is stored at offset 1196. Otherwise it’s invalid.

### 4.28.6 Verifying an Image

An image is “verified” if the public key stored in any signature block is valid for this device, and if the stored signature is valid for the image data read from flash.

1. Compare the SHA-256 hash digest of the public key embedded in the bootloader’s signature block with the digest(s) saved in the eFuses. If public key’s hash doesn’t match any of the hashes from the eFuses, the verification fails.
2. Generate the application image digest and match it with the image digest in the signature block. If the digests don’t match, the verification fails.
3. Use the public key to verify the signature of the bootloader image, using RSA-PSS (section 8.1.2 of RFC8017) with the image digest calculated in step (2) for comparison.

### 4.28.7 Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See [引导加载程序大小](#).

### 4.28.8 eFuse usage

ESP32-ECO3:

- ABS\_DONE\_1 - Enables Secure Boot protection on boot.

- BLK2 - Stores the SHA-256 digest of the public key. SHA-256 hash of public key modulus, exponent, pre-calculated R & M' values (represented as 776 bytes –offsets 36 to 812 - as per the *Signature Block Format*) is written to an eFuse key block. The write-protection bit must be set, but the read-protection bit must not.

The key(s) must be readable in order to give software access to it. If the key(s) is read-protected then the software reads the key(s) as all zeros and the signature verification process will fail, and the boot process will be aborted.

## 4.28.9 How To Enable Secure Boot V2

1. Open the *Project Configuration Menu*, in “Security features” set “Enable hardware Secure Boot in bootloader” to enable Secure Boot.
2. For ESP32, Secure Boot V2 is available only ESP32 ECO3 onwards. To view the “Secure Boot V2” option the chip revision should be changed to revision 3 (ESP32- ECO3). To change the chip revision, set “Minimum Supported ESP32 Revision” to Rev 3 in “Component Config” -> “ESP32- Specific” .
3. Specify the path to Secure Boot signing key, relative to the project directory.
4. Select the desired UART ROM download mode in “UART ROM download mode” . By default the UART ROM download mode has been kept enabled in order to prevent permanently disabling it in the development phase, this option is a potentially insecure option. It is recommended to disable the UART download mode for better security.
5. Set other menuconfig options (as desired). Then exit menuconfig and save your configuration.
6. The first time you run `make` or `idf.py build`, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

---

**重要:** A signing key generated this way will use the best random number source available to the OS and its Python installation (`/dev/urandom` on OSX/Linux and `CryptGenRandom()` on Windows). If this random number source is weak, then the private key will be weak.

---

---

**重要:** For production environments, we recommend generating the key pair using `openssl` or another industry standard encryption program. See *Generating Secure Boot Signing Key* for more details.

---

7. Run `idf.py bootloader` to build a Secure Boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.
8. When you're ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by the build system) and then wait for flashing to complete.
9. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 4.

---

**备注:** `idf.py flash` doesn't flash the bootloader if Secure Boot is enabled.

---

10. Reset the ESP32 and it will boot the software bootloader you flashed. The software bootloader will enable Secure Boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32 to verify that Secure Boot is enabled and no errors have occurred due to the build configuration.

---

**备注:** Secure boot won't be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

---

---

**备注:** If the ESP32 is reset or powered down during the first boot, it will start the process again on the next boot.

---

11. On subsequent boots, the Secure Boot hardware will verify the software bootloader has not changed and the software bootloader will verify the signed app image (using the validated public key portion of its appended signature block).

#### 4.28.10 Restrictions after Secure Boot is enabled

- Any updated bootloader or app will need to be signed with a key matching the digest already stored in eFuse.
- After Secure Boot is enabled, no further eFuses can be read protected. (If *Flash 加密* is enabled then the bootloader will ensure that any flash encryption key generated on first boot will already be read protected.) If `CONFIG_SECURE_BOOT_INSECURE` is enabled then this behavior can be disabled, but this is not recommended.

#### 4.28.11 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via `espsecure.py generate_signing_key`. The `--version 2` parameter will generate the RSA 3072 private key for Secure Boot V2.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available RSA key generation utilities.

For example, to generate a signing key using the `openssl` command line:

```
` openssl genrsa -out my_secure_boot_signing_key.pem 3072 `
```

Remember that the strength of the Secure Boot system depends on keeping the signing key private.

#### 4.28.12 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default `esp-idf` Secure Boot configuration). The `espsecure.py` command line program can be used to sign app images & partition table data for Secure Boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system.

After the app image and partition table are built, the build system will print signing steps using `espsecure.py`:

```
espsecure.py sign_data BINARY_FILE --version 2 --keyfile PRIVATE_SIGNING_KEY
```

The above command appends the image signature to the existing binary. You can use the `--output` argument to write the signed binary to a separate file:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY --output SIGNED_
↪BINARY_FILE BINARY_FILE
```

#### 4.28.13 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the Secure Boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using `espsecure.py`. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all Secure Boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use Secure Boot in combination with *flash encryption* to prevent local readout of the flash contents.

### 4.28.14 Technical Details

The following sections contain low-level reference descriptions of various Secure Boot elements:

#### Manual Commands

Secure boot is integrated into the esp-idf build system, so `make` or `idf.py build` will sign an app image and `idf.py bootloader` will produce a signed bootloader if secure signed binaries on build is enabled.

However, it is possible to use the `espsecure.py` tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --version 2 --keyfile ./my_signing_key.pem --output ./image_
↳signed.bin image-unsigned.bin
```

Keyfile is the PEM file containing an RSA-3072 private signing key.

### 4.28.15 Secure Boot & Flash Encryption

If Secure Boot is used without *Flash Encryption*, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

### 4.28.16 Signed App Verification Without Hardware Secure Boot

The Secure Boot V2 signature of apps can be checked on OTA update, without enabling the hardware Secure Boot option. This option uses the same app signature scheme as Secure Boot V2, but unlike hardware Secure Boot it does not prevent an attacker who can write to flash from bypassing the signature protection.

This may be desirable in cases where the delay of Secure Boot verification on startup is unacceptable, and/or where the threat model does not include physical access or attackers writing to bootloader or app partitions in flash.

In this mode, the public key which is present in the signature block of the currently running app will be used to verify the signature of a newly updated app. (The signature on the running app isn't verified during the update process, it's assumed to be valid.) In this way the system creates a chain of trust from the running app to the newly updated app.

For this reason, it's essential that the initial app flashed to the device is also signed. A check is run on app startup and the app will abort if no signatures are found. This is to try and prevent a situation where no update is possible. The app should have only one valid signature block in the first position. Note again that, unlike hardware Secure Boot V2, the signature of the running app isn't verified on boot. The system only verifies a signature block in the first position and ignores any other appended signatures.

---

**备注:** In general, it's recommended to use full hardware Secure Boot unless certain that this option is sufficient for application security needs.

---

#### How To Enable Signed App Verification

1. Open *Project Configuration Menu* -> Security features
2. Ensure *App Signing Scheme* is *RSA*. For ESP32 ECO3 chip, select *CONFIG\_ESP32\_REV\_MIN* to *Rev 3* to get *RSA* option available
3. Enable *CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT*
4. By default, “Sign binaries during build” will be enabled on selecting “Require signed app images” option, which will sign binary files as a part of build process. The file named in “Secure boot private signing key” will be used to sign the image.

5. If you disable “Sign binaries during build” option then all app binaries must be manually signed by following instructions in *Remote Signing of Images*.

**警告:** It is very important that all apps flashed have been signed, either during the build or after the build.

## 4.28.17 Advanced Features

### JTAG Debugging

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See *JTAG 与闪存加密和安全引导* for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

## 4.29 Thread Local Storage

### 4.29.1 Overview

Thread-local storage (TLS) is a mechanism by which variables are allocated such that there is one instance of the variable per extant thread. ESP-IDF provides three ways to make use of such variables:

- *FreeRTOS Native API*: ESP-IDF FreeRTOS native API.
- *Pthread API*: ESP-IDF's pthread API.
- *C11 Standard*: C11 standard introduces special keyword to declare variables as thread local.

### 4.29.2 FreeRTOS Native API

The ESP-IDF FreeRTOS provides the following API to manage thread local variables:

- `vTaskSetThreadLocalStoragePointer()`
- `pvTaskGetThreadLocalStoragePointer()`
- `vTaskSetThreadLocalStoragePointerAndDelCallback()`

In this case maximum number of variables that can be allocated is limited by `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS` configuration value. Variables are kept in the task control block (TCB) and accessed by their index. Note that index 0 is reserved for ESP-IDF internal uses.

Using that API user can allocate thread local variables of an arbitrary size and assign them to any number of tasks. Different tasks can have different sets of TLS variables.

If size of the variable is more than 4 bytes then user is responsible for allocating/deallocating memory for it. Variable's deallocation is initiated by FreeRTOS when task is deleted, but user must provide function (callback) to do proper cleanup.

### 4.29.3 Pthread API

The ESP-IDF provides the following *pthread API* to manage thread local variables:

- `pthread_key_create()`
- `pthread_key_delete()`
- `pthread_getspecific()`
- `pthread_setspecific()`

This API has all benefits of the one above, but eliminates some its limits. The number of variables is limited only by size of available memory on the heap. Due to the dynamic nature this API introduces additional performance overhead compared to the native one.

#### 4.29.4 C11 Standard

The ESP-IDF FreeRTOS supports thread local variables according to C11 standard (ones specified with `__thread` keyword). For details on this GCC feature please see <https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local>. Storage for that kind of variables is allocated on the task's stack. Note that area for all such variables in the program will be allocated on the stack of every task in the system even if that task does not use such variables at all. For example ESP-IDF system tasks (like `ipc`, `timer` tasks etc.) will also have that extra stack space allocated. So this feature should be used with care. There is a tradeoff: C11 thread local variables are quite handy to use in programming and can be accessed using minimal CPU instructions, but this benefit goes with the cost of additional stack usage for all tasks in the system. Due to static nature of variables allocation all tasks in the system have the same sets of C11 thread local variables.

### 4.30 工具

#### 4.30.1 Downloadable Tools

ESP-IDF build process relies on a number of tools: cross-compiler toolchains, CMake build system, and others.

Installing the tools using an OS-specific package manager (like `apt`, `yum`, `brew`, etc.) is the preferred method when the required version of the tool is available. This recommendation is reflected in the Getting Started guide. For example, on Linux and macOS it is recommended to install CMake using an OS package manager.

However, some of the tools are IDF-specific and are not available in OS package repositories. Furthermore, different versions of ESP-IDF require different versions of the tools to operate correctly. To solve these two problems, ESP-IDF provides a set of scripts for downloading and installing the correct versions of tools, and exposing them in the environment.

The rest of the document refers to these downloadable tools simply as “tools”. Other kinds of tools used in ESP-IDF are:

- Python scripts bundled with ESP-IDF (such as `idf.py`)
- Python packages installed from PyPI.

The following sections explain the installation method, and provide the list of tools installed on each platform.

---

**备注:** This document is provided for advanced users who need to customize their installation, users who wish to understand the installation process, and ESP-IDF developers.

If you are looking for instructions on how to install the tools, see the [Getting Started Guide](#).

---

#### Tools metadata file

The list of tools and tool versions required for each platform is located in [tools/tools.json](#). The schema of this file is defined by [tools/tools\\_schema.json](#).

This file is used by [tools/idf\\_tools.py](#) script when installing the tools or setting up the environment variables.

#### Tools installation directory

`IDF_TOOLS_PATH` environment variable specifies the location where the tools are to be downloaded and installed. If not set, `IDF_TOOLS_PATH` defaults to `HOME/.espressif` on Linux and macOS, and `%USER_PROFILE%\espressif` on Windows.

Inside `IDF_TOOLS_PATH`, the scripts performing tools installation create the following directories:

- `dist` —where the archives of the tools are downloaded.
- `tools` —where the tools are extracted. The tools are extracted into subdirectories: `tools/TOOL_NAME/VERSION/`. This arrangement allows different versions of tools to be installed side by side.

### GitHub Assets Mirror

Most of the tools downloaded by the tools installer are GitHub Release Assets, which are files attached to a software release on GitHub.

If GitHub downloads are inaccessible or slow to access, it's possible to configure a GitHub assets mirror.

To use Espressif's download server, set the environment variable `IDF_GITHUB_ASSETS` to `dl.espressif.com/github_assets`. When the install process is downloading a tool from `github.com`, the URL will be rewritten to use this server instead.

Any mirror server can be used provided the URL matches the `github.com` download URL format: the install process will replace `https://github.com` with `https://${IDF_GITHUB_ASSETS}` for any GitHub asset URL that it downloads.

---

**备注:** The Espressif download server doesn't currently mirror everything from GitHub, it only mirrors files attached as Assets to some releases as well as source archives for some releases.

---

### `idf_tools.py` script

`tools/idf_tools.py` script bundled with ESP-IDF performs several functions:

- `install`: Download the tool into `${IDF_TOOLS_PATH}/dist` directory, extract it into `${IDF_TOOLS_PATH}/tools/TOOL_NAME/VERSION`. `install` command accepts the list of tools to install, in `TOOL_NAME` or `TOOL_NAME@VERSION` format. If `all` is given, all the tools (required and optional ones) are installed. If no argument or `required` is given, only the required tools are installed.
- `download`: Similar to `install` but doesn't extract the tools. An optional `--platform` argument may be used to download the tools for the specific platform.
- `export`: Lists the environment variables which need to be set to use the installed tools. For most of the tools, setting `PATH` environment variable is sufficient, but some tools require extra environment variables. The environment variables can be listed in either of `shell` or `key-value` formats, set by `--format` parameter:
  - `shell` produces output suitable for evaluation in the shell. For example,

```
export PATH="/home/user/.espressif/tools/tool/v1.0.0/bin:$PATH"
```

on Linux and macOS, and

```
set "PATH=C:\Users\user\.espressif\tools\v1.0.0\bin;%PATH%"
```

on Windows.

---

**备注:** Exporting environment variables in Powershell format is not supported at the moment. `key-value` format may be used instead.

---

The output of this command may be used to update the environment variables, if the shell supports this. For example:

```
eval $(${IDF_PATH}/tools/idf_tools.py export)
```

- `key-value` produces output in `VARIABLE=VALUE` format, suitable for parsing by other scripts:

```
PATH=/home/user/.espressif/tools/tool/v1.0.0:$PATH
```

Note that the script consuming this output has to perform expansion of `$VAR` or `%VAR%` patterns found in the output.

- `list`: Lists the known versions of the tools, and indicates which ones are installed.
- `check`: For each tool, checks whether the tool is available in the system path and in `IDF_TOOLS_PATH`.

### Install scripts

Shell-specific user-facing scripts are provided in the root of ESP-IDF repository to facilitate tools installation. These are:

- `install.bat` for Windows Command Prompt
- `install.ps1` for Powershell
- `install.sh` for Bash

Aside from downloading and installing the tools into `IDF_TOOLS_PATH`, these scripts prepare a Python virtual environment, and install the required packages into that environment.

### Export scripts

Since the installed tools are not permanently added into the user or system `PATH` environment variable, an extra step is required to use them in the command line. The following scripts modify the environment variables in the current shell to make the correct versions of the tools available:

- `export.bat` for Windows Command Prompt
- `export.ps1` for Powershell
- `export.sh` for Bash

---

**备注:** To modify the shell environment in Bash, `export.sh` must be “sourced” : `./export.sh` (note the leading dot and space).

`export.sh` may be used with shells other than Bash (such as `zsh`). However in this case the `IDF_PATH` environment variable must be set before running the script. When used in Bash, the script will guess the `IDF_PATH` value from its own location.

---

In addition to calling `idf_tools.py`, these scripts list the directories which have been added to the `PATH`.

### Other installation methods

Depending on the environment, more user-friendly wrappers for `idf_tools.py` are provided:

- *IDF Tools installer for Windows* can download and install the tools. Internally the installer uses `idf_tools.py`.
- *Eclipse plugin for ESP-IDF* includes a menu item to set up the tools. Internally the plugin calls `idf_tools.py`.
- Visual Studio Code extension for ESP-IDF includes an onboarding flow. This flow helps setting up the tools. Although the extension does not rely on `idf_tools.py`, the same installation method is used.

### Custom installation

Although the methods above are recommended for ESP-IDF users, they are not a must for building ESP-IDF applications. ESP-IDF build system expects that all the necessary tools are installed somewhere, and made available in the `PATH`.

**cmake** CMake build system

On Linux and macOS, it is recommended to install CMake using the OS package manager. However, for convenience it is possible to install CMake using `idf_tools.py` along with the other tools.

### 4.30.2 IDF Docker Image

IDF Docker image ( `espressif/idf` ) is intended for building applications and libraries with specific versions of ESP-IDF, when doing automated builds.

The image contains:

- Common utilities such as `git`, `wget`, `curl`, `zip`.
- Python 3.6 or newer.
- A copy of a specific version of ESP-IDF (see below for information about versions). `IDF_PATH` environment variable is set, and points to ESP-IDF location in the container.
- All the build tools required for the specific version of ESP-IDF: `CMake`, `make`, `ninja`, `cross-compiler toolchains`, etc.
- All Python packages required by ESP-IDF are installed in a virtual environment.

The image entrypoint sets up `PATH` environment variable to point to the correct version of tools, and activates the Python virtual environment. As a result, the environment is ready to use the ESP-IDF build system.

The image can also be used as a base for custom images, if additional utilities are required.

#### Tags

Multiple tags of this image are maintained:

- `latest`: tracks `master` branch of ESP-IDF
- `vX.Y`: corresponds to ESP-IDF release `vX.Y`
- `release-vX.Y`: tracks `release/vX.Y` branch of ESP-IDF

---

**备注:** Versions of ESP-IDF released before this feature was introduced do not have corresponding Docker image versions. You can check the up-to-date list of available tags at <https://hub.docker.com/r/espressif/idf/tags>.

---

#### Usage

**Setting up Docker** Before using the  `espressif/idf`  Docker image locally, make sure you have Docker installed. Follow the instructions at <https://docs.docker.com/install/>, if it is not installed yet.

If using the image in CI environment, consult the documentation of your CI service on how to specify the image used for the build process.

**Building a project with CMake** In the project directory, run:

```
docker run --rm -v $PWD:/project -w /project espressif/idf idf.py build
```

The above command explained:

- `docker run`: runs a Docker image. It is a shorter form of the command `docker container run`.
- `--rm`: removes the container when the build is finished
- `-v $PWD:/project`: mounts the current directory on the host (`$PWD`) as `/project` directory in the container
- `espressif/idf` : uses Docker image  `espressif/idf`  with tag `latest` (implicitly added by Docker when no tag is specified)
- `idf.py build`: runs this command inside the container

To build with a specific docker image tag, specify it as  `espressif/idf :TAG` , for example:

```
docker run --rm -v $PWD:/project -w /project espressif/idf:release-v4.4 idf.py ↵  
↵build
```

You can check the up-to-date list of available tags at <https://hub.docker.com/r/espressif/idf/tags>.

**Building a project with GNU Make** Same as for CMake, except that the build command is different:

```
docker run --rm -v $PWD:/project -w /project espressif/idf make defconfig all -j4
```

---

**备注:** If the `sdkconfig` file does not exist, the default behavior of GNU Make build system is to open the menuconfig UI. This may be not desired in automated build environments. To ensure that the `sdkconfig` file exists, `defconfig` target is added before `all`.

---

If you intend to build the same project repeatedly, you may bind the `tools/kconfig` directory of ESP-IDF to a named volume. This will prevent Kconfig tools, located in ESP-IDF directory, from being rebuilt, causing a rebuild of the rest of the project:

```
docker run --rm -v $PWD:/project -v kconfig:/opt/esp/idf/tools/kconfig -w /project_
↳espressif/idf make defconfig all -j4
```

If you need clean up the `kconfig` volume, run `docker volume rm kconfig`.

Binding the `tools/kconfig` directory to a volume is not necessary when using the CMake build system.

**Using the image interactively** It is also possible to do builds interactively, to debug build issues or test the automated build scripts. Start the container with `-i -t` flags:

```
docker run --rm -v $PWD:/project -w /project -it espressif/idf
```

Then inside the container, use `idf.py` as usual:

```
idf.py menuconfig
idf.py build
```

---

**备注:** Commands which communicate with the development board, such as `idf.py flash` and `idf.py monitor` will not work in the container unless the serial port is passed through into the container. However currently this is not possible with Docker for Windows (<https://github.com/docker/for-win/issues/1018>) and Docker for Mac (<https://github.com/docker/for-mac/issues/900>).

---

## Building custom images

The Dockerfile in ESP-IDF repository provides several build arguments which can be used to customize the Docker image:

- `IDF_CLONE_URL`: URL of the repository to clone ESP-IDF from. Can be set to a custom URL when working with a fork of ESP-IDF. Default is `https://github.com/espressif/esp-idf.git`.
- `IDF_CLONE_BRANCH_OR_TAG`: Name of a git branch or tag use when cloning ESP-IDF. This value is passed to `git clone` command using the `--branch` argument. Default is `master`.
- `IDF_CHECKOUT_REF`: If this argument is set to a non-empty value, `git checkout $IDF_CHECKOUT_REF` command will be performed after cloning. This argument can be set to the SHA of the specific commit to check out, for example if some specific commit on a release branch is desired.
- `IDF_CLONE_SHALLOW`: If this argument is set to a non-empty value, `--depth=1 --shallow-submodules` arguments will be used when performing `git clone`. This significantly reduces the amount of data downloaded and the size of the resulting Docker image. However, if switching to a different branch in such a “shallow” repository is necessary, an additional `git fetch origin <branch>` command must be executed first.
- `IDF_INSTALL_TARGETS`: Comma-separated list of IDF targets to install toolchains for, or `all` to install toolchains for all targets. Selecting specific targets reduces the amount of data downloaded and the size of the resulting Docker image. Default is `all`.

To use these arguments, pass them via the `--build-arg` command line option. For example, the following command will build a Docker image with a shallow clone of ESP-IDF v4.4.1 and tools for ESP32-C3, only:

```
docker build -t idf-custom:v4.4.1-esp32c3 \
  --build-arg IDF_CLONE_BRANCH_OR_TAG=v4.4.1 \
  --build-arg IDF_CLONE_SHALLOW=1 \
  --build-arg IDF_INSTALL_TARGETS=esp32c3 \
  tools/docker
```

### 4.30.3 IDF Windows Installer

#### Command-line parameters

Windows Installer `esp-idf-tools-setup` provides the following command-line parameters:

- `/CONFIG=[PATH]` - Path to `ini` configuration file to override default configuration of the installer. Default: `config.ini`.
- `/GITCLEAN=[yes|no]` - Perform git clean and remove untracked directories in Offline mode installation. Default: `yes`.
- `/GITRECURSIVE=[yes|no]` - Clone recursively all git repository submodules. Default: `yes`
- `/GITREPO=[URL|PATH]` - URL of repository to clone ESP-IDF. Default: <https://github.com/espressif/esp-idf.git>
- `/GITRESET=[yes|no]` - Enable/Disable git reset of repository during installation. Default: `yes`.
- `/HELP` - Display command line options provided by Inno Setup installer.
- `/IDFDIR=[PATH]` - Path to directory where it will be installed. Default: `{userdesktop}\esp-idf`
- `/IDFVERSION=[v4.3|v4.1|master]` - Use specific IDF version. E.g. `v4.1`, `v4.2`, `master`. Default: empty, pick the first version in the list.
- `/IDFVERSIONSURL=[URL]` - Use URL to download list of IDF versions. Default: [https://dl.espressif.com/dl/esp-idf/idf\\_versions.txt](https://dl.espressif.com/dl/esp-idf/idf_versions.txt)
- `/LOG=[PATH]` - Store installation log file in specific directory. Default: empty.
- `/OFFLINE=[yes|no]` - Execute installation of Python packages by PIP in offline mode. The same result can be achieved by setting the environment variable `PIP_NO_INDEX`. Default: `no`.
- `/USEEMBEDDEDPYTHON=[yes|no]` - Use Embedded Python version for the installation. Set to `no` to allow Python selection screen in the installer. Default: `yes`.
- `/PYTHONNOUSERSITE=[yes|no]` - Set `PYTHONNOUSERSITE` variable before launching any Python command to avoid loading Python packages from `AppDataRoaming`. Default: `yes`.
- `/PYTHONWHEELSURL=[URL]` - Specify URLs to PyPi repositories for resolving binary Python Wheel dependencies. The same result can be achieved by setting the environment variable `PIP_EXTRA_INDEX_URL`. Default: <https://dl.espressif.com/pypi>
- `/SKIPSYSTEMCHECK=[yes|no]` - Skip System Check page. Default: `no`.
- `/VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL` - Perform silent installation.

#### Unattended installation

The unattended installation of IDF can be achieved by following command-line parameters:

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
```

The installer detaches its process from the command-line. Waiting for installation to finish could be achieved by following PowerShell script:

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
$InstallerProcess = Get-Process esp-idf-tools-setup
Wait-Process -Id $InstallerProcess.id
```

### Custom Python and custom location of Python wheels

The IDF installer is using by default embedded Python with reference to Python Wheel mirror.

Following parameters allows to select custom Python and custom location of Python wheels:

```
esp-idf-tools-setup-x.x.exe /USEEMBEDDEDPYTHON=no /PYTHONWHEELSURL=https://pypi.
↳org/simple/
```

#### 4.30.4 IDF Component Manager

The IDF Component manager is a tool that downloads dependencies for any ESP-IDF CMake project. The download happens automatically during a run of CMake. It can source components either from [the component registry](#) or from a git repository.

A list of components can be found on <https://components.espressif.com/>

#### Using with a project

Dependencies for each component in the project are defined in a separate manifest file named `idf_component.yml` placed in the root of the component. The manifest file template can be created for a component by running `idf.py create-manifest --component=my_component`. When a new manifest is added to one of the components in the project it's necessary to reconfigure it manually by running `idf.py reconfigure`. Then build will track changes in `idf_component.yml` manifests and automatically triggers CMake when necessary.

There is an example application: `example:build_system/cmake/component_manager` that uses components installed by the component manager.

It's not necessary to have a manifest for components that don't need any managed dependencies.

When CMake configures the project (e.g. `idf.py reconfigure`) component manager does a few things:

- Processes `idf_component.yml` manifests for every component in the project and recursively solves dependencies
- Creates a `dependencies.lock` file in the root of the project with a full list of dependencies
- Downloads all dependencies to the `managed_components` directory

The lock-file `dependencies.lock` and content of `managed_components` directory is not supposed to be modified by a user. When the component manager runs it always make sure they are up to date. If these files were accidentally modified it's possible to re-run the component manager by triggering CMake with `idf.py reconfigure`

#### Defining dependencies in the manifest

```
dependencies:
  # Required IDF version
  idf: ">=4.1"
  # Defining a dependency from the registry:
  # https://components.espressif.com/component/example/cmp
  example/cmp: ">=1.0.0"

  # # Other ways to define dependencies
  #
  # # For components maintained by Espressif only name can be used.
  # # Same as `espressif/cmp`
  # component: "~1.0.0"
  #
  # # Or in a longer form with extra parameters
  # component2:
```

(下页继续)

```
# version: ">=2.0.0"
#
# # For transient dependencies `public` flag can be set.
# # `public` flag doesn't affect the `main` component.
# # All dependencies of `main` are public by default.
# public: true
#
# # For components hosted on non-default registry:
# service_url: "https://componentregistry.company.com"
#
# # For components in git repository:
# test_component:
#   path: test_component
#   git: ssh://git@gitlab.com/user/components.git
#
# # For test projects during component development
# # components can be used from a local directory
# # with relative or absolute path
# some_local_component:
#   path: ../../projects/component
```

### Disabling the Component Manager

The component manager can be explicitly disabled by setting `IDF_COMPONENT_MANAGER` environment variable to 0.

### 4.30.5 IDF Clang Tidy

The IDF Clang Tidy is a tool that uses [clang-tidy](#) to run static analysis on your current app.

**警告:** This functionality and the toolchain it relies on are still under development. There may be breaking changes before a final release.

### Prerequisites

If you have never run this tool before, take the following steps to get this tool prepared.

1. Run the export scripts (`export.sh / export.bat / ...`) to set up the environment variables.
2. Run `pip install --upgrade pyclang` to install this plugin. The extra commands would be activated in `idf.py` automatically.
3. Run `idf_tools.py install xtensa-clang` to install the clang-tidy required binaries

**备注:** This toolchain is still under development. After the final release, you don't have to install them manually.

4. Get file from the [llvm repository](#) and add the folder of this script to the `$PATH`. Or you could pass an optional argument `--run-clang-tidy-py` later when you call `idf.py clang-check`.

**备注:** This file would be bundled in future toolchain releases. This is a temporary workaround.

5. Run the export scripts (`export.sh / export.bat / ...`) again to refresh the environment variables.

## Extra Commands

**clang-check** Run `idf.py clang-check` to re-generate the compilation database and run `clang-tidy` under your current project folder. The output would be written to `<project_dir>/warnings.txt`.

Run `idf.py clang-check --help` to see the full documentation.

## clang-html-report

1. Run `pip install codereport` to install the additional dependency.
2. Run `idf.py clang-html-report` to generate an HTML report in folder `<project_dir>/html_report` according to the `warnings.txt`. Please open the `<project_dir>/html_report/index.html` in your browser to check the report.

## Bug Report

This tool is hosted in [espressif/clang-tidy-runner](https://github.com/espressif/clang-tidy-runner). If you faced any bugs or have any feature request, please report them via [github issues](https://github.com/espressif/clang-tidy-runner/issues).

## 4.31 ULP 协处理器编程

ULP (Ultra Low Power, 超低功耗) 协处理器是一种简单的有限状态机 (FSM), 可以在主处理器处于深度睡眠模式时, 使用 ADC、温度传感器和外部 I2C 传感器执行测量操作。ULP 协处理器可以访问 RTC\_SLOW\_MEM 内存区域及 RTC\_CNTL、RTC\_IO、SARADC 外设中的寄存器。ULP 协处理器使用 32 位固定宽度的指令, 32 位内存寻址, 配备 4 个 16 位通用寄存器。在 ESP-IDF 项目中, 此协处理器被称作 *ULP FSM*。

### 4.31.1 安装工具链

ULP FSM 协处理器代码由汇编语言编写, 使用 [binutils-esp32ulp 工具链](#) 进行编译。

如果您已经按照[快速入门指南](#)中的介绍安装好了 ESP-IDF 及其 CMake 构建系统, 那么 ULP 工具链已经被默认安装到了您的开发环境中。

### 4.31.2 编写 ULP FSM

使用受支持的指令集即可编写 ULP FSM 协处理器, 此外也可使用主处理器上的 C 语言宏进行编程。以下小节分别介绍了这两种方法:

#### ESP32 ULP coprocessor instruction set

This document provides details about the instructions used by ESP32 ULP FSM coprocessor assembler.

ULP FSM coprocessor has 4 16-bit general purpose registers, labeled R0, R1, R2, R3. It also has an 8-bit counter register (`stage_cnt`) which can be used to implement loops. Stage count register is accessed using special instructions.

ULP coprocessor can access 8k bytes of RTC\_SLOW\_MEM memory region. Memory is addressed in 32-bit word units. It can also access peripheral registers in RTC\_CNTL, RTC\_IO, and SENS peripherals.

All instructions are 32-bit. Jump instructions, ALU instructions, peripheral register and memory access instructions are executed in 1 cycle. Instructions which work with peripherals (TSENS, ADC, I2C) take variable number of cycles, depending on peripheral operation.

The instruction syntax is case insensitive. Upper and lower case letters can be used and intermixed arbitrarily. This is true both for register names and instruction names.

**Note about addressing** ESP32 ULP FSM coprocessor's `JUMP`, `ST`, `LD` family of instructions expect the address argument to be expressed in the following way depending on the type of address argument used:

- When the address argument is presented as a label then the instruction expects the address to be expressed as 32-bit words.

Consider the following example program:

```
entry:
    NOP
    NOP
    NOP
    NOP
loop:
    MOVE R1, loop
    JUMP R1
```

When this program is assembled and linked, address of label `loop` will be equal to 16 (expressed in bytes). However `JUMP` instruction expects the address stored in register `R1` to be expressed in 32-bit words. To account for this common use case, the assembler will convert the address of label `loop` from bytes to words, when generating the `MOVE` instruction. Hence, the code generated code will be equivalent to:

```
0000    NOP
0004    NOP
0008    NOP
000c    NOP
0010    MOVE R1, 4
0014    JUMP R1
```

- The other case is when the argument of `MOVE` instruction is not a label but a constant. In this case assembler will **use the value as is**, without any conversion:

```
.set      val, 0x10
MOVE     R1, val
```

In this case, value loaded into `R1` will be `0x10`.

However, when an immediate value is used as an offset in `LD` and `ST` instructions, the assembler considers the address argument in bytes and converts it to 32-bit words before executing the instruction:

```
ST R1, R2, 4          // offset = 4 bytes; Mem[R2 + 4 / 4] = R1
```

In this case, the value in `R1` is stored at the memory location pointed by `[R2 + offset / 4]`

Consider the following code:

```
.global array
array: .long 0
       .long 0
       .long 0
       .long 0

MOVE R1, array
MOVE R2, 0x1234
ST R2, R1, 0          // write value of R2 into the first array element,
                       // i.e. array[0]

ST R2, R1, 4          // write value of R2 into the second array element
                       // (4 byte offset), i.e. array[1]

ADD R1, R1, 2         // this increments address by 2 words (8 bytes)
ST R2, R1, 0          // write value of R2 into the third array element,
                       // i.e. array[2]
```

**Note about instruction execution time** ULP coprocessor is clocked from `RTC_FAST_CLK`, which is normally derived from the internal 8MHz oscillator. Applications which need to know exact ULP clock frequency can calibrate it against the main `XTAL` clock:

```
#include "soc/rtc.h"

// calibrate 8M/256 clock against XTAL, get 8M/256 clock period
uint32_t rtc_8md256_period = rtc_clk_cal(RTC_CAL_8MD256, 100);
uint32_t rtc_fast_freq_hz = 1000000ULL * (1 << RTC_CLK_CAL_FRACT) * 256 / rtc_
↪8md256_period;
```

ULP coprocessor needs certain number of clock cycles to fetch each instruction, plus certain number of cycles to execute it, depending on the instruction. See description of each instruction below for details on the execution time.

Instruction fetch time is:

- 2 clock cycles —for instructions following ALU and branch instructions.
- 4 clock cycles —in other cases.

Note that when accessing RTC memories and RTC registers, ULP coprocessor has lower priority than the main CPUs. This means that ULP coprocessor execution may be suspended while the main CPUs access same memory region as the ULP.

The detailed description of all instructions is presented below:

### NOP - no operation

**Syntax** NOP

**Operands** None

**Cycles** 2 cycle to execute, 4 cycles to fetch next instruction

**Description** No operation is performed. Only the PC is incremented.

**Example:**

```
1:    NOP
```

### ADD - Add to register

**Syntax** ADD *Rdst*, *Rsrc1*, *Rsrc2*

ADD *Rdst*, *Rsrc1*, *imm*

**Operands**

- *Rdst* - Register R[0..3]
- *Rsrc1* - Register R[0..3]
- *Rsrc2* - Register R[0..3]
- *Imm* - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction adds source register to another source register or to a 16-bit signed value and stores the result in the destination register.

**Examples:**

```
1:    ADD R1, R2, R3           // R1 = R2 + R3
2:    Add R1, R2, 0x1234      // R1 = R2 + 0x1234
3:    .set value1, 0x03       // constant value1=0x03
    Add R1, R2, value1       // R1 = R2 + value1
4:    .global label           // declaration of variable label
    add R1, R2, label        // R1 = R2 + label
    ...
    label: nop               // definition of variable label
```

**SUB - Subtract from register**

**Syntax** **SUB** *Rdst, Rsrc1, Rsrc2*  
**SUB** *Rdst, Rsrc1, imm*

**Operands**

- *Rdst* - Register R[0..3]
- *Rsrc1* - Register R[0..3]
- *Rsrc2* - Register R[0..3]
- *Imm* - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction subtracts the source register from another source register or subtracts a 16-bit signed value from a source register, and stores the result to the destination register.

**Examples:**

```

1:      SUB R1, R2, R3           // R1 = R2 - R3
2:      sub R1, R2, 0x1234      // R1 = R2 - 0x1234
3:      .set value1, 0x03       // constant value1=0x03
      SUB R1, R2, value1        // R1 = R2 - value1
4:      .global label           // declaration of variable label
      SUB R1, R2, label         // R1 = R2 - label
      . . . .
label:  nop                     // definition of variable label

```

**AND - Logical AND of two operands**

**Syntax** **AND** *Rdst, Rsrc1, Rsrc2*  
**AND** *Rdst, Rsrc1, imm*

**Operands**

- *Rdst* - Register R[0..3]
- *Rsrc1* - Register R[0..3]
- *Rsrc2* - Register R[0..3]
- *Imm* - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction does a logical AND of a source register and another source register or a 16-bit signed value and stores the result to the destination register.

**Examples:**

```

1:      AND R1, R2, R3          // R1 = R2 & R3
2:      AND R1, R2, 0x1234     // R1 = R2 & 0x1234
3:      .set value1, 0x03      // constant value1=0x03
      AND R1, R2, value1       // R1 = R2 & value1
4:      .global label          // declaration of variable label
      AND R1, R2, label        // R1 = R2 & label
      . . . .
label:  nop                     // definition of variable label

```

**OR - Logical OR of two operands**

**Syntax** **OR** *Rdst, Rsrc1, Rsrc2*  
**OR** *Rdst, Rsrc1, imm*

**Operands**

- *Rdst* - Register R[0..3]
- *Rsrc1* - Register R[0..3]

- *Rsrc2* - Register R[0..3]
- *Imm* - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction does a logical OR of a source register and another source register or a 16-bit signed value and stores the result to the destination register.

**Examples:**

```

1:      OR R1, R2, R3           // R1 = R2 || R3
2:      OR R1, R2, 0x1234      // R1 = R2 || 0x1234
3:      .set value1, 0x03      // constant value1=0x03
        OR R1, R2, value1      // R1 = R2 || value1
4:      .global label         // declaration of variable label
        OR R1, R2, label       // R1 = R2 || label
        ...
label:  nop                    // definition of variable label

```

### LSH - Logical Shift Left

**Syntax** **LSH** *Rdst, Rsrc1, Rsrc2*

**LSH** *Rdst, Rsrc1, imm*

**Operands**

- *Rdst* - Register R[0..3]
- *Rsrc1* - Register R[0..3]
- *Rsrc2* - Register R[0..3]
- *Imm* - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction does a logical shift to left of the source register by the number of bits from another source register or a 16-bit signed value and stores the result to the destination register.

---

**备注:** Shift operations which are greater than 15 bits will have an undefined result.

---

**Examples:**

```

1:      LSH R1, R2, R3         // R1 = R2 << R3
2:      LSH R1, R2, 0x03      // R1 = R2 << 0x03
3:      .set value1, 0x03     // constant value1=0x03
        LSH R1, R2, value1    // R1 = R2 << value1
4:      .global label         // declaration of variable label
        LSH R1, R2, label     // R1 = R2 << label
        ...
label:  nop                    // definition of variable label

```

### RSH - Logical Shift Right

**Syntax** **RSH** *Rdst, Rsrc1, Rsrc2*

**RSH** *Rdst, Rsrc1, imm*

**Operands** *Rdst* - Register R[0..3] *Rsrc1* - Register R[0..3] *Rsrc2* - Register R[0..3] *Imm* - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction does a logical shift to right of a source register by the number of bits from another source register or a 16-bit signed value and stores the result to the destination register.

---

**备注:** Shift operations which are greater than 15 bits will have an undefined result.

---

**Examples:**

```

1:      RSH R1, R2, R3           // R1 = R2 >> R3
2:      RSH R1, R2, 0x03        // R1 = R2 >> 0x03
3:      .set value1, 0x03       // constant value1=0x03
      RSH R1, R2, value1        // R1 = R2 >> value1
4:      .global label           // declaration of variable label
      RSH R1, R2, label         // R1 = R2 >> label
label:  nop                      // definition of variable label

```

**MOVE –Move to register****Syntax** `MOVE Rdst, Rsrc``MOVE Rdst, imm`**Operands**

- *Rdst* –Register R[0..3]
- *Rsrc* –Register R[0..3]
- *Imm* –16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction**Description** The instruction moves the value from the source register or a 16-bit signed value to the destination register.

---

**备注:** Note that when a label is used as an immediate, the address of the label will be converted from bytes to words. This is because LD, ST, and JUMP instructions expect the address register value to be expressed in words rather than bytes. See the section [Note about addressing](#) for more details.

