

ESP32

ESP-IDF Programming Guide

Release v4.4.7
乐鑫信息科技
2024年02月27日

Table of contents

Table of contents	i
1 快速入门	3
1.1 概述	3
1.2 准备工作	3
1.3 开发板简介	4
1.3.1 ESP32-DevKitC V4 入门指南	4
1.3.2 ESP-WROVER-KIT V4.1 入门指南	11
1.3.3 ESP32-PICO-KIT V4/V4.1 入门指南	36
1.3.4 ESP32-Ethernet-Kit V1.2 入门指南	46
1.3.5 ESP32-DevKitS(-R)	72
1.3.6 ESP32-PICO-KIT-1	78
1.3.7 ESP32-PICO-DevKitM-2	83
1.3.8 ESP32-DevKitM-1	88
1.4 详细安装步骤	92
1.4.1 设置开发环境	93
1.4.2 创建您的第一个工程	93
1.5 第一步：安装准备	93
1.5.1 Windows 平台工具链的标准设置	93
1.5.2 Linux 平台工具链的标准设置	98
1.5.3 macOS 平台工具链的标准设置	98
1.6 第二步：获取 ESP-IDF	100
1.6.1 Linux 和 macOS 操作系统	100
1.6.2 Windows 操作系统	100
1.7 第三步：设置工具	100
1.7.1 Windows 操作系统	101
1.7.2 Linux 和 macOS 操作系统	101
1.7.3 下载工具备选方案	101
1.7.4 自定义工具安装路径	102
1.8 第四步：设置环境变量	102
1.8.1 Windows 操作系统	102
1.8.2 Linux 和 macOS 操作系统	102
1.9 第五步：开始创建工程	103
1.9.1 Linux 和 macOS 操作系统	103
1.9.2 Windows 操作系统	103
1.10 第六步：连接设备	103
1.11 第七步：配置	103
1.11.1 Linux 和 macOS 操作系统	103
1.11.2 Windows 操作系统	104
1.12 第八步：编译工程	104
1.13 第九步：烧录到设备	105
1.13.1 烧录过程中可能遇到的问题	105
1.13.2 常规操作	106
1.14 第十步：监视器	106
1.15 更新 ESP-IDF	108
1.16 相关文档	108

1.16.1	与 ESP32 创建串口连接	108
1.16.2	Eclipse IDE 创建和烧录指南	114
1.16.3	VS Code IDE 快速入门	114
1.16.4	IDF 监视器	115
1.16.5	工具链的自定义设置	119
1.16.6	快速入门 (传统 GNU Make)	124
2	API 参考	149
2.1	蓝牙 API	149
2.1.1	Controller && VHCI	149
2.1.2	BT COMMON	158
2.1.3	BT LE	167
2.1.4	CLASSIC BT	297
2.1.5	NimBLE-based host APIs	407
2.1.6	ESP-BLE-MESH	410
2.2	联网 API	692
2.2.1	Wi-Fi	692
2.2.2	以太网	798
2.2.3	Thread	818
2.2.4	IP 网络层协议	823
2.2.5	应用层协议	842
2.3	外设 API	842
2.3.1	Analog to Digital Converter (ADC)	842
2.3.2	Digital To Analog Converter (DAC)	866
2.3.3	GPIO & RTC GPIO	869
2.3.4	通用定时器	891
2.3.5	I2C 驱动程序	902
2.3.6	Inter-IC Sound (I2S)	919
2.3.7	LCD	936
2.3.8	LED PWM 控制器	949
2.3.9	Motor Control Pulse Width Modulator (MCPWM)	967
2.3.10	Pulse Counter (PCNT)	996
2.3.11	Remote Control (RMT)	1007
2.3.12	SD Pull-up Requirements	1026
2.3.13	SDMMC Host Driver	1030
2.3.14	SD SPI Host Driver	1035
2.3.15	SDIO Card Slave Driver	1040
2.3.16	Sigma-delta Modulation	1051
2.3.17	SPI Master Driver	1054
2.3.18	SPI Slave Driver	1079
2.3.19	ESP32-WROOM-32SE (Secure Element)	1086
2.3.20	触摸传感器	1087
2.3.21	Two-Wire Automotive Interface (TWAI)	1103
2.3.22	Universal Asynchronous Receiver/Transmitter (UART)	1120
2.4	应用层协议	1147
2.4.1	mDNS 服务	1147
2.4.2	ESP-TLS	1161
2.4.3	OpenSSL-APIs	1173
2.4.4	ESP HTTP Client	1201
2.4.5	ESP WebSocket Client	1217
2.4.6	HTTP 服务器	1225
2.4.7	HTTPS server	1251
2.4.8	ICMP Echo	1254
2.4.9	ASIO port	1258
2.4.10	ESP-MQTT	1259
2.4.11	ESP-Modbus	1272
2.4.12	ESP Local Control	1273
2.4.13	ESP Serial Slave Link	1282

2.4.14	ESP x509 Certificate Bundle	1299
2.4.15	IP 网络层协议	1301
2.5	配网 API	1302
2.5.1	Unified Provisioning	1302
2.5.2	Protocol Communication	1305
2.5.3	Wi-Fi Provisioning	1318
2.6	存储 API	1336
2.6.1	FAT 文件系统	1336
2.6.2	量产程序	1341
2.6.3	非易失性存储库	1345
2.6.4	NVS 分区生成程序	1366
2.6.5	SD/SDIO/MMC 驱动程序	1371
2.6.6	SPI Flash API	1382
2.6.7	SPIFFS 文件系统	1413
2.6.8	虚拟文件系统组件	1416
2.6.9	磨损均衡 API	1430
2.7	System API	1434
2.7.1	App Image Format	1434
2.7.2	Application Level Tracing	1440
2.7.3	Chip Revision	1445
2.7.4	控制台终端	1448
2.7.5	eFuse Manager	1457
2.7.6	Error Codes and Helper Functions	1474
2.7.7	ESP HTTPS OTA	1476
2.7.8	POSIX Threads Support	1480
2.7.9	Event Loop Library	1485
2.7.10	FreeRTOS	1504
2.7.11	FreeRTOS Additions	1615
2.7.12	Heap Memory Allocation	1634
2.7.13	Heap Memory Debugging	1647
2.7.14	High Resolution Timer	1658
2.7.15	The himem allocation API	1663
2.7.16	Inter-Processor Call	1666
2.7.17	Call function with external stack	1671
2.7.18	Interrupt allocation	1672
2.7.19	Logging library	1679
2.7.20	Miscellaneous System APIs	1686
2.7.21	空中升级 (OTA)	1691
2.7.22	Performance Monitor	1701
2.7.23	电源管理	1705
2.7.24	Random Number Generation	1711
2.7.25	Sleep Modes	1713
2.7.26	Watchdogs	1724
2.7.27	System Time	1728
2.7.28	Internal and Unstable APIs	1733
2.8	API Conventions	1734
2.8.1	Error handling	1734
2.8.2	Configuration structures	1734
2.8.3	Private APIs	1735
2.8.4	Components in example projects	1735
2.8.5	API Stability	1736
2.9	Project Configuration	1737
2.9.1	Introduction	1737
2.9.2	Project Configuration Menu	1737
2.9.3	Using sdkconfig.defaults	1737
2.9.4	Kconfig Formatting Rules	1737
2.9.5	Backward Compatibility of Kconfig Options	1738
2.9.6	Configuration Options Reference	1738

2.9.7	Customisations	2009
2.10	Error Codes Reference	2009
3	ESP32 H/W 硬件参考	2017
3.1	芯片系列对比	2017
3.1.1	相关文档	2019
4	API 指南	2021
4.1	应用层跟踪库	2021
4.1.1	概述	2021
4.1.2	运行模式	2021
4.1.3	配置选项与依赖项	2022
4.1.4	如何使用这个库	2023
4.2	应用程序的启动流程	2031
4.2.1	一级引导程序	2031
4.2.2	二级引导程序	2032
4.2.3	应用程序启动阶段	2032
4.3	BluFi	2034
4.3.1	概览	2034
4.3.2	BluFi 流程	2034
4.3.3	BluFi 流程图	2035
4.3.4	BluFi 中定义的帧格式	2035
4.3.5	ESP32 端的安全实现	2039
4.3.6	GATT 相关说明	2040
4.4	引导加载程序 (Bootloader)	2040
4.4.1	引导加载程序兼容性	2040
4.4.2	日志级别	2041
4.4.3	恢复出厂设置	2041
4.4.4	从测试固件启动	2042
4.4.5	回滚	2042
4.4.6	看门狗	2042
4.4.7	引导加载程序大小	2043
4.4.8	从深度睡眠中快速启动	2043
4.4.9	自定义引导加载程序	2043
4.5	构建系统 (CMake 版)	2043
4.5.1	概述	2044
4.5.2	使用构建系统	2044
4.5.3	示例项目	2048
4.5.4	项目 CMakeLists 文件	2048
4.5.5	组件 CMakeLists 文件	2050
4.5.6	组件配置	2052
4.5.7	预处理器定义	2052
4.5.8	组件依赖	2052
4.5.9	组件 CMakeLists 示例	2057
4.5.10	自定义 sdkconfig 的默认值	2061
4.5.11	Flash 参数	2061
4.5.12	构建 Bootloader	2061
4.5.13	选择目标芯片	2062
4.5.14	编写纯 CMake 组件	2062
4.5.15	组件中使用第三方 CMake 项目	2062
4.5.16	组件中使用预建库	2063
4.5.17	在自定义 CMake 项目中使用 ESP-IDF	2064
4.5.18	ESP-IDF CMake 构建系统 API	2064
4.5.19	文件通配 & 增量构建	2068
4.5.20	构建系统的元数据	2068
4.5.21	构建系统内部	2069
4.5.22	从 ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统	2070
4.6	构建系统 (传统 GNU Make)	2072

4.6.1	使用构建系统	2072
4.6.2	概述	2072
4.6.3	代码和数据的存放	2081
4.6.4	构建 Bootloader	2081
4.7	Deep Sleep Wake Stubs	2082
4.7.1	Rules for Wake Stubs	2082
4.7.2	Implementing A Stub	2082
4.7.3	Loading Code Into RTC Memory	2082
4.7.4	Loading Data Into RTC Memory	2083
4.7.5	CRC Check For Wake Stubs	2083
4.7.6	Example	2083
4.8	错误处理	2084
4.8.1	概述	2084
4.8.2	错误码	2084
4.8.3	错误码到错误消息	2084
4.8.4	ESP_ERROR_CHECK 宏	2085
4.8.5	ESP_ERROR_CHECK_WITHOUT_ABORT 宏	2085
4.8.6	ESP_RETURN_ON_ERROR 宏	2085
4.8.7	ESP_GOTO_ON_ERROR 宏	2085
4.8.8	ESP_RETURN_ON_FALSE 宏	2085
4.8.9	ESP_GOTO_ON_FALSE 宏	2085
4.8.10	CHECK 宏使用示例	2086
4.8.11	错误处理模式	2086
4.8.12	C++ 异常	2087
4.9	ESP-BLE-MESH	2087
4.9.1	概述	2087
4.9.2	ESP-BLE-MESH 快速入门	2088
4.9.3	ESP-BLE-MESH 示例	2092
4.9.4	ESP-BLE-MESH 演示视频	2095
4.9.5	ESP-BLE-MESH 常见问题手册	2095
4.9.6	相关文档	2095
4.10	ESP-WIFI-MESH	2121
4.10.1	概述	2121
4.10.2	简介	2122
4.10.3	ESP-WIFI-MESH 概念	2123
4.10.4	建立网络	2127
4.10.5	管理网络	2132
4.10.6	数据传输	2134
4.10.7	信道切换	2137
4.10.8	性能	2139
4.10.9	更多注意事项	2140
4.11	Core Dump	2140
4.11.1	Overview	2140
4.11.2	Configurations	2140
4.11.3	Save core dump to flash	2141
4.11.4	Print core dump to UART	2141
4.11.5	ROM Functions in Backtraces	2141
4.11.6	Dumping variables on demand	2142
4.11.7	Running espcoredump.py	2142
4.12	Event Handling	2143
4.12.1	Wi-Fi, Ethernet, and IP Events	2143
4.12.2	Mesh Events	2144
4.12.3	Bluetooth Events	2145
4.13	片外 RAM	2145
4.13.1	简介	2145
4.13.2	硬件	2145
4.13.3	配置片外 RAM	2146
4.13.4	片外 RAM 使用限制	2147

4.13.5	初始化失败	2147
4.13.6	加密	2148
4.13.7	Chip revisions	2148
4.14	严重错误	2148
4.14.1	概述	2148
4.14.2	紧急处理程序	2149
4.14.3	寄存器转储与回溯	2151
4.14.4	GDB Stub	2152
4.14.5	Guru Meditation 错误	2152
4.14.6	其他严重错误	2154
4.15	Flash 加密	2156
4.15.1	概述	2156
4.15.2	相关 eFuses	2156
4.15.3	Flash 的加密过程	2157
4.15.4	Flash 加密设置	2158
4.15.5	可能出现的错误	2163
4.15.6	ESP32 flash 加密状态	2165
4.15.7	在加密的 flash 中读写数据	2165
4.15.8	更新加密的 flash	2166
4.15.9	关闭 flash 加密	2166
4.15.10	Flash 加密的要点	2166
4.15.11	Flash 加密的局限性	2167
4.15.12	Flash 加密与安全启动	2167
4.15.13	Flash 加密的高级功能	2167
4.15.14	技术细节	2169
4.16	ESP-IDF FreeRTOS (SMP)	2170
4.16.1	Overview	2170
4.16.2	Symmetric Multiprocessing	2171
4.16.3	Tasks	2172
4.16.4	SMP Scheduler	2173
4.16.5	Critical Sections	2176
4.16.6	Misc	2178
4.17	Hardware Abstraction	2178
4.17.1	Architecture	2179
4.17.2	LL (Low Level) Layer	2180
4.17.3	HAL (Hardware Abstraction Layer)	2181
4.18	High-Level Interrupts	2182
4.18.1	Interrupt Levels	2182
4.18.2	Notes	2183
4.19	JTAG 调试	2183
4.19.1	引言	2184
4.19.2	工作原理	2184
4.19.3	选择 JTAG 适配器	2185
4.19.4	安装 OpenOCD	2185
4.19.5	配置 ESP32 目标板	2185
4.19.6	启动调试器	2191
4.19.7	调试范例	2191
4.19.8	从源码构建 OpenOCD	2191
4.19.9	注意事项和补充内容	2195
4.19.10	相关文档	2200
4.20	链接器脚本生成机制	2225
4.20.1	概述	2225
4.20.2	快速上手	2225
4.20.3	链接器脚本生成机制内核	2228
4.21	lwIP	2233
4.21.1	Supported APIs	2234
4.21.2	BSD Sockets API	2234
4.21.3	Netconn API	2238

4.21.4	lwIP FreeRTOS Task	2238
4.21.5	IPv6 Support	2238
4.21.6	esp-lwip custom modifications	2239
4.21.7	Performance Optimization	2240
4.22	OpenThread	2241
4.22.1	Mode of the OpenThread stack	2241
4.22.2	How To Write an OpenThread Application	2242
4.22.3	The OpenThread border router	2243
4.23	存储器类型	2243
4.23.1	DRAM (数据 RAM)	2243
4.23.2	RTC FAST memory (RTC 快速存储器)	2245
4.23.3	DROM (数据存储在 flash 中)	2245
4.23.4	RTC Slow memory (RTC 慢速存储器)	2245
4.23.5	具备 DMA 功能	2246
4.23.6	在堆栈中放置 DMA 缓冲区	2246
4.24	分区表	2247
4.24.1	概述	2247
4.24.2	内置分区表	2247
4.24.3	创建自定义分区表	2247
4.24.4	生成二进制分区表	2250
4.24.5	分区大小检查	2250
4.24.6	烧写分区表	2250
4.24.7	分区工具 (parttool.py)	2251
4.25	Performance	2252
4.25.1	How to Optimize Performance	2252
4.25.2	Guides	2252
4.26	RF calibration	2270
4.26.1	Partial calibration	2270
4.26.2	Full calibration	2270
4.26.3	No calibration	2271
4.26.4	PHY initialization data	2271
4.27	Secure Boot	2271
4.27.1	Background	2271
4.27.2	Secure Boot Process Overview	2271
4.27.3	Keys	2272
4.27.4	Bootloader Size	2272
4.27.5	How To Enable Secure Boot	2272
4.27.6	Re-Flashable Software Bootloader	2273
4.27.7	Generating Secure Boot Signing Key	2274
4.27.8	Remote Signing of Images	2274
4.27.9	Secure Boot Best Practices	2275
4.27.10	Technical Details	2275
4.27.11	Secure Boot & Flash Encryption	2276
4.27.12	Signed App Verification Without Hardware Secure Boot	2276
4.27.13	Advanced Features	2277
4.28	Secure Boot V2	2277
4.28.1	Background	2277
4.28.2	Advantages	2278
4.28.3	Secure Boot V2 Process	2278
4.28.4	Signature Block Format	2278
4.28.5	Verifying a Signature Block	2279
4.28.6	Verifying an Image	2279
4.28.7	Bootloader Size	2279
4.28.8	eFuse usage	2279
4.28.9	How To Enable Secure Boot V2	2280
4.28.10	Restrictions after Secure Boot is enabled	2281
4.28.11	Generating Secure Boot Signing Key	2281
4.28.12	Remote Signing of Images	2281

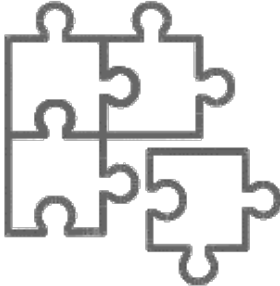

4.28.13	Secure Boot Best Practices	2281
4.28.14	Technical Details	2282
4.28.15	Secure Boot & Flash Encryption	2282
4.28.16	Signed App Verification Without Hardware Secure Boot	2282
4.28.17	Advanced Features	2283
4.29	Thread Local Storage	2283
4.29.1	Overview	2283
4.29.2	FreeRTOS Native API	2283
4.29.3	Pthread API	2283
4.29.4	C11 Standard	2284
4.30	工具	2284
4.30.1	Downloadable Tools	2284
4.30.2	IDF Docker Image	2296
4.30.3	IDF Windows Installer	2298
4.30.4	IDF Component Manager	2299
4.30.5	IDF Clang Tidy	2300
4.31	ULP 协处理器编程	2301
4.31.1	安装工具链	2301
4.31.2	编写 ULP FSM	2301
4.31.3	编译 ULP 代码	2328
4.31.4	访问 ULP FSM 程序变量	2329
4.31.5	启动 ULP FSM 程序	2330
4.31.6	ESP32 ULP 程序流	2330
4.31.7	应用示例	2331
4.31.8	API 参考	2331
4.32	ULP 协处理器 (传统的 GNU Make)	2333
4.32.1	安装工具链	2333
4.32.2	编译 ULP 代码	2333
4.32.3	访问 ULP 程序变量	2334
4.32.4	启动 ULP 程序	2335
4.32.5	ULP 程序流	2336
4.33	ESP32 中的单元测试	2337
4.33.1	添加常规测试用例	2337
4.33.2	添加多设备测试用例	2338
4.33.3	添加多阶段测试用例	2338
4.33.4	应用于不同芯片的单元测试	2339
4.33.5	编译单元测试程序	2340
4.33.6	运行单元测试	2340
4.33.7	带缓存补偿定时器的定时代码	2341
4.33.8	Mocks	2342
4.34	Unit Testing on Linux	2343
4.34.1	Embedded Software Tests	2343
4.34.2	IDF Unit Tests on Linux Host	2343
4.35	单元测试 (传统的 GNU Make)	2344
4.35.1	添加常规测试用例	2344
4.35.2	添加多设备测试用例	2345
4.35.3	添加多阶段测试用例	2346
4.35.4	编译单元测试程序	2346
4.35.5	运行单元测试	2347
4.36	Wi-Fi 驱动程序	2348
4.36.1	ESP32 Wi-Fi 功能列表	2348
4.36.2	如何编写 Wi-Fi 应用程序	2348
4.36.3	ESP32 Wi-Fi API 错误代码	2349
4.36.4	初始化 ESP32 Wi-Fi API 参数	2349
4.36.5	ESP32 Wi-Fi 编程模型	2350
4.36.6	ESP32 Wi-Fi 事件描述	2350

这里是乐鑫 IoT 开发框架 ([esp-idf](#)) 的文档中心。ESP-IDF 是 [ESP32](#)、[ESP32-S](#) 和 [ESP32-C](#) 系列芯片的官方开发框架。

本文档仅包含针对 ESP32 芯片的 ESP-IDF 使用。

		
快速入门	API 参考	H/W 参考
		
API 指南	贡献代码	相关资源

Chapter 1

快速入门

本文档旨在指导用户搭建 ESP32 硬件开发的软件环境，通过一个简单的示例展示如何使用 ESP-IDF (Espressif IoT Development Framework) 配置菜单，并编译、下载固件至 ESP32 开发板等步骤。

备注：这是 ESP-IDF 稳定版本 v4.4.7 的文档，还有其他版本的文档[ESP-IDF 版本简介](#) 供参考。

1.1 概述

ESP32 SoC 芯片支持以下功能：

- 2.4 GHz Wi-Fi
- 蓝牙
- 高性能 Xtensa® 32 位 LX6 双核处理器
- 超低功耗协处理器
- 多种外设

ESP32 采用 40 nm 工艺制成，具有最佳的功耗性能、射频性能、稳定性、通用性和可靠性，适用于各种应用场景和不同功耗需求。

乐鑫为用户提供完整的软、硬件资源，进行 ESP32 硬件设备的开发。其中，乐鑫的软件开发环境 ESP-IDF 旨在协助用户快速开发物联网 (IoT) 应用，可满足用户对 Wi-Fi、蓝牙、低功耗等方面的要求。

1.2 准备工作

硬件：

- 一款 **ESP32** 开发板
- **USB 数据线** (A 转 Micro-B)
- 电脑 (Windows、Linux 或 Mac OS)

软件：

您可以选择下载并手动安装以下软件：

- 设置 **工具链**，用于编译 ESP32 代码；
- **编译构建工具**——CMake 和 Ninja 编译构建工具，用于编译 ESP32 **应用程序**；
- 获取 **ESP-IDF** 软件开发框架。该框架已经基本包含 ESP32 使用的 API (软件库和源代码) 和运行 **工具链** 的脚本；

或者，您也可以通过以下集成开发环境 (IDE) 中的官方插件完成安装流程：

- [Eclipse 插件 \(安装\)](#)
- [VS Code 插件 \(安装\)](#)

图 1: ESP32 应用程序开发

1.3 开发板简介

请点击下方连接，了解有关开发板的详细信息。

1.3.1 ESP32-DevKitC V4 入门指南

本指南介绍了如何开始使用 ESP32-DevKitC V4 开发板。

准备工作

- [ESP32-DevKitC V4 开发板](#)
- USB A / micro USB B 数据线
- PC (Windows、Linux 或 Mac OS)

您可以跳过介绍部分，直接前往[应用程序开发](#) 章节。

概述

ESP32-DevKitC V4 是 乐鑫 一款基于 ESP32 的小型开发板，板上模组的绝大部分管脚均已引出，开发人员可根据实际需求，轻松通过跳线连接多种外围器件，或将开发板插在面包板上使用。

为了更好地满足不同用户需求，ESP32-DevKitC V4 还支持以下不同配置：

- 可选多款 ESP32 模组
 - ESP32-WROOM-32E
 - ESP32-WROOM-32UE
 - ESP32-WROOM-32D
 - ESP32-WROOM-32U
 - ESP32-SOLO-1
 - ESP32-WROVER-E
 - ESP32-WROVER-IE
 - ESP32-WROOM-DA
- 可选排针或排母

详情请见 [乐鑫产品选型工具](#)。

功能说明

ESP32-DevKitC V4 开发板的主要组件、接口及控制方式见下。

图 2: ESP32-DevKitC V4 (板载 ESP32-WROOM-32)

主要组件	基本介绍
ESP32-WROOM-32	基于 ESP32 的模组。更多详情，请见 《ESP32-WROOM-32 技术规格书》 。
EN	复位按键。
Boot	下载按键。按下 Boot 键并保持，同时按一下 EN 键（此时不要松开 Boot 键）进入“固件下载”模式，通过串口下载固件。
USB-to-UART 桥接器	单芯片 USB-UART 桥接器，可提供高达 3 Mbps 的传输速率。
Micro USB 接口。	USB 接口，可用作电路板的供电电源，或连接 PC 和 ESP32-WROOM-32 模组的通信接口。
5V Power On LED	开发板通电后（USB 或外部 5 V），该指示灯将亮起。更多信息，请见 相关文档 中的原理图。
I/O	板上模组的绝大部分管脚均已引出至开发板的排针。用户可以对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等多种功能。

备注：管脚 D0、D1、D2、D3、CMD 和 CLK 用于 ESP32 芯片与 SPI flash 间的内部通信，集中分布在开发板两侧靠近 USB 端口的位置。通常而言，这些管脚最好不连，否则可能影响 SPI flash / SPI RAM 的工作。

备注：管脚 GPIO16 和 GPIO17 仅适用于板载 ESP32-WROOM 系列和 ESP32-SOLO-1 的开发板，板载 ESP32-WROVER 系列开发板的管脚 GPIO16 和 GPIO17 保留内部使用。

电源选项

开发板可从以下三种供电方式中任选其一：

- Micro USB 供电（默认）
- 5V / GND 管脚供电
- 3V3 / GND 管脚供电

警告：上述供电模式 **不可同时连接**，否则可能会损坏开发板和/或电源。

排针

下表列出了开发板两侧排针（J1 和 J3）的名称和功能，排针名称如图 [ESP32-DevKitC V4](#)（板载 [ESP32-WROOM-32](#)）中所示，排针编号与 [ESP32-DevKitC V4 原理图 \(PDF\)](#) 一致。

J1

编号	名称	类型	功能
1	3V3	P	3.3 V 电源
2	EN	I	CHIP_PU, Reset
3	IO36	I	GPIO36, ADC1_CH0, S_VP
4	IO39	I	GPIO39, ADC1_CH3, S_VN
5	IO34	I	GPIO34, ADC1_CH6, VDET_1
6	IO35	I	GPIO35, ADC1_CH7, VDET_2
7	IO32	I/O	GPIO32, ADC1_CH4, TOUCH_CH9, XTAL_32K_P
8	IO33	I/O	GPIO33, ADC1_CH5, TOUCH_CH8, XTAL_32K_N
9	IO25	I/O	GPIO25, ADC1_CH8, DAC_1
10	IO26	I/O	GPIO26, ADC2_CH9, DAC_2
11	IO27	I/O	GPIO27, ADC2_CH7, TOUCH_CH7
12	IO14	I/O	GPIO14, ADC2_CH6, TOUCH_CH6, MTMS
13	IO12	I/O	GPIO12, ADC2_CH5, TOUCH_CH5, MTDI
14	GND	G	接地
15	IO13	I/O	GPIO13, ADC2_CH4, TOUCH_CH4, MTCK
16	IO9	I/O	GPIO9, D2
17	IO10	I/O	GPIO10, D3
18	IO11	I/O	GPIO11, CMD
19	5V0	P	5 V 电源

J3

编号	名称	类型	功能
1	GND	G	接地
2	IO23	I/O	GPIO23
3	IO22	I/O	GPIO22
4	IO1	I/O	GPIO1, U0TXD
5	IO3	I/O	GPIO3, U0RXD
6	IO21	I/O	GPIO21
7	GND	G	接地
8	IO19	I/O	GPIO19
9	IO18	I/O	GPIO18
10	IO5	I/O	GPIO5
11	IO17	I/O	GPIO17
12	IO16	I/O	GPIO16
13	IO4	I/O	GPIO4, ADC2_CH0, TOUCH_CH0
14	IO0	I/O	GPIO0, ADC2_CH1, TOUCH_CH1, Boot
16	IO2	I/O	GPIO2, ADC2_CH2, TOUCH_CH2
17	IO15	I/O	GPIO15, ADC2_CH3, TOUCH_CH3, MTDO
17	IO8	I/O	GPIO8, D1
18	IO7	I/O	GPIO7, D0
19	IO6	I/O	GPIO6, SCK

P: 电源; I: 输入; O: 输出。

管脚布局

有关 C15 的提示

较早版本 ESP32-DevKitC 开发板上的 C15 可能存在以下问题:

- 开发板上电后可能进入下载模式;
- 如果用户通过 GPIO0 输出时钟, C15 可能会影响信号。

ESP32-DevKitC

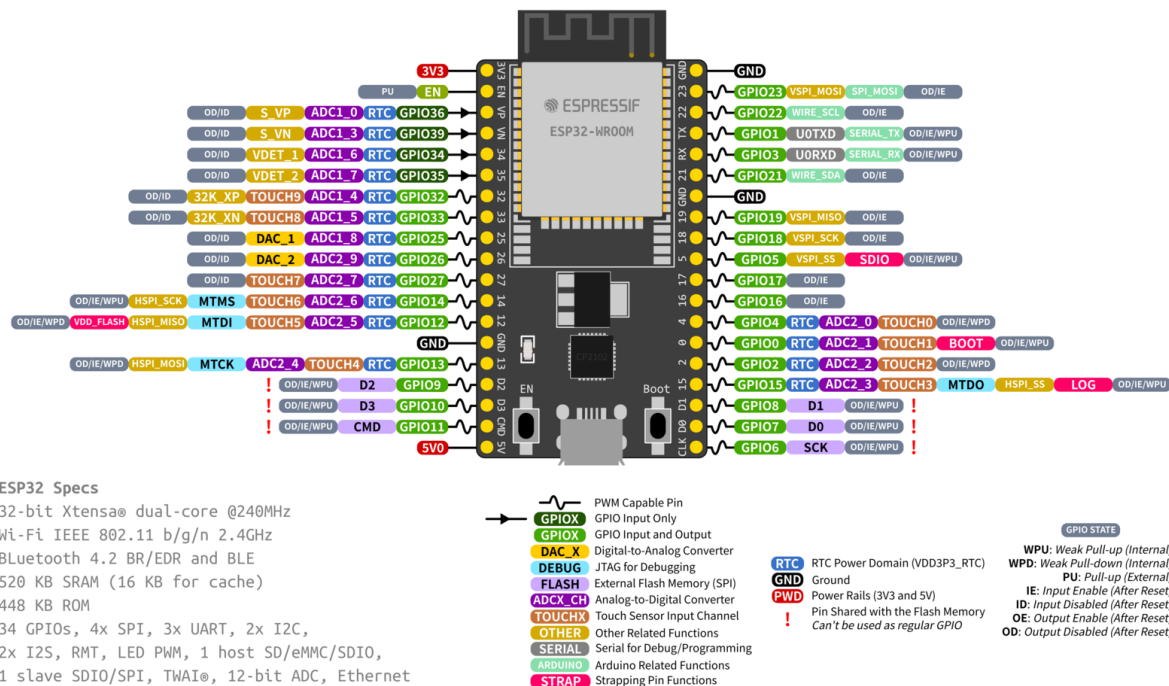

图 3: ESP32-DevKitC 管脚布局 (点击放大)

用户如果认为 C15 可能影响开发板的使用，则可以将 C15 完全移除。C15 在开发板上的具体位置见下图黄色部分。

应用程序开发

ESP32-DevKitC V4 上电前，请首先确认开发板完好无损。

现在，请前往[快速入门](#)中的[详细安装步骤](#)章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

1.3.2 ESP-WROVER-KIT V4.1 入门指南

本指南介绍了如何开始使用 ESP-WROVER-KIT V4.1 开发板及其功能和相关配置。

准备工作

- [ESP-WROVER-KIT V4.1 开发板](#)
- USB 2.0 数据线 (A 转 Micro-B)
- PC (Windows、Linux 或 Mac OS)

您可以跳过介绍部分，直接前往[应用程序开发](#) 章节。

概述

ESP-WROVER-KIT 是 [乐鑫](#) 一款基于 ESP32 的开发板。

ESP-WROVER-KIT 开发板已集成了如下组件：

- ESP32-WROVER-E 模组
- LCD 屏
- MicroSD 卡槽

此外，ESP-WROVER-KIT 的独特之处在于集成了一款先进多协议 USB 桥接器 (FTDI FT2232HL)，允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 调试器。ESP-WROVER-KIT 可为开发人员提供简单、便捷且极具成本效益的开发体验。

为了便于使用，板上模组的绝大部分管脚均已引出至开发板的引脚。

备注：ESP32 的 GPIO16 和 GPIO17 管脚用作 PSRAM 的片选和时钟信号。默认情况下，为了给用户提供的性能，这两个 GPIO 管脚不引出至开发板引脚。

功能概述

ESP-WROVER-KIT 开发板的主要组件和连接方式如下图所示。

功能说明

ESP-WROVER-KIT 开发板的主要组件、接口及控制方式见下。

下表将从图片右上角开始，以顺时针顺序介绍图 1 中的主要组件，然后按同样顺序介绍图 2 中的主要组件。

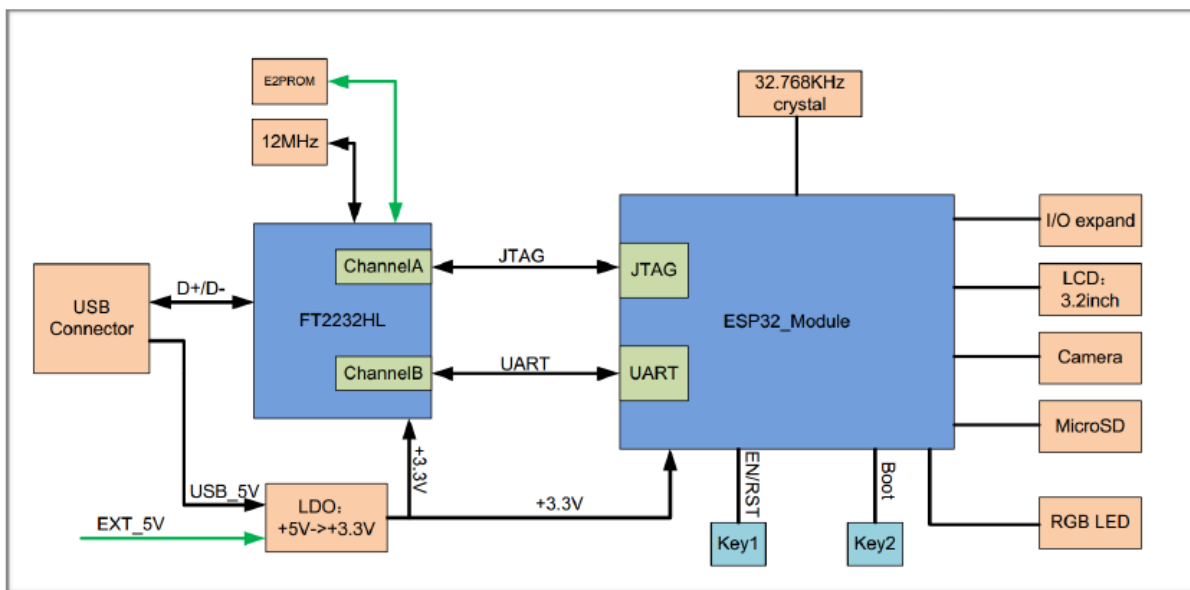

图 6: ESP-WROVER-KIT 功能框图

图 7: ESP-WROVER-KIT 开发板布局-俯视图

图 8: ESP-WROVER-KIT 开发板布局-仰视图

主要组件	基本介绍
FT2232	FT2232 多协议 USB 转串口桥接器。开发人员可通过 USB 接口对 FT2232 芯片进行控制和编程，与 ESP32 建立连接。FT2232 芯片可在通道 A 提供 USB-to-JTAG 接口功能，并在通道 B 提供 USB-to-Serial 接口功能，便利开发人员的应用开发与调试。详见 ESP-WROVER-KIT V4.1 原理图 。
32.768 kHz	32.768 kHz 晶振，可提供 Deep-sleep 下使用的低功耗时钟。
0 欧电阻	ESP-WROVER-KIT 开发板设计了一个 0 欧电阻，可在测量 ESP32 系列模组在不同功耗模式下的电流时，直接移除或替换为分流器。
ESP32-WROVER-E 模组	这款 ESP32 模组内置 64-Mbit PSRAM，可提供灵活的额外存储空间和数据处理能力。
诊断 LED 信号灯	本开发板 FT2232 芯片的 GPIO 管脚连接了 4 个红色 LED 信号灯，以备后用。
UART	串口。FT2232 和 ESP32 的串行 TX/RX 信号已引出至 JP2 的两端。默认情况下，这两路信号由跳线帽连接。如果仅需使用 ESP32 模组串口，则可移除相关跳线帽，将模组连接至其他外部串口设备。
SPI	默认情况下，ESP32 使用 SPI 接口访问内置 flash 和 PSRAM。使用这些引脚连接 ESP32 和其他 SPI 设备。这种情况下，需增加额外的片选 (CS) 信号。注意，本接口的工作电压为 3.3 V。
CTS/RTS	串口流控信号。管脚默认不连接至电路。为了能使该功能，必须用跳线帽断路掉 JP14 的相应管脚。
JTAG	JTAG 接口。FT2232 和 ESP32 的 JTAG 信号已引出至 JP2 的两端。默认情况下，这两路信号不连接。如需使能 JTAG，请按照 设置选项 的介绍，连接跳线帽。
USB 端口	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
EN	复位按键。
BOOT 按键	下载按键。按下 Boot 键并保持，同时按一下 EN 键（此时不要松开 Boot 键）进入“固件下载”模式，通过串口下载固件。
电源开关	电源开关。拨向 Boot 按键一侧，开发板上电；拨离 Boot 按键一侧，开发板掉电。
电源选择开关	ESP-WROVER-KIT 开发板可通过 USB 端口或 5V 输入接口供电。用户可使用跳线帽在两种供电模式中进行选择。更多详细信息，请见章节 设置选项 中有关 JP7 连接器的描述。
5V Input	5V 电源接口。为标准同轴电源接口，5.5 x 2.1 mm，中心正极。建议仅在开发板自动运行（未连接 PC）时使用。
5V Power On LED LDO	当开发板通电后（USB 或外部 5V 供电），该红色指示灯将亮起。 5V-to-3.3V 低压差线型稳压器 NCP1117(1A)。NCP1117 最大电流输出为 1 A。板上 LDO 为固定输出电压，但用户也可以选用具有可变输出电压的 LDO。更多信息，请见 ESP-WROVER-KIT V4.1 原理图 。
摄像头连接器	摄像头接口，支持标准 OV7670 摄像头模块。

设置选项

用户可通过 3 组排针，设置开发板功能，其中常见功能见下表：

排针	跳线设置	功能描述
JP7		使用外部电源为 ESP-WROVER-KIT 开发板供电
JP7		使用 USB 端口为 ESP-WROVER-KIT 开发板供电
JP2		使能 JTAG 功能
JP2		使能 UART 通信
		

ESP32 管脚分配

ESP32 模组的部分管脚/终端已被板上组件占用或用于外部硬件设备。如果某管脚对应的特定硬件未连接，则该管脚可用作他用。比如，摄像头/JP4 排针未连接相应硬件，则这些 GPIO 可用于其他用途。

部分管脚具备多个功能，可供板上组件或外部硬件设备同时使用，比如 GPIO0 和 GPIO2。由于管脚限制，一些外围设备不可同时使用，比如，由于 JTAG 和 SD 卡槽需共用部分管脚，因此一些使用 SD 卡功能的应用无法同时进行 JTAG 调试。

其他情况下，不同外设可同时使用。比如，LCD 屏幕和 SD 卡仅共用一个 GPIO21 管脚，可以同时使用。该管脚可为 LCD 屏幕提供 D/C（数据/控制）信号，并用于读取来自 SD 卡槽的卡检测信号。如无需使用卡检测功能，开发人员还可以通过移除 R167 来禁用该功能。此时，LCD 和 SD 卡槽可同时使用。

更多外设共享管脚的介绍，请见下一章节中的表格。

主要 I/O 连接器 / JP1 JP1 连接器包括 14 x 2 个排针，具体功能可见下表中间“I/O”列的介绍。两侧的“共用”列则介绍了这些管脚在板上的其他用途。

共用	I/O	I/O	共用
n/a	3.3V	GND	n/a
NC/XTAL	IO32	IO33	NC/XTAL
JTAG, MicroSD	IO12	IO13	JTAG, MicroSD
JTAG, MicroSD	IO14	IO27	摄像头
摄像头	IO26	IO25	摄像头, LCD
摄像头	IO35	IO34	摄像头
摄像头	IO39	IO36	摄像头
JTAG	EN	IO23	摄像头, LCD
摄像头, LCD	IO22	IO21	摄像头, LCD, MicroSD
摄像头, LCD	IO19	IO18	摄像头, LCD
摄像头, LCD	IO5	IO17	PSRAM
PSRAM	IO16	IO4	LED, 摄像头, MicroSD
摄像头, LED, Boot	IO0	IO2	LED, MicroSD
JTAG, MicroSD	IO15	5V	

说明：

- NC/XTAL - [32.768 kHz 晶振](#)
- JTAG - [JTAG / JP2](#)
- Boot - Boot 按键 / SW2
- 摄像头 - [摄像头 / JP4](#)
- LED - [RGB LED](#)
- MicroSD - [MicroSD Card / J4](#)
- LCD - [LCD / U5](#)
- PSRAM - ESP32-WROVER-E 的 PSRAM

32.768 kHz 晶振

	ESP32 管脚
1.	GPIO32
2.	GPIO33

备注：默认情况下，管脚 GPIO32 和 GPIO33 已连接至晶振。因此，为了保证信号的完整性，这两个管脚并未连接至 JP1 I/O 连接器。用户可通过将 R11/R23 处的 0 欧姆电阻移至 R12/R24 处，以将 GPIO32 和

GPIO33 的连接从晶振移至 JP1。

SPI Flash / JP2

.	ESP32 管脚
1.	CLK / GPIO6
2.	SD0 / GPIO7
3.	SD1 / GPIO8
4.	SD2 / GPIO9
5.	SD3 / GPIO10
6.	CMD / GPIO11

重要：模组的 flash 总线已通过 0 欧电阻 R140 ~ R145 连接至排针 JP2。如果需要将 flash 的工作频率控制在 80 MHz，以达到保证总线信号完整性等目的，建议移除 R140 ~ R145 电阻，将模组的 flash 总线与排针 JP2 断开。

JTAG / JP2

.	ESP32 管脚	JTAG 信号
1.	EN	TRST_N
2.	MTMS / GPIO14	TMS
3.	MTDO / GPIO15	TDO
4.	MTDI / GPIO12	TDI
5.	MTCK / GPIO13	TCK

摄像头 / JP4

.	ESP32 管脚	摄像头信号
1.	n/a	3.3V
2.	n/a	地
3.	GPIO27	SIO_C / SCCB 时钟
4.	GPIO26	SIO_D / SCCB 数据
5.	GPIO25	VSYNC / 垂直同步
6.	GPIO23	HREF / 水平参考
7.	GPIO22	PCLK / 像素时钟
8.	GPIO21	XCLK / 系统时钟
9.	GPIO35	D7 / 像素数据 Bit 7
10.	GPIO34	D6 / 像素数据 Bit 6
11.	GPIO39	D5 / 像素数据 Bit 5
12.	GPIO36	D4 / 像素数据 Bit 4
13.	GPIO19	D3 / 像素数据 Bit 3
14.	GPIO18	D2 / 像素数据 Bit 2
15.	GPIO5	D1 / 像素数据 Bit 1
16.	GPIO4	D0 / 像素数据 Bit 0
17.	GPIO0	RESET / 摄像头复位
18.	n/a	PWDN / 摄像头断电

- D0 到 D7 为摄像头的数据总线

RGB LED

.	ESP32 管脚	RGB LED
1.	GPIO0	红色
2.	GPIO2	绿色
3.	GPIO4	蓝色

MicroSD 卡

.	ESP32 管脚	MicroSD 信号
1.	MTDI / GPIO12	DATA2
2.	MTCK / GPIO13	CD / DATA3
3.	MTDO / GPIO15	CMD
4.	MTMS / GPIO14	CLK
5.	GPIO2	DATA0
6.	GPIO4	DATA1
7.	GPIO21	Card Detect

LCD / U5

.	ESP32 管脚	LCD 信号
1.	GPIO18	复位
2.	GPIO19	SCL
3.	GPIO21	D/C
4.	GPIO22	CS
5.	GPIO23	SDA
6.	GPIO25	SDO
7.	GPIO5	背光

应用程序开发

ESP-WROVER-KIT 上电前，请首先确认开发板完好无损。

初始设置 请严格按照下图所示连接跳线帽，注意不要额外连接其他跳线帽。

- 使用 JP7 连接器，选择 USB 为开发板供电。
- 使用 JP2 连接器，使能 UART 通信。

注意不要连接其他跳线帽。

打开 **电源开关**，**5V Power On LED** 应点亮。

正式开始开发 现在，请前往快速入门中的[详细安装步骤](#) 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

以下链接提供了与 ESP-WROVER-KIT 开发板硬件相关的示例：

- 板上 LCD 示例：[peripherals/spi_master/lcd](#)
- SD 卡槽示例：[storage/sd_card](#)
- 摄像头示例：<https://github.com/espressif/esp32-camera>

ESP-WROVER-KIT V3 入门指南

本指南介绍了如何开始使用 ESP-WROVER-KIT V3 开发板及其功能和相关配置。有关 ESP-WROVER-KIT 其他版本的介绍，请见：[ESP32 H/W 硬件参考](#)。

准备工作

- [ESP-WROVER-KIT V3 开发板](#)
- USB 数据线 (A 转 Micro-B)
- PC (Windows、Linux 或 macOS)

您可以跳过介绍部分，直接前往[应用程序开发](#) 章节。

概述 ESP-WROVER-KIT 是 [乐鑫](#) 一款基于 ESP32 的开发板，集成了 LCD 屏幕和 MicroSD 卡槽。

ESP-WROVER-KIT 可选贴以下 ESP32 模组：

- ESP32-WROOM-32
- ESP32-WROVER 系列模组

此外，ESP-WROVER-KIT 的独特之处在于集成了一款先进多协议 USB 桥接器 (FTDI FT2232HL)，允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 调试器。ESP-WROVER-KIT 可为开发人员提供简单、便捷且极具成本效益的开发体验。

为了便于使用，板上模组的绝大部分管脚均已引出至开发板的引脚。

备注：该版本 ESP32-WROVER 模组的 GPIO16 和 GPIO17 管脚用作 PSRAM 的片选和时钟信号。默认情况下，为了给用户提供可靠的性能，这两个 GPIO 管脚不引出至开发板引脚。

功能概述 ESP-WROVER-KIT 开发板的主要组件和连接方式如下图所示。

图 9: ESP-WROVER-KIT 功能框图

功能说明 ESP-WROVER-KIT 开发板的主要组件、接口及控制方式见下。

下表从图片右上角开始，以顺时针顺序介绍了图 1 中的主要组件，然后以同样的顺序介绍图 2 中的主要组件。

图 10: ESP-WROVER-KIT 开发板布局—俯视图

图 11: ESP-WROVER-KIT 开发板布局-仰视图

主要组件	基本介绍
32.768 kHz	外接 32.768 kHz 晶振，可提供 Deep-sleep 下使用的低功耗时钟。
0 欧电阻	ESP-WROVER-KIT 开发板设计了一个 0 欧电阻，可在测量 ESP32 系列模组在不同功耗模式下的电流时，直接移除或替换为分流器。
ESP32 模组	可选贴 ESP32-WROOM-32 或 ESP32-WROVER。ESP32-WROVER 模组完整集成了 ESP32-WROOM-32 的所有功能，且内置 32-Mbit PSRAM，可提供灵活的额外存储空间和数据处理能力。
FT2232	FT2232 多协议 USB 转串口桥接器。开发人员可通过 USB 接口对 FT2232 芯片进行控制和编程，与 ESP32 建立连接。FT2232 芯片可在通道 A 提供 USB-to-JTAG 接口功能，并在通道 B 提供 USB-to-Serial 接口功能，便利开发人员的应用开发与调试。见 ESP-WROVER-KIT V3 原理图 。
UART	串口。FT2232HL 和 ESP32 的串行 TX/RX 信号已引出至 JP11 的两端。默认情况下，这两路信号由跳线帽连接。如果要跳过 FT2232 使用 ESP32 模组串口，则可移除相关跳线帽，将模组连接至其他外部串口设备。
SPI	默认情况下，ESP32 使用 SPI 接口访问内置 flash 和 PSRAM。使用这些引脚连接 ESP32 和其他 SPI 设备。这种情况下，需增加额外的片选 (CS) 信号。注意，选贴 ESP32-WROVER 模组时，该接口的工作电压为 1.8 V；选贴 ESP32-WROOM-32 时，该接口的工作电压为 3.3V。
CTS/RTS	串口流控信号。管脚默认不连接至电路。为了使能该功能，必须用跳线帽短路掉 JP14 的相应管脚。
JTAG	JTAG 接口。FT2232HL 和 ESP32 的 JTAG 信号已引出至 JP8 的两端。默认情况下，这两路信号不连接。如需使能 JTAG，请按照 设置选项 的介绍，连接跳线帽。
EN	复位按键。
Boot	下载按键。按下 Boot 键并保持，同时按一下 EN 键（此时不要松开 Boot 键）进入“固件下载”模式，通过串口下载固件。
USB	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
电源开关	拨向 USB 按键一侧，开发板上电；拨离 USB 按键一侧，开发板掉电。
电源选择开关	ESP-WROVER-KIT 开发板可通过 USB 端口或 5V 输入接口供电。用户可使用跳线帽在两种供电模式中进行选择。更多详细信息，请见章节 设置选项 中有关 JP7 连接器的描述。
5V Input	5V 电源接口建议仅在开发板自动运行（未连接 PC）时使用。仅用于全负荷工作下的后备电源。
LDO	5V-to-3.3V 低压差线型稳压器 NCP1117(1A)。NCP1117 最大电流输出为 1 A。板上 LDO 为固定输出电压，但用户也可以选用具有可变输出电压的 LDO。更多信息，请见 ESP-WROVER-KIT V3 原理图 。
摄像头	摄像头接口，支持标准 OV7670 摄像头模块。
RGB LED	红绿蓝发光二极管，可由 PWM（脉冲宽度调制）控制。
I/O	板上模组的所有管脚均已引出至开发板的排针。用户可以对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等多种功能。
MicroSD 卡槽	适用于需要扩充数据存储空间或进行备份的应用开发场景。
LCD 显示屏	支持贴装一款 3.2” 的 SPI（标准四线串行外设接口）LCD 显示器，请见 ESP-WROVER-KIT 开发板布局-仰视图 。

设置选项 用户可通过 5 组排针，设置开发板功能，其中常见功能见下表：

排针	跳线设置	功能描述
JP7		使用外部电源为 ESP-WROVER-KIT 开发板供电
JP7		使用 USB 端口为 ESP-WROVER-KIT 开发板供电
JP8		使能 JTAG 功能
Espressif Systems		<p style="text-align: center;">25</p> <p style="text-align: center;">Submit Document Feedback</p>

ESP32 管脚分配 ESP32 模组的部分管脚/终端已被板上组件占用或用于外部硬件设备。如果某管脚对应的特定硬件未连接，则该管脚可用作他用。比如，摄像头/JP4 排针未连接相应硬件，则这些 GPIO 可用于其他用途。

部分管脚具备多个功能，可供板上组件或外部硬件设备同时使用，比如 GPIO0 和 GPIO2。由于管脚限制，一些外围设备不可同时使用，比如，由于 JTAG 和 SD 卡槽需共用部分管脚，因此一些使用 SD 卡功能的应用无法同时进行 JTAG 调试。

其他情况下，不同外设可同时使用。比如，LCD 屏幕和 SD 卡仅共用一个 GPIO21 管脚，可以同时使用。该管脚可为 LCD 屏幕提供 D/C（数据/控制）信号，并用于读取来自 SD 卡槽的 CD 信号（卡检测信号）。如无需使用卡检测功能，开发人员还可以通过移除 R167 来禁用该功能。此时，LCD 和 SD 卡槽可同时使用。

更多外设共享管脚的介绍，请见下一章节中的表格。

主要 I/O 连接器 / JP1 JP1 连接器包括 14 x 2 个排针，具体功能可见下表中间“I/O”列的介绍。两侧的“共用”列则介绍了这些管脚在板上的其他用途。

共用	I/O	I/O	共用
n/a	3.3V	GND	n/a
NC/XTAL	IO32	IO33	NC/XTAL
JTAG, MicroSD	IO12	IO13	JTAG, MicroSD
JTAG, MicroSD	IO14	IO27	摄像头
摄像头	IO26	IO25	摄像头, LCD
摄像头	IO35	IO34	摄像头
摄像头	IO39	IO36	摄像头
JTAG	EN	IO23	摄像头, LCD
摄像头, LCD	IO22	IO21	摄像头, LCD, MicroSD
摄像头, LCD	IO19	IO18	摄像头, LCD
摄像头, LCD	IO5	IO17	PSRAM
PSRAM	IO16	IO4	LED, 摄像头, MicroSD
摄像头, LED, Boot	IO0	IO2	LED, MicroSD
JTAG, MicroSD	IO15	5V	

说明：

- NC/XTAL - [32.768 kHz Oscillator](#)
- JTAG - [JTAG / JP8](#)
- Boot - Boot 按键 / SW2
- 摄像头 - 摄像头 / JP4
- LED - [RGB LED](#)
- MicroSD - [MicroSD Card / J4](#)
- LCD - [LCD / U5](#)
- PSRAM - 仅适用于选贴 ESP32-WROVER 的情况。

32.768 kHz 晶振

	ESP32 管脚
1.	GPIO32
2.	GPIO33

备注：默认情况下，管脚 GPIO32 和 GPIO33 已连接至晶振。因此，为了保证信号的完整性，这两个管脚并未连接至 JP1 I/O 连接器。用户可通过将 R11/R23 处的 0 欧姆电阻移至 R12/R24 处，以将 GPIO32 和

GPIO33 的连接从晶振移至 JP1。

SPI Flash / JP13

.	ESP32 管脚
1.	CLK / GPIO6
2.	SD0 / GPIO7
3.	SD1 / GPIO8
4.	SD2 / GPIO9
5.	SD3 / GPIO10
6.	CMD / GPIO11

重要： 模组的 flash 总线已通过 0 欧电阻 R140 ~ R145 连接至排针 JP13。如果需要将 flash 的工作频率控制在 80 MHz，为了达到保证总线信号完整性等目的，建议移除 R140 ~ R145 电阻，将模组的 flash 总线与排针 JP2 断开。

JTAG / JP8

.	ESP32 管脚	JTAG 信号
1.	EN	TRST_N
2.	MTMS / GPIO14	TMS
3.	MTDO / GPIO15	TDO
4.	MTDI / GPIO12	TDI
5.	MTCK / GPIO13	TCK

摄像头 / JP4

.	ESP32 管脚	摄像头信号
1.	n/a	3.3V
2.	n/a	地
3.	GPIO27	SIO_C / SCCB 时钟
4.	GPIO26	SIO_D / SCCB 数据
5.	GPIO25	VSYNC / 垂直同步
6.	GPIO23	HREF / 水平参考
7.	GPIO22	PCLK / 像素时钟
8.	GPIO21	XCLK / 系统时钟
9.	GPIO35	D7 / 像素数据 Bit 7
10.	GPIO34	D6 / 像素数据 Bit 6
11.	GPIO39	D5 / 像素数据 Bit 5
12.	GPIO36	D4 / 像素数据 Bit 4
13.	GPIO19	D3 / 像素数据 Bit 3
14.	GPIO18	D2 / 像素数据 Bit 2
15.	GPIO5	D1 / 像素数据 Bit 1
16.	GPIO4	D0 / 像素数据 Bit 0
17.	GPIO0	RESET / 摄像头复位
18.	n/a	PWDN / 摄像头断电

- D0 到 D7 为摄像头的数据总线

RGB LED

.	ESP32 管脚	RGB LED
1.	GPIO0	红色
2.	GPIO2	绿色
3.	GPIO4	蓝色

MicroSD 卡

.	ESP32 管脚	MicroSD 信号
1.	MTDI / GPIO12	DATA2
2.	MTCK / GPIO13	CD / DATA3
3.	MTDO / GPIO15	CMD
4.	MTMS / GPIO14	CLK
5.	GPIO2	DATA0
6.	GPIO4	DATA1
7.	GPIO21	CD

LCD / U5

.	ESP32 管脚	LCD 信号
1.	GPIO18	复位
2.	GPIO19	SCL
3.	GPIO21	D/C
4.	GPIO22	CS
5.	GPIO23	SDA
6.	GPIO25	SDO
7.	GPIO5	背光

应用程序开发 ESP-WROVER-KIT 上电前，请首先确认开发板完好无损。

初始设置 请严格按照下图所示连接跳线帽，注意不要额外连接其他跳线帽。

- 使用 JP7 连接器，选择 USB 为开发板供电。
- 使用 JP11 连接器，使能 UART 通信。

注意不要连接其他跳线帽。

打开 **电源开关**，**5V Power On LED** 应点亮。

正式开始开发 现在，请前往[快速入门](#)中的[详细安装步骤](#)章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

ESP-WROVER-KIT V2 入门指南

本指南介绍了如何开始使用 ESP-WROVER-KIT V2 开发板及其功能和相关配置。有关 ESP-WROVER-KIT 其他版本的介绍，请见：[ESP32 H/W 硬件参考](#)。

准备工作

- ESP-WROVER-KIT V2 开发板
- USB 数据线 (A 转 Micro-B)
- PC (Windows、Linux 或 macOS)

您可以跳过介绍部分，直接前往[应用程序开发](#)章节。

概述 ESP-WROVER-KIT 是 [乐鑫](#) 一款基于 ESP32 的开发板，集成了 LCD 屏幕和 MicroSD 卡槽。

ESP-WROVER-KIT 可选贴以下 ESP32 模组：

- ESP32-WROOM-32

- ESP32-WROVER 系列模组

此外，ESP-WROVER-KIT 的独特之处在于集成了一款先进多协议 USB 桥接器 (FTDI FT2232HL)，允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 调试器。ESP-WROVER-KIT 可为开发人员提供简单、便捷且极具成本效益的开发体验。

为了便于使用，板上模组的绝大部分管脚均已引出至开发板的引脚。

备注：ESP-WROVER-KIT V2 板载 ESP32-WROVER 模组的 GPIO16 和 GPIO17 管脚用作 PSRAM 的片选和时钟信号。默认情况下，为了给用户提供可靠的性能，这两个 GPIO 管脚不引出至开发板引脚。

功能概述 ESP-WROVER-KIT 开发板的主要组件和连接方式如下图所示。

图 12: ESP-WROVER-KIT 功能框图

功能说明 ESP-WROVER-KIT 开发板的主要组件、接口及控制方式见下。

下表从图片右上角开始，以顺时针顺序介绍了图 1 中的主要组件，然后以同样的顺序介绍了图 2 中的主要组件。

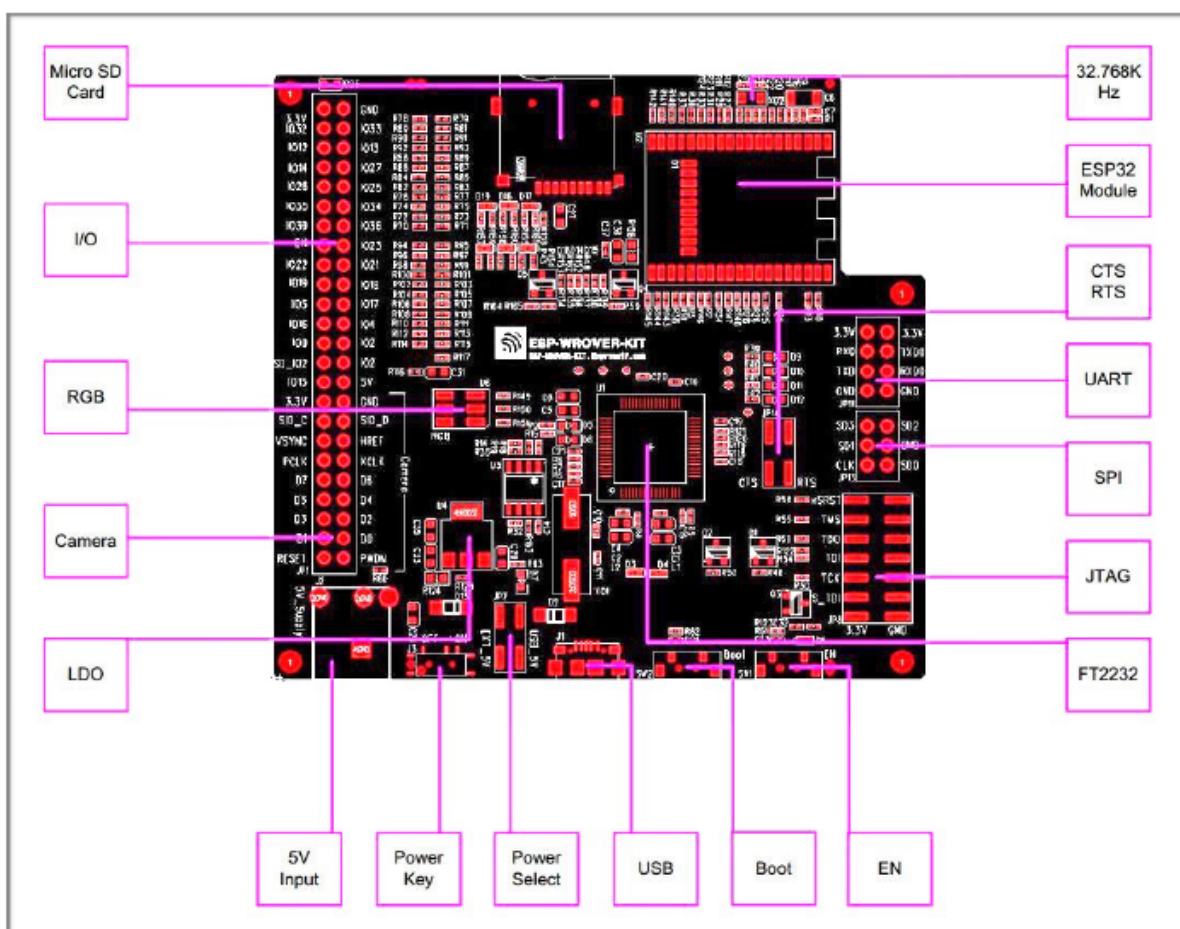

图 13: ESP-WROVER-KIT 开发板布局-俯视图

图 14: ESP-WROVER-KIT 开发板布局-仰视图

主要组件	基本介绍
32.768 kHz	外接 32.768 kHz 晶振，可提供 Deep-sleep 下使用的低功耗时钟。
ESP32 模组	可选贴 ESP32-WROOM-32 或 ESP32-WROVER。ESP32-WROVER 模组完整集成了 ESP32-WROOM-32 的所有功能，且内置 32-Mbit PSRAM，可提供灵活的额外存储空间和数据处理能力。
CTS/RTS	串口流控信号。管脚默认不连接至电路。为了使能该功能，必须用跳线帽短路掉 JP14 的相应管脚。
UART	串口。FT2232HL 和 ESP32 的串行 TX/RX 信号已引出至 JP11 的两端。默认情况下，这两路信号由跳线帽连接。如果要跳过 FT2232 使用 ESP32 模组串口，则可移除相关跳线帽，将模组连接至其他外部串口设备。
SPI	默认情况下，ESP32 使用 SPI 接口访问内置 flash 和 PSRAM。使用这些引脚连接 ESP32 和其他 SPI 设备。这种情况下，需增加额外的片选 (CS) 信号。注意，选贴 ESP32-WROVER 模组时，该接口的工作电压为 1.8 V；选贴 ESP32-WROOM-32 时，该接口的工作电压为 3.3V。
JTAG	JTAG 接口。FT2232HL 和 ESP32 的 JTAG 信号已引出至 JP8 的两端。默认情况下，这两路信号不连接。如需使能 JTAG，请按照 设置选项 的介绍，连接跳线帽。
FT2232	FT2232 多协议 USB 转串口桥接器。开发人员可通过 USB 接口对 FT2232 芯片进行控制和编程，与 ESP32 建立连接。FT2232 具有 USB-to-UART 和 USB-to-JTAG 功能。
EN	复位按键。
Boot	下载按键。按下 Boot 键并保持，同时按一下 EN 键（此时不要松开 Boot 键）进入“固件下载”模式，通过串口下载固件。
USB	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
电源选择开关	ESP-WROVER-KIT 开发板可通过 USB 端口或 5V 输入接口供电。用户可使用跳线帽在两种供电模式中进行选择。更多详细信息，请见章节 设置选项 中有关 JP7 连接器的描述。
电源开关	拨向 USB 按键一侧，开发板上电；拨离 USB 按键一侧，开发板掉电。
5V Input	5V 电源接口建议仅在开发板自动运行（未连接 PC）时使用。仅用于全负荷工作下的后备电源。
LDO	5V-to-3.3V 低压差线型稳压器 NCP1117(1A)。NCP1117 最大电流输出为 1 A。板上 LDO 为固定输出电压，但用户也可以选用具有可变输出电压的 LDO。更多信息，请见 ESP-WROVER-KIT V2 原理图 。
摄像头	摄像头接口，支持标准 OV7670 摄像头模块。
RGB LED	红绿蓝发光二极管，可由 PWM（脉冲宽度调制）控制。
I/O	板上模组的所有管脚均已引出至开发板的排针。用户可以对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等多种功能。
MicroSD 卡槽	MicroSD 卡槽，可扩充存储空间：当 ESP32 进入下载模式时，GPIO2 不可处于高电平。然而，为了使能 MicroSD 卡功能，需为 GPIO2 增加一个上拉电阻。默认情况下，GPIO2 和上拉电阻 R153 处于断开状态。为了使能 MicroSD 卡，请按照 设置选项 章节的要求，连接 JP1 连接器。
LCD 显示屏	支持贴装一款 3.2” 的 SPI（标准四线串行外设接口）LCD 显示器，请见 ESP-WROVER-KIT 开发板布局-仰视图 。

设置选项 用户可通过 5 组排针，设置开发板功能，其中常见功能见下表：

排针	跳线设置	功能描述
JP1		使能 MicroSD Card 功能的上拉电阻
JP1		确保开发板处于下载模式时，GPIO2 时钟处于低位（将 JP1 连接至 GPIO0）
JP7		使用外部电源为 ESP-WROVER-KIT 开发板供电
JP7		使用 USB 端口为 ESP-WROVER-KIT 开发板供电
JP8		使能 JTAG 功能
Espressif Systems		<p style="text-align: center;">35</p> <p style="text-align: center;">Submit Document Feedback</p>

应用程序开发 ESP-WROVER-KIT 上电前，请首先确认开发板完好无损。

初始设置 请严格按照下图所示连接跳线帽，注意不要额外连接其他跳线帽。

- 使用 JP7 连接器，选择 USB 为开发板供电。
- 使用 JP11 连接器，使能 UART 通信。

注意不要连接其他跳线帽。

打开 **电源开关**，**5V Power On LED** 应点亮。

正式开始开发 现在，请前往[快速入门](#)中的[详细安装步骤](#)章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

1.3.3 ESP32-PICO-KIT V4/V4.1 入门指南

本指南介绍了如何开始使用 ESP32-PICO-KIT V4 / V4.1 迷你开发板。有关 ESP32-PICO-KIT 其他版本的介绍，请见：[ESP32 H/W 硬件参考](#)。

本指南仅适用于 ESP32-PICO-KIT V4 和 V4.1。ESP32-PICO-KIT V4.1 与 V4 的最大差别在于桥接器，其中 V4 搭载的 CP2102 USB-to-UART 桥接器最高速率为 1 Mbps，V4.1 搭载的 CP2102N 桥接器最高传输速率 3 Mbps。

准备工作

- [ESP32-PICO-KIT 迷你开发板](#)
- USB 2.0 线 (A 型转 Micro-B 型)
- PC (Windows、Linux 或 Mac OS)

您可以跳过介绍部分，直接前往[应用程序开发](#)章节。

概述

ESP32-PICO-KIT 是一款来自 乐鑫 的迷你开发板，其核心是具有完整 Wi-Fi 和蓝牙功能的 ESP32 系列 SiP 模组 ESP32-PICO-D4。与其他 ESP32 系列模组相比，ESP32-PICO-D4 模组已完整集成以下外围器件：

- 40 MHz 晶体振荡器
- 4 MB flash
- 滤波电容
- 射频匹配网络等

这大大降低了用户额外采购和安装这些元器件的数量和成本，及额外组装测试的复杂度，并增加了可用性。

ESP32-PICO-KIT 集成了 USB 转 UART 桥接电路，允许开发人员直接通过 PC 的 USB 端口进行下载和调试。

为了便于连接，ESP32-PICO-D4 上的所有 IO 信号和系统电源管脚均通过开发板两侧焊盘（每侧 20 个 x 0.1 英寸间隔）引出。为了方便杜邦线的使用，ESP32-PICO-KIT 开发板每侧的 20 个焊盘中，有 17 个引出至排针，另外 3 个靠近天线的焊盘未引出，可供用户日后焊接使用。

备注：

1. 每排未引出至排针的 3 个管脚已连接至 ESP32-PICO-D4 SiP 模组的内置 flash 模块。更多信息，请见 [相关文档](#) 中的模组技术规格书。
2. ESP32-PICO-D4 开发板默认采用排针。

功能概述

ESP32-PICO-KIT 开发板的主要组件和连接方式见下。

图 15: ESP32-PICO-KIT 框图

功能说明

ESP32-PICO-KIT 开发板的主要组件、接口及控制方式见下。

图 16: ESP32-PICO-KIT 开发板布局

ESP32-PICO-KIT 开发板的主要组件描述见下表（从左上角起顺时针顺序）。

主要组件	基本介绍
ESP32-PICO-D4	ESP32-PICO-KIT 开发板上焊接的标准 ESP32-PICO-D4 模组，集成了 ESP32 芯片的完整系统，仅需连接天线、LC 匹配电路、退耦电容和一个 EN 信号上拉电阻即可正常工作。
LDO	5V-to-3.3V 低压差稳压器
USB-to-UART 桥接器	单芯片 USB-to-UART 桥接器。V4 版本搭载的 CP2102 可提供高达 1 Mbps 的传输速率，V4.1 版本搭载的 CP2102N 可提供高达 3 Mbps 的传输速率。
Micro USB 端口	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
5V Power On LED	开发板通电后，该红色指示灯将亮起。更多信息，请见 相关文档 中的原理图。
I/O	ESP32-PICO-D4 的所有管脚均已引出至开发板的排针。用户可以对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等多种功能。更多详情，请见章节 管脚说明 。
BOOT	下载按钮。按下 Boot 键并保持，同时按一下 EN 键（此时不要松开 Boot 键）进入“固件下载”模式，通过串口下载固件。
EN	复位按钮。

电源选项

开发板可任一选用以下三种供电方式：

- Micro USB 供电（默认）
- 5V / GND 管脚供电
- 3V3 / GND 管脚供电

警告： 上述供电模式 **不可同时连接**，否则可能会损坏开发板和/或电源。

管脚说明

下表介绍了开发板 I/O 管脚的 **名称**和 **功能**，具体布局请见[相关文档](#)中的原理图。请参考[ESP32-PICO-KIT 开发板布局](#)。

Header J2

4	SENSOR_VP (FSVP)	I	GPIO36, ADC1_CH0, RTC_GPIO0
5	SENSOR_VN (FSVN)	I	GPIO39, ADC1_CH3, RTC_GPIO3
6	IO25	I/O	GPIO25, DAC_1, ADC2_CH8, RTC_GPIO6, EMAC_RXD0
7	IO26	I/O	GPIO26, DAC_2, ADC2_CH9, RTC_GPIO7, EMAC_RXD1
8	IO32	I/O	32K_XP (见说明 2a) , ADC1_CH4, TOUCH9, RTC_GPIO9
9	IO33	I/O	32K_XN (见说明 2b) , ADC1_CH5, TOUCH8, RTC_GPIO8
10	IO27	I/O	GPIO27, ADC2_CH7, TOUCH7, RTC_GPIO17 EMAC_RX_DV
Espressif Systems	IO14	42 I/O	Release v4.4.7 ADC2_CH6, TOUCH6, RTC_GPIO16, MTMS, HSPICLK

有关上表的说明：

1. 该管脚已连接至 ESP32-PICO-D4 的内置 flash 管脚。
2. 32.768 kHz 晶振：(a) 输入；(b) 输出。
3. 该管脚已连接至开发板的 USB 桥接器芯片。
4. ESP32-PICO-KIT 内置 SPI flash 的工作电压为 3.3V。因此，strapping 管脚 MTDI 在模组上电复位过程中应保持低电平。如连接该管脚，请确保该管脚在复位中不要保持高电平。

应用程序开发

ESP32-PICO-KIT 上电前，请首先确认开发板完好无损。

现在，请前往[快速入门](#)中的[详细安装步骤](#)章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

开发板尺寸

ESP32-PICO-KIT 的尺寸为 52 x 20.3 x 10 mm (2.1" x 0.8" x 0.4")。

图 17: ESP32-PICO-KIT 尺寸图-背面

图 18: ESP32-PICO-KIT 尺寸图-侧面

有关开发板的物理结构细节，请见下方参考设计。

ESP32-PICO-KIT V3 入门指南

本指南介绍了如何开始使用 ESP32-PICO-KIT V3 迷你开发板。有关 ESP32-PICO-KIT 其他版本的介绍，请见：[ESP32 H/W 硬件参考](#)。

准备工作

- ESP32-PICO-KIT V3 迷你开发板
- USB 2.0 线（A 型转 Micro-B 型）
- PC（Windows、Linux 或 Mac OS）

您可以跳过介绍部分，直接前往[应用程序开发](#) 章节。

概述 ESP32-PICO-KIT V3 是一款来自 [乐鑫](#) 的迷你开发板，其核心是具有完整 Wi-Fi 和蓝牙功能的 ESP32 系列 SiP 模组 ESP32-PICO-D4。

ESP32-PICO-KIT 集成了 USB 转 UART 桥接电路，允许开发人员直接通过 PC 的 USB 端口进行下载和调试。

为了便于连接，ESP32-PICO-D4 上的所有 IO 信号和系统电源管脚均通过开发板两侧焊盘（每侧 20 个 x 0.1 英寸间隔）引出。

功能说明 ESP32-PICO-KIT V3 开发板的主要组件、接口及控制方式见下。

ESP32-PICO-KIT 开发板的主要组件描述见下表。

主要组件	基本介绍
ESP32-PICO-D4	ESP32-PICO-KIT V3 开发板上焊接的标准 ESP32-PICO-D4 模组，集成了 ESP32 芯片的完整系统，仅需连接天线、LC 匹配电路、退耦电容和一个 EN 信号上拉电阻即可正常工作。
LDO	5V-to-3.3V 低压差稳压器。
USB-to-UART 桥接器	单芯片 USB-to-UART 桥接器，可提供高达 1 Mbps 的传输速率。
Micro USB 端口	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
Power On LED	开发板通电后，该红色指示灯将亮起。
I/O	ESP32-PICO-D4 的所有管脚均已引出至开发板的排针。用户可以对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等多种功能。
BOOT	下载按键。按下 Boot 键并保持，同时按一下 EN 键（此时不要松开 Boot 键）进入“固件下载”模式，通过串口下载固件。
EN	复位按键。

应用程序开发 ESP32-PICO-KIT V3 上电前，请首先确认开发板完好无损。

现在，请前往[快速入门](#) 中的[详细安装步骤](#) 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

1.3.4 ESP32-Ethernet-Kit V1.2 入门指南

本指南将介绍 ESP32-Ethernet-Kit 开发板的配置以及相关功能的使用。

ESP32-Ethernet-Kit 是一款以太网转 Wi-Fi 开发板，可为以太网设备赋予 Wi-Fi 连接功能。为了提供更灵活的电源选项，ESP32-Ethernet-Kit 同时也支持以太网供电 (PoE)。

图 20: ESP32-Ethernet-Kit V1.2 概图 (点击放大)

准备工作

- [ESP32-Ethernet-Kit V1.2 开发板](#)
- USB 数据线 (A 转 Micro-B)
- PC (Windows、Linux 或 Mac OS)

您可以跳过介绍部分，直接前往[应用程序开发](#) 章节。

概述

ESP32-Ethernet-Kit 是一款来自 [乐鑫](#) 的开发板。

它由以太网母板 (A 板) 和 PoE 子板 (B 板) 两部分组成。其中以太网母板 (A 板) 集成蓝牙/Wi-Fi 双模 ESP32-WROVER-E 模组和单端口 10/100 Mbps 快速以太网收发器 (PHY) IP101GRI。PoE 子板 (B 板) 提供以太网供电功能。ESP32-Ethernet-Kit 的 A 板可在不连接 B 板的情况下独立工作。

图 21: ESP32-Ethernet-Kit V1.2 (点击放大)

为了实现程序下载和监控，A 板还集成了一款先进多协议 USB 桥接器 (FT2232H 芯片)。FT2232H 芯片使得开发人员无需额外的 JTAG 适配器，通过 USB 桥接器使用 JTAG 接口便可对 ESP32 直接进行调试。

功能概述

ESP32-Ethernet-Kit 开发板的主要组件和连接方式如下。

功能说明

有关 ESP32-Ethernet-Kit 开发板的主要组件、接口及控制方式，请见下方的图片和表格。

以太网母板 (A 板) 下表将从图片右上角开始，以顺时针顺序介绍图中的主要组件。

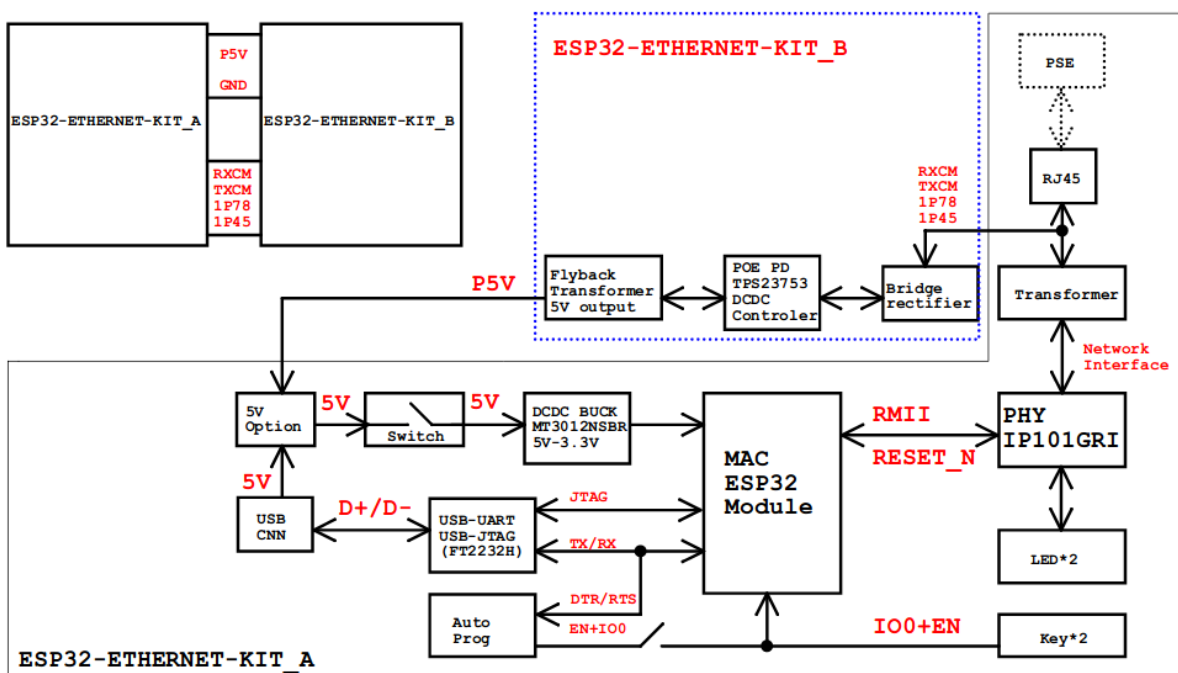

图 22: ESP32-Ethernet-Kit 功能框图 (点击放大)

图 23: ESP32-Ethernet-Kit - 以太网母板 (A 板) 布局 (点击放大)

表 1: 表格 1 组件介绍

主要组件	基本介绍
ESP32-WROVER-E 模组	这款 ESP32 模组内置 64-Mbit PSRAM，可提供灵活的额外存储空间和数据处理能力。
GPIO Header 2	由 5 个未引出通孔组成，可连接至 ESP32 的部分 GPIO。具体介绍，请见 GPIO Header 2 。
功能选择开关	一个 4 位拨码开关，可配置 ESP32 部分 GPIO 的功能。具体介绍，请见 功能选择开关 。
Tx/Rx LEDs	2 个 LED，可显示 UART 传输的状态。
FT2232H	FT2232H 多协议 USB 转串口桥接器。开发人员可通过 USB 接口对 FT2232H 芯片进行控制和编程，与 ESP32 建立连接。FT2232H 芯片可在通道 A 提供 USB-to-JTAG 接口功能，并在通道 B 提供 USB-to-Serial 接口功能，便利开发人员的应用开发与调试。见 ESP32-Ethernet-Kit V1.2 以太网母板 (A 板) 原理图 。
USB 端口	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
电源开关	电源开关。拨向 5V0 按键侧，开发板上电；拨向 GND 按键一侧，开发板掉电。
5V Input	5V 电源接口建议仅在开发板自动运行（未连接 PC）时使用。
5V Power On LED	当开发板通电后（USB 或外部 5V 供电），该红色指示灯将亮起。
DC/DC 转换器	直流 5 V 转 3.3 V，输出电流最高可达 2 A。
Board B 连接器	1 对排针和排母，用于连接 PoE 子板 (B 板) 。
IP101GRI (PHY)	物理层 (PHY) 单端口 10/100 快速以太网收发器 IP101GRI 芯片，允许开发人员实现与以太网线缆的物理层连接。PHY 与 ESP32 通过简化媒体独立接口 (RMII) 实现连接。RMII 是 媒体独立接口 (MII) 的标准简化版本。PHY 可在 10/100 Mbps 速率下支持 IEEE 802.3 / 802.3u 标准。
RJ45 端口	以太网数据传输端口。
网络变压器	网络变压器属于以太网物理层的一部分，可保护电路，使其免受故障和电压瞬变影响，包括防止收发器芯片和线缆之间产生共模信号。同时它也可以在收发器与以太网设备之间提供电流隔绝。
Link/Activity LED	2 个 LED（绿色和红色），可分别显示 PHY 处于“Link”状态或“Activity”状态。
BOOT Button	下载按键。按下 BOOT 键并保持，同时按一下 EN 键（此时不要松开 BOOT 键）进入“固件下载”模式，通过串口下载固件。
EN 按键	复位按键。
GPIO Header 1	由 6 个未引出通孔组成，可连接至 ESP32 的备用 GPIO。具体介绍，请见 GPIO Header 1 。

备注： 如果采用了固件自动下载模式，则无需对 BOOT 或 EN 按键进行任何操作。

PoE 子板 (B 板) PoE 子板转换以太网电缆传输的电能 (PoE)，为以太网母板 (A 板) 提供电源。PoE 子板 (B 板) 的主要组件见 [功能概述](#) 中的功能框图。

PoE 子板 (B 板) 具有以下特性：

- 支持 IEEE 802.3at 标准
- 电源输出：5 V，1.4 A

如需使用 PoE 功能，请用以太网线缆将以太网母板 (A 板) 上的 **RJ45 Port** 连接至 PoE 的交换机。以太网母板 (A 板) 检测到来自 PoE 子板 (B 板) 的 5 V 供电后，将从 USB 供电自动切换至 PoE 供电。

表 2: 表格 2 PoE 子板 (B 板)

主要组件	基本介绍
A 板连接器	4 个排针 (左侧) 和排母 (右侧)，用于将 PoE 子板 (B 板) 连接至 Ethernet board (A) 。左侧的管脚接受来自 PoE 交换机的电源。右侧的管脚为以太网母板 (A 板) 提供 5 V 电源。
外部电源终端	PoE 子板 (B 板) 可选电源 (26.6 ~ 54 V)。

图 24: ESP32-Ethernet-Kit - PoE 子板 (B 板) 布局 (点击放大)

设置选项

本节介绍用于 ESP32-Ethernet-Kit 开发板的硬件配置选项。

功能选择开关 拨码开关打开时，拨码开关将列出的 GPIO 路由到 FT2232H 以提供 JTAG 功能。拨码开关关闭时，GPIO 可以用于其他目的。

拨码开关	GPIO 管脚
1	GPIO13
2	GPIO12
3	GPIO15
4	GPIO14

RMII 时钟源选择 RMII 工作模式下的以太网 MAC 和 PHY 需要一个公共的 50MHz 同步时钟（即 RMII 时钟），它既可以由外部提供，也可以由内部的 ESP32 APLL 产生（不推荐）。

备注：有关 RMII 时钟源选择的更多信息，请参见 [ESP32-Ethernet-Kit V1.2 以太网母板 \(A 板\) 原理图](#)，第 2 页的位置 D2。

PHY 侧提供 RMII 时钟 ESP32-Ethernet-Kit 默认配置为 IP101GRI 的 50M_CLKO 信号线提供 RMII 时钟，该时钟信号由 PHY 外侧连接的 25 MHz 无源晶振经过倍频产生。详情请参见下图。

请注意，系统上电时 RESET_N 旁的下拉电阻会将 PHY 置于复位状态，ESP32 需要通过 GPIO5 将 RESET_N 拉高才能启动 PHY，只有这样才能保证系统的正常上电，否则 ESP32 会存在一定几率进入下载模式（当 REF_CLK_50M 时钟信号在 GPIO0 上电采样阶段刚好处于高电平）。

ESP32 APLL 内部提供的 RMII 时钟 另一种选择是从 ESP32 APLL 内部获取 RMII 时钟，请参见下图。来自 GPIO0 的时钟信号首先被反相，以解决传输线延迟的问题，然后提供给 PHY。

要实现此选项，用户需要在板上移除或添加一些阻容元器件。有关详细信息，请参见 [ESP32-Ethernet-Kit V1.2 以太网母板 \(A 板\) 原理图](#)，第 2 页，位置 D2。请注意，如果 APLL 已经用于其他用途（如 I2S 外设），那么只能使用外部 RMII 时钟。

GPIO 分配

本节介绍了 ESP32-Ethernet-Kit 开发板特定接口或功能的 GPIO 分配情况。

图 25: PHY 侧提供 RMIICLK 时钟

图 26: ESP32 APLL 内部提供的 RMIi 时钟

IP101GRI (PHY) 接口 下表显示了 ESP32 (MAC) 与 IP101GRI (PHY) 的管脚对应关系。ESP32-Ethernet-Kit 的实现默认设置为简化媒体独立接口。

No.	ESP32 管脚 (MAC)	IP101GRI (PHY)
<i>RMI</i> 接口		
1	GPIO21	TX_EN
2	GPIO19	TXD[0]
3	GPIO22	TXD[1]
4	GPIO25	RXD[0]
5	GPIO26	RXD[1]
6	GPIO27	CRS_DV
7	GPIO0	REF_CLK
串行管理接口		
8	GPIO23	MDC
9	GPIO18	MDIO
<i>PHY</i> 复位		
10	GPIO5	Reset_N

备注: ESP32 的 *RMI* 接口下的所有管脚分配都是固定的，不能通过 IOMUX 或 GPIO 矩阵进行更改。REF_CLK 仅可选择 GPIO0、GPIO16 或 GPIO17，且不可通过 GPIO 矩阵进行更改。

GPIO Header 1 本连接器包括 ESP32-Ethernet-Kit 开发板上部分不用做他用的 GPIO。

No.	ESP32 管脚
1	GPIO32
2	GPIO33
3	GPIO34
4	GPIO35
5	GPIO36
6	GPIO39

GPIO Header 2 根据“说明”描述的不同情形，本连接器包含可用做他用的 GPIO。

No.	ESP32 管脚	说明
1	GPIO17	见下方说明 1
2	GPIO16	见下方说明 1
3	GPIO4	
4	GPIO2	
5	GPIO13	见下方说明 2
6	GPIO12	见下方说明 2
7	GPIO15	见下方说明 2
8	GPIO14	见下方说明 2
9	GND	Ground
10	3V3	3.3 V 电源

备注:

- ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-E 模组的管脚，因此无法使用。如需使用 ESP32 的 GPIO16 和 GPIO17 管脚，建议更换其他不含 PSRAM 的模组，比如 ESP32-WROOM-32D 或 ESP32-SOLO-1。
- 具体功能取决与 [功能选择开关](#) 的设置。

GPIO 管脚分配总结

ESP32-WROVER-E	IP101GRI	UART	JTAG	GPIO	Comments
S_VP				IO36	
S_VN				IO39	
IO34				IO34	
IO35				IO35	
IO32				IO32	
IO33				IO33	
IO25	RXD[0]				
IO26	RXD[1]				
IO27	CRS_DV				
IO14			TMS	IO14	
IO12			TDI	IO12	
IO13			TCK	IO13	
IO15			TDO	IO15	
IO2				IO2	
IO0	REF_CLK				See note 1
IO4				IO4	
IO16				IO16 (NC)	See note 2
IO17				IO17 (NC)	See note 2
IO5	Reset_N				See note 1
IO18	MDIO				
IO19	TXD[0]				
IO21	TX_EN				
RXD0		RXD			
TXD0		TXD			
IO22	TXD[1]				
IO23	MDC				

备注:

1. 为防止 ESP32 侧 GPIO0 的上电状态受 PHY 侧时钟输出的影响，PHY 侧 RESET_N 默认为低，以关闭 PHY 侧时钟输出。上电后，您可通过 GPIO5 控制 RESET_N 以打开该时钟输出。参见 [PHY 侧提供 RMI 时钟](#)。对于无法通过 RESET_N 关闭时钟输出的 PHY，PHY 侧建议使用可在外部禁用/使能的有源晶振。与使用 RESET_N 类似，默认情况下晶振模块应禁用，并在上电后由 ESP32 开启。有关参考设计，请参见 [ESP32-Ethernet-Kit V1.2 以太网母板 \(A 板\) 原理图](#)。
2. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-E 模组的管脚，因此无法使用。如需使用 ESP32 的 GP1016 和 GPIO17 管脚，建议更换其他不含 PSRAM 的模组，比如 ESP32-WROOM-32D 或 ESP32-SOLO-1。

应用程序开发

ESP32-Ethernet-Kit 上电前，请首先确认开发板完好无损。

初始设置

1. 首先，请将 [以太网母板 \(A 板\)](#) 上的所有开关均拨至 **ON** 状态，使 **功能选择开关** 处于默认状态。
2. 为了方便应用程序的下载和测试，不要为开发板输入任何信号。
3. 此时可以连接 [PoE 子板 \(B 板\)](#)，但不要向 B 板连接任何外部电源。
4. 使用 USB 数据线将 [以太网母板 \(A 板\)](#) 连接至 PC。
5. 将 **电源开关** 从 GND 拨至 5V0 一侧。此时，**5V Power On LED** 应点亮。

正式开始开发 现在，请前往 [快速入门](#) 中的 [详细安装步骤](#) 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

请务必在进入下一步前，确保您已完成上述所有步骤。

配置与加载以太网示例 在完成开发环境设置和开发板测试后，您可以配置并烧录 [ethernet/basic](#) 示例。本示例专门用于测试以太网功能，支持不同 PHY，包括 [ESP32-Ethernet-Kit V1.2 \(点击放大\)](#) 开发板使用的 **IP101GRI**。

针对 ESP32-Ethernet-Kit V1.1 的主要修改：

- 更正拨码开关周围 GPIO 编号丝印。
- C1、C2、C42 和 C43 更新为 20 pF。详细信息见 [ESP32-Ethernet-Kit V1.2 以太网母板 \(A 板\) 原理图](#)。
- 模组 ESP32-WROVER-B 替换为 ESP32-WROVER-E。

ESP32-Ethernet-Kit V1.0 入门指南

本指南介绍了如何使用 ESP32-Ethernet-Kit 开发板以及配置相关功能。

[ESP32-Ethernet-Kit](#) 是一款以太网转 Wi-Fi 开发板，可为以太网设备赋予 Wi-Fi 连接功能。为了提供更灵活的电源选项，ESP32-Ethernet-Kit 也同时支持以太网供电 (PoE)。

准备工作

- [ESP32-Ethernet-Kit V1.0 开发板](#)
- USB 数据线 (A 转 Micro-B)
- PC (Windows、Linux 或 Mac OS)

您可以跳过介绍部分，直接前往[应用程序开发](#) 章节。

概述 ESP32-Ethernet-Kit 是一款来自 [乐鑫](#) 的开发板，由以太网母板 (A 板) 和 PoE 子板 (B 板) 两部分组成。其中 [以太网母板 \(A 板\)](#) 贴蓝牙 / Wi-Fi 双模 ESP32-WROVER-B 模组和单端口 10/100 快速以太网收发器 (PHY) IP101GRI。 [PoE 子板 \(B 板\)](#) 提供以太网供电功能。ESP32-Ethernet-Kit 的 A 板可在不连接 B 板的情况下独立工作。

为了实现程序下载和监控，A 板还集成了一款先进多协议 USB 桥接器 (FTDI FT2232H 芯片)，进而允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 适配器。

功能概述 ESP32-Ethernet-Kit 开发板的主要组件和连接方式见下。

图 27: ESP32-Ethernet-Kit V1.0

图 28: ESP32-Ethernet-Kit 功能框图 (点击放大)

功能说明 ESP32-Ethernet-Kit 开发板的主要组件、接口及控制方式见下。

图 29: ESP32-Ethernet-Kit - 以太网母板 (A 板) 布局 (点击放大)

以太网母板 (A 板) 下表将从图片右上角开始, 以顺时针顺序介绍图中的主要组件。

主要组件	基本介绍
ESP32-WROVER-B 模组	这款 ESP32 模组内置 64-Mbit PSRAM，可提供灵活的额外存储空间和数据处理能力。
GPIO Header 2	由 5 个未引出通孔组成，可连接至 ESP32 的部分 GPIO。具体介绍，请见 GPIO Header 2 。
流控	跳线帽，可接入开发板信号。具体介绍，请见 流控 。
功能选择开关	DIP 开关，可配置 ESP32 部分 GPIO 的功能。具体介绍，请见 功能选择开关 。
Tx/Rx LED	2 个 LED，可显示 UART 传输的状态。
GPIO Header 3	可连接至 ESP32 的部分 GPIO，根据 功能选择开关 的位置有不同功能。
FT2232H	FT2232H 多协议 USB 转串口桥接器。开发人员可通过 USB 接口对 FT2232H 芯片进行控制和编程，与 ESP32 建立连接。FT2232H 芯片可在通道 A 提供 USB-to-JTAG 接口功能，并在通道 B 提供 USB-to-Serial 接口功能，便利开发人员的应用开发与调试。见 ESP32-Ethernet-Kit V1.0 以太网母板 (A 板) 原理图 。
USB 端口	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
电源开关	电源开关。拨向 Boot 按键一侧，开发板上电；拨离 Boot 按键一侧，开发板掉电。
5V Input	5V 电源接口建议仅在开发板自动运行（未连接 PC）时使用。仅用于全负荷工作下的后备电源。
5V Power On LED	当开发板通电后（USB 或外部 5V 供电），该红色指示灯将亮起。
DC/DC 转换器	直流 5 V 转 3.3 V，输出电流高达 2 A。
B 板连接器	1 对 2 针排针，用于连接 PoE 子板 (B 板) 。
IP101GRI (PHY)	物理层 (PHY) 单端口 10/100 快速以太网收发器 IP101GRI ，允许开发人员实现与以太网线缆的物理层连接。PHY 与 ESP32 通过简化媒体独立接口 (RMII) 实现连接。RMII 是 媒体独立接口 (MII) 的简化版本。PHY 可在 10/100 Mbps 速率下支持 IEEE 802.3 / 802.3u 标准。
RJ45 端口	以太网数据传输端口。
网络变压器	网络变压器属于以太网物理层的一部分，可保护电路免受故障和电压瞬变影响，包括防止收发器芯片和线缆之间产生共模信号。同时它也可以在收发器与以太网设备之间提供电流隔绝。
Link/Activity LED	2 个 LED（绿色和红色），可分别显示 PHY 处于“Link”状态或“Activity”状态。
BOOT 按键	下载按键。按下 BOOT 键并保持，同时按一下 EN 键（此时不要松开 BOOT 键）进入“固件下载”模式，通过串口下载固件。
CH_PU 按键	复位按键。
GPIO Header 1	由 6 个未引出通孔组成，可连接至 ESP32 的备用 GPIO。具体介绍，请见 GPIO Header 1 。

PoE 子板 (B 板) PoE 子板通过以太网电缆传输电能 (PoE)，为以太网母板 (A 板) 提供电源。PoE 子板 (B 板) 的主要组件见 [功能概述](#) 中的功能框图。

PoE 子板 (B 板) 具有以下特性:

- 支持 IEEE 802.3at
- 电源输出: 5 V, 1.4 A

如需使用 PoE 功能, 请用以太网线缆将以太网母板 (A 板) 上的 **RJ45 端口** 连接至 PoE 的交换机。以太网母板 (A 板) 检测到来自 PoE 子板 (B 板) 的 5 V 供电后, 将从 USB 供电自动切换至 PoE 供电。

图 30: ESP32-Ethernet-Kit - PoE 子板 (B 板) 布局 (点击放大)

主要组件	基本介绍
A 板连接器	1 个 4 针排母, 用于将 B 板连接至以太网母板 (A 板)。
外部电源终端	PoE 子板 (B 板) 备用电源。

设置选项 本节介绍用于 ESP32-Ethernet-Kit 开发板的硬件配置选项。

功能选择开关 用户可使用 **功能选择开关** 配置特定 GPIO 管脚的功能。

DIP SW	GPIO 管脚	管脚功能 (DIP SW 开启状态)
1.	GPIO14	连接至 FT2232H, 提供 JTAG 功能
2.	GPIO12	连接至 FT2232H, 提供 JTAG 功能
3.	GPIO13	连接至 FT2232H, 提供 JTAG 功能
4.	GPIO15	连接至 FT2232H, 提供 JTAG 功能
5.	GPIO4	连接至 FT2232H, 提供 JTAG 功能
6.	GPIO2	连接至板上 25 MHz 晶振
7.	GPIO5	连接至 IP101GRI 的 RESET_N 输入
8.	n/a	

用户还可以关闭 DIP DW, 将部分 GPIO 用于其他用途。

流控 2 x 2 跳线连接器, 可用于 UART 流控功能。

	信号	备注
1.	MTDO	GPIO13, 见 功能选择开关 。
2.	MTCK	GPIO15, 见 功能选择开关 。
3.	RTS	FT2232H 的 RTS 信号
4.	CTS	FT2232H 的 CTS 信号

GPIO 分配 本节介绍了 ESP32-Ethernet-Kit 开发板特定接口或功能的 GPIO 分配情况。

IP101GRI (PHY) 接口 ESP32 (MAC) 与 IP101GRI (PHY) 的管脚对应关系见下：

	ESP32 管脚 (MAC)	IP101GRI (PHY)
<i>RMII</i> 接口		
1.	GPIO21	TX_EN
2.	GPIO19	TXD[0]
3.	GPIO22	TXD[1]
4.	GPIO25	RXD[0]
5.	GPIO26	RXD[1]
6.	GPIO27	CRS_DV
7.	GPIO0	REF_CLK
串行管理接口		
8	GPIO23	MDC
9	GPIO18	MDIO
<i>PHY</i> 复位		
10	GPIO5	Reset_N

备注：除了 REF_CLK 之外，*RMII* 接口下的所有管脚分配都是固定的，不能通过 IOMUX 或 GPIO 矩阵进行更改。

GPIO Header 2 本连接器包括具有特定 MII 功能的 GPIO (GPIO2 除外)。根据具体情况, 部分以太网应用程序可能需要使用此功能。

.	ESP32 管脚	MI I 功能	说明
1.	GPIO17	EMAC_CLK_180	见说明 1。
2.	GPIO16	EMAC_CLK_OUT	见说明 1。
3.	GPIO4	EMAC_TX_ER	
4.	GPIO2	n/a	见说明 2。
5.	GPIO5	EMAC_RX_CLK	见说明 2。

备注:

1. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-B 模组的管脚, 因此无法使用。如需使用 ESP32 的 GP1016 和 GPIO17 管脚, 建议更换其他不含 SPIRAM 的模组, 比如 ESP32-WROOM-32D 或 ESP32-SOLO-1。
2. 具体功能取决于[功能选择开关](#)的设置。

GPIO Header 3 本连接器中 GPIO 的功能取决于[功能选择开关](#)的设置。

备注:

- GPIO2 用于使能 PHY 的外部振荡器。
- GPIO0 用于为 PHY 提供 50 MHz 基准时钟源。为了防止传输线路延迟对时钟相位带来的影响，该时钟信号将首先被反相，而后提供给 PHY。
- 为防止 PHY 端 GPIO0 的上电状态受到时钟输出的影响，PHY 的外部晶振将在 ESP32 上电后通过 GPIO2 使能。

4. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-B 模组的管脚，因此无法使用。如需使用 ESP32 的 GP1016 和 GPIO17 管脚，建议更换其他不含 SPIRAM 的模组，比如 ESP32-WROOM-32D 或 ESP32-SOLO-1。
-

应用程序开发 ESP32-Ethernet-Kit 上电前，请首先确认开发板完好无损。

初始设置

1. 首先，请将以太网母板 (A 板) 上的所有开关均拨至 ON 状态，即使功能选择开关处于默认状态。
2. 为了方便应用程序的下载和测试，此时请不要在开发板安装任何跳线帽，也不要为开发板接入任何信号。
3. 此时可以连接 PoE 子板 (B 板)，但不要向 B 板连接任何外部电源。
4. 使用 USB 数据线将以太网母板 (A 板) 连接至 PC。
5. 将电源开关从 GND 拨至 5V0 一侧。此时，5V Power On LED 应点亮。

正式开始开发 现在，请前往快速入门 中的详细安装步骤 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

如需使用较早 GNU Make 编译系统，则请参考详细安装步骤 章节。

请务必在进入下一步前，确保您已完成上述所有步骤。

配置与加载以太网示例 在完成开发环境设置和开发板测试后，您可以配置并烧录 ethernet/basic 示例。本示例专门用于测试以太网功能，支持不同 PHY，包括 ESP32-Ethernet-Kit V1.0 开发板 使用的 IP101GRI。

ESP32-Ethernet-Kit V1.1 入门指南

本指南将介绍 ESP32-Ethernet-Kit 开发板的配置以及相关功能的使用。

[ESP32-Ethernet-Kit](#) 是一款以太网转 Wi-Fi 开发板，可为以太网设备赋予 Wi-Fi 连接功能。为了提供更灵活的电源选项，ESP32-Ethernet-Kit 同时也支持以太网供电 (PoE)。

准备工作

- [ESP32-Ethernet-Kit V1.1 开发板](#)
- USB 数据线 (A 转 Micro-B)
- PC (Windows、Linux 或 Mac OS)

您可以跳过介绍部分，直接前往[应用程序开发](#) 章节。

图 31: ESP32-Ethernet-Kit V1.1

概述 ESP32-Ethernet-Kit 是一款来自 乐鑫 的开发板。

它由以太网母板 (A 板) 和 PoE 子板 (B 板) 两部分组成。其中以太网母板 (A 板) 集成蓝牙 / Wi-Fi 双模 ESP32-WROVER-B 模组和单端口 10/100 Mbps 快速以太网收发器 (PHY) IP101GRI。PoE 子板 (B 板) 提供以太网供电功能。ESP32-Ethernet-Kit 的 A 板可在不连接 B 板的情况下独立工作。

为了实现程序下载和监控, A 板还集成了一款先进多协议 USB 桥接器 (FTDI FT2232H 芯片)。FTDI FT2232H 芯片使得开发人员无需额外的 JTAG 适配器, 通过 USB 桥接器使用 JTAG 接口便可对 ESP32 直接进行调试。

功能概述 ESP32-Ethernet-Kit 开发板的主要组件和连接方式如下。

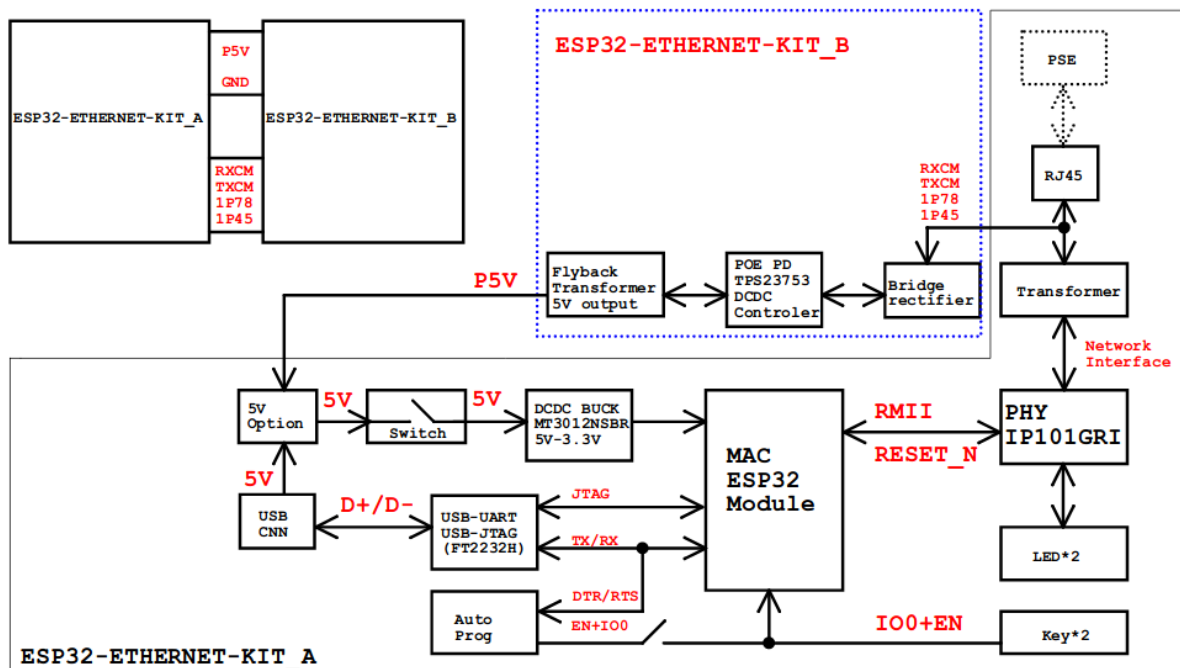

图 32: ESP32-Ethernet-Kit 功能框图 (点击放大)

功能说明 有关 ESP32-Ethernet-Kit 开发板的主要组件、接口及控制方式, 请见下方的图片和表格。

以太网母板 (A 板) 下表将从图片右上角开始, 以顺时针顺序介绍图中的主要组件。

图 33: ESP32-Ethernet-Kit - 以太网母板 (A 板) 布局 (点击放大) (请更新图片)

表 3: 表格 1 组件介绍

主要组件	基本介绍
ESP32-WROVER-B 模组	这款 ESP32 模组内置 64-Mbit PSRAM，可提供灵活的额外存储空间和数据处理能力。
GPIO Header 2	由 5 个未引出通孔组成，可连接至 ESP32 的部分 GPIO。具体介绍，请见 GPIO Header 2 。
功能选择开关	一个 4 位拨码开关，可配置 ESP32 部分 GPIO 的功能。请注意，拨码开关旁边开发板的丝印层上的 GPIO 管脚标记的位置是不正确的。有关详细信息和正确的管脚分配，请见 功能选择开关 。
Tx/Rx LEDs	2 个 LED，可显示 UART 传输的状态。
FT2232H	FT2232H 多协议 USB 转串口桥接器。开发人员可通过 USB 接口对 FT2232H 芯片进行控制和编程，与 ESP32 建立连接。FT2232H 芯片可在通道 A 提供 USB-to-JTAG 接口功能，并在通道 B 提供 USB-to-Serial 接口功能，便利开发人员的应用开发与调试。见 ESP32-Ethernet-Kit V1.1 以太网母板 (A 板) 原理图 。
USB 端口	USB 接口。可用作开发板的供电电源，或连接 PC 和开发板的通信接口。
电源开关	电源开关。拨向 5V0 按键侧，开发板上电；拨向 GND 按键一侧，开发板掉电。
5V Input	5V 电源接口建议仅在开发板自动运行（未连接 PC）时使用。
5V Power On LED	当开发板通电后（USB 或外部 5V 供电），该红色指示灯将亮起。
DC/DC 转换器	直流 5 V 转 3.3 V，输出电流最高可达 2 A。
Board B 连接器	1 对排针和排母，用于连接 PoE 子板 (B 板) 。
IP101GRI (PHY)	物理层 (PHY) 单端口 10/100 快速以太网收发器 IP101GRI 芯片，允许开发人员实现与以太网线缆的物理层连接。PHY 与 ESP32 通过简化媒体独立接口 (RMII) 实现连接。RMII 是 媒体独立接口 (MII) 的标准简化版本。PHY 可在 10/100 Mbps 速率下支持 IEEE 802.3 / 802.3u 标准。
RJ45 端口	以太网数据传输端口。
网络变压器	网络变压器属于以太网物理层的一部分，可保护电路，使其免受故障和电压瞬变影响，包括防止收发器芯片和线缆之间产生共模信号。同时它也可以在收发器与以太网设备之间提供电流隔绝。
Link/Activity LED	2 个 LED（绿色和红色），可分别显示 PHY 处于“Link”状态或“Activity”状态。
BOOT Button	下载按键。按下 BOOT 键并保持，同时按一下 EN 键（此时不要松开 BOOT 键）进入“固件下载”模式，通过串口下载固件。
EN 按键	复位按键。
GPIO Header 1	由 6 个未引出通孔组成，可连接至 ESP32 的备用 GPIO。具体介绍，请见 GPIO Header 1 。

PoE 子板 (B 板) PoE 子板转换以太网电缆传输的电能 (PoE)，为以太网母板 (A 板) 提供电源。PoE 子板 (B 板) 的主要组件见 [功能概述](#) 中的功能框图。

PoE 子板 (B 板) 具有以下特性：

- 支持 IEEE 802.3at 标准
- 电源输出：5 V，1.4 A

如需使用 PoE 功能，请用以太网线缆将以太网母板 (A 板) 上的 **RJ45 Port** 连接至 PoE 的交换机。以太网母板 (A 板) 检测到来自 PoE 子板 (B 板) 的 5 V 供电后，将从 USB 供电自动切换至 PoE 供电。

图 34: ESP32-Ethernet-Kit - PoE 子板 (B 板) 布局 (点击放大)

表 4: 表格 2 PoE 子板 (B 板)

主要组件	基本介绍
A 板连接器	4 个排针 (左侧) 和排母 (右侧)，用于将 PoE 子板 (B 板) 连接至 Ethernet board (A) 。左侧的管脚接受来自 PoE 交换机的电源。右侧的管脚为以太网母板 (A 板) 提供 5 V 电源。
外部电源终端	PoE 子板 (B 板) 可选电源 (26.6 ~ 54 V)。

设置选项 本节介绍用于 ESP32-Ethernet-Kit 开发板的硬件配置选项。

功能选择开关 拨码开关打开时，拨码开关将列出的 GPIO 路由到 FT2232H 以提供 JTAG 功能。拨码开关关闭时，GPIO 可以用于其他目的。

拨码开关	GPIO 管脚
1	GPIO13
2	GPIO12
3	GPIO15
4	GPIO14

备注： 拨码开关旁边开发板的丝印层上的 GPIO 管脚标记的位置是不正确的。请以表格中的顺序为准。

RMII 时钟源选择 RMII 工作模式下的以太网 MAC 和 PHY 需要一个公共的 50MHz 同步时钟 (即 RMII 时钟)，它既可以由外部提供，也可以由内部的 ESP32 APLL 产生。

备注： 有关 RMII 时钟源选择的更多信息，请参见 [ESP32-Ethernet-Kit V1.1 以太网母板 \(A 板\) 原理图](#)，第 2 页的位置 D2。

PHY 侧提供 RMII 时钟 ESP32-Ethernet-Kit 默认配置为 IP101GRI 的 50M_CLKO 信号线提供 RMII 时钟，该时钟信号由 PHY 外侧连接的 25MHz 无源晶振经过倍频产生。详情请参见下图。

图 35: PHY 侧提供 RMIi 时钟

请注意，系统上电时 RESET_N 旁的下拉电阻会将 PHY 置于复位状态，ESP32 需要通过 GPIO5 将 RESET_N 拉高才能启动 PHY，只有这样才能保证系统的正常上电，否则 ESP32 会存在一定几率进入下载模式（当 REF_CLK_50M 时钟信号在 GPIO0 上电采样阶段刚好处于高电平）。

ESP32 APLL 内部提供的 RMII 时钟 另一种选择是从 ESP32 APLL 内部获取 RMII 时钟，请参见下图。来自 GPIO0 的时钟信号首先被反相，以解决传输线延迟的问题，然后提供给 PHY。

图 36: ESP32 APLL 内部提供的 RMII 时钟

要实现此选项，用户需要在板子上移除或添加一些阻容元器件。有关详细信息，请参见 [ESP32-Ethernet-Kit V1.1 以太网母板 \(A 板\) 原理图](#)，第 2 页，位置 D2。请注意，如果 APLL 已经用于其他用途（如 I2S 外设），那么只能使用外部 RMII 时钟。

GPIO 分配 本节介绍了 ESP32-Ethernet-Kit 开发板特定接口或功能的 GPIO 分配情况。

IP101GRI (PHY) 接口 下表显示了 ESP32 (MAC) 与 IP101GRI (PHY) 的管脚对应关系。ESP32-Ethernet-Kit 的实现默认设置为简化媒体独立接口。

.	ESP32 管脚 (MAC)	IP101GRI (PHY)
<i>RMII</i> 接口		
1	GPIO21	TX_EN
2	GPIO19	TXD[0]
3	GPIO22	TXD[1]
4	GPIO25	RXD[0]
5	GPIO26	RXD[1]
6	GPIO27	CRS_DV
7	GPIO0	REF_CLK
串行管理接口		
8	GPIO23	MDC
9	GPIO18	MDIO
<i>PHY</i> 复位		
10	GPIO5	Reset_N

备注：除了 REF_CLK 之外，ESP32 的 *RMII* 接口下的所有管脚分配都是固定的，不能通过 IOMUX 或 GPIO 矩阵进行更改。

GPIO Header 1 本连接器包括 ESP32-Ethernet-Kit 开发板上部分不用做他用的 GPIO。

.	ESP32 管脚
1	GPIO32
2	GPIO33
3	GPIO34
4	GPIO35
5	GPIO36
6	GPIO39

GPIO Header 2 根据“说明”描述的不同情形，本连接器包含可用做他用的 GPIO。

.	ESP32 管脚	说明
1	GPIO17	见下方说明 1
2	GPIO16	见下方说明 1
3	GPIO4	
4	GPIO2	
5	GPIO13	见下方说明 2
6	GPIO12	见下方说明 2
7	GPIO15	见下方说明 2
8	GPIO14	见下方说明 2
9	GND	Ground
10	3V3	3.3 V 电源

备注：

- ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-B 模组的管脚，因此无法使用。如需使用 ESP32 的 GPIO16 和 GPIO17 管脚，建议更换其他不含 PSRAM 的模组，比如 ESP32-WROOM-32D 或 ESP32-SOLO-1。
- 具体功能取决于 [功能选择开关](#) 的设置。

GPIO 管脚分配总结

ESP32-WROVER-B	IP101GRI	UART	JTAG	GPIO	Comments
S_VP				IO36	
S_VN				IO39	
IO34				IO34	
IO35				IO35	
IO32				IO32	
IO33				IO33	
IO25	RXD[0]				
IO26	RXD[1]				
IO27	CRS_DV				
IO14			TMS	IO14	
IO12			TDI	IO12	
IO13		RTS	TCK	IO13	
IO15		CTS	TDO	IO15	
IO2				IO2	
IO0	REF_CLK				See note 1
IO4				IO4	
IO16				IO16 (NC)	See note 2
IO17				IO17 (NC)	See note 2
IO5	Reset_N				See note 1
IO18	MDIO				
IO19	TXD[0]				
IO21	TX_EN				
RXD0		RXD			
TXD0		TXD			
IO22	TXD[1]				
IO23	MDC				

备注:

1. 为防止 ESP32 侧 GPIO0 的上电状态受 PHY 侧时钟输出的影响，PHY 侧 RESET_N 默认为低，以关闭 PHY 侧时钟输出。上电后，您可通过 GPIO5 控制 RESET_N 以打开该时钟输出。参见 [PHY 侧提供 RMI 时钟](#)。对于无法通过 RESET_N 关闭时钟输出的 PHY，PHY 侧建议使用可在外部禁用/使能的有源晶振。与使用 RESET_N 类似，默认情况下晶振模块应禁用，并在上电后由 ESP32 开启。有关参考设计，请参见 [ESP32-Ethernet-Kit V1.1 以太网母板 \(A 板\) 原理图](#)。
2. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-B 模组的管脚，因此无法使用。如需使用 ESP32 的 GP1016 和 GPIO17 管脚，建议更换其他不含 PSRAM 的模组，比如 ESP32-WROOM-32D 或 ESP32-SOLO-1。

应用程序开发 ESP32-Ethernet-Kit 上电前，请首先确认开发板完好无损。

初始设置

1. 首先，请将 [以太网母板 \(A 板\)](#) 上的所有开关均拨至 **ON** 状态，使 **功能选择开关** 处于默认状态。
2. 为了方便应用程序的下载和测试，不要为开发板输入任何信号。
3. 此时可以连接 [PoE 子板 \(B 板\)](#)，但不要向 B 板连接任何外部电源。
4. 使用 USB 数据线将 [以太网母板 \(A 板\)](#) 连接至 PC。
5. 将 **电源开关** 从 GND 拨至 5V0 一侧。此时，**5V Power On LED** 应点亮。

正式开始开发 现在，请前往 [快速入门](#) 中的 [详细安装步骤](#) 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

请务必在进入下一步前，确保您已完成上述所有步骤。

配置与加载以太网示例 在完成开发环境设置和开发板测试后，您可以配置并烧录 [ethernet/basic](#) 示例。本示例专门用于测试以太网功能，支持不同 PHY，包括 *ESP32-Ethernet-Kit V1.1* 开发板使用的 **IP101GRI**。

针对 ESP32-Ethernet-Kit V1.0 的主要修改：

- 原 GPIO0 反相后时钟提供给 PHY 方案改为由 PHY 侧外接无源晶振，提供时钟给 GPIO0。原用于控制有源晶振的 OSC_EN 的 IO2 释放，可用作其他用途。
- 为防止 ESP32 侧 GPIO0 的上电状态受到 PHY 侧时钟输出的影响，PHY 侧 RESET_N 默认为低，关闭 PHY 侧时钟输出。而后可通过 GPIO5 控制 RESET_N 打开该时钟输出。
- 移除 FT2232H 芯片的外部 SPI Flash U6。
- 移除流控的测试排针 J4。
- 移除 nTRST JTAG 信号，相应的 GPIO4 可用作其他用途。
- GPIO15 线上的上拉电阻 R68 移至 JTAG 的 MTDO 侧。
- 为了加强 A 板和 B 板连接间的防呆设计（减少反向插入 B 板的机会），将原先 A 板上的 2 排 4 针排针改为 1 排 4 针排母和 1 排 4 针排针。相应的 4 针排针排和排母排则安装在 B 板上。

1.3.5 ESP32-DevKitS(-R)

本指南介绍了乐鑫专为 ESP32 设计的烧录底板 ESP32-DevKitS(-R)。

ESP32-DevKitS(-R) 包括两款开发板，分别是 ESP32-DevKitS 和 ESP32-DevKitS-R。S 代表弹簧 (spring)，R 代表 WROVER 模组。

本指南包括如下内容：

- **入门指南**: 简要介绍了 ESP32-DevKitS(-R) 和硬件、软件设置指南。
- **硬件参考**: 详细介绍了 ESP32-DevKitS(-R) 的硬件。
- **相关文档**: 列出了相关文档的链接。

入门指南

本节介绍了如何快速上手 ESP32-DevKitS(-R)。开头部分介绍了 ESP32-DevKitS(-R)，[如何烧录开发板](#) 小节介绍了怎样在 ESP32-DevKitS(-R) 上安装模组、配置及烧录固件。

概述 ESP32-DevKitS(-R) 是乐鑫专为 ESP32 设计的烧录底板，无需将 ESP32 模组与电源和信号线焊接便可进行烧录。ESP32-DevKitS(-R) 搭载模组后，可作为类似 ESP32-DevKitC 的小型开发板使用。

ESP32-DevKitS 和 ESP32-DevKitS-R 仅在弹簧布局上有所不同，用于适配不同的 ESP32 模组。

- **ESP32-DevKitS:**
 - ESP32-WROOM-32
 - ESP32-WROOM-32D
 - ESP32-WROOM-32U
 - ESP32-SOLO-1
 - ESP32-WROOM-32E
 - ESP32-WROOM-32UE
- **ESP32-DevKitS-R:**
 - ESP32-WROVER (PCB & IPEX)
 - ESP32-WROVER-B (PCB & IPEX)
 - ESP32-WROVER-E
 - ESP32-WROVER-IE

有关上述模组的详细信息，请参考 [ESP32 系列模组](#)。

图 37: ESP32-DevKitS - 正面

组件介绍

图 38: ESP32-DevKitS-R - 正面

主要组件	介绍
引脚弹簧	适配模组上的邮票孔，用于连接和固定模组。
2.54 mm 排母	连接板上搭载模组的引脚。关于排母的描述，请见 针座 小节。
USB-to-UART 桥接器	单芯片 USB 转 UART 桥接器，可提供高达 3 Mbps 的传输速率。
LDO	5V-to-3.3V 低压差线性稳压器 (LDO)。
Micro-USB 连接器/Micro USB 端口	USB 接口。可用作开发板的供电电源或连接电脑和开发板的通信接口。
EN 键	复位按键。
Boot 键	下载按键。按住 Boot 键的同时按一下 EN 键进入“固件下载”模式，通过串口下载固件。
电源指示 LED	开发板通电后 (USB 或供电电源)，该指示灯亮起。

如何烧录开发板 通电前，请确保 ESP32-DevKitS(-R) 完好无损。

必备硬件

- 任选一款 ESP32 模组
- USB 2.0 数据线 (标准 A 型转 Micro-B 型)
- 电脑 (Windows、Linux 或 macOS)

硬件设置 请按照下列步骤将模组安装到 ESP32-DevKitS(-R) 烧录底板上：

- 将模组轻放到 ESP32-DevKitS(-R) 烧录底板上。确保模组上方的邮票孔与底板上的引脚弹簧对齐。
- 将模组向下压，听到“咔哒”一声即说明模组已经压入底板。
- 检查所有引脚弹簧是否均已卡进邮票孔中。如发现错位，可使用镊子将引脚弹簧拨入邮票孔中。

软件设置

首选方式 使用 ESP-IDF 开发框架是将二进制文件 (*.bin) 烧录到 ESP32-DevKitS(-R) 的首选方式。请前往[快速入门](#)，在[详细安装步骤](#)一节查看如何快速设置开发环境，将应用程序烧录至 ESP32-DevKitS(-R)。

备选方式 Windows 用户也可以使用 [Flash 下载工具](#) 烧录二进制文件。请下载该工具、解压并参照 *doc* 文件夹内的使用指南。

备注:

1. 烧录二进制文件时需将 ESP32 芯片设置成固件下载模式。这一步骤可由烧录工具自动执行，也可按住 Boot 按键并点按 EN 按键手动执行。
 2. 烧录完成后，烧录工具默认情况下会重启模组，运行已烧录的程序。
-

图 39: ESP32-DevKitS 尺寸 - 背面

底板尺寸

内含组件和包装

零售订单 如购买样品，每个 ESP32-DevKitS(-R) 底板将以防静电袋或零售商选择的其他方式包装。零售订单请前往 <https://www.espressif.com/zh-hans/company/contact/buy-a-sample>。

批量订单 如批量购买，ESP32-DevKitS(-R) 烧录底板将以大纸板箱包装。批量订单请前往 <https://www.espressif.com/zh-hans/contact-us/sales-questions>。

硬件参考

功能框图 ESP32-DevKitS(-R) 的主要组件和连接方式如下图所示。

图 40: ESP32-DevKitS-R 尺寸 - 背面

图 41: ESP32-DevKitS(-R) (点击放大)

电源选项 您可从以下三种供电方式中任选其一给 ESP32-DevKitS(-R) 供电：

- Micro USB 端口供电（默认）
- 5V 和 GND 管脚供电
- 3V3 和 GND 管脚供电

建议选择第一种供电方式：Micro USB 端口供电。

1.3.6 ESP32-PICO-KIT-1

概述

ESP32-PICO-KIT-1 是一款基于 ESP32 的乐鑫开发板，板上搭载 ESP32-PICO-V3 (SiP, 系统级封装) 模组。ESP32-PICO-V3 具备完整的 Wi-Fi 和蓝牙功能，与其它 ESP32 系列模组相比，此模组已集成下述外围组件，无需额外安装：

- 40 MHz 晶振
- 4 MB flash
- 滤波电容
- 射频匹配网络等

将上述组件封装至 ESP32-PICO-V3，用户无需额外购买，大大降低了安装和测试的成本，同时也增加了产品的可用性。

ESP32-PICO-KIT-1 开发板还集成了 USB-to-UART 桥接电路，方便开发人员直接通过 PC 的 USB 端口直接进行固件烧录和调试。

为方便硬件连接，ESP32-PICO-V3 上的所有 IO 信号和系统电源管脚均引出至开发板两侧焊盘 (18 x 0.1”)。上述 18 个焊盘也均引出至排针，可使用杜邦线连接。

备注：ESP32-PICO-KIT-1 开发板默认采用排针。

ESP32-PICO-KIT-1 为用户提供了基于 ESP32 芯片应用开发的硬件，更加方便用户探索 ESP32 芯片的功能。

本指南包括以下几个章节：

- **快速入门：** 简要介绍 ESP32-PICO-KIT-1 开发板，以及上手这款开发板所需的软件配置；
- **内含组件和包装方式：** 介绍零售订单和批量订单所提供的组件及包装方式；
- **硬件参考：** 提供 ESP32-PICO-KIT-1 开发板硬件详细信息；
- **硬件版本：** 介绍硬件历史版本 (如有)，已知问题 (如有)，并提供链接至历史版本开发板的入门指南 (如有)；
- **相关文档：** 提供相关文档的链接。

快速入门

本节介绍了如何快速上手 ESP32-PICO-KIT-1。首先对 ESP32-PICO-KIT-1 开发板进行了简要介绍，然后在 [应用开发](#) 小节介绍如何将固件烧录至开发板。

组件描述 ESP32-PICO-KIT-1 开发板的主要组件、接口及控制方式见下图。

从左上角开始，按顺时针顺序，开发板主要组件的描述见下表。

图 42: ESP32-PICO-KIT-1 外观图 (点击放大)

图 43: ESP32-PICO-KIT-1 开发板布局 - 正面 (点击放大)

主要组件	描述
ESP32-PICO-V3	ESP32-PICO-KIT-1 开发板的板载模组 (SiP)，搭载 ESP32 SoC 芯片，仅需连接天线、LC 匹配电路、去耦电容和一个 EN 信号上拉电阻即可正常工作。
LDO	5V 转 3.3V 低压差稳压器
USB-to-UART	CP2102N: 单芯片 USB-to-UART 桥接器，数据传输速率可达 3 Mbps。
Micro-B USB	USB 接口。可为开发板供电，或连接 PC 进行 USB 通信。
5V Power On LED	开发板上电后，红色指示灯亮起。更多信息，见 相关文档 中提供的原理图。
I/O Connector	ESP32-PICO-V3 上的管脚均已引出至开发板排针。用户可对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等功能。更多信息，见 章节管脚描述 。
BOOT 按键	下载按键。按下 Boot 键并保持，同时按下 EN 键将进入固件下载模式，通过串口下载固件。
EN 按键	复位按键。

应用开发 上电前，请确保 ESP32-PICO-KIT-1 完好无损。

所需硬件

- 1 x ESP32-PICO-KIT-1 开发板
- 1 x USB 2.0 A 转 Micro B 数据线
- 1 x PC，运行 Windows、Linux 或 macOS 系统

软件配置 请前往[快速入门](#)，在[详细安装步骤](#)一节查看如何快速配置开发环境，将应用程序烧录至 ESP32-PICO-KIT-1 开发板。

内含组件和包装方式

零售订单 如购买样品，每个 ESP32-PICO-KIT-1 将单独包装。

零售订单，请前往 <https://www.espressif.com/en/company/contact/buy-a-sample>。

批量订单 如批量购买，ESP32-PICO-KIT-1 开发板将以大纸板箱包装。

批量订单请前往 <https://www.espressif.com/zh-hans/contact-us/sales-questions>。

硬件参考

功能框图 ESP32-PICO-KIT-1 的主要组件和连接方式如下图所示。

图 44: ESP32-PICO-KIT-1 功能框图 (点击放大)

供电选项 开发板提供以下三种供电方式，可任意选择一种：

- Micro USB 供电（默认）
- 5V/GND 管脚供电
- 3V3/GND 管脚供电

警告： 上述供电方式只能选择一种方式，不能同时选择，否则可能会损坏开发板和/或电源。

管脚描述 [组件描述](#) 中所示的开发板两侧 I/O 管脚，其具体名称和功能见下表。管脚名称和编号与[相关文档](#)中原理图保持一致。

1.3.7 ESP32-PICO-DevKitM-2

概述

ESP32-PICO-DevKitM-2 是一款基于 ESP32 的乐鑫开发板，板上搭载 ESP32-PICO-MINI-02(02U) 模组。ESP32-PICO-MINI-02(02U) 模组具备完整的 Wi-Fi 和蓝牙功能。

ESP32-PICO-DevKitM-2 开发板同时集成了 USB-to-UART 桥接电路，方便开发人员直接通过 PC 的 USB 端口直接进行固件烧录和调试。

为方便硬件连接，ESP32-PICO-MINI-02(02U) 上的所有 IO 信号和系统电源管脚均引出至开发板两侧焊盘 (18 x 0.1")。上述 18 个焊盘也均引出至排针，可使用杜邦线连接。

备注：ESP32-PICO-DevKitM-2 开发板默认采用排针。

ESP32-PICO-DevKitM-2 为用户提供了基于 ESP32 芯片应用开发的硬件，更加方便用户探索 ESP32 芯片的功能。

图 46: ESP32-PICO-DevKitM-2 外观图 (点击放大)

本指南包括以下几个章节：

- **快速入门：** 简要介绍 ESP32-PICO-DevKitM-2 开发板，以及上手这款开发板所需的软件配置；
- **内含组件和包装方式：** 介绍零售订单和批量订单所提供的组件及包装方式；
- **硬件参考：** 提供 ESP32-PICO-DevKitM-2 开发板硬件详细信息；

快速入门

本节介绍了如何快速上手 ESP32-PICO-DevKitM-2。首先对 ESP32-PICO-DevKitM-2 开发板进行了简要介绍，然后在[应用开发](#)小节介绍如何将固件烧录至开发板。

组件描述 ESP32-PICO-DevKitM-2 开发板的主要组件、接口及控制方式见下图。下文以板载 ESP32-PICO-MINI-02 的开发板为例进行说明。

图 47: ESP32-PICO-DevKitM-2 开发板组件布局 - 正面 (点击放大)

从左上角开始，按顺时针顺序，开发板主要组件的描述见下表。

主要组件	描述
ESP32-PICO-MINI-02	ESP32-PICO-DevKitM-2 开发板的板载模组，搭载 ESP32 SoC 芯片。用户也可选择板载 ESP32-PICO-MINI-02U 的开发板。
LDO	5V 转 3.3V 低压差稳压器
USB-to-UART	CP2102N: 单芯片 USB-to-UART 桥接器，数据传输速率可达 3 Mbps。
Micro-B USB 接口	USB 接口。可为开发板供电，或连接 PC 进行 USB 通信。
5V Power On LED	开发板上电后，红色指示灯亮起。更多信息，见 相关文档 中提供的原理图。
I/O Connector	ESP32-PICO-MINI-02 上的管脚均已引出至开发板排针。用户可对 ESP32 进行编程，实现 PWM、ADC、DAC、I2C、I2S、SPI 等功能。更多信息，见 章节管脚描述 。
BOOT 按键	下载按键。按下 Boot 键并保持，同时按下 EN 键将进入固件下载模式，通过串口下载固件。
EN 按键	复位按键。

应用开发 上电前，请确保 ESP32-PICO-DevKitM-2 完好无损。

所需硬件

- 1 x ESP32-PICO-DevKitM-2 开发板
- 1 x USB 2.0 A 转 Micro B 数据线
- 1 x PC，运行 Windows、Linux 或 macOS 系统

软件配置 请前往[快速入门](#)，在[详细安装步骤](#)一节查看如何快速配置开发环境，将应用程序烧录至 ESP32-PICO-DevKitM-2 开发板。

内含组件和包装方式

零售订单 如购买样品，每个 ESP32-PICO-DevKitM-2 将单独包装。

零售订单，请前往 <https://www.espressif.com/en/company/contact/buy-a-sample>。

批量订单 如批量购买，ESP32-PICO-DevKitM-2 开发板将以大纸板箱包装。

批量订单请前往 <https://www.espressif.com/zh-hans/contact-us/sales-questions>。

硬件参考

1.3.8 ESP32-DevKitM-1

本指南将介绍如何使用 ESP32-DevKitM-1, 并提供更多关于此开发板的信息。

ESP32-DevKitM-1 是乐鑫推出的一款基于 ESP32-MINI-1(1U) 模组的入门级开发板。板上模组大部分管脚均已引出至两侧排针，用户可根据实际需求，通过跳线轻松连接多种外围设备，同时也可将开发板插在面包板上使用。

本指南包括：

- **快速入门**：提供 ESP32-DevKitM-1 的简要概述及必要的硬件和软件信息。
- **硬件参考**：提供 ESP32-DevKitM-1 的详细硬件信息。
- **相关文档**：提供相关文档的链接。

快速入门

本节介绍如何开始使用 ESP32-DevKitM-1，主要包括三大部分：首先，介绍一些关于 ESP32-DevKitM-1 的基本信息，然后在 [应用程序开发](#) 章节介绍如何进行硬件初始化，最后介绍如何为 ESP32-DevKitM-1 烧录固件。

概述 ESP32-DevKitM-1 开发板是一款小巧实用的开发板，具备以下特色功能：

- 集成了 [ESP32-MINI-1](#) 或 [ESP32-MINI-1U](#) 模组
- USB 转串口编程接口同时可为开发板供电
- 设有排针
- 设有重置按钮和固件下载模式激活按钮
- 以及其他组件

内含组件和包装

零售订单 如购买样品，每个 ESP32-DevKitM-1 开发板将以防静电袋或零售商选择的其他方式包装。

零售订单请前往 <https://www.espressif.com/zh-hans/company/contact/buy-a-sample>。

批量订单 如批量购买，ESP32-DevKitM-1 开发板将以大纸板箱包装。

批量订单请前往 <https://www.espressif.com/zh-hans/contact-us/sales-questions>。

组件介绍 ESP32-DevKitM-1 开发板的主要组件、接口及控制方式见下图。下文以板载 ESP32-MINI-1 的开发板为例进行说明。

图 50: ESP32-DevKitM-1 - 正面

主要组件	基本介绍
板载模组	ESP32-MINI-1 模组或 ESP32-MINI-1U 模组。ESP32-MINI-1 带有板载 PCB 天线；ESP32-MINI-1U 带有外部天线连接器。两款模组内置的芯片均叠封 4 MB flash。更多详情，请见《ESP32-MINI-1 & ESP32-MINI-1U 技术规格书》
5 V 转 3.3 V LDO	电源转换器，输入 5 V，输出 3.3 V
Boot 键	下载按键。按下 Boot 键的同时按一下 Reset 键进入“固件下载”模式，通过串口下载固件
Reset 键	复位按键
Micro-USB 接口	USB 接口，可用作开发板的供电电源或 PC 和 ESP32 芯片的通信接口
USB 至 UART 桥接器	单芯片 USB 至 UART 桥接器，可提供高达 3 Mbps 的传输速率
3.3 V 电源指示灯	开发板连接 USB 电源后，该指示灯亮起。更多信息，请见 相关文档 中的原理图
I/O 连接器	所有可用 GPIO 管脚（除 Flash 的 SPI 总线）均已引出至开发板的排针。用户可对 ESP32 芯片编程，开发多种功能

应用程序开发 ESP32-DevKitM-1 上电前，请首先确认开发板完好无损。

硬件准备

- ESP32-DevKitM-1 开发板
- USB A / micro USB B 数据线
- PC (Windows、Linux 或 Mac OS)

软件设置 现在，请前往[快速入门](#)中的[详细安装步骤](#)章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

注意：ESP32-DevKitM-1 搭载的模组为单核 MCU 模组，烧录应用程序前，需要在 `menuconfig` 中使能单核模式 (`CONFIG_FREERTOS_UNICORE`)。

硬件参考

功能框图 ESP32-DevKitM-1 的主要组件和连接方式如下图所示。

图 51: ESP32-DevKitM-1

电源选项 开发板可从以下三种供电方式中任选其一：

- Micro USB 供电（默认）
- 5V / GND 管脚供电
- 3V3 / GND 管脚供电

警告：

- 上述供电模式 **不可同时连接**，否则可能会损坏开发板和/或电源。
- 建议选择第一种供电方式：Micro USB 端口供电。

管脚描述 开发板两侧 I/O 管脚，其具体名称和功能见下表。外设管脚分配请参考 [《ESP32 技术规格书》](#)。

编号	名称	类型	功能
1	GND	P	接地
2	3V3	P	3.3 V 电源
3	I36	I	GPIO36, ADC1_CH0, RTC_GPIO0
4	I37	I	GPIO37, ADC1_CH1, RTC_GPIO1
5	I38	I	GPIO38, ADC1_CH2, RTC_GPIO2
6	I39	I	GPIO39, ADC1_CH3, RTC_GPIO3
7	RST	I	复位；高电平：使能；低电平：关闭
8	I34	I	GPIO34, ADC1_CH6, RTC_GPIO4
9	I35	I	GPIO35, ADC1_CH7, RTC_GPIO5

1.4 详细安装步骤

请根据下方详细步骤，完成安装过程。

1.4.1 设置开发环境

- 第一步：安装准备 (*Windows*、*Linux* 和 *macOS*)
- 第二步：获取 *ESP-IDF*
- 第三步：设置工具
- 第四步：设置环境变量

1.4.2 创建您的第一个工程

- 第五步：开始创建工程
- 第六步：连接设备
- 第七步：配置
- 第八步：编译工程
- 第九步：烧录到设备
- 第十步：监视器

1.5 第一步：安装准备

在正式开始创建工程前，请先完成工具的安装，具体步骤见下：

1.5.1 Windows 平台工具链的标准设置

备注：目前，基于 CMake 的构建系统仅支持 64 位 Windows 版本。32 位 Windows 版本的用户可根据 [传统 GNU Make 构建系统](#) 中的介绍进行操作。

概述

ESP-IDF 需要安装一些必备工具，才能围绕 ESP32 构建固件，包括 Python、Git、交叉编译器、CMake 和 Ninja 编译工具等。

在本入门指南中，我们通过 **命令提示符** 进行有关操作。不过，您在安装 ESP-IDF 后还可以使用 *Eclipse* 或其他支持 CMake 的图形化工具 IDE。

备注：较早 ESP-IDF 版本使用 [传统 GNU Make 构建系统](#) 和 *MSYS2* Unix 兼容环境。但如今已非必需，用户可直接通过 Windows 命令提示符使用 ESP-IDF。

备注：限定条件：- 请注意 ESP-IDF 和 ESP-IDF 工具的安装路径不能超过 90 个字符，安装路径过长可能会导致构建失败。- Python 或 ESP-IDF 的安装路径中一定不能包含空格或括号。- 除非操作系统配置为支持 Unicode UTF-8，否则 Python 或 ESP-IDF 的安装路径中也不能包括特殊字符（非 ASCII 码字符）

系统管理员可以通过如下方式将操作系统配置为支持 Unicode UTF-8：控制面板-更改日期、时间或数字格式-管理选项卡-更改系统地域-勾选选项“Beta：使用 Unicode UTF-8 支持全球语言”-点击确定-重启电脑。

ESP-IDF 工具安装器

安装 ESP-IDF 必备工具最简易的方式是从 <https://dl.espressif.com/dl/esp-idf/?idf=4.4> 中下载 ESP-IDF 工具安装器。

在线安装与离线安装的区别 在线安装程序非常小，可以安装 ESP-IDF 的所有版本。在安装过程中，安装程序只下载必要的依赖文件，包括 [Git For Windows](#) 安装器。在线安装程序会将下载的文件存储在缓存目录 `%userprofile%/espressif` 中。

离线安装程序不需要任何网络连接。安装程序中包含了所有需要的依赖文件，包括 [Git For Windows](#) 安装器。

安装内容 安装程序会安装以下组件：

- 内置的 Python
- 交叉编译器
- OpenOCD
- CMake 和 Ninja 编译工具
- ESP-IDF

安装程序允许将程序下载到现有的 ESP-IDF 目录。推荐将 ESP-IDF 下载到 `%userprofile%\Desktop\esp-idf` 目录下，其中 `%userprofile%` 代表家目录。

启动 ESP-IDF 环境 安装结束时，如果勾选了 Run ESP-IDF PowerShell Environment 或 Run ESP-IDF Command Prompt (`cmd.exe`)，安装程序会在选定的提示符窗口启动 ESP-IDF。

Run ESP-IDF PowerShell Environment:

图 52: 完成 ESP-IDF 工具安装向导时运行 Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (`cmd.exe`):

```
ESP-IDF PowerShell

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

  idf.py build

C:\Users\test\esp\esp-idf>
```

图 55: ESP-IDF 命令提示符窗口

使用命令提示符

在后续步骤中，我们将使用 Windows 的命令提示符进行操作。

ESP-IDF 工具安装器可在“开始”菜单中，创建一个打开 ESP-IDF 命令提示符窗口的快捷方式。本快捷方式可以打开 Windows 命令提示符（即 `cmd.exe`），并运行 `export.bat` 脚本以设置各环境变量（比如 `PATH`，`IDF_PATH` 等）。此外，您还可以通过 Windows 命令提示符使用各种已经安装的工具。

注意，本快捷方式仅适用 ESP-IDF 工具安装器中指定的 ESP-IDF 路径。如果您的电脑上存在多个 ESP-IDF 路径（比如您需要不同版本的 ESP-IDF），您有以下两种解决方法：

1. 为 ESP-IDF 工具安装器创建的快捷方式创建一个副本，并将新快捷方式的 ESP-IDF 工作路径指定为您希望使用的 ESP-IDF 路径。
2. 或者，您可以运行 `cmd.exe`，并切换至您希望使用的 ESP-IDF 目录，然后运行 `export.bat`。注意，这种方法要求 `PATH` 中存在 Python 和 Git。如果您在使用时遇到有关“找不到 Python 或 Git”的错误信息，请使用第一种方法。

后续步骤

当 ESP-IDF 工具安装器安装成功后，开发环境设置也到此结束。后续开发步骤，请前往[第五步：开始建设工程](#)查看。

相关文档

想要自定义安装流程的高阶用户可参照：

在 Windows 环境下更新 ESP-IDF 工具

使用脚本安装 ESP-IDF 工具 请从 Windows “命令提示符”窗口，切换至 ESP-IDF 的安装目录。然后运行：

```
install.bat
```

对于 Powershell，请切换至 ESP-IDF 的安装目录。然后运行：

```
install.ps1
```

该命令可下载并安装 ESP-IDF 所需的工具。如您已经安装了某个版本的工具，则该命令将无效。该工具的下载安装位置由 ESP-IDF 工具安装器的设置决定，默认情况下为：`C:\Users\username\.espressif`。

使用“导出脚本”将 ESP-IDF 工具添加至 PATH 环境变量 ESP-IDF 工具安装器将在“开始菜单”为“ESP-IDF 命令提示符”创建快捷方式。点击该快捷方式可打开 Windows 命令提示符窗口，您可在该窗口使用所有已安装的工具。

有些情况下，您正在使用的命令提示符窗口并不是通过快捷方式打开的，此时如果想要在该窗口使用 ESP-IDF，您可以根据下方步骤将 ESP-IDF 工具添加至 PATH 环境变量。

首先，请打开需要使用 ESP-IDF 的命令提示符窗口，切换至安装 ESP-IDF 的目录，然后执行 `export.bat`，具体命令如下：

```
cd %userprofile%\esp\esp-idf
export.bat
```

对于 Powershell 用户，请同样切换至安装 ESP-IDF 的目录，然后执行 `export.ps1`，具体命令如下：

```
cd ~/esp/esp-idf
export.ps1
```

运行完成后，您就可以通过命令提示符使用 ESP-IDF 工具了。

1.5.2 Linux 平台工具链的标准设置

安装准备

编译 ESP-IDF 需要以下软件包。请根据使用的系统，选择合适的安装命令，如下所示：

- Ubuntu 和 Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-  
→setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.  
→0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3  
→python3-pip python3-setuptools cmake ninja-build ccache dfu-util libusbx
```

目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja  
→ccache dfu-util libusb
```

备注:

- 使用 ESP-IDF 需要 CMake 3.5 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库，或开启 backports 套件库，或安装“cmake3”软件包（不是安装“cmake”）。
 - 如果上述列表中，并没有您使用的系统，请参考您所用系统的相关文档，查看安装软件包所用的命令。
-

其他提示

权限问题 /dev/ttyUSB0 使用某些 Linux 版本向 ESP32 烧录固件时，可能会出现 Failed to open port /dev/ttyUSB0 错误消息。此时可以将用户添加至 [Linux Dialout](#) 组。

兼容的 Python 版本

ESP-IDF 支持 Python 3.6 及以上版本，建议升级操作系统到最新版本从而更新 Python。也可选择从 [sources](#) 安装最新版 Python，或使用 Python 管理系统如 [pyenv](#) 对版本进行升级管理。

后续步骤

继续设置开发环境，请前往 [第二步：获取 ESP-IDF](#) 章节。

1.5.3 macOS 平台工具链的标准设置

安装准备

ESP-IDF 将使用 macOS 上默认安装的 Python 版本。

- 安装 pip:

```
sudo easy_install pip
```

- 安装 CMake 和 Ninja 编译工具:
 - 若有 [HomeBrew](#), 您可以运行:

```
brew install cmake ninja dfu-util
```

- 若有 [MacPorts](#), 您可以运行:

```
sudo port install cmake ninja dfu-util
```

- 若以上均不适用, 请访问 [CMake](#) 和 [Ninja](#) 主页, 查询有关 macOS 平台的下载安装问题。
- 强烈建议同时安装 [ccache](#) 以获得更快的编译速度。如有 [HomeBrew](#), 可通过 [MacPorts](#) 上的 `brew install ccache` 或 `sudo port install ccache` 完成安装。

备注: 如您在上述任何步骤中遇到以下错误:

```
``xcrun: error: invalid active developer path (/Library/Developer/
↪CommandLineTools), missing xcrun at:/Library/Developer/CommandLineTools/usr/bin/
↪xcrun``
```

则必须安装 XCode 命令行工具, 具体可运行 `xcode-select --install`。

安装 Python 3 [Catalina 10.15 发布说明](#) 中表示不推荐使用 Python 2.7 版本, 在未来的 macOS 版本中也不会默认包含 Python 2.7。执行以下命令来检查您当前使用的 Python 版本:

```
python --version
```

如果输出结果是 Python 2.7.17, 则代表您的默认解析器是 Python 2.7。这时需要您运行以下命令检查电脑上是否已经安装过 Python 3:

```
python3 --version
```

如果运行上述命令出现错误, 则代表电脑上没有安装 Python 3。

请根据以下步骤安装 Python 3:

- 使用 [HomeBrew](#) 进行安装的方法如下:

```
brew install python3
```

- 使用 [MacPorts](#) 进行安装的方法如下:

```
sudo port install python38
```

后续步骤

请前往 [第二步: 获取 ESP-IDF](#) 章节继续设置开发环境。

备注：在本文档中，Linux 和 macOS 操作系统中 ESP-IDF 的默认安装路径为 `~/esp`；Windows 操作系统中的默认安装路径为 `%userprofile%\esp`。您也可以将 ESP-IDF 安装在任何其他路径下，但请注意在使用命令行时进行相应替换。注意，ESP-IDF 不支持带有空格的路径。

1.6 第二步：获取 ESP-IDF

在围绕 ESP32 构建应用程序之前，请先获取乐鑫提供的软件库文件 [ESP-IDF 仓库](#)。

获取 ESP-IDF 的本地副本：打开终端，切换到您要保存 ESP-IDF 的工作目录，使用 `git clone` 命令克隆远程仓库。针对不同操作系统的详细步骤，请见下文。

1.6.1 Linux 和 macOS 操作系统

打开终端，后运行以下命令：

```
mkdir -p ~/esp
cd ~/esp
git clone -b v4.4.7 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 `~/esp/esp-idf`。

请前往 [ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

1.6.2 Windows 操作系统

除了安装必要工具外，第一步中介绍的 [ESP-IDF 工具安装器](#) 也能同时下载 ESP-IDF 本地副本。

请前往 [ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

除了使用 ESP-IDF 工具安装器，您也可以参考 [指南](#) 手动下载 ESP-IDF。

1.7 第三步：设置工具

除了 ESP-IDF 本身，您还需要安装 ESP-IDF 使用的各种工具，比如编译器、调试器、Python 包等。

1.7.1 Windows 操作系统

请根据第一步中对 Windows (*ESP-IDF 工具安装器*) 的介绍，安装所有必需工具。

除了使用 ESP-IDF 工具安装器，您也可以通过 **命令提示符**窗口手动安装这些工具。具体步骤见下：

```
cd %userprofile%\esp\esp-idf
install.bat esp32
```

或使用 Windows PowerShell

```
cd ~/esp/esp-idf
./install.ps1 esp32
```

1.7.2 Linux 和 macOS 操作系统

```
cd ~/esp/esp-idf
./install.sh esp32
```

或使用 Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32
```

备注：通过一次性指定多个目标，可为多个目标芯片同时安装工具，如运行 `./install.sh esp32, esp32c3, esp32s3`。通过运行 `./install.sh` 或 `./install.sh all` 可一次性为所有支持的目标芯片安装工具。

1.7.3 下载工具备选方案

ESP-IDF 工具安装器会下载 Github 发布版本中附带的一些工具，如果访问 Github 较为缓慢，则可以设置一个环境变量，实现优先选择 Espressif 的下载服务器进行 Github 资源下载。

备注：该设置只影响从 Github 发布版本中下载单个工具，它并不会改变访问任何 Git 仓库的 URL。

Windows 操作系统

如果希望在运行 ESP-IDF 工具安装器时优先选择 Espressif 下载服务器，请在 **Select Components** 窗口中的 **Optimization** 部分勾选 **Use Espressif download mirror instead of GitHub** 选项。

Linux 和 macOS 操作系统

要在安装工具时优先选择 Espressif 下载服务器，请在运行 `install.sh` 时使用以下命令：

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

1.7.4 自定义工具安装路径

本步骤中介绍的脚本将 ESP-IDF 所需的编译工具默认安装在用户的根目录中，即 Linux 和 macOS 系统中的 `$HOME/.espressif` 和 Windows 系统的 `%USERPROFILE%\espressif`。此外，您可以将工具安装到其他目录中，但请在运行安装脚本前，重新设置环境变量 `IDF_TOOLS_PATH`。注意，请确保您的用户已经具备了读写该路径的权限。

如果修改了 `IDF_TOOLS_PATH` 变量，请确保该变量在每次执行安装脚本 (`install.bat`、`install.ps1` 或 `install.sh`) 和导出脚本 (`export.bat`、`export.ps1` 或 `export.sh`) 均保持一致。

1.8 第四步：设置环境变量

此时，您刚刚安装的工具尚未添加至 `PATH` 环境变量，无法通过“命令窗口”使用这些工具。因此，必须设置一些环境变量，这可以通过 ESP-IDF 提供的另一个脚本完成。

1.8.1 Windows 操作系统

Windows 安装器 (*ESP-IDF 工具安装器*) 可在“开始”菜单创建一个“ESP-IDF Command Prompt”快捷方式。该快捷方式可以打开命令提示符窗口，并设置所有环境变量。您可以点击该快捷方式，然后继续下一步。

此外，如果您希望在当下命令提示符窗口使用 ESP-IDF，请使用下方代码：

```
%userprofile%\esp\esp-idf\export.bat
```

或使用 Windows PowerShell

```
.$HOME/esp/esp-idf/export.ps1
```

1.8.2 Linux 和 macOS 操作系统

请在需要运行 ESP-IDF 的终端窗口运行以下命令：

```
.$HOME/esp/esp-idf/export.sh
```

对于 fish shell（仅支持 fish 3.0.0 及以上版本），请运行以下命令：

```
.$HOME/esp/esp-idf/export.fish
```

注意，命令开始的“.”与路径之间应有一个空格！

如果您需要经常运行 ESP-IDF，您可以为执行 `export.sh` 创建一个别名，具体步骤如下：

1. 复制并粘贴以下命令到 shell 配置文件中 (`.profile`、`.bashrc`、`.zprofile` 等)

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. 通过重启终端窗口或运行 `source [path to profile]`，如 `source ~/.bashrc` 来刷新配置文件。

现在您可以在任何终端窗口中运行 `get_idf` 来设置或刷新 `esp-idf` 环境。

这里不建议您直接将 `export.sh` 添加到 shell 的配置文件。因为这会导致在每个终端会话中都激活 IDF 虚拟环境（包括无需使用 IDF 的情况），从而破坏使用虚拟环境的目的，并可能影响其他软件的使用。

1.9 第五步：开始创建工程

现在，您可以开始准备开发 ESP32 应用程序了。您可以从 ESP-IDF 中 `examples` 目录下的 `get-started/hello_world` 工程开始。

将 `get-started/hello_world` 工程复制至您本地的 `~/esp` 目录下：

1.9.1 Linux 和 macOS 操作系统

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

1.9.2 Windows 操作系统

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

ESP-IDF 的 `examples` 目录下有一系列示例工程，都可以按照上面的方法进行创建。您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

重要： ESP-IDF 编译系统不支持带有空格的路径。

1.10 第六步：连接设备

现在，请将您的 ESP32 开发板连接到 PC，并查看开发板使用的串口。

通常，串口在不同操作系统下显示的名称有所不同：

- **Windows 操作系统：** COM1 等
- **Linux 操作系统：** 以 `/dev/tty` 开始
- **macOS 操作系统：** 以 `/dev/cu.` 开始

有关如何查看串口名称的详细信息，请见与 [ESP32 创建串口连接](#)。

备注： 请记住串口名，您会在下面的步骤中用到。

1.11 第七步：配置

请进入 [第五步：开始创建工程](#) 中提到的 `hello_world` 目录，并运行工程配置工具 `menuconfig`。

1.11.1 Linux 和 macOS 操作系统

```
cd ~/esp/hello_world
idf.py set-target esp32
idf.py menuconfig
```

1.11.2 Windows 操作系统

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32
idf.py menuconfig
```

打开一个新项目后，应首先设置“目标”芯片 `idf.py set-target esp32`。注意，此操作将清除并初始化项目之前的编译和配置（如有）。您也可以直接将“目标”配置为环境变量（此时可跳过该步骤）。更多信息，请见[选择目标芯片](#)。

如果之前的步骤都正确，则会显示下面的菜单：

```
(Top)
Espressif IoT Development Framework Configuration
SDK tool configuration --->
Build type --->
Application manager --->
Bootloader config --->
Security features --->
Serial flasher config --->
Partition Table --->
Compiler options --->
Component config --->
Compatibility options --->

[Space/Enter] Toggle/enter  [ESC] Leave menu          [S] Save
[O] Load                    [?] Symbol info          [/] Jump to symbol
[F] Toggle show-help mode  [C] Toggle show-name mode [A] Toggle show-all mode
[Q] Quit (prompts for save) [D] Save minimal config (advanced)
```

图 56: 工程配置—主窗口

您可以通过此菜单设置项目的具体变量，包括 Wi-Fi 网络名称、密码和处理器速度等。hello_world 示例项目会以默认配置运行，因此可以跳过使用 `menuconfig` 进行项目配置这一步骤。

注意： 如果您使用的是 ESP32-DevKitC（板载 ESP32-SOLO-1 模组）或 ESP32-DevKitM-1（板载 ESP32-MINI-1(1U) 模组），请在烧写示例程序前，前往 `menuconfig` 中使能单核模式（[CONFIG_FREERTOS_UNICORE](#)）。

备注： 您终端窗口中显示出的菜单颜色可能会与上图不同。您可以通过选项 `--style` 来改变外观。更多信息，请运行 `idf.py menuconfig --help` 命令。

1.12 第八步：编译工程

请使用以下命令，编译烧录工程：

```
idf.py build
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成 `bootloader`、分区表和应用程序二进制文件。

```

$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git:/usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../..../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'

```

如果一切正常，编译完成后将生成.bin 文件。

1.13 第九步：烧录到设备

请使用以下命令，将刚刚生成的二进制文件 (bootloader.bin, partition-table.bin 和 hello_world.bin) 烧录至您的 ESP32 开发板：

```
idf.py -p PORT [-b BAUD] flash
```

请将 PORT 替换为 ESP32 开发板的串口名称，具体可见[第六步：连接设备](#)。

您还可以将 BAUD 替换为您希望的烧录波特率。默认波特率为 460800。

更多有关 idf.py 参数的详情，请见[idf.py](#)。

备注：勾选 flash 选项将自动编译并烧录工程，因此无需再运行 idf.py build。

1.13.1 烧录过程中可能遇到的问题

如果在运行给定命令时出现如“连接失败”这样的错误，原因之一则可能是运行 esptool.py 出现错误。esptool.py 是构建系统调用的程序，用于重置芯片、与 ROM 引导加载器交互以及烧录固件的工具。解决该问题的一个简单的方法就是按照以下步骤进行手动复位。如果问题仍未解决，请参考[Troubleshooting](#) 获取更多信息。

esptool.py 通过使 USB 转串口转接器芯片（如 FTDI 或 CP210x）的 DTR 和 RTS 控制线生效来自动复位 ESP32（请参考[与 ESP32 创建串口连接](#) 获取更多详细信息）。DTR 和 RTS 控制线又连接到 ESP32 的 GPIO0 和 CHIP_PU (EN) 管脚上，因此 DTR 和 RTS 的电压电平变化会使 ESP32 进入固件下载模式。相关示例可查看 ESP32 DevKitC 开发板的[原理图](#)。

一般来说，使用官方的 esp-idf 开发板不会出现问题。但是，esptool.py 在以下情况下不能自动重置硬件。

- 您的硬件没有连接到 GPIO0 和 CHIP_PU 的 DTR 和 RTS 控制线。
- DTR 和 RTS 控制线的配置方式不同
- 根本没有这样的串行控制线路

根据您的硬件的种类，也可以将您 ESP32 开发板手动设置成固件下载模式（复位）。

- 对于 Espressif 的开发板，您可以参考对应开发板的入门指南或用户指南。例如，可以通过按住 **Boot** 按钮 (GPIO0) 再按住 **EN** 按钮 (CHIP_PU) 来手动复位 esp-idf 开发板。
- 对于其他类型的硬件，可以尝试将 GPIO0 拉低。

1.13.2 常规操作

在烧录过程中，您会看到类似如下的输出日志：

```
...
esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
↳after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB
↳0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin
↳0x10000 hello_world.bin
esptool.py v3.0-dev
Serial port /dev/ttyUSB0

```

如果一切顺利，烧录完成后，开发板将会复位，应用程序“hello_world”开始运行。

如果您希望使用 Eclipse 或是 VS Code IDE，而非 idf.py，请参考 [Eclipse 指南](#)，以及 [VS Code 指南](#)。

1.14 第十步：监视器

您可以使用 `idf.py -p PORT monitor` 命令，监视“hello_world”工程的运行情况。注意，不要忘记将 `PORT` 替换为您的串口名称。

运行该命令后，[IDF 监视器](#) 应用程序将启动：

```
$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

此时，您就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```
...
Hello world!
Restarting in 10 seconds...
This is esp32 chip with 2 CPU core(s), WiFi/BT/BLE, silicon revision 1, 2MB,
↪external flash
Minimum free heap size: 298968 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

您可使用快捷键 Ctrl+]，退出 IDF 监视器。

如果 IDF 监视器在烧录后很快发生错误，或打印信息全是乱码（如下），很有可能是因为您的开发板采用了 26 MHz 晶振，而 ESP-IDF 默认支持大多数开发板使用的 40 MHz 晶振。

```
e000)(Xn0y.!00(0PW+)00Hn9a~/90!0t500P0~0k00e0ea050jA
~zY00Y(10,1 00 e000)(Xn0y.!Dr0zY(0 jpi0|0+z5Ymvp
```

此时，您可以：

1. 退出监视器。
2. 打开 [menuconfig](#)。
3. 进入 Component config -> ESP32-specific -> Main XTAL frequency 进行配置，将 `CONFIG_ESP32_XTAL_FREQ_SEL` 设置为 26 MHz。
4. 然后，请重新编译和烧录应用程序。

备注：您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
idf.py -p PORT flash monitor
```

此外，

- 请前往 [IDF 监视器](#)，了解更多使用 IDF 监视器的快捷键和其他详情。
- 请前往 [idf.py](#)，查看更多 idf.py 命令和选项。

恭喜，您已完成 ESP32 的入门学习！

现在，您可以尝试一些其他 [examples](#)，或者直接开发自己的应用程序。

重要：一些示例程序不支持 ESP32，因为 ESP32 中不包含所需的硬件。

在编译示例程序前请查看 README 文件中 Supported Targets 表格。如果表格中包含 ESP32，或者不存在这个表格，那么即表示 ESP32 支持这个示例程序。

1.15 更新 ESP-IDF

乐鑫会不时推出更新版本的 ESP-IDF，修复 bug 或提供新的功能。因此，您在使用时，也应注意更新您本地的版本。最简单的方法是：直接删除您本地的 esp-idf 文件夹，然后按照[第二步：获取 ESP-IDF](#) 中的指示，重新完成克隆。

此外，您可以仅更新变更部分。具体方式，请前往[更新](#) 章节查看。

注意，更新完成后，请再次运行安装脚本，以防新版 ESP-IDF 所需的工具也有所更新。具体请参考[第三步：设置工具](#)。

一旦重新安装好工具，请使用导出脚本更新环境，具体请参考[第四步：设置环境变量](#)。

1.16 相关文档

1.16.1 与 ESP32 创建串口连接

本章节主要介绍如何创建 ESP32 和 PC 之间的串口连接。

连接 ESP32 和 PC

用 USB 线将 ESP32 开发板连接到 PC。如果设备驱动程序没有自动安装，请先确认 ESP32 开发板上的 USB 转串口芯片（或外部转串口适配器）型号，然后在网上搜索驱动程序，并进行手动安装。

以下是乐鑫 ESP32 开发板驱动程序的链接：

- CP210x: [CP210x USB 至 UART 桥 VCP 驱动程序](#)
- FTDI: [FTDI 虚拟 COM 端口驱动程序](#)

以上驱动仅供参考，请参考开发板用户指南，查看开发板具体使用的 USB 转串口芯片。一般情况下，当 ESP32 开发板与 PC 连接时，对应驱动程序应该已经被打包在操作系统中，并已经自动安装。

在 Windows 上查看端口

检查 Windows 设备管理器中的 COM 端口列表。断开 ESP32 与 PC 的连接，然后重新连接，查看哪个端口从列表中消失后又再次出现。

以下为 ESP32 DevKitC 和 ESP32 WROVER KIT 串口：

在 Linux 和 macOS 上查看端口

查看 ESP32 开发板（或外部转串口适配器）的串口设备名称，请将以下命令运行两次。首先，断开开发板或适配器，首次运行以下命令；然后，连接开发板或适配器，再次运行以下命令。其中，第二次运行命令后出现的端口即是 ESP32 对应的串口：

Linux:

```
ls /dev/tty*
```

macOS:

```
ls /dev/cu.*
```

备注：对于 macOS 用户：若你没有看到串口，请检查你是否已按照《入门指南》安装了适用于你特定开发板的 USB/串口驱动程序。对于 macOS High Sierra (10.13) 的用户，你可能还需要手动允许驱动程序的

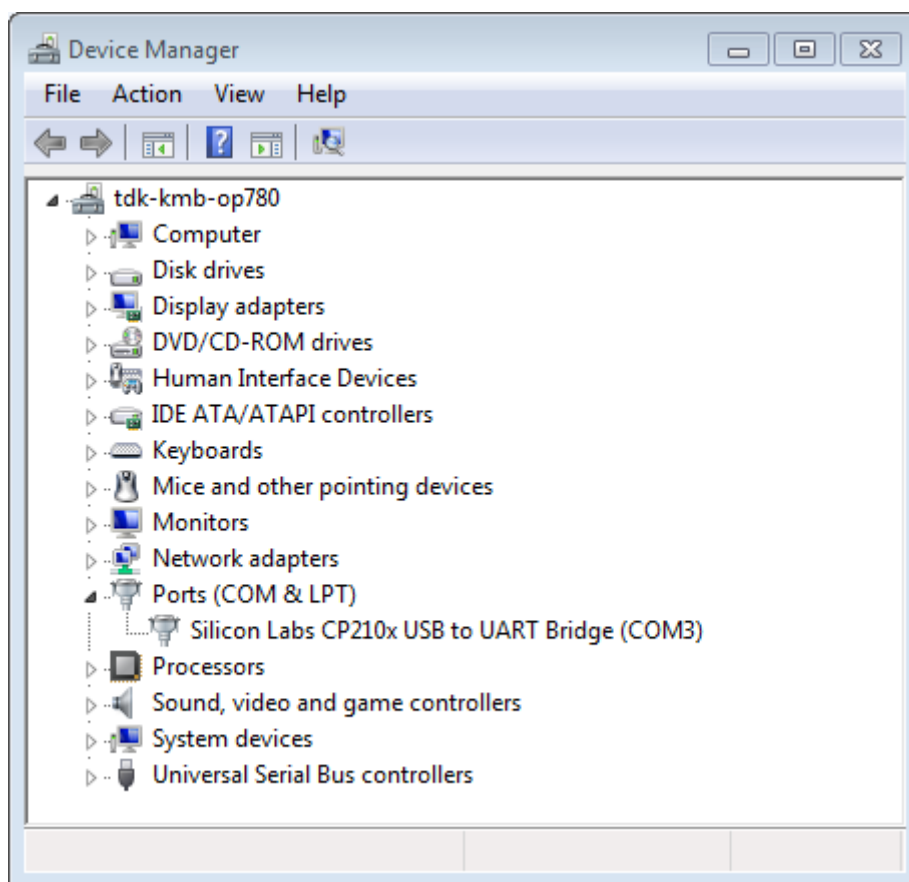

图 57: 设备管理器中 ESP32-DevKitC 的 USB 至 UART 桥

图 58: Windows 设备管理器中 ESP-WROVER-KIT 的两个 USB 串行端口

加载，具体可打开 系统偏好设置 -> 安全和隐私 -> 通用，检查是否有信息显示：“来自开发人员的系统软件…”，其中开发人员的名称为 Silicon Labs 或 FTDI。

在 Linux 中添加用户到 dialout

当前登录用户应当可以通过 USB 对串口进行读写操作。在多数 Linux 版本中，您都可以通过以下命令，将用户添加到 dialout 组，从而获许读写权限：

```
sudo usermod -a -G dialout $USER
```

在 Arch Linux 中，需要通过以下命令将用户添加到 uucp 组中：

```
sudo usermod -a -G uucp $USER
```

请重新登录，确保串口读写权限生效。

确认串口连接

现在，请使用串口终端程序，查看重置 ESP32 后终端上是否有输出，从而验证串口连接是否可用。

Windows 和 Linux 操作系统 在本示例中，我们将使用 PuTTY SSH Client，PuTTY SSH Client 既可用于 Windows 也可用于 Linux。你也可以使用其他串口程序并设置如下的通信参数。

运行终端，配置在上述步骤中确认的串口：波特率 = 115200，数据位 = 8，停止位 = 1，奇偶校验 = N。以下截屏分别展示了如何在 Windows 和 Linux 中配置串口和上述通信参数（如 115200-8-1-N）。注意，这里一定要选择在上述步骤中确认的串口进行配置。

然后，请检查 ESP32 是否有打印日志。如有，请在终端打开串口进行查看。这里的日志内容取决于加载到 ESP32 的应用程序，请参考[输出示例](#)。

备注：请在验证完串口通信正常后，关闭串口终端。如果您让终端一直保持打开的状态，之后上传固件时将无法访问串口。

macOS 操作系统 macOS 提供了 屏幕命令，因此您不用安装串口终端程序。

- 参考在 [Linux 和 macOS 上查看端口](#)，运行以下命令：

```
ls /dev/cu.*
```

- 您会看到类似如下输出：

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↳USBtoUART7
```

- 根据您的连接到电脑上的开发板类型和数量，输出结果会有所不同。请选择开发板的设备名称，并运行以下命令：

```
screen /dev/cu.device_name 115200
```

将 device_name 替换为运行 ls /dev/cu.* 后出现的设备串口号。

- 您需要的正是 屏幕显示的日志。日志内容取决于加载到 ESP32 的应用程序，请参考[输出示例](#)。请使用 Ctrl-A + \ 键退出 屏幕会话。

备注：请在验证完串口通信正常后，关闭 屏幕会话。如果直接关闭终端窗口而没有关闭 屏幕，之后上传固件时将无法访问串口。

图 59: 在 Windows 操作系统中使用 PuTTY 设置串口通信参数

图 60: 在 Linux 操作系统中使用 PuTTY 设置串口通信参数

输出示例 以下是 ESP32 的一个日志示例。如果没看到任何输出，请尝试重置开发板。

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10

...
```

如果打印出的日志是可读的（而不是乱码），则表示串口连接正常。此时，您可以继续进行安装，并最终将应用程序上载到 ESP32。

备注：在某些串口接线方式下，在 ESP32 启动并开始打印串口日志前，需要在终端程序中禁用串口 RTS & DTR 管脚。该问题仅存在于将 RTS & DTR 管脚直接连接到 EN & GPIO0 管脚上的情况，绝大多数开发板（包括乐鑫所有的开发板）都没有这个问题。更多详细信息，请参考 [esptool 文档](#)。

如您在安装 ESP32 硬件开发的软件环境时，从 [第六步：连接设备](#) 跳转到了这里，请从 [第七步：配置](#) 继续阅读。

1.16.2 Eclipse IDE 创建和烧录指南

ESP-IDF V4.0 默认采用基于 CMake 的构建系统。

针对 CMake 构建系统，ESP-IDF 有一款新的 Eclipse 插件。具体操作指南，请见 [ESP-IDF Eclipse 插件](#)。

备注：[ESP-IDF Eclipse 插件](#) 中使用的是 macOS 截图，但安装指南对 Windows、Linux 和 macOS 均适用。

如需使用针对 GNU Make 传统构建系统的 Eclipse IDE 开发环境，请前往 [快速入门（传统 GNU Make）](#)，查看 [Eclipse IDE 的创建和烧录指南（传统 GNU Make）](#)。

1.16.3 VS Code IDE 快速入门

我们支持 VS code，并且致力于为所有与 ESP-IDF 相关的操作提供完善的端到端支持，包括构建、烧录、监控、调试、追踪、core-dump、以及系统追踪查看器等操作。

快速安装指南

推荐您从 [VS Code 插件市场](#) 中下载 ESP-IDF VS Code 插件，或根据 [快速安装指南](#) 安装 ESP-IDF VS Code 插件。

查看 [ESP-IDF VS Code 插件教程 <https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/toc.md>](https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/toc.md) 了解如何使用所有功能。

支持如下功能

- **安装程序**: 帮助您迅速安装 ESP-IDF 及其相关工具链。
- **构建**: 通过一键构建和多目标构建, 轻松构建并部署您的应用程序。
- **烧录**: UART 和 JTAG 均可完成烧录。
- **监控**: 内置终端带有监控功能, 您可以在 VS Code 中启用 IDF 监控命令, 操作方法和传统终端一样。
- **调试** [<https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md>](https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md): 提供立即可用的硬件调试功能, 同时支持事后剖析调试如 core-dump 功能, 分析 bug 更加方便。
- **GUI 菜单配置**: 提供简化的用户界面, 用于配置您的芯片。
- **应用程序追踪 & 堆追踪**: 支持从应用程序中收集跟踪, 并提供简化的用户界面分析跟踪。
- **系统视图查看器**: 读取并显示 .svdat 文件到用户追踪界面, 同时支持多个内核追踪视图。
- **IDF 二进制大小分析**: 为分析二进制文件大小提供用户界面。
- **Rainmaker Cloud**: 我们有内置的 Rainmaker Cloud 支持, 您可以轻松编辑/读取连接的物联网设备的状态。
- **代码覆盖**: 我们有内置的代码覆盖支持, 将用颜色突出显示已经覆盖的行。我们也会在 IDE 内部直接渲染现有的 HTML 报告。

Bugs 问题 & 功能请求

如果您在使用 VS Code 或其某些功能上遇到问题, 建议您在 [论坛](#) 或是 [github](#) 上提出您的问题, 我们开发团队会对问题进行解答。

我们也欢迎您提出新的功能需求, 正是由于用户要求新功能或是建议对现有功能进行改善, 才成就我们今天所具备的大多数功能。欢迎您在 [github](#) 上提出功能请求。

1.16.4 IDF 监视器

IDF 监视器是一个串行终端程序, 用于收发目标设备串口的串行数据, IDF 监视器同时还兼具 IDF 的其他特性。

在 IDF 中调用以下目标函数可以启用此监视器:

- 若使用 CMake 编译系统, 则请调用: `idf.py monitor`
- 若使用传统 GNU Make 编译系统, 请调用: `make monitor`

操作快捷键

为了方便与 IDF 监视器进行交互, 请使用表中给出的快捷键。

快捷键	操作	描述
Ctrl+]]	退出监视器程序	
Ctrl+T	菜单退出键	按下如下给出的任意键之一，并按指示操作。
• Ctrl+T	将菜单字符发送至远程	
• Ctrl+]]	将 exit 字符发送至远程	
• Ctrl+P	重置目标设备，进入 Bootloader，通过 RTS 线暂停应用程序	重置目标设备，通过 RTS 线（如已连接）进入 Bootloader，此时开发板不运行任何程序。等待其他设备启动时可以使用此操作。
• Ctrl+R	通过 RTS 线重置目标设备	重置设备，并通过 RTS 线（如已连接）重新启动应用程序。
• Ctrl+F	编译并烧录此项目	暂停 idf_monitor，运行 flash 目标，然后恢复 idf_monitor。任何改动的源文件都会被重新编译，然后重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。
• Ctrl+A (或者 A)	仅编译及烧录应用程序	暂停 idf_monitor，运行 app-flash 目标，然后恢复 idf_monitor。这与 flash 类似，但只有主应用程序被编译并被重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。
• Ctrl+Y	停止/恢复在屏幕上打印日志输出	激活时，会丢弃所有传入的串行数据。允许在不退出监视器的情况下快速暂停和检查日志输出。
• Ctrl+L	停止/恢复向文件写入日志输出	在工程目录下创建一个文件，用于写入日志输出。可使用快捷键停止/恢复该功能（退出 IDF 监视器也会终止该功能）
• Ctrl+I (或者 I)	停止/恢复打印时间标记	IDF 监视器可以在每一行的开头打印一个时间标记。时间标记的格式可以通过 --timestamp-format 命令行参数来改变。
• Ctrl+H (或者 H)	显示所有快捷键	
• Ctrl+X (或者 X)	退出监视器程序	
Ctrl+C	中断正在运行的应用程序	暂停 IDF 监视器并运行 GDB 项目调试器，从而在运行时调试应用程序。这需要启:ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME 选项。

除了 Ctrl-] 和 Ctrl-T，其他快捷键信号会通过串口发送到目标设备。

兼具 IDF 特性

自动解码地址 ESP-IDF 输出形式为 0x4_____ 的十六进制代码地址后，IDF 监视器将使用 `addr2line` 查找该地址在源代码中的位置和对应的函数名。

ESP-IDF 应用程序发生 crash 和 panic 事件时，将产生如下的寄存器转储和回溯：

```
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was
↳unhandled.
Register dump:

```

IDF 监视器在后台运行以下命令, 解码各地址:

```
xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

备注: 将环境变量 ESP_MONITOR_DECODE 设置为 0 或者调用 `idf_monitor.py` 的特定命令行选项:

`idf_monitor.py --disable-address-decoding` 来禁止地址解码。

配置 GDBStub 以启用 GDB 默认情况下，如果 ESP-IDF 应用程序发生 crash 事件，panic 处理器将在串口上打印相关寄存器和堆栈转储（类似上述情况），然后重置开发板。

此外，可以配置应用程序在后台运行 GDBStub 并处理运行中的应用程序突然中断事件 (Ctrl+C)。

或者选择配置 panic 处理器以运行 GDBStub，GDBStub 工具可以与 GDB 项目调试器进行通信，允许读取内存、检查调用堆栈帧和变量等。GDBStub 虽然没有 JTAG 通用，但不需要使用特殊硬件。

如需在发生 panic 事件时启用 GDBStub，请运行 `idf.py menuconfig` 打开项目配置菜单，并将 `CONFIG_ESP_SYSTEM_PANIC` 选项设置为 GDBStub on panic，或者将 `CONFIG_ESP_SYSTEM_PANIC` 设置为 GDBStub on runtime。

在这种情况下，如果 panic 处理器被触发或应用程序突然中断 (Ctrl+C)，只要 IDF 监视器监控到 GDBStub 已经加载，panic 处理器就会自动暂停串行监控并使用必要的参数运行 GDB。GDB 退出后，通过 RTS 串口线复位开发板。如果未连接 RTS 串口线，请按复位键，手动复位开发板。

IDF 监视器在后台运行如下命令：

```
xtensa-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex.
↳ interrupt build/PROJECT.elf :idf_target: `Hello NAME chip`
```

输出筛选 可以调用 `idf.py monitor --print-filter="xyz"` 启动 IDF 监视器，其中，`--print-filter` 是输出筛选的参数。参数默认值为空字符串，可打印任何内容。

若需对打印内容设置限制，可指定 `<tag>:<log_level>` 等选项，其中 `<tag>` 是标签字符串，`<log_level>` 是 {N, E, W, I, D, V, *} 集合中的一个字母，指的是日志级别。

例如，`PRINT_FILTER="tag1:W"` 只匹配并打印 `ESP_LOGW("tag1", ...)` 所写的输出，或者写在较低日志详细度级别的输出，即 `ESP_LOGE("tag1", ...)`。请勿指定 `<log_level>` 或使用详细级别默认值 `*`。

备注：编译时，可以使用主日志在日志库中禁用不需要的输出。也可以使用 IDF 监视器筛选输出来调整筛选设置，且无需重新编译应用程序。

应用程序标签不能包含空格、星号 `*`、冒号 `:`，以便兼容输出筛选功能。

如果应用程序输出的最后一行后面没有回车，可能会影响输出筛选功能，即，监视器开始打印该行，但后来发现该行不应该被写入。这是一个已知问题，可以通过添加回车来避免此问题（特别是在没有输出紧跟其后的情况下）。

筛选规则示例

- `*` 可用于匹配任何类型标签。但 `PRINT_FILTER="*:I tag1:E"` 打印关于 tag1 的输出时会报错，这是因为 tag1 规则比 `*` 规则的优先级高。
- 默认规则（空）等价于 `*:V`，因为在详细级别或更低级别匹配任意标签即意味匹配所有内容。
- `*:N` 不仅抑制了日志功能的输出，也抑制了 `printf` 的打印输出。为了避免这一问题，请使用 `*:E` 或更高的冗余级别。
- 规则 `"tag1:V"`、`"tag1:v"`、`"tag1:"`、`"tag1:*"` 和 `"tag1"` 等同。
- 规则 `"tag1:W tag1:E"` 等同于 `"tag1:E"`，这是因为后续出现的具有相同名称的标签会覆盖掉前一个标签。
- 规则 `"tag1:I tag2:W"` 仅在 Info 详细度级别或更低级别打印 tag1，在 Warning 详细度级别或更低级别打印 tag2。
- 规则 `"tag1:I tag2:W tag3:N"` 在本质上等同于上一规则，这是因为 tag3:N 指定 tag3 不打印。

- tag3:N 在规则 "tag1:I tag2:W tag3:N *:V" 中更有意义，这是因为如果没有 tag3:N，tag3 信息就可能打印出来了；tag1 和 tag2 错误信息会打印在指定的详细度级别（或更低级别），并默认打印所有内容。

高级筛选规则示例 如下日志是在没有设置任何筛选选项的情况下获得的：

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte

E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

PRINT_FILTER="wifi esp_image:E light_driver:I" 筛选选项捕获的输出如下所示：

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V" 选项的输出如下：

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

IDF 监视器已知问题

Windows 环境下已知问题

- 由于 Windows 控制台限制，有些箭头键及其他一些特殊键无法在 GDB 中使用。
- 偶然情况下，idf.py 或 make 退出时，可能会在 IDF 监视器恢复之前暂停 30 秒。
- GDB 运行时，可能会暂停一段时间，然后才开始与 GDBStub 进行通信。

1.16.5 工具链的自定义设置

除了从乐鑫官网（请见[第三步：设置工具](#)）下载二进制工具链外，您还可以自行编译工具链。

如无特殊需求，建议直接使用我们提供的预编译二进制工具链。不过，您可以在以下情况考虑自行编译工具链：

- 需要定制工具链编译配置
- 需要使用其他 GCC 版本（如 4.8.5）
- 需要破解 gcc、newlib 或 libstdc++
- 有相关兴趣或时间充裕
- 不信任从网站下载的 bin 文件

如需自行编译工具链，请查看以下文档：

从零开始设置 Windows 环境下的工具链

除了使用 [ESP-IDF 工具安装器](#)，用户也可以手动设置 Windows 环境下的工具链，这正是本文的主要内容。手动安装工具可以更好地控制安装流程，同时也方便高阶用户进行自定义安装。

使用 ESP-IDF 工具安装器对工具链及其他工具进行快速标准设置，请参照 [Windows 平台工具链的标准设置](#)。

备注：基于 GNU Make 的构建系统要求 Windows 兼容 MSYS2 Unix，基于 CMake 的构建系统则无此要求。

获取 ESP-IDF

备注：较早版本 ESP-IDF 使用了 MSYS2 bash 终端命令行。目前，基于 CMake 的编译系统可使用常见的 Windows 命令窗口，即本指南中使用的终端。

请注意，如果您使用基于 bash 的终端或 PowerShell 终端，一些命令语法将与下面描述有所不同。

打开命令提示符，运行以下命令：

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone -b v4.4.7 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 %userprofile%\esp\esp-idf。

请前往 [ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

备注：git clone 命令的 -b v4.4.7 选项告诉 git 从 ESP-IDF 仓库中克隆与此版本的文档对应的分支。

备注：作为备份，还可以从 [Releases page](#) 下载此稳定版本的 zip 文件。不要下载由 GitHub 自动生成的“源代码”的 zip 文件，它们不适用于 ESP-IDF。

备注：在克隆远程仓库时，请加上可选参数 --recursive。如果你已经克隆了 ESP-IDF 但没有加上此参数，请运行以下命令获取所有子模块

```
cd esp-idf
git submodule update --init
```

工具

CMake 工具 下载最新发布的 Windows 平台稳定版 CMake，并运行安装器。

当安装器询问“安装选项”时，选择“Add CMake to the system PATH for all users”（为所有用户的系统路径添加 CMake）或“Add CMake to the system PATH for the current user”（为当前用户的系统路径添加 CMake）。

Ninja 编译工具

备注：目前，Ninja 仅提供支持 64 位 Windows 版本的 bin 文件。您也可以配合其他编译工具（如 mingw-make）在 32 位 Windows 版本中使用 CMake 和 idf.py。但是目前暂无关于此工具的说明文档。

请从 [下载页面](#) 下载最新发布的 Windows 平台稳定版 [Ninja](#)。

适用于 Windows 平台的 Ninja 下载文件是一个 .zip 文件，包含一个 `ninja.exe` 文件。您需要将该文件解压到目录，并添加到 [Path 环境变量](#)（或者选择解压到 Path 变量中已有的目录）。

Python 下载并运行适用于 Windows 安装器的最新版 [Python](#)。

Python 安装器的“自定义”菜单可为您提供一系列选项，最后一项为“Add python.exe to Path”（添加 python.exe 到 Path 环境变量中），请将该项更改为“Will be installed”（将会安装）。

Python 安装完成后，从 Windows 开始菜单中打开“命令提示符”窗口，并运行以下命令：

```
pip install --user pyserial
```

工具链设置 下载预编译的 Windows 工具链：

https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-patch5-win32.zip

将压缩包文件解压到 `C:\Program Files\``（或其他位置）。压缩包文件包含一个 `\`xtensa-esp32-elf` 目录。

然后，请将该目录下的 `bin` 子目录添加到 [Path 环境变量](#)。例如，将目录 `C:\Program Files\xtensa-esp32-elf\bin` 添加到 Path 环境变量。

备注：如果您已安装 MSYS2 环境（适用“GNU Make”编译系统），则可以跳过下载那一步，直接添加目录 `C:\msys32\opt\xtensa-esp32-elf\bin` 到 Path 环境变量，因为 MSYS2 环境已包含工具链。

添加目录到 Path 环境变量 在 Windows 环境下，向 Path 环境变量增加任何新目录，请：

打开系统“控制面板”，找到环境变量对话框（Windows 10 用户请前往“高级系统设置”）。

双击 Path 变量（选择“用户路径”或“系统路径”，具体取决于您是否希望其他用户的 Path 中也存在该目录）。最后在值的末尾增加 `;<new value>`。

后续步骤 请前往 [第三步：设置工具](#) 章节继续设置开发环境。

从零开始设置 Linux 环境下的工具链

除了从乐鑫官网直接下载已编译好的二进制工具链外，您还可以按照本文介绍，从头开始设置自己的工具链。如需快速使用已编译好的二进制工具链，可回到 [Linux 平台工具链的标准设置](#) 章节。

备注：设置自己的工具链可以解决 Y2K38 问题（`time_t` 从 32 位扩展到 64 位）。

安装准备 编译 ESP-IDF 需要以下软件包：

- CentOS 7:

```
sudo yum -y update && sudo yum install git wget ncurses-devel flex bison gperf_
↳python3 python3-pip cmake ninja-build ccache dfu-util libusbx
```

目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。

- Ubuntu 和 Debian:

```
sudo apt-get install git wget libncurses-dev flex bison gperf python3 python3-
↳pip python3-setuptools python3-serial python3-cryptography python3-future
↳python3-pyparsing python3-pyelftools cmake ninja-build ccache libffi-dev
↳libssl-dev dfu-util libusb-1.0-0
```

- Arch:

```
sudo pacman -Sy --needed gcc git make ncurses flex bison gperf python-pyserial
↳python-cryptography python-future python-pyparsing python-pyelftools cmake
↳ninja ccache dfu-util libusb
```

备注: 使用 ESP-IDF 需要 CMake 3.5 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库，或开启 backports 套件库，或安装 “cmake3” 软件包（不是安装 “cmake”）。

从源代码编译工具链 安装依赖项:

- CentOS 7:

```
sudo yum install gawk gperf grep gettext ncurses-devel python3 python3-devel
↳automake bison flex texinfo help2man libtool make
```

- Ubuntu pre-16.04:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev
↳automake bison flex texinfo help2man libtool make
```

- Ubuntu 16.04 或以上

```
sudo apt-get install gawk gperf grep gettext python python-dev automake bison
↳flex texinfo help2man libtool libtool-bin make
```

- Debian 9:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev
↳automake bison flex texinfo help2man libtool libtool-bin make
```

- Arch:

```
sudo pacman -Sy --needed python-pip
```

创建工作目录，并进入该目录:

```
mkdir -p ~/esp
cd ~/esp
```

下载并编译 crosstool-NG:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2-patch5
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

备注: 在设置支持 64 位 `time_t` 的工具链时，您需要将 `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` 文件中第 33 和 43 行的可选参数 `--enable-newlib-long-time_t` 删除。

编译工具链:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

编译得到的工具链会被保存至 `~/esp/crosstool-NG/builds/xtensa-esp32-elf`。

添加工具链到 PATH 环境变量 需要将自定义工具链复制到一个二进制目录中，并将其添加到 PATH 中。例如，您可以将编译好的工具链复制到 `~/esp/xtensa-esp32-elf/` 目录中。

为了正常使用工具链，您需要更新 `~/.profile` 文件中 PATH 环境变量。此外，您还可以在 `~/.profile` 文件中增加以下代码。这样，所有终端窗口均可以使用 `xtensa-esp32-elf`：

```
export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

备注：如果您已将 `/bin/bash` 设置为登录 shell，且同时存在 `.bash_profile` 和 `.profile` 两个文件，则请更新 `.bash_profile`。在 CentOS 环境下，`alias` 需要添加到 `.bashrc` 文件中。

退出并重新登录以使 `.profile` 的更改生效。运行以下命令来检查 PATH 设置是否正确：

```
printenv PATH
```

此时您需要检查输出结果的开头中是否包含类似如下的工具链路径：

```
$ printenv PATH
/home/user-name/esp/xtensa-esp32-elf/bin:/home/user-name/bin:/home/user-name/.
↪local/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/
↪games:/usr/local/games:/snap/bin
```

注意这里的 `/home/user-name` 应该替换成您安装的主路径。

后续步骤 请前往 [第二步：获取 ESP-IDF](#) 章节继续设置开发环境。

从零开始设置 macOS 环境下的工具链

软件包管理器 从零开始设置工具链，您需要安装 [MacPorts](#) 或 [Homebrew](#) 软件包管理器。或者，您也可以直接下载 [预编译的工具链](#)。

MacPorts 需要完整的 XCode 软件，而 Homebrew 只需要安装 XCode 命令行工具即可。

请参考 [工具链自定义设置](#) 章节，查看可能需从头开始设置工具链的情况。

安装准备

- 安装 pip:

```
sudo easy_install pip
```

- 安装 pyserial:

```
pip install --user pyserial
```

- 安装 CMake 和 Ninja 编译工具：
 - 若有 Homebrew，您可以运行：

```
brew install cmake ninja dfu-util
```

- 若有 MacPorts, 您可以运行:

```
sudo port install cmake ninja dfu-util
```

从源代码编译工具链 安装依赖项:

- 对于 MacPorts:

```
sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf_
↳automake make
```

- 对于 Homebrew:

```
brew install gnu-sed gawk binutils gperftools gettext wget help2man libtool_
↳autoconf automake make
```

创建一个文件系统镜像 (区分大小写) :

```
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive_
↳HFS+"
```

挂载:

```
hdiutil mount ~/esp/crosstool.dmg
```

创建指向您工作目录的符号链接:

```
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

前往新创建的目录:

```
cd ~/esp/ctng-volume
```

下载并编译 crosstool-NG:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2-patch5
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

编译工具链:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

编译得到的工具链会被保存到 ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf。使用工具链前, 请将 ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf/bin 添加至 PATH 环境变量。

后续步骤 请前往 [第二步: 获取 ESP-IDF](#) 章节继续设置开发环境。

1.16.6 快速入门 (传统 GNU Make)

备注：ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

本文档旨在指导用户搭建 ESP32 硬件开发的软件环境，通过一个简单的示例展示如何使用 ESP-IDF (Espressif IoT Development Framework) 配置菜单，并编译、下载固件至 ESP32 开发板等步骤。

备注：这是 ESP-IDF 稳定版本 v4.4.7 的文档，还有其他版本的文档[ESP-IDF 版本简介](#) 供参考。

概述

ESP32 SoC 芯片支持以下功能：

- 2.4 GHz Wi-Fi
- 蓝牙
- 高性能双核
- 超低功耗协处理器
- 多种外设

ESP32 采用 40 nm 工艺制成，具有最佳的功耗性能、射频性能、稳定性、通用性和可靠性，适用于各种应用场景和不同功耗需求。

乐鑫为用户提供完整的软、硬件资源，进行 ESP32 硬件设备的开发。其中，乐鑫的软件开发环境 ESP-IDF 旨在协助用户快速开发物联网 (IoT) 应用，可满足用户对 Wi-Fi、蓝牙、低功耗等方面的要求。

准备工作

硬件：

- 一款 **ESP32** 开发板
- **USB 数据线** (A 转 Micro-B)
- PC (Windows、Linux 或 macOS)

软件：

- 设置 **工具链**，用于编译 ESP32 **应用程序**；
- 获取 **ESP-IDF** 软件开发框架。该框架已经基本包含 ESP32 使用的 API (软件库和源代码) 和运行 **工具链** 的脚本；
- 安装 C 语言编程 (工程) 的 **文本编辑器**，例如 [Eclipse](#)。

开发板简介

请点击下方连接，了解有关具体开发板的详细信息。

详细安装步骤

请根据下方详细步骤，完成安装过程。

设置开发环境

- [Windows](#)、[Linux](#) 和 [macOS](#) 的第一步：设置工具链
- 第二步：获取 [ESP-IDF](#)
- 第三步：设置环境变量
- 第四步：安装 [Python](#) 软件包

创建您的第一个工程

- 第五步：开始创建工程
- 第六步：连接设备
- 第七步：配置
- 第八步：编译和烧录
- 第九步：监视器

第一步：设置工具链

工具链指一套用于编译代码和应用程序的程序。

为了加快开发进度，您可以直接使用乐鑫提供的预制工具链。请根据您的操作系统点击对应的链接，并按照链接中的指导进行安装。

Windows 平台工具链的标准设置（传统 GNU Make）

备注：ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

概述 Windows 系统没有内置的“make”环境，所以除了安装工具链之外，您还需要一个兼容 GNU 的环境。这里，我们使用 MSYS2 环境兼容 GNU。您无需一直使用这个环境，比如您可以使用 *Eclipse* 或其他前端，仅需在后台运行 MSYS2 即可。

工具链设置 最简便的工具链设置方法是从下方地址下载 Windows 多合一工具链和 MSYS2 压缩包文件：

https://dl.espressif.com/dl/esp32_win32_msys2_environment_and_esp2020r2_toolchain-20200601.zip

请将压缩包文件解压至 C:\` (或其他目录，但本文档中以 `C:\ 为例)，该文件将为您创建一个带有预配置环境的 msys32 目录。

开始尝试 请运行 C:\msys32\mingw32.exe 文件，打开一个 MSYS2 MINGW32 终端窗口。该窗口的环境为 bash shell。请创建一个名为 esp 的文件夹，作为 ESP32 应用程序开发的默认目录。您可以使用以下命令创建文件夹：

```
mkdir -p ~/esp
```

您还可以通过 `cd ~/esp` 命令，进入刚刚创建的文件夹。如无其他问题，本步骤到此结束。

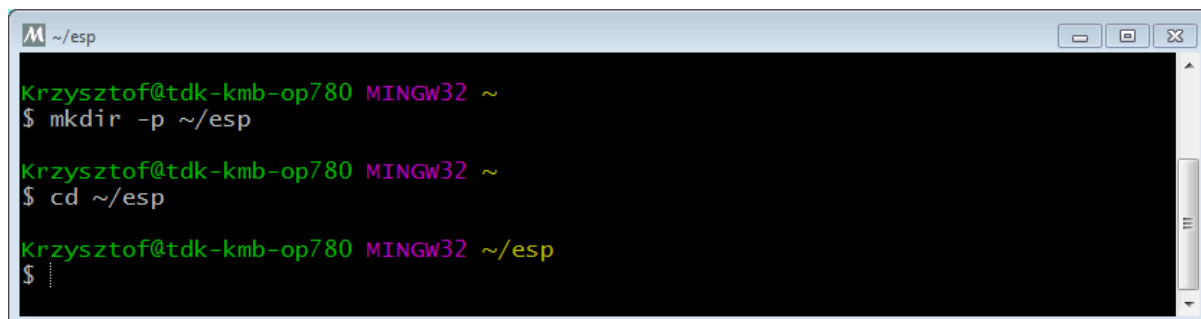

图 61: MSYS2 MINGW32 shell 窗口

请在后续步骤中，使用本窗口配置 ESP32 的开发环境。

后续步骤 继续设置开发环境，请前往 [第二步：获取 ESP-IDF](#) 章节。

更新环境 当 IDF 有更新时，有时需要安装新的工具链或为 Windows MSYS2 环境添加新的要求。如需将旧版本预编译环境中的数据迁移至新版本，您可以：

1. 复制旧的 MSYS2 环境（即 C:\msys32），并将其移动/重命名到不同目录下（即 C:\msys32_old）。
2. 使用上述步骤，下载新的预编译环境。
3. 将新的 MSYS2 环境解压缩至 C:\msys32（或您指定的其他位置）。
4. 找到旧的 C:\msys32_old\home 文件夹，并将其移动至 C:\msys32。
5. 此时，如无其他需要，您可以删除旧的 C:\msys32_old\home 文件夹。

注意，您可以在电脑中安装多个不同的 MSYS2 环境，仅需将它们保存在不同的路径下即可。

此外，您还可以直接更新现有环境（无需下载新的版本），但步骤更加复杂。

相关文档

从零开始设置 Windows 环境下的工具链（传统 GNU Make）

备注：ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

手动安装所有工具能更好地控制整个安装流程，同时也方便高阶用户进行自定义安装。此外，经验不足的用户还可以参考[预编译环境](#)中的步骤进行准备。

使用预编译环境对工具链进行快速标准设置，请参照[Windows 平台工具链的标准设置（传统 GNU Make）](#)。

从零开始配置工具链和环境 本流程包括：首先，安装 MSYS2；其次，安装 ESP-IDF 所需的 Python 工具包；最后，下载并安装 Xtensa 工具链。

- 请前往 [MSYS2 安装器](#) 页面，并下载 `msys2-i686-xxxxxxx.exe` 安装器（我们仅支持 32-bit MSYS 环境，32 位和 64 位 Window 均可使用）。截止至本文最新更新之时，最新版安装器为 `msys2-i686-20161025.exe`。
- 完成所有安装步骤。**最后一步时，请不要勾选“Run MSYS2 32-bit now”。**
- 安装完成后，请从“开始”菜单中找到“MSYS2 MinGW 32-bit”，运行“命令提示符”窗口。
 - 为什么要特别打开这个终端窗口？MSYS2 会对不同环境进行区分。默认的“MSYS”环境与 Cygwin 相仿，会为 Windows 系统的 API 调用增加一个转换层。但为了使用支持 COM 端口的原生 Python，我们需要准备好“MinGW”环境。
- GitHub 上的 ESP-IDF 仓库的 `tools` 目录下可以找到名为 `windows_install_prerequisites.sh` 的脚本。如果您还没有本地 ESP-IDF 副本，也可以从以下地址进行下载（请下载 raw 格式）：[tools/windows/windows_install_prerequisites.sh](#)，并将其保存至您的电脑。
- 请在 MSYS2 终端窗口中指定该脚本的保存路径。注意，路径格式与 Window 路径相同，但需使用正斜杠 (/) 而不是反斜杠 (\)。例 `C:/Users/myuser/Downloads/windows_install_prerequisites.sh`。当然，您也可以直接打开查看该脚本的内容。
- `windows_install_prerequisites.sh` 脚本将帮您下载并安装支持 ESP-IDF 的软件包和 ESP32 工具链。

疑难解答

- MSYS 可能在脚本运行过程中进行自动升级，导致无法使用。此时，您会看到以下错误信息：

```
*** fatal error - cygheap base mismatch detected - 0x612E5408/0x612E4408
```

这个问题很大可能是由于 cygwin DLL 版本不兼容。

这种情况下，请完全关闭终端窗口（相当于终止所有进程），并重新打开一个窗口。然后，请在新窗口中重新运行 `windows_install_prerequisites.sh`（小技巧：您可以使用“向上箭头”找到之前运行的命令）。此时，更新流程将重启。

- 注意，MSYS2 是一个“滚动”发行版，因此安装脚本可能会为您安装比“预编译环境”中更新的软件包。因此，如果遇到与 MSYS2 安装包有关的错误，请前往 [MSYS2-packages 问题列表](#) 页面寻找答案。如果未找到所需答案，请 [提交一个 IDF Issue](#)。

中国地区的 MSYS2 镜像 中国地区有一些（非官方）的 MSYS2 镜像，这可以大幅提高中国地区的下载速度。

如需添加这些镜像，请在运行安装脚本前修改以下两个 MSYS2 镜像列表文件。镜像文件的保存路径为 `/etc/pacman.d`，比如 `c:\msys2\etc\pacman.d`。

请在 `mirrorlist.mingw32` 最上方增加如下语句：

```
Server = https://mirrors.ustc.edu.cn/msys2/mingw/i686/  
Server = http://mirror.bit.edu.cn/msys2/REPOS/MINGW/i686
```

请在 `mirrorlist.msys` 最上方增加如下语句：

```
Server = http://mirrors.ustc.edu.cn/msys2/msys/$arch  
Server = http://mirror.bit.edu.cn/msys2/REPOS/MSYS2/$arch
```

HTTP 代理 您可以在运行“设置脚本”之前，在终端中设置 `http_proxy` 变量，从而允许使用 HTTP 代理下载 MSYS 和 PIP：

```
export http_proxy='http://http.proxy.server:PORT'
```

或者修改证书：

```
export http_proxy='http://user:password@http.proxy.server:PORT'
```

如需始终用代理使用 MSYS，请在 MSYS 目录中增加 `/etc/profile`。

其他设置：下载工具链 如果您已经安装了 MSYS2，或者想要以不同的方式执行操作，您可以在此处下载工具链：

https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-patch5-win32.zip

备注：如果您已完成了从**从零开始配置工具链和环境**中介绍的所有步骤，则已经拥有了工具链，这里无需重复下载。

重要：仅拥有工具链尚无法让您在 Windows 中使用 ESP-IDF。除此之外，您还至少需要安装 GNU make、bash 和 sed。上述环境已经包括这些配置，此外还有一个主机编译器（这样才能使用 menuconfig）。

后续步骤 继续设置开发环境，请前往**第二步：获取 ESP-IDF** 章节。

更新环境 当 IDF 有更新时，有时需要安装新的工具链或为 Windows MSYS2 环境添加新的系统要求。

此时，您无需重新配置环境，仅需更新现有 Windows 环境和工具链即可。

- 将 IDF 更新至您希望的版本。
- 请运行 IDF 仓库中的 `tools/windows/windows_install_prerequisites.sh` 脚本。该脚本将帮您安装所有新的软件包，并下载更新工具链至最新版本。

注意，该脚本在更新 MSYS2 时也会遇到**疑难解答**中介绍的问题。

如需要同时支持多个 IDF 版本，您可以在不同的目录下配置独立的 MSYS2 环境。或者，您还可以下载多个工具链，并将其解压缩到不同的目录下，然后使用 PATH 环境变量指定默认工具链。

Linux 平台工具链的标准设置 (传统 GNU Make)

备注: ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意, 未来, 我们可能不会继续支持基于 GNU Make 的构建系统。

安装准备 编译 ESP-IDF 需要以下软件包:

- CentOS 7:

```
sudo yum install gcc git wget make flex bison gperf python python2-cryptography
```

- Ubuntu and Debian:

```
sudo apt-get install gcc git wget make flex bison gperf python python-pip
↳python-setuptools python-serial python-cryptography python-future python-
↳pyparsing python-pyelftools libffi-dev libssl-dev
```

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python-pyserial python-
↳cryptography python-future python-pyparsing python-pyelftools
```

备注: 一些旧的 (2014 年之前) Linux 发行版中使用的 pyserial 版本可能是 2.x, ESP-IDF 并不支持。这种情况下, 请按照 [第四步: 安装 Python 软件包](#) 章节的介绍, 使用 pip 安装软件包。

工具链设置 Linux 版的 ESP32 工具链可以从 Espressif 的网站下载:

- 64 位 Linux:
https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-patch5-linux-amd64.tar.gz
- 32 位 Linux:
https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-patch5-linux-i686.tar.gz

1. 下载压缩文件之后, 解压到 ~/esp 目录中:

- 64 位 Linux:

```
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-patch5-linux-
↳amd64.tar.gz
```

- 32 位 Linux:

```
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-patch5-linux-
↳i686.tar.gz
```

2. 工具链将被解压到 ~/esp/xtensa-esp32-elf/ 路径下。
为了正常使用工具链, 您必须更新 ~/.profile 文件中的 PATH 环境变量。此外, 您还可以在 ~/.profile 文件中增加以下代码, 这样一来, 所有终端窗口均可以使用 xtensa-esp32-elf:

```
export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

或者, 您可以为上述命令创建一个别名。这样, 您只有在需要时才可以使用工具链。如需设置别名, 请将以下代码增加至您的 `~/.profile` 文件中:

```
alias get_esp32='export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"'
```

这样，您可以在终端输入 `get_esp32` 命令将工具链添加至您的 `PATH`，从而使用工具链。

备注：如果您已将 `/bin/bash` 设置为登录 shell，且同时存在 `.bash_profile` 和 `.profile`，则请更新 `.bash_profile`。在 **CentOS** 环境下，`alias` 需要添加到 `.bashrc` 文件中。

- 退出并重新登录以使 `.profile` 更改生效。运行以下命令来检查 `PATH` 设置是否正确

```
printenv PATH
```

检查字符串的开头是否包含类似的工具链路径：

```
$ printenv PATH
/home/user-name/esp/xtensa-esp32-elf/bin:/home/user-name/bin:/home/user-name/.
↪local/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/
↪games:/usr/local/games:/snap/bin
```

这里，您需要将 `/home/user-name` 替换为您的安装主目录。

权限问题 /dev/ttyUSB0 某些 Linux 版本可能在烧写 ESP32 时会出现 `Failed to open port /dev/ttyUSB0` 错误消息，这可以通过将当前用户添加到 `dialout` 组来解决。

后续步骤 继续设置开发环境，请前往 [第二步：获取 ESP-IDF](#) 章节。

相关文档

从零开始设置 Linux 环境下的工具链（传统 GNU Make）

备注：ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

备注：安装工具链的标准方法请见 [这里](#)。请参考 [工具链自定义设置](#) 章节，查看可能需从头开始设置工具链的情况。

安装准备 编译 ESP-IDF 需要以下软件包：

- Ubuntu and Debian:

```
sudo apt-get install gcc git wget make libncurses-dev flex bison gperf python_
↪python-pip python-setuptools python-serial python-cryptography python-future_
↪python-pyparsing python-pyelftools libffi-dev libssl-dev
```

- Arch:

```
sudo pacman -S --needed gcc git make ncurses flex bison gperf python-pyserial_
↪python-cryptography python-future python-pyparsing python-pyelftools
```

备注：一些旧的（2014 年之前）Linux 发行版中使用的 `pyserial` 版本可能是 2.x，ESP-IDF 并不支持。这种情况下，请按照 [第四步：安装 Python 软件包](#) 章节的介绍，使用 `pip` 安装软件包。

从源代码编译工具链

- 安装依赖项：
 - CentOS 7:

```
sudo yum install gawk gperf grep gettext ncurses-devel python python-devel_
↳ automake bison flex texinfo help2man libtool
```

– Ubuntu pre-16.04:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
↳ dev automake bison flex texinfo help2man libtool
```

– Ubuntu 16.04 或以上

```
sudo apt-get install gawk gperf grep gettext python python-dev automake_
↳ bison flex texinfo help2man libtool libtool-bin
```

– Debian 9:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
↳ dev automake bison flex texinfo help2man libtool libtool-bin
```

– Arch:

```
TODO
```

- 创建工作目录，并进入该目录:

```
mkdir -p ~/esp
cd ~/esp
```

- 下载并编译 crosstool-NG :

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2-patch5
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

- 编译工具链:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

编译得到的工具链会被保存到 `~/esp/crosstool-NG/builds/xtensa-esp32-elf`。请按照 [标准设置指南](#) 的介绍，将工具链添加到 `PATH`。

后续步骤 继续设置开发环境，请前往 [第二步：获取 ESP-IDF](#) 章节。

Mac OS 平台工具链的标准设置 (传统 GNU Make)

备注：ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

安装准备

- 安装 pip:

```
sudo easy_install pip
```

备注：pip 稍后将用于安装所需 *Python* 包。

工具链设置 Mac OS 版本的 ESP32 工具链可以从以下地址下载：

https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-patch5-macos.tar.gz

下载压缩文件之后，解压到 ~/esp 目录中：

```
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-patch5-macos.tar.gz
```

工具链将被解压到 ~/esp/xtensa-esp32-elf/ 路径下。

为了正常使用工具链，您必须更新 ~/.profile 文件中的 PATH 环境变量。此外，您还可以在 ~/.profile 文件中增加以下代码，这样一来，所有终端窗口均可以使用 xtensa-esp32-elf：

```
export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH
```

或者，您可以为上述命令创建一个别名。这样，您只有在需要时才可以使用工具链。如需设置别名，请将以下代码增加至您的 `~/.profile` 文件中：

```
alias get_esp32="export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

这样，您可以在终端输入 get_esp32 命令将工具链添加至您的 PATH，从而使用工具链。

后续步骤 继续设置开发环境，请前往 [第二步：获取 ESP-IDF 章节](#)。

相关文档

从零开始设置 Mac OS 环境下的工具链（传统 GNU Make）

备注：ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

备注：安装工具链的标准方法请见 [这里](#)。请参考 [工具链自定义设置](#) 章节，查看可能需从头开始设置工具链的情况。

安装准备

- 安装 pip:

```
sudo easy_install pip
```

备注：pip 稍后将用于安装必要的 [Python](#) 软件包。

从源代码编译工具链

- 安装依赖项：
 - 安装 [MacPorts](#) 或 [homebrew](#) 安装包管理器。MacPorts 需要完整的 XCode 软件，而 homebrew 只需要安装 XCode 命令行工具即可。
 - 对于 MacPorts:

```
sudo port install gsed gawk binutils gperf grep gettext wget
↪ libtool autoconf automake
```

- 对于 homebrew:

```
brew install gnu-sed gawk binutils gperf tools gettext wget ↵
↵ help2man libtool autoconf automake
```

- 创建一个文件系统镜像 (区分大小写) :

```
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-
↵ sensitive HFS+"
```

- 挂载:

```
hdiutil mount ~/esp/crosstool.dmg
```

- 创建指向您工作目录的符号链接:

```
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

- 前往新创建的目录

```
cd ~/esp/ctng-volume
```

- 下载并编译 crosstool-NG :

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2-patch5
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

- 编译工具链:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

编译得到的工具链会被保存到 `~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf`。请按照[标准设置指南](#)的介绍，将工具链添加到 PATH。

后续步骤 继续设置开发环境，请前往[第二步：获取 ESP-IDF](#) 章节。

备注: 在本文档中，Linux 和 macOS 操作系统中 ESP-IDF 的默认安装路径为 `~/esp`；Windows 操作系统的默认路径为 `%userprofile%\esp`。您也可以将 ESP-IDF 安装在任何其他路径下，但请注意在使用命令行时进行相应替换。注意，ESP-IDF 不支持带有空格的路径。

此外，您也可以根据自身经验和实际需求，对环境进行个性化设置，而非使用预制工具链。此时，请前往[工具链自定义设置 \(传统 GNU Make 系统\)](#) 章节获取更多信息。

第二步：获取 ESP-IDF

除了工具链，您还需要供 ESP32 使用的 API（软件库和源代码），具体请见 [ESP-IDF 仓库](#)。

获取本地副本：打开终端，切换到您要存放 ESP-IDF 的工作目录，使用 `git clone` 命令克隆远程仓库。打开终端，后运行以下命令：

```
mkdir -p ~/esp
cd ~/esp
git clone -b v4.4.7 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 `~/esp/esp-idf`。

请前往 [ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

备注： `git clone` 命令的 `-b v4.4.7` 选项告诉 `git` 从 ESP-IDF 仓库中克隆与此版本的文档对应的分支。

备注： 作为备份，还可以从 [Releases page](#) 下载此稳定版本的 `zip` 文件。不要下载由 GitHub 自动生成的“源代码”的 `zip` 文件，它们不适用于 ESP-IDF。

备注： 在克隆远程仓库时，不要忘记加上 `--recursive` 选项。否则，请接着运行以下命令，获取所有子模块：

```
cd esp-idf
git submodule update --init
```

第三步：设置环境变量

工具链通过环境变量 `IDF_PATH` 获得 ESP-IDF 的目录。因此，您需要在 PC 中设置该环境变量，否则无法编译工程。

您可以在每次重启会话时手动设置，也可以在用户配置中进行永久设置，具体请前往 [在用户配置文件中添加 IDF_PATH（传统 GNU Make）](#) 章节，查看 [Windows](#)、[Linux](#) 及 [MacOS](#) 操作系统的具体设置方式。

第四步：安装 Python 软件包

ESP-IDF 所需的 Python 软件包位于 `IDF_PATH/requirements.txt` 中。您可以运行以下命令进行安装：

```
python -m pip install --user -r $IDF_PATH/requirements.txt
```

备注： 请注意查询您所使用的 Python 解释器的版本（运行命令 `python --version`），并根据查询结果将上方命令中的 `python` 替换为 `python3`、`python3.7`，例如：

```
python3 -m pip install --user -r $IDF_PATH/requirements.txt
```

第五步：开始创建工程

现在，您可以开始准备开发 ESP32 应用程序了。您可以从 ESP-IDF 中 `examples` 目录下的 `get-started/hello_world` 工程开始。

将 `get-started/hello_world` 复制至您本地的 `~/esp` 目录下:

Linux 和 macOS 操作系统

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

Windows 操作系统

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

ESP-IDF 的 `examples` 目录下有一系列示例工程，都可以按照上面的方法进行创建。您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

重要：ESP-IDF 编译系统不支持带有空格的路径。

第六步：连接设备

现在，请将您的 ESP32 开发板连接到 PC，并查看开发板使用的串口。

通常，串口在不同操作系统下显示的名称有所不同：

- **Windows 操作系统：** COM1 等
- **Linux 操作系统：** 以 `/dev/tty` 开始
- **macOS 操作系统：** 以 `/dev/cu.` 开始

有关如何查看串口名称的详细信息，请见与 [ESP32 创建串口连接](#)（传统 *GNU Make* 系统）。

备注：请记住串口名，您会在下面的步骤中用到。

第七步：配置

请进入 [第五步：开始创建工程](#) 中提到的 `hello_world` 目录，并运行工程配置工具 `menuconfig`。

Linux 和 macOS 操作系统

```
cd ~/esp/hello_world
make menuconfig
```

Windows 操作系统

```
cd %userprofile%\esp\hello_world
make menuconfig
```

如果之前的步骤都正确，则会显示下面的菜单：

进入菜单后，选择 `Serial flasher config>Default serial port` 配置串口（设备将通过该串口加载工程）。按回车键确认选择，点击 `< Save >` 保存配置，然后点击 `< Exit >` 退出 `menuconfig`。

`menuconfig` 工具的常见操作见下。

- 上下箭头：移动
- 回车：进入子菜单
- ESC 键：返回上级菜单或退出
- 英文问号：调出帮助菜单（退出帮助菜单，请按回车键）。

图 62: 工程配置—主窗口

- 空格、`或 `Y 键：选择 [*] 配置选项；N 键：禁用 [*] 配置选项
- 英文问号（查询配置选项）：调出有关该选项的帮助菜单
- / 键：寻找配置工程

注意： 如果您使用的是 ESP32-DevKitC（板载 ESP32-SOLO-1 模组），请在烧写示例程序前，前往 menuconfig 中使能单核模式（`CONFIG_FREERTOS_UNICORE`）。

第八步：编译和烧录

请使用以下命令，编译烧录工程：

```
make flash
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成 bootloader、分区表和应用程序二进制文件。接着，这些二进制文件将被烧录至 ESP32 开发板。

烧录过程中可能遇到的问题 如果在运行给定命令时出现如“连接失败”这样的错误，原因之一则可能是运行 `esptool.py` 出现错误。`esptool.py` 是构建系统调用的程序，用于重置芯片、与 ROM 引导加载器交互以及烧录固件的工具。解决该问题的一个简单的方法就是按照以下步骤进行手动复位。如果问题仍未解决，请参考 [Troubleshooting](#) 获取更多信息。

`esptool.py` 通过使 USB 转串口转接器芯片（如 FTDI 或 CP210x）的 DTR 和 RTS 控制线生效来自动复位 ESP32（请参考与 [ESP32 创建串口连接（传统 GNU Make 系统）](#) 获取更多详细信息）。DTR 和 RTS 控制线又连接到 ESP32 的 GPIO0 和 CHIP_PU (EN) 管脚上，因此 DTR 和 RTS 的电压电平变化会使 ESP32 进入固件下载模式。相关示例可查看 ESP32 DevKitC 开发板的 [原理图](#)。

一般来说，使用官方的 `esp-idf` 开发板不会出现问题。但是，`esptool.py` 在以下情况下不能自动重置硬件。

- 您的硬件没有连接到 GPIO0 和 CHIP_PU 的 DTR 和 RTS 控制线
- DTR 和 RTS 控制线的配置方式不同
- 根本没有这样的串行控制线路

根据您的硬件的种类，也可以将您 ESP32 开发板手动设置成固件下载模式（复位）。

- 对于 Espressif 的开发板，您可以参考对应开发板的入门指南或用户指南。例如，可以通过按住 **Boot** 按钮 (GPIO0) 再按住 **EN** 按钮 (CHIP_PU) 来手动复位 esp-idf 开发板。
- 对于其他类型的硬件，可以尝试将 GPIO0 拉低。

常规操作 如果一切顺利，您可在烧录完成后看到类似下方的打印信息。接着，开发板将会复位，应用程序 “hello_world” 开始启动。

```

esptool.py v3.0-dev
Flashing binaries to serial port /dev/ttyUSB0 (app at offset 0x10000)...
esptool.py v3.0-dev
Serial port /dev/cu.SLAB_USBtoUART
Connecting.....
Chip is ESP32D0WDQ6 (revision 1)

Leaving...
Hard resetting via RTS pin...

```

如果您希望使用 Eclipse IDE，而非 make 编译系统，请参考 [Eclipse guide](#)。

第九步：监视器

您可以使用 make monitor 命令，监视 “hello_world” 的运行情况。

运行该命令后，*IDF* 监视器 应用程序将启动：

```

$ make monitor
MONITOR
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...

```

此时，您就可以在启动日志和诊断日志之后，看到打印的 “Hello world!” 了。

```

...
Hello world!

```

(下页继续)

(续上页)

```
This is esp32 chip with 2 CPU cores, WiFi/BT/BLE, silicon revision 1, 4MB external
↳ flash
Restarting in 10 seconds...
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

您可使用快捷键 `Ctrl+]`，退出 IDF 监视器。

如果 IDF 监视器在烧录后很快发生错误，或打印信息全是乱码（见下），很有可能是因为您的开发板采用了 26 MHz 晶振，而 ESP-IDF 默认支持大多数开发板使用的 40 MHz 晶振。

```
e000)(Xn@0y.!00(0PW+)00Hn9a~/90!0t500P0~0k00e0ea050jA
~zY00Y(10,1 00 e000)(Xn@0y.!Dr0zY(0 jpi0|0+z5Ymvp
```

此时，请您：

1. 退出监视器。
2. 打开 `menuconfig`，
3. 进入 Component config → ESP32-specific → Main XTAL frequency 进行配置，将 `CONFIG_ESP32_XTAL_FREQ_SEL` 设置为 26 MHz。
4. 然后，请重新编译和烧录应用程序。

备注：您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
make flash monitor
```

此外，请前往 [IDF 监视器](#)，了解更多使用 IDF 监视器的快捷键和其他详情。

恭喜，您已完成 ESP32 的入门学习！

现在，您可以尝试一些其他 [examples](#)，或者直接开发自己的应用程序。

环境变量

用户可以在使用 `make` 命令时 **直接设置**部分环境变量，而无需进入 `make menuconfig` 进行重新配置。这些变量包括：

变量	描述与使用方式
ESPSPORT	覆盖 <code>flash</code> 和 <code>monitor</code> 命令使用的串口。例： <code>make flash ESPSPORT=/dev/ttyUSB1,make monitor ESPSPORT=COM1</code>
ESPBAUD	覆盖烧录 ESP32 时使用的串口速率。例： <code>make flash ESPBAUD=9600</code>
MONITORBAUD	覆盖监控时使用的串口速率。例： <code>make monitor MONITORBAUD=9600</code>

备注：您可导出环境变量（例：`export ESPSPORT=/dev/ttyUSB1`）。在同一会话窗口中，如果未被同步覆盖，所有 `make` 命令均会使用导出的环境变量值。

更新 ESP-IDF

乐鑫会不时推出更新版本的 ESP-IDF，修复 `bug` 或推出新的特性。因此，您在使用时，也应注意更新您本地的版本。最简单的方法是：直接删除您本地的 `esp-idf` 文件夹，然后按照 [第二步：获取 ESP-IDF](#) 中的指示，重新完成克隆。

如果您希望将 ESP-IDF 克隆到新的路径下，请务必重新设置 `IDF_PATH`。否则，工具链将无法找到 ESP-IDF。

此外，您可以仅更新变更部分。具体方式，请前往[更新](#) 章节查看。

相关文档

在用户配置文件中添加 `IDF_PATH` (传统 GNU Make)

备注：ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

为了在系统多次启动时，保留 `IDF_PATH` 环境变量的设置，请按照以下说明将该变量的设置增加至用户配置文件。

Windows 操作系统 用户配置文件脚本保存在 `C:/msys32/etc/profile.d/` 路径下，每次打开 `MSYS2` 窗口时均会执行。

1. 在 `C:/msys32/etc/profile.d/` 目录下创建一个新的脚本文件，并将其命名为 `export_idf_path.sh`。
2. 指定您的 ESP-IDF 保存路径，这通常与您的系统配置有关，比如 `C:\msys32\home\user-name\esp\esp-idf`。
3. 在脚本文件中加入下方 `export` 命令行，例：

```
export IDF_PATH="C:/msys32/home/user-name/esp/esp-idf"
```

注意请将反斜杠替换为 Windows 操作系统路径要求的正斜杠。

4. 保存脚本文件。
5. 关闭 `MSYS2` 窗口，并重新打开。运行以下命令，检查 `IDF_PATH` 是否成功设置：

```
printenv IDF_PATH
```

如果设置成功，则此时将打印之前在脚本中输入的路径。

如果您不希望永久设置 `IDF_PATH` 变量，也可以在每次打开 `MSYS2` 窗口时进行手动设置：

```
export IDF_PATH="C:/msys32/home/user-name/esp/esp-idf"
```

如果您是在安装 ESP32 软件的过程中从[第三步：设置环境变量](#) 章节跳转至此，请返回[第五步：开始创建工程](#) 章节。

Linux 和 MacOS 操作系统 在 `~/.profile` 文件中增加以下命令，设置 `IDF_PATH` 变量：

```
export IDF_PATH=~/.esp/esp-idf
```

退出并重新登陆，检查设置是否生效。

备注：如果您已将 `/bin/bash` 设置为登录 shell，且同时存在 `.bash_profile` 和 `.profile`，则请更新 `.bash_profile`。

运行以下命令，检查 `IDF_PATH` 是否成功设置：

```
printenv IDF_PATH
```

如果设置成功，则此时将打印之前在 `~/.profile` 文件中输入（或手动设置）的路径。

如果您不希望永久设置 `IDF_PATH` 变量，也可以在每次重新打开终端窗口时进行手动设置：

```
export IDF_PATH=~/.esp/esp-idf
```

如果您是在安装 ESP32 软件的过程中从 [第三步：设置环境变量](#) 章节跳转至此，请返回 [第五步：开始创建工程](#) 章节。

与 ESP32 创建串口连接（传统 GNU Make 系统）

备注：ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

本章节主要介绍如何创建 ESP32 和 PC 之间的串口连接。

连接 ESP32 和 PC 用 USB 线将 ESP32 开发板连接到 PC。如果设备驱动程序没有自动安装，请先确认 ESP32 开发板上的 USB 转串口芯片（或外部转串口适配器）型号，然后在网上搜索驱动程序，并进行手动安装。

以下是乐鑫 ESP32 等开发板驱动程序的链接：

开发板	USB 驱动	备注
ESP32-DevKitC	CP210x	
ESP32-LyraT	CP210x	
ESP32-LyraTD-MSC	CP210x	
ESP32-PICO-KIT	CP210x	
ESP-WROVER-KIT	FTDI	
ESP32 Demo 板	FTDI	
ESP-Prog	FTDI	编程板 (w/o ESP32)
ESP32-MeshKit-Sense	n/a	搭配 ESP-Prog 使用
ESP32-Sense Kit	n/a	搭配 ESP-Prog 使用

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

以上驱动仅作参考。正常情况下，当上述任一 ESP32 开发板与 PC 连接时，打包在操作系统中的驱动程序将会开始自动安装。

查看端口（Windows 用户） 检查 Windows 设备管理器中的 COM 端口列表。断开 ESP32 与 PC 的连接，然后重连。查看从列表中消失后再次出现的是哪个端口。

以下为 ESP32 DevKitC 和 ESP32 WROVER KIT 串口：

查看端口（Linux 和 MacOS 用户） 查看 ESP32 开发板（或外部转串口适配器）的串口设备名称，请运行两次下述命令。首先，断开开发板或适配器，第一次运行命令；然后，连接开发板或适配器，第二次运行命令。其中，第二次运行命令后出现的端口即是 ESP32 对应的串口：

Linux

```
ls /dev/tty*
```

MacOS

```
ls /dev/cu.*
```

图 63: Windows 设备管理器中 ESP32-DevKitC 的 USB 至 UART 桥

图 64: Windows 设备管理器中 ESP-WROVER-KIT 的两个 USB 串行端口

将用户增加至 Linux 的 dialout 组 当前登录用户应当拥有通过 USB 对串口进行读写的权限。在多数 Linux 版本中，您都可以通过以下命令，将用户添加到 dialout 组，来获取读写权限：

```
sudo usermod -a -G dialout $USER
```

在 Arch Linux 中，需要通过以下命令将用户添加到 uucp 组中：

```
sudo usermod -a -G uucp $USER
```

请重新登录，确保串口读写权限可以生效。

确认串口连接 现在，请使用串口终端程序，验证串口连接是否可用。在本示例中，我们将使用 **PuTTY SSH Client** 进行验证。该工具同时适用于 Windows 和 Linux 操作系统。您也可以使用其他串口程序，设置通信参数如下。

运行终端，配置串口：波特率 = 115200，数据位 = 8，停止位 = 1，奇偶校验 = N。在 Windows 和 Linux 中配置串口和通信参数（如 115200-8-1-N）的截图如下。注意，这里一定要选择在上述步骤中确认的串口进行配置。

图 65: 在 Windows 操作系统中使用 PuTTY 设置串口通信参数

然后，请在终端打开串口，查看 ESP32 是否有任何打印，具体打印内容取决于加载至 ESP32 的程序。ESP32 打印示例

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

rst:0x7 (TGWDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
```

(下页继续)

图 66: 在 Linux 操作系统中使用 PuTTY 设置串口通信参数

(续上页)

```

configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...

```

如果打印出的日志是可读的（而不是乱码），则表示串口连接正常。此时，您可以继续进行安装，并最终将应用程序下载到 ESP32。

备注：在某些串口接线方式下，在 ESP32 启动并开始打印串口日志前，需要在终端程序中禁用串口 RTS & DTR 引脚。该问题仅存在于将 RTS & DTR 引脚直接连接到 EN & GPIO0 引脚上的情况，绝大多数开发板（包括乐鑫所有的开发板）都没有这个问题。更多详细信息，参见 [esptool 文档](#)。

备注：验证完成后，请关闭串口终端。我们将在后续步骤中向 ESP32 下载新的应用程序，如果未关闭终端，则该应用程序将无法访问串口。

如果您是在安装 ESP32 软件的过程中从 [第六步：连接设备](#) 章节跳转至此，请返回 [第七步：配置](#) 章节。

通过 make 指令创建和烧录项目（传统 GNU Make）

备注：ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

寻找项目 除了 [esp-idf-template](#) 项目模版外，ESP-IDF 还在 GitHub 仓库中的 [examples](#) 目录下提供多个示例项目。

请找到并进入您想要的项目，开始配置、构建该项目。

配置项目

```
make menuconfig
```

编译项目

```
make all
```

该命令将配置 app 和 bootloader，并根据配置生成分区表。

烧录项目 `make all` 完成后将打印一行命令，提示您如何使用 `esptool.py` 烧录芯片。不过，您可以使用以下命令进行烧录：

```
make flash
```

该命令可以将整个项目（包括 app、bootloader 和分区表）烧录至新芯片。此外，如果分区表中存在 ota_data，则该命令还会同时将初始 ota_data 烧录至芯片。该命令允许您直接从 factory 分区中运行新加载的 app（如果 factory 分区不存在，则从第一个 OTA 分区开始运行）。您可以使用 make menuconfig 配置串口的烧录。

在运行 make flash 之前无需单独运行 make all。make flash 命令本身就可以自动构建所需的文件。

仅编译和烧录应用程序 在首次烧录完成后，您可以只希望烧录并编译应用程序，而不再包括 bootloader 和分区表。这种情况可以使用以下命令：

- make app - 仅编译应用程序
- make app-flash - 仅烧录应用程序

make app-flash - 在有需要时自动重新编译应用程序

如果没有变化，每次都重新烧录、编译 bootloader 和分区表也没有坏处。

分区表 项目编译完成后，“build”目录下将出现一个名为“my_app.bin”（例）的二进制文件。这是一个可由 bootloader 加载的 ESP32 映像文件。

ESP32 的一块 flash 可以包含多个应用程序，以及多种数据（校准数据、文件系统、参数存储等）。因此，在向 flash 烧录分区表时，通常保留 0x8000 的偏移量。

分区表中的每个条目都有名称（标签）、类型（app、数据或其他）、子类型及在 flash 中的偏移量。

使用分区表最简便的方法是：运行 make menuconfig，选择一个预定义分区表：

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

上述两种情况中，factory app 在 flash 中的烧录偏移地址均为 0x10000。运行 make partition_table 命令可以打印分区表摘要。

更多有关分区表及自定义分区表的内容，请见[相关文档](#)。

Eclipse IDE 的创建和烧录指南（传统 GNU Make）

备注：ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

安装 Eclipse IDE Eclipse IDE 是一个可视化的集成开发环境，可用于编写、编译和调试 ESP-IDF 项目。

- 首先，请在您的平台上安装相应的 ESP-IDF，具体步骤请按照您的操作系统（Windows、OS X 和 Linux）对应的指示进行安装。
- 我们建议，您可以首先使用命令行创建一个项目，大致熟悉项目的创建流程。此外，您还需要使用命令行 (make menuconfig) 对您的 ESP-IDF 项目进行配置。目前，Eclipse 还无法配置 ESP-IDF 项目。
- 从 eclipse.org 下载对应操作系统的 Eclipse 安装器。
- 运行 Eclipse Installer，选择 “Eclipse for C/C++ Development”（有的版本也可能显示为 CDT）。

配置 Eclipse 打开安装好的 Eclipse IDE，并按照以下步骤进行操作：

导入新项目

- Eclipse 需使用 ESP-IDF 的 Makefile 功能。因此，在使用 Eclipse 前，您需要先创建一个 ESP-IDF 项目。在创建 ESP-IDF 项目时，您可以使用 GitHub 中的 idf-template 项目模版，或从 ESP-IDF 子目录中复制一个 example。

- 运行 Eclipse，选择 “File” -> “Import…”。
- 在弹出的对话框中选择 “C/C++” -> “Existing Code as Makefile Project”，点击 “Next”。
- 进入下一界面，在 “Existing Code Location” 处输入您的 IDF 项目路径。注意，这里应输入 ESP-IDF 项目的路径，而非 ESP-IDF 本身的路径（这个稍后再填）。此外，您指定的目标路径中应包含名为 Makefile（项目 Makefile）的文件。
- 本界面中，找到 “Toolchain for Indexer Settings”，选择 “Cross GCC”，最后点击 “Finish”。

项目属性

- 新项目将出现在 “Project Explorer” 下。右键选择该项目，并在菜单中选择 “Properties”。
- 点击 “C/C++ Build” 下的 “Environment” 属性页，选择 “Add…”，并在对应位置输入 BATCH_BUILD 和 1。
- 再次点击 “Add…”，并在 IDF_PATH 处输入 ESP-IDF 所在的完整安装路径。Windows 用户可以从 Windows 浏览器复制 IDF_PATH。
- 编辑 PATH 环境变量。保留当前值，并将该路径增加至 Xtensa 工具链安装路径后，作为 IDF 设置的一部分（如已增加至 PATH，则可忽略）。工具链的常见路径为 /home/user-name/esp/xtensa-esp32-elf/bin（例）。注意，您需要在补充的路径前增加一个冒号(:)。Windows 用户需要将 PATH 环境变量前增加 C:\msys32\mingw32\bin;C:\msys32\opt\xtensa-esp32-elf\bin;C:\msys32\usr\bin。注意，请根据 msys32 的具体安装路径，修改 PATH 环境变量。
- MacOS 用户需要增加一个 PYTHONPATH 环境变量，并将其设置为 /Library/Frameworks/Python.framework/Versions/2.7/lib/python2.7/site-packages。保证系统中预先安装的 Python（需安装 pyserial 模块）可以覆盖 Eclipse 内置的任何 Python。

特别说明：如果您的 IDF_PATH 或项目不在 C:\msys32\home 之下，则应使用自定义编译命令：`python ${IDF_PATH}/tools/windows/eclipse_make.py`（请注意，这种方法可能导致编译时间显著增加。）

- 前往 “C/C++ General” -> “Preprocessor Include Paths” 属性页面。点击 “Providers” 选项卡。
 - 从 “Providers” 列表中选择 “CDT Cross GCC Built-in Compiler Settings”，将 “Command to get compiler specs” 修改为 `xtensa-esp32-elf-gcc ${FLAGS} -std=c++11 -E -P -v -dD "${INPUTS}"`。
 - 从 “Providers” 列表中选择 “CDT GCC Build Output Parser”，将 “Compiler command pattern” 修改为 `xtensa-esp32-elf-(gcc|g\+\+|c\+\+|cc|cpp|clang)`。
- 前往 “C/C++ General” -> “Indexer” 属性页面。
 - 勾选 “Enable project specific settings”，启用本页面上的其他设置。
 - 取消勾选 “Allow heuristic resolution of includes”。勾选该选项有时会导致 Eclipse 无法找到正确的头文件目录。
- 前往 “C/C++ Build” -> “Behavior” 属性页面。
 - 勾选 “Enable parallel build”，启用 “并行编译” 配置。

在 Eclipse 中构建项目 在首次创建项目前，Eclipse IDE 可能会显示大量有关未定义值的错误和警告，这是因为 ESP-IDF 在编译过程中会自动生成一些源文件。因此，这些错误和警告均会在项目编译完成后消失。

- 点击 “OK”，关闭 Eclipse IDE 中的 “Properties” 对话框。
- 在 Eclipse IDE 界面外，打开命令提示符窗口。进入项目目录，运行 `make menuconfig` 设置项目的 ESP-IDF 配置。现阶段，您还无法在 Eclipse 中完成本操作。
- 回到 Eclipse IDE 界面，选择 “Project” -> “Build” 开始编译项目。

小提示：如果您的项目不是通过 Eclipse 创建的，则在选择 “Project” -> “Build” 前还需进行 “Project” -> “Clean” 操作。如此操作后，Eclipse 才能查看所有源文件的编译器参数，并借此确定头文件包含路径。

在 Eclipse 中烧录项目 您可以将 `make flash` 目标集成在 Eclipse 项目中，这样就可以通过 Eclipse UI 调用 `esptool.py` 进行烧录：

- 打开 “Project Explorer”，并右击您的项目（请注意右击项目本身，而非项目下的子文件，否则 Eclipse 可能会找到错误的 Makefile）。

- 从菜单中选择 **“Build Targets”** -> **“Create...”**。
- 目标名称输入 **“flash”**，其他选项使用默认值。
- 这时，您可以选择 **“Project”** -> **“Build Target”** -> **“Build”** (快捷键: Shift + F9)，创建自定义烧录目标，用于编译、烧录项目。

注意，您仍需要通过 `make menuconfig` 设置串行端口和其他烧录选项。`make menuconfig` 仍需通过命令行操作（具体请见对应操作系统的指南）。

如有需要，请按照相同步骤添加 `bootloader` 和 `partition_table` 目标。

工具链自定义设置（传统 GNU Make 系统） 除了从乐鑫官网（请见[第一步：设置工具链](#)）下载二进制工具链外，您还可以自行编译工具链。

备注：ESP-IDF V4.0 及之后版本的默认构建系统为 CMake。本文档主要针对之前基于 GNU Make 的传统构建系统。请注意，未来，我们可能不会继续支持基于 GNU Make 的构建系统。

如无特殊需求，建议直接使用我们提供的预编译二进制工具链。不过，您可以在以下情况考虑自行编译工具链：

- 需要定制工具链编译配置
- 需要使用其他 GCC 版本（如 4.8.5）
- 需要破解 `gcc`、`newlib` 或 `libstdc++`
- 有相关兴趣或时间充裕
- 不信任从网站下载的 `bin` 文件

如需自行编译工具链，请查看以下文档：

Chapter 2

API 参考

2.1 蓝牙 API

2.1.1 Controller && VHCI

Application Example

Check `bluetooth/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising - [bluetooth/hci/controller_vhci_ble_adv](#).

API Reference

Header File

- `components/bt/include/esp32/include/esp_bt.h`

Functions

`esp_err_t esp_ble_tx_power_set` (`esp_ble_power_type_t` power_type, `esp_power_level_t` power_level)

Set BLE TX power Connection Tx power should only be set after connection created.

参数

- **power_type** -: The type of which tx power, could set Advertising/Connection/Default and etc
- **power_level** -Power level(index) corresponding to absolute value(dbm)

返回 ESP_OK - success, other - failed

`esp_power_level_t esp_ble_tx_power_get` (`esp_ble_power_type_t` power_type)

Get BLE TX power Connection Tx power should only be get after connection created.

参数 **power_type** -: The type of which tx power, could set Advertising/Connection/Default and etc

返回 `>= 0` - Power level, `< 0` - Invalid

esp_err_t esp_bredr_tx_power_set (*esp_power_level_t* min_power_level, *esp_power_level_t* max_power_level)

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is `ESP_PWR_LVL_N0`, and maximum power level is `ESP_PWR_LVL_P3`.

参数

- **min_power_level** –The minimum power level
- **max_power_level** –The maximum power level

返回 `ESP_OK` - success, other - failed

esp_err_t esp_bredr_tx_power_get (*esp_power_level_t* *min_power_level, *esp_power_level_t* *max_power_level)

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

参数

- **min_power_level** –The minimum power level
- **max_power_level** –The maximum power level

返回 `ESP_OK` - success, other - failed

esp_err_t esp_bredr_sco_datapath_set (*esp_sco_data_path_t* data_path)

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

参数 **data_path** –SCO data path

返回 `ESP_OK` - success, other - failed

esp_err_t esp_bt_controller_init (*esp_bt_controller_config_t* *cfg)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

参数 **cfg** –Initial configuration of BT controller. Different from previous version, there' s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

返回 `ESP_OK` - success, other - failed

esp_err_t esp_bt_controller_deinit (void)

De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

This function should be called only once, after any other BT functions are called.

返回 `ESP_OK` - success, other - failed

esp_err_t esp_bt_controller_enable (*esp_bt_mode_t* mode)

Enable BT controller. Due to a known issue, you cannot call `esp_bt_controller_enable()` a second time to change the controller mode dynamically. To change controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.

参数 **mode** –: the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of `esp_bt_controller_init()`.

返回 `ESP_OK` - success, other - failed

esp_err_t esp_bt_controller_disable (void)

Disable BT controller.

返回 `ESP_OK` - success, other - failed

esp_bt_controller_status_t esp_bt_controller_get_status (void)

Get BT controller is initialised/de-initialised/enabled/disabled.

返回 status value

bool **esp_vhci_host_check_send_available** (void)

esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.

返回 true for ready to send, false means cannot send packet

void **esp_vhci_host_send_packet** (uint8_t *data, uint16_t len)

esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

参数

- **data** –the packet point
- **len** –the packet length

esp_err_t **esp_vhci_host_register_callback** (const *esp_vhci_host_callback_t* *callback)

esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

参数 **callback** –*esp_vhci_host_callback* type variable

返回 ESP_OK - success, ESP_FAIL - failed

esp_err_t **esp_bt_controller_mem_release** (*esp_bt_mode_t* mode)

esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function

参数 **mode** –: the mode want to release memory

返回 ESP_OK - success, other - failed

esp_err_t **esp_bt_mem_release** (*esp_bt_mode_t* mode)

esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call `esp_bt_mem_release(ESP_BT_MODE_BTDM)` before `esp_bt_controller_init` or after `esp_bt_controller_deinit`.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation”. In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

备注: In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to `ESP_BT_MODE_BTDM` as controller is dual mode.