---

**Examples:**

```

1:      MOVE      R1, R2           // R1 = R2
2:      MOVE      R1, 0x03        // R1 = 0x03
3:      .set      value1, 0x03     // constant value1=0x03
      MOVE      R1, value1        // R1 = value1
4:      .global   label           // declaration of label
      MOVE      R1, label         // R1 = address_of(label) / 4
      ...
label:  nop                      // definition of label

```

**ST –Store data to the memory****Syntax** `ST Rsrc, Rdst, offset`**Operands**

- *Rsrc* –Register R[0..3], holds the 16-bit value to store
- *Rdst* –Register R[0..3], address of the destination, in 32-bit words
- *Offset* –13-bit signed value, offset in bytes

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction**Description** The instruction stores the 16-bit value of *Rsrc* to the lower half-word of memory with address *Rdst*+*offset*. The upper half-word is written with the current program counter (PC) (expressed in words, shifted left by 5 bits) OR'ed with *Rdst* (0..3):

```
Mem[Rdst + offset / 4]{31:0} = {PC[10:0], 3'b0, Rdst, Rsrc[15:0]}
```

The application can use the higher 16 bits to determine which instruction in the ULP program has written any particular word into memory.

**备注:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section [Note about addressing](#) for more details.

#### Examples:

```
1:      ST  R1, R2, 0x12      // MEM[R2 + 0x12 / 4] = R1

2:      .data                // Data section definition
Addr1:  .word    123         // Define label Addr1 16 bit
        .set     offs, 0x00  // Define constant offs
        .text    // Text section definition
        MOVE    R1, 1        // R1 = 1
        MOVE    R2, Addr1    // R2 = Addr1
        ST      R1, R2, offs // MEM[R2 + 0 / 4] = R1
                          // MEM[Addr1 + 0] will be 32'h600001
```

### LD –Load data from the memory

**Syntax** LD *Rdst, Rsrc, offset*

#### Operands

- *Rdst* –Register R[0..3], destination
- *Rsrc* –Register R[0..3], holds address of destination, in 32-bit words
- *Offset* –13-bit signed value, offset in bytes

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction loads the lower 16-bit half-word from memory with address [Rsrc + offset / 4] into the destination register Rdst:

```
Rdst[15:0] = Mem[Rsrc + offset / 4][15:0]
```

**备注:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section [Note about addressing](#) for more details.

#### Examples:

```
1:      LD  R1, R2, 0x12      // R1 = MEM[R2 + 0x12 / 4]

2:      .data                // Data section definition
Addr1:  .word    123         // Define label Addr1 16 bit
        .set     offs, 0x00  // Define constant offs
        .text    // Text section definition
        MOVE    R1, 1        // R1 = 1
        MOVE    R2, Addr1    // R2 = Addr1 / 4 (address of label is
↳converted into words)
        LD      R1, R2, offs // R1 = MEM[R2 + 0]
                          // R1 will be 123
```

### JUMP –Jump to an absolute address

**Syntax** JUMP *Rdst*

**JUMP** *ImmAddr*

**JUMP** *Rdst, Condition*

**JUMP** *ImmAddr, Condition*

**Operands**

- *Rdst* – Register R[0..3] containing address to jump to (expressed in 32-bit words)
- *ImmAddr* – 13 bits address (expressed in bytes), aligned to 4 bytes
- **Condition:**
  - EQ – jump if last ALU operation result was zero
  - OV – jump if last ALU has set overflow flag

**Cycles** 2 cycles to execute, 2 cycles to fetch next instruction

**Description** The instruction makes jump to the specified address. Jump can be either unconditional or based on an ALU flag.

**Examples:**

```

1:      JUMP      R1          // Jump to address in R1 (address in R1 is in
↳32-bit words)

2:      JUMP      0x120, EQ   // Jump to address 0x120 (in bytes) if ALU
↳result is zero

3:      JUMP      label      // Jump to label
      ...
label:  nop                // Definition of label

4:      .global   label      // Declaration of global label

      MOVE      R1, label    // R1 = label (value loaded into R1 is in
      JUMP      R1          // Jump to label
      ...
label:  nop                // Definition of label

```

**JUMPR – Jump to a relative offset (condition based on R0)**

**Syntax** JUMPR *Step, Threshold, Condition*

**Operands**

- *Step* – relative shift from current position, in bytes
- *Threshold* – threshold value for branch condition
- **Condition:**
  - EQ (equal) – jump if value in R0 == threshold
  - LT (less than) – jump if value in R0 < threshold
  - LE (less or equal) – jump if value in R0 <= threshold
  - GT (greater than) – jump if value in R0 > threshold
  - GE (greater or equal) – jump if value in R0 >= threshold

**Cycles** Conditions EQ, GT and LT: 2 cycles to execute, 2 cycles to fetch next instruction Conditions LE and GE are implemented in the assembler using two JUMPR instructions:

```

// JUMPR target, threshold, LE is implemented as:

      JUMPR target, threshold, EQ
      JUMPR target, threshold, LT

// JUMPR target, threshold, GE is implemented as:

      JUMPR target, threshold, EQ
      JUMPR target, threshold, GT

```

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of R0 register value and the threshold value.

**Examples:**

```

1:pos:    JUMPR        16, 20, GE    // Jump to address (position + 16 bytes) if
↳value in R0 >= 20

2:        // Down counting loop using R0 register
          MOVE        R0, 16        // load 16 into R0
label:    SUB         R0, R0, 1      // R0--
          NOP         // do something
          JUMPR       label, 1, GE  // jump to label if R0 >= 1

```

### JUMPS –Jump to a relative address (condition based on stage count)

**Syntax** JUMPS *Step, Threshold, Condition*

#### Operands

- *Step* –relative shift from current position, in bytes
- *Threshold* –threshold value for branch condition
- **Condition:**
  - *EQ* (equal) –jump if value in stage\_cnt == threshold
  - *LT* (less than) –jump if value in stage\_cnt < threshold
  - *LE* (less or equal) - jump if value in stage\_cnt <= threshold
  - *GT* (greater than) –jump if value in stage\_cnt > threshold
  - *GE* (greater or equal) —jump if value in stage\_cnt >= threshold

**Cycles** 2 cycles to execute, 2 cycles to fetch next instruction:

```

// JUMPS target, threshold, EQ is implemented as:

        JUMPS next, threshold, LT
        JUMPS target, threshold, LE
next:

// JUMPS target, threshold, GT is implemented as:

        JUMPS next, threshold, LE
        JUMPS target, threshold, GE
next:

```

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of count register value and threshold value.

#### Examples:

```

1:pos:    JUMPS        16, 20, EQ    // Jump to (position + 16 bytes) if stage_cnt_
↳== 20

2:        // Up counting loop using stage count register
          STAGE_RST    // set stage_cnt to 0
label:    STAGE_INC   1          // stage_cnt++
          NOP         // do something
          JUMPS       label, 16, LT // jump to label if stage_cnt < 16

```

### STAGE\_RST –Reset stage count register

**Syntax** STAGE\_RST

**Operands** No operands

**Description** The instruction sets the stage count register to 0

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

#### Examples:

```
1:      STAGE_RST      // Reset stage count register
```

### STAGE\_INC –Increment stage count register

**Syntax** STAGE\_INC *Value*

**Operands**

- *Value* –8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction increments the stage count register by the given value.

**Examples:**

```
1:      STAGE_INC      10      // stage_cnt += 10
2:      // Up counting loop example:
      STAGE_RST      // set stage_cnt to 0
label:  STAGE_INC      1      // stage_cnt++
      NOP            // do something
      JUMPS          label, 16, LT // jump to label if stage_cnt < 16
```

### STAGE\_DEC –Decrement stage count register

**Syntax** STAGE\_DEC *Value*

**Operands**

- *Value* –8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction decrements the stage count register by the given value.

**Examples:**

```
1:      STAGE_DEC      10      // stage_cnt -= 10;
2:      // Down counting loop example
      STAGE_RST      // set stage_cnt to 0
      STAGE_INC      16      // increment stage_cnt to 16
label:  STAGE_DEC      1      // stage_cnt--;
      NOP            // do something
      JUMPS          label, 0, GT // jump to label if stage_cnt > 0
```

### HALT –End the program

**Syntax** HALT

**Operands** No operands

**Cycles** 2 cycles to execute

**Description** The instruction halts the ULP coprocessor and restarts the ULP wakeup timer, if it is enabled.

**Examples:**

```
1:      HALT          // Halt the coprocessor
```

### WAKE –Wake up the chip

**Syntax** WAKE

**Operands** No operands

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction sends an interrupt from the ULP coprocessor to the RTC controller.

- If the SoC is in deep sleep mode, and ULP wakeup is enabled, this causes the SoC to wake up.

- If the SoC is not in deep sleep mode, and ULP interrupt bit (RTC\_CNTL\_ULP\_CP\_INT\_ENA) is set in RTC\_CNTL\_INT\_ENA\_REG register, RTC interrupt will be triggered.

Note that before using WAKE instruction, ULP program may needs to wait until RTC controller is ready to wake up the main CPU. This is indicated using RTC\_CNTL\_RDY\_FOR\_WAKEUP bit of RTC\_CNTL\_LOW\_POWER\_ST\_REG register. If WAKE instruction is executed while RTC\_CNTL\_RDY\_FOR\_WAKEUP is zero, it has no effect (wake up does not occur).

#### Examples:

```
1: is_rdy_for_wakeup:                // Read RTC_CNTL_RDY_FOR_WAKEUP bit
    READ_RTC_FIELD(RTC_CNTL_LOW_POWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
    AND r0, r0, 1
    JUMP is_rdy_for_wakeup, eq      // Retry until the bit is set
    WAKE                            // Trigger wake up
    REG_WR 0x006, 24, 24, 0        // Stop ULP timer (clear RTC_CNTL_ULP_CP_
↳SLP_TIMER_EN)
    HALT                            // Stop the ULP program
    // After these instructions, SoC will wake up,
    // and ULP will not run again until started by the main program.
```

### SLEEP –set ULP wakeup timer period

**Syntax** SLEEP *sleep\_reg*

#### Operands

- *sleep\_reg* –0..4, selects one of SENS\_ULP\_CP\_SLEEP\_CYCx\_REG registers.

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction selects which of the SENS\_ULP\_CP\_SLEEP\_CYCx\_REG (x = 0..4) register values is to be used by the ULP wakeup timer as wakeup period. By default, the value from SENS\_ULP\_CP\_SLEEP\_CYC0\_REG is used.

#### Examples:

```
1:      SLEEP    1          // Use period set in SENS_ULP_CP_SLEEP_CYC1_REG
2:      .set sleep_reg, 4  // Set constant
        SLEEP  sleep_reg  // Use period set in SENS_ULP_CP_SLEEP_CYC4_REG
```

### WAIT –wait some number of cycles

**Syntax** WAIT *Cycles*

#### Operands

- *Cycles* –number of cycles for wait

**Cycles** 2 + *Cycles* cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction delays for given number of cycles.

#### Examples:

```
1:      WAIT     10         // Do nothing for 10 cycles
2:      .set wait_cnt, 10  // Set a constant
        WAIT  wait_cnt    // wait for 10 cycles
```

### TSENS –do measurement with temperature sensor

**Syntax**

- TSENS *Rdst*, *Wait\_Delay*

#### Operands

- *Rdst* –Destination Register R[0..3], result will be stored to this register
- *Wait\_Delay* –number of cycles used to perform the measurement

**Cycles** 2 + *Wait\_Delay* + 3 \* TSENS\_CLK to execute, 4 cycles to fetch next instruction

**Description** The instruction performs measurement using TSENS and stores the result into a general purpose register.

**Examples:**

```
1:      TSENS      R1, 1000      // Measure temperature sensor for 1000 cycles,
// and store result to R1
```

### ADC –do measurement with ADC

**Syntax**

- **ADC** *Rdst, Sar\_sel, Mux*
- **ADC** *Rdst, Sar\_sel, Mux, 0* —deprecated form

**Operands**

- *Rdst* –Destination Register R[0..3], result will be stored to this register
- *Sar\_sel* –Select ADC: 0 = SARADC1, 1 = SARADC2
- *Mux* - Enable ADC channel. Channel number is [Mux-1]. If the user passes Mux value 1, then ADC channel 0 gets used.

**Cycles**  $23 + \max(1, \text{SAR\_AMP\_WAIT1}) + \max(1, \text{SAR\_AMP\_WAIT2}) + \max(1, \text{SAR\_AMP\_WAIT3}) + \text{SARx\_SAMPLE\_CYCLE} + \text{SARx\_SAMPLE\_BIT}$  cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction makes measurements from ADC.

**Examples:**

```
.. only:: esp32
```

```
1: ADC R1, 0, 1 // Measure value using ADC1 channel 0 and store result into R1
```

### I2C\_RD - read single byte from I2C slave

**Syntax**

- **I2C\_RD** *Sub\_addr, High, Low, Slave\_sel*

**Operands**

- *Sub\_addr* –Address within the I2C slave to read.
- *High, Low* —Define range of bits to read. Bits outside of [High, Low] range are masked.
- *Slave\_sel* - Index of I2C slave address to use.

**Cycles** Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

**Description** I2C\_RD instruction reads one byte from I2C slave with index *Slave\_sel*. Slave address (in 7-bit format) has to be set in advance into *SENS\_I2C\_SLAVE\_ADDRx* register field, where *x* == *Slave\_sel*. 8 bits of read result is stored into *R0* register.

**Examples:**

```
1:      I2C_RD      0x10, 7, 0, 0      // Read byte from sub-address 0x10 of
↪slave with address set in SENS_I2C_SLAVE_ADDR0
```

### I2C\_WR - write single byte to I2C slave

**Syntax**

- **I2C\_WR** *Sub\_addr, Value, High, Low, Slave\_sel*

**Operands**

- *Sub\_addr* –Address within the I2C slave to write.
- *Value* –8-bit value to be written.
- *High, Low* —Define range of bits to write. Bits outside of [High, Low] range are masked.
- *Slave\_sel* - Index of I2C slave address to use.

**Cycles** Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

**Description** I2C\_WR instruction writes one byte to I2C slave with index `Slave_sel`. Slave address (in 7-bit format) has to be set in advance into `SENS_I2C_SLAVE_ADDRx` register field, where `x == Slave_sel`.

**Examples:**

```
1:      I2C_WR      0x20, 0x33, 7, 0, 1      // Write byte 0x33 to sub-address_
↪0x20 of slave with address set in SENS_I2C_SLAVE_ADDR1.
```

### REG\_RD –read from peripheral register

**Syntax** REG\_RD *Addr, High, Low*

**Operands**

- *Addr* –Register address, in 32-bit words
- *High* –Register end bit number
- *Low* –Register start bit number

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction reads up to 16 bits from a peripheral register into a general purpose register: `R0 = REG[Addr][High:Low]`.

This instruction can access registers in `RTC_CNTL`, `RTC_IO`, `SENS`, and `RTC_I2C` peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

```
addr_ulp = (addr_dport - DR_REG_RTCCNTL_BASE) / 4
```

**Examples:**

```
1:      REG_RD      0x120, 7, 4      // load 4 bits: R0 = {12'b0, REG[0x120][7:4]}
```

### REG\_WR –write to peripheral register

**Syntax** REG\_WR *Addr, High, Low, Data*

**Operands**

- *Addr* –Register address, in 32-bit words.
- *High* –Register end bit number
- *Low* –Register start bit number
- *Data* –Value to write, 8 bits

**Cycles** 8 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction writes up to 8 bits from an immediate data value into a peripheral register: `REG[Addr][High:Low] = data`.

This instruction can access registers in `RTC_CNTL`, `RTC_IO`, `SENS`, and `RTC_I2C` peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

```
addr_ulp = (addr_dport - DR_REG_RTCCNTL_BASE) / 4
```

**Examples:**

```
1:      REG_WR      0x120, 7, 0, 0x10      // set 8 bits: REG[0x120][7:0] = 0x10
```

**Convenience macros for peripheral registers access** ULP source files are passed through C preprocessor before the assembler. This allows certain macros to be used to facilitate access to peripheral registers.

Some existing macros are defined in `soc/soc_ulp.h` header file. These macros allow access to the fields of peripheral registers by their names. Peripheral registers names which can be used with these macros are the ones defined in `soc/rtc_cntl_reg.h`, `soc/rtc_io_reg.h`, `soc/sens_reg.h`, and `soc/rtc_i2c_reg.h`.

**READ\_RTC\_REG(*rtc\_reg*, *low\_bit*, *bit\_width*)** Read up to 16 bits from *rtc\_reg*[*low\_bit* + *bit\_width* - 1 : *low\_bit*] into R0. For example:

```
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Read 16 lower bits of RTC_CNTL_TIME0_REG into R0 */
READ_RTC_REG(RTC_CNTL_TIME0_REG, 0, 16)
```

**READ\_RTC\_FIELD(*rtc\_reg*, *field*)** Read from a field in *rtc\_reg* into R0, up to 16 bits. For example:

```
#include "soc/soc_ulp.h"
#include "soc/sens_reg.h"

/* Read 8-bit SENS_TSENS_OUT field of SENS_SAR_SLAVE_ADDR3_REG into R0 */
READ_RTC_FIELD(SENS_SAR_SLAVE_ADDR3_REG, SENS_TSENS_OUT)
```

**WRITE\_RTC\_REG(*rtc\_reg*, *low\_bit*, *bit\_width*, *value*)** Write immediate value into *rtc\_reg*[*low\_bit* + *bit\_width* - 1 : *low\_bit*], *bit\_width* <= 8. For example:

```
#include "soc/soc_ulp.h"
#include "soc/rtc_io_reg.h"

/* Set BIT(2) of RTC_GPIO_OUT_DATA_W1TS field in RTC_GPIO_OUT_W1TS_REG */
WRITE_RTC_REG(RTC_GPIO_OUT_W1TS_REG, RTC_GPIO_OUT_DATA_W1TS_S + 2, 1, 1)
```

**WRITE\_RTC\_FIELD(*rtc\_reg*, *field*, *value*)** Write immediate value into a field in *rtc\_reg*, up to 8 bits. For example:

```
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Set RTC_CNTL_ULP_CP_SLP_TIMER_EN field of RTC_CNTL_STATE0_REG to 0 */
WRITE_RTC_FIELD(RTC_CNTL_STATE0_REG, RTC_CNTL_ULP_CP_SLP_TIMER_EN, 0)
```

### Programming ULP FSM coprocessor using C macros (legacy)

In addition to the existing binutils port for the ESP32 ULP coprocessor, it is possible to generate programs for the ULP FSM coprocessor by embedding assembly-like macros into an ESP32 application. Here is an example how this can be done:

```
const ulp_insn_t program[] = {
    I_MOVI(R3, 16),          // R3 <- 16
    I_LD(R0, R3, 0),        // R0 <- RTC_SLOW_MEM[R3 + 0]
    I_LD(R1, R3, 1),        // R1 <- RTC_SLOW_MEM[R3 + 1]
    I_ADDR(R2, R0, R1),     // R2 <- R0 + R1
    I_ST(R2, R3, 2),        // R2 -> RTC_SLOW_MEM[R2 + 2]
    I_HALT()
};
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);
```

The program array is an array of `ulp_insn_t`, i.e. ULP coprocessor instructions. Each `I_XXX` preprocessor define translates into a single 32-bit instruction. Arguments of these preprocessor defines can be register numbers (R0—R3) and literal constants. See the API reference section at the end of this guide for descriptions of instructions and arguments they take.

**备注:** Because some of the instruction macros expand to inline function calls, defining such array in global scope will cause the compiler to produce an “initializer element is not constant” error. To fix this error, move the definition

of instructions array into local scope.

**备注:** Load, store and move instructions use **addresses expressed in 32-bit words**. Address 0 corresponds to the first word of RTC\_SLOW\_MEM. This is different to how address arguments are handled in assembly code of the same instructions. See the section *Note about addressing* for more details for reference.

To generate branch instructions, special M\_ preprocessor defines are used. M\_LABEL define can be used to define a branch target. Label identifier is a 16-bit integer. M\_Bxxx defines can be used to generate branch instructions with target set to a particular label.

Implementation note: these M\_ preprocessor defines will be translated into two ulp\_insn\_t values: one is a token value which contains label number, and the other is the actual instruction. ulp\_process\_macros\_and\_load function resolves the label number to the address, modifies the branch instruction to use the correct address, and removes the the extra ulp\_insn\_t token which contains the label number.

Here is an example of using labels and branches:

```
const ulp_insn_t program[] = {
    I_MOVI(R0, 34),           // R0 <- 34
    M_LABEL(1),              // label_1
    I_MOVI(R1, 32),           // R1 <- 32
    I_LD(R1, R1, 0),          // R1 <- RTC_SLOW_MEM[R1]
    I_MOVI(R2, 33),           // R2 <- 33
    I_LD(R2, R2, 0),          // R2 <- RTC_SLOW_MEM[R2]
    I_SUBR(R3, R1, R2),       // R3 <- R1 - R2
    I_ST(R3, R0, 0),          // R3 -> RTC_SLOW_MEM[R0 + 0]
    I_ADDI(R0, R0, 1),        // R0++
    M_BL(1, 64),             // if (R0 < 64) goto label_1
    I_HALT(),
};
RTC_SLOW_MEM[32] = 42;
RTC_SLOW_MEM[33] = 18;
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);
```

## API Reference

### Header File

- [components/ulp/include/esp32/ulp.h](#)

### Functions

static inline uint32\_t **SOC\_REG\_TO\_ULP\_PERIPH\_SEL** (uint32\_t reg)

Map SoC peripheral register to periph\_sel field of RD\_REG and WR\_REG instructions.

**参数 reg** – peripheral register in RTC\_CNTL\_, RTC\_IO\_, SENS\_, RTC\_I2C peripherals.

**返回** periph\_sel value for the peripheral to which this register belongs.

### Unions

union **ulp\_insn**

*#include <ulp.h>* Instruction format structure.

All ULP instructions are 32 bit long. This union contains field layouts used by all of the supported instructions. This union also includes a special “macro” instruction layout. This is not a real instruction which can be executed

by the CPU. It acts as a token which is removed from the program by the `ulp_process_macros_and_load` function.

These structures are not intended to be used directly. Preprocessor definitions provided below fill the fields of these structure with the right arguments.

### Public Members

#### `uint32_t cycles`

Number of cycles to sleep

TBD, cycles used for measurement

#### `uint32_t unused`

Unused

#### `uint32_t opcode`

Opcode (OPCODE\_DELAY)

Opcode (OPCODE\_ST)

Opcode (OPCODE\_LD)

Opcode (OPCODE\_HALT)

Opcode (OPCODE\_BRANCH)

Opcode (OPCODE\_ALU)

Opcode (OPCODE\_WR\_REG)

Opcode (OPCODE\_RD\_REG)

Opcode (OPCODE\_ADC)

Opcode (OPCODE\_TSENS)

Opcode (OPCODE\_I2C)

Opcode (OPCODE\_END)

Opcode (OPCODE\_MACRO)

#### struct `ulp_insn::[anonymous] delay`

Format of DELAY instruction

#### `uint32_t dreg`

Register which contains data to store

Register where the data should be loaded to

Register which contains target PC, expressed in words (used if `.reg == 1`)

Destination register

Register where to store ADC result

Register where to store temperature measurement result

Destination register (for `SUB_OPCODE_MACRO_LABELPC`) >

**uint32\_t sreg**

Register which contains address in RTC memory (expressed in words)

Register with operand A

**uint32\_t unused1**

Unused

**uint32\_t offset**

Offset to add to sreg

Absolute value of target PC offset w.r.t. current PC, expressed in words

**uint32\_t unused2**

Unused

**uint32\_t sub\_opcode**

Sub opcode (SUB\_OPCODE\_ST)

Sub opcode (SUB\_OPCODE\_BX)

Sub opcode (SUB\_OPCODE\_B)

Sub opcode (SUB\_OPCODE\_BS)

Sub opcode (SUB\_OPCODE\_ALU\_REG)

Sub opcode (SUB\_OPCODE\_ALU\_CNT)

Sub opcode (SUB\_OPCODE\_ALU\_IMM)

Sub opcode (SUB\_OPCODE\_WAKEUP)

Sub opcode (SUB\_OPCODE\_SLEEP)

SUB\_OPCODE\_MACRO\_LABEL

or

SUB\_OPCODE\_MACRO\_BRANCH

or

SUB\_OPCODE\_MACRO\_LABELPC

**struct *ulp\_insn*::[anonymous] st**

Format of ST instruction

**struct *ulp\_insn*::[anonymous] ld**

Format of LD instruction

**struct *ulp\_insn*::[anonymous] halt**

Format of HALT instruction

**uint32\_t addr**

Target PC, expressed in words (used if .reg == 0)

Address within either RTC\_CNTL, RTC\_IO, or SARADC

**uint32\_t reg**

Target PC in register (1) or immediate (0)

**uint32\_t type**

Jump condition (BX\_JUMP\_TYPE\_XXX)

struct *ulp\_insn*::[anonymous] **bx**

Format of BRANCH instruction (absolute address)

uint32\_t **imm**

Immediate value to compare against

Immediate value of operand

Immediate value of operand B

uint32\_t **cmp**

Comparison to perform: B\_CMP\_L or B\_CMP\_GE

Comparison to perform: JUMPS\_LT, JUMPS\_GE or JUMPS\_LE

uint32\_t **sign**

Sign of target PC offset: 0: positive, 1: negative

struct *ulp\_insn*::[anonymous] **b**

Format of BRANCH instruction (relative address, conditional on R0)

struct *ulp\_insn*::[anonymous] **bs**

Format of BRANCH instruction (relative address, conditional on the stage counter)

uint32\_t **treg**

Register with operand B

uint32\_t **sel**

Operation to perform, one of ALU\_SEL\_XXX

Operation to perform, one of ALU\_SEL\_Sxxx

struct *ulp\_insn*::[anonymous] **alu\_reg**

Format of ALU instruction (both sources are registers)

struct *ulp\_insn*::[anonymous] **alu\_reg\_s**

Format of ALU instruction (stage counter and an immediate)

struct *ulp\_insn*::[anonymous] **alu\_imm**

Format of ALU instruction (one source is an immediate)

uint32\_t **periph\_sel**

Select peripheral: RTC\_CNTL (0), RTC\_IO(1), SARADC(2)

uint32\_t **data**

8 bits of data to write

8 bits of data for write operation

uint32\_t **low**

Low bit

uint32\_t **high**

High bit

struct *ulp\_insn*::[anonymous] **wr\_reg**

Format of WR\_REG instruction

struct *ulp\_insn*::[anonymous] **rd\_reg**

Format of RD\_REG instruction

uint32\_t **mux**

Select SARADC pad (mux + 1)

uint32\_t **sar\_sel**

Select SARADC0 (0) or SARADC1 (1)

struct *ulp\_insn*::[anonymous] **adc**

Format of ADC instruction

uint32\_t **wait\_delay**

Cycles to wait after measurement is done

uint32\_t **reserved**

Reserved, set to 0

struct *ulp\_insn*::[anonymous] **tsens**

Format of TSENS instruction

uint32\_t **i2c\_addr**

I2C slave address

uint32\_t **low\_bits**

low bit of range for write operation (lower bits are masked)

uint32\_t **high\_bits**

high bit of range for write operation (higher bits are masked)

uint32\_t **i2c\_sel**

index of slave address register [7:0]

uint32\_t **rw**

Write (1) or read (0)

struct *ulp\_insn*::[anonymous] **i2c**

Format of I2C instruction

uint32\_t **wakeup**

Set to 1 to wake up chip

struct *ulp\_insn*::[anonymous] **end**

Format of END instruction with wakeup

uint32\_t **cycle\_sel**

Select which one of SARADC\_ULP\_CP\_SLEEP\_CYCx\_REG to get the sleep duration from

struct *ulp\_insn*::[anonymous] **sleep**

Format of END instruction with sleep

uint32\_t **label**

Label number

struct *ulp\_insn*::[anonymous] **macro**

Format of tokens used by MACROs

uint32\_t **instruction**

Encoded instruction for ULP coprocessor

## Macros

**ULP\_FSM\_PREPARE\_SLEEP\_CYCLES**

Cycles spent by FSM preparing ULP for sleep

**ULP\_FSM\_WAKEUP\_SLEEP\_CYCLES**

Cycles spent by FSM waking up ULP from sleep

**R0**

general purpose register 0

**R1**

general purpose register 1

**R2**

general purpose register 2

**R3**

general purpose register 3

**OPCODE\_WR\_REG**

Instruction: write peripheral register (RTC\_CNTL/RTC\_IO/SARADC)

**OPCODE\_RD\_REG**

Instruction: read peripheral register (RTC\_CNTL/RTC\_IO/SARADC)

**RD\_REG\_PERIPH\_RTC\_CNTL**

Identifier of RTC\_CNTL peripheral for RD\_REG and WR\_REG instructions

**RD\_REG\_PERIPH\_RTC\_IO**

Identifier of RTC\_IO peripheral for RD\_REG and WR\_REG instructions

**RD\_REG\_PERIPH\_SENS**

Identifier of SARADC peripheral for RD\_REG and WR\_REG instructions

**RD\_REG\_PERIPH\_RTC\_I2C**

Identifier of RTC\_I2C peripheral for RD\_REG and WR\_REG instructions

**OPCODE\_I2C**

Instruction: read/write I2C

**SUB\_OPCODE\_I2C\_RD**

I2C read

**SUB\_OPCODE\_I2C\_WR**

I2C write

**OPCODE\_DELAY**

Instruction: delay (nop) for a given number of cycles

**OPCODE\_ADC**

Instruction: SAR ADC measurement

**OPCODE\_ST**

Instruction: store indirect to RTC memory

**SUB\_OPCODE\_ST**

Store 32 bits, 16 MSBs contain PC, 16 LSBs contain value from source register

**OPCODE\_ALU**

Arithmetic instructions

**SUB\_OPCODE\_ALU\_REG**

Arithmetic instruction, both source values are in register

**SUB\_OPCODE\_ALU\_IMM**

Arithmetic instruction, one source value is an immediate

**SUB\_OPCODE\_ALU\_CNT**

Arithmetic instruction, stage counter and an immediate

**ALU\_SEL\_ADD**

Addition

**ALU\_SEL\_SUB**

Subtraction

**ALU\_SEL\_AND**

Logical AND

**ALU\_SEL\_OR**

Logical OR

**ALU\_SEL\_MOV**

Copy value (immediate to destination register or source register to destination register)

**ALU\_SEL\_LSH**

Shift left by given number of bits

**ALU\_SEL\_RSH**

Shift right by given number of bits

**ALU\_SEL\_SINC**

Increment the stage counter

**ALU\_SEL\_SDEC**

Decrement the stage counter

**ALU\_SEL\_SRST**

Reset the stage counter

**OPCODE\_BRANCH**

Branch instructions

**SUB\_OPCODE\_BX**

Branch to absolute PC (immediate or in register)

**SUB\_OPCODE\_BR**

Branch to relative PC, conditional on R0

**SUB\_OPCODE\_BS**

Branch to relative PC, conditional on the stage counter

**BX\_JUMP\_TYPE\_DIRECT**

Unconditional jump

**BX\_JUMP\_TYPE\_ZERO**

Branch if last ALU result is zero

**BX\_JUMP\_TYPE\_OVF**

Branch if last ALU operation caused and overflow

**SUB\_OPCODE\_B**

Branch to a relative offset

**B\_CMP\_L**

Branch if R0 is less than an immediate

**B\_CMP\_GE**

Branch if R0 is greater than or equal to an immediate

**JUMPS\_LT**

Branch if the stage counter <

**JUMPS\_GE**

Branch if the stage counter >=

**JUMPS\_LE**

Branch if the stage counter <=

**OPCODE\_END**

Stop executing the program

**SUB\_OPCODE\_END**

Stop executing the program and optionally wake up the chip

**SUB\_OPCODE\_SLEEP**

Stop executing the program and run it again after selected interval

**OPCODE\_TSENS**

Instruction: temperature sensor measurement

**OPCODE\_HALT**

Halt the coprocessor

**OPCODE\_LD**

Indirect load lower 16 bits from RTC memory

**OPCODE\_MACRO**

Not a real opcode. Used to identify labels and branches in the program

**SUB\_OPCODE\_MACRO\_LABEL**

Label macro

**SUB\_OPCODE\_MACRO\_BRANCH**

Branch macro

**SUB\_OPCODE\_MACRO\_LABELPC**

Label pointer macro

**I\_DELAY** (cycles\_)

Delay (nop) for a given number of cycles

**I\_HALT** ()

Halt the coprocessor.

This instruction halts the coprocessor, but keeps ULP timer active. As such, ULP program will be restarted again by timer. To stop the program and prevent the timer from restarting the program, use I\_END(0) instruction.

**I\_WR\_REG** (reg, low\_bit, high\_bit, val)

Write literal value to a peripheral register

reg[high\_bit : low\_bit] = val This instruction can access RTC\_CNTL\_, RTC\_IO\_, SENS\_, and RTC\_I2C peripheral registers.

**I\_RD\_REG** (reg, low\_bit, high\_bit)

Read from peripheral register into R0

R0 = reg[high\_bit : low\_bit] This instruction can access RTC\_CNTL\_, RTC\_IO\_, SENS\_, and RTC\_I2C peripheral registers.

**I\_WR\_REG\_BIT** (reg, shift, val)

Set or clear a bit in the peripheral register.

Sets bit (1 << shift) of register reg to value val. This instruction can access RTC\_CNTL\_, RTC\_IO\_, SENS\_, and RTC\_I2C peripheral registers.

**I\_WAKE** ()

Wake the SoC from deep sleep.

This instruction initiates wake up from deep sleep. Use esp\_deep\_sleep\_enable\_ulp\_wakeup to enable deep sleep wakeup triggered by the ULP before going into deep sleep. Note that ULP program will still keep running until the I\_HALT instruction, and it will still be restarted by timer at regular intervals, even when the SoC is woken up.

To stop the ULP program, use I\_HALT instruction.

To disable the timer which start ULP program, use I\_END() instruction. I\_END instruction clears the RTC\_CNTL\_ULP\_CP\_SLP\_TIMER\_EN\_S bit of RTC\_CNTL\_STATE0\_REG register, which controls the ULP timer.

**I\_END** ()

Stop ULP program timer.

This is a convenience macro which disables the ULP program timer. Once this instruction is used, ULP program will not be restarted anymore until ulp\_run function is called.

ULP program will continue running after this instruction. To stop the currently running program, use I\_HALT().

**I\_SLEEP\_CYCLE\_SEL** (timer\_idx)

Select the time interval used to run ULP program.

This instructions selects which of the SENS\_SLEEP\_CYCLES\_Sx registers' value is used by the ULP program timer. When the ULP program stops at I\_HALT instruction, ULP program timer start counting. When the counter reaches the value of the selected SENS\_SLEEP\_CYCLES\_Sx register, ULP program start running again from the start address (passed to the ulp\_run function). There are 5 SENS\_SLEEP\_CYCLES\_Sx registers, so 0 <= timer\_idx < 5.

By default, SENS\_SLEEP\_CYCLES\_S0 register is used by the ULP program timer.

**I\_TSENS** (reg\_dest, delay)

Perform temperature sensor measurement and store it into reg\_dest.

Delay can be set between 1 and ((1 << 14) - 1). Higher values give higher measurement resolution.

**I\_ADC** (reg\_dest, adc\_idx, pad\_idx)

Perform ADC measurement and store result in reg\_dest.

adc\_idx selects ADC (0 or 1). pad\_idx selects ADC pad (0 - 7).

**I\_ST** (reg\_val, reg\_addr, offset\_)

Store value from register reg\_val into RTC memory.

The value is written to an offset calculated by adding value of reg\_addr register and offset\_ field (this offset is expressed in 32-bit words). 32 bits written to RTC memory are built as follows:

- bits [31:21] hold the PC of current instruction, expressed in 32-bit words
- bits [20:18] = 3' b0
- bits [17:16] reg\_addr (0..3)
- bits [15:0] are assigned the contents of reg\_val

RTC\_SLOW\_MEM[addr + offset\_] = { insn\_PC[10:0], 3' b0, reg\_addr, reg\_val[15:0] }

**I\_LD** (reg\_dest, reg\_addr, offset\_)

Load value from RTC memory into reg\_dest register.

Loads 16 LSBs from RTC memory word given by the sum of value in reg\_addr and value of offset\_.

**I\_BL** (pc\_offset, imm\_value)

Branch relative if R0 less than immediate value.

pc\_offset is expressed in words, and can be from -127 to 127 imm\_value is a 16-bit value to compare R0 against

**I\_BGE** (pc\_offset, imm\_value)

Branch relative if R0 greater or equal than immediate value.

pc\_offset is expressed in words, and can be from -127 to 127 imm\_value is a 16-bit value to compare R0 against

**I\_BXR** (reg\_pc)

Unconditional branch to absolute PC, address in register.

reg\_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I\_BXI** (imm\_pc)

Unconditional branch to absolute PC, immediate address.

Address imm\_pc is expressed in 32-bit words.

**I\_BXZR** (reg\_pc)

Branch to absolute PC if ALU result is zero, address in register.

reg\_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I\_BXZI** (imm\_pc)

Branch to absolute PC if ALU result is zero, immediate address.

Address imm\_pc is expressed in 32-bit words.

**I\_BXFR** (reg\_pc)

Branch to absolute PC if ALU overflow, address in register

reg\_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I\_BXFI** (imm\_pc)

Branch to absolute PC if ALU overflow, immediate address

Address imm\_pc is expressed in 32-bit words.

**I\_ADDR** (reg\_dest, reg\_src1, reg\_src2)

Addition: dest = src1 + src2

**I\_SUBR** (reg\_dest, reg\_src1, reg\_src2)

Subtraction: dest = src1 - src2

**I\_ANDR** (reg\_dest, reg\_src1, reg\_src2)

Logical AND: dest = src1 & src2

**I\_ORR** (reg\_dest, reg\_src1, reg\_src2)

Logical OR: dest = src1 | src2

**I\_MOVR** (reg\_dest, reg\_src)

Copy: dest = src

**I\_LSHR** (reg\_dest, reg\_src, reg\_shift)

Logical shift left: dest = src « shift

**I\_RSHR** (reg\_dest, reg\_src, reg\_shift)

Logical shift right: dest = src » shift

**I\_ADDI** (reg\_dest, reg\_src, imm\_)

Add register and an immediate value: dest = src + imm

**I\_SUBI** (reg\_dest, reg\_src, imm\_)

Subtract register and an immediate value: dest = src - imm

**I\_ANDI** (reg\_dest, reg\_src, imm\_)

Logical AND register and an immediate value: dest = src & imm

**I\_ORI** (reg\_dest, reg\_src, imm\_)

Logical OR register and an immediate value: dest = src | imm

**I\_MOVI** (reg\_dest, imm\_)

Copy an immediate value into register: dest = imm

**I\_LSHI** (reg\_dest, reg\_src, imm\_)

Logical shift left register value by an immediate: dest = src « imm

**I\_RSHI** (reg\_dest, reg\_src, imm\_)

Logical shift right register value by an immediate: dest = val » imm

**M\_LABEL** (label\_num)

Define a label with number label\_num.

This is a macro which doesn't generate a real instruction. The token generated by this macro is removed by ulp\_process\_macros\_and\_load function. Label defined using this macro can be used in branch macros defined below.

**M\_BRANCH** (label\_num)

Token macro used by M\_B and M\_BX macros. Not to be used directly.

**M\_LABELPC** (label\_num)

Token macro used by M\_MOVL macro. Not to be used directly.

**M\_MOVL** (reg\_dest, label\_num)

Macro: Move the program counter at the given label into the register. This address can then be used with I\_BXR, I\_BXZR, I\_BXFR, etc.

This macro generates two ulp\_insn\_t values separated by a comma, and should be used when defining contents of ulp\_insn\_t arrays. First value is not a real instruction; it is a token which is removed by ulp\_process\_macros\_and\_load function.

**M\_BL** (label\_num, imm\_value)

Macro: branch to label label\_num if R0 is less than immediate value.

This macro generates two ulp\_insn\_t values separated by a comma, and should be used when defining contents of ulp\_insn\_t arrays. First value is not a real instruction; it is a token which is removed by ulp\_process\_macros\_and\_load function.

**M\_BGE** (label\_num, imm\_value)

Macro: branch to label label\_num if R0 is greater or equal than immediate value

This macro generates two ulp\_insn\_t values separated by a comma, and should be used when defining contents of ulp\_insn\_t arrays. First value is not a real instruction; it is a token which is removed by ulp\_process\_macros\_and\_load function.