参数 mode –: the mode whose memory is to be released
返回 `ESP_OK` - success, other - failed

esp_err_t **esp_bt_sleep_enable**(void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if `CONFIG_CTRL_BTDM_MODEM_SLEEP` is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “`esp_bt_controller_wakeup_request`” .

返回

- `ESP_OK` : success
- other : failed

esp_err_t **esp_bt_sleep_disable**(void)

disable bluetooth modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

If `esp_bt_sleep_disable()` is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, `esp_bt_controller_wakeup_request()` can be used to shorten the time for wakeup.

返回

- `ESP_OK` : success
- other : failed

esp_err_t **esp_ble_scan_duplicate_list_flush**(void)

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

备注: This function name is incorrectly spelled, it will be fixed in release 5.x version.

返回

- ESP_OK : success
- other : failed

void **esp_wifi_bt_power_domain_on** (void)

bt Wi-Fi power domain power on

void **esp_wifi_bt_power_domain_off** (void)

bt Wi-Fi power domain power off

Structures

struct **esp_bt_controller_config_t**

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

Public Members

uint16_t **controller_task_stack_size**

Bluetooth controller task stack size

uint8_t **controller_task_prio**

Bluetooth controller task priority

uint8_t **hci_uart_no**

If use UART1/2 as HCI IO interface, indicate UART number

uint32_t **hci_uart_baudrate**

If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8_t **scan_duplicate_mode**

scan duplicate mode

uint8_t **scan_duplicate_type**

scan duplicate type

uint16_t **normal_adv_size**

Normal adv size for scan duplicate

uint16_t **mesh_adv_size**

Mesh adv size for scan duplicate

uint16_t **send_adv_reserved_size**

Controller minimum memory value

uint32_t **controller_debug_flag**

Controller debug log flag

uint8_t **mode**

Controller mode: BR/EDR, BLE or Dual Mode

uint8_t **ble_max_conn**

BLE maximum connection numbers

uint8_t **bt_max_acl_conn**

BR/EDR maximum ACL connection numbers

uint8_t **bt_sco_datapath**

SCO data path, i.e. HCI or PCM module

bool **auto_latency**

BLE auto latency, used to enhance classic BT performance

bool **bt_legacy_auth_vs_evt**

BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t **bt_max_sync_conn**

BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t **ble_sca**

BLE low power crystal accuracy index

uint8_t **pcm_role**

PCM role (master & slave)

uint8_t **pcm_polar**

PCM polar trig (falling clk edge & rising clk edge)

bool **hli**

Using high level interrupt or not

uint16_t **dup_list_refresh_period**

Duplicate scan list refresh period

uint32_t **magic**

Magic number

struct **esp_vhci_host_callback**

esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

void (***notify_host_send_available**)(void)

callback used to notify that the host can send packet to controller

int (***notify_host_rcv**)(uint8_t *data, uint16_t len)

callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT ()

Type Definitions

typedef struct *esp_vhci_host_callback* **esp_vhci_host_callback_t**
esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum **esp_bt_mode_t**
Bluetooth mode for controller enable/disable.

Values:

enumerator **ESP_BT_MODE_IDLE**
Bluetooth is not running

enumerator **ESP_BT_MODE_BLE**
Run BLE mode

enumerator **ESP_BT_MODE_CLASSIC_BT**
Run Classic BT mode

enumerator **ESP_BT_MODE_BTDM**
Run dual mode

enum [**anonymous**]

BLE sleep clock accuracy(SCA), values for ble_sca field in *esp_bt_controller_config_t*, currently only ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.

Values:

enumerator **ESP_BLE_SCA_500PPM**
BLE SCA at 500ppm

enumerator **ESP_BLE_SCA_250PPM**
BLE SCA at 250ppm

enumerator **ESP_BLE_SCA_150PPM**
BLE SCA at 150ppm

enumerator **ESP_BLE_SCA_100PPM**
BLE SCA at 100ppm

enumerator **ESP_BLE_SCA_75PPM**
BLE SCA at 75ppm

enumerator **ESP_BLE_SCA_50PPM**
BLE SCA at 50ppm

enumerator **ESP_BLE_SCA_30PPM**

BLE SCA at 30ppm

enumerator **ESP_BLE_SCA_20PPM**

BLE SCA at 20ppm

enum **esp_bt_controller_status_t**

Bluetooth controller enable/disable/initialised/de-initialised status.

Values:

enumerator **ESP_BT_CONTROLLER_STATUS_IDLE**

enumerator **ESP_BT_CONTROLLER_STATUS_INITED**

enumerator **ESP_BT_CONTROLLER_STATUS_ENABLED**

enumerator **ESP_BT_CONTROLLER_STATUS_NUM**

enum **esp_ble_power_type_t**

BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV : for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN : for scan. ESP_BLE_PWR_TYPE_DEFAULT : if each connection's TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL0**

For connection handle 0

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL1**

For connection handle 1

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL2**

For connection handle 2

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL3**

For connection handle 3

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL4**

For connection handle 4

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL5**

For connection handle 5

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL6**

For connection handle 6

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL7**

For connection handle 7

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL8**

For connection handle 8

enumerator **ESP_BLE_PWR_TYPE_ADV**

For advertising

enumerator **ESP_BLE_PWR_TYPE_SCAN**

For scan

enumerator **ESP_BLE_PWR_TYPE_DEFAULT**

For default, if not set other, it will use default value

enumerator **ESP_BLE_PWR_TYPE_NUM**

TYPE numbers

enum **esp_power_level_t**

Bluetooth TX power level(index), it's just a index corresponding to power(dbm).

Values:

enumerator **ESP_PWR_LVL_N12**

Corresponding to -12dbm

enumerator **ESP_PWR_LVL_N9**

Corresponding to -9dbm

enumerator **ESP_PWR_LVL_N6**

Corresponding to -6dbm

enumerator **ESP_PWR_LVL_N3**

Corresponding to -3dbm

enumerator **ESP_PWR_LVL_N0**

Corresponding to 0dbm

enumerator **ESP_PWR_LVL_P3**

Corresponding to +3dbm

enumerator **ESP_PWR_LVL_P6**

Corresponding to +6dbm

enumerator **ESP_PWR_LVL_P9**

Corresponding to +9dbm

enumerator **ESP_PWR_LVL_N14**

Backward compatibility! Setting to -14dbm will actually result to -12dbm

enumerator **ESP_PWR_LVL_N11**

Backward compatibility! Setting to -11dbm will actually result to -9dbm

enumerator **ESP_PWR_LVL_N8**

Backward compatibility! Setting to -8dbm will actually result to -6dbm

enumerator **ESP_PWR_LVL_N5**

Backward compatibility! Setting to -5dbm will actually result to -3dbm

enumerator **ESP_PWR_LVL_N2**

Backward compatibility! Setting to -2dbm will actually result to 0dbm

enumerator **ESP_PWR_LVL_P1**

Backward compatibility! Setting to +1dbm will actually result to +3dbm

enumerator **ESP_PWR_LVL_P4**

Backward compatibility! Setting to +4dbm will actually result to +6dbm

enumerator **ESP_PWR_LVL_P7**

Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum **esp_sco_data_path_t**

Bluetooth audio data transport path.

Values:

enumerator **ESP_SCO_DATA_PATH_HCI**

data over HCI transport

enumerator **ESP_SCO_DATA_PATH_PCM**

data over PCM interface

2.1.2 BT COMMON

BT GENERIC DEFINES

`ESP_BLE_CONN_SUP_TOUT_MAX`

relate to `ESP_BLE_CONN_SUP_TOUT_MAX` in `stack/btm_ble_api.h`

ESP_BLE_IS_VALID_PARAM (x, min, max)

Check the param is valid or not.

ESP_UUID_LEN_16

ESP_UUID_LEN_32

ESP_UUID_LEN_128

ESP_BD_ADDR_LEN

Bluetooth address length.

ESP_BLE_ENC_KEY_MASK

Used to exchange the encryption key in the init key & response key.

ESP_BLE_ID_KEY_MASK

Used to exchange the IRK key in the init key & response key.

ESP_BLE_CSR_KEY_MASK

Used to exchange the CSRK key in the init key & response key.

ESP_BLE_LINK_KEY_MASK

Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN

Minimum of the application id.

ESP_APP_ID_MAX

Maximum of the application id.

ESP_BD_ADDR_STR

ESP_BD_ADDR_HEX (addr)

enum **esp_bt_dev_type_t**

Bluetooth device type.

Values:

enumerator **ESP_BT_DEVICE_TYPE_BREDR**

enumerator **ESP_BT_DEVICE_TYPE_BLE**

enumerator **ESP_BT_DEVICE_TYPE_DUMO**

enum **esp_ble_addr_type_t**

BLE device address type.

Values:

enumerator **BLE_ADDR_TYPE_PUBLIC**

Public Device Address

enumerator **BLE_ADDR_TYPE_RANDOM**

Random Device Address. To set this address, use the function `esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)`

enumerator **BLE_ADDR_TYPE_RPA_PUBLIC**

Resolvable Private Address (RPA) with public identity address

enumerator **BLE_ADDR_TYPE_RPA_RANDOM**

Resolvable Private Address (RPA) with random identity address. To set this address, use the function `esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)`

enum **esp_ble_wl_addr_type_t**

white list address type

Values:

enumerator **BLE_WL_ADDR_TYPE_PUBLIC**

enumerator **BLE_WL_ADDR_TYPE_RANDOM**

BT MAIN API

API Reference

Header File

- `components/bt/host/bluedroid/api/include/api/esp_bt_main.h`

Functions

`esp_bluedroid_status_t esp_bluedroid_get_status` (void)

Get bluetooth stack status.

返回 Bluetooth stack status

`esp_err_t esp_bluedroid_enable` (void)

Enable bluetooth, must after `esp_bluedroid_init()`.

返回

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_disable** (void)

Disable bluetooth, must prior to esp_bluedroid_deinit().

返回

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_init** (void)

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

返回

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_deinit** (void)

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

返回

- ESP_OK : Succeed
- Other : Failed

Enumerations

enum **esp_bluedroid_status_t**

Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

Values:

enumerator **ESP_BLUEDROID_STATUS_UNINITIALIZED**

Bluetooth not initialized

enumerator **ESP_BLUEDROID_STATUS_INITIALIZED**

Bluetooth initialized but not enabled

enumerator **ESP_BLUEDROID_STATUS_ENABLED**

Bluetooth initialized and enabled

BT DEVICE APIs

Overview Bluetooth device reference APIs.

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_bt_device.h](#)

Functions

const uint8_t ***esp_bt_dev_get_address** (void)

Get bluetooth device address. Must use after “esp_bluedroid_enable” .

返回 bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

esp_err_t **esp_bt_dev_set_device_name** (const char *name)

Set bluetooth device name. This function should be called after `esp_bluedroid_enable()` completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

参数 **name** **–[in]** : device name to be set

返回

- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- ESP_FAIL : others

2.1.3 BT LE

GAP API

Application Example Check `bluetooth/bluedroid/ble` folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
 - [bluetooth/bluedroid/ble/gatt_security_client](#)
 - [GATT Security Client Example Walkthrough](#)
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
 - [bluetooth/bluedroid/ble/gatt_security_server](#)
 - [GATT Security Server Example Walkthrough](#)

API Reference

Header File

- `components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h`

Functions

esp_err_t **esp_ble_gap_register_callback** (*esp_gap_ble_cb_t* callback)

This function is called to occur gap event, such as scan result.

参数 **callback** **–[in]** callback function

返回

- ESP_OK : success
- other : failed

esp_gap_ble_cb_t **esp_ble_gap_get_callback** (void)

This function is called to get the current gap callback.

返回

- `esp_gap_ble_cb_t` : callback function

esp_err_t **esp_ble_gap_config_adv_data** (*esp_ble_adv_data_t* *adv_data)

This function is called to override the BTA default ADV parameters.

参数 **adv_data** **–[in]** Pointer to User defined ADV data structure. This memory space can not be freed until callback of `config_adv_data` is received.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_scan_params** (*esp_ble_scan_params_t* *scan_params)

This function is called to set scan parameters.

参数 scan_params –[in] Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_start_scanning** (uint32_t duration)

This procedure keep the device scanning the peer device which advertising on the air.

参数 duration –[in] Keeping the scanning time, the unit is second.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_stop_scanning** (void)

This function call to stop the device scanning the peer device which advertising on the air.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_start_advertising** (*esp_ble_adv_params_t* *adv_params)

This function is called to start advertising.

参数 adv_params –[in] pointer to User defined adv_params data structure.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_stop_advertising** (void)

This function is called to stop advertising.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_update_conn_params** (*esp_ble_conn_update_params_t* *params)

Update connection parameters, can only be used when connection is up.

参数 params –[in] - connection update parameters

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_pkt_data_len** (*esp_bd_addr_t* remote_device, uint16_t tx_data_length)

This function is to set maximum LE data packet size.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_rand_addr** (*esp_bd_addr_t* rand_addr)

This function allows configuring either a Non-Resolvable Private Address or a Static Random Address.

参数 rand_addr –[in] The address to be configured. Refer to the table below for possible address subtypes:

address [47:46]	Address Type
-----	-----
0b00	Non-Resolvable Private

(下页继续)

(续上页)

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_clear_rand_addr** (void)

This function clears the random address for the application.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_local_privacy** (bool privacy_enable)

Enable/disable privacy (including address resolution) on the local device.

参数 **privacy_enable** *-[in]* - enable/disable privacy on remote device.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_local_icon** (uint16_t icon)

set local gap appearance icon

参数 **icon** *-[in]* - External appearance value, these values are defined by the Bluetooth SIG, please refer to <https://www.bluetooth.com/specifications/assigned-numbers/>

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_update_whitelist** (bool add_remove, *esp_bd_addr_t* remote_bda, *esp_ble_wl_addr_type_t* wl_addr_type)

Add or remove device from white list.

参数

- **add_remove** *-[in]* the value is true if added the ble device to the white list, and false remove to the white list.
- **remote_bda** *-[in]* the remote device address add/remove from the white list.
- **wl_addr_type** *-[in]* whitelist address type

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_clear_whitelist** (void)

Clear all white list.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_whitelist_size** (uint16_t *length)

Get the whitelist size in the controller.

参数 **length** *-[out]* the white list length.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_prefer_conn_params** (*esp_bd_addr_t* bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

参数

- **bd_addr** –[in] BD address of the peripheral
- **min_conn_int** –[in] minimum preferred connection interval
- **max_conn_int** –[in] maximum preferred connection interval
- **slave_latency** –[in] preferred slave latency
- **supervision_tout** –[in] preferred supervision timeout

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_device_name** (const char *name)

Set device name to the local device Note: This API don't affect the advertising data.

参数 **name** –[in] - device name.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_device_name** (void)

Get device name of the local device.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_local_used_addr** (*esp_bd_addr_t* local_used_addr, uint8_t *addr_type)

This function is called to get local used address and address type. uint8_t *esp_bt_dev_get_address(void) get the public address.

参数

- **local_used_addr** –[in] - current local used ble address (six bytes)
- **addr_type** –[in] - ble address type

返回 - ESP_OK : success

- other : failed

uint8_t ***esp_ble_resolve_adv_data** (uint8_t *adv_data, uint8_t type, uint8_t *length)

This function is called to get ADV data for a specific type.

参数

- **adv_data** –[in] - pointer of ADV data which to be resolved
- **type** –[in] - finding ADV data type
- **length** –[out] - return the length of ADV data not including type

返回 pointer of ADV data

esp_err_t **esp_ble_gap_config_adv_data_raw** (uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw advertising data. User need to fill ADV data by self.

参数

- **raw_data** –[in] : raw advertising data with the format: [Length 1][Data Type 1][Data 1][Length 2][Data Type 2][Data 2] ...
- **raw_data_len** –[in] : raw advertising data length , less than 31 bytes

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_scan_rsp_data_raw** (uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw scan response data. User need to fill scan response data by self.

参数

- **raw_data** –[in] : raw scan response data
- **raw_data_len** –[in] : raw scan response data length , less than 31 bytes

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_read_rssi** (*esp_bd_addr_t* remote_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

参数 **remote_addr** –[in] : The remote connection device address.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_add_duplicate_scan_exceptional_device** (*esp_ble_duplicate_exceptional_info_type_t* type, *esp_duplicate_info_t* device_info)

This function is called to add a device info into the duplicate scan exceptional list.

参数

- **type** –[in] device info type, it is defined in *esp_ble_duplicate_exceptional_info_type_t* when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.
- **device_info** –[in] the device information.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_remove_duplicate_scan_exceptional_device** (*esp_ble_duplicate_exceptional_info_type_t* type, *esp_duplicate_info_t* device_info)

This function is called to remove a device info from the duplicate scan exceptional list.

参数

- **type** –[in] device info type, it is defined in *esp_ble_duplicate_exceptional_info_type_t* when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.
- **device_info** –[in] the device information.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_clean_duplicate_scan_exceptional_list** (*esp_duplicate_scan_exceptional_list_type_t* list_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

参数 **list_type** –[in] duplicate scan exceptional list type, the value can be one or more of *esp_duplicate_scan_exceptional_list_type_t*.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_security_param** (*esp_ble_sm_param_t* param_type, void *value, uint8_t len)

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like ‘Impersonation in the Pin Pairing Protocol’ (CVE-2020-26555) and ‘Authentication of the LE Legacy Pairing Protocol’.

To accept only `secure connection` mode, it is necessary do as following:

- a. Set bit `ESP_LE_AUTH_REQ_SC_ONLY` (`param_type` is `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit `ESP_LE_AUTH_REQ_MITM` is optional as required.
- b. Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` (`param_type` is `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).

参数

- **param_type** –[in]: the type of the param which to be set
- **value** –[in]: the param value
- **len** –[in]: the length of the param value

返回 - `ESP_OK` : success
 • other : failed

esp_err_t **esp_ble_gap_security_rsp** (*esp_bd_addr_t* bd_addr, bool accept)

Grant security request access.

参数

- **bd_addr** –[in]: BD address of the peer
- **accept** –[in]: accept the security request or not

返回 - `ESP_OK` : success
 • other : failed

esp_err_t **esp_ble_set_encryption** (*esp_bd_addr_t* bd_addr, *esp_ble_sec_act_t* sec_act)

Set a gap parameter value. Use this function to change the default GAP parameter values.

参数

- **bd_addr** –[in]: the address of the peer device need to encryption
- **sec_act** –[in]: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

返回 - `ESP_OK` : success
 • other : failed

esp_err_t **esp_ble_passkey_reply** (*esp_bd_addr_t* bd_addr, bool accept, *uint32_t* passkey)

Reply the key value to the peer device in the legacy connection stage.

参数

- **bd_addr** –[in]: BD address of the peer
- **accept** –[in]: passkey entry successful or declined.
- **passkey** –[in]: passkey value, must be a 6 digit number, can be lead by 0.

返回 - `ESP_OK` : success
 • other : failed

esp_err_t **esp_ble_confirm_reply** (*esp_bd_addr_t* bd_addr, bool accept)

Reply the confirm value to the peer device in the secure connection stage.

参数

- **bd_addr** –[in]: BD address of the peer device
- **accept** –[in]: numbers to compare are the same or different.

返回 - `ESP_OK` : success
 • other : failed

esp_err_t **esp_ble_remove_bond_device** (*esp_bd_addr_t* bd_addr)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

参数 **bd_addr** –[in] : BD address of the peer device

返回 - ESP_OK : success
 • other : failed

int **esp_ble_get_bond_device_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

返回 - >= 0 : bonded devices number.
 • ESP_FAIL : failed

esp_err_t **esp_ble_get_bond_device_list** (int *dev_num, *esp_ble_bond_dev_t* *dev_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

参数

- **dev_num** –[inout] Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- **dev_list** –[out] an array(buffer) of *esp_ble_bond_dev_t* type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_oob_req_reply** (*esp_bd_addr_t* bd_addr, uint8_t *TK, uint8_t len)

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

参数

- **bd_addr** –[in] BD address of the peer device.
- **TK** –[in] Temporary Key value, the TK value shall be a 128-bit random number
- **len** –[in] length of temporary key, should always be 128-bit

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_sc_oob_req_reply** (*esp_bd_addr_t* bd_addr, uint8_t p_c[16], uint8_t p_r[16])

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_SC_OOB_REQ_EVT.

参数

- **bd_addr** –[in] BD address of the peer device.
- **p_c** –[in] Confirmation value, it shall be a 128-bit random number
- **p_r** –[in] Randomizer value, it should be a 128-bit random number

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_create_sc_oob_data** (void)

This function is called to create the OOB data for SMP when secure connection.

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_disconnect** (*esp_bd_addr_t* remote_device)

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

参数 **remote_device** –[in] : BD address of the peer device

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_get_current_conn_params** (*esp_bd_addr_t* bd_addr, *esp_gap_conn_params_t* *conn_params)

This function is called to read the connection parameters information of the device.

参数

- **bd_addr** –[in] BD address of the peer device.
- **conn_params** –[out] the connection parameters information

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_gap_ble_set_channels** (*esp_gap_ble_channels_t* channels)

BLE set channels.

参数 channels –[in] : The nth such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

返回 - ESP_OK : success
 • ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
 • other : failed

esp_err_t **esp_gap_ble_set_authorization** (*esp_bd_addr_t* bd_addr, bool authorize)

This function is called to authorized a link after Authentication(MITM protection)

参数

- **bd_addr** –[in] BD address of the peer device.
- **authorize** –[out] Authorized the link or not.

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_read_phy** (*esp_bd_addr_t* bd_addr)

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

参数 bd_addr –[in] : BD address of the peer device

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_set_prefered_default_phy** (*esp_ble_gap_phy_mask_t* tx_phy_mask, *esp_ble_gap_phy_mask_t* rx_phy_mask)

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

参数

- **tx_phy_mask** –[in] : indicates the transmitter PHYs that the Host prefers the Controller to use
- **rx_phy_mask** –[in] : indicates the receiver PHYs that the Host prefers the Controller to use

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_set_prefered_phy** (*esp_bd_addr_t* bd_addr, *esp_ble_gap_all_phys_t* all_phys_mask, *esp_ble_gap_phy_mask_t* tx_phy_mask, *esp_ble_gap_phy_mask_t* rx_phy_mask, *esp_ble_gap_prefer_phy_options_t* phy_options)

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

参数

- **bd_addr** –[in] : remote address
- **all_phys_mask** –[in] : a bit field that allows the Host to specify

- **tx_phy_mask** –[in]: a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
 - **rx_phy_mask** –[in]: a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
 - **phy_options** –[in]: a bit field that allows the Host to specify options for PHYs
- 返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_rand_addr** (uint8_t instance, *esp_bd_addr_t* rand_addr)

This function is used by the Host to set the random device address specified by the Random_Address parameter.

参数

- **instance** –[in]: Used to identify an advertising set
- **rand_addr** –[in]: Random Device Address

返回 - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_params** (uint8_t instance, const *esp_ble_gap_ext_adv_params_t* *params)

This function is used by the Host to set the advertising parameters.

参数

- **instance** –[in]: identifies the advertising set whose parameters are being configured.
- **params** –[in]: advertising parameters

返回 - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_config_ext_adv_data_raw** (uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in advertising PDUs that have a data field.

参数

- **instance** –[in]: identifies the advertising set whose data are being configured
- **length** –[in]: data length
- **data** –[in]: data information

返回 - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_config_ext_scan_rsp_data_raw** (uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)

This function is used to provide scan response data used in scanning response PDUs.

参数

- **instance** –[in]: identifies the advertising set whose response data are being configured.
- **length** –[in]: response data length
- **scan_rsp_data** –[in]: response data information

返回 - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_start** (uint8_t num_adv, const *esp_ble_gap_ext_adv_t* *ext_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

参数

- **num_adv** –[in]: Number of advertising sets to enable or disable
- **ext_adv** –[in]: adv parameters

返回 - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_stop** (uint8_t num_adv, const uint8_t *ext_adv_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

参数

- **num_adv** **–[in]** : Number of advertising sets to enable or disable
- **ext_adv_inst** **–[in]** : ext adv instance

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_ext_adv_set_remove** (uint8_t instance)

This function is used to remove an advertising set from the Controller.

参数 **instance** **–[in]** : Used to identify an advertising set

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_ext_adv_set_clear** (void)

This function is used to remove all existing advertising sets from the Controller.

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_set_params** (uint8_t instance, const *esp_ble_gap_periodic_adv_params_t* *params)

This function is used by the Host to set the parameters for periodic advertising.

参数

- **instance** **–[in]** : identifies the advertising set whose periodic advertising parameters are being configured.
- **params** **–[in]** : periodic adv parameters

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_config_periodic_adv_data_raw** (uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in periodic advertising PDUs.

参数

- **instance** **–[in]** : identifies the advertising set whose periodic advertising parameters are being configured.
- **length** **–[in]** : the length of periodic data
- **data** **–[in]** : periodic data information

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_start** (uint8_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

参数 **instance** **–[in]** : Used to identify an advertising set

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_stop** (uint8_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

参数 **instance** **–[in]** : Used to identify an advertising set

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_set_ext_scan_params** (const *esp_ble_ext_scan_params_t* *params)

This function is used to set the extended scan parameters to be used on the advertising channels.

参数 **params** **–[in]** : scan parameters

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_start_ext_scan** (uint32_t duration, uint16_t period)

This function is used to enable scanning.

参数

- **duration** –[in] Scan duration time, where Time = N * 10 ms. Range: 0x0001 to 0xFFFF.
- **period** –[in] Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration. Time = N * 1.28 sec. Range: 0x0001 to 0xFFFF.

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_stop_ext_scan** (void)

This function is used to disable scanning.

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_create_sync** (const *esp_ble_gap_periodic_adv_sync_params_t* *params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

参数 **params** –[in] : sync parameters

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_sync_cancel** (void)

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_sync_terminate** (uint16_t sync_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

参数 **sync_handle** –[in] : identify the periodic advertiser

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_add_dev_to_list** (*esp_ble_addr_type_t* addr_type, *esp_bd_addr_t* addr, uint8_t sid)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

参数

- **addr_type** –[in] : address type
- **addr** –[in] : Device Address
- **sid** –[in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_remove_dev_from_list** (*esp_ble_addr_type_t* addr_type, *esp_bd_addr_t* addr, uint8_t sid)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

参数

- **addr_type** –[in] : address type
- **addr** –[in] : Device Address
- **sid** –[in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_clear_dev** (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_prefer_ext_connect_params_set** (*esp_bd_addr_t* addr, *esp_ble_gap_phy_mask_t* phy_mask, const *esp_ble_gap_conn_params_t* *phy_1m_conn_params, const *esp_ble_gap_conn_params_t* *phy_2m_conn_params, const *esp_ble_gap_conn_params_t* *phy_coded_conn_params)

This function is used to set aux connection parameters.

参数

- **addr** -[in] : device address
- **phy_mask** -[in] : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- **phy_1m_conn_params** -[in] : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- **phy_2m_conn_params** -[in] : Connection parameters for the LE 2M PHY are provided.
- **phy_coded_conn_params** -[in] : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_recv_enable** (uint16_t sync_handle, uint8_t enable)

This function is used to set periodic advertising receive enable.

参数

- **sync_handle** -[in] : Handle of periodic advertising sync
- **enable** -[in] : Determines whether reporting and duplicate filtering are enabled or disabled

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_sync_trans** (*esp_bd_addr_t* addr, uint16_t service_data, uint16_t sync_handle)

This function is used to transfer periodic advertising sync.

参数

- **addr** -[in] : Peer device address
- **service_data** -[in] : Service data used by Host
- **sync_handle** -[in] : Handle of periodic advertising sync

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_set_info_trans** (*esp_bd_addr_t* addr, uint16_t service_data, uint8_t adv_handle)

This function is used to transfer periodic advertising set info.

参数

- **addr** -[in] : Peer device address
- **service_data** -[in] : Service data used by Host
- **adv_handle** -[in] : Handle of advertising set

返回 - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_set_periodic_adv_sync_trans_params** (*esp_bd_addr_t* addr, const *esp_ble_gap_past_params_t* *params)

This function is used to set periodic advertising sync transfer params.

参数

- **addr** - [in] : Peer device address
- **params** - [in] : Params of periodic advertising sync transfer

返回 - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_clear_advertising** (void)

This function is used to clear legacy advertising.

返回 - ESP_OK : success

- other : failed

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT.
```

Public Members

esp_bt_status_t status

Indicate periodic advertising data set status

```
struct ble_periodic_adv_rcv_enable_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_RECV_ENABLE_COMPLETE_EVT.
```

Public Members

esp_bt_status_t status

Set periodic advertising receive enable status

```
struct ble_periodic_adv_report_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT.
```

Public Members

esp_ble_gap_periodic_adv_report_t params

periodic advertising report parameters

```
struct ble_periodic_adv_set_info_trans_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SET_INFO_TRANS_COMPLETE_EVT.
```

Public Members

esp_bt_status_t status

Periodic advertising set info transfer status

esp_bd_addr_t bda

The remote device address

```
struct ble_periodic_adv_set_params_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT.
```

Public Members

esp_bt_status_t status

Indicate periodic advertising parameters set status

```
struct ble_periodic_adv_start_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT.
```

Public Members

esp_bt_status_t **status**

Indicate periodic advertising start status

struct **ble_periodic_adv_stop_cmpl_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate periodic advertising stop status

struct **ble_periodic_adv_sync_estab_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTAB_EVT.

Public Members

uint8_t **status**

periodic advertising sync status

uint16_t **sync_handle**

periodic advertising sync handle

uint8_t **sid**

periodic advertising sid

esp_ble_addr_type_t **adv_addr_type**

periodic advertising address type

esp_bd_addr_t **adv_addr**

periodic advertising address

esp_ble_gap_phy_t **adv_phy**

periodic advertising phy type

uint16_t **period_adv_interval**

periodic advertising interval

uint8_t **adv_clk_accuracy**

periodic advertising clock accuracy

struct **ble_periodic_adv_sync_lost_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT.

Public Members**uint16_t sync_handle**

sync handle

struct **ble_periodic_adv_sync_trans_cmpl_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_COMPLETE_EVT.

Public Members*esp_bt_status_t* **status**

Periodic advertising sync transfer status

esp_bd_addr_t **bda**

The remote device address

struct **ble_periodic_adv_sync_trans_rcv_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_RECV_EVT.

Public Members*esp_bt_status_t* **status**

Periodic advertising sync transfer received status

esp_bd_addr_t **bda**

The remote device address

uint16_t service_data

The value provided by the peer device

uint16_t sync_handle

Periodic advertising sync handle

uint8_t adv_sid

Periodic advertising set id

uint8_t adv_addr_type

Periodic advertiser address type

esp_bd_addr_t **adv_addr**

Periodic advertiser address

esp_ble_gap_phy_t **adv_phy**

Periodic advertising PHY

uint16_t adv_interval

Periodic advertising interval

uint8_t **adv_clk_accuracy**

Periodic advertising clock accuracy

struct **ble_phy_update_cmpl_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

phy update status

esp_bd_addr_t **bda**

address

esp_ble_gap_phy_t **tx_phy**

tx phy type

esp_ble_gap_phy_t **rx_phy**

rx phy type

struct **ble_pkt_data_length_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the set pkt data length operation success status

esp_ble_pkt_data_length_params_t **params**

pkt data length value

struct **ble_read_phy_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_READ_PHY_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

read phy complete status

esp_bd_addr_t **bda**

read phy address

esp_ble_gap_phy_t **tx_phy**

tx phy type

esp_ble_gap_phy_t rx_phy

rx phy type

struct **ble_read_rssi_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT.

Public Members

esp_bt_status_t status

Indicate the read adv tx power operation success status

int8_t **rssi**

The ble remote device rssi value, the range is from -127 to 20, the unit is dbm, if the RSSI cannot be read, the RSSI metric shall be set to 127.

esp_bd_addr_t remote_addr

The remote device address

struct **ble_remove_bond_dev_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT.

Public Members

esp_bt_status_t status

Indicate the remove bond device operation success status

esp_bd_addr_t bd_addr

The device address which has been remove from the bond list

struct **ble_scan_param_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t status

Indicate the set scan param operation success status

struct **ble_scan_req_received_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT.

Public Members

uint8_t **adv_instance**

extend advertising handle

esp_ble_addr_type_t **scan_addr_type**
scanner address type

esp_bd_addr_t **scan_addr**
scanner address

struct **ble_scan_result_evt_param**
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RESULT_EVT.

Public Members

esp_gap_search_evt_t **search_evt**
Search event type

esp_bd_addr_t **bda**
Bluetooth device address which has been searched

esp_bt_dev_type_t **dev_type**
Device type

esp_ble_addr_type_t **ble_addr_type**
Ble device address type

esp_ble_evt_type_t **ble_evt_type**
Ble scan result event type

int **rssi**
Searched device' s RSSI

uint8_t **ble_adv**[31 + 31]
Received EIR

int **flag**
Advertising data flag bit

int **num_resps**
Scan result number

uint8_t **adv_data_len**
Adv data length

uint8_t **scan_rsp_len**
Scan response length

uint32_t **num_dis**
The number of discard packets

struct **ble_scan_rsp_data_cmpl_evt_param**
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT.

Public Members*esp_bt_status_t* status

Indicate the set scan response data operation success status

```
struct ble_scan_rsp_data_raw_cmpl_evt_param
```

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT.
```

Public Members*esp_bt_status_t* status

Indicate the set raw advertising data operation success status

```
struct ble_scan_start_cmpl_evt_param
```

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_START_COMPLETE_EVT.
```

Public Members*esp_bt_status_t* status

Indicate scan start operation success status

```
struct ble_scan_stop_cmpl_evt_param
```

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT.
```

Public Members*esp_bt_status_t* status

Indicate scan stop operation success status

```
struct ble_set_channels_evt_param
```

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_CHANNELS_EVT.
```

Public Members*esp_bt_status_t* stat

BLE set channel status

```
struct ble_set_ext_scan_params_cmpl_param
```

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT.
```

Public Members*esp_bt_status_t* status

Indicate extend advertising parameters set status

```
struct ble_set_past_params_cmpl_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PAST_PARAMS_COMPLETE_EVT.
```

Public Members

esp_bt_status_t **status**
Set periodic advertising sync transfer params status

esp_bd_addr_t **bda**
The remote device address

```
struct ble_set_perf_def_phy_cmpl_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERED_DEFAULT_PHY_COMPLETE_EVT.
```

Public Members

esp_bt_status_t **status**
Indicate perf default phy set status

```
struct ble_set_perf_phy_cmpl_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT.
```

Public Members

esp_bt_status_t **status**
Indicate perf phy set status

```
struct ble_set_rand_cmpl_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.
```

Public Members

esp_bt_status_t **status**
Indicate set static rand address operation success status

```
struct ble_update_conn_params_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT.
```

Public Members

esp_bt_status_t **status**
Indicate update connection parameters success status

esp_bd_addr_t **bda**
Bluetooth device address

`uint16_t min_int`

Min connection interval

`uint16_t max_int`

Max connection interval

`uint16_t latency`

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t conn_int`

Current connection interval

`uint16_t timeout`

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

struct `ble_update_duplicate_exceptional_list_cmpl_evt_param`

`#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.`

Public Members

`esp_bt_status_t status`

Indicate update duplicate scan exceptional list operation success status

`uint8_t subcode`

Define in `esp_bt_duplicate_exceptional_subcode_type_t`

`uint16_t length`

The length of `device_info`

`esp_duplicate_info_t device_info`

device information, when subcode is `ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN`, the value is invalid

struct `ble_update_whitelist_cmpl_evt_param`

`#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.`

Public Members

`esp_bt_status_t status`

Indicate the add or remove whitelist operation success status

`esp_ble_wl_operation_t wl_operation`

The value is `ESP_BLE_WHITELIST_ADD` if add address to whitelist operation success, `ESP_BLE_WHITELIST_REMOVE` if remove address from the whitelist operation success

Structures

struct **esp_ble_adv_params_t**

Advertising parameters.

Public Members

uint16_t **adv_int_min**

Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t **adv_int_max**

Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval

esp_ble_adv_type_t **adv_type**

Advertising type

esp_ble_addr_type_t **own_addr_type**

Owner bluetooth device address type

esp_bd_addr_t **peer_addr**

Peer device bluetooth device address

esp_ble_addr_type_t **peer_addr_type**

Peer device bluetooth device address type, only support public address type and random address type

esp_ble_adv_channel_t **channel_map**

Advertising channel map

esp_ble_adv_filter_t **adv_filter_policy**

Advertising filter policy

struct **esp_ble_adv_data_t**

Advertising data content, according to “Supplement to the Bluetooth Core Specification” .

Public Members

bool **set_scan_rsp**

Set this advertising data as scan response or not

bool **include_name**

Advertising data include device name or not

bool **include_txpower**

Advertising data include TX power

int min_interval

Advertising data show slave preferred connection min interval. The connection interval in the following manner: $\text{connIntervalmin} = \text{Conn_Interval_Min} * 1.25 \text{ ms}$ Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int max_interval

Advertising data show slave preferred connection max interval. The connection interval in the following manner: $\text{connIntervalmax} = \text{Conn_Interval_Max} * 1.25 \text{ ms}$ Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int appearance

External appearance of device

uint16_t manufacturer_len

Manufacturer data length

uint8_t *p_manufacturer_data

Manufacturer data point

uint16_t service_data_len

Service data length

uint8_t *p_service_data

Service data point

uint16_t service_uuid_len

Service uuid length

uint8_t *p_service_uuid

Service uuid array point

uint8_t flag

Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t

Ble scan parameters.

Public Members*esp_ble_scan_type_t* **scan_type**

Scan type

esp_ble_addr_type_t **own_addr_type**

Owner address type

esp_ble_scan_filter_t **scan_filter_policy**

Scan filter policy

uint16_t scan_interval

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = $N * 0.625$ msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window

Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = $N * 0.625$ msec Time Range: 2.5 msec to 10240 msec

***esp_ble_scan_duplicate_t* scan_duplicate**

The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct **esp_gap_conn_params_t**

connection parameters information

Public Members**uint16_t interval**

connection interval

uint16_t latency

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = $N * 10$ msec Time Range: 100 msec to 32 seconds

struct **esp_ble_conn_update_params_t**

Connection update parameters.

Public Members***esp_bd_addr_t* bda**

Bluetooth device address

uint16_t min_int

Min connection interval

uint16_t max_int

Max connection interval

uint16_t latency

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t timeout`

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct `esp_ble_pkt_data_length_params_t`

BLE pkt data length keys.

Public Members

`uint16_t rx_len`

pkt rx data length value

`uint16_t tx_len`

pkt tx data length value

struct `esp_ble_penc_keys_t`

BLE encryption keys.

Public Members

`esp_bt_octet16_t ltk`

The long term key

`esp_bt_octet8_t rand`

The random number

`uint16_t ediv`

The ediv value

`uint8_t sec_level`

The security level of the security link

`uint8_t key_size`

The key size(7~16) of the security link

struct `esp_ble_pcsrkeys_t`

BLE CSRK keys.

Public Members

`uint32_t counter`

The counter

`esp_bt_octet16_t csrkey`

The csrkey

uint8_t **sec_level**
The security level

struct **esp_ble_pid_keys_t**
BLE pid keys.

Public Members

esp_bt_octet16_t **irk**
The irk value

esp_ble_addr_type_t **addr_type**
The address type

esp_bd_addr_t **static_addr**
The static address

struct **esp_ble_lenc_keys_t**
BLE Encryption reproduction keys.

Public Members

esp_bt_octet16_t **ltk**
The long term key

uint16_t **div**
The div value

uint8_t **key_size**
The key size of the security link

uint8_t **sec_level**
The security level of the security link

struct **esp_ble_lcsrk_keys**
BLE SRK keys.

Public Members

uint32_t **counter**
The counter value

uint16_t **div**
The div value

uint8_t **sec_level**

The security level of the security link

esp_bt_octet16_t **csrkey**

The csrkey value

struct **esp_ble_sec_key_notif_t**

Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

esp_bd_addr_t **bd_addr**

peer address

uint32_t **passkey**

the numeric value for comparison. If just_works, do not show this number to UI

struct **esp_ble_sec_req_t**

Structure of the security request.

Public Members

esp_bd_addr_t **bd_addr**

peer address

struct **esp_ble_bond_key_info_t**

struct type of the bond key information value

Public Members

esp_ble_key_mask_t **key_mask**

the key mask to indicate which key is present

esp_ble_penc_keys_t **penc_key**

received peer encryption key

esp_ble_pcsrkey_keys_t **pcsrkey_key**

received peer device SRK

esp_ble_pid_keys_t **pid_key**

peer device ID key

struct **esp_ble_bond_dev_t**

struct type of the bond device value

Public Members

esp_bd_addr_t **bd_addr**

peer address

esp_ble_bond_key_info_t **bond_key**

the bond key information

struct **esp_ble_key_t**

union type of the security key value

Public Members

esp_bd_addr_t **bd_addr**

peer address

esp_ble_key_type_t **key_type**

key type of the security link

esp_ble_key_value_t **p_key_value**

the pointer to the key value

struct **esp_ble_local_id_keys_t**

structure type of the ble local id keys value

Public Members

esp_bt_octet16_t **ir**

the 16 bits of the ir value

esp_bt_octet16_t **irk**

the 16 bits of the ir key value

esp_bt_octet16_t **dhk**

the 16 bits of the dh key value

struct **esp_ble_local_oob_data_t**

structure type of the ble local oob data value

Public Members

esp_bt_octet16_t **oob_c**

the 128 bits of confirmation value

esp_bt_octet16_t **oob_r**

the 128 bits of randomizer value

struct **esp_ble_auth_cmpl_t**

Structure associated with ESP_AUTH_CMPL_EVT.

Public Members

esp_bd_addr_t **bd_addr**

BD address peer device.

bool **key_present**

Valid link key value in key element

esp_link_key **key**

Link key associated with peer device.

uint8_t **key_type**

The type of Link Key

bool **success**

TRUE of authentication succeeded, FALSE if failed.

uint8_t **fail_reason**

The HCI reason/error code for when success=FALSE

esp_ble_addr_type_t **addr_type**

Peer device address type

esp_bt_dev_type_t **dev_type**

Device type

esp_ble_auth_req_t **auth_mode**

authentication mode

struct **esp_ble_gap_ext_adv_params_t**

ext adv parameters

Public Members

esp_ble_ext_adv_type_mask_t **type**

ext adv type

uint32_t **interval_min**

ext adv minimum interval

uint32_t **interval_max**

ext adv maximum interval

esp_ble_adv_channel_t **channel_map**
ext adv channel map

esp_ble_addr_type_t **own_addr_type**
ext adv own address type

esp_ble_addr_type_t **peer_addr_type**
ext adv peer address type

esp_bd_addr_t **peer_addr**
ext adv peer address

esp_ble_adv_filter_t **filter_policy**
ext adv filter policy

int8_t **tx_power**
ext adv tx power

esp_ble_gap_pri_phy_t **primary_phy**
ext adv primary phy

uint8_t **max_skip**
ext adv maximum skip

esp_ble_gap_phy_t **secondary_phy**
ext adv secondary phy

uint8_t **sid**
ext adv sid

bool **scan_req_notif**
ext adv scan request event notify

struct **esp_ble_ext_scan_cfg_t**
ext scan config

Public Members

esp_ble_scan_type_t **scan_type**
ext scan type

uint16_t **scan_interval**
ext scan interval

uint16_t **scan_window**
ext scan window

struct **esp_ble_ext_scan_params_t**
ext scan parameters

Public Members

esp_ble_addr_type_t **own_addr_type**
ext scan own addresss type

esp_ble_scan_filter_t **filter_policy**
ext scan filter policy

esp_ble_scan_duplicate_t **scan_duplicate**
ext scan duplicate scan

esp_ble_ext_scan_cfg_mask_t **cfg_mask**
ext scan config mask

esp_ble_ext_scan_cfg_t **uncoded_cfg**
ext scan uncoded config parameters

esp_ble_ext_scan_cfg_t **coded_cfg**
ext scan coded config parameters

struct **esp_ble_gap_conn_params_t**
create extend connection parameters

Public Members

uint16_t **scan_interval**
init scan interval

uint16_t **scan_window**
init scan window

uint16_t **interval_min**
minimum interval

uint16_t **interval_max**
maximum interval

uint16_t **latency**
ext scan type

uint16_t **supervision_timeout**
connection supervision timeout

uint16_t **min_ce_len**
minimum ce length

uint16_t **max_ce_len**
maximum ce length

struct **esp_ble_gap_ext_adv_t**
extend adv enable parameters

Public Members

uint8_t **instance**
advertising handle

int **duration**
advertising duration

int **max_events**
maximum number of extended advertising events

struct **esp_ble_gap_periodic_adv_params_t**
periodic adv parameters

Public Members

uint16_t **interval_min**
periodic advertising minimum interval

uint16_t **interval_max**
periodic advertising maximum interval

uint8_t **properties**
periodic advertising properties

struct **esp_ble_gap_periodic_adv_sync_params_t**
periodic adv sync parameters

Public Members

esp_ble_gap_sync_t **filter_policy**
periodic advertising sync filter policy

uint8_t **sid**
periodic advertising sid

esp_ble_addr_type_t **addr_type**
periodic advertising address type

esp_bd_addr_t **addr**
periodic advertising address

uint16_t **skip**

the maximum number of periodic advertising events that can be skipped

uint16_t **sync_timeout**

synchronization timeout

struct **esp_ble_gap_ext_adv_reprot_t**

extend adv report parameters

Public Members

esp_ble_gap_adv_type_t **event_type**

extend advertising type

uint8_t **addr_type**

extend advertising address type

esp_bd_addr_t **addr**

extend advertising address

esp_ble_gap_pri_phy_t **primary_phy**

extend advertising primary phy

esp_ble_gap_phy_t **secondly_phy**

extend advertising secondary phy

uint8_t **sid**

extend advertising sid

uint8_t **tx_power**

extend advertising tx power

int8_t **rssi**

extend advertising rssi

uint16_t **per_adv_interval**

periodic advertising interval

uint8_t **dir_addr_type**

direct address type

esp_bd_addr_t **dir_addr**

direct address

esp_ble_gap_ext_adv_data_status_t **data_status**

data type

uint8_t **adv_data_len**
extend advertising data length

uint8_t **adv_data**[251]
extend advertising data

struct **esp_ble_gap_periodic_adv_report_t**
periodic adv report parameters

Public Members

uint16_t **sync_handle**
periodic advertising train handle

uint8_t **tx_power**
periodic advertising tx power

int8_t **rssi**
periodic advertising rssi

[*esp_ble_gap_ext_adv_data_status_t*](#) **data_status**
periodic advertising data type

uint8_t **data_length**
periodic advertising data length

uint8_t **data**[251]
periodic advertising data

struct **esp_ble_gap_periodic_adv_sync_estab_t**
periodic adv sync establish parameters

Public Members

uint8_t **status**
periodic advertising sync status

uint16_t **sync_handle**
periodic advertising train handle

uint8_t **sid**
periodic advertising sid

[*esp_ble_addr_type_t*](#) **addr_type**
periodic advertising address type

esp_bd_addr_t **adv_addr**

periodic advertising address

esp_ble_gap_phy_t **adv_phy**

periodic advertising adv phy type

uint16_t **period_adv_interval**

periodic advertising interval

uint8_t **adv_clk_accuracy**

periodic advertising clock accuracy

struct **esp_ble_gap_past_params_t**

periodic adv sync transfer parameters

Public Members

esp_ble_gap_past_mode_t **mode**

periodic advertising sync transfer mode

uint16_t **skip**

the number of periodic advertising packets that can be skipped

uint16_t **sync_timeout**

synchronization timeout for the periodic advertising train

uint8_t **cte_type**

periodic advertising sync transfer CET type

Macros

ESP_BLE_ADV_FLAG_LIMIT_DISC

BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag.

ESP_BLE_ADV_FLAG_GEN_DISC

ESP_BLE_ADV_FLAG_BREDR_NOT_SPT

ESP_BLE_ADV_FLAG_DMT_CONTROLLER_SPT

ESP_BLE_ADV_FLAG_DMT_HOST_SPT

ESP_BLE_ADV_FLAG_NON_LIMIT_DISC

ESP_LE_KEY_NONE

relate to BTM_LE_KEY_xxx in stack/btm_api.h

No encryption key

ESP_LE_KEY_PENC

encryption key, encryption information of peer device

ESP_LE_KEY_PID

identity key of the peer device

ESP_LE_KEY_PCSRK

peer SRK

ESP_LE_KEY_PLK

Link key

ESP_LE_KEY_LLK

peer link key

ESP_LE_KEY_LENC

master role security information:div

ESP_LE_KEY_LID

master device ID key

ESP_LE_KEY_LCSRK

local CSRK has been deliver to peer

ESP_LE_AUTH_NO_BOND

relate to BTM_LE_AUTH_xxx in stack/btm_api.h

0 no bondingv

ESP_LE_AUTH_BOND

1 << 0 device in the bonding with peer

ESP_LE_AUTH_REQ_MITM

1 << 2 man in the middle attack

ESP_LE_AUTH_REQ_BOND_MITM

0101 banding with man in the middle attack

ESP_LE_AUTH_REQ_SC_ONLY

1 << 3 secure connection

ESP_LE_AUTH_REQ_SC_BOND

1001 secure connection with band

ESP_LE_AUTH_REQ_SC_MITM

1100 secure conn with MITM

ESP_LE_AUTH_REQ_SC_MITM_BOND

1101 SC with MITM and Bonding

ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_DISABLE

authentication disable

ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE

authentication enable

ESP_BLE_OOB_DISABLE

disbale the out of bond

ESP_BLE_OOB_ENABLE

enable the out of bond

ESP_IO_CAP_OUT

relate to BTM_IO_CAP_xxx in stack/btm_api.h

DisplayOnly

ESP_IO_CAP_IO

DisplayYesNo

ESP_IO_CAP_IN

KeyboardOnly

ESP_IO_CAP_NONE

NoInputNoOutput

ESP_IO_CAP_KBDISP

Keyboard display

ESP_BLE_APPEARANCE_UNKNOWN

relate to BTM_BLE_APPEARANCE_UNKNOWN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PHONE

relate to BTM_BLE_APPEARANCE_GENERIC_PHONE in stack/btm_ble_api.h

relate to BTM_BLE_APPEARANCE_CYCLING_SPEED in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_CADENCE

relate to BTM_BLE_APPEARANCE_CYCLING_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_POWER

relate to BTM_BLE_APPEARANCE_CYCLING_POWER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_SPEED_CADENCE

relate to BTM_BLE_APPEARANCE_CYCLING_SPEED_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER

relate to BTM_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP

relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_PULSE_OXIMETER_WRIST

relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_WRIST in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WEIGHT

relate to BTM_BLE_APPEARANCE_GENERIC_WEIGHT in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE

relate to BTM_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_POWERED_WHEELCHAIR

relate to BTM_BLE_APPEARANCE_POWERED_WHEELCHAIR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_MOBILITY_SCOOTER

relate to BTM_BLE_APPEARANCE_MOBILITY_SCOOTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CONTINUOUS_GLUCOSE_MONITOR

relate to BTM_BLE_APPEARANCE_GENERIC_CONTINUOUS_GLUCOSE_MONITOR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_INSULIN_PUMP

relate to BTM_BLE_APPEARANCE_GENERIC_INSULIN_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP

relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP

relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PEN

relate to BTM_BLE_APPEARANCE_INSULIN_PEN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY

relate to BTM_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS

relate to BTM_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV in stack/btm_ble_api.h

ESP_GAP_BLE_CHANNELS_LEN

channel length

ESP_GAP_BLE_ADD_WHITELIST_COMPLETE_EVT

This is the old name, just for backwards compatibility.

ESP_BLE_ADV_DATA_LEN_MAX

Advertising data maximum length.

ESP_BLE_SCAN_RSP_DATA_LEN_MAX

Scan response data maximum length.

BLE_BIT (n)

ESP_BLE_GAP_SET_EXT_ADV_PROP_NONCONN_NONSCANNABLE_UNDIRECTED

Non-Connectable and Non-Scannable Undirected advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_CONNECTABLE

Connectable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_SCANNABLE

Scannable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_DIRECTED

Directed advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_HD_DIRECTED

High Duty Cycle Directed Connectable advertising (<= 3.75 ms Advertising Interval)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY

Use legacy advertising PDUs

ESP_BLE_GAP_SET_EXT_ADV_PROP_ANON_ADV

Omit advertiser's address from all PDUs ("anonymous advertising")

ESP_BLE_GAP_SET_EXT_ADV_PROP_INCLUDE_TX_PWR

Include TxPower in the extended header of the advertising PDU

ESP_BLE_GAP_SET_EXT_ADV_PROP_MASK

Reserved for future use If extended advertising PDU types are being used (bit 4 = 0) then: The advertisement shall not be both connectable and scannable. High duty cycle directed connectable advertising (<= 3.75 ms advertising interval) shall not be used (bit 3 = 0)ADV_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_IND

ADV_DIRECT_IND (low duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_LD_DIR

ADV_DIRECT_IND (high duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_HD_DIR

ADV_SCAN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_SCAN

ADV_NONCONN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_NONCONN**ESP_BLE_GAP_PHY_1M**

Secondary Advertisement PHY is LE1M

ESP_BLE_GAP_PHY_2M

Secondary Advertisement PHY is LE2M

ESP_BLE_GAP_PHY_CODED

Secondary Advertisement PHY is LE Coded

ESP_BLE_GAP_NO_PREFER_TRANSMIT_PHY

No Prefer TX PHY supported by controller

ESP_BLE_GAP_NO_PREFER_RECEIVE_PHY

No Prefer RX PHY supported by controller

ESP_BLE_GAP_PRI_PHY_1M

Primary phy only support 1M and LE coded phy.

Primary Phy is LE1M

ESP_BLE_GAP_PRI_PHY_CODED

Primary Phy is LE CODED

ESP_BLE_GAP_PHY_1M_PREF_MASK

The Host prefers use the LE1M transmitter or reciever PHY

ESP_BLE_GAP_PHY_2M_PREF_MASK

The Host prefers use the LE2M transmitter or reciever PHY

ESP_BLE_GAP_PHY_CODED_PREF_MASK

The Host prefers use the LE CODED transmitter or reciever PHY

ESP_BLE_GAP_PHY_OPTIONS_NO_PREF

The Host has no preferred coding when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S2_CODING

The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S8_CODING

The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_EXT_SCAN_CFG_UNCODE_MASK

Scan Advertisements on the LE1M PHY

ESP_BLE_GAP_EXT_SCAN_CFG_CODE_MASK

Scan advertisements on the LE coded PHY

ESP_BLE_GAP_EXT_ADV_DATA_COMPLETE

Advertising data.

extended advertising data compete

ESP_BLE_GAP_EXT_ADV_DATA_INCOMPLETE

extended advertising data incomplete

ESP_BLE_GAP_EXT_ADV_DATA_TRUNCATED

extended advertising data truncated mode

ESP_BLE_GAP_SYNC_POLICY_BY_ADV_INFO

Advertising SYNC policy.

sync policy by advertising info

ESP_BLE_GAP_SYNC_POLICY_BY_PERIODIC_LIST

periodic advertising sync policy

ESP_BLE_ADV_REPORT_EXT_ADV_IND

Advertising report.

advertising report with extended advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_IND

advertising report with extended scan indication type

ESP_BLE_ADV_REPORT_EXT_DIRECT_ADV

advertising report with extended direct advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_RSP

advertising report with extended scan response indication type Bluetooth 5.0, Vol 2, Part E, 7.7.65.13

ESP_BLE_LEGACY_ADV_TYPE_IND

advertising report with legacy advertising indication type

ESP_BLE_LEGACY_ADV_TYPE_DIRECT_IND

advertising report with legacy direct indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_IND

advertising report with legacy scan indication type

ESP_BLE_LEGACY_ADV_TYPE_NONCON_IND

advertising report with legacy non connectable indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_IND

advertising report with legacy scan response indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_SCAN_IND

advertising report with legacy advertising with scan response indication type

EXT_ADV_TX_PWR_NO_PREFERENCE

Extend advertising tx power, range: [-127, +126] dBm.

host has no preference for tx power

ESP_BLE_GAP_PAST_MODE_NO_SYNC_EVT

Periodic advertising sync trans mode.

No attempt is made to sync and no periodic adv sync transfer received event

ESP_BLE_GAP_PAST_MODE_NO_REPORT_EVT

An periodic adv sync transfer received event and no periodic adv report events

ESP_BLE_GAP_PAST_MODE_DUP_FILTER_DISABLED

Periodic adv report events will be enabled with duplicate filtering disabled

ESP_BLE_GAP_PAST_MODE_DUP_FILTER_ENABLED

Periodic adv report events will be enabled with duplicate filtering enabled

Type Definitions

```
typedef uint8_t esp_ble_key_type_t
```

```
typedef uint8_t esp_ble_auth_req_t
```

combination of the above bit pattern

```
typedef uint8_t esp_ble_io_cap_t
```

combination of the io capability

```
typedef uint8_t esp_gap_ble_channels[5]
```

```

```
typedef uint8_t esp_ble_gap_adv_type_t
```

```
typedef uint8_t esp_ble_gap_past_mode_t
```

```
typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)
```

GAP callback function type.

Param event : Event type

Param param : Point to callback parameter, currently is union type

Enumerations

```
enum esp_gap_ble_cb_event_t
```

GAP BLE callback event type.

Values:

enumerator **ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT**

When advertising data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT**

When scan response data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT**

When scan parameters set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RESULT_EVT**

When one scan result ready, the event comes each time

enumerator **ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT**

When raw advertising data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT**

When raw scan response data set complete, the event comes

enumerator **ESP_GAP_BLE_ADV_START_COMPLETE_EVT**

When start advertising complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_START_COMPLETE_EVT**

When start scan complete, the event comes

enumerator **ESP_GAP_BLE_AUTH_CMPL_EVT**

Authentication complete indication.

enumerator **ESP_GAP_BLE_KEY_EVT**

BLE key event for peer device keys

enumerator **ESP_GAP_BLE_SEC_REQ_EVT**

BLE security request

enumerator **ESP_GAP_BLE_PASSKEY_NOTIF_EVT**

passkey notification event

enumerator **ESP_GAP_BLE_PASSKEY_REQ_EVT**

passkey request event

enumerator **ESP_GAP_BLE_OOB_REQ_EVT**

OOB request event

enumerator **ESP_GAP_BLE_LOCAL_IR_EVT**

BLE local IR (identity Root 128-bit random static value used to generate Long Term Key) event

enumerator **ESP_GAP_BLE_LOCAL_ER_EVT**

BLE local ER (Encryption Root value used to generate identity resolving key) event

enumerator **ESP_GAP_BLE_NC_REQ_EVT**

Numeric Comparison request event

enumerator **ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT**

When stop adv complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT**

When stop scan complete, the event comes

enumerator **ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT**

When set the static rand address complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT**

When update connection parameters complete, the event comes

enumerator **ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT**

When set pkt length complete, the event comes

enumerator **ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT**

When Enable/disable privacy on the local device complete, the event comes

enumerator **ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT**

When remove the bond device complete, the event comes

enumerator **ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT**

When clear the bond device clear complete, the event comes

enumerator **ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT**

When get the bond device list complete, the event comes

enumerator **ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT**

When read the rssi complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT**

When add or remove whitelist complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT**

When update duplicate exceptional list complete, the event comes

enumerator **ESP_GAP_BLE_SET_CHANNELS_EVT**

When setting BLE channels complete, the event comes

enumerator **ESP_GAP_BLE_READ_PHY_COMPLETE_EVT**

when reading phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERED_DEFAULT_PHY_COMPLETE_EVT**

when preferred default phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT**

when preferred phy complete , this event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT**

when extended set random address complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_PARAMS_COMPLETE_EVT**

when extended advertising parameter complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_DATA_SET_COMPLETE_EVT**

when extended advertising data complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_RSP_DATA_SET_COMPLETE_EVT**

when extended scan response data complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_START_COMPLETE_EVT**

when extended advertising start complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_STOP_COMPLETE_EVT**

when extended advertising stop complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_REMOVE_COMPLETE_EVT**

when extended advertising set remove complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_CLEAR_COMPLETE_EVT**

when extended advertising set clear complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT**

when periodic advertising parameter complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT**

when periodic advertising data complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT**

when periodic advertising start complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT**

when periodic advertising stop complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_CREATE_SYNC_COMPLETE_EVT**

when periodic advertising create sync complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_CANCEL_COMPLETE_EVT**

when extended advertising sync cancel complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_TERMINATE_COMPLETE_EVT**

when extended advertising sync terminate complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_ADD_DEV_COMPLETE_EVT**

when extended advertising add device complete , the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_REMOVE_DEV_COMPLETE_EVT**

when extended advertising remove device complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_CLEAR_DEV_COMPLETE_EVT**

when extended advertising clear device, the event comes

enumerator **ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT**

when extended scan parameter complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_START_COMPLETE_EVT**

when extended scan start complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_STOP_COMPLETE_EVT**

when extended scan stop complete, the event comes

enumerator **ESP_GAP_BLE_PREFER_EXT_CONN_PARAMS_SET_COMPLETE_EVT**

when extended prefer connection parameter set complete, the event comes

enumerator **ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT**

when ble phy update complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_REPORT_EVT**

when extended advertising report complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_TIMEOUT_EVT**

when scan timeout complete, the event comes

enumerator **ESP_GAP_BLE_ADV_TERMINATED_EVT**

when advertising terminate data complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT**

when scan req received complete, the event comes

enumerator **ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT**

when channel select algorithm complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT**

when periodic report advertising complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT**

when periodic advertising sync lost complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTAB_EVT**

when periodic advertising sync establish complete, the event comes

enumerator **ESP_GAP_BLE_SC_OOB_REQ_EVT**

Secure Connection OOB request event

enumerator **ESP_GAP_BLE_SC_CR_LOC_OOB_EVT**

Secure Connection create OOB data complete event

enumerator **ESP_GAP_BLE_GET_DEV_NAME_COMPLETE_EVT**

When getting BT device name complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_RECV_ENABLE_COMPLETE_EVT**

when set periodic advertising receive enable complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_COMPLETE_EVT**

when periodic advertising sync transfer complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SET_INFO_TRANS_COMPLETE_EVT**

when periodic advertising set info transfer complete, the event comes

enumerator **ESP_GAP_BLE_SET_PAST_PARAMS_COMPLETE_EVT**

when set periodic advertising sync transfer params complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_RECV_EVT**

when periodic advertising sync transfer received, the event comes

enumerator **ESP_GAP_BLE_ADV_CLEAR_COMPLETE_EVT**

When clear advertising complete, the event comes

enumerator **ESP_GAP_BLE_EVT_MAX**

when maximum advertising event complete, the event comes

enum **esp_ble_adv_data_type**

The type of advertising data(not adv_type)

Values:

enumerator **ESP_BLE_AD_TYPE_FLAG**

enumerator **ESP_BLE_AD_TYPE_16SRV_PART**

enumerator **ESP_BLE_AD_TYPE_16SRV_CMPL**

enumerator **ESP_BLE_AD_TYPE_32SRV_PART**

enumerator **ESP_BLE_AD_TYPE_32SRV_CMPL**

enumerator **ESP_BLE_AD_TYPE_128SRV_PART**

enumerator **ESP_BLE_AD_TYPE_128SRV_CMPL**

enumerator **ESP_BLE_AD_TYPE_NAME_SHORT**

enumerator **ESP_BLE_AD_TYPE_NAME_CMPL**

enumerator **ESP_BLE_AD_TYPE_TX_PWR**

enumerator **ESP_BLE_AD_TYPE_DEV_CLASS**

enumerator **ESP_BLE_AD_TYPE_SM_TK**

enumerator **ESP_BLE_AD_TYPE_SM_OOB_FLAG**

enumerator **ESP_BLE_AD_TYPE_INT_RANGE**

enumerator **ESP_BLE_AD_TYPE_SOL_SRV_UUID**

enumerator **ESP_BLE_AD_TYPE_128SOL_SRV_UUID**

enumerator **ESP_BLE_AD_TYPE_SERVICE_DATA**

enumerator **ESP_BLE_AD_TYPE_PUBLIC_TARGET**

enumerator **ESP_BLE_AD_TYPE_RANDOM_TARGET**

enumerator **ESP_BLE_AD_TYPE_APPEARANCE**

enumerator **ESP_BLE_AD_TYPE_ADV_INT**

enumerator **ESP_BLE_AD_TYPE_LE_DEV_ADDR**

enumerator **ESP_BLE_AD_TYPE_LE_ROLE**

enumerator **ESP_BLE_AD_TYPE_SPAIR_C256**

enumerator **ESP_BLE_AD_TYPE_SPAIR_R256**

enumerator **ESP_BLE_AD_TYPE_32SOL_SRV_UUID**

enumerator **ESP_BLE_AD_TYPE_32SERVICE_DATA**

enumerator **ESP_BLE_AD_TYPE_128SERVICE_DATA**

enumerator **ESP_BLE_AD_TYPE_LE_SECURE_CONFIRM**

enumerator **ESP_BLE_AD_TYPE_LE_SECURE_RANDOM**

enumerator **ESP_BLE_AD_TYPE_URI**

enumerator **ESP_BLE_AD_TYPE_INDOOR_POSITION**

enumerator **ESP_BLE_AD_TYPE_TRANS_DISC_DATA**

enumerator **ESP_BLE_AD_TYPE_LE_SUPPORT_FEATURE**

enumerator **ESP_BLE_AD_TYPE_CHAN_MAP_UPDATE**

enumerator **ESP_BLE_AD_MANUFACTURER_SPECIFIC_TYPE**

enum **esp_ble_adv_type_t**

Advertising mode.

Values:

enumerator **ADV_TYPE_IND**

enumerator **ADV_TYPE_DIRECT_IND_HIGH**

enumerator **ADV_TYPE_SCAN_IND**

enumerator **ADV_TYPE_NONCONN_IND**

enumerator **ADV_TYPE_DIRECT_IND_LOW**

enum **esp_ble_adv_channel_t**

Advertising channel mask.

Values:

enumerator **ADV_CHNL_37**

enumerator **ADV_CHNL_38**

enumerator **ADV_CHNL_39**

enumerator **ADV_CHNL_ALL**

enum **esp_ble_adv_filter_t**

Values:

enumerator **ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY**

Allow both scan and connection requests from anyone.

enumerator **ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY**

Allow both scan req from White List devices only and connection req from anyone.

enumerator **ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST**

Allow both scan req from anyone and connection req from White List devices only.

enumerator **ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST**

Allow scan and connection requests from White List devices only.

enum **esp_ble_sec_act_t**

Values:

enumerator **ESP_BLE_SEC_ENCRYPT**

relate to `BTA_DM_BLE_SEC_ENCRYPT` in `bta/bta_api.h`. If the device has already bonded, the stack will use Long Term Key (LTK) to encrypt with the remote device directly. Else if the device hasn't bonded, the stack will use the default authentication request used in the `esp_ble_gap_set_security_param` function set by the user.

enumerator **ESP_BLE_SEC_ENCRYPT_NO_MITM**

relate to `BTA_DM_BLE_SEC_ENCRYPT_NO_MITM` in `bta/bta_api.h`. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn't been bonded, the stack will use NO MITM authentication request in the current link instead of using the `authreq` in the `esp_ble_gap_set_security_param` function set by the user.

enumerator **ESP_BLE_SEC_ENCRYPT_MITM**

relate to `BTA_DM_BLE_SEC_ENCRYPT_MITM` in `bta/bta_api.h`. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn't been bonded, the stack will use MITM authentication request in the current link instead of using the `authreq` in the `esp_ble_gap_set_security_param` function set by the user.

enum **esp_ble_sm_param_t**

Values:

enumerator **ESP_BLE_SM_PASSKEY**

Authentication requirements of local device

enumerator **ESP_BLE_SM_AUTHEN_REQ_MODE**

The IO capability of local device

enumerator **ESP_BLE_SM_IOCAP_MODE**

Initiator Key Distribution/Generation

enumerator **ESP_BLE_SM_SET_INIT_KEY**

Responder Key Distribution/Generation

enumerator **ESP_BLE_SM_SET_RSP_KEY**

Maximum Encryption key size to support

enumerator **ESP_BLE_SM_MAX_KEY_SIZE**

Minimum Encryption key size requirement from Peer

enumerator **ESP_BLE_SM_MIN_KEY_SIZE**

Set static Passkey

enumerator **ESP_BLE_SM_SET_STATIC_PASSKEY**

Reset static Passkey

enumerator **ESP_BLE_SM_CLEAR_STATIC_PASSKEY**

Accept only specified SMP Authentication requirement

enumerator **ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH**

Enable/Disable OOB support

enumerator **ESP_BLE_SM_OOB_SUPPORT**

Appl encryption key size

enumerator **ESP_BLE_APP_ENC_KEY_SIZE**

authentication max param

enumerator **ESP_BLE_SM_MAX_PARAM**

enum **esp_ble_scan_type_t**

Ble scan type.

Values:

enumerator **BLE_SCAN_TYPE_PASSIVE**

Passive scan

enumerator **BLE_SCAN_TYPE_ACTIVE**

Active scan

enum **esp_ble_scan_filter_t**

Ble scan filter type.

Values:

enumerator **BLE_SCAN_FILTER_ALLOW_ALL**

Accept all :

- i. advertisement packets except directed advertising packets not addressed to this device (default).

enumerator **BLE_SCAN_FILTER_ALLOW_ONLY_WLST**

Accept only :

- i. advertisement packets from devices where the advertiser' s address is in the White list.
- ii. Directed advertising packets which are not addressed for this device shall be ignored.

enumerator **BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR**

Accept all :

- i. undirected advertisement packets, and
- ii. directed advertising packets where the initiator address is a resolvable private address, and
- iii. directed advertising packets addressed to this device.

enumerator **BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR**

Accept all :

- i. advertisement packets from devices where the advertiser' s address is in the White list, and
- ii. directed advertising packets where the initiator address is a resolvable private address, and
- iii. directed advertising packets addressed to this device.

enum **esp_ble_scan_duplicate_t**

Ble scan duplicate type.

Values:

enumerator **BLE_SCAN_DUPLICATE_DISABLE**

the Link Layer should generate advertising reports to the host for each packet received

enumerator **BLE_SCAN_DUPLICATE_ENABLE**

the Link Layer should filter out duplicate advertising reports to the Host

enumerator **BLE_SCAN_DUPLICATE_ENABLE_RESET**

Duplicate filtering enabled, reset for each scan period, only supported in BLE 5.0.

enumerator **BLE_SCAN_DUPLICATE_MAX**

Reserved for future use.

enum **esp_gap_search_evt_t**

Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

enumerator **ESP_GAP_SEARCH_INQ_RES_EVT**

Inquiry result for a peer device.

enumerator **ESP_GAP_SEARCH_INQ_CMPL_EVT**

Inquiry complete.

enumerator **ESP_GAP_SEARCH_DISC_RES_EVT**

Discovery result for a peer device.

enumerator **ESP_GAP_SEARCH_DISC_BLE_RES_EVT**

Discovery result for BLE GATT based service on a peer device.

enumerator **ESP_GAP_SEARCH_DISC_CMPL_EVT**

Discovery complete.

enumerator **ESP_GAP_SEARCH_DI_DISC_CMPL_EVT**

Discovery complete.

enumerator **ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT**

Search cancelled

enumerator **ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT**

The number of pkt discarded by flow control

enum **esp_ble_evt_type_t**

Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:

enumerator **ESP_BLE_EVT_CONN_ADV**
Connectable undirected advertising (ADV_IND)

enumerator **ESP_BLE_EVT_CONN_DIR_ADV**
Connectable directed advertising (ADV_DIRECT_IND)

enumerator **ESP_BLE_EVT_DISC_ADV**
Scannable undirected advertising (ADV_SCAN_IND)

enumerator **ESP_BLE_EVT_NON_CONN_ADV**
Non connectable undirected advertising (ADV_NONCONN_IND)

enumerator **ESP_BLE_EVT_SCAN_RSP**
Scan Response (SCAN_RSP)

enum **esp_ble_wl_operation_t**

Values:

enumerator **ESP_BLE_WHITELIST_REMOVE**
remove mac from whitelist

enumerator **ESP_BLE_WHITELIST_ADD**
add address to whitelist

enumerator **ESP_BLE_WHITELIST_CLEAR**
clear all device in whitelist

enum **esp_bt_duplicate_exceptional_subcode_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD**
Add device info into duplicate scan exceptional list

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE**
Remove device info from duplicate scan exceptional list

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN**
Clean duplicate scan exceptional list

enum **esp_ble_duplicate_exceptional_info_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR**
BLE advertising address , device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID**
BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE**

BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV**

BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ... |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV**

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ... |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SOLIC_ADV**

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1859 | ... |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_URI_ADV**

BLE mesh URI adv, the format is ... | Len | 0x24 | data | ...

enum **esp_duplicate_scan_exceptional_list_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST**

duplicate scan exceptional addr list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST**

duplicate scan exceptional mesh link ID list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST**

duplicate scan exceptional mesh beacon type list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST**

duplicate scan exceptional mesh adv with proxy service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SOLIC_ADV_LIST**

duplicate scan exceptional mesh adv with proxy solicitation PDU uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_URI_ADV_LIST**

duplicate scan exceptional URI list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST**

duplicate scan exceptional all list

GATT DEFINES

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h](#)

Unions

union **esp_gatt_rsp_t**

#include <esp_gatt_defs.h> GATT remote read request response type.

Public Members

esp_gatt_value_t **attr_value**

Gatt attribute structure

uint16_t **handle**

Gatt attribute handle

Structures

struct **esp_gatt_id_t**

Gatt id, include uuid and instance id.

Public Members

esp_bt_uuid_t **uuid**

UUID

uint8_t **inst_id**

Instance id

struct **esp_gatt_srvc_id_t**

Gatt service id, include id (uuid and instance id) and primary flag.

Public Members

esp_gatt_id_t **id**

Gatt id, include uuid and instance

bool **is_primary**

This service is primary or not

struct **esp_attr_desc_t**

Attribute description (used to create database)

Public Members

uint16_t **uuid_length**

UUID length

uint8_t ***uuid_p**

UUID value

uint16_t **perm**

Attribute permission

uint16_t **max_length**

Maximum length of the element

uint16_t **length**

Current length of the element

uint8_t ***value**

Element value array

struct **esp_attr_control_t**

attribute auto response flag

Public Members

uint8_t **auto_rsp**

if `auto_rsp` set to `ESP_GATT_RSP_BY_APP`, means the response of Write/Read operation will be replied by application. if `auto_rsp` set to `ESP_GATT_AUTO_RSP`, means the response of Write/Read operation will be replied by GATT stack automatically.

struct **esp_gatts_attr_db_t**

attribute type added to the gatt server database

Public Members

esp_attr_control_t **attr_control**

The attribute control type

esp_attr_desc_t **att_desc**

The attribute type

struct **esp_attr_value_t**

set the attribute value type

Public Members

uint16_t **attr_max_len**

attribute max value length

uint16_t **attr_len**

attribute current value length

uint8_t ***attr_value**

the pointer to attribute value

struct **esp_gatts_incl_svc_desc_t**

Gatt include service entry element.

Public Members

uint16_t **start_hdl**

Gatt start handle value of included service

uint16_t **end_hdl**

Gatt end handle value of included service

uint16_t **uuid**

Gatt attribute value UUID of included service

struct **esp_gatts_incl128_svc_desc_t**

Gatt include 128 bit service entry element.

Public Members

uint16_t **start_hdl**

Gatt start handle value of included 128 bit service

uint16_t **end_hdl**

Gatt end handle value of included 128 bit service

struct **esp_gatt_value_t**

Gatt attribute value.

Public Members

uint8_t **value**[600]

Gatt attribute value

uint16_t **handle**

Gatt attribute handle

uint16_t **offset**

Gatt attribute value offset

uint16_t **len**

Gatt attribute value length

uint8_t **auth_req**

Gatt authentication request

struct **esp_gatt_conn_params_t**

Connection parameters information.

Public Members**uint16_t interval**

connection interval

uint16_t latency

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeoutSupervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 secondsstruct **esp_gattc_multi_t**

read multiple attribute

Public Members**uint8_t num_attr**

The number of the attribute

uint16_t handles[10]

The handles list

struct **esp_gattc_db_elem_t**

data base attribute element

Public Members*esp_gatt_db_attr_type_t* **type**

The attribute type

uint16_t attribute_handle

The attribute handle, it' s valid for all of the type

uint16_t start_handle

The service start handle, it' s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

uint16_t end_handle

The service end handle, it' s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

esp_gatt_char_prop_t **properties**

The characteristic properties, it' s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

esp_bt_uuid_t **uuid**

The attribute uuid, it' s valid for all of the type

struct **esp_gattc_service_elem_t**
service element

Public Members

bool **is_primary**
The service flag, true if the service is primary service, else is secondary service

uint16_t **start_handle**
The start handle of the service

uint16_t **end_handle**
The end handle of the service

esp_bt_uuid_t **uuid**
The uuid of the service

struct **esp_gattc_char_elem_t**
characteristic element

Public Members

uint16_t **char_handle**
The characteristic handle

esp_gatt_char_prop_t **properties**
The characteristic properties

esp_bt_uuid_t **uuid**
The characteristic uuid

struct **esp_gattc_descr_elem_t**
descriptor element

Public Members

uint16_t **handle**
The characteristic descriptor handle

esp_bt_uuid_t **uuid**
The characteristic descriptor uuid

struct **esp_gattc_incl_svc_elem_t**
include service element

Public Members

`uint16_t handle`

The include service current attribute handle

`uint16_t incl_srvc_s_handle`

The start handle of the service which has been included

`uint16_t incl_srvc_e_handle`

The end handle of the service which has been included

`esp_bt_uuid_t uuid`

The include service uuid

ESP_GATT_MAX_ATTR_LEN

GATT maximum attribute length.

ESP_GATT_RSP_BY_APP

ESP_GATT_AUTO_RSP

ESP_GATT_IF_NONE

If callback report `gattc_if/gatts_if` as this macro, means this event is not correspond to any app

Type Definitions

```
typedef uint16_t esp_gatt_perm_t
```

```
typedef uint8_t esp_gatt_char_prop_t
```

```
typedef uint8_t esp_gatt_if_t
```

Gatt interface type, different application on GATT client use different `gatt_if`

Enumerations

enum **esp_gatt_prep_write_type**

Attribute write data type from the client.

Values:

enumerator **ESP_GATT_PREP_WRITE_CANCEL**

Prepare write cancel

enumerator **ESP_GATT_PREP_WRITE_EXEC**

Prepare write execute

enum **esp_gatt_status_t**

GATT success code and error codes.

Values:

enumerator **ESP_GATT_OK**

enumerator **ESP_GATT_INVALID_HANDLE**

enumerator **ESP_GATT_READ_NOT_PERMIT**

enumerator **ESP_GATT_WRITE_NOT_PERMIT**

enumerator **ESP_GATT_INVALID_PDU**

enumerator **ESP_GATT_INSUF_AUTHENTICATION**

enumerator **ESP_GATT_REQ_NOT_SUPPORTED**

enumerator **ESP_GATT_INVALID_OFFSET**

enumerator **ESP_GATT_INSUF_AUTHORIZATION**

enumerator **ESP_GATT_PREPARE_Q_FULL**

enumerator **ESP_GATT_NOT_FOUND**

enumerator **ESP_GATT_NOT_LONG**

enumerator **ESP_GATT_INSUF_KEY_SIZE**

enumerator **ESP_GATT_INVALID_ATTR_LEN**

enumerator **ESP_GATT_ERR_UNLIKELY**

enumerator **ESP_GATT_INSUF_ENCRYPTION**

enumerator **ESP_GATT_UNSUPPORT_GRP_TYPE**

enumerator **ESP_GATT_INSUF_RESOURCE**

enumerator **ESP_GATT_NO_RESOURCES**

enumerator **ESP_GATT_INTERNAL_ERROR**

enumerator **ESP_GATT_WRONG_STATE**

enumerator **ESP_GATT_DB_FULL**

enumerator **ESP_GATT_BUSY**

enumerator **ESP_GATT_ERROR**

enumerator **ESP_GATT_CMD_STARTED**

enumerator **ESP_GATT_ILLEGAL_PARAMETER**

enumerator **ESP_GATT_PENDING**

enumerator **ESP_GATT_AUTH_FAIL**

enumerator **ESP_GATT_MORE**

enumerator **ESP_GATT_INVALID_CFG**

enumerator **ESP_GATT_SERVICE_STARTED**

enumerator **ESP_GATT_ENCRYPED_MITM**

enumerator **ESP_GATT_ENCRYPED_NO_MITM**

enumerator **ESP_GATT_NOT_ENCRYPTED**

enumerator **ESP_GATT_CONGESTED**

enumerator **ESP_GATT_DUP_REG**

enumerator **ESP_GATT_ALREADY_OPEN**

enumerator **ESP_GATT_CANCEL**

enumerator **ESP_GATT_STACK_RSP**

enumerator **ESP_GATT_APP_RSP**

enumerator **ESP_GATT_UNKNOWN_ERROR**

enumerator **ESP_GATT_CCC_CFG_ERR**

enumerator **ESP_GATT_PRC_IN_PROGRESS**

enumerator **ESP_GATT_OUT_OF_RANGE**

enum **esp_gatt_conn_reason_t**

Gatt Connection reason enum.

Values:

enumerator **ESP_GATT_CONN_UNKNOWN**

Gatt connection unknown

enumerator **ESP_GATT_CONN_L2C_FAILURE**

General L2cap failure

enumerator **ESP_GATT_CONN_TIMEOUT**

Connection timeout

enumerator **ESP_GATT_CONN_TERMINATE_PEER_USER**

Connection terminate by peer user

enumerator **ESP_GATT_CONN_TERMINATE_LOCAL_HOST**

Connection terminated by local host

enumerator **ESP_GATT_CONN_FAIL_ESTABLISH**

Connection fail to establish

enumerator **ESP_GATT_CONN_LMP_TIMEOUT**

Connection fail for LMP response tout

enumerator **ESP_GATT_CONN_CONN_CANCEL**

L2CAP connection cancelled

enumerator **ESP_GATT_CONN_NONE**

No connection to cancel

enum **esp_gatt_auth_req_t**

Gatt authentication request type.

Values:

enumerator **ESP_GATT_AUTH_REQ_NONE**

enumerator **ESP_GATT_AUTH_REQ_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_MITM**

enum **esp_service_source_t**

Values:

enumerator **ESP_GATT_SERVICE_FROM_REMOTE_DEVICE**

enumerator **ESP_GATT_SERVICE_FROM_NVS_FLASH**

enumerator **ESP_GATT_SERVICE_FROM_UNKNOWN**

enum **esp_gatt_write_type_t**

Gatt write type.

Values:

enumerator **ESP_GATT_WRITE_TYPE_NO_RSP**

Gatt write attribute need no response

enumerator **ESP_GATT_WRITE_TYPE_RSP**

Gatt write attribute need remote response

enum **esp_gatt_db_attr_type_t**

the type of attribute element

Values:

enumerator **ESP_GATT_DB_PRIMARY_SERVICE**

Gattc primary service attribute type in the cache

enumerator **ESP_GATT_DB_SECONDARY_SERVICE**

Gattc secondary service attribute type in the cache

enumerator **ESP_GATT_DB_CHARACTERISTIC**

Gattc characteristic attribute type in the cache

enumerator **ESP_GATT_DB_DESCRIPTOR**

Gattc characteristic descriptor attribute type in the cache

enumerator **ESP_GATT_DB_INCLUDED_SERVICE**

Gattc include service attribute type in the cache

enumerator **ESP_GATT_DB_ALL**

Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

GATT SERVER API

Application Example Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
 - [bluetooth/bluedroid/ble/gatt_server_service_table](#)
 - [GATT Server Service Table Example Walkthrough](#)
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
 - [bluetooth/bluedroid/ble/gatt_server](#)
 - [GATT Server Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
 - [bluetooth/bluedroid/ble/ble_spp_server](#)

API Reference

Header File

Functions

esp_err_t **esp_ble_gatts_register_callback** (*esp_gatts_cb_t* callback)

This function is called to register application callbacks with BTA GATTS module.

返回

- ESP_OK : success
- other : failed

esp_gatts_cb_t **esp_ble_gatts_get_callback** (void)

This function is called to get the current application callbacks with BTA GATTS module.

返回

- esp_gatts_cb_t : current callback

esp_err_t **esp_ble_gatts_app_register** (uint16_t app_id)

This function is called to register application identifier.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_app_unregister** (*esp_gatt_if_t* gatts_if)

unregister with GATT Server.

参数 **gatts_if** –[in] GATT server access interface

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_create_service** (*esp_gatt_if_t* gatts_if, *esp_gatt_srvc_id_t* *service_id, uint16_t num_handle)

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

参数

- **gatts_if** –[in] GATT server access interface
- **service_id** –[in] service ID.
- **num_handle** –[in] number of handle requested for this service.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_create_attr_tab** (const *esp_gatts_attr_db_t* *gatts_attr_db, *esp_gatt_if_t* gatts_if, uint16_t max_nb_attr, uint8_t srvc_inst_id)

Create a service attribute tab.

参数

- **gatts_attr_db** –[in] the pointer to the service attr tab
- **gatts_if** –[in] GATT server access interface
- **max_nb_attr** –[in] the number of attribute to be added to the service database.
- **srvc_inst_id** –[in] the instance id of the service

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_add_included_service** (uint16_t service_handle, uint16_t included_service_handle)

This function is called to add an included service. This function have to be called between 'esp_ble_gatts_create_service' and 'esp_ble_gatts_add_char' . After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

参数

- **service_handle** –[in] service handle to which this included service is to be added.
- **included_service_handle** –[in] the service ID to be included.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_add_char** (uint16_t service_handle, *esp_bt_uuid_t* *char_uuid, *esp_gatt_perm_t* perm, *esp_gatt_char_prop_t* property, *esp_attr_value_t* *char_val, *esp_attr_control_t* *control)

This function is called to add a characteristic into a service.

参数

- **service_handle** –[in] service handle to which this included service is to be added.
- **char_uuid** –[in] : Characteristic UUID.
- **perm** –[in] : Characteristic value declaration attribute permission.
- **property** –[in] : Characteristic Properties
- **char_val** –[in] : Characteristic value
- **control** –[in] : attribute response control byte

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_add_char_descr** (uint16_t service_handle, *esp_bt_uuid_t* *descr_uuid, *esp_gatt_perm_t* perm, *esp_attr_value_t* *char_descr_val, *esp_attr_control_t* *control)

This function is called to add characteristic descriptor. When it' s done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

参数

- **service_handle** –[in] service handle to which this characteristic descriptor is to be added.
- **perm** –[in] descriptor access permission.
- **descr_uuid** –[in] descriptor UUID.
- **char_descr_val** –[in] : Characteristic descriptor value
- **control** –[in] : attribute response control byte

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_delete_service** (uint16_t service_handle)

This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

参数 **service_handle** –[in] service_handle to be deleted.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_start_service** (uint16_t service_handle)

This function is called to start a service.

参数 **service_handle** –[in] the service handle to be started.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_stop_service** (uint16_t service_handle)

This function is called to stop a service.

参数 **service_handle** –[in] - service to be topped.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_send_indicate** (*esp_gatt_if_t* gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication. Note: the size of indicate or notify data need less than MTU size,see “esp_ble_gattc_send_mtu_req”

参数

- **gatts_if** –[in] GATT server access interface
- **conn_id** –[in] - connection id to indicate.
- **attr_handle** –[in] - attribute handle to indicate.
- **value_len** –[in] - indicate value length.
- **value** –[in] value to indicate.
- **need_confirm** –[in] - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_send_response** (*esp_gatt_if_t* gatts_if, uint16_t conn_id, uint32_t trans_id, *esp_gatt_status_t* status, *esp_gatt_rsp_t* *rsp)

This function is called to send a response to a request.

参数

- **gatts_if** –[in] GATT server access interface
- **conn_id** –[in] - connection identifier.
- **trans_id** –[in] - transfer id

- **status** –[in] - response status
- **rsp** –[in] - response data.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_set_attr_value** (uint16_t attr_handle, uint16_t length, const uint8_t *value)

This function is called to set the attribute value by the application.

参数

- **attr_handle** –[in] the attribute handle which to be set
- **length** –[in] the value length
- **value** –[in] the pointer to the attribute value

返回

- ESP_OK : success
- other : failed

esp_gatt_status_t **esp_ble_gatts_get_attr_value** (uint16_t attr_handle, uint16_t *length, const uint8_t **value)

Retrieve attribute value.

参数

- **attr_handle** –[in] Attribute handle.
- **length** –[out] pointer to the attribute value length
- **value** –[out] Pointer to attribute value payload, the value cannot be modified by user

返回

- ESP_GATT_OK : success
- other : failed

esp_err_t **esp_ble_gatts_open** (*esp_gatt_if_t* gatts_if, *esp_bd_addr_t* remote_bda, bool is_direct)

Open a direct open connection or add a background auto connection.

参数

- **gatts_if** –[in] GATT server access interface
- **remote_bda** –[in] remote device bluetooth device address.
- **is_direct** –[in] direct connection or background auto connection

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_close** (*esp_gatt_if_t* gatts_if, uint16_t conn_id)

Close a connection a remote device.

参数

- **gatts_if** –[in] GATT server access interface
- **conn_id** –[in] connection ID to be closed.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_send_service_change_indication** (*esp_gatt_if_t* gatts_if, *esp_bd_addr_t* remote_bda)

Send service change indication.

参数

- **gatts_if** –[in] GATT server access interface
- **remote_bda** –[in] remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_show_local_database** (void)

Print local database (GATT service table)

返回

- ESP_OK : success
- other : failed

Unions

union **esp_ble_gatts_cb_param_t**

#include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

struct *esp_ble_gatts_cb_param_t::gatts_reg_evt_param* **reg**

Gatt server callback param of ESP_GATTS_REG_EVT

struct *esp_ble_gatts_cb_param_t::gatts_read_evt_param* **read**

Gatt server callback param of ESP_GATTS_READ_EVT

struct *esp_ble_gatts_cb_param_t::gatts_write_evt_param* **write**

Gatt server callback param of ESP_GATTS_WRITE_EVT

struct *esp_ble_gatts_cb_param_t::gatts_exec_write_evt_param* **exec_write**

Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct *esp_ble_gatts_cb_param_t::gatts_mtu_evt_param* **mtu**

Gatt server callback param of ESP_GATTS_MTU_EVT

struct *esp_ble_gatts_cb_param_t::gatts_conf_evt_param* **conf**

Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct *esp_ble_gatts_cb_param_t::gatts_create_evt_param* **create**

Gatt server callback param of ESP_GATTS_CREATE_EVT

struct *esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param* **add_incl_srvc**

Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

struct *esp_ble_gatts_cb_param_t::gatts_add_char_evt_param* **add_char**

Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct *esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param* **add_char_descr**

Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct *esp_ble_gatts_cb_param_t::gatts_delete_evt_param* **del**

Gatt server callback param of ESP_GATTS_DELETE_EVT

struct *esp_ble_gatts_cb_param_t::gatts_start_evt_param* **start**

Gatt server callback param of ESP_GATTS_START_EVT

```
struct esp_ble_gatts_cb_param_t::gatts_stop_evt_param stop
    Gatt server callback param of ESP_GATTS_STOP_EVT

struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect
    Gatt server callback param of ESP_GATTS_CONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_disconnect_evt_param disconnect
    Gatt server callback param of ESP_GATTS_DISCONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_open_evt_param open
    Gatt server callback param of ESP_GATTS_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_cancel_open_evt_param cancel_open
    Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_close_evt_param close
    Gatt server callback param of ESP_GATTS_CLOSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_congest_evt_param congest
    Gatt server callback param of ESP_GATTS_CONGEST_EVT

struct esp_ble_gatts_cb_param_t::gatts_rsp_evt_param rsp
    Gatt server callback param of ESP_GATTS_RESPONSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab
    Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT

struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val
    Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT

struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change
    Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT

struct gatts_add_attr_tab_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_CREAT_ATTR_TAB_EVT.
```

Public Members

esp_gatt_status_t **status**

Operation status

esp_bt_uuid_t **svc_uuid**

Service uuid type

uint8_t **svc_inst_id**

Service id

uint16_t **num_handle**

The number of the attribute handle to be added to the gatts database

uint16_t ***handles**

The number to the handles

struct **gatts_add_char_descr_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_ADD_CHAR_DESCR_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **attr_handle**

Descriptor attribute handle

uint16_t **service_handle**

Service attribute handle

esp_bt_uuid_t **descr_uuid**

Characteristic descriptor uuid

struct **gatts_add_char_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_ADD_CHAR_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **attr_handle**

Characteristic attribute handle

uint16_t **service_handle**

Service attribute handle

esp_bt_uuid_t **char_uuid**

Characteristic uuid

struct **gatts_add_incl_srvc_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_ADD_INCL_SRVC_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **attr_handle**

Included service attribute handle

uint16_t **service_handle**

Service attribute handle

struct **gatts_cancel_open_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_CANCEL_OPEN_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

struct **gatts_close_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_CLOSE_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **conn_id**

Connection id

struct **gatts_conf_evt_param**

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **conn_id**

Connection id

uint16_t **handle**

attribute handle

uint16_t **len**

The indication or notification value length, len is valid when send notification or indication failed

uint8_t ***value**

The indication or notification value , value is valid when send notification or indication failed

```
struct gatts_congest_evt_param  
#include <esp_gatts_api.h> ESP_GATTS_LISTEN_EVT.  
ESP_GATTS_CONGEST_EVT
```

Public Members

uint16_t **conn_id**

Connection id

bool **congested**

Congested or not

```
struct gatts_connect_evt_param  
#include <esp_gatts_api.h> ESP_GATTS_CONNECT_EVT.
```

Public Members

uint16_t **conn_id**

Connection id

uint8_t **link_role**

Link role : master role = 0 ; slave role = 1

esp_bd_addr_t **remote_bda**

Remote bluetooth device address

esp_gatt_conn_params_t **conn_params**

current Connection parameters

esp_ble_addr_type_t **ble_addr_type**

Remote BLE device address type

uint16_t **conn_handle**

HCI connection handle

```
struct gatts_create_evt_param  
#include <esp_gatts_api.h> ESP_GATTS_UNREG_EVT.  
ESP_GATTS_CREATE_EVT
```

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **service_handle**

Service attribute handle

esp_gatt_srv_id_t **service_id**

Service id, include service uuid and other information

struct **gatts_delete_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_DELETE_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **service_handle**

Service attribute handle

Public Members

uint16_t **conn_id**

Connection id

uint8_t **link_role**

Link role : master role = 0 ; slave role = 1

esp_bd_addr_t **remote_bda**

Remote bluetooth device address

esp_gatt_conn_reason_t **reason**

Indicate the reason of disconnection

struct **gatts_exec_write_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_EXEC_WRITE_EVT.

Public Members

uint16_t **conn_id**

Connection id

uint32_t **trans_id**

Transfer id

esp_bd_addr_t **bda**

The bluetooth device address which been written

uint8_t **exec_write_flag**

Execute write flag

struct **gatts_mtu_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_MTU_EVT.

Public Members

uint16_t **conn_id**

Connection id

uint16_t **mtu**

MTU size

struct **gatts_open_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_OPEN_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

struct **gatts_read_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_READ_EVT.

Public Members

uint16_t **conn_id**

Connection id

uint32_t **trans_id**

Transfer id

esp_bd_addr_t **bda**

The bluetooth device address which been read

uint16_t **handle**

The attribute handle

uint16_t **offset**

Offset of the value, if the value is too long

bool **is_long**
The value is too long or not

bool **need_rsp**
The read operation need to do response

struct **gatts_reg_evt_param**
#include <esp_gatts_api.h> ESP_GATTS_REG_EVT.

Public Members

esp_gatt_status_t **status**
Operation status

uint16_t **app_id**
Application id which input in register API

struct **gatts_rsp_evt_param**
#include <esp_gatts_api.h> ESP_GATTS_RESPONSE_EVT.

Public Members

esp_gatt_status_t **status**
Operation status

uint16_t **handle**
Attribute handle which send response

struct **gatts_send_service_change_evt_param**
#include <esp_gatts_api.h> ESP_GATTS_SEND_SERVICE_CHANGE_EVT.

Public Members

esp_gatt_status_t **status**
Operation status

struct **gatts_set_attr_val_evt_param**
#include <esp_gatts_api.h> ESP_GATTS_SET_ATTR_VAL_EVT.

Public Members

uint16_t **srvc_handle**
The service handle

uint16_t **attr_handle**
The attribute handle

esp_gatt_status_t **status**

Operation status

struct **gatts_start_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_START_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **service_handle**

Service attribute handle

struct **gatts_stop_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_STOP_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **service_handle**

Service attribute handle

struct **gatts_write_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_WRITE_EVT.

Public Members

uint16_t **conn_id**

Connection id

uint32_t **trans_id**

Transfer id

esp_bd_addr_t **bda**

The bluetooth device address which been written

uint16_t **handle**

The attribute handle

uint16_t **offset**

Offset of the value, if the value is too long

bool **need_rsp**
The write operation need to do response

bool **is_prep**
This write operation is prepare write

uint16_t **len**
The write attribute value length

uint8_t ***value**
The write attribute value

Macros

ESP_GATT_PREP_WRITE_CANCEL
Prepare write flag to indicate cancel prepare write

ESP_GATT_PREP_WRITE_EXEC
Prepare write flag to indicate execute prepare write

Type Definitions

typedef void (***esp_gatts_cb_t**)(*esp_gatts_cb_event_t* event, *esp_gatt_if_t* gatts_if, *esp_ble_gatts_cb_param_t* *param)

GATT Server callback function type.

Param event : Event type

Param gatts_if : GATT server access interface, normally different gatts_if correspond to different profile

Param param : Point to callback parameter, currently is union type

Enumerations

enum **esp_gatts_cb_event_t**
GATT Server callback function events.

Values:

enumerator **ESP_GATTS_REG_EVT**
When register application id, the event comes

enumerator **ESP_GATTS_READ_EVT**
When gatt client request read operation, the event comes

enumerator **ESP_GATTS_WRITE_EVT**
When gatt client request write operation, the event comes

enumerator **ESP_GATTS_EXEC_WRITE_EVT**
When gatt client request execute write, the event comes

enumerator **ESP_GATTS_MTU_EVT**
When set mtu complete, the event comes

enumerator **ESP_GATTS_CONF_EVT**

When receive confirm, the event comes

enumerator **ESP_GATTS_UNREG_EVT**

When unregister application id, the event comes

enumerator **ESP_GATTS_CREATE_EVT**

When create service complete, the event comes

enumerator **ESP_GATTS_ADD_INCL_SRVC_EVT**

When add included service complete, the event comes

enumerator **ESP_GATTS_ADD_CHAR_EVT**

When add characteristic complete, the event comes

enumerator **ESP_GATTS_ADD_CHAR_DESCR_EVT**

When add descriptor complete, the event comes

enumerator **ESP_GATTS_DELETE_EVT**

When delete service complete, the event comes

enumerator **ESP_GATTS_START_EVT**

When start service complete, the event comes

enumerator **ESP_GATTS_STOP_EVT**

When stop service complete, the event comes

enumerator **ESP_GATTS_CONNECT_EVT**

When gatt client connect, the event comes

enumerator **ESP_GATTS_DISCONNECT_EVT**

When gatt client disconnect, the event comes

enumerator **ESP_GATTS_OPEN_EVT**

When connect to peer, the event comes

enumerator **ESP_GATTS_CANCEL_OPEN_EVT**

When disconnect from peer, the event comes

enumerator **ESP_GATTS_CLOSE_EVT**

When gatt server close, the event comes

enumerator **ESP_GATTS_LISTEN_EVT**

When gatt listen to be connected the event comes

enumerator **ESP_GATTS_CONGEST_EVT**

When congest happen, the event comes

enumerator **ESP_GATTS_RESPONSE_EVT**

When gatt send response complete, the event comes

enumerator **ESP_GATTS_CREAT_ATTR_TAB_EVT**

When gatt create table complete, the event comes

enumerator **ESP_GATTS_SET_ATTR_VAL_EVT**

When gatt set attr value complete, the event comes

enumerator **ESP_GATTS_SEND_SERVICE_CHANGE_EVT**

When gatt send service change indication complete, the event comes

GATT CLIENT API

Application Example Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
 - [bluetooth/bluedroid/ble/gatt_client](#)
 - [GATT Client Example Walkthrough](#)
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
 - [bluetooth/bluedroid/ble/gattc_multi_connect](#)
 - [GATT Client Multi-connection Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
 - [bluetooth/bluedroid/ble/ble_spp_client](#)

Functions

esp_err_t **esp_ble_gattc_register_callback** (*esp_gattc_cb_t* callback)

This function is called to register application callbacks with GATTC module.

参数 callback **–[in]** : pointer to the application callback function.

返回

- ESP_OK: success
- other: failed

esp_gattc_cb_t **esp_ble_gattc_get_callback** (void)

This function is called to get the current application callbacks with BTA GATTC module.

返回

- *esp_gattc_cb_t* : current callback

esp_err_t **esp_ble_gattc_app_register** (uint16_t app_id)

This function is called to register application callbacks with GATTC module.

参数 app_id **–[in]** : Application Identify (UUID), for different application

返回

- ESP_OK: success

- other: failed

esp_err_t **esp_ble_gattc_app_unregister** (*esp_gatt_if_t* gattc_if)

This function is called to unregister an application from GATTC module.

参数 **gattc_if** –[in] Gatt client access interface.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_open** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* remote_bda, *esp_ble_addr_type_t* remote_addr_type, bool is_direct)

Open a direct connection or add a background auto connection.

参数

- **gattc_if** –[in] Gatt client access interface.
- **remote_bda** –[in] remote device bluetooth device address.
- **remote_addr_type** –[in] remote device bluetooth device the address type.
- **is_direct** –[in] direct connection or background auto connection (by now, background auto connection is not supported).

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_aux_open** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* remote_bda, *esp_ble_addr_type_t* remote_addr_type, bool is_direct)

esp_err_t **esp_ble_gattc_close** (*esp_gatt_if_t* gattc_if, uint16_t conn_id)

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID to be closed.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_send_mtu_req** (*esp_gatt_if_t* gattc_if, uint16_t conn_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_search_service** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_bt_uuid_t* *filter_uuid)

This function is called to get service from local cache. This function report service search result by a call-back event, and followed by a service search complete event. Note: 128-bit base UUID will automatically be converted to a 16-bit UUID in the search results. Other types of UUID remain unchanged.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID.
- **filter_uuid** –[in] a UUID of the service application is interested in. If Null, discover for all services.

返回

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_service** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_bt_uuid_t* *svc_uuid, *esp_gattc_service_elem_t* *result, uint16_t *count, uint16_t offset)

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **svc_uuid** –[in] the pointer to the service uuid.
- **result** –[out] The pointer to the service which has been found in the gattc cache.
- **count** –[inout] input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- **offset** –[in] Offset of the service position to get.

返回

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_all_char** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_gattc_char_elem_t* *result, uint16_t *count, uint16_t offset)

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **start_handle** –[in] the attribute start handle.
- **end_handle** –[in] the attribute end handle
- **result** –[out] The pointer to the characteristic in the service.
- **count** –[inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- **offset** –[in] Offset of the characteristic position to get.

返回

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_all_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t char_handle, *esp_gattc_descr_elem_t* *result, uint16_t *count, uint16_t offset)

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **char_handle** –[in] the given characteristic handle
- **result** –[out] The pointer to the descriptor in the characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- **offset** –[in] Offset of the descriptor position to get.

返回

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)
```

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **start_handle** –[in] the attribute start handle
- **end_handle** –[in] the attribute end handle
- **char_uuid** –[in] the characteristic uuid
- **result** –[out] The pointer to the characteristic in the service.
- **count** –[inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

返回

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **start_handle** –[in] the attribute start handle
- **end_handle** –[in] the attribute end handle
- **char_uuid** –[in] the characteristic uuid.
- **descr_uuid** –[in] the descriptor uuid.
- **result** –[out] The pointer to the descriptor in the given characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

返回

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **char_handle** –[in] the characteristic handle.
- **descr_uuid** –[in] the descriptor uuid.
- **result** –[out] The pointer to the descriptor in the given characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

返回

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_include_service (esp_gatt_if_t gattc_if, uint16_t conn_id,
                                                    uint16_t start_handle, uint16_t end_handle,
                                                    esp_bt_uuid_t *incl_uuid,
                                                    esp_gattc_incl_svc_elem_t *result, uint16_t
                                                    *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won't get from remote devices.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **start_handle** –[in] the attribute start handle
- **end_handle** –[in] the attribute end handle
- **incl_uuid** –[in] the include service uuid
- **result** –[out] The pointer to the include service in the given service.
- **count** –[inout] input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

返回

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_attr_count (esp_gatt_if_t gattc_if, uint16_t conn_id,
                                                esp_gatt_db_attr_type_t type, uint16_t start_handle,
                                                uint16_t end_handle, uint16_t char_handle, uint16_t
                                                *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **type** –[in] the attribute type.
- **start_handle** –[in] the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- **end_handle** –[in] the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- **char_handle** –[in] the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn't ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- **count** –[out] output the number of attribute has been found in the gattc cache with the given attribute type.

返回

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_db (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle,
                                         uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won't get from remote devices.

参数

- **gattc_if** –[in] Gatt client access interface.
- **start_handle** –[in] the attribute start handle
- **end_handle** –[in] the attribute end handle
- **conn_id** –[in] connection ID which identify the server.
- **db** –[in] output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- **count** –[in] number of elements in database.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_char** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, *esp_gatt_auth_req_t* auth_req)

This function is called to read a service' s characteristics of the given characteristic handle.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : characteritic handle to read.
- **auth_req** –[in] : authenticate request type

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_by_type** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_bt_uuid_t* *uuid, *esp_gatt_auth_req_t* auth_req)

This function is called to read a service' s characteristics of the given characteristic UUID.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **start_handle** –[in] : the attribute start handle.
- **end_handle** –[in] : the attribute end handle
- **uuid** –[in] : The UUID of attribute which will be read.
- **auth_req** –[in] : authenticate request type

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_multiple** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_gattc_multi_t* *read_multi, *esp_gatt_auth_req_t* auth_req)

This function is called to read multiple characteristic or characteristic descriptors.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **read_multi** –[in] : pointer to the read multiple parameter.
- **auth_req** –[in] : authenticate request type

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_multiple_variable** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_gattc_multi_t* *read_multi, *esp_gatt_auth_req_t* auth_req)

This function is called to read multiple variable length characteristic or characteristic descriptors.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **read_multi** –[in] : pointer to the read multiple parameter.
- **auth_req** –[in] : authenticate request type

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_char_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, *esp_gatt_auth_req_t* auth_req)

This function is called to read a characteristics descriptor.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : descriptor handle to read.
- **auth_req** –[in] : authenticate request type

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_write_char** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, *esp_gatt_write_type_t* write_type, *esp_gatt_auth_req_t* auth_req)

This function is called to write characteristic value.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : characteristic handle to write.
- **value_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **write_type** –[in] : the type of attribute write operation.
- **auth_req** –[in] : authentication request.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_write_char_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, *esp_gatt_write_type_t* write_type, *esp_gatt_auth_req_t* auth_req)

This function is called to write characteristic descriptor value.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID
- **handle** –[in] : descriptor handle to write.
- **value_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **write_type** –[in] : the type of attribute write operation.
- **auth_req** –[in] : authentication request.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_prepare_write** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, *esp_gatt_auth_req_t* auth_req)

This function is called to prepare write a characteristic value.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : characteristic handle to prepare write.
- **offset** –[in] : offset of the write value.
- **value_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **auth_req** –[in] : authentication request.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_prepare_write_char_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, *esp_gatt_auth_req_t* auth_req)

This function is called to prepare write a characteristic descriptor value.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : characteristic descriptor handle to prepare write.
- **offset** –[in] : offset of the write value.
- **value_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **auth_req** –[in] : authentication request.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_execute_write** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, bool is_execute)

This function is called to execute write a prepare write sequence.

参数

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **is_execute** –[in] : execute or cancel.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_register_for_notify** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* server_bda, uint16_t handle)

This function is called to register for notification of a service.

参数

- **gattc_if** –[in] Gatt client access interface.
- **server_bda** –[in] : target GATT server.
- **handle** –[in] : GATT characteristic handle.

返回

- ESP_OK: registration succeeds
- other: failed

esp_err_t **esp_ble_gattc_unregister_for_notify** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* server_bda, uint16_t handle)

This function is called to de-register for notification of a service.

参数

- **gattc_if** –[in] Gatt client access interface.
- **server_bda** –[in] : target GATT server.
- **handle** –[in] : GATT characteristic handle.

返回

- ESP_OK: unregister succeeds
- other: failed

esp_err_t **esp_ble_gattc_cache_refresh** (*esp_bd_addr_t* remote_bda)

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

参数 **remote_bda** –[in] remote device BD address.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_cache_assoc** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* src_addr, *esp_bd_addr_t* assoc_addr, bool is_assoc)

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device's attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address means that device want to use the database has stored in the local cache. The source address means that device want to share the database to the associated address device.

参数

- **gattc_if** –[in] Gatt client access interface.
- **src_addr** –[in] the source address which provide the attribute table.
- **assoc_addr** –[in] the associated device address which went to share the attribute table with the source address.
- **is_assoc** –[in] true add the associated device address, false remove the associated device address.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_cache_get_addr_list** (*esp_gatt_if_t* gattc_if)

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

参数 **gattc_if** –[in] Gatt client access interface.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_cache_clean** (*esp_bd_addr_t* remote_bda)

Clean the service cache of this device in the gattc stack,.

参数 **remote_bda** –[in] remote device BD address.

返回

- ESP_OK: success
- other: failed

Unions

union **esp_ble_gattc_cb_param_t**

#include <esp_gattc_api.h> Gatt client callback parameters union.

Public Members

struct *esp_ble_gattc_cb_param_t::gattc_reg_evt_param* **reg**
Gatt client callback param of ESP_GATTC_REG_EVT

struct *esp_ble_gattc_cb_param_t::gattc_open_evt_param* **open**
Gatt client callback param of ESP_GATTC_OPEN_EVT

struct *esp_ble_gattc_cb_param_t::gattc_close_evt_param* **close**
Gatt client callback param of ESP_GATTC_CLOSE_EVT

struct *esp_ble_gattc_cb_param_t::gattc_cfg_mtu_evt_param* **cfg_mtu**
Gatt client callback param of ESP_GATTC_CFG_MTU_EVT

```
struct esp_ble_gattc_cb_param_t::gattc_search_cmpl_evt_param search_cmpl
    Gatt client callback param of ESP_GATTC_SEARCH_CMPL_EVT

struct esp_ble_gattc_cb_param_t::gattc_search_res_evt_param search_res
    Gatt client callback param of ESP_GATTC_SEARCH_RES_EVT

struct esp_ble_gattc_cb_param_t::gattc_read_char_evt_param read
    Gatt client callback param of ESP_GATTC_READ_CHAR_EVT

struct esp_ble_gattc_cb_param_t::gattc_write_evt_param write
    Gatt client callback param of ESP_GATTC_WRITE_DESCR_EVT

#include <esp_gattc_api.h> ESP_GATTC_UNREG_FOR_NOTIFY_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **handle**

The characteristic or descriptor handle

struct **gattc_write_evt_param**

#include <esp_gattc_api.h> ESP_GATTC_WRITE_CHAR_EVT, ESP_GATTC_PREP_WRITE_EVT, ESP_GATTC_WRITE_DESCR_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **conn_id**

Connection id

uint16_t **handle**

The Characteristic or descriptor handle

uint16_t **offset**

The prepare write offset, this value is valid only when prepare write

Type Definitions

```
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)
```

GATT Client callback function type.

Param event : Event type

Param gattc_if : GATT client access interface, normally different gattc_if correspond to different profile

Param param : Point to callback parameter, currently is union type

Enumerations

```
enum esp_gattc_cb_event_t
```

GATT Client callback function events.

Values:

enumerator **ESP_GATTC_REG_EVT**

When GATT client is registered, the event comes

enumerator **ESP_GATTC_UNREG_EVT**

When GATT client is unregistered, the event comes

enumerator **ESP_GATTC_OPEN_EVT**

When GATT virtual connection is set up, the event comes

enumerator **ESP_GATTC_READ_CHAR_EVT**

When GATT characteristic is read, the event comes

enumerator **ESP_GATTC_WRITE_CHAR_EVT**

When GATT characteristic write operation completes, the event comes

enumerator **ESP_GATTC_CLOSE_EVT**

When GATT virtual connection is closed, the event comes

enumerator **ESP_GATTC_SEARCH_CMPL_EVT**

When GATT service discovery is completed, the event comes

enumerator **ESP_GATTC_SEARCH_RES_EVT**

When GATT service discovery result is got, the event comes

enumerator **ESP_GATTC_READ_DESCR_EVT**

When GATT characteristic descriptor read completes, the event comes

enumerator **ESP_GATTC_WRITE_DESCR_EVT**

When GATT characteristic descriptor write completes, the event comes

enumerator **ESP_GATTC_NOTIFY_EVT**

When GATT notification or indication arrives, the event comes

enumerator **ESP_GATTC_PREP_WRITE_EVT**

When GATT prepare-write operation completes, the event comes

enumerator **ESP_GATTC_EXEC_EVT**

When write execution completes, the event comes

enumerator **ESP_GATTC_ACL_EVT**

When ACL connection is up, the event comes

enumerator **ESP_GATTC_CANCEL_OPEN_EVT**

When GATT client ongoing connection is cancelled, the event comes

enumerator **ESP_GATTC_SRVC_CHG_EVT**

When “service changed” occurs, the event comes

enumerator **ESP_GATTC_ENC_CMPL_CB_EVT**

When encryption procedure completes, the event comes

enumerator **ESP_GATTC_CFG_MTU_EVT**

When configuration of MTU completes, the event comes

enumerator **ESP_GATTC_ADV_DATA_EVT**

When advertising of data, the event comes

enumerator **ESP_GATTC_MULT_ADV_ENB_EVT**

When multi-advertising is enabled, the event comes

enumerator **ESP_GATTC_MULT_ADV_UPD_EVT**

When multi-advertising parameters are updated, the event comes

enumerator **ESP_GATTC_MULT_ADV_DATA_EVT**

When multi-advertising data arrives, the event comes

enumerator **ESP_GATTC_MULT_ADV_DIS_EVT**

When multi-advertising is disabled, the event comes

enumerator **ESP_GATTC_CONGEST_EVT**

When GATT connection congestion comes, the event comes

enumerator **ESP_GATTC_BTH_SCAN_ENB_EVT**

When batch scan is enabled, the event comes

enumerator **ESP_GATTC_BTH_SCAN_CFG_EVT**

When batch scan storage is configured, the event comes

enumerator **ESP_GATTC_BTH_SCAN_RD_EVT**

When Batch scan read event is reported, the event comes

enumerator **ESP_GATTC_BTH_SCAN_THR_EVT**

When Batch scan threshold is set, the event comes

enumerator **ESP_GATTC_BTH_SCAN_PARAM_EVT**

When Batch scan parameters are set, the event comes

enumerator **ESP_GATTC_BTH_SCAN_DIS_EVT**

When Batch scan is disabled, the event comes

enumerator **ESP_GATTC_SCAN_FLT_CFG_EVT**

When Scan filter configuration completes, the event comes

enumerator **ESP_GATTC_SCAN_FLT_PARAM_EVT**

When Scan filter parameters are set, the event comes

enumerator **ESP_GATTC_SCAN_FLT_STATUS_EVT**

When Scan filter status is reported, the event comes

enumerator **ESP_GATTC_ADV_VSC_EVT**

When advertising vendor spec content event is reported, the event comes

enumerator **ESP_GATTC_REG_FOR_NOTIFY_EVT**

When register for notification of a service completes, the event comes

enumerator **ESP_GATTC_UNREG_FOR_NOTIFY_EVT**

When unregister for notification of a service completes, the event comes

enumerator **ESP_GATTC_CONNECT_EVT**

When the ble physical connection is set up, the event comes

enumerator **ESP_GATTC_DISCONNECT_EVT**

When the ble physical connection disconnected, the event comes

enumerator **ESP_GATTC_READ_MULTIPLE_EVT**

When the ble characteristic or descriptor multiple complete, the event comes

enumerator **ESP_GATTC_QUEUE_FULL_EVT**

When the gattc command queue full, the event comes

enumerator **ESP_GATTC_SET_ASSOC_EVT**

When the ble gattc set the associated address complete, the event comes

enumerator **ESP_GATTC_GET_ADDR_LIST_EVT**

When the ble get gattc address list in cache finish, the event comes

enumerator **ESP_GATTC_DIS_SRVC_CMPL_EVT**

When the ble discover service complete, the event comes

enumerator **ESP_GATTC_READ_MULTI_VAR_EVT**

When read multiple variable characteristic complete, the event comes

BLUFI API

Overview BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

Application Example Check [bluetooth](#) folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - [bluetooth/blufi](#)

API Reference

Header File

- [components/bt/common/api/include/api/esp_blufi_api.h](#)

Functions

esp_err_t **esp_blufi_register_callbacks** (*esp_blufi_callbacks_t**callbacks)

This function is called to receive blufi callback event.

参数 **callbacks** –[in] callback functions

返回 ESP_OK - success, other - failed

esp_err_t **esp_blufi_profile_init** (void)

This function is called to initialize blufi_profile.

返回 ESP_OK - success, other - failed

esp_err_t **esp_blufi_profile_deinit** (void)

This function is called to de-initialize blufi_profile.

返回 ESP_OK - success, other - failed

esp_err_t **esp_blufi_send_wifi_conn_report** (*wifi_mode_t* opmode, *esp_blufi_sta_conn_state_t* sta_conn_state, *uint8_t* softap_conn_num, *esp_blufi_extra_info_t**extra_info)

This function is called to send wifi connection report.

参数

- **opmode** –: wifi opmode

- **sta_conn_state** –: station is already in connection or not
 - **softap_conn_num** –: softap connection number
 - **extra_info** –: extra information, such as sta_ssid, softap_ssid and etc.
- 返回 ESP_OK - success, other - failed

esp_err_t **esp_blufi_send_wifi_list** (uint16_t apCount, *esp_blufi_ap_record_t* *list)

This function is called to send wifi list.

参数

- **apCount** –: wifi list count
- **list** –: wifi list

返回 ESP_OK - success, other - failed

uint16_t **esp_blufi_get_version** (void)

Get BLUFI profile version.

返回 Most 8bit significant is Great version, Least 8bit is Sub version

esp_err_t **esp_blufi_send_error_info** (*esp_blufi_error_state_t* state)

This function is called to send blufi error information.

参数 **state** –: error state

返回 ESP_OK - success, other - failed

esp_err_t **esp_blufi_send_custom_data** (uint8_t *data, uint32_t data_len)

This function is called to custom data.

参数

- **data** –: custom data value
- **data_len** –: the length of custom data

返回 ESP_OK - success, other - failed

Unions

union **esp_blufi_cb_param_t**

#include <esp_blufi_api.h> BLUFI callback parameters union.

Public Members

struct *esp_blufi_cb_param_t::blufi_init_finish_evt_param* **init_finish**
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct *esp_blufi_cb_param_t::blufi_deinit_finish_evt_param* **deinit_finish**
Blufi callback param of ESP_BLUFI_EVENT_DEINIT_FINISH

struct *esp_blufi_cb_param_t::blufi_set_wifi_mode_evt_param* **wifi_mode**
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct *esp_blufi_cb_param_t::blufi_connect_evt_param* **connect**
Blufi callback param of ESP_BLUFI_EVENT_CONNECT

struct *esp_blufi_cb_param_t::blufi_disconnect_evt_param* **disconnect**
Blufi callback param of ESP_BLUFI_EVENT_DISCONNECT

struct *esp_blufi_cb_param_t::blufi_recv_sta_bssid_evt_param* **sta_bssid**
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_BSSID

```
struct esp_blufi_cb_param_t::blufi_rcv_sta_ssid_evt_param sta_ssid  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_SSID
```

    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_SSID
```

```
struct esp_blufi_cb_param_t::blufi_rcv_softap_passwd_evt_param softap_passwd  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD
```

```
struct esp_blufi_cb_param_t::blufi_rcv_softap_max_conn_num_evt_param softap_max_conn_num  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM
```

```
struct esp_blufi_cb_param_t::blufi_rcv_softap_auth_mode_evt_param softap_auth_mode  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE
```

```
struct esp_blufi_cb_param_t::blufi_rcv_softap_channel_evt_param softap_channel  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL
```

```
struct esp_blufi_cb_param_t::blufi_rcv_username_evt_param username  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_USERNAME
```

```
struct esp_blufi_cb_param_t::blufi_rcv_ca_evt_param ca  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CA_CERT
```

```
struct esp_blufi_cb_param_t::blufi_rcv_client_cert_evt_param client_cert  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_CERT
```

```
struct esp_blufi_cb_param_t::blufi_rcv_server_cert_evt_param server_cert  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_CERT
```

```
struct esp_blufi_cb_param_t::blufi_rcv_client_pkey_evt_param client_pkey  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY
```

```
struct esp_blufi_cb_param_t::blufi_rcv_server_pkey_evt_param server_pkey  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY
```

```
struct esp_blufi_cb_param_t::blufi_get_error_evt_param report_error  
    Blufi callback param of ESP_BLUFI_EVENT_REPORT_ERROR
```

```
struct esp_blufi_cb_param_t::blufi_rcv_custom_data_evt_param custom_data  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CUSTOM_DATA
```

```
struct blufi_connect_evt_param  
    #include <esp_blufi_api.h> ESP_BLUFI_EVENT_CONNECT.
```

Param event : Event type

Param param : Point to callback parameter, currently is union type

typedef void (***esp_blufi_negotiate_data_handler_t**)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)

BLUFI negotiate data handler.

Param data : data from phone

Param len : length of data from phone

Param output_data : data want to send to phone

Param output_len : length of data want to send to phone

Param need_free : output reporting if memory needs to be freed or not *

typedef int (***esp_blufi_encrypt_func_t**)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI encrypt the data after negotiate a share key.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number

Param crypt_data : plain text and encrypted data, the encrypt function must support autochthonous encrypt

Param crypt_len : length of plain text

Return Nonnegative number is encrypted length, if error, return negative number;

typedef int (***esp_blufi_decrypt_func_t**)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI decrypt the data after negotiate a share key.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number

Param crypt_data : encrypted data and plain text, the encrypt function must support autochthonous decrypt

Param crypt_len : length of encrypted text

Return Nonnegative number is decrypted length, if error, return negative number;

typedef uint16_t (***esp_blufi_checksum_func_t**)(uint8_t iv8, uint8_t *data, int len)

BLUFI checksum.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number

Param data : data need to checksum

Param len : length of data

Enumerations

enum **esp_blufi_cb_event_t**

Values:

enumerator **ESP_BLUFI_EVENT_INIT_FINISH**

enumerator **ESP_BLUFI_EVENT_DEINIT_FINISH**

enumerator **ESP_BLUFI_EVENT_SET_WIFI_OPMODE**

enumerator **ESP_BLUFI_EVENT_BLE_CONNECT**

enumerator **ESP_BLUFI_EVENT_BLE_DISCONNECT**

enumerator **ESP_BLUFI_EVENT_REQ_CONNECT_TO_AP**

enumerator **ESP_BLUFI_EVENT_REQ_DISCONNECT_FROM_AP**

enumerator **ESP_BLUFI_EVENT_GET_WIFI_STATUS**

enumerator **ESP_BLUFI_EVENT_DEAUTHENTICATE_STA**

enumerator **ESP_BLUFI_EVENT_RECV_STA_BSSID**

enumerator **ESP_BLUFI_EVENT_RECV_STA_SSID**

enumerator **ESP_BLUFI_EVENT_RECV_STA_PASSWD**

enumerator **ESP_BLUFI_EVENT_RECV_SOFTAP_SSID**

enumerator **ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD**

enumerator **ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL**

enumerator **ESP_BLUFI_EVENT_RECV_USERNAME**

enumerator **ESP_BLUFI_EVENT_RECV_CA_CERT**

enumerator **ESP_BLUFI_EVENT_RECV_CLIENT_CERT**

enumerator **ESP_BLUFI_EVENT_RECV_SERVER_CERT**

enumerator **ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY**

enumerator **ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY**

enumerator **ESP_BLUFI_EVENT_RECV_SLAVE_DISCONNECT_BLE**

enumerator **ESP_BLUFI_EVENT_GET_WIFI_LIST**

enumerator **ESP_BLUFI_EVENT_REPORT_ERROR**

enumerator **ESP_BLUFI_EVENT_RECV_CUSTOM_DATA**

enum **esp_blufi_sta_conn_state_t**

BLUFI config status.

Values:

enumerator **ESP_BLUFI_STA_CONN_SUCCESS**

enumerator **ESP_BLUFI_STA_CONN_FAIL**

enumerator **ESP_BLUFI_STA_CONNECTING**

enumerator **ESP_BLUFI_STA_NO_IP**

enum **esp_blufi_init_state_t**

BLUFI init status.

Values:

enumerator **ESP_BLUFI_INIT_OK**

enumerator **ESP_BLUFI_INIT_FAILED**

enum **esp_blufi_deinit_state_t**

BLUFI deinit status.

Values:

enumerator **ESP_BLUFI_DEINIT_OK**

enumerator **ESP_BLUFI_DEINIT_FAILED**

enum **esp_blufi_error_state_t**

Values:

enumerator **ESP_BLUFI_SEQUENCE_ERROR**

enumerator **ESP_BLUFI_CHECKSUM_ERROR**

enumerator **ESP_BLUFI_DECRYPT_ERROR**

enumerator **ESP_BLUFI_ENCRYPT_ERROR**

enumerator **ESP_BLUFI_INIT_SECURITY_ERROR**

enumerator **ESP_BLUFI_DH_MALLOC_ERROR**

enumerator **ESP_BLUFI_DH_PARAM_ERROR**

enumerator **ESP_BLUFI_READ_PARAM_ERROR**

enumerator **ESP_BLUFI_MAKE_PUBLIC_ERROR**

enumerator **ESP_BLUFI_DATA_FORMAT_ERROR**

enumerator **ESP_BLUFI_WIFI_SCAN_FAIL**

enumerator **ESP_BLUFI_MSG_STATE_ERROR**

2.1.4 CLASSIC BT

CLASSIC BLUETOOTH GAP API

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_gap_bt_api.h](#)

Functions

static inline uint32_t **esp_bt_gap_get_cod_srvc** (uint32_t cod)

get major service field of COD

参数 **cod** –[in] Class of Device

返回 major service bits

static inline uint32_t **esp_bt_gap_get_cod_major_dev** (uint32_t cod)

get major device field of COD

参数 **cod** –[in] Class of Device

返回 major device bits

static inline uint32_t **esp_bt_gap_get_cod_minor_dev** (uint32_t cod)

get minor service field of COD

参数 **cod** –[in] Class of Device

返回 minor service bits

static inline uint32_t **esp_bt_gap_get_cod_format_type** (uint32_t cod)

get format type of COD

参数 **cod** –[in] Class of Device

返回 format type

static inline bool **esp_bt_gap_is_valid_cod** (uint32_t cod)

decide the integrity of COD

参数 **cod** –[in] Class of Device

返回

- true if cod is valid
- false otherwise

esp_err_t **esp_bt_gap_register_callback** (*esp_bt_gap_cb_t* callback)

register callback function. This function should be called after `esp_bluedroid_enable()` completes successfully

返回

- ESP_OK : Succeed
- ESP_FAIL: others

esp_err_t **esp_bt_gap_set_scan_mode** (*esp_bt_connection_mode_t* c_mode, *esp_bt_discovery_mode_t* d_mode)

Set discoverability and connectability mode for legacy bluetooth. This function should be called after `esp_bluedroid_enable()` completes successfully.

参数

- **c_mode** –[in] : one of the enums of `esp_bt_connection_mode_t`
- **d_mode** –[in] : one of the enums of `esp_bt_discovery_mode_t`

返回

- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG: if argument invalid
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled

- ESP_FAIL: others

esp_err_t **esp_bt_gap_start_discovery** (*esp_bt_inq_mode_t* mode, uint8_t inq_len, uint8_t num_rsps)

This function starts Inquiry and Name Discovery. This function should be called after `esp_bluedroid_enable()` completes successfully. When Inquiry is halted and cached results do not contain device name, then Name Discovery will connect to the peer target to get the device name. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_STATE_CHANGED_EVT` when Inquiry is started or Name Discovery is completed. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_RES_EVT` each time the two types of discovery results are got.

参数

- **mode** –[in] - Inquiry mode
- **inq_len** –[in] - Inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30. This parameter only specifies the total duration of the Inquiry process,
 - when this time expires, Inquiry will be halted.
- **num_rsps** –[in] - Number of responses that can be received before the Inquiry is halted, value 0 indicates an unlimited number of responses.

返回

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if invalid parameters are provided
- ESP_FAIL: others

esp_err_t **esp_bt_gap_cancel_discovery** (void)

Cancel Inquiry and Name Discovery. This function should be called after `esp_bluedroid_enable()` completes successfully. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_STATE_CHANGED_EVT` if Inquiry or Name Discovery is cancelled by calling this function.

返回

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_gap_get_remote_services** (*esp_bd_addr_t* remote_bda)

Start SDP to get remote services. This function should be called after `esp_bluedroid_enable()` completes successfully. `esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_RMT_SRVCS_EVT` after service discovery ends.

返回

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_gap_get_remote_service_record** (*esp_bd_addr_t* remote_bda, *esp_bt_uuid_t* *uuid)

Start SDP to look up the service matching uuid on the remote device. This function should be called after `esp_bluedroid_enable()` completes successfully.

`esp_bt_gap_cb_t` will be called with `ESP_BT_GAP_RMT_SRVC_REC_EVT` after service discovery ends

返回

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

uint8_t ***esp_bt_gap_resolve_eir_data** (uint8_t *eir, *esp_bt_eir_type_t* type, uint8_t *length)

This function is called to get EIR data for a specific type.

参数

- **eir** –[in] - pointer of raw eir data to be resolved
- **type** –[in] - specific EIR data type
- **length** –[out] - return the length of EIR data excluding fields of length and data type

返回 pointer of starting position of eir data excluding eir data type, NULL if not found

esp_err_t **esp_bt_gap_config_eir_data** (*esp_bt_eir_data_t* *eir_data)

This function is called to config EIR data.

esp_bt_gap_cb_t will be called with ESP_BT_GAP_CONFIG_EIR_DATA_EVT after config EIR ends.

参数 **eir_data** -[in] - pointer of EIR data content

返回

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

esp_err_t **esp_bt_gap_set_cod** (*esp_bt_cod_t* cod, *esp_bt_cod_mode_t* mode)

This function is called to set class of device. The structure esp_bt_gap_cb_t will be called with ESP_BT_GAP_SET_COD_EVT after set COD ends. This function should be called after Bluetooth profiles are initialized, otherwise the user configured class of device can be overwritten. Some profiles have special restrictions on class of device, and changes may make these profiles unable to work.

参数

- **cod** -[in] - class of device
- **mode** -[in] - setting mode

返回

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

esp_err_t **esp_bt_gap_get_cod** (*esp_bt_cod_t* *cod)

This function is called to get class of device.

参数 **cod** -[out] - class of device

返回

- ESP_OK : Succeed
- ESP_FAIL: others

esp_err_t **esp_bt_gap_read_rssi_delta** (*esp_bd_addr_t* remote_addr)

This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP_BT_GAP_READ_RSSI_DELTA_EVT.

参数 **remote_addr** -[in] - remote device address, corresponding to a certain connection handle

返回

- ESP_OK : Succeed
- ESP_FAIL: others

esp_err_t **esp_bt_gap_remove_bond_device** (*esp_bd_addr_t* bd_addr)

Removes a device from the security database list of peer device.

参数 **bd_addr** -[in] : BD address of the peer device

返回 - ESP_OK : success

- ESP_FAIL : failed

int **esp_bt_gap_get_bond_device_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

返回 - >= 0 : bonded devices number

- ESP_FAIL : failed

esp_err_t **esp_bt_gap_get_bond_device_list** (int *dev_num, *esp_bd_addr_t* *dev_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

参数

- **dev_num** **–[inout]** Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- **dev_list** **–[out]** an array(buffer) of esp_bd_addr_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

返回

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_gap_set_pin** (*esp_bt_pin_type_t* pin_type, uint8_t pin_code_len, *esp_bt_pin_code_t* pin_code)

Set pin type and default pin code for legacy pairing.

参数

- **pin_type** **–[in]** Use variable or fixed pin. If pin_type is ESP_BT_PIN_TYPE_VARIABLE, pin_code and pin_code_len will be ignored, and ESP_BT_GAP_PIN_REQ_EVT will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
- **pin_code_len** **–[in]** Length of pin_code
- **pin_code** **–[in]** Pin_code

返回 - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

esp_err_t **esp_bt_gap_pin_reply** (*esp_bd_addr_t* bd_addr, bool accept, uint8_t pin_code_len, *esp_bt_pin_code_t* pin_code)

Reply the pin_code to the peer device for legacy pairing when ESP_BT_GAP_PIN_REQ_EVT is coming.

参数

- **bd_addr** **–[in]** BD address of the peer
- **accept** **–[in]** Pin_code reply successful or declined.
- **pin_code_len** **–[in]** Length of pin_code
- **pin_code** **–[in]** Pin_code

返回 - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

esp_err_t **esp_bt_gap_set_security_param** (*esp_bt_sp_param_t* param_type, void *value, uint8_t len)

Set a GAP security parameter value. Overrides the default value.

参数

- **param_type** **–[in]** : the type of the param which is to be set
- **value** **–[in]** : the param value
- **len** **–[in]** : the length of the param value

返回 - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

esp_err_t **esp_bt_gap_ssp_passkey_reply** (*esp_bd_addr_t* bd_addr, bool accept, uint32_t passkey)

Reply the key value to the peer device in the legacy connection stage.

参数

- **bd_addr** **–[in]** : BD address of the peer
- **accept** **–[in]** : passkey entry successful or declined.
- **passkey** **–[in]** : passkey value, must be a 6 digit number, can be lead by 0.

返回 - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

esp_err_t **esp_bt_gap_ssp_confirm_reply** (*esp_bd_addr_t* bd_addr, bool accept)

Reply the confirm value to the peer device in the legacy connection stage.

参数

- **bd_addr** **–[in]** : BD address of the peer device
- **accept** **–[in]** : numbers to compare are the same or different

返回 - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

esp_err_t **esp_bt_gap_set_afh_channels** (*esp_bt_gap_afh_channels* channels)

Set the AFH channels.

参数 **channels** **–[in]** : The nth such field (in the range 0 to 78) contains the value for channel n : 0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved and shall be set to 0. At least 20 channels shall be marked as unknown.

返回 - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

esp_err_t **esp_bt_gap_read_remote_name** (*esp_bd_addr_t* remote_bda)

Read the remote device name.

参数 **remote_bda** **–[in]** The remote device' s address

返回 - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

esp_err_t **esp_bt_gap_set_qos** (*esp_bd_addr_t* remote_bda, uint32_t t_poll)

Config Quality of service.

参数

- **remote_bda** **–[in]** The remote device' s address
- **t_poll** **–[in]** Poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625ms

返回 - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

Unions

union **esp_bt_gap_cb_param_t**

Device property value length

void ***val**

Device property value

struct **esp_bt_eir_data_t**

EIR data content, according to “Supplement to the Bluetooth Core Specification” .

Public Members

bool **fec_required**

FEC is required or not, true by default

bool **include_txpower**

EIR data include TX power, false by default

bool **include_uuid**

EIR data include UUID, false by default

uint8_t **flag**

EIR flags, see ESP_BT_EIR_FLAG for details, EIR will not include flag if it is 0, 0 by default

uint16_t **manufacturer_len**

Manufacturer data length, 0 by default

uint8_t ***p_manufacturer_data**

Manufacturer data point

uint16_t **url_len**

URL length, 0 by default

uint8_t *p_url
URL point

Macros

ESP_BT_GAP_RSSI_HIGH_THRDL

RSSI threshold.

High RSSI threshold

ESP_BT_GAP_RSSI_LOW_THRDL

Low RSSI threshold

ESP_BT_GAP_AFH_CHANNELS_LEN

ESP_BT_GAP_MAX_BDNAME_LEN

Maximum bytes of Bluetooth device name.

ESP_BT_GAP_EIR_DATA_LEN

Maximum size of EIR Significant part.

ESP_BT_EIR_TYPE_FLAGS

Extended Inquiry Response data type.

Flag with information such as BR/EDR and LE support

ESP_BT_EIR_TYPE_INCMPL_16BITS_UUID

Incomplete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_16BITS_UUID

Complete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_32BITS_UUID

Incomplete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_32BITS_UUID

Complete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_128BITS_UUID

Incomplete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_128BITS_UUID

Complete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_SHORT_LOCAL_NAME

Shortened Local Name

ESP_BT_EIR_TYPE_CMPL_LOCAL_NAME

Complete Local Name

ESP_BT_EIR_TYPE_TX_POWER_LEVEL

Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

ESP_BT_EIR_TYPE_URL

Uniform resource identifier

ESP_BT_EIR_TYPE_MANU_SPECIFIC

Manufacturer specific data

ESP_BT_EIR_TYPE_MAX_NUM

MAX number of EIR type

ESP_BT_EIR_FLAG_LIMIT_DISC

ESP_BT_EIR_FLAG_GEN_DISC

ESP_BT_EIR_FLAG_BREDR_NOT_SPT

ESP_BT_EIR_FLAG_DMT_CONTROLLER_SPT

ESP_BT_EIR_FLAG_DMT_HOST_SPT

ESP_BT_EIR_MAX_LEN

ESP_BT_PIN_CODE_LEN

Max pin code length

ESP_BT_IO_CAP_OUT

ESP_BT_IO_CAP_IO

ESP_BT_IO_CAP_IN

ESP_BT_IO_CAP_NONE

ESP_BT_PM_MD_ACTIVE

Active mode

ESP_BT_PM_MD_HOLD

Hold mode

ESP_BT_PM_MD_SNIFF

Sniff mode

ESP_BT_PM_MD_PARK

Park state

ESP_BT_COD_SRVC_BIT_MASK

Bits of major service class field.

Major service bit mask

ESP_BT_COD_SRVC_BIT_OFFSET

Major service bit offset

ESP_BT_COD_MAJOR_DEV_BIT_MASK

Bits of major device class field.

Major device bit mask

ESP_BT_COD_MAJOR_DEV_BIT_OFFSET

Major device bit offset

ESP_BT_COD_MINOR_DEV_BIT_MASK

Bits of minor device class field.

Minor device bit mask

ESP_BT_COD_MINOR_DEV_BIT_OFFSET

Minor device bit offset

ESP_BT_COD_FORMAT_TYPE_BIT_MASK

Bits of format type.

Format type bit mask

ESP_BT_COD_FORMAT_TYPE_BIT_OFFSET

Format type bit offset

ESP_BT_COD_FORMAT_TYPE_1

Class of device format type 1.

ESP_BT_GAP_MIN_INQ_LEN

Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s

ESP_BT_GAP_MAX_INQ_LEN

Maximum inquiry duration, unit is 1.28s

ESP_BT_GAP_TPOLL_MIN

Minimum, Default and Maximum poll interval Minimum poll interval, unit is 625 microseconds

ESP_BT_GAP_TPOLL_DFT

Default poll interval, unit is 625 microseconds

ESP_BT_GAP_TPOLL_MAX

Maximum poll interval, unit is 625 microseconds

Type Definitions

typedef uint8_t **esp_bt_gap_afh_channels**[10]

typedef uint8_t **esp_bt_eir_type_t**

typedef uint8_t **esp_bt_pin_code_t**[16]

Pin Code (upto 128 bits) MSB is 0

typedef uint8_t **esp_bt_io_cap_t**

Combination of the IO Capability

typedef uint8_t **esp_bt_pm_mode_t**

typedef void (***esp_bt_gap_cb_t**)(*esp_bt_gap_cb_event_t* event, *esp_bt_gap_cb_param_t* *param)

bluetooth GAP callback function type

Param event : Event type

Param param : Pointer to callback parameter

Enumerations

enum **esp_bt_cod_mode_t**

class of device settings

Values:

enumerator **ESP_BT_SET_COD_MAJOR_MINOR**

overwrite major, minor class

enumerator **ESP_BT_SET_COD_SERVICE_CLASS**

set the bits in the input, the current bit will remain

enumerator **ESP_BT_CLR_COD_SERVICE_CLASS**

clear the bits in the input, others will remain

enumerator **ESP_BT_SET_COD_ALL**

overwrite major, minor, set the bits in service class

enumerator **ESP_BT_INIT_COD**

overwrite major, minor, and service class

enum **esp_bt_connection_mode_t**

Discoverability and Connectability mode.

Values:

enumerator **ESP_BT_NON_CONNECTABLE**

Non-connectable

enumerator **ESP_BT_CONNECTABLE**

Connectable

enum **esp_bt_discovery_mode_t**

Values:

enumerator **ESP_BT_NON_DISCOVERABLE**

Non-discoverable

enumerator **ESP_BT_LIMITED_DISCOVERABLE**

Limited Discoverable

enumerator **ESP_BT_GENERAL_DISCOVERABLE**

General Discoverable

enum **esp_bt_gap_dev_prop_type_t**

Bluetooth Device Property type.

Values:

enumerator **ESP_BT_GAP_DEV_PROP_BDNAME**

Bluetooth device name, value type is int8_t []

enumerator **ESP_BT_GAP_DEV_PROP_COD**

Class of Device, value type is uint32_t

enumerator **ESP_BT_GAP_DEV_PROP_RSSI**

Received Signal strength Indication, value type is int8_t, ranging from -128 to 127

enumerator **ESP_BT_GAP_DEV_PROP_EIR**

Extended Inquiry Response, value type is uint8_t []

enum **esp_bt_cod_srvc_t**

Major service class field of Class of Device, mutiple bits can be set.

Values:

enumerator **ESP_BT_COD_SRVC_NONE**

None indicates an invalid value

enumerator **ESP_BT_COD_SRVC_LMTD_DISCOVER**

Limited Discoverable Mode

enumerator **ESP_BT_COD_SRVC_POSITIONING**

Positioning (Location identification)

enumerator **ESP_BT_COD_SRVC_NETWORKING**

Networking, e.g. LAN, Ad hoc

enumerator **ESP_BT_COD_SRVC_RENDERING**

Rendering, e.g. Printing, Speakers

enumerator **ESP_BT_COD_SRVC_CAPTURING**

Capturing, e.g. Scanner, Microphone

enumerator **ESP_BT_COD_SRVC_OBJ_TRANSFER**

Object Transfer, e.g. v-Inbox, v-Folder

enumerator **ESP_BT_COD_SRVC_AUDIO**

Audio, e.g. Speaker, Microphone, Headset service

enumerator **ESP_BT_COD_SRVC_TELEPHONY**

Telephony, e.g. Cordless telephony, Modem, Headset service

enumerator **ESP_BT_COD_SRVC_INFORMATION**

Information, e.g., WEB-server, WAP-server

enum **esp_bt_pin_type_t**

Values:

enumerator **ESP_BT_PIN_TYPE_VARIABLE**

Refer to BTM_PIN_TYPE_VARIABLE

enumerator **ESP_BT_PIN_TYPE_FIXED**

Refer to BTM_PIN_TYPE_FIXED

enum **esp_bt_sp_param_t**

Values:

enumerator **ESP_BT_SP_IOCAP_MODE**

Set IO mode

enum **esp_bt_cod_major_dev_t**

Major device class field of Class of Device.

Values:

enumerator **ESP_BT_COD_MAJOR_DEV_MISC**

Miscellaneous

enumerator **ESP_BT_COD_MAJOR_DEV_COMPUTER**

Computer

enumerator **ESP_BT_COD_MAJOR_DEV_PHONE**

Phone(cellular, cordless, pay phone, modem)

enumerator **ESP_BT_COD_MAJOR_DEV_LAN_NAP**

LAN, Network Access Point

enumerator **ESP_BT_COD_MAJOR_DEV_AV**

Audio/Video(headset, speaker, stereo, video display, VCR)

enumerator **ESP_BT_COD_MAJOR_DEV_PERIPHERAL**

Peripheral(mouse, joystick, keyboard)

enumerator **ESP_BT_COD_MAJOR_DEV_IMAGING**

Imaging(printer, scanner, camera, display)

enumerator **ESP_BT_COD_MAJOR_DEV_WEARABLE**

Wearable

enumerator **ESP_BT_COD_MAJOR_DEV_TOY**

Toy

enumerator **ESP_BT_COD_MAJOR_DEV_HEALTH**

Health

enumerator **ESP_BT_COD_MAJOR_DEV_UNCATEGORIZED**

Uncategorized: device not specified

enum **esp_bt_gap_discovery_state_t**

Bluetooth Device Discovery state

Values:

enumerator **ESP_BT_GAP_DISCOVERY_STOPPED**

Device discovery stopped

enumerator **ESP_BT_GAP_DISCOVERY_STARTED**

Device discovery started

enum **esp_bt_gap_cb_event_t**

BT GAP callback events.

Values:

enumerator **ESP_BT_GAP_DISC_RES_EVT**

Device discovery result event

enumerator **ESP_BT_GAP_DISC_STATE_CHANGED_EVT**

Discovery state changed event

enumerator **ESP_BT_GAP_RMT_SRVCS_EVT**

Get remote services event

enumerator **ESP_BT_GAP_RMT_SRVC_REC_EVT**

Get remote service record event

enumerator **ESP_BT_GAP_AUTH_CMPL_EVT**

Authentication complete event

enumerator **ESP_BT_GAP_PIN_REQ_EVT**

Legacy Pairing Pin code request

enumerator **ESP_BT_GAP_CFM_REQ_EVT**

Security Simple Pairing User Confirmation request.

enumerator **ESP_BT_GAP_KEY_NOTIF_EVT**

Security Simple Pairing Passkey Notification

enumerator **ESP_BT_GAP_KEY_REQ_EVT**

Security Simple Pairing Passkey request

enumerator **ESP_BT_GAP_READ_RSSI_DELTA_EVT**

Read rssi event

enumerator **ESP_BT_GAP_CONFIG_EIR_DATA_EVT**

Config EIR data event

enumerator **ESP_BT_GAP_SET_AFH_CHANNELS_EVT**

Set AFH channels event

enumerator **ESP_BT_GAP_READ_REMOTE_NAME_EVT**

Read Remote Name event

enumerator **ESP_BT_GAP_MODE_CHG_EVT**

enumerator **ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT**

remove bond device complete event

enumerator **ESP_BT_GAP_QOS_CMPL_EVT**

QOS complete event

enumerator **ESP_BT_GAP_ACL_CONN_CMPL_STAT_EVT**

ACL connection complete status event

enumerator **ESP_BT_GAP_ACL_DISCONN_CMPL_STAT_EVT**

ACL disconnection complete status event

enumerator **ESP_BT_GAP_EVT_MAX**

enum **esp_bt_inq_mode_t**

Inquiry Mode

Values:

enumerator **ESP_BT_INQ_MODE_GENERAL_INQUIRY**

General inquiry mode

enumerator **ESP_BT_INQ_MODE_LIMITED_INQUIRY**

Limited inquiry mode

Bluetooth A2DP API

Application Example Check `bluetooth/bluedroid/classic_bt` folder in ESP-IDF examples, which contains the following application:

- This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - `bluetooth/bluedroid/classic_bt/a2dp_sink`

API Reference

Header File

- `components/bt/host/bluedroid/api/include/api/esp_a2dp_api.h`

Functions

`esp_err_t esp_a2d_register_callback` (`esp_a2d_cb_t` callback)

Register application callback function to A2DP module. This function should be called only after `esp_bluedroid_enable()` completes successfully, used by both A2DP source and sink.

参数 `callback` –[in] A2DP event callback function

返回

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: if callback is a NULL function pointer

`esp_err_t esp_a2d_sink_register_data_callback` (`esp_a2d_sink_data_cb_t` callback)

Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after `esp_bluedroid_enable()` completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through `menuconfig`.

参数 `callback` –[in] A2DP sink data callback function

返回

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: if callback is a NULL function pointer

`esp_err_t esp_a2d_sink_init` (void)

Initialize the bluetooth A2DP sink module. This function should be called after `esp_bluedroid_enable()` completes successfully, and `ESP_A2D_PROF_STATE_EVT` with `ESP_A2D_INIT_SUCCESS` will be reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after `esp_bluedroid_enable()` completes successfully.

返回

- `ESP_OK`: if the initialization request is sent successfully
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

`esp_err_t esp_a2d_sink_deinit` (void)

De-initialize for A2DP sink module. This function should be called only after `esp_bluedroid_enable()` completes successfully, and `ESP_A2D_PROF_STATE_EVT` with `ESP_A2D_DEINIT_SUCCESS` will be reported to APP layer.

返回

- `ESP_OK`: if the deinitialization request is sent successfully
- `ESP_ERR_INVALID_STATE`: if bluetooth stack is not yet enabled
- `ESP_FAIL`: others

esp_err_t esp_a2d_sink_connect (*esp_bd_addr_t* remote_bda)

Connect to remote bluetooth A2DP source device. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

参数 `remote_bda` –[in] remote bluetooth device address

返回

- ESP_OK: connect request is sent to lower layer successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_a2d_sink_disconnect (*esp_bd_addr_t* remote_bda)

Disconnect from the remote A2DP source device. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

参数 `remote_bda` –[in] remote bluetooth device address

返回

- ESP_OK: disconnect request is sent to lower layer successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_a2d_media_ctrl (*esp_a2d_media_ctrl_t* ctrl)

Media control commands. This API can be used for both A2DP sink and source and must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

参数 `ctrl` –[in] control commands for A2DP data channel

返回

- ESP_OK: control command is sent to lower layer successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_a2d_source_init (void)

Initialize the bluetooth A2DP source module. A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after `esp_bluedroid_enable()` completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

返回

- ESP_OK: if the initialization request is sent to lower layer successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_a2d_source_deinit (void)

De-initialize for A2DP source module. This function should be called only after `esp_bluedroid_enable()` completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_a2d_source_register_data_callback (*esp_a2d_source_data_cb_t* callback)

Register A2DP source data input function. For now, the input should be PCM data stream. This function should be called only after `esp_bluedroid_enable()` completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

参数 `callback` –[in] A2DP source data callback function

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

esp_err_t **esp_a2d_source_connect** (*esp_bd_addr_t* remote_bda)

Connect to remote A2DP sink device. This API must be called after `esp_a2d_source_init()` and before `esp_a2d_source_deinit()`.

参数 `remote_bda` –[in] remote bluetooth device address

返回

- ESP_OK: connect request is sent to lower layer successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_a2d_source_disconnect** (*esp_bd_addr_t* remote_bda)

Disconnect from the remote A2DP sink device. This API must be called after `esp_a2d_source_init()` and before `esp_a2d_source_deinit()`.

参数 `remote_bda` –[in] remote bluetooth device address

返回

- ESP_OK: disconnect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Unions

union **esp_a2d_cb_param_t**

`#include <esp_a2dp_api.h>` A2DP state callback parameters.

Public Members

struct *esp_a2d_cb_param_t::a2d_conn_stat_param* **conn_stat**

A2DP connection status

struct *esp_a2d_cb_param_t::a2d_audio_stat_param* **audio_stat**

audio stream playing state

struct *esp_a2d_cb_param_t::a2d_audio_cfg_param* **audio_cfg**

media codec configuration information

struct *esp_a2d_cb_param_t::media_ctrl_stat_param* **media_ctrl_stat**

status in acknowledgement to media control commands

struct *esp_a2d_cb_param_t::a2d_prof_stat_param* **a2d_prof_stat**

status to indicate a2d prof init or deinit

struct **a2d_audio_cfg_param**

`#include <esp_a2dp_api.h>` ESP_A2D_AUDIO_CFG_EVT.

Public Members

esp_bd_addr_t **remote_bda**

remote bluetooth device address

esp_a2d_mcc_t **mcc**

A2DP media codec capability information

```
struct a2d_audio_stat_param  
    #include <esp_a2dp_api.h> ESP_A2D_AUDIO_STATE_EVT.
```

Public Members

esp_a2d_audio_state_t **state**
one of the values from *esp_a2d_audio_state_t*

esp_bd_addr_t **remote_bda**
remote bluetooth device address

```
struct a2d_conn_stat_param  
    #include <esp_a2dp_api.h> ESP_A2D_CONNECTION_STATE_EVT.
```

Public Members

esp_a2d_connection_state_t **state**
one of values from *esp_a2d_connection_state_t*

esp_bd_addr_t **remote_bda**
remote bluetooth device address

esp_a2d_disc_rsn_t **disc_rsn**
reason of disconnection for “DISCONNECTED”

```
struct a2d_prof_stat_param  
    #include <esp_a2dp_api.h> ESP_A2D_PROF_STATE_EVT.
```

Public Members

esp_a2d_init_state_t **init_state**
a2dp profile state param

```
struct media_ctrl_stat_param  
    #include <esp_a2dp_api.h> ESP_A2D_MEDIA_CTRL_ACK_EVT.
```

Public Members

esp_a2d_media_ctrl_t **cmd**
media control commands to acknowledge

esp_a2d_media_ctrl_ack_t **status**
acknowledgement to media control commands

Structures

struct **esp_a2d_mcc_t**
A2DP media codec capabilities union

Public Members

esp_a2d_mct_t type

A2DP media codec type

uint8_t **sbc**[(4)]
SBC codec capabilities

uint8_t **m12**[(4)]
MPEG-1,2 audio codec capabilities

uint8_t **m24**[(6)]
MPEG-2, 4 AAC audio codec capabilities

uint8_t **atrac**[(7)]
ATRAC family codec capabilities

union *esp_a2d_mcc_t*::[anonymous] **cie**
A2DP codec information element

Macros

ESP_A2D_MCT_SBC
Media codec types supported by A2DP.
SBC

ESP_A2D_MCT_M12
MPEG-1, 2 Audio

ESP_A2D_MCT_M24
MPEG-2, 4 AAC

ESP_A2D_MCT_ATRAC
ATRAC family

ESP_A2D_MCT_NON_A2DP

ESP_A2D_CIE_LEN_ATRAC

Type Definitions

typedef uint8_t **esp_a2d_mct_t**

typedef void (***esp_a2d_cb_t**)(*esp_a2d_cb_event_t* event, *esp_a2d_cb_param_t* *param)

A2DP profile callback function type.

Param event : Event type

Param param : Pointer to callback parameter

typedef void (***esp_a2d_sink_data_cb_t**)(const uint8_t *buf, uint32_t len)

A2DP sink data callback function.

Param buf [in] : pointer to the data received from A2DP source device and is PCM format decoded from SBC decoder; buf references to a static memory block and can be overwritten by upcoming data

Param len [in] : size(in bytes) in buf

typedef int32_t (***esp_a2d_source_data_cb_t**)(uint8_t *buf, int32_t len)

A2DP source data read callback function.

Param buf [in] : buffer to be filled with PCM data stream from higher layer

Param len [in] : size(in bytes) of data block to be copied to buf. -1 is an indication to user that data buffer shall be flushed

Return size of bytes read successfully, if the argument len is -1, this value is ignored.

Enumerations

enum **esp_a2d_connection_state_t**

Bluetooth A2DP connection states.

Values:

enumerator **ESP_A2D_CONNECTION_STATE_DISCONNECTED**

connection released

enumerator **ESP_A2D_CONNECTION_STATE_CONNECTING**

connecting remote device

enumerator **ESP_A2D_CONNECTION_STATE_CONNECTED**

connection established

enumerator **ESP_A2D_CONNECTION_STATE_DISCONNECTING**

disconnecting remote device

enum **esp_a2d_disc_rsn_t**

Bluetooth A2DP disconnection reason.

Values:

enumerator **ESP_A2D_DISC_RSN_NORMAL**

Finished disconnection that is initiated by local or remote device

enumerator **ESP_A2D_DISC_RSN_ABNORMAL**

Abnormal disconnection caused by signal loss

enum **esp_a2d_audio_state_t**

Bluetooth A2DP datapath states.

Values:

enumerator **ESP_A2D_AUDIO_STATE_REMOTE_SUSPEND**

audio stream datapath suspended by remote device

enumerator **ESP_A2D_AUDIO_STATE_STOPPED**

audio stream datapath stopped

enumerator **ESP_A2D_AUDIO_STATE_STARTED**

audio stream datapath started

enum **esp_a2d_media_ctrl_ack_t**

A2DP media control command acknowledgement code.

Values:

enumerator **ESP_A2D_MEDIA_CTRL_ACK_SUCCESS**

media control command is acknowledged with success

enumerator **ESP_A2D_MEDIA_CTRL_ACK_FAILURE**

media control command is acknowledged with failure

enumerator **ESP_A2D_MEDIA_CTRL_ACK_BUSY**

media control command is rejected, as previous command is not yet acknowledged

enum **esp_a2d_media_ctrl_t**

A2DP media control commands.

Values:

enumerator **ESP_A2D_MEDIA_CTRL_NONE**

Not for application use, use inside stack only.

enumerator **ESP_A2D_MEDIA_CTRL_CHECK_SRC_RDY**

check whether AVDTP is connected, only used in A2DP source

enumerator **ESP_A2D_MEDIA_CTRL_START**

command to set up media transmission channel

enumerator **ESP_A2D_MEDIA_CTRL_STOP**

command to stop media transmission

enumerator **ESP_A2D_MEDIA_CTRL_SUSPEND**

command to suspend media transmission

enum **esp_a2d_init_state_t**

Bluetooth A2DP Initiation states.

Values:

enumerator **ESP_A2D_DEINIT_SUCCESS**

A2DP profile deinit successful event

enumerator **ESP_A2D_INIT_SUCCESS**

A2DP profile deinit successful event

enum **esp_a2d_cb_event_t**

A2DP callback events.

Values:

enumerator **ESP_A2D_CONNECTION_STATE_EVT**

connection state changed event

enumerator **ESP_A2D_AUDIO_STATE_EVT**

audio stream transmission state changed event

enumerator **ESP_A2D_AUDIO_CFG_EVT**

audio codec is configured, only used for A2DP SINK

enumerator **ESP_A2D_MEDIA_CTRL_ACK_EVT**

acknowledge event in response to media control commands

enumerator **ESP_A2D_PROF_STATE_EVT**

indicate a2dp init&deinit complete

BT AVRCP APIs

Overview Bluetooth AVRCP reference APIs.

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_avrc_api.h](#)

Functions

esp_err_t **esp_avrc_ct_register_callback** (*esp_avrc_ct_cb_t* callback)

Register application callbacks to AVRCP module. This function should be called after `esp_bluedroid_enable()` completes successfully.

参数 **callback** –[in] AVRCP controller callback function

返回

- **ESP_OK**: success
- **ESP_ERR_INVALID_STATE**: if bluetooth stack is not yet enabled
- **ESP_FAIL**: others

esp_err_t **esp_avrc_ct_init** (void)

Initialize the bluetooth AVRCP controller module, This function should be called after `esp_bluedroid_enable()` completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be initialized before A2DP.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_avrc_ct_deinit (void)

De-initialize AVRCP controller module. This function should be called after after esp_bluetooth_enable() completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be deinitialized before A2DP.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_avrc_ct_send_set_player_value_cmd (uint8_t tl, uint8_t attr_id, uint8_t value_id)

Send player application settings command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

参数

- **tl** **-[in]** : transaction label, 0 to 15, consecutive commands should use different values
- **attr_id** **-[in]** : player application setting attribute IDs from one of esp_avrc_ps_attr_ids_t
- **value_id** **-[in]** : attribute value defined for the specific player application setting attribute

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_avrc_ct_send_get_rn_capabilities_cmd (uint8_t tl)

Send GetCapabilities PDU to AVRCP target to retrieve remote device's supported notification event_ids. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

参数 **tl** **-[in]** : transaction label, 0 to 15, consecutive commands should use different values

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_avrc_ct_send_register_notification_cmd (uint8_t tl, uint8_t event_id, uint32_t event_parameter)

Send register notification command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

参数

- **tl** **-[in]** : transaction label, 0 to 15, consecutive commands should use different values.
- **event_id** **-[in]** : id of events, e.g. ESP_AVRC_RN_PLAY_STATUS_CHANGE, ESP_AVRC_RN_TRACK_CHANGE, etc.
- **event_parameter** **-[in]** : playback interval for ESP_AVRC_RN_PLAY_POS_CHANGED; For other events, value of this parameter is ignored.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

esp_err_t esp_avrc_ct_send_set_absolute_volume_cmd (uint8_t tl, uint8_t volume)

Send set absolute volume command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

参数

- **tl** **–[in]** : transaction label, 0 to 15, consecutive commands should use different values
- **volume** **–[in]** : volume, 0 to 0x7f, means 0% to 100%

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

esp_err_t **esp_avrc_ct_send_metadata_cmd** (uint8_t tl, uint8_t attr_mask)

Send metadata command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

参数

- **tl** **–[in]** : transaction label, 0 to 15, consecutive commands should use different values.
- **attr_mask** **–[in]** : mask of attributes, e.g. ESP_AVRC_MD_ATTR_ID_TITLE | ESP_AVRC_MD_ATTR_ID_ARTIST.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_avrc_ct_send_passthrough_cmd** (uint8_t tl, uint8_t key_code, uint8_t key_state)

Send passthrough command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

参数

- **tl** **–[in]** : transaction label, 0 to 15, consecutive commands should use different values.
- **key_code** **–[in]** : passthrough command code, e.g. ESP_AVRC_PT_CMD_PLAY, ESP_AVRC_PT_CMD_STOP, etc.
- **key_state** **–[in]** : passthrough command key state, ESP_AVRC_PT_CMD_STATE_PRESSED or ESP_AVRC_PT_CMD_STATE_RELEASED

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_avrc_tg_register_callback** (*esp_avrc_tg_cb_t* callback)

Register application callbacks to AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully.

参数 **callback** **–[in]** AVRCP target callback function

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_avrc_tg_init** (void)

Initialize the bluetooth AVRCP target module, This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRCP should be initialized before A2DP.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_avrc_tg_deinit** (void)

De-initialize AVRCP target module. This function should be called after after esp_bluedroid_enable() com-

pletes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_avrc_tg_get_psth_cmd_filter** (*esp_avrc_psth_filter_t* filter, *esp_avrc_psth_bit_mask_t* *cmd_set)

Get the current filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after `esp_avrc_tg_init()`. For filter type `ESP_AVRC_PSTH_FILTER_ALLOWED_CMD`, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type `ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS`, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using `esp_avrc_tg_set_psth_cmd_filter()`.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

esp_err_t **esp_avrc_tg_set_psth_cmd_filter** (*esp_avrc_psth_filter_t* filter, const *esp_avrc_psth_bit_mask_t* *cmd_set)

Set the filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after `esp_avrc_tg_init()`.

If filter type is `ESP_AVRC_PSTH_FILTER_SUPPORT_CMD`, the passthrough commands which are set “1” as given in `cmd_set` will generate `ESP_AVRC_CT_PASSTHROUGH_RSP_EVT` callback event and are auto-accepted in the protocol stack, other commands are replied with response type “NOT IMPLEMENTED” (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using `esp_avrc_tg_get_psth_cmd_filter()` with filter type “`ESP_AVRC_PSTH_FILTER_ALLOWED_CMD`”.

Filter type “`ESP_AVRC_PSTH_FILTER_ALLOWED_CMD`” does not apply to this function.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_ERR_NOT_SUPPORTED: if filter type is `ESP_AVRC_PSTH_FILTER_ALLOWED_CMD`, or `cmd_set` includes unallowed commands

bool **esp_avrc_psth_bit_mask_operation** (*esp_avrc_bit_mask_op_t* op, *esp_avrc_psth_bit_mask_t* *psth, *esp_avrc_pt_cmd_t* cmd)

Operate on the type *esp_avrc_psth_bit_mask_t* with regard to a specific PASSTHROUGH command.

参数

- **op** –[in] operation requested on the bit mask field
- **psth** –[in] pointer to passthrough command bit mask structure
- **cmd** –[in] passthrough command code

返回 For operation `ESP_AVRC_BIT_MASK_OP_SET` or `ESP_AVRC_BIT_MASK_OP_CLEAR`, return true for a successful operation, otherwise return false. For operation `ESP_AVRC_BIT_MASK_OP_TEST`, return true if the corresponding bit is set, otherwise false.

esp_err_t **esp_avrc_tg_get_rn_evt_cap** (*esp_avrc_rn_evt_cap_t* cap, *esp_avrc_rn_evt_cap_mask_t* *evt_set)

Get the requested event notification capabilities on local AVRC target. The capability is returned in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`.

For capability type “ESP_AVRC_RN_CAP_ALLOWED_EVT, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation.

For capability type ESP_AVRC_RN_CAP_SUPPORTED_EVT, the event set covers the notification events selected to be supported under current configuration, The configuration can be changed using `esp_avrc_tg_set_rn_evt_cap()`.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if cap is invalid or evt_set is NULL
- ESP_FAIL: otherwise

esp_err_t `esp_avrc_tg_set_rn_evt_cap` (const *esp_avrc_rn_evt_cap_mask_t* *evt_set)

Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in `evt_set` and must be a subset of allowed event IDs with current implementation. This function should be called after `esp_avrc_tg_init()`.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if evt_set is NULL

bool `esp_avrc_rn_evt_bit_mask_operation` (*esp_avrc_bit_mask_op_t* op, *esp_avrc_rn_evt_cap_mask_t* *events, *esp_avrc_rn_event_ids_t* event_id)

Operate on the type *esp_avrc_rn_evt_cap_mask_t* with regard to a specific event.

For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

参数

- **op** –[in] operation requested on the bit mask field
- **events** –[in] pointer to event notification capability bit mask structure
- **event_id** –[in] notification event code

返回 For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false.

esp_err_t `esp_avrc_tg_send_rn_rsp` (*esp_avrc_rn_event_ids_t* event_id, *esp_avrc_rn_rsp_t* rsp, *esp_avrc_rn_param_t* *param)

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using `esp_avrc_tg_set_rn_evt_cap()`, in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`.

参数

- **event_id** –[in] notification event ID that remote AVRCP CT registers
- **rsp** –[in] notification response code
- **param** –[in] parameters included in the specific notification

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if evt_set is NULL

Unions

union **esp_avrc_rn_param_t**

#include <esp_avrc_api.h> AVRCP notification parameters.

Public Members

event id of AVRC RegisterNotification

uint32_t **event_parameter**
event notification parameter

struct **avrc_tg_rmt_feats_param**
#include <esp_avrc_api.h> ESP_AVRC_TG_REMOTE_FEATURES_EVT.

Public Members

uint32_t **feat_mask**

AVRC feature mask of remote device

uint16_t **ct_feat_flag**

feature flag of remote device as CT

esp_bd_addr_t **remote_bda**

remote bluetooth device address

struct **avrc_tg_set_abs_vol_param**

#include <esp_avrc_api.h> ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT.

Public Members

uint8_t **volume**

volume ranges from 0 to 127

struct **avrc_tg_set_app_value_param**

#include <esp_avrc_api.h> ESP_AVRC_TG_SET_PLAYER_APP_VALUE_EVT.

Public Members

uint8_t **num_val**

attribute num

esp_avrc_set_app_value_param_t ***p_vals**

point to the id and value of player application attribute

Structures

struct **esp_avrc_psth_bit_mask_t**

AVRC passthrough command bit mask.

Public Members

uint16_t **bits**[8]

bit mask representation of PASSTHROUGH commands

struct **esp_avrc_rn_evt_cap_mask_t**

AVRC target notification event capability bit mask.

Public Members

`uint16_t bits`

bit mask representation of PASSTHROUGH commands

struct `esp_avrc_set_app_value_param_t`

AVRCP set app value parameters.

Public Members

`uint8_t attr_id`

player application attribute id

`uint8_t attr_val`

player application attribute value

Macros

`ESP_AVRC_TRANS_LABEL_MAX`

max transaction label

Type Definitions

typedef void (*`esp_avrc_ct_cb_t`)(`esp_avrc_ct_cb_event_t` event, `esp_avrc_ct_cb_param_t` *param)

AVRCP controller callback function type.

Param event : Event type

Param param : Pointer to callback parameter union

typedef void (*`esp_avrc_tg_cb_t`)(`esp_avrc_tg_cb_event_t` event, `esp_avrc_tg_cb_param_t` *param)

AVRCP target callback function type.

Param event : Event type

Param param : Pointer to callback parameter union

Enumerations

enum `esp_avrc_features_t`

AVRC feature bit mask.

Values:

enumerator `ESP_AVRC_FEAT_RCTG`

remote control target

enumerator `ESP_AVRC_FEAT_RCCT`

remote control controller

enumerator `ESP_AVRC_FEAT_VENDOR`

remote control vendor dependent commands

enumerator `ESP_AVRC_FEAT_BROWSE`

use browsing channel

enumerator **ESP_AVRC_FEAT_META_DATA**
remote control metadata transfer command/response

enumerator **ESP_AVRC_FEAT_ADV_CTRL**
remote control advanced control commmand/response

enum **esp_avrc_feature_flag_t**
AVRC supported features flag retrieved in SDP record.

Values:

enumerator **ESP_AVRC_FEAT_FLAG_CAT1**
category 1

enumerator **ESP_AVRC_FEAT_FLAG_CAT2**
category 2

enumerator **ESP_AVRC_FEAT_FLAG_CAT3**
category 3

enumerator **ESP_AVRC_FEAT_FLAG_CAT4**
category 4

enumerator **ESP_AVRC_FEAT_FLAG_BROWSING**
browsing

enumerator **ESP_AVRC_FEAT_FLAG_COVER_ART_GET_IMAGE_PROP**
Cover Art GetImageProperties

dot

enumerator **ESP_AVRC_PT_CMD_ENTER**

enter

enumerator **ESP_AVRC_PT_CMD_CLEAR**

clear

enumerator **ESP_AVRC_PT_CMD_CHAN_UP**

channel up

enumerator **ESP_AVRC_PT_CMD_CHAN_DOWN**

channel down

enumerator **ESP_AVRC_PT_CMD_PREV_CHAN**

previous channel

enumerator **ESP_AVRC_PT_CMD_SOUND_SEL**

sound select

enumerator **ESP_AVRC_PT_CMD_INPUT_SEL**

input select

enumerator **ESP_AVRC_PT_CMD_DISP_INFO**

display information

enumerator **ESP_AVRC_PT_CMD_HELP**

help

enumerator **ESP_AVRC_PT_CMD_PAGE_UP**

page up

enumerator **ESP_AVRC_PT_CMD_PAGE_DOWN**

page down

enumerator **ESP_AVRC_PT_CMD_POWER**

power

enumerator **ESP_AVRC_PT_CMD_VOL_UP**

volume up

enumerator **ESP_AVRC_PT_CMD_VOL_DOWN**

volume down

enumerator **ESP_AVRC_PT_CMD_MUTE**

mute

enumerator **ESP_AVRC_PT_CMD_PLAY**

play

enumerator **ESP_AVRC_PT_CMD_STOP**

stop

enumerator **ESP_AVRC_PT_CMD_PAUSE**

pause

enumerator **ESP_AVRC_PT_CMD_RECORD**

record

enumerator **ESP_AVRC_PT_CMD_REWIND**

rewind

enumerator **ESP_AVRC_PT_CMD_FAST_FORWARD**

fast forward

enumerator **ESP_AVRC_PT_CMD_EJECT**

eject

enumerator **ESP_AVRC_PT_CMD_FORWARD**

forward

enumerator **ESP_AVRC_PT_CMD_BACKWARD**

backward

enumerator **ESP_AVRC_PT_CMD_ANGLE**

angle

enumerator **ESP_AVRC_PT_CMD_SUBPICT**

subpicture

enumerator **ESP_AVRC_PT_CMD_F1**

F1

enumerator **ESP_AVRC_PT_CMD_F2**

F2

enumerator **ESP_AVRC_PT_CMD_F3**

F3

enumerator **ESP_AVRC_PT_CMD_F4**

F4

enumerator **ESP_AVRC_PT_CMD_F5**

F5

enumerator **ESP_AVRC_PT_CMD_VENDOR**

vendor unique

enum **esp_avrc_psth_filter_t**

AVRC passthrough command filter.

Values:

enumerator **ESP_AVRC_PSTH_FILTER_ALLOWED_CMD**

all of the PASSTHROUGH commands that can possibly be used, immutable

enumerator **ESP_AVRC_PSTH_FILTER_SUPPORTED_CMD**

PASSTHROUGH commands selectively supported according to the current configuration

enumerator **ESP_AVRC_PSTH_FILTER_SUPPORT_MAX**

enum **esp_avrc_bit_mask_op_t**

Values:

enumerator **ESP_AVRC_BIT_MASK_OP_TEST**

operation code to test a specific bit

enumerator **ESP_AVRC_BIT_MASK_OP_SET**

operation code to set a specific bit

enumerator **ESP_AVRC_BIT_MASK_OP_CLEAR**

operation code to clear a specific bit

enum **esp_avrc_pt_cmd_state_t**

AVRC passthrough command state.

Values:

enumerator **ESP_AVRC_PT_CMD_STATE_PRESSED**

key pressed

enumerator **ESP_AVRC_PT_CMD_STATE_RELEASED**

key released

enum **esp_avrc_ct_cb_event_t**

AVRC Controller callback events.

Values:

enumerator **ESP_AVRC_CT_CONNECTION_STATE_EVT**

connection state changed event

enumerator **ESP_AVRC_CT_PASSTHROUGH_RSP_EVT**

passthrough response event

enumerator **ESP_AVRC_CT_METADATA_RSP_EVT**

metadata response event

enumerator **ESP_AVRC_CT_PLAY_STATUS_RSP_EVT**

play status response event

enumerator **ESP_AVRC_CT_CHANGE_NOTIFY_EVT**

notification event

enumerator **ESP_AVRC_CT_REMOTE_FEATURES_EVT**

feature of remote device indication event

enumerator **ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT**

supported notification events capability of peer device

enumerator **ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT**

set absolute volume response event

enum **esp_avrc_tg_cb_event_t**

AVRC Target callback events.

Values:

enumerator **ESP_AVRC_TG_CONNECTION_STATE_EVT**

connection state changed event

enumerator **ESP_AVRC_TG_REMOTE_FEATURES_EVT**

feature of remote device indication event

enumerator **ESP_AVRC_TG_PASSTHROUGH_CMD_EVT**

passthrough command event

enumerator **ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT**

set absolute volume command from remote device

enumerator **ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT**

register notification event

enumerator **ESP_AVRC_TG_SET_PLAYER_APP_VALUE_EVT**
set application attribute value, attribute refer to esp_avrc_ps_attr_ids_t

enum **esp_avrc_md_attr_mask_t**
AVRC metadata attribute mask.

Values:

enumerator **ESP_AVRC_MD_ATTR_TITLE**
title of the playing track

enumerator **ESP_AVRC_MD_ATTR_ARTIST**
track artist

enumerator **ESP_AVRC_MD_ATTR_ALBUM**
album name

enumerator **ESP_AVRC_MD_ATTR_TRACK_NUM**
track position on the album

enumerator **ESP_AVRC_MD_ATTR_NUM_TRACKS**
number of tracks on the album

enumerator **ESP_AVRC_MD_ATTR_GENRE**
track genre

enumerator **ESP_AVRC_MD_ATTR_PLAYING_TIME**
total album playing time in milliseconds

enum **esp_avrc_rn_event_ids_t**
AVRC event notification ids.

Values:

enumerator **ESP_AVRC_RN_PLAY_STATUS_CHANGE**
track status change, eg. from playing to paused

enumerator **ESP_AVRC_RN_TRACK_CHANGE**
new track is loaded

enumerator **ESP_AVRC_RN_TRACK_REACHED_END**
current track reached end

enumerator **ESP_AVRC_RN_TRACK_REACHED_START**
current track reached start position

enumerator **ESP_AVRC_RN_PLAY_POS_CHANGED**
track playing position changed

enumerator **ESP_AVRC_RN_BATTERY_STATUS_CHANGE**

battery status changed

enumerator **ESP_AVRC_RN_SYSTEM_STATUS_CHANGE**

system status changed

enumerator **ESP_AVRC_RN_APP_SETTING_CHANGE**

application settings changed

enumerator **ESP_AVRC_RN_NOW_PLAYING_CHANGE**

now playing content changed

enumerator **ESP_AVRC_RN_AVAILABLE_PLAYERS_CHANGE**

available players changed

enumerator **ESP_AVRC_RN_ADDRESSED_PLAYER_CHANGE**

the addressed player changed

enumerator **ESP_AVRC_RN_UIDS_CHANGE**

UIDs changed

enumerator **ESP_AVRC_RN_VOLUME_CHANGE**

volume changed locally on TG

enumerator **ESP_AVRC_RN_MAX_EVT**

enum **esp_avrc_rn_evt_cap_t**

AVRC target notification event notification capability.

Values:

enumerator **ESP_AVRC_RN_CAP_ALLOWED_EVT**

all of the notification events that can possibly be supported, immutable

enumerator **ESP_AVRC_RN_CAP_SUPPORTED_EVT**

notification events selectively supported according to the current configuration

enumerator **ESP_AVRC_RN_CAP_MAX**

enum **esp_avrc_rn_rsp_t**

AVRC notification response type.

Values:

enumerator **ESP_AVRC_RN_RSP_INTERIM**

initial response to RegisterNotification, should be sent T_mtp(1000ms) from receiving the command

enumerator **ESP_AVRC_RN_RSP_CHANGED**

final response to RegisterNotification command

enum **esp_avrc_ps_attr_ids_t**

AVRC player setting ids.

Values:

enumerator **ESP_AVRC_PS_EQUALIZER**

equalizer, on or off

enumerator **ESP_AVRC_PS_REPEAT_MODE**

repeat mode

enumerator **ESP_AVRC_PS_SHUFFLE_MODE**

shuffle mode

enumerator **ESP_AVRC_PS_SCAN_MODE**

scan mode on or off

enumerator **ESP_AVRC_PS_MAX_ATTR**

enum **esp_avrc_ps_eq_value_ids_t**

AVRC equalizer modes.

Values:

enumerator **ESP_AVRC_PS_EQUALIZER_OFF**

equalizer OFF

enumerator **ESP_AVRC_PS_EQUALIZER_ON**

equalizer ON

enum **esp_avrc_ps_rpt_value_ids_t**

AVRC repeat modes.

Values:

enumerator **ESP_AVRC_PS_REPEAT_OFF**

repeat mode off

enumerator **ESP_AVRC_PS_REPEAT_SINGLE**

single track repeat

enumerator **ESP_AVRC_PS_REPEAT_GROUP**

group repeat

enum **esp_avrc_ps_shf_value_ids_t**

AVRC shuffle modes.

Values:

enumerator **ESP_AVRC_PS_SHUFFLE_OFF**

enumerator **ESP_AVRC_PS_SHUFFLE_ALL**

enumerator **ESP_AVRC_PS_SHUFFLE_GROUP**

enum **esp_avrc_ps_scn_value_ids_t**

AVRC scan modes.

Values:

enumerator **ESP_AVRC_PS_SCAN_OFF**

scan off

enumerator **ESP_AVRC_PS_SCAN_ALL**

all tracks scan

enumerator **ESP_AVRC_PS_SCAN_GROUP**

group scan

enum **esp_avrc_rsp_t**

AVCTP response codes.

Values:

enumerator **ESP_AVRC_RSP_NOT_IMPL**

not implemented

enumerator **ESP_AVRC_RSP_ACCEPT**

accept

enumerator **ESP_AVRC_RSP_REJECT**

reject

enumerator **ESP_AVRC_RSP_IN_TRANS**

in transition

enumerator **ESP_AVRC_RSP_IMPL_STBL**

implemented/stable

enumerator **ESP_AVRC_RSP_CHANGED**

changed

enumerator **ESP_AVRC_RSP_INTERIM**

interim

enum **esp_avrc_batt_stat_t**

AVRCP battery status.

Values:

enumerator **ESP_AVRC_BATT_NORMAL**

normal state

enumerator **ESP_AVRC_BATT_WARNING**

unable to operate soon

enumerator **ESP_AVRC_BATT_CRITICAL**

cannot operate any more

enumerator **ESP_AVRC_BATT_EXTERNAL**

plugged to external power supply

enumerator **ESP_AVRC_BATT_FULL_CHARGE**

when completely charged from external power supply

enum **esp_avrc_playback_stat_t**

AVRCP current status of playback.

Values:

enumerator **ESP_AVRC_PLAYBACK_STOPPED**

stopped

enumerator **ESP_AVRC_PLAYBACK_PLAYING**

playing

enumerator **ESP_AVRC_PLAYBACK_PAUSED**

paused

enumerator **ESP_AVRC_PLAYBACK_FWD_SEEK**

forward seek

enumerator **ESP_AVRC_PLAYBACK_REV_SEEK**

reverse seek

enumerator **ESP_AVRC_PLAYBACK_ERROR**

error

SPP API

Application Example Check [bluetooth/bluedroid/classic_bt](#) folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and receive SPP data [bluetooth/bluedroid/classic_bt/bt_spp_acceptor](#), [bluetooth/bluedroid/classic_bt/bt_spp_initiator](#)

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_spp_api.h](#)

Functions

esp_err_t **esp_spp_register_callback** (*esp_spp_cb_t* callback)

This function is called to init callbacks with SPP module.

参数 **callback** –[in] pointer to the init callback function.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_spp_init** (*esp_spp_mode_t* mode)

This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP_SPP_INIT_EVT. This function should be called after `esp_bluetooth_enable()` completes successfully.

参数 **mode** –[in] Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_spp_deinit** (void)

This function is called to uninit SPP module. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_SPP_UNINIT_EVT. This function should be called after `esp_spp_init()` completes successfully.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_spp_start_discovery** (*esp_bd_addr_t* bd_addr)

This function is called to performs service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SPP_DISCOVERY_COMP_EVT. This function must be called after `esp_spp_init()` successful and before `esp_spp_deinit()`.

参数 **bd_addr** –[in] Remote device bluetooth device address.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_spp_connect** (*esp_spp_sec_t* sec_mask, *esp_spp_role_t* role, uint8_t remote_scn, *esp_bd_addr_t* peer_bd_addr)

This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_SPP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_SPP_OPEN_EVT. This function must be called after `esp_spp_init()` successful and before `esp_spp_deinit()`.

参数

- **sec_mask** –[in] Security Setting Mask. Suggest to use ESP_SPP_SEC_NONE, ESP_SPP_SEC_AUTHORIZE or ESP_SPP_SEC_AUTHENTICATE only.
- **role** –[in] Master or slave.
- **remote_scn** –[in] Remote device bluetooth device SCN.
- **peer_bd_addr** –[in] Remote device bluetooth device address.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_spp_disconnect** (uint32_t handle)

This function closes an SPP connection. When the operation is completed, the callback function will be called with ESP_SPP_CLOSE_EVT. This function must be called after `esp_spp_init()` successful and before `esp_spp_deinit()`.

参数 **handle** –[in] The connection handle.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_spp_start_srv** (*esp_spp_sec_t* sec_mask, *esp_spp_role_t* role, uint8_t local_scn, const char *name)

This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_SPP_START_EVT. When the connection is established, the callback is called with ESP_SPP_SRV_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

参数

- **sec_mask** –[in] Security Setting Mask. Suggest to use ESP_SPP_SEC_NONE, ESP_SPP_SEC_AUTHORIZE or ESP_SPP_SEC_AUTHENTICATE only.
- **role** –[in] Master or slave.
- **local_scn** –[in] The specific channel you want to get. If channel is 0, means get any channel.
- **name** –[in] Server's name.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_spp_stop_srv** (void)

This function stops all SPP servers. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_spp_stop_srv_scn** (uint8_t scn)

This function stops a specific SPP server. The operation will close all active SPP connection first on the specific SPP server, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

参数 **scn** –[in] Server channel number.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_spp_write** (uint32_t handle, int len, uint8_t *p_data)

This function is used to write data, only for ESP_SPP_MODE_CB. When this function need to be called repeatedly, it is strongly recommended to call this function again after the previous event ESP_SPP_WRITE_EVT is received and the parameter 'cong' is equal to false. If the previous event ESP_SPP_WRITE_EVT with parameter 'cong' is equal to true, the function can only be called again when the event ESP_SPP_CONG_EVT with parameter 'cong' equal to false is received. This function must be called after an connection between initiator and acceptor has been established.

参数

- **handle** –[in] The connection handle.
- **len** –[in] The length of the data written.
- **p_data** –[in] The data written.

返回

- ESP_OK: success
- other: failed

***esp_err_t* esp_spp_vfs_register** (void)

This function is used to register VFS. For now, SPP only supports write, read and close. When the operation is completed, the callback function will be called with ESP_SPP_VFS_REGISTER_EVT. This function must be called after esp_spp_init()/esp_spp_enhanced_init() successful and before esp_spp_deinit().

返回

- ESP_OK: success
- other: failed

***esp_err_t* esp_spp_vfs_unregister** (void)

This function is used to unregister VFS. When the operation is completed, the callback function will be called with ESP_SPP_VFS_UNREGISTER_EVT. This function must be called after esp_spp_vfs_register() successful and before esp_spp_deinit().

返回

- ESP_OK: success
- other: failed

Unions

union **esp_spp_cb_param_t**

#include <esp_spp_api.h> SPP callback parameters union.

Public Members

struct *esp_spp_cb_param_t::spp_init_evt_param* **init**

SPP callback param of SPP_INIT_EVT

struct *esp_spp_cb_param_t::spp_uninit_evt_param* **uninit**

SPP callback param of SPP_UNINIT_EVT

struct *esp_spp_cb_param_t::spp_discovery_comp_evt_param* **disc_comp**

SPP callback param of SPP_DISCOVERY_COMP_EVT

struct *esp_spp_cb_param_t::spp_open_evt_param* **open**

SPP callback param of ESP_SPP_OPEN_EVT

struct *esp_spp_cb_param_t::spp_srv_open_evt_param* **srv_open**

SPP callback param of ESP_SPP_SRV_OPEN_EVT

struct *esp_spp_cb_param_t::spp_close_evt_param* **close**

SPP callback param of ESP_SPP_CLOSE_EVT

struct *esp_spp_cb_param_t::spp_start_evt_param* **start**

SPP callback param of ESP_SPP_START_EVT

struct *esp_spp_cb_param_t::spp_srv_stop_evt_param* **srv_stop**

SPP callback param of ESP_SPP_SRV_STOP_EVT

struct *esp_spp_cb_param_t::spp_cl_init_evt_param* **cl_init**

SPP callback param of ESP_SPP_CL_INIT_EVT

struct *esp_spp_cb_param_t::spp_write_evt_param* **write**
SPP callback param of ESP_SPP_WRITE_EVT

struct *esp_spp_cb_param_t::spp_data_ind_evt_param* **data_ind**
SPP callback param of ESP_SPP_DATA_IND_EVT

Macros

ESP_SPP_SEC_NONE

No security. relate to BTA_SEC_NONE in bta/bta_api.h

ESP_SPP_SEC_AUTHORIZE

Authorization required (only needed for out going connection) relate to BTA_SEC_AUTHORIZE in bta/bta_api.h

ESP_SPP_SEC_AUTHENTICATE

Authentication required. relate to BTA_SEC_AUTHENTICATE in bta/bta_api.h

ESP_SPP_SEC_ENCRYPT

Encryption required. relate to BTA_SEC_ENCRYPT in bta/bta_api.h

ESP_SPP_SEC_MODE4_LEVEL4

Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA_SEC_MODE4_LEVEL4 in bta/bta_api.h

ESP_SPP_SEC_MITM

Man-In-The_Middle protection relate to BTA_SEC_MITM in bta/bta_api.h

ESP_SPP_SEC_IN_16_DIGITS

Min 16 digit for pin code relate to BTA_SEC_IN_16_DIGITS in bta/bta_api.h

ESP_SPP_MAX_MTU

SPP max MTU

ESP_SPP_MAX_SCN

SPP max SCN

Type Definitions

```
typedef uint16_t esp_spp_sec_t
```

```
typedef void (*esp_spp_cb_t)(esp_spp_cb_event_t event, esp_spp_cb_param_t *param)
```

SPP callback function type. When handle ESP_SPP_DATA_IND_EVT, it is strongly recommended to cache incoming data, and process them in other lower priority application task rather than in this callback directly.

Param event Event type

Param param Point to callback parameter, currently is union type

Enumerations

```
enum esp_spp_status_t
```

Values:

enumerator **ESP_SPP_SUCCESS**

Successful operation.

enumerator **ESP_SPP_FAILURE**

Generic failure.

enumerator **ESP_SPP_BUSY**

Temporarily can not handle this request.

enumerator **ESP_SPP_NO_DATA**

No data

enumerator **ESP_SPP_NO_RESOURCE**

No more resource

enumerator **ESP_SPP_NEED_INIT**

SPP module shall init first

enumerator **ESP_SPP_NEED_DEINIT**

SPP module shall deinit first

enumerator **ESP_SPP_NO_CONNECTION**

Connection may have been closed

enumerator **ESP_SPP_NO_SERVER**

No SPP server

enum **esp_spp_role_t**

Values:

enumerator **ESP_SPP_ROLE_MASTER**

Role: master

enumerator **ESP_SPP_ROLE_SLAVE**

Role: slave

enum **esp_spp_mode_t**

Values:

enumerator **ESP_SPP_MODE_CB**

When data is coming, a callback will come with data

enumerator **ESP_SPP_MODE_VFS**

Use VFS to write/read data

enum **esp_spp_cb_event_t**

SPP callback function events.

Values:

enumerator **ESP_SPP_INIT_EVT**

When SPP is initied, the event comes

enumerator **ESP_SPP_UNINIT_EVT**

When SPP is uninitied, the event comes

enumerator **ESP_SPP_DISCOVERY_COMP_EVT**

When SDP discovery complete, the event comes

enumerator **ESP_SPP_OPEN_EVT**

When SPP Client connection open, the event comes

enumerator **ESP_SPP_CLOSE_EVT**

When SPP connection closed, the event comes

enumerator **ESP_SPP_START_EVT**

When SPP server started, the event comes

enumerator **ESP_SPP_CL_INIT_EVT**

When SPP client initiated a connection, the event comes

enumerator **ESP_SPP_DATA_IND_EVT**

When SPP connection received data, the event comes, only for ESP_SPP_MODE_CB

enumerator **ESP_SPP_CONG_EVT**

When SPP connection congestion status changed, the event comes, only for ESP_SPP_MODE_CB

enumerator **ESP_SPP_WRITE_EVT**

When SPP write operation completes, the event comes, only for ESP_SPP_MODE_CB

enumerator **ESP_SPP_SRV_OPEN_EVT**

When SPP Server connection open, the event comes

enumerator **ESP_SPP_SRV_STOP_EVT**

When SPP server stopped, the event comes

enumerator **ESP_SPP_VFS_REGISTER_EVT**

When SPP VFS register, the event comes

enumerator **ESP_SPP_VFS_UNREGISTER_EVT**

When SPP VFS unregister, the event comes

Type Definitions

```
typedef void (*esp_hf_connection_state_callback)(esp_hf_connection_state_t state, esp_bd_addr_t *bd_addr)
```

Callback for connection state change. state will have one of the values from BtHfConnectionState

```
typedef void (*esp_hf_audio_state_callback)(esp_hf_audio_state_t state, esp_bd_addr_t *bd_addr)
```

Callback for audio connection state change. state will have one of the values from BtHfAudioState

```
typedef void (*esp_hf_vr_cmd_callback)(esp_hf_vr_state_t state, esp_bd_addr_t *bd_addr)
```

Callback for VR connection state change. state will have one of the values from BtHfVRState

```
typedef void (*esp_hf_answer_call_cmd_callback)(esp_bd_addr_t *bd_addr)
```

Callback for answer incoming call (ATA)

```
typedef void (*esp_hf_hangup_call_cmd_callback)(esp_bd_addr_t *bd_addr)
```

Callback for disconnect call (AT+CHUP)

```
typedef void (*esp_hf_volume_cmd_callback)(esp_hf_volume_control_target_t type, int volume, esp_bd_addr_t *bd_addr)
```

Callback for disconnect call (AT+CHUP) type will denote Speaker/Mic gain (BtHfVolumeControl).

```
typedef void (*esp_hf_dial_call_cmd_callback)(char *number, esp_bd_addr_t *bd_addr)
```

Callback for dialing an outgoing call If number is NULL, redial

```
typedef void (*esp_hf_dtmf_cmd_callback)(char tone, esp_bd_addr_t *bd_addr)
```

Callback for sending DTMF tones tone contains the dtmf character to be sent

```
typedef void (*esp_hf_nrec_cmd_callback)(esp_hf_nrec_t nrec, esp_bd_addr_t *bd_addr)
```

Callback for enabling/disabling noise reduction/echo cancellation value will be 1 to enable, 0 to disable

```
typedef void (*esp_hf_wbs_callback)(esp_hf_wbs_config_t wbs, esp_bd_addr_t *bd_addr)
```

Callback for AT+BCS and event from BAC WBS enable, WBS disable

```
typedef void (*esp_hf_chld_cmd_callback)(esp_hf_chld_type_t chld, esp_bd_addr_t *bd_addr)
```

Callback for call hold handling (AT+CHLD) value will contain the call hold command (0, 1, 2, 3)

```
typedef void (*esp_hf_cnum_cmd_callback)(esp_bd_addr_t *bd_addr)
```

Callback for CNUM (subscriber number)

```
typedef void (*esp_hf_cind_cmd_callback)(esp_bd_addr_t *bd_addr)
```

Callback for indicators (CIND)

```
typedef void (*esp_hf_cops_cmd_callback)(esp_bd_addr_t *bd_addr)
```

Callback for operator selection (COPS)

```
typedef void (*esp_hf_clcc_cmd_callback)(esp_bd_addr_t *bd_addr)
```

Callback for call list (AT+CLCC)

```
typedef void (*esp_hf_unknown_at_cmd_callback)(char *at_string, esp_bd_addr_t *bd_addr)
```

Callback for unknown AT command recd from AG at_string will contain the unparsed AT string

typedef void (***esp_hf_key_pressed_cmd_callback**)(*esp_bd_addr_t* *bd_addr)

Callback for keypressed (HSP) event.

Enumerations

enum **esp_hf_in_band_ring_state_t**

in-band ring tone state

Values:

enumerator **ESP_HF_IN_BAND_RINGTONE_NOT_PROVIDED**

enumerator **ESP_HF_IN_BAND_RINGTONE_PROVIDED**

enum **esp_hf_vr_state_t**

voice recognition state

Values:

enumerator **ESP_HF_VR_STATE_DISABLED**

voice recognition disabled

enumerator **ESP_HF_VR_STATE_ENABLED**

voice recognition enabled

enum **esp_hf_volume_control_target_t**

Bluetooth HFP audio volume control target.

Values:

enumerator **ESP_HF_VOLUME_CONTROL_TARGET_SPK**

speaker

enumerator **ESP_HF_VOLUME_CONTROL_TARGET_MIC**

microphone

enum **esp_hf_audio_state_t**

Bluetooth HFP audio connection status.

Values:

enumerator **ESP_HF_AUDIO_STATE_DISCONNECTED**

audio connection released

enumerator **ESP_HF_AUDIO_STATE_CONNECTING**

audio connection has been initiated

enumerator **ESP_HF_AUDIO_STATE_CONNECTED**

audio connection is established

enumerator **ESP_HF_AUDIO_STATE_CONNECTED_MSBC**

mSBC audio connection is established

enum **esp_hf_volume_type_t**

Values:

enumerator **ESP_HF_VOLUME_TYPE_SPK**

enumerator **ESP_HF_VOLUME_TYPE_MIC**

enum **esp_hf_network_state_t**

+CIND network service availability status

Values:

enumerator **ESP_HF_NETWORK_STATE_NOT_AVAILABLE**

enumerator **ESP_HF_NETWORK_STATE_AVAILABLE**

enum **esp_hf_service_type_t**

+CIEV Service type

Values:

enumerator **ESP_HF_SERVICE_TYPE_HOME**

enumerator **ESP_HF_SERVICE_TYPE_ROAMING**

enum **esp_hf_call_status_t**

+CIND call status indicator values

Values:

enumerator **ESP_HF_CALL_STATUS_NO_CALLS**

no call in progress

enumerator **ESP_HF_CALL_STATUS_CALL_IN_PROGRESS**

call is present(active or held)

enum **esp_hf_call_setup_status_t**

+CIND call setup status indicator values

Values:

enumerator **ESP_HF_CALL_SETUP_STATUS_IDLE**

no call setup in progress

enumerator **ESP_HF_CALL_SETUP_STATUS_INCOMING**

incoming call setup in progress

enumerator **ESP_HF_CALL_SETUP_STATUS_OUTGOING_DIALING**

outgoing call setup in dialing state

enumerator **ESP_HF_CALL_SETUP_STATUS_OUTGOING_ALERTING**
outgoing call setup in alerting state

enum **esp_hf_roaming_status_t**
+CIND roaming status indicator values

Values:

enumerator **ESP_HF_ROAMING_STATUS_INACTIVE**
roaming is not active

enumerator **ESP_HF_ROAMING_STATUS_ACTIVE**
a roaming is active

enum **esp_hf_call_held_status_t**
+CIND call held indicator values

Values:

enumerator **ESP_HF_CALL_HELD_STATUS_NONE**
no calls held

enumerator **ESP_HF_CALL_HELD_STATUS_HELD_AND_ACTIVE**
both active and held call

enumerator **ESP_HF_CALL_HELD_STATUS_HELD**
call on hold, no active call

enum **esp_hf_current_call_status_t**
+CLCC status of the call

Values:

enumerator **ESP_HF_CURRENT_CALL_STATUS_ACTIVE**
active

enumerator **ESP_HF_CURRENT_CALL_STATUS_HELD**
held

enumerator **ESP_HF_CURRENT_CALL_STATUS_DIALING**
dialing (outgoing calls only)

enumerator **ESP_HF_CURRENT_CALL_STATUS_ALERTING**
alerting (outgoing calls only)

enumerator **ESP_HF_CURRENT_CALL_STATUS_INCOMING**
incoming (incoming calls only)

enumerator **ESP_HF_CURRENT_CALL_STATUS_WAITING**
waiting (incoming calls only)

enumerator **ESP_HF_CURRENT_CALL_STATUS_HELD_BY_RESP_HOLD**
call held by response and hold

enum **esp_hf_current_call_direction_t**
+CLCC direction of the call

Values:

enumerator **ESP_HF_CURRENT_CALL_DIRECTION_OUTGOING**
outgoing

enumerator **ESP_HF_CURRENT_CALL_DIRECTION_INCOMING**
incoming

enum **esp_hf_current_call_mpty_type_t**
+CLCC multi-party call flag

Values:

enumerator **ESP_HF_CURRENT_CALL_MPTY_TYPE_SINGLE**
not a member of a multi-party call

enumerator **ESP_HF_CURRENT_CALL_MPTY_TYPE_MULTI**
member of a multi-party call

enum **esp_hf_current_call_mode_t**
+CLCC call mode

Values:

enumerator **ESP_HF_CURRENT_CALL_MODE_VOICE**

enumerator **ESP_HF_CURRENT_CALL_MODE_DATA**

enumerator **ESP_HF_CURRENT_CALL_MODE_FAX**

enum **esp_hf_call_addr_type_t**
+CLCC address type

Values:

enumerator **ESP_HF_CALL_ADDR_TYPE_UNKNOWN**
unknown address type

enumerator **ESP_HF_CALL_ADDR_TYPE_INTERNATIONAL**
international address

enum **esp_hf_subscriber_service_type_t**
+CNUM service type of the phone number

Values:

enumerator **ESP_HF_SUBSCRIBER_SERVICE_TYPE_UNKNOWN**
unknown

enumerator **ESP_HF_SUBSCRIBER_SERVICE_TYPE_VOICE**
voice service

enumerator **ESP_HF_SUBSCRIBER_SERVICE_TYPE_FAX**
fax service

enum **esp_hf_btrh_status_t**
+BTRH response and hold result code

Values:

enumerator **ESP_HF_BTRH_STATUS_HELD**
incoming call is put on held in AG

enumerator **ESP_HF_BTRH_STATUS_ACCEPTED**
held incoming call is accepted in AG

enumerator **ESP_HF_BTRH_STATUS_REJECTED**
held incoming call is rejected in AG

enum **esp_hf_btrh_cmd_t**
AT+BTRH response and hold action code.

Values:

enumerator **ESP_HF_BTRH_CMD_HOLD**
put the incoming call on hold

enumerator **ESP_HF_BTRH_CMD_ACCEPT**
accept a held incoming call

enumerator **ESP_HF_BTRH_CMD_REJECT**
reject a held incoming call

enum **esp_hf_nrec_t**

Values:

enumerator **ESP_HF_NREC_STOP**

enumerator **ESP_HF_NREC_START**

enum **esp_hf_call_waiting_status_t**
+CCWA response status

Values:

enumerator **ESP_HF_CALL_WAITING_INACTIVE**

enumerator **ESP_HF_CALL_WAITING_ACTIVE**

enum **esp_hf_wbs_config_t**

Values:

enumerator **ESP_HF_WBS_NONE**

enumerator **ESP_HF_WBS_NO**

enumerator **ESP_HF_WBS_YES**

enum **esp_hf_connection_state_t**

Bluetooth HFP RFCOMM connection and service level connection status.

Values:

enumerator **ESP_HF_CONNECTION_STATE_DISCONNECTED**

RFCOMM data link channel released

enumerator **ESP_HF_CONNECTION_STATE_CONNECTING**

connecting remote device on the RFCOMM data link

enumerator **ESP_HF_CONNECTION_STATE_CONNECTED**

RFCOMM connection established

enumerator **ESP_HF_CONNECTION_STATE_SLC_CONNECTED**

service level connection established

enumerator **ESP_HF_CONNECTION_STATE_DISCONNECTING**

disconnecting with remote device on the RFCOMM data link

enum **esp_hf_chld_type_t**

AT+CHLD command values.

Values:

enumerator **ESP_HF_CHLD_TYPE_REL**

<0>, Terminate all held or set UDUB(“busy”) to a waiting call

enumerator **ESP_HF_CHLD_TYPE_REL_ACC**

<1>, Terminate all active calls and accepts a waiting/held call

enumerator **ESP_HF_CHLD_TYPE_HOLD_ACC**

<2>, Hold all active calls and accepts a waiting/held call

enumerator **ESP_HF_CHLD_TYPE_MERGE**

<3>, Add all held calls to a conference

enumerator **ESP_HF_CHLD_TYPE_MERGE_DETACH**

<4>, connect the two calls and disconnects the subscriber from both calls

enumerator **ESP_HF_CHLD_TYPE_REL_X**

<1x>, releases specified calls only

enumerator **ESP_HF_CHLD_TYPE_PRIV_X**

<2x>, request private consultation mode with specified call

enum **esp_hf_at_response_code_t**

Values:

enumerator **ESP_HF_AT_RESPONSE_CODE_OK**

acknowledges execution of a command line

enumerator **ESP_HF_AT_RESPONSE_CODE_ERR**

command not accepted

enumerator **ESP_HF_AT_RESPONSE_CODE_NO_CARRIER**

connection terminated

enumerator **ESP_HF_AT_RESPONSE_CODE_BUSY**

busy signal detected

enumerator **ESP_HF_AT_RESPONSE_CODE_NO_ANSWER**

connection completion timeout

enumerator **ESP_HF_AT_RESPONSE_CODE_DELAYED**

delayed

enumerator **ESP_HF_AT_RESPONSE_CODE_BLACKLISTED**

blacklisted

enumerator **ESP_HF_AT_RESPONSE_CODE_CME**

CME error

enum **esp_hf_at_response_t**

Values:

enumerator **ESP_HF_AT_RESPONSE_ERROR**

enumerator **ESP_HF_AT_RESPONSE_OK**

enum **esp_hf_cme_err_t**

Extended Audio Gateway Error Result Code Response.

Values:

enumerator **ESP_HF_CME_AG_FAILURE**

ag failure

enumerator **ESP_HF_CME_NO_CONNECTION_TO_PHONE**
no connection to phone

enumerator **ESP_HF_CME_OPERATION_NOT_ALLOWED**
operation not allowed

enumerator **ESP_HF_CME_OPERATION_NOT_SUPPORTED**
operation not supported

enumerator **ESP_HF_CME_PH_SIM_PIN_REQUIRED**
PH-SIM PIN Required

enumerator **ESP_HF_CME_SIM_NOT_INSERTED**
SIM not inserted

enumerator **ESP_HF_CME_SIM_PIN_REQUIRED**
SIM PIN required

enumerator **ESP_HF_CME_SIM_PUK_REQUIRED**
SIM PUK required

enumerator **ESP_HF_CME_SIM_FAILURE**
SIM failure

enumerator **ESP_HF_CME_SIM_BUSY**
SIM busy

enumerator **ESP_HF_CME_INCORRECT_PASSWORD**
incorrect password

enumerator **ESP_HF_CME_SIM_PIN2_REQUIRED**
SIM PIN2 required

enumerator **ESP_HF_CME_SIM_PUK2_REQUIRED**
SIM PUK2 required

enumerator **ESP_HF_CME_MEMEORY_FULL**
memory full

enumerator **ESP_HF_CME_INVALID_INDEX**
invalid index

enumerator **ESP_HF_CME_MEMEORY_FAILURE**
memory failure

enumerator **ESP_HF_CME_TEXT_STRING_TOO_LONG**
test string too long

enumerator **ESP_HF_CME_INVALID_CHARACTERS_IN_TEXT_STRING**
invalid characters in text string

enumerator **ESP_HF_CME_DIAL_STRING_TOO_LONG**
dial string too long

enumerator **ESP_HF_CME_INVALID_CHARACTERS_IN_DIAL_STRING**
invalid characters in dial string

enumerator **ESP_HF_CME_NO_NETWORK_SERVICE**
no network service

enumerator **ESP_HF_CME_NETWORK_TIMEOUT**
network timeout

enumerator **ESP_HF_CME_NETWORK_NOT_ALLOWED**
network not allowed —emergency calls only

HFP CLIENT API

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_hf_client_api.h](#)

Functions

esp_err_t **esp_hf_client_register_callback** (*esp_hf_client_cb_t* callback)

Register application callback function to HFP client module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

参数 **callback** –[in] HFP client event callback function

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

esp_err_t **esp_hf_client_init** (void)

Initialize the bluetooth HFP client module. This function should be called after `esp_bluedroid_enable()` completes successfully.

返回

- ESP_OK: if the initialization request is sent successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_hf_client_deinit** (void)

De-initialize for HFP client module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_connect (*esp_bd_addr_t* remote_bda)

Establish a Service Level Connection to remote bluetooth HFP audio gateway(AG) device. This function must be called after `esp_hf_client_init()` and before `esp_hf_client_deinit()`.

参数 `remote_bda` –[in] remote bluetooth device address

返回

- ESP_OK: connect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_disconnect (*esp_bd_addr_t* remote_bda)

Disconnect from the remote HFP audio gateway. This function must be called after `esp_hf_client_init()` and before `esp_hf_client_deinit()`.

参数 `remote_bda` –[in] remote bluetooth device address

返回

- ESP_OK: disconnect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_connect_audio (*esp_bd_addr_t* remote_bda)

Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

参数 `remote_bda` –[in] remote bluetooth device address

返回

- ESP_OK: connect audio request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_disconnect_audio (*esp_bd_addr_t* remote_bda)

Release the established audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

参数 `remote_bda` –[in] remote bluetooth device address

返回

- ESP_OK: disconnect audio request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_start_voice_recognition (void)

Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

返回

- ESP_OK: starting voice recognition is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_stop_voice_recognition (void)

Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

返回

- ESP_OK: stopping voice recognition is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_volume_update (*esp_hf_volume_control_target_t* type, int volume)

Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

参数

- **type** –[in] volume control target, speaker or microphone
- **volume** –[in] gain of the speaker of microphone, ranges 0 to 15

返回

- ESP_OK: volume update is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_hf_client_dial** (const char *number)

Place a call with a specified number, if number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.

参数 number –[in] number string of the call. If NULL, the last number is called(aka re-dial)

返回

- ESP_OK: a call placing is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_hf_client_dial_memory** (int location)

Place a call with number specified by location(speed dial). As a precondition to use this API, Service Level Connection shall exist with AG.

参数 location –[in] location of the number in the memory

返回

- ESP_OK: a memory call placing is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_hf_client_send_chld_cmd** (*esp_hf_chld_type_t* chld, int idx)

Send call hold and multiparty commands, or enhanced call control commands(Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.

参数

- **chld** –[in] AT+CHLD call hold and multiparty handling AT command.
- **idx** –[in] used in Enhanced Call Control Mechanisms, used if chld is ESP_HF_CHLD_TYPE_REL_X or ESP_HF_CHLD_TYPE_PRIV_X

返回

- ESP_OK: command AT+CHLD is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_hf_client_send_btrh_cmd** (*esp_hf_btrh_cmd_t* btrh)

Send response and hold action command(Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

参数 btrh –[in] response and hold action to send

返回

- ESP_OK: command AT+BTRH is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_hf_client_answer_call** (void)

Answer an incoming call(send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

返回

- ESP_OK: a call answering is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_hf_client_reject_call** (void)

Reject an incoming call or terminate an ongoing call(send AT+CHUP command). As a precondition to use this API, Service Level Connection shall exist with AG.

返回

- ESP_OK: the call rejecting is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

***esp_err_t* esp_hf_client_query_current_calls** (void)

Query list of current calls in AG(send AT+CLCC command). As a precondition to use this API, Service Level Connection shall exist with AG.

返回

- ESP_OK: query of current calls is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

***esp_err_t* esp_hf_client_query_current_operator_name** (void)

Query the name of currently selected network operator in AG(use AT+COPS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

返回

- ESP_OK: query of current operator name is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

***esp_err_t* esp_hf_client_retrieve_subscriber_info** (void)

Get subscriber information number from AG(send AT+CNUM command) As a precondition to use this API, Service Level Connection shall exist with AG.

返回

- ESP_OK: the retrieving of subscriber information is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

***esp_err_t* esp_hf_client_send_dtmf** (char code)

Transmit DTMF codes during an ongoing call(use AT+VTS commands) As a precondition to use this API, Service Level Connection shall exist with AG.

参数 **code** –[in] dtmf code, single ascii character in the set 0-9, #, *, A-D

返回

- ESP_OK: the DTMF codes are sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

***esp_err_t* esp_hf_client_request_last_voice_tag_number** (void)

Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

返回

- ESP_OK: the phone number request corresponding to last voice tag recorded is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

***esp_err_t* esp_hf_client_send_nrec** (void)

Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command). As a precondition to use this API, Service Level Connection shall exist with AG.

返回

- ESP_OK: NREC=0 request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

***esp_err_t* esp_hf_client_register_data_callback** (*esp_hf_client_incoming_data_cb_t* recv, *esp_hf_client_outgoing_data_cb_t* send)

Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

参数

- **recv** –[in] HFP client incoming data callback function
- **send** –[in] HFP client outgoing data callback function

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

esp_err_t **esp_hf_client_pkt_stat_nums_get** (uint16_t sync_conn_handle)

Get the number of packets received and sent This function is only used in the case that Voice Over HCI is enabled and the audio state is connected. When the operation is completed, the callback function will be called with ESP_HF_CLIENT_PKT_STAT_NUMS_GET_EVT.

参数 **sync_conn_handle** –[in] the (e)SCO connection handle

返回

- ESP_OK: if the request is sent successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

void **esp_hf_client_outgoing_data_ready** (void)

Trigger the lower-layer to fetch and send audio data. This function is only used in the case that Voice Over HCI is enabled. After this function is called, lower layer will invoke `esp_hf_client_outgoing_data_cb_t` to fetch data.

As a precondition to use this API, Service Level Connection shall exist with AG.

void **esp_hf_client_pcm_resample_init** (uint32_t src_sps, uint32_t bits, uint32_t channels)

Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

参数

- **src_sps** –[in] original samples per second(source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- **bits** –[in] number of bits per pcm sample (16)
- **channels** –[in] number of channels (i.e. mono(1), stereo(2)...

void **esp_hf_client_pcm_resample_deinit** (void)

Deinitialize the down sampling converter.

int32_t **esp_hf_client_pcm_resample** (void *src, uint32_t in_bytes, void *dst)

Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.

参数

- **src** –[in] pointer to the buffer where the original sampling PCM are stored
- **in_bytes** –[in] length of the input PCM sample buffer in byte
- **dst** –[in] pointer to the buffer which is to be used to store the converted PCM samples

返回 number of samples converted

Unions

union **esp_hf_client_cb_param_t**

#include <esp_hf_client_api.h> HFP client callback parameters.

Public Members

struct *esp_hf_client_cb_param_t::hf_client_conn_stat_param* **conn_stat**
HF callback param of ESP_HF_CLIENT_CONNECTION_STATE_EVT

struct *esp_hf_client_cb_param_t::hf_client_audio_stat_param* **audio_stat**
HF callback param of ESP_HF_CLIENT_AUDIO_STATE_EVT

struct *esp_hf_client_cb_param_t::hf_client_bvra_param* **bvra**
HF callback param of ESP_HF_CLIENT_BVRA_EVT

struct *esp_hf_client_cb_param_t::hf_client_service_availability_param* **service_availability**
HF callback param of ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT

struct *esp_hf_client_cb_param_t::hf_client_network_roaming_param* **roaming**
HF callback param of ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT

struct *esp_hf_client_cb_param_t::hf_client_signal_strength_ind_param* **signal_strength**
HF callback param of ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT

Public Members

int **value**

battery charge value, ranges from 0 to 5

struct **hf_client_binp_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_BINP_EVT.

Public Members

const char ***number**

phone number corresponding to the last voice tag in the HF

struct **hf_client_bsirparam**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_BSIR_EVT.

Public Members

esp_hf_client_in_band_ring_state_t **state**

setting state of in-band ring tone

struct **hf_client_btrh_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_BTRH_EVT.

Public Members

esp_hf_btrh_status_t **status**

call hold and response status result code

struct **hf_client_bvra_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_BVRA_EVT.

Public Members

esp_hf_vr_state_t **value**

voice recognition state

struct **hf_client_call_held_ind_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_CALL_HELD_EVT.

Public Members

esp_hf_call_held_status_t **status**

bluetooth proprietary call hold status indicator

struct **hf_client_call_ind_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_CALL_EVT.

Public Members

esp_hf_call_status_t **status**

call status indicator

struct **hf_client_call_setup_ind_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_CALL_SETUP_EVT.

Public Members

esp_hf_call_setup_status_t **status**

call setup status indicator

struct **hf_client_ccwa_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_CCWA_EVT.

Public Members

const char ***number**

phone number string of waiting call

struct **hf_client_clcc_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_CLCC_EVT.

Public Members

int **idx**

numbering(starting with 1) of the call

esp_hf_current_call_direction_t **dir**

direction of the call

esp_hf_current_call_status_t **status**

status of the call

esp_hf_current_call_mpty_type_t **mpty**

multi-party flag

char ***number**

phone number(optional)

struct **hf_client_clip_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_CLIP_EVT.

Public Members

const char ***number**
phone number string of call

struct **hf_client_cnum_param**
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CNUM_EVT.

Public Members

const char ***number**
phone number string

esp_hf_subscriber_service_type_t **type**
service type that the phone number relates to

struct **hf_client_conn_stat_param**
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CONNECTION_STATE_EVT.

Public Members

esp_hf_client_connection_state_t **state**
HF connection state

uint32_t **peer_feat**
AG supported features

uint32_t **chld_feat**
AG supported features on call hold and multiparty services

esp_bd_addr_t **remote_bda**
remote bluetooth device address

struct **hf_client_current_operator_param**
#include <esp_hf_client_api.h> ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT.

Public Members

const char ***name**
name of the network operator

struct **hf_client_network_roaming_param**
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT.

Public Members

esp_hf_roaming_status_t **status**

roaming status

struct **hf_client_pkt_status_nums**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_PKT_STAT_NUMS_GET_EVT.

Public Members

uint32_t **rx_total**

the total number of packets received

uint32_t **rx_correct**

the total number of packets data correctly received

uint32_t **rx_err**

the total number of packets data with possible invalid

uint32_t **rx_none**

the total number of packets data no received

uint32_t **rx_lost**

the total number of packets data partially lost

uint32_t **tx_total**

the total number of packets send

uint32_t **tx_discarded**

the total number of packets send lost

struct **hf_client_service_availability_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT.

Public Members

esp_hf_network_state_t **status**

service availability status

struct **hf_client_signal_strength_ind_param**

#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT.

Public Members

int **value**

signal strength value, ranges from 0 to 5

```
struct hf_client_volume_control_param
    #include <esp_hf_client_api.h> ESP_HF_CLIENT_VOLUME_CONTROL_EVT.
```

Public Members

esp_hf_volume_control_target_t type
volume control target, speaker or microphone

int **volume**
gain, ranges from 0 to 15

Type Definitions

typedef void (***esp_hf_client_incoming_data_cb_t**)(const uint8_t *buf, uint32_t len)

HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

Param buf [in] : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.

Param len [in] : size(in bytes) in buf

typedef uint32_t (***esp_hf_client_outgoing_data_cb_t**)(uint8_t *buf, uint32_t len)

HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

Param buf [in] : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.

Param len [in] : size(in bytes) in buf

Return length of data successfully read

typedef void (***esp_hf_client_cb_t**)(*esp_hf_client_cb_event_t* event, *esp_hf_client_cb_param_t* *param)

HFP client callback function type.

Param event : Event type

Param param : Pointer to callback parameter

Enumerations

enum **esp_hf_client_connection_state_t**

Bluetooth HFP RFCOMM connection and service level connection status.

Values:

enumerator **ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED**

RFCOMM data link channel released

enumerator **ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING**

connecting remote device on the RFCOMM data link

enumerator **ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED**

RFCOMM connection established

enumerator **ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED**
service level connection established

enumerator **ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING**
disconnecting with remote device on the RFCOMM dat link

enum **esp_hf_client_audio_state_t**

Bluetooth HFP audio connection status.

Values:

enumerator **ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED**
audio connection released

enumerator **ESP_HF_CLIENT_AUDIO_STATE_CONNECTING**
audio connection has been initiated

enumerator **ESP_HF_CLIENT_AUDIO_STATE_CONNECTED**
audio connection is established

enumerator **ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC**
mSBC audio connection is established

enum **esp_hf_client_in_band_ring_state_t**

in-band ring tone state

Values:

enumerator **ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED**

enumerator **ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED**

enum **esp_hf_client_cb_event_t**

HF CLIENT callback events.

Values:

enumerator **ESP_HF_CLIENT_CONNECTION_STATE_EVT**
connection state changed event

enumerator **ESP_HF_CLIENT_AUDIO_STATE_EVT**
audio connection state change event

enumerator **ESP_HF_CLIENT_BVRA_EVT**
voice recognition state change event

enumerator **ESP_HF_CLIENT_CIND_CALL_EVT**
call indication

enumerator **ESP_HF_CLIENT_CIND_CALL_SETUP_EVT**
call setup indication

- enumerator **ESP_HF_CLIENT_CIND_CALL_HELD_EVT**
call held indication
- enumerator **ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT**
network service availability indication
- enumerator **ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT**
signal strength indication
- enumerator **ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT**
roaming status indication
- enumerator **ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT**
battery level indication
- enumerator **ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT**
current operator information
- enumerator **ESP_HF_CLIENT_BTRH_EVT**
call response and hold event
- enumerator **ESP_HF_CLIENT_CLIP_EVT**
Calling Line Identification notification
- enumerator **ESP_HF_CLIENT_CCWA_EVT**
call waiting notification
- enumerator **ESP_HF_CLIENT_CLCC_EVT**
list of current calls notification
- enumerator **ESP_HF_CLIENT_VOLUME_CONTROL_EVT**
audio volume control command from AG, provided by +VGM or +VGS message
- enumerator **ESP_HF_CLIENT_AT_RESPONSE_EVT**
AT command response event
- enumerator **ESP_HF_CLIENT_CNUM_EVT**
subscriber information response from AG
- enumerator **ESP_HF_CLIENT_BSIR_EVT**
setting of in-band ring tone
- enumerator **ESP_HF_CLIENT_BINP_EVT**
requested number of last voice tag from AG
- enumerator **ESP_HF_CLIENT_RING_IND_EVT**
ring indication event
- enumerator **ESP_HF_CLIENT_PKT_STAT_NUMS_GET_EVT**
requested number of packet different status

HFP AG API

API Reference

Header File

- [components/bt/host/bluetooth/api/include/api/esp_hf_ag_api.h](#)

Functions

esp_err_t **esp_bt_hf_register_callback** (*esp_hf_cb_t* callback)

Register application callback function to HFP AG module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

参数 **callback** **–[in]** HFP AG event callback function

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

esp_err_t **esp_bt_hf_init** (*esp_bd_addr_t* remote_addr)

Initialize the bluetooth HF AG module. This function should be called after `esp_bluedroid_enable()` completes successfully.

参数 **remote_addr** **–[in]** remote bluetooth device address

返回

- ESP_OK: if the initialization request is sent successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_hf_deinit** (*esp_bd_addr_t* remote_addr)

De-initialize for HF AG module. This function should be called only after `esp_bluedroid_enable()` completes successfully.

参数 **remote_addr** **–[in]** remote bluetooth device address

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_hf_connect** (*esp_bd_addr_t* remote_bda)

To establish a Service Level Connection to remote bluetooth HFP client device. This function must be called after `esp_bt_hf_init()` and before `esp_bt_hf_deinit()`.

参数 **remote_bda** **–[in]** remote bluetooth HFP client device address

返回

- ESP_OK: connect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_hf_disconnect** (*esp_bd_addr_t* remote_bda)

Disconnect from the remote HFP client. This function must be called after `esp_bt_hf_init()` and before `esp_bt_hf_deinit()`.

参数 **remote_bda** **–[in]** remote bluetooth device address

返回

- ESP_OK: disconnect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_hf_connect_audio** (*esp_bd_addr_t* remote_bda)

Create audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数 **remote_bda** –[in] remote bluetooth device address

返回

- ESP_OK: audio connect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_hf_disconnect_audio** (*esp_bd_addr_t* remote_bda)

Release the established audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数 **remote_bda** –[in] remote bluetooth device address

返回

- ESP_OK: audio disconnect request is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_hf_vra** (*esp_bd_addr_t* remote_bda, *esp_hf_vr_state_t* value)

Response of Volume Recognition Command(AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_bda** –[in] the device address of voice recognition initiator
- **value** –[in] 0 - voice recognition disabled, 1- voice recognition enabled

返回

- ESP_OK: response of volume recognition is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_hf_volume_control** (*esp_bd_addr_t* remote_bda, *esp_hf_volume_control_target_t* type, int volume)

Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_bda** –[in] remote bluetooth device address
- **type** –[in] volume control target, speaker or microphone
- **volume** –[in] gain of the speaker of microphone, ranges 0 to 15

返回

- ESP_OK: volume synchronization control is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if arguments are invalid
- ESP_FAIL: others

esp_err_t **esp_hf_unat_response** (*esp_bd_addr_t* remote_addr, char *unat)

Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_addr** –[in] remote bluetooth device address
- **unat** –[in] User AT command response to HF Client. It will response “ERROR” by default if unat is NULL.

返回

- ESP_OK: response of unknown AT command is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_hf_cmee_response** (*esp_bd_addr_t* remote_bda, *esp_hf_at_response_code_t* response_code, *esp_hf_cme_err_t* error_code)

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_bda** –[in] remote bluetooth device address
- **response_code** –[in] AT command response code
- **error_code** –[in] CME error code

返回

- ESP_OK: extend error code is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_bt_hf_indchange_notification (*esp_bd_addr_t* remote_addr, *esp_hf_call_status_t* call_state, *esp_hf_call_setup_status_t* call_setup_state, *esp_hf_network_state_t* ntk_state, int signal)

Unsolicited send device status notification to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_addr** –[in] remote bluetooth device address
- **call_state** –[in] call state
- **call_setup_state** –[in] call setup state
- **ntk_state** –[in] network service state
- **signal** –[in] signal strength from 0 to 5

返回

- ESP_OK: device status notification is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if arguments are invalid
- ESP_FAIL: others

esp_err_t esp_bt_hf_cind_response (*esp_bd_addr_t* remote_addr, *esp_hf_call_status_t* call_state, *esp_hf_call_setup_status_t* call_setup_state, *esp_hf_network_state_t* ntk_state, int signal, *esp_hf_roaming_status_t* roam, int batt_lev, *esp_hf_call_held_status_t* call_held_status)

Response to device individual indicators to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_addr** –[in] remote bluetooth device address
- **call_state** –[in] call state
- **call_setup_state** –[in] call setup state
- **ntk_state** –[in] network service state
- **signal** –[in] signal strength from 0 to 5
- **roam** –[in] roam state
- **batt_lev** –[in] battery level from 0 to 5
- **call_held_status** –[in] call held status

返回

- ESP_OK: response to device individual indicators is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if the arguments are invalid
- ESP_FAIL: others

esp_err_t esp_bt_hf_cops_response (*esp_bd_addr_t* remote_addr, char *name)

Response for AT+COPS command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_addr** –[in] remote bluetooth device address
- **name** –[in] current operator name

返回

- ESP_OK: response for AT+COPS command is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_hf_clcc_response** (*esp_bd_addr_t* remote_addr, int index, *esp_hf_current_call_direction_t* dir, *esp_hf_current_call_status_t* current_call_state, *esp_hf_current_call_mode_t* mode, *esp_hf_current_call_mpty_type_t* mpty, char *number, *esp_hf_call_addr_type_t* type)

Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_addr** –[in] remote bluetooth device address
- **index** –[in] the index of current call, starting with 1, finishing response with 0 (send OK)
- **dir** –[in] call direction (incoming/outgoing)
- **current_call_state** –[in] current call state
- **mode** –[in] current call mode (voice/data/fax)
- **mpty** –[in] single or multi type
- **number** –[in] current call number
- **type** –[in] international type or unknow

返回

- ESP_OK: response to AT+CLCC command is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_hf_cnum_response** (*esp_bd_addr_t* remote_addr, char *number, int number_type, *esp_hf_subscriber_service_type_t* service_type)

Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_addr** –[in] remote bluetooth device address
- **number** –[in] registration number
- **number_type** –[in] value of number type from 128-143: national or international, may contain prefix and/or escape digits 144-159: international, includes country code prefix, add “+” if needed 160-175: national, but no prefix nor escape digits
- **service_type** –[in] service type (unknown/voice/fax)

返回

- ESP_OK: response for AT+CNUM command is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_hf_bsir** (*esp_bd_addr_t* remote_addr, *esp_hf_in_band_ring_state_t* state)

Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_addr** –[in] remote bluetooth device address
- **state** –[in] in-band ring tone state

返回

- ESP_OK: information of in-band ring tone is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if arguments are invalid
- ESP_FAIL: others

esp_err_t **esp_bt_hf_answer_call** (*esp_bd_addr_t* remote_addr, int num_active, int num_held, *esp_hf_call_status_t* call_state, *esp_hf_call_setup_status_t* call_setup_state, char *number, *esp_hf_call_addr_type_t* call_addr_type)

Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_addr** –[in] remote bluetooth device address
- **num_active** –[in] the number of active call
- **num_held** –[in] the number of held call
- **call_state** –[in] call state
- **call_setup_state** –[in] call setup state
- **number** –[in] number of the incoming call
- **call_addr_type** –[in] call address type

返回

- ESP_OK: answer incoming call is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_bt_hf_reject_call (*esp_bd_addr_t* remote_addr, int num_active, int num_held, *esp_hf_call_status_t* call_state, *esp_hf_call_setup_status_t* call_setup_state, char *number, *esp_hf_call_addr_type_t* call_addr_type)

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_addr** –[in] remote bluetooth device address
- **num_active** –[in] the number of active call
- **num_held** –[in] the number of held call
- **call_state** –[in] call state
- **call_setup_state** –[in] call setup state
- **number** –[in] number of the incoming call
- **call_addr_type** –[in] call address type

返回

- ESP_OK: reject incoming call is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_bt_hf_out_call (*esp_bd_addr_t* remote_addr, int num_active, int num_held, *esp_hf_call_status_t* call_state, *esp_hf_call_setup_status_t* call_setup_state, char *number, *esp_hf_call_addr_type_t* call_addr_type)

Initiate a call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client. If the AG is driven by the HF to call `esp_hf_ag_out_call`, it needs to response an OK or ERROR to HF. But if the AG is actively calling `esp_hf_ag_out_call`, it does not need to take a response to HF.

参数

- **remote_addr** –[in] remote bluetooth device address
- **num_active** –[in] the number of active call
- **num_held** –[in] the number of held call
- **call_state** –[in] call state
- **call_setup_state** –[in] call setup state
- **number** –[in] number of the outgoing call
- **call_addr_type** –[in] call address type

返回

- ESP_OK: a call initiation is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_bt_hf_end_call (*esp_bd_addr_t* remote_addr, int num_active, int num_held, *esp_hf_call_status_t* call_state, *esp_hf_call_setup_status_t* call_setup_state, char *number, *esp_hf_call_addr_type_t* call_addr_type)

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with HFP client.

参数

- **remote_addr** –[in] remote bluetooth device address
- **num_active** –[in] the number of active call
- **num_held** –[in] the number of held call
- **call_state** –[in] call state
- **call_setup_state** –[in] call setup state
- **number** –[in] number of the call
- **call_addr_type** –[in] call address type

返回

- ESP_OK: end an ongoing call is sent to lower layer
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t **esp_bt_hf_register_data_callback** (*esp_hf_incoming_data_cb_t* recv, *esp_hf_outgoing_data_cb_t* send)

Register AG data output function. The callback is only used in the case that Voice Over HCI is enabled.

参数

- **recv** –[in] HFP client incoming data callback function
- **send** –[in] HFP client outgoing data callback function

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

esp_err_t **esp_hf_ag_pkt_stat_nums_get** (uint16_t sync_conn_handle)

Get the number of packets received and sent.

This function is only used in the case that Voice Over HCI is enabled and the audio state is connected. When the operation is completed, the callback function will be called with ESP_HF_PKT_STAT_NUMS_GET_EVT.

参数 **sync_conn_handle** –[in] the (e)SCO connection handle

返回

- ESP_OK: if the request is sent successfully
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

void **esp_hf_outgoing_data_ready** (void)

Trigger the lower-layer to fetch and send audio data.

This function is only used in the case that Voice Over HCI is enabled. As a precondition to use this API, Service Level Connection shall exist with HFP client. After this function is called, lower layer will invoke *esp_hf_client_outgoing_data_cb_t* to fetch data

Unions

Type Definitions

typedef void (*esp_hf_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)

AG incoming data callback function, the callback is useful in case of Voice Over HCI.

Param buf [in] : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.

Param len [in] : size(in bytes) in buf

typedef uint32_t (*esp_hf_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)

AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

Param buf [in] : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.

Param len [in] : size(in bytes) in buf

Return length of data successfully read

typedef void (*esp_hf_cb_t)(esp_hf_cb_event_t event, esp_hf_cb_param_t *param)

HF AG callback function type.

Param event : Event type

Param param : Pointer to callback parameter

Enumerations

enum **esp_hf_cb_event_t**

HF callback events.

Values:

enumerator **ESP_HF_CONNECTION_STATE_EVT**

Connection state changed event

enumerator **ESP_HF_AUDIO_STATE_EVT**

Audio connection state change event

enumerator **ESP_HF_BVRA_RESPONSE_EVT**

Voice recognition state change event

enumerator **ESP_HF_VOLUME_CONTROL_EVT**

Audio volume control command from HF Client, provided by +VGM or +VGS message

enumerator **ESP_HF_UNAT_RESPONSE_EVT**

Unknown AT cmd Response

enumerator **ESP_HF_IND_UPDATE_EVT**

Indicator Update Event

enumerator **ESP_HF_CIND_RESPONSE_EVT**

Call And Device Indicator Response

enumerator **ESP_HF_COPS_RESPONSE_EVT**

Current operator information

enumerator **ESP_HF_CLCC_RESPONSE_EVT**

List of current calls notification

enumerator **ESP_HF_CNUM_RESPONSE_EVT**

Subscriber information response from HF Client

enumerator **ESP_HF_VTS_RESPONSE_EVT**

Enable or not DTMF

enumerator **ESP_HF_NREC_RESPONSE_EVT**

Enable or not NREC

enumerator **ESP_HF_ATA_RESPONSE_EVT**

Answer an Incoming Call

enumerator **ESP_HF_CHUP_RESPONSE_EVT**

Reject an Incoming Call

enumerator **ESP_HF_DIAL_EVT**

Origin an outgoing call with specific number or the dial the last number

enumerator **ESP_HF_WBS_RESPONSE_EVT**

Codec Status

enumerator **ESP_HF_BCS_RESPONSE_EVT**

Final Codec Choice

enumerator **ESP_HF_PKT_STAT_NUMS_GET_EVT**

Request number of packet different status

enum **esp_hf_dial_type_t**

Dial type of ESP_HF_DIAL_EVT.

Values:

enumerator **ESP_HF_DIAL_NUM**

Dial with a phone number

enumerator **ESP_HF_DIAL_VOIP**

Dial with VoIP

enumerator **ESP_HF_DIAL_MEM**

Dial with a memory position

Bluetooth HID Device API

Overview A Bluetooth HID device is a device providing the service of human or other data input and output to and from a Bluetooth HID Host. Users can use the Bluetooth HID Device APIs to make devices like keyboards, mice, joysticks and so on.

Application Example Check [bluetooth/bluedroid/classic_bt](#) folder in ESP-IDF examples, which contains the following application:

- This is an example of Bluetooth HID mouse device. The device running this example can be discovered and connected by a Bluetooth HID Host device such as a PC, and the pointer will move left and right after HID connection is established - [bluetooth/bluedroid/classic_bt/bt_hid_mouse_device](#)

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_hidd_api.h](#)

Functions

esp_err_t **esp_bt_hid_device_register_callback** (*esp_hd_cb_t* callback)

This function is called to init callbacks with HID device module.

参数 **callback** –[in] pointer to the init callback function.

返回

- ESP_OK: success
- other: failed

***esp_err_t* esp_bt_hid_device_init** (void)

Initializes HIDD interface. This function should be called after `esp_bluedroid_init()` and `esp_bluedroid_enable()` success, and should be called after `esp_bt_hid_device_register_callback`. When the operation is complete, the callback function will be called with `ESP_HIDD_INIT_EVT`.

返回

- `ESP_OK`: success
- other: failed

***esp_err_t* esp_bt_hid_device_deinit** (void)

De-initializes HIDD interface. This function should be called after `esp_bluedroid_init()` and `esp_bluedroid_enable()` success, and should be called after `esp_bt_hid_device_init()`. When the operation is complete, the callback function will be called with `ESP_HIDD_DEINIT_EVT`.

返回

- `ESP_OK`: success
- other: failed

***esp_err_t* esp_bt_hid_device_register_app** (*esp_hidd_app_param_t* *app_param, *esp_hidd_qos_param_t* *in_qos, *esp_hidd_qos_param_t* *out_qos)

Registers HIDD parameters with SDP and sets l2cap Quality of Service. This function should be called after `esp_bluedroid_init()` and `esp_bluedroid_enable()` success, and should be called after `esp_bt_hid_device_init()`. When the operation is complete, the callback function will be called with `ESP_HIDD_REGISTER_APP_EVT`.

参数

- **app_param** –[in] HIDD parameters
- **in_qos** –[in] incoming QoS parameters
- **out_qos** –[in] outgoing QoS parameters

返回

- `ESP_OK`: success
- other: failed

***esp_err_t* esp_bt_hid_device_unregister_app** (void)

Removes HIDD parameters from SDP and resets l2cap Quality of Service. This function should be called after `esp_bluedroid_init()` and `esp_bluedroid_enable()` success, and should be called after `esp_bt_hid_device_init()`. When the operation is complete, the callback function will be called with `ESP_HIDD_UNREGISTER_APP_EVT`.

返回

- `ESP_OK`: success
- other: failed

***esp_err_t* esp_bt_hid_device_connect** (*esp_bd_addr_t* bd_addr)

Connects to the peer HID Host with virtual cable. This function should be called after `esp_bluedroid_init()` and `esp_bluedroid_enable()` success, and should be called after `esp_bt_hid_device_init()`. When the operation is complete, the callback function will be called with `ESP_HIDD_OPEN_EVT`.

参数 **bd_addr** –[in] Remote host bluetooth device address.

返回

- `ESP_OK`: success
- other: failed

***esp_err_t* esp_bt_hid_device_disconnect** (void)

Disconnects from the currently connected HID Host. This function should be called after `esp_bluedroid_init()` and `esp_bluedroid_enable()` success, and should be called after `esp_bt_hid_device_init()`. When the operation is complete, the callback function will be called with `ESP_HIDD_CLOSE_EVT`.

备注: The disconnect operation will not remove the virtually cabled device. If the connect request from the

different HID Host, it will reject the request.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_bt_hid_device_send_report** (*esp_hidd_report_type_t* type, uint8_t id, uint16_t len, uint8_t *data)

Sends HID report to the currently connected HID Host. This function should be called after `esp_bluedroid_init()` and `esp_bluedroid_enable()` success, and should be called after `esp_bt_hid_device_init()`. When the operation is complete, the callback function will be called with `ESP_HIDD_SEND_REPORT_EVT`.

参数

- **type** –[in] type of report
- **id** –[in] report id as defined by descriptor
- **len** –[in] length of report
- **data** –[in] report data

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_bt_hid_device_report_error** (*esp_hidd_handshake_error_t* error)

Sends HID Handshake with error info for invalid set_report to the currently connected HID Host. This function should be called after `esp_bluedroid_init()` and `esp_bluedroid_enable()` success, and should be called after `esp_bt_hid_device_init()`. When the operation is complete, the callback function will be called with `ESP_HIDD_REPORT_ERR_EVT`.

参数 **error** –[in] type of error

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_bt_hid_device_virtual_cable_unplug** (void)

Remove the virtually cabled device. This function should be called after `esp_bluedroid_init()` and `esp_bluedroid_enable()` success, and should be called after `esp_bt_hid_device_init()`. When the operation is complete, the callback function will be called with `ESP_HIDD_VC_UNPLUG_EVT`.

备注: If the connection exists, then HID Device will send a `VIRTUAL_CABLE_UNPLUG` control command to the peer HID Host, and the connection will be destroyed. If the connection does not exist, then HID Device will only unplug on it's single side. Once the unplug operation is success, the related pairing and bonding information will be removed, then the HID Device can accept connection request from the different HID Host,

返回 - ESP_OK: success

- other: failed

Unions

Type Definitions

typedef void (***esp_hd_cb_t**)(*esp_hidd_cb_event_t* event, *esp_hidd_cb_param_t* *param)

HID device callback function type.

Param event Event type

Param param Point to callback parameter, currently is union type

Enumerations

enum **esp_hidd_handshake_error_t**

HIDD handshake result code.

Values:

enumerator **ESP_HID_PAR_HANDSHAKE_RSP_SUCCESS**

successful

enumerator **ESP_HID_PAR_HANDSHAKE_RSP_NOT_READY**

not ready, device is too busy to accept data

enumerator **ESP_HID_PAR_HANDSHAKE_RSP_ERR_INVALID_REP_ID**

invalid report ID

enumerator **ESP_HID_PAR_HANDSHAKE_RSP_ERR_UNSUPPORTED_REQ**

device does not support the request

enumerator **ESP_HID_PAR_HANDSHAKE_RSP_ERR_INVALID_PARAM**

parameter value is out of range or inappropriate

enumerator **ESP_HID_PAR_HANDSHAKE_RSP_ERR_UNKNOWN**

device could not identify the error condition

enumerator **ESP_HID_PAR_HANDSHAKE_RSP_ERR_FATAL**

restart is essential to resume functionality

enum **esp_hidd_report_type_t**

HIDD report types.

Values:

enumerator **ESP_HIDD_REPORT_TYPE_OTHER**

unknown report type

enumerator **ESP_HIDD_REPORT_TYPE_INPUT**

input report

enumerator **ESP_HIDD_REPORT_TYPE_OUTPUT**

output report

enumerator **ESP_HIDD_REPORT_TYPE_FEATURE**

feature report

enumerator **ESP_HIDD_REPORT_TYPE_INTRDATA**

special value for reports to be sent on interrupt channel, INPUT is assumed

enum **esp_hidd_connection_state_t**

HIDD connection state.