**M\_BX** (label\_num)

Macro: unconditional branch to label

This macro generates two `ulp_insn_t` values separated by a comma, and should be used when defining contents of `ulp_insn_t` arrays. First value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**M\_BXZ** (label\_num)

Macro: branch to label if ALU result is zero

This macro generates two `ulp_insn_t` values separated by a comma, and should be used when defining contents of `ulp_insn_t` arrays. First value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**M\_BXF** (label\_num)

Macro: branch to label if ALU overflow

This macro generates two `ulp_insn_t` values separated by a comma, and should be used when defining contents of `ulp_insn_t` arrays. First value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**I\_STAGE\_INC** (imm\_)

Increment the stage counter by immediate value

**I\_STAGE\_DEC** (imm\_)

Decrement the stage counter by immediate value

**I\_STAGE\_RST** ()

Reset the stage counter

**M\_BSLT** (label\_num, imm\_value)

Macro: branch to label if the stage counter is less than immediate value

This macro generates two `ulp_insn_t` values separated by a comma, and should be used when defining contents of `ulp_insn_t` arrays. First value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**M\_BSGE** (label\_num, imm\_value)

Macro: branch to label if the stage counter is greater than or equal to immediate value

This macro generates two `ulp_insn_t` values separated by a comma, and should be used when defining contents of `ulp_insn_t` arrays. First value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**M\_BSLE** (label\_num, imm\_value)

Macro: branch to label if the stage counter is less than or equal to immediate value

This macro generates two `ulp_insn_t` values separated by a comma, and should be used when defining contents of `ulp_insn_t` arrays. First value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**M\_BSEQ** (label\_num, imm\_value)

Macro: branch to label if the stage counter is equal to immediate value. Implemented using two JUMPS instructions: JUMPS next, imm\_value, LT JUMPS label\_num, imm\_value, LE

This macro generates three `ulp_insn_t` values separated by commas, and should be used when defining contents of `ulp_insn_t` arrays. Second value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**M\_BSGT** (label\_num, imm\_value)

Macro: branch to label if the stage counter is greater than immediate value. Implemented using two instructions: JUMPS next, imm\_value, LE JUMPS label\_num, imm\_value, GE

This macro generates three `ulp_insn_t` values separated by commas, and should be used when defining contents of `ulp_insn_t` arrays. Second value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

#### **I\_JUMPS** (`pc_offset`, `imm_value`, `comp_type`)

Branch relative if (stage counter [`comp_type`] [`imm_value`]) evaluates to true.

`pc_offset` is expressed in words, and can be from -127 to 127 `imm_value` is an 8-bit value to compare the stage counter against `comp_type` is the type of comparison to perform: `JUMPS_LT` (<), `JUMPS_GE` (>=) or `JUMPS_LE` (<=)

#### **I\_I2C\_RW** (`sub_addr`, `val`, `low_bit`, `high_bit`, `slave_sel`, `rw_bit`)

Perform an I2C transaction with a slave device. `I_I2C_READ` and `I_I2C_WRITE` are provided for convenience, instead of using this directly.

Slave address (in 7-bit format) has to be set in advance into `SENS_I2C_SLAVE_ADDRx` register field, where `x == slave_sel`. For read operations, 8 bits of read result is stored into R0 register. For write operations, val will be written to `sub_addr` at [`high_bit`:`low_bit`]. Bits outside of this range are masked.

#### **I\_I2C\_READ** (`slave_sel`, `sub_addr`)

Read a byte from the sub address of an I2C slave, and store the result in R0.

Slave address (in 7-bit format) has to be set in advance into `SENS_I2C_SLAVE_ADDRx` register field, where `x == slave_sel`.

#### **I\_I2C\_WRITE** (`slave_sel`, `sub_addr`, `val`)

Write a byte to the sub address of an I2C slave.

Slave address (in 7-bit format) has to be set in advance into `SENS_I2C_SLAVE_ADDRx` register field, where `x == slave_sel`.

#### **RTC\_SLOW\_MEM**

RTC slow memory, 8k size

如果你的 ESP-IDF 仍在使用传统的基于 GNU Make 的构建系统, 请参考 [ULP 协处理器 \(传统的 GNU Make\)](#) 一文中的说明, 完成工具链的安装。

### 4.31.3 编译 ULP 代码

若需要将 ULP FSM 代码编译为某组件的一部分, 则必须执行以下步骤:

1. 用汇编语言编写的 ULP FSM 代码必须导入到一个或多个 `.S` 扩展文件中, 且这些文件必须放在组件目录中一个独立的目录中, 例如 `ulp/`。
2. 注册后从组件 `CMakeLists.txt` 中调用 `ulp_embed_binary` 示例如下:

```
...
idf_component_register()

set(ulp_app_name ulp_${COMPONENT_NAME})
set(ulp_s_sources ulp/ulp_assembly_source_file.S)
set(ulp_exp_dep_srcs "ulp_c_source_file.c")

ulp_embed_binary(${ulp_app_name} "${ulp_s_sources}" "${ulp_exp_dep_srcs}")
```

`ulp_embed_binary` 的第一个参数为 ULP 二进制文件命名。指定的此名称也用于生成的其他文件, 如: ELF 文件、`.map` 文件、头文件和链接器导出文件。第二个参数指定 ULP FSM 程序集源文件。最后, 第三个参数指定组件源文件列表, 其中包括被生成的头文件。此列表用以建立正确的依赖项, 并确保在编译这些文件之前先创建生成的头文件。有关 ULP FSM 应用程序生成的头文件等相关概念, 请参考下文。

3. 使用常规方法 (例如 `idf.py app`) 编译应用程序。  
在内部, 构建系统将按照以下步骤编译 ULP FSM 程序:

1. 通过 C 预处理器运行每个程序集文件 (foo.S)。此步骤在组件编译目录中生成预处理的程序集文件 (foo.ulp.S)，同时生成依赖文件 (foo.ulp.d)。
2. 通过汇编器运行预处理过的汇编源码。此步骤会生成目标文件 (foo.ulp.o) 和清单 (foo.ulp.lst)。清单文件仅用于调试，不用于编译进程的后续步骤。
3. 通过 C 预处理器运行链接器脚本模板。模板位于 components/ulp/ld 目录中。
4. 将目标文件链接到 ELF 输出文件 (ulp\_app\_name.elf)。此步骤生成的.map 文件 (ulp\_app\_name.map) 默认用于调试。
5. 将 ELF 文件中的内容转储为二进制文件 (ulp\_app\_name.bin)，以便嵌入到应用程序中。
6. 使用 esp32ulp-elf-nm 在 ELF 文件中生成全局符号列表 (ulp\_app\_name.sym)。
7. 创建 LD 导出脚本和头文件 (ulp\_app\_name.ld 和 ulp\_app\_name.h)，包含来自 ulp\_app\_name.sym 的符号。此步骤可借助 esp32ulp\_mapgen.py 工具来完成。
8. 将生成的二进制文件添加到要嵌入应用程序的二进制文件列表中。

#### 4.31.4 访问 ULP FSM 程序变量

在 ULP FSM 程序中定义的全局符号也可以在主程序中使用。

例如，ULP FSM 程序可以定义 measurement\_count 变量，此变量可以定义程序从深度睡眠中唤醒芯片之前需要进行的 ADC 测量的次数：

```

.global measurement_count
measurement_count:
    .long 0

    // later, use measurement_count
    move r3, measurement_count
    ld r3, r3, 0

```

主程序需要在启动 ULP 程序之前初始化 measurement\_count 变量，构建系统通过生成定义 ULP 编程中全局符号的 \${ULP\_APP\_NAME}.h 和 \${ULP\_APP\_NAME}.ld 文件实现上述操作。这些文件包含了在 ULP 程序中定义的所有全局符号，文件以 ulp\_ 开头。

头文件包含对此类符号的声明：

```
extern uint32_t ulp_measurement_count;
```

注意，所有符号（包括变量、数组、函数）均被声明为 uint32\_t。对于函数和数组，先获取符号地址，然后转换为适当的类型。

生成的链接器脚本文件定义了 RTC\_SLOW\_MEM 中的符号位置：

```
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

如果要从主程序访问 ULP 程序变量，应先使用 include 语句包含生成的头文件，这样，就可以像访问常规变量一样访问 ulp 程序变量。操作如下：

```

#include "ulp_app_name.h"

// later
void init_ulp_vars() {
    ulp_measurement_count = 64;
}

```

注意，ULP FSM 程序在 RTC 内存中只能使用 32 位字的低 16 位，因为寄存器是 16 位的，并且不具备从字的高位加载的指令。同样，ULP 储存指令将寄存器值写入 32 位字的低 16 位中。高 16 位写入的值取决于储存指令的地址，因此在读取 ULP 协处理器写的变量时，主应用程序需要屏蔽高 16 位，例如：

```
printf("Last measurement value: %d\n", ulp_last_measurement & UINT16_MAX);
```

### 4.31.5 启动 ULP FSM 程序

要运行 ULP FSM 程序，主应用程序需要调用 `ulp_load_binary()` 函数将 ULP 程序加载到 RTC 内存中，然后调用 `ulp_run()` 函数，启动 ULP 程序。

注意，在 `menuconfig` 中必须启用 Enable Ultra Low Power (ULP) Coprocessor 选项，以便正常运行 ULP，并且必须设置 ULP Co-processor type 选项，以便选择要使用的 ULP 类型。RTC slow memory reserved for coprocessor 选项设置的值必须足够储存 ULP 代码和数据。如果应用程序组件包含多个 ULP 程序，则 RTC 内存必须足以容纳最大的程序。

每个 ULP 程序均以二进制 BLOB 的形式嵌入到 ESP-IDF 应用程序中。应用程序可以引用此 BLOB，并以下面的方式加载此 BLOB（假设 `ULP_APP_NAME` 已被定义为 `ulp_app_name`）：

```
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[]  asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK( ulp_load_binary(
        0 // load address, set to 0 when using default linker scripts
        bin_start,
        (bin_end - bin_start) / sizeof(uint32_t) ));
}
```

一旦上述程序加载到 RTC 内存后，应用程序即可启动此程序，并将入口点的地址传递给 `ulp_run` 函数：

```
ESP_ERROR_CHECK( ulp_run(&ulp_entry - RTC_SLOW_MEM) );
```

上述生成的头文件 `_${ULP_APP_NAME}.h` 声明了入口点符号。在 ULP 应用程序的汇编源代码中，此符号必须标记为 `.global`：

```
.global entry
entry:
    // code starts here
```

### 4.31.6 ESP32 ULP 程序流

ESP32 ULP 协处理器由定时器启动，而调用 `ulp_run()` 则可启动此定时器。定时器为 `RTC_SLOW_CLK` 的 Tick 事件计数（默认情况下，Tick 由内部 150 KHz RC 振荡器生成）。使用 `SENS_ULP_CP_SLEEP_CYCx_REG` 寄存器 ( $x = 0..4$ ) 设置 Tick 数值。第一次启动 ULP 时，使用 `SENS_ULP_CP_SLEEP_CYC0_REG` 设置定时器 Tick 数值，之后，ULP 程序可以使用 `sleep` 指令来选择另一个 `SENS_ULP_CP_SLEEP_CYCx_REG` 寄存器。

此应用程序可以调用 `ulp_set_wakeup_period` 函数来设置 ULP 定时器周期值 (`SENS_ULP_CP_SLEEP_CYCx_REG`,  $x = 0..4$ )。

一旦定时器计数到 `SENS_ULP_CP_SLEEP_CYCx_REG` 寄存器设定的 Tick 数值，ULP 协处理器就会启动，并调用 `ulp_run()` 的入口点开始运行程序。

程序保持运行，直到遇到 `halt` 指令或非法指令。一旦程序停止，ULP 协处理器电源关闭，定时器再次启动。

如果想禁用定时器（有效防止 ULP 程序再次运行），可在 ULP 代码或主程序中清除 `RTC_CNTL_STATE0_REG` 寄存器中的 `RTC_CNTL_ULP_CP_SLP_TIMER_EN` 位。

### 4.31.7 应用示例

- 主处理器处于 Deep-sleep 状态时，ULP FSM 协处理器对 IO 脉冲进行计数：[system/ulp\\_fsm/ulp](#)。
- 主处理器处于 Deep-sleep 状态时，ULP FSM 协处理器轮询 ADC：[system/ulp\\_fsm/ulp\\_adc](#)。

### 4.31.8 API 参考

#### Header File

- [components/ulp/include/ulp\\_common.h](#)

#### Functions

*esp\_err\_t* **ulp\_process\_macros\_and\_load** (uint32\_t load\_addr, const *ulp\_insn\_t* \*program, size\_t \*psize)

Resolve all macro references in a program and load it into RTC memory.

##### 参数

- **load\_addr** –address where the program should be loaded, expressed in 32-bit words
- **program** –ulp\_insn\_t array with the program
- **psize** –size of the program, expressed in 32-bit words

##### 返回

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if auxiliary temporary structure can not be allocated
- one of ESP\_ERR\_ULP\_XXX if program is not valid or can not be loaded

*esp\_err\_t* **ulp\_load\_binary** (uint32\_t load\_addr, const uint8\_t \*program\_binary, size\_t program\_size)

Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):

- MAGIC, (value 0x00706c75, 4 bytes)
- TEXT\_OFFSET, offset of .text section from binary start (2 bytes)
- TEXT\_SIZE, size of .text section (2 bytes)
- DATA\_SIZE, size of .data section (2 bytes)
- BSS\_SIZE, size of .bss section (2 bytes)
- (TEXT\_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
- .text section
- .data section

Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with load\_addr == 0.

##### 参数

- **load\_addr** –address where the program should be loaded, expressed in 32-bit words
- **program\_binary** –pointer to program binary
- **program\_size** –size of the program binary

##### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if load\_addr is out of range
- ESP\_ERR\_INVALID\_SIZE if program\_size doesn't match (TEXT\_OFFSET + TEXT\_SIZE + DATA\_SIZE)
- ESP\_ERR\_NOT\_SUPPORTED if the magic number is incorrect

*esp\_err\_t* **ulp\_run** (uint32\_t entry\_point)

Run the program loaded into RTC memory.

**参数** **entry\_point** –entry point, expressed in 32-bit words

**返回** ESP\_OK on success

*esp\_err\_t* **ulp\_set\_wakeup\_period** (size\_t period\_index, uint32\_t period\_us)

Set one of ULP wakeup period values.

ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into SENS\_ULP\_CP\_SLEEP\_CYCx\_REG registers, x = 0..4 for ESP32, and one period value which can be programmed into RTC\_CNTL\_ULP\_CP\_TIMER\_1\_REG

register for ESP32-S2. By default, for ESP32, wakeup timer will use the period set into SENS\_ULP\_CP\_SLEEP\_CYC0\_REG, i.e. period number 0. ULP program code can use SLEEP instruction to select which of the SENS\_ULP\_CP\_SLEEP\_CYCx\_REG should be used for subsequent wakeups.

However, please note that SLEEP instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

For ESP32-s2 the SLEEP instruction not exist. Instead a WAKE instruction will be used.

---

**备注:** The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

---

#### 参数

- **period\_index** –wakeup period setting number (0 - 4)
- **period\_us** –wakeup period, us

#### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if period\_index is out of range

void **ulp\_timer\_stop** (void)

Stop the ULP timer.

---

**备注:** This will stop the ULP from waking up if halted, but will not abort any program currently executing on the ULP.

---

void **ulp\_timer\_resume** (void)

Resume the ULP timer.

---

**备注:** This will resume an already configured timer, but does no other configuration

---

## Macros

### ESP\_ERR\_ULP\_BASE

Offset for ULP-related error codes

### ESP\_ERR\_ULP\_SIZE\_TOO\_BIG

Program doesn't fit into RTC memory reserved for the ULP

### ESP\_ERR\_ULP\_INVALID\_LOAD\_ADDR

Load address is outside of RTC memory reserved for the ULP

### ESP\_ERR\_ULP\_DUPLICATE\_LABEL

More than one label with the same number was defined

### ESP\_ERR\_ULP\_UNDEFINED\_LABEL

Branch instructions references an undefined label

**ESP\_ERR\_ULP\_BRANCH\_OUT\_OF\_RANGE**

Branch target is out of range of B instruction (try replacing with BX)

**Type Definitions**

```
typedef union ulp_insn ulp_insn_t
```

**4.32 ULP 协处理器 (传统的 GNU Make)**

**备注：**ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

ULP (Ultra Low Power 超低功耗) 协处理器是一种简单的有限状态机 (FSM)，可以在主处理器处于深度睡眠模式时，使用 ADC、温度传感器和外部 I2C 传感器执行测量操作。ULP 协处理器可以访问 RTC\_SLOW\_MEM 内存区域及 RTC\_CNTL、RTC\_IO、SARADC 等外设寄存器。ULP 协处理器使用 32 位固定宽度的指令，32 位内存寻址，配备 4 个 16 位通用寄存器。

**4.32.1 安装工具链**

ULP 协处理器代码是用汇编语言编写的，并使用 *binutils-esp32ulp toolchain* 进行编译。

1. 从 <https://github.com/espressif/binutils-esp32ulp/releases> 网站下载预编译的最新版本工具链二进制文件。
2. 将工具链提取至目录中，向工具链的 bin/ 目录中添加路径至 PATH 环境变量中。

**4.32.2 编译 ULP 代码**

若需要将 ULP 代码编译为某组件的一部分，则必须执行以下步骤：

1. 用汇编语言编写的 ULP 代码必须导入到一个或多个 .S 扩展文件中，且这些文件必须放在组件目录中一个独立的目录中，例如 *ulp/*。
2. 修改组件 makefile，添加下列参数：

```
ULP_APP_NAME ?= ulp_$(COMPONENT_NAME)
ULP_S_SOURCES = $(COMPONENT_PATH)/ulp/ulp_source_file.S
ULP_EXP_DEP_OBJECTS := main.o
include $(IDF_PATH)/components/ulp/component_ulp_common.mk
```

代码解释如下：

**ULP\_APP\_NAME** 为生成的 ULP 应用程序命名，不带扩展名。此名称用于 ULP 应用程序的构建输出：ELF 文件、map 文件、二进制文件、生成的头文件和链接器导出文件。

**ULP\_S\_SOURCES** 设置要传递给 ULP 汇编器的程序集文件列表。列表中的路径须是绝对路径，即以 \$(COMPONENT\_PATH) 开头的路径。如果列表中需列出多个文件，可使用函数 \$(addprefix)。因为路径与组件构建目录相关，因而不需前置。

**ULP\_EXP\_DEP\_OBJECTS** 设置组件中目标文件名称的列表，其中包含生成的头文件。此列表用以建立正确的依赖项，并确保在此类文件被编译前生成头文件。ULP 应用程序头文件的定义请见下文。

**include \$(IDF\_PATH)/components/ulp/component\_ulp\_common.mk** 包含常见的 ULP 编译步骤。为 ULP 目标文件、ELF 文件、二进制文件等定义编译目标。

3. 使用常规方法（例如 `idf.py build` 或 `idf.py app`）编译应用程序

在编译过程中，构建系统将按照以下步骤编译 ULP 程序：

1. **通过 C 预处理器运行每个程序集文件 (foo.S)**。此步骤在组件编译目录中生成预处理的程序集文件 (foo.ulp.pS)，同时生成依赖文件 (foo.ulp.d)。
2. **通过汇编器运行预处理过的汇编源码**。此步骤会生成目标文件 (foo.ulp.o) 和清单文件 (foo.ulp.lst)。生成的清单文件用于调试，不用于构建过程的后续步骤。
3. **通过 C 预处理器运行链接器脚本模板**。模版位于 components/ulp/ld 目录中。
4. **将目标文件链接到 ELF 输出文件 (ulp\_app\_name.elf)**。此步骤生成的.map 文件 (ulp\_app\_name.map) 可能会用于调试。
5. **将 ELF 文件中的内容转储为二进制文件 (ulp\_app\_name.bin)**，以便嵌入到应用程序中。
6. **使用 esp32ulp-elf-nm 在 ELF 文件中生成全局符号列表 (ulp\_app\_name.sym)**。
7. **创建 LD 导出脚本和头文件 (ulp\_app\_name.ld 和 ulp\_app\_name.h)**，包含来自 ulp\_app\_name.sym 的符号。此步骤通过 esp32ulp\_mapgen.py 工具来完成。
8. **将生成的二进制文件添加到要嵌入应用程序的二进制文件列表中**。

### 4.32.3 访问 ULP 程序变量

在 ULP 程序中定义的全局符号也可以在主程序中使用。

例如，ULP 程序可以定义 measurement\_count 变量，此变量规定了芯片从深度睡眠模式唤醒之前，程序需要进行 ADC 测量的次数：

```

.global measurement_count
measurement_count:
    .long 0

    /* later, use measurement_count */
    move r3, measurement_count
    ld r3, r3, 0

```

主程序需要在启动 ULP 程序之前初始化 measurement\_count 变量，构建系统通过生成定义 ULP 程序中全局符号的 \$(ULP\_APP\_NAME).h 和 \$(ULP\_APP\_NAME).ld 文件，可以实现上述操作；这些文件包含了 ULP 程序中所有全局符号，文件名以 ulp\_ 开头。

头文件包含对此类符号的声明：

```
extern uint32_t ulp_measurement_count;
```

注意，所有符号（包括变量、数组、函数）均被声明为 uint32\_t。对于函数和数组，先获取符号地址，然后转换为适当的类型。

生成的链接器脚本文件定义了符号在 RTC\_SLOW\_MEM 中的位置：

```
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

如果要从主程序访问 ULP 程序变量，应先使用 include 语句包含生成的头文件，这样，就可以像访问常规变量一样访问 ulp 程序变量。操作如下：

```

#include "ulp_app_name.h"

// later
void init_ulp_vars() {
    ulp_measurement_count = 64;
}

```

注意，ULP 程序只能使用 RTC 内存中 32 位字的低 16 位，因为寄存器是 16 位的，并且不存在从字的高位加载的指令。

同样，ULP 储存指令将寄存器值写入 32 位字的低 16 位中。写入高 16 位的值取决于存储指令的地址，因此在读取 ULP 写的变量时，主应用程序需要屏蔽高 16 位，例如：

```
printf("Last measurement value: %d\n", ulp_last_measurement & UINT16_MAX);
```

### 4.32.4 启动 ULP 程序

要运行 ULP 程序，主应用程序需要调用 `ulp_load_binary` 函数将 ULP 程序加载到 RTC 内存中，然后调用 `ulp_run` 函数，启动 ULP 程序。

注意，在 `menuconfig` 中必须启用“Enable Ultra Low Power (ULP) Coprocessor”选项，以便为 ULP 预留内存。”RTC slow memory reserved for coprocessor”选项设置的值必须足够储存 ULP 代码和数据。如果应用程序组件包含多个 ULP 程序，则 RTC 内存必须足以容纳最大的程序。

每个 ULP 程序均以二进制 BLOB 的形式嵌入到 ESP-IDF 应用程序中。应用程序可以引用此 BLOB，并以下面的方式加载此 BLOB（假设 `ULP_APP_NAME` 已被定义为 `ulp_app_name`）：

```
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[] asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK(ulp_load_binary(
        0 /* load address, set to 0 when using default linker scripts */,
        bin_start,
        (bin_end - bin_start) / sizeof(uint32_t) );
}
```

**`esp_err_t ulp_load_binary`** (`uint32_t load_addr`, `const uint8_t *program_binary`, `size_t program_size`)

Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):

- a. MAGIC, (value 0x00706c75, 4 bytes)
- b. TEXT\_OFFSET, offset of .text section from binary start (2 bytes)
- c. TEXT\_SIZE, size of .text section (2 bytes)
- d. DATA\_SIZE, size of .data section (2 bytes)
- e. BSS\_SIZE, size of .bss section (2 bytes)
- f. (TEXT\_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
- g. .text section
- h. .data section

Linker script in `components/ulp/ld/esp32.ulp.ld` produces ELF files which correspond to this format. This linker script produces binaries with `load_addr == 0`.

#### 参数

- **`load_addr`** –address where the program should be loaded, expressed in 32-bit words
- **`program_binary`** –pointer to program binary
- **`program_size`** –size of the program binary

#### 返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `load_addr` is out of range
- `ESP_ERR_INVALID_SIZE` if `program_size` doesn't match (`TEXT_OFFSET + TEXT_SIZE + DATA_SIZE`)
- `ESP_ERR_NOT_SUPPORTED` if the magic number is incorrect

一旦上述程序加载到 RTC 内存后，应用程序即可启动此程序，并将入口点的地址传递给 `ulp_run` 函数：

```
ESP_ERROR_CHECK(ulp_run(&ulp_entry - RTC_SLOW_MEM) );
```

**`esp_err_t ulp_run`** (`uint32_t entry_point`)

Run the program loaded into RTC memory.

**参数** **`entry_point`** –entry point, expressed in 32-bit words

**返回** `ESP_OK` on success

上述生成的头文件 `$(ULP_APP_NAME).h` 声明了入口点符号。在 ULP 应用程序的汇编源代码中，此符号必须标记为 `.global`：

```

.global entry
entry:
    /* code starts here */

```

### 4.32.5 ULP 程序流

ULP 协处理器由定时器启动，而调用 `ulp_run` 则可启动此定时器。定时器为 `RTC_SLOW_CLK` 的 Tick 事件计数（默认情况下，Tick 由内部 150 kHz 晶振器生成）。使用 `SENS_ULP_CP_SLEEP_CYCx_REG` 寄存器 ( $x = 0..4$ ) 设置 Tick 数值。第一次启动 ULP 时，使用 `SENS_ULP_CP_SLEEP_CYC0_REG` 设置定时器 Tick 数值，之后，ULP 程序可以使用 `sleep` 指令来另外选择 `SENS_ULP_CP_SLEEP_CYCx_REG` 寄存器。

此应用程序可以调用 `ulp_set_wakeup_period` 函数来设置 ULP 定时器周期值 (`SENS_ULP_CP_SLEEP_CYCx_REG`,  $x = 0..4$ )。

*esp\_err\_t* **ulp\_set\_wakeup\_period** (*size\_t* period\_index, *uint32\_t* period\_us)

Set one of ULP wakeup period values.

ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into `SENS_ULP_CP_SLEEP_CYCx_REG` registers,  $x = 0..4$  for ESP32, and one period value which can be programmed into `RTC_CNTL_ULP_CP_TIMER_1_REG` register for ESP32-S2. By default, for ESP32, wakeup timer will use the period set into `SENS_ULP_CP_SLEEP_CYC0_REG`, i.e. period number 0. ULP program code can use `SLEEP` instruction to select which of the `SENS_ULP_CP_SLEEP_CYCx_REG` should be used for subsequent wakeups.

However, please note that `SLEEP` instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

For ESP32-s2 the `SLEEP` instruction not exist. Instead a `WAKE` instruction will be used.

---

**备注:** The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

---

#### 参数

- **period\_index** –wakeup period setting number (0 - 4)
- **period\_us** –wakeup period, us

#### 返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if period\_index is out of range

一旦定时器数值达到在所选的 `SENS_ULP_CP_SLEEP_CYCx_REG` 寄存器中设置的数值，ULP 协处理器就会启动，并调用 `ulp_run` 的入口点，开始运行程序。

程序保持运行，直到遇到 `halt` 指令或非法指令才停止。一旦程序停止，ULP 协处理器电源关闭，定时器再次启动。

如果想禁用定时器（禁用定时器可有效防止 ULP 程序再次运行），请清除 `RTC_CNTL_STATE0_REG` 寄存器中的 `RTC_CNTL_ULP_CP_SLP_TIMER_EN` 位，可在 ULP 代码或主程序中进行以上操作。

## 4.33 ESP32 中的单元测试

ESP-IDF 提供以下方法测试软件。

- 一种是在目标芯片上运行并基于 Unity 测试框架的应用程序。这些单元测试用例都保存在 ESP-IDF 仓库中，分别存放在每个组件的 test 子目录中。本文主要介绍这种单元测试方法。
- 另一种是基于 Linux 主机的单元测试，其中所有硬件行为都通过 Mock 组件进行模拟。此测试方法目前仍在开发中，只有一小部分 IDF 组件支持了 Mock，具体请参考[基于 Linux 主机的单元测试](#)。

### 4.33.1 添加常规测试用例

单元测试被添加在相应组件的 test 子目录中，测试用例写在 C 文件中，一个 C 文件可以包含多个测试用例。测试文件的名字要以 “test” 开头。

测试文件需要包含 unity.h 头文件，此外还需要包含待测试 C 模块需要的头文件。

测试用例需要通过 C 文件中特定的函数来添加，如下所示：

```
TEST_CASE("test name", "[module name]")
{
    // 在这里添加测试用例
}
```

- 第一个参数是此测试的描述性名称。
- 第二个参数用方括号中的标识符来表示，标识符用来对相关测试或具有特定属性的测试进行分组。

**备注：** 没有必要在每个测试用例中使用 UNITY\_BEGIN() 和 UNITY\_END() 来声明主函数的区域，unity\_platform.c 会自动调用 UNITY\_BEGIN()，然后运行测试用例，最后调用 UNITY\_END()。

test 子目录应包含组件 *CMakeLists.txt*，因为他们本身就是一种组件（即测试组件）。ESP-IDF 使用了 Unity 测试框架，位于 unity 组件里。因此，每个测试组件都需要通过 REQUIRES 参数将 unity 组件设为依赖项。通常，组件需要手动指定待编译的源文件，但是，对于测试组件来说，这个要求被放宽为仅建议将参数 SRC\_DIRS 用于 idf\_component\_register。

总的来说，test 子目录下最小的 CMakeLists.txt 文件可能如下所示：

```
idf_component_register(SRC_DIRS "."
                      INCLUDE_DIRS "."
                      REQUIRES unity)
```

更多关于如何在 Unity 下编写测试用例的信息，请查阅 <http://www.throwtheswitch.org/unity>。

### 4.33.2 添加多设备测试用例

常规测试用例会在一个 DUT（Device Under Test，在试设备）上执行。但是，那些需要互相通信的组件（比如 GPIO、SPI）需要其他设备与其通信，因此不能使用常规测试用例进行测试。多设备测试用例包括写入多个测试函数，并在多个 DUT 进行运行测试。

以下是一个多设备测试用例：

```
void gpio_master_test()
{
    gpio_config_t slave_config = {
        .pin_bit_mask = 1 << MASTER_GPIO_PIN,
        .mode = GPIO_MODE_INPUT,
    };
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
```

(下页继续)

```

gpio_config_t master_config = {
    .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
    .mode = GPIO_MODE_OUTPUT,
};
gpio_config(&master_config);
gpio_set_level(SLAVE_GPIO_PIN, 1);
unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", "[driver]", gpio_
↪master_test, gpio_slave_test);

```

宏 `TEST_CASE_MULTIPLE_DEVICES` 用来声明多设备测试用例。

- 第一个参数指定测试用例的名字。
- 第二个参数是测试用例的描述。
- 从第三个参数开始，可以指定最多 5 个测试函数，每个函数都是单独运行在一个 DUT 上的测试入口点。

在不同的 DUT 上运行的测试用例，通常会要求它们之间进行同步。我们提供 `unity_wait_for_signal` 和 `unity_send_signal` 这两个函数来使用 UART 去支持同步操作。如上例中的场景，slave 应该在 master 设置好 GPIO 电平后再去读取 GPIO 电平，DUT 的 UART 终端会打印提示信息，并要求用户进行交互。

DUT1 (master) 终端:

```

Waiting for signal: [output high level]!
Please press "Enter" key once any board send this signal.

```

DUT2 (slave) 终端:

```

Send signal: [output high level]!

```

一旦 DUT2 发送了该信号，您需要在 DUT1 的终端按回车键，然后 DUT1 会从 `unity_wait_for_signal` 函数中解除阻塞，并开始更改 GPIO 的电平。

### 4.3.3 添加多阶段测试用例

常规的测试用例无需重启就会结束（或者仅需要检查是否发生了重启），可有些时候我们想在某些特定类型的重启事件后运行指定的测试代码，例如，我们想在深度睡眠唤醒后检查复位的原因是否正确。首先我们需要触发深度睡眠复位事件，然后检查复位的原因。为了实现这一点，我们可以定义多阶段测试用例来将这些测试函数组合在一起：

```

static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    soc_reset_reason_t reason = esp_rom_get_reset_reason(0);
    TEST_ASSERT(reason == RESET_REASON_CORE_DEEP_SLEEP);
}

TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", "[esp32]", trigger_
↪deepsleep, check_deepsleep_reset_reason);

```

多阶段测试用例向用户呈现了一组测试函数，它需要用户进行交互（选择用例并选择不同的阶段）来运行。

### 4.33.4 应用于不同芯片的单元测试

某些测试（尤其与硬件相关的）无法在所有的芯片上执行。请参照本节让你的单元测试只在其中一部分芯片上执行。

1. 使用宏 `!(TEMPORARY_)DISABLED_FOR_TARGETS()` 包装你的测试代码，并将其放于原始的测试文件中，或将代码分成按功能分组的文件。但请确保所有这些文件都会由编译器处理。例：

```
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
TEST_CASE("a test that is not ready for esp32 and esp8266 yet", "[ ]")
{
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
```

一旦你需要其中一个测试在某个芯片上被编译，只需要修改禁止的芯片列表。我们更鼓励使用一些通用的概念（能在 `soc_caps.h` 中被清楚描述）来禁止某些单元测试。如果你已经这样做，但有一些测试还没有在新的芯片版本中被调试通过，请同时使用上述两种方法，当调试完成后移除 `!(TEMPORARY_)DISABLED_FOR_TARGETS()`。例：

```
#if SOC_SDIO_SLAVE_SUPPORTED
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
TEST_CASE("a sdio slave tests that is not ready for esp64 yet", "[sdio_slave]")
{
    //available for esp32 now, and will be available for esp64 in the future
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
#endif //SOC_SDIO_SLAVE_SUPPORTED
```

2. 对于某些你确定不会支持的测试（例如，芯片根本没有该外设），使用 `DISABLED_FOR_TARGETS` 来禁止该测试；对于其他只是临时性需要关闭的（例如，没有 `runner` 资源等），使用 `TEMPORARY_DISABLED_FOR_TARGETS` 来暂时关闭该测试。

一些禁用目标芯片测试用例的旧方法，由于它们具有明显的缺陷，已经被废弃，请勿继续使用：

- 请勿将测试代码放在 `test/芯片版本目录` 下面，然后用 `CMakeLists.txt` 来选择其中一个进行编译。这是因为测试代码比实现代码更容易被复用。如果你将一些代码放在 `test/esp32` 目录下来避免 `esp32s2` 芯片执行它，一旦你需要在新的芯片（比如 `esp32s3`）中启用该测试，你会发现这种结构非常难以保持代码的整洁。
- 请勿继续使用 `CONFIG_IDF_TARGET_XXX` 宏来禁止某些测试在一些芯片上编译。这种方法会让被禁止的测试项目难以追踪和重新打开。并且，相比于白名单式的 `#if CONFIG_IDF_TARGET_XXX`，黑名单式的 `#if !disabled` 能避免新芯片引入时这些测试被自动关闭。但对于用于测试的一些实现，`#if CONFIG_IDF_TARGET_XXX` 仍可用于给不同芯片版本选择实现代码。测试项目和测试实现区分如下：
  - 测试项目：那些会在一些芯片上执行，而在另外一些上跳过的项目，例如：
    - 有三个测试项目 `SD 1-bit`、`SD 4-bit` 和 `SDSPI`。对于不支持 `SD Host` 外设的 `ESP32-S2` 芯片，只有 `SDSPI` 一个项目需要被执行。
  - 测试实现：一些始终会发生的代码，但采取不同的实现方式。例如：
    - `ESP8266` 芯片没有 `SDIO_PKT_LEN` 寄存器。如果在测试过程中需要获取从设备的数据长度，你可以用不同方式读取的 `#if CONFIG_IDF_TARGET_` 宏来保护不同的实现代码。但请注意避免使用 `#else` 宏。这样当新芯片被引入时，测试就会在编译阶段失败，提示维护者去显示选择一个正确的测试实现。

### 4.33.5 编译单元测试程序

按照 `esp-idf` 顶层目录的 `README` 文件中的说明进行操作，请确保 `IDF_PATH` 环境变量已经被设置指向了 `esp-idf` 的顶层目录。

切换到 `tools/unit-test-app` 目录下进行配置和编译：

- `idf.py menuconfig` - 配置单元测试程序。
- `idf.py -T all build` - 编译单元测试程序，测试每个组件 `test` 子目录下的用例。

- `idf.py -T "xxx yyy" build`- 编译单元测试程序，测试指定的组件。(如 `idf.py -T heap build`- 仅对 `heap` 组件目录下的单元测试程序进行编译)
- `idf.py -T all -E "xxx yyy" build`- 编译单元测试程序，测试除指定组件之外的所有组件。(例如 `idf.py -T all -E "ulp mbedtls" build`- 编译所有的单元测试，不包括 `ulp` 和 `mbedtls` 组件。)

**备注：** 由于 Windows 命令提示符固有限制，需使用以下语法来编译多个组件的单元测试程序：`idf.py -T xxx -T yyy build` 或者在 PowerShell 中使用 `idf.py -T `\"xxx yyy\"` build`，在 Windows 命令提示符中使用 `idf.py -T `^\"ssd1306 hts221\"^` build`。

当编译完成时，它会打印出烧写芯片的指令。您只需要运行 `idf.py flash` 即可烧写所有编译输出的文件。

您还可以运行 `idf.py -T all flash` 或者 `idf.py -T xxx flash` 来编译并烧写，所有需要的文件都会在烧写之前自动重新编译。

使用 `menuconfig` 可以设置烧写测试程序所使用的串口。

### 4.33.6 运行单元测试

烧写完成后重启 ESP32，它将启动单元测试程序。

当单元测试应用程序空闲时，输入回车键，它会打印出测试菜单，其中包含所有的测试项目：

```
Here's the test menu, pick your combo:
(1)    "esp_ota_begin() verifies arguments" [ota]
(2)    "esp_ota_get_next_update_partition logic" [ota]
(3)    "Verify bootloader image in flash" [bootloader_support]
(4)    "Verify unit test app image" [bootloader_support]
(5)    "can use new and delete" [cxx]
(6)    "can call virtual functions" [cxx]
(7)    "can use static initializers for non-POD types" [cxx]
(8)    "can use std::vector" [cxx]
(9)    "static initialization guards work as expected" [cxx]
(10)   "global initializers run in the correct order" [cxx]
(11)   "before scheduler has started, static initializers work correctly" [cxx]
(12)   "adc2 work with wifi" [adc]
(13)   "gpio master/slave test example" [ignore][misc][test_env=UT_T2_1][multi_
↪device]
      (1)    "gpio_master_test"
      (2)    "gpio_slave_test"
(14)   "SPI Master clockdiv calculation routines" [spi]
(15)   "SPI Master test" [spi][ignore]
(16)   "SPI Master test, interaction of multiple devs" [spi][ignore]
(17)   "SPI Master no response when switch from host1 (SPI2) to host2 (SPI3)" ↪
↪[spi]
(18)   "SPI Master DMA test, TX and RX in different regions" [spi]
(19)   "SPI Master DMA test: length, start, not aligned" [spi]
(20)   "reset reason check for deepsleep" [esp32][test_env=UT_T2_1][multi_stage]
      (1)    "trigger_deepsleep"
      (2)    "check_deepsleep_reset_reason"
```

常规测试用例会打印用例名字和描述，主从测试用例还会打印子菜单（已注册的测试函数的名字）。

可以输入以下任意一项来运行测试用例：

- 引号中写入测试用例的名字，运行单个测试用例。
- 测试用例的序号，运行单个测试用例。
- 方括号中的模块名字，运行指定模块所有的测试用例。
- 星号，运行所有测试用例。

[multi\_device] 和 [multi\_stage] 标签告诉测试运行者该用例是多设备测试还是多阶段测试。这些标签由 TEST\_CASE\_MULTIPLE\_STAGES 和 TEST\_CASE\_MULTIPLE\_DEVICES 宏自动生成。

一旦选择了多设备测试用例，它会打印一个子菜单：

```
Running gpio master/slave test example...
gpio master/slave test example
  (1)      "gpio_master_test"
  (2)      "gpio_slave_test"
```

您需要输入数字以选择在 DUT 上运行的测试。

与多设备测试用例相似，多阶段测试用例也会打印子菜单：

```
Running reset reason check for deepsleep...
reset reason check for deepsleep
  (1)      "trigger_deepsleep"
  (2)      "check_deepsleep_reset_reason"
```

第一次执行此用例时，输入 1 来运行第一阶段（触发深度睡眠）。在重启 DUT 并再次选择运行此用例后，输入 2 来运行第二阶段。只有在最后一个阶段通过并且之前所有的阶段都成功触发了复位的情况下，该测试才算通过。

### 4.33.7 带缓存补偿定时器的定时代码

存储在外部存储器（如 SPI Flash 和 SPI RAM）中的指令和数据是通过 CPU 的统一指令和数据缓存来访问的。当代码或数据在缓存中时，访问速度会非常快（即缓存命中）。

然而，如果指令或数据不在缓存中，则需要从外部内存中获取（即缓存缺失）。访问外部存储器的速度明显较慢，因为 CPU 在等待从外部存储器获取指令或数据时会陷入停滞。这导致整体代码执行速度会依据缓存命中或缓存缺失的次数而变化。

在不同的编译中，代码和数据的位置可能会有所不同，一些可能会更有利于缓存访问（即，最大限度地减少缓存缺失）。理论上说这会影响执行速度，但这些因素通常却是无关紧要，因为它们的影响会在设备的运行过程中“平均化”。

然而，高速缓存对执行速度的影响可能与基准测试场景（尤其是微基准测试）有关。每次运行和构建时的测量时间可能会有所差异，消除部分差异的方法之一是将代码和数据分别放在指令或数据 RAM (IRAM/DRAM) 中。CPU 可以直接访问 IIRAM 和 DRAM，从而消除了高速缓存的影响因素。然而，由于 IIRAM 和 DRAM 容量有限，该方法并不总是可行。

缓存补偿定时器是将要基准测试的代码/数据放置在 IIRAM/DRAM 中的替代方法，该定时器使用处理器的内部事件计数器来确定在发生高速缓存未命中时等待代码/数据所花费的时间，然后从记录的实时时间中减去该时间。

```
// Start the timer
ccomp_timer_start();

// Function to time
func_code_to_time();

// Stop the timer, and return the elapsed time in microseconds relative to
// ccomp_timer_start
int64_t t = ccomp_timer_stop();
```

缓存补偿定时器的限制之一是基准功能必须固定在一个内核上。这是由于每个内核都有自己的事件计数器，这些事件计数器彼此独立。例如，如果在一个内核上调用 ccomp\_timer\_start，使调度器进入睡眠状态，唤醒并在在另一个内核上重新调度，那么对应的 ccomp\_timer\_stop 将无效。

### 4.33.8 Mocks

嵌入式系统中单元测试的最大问题之一是硬件依赖性极强。所以 ESP-IDF 有一个集成了 CMock mocking 框架的组件。理想情况下，除了需要被测试的组件（待测组件）之外的所有组件都要被模拟。这样，测试环境就可以完全控制与被测组件之间的所有交互。但是，在模拟过程中如果遇到过于具体而导致的困难，用户可以在测试代码中包含“真正”（非模拟）代码。

除了常规的 IDF 要求，ruby 是生成 Mock 的必要条件，具体请参考 [cmock/CMock/docs/CMock\\_Summary.md](#) 了解 CMock 工作原理以及如何创建和使用 Mock。

在 IDF 中，与编写普通组件或不需要 Mock 的单元测试相比，需要 Mock 的组件以及单元测试内部需要进行一些修改。

#### 修改需要模拟的组件

要被模拟的组件需要一个单独的 mock 目录，用来包含实现模拟的文件。最重要的是，该目录下要包含用于配置 CMock 的 mock\_config.yaml 文件。关于此配置文件中选项的含义以及如何编写自己的配置文件，请参考 [CMock 文档](#)。mock 目录中可能还需要包括其它与 Mock 有关的文件。

此外，组件的 CMakeLists.txt 文件中需要一个“开关”来决定是否编译 Mock。通常可以通过检查特定组件的属性 USE MOCK 来实现。例如，spi\_flash 组件在其 CMakeLists.txt 中执行以下代码，以检查是否应该编译 Mock。

```
idf_component_get_property(spi_flash_mock ${COMPONENT_NAME} USE MOCK)
```

在组件的 CMakeLists.txt 中创建组件的 Mock 的 CMake 编译命令可能如下所示：

```
add_custom_command(
  OUTPUT ${MOCK_OUTPUT}
  COMMAND ruby ${CMOCK_DIR}/lib/cmock.rb -o${CMAKE_CURRENT_SOURCE_DIR}/mock/mock_
  ↪config.yaml ${MOCK_HEADERS}
  COMMAND ${CMAKE_COMMAND} -E env "UNITY_DIR=${IDF_PATH}/components/unity/unity"
  ↪ruby ${CMOCK_DIR}/lib/cmock.rb -o${CMAKE_CURRENT_SOURCE_DIR}/mock/mock_config.
  ↪yaml ${MOCK_HEADERS}
)
```

`${MOCK_OUTPUT}` 包含所有 CMock 生成的输出文件，`${MOCK_HEADERS}` 包含所有要 Mock 的头文件，`${CMOCK_DIR}` 需要设置为 IDF 内的 CMock 目录。`${CMAKE_COMMAND}` 会由 IDF 构建系统自动设置。

使用 CMock 要特别注意的一个方面是：CMock 通常使用 Unity 作为一个子模块，但由于一些 Espressif 内部 CI 的限制，我们仍然将 Unity 作为 ESP-IDF 中的一个普通模块。要使用 IDF 提供的 Unity 组件（不是子模块），构建系统需要传递一个环境变量 `UNITY_IDR` 给 CMock。该变量仅包含 IDF 中 Unity 目录的路径，如 `export "UNITY_DIR=${IDF_PATH}/components/unity/unity"`。关于 CMock 中 Unity 目录是如何确定的，请参考 [cmock/CMock/lib/cmock\\_generator.rb](#)。

更多细节可参考 [spi\\_flash](#) 目录下启用 Mock 的 CMakeLists.txt 示例文件。

#### 修改单元测试文件

单元测试要为需要模拟的组件设置 USE MOCK 组件属性。这会让依赖组件编译 Mock，而不是实际的组件。例如，在 NVS 主机测试的 [CMakeLists.txt](#) 中，以下代码用于启用 spi\_flash Mock。

```
idf_component_set_property(spi_flash USE MOCK 1)
```

关于如何在单元测试中使用及控制 CMock，请参考 [NVS 主机单元测试](#)。

## 4.34 Unit Testing on Linux

**备注:** Host testing with IDF is experimental for now. We try our best to keep interfaces stable but can't guarantee it for now. Feedback via [github](#) or the forum on [esp32.com](#) is highly welcome, though and may influence the future design of the host-based tests.