Values:

enumerator **ESP_HIDD_CONN_STATE_CONNECTED**

HID connection established

enumerator **ESP_HIDD_CONN_STATE_CONNECTING**

connection to remote Bluetooth device

enumerator **ESP_HIDD_CONN_STATE_DISCONNECTED**
connection released

enumerator **ESP_HIDD_CONN_STATE_DISCONNECTING**
disconnecting to remote Bluetooth device

enumerator **ESP_HIDD_CONN_STATE_UNKNOWN**
unknown connection state

enum **esp_hidd_protocol_mode_t**
HID device protocol modes.

Values:

enumerator **ESP_HIDD_REPORT_MODE**
Report Protocol Mode

enumerator **ESP_HIDD_BOOT_MODE**
Boot Protocol Mode

enumerator **ESP_HIDD_UNSUPPORTED_MODE**
unsupported

enum **esp_hidd_boot_report_id_t**
HID Boot Protocol report IDs.

Values:

enumerator **ESP_HIDD_BOOT_REPORT_ID_KEYBOARD**
report ID of Boot Protocol keyboard report

enumerator **ESP_HIDD_BOOT_REPORT_ID_MOUSE**
report ID of Boot Protocol mouse report

enum **[anonymous]**
HID Boot Protocol report size including report ID.

Values:

enumerator **ESP_HIDD_BOOT_REPORT_SIZE_KEYBOARD**
report size of Boot Protocol keyboard report

enumerator **ESP_HIDD_BOOT_REPORT_SIZE_MOUSE**
report size of Boot Protocol mouse report

enum **esp_hidd_cb_event_t**
HID device callback function events.

Values:

enumerator **ESP_HIDD_INIT_EVT**
When HID device is initied, the event comes

enumerator **ESP_HIDD_DEINIT_EVT**

When HID device is deinit, the event comes

enumerator **ESP_HIDD_REGISTER_APP_EVT**

When HID device application registered, the event comes

enumerator **ESP_HIDD_UNREGISTER_APP_EVT**

When HID device application unregistered, the event comes

enumerator **ESP_HIDD_OPEN_EVT**

When HID device connection to host opened, the event comes

enumerator **ESP_HIDD_CLOSE_EVT**

When HID device connection to host closed, the event comes

enumerator **ESP_HIDD_SEND_REPORT_EVT**

When HID device send report to lower layer, the event comes

enumerator **ESP_HIDD_REPORT_ERR_EVT**

When HID device report handshake error to lower layer, the event comes

enumerator **ESP_HIDD_GET_REPORT_EVT**

When HID device receives GET_REPORT request from host, the event comes

enumerator **ESP_HIDD_SET_REPORT_EVT**

When HID device receives SET_REPORT request from host, the event comes

enumerator **ESP_HIDD_SET_PROTOCOL_EVT**

When HID device receives SET_PROTOCOL request from host, the event comes

enumerator **ESP_HIDD_INTR_DATA_EVT**

When HID device receives DATA from host on intr, the event comes

enumerator **ESP_HIDD_VC_UNPLUG_EVT**

When HID device initiates Virtual Cable Unplug, the event comes

enumerator **ESP_HIDD_API_ERR_EVT**

When HID device has API error, the event comes

enum **esp_hidd_status_t**

Values:

enumerator **ESP_HIDD_SUCCESS**

enumerator **ESP_HIDD_ERROR**

general ESP HD error

enumerator **ESP_HIDD_NO_RES**

out of system resources

enumerator **ESP_HIDD_BUSY**

Temporarily can not handle this request.

enumerator **ESP_HIDD_NO_DATA**

No data.

enumerator **ESP_HIDD_NEED_INIT**

HIDD module shall init first

enumerator **ESP_HIDD_NEED_DEINIT**

HIDD module shall deinit first

enumerator **ESP_HIDD_NEED_REG**

HIDD module shall register first

enumerator **ESP_HIDD_NEED_DEREG**

HIDD module shall deregister first

enumerator **ESP_HIDD_NO_CONNECTION**

connection may have been closed

2.1.5 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to [NimBLE user guide](#) for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

图 1: ESP NimBLE Stack

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- `components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h`

Functions

`esp_err_t esp_nimble_hci_init` (void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

返回

- ESP_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_and_controller_init` (void)

Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```
void ble_host_task(void *param)
{
    nimble_port_run(); //This function will return only when nimble_port_
    ↪stop() is executed.
    nimble_port_freertos_deinit();
}
```

(下页继续)

(续上页)

```

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d
↪", ret);
    return;
}

nimble_port_init();

//Initialize the NimBLE Host configuration

nimble_port_freertos_init(ble_host_task);

```

`nimble_port_freertos_init()` is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to `nimble_port_run()`. If a separate task is not required, calling `nimble_port_run()` will run the NimBLE host in the current task.

返回

- ESP_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_deinit` (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

备注: This function should be called after the NimBLE host is deinitialized.

返回

- ESP_OK if the deinitialization is successful
- Appropriate error codes from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_and_controller_deinit` (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

```

int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();

    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with
↪error: %d", ret);
    }
}

```

If `nimble_port_freertos_init()` is used during initialization, then `nimble_port_freertos_deinit()` should be called in the host task after `nimble_port_run()`.

备注: This function should not be executed in the context of Bluetooth host task.

备注: This function should be called after the NimBLE host is deinitialized.

返回

- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

Macros**BLE_HCI_UART_H4_NONE****BLE_HCI_UART_H4_CMD****BLE_HCI_UART_H4_ACL****BLE_HCI_UART_H4_SCO****BLE_HCI_UART_H4_EVT****2.1.6 ESP-BLE-MESH**

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section [ESP-BLE-MESH 快速入门](#). If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section [ESP-BLE-MESH 架构](#).

Application Examples and Demos

Please refer to Sections [ESP-BLE-MESH 示例](#) and [ESP-BLE-MESH 演示视频](#).

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- [ESP-BLE-MESH Definitions](#)
- [ESP-BLE-MESH Core API Reference](#)
- [ESP-BLE-MESH Models API Reference](#)

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

Unions

union **esp_ble_mesh_prov_cb_param_t**

```

Public Members

uint16_t **lpn_addr**

Low Power Node unicast address

struct **ble_mesh_friend_friendship_terminate_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.

Public Types

enum [**anonymous**]

This enum value is the reason of friendship termination on the friend node side

Values:

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL**

Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT**

Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ**

Receive Friend Request from existing Low Power Node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR**

Receive Friend Clear from other friend node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE**

Friend feature disabled or corresponding NetKey is deleted

Public Members

uint16_t **lpn_addr**

Low Power Node unicast address

enum *esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous]*
reason

This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

struct **ble_mesh_heartbeat_msg_rcv_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.

Public Members

uint8_t **hops**

Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t **feature**

Bit field of currently active features of the node

struct **ble_mesh_input_evt_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_EVT.

Public Members

esp_ble_mesh_input_action_t **action**

Action of Input OOB Authentication

The Light HSL Saturation state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_xyl_lightness**

The Light xyL Lightness state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_lc_light_onoff**

The Light LC Light OnOff state

union **esp_ble_mesh_model_cb_param_t**

#include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.

Public Members

struct *esp_ble_mesh_model_cb_param_t::ble_mesh_model_operation_evt_param* **model_operation**
Event parameter of ESP_BLE_MESH_MODEL_OPERATION_EVT

struct *esp_ble_mesh_model_cb_param_t::ble_mesh_model_send_comp_param* **model_send_comp**
Event parameter of ESP_BLE_MESH_MODEL_SEND_COMP_EVT

struct *esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_comp_param* **model_publish_comp**
Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT

struct *esp_ble_mesh_model_cb_param_t::ble_mesh_mod_rcv_publish_msg_param*
client_rcv_publish_msg
Event parameter of ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT

struct *esp_ble_mesh_model_cb_param_t::ble_mesh_client_model_send_timeout_param*
client_send_timeout
Event parameter of ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT

struct *esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_update_evt_param*
model_publish_update
Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT

struct *esp_ble_mesh_model_cb_param_t::ble_mesh_server_model_update_state_comp_param*
server_model_update_state
Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT

struct **ble_mesh_client_model_send_timeout_param**
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.

Public Members

uint32_t **opcode**
Opcode of the previously sent message

esp_ble_mesh_model_t ***model**
Pointer to the model which sends the previous message

esp_ble_mesh_msg_ctx_t ***ctx**
Pointer to the context of the previous message

struct **ble_mesh_mod_rcv_publish_msg_param**
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.

Public Members

uint32_t **opcode**
Opcode of the unsolicited received message

esp_ble_mesh_model_t ***model**

Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t ***ctx**

Pointer to the context of the message

uint16_t **length**

Length of the received message

uint8_t ***msg**

Value of the received message

struct **ble_mesh_model_operation_evt_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.

Public Members

uint32_t **opcode**

Opcode of the received message

esp_ble_mesh_model_t ***model**

Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t ***ctx**

Pointer to the context of the received message

uint16_t **length**

Length of the received message

uint8_t ***msg**

Value of the received message

struct **ble_mesh_model_publish_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int **err_code**

Indicate the result of publishing a message

esp_ble_mesh_model_t ***model**

Pointer to the model which publishes the message

struct **ble_mesh_model_publish_update_evt_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the model which is going to update its publish message

struct **ble_mesh_model_send_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int **err_code**

Indicate the result of sending a message

uint32_t **opcode**

Opcode of the message

esp_ble_mesh_model_t ***model**

Pointer to the model which sends the message

esp_ble_mesh_msg_ctx_t ***ctx**

Context of the message

struct **ble_mesh_server_model_update_state_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.

Public Members

int **err_code**

Indicate the result of updating server model state

esp_ble_mesh_model_t ***model**

Pointer to the server model which state value is updated

esp_ble_mesh_server_state_type_t **type**

Type of the updated server state

Structures

struct **esp_ble_mesh_deinit_param_t**

BLE Mesh deinit parameters

Public Members

bool **erase_flash**

Indicate if erasing flash when deinit mesh stack

struct **esp_ble_mesh_elem_t**

Abstraction that describes a BLE Mesh Element. This structure is associated with struct `bt_mesh_elem` in `mesh_access.h`

Public Members

uint16_t **element_addr**

Element Address, assigned during provisioning.

const uint16_t **location**

Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t **sig_model_count**

SIG Model count

const uint8_t **vnd_model_count**

Vendor Model count

esp_ble_mesh_model_t ***sig_models**

SIG Models

esp_ble_mesh_model_t ***vnd_models**

Vendor Models

struct **esp_ble_mesh_model_pub_t**

Abstraction that describes a model publication context. This structure is associated with struct `bt_mesh_model_pub` in `mesh_access.h`

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the model to which the context belongs. Initialized by the stack.

uint16_t **publish_addr**

Publish Address.

uint16_t **app_idx**

Publish AppKey Index.

uint16_t **cred**

Friendship Credentials Flag.

uint16_t **send_rel**

Force reliable sending (segment acks)

uint8_t **ttl**

Publish Time to Live.

uint8_t **retransmit**

Retransmit Count & Interval Steps.

uint8_t **period**

Publish Period.

uint8_t **period_div**

Divisor for the Period.

uint8_t **fast_period**

Use FastPeriodDivisor

uint8_t **count**

Retransmissions left.

uint32_t **period_start**

Start of the current period.

struct net_buf_simple ***msg**

Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the `ESP_BLE_MESH_MODEL_PUB_DEFINE` macro.

`ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);`

esp_ble_mesh_cb_t **update**

Callback used to update publish message. Initialized by the stack.

struct k_delayed_work **timer**

Publish Period Timer. Initialized by the stack.

uint8_t **dev_role**

Role of the device that is going to publish messages

struct **esp_ble_mesh_model_op_t**

Abstraction that describes a model operation context. This structure is associated with struct `bt_mesh_model_op` in `mesh_access.h`

Public Members

const uint32_t **opcode**

Message opcode

const size_t **min_len**

Message minimum length

esp_ble_mesh_cb_t **param_cb**

Callback used to handle message. Initialized by the stack.

struct **esp_ble_mesh_model_cbs_t**

Abstraction that describes a model callback structure. This structure is associated with struct `bt_mesh_model_cb` in `mesh_access.h`.

Public Members

esp_ble_mesh_cb_t **init_cb**

Callback used during model initialization. Initialized by the stack.

struct **esp_ble_mesh_model**

Abstraction that describes a Mesh Model instance. This structure is associated with struct `bt_mesh_model` in `mesh_access.h`

Public Members

const uint16_t **model_id**

16-bit model identifier

uint16_t **company_id**

16-bit company identifier

uint16_t **model_id**

16-bit model identifier

struct *esp_ble_mesh_model::*[anonymous]::[anonymous] **vnd**

Structure encapsulating a model ID with a company ID

union *esp_ble_mesh_model::*[anonymous] **[anonymous]**

Model ID

uint8_t **element_idx**

Internal information, mainly for persistent storage Belongs to Nth element

uint8_t **model_idx**

Is the Nth model in the element

uint16_t **flags**

Information about what has changed

esp_ble_mesh_elem_t ***element**

The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const **pub**

Model Publication

uint16_t **keys**[CONFIG_BLE_MESH_MODEL_KEY_COUNT]

AppKey List

uint16_t **groups**[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]

Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t ***op**

Model operation context

esp_ble_mesh_model_cbs_t ***cb**

Model callback structure

void ***user_data**

Model-specific user data

struct **esp_ble_mesh_msg_ctx_t**

Message sending context. This structure is associated with struct `bt_mesh_msg_ctx` in `mesh_access.h`

Public Members

uint16_t **net_idx**

NetKey Index of the subnet through which to send the message.

uint16_t **app_idx**

AppKey Index for message encryption.

uint16_t **addr**

Remote address.

uint16_t **recv_dst**

Destination address of a received message. Not used for sending.

int8_t **recv_rssi**

RSSI of received packet. Not used for sending.

uint8_t **recv_ttl**

Received TTL value. Not used for sending.

uint8_t **send_rel**

Force sending reliably by using segment acknowledgement

uint8_t **send_ttl**

TTL, or `ESP_BLE_MESH_TTL_DEFAULT` for default TTL.

uint32_t **recv_op**

Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t ***model**

Model corresponding to the message, no need to be initialized before sending message

bool **srv_send**

Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct **esp_ble_mesh_prov_t**

Provisioning properties & capabilities. This structure is associated with struct `bt_mesh_prov` in `mesh_access.h`

struct **esp_ble_mesh_comp_t**

Node Composition data context. This structure is associated with struct `bt_mesh_comp` in `mesh_access.h`

Public Members

uint16_t **cid**

16-bit SIG-assigned company identifier

uint16_t **pid**

16-bit vendor-assigned product identifier

uint16_t **vid**

16-bit vendor-assigned product version identifier

size_t **element_count**

Element count

esp_ble_mesh_elem_t ***elements**

A sequence of elements

struct **esp_ble_mesh_unprov_dev_add_t**

Information of the device which is going to be added for provisioning.

Public Members

esp_ble_mesh_bd_addr_t **addr**

Device address

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t **uuid**[16]

Device UUID

uint16_t **oob_info**

Device OOB Info `ADD_DEV_START_PROV_NOW_FLAG` shall not be set if the bearer has both PB-ADV and PB-GATT enabled

esp_ble_mesh_prov_bearer_t **bearer**

Provisioning Bearer

struct **esp_ble_mesh_device_delete_t**

Information of the device which is going to be deleted.

Public Members

esp_ble_mesh_bd_addr_t **addr**

Device address

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t **uuid**[16]

Device UUID

uint8_t **flag**

BIT0: device address; BIT1: device UUID

struct **esp_ble_mesh_prov_data_info_t**

Information of the provisioner which is going to be updated.

Public Members

uint16_t **net_idx**

NetKey Index

uint8_t **flags**

Flags

uint32_t **iv_index**

IV Index

uint8_t **flag**

BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct **esp_ble_mesh_node_t**

Information of the provisioned node

Public Members

esp_ble_mesh_bd_addr_t **addr**

Node device address

esp_ble_mesh_addr_type_t **addr_type**

Node device address type

uint8_t **dev_uuid**[16]

Device UUID

uint16_t **oob_info**

Node OOB information

uint16_t **unicast_addr**

Node unicast address

uint8_t **element_num**

Node element number

uint16_t **net_idx**

Node NetKey Index

uint8_t **flags**

Node key refresh flag and iv update flag

uint32_t **iv_index**

Node IV Index

uint8_t **dev_key**[16]

Node device key

char **name**[31 + 1]

Node name

uint16_t **comp_length**

Length of Composition Data

uint8_t ***comp_data**

Value of Composition Data

struct **esp_ble_mesh_fast_prov_info_t**

Context of fast provisioning which need to be set.

Public Members

uint16_t **unicast_min**

Minimum unicast address used for fast provisioning

uint16_t **unicast_max**

Maximum unicast address used for fast provisioning

uint16_t **net_idx**

Netkey index used for fast provisioning

`uint8_t flags`

Flags used for fast provisioning

`uint32_t iv_index`

IV Index used for fast provisioning

`uint8_t offset`

Offset of the UUID to be compared

`uint8_t match_len`

Length of the UUID to be compared

`uint8_t match_val[16]`

Value of UUID to be compared

struct `esp_ble_mesh_heartbeat_filter_info_t`

Context of Provisioner heartbeat filter information to be set

Public Members

`uint16_t hb_src`

Heartbeat source address (unicast address)

`uint16_t hb_dst`

Heartbeat destination address (unicast address or group address)

struct `esp_ble_mesh_client_op_pair_t`

BLE Mesh client models related definitions.

Client model Get/Set message opcode and corresponding Status message opcode

Public Members

`uint32_t cli_op`

The client message opcode

`uint32_t status_op`

The server status opcode corresponding to the client message opcode

struct `esp_ble_mesh_client_t`

Client Model user data context.

Public Members

`esp_ble_mesh_model_t *model`

Pointer to the client model. Initialized by the stack.

int op_pair_size

Size of the op_pair

const *esp_ble_mesh_client_op_pair_t* ***op_pair**

Table containing get/set message opcode and corresponding status message opcode

uint32_t **publish_status**

Callback used to handle the received unsolicited message. Initialized by the stack.

void ***internal_data**

Pointer to the internal data of client model

uint8_t **msg_role**

Role of the device (Node/Provisioner) that is going to send messages

struct **esp_ble_mesh_client_common_param_t**

Common parameters of the messages sent by Client Model.

Public Members

esp_ble_mesh_opcode_t **opcode**

Message opcode

esp_ble_mesh_model_t ***model**

Pointer to the client model structure

esp_ble_mesh_msg_ctx_t **ctx**

The context used to send message

int32_t **msg_timeout**

Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t **msg_role**

Role of the device - Node/Provisioner

struct **esp_ble_mesh_state_transition_t**

Parameters of the server model state transition

Public Functions

BLE_MESH_ATOMIC_DEFINE (flag, *ESP_BLE_MESH_SERVER_FLAG_MAX*)

Flag used to indicate if the transition timer has been started internally.

If the model which contains *esp_ble_mesh_state_transition_t* sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

Public Members**bool just_started**

Indicate if the state transition has just started

uint8_t trans_time

State transition time

uint8_t remain_time

Remaining time of state transition

uint8_t delay

Delay before starting state transition

uint32_t quo_tt

Duration of each divided transition step

uint32_t counter

Number of steps which the transition duration is divided

uint32_t total_duration

State transition total duration

int64_t start_timestamp

Time when the state transition is started

struct k_delayed_work timer

Timer used for state transition

struct esp_ble_mesh_last_msg_info_t

Parameters of the server model received last same set message.

Public Members**uint8_t tid**

Transaction number of the last message

uint16_t src

Source address of the last message

uint16_t dst

Destination address of the last message

int64_t timestamp

Time when the last message is received

struct esp_ble_mesh_server_rsp_ctrl_t

Parameters of the Server Model response control

Public Members

`uint8_t get_auto_rsp`

BLE Mesh Server Response Option.

- i. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Get messages need to be replied by the application;
- ii. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Get messages will be replied by the server models;
- iii. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Set messages need to be replied by the application;
- iv. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Set messages will be replied by the server models;
- v. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Server Status messages need to be replied by the application;
- vi. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Server Status messages will be replied by the server models; Response control for Client Get messages

`uint8_t set_auto_rsp`

Response control for Client Set messages

`uint8_t status_auto_rsp`

Response control for Server Status messages

Macros

ESP_BLE_MESH_SDU_MAX_LEN

< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

ESP_BLE_MESH_MIC_SHORT

Length of a long Mesh MIC.

ESP_BLE_MESH_MIC_LONG

The maximum length of a BLE Mesh provisioned node name

ESP_BLE_MESH_NODE_NAME_MAX_LEN

The maximum length of a BLE Mesh unprovisioned device name

ESP_BLE_MESH_DEVICE_NAME_MAX_LEN

The maximum length of settings user id

ESP_BLE_MESH_SETTINGS_UID_SIZE

Invalid settings index

ESP_BLE_MESH_INVALID_SETTINGS_IDX

Define the BLE Mesh octet 16 bytes size

ESP_BLE_MESH_OCTET16_LEN

ESP_BLE_MESH_OCTETS_LEN

ESP_BLE_MESH_CID_NVAL

Special TTL value to request using configured default TTL

ESP_BLE_MESH_TTL_DEFAULT

Maximum allowed TTL value

ESP_BLE_MESH_TTL_MAX

ESP_BLE_MESH_ADDR_UNASSIGNED

ESP_BLE_MESH_ADDR_ALL_NODES

ESP_BLE_MESH_ADDR_PROXIES

ESP_BLE_MESH_ADDR_FRIENDS

ESP_BLE_MESH_ADDR_RELAYS

ESP_BLE_MESH_KEY_UNUSED

ESP_BLE_MESH_KEY_DEV

ESP_BLE_MESH_KEY_PRIMARY

ESP_BLE_MESH_KEY_ANY

Primary Network Key index

ESP_BLE_MESH_NET_PRIMARY

Relay state value

ESP_BLE_MESH_RELAY_DISABLED

ESP_BLE_MESH_RELAY_ENABLED

ESP_BLE_MESH_RELAY_NOT_SUPPORTED

Beacon state value

ESP_BLE_MESH_BEACON_DISABLED

ESP_BLE_MESH_BEACON_ENABLED

GATT Proxy state value

ESP_BLE_MESH_GATT_PROXY_DISABLED

ESP_BLE_MESH_GATT_PROXY_ENABLED

ESP_BLE_MESH_GATT_PROXY_NOT_SUPPORTED

Friend state value

ESP_BLE_MESH_FRIEND_DISABLED

ESP_BLE_MESH_FRIEND_ENABLED

ESP_BLE_MESH_FRIEND_NOT_SUPPORTED

Node identity state value

ESP_BLE_MESH_NODE_IDENTITY_STOPPED

ESP_BLE_MESH_NODE_IDENTITY_RUNNING

ESP_BLE_MESH_NODE_IDENTITY_NOT_SUPPORTED

Supported features

ESP_BLE_MESH_FEATURE_RELAY

ESP_BLE_MESH_FEATURE_PROXY

ESP_BLE_MESH_FEATURE_FRIEND

ESP_BLE_MESH_FEATURE_LOW_POWER

ESP_BLE_MESH_FEATURE_ALL_SUPPORTED

ESP_BLE_MESH_ADDR_IS_UNICAST (addr)

ESP_BLE_MESH_ADDR_IS_GROUP (addr)

ESP_BLE_MESH_ADDR_IS_VIRTUAL (addr)

ESP_BLE_MESH_ADDR_IS_RFU (addr)

ESP_BLE_MESH_INVALID_NODE_INDEX

ESP_BLE_MESH_TRANSMIT (count, int_ms)

Encode transmission count & interval steps.

备注: For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

参数

- **count** –Number of retransmissions (first transmission is excluded).
- **int_ms** –Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

返回 BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

ESP_BLE_MESH_GET_TRANSMIT_COUNT (transmit)

Decode transmit count from a transmit value.

参数

- **transmit** –Encoded transmit count & interval value.

返回 Transmission count (actual transmissions equal to N + 1).

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL (transmit)

Decode transmit interval from a transmit value.

参数

- **transmit** –Encoded transmit count & interval value.

返回 Transmission interval in milliseconds.

ESP_BLE_MESH_PUBLISH_TRANSMIT (count, int_ms)

Encode Publish Retransmit count & interval steps.

参数

- **count** –Number of retransmissions (first transmission is excluded).
- **int_ms** –Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

返回 BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT (transmit)

Decode Publish Retransmit count from a given value.

参数

- **transmit** –Encoded Publish Retransmit count & interval value.

返回 Retransmission count (actual transmissions equal to N + 1).

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL (transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

参数

- **transmit** –Encoded Publish Retransmit count & interval value.

返回 Transmission interval in milliseconds.

ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN

Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN

Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN

Macros used to define message opcode

ESP_BLE_MESH_MODEL_OP_1 (b0)**ESP_BLE_MESH_MODEL_OP_2** (b0, b1)**ESP_BLE_MESH_MODEL_OP_3** (b0, cid)

This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

ESP_BLE_MESH_SIG_MODEL (_id, _op, _pub, _user_data)

This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

ESP_BLE_MESH_VENDOR_MODEL (_company, _id, _op, _pub, _user_data)

ESP_BLE_MESH_ELEMENT (*_loc*, *_mods*, *_vnd_mods*)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro `ESP_BLE_MESH_MODEL_NONE` can be given instead.

备注: This macro is associated with `BLE_MESH_ELEM` in `mesh_access.h`

参数

- **_loc** –Location Descriptor.
- **_mods** –Array of SIG models.
- **_vnd_mods** –Array of vendor models.

ESP_BLE_MESH_PROV (*uuid*, *sta_val*, *sta_val_len*, *out_size*, *out_act*, *in_size*, *in_act*)

BT_OCTET32_LEN

BD_ADDR_LEN

ESP_BLE_MESH_ADDR_TYPE_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RANDOM

ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (*_name*, *_msg_len*, *_role*)

Define a model publication context.

参数

- **_name** –Variable name given to the context.
- **_msg_len** –Length of the publication message.
- **_role** –Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (*_opcode*, *_min_len*)

Define a model operation context.

参数

- **_opcode** –Message opcode.
- **_min_len** –Message minimum length.

ESP_BLE_MESH_MODEL_OP_END

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE

Helper to define an empty model array. This structure is associated with `BLE_MESH_MODEL_NONE` in `mesh_access.h`

ADD_DEV_RM_AFTER_PROV_FLAG

Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG

Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG

Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG

DEL_DEV_UUID_FLAG

PROV_DATA_NET_IDX_FLAG

PROV_DATA_FLAGS_FLAG

PROV_DATA_IV_INDEX_FLAG

ESP_BLE_MESH_HEARTBEAT_FILTER_ACCEPTLIST

ESP_BLE_MESH_HEARTBEAT_FILTER_REJECTLIST

Provisioner heartbeat filter operation

ESP_BLE_MESH_HEARTBEAT_FILTER_ADD

ESP_BLE_MESH_HEARTBEAT_FILTER_REMOVE

ESP_BLE_MESH_MODEL_ID_CONFIG_SRV

BLE Mesh models related Model ID and Opcode definitions.

< Foundation Models

Type Definitions

typedef uint8_t esp_ble_mesh_octet16_t[16]

Define the BLE Mesh octet 8 bytes size

typedef uint8_t esp_ble_mesh_octet8_t[8]

Invalid Company ID

```
typedef uint32_t esp_ble_mesh_cb_t
```

```
typedef uint8_t UINT8
```

```
typedef uint16_t UINT16
```

```
typedef uint32_t UINT32
```

```
typedef uint64_t UINT64
```

```
typedef UINT8 BT_OCTET32[32]
```

```
typedef uint8_t BD_ADDR[6]
```

```
typedef uint8_t esp_ble_mesh_bd_addr_t[6]
```

```
typedef uint8_t esp_ble_mesh_addr_type_t
```

BLE device address type.

```
typedef struct esp_ble_mesh_model esp_ble_mesh_model_t
```

```
typedef uint8_t esp_ble_mesh_dev_add_flag_t
```

```
typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
```

`esp_ble_mesh_opcode_config_client_get_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by `esp_ble_mesh_config_client_get_state`. The following opcodes will only be used in the `esp_ble_mesh_config_client_get_state` function.

```
typedef uint32_t esp_ble_mesh_opcode_config_client_set_t
```

`esp_ble_mesh_opcode_config_client_set_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by `esp_ble_mesh_config_client_set_state`. The following opcodes will only be used in the `esp_ble_mesh_config_client_set_state` function.

```
typedef uint32_t esp_ble_mesh_opcode_config_status_t
```

`esp_ble_mesh_opcode_config_status_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model's request messages.

```
typedef uint8_t esp_ble_mesh_cfg_status_t
```

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

```
typedef uint32_t esp_ble_mesh_opcode_health_client_get_t
```

`esp_ble_mesh_opcode_health_client_get_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by `esp_ble_mesh_health_client_get_state`. The following opcodes will only be used in the `esp_ble_mesh_health_client_get_state` function.

typedef uint32_t **esp_ble_mesh_opcode_health_client_set_t**

esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t **esp_ble_mesh_health_model_status_t**

esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model's request messages.

typedef uint32_t **esp_ble_mesh_generic_message_opcode_t**

esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode

typedef uint32_t **esp_ble_mesh_sensor_message_opcode_t**

esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t **esp_ble_mesh_time_scene_message_opcode_t**

esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t **esp_ble_mesh_light_message_opcode_t**

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode

typedef uint32_t **esp_ble_mesh_opcode_t**

End of defines of esp_ble_mesh_opcode_t

typedef uint8_t **esp_ble_mesh_model_status_t**

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

Enumerations

enum **esp_ble_mesh_cb_type_t**

- enumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT**
Node add AppKey locally completion event
- enumerator **ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT**
Node bind AppKey to model locally completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT**
Provisioner enable provisioning functionality completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT**
Provisioner disable provisioning functionality completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT**
Provisioner receives unprovisioned device beacon event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT**
Provisioner read unprovisioned device OOB public key event

- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT**
Provisioner input value for provisioning procedure event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT**
Provisioner output value for provisioning procedure event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT**
Provisioner establish a BLE Mesh link event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT**
Provisioner close a BLE Mesh link event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT**
Provisioner provisioning done event
- enumerator **ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT**
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT**
Provisioner start to provision an unprovisioned device completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT**
Provisioner delete a device from the list, close provisioning link with the device completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT**
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT**
Provisioner set net_idx/flags/iv_index used for provisioning completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT**
Provisioner set static oob value used for provisioning completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT**
Provisioner set unicast address of primary element completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT**
Provisioner read unprovisioned device OOB public key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT**
Provisioner input number completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT**
Provisioner input string completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT**
Provisioner set node name completion event

- enumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT**
Provisioner add local app key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT**
Provisioner update local app key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT**
Provisioner bind local model with local app key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT**
Provisioner add local network key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT**
Provisioner update local network key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT**
Provisioner store node composition data completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT**
Provisioner delete node with uuid completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT**
Provisioner delete node with unicast address completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT**
Provisioner start to receive heartbeat message completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT**
Provisioner set the heartbeat filter type completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT**
Provisioner set the heartbeat filter information completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT**
Provisioner receive heartbeat message event
- enumerator **ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT**
Provisioner directly erase settings completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner open settings with index completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT**
Provisioner open settings with user id completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner close settings with index completion event

enumerator **ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT**

Provisioner close settings with user id completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT**

Provisioner delete settings with index completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT**

Provisioner delete settings with user id completion event

enumerator **ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT**

Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

enumerator **ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT**

Set fast provisioning action completion event

enumerator **ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT**

Receive Heartbeat message event

enumerator **ESP_BLE_MESH_LPN_ENABLE_COMP_EVT**

Enable Low Power Node completion event

enumerator **ESP_BLE_MESH_LPN_DISABLE_COMP_EVT**

Disable Low Power Node completion event

enumerator **ESP_BLE_MESH_LPN_POLL_COMP_EVT**

Low Power Node send Friend Poll completion event

enumerator **ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT**

Low Power Node establishes friendship event

enumerator **ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT**

Low Power Node terminates friendship event

enumerator **ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT**

Friend Node establishes friendship event

enumerator **ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT**

Friend Node terminates friendship event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT**

Proxy Client receives Network ID advertising packet event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT**

Proxy Client establishes connection successfully event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT**

Proxy Client terminates connection successfully event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT**

Proxy Client receives Proxy Filter Status event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT**

Proxy Client connect completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT**

Proxy Client disconnect completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT**

Proxy Client set filter type completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT**

Proxy Client add filter address completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT**

Proxy Client remove filter address completion event

enumerator **ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT**

Proxy Server establishes connection successfully event

enumerator **ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT**

Proxy Server terminates connection successfully event

enumerator **ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT**

Local model subscribes group address completion event

enumerator **ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT**

Local model unsubscribes group address completion event

enumerator **ESP_BLE_MESH_DEINIT_MESH_COMP_EVT**

De-initialize BLE Mesh stack completion event

enumerator **ESP_BLE_MESH_PROV_EVT_MAX**

enum **[anonymous]**

BLE Mesh server models related definitions.

This enum value is the flag of transition timer operation

Values:

enumerator **ESP_BLE_MESH_SERVER_TRANS_TIMER_START**

enumerator **ESP_BLE_MESH_SERVER_FLAG_MAX**

enum **esp_ble_mesh_server_state_type_t**

This enum value is the type of server model states

Values:

enumerator **ESP_BLE_MESH_GENERIC_ONOFF_STATE**

enumerator **ESP_BLE_MESH_GENERIC_LEVEL_STATE**

enumerator **ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE**

enumerator **ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE**

enumerator **ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_HUE_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE**

enumerator **ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE**

enumerator **ESP_BLE_MESH_SERVER_MODEL_STATE_MAX**

enum **esp_ble_mesh_model_cb_event_t**

Values:

enumerator **ESP_BLE_MESH_MODEL_OPERATION_EVT**

User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

enumerator **ESP_BLE_MESH_MODEL_SEND_COMP_EVT**

User-defined models send messages completion event

enumerator **ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT**

User-defined models publish messages completion event

enumerator **ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT**

User-defined client models receive publish messages event

enumerator **ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT**

Timeout event for the user-defined client models that failed to receive response from peer server models

enumerator **ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT**

When a model is configured to publish messages periodically, this event will occur during every publish period

enumerator **ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT**

Server models update state value completion event

enumerator **ESP_BLE_MESH_MODEL_EVT_MAX**

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- *ESP-BLE-MESH Stack Initialization*
- *Reading of Local Data Information*
- *Low Power Operation (Updating)*
- *Send/Publish Messages, add Local AppKey, etc.*
- *ESP-BLE-MESH Node/Provisioner Provisioning*
- *ESP-BLE-MESH GATT Proxy Server*

ESP-BLE-MESH Stack Initialization

Header File

- [components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h](#)

Functions

esp_err_t **esp_ble_mesh_init** (*esp_ble_mesh_prov_t* *prov, *esp_ble_mesh_comp_t* *comp)

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

备注: After calling this API, the device needs to call `esp_ble_mesh_prov_enable()` to enable provisioning functionality again.

参数

- **prov** –[in] Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- **comp** –[in] Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_deinit** (*esp_ble_mesh_deinit_param_t* *param)

De-initialize BLE Mesh module.

备注: This function shall be invoked after `esp_ble_mesh_client_model_deinit()`.

参数 **param** –[in] Pointer to the structure of BLE Mesh deinit parameters.

返回 ESP_OK on success or error code otherwise.

Reading of Local Data Information

Header File

- [components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h](#)

Functions

`int32_t esp_ble_mesh_get_model_publish_period(esp_ble_mesh_model_t *model)`

Get the model publish period, the unit is ms.

参数 `model` –[in] Model instance pointer.

返回 Publish period value on success, 0 or (negative) error code from `errno.h` on failure.

`uint16_t esp_ble_mesh_get_primary_element_address(void)`

Get the address of the primary element.

返回 Address of the primary element on success, or `ESP_BLE_MESH_ADDR_UNASSIGNED` on failure which means the device has not been provisioned.

`uint16_t *esp_ble_mesh_is_model_subscribed_to_group(esp_ble_mesh_model_t *model, uint16_t group_addr)`

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

参数

- `model` –[in] Pointer to the model.
- `group_addr` –[in] Group address.

返回 Pointer to the group address within the Subscription List of the model on success, or `NULL` on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to `0x0000` in order to unsubscribe the model from the group.

`esp_ble_mesh_elem_t *esp_ble_mesh_find_element(uint16_t element_addr)`

Find the BLE Mesh element pointer via the element address.

参数 `element_addr` –[in] Element address.

返回 Pointer to the element on success, or `NULL` on failure.

`uint8_t esp_ble_mesh_get_element_count(void)`

Get the number of elements that have been registered.

返回 Number of elements.

`esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model(const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)`

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

参数

- `element` –[in] Element to which the model belongs.
- `company_id` –[in] A 16-bit company identifier assigned by the Bluetooth SIG.
- `model_id` –[in] A 16-bit vendor-assigned model identifier.

返回 Pointer to the Vendor Model on success, or `NULL` on failure which means the Vendor Model is not found.

`esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model(const esp_ble_mesh_elem_t *element, uint16_t model_id)`

Find the SIG model with the given element and Model id.

参数

- `element` –[in] Element to which the model belongs.
- `model_id` –[in] SIG model identifier.

返回 Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

const *esp_ble_mesh_comp_t* ***esp_ble_mesh_get_composition_data** (void)

Get the Composition data which has been registered.

返回 Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

esp_err_t **esp_ble_mesh_model_subscribe_group_addr** (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner subscribes a group address.

备注: This function shall not be invoked before node is provisioned or Provisioner is enabled.

参数

- **element_addr** –[in] Unicast address of the element to which the model belongs.
- **company_id** –[in] A 16-bit company identifier.
- **model_id** –[in] A 16-bit model identifier.
- **group_addr** –[in] The group address to be subscribed.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_model_unsubscribe_group_addr** (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner unsubscribes a group address.

备注: This function shall not be invoked before node is provisioned or Provisioner is enabled.

参数

- **element_addr** –[in] Unicast address of the element to which the model belongs.
- **company_id** –[in] A 16-bit company identifier.
- **model_id** –[in] A 16-bit model identifier.
- **group_addr** –[in] The subscribed group address.

返回 ESP_OK on success or error code otherwise.

const uint8_t ***esp_ble_mesh_node_get_local_net_key** (uint16_t net_idx)

This function is called by Node to get the local NetKey.

参数 **net_idx** –[in] NetKey index.

返回 NetKey on success, or NULL on failure.

const uint8_t ***esp_ble_mesh_node_get_local_app_key** (uint16_t app_idx)

This function is called by Node to get the local AppKey.

参数 **app_idx** –[in] AppKey index.

返回 AppKey on success, or NULL on failure.

esp_err_t **esp_ble_mesh_node_add_local_net_key** (const uint8_t net_key[16], uint16_t net_idx)

This function is called by Node to add a local NetKey.

备注: This function can only be called after the device is provisioned.

参数

- **net_key** –[in] NetKey to be added.

- **net_idx** –[in] NetKey Index.
- 返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_add_local_app_key** (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called by Node to add a local AppKey.

备注: The net_idx must be an existing one. This function can only be called after the device is provisioned.

参数

- **app_key** –[in] AppKey to be added.
 - **net_idx** –[in] NetKey Index.
 - **app_idx** –[in] AppKey Index.
- 返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_bind_app_key_to_local_model** (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)

This function is called by Node to bind AppKey to model locally.

备注: If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

参数

- **element_addr** –[in] Node local element address
 - **company_id** –[in] Node local company id
 - **model_id** –[in] Node local model id
 - **app_idx** –[in] Node local appkey index
- 返回 ESP_OK on success or error code otherwise.

Low Power Operation (Updating)

Header File

- [components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h](#)

Functions

esp_err_t **esp_ble_mesh_lpn_enable** (void)
Enable BLE Mesh device LPN functionality.

备注: This API enables LPN functionality. Once called, the proper Friend Request will be sent.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_lpn_disable** (bool force)
Disable BLE Mesh device LPN functionality.

参数 force –[in] when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_lpn_poll** (void)

LPN tries to poll messages from the Friend Node.

备注: The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

返回 ESP_OK on success or error code otherwise.

Send/Publish Messages, add Local AppKey, etc.

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

Functions

esp_err_t **esp_ble_mesh_register_custom_model_callback** (*esp_ble_mesh_model_cb_t* callback)

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call `esp_ble_mesh_server/client_model_send`, this callback notifies the application layer of the `send_complete` event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

备注: The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, `esp_ble_mesh_register_config_client_callback` is the register function for Config Client Model.

参数 **callback** **–[in]** Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_model_msg_opcode_init** (uint8_t *data, uint32_t opcode)

Add the message opcode to the beginning of the model message before sending or publishing the model message.

备注: This API is only used to set the opcode of the message.

参数

- **data** **–[in]** Pointer to the message data.
- **opcode** **–[in]** The message opcode.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_client_model_init** (*esp_ble_mesh_model_t* *model)

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the `op_pair_size` and `op_pair` variables within the `user_data` (defined using `esp_ble_mesh_client_t`) of the client model need to be initialized.

参数 `model` –[in] BLE Mesh Client model to which the message belongs.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_client_model_deinit** (*esp_ble_mesh_model_t* *model)

De-initialize the user-defined client model.

备注: This function shall be invoked before `esp_ble_mesh_deinit()` is called.

参数 `model` –[in] Pointer of the Client model.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_server_model_send_msg** (*esp_ble_mesh_model_t* *model,
esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode,
uint16_t length, uint8_t *data)

Send server model messages (such as server model status messages).

参数

- `model` –[in] BLE Mesh Server Model to which the message belongs.
- `ctx` –[in] Message context, includes keys, TTL, etc.
- `opcode` –[in] Message opcode.
- `length` –[in] Message length (exclude the message opcode).
- `data` –[in] Parameters of Access Payload (exclude the message opcode) to be sent.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_client_model_send_msg** (*esp_ble_mesh_model_t* *model,
esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode,
uint16_t length, uint8_t *data, int32_t
msg_timeout, bool need_rsp,
esp_ble_mesh_dev_role_t device_role)

Send client model message (such as model get, set, etc).

参数

- `model` –[in] BLE Mesh Client Model to which the message belongs.
- `ctx` –[in] Message context, includes keys, TTL, etc.
- `opcode` –[in] Message opcode.
- `length` –[in] Message length (exclude the message opcode).
- `data` –[in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- `msg_timeout` –[in] Time to get response to the message (in milliseconds).
- `need_rsp` –[in] TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- `device_role` –[in] Role of the device (Node/Provisioner) that sends the message.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_model_publish** (*esp_ble_mesh_model_t* *model, uint32_t opcode, uint16_t
length, uint8_t *data, *esp_ble_mesh_dev_role_t* device_role)

Send a model publication message.

备注: Before calling this function, the user needs to ensure that the model publication message (*esp_ble_mesh_model_pub_t::msg*) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in `ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT` with the message updated.

参数

- **model** –[in] Mesh (client) Model publishing the message.
- **opcode** –[in] Message opcode.
- **length** –[in] Message length (exclude the message opcode).
- **data** –[in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **device_role** –[in] Role of the device (node/provisioner) publishing the message of the type `esp_ble_mesh_dev_role_t`.

返回 ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_server_model_update_state` (`esp_ble_mesh_model_t *model`,
`esp_ble_mesh_server_state_type_t type`,
`esp_ble_mesh_server_state_value_t *value`)

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

备注: Currently this API is used to update bound state value, not for all server model states.

参数

- **model** –[in] Server model which is going to update the state.
- **type** –[in] Server model state type.
- **value** –[in] Server model state value.

返回 ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_node_local_reset` (void)

Reset the provisioning procedure of the local BLE Mesh node.

备注: All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function `esp_ble_mesh_node_prov_enable()` needs to be called to start a new provisioning procedure.

返回 ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_set_node_name` (uint16_t index, const char *name)

This function is called to set the node (provisioned device) name.

备注: index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

参数

- **index** –[in] Index of the node in the node queue.
- **name** –[in] Name (end by ‘\0’) to be set for the node.

返回 ESP_OK on success or error code otherwise.

const char *`esp_ble_mesh_provisioner_get_node_name` (uint16_t index)

This function is called to get the node (provisioned device) name.

备注: index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

参数 **index** –[in] Index of the node in the node queue.

返回 Node name on success, or NULL on failure.

`uint16_t esp_ble_mesh_provisioner_get_node_index` (const char *name)

This function is called to get the node (provisioned device) index.

参数 `name` –[in] Name of the node (end by ‘\0’).

返回 Node index on success, or an invalid value (0xFFFF) on failure.

`esp_err_t esp_ble_mesh_provisioner_store_node_comp_data` (uint16_t unicast_addr, uint8_t *data, uint16_t length)

This function is called to store the Composition Data of the node.

参数

- **unicast_addr** –[in] Element address of the node
- **data** –[in] Pointer of Composition Data
- **length** –[in] Length of Composition Data

返回 ESP_OK on success or error code otherwise.

`esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid` (const uint8_t uuid[16])

This function is called to get the provisioned node information with the node device uuid.

参数 `uuid` –[in] Device UUID of the node

返回 Pointer of the node info struct or NULL on failure.

`esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr` (uint16_t unicast_addr)

This function is called to get the provisioned node information with the node unicast address.

参数 `unicast_addr` –[in] Unicast address of the node

返回 Pointer of the node info struct or NULL on failure.

`esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name` (const char *name)

This function is called to get the provisioned node information with the node name.

参数 `name` –[in] Name of the node (end by ‘\0’).

返回 Pointer of the node info struct or NULL on failure.

`uint16_t esp_ble_mesh_provisioner_get_prov_node_count` (void)

This function is called by Provisioner to get provisioned node count.

返回 Number of the provisioned nodes.

`const esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry` (void)

This function is called by Provisioner to get the entry of the node table.

备注: After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro `CONFIG_BLE_MESH_MAX_PROV_NODES` to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the `*(esp_ble_mesh_node_t **node)` is NULL. For example: ““ const `esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry();` for (int i = 0; i < `CONFIG_BLE_MESH_MAX_PROV_NODES;` i++) { const `esp_ble_mesh_node_t *node = entry[i];` if (node) { …… } } ““

返回 Pointer to the start of the node table.

`esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid` (const uint8_t uuid[16])

This function is called to delete the provisioned node information with the node device uuid.

参数 `uuid` –[in] Device UUID of the node

返回 ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr` (uint16_t unicast_addr)

This function is called to delete the provisioned node information with the node unicast address.

参数 `unicast_addr` –[in] Unicast address of the node

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_add_local_app_key** (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called to add a local AppKey for Provisioner.

备注: app_key: If set to NULL, app_key will be generated internally. net_idx: Should be an existing one. app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

参数

- **app_key** –[in] The app key to be set for the local BLE Mesh stack.
- **net_idx** –[in] The network key index.
- **app_idx** –[in] The app key index.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_update_local_app_key** (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is used to update a local AppKey for Provisioner.

参数

- **app_key** –[in] Value of the AppKey.
- **net_idx** –[in] Corresponding NetKey Index.
- **app_idx** –[in] The AppKey Index

返回 ESP_OK on success or error code otherwise.

const uint8_t ***esp_ble_mesh_provisioner_get_local_app_key** (uint16_t net_idx, uint16_t app_idx)

This function is called by Provisioner to get the local app key value.

参数

- **net_idx** –[in] Network key index.
- **app_idx** –[in] Application key index.

返回 App key on success, or NULL on failure.

esp_err_t **esp_ble_mesh_provisioner_bind_app_key_to_local_model** (uint16_t element_addr, uint16_t app_idx, uint16_t model_id, uint16_t company_id)

This function is called by Provisioner to bind own model with proper app key.

备注: company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

参数

- **element_addr** –[in] Provisioner local element address
- **app_idx** –[in] Provisioner local appkey index
- **model_id** –[in] Provisioner local model id
- **company_id** –[in] Provisioner local company id

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_add_local_net_key** (const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to add local network key.

备注: `net_key`: If set to NULL, `net_key` will be generated internally. `net_idx`: If it is going to be generated internally, it should be set to 0xFFFF, and the new `net_idx` will be reported via an event.

参数

- `net_key` –[in] The network key to be added to the Provisioner local BLE Mesh stack.
- `net_idx` –[in] The network key index.

返回 ESP_OK on success or error code otherwise.

esp_err_t `esp_ble_mesh_provisioner_update_local_net_key` (const uint8_t net_key[16],
uint16_t net_idx)

This function is called by Provisioner to update a local network key.

参数

- `net_key` –[in] Value of the NetKey.
- `net_idx` –[in] The NetKey Index.

返回 ESP_OK on success or error code otherwise.

const uint8_t *`esp_ble_mesh_provisioner_get_local_net_key` (uint16_t net_idx)

This function is called by Provisioner to get the local network key value.

参数 `net_idx` –[in] Network key index.

返回 Network key on success, or NULL on failure.

esp_err_t `esp_ble_mesh_provisioner_recv_heartbeat` (bool enable)

This function is called by Provisioner to enable or disable receiving heartbeat messages.

备注: If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

参数 `enable` –[in] Enable or disable receiving heartbeat messages.

返回 ESP_OK on success or error code otherwise.

esp_err_t `esp_ble_mesh_provisioner_set_heartbeat_filter_type` (uint8_t type)

This function is called by Provisioner to set the heartbeat filter type.

备注: 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

- If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.
-

参数 `type` –[in] Heartbeat filter type (acceptlist or rejectlist).

返回 ESP_OK on success or error code otherwise.

esp_err_t `esp_ble_mesh_provisioner_set_heartbeat_filter_info` (uint8_t op,
esp_ble_mesh_heartbeat_filter_info_t *info)

This function is called by Provisioner to add or remove a heartbeat filter entry.

- If the operation is “REMOVE” , the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
 - The filter entry with the same SRC or DST will be removed.

备注: 1. If the operation is “ADD”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.

- If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
 - If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
 - If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.
-

参数

- **op** **–[in]** Add or REMOVE
- **info** **–[in]** Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_direct_erase_settings** (void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

备注: This function can be invoked when the mesh stack is not initialized or has been de-initialized.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_open_settings_with_index** (uint8_t index)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

备注: Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

参数 **index** **–[in]** Settings index.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_open_settings_with_uid** (const char *uid)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

备注: Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

参数 **uid** **–[in]** Settings user id.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_close_settings_with_index** (uint8_t index, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

备注: 1. Before closing the nvs namespace, it must be open.

- a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
-

- b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
 - c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g)
-

参数

- **index** –[in] Settings index.
- **erase** –[in] Indicate if erasing mesh information.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_close_settings_with_uid** (const char *uid, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

备注: 1. Before closing the nvs namespace, it must be open.

- a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
 - b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
 - c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g)
-

参数

- **uid** –[in] Settings user id.
- **erase** –[in] Indicate if erasing mesh information.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_settings_with_index** (uint8_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

备注: When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

参数 **index** –[in] Settings index.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_settings_with_uid** (const char *uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

备注: When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

参数 **uid** –[in] Settings user id.

返回 ESP_OK on success or error code otherwise.

const char ***esp_ble_mesh_provisioner_get_settings_uid** (uint8_t index)

This function is called by Provisioner to get settings user id.

参数 **index** –[in] Settings index.

返回 Setting user id on success or NULL on failure.

uint8_t **esp_ble_mesh_provisioner_get_settings_index** (const char *uid)

This function is called by Provisioner to get settings index.

参数 **uid** –[in] Settings user id.

返回 Settings index.

uint8_t **esp_ble_mesh_provisioner_get_free_settings_count** (void)

This function is called by Provisioner to get the number of free settings user id.

返回 Number of free settings user id.

const uint8_t ***esp_ble_mesh_get_fast_prov_app_key** (uint16_t net_idx, uint16_t app_idx)

This function is called to get fast provisioning application key.

参数

• **net_idx** –[in] Network key index.

• **app_idx** –[in] Application key index.

返回 Application key on success, or NULL on failure.

Type Definitions

```
typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event,  
esp_ble_mesh_model_cb_param_t *param)
```

: event, event code of user-defined model events; param, parameters of user-defined model events

ESP-BLE-MESH Node/Provisioner Provisioning

Header File

- [components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h](#)

Functions

esp_err_t **esp_ble_mesh_register_prov_callback** (*esp_ble_mesh_prov_cb_t* callback)

Register BLE Mesh provisioning callback.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

bool **esp_ble_mesh_node_is_provisioned** (void)

Check if a device has been provisioned.

返回 TRUE if the device is provisioned, FALSE if the device is unprovisioned.

esp_err_t **esp_ble_mesh_node_prov_enable** (*esp_ble_mesh_prov_bearer_t* bearers)

Enable specific provisioning bearers to get the device ready for provisioning.

备注: PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

参数 **bearers** –Bit-wise OR of provisioning bearers.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_prov_disable** (*esp_ble_mesh_prov_bearer_t* bearers)

Disable specific provisioning bearers to make a device inaccessible for provisioning.

参数 **bearers** –Bit-wise OR of provisioning bearers.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_set_oob_pub_key** (uint8_t pub_key_x[32], uint8_t pub_key_y[32],
uint8_t private_key[32])

Unprovisioned device set own oob public key & private key pair.

备注: In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

参数

- **pub_key_x** –[in] Unprovisioned device' s Public Key X
- **pub_key_y** –[in] Unprovisioned device' s Public Key Y
- **private_key** –[in] Unprovisioned device' s Private Key

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_input_number** (uint32_t number)

Provide provisioning input OOB number.

备注: This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

参数 **number** –[in] Number input by device.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_input_string** (const char *string)

Provide provisioning input OOB string.

备注: This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

参数 **string** –[in] String input by device.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_set_unprovisioned_device_name** (const char *name)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

备注: This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn't apply to PB-ADV mode.

参数 **name** –[in] Unprovisioned device name

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_read_oob_pub_key** (uint8_t link_idx, uint8_t pub_key_x[32],
uint8_t pub_key_y[32])

Provisioner inputs unprovisioned device's oob public key.

备注: In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

参数

- **link_idx** –[in] The provisioning link index
- **pub_key_x** –[in] Unprovisioned device's Public Key X
- **pub_key_y** –[in] Unprovisioned device's Public Key Y

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_input_string** (const char *string, uint8_t link_idx)

Provide provisioning input OOB string.

This is intended to be called after the *esp_ble_mesh_prov_t* prov_input_num callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

参数

- **string** –[in] String input by Provisioner.
- **link_idx** –[in] The provisioning link index.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_input_number** (uint32_t number, uint8_t link_idx)

Provide provisioning input OOB number.

This is intended to be called after the *esp_ble_mesh_prov_t* prov_input_num callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.

参数

- **number** –[in] Number input by Provisioner.
- **link_idx** –[in] The provisioning link index.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_prov_enable** (*esp_ble_mesh_prov_bearer_t* bearers)

Enable one or more provisioning bearers.

备注: PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

参数 **bearers** –[in] Bit-wise OR of provisioning bearers.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_prov_disable** (*esp_ble_mesh_prov_bearer_t* bearers)

Disable one or more provisioning bearers.

备注: PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

参数 **bearers** –[in] Bit-wise OR of provisioning bearers.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_add_unprov_dev** (*esp_ble_mesh_unprov_dev_add_t*
*add_dev, *esp_ble_mesh_dev_add_flag_t*
flags)

Add unprovisioned device info to the `unprov_dev` queue.

备注: : 1. Currently address type only supports public address and static random address.

- a. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
 - b. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device's advertising packets, it will start provisioning the device internally.
 - In this situation, the Provisioner can set bearers with each one or both of `ESP_BLE_MESH_PROV_ADV` and `ESP_BLE_MESH_PROV_GATT` enabled, and cannot set flags with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
 - c. Another example is when the Provisioner receives the unprovisioned device's beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function `esp_ble_mesh_register_prov_callback`. And in the callback, the Provisioner can call this API to start provisioning the device.
 - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with `ESP_BLE_MESH_PROV_ADV` enabled and the flags shall be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
 - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with `ESP_BLE_MESH_PROV_GATT` enabled, and the flags shall be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
 - If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of `ESP_BLE_MESH_PROV_ADV` and `ESP_BLE_MESH_PROV_GATT` enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
 - Note: `ESP_BLE_MESH_PROV_ADV`, `ESP_BLE_MESH_PROV_GATT` and `ADD_DEV_START_PROV_NOW_FLAG` can not be enabled at the same time.
-

参数

- **add_dev** – [in] Pointer to a struct containing the device information
- **flags** – [in] Flags indicate several operations on the device information
 - Remove device information from queue after device has been provisioned (BIT0)
 - Start provisioning immediately after device is added to queue (BIT1)
 - Device can be removed if device queue is full (BIT2)

返回 `ESP_OK` on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr` (`const uint8_t uuid[16]`,
`esp_ble_mesh_bd_addr_t addr`,
`esp_ble_mesh_addr_type_t addr_type`,
`esp_ble_mesh_prov_bearer_t bearer`, `uint16_t oob_info`,
`uint16_t unicast_addr`)

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

备注: : 1. Currently address type only supports public address and static random address.

- a. Bearer must be equal to `ESP_BLE_MESH_PROV_ADV` or `ESP_BLE_MESH_PROV_GATT`, since Provisioner will start to provision a device immediately once this function is in-

voked. And the input bearer must be identical with the one within the parameters of the `ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT` event.

- b. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
- c. Recommend to use only one of the functions “`esp_ble_mesh_provisioner_add_unprov_dev`” and “`esp_ble_mesh_provisioner_prov_device_with_addr`” by a Provisioner.

参数

- **uuid** –[in] Device UUID of the unprovisioned device
- **addr** –[in] Device address of the unprovisioned device
- **addr_type** –[in] Device address type of the unprovisioned device
- **bearer** –[in] Provisioning bearer going to be used by Provisioner
- **oob_info** –[in] OOB info of the unprovisioned device
- **unicast_addr** –[in] Unicast address going to be allocated for the unprovisioned device

返回 Zero on success or (negative) error code otherwise.

esp_err_t `esp_ble_mesh_provisioner_delete_dev` (*esp_ble_mesh_device_delete_t* *del_dev)

Delete device from queue, and reset current provisioning link with the device.

备注: If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

参数 **del_dev** –[in] Pointer to a struct containing the device information.

返回 ESP_OK on success or error code otherwise.

esp_err_t `esp_ble_mesh_provisioner_set_dev_uuid_match` (const uint8_t *match_val, uint8_t match_len, uint8_t offset, bool prov_after_match)

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

参数

- **match_val** –[in] Value to be compared with the part of the device UUID.
- **match_len** –[in] Length of the compared match value.
- **offset** –[in] Offset of the device UUID to be compared (based on zero).
- **prov_after_match** –[in] Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

返回 ESP_OK on success or error code otherwise.

esp_err_t `esp_ble_mesh_provisioner_set_prov_data_info` (*esp_ble_mesh_prov_data_info_t* *prov_data_info)

This function is called by Provisioner to set provisioning data information before starting to provision.

参数 **prov_data_info** –[in] Pointer to a struct containing net_idx or flags or iv_index.

返回 ESP_OK on success or error code otherwise.

esp_err_t `esp_ble_mesh_provisioner_set_static_oob_value` (const uint8_t *value, uint8_t length)

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

备注: The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

参数

- **value** –[in] Pointer to the static oob value.
- **length** –[in] Length of the static oob value.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_primary_elem_addr** (uint16_t addr)

This function is called by Provisioner to set own Primary element address.

备注: This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct *esp_ble_mesh_prov_t* will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

参数 **addr** –[in] Unicast address of the Primary element of Provisioner.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_set_fast_prov_info** (*esp_ble_mesh_fast_prov_info_t* *fast_prov_info)

This function is called to set provisioning data information before starting fast provisioning.

参数 **fast_prov_info** –[in] Pointer to a struct containing unicast address range, net_idx, etc.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_set_fast_prov_action** (*esp_ble_mesh_fast_prov_action_t* action)

This function is called to start/suspend/exit fast provisioning.

参数 **action** –[in] fast provisioning action (i.e. enter, suspend, exit).

返回 ESP_OK on success or error code otherwise.

Type Definitions

```
typedef void (*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event,
esp_ble_mesh_prov_cb_param_t *param)
```

: event, event code of provisioning events; param, parameters of provisioning events

```
typedef void (*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr, const
esp_ble_mesh_addr_type_t addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info,
esp_ble_mesh_prov_bearer_t bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

Param **addr** [in] Pointer to the unprovisioned device address.

Param **addr_type** [in] Unprovisioned device address type.

Param **adv_type** [in] Adv packet type(ADV_IND or ADV_NONCONN_IND).

Param **dev_uuid** [in] Unprovisioned device UUID pointer.

Param **oob_info** [in] OOB information of the unprovisioned device.

Param **bearer** [in] Adv packet received from PB-GATT or PB-ADV bearer.

ESP-BLE-MESH GATT Proxy Server

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h

Functions

esp_err_t **esp_ble_mesh_proxy_identity_enable** (void)

Enable advertising with Node Identity.

备注: This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_gatt_enable** (void)

Enable BLE Mesh GATT Proxy Service.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_gatt_disable** (void)

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_connect** (*esp_ble_mesh_bd_addr_t* addr,
esp_ble_mesh_addr_type_t addr_type, uint16_t
net_idx)

Proxy Client creates a connection with the Proxy Server.

参数

- **addr** –[in] Device address of the Proxy Server.
- **addr_type** –[in] Device address type(public or static random).
- **net_idx** –[in] NetKey Index related with Network ID in the Mesh Proxy advertising packet.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_disconnect** (uint8_t conn_handle)

Proxy Client terminates a connection with the Proxy Server.

参数 **conn_handle** –[in] Proxy connection handle.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_set_filter_type** (uint8_t conn_handle, uint16_t net_idx,
esp_ble_mesh_proxy_filter_type_t
filter_type)

Proxy Client sets the filter type of the Proxy Server.

参数

- **conn_handle** –[in] Proxy connection handle.
- **net_idx** –[in] Corresponding NetKey Index.
- **filter_type** –[in] whitelist or blacklist.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_add_filter_addr** (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)

Proxy Client adds address to the Proxy Server filter list.

参数

- **conn_handle** –[in] Proxy connection handle.
- **net_idx** –[in] Corresponding NetKey Index.
- **addr** –[in] Pointer to the filter address.
- **addr_num** –[in] Number of the filter address.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_remove_filter_addr** (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)

Proxy Client removes address from the Proxy Server filter list.

参数

- **conn_handle** –[in] Proxy connection handle.
- **net_idx** –[in] Corresponding NetKey Index.
- **addr** –[in] Pointer to the filter address.
- **addr_num** –[in] Number of the filter address.

返回 ESP_OK on success or error code otherwise.

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- *Configuration Client/Server Models*
- *Health Client/Server Models*
- *Generic Client/Server Models*
- *Sensor Client/Server Models*
- *Time and Scenes Client/Server Models*
- *Lighting Client/Server Models*

备注: Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

Functions

esp_err_t **esp_ble_mesh_register_config_client_callback** (*esp_ble_mesh_cfg_client_cb_t* callback)

Register BLE Mesh Config Client Model callback.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_config_server_callback** (*esp_ble_mesh_cfg_server_cb_t* callback)

Register BLE Mesh Config Server Model callback.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_config_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_cfg_client_get_state_t* *get_state)

Get the value of Config Server Model states using the Config Client Model get messages.

备注: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_opcode_config_client_get_t* in *esp_ble_mesh_defs.h*

参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_config_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_cfg_client_set_state_t* *set_state)

Set the value of the Configuration Server Model states using the Config Client Model set messages.

备注: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_opcode_config_client_set_t* in *esp_ble_mesh_defs.h*

参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

Unions

Parameters of Config Key Refresh Phase Get.

Public Members

uint16_t **net_idx**

The network key index

struct **esp_ble_mesh_cfg_lpn_polltimeout_get_t**

Parameters of Config Low Power Node PollTimeout Get.

Public Members

uint16_t **lpn_addr**

The unicast address of the Low Power node

struct **esp_ble_mesh_cfg_beacon_set_t**

Parameters of Config Beacon Set.

Public Members

uint8_t **beacon**

New Secure Network Beacon state

struct **esp_ble_mesh_cfg_default_ttl_set_t**

Parameters of Config Default TTL Set.

Public Members`uint8_t ttl`

The default TTL state value

struct `esp_ble_mesh_cfg_friend_set_t`

Parameters of Config Friend Set.

Public Members`uint8_t friend_state`

The friend state value

struct `esp_ble_mesh_cfg_gatt_proxy_set_t`

Parameters of Config GATT Proxy Set.

Public Members`uint8_t gatt_proxy`

The GATT Proxy state value

struct `esp_ble_mesh_cfg_relay_set_t`

Parameters of Config Relay Set.

Public Members`uint8_t relay`

The relay value

`uint8_t relay_retransmit`

The relay retransmit value

struct `esp_ble_mesh_cfg_net_key_add_t`

Parameters of Config NetKey Add.

Public Members`uint16_t net_idx`

The network key index

`uint8_t net_key[16]`

The network key value

struct `esp_ble_mesh_cfg_app_key_add_t`

Parameters of Config AppKey Add.

Public Members**uint16_t net_idx**

The network key index

uint16_t app_idx

The app key index

uint8_t app_key[16]

The app key value

struct **esp_ble_mesh_cfg_model_app_bind_t**

Parameters of Config Model App Bind.

Public Members**uint16_t element_addr**

The element address

uint16_t model_app_idx

Index of the app key to bind with the model

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_pub_set_t**

Parameters of Config Model Publication Set.

Public Members**uint16_t element_addr**

The element address

uint16_t publish_addr

Value of the publish address

uint16_t publish_app_idx

Index of the application key

bool cred_flag

Value of the Friendship Credential Flag

uint8_t publish_ttl

Default TTL value for the publishing messages

uint8_t **publish_period**

Period for periodic status publishing

uint8_t **publish_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_add_t**

Parameters of Config Model Subscription Add.

Public Members

uint16_t **element_addr**

The element address

uint16_t **sub_addr**

The address to be added to the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_delete_t**

Parameters of Config Model Subscription Delete.

Public Members

uint16_t **element_addr**

The element address

uint16_t **sub_addr**

The address to be removed from the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_overwrite_t**

Parameters of Config Model Subscription Overwrite.

Public Members**uint16_t element_addr**

The element address

uint16_t sub_addr

The address to be added to the Subscription List

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_va_add_t**

Parameters of Config Model Subscription Virtual Address Add.

Public Members**uint16_t element_addr**

The element address

uint8_t label_uuid[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_va_delete_t**

Parameters of Config Model Subscription Virtual Address Delete.

Public Members**uint16_t element_addr**

The element address

uint8_t label_uuid[16]

The Label UUID of the virtual address to be removed from the Subscription List

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_va_overwrite_t**

Parameters of Config Model Subscription Virtual Address Overwrite.

Public Members

uint16_t **element_addr**

The element address

uint8_t **label_uuid**[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_pub_va_set_t**

Parameters of Config Model Publication Virtual Address Set.

Public Members

uint16_t **element_addr**

The element address

uint8_t **label_uuid**[16]

Value of the Label UUID publish address

uint16_t **publish_app_idx**

Index of the application key

bool **cred_flag**

Value of the Friendship Credential Flag

uint8_t **publish_ttl**

Default TTL value for the publishing messages

uint8_t **publish_period**

Period for periodic status publishing

uint8_t **publish_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_delete_all_t**

Parameters of Config Model Subscription Delete All.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_net_key_update_t**

Parameters of Config NetKey Update.

Public Members

uint16_t **net_idx**

The network key index

uint8_t **net_key**[16]

The network key value

struct **esp_ble_mesh_cfg_net_key_delete_t**

Parameters of Config NetKey Delete.

Public Members

uint16_t **net_idx**

The network key index

struct **esp_ble_mesh_cfg_app_key_update_t**

Parameters of Config AppKey Update.

Public Members

uint16_t **net_idx**

The network key index

uint16_t **app_idx**

The app key index

uint8_t **app_key**[16]

The app key value

struct **esp_ble_mesh_cfg_app_key_delete_t**

Parameters of Config AppKey Delete.

Public Members

uint16_t **net_idx**

The network key index

uint16_t **app_idx**

The app key index

struct **esp_ble_mesh_cfg_node_identity_set_t**

Parameters of Config Node Identity Set.

Public Members

uint16_t **net_idx**

The network key index

uint8_t **identity**

New Node Identity state

struct **esp_ble_mesh_cfg_model_app_unbind_t**

Parameters of Config Model App Unbind.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_app_idx**

Index of the app key to bind with the model

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_kr_phase_set_t**

Parameters of Config Key Refresh Phase Set.

Public Members**uint16_t net_idx**

The network key index

uint8_t transition

New Key Refresh Phase Transition

struct **esp_ble_mesh_cfg_net_transmit_set_t**

Parameters of Config Network Transmit Set.

Public Members**uint8_t net_transmit**

Network Transmit State

struct **esp_ble_mesh_cfg_heartbeat_pub_set_t**

Parameters of Config Model Heartbeat Publication Set.

Public Members**uint16_t dst**

Destination address for Heartbeat messages

uint8_t count

Number of Heartbeat messages to be sent

uint8_t period

Period for sending Heartbeat messages

uint8_t ttl

TTL to be used when sending Heartbeat messages

uint16_t feature

Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx

NetKey Index

struct **esp_ble_mesh_cfg_heartbeat_sub_set_t**

Parameters of Config Model Heartbeat Subscription Set.

Public Members**uint16_t src**

Source address for Heartbeat messages

uint16_t **dst**

Destination address for Heartbeat messages

uint8_t **period**

Period for receiving Heartbeat messages

struct **esp_ble_mesh_cfg_beacon_status_cb_t**

Parameter of Config Beacon Status

Public Members

uint8_t **beacon**

Secure Network Beacon state value

struct **esp_ble_mesh_cfg_comp_data_status_cb_t**

Parameters of Config Composition Data Status

Public Members

uint8_t **page**

Page number of the Composition Data

struct net_buf_simple ***composition_data**

Pointer to Composition Data for the identified page

struct **esp_ble_mesh_cfg_default_ttl_status_cb_t**

Parameter of Config Default TTL Status

Public Members

uint8_t **default_ttl**

Default TTL state value

struct **esp_ble_mesh_cfg_gatt_proxy_status_cb_t**

Parameter of Config GATT Proxy Status

Public Members

uint8_t **gatt_proxy**

GATT Proxy state value

struct **esp_ble_mesh_cfg_relay_status_cb_t**

Parameters of Config Relay Status

Public Members**uint8_t relay**

Relay state value

uint8_t retransmit

Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)

struct **esp_ble_mesh_cfg_model_pub_status_cb_t**

Parameters of Config Model Publication Status

Public Members**uint8_t status**

Status Code for the request message

uint16_t element_addr

Address of the element

uint16_t publish_addr

Value of the publish address

uint16_t app_idx

Index of the application key

bool cred_flag

Value of the Friendship Credential Flag

uint8_t ttl

Default TTL value for the outgoing messages

uint8_t period

Period for periodic status publishing

uint8_t transmit

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id

Company ID

uint16_t model_id

Model ID

struct **esp_ble_mesh_cfg_model_sub_status_cb_t**

Parameters of Config Model Subscription Status

Public Members**uint8_t status**

Status Code for the request message

uint16_t element_addr

Address of the element

uint16_t sub_addr

Value of the address

uint16_t company_id

Company ID

uint16_t model_id

Model ID

struct **esp_ble_mesh_cfg_net_key_status_cb_t**

Parameters of Config NetKey Status

Public Members**uint8_t status**

Status Code for the request message

uint16_t net_idx

Index of the NetKey

struct **esp_ble_mesh_cfg_app_key_status_cb_t**

Parameters of Config AppKey Status

Public Members**uint8_t status**

Status Code for the request message

uint16_t net_idx

Index of the NetKey

uint16_t app_idx

Index of the application key

struct **esp_ble_mesh_cfg_mod_app_status_cb_t**

Parameters of Config Model App Status

Public Members**uint8_t status**

Status Code for the request message

uint16_t element_addr

Address of the element

uint16_t app_idx

Index of the application key

uint16_t company_id

Company ID

uint16_t model_id

Model ID

struct **esp_ble_mesh_cfg_friend_status_cb_t**

Parameter of Config Friend Status

Public Members**uint8_t friend_state**

Friend state value

struct **esp_ble_mesh_cfg_hb_pub_status_cb_t**

Parameters of Config Heartbeat Publication Status

Public Members**uint8_t status**

Status Code for the request message

uint16_t dst

Destination address for Heartbeat messages

uint8_t count

Number of Heartbeat messages remaining to be sent

uint8_t period

Period for sending Heartbeat messages

uint8_t ttl

TTL to be used when sending Heartbeat messages

uint16_t features

Features that trigger Heartbeat messages when changed

uint16_t **net_idx**

Index of the NetKey

struct **esp_ble_mesh_cfg_hb_sub_status_cb_t**

Parameters of Config Heartbeat Subscription Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **src**

Source address for Heartbeat messages

uint16_t **dst**

Destination address for Heartbeat messages

uint8_t **period**

Remaining Period for processing Heartbeat messages

uint8_t **count**

Number of Heartbeat messages received

uint8_t **min_hops**

Minimum hops when receiving Heartbeat messages

uint8_t **max_hops**

Maximum hops when receiving Heartbeat messages

struct **esp_ble_mesh_cfg_net_trans_status_cb_t**

Parameters of Config Network Transmit Status

Public Members

uint8_t **net_trans_count**

Number of transmissions for each Network PDU originating from the node

uint8_t **net_trans_step**

Maximum hops when receiving Heartbeat messages

struct **esp_ble_mesh_cfg_model_sub_list_cb_t**

Parameters of Config SIG/Vendor Subscription List

Public Members

`uint8_t status`

Status Code for the request message

`uint16_t element_addr`

Address of the element

`uint16_t company_id`

Company ID

`uint16_t model_id`

Model ID

`struct net_buf_simple *sub_addr`

A block of all addresses from the Subscription List

`struct esp_ble_mesh_cfg_net_key_list_cb_t`

Parameter of Config NetKey List

Public Members

`struct net_buf_simple *net_idx`

A list of NetKey Indexes known to the node

`struct esp_ble_mesh_cfg_app_key_list_cb_t`

Parameters of Config AppKey List

Public Members

`uint8_t status`

Status Code for the request message

`uint16_t net_idx`

NetKey Index of the NetKey that the AppKeys are bound to

`struct net_buf_simple *app_idx`

A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

`struct esp_ble_mesh_cfg_node_id_status_cb_t`

Parameters of Config Node Identity Status

Public Members

`uint8_t status`

Status Code for the request message

uint16_t **net_idx**

Index of the NetKey

uint8_t **identity**

Node Identity state

struct **esp_ble_mesh_cfg_model_app_list_cb_t**

Parameters of Config SIG/Vendor Model App List

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **element_addr**

Address of the element

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct net_buf_simple ***app_idx**

All AppKey indexes bound to the Model

struct **esp_ble_mesh_cfg_kr_phase_status_cb_t**

Parameters of Config Key Refresh Phase Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

Index of the NetKey

uint8_t **phase**

Key Refresh Phase state

struct **esp_ble_mesh_cfg_lpn_pollto_status_cb_t**

Parameters of Config Low Power Node PollTimeout Status

Public Members

uint16_t **lpn_addr**

The unicast address of the Low Power node

int32_t **poll_timeout**

The current value of the PollTimeout timer of the Low Power node

struct **esp_ble_mesh_cfg_client_cb_param_t**

Configuration Client Model callback parameters

Public Members

int **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters

esp_ble_mesh_cfg_client_common_cb_param_t **status_cb**

The config status message callback values

struct **esp_ble_mesh_state_change_cfg_mod_pub_set_t**

Configuration Server model related context.

Public Members

uint16_t **element_addr**

Element Address

uint16_t **pub_addr**

Publish Address

uint16_t **app_idx**

AppKey Index

bool **cred_flag**

Friendship Credential Flag

uint8_t **pub_ttl**

Publish TTL

uint8_t **pub_period**

Publish Period

uint8_t **pub_retransmit**

Publish Retransmit

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_state_change_cfg_model_sub_add_t**

Parameters of Config Model Subscription Add

Public Members

uint16_t **element_addr**

Element Address

uint16_t **sub_addr**

Subscription Address

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_state_change_cfg_model_sub_delete_t**

Parameters of Config Model Subscription Delete

Public Members

uint16_t **element_addr**

Element Address

uint16_t **sub_addr**

Subscription Address

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_state_change_cfg_netkey_add_t**

Parameters of Config NetKey Add

Public Members

uint16_t **net_idx**

NetKey Index

uint8_t **net_key**[16]

NetKey

struct **esp_ble_mesh_state_change_cfg_netkey_update_t**

Parameters of Config NetKey Update

Public Members

uint16_t **net_idx**

NetKey Index

uint8_t **net_key**[16]

NetKey

struct **esp_ble_mesh_state_change_cfg_netkey_delete_t**

Parameter of Config NetKey Delete

Public Members

uint16_t **net_idx**

NetKey Index

struct **esp_ble_mesh_state_change_cfg_appkey_add_t**

Parameters of Config AppKey Add

Public Members

uint16_t **net_idx**

NetKey Index

uint16_t **app_idx**

AppKey Index

uint8_t **app_key**[16]

AppKey

struct **esp_ble_mesh_state_change_cfg_appkey_update_t**

Parameters of Config AppKey Update

Public Members

uint16_t **net_idx**

NetKey Index

uint16_t **app_idx**

AppKey Index

uint8_t **app_key**[16]

AppKey

struct **esp_ble_mesh_state_change_cfg_appkey_delete_t**

Parameters of Config AppKey Delete

Public Members

uint16_t **net_idx**

NetKey Index

uint16_t **app_idx**

AppKey Index

struct **esp_ble_mesh_state_change_cfg_model_app_bind_t**

Parameters of Config Model App Bind

Public Members

uint16_t **element_addr**

Element Address

uint16_t **app_idx**

AppKey Index

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_state_change_cfg_model_app_unbind_t**

Parameters of Config Model App Unbind

Public Members

uint16_t **element_addr**

Element Address

uint16_t **app_idx**

AppKey Index

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_state_change_cfg_kr_phase_set_t**

Parameters of Config Key Refresh Phase Set

Public Members

uint16_t **net_idx**

NetKey Index

uint8_t **kr_phase**

New Key Refresh Phase Transition

struct **esp_ble_mesh_cfg_server_cb_param_t**

Configuration Server model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the server model structure

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received message

esp_ble_mesh_cfg_server_cb_value_t **value**

Value of the received configuration messages

Macros

ESP_BLE_MESH_MODEL_CFG_SRV (srv_data)

Define a new Config Server Model.

备注: The Config Server Model can only be included by a Primary Element.

参数

- **srv_data** –Pointer to a unique Config Server Model user_data.

返回 New Config Server Model instance.

ESP_BLE_MESH_MODEL_CFG_CLI (cli_data)

Define a new Config Client Model.

备注: The Config Client Model can only be included by a Primary Element.

参数

- **cli_data** –Pointer to a unique struct *esp_ble_mesh_client_t*.
- 返回 New Config Client Model instance.

Type Definitions

typedef struct *esp_ble_mesh_cfg_srv* **esp_ble_mesh_cfg_srv_t**

Configuration Server Model context

typedef void (***esp_ble_mesh_cfg_client_cb_t**)(*esp_ble_mesh_cfg_client_cb_event_t* event,
esp_ble_mesh_cfg_client_cb_param_t *param)

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

typedef void (***esp_ble_mesh_cfg_server_cb_t**)(*esp_ble_mesh_cfg_server_cb_event_t* event,
esp_ble_mesh_cfg_server_cb_param_t *param)

Configuration Server Model callback function type.

Param event Event type

Param param Pointer to callback parameter

Enumerations

enum **esp_ble_mesh_cfg_client_cb_event_t**

This enum value is the event of Configuration Client Model

Values:

enumerator **ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_CFG_CLIENT_EVT_MAX**

enum **esp_ble_mesh_cfg_server_cb_event_t**

This enum value is the event of Configuration Server model

Values:

enumerator **ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT**

enumerator **ESP_BLE_MESH_CFG_SERVER_EVT_MAX**

Health Client/Server Models

Header File

- [components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h](#)

Functions

esp_err_t **esp_ble_mesh_register_health_client_callback** (*esp_ble_mesh_health_client_cb_t* callback)

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_health_server_callback** (*esp_ble_mesh_health_server_cb_t* callback)

Register BLE Mesh Health Server Model callback.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_health_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_health_client_get_state_t* *get_state)

This function is called to get the Health Server states using the Health Client Model get messages.

备注: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_get_t` in `esp_ble_mesh_defs.h`

参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_health_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_health_client_set_state_t* *set_state)

This function is called to set the Health Server states using the Health Client Model set messages.

备注: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_set_t` in `esp_ble_mesh_defs.h`

参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_health_server_fault_update** (*esp_ble_mesh_elem_t* *element)

This function is called by the Health Server Model to update the context of its Health Current status.

参数 **element** –[in] The element to which the Health Server Model belongs.

返回 ESP_OK on success or error code otherwise.

Unions

union **esp_ble_mesh_health_client_get_state_t**

`#include <esp_ble_mesh_health_model_api.h>` For `ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET` `ESP_BLE_MESH_MODEL_OP_ATTENTION_GET` `ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET` the `get_state` parameter in the `esp_ble_mesh_health_client_get_state` function should not be set to NULL.

Public Members*esp_ble_mesh_health_fault_get_t* **fault_get**

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

union **esp_ble_mesh_health_client_set_state_t**

#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR
 ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST
 ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD
 ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK ESP_BLE_MESH_MODEL_OP_ATTENTION_SET
 ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK the set_state parameter in the
 esp_ble_mesh_health_client_set_state function should not be set to NULL.

Public Members*esp_ble_mesh_health_attention_set_t* **attention_set**

For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.

esp_ble_mesh_health_period_set_t **period_set**For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or

ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT

esp_ble_mesh_health_attention_on_cb_t **attention_on**

ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT

esp_ble_mesh_health_attention_off_cb_t **attention_off**

ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT

Structures

struct **esp_ble_mesh_health_srv_cb_t**

ESP BLE Mesh Health Server callback

Public Members

esp_ble_mesh_cb_t **fault_clear**

Clear health registered faults. Initialized by the stack.

esp_ble_mesh_cb_t **fault_test**

Run a specific health test. Initialized by the stack.

esp_ble_mesh_cb_t **attention_on**

Health attention on callback. Initialized by the stack.

esp_ble_mesh_cb_t **attention_off**

Health attention off callback. Initialized by the stack.

struct **esp_ble_mesh_health_test_t**

ESP BLE Mesh Health Server test Context

Public Members

uint8_t **id_count**

Number of Health self-test ID

const uint8_t ***test_ids**

Array of Health self-test IDs

uint16_t **company_id**
Company ID used to identify the Health Fault state

uint8_t **prev_test_id**
Current test ID of the health fault test

uint8_t **current_faults**[32]
Array of current faults

uint8_t **registered_faults**[32]
Array of registered faults

struct **esp_ble_mesh_health_srv_t**
ESP BLE Mesh Health Server Model Context

Public Members

esp_ble_mesh_model_t ***model**
Pointer to Health Server Model

esp_ble_mesh_health_srv_cb_t **health_cb**
Health callback struct

struct k_delayed_work **attention_timer**
Attention Timer state

bool **attention_timer_start**
Attention Timer start flag

esp_ble_mesh_health_test_t **health_test**
Health Server fault test

struct **esp_ble_mesh_health_fault_get_t**
Parameter of Health Fault Get

Public Members

uint16_t **company_id**
Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_attention_set_t**
Parameter of Health Attention Set

Public Members

uint8_t **attention**

Value of the Attention Timer state

struct **esp_ble_mesh_health_period_set_t**

Parameter of Health Period Set

Public Members

uint8_t **fast_period_divisor**

Divider for the Publish Period

struct **esp_ble_mesh_health_fault_test_t**

Parameter of Health Fault Test

Public Members

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

uint8_t **test_id**

ID of a specific test to be performed

struct **esp_ble_mesh_health_fault_clear_t**

Parameter of Health Fault Clear

Public Members

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_current_status_cb_t**

Parameters of Health Current Status

Public Members

uint8_t **test_id**

ID of a most recently performed test

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct net_buf_simple ***fault_array**

FaultArray field contains a sequence of 1-octet fault values

struct **esp_ble_mesh_health_fault_status_cb_t**

Parameters of Health Fault Status

Public Members**uint8_t test_id**

ID of a most recently performed test

uint16_t company_id

Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array

FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_period_status_cb_t

Parameter of Health Period Status

Public Members**uint8_t fast_period_divisor**

Divider for the Publish Period

struct esp_ble_mesh_health_attention_status_cb_t

Parameter of Health Attention Status

Public Members**uint8_t attention**

Value of the Attention Timer state

struct esp_ble_mesh_health_client_cb_param_t

Health Client Model callback parameters

Public Members**int error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t *params

The client common parameters.

esp_ble_mesh_health_client_common_cb_param_t status_cb

The health message status callback values

struct esp_ble_mesh_health_fault_update_comp_cb_t

Parameter of publishing Health Current Status completion event

Public Members**int error_code**

The result of publishing Health Current Status

esp_ble_mesh_elem_t ***element**

Pointer to the element which contains the Health Server Model

struct **esp_ble_mesh_health_fault_clear_cb_t**

Parameters of Health Fault Clear event

Public Members*esp_ble_mesh_model_t* ***model**

Pointer to the Health Server Model

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_fault_test_cb_t**

Parameters of Health Fault Test event

Public Members*esp_ble_mesh_model_t* ***model**

Pointer to the Health Server Model

uint8_t **test_id**

ID of a specific test to be performed

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_attention_on_cb_t**

Parameter of Health Attention On event

Public Members*esp_ble_mesh_model_t* ***model**

Pointer to the Health Server Model

uint8_t **time**

Duration of attention timer on (in seconds)

struct **esp_ble_mesh_health_attention_off_cb_t**

Parameter of Health Attention Off event

Public Members

esp_ble_mesh_model_t *model

Pointer to the Health Server Model

Macros

ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)

Define a new Health Server Model.

备注: The Health Server Model can only be included by a Primary Element.

参数

- **srv** –Pointer to the unique struct *esp_ble_mesh_health_srv_t*.
- **pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.

返回 New Health Server Model instance.

ESP_BLE_MESH_MODEL_HEALTH_CLI (cli_data)

Define a new Health Client Model.

备注: This API needs to be called for each element on which the application needs to have a Health Client Model.

参数

- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Health Client Model instance.

ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)

A helper to define a health publication context

参数

- **_name** –Name given to the publication context variable.
- **_max** –Maximum number of faults the element can have.
- **_role** –Role of the device which contains the model.

ESP_BLE_MESH_HEALTH_STANDARD_TEST

SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

ESP_BLE_MESH_NO_FAULT

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

```
typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event,  
esp_ble_mesh_health_client_cb_param_t *param)
```

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event,  
esp_ble_mesh_health_server_cb_param_t *param)
```

Health Server Model callback function type.

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_health_client_cb_event_t
```

This enum value is the event of Health Client Model

Values:

enumerator **ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX**

```
enum esp_ble_mesh_health_server_cb_event_t
```

This enum value is the event of Health Server Model

Values:

enumerator **ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT**

enumerator **ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT**

enumerator **ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT**

enumerator **ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT**

enumerator **ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT**

enumerator **ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX**

Generic Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

Functions

esp_err_t **esp_ble_mesh_register_generic_client_callback** (*esp_ble_mesh_generic_client_cb_t* callback)

Register BLE Mesh Generic Client Model callback.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_generic_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_generic_client_get_state_t* *get_state)

Get the value of Generic Server Model states using the Generic Client Model get messages.

备注: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_generic_message_opcode_t* in *esp_ble_mesh_defs.h*

参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to generic get message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_generic_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_generic_client_set_state_t* *set_state)

Set the value of Generic Server Model states using the Generic Client Model set messages.

备注: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_generic_message_opcode_t* in *esp_ble_mesh_defs.h*

参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to generic set message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_generic_server_callback** (*esp_ble_mesh_generic_server_cb_t* callback)

Register BLE Mesh Generic Server Model callback.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

Structures

struct **esp_ble_mesh_gen_onoff_set_t**

Bluetooth Mesh Generic Client Model Get and Set parameters structure.

Parameters of Generic OnOff Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint8_t **onoff**

Target value of Generic OnOff state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_level_set_t**

Parameters of Generic Level Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **level**

Target value of Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_delta_set_t**
Parameters of Generic Delta Set.

Public Members

bool **op_en**
Indicate if optional parameters are included

int32_t **level**
Delta change of Generic Level state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_move_set_t**
Parameters of Generic Move Set.

Public Members

bool **op_en**
Indicate if optional parameters are included

int16_t **delta_level**
Delta Level step to calculate Move speed for Generic Level state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_def_trans_time_set_t**
Parameter of Generic Default Transition Time Set.

Public Members**uint8_t trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_onpowerup_set_t**

Parameter of Generic OnPowerUp Set.

Public Members**uint8_t onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_level_set_t**

Parameters of Generic Power Level Set.

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t power

Target value of Generic Power Actual state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_power_default_set_t**

Parameter of Generic Power Default Set.

Public Members**uint16_t power**

The value of the Generic Power Default state

struct **esp_ble_mesh_gen_power_range_set_t**

Parameters of Generic Power Range Set.

Public Members

uint16_t **range_min**

Value of Range Min field of Generic Power Range state

uint16_t **range_max**

Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_gen_loc_global_set_t**

Parameters of Generic Location Global Set.

Public Members

int32_t **global_latitude**

Global Coordinates (Latitude)

int32_t **global_longitude**

Global Coordinates (Longitude)

int16_t **global_altitude**

Global Altitude

struct **esp_ble_mesh_gen_loc_local_set_t**

Parameters of Generic Location Local Set.

Public Members

int16_t **local_north**

Local Coordinates (North)

int16_t **local_east**

Local Coordinates (East)

int16_t **local_altitude**

Local Altitude

uint8_t **floor_number**

Floor Number

uint16_t **uncertainty**

Uncertainty

struct **esp_ble_mesh_gen_user_property_get_t**

Parameter of Generic User Property Get.

Public Members**uint16_t property_id**

Property ID identifying a Generic User Property

struct **esp_ble_mesh_gen_user_property_set_t**

Parameters of Generic User Property Set.

Public Members**uint16_t property_id**

Property ID identifying a Generic User Property

struct net_buf_simple ***property_value**

Raw value for the User Property

struct **esp_ble_mesh_gen_admin_property_get_t**

Parameter of Generic Admin Property Get.

Public Members**uint16_t property_id**

Property ID identifying a Generic Admin Property

struct **esp_ble_mesh_gen_admin_property_set_t**

Parameters of Generic Admin Property Set.

Public Members**uint16_t property_id**

Property ID identifying a Generic Admin Property

uint8_t user_access

Enumeration indicating user access

struct net_buf_simple ***property_value**

Raw value for the Admin Property

struct **esp_ble_mesh_gen_manufacturer_property_get_t**

Parameter of Generic Manufacturer Property Get.

Public Members**uint16_t property_id**

Property ID identifying a Generic Manufacturer Property

struct **esp_ble_mesh_gen_manufacturer_property_set_t**

Parameters of Generic Manufacturer Property Set.

Public Members

uint16_t **property_id**

Property ID identifying a Generic Manufacturer Property

uint8_t **user_access**

Enumeration indicating user access

struct **esp_ble_mesh_gen_client_properties_get_t**

Parameter of Generic Client Properties Get.

Public Members

uint16_t **property_id**

A starting Client Property ID present within an element

struct **esp_ble_mesh_gen_onoff_status_cb_t**

Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.

Parameters of Generic OnOff Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint8_t **present_onoff**

Current value of Generic OnOff state

uint8_t **target_onoff**

Target value of Generic OnOff state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_level_status_cb_t**

Parameters of Generic Level Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **present_level**

Current value of Generic Level state

int16_t **target_level**

Target value of the Generic Level state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_def_trans_time_status_cb_t**

Parameter of Generic Default Transition Time Status.

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_onpowerup_status_cb_t**

Parameter of Generic OnPowerUp Status.

Public Members

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_level_status_cb_t**

Parameters of Generic Power Level Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_power**

Current value of Generic Power Actual state

uint16_t **target_power**

Target value of Generic Power Actual state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_power_last_status_cb_t**

Parameter of Generic Power Last Status.

Public Members**uint16_t power**

The value of the Generic Power Last state

struct **esp_ble_mesh_gen_power_default_status_cb_t**

Parameter of Generic Power Default Status.

Public Members**uint16_t power**

The value of the Generic Default Last state

struct **esp_ble_mesh_gen_power_range_status_cb_t**

Parameters of Generic Power Range Status.

Public Members**uint8_t status_code**

Status Code for the request message

uint16_t range_min

Value of Range Min field of Generic Power Range state

uint16_t range_max

Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_gen_battery_status_cb_t**

Parameters of Generic Battery Status.

Public Members**uint32_t battery_level**

Value of Generic Battery Level state

uint32_t time_to_discharge

Value of Generic Battery Time to Discharge state

uint32_t time_to_charge

Value of Generic Battery Time to Charge state

uint32_t flags

Value of Generic Battery Flags state

struct **esp_ble_mesh_gen_loc_global_status_cb_t**

Parameters of Generic Location Global Status.

Public Members**int32_t global_latitude**

Global Coordinates (Latitude)

int32_t global_longitude

Global Coordinates (Longitude)

int16_t global_altitude

Global Altitude

struct **esp_ble_mesh_gen_loc_local_status_cb_t**

Parameters of Generic Location Local Status.

Public Members**int16_t local_north**

Local Coordinates (North)

int16_t local_east

Local Coordinates (East)

int16_t local_altitude

Local Altitude

uint8_t floor_number

Floor Number

uint16_t uncertainty

Uncertainty

struct **esp_ble_mesh_gen_user_properties_status_cb_t**

Parameter of Generic User Properties Status.

Public Membersstruct net_buf_simple ***property_ids**

Buffer contains a sequence of N User Property IDs

struct **esp_ble_mesh_gen_user_property_status_cb_t**

Parameters of Generic User Property Status.

Public Membersbool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID identifying a Generic User Property

uint8_t **user_access**

Enumeration indicating user access (optional)

struct net_buf_simple ***property_value**

Raw value for the User Property (C.1)

struct **esp_ble_mesh_gen_admin_properties_status_cb_t**

Parameter of Generic Admin Properties Status.

Public Members

struct net_buf_simple ***property_ids**

Buffer contains a sequence of N Admin Property IDs

struct **esp_ble_mesh_gen_admin_property_status_cb_t**

Parameters of Generic Admin Property Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID identifying a Generic Admin Property

uint8_t **user_access**

Enumeration indicating user access (optional)

struct net_buf_simple ***property_value**

Raw value for the Admin Property (C.1)

struct **esp_ble_mesh_gen_manufacturer_properties_status_cb_t**

Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple ***property_ids**

Buffer contains a sequence of N Manufacturer Property IDs

struct **esp_ble_mesh_gen_manufacturer_property_status_cb_t**

Parameters of Generic Manufacturer Property Status.

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t property_id

Property ID identifying a Generic Manufacturer Property

uint8_t user_access

Enumeration indicating user access (optional)

struct net_buf_simple *property_value

Raw value for the Manufacturer Property (C.1)

struct esp_ble_mesh_gen_client_properties_status_cb_t

Parameter of Generic Client Properties Status.

Public Members**struct net_buf_simple *property_ids**

Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_cb_param_t

Generic Client Model callback parameters

Public Members**int error_code**

Appropriate error code

***esp_ble_mesh_client_common_param_t* *params**

The client common parameters.

***esp_ble_mesh_gen_client_status_cb_t* status_cb**

The generic status message callback values

struct esp_ble_mesh_gen_onoff_state_t

Parameters of Generic OnOff state

Public Members**uint8_t onoff**

The present value of the Generic OnOff state

uint8_t target_onoff

The target value of the Generic OnOff state

struct **esp_ble_mesh_gen_onoff_srv_t**

User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t **state**

Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct **esp_ble_mesh_gen_level_state_t**

Parameters of Generic Level state

Public Members

int16_t **level**

The present value of the Generic Level state

int16_t **target_level**

The target value of the Generic Level state

int16_t **last_level**

When a new transaction starts, level should be set to last_level, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t **last_delta**

The last delta change of the Generic Level state

bool **move_start**

Indicate if the transition of the Generic Level state has been started

bool **positive**

Indicate if the transition is positive or negative

struct **esp_ble_mesh_gen_level_srv_t**

User data of Generic Level Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_level_state_t **state**

Parameters of the Generic Level state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_level**

Delta change value of level state transition

struct **esp_ble_mesh_gen_def_trans_time_state_t**

Parameter of Generic Default Transition Time state

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_def_trans_time_srv_t**

User data of Generic Default Transition Time Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_def_trans_time_state_t **state**

Parameters of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_onpowerup_state_t**

Parameter of Generic OnPowerUp state

Public Members**uint8_t onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_onoff_srv_t**

User data of Generic Power OnOff Server Model

Public Members*esp_ble_mesh_model_t* ***model**

Pointer to the Generic Power OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t ***state**

Parameters of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_onoff_setup_srv_t**

User data of Generic Power OnOff Setup Server Model

Public Members*esp_ble_mesh_model_t* ***model**

Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t ***state**

Parameters of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_level_state_t**

Parameters of Generic Power Level state

Public Members**uint16_t power_actual**

The present value of the Generic Power Actual state

uint16_t target_power_actual

The target value of the Generic Power Actual state

uint16_t power_last

The value of the Generic Power Last state

uint16_t **power_default**

The value of the Generic Power Default state

uint8_t **status_code**

The status code of setting Generic Power Range state

uint16_t **power_range_min**

The minimum value of the Generic Power Range state

uint16_t **power_range_max**

The maximum value of the Generic Power Range state

struct **esp_ble_mesh_gen_power_level_srv_t**

User data of Generic Power Level Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t ***state**

Parameters of the Generic Power Level state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_level**

Delta change value of level state transition

struct **esp_ble_mesh_gen_power_level_setup_srv_t**

User data of Generic Power Level Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power Level Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state

Parameters of the Generic Power Level state

struct **esp_ble_mesh_gen_battery_state_t**

Parameters of Generic Battery state

Public Members

uint32_t **battery_level**

The value of the Generic Battery Level state

uint32_t **time_to_discharge**

The value of the Generic Battery Time to Discharge state

uint32_t **time_to_charge**

The value of the Generic Battery Time to Charge state

uint32_t **battery_flags**

The value of the Generic Battery Flags state

struct **esp_ble_mesh_gen_battery_srv_t**

User data of Generic Battery Server Model

Public Members

esp_ble_mesh_model_t *model

Pointer to the Generic Battery Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_battery_state_t **state**

Parameters of the Generic Battery state

struct **esp_ble_mesh_gen_location_state_t**

Parameters of Generic Location state

Public Members

int32_t **global_latitude**

The value of the Global Latitude field

int32_t **global_longitude**

The value of the Global Longitude field

`int16_t global_altitude`

The value of the Global Altitude field

`int16_t local_north`

The value of the Local North field

`int16_t local_east`

The value of the Local East field

`int16_t local_altitude`

The value of the Local Altitude field

`uint8_t floor_number`

The value of the Floor Number field

`uint16_t uncertainty`

The value of the Uncertainty field

struct `esp_ble_mesh_gen_location_srv_t`

User data of Generic Location Server Model

Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Generic Location Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`

Parameters of the Generic Location state

struct `esp_ble_mesh_gen_location_setup_srv_t`

User data of Generic Location Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Generic Location Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`

Parameters of the Generic Location state

struct `esp_ble_mesh_generic_property_t`

Parameters of Generic Property states

Public Members**uint16_t id**

The value of User/Admin/Manufacturer Property ID

uint8_t user_access

The value of User Access field

uint8_t admin_access

The value of Admin Access field

uint8_t manu_access

The value of Manufacturer Access field

struct net_buf_simple *val

The value of User/Admin/Manufacturer Property

struct esp_ble_mesh_gen_user_prop_srv_t

User data of Generic User Property Server Model

Public Members*esp_ble_mesh_model_t* ***model**

Pointer to the Generic User Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t property_count

Generic User Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic User Property state

struct esp_ble_mesh_gen_admin_prop_srv_t

User data of Generic Admin Property Server Model

Public Members*esp_ble_mesh_model_t* ***model**

Pointer to the Generic Admin Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t property_count

Generic Admin Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic Admin Property state

struct **esp_ble_mesh_gen_manu_prop_srv_t**

User data of Generic Manufacturer Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic Manufacturer Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic Manufacturer Property state

struct **esp_ble_mesh_gen_client_prop_srv_t**

User data of Generic Client Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Client Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **id_count**

Generic Client Property ID count

uint16_t ***property_ids**

Parameters of the Generic Client Property state

struct **esp_ble_mesh_state_change_gen_onoff_set_t**

Parameter of Generic OnOff Set state change event

Public Members

uint8_t **onoff**

The value of Generic OnOff state

struct **esp_ble_mesh_state_change_gen_level_set_t**

Parameter of Generic Level Set state change event

Public Members**int16_t level**

The value of Generic Level state

struct **esp_ble_mesh_state_change_gen_delta_set_t**

Parameter of Generic Delta Set state change event

Public Members**int16_t level**

The value of Generic Level state

struct **esp_ble_mesh_state_change_gen_move_set_t**

Parameter of Generic Move Set state change event

Public Members**int16_t level**

The value of Generic Level state

struct **esp_ble_mesh_state_change_gen_def_trans_time_set_t**

Parameter of Generic Default Transition Time Set state change event

Public Members**uint8_t trans_time**

The value of Generic Default Transition Time state

struct **esp_ble_mesh_state_change_gen_onpowerup_set_t**

Parameter of Generic OnPowerUp Set state change event

Public Members**uint8_t onpowerup**

The value of Generic OnPowerUp state

struct **esp_ble_mesh_state_change_gen_power_level_set_t**

Parameter of Generic Power Level Set state change event

Public Members**uint16_t power**

The value of Generic Power Actual state

struct **esp_ble_mesh_state_change_gen_power_default_set_t**
Parameter of Generic Power Default Set state change event

Public Members

uint16_t **power**
The value of Generic Power Default state

struct **esp_ble_mesh_state_change_gen_power_range_set_t**
Parameters of Generic Power Range Set state change event

Public Members

uint16_t **range_min**
The minimum value of Generic Power Range state

uint16_t **range_max**
The maximum value of Generic Power Range state

struct **esp_ble_mesh_state_change_gen_loc_global_set_t**
Parameters of Generic Location Global Set state change event

Public Members

int32_t **latitude**
The Global Latitude value of Generic Location state

int32_t **longitude**
The Global Longitude value of Generic Location state

int16_t **altitude**
The Global Altitude value of Generic Location state

struct **esp_ble_mesh_state_change_gen_loc_local_set_t**
Parameters of Generic Location Local Set state change event

Public Members

int16_t **north**
The Local North value of Generic Location state

int16_t **east**
The Local East value of Generic Location state

int16_t **altitude**
The Local Altitude value of Generic Location state

uint8_t **floor_number**

The Floor Number value of Generic Location state

uint16_t **uncertainty**

The Uncertainty value of Generic Location state

struct **esp_ble_mesh_state_change_gen_user_property_set_t**

Parameters of Generic User Property Set state change event

Public Members

uint16_t **id**

The property id of Generic User Property state

struct net_buf_simple ***value**

The property value of Generic User Property state

struct **esp_ble_mesh_state_change_gen_admin_property_set_t**

Parameters of Generic Admin Property Set state change event

Public Members

uint16_t **id**

The property id of Generic Admin Property state

uint8_t **access**

The property access of Generic Admin Property state

struct net_buf_simple ***value**

The property value of Generic Admin Property state

struct **esp_ble_mesh_state_change_gen_manu_property_set_t**

Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t **id**

The property id of Generic Manufacturer Property state

uint8_t **access**

The property value of Generic Manufacturer Property state

struct **esp_ble_mesh_server_rcv_gen_user_property_get_t**

Context of the received Generic User Property Get message

Public Members**uint16_t property_id**

Property ID identifying a Generic User Property

struct **esp_ble_mesh_server_rcv_gen_admin_property_get_t**

Context of the received Generic Admin Property Get message

Public Members**uint16_t property_id**

Property ID identifying a Generic Admin Property

struct **esp_ble_mesh_server_rcv_gen_manufacturer_property_get_t**

Context of the received Generic Manufacturer Property message

Public Members**uint16_t property_id**

Property ID identifying a Generic Manufacturer Property

struct **esp_ble_mesh_server_rcv_gen_client_properties_get_t**

Context of the received Generic Client Properties Get message

Public Members**uint16_t property_id**

A starting Client Property ID present within an element

struct **esp_ble_mesh_server_rcv_gen_onoff_set_t**

Context of the received Generic OnOff Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint8_t onoff

Target value of Generic OnOff state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_gen_level_set_t`

Context of the received Generic Level Set message

Public Members

bool `op_en`

Indicate if optional parameters are included

int16_t `level`

Target value of Generic Level state

uint8_t `tid`

Transaction ID

uint8_t `trans_time`

Time to complete state transition (optional)

uint8_t `delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_gen_delta_set_t`

Context of the received Generic Delta Set message

Public Members

bool `op_en`

Indicate if optional parameters are included

int32_t `delta_level`

Delta change of Generic Level state

uint8_t `tid`

Transaction ID

uint8_t `trans_time`

Time to complete state transition (optional)

uint8_t `delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_gen_move_set_t`

Context of the received Generic Move Set message

Public Members**bool op_en**

Indicate if optional parameters are included

int16_t delta_level

Delta Level step to calculate Move speed for Generic Level state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_gen_def_trans_time_set_t**

Context of the received Generic Default Transition Time Set message

Public Members**uint8_t trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_server_rcv_gen_onpowerup_set_t**

Context of the received Generic OnPowerUp Set message

Public Members**uint8_t onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_server_rcv_gen_power_level_set_t**

Context of the received Generic Power Level Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t power

Target value of Generic Power Actual state

uint8_t tid

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_gen_power_default_set_t`

Context of the received Generic Power Default Set message

Public Members

`uint16_t power`

The value of the Generic Power Default state

struct `esp_ble_mesh_server_rcv_gen_power_range_set_t`

Context of the received Generic Power Range Set message

Public Members

`uint16_t range_min`

Value of Range Min field of Generic Power Range state

`uint16_t range_max`

Value of Range Max field of Generic Power Range state

struct `esp_ble_mesh_server_rcv_gen_loc_global_set_t`

Context of the received Generic Location Global Set message

Public Members

`int32_t global_latitude`

Global Coordinates (Latitude)

`int32_t global_longitude`

Global Coordinates (Longitude)

`int16_t global_altitude`

Global Altitude

struct `esp_ble_mesh_server_rcv_gen_loc_local_set_t`

Context of the received Generic Location Local Set message

Public Members

`int16_t local_north`

Local Coordinates (North)

`int16_t local_east`
Local Coordinates (East)

`int16_t local_altitude`
Local Altitude

`uint8_t floor_number`
Floor Number

`uint16_t uncertainty`
Uncertainty

struct `esp_ble_mesh_server_recv_gen_user_property_set_t`
Context of the received Generic User Property Set message

Public Members

`uint16_t property_id`
Property ID identifying a Generic User Property

struct net_buf_simple *`property_value`
Raw value for the User Property

struct `esp_ble_mesh_server_recv_gen_admin_property_set_t`
Context of the received Generic Admin Property Set message

Public Members

`uint16_t property_id`
Property ID identifying a Generic Admin Property

`uint8_t user_access`
Enumeration indicating user access

struct net_buf_simple *`property_value`
Raw value for the Admin Property

struct `esp_ble_mesh_server_recv_gen_manufacturer_property_set_t`
Context of the received Generic Manufacturer Property Set message

Public Members

`uint16_t property_id`
Property ID identifying a Generic Manufacturer Property

uint8_t **user_access**

Enumeration indicating user access

struct **esp_ble_mesh_generic_server_cb_param_t**

Generic Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Generic Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_generic_server_cb_value_t **value**

Value of the received Generic Messages

Macros

ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI (cli_pub, cli_data)

Define a new Generic OnOff Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Generic OnOff Client Model instance.

ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI (cli_pub, cli_data)

Define a new Generic Level Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Generic Level Client Model instance.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI (cli_pub, cli_data)

Define a new Generic Default Transition Time Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.

- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.
- 返回 New Generic Default Transition Time Client Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI (cli_pub, cli_data)

Define a new Generic Power OnOff Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
 - **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.
- 返回 New Generic Power OnOff Client Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI (cli_pub, cli_data)

Define a new Generic Power Level Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
 - **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.
- 返回 New Generic Power Level Client Model instance.

ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI (cli_pub, cli_data)

Define a new Generic Battery Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
 - **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.
- 返回 New Generic Battery Client Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI (cli_pub, cli_data)

Define a new Generic Location Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
 - **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.
- 返回 New Generic Location Client Model instance.

ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI (cli_pub, cli_data)

Define a new Generic Property Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Generic Location Client Model instance.

ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV (srv_pub, srv_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

备注: 1. The Generic OnOff Server Model is a root model.

- a. This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_onoff_srv_t*.

返回 New Generic OnOff Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV (srv_pub, srv_data)

Define a new Generic Level Server Model.

备注: 1. The Generic Level Server Model is a root model.

- a. This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_level_srv_t*.

返回 New Generic Level Server Model instance.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV (srv_pub, srv_data)

Define a new Generic Default Transition Time Server Model.

备注: 1. The Generic Default Transition Time Server Model is a root model.

- a. This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_def_trans_time_srv_t*.

返回 New Generic Default Transition Time Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (srv_pub, srv_data)

Define a new Generic Power OnOff Server Model.

备注: 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.

- a. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
- b. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_onoff_srv_t*.

返回 New Generic Power OnOff Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)

Define a new Generic Power OnOff Setup Server Model.

备注: 1. The Generic Power OnOff Setup Server model extends the Generic Power OnOff Server model and the Generic Default Transition Time Server model.

- a. This model shall support model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_onoff_setup_srv_t*.

返回 New Generic Power OnOff Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)

Define a new Generic Power Level Server Model.

备注: 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_level_srv_t*.

返回 New Generic Power Level Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)

Define a new Generic Power Level Setup Server Model.

备注: 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.

- a. This model shall support model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_level_setup_srv_t*.

返回 New Generic Power Level Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)

Define a new Generic Battery Server Model.

备注: 1. The Generic Battery Server Model is a root model.

- a. This model shall support model publication and model subscription.
 - b. The model may be used to represent an element that is powered by a battery.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_battery_srv_t*.

返回 New Generic Battery Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV (srv_pub, srv_data)

Define a new Generic Location Server Model.

备注: 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. The model may be used to represent an element that knows its location (global or local).
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_location_srv_t*.

返回 New Generic Location Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV (srv_pub, srv_data)

Define a new Generic Location Setup Server Model.

备注: 1. The Generic Location Setup Server model extends the Generic Location Server model.

- a. This model shall support model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_location_setup_srv_t*.

返回 New Generic Location Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)

Define a new Generic User Property Server Model.

备注: 1. The Generic User Property Server model is a root model.

- a. This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_user_prop_srv_t*.

返回 New Generic User Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)

Define a new Generic Admin Property Server Model.

备注: 1. The Generic Admin Property Server model extends the Generic User Property Server model.

- a. This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_admin_prop_srv_t*.

返回 New Generic Admin Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)

Define a new Generic Manufacturer Property Server Model.

备注: 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.

- This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_manu_prop_srv_t*.

返回 New Generic Manufacturer Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)

Define a new Generic User Property Server Model.

备注: 1. The Generic Client Property Server model is a root model.

- This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_client_prop_srv_t*.

返回 New Generic Client Property Server Model instance.

Type Definitions

```
typedef void (*esp_ble_mesh_generic_client_cb_t)(esp_ble_mesh_generic_client_cb_event_t event,
esp_ble_mesh_generic_client_cb_param_t *param)
```

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_generic_server_cb_t)(esp_ble_mesh_generic_server_cb_event_t event,
esp_ble_mesh_generic_server_cb_param_t *param)
```

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_generic_client_cb_event_t
```

This enum value is the event of Generic Client Model

Values:

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX**

enum **esp_ble_mesh_gen_user_prop_access_t**

This enum value is the access value of Generic User Property

Values:

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT**

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_READ**

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_WRITE**

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE**

enum **esp_ble_mesh_gen_admin_prop_access_t**

This enum value is the access value of Generic Admin Property

Values:

enumerator **ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE**

enum **esp_ble_mesh_gen_manu_prop_access_t**

This enum value is the access value of Generic Manufacturer Property

Values:

enumerator **ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP**

enumerator **ESP_BLE_MESH_GEN_MANU_ACCESS_READ**

enum **esp_ble_mesh_generic_server_cb_event_t**

This enum value is the event of Generic Server Model

Values:

enumerator **ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Generic Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Get messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX**

Sensor Client/Server Models

Header File

- [components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h](#)

Functions

esp_err_t **esp_ble_mesh_register_sensor_client_callback** (*esp_ble_mesh_sensor_client_cb_t* callback)

Register BLE Mesh Sensor Client Model callback.

参数 `callback` –[in] Pointer to the callback function.

返回 `ESP_OK` on success or error code otherwise.

esp_err_t **esp_ble_mesh_sensor_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_sensor_client_get_state_t* *get_state)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to sensor get message value. Shall not be set to NULL.

返回 `ESP_OK` on success or error code otherwise.

esp_err_t **esp_ble_mesh_sensor_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_sensor_client_set_state_t* *set_state)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to sensor set message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_sensor_server_callback** (*esp_ble_mesh_sensor_server_cb_t* callback)

Register BLE Mesh Sensor Server Model callback.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

Structures

struct **esp_ble_mesh_sensor_descriptor_get_t**

Bluetooth Mesh Sensor Client Model Get and Set parameters structure.

Parameters of Sensor Descriptor Get

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID of a sensor (optional)

struct **esp_ble_mesh_sensor_cadence_get_t**

Parameter of Sensor Cadence Get

Public Members

uint16_t **property_id**

Property ID of a sensor

struct **esp_ble_mesh_sensor_cadence_set_t**

Parameters of Sensor Cadence Set

Public Members

uint16_t **property_id**

Property ID for the sensor

uint8_t **fast_cadence_period_divisor**

Divisor for the publish period

uint8_t **status_trigger_type**

The unit and format of the Status Trigger Delta fields

struct net_buf_simple ***status_trigger_delta_down**

Delta down value that triggers a status message

struct net_buf_simple ***status_trigger_delta_up**

Delta up value that triggers a status message

uint8_t **status_min_interval**

Minimum interval between two consecutive Status messages

struct net_buf_simple ***fast_cadence_low**

Low value for the fast cadence range

struct net_buf_simple ***fast_cadence_high**

Fast value for the fast cadence range

struct **esp_ble_mesh_sensor_settings_get_t**

Parameter of Sensor Settings Get

Public Members

uint16_t **sensor_property_id**

Property ID of a sensor

struct **esp_ble_mesh_sensor_setting_get_t**

Parameters of Sensor Setting Get

Public Members

uint16_t **sensor_property_id**

Property ID of a sensor

uint16_t **sensor_setting_property_id**

Setting ID identifying a setting within a sensor

struct **esp_ble_mesh_sensor_setting_set_t**

Parameters of Sensor Setting Set

Public Members

uint16_t **sensor_property_id**

Property ID identifying a sensor

uint16_t **sensor_setting_property_id**

Setting ID identifying a setting within a sensor

struct net_buf_simple ***sensor_setting_raw**

Raw value for the setting

struct **esp_ble_mesh_sensor_get_t**

Parameters of Sensor Get

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID for the sensor (optional)

struct **esp_ble_mesh_sensor_column_get_t**

Parameters of Sensor Column Get

Public Members

uint16_t **property_id**

Property identifying a sensor

struct net_buf_simple ***raw_value_x**

Raw value identifying a column

struct **esp_ble_mesh_sensor_series_get_t**

Parameters of Sensor Series Get

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property identifying a sensor

struct net_buf_simple ***raw_value_x1**

Raw value identifying a starting column (optional)

struct net_buf_simple ***raw_value_x2**

Raw value identifying an ending column (C.1)

struct **esp_ble_mesh_sensor_descriptor_status_cb_t**

Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.

Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple ***descriptor**

Sequence of 8-octet sensor descriptors (optional)

struct **esp_ble_mesh_sensor_cadence_status_cb_t**

Parameters of Sensor Cadence Status

Public Members

uint16_t **property_id**

Property for the sensor

struct net_buf_simple ***sensor_cadence_value**

Value of sensor cadence state

struct **esp_ble_mesh_sensor_settings_status_cb_t**

Parameters of Sensor Settings Status

Public Members

uint16_t **sensor_property_id**

Property ID identifying a sensor

struct net_buf_simple ***sensor_setting_property_ids**

A sequence of N sensor setting property IDs (optional)

struct **esp_ble_mesh_sensor_setting_status_cb_t**

Parameters of Sensor Setting Status

Public Members

bool **op_en**

Indicate id optional parameters are included

uint16_t **sensor_property_id**

Property ID identifying a sensor

uint16_t **sensor_setting_property_id**

Setting ID identifying a setting within a sensor

uint8_t **sensor_setting_access**

Read/Write access rights for the setting (optional)

struct net_buf_simple ***sensor_setting_raw**

Raw value for the setting

struct **esp_ble_mesh_sensor_status_cb_t**

Parameter of Sensor Status

Public Members

struct net_buf_simple ***marshalled_sensor_data**

Value of sensor data state (optional)

struct **esp_ble_mesh_sensor_column_status_cb_t**

Parameters of Sensor Column Status

Public Members**uint16_t property_id**

Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_column_value

Left values of sensor column status

struct esp_ble_mesh_sensor_series_status_cb_t

Parameters of Sensor Series Status

Public Members**uint16_t property_id**

Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_series_value

Left values of sensor series status

struct esp_ble_mesh_sensor_client_cb_param_t

Sensor Client Model callback parameters

Public Members**int error_code**

0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

***esp_ble_mesh_client_common_param_t* *params**

The client common parameters.

***esp_ble_mesh_sensor_client_status_cb_t* status_cb**

The sensor status message callback values

struct esp_ble_mesh_sensor_descriptor_t

Parameters of Sensor Descriptor state

Public Members**uint32_t positive_tolerance**

The value of Sensor Positive Tolerance field

uint32_t negative_tolerance

The value of Sensor Negative Tolerance field

uint32_t sampling_function

The value of Sensor Sampling Function field

`uint8_t measure_period`

The value of Sensor Measurement Period field

`uint8_t update_interval`

The value of Sensor Update Interval field

struct `esp_ble_mesh_sensor_setting_t`

Parameters of Sensor Setting state

Public Members

`uint16_t property_id`

The value of Sensor Setting Property ID field

`uint8_t access`

The value of Sensor Setting Access field

struct net_buf_simple *`raw`

The value of Sensor Setting Raw field

struct `esp_ble_mesh_sensor_cadence_t`

Parameters of Sensor Cadence state

Public Members

`uint8_t period_divisor`

The value of Fast Cadence Period Divisor field

`uint8_t trigger_type`

The value of Status Trigger Type field

struct net_buf_simple *`trigger_delta_down`

Note: The parameter “size” in `trigger_delta_down`, `trigger_delta_up`, `fast_cadence_low` & `fast_cadence_high` indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

struct net_buf_simple *`trigger_delta_up`

The value of Status Trigger Delta Up field

`uint8_t min_interval`

The value of Status Min Interval field

struct net_buf_simple *`fast_cadence_low`

The value of Fast Cadence Low field

struct net_buf_simple *`fast_cadence_high`

The value of Fast Cadence High field

struct **esp_ble_mesh_sensor_data_t**

Parameters of Sensor Data state

Public Members

uint8_t **format**

Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).

Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t **length**

The value of the Sensor Data length

struct net_buf_simple ***raw_value**

The value of Sensor Data raw value

struct **esp_ble_mesh_sensor_series_column_t**

Parameters of Sensor Series Column state

Public Members

struct net_buf_simple ***raw_value_x**

The value of Sensor Raw Value X field

struct net_buf_simple ***column_width**

The value of Sensor Column Width field

struct net_buf_simple ***raw_value_y**

The value of Sensor Raw Value Y field

struct **esp_ble_mesh_sensor_state_t**

Parameters of Sensor states

Public Members

uint16_t **sensor_property_id**

The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t **descriptor**

Parameters of the Sensor Descriptor state

const uint8_t **setting_count**

Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t ***settings**

Parameters of the Sensor Setting state

***esp_ble_mesh_sensor_cadence_t* *cadence**

The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

***esp_ble_mesh_sensor_data_t* sensor_data**

Parameters of the Sensor Data state

***esp_ble_mesh_sensor_series_column_t* series_column**

Parameters of the Sensor Series Column state

struct **esp_ble_mesh_sensor_srv_t**

User data of Sensor Server Model

Public Members***esp_ble_mesh_model_t* *model**

Pointer to the Sensor Server Model. Initialized internally.

***esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl**

Response control of the server model received messages

const uint8_t state_count

Sensor state count

***esp_ble_mesh_sensor_state_t* *states**

Parameters of the Sensor states

struct **esp_ble_mesh_sensor_setup_srv_t**

User data of Sensor Setup Server Model

Public Members***esp_ble_mesh_model_t* *model**

Pointer to the Sensor Setup Server Model. Initialized internally.

***esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl**

Response control of the server model received messages

const uint8_t state_count

Sensor state count

***esp_ble_mesh_sensor_state_t* *states**

Parameters of the Sensor states

struct **esp_ble_mesh_state_change_sensor_cadence_set_t**

Parameters of Sensor Cadence Set state change event

Public Members**uint16_t property_id**

The value of Sensor Property ID state

uint8_t period_divisor

The value of Fast Cadence Period Divisor state

uint8_t trigger_type

The value of Status Trigger Type state

struct net_buf_simple *trigger_delta_down

The value of Status Trigger Delta Down state

struct net_buf_simple *trigger_delta_up

The value of Status Trigger Delta Up state

uint8_t min_interval

The value of Status Min Interval state

struct net_buf_simple *fast_cadence_low

The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high

The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t

Parameters of Sensor Setting Set state change event

Public Members**uint16_t property_id**

The value of Sensor Property ID state

uint16_t setting_property_id

The value of Sensor Setting Property ID state

struct net_buf_simple *setting_value

The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t

Context of the received Sensor Descriptor Get message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID of a sensor (optional)

struct **esp_ble_mesh_server_rcv_sensor_cadence_get_t**

Context of the received Sensor Cadence Get message

Public Members

uint16_t **property_id**

Property ID of a sensor

struct **esp_ble_mesh_server_rcv_sensor_settings_get_t**

Context of the received Sensor Settings Get message

Public Members

uint16_t **property_id**

Property ID of a sensor

struct **esp_ble_mesh_server_rcv_sensor_setting_get_t**

Context of the received Sensor Setting Get message

Public Members

uint16_t **property_id**

Property ID of a sensor

uint16_t **setting_property_id**

Setting ID identifying a setting within a sensor

struct **esp_ble_mesh_server_rcv_sensor_get_t**

Context of the received Sensor Get message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID for the sensor (optional)

struct **esp_ble_mesh_server_rcv_sensor_column_get_t**

Context of the received Sensor Column Get message

Public Members**uint16_t property_id**

Property identifying a sensor

struct net_buf_simple *raw_value_x

Raw value identifying a column

struct esp_ble_mesh_server_recv_sensor_series_get_t

Context of the received Sensor Series Get message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t property_id

Property identifying a sensor

struct net_buf_simple *raw_value

Raw value containing X1 and X2 (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_set_t

Context of the received Sensor Cadence Set message

Public Members**uint16_t property_id**

Property ID for the sensor

struct net_buf_simple *cadence

Value of Sensor Cadence state

struct esp_ble_mesh_server_recv_sensor_setting_set_t

Context of the received Sensor Setting Set message

Public Members**uint16_t property_id**

Property ID identifying a sensor

uint16_t setting_property_id

Setting ID identifying a setting within a sensor

struct net_buf_simple *setting_raw

Raw value for the setting

struct **esp_ble_mesh_sensor_server_cb_param_t**

Sensor Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Sensor Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_sensor_server_cb_value_t **value**

Value of the received Sensor Messages

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)

Define a new Sensor Client Model.

备注: This API needs to be called for each element on which the application needs to have a Sensor Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Sensor Client Model instance.

ESP_BLE_MESH_MODEL_SENSOR_SRV (srv_pub, srv_data)

Sensor Server Models related context.

Define a new Sensor Server Model.

备注: 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_sensor_srv_t*.

返回 New Sensor Server Model instance.

ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV (srv_pub, srv_data)

Define a new Sensor Setup Server Model.

备注: 1. The Sensor Setup Server model extends the Sensor Server model.

- a. This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.

- **srv_data** –Pointer to the unique struct *esp_ble_mesh_sensor_setup_srv_t*.
返回 New Sensor Setup Server Model instance.

ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID

Invalid Sensor Property ID

ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN

Length of Sensor Property ID

ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN

Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE

Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE

Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD

Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL

Not applicable Sensor Update Interval

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID

Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN

Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN

Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ

Sensor Setting Access - Read

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE

Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN

Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN

Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE

Maximum value of Sensor Period Divisor

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX

Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR

Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16

Sensor Status Trigger Type - Format Type “uint16”

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A

Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B

Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN

MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN

MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN

Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT (_data)

Get format of the sensor data.

备注: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

参数

- **_data** –Pointer to the start of the sensor data.

返回 Format of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)

Get length of the sensor data.

备注: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

参数

- **_data** –Pointer to the start of the sensor data.
- **_fmt** –Format of the sensor data.

返回 Length (zero-based) of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)

Get Sensor Property ID of the sensor data.

备注: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

参数

- **_data** –Pointer to the start of the sensor data.
- **_fmt** –Format of the sensor data.

返回 Sensor Property ID of the sensor data.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)

Generate a MPID value for sensor data with Format A.

备注: 1. The Format field is 0b0 and indicates that Format A is used.

- a. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
 - b. The Property ID is an 11-bit bit field representing 11 LSB of a Property ID.
 - c. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.
-

参数

- **_len** –Length of Sensor Raw value.
- **_id** –Sensor Property ID.

返回 2-octet MPID value for sensor data with Format A.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)

Generate a MPID value for sensor data with Format B.

备注: 1. The Format field is 0b1 and indicates Format B is used.

- a. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
 - b. The Property ID is a 16-bit bit field representing a Property ID.
 - c. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
 - d. Exclude the generated 1-octet value, the 2-octet Sensor Property ID
-

参数

- **_len** –Length of Sensor Raw value.
- **_id** –Sensor Property ID.

返回 3-octet MPID value for sensor data with Format B.

Type Definitions