This article provides an overview of unit tests with IDF on Linux. For using unit tests on the target, please refer to [target based unit testing](#).

### 4.34.1 Embedded Software Tests

Embedded software tests are challenging due to the following factors:

- Difficulties running tests efficiently.
- Lack of many operating system abstractions when interfacing with hardware, making it difficult to isolate code under test.

To solve these two problems, Linux host-based tests with [CMock](#) are introduced. Linux host-based tests are more efficient than unit tests on the target since they:

- Compile the necessary code only
- Don't need time to upload to a target
- Run much faster on a host-computer, compared to an ESP

Using the [CMock](#) framework also solves the problem of hardware dependencies. Through mocking, hardware details are emulated and specified at run time, but only if necessary.

Of course, using code on the host and using mocks does not fully represent the target device. Thus, two kinds of tests are recommended:

1. Unit tests which test program logic on a Linux machine, isolated through mocks.
2. System/Integration tests which test the interaction of components and the whole system. They run on the target, where irrelevant components and code may as well be emulated via mocks.

This documentation is about the first kind of tests. Refer to [target based unit testing](#) for more information on target tests (the second kind of tests).

### 4.34.2 IDF Unit Tests on Linux Host

The current focus of the Linux host tests is on creating isolated unit tests of components, while mocking the component's dependencies with [CMock](#).

A complete implementation of IDF to run on Linux does not exist currently.

There are currently two examples for running IDF-built code on Linux host:

- An example [hello-world application](#)
- A [unit test for NVS](#).

Inside the component which should be tested, there is a separate directory `host_test`, besides the “traditional” test directory or the `test_apps` directory. It has one or more subdirectories:

```
- host_test/
    - fixtures/
        contains test fixtures (structs/functions to do test case set-up_
->and tear-down).
        If there are no fixtures, this can be omitted.
    - <test_name>/
        IDF applications which run the tests
```

(下页继续)

```
- <test_name2>/
  Further tests are possible.
```

The IDF applications inside `host_test` set the mocking configuration as described in the *IDF unit test documentation*.

The [NVS page unit test](#) provides some illustration of how to control the mocks.

### Requirements

- Installed IDF including all IDF requirements
- CMock requirements (Ruby)
- `libbsd`

The host tests have been tested on Ubuntu 20.04 with GCC version 9 and 10.

## 4.35 单元测试 (传统的 GNU Make)

---

**备注:** ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

---

ESP-IDF 中附带了一个基于 Unity 的单元测试应用程序框架，且所有的单元测试用例分别保存在 ESP-IDF 仓库中每个组件的 `test` 子目录中。

### 4.35.1 添加常规测试用例

单元测试被添加在相应组件的 `test` 子目录中，测试用例写在 C 文件中，一个 C 文件可以包含多个测试用例。测试文件的名字要以 “test” 开头。

测试文件需要包含 `unity.h` 头文件，此外还需要包含待测试 C 模块需要的头文件。

测试用例需要通过 C 文件中特定的函数来添加，如下所示：

```
TEST_CASE("test name", "[module name]"
{
    // 在这里添加测试用例
})
```

第一个参数是字符串，用来描述当前测试。第二个参数是字符串，用方括号中的标识符来表示，标识符用来对相关测试或具有特定属性的测试进行分组。

---

**备注:** 没有必要在每个测试用例中使用 `UNITY_BEGIN()` 和 `UNITY_END()` 来声明主函数的区域，`unity_platform.c` 会自动调用 `UNITY_BEGIN()`，然后运行测试用例，最后调用 `UNITY_END()`。

---

每一个测试子目录下都需包含 `component.mk` 文件，并且其中至少要包含如下的一行代码：

```
COMPONENT_ADD_LDFLAGS = -Wl,--whole-archive -l$(COMPONENT_NAME) -Wl,--no-whole-
→archive
```

更多关于如何在 Unity 下编写测试用例的信息，请查阅 <http://www.throwtheswitch.org/unity>。

### 4.35.2 添加多设备测试用例

常规测试用例会在一个 DUT (Device Under Test, 在试设备) 上执行. 但是, 那些需要互相通信的组件 (比如 GPIO、SPI) 需要与其通信的其他设备, 因此不能使用常规测试用例进行测试. 多设备测试用例包括写入多个测试函数, 并在多个 DUT 进行运行测试.

以下是一个多设备测试用例:

```
void gpio_master_test()
{
    gpio_config_t slave_config = {
        .pin_bit_mask = 1 << MASTER_GPIO_PIN,
        .mode = GPIO_MODE_INPUT,
    };
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
    gpio_config_t master_config = {
        .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
        .mode = GPIO_MODE_OUTPUT,
    };
    gpio_config(&master_config);
    gpio_set_level(SLAVE_GPIO_PIN, 1);
    unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", "[driver]", gpio_
↪master_test, gpio_slave_test);
```

宏 TEST\_CASE\_MULTIPLE\_DEVICES 用来声明多设备测试用例,

- 第一个参数指定测试用例的名字。
- 第二个参数是测试用例的描述。
- 从第三个参数开始, 可以指定最多 5 个测试函数, 每个函数都是单独运行在一个 DUT 上的测试入口点。

在不同的 DUT 上运行的测试用例, 通常会要求它们之间进行同步. 我们提供 `unity_wait_for_signal` 和 `unity_send_signal` 这两个函数来使用 UART 去支持同步操作. 如上例中的场景, `slave` 应该在在 `master` 设置好 GPIO 电平后再去读取 GPIO 电平, DUT 的 UART 终端会打印提示信息, 并要求用户进行交互.

DUT1 (master) 终端:

```
Waiting for signal: [output high level]!
Please press "Enter" key once any board send this signal.
```

DUT2 (slave) 终端:

```
Send signal: [output high level]!
```

一旦 DUT2 发送了该信号, 您需要在 DUT1 按回车键, 然后 DUT1 会从 `unity_wait_for_signal` 函数中解除阻塞, 并开始更改 GPIO 的电平.

信号也可以用来在不同设备之间传递参数. 例如, DUT1 希望得到 DUT2 的 MAC 地址来进行蓝牙连接, 这时, 可使用 `unity_wait_for_signal_param` 以及 `unity_send_signal_param`.

DUT1 终端:

```
Waiting for signal: [dut2 mac address]!
Please input parameter value from any board send this signal and press "Enter" key.
```

DUT2 终端:

```
Send signal: [dut2 mac address][10:20:30:40:50:60]!
```

一旦 DUT2 发送信号，您需要在 DUT1 输入 10:20:30:40:50:60 并按回车键，然后 DUT1 会获取 DUT2 的 MAC 地址字符串，并从 `unity_wait_for_signal_param` 函数中解除阻塞，然后蓝牙连接 DUT2。

### 4.35.3 添加多阶段测试用例

常规的测试用例无需重启就会结束（或者仅需要检查是否发生了重启），可有些时候我们想在某些特定类型的重启事件后运行指定的测试代码，例如，我们想在深度睡眠唤醒后检查复位的原因是否正确。首先我们需要出发深度睡眠复位事件，然后检查复位的原因。为了实现这一点，我们可以定义多阶段测试用例来将这些测试函数组合在一起。

```
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    soc_reset_reason_t reason = esp_rom_get_reset_reason(0);
    TEST_ASSERT(reason == RESET_REASON_CORE_DEEP_SLEEP);
}

TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", "[esp32]", trigger_
↪deepsleep, check_deepsleep_reset_reason);
```

多阶段测试用例向用户呈现了一组测试函数，它需要用户进行交互（选择用例并选择不同的阶段）来运行。

### 4.35.4 编译单元测试程序

按照 `esp-idf` 顶层目录的 `README` 文件中的说明进行操作，请确保 `IDF_PATH` 环境变量已经被设置指向了 `esp-idf` 的顶层目录。

切换到 `tools/unit-test-app` 目录下进行配置和编译：

- `make menuconfig` - 配置单元测试程序。
- `make TESTS_ALL=1` - 编译单元测试程序，测试每个组件 `test` 子目录下的用例。
- `make TEST_COMPONENTS='xxx'` - 编译单元测试程序，测试指定的组件。
- `make TESTS_ALL=1 TEST_EXCLUDE_COMPONENTS='xxx'` - 编译单元测试程序，测试所有（除开指定）的组件。（例如 `make TESTS_ALL=1 TEST_EXCLUDE_COMPONENTS='ulp mbedtls'` - 编译所有的单元测试，不包括 `ulp` 和 `mbedtls` 组件。）

当编译完成时，它会打印出烧写芯片的指令。您只需要运行 `make flash` 即可烧写所有编译输出的文件。

您还可以运行 `make flash TESTS_ALL=1` 或者 `make TEST_COMPONENTS='xxx'` 来编译并烧写，所有需要的文件都会在烧写之前自动重新编译。

使用 `menuconfig` 可以设置烧写测试程序所使用的串口。

### 4.35.5 运行单元测试

烧写完成后重启 ESP32，它将启动单元测试程序。

当单元测试应用程序空闲时，输入回车键，它会打印出测试菜单，其中包含所有的测试项目。

```

Here's the test menu, pick your combo:
(1)   "esp_ota_begin() verifies arguments" [ota]
(2)   "esp_ota_get_next_update_partition logic" [ota]
(3)   "Verify bootloader image in flash" [bootloader_support]
(4)   "Verify unit test app image" [bootloader_support]
(5)   "can use new and delete" [cxx]
(6)   "can call virtual functions" [cxx]
(7)   "can use static initializers for non-POD types" [cxx]
(8)   "can use std::vector" [cxx]
(9)   "static initialization guards work as expected" [cxx]
(10)  "global initializers run in the correct order" [cxx]
(11)  "before scheduler has started, static initializers work correctly" [cxx]
(12)  "adc2 work with wifi" [adc]
(13)  "gpio master/slave test example" [ignore][misc][test_env=UT_T2_1][multi_
↪device]
      (1)   "gpio_master_test"
      (2)   "gpio_slave_test"
(14)  "SPI Master clockdiv calculation routines" [spi]
(15)  "SPI Master test" [spi][ignore]
(16)  "SPI Master test, interaction of multiple devs" [spi][ignore]
(17)  "SPI Master no response when switch from host1 (SPI2) to host2 (SPI3)" ↪
↪[spi]
(18)  "SPI Master DMA test, TX and RX in different regions" [spi]
(19)  "SPI Master DMA test: length, start, not aligned" [spi]
(20)  "reset reason check for deepsleep" [esp32][test_env=UT_T2_1][multi_stage]
      (1)   "trigger_deepsleep"
      (2)   "check_deepsleep_reset_reason"

```

常规测试用例会打印用例名字和描述，主从测试用例还会打印子菜单（已注册的测试函数的名字）。

可以输入以下任意一项来运行测试用例：

- 引号中的测试用例的名字（例如 "esp\_ota\_begin() verifies arguments"），运行单个测试用例。
- 测试用例的序号（例如 1），运行单个测试用例。
- 方括号中的模组名称（例如 [cxx]），运行指定模组的所有的测试用例。
- 星号(\*)，运行所有测试用例。

[multi\_device] 和 [multi\_stage] 标签告诉测试运行者该用例是多设备测试还是多阶段测试。这些标签由 TEST\_CASE\_MULTIPLE\_STAGES 和 TEST\_CASE\_MULTIPLE\_DEVICES 宏自动生成。

一旦选择了多设备测试用例，它会打印一个子菜单：

```

Running gpio master/slave test example...
gpio master/slave test example
      (1)   "gpio_master_test"
      (2)   "gpio_slave_test"

```

您需要输入数字以选择在 DUT 上运行的测试。

与多设备测试用例相似，多阶段测试用例也会打印子菜单：

```

Running reset reason check for deepsleep...
reset reason check for deepsleep
      (1)   "trigger_deepsleep"
      (2)   "check_deepsleep_reset_reason"

```

第一次执行此用例时，输入 1 来运行第一阶段（触发深度睡眠）。在重启 DUT 并再次选择运行此用例后，输入 2 来运行第二阶段。只有在最后一个阶段通过并且之前所有的阶段都成功触发了复位的情况下，该测试才算通过。

## 4.36 Wi-Fi 驱动程序

### 4.36.1 ESP32 Wi-Fi 功能列表

- 支持 4 个虚拟接口，即 STA、AP、Sniffer 和 reserved。
- 支持仅 station 模式、仅 AP 模式、station/AP 共存模式
- 支持使用 IEEE 802.11B、IEEE 802.11G、IEEE 802.11N 和 API 配置协议模式
- 支持 WPA/WPA2/WPA2-企业版和 WPS
- 支持 AMPDU、HT40、QoS 以及其它主要功能
- 支持 Modem-sleep
- 支持乐鑫专属协议，可实现 1 km 数据通信量
- 空中数据传输最高可达 20 MBit/s TCP 吞吐量和 30 MBit/s UDP 吞吐量
- 支持 Sniffer
- 支持用于 Wi-Fi 连接的 fast\_crypto 算法与普通算法的切换
- 支持快速扫描和全信道扫描
- 支持多个天线
- 支持获取信道状态信息

### 4.36.2 如何编写 Wi-Fi 应用程序

#### 准备工作

一般来说，要编写自己的 Wi-Fi 应用程序，最高效的方式是先选择一个相似的应用程序示例，然后将其中可用的部分移植到自己的项目中。如果您希望编写一个强健的 Wi-Fi 应用程序，强烈建议您在开始之前先阅读本文。**非强制要求，请依个人情况而定。**

本文将补充说明 Wi-Fi API 和 Wi-Fi 示例的相关信息，重点描述使用 Wi-Fi API 的原则、当前 Wi-Fi API 实现的限制以及使用 Wi-Fi 时的常见错误。同时，本文还介绍了 Wi-Fi 驱动程序的一些设计细节。建议您选择一个示例 [example](#) 进行参考。

#### 设置 Wi-Fi 编译时选项

请参阅 [Wi-Fi menuconfig](#)。

#### Wi-Fi 初始化

请参阅 [ESP32 Wi-Fi station 一般情况](#)、[ESP32 Wi-Fi AP 一般情况](#)。

#### 启动/连接 Wi-Fi

请参阅 [ESP32 Wi-Fi station 一般情况](#)、[ESP32 Wi-Fi AP 一般情况](#)。

#### 事件处理

通常，在晴好环境下编写代码难度并不大，如 [WIFI\\_EVENT\\_STA\\_START](#)、[WIFI\\_EVENT\\_STA\\_CONNECTED](#) 中所述。难度在于如何在阴翳的困难环境下编写代码，如 [WIFI\\_EVENT\\_STA\\_DISCONNECTED](#) 中所述。能否在后者情况下完美地解决各类事件冲突，是编写一个强健的 Wi-Fi 应用程序的根本。请参阅 [ESP32 Wi-Fi station 一般情况](#)、[ESP32 Wi-Fi AP 一般情况](#)。另可参阅 ESP-IDF 中的事件处理概述 [Event Handling](#)。

## 编写错误恢复程序

除了在能在比较差的环境下工作，错误恢复能力也对一个强健的 Wi-Fi 应用程序至关重要。请参阅 [ESP32 Wi-Fi API 错误代码](#)。

### 4.36.3 ESP32 Wi-Fi API 错误代码

所有 ESP32 Wi-Fi API 都有定义好的返回值，即错误代码。这些错误代码可分类为：

- 无错误，例如：返回值 ESP\_OK 代表 API 成功返回
- 可恢复错误，例如：ESP\_ERR\_NO\_MEM
- 不可恢复的非关键性错误
- 不可恢复的关键性错误

一个错误是否为关键性取决于其 API 和应用场景，并且由 API 用户定义。

**要使用 Wi-Fi API 编写一个强健的应用程序，根本原则便是要时刻检查错误代码并编写相应的错误处理代码。**一般来说，错误处理代码可用于解决：

- 可恢复错误，您可以编写一个可恢复错误处理代码解决该类错误。例如，当 `esp_wifi_start()` 返回 ESP\_ERR\_NO\_MEM 时，调用可恢复错误处理代码 `vTaskDelay` 可以获取几微秒的重试时间。
- 不可恢复非关键性错误，打印错误代码可以帮助您更好地处理该类错误。
- 不可恢复关键性错误，可使用“assert”语句处理该类错误。例如，如果 `esp_wifi_set_mode()` 返回 ESP\_ERR\_WIFI\_NOT\_INIT，该值意为 `esp_wifi_init()` 未成功初始化 Wi-Fi 驱动程序。您可以在应用程序开发阶段非常快速地检测到此类错误。

在 `esp_err.h` 中，ESP\_ERROR\_CHECK 负责检查返回值。这是一个较为常见的错误处理代码，可在应用程序开发阶段作为默认的错误处理代码。但是，我们强烈建议 API 的使用者自己编写错误处理代码。

### 4.36.4 初始化 ESP32 Wi-Fi API 参数

初始化 API 的结构参数时，应遵循以下两种方式之一：

- 设置该参数的所有字段
- 先使用 `get` API 获取当前配置，然后只设置特定于应用程序的字段

初始化或获取整个结构这一步至关重要，因为大多数情况下，返回值 0 意味着程序使用了默认值。未来，我们将会在该结构中加入更多字段，并将这些字段初始化为 0，确保即使 IDF 版本升级后您的应用程序依然能够正常运行。

### 4.36.5 ESP32 Wi-Fi 编程模型

ESP32 Wi-Fi 编程模型如下图所示：

Wi-Fi 驱动程序可以看作是一个无法感知上层代码（如 TCP/IP 堆栈、应用程序任务、事件任务等）的黑匣子。通常，应用程序任务（代码）负责调用 [Wi-Fi 驱动程序 APIs](#) 来初始化 Wi-Fi，并在必要时处理 Wi-Fi 事件。然后，Wi-Fi 驱动程序接收并处理 API 数据，并在应用程序中插入事件。

Wi-Fi 事件处理是在 [esp\\_event](#) 库的基础上进行的。Wi-Fi 驱动程序将事件发送至 [默认事件循环](#)，应用程序便可以使用 `esp_event_handler_register()` 中的回调函数处理这些事件。除此之外，[esp\\_netif](#) 组件也负责处理 Wi-Fi 事件，并产生一系列默认行为。例如，当 Wi-Fi station 连接至一个 AP 时，`esp_netif` 将自动开启 DHCP 客户端服务（系统默认）。

### 4.36.6 ESP32 Wi-Fi 事件描述

#### WIFI\_EVENT\_WIFI\_READY

Wi-Fi 驱动程序永远不会生成此事件，因此，应用程序的事件回调函数可忽略此事件。在未来的版本中，此事件可能会被移除。

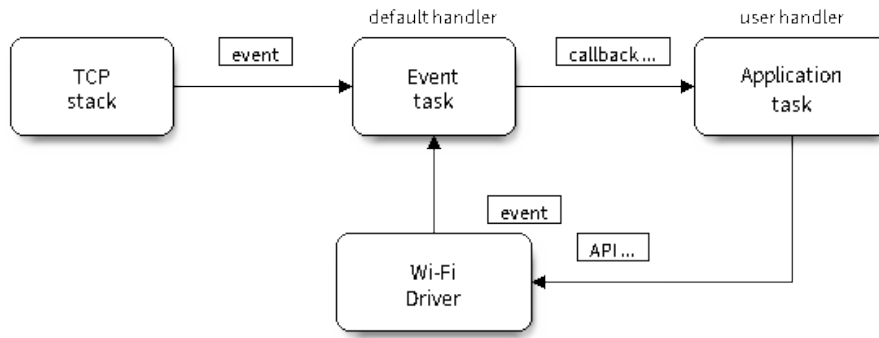

图 51: Wi-Fi 编程模型

### WIFI\_EVENT\_SCAN\_DONE

扫描完成事件，由 `esp_wifi_scan_start()` 函数触发，将在以下情况下产生：

- 扫描已完成，例如：Wi-Fi 已成功找到目标 AP 或已扫描所有信道。
- 当前扫描因函数 `esp_wifi_scan_stop()` 而终止。
- 在当前扫描完成之前调用了函数 `esp_wifi_scan_start()`。此时，新的扫描将覆盖当前扫描过程，并生成一个扫描完成事件。

以下情况下将不会产生扫描完成事件：

- 当前扫描被阻止。
- 当前扫描是由函数 `esp_wifi_connect()` 触发的。

接收到此事件后，事件任务暂不做任何响应。首先，应用程序的事件回调函数需调用 `esp_wifi_scan_get_ap_num()` 和 `esp_wifi_scan_get_ap_records()` 获取已扫描的 AP 列表，然后触发 Wi-Fi 驱动程序释放在扫描过程中占用的内存空间（**切记该步骤**）。更多详细信息，请参阅 [ESP32 Wi-Fi 扫描](#)。

### WIFI\_EVENT\_STA\_START

如果调用函数 `esp_wifi_start()` 后接收到返回值 `ESP_OK`，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将初始化 LwIP 网络接口 (netif)。通常，应用程序的事件回调函数需调用 `esp_wifi_connect()` 来连接已配置的 AP。

### WIFI\_EVENT\_STA\_STOP

如果调用函数 `esp_wifi_stop()` 后接收到返回值 `ESP_OK`，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将进行释放 station IP 地址、终止 DHCP 客户端服务、移除 TCP/UDP 相关连接并清除 LwIP station netif 等动作。此时，应用程序的事件回调函数通常不需做任何响应。

### WIFI\_EVENT\_STA\_CONNECTED

如果调用函数 `esp_wifi_connect()` 后接收到返回值 `ESP_OK`，且 station 已成功连接目标 AP，则将产生此连接事件。接收到此事件后，事件任务将启动 DHCP 客户端服务并开始获取 IP 地址。此时，Wi-Fi 驱动程序已准备就绪，可发送和接收数据。如果您的应用程序不依赖于 LwIP（即 IP 地址），则此刻便可以开始应用程序开发工作。但是，如果您的应用程序需基于 LwIP 进行，则还需等待 `got ip` 事件发生后才可开始。

## WIFI\_EVENT\_STA\_DISCONNECTED

此事件将在以下情况下产生：

- 调用了函数 `esp_wifi_disconnect()`、`esp_wifi_stop()` 或 `esp_wifi_deinit()`，且 Wi-Fi station 已成功连接至 AP。
- 调用了函数 `esp_wifi_connect()`，但 Wi-Fi 驱动程序因为某些原因未能成功连接至 AP，例如：未扫描到目标 AP、验证超时等。或存在多个 SSID 相同的 AP，station 无法连接所有已找到的 AP，也将产生该事件。
- Wi-Fi 连接因为某些原因而中断，例如：station 连续多次丢失 N beacon、AP 脱离 station 连接、AP 验证模式改变等。

接收到此事件后，事件任务的默认动作为：

- 关闭 station 的 LwIP netif。
- 通知 LwIP 任务清除导致所有套接字状态错误的 UDP/TCP 连接。针对基于套接字编写的应用程序，其回调函数可以在接收到此事件时（如有必要）关闭并重新创建所有套接字。

应用程序处理此事件最常用的方法为：调用函数 `esp_wifi_connect()` 重新连接 Wi-Fi。但是，如果此事件是由函数 `esp_wifi_disconnect()` 引发的，则应用程序不应调用 `esp_wifi_connect()` 来重新连接。应用程序须明确区分此事件的引发原因，因为某些情况下应使用其它更好的方式进行重新连接。请参阅 [Wi-Fi 重新连接](#) 和 [连接 Wi-Fi 时扫描](#)。

需要注意的另一点是：接收到此事件后，LwIP 的默认动作为终止所有 TCP 套接字连接。大多数情况下，该动作不会造成影响。但对某些特殊应用程序可能除外。例如：

- 应用程序创建了一个 TCP 连接，以维护每 60 秒发送一次的应用程序级、保持活动状态的数据。
- 由于某些原因，Wi-Fi 连接被切断并引发了 `WIFI_EVENT_STA_DISCONNECTED` 事件。根据当前实现，此时所有 TCP 连接都将被移除，且保持活动的套接字将处于错误的状态中。但是，由于应用程序设计者认为网络层 **不应** 考虑这个 Wi-Fi 层的错误，因此应用程序不会关闭套接字。
- 5 秒后，因为在应用程序的事件回调函数中调用了 `esp_wifi_connect()`，Wi-Fi 连接恢复。**同时，station 连接至同一个 AP 并获得与之前相同的 IPV4 地址。**
- 60 秒后，当应用程序发送具有保持活动状态的套接字的数据时，套接字将返回错误，应用程序将关闭套接字并在必要时重新创建。

在上述场景中，理想状态下应用程序套接字和网络层将不会受到影响，因为在此过程中 Wi-Fi 连接只是短暂地断开然后快速恢复。应用程序可通过 LwIP menuconfig 启动“IP 改变时保持 TCP 连接”的功能。

## IP\_EVENT\_STA\_GOT\_IP

当 DHCP 客户端成功从 DHCP 服务器获取 IPV4 地址或 IPV4 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

IPV4 地址可能由于以下原因而发生改变：

- DHCP 客户端无法重新获取/绑定 IPV4 地址，且 station 的 IPV4 重置为 0。
- DHCP 客户端重新绑定了其它地址。
- 静态配置的 IPV4 地址已发生改变。

函数 `ip_event_got_ip_t` 中的字段 `ip_change` 说明了 IPV4 地址是否发生改变。

套接字的状态是基于 IPV4 地址的，这意味着，如果 IPV4 地址发生改变，则所有与此 IPV4 相关的套接字都将变为异常。接收到此事件后，应用程序需关闭所有套接字，并在 IPV4 变为有效地址时重新创建应用程序。

## IP\_EVENT\_GOT\_IP6

当 IPV6 SLAAC 支持自动为 ESP32 配置一个地址，或 ESP32 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

### IP\_EVENT\_STA\_LOST\_IP

当 IPv4 地址失效时，将引发此事件。

此事件不会在 Wi-Fi 断连后立刻出现。Wi-Fi 连接断开后，首先将启动一个 IPv4 地址丢失计时器，如果 station 在该计时器超时之前成功获取了 IPv4 地址，则不会发生此事件。否则，此事件将在计时器超时发生时。

一般来说，应用程序可忽略此事件。这只是一个调试事件，主要使应用程序获知 IPv4 地址已丢失。

### WIFI\_EVENT\_AP\_START

与 `WIFI_EVENT_STA_START` 事件相似。

### WIFI\_EVENT\_AP\_STOP

与 `WIFI_EVENT_STA_STOP` 事件相似。

### WIFI\_EVENT\_AP\_STACONNECTED

每当有一个 station 成功连接 ESP32 AP 时，将引发此事件。接收到此事件后，事件任务将不做任何响应，应用程序的回调函数也可忽略这一事件。但是，您可以在此时进行一些操作，例如：获取已连接 STA 的信息等。

### WIFI\_EVENT\_AP\_STADISCONNECTED

此事件将在以下情况下发生：

- 应用程序通过调用函数 `esp_wifi_disconnect()` 或 `esp_wifi_deinit_sta()` 手动断开 station 连接。
- Wi-Fi 驱动程序出于某些原因断开 station 连接，例如：AP 在过去 5 分钟（可通过函数 `esp_wifi_set_inactive_time()` 修改该时间）内未接收到任何数据包等。
- station 断开与 AP 之间的连接。

发生此事件时，事件任务将不做任何响应，但应用程序的事件回调函数需执行一些操作，例如：关闭与此 station 相关的套接字等。

### WIFI\_EVENT\_AP\_PROBEREQRCVED

默认情况下，此事件处于禁用状态，应用程序可以通过调用 API `esp_wifi_set_event_mask()` 启用。启用后，每当 AP 接收到 probe request 时都将引发此事件。

### WIFI\_EVENT\_STA\_BEACON\_TIMEOUT

如果 station 在 inactive 时间内未收到所连接 AP 的 beacon，将发生 beacon 超时，将引发此事件。inactive 时间通过调用函数 `esp_wifi_set_inactive_time()` 设置。

## 4.36.7 ESP32 Wi-Fi station 一般情况

下图为 station 模式下的宏观场景，其中包含不同阶段的具体描述：

图 52: station 模式下 Wi-Fi 事件场景示例

## 1. Wi-Fi/LwIP 初始化阶段

- s1.1: 主任务通过调用函数 `esp_netif_init()` 创建一个 LwIP 核心任务, 并初始化 LwIP 相关工作。
- s1.2: 主任务通过调用函数 `esp_event_loop_create()` 创建一个系统事件任务, 并初始化应用程序事件的回调函数。在此情况下, 该回调函数唯一的动作就是将事件中继到应用程序任务中。
- s1.3: 主任务通过调用函数 `esp_netif_create_default_wifi_ap()` 或 `esp_netif_create_default_wifi_sta()` 创建有 TCP/IP 堆栈的默认网络接口实例绑定 station 或 AP。
- s1.4: 主任务通过调用函数 `esp_wifi_init()` 创建 Wi-Fi 驱动程序任务, 并初始化 Wi-Fi 驱动程序。
- s1.5: 主任务通过调用 OS API 创建应用程序任务。

推荐按照 s1.1 ~ s1.5 的步骤顺序针对基于 Wi-Fi/LwIP 的应用程序进行初始化。但这一顺序并非强制, 您可以在第 s1.1 步创建应用程序任务, 然后在应用程序任务中进行所有其它初始化操作。不过, 如果您的应用程序任务依赖套接字, 那么在初始化阶段创建应用程序任务可能并不适用。此时, 您可以在接收到 IP 后再进行任务创建。

## 2. Wi-Fi 配置阶段

Wi-Fi 驱动程序初始化成功后, 可以进入到配置阶段。该场景下, Wi-Fi 驱动程序处于 station 模式。因此, 首先您需调用函数 `esp_wifi_set_mode()` (WIFI\_MODE\_STA) 将 Wi-Fi 模式配置为 station 模式。可通过调用其它 `esp_wifi_set_xxx` API 进行更多设置, 例如: 协议模式、国家代码、带宽等。请参阅 [ESP32 Wi-Fi 配置](#)。

一般情况下, 我们会在建立 Wi-Fi 连接之前配置 Wi-Fi 驱动程序, 但这并非强制要求。也就是说, 只要 Wi-Fi 驱动程序已成功初始化, 您可以在任意阶段进行配置。但是, 如果您的 Wi-Fi 在建立连接后不需要更改配置, 则应先在此阶段完成配置。因为调用配置 API (例如 `esp_wifi_set_protocol()`) 将会导致 Wi-Fi 连接断开, 为您的操作带来不便。

如果 menuconfig 已使能 Wi-Fi NVS flash, 则不论当前阶段还是后续的 Wi-Fi 配置信息都将被存储至该 flash 中。那么, 当主板上电/重新启动时, 就不需从头开始配置 Wi-Fi 驱动程序。您只需调用函数 `esp_wifi_get_xxx` API 获取之前存储的配置信息。当然, 如果不想使用之前的配置, 您依然可以重新配置 Wi-Fi 驱动程序。

## 3. Wi-Fi 启动阶段

- s3.1: 调用函数 `esp_wifi_start()` 启动 Wi-Fi 驱动程序。
- s3.2: Wi-Fi 驱动程序将事件 `WIFI_EVENT_STA_START` 发布到事件任务中, 然后, 事件任务将执行一些正常操作并调用应用程序的事件回调函数。
- s3.3: 应用程序的事件回调函数将事件 `WIFI_EVENT_STA_START` 中继到应用程序任务中。推荐您此时调用函数 `esp_wifi_connect()` 进行 Wi-Fi 连接。当然, 您也可以等待在 `WIFI_EVENT_STA_START` 事件发生后的其它阶段再调用此函数。

## 4. Wi-Fi 连接阶段

- s4.1: 调用函数 `esp_wifi_connect()` 后, Wi-Fi 驱动程序将启动内部扫描/连接过程。
- s4.2: 如果内部扫描/连接过程成功, 将产生 `WIFI_EVENT_STA_CONNECTED` 事件。然后, 事件任务将启动 DHCP 客户端服务, 最终触发 DHCP 程序。
- s4.3: 在此情况下, 应用程序的事件回调函数会将 `WIFI_EVENT_STA_CONNECTED` 事件中继到应用程序任务中。通常, 应用程序不需进行操作, 而您可以执行任何动作, 例如: 打印日志等。

步骤 s4.2 中 Wi-Fi 连接可能会由于某些原因而失败, 例如: 密码错误、未找到 AP 等。这种情况下, 将引发 `WIFI_EVENT_STA_DISCONNECTED` 事件并提示连接错误原因。有关如何处理中断 Wi-Fi 连接的事件, 请参阅下文阶段 6 的描述。

## 5. Wi-Fi 获取 IP 阶段

- s5.1: 一旦步骤 4.2 中的 DHCP 客户端初始化完成, Wi-Fi 驱动程序将进入 获取 IP 阶段。
- s5.2: 如果 Wi-Fi 成功从 DHCP 服务器接收到 IP 地址, 则将引发 `IP_EVENT_STA_GOT_IP` 事件, 事件任务将执行正常处理。
- s5.3: 应用程序的事件回调函数将事件 `IP_EVENT_STA_GOT_IP` 中继到应用程序任务中。对于那些基于 LwIP 构建的应用程序, 此事件较为特殊, 因为它意味着应用程序已准备就绪, 可以开始任务, 例如: 创建 TCP/UDP 套接字等。此时较为容易犯的一个错误就是在接收到 `IP_EVENT_STA_GOT_IP` 事件之前就初始化套接字。**切忌在接收到 IP 之前启动任何套接字相关操作。**

## 6. Wi-Fi 断开阶段

- s6.1: 当 Wi-Fi 因为某些原因 (例如: AP 掉电、RSSI 较弱等) 连接中断时, 将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件。此事件也可能在上文阶段 3 中发生。在这里, 事件任务将通知 LwIP 任务清除/移除所有 UDP/TCP 连接。然后, 所有应用程序套接字都将处于错误状态。也就是说, `WIFI_EVENT_STA_DISCONNECTED` 事件发生时, 任何套接字都无法正常工作。
- s6.2: 上述情况下, 应用程序的事件回调函数会将 `WIFI_EVENT_STA_DISCONNECTED` 事件中中继到应用程序任务中。推荐您调用函数 `esp_wifi_connect()` 重新连接 Wi-Fi, 关闭所有套接字, 并在必要时重新创建套接字。请参阅 `WIFI_EVENT_STA_DISCONNECTED`。

## 7. Wi-Fi IP 更改阶段

- s7.1: 如果 IP 地址发生更改, 将引发 `IP_EVENT_STA_GOT_IP` 事件, 其中 “ip\_change” 被置为 “true”。
- s7.2: **此事件对应用程序至关重要。这一事件发生时, 适合关闭所有已创建的套接字并进行重新创建。**

## 8. Wi-Fi 清理阶段

- s8.1: 调用函数 `esp_wifi_disconnect()` 断开 Wi-Fi 连接。
- s8.2: 调用函数 `esp_wifi_stop()` 终止 Wi-Fi 驱动程序。
- s8.3: 调用函数 `esp_wifi_deinit()` 清理 Wi-Fi 驱动程序。

### 4.36.8 ESP32 Wi-Fi AP 一般情况

下图为 AP 模式下的宏观场景, 其中包含不同阶段的具体描述:

### 4.36.9 ESP32 Wi-Fi 扫描

目前, 仅 station 或 station/AP 共存模式支持 `esp_wifi_scan_start()` API。

图 53: AP 模式下 Wi-Fi 事件场景示例

## 扫描类型

| 模式     | 描述   |
|--------|--|
| 主动扫描   | 通过发送 probe request 进行扫描。该模式为默认的扫描模式。   |
| 被动扫描   | 跳至某一特定信道并等待 beacon。应用程序可通过 wifi_scan_config_t 中的 scan_type 字段使能被动扫描。                       |
| 前端扫描   | 不发出 probe request。在 station 模式下 Wi-Fi 未连接时，可进行前端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描，应用程序无法配置这两种模式。 |
| 后端扫描   | 在 station 模式或 station/AP 共存模式下 Wi-Fi 已连接时，可进行后端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描，应用程序无法配置这两种模式。  |
| 全信道扫描  | 扫描所有信道。wifi_scan_config_t 中的 channel 字段为 0 时，当前模式为全信道扫描。                                   |
| 特定信道扫描 | 仅扫描特定的信道。wifi_scan_config_t 中的 channel 字段为 1 时，当前模式为特定信道扫描。                                |

上表中的扫描模式可以任意组合，因此共有 8 种不同扫描方式：

- 全信道后端主动扫描
- 全信道后端被动扫描
- 全信道前端主动扫描
- 全信道后端被动扫描
- 特定信道后端主动扫描
- 特定信道后端被动扫描
- 特定信道前端主动扫描
- 特定信道前端被动扫描

## 扫描配置

扫描类型与其他扫描属性通过函数 `esp_wifi_scan_start()` 进行配置。下表详细描述了函数 `wifi_scan_config_t` 各字段信息。

| 字段          | 描述  |
|-------------|---|
| ssid        | 如果该字段的值不为 NULL，则仅可扫描到具有相同 SSID 值的 AP。   |
| bssid       | 如果该字段的值不为 NULL，则仅可扫描到具有相同 BSSID 值的 AP。  |
| channel     | 如果该字段值为 0，将进行全信道扫描；反之，将针对特定信道进行扫描。  |
| show_hidden | 如果该字段值为 0，本次扫描将忽略具有隐藏 SSID 的 AP；反之，这些 AP 也会在扫描时被视为正常 AP。  |
| scan_type   | 如果该字段值为 WIFI_SCAN_TYPE_ACTIVE，则本次扫描为主动扫描；反之，将被视为被动扫描。   |
| scan_time   | <p>该字段用于控制每个信道的扫描时间。</p> <p>被动扫描时，scan_time.passive 字段负责为每个信道指定扫描时间。</p> <p>主动扫描时，每个信道的扫描时间如下列表所示。其中，min 代表 scan_time_active_min，max 代表 scan_time_active_max。</p> <ul style="list-style-type: none"> <li>• min=0, max=0: 每个信道的扫描时间为 120 ms。</li> <li>• min&gt;0, max=0: 每个信道的扫描时间为 120 ms。</li> <li>• min=0, max&gt;0: 每个信道的扫描时间为 max ms。</li> <li>• min&gt;0, max&gt;0: 每个信道扫描的最短时间为 min ms。如果在这段时间内未找到 AP，将跳转至下一个信道。如这段时间内找到 AP，则该信道的扫描时间为 max ms。</li> </ul> <p>如希望提升 Wi-Fi 扫描性能，则可修改上述两个参数。</p> |

调用 API `esp_wifi_set_config()` 可全局配置一些扫描属性，请参阅[station 基本配置](#)。

### 在所有信道中扫描全部 AP（前端）

场景：

上述场景中描述了全信道前端扫描过程。仅 station 模式支持前端扫描，该模式下 station 未连接任何 AP。前端扫描还是后端扫描完全由 Wi-Fi 驱动程序决定，应用程序无法配置这一模式。

详细描述：

#### 扫描配置阶段

- s1.1: 如果默认的国家信息有误，调用函数 `esp_wifi_set_country()` 进行配置。请参阅[Wi-Fi 国家/地区代码](#)。
- s1.2: 调用函数 `esp_wifi_scan_start()` 配置扫描信息，可参阅[扫描配置](#)。该场景为全信道扫描，将 SSID/BSSID/channel 设置为 0 即可。

#### Wi-Fi 驱动程序内部扫描阶段

- s2.1: Wi-Fi 驱动程序切换至信道 1，此时的扫描类型为 WIFI\_SCAN\_TYPE\_ACTIVE，同时发送一个 probe request。反之，Wi-Fi 将等待接收 AP beacon。Wi-Fi 驱动程序将在信道 1 停留一段时间。min/max 扫描时间中定义了 Wi-Fi 在信道 1 中停留的时间长短，默认为 120 ms。
- s2.2: Wi-Fi 驱动程序跳转至信道 2，并重复进行 s2.1 中的步骤。
- s2.3: Wi-Fi 驱动程序扫描最后的信道 N，N 的具体数值由步骤 s1.1 中配置的国家代码决定。

图 54: 所有 Wi-Fi 信道的前端扫描

### 扫描完成后事件处理阶段

- s3.1: 当所有信道扫描全部完成后，将产生 `WIFI_EVENT_SCAN_DONE` 事件。
- s3.2: 应用程序的事件回调函数告知应用程序任务已接收到 `WIFI_EVENT_SCAN_DONE` 事件。调用函数 `esp_wifi_scan_get_ap_num()` 获取在本次扫描中找到的 AP 数量。然后，分配出足够的事物槽，并调用函数 `esp_wifi_scan_get_ap_records()` 获取 AP 记录。请注意，一旦调用 `esp_wifi_scan_get_ap_records()`，Wi-Fi 驱动程序中的 AP 记录将被释放。但是，请不要在单个扫描完成事件中重复调用两次 `esp_wifi_scan_get_ap_records()`。反之，如果扫描完成事件发生后未调用 `esp_wifi_scan_get_ap_records()`，则 Wi-Fi 驱动程序中的 AP 记录不会被释放。因此，请务必确保调用函数 `esp_wifi_scan_get_ap_records()`，且仅调用一次。

### 在所有信道上扫描全部 AP（后端）

场景：

上述场景为一次全信道后端扫描。与在**所有信道中扫描全部 AP（前端）**相比，全信道后端扫描的不同之处在于：在跳至下一个信道之前，Wi-Fi 驱动程序会先返回主信道进行 30 ms 扫描，以便 Wi-Fi 连接有一定的时间发送/接收数据。

### 在所有信道中扫描特定 AP

场景：

该扫描过程与在**所有信道中扫描全部 AP（前端）**相似。区别在于：

- s1.1: 在步骤 1.2 中，目标 AP 将配置为 SSID/BSSID。
- s2.1 ~ s2.N: 每当 Wi-Fi 驱动程序扫描某个 AP 时，它将检查该 AP 是否为目标 AP。如果本次扫描类型为 `WIFI_FAST_SCAN`，且确认已找到目标 AP，则将产生扫描完成事件，同时结束本次扫描；反之，扫描将继续。请注意，第一个扫描的信道可能不是信道 1，因为 Wi-Fi 驱动程序会优化扫描顺序。

如果有多个匹配目标 AP 信息的 AP，例如：碰巧扫描到两个 SSID 为“ap”的 AP。如果本次扫描类型为 `WIFI_FAST_SCAN`，则仅可找到第一个扫描到的“ap”；如果本次扫描类型为 `WIFI_ALL_CHANNEL_SCAN`，则两个“ap”都将被找到，且 station 将根据配置规则连接至其需要连接的“ap”，请参阅 [station 基本配置](#)。

您可以在任意信道中扫描某个特定的 AP，或扫描该信道中的所有 AP。这两种扫描过程也较为相似。

### 在 Wi-Fi 连接模式下扫描

调用函数 `esp_wifi_connect()` 后，Wi-Fi 驱动程序将首先尝试扫描已配置的 AP。Wi-Fi 连接模式下的扫描过程与在**所有信道中扫描特定 AP**过程相同，但连接模式下扫描结束后将不会产生扫描完成事件。如果已找到目标 AP，则 Wi-Fi 驱动程序将开始 Wi-Fi 连接；反之，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件。请参阅在**所有信道中扫描特定 AP**。

### 在禁用模式下扫描

如果函数 `esp_wifi_scan_start()` 中的禁用参数为“true”，则本次扫描为禁用模式下的扫描。在该次扫描完成之前，应用程序任务都将被禁用。禁用模式下的扫描和正常扫描相似，不同之处在于，禁用模式下扫描完成之后将不会出现扫描完成事件。

### 并行扫描

有时，可能会有两个应用程序任务同时调用函数 `esp_wifi_scan_start()`，或者某个应用程序任务在获取扫描完成事件之前再次调用了函数 `esp_wifi_scan_start()`。这两种情况都有可能发生。但是，Wi-Fi 驱动程序并不足以支持多个并行的扫描。因此，应避免上述并行扫描。随着 ESP32 的 Wi-Fi 功能不断提升，未来的版本中可能会增加并行扫描支持。

图 55: 所有 Wi-Fi 信道的后端扫描

图 56: 扫描特定的 Wi-Fi 信道

## 连接 Wi-Fi 时扫描

如果 Wi-Fi 正在连接，则调用函数 `esp_wifi_scan_start()` 后扫描将立即失败，因为 Wi-Fi 连接优先级高于扫描。如果扫描是因为 Wi-Fi 连接而失败的，此时推荐采取的策略为：等待一段时间后重试。因为一旦 Wi-Fi 连接完成后，扫描将立即成功。

但是，延时重试策略并非万无一失。试想以下场景：

- 如果 station 正在连接一个不存在的 AP，或正在使用错误的密码连接一个 AP，此时将产生事件 `WIFI_EVENT_STA_DISCONNECTED`。
- 接收到断开连接事件后，应用程序调用函数 `esp_wifi_connect()` 进行重新连接。
- 而另一个应用程序任务（如，控制任务）调用了函数 `esp_wifi_scan_start()` 进行扫描。这种情况下，每一次扫描都会立即失败，因为 station 一直处于正在连接状态。
- 扫描失败后，应用程序将等待一段时间后进行重新扫描。

上述场景中的扫描永远不会成功，因为 Wi-Fi 一直处于正在连接过程中。因此，如果您的应用程序也可能发生相似的场景，那么就需要为其配置一个更佳的重新连接策略。例如：

- 应用程序可以定义一个连续重新连接次数的最大值，当重新连接的次数达到这个最大值时，立刻停止重新连接。
- 应用程序可以在首轮连续重新连接 N 次后立即进行重新连接，然后延时一段时间后再进行下一次重新连接。

可以给应用程序定义其特殊的重新连接策略，以防止扫描无法成功。请参阅 [Wi-Fi 重新连接](#)。

### 4.36.10 ESP32 Wi-Fi station 连接场景

该场景仅针对在扫描阶段只找到一个目标 AP 的情况，对于多个相同 SSID AP 的情况，请参阅 [找到多个 AP 时的 ESP32 Wi-Fi station 连接](#)。

通常，应用程序无需关心这一连接过程。如感兴趣，可参看下述简介。

场景：

#### 扫描阶段

- s1.1: Wi-Fi 驱动程序开始在“Wi-Fi 连接”模式下扫描。详细信息请参阅 [在 Wi-Fi 连接模式下扫描](#)。
- s1.2: 如果未找到目标 AP，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_NO_AP_FOUND`。请参阅 [Wi-Fi 原因代码](#)。

#### 认证阶段

- s2.1: 发送认证请求数据包并使能认证计时器。
- s1.2: 如果在认证计时器超时之前未接收到认证响应数据包，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_AUTH_EXPIRE`。请参阅 [Wi-Fi 原因代码](#)。
- s2.3: 接收到认证响应数据包，且认证计时器终止。
- s2.4: AP 在响应中拒绝认证且产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，原因代码为 `WIFI_REASON_AUTH_FAIL` 或为 AP 指定的其它原因。请参阅 [Wi-Fi 原因代码](#)。

#### 关联阶段

- s3.1: 发送关联请求并使能关联计时器。
- s3.2: 如果在关联计时器超时之前未接收到关联响应，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_ASSOC_EXPIRE`。请参阅 [Wi-Fi 原因代码](#)。
- s3.3: 接收到关联响应，且关联计时器终止。
- s3.4: AP 在响应中拒绝关联且产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，原因代码将在关联响应中指定。请参阅 [Wi-Fi 原因代码](#)。

图 57: Wi-Fi station 连接过程

## 四次握手阶段

- s4.1: 使能握手定时器，定时器终止之前未接收到 1/4 EAPOL，此时将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_HANDSHAKE_TIMEOUT`。请参阅 [Wi-Fi 原因代码](#)。
- s4.2: 接收到 1/4 EAPOL。
- s4.3: station 回复 2/4 EAPOL。
- s4.4: 如果在握手定时器终止之前未接收到 3/4 EAPOL，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_HANDSHAKE_TIMEOUT`。请参阅 [Wi-Fi 原因代码](#)。
- s4.5: 接收到 3/4 EAPOL。
- s4.6: station 回复 4/4 EAPOL。
- s4.7: station 产生 `WIFI_EVENT_STA_CONNECTED` 事件。

## Wi-Fi 原因代码

下表罗列了 ESP32 中定义的原因代码。其中，第一列为 `esp_wifi_types.h` 中定义的宏名称。名称中省去了前缀 `WIFI_REASON`，也就是说，名称 `UNSPECIFIED` 实际应为 `WIFI_REASON_UNSPECIFIED`，以此类推。第二列为原因代码的相应数值。第三列为该原因映射到 IEEE 802.11-2020 中 9.4.1.7 段的标准值。（更多信息，请参阅前文描述。）最后一列为这一原因的描述。

| 原因代码          | 数值 | 映射值 | 描述  |
|---------------|----|-----|---|
| UN-SPECIFIED  | 1  | 1   | 出现内部错误，例如：内存已满，内部发送失败，或该原因已被远端接收等。  |
| AUTH_EXPIRE   |    | 2   | 先前的 authentication 已失效。<br>对于 ESP station，出现以下情况时将报告该代码： <ul style="list-style-type: none"> <li>• authentication 超时；</li> <li>• 从 AP 接收到该代码。</li> </ul> 对于 ESP AP，出现以下情况时将报告该代码： <ul style="list-style-type: none"> <li>• 在过去五分钟之内，AP 未从 station 接收到任何数据包；</li> <li>• 由于调用了函数 <code>esp_wifi_stop()</code> 导致 AP 终止；</li> <li>• 由于调用了函数 <code>esp_wifi_deauth_sta()</code> 导致 station 的 authentication 取消。</li> </ul> |
| AUTH_BEAVE    |    | 3   | authentication 取消，因为发送 station 正在离开（或已经离开）。<br>对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> <li>• 从 AP 接收到该代码。</li> </ul>  |
| AS-SOC_EXPIRE | 4  | 4   | 因为 AP 不活跃，association 取消。<br>对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> <li>• 从 AP 接收到该代码。</li> </ul> 对于 ESP AP，出现以下情况时将报告该代码： <ul style="list-style-type: none"> <li>• 在过去五分钟之内，AP 未从 station 接收到任何数据包；</li> <li>• 由于调用了函数 <code>esp_wifi_stop()</code> 导致 AP 终止；</li> <li>• 由于调用了函数 <code>esp_wifi_deauth_sta()</code> 导致 station 的 authentication 取消。</li> </ul>                              |

下页继续

表 29 - 续上页

| 原因代码                   | 数值 | 映射值 | 描述  |
|------------------------|----|-----|---|
| AS-SOC_TOOMANY         | 5  | 5   | association 取消, 因为 AP 无法同时处理所有当前已关联的 STA。<br>对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> <li>从 AP 接收到该代码。</li> </ul> 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> <li>与 AP 相关联的 station 数量已到达 AP 可支持的最大值。</li> </ul>   |
| NOT_AUTHED             |    | 6   | 从一个未认证 station 接收到 class-2 frame。<br>对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> <li>从 AP 接收到该代码。</li> </ul> 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> <li>AP 从一个未认证 station 接收到数据包。</li> </ul>                     |
| NOT_ASSOCED            |    | 7   | 从一个未关联 station 接收到的 class-3 frame。<br>对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> <li>从 AP 接收到该代码。</li> </ul> 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> <li>AP 从未关联 station 接收到数据包。</li> </ul>                      |
| AS-SOC_LEAVE           | 8  | 8   | association 取消, 因为发送 station 正在离开 (或已经离开) BSS。<br>对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> <li>从 AP 接收到该代码。</li> <li>由于调用 <code>esp_wifi_disconnect()</code> 和其它 API, station 断开连接。</li> </ul>                                      |
| AS-SOC_NOT_AUTHED      | 9  | 9   | station 的 re(association) 请求未被响应 station 认证。<br>对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> <li>从 AP 接收到该代码。</li> </ul> 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> <li>AP 从一个已关联, 但未认证的 station 接收到数据包。</li> </ul>   |
| DIS-AS-SOC_PWRCAP_BAD  | 10 | 10  | association 取消, 因为无法接收功率能力 (Power Capability) 元素中的信息。<br>对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> <li>从 AP 接收到该代码。</li> </ul>   |
| DIS-AS-SOC_SUPCHAN_BAD | 11 | 11  | association 取消, 因为无法接收支持的信道 (Supported Channels) 元素中的信息。<br>对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> <li>从 AP 接收到该代码。</li> </ul>  |
| IE_INVABID             |    | 13  | 无效元素, 即内容不符合 Wi-Fi 协议中帧格式 (Frame formats) 章节所描述标准的元素。<br>对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> <li>从 AP 接收到该代码。</li> </ul> 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> <li>AP 解析了一个错误的 WPA 或 RSN IE。</li> </ul> |
| MIC_FAILURE            |    | 14  | 消息完整性代码 (MIC) 出错。<br>对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> <li>从 AP 接收到该代码。</li> </ul>   |

表 29 - 续上页

| 原因代码                                   | 数值      | 映射值     | 描述   |
|--|---------|---------|--|
| NOT_AUTHORIZED_TSCATION                |         | TS_LO   | 请求的服务在此位置未得到授权。  |
| SERVICE_CHANGE_PRECLUDES_TS            | 31      | 31      | TS 被删除，原因是：BSS 服务特性或者运行模式改变导致 QoS AP 缺少足够的带宽给 QoS STA 使用（例如：一个 HT BSS 从 40 MHz 的信道切换到 20 MHz 的信道）。 |
| UNSPECIFIED_QOS                        | 32      | 32      | association 取消，由于不明确的 QoS 相关原因。  |
| NOT_ENOUGH_BANDWIDTH                   |         |         | association 取消，由于 QoS AP 缺少足够的带宽给该 QoS STA 使用。   |
| MISSING_ACKS                           | 34      | 34      | association 取消，原因是：大量的帧需要被确认，但由于 AP 传输或者糟糕的信道条件而没有被确认。   |
| EXCEEDED_TXOP                          | 35      | 35      | association 取消，由于 STA 的传输超过了 TXOPs 的限制。  |
| STA_LEAVING                            | 36      | 36      | 请求 STA 离开了 BSS 或者重置了。  |
| END_BA                                 | 37      | 37      | 请求 STA 不再使用该流或者会话。   |
| UNKNOWN_BA                             | 38      | 38      | 请求 STA 使用一种尚未完成的机制接收帧。   |
| TIMEOUT                                | 39      | 39      | 对端 STA 的请求超时。  |
| Reserved                               | 40 ~ 45 | 40 ~ 45 | 保留   |
| PEER_INITIATED                         | 46      | 46      | 在 Disassociation 帧中：已达到授权访问限制。   |
| AP_INITIATED                           | 47      | 47      | 在 Disassociation 帧中：外部服务需求。  |
| INVALID_FT_ACTION_FRAME_COUNT          | 48      | 48      | 无效的 FT Action 帧计数。   |
| INVALID_PMKID                          | 49      | 49      | 无效的成对主密钥标识符（PMKID）。  |
| INVALID_MDE                            | 50      | 50      | 无效的 MDE。   |
| INVALID_FTE                            | 51      | 51      | 无效的 FTE。   |
| TRANSMISSION_LINK_ESTABLISHMENT_FAILED | 67      | 67      | 在备用信道中建立传输链路失败。  |
| ALTERNATIVE_CHANNEL_OCCUPIED           | 68      | 68      | 备用信道被占用。   |
| BEACON_TIMEOUT                         | 200     | 保留      | 乐鑫特有的 Wi-Fi 原因代码：当 station 连续失去 N 个 beacon，将中断连接并报告该代码。  |
| NO_AP_FOUND                            | 201     | 保留      | 乐鑫特有的 Wi-Fi 原因代码：当 station 未扫描到目标 AP 时，将报告该代码。   |
| AUTH_FAIL                              | 202     | 保留      | 乐鑫特有的 Wi-Fi 原因代码：authentication 失败，但并非由超时而引发。  |
| ASSOC_FAIL                             | 203     | 保留      | 乐鑫特有的 Wi-Fi 原因代码：association 失败，但并非由 ASSOC_EXPIRE 或 ASSOC_TOOMANY 引发。                              |
| HANDSHAKE_TIMEOUT                      | 204     | 保留      | 乐鑫特有的 Wi-Fi 原因代码：握手失败，与 WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT 中失败原因相同。                                |
| CONNECTION_FAIL                        | 205     | 保留      | 乐鑫特有的 Wi-Fi 原因代码：AP 连接失败。  |

### 与密码错误有关的 Wi-Fi 原因代码

下表罗列了与密码错误相关的 Wi-Fi 原因代码。

| 原因代码                   | 数值  | 描述  |
|------------------------|-----|---|
| 4WAY_HANDSHAKE_TIMEOUT | 204 | 四次握手超时。STA 在连接加密的 AP 的时候输入了错误的密码  |
| NO_AP_FOUND            | 204 | 密码错误会出现这个原因代码的场景有如下两个： <ul style="list-style-type: none"> <li>• STA 在连接加密的 AP 的时候没有输入密码</li> <li>• STA 在连接非加密的 AP 的时候输入了密码</li> </ul> |
| HANDSHAKE_TIMEOUT      | 204 | 握手超时。   |

### 与低 RSSI 有关的 Wi-Fi 原因代码

下表罗列了与低 RSSI 相关的 Wi-Fi 原因代码。

| 原因代码              | 数值  | 描述                           |
|-------------------|-----|------------------------------|
| NO_AP_FOUND       | 204 | 低 RSSI 导致 station 无法扫描到目标 AP |
| HANDSHAKE_TIMEOUT | 204 | 握手超时。                        |

#### 4.36.11 找到多个 AP 时的 ESP32 Wi-Fi station 连接

该场景与 *ESP32 Wi-Fi station 连接场景* 相似，不同之处在于该场景中不会产生 *WIFI\_EVENT\_STA\_DISCONNECTED* 事件，除非 station 无法连接所有找到的 AP。

#### 4.36.12 Wi-Fi 重新连接

出于多种原因，station 可能会断开连接，例如：连接的 AP 重新启动等。应用程序应负责重新连接。推荐使用的方法为：在接收到 *WIFI\_EVENT\_STA\_DISCONNECTED* 事件后调用函数 `esp_wifi_connect()`。

但有时，应用程序需要更复杂的方式进行重新连接：

- 如果断开连接事件是由调用函数 `esp_wifi_disconnect()` 引发的，那么应用程序可能不希望进行重新连接。
- 如果 station 随时可能调用函数 `esp_wifi_scan_start()` 开始扫描，此时就需要一个更佳的重新连接方法，请参阅 [连接 Wi-Fi 时扫描](#)。

另一点需要注意的是，如果存在多个具有相同 SSID 的 AP，那么重新连接后可能不会连接到之前的同一个 AP。重新连接时，station 将永远选择最佳的 AP 进行连接。

#### 4.36.13 Wi-Fi beacon 超时

ESP32 使用 beacon 超时机制检测 AP 是否活跃。如果 station 在 inactive 时间内未收到所连接 AP 的 beacon，将发生 beacon 超时。inactive 时间通过调用函数 `esp_wifi_set_inactive_time()` 设置。

beacon 超时发生后，station 将向 AP 发送 5 个 probe request，如果仍未从 AP 接收到 probe response 或 beacon，station 将与 AP 断开连接并产生 *WIFI\_EVENT\_STA\_DISCONNECTED* 事件。

需要注意的是，扫描过程中会重置 beacon 超时所使用的定时器，即扫描过程会影响 *WIFI\_EVENT\_STA\_BEACON\_TIMEOUT* 事件的触发。

### 4.36.14 ESP32 Wi-Fi 配置

使能 Wi-Fi NVS 时，所有配置都将存储到 flash 中；反之，请参阅 [Wi-Fi NVS Flash](#)。

#### Wi-Fi 模式

调用函数 `esp_wifi_set_mode()` 设置 Wi-Fi 模式。

| 模式              | 描述   |
|-----------------|--|
| WIFI_MODE_NULL  | NULL 模式：此模式下，内部数据结构不分配给 station 和 AP，同时，station 和 AP 接口不会为发送/接收 Wi-Fi 数据进行初始化。通常，此模式用于 Sniffer，或者您不想通过调用函数 <code>esp_wifi_deinit()</code> 卸载整个 Wi-Fi 驱动程序来同时停止 station 和 AP。 |
| WIFI_MODE_STA   | Station 模式：此模式下， <code>esp_wifi_start()</code> 将初始化内部 station 数据，同时 station 接口准备发送/接收 Wi-Fi 数据。调用函数 <code>esp_wifi_connect()</code> 后，station 将连接到目标 AP。                     |
| WIFI_MODE_AP    | AP 模式：在此模式下， <code>esp_wifi_start()</code> 将初始化内部 AP 数据，同时 AP 接口准备发送/接收 Wi-Fi 数据。随后，Wi-Fi 驱动程序开始广播 beacon，AP 即可与其它 station 连接。   |
| WIFI_MODE_STAAP | Station/AP 共存模式：在此模式下，函数 <code>esp_wifi_start()</code> 将同时初始化 station 和 AP。该步骤在 Station 模式和 AP 模式下完成。请注意 ESP Station 所连外部 AP 的信道优先于 ESP AP 信道。                               |

#### Station 基本配置

API `esp_wifi_set_config()` 可用于配置 station。配置的参数信息会保存到 NVS 中。下表详细介绍了各个字段。

| 字段          | 描述  |
|-------------|---|
| ssid        | station 想要连接的目标 AP 的 SSID。  |
| password    | 目标 AP 的密码。  |
| scan_mode   | 在 WIFI_FAST_SCAN 模式下，扫描到一个匹配的 AP 时即结束。WIFI_ALL_CHANNEL_SCAN 模式下，在所有信道扫描所有匹配的 AP。默认扫描模式是 WIFI_FAST_SCAN。   |
| bssid_set   | 如果 bssid_set 为 0，station 连接 SSID 与 “ssid” 字段相同的 AP，同时忽略字段 “bssid”。其他情况下，station 连接 SSID 与 “ssid” 字段相同、BSSID 与 “bssid” 字段也相同的 AP。  |
| bssid       | 只有当 bssid_set 为 1 时有效。见字段 “bssid_set”。  |
| channel     | 该字段为 0 时，station 扫描信道 1~N 寻找目标 AP；否则，station 首先扫描值与 “channel” 字段相同的信道，再扫描其他信道。如果您不知道目标 AP 在哪个信道，请将该字段设置为 0。   |
| sort_method | 该字段仅用于 WIFI_ALL_CHANNEL_SCAN 模式。如果设置为 WIFI_CONNECT_AP_BY_SIGNAL，所有匹配的 AP 将会按照信号强度排序，信号最好的 AP 会被首先连接。比如，如果 station 想要连接 ssid 为 “apxx” 的 AP，且扫描到两个这样的 AP。第一个 AP 的信号为 -90 dBm，第二个 AP 的信号为 -30 dBm，station 首先连接第二个 AP。除非失败，才会连接第一个。如果设置为 WIFI_CONNECT_AP_BY_SECURITY，所有匹配的 AP 将会按照安全性排序。比如，如果 station 想要连接 ssid 为 “apxx” 的 AP，并且扫描到两个这样的 AP。第一个 AP 为开放式，第二个 AP 为 WPA2 加密，station 首先连接第二个 AP。除非失败，才会连接第一个。 |
| threshold   | 该字段用来筛选找到的 AP，如果 AP 的 RSSI 或安全模式小于配置的阈值，则不会被连接。如果 RSSI 设置为 0，则取 RSSI 的默认阈值 -127 dBm。如果 authmode 设置为 0，则取 authmode 默认阈值无授权。  |

**注意：**WEP/WPA 安全模式在 IEEE802.11-2016 协议中已弃用，建议不要使用。可使用 authmode 阈值代替，通过将 threshold.authmode 设置为 WIFI\_AUTH\_WPA2\_PSK 使用 WPA2 模式

## AP 基本配置

API `esp_wifi_set_config()` 可用于配置 AP。配置的参数信息会保存到 NVS 中。下表详细介绍了各个字段。

| 字段              | 描述   |
|-----------------|--|
| ssid            | 指 AP 的 SSID。如果 ssid[0] 和 ssid[1] 均为 0xFF, AP 默认 SSID 为 ESP_aabbcc, "aabbcc" 是 AP MAC 的最后三个字节。  |
| password        | AP 的密码。如果身份验证模式为 WIFI_AUTH_OPEN, 此字段将被忽略。  |
| ssid_len        | SSID 的长度。如果 ssid_len 为 0, 则检查 SSID 直至出现终止字符。如果 ssid_len 大于 32, 请更改为 32, 或者根据 ssid_len 设置 SSID 长度。  |
| channel         | AP 的信道。如果信道超出范围, Wi-Fi 驱动程序将默认该信道为信道 1。所以, 请确保信道在要求的范围内。有关详细信息, 请参阅 <a href="#">Wi-Fi 国家/地区代码</a> 。  |
| authmode        | ESP AP 的身份验证模式。目前, ESP AP 不支持 AUTH_WEP。如果 authmode 是一个无效值, AP 默认该值为 WIFI_AUTH_OPEN。  |
| ssid_hidden     | 如果 ssid_hidden 为 1, AP 不广播 SSID。若为其他值, 则广播。  |
| max_connection  | 允许连接 station 的最大数目, 默认值是 10。目前, ESP Wi-Fi 支持 15 (ESP_WIFI_MAX_CONN_NUM) 个 Wi-Fi 连接。请注意, ESP AP 和 ESP-NOW 共享同一块加密硬件 keys, 因此 max_connection 参数将受到 <code>CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM</code> 的影响。加密硬件 keys 的总数是 17, 如果 <code>CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM</code> 小于等于 2, 那么 max_connection 最大可以设置为 15, 否则 max_connection 最大可以设置为 $(17 - CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM)$ 。 |
| beacon_interval | beacon 间隔。值为 100 ~ 60000 ms, 默认值为 100 ms。如果该值不在上述范围, AP 默认取 100 ms。  |

## Wi-Fi 协议模式

目前, ESP-IDF 支持以下协议模式:

| 协议模式         | 描述  |
|--------------|---|
| 802.11b      | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B)</code> , 将 station/AP 设置为仅 802.11b 模式。   |
| 802.11bg     | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G)</code> , 将 station/AP 设置为 802.11bg 模式。   |
| 802.11g      | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G)</code> 和 <code>esp_wifi_config_11b_rate(ifx, true)</code> , 将 station/AP 设置为 802.11g 模式。                     |
| 802.11bgn    | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11GN)</code> , 将 station/AP 设置为 802.11bgn 模式。   |
| 802.11gn     | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11GN)</code> 和 <code>esp_wifi_config_11b_rate(ifx, true)</code> , 将 station/AP 设置为 802.11gn 模式。 |
| 802.11 BGNLR | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11GN WIFI_PROTOCOL_LR)</code> , 将 station/AP 设置为 802.11bgn 和 LR 模式。                             |
| 802.11 LR    | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_LR)</code> , 将 station/AP 设置为 LR 模式。<br>此模式是乐鑫的专利模式, 可以达到 1 公里视线范围。请确保 station 和 AP 同时连接至 ESP 设备。                                   |

## 长距离 (LR)

长距离 (LR) 模式是乐鑫的一项专利 Wi-Fi 模式, 可达到 1 公里视线范围。与传统 802.11b 模式相比, 接收灵敏度更高, 抗干扰能力更强, 传输距离更长。

**LR 兼容性** 由于 LR 是乐鑫的独有 Wi-Fi 模式，只有 ESP32 设备才能传输和接收 LR 数据。也就是说，如果连接的设备不支持 LR，ESP32 设备则不会以 LR 数据速率传输数据。可通过配置适当的 Wi-Fi 模式使您的应用程序实现这一功能。如果协商的模式支持 LR，ESP32 可能会以 LR 速率传输数据，否则，ESP32 将以传统 Wi-Fi 数据速率传输所有数据。

下表是 Wi-Fi 模式协商：

| APSTA | BGN | BG | B | BGNLR | BGLR | BLR | LR |
|-------|-----|----|---|-------|------|-----|----|
| BGN   | BGN | BG | B | BGN   | BG   | B   | •  |
| BG    | BG  | BG | B | BG    | BG   | B   | •  |
| B     | B   | B  | B | B     | B    | B   | •  |
| BGNLR | •   | •  | • | BGNLR | BGLR | BLR | LR |
| BGLR  | •   | •  | • | BGLR  | BGLR | BLR | LR |
| BLR   | •   | •  | • | BLR   | BLR  | BLR | LR |
| LR    | •   | •  | • | LR    | LR   | LR  | LR |

上表中，行是 AP 的 Wi-Fi 模式，列是 station 的 Wi-Fi 模式。”-” 表示 AP 和 station 的 Wi-Fi 模式不兼容。

根据上表，得出以下结论：

- 对于已使能 LR 的 ESP32 AP，由于不是以 LR 模式发送 beacon，因此与传统的 802.11 模式不兼容。
- 对于已使能 LR 且并非仅 LR 模式的 ESP32 station，与传统 802.11 模式兼容。
- 如果 station 和 AP 都是 ESP32 设备，并且两者都使能 LR 模式，则协商的模式支持 LR。

如果协商的 Wi-Fi 模式同时支持传统的 802.11 模式和 LR 模式，则 Wi-Fi 驱动程序会在不同的 Wi-Fi 模式下自动选择最佳数据速率，应用程序无需任何操作。

**LR 对传统 Wi-Fi 设备的影响** 以 LR 速率进行的数据传输不会影响传统 Wi-Fi 设备，因为：

- LR 模式下的 CCA 和回退过程符合 802.11 协议。
- 传统的 Wi-Fi 设备可以通过 CCA 检测 LR 信号并进行回退。

也就是说，LR 模式下传输效果与 802.11b 模式相似。

**LR 传输距离** LR 的接收灵敏度比传统的 802.11B 模式高 4 dB，理论上，传输距离约为 802.11B 的 2 至 2.5 倍。

**LR 吞吐量** 因为原始 PHY 数据传输速率为 1/2 Mbps 和 1/4 Mbps，LR 的吞吐量有限。

**何时使用 LR** 通常使用 LR 的场景包括：

- AP 和 station 都是乐鑫设备。
- 需要长距离 Wi-Fi 连接和数据传输。
- 数据吞吐量要求非常小，例如远程设备控制等。

## Wi-Fi 国家/地区代码

调用 `esp_wifi_set_country()`，设置国家/地区信息。下表详细介绍了各个字段，请在配置这些字段之前参考当地的 2.4 GHz RF 操作规定。

| 字段     | 描述  |
|--------|---|
| cc[3]  | 国家/地区代码字符串，此属性标识 station/AP 位于的国家/地区或非国家/地区实体。如果是一个国家/地区，该字符串的前两个八位字节是 ISO/IEC3166-1 中规定的国家/地区两位字母代码。第三个八位字节应是下述之一： <ul style="list-style-type: none"> <li>• ASCII 码空格字符，代表 station/AP 所处国家/地区的规定允许当前频段所需的所有环境。</li> <li>• ASCII 码 ‘O’ 字符，代表 station/AP 所处国家/地区的规定仅允许室外环境。</li> <li>• ASCII 码 ‘I’ 字符，代表 station/AP 所处国家/地区的规定仅允许室内环境。</li> <li>• ASCII 码 ‘X’ 字符，代表 station/AP 位于非国家/地区实体。非国家实体的前两个八位字节是两个 ASCII 码 ‘XX’ 字符。</li> <li>• 当前使用的操作类表编号的二进制形式。见 IEEE Std 802.11-2020 附件 E。</li> </ul> |
| schan  | 起始信道，station/AP 所处国家/地区规定的最小信道值。  |
| nchan  | 规定的总信道数，比如，如果 schan=1，nchan=13，那么 station/AP 可以从信道 1 至 13 发送数据。   |
| policy | 国家/地区策略，当配置的国家/地区信息与所连 AP 的国家/地区信息冲突时，该字段决定使用哪一信息。更多策略相关信息，可参见下文。   |

默认国家/地区信息为：

```
wifi_country_t config = {
    .cc = "CN",
    .schan = 1,
    .nchan = 13,
    .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

如果 Wi-Fi 模式为 station/AP 共存模式，则它们配置的国家/地区信息相同。有时，station 所连 AP 的国家/地区信息与配置的不同。例如，配置的 station 国家/地区信息为：

```
wifi_country_t config = {
    .cc = "JP",
    .schan = 1,
    .nchan = 14,
    .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

但所连 AP 的国家/地区信息为：

```
wifi_country_t config = {
    .cc = "CN",
    .schan = 1,
    .nchan = 13,
};
```

此时，使用所连 AP 的国家/地区信息。

下表描述了在不同 Wi-Fi 模式和不同国家/地区策略下使用的国家/地区信息，并描述了对主动扫描的影响。

| Wi-Fi 模式        | 策略                          | 描述  |
|-----------------|-----------------------------|---|
| station 模式      | WIFI_COUNTRY_POLICY_DEFAULT | 如果 AP 的 beacon 中有国家/地区的 IE，使用的国家/地区信息为 beacon 中的信息，否则，使用默认信息。<br>扫描时：<br>主动扫描信道 1 至信道 11，被动扫描信道 12 至信道 14。<br>请记住，如果带有隐藏 SSID 的 AP 和 station 被设置在被动扫描信道上，被动扫描将无法找到该 AP。也就是说，如果应用程序希望在每个信道中找到带有隐藏 SSID 的 AP，国家/地区信息应该配置为 WIFI_COUNTRY_POLICY_MANUAL。 |
| station 模式      | WIFI_COUNTRY_POLICY_MANUAL  | 总是使用配置的国家/地区信息。<br>扫描时：<br>主动扫描信道 schan 至信道 schan+nchan-1。  |
| AP 模式           | WIFI_COUNTRY_POLICY_DEFAULT | 总是使用配置的国家/地区信息。   |
| AP 模式           | WIFI_COUNTRY_POLICY_MANUAL  | 总是使用配置的国家/地区信息。   |
| station/AP 共存模式 | WIFI_COUNTRY_POLICY_AUTO    | station 与 station 模式、WIFI_COUNTRY_POLICY_AUTO 策略下使用的国家/地区信息相同。如果 station 不连接任何外部 AP，AP 使用配置的国家/地区信息。如果 station 连接一个外部 AP，该 AP 的国家/地区信息与该 station 相同。  |
| station/AP 共存模式 | WIFI_COUNTRY_POLICY_MANUAL  | station 与 station 模式、WIFI_COUNTRY_POLICY_MANUAL 策略下使用的国家/地区信息相同。该 AP 与 AP 模式、WIFI_COUNTRY_POLICY_MANUAL 策略下使用的国家/地区信息相同。  |

**主信道** AP 模式下，AP 的信道定义为主信道。Station 模式下，station 所连 AP 的信道定义为主信道。Station/AP 共存模式下，AP 和 station 的主信道必须相同。如果不同，station 的主信道始终优先。比如，初始时，AP 位于信道 6，但 station 连接信道 9 的 AP。因为 station 的主信道具有优先性，该 AP 需要将信道从 6 切换至 9，确保与 station 主信道相同。切换信道时，SoftAP 模式下的 ESP32 将使用信道切换公告 (CSA) 通知连接的 station。支持信道切换的 station 将直接通过，无需与 SoftAP 断连再重新连接。

### Wi-Fi 供应商 IE 配置

默认情况下，所有 Wi-Fi 管理帧都由 Wi-Fi 驱动程序处理，应用程序不需要任何操作。但是，某些应用程序可能需要处理 beacon、probe request、probe response 和其他管理帧。例如，如果在管理帧中插入一些只针对供应商的 IE，则只有包含此 IE 的管理帧才能得到处理。ESP32 中，`esp_wifi_set_vendor_ie()` 和 `esp_wifi_set_vendor_ie_cb()` 负责此类任务。

### 4.36.15 Wi-Fi 安全性

除了传统的安全保障方法 (WEP/WPA-TKIP/WPA2-CCMP)，ESP32 Wi-Fi 如今还支持最先进的安全协议，即基于 802.11w 标准的“受保护的管理帧” (PMF) 和 Wi-Fi Protected Access 3 (WPA3-Personal) 技术。PMF 与 WPA3 一道，提供更好的隐私性，也能更强地抵御传统模式下的已知攻击。

#### 受保护的管理帧 (PMF)

在 Wi-Fi 中，非 AP station 使用 beacon、探测器、(de)authentication、(dis)association 等管理帧来扫描和连接 AP。与数据帧不同，这些帧发送时未加密。攻击者可以使用窃听和数据包注入等方式在恰当的时间发送虚假的 (de)authentication 和 (dis)association 帧，如果未受保护的管理帧发生改变，将出现以下攻击。