```
typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event,  
esp_ble_mesh_sensor_client_cb_param_t *param)
```

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event,  
esp_ble_mesh_sensor_server_cb_param_t *param)
```

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_sensor_client_cb_event_t
```

This enum value is the event of Sensor Client Model

Values:

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX**

```
enum esp_ble_mesh_sensor_sample_func
```

This enum value is value of Sensor Sampling Function

Values:

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_RMS**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_COUNT**

```
enum esp_ble_mesh_sensor_server_cb_event_t
```

This enum value is the event of Sensor Server Model

Values:

enumerator **ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Sensor Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Get messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX**

Time and Scenes Client/Server Models

Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h`

Functions

`esp_err_t esp_ble_mesh_register_time_scene_client_callback` (`esp_ble_mesh_time_scene_client_cb_t` callback)

Register BLE Mesh Time Scene Client Model callback.

参数 `callback` –[in] Pointer to the callback function.

返回 `ESP_OK` on success or error code otherwise.

`esp_err_t esp_ble_mesh_time_scene_client_get_state` (`esp_ble_mesh_client_common_param_t` *params, `esp_ble_mesh_time_scene_client_get_state_t` *get_state)

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to time scene get message value. Shall not be set to NULL.

返回 `ESP_OK` on success or error code otherwise.

`esp_err_t esp_ble_mesh_time_scene_client_set_state` (`esp_ble_mesh_client_common_param_t` *params, `esp_ble_mesh_time_scene_client_set_state_t` *set_state)

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to time scene set message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_time_scene_server_callback** (*esp_ble_mesh_time_scene_server_cb_t* callback)

Register BLE Mesh Time and Scenes Server Model callback.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

Structures

struct **esp_ble_mesh_time_set_t**

Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **sub_second**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_time_zone_set_t**

Parameters of Time Zone Set

Public Members

uint8_t **time_zone_offset_new**

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_tai_utc_delta_set_t**

Parameters of TAI-UTC Delta Set

Public Members

uint16_t **tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint16_t **padding**

Always 0b0. Other values are Prohibited.

uint8_t **tai_delta_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_time_role_set_t**

Parameter of Time Role Set

Public Members

uint8_t **time_role**

The Time Role for the element

struct **esp_ble_mesh_scene_store_t**
Parameter of Scene Store

Public Members

uint16_t **scene_number**
The number of scenes to be stored

struct **esp_ble_mesh_scene_recall_t**
Parameters of Scene Recall

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **scene_number**
The number of scenes to be recalled

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

struct **esp_ble_mesh_scene_delete_t**
Parameter of Scene Delete

Public Members

uint16_t **scene_number**
The number of scenes to be deleted

struct **esp_ble_mesh_scheduler_act_get_t**
Parameter of Scheduler Action Get

Public Members

uint8_t **index**
Index of the Schedule Register entry to get

struct **esp_ble_mesh_scheduler_act_set_t**
Parameters of Scheduler Action Set

Public Members

uint64_t **index**

Index of the Schedule Register entry to set

uint64_t **year**

Scheduled year for the action

uint64_t **month**

Scheduled month for the action

uint64_t **day**

Scheduled day of the month for the action

uint64_t **hour**

Scheduled hour for the action

uint64_t **minute**

Scheduled minute for the action

uint64_t **second**

Scheduled second for the action

uint64_t **day_of_week**

Schedule days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action

uint16_t **scene_number**

Transition time for this action

struct **esp_ble_mesh_time_status_cb_t**

Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **sub_second**

The sub-second time in units of 1/256 second

`uint8_t uncertainty`

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority`

0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta`

Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset`

The local time zone offset in 15-minute increments

struct `esp_ble_mesh_time_zone_status_cb_t`

Parameters of Time Zone Status

Public Members

`uint8_t time_zone_offset_curr`

Current local time zone offset

`uint8_t time_zone_offset_new`

Upcoming local time zone offset

`uint8_t tai_zone_change[5]`

TAI Seconds time of the upcoming Time Zone Offset change

struct `esp_ble_mesh_tai_utc_delta_status_cb_t`

Parameters of TAI-UTC Delta Status

Public Members

`uint16_t tai_utc_delta_curr`

Current difference between TAI and UTC in seconds

`uint16_t padding_1`

Always 0b0. Other values are Prohibited.

`uint16_t tai_utc_delta_new`

Upcoming difference between TAI and UTC in seconds

`uint16_t padding_2`

Always 0b0. Other values are Prohibited.

`uint8_t tai_delta_change[5]`

TAI Seconds time of the upcoming TAI-UTC Delta change

struct `esp_ble_mesh_time_role_status_cb_t`

Parameter of Time Role Status

Public Members**uint8_t time_role**

The Time Role for the element

struct **esp_ble_mesh_scene_status_cb_t**

Parameters of Scene Status

Public Members**bool op_en**

Indicate if optional parameters are included

uint8_t status_code

Status code of the last operation

uint16_t current_scene

Scene Number of the current scene

uint16_t target_scene

Scene Number of the target scene (optional)

uint8_t remain_time

Time to complete state transition (C.1)

struct **esp_ble_mesh_scene_register_status_cb_t**

Parameters of Scene Register Status

Public Members**uint8_t status_code**

Status code for the previous operation

uint16_t current_scene

Scene Number of the current scene

struct net_buf_simple ***scenes**

A list of scenes stored within an element

struct **esp_ble_mesh_scheduler_status_cb_t**

Parameter of Scheduler Status

Public Members**uint16_t schedules**

Bit field indicating defined Actions in the Schedule Register

struct **esp_ble_mesh_scheduler_act_status_cb_t**

Parameters of Scheduler Action Status

Public Members

uint64_t **index**

Enumerates (selects) a Schedule Register entry

uint64_t **year**

Scheduled year for the action

uint64_t **month**

Scheduled month for the action

uint64_t **day**

Scheduled day of the month for the action

uint64_t **hour**

Scheduled hour for the action

uint64_t **minute**

Scheduled minute for the action

uint64_t **second**

Scheduled second for the action

uint64_t **day_of_week**

Schedule days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action

uint16_t **scene_number**

Transition time for this action

struct **esp_ble_mesh_time_scene_client_cb_param_t**

Time Scene Client Model callback parameters

Public Members

int **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t *params

The client common parameters.

esp_ble_mesh_time_scene_client_status_cb_t status_cb

The scene status message callback values

struct **esp_ble_mesh_time_state_t**

Parameters of Time state

Public Members

uint8_t **tai_seconds**[5]

The value of the TAI Seconds state

uint8_t **subsecond**

The value of the Subsecond field

uint8_t **uncertainty**

The value of the Uncertainty field

uint8_t **time_zone_offset_curr**

The value of the Time Zone Offset Current field

uint8_t **time_zone_offset_new**

The value of the Time Zone Offset New state

uint8_t **tai_zone_change**[5]

The value of the TAI of Zone Chaneg field

uint16_t **time_authority**

The value of the Time Authority bit

uint16_t **tai_utc_delta_curr**

The value of the TAI-UTC Delta Current state

uint16_t **tai_utc_delta_new**

The value of the TAI-UTC Delta New state

uint8_t **tai_delta_change**[5]

The value of the TAI of Delta Change field

struct *esp_ble_mesh_time_state_t*::[anonymous] **time**

Parameters of the Time state

uint8_t **time_role**

The value of the Time Role state

struct **esp_ble_mesh_time_srv_t**

User data of Time Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_time_state_t ***state**

Parameters of the Time state

struct **esp_ble_mesh_time_setup_srv_t**

User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_time_state_t ***state**

Parameters of the Time state

struct **esp_ble_mesh_scene_register_t**

- a. Scene Store is an operation of storing values of a present state of an element.
- b. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
- c. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
- d. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

Public Members

uint16_t **scene_number**

The value of the Scene Number

uint8_t **scene_type**

The value of the Scene Type

struct net_buf_simple ***scene_value**

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

struct **esp_ble_mesh_scenes_state_t**

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

Public Members

const uint16_t **scene_count**

The Scenes state's scene count

esp_ble_mesh_scene_register_t ***scenes**

Parameters of the Scenes state

uint16_t **current_scene**

The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element's state that is marked as "Stored with Scene" has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t **target_scene**

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

uint8_t **status_code**

The status code of the last scene operation

bool **in_progress**

Indicate if the scene transition is in progress

struct **esp_ble_mesh_scene_srv_t**

User data of Scene Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scene Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scenes_state_t ***state**

Parameters of the Scenes state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct **esp_ble_mesh_scene_setup_srv_t**

User data of Scene Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scene Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scenes_state_t ***state**

Parameters of the Scenes state

struct **esp_ble_mesh_schedule_register_t**

Parameters of Scheduler Register state

Public Members

bool **in_use**

Indicate if the registered schedule is in use

uint64_t **year**

The value of Scheduled year for the action

uint64_t **month**

The value of Scheduled month for the action

uint64_t **day**

The value of Scheduled day of the month for the action

uint64_t **hour**

The value of Scheduled hour for the action

uint64_t **minute**

The value of Scheduled minute for the action

uint64_t **second**

The value of Scheduled second for the action

uint64_t **day_of_week**

The value of Schedule days of the week for the action

uint64_t **action**

The value of Action to be performed at the scheduled time

uint64_t **trans_time**

The value of Transition time for this action

uint16_t **scene_number**

The value of Scene Number to be used for some actions

struct **esp_ble_mesh_scheduler_state_t**

Parameters of Scheduler state

Public Members

const uint8_t **schedule_count**

Scheduler count

esp_ble_mesh_schedule_register_t ***schedules**

Up to 16 scheduled entries

struct **esp_ble_mesh_scheduler_srv_t**

User data of Scheduler Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scheduler Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scheduler_state_t ***state**

Parameters of the Scheduler state

struct **esp_ble_mesh_scheduler_setup_srv_t**

User data of Scheduler Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scheduler Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scheduler_state_t ***state**

Parameters of the Scheduler state

struct **esp_ble_mesh_state_change_time_set_t**

Parameters of Time Set state change event

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **subsecond**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta_curr**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset_curr**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_state_change_time_status_t**

Parameters of Time Status state change event

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **subsecond**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta_curr**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset_curr**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_state_change_time_zone_set_t**

Parameters of Time Zone Set state change event

Public Members

uint8_t **time_zone_offset_new**

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_state_change_tai_utc_delta_set_t**

Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t **tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint8_t **tai_delta_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_state_change_time_role_set_t**

Parameter of Time Role Set state change event

Public Members**uint8_t time_role**

The Time Role for the element

struct **esp_ble_mesh_state_change_scene_store_t**

Parameter of Scene Store state change event

Public Members**uint16_t scene_number**

The number of scenes to be stored

struct **esp_ble_mesh_state_change_scene_recall_t**

Parameter of Scene Recall state change event

Public Members**uint16_t scene_number**

The number of scenes to be recalled

struct **esp_ble_mesh_state_change_scene_delete_t**

Parameter of Scene Delete state change event

Public Members**uint16_t scene_number**

The number of scenes to be deleted

struct **esp_ble_mesh_state_change_scheduler_act_set_t**

Parameter of Scheduler Action Set state change event

Public Members**uint64_t index**

Index of the Schedule Register entry to set

uint64_t year

Scheduled year for the action

uint64_t month

Scheduled month for the action

uint64_t day

Scheduled day of the month for the action

uint64_t **hour**

Scheduled hour for the action

uint64_t **minute**

Scheduled minute for the action

uint64_t **second**

Scheduled second for the action

uint64_t **day_of_week**

Schedule days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action

uint16_t **scene_number**

Scene number to be used for some actions

struct **esp_ble_mesh_server_rcv_scheduler_act_get_t**

Context of the received Scheduler Action Get message

Public Members

uint8_t **index**

Index of the Schedule Register entry to get

struct **esp_ble_mesh_server_rcv_time_set_t**

Context of the received Time Set message

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **subsecond**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_server_rcv_time_zone_set_t**

Context of the received Time Zone Set message

Public Members

uint8_t **time_zone_offset_new**

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_server_rcv_tai_utc_delta_set_t**

Context of the received TAI UTC Delta Set message

Public Members

uint16_t **tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint16_t **padding**

Always 0b0. Other values are Prohibited.

uint8_t **tai_delta_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_server_rcv_time_role_set_t**

Context of the received Time Role Set message

Public Members

uint8_t **time_role**

The Time Role for the element

struct **esp_ble_mesh_server_rcv_scene_store_t**

Context of the received Scene Store message

Public Members

uint16_t **scene_number**

The number of scenes to be stored

struct **esp_ble_mesh_server_rcv_scene_recall_t**

Context of the received Scene Recall message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **scene_number**

The number of scenes to be recalled

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_scene_delete_t**

Context of the received Scene Delete message

Public Members

uint16_t **scene_number**

The number of scenes to be deleted

struct **esp_ble_mesh_server_rcv_scheduler_act_set_t**

Context of the received Scheduler Action Set message

Public Members

uint64_t **index**

Index of the Schedule Register entry to set

uint64_t **year**

Scheduled year for the action

uint64_t **month**

Scheduled month for the action

uint64_t **day**

Scheduled day of the month for the action

`uint64_t hour`

Scheduled hour for the action

`uint64_t minute`

Scheduled minute for the action

`uint64_t second`

Scheduled second for the action

`uint64_t day_of_week`

Schedule days of the week for the action

`uint64_t action`

Action to be performed at the scheduled time

`uint64_t trans_time`

Transition time for this action

`uint16_t scene_number`

Scene number to be used for some actions

struct `esp_ble_mesh_server_rcv_time_status_t`

Context of the received Time Status message

Public Members

`uint8_t tai_seconds[5]`

The current TAI time in seconds

`uint8_t subsecond`

The sub-second time in units of 1/256 second

`uint8_t uncertainty`

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority`

0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta`

Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset`

The local time zone offset in 15-minute increments

struct `esp_ble_mesh_time_scene_server_cb_param_t`

Time Scene Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Time and Scenes Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_time_scene_server_cb_value_t **value**

Value of the received Time and Scenes Messages

Macros

ESP_BLE_MESH_MODEL_TIME_CLI (cli_pub, cli_data)

Define a new Time Client Model.

备注: This API needs to be called for each element on which the application needs to have a Time Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Time Client Model instance.

ESP_BLE_MESH_MODEL_SCENE_CLI (cli_pub, cli_data)

Define a new Scene Client Model.

备注: This API needs to be called for each element on which the application needs to have a Scene Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Scene Client Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)

Define a new Scheduler Client Model.

备注: This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Scheduler Client Model instance.

ESP_BLE_MESH_MODEL_TIME_SRV (srv_pub, srv_data)

Time Scene Server Models related context.

Define a new Time Server Model.

备注: 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_time_srv_t*.

返回 New Time Server Model instance.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)

Define a new Time Setup Server Model.

备注: 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

- a. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
 - b. This model does not support subscribing nor publishing.
-

参数

- **srv_data** –Pointer to the unique struct *esp_ble_mesh_time_setup_srv_t*.

返回 New Time Setup Server Model instance.

ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)

Define a new Scene Server Model.

备注: 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. The model may be present only on the Primary element of a node.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scene_srv_t*.

返回 New Scene Server Model instance.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV (srv_pub, srv_data)

Define a new Scene Setup Server Model.

备注: 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

- a. This model shall support model subscription.
 - b. The model may be present only on the Primary element of a node.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scene_setup_srv_t*.

返回 New Scene Setup Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)

Define a new Scheduler Server Model.

备注: 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. The model may be present only on the Primary element of a node.
 - c. The model requires the Time Server model shall be present on the element.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scheduler_srv_t*.

返回 New Scheduler Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)

Define a new Scheduler Setup Server Model.

备注: 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.

- a. This model shall support model subscription.
 - b. The model may be present only on the Primary element of a node.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scheduler_setup_srv_t*.

返回 New Scheduler Setup Server Model instance.

ESP_BLE_MESH_UNKNOWN_TAI_SECONDS

Unknown TAI Seconds

ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE

Unknown TAI of Zone Change

ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE

Unknown TAI of Delta Change

ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE

Maximum TAI-UTC Delta value

ESP_BLE_MESH_TAI_SECONDS_LEN

Length of TAI Seconds

ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN

Length of TAI of Zone Change

ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN

Length of TAI of Delta Change

ESP_BLE_MESH_INVALID_SCENE_NUMBER

Invalid Scene Number

ESP_BLE_MESH_SCENE_NUMBER_LEN

Length of the Scene Number

ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR

Any year of the Scheduled year

ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY

Any day of the Scheduled day

ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR

Any hour of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY

Any hour of the Scheduled Day

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR

Any minute of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC EVERY 15 MIN

Every 15 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC EVERY 20 MIN

Every 20 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC ONCE AN HOUR

Once of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC ANY OF MIN

Any second of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC EVERY 15 SEC

Every 15 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC EVERY 20 SEC

Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC ONCE AN MIN

Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF

Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON

Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL

Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION

Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE

Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX

Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE

Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY

Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY

Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLIENT

Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS

Scene operation - Success

ESP_BLE_MESH_SCENE_REG_FULL

Scene operation - Scene Register Full

ESP_BLE_MESH_SCENE_NOT_FOUND

Scene operation - Scene Not Found

Type Definitions

```
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(esp_ble_mesh_time_scene_client_cb_event_t  
event, esp_ble_mesh_time_scene_client_cb_param_t *param)
```

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

Param event Event type**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_time_scene_server_cb_t)(esp_ble_mesh_time_scene_server_cb_event_t  
event, esp_ble_mesh_time_scene_server_cb_param_t *param)
```

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

Param event Event type**Param param** Pointer to callback parameter**Enumerations**

enum **esp_ble_mesh_time_scene_client_cb_event_t**

This enum value is the event of Time Scene Client Model

Values:

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX**

enum **esp_ble_mesh_time_scene_server_cb_event_t**

This enum value is the event of Time Scene Server Model

Values:

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Time Scene Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Get messages are received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Status message is received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX**

Lighting Client/Server Models

Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h`

Functions

`esp_err_t esp_ble_mesh_register_light_client_callback` (`esp_ble_mesh_light_client_cb_t` callback)

Register BLE Mesh Light Client Model callback.

参数 **callback** –[in] pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_light_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_light_client_get_state_t* *get_state)

Get the value of Light Server Model states using the Light Client Model get messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_light_message_opcode_t* in *esp_ble_mesh_defs.h*

参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer of light get message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_light_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_light_client_set_state_t* *set_state)

Set the value of Light Server Model states using the Light Client Model set messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_light_message_opcode_t* in *esp_ble_mesh_defs.h*

参数

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer of light set message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_lighting_server_callback** (*esp_ble_mesh_lighting_server_cb_t* callback)

Register BLE Mesh Lighting Server Model callback.

参数 **callback** –[in] Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

Structures

struct **esp_ble_mesh_light_lightness_set_t**

Bluetooth Mesh Light Lightness Client Model Get and Set parameters structure.

Parameters of Light Lightness Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **lightness**

Target value of light lightness actual state

uint8_t **tid**

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_light_lightness_linear_set_t`

Parameters of Light Lightness Linear Set

Public Members

`bool op_en`

Indicate if optional parameters are included

`uint16_t lightness`

Target value of light lightness linear state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_light_lightness_default_set_t`

Parameter of Light Lightness Default Set

Public Members

`uint16_t lightness`

The value of the Light Lightness Default state

struct `esp_ble_mesh_light_lightness_range_set_t`

Parameters of Light Lightness Range Set

Public Members

`uint16_t range_min`

Value of range min field of light lightness range state

`uint16_t range_max`

Value of range max field of light lightness range state

struct `esp_ble_mesh_light_ctl_set_t`

Parameters of Light CTL Set

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t ctl_lightness

Target value of light ctl lightness state

uint16_t ctl_temperatrue

Target value of light ctl temperature state

int16_t ctl_delta_uv

Target value of light ctl delta UV state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_ctl_temperature_set_t**

Parameters of Light CTL Temperature Set

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t ctl_temperatrue

Target value of light ctl temperature state

int16_t ctl_delta_uv

Target value of light ctl delta UV state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_ctl_temperature_range_set_t**

Parameters of Light CTL Temperature Range Set

Public Members**uint16_t range_min**

Value of temperature range min field of light ctl temperature range state

uint16_t range_max

Value of temperature range max field of light ctl temperature range state

struct **esp_ble_mesh_light_ctl_default_set_t**

Parameters of Light CTL Default Set

Public Members**uint16_t lightness**

Value of light lightness default state

uint16_t temperature

Value of light temperature default state

int16_t delta_uv

Value of light delta UV default state

struct **esp_ble_mesh_light_hsl_set_t**

Parameters of Light HSL Set

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t hsl_lightness

Target value of light hsl lightness state

uint16_t hsl_hue

Target value of light hsl hue state

uint16_t hsl_saturation

Target value of light hsl saturation state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_hsl_hue_set_t**

Parameters of Light HSL Hue Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hue**

Target value of light hsl hue state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_hsl_saturation_set_t**

Parameters of Light HSL Saturation Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **saturation**

Target value of light hsl hue state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_hsl_default_set_t**

Parameters of Light HSL Default Set

Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t hue`

Value of light hue default state

`uint16_t saturation`

Value of light saturation default state

struct `esp_ble_mesh_light_hsl_range_set_t`

Parameters of Light HSL Range Set

Public Members

`uint16_t hue_range_min`

Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

struct `esp_ble_mesh_light_xyl_set_t`

Parameters of Light xyL Set

Public Members

bool `op_en`

Indicate whether optional parameters included

`uint16_t xyl_lightness`

The target value of the Light xyL Lightness state

`uint16_t xyl_x`

The target value of the Light xyL x state

`uint16_t xyl_y`

The target value of the Light xyL y state

`uint8_t tid`

Transaction Identifier

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_light_xyl_default_set_t`

Parameters of Light xyL Default Set

Public Members

`uint16_t lightness`

The value of the Light Lightness Default state

`uint16_t xyl_x`

The value of the Light xyL x Default state

`uint16_t xyl_y`

The value of the Light xyL y Default state

struct `esp_ble_mesh_light_xyl_range_set_t`

Parameters of Light xyL Range Set

Public Members

`uint16_t xyl_x_range_min`

The value of the xyL x Range Min field of the Light xyL x Range state

`uint16_t xyl_x_range_max`

The value of the xyL x Range Max field of the Light xyL x Range state

`uint16_t xyl_y_range_min`

The value of the xyL y Range Min field of the Light xyL y Range state

`uint16_t xyl_y_range_max`

The value of the xyL y Range Max field of the Light xyL y Range state

struct `esp_ble_mesh_light_lc_mode_set_t`

Parameter of Light LC Mode Set

Public Members

`uint8_t mode`

The target value of the Light LC Mode state

struct `esp_ble_mesh_light_lc_om_set_t`

Parameter of Light LC OM Set

Public Members**uint8_t mode**

The target value of the Light LC Occupancy Mode state

struct **esp_ble_mesh_light_lc_light_onoff_set_t**

Parameters of Light LC Light OnOff Set

Public Members**bool op_en**

Indicate whether optional parameters included

uint8_t light_onoff

The target value of the Light LC Light OnOff state

uint8_t tid

Transaction Identifier

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_lc_property_get_t**

Parameter of Light LC Property Get

Public Members**uint16_t property_id**

Property ID identifying a Light LC Property

struct **esp_ble_mesh_light_lc_property_set_t**

Parameters of Light LC Property Set

Public Members**uint16_t property_id**

Property ID identifying a Light LC Property

struct net_buf_simple ***property_value**

Raw value for the Light LC Property

struct **esp_ble_mesh_light_lightness_status_cb_t**

Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t present_lightness

Current value of light lightness actual state

uint16_t target_lightness

Target value of light lightness actual state (optional)

uint8_t remain_time

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_lightness_linear_status_cb_t**

Parameters of Light Lightness Linear Status

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t present_lightness

Current value of light lightness linear state

uint16_t target_lightness

Target value of light lightness linear state (optional)

uint8_t remain_time

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_lightness_last_status_cb_t**

Parameter of Light Lightness Last Status

Public Members**uint16_t lightness**

The value of the Light Lightness Last state

struct **esp_ble_mesh_light_lightness_default_status_cb_t**

Parameter of Light Lightness Default Status

Public Members**uint16_t lightness**

The value of the Light Lightness default State

struct **esp_ble_mesh_light_lightness_range_status_cb_t**

Parameters of Light Lightness Range Status

Public Members

uint8_t **status_code**

Status Code for the request message

uint16_t **range_min**

Value of range min field of light lightness range state

uint16_t **range_max**

Value of range max field of light lightness range state

struct **esp_ble_mesh_light_ctl_status_cb_t**

Parameters of Light CTL Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_ctl_lightness**

Current value of light ctl lightness state

uint16_t **present_ctl_temperature**

Current value of light ctl temperature state

uint16_t **target_ctl_lightness**

Target value of light ctl lightness state (optional)

uint16_t **target_ctl_temperature**

Target value of light ctl temperature state (C.1)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_ctl_temperature_status_cb_t**

Parameters of Light CTL Temperature Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_ctl_temperature**

Current value of light ctl temperature state

uint16_t **present_ctl_delta_uv**

Current value of light ctl delta UV state

uint16_t **target_ctl_temperature**

Target value of light ctl temperature state (optional)

uint16_t **target_ctl_delta_uv**

Target value of light ctl delta UV state (C.1)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_ctl_temperature_range_status_cb_t**

Parameters of Light CTL Temperature Range Status

Public Members

uint8_t **status_code**

Status code for the request message

uint16_t **range_min**

Value of temperature range min field of light ctl temperature range state

uint16_t **range_max**

Value of temperature range max field of light ctl temperature range state

struct **esp_ble_mesh_light_ctl_default_status_cb_t**

Parameters of Light CTL Default Status

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **temperature**

Value of light temperature default state

int16_t **delta_uv**

Value of light delta UV default state

struct **esp_ble_mesh_light_hsl_status_cb_t**

Parameters of Light HSL Status

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t hsl_lightness

Current value of light hsl lightness state

uint16_t hsl_hue

Current value of light hsl hue state

uint16_t hsl_saturation

Current value of light hsl saturation state

uint8_t remain_time

Time to complete state transition (optional)

struct **esp_ble_mesh_light_hsl_target_status_cb_t**

Parameters of Light HSL Target Status

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t hsl_lightness_target

Target value of light hsl lightness state

uint16_t hsl_hue_target

Target value of light hsl hue state

uint16_t hsl_saturation_target

Target value of light hsl saturation state

uint8_t remain_time

Time to complete state transition (optional)

struct **esp_ble_mesh_light_hsl_hue_status_cb_t**

Parameters of Light HSL Hue Status

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t present_hue

Current value of light hsl hue state

uint16_t **target_hue**

Target value of light hsl hue state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_hsl_saturation_status_cb_t**

Parameters of Light HSL Saturation Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_saturation**

Current value of light hsl saturation state

uint16_t **target_saturation**

Target value of light hsl saturation state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_hsl_default_status_cb_t**

Parameters of Light HSL Default Status

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **hue**

Value of light hue default state

uint16_t **saturation**

Value of light saturation default state

struct **esp_ble_mesh_light_hsl_range_status_cb_t**

Parameters of Light HSL Range Status

Public Members

uint8_t **status_code**

Status code for the request message

uint16_t **hue_range_min**

Value of hue range min field of light hsl hue range state

uint16_t **hue_range_max**

Value of hue range max field of light hsl hue range state

uint16_t **saturation_range_min**

Value of saturation range min field of light hsl saturation range state

uint16_t **saturation_range_max**

Value of saturation range max field of light hsl saturation range state

struct **esp_ble_mesh_light_xyl_status_cb_t**

Parameters of Light xyL Status

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **xyl_lightness**

The present value of the Light xyL Lightness state

uint16_t **xyl_x**

The present value of the Light xyL x state

uint16_t **xyl_y**

The present value of the Light xyL y state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_xyl_target_status_cb_t**

Parameters of Light xyL Target Status

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **target_xyl_lightness**

The target value of the Light xyL Lightness state

uint16_t **target_xyl_x**

The target value of the Light xyL x state

uint16_t **target_xyL_y**

The target value of the Light xyL y state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_xyL_default_status_cb_t**

Parameters of Light xyL Default Status

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

uint16_t **xyL_x**

The value of the Light xyL x Default state

uint16_t **xyL_y**

The value of the Light xyL y Default state

struct **esp_ble_mesh_light_xyL_range_status_cb_t**

Parameters of Light xyL Range Status

Public Members

uint8_t **status_code**

Status Code for the requesting message

uint16_t **xyL_x_range_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t **xyL_x_range_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t **xyL_y_range_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t **xyL_y_range_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp_ble_mesh_light_lc_mode_status_cb_t**

Parameter of Light LC Mode Status

Public Members

`uint8_t mode`

The present value of the Light LC Mode state

struct `esp_ble_mesh_light_lc_om_status_cb_t`

Parameter of Light LC OM Status

Public Members

`uint8_t mode`

The present value of the Light LC Occupancy Mode state

struct `esp_ble_mesh_light_lc_light_onoff_status_cb_t`

Parameters of Light LC Light OnOff Status

Public Members

bool `op_en`

Indicate whether optional parameters included

`uint8_t present_light_onoff`

The present value of the Light LC Light OnOff state

`uint8_t target_light_onoff`

The target value of the Light LC Light OnOff state (Optional)

`uint8_t remain_time`

Time to complete state transition (C.1)

struct `esp_ble_mesh_light_lc_property_status_cb_t`

Parameters of Light LC Property Status

Public Members

`uint16_t property_id`

Property ID identifying a Light LC Property

struct net_buf_simple *`property_value`

Raw value for the Light LC Property

struct `esp_ble_mesh_light_client_cb_param_t`

Lighting Client Model callback parameters

Public Members

int `error_code`

Appropriate error code

esp_ble_mesh_client_common_param_t *params

The client common parameters.

esp_ble_mesh_light_client_status_cb_t status_cb

The light status message callback values

struct **esp_ble_mesh_light_lightness_state_t**

Parameters of Light Lightness state

Public Members

uint16_t **lightness_linear**

The present value of Light Lightness Linear state

uint16_t **target_lightness_linear**

The target value of Light Lightness Linear state

uint16_t **lightness_actual**

The present value of Light Lightness Actual state

uint16_t **target_lightness_actual**

The target value of Light Lightness Actual state

uint16_t **lightness_last**

The value of Light Lightness Last state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint8_t **status_code**

The status code of setting Light Lightness Range state

uint16_t **lightness_range_min**

The minimum value of Light Lightness Range state

uint16_t **lightness_range_max**

The maximum value of Light Lightness Range state

struct **esp_ble_mesh_light_lightness_srv_t**

User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t *model

Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t ***state**

Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **actual_transition**

Parameters of state transition

esp_ble_mesh_state_transition_t **linear_transition**

Parameters of state transition

int32_t **tt_delta_lightness_actual**

Delta change value of lightness actual state transition

int32_t **tt_delta_lightness_linear**

Delta change value of lightness linear state transition

struct **esp_ble_mesh_light_lightness_setup_srv_t**

User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t ***state**

Parameters of the Light Lightness state

struct **esp_ble_mesh_light_ctl_state_t**

Parameters of Light CTL state

Public Members

uint16_t **lightness**

The present value of Light CTL Lightness state

uint16_t **target_lightness**

The target value of Light CTL Lightness state

`uint16_t temperature`

The present value of Light CTL Temperature state

`uint16_t target_temperature`

The target value of Light CTL Temperature state

`int16_t delta_uv`

The present value of Light CTL Delta UV state

`int16_t target_delta_uv`

The target value of Light CTL Delta UV state

`uint8_t status_code`

The statue code of setting Light CTL Temperature Range state

`uint16_t temperature_range_min`

The minimum value of Light CTL Temperature Range state

`uint16_t temperature_range_max`

The maximum value of Light CTL Temperature Range state

`uint16_t lightness_default`

The value of Light Lightness Default state

`uint16_t temperature_default`

The value of Light CTL Temperature Default state

`int16_t delta_uv_default`

The value of Light CTL Delta UV Default state

struct `esp_ble_mesh_light_ctl_srv_t`

User data of Light CTL Server Model

Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Lighting CTL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`

Parameters of the Light CTL state

`esp_ble_mesh_last_msg_info_t last`

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_lightness**

Delta change value of lightness state transition

int32_t **tt_delta_temperature**

Delta change value of temperature state transition

int32_t **tt_delta_delta_uv**

Delta change value of delta uv state transition

struct **esp_ble_mesh_light_ctl_setup_srv_t**

User data of Light CTL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

struct **esp_ble_mesh_light_ctl_temp_srv_t**

User data of Light CTL Temperature Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t tt_delta_temperature
Delta change value of temperature state transition

int32_t tt_delta_delta_uv
Delta change value of delta uv state transition

struct **esp_ble_mesh_light_hsl_state_t**
Parameters of Light HSL state

Public Members

uint16_t lightness
The present value of Light HSL Lightness state

uint16_t target_lightness
The target value of Light HSL Lightness state

uint16_t hue
The present value of Light HSL Hue state

uint16_t target_hue
The target value of Light HSL Hue state

uint16_t saturation
The present value of Light HSL Saturation state

uint16_t target_saturation
The target value of Light HSL Saturation state

uint16_t lightness_default
The value of Light Lightness Default state

uint16_t hue_default
The value of Light HSL Hue Default state

uint16_t saturation_default
The value of Light HSL Saturation Default state

uint8_t status_code
The status code of setting Light HSL Hue & Saturation Range state

uint16_t hue_range_min
The minimum value of Light HSL Hue Range state

uint16_t hue_range_max
The maximum value of Light HSL Hue Range state

uint16_t **saturation_range_min**

The minimum value of Light HSL Saturation state

uint16_t **saturation_range_max**

The maximum value of Light HSL Saturation state

struct **esp_ble_mesh_light_hsl_srv_t**

User data of Light HSL Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting HSL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t ***state**

Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_lightness**

Delta change value of lightness state transition

int32_t **tt_delta_hue**

Delta change value of hue state transition

int32_t **tt_delta_saturation**

Delta change value of saturation state transition

struct **esp_ble_mesh_light_hsl_setup_srv_t**

User data of Light HSL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting HSL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state

Parameters of the Light HSL state

struct **esp_ble_mesh_light_hsl_hue_srv_t**

User data of Light HSL Hue Server Model

Public Members

esp_ble_mesh_model_t *model

Pointer to the Lighting HSL Hue Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state

Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last

Parameters of the last received set message

esp_ble_mesh_state_transition_t transition

Parameters of state transition

int32_t tt_delta_hue

Delta change value of hue state transition

struct **esp_ble_mesh_light_hsl_sat_srv_t**

User data of Light HSL Saturation Server Model

Public Members

esp_ble_mesh_model_t *model

Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state

Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last

Parameters of the last received set message

esp_ble_mesh_state_transition_t transition

Parameters of state transition

`int32_t tt_delta_saturation`

Delta change value of saturation state transition

struct `esp_ble_mesh_light_xyl_state_t`

Parameters of Light xyL state

Public Members

`uint16_t lightness`

The present value of Light xyL Lightness state

`uint16_t target_lightness`

The target value of Light xyL Lightness state

`uint16_t x`

The present value of Light xyL x state

`uint16_t target_x`

The target value of Light xyL x state

`uint16_t y`

The present value of Light xyL y state

`uint16_t target_y`

The target value of Light xyL y state

`uint16_t lightness_default`

The value of Light Lightness Default state

`uint16_t x_default`

The value of Light xyL x Default state

`uint16_t y_default`

The value of Light xyL y Default state

`uint8_t status_code`

The status code of setting Light xyL x & y Range state

`uint16_t x_range_min`

The minimum value of Light xyL x Range state

`uint16_t x_range_max`

The maximum value of Light xyL x Range state

`uint16_t y_range_min`

The minimum value of Light xyL y Range state

uint16_t **y_range_max**

The maximum value of Light xyL y Range state

struct **esp_ble_mesh_light_xyl_srv_t**

User data of Light xyL Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting xyL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t ***state**

Parameters of the Light xyL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_lightness**

Delta change value of lightness state transition

int32_t **tt_delta_x**

Delta change value of x state transition

int32_t **tt_delta_y**

Delta change value of y state transition

struct **esp_ble_mesh_light_xyl_setup_srv_t**

User data of Light xyL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting xyL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t ***state**

Parameters of the Light xyL state

struct **esp_ble_mesh_light_lc_state_t**

Parameters of Light LC states

Public Members**uint32_t mode**

0b0 The controller is turned off.

- The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32_t occupancy_mode

The value of Light LC Occupancy Mode state

uint32_t light_onoff

The present value of Light LC Light OnOff state

uint32_t target_light_onoff

The target value of Light LC Light OnOff state

uint32_t occupancy

The value of Light LC Occupancy state

uint32_t ambient_luxlevel

The value of Light LC Ambient LuxLevel state

uint16_t linear_output

- Light LC Linear Output = $\max((\text{Lightness Out})^2/65535, \text{Regulator Output})$
- If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
- If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

struct esp_ble_mesh_light_lc_property_state_t

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

Public Members**uint32_t time_occupancy_delay**

A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on

A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t time_prolong

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

uint16_t lightness_on

A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong

A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby

A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on

A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong

A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby

A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float **regulator_kpu**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float **regulator_kpd**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t **regulator_accuracy**

A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t **set_occupancy_to_1_delay**

If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct **esp_ble_mesh_light_lc_state_machine_t**

Parameters of Light LC state machine

Public Members

uint8_t **fade_on**

The value of transition time of Light LC Time Fade On

uint8_t **fade**

The value of transition time of Light LC Time Fade

uint8_t **fade_standby_auto**

The value of transition time of Light LC Time Fade Standby Auto

uint8_t **fade_standby_manual**

The value of transition time of Light LC Time Fade Standby Manual

struct *esp_ble_mesh_light_lc_state_machine_t*::[anonymous] **trans_time**

The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

esp_ble_mesh_lc_state_t **state**

The value of Light LC state machine state

struct k_delayed_work **timer**

Timer of Light LC state machine

struct **esp_ble_mesh_light_control_t**

Parameters of Light Lightness controller

Public Members

esp_ble_mesh_light_lc_state_t **state**

Parameters of Light LC state

esp_ble_mesh_light_lc_property_state_t **prop_state**

Parameters of Light LC Property state

esp_ble_mesh_light_lc_state_machine_t **state_machine**

Parameters of Light LC state machine

struct **esp_ble_mesh_light_lc_srv_t**

User data of Light LC Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting LC Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_control_t ***lc**

Parameters of the Light controller

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct **esp_ble_mesh_light_lc_setup_srv_t**

User data of Light LC Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting LC Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_control_t ***lc**

Parameters of the Light controller

struct **esp_ble_mesh_state_change_light_lightness_set_t**

Parameter of Light Lightness Actual state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Actual state

struct **esp_ble_mesh_state_change_light_lightness_linear_set_t**

Parameter of Light Lightness Linear state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Linear state

struct **esp_ble_mesh_state_change_light_lightness_default_set_t**

Parameter of Light Lightness Default state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Default state

struct **esp_ble_mesh_state_change_light_lightness_range_set_t**

Parameters of Light Lightness Range state change event

Public Members

uint16_t **range_min**

The minimum value of Light Lightness Range state

uint16_t **range_max**

The maximum value of Light Lightness Range state

struct **esp_ble_mesh_state_change_light_ctl_set_t**

Parameters of Light CTL state change event

Public Members**uint16_t lightness**

The value of Light CTL Lightness state

uint16_t temperature

The value of Light CTL Temperature state

int16_t delta_uv

The value of Light CTL Delta UV state

struct **esp_ble_mesh_state_change_light_ctl_temperature_set_t**

Parameters of Light CTL Temperature state change event

Public Members**uint16_t temperature**

The value of Light CTL Temperature state

int16_t delta_uv

The value of Light CTL Delta UV state

struct **esp_ble_mesh_state_change_light_ctl_temperature_range_set_t**

Parameters of Light CTL Temperature Range state change event

Public Members**uint16_t range_min**

The minimum value of Light CTL Temperature Range state

uint16_t range_max

The maximum value of Light CTL Temperature Range state

struct **esp_ble_mesh_state_change_light_ctl_default_set_t**

Parameters of Light CTL Default state change event

Public Members**uint16_t lightness**

The value of Light Lightness Default state

uint16_t temperature

The value of Light CTL Temperature Default state

int16_t delta_uv

The value of Light CTL Delta UV Default state

struct **esp_ble_mesh_state_change_light_hsl_set_t**
Parameters of Light HSL state change event

Public Members

uint16_t **lightness**
The value of Light HSL Lightness state

uint16_t **hue**
The value of Light HSL Hue state

uint16_t **saturation**
The value of Light HSL Saturation state

struct **esp_ble_mesh_state_change_light_hsl_hue_set_t**
Parameter of Light HSL Hue state change event

Public Members

uint16_t **hue**
The value of Light HSL Hue state

struct **esp_ble_mesh_state_change_light_hsl_saturation_set_t**
Parameter of Light HSL Saturation state change event

Public Members

uint16_t **saturation**
The value of Light HSL Saturation state

struct **esp_ble_mesh_state_change_light_hsl_default_set_t**
Parameters of Light HSL Default state change event

Public Members

uint16_t **lightness**
The value of Light HSL Lightness Default state

uint16_t **hue**
The value of Light HSL Hue Default state

uint16_t **saturation**
The value of Light HSL Saturation Default state

struct **esp_ble_mesh_state_change_light_hsl_range_set_t**
Parameters of Light HSL Range state change event

Public Members**uint16_t hue_range_min**

The minimum hue value of Light HSL Range state

uint16_t hue_range_max

The maximum hue value of Light HSL Range state

uint16_t saturation_range_min

The minimum saturation value of Light HSL Range state

uint16_t saturation_range_max

The maximum saturation value of Light HSL Range state

struct **esp_ble_mesh_state_change_light_xyL_set_t**

Parameters of Light xyL state change event

Public Members**uint16_t lightness**

The value of Light xyL Lightness state

uint16_t x

The value of Light xyL x state

uint16_t y

The value of Light xyL y state

struct **esp_ble_mesh_state_change_light_xyL_default_set_t**

Parameters of Light xyL Default state change event

Public Members**uint16_t lightness**

The value of Light Lightness Default state

uint16_t x

The value of Light xyL x Default state

uint16_t y

The value of Light xyL y Default state

struct **esp_ble_mesh_state_change_light_xyL_range_set_t**

Parameters of Light xyL Range state change event

Public Members**uint16_t x_range_min**

The minimum value of Light xyL x Range state

uint16_t x_range_max

The maximum value of Light xyL x Range state

uint16_t y_range_min

The minimum value of Light xyL y Range state

uint16_t y_range_max

The maximum value of Light xyL y Range state

struct **esp_ble_mesh_state_change_light_lc_mode_set_t**

Parameter of Light LC Mode state change event

Public Members**uint8_t mode**

The value of Light LC Mode state

struct **esp_ble_mesh_state_change_light_lc_om_set_t**

Parameter of Light LC Occupancy Mode state change event

Public Members**uint8_t mode**

The value of Light LC Occupancy Mode state

struct **esp_ble_mesh_state_change_light_lc_light_onoff_set_t**

Parameter of Light LC Light OnOff state change event

Public Members**uint8_t onoff**

The value of Light LC Light OnOff state

struct **esp_ble_mesh_state_change_light_lc_property_set_t**

Parameters of Light LC Property state change event

Public Members**uint16_t property_id**

The property id of Light LC Property state

struct net_buf_simple ***property_value**

The property value of Light LC Property state

struct **esp_ble_mesh_state_change_sensor_status_t**

Parameters of Sensor Status state change event

Public Members

uint16_t **property_id**

The value of Sensor Property ID

uint8_t **occupancy**

The value of Light LC Occupancy state

uint32_t **set_occupancy_to_1_delay**

The value of Light LC Set Occupancy to 1 Delay state

uint32_t **ambient_luxlevel**

The value of Light LC Ambient Luxlevel state

union *esp_ble_mesh_state_change_sensor_status_t*::[anonymous] **state**

Parameters of Sensor Status related state

struct **esp_ble_mesh_server_rcv_light_lc_property_get_t**

Context of the received Light LC Property Get message

Public Members

uint16_t **property_id**

Property ID identifying a Light LC Property

struct **esp_ble_mesh_server_rcv_light_lightness_set_t**

Context of the received Light Lightness Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **lightness**

Target value of light lightness actual state

uint8_t **tid**

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_lightness_linear_set_t`

Context of the received Light Lightness Linear Set message

Public Members

bool `op_en`

Indicate if optional parameters are included

`uint16_t lightness`

Target value of light lightness linear state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_lightness_default_set_t`

Context of the received Light Lightness Default Set message

Public Members

`uint16_t lightness`

The value of the Light Lightness Default state

struct `esp_ble_mesh_server_rcv_light_lightness_range_set_t`

Context of the received Light Lightness Range Set message

Public Members

`uint16_t range_min`

Value of range min field of light lightness range state

`uint16_t range_max`

Value of range max field of light lightness range state

struct `esp_ble_mesh_server_rcv_light_ctl_set_t`

Context of the received Light CTL Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t lightness

Target value of light ctl lightness state

uint16_t temperature

Target value of light ctl temperature state

int16_t delta_uv

Target value of light ctl delta UV state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_ctl_temperature_set_t**

Context of the received Light CTL Temperature Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t temperature

Target value of light ctl temperature state

int16_t delta_uv

Target value of light ctl delta UV state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_ctl_temperature_range_set_t**

Context of the received Light CTL Temperature Range Set message

Public Members**uint16_t range_min**

Value of temperature range min field of light ctl temperature range state

uint16_t range_max

Value of temperature range max field of light ctl temperature range state

struct **esp_ble_mesh_server_rcv_light_ctl_default_set_t**

Context of the received Light CTL Default Set message

Public Members**uint16_t lightness**

Value of light lightness default state

uint16_t temperature

Value of light temperature default state

int16_t delta_uv

Value of light delta UV default state

struct **esp_ble_mesh_server_rcv_light_hsl_set_t**

Context of the received Light HSL Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t lightness

Target value of light hsl lightness state

uint16_t hue

Target value of light hsl hue state

uint16_t saturation

Target value of light hsl saturation state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_hsl_hue_set_t**

Context of the received Light HSL Hue Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hue**

Target value of light hsl hue state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_hsl_saturation_set_t**

Context of the received Light HSL Saturation Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **saturation**

Target value of light hsl hue state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_hsl_default_set_t**

Context of the received Light HSL Default Set message

Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t hue`

Value of light hue default state

`uint16_t saturation`

Value of light saturation default state

struct `esp_ble_mesh_server_rcv_light_hsl_range_set_t`

Context of the received Light HSL Range Set message

Public Members

`uint16_t hue_range_min`

Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

struct `esp_ble_mesh_server_rcv_light_xyl_set_t`

Context of the received Light xyL Set message

Public Members

bool `op_en`

Indicate whether optional parameters included

`uint16_t lightness`

The target value of the Light xyL Lightness state

`uint16_t x`

The target value of the Light xyL x state

`uint16_t y`

The target value of the Light xyL y state

`uint8_t tid`

Transaction Identifier

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_xyl_default_set_t`

Context of the received Light xyL Default Set message

Public Members

`uint16_t lightness`

The value of the Light Lightness Default state

`uint16_t x`

The value of the Light xyL x Default state

`uint16_t y`

The value of the Light xyL y Default state

struct `esp_ble_mesh_server_rcv_light_xyl_range_set_t`

Context of the received Light xyL Range Set message

Public Members

`uint16_t x_range_min`

The value of the xyL x Range Min field of the Light xyL x Range state

`uint16_t x_range_max`

The value of the xyL x Range Max field of the Light xyL x Range state

`uint16_t y_range_min`

The value of the xyL y Range Min field of the Light xyL y Range state

`uint16_t y_range_max`

The value of the xyL y Range Max field of the Light xyL y Range state

struct `esp_ble_mesh_server_rcv_light_lc_mode_set_t`

Context of the received Light LC Mode Set message

Public Members

`uint8_t mode`

The target value of the Light LC Mode state

struct `esp_ble_mesh_server_rcv_light_lc_om_set_t`

Context of the received Light OM Set message

Public Members**uint8_t mode**

The target value of the Light LC Occupancy Mode state

struct **esp_ble_mesh_server_rcv_light_lc_light_onoff_set_t**

Context of the received Light LC Light OnOff Set message

Public Members**bool op_en**

Indicate whether optional parameters included

uint8_t light_onoff

The target value of the Light LC Light OnOff state

uint8_t tid

Transaction Identifier

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_lc_property_set_t**

Context of the received Light LC Property Set message

Public Members**uint16_t property_id**

Property ID identifying a Light LC Property

struct net_buf_simple ***property_value**

Raw value for the Light LC Property

struct **esp_ble_mesh_server_rcv_sensor_status_t**

Context of the received Sensor Status message

Public Membersstruct net_buf_simple ***data**

Value of sensor data state (optional)

struct **esp_ble_mesh_lighting_server_cb_param_t**

Lighting Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Lighting Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_lighting_server_cb_value_t **value**

Value of the received Lighting Messages

Macros

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI (cli_pub, cli_data)

Define a new Light Lightness Client Model.

备注: This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Light Lightness Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI (cli_pub, cli_data)

Define a new Light CTL Client Model.

备注: This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Light CTL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI (cli_pub, cli_data)

Define a new Light HSL Client Model.

备注: This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Light HSL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI (cli_pub, cli_data)

Define a new Light xyL Client Model.

备注: This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Light xyL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_CLI (cli_pub, cli_data)

Define a new Light LC Client Model.

备注: This API needs to be called for each element on which the application needs to have a Light LC Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Light LC Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV (srv_pub, srv_data)

Lighting Server Models related context.

Define a new Light Lightness Server Model.

备注: 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

- This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lightness_srv_t*.

返回 New Light Lightness Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV (srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

备注: 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

- This model shall support model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lightness_setup_srv_t*.

返回 New Light Lightness Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV (srv_pub, srv_data)

Define a new Light CTL Server Model.

备注: 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_ctl_srv_t*.

返回 New Light CTL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV (srv_pub, srv_data)

Define a new Light CTL Setup Server Model.

备注: 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

- a. This model shall support model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_ctl_setup_srv_t*.

返回 New Light CTL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV (srv_pub, srv_data)

Define a new Light CTL Temperature Server Model.

备注: 1. The Light CTL Temperature Server model extends the Generic Level Server model.

- a. This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_ctl_temp_srv_t*.

返回 New Light CTL Temperature Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV (srv_pub, srv_data)

Define a new Light HSL Server Model.

备注: 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
- b. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is

bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_srv_t*.

返回 New Light HSL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)

Define a new Light HSL Setup Server Model.

备注: 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

- a. This model shall support model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_setup_srv_t*.

返回 New Light HSL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (srv_pub, srv_data)

Define a new Light HSL Hue Server Model.

备注: 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

- a. This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_hue_srv_t*.

返回 New Light HSL Hue Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (srv_pub, srv_data)

Define a new Light HSL Saturation Server Model.

备注: 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

- a. This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_sat_srv_t*.

返回 New Light HSL Saturation Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (srv_pub, srv_data)

Define a new Light xyL Server Model.

备注: 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_xyl_srv_t*.

返回 New Light xyL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)

Define a new Light xyL Setup Server Model.

备注: 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.

- a. This model shall support model subscription.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_xyl_setup_srv_t*.

返回 New Light xyL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_SRV (srv_pub, srv_data)

Define a new Light LC Server Model.

备注: 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lc_srv_t*.

返回 New Light LC Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV (srv_pub, srv_data)

Define a new Light LC Setup Server Model.

备注: 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.

- a. This model shall support model publication and model subscription.
 - b. This model may be used to configure setup parameters for the Light LC Server model.
-

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lc_setup_srv_t*.

返回 New Light LC Setup Server Model instance.

Type Definitions

```
typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event,  
esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event,  
esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_light_client_cb_event_t
```

This enum value is the event of Lighting Client Model

Values:

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX**

```
enum esp_ble_mesh_lc_state_t
```

This enum value is the Light LC State Machine states

Values:

enumerator **ESP_BLE_MESH_LC_OFF**

enumerator **ESP_BLE_MESH_LC_STANDBY**

enumerator **ESP_BLE_MESH_LC_FADE_ON**

enumerator **ESP_BLE_MESH_LC_RUN**

enumerator **ESP_BLE_MESH_LC_FADE**

enumerator **ESP_BLE_MESH_LC_PROLONG**

enumerator **ESP_BLE_MESH_LC_FADE_STANDBY_AUTO**

enumerator **ESP_BLE_MESH_IC_FADE_STANDBY_MANUAL**

enum **esp_ble_mesh_lighting_server_cb_event_t**

This enum value is the event of Lighting Server Model

Values:

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Lighting Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Get messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Status message is received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX**

2.2 连网 API

2.2.1 Wi-Fi

Wi-Fi 库

概述 Wi-Fi 库支持配置及监控 ESP32 Wi-Fi 连网功能。

支持配置：

- 基站模式（即 STA 模式或 Wi-Fi 客户端模式），此时 ESP32 连接到接入点 (AP)。
- AP 模式（即 Soft-AP 模式或接入点模式），此时基站连接到 ESP32。
- AP-STA 共存模式（ESP32 既是接入点，同时又作为基站连接到另外一个接入点）。
- 上述模式的各种安全模式（WPA、WPA2、WPA3 等）。
- 扫描接入点（包括主动扫描及被动扫描）。
- 使用混杂模式监控 IEEE802.11 Wi-Fi 数据包。

应用示例 ESP-IDF 示例项目的 `wifi` 目录下包含以下应用程序：

- Wi-Fi 示例代码；
- 另外一个简单的应用程序 `esp-idf-template`，演示了如何将 ESP32 模组连接到 AP。

API 参考

Header File

- `components/esp_wifi/include/esp_wifi.h`

Functions

`esp_err_t esp_wifi_init` (const `wifi_init_config_t` *config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

Attention 1. This API must be called before all other WiFi API can be called

Attention 2. Always use `WIFI_INIT_CONFIG_DEFAULT` macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into `wifi_init_config_t` in future release. If you want to set your own initial values, overwrite the default values which are set by `WIFI_INIT_CONFIG_DEFAULT`. Please be notified that the field ‘magic’ of `wifi_init_config_t` should always be `WIFI_INIT_CONFIG_MAGIC`!

参数 `config` –pointer to WiFi initialized configuration structure; can point to a temporary variable.

返回

- `ESP_OK`: succeed
- `ESP_ERR_NO_MEM`: out of memory
- others: refer to error code `esp_err.h`

`esp_err_t esp_wifi_deinit` (void)

Deinit WiFi Free all resource allocated in `esp_wifi_init` and stop WiFi task.

Attention 1. This API should be called if you want to remove WiFi driver from the system

返回

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

`esp_err_t esp_wifi_set_mode` (`wifi_mode_t` mode)

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.

参数 `mode` –WiFi operating mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

esp_err_t **esp_wifi_get_mode** (*wifi_mode_t* *mode)

Get current operating mode of WiFi.

参数 mode –[out] store current WiFi mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_start** (void)

Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors

esp_err_t **esp_wifi_stop** (void)

Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_restore** (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp_wifi_set_bandwidth,
- esp_wifi_set_protocol,
- esp_wifi_set_config related
- esp_wifi_set_mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_connect** (void)

Connect the ESP32 WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode

Attention 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.

Attention 3. The scanning triggered by esp_wifi_scan_start() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE.

Attention 4. This API attempts to connect to an Access Point (AP) only once. To enable reconnection in case of a connection failure, please use the ‘failure_retry_cnt’ feature in the ‘wifi_sta_config_t’. Users are suggested to implement reconnection logic in their application for scenarios where the specified AP does not exist, or reconnection is desired after the device has received a disconnect event.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

esp_err_t **esp_wifi_disconnect** (void)

Disconnect the ESP32 WiFi station from the AP.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

esp_err_t **esp_wifi_clear_fast_connect** (void)

Currently this API is just an stub API.

返回

- ESP_OK: succeed
- others: fail

esp_err_t **esp_wifi_deauth_sta** (uint16_t aid)

deauthenticate all stations or associated id equals to aid

参数 **aid** –when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

esp_err_t **esp_wifi_scan_start** (const *wifi_scan_config_t* *config, bool block)

Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

参数

- **config** –configuration settings for scanning, if set to NULL default settings will be used of which default values are show_hidden:false, scan_type:active, scan_time.active.min:0, scan_time.active.max:120 miliseconds, scan_time.passive:360 miliseconds
- **block** –if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start

- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

esp_err_t **esp_wifi_scan_stop** (void)

Stop the scan in process.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

esp_err_t **esp_wifi_scan_get_ap_num** (uint16_t *number)

Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.

参数 **number** –[out] store number of APs found in last scan

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_scan_get_ap_records** (uint16_t *number, *wifi_ap_record_t* *ap_records)

Get AP list found in last scan.

参数

- **number** –[inout] As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- **ap_records** –*wifi_ap_record_t* array to hold the found APs

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

esp_err_t **esp_wifi_clear_ap_list** (void)

Clear AP list found in last scan.

Attention When the obtained ap list fails, bss info must be cleared, otherwise it may cause memory leakage.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_sta_get_ap_info** (*wifi_ap_record_t* *ap_info)

Get information of AP which the ESP32 station is associated with.

Attention When the obtained country information is empty, it means that the AP does not carry country information

参数 **ap_info** –the *wifi_ap_record_t* to hold AP information sta can get the connected ap's phy mode info through the struct member *phy_11b*, *phy_11g*, *phy_11n*, *phy_lr* in the *wifi_ap_record_t* struct. For example, *phy_11b* = 1 imply that ap support 802.11b mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don't initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

esp_err_t **esp_wifi_set_ps** (*wifi_ps_type_t* type)

Set current WiFi power save type.

Attention Default power save type is WIFI_PS_MIN_MODEM.

参数 **type** –power save type

返回 ESP_OK: succeed

esp_err_t **esp_wifi_get_ps** (*wifi_ps_type_t* *type)

Get current WiFi power save type.

Attention Default power save type is WIFI_PS_MIN_MODEM.

参数 **type** –[out] store current power save type

返回 ESP_OK: succeed

esp_err_t **esp_wifi_set_protocol** (*wifi_interface_t* ifx, uint8_t protocol_bitmap)

Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N|WIFI_PROTOCOL_LR)

Attention Support 802.11b or 802.11bg or 802.11bgn or LR mode

参数

- **ifx** –interfaces
- **protocol_bitmap** –WiFi protocol bitmap

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_get_protocol** (*wifi_interface_t* ifx, uint8_t *protocol_bitmap)

Get the current protocol bitmap of the specified interface.

参数

- **ifx** –interface
- **protocol_bitmap** –[out] store current WiFi protocol bitmap of interface ifx

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_set_bandwidth** (*wifi_interface_t* ifx, *wifi_bandwidth_t* bw)

Set the bandwidth of ESP32 specified interface.

- Attention** 1. API return false if try to configure an interface that is not enabled
Attention 2. WIFI_BW_HT40 is supported only when the interface support 11N

参数

- **ifx** –interface to be configured
- **bw** –bandwidth

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_get_bandwidth** (*wifi_interface_t* ifx, *wifi_bandwidth_t* *bw)

Get the bandwidth of ESP32 specified interface.

- Attention** 1. API return false if try to get a interface that is not enable

参数

- **ifx** –interface to be configured
- **bw** –[out] store bandwidth of interface ifx

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_channel** (uint8_t primary, *wifi_second_chan_t* second)

Set primary/secondary channel of ESP32.

- Attention** 1. This API should be called after esp_wifi_start() and before esp_wifi_stop()

- Attention** 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

- Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs

- Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

- Attention** 5. The channel info set by this API will not be stored in NVS. So If you want to remeber the channel used before wifi stop, you need to call this API again after wifi start, or you can call esp_wifi_set_config() to store the channel info in NVS.

参数

- **primary** –for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second** –for HT20, second is ignored, for HT40, second is the second channel

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

esp_err_t **esp_wifi_get_channel** (uint8_t *primary, *wifi_second_chan_t* *second)

Get the primary/secondary channel of ESP32.

Attention 1. API return false if try to get a interface that is not enable

参数

- **primary** –store current primary channel
- **second** –[out] store current second channel

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_country** (const *wifi_country_t* *country)

configure country info

Attention 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.

Attention 2. The default country is CHINA {.cc="CN", .schan=1, .nchan=13, .policy=WIFI_COUNTRY_POLICY_AUTO}.

Attention 3. The third octet of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as ' '.

Attention 4. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc="US", .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc="JP", .schan=1, .nchan=14} then the country info that will be used is {.cc="JP", .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc="US", .schan=1, .nchan=11} in the example.

Attention 5. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

Attention 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 7. The country configuration is stored into flash.

Attention 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

参数 **country** –the configured country info

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_get_country** (*wifi_country_t* *country)

get the current country info

参数 **country** –country info

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_mac** (*wifi_interface_t* ifx, const uint8_t mac[6])

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

Attention 1. This API can only be called when the interface is disabled

Attention 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

Attention 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be "1a:XX:XX:XX:XX:XX", but can not be "15:XX:XX:XX:XX:XX".

参数

- **ifx** –interface
- **mac** –the MAC address

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_get_mac** (*wifi_interface_t* ifx, uint8_t mac[6])

Get mac of specified interface.

参数

- **ifx** –interface
- **mac** –[out] store mac of the interface ifx

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

esp_err_t **esp_wifi_set_promiscuous_rx_cb** (*wifi_promiscuous_cb_t* cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

参数 **cb** –callback

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_promiscuous** (bool en)

Enable the promiscuous mode.

参数 **en** –false - disable, true - enable

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_get_promiscuous** (bool *en)

Get the promiscuous mode.

参数 **en** –[out] store the current status of promiscuous mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_promiscuous_filter** (const *wifi_promiscuous_filter_t* *filter)

Enable the promiscuous mode packet type filter.

备注: The default filter is to filter all packets except WIFI_PKT_MISC

参数 **filter** –the packet type filtered in promiscuous mode.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_get_promiscuous_filter** (*wifi_promiscuous_filter_t* *filter)

Get the promiscuous filter.

参数 **filter** –[out] store the current status of promiscuous filter

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_promiscuous_ctrl_filter** (const *wifi_promiscuous_filter_t* *filter)

Enable subtype filter of the control packet in promiscuous mode.

备注: The default filter is to filter none control packet.

参数 **filter** –the subtype of the control packet filtered in promiscuous mode.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_get_promiscuous_ctrl_filter** (*wifi_promiscuous_filter_t* *filter)

Get the subtype filter of the control packet in promiscuous mode.

参数 **filter** –[out] store the current status of subtype filter of the control packet in promiscuous mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_config** (*wifi_interface_t* interface, *wifi_config_t* *conf)

Set the configuration of the ESP32 STA or AP.

Attention 1. This API can be called only when specified interface is enabled, otherwise, API fail

Attention 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

Attention 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

Attention 4. The configuration will be stored in NVS

参数

- **interface** –interface
- **conf** –station or soft-AP configuration

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the error code in esp_err.h

esp_err_t **esp_wifi_get_config** (*wifi_interface_t* interface, *wifi_config_t* *conf)

Get configuration of specified interface.

参数

- **interface** –interface

- **conf** –[out] station or soft-AP configuration

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

esp_err_t **esp_wifi_ap_get_sta_list** (*wifi_sta_list_t* *sta)

Get STAs associated with soft-AP.

Attention SSC only API

参数 **sta** –[out] station list ap can get the connected sta' s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the *wifi_sta_info_t* struct. For example, phy_11b = 1 imply that sta support 802.11b mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

esp_err_t **esp_wifi_ap_get_sta_aid** (const uint8_t mac[6], uint16_t *aid)

Get AID of STA connected with soft-AP.

参数

- **mac** –STA' s mac address
- **aid** –[out] Store the AID corresponding to STA mac

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

esp_err_t **esp_wifi_set_storage** (*wifi_storage_t* storage)

Set the WiFi API configuration storage type.

Attention 1. The default value is WIFI_STORAGE_FLASH

参数 **storage** –: storage type

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_vendor_ie** (bool enable, *wifi_vendor_ie_type_t* type, *wifi_vendor_ie_id_t* idx, const void *vnd_ie)

Set 802.11 Vendor-Specific Information Element.

参数

- **enable** –If true, specified IE is enabled. If false, specified IE is removed.
- **type** –Information Element type. Determines the frame type to associate with the IE.
- **idx** –Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).

- **vnd_ie** –Pointer to vendor specific element data. First 6 bytes should be a header with fields matching *vendor_ie_data_t*. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

esp_err_t **esp_wifi_set_vendor_ie_cb** (*esp_vendor_ie_cb_t* cb, void *ctx)

Register Vendor-Specific Information Element monitoring callback.

参数

- **cb** –Callback function
- **ctx** –Context argument, passed to callback function.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_max_tx_power** (int8_t power)

Set maximum transmitting power after WiFi start.

Attention 1. Maximum power before wifi startup is limited by PHY init data bin.

Attention 2. The value set by this API will be mapped to the max_tx_power of the structure *wifi_country_t* variable.

Attention 3. Mapping Table {Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

Attention 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

Attention 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

参数 power –Maximum WiFi transmitting power.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument, e.g. parameter is out of range

esp_err_t **esp_wifi_get_max_tx_power** (int8_t *power)

Get maximum transmitting power after WiFi start.

参数 power –Maximum WiFi transmitting power, unit is 0.25dBm.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_event_mask** (uint32_t mask)

Set mask to enable or disable some WiFi events.

Attention 1. Mask can be created by logical OR of various WIFI_EVENT_MASK_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

Attention 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRCVED.

Attention 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

参数 **mask** –WiFi event mask.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_get_event_mask** (uint32_t *mask)

Get mask of WiFi events.

参数 **mask** –WiFi event mask.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_80211_tx** (*wifi_interface_t* ifx, const void *buffer, int len, bool en_sys_seq)

Send raw ieee80211 data.

Attention Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

参数

- **ifx** –interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- **buffer** –raw ieee80211 buffer
- **len** –the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- **en_sys_seq** –indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_INVALID_ARG is returned.

返回

- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

esp_err_t **esp_wifi_set_csi_rx_cb** (*wifi_csi_cb_t* cb, void *ctx)

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

参数

- **cb** –callback
- **ctx** –context argument, passed to callback function

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_csi_config** (const *wifi_csi_config_t* *config)

Set CSI data configuration.

return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

参数 **config** –configuration

esp_err_t **esp_wifi_set_csi** (bool en)

Enable or disable CSI.

return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

参数 **en** –true - enable, false - disable

esp_err_t **esp_wifi_set_ant_gpio** (const *wifi_ant_gpio_config_t* *config)

Set antenna GPIO configuration.

参数 **config** –Antenna GPIO configuration.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

esp_err_t **esp_wifi_get_ant_gpio** (*wifi_ant_gpio_config_t* *config)

Get current antenna GPIO configuration.

参数 **config** –Antenna GPIO configuration.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument, e.g. parameter is NULL

esp_err_t **esp_wifi_set_ant** (const *wifi_ant_config_t* *config)

Set antenna configuration.

参数 **config** –Antenna configuration.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

esp_err_t **esp_wifi_get_ant** (*wifi_ant_config_t* *config)

Get current antenna configuration.

参数 **config** –Antenna configuration.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument, e.g. parameter is NULL

int64_t **esp_wifi_get_tsf_time** (*wifi_interface_t* interface)

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn't receive at least one beacon after connected, will return 0.

Attention Enabling power save may cause the return value inaccurate, except WiFi modem sleep

参数 interface –The interface whose tsf_time is to be retrieved.
返回 0 or the TSF time

esp_err_t **esp_wifi_set_inactive_time** (*wifi_interface_t* ifx, uint16_t sec)

Set the inactive time of the ESP32 STA or AP.

Attention 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

Attention 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

Attention 3. The inactive time configuration is not stored into flash

参数

- **ifx** –interface to be configured.
- **sec** –Inactive time. Unit seconds.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

esp_err_t **esp_wifi_get_inactive_time** (*wifi_interface_t* ifx, uint16_t *sec)

Get inactive time of specified interface.

参数

- **ifx** –Interface to be configured.
- **sec** –Inactive time. Unit seconds.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_stats_dump** (uint32_t modules)

Dump WiFi statistics.

参数 modules –statistic modules to be dumped

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_set_rssi_threshold** (int32_t rssi)

Set RSSI threshold, if average rssi gets lower than threshold, WiFi task will post event WIFI_EVENT_STA_BSS_RSSI_LOW.

Attention If the user wants to receive another WIFI_EVENT_STA_BSS_RSSI_LOW event after receiving one, this API needs to be called again with an updated/same RSSI threshold.

参数 rssi –threshold value in dbm between -100 to 10 Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_ftm_initiate_session** (*wifi_ftm_initiator_cfg_t* *cfg)

Start an FTM Initiator session by sending FTM request. If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

Attention 1. Use this API only in Station mode.

Attention 2. If FTM is initiated on a different channel than Station is connected in or internal SoftAP is started in, FTM defaults to a single burst in ASAP mode.

参数 **cfg** –FTM Initiator session configuration

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_ftm_end_session** (void)

End the ongoing FTM Initiator session.

Attention This API works only on FTM Initiator

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_ftm_resp_set_offset** (int16_t offset_cm)

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

Attention Use this API only in AP mode before performing FTM as responder

参数 **offset_cm** –T1 Offset to be added in centimeters

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_config_11b_rate** (*wifi_interface_t* ifx, bool disable)

Enable or disable 11b rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

Attention 2. Only when really need to disable 11b rate call this API otherwise don't call this.

参数

- **ifx** –Interface to be configured.
- **disable** –true means disable 11b rate while false means enable 11b rate.

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_set_connectionless_wake_interval** (uint16_t interval)

Set interval for station to wake up periodically at disconnected.

Attention 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work

Attention 2. This configuration only work for station mode and disconnected status

Attention 3. This configuration would influence nothing until some module configure wake_window

Attention 4. A sensible interval which is not too small is recommended (e.g. 100ms)

参数 interval –how much milliseconds would the chip wake up, from 1 to 65535.

esp_err_t **esp_wifi_force_wakeup_acquire** (void)

Request extra reference of Wi-Fi radio. Wi-Fi keep active state(RF opened) to be able to receive packets.

Attention Please pair the use of `esp_wifi_force_wakeup_acquire` with `esp_wifi_force_wakeup_release`.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`

esp_err_t **esp_wifi_force_wakeup_release** (void)

Release extra reference of Wi-Fi radio. Wi-Fi go to sleep state(RF closed) if no more use of radio.

Attention Please pair the use of `esp_wifi_force_wakeup_acquire` with `esp_wifi_force_wakeup_release`.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`

esp_err_t **esp_wifi_set_country_code** (const char *country, bool ieee80211d_enabled)

configure country

Attention 1. When `ieee80211d_enabled`, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

Attention 2. When `ieee80211d_enabled` is disabled, then the configured country info is used always.

Attention 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 4. The country configuration is stored into flash.

Attention 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Attention 6. Supported country codes are “01” (world safe mode) “AT” ,” AU” ,” BE” ,” BG” ,” BR” ,” CA” ,” CH” ,” CN” ,” CY” ,” CZ” ,” DE” ,” DK” ,” EE” ,” ES” ,” FI” ,” FR” ,” GB” ,” GR” ,” HK” ,” HR” ,” HU” ,” IE” ,” IN” ,” IS” ,” IT” ,” JP” ,” KR” ,” LI” ,” LT” ,” LU” ,” LV” ,” MT” ,” MX” ,” NL” ,” NO” ,” NZ” ,” PL” ,” PT” ,” RO” ,” SE” ,” SI” ,” SK” ,” TW” ,” US”

Attention 7. When country code “01” (world safe mode) is set, SoftAP mode won't contain country IE.

Attention 8. The default country is “CN” and `ieee80211d_enabled` is TRUE.

Attention 9. The third octet of country code string is one of the following: ‘ ‘, ‘O’, ‘I’, ‘X’, otherwise it is considered as ‘ ‘.

参数

- **country** –the configured country ISO code
- **ieee80211d_enabled** –802.11d is enabled or not

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_get_country_code** (char *country)

get the current country code

参数 **country** –country code

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_config_80211_tx_rate** (*wifi_interface_t* ifx, *wifi_phy_rate_t* rate)

Config 80211 tx rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

参数

- **ifx** –Interface to be configured.
- **rate** –Phy rate to be configured.

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_disable_pmf_config** (*wifi_interface_t* ifx)

Disable PMF configuration for specified interface.

Attention This API should be called after esp_wifi_set_config() and before esp_wifi_start().

参数 **ifx** –Interface to be configured.

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_sta_get_aid** (uint16_t *aid)

Get the Association id assigned to STA by AP.

Attention aid = 0 if station is not connected to AP.

参数 **aid** –[out] store the aid

返回

- ESP_OK: succeed

esp_err_t **esp_wifi_sta_get_negotiated_phymode** (*wifi_phy_mode_t* *phymode)

Get the negotiated phymode after connection.

参数 **phymode** –[out] store the negotiated phymode.

返回

- ESP_OK: succeed

esp_err_t **esp_wifi_sta_get_rssi** (int *rssi)

Get the rssi info after station connected to AP.

Attention This API should be called after station connected to AP.

参数 **rssi** –store the rssi info received from last beacon.

返回

- ESP_OK: succeed
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_FAIL: failed

Structures

struct **wifi_init_config_t**

WiFi stack configuration parameters passed to esp_wifi_init call.

Public Members

system_event_handler_t **event_handler**

WiFi event handler

wifi_osi_funcs_t ***osi_funcs**

WiFi OS functions

wpa_crypto_funcs_t **wpa_crypto_funcs**

WiFi station crypto functions when connect

int **static_rx_buf_num**

WiFi static RX buffer number

int **dynamic_rx_buf_num**

WiFi dynamic RX buffer number

int **tx_buf_type**

WiFi TX buffer type

int **static_tx_buf_num**

WiFi static TX buffer number

int **dynamic_tx_buf_num**

WiFi dynamic TX buffer number

int **rx_mgmt_buf_type**

WiFi RX MGMT buffer type

int **rx_mgmt_buf_num**

WiFi RX MGMT buffer number

- int **cache_tx_buf_num**
WiFi TX cache buffer number
- int **csi_enable**
WiFi channel state information enable flag
- int **ampdu_rx_enable**
WiFi AMPDU RX feature enable flag
- int **ampdu_tx_enable**
WiFi AMPDU TX feature enable flag
- int **amsdu_tx_enable**
WiFi AMSDU TX feature enable flag
- int **nvs_enable**
WiFi NVS flash enable flag
- int **nano_enable**
Nano option for printf/scan family enable flag
- int **rx_ba_win**
WiFi Block Ack RX window size
- int **wifi_task_core_id**
WiFi Task Core ID
- int **beacon_max_len**
WiFi softAP maximum length of the beacon
- int **mgmt_sbuf_num**
WiFi management short buffer number, the minimum value is 6, the maximum value is 32
- uint64_t **feature_caps**
Enables additional WiFi features and capabilities
- bool **sta_disconnected_pm**
WiFi Power Management for station at disconnected status
- int **espnow_max_encrypt_num**
Maximum encrypt number of peers supported by espnow
- int **magic**
WiFi init magic number, it should be the last field

Macros

- ESP_ERR_WIFI_NOT_INIT**
WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED

WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED

WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF

WiFi interface error

ESP_ERR_WIFI_MODE

WiFi mode error

ESP_ERR_WIFI_STATE

WiFi internal state error

ESP_ERR_WIFI_CONN

WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS

WiFi internal NVS module error

ESP_ERR_WIFI_MAC

MAC address is invalid

ESP_ERR_WIFI_SSID

SSID is invalid

ESP_ERR_WIFI_PASSWORD

Password is invalid

ESP_ERR_WIFI_TIMEOUT

Timeout error

ESP_ERR_WIFI_WAKE_FAIL

WiFi is in sleep state(RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK

The caller would block

ESP_ERR_WIFI_NOT_CONNECT

Station still in disconnect status

ESP_ERR_WIFI_POST

Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE

Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE

Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC

The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW

The WiFi TX is disallowed

ESP_ERR_WIFI_DISCARD

Discard frame

ESP_ERR_WIFI_ROC_IN_PROGRESS

ROC op is in progress

Type Definitions

typedef void (***wifi_promiscuous_cb_t**)(void *buf, *wifi_promiscuous_pkt_type_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Param buf Data received. Type of data in buffer (*wifi_promiscuous_pkt_t* or *wifi_pkt_rx_ctrl_t*) indicated by 'type' parameter.

Param type promiscuous packet type.

typedef void (***esp_vendor_ie_cb_t**)(void *ctx, *wifi_vendor_ie_type_t* type, const uint8_t sa[6], const *vendor_ie_data_t* *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

Param ctx Context argument, as passed to `esp_wifi_set_vendor_ie_cb()` when registering callback.

Param type Information element type, based on frame type received.

Param sa Source 802.11 address.

Param vnd_ie Pointer to the vendor specific element data received.

Param rssi Received signal strength indication.

typedef void (***wifi_csi_cb_t**)(void *ctx, *wifi_csi_info_t* *data)

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

Param ctx context argument, passed to `esp_wifi_set_csi_rx_cb()` when registering callback function.

Param data CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File

- `components/esp_wifi/include/esp_wifi_types.h`

Unions

union **wifi_config_t**

#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to `esp_wifi_set_config()` or `esp_wifi_get_config()`

Public Members

wifi_ap_config_t **ap**
configuration of AP

wifi_sta_config_t **sta**
configuration of STA

Structures

struct **wifi_country_t**
Structure describing WiFi country-based regional restrictions.

Public Members

char **cc**[3]
country code string

uint8_t **schan**
start channel

uint8_t **nchan**
total channel number

int8_t **max_tx_power**
This field is used for getting WiFi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

wifi_country_policy_t **policy**
country policy

struct **wifi_active_scan_time_t**
Range of active scan times per channel.

Public Members

uint32_t **min**
minimum active scan time per channel, units: millisecond

uint32_t **max**
maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct **wifi_scan_time_t**
Aggregate of active & passive scan time per channel.

Public Members

wifi_active_scan_time_t **active**

active scan time per channel, units: millisecond.

uint32_t **passive**

passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct **wifi_scan_config_t**

Parameters for an SSID scan.

Public Members

uint8_t ***ssid**

SSID of AP

uint8_t ***bssid**

MAC address of AP

uint8_t **channel**

channel, scan the specific channel

bool **show_hidden**

enable to scan AP whose SSID is hidden

wifi_scan_type_t **scan_type**

scan type, active or passive

wifi_scan_time_t **scan_time**

scan time per channel

uint8_t **home_chan_dwell_time**

time spent at home channel between scanning consecutive channels.

struct **wifi_ap_record_t**

Description of a WiFi AP.

Public Members

uint8_t **bssid**[6]

MAC address of AP

uint8_t **ssid**[33]

SSID of AP

uint8_t **primary**

channel of AP

wifi_second_chan_t **second**

secondary channel of AP

int8_t **rss**

signal strength of AP. Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive

wifi_auth_mode_t **authmode**

authmode of AP

wifi_cipher_type_t **pairwise_cipher**

pairwise cipher of AP

wifi_cipher_type_t **group_cipher**

group cipher of AP

wifi_ant_t **ant**

antenna used to receive beacon from AP

uint32_t **phy_11b**

bit: 0 flag to identify if 11b mode is enabled or not

uint32_t **phy_11g**

bit: 1 flag to identify if 11g mode is enabled or not

uint32_t **phy_11n**

bit: 2 flag to identify if 11n mode is enabled or not

uint32_t **phy_1r**

bit: 3 flag to identify if low rate is enabled or not

uint32_t **wps**

bit: 4 flag to identify if WPS is supported or not

uint32_t **ftm_responder**

bit: 5 flag to identify if FTM is supported in responder mode

uint32_t **ftm_initiator**

bit: 6 flag to identify if FTM is supported in initiator mode

uint32_t **reserved**

bit: 7..31 reserved

wifi_country_t **country**

country information of AP

struct **wifi_scan_threshold_t**

Structure describing parameters for a WiFi fast scan.

Public Members

`int8_t rssi`

The minimum rssi to accept in the fast scan mode

`wifi_auth_mode_t authmode`

The weakest authmode to accept in the fast scan mode

struct `wifi_pmf_config_t`

Configuration structure for Protected Management Frame

Public Members

bool `capable`

Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool `required`

Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct `wifi_ap_config_t`

Soft-AP configuration settings for the ESP32.

Public Members

`uint8_t ssid[32]`

SSID of ESP32 soft-AP. If `ssid_len` field is 0, this must be a Null terminated string. Otherwise, length is set according to `ssid_len`.

`uint8_t password[64]`

Password of ESP32 soft-AP.

`uint8_t ssid_len`

Optional length of SSID field.

`uint8_t channel`

Channel of soft-AP

`wifi_auth_mode_t authmode`

Auth mode of soft-AP. Do not support `AUTH_WEP`, `AUTH_WAPI_PSK` and `AUTH_OWE` in soft-AP mode. When the auth mode is set to `WPA2_PSK`, `WPA2_WPA3_PSK` or `WPA3_PSK`, the pairwise cipher will be overwritten with `WIFI_CIPHER_TYPE_CCMP`.

`uint8_t ssid_hidden`

Broadcast SSID or not, default 0, broadcast the SSID

uint8_t **max_connection**

Max number of stations allowed to connect in

uint16_t **beacon_interval**

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

wifi_cipher_type_t **pairwise_cipher**

Pairwise cipher of SoftAP, group cipher will be derived using this. Cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

bool **ftm_responder**

Enable FTM Responder mode

struct **wifi_sta_config_t**

STA configuration settings for the ESP32.

Public Members

uint8_t **ssid**[32]

SSID of target AP.

uint8_t **password**[64]

Password of target AP.

wifi_scan_method_t **scan_method**

do all channel scan or fast scan

bool **bssid_set**

whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

uint8_t **bssid**[6]

MAC address of target AP

uint8_t **channel**

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

uint16_t **listen_interval**

Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

wifi_sort_method_t **sort_method**

sort the connect AP in the list by rssi or security mode

wifi_scan_threshold_t threshold

When scan_threshold is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

wifi_pmf_config_t pmf_cfg

Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

uint32_t rm_enabled

Whether Radio Measurements are enabled for the connection

uint32_t btm_enabled

Whether BSS Transition Management is enabled for the connection

uint32_t mbo_enabled

Whether MBO is enabled for the connection

uint32_t transition_disable

Whether to enable transition disable feature

uint32_t reserved

Reserved for future feature set

wifi_sae_pwe_method_t sae_pwe_h2e

Configuration for SAE PWE derivation method

uint8_t failure_retry_cnt

Number of connection retries station will do before moving to next AP. scan_method should be set as WIFI_ALL_CHANNEL_SCAN to use this config. Note: Enabling this may cause connection time to increase incase best AP doesn't behave properly.

struct wifi_sta_info_t

Description of STA associated with AP.

Public Members**uint8_t mac[6]**

mac address

int8_t rssi

current average rssi of sta connected

uint32_t phy_11b

bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g

bit: 1 flag to identify if 11g mode is enabled or not

uint32_t **phy_11n**

bit: 2 flag to identify if 11n mode is enabled or not

uint32_t **phy_lr**

bit: 3 flag to identify if low rate is enabled or not

uint32_t **is_mesh_child**

bit: 4 flag to identify mesh child

uint32_t **reserved**

bit: 5..31 reserved

struct **wifi_sta_list_t**

List of stations associated with the ESP32 Soft-AP.

Public Members

wifi_sta_info_t **sta**[(15)]

station list

int **num**

number of stations in the list (other entries are invalid)

struct **vendor_ie_data_t**

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t **element_id**

Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t **length**

Length of all bytes in the element data following this field. Minimum 4.

uint8_t **vendor_oui**[3]

Vendor identifier (OUI).

uint8_t **vendor_oui_type**

Vendor-specific OUI type.

uint8_t **payload**[0]

Payload. Length is equal to value in 'length' field, minus 4.

struct **wifi_pkt_rx_ctrl_t**

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

Public Members

signed **rss_i**

Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned **rate**

PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned **__pad0__**

reserved

unsigned **sig_mode**

0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned **__pad1__**

reserved

unsigned **mcs**

Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned **cwb**

Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned **__pad2__**

reserved

unsigned **smoothing**

reserved

unsigned **not_sounding**

reserved

unsigned **__pad3__**

reserved

unsigned **aggregation**

Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned **stbc**

Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned **fec_coding**

Flag is set for 11n packets which are LDPC

unsigned **sgi**

Short Guide Interval(SGI). 0: Long GI; 1: Short GI

signed **noise_floor**

noise floor of Radio Frequency Module(RF). unit: dBm

unsigned **ampdu_cnt**

ampdu cnt

unsigned **channel**

primary channel on which this packet is received

unsigned **secondary_channel**

secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **__pad4__**

reserved

unsigned **timestamp**

timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **__pad5__**

reserved

unsigned **__pad6__**

reserved

unsigned **ant**

antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **sig_len**

length of packet including Frame Check Sequence(FCS)

unsigned **__pad7__**

reserved

unsigned **rx_state**

state of the packet. 0: no error; others: error numbers which are not public

struct **wifi_promiscuous_pkt_t**

Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

Public Members

wifi_pkt_rx_ctrl_t **rx_ctrl**

metadata header

uint8_t **payload**[0]

Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

struct **wifi_promiscuous_filter_t**

Mask for filtering different packet types in promiscuous mode.

Public Members

uint32_t **filter_mask**

OR of one or more filter values WIFI_PROMIS_FILTER_*

struct **wifi_csi_config_t**

Channel state information(CSI) configuration type.

Public Members

bool **lltf_en**

enable to receive legacy long training field(lltf) data. Default enabled

bool **htltf_en**

enable to receive HT long training field(htltf) data. Default enabled

bool **stbc_htltf2_en**

enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

bool **ltf_merge_en**

enable to generate htltf data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

bool **channel_filter_en**

enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool **manu_scale**

manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8_t **shift**

manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct **wifi_csi_info_t**

CSI data type.

Public Members

wifi_pkt_rx_ctrl_t **rx_ctrl**

received packet radio metadata header of the CSI data

uint8_t **mac**[6]

source MAC address of the CSI data

bool **first_word_invalid**
first four bytes of the CSI data is invalid or not

int8_t ***buf**
buffer of CSI data

uint16_t **len**
length of CSI data

struct **wifi_ant_gpio_t**
WiFi GPIO configuration for antenna selection.

Public Members

uint8_t **gpio_select**
Whether this GPIO is connected to external antenna switch

uint8_t **gpio_num**
The GPIO number that connects to external antenna switch

struct **wifi_ant_gpio_config_t**
WiFi GPIOs configuration for antenna selection.

Public Members

wifi_ant_gpio_t **gpio_cfg[4]**
The configurations of GPIOs that connect to external antenna switch

struct **wifi_ant_config_t**
WiFi antenna configuration.

Public Members

wifi_ant_mode_t **rx_ant_mode**
WiFi antenna mode for receiving

wifi_ant_t **rx_ant_default**
Default antenna mode for receiving, it's ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

wifi_ant_mode_t **tx_ant_mode**
WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

uint8_t **enabled_ant0**
Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t **enabled_ant1**

Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct **wifi_action_tx_req_t**

Action Frame Tx Request.

Public Members

wifi_interface_t **ifx**

WiFi interface to send request to

uint8_t **dest_mac**[6]

Destination MAC address

bool **no_ack**

Indicates no ack required

wifi_action_rx_cb_t **rx_cb**

Rx Callback to receive any response

uint32_t **data_len**

Length of the appended Data

uint8_t **data**[0]

Appended Data payload

struct **wifi_ftm_initiator_cfg_t**

FTM Initiator configuration.

Public Members

uint8_t **resp_mac**[6]

MAC address of the FTM Responder

uint8_t **channel**

Primary channel of the FTM Responder

uint8_t **frm_count**

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16_t **burst_period**

Requested time period between consecutive FTM bursts in 100⁷ s of milliseconds (0 - No pref)

struct **wifi_event_sta_scan_done_t**

Argument structure for WIFI_EVENT_SCAN_DONE event

Public Members**uint32_t status**

status of scanning APs: 0 — success, 1 - failure

uint8_t number

number of scan results

uint8_t scan_id

scan sequence number, used for block scan

struct **wifi_event_sta_connected_t**

Argument structure for WIFI_EVENT_STA_CONNECTED event

Public Members**uint8_t ssid[32]**

SSID of connected AP

uint8_t ssid_len

SSID length of connected AP

uint8_t bssid[6]

BSSID of connected AP

uint8_t channel

channel of connected AP

wifi_auth_mode_t **authmode**

authentication mode used by AP

struct **wifi_event_sta_disconnected_t**

Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members**uint8_t ssid[32]**

SSID of disconnected AP

uint8_t ssid_len

SSID length of disconnected AP

uint8_t bssid[6]

BSSID of disconnected AP

uint8_t reason

reason of disconnection

int8_t **rssi**

rss of disconnection

struct **wifi_event_sta_authmode_change_t**

Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

wifi_auth_mode_t **old_mode**

the old auth mode of AP

wifi_auth_mode_t **new_mode**

the new auth mode of AP

struct **wifi_event_sta_wps_er_pin_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

uint8_t **pin_code**[8]

PIN code of station in enrollee mode

struct **wifi_event_sta_wps_er_success_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

uint8_t **ap_cred_cnt**

Number of AP credentials received

uint8_t **ssid**[32]

SSID of AP

uint8_t **passphrase**[64]

Passphrase for the AP

struct *wifi_event_sta_wps_er_success_t*::[anonymous] **ap_cred**[3]

All AP credentials received from WPS handshake

struct **wifi_event_ap_staconnected_t**

Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

uint8_t **mac**[6]

MAC address of the station connected to ESP32 soft-AP

uint8_t **aid**

the aid that ESP32 soft-AP gives to the station connected to

bool **is_mesh_child**

flag to identify mesh child

struct **wifi_event_ap_stadisconnected_t**

Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t **mac**[6]

MAC address of the station disconnects to ESP32 soft-AP

uint8_t **aid**

the aid that ESP32 soft-AP gave to the station disconnects to

bool **is_mesh_child**

flag to identify mesh child

struct **wifi_event_ap_probe_req_rx_t**

Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int **rssi**

Received probe request signal strength

uint8_t **mac**[6]

MAC address of the station which send probe request

struct **wifi_event_bss_rssi_low_t**

Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t **rssi**

RSSI value of bss

struct **wifi_ftm_report_entry_t**

Argument structure for

Public Members

uint8_t **dlog_token**

Dialog Token of the FTM frame

`int8_t rssi`

RSSI of the FTM frame received

`uint32_t rtt`

Round Trip Time in pSec with a peer

`uint64_t t1`

Time of departure of FTM frame from FTM Responder in pSec

`uint64_t t2`

Time of arrival of FTM frame at FTM Initiator in pSec

`uint64_t t3`

Time of departure of ACK from FTM Initiator in pSec

`uint64_t t4`

Time of arrival of ACK at FTM Responder in pSec

struct `wifi_event_ftm_report_t`

Argument structure for WIFI_EVENT_FTM_REPORT event

Public Members

`uint8_t peer_mac[6]`

MAC address of the FTM Peer

`wifi_ftm_status_t status`

Status of the FTM operation

`uint32_t rtt_raw`

Raw average Round-Trip-Time with peer in Nano-Seconds

`uint32_t rtt_est`

Estimated Round-Trip-Time with peer in Nano-Seconds

`uint32_t dist_est`

Estimated one-way distance in Centi-Meters

`wifi_ftm_report_entry_t *ftm_report_data`

Pointer to FTM Report with multiple entries, should be freed after use

`uint8_t ftm_report_num_entries`

Number of entries in the FTM Report data

struct `wifi_event_action_tx_status_t`

Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

Public Members

wifi_interface_t **ifx**

WiFi interface to send request to

uint32_t **context**

Context to identify the request

uint8_t **da**[6]

Destination MAC address

uint8_t **status**

Status of the operation

struct **wifi_event_roc_done_t**

Argument structure for WIFI_EVENT_ROC_DONE event

Public Members

uint32_t **context**

Context to identify the request

Macros

WIFI_OFFCHAN_TX_REQ

WIFI_OFFCHAN_TX_CANCEL

WIFI_ROC_REQ

WIFI_ROC_CANCEL

WIFI_PROTOCOL_11B

WIFI_PROTOCOL_11G

WIFI_PROTOCOL_11N

WIFI_PROTOCOL_LR

ESP_WIFI_MAX_CONN_NUM

max number of stations which can connect to ESP32/ESP32S3/ESP32S2 soft-AP

WIFI_VENDOR_IE_ELEMENT_ID

WIFI_PROMIS_FILTER_MASK_ALL

filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT

filter the packets with type of WIFI_PKT_MGMT

WIFI_PROMIS_FILTER_MASK_CTRL

filter the packets with type of WIFI_PKT_CTRL

WIFI_PROMIS_FILTER_MASK_DATA

filter the packets with type of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_MISC

filter the packets with type of WIFI_PKT_MISC

WIFI_PROMIS_FILTER_MASK_DATA_MPDU

filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU

filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_FCSFAIL

filter the FCS failed packets, do not open it in general

WIFI_PROMIS_CTRL_FILTER_MASK_ALL

filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER

filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR

filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA

filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL

filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS

filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS

filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK

filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND

filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK

filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL

mask all WiFi events

WIFI_EVENT_MASK_NONE

mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED

mask SYSTEM_EVENT_AP_PROBEREQRECVED event

MAX_SSID_LEN**MAX_PASSPHRASE_LEN****MAX_WPS_AP_CRED****WIFI_STATIS_BUFFER****WIFI_STATIS_RXTX****WIFI_STATIS_HW****WIFI_STATIS_DIAG****WIFI_STATIS_PS****WIFI_STATIS_ALL**

Type Definitions

```
typedef int (*wifi_action_rx_cb_t)(uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)
```

The Rx callback function of Action Tx operations.

Param hdr pointer to the IEEE 802.11 Header structure

Param payload pointer to the Payload following 802.11 Header

Param len length of the Payload

Param channel channel number the frame is received on

Enumerations

```
enum wifi_mode_t
```

Values:

enumerator **WIFI_MODE_NULL**

null mode

enumerator **WIFI_MODE_STA**

WiFi station mode

enumerator **WIFI_MODE_AP**

WiFi soft-AP mode

enumerator **WIFI_MODE_APSTA**

WiFi station + soft-AP mode

enumerator **WIFI_MODE_MAX**

enum **wifi_interface_t**

Values:

enumerator **WIFI_IF_STA**

enumerator **WIFI_IF_AP**

enum **wifi_country_policy_t**

Values:

enumerator **WIFI_COUNTRY_POLICY_AUTO**

Country policy is auto, use the country info of AP to which the station is connected

enumerator **WIFI_COUNTRY_POLICY_MANUAL**

Country policy is manual, always use the configured country info

enum **wifi_auth_mode_t**

Values:

enumerator **WIFI_AUTH_OPEN**

authenticate mode : open

enumerator **WIFI_AUTH_WEP**

authenticate mode : WEP

enumerator **WIFI_AUTH_WPA_PSK**

authenticate mode : WPA_PSK

enumerator **WIFI_AUTH_WPA2_PSK**

authenticate mode : WPA2_PSK

enumerator **WIFI_AUTH_WPA_WPA2_PSK**

authenticate mode : WPA_WPA2_PSK

enumerator **WIFI_AUTH_ENTERPRISE**

authenticate mode : WiFi EAP security

enumerator **WIFI_AUTH_WPA2_ENTERPRISE**

authenticate mode : WiFi EAP security

enumerator **WIFI_AUTH_WPA3_PSK**

authenticate mode : WPA3_PSK

enumerator **WIFI_AUTH_WPA2_WPA3_PSK**

authenticate mode : WPA2_WPA3_PSK

enumerator **WIFI_AUTH_WAPI_PSK**

authenticate mode : WAPI_PSK

enumerator **WIFI_AUTH_WPA3_ENT_192**

authenticate mode : WPA3_ENT_SUITE_B_192_BIT

enumerator **WIFI_AUTH_MAX**

enum **wifi_err_reason_t**

Values:

enumerator **WIFI_REASON_UNSPECIFIED**

enumerator **WIFI_REASON_AUTH_EXPIRE**

enumerator **WIFI_REASON_AUTH_LEAVE**

enumerator **WIFI_REASON_ASSOC_EXPIRE**

enumerator **WIFI_REASON_ASSOC_TOOMANY**

enumerator **WIFI_REASON_NOT_AUTHED**

enumerator **WIFI_REASON_NOT_ASSOCED**

enumerator **WIFI_REASON_ASSOC_LEAVE**

enumerator **WIFI_REASON_ASSOC_NOT_AUTHED**

enumerator **WIFI_REASON_DISASSOC_PWRCAP_BAD**

enumerator **WIFI_REASON_DISASSOC_SUPCHAN_BAD**

enumerator **WIFI_REASON_BSS_TRANSITION_DISASSOC**

enumerator **WIFI_REASON_IE_INVALID**

enumerator **WIFI_REASON_MIC_FAILURE**

enumerator **WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT**

enumerator **WIFI_REASON_GROUP_KEY_UPDATE_TIMEOUT**

enumerator **WIFI_REASON_IE_IN_4WAY_DIFFERS**

enumerator **WIFI_REASON_GROUP_CIPHER_INVALID**

enumerator **WIFI_REASON_PAIRWISE_CIPHER_INVALID**

enumerator **WIFI_REASON_AKMP_INVALID**

enumerator **WIFI_REASON_UNSUPP_RSN_IE_VERSION**

enumerator **WIFI_REASON_INVALID_RSN_IE_CAP**

enumerator **WIFI_REASON_802_1X_AUTH_FAILED**

enumerator **WIFI_REASON_CIPHER_SUITE_REJECTED**

enumerator **WIFI_REASON_TDLS_PEER_UNREACHABLE**

enumerator **WIFI_REASON_TDLS_UNSPECIFIED**

enumerator **WIFI_REASON_SSP_REQUESTED_DISASSOC**

enumerator **WIFI_REASON_NO_SSP_ROAMING_AGREEMENT**

enumerator **WIFI_REASON_BAD_CIPHER_OR_AKM**

enumerator **WIFI_REASON_NOT_AUTHORIZED_THIS_LOCATION**

enumerator **WIFI_REASON_SERVICE_CHANGE_PERCLUDES_TS**

enumerator **WIFI_REASON_UNSPECIFIED_QOS**

enumerator **WIFI_REASON_NOT_ENOUGH_BANDWIDTH**

enumerator **WIFI_REASON_MISSING_ACKS**

enumerator **WIFI_REASON_EXCEEDED_TXOP**

enumerator **WIFI_REASON_STA_LEAVING**

enumerator **WIFI_REASON_END_BA**

enumerator **WIFI_REASON_UNKNOWN_BA**

enumerator **WIFI_REASON_TIMEOUT**

enumerator **WIFI_REASON_PEER_INITIATED**

enumerator **WIFI_REASON_AP_INITIATED**

enumerator **WIFI_REASON_INVALID_FT_ACTION_FRAME_COUNT**

enumerator **WIFI_REASON_INVALID_PMKID**

enumerator **WIFI_REASON_INVALID_MDE**

enumerator **WIFI_REASON_INVALID_FTE**

enumerator **WIFI_REASON_TRANSMISSION_LINK_ESTABLISH_FAILED**

enumerator **WIFI_REASON_ALTERATIVE_CHANNEL_OCCUPIED**

enumerator **WIFI_REASON_BEACON_TIMEOUT**

enumerator **WIFI_REASON_NO_AP_FOUND**

enumerator **WIFI_REASON_AUTH_FAIL**

enumerator **WIFI_REASON_ASSOC_FAIL**

enumerator **WIFI_REASON_HANDSHAKE_TIMEOUT**

enumerator **WIFI_REASON_CONNECTION_FAIL**

enumerator **WIFI_REASON_AP_TSF_RESET**

enumerator **WIFI_REASON_ROAMING**

enumerator **WIFI_REASON_ASSOC_COMEBACK_TIME_TOO_LONG**

enumerator **WIFI_REASON_SA_QUERY_TIMEOUT**

enum **wifi_second_chan_t**

Values:

enumerator **WIFI_SECOND_CHAN_NONE**

the channel width is HT20

enumerator **WIFI_SECOND_CHAN_ABOVE**

the channel width is HT40 and the secondary channel is above the primary channel

enumerator **WIFI_SECOND_CHAN_BELOW**

the channel width is HT40 and the secondary channel is below the primary channel

enum **wifi_scan_type_t**

Values:

enumerator **WIFI_SCAN_TYPE_ACTIVE**

active scan

enumerator **WIFI_SCAN_TYPE_PASSIVE**

passive scan

enum **wifi_cipher_type_t**

Values:

enumerator **WIFI_CIPHER_TYPE_NONE**

the cipher type is none

enumerator **WIFI_CIPHER_TYPE_WEP40**

the cipher type is WEP40

enumerator **WIFI_CIPHER_TYPE_WEP104**

the cipher type is WEP104

enumerator **WIFI_CIPHER_TYPE_TKIP**

the cipher type is TKIP

enumerator **WIFI_CIPHER_TYPE_CCMP**

the cipher type is CCMP

enumerator **WIFI_CIPHER_TYPE_TKIP_CCMP**

the cipher type is TKIP and CCMP

enumerator **WIFI_CIPHER_TYPE_AES_CMAC128**

the cipher type is AES-CMAC-128

enumerator **WIFI_CIPHER_TYPE_SMS4**

the cipher type is SMS4

enumerator **WIFI_CIPHER_TYPE_GCMP**

the cipher type is GCMP

enumerator **WIFI_CIPHER_TYPE_GCMP256**

the cipher type is GCMP-256

enumerator **WIFI_CIPHER_TYPE_AES_GMAC128**

the cipher type is AES-GMAC-128

enumerator **WIFI_CIPHER_TYPE_AES_GMAC256**

the cipher type is AES-GMAC-256

enumerator **WIFI_CIPHER_TYPE_UNKNOWN**

the cipher type is unknown

enum **wifi_ant_t**

WiFi antenna.

Values:

enumerator **WIFI_ANT_ANT0**

WiFi antenna 0

enumerator **WIFI_ANT_ANT1**

WiFi antenna 1

enumerator **WIFI_ANT_MAX**

Invalid WiFi antenna

enum **wifi_scan_method_t**

Values:

enumerator **WIFI_FAST_SCAN**

Do fast scan, scan will end after find SSID match AP

enumerator **WIFI_ALL_CHANNEL_SCAN**

All channel scan, scan will end after scan all the channel

enum **wifi_sort_method_t**

Values:

enumerator **WIFI_CONNECT_AP_BY_SIGNAL**

Sort match AP in scan list by RSSI

enumerator **WIFI_CONNECT_AP_BY_SECURITY**

Sort match AP in scan list by security mode

enum **wifi_ps_type_t**

Values:

enumerator **WIFI_PS_NONE**

No power save

enumerator **WIFI_PS_MIN_MODEM**

Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

enumerator **WIFI_PS_MAX_MODEM**

Maximum modem power saving. In this mode, interval to receive beacons is determined by the `listen_interval` parameter in [wifi_sta_config_t](#)

enum **wifi_bandwidth_t**

Values:

enumerator **WIFI_BW_HT20**

enumerator **WIFI_BW_HT40**

enum **wifi_sae_pwe_method_t**

Configuration for SAE PWE derivation

Values:

enumerator **WPA3_SAE_PWE_UNSPECIFIED**

enumerator **WPA3_SAE_PWE_HUNT_AND_PECK**

enumerator **WPA3_SAE_PWE_HASH_TO_ELEMENT**

enumerator **WPA3_SAE_PWE_BOTH**

enum **wifi_storage_t**

Values:

enumerator **WIFI_STORAGE_FLASH**

all configuration will store in both memory and flash

enumerator **WIFI_STORAGE_RAM**

all configuration will only store in the memory

enum **wifi_vendor_ie_type_t**

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

Values:

enumerator **WIFI_VND_IE_TYPE_BEACON**

enumerator **WIFI_VND_IE_TYPE_PROBE_REQ**

enumerator **WIFI_VND_IE_TYPE_PROBE_RESP**

enumerator **WIFI_VND_IE_TYPE_ASSOC_REQ**

enumerator **WIFI_VND_IE_TYPE_ASSOC_RESP**

enum **wifi_vendor_ie_id_t**

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

Values:

enumerator **WIFI_VND_IE_ID_0**

enumerator **WIFI_VND_IE_ID_1**

enum **wifi_phy_mode_t**

Operation Phymode.

Values:

enumerator **WIFI_PHY_MODE_LR**

PHY mode for Low Rate

enumerator **WIFI_PHY_MODE_11B**

PHY mode for 11b

enumerator **WIFI_PHY_MODE_11G**

PHY mode for 11g

enumerator **WIFI_PHY_MODE_HT20**

PHY mode for Bandwidth HT20

enumerator **WIFI_PHY_MODE_HT40**

PHY mode for Bandwidth HT40

enumerator **WIFI_PHY_MODE_HE20**

PHY mode for Bandwidth HE20

enum **wifi_promiscuous_pkt_type_t**

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

Values:

enumerator **WIFI_PKT_MGMT**

Management frame, indicates ‘buf’ argument is *wifi_promiscuous_pkt_t*

enumerator **WIFI_PKT_CTRL**

Control frame, indicates ‘buf’ argument is *wifi_promiscuous_pkt_t*

enumerator **WIFI_PKT_DATA**

Data frame, indicates 'buf' argument is *wifi_promiscuous_pkt_t*

enumerator **WIFI_PKT_MISC**

Other type, such as MIMO etc. 'buf' argument is *wifi_promiscuous_pkt_t* but the payload is zero length.

enum **wifi_ant_mode_t**

WiFi antenna mode.

Values:

enumerator **WIFI_ANT_MODE_ANT0**

Enable WiFi antenna 0 only

enumerator **WIFI_ANT_MODE_ANT1**

Enable WiFi antenna 1 only

enumerator **WIFI_ANT_MODE_AUTO**

Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator **WIFI_ANT_MODE_MAX**

Invalid WiFi enabled antenna

enum **wifi_phy_rate_t**

WiFi PHY rate encodings.

Values:

enumerator **WIFI_PHY_RATE_1M_L**

1 Mbps with long preamble

enumerator **WIFI_PHY_RATE_2M_L**

2 Mbps with long preamble

enumerator **WIFI_PHY_RATE_5M_L**

5.5 Mbps with long preamble

enumerator **WIFI_PHY_RATE_11M_L**

11 Mbps with long preamble

enumerator **WIFI_PHY_RATE_2M_S**

2 Mbps with short preamble

enumerator **WIFI_PHY_RATE_5M_S**

5.5 Mbps with short preamble

- enumerator **WIFI_PHY_RATE_MCS7_LGI**
MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS0_SGI**

MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS1_SGI**

MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS2_SGI**

MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS3_SGI**

MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS4_SGI**

MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS5_SGI**

MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS6_SGI**

MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS7_SGI**

MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_LORA_250K**

250 Kbps

enumerator **WIFI_PHY_RATE_LORA_500K**

500 Kbps

enumerator **WIFI_PHY_RATE_MAX**

enum **wifi_event_t**

WiFi event declarations

Values:

enumerator **WIFI_EVENT_WIFI_READY**

ESP32 WiFi ready

enumerator **WIFI_EVENT_SCAN_DONE**

ESP32 finish scanning AP

enumerator **WIFI_EVENT_STA_START**

ESP32 station start

enumerator **WIFI_EVENT_STA_STOP**

ESP32 station stop

- enumerator **WIFI_EVENT_STA_CONNECTED**
ESP32 station connected to AP

- enumerator **WIFI_EVENT_STA_DISCONNECTED**
ESP32 station disconnected from AP

- enumerator **WIFI_EVENT_STA_AUTHMODE_CHANGE**
the auth mode of AP connected by ESP32 station changed

- enumerator **WIFI_EVENT_STA_WPS_ER_SUCCESS**
ESP32 station wps succeeds in enrollee mode

- enumerator **WIFI_EVENT_STA_WPS_ER_FAILED**
ESP32 station wps fails in enrollee mode

- enumerator **WIFI_EVENT_STA_WPS_ER_TIMEOUT**
ESP32 station wps timeout in enrollee mode

- enumerator **WIFI_EVENT_STA_WPS_ER_PIN**
ESP32 station wps pin code in enrollee mode

- enumerator **WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP**
ESP32 station wps overlap in enrollee mode

- enumerator **WIFI_EVENT_AP_START**
ESP32 soft-AP start

- enumerator **WIFI_EVENT_AP_STOP**
ESP32 soft-AP stop

- enumerator **WIFI_EVENT_AP_STACONNECTED**
a station connected to ESP32 soft-AP

- enumerator **WIFI_EVENT_AP_STADISCONNECTED**
a station disconnected from ESP32 soft-AP

- enumerator **WIFI_EVENT_AP_PROBEREQRCVD**
Receive probe request packet in soft-AP interface

- enumerator **WIFI_EVENT_FTM_REPORT**
Receive report of FTM procedure

- enumerator **WIFI_EVENT_STA_BSS_RSSI_LOW**
AP' s RSSI crossed configured threshold

- enumerator **WIFI_EVENT_ACTION_TX_STATUS**
Status indication of Action Tx operation

enumerator **WIFI_EVENT_ROC_DONE**
Remain-on-Channel operation complete

enumerator **WIFI_EVENT_STA_BEACON_TIMEOUT**
ESP32 station beacon timeout

enumerator **WIFI_EVENT_MAX**
Invalid WiFi event ID

enum **wifi_event_sta_wps_fail_reason_t**
Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event
Values:

enumerator **WPS_FAIL_REASON_NORMAL**
ESP32 WPS normal fail reason

enumerator **WPS_FAIL_REASON_RECV_M2D**
ESP32 WPS receive M2D frame

enumerator **WPS_FAIL_REASON_MAX**

enum **wifi_ftm_status_t**
FTM operation status types.
Values:

enumerator **FTM_STATUS_SUCCESS**
FTM exchange is successful

enumerator **FTM_STATUS_UNSUPPORTED**
Peer does not support FTM

enumerator **FTM_STATUS_CONF_REJECTED**
Peer rejected FTM configuration in FTM Request

enumerator **FTM_STATUS_NO_RESPONSE**
Peer did not respond to FTM Requests

enumerator **FTM_STATUS_FAIL**
Unknown error during FTM exchange

SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32 devices, check [配网 API](#).

Application Example Connect ESP32 to target AP using SmartConfig: [wifi/smart_config](#).

API Reference

Header File

- [components/esp_wifi/include/esp_smartconfig.h](#)

Functions

const char ***esp_smartconfig_get_version** (void)

Get the version of SmartConfig.

返回

- SmartConfig version const char.

esp_err_t **esp_smartconfig_start** (const *smartconfig_start_config_t* *config)

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.

Attention 2. Can not call `esp_smartconfig_start` twice before it finish, please call `esp_smartconfig_stop` first.

参数 config –pointer to smartconfig start configure structure

返回

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_stop** (void)

Stop SmartConfig, free the buffer taken by `esp_smartconfig_start`.

Attention Whether connect to AP succeed or not, this API should be called to free memory taken by `smartconfig_start`.

返回

- ESP_OK: succeed
- others: fail

esp_err_t **esp_esptouch_set_timeout** (uint8_t time_s)

Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

参数 time_s –range 15s~255s, offset:45s.

返回

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_set_type** (*smartconfig_type_t* type)

Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

参数 type –Choose from the `smartconfig_type_t`.

返回

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_fast_mode** (bool enable)

Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API `esp_smartconfig_start`.

Attention 2. Fast mode have corresponding APP(phone).

Attention 3. Two mode is compatible.

参数 **enable** –false-disable(default); true-enable;

返回

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_get_rvd_data** (uint8_t *rvd_data, uint8_t len)

Get reserved data of ESPTouch v2.

参数

- **rvd_data** –reserved data
- **len** –length of reserved data

返回

- ESP_OK: succeed
- others: fail

Structures

struct **smartconfig_event_got_ssid_pswd_t**

Argument structure for SC_EVENT_GOT_SSID_PSWD event

Public Members

uint8_t **ssid**[32]

SSID of the AP. Null terminated string.

uint8_t **password**[64]

Password of the AP. Null terminated string.

bool **bssid_set**

whether set MAC address of target AP or not.

uint8_t **bssid**[6]

MAC address of target AP.

smartconfig_type_t **type**

Type of smartconfig(ESPTouch or AirKiss).

uint8_t **token**

Token from cellphone which is used to send ACK to cellphone.

uint8_t **cellphone_ip**[4]

IP address of cellphone.

struct **smartconfig_start_config_t**

Configure structure for esp_smartconfig_start

Public Members

bool **enable_log**

Enable smartconfig logs.

bool **esp_touch_v2_enable_crypt**

Enable ESPTouch v2 crypt.

char ***esp_touch_v2_key**

ESPTouch v2 crypt key, len should be 16.