- 在攻击者范围内对一个或所有 client 进行 DOS 攻击。
- 通过发送关联请求取消 AP 端的现有关联。
- 如果 PSK 遭到破坏，强制 client 再次执行 4 次握手，以获得 PTK。
- 从关联请求获取隐藏网络的 SSID。
- 强制 client 从合法 AP 中 (de)authentication，并关联到流氓 AP，发起中间人攻击。

PMF 通过对单播管理帧进行加密，并检查广播管理帧的完整性，阻止上述攻击。其中包括 (de)authentication、(dis)association 和强奸的管理帧。PMF 同样提供“安全关联”(SA) 拆解机制，阻止欺骗 association/authentication frame 断开已连接的 client。

关于 PMF，ESP32 支持以下三种操作模式。

- 不支持 PMF：此模式下，ESP32 向 AP 表示在关联过程中不能支持管理保护。实际上，此模式下的安全性与传统模式相同。
- 支持但未要求使用 PMF：此模式下，ESP32 向 AP 表示能够支持 PMF。如果 AP 授权 PMF 或至少能支持 PMF，将使用管理保护。
- 支持且需要 PMF：此模式下，如果 AP 支持 PMF，ESP32 将仅连接该 AP。如果不支持，ESP32 将拒绝连接该 AP。

通过在 `pmf_cfg` 参数中设置适当标志，`esp_wifi_set_config()` 可以用来配置 PMF 模式。目前，仅 station 模式支持 PMF。

### WPA3-Personal

Wi-Fi Protected Access-3 (WPA3) 是一套增强 Wi-Fi 接入安全性的措施，旨在取代目前的 WPA2 标准。为了提供更强健的认证方式，WPA3 采用了等值同时认证 (SAE) 算法，即基于 Diffie-Hellman 密钥交换的密码认证密钥协议方法。与 WPA2 不同，该技术可以抵御离线字典攻击，即攻击者试图在没有任何进一步网络交互的情况下，根据捕获的 4 次握手来确定共享密码。WPA3 还提供前向保密功能，即数据传输后，即使密码泄露，也无法对捕获的数据进行解密。更多详细信息，请见 Wi-Fi 联盟官方网站 [Security](#) 一章。

要启用 WPA3-Personal，请在 `menuconfig` 中选择“Enable WPA3-Personal”。启用后，如果 AP 支持，ESP32 会使用 SAE 进行身份认证。由于 WPA3 强制要求 PMF，ESP32 要使用 WPA3 模式，至少应该将 PMF 模式设置为“PMF capable, but not required”（支持但未要求使用 PMF）。应用程序的安全模式已经选用最高级别，因此开发者无需担心。请注意，使用 WPA3 时，Wi-Fi 协议栈大小要求将增加约 3 k。目前，仅 Station 模式支持 WPA3。

## 4.36.16 ESP32 Wi-Fi 节能模式

### Station 睡眠

目前，ESP32 Wi-Fi 支持 Modem-sleep 模式，该模式是 IEEE 802.11 协议中的传统节能模式。仅 Station 模式支持该模式，station 必须先连接到 AP。如果启用了 Modem-sleep 模式，station 将定期在活动状态和睡眠状态之间切换。在睡眠状态下，RF、PHY 和 BB 处于关闭状态，以减少功耗。Modem-sleep 模式下，station 可以与 AP 保持连接。

Modem-sleep 模式包括最小和最大节能模式。在最小节能模式下，每个 DTIM 间隔，station 都将唤醒以接收 beacon。广播数据在 DTIM 之后传输，因此不会丢失。但是，由于 DTIM 间隔长短由 AP 决定，如果该间隔时间设置较短，则省电效果不大。

在最大节能模式下，每个监听间隔，station 都将唤醒以接收 beacon。可以设置该监听间隔长于 AP 的 DTIM 周期。在 DTIM 期间内，station 可能处于睡眠状态，广播数据会丢失。如果监听间隔较长，则可以节省更多电量，但广播数据更容易丢失。连接 AP 前，可以通过调用 API `esp_wifi_set_config()` 配置监听间隔。

调用 `esp_wifi_init()` 后，调用 `esp_wifi_set_ps(WIFI_PS_MIN_MODEM)` 可启用 Modem-sleep 最小节能模式。调用 `esp_wifi_set_ps(WIFI_PS_MAX_MODEM)` 可启用 Modem-sleep 最大节能模式。station 连接到 AP 时，Modem-sleep 模式将启动。station 与 AP 断开连接时，Modem-sleep 模式将停止。

调用 `esp_wifi_set_ps(WIFI_PS_NONE)` 可以完全禁用 Modem-sleep 模式。禁用会增大功耗，但可以最大限度减少实时接收 Wi-Fi 数据的延迟。启用 Modem-sleep 时，接收 Wi-Fi 数据的延迟时间可能与

DTIM 周期（最小节能模式）或监听间隔（最大节能模式）相同。在 Wi-Fi 与 Bluetooth LE 共存模式下，无法完全禁用 modem-sleep 模式。

默认的 Modem-sleep 模式是 WIFI\_PS\_MIN\_MODEM。

## AP 睡眠

目前，ESP32 AP 不支持 Wi-Fi 协议中定义的所有节能功能。具体来说，AP 只缓存所连 station 单播数据，不缓存组播数据。如果 ESP32 AP 所连的 station 已使能节能功能，可能发生组播数据包丢失。

未来，ESP32 AP 将支持所有节能功能。

### 4.36.17 ESP32 Wi-Fi 吞吐量

下表是我们在 Espressif 实验室和屏蔽箱中获得的最佳吞吐量结果。

| 类型/吞吐量            | 实验室空气状况   | 屏蔽箱        | 测试工具          | IDF 版本 (commit ID) |
|-------------------|-----------|------------|---------------|--------------------|
| 原始 802.11 数据包接收数据 | N/A       | 130 MBit/s | 内部工具          | N/A                |
| 原始 802.11 数据包发送数据 | N/A       | 130 MBit/s | 内部工具          | N/A                |
| UDP 接收数据          | 30 MBit/s | 85 MBit/s  | iperf example | 15575346           |
| UDP 发送数据          | 30 MBit/s | 75 MBit/s  | iperf example | 15575346           |
| TCP 接收数据          | 20 MBit/s | 65 MBit/s  | iperf example | 15575346           |
| TCP 发送数据          | 20 MBit/s | 75 MBit/s  | iperf example | 15575346           |

使用 iperf example 测试吞吐量时，sdkconfig 是:idf\_file:' 示例/wifi/iperf/sdkconfig.defaults.esp32'。

### 4.36.18 Wi-Fi 80211 数据包发送

**重要说明：** API `esp_wifi_80211_tx()` 在 IDF 2.1 中不可用，即将发布的版本将可以使用。

`esp_wifi_80211_tx()` API 可用于：

- 发送 beacon、probe request、probe response 和 action 帧。
- 发送非 QoS 数据帧。

不能用于发送加密或 QoS 帧。

#### 使用 `esp_wifi_80211_tx()` 的前提条件

- Wi-Fi 模式为 station 模式，AP 模式，或 station/AP 共存模式。
- API `esp_wifi_set_promiscuous(true)` 或 `esp_wifi_start()`，或者二者都返回 ESP\_OK。这是为确保在调用函数 `esp_wifi_80211_tx()` 前，Wi-Fi 硬件已经初始化。对于 ESP32，`esp_wifi_set_promiscuous(true)` 和 `esp_wifi_start()` 都可以触发 Wi-Fi 硬件初始化。
- 提供正确的 `esp_wifi_80211_tx()` 参数。

#### 传输速率

- 默认传输速率为 1 Mbps。
- 可以通过函数 `esp_wifi_config_80211_tx_rate()` 设置任意速率。
- 可以通过函数 `esp_wifi_set_bandwidth()` 设置任意带宽。

### 在不同情况下需要避免的副作用

理论上, 如果不考虑 API 对 Wi-Fi 驱动程序或其他 station 或 AP 的副作用, 可以通过空中发送一个原始的 802.11 数据包, 包括任何目的地址的 MAC、任何源地址的 MAC、任何 BSSID、或任何其他类型的数据包。但是, 一个具有强健、有用的应用程序应该避免这种副作用。下表针对如何避免 `esp_wifi_80211_tx()` 的副作用提供了一些提示或建议。

| 场景         | 描述  |
|------------|---|
| 无 Wi-Fi 连接 | <p>在这种情况下，因为没有 Wi-Fi 连接，Wi-Fi 驱动程序不会受到副作用影响。如果 <code>en_sys_seq==true</code>，则 Wi-Fi 驱动程序负责序列控制。如果 <code>en_sys_seq==false</code>，应用程序需要确保缓冲区的序列正确。</p> <p>理论上，MAC 地址可以是任何地址。但是，这样可能会影响其他使用相同 MAC/BSSID 的 station/AP。例如，AP 模式下，应用程序调用函数 <code>esp_wifi_80211_tx()</code> 发送带有 BSSID == <code>mac_x</code> 的 beacon，但是 <code>mac_x</code> 并非 AP 接口的 MAC。而且，还有另一个 AP（我们称之为“other-AP”）的 bssid 是 <code>mac_x</code>。因此，连接到“other-AP”的 station 无法分辨 beacon 来自“other-AP”还是 <code>esp_wifi_80211_tx()</code>，就会出现“意外行为”。</p> <p>为了避免上述副作用，我们建议：</p> <ul style="list-style-type: none"> <li>-如果在 Station 模式下调用函数 <code>esp_wifi_80211_tx()</code>，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 station 接口的 MAC。</li> <li>-如果在 AP 模式下调用函数 <code>esp_wifi_80211_tx</code>，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 AP 接口的 MAC。</li> </ul> <p>上述建议仅供避免副作用，在有充分理由的情况下可以忽略。</p>                              |
| 有 Wi-Fi 连接 | <p>当 Wi-Fi 已连接，且序列由应用程序控制，应用程序可能会影响整个 Wi-Fi 连接的序列控制。因此，<code>en_sys_seq</code> 要为 <code>true</code>，否则将返回 <code>ESP_ERR_WIFI_ARG</code>。</p> <p>“无 Wi-Fi 连接”情况下的 MAC 地址建议也适用于此情况。如果 Wi-Fi 模式是 Station 模式，MAC 的地址 1 是 station 所连 AP 的 MAC，地址 2 是 station 接口的 MAC，那么就称数据包是从 station 发送到 AP。另一方面，如果 Wi-Fi 模式是 AP 模式，且 MAC 地址 1 是该 AP 所连 station 的 MAC，地址 2 是 AP 接口的 MAC，那么就称数据包是从 AP 发送到 station。为避免与 Wi-Fi 连接冲突，可采用以下检查方法：</p> <ul style="list-style-type: none"> <li>-如果数据包类型是数据，且是从 station 发送到 AP，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 1，FromDS 位为 0，否则，Wi-Fi 驱动程序不接受该数据包。</li> <li>-如果数据包类型是数据，且是从 AP 发送到 station，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 0，FromDS 位为 1，否则，Wi-Fi 驱动程序不接受该数据包。</li> <li>-如果数据包是从 station 发送到 AP，或从 AP 到 station，Power Management、More Data 和 Re-Transmission 位应该为 0，否则，Wi-Fi 驱动程序不接受该数据包。</li> </ul> <p>如果任何检查失败，将返回 <code>ESP_ERR_WIFI_ARG</code>。</p> |

### 4.36.19 Wi-Fi Sniffer 模式

Wi-Fi Sniffer 模式可以通过 `esp_wifi_set_promiscuous()` 使能。如果使能 Sniffer 模式，可以向应用程序转储以下数据包。

- 802.11 管理帧
- 802.11 数据帧，包括 MPDU、AMPDU、AMSDU 等
- 802.11 MIMO 帧，Sniffer 模式仅转储 MIMO 帧的长度。
- 802.11 控制帧

不可以向应用程序转储以下数据包。

- 802.11 错误帧，如有 CRC 错误的帧等。

对于 Sniffer 模式可以转储的帧，应用程序可以另外使用 `esp_wifi_set_promiscuous_filter()` 和 `esp_wifi_set_promiscuous_ctrl_filter()` 决定筛选哪些特定类型的数据包。应用程序默认筛选所有 802.11 数据和管理帧。

可以在 `WIFI_MODE_NULL`、`WIFI_MODE_STA`、`WIFI_MODE_AP`、`WIFI_MODE_APSTA` 等 Wi-Fi 模式下使能 Wi-Fi Sniffer 模式。也就是说，当 station 连接到 AP，或者 AP 有 Wi-Fi 连接时，就可以使能。请注意，Sniffer 模式对 station/AP Wi-Fi 连接的吞吐量有 **很大影响**。通常，除非有特别原因，当 station/AP Wi-Fi 连接出现大量流量，不应使能。

该模式下还应注意回调函数 `wifi_promiscuous_cb_t` 的使用。该回调将直接在 Wi-Fi 驱动程序任务中进行，所以如果应用程序需处理大量过滤的数据包，建议在回调中向应用程序任务发布一个事件，把真正的工作推迟到应用程序任务中完成。

### 4.36.20 Wi-Fi 多根天线

下图描述 Wi-Fi 多根天线的选择过程：

ESP32 通过外部天线开关，最多支持 16 根天线。天线开关最多可由四个地址管脚控制 - `antenna_select[0:3]`。向 `antenna_select[0:3]` 输入不同的值，以选择不同的天线。例如，输入值 ‘0b1011’ 表示选中天线 11。 `antenna_select[3:0]` 的默认值为 “0b0000”，表示默认选择了天线 0。

四个高电平有效 `antenna_select` 管脚有多达四个 GPIO 连接。ESP32 可以通过控制 GPIO[0:3] 选择天线。API `esp_wifi_set_ant_gpio()` 用于配置 `antenna_selects` 连接哪些 GPIO。如果 GPIO[x] 连接到 `antenna_select[x]`，`gpio_config->gpio_cfg[x].gpio_select` 应设置为 1，且要提供 `gpio_config->gpio_cfg[x].gpio_num` 的值。

天线开关的具体实现不同，`antenna_select[0:3]` 的输入值中可能存在非法值，即 ESP32 通过外部天线开关支持的天线数可能小于 16 根。例如，ESP32-WROOM-DA 使用 RTC6603SP 作为天线开关，仅支持 2 根天线。两个天线选择输入管脚为高电平有效，连接到两个 GPIO。’ 0b01’ 表示选中天线 0，’ 0b10’ 表示选中天线 1。输入值 ‘0b00’ 和 ‘0b11’ 为非法值。

尽管最多支持 16 根天线，发送和接收数据时，最多仅能同时使能两根天线。API `esp_wifi_set_ant()` 用于配置使能哪些天线。

使能天线后，选择算法的过程同样可由 `esp_wifi_set_ant()` 配置。接收/发送数据源的天线模式可以是 `WIFI_ANT_MODE_ANT0`、`WIFI_ANT_MODE_ANT1` 或 `WIFI_ANT_MODE_AUTO`。如果天线模式为 `WIFI_ANT_MODE_ANT0`，使能的天线 0 用于接收/发送数据。如果天线模式为 `WIFI_ANT_MODE_ANT1`，使能天线 1 用于接收/发送数据。否则，Wi-Fi 会自动选择使能天线中信号较好的天线。

如果接收数据的天线模式为 `WIFI_ANT_MODE_AUTO`，还需要设置默认天线模式。只有在满足某些条件时，接收数据天线才会切换，例如，如果 RSSI 低于 -65 dBm，或另一根天线信号更好。如果条件不满足，接收数据使用默认天线。如果默认天线模式为 `WIFI_ANT_MODE_ANT1`，则使能的天线 1 是默认接收数据天线，否则是使能的天线 0。

有一些限制情况需要考虑：

- 因为发送数据天线基于 `WIFI_ANT_MODE_AUTO` 类型的接收数据天线选择算法，只有接收数据的天线模式为 `WIFI_ANT_MODE_AUTO` 时，发送数据天线才能设置为 `WIFI_ANT_MODE_AUTO`。
- 目前，Bluetooth® 不支持多根天线功能，请不要使用与多根天线有关的 API。
- 目前不支持 Bluetooth/Bluetooth LE SoftAP 共存模式。

推荐在以下场景中使用多根天线：

- Wi-Fi 模式 `WIFI_MODE_STA` 下，接收/发送数据的天线模式均配置为 `WIFI_ANT_MODE_AUTO`。Wi-Fi 驱动程序自动选择更好的接收/发送数据天线。
- 接收数据天线模式配置为 `WIFI_ANT_MODE_AUTO`。发送数据的天线模式配置为 `WIFI_ANT_MODE_ANT0` 或 `WIFI_ANT_MODE_ANT1`。应用程序可以始终选择指定的天线用于发送数据，也可以执行自身发送数据天线选择算法，如根据信道切换信息选择发送数据的天线模式等。
- 接收/发送数据的天线模式均配置为 `WIFI_ANT_MODE_ANT0` 或 `WIFI_ANT_MODE_ANT1`。

## Wi-Fi 多根天线配置

通常，可以执行以下步骤来配置多根天线：

- 配置 `antenna_selects` 连接哪些 GPIOs，例如，如果支持四根天线，且 GPIO20/GPIO21 连接到 `antenna_select[0]`/`antenna_select[1]`，配置如下所示：

```
wifi_ant_gpio_config_t config = {
    { .gpio_select = 1, .gpio_num = 20 },
    { .gpio_select = 1, .gpio_num = 21 }
};
```

- 配置使能哪些天线、以及接收/发送数据如何使用使能的天线，例如，如果使能了天线 1 和天线 3，接收数据需要自动选择较好的天线，并将天线 1 作为默认天线，发送数据始终选择天线 3。配置如下所示：

```
wifi_ant_config_t config = {
    .rx_ant_mode = WIFI_ANT_MODE_AUTO,
    .rx_ant_default = WIFI_ANT_ANT0,
    .tx_ant_mode = WIFI_ANT_MODE_ANT1,
    .enabled_ant0 = 1,
    .enabled_ant1 = 3
};
```

### 4.36.21 Wi-Fi 信道状态信息

信道状态信息 (CSI) 是指 Wi-Fi 连接的信道信息。ESP32 中，CSI 由子载波的信道频率响应组成，CSI 从发送端接收数据包时开始估计。每个子载波信道频率响应由两个字节的有符号字符记录，第一个字节是虚部，第二个字节是实部。根据接收数据包的类型，信道频率响应最多有三个字段。分别是 LLTF、HT-LTF 和 STBC-HT-LTF。对于在不同状态的信道上接收到的不同类型的数据包，CSI 的子载波索引和总字节数如下表所示。

| 信道    | 辅助信道        | 下          |            |            |        |        |        |            |            | 上      |      |        |            |            |            |      |
|-------|-------------|------------|------------|------------|--------|--------|--------|------------|------------|--------|------|--------|------------|------------|------------|------|
|       |             | 非 HT       | HT         |            |        | 非 HT   | HT     |            | 40 MHz     |        |      | 非 HT   | HT         |            |            |      |
| 数据包信息 | 信号模式        | 20 MHz     | 20 MHz     |            |        | 20 MHz | 20 MHz |            | 40 MHz     |        |      | 20 MHz | 20 MHz     |            | 40 MHz     |      |
|       | STBC        | 非 STBC     | 非 STBC     | STBC       | 非 STBC | 非 STBC | STBC   | 非 STBC     | STBC       | 非 STBC | STBC | 非 STBC | 非 STBC     | STBC       | 非 STBC     | STBC |
| 子载波索引 | LLTF        | 0~31, 32~1 | 0~31, 32~1 | 0~31, 32~1 | 0~63   | 0~63   | 0~63   | 0~63       | 0~63       | -      | -    | -      | -          | -          |            |      |
|       | HT-LTF      | —          | 0~31, 32~1 | 0~31, 32~1 | —      | 0~63   | 0~62   | 0~63, 64~1 | 0~60, 60~1 | —      | -    | -      | 0~63, 64~1 | 0~60, 60~1 |            |      |
|       | STBC-HT-LTF | —          | —          | 0~31, 32~1 | —      | —      | 0~62   | —          | 0~60, 60~1 | —      | —    | -      | 62~1       | —          | 0~60, 60~1 |      |
| 总字节数  |             | 128        | 256        | 384        | 128    | 256    | 380    | 384        | 612        | 128    | 256  | 376    | 384        | 612        |            |      |

表中的所有信息可以在 `wifi_csi_info_t` 结构中找到。

- 辅助信道指 `rx_ctrl` 字段的 `secondary_channel` 字段。
- 数据包的信号模式指 `rx_ctrl` 字段的 `sig_mode` 字段。
- 信道带宽指 `rx_ctrl` 字段中的 `cwb` 字段。
- STBC 指 `rx_ctrl` 字段的 `stbc` 字段。
- 总字节数指 `len` 字段。
- 每个长训练字段 (LTF) 类型对应的 CSI 数据存储在与从 `buf` 字段开始的缓冲区中。每个元素以两个字节的形式存储：虚部和实部。每个元素的顺序与表中的子载波相同。LTF 的顺序是 LLTF、HT-LTF 和 STBC-HT-LTF。但是，根据信道和数据包的信息，3 个 LTF 可能都不存在（见上文）。
- 如果 `wifi_csi_info_t` 的 `first_word_invalid` 字段为 `true`，表示由于 ESP32 的硬件限制，CSI 数据的前四个字节无效。
- 更多信息，如 RSSI，射频的噪声底，接收时间和天线 `rx_ctrl` 领域。

子载波的虚部和实部的使用请参考下表。

| PHY 标准         | 子载波范围      | 导频子载波                        | 子载波个数 (总数/数据子载波)      |
|----------------|------------|------------------------------|-----------------------|
| 802.11a/g      | -26 to +26 | -21, -7, +7, +21             | 52 total, 48 usable   |
| 802.11n, 20MHz | -28 to +28 | -21, -7, +7, +21             | 56 total, 52 usable   |
| 802.11n, 40MHz | -57 to +57 | -53, -25, -11, +11, +25, +53 | 114 total, 108 usable |

#### 备注:

- 对于 STBC 数据包，每个空时流都提供了 CSI，不会出现 CSD（循环移位延迟）。由于附加链上的每一次循环移位为 -200 ns，因为子载波 0 中没有信道频率响应，在 HT-LTF 和 STBC-HT-LTF 中只记录第一空时流的 CSD 角度。CSD[10:0] 是 11 位，范围从  $-\pi$  到  $\pi$ 。
- 如果调用 API `esp_wifi_set_csi_config()` 没有使能 LLTF、HT-LTF 或 STBC-HT-LTF，则 CSI 数据的总字节数会比表中的少。例如，如果没有使能 LLTF 和 HT-LTF，而使能 STBC-HT-LTF，当接收到上述条件、HT、40 MHz 或 STBC 的数据包时，CSI 数据的总字节数为 244 ( $(61+60)*2+2=244$ ，结果对齐为四个字节，最后两个字节无效)。

### 4.36.22 Wi-Fi 信道状态信息配置

要使用 Wi-Fi CSI，需要执行以下步骤。

- 在菜单配置中选择 Wi-Fi CSI。方法是“菜单配置 -> 组件配置 -> Wi-Fi -> Wi-Fi CSI (信道状态信息)”。

- 调用 API `esp_wifi_set_csi_rx_cb()` 设置 CSI 接收回调函数。
- 调用 API `esp_wifi_set_csi_config()` 配置 CSI。
- 调用 API `esp_wifi_set_csi()` 使能 CSI。

CSI 接收回调函数从 Wi-Fi 任务中运行。因此，不要在回调函数中进行冗长的操作。可以将需要的数据发布到队列中，并从一个较低优先级的任务中处理。由于 station 在断开连接时不会收到任何数据包，只有在连接时才会收到来自 AP 的数据包，因此建议通过调用函数 `esp_wifi_set_promiscuous()` 使能 Sniffer 模式接收更多 CSI 数据。

### 4.36.23 Wi-Fi HT20/40

ESP32 支持 Wi-Fi 带宽 HT20 或 HT40，不支持 HT20/40 共存，调用函数 `esp_wifi_set_bandwidth()` 可改变 station/AP 的默认带宽。ESP32 station 和 AP 的默认带宽为 HT40。

Station 模式下，实际带宽首先在 Wi-Fi 连接时协商。只有当 station 和所连 AP 都支持 HT40 时，带宽才为 HT40，否则为 HT20。如果所连的 AP 的带宽发生变化，则在不断开 Wi-Fi 连接的情况下再次协商实际带宽。

同样，在 AP 模式下，在 AP 与所连 station 协商实际带宽。如果 AP 和其中一个 station 支持 HT40，则为 HT40，否则为 HT20。

在 Station/AP 共存模式下，station 和 AP 都可独立配置为 HT20/40。如果 station 和 AP 都协商为 HT40，由于 ESP32 中，station 的优先级总高于 AP，HT40 信道是 station 的信道。例如，AP 的配置带宽为 HT40，配置的主信道为 6，配置的辅助信道为 10。如果，station 所连路由器的主信道为 6、辅助信道为 2，AP 的实际信道将自动更改为主 6 和辅 2。

理论上，HT40 可以获得更大的吞吐量，因为 HT40 的最大原始 PHY 数据速率为 150Mbps，而 HT20 为 72Mbps。但是，如果设备在某些特殊环境中使用，例如，ESP32 周围其他 Wi-Fi 设备过多，HT40 的性能可能会降低。因此，如果应用程序需要支持相同或类似的情况，建议始终将带宽配置为 HT20。

### 4.36.24 Wi-Fi QoS

ESP32 支持 WFA Wi-Fi QoS 认证所要求的所有必备功能。

Wi-Fi 协议中定义了四个 AC（访问类别），每个 AC 有各自的优先级访问 Wi-Fi 信道。此外，还定义了映射规则以映射其他协议的 QoS 优先级，例如 802.11D 或 TCP/IP 到 Wi-Fi AC。

下表描述 ESP32 中 IP 优先级如何映射到 Wi-Fi AC，还指明此 AC 是否支持 AMPDU。该表按优先级降序排列，即 AC\_VO 拥有最高优先级。

| IP 优先级 | Wi-Fi AC            | 是否支持 AMPDU |
|--------|---------------------|------------|
| 6, 7   | AC_VO (Voice)       | 否          |
| 4, 5   | AC_VI (Video)       | 是          |
| 3, 0   | AC_BE (Best Effort) | 是          |
| 1, 2   | AC_BK (Background)  | 是          |

应用程序可以通过套接字选项 `IP_TOS` 配置 IP 优先级使用 QoS 功能。下面是使套接字使用 VI 队列的示例：

```
const int ip_precedence_vi = 4;
const int ip_precedence_offset = 5;
int priority = (ip_precedence_vi << ip_precedence_offset);
setsockopt(socket_id, IPPROTO_IP, IP_TOS, &priority, sizeof(priority));
```

理论上，高优先级的 AC 比低优先级 AC 具有更好的性能，但并非总是如此，下面是一些关于如何使用 Wi-Fi QoS 的建议：

- 可以把一些真正重要的应用程序流量放到 AC\_VO 队列中。避免通过 AC\_VO 队列发送大流量。一方面，AC\_VO 队列不支持 AMPDU，如果流量很大，性能不会优于其他队列。另一方面，可能会影响同样使用 AC\_VO 队列的管理帧。

- 避免使用 AMPDU 支持的、两个以上的不同优先级，比如 socket A 使用优先级 0，socket B 使用优先级 1，socket C 使用优先级 2。因为可能需要更多的内存，不是好的设计。具体来说，Wi-Fi 驱动程序可能会为每个优先级生成一个 Block Ack 会话，如果设置了 Block Ack 会话，则需要更多内存。

### 4.36.25 Wi-Fi AMSDU

ESP32 支持接收和发送 AMSDU。

### 4.36.26 Wi-Fi 分片

支持 Wi-Fi 接收分片，但不支持 Wi-Fi 发送分片。

### 4.36.27 WPS 注册

在 Wi-Fi 模式 WIFL\_MODE\_STA 或 WIFI\_MODE\_APSTA 下，ESP32 支持 WPS 注册功能。目前，ESP32 支持的 WPS enrollee 类型有 PBC 和 PIN。

### 4.36.28 Wi-Fi 缓冲区使用情况

本节只介绍动态缓冲区配置。

#### 缓冲区配置的重要性

为了获得一个具有强健、高性能的系统，我们需要非常谨慎地考虑内存的使用或配置情况，因为：

- ESP32 的可用内存有限。
- 目前，LwIP 和 Wi-Fi 驱动程序中默认的缓冲区类型是“动态”，意味着 LwIP 和 Wi-Fi 都与应用程序共享内存。程序员应该时刻牢记这一点，否则将面临如“堆内存耗尽”等的内存问题。
- “堆耗尽”情况非常危险，会导致 ESP32 出现“未定义行为”。因此，应该为应用程序预留足够的堆内存，防止耗尽。
- Wi-Fi 的吞吐量很大程度上取决于与内存相关的配置，如 TCP 窗口大小、Wi-Fi 接收/发送数据动态缓冲区数量等。
- ESP32 LwIP/Wi-Fi 可能使用的堆内存峰值取决于许多因素，例如应用程序可能拥有的最大 TCP/UDP 连接等。
- 在考虑内存配置时，应用程序所需的总内存也是一个重要因素。

由于这些原因，不存在一个适合所有应用程序的配置。相反，我们必须为每个不同的应用程序考虑不同的内存配置。

#### 动态与静态缓冲区

Wi-Fi 驱动程序中默认的缓存类型是“动态”。大多数情况下，动态缓冲区可以极大地节省内存。但是因为应用程序需要考虑 Wi-Fi 的内存使用情况，会给应用程序编程造成一定的难度。

LwIP 还在 TCP/IP 层分配缓冲区，这种缓冲区分配也是动态的。具体内容，见 [lwIP 文档内存使用和性能部分](#)。

#### Wi-Fi 动态缓冲区峰值

Wi-Fi 驱动程序支持多种类型的缓冲区（参考 [Wi-Fi 缓冲区配置](#)）。但本节只介绍 Wi-Fi 动态缓冲的使用方法 Wi-Fi 使用的堆内存峰值是 Wi-Fi 驱动程序理论上消耗的最大内存。通常，该内存峰值取决于：

- 配置的动态接收数据缓冲区数：wifi\_rx\_dynamic\_buf\_num
- 配置的动态发送数据缓冲区数：wifi\_tx\_dynamic\_buf\_num

- Wi-Fi 驱动程序可以接收的最大数据包: `wifi_rx_pkt_size_max`
- Wi-Fi 驱动程序可以发送的最大数据包: `wifi_tx_pkt_size_max`

因此, Wi-Fi 驱动程序消耗的内存峰值可以用下面的公式计算:

$$\text{wifi\_dynamic\_peek\_memory} = (\text{wifi\_rx\_dynamic\_buf\_num} * \text{wifi\_rx\_pkt\_size\_max}) + (\text{wifi\_tx\_dynamic\_buf\_num} * \text{wifi\_tx\_pkt\_size\_max})$$

一般情况下, 不需要关心动态发送数据长缓冲区和超长缓冲区, 因为它们是管理帧, 对系统的影响很小。

### 4.36.29 如何提高 Wi-Fi 性能

ESP32 Wi-Fi 的性能收到许多参数的影响, 各参数之间存在相互制约。如果配置地合理, 不仅可以提高性能, 还可以增加应用程序的可用内存, 提高稳定性。

在本节中, 我们将简单介绍 Wi-Fi/LWIP 协议栈的工作模式, 并说明各个参数的作用。我们将推荐几种配置等级, 您可以根据使用场景选择合适的等级。

#### 协议栈工作模式

图 58: ESP32 数据路径

ESP32 协议栈分为四层, 分别为应用层、LWIP 层、Wi-Fi 层和硬件层。

- 在接收过程中, 硬件将接收到的数据包放入 DMA 缓冲区, 然后依次传送到 Wi-Fi 的接收数据缓冲区、LWIP 的接收数据缓冲区进行相关协议处理, 最后传送到应用层。Wi-Fi 的接收数据缓冲区和 LWIP 的接收数据缓冲区默认共享同一个缓冲区。也就是说, Wi-Fi 默认将数据包转发到 LWIP 作为参考。
- 在发送过程中, 应用程序首先将要发送的消息复制到 LWIP 层的发送数据缓冲区, 进行 TCP/IP 封装。然后将消息发送到 Wi-Fi 层的发送数据缓冲区进行 MAC 封装, 最后等待发送。

#### 参数

适当增加上述缓冲区的大小或数量, 可以提高 Wi-Fi 性能, 但同时, 会减少应用程序的可用内存。下面我们将介绍您需要配置的参数:

##### 接收数据方向:

- **`CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM`** 该参数表示硬件层的 DMA 缓冲区数量。提高该参数将增加发送方的一次性接收吞吐量, 从而提高 Wi-Fi 协议栈处理突发流量的能力。

- ***CONFIG\_ESP32\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM*** 该参数表示 Wi-Fi 层中接收数据缓冲区的数量。提高该参数可以增强数据包的接收性能。该参数需要与 LWIP 层的接收数据缓冲区大小相匹配。
- ***CONFIG\_ESP32\_WIFI\_RX\_BA\_WIN*** 该参数表示接收端 AMPDU BA 窗口的大小，应配置为 ***CONFIG\_ESP32\_WIFI\_STATIC\_RX\_BUFFER\_NUM*** 和 ***CONFIG\_ESP32\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM*** 的二倍数值中较小的数值。
- ***CONFIG\_LWIP\_TCP\_WND\_DEFAULT*** 该参数表示 LWIP 层用于每个 TCP 流的接收数据缓冲区大小，应配置为 ***WIFI\_DYNAMIC\_RX\_BUFFER\_NUM***(KB) 的值，从而实现高稳定性能。同时，在有多个流的情况下，应相应降低该参数。

#### 发送数据方向：

- ***CONFIG\_ESP32\_WIFI\_STATIC\_TX\_BUFFER\_NUM*** 该参数表示发送数据缓冲区的类型，建议配置为动态缓冲区，该配置可以充分利用内存。
- ***CONFIG\_ESP32\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM*** 该参数表示 Wi-Fi 层发送数据缓冲区数量。提高该参数可以增强数据包发送的性能。该参数值需要与 LWIP 层的发送数据缓冲区大小相匹配。
- ***CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT*** 该参数表示 LWIP 层用于每个 TCP 流的发送数据缓冲区大小，应配置为 ***WIFI\_DYNAMIC\_TX\_BUFFER\_NUM***(KB) 的值，从而实现高稳定性能。在有多个流的情况下，应相应降低该参数。

#### 通过在 IRAM 中放置代码优化吞吐量：

- ***CONFIG\_ESP32\_WIFI\_IRAM\_OPT*** 如果使能该选项，一些 Wi-Fi 功能将被移至 IRAM，从而提高吞吐量，IRAM 使用量将增加 15 kB。
- ***CONFIG\_ESP32\_WIFI\_RX\_IRAM\_OPT*** 如果使能该选项，一些 Wi-Fi 接收数据功能将被移至 IRAM，从而提高吞吐量，IRAM 使用量将增加 16 kB。
- ***CONFIG\_LWIP\_IRAM\_OPTIMIZATION*** 如果使能该选项，一些 LWIP 功能将被移至 IRAM，从而提高吞吐量，IRAM 使用量将增加 13 kB。

---

**备注：** 上述的缓冲区大小固定为 1.6 KB。

---

### 如何配置参数

ESP32 的内存由协议栈和应用程序共享。

在这里，我们给出了几种配置等级。在大多数情况下，您应根据应用程序所占用内存的大小，选择合适的等级进行参数配置。

下表中未提及的参数应设置为默认值。

| 等级                         | Iperf | 发送数据<br>优先 | 高性<br>能 | 接收数据<br>优先 | 默认<br>值 | 节省内<br>存 | 最小    |
|----------------------------|-------|------------|---------|------------|---------|----------|-------|
| 可用内存 (KB)                  | 37.1  | 113.8      | 123.3   | 145.5      | 144.5   | 170.2    | 185.2 |
| WIFI_STATIC_RX_BUFFER_NUM  | 6     | 6          | 6       | 6          | 6       | 6        | 4     |
| WIFI_DYNAMIC_RX_BUFFER_NUM | 16    | 16         | 24      | 34         | 20      | 12       | 8     |
| WIFI_DYNAMIC_TX_BUFFER_NUM | 16    | 28         | 24      | 18         | 20      | 12       | 8     |
| WIFI_RX_BA_WIN             | 32    | 8          | 12      | 12         | 10      | 6        | 禁用    |
| TCP_SND_BUF_DEFAULT (KB)   | 65    | 28         | 24      | 18         | 20      | 12       | 8     |
| TCP_WND_DEFAULT (KB)       | 65    | 16         | 24      | 34         | 20      | 12       | 8     |
| WIFI_IRAM_OPT              | 15    | 15         | 15      | 15         | 15      | 15       | 15    |
| WIFI_RX_IRAM_OPT           | 16    | 16         | 16      | 16         | 16      | 16       | 16    |
| LWIP_IRAM_OPTIMIZATION     | 13    | 13         | 13      | 13         | 13      | 13       | 13    |
| TCP 发送数据吞吐量 (Mbit/s)       | 74.6  | 50.8       | 46.5    | 39.9       | 44.2    | 33.8     | 25.6  |
| TCP 接收数据吞吐量 (Mbit/s)       | 63.6  | 35.5       | 42.3    | 48.5       | 40.5    | 30.1     | 27.8  |
| UDP 发送数据吞吐量 (Mbit/s)       | 76.2  | 75.1       | 74.1    | 72.4       | 69.6    | 64.1     | 36.5  |
| UDP 接收数据吞吐量 (Mbit/s)       | 83.1  | 66.3       | 75.1    | 75.6       | 73.1    | 65.3     | 54.7  |

**备注：**以上结果使用华硕 RT-N66U 路由器，在屏蔽箱中进行单流测试得出。ESP32 的 CPU 为双核，频率为 240 MHz，flash 为 QIO 模式，频率为 80 MHz。

#### 等级：

- **Iperf 等级** ESP32 的极端性能等级，用于测试极端性能。
- **高性能等级** ESP32 的高性能配置等级，适用于应用程序占用内存较少且有高性能要求的场景。在该等级中，您可以根据使用场景选择使用接收数据优先等级或发送数据优先等级。
- **默认等级** {IDF\_TARGET\_NAME} 的默认配置等级，兼顾可用内存和性能。
- **节省内存等级** 该等级适用于应用程序需要大量内存的场景，在这一等级下，收发器的性能会有所降低。
- **最小等级** ESP32 的最小配置等级。协议栈只使用运行所需的内存。适用于对性能没有要求，而应用程序需要大量内存的场景。

#### 使用 PSRAM

PSRAM 一般在应用程序占用大量内存时使用。在该模式下，`CONFIG_ESP32_WIFI_TX_BUFFER` 被强制为静态。`CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM` 表示硬件层 DMA 缓冲区数量，提高这一参数可以增强性能。我们推荐以下 PSRAM 等级。

| 等级                         | Iperf | 默认    | 节省内存  | 最小    |
|----------------------------|-------|-------|-------|-------|
| 可用内存 (KB)                  | 113.8 | 152.4 | 181.2 | 202.6 |
| WIFI_STATIC_RX_BUFFER_NUM  | 16    | 8     | 4     | 2     |
| WIFI_DYNAMIC_RX_BUFFER_NUM | 128   | 128   | 128   | 128   |
| WIFI_STATIC_TX_BUFFER_NUM  | 16    | 8     | 4     | 2     |
| WIFI_RX_BA_WIN             | 16    | 16    | 8     | 禁用    |
| TCP_SND_BUF_DEFAULT (KB)   | 65    | 65    | 65    | 65    |
| TCP_WND_DEFAULT (KB)       | 65    | 65    | 65    | 65    |
| WIFI_IRAM_OPT              | 15    | 15    | 15    | 0     |
| WIFI_RX_IRAM_OPT           | 16    | 16    | 0     | 0     |
| LWIP_IRAM_OPTIMIZATION     | 13    | 0     | 0     | 0     |
| TCP 发送数据吞吐量 (Mbit/s)       | 37.5  | 31.7  | 21.7  | 14.6  |
| TCP 接收数据吞吐量 (Mbit/s)       | 31.5  | 29.8  | 26.5  | 21.1  |
| UDP 发送数据吞吐量 (Mbit/s)       | 69.1  | 31.5  | 27.1  | 24.1  |
| UDP 接收数据吞吐量 (Mbit/s)       | 40.1  | 38.5  | 37.5  | 36.9  |

### 4.36.30 Wi-Fi Menuconfig

#### Wi-Fi 缓冲区配置

如果您要修改默认的缓冲区数量或类型，最好也了解缓冲区在数据路径中是如何分配或释放的。下图显示了发送数据方向的这一过程。

图 59: TX Buffer Allocation

描述:

- 应用程序分配需要发送的数据。
- 应用程序调用 TCPIP 或套接字相关的 API 发送用户数据。这些 API 会分配一个在 LwIP 中使用的 PBUF，并复制用户数据。
- 当 LwIP 调用 Wi-Fi API 发送 PBUF 时，Wi-Fi API 会分配一个“动态发送数据缓冲区”或“静态发送数据缓冲区”，并复制 LwIP PBUF，最后发送数据。

下图展示了如何在接收数据方向分配或释放缓冲区:

图 60: 接收数据缓冲区分配

描述:

- Wi-Fi 硬件在空中接收到数据包后，将数据包内容放到“静态接收数据缓冲区”，也就是“接收数据 DMA 缓冲区”。
- Wi-Fi 驱动程序分配一个“动态接收数据缓冲区”、复制“静态接收数据缓冲区”，并将“静态接收数据缓冲区”返回给硬件。
- Wi-Fi 驱动程序将数据包传送到上层 (LwIP)，并分配一个 PBUF 用于存放“动态接收数据缓冲区”。
- 应用程序从 LwIP 接收数据。

下表是 Wi-Fi 内部缓冲区的配置情况。

| 缓冲区类型                    | 分配类型 | 默认                 | 是否可配置 | 描述  |
|--------------------------|------|--------------------|-------|---|
| 静态接收数据缓冲区<br>(硬件接收数据缓冲区) | 静态   | 10 *<br>1600 Bytes | 是     | 这是一种 DMA 内存，在函数 <code>esp_wifi_init()</code> 中初始化，在函数 <code>esp_wifi_deinit()</code> 中释放。该缓冲区形成硬件接收列表。当通过空中接收到一个帧时，硬件将该帧写入缓冲区，并向 CPU 发起一个中断。然后，Wi-Fi 驱动程序从缓冲区中读取内容，并将缓冲区返回到列表中。如果应用程序希望减少 Wi-Fi 静态分配的内存，可以将该值从 10 减少到 6，从而节省 6400 Bytes 的内存。除非禁用 AMPDU 功能，否则不建议将该值降低到 6 以下。 |
| 动态接收数据缓冲区                | 动态   | 32                 | 是     | 缓冲区的长度可变，取决于所接收帧的长度。当 Wi-Fi 驱动程序从“硬件接收数据缓冲区”接收到一帧时，需要从堆中分配“动态接收数据缓冲区”。在 Menuconfig 中配置的“动态接收数据缓冲区”数量用来限制未释放的“动态接收数据缓冲区”总数量。   |
| 动态发送数据缓冲区                | 动态   | 32                 | 是     | 这是一种 DMA 内存，位于堆内存中。当上层 (LwIP) 向 Wi-Fi 驱动程序发送数据包时，该缓冲区首先分配一个“动态发送数据缓冲区”，并复制上层缓冲区。动态发送数据缓冲区和静态发送数据缓冲区相互排斥。  |
| 静态发送数据缓冲区                | 静态   | 16 *<br>1600 Bytes | 是     | 这是一种 DMA 内存，在函数 <code>esp_wifi_init()</code> 中初始化，在函数 <code>esp_wifi_deinit()</code> 中释放。当上层 (LwIP) 向 Wi-Fi 驱动程序发送数据包时，该缓冲区首先分配一个“静态发送数据缓冲区”，并复制上层缓冲区。动态发送数据缓冲区和静态发送数据缓冲区相互排斥。由于发送数据缓冲区必须是 DMA 缓冲区，所以当使能 PSRAM 时，发送数据缓冲区必须是静态的。   |
| 管理短缓冲区                   | 动态   | 8                  | 否     | Wi-Fi 驱动程序的内部缓冲区。   |
| 管理长缓冲区                   | 动态   | 32                 | 否     | Wi-Fi 驱动程序的内部缓冲区。   |
| 管理超长缓冲区                  | 动态   | 32                 | 否     | Wi-Fi 驱动程序的内部缓冲区。   |

### Wi-Fi NVS Flash

如果使能 Wi-Fi NVS flash，所有通过 Wi-Fi API 设置的 Wi-Fi 配置都会被存储到 flash 中，Wi-Fi 驱动程序在下次开机或重启时将自动加载这些配置。但是，应用程序可视情况禁用 Wi-Fi NVS flash，例如：其配置信息不需要存储在非易失性内存中、其配置信息已安全备份，或仅出于某些调试原因等。

### Wi-Fi AMPDU

ESP32 同时支持接收和发送 AMPDU，AMPDU 可以大大提高 Wi-Fi 的吞吐量。

通常，应使能 AMPDU。禁用 AMPDU 通常用于调试目的。

## 4.36.31 故障排除

请见乐鑫 [Wireshark 使用指南](#)。

### 乐鑫 Wireshark 使用指南

#### 1. 概述

**1.1 什么是 Wireshark ?** Wireshark (原称 Ethereal) 是一个网络封包分析软件。网络封包分析软件的功能是撷取网络封包, 并尽可能显示出最为详细的网络封包资料。Wireshark 使用 WinPCAP 作为接口, 直接与网卡进行数据报文交换。

网络封包分析软件的功能可想像成“电工技师使用电表来量测电流、电压、电阻”的工作, 只是将场景移植到网络上, 并将电线替换成网线。

在过去, 网络封包分析软件是非常昂贵, 或是专门属于营利用的软件。Wireshark 的出现改变了这一切。

在 GNU GPL 通用许可证的保障范围下, 使用者可以以免费的代价取得软件与其源代码, 并拥有针对其源代码修改及客制化的权利。

Wireshark 是目前全世界最广泛的网络封包分析软件之一。

**1.2 Wireshark 的主要应用** 下面是 Wireshark 一些应用的举例:

- 网络管理员用来解决网络问题
- 网络安全工程师用来检测安全隐患
- 开发人员用来测试协议执行情况
- 用来学习网络协议

除了上面提到的, Wireshark 还可以用在其它许多场合。

**1.3 Wireshark 的特性**

- 支持 UNIX 和 Windows 平台
- 在接口实时捕捉包
- 能详细显示包的详细协议信息
- 可以打开/保存捕捉的包
- 可以导入导出其他捕捉程序支持的包数据格式
- 可以通过多种方式过滤包
- 多种方式查找包
- 通过过滤以多种色彩显示包
- 创建多种统计分析
- 等等

**1.4 Wireshark 的“能”与“不能”?**

- **捕捉多种网络接口**  
Wireshark 可以捕捉多种网络接口类型的包, 哪怕是无线局域网接口。
- **支持多种其它程序捕捉的文件**  
Wireshark 可以打开多种网络分析软件捕捉的包。
- **支持多格式输出**  
Wireshark 可以将捕捉文件输出为多种其他捕捉软件支持的格式。
- **对多种协议解码提供支持**  
Wireshark 可以支持许多协议的解码。
- **Wireshark 不是入侵检测系统**  
如果您的网络中存在任何可疑活动, Wireshark 并不会主动发出警告。不过, 当您希望对这些可疑活动一探究竟时, Wireshark 可以发挥作用。
- **Wireshark 不会处理网络事务, 它仅仅是“测量”(监视)网络**  
Wireshark 不会发送网络包或做其它交互性的事情 (名称解析除外, 但您也可以禁止解析)。

**2. 如何获取 Wireshark** 官网链接: <https://www.wireshark.org/download.html>

Wireshark 支持多种操作系统, 请在下载安装文件时, 注意选择与您所用操作系统匹配的安装文件。

### 3. 使用步骤 本文档仅以 Linux 系统下的 Wireshark（版本号：2.2.6）为例。

#### 1) 启动 Wireshark

Linux 下，可编写一个 Shell 脚本，运行该文件即可启动 Wireshark 配置抓包网卡和信道。Shell 脚本如下：

```
ifconfig $1 down
iwconfig $1 mode monitor
iwconfig $1 channel $2
ifconfig $1 up
Wireshark&
```

脚本中有两个参数：\$1 和 \$2，分别表示网卡和信道，例如，./xxx.sh wlan0 6（此处，wlan0 即为抓包使用的网卡，后面的数字 6 即为 AP 或 soft-AP 所在的 channel）。

#### 2) 运行 Shell 脚本打开 Wireshark，会出现 Wireshark 抓包开始界面

图 61: Wireshark 抓包界面

#### 3) 选择接口，开始抓包

从上图红色框中可以看到有多个接口，第一个为本地网卡，第二个为无线网络。

可根据自己的需求选取相应的网卡，本文是以利用无线网卡抓取空中包为例进行简单说明。

双击 `wlan0` 即可开始抓包。

#### 4) 设置过滤条件

抓包过程中会抓取到同信道所有的空中包，但其实很多都是我们不需要的，因此很多时候我们会设置抓包的过滤条件从而得到我们想要的包。

下图中红色框内即为设置 filter 的位置。

图 62: 设置 Wireshark 过滤条件

点击 *Filter* 按钮（下图的左上角蓝色按钮）会弹出 *display filter* 对话框。

图 63: *Display Filter* 对话框

点击 *Expression* 按钮，会出现 *Filter Expression* 对话框，在此你可以根据需求进行 filter 的设置。

**最直接的方法：**直接在工具栏上输入过滤条件。

点击在此区域输入或修改显示的过滤字符，在输入过程中会进行语法检查。如果您输入的格式不正确，或者未输入完成，则背景显示为红色。直到您输入合法的表达式，背景会变为绿色。你可以点击下拉列表选择您先前键入的过滤字符。列表会一直保留，即使您重新启动程序。

例如：下图所示，直接输入 2 个 MAC 作为过滤条件，点击 *Apply*（即图中的蓝色箭头），则表示只抓取 2 个此 MAC 地址之间的交互的包。

## 5) 封包列表

若想查看包的具体的信息只需要选中要查看的包，在界面的下方会显示出包的具体的格式和包的内容。

如上图所示，我要查看第 1 个包，选中此包，图中红色框中即为包的具体内容。

## 6) 停止/开始包的捕捉

若要停止当前抓包，点击下图的红色按钮即可。

若要重新开始抓包，点击下图左上角的蓝色按钮即可。

## 7) 保存当前捕捉包

Linux 下，可以通过依次点击“File”->“Export Packet Dissections”->“As Plain Text File”进行保存。

上图中，需要注意的是，选择 *All packets*、*Displayed* 以及 *All expanded* 三项。

Wireshark 捕捉的包可以保存为其原生格式文件（libpcap），也可以保存为其他格式（如.txt 文件）供其他工具进行读取分析。

## 4.37 Wi-Fi Security

### 4.37.1 ESP32 Wi-Fi Security Features

- Support for Protected Management Frames (PMF)
- Support for WPA3-Personal

In addition to traditional security methods (WEP/WPA-TKIP/WPA2-CCMP), ESP32 Wi-Fi supports state-of-the-art security protocols, namely Protected Management Frames based on 802.11w standard and Wi-Fi Protected Access 3 (WPA3-Personal). Together, PMF and WPA3 provide better privacy and robustness against known attacks on traditional modes.

图 64: Filter Expression 对话框

图 65: 过滤条件工具栏

图 66: 在过滤条件工具栏中运用 MAC 地址过滤示例

图 67: 封包列表具体信息示例

图 68: 停止包的捕捉

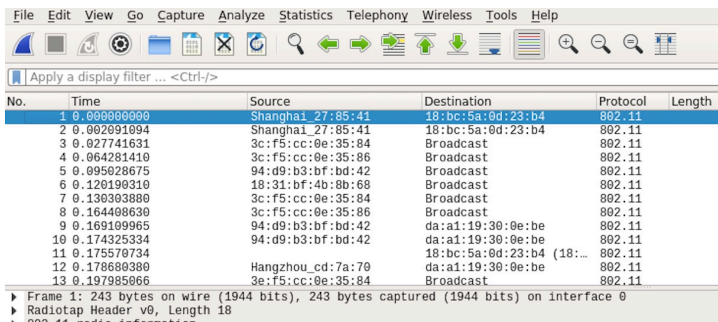

图 69: 开始或继续包的捕捉

图 70: 保存捕捉包

### 4.37.2 Protected Management Frames (PMF)

#### Introduction

In Wi-Fi, management frames such as beacons, probes, (de)authentication, (dis)association are used by non-AP stations to scan and connect to an AP. Unlike data frames, these frames are sent unencrypted. An attacker can use eavesdropping and packet injection to send spoofed (de)authentication/(dis)association frames at the right time, leading to the following attacks in case of unprotected management frame exchanges.

- DOS attack on one or all clients in the range of the attacker.
- Tearing down existing association on AP side by sending association request.
- Forcing a client to perform 4-way handshake again in case PSK is compromised in order to get PTK.
- Getting SSID of hidden network from association request.
- Launching man-in-the-middle attack by forcing clients to deauth from legitimate AP and associating to a rogue one.

PMF provides protection against these attacks by encrypting unicast management frames and providing integrity checks for broadcast management frames. These include deauthentication, disassociation and robust management frames. It also provides Secure Association (SA) teardown mechanism to prevent spoofed association/authentication frames from disconnecting already connected clients.

**There are 3 types of PMF configuration modes on both Station and AP side -**

- PMF Optional
- PMF Required
- PMF Disabled

Depending on the PMF configuration on Station and AP side, the resulting connection will behave differently. Below table summarises all possible outcomes.

| STA Setting  | AP Setting            | Outcome                   |
|--------------|-----------------------|---------------------------|
| PMF Optional | PMF Optional/Required | Mgmt Frames Protected     |
| PMF Optional | PMF Disabled          | Mgmt Frames Not Protected |
| PMF Required | PMF Optional/Required | Mgmt Frames Protected     |
| PMF Required | PMF Disabled          | STA refuses Connection    |
| PMF Disabled | PMF Optional/Disabled | Mgmt Frames Not Protected |
| PMF Disabled | PMF Required          | AP refuses Connection     |

## API & Usage

ESP32 supports PMF only in Station mode. Station defaults to PMF Optional mode and disabling PMF is not possible. For even higher security, PMF required mode can be enabled by setting the `required` flag in `pmf_cfg` while using the `esp_wifi_set_config()` API. This will result in Station only connecting to a PMF enabled AP and rejecting all other AP's. An example of this configuration is given below.

```
wifi_config_t wifi_config = {
    .sta = {
        .ssid = EXAMPLE_WIFI_SSID,
        .password = EXAMPLE_WIFI_PASSWORD,
        .pmf_cfg = {
            .required = true
        }
    }
};
```

**注意:** `capable` flag in `pmf_cfg` is deprecated and set to true internally. This is to take the additional security benefit of PMF whenever possible.

### 4.37.3 WPA3-Personal

#### Introduction

Wi-Fi Protected Access-3 (WPA3) is a set of enhancements to Wi-Fi access security intended to replace the current WPA2 standard. It includes new features and capabilities that offer significantly better protection against different types of attacks. It improves upon WPA2-Personal in following ways:

- WPA3 uses Simultaneous Authentication of Equals (SAE), which is password-authenticated key agreement method based on Diffie-Hellman key exchange. Unlike WPA2, the technology is resistant to offline-dictionary attack, where the attacker attempts to determine shared password based on captured 4-way handshake without any further network interaction.
- Disallows outdated protocols such as TKIP, which is susceptible to simple attacks like MIC key recovery attack.
- Mandates Protected Management Frames (PMF), which provides protection for unicast and multicast robust management frames which include Disassoc and Deauth frames. This means that the attacker cannot disrupt an established WPA3 session by sending forged Assoc frames to the AP or Deauth/Disassoc frames to the Station.
- Provides forward secrecy, which means the captured data cannot be decrypted even if password is compromised after data transmission.

Please refer to [Security](#) section of Wi-Fi Alliance's official website for further details.

#### Setting up WPA3 with ESP32

In IDF Menuconfig under Wi-Fi component, a config option "Enable WPA3-Personal" is provided to Enable/Disable WPA3. By default it is kept enabled, if disabled ESP32 will not be able to establish a WPA3 connection. Currently, WPA3 is supported only in the Station mode. Additionally, since PMF is mandated by WPA3 protocol, PMF Mode should be set to either Optional or Required while setting WiFi config.

Refer to [Protected Management Frames \(PMF\)](#) on how to set this mode.

After these settings are done, Station is ready to use WPA3-Personal. Application developers need not worry about the underlying security mode of the AP. WPA3-Personal is now the highest supported protocol in terms of security, so it will be automatically selected for the connection whenever available. For example, if an AP is configured to be in WPA3 Transition Mode, where it will advertise as both WPA2 and WPA3 capable, Station will choose WPA3 for the connection with above settings. Note that Wi-Fi stack size requirement will increase 3kB when WPA3 is used.

## Chapter 5

# Libraries and Frameworks

### 5.1 Cloud Frameworks

ESP32 supports multiple cloud frameworks using agents built on top of ESP-IDF. Here are the pointers to various supported cloud frameworks' agents and examples:

#### 5.1.1 ESP RainMaker

ESP RainMaker is a complete solution for accelerated AIoT development. [ESP RainMaker on GitHub](#).

#### 5.1.2 AWS IoT

<https://github.com/espressif/esp-aws-iot> is an open source repository for ESP32 based on Amazon Web Services' `aws-iot-device-sdk-embedded-C`.

#### 5.1.3 Azure IoT

<https://github.com/espressif/esp-azure> is an open source repository for ESP32 based on Microsoft Azure' s `azure-iot-sdk-c` SDK.

#### 5.1.4 Google IoT Core

<https://github.com/espressif/esp-google-iot> is an open source repository for ESP32 based on Google' s `iot-device-sdk-embedded-c` SDK.

#### 5.1.5 Aliyun IoT

<https://github.com/espressif/esp-aliyun> is an open source repository for ESP32 based on Aliyun' s `iotkit-embedded` SDK.

#### 5.1.6 Joylink IoT

<https://github.com/espressif/esp-joylink> is an open source repository for ESP32 based on Joylink' s `joylink_dev_sdk` SDK.

### 5.1.7 Tencent IoT

<https://github.com/espressif/esp-welink> is an open source repository for ESP32 based on Tencent's [welink SDK](#).

### 5.1.8 Tencentyun IoT

<https://github.com/espressif/esp-qcloud> is an open source repository for ESP32 based on Tencentyun's [qcloud-iot-sdk-embedded-c SDK](#).

### 5.1.9 Baidu IoT

<https://github.com/espressif/esp-baidu-iot> is an open source repository for ESP32 based on Baidu's [iot-sdk-c SDK](#).

## 5.2 Espressif's Frameworks

Here you will find a collection of the official Espressif libraries and frameworks.

### 5.2.1 Espressif Audio Development Framework

The ESP-ADF is a comprehensive framework for audio applications including:

- CODEC's HAL
- Music Players and Recorders
- Audio Processing
- Bluetooth Speakers
- Internet Radios
- Hands-free devices
- Speech Recognition

This framework is available at GitHub: [ESP-ADF](#).

### 5.2.2 ESP-CSI

ESP-CSI is an experimental implementation that uses the Wi-Fi Channel State Information to detect the presence of a human body.

See [ESP-CSI](#) project for more information about it.

### 5.2.3 Espressif DSP Library

The library provides algorithms optimized specifically for digital signal processing applications. This library supports:

- Matrix multiplication
- Dot product
- FFT (Fast Fourier Transform)
- IIR (Infinite Impulse Response)
- FIR (Finite Impulse Response)
- Vector math operations

This library is available here: [ESP-DSP library](#).

## 5.2.4 ESP-WIFI-MESH Development Framework

This framework is based on the ESP-WIFI-MESH protocol with the following features:

- Fast network configuration
- Stable upgrade
- Efficient debugging
- LAN control
- Various application demos

[ESP-MDF](#).

## 5.2.5 ESP-WHO

The ESP-WHO is a face detection and recognition framework using the ESP32 and camera. To know more about the project, see [ESP-WHO](#) on GitHub.

## 5.2.6 ESP RainMaker

[ESP RainMaker](#) is a complete solution for accelerated AIoT development. Using ESP RainMaker, you can create AIoT devices from the firmware to the integration with voice-assistant, phone apps and cloud backend.

[ESP RainMaker on GitHub](#).

## 5.2.7 ESP-IoT-Solution

[ESP-IoT-Solution](#) contains commonly used device drivers and code frameworks when developing IoT systems. The device drivers and code frameworks within the ESP-IoT-Solution are organized as separate components, allowing them to be easily integrated into an ESP-IDF project.

ESP-IoT-Solution includes:

- Device drivers for sensors, display, audio, GUI, input, actuators, etc.
- Framework and documentation for low power, security, storage, etc.
- Guide for Espressif open source solutions from practical application point.

[ESP-IoT-Solution on GitHub](#).

# Chapter 6

## Contributions Guide

We welcome contributions to the esp-idf project!

### 6.1 How to Contribute

Contributions to esp-idf - fixing bugs, adding features, adding documentation - are welcome. We accept contributions via [Github Pull Requests](#).

### 6.2 Before Contributing

Before sending us a Pull Request, please consider this list of points:

- Is the contribution entirely your own work, or already licensed under an Apache License 2.0 compatible Open Source License? If not then we unfortunately cannot accept it.
- Does any new code conform to the esp-idf *Style Guide*?
- Have you installed the *pre-commit hook* for esp-idf project?
- Does the code documentation follow requirements in *Documenting Code*?
- Is the code adequately commented for people to understand how it is structured?
- Is there documentation or examples that go with code contributions? There are additional suggestions for writing good examples in [examples](#) readme.
- Are comments and documentation written in clear English, with no spelling or grammar errors?
- Example contributions are also welcome. Please check the [创建示例项目](#) guide for these.
- If the contribution contains multiple commits, are they grouped together into logical changes (one major change per pull request)? Are any commits with names like “fixed typo” [squashed into previous commits](#)?
- If you’re unsure about any of these points, please open the Pull Request anyhow and then ask us for feedback.

### 6.3 Pull Request Process

After you open the Pull Request, there will probably be some discussion in the comments field of the request itself.

Once the Pull Request is ready to merge, it will first be merged into our internal git system for in-house automated testing.

If this process passes, it will be merged onto the public github repository.

## 6.4 Legal Part

Before a contribution can be accepted, you will need to sign our *Contributor Agreement*. You will be prompted for this automatically as part of the Pull Request process.

## 6.5 Related Documents

### 6.5.1 Espressif IoT Development Framework Style Guide

#### About This Guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF.

Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

#### C Code Formatting

##### Naming

- Any variable or function which is only used in a single source file should be declared `static`.
- Public names (non-static variables and functions) should be namespaced with a per-component or per-unit prefix, to avoid naming collisions. ie `esp_vfs_register()` or `esp_console_run()`. Starting the prefix with `esp_` for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with `s_` for easy identification. For example, `static bool s_invert`.
- Avoid unnecessary abbreviations (ie shortening `data` to `dat`), unless the resulting name would otherwise be very long.

**Indentation** Use 4 spaces for each indentation level. Don't use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

**Vertical Space** Place one empty line between functions. Don't begin or end a function with an empty line.

```
void function1()
{
    do_one_thing();
    do_another_thing();
}
// INCORRECT, don't place empty line here
// place empty line here
void function2()
{
    // INCORRECT, don't use an empty line here
    int var = 0;
    while (var < SOME_CONSTANT) {
        do_stuff(&var);
    }
}
```

(下页继续)

```
}
}
```

The maximum line length is 120 characters as long as it doesn't seriously affect the readability.

**Horizontal Space** Always add single space after conditional and loop keywords:

```
if (condition) {      // correct
    // ...
}

switch (n) {          // correct
    case 0:
        // ...
}

for(int i = 0; i < CONST; ++i) {    // INCORRECT
    // ...
}
```

Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);    // correct

const int y = y0 + (x - x0)*(y1 - y0)/(x1 - x0);        // also okay

int y_cur = -y;                                         // correct
++y_cur;

const int y = y0+(x-x0)*(y1-y0)/(x1-x0);                // INCORRECT
```

No space is necessary around `.` and `->` operators.

Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```
esp_rom_gpio_connect_in_signal(PIN_CAM_D6,    I2S0I_DATA_IN14_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_D7,    I2S0I_DATA_IN15_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_HREF,  I2S0I_H_ENABLE_IDX,  false);
esp_rom_gpio_connect_in_signal(PIN_CAM_PCLK,  I2S0I_DATA_IN15_IDX, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g. `PIN_CAM_VSYNC`), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.

Never add trailing whitespace at the end of the line.

## Braces

- Function definition should have a brace on a separate line:

```
// This is correct:
void function(int arg)
{
}
}
```

```
// NOT like this:
void function(int arg) {
}
```

- Within a function, place opening brace on the same line with conditional and loop statements:

```
if (condition) {
    do_one();
} else if (other_condition) {
    do_two();
}
```

**Comments** Use // for single line comments. For multi-line comments it is okay to use either // on each line or a /\* \*/ block.

Although not directly related to formatting, here are a few notes about using comments effectively.

- Don't use single comments to disable some functionality:

```
void init_something()
{
    setup_dma();
    // load_resources();           // WHY is this thing commented, asks_
    ↪the reader?
    start_timer();
}
```

- If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

```
void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated_
    ↪yet.
    // load_resources();
    start_timer();
}
```

- Same goes for #if 0 ... #endif blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Don't use #if 0 ... #endif or comments to store code snippets which you may need in the future.
- Don't add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g. this comment adds clutter to the code without adding any useful information:

```
void init_something()
{
    setup_dma();
    // XXX add 2016-09-01
    init_dma_list();
    fill_dma_item(0);
    // end XXX add
    start_timer();
}
```

**Line Endings** Commits should only contain files with LF (Unix style) endings.

Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the `core.autocrlf` setting. *Github has a document about setting this option <github-line-endings>*. However because MSYS2 uses Unix-style line endings, it is often easier to configure your text editor to use LF (Unix style) endings when editing ESP-IDF source files.

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

```
git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs ↵
↳dos2unix && git commit -a --amend --no-edit --allow-empty' master
```

(Note that this line rebases on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it's possible to run `dos2unix FILENAME` and then run `git commit --amend`

**Formatting Your Code** You can use `astyle` program to format your code according to the above recommendations.

If you are writing a file from scratch, or doing a complete rewrite, feel free to re-format the entire file. If you are changing a small portion of file, don't re-format the code you didn't change. This will help others when they review your changes.

To re-format a file, run:

```
tools/format.sh components/my_component/file.c
```

**Type Definitions** Should be snake\_case, ending with `_t` suffix:

```
typedef int signed_32_bit_t;
```

**Enum** Enums should be defined through the `typedef` and be namespaced:

```
typedef enum
{
    MODULE_FOO_ONE,
    MODULE_FOO_TWO,
    MODULE_FOO_THREE
} module_foo_t;
```

**Assertions** The standard C `assert()` function, defined in `assert.h` should be used to check conditions that should be true in source code. In the default configuration, an assert condition that returns `false` or `0` will call `abort()` and trigger a *Fatal Error*.

`assert()` should only be used to detect unrecoverable errors due to a serious internal logic bug or corruption, where it's not possible for the program to continue. For recoverable errors, including errors that are possible due to invalid external input, an *error value should be returned*.

---

**备注:** When asserting a value of type `esp_err_t` is equal to `ESP_OK`, use the `ESP_ERROR_CHECK`宏 instead of an `assert()`.

---

It's possible to configure ESP-IDF projects with assertions disabled (see `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`). Therefore, functions called in an `assert()` statement should not have side-effects.

It's also necessary to use particular techniques to avoid “variable set but not used” warnings when assertions are disabled, due to code patterns such as:

```
int res = do_something();
assert(res == 0);
```

Once the `assert` is optimized out, the `res` value is unused and the compiler will warn about this. However the function `do_something()` must still be called, even if assertions are disabled.

When the variable is declared and initialized in a single statement, a good strategy is to cast it to `void` on a new line. The compiler will not produce a warning, and the variable can still be optimized out of the final binary:

```
int res = do_something();
assert(res == 0);
(void)res;
```

If the variable is declared separately, for example if it is used for multiple assertions, then it can be declared with the GCC attribute `__attribute__((unused))`. The compiler will not produce any unused variable warnings, but the variable can still be optimized out:

```
int res __attribute__((unused));

res = do_something();
assert(res == 0);

res = do_something_else();
assert(res != 0);
```

### Header file guards

All public facing header files should have preprocessor guards. A `pragma` is preferred:

```
#pragma once
```

over the following pattern:

```
#ifndef FILE_NAME_H
#define FILE_NAME_H
...
#endif // FILE_NAME_H
```

In addition to guard macros, all C header files should have `extern "C"` guards to allow the header to be used from C++ code. Note that the following order should be used: `pragma once`, then any `#include` statements, then `extern "C"` guards:

```
#pragma once

#include <stdint.h>

#ifdef __cplusplus
extern "C" {
#endif

/* declarations go here */

#ifdef __cplusplus
}
#endif
```

### Include statements

When writing `#include` statements, try to maintain the following order:

- C standard library headers.
- Other POSIX standard headers and common extensions to them (such as `sys/queue.h`.)
- Common IDF headers (`esp_log.h`, `esp_system.h`, `esp_timer.h`, `esp_sleep.h`, etc.)
- Headers of other components, such as FreeRTOS.
- Public headers of the current component.
- Private headers.

Use angle brackets for C standard library headers and other POSIX headers (`#include <stdio.h>`).

Use double quotes for all other headers (`#include "esp_log.h"`).

## C++ Code Formatting

The same rules as for C apply. Where they are not enough, apply the following rules.

**File Naming** C++ Header files have the extension `.hpp`. C++ source files have the extension `.cpp`. The latter is important for the compiler to distinguish them from normal C source files.

## Naming

- **Class and struct** names shall be written in `CamelCase` with a capital letter as beginning. Member variables and methods shall be in `snake_case`.
- **Namespaces** shall be in lower `snake_case`.
- **Templates** are specified in the line above the function declaration.
- Interfaces in terms of Object-Oriented Programming shall be named without the suffix `...Interface`. Later, this makes it easier to extract interfaces from normal classes and vice versa without making a breaking change.

**Member Order in Classes** In order of precedence:

- First put the public members, then the protected, then private ones. Omit public, protected or private sections without any members.
- First put constructors/destructors, then member functions, then member variables.

For example:

```
class ForExample {
public:
    // first constructors, then default constructor, then destructor
    ForExample(double example_factor_arg);
    ForExample();
    ~ForExample();

    // then remaining public methods
    set_example_factor(double example_factor_arg);

    // then public member variables
    uint32_t public_data_member;

private:
    // first private methods
    void internal_method();

    // then private member variables
    double example_factor;
};
```

## Spacing

- Don't indent inside namespaces.
- Put public, protected and private labels at the same indentation level as the corresponding class label.

## Simple Example

```
// file spaceship.h
#ifndef SPACESHIP_H_
#define SPACESHIP_H_
#include <cstdlib>

namespace spaceships {

class SpaceShip {
public:
    SpaceShip(size_t crew);
    size_t get_crew_size() const;

private:
    const size_t crew;
};

class SpaceShuttle : public SpaceShip {
public:
    SpaceShuttle();
};

class Sojuz : public SpaceShip {
public:
    Sojuz();
};

template <typename T>
class CargoShip {
public:
    CargoShip(const T &cargo);

private:
    T cargo;
};

} // namespace spaceships

#endif // SPACESHIP_H_

// file spaceship.cpp
#include "spaceship.h"

namespace spaceships {

// Putting the curly braces in the same line for constructors is OK if it only
↳initializes
// values in the initializer list
SpaceShip::SpaceShip(size_t crew) : crew(crew) { }

size_t SpaceShip::get_crew_size() const
{
    return crew;
}

}
```

(下页继续)

```
SpaceShuttle::SpaceShuttle() : SpaceShip(7)
{
    // doing further initialization
}

Sojuz::Sojuz() : SpaceShip(3)
{
    // doing further initialization
}

template <typename T>
CargoShip<T>::CargoShip(const T &cargo) : cargo(cargo) { }

} // namespace spaceships
```

### CMake Code Style

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Don't put anything in the optional parentheses after `foreach()`, `endif()`, etc.
- Use lowercase (`with_underscores`) for command, function, and macro names.
- For locally scoped variables, use lowercase (`with_underscores`).
- For globally scoped variables, use uppercase (`WITH_UNDERSCORES`).
- Otherwise follow the defaults of the [cmake-lint](#) project.

### Configuring the Code Style for a Project Using EditorConfig

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see [EditorConfig Website](#).

### Documenting Code

Please see the guide here: [Documenting Code](#).

### Structure

To be written.

### Language Features

To be written.

## 6.5.2 Install pre-commit Hook for ESP-IDF Project

### Required Dependency

Python 3.6.1 or above. This is our recommendation python version for IDF developers.

If you still have python versions not compatible, please do not install pre-commit hook and update your python versions.

### Install pre-commit

Run `pip install pre-commit`

### Install pre-commit hook

1. Go to the IDF Project Directory
2. Run `pre-commit install --allow-missing-config`. Install hook by this approach will let you commit successfully even in branches without the `.pre-commit-config.yaml`
3. pre-commit hook will run automatically when you' re running `git commit` command

### Uninstall pre-commit

Run `pre-commit uninstall`

### What' s More?

For detailed usage, please refer to the documentation of [pre-commit](#).

### Common Problems For Windows Users

`/usr/bin/env: python: Permission denied.`

If you' re in Git Bash or MSYS terminal, please check the python executable location by run `which python`.

If the executable is under `~/AppData/Local/Microsoft/WindowsApps/`, then it' s a link to Windows AppStore, not a real one.

Please install python manually and update this in your PATH environment variable.

Your `%USERPROFILE%` contains non-ASCII characters

`pre-commit` may fail when initializing an environment for a particular hook when the path of `pre-commit`' s cache contains non-ASCII characters. The solution is to set `PRE_COMMIT_HOME` to a path containing only standard characters before running `pre-commit`.

- CMD: `set PRE_COMMIT_HOME=C:\somepath\pre-commit`
- PowerShell: `$Env:PRE_COMMIT_HOME = "C:\somepath\pre-commit"`
- git bash: `export PRE_COMMIT_HOME="/c/somepath/pre-commit"`

## 6.5.3 Documenting Code

The purpose of this description is to provide quick summary on documentation style used in [espressif/esp-idf](#) repository and how to add new documentation.

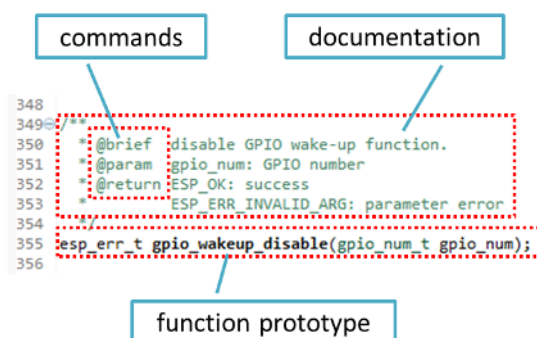

## Introduction

When documenting code for this repository, please follow [Doxygen style](#). You are doing it by inserting special commands, for instance `@param`, into standard comments blocks, for example:

```
/**
 * @param ratio this is oxygen to air ratio
 */
```

Doxygen is phrasing the code, extracting the commands together with subsequent text, and building documentation out of it.

Typical comment block, that contains documentation of a function, looks like below.

Doxygen supports couple of formatting styles. It also gives you great flexibility on level of details to include in documentation. To get familiar with available features, please check data rich and very well organized [Doxygen Manual](#).

## Why we need it?

The ultimate goal is to ensure that all the code is consistently documented, so we can use tools like [Sphinx](#) and [Breathe](#) to aid preparation and automatic updates of API documentation when the code changes.

With these tools the above piece of code renders like below:

## Go for it!

When writing code for this repository, please follow guidelines below.

1. Document all building blocks of code: functions, structs, typedefs, enums, macros, etc. Provide enough information about purpose, functionality and limitations of documented items, as you would like to see them documented when reading the code by others.
2. Documentation of function should describe what this function does. If it accepts input parameters and returns some value, all of them should be explained.
3. Do not add a data type before parameter or any other characters besides spaces. All spaces and line breaks are compressed into a single space. If you like to break a line, then break it twice.

do not add data type

white spaces are compressed

a line break that will render

this line break will not render

```

41 @ /**
42  * @brief Set log level for given tag
43  *
44  * If logging for given component has already been enabled, changes previous setting.
45  *
46  * @param tag Tag of the log entries to enable. Must be a non-NULL zero terminated string.
47  * Value "" resets log level for all tags to the given value.
48  *
49  * @param level Selects log level to enable.
50  * Only logs at this and lower levels will be shown.
51  */
52 void esp_log_level_set(const char* tag, esp_log_level_t level);
    
```

**void esp\_log\_level\_set(const char\* tag, esp\_log\_level\_t level)**

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

**Parameters**

- **tag** - Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "" resets log level for all tags to the given value.
- **level** - Selects log level to enable. Only logs at this and lower levels will be shown.

4. If function has void input or does not return any value, then skip @param or @return

```

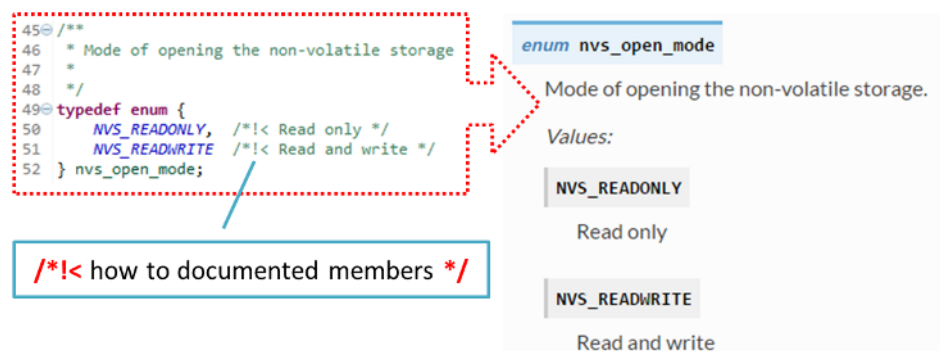

26 @ /**
27  * @brief Initialize BT controller
28  *
29  * This function should be called only once,
30  * before any other BT functions are called.
31  */
32 void bt_controller_init(void);
    
```

**void bt\_controller\_init(void)**

Initialize BT controller.

This function should be called only once, before any other BT functions are called.

5. When documenting a define as well as members of a struct or enum, place specific comment like below after each member.

6. To provide well formatted lists, break the line after command (like @return in example below).

```

*
* @return
*   - ESP_OK if erase operation was successful
*   - ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
*   - ESP_ERR_NVS_READ_ONLY if handle was opened as read only
*   - ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
*   - other error codes from the underlying storage driver
*

```

7. Overview of functionality of documented header file, or group of files that make a library, should be placed in a separate README.rst file of the same directory. If this directory contains header files for different APIs, then the file name should be apiname-readme.rst.

### Go one extra mile

Here are a couple of tips on how you can make your documentation even better and more useful to the reader and writer.

When writing codes, please follow the guidelines below:

1. Add code snippets to illustrate implementation. To do so, enclose snippet using @code{c} and @endcode commands.

```

*
* @code{c}
* // Example of using nvs_get_i32:
* int32_t max_buffer_size = 4096; // default value
* esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
* assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
* // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
* // have its default value.
* @endcode
*

```

The code snippet should be enclosed in a comment block of the function that it illustrates.

2. To highlight some important information use command @attention or @note.

```

*
* @attention
*   1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
*   2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to
*   ↪disconnect.
*

```

Above example also shows how to use a numbered list.

3. To provide common description to a group of similar functions, enclose them using /\*\*@{ \*/ and /\*\*@} \*/ markup commands:

```

/**@{ */
/**
 * @brief common description of similar functions
 *
 */
void first_similar_function (void);
void second_similar_function (void);
/**@} */

```

For practical example see [nvs\\_flash/include/nvs.h](#).

- You may want to go even further and skip some code like repetitive defines or enumerations. In such case, enclose the code within `/** @cond */` and `/** @endcond */` commands. Example of such implementation is provided in [driver/include/driver/gpio.h](#).
- Use markdown to make your documentation even more readable. You will add headers, links, tables and more.