Macros

SMARTCONFIG_START_CONFIG_DEFAULT ()

Enumerations

enum **smartconfig_type_t**

Values:

enumerator **SC_TYPE_ESPTOUCH**

protocol: ESPTouch

enumerator **SC_TYPE_AIRKISS**

protocol: AirKiss

enumerator **SC_TYPE_ESPTOUCH_AIRKISS**

protocol: ESPTouch and AirKiss

enumerator **SC_TYPE_ESPTOUCH_V2**

protocol: ESPTouch v2

enum **smartconfig_event_t**

Smartconfig event declarations

Values:

enumerator **SC_EVENT_SCAN_DONE**

ESP32 station smartconfig has finished to scan for APs

enumerator **SC_EVENT_FOUND_CHANNEL**

ESP32 station smartconfig has found the channel of the target AP

enumerator **SC_EVENT_GOT_SSID_PSWD**

ESP32 station smartconfig got the SSID and password

enumerator **SC_EVENT_SEND_ACK_DONE**

ESP32 station smartconfig has sent ACK to cellphone

ESP-NOW

概述 ESP-NOW 是一种由乐鑫公司定义的无连接 Wi-Fi 通信协议。在 ESP-NOW 中，应用程序数据被封装在各个供应商的动作帧中，然后在无连接的情况下，从一个 Wi-Fi 设备传输到另一个 Wi-Fi 设备。CTR 与 CBC-MAC 协议 (CCMP) 可用于保护动作帧的安全。ESP-NOW 广泛应用于智能照明、远程控制、传感器等领域。

帧格式 ESP-NOW 使用各个供应商的动作帧传输数据，默认比特率为 1 Mbps。各个供应商的动作帧格式为：

- 分类代码：分类代码字段可用于指示各个供应商的类别（比如 127）。
- 组织标识符：组织标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字节。
- 随机值：防止重放攻击。
- 供应商特定内容：供应商特定内容包含供应商特定字段，如下所示：

- 元素 ID：元素 ID 字段可用于指示特定于供应商的元素。
- 长度：长度是组织标识符、类型、版本和正文的总长度。
- 组织标识符：组织标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字节。
- 类型：类型字段设置为 4，代表 ESP-NOW。
- 版本：版本字段设置为 ESP-NOW 的版本。
- 正文：正文包含 ESP-NOW 数据。

由于 ESP-NOW 是无连接的，因此 MAC 报头与标准帧略有不同。FrameControl 字段的 FromDS 和 ToDS 位均为 0。第一个地址字段用于配置目标地址。第二个地址字段用于配置源地址。第三个地址字段用于配置广播地址 (0xff:0xff:0xff:0xff:0xff:0xff)。

安全

ESP-NOW 采用 CCMP 方法保护供应商特定动作帧的安全，具体可参考 IEEE Std. 802.11-2012。Wi-Fi 设备维护一个初始

- PMK 可使用 AES-128 算法加密 LMK。请调用 `esp_now_set_pmk()` 设置 PMK。如果未设置 PMK，将使用默认 PMK。
- LMK 可通过 CCMP 方法对供应商特定的动作帧进行加密，最多拥有 6 个不同的 LMK。如果未设置配对设备的 LMK，则动作帧不进行加密。

目前，不支持加密组播供应商特定的动作帧。

初始化和反初始化 调用 `esp_now_init()` 初始化 ESP-NOW，调用 `esp_now_deinit()` 反初始化 ESP-NOW。ESP-NOW 数据必须在 Wi-Fi 启动后传输，因此建议在初始化 ESP-NOW 之前启动 Wi-Fi，并在反初始化 ESP-NOW 之后停止 Wi-Fi。当调用 `esp_now_deinit()` 时，配对设备的所有信息都将被删除。

添加配对设备 在将数据发送到其他设备之前，请先调用 `esp_now_add_peer()` 将其添加到配对设备列表中。如果启用了加密，则必须设置 LMK。ESP-NOW 数据可以从 Station 或 Softap 接口发送。确保在发送 ESP-NOW 数据之前已启用该接口。

配对设备的最大数量是 20，其中加密设备的数量不超过 17，默认值是 7。如果想要修改加密设备的数量，在 WiFi menuconfig 设置 `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM`。

在发送广播数据之前必须添加具有广播 MAC 地址的设备。配对设备的信道范围是从 0 ~ 14。如果信道设置为 0，数据将在当前信道上发送。否则，必须使用本地设备所在的通道。

发送 ESP-NOW 数据 调用 `esp_now_send()` 发送 ESP-NOW 数据，调用 `esp_now_register_send_cb()` 注册发送回调函数。如果 MAC 层成功接收到数据，则该函数将返回 `ESP_NOW_SEND_SUCCESS` 事件。否则，它将返回 `ESP_NOW_SEND_FAIL`。ESP-NOW 数据发送失败可能有几种原因，比如目标设备不存在、设备的信道不相同、动作帧在传输过程中丢失等。应用层并不一定可以总能接收到数据。如果需要，应用层可在接收 ESP-NOW 数据时发回一个应答 (ACK) 数据。如果接收 ACK 数据超时，则将重新传输 ESP-NOW 数据。可以为 ESP-NOW 数据设置序列号，从而删除重复的数据。

如果有大量 ESP-NOW 数据要发送，则调用 `esp_now_send()` 一次性发送不大于 250 字节的数据。请注意，两个 ESP-NOW 数据包的发送间隔太短可能导致回调函数返回混乱。因此，建议在等到上一次回调函数返回 ACK 后再发送下一个 ESP-NOW 数据。发送回调函数从高优先级的 Wi-Fi 任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数发布到队列，并交给优先级较低的任务处理。

接收 ESP-NOW 数据 调用 `esp_now_register_rcv_cb()` 注册接收回调函数。当接收 ESP-NOW 数据时，需要调用接收回调函数。接收回调函数也在 Wi-Fi 任务任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数发布到队列，并交给优先级较低的任务处理。

配置 ESP-NOW 速率 调用 `esp_wifi_config_espnw_rate()` 配置指定接口的 ESPNOW 速率。确保在配置速率之前使能接口。这个 API 应该在 `esp_wifi_start()` 之后调用。

应用示例

- 如何在设备间传输 ESP-NOW 数据：[wifi/espnw](#)。
- 了解更多 ESP-NOW 的应用示例，请参考 [README.md](#) 文件。

API 参考

Header File

- `components/esp_wifi/include/esp_now.h`

Functions***esp_err_t* esp_now_init** (void)

Initialize ESPNOW function.

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_INTERNAL : Internal error

***esp_err_t* esp_now_deinit** (void)

De-initialize ESPNOW function.

返回

- ESP_OK : succeed

***esp_err_t* esp_now_get_version** (uint32_t *version)

Get the version of ESPNOW.

参数 **version** –ESPNOW version

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_ARG : invalid argument

***esp_err_t* esp_now_register_recv_cb** (*esp_now_recv_cb_t* cb)

Register callback function of receiving ESPNOW data.

参数 **cb** –callback function of receiving ESPNOW data

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

***esp_err_t* esp_now_unregister_recv_cb** (void)

Unregister callback function of receiving ESPNOW data.

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

***esp_err_t* esp_now_register_send_cb** (*esp_now_send_cb_t* cb)

Register callback function of sending ESPNOW data.

参数 **cb** –callback function of sending ESPNOW data

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

***esp_err_t* esp_now_unregister_send_cb** (void)

Unregister callback function of sending ESPNOW data.

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

***esp_err_t* esp_now_send** (const uint8_t *peer_addr, const uint8_t *data, size_t len)

Send ESPNOW data.

Attention 1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr**Attention** 2. If peer_addr is NULL, send data to all of the peers that are added to the peer list**Attention** 3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN**Attention** 4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

参数

- **peer_addr** –peer MAC address
- **data** –data to send
- **len** –length of data

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_INTERNAL : internal error
- ESP_ERR_ESPNOW_NO_MEM : out of memory, when this happens, you can delay a while before sending the next data
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found
- ESP_ERR_ESPNOW_IF : current WiFi interface doesn't match that of peer

esp_err_t **esp_now_add_peer** (const *esp_now_peer_info_t* *peer)

Add a peer to peer list.

参数 **peer** –peer information

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_FULL : peer list is full
- ESP_ERR_ESPNOW_NO_MEM : out of memory
- ESP_ERR_ESPNOW_EXIST : peer has existed

esp_err_t **esp_now_del_peer** (const uint8_t *peer_addr)

Delete a peer from peer list.

参数 **peer_addr** –peer MAC address

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

esp_err_t **esp_now_mod_peer** (const *esp_now_peer_info_t* *peer)

Modify a peer.

参数 **peer** –peer information

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_FULL : peer list is full

esp_err_t **esp_wifi_config_espnow_rate** (*wifi_interface_t* ifx, *wifi_phy_rate_t* rate)

Config ESPNOW rate of specified interface.

Attention 1. This API should be called after `esp_wifi_start()`.

参数

- **ifx** –Interface to be configured.
- **rate** –Phy rate to be configured.

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_now_get_peer** (const uint8_t *peer_addr, *esp_now_peer_info_t* *peer)

Get a peer whose MAC address matches peer_addr from peer list.

参数

- **peer_addr** –peer MAC address
- **peer** –peer information

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

esp_err_t **esp_now_fetch_peer** (bool from_head, *esp_now_peer_info_t* *peer)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

参数

- **from_head** –fetch from head of list or not
- **peer** –peer information

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

bool **esp_now_is_peer_exist** (const uint8_t *peer_addr)

Peer exists or not.

参数 **peer_addr** –peer MAC address

返回

- true : peer exists
- false : peer not exists

esp_err_t **esp_now_get_peer_num** (*esp_now_peer_num_t* *num)

Get the number of peers.

参数 **num** –number of peers

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument

esp_err_t **esp_now_set_pmk** (const uint8_t *pmk)

Set the primary master key.

Attention 1. primary master key is used to encrypt local master key

参数 **pmk** –primary master key

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument

esp_err_t **esp_now_set_wake_window** (uint16_t window)

Set esp_now wake window for sta_disconnected power management.

Attention 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work

Attention 2. This configuration only work for station mode and disconnected status

Attention 3. If more than one module has configured its wake_window, chip would choose the largest one to stay waked

Attention 4. If the gap between interval and window is smaller than 5ms, the chip would keep waked all the time

Attention 5. If never configured wake_window, the chip would keep waked at disconnected once it uses esp_now

参数 window –how much microsecond would the chip keep waked each interval, vary from 0 to 65535

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

Structures

struct **esp_now_peer_info**

ESPNOW peer information parameters.

Public Members

uint8_t **peer_addr**[6]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8_t **lmk**[16]

ESPNOW peer local master key that is used to encrypt data

uint8_t **channel**

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

wifi_interface_t **ifidx**

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool **encrypt**

ESPNOW data that this peer sends/receives is encrypted or not

void ***priv**

ESPNOW peer private data

struct **esp_now_peer_num**

Number of ESPNOW peers which exist currently.

Public Members

int **total_num**

Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

int **encrypt_num**

Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM

Macros

ESP_ERR_ESPNOW_BASE

ESPNOW error number base.

ESP_ERR_ESPNOW_NOT_INIT

ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG

Invalid argument

ESP_ERR_ESPNOW_NO_MEM

Out of memory

ESP_ERR_ESPNOW_FULL

ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND

ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL

Internal error

ESP_ERR_ESPNOW_EXIST

ESPNOW peer has existed

ESP_ERR_ESPNOW_IF

Interface error

ESP_NOW_ETH_ALEN

Length of ESPNOW peer MAC address

ESP_NOW_KEY_LEN

Length of ESPNOW peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM

Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM

Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN

Maximum length of ESPNOW data which is sent very time

Type Definitions

typedef struct *esp_now_peer_info* **esp_now_peer_info_t**

ESPNOW peer information parameters.

typedef struct *esp_now_peer_num* **esp_now_peer_num_t**

Number of ESPNOW peers which exist currently.

```
typedef void (*esp_now_recv_cb_t)(const uint8_t *mac_addr, const uint8_t *data, int data_len)
```

Callback function of receiving ESPNOW data.

Param mac_addr peer MAC address
Param data received data
Param data_len length of received data

```
typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
```

Callback function of sending ESPNOW data.

Param mac_addr peer MAC address
Param status status of sending ESPNOW data (succeed or fail)

Enumerations

```
enum esp_now_send_status_t
```

Status of sending ESPNOW data .

Values:

```
enumerator ESP_NOW_SEND_SUCCESS
```

Send ESPNOW data successfully

```
enumerator ESP_NOW_SEND_FAIL
```

Send ESPNOW data fail

ESP-WIFI-MESH 编程指南

这是 ESP-WIFI-MESH 的编程指南，包括 API 参考和编码示例。本指南分为以下部分：

1. [ESP-WIFI-MESH 编程模型](#)
2. [编写 ESP-WIFI-MESH 应用程序](#)
3. [自组网](#)
4. [应用实例](#)
5. [API 参考](#)

有关 ESP-WIFI-MESH 协议的文档，请见[ESP-WIFI-MESH API 指南](#)。有关 ESP-WIFI-MESH 开发框架的更多内容，请见 [ESP-WIFI-MESH 开发框架](#)。

ESP-WIFI-MESH 编程模型

软件栈 ESP-WIFI-MESH 软件栈基于 Wi-Fi 驱动程序和 FreeRTOS 构建，某些情况下（如根节点）也会使用 LwIP 软件栈。下图展示了 ESP-WIFI-MESH 软件栈。

系统事件 应用程序可通过 **ESP-WIFI-MESH 事件** 与 ESP-WIFI-MESH 交互。由于 ESP-WIFI-MESH 构建在 Wi-Fi 软件栈之上，因此也可以通过 **Wi-Fi 事件任务** 与 Wi-Fi 驱动程序进行交互。下图展示了 ESP-WIFI-MESH 应用程序中各种系统事件的接口。

`mesh_event_id_t` 定义了所有可能的 ESP-WIFI-MESH 事件，并且可以指示父节点和子节点的连接或断开等事件。应用程序如需使用 ESP-WIFI-MESH 事件，则必须通过 `esp_event_handler_register()` 将 **Mesh 事件处理程序** 注册在默认事件任务中。注册完成后，ESP-WIFI-MESH 事件将包含与应用程序所有相关事件相关的处理程序。

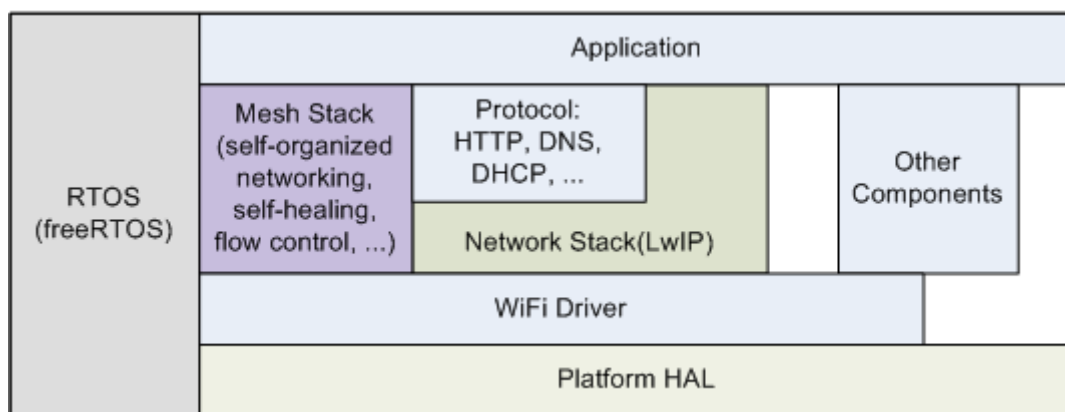

图 2: ESP-WIFI-MESH 软件栈

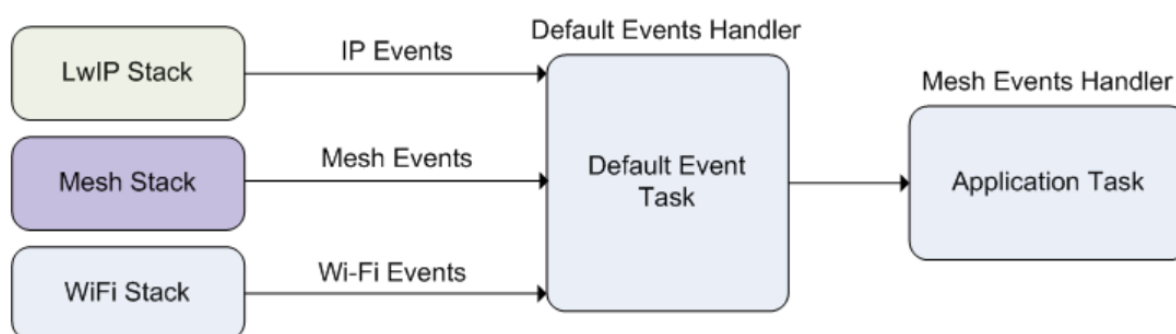

图 3: ESP-WIFI-MESH 系统事件交付

Mesh 事件的典型应用场景包括：使用 `MESH_EVENT_PARENT_CONNECTED` 和 `MESH_EVENT_CHILD_CONNECTED` 事件来指示节点何时可以分别开始传输上行和下行的数据。同样，也可以使用 `IP_EVENT_STA_GOT_IP` 和 `IP_EVENT_STA_LOST_IP` 事件来指示根节点何时可以向外部 IP 网络传输数据。

警告： 在自组网模式下使用 ESP-WIFI-MESH 时，用户必须确保不得调用 Wi-Fi API。原因在于：自组网模式将在内部调用 Wi-Fi API 实现连接/断开/扫描等操作。此时，如果外部应用程序调用 Wi-Fi API（包括来自回调函数和 Wi-Fi 事件处理程序的调用）都可能会干扰 ESP-WIFI-MESH 的自组网行为。因此，用户不应该在 `esp_mesh_start()` 和 `esp_mesh_stop()` 之间调用 Wi-Fi API。

LwIP & ESP-WIFI-MESH 应用程序无需通过 LwIP 层便可直接访问 ESP-WIFI-MESH 软件栈，LwIP 层仅在根节点和外部 IP 网络的数据发送与接收时会用到。但是，由于每个节点都有可能成为根节点（由于自动根节点选择机制的存在），每个节点仍必须初始化 LwIP 软件栈。

每个节点都需要通过调用 `tcpip_adapter_init()` 初始化 LwIP 软件栈。为了防止非根节点访问 LwIP，应用程序应该在 LwIP 初始化完成后停止以下服务：

- SoftAP 接口上的 DHCP 服务器服务。
- Station 接口上的 DHCP 客户端服务。

下方代码片段展示如何为 ESP-WIFI-MESH 应用程序进行 LwIP 初始化。

```
/* tcpip 初始化 */
tcpip_adapter_init();
/*
 * 对于 MESH
 * 默认情况下，在 SoftAP 接口上停止 DHCP 服务器
```

(下页继续)

```

* 默认情况下, 在 Station 接口上停止 DHCP 客户端
*/
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));

```

备注: ESP-WIFI-MESH 的根节点必须与路由器连接。因此, 当一个节点成为根节点时, **该节点对应的处理程序必须启动 DHCP 客户端服务并立即获取 IP 地址**。这样做将允许其他节点开始向/从外部 IP 网络发送/接收数据包。但是, 如果使用静态 IP 设置, 则不需要执行此步骤。

编写 ESP-WIFI-MESH 应用程序 ESP-WIFI-MESH 在正常启动前必须先初始化 LwIP 和 Wi-Fi 软件栈。下方代码展示了 ESP-WIFI-MESH 在开始自身初始化前必须完成的步骤。

```

tcpip_adapter_init();
/*
* 对于 MESH
* 默认情况下, 在 SoftAP 接口上停止 DHCP 服务器
* 默认情况下, 在 Station 接口上停止 DHCP 客户端
*/
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));

/*事件初始化*/
ESP_ERROR_CHECK(esp_event_loop_create_default());

/*Wi-Fi 初始化 */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/*注册 IP 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↪event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());

```

在完成 LwIP 和 Wi-Fi 的初始化后, 需完成以下三个步骤以启动并运行 ESP-WIFI-MESH。

1. 初始化 Mesh
2. 配置 ESP-WIFI-MESH 网络
3. 启动 Mesh

初始化 Mesh 下方代码片段展示如何初始化 ESP-WIFI-MESH。

```

/*Mesh 初始化 */
ESP_ERROR_CHECK(esp_mesh_init());
/*注册 mesh 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↪event_handler, NULL));

```

配置 ESP-WIFI-MESH 网络 ESP-WIFI-MESH 可通过 `esp_mesh_set_config()` 进行配置, 并使用 `mesh_cfg_t` 结构体传递参数。该结构体包含以下 ESP-WIFI-MESH 的配置参数:

参数	描述
Channel (信道)	1 到 14 信道
Mesh ID	ESP-WIFI-MESH 网络的 ID, 见 mesh_addr_t 。
Router (路由器)	路由器配置, 见 mesh_router_t 。
Mesh AP	Mesh AP 配置, 见 mesh_ap_cfg_t
Crypto Functions (加密函数)	Mesh IE 的加密函数, 见 mesh_crypto_funcs_t 。

下方代码片段展示如何配置 ESP-WIFI-MESH。

```
/* 默认启用 MESH IE 加密 */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* Mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* 信道 (需与路由器信道匹配) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* 路由器 */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
        strlen(CONFIG_MESH_ROUTER_PASSWD));
/* Mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
        strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```

启动 Mesh 下方代码片段展示如何启动 ESP-WIFI-MESH。

```
/* 启动 Mesh */
ESP_ERROR_CHECK(esp_mesh_start());
```

启动 ESP-WIFI-MESH 后, 应用程序应检查 ESP-WIFI-MESH 事件, 以确定它是何时连接到网络的。连接后, 应用程序可使用 [esp_mesh_send\(\)](#) 和 [esp_mesh_recv\(\)](#) 在 ESP-WIFI-MESH 网络中发送、接收数据包。

自组网 自组网是 ESP-WIFI-MESH 的功能之一, 允许节点自动扫描/选择/连接/重新连接到其他节点和路由器。此功能允许 ESP-WIFI-MESH 网络具有很高的自主性, 可适应变化的动态网络拓扑结构和环境。启用自组网功能后, ESP-WIFI-MESH 网络中的节点能够自主完成以下操作:

- 选择或选举根节点 (见 [建立网络](#) 中的 [自动根节点选择](#))
- 选择首选的父节点 (见 [建立网络](#) 中的 [父节点选择](#))
- 网络断开时自动重新连接 (见 [管理网络](#) 中的 [中间父节点失败](#))

启用自组网功能后, ESP-WIFI-MESH 软件栈将内部调用 Wi-Fi API。因此, 在启用自组网功能时, 应用层不得调用 Wi-Fi API, 否则会干扰 ESP-WIFI-MESH 的工作。

开关自组网 应用程序可以在运行时通过调用 [esp_mesh_set_self_organized\(\)](#) 函数, 启用或禁用自组网功能。该函数具有以下两个参数:

- bool enable 指定启用或禁用自组网功能。
- bool select_parent 指定在启用自组网功能时是否应选择新的父节点。根据节点类型和节点当前状态, 选择新的父节点具有不同的作用。在禁用自组网功能时, 此参数不使用。

禁用自组网 下方代码片段展示了如何禁用自组网功能。

```
//禁用自组网
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH 将在禁用自组网时尝试维护节点的当前 Wi-Fi 状态。

- 如果节点先前已连接到其他节点，则将保持连接。
- 如果节点先前已断开连接并且正在扫描父节点或路由器，则将停止扫描。
- 如果节点以前尝试重新连接到父节点或路由器，则将停止重新连接。

启用自组网 ESP-WIFI-MESH 将尝试在启用自组网时保持节点的当前 Wi-Fi 状态。但是，根据节点类型以及是否选择了新的父节点，节点的 Wi-Fi 状态可能会发生变化。下表显示了启用自组网的效果。

是否选择父节点	是否为根结点	作用
N	N	已连接到父节点的节点将保持连接。 之前扫描父节点的节点将停止扫描。调用 <code>esp_mesh_connect()</code> 重新启动。
	Y	已连接到路由器的根节点将保持连接。 从路由器断开的根节点需调用 <code>esp_mesh_connect()</code> 进行重连。
Y	N	没有父节点的节点将自动选择首选父节点并连接。 已连接到父节点的节点将断开连接，重新选择首选父节点并进行重连。
	Y	根结点在连接至父节点前必须放弃“根结点”的角色。因此，根节点将断开与路由器和所有子节点的连接，选择首选父节点并进行连接。

下方代码片段展示了如何启用自组网功能。

```
//启用自组网，并选择一个新的父节点
esp_mesh_set_self_organized(true, true);

...

//启用自组网并手动重新连接
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

调用 Wi-Fi API 在有些情况下，应用程序可能希望在使用 ESP-WIFI-MESH 期间调用 Wi-Fi API。例如，应用程序可能需要手动扫描邻近的接入点 (AP)。但在应用程序调用任何 Wi-Fi API 之前，必须先禁用自组网。否则，ESP-WIFI-MESH 软件栈可能会同时调用 Wi-Fi API，进而影响应用程序的正常调用。

应用程序不应在 `esp_mesh_set_self_organized()` 之间调用 Wi-Fi API。下方代码片段展示了应用程序如何在 ESP-WIFI-MESH 运行期间安全地调用 `esp_wifi_scan_start()`。

```
//禁用自组网
esp_mesh_set_self_organized(0, 0);

//停止任何正在进行的扫描
esp_wifi_scan_stop();
//手动启动扫描运行完成时自动停止
esp_wifi_scan_start();

//进程扫描结果
...

//如果仍为连接状态，则重新启用自组网
esp_mesh_set_self_organized(1, 0);

...

//如果不为根节点且未连接，则重新启用自组网
esp_mesh_set_self_organized(1, 1);

...

```

(下页继续)

```
//如果为根节点且未连接，则重新启用
esp_mesh_set_self_organized(1, 0); //不选择新的父节点
esp_mesh_connect(); //手动重新连接到路由器
```

应用实例 ESP-IDF 包含以下 ESP-WIFI-MESH 示例项目：

内部通信示例 展示了如何搭建 ESP-WIFI-MESH 网络，并让根节点向网络中的每个节点发送数据包。

手动连网示例 展示了如何在禁用自组网功能的情况下使用 ESP-WIFI-MESH。此示例展示了如何对节点进行编程，以手动扫描潜在父节点的列表，并根据自定义标准选择父节点。

API 参考

Header File

- [components/esp_wifi/include/esp_mesh.h](#)

Functions

esp_err_t **esp_mesh_init** (void)

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

Attention This API shall be called after Wi-Fi is started.

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_deinit** (void)

Mesh de-initialization.

- Release resources and stop the mesh

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_start** (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

Attention This API shall be called after mesh initialization and configuration.

返回

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

esp_err_t **esp_mesh_stop** (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_send** (const *mesh_addr_t* *to, const *mesh_data_t* *data, int flag, const *mesh_opt_t* opt[], int opt_count)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

Attention This API is not reentrant.

参数

- **to** –[in] the address of the final destination of the packet
 - If the packet is to the root, set this parameter to NULL.
 - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **data** –[in] pointer to a sending mesh packet
 - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
 - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
 - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- **flag** –[in] bitmap for data sent
 - Speed up the route search
 - * If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
 - * If the packet is to an internal device, MESH_DATA_P2P should be set.
 - * If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
 - * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
 - Specify whether this API is block or non-block, block by default

- * If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use `esp_mesh_send_block_time()` to specify a blocking time.
- In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn't read out in time by `esp_mesh_rcv_toDS()`.
Generally, we suggest `esp_mesh_rcv_toDS()` is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading `esp_mesh_rcv_toDS()` which avoids unnecessary memory copy.
- **opt** –[in] options
 - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
 - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- **opt_count** –[in] option count
 - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

返回

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

esp_err_t **esp_mesh_send_block_time** (uint32_t time_ms)

Set blocking time of `esp_mesh_send()`

Attention This API shall be called before mesh is started.

参数 `time_ms` –[in] blocking time of `esp_mesh_send()`, unit:ms

返回

- ESP_OK

esp_err_t **esp_mesh_rcv** (*mesh_addr_t* *from, *mesh_data_t* *data, int timeout_ms, int *flag, *mesh_opt_t* opt[], int opt_count)

Receive a packet targeted to self over the mesh network.

flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

Attention Mesh RX queue should be checked regularly to avoid running out of memory.

- Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications.

参数

- **from** –[out] the address of the original source of the packet
- **data** –[out] pointer to the received mesh packet
 - Field proto is the data protocol in use. Should follow it to parse the received data.

- Field `tos` is the transmission `tos` (type of service) in use.
- **timeout_ms** –[in] wait time if a packet isn't immediately available (0:no wait, port-MAX_DELAY:wait forever)
- **flag** –[out] bitmap for data received
 - MESH_DATA_FROMDS represents data from external IP network
 - MESH_DATA_TODS represents data directed upward within the mesh network
- **opt** –[out] options desired to receive
 - MESH_OPT_RECV_DS_ADDR attaches the DS address
- **opt_count** –[in] option count desired to receive
 - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

`esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn't been called by applications, packets from the whole mesh network will be pending in `toDS` queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` isn't called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

`flag` could be MESH_DATA_TODS.

Attention This API is only called by the root.

参数

- **from** –[out] the address of the original source of the packet
- **to** –[out] the address contains remote IP address and port (IPv4:PORT)
- **data** –[out] pointer to the received packet
 - Contain the protocol and applications should follow it to parse the data.
- **timeout_ms** –[in] wait time if a packet isn't immediately available (0:no wait, port-MAX_DELAY:wait forever)
- **flag** –[out] bitmap for data received
 - MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** –[out] options desired to receive
- **opt_count** –[in] option count desired to receive

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD
- ESP_ERR_MESH_RECV_RELEASE

esp_err_t **esp_mesh_set_config** (const *mesh_cfg_t* *config)

Set mesh stack configuration.

- Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

Attention This API shall be called before mesh is started after mesh is initialized.

参数 config –[in] pointer to mesh stack configuration

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t **esp_mesh_get_config** (*mesh_cfg_t* *config)

Get mesh stack configuration.

参数 config –[out] pointer to mesh stack configuration

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_set_router** (const *mesh_router_t* *router)

Get router configuration.

Attention This API is used to dynamically modify the router configuration after mesh is configured.

参数 router –[in] pointer to router configuration

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_get_router** (*mesh_router_t* *router)

Get router configuration.

参数 router –[out] pointer to router configuration

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_set_id** (const *mesh_addr_t* *id)

Set mesh network ID.

Attention This API is used to dynamically modify the mesh network ID.

参数 **id** –[in] pointer to mesh network ID

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

esp_err_t **esp_mesh_get_id** (*mesh_addr_t* *id)

Get mesh network ID.

参数 **id** –[out] pointer to mesh network ID

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_set_type** (*mesh_type_t* type)

Designate device type over the mesh network.

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

参数 **type** –[in] device type

返回

- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

mesh_type_t **esp_mesh_get_type** (void)

Get device type over mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

返回 mesh type

esp_err_t **esp_mesh_set_max_layer** (int max_layer)

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

Attention This API shall be called before mesh is started.

参数 **max_layer** –[in] max layer value

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

int **esp_mesh_get_max_layer** (void)

Get max layer value.

返回 max layer value

esp_err_t **esp_mesh_set_ap_password** (const uint8_t *pwd, int len)

Set mesh softAP password.

Attention This API shall be called before mesh is started.

参数

- **pwd** –[in] pointer to the password
- **len** –[in] password length

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t **esp_mesh_set_ap_authmode** (*wifi_auth_mode_t* authmode)

Set mesh softAP authentication mode.

Attention This API shall be called before mesh is started.

参数 **authmode** –[in] authentication mode

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

wifi_auth_mode_t **esp_mesh_get_ap_authmode** (void)

Get mesh softAP authentication mode.

返回 authentication mode

esp_err_t **esp_mesh_set_ap_connections** (int connections)

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

Attention This API shall be called before mesh is started.

参数 **connections** –[in] the number of max connections

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

int **esp_mesh_get_ap_connections** (void)

Get mesh max connection configuration.

返回 the number of mesh max connections

int **esp_mesh_get_non_mesh_connections** (void)

Get non-mesh max connection configuration.

返回 the number of non-mesh max connections

int **esp_mesh_get_layer** (void)

Get current layer value over the mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

返回 layer value

esp_err_t **esp_mesh_get_parent_bssid** (*mesh_addr_t* *bssid)

Get the parent BSSID.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

参数 **bssid** –[out] pointer to parent BSSID

返回

- ESP_OK
- ESP_FAIL

bool **esp_mesh_is_root** (void)

Return whether the device is the root node of the network.

返回 true/false

esp_err_t **esp_mesh_set_self_organized** (bool enable, bool select_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via `esp_mesh_set_parent()`.

Attention This API is used to dynamically modify whether to enable the self organizing.

参数

- **enable** –[in] enable or disable self-organized networking
- **select_parent** –[in] Only valid when self-organized networking is enabled.
 - if `select_parent` is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

返回

- ESP_OK
- ESP_FAIL

bool **esp_mesh_get_self_organized** (void)

Return whether enable self-organized networking or not.

返回 true/false

esp_err_t **esp_mesh_waive_root** (const *mesh_vote_t* *vote, int reason)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.

- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

参数

- **vote** –[in] vote configuration
 - If this parameter is set NULL, the vote will perform the default 15 times.
 - Field percentage threshold is 0.9 by default.
 - Field is_rc_specified shall be false.
 - Field attempts shall be at least 15 times.
- **reason** –[in] only accept MESH_VOTE_REASON_ROOT_INITIATED for now

返回

- ESP_OK
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD
- ESP_FAIL

esp_err_t **esp_mesh_set_vote_percentage** (float percentage)

Set vote percentage threshold for approval of being a root (default:0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

Attention This API shall be called before mesh is started.

参数 **percentage** –[in] vote percentage threshold

返回

- ESP_OK
- ESP_FAIL

float **esp_mesh_get_vote_percentage** (void)

Get vote percentage threshold for approval of being a root.

返回 percentage threshold

esp_err_t **esp_mesh_set_ap_assoc_expire** (int seconds)

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn't received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

参数 **seconds** –[in] the expired time

返回

- ESP_OK
- ESP_FAIL

int **esp_mesh_get_ap_assoc_expire** (void)

Get mesh softAP associate expired time.

返回 seconds

int **esp_mesh_get_total_node_num** (void)

Get total number of devices in current network (including the root)

Attention The returned value might be incorrect when the network is changing.

返回 total number of devices (including the root)

int **esp_mesh_get_routing_table_size** (void)

Get the number of devices in this device' s sub-network (including self)

返回 the number of devices over this device' s sub-network (including self)

esp_err_t **esp_mesh_get_routing_table** (*mesh_addr_t* *mac, int len, int *size)

Get routing table of this device' s sub-network (including itself)

参数

- **mac** –[out] pointer to routing table
- **len** –[in] routing table size(in bytes)
- **size** –[out] pointer to the number of devices in routing table (including itself)

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_post_toDS_state** (bool reachable)

Post the toDS state to the mesh stack.

Attention This API is only for the root.

参数 **reachable** –[in] this state represents whether the root is able to access external IP network

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_tx_pending** (*mesh_tx_pending_t* *pending)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

参数 **pending** –[out] pointer to the TX pending

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_rx_pending** (*mesh_rx_pending_t* *pending)

Return the number of packets available in the queue waiting to be received by applications.

参数 **pending** –[out] pointer to the RX pending

返回

- ESP_OK
- ESP_FAIL

int **esp_mesh_available_txupQ_num** (const *mesh_addr_t* *addr, uint32_t *xseqno_in)

Return the number of packets could be accepted from the specified address.

参数

- **addr** –[in] self address or an associate children address

- **xseqno_in** **–[out]** sequence number of the last received packet from the specified address

返回 the number of upQ for a certain address

esp_err_t **esp_mesh_set_xon_qsize** (int qsize)

Set the number of RX queue for the node, the average number of window allocated to one of its child node is: $wnd = xon_qsize / (2 * max_connection + 1)$. However, the window of each child node is not strictly equal to the average value, it is affected by the traffic also.

Attention This API shall be called before mesh is started.

参数 **qsize** **–[in]** default:32 (min:16)

返回

- ESP_OK
- ESP_FAIL

int **esp_mesh_get_xon_qsize** (void)

Get queue size.

返回 the number of queue

esp_err_t **esp_mesh_allow_root_conflicts** (bool allowed)

Set whether allow more than one root existing in one network.

参数 **allowed** **–[in]** allow or not

返回

- ESP_OK
- ESP_WIFI_ERR_NOT_INIT
- ESP_WIFI_ERR_NOT_START

bool **esp_mesh_is_root_conflicts_allowed** (void)

Check whether allow more than one root to exist in one network.

返回 true/false

esp_err_t **esp_mesh_set_group_id** (const *mesh_addr_t* *addr, int num)

Set group ID addresses.

参数

- **addr** **–[in]** pointer to new group ID addresses
- **num** **–[in]** the number of group ID addresses

返回

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t **esp_mesh_delete_group_id** (const *mesh_addr_t* *addr, int num)

Delete group ID addresses.

参数

- **addr** **–[in]** pointer to deleted group ID address
- **num** **–[in]** the number of group ID addresses

返回

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

int **esp_mesh_get_group_num** (void)

Get the number of group ID addresses.

返回 the number of group ID addresses

esp_err_t **esp_mesh_get_group_list** (*mesh_addr_t* *addr, int num)

Get group ID addresses.

参数

- **addr** –[out] pointer to group ID addresses
- **num** –[in] the number of group ID addresses

返回

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

bool **esp_mesh_is_my_group** (const *mesh_addr_t* *addr)

Check whether the specified group address is my group.

返回 true/false

esp_err_t **esp_mesh_set_capacity_num** (int num)

Set mesh network capacity (max:1000, default:300)

Attention This API shall be called before mesh is started.

参数 **num** –[in] mesh network capacity

返回

- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

int **esp_mesh_get_capacity_num** (void)

Get mesh network capacity.

返回 mesh network capacity

esp_err_t **esp_mesh_set_ie_crypto_funcs** (const *mesh_crypto_funcs_t* *crypto_funcs)

Set mesh IE crypto functions.

Attention This API can be called at any time after mesh is initialized.

参数 **crypto_funcs** –[in] crypto functions for mesh IE

- If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

返回

- ESP_OK

esp_err_t **esp_mesh_set_ie_crypto_key** (const char *key, int len)

Set mesh IE crypto key.

Attention This API can be called at any time after mesh is initialized.

参数

- **key** –[in] ASCII crypto key
- **len** –[in] length in bytes, range:8~64

返回

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t **esp_mesh_get_ie_crypto_key** (char *key, int len)

Get mesh IE crypto key.

参数

- **key** **–[out]** ASCII crypto key
- **len** **–[in]** length in bytes, range:8~64

返回

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t **esp_mesh_set_root_healing_delay** (int delay_ms)

Set delay time before starting root healing.

参数 **delay_ms** **–[in]** delay time in milliseconds

返回

- ESP_OK

int **esp_mesh_get_root_healing_delay** (void)

Get delay time before network starts root healing.

返回 delay time in milliseconds

esp_err_t **esp_mesh_fix_root** (bool enable)

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

参数 **enable** **–[in]** enable or not

返回

- ESP_OK

bool **esp_mesh_is_root_fixed** (void)

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root()`.
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

返回 true/false

esp_err_t **esp_mesh_set_parent** (const *wifi_config_t* *parent, const *mesh_addr_t* *parent_mesh_id, *mesh_type_t* my_type, int my_layer)

Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

参数

- **parent** **–[in]** parent configuration, the SSID and the channel of the parent are mandatory.
 - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- **parent_mesh_id** **–[in]** parent mesh ID,
 - If this value is not set, the original mesh ID is used.
- **my_type** **–[in]** mesh type
 - MESH_STA is not supported.
 - If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
- **my_layer** **–[in]** mesh layer
 - my_layer of the device may change after joining the network.

- If `my_type` is set `MESH_NODE`, `my_layer` shall be greater than `MESH_ROOT_LAYER`.
- If `my_type` is set `MESH_LEAF`, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

返回

- `ESP_OK`
- `ESP_ERR_ARGUMENT`
- `ESP_ERR_MESH_NOT_CONFIG`

esp_err_t **esp_mesh_scan_get_ap_ie_len** (int *len)

Get mesh networking IE length of one AP.

参数 `len` –[out] mesh networking IE length

返回

- `ESP_OK`
- `ESP_ERR_WIFI_NOT_INIT`
- `ESP_ERR_INVALID_ARG`
- `ESP_ERR_WIFI_FAIL`

esp_err_t **esp_mesh_scan_get_ap_record** (*wifi_ap_record_t* *ap_record, void *buffer)

Get AP record.

Attention Different from `esp_wifi_scan_get_ap_records()`, this API only gets one of APs scanned each time. See “manual_networking” example.

参数

- `ap_record` –[out] pointer to one AP record
- `buffer` –[out] pointer to the mesh networking IE of this AP

返回

- `ESP_OK`
- `ESP_ERR_WIFI_NOT_INIT`
- `ESP_ERR_INVALID_ARG`
- `ESP_ERR_WIFI_FAIL`

esp_err_t **esp_mesh_flush_upstream_packets** (void)

Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

返回

- `ESP_OK`

esp_err_t **esp_mesh_get_subnet_nodes_num** (const *mesh_addr_t* *child_mac, int *nodes_num)

Get the number of nodes in the subnet of a specific child.

参数

- `child_mac` –[in] an associated child address of this device
- `nodes_num` –[out] pointer to the number of nodes in the subnet of a specific child

返回

- `ESP_OK`
- `ESP_ERR_MESH_NOT_START`
- `ESP_ERR_MESH_ARGUMENT`

esp_err_t **esp_mesh_get_subnet_nodes_list** (const *mesh_addr_t* *child_mac, *mesh_addr_t* *nodes, int nodes_num)

Get nodes in the subnet of a specific child.

参数

- `child_mac` –[in] an associated child address of this device
- `nodes` –[out] pointer to nodes in the subnet of a specific child
- `nodes_num` –[in] the number of nodes in the subnet of a specific child

返回

- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_disconnect** (void)

Disconnect from current parent.

返回

- ESP_OK

esp_err_t **esp_mesh_connect** (void)

Connect to current parent.

返回

- ESP_OK

esp_err_t **esp_mesh_flush_scan_result** (void)

Flush scan result.

返回

- ESP_OK

esp_err_t **esp_mesh_switch_channel** (const uint8_t *new_bssid, int csa_newchan, int csa_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

Attention This API is only called by the root.

参数

- **new_bssid** –[in] the new router BSSID if the router changes
- **csa_newchan** –[in] the new channel number to which the whole network is moving
- **csa_count** –[in] channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

返回

- ESP_OK

esp_err_t **esp_mesh_get_router_bssid** (uint8_t *router_bssid)

Get the router BSSID.

参数 **router_bssid** –[out] pointer to the router BSSID

返回

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_INVALID_ARG

int64_t **esp_mesh_get_tsf_time** (void)

Get the TSF time.

返回 the TSF time

esp_err_t **esp_mesh_set_topology** (*esp_mesh_topology_t* topo)

Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

Attention This API shall be called before mesh is started.

参数 **topo** `-[in]` MESH_TOPO_TREE or MESH_TOPO_CHAIN

返回

- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_mesh_topology_t **esp_mesh_get_topology** (void)

Get mesh topology.

返回 MESH_TOPO_TREE or MESH_TOPO_CHAIN

esp_err_t **esp_mesh_enable_ps** (void)

Enable mesh Power Save function.

Attention This API shall be called before mesh is started.

返回

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t **esp_mesh_disable_ps** (void)

Disable mesh Power Save function.

Attention This API shall be called before mesh is started.

返回

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

bool **esp_mesh_is_ps_enabled** (void)

Check whether the mesh Power Save function is enabled.

返回 true/false

bool **esp_mesh_is_device_active** (void)

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

返回 true/false

esp_err_t **esp_mesh_set_active_duty_cycle** (int dev_duty, int dev_duty_type)

Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.

- If `dev_duty_type` is set to `MESH_PS_DEVICE_DUTY_REQUEST`, the device will use a `nwk_duty` provided by the network.
- If `dev_duty_type` is set to `MESH_PS_DEVICE_DUTY_DEMAND`, the device will use the specified `dev_duty`.

Attention This API can be called at any time after mesh is started.

参数

- **dev_duty** `–[in]` device duty cycle
- **dev_duty_type** `–[in]` device PS duty cycle type, not accept `MESH_PS_NETWORK_DUTY_MASTER`

返回

- `ESP_OK`
- `ESP_FAIL`

esp_err_t **esp_mesh_get_active_duty_cycle** (int *dev_duty, int *dev_duty_type)

Get device duty cycle and type.

参数

- **dev_duty** `–[out]` device duty cycle
- **dev_duty_type** `–[out]` device PS duty cycle type

返回

- `ESP_OK`

esp_err_t **esp_mesh_set_network_duty_cycle** (int nwk_duty, int duration_mins, int applied_rule)

Set the network duty cycle, duration and rule.

- The range of `nwk_duty` values is 1 to 100. The default value is 10.
- `nwk_duty` is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the `nwk_duty` is known as a `NWK-DUTY-MASTER`.
- `duration_mins` specifies how long the specified `nwk_duty` will be used. Once `duration_mins` expires, the root will take over as the `NWK-DUTY-MASTER`. If an existing `NWK-DUTY-MASTER` leaves the network, the root will take over as the `NWK-DUTY-MASTER` again.
- `duration_mins = (-1)` represents `nwk_duty` will be used until a new `NWK-DUTY-MASTER` with a different `nwk_duty` appears.
- Only the root can set `duration_mins` to `(-1)`.
- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`, the `nwk_duty` will be used by the entire network.
- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`, the `nwk_duty` will only be used by the up-link path nodes.
- The root does not accept `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`.
- A `nwk_duty` with `duration_mins(-1)` set by the root is the default network duty cycle used by the entire network.

Attention This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)`nwk_duty` shall be set to the same value for all devices; (2)`duration_mins` shall be set to `(-1)`; (3)`applied_rule` shall be set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`; after the voted root appears, the root will become the `NWK-DUTY-MASTER` and broadcast the `nwk_duty` and its identity of `NWK-DUTY-MASTER`.
- If the root is specified (`FIXED-ROOT`), call this API in the root to provide a default `nwk_duty` for the entire network.
- After joins the network, any device can call this API to change the `nwk_duty`, `duration_mins` or `applied_rule`.

参数

- **nwk_duty** –[in] network duty cycle
- **duration_mins** –[in] duration (unit: minutes)
- **applied_rule** –[in] only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_network_duty_cycle** (int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)

Get the network duty cycle, duration, type and rule.

参数

- **nwk_duty** –[out] current network duty cycle
- **duration_mins** –[out] the duration of current nwk_duty
- **dev_duty_type** –[out] if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- **applied_rule** –[out] MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

返回

- ESP_OK

int **esp_mesh_get_running_active_duty_cycle** (void)

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
- If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

返回 the running active duty cycle

esp_err_t **esp_mesh_ps_duty_signaling** (int fwd_times)

Duty signaling.

参数 **fwd_times** –[in] the times of forwarding duty signaling packets

返回

- ESP_OK

Unions

union **mesh_addr_t**

#include <esp_mesh.h> Mesh address.

Public Members

uint8_t **addr**[6]

mac address

mip_t **mip**

mip address

union **mesh_event_info_t**

#include <esp_mesh.h> Mesh event information.

Public Members

mesh_event_channel_switch_t **channel_switch**

channel switch

mesh_event_child_connected_t **child_connected**

child connected

mesh_event_child_disconnected_t **child_disconnected**

child disconnected

mesh_event_routing_table_change_t **routing_table**

routing table change

mesh_event_connected_t **connected**

parent connected

mesh_event_disconnected_t **disconnected**

parent disconnected

mesh_event_no_parent_found_t **no_parent**

no parent found

mesh_event_layer_change_t **layer_change**

layer change

mesh_event_toDS_state_t **toDS_state**

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t **vote_started**

vote started

mesh_event_root_address_t **root_addr**

root address

mesh_event_root_switch_req_t **switch_req**

root switch request

mesh_event_root_conflict_t **root_conflict**

other powerful root

mesh_event_root_fixed_t **root_fixed**

fixed root

mesh_event_scan_done_t **scan_done**

scan done

mesh_event_network_state_t **network_state**

network state, such as whether current mesh network has a root.

mesh_event_find_network_t **find_network**

network found that can join

mesh_event_router_switch_t **router_switch**

new router information

mesh_event_ps_duty_t **ps_duty**

PS duty information

union **mesh_rc_config_t**

#include <esp_mesh.h> Vote address configuration.

Public Members

int **attempts**

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t **rc_addr**

a new root address specified by users for API `esp_mesh_waive_root()`

Structures

struct **mip_t**

IP address and port.

Public Members

ip4_addr_t **ip4**

IP address

uint16_t **port**

port

struct **mesh_event_channel_switch_t**

Channel switch information.

Public Members

uint8_t **channel**
new channel

struct **mesh_event_connected_t**
Parent connected information.

Public Members

wifi_event_sta_connected_t **connected**
parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint16_t **self_layer**
layer

uint8_t **duty**
parent duty

struct **mesh_event_no_parent_found_t**
No parent found information.

Public Members

int **scan_times**
scan times being through

struct **mesh_event_layer_change_t**
Layer change information.

Public Members

uint16_t **new_layer**
new layer

struct **mesh_event_vote_started_t**
vote started information

Public Members

int **reason**
vote reason, vote could be initiated by children or by the root itself

int **attempts**
max vote attempts before stopped

mesh_addr_t **rc_addr**

root address specified by users via API `esp_mesh_waive_root()`

struct **mesh_event_find_network_t**

find a mesh network that this device can join

Public Members

uint8_t **channel**

channel number of the new found network

uint8_t **router_bssid**[6]

router BSSID

struct **mesh_event_root_switch_req_t**

Root switch request information.

Public Members

int **reason**

root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`

mesh_addr_t **rc_addr**

the address of root switch requester

struct **mesh_event_root_conflict_t**

Other powerful root address.

Public Members

int8_t **rssi**

rssi with router

uint16_t **capacity**

the number of devices in current network

uint8_t **addr**[6]

other powerful root address

struct **mesh_event_routing_table_change_t**

Routing table change.

Public Members

uint16_t **rt_size_new**

the new value

uint16_t **rt_size_change**

the changed value

struct **mesh_event_root_fixed_t**

Root fixed.

Public Members

bool **is_fixed**

status

struct **mesh_event_scan_done_t**

Scan done event information.

Public Members

uint8_t **number**

the number of APs scanned

struct **mesh_event_network_state_t**

Network state information.

Public Members

bool **is_rootless**

whether current mesh network has a root

struct **mesh_event_ps_duty_t**

PS duty information.

Public Members

uint8_t **duty**

parent or child duty

[*mesh_event_child_connected_t*](#) **child_connected**

child info

struct **mesh_opt_t**

Mesh option.

Public Members

uint8_t **type**

option type

`uint16_t len`
option length

`uint8_t *val`
option value

struct `mesh_data_t`
Mesh data for `esp_mesh_send()` and `esp_mesh_rcv()`

Public Members

`uint8_t *data`
data

`uint16_t size`
data size

`mesh_proto_t proto`
data protocol

`mesh_tos_t tos`
data type of service

struct `mesh_router_t`
Router configuration.

Public Members

`uint8_t ssid[32]`
SSID

`uint8_t ssid_len`
length of SSID

`uint8_t bssid[6]`
BSSID, if this value is specified, users should also specify “`allow_router_switch`” .

`uint8_t password[64]`
password

bool `allow_router_switch`

if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (`mesh_attempts_t`) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct `mesh_ap_cfg_t`
Mesh softAP configuration.

Public Members

uint8_t **password**[64]

mesh softAP password

uint8_t **max_connection**

max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connectionmax mesh connections

uint8_t **nonmesh_max_connection**

max non-mesh connections

struct **mesh_cfg_t**

Mesh initialization configuration.

Public Members

uint8_t **channel**

channel, the mesh network on

bool **allow_channel_switch**

if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

mesh_addr_t **mesh_id**

mesh network identification

mesh_router_t **router**

router configuration

mesh_ap_cfg_t **mesh_ap**

mesh softAP configuration

const mesh_crypto_funcs_t ***crypto_funcs**

crypto functions

struct **mesh_vote_t**

Vote.

Public Members

float **percentage**

vote percentage threshold for approval of being a root

bool **is_rc_specified**

if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

mesh_rc_config_t **config**

vote address configuration

struct **mesh_tx_pending_t**

The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int **to_parent**

to parent queue

int **to_parent_p2p**

to parent (P2P) queue

int **to_child**

to child queue

int **to_child_p2p**

to child (P2P) queue

int **mgmt**

management queue

int **broadcast**

broadcast and multicast queue

struct **mesh_rx_pending_t**

The number of packets available in the queue waiting to be received by applications.

Public Members

int **toDS**

to external DS

int **toSelf**

to self

Macros

MESH_ROOT_LAYER

root layer value

MESH_MTU

max transmit unit(in bytes)

MESH_MPS

max payload size(in bytes)

ESP_ERR_MESH_WIFI_NOT_START

Mesh error code definition.

Wi-Fi isn't started

ESP_ERR_MESH_NOT_INIT

mesh isn't initialized

ESP_ERR_MESH_NOT_CONFIG

mesh isn't configured

ESP_ERR_MESH_NOT_STARTED

mesh isn't started

ESP_ERR_MESH_NOT_SUPPORTED

not supported yet

ESP_ERR_MESH_NOT_ALLOWED

operation is not allowed

ESP_ERR_MESH_NO_MEMORY

out of memory

ESP_ERR_MESH_ARGUMENT

illegal argument

ESP_ERR_MESH_EXCEED_MTU

packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT

timeout

ESP_ERR_MESH_DISCONNECTED

disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL

queue fail

ESP_ERR_MESH_QUEUE_FULL

queue full

ESP_ERR_MESH_NO_PARENT_FOUND

no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND

no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL

no option found

ESP_ERR_MESH_OPTION_UNKNOWN

unknown option

ESP_ERR_MESH_XON_NO_WINDOW

no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE

low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE

discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD

discard the packet

ESP_ERR_MESH_VOTING

vote in progress

ESP_ERR_MESH_XMIT

XMIT

ESP_ERR_MESH_QUEUE_READ

error in reading queue

ESP_ERR_MESH_PS

mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE

release esp_mesh_recv_toDS

MESH_DATA_ENC

Flags bitmap for esp_mesh_send() and esp_mesh_recv()
data encrypted (Unimplemented)

MESH_DATA_P2P

point-to-point delivery over the mesh network

MESH_DATA_FROMDS

receive from external IP network

MESH_DATA_TODS

identify this packet is target to external IP network

MESH_DATA_NONBLOCK

esp_mesh_send() non-block

MESH_DATA_DROP

in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP

identify this packet is target to a group address

MESH_OPT_SEND_GROUP

Option definitions for `esp_mesh_send()` and `esp_mesh_rcv()`

data transmission by group; used with `esp_mesh_send()` and shall have payload

MESH_OPT_RECV_DS_ADDR

return a remote IP address; used with `esp_mesh_send()` and `esp_mesh_rcv()`

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS

Flag of mesh networking IE.

vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE

no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND

root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED

fixed root

MESH_PS_DEVICE_DUTY_REQUEST

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

MESH_PS_DEVICE_DUTY_DEMAND

requests to join a network PS and specifies a demanded device duty cycle

MESH_PS_NETWORK_DUTY_MASTER

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Mesh PS (Power Save) duty cycle applied rule.

MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**MESH_INIT_CONFIG_DEFAULT ()****Type Definitions**

```
typedef mesh_addr_t mesh_event_root_address_t
```

Root address.

```
typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
```

Parent disconnected information.

typedef *wifi_event_ap_staconnected_t* **mesh_event_child_connected_t**
Child connected information.

typedef *wifi_event_ap_stadisconnected_t* **mesh_event_child_disconnected_t**
Child disconnected information.

typedef *wifi_event_sta_connected_t* **mesh_event_router_switch_t**
New router information.

Enumerations

enum **mesh_event_id_t**

Enumerated list of mesh event id.

Values:

enumerator **MESH_EVENT_STARTED**
mesh is started

enumerator **MESH_EVENT_STOPPED**
mesh is stopped

enumerator **MESH_EVENT_CHANNEL_SWITCH**
channel switch

enumerator **MESH_EVENT_CHILD_CONNECTED**
a child is connected on softAP interface

enumerator **MESH_EVENT_CHILD_DISCONNECTED**
a child is disconnected on softAP interface

enumerator **MESH_EVENT_ROUTING_TABLE_ADD**
routing table is changed by adding newly joined children

enumerator **MESH_EVENT_ROUTING_TABLE_REMOVE**
routing table is changed by removing leave children

enumerator **MESH_EVENT_PARENT_CONNECTED**
parent is connected on station interface

enumerator **MESH_EVENT_PARENT_DISCONNECTED**
parent is disconnected on station interface

enumerator **MESH_EVENT_NO_PARENT_FOUND**
no parent found

enumerator **MESH_EVENT_LAYER_CHANGE**
layer changes over the mesh network

enumerator MESH_EVENT_TODS_STATE

state represents whether the root is able to access external IP network. This state is a manual event that needs to be triggered with `esp_mesh_post_toDS_state()`.

enumerator MESH_EVENT_VOTE_STARTED

the process of voting a new root is started either by children or by the root

enumerator MESH_EVENT_VOTE_STOPPED

the process of voting a new root is stopped

enumerator MESH_EVENT_ROOT_ADDRESS

the root address is obtained. It is posted by mesh stack automatically.

enumerator MESH_EVENT_ROOT_SWITCH_REQ

root switch request sent from a new voted root candidate

enumerator MESH_EVENT_ROOT_SWITCH_ACK

root switch acknowledgment responds the above request sent from current root

enumerator MESH_EVENT_ROOT_ASKED_YIELD

the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

enumerator MESH_EVENT_ROOT_FIXED

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator MESH_EVENT_SCAN_DONE

if self-organized networking is disabled, user can call `esp_wifi_scan_start()` to trigger this event, and add the corresponding scan done handler in this event.

enumerator MESH_EVENT_NETWORK_STATE

network state, such as whether current mesh network has a root.

enumerator MESH_EVENT_STOP_RECONNECTION

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator MESH_EVENT_FIND_NETWORK

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator MESH_EVENT_ROUTER_SWITCH

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

enumerator MESH_EVENT_PS_PARENT_DUTY

parent duty

enumerator **MESH_EVENT_PS_CHILD_DUTY**

child duty

enumerator **MESH_EVENT_PS_DEVICE_DUTY**

device duty

enumerator **MESH_EVENT_MAX**

enum **mesh_type_t**

Device type.

Values:

enumerator **MESH_IDLE**

hasn't joined the mesh network yet

enumerator **MESH_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

enumerator **MESH_NODE**

intermediate device. Has the ability to forward packets over the mesh network

enumerator **MESH_LEAF**

has no forwarding ability

enumerator **MESH_STA**

connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh_proto_t**

Protocol of transmitted application data.

Values:

enumerator **MESH_PROTO_BIN**

binary

enumerator **MESH_PROTO_HTTP**

HTTP protocol

enumerator **MESH_PROTO_JSON**

JSON format

enumerator **MESH_PROTO_MQTT**

MQTT protocol

enumerator **MESH_PROTO_AP**

IP network mesh communication of node's AP interface

enumerator **MESH_PROTO_STA**

IP network mesh communication of node's STA interface

enum **mesh_tos_t**

For reliable transmission, mesh stack provides three type of services.

Values:

enumerator **MESH_TOS_P2P**

provide P2P (point-to-point) retransmission on mesh stack by default

enumerator **MESH_TOS_E2E**

provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

enumerator **MESH_TOS_DEF**

no retransmission on mesh stack

enum **mesh_vote_reason_t**

Vote reason.

Values:

enumerator **MESH_VOTE_REASON_ROOT_INITIATED**

vote is initiated by the root

enumerator **MESH_VOTE_REASON_CHILD_INITIATED**

vote is initiated by children

enum **mesh_disconnect_reason_t**

Mesh disconnect reason code.

Values:

enumerator **MESH_REASON_CYCLIC**

cyclic is detected

enumerator **MESH_REASON_PARENT_IDLE**

parent is idle

enumerator **MESH_REASON_LEAF**

the connected device is changed to a leaf

enumerator **MESH_REASON_DIFF_ID**

in different mesh ID

enumerator **MESH_REASON_ROOTS**

root conflict is detected

enumerator **MESH_REASON_PARENT_STOPPED**

parent has stopped the mesh

enumerator **MESH_REASON_SCAN_FAIL**

scan fail

enumerator **MESH_REASON_IE_UNKNOWN**

unknown IE

enumerator **MESH_REASON_WAIVE_ROOT**

waive root

enumerator **MESH_REASON_PARENT_WORSE**

parent with very poor RSSI

enumerator **MESH_REASON_EMPTY_PASSWORD**

use an empty password to connect to an encrypted parent

enumerator **MESH_REASON_PARENT_UNENCRYPTED**

connect to an unencrypted parent/router

enum **esp_mesh_topology_t**

Mesh topology.

Values:

enumerator **MESH_TOPO_TREE**

tree topology

enumerator **MESH_TOPO_CHAIN**

chain topology

enum **mesh_event_toDS_state_t**

The reachability of the root to a DS (distribute system)

Values:

enumerator **MESH_TODS_UNREACHABLE**

the root isn't able to access external IP network

enumerator **MESH_TODS_REACHABLE**

the root is able to access external IP network

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance' s official page on [Easy Connect](#) for more information.

ESP32 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

Application Example Example on how to provision ESP32 using a supported smartphone: [wifi/wifi_easy_connect/dpp-enrollee](#).

API Reference

Header File

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h

Functions

esp_err_t **esp_supp_dpp_init** (*esp_supp_dpp_event_cb_t* evt_cb)

Initialize DPP Supplicant.

Starts DPP Supplicant and initializes related Data Structures.

return

- ESP_OK: Success
- ESP_FAIL: Failure

参数 *evt_cb* –Callback function to receive DPP related events

void **esp_supp_dpp_deinit** (void)

De-initialize DPP Supplicant.

Frees memory from DPP Supplicant Data Structures.

esp_err_t **esp_supp_dpp_bootstrap_gen** (const char *chan_list, *esp_supp_dpp_bootstrap_t* type, const char *key, const char *info)

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

参数

- **chan_list** –List of channels device will be available on for listening
- **type** –Bootstrap method type, only QR Code method is supported for now.
- **key** –(Optional) Private Key used to generate a Bootstrapping Public Key
- **info** –(Optional) Ancilliary Device Information like Serial Number

返回

- ESP_OK: Success
- ESP_FAIL: Failure

esp_err_t **esp_supp_dpp_start_listen** (void)

Start listening on Channels provided during `esp_supp_dpp_bootstrap_gen`.

Listens on every Channel from Channel List for a pre-defined wait time.

返回

- ESP_OK: Success

- `ESP_FAIL`: Generic Failure
- `ESP_ERR_INVALID_STATE`: ROC attempted before WiFi is started
- `ESP_ERR_NO_MEM`: Memory allocation failed while posting ROC request

void `esp_supp_dpp_stop_listen` (void)

Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.

Macros

`ESP_ERR_DPP_FAILURE`

Generic failure during DPP Operation

`ESP_ERR_DPP_TX_FAILURE`

DPP Frame Tx failed OR not Acked

`ESP_ERR_DPP_INVALID_ATTR`

Encountered invalid DPP Attribute

Type Definitions

typedef enum *dpp_bootstrap_type* `esp_supp_dpp_bootstrap_t`

Types of Bootstrap Methods for DPP.

typedef void (*`esp_supp_dpp_event_cb_t`)(*esp_supp_dpp_event_t* evt, void *data)

Callback function for receiving DPP Events from Supplicant.

Callback function will be called with DPP related information.

Param evt DPP event ID

Param data Event data payload

Enumerations

enum `dpp_bootstrap_type`

Types of Bootstrap Methods for DPP.

Values:

enumerator `DPP_BOOTSTRAP_QR_CODE`

QR Code Method

enumerator `DPP_BOOTSTRAP_PKEX`

Proof of Knowledge Method

enumerator `DPP_BOOTSTRAP_NFC_URI`

NFC URI record Method

enum `esp_supp_dpp_event_t`

Types of Callback Events received from DPP Supplicant.

Values:

enumerator `ESP_SUPP_DPP_URI_READY`

URI is ready through Bootstrapping

enumerator **ESP_SUPP_DPP_CFG_RECVD**

Config received via DPP Authentication

enumerator **ESP_SUPP_DPP_FAIL**

DPP Authentication failure

本部分的 Wi-Fi API 示例代码存放在 ESP-IDF 示例项目的 `wifi` 目录下。

ESP-WIFI-MESH 的示例代码存放在 ESP-IDF 示例项目的 `mesh` 目录下。

Header File

- [components/esp_eth/include/esp_eth.h](#)

Functions

esp_err_t **esp_eth_driver_install** (const *esp_eth_config_t* *config, *esp_eth_handle_t* *out_hdl)

Install Ethernet driver.

参数

- **config** –[in] configuration of the Ethernet driver
- **out_hdl** –[out] handle of Ethernet driver

返回

- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there's no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_driver_uninstall** (*esp_eth_handle_t* hdl)

Uninstall Ethernet driver.

备注: It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

参数 **hdl** –[in] handle of Ethernet driver

返回

- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_start** (*esp_eth_handle_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

备注: This API will start driver state machine and internal software timer (for checking link status).

参数 **hdl** –[in] handle of Ethernet driver

返回

- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_stop** (*esp_eth_handle_t* hdl)

Stop Ethernet driver.

备注: This function does the oppsite operation of esp_eth_start.

参数 **hdl** –[in] handle of Ethernet driver

返回

- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet

- **ESP_FAIL**: stop esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_update_input_path** (*esp_eth_handle_t* hdl, *esp_err_t* (*stack_input)(*esp_eth_handle_t* hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)

Update Ethernet data input path (i.e. specify where to pass the input buffer)

备注: After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

参数

- **hdl** –[in] handle of Ethernet driver
- **stack_input** –[in] function pointer, which does the actual process on incoming packets
- **priv** –[in] private resource, which gets passed to `stack_input` callback without any modification

返回

- **ESP_OK**: update input path successfully
- **ESP_ERR_INVALID_ARG**: update input path failed because of some invalid argument
- **ESP_FAIL**: update input path failed because some other error occurred

esp_err_t **esp_eth_transmit** (*esp_eth_handle_t* hdl, void *buf, size_t length)

General Transmit.

参数

- **hdl** –[in] handle of Ethernet driver
- **buf** –[in] buffer of the packet to transfer
- **length** –[in] length of the buffer to transfer

返回

- **ESP_OK**: transmit frame buffer successfully
- **ESP_ERR_INVALID_ARG**: transmit frame buffer failed because of some invalid argument
- **ESP_FAIL**: transmit frame buffer failed because some other error occurred

esp_err_t **esp_eth_receive** (*esp_eth_handle_t* hdl, uint8_t *buf, uint32_t *length)

General Receive is deprecated and shall not be accessed from app code, as polling is not supported by Ethernet.

备注: Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

备注: This API was exposed by accident, users should not use this API in their applications. Ethernet driver is interrupt driven, and doesn't support polling mode. Instead, users should register input callback with `esp_eth_update_input_path`.

参数

- **hdl** –[in] handle of Ethernet driver
- **buf** –[out] buffer to preserve the received packet
- **length** –[out] length of the received packet

返回

- **ESP_OK**: receive frame buffer successfully
- **ESP_ERR_INVALID_ARG**: receive frame buffer failed because of some invalid argument
- **ESP_ERR_INVALID_SIZE**: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- **ESP_FAIL**: receive frame buffer failed because some other error occurred

esp_err_t **esp_eth_ioctl** (*esp_eth_handle_t* hdl, *esp_eth_io_cmd_t* cmd, void *data)

Misc IO function of Ethernet driver.

The following IO control commands are supported:

- `ETH_CMD_S_MAC_ADDR` sets Ethernet interface MAC address. `data` argument is pointer to MAC address buffer with expected size of 6 bytes.
- `ETH_CMD_G_MAC_ADDR` gets Ethernet interface MAC address. `data` argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- `ETH_CMD_S_PHY_ADDR` sets PHY address in range of <0-31>. `data` argument is pointer to memory of `uint32_t` datatype from where the configuration option is read.
- `ETH_CMD_G_PHY_ADDR` gets PHY address. `data` argument is pointer to memory of `uint32_t` datatype to which the PHY address is to be stored.
- `ETH_CMD_G_SPEED` gets current Ethernet link speed. `data` argument is pointer to memory of `eth_speed_t` datatype to which the speed is to be stored.
- `ETH_CMD_S_PROMISCUOUS` sets/resets Ethernet interface promiscuous mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- `ETH_CMD_S_FLOW_CTRL` sets/resets Ethernet interface flow control. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- `ETH_CMD_G_DUPLEX_MODE` gets current Ethernet link duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.
- `ETH_CMD_S_PHY_LOOPBACK` sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.

参数

- **hdl** –[in] handle of Ethernet driver
- **cmd** –[in] IO control command
- **data** –[inout] address of data for `set` command or address where to store the data when used with `get` command

返回

- `ESP_OK`: process io command successfully
- `ESP_ERR_INVALID_ARG`: process io command failed because of some invalid argument
- `ESP_FAIL`: process io command failed because some other error occurred

esp_err_t **esp_eth_increase_reference** (*esp_eth_handle_t* hdl)

Increase Ethernet driver reference.

备注: Ethernet driver handle can be obtained by `os timer`, `netif`, etc. It's dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

参数 **hdl** –[in] handle of Ethernet driver

返回

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

esp_err_t **esp_eth_decrease_reference** (*esp_eth_handle_t* hdl)

Decrease Ethernet driver reference.

参数 **hdl** –[in] handle of Ethernet driver

返回

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

Structures

struct **esp_eth_config_t**

Configuration of Ethernet driver.

Public Members

esp_eth_mac_t ***mac**

Ethernet MAC object.

esp_eth_phy_t ***phy**

Ethernet PHY object.

uint32_t **check_link_period_ms**

Period time of checking Ethernet link status.

esp_err_t (***stack_input**)(*esp_eth_handle_t* eth_handle, uint8_t *buffer, uint32_t length, void *priv)

Input frame buffer to user's stack.

Param eth_handle [in] handle of Ethernet driver

Param buffer [in] frame buffer that will get input to upper stack

Param length [in] length of the frame buffer

Return

- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack

esp_err_t (***on_lowlevel_init_done**)(*esp_eth_handle_t* eth_handle)

Callback function invoked when lowlevel initialization is finished.

Param eth_handle [in] handle of Ethernet driver

Return

- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

esp_err_t (***on_lowlevel_deinit_done**)(*esp_eth_handle_t* eth_handle)

Callback function invoked when lowlevel deinitialization is finished.

Param eth_handle [in] handle of Ethernet driver

Return

- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

esp_err_t (***read_phy_reg**)(*esp_eth_handle_t* eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

备注: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

Param eth_handle [in] handle of Ethernet driver

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [out] PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

esp_err_t (***write_phy_reg**)(*esp_eth_handle_t* eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

备注: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

Param eth_handle [in] handle of Ethernet driver

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [in] PHY register value

Return

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

Macros

ETH_DEFAULT_CONFIG (emac, ephy)

Default configuration for Ethernet driver.

Type Definitions

typedef void ***esp_eth_handle_t**

Handle of Ethernet driver.

API 参考-通用接口

Header File

- [components/esp_eth/include/esp_eth_com.h](#)

Functions

esp_err_t **esp_eth_detect_phy_addr** (*esp_eth_mediator_t* *eth, int *detected_addr)

Detect PHY address.

参数

- **eth** –[in] mediator of Ethernet driver
- **detected_addr** –[out] a valid address after detection

返回

- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can't detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

Structures

struct **esp_eth_mediator_s**

Ethernet mediator.

Public Members

esp_err_t (***phy_reg_read**)(*esp_eth_mediator_t* *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Param eth [in] mediator of Ethernet driver

Param phy_addr [in] PHY Chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [out] PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

esp_err_t (***phy_reg_write**)(*esp_eth_mediator_t* *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Param eth [in] mediator of Ethernet driver

Param phy_addr [in] PHY Chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [in] PHY register value

Return

- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

esp_err_t (***stack_input**)(*esp_eth_mediator_t* *eth, uint8_t *buffer, uint32_t length)

Deliver packet to upper stack.

Param eth [in] mediator of Ethernet driver

Param buffer [in] packet buffer

Param length [in] length of the packet

Return

- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

esp_err_t (***on_state_changed**)(*esp_eth_mediator_t* *eth, *esp_eth_state_t* state, void *args)

Callback on Ethernet state changed.

Param eth [in] mediator of Ethernet driver

Param state [in] new state

Param args [in] optional argument for the new state

Return

- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

Macros

ETH_MAX_PAYLOAD_LEN

Maximum Ethernet payload size.

ETH_MIN_PAYLOAD_LEN

Minimum Ethernet payload size.

ETH_HEADER_LEN

Ethernet frame header size: Dest addr(6 Bytes) + Src addr(6 Bytes) + length/type(2 Bytes)

ETH_VLAN_TAG_LEN

Optional 802.1q VLAN Tag length.

ETH_JUMBO_FRAME_PAYLOAD_LEN

Jumbo frame payload size.

ETH_MAX_PACKET_SIZE

Maximum frame size (1522 Bytes)

ETH_MIN_PACKET_SIZE

Minimum frame size (64 Bytes)

Type Definitions

typedef struct *esp_eth_mediator_s* **esp_eth_mediator_t**

Ethernet mediator.

Enumerations

enum **esp_eth_state_t**

Ethernet driver state.

Values:

enumerator **ETH_STATE_LLINIT**

Lowlevel init done

enumerator **ETH_STATE_DEINIT**

Deinit done

enumerator **ETH_STATE_LINK**

Link status changed

enumerator **ETH_STATE_SPEED**

Speed updated

enumerator **ETH_STATE_DUPLEX**

Duplex updated

enumerator **ETH_STATE_PAUSE**

Pause ability updated

enum **esp_eth_io_cmd_t**

Command list for ioctl API.

Values:

enumerator **ETH_CMD_G_MAC_ADDR**

Get MAC address

enumerator **ETH_CMD_S_MAC_ADDR**

Set MAC address

enumerator **ETH_CMD_G_PHY_ADDR**

Get PHY address

enumerator **ETH_CMD_S_PHY_ADDR**

Set PHY address

enumerator **ETH_CMD_G_SPEED**

Get Speed

enumerator **ETH_CMD_S_PROMISCUOUS**

Set promiscuous mode

enumerator **ETH_CMD_S_FLOW_CTRL**

Set flow control

enumerator **ETH_CMD_G_DUPLEX_MODE**

Get Duplex mode

enumerator **ETH_CMD_S_PHY_LOOPBACK**

Set PHY loopback

enum **eth_event_t**

Ethernet event declarations.

Values:

enumerator **ETHERNET_EVENT_START**

Ethernet driver start

enumerator **ETHERNET_EVENT_STOP**

Ethernet driver stop

enumerator **ETHERNET_EVENT_CONNECTED**

Ethernet got a valid link

enumerator **ETHERNET_EVENT_DISCONNECTED**

Ethernet lost a valid link

API 参考-MAC 接口

Header File

- `components/esp_eth/include/esp_eth_mac.h`

Functions

`esp_eth_mac_t *esp_eth_mac_new_esp32` (const `eth_mac_config_t` *config)

Create ESP32 Ethernet MAC instance.

参数 `config` – Ethernet MAC configuration

返回

- instance: create MAC instance successfully
- NULL: create MAC instance failed because some error occurred

Unions

union `eth_mac_clock_config_t`

`#include <esp_eth_mac.h>` Ethernet MAC Clock Configuration.

Public Members

struct `eth_mac_clock_config_t::[anonymous]` `mii`

EMAC MII Clock Configuration

`emac_rmii_clock_mode_t` `clock_mode`

RMII Clock Mode Configuration

`emac_rmii_clock_gpio_t` `clock_gpio`

RMII Clock GPIO Configuration

struct `eth_mac_clock_config_t::[anonymous]` `rmii`

EMAC RMII Clock Configuration

Structures

struct `esp_eth_mac_s`

Ethernet MAC.

Public Members

`esp_err_t (*set_mediator)`(`esp_eth_mac_t` *mac, `esp_eth_mediator_t` *eth)

Set mediator for Ethernet MAC.

Param `mac` [in] Ethernet MAC instance

Param `eth` [in] Ethernet mediator

Return

- ESP_OK: set mediator for Ethernet MAC successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

esp_err_t (***init**)(*esp_eth_mac_t* *mac)

Initialize Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

esp_err_t (***deinit**)(*esp_eth_mac_t* *mac)

Deinitialize Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

esp_err_t (***start**)(*esp_eth_mac_t* *mac)

Start Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

esp_err_t (***stop**)(*esp_eth_mac_t* *mac)

Stop Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: stop Ethernet MAC successfully
- ESP_FAIL: stop Ethernet MAC failed because some error occurred

esp_err_t (***transmit**)(*esp_eth_mac_t* *mac, uint8_t *buf, uint32_t length)

Transmit packet from Ethernet MAC.

Param mac [in] Ethernet MAC instance

Param buf [in] packet buffer to transmit

Param length [in] length of packet

Return

- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
- ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
- ESP_FAIL: transmit packet failed because some other error occurred

esp_err_t (***receive**)(*esp_eth_mac_t* *mac, uint8_t *buf, uint32_t *length)

Receive packet from Ethernet MAC.

备注: Memory of buf is allocated in the Layer2, make sure it get free after process.

备注: Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Param mac [in] Ethernet MAC instance

Param buf [out] packet buffer which will preserve the received frame

Param length [out] length of the received packet

Return

- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred

esp_err_t (***read_phy_reg**)(*esp_eth_mac_t* *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Param mac [in] Ethernet MAC instance

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [out] PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

esp_err_t (***write_phy_reg**)(*esp_eth_mac_t* *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Param mac [in] Ethernet MAC instance

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [in] PHY register value

Return

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

esp_err_t (***set_addr**)(*esp_eth_mac_t* *mac, uint8_t *addr)

Set MAC address.

Param mac [in] Ethernet MAC instance

Param addr [in] MAC address

Return

- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

esp_err_t (***get_addr**)(*esp_eth_mac_t* *mac, uint8_t *addr)

Get MAC address.

Param mac [in] Ethernet MAC instance

Param addr [out] MAC address

Return

- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument

- ESP_FAIL: get MAC address failed because some other error occurred

esp_err_t (***set_speed**)(*esp_eth_mac_t* *mac, eth_speed_t speed)

Set speed of MAC.

Param mac [in] Ethernet MAC instance

Param speed [in] MAC speed

Return

- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

esp_err_t (***set_duplex**)(*esp_eth_mac_t* *mac, eth_duplex_t duplex)

Set duplex mode of MAC.

Param mac [in] Ethernet MAC instance

Param duplex [in] MAC duplex

Return

- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

esp_err_t (***set_link**)(*esp_eth_mac_t* *mac, eth_link_t link)

Set link status of MAC.

Param mac [in] Ethernet MAC instance

Param link [in] Link status

Return

- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

esp_err_t (***set_promiscuous**)(*esp_eth_mac_t* *mac, bool enable)

Set promiscuous of MAC.

Param mac [in] Ethernet MAC instance

Param enable [in] set true to enable promiscuous mode; set false to disable promiscuous mode

Return

- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

esp_err_t (***enable_flow_ctrl**)(*esp_eth_mac_t* *mac, bool enable)

Enable flow control on MAC layer or not.

Param mac [in] Ethernet MAC instance

Param enable [in] set true to enable flow control; set false to disable flow control

Return

- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

esp_err_t (***set_peer_pause_ability**)(*esp_eth_mac_t* *mac, uint32_t ability)

Set the PAUSE ability of peer node.

Param mac [in] Ethernet MAC instance

Param ability [in] zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

Return

- ESP_OK: set peer pause ability successfully

- `ESP_FAIL`: set peer pause ability failed because some error occurred

`esp_err_t (*del)(esp_eth_mac_t *mac)`

Free memory of Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- `ESP_OK`: free Ethernet MAC instance successfully
- `ESP_FAIL`: free Ethernet MAC instance failed because some error occurred

struct **eth_mac_config_t**

Configuration of Ethernet MAC object.

Public Members

uint32_t **sw_reset_timeout_ms**

Software reset timeout value (Unit: ms)

uint32_t **rx_task_stack_size**

Stack size of the receive task

uint32_t **rx_task_prio**

Priority of the receive task

int **smi_mdc_gpio_num**

SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

int **smi_mdio_gpio_num**

SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

uint32_t **flags**

Flags that specify extra capability for mac driver

eth_data_interface_t **interface**

EMAC Data interface to PHY (MII/RMII)

eth_mac_clock_config_t **clock_config**

EMAC Interface clock configuration

Macros

ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE

MAC driver can work when cache is disabled

ETH_MAC_FLAG_PIN_TO_CORE

Pin MAC task to the CPU core where driver installation happened

ETH_MAC_DEFAULT_CONFIG ()

Default configuration for Ethernet MAC object.

Type Definitions

typedef struct *esp_eth_mac_s* **esp_eth_mac_t**

Ethernet MAC.

Enumerations

enum **emac_rmii_clock_mode_t**

RMII Clock Mode Options.

Values:

enumerator **EMAC_CLK_DEFAULT**

Default values configured using Kconfig are going to be used when “Default” selected.

enumerator **EMAC_CLK_EXT_IN**

Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

备注: MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_CLK_OUT**

Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum **emac_rmii_clock_gpio_t**

RMII Clock GPIO number Options.

Values:

enumerator **EMAC_CLK_IN_GPIO**

MAC will get RMII clock from outside at this GPIO.

备注: ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_APPL_CLK_OUT_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO0.

备注: GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn't have directly relationship with EMAC peripheral. Sometimes this clock won't work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don't select GPIO0 output mode for stability.

enumerator **EMAC_CLK_OUT_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC_CLK_OUT_180_GPIO**

Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

API 参考-PHY 接口

Header File

- components/esp_eth/include/esp_eth_phy.h

Functions

esp_eth_phy_t ***esp_eth_phy_new_ip101** (const *eth_phy_config_t* *config)

Create a PHY instance of IP101.

参数 **config** –[in] configuration of PHY

返回

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_rt18201** (const *eth_phy_config_t* *config)

Create a PHY instance of RTL8201.

参数 **config** –[in] configuration of PHY

返回

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_lan87xx** (const *eth_phy_config_t* *config)

Create a PHY instance of LAN87xx.

参数 **config** –[in] configuration of PHY

返回

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

static inline *esp_eth_phy_t* ***esp_eth_phy_new_lan8720** (const *eth_phy_config_t* *config)

Create a PHY instance of LAN8720.

备注: For ESP-IDF backwards compatibility reasons. In all other cases, use `esp_eth_phy_new_lan87xx` instead.

参数 **config** –[in] configuration of PHY

返回

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_dp83848** (const *eth_phy_config_t* *config)

Create a PHY instance of DP83848.

参数 **config** –[in] configuration of PHY

返回

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_ksz8041** (const *eth_phy_config_t* *config)

Create a PHY instance of KSZ8041.

参数 **config** –[in] configuration of PHY

返回

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_ksz8081** (const *eth_phy_config_t* *config)

Create a PHY instance of KSZ8081.

参数 config [in] configuration of PHY

返回

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Structures

struct **esp_eth_phy_s**

Ethernet PHY.

Public Members

esp_err_t (***set_mediator**)(*esp_eth_phy_t* *phy, *esp_eth_mediator_t* *mediator)

Set mediator for PHY.

Param phy [in] Ethernet PHY instance

Param mediator [in] mediator of Ethernet driver

Return

- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

esp_err_t (***reset**)(*esp_eth_phy_t* *phy)

Software Reset Ethernet PHY.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

esp_err_t (***reset_hw**)(*esp_eth_phy_t* *phy)

Hardware Reset Ethernet PHY.

备注: Hardware reset is mostly done by pull down and up PHY's nRST pin

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

esp_err_t (***init**)(*esp_eth_phy_t* *phy)

Initialize Ethernet PHY.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

esp_err_t (***deinit**)(*esp_eth_phy_t* *phy)

Deinitialize Ethernet PHY.

Param phyL [in] Ethernet PHY instance

Return

- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

esp_err_t (***negotiate**)(*esp_eth_phy_t* *phy)

Start auto negotiation.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred

esp_err_t (***get_link**)(*esp_eth_phy_t* *phy)

Get Ethernet PHY link status.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

esp_err_t (***pwrcctl**)(*esp_eth_phy_t* *phy, bool enable)

Power control of Ethernet PHY.

Param phy [in] Ethernet PHY instance

Param enable [in] set true to power on Ethernet PHY; ser false to power off Ethernet PHY

Return

- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

esp_err_t (***set_addr**)(*esp_eth_phy_t* *phy, uint32_t addr)

Set PHY chip address.

Param phy [in] Ethernet PHY instance

Param addr [in] PHY chip address

Return

- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

esp_err_t (***get_addr**)(*esp_eth_phy_t* *phy, uint32_t *addr)

Get PHY chip address.

Param phy [in] Ethernet PHY instance

Param addr [out] PHY chip address

Return

- ESP_OK: get Ethernet PHY address successfully
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

esp_err_t (***advertise_pause_ability**)(*esp_eth_phy_t* *phy, uint32_t ability)

Advertise pause function supported by MAC layer.

Param phy [in] Ethernet PHY instance

Param addr [out] Pause ability

Return

- ESP_OK: Advertise pause ability successfully
- ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

esp_err_t (***loopback**)(*esp_eth_phy_t* *phy, bool enable)

Param phy [in] Ethernet PHY instance

Param enable [in] enables or disables PHY loopback

Return

- ESP_OK: configures PHY instance loopback function successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

esp_err_t (***del**)(*esp_eth_phy_t* *phy)

Free memory of Ethernet PHY instance.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

struct **eth_phy_config_t**

Ethernet PHY configuration.

Public Members

int32_t **phy_addr**

PHY address, set -1 to enable PHY address detection at initialization stage

uint32_t **reset_timeout_ms**

Reset timeout value (Unit: ms)

uint32_t **autonego_timeout_ms**

Auto-negotiation timeout value (Unit: ms)

int **reset_gpio_num**

Reset GPIO number, -1 means no hardware reset

Macros

ESP_ETH_PHY_ADDR_AUTO

ETH_PHY_DEFAULT_CONFIG ()

Default configuration for Ethernet PHY object.

Type Definitions

typedef struct *esp_eth_phy_s* **esp_eth_phy_t**

Ethernet PHY.

API 参考-esp_netif 相关使用

Header File

- [components/esp_eth/include/esp_eth_netif_glue.h](#)

Functions

esp_eth_netif_glue_handle_t **esp_eth_new_netif_glue** (*esp_eth_handle_t* eth_hdl)

Create a netif glue for Ethernet driver.

备注: netif glue is used to attach io driver to TCP/IP netif

参数 **eth_hdl** –Ethernet driver handle

返回 glue object, which inherits esp_netif_driver_base_t

esp_err_t **esp_eth_del_netif_glue** (*esp_eth_netif_glue_handle_t* eth_netif_glue)

Delete netif glue of Ethernet driver.

参数 **eth_netif_glue** –netif glue

返回 -ESP_OK: delete netif glue successfully

esp_err_t **esp_eth_set_default_handlers** (void *esp_netif)

Register default IP layer handlers for Ethernet.

备注: : Ethernet handle might not yet properly initialized when setting up these default handlers

警告: : This function is deprecated and is kept here only for compatibility reasons. Registration of default IP layer handlers for Ethernet is now handled automatically. Do not call this function if you want to use multiple Ethernet instances at a time.

参数 **esp_netif** –[in] esp network interface handle created for Ethernet driver

返回

- ESP_ERR_INVALID_ARG: invalid parameter (esp_netif is NULL)
- ESP_OK: set default IP layer handlers successfully
- others: other failure occurred during register esp_event handler

esp_err_t **esp_eth_clear_default_handlers** (void *esp_netif)

Unregister default IP layer handlers for Ethernet.

警告: : This function is deprecated and is kept here only for compatibility reasons. Unregistration of default IP layer handlers for Ethernet is now handled automatically if not registered by calling esp_eth_set_default_handlers.

参数 **esp_netif** –[in] esp network interface handle created for Ethernet driver

返回

- ESP_ERR_INVALID_ARG: invalid parameter (esp_netif is NULL)
- ESP_OK: clear default IP layer handlers successfully
- others: other failure occurred during unregister esp_event handler

Type Definitions

typedef struct esp_eth_netif_glue_t ***esp_eth_netif_glue_handle_t**

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

本部分的以太网 API 示例代码存放在 ESP-IDF 示例项目的 [ethernet](#) 目录下。

2.2.3 Thread

Thread

Introduction Thread is a IP-based mesh networking protocol. It's based on the 802.15.4 physical and MAC layer.

Application Examples The `openthread` directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell `openthread/ot_cli`.
- The Thread border router `openthread/ot_br`.
- The Thread radio co-processor `openthread/ot_rcp`.

API Reference For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](#).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

Header File

- `components/openthread/include/esp_openthread.h`

Functions

`esp_err_t esp_openthread_init` (const `esp_openthread_platform_config_t` *init_config)

Initializes the full OpenThread stack.

备注: The OpenThread instance will also be initialized in this function.

参数 `init_config` **–[in]** The initialization configuration.

返回

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` if allocation has failed
- `ESP_ERR_INVALID_ARG` if radio or host connection mode not supported
- `ESP_ERR_INVALID_STATE` if already initialized

`esp_err_t esp_openthread_launch_mainloop` (void)

Launches the OpenThread main loop.

备注: This function will not return unless error happens when running the OpenThread stack.

返回

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` if allocation has failed
- `ESP_FAIL` on other failures

`esp_err_t esp_openthread_deinit` (void)

This function performs OpenThread stack and platform driver deinitialization.

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if not initialized

otInstance ***esp_openthread_get_instance** (void)

This function acquires the underlying OpenThread instance.

备注: This function can be called on other tasks without lock.

返回 The OpenThread instance pointer

Header File

- [components/openthread/include/esp_openthread_types.h](#)

Structures

struct **esp_openthread_mainloop_context_t**

This structure represents a context for a select() based mainloop.

Public Members

fd_set **read_fds**

The read file descriptors

fd_set **write_fds**

The write file descriptors

fd_set **error_fds**

The error file descriptors

int **max_fd**

The max file descriptor

struct timeval **timeout**

The timeout

struct **esp_openthread_uart_config_t**

The uart port config for OpenThread.

Public Members

[uart_port_t](#) **port**

UART port number

[uart_config_t](#) **uart_config**

UART configuration, see [uart_config_t](#) docs

int **rx_pin**

UART RX pin

int **tx_pin**
UART TX pin

struct **esp_openthread_radio_config_t**
The OpenThread radio configuration.

Public Members

esp_openthread_radio_mode_t **radio_mode**
The radio mode

esp_openthread_uart_config_t **radio_uart_config**
The uart configuration to RCP

struct **esp_openthread_host_connection_config_t**
The OpenThread host connection configuration.

Public Members

esp_openthread_host_connection_mode_t **host_connection_mode**
The host connection mode

esp_openthread_uart_config_t **host_uart_config**
The uart configuration to host

struct **esp_openthread_port_config_t**
The OpenThread port specific configuration.

Public Members

const char ***storage_partition_name**
The partition for storing OpenThread dataset

uint8_t **netif_queue_size**
The packet queue size for the network interface

uint8_t **task_queue_size**
The task queue size

struct **esp_openthread_platform_config_t**
The OpenThread platform configuration.

Public Members

esp_openthread_radio_config_t **radio_config**
The radio configuration

esp_openthread_host_connection_config_t **host_config**

The host connection configuration

esp_openthread_port_config_t **port_config**

The port configuration

Enumerations

enum **esp_openthread_event_t**

OpenThread event declarations.

Values:

enumerator **OPENTHREAD_EVENT_START**

OpenThread stack start

enumerator **OPENTHREAD_EVENT_STOP**

OpenThread stack stop

enumerator **OPENTHREAD_EVENT_IF_UP**

OpenThread network interface up

enumerator **OPENTHREAD_EVENT_IF_DOWN**

OpenThread network interface down

enumerator **OPENTHREAD_EVENT_GOT_IP6**

OpenThread stack added IPv6 address

enumerator **OPENTHREAD_EVENT_LOST_IP6**

OpenThread stack removed IPv6 address

enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN**

OpenThread stack joined IPv6 multicast group

enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE**

OpenThread stack left IPv6 multicast group

enum **esp_openthread_radio_mode_t**

The radio mode of OpenThread.

Values:

enumerator **RADIO_MODE_NATIVE**

Use the native 15.4 radio

enumerator **RADIO_MODE_UART_RCP**

UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_SPI_RCP**

SPI connection to a 15.4 capable radio co-processor (RCP)

enum **esp_openthread_host_connection_mode_t**

How OpenThread connects to the host.

Values:

enumerator **HOST_CONNECTION_MODE_NONE**

Disable host connection

enumerator **HOST_CONNECTION_MODE_CLI_UART**

CLI UART connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_UART**

RCP UART connection to the host

Header File

- [components/openthread/include/esp_openthread_lock.h](#)

Functions

esp_err_t **esp_openthread_lock_init** (void)

This function initializes the OpenThread API lock.

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

void **esp_openthread_lock_deinit** (void)

This function deinitializes the OpenThread API lock.

bool **esp_openthread_lock_acquire** (TickType_t block_ticks)

This functions acquires the OpenThread API lock.

备注: Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

参数 **block_ticks** **-[in]** The maximum number of RTOS ticks to wait for the lock.

返回

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp_openthread_lock_release** (void)

This function releases the OpenThread API lock.

Header File

- [components/openthread/include/esp_openthread_netif_glue.h](#)

Functions

void ***esp_openthread_netif_glue_init** (const *esp_openthread_platform_config_t* *config)

This function initializes the OpenThread network interface glue.

参数 **config** **-[in]** The platform configuration.

返回

- glue pointer on success
- NULL on failure

void **esp_openthread_netif_glue_deinit** (void)

This function deinitializes the OpenThread network interface glue.

esp_netif_t ***esp_openthread_get_netif** (void)

This function acquires the OpenThread netif.

返回 The OpenThread netif or NULL if not initialized.

Header File

- [components/openthread/include/esp_openthread_border_router.h](#)

Functions

esp_err_t **esp_openthread_border_router_init** (esp_netif_t *backbone_netif)

Initializes the border router features of OpenThread.

备注: Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD_BORDER_ROUTER is required.

参数 *backbone_netif* –[in] The backbone network interface (WiFi or ethernet)

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if feature not supported
- ESP_ERR_INVALID_STATE if already initialized
- ESP_FIAL on other failures

esp_err_t **esp_openthread_border_router_deinit** (void)

Deinitializes the border router features of OpenThread.

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
- ESP_FIAL on other failures

esp_netif_t ***esp_openthread_get_backbone_netif** (void)

Gets the backbone interface of OpenThread border router.

返回 The backbone interface or NULL if border router not initialized.

本部分的 Thread API 示例代码存放在 ESP-IDF 示例项目的 [openthread](#) 目录下。

2.2.4 IP 网络层协议

ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

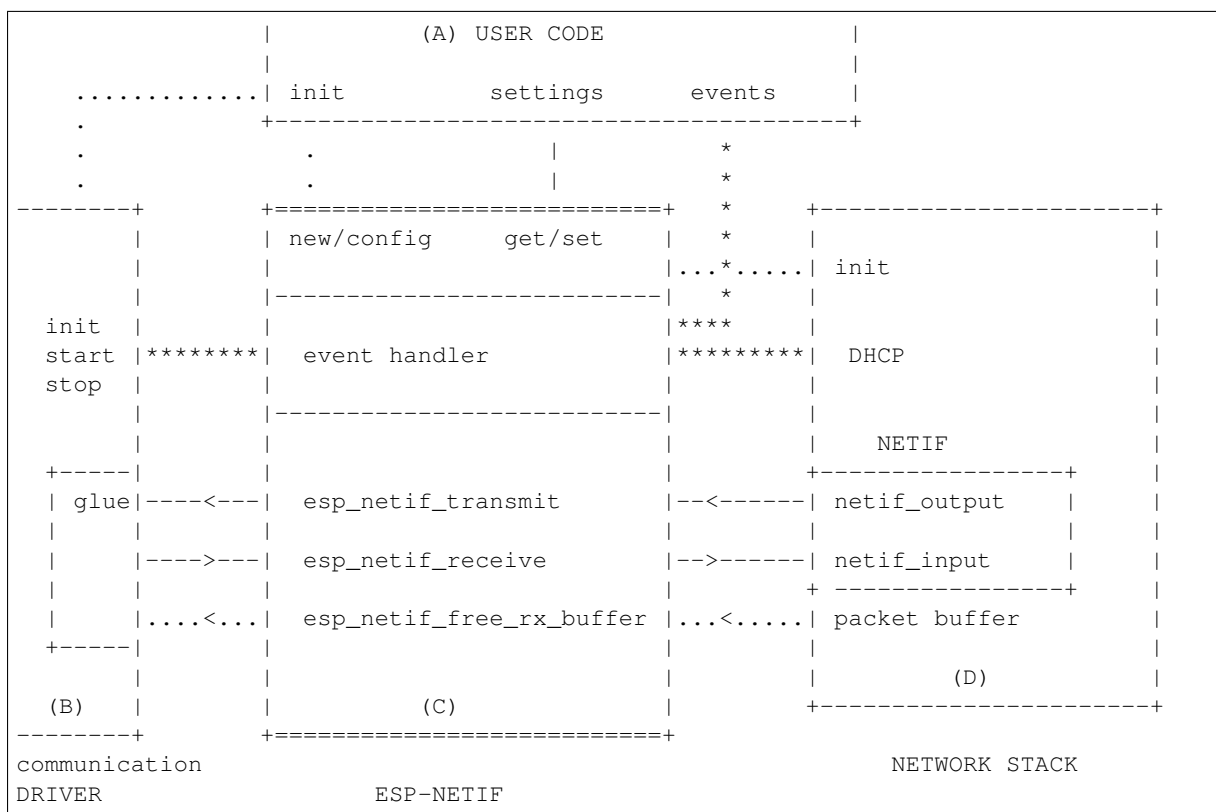

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the `tcpip_adapter`, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the [TCP/IP 适配器迁移指南](#) section in case existing applications to be ported to use the `esp-netif` API instead.

ESP-NETIF architecture

Data and event flow in the diagram

- Initialization line from user code to ESP-NETIF and communication driver
- --<--->--- Data packets going from communication media to TCP/IP stack and back
- ***** Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure with
 - ESP-NETIF specific options (flags, behaviour, name)
 - Network stack options (netif init and input functions, not publicly available)
 - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers

- use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
- register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver Communication driver plays these two important roles in relation with ESP-NETIF:

- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
 - Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
 - Calls `esp_netif_receive()` to pass incoming data to network stack

C) ESP-NETIF, former tcpip_adapter ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input/Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
 - Used for network interface lifecycle management
 - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters for basic network interface properties
- 5) Network stack abstraction: enabling user interaction with TCP/IP stack
 - Set interface up or down
 - DHCP server and client API
 - DNS API
- 6) Driver conversion utilities

D) Network stack Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

ESP-NETIF programmer' s manual Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: [wifi/getting_started/station/main/station_example_main.c](#)
- WiFi Access Point: [wifi/getting_started/softAP/main/softap_example_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet_example_main.c](#)

For more specific cases please consult this guide: [ESP-NETIF Custom I/O Driver](#).

WiFi default initialization The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_ap()`
- `esp_netif_create_default_wifi_sta()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

API Reference

Header File

- `components/esp_netif/include/esp_netif.h`

Functions

`esp_err_t esp_netif_init` (void)

Initialize the underlying TCP/IP stack.

备注: This function should be called exactly once from application code, when the application starts up.

返回

- ESP_OK on success
- ESP_FAIL if initializing failed

`esp_err_t esp_netif_deinit` (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization is not supported yet

返回

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

`esp_netif_t *esp_netif_new` (const `esp_netif_config_t` *`esp_netif_config`)

Creates an instance of new esp-netif object based on provided config.

参数 `esp_netif_config` –[in] pointer esp-netif configuration

返回

- pointer to esp-netif object on success
- NULL otherwise

void `esp_netif_destroy` (`esp_netif_t` *`esp_netif`)

Destroys the esp_netif object.

参数 `esp_netif` –[in] pointer to the object to be deleted

`esp_err_t esp_netif_set_driver_config` (`esp_netif_t` *`esp_netif`, const `esp_netif_driver_ifconfig_t` *`driver_config`)

Configures driver related options of esp_netif object.

参数

- `esp_netif` –[inout] pointer to the object to be configured
- `driver_config` –[in] pointer esp-netif io driver related configuration

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

esp_err_t **esp_netif_attach** (esp_netif_t *esp_netif, esp_netif_io_driver_handle driver_handle)

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

参数

- **esp_netif** –[inout] pointer to esp_netif object to be attached
- **driver_handle** –[in] pointer to the driver handle

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver's post_attach callback failed

esp_err_t **esp_netif_receive** (esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **buffer** –[in] Received data
- **len** –[in] Length of the data frame
- **eb** –[in] Pointer to internal buffer (used in Wi-Fi driver)

返回

- ESP_OK

void **esp_netif_action_start** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver start event. Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

备注: This API can be directly used as event handler

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_stop** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver stop event.

备注: This API can be directly used as event handler

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_connected** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver connected event.

备注: This API can be directly used as event handler

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_disconnected** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver disconnected event.

备注: This API can be directly used as event handler

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_got_ip** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon network got IP event.

备注: This API can be directly used as event handler

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_join_ip6_multicast_group** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group join.

备注: This API can be directly used as event handler

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_leave_ip6_multicast_group** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

备注: This API can be directly used as event handler

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –

- **data** –

void **esp_netif_action_add_ip6_address** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

备注: This API can be directly used as event handler

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_remove_ip6_address** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

备注: This API can be directly used as event handler

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

esp_err_t **esp_netif_set_mac** (esp_netif_t *esp_netif, uint8_t mac[])

Set the mac address for the interface instance.

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **mac** –[in] Desired mac address for the related network interface

返回

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

esp_err_t **esp_netif_get_mac** (esp_netif_t *esp_netif, uint8_t mac[])

Get the mac address for the interface instance.

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **mac** –[out] Resultant mac address for the related network interface

返回

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

esp_err_t **esp_netif_set_hostname** (esp_netif_t *esp_netif, const char *hostname)

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

参数

- **esp_netif** –[in] Handle to esp-netif instance

- **hostname** –[in] New hostname for the interface. Maximum length 32 bytes.

返回

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

esp_err_t **esp_netif_get_hostname** (esp_netif_t *esp_netif, const char **hostname)

Get interface hostname.

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **hostname** –[out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

返回

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

bool **esp_netif_is_netif_up** (esp_netif_t *esp_netif)

Test if supplied interface is up or down.

参数 **esp_netif** –[in] Handle to esp-netif instance

返回

- true - Interface is up
- false - Interface is down

esp_err_t **esp_netif_get_ip_info** (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface' s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **ip_info** –[out] If successful, IP information will be returned in this argument.

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_get_old_ip_info** (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface' s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **ip_info** –[out] If successful, IP information will be returned in this argument.

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_set_ip_info** (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface' s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

备注: DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

备注: Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **ip_info** –[in] IP information to set on the specified interface

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

esp_err_t **esp_netif_set_old_ip_info** (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **ip_info** –[in] Store the old IP information for the specified interface

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

int **esp_netif_get_netif_impl_index** (esp_netif_t *esp_netif)

Get net interface index from network stack implementation.

备注: This index could be used in `setsockopt()` to bind socket with multicast interface

参数 **esp_netif** –[in] Handle to esp-netif instance

返回 implementation specific index of interface represented with supplied esp_netif

esp_err_t **esp_netif_get_netif_impl_name** (esp_netif_t *esp_netif, char *name)

Get net interface name from network stack implementation.

备注: This name could be used in `setsockopt()` to bind socket with appropriate interface

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **name** –[out] Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_dhcps_option** (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP server option.

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **opt_op** –[in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** –[in] Option index to get or set, must be one of the supported enum values.
- **opt_val** –[inout] Pointer to the option parameter.
- **opt_len** –[in] Length of the option parameter.

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t **esp_netif_dhcpc_option** (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP client option.

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **opt_op** –[in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** –[in] Option index to get or set, must be one of the supported enum values.
- **opt_val** –[inout] Pointer to the option parameter.
- **opt_len** –[in] Length of the option parameter.

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t **esp_netif_dhcpc_start** (esp_netif_t *esp_netif)

Start DHCP client (only if enabled in interface object)

备注: The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

参数 **esp_netif** –[in] Handle to esp-netif instance

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

esp_err_t **esp_netif_dhcpc_stop** (esp_netif_t *esp_netif)

Stop DHCP client (only if enabled in interface object)

备注: Calling action_netif_stop() will also stop the DHCP Client if it is running.

参数 **esp_netif** –[in] Handle to esp-netif instance

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

esp_err_t **esp_netif_dhcpc_get_status** (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)

Get DHCP client status.

参数

- **esp_netif** **–[in]** Handle to esp-netif instance
- **status** **–[out]** If successful, the status of DHCP client will be returned in this argument.

返回

- ESP_OK

esp_err_t **esp_netif_dhcps_get_status** (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)

Get DHCP Server status.

参数

- **esp_netif** **–[in]** Handle to esp-netif instance
- **status** **–[out]** If successful, the status of the DHCP server will be returned in this argument.

返回

- ESP_OK

esp_err_t **esp_netif_dhcps_start** (esp_netif_t *esp_netif)

Start DHCP server (only if enabled in interface object)

参数 **esp_netif** **–[in]** Handle to esp-netif instance

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t **esp_netif_dhcps_stop** (esp_netif_t *esp_netif)

Stop DHCP server (only if enabled in interface object)

参数 **esp_netif** **–[in]** Handle to esp-netif instance

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

esp_err_t **esp_netif_set_dns_info** (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP_NETIF_DNS_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

参数

- **esp_netif** **–[in]** Handle to esp-netif instance
- **type** **–[in]** Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- **dns** **–[in]** DNS Server address to set

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

esp_err_t **esp_netif_get_dns_info** (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to *esp_netif_set_dns_info()*. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

参数

- **esp_netif** **–[in]** Handle to esp-netif instance
- **type** **–[in]** Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- **dns** **–[out]** DNS Server result is written here on success

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

esp_err_t **esp_netif_create_ip6_linklocal** (esp_netif_t *esp_netif)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

参数 **esp_netif** **–[in]** Handle to esp-netif instance

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_get_ip6_linklocal** (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

参数

- **esp_netif** **–[in]** Handle to esp-netif instance
- **if_ip6** **–[out]** IPv6 information will be returned in this argument if successful.

返回

- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

esp_err_t **esp_netif_get_ip6_global** (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

参数

- **esp_netif** **–[in]** Handle to esp-netif instance
- **if_ip6** **–[out]** IPv6 information will be returned in this argument if successful.

返回

- ESP_OK

- **ESP_FAIL** If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

int **esp_netif_get_all_ip6** (esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])

Get all IPv6 addresses of the specified interface.

参数

- **esp_netif** **–[in]** Handle to esp-netif instance
- **if_ip6** **–[out]** Array of IPv6 addresses will be copied to the argument

返回 number of returned IPv6 addresses

void **esp_netif_set_ip4_addr** (esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)

Sets IPv4 address to the specified octets.

参数

- **addr** **–[out]** IP address to be set
- **a** **–**the first octet (127 for IP 127.0.0.1)
- **b** **–**
- **c** **–**
- **d** **–**

char ***esp_ip4addr_ntoa** (const esp_ip4_addr_t *addr, char *buf, int buflen)

Converts numeric IP address into decimal dotted ASCII representation.

参数

- **addr** **–**ip address in network order to convert
- **buf** **–**target buffer where the string is stored
- **buflen** **–**length of buf

返回 either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

uint32_t **esp_ip4addr_aton** (const char *addr)

Ascii internet address interpretation routine The value returned is in network order.

参数 **addr** **–**IP address in ascii representation (e.g. “127.0.0.1”)

返回 ip address in network order

esp_err_t **esp_netif_str_to_ip4** (const char *src, esp_ip4_addr_t *dst)

Converts Ascii internet IPv4 address into esp_ip4_addr_t.

参数

- **src** **–[in]** IPv4 address in ascii representation (e.g. “127.0.0.1”)
- **dst** **–[out]** Address of the target esp_ip4_addr_t structure to receive converted address

返回

- **ESP_OK** on success
- **ESP_FAIL** if conversion failed
- **ESP_ERR_INVALID_ARG** if invalid parameter is passed into

esp_err_t **esp_netif_str_to_ip6** (const char *src, esp_ip6_addr_t *dst)

Converts Ascii internet IPv6 address into esp_ip4_addr_t Zeros in the IP address can be stripped or completely omitted: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1”)

参数

- **src** **–[in]** IPv6 address in ascii representation (e.g. “2001:0db8:85a3:0000:0000:0000:0002:0001”)
- **dst** **–[out]** Address of the target esp_ip6_addr_t structure to receive converted address

返回

- **ESP_OK** on success
- **ESP_FAIL** if conversion failed
- **ESP_ERR_INVALID_ARG** if invalid parameter is passed into

esp_netif_iodriver_handle **esp_netif_get_io_driver** (esp_netif_t *esp_netif)

Gets media driver handle for this esp-netif instance.

参数 `esp_netif` –[in] Handle to esp-netif instance
返回 opaque pointer of related IO driver

`esp_netif_t *esp_netif_get_handle_from_ifkey` (const char *if_key)

Searches over a list of created objects to find an instance with supplied if key.

参数 `if_key` –Textual description of network interface
返回 Handle to esp-netif instance

`esp_netif_flags_t esp_netif_get_flags` (esp_netif_t *esp_netif)

Returns configured flags for this interface.

参数 `esp_netif` –[in] Handle to esp-netif instance
返回 Configuration flags

const char *`esp_netif_get_ifkey` (esp_netif_t *esp_netif)

Returns configured interface key for this esp-netif instance.

参数 `esp_netif` –[in] Handle to esp-netif instance
返回 Textual description of related interface

const char *`esp_netif_get_desc` (esp_netif_t *esp_netif)

Returns configured interface type for this esp-netif instance.

参数 `esp_netif` –[in] Handle to esp-netif instance
返回 Enumerated type of this interface, such as station, AP, ethernet

int `esp_netif_get_route_prio` (esp_netif_t *esp_netif)

Returns configured routing priority number.

参数 `esp_netif` –[in] Handle to esp-netif instance
返回 Integer representing the instance's route-prio, or -1 if invalid paramters

int32_t `esp_netif_get_event_id` (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)

Returns configured event for this esp-netif instance and supplied event type.

参数

- `esp_netif` –[in] Handle to esp-netif instance
- `event_type` –(either get or lost IP)

返回 specific event id which is configured to be raised if the interface lost or acquired IP address
-1 if supplied event_type is not known

`esp_netif_t *esp_netif_next` (esp_netif_t *esp_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

参数 `esp_netif` –[in] Handle to esp-netif instance
返回 First netif from the list if supplied parameter is NULL, next one otherwise

size_t `esp_netif_get_nr_of_ifs` (void)

Returns number of registered esp_netif objects.

返回 Number of esp_netifs

void `esp_netif_netstack_buf_ref` (void *netstack_buf)

increase the reference counter of net stack buffer

参数 `netstack_buf` –[in] the net stack buffer

void `esp_netif_netstack_buf_free` (void *netstack_buf)

free the netstack buffer

参数 `netstack_buf` –[in] the net stack buffer

esp_err_t **esp_netif_tcpip_exec** (*esp_netif_callback_fn* fn, void *ctx)

Utility to execute the supplied callback in TCP/IP context.

参数

- **fn** –Pointer to the callback
- **ctx** –Parameter to the callback

返回 The error code (*esp_err_t*) returned by the callback

Macros

_ESP_NETIF_SUPPRESS_LEGACY_WARNING_

Type Definitions

typedef *esp_err_t* (***esp_netif_callback_fn**)(void *ctx)

TCP/IP thread safe callback used with *esp_netif_tcpip_exec()*

WiFi default API reference

Header File

- components/esp_wifi/include/esp_wifi_default.h

Functions

esp_err_t **esp_netif_attach_wifi_station** (*esp_netif_t* *esp_netif)

Attaches wifi station interface to supplied netif.

参数 **esp_netif** –instance to attach the wifi station to

返回

- ESP_OK on success
- ESP_FAIL if attach failed

esp_err_t **esp_netif_attach_wifi_ap** (*esp_netif_t* *esp_netif)

Attaches wifi soft AP interface to supplied netif.

参数 **esp_netif** –instance to attach the wifi AP to

返回

- ESP_OK on success
- ESP_FAIL if attach failed

esp_err_t **esp_wifi_set_default_wifi_sta_handlers** (void)

Sets default wifi event handlers for STA interface.

返回

- ESP_OK on success, error returned from *esp_event_handler_register* if failed

esp_err_t **esp_wifi_set_default_wifi_ap_handlers** (void)

Sets default wifi event handlers for AP interface.

返回

- ESP_OK on success, error returned from *esp_event_handler_register* if failed

esp_err_t **esp_wifi_clear_default_wifi_driver_and_handlers** (void *esp_netif)

Clears default wifi event handlers for supplied network interface.

参数 **esp_netif** –instance of corresponding if object

返回

- ESP_OK on success, error returned from *esp_event_handler_register* if failed

```
esp_netif_t *esp_netif_create_default_wifi_ap (void)
```

Creates default WIFI AP. In case of any init error this API aborts.

备注: The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

返回 pointer to esp-netif instance

```
esp_netif_t *esp_netif_create_default_wifi_sta (void)
```

Creates default WIFI STA. In case of any init error this API aborts.

备注: The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

返回 pointer to esp-netif instance

```
void esp_netif_destroy_default_wifi (void *esp_netif)
```

Destroys default WIFI netif created with esp_netif_create_default_wifi_...() API.

备注: This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

参数 **esp_netif** –[in] object to detach from WiFi and destroy

```
esp_netif_t *esp_netif_create_wifi (wifi_interface_t wifi_if, esp_netif_inherent_config_t
                                   *esp_netif_config)
```

Creates esp_netif WiFi object based on the custom configuration.

Attention This API DOES NOT register default handlers!

参数

- **wifi_if** –[in] type of wifi interface
- **esp_netif_config** –[in] inherent esp-netif configuration pointer

返回 pointer to esp-netif instance

```
esp_err_t esp_netif_create_default_wifi_mesh_netifs (esp_netif_t **p_netif_sta, esp_netif_t
                                                     **p_netif_ap)
```

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

参数

- **p_netif_sta** –[out] pointer where the resultant STA interface is saved (if non NULL)
- **p_netif_ap** –[out] pointer where the resultant AP interface is saved (if non NULL)

返回 ESP_OK on success

TCP/IP 适配器迁移指南

TCP/IP 适配器是在 IDF V4.1 之前使用的网络接口抽象组件。本文档概述了从 `tcpip_adapter` 移出至其后继者 *ESP-NETIF* 的过程。

更新网络连接代码

网络软件栈初始化 只需将 `tcpip_adapter_init()` 替换为 `esp_netif_init()`。请注意，*ESP-NETIF* 初始化 API 可返回标准错误代码，还可以使用 `esp_netif_deinit()` 进行去初始化。

此外，还需将 `#include "tcpip_adapter.h"` 替换为 `#include "esp_netif.h"`。

创建网络接口 TCP/IP 适配器静态定义了三个接口：

- Wi-Fi Station
- Wi-Fi AP
- 以太网

网络接口的设计应严格参考 *ESP-NETIF*，以使其能够连接到 TCP/IP 软件栈。例如，在 TCP/IP 软件栈和事件循环初始化完成后，Wi-Fi 的初始化代码必须显示调用 `esp_netif_create_default_wifi_sta()`；或 `esp_netif_create_default_wifi_ap()`。请参阅这三个接口的初始化代码示例：

- Wi-Fi Station: `wifi/getting_started/station/main/station_example_main.c`
- Wi-Fi AP: `wifi/getting_started/softAP/main/softap_example_main.c`
- 以太网: `ethernet/basic/main/ethernet_example_main.c`

更换其他 `tcpip_adapter` API 所有 `tcpip_adapter` 函数都有对应的 `esp-netif`。具体请见 `esp_netif` 的内容：

- `Setters/Getters`
- `DHCP`
- `DNS`
- `IP address`

默认事件处理程序 事件处理程序已经从 `tcpip_adapter` 移动到相应的驱动程序代码。从应用程序的角度来看，这不会带来任何影响，所有事件仍以相同的方式处理。请注意，在与 IP 相关的事件处理程序中，应用程序代码通常以 `esp-netif` 结构体的形式接收 IP 地址（不是 LwIP 结构，但兼容二进制格式）。这是打印地址的首选方式：

```
ESP_LOGI(TAG, "got ip:" IPSTR "\n", IP2STR(&event->ip_info.ip));
```

而不是

```
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

由于 `ip4addr_ntoa()` 为 LwIP API，因此 `esp-netif` 还提供了替代函数 `esp_ip4addr_ntoa()`，但整体而言仍推荐上述方法。

IP 地址 推荐使用 `esp-netif` 定义的 IP 结构。请注意，在启用默认兼容性时，LwIP 结构体仍然可以工作。
* `esp-netif IP address definitions`

下一步 为了移植应用程序使其可以使用 *ESP-NETIF* 还需完成的步骤包括：在组件配置中禁用 `tcpip_adapter` 兼容层。方法为：`ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface`，并检查工程是否编译成功。TCP/IP 适配器涉及大量依赖项，这一步可能有助于将应用程序与使用特定 TCP/IP 软件栈的 API 分离开来。

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver's lifecycle transitions.

Packet input/output As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls `esp_netif_receive()` on a new data received event.

Post attach callback A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iedriver_handle_t
↳driver_handle);
```

It is assumed that the `esp_netif_iedriver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as
↳esp-netif driver */
    driver_impl_t *h;                     /*!< handle of driver
↳implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

Default handlers I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example *driver start* → *network start*, etc. An example of such a default handler is provided below:

```
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↪netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↪EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↪EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

Network stack connection The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

Header File

- [components/esp_netif/include/esp_netif_net_stack.h](#)

Functions

`esp_netif_t *esp_netif_get_handle_from_netif_impl` (void *dev)

Returns esp-netif handle.

参数 dev –[in] opaque ptr to network interface of specific TCP/IP stack

返回 handle to related esp-netif instance

`void *esp_netif_get_netif_impl` (esp_netif_t *esp_netif)

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

参数 esp_netif –[in] Handle to esp-netif instance

返回 handle to related network stack netif handle

`esp_err_t esp_netif_transmit` (esp_netif_t *esp_netif, void *data, size_t len)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **data** –[in] Data to be transmitted
- **len** –[in] Length of the data frame

返回 ESP_OK on success, an error passed from the I/O driver otherwise

`esp_err_t esp_netif_transmit_wrap` (esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **data** –[in] Data to be transmitted
- **len** –[in] Length of the data frame
- **netstack_buf** –[in] net stack buffer

返回 ESP_OK on success, an error passed from the I/O driver otherwise

void **esp_netif_free_rx_buffer** (void *esp_netif, void *buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

参数

- **esp_netif** –[in] Handle to esp-netif instance
- **buffer** –[in] Rx buffer pointer

TCP/IP 套接字 API 的示例代码存放在 ESP-IDF 示例项目的 [protocols/sockets](#) 目录下。

2.2.5 应用层协议

应用层网络协议（IP 网络层协议之上）的相关文档存放在 [应用层协议](#)。

2.3 外设 API

2.3.1 Analog to Digital Converter (ADC)

ADC Channels

The ESP32 integrates 2 SAR ([Successive Approximation Register](#)) ADCs, supporting a total of 18 measurement channels (analog enabled pins).

These channels are supported:

ADC1:

- 8 channels: GPIO32 - GPIO39

ADC2:

- 10 channels: GPIO0, GPIO2, GPIO4, GPIO12 - GPIO15, GOIO25 - GPIO27

ADC Attenuation

Vref is the reference voltage used internally by ESP32 ADCs for measuring the input voltage. The ESP32 ADCs can measure analog voltages from 0 V to Vref. Among different chips, the Vref varies, the median is 1.1 V. In order to convert voltages larger than Vref, input voltages can be attenuated before being input to the ADCs. There are 4 available attenuation options, the higher the attenuation is, the higher the measurable input voltage could be.

Attenuation	Measurable input voltage range
ADC_ATTEN_DB_0	100 mV ~ 950 mV
ADC_ATTEN_DB_2_5	100 mV ~ 1250 mV
ADC_ATTEN_DB_6	150 mV ~ 1750 mV
ADC_ATTEN_DB_12	150 mV ~ 2450 mV

ADC Conversion

An ADC conversion is to convert the input analog voltage to a digital value. The ADC conversion results provided by the ADC driver APIs are raw data. Resolution of ESP32 ADC raw results under Single Read mode is 12-bit.

- [adc1_get_raw\(\)](#)
- [adc2_get_raw\(\)](#)

To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, see ADC Attenuation .
Dmax	Maximum of the output ADC raw digital reading result, which is 4095 under Single Read mode, 4095 under Continuous Read mode.

For boards with eFuse ADC calibration bits, [esp_adc_cal_raw_to_voltage\(\)](#) can be used to get the calibrated conversion results. These results stand for the actual voltage (in mV). No need to transform these data via the formula (1). If ADC calibration APIs are used on boards without eFuse ADC calibration bits, warnings will be generated. See [ADC Calibration](#).

ADC Limitations

备注:

- Some of the ADC2 pins are used as strapping pins (GPIO 0, 2, 15) thus cannot be used freely. Such is the case in the following official Development Kits:
- ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
- ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.
- Since the ADC2 module is also used by the Wi-Fi, only one of them could get the preemption when using together, which means the [adc2_get_raw\(\)](#) may get blocked until Wi-Fi stops, and vice versa.

Driver Usage

Both of the ADC units support single read mode, which is suitable for low-frequency sampling operations.

备注: ADC readings from a pin not connected to any signal are random.

ADC Single Read mode The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions [adc1_config_width\(\)](#) and [adc1_config_channel_atten\(\)](#).
- For ADC2, configure the attenuation by [adc2_config_channel_atten\(\)](#). The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see [adc1_channel_t](#) and [adc2_channel_t](#), set as a parameter of above functions.