```

*
* [ESP32 Technical Reference Manual] (https://www.espressif.com/sites/default/files/documentation/esp32\_technical\_reference\_manual\_en.pdf)
*

```

**备注:** Code snippets, notes, links, etc. will not make it to the documentation, if not enclosed in a comment block associated with one of documented objects.

- Prepare one or more complete code examples together with description. Place description to a separate file `README.md` in specific folder of `examples` directory.

### Standardize Document Format

When it comes to text, please follow guidelines below to provide well formatted Markdown (.md) or reST (.rst) documents.

- Please ensure that one paragraph is written in one line. Don't break lines like below. Breaking lines to enhance readability is only suitable for writing codes. To make the text easier to read, it is recommended to place an empty line to separate the paragraph.

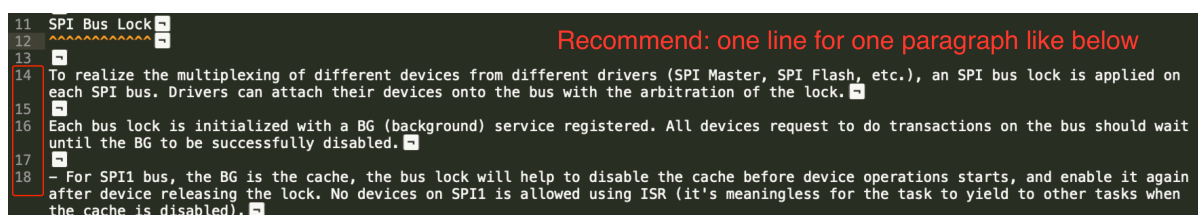

图 1: One line for one paragraph (click to enlarge)

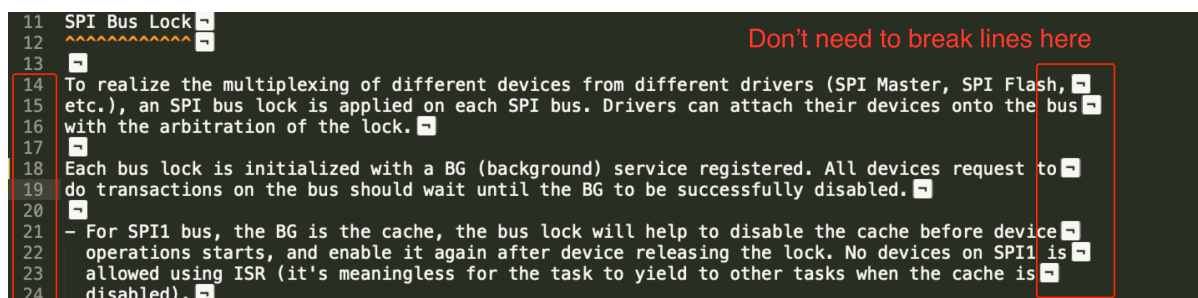

图 2: No line breaks within the same paragraph (click to enlarge)

- Please make the line number of CN and EN documents consistent like below. The benefit of this approach is that it can save time for both writers and translators. When non-bilingual writers need to update text, they only need to update the same line in the corresponding CN or EN document. For translators, if documents are updated in English, then translators can quickly locate where to update in the corresponding CN document later. Besides, by comparing the total number of lines in EN and CN documents, you can quickly find out whether the CN version lags behind the EN version.

图 3: Keep the line number for EN and CN documents consistent (click to enlarge)

## Building Documentation

The documentation is built with the *esp-docs* Python package, which is a wrapper around [Sphinx](#)

To install it simply do:

```
pip install esp-docs
```

After a successful install then the documentation can be built from the docs folder with:

```
build-docs build
```

or for specific target and language with:

```
build-docs -t esp32 -l en build
```

For more in-depth documentation about *esp-docs* features please see the *esp-doc* documentation.

## Wrap up

We love good code that is doing cool things. We love it even better, if it is well documented, so we can quickly make it run and also do the cool things.

Go ahead, contribute your code and documentation!

- [API Documentation Template](#)

## 6.5.4 创建示例项目

每个 ESP-IDF 的示例都是一个完整的项目，其他人可以将示例复制至本地，并根据实际情况进行一定修改。请注意，示例项目主要是为了展示 ESP-IDF 的功能。

### 示例项目结构

- main 目录需要包含一个名为 `(something)_example_main.c` 的源文件，里面包含示例项目的主要功能。
- 如果该示例项目的子任务比较多，请根据逻辑将其拆分为 main 目录下的多个 C 或者 C++ 源文件，并将对应的头文件也放在同一目录下。
- 如果该示例项目具有多种功能，可以考虑在项目中增加一个 components 子目录，通过库功能，将示例项目的不同功能划分为不同的组件。注意，如果该组件提供的功能相对完整，且具有一定的通用性，则应该将它们添加到 ESP-IDF 的 components 目录中，使其成为 ESP-IDF 的一部分。
- 示例项目需要包含一个 README.md 文件，建议使用 [示例项目 README 模板](#)，并根据项目实际情况进行修改。
- 示例项目需要包含一个 `example_test.py` 文件，用于进行自动化测试。如果在 GitHub 上初次提交 Pull Request 时，可以先不包含这个脚本文件。具体细节，请见有关 [Pull Request](#) 的相关内容。

### 一般准则

示例代码需要遵循 [《乐鑫物联网开发框架风格指南》](#)。

### 检查清单

提交一个新的示例项目之前，需要检查以下内容：

- 示例项目的名字（包括 Makefile 和 README.md 中）应使用 `example`，而不要写“demo”，“test”等词汇。
- 每个示例项目只能有一个主要功能。如果某个示例项目有多个主要功能，请将其拆分为两个或更多示例项目。
- 每个示例项目应包含一个 README.md 文件，建议使用 [示例项目 README 模板](#)。
- 示例项目中的函数和变量的命令要遵循[命名规范](#)中的要求。对于仅在示例项目源文件中使用的非静态变量/函数，请使用 `example` 或其他类似的前缀。
- 示例项目中的所有代码结构良好，关键代码要有详细注释。
- 示例项目中所有不必要的代码（旧的调试日志，注释掉的代码等）都必须清除掉。
- 示例项目中使用的选项（比如网络名称，地址等）不得直接硬编码，应尽可能地使用配置项，或者定义为宏或常量。
- 配置项可见 `KConfig.projbuild` 文件，该文件中包含一个名为“Example Configuration”的菜单。具体情况，请查看现有示例项目。
- 所有的源代码都需要在文件开头指定许可信息（表示该代码是 in the public domain CC0）和免责声明。或者，源代码也可以应用 Apache License 2.0 许可条款。请查看现有示例项目的许可信息和免责声明，并根据实际情况进行修改。
- 任何第三方代码（无论是直接使用，还是进行了一些改进）均应保留原始代码中的许可信息，且这些代码的许可必须兼容 Apache License 2.0 协议。

## 6.5.5 API Documentation Template

### 备注：INSTRUCTIONS

1. Use this file ([docs/en/api-reference/template.rst](#)) as a template to document API.
2. Change the file name to the name of the header file that represents documented API.
3. Include respective files with descriptions from the API folder using `..include::`

- README.rst
  - example.rst
  - ...
4. Optionally provide description right in this file.
  5. Once done, remove all instructions like this one and any superfluous headers.
- 

## Overview

---

### 备注: INSTRUCTIONS

1. Provide overview where and how this API may be used.
  2. Where applicable include code snippets to illustrate functionality of particular functions.
  3. To distinguish between sections, use the following [heading levels](#):
    - # with overline, for parts
    - \* with overline, for chapters
    - =, for sections
    - -, for subsections
    - ^, for subsubsections
    - ", for paragraphs
- 

## Application Example

---

### 备注: INSTRUCTIONS

1. Prepare one or more practical examples to demonstrate functionality of this API.
  2. Each example should follow pattern of projects located in `esp-idf/examples/` folder.
  3. Place example in this folder complete with `README.md` file.
  4. Provide overview of demonstrated functionality in `README.md`.
  5. With good overview reader should be able to understand what example does without opening the source code.
  6. Depending on complexity of example, break down description of code into parts and provide overview of functionality of each part.
  7. Include flow diagram and screenshots of application output if applicable.
  8. Finally add in this section synopsis of each example together with link to respective folder in `esp-idf/examples/`.
- 

## API Reference

---

### 备注: INSTRUCTIONS

1. This repository provides for automatic update of API reference documentation using [code markup retrieved by Doxygen from header files](#).
1. Update is done on each documentation build by invoking Sphinx extension `:esp_extensions/run_doxygen.py` for all header files listed in the `INPUT` statement of `docs/doxygen/Doxyfile`.
1. Each line of the `INPUT` statement (other than a comment that begins with `##`) contains a path to header file `*.h` that will be used to generate corresponding `*.inc` files:

```
##  
## Wi-Fi - API Reference  
##  
../components/esp32/include/esp_wifi.h \  
../components/esp32/include/esp_smartconfig.h \  

```

1. When the headers are expanded, any macros defined by default in `sdkconfig.h` as well as any macros defined in SOC-specific `include/soc/*_caps.h` headers will be expanded. This allows the headers to include/exclude material based on the `IDF_TARGET` value.
1. The `*.inc` files contain formatted reference of API members generated automatically on each documentation build. All `*.inc` files are placed in Sphinx `_build` directory. To see directives generated for e.g. `esp_wifi.h`, run `python gen-dxd.py esp32/include/esp_wifi.h`.
1. To show contents of `*.inc` file in documentation, include it as follows:

```
.. include-build-file:: inc/esp_wifi.inc
```

For example see [docs/en/api-reference/network/esp\\_wifi.rst](#)

1. Optionally, rather than using `*.inc` files, you may want to describe API in your own way. See [docs/en/api-reference/storage/fatfs.rst](#) for example.

Below is the list of common `.. doxygen...::` directives:

- Functions - `.. doxygenfunction:: name_of_function`
- Unions - `.. doxygenunion:: name_of_union`
- Structures - `.. doxygenstruct:: name_of_structure` together with `:members:`
- Macros - `.. doxygendefine:: name_of_define`
- Type Definitions - `.. doxygentypedef:: name_of_type`
- Enumerations - `.. doxygenenum:: name_of_enumeration`

See [Breathe documentation](#) for additional information.

To provide a link to header file, use the `link custom role` directive as follows:

```
* :component_file:`path_to/header_file.h`
```

1. In any case, to generate API reference, the file [docs/doxygen/Doxyfile](#) should be updated with paths to `*.h` headers that are being documented.
1. When changes are committed and documentation is built, check how this section has been rendered. [Correct annotations](#) in respective header files, if required.

## 6.5.6 Contributor Agreement

### Individual Contributor Non-Exclusive License Agreement

#### including the Traditional Patent License OPTION

Thank you for your interest in contributing to Espressif IoT Development Framework (esp-idf) ( “We” or “Us” ).

The purpose of this contributor agreement ( “Agreement” ) is to clarify and document the rights granted by contributors to Us. To make this document effective, please follow the instructions at [CONTRIBUTING.rst](#)

**1. DEFINITIONS** “You” means the Individual Copyright owner who submits a Contribution to Us. If You are an employee and submit the Contribution as part of your employment, You have had Your employer approve this Agreement or sign the Entity version of this document.

“**Contribution**” means any original work of authorship (software and/or documentation) including any modifications or additions to an existing work, Submitted by You to Us, in which You own the Copyright. If You do not own the Copyright in the entire work of authorship, please contact Us at [maris.vikhammer@espressif.com](mailto:maris.vikhammer@espressif.com).

“**Copyright**” means all rights protecting works of authorship owned or controlled by You, including copyright, moral and neighboring rights, as appropriate, for the full term of their existence including any extensions by You.

“**Material**” means the software or documentation made available by Us to third parties. When this Agreement covers more than one software project, the Material means the software or documentation to which the Contribution was Submitted. After You Submit the Contribution, it may be included in the Material.

“**Submit**” means any form of physical, electronic, or written communication sent to Us, including but not limited to electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, Us, but excluding communication that is conspicuously marked or otherwise designated in writing by You as “Not a Contribution.”

“**Submission Date**” means the date You Submit a Contribution to Us.

“**Documentation**” means any non-software portion of a Contribution.

## **2. LICENSE GRANT** 2.1 Copyright License to Us

Subject to the terms and conditions of this Agreement, You hereby grant to Us a worldwide, royalty-free, NON-exclusive, perpetual and irrevocable license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, under the Copyright covering the Contribution to use the Contribution by all means, including, but not limited to:

- to publish the Contribution,
- to modify the Contribution, to prepare derivative works based upon or containing the Contribution and to combine the Contribution with other software code,
- to reproduce the Contribution in original or modified form,
- to distribute, to make the Contribution available to the public, display and publicly perform the Contribution in original or modified form.

2.2 Moral Rights remain unaffected to the extent they are recognized and not waivable by applicable law. Notwithstanding, You may add your name in the header of the source code files of Your Contribution and We will respect this attribution when using Your Contribution.

## **3. PATENTS** 3.1 Patent License

Subject to the terms and conditions of this Agreement You hereby grant to us a worldwide, royalty-free, non-exclusive, perpetual and irrevocable (except as stated in Section 3.2) patent license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, to make, have made, use, sell, offer for sale, import and otherwise transfer the Contribution and the Contribution in combination with the Material (and portions of such combination). This license applies to all patents owned or controlled by You, whether already acquired or hereafter acquired, that would be infringed by making, having made, using, selling, offering for sale, importing or otherwise transferring of Your Contribution(s) alone or by combination of Your Contribution(s) with the Material.

### 3.2 Revocation of Patent License

You reserve the right to revoke the patent license stated in section 3.1 if we make any infringement claim that is targeted at your Contribution and not asserted for a Defensive Purpose. An assertion of claims of the Patents shall be considered for a “Defensive Purpose” if the claims are asserted against an entity that has filed, maintained, threatened, or voluntarily participated in a patent infringement lawsuit against Us or any of Our licensees.

**4. DISCLAIMER** THE CONTRIBUTION IS PROVIDED “AS IS” . MORE PARTICULARLY, ALL EXPRESS OR IMPLIED WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT ARE EXPRESSLY DISCLAIMED BY YOU TO US AND BY US TO YOU. TO THE EXTENT THAT ANY SUCH WARRANTIES CANNOT BE DISCLAIMED, SUCH WARRANTY IS LIMITED IN DURATION TO THE MINIMUM PERIOD PERMITTED BY LAW.

**5. Consequential Damage Waiver** TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT WILL YOU OR US BE LIABLE FOR ANY LOSS OF PROFITS, LOSS OF ANTICIPATED SAVINGS, LOSS OF DATA, INDIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL AND EXEMPLARY DAMAGES ARISING OUT OF THIS AGREEMENT REGARDLESS OF THE LEGAL OR EQUITABLE THEORY (CONTRACT, TORT OR OTHERWISE) UPON WHICH THE CLAIM IS BASED.

**6. Approximation of Disclaimer and Damage Waiver** IF THE DISCLAIMER AND DAMAGE WAIVER MENTIONED IN SECTION 4 AND SECTION 5 CANNOT BE GIVEN LEGAL EFFECT UNDER APPLICABLE LOCAL LAW, REVIEWING COURTS SHALL APPLY LOCAL LAW THAT MOST CLOSELY APPROXIMATES AN ABSOLUTE WAIVER OF ALL CIVIL LIABILITY IN CONNECTION WITH THE CONTRIBUTION.

**7. Term** 7.1 This Agreement shall come into effect upon Your acceptance of the terms and conditions.

7.2 In the event of a termination of this Agreement Sections 4, 5, 6, 7 and 8 shall survive such termination and shall remain in full force thereafter. For the avoidance of doubt, Contributions that are already licensed under a free and open source license at the date of the termination shall remain in full force after the termination of this Agreement.

**8. Miscellaneous** 8.1 This Agreement and all disputes, claims, actions, suits or other proceedings arising out of this agreement or relating in any way to it shall be governed by the laws of People’s Republic of China excluding its private international law provisions.

8.2 This Agreement sets out the entire agreement between You and Us for Your Contributions to Us and overrides all other agreements or understandings.

8.3 If any provision of this Agreement is found void and unenforceable, such provision will be replaced to the extent possible with a provision that comes closest to the meaning of the original provision and that is enforceable. The terms and conditions set forth in this Agreement shall apply notwithstanding any failure of essential purpose of this Agreement or any limited remedy to the maximum extent possible under law.

8.4 You agree to notify Us of any facts or circumstances of which you become aware that would make this Agreement inaccurate in any respect.

**You**

|          |  |

## Chapter 7

# ESP-IDF 版本简介

ESP-IDF 的 GitHub 仓库时常更新，特别是用于开发新特性的 `master` 分支。  
如有量产需求，请使用稳定版本。

### 7.1 发布版本

您可以通过以下链接访问各个版本的配套文档：

- 最新稳定版 ESP-IDF： [https://docs.espressif.com/projects/esp-idf/zh\\_CN/stable/](https://docs.espressif.com/projects/esp-idf/zh_CN/stable/)
- 最新版 ESP-IDF（即 `master` 分支）： [https://docs.espressif.com/projects/esp-idf/zh\\_CN/latest/](https://docs.espressif.com/projects/esp-idf/zh_CN/latest/)

ESP-IDF 在 GitHub 平台上的完整发布历史请见 [发布说明页面](#)。您可以在该页面查看各个版本的发布说明、配套文档及相应获取方式。

### 7.2 我该选择哪个版本？

- 如有量产需求，请使用 [最新稳定版本](#)。稳定版本已通过人工测试，后续更新仅修复 `bug`，主要特性不受影响（更多详情，请见 [版本管理](#)）。请访问 [发布说明页面](#) 界面查看每一个稳定发布版本。
- 如需尝试/测试 ESP-IDF 的最新特性，请使用 [最新版本（在 `master` 分支上）](#)。最新版本包含 ESP-IDF 的所有最新特性，已通过自动化测试，但尚未全部完成人工测试（因此存在一定风险）。
- 如需使用稳定版本中没有的新特性，但同时又不希望受到 `master` 分支更新的影响，您可以将一个最适合您的稳定版本 [更新至一个预发布版本](#) 或 [更新至一个发布分支](#)。

有关如何更新 ESP-IDF 本地副本的内容，请参考 [更新 ESP-IDF](#) 章节。

### 7.3 版本管理

ESP-IDF 采用了 [语义版本管理方法](#)，即您可以从字面含义理解每个版本的差异。其中

- 主要版本（例 `v3.0`）代表有重大更新，包括增加新特性、改变现有特性及移除已弃用的特性。  
升级至一个新的主要版本（例 `v2.1` 升级至 `v3.0`）意味着您可能需要更新您的工程代码，并重新测试您的工程，具体可参考 [发布说明页面](#) 的重大变更 (**Breaking Change**) 部分。
- 次要版本（例 `v3.1`）代表有新增特性和 `bug` 修复，但现有特性不受影响，公开 API 的使用也不受影响。  
升级至一个新的次要版本（例 `v3.0` 升级至 `v3.1`）意味着您可能不需要更新您的工程代码，但需重新测试您的工程，特别是 [发布说明页面](#) 中专门提到的部分。
- `Bugfix` 版本（例 `v3.0.1`）仅修复 `bug`，并不增加任何新特性。

升级至一个新的 **Bugfix** 版本（例 v3.0 升级至 v3.0.1）意味着您不需要更新您的工程代码，仅需测试与本次发布修复 **bug**（列表见 [发布说明页面](#)）直接相关的特性。

## 7.4 支持期限

ESP-IDF 的每个主要版本和次要版本都有相应的支持期限。支持期限满后，版本停止更新维护，将不再提供支持。

[支持期限政策](#) 对此有具体描述，并介绍了每个版本的支持期限是如何界定的。

[发布说明页面](#) 界面上的每一个发布版本都提供了该版本的支持期限信息。

一般而言：

- 如您刚开始一个新项目，建议使用最新稳定版本。
- 如您有 [GitHub](#) 账号，请点击 [发布说明页面](#) 界面右上角的“Watch”按钮，并选中“Releases only”选项。[GitHub](#) 将会在新版本发布的时候通知您。当您所使用的版本有 **Bugfix** 版本发布时，请做好升级至该 **Bugfix** 版本的规划。
- 如可能，请定期（如每年一次）将项目的 **IDF** 版本升级至一个新的主要版本或次要版本。对于次要版本更新，更新过程应该比较简单，但对于主要版本更新，可能需要细致查看发布说明并做对应的更新规划。
- 请确保您所使用的版本停止更新维护前，已做好升级至新版本的规划。

ESP-IDF 的每个主要版本和次要版本（V4.1、V4.2 等）的支持期限为 30 个月，从最初的稳定版发布日期算起。

在支持期限内意味着 ESP-IDF 团队将继续在 [GitHub](#) 的发布分支上进行 **bug** 修复、安全修复等，并根据需要定期发布新的 **Bugfix** 版本。

支持期限分为“服务期”和“维护期”：

| 周期  | 时长    | 是否推荐新工程使用 |
|-----|-------|-----------|
| 服务期 | 12 个月 | 是         |
| 维护期 | 18 个月 | 否         |

在服务期内，**Bugfix** 版本的发布更为频繁。某些情况下，在服务期内会增加新特性，这些特性主要是为了满足新产品特定监管要求或标准，并且回归风险非常低。

在维护期内，该版本仍受支持，但只会对严重性较高的问题或安全问题进行 **bug** 修复。

当开始一个新项目时，建议使用在服务期内的版本。

鼓励用户在您所用的版本支持期限结束之前，将所有的工程升级到最新的 ESP-IDF 版本。在版本支持期限满后，我们将不再继续进行 **bug** 修复。

支持期限不包括预发布版本（betas、预览版、-rc 和 -dev 版等），有时会将某个特性在发布版中标记为“预览版”，这意味着该特性也不在支持期限内。

关于 [不同版本的 ESP-IDF](#)（主要版本、次要版本、**Bugfix** 版本等）的更多信息，请参考 [ESP-IDF 编程指南](#)。

## 7.5 查看当前版本

查看 ESP-IDF 本地副本的版本，请使用 `idf.py` 命令：

```
idf.py --version
```

此外，由于 ESP-IDF 的版本也已编译至固件中，因此您也可以使用宏 `IDF_VER` 查看 ESP-IDF 的版本（以字符串的格式）。ESP-IDF 默认引导程序会在设备启动时打印 ESP-IDF 的版本。请注意，在 GitHub 仓库中的代码更新时，代码中的版本信息仅会在源代码重新编译或在清除编译时才会更新，因此打印出来的版本可能并不是最新的。

如果编写的代码需要支持多个 ESP-IDF 版本，可以在编译时使用 *compile-time macros* 检查版本。

几个 ESP-IDF 版本的例子：

| 版本字符串                    | 含义   |
|--------------------------|--|
| v3.2-dev-306-gbeb3611ca  | <p>master 分支上的预发布版本。</p> <ul style="list-style-type: none"> <li>- v3.2-dev: 为 v3.2 进行的开发。</li> <li>- 306: v3.2 开发启动后的 commit 数量。</li> <li>- beb3611ca: commit 标识符。</li> </ul>                              |
| v3.0.2                   | 稳定版本，标签为 v3.0.2。   |
| v3.1-beta1-75-g346d6b0ea | <p>v3.1 的 beta 测试版本（可参考<a href="#">更新至一个发布分支</a>）。</p> <ul style="list-style-type: none"> <li>- v3.1-beta1 - 预发布标签。</li> <li>- 75: 添加预发布 beta 标签后的 commit 数量。</li> <li>- 346d6b0ea: commit 标识符。</li> </ul> |
| v3.0.1-dirty             | <p>稳定版本，标签为 v3.0.1。</p> <ul style="list-style-type: none"> <li>- dirty 代表 ESP-IDF 的本地副本有修改。</li> </ul>   |

## 7.6 Git 工作流

乐鑫 ESP-IDF 团队的 (Git) 开发工作流程如下：

- 新的改动总是在 `master` 分支（最新版本）上进行。`master` 分支上的 ESP-IDF 版本总带有 `-dev` 标签，表示“正在开发中”，例 `v3.1-dev`。
- 这些改动将首先在乐鑫的内部 Git 仓库进行代码审阅与测试，然后在自动化测试完成后推至 GitHub。
- 新版本一旦完成特性开发（在 `master` 分支上进行）并达到进入 `beta` 测试的标准，则将该版本切换至一个新分支（例 `release/v3.1`）。此外，该分支还打上预发布标签（例 `v3.1-beta1`）。您可以在 GitHub 平台上查看 ESP-IDF 的完整 [分支列表](#) 和 [标签列表](#)。`Beta` 预发布版本可能仍存在大量“已知问题”（Known Issue）。
- 随着对 `beta` 版本的不断测试，`bug` 修复将同时增加至该发布分支和 `master` 分支。而且，`master` 分支可能也已经开始为下个版本开发新特性了。
- 当测试快结束时，该发布分支上将增加一个 `rc` 标签，代表候选发布（Release Candidate），例 `v3.1-rc1`。此时，该分支仍属于预发布版本。
- 如果一直未发现或报告重大 `bug`，则该预发布版本将最终增加“主要版本”（例 `v4.0`）或“次要版本”标记（例 `v3.1`），成为正式发布版本，并体现在 [发布说明页面](#)。
- 后续，该版本中发现的 `bug` 都将在该发布分支上进行修复。人工测试完成后，该分支将增加一个 `Bugfix` 版本标签（例 `v3.1.1`），并体现在 [发布说明页面](#)。

## 7.7 更新 ESP-IDF

请根据您的实际情况，对 ESP-IDF 进行更新。

- 如有量产用途，建议参考[更新至一个稳定发布版本](#)。
- 如需测试/研发/尝试最新特性，建议参考[更新至 `master` 分支](#)。
- 两者折衷建议参考[更新至一个发布分支](#)。

---

**备注：** 在参考本指南时，请首先获得 ESP-IDF 的本地副本，具体步骤请参考[入门指南](#) 中的介绍。

---

### 7.7.1 更新至一个稳定发布版本

对于量产用户，推荐更新至一个新的 ESP-IDF 发布版本，请参考以下步骤：

- 请定期查看 [发布说明页面](#)，了解最新发布情况。
- 如有新发布的 `Bugfix` 版本（例 `v3.0.1` 或 `v3.0.2`）时，请将新的 `Bugfix` 版本更新至您的 ESP-IDF 目录：

```
cd $IDF_PATH
git fetch
git checkout vX.Y.Z
git submodule update --init --recursive
```

- 在主要版本或次要版本新发布时，请查看发布说明中的具体描述，并决定是否升级您的版本。具体命令与上方描述一致。

---

**备注：** 如果您之前在安装 ESP-IDF 时使用了 `zip` 文件包，而非通过 Git 命令，则您将无法使用 Git 命令进行版本升级，此属正常情况。这种情况下，请重新下载最新 `zip` 文件包，并替换掉之前 `IDF_PATH` 下的全部内容。

---

## 7.7.2 更新至一个预发布版本

您也可以将您的本地副本切换（命令 `git checkout`）至一个预发布版本或 rc 版本，具体方法请参考[更新至一个稳定发布版本](#) 中的描述。

预发布版本通常不体现在 [发布说明页面](#)。更多详情，请查看完整 [标签列表](#)。使用预发布版本的注意事项，请参考[更新至一个发布分支](#) 中的描述。

## 7.7.3 更新至 master 分支

---

**备注：**ESP-IDF 中 master 分支上的代码会时时更新，因此使用 master 分支相当在“流血的边缘试探”，存在一定风险。

---

如需使用 ESP-IDF 的 master 分支，请参考以下步骤：

- 本地切换至 master 分支：

```
cd $IDF_PATH
git checkout master
git pull
git submodule update --init --recursive
```

- 此外，您还应在后续工作中不时使用 `git pull` 命令，将远端 master 上的更新同步到本地。注意，在更新 master 分支后，您可能需要更改工程代码，也可能遇到新的 bug。
- 如需从 master 分支切换至一个发布分支或稳定版本，请使用 `git checkout` 命令。

---

**重要：**强烈建议您定期使用 `git pull` 和 `git submodule update --init --recursive` 命令，确保本地副本的及时更新。旧的 master 分支相当于一个“快照”，可能存在未记录的问题，且无法获得支持。对于半稳定版本，请参考[更新至一个发布分支](#)。

---

## 7.7.4 更新至一个发布分支

从稳定性来说，使用“发布分支”相当于在使用 master 分支和稳定版本之间进行折衷，包含一些 master 分支上的新特性，但也同时保证可通过 beta 测试且基本完成了 bug 修复。

更多详情，请前往 [GitHub](#) 查看完整 [标签列表](#)。

举例，您可以关注 ESP-IDF v3.1 分支，随时关注该分支上的 Bugfix 版本发布（例 v3.1.1 等）：

```
cd $IDF_PATH
git fetch
git checkout release/v3.1
git pull
git submodule update --init --recursive
```

您每次在该分支上使用 `git pull` 时都相当于把最新的 Bugfix 版本发布更新至您的本地副本中。

---

**备注：**发布分支并不会会有专门的配套文档，建议您使用与本分支最接近版本的文档。

---

## Chapter 8

# 资源

### 8.1 PlatformIO

- [What is PlatformIO?](#)
- [Installation](#)
- [Configuration](#)
- [Tutorials](#)
- [Project Examples](#)
- [Next Steps](#)

#### 8.1.1 What is PlatformIO?

PlatformIO is a cross-platform embedded development environment with out-of-the-box support for ESP-IDF.

Since ESP-IDF support within PlatformIO is not maintained by the Espressif team, please report any issues with PlatformIO directly to its developers in [the official PlatformIO repositories](#).

A detailed overview of the PlatformIO ecosystem and its philosophy can be found in [the official PlatformIO documentation](#).

#### 8.1.2 Installation

- [PlatformIO IDE](#) is a toolset for embedded C/C++ development available on Windows, macOS and Linux platforms
- [PlatformIO Core \(CLI\)](#) is a command-line tool that consists of multi-platform build system, platform and library managers and other integration components. It can be used with a variety of code development environments and allows integration with cloud platforms and web services

### 8.1.3 Configuration

Please go through [the official PlatformIO configuration guide](#) for ESP-IDF.

### 8.1.4 Tutorials

- [ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis](#)

### 8.1.5 Project Examples

Please check ESP-IDF page in [the official PlatformIO documentation](#)

### 8.1.6 Next Steps

Here are some useful links for exploring the PlatformIO ecosystem:

- Learn more about [integrations with other IDEs/Text Editors](#)
- Get help from [PlatformIO community](#)

## 8.2 有用的链接

- 您可以在 [ESP32 论坛](#) 中提出您的问题，访问社区资源。
- 您可以通过 [GitHub](#) 的 [Issues](#) 版块提交 bug 或功能请求。在提交新 Issue 之前，请先查看现有的 [Issues](#)。
- 您可以在 [ESP IoT Solution](#) 库中找到基于 ESP-IDF 的 [解决方案](#)、[应用实例](#)、[组件和驱动](#) 等内容。多数文档均提供中英文版本。
- 通过 [Arduino](#) 平台开发应用，请参考 [ESP32 Wi-Fi 芯片的 Arduino 内核](#)。
- 关于 ESP32 的书籍列表，请查看 [乐鑫](#) 网站。
- 如果您有兴趣参与到 ESP-IDF 的开发，请查阅 [Contributions Guide](#)。
- 关于 ESP32 的其它信息，请查看官网 [文档](#) 版块。
- 关于本文档的 PDF 和 HTML 格式下载（最新版本和早期版本），请点击 [下载](#)。

# Chapter 9

## Copyrights and Licenses

### 9.1 Software Copyrights

All original source code in this repository is Copyright (C) 2015-2022 Espressif Systems. This source code is licensed under the Apache License 2.0 as described in the file LICENSE.

Additional third party copyrighted code is included under the following licenses.

Where source code headers specify Copyright & License information, this information takes precedence over the summaries made here.

#### 9.1.1 Firmware Components

These third party libraries can be included into the application (firmware) produced by ESP-IDF.

- [Newlib](#) is licensed under the BSD License and is Copyright of various parties, as described in [COPYING.NEWLIB](#).
- [Xtensa header files](#) are Copyright (C) 2013 Tensilica Inc and are licensed under the MIT License as reproduced in the individual header files.
- Original parts of [FreeRTOS](#) (components/freertos) are Copyright (C) 2017 Amazon.com, Inc. or its affiliates are licensed under the MIT License, as described in [license.txt](#).
- Original parts of [LWIP](#) (components/lwip) are Copyright (C) 2001, 2002 Swedish Institute of Computer Science and are licensed under the BSD License as described in [COPYING file](#).
- [wpa\\_supplicant](#) Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- [FreeBSD net80211](#) Copyright (c) 2004-2008 Sam Leffler, Errno Consulting and licensed under the BSD license.
- [JSMN](#) JSON Parser (components/jsmn) Copyright (c) 2010 Serge A. Zaitsev and licensed under the MIT license.
- [argtable3](#) argument parsing library Copyright (C) 1998-2001,2003-2011,2013 Stewart Heitmann and licensed under 3-clause BSD license. [argtable3](#) also includes the following software components. For details, please see [argtable3 LICENSE file](#).
  - C Hash Table library, Copyright (c) 2002, Christopher Clark and licensed under 3-clause BSD license.
  - The Better String library, Copyright (c) 2014, Paul Hsieh and licensed under 3-clause BSD license.
  - TCL library, Copyright the Regents of the University of California, Sun Microsystems, Inc., Scriptics Corporation, ActiveState Corporation and other parties, and licensed under TCL/TK License.
- [linenoise](#) line editing library Copyright (c) 2010-2014 Salvatore Sanfilippo, Copyright (c) 2010-2013 Pieter Noordhuis, licensed under 2-clause BSD license.
- [libcoap](#) COAP library Copyright (c) 2010-2017 Olaf Bergmann and others, is licensed under 2-clause BSD license as described in [LICENSE file](#) and [COPYING file](#) .
- [libexpat](#) XML parsing library Copyright (c) 1998-2000 Thai Open Source Software Center Ltd and Clark Cooper, Copyright (c) 2001-2017 Expat maintainers, is licensed under MIT license as described in [COPYING file](#) .
- [FatFS](#) library, Copyright (C) 2017 ChaN, is licensed under a [BSD-style license](#) .

- [cJSON](#) library, Copyright (c) 2009-2017 Dave Gamble and cJSON contributors, is licensed under MIT license as described in [LICENSE file](#) .
- [libsodium](#) library, Copyright (c) 2013-2018 Frank Denis, is licensed under ISC license as described in [LICENSE file](#) .
- [micro-ecc](#) library, Copyright (c) 2014 Kenneth MacKay, is licensed under 2-clause BSD license.
- [nghttp2](#) library, Copyright (c) 2012, 2014, 2015, 2016 Tatsuhiro Tsujikawa, Copyright (c) 2012, 2014, 2015, 2016 nghttp2 contributors, is licensed under MIT license as described in [COPYING file](#) .
- [Mbed TLS](#) library, Copyright (C) 2006-2018 ARM Limited, is licensed under Apache License 2.0 as described in [LICENSE file](#) .
- [SPIFFS](#) library, Copyright (c) 2013-2017 Peter Andersson, is licensed under MIT license as described in [LICENSE file](#) .
- [TinyCBOR](#) library, Copyright (c) 2017 Intel Corporation, is licensed under MIT License as described in [LICENSE file](#) .
- [SD/MMC driver](#) is derived from [OpenBSD SD/MMC driver](#), Copyright (c) 2006 Uwe Stuehler, and is licensed under BSD license.
- [Asio](#) , Copyright (c) 2003-2018 Christopher M. Kohlhoff is licensed under the Boost Software License as described in [COPYING file](#).
- [ESP-MQTT](#) MQTT Package (contiki-mqtt) - Copyright (c) 2014, Stephen Robinson, MQTT-ESP - Tuan PM <tuanpm at live dot com> is licensed under Apache License 2.0 as described in [LICENSE file](#) .
- [BLE Mesh](#) is adapted from Zephyr Project, Copyright (c) 2017-2018 Intel Corporation and licensed under Apache License 2.0
- [mynewt-nimble](#) Apache Mynewt NimBLE, Copyright 2015-2018, The Apache Software Foundation, is licensed under Apache License 2.0 as described in [LICENSE file](#).
- [cryptoauthlib](#) Microchip CryptoAuthentication Library - Copyright (c) 2015 - 2018 Microchip Technology Inc, is licensed under common Microchip software License as described in [LICENSE file](#)
- [TLSF allocator](#) Two Level Segregated Fit memory allocator, Copyright (c) 2006-2016, Matthew Conte, and licensed under the BSD license.
- [qrcode](#) QR Code generator library Copyright (c) Project Nayuki, is licensed under MIT license.
- [openthread](#), Copyright (c) The OpenThread Authors, is licensed under Apache License 2.0 as described in [LICENSE file](#).
- [UBSAN runtime](#) —Copyright (c) 2016, Linaro Limited and Jiří Závěručky, licensed under the BSD 2-clause license.
- [freemodbus](#) Copyright (c) 2006-2013 Christian Walter, Armink and licensed under the BSD license.

### 9.1.2 Build Tools

This is the list of licenses for tools included in this repository, which are used to build applications. The tools do not become part of the application (firmware), so their license does not affect licensing of the application.

- [esptool.py](#) is Copyright (C) 2014-2016 Fredrik Ahlberg, Angus Gratton and is licensed under the GNU General Public License v2, as described in [LICENSE file](#).
- [KConfig](#) is Copyright (C) 2002 Roman Zippel and others, and is licensed under the GNU General Public License V2.

### 9.1.3 Documentation

- HTML version of the [ESP-IDF Programming Guide](#) uses the Sphinx theme [sphinx\\_idf\\_theme](#), which is Copyright (c) 2013-2020 Dave Snider, Read the Docs, Inc. & contributors, and Espressif Systems (Shanghai) CO., LTD. It is based on [sphinx\\_rtd\\_theme](#). Both are licensed under MIT license.

## 9.2 ROM Source Code Copyrights

ESP32, ESP32-S and ESP32-C Series SoCs mask ROM hardware includes binaries compiled from portions of the following third party software:

- [Newlib](#) , licensed under the BSD License and is Copyright of various parties, as described in [COPYING.NEWLIB](#).
- Xtensa libhal, Copyright (c) Tensilica Inc and licensed under the MIT license (see below).
- [TinyBasic Plus](#), Copyright Mike Field & Scott Lawrence and licensed under the MIT license (see below).
- [miniz](#), by Rich Geldreich - placed into the public domain.
- [wpa\\_supplicant](#) Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- [TJpgDec](#) Copyright (C) 2011, ChaN, all right reserved. See below for license.

### 9.3 Xtensa libhal MIT License

Copyright (c) 2003, 2006, 2010 Tensilica Inc.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software” ), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

### 9.4 TinyBasic Plus MIT License

Copyright (c) 2012-2013

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software” ), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

### 9.5 TJpgDec License

TJpgDec - Tiny JPEG Decompressor R0.01 (C)ChaN, 2011 The TJpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

- The TJpgDec module is a free software and there is NO WARRANTY.
- No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.

- Redistributions of source code must retain the above copyright notice.

## Chapter 10

# 关于本指南

本指南为 乐鑫 公司 ESP32 官方应用开发框架 ESP-IDF 的配套文档。

ESP32 芯片是一款 2.4 GHz Wi-Fi 和蓝牙双模芯片，内置 1 或 2 个 Xtensa® 32 位 LX6 处理器，运算能力最高可达 600 DMIPS。

图 1: 乐鑫物联网综合开发框架

ESP-IDF 即乐鑫物联网开发框架，可为在 Windows、Linux 和 macOS 系统平台上开发 ESP32 应用程序提供工具链、API、组件和工作流程的支持。

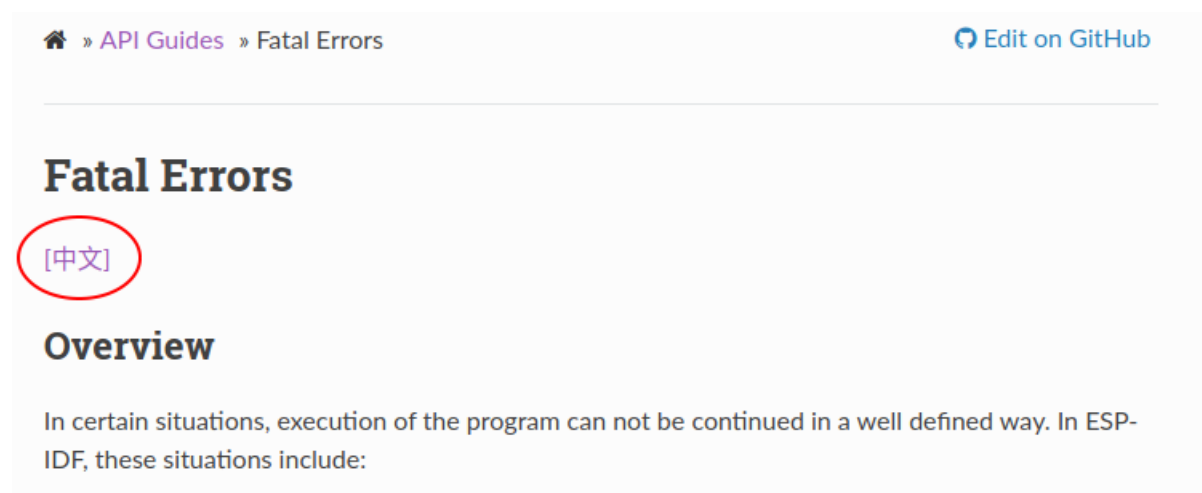

## Chapter 11

# 切换语言

《ESP-IDF 编程指南》部分文档现在有两种语言的版本。如有出入请以英文版本为准。

- 英文
- 中文

如下图所示，如果该文档两种语言版本均具备，您可以通过点击文档上方的语言链接轻松进行语言切换。