Then it is possible to read ADC conversion result with [adc1_get_raw\(\)](#) and [adc2_get_raw\(\)](#). Reading width of ADC2 should be set as a parameter of [adc2_get_raw\(\)](#) instead of in the configuration functions.

Single Read mode ADC example can be found in [peripherals/adc/single_read](#) directory of ESP-IDF examples.

It is also possible to read the internal hall effect sensor via ADC1 by calling dedicated function [hall_sensor_read\(\)](#). Note that even the hall sensor is internal to ESP32, reading from it uses channels 0 and 3 of ADC1 (GPIO 36 and 39). Do not connect anything else to these pins and do not change their configuration. Otherwise it may affect the measurement of low value signal from the sensor.

This API provides convenient way to configure ADC1 for reading from *ULP*. To do so, call function [adc1_ulp_enable\(\)](#) and then set precision and attenuation as discussed above.

There is another specific function `adc_vref_to_gpio()` used to route internal reference voltage to a GPIO pin. It comes handy to calibrate ADC reading and this is discussed in section [ADC Calibration](#).

备注: See [ADC Limitations](#) for the limitation of using ADC single read mode.

Minimizing Noise

The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, users may connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

图 4: Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.

ADC Calibration

The `esp_adc_cal/include/esp_adc_cal.h` API provides functions to correct for differences in measured voltages caused by variation of ADC reference voltages (Vref) between chips. Per design the ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV amongst different ESP32s.

Correcting ADC readings using this API involves characterizing one of the ADCs at a given attenuation to obtain a characteristics curve (ADC-Voltage curve) that takes into account the difference in ADC reference voltage. The characteristics curve is in the form of $y = \text{coeff_a} * x + \text{coeff_b}$ and is used to convert ADC readings to voltages in mV. Calculation of the characteristics curve is based on calibration values which can be stored in eFuse or provided by the user.

Calibration Values Calibration values are used to generate characteristic curves that account for the variation of ADC reference voltage of a particular ESP32 chip. There are currently 3 source(s) of calibration values on ESP32. The availability of these calibration values will depend on the type and production date of the ESP32 chip/module.

- **Two Point** values represent each of the ADCs' readings at 150 mV and 850 mV. To obtain more accurate calibration results these values should be measured by user and burned into eFuse BLOCK3.

图 5: Graph illustrating effect of differing reference voltages on the ADC voltage curve.

- **eFuse Vref** represents the true ADC reference voltage. This value is measured and burned into eFuse BLOCK0 during factory calibration.
- **Default Vref** is an estimate of the ADC reference voltage provided by the user as a parameter during characterization. If Two Point or eFuse Vref values are unavailable, **Default Vref** will be used.

Individual measurement and burning of the **eFuse Vref** has been applied to ESP32-D0WD and ESP32-D0WDQ6 chips produced on/after the 1st week of 2018. Such chips may be recognized by date codes on/later than 012018 (see Line 4 on figure below).

If you would like to purchase chips or modules with calibration, double check with distributor or Espressif (sales@espressif.com) directly.

If you are unable to check the date code (i.e. the chip may be enclosed inside a canned module, etc.), you can still verify if **eFuse Vref** is present by running the [espefuse.py](#) tool with `adc_info` parameter

```
$IDF_PATH/components/esptool_py/esptool/espefuse.py --port /dev/
↳ttyUSB0 adc_info
```

Replace `/dev/ttyUSB0` with ESP32 board's port name.

A chip that has specific **eFuse Vref** value programmed (in this case 1093 mV) will be reported as follows:

```
ADC VRef calibration: 1093 mV
```

In another example below the **eFuse Vref** is not programmed:

```
ADC VRef calibration: None (1100 mV nominal)
```

For a chip with two point calibration the message will look similar to:

```
ADC VRef calibration: 1149 mV
ADC readings stored in efuse BLK3:
  ADC1 Low reading (150 mV): 306
  ADC1 High reading (850 mV): 3153
  ADC2 Low reading (150 mV): 389
  ADC2 High reading (850 mV): 3206
```

图 6: ESP32 Chip Surface Marking

Application Extensions

For a full example see esp-idf: [peripherals/adc/single_read](#)

Characterizing an ADC at a particular attenuation:

```
#include "driver/adc.h"
#include "esp_adc_cal.h"

...

//Characterize ADC at particular atten
esp_adc_cal_characteristics_t *adc_chars = calloc(1, sizeof(esp_adc_cal_
↪characteristics_t));
esp_adc_cal_value_t val_type = esp_adc_cal_characterize(unit, atten, ADC_WIDTH_
↪BIT_12, DEFAULT_VREF, adc_chars);
//Check type of calibration value used to characterize ADC
if (val_type == ESP_ADC_CAL_VAL_EFUSE_VREF) {
    printf("eFuse Vref");
} else if (val_type == ESP_ADC_CAL_VAL_EFUSE_TP) {
    printf("Two Point");
} else {
    printf("Default");
}
}
```

Reading an ADC then converting the reading to a voltage:

```
#include "driver/adc.h"
#include "esp_adc_cal.h"

...

uint32_t reading = adc1_get_raw(ADC1_CHANNEL_5);
uint32_t voltage = esp_adc_cal_raw_to_voltage(reading, adc_chars);
```

Routing ADC reference voltage to GPIO, so it can be manually measured (for **Default Vref**):

```
#include "driver/adc.h"
```

(下页继续)

```
...  
  
esp_err_t status = adc_vref_to_gpio(ADC_UNIT_1, GPIO_NUM_25);  
if (status == ESP_OK) {  
    printf("v_ref routed to GPIO\n");  
} else {  
    printf("failed to route v_ref\n");  
}
```

GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. `ADC1_CHANNEL_0_GPIO_NUM` is the GPIO number of ADC1 channel 0.
2. `ADC1_GPIOn_CHANNEL` is the ADC1 channel number of GPIO n.

API Reference

This reference covers three components:

- [ADC driver](#)
- [ADC Calibration](#)
- [GPIO Lookup Macros](#)

ADC driver

Header File

- [components/driver/include/driver/adc.h](#)

Functions

void **adc_power_on** (void)

Enable ADC power.

Deprecated:

Use `adc_power_acquire` and `adc_power_release` instead.

void **adc_power_off** (void)

Power off SAR ADC.

Deprecated:

Use `adc_power_acquire` and `adc_power_release` instead. This function will force power down for ADC. This function is deprecated because forcing power ADC power off may disrupt operation of other components which may be using the ADC.

void **adc_power_acquire** (void)

Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call `adc_power_release` when done using the ADC.

void **adc_power_release** (void)

Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call this function when done using the ADC.

`esp_err_t adc1_pad_get_io_num(adc1_channel_t channel, gpio_num_t *gpio_num)`

Get the GPIO number of a specific ADC1 channel.

参数

- **channel** –Channel to get the GPIO number
- **gpio_num** –output buffer to hold the GPIO number

返回

- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

`esp_err_t adc1_config_channel_atten(adc1_channel_t channel, adc_atten_t atten)`

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

SoC	attenuation (dB)	suggested range (mV)
ESP32	0	100 ~ 950
	2.5	100 ~ 1250
	6	150 ~ 1750
	11	150 ~ 2450
ESP32-S2	0	0 ~ 750
	2.5	0 ~ 1050
	6	0 ~ 1300
	11	0 ~ 2500

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

备注: For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

备注: This function can be called multiple times to configure multiple ADC channels simultaneously. You may call `adc1_get_raw()` only after configuring a channel.

参数

- **channel** –ADC1 channel to configure
- **atten** –Attenuation level

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **adc1_config_width** (*adc_bits_width_t* width_bit)

Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

参数 **width_bit** –Bit capture width for ADC1

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

int **adc1_get_raw** (*adc1_channel_t* channel)

Take an ADC1 reading from a single channel.

备注: ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

备注: Call `adc1_config_width()` before the first time this function is called.

备注: For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

参数 **channel** –ADC1 channel to read

返回

- -1: Parameter error
- Other: ADC1 channel reading.

esp_err_t **adc_set_data_inv** (*adc_unit_t* adc_unit, bool inv_en)

Set ADC data invert.

参数

- **adc_unit** –ADC unit index
- **inv_en** –whether enable data invert

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **adc_set_clk_div** (uint8_t clk_div)

Set ADC source clock.

参数 **clk_div** –ADC clock divider, ADC clock is divided from APB clock

返回

- ESP_OK success

esp_err_t **adc_set_data_width** (*adc_unit_t* adc_unit, *adc_bits_width_t* width_bit)

Configure ADC capture width.

参数

- **adc_unit** –ADC unit index
- **width_bit** –Bit capture width for ADC unit.

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

void **adc1_ulp_enable** (void)

Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using `adc1_get_raw()` function.

Note that `adc1_config_channel_atten`, `adc1_config_width()` functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

esp_err_t **adc2_pad_get_io_num** (*adc2_channel_t* channel, *gpio_num_t* *gpio_num)

Get the GPIO number of a specific ADC2 channel.

参数

- **channel** –Channel to get the GPIO number
- **gpio_num** –output buffer to hold the GPIO number

返回

- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

esp_err_t **adc2_config_channel_atten** (*adc2_channel_t* channel, *adc_atten_t* atten)

Configure the ADC2 channel, including setting attenuation.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

SoC	attenuation (dB)	suggested range (mV)
ESP32	0	100 ~ 950
	2.5	100 ~ 1250
	6	150 ~ 1750
	11	150 ~ 2450
ESP32-S2	0	0 ~ 750
	2.5	0 ~ 1050
	6	0 ~ 1300
	11	0 ~ 2500

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

备注: This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

备注: For any given channel, this function must be called before the first time `adc2_get_raw()` is called for that channel.

参数

- **channel** –ADC2 channel to configure

- **atten** –Attenuation level
- 返回
- ESP_OK success
 - ESP_ERR_INVALID_ARG Parameter error

esp_err_t **adc2_get_raw** (*adc2_channel_t* channel, *adc_bits_width_t* width_bit, int *raw_out)

Take an ADC2 reading on a single channel.

备注: ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

备注: ESP32: For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with ESP_ERR_TIMEOUT.

备注: ESP32-S2: ADC2 support hardware arbiter. The arbiter is to improve the use efficiency of ADC2. After the control right is robbed by the high priority, the low priority controller will read the invalid ADC2 data. Default priority: Wi-Fi > RTC > Digital;

参数

- **channel** –ADC2 channel to read
- **width_bit** –Bit capture width for ADC2
- **raw_out** –the variable to hold the output data.

返回

- ESP_OK if success
- ESP_ERR_TIMEOUT ADC2 is being used by other controller and the request timed out.
- ESP_ERR_INVALID_STATE The controller status is invalid. Please try again.

esp_err_t **adc_vref_to_gpio** (*adc_unit_t* adc_unit, *gpio_num_t* gpio)

Output ADC1 or ADC2’ s reference voltage to `adc2_channe_t’` s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’ s channels. This reference voltage can then be manually measured for calibration purposes.

备注: ESP32 only supports output of ADC2’ s internal reference voltage.

参数

- **adc_unit** –[in] ADC unit index
- **gpio** –[in] GPIO number (Only ADC2’ s channels IO are supported)

返回

- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

esp_err_t **adc2_vref_to_gpio** (*gpio_num_t* gpio)

Output ADC2 reference voltage to `adc2_channe_t’` s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’ s channels. This reference voltage can then be manually measured for calibration purposes.

Deprecated:

Use `adc_vref_to_gpio` instead.

参数 `gpio` –[in] GPIO number (ADC2' s channels are supported)

返回

- `ESP_OK`: v_ref successfully routed to selected GPIO
- `ESP_ERR_INVALID_ARG`: Unsupported GPIO

esp_err_t **adc_digi_initialize** (const *adc_digi_init_config_t* *init_config)

Initialize the Digital ADC.

参数 `init_config` –Pointer to Digital ADC initialization config. Refer to `adc_digi_init_config_t`.

返回

- `ESP_ERR_INVALID_ARG` If the combination of arguments is invalid.
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags
- `ESP_ERR_NO_MEM` If out of memory
- `ESP_OK` On success

esp_err_t **adc_digi_read_bytes** (uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)

Read bytes from Digital ADC through DMA.

参数

- `buf` –[out] Buffer to read from ADC.
- `length_max` –[in] Expected length of data read from the ADC.
- `out_length` –[out] Real length of data read from the ADC via this API.
- `timeout_ms` –[in] Time to wait for data via this API, in millisecond.

返回

- `ESP_ERR_INVALID_STATE` Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- `ESP_ERR_TIMEOUT` Operation timed out
- `ESP_OK` On success

esp_err_t **adc_digi_start** (void)

Start the Digital ADC and DMA peripherals. After this, the hardware starts working.

返回

- `ESP_ERR_INVALID_STATE` Driver state is invalid.
- `ESP_OK` On success

esp_err_t **adc_digi_stop** (void)

Stop the Digital ADC and DMA peripherals. After this, the hardware stops working.

返回

- `ESP_ERR_INVALID_STATE` Driver state is invalid.
- `ESP_OK` On success

esp_err_t **adc_digi_deinitialize** (void)

Deinitialize the Digital ADC.

返回

- `ESP_ERR_INVALID_STATE` Driver state is invalid.
- `ESP_OK` On success

esp_err_t **adc_digi_controller_configure** (const *adc_digi_configuration_t* *config)

Setting the digital controller.

参数 `config` –Pointer to digital controller paramter. Refer to `adc_digi_config_t`.

返回

- `ESP_ERR_INVALID_STATE` Driver state is invalid.
- `ESP_ERR_INVALID_ARG` If the combination of arguments is invalid.
- `ESP_OK` On success

int **hall_sensor_read** (void)

Read Hall Sensor.

备注: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.

备注: The Hall Sensor uses channels 0 and 3 of ADC1. Do not configure these channels for use as ADC channels.

备注: The ADC1 module must be enabled by calling `adc1_config_width()` before calling `hall_sensor_read()`. ADC1 should be configured for 12 bit readings, as the hall sensor readings are low values and do not cover the full range of the ADC.

返回 The hall sensor reading.

esp_err_t **adc_set_i2s_data_source** (*adc_i2s_source_t* src)

Set I2S data source.

参数 **src** –I2S DMA data source, I2S DMA can get data from digital signals or from ADC.

返回

- `ESP_OK` success

esp_err_t **adc_i2s_mode_init** (*adc_unit_t* adc_unit, *adc_channel_t* channel)

Initialize I2S ADC mode.

参数

- **adc_unit** –ADC unit index
- **channel** –ADC channel index

返回

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

Structures

struct **adc_digi_init_config_s**

ADC DMA driver configuration.

Public Members

uint32_t **max_store_buf_size**

Max length of the converted data that driver can store before they are processed.

uint32_t **conv_num_each_intr**

Bytes of data that can be converted in 1 interrupt.

uint32_t **adc1_chan_mask**

Channel list of ADC1 to be initialized.

uint32_t **adc2_chan_mask**

Channel list of ADC2 to be initialized.

struct **adc_digi_configuration_t**

ADC digital controller settings.

Public Members

bool **conv_limit_en**

To limit ADC conversion times. Conversion stops after finishing `conv_limit_num` times conversion.

uint32_t **conv_limit_num**

Set the upper limit of the number of ADC conversion triggers. Range: 1 ~ 255.

uint32_t **pattern_num**

Number of ADC channels that will be used.

[*adc_digi_pattern_config_t*](#) ***adc_pattern**

List of configs for each ADC channel that will be used.

uint32_t **sample_freq_hz**

The expected ADC sampling frequency in Hz. Range: 611Hz ~ 83333Hz $F_s = F_d / \text{interval} / 2$ F_s : sampling frequency; F_d : digital controller frequency, no larger than 5M for better performance interval: interval between 2 measurement trigger signal, the smallest interval should not be smaller than the ADC measurement period, the largest interval should not be larger than 4095

[*adc_digi_convert_mode_t*](#) **conv_mode**

ADC DMA conversion mode, see `adc_digi_convert_mode_t`.

[*adc_digi_output_format_t*](#) **format**

ADC DMA conversion output format, see `adc_digi_output_format_t`.

Macros

ADC_ATTEN_0db

ADC rtc controller attenuation option.

备注: This definitions are only for being back-compatible

ADC_ATTEN_2_5db

ADC_ATTEN_6db

ADC_ATTEN_11db

ADC_WIDTH_BIT_DEFAULT

The default (max) bit width of the ADC of current version. You can also get the maximum bitwidth by `SOC_ADC_MAX_BITWIDTH` defined in `soc_caps.h`.

ADC_WIDTH_9Bit**ADC_WIDTH_10Bit****ADC_WIDTH_11Bit****ADC_WIDTH_12Bit****ADC_MAX_DELAY**

Digital ADC DMA read max timeout value, it may make the `adc_digi_read_bytes` block forever if the OS supports.

Type Definitions

```
typedef struct adc_digi_init_config_s adc_digi_init_config_t
```

ADC DMA driver configuration.

Enumerations

```
enum adc1_channel_t
```

Values:

```
enumerator ADC1_CHANNEL_0
```

ADC1 channel 0 is GPIO36

```
enumerator ADC1_CHANNEL_1
```

ADC1 channel 1 is GPIO37

```
enumerator ADC1_CHANNEL_2
```

ADC1 channel 2 is GPIO38

```
enumerator ADC1_CHANNEL_3
```

ADC1 channel 3 is GPIO39

```
enumerator ADC1_CHANNEL_4
```

ADC1 channel 4 is GPIO32

```
enumerator ADC1_CHANNEL_5
```

ADC1 channel 5 is GPIO33

```
enumerator ADC1_CHANNEL_6
```

ADC1 channel 6 is GPIO34

```
enumerator ADC1_CHANNEL_7
```

ADC1 channel 7 is GPIO35

enumerator **ADC1_CHANNEL_MAX**

enum **adc2_channel_t**

Values:

enumerator **ADC2_CHANNEL_0**

ADC2 channel 0 is GPIO4 (ESP32), GPIO11 (ESP32-S2)

enumerator **ADC2_CHANNEL_1**

ADC2 channel 1 is GPIO0 (ESP32), GPIO12 (ESP32-S2)

enumerator **ADC2_CHANNEL_2**

ADC2 channel 2 is GPIO2 (ESP32), GPIO13 (ESP32-S2)

enumerator **ADC2_CHANNEL_3**

ADC2 channel 3 is GPIO15 (ESP32), GPIO14 (ESP32-S2)

enumerator **ADC2_CHANNEL_4**

ADC2 channel 4 is GPIO13 (ESP32), GPIO15 (ESP32-S2)

enumerator **ADC2_CHANNEL_5**

ADC2 channel 5 is GPIO12 (ESP32), GPIO16 (ESP32-S2)

enumerator **ADC2_CHANNEL_6**

ADC2 channel 6 is GPIO14 (ESP32), GPIO17 (ESP32-S2)

enumerator **ADC2_CHANNEL_7**

ADC2 channel 7 is GPIO27 (ESP32), GPIO18 (ESP32-S2)

enumerator **ADC2_CHANNEL_8**

ADC2 channel 8 is GPIO25 (ESP32), GPIO19 (ESP32-S2)

enumerator **ADC2_CHANNEL_9**

ADC2 channel 9 is GPIO26 (ESP32), GPIO20 (ESP32-S2)

enumerator **ADC2_CHANNEL_MAX**

enum **adc_i2s_encode_t**

ADC digital controller encode option.

Deprecated:

The ESP32-S2 doesn't use I2S DMA. Call `adc_digi_output_format_t` instead.

Values:

enumerator **ADC_ENCODE_12BIT**

ADC to DMA data format, , [15:12]-channel [11:0]-12 bits ADC data

enumerator **ADC_ENCODE_11BIT**

ADC to DMA data format, [15]-unit, [14:11]-channel [10:0]-11 bits ADC data

enumerator **ADC_ENCODE_MAX**

Header File

- [components/hal/include/hal/adc_types.h](#)

Structures

struct **adc_digi_pattern_config_t**

ADC digital controller pattern configuration.

Public Members

uint8_t **atten**

Attenuation of this ADC channel.

uint8_t **channel**

ADC channel.

uint8_t **unit**

ADC unit.

uint8_t **bit_width**

ADC output bit width.

struct **adc_digi_output_data_t**

ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

备注: ESP32: Only `type1` is valid. ADC2 does not support DMA mode.

备注: ESP32-S2: Member `channel` can be used to judge the validity of the ADC data, because the role of the arbiter may get invalid ADC data.

Public Members

uint16_t **data**

ADC real output data info. Resolution: 12 bit.

ADC real output data info. Resolution: 11 bit.

uint16_t **channel**

ADC channel index info.

ADC channel index info. For ESP32-S2: If (`channel < ADC_CHANNEL_MAX`), The data is valid. If (`channel > ADC_CHANNEL_MAX`), The data is invalid.

struct *adc_digi_output_data_t*::[anonymous]::[anonymous] **type1**

ADC type1

uint16_t **unit**

ADC unit index info. 0: ADC1; 1: ADC2.

struct *adc_digi_output_data_t*::[anonymous]::[anonymous] **type2**

When the configured output format is 11bit. `ADC_DIGI_FORMAT_11BIT`

uint16_t **val**

Raw data value

Enumerations

enum **adc_unit_t**

ADC unit enumeration.

备注: For ADC digital controller (DMA mode), ESP32 doesn't support `ADC_UNIT_2`, `ADC_UNIT_BOTH`, `ADC_UNIT_ALTER`.

Values:

enumerator **ADC_UNIT_1**

SAR ADC 1.

enumerator **ADC_UNIT_2**

SAR ADC 2.

enumerator **ADC_UNIT_BOTH**

SAR ADC 1 and 2.

enumerator **ADC_UNIT_ALTER**

SAR ADC 1 and 2 alternative mode.

enumerator **ADC_UNIT_MAX**

enum **adc_channel_t**

ADC channels handle. See `adc1_channel_t`, `adc2_channel_t`.

备注: For ESP32 ADC1, don't use `ADC_CHANNEL_8`, `ADC_CHANNEL_9`. See `adc1_channel_t`.

Values:

enumerator **ADC_CHANNEL_0**

ADC channel

enumerator **ADC_CHANNEL_1**

ADC channel

enumerator **ADC_CHANNEL_2**

ADC channel

enumerator **ADC_CHANNEL_3**

ADC channel

enumerator **ADC_CHANNEL_4**

ADC channel

enumerator **ADC_CHANNEL_5**

ADC channel

enumerator **ADC_CHANNEL_6**

ADC channel

enumerator **ADC_CHANNEL_7**

ADC channel

enumerator **ADC_CHANNEL_8**

ADC channel

enumerator **ADC_CHANNEL_9**

ADC channel

enumerator **ADC_CHANNEL_MAX**

enum **adc_atten_t**

ADC attenuation parameter. Different parameters determine the range of the ADC. See `adc1_config_channel_atten`.

Values:

enumerator **ADC_ATTEN_DB_0**

No input attenuation, ADC can measure up to approx.

enumerator **ADC_ATTEN_DB_2_5**

The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB.

enumerator **ADC_ATTEN_DB_6**

The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB.

enumerator **ADC_ATTEN_DB_12**

The input voltage of ADC will be attenuated extending the range of measurement by about 12 dB.

enumerator **ADC_ATTEN_DB_11**

This is deprecated, it behaves the same as `ADC_ATTEN_DB_12`

enumerator **ADC_ATTEN_MAX**

enum **adc_bits_width_t**

ADC resolution setting option.

备注: Only used in single read mode

Values:

enumerator **ADC_WIDTH_BIT_9**

ADC capture width is 9Bit.

enumerator **ADC_WIDTH_BIT_10**

ADC capture width is 10Bit.

enumerator **ADC_WIDTH_BIT_11**

ADC capture width is 11Bit.

enumerator **ADC_WIDTH_BIT_12**

ADC capture width is 12Bit.

enumerator **ADC_WIDTH_MAX**

enum **adc_digi_convert_mode_t**

ADC digital controller (DMA mode) work mode.

Values:

enumerator **ADC_CONV_SINGLE_UNIT_1**

Only use ADC1 for conversion.

enumerator **ADC_CONV_SINGLE_UNIT_2**

Only use ADC2 for conversion.

enumerator **ADC_CONV_BOTH_UNIT**

Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC_CONV_ALTER_UNIT**

Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2

enumerator **ADC_CONV_UNIT_MAX**

enum **adc_digi_output_format_t**

ADC digital controller (DMA mode) output data format option.

Values:

enumerator **ADC_DIGI_FORMAT_12BIT**

ADC to DMA data format, [15:12]-channel, [11: 0]-12 bits ADC data ([adc_digi_output_data_t](#)). Note: For single convert mode.

enumerator **ADC_DIGI_FORMAT_11BIT**

ADC to DMA data format, [15]-adc unit, [14:11]-channel, [10: 0]-11 bits ADC data (*adc_digi_output_data_t*). Note: For multi or alter convert mode.

enumerator **ADC_DIGI_FORMAT_MAX**

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE1**

See *adc_digi_output_data_t.type1*

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE2**

See *adc_digi_output_data_t.type2*

enum **adc_i2s_source_t**

ESP32 ADC DMA source selection.

Values:

enumerator **ADC_I2S_DATA_SRC_IO_SIG**

I2S data from GPIO matrix signal

enumerator **ADC_I2S_DATA_SRC_ADC**

I2S data from ADC

enumerator **ADC_I2S_DATA_SRC_MAX**

ADC Calibration

Header File

- [components/esp_adc_cal/include/esp_adc_cal.h](#)

Functions

esp_err_t **esp_adc_cal_check_efuse** (*esp_adc_cal_value_t* value_type)

Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

备注: in ESP32S2, only `ESP_ADC_CAL_VAL_EFUSE_TP` is supported. Some old ESP32S2s do not support this, either. In which case you have to calibrate it manually, possibly by performing your own two-point calibration on the chip.

参数 **value_type** -Type of calibration value (`ESP_ADC_CAL_VAL_EFUSE_VREF` or `ESP_ADC_CAL_VAL_EFUSE_TP`)

返回

- `ESP_OK`: The calibration mode is supported in eFuse
- `ESP_ERR_NOT_SUPPORTED`: Error, eFuse values are not burned
- `ESP_ERR_INVALID_ARG`: Error, invalid argument (`ESP_ADC_CAL_VAL_DEFAULT_VREF`)

```
esp_adc_cal_value_t esp_adc_cal_characterize (adc_unit_t adc_num, adc_atten_t atten,
                                             adc_bits_width_t bit_width, uint32_t default_vref,
                                             esp_adc_cal_characteristics_t *chars)
```

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of $[y = \text{coeff_a} * x + \text{coeff_b}]$. Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

备注: For ESP32, Two Point values and eFuse Vref calibration can be enabled/disabled using menuconfig. For ESP32s2, only Two Point values calibration and only ADC_WIDTH_BIT_13 is supported. The parameter default_vref is unused.

参数

- **adc_num** –[in] ADC to characterize (ADC_UNIT_1 or ADC_UNIT_2)
- **atten** –[in] Attenuation to characterize
- **bit_width** –[in] Bit width configuration of ADC
- **default_vref** –[in] Default ADC reference voltage in mV (Only in ESP32, used if eFuse values is not available)
- **chars** –[out] Pointer to empty structure used to store ADC characteristics

返回

- ESP_ADC_CAL_VAL_EFUSE_VREF: eFuse Vref used for characterization
- ESP_ADC_CAL_VAL_EFUSE_TP: Two Point value used for characterization (only in Linear Mode)
- ESP_ADC_CAL_VAL_DEFAULT_VREF: Default Vref used for characterization

```
uint32_t esp_adc_cal_raw_to_voltage (uint32_t adc_reading, const esp_adc_cal_characteristics_t
                                     *chars)
```

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC' s characteristics.

备注: Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

参数

- **adc_reading** –[in] ADC reading
- **chars** –[in] Pointer to initialized structure containing ADC characteristics

返回 Voltage in mV

```
esp_err_t esp_adc_cal_get_voltage (adc_channel_t channel, const esp_adc_cal_characteristics_t *chars,
                                     uint32_t *voltage)
```

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

备注: The Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

参数

- **channel** –[in] ADC Channel to read
- **chars** –[in] Pointer to initialized ADC characteristics structure
- **voltage** –[out] Pointer to store converted voltage

返回

- ESP_OK: ADC read and converted to mV
- ESP_ERR_INVALID_ARG: Error due to invalid arguments
- ESP_ERR_INVALID_STATE: Reading result is invalid. Try to read again.

Structures

struct **esp_adc_cal_characteristics_t**

Structure storing characteristics of an ADC.

备注: Call `esp_adc_cal_characterize()` to initialize the structure

Public Members

adc_unit_t **adc_num**

ADC number

adc_atten_t **atten**

ADC attenuation

adc_bits_width_t **bit_width**

ADC bit width

uint32_t **coeff_a**

Gradient of ADC-Voltage curve

uint32_t **coeff_b**

Offset of ADC-Voltage curve

uint32_t **vref**

Vref used by lookup table

const uint32_t ***low_curve**

Pointer to low Vref curve of lookup table (NULL if unused)

const uint32_t ***high_curve**

Pointer to high Vref curve of lookup table (NULL if unused)

uint8_t **version**

ADC Calibration

Enumerations

enum **esp_adc_cal_value_t**

Type of calibration value used in characterization.

Values:

enumerator **ESP_ADC_CAL_VAL_EFUSE_VREF**

Characterization based on reference voltage stored in eFuse

enumerator **ESP_ADC_CAL_VAL_EFUSE_TP**

Characterization based on Two Point values stored in eFuse

enumerator **ESP_ADC_CAL_VAL_DEFAULT_VREF**

Characterization based on default reference voltage

enumerator **ESP_ADC_CAL_VAL_EFUSE_TP_FIT**

Characterization based on Two Point values and fitting curve coefficients stored in eFuse

enumerator **ESP_ADC_CAL_VAL_MAX**

enumerator **ESP_ADC_CAL_VAL_NOT_SUPPORTED**

2.3.2 Digital To Analog Converter (DAC)

Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2).

The DAC driver allows these channels to be set to arbitrary voltages.

The DAC channels can also be driven with DMA-style written sample data by the digital controller, via the *I2S driver* when using the “built-in DAC mode” .

For other analog output options, see the *Sigma-delta Modulation module* and the *LED Control module*. Both these modules produce high frequency PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

Application Example

Setting DAC channel 1 (GPIO25) voltage to approx 0.78 of VDD_A voltage ($VDD * 200 / 255$). For VDD_A 3.3V, this is 2.59V.

```
#include <driver/dac.h>

...

dac_output_enable (DAC_CHANNEL_1);
dac_output_voltage (DAC_CHANNEL_1, 200);
```

API Reference

Header File

- [components/driver/esp32/include/driver/dac.h](#)

Functions

esp_err_t **dac_i2s_enable** (void)

Enable DAC output data from I2S.

返回

- ESP_OK success

esp_err_t **dac_i2s_disable** (void)

Disable DAC output data from I2S.

返回

- ESP_OK success

Header File

- [components/driver/include/driver/dac_common.h](#)

Functions

esp_err_t **dac_pad_get_io_num** (*dac_channel_t* channel, *gpio_num_t* *gpio_num)

Get the GPIO number of a specific DAC channel.

参数

- **channel** –Channel to get the gpio number
- **gpio_num** –output buffer to hold the gpio number

返回

- ESP_OK if success

esp_err_t **dac_output_voltage** (*dac_channel_t* channel, uint8_t dac_value)

Set DAC output voltage. DAC output is 8-bit. Maximum (255) corresponds to VDD3P3_RTC.

备注: Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

参数

- **channel** –DAC channel
- **dac_value** –DAC output value

返回

- ESP_OK success

esp_err_t **dac_output_enable** (*dac_channel_t* channel)

DAC pad output enable.

备注: DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26 I2S left channel will be mapped to DAC channel 2 I2S right channel will be mapped to DAC channel 1

参数 **channel** –DAC channel

esp_err_t **dac_output_disable** (*dac_channel_t* channel)

DAC pad output disable.

备注: DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

参数 **channel** –DAC channel

返回

- ESP_OK success

esp_err_t **dac_cw_generator_enable** (void)

Enable cosine wave generator output.

返回

- ESP_OK success

esp_err_t **dac_cw_generator_disable** (void)

Disable cosine wave generator output.

返回

- ESP_OK success

esp_err_t **dac_cw_generator_config** (*dac_cw_config_t* *cw)

Config the cosine wave generator function in DAC module.

参数 **cw** –Configuration.

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG The parameter is NULL.

GPIO Lookup Macros Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa. e.g.

1. DAC_CHANNEL_1_GPIO_NUM is the GPIO number of channel 1 (GPIO25);
2. DAC_GPIO26_CHANNEL is the channel number of GPIO 26 (channel 2).

Header File

- [components/soc/esp32/include/soc/dac_channel.h](#)

Macros

DAC_GPIO25_CHANNEL

DAC_CHANNEL_1_GPIO_NUM

DAC_GPIO26_CHANNEL

DAC_CHANNEL_2_GPIO_NUM

Header File

- [components/hal/include/hal/dac_types.h](#)

Structures

struct **dac_cw_config_t**

Config the cosine wave generator function in DAC module.

Public Members

dac_channel_t **en_ch**

Enable the cosine wave generator of DAC channel.

dac_cw_scale_t **scale**

Set the amplitude of the cosine wave generator output.

dac_cw_phase_t **phase**

Set the phase of the cosine wave generator output.

uint32_t **freq**

Set frequency of cosine wave generator output. Range: 130(130Hz) ~ 55000(100KHz).

int8_t **offset**

Set the voltage value of the DC component of the cosine wave generator output. Note: Unreasonable settings can cause waveform to be oversaturated. Range: -128 ~ 127.

Enumerations

enum **dac_channel_t**

Values:

enumerator **DAC_CHANNEL_1**

DAC channel 1 is GPIO25(ESP32) / GPIO17(ESP32S2)

enumerator **DAC_CHANNEL_2**

DAC channel 2 is GPIO26(ESP32) / GPIO18(ESP32S2)

enumerator **DAC_CHANNEL_MAX**

enum **dac_cw_scale_t**

The multiple of the amplitude of the cosine wave generator. The max amplitude is VDD3P3_RTC.

Values:

enumerator **DAC_CW_SCALE_1**

1/1. Default.

enumerator **DAC_CW_SCALE_2**

1/2.

enumerator **DAC_CW_SCALE_4**

1/4.

enumerator **DAC_CW_SCALE_8**

1/8.

enum **dac_cw_phase_t**

Set the phase of the cosine wave generator output.

Values:

enumerator **DAC_CW_PHASE_0**

Phase shift +0°

enumerator **DAC_CW_PHASE_180**

Phase shift +180°

2.3.3 GPIO & RTC GPIO

Overview

The ESP32 chip features 34 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package. For more details, see *ESP32 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)* [PDF].

Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal. The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

GPIO	Analog Function	RTC GPIO	Comments
GPIO0	ADC2_CH1	RTC_GPIO11	Strapping pin
GPIO1			TXD
GPIO2	ADC2_CH2	RTC_GPIO12	Strapping pin
GPIO3			RXD
GPIO4	ADC2_CH0	RTC_GPIO10	
GPIO5			Strapping pin
GPIO6			SPI0/1
GPIO7			SPI0/1
GPIO8			SPI0/1
GPIO9			SPI0/1
GPIO10			SPI0/1
GPIO11			SPI0/1
GPIO12	ADC2_CH5	RTC_GPIO15	Strapping pin; JTAG
GPIO13	ADC2_CH4	RTC_GPIO14	JTAG
GPIO14	ADC2_CH6	RTC_GPIO16	JTAG
GPIO15	ADC2_CH3	RTC_GPIO13	Strapping pin; JTAG
GPIO16			SPI0/1
GPIO17			SPI0/1
GPIO18			
GPIO19			
GPIO20			This pin is only available on ESP32-PICO-V3 chip package
GPIO21			
GPIO22			
GPIO23			
GPIO25	ADC2_CH8	RTC_GPIO6	
GPIO26	ADC2_CH9	RTC_GPIO7	
GPIO27	ADC2_CH7	RTC_GPIO17	
GPIO32	ADC1_CH4	RTC_GPIO9	
GPIO33	ADC1_CH5	RTC_GPIO8	
GPIO34	ADC1_CH6	RTC_GPIO4	GPI
GPIO35	ADC1_CH7	RTC_GPIO5	GPI
GPIO36	ADC1_CH0	RTC_GPIO0	GPI
GPIO37	ADC1_CH1	RTC_GPIO1	GPI
GPIO38	ADC1_CH2	RTC_GPIO2	GPI
GPIO39	ADC1_CH3	RTC_GPIO3	GPI

备注:

- Strapping pin: GPIO0, GPIO2, GPIO5, GPIO12 (MTDI), and GPIO15 (MTDO) are strapping pins. For more information, please refer to [ESP32 datasheet](#).
- SPI0/1: GPIO6-11 and GPIO16-17 are usually connected to the SPI flash and PSRAM integrated on the module and therefore should not be used for other purposes.
- JTAG: GPIO12-15 are usually used for inline debug.
- GPI: GPIO34-39 can only be set as input mode and do not have software-enabled pullup or pulldown functions.
- TXD & RXD are usually used for flashing and debugging.
- ADC2: ADC2 pins cannot be used when Wi-Fi is used. So, if you're using Wi-Fi and you're having trouble getting the value from an ADC2 GPIO, you may consider using an ADC1 GPIO instead, that should solve your problem. For more details, please refer to [ADC limitations](#).

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In deep sleep

- The *Ultra Low Power co-processor* is running
- Analog functions such as ADC/DAC/etc are in use.

Application Example

GPIO output and input interrupt example: [peripherals/gpio/generic_gpio](#).

API Reference - Normal GPIO

Header File

- `components/driver/include/driver/gpio.h`

Functions

`esp_err_t gpio_config` (`const gpio_config_t *pGPIOConfig`)

GPIO common configuration.

Configure GPIO's Mode, pull-up, PullDown, IntrType

参数 `pGPIOConfig` –Pointer to GPIO configure struct

返回

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t gpio_reset_pin` (`gpio_num_t gpio_num`)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

备注: This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

参数 `gpio_num` –GPIO number.

返回 Always return `ESP_OK`.

`esp_err_t gpio_set_intr_type` (`gpio_num_t gpio_num`, `gpio_int_type_t intr_type`)

GPIO set interrupt trigger type.

参数

- `gpio_num` –GPIO number. If you want to set the trigger type of e.g. of GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `intr_type` –Interrupt type, select from `gpio_int_type_t`

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t gpio_intr_enable` (`gpio_num_t gpio_num`)

Enable GPIO module interrupt signal.

备注: ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of [ESP32 ECO and Workarounds for Bugs](#) for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

参数 `gpio_num` –GPIO number. If you want to enable an interrupt on e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_intr_disable** (*gpio_num_t* gpio_num)

Disable GPIO module interrupt signal.

参数 **gpio_num** –GPIO number. If you want to disable the interrupt of e.g. GPIO16, **gpio_num** should be GPIO_NUM_16 (16);

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_set_level** (*gpio_num_t* gpio_num, *uint32_t* level)

GPIO set output level.

参数

- **gpio_num** –GPIO number. If you want to set the output level of e.g. GPIO16, **gpio_num** should be GPIO_NUM_16 (16);
- **level** –Output level. 0: low ; 1: high

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

int **gpio_get_level** (*gpio_num_t* gpio_num)

GPIO get input level.

警告: If the pad is not configured for input (or input and output) the returned value is always 0.

参数 **gpio_num** –GPIO number. If you want to get the logic level of e.g. pin GPIO16, **gpio_num** should be GPIO_NUM_16 (16);

返回

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

esp_err_t **gpio_set_direction** (*gpio_num_t* gpio_num, *gpio_mode_t* mode)

GPIO set direction.

Configure GPIO direction,such as output_only,input_only,output_and_input

参数

- **gpio_num** –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, **gpio_num** should be GPIO_NUM_16 (16);
- **mode** –GPIO direction

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

esp_err_t **gpio_set_pull_mode** (*gpio_num_t* gpio_num, *gpio_pull_mode_t* pull)

Configure GPIO pull-up/pull-down resistors.

备注: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

参数

- **gpio_num** –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, **gpio_num** should be GPIO_NUM_16 (16);

- **pull** –GPIO pull up/down mode.
- 返回
- ESP_OK Success
 - ESP_ERR_INVALID_ARG : Parameter error

esp_err_t **gpio_wakeup_enable** (*gpio_num_t* gpio_num, *gpio_int_type_t* intr_type)

Enable GPIO wake-up function.

参数

- **gpio_num** –GPIO number.
- **intr_type** –GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_wakeup_disable** (*gpio_num_t* gpio_num)

Disable GPIO wake-up function.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_isr_register** (void (*fn)(void*), void *arg, int intr_alloc_flags, *gpio_isr_handle_t* *handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

参数

- **fn** –Interrupt handler function.
- **arg** –Parameter for handler function
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

返回

- ESP_OK Success ;
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

esp_err_t **gpio_pullup_en** (*gpio_num_t* gpio_num)

Enable pull-up on GPIO.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_pullup_dis** (*gpio_num_t* gpio_num)

Disable pull-up on GPIO.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpiopulldown_en** (*gpio_num_t* gpio_num)

Enable pull-down on GPIO.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_pullup_dis** (*gpio_num_t* gpio_num)

Disable pull-up on GPIO.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_install_isr_service** (int intr_alloc_flags)

Install the driver's GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

参数 **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.

返回

- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

void **gpio_uninstall_isr_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

esp_err_t **gpio_isr_handler_add** (*gpio_num_t* gpio_num, *gpio_isr_t* isr_handler, void *args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

参数

- **gpio_num** –GPIO number
- **isr_handler** –ISR handler function for the corresponding GPIO number.
- **args** –parameter for ISR handler.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_isr_handler_remove** (*gpio_num_t* gpio_num)

Remove ISR handler for the corresponding GPIO pin.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_set_drive_capability** (*gpio_num_t* gpio_num, *gpio_drive_cap_t* strength)

Set GPIO pad drive capability.

参数

- **gpio_num** –GPIO number, only support output GPIOs
- **strength** –Drive capability of the pad

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_get_drive_capability** (*gpio_num_t* gpio_num, *gpio_drive_cap_t* *strength)

Get GPIO pad drive capability.

参数

- **gpio_num** –GPIO number, only support output GPIOs
- **strength** –Pointer to accept drive capability of the pad

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_hold_en** (*gpio_num_t* gpio_num)

Enable gpio pad hold function.

When the pin is set to hold, the state is latched at that moment and will not change no matter how the internal signals change or how the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). It can be used to retain the pin state through a core reset and system reset triggered by watchdog time-out or Deep-sleep events.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: input read value can still reflect the changes of the input signal.

The state of the digital gpio cannot be held during Deep-sleep, and it will resume to hold at its default pin state when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

参数 **gpio_num** –GPIO number, only support output-capable GPIOs

返回

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

esp_err_t **gpio_hold_dis** (*gpio_num_t* gpio_num)

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

参数 **gpio_num** –GPIO number, only support output-capable GPIOs

返回

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

void **gpio_deep_sleep_hold_en** (void)

Enable all digital gpio pads hold function during Deep-sleep.

Enabling this feature makes all digital gpio pads be at the holding state during Deep-sleep. The state of each pad holds is its active configuration (not pad's sleep configuration!).

Note that this pad hold feature only works when the chip is in Deep-sleep mode. When the chip is in active mode, the digital gpio state can be changed freely even you have called this function.

After this API is being called, the digital gpio Deep-sleep hold feature will work during every sleep process. You should call `gpio_deep_sleep_hold_dis` to disable this feature.

void **gpio_deep_sleep_hold_dis** (void)

Disable all digital gpio pads hold function during Deep-sleep.

void **gpio_iomux_in** (uint32_t gpio_num, uint32_t signal_idx)

Set pad input to a peripheral signal through the IOMUX.

参数

- **gpio_num** –GPIO number of the pad.
- **signal_idx** –Peripheral signal id to input. One of the *_IN_IDX signals in `soc/gpio_sig_map.h`.

void **gpio_iomux_out** (uint8_t gpio_num, int func, bool oen_inv)

Set peripheral output to an GPIO pad through the IOMUX.

参数

- **gpio_num** –gpio_num GPIO number of the pad.
- **func** –The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in `soc/io_mux_reg.h`.
- **oen_inv** –True if the output enable needs to be inverted, otherwise False.

esp_err_t **gpio_sleep_sel_en** (*gpio_num_t* gpio_num)

Enable SLP_SEL to change GPIO status automantically in lightsleep.

参数 **gpio_num** –GPIO number of the pad.

返回

- ESP_OK Success

esp_err_t **gpio_sleep_sel_dis** (*gpio_num_t* gpio_num)

Disable SLP_SEL to change GPIO status automantically in lightsleep.

参数 **gpio_num** –GPIO number of the pad.

返回

- ESP_OK Success

esp_err_t **gpio_sleep_set_direction** (*gpio_num_t* gpio_num, *gpio_mode_t* mode)

GPIO set direction at sleep.

Configure GPIO direction,such as output_only,input_only,output_and_input

参数

- **gpio_num** –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **mode** –GPIO direction

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

esp_err_t **gpio_sleep_set_pull_mode** (*gpio_num_t* gpio_num, *gpio_pull_mode_t* pull)

Configure GPIO pull-up/pull-down resistors at sleep.

备注: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

参数

- **gpio_num** –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **pull** –GPIO pull up/down mode.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

Macros

GPIO_PIN_COUNT

GPIO_IS_VALID_GPIO (gpio_num)

Check whether it is a valid GPIO number.

GPIO_IS_VALID_OUTPUT_GPIO (gpio_num)

Check whether it can be a valid GPIO number of output mode.

GPIO_IS_VALID_DIGITAL_IO_PAD (gpio_num)

Check whether it can be a valid digital I/O pad.

Type Definitions

GPIO39, input mode only

enumerator **GPIO_NUM_MAX**

enum **gpio_int_type_t**

Values:

enumerator **GPIO_INTR_DISABLE**
Disable GPIO interrupt

enumerator **GPIO_INTR_POSEDGE**
GPIO interrupt type : rising edge

enumerator **GPIO_INTR_NEGEDGE**
GPIO interrupt type : falling edge

enumerator **GPIO_INTR_ANYEDGE**
GPIO interrupt type : both rising and falling edge

enumerator **GPIO_INTR_LOW_LEVEL**
GPIO interrupt type : input low level trigger

enumerator **GPIO_INTR_HIGH_LEVEL**
GPIO interrupt type : input high level trigger

enumerator **GPIO_INTR_MAX**

enum **gpio_mode_t**

Values:

enumerator **GPIO_MODE_DISABLE**
GPIO mode : disable input and output

enumerator **GPIO_MODE_INPUT**

GPIO mode : input only

enumerator **GPIO_MODE_OUTPUT**

GPIO mode : output only mode

enumerator **GPIO_MODE_OUTPUT_OD**

GPIO mode : output only with open-drain mode

enumerator **GPIO_MODE_INPUT_OUTPUT_OD**

GPIO mode : output and input with open-drain mode

enumerator **GPIO_MODE_INPUT_OUTPUT**

GPIO mode : output and input mode

enum **gpio_pullup_t**

Values:

enumerator **GPIO_PULLUP_DISABLE**

Disable GPIO pull-up resistor

enumerator **GPIO_PULLUP_ENABLE**

Enable GPIO pull-up resistor

enum **gpio_pulldown_t**

Values:

enumerator **GPIO_PULLDOWN_DISABLE**

Disable GPIO pull-down resistor

enumerator **GPIO_PULLDOWN_ENABLE**

Enable GPIO pull-down resistor

enum **gpio_pull_mode_t**

Values:

enumerator **GPIO_PULLUP_ONLY**

Pad pull up

enumerator **GPIO_PULLDOWN_ONLY**

Pad pull down

enumerator **GPIO_PULLUP_PULLDOWN**

Pad pull up + pull down

enumerator **GPIO_FLOATING**

Pad floating

enum **gpio_drive_cap_t**

Values:

enumerator **GPIO_DRIVE_CAP_0**

Pad drive capability: weak

enumerator **GPIO_DRIVE_CAP_1**

Pad drive capability: stronger

enumerator **GPIO_DRIVE_CAP_2**

Pad drive capability: medium

enumerator **GPIO_DRIVE_CAP_DEFAULT**

Pad drive capability: medium

enumerator **GPIO_DRIVE_CAP_3**

Pad drive capability: strongest

enumerator **GPIO_DRIVE_CAP_MAX**

API Reference - RTC GPIO

Header File

- [components/driver/include/driver/rtc_io.h](#)

Functions

static inline bool **rtc_gpio_is_valid_gpio** (*gpio_num_t* gpio_num)

Determine if the specified GPIO is a valid RTC GPIO.

参数 *gpio_num* –GPIO number

返回 true if GPIO is valid for RTC GPIO use. false otherwise.

static inline int **rtc_io_number_get** (*gpio_num_t* gpio_num)

Get RTC IO index number by gpio number.

参数 *gpio_num* –GPIO number

返回 >=0: Index of rtcio. -1 : The gpio is not rtcio.

esp_err_t **rtc_gpio_init** (*gpio_num_t* gpio_num)

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

参数 *gpio_num* –GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_deinit** (*gpio_num_t* gpio_num)

Init a GPIO as digital GPIO.

参数 *gpio_num* –GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

`uint32_t rtc_gpio_get_level (gpio_num_t gpio_num)`

Get the RTC IO input level.

参数 `gpio_num` –GPIO number (e.g. GPIO_NUM_12)

返回

- 1 High level
- 0 Low level
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_set_level (gpio_num_t gpio_num, uint32_t level)`

Set the RTC IO output level.

参数

- `gpio_num` –GPIO number (e.g. GPIO_NUM_12)
- `level` –output level

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_set_direction (gpio_num_t gpio_num, rtc_gpio_mode_t mode)`

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

参数

- `gpio_num` –GPIO number (e.g. GPIO_NUM_12)
- `mode` –GPIO direction

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_set_direction_in_sleep (gpio_num_t gpio_num, rtc_gpio_mode_t mode)`

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT_ONLY mode. ESP32S2 support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

参数

- `gpio_num` –GPIO number (e.g. GPIO_NUM_12)
- `mode` –GPIO direction

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_pullup_en (gpio_num_t gpio_num)`

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call `gpio_pullup_en`, which will work both for normal GPIOs and RTC IOs.

参数 `gpio_num` –GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_pulldown_en (gpio_num_t gpio_num)`

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call `gpio_pulldown_en`, which will work both for normal GPIOs and RTC IOs.

参数 `gpio_num` –GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_pullup_dis** (*gpio_num_t* gpio_num)

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call `gpio_pullup_dis`, which will work both for normal GPIOs and RTC IOs.

参数 **gpio_num** –GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_pulldown_dis** (*gpio_num_t* gpio_num)

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call `gpio_pulldown_dis`, which will work both for normal GPIOs and RTC IOs.

参数 **gpio_num** –GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_set_drive_capability** (*gpio_num_t* gpio_num, *gpio_drive_cap_t* strength)

Set RTC GPIO pad drive capability.

参数

- **gpio_num** –GPIO number, only support output GPIOs
- **strength** –Drive capability of the pad

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **rtc_gpio_get_drive_capability** (*gpio_num_t* gpio_num, *gpio_drive_cap_t* *strength)

Get RTC GPIO pad drive capability.

参数

- **gpio_num** –GPIO number, only support output GPIOs
- **strength** –Pointer to accept drive capability of the pad

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **rtc_gpio_hold_en** (*gpio_num_t* gpio_num)

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

参数 **gpio_num** –GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_hold_dis** (*gpio_num_t* gpio_num)

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

参数 **gpio_num** –GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_isolate** (*gpio_num_t* gpio_num)

Helper function to disconnect internal circuits from an RTC IO. This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call `rtc_gpio_isolate(GPIO_NUM_12)` before entering deep sleep, to reduce deep sleep current.

参数 `gpio_num` –GPIO number (e.g. `GPIO_NUM_12`).

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if GPIO is not an RTC IO

esp_err_t **rtc_gpio_force_hold_en_all** (void)

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

esp_err_t **rtc_gpio_force_hold_dis_all** (void)

Disable force hold signal for all RTC IOs.

esp_err_t **rtc_gpio_wakeup_enable** (*gpio_num_t* gpio_num, *gpio_intr_type_t* intr_type)

Enable wakeup from sleep mode using specific GPIO.

参数

- `gpio_num` –GPIO number
- `intr_type` –Wakeup on high level (`GPIO_INTR_HIGH_LEVEL`) or low level (`GPIO_INTR_LOW_LEVEL`)

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `gpio_num` is not an RTC IO, or `intr_type` is not one of `GPIO_INTR_HIGH_LEVEL`, `GPIO_INTR_LOW_LEVEL`.

esp_err_t **rtc_gpio_wakeup_disable** (*gpio_num_t* gpio_num)

Disable wakeup from sleep mode using specific GPIO.

参数 `gpio_num` –GPIO number

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `gpio_num` is not an RTC IO

Macros

RTC_GPIO_IS_VALID_GPIO (gpio_num)

Header File

- `components/hal/include/hal/rtc_io_types.h`

Enumerations

enum **rtc_gpio_mode_t**

RTCIO output/input mode type.

Values:

enumerator <code>RTC_GPIO_MODE_INPUT_ONLY</code>	Pad input
enumerator <code>RTC_GPIO_MODE_OUTPUT_ONLY</code>	Pad output
enumerator <code>RTC_GPIO_MODE_INPUT_OUTPUT</code>	Pad input + output
enumerator <code>RTC_GPIO_MODE_DISABLED</code>	Pad (output + input) disable
enumerator <code>RTC_GPIO_MODE_OUTPUT_OD</code>	Pad open-drain output
enumerator <code>RTC_GPIO_MODE_INPUT_OUTPUT_OD</code>	Pad input + open-drain output

2.3.4 通用定时器

简介

ESP32 芯片提供两组硬件定时器，每组包含两个通用硬件定时器。所有通用定时器均基于 16 位预分频器和 64 位可自动重新加载向上/向下计数器。

功能概述

下文介绍了配置和操作定时器的常规步骤：

- **定时器初始化** - 启动定时器前应设置的参数，以及每个设置提供的具体功能。
- **定时器控制** - 如何读取定时器的值，如何暂停/启动定时器以及如何改变定时器的操作方式。
- **警报** - 如何设置和使用警报。
- **处理中断事务** - 如何使用中断提供的回调函数。

定时器初始化 两个 ESP32 定时器组中，每组都有两个定时器，两组共有四个定时器供使用。ESP32 定时器组的类型为 `timer_group_t`，每组中的个体定时器类型为 `timer_idx_t`。

首先调用 `timer_init()` 函数，并将 `timer_config_t` 结构体传递给此函数，用于定义定时器的工作方式，实现定时器初始化。特别注意以下定时器参数可设置为：

- **分频器**: 设置定时器中计数器计数的速度，`divider` 的设置将用作输入时钟源的除数。默认的时钟源是 `APB_CLK` (一般是 80 MHz)。更多有关 `APB_CLK` 时钟频率信息，请查看 *ESP32 技术参考手册* > 复位和时钟 [PDF] 章节。
- **模式**: 设置计数器是递增还是递减。可通过从 `timer_count_dir_t` 中选取一个值，后使用 `counter_dir` 来选择模式。
- **计数器使能**: 如果计数器已使能，则在调用 `timer_init()` 后计数器将立即开始递增/递减。您可通过从 `timer_start_t` 中选取一个值，后使用 `counter_en` 改变此行为。
- **报警使能**: 可使用 `alarm_en` 设置。

- **自动重载:** 设置计数器是否应该在定时器警报上使用 `auto_reload` 自动重载首个计数值，还是继续递增或递减。

要获取定时器设置的当前值，请使用函数 `timer_get_config()`。

定时器控制 定时器使能后便开始计数。要启用定时器，可首先设置 `counter_en` 为 `true`，然后调用函数 `timer_init()`，或者直接调用函数 `timer_start()`。您可通过调用函数 `timer_set_counter_value()` 来指定定时器的首个计数值。要检查定时器的当前值，调用函数 `timer_get_counter_value()` 或 `timer_get_counter_time_sec()`。

可通过调用函数 `timer_pause()` 随时暂停定时器。要再次启动它，调用函数 `timer_start()`。

要重新配置定时器，可调用函数 `timer_init()`，该函数详细介绍见 [定时器初始化](#)。

除此之外，还可通过使用专有函数更改个别设置来重新配置定时器：

设置	专有函数	描述
分频器	<code>timer_set_divider()</code>	更改计数频率。为避免发生不可预测情况，更改分频器时应暂停定时器。如果定时器正在运行，则使用 <code>timer_set_divider()</code> 将其暂停并更改设置，然后重启定时器。
模式	<code>timer_set_counter_mode()</code>	设置计数器应递增还是递减
自动重载	<code>timer_set_auto_reload()</code>	设置是否应在定时器警报上重载首个计数值

警报 要设置警报，先调用函数 `timer_set_alarm_value()`，然后使用 `timer_set_alarm()` 使能警报。当调用函数 `timer_init()` 时，也可以在定时器初始化阶段使能警报。

警报已使能且定时器达到警报值后，根据配置，可能会出现以下两种行为：

- 如果先前已配置，此时将触发中断。有关如何配置中断，请参见 [处理中断事务](#)。
- 如 `auto_reload` 已使能，定时器的计数器将重新加载，从先前配置好的值开始再次计数。应使用函数 `timer_set_counter_value()` 预先设置该值。

备注:

- 如果已设置警报值且定时器已超过该值，则将立即触发警报。
- 一旦触发后，警报将自动关闭，需要重新使能以再次触发。

要检查某特定的警报值，调用函数 `timer_get_alarm_value()`。

处理中断事务 调用 `timer_isr_callback_add()` 函数可以给某个定时器注册一个中断回调函数，顾名思义，该函数会在中断上下文中被执行，因此用户不能在回调函数中调用任何会阻塞 CPU 的 API。相较于从头编写中断处理程序，使用中断回调函数的好处是，用户无需检测和处理中断的状态位，这些操作会由驱动中默认的中断处理程序替我们完成。

有关如何使用中断回调函数，请参考如下应用示例。

应用示例

64 位通用硬件定时器示例：[peripherals/timer_group](#)。

API 参考

Header File

Functions

esp_err_t **timer_get_counter_value** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint64_t *timer_val)

Read the counter value of hardware timer.

参数

- **group_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **timer_val** –Pointer to accept timer counter value.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_get_counter_time_sec** (*timer_group_t* group_num, *timer_idx_t* timer_num, double *time)

Read the counter value of hardware timer, in unit of a given scale.

参数

- **group_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **time** –Pointer, type of double*, to accept timer counter value, in seconds.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_set_counter_value** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint64_t load_val)

Set counter value to hardware timer.

参数

- **group_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **load_val** –Counter value to write to the hardware timer.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_start** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Start the counter of hardware timer.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_pause** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Pause the counter of hardware timer.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

返回

- ESP_OK Success

- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_set_counter_mode** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_count_dir_t* counter_dir)

Set counting mode for hardware timer.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **counter_dir** –Counting direction of timer, count-up or count-down

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_set_auto_reload** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_autoreload_t* reload)

Enable or disable counter reload function when alarm event occurs.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **reload** –Counter reload mode.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_set_divider** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint32_t divider)

Set hardware divider of the source clock to the timer group. By default, the source clock is APB clock running at 80 MHz. For more information, please check Chapter Reset and Clock in Chip Technical Reference Manual.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **divider** –Timer clock divider value. The divider's range is from 2 to 65536.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_set_alarm_value** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint64_t alarm_value)

Set timer alarm value.

参数

- **group_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **alarm_value** –A 64-bit value to set the alarm value.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_get_alarm_value** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint64_t *alarm_value)

Get timer alarm value.

参数

- **group_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **alarm_value** –Pointer of A 64-bit value to accept the alarm value.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_set_alarm** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_alarm_t* alarm_en)

Enable or disable generation of timer alarm events.

参数

- **group_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **alarm_en** –To enable or disable timer alarm function.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_isr_callback_add** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_isr_t* isr_handler, void *arg, int intr_alloc_flags)

Add ISR handle callback for the corresponding timer.

The callback should return a bool value to determine whether need to do YIELD at the end of the ISR.

If the intr_alloc_flags value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs.

备注: This ISR handler will be called from an ISR. This ISR handler do not need to handle interrupt status, and should be kept short. If you want to realize some specific applications or write the whole ISR, you can call timer_isr_register(...) to register ISR.

参数

- **group_num** –Timer group number
- **timer_num** –Timer index of timer group
- **isr_handler** –Interrupt handler function, it is a callback function.
- **arg** –Parameter for handler function
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_isr_callback_remove** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Remove ISR handle callback for the corresponding timer.

参数

- **group_num** –Timer group number
- **timer_num** –Timer index of timer group

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_isr_register** (*timer_group_t* group_num, *timer_idx_t* timer_num, void (*fn)(void*), void *arg, int intr_alloc_flags, *timer_isr_handle_t* *handle)

Register Timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

If the intr_alloc_flags value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.

备注: If use this function to register ISR, you need to write the whole ISR. In the interrupt handler, you need to call `timer_spinlock_take(..)` before your handling, and call `timer_spinlock_give(...)` after your handling.

参数

- **group_num** –Timer group number
- **timer_num** –Timer index of timer group
- **fn** –Interrupt handler function.
- **arg** –Parameter for handler function
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_init (timer_group_t group_num, timer_idx_t timer_num, const timer_config_t *config)`

Initializes and configure the timer.

参数

- **group_num** –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- **timer_num** –Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- **config** –Pointer to timer initialization parameters.

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_deinit (timer_group_t group_num, timer_idx_t timer_num)`

Deinitializes the timer.

参数

- **group_num** –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- **timer_num** –Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_get_config (timer_group_t group_num, timer_idx_t timer_num, timer_config_t *config)`

Get timer configure value.

参数

- **group_num** –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- **timer_num** –Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- **config** –Pointer of struct to accept timer parameters.

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_group_intr_enable (timer_group_t group_num, timer_intr_t intr_mask)`

Enable timer group interrupt, by enable mask.

参数

- **group_num** –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- **intr_mask** –Timer interrupt enable mask.
 - `TIMER_INTR_T0`: t0 interrupt
 - `TIMER_INTR_T1`: t1 interrupt
 - `TIMER_INTR_WDT`: watchdog interrupt

返回

- `ESP_OK` Success

- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t timer_group_intr_disable` (*timer_group_t* group_num, *timer_intr_t* intr_mask)

Disable timer group interrupt, by disable mask.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **intr_mask** –Timer interrupt disable mask.
 - TIMER_INTR_T0: t0 interrupt
 - TIMER_INTR_T1: t1 interrupt
 - TIMER_INTR_WDT: watchdog interrupt

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t timer_enable_intr` (*timer_group_t* group_num, *timer_idx_t* timer_num)

Enable timer interrupt.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t timer_disable_intr` (*timer_group_t* group_num, *timer_idx_t* timer_num)

Disable timer interrupt.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`void timer_group_intr_clr_in_isr` (*timer_group_t* group_num, *timer_idx_t* timer_num)

Clear timer interrupt status, just used in ISR.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.

`void timer_group_clr_intr_status_in_isr` (*timer_group_t* group_num, *timer_idx_t* timer_num)

Clear timer interrupt status, just used in ISR.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.

`void timer_group_enable_alarm_in_isr` (*timer_group_t* group_num, *timer_idx_t* timer_num)

Enable alarm interrupt, just used in ISR.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.

`uint64_t timer_group_get_counter_value_in_isr` (*timer_group_t* group_num, *timer_idx_t* timer_num)

Get the current counter value, just used in ISR.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.

返回

- Counter value

void **timer_group_set_alarm_value_in_isr** (*timer_group_t* group_num, *timer_idx_t* timer_num, *uint64_t* alarm_val)

Set the alarm threshold for the timer, just used in ISR.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.
- **alarm_val** –Alarm threshold.

void **timer_group_set_counter_enable_in_isr** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_start_t* counter_en)

Enable/disable a counter, just used in ISR.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.
- **counter_en** –Enable/disable.

timer_intr_t **timer_group_intr_get_in_isr** (*timer_group_t* group_num)

Get the masked interrupt status, just used in ISR.

参数 **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1

返回

- Interrupt status

uint32_t **timer_group_get_intr_status_in_isr** (*timer_group_t* group_num)

Get interrupt status, just used in ISR.

参数 **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1

返回

- Interrupt status

void **timer_group_clr_intr_sta_in_isr** (*timer_group_t* group_num, *timer_intr_t* intr_mask)

Clear the masked interrupt status, just used in ISR.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **intr_mask** –Masked interrupt.

bool **timer_group_get_auto_reload_in_isr** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Get auto reload enable status, just used in ISR.

参数

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index

返回

- True Auto reload enabled
- False Auto reload disabled

esp_err_t **timer_spinlock_take** (*timer_group_t* group_num)

Take timer spinlock to enter critical protect.

备注: Deprecated, the recommended way is to use ISR callbacks instead, see `timer_group_example_main`

参数 **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_spinlock_give** (*timer_group_t* group_num)

Give timer spinlock to exit critical protect.

备注: Deprecated, the recommended way is to use ISR callbacks instead, see `timer_group_example_main`

参数 `group_num` –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Macros

TIMER_BASE_CLK

Frequency of the clock on the input of the timer groups

Type Definitions

typedef bool (**timer_isr_t*)(void*)

Interrupt handle callback function. User need to retrun a bool value in callback.

备注: If you called FreeRTOS functions in callback, you need to return true or false based on the retrun value of argument `pxHigherPriorityTaskWoken`. For example, `xQueueSendFromISR` is called in callback, if the return value `pxHigherPriorityTaskWoken` of any FreeRTOS calls is `pdTRUE`, return true; otherwise return false.

Return

- True Do task yield at the end of ISR
- False Not do task yield at the end of ISR

typedef *intr_handle_t* **timer_isr_handle_t**

Interrupt handle, used in order to free the isr after use. Aliases to an int handle for now.

Header File

- `components/hal/include/hal/timer_types.h`

Structures

struct **timer_config_t**

Data structure with timer' s configuration settings.

Public Members

timer_alarm_t **alarm_en**

Timer alarm enable

timer_start_t **counter_en**

Counter enable

timer_intr_mode_t **intr_type**

Interrupt mode

timer_count_dir_t **counter_dir**

Counter direction

timer_autoreload_t **auto_reload**

Timer auto-reload

uint32_t **divider**

Counter clock divider. The divider's range is from 2 to 65536.

Enumerations

enum **timer_group_t**

Selects a Timer-Group out of 2 available groups.

Values:

enumerator **TIMER_GROUP_0**

Hw timer group 0

enumerator **TIMER_GROUP_1**

Hw timer group 1

enumerator **TIMER_GROUP_MAX**

enum **timer_idx_t**

Select a hardware timer from timer groups.

Values:

enumerator **TIMER_0**

Select timer0 of GROUPx

enumerator **TIMER_1**

Select timer1 of GROUPx

enumerator **TIMER_MAX**

enum **timer_count_dir_t**

Decides the direction of counter.

Values:

enumerator **TIMER_COUNT_DOWN**

Descending Count from cnt.hightcnt.low

enumerator **TIMER_COUNT_UP**

Ascending Count from Zero

enumerator **TIMER_COUNT_MAX**

enum **timer_start_t**

Decides whether timer is on or paused.

Values:

enumerator **TIMER_PAUSE**

Pause timer counter

enumerator **TIMER_START**

Start timer counter

enum **timer_intr_t**

Interrupt types of the timer.

Values:

enumerator **TIMER_INTR_T0**

interrupt of timer 0

enumerator **TIMER_INTR_T1**

interrupt of timer 1

enumerator **TIMER_INTR_WDT**

interrupt of watchdog

enumerator **TIMER_INTR_NONE**

enum **timer_alarm_t**

Decides whether to enable alarm mode.

Values:

enumerator **TIMER_ALARM_DIS**

Disable timer alarm

enumerator **TIMER_ALARM_EN**

Enable timer alarm

enumerator **TIMER_ALARM_MAX**

enum **timer_intr_mode_t**

Select interrupt type if running in alarm mode.

Values:

enumerator **TIMER_INTR_LEVEL**

Interrupt mode: level mode

enumerator **TIMER_INTR_MAX**

enum **timer_autoreload_t**

Select if Alarm needs to be loaded by software or automatically reload by hardware.

Values:

enumerator **TIMER_AUTORELOAD_DIS**

Disable auto-reload: hardware will not load counter value after an alarm event

enumerator **TIMER_AUTORELOAD_EN**

Enable auto-reload: hardware will load counter value after an alarm event

enumerator **TIMER_AUTORELOAD_MAX**

2.3.5 I2C 驱动程序

概述

I2C 是一种串行同步半双工通信协议，总线上可以同时挂载多个主机和从机。I2C 总线由串行数据线 (SDA) 和串行时钟线 (SCL) 线构成。这些线都需要上拉电阻。

I2C 具有简单且制造成本低廉等优点，主要用于低速外围设备的短距离通信（一英尺以内）。

ESP32 有两个 I2C 控制器（也称为端口），负责处理在 I2C 两根总线上的通信。每个控制器都可以设置为主机或从机。例如，可以同时让一个控制器用作主机，另一个用作从机。

驱动程序的功能

I2C 驱动程序管理在 I2C 总线上设备的通信，该驱动程序具备以下功能：

- 在主机模式下读写字节
- 支持从机模式
- 读取并写入寄存器，然后由主机读取/写入

使用驱动程序

以下部分将指导您完成 I2C 驱动程序配置和工作的基本步骤：

1. **配置驱动程序** - 设置初始化参数（如主机模式或从机模式，SDA 和 SCL 使用的 GPIO 管脚，时钟速度等）
2. **安装驱动程序** - 激活一个 I2C 控制器的驱动，该控制器可为主机也可为从机
3. 根据是为主机还是从机配置驱动程序，选择合适的项目
 - a) **主机模式下通信** - 发起通信（主机模式）
 - b) **从机模式下通信** - 响应主机消息（从机模式）
4. **中断处理** - 配置 I2C 中断服务
5. **用户自定义配置** - 调整默认的 I2C 通信参数（如时序、位序等）
6. **错误处理** - 如何识别和处理驱动程序配置和通信错误
7. **删除驱动程序** - 在通信结束时释放 I2C 驱动程序所使用的资源

配置驱动程序 建立 I2C 通信第一步是配置驱动程序，这需要设置 `i2c_config_t` 结构中的几个参数：

- 设置 I2C 工作模式 - 从 `i2c_mode_t` 中选择主机模式或从机模式
- 设置 通信管脚
 - 指定 SDA 和 SCL 信号使用的 GPIO 管脚
 - 是否启用 ESP32 的内部上拉电阻
- (仅限主机模式) 设置 I2C 时钟速度
- (仅限从机模式) 设置以下内容：
 - 是否应启用 10 位寻址模式
 - 定义 从机地址

然后，初始化给定 I2C 端口的配置，请使用端口号和 `i2c_config_t` 作为函数调用参数来调用 `i2c_param_config()` 函数。

配置示例 (主机):

```
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,           // select GPIO specific to your_
↪project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,           // select GPIO specific to your_
↪project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ,   // select frequency specific to your_
↪project
    // .clk_flags = 0,                          /*!< Optional, you can use I2C_SCLK_SRC_FLAG_*_
↪flags to choose i2c source clock here. */
};
```

配置示例 (从机):

```
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,           // select GPIO specific to your_
↪project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO,           // select GPIO specific to your_
↪project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR,       // address of your project
};
```

在此阶段，`i2c_param_config()` 还将其他 I2C 配置参数设置为 I2C 总线协议规范中定义的默认值。有关默认值及修改默认值的详细信息，请参考[用户自定义配置](#)。

源时钟配置 增加了 时钟源分配器，用于支持不同的时钟源。时钟分配器将选择一个满足所有频率和能力要求的时钟源（如 `i2c_config_t::clk_flags` 中的要求）。

当 `i2c_config_t::clk_flags` 为 0 时，时钟分配器将仅根据所需频率进行选择。如果不需要诸如 APB 之类的特殊功能，则可以将时钟分配器配置为仅根据所需频率选择源时钟。为此，请将 `i2c_config_t::clk_flags` 设置为 0。有关时钟特性，请参见下表。

备注： 如果时钟不满足请求的功能，则该时钟不是有效的选项，即，请求的功能中的任何位 (`clk_flags`) 在时钟的功能中均为 0。

表 2: ESP32 时钟源特性

时钟名称	时钟频率	SCL 的最大频率	时钟功能
APB 时钟	80 MHz	4 MHz	/

对 `i2c_config_t::clk_flags` 的解释如下:

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`: 当 APB 时钟改变时, 时钟的波特率不会改变。
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`: 支持轻度睡眠模式, APB 时钟则不支持。
3. ESP32 可能不支持某些标志, 请在使用前阅读技术参考手册。

备注: 在主机模式下, SCL 的时钟频率不应大于上表中提到的 SCL 的最大频率。

备注: SCL 的时钟频率会被上拉电阻和线上电容 (或是从机电容) 一起影响。因此, 用户需要自己选择合适的上拉电阻去保证 SCL 时钟频率是准确的。尽管 I2C 协议推荐上拉电阻值为 1K 欧姆到 10K 欧姆, 但是需要根据不同的频率需要选择不同的上拉电阻。

通常来说, 所选择的频率越高, 需要的上拉电阻越小 (但是不要小于 1K 欧姆)。这是因为高电阻会减小电流, 这会延长上升时间从而是频率变慢。通常我们推荐的上拉阻值范围为 2K 欧姆到 5K 欧姆, 但是用户可能也需要根据他们的实际情况做出一些调整。

安装驱动程序 配置好 I2C 驱动程序后, 使用以下参数调用函数 `i2c_driver_install()` 安装驱动程序:

- 端口号, 从 `i2c_port_t` 中二选一
- 主机或从机模式, 从 `i2c_mode_t` 中选择
- (仅限从机模式) 分配用于在从机模式下发送和接收数据的缓存区大小。I2C 是一个以主机为中心的总线, 数据只能根据主机的请求从从机传输到主机。因此, 从机通常有一个发送缓存区, 供从应用程序写入数据使用。数据保留在发送缓存区中, 由主机自行读取。
- 用于分配中断的标志 (请参考 `esp_hw_support/include/esp_intr_alloc.h` 中 `ESP_INTR_FLAG_*` 值)

主机模式下通信 安装 I2C 驱动程序后, ESP32 即可与其他 I2C 设备通信。

ESP32 的 I2C 控制器在主机模式下负责与 I2C 从机设备建立通信, 并发送命令让从机响应, 如进行测量并将结果发给主机。

为优化通信流程, 驱动程序提供一个名为“命令链接”的容器, 该容器应填充一系列命令, 然后传递给 I2C 控制器执行。

主机写入数据 下面的示例展示如何为 I2C 主机构建命令链接, 从而向从机发送 n 个字节。

下面介绍如何为“主机写入数据”设置命令链接及其内部内容:

1. 使用 `i2c_cmd_link_create()` 创建一个命令链接。
然后, 将一系列待发送给从机的数据填充命令链接:
 - a) **启动位** - `i2c_master_start()`
 - b) **从机地址** - `i2c_master_write_byte()`。提供单字节地址作为调用此函数的实参。
 - c) **数据** - 一个或多个字节的数据作为 `i2c_master_write()` 的实参。
 - d) **停止位** - `i2c_master_stop()`
函数 `i2c_master_write_byte()` 和 `i2c_master_write()` 都有额外的实参, 规定主机是否应确认其有无接收到 ACK 位。

图 7: I2C command link - master write example

2. 通过调用 `i2c_master_cmd_begin()` 来触发 I2C 控制器执行命令链接。一旦开始执行，就不能再修改命令链接。
3. 命令发送后，通过调用 `i2c_cmd_link_delete()` 释放命令链接使用的资源。

主机读取数据 下面的示例展示如何为 I2C 主机构建命令链接，以便从从机读取 n 个字节。

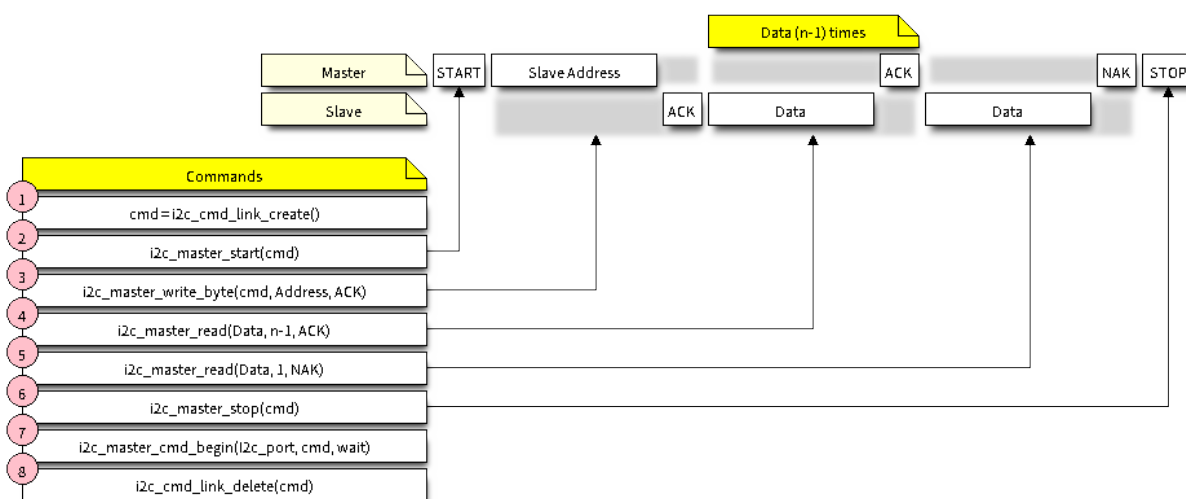

图 8: I2C command link - master read example

在读取数据时，在上图的步骤 4 中，不是用 `i2c_master_write...`，而是用 `i2c_master_read_byte()` 和/或 `i2c_master_read()` 填充命令链接。同样，在步骤 5 中配置最后一次的读取，以便主机不提供 ACK 位。

指示写入或读取数据 发送从机地址后（请参考上图中第 3 步），主机可以写入或从从机读取数据。

主机实际执行的操作信息存储在从机地址的最低有效位中。

因此，为了将数据写入从机，主机发送的命令链接应包含地址 $(ESP_SLAVE_ADDR \ll 1) \mid I2C_MASTER_WRITE$ ，如下所示：

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

同理，指示从从机读取数据的命令链接如下所示：

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

从机模式下通信 安装 I2C 驱动程序后，ESP32 即可与其他 I2C 设备通信。

API 为从机提供以下功能：

- `i2c_slave_read_buffer()`
当主机将数据写入从机时，从机将自动将其存储在接收缓存区中。从机应用程序可自行调用函数 `i2c_slave_read_buffer()`。如果接收缓存区中没有数据，此函数还具有一个参数用于指定阻塞时间。这将允许从机应用程序在指定的超时设定内等待数据到达缓存区。
- `i2c_slave_write_buffer()`
发送缓存区是用于存储从机要以 FIFO 顺序发送给主机的所有数据。在主机请求接收前，这些数据一直存储在发送缓存区。函数 `i2c_slave_write_buffer()` 有一个参数，用于指定发送缓存区已满时的块时间。这将允许从机应用程序在指定的超时设定内等待发送缓存区中足够的可用空间。

在 `peripherals/i2c` 中可找到介绍如何使用这些功能的代码示例。

中断处理 安装驱动程序时，默认情况下会安装中断处理程序。但是，您可以通过调用函数 `i2c_isr_register()` 来注册自己的而不是默认的中断处理程序。在运行自己的中断处理程序时，可以参考 *ESP32 技术参考手册 > I2C 控制器 (I2C) > 中断 [PDF]*，以获取有关 I2C 控制器触发的中断描述。

调用函数 `i2c_isr_free()` 删除中断处理程序。

用户自定义配置 如本节末尾所述 [配置驱动程序](#)，函数 `i2c_param_config()` 在初始化 I2C 端口的驱动程序配置时，也会将几个 I2C 通信参数设置为 I2C 总线协议规范规定的默认值。其他一些相关参数已在 I2C 控制器的寄存器中预先配置。

通过调用下表中提供的专用函数，可以将所有这些参数更改为用户自定义值。请注意，时序值是在 APB 时钟周期中定义。APB 的频率在 `I2C_APB_CLK_FREQ` 中指定。

表 3: 其他可配置的 I2C 通信参数

要更改的参数	函数
SCL 脉冲周期的高电平和低电平	<code>i2c_set_period()</code>
在产生 启动 信号期间使用的 SCL 和 SDA 信号时序	<code>i2c_set_start_timing()</code>
在产生 停止 信号期间使用的 SCL 和 SDA 信号时序	<code>i2c_set_stop_timing()</code>
从机采样以及主机切换时，SCL 和 SDA 信号之间的时序关系	<code>i2c_set_data_timing()</code>
I2C 超时	<code>i2c_set_timeout()</code>
优先发送/接收最高有效位 (LSB) 或最低有效位 (MSB)，可在 <code>i2c_trans_mode_t</code> 定义的模式中选择	<code>i2c_set_data_mode()</code>

上述每个函数都有一个 `_get_` 对应项来检查当前设置的值。例如，调用 `i2c_get_timeout()` 来检查 I2C 超时值。

要检查在驱动程序配置过程中设置的参数默认值，请参考文件 `driver/i2c.c` 并查找带有后缀 `_DEFAULT` 的定义。

通过函数 `i2c_set_pin()` 可以为 SDA 和 SCL 信号选择不同的管脚并改变上拉配置。如果要修改已经输入的值，请使用函数 `i2c_param_config()`。

备注: ESP32 的内部上拉电阻范围为几万欧姆，因此在大多数情况下，它们本身不足以用作 I2C 上拉电阻。建议用户使用阻值在 I2C 总线协议规范规定范围内的上拉电阻。计算阻值的具体方法，可参考 [TI 应用说明](#)

错误处理 大多数 I2C 驱动程序的函数在成功完成时会返回 `ESP_OK`，或在失败时会返回特定的错误代码。实时检查返回的值并进行错误处理是一种好习惯。驱动程序也会打印日志消息，其中包含错误说明，例如检查输入配置的正确性。有关详细信息，请参考文件 `driver/i2c.c` 并用后缀 `_ERR_STR` 查找定义。

使用专用中断来捕获通信故障。例如，如果从机将数据发送回主机耗费太长时间，会触发 `I2C_TIME_OUT_INT` 中断。详细信息请参考 [中断处理](#)。

如果出现通信失败，可以分别为发送和接收缓存区调用 `i2c_reset_tx_fifo()` 和 `i2c_reset_rx_fifo()` 来重置内部硬件缓存区。

删除驱动程序 当使用 `i2c_driver_install()` 建立 I2C 通信，一段时间后不再需要 I2C 通信时，可以通过调用 `i2c_driver_delete()` 来移除驱动程序以释放分配的资源。

由于函数 `i2c_driver_delete()` 无法保证线程安全性，请在调用该函数移除驱动程序前务必确保所有的线程都已停止使用驱动程序。

应用示例

Functions

`esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)`

Install an I2C driver.

备注: In master mode, if the cache is likely to be disabled(such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in `i2c` read and write function, because we can not access the `psram`(if `psram` is enabled) in interrupt handle function when cache is disabled.

参数

- `i2c_num` –I2C port number
- `mode` –I2C mode (either master or slave)
- `slv_rx_buf_len` –Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- `slv_tx_buf_len` –Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- `intr_alloc_flags` –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver installation error

`esp_err_t i2c_driver_delete(i2c_port_t i2c_num)`

Delete I2C driver.

备注: This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

参数 `i2c_num` –I2C port to delete

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)`

Configure an I2C bus with the given configuration.

参数

- `i2c_num` –I2C port to configure
- `i2c_conf` –Pointer to the I2C configuration

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_reset_tx_fifo(i2c_port_t i2c_num)`

reset I2C tx hardware fifo

参数 `i2c_num` –I2C port number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)`

reset I2C rx fifo

参数 `i2c_num` –I2C port number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_isr_register(i2c_port_t i2c_num, void (*fn)(void*), void *arg, int intr_alloc_flags, intr_handle_t *handle)`

Register an I2C ISR handler.

参数

- `i2c_num` –I2C port number to attach handler to
- `fn` –ISR handler function
- `arg` –Parameter for the ISR handler
- `intr_alloc_flags` –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- `handle` –Handle return from esp_intr_alloc.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_isr_free(intr_handle_t handle)`

Delete and free I2C ISR handle.

参数 `handle` –Handle of isr to delete.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_pin** (*i2c_port_t* i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, *i2c_mode_t* mode)

Configure GPIO pins for I2C SCK and SDA signals.

参数

- **i2c_num** –I2C port number
- **sda_io_num** –GPIO number for I2C SDA signal
- **scl_io_num** –GPIO number for I2C SCL signal
- **sda_pullup_en** –Enable the internal pullup for SDA pin
- **scl_pullup_en** –Enable the internal pullup for SCL pin
- **mode** –I2C mode

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_master_write_to_device** (*i2c_port_t* i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

参数

- **i2c_num** –I2C port number to perform the transfer on
- **device_address** –I2C device's 7-bit address
- **write_buffer** –Bytes to send on the bus
- **write_size** –Size, in bytes, of the write buffer
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

esp_err_t **i2c_master_read_from_device** (*i2c_port_t* i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

参数

- **i2c_num** –I2C port number to perform the transfer on
- **device_address** –I2C device's 7-bit address
- **read_buffer** –Buffer to store the bytes received on the bus
- **read_size** –Size, in bytes, of the read buffer
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

esp_err_t **i2c_master_write_read_device** (*i2c_port_t* i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

参数

- **i2c_num** –I2C port number to perform the transfer on
- **device_address** –I2C device’s 7-bit address
- **write_buffer** –Bytes to send on the bus
- **write_size** –Size, in bytes, of the write buffer
- **read_buffer** –Buffer to store the bytes received on the bus
- **read_size** –Size, in bytes, of the read buffer
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

i2c_cmd_handle_t **i2c_cmd_link_create_static** (uint8_t *buffer, uint32_t size)

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, …) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

备注: It is **highly** advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with `malloc`).

参数

- **buffer** –Buffer to use for commands allocations
- **size** –Size in bytes of the buffer

返回 Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

i2c_cmd_handle_t **i2c_cmd_link_create** (void)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

返回 Handle to the I2C command link

void **i2c_cmd_link_delete_static** (*i2c_cmd_handle_t* cmd_handle)

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static`.

参数 **cmd_handle** –I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function

void **i2c_cmd_link_delete** (*i2c_cmd_handle_t* cmd_handle)

Free the I2C commands list.

参数 **cmd_handle** –I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function

esp_err_t **i2c_master_start** (*i2c_cmd_handle_t* cmd_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

参数 **cmd_handle** –I2C commands list

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small

- `ESP_FAIL` No more memory left on the heap

`esp_err_t i2c_master_write_byte(i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)`

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

参数

- `cmd_handle` –I2C commands list
- `data` –Byte to send on the port
- `ack_en` –Enable ACK signal

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

`esp_err_t i2c_master_write(i2c_cmd_handle_t cmd_handle, const uint8_t *data, size_t data_len, bool ack_en)`

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

参数

- `cmd_handle` –I2C commands list
- `data` –Bytes to send. This buffer shall remain **valid** until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to `ESP_INTR_FLAG_IRAM`, `data` should be allocated from internal RAM.
- `data_len` –Length, in bytes, of the data buffer
- `ack_en` –Enable ACK signal

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

`esp_err_t i2c_master_read_byte(i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)`

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

参数

- `cmd_handle` –I2C commands list
- `data` –Pointer where the received byte will be stored. This buffer shall remain **valid** until the transaction is finished.
- `ack` –ACK signal

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

`esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)`

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

参数

- `cmd_handle` –I2C commands list
- `data` –Pointer where the received bytes will be stored. This buffer shall remain **valid** until the transaction is finished.
- `data_len` –Size, in bytes, of the `data` buffer
- `ack` –ACK signal

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_stop** (*i2c_cmd_handle_t* cmd_handle)

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

参数 **cmd_handle** –I2C commands list

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_cmd_begin** (*i2c_port_t* i2c_num, *i2c_cmd_handle_t* cmd_handle, TickType_t ticks_to_wait)

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C port is protected by mutex, so this function is thread-safe. This function shall only be called in I2C master mode.

参数

- **i2c_num** –I2C port number
- **cmd_handle** –I2C commands list
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

int **i2c_slave_write_buffer** (*i2c_port_t* i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

备注: This function shall only be called in I2C slave mode.

参数

- **i2c_num** –I2C port number
- **data** –Bytes to write into internal buffer
- **size** –Size, in bytes, of `data` buffer
- **ticks_to_wait** –Maximum ticks to wait.

返回

- ESP_FAIL (-1) Parameter error
- Other (>=0) The number of data bytes pushed to the I2C slave buffer.

int **i2c_slave_read_buffer** (*i2c_port_t* i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the `data` user buffer.

备注: This function shall only be called in I2C slave mode.

参数

- **i2c_num** –I2C port number
- **data** –Buffer to fill with ringbuffer' s bytes
- **max_size** –Maximum bytes to read
- **ticks_to_wait** –Maximum waiting ticks

返回

- ESP_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes read from I2C slave buffer.

esp_err_t **i2c_set_period** (*i2c_port_t* i2c_num, int high_period, int low_period)

Set I2C master clock period.

参数

- **i2c_num** –I2C port number
- **high_period** –Clock cycle number during SCL is high level, high_period is a 14 bit value
- **low_period** –Clock cycle number during SCL is low level, low_period is a 14 bit value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_period** (*i2c_port_t* i2c_num, int *high_period, int *low_period)

Get I2C master clock period.

参数

- **i2c_num** –I2C port number
- **high_period** –pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- **low_period** –pointer to get clock cycle number during SCL is low level, will get a 14 bit value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_filter_enable** (*i2c_port_t* i2c_num, uint8_t cyc_num)

Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

备注: Enable filter will slow down the SCL clock.

参数

- **i2c_num** –I2C port number to filter
- **cyc_num** –the APB cycles need to be filtered ($0 \leq \text{cyc_num} \leq 7$). When the period of a pulse is less than $\text{cyc_num} * \text{APB_cycle}$, the I2C controller will ignore this pulse.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_filter_disable** (*i2c_port_t* i2c_num)

Disable filter on I2C bus.

参数 **i2c_num** –I2C port number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_start_timing** (*i2c_port_t* i2c_num, int setup_time, int hold_time)

set I2C master start signal timing

参数

- **i2c_num** –I2C port number
- **setup_time** –clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it' s a 10-bit value.
- **hold_time** –clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it' s a 10-bit value.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_start_timing** (*i2c_port_t* i2c_num, int *setup_time, int *hold_time)

get I2C master start signal timing

参数

- **i2c_num** –I2C port number
- **setup_time** –pointer to get setup time
- **hold_time** –pointer to get hold time

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_stop_timing** (*i2c_port_t* i2c_num, int setup_time, int hold_time)

set I2C master stop signal timing

参数

- **i2c_num** –I2C port number
- **setup_time** –clock num between the rising-edge of SCL and the rising-edge of SDA, it' s a 10-bit value.
- **hold_time** –clock number after the STOP bit' s rising-edge, it' s a 14-bit value.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_stop_timing** (*i2c_port_t* i2c_num, int *setup_time, int *hold_time)

get I2C master stop signal timing

参数

- **i2c_num** –I2C port number
- **setup_time** –pointer to get setup time.
- **hold_time** –pointer to get hold time.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_data_timing** (*i2c_port_t* i2c_num, int sample_time, int hold_time)

set I2C data signal timing

参数

- **i2c_num** –I2C port number
- **sample_time** –clock number I2C used to sample data on SDA after the rising-edge of SCL, it' s a 10-bit value
- **hold_time** –clock number I2C used to hold the data after the falling-edge of SCL, it' s a 10-bit value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_data_timing** (*i2c_port_t* i2c_num, int *sample_time, int *hold_time)

get I2C data signal timing

参数

- **i2c_num** –I2C port number
- **sample_time** –pointer to get sample time
- **hold_time** –pointer to get hold time

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_timeout** (*i2c_port_t* i2c_num, int timeout)

set I2C timeout value

参数

- **i2c_num** –I2C port number
- **timeout** –timeout value for I2C bus (unit: APB 80Mhz clock cycle)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_timeout** (*i2c_port_t* i2c_num, int *timeout)

get I2C timeout value

参数

- **i2c_num** –I2C port number
- **timeout** –pointer to get timeout value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_data_mode** (*i2c_port_t* i2c_num, *i2c_trans_mode_t* tx_trans_mode, *i2c_trans_mode_t* rx_trans_mode)

set I2C data transfer mode

参数

- **i2c_num** –I2C port number
- **tx_trans_mode** –I2C sending data mode
- **rx_trans_mode** –I2C receiving data mode

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_data_mode** (*i2c_port_t* i2c_num, *i2c_trans_mode_t* *tx_trans_mode, *i2c_trans_mode_t* *rx_trans_mode)

get I2C data transfer mode

参数

- **i2c_num** –I2C port number
- **tx_trans_mode** –pointer to get I2C sending data mode
- **rx_trans_mode** –pointer to get I2C receiving data mode

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Structures

struct **i2c_config_t**

I2C initialization parameters.

Public Members

i2c_mode_t **mode**

I2C mode

int **sda_io_num**

GPIO number for I2C sda signal

int **scl_io_num**

GPIO number for I2C scl signal

bool **sda_pullup_en**

Internal GPIO pull mode for I2C sda signal

bool **scl_pullup_en**

Internal GPIO pull mode for I2C scl signal

uint32_t **clk_speed**

I2C clock frequency for master mode, (no higher than 1MHz for now)

struct *i2c_config_t*::[anonymous]::[anonymous] **master**

I2C master config

uint8_t **addr_10bit_en**

I2C 10bit address mode enable for slave mode

uint16_t **slave_addr**

I2C address for slave mode

uint32_t **maximum_speed**

I2C expected clock speed from SCL.

struct *i2c_config_t*::[anonymous]::[anonymous] **slave**

I2C slave config

uint32_t **clk_flags**

Bitwise of I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice

Macros

I2C_APB_CLK_FREQ

I2C source clock is APB clock, 80MHz

I2C_NUM_MAX

I2C port max

I2C_NUM_0

I2C port 0

I2C_NUM_1

I2C port 1

I2C_SCLK_SRC_FLAG_FOR_NOMAL

Any one clock source that is available for the specified frequency may be chosen

I2C_SCLK_SRC_FLAG_AWARE_DFS

For REF tick clock, it won't change with APB.

I2C_SCLK_SRC_FLAG_LIGHT_SLEEP

For light sleep mode.

I2C_INTERNAL_STRUCT_SIZE

Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

I2C_LINK_RECOMMENDED_SIZE (TRANSACTIONS)

The following macro is used to determine the recommended size of the buffer to pass to `i2c_cmd_link_create_static()` function. It requires one parameter, `TRANSACTIONS`, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, `TRANSACTIONS` must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as “(repeated) start” , “stop” , “nack” , “ack” shall not be counted.

Type Definitions

```
typedef void *i2c_cmd_handle_t
```

I2C command handle

Header File

- [components/hal/include/hal/i2c_types.h](#)

Macros**I2C_CLK_FREQ_MAX**

Use the highest speed that is available for the clock source picked by `clk_flags`.

Type Definitions

```
typedef int i2c_port_t
```

I2C port number, can be `I2C_NUM_0` ~ (`I2C_NUM_MAX-1`).

Enumerations

```
enum i2c_mode_t
```

Values:

enumerator **I2C_MODE_SLAVE**

I2C slave mode

enumerator **I2C_MODE_MASTER**

I2C master mode

enumerator **I2C_MODE_MAX**

enum **i2c_rw_t**

Values:

enumerator **I2C_MASTER_WRITE**

I2C write data

enumerator **I2C_MASTER_READ**

I2C read data

enum **i2c_trans_mode_t**

Values:

enumerator **I2C_DATA_MODE_MSB_FIRST**

I2C data msb first

enumerator **I2C_DATA_MODE_LSB_FIRST**

I2C data lsb first

enumerator **I2C_DATA_MODE_MAX**

enum **i2c_addr_mode_t**

Values:

enumerator **I2C_ADDR_BIT_7**

I2C 7bit address for slave mode

enumerator **I2C_ADDR_BIT_10**

I2C 10bit address for slave mode

enumerator **I2C_ADDR_BIT_MAX**

enum **i2c_ack_type_t**

Values:

enumerator **I2C_MASTER_ACK**

I2C ack for each byte read

enumerator **I2C_MASTER_NACK**

I2C nack for each byte read

enumerator **I2C_MASTER_LAST_NACK**

I2C nack for the last byte

enumerator **I2C_MASTER_ACK_MAX**

enum **i2c_sclk_t**

I2C clock source, sorting from smallest to largest, place them in order. This can be expanded in the future use.

Values:

enumerator **I2C_SCLK_DEFAULT**

I2C source clock not selected

enumerator **I2C_SCLK_APB**

I2C source clock from APB, 80M

enumerator **I2C_SCLK_MAX**

enum **i2c_opmode_t**

Values:

enumerator **I2C_CMD_RESTART**

I2C restart command

enumerator **I2C_CMD_WRITE**

I2C write command

enumerator **I2C_CMD_READ**

I2C read command

enumerator **I2C_CMD_STOP**

2.3.6 Inter-IC Sound (I2S)

Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus consists of the following lines:

- Master clock line (operational)
- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver

- DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

I2S0 output can be routed directly to the digital-to-analog converter's (DAC) output channels (GPIO 25 & GPIO 26) to produce direct analog output without involving any external I2S codecs. I2S0 can also be used for transmitting PDM (Pulse-density modulation) signals.

The I2S peripherals also support LCD mode for communicating data over a parallel bus, as used by some LCD displays and camera modules. LCD mode has the following operational modes:

- LCD master transmitting mode
- Camera slave receiving mode
- ADC/DAC mode

For more information, see *ESP32 Technical Reference Manual > I2S Controller (I2S) > LCD Mode* [PDF].

备注: For high accuracy clock applications, use the APLL_CLK clock source, which has the frequency range of 16 ~ 128 MHz. You can enable the APLL_CLK clock source by setting `i2s_config_t::use_apll` to TRUE.

If `i2s_config_t::use_apll = TRUE` and `i2s_config_t::fixed_mclk > 0`, then the master clock output frequency for I2S will be equal to the value of `i2s_config_t::fixed_mclk`, which means that the mclk frequency is provided by the user, instead of being calculated by the driver.

The clock rate of the word select line, which is called audio left-right clock rate (LRCK) here, is always the divisor of the master clock output frequency and for which the following is always true: $0 < \text{MCLK/LRCK/channels/bits_per_sample} < 64$.

Functional Overview

Installing the Driver Install the I2S driver by calling the function `:cpp:func'i2s_driver_install'` and passing the following arguments:

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Once `:cpp:func'i2s_driver_install'` returns `ESP_OK`, it means I2S has started.

Configuration example:

```
static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false,
    .intr_alloc_flags = ESP_INTR_FLAG_LEVEL1 // Interrupt level 1, default 0
};

i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);
```

Setting Communication Pins Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `:cpp:func'i2s_set_pin'` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the MCK, BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

备注: MCK only takes effect in `I2S_MODE_MASTER` mode.

```
static const i2s_pin_config_t pin_config = {
    .mck_io_num = 0,
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_set_pin(i2s_num, &pin_config);
```

Running I2S Communication To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the DMA Tx buffer, and then the data will be transmitted automatically.

```
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_
↪write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the DMA Rx buffer, once the data is received by the I2S controller.

```
i2s_read(I2S_NUM, data_recv, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_read,
↪100);
```

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `:cpp:func:i2s_driver_install` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

Deleting the Driver If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

Application Example

A code example for the I2S driver can be found in the directory `peripherals/i2s`.

In addition, there are two short configuration examples for the I2S driver.

In addition, there is a short configuration examples for the I2S driver.

I2S configuration Example for general usage.

```
#include "driver/i2s.h"

static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
```

(下页继续)

(续上页)

```

        .sample_rate = 44100,
        .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
        .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
        .communication_format = I2S_COMM_FORMAT_STAND_I2S
        .tx_desc_auto_clear = false,
        .dma_buf_count = 8,
        .dma_buf_len = 64,
        .use_apll = false,
        .intr_alloc_flags = ESP_INTR_FLAG_LEVEL1 // Interrupt level 1, default 0
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);

...
/* You can reset parameters by calling 'i2s_set_clk'
 *
 * The low 16 bits are the valid data bits in one chan and the high 16 bits are
 * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
 * be set to a same value as low 16 bits.
 */
uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_num, 22050, bits_cfg, I2S_CHANNEL_STEREO);
...

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

```

Configuring I2S to use internal DAC for analog output

```

#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX | I2S_MODE_DAC_BUILT_IN,
    .sample_rate = 44100,
    .bits_per_sample = 16, /* the DAC module will only take the 8bits from MSB */
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .intr_alloc_flags = 0, // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};

...

    i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s_
↪driver

    i2s_set_pin(i2s_num, NULL); //for internal DAC, this will enable both of the_
↪internal channels

```

(下页继续)

(续上页)

```
//You can call i2s_set_dac_mode to set built-in DAC output mode.
//i2s_set_dac_mode(I2S_DAC_CHANNEL_BOTH_EN);

i2s_set_sample_rates(i2s_num, 22050); //set sample rates

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver
```

Application Notes

How to Prevent Data Lost For the applications that need a high frequency sample rate, sometimes the massive throughput of receiving data may cause data lost. Users can receive data lost event by registering an event queue handler to the driver during installation:

```
QueueHandle_t evt_que;
i2s_driver_install(i2s_num, &i2s_config, 10, &evt_que);
```

You will receive I2S_EVENT_RX_Q_OVF event when there are data lost.

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happened, the interval should be the bigger the better, it can help to reduce the interrupt times, i.e., `dma_buf_len` should be as big as possible while the DMA buffer size won't exceed its maximum value 4092. The relationships are:

```
interrupt_interval(unit: sec) = dma_buf_len / sample_rate
dma_buffer_size = dma_buf_len * slot_num * data_bit_width / 8 <= 4092
```

2. Determine the `dma_buf_count`. The `dma_buf_count` is decided by the max time of `i2s_read` polling cycle, all the received data are supposed to be stored between two `i2s_read`. This cycle can be measured by a timer or an outputting gpio signal. The relationship is:

```
dma_buf_count > polling_cycle / interrupt_interval
```

3. Determine the receiving buffer size. The receiving buffer that offered by user in `i2s_read` should be able to take all the data in all dma buffers, that means it should be bigger than the total size of all the dma buffers:

```
recv_buffer_size > dma_buf_count * dma_buffer_size
```

For example, if there is an I2S application, and the known values are:

```
sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10ms
```

Then the parameters `dma_buf_len`, `dma_buf_count` and `recv_buf_size` can be calculated according to the given known values:

```
dma_buf_len * slot_num * data_bit_width / 8 = dma_buffer_size <= 4092
dma_buf_len <= 511
interrupt_interval = dma_buf_len / sample_rate = 511 / 144000 = 0.003549 s = 3.549_
↪ms
dma_buf_count > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.
↪818) = 3
recv_buffer_size > dma_buf_count * dma_buffer_size = 3 * 4092 = 12276 bytes
```

To check whether there are data lost, you can offer an event queue handler to the driver during installation:

```
QueueHandle_t evt_que;
i2s_driver_install(i2s_num, &i2s_config, 10, &evt_que);
```

You will receive I2S_EVENT_RX_Q_OVF event when there are data lost.

- components/driver/include/driver/i2s.h

Functions

esp_err_t **i2s_set_pin** (*i2s_port_t* i2s_num, const *i2s_pin_config_t* *pin)

Set I2S pin number.

Inside the pin configuration structure, set I2S_PIN_NO_CHANGE for any pin where the current configuration should not be changed.

备注: The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

备注: if *pin is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don't want this to happen and you want to initialize only one of the DAC channels, you can call *i2s_set_dac_mode* instead.

参数

- **i2s_num** –I2S port number
- **pin** –I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL IO error

esp_err_t **i2s_set_pdm_rx_down_sample** (*i2s_port_t* i2s_num, *i2s_pdm_dsr_t* downsample)

Set PDM mode down-sample rate In PDM RX mode, there would be 2 rounds of downsample process in hardware. In the first downsample process, the sampling number can be 16 or 8. In the second downsample process, the sampling number is fixed as 8. So the clock frequency in PDM RX mode would be (fpcm * 64) or (fpcm * 128) accordingly.

备注: After calling this function, it would call *i2s_set_clk* inside to update the clock frequency. Please call this function after I2S driver has been initialized.

参数

- **i2s_num** –I2S port number
- **downsample** –i2s RX down sample rate for PDM mode.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

esp_err_t **i2s_set_pdm_tx_up_sample** (*i2s_port_t* i2s_num, const *i2s_pdm_tx_upsample_cfg_t* *upsample_cfg)

Set TX PDM mode up-sample rate.

备注: If you have set PDM mode while calling ‘i2s_driver_install’, default PDM TX upsample parameters have already been set, no need to call this function again if you don’t have to change the default configuration

参数

- **i2s_num** –I2S port number
- **upsample_cfg** –Set I2S PDM up-sample rate configuration

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

esp_err_t **i2s_driver_install** (*i2s_port_t* i2s_num, const *i2s_config_t* *i2s_config, int queue_size, void *i2s_queue)

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

参数

- **i2s_num** –I2S port number
- **i2s_config** –I2S configurations - see *i2s_config_t* struct
- **queue_size** –I2S event queue size/depth.
- **i2s_queue** –I2S event queue handle, if set NULL, driver will not use an event queue.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory
- ESP_ERR_INVALID_STATE Current I2S port is in use

esp_err_t **i2s_driver_uninstall** (*i2s_port_t* i2s_num)

Uninstall I2S driver.

参数 **i2s_num** –I2S port number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE I2S port has been uninstalled by others (e.g. LCD i80)

esp_err_t **i2s_write** (*i2s_port_t* i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)

Write data to I2S DMA transmit buffer.

参数

- **i2s_num** –I2S port number
- **src** –Source address to write from
- **size** –Size of data in bytes
- **bytes_written** –[out] Number of bytes written, if timeout, the result will be less than the size passed in.
- **ticks_to_wait** –TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_write_expand** (*i2s_port_t* i2s_num, const void *src, size_t size, size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see `i2s_config_t`).

参数

- **i2s_num** –I2S port number
- **src** –Source address to write from
- **size** –Size of data in bytes
- **src_bits** –Source audio bit
- **aim_bits** –Bit wanted, no more than 32, and must be greater than `src_bits`
- **bytes_written** –[out] Number of bytes written, if timeout, the result will be less than the size passed in.
- **ticks_to_wait** –TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass `portMAX_DELAY` for no timeout.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2s_read(i2s_port_t i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)`

Read data from I2S DMA receive buffer.

备注: If the built-in ADC mode is enabled, we should call `i2s_adc_enable` and `i2s_adc_disable` around the whole reading process, to prevent the data getting corrupted.

参数

- **i2s_num** –I2S port number
- **dest** –Destination address to read into
- **size** –Size of data in bytes
- **bytes_read** –[out] Number of bytes read, if timeout, bytes read will be less than the size passed in.
- **ticks_to_wait** –RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass `portMAX_DELAY` for no timeout.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2s_set_sample_rates(i2s_port_t i2s_num, uint32_t rate)`

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and `i2s_config_t` configuration parameters (number of channels, `bits_per_sample`).

`bit_clock = rate * (number of channels) * bits_per_sample`

参数

- **i2s_num** –I2S port number
- **rate** –I2S sample rate (ex: 8000, 44100...)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

esp_err_t **i2s_stop** (*i2s_port_t* i2s_num)

Stop I2S driver.

There is no need to call `i2s_stop()` before calling `i2s_driver_uninstall()`.

Disables I2S TX/RX, until `i2s_start()` is called.

参数 `i2s_num` –I2S port number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_start** (*i2s_port_t* i2s_num)

Start I2S driver.

It is not necessary to call this function after `i2s_driver_install()` (it is started automatically), however it is necessary to call it after `i2s_stop()`.

参数 `i2s_num` –I2S port number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_zero_dma_buffer** (*i2s_port_t* i2s_num)

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

参数 `i2s_num` –I2S port number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_set_clk** (*i2s_port_t* i2s_num, uint32_t rate, uint32_t bits_cfg, *i2s_channel_t* ch)

Set clock & bit width used for I2S RX and TX.

Similar to `i2s_set_sample_rates()`, but also sets bit width.

- stop i2s;
- calculate mclk, bck, bck_factor
- malloc dma buffer;
- start i2s

参数

- `i2s_num` –I2S port number
- `rate` –I2S sample rate (ex: 8000, 44100...)
- `bits_cfg` –I2S bits configuration the low 16 bits is for data bits per sample in one channel (see ‘`i2s_bits_per_sample_t`’) the high 16 bits is for total bits in one channel (see ‘`i2s_bits_per_chan_t`’) high 16bits=0 means same as the bits per sample.
- `ch` –I2S channel, (I2S_CHANNEL_MONO, I2S_CHANNEL_STEREO or specific channel in TDM mode)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

float **i2s_get_clk** (*i2s_port_t* i2s_num)

get clock set on particular port number.

参数 `i2s_num` –I2S port number

返回

- actual clock set by i2s driver

esp_err_t **i2s_set_adc_mode** (*adc_unit_t* adc_unit, *adc1_channel_t* adc_channel)

Set built-in ADC mode for I2S DMA, this function will initialize ADC pad, and set ADC parameters.

备注: In this mode, the ADC maximum sampling rate is 150KHz. Set the sampling rate through *i2s_config_t*.

参数

- **adc_unit** –SAR ADC unit index
- **adc_channel** –ADC channel index

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_adc_enable** (*i2s_port_t* i2s_num)

Start to use I2S built-in ADC mode.

备注: This function would acquire the lock of ADC to prevent the data getting corrupted during the I2S peripheral is being used to do fully continuous ADC sampling.

参数 *i2s_num* –i2s port index

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver state error

esp_err_t **i2s_adc_disable** (*i2s_port_t* i2s_num)

Stop to use I2S built-in ADC mode.

备注: This function would release the lock of ADC so that other tasks can use ADC.

参数 *i2s_num* –i2s port index

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver state error

esp_err_t **i2s_set_dac_mode** (*i2s_dac_mode_t* dac_mode)

Set I2S dac mode, I2S built-in DAC is disabled by default.

备注: Built-in DAC functions are only supported on I2S0 for current ESP32 chip. If either of the built-in DAC channel are enabled, the other one can not be used as RTC DAC function at the same time.

参数 **dac_mode** –DAC mode configurations - see *i2s_dac_mode_t*

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Structures

struct **i2s_pdm_tx_upsample_cfg_t**
I2S PDM up-sample rate configuration.

备注: TX PDM can only be set to the following two upsampling rate configurations: 1: $fp = 960$, $fs = \text{sample_rate} / 100$, in this case, $Fpdm = 128 * 48000$ 2: $fp = 960$, $fs = 480$, in this case, $Fpdm = 128 * Fpcm = 128 * \text{sample_rate}$ If the pdm receiver do not care the pdm serial clock, it' s recommended set $Fpdm = 128 * 48000$. Otherwise, the second configuration should be applied.

Public Members

int **sample_rate**
I2S PDM sample rate

int **fp**
I2S PDM TX upsampling paramater. Normally it should be set to 960

int **fs**
I2S PDM TX upsampling paramater. When it is set to 480, the pdm clock frequency $Fpdm = 128 * \text{sample_rate}$, when it is set to $\text{sample_rate} / 100$, $Fpdm$ will be fixed to $128 * 48000$

struct **i2s_pin_config_t**
I2S pin number for `i2s_set_pin`.

Public Members

int **mck_io_num**
MCK in out pin. Note that ESP32 supports setting MCK on GPIO0/GPIO1/GPIO3 only

int **bck_io_num**
BCK in out pin

int **ws_io_num**
WS in out pin

int **data_out_num**
DATA out pin

int **data_in_num**
DATA in pin

struct **i2s_driver_config_t**
I2S driver configuration parameters.

Public Members

i2s_mode_t **mode**
I2S work mode

uint32_t **sample_rate**

I2S sample rate

i2s_bits_per_sample_t **bits_per_sample**

I2S sample bits in one channel

i2s_channel_fmt_t **channel_format**

I2S channel format.

i2s_comm_format_t **communication_format**

I2S communication format

int **intr_alloc_flags**

Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info

int **dma_buf_count**

The total number of DMA buffers to receive/transmit data. A descriptor includes some information such as buffer address, the address of the next descriptor, and the buffer length. Since one descriptor points to one buffer, therefore, 'dma_desc_num' can be interpreted as the total number of DMA buffers used to store data from DMA interrupt. Notice that these buffers are internal to 'i2s_read' and descriptors are created automatically inside of the I2S driver. Users only need to set the buffer number while the length is derived from the parameter described below.

int **dma_buf_len**

Number of frames in a DMA buffer. A frame means the data of all channels in a WS cycle. The $real_dma_buf_size = dma_buf_len * chan_num * bits_per_chan / 8$. For example, if two channels in stereo mode (i.e., 'channel_format' is set to 'I2S_CHANNEL_FMT_RIGHT_LEFT') are active, and each channel transfers 32 bits (i.e., 'bits_per_sample' is set to 'I2S_BITS_PER_CHAN_32BIT'), then the total number of bytes of a frame is 'channel_format' * 'bits_per_sample' = 2 * 32 / 8 = 8 bytes. We assume that the current 'dma_buf_len' is 100, then the real length of the DMA buffer is 8 * 100 = 800 bytes. Note that the length of an internal real DMA buffer shouldn't be greater than 4092.

bool **use_apll**

I2S using APLL as main I2S clock, enable it to get accurate clock

bool **tx_desc_auto_clear**

I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

int **fixed_mclk**

I2S using fixed MCLK output. If use_apll = true and fixed_mclk > 0, then the clock output for i2s is fixed and equal to the fixed_mclk value. If fixed_mclk set, mclk_multiple won't take effect

i2s_mclk_multiple_t **mclk_multiple**

The multiple of I2S master clock(MCLK) to sample rate

i2s_bits_per_chan_t **bits_per_chan**

I2S total bits in one channel, only take effect when larger than 'bits_per_sample', default '0' means equal to 'bits_per_sample'

struct **i2s_event_t**

Event structure used in I2S event queue.

Public Members

i2s_event_type_t **type**

I2S event type

size_t **size**

I2S data size for I2S_DATA event

Macros

I2S_PIN_NO_CHANGE

Use in *i2s_pin_config_t* for pins which should not be changed

I2S_PDM_DEFAULT_UPSAMPLE_CONFIG (rate)

Default I2S PDM Up-Sampling Rate configuration.

Type Definitions

typedef *i2s_driver_config_t* **i2s_config_t**

typedef *intr_handle_t* **i2s_isr_handle_t**

Enumerations

enum **i2s_port_t**

I2S port number, the max port number is (I2S_NUM_MAX -1).

Values:

enumerator **I2S_NUM_0**

I2S port 0

enumerator **I2S_NUM_1**

I2S port 1

enumerator **I2S_NUM_MAX**

I2S port max

enum **i2s_event_type_t**

I2S event queue types.

Values:

enumerator **I2S_EVENT_DMA_ERROR**

enumerator **I2S_EVENT_TX_DONE**

I2S DMA finish sent 1 buffer

enumerator **I2S_EVENT_RX_DONE**
I2S DMA finish received 1 buffer

enumerator **I2S_EVENT_TX_Q_OVF**
I2S DMA sent queue overflow

enumerator **I2S_EVENT_RX_Q_OVF**
I2S DMA receive queue overflow

enumerator **I2S_EVENT_MAX**
I2S event max index

Header File

- [components/hal/include/hal/i2s_types.h](#)

Enumerations

enum **i2s_bits_per_sample_t**

I2S bit width per sample.

Values:

enumerator **I2S_BITS_PER_SAMPLE_8BIT**
data bit-width: 8

enumerator **I2S_BITS_PER_SAMPLE_16BIT**
data bit-width: 16

enumerator **I2S_BITS_PER_SAMPLE_24BIT**
data bit-width: 24

enumerator **I2S_BITS_PER_SAMPLE_32BIT**
data bit-width: 32

enum **i2s_bits_per_chan_t**

I2S bit width per chan.

Values:

enumerator **I2S_BITS_PER_CHAN_DEFAULT**
channel bit-width equals to data bit-width

enumerator **I2S_BITS_PER_CHAN_8BIT**
channel bit-width: 8

enumerator **I2S_BITS_PER_CHAN_16BIT**
channel bit-width: 16

enumerator **I2S_BITS_PER_CHAN_24BIT**
channel bit-width: 24

enumerator **I2S_BITS_PER_CHAN_32BIT**

channel bit-width: 32

enum **i2s_channel_t**

I2S channel.

Values:

enumerator **I2S_CHANNEL_MONO**

I2S channel (mono), one channel activated. In this mode, you only need to send one channel data but the fifo will copy same data for the other unactivated channels automatically, then both channels will transmit same data.

enumerator **I2S_CHANNEL_STEREO**

I2S channel (stereo), two (or more) channels activated. In this mode, these channels will transmit different data.

enum **i2s_comm_format_t**

I2S communication standard format.

Values:

enumerator **I2S_COMM_FORMAT_STAND_I2S**

I2S communication I2S Philips standard, data launch at second BCK

enumerator **I2S_COMM_FORMAT_STAND_MSB**

I2S communication MSB alignment standard, data launch at first BCK

enumerator **I2S_COMM_FORMAT_STAND_PCM_SHORT**

PCM Short standard, also known as DSP mode. The period of synchronization signal (WS) is 1 bck cycle.

enumerator **I2S_COMM_FORMAT_STAND_PCM_LONG**

PCM Long standard. The period of synchronization signal (WS) is channel_bit*bck cycles.

enumerator **I2S_COMM_FORMAT_STAND_MAX**

standard max

enumerator **I2S_COMM_FORMAT_I2S**

I2S communication format I2S, correspond to **I2S_COMM_FORMAT_STAND_I2S**

enumerator **I2S_COMM_FORMAT_I2S_MSB**

I2S format MSB, (**I2S_COMM_FORMAT_I2S** || **I2S_COMM_FORMAT_I2S_MSB**) correspond to **I2S_COMM_FORMAT_STAND_I2S**

enumerator **I2S_COMM_FORMAT_I2S_LSB**

I2S format LSB, (**I2S_COMM_FORMAT_I2S** || **I2S_COMM_FORMAT_I2S_LSB**) correspond to **I2S_COMM_FORMAT_STAND_MSB**

enumerator **I2S_COMM_FORMAT_PCM**

I2S communication format PCM, correspond to **I2S_COMM_FORMAT_STAND_PCM_SHORT**

enumerator **I2S_COMM_FORMAT_PCM_SHORT**

PCM Short, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_SHORT) correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

enumerator **I2S_COMM_FORMAT_PCM_LONG**

PCM Long, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_LONG) correspond to I2S_COMM_FORMAT_STAND_PCM_LONG

enum **i2s_channel_fmt_t**

I2S channel format type.

Values:

enumerator **I2S_CHANNEL_FMT_RIGHT_LEFT**

Separated left and right channel

enumerator **I2S_CHANNEL_FMT_ALL_RIGHT**

Load right channel data in both two channels

enumerator **I2S_CHANNEL_FMT_ALL_LEFT**

Load left channel data in both two channels

enumerator **I2S_CHANNEL_FMT_ONLY_RIGHT**

Only load data in right channel (mono mode)

enumerator **I2S_CHANNEL_FMT_ONLY_LEFT**

Only load data in left channel (mono mode)

enum **i2s_mode_t**

I2S Mode.

Values:

enumerator **I2S_MODE_MASTER**

Master mode

enumerator **I2S_MODE_SLAVE**

Slave mode

enumerator **I2S_MODE_TX**

TX mode

enumerator **I2S_MODE_RX**

RX mode

enumerator **I2S_MODE_DAC_BUILT_IN**

Output I2S data to built-in DAC, no matter the data format is 16bit or 32 bit, the DAC module will only take the 8bits from MSB

enumerator **I2S_MODE_ADC_BUILT_IN**

Input I2S data from built-in ADC, each data can be 12-bit width at most

enumerator **I2S_MODE_PDM**

I2S PDM mode

enum **i2s_clock_src_t**

I2S source clock.

Values:

enumerator **I2S_CLK_D2CLK**

Clock from PLL_D2_CLK(160M)

enumerator **I2S_CLK_APLL**

Clock from APLL

enum **i2s_mclk_multiple_t**

The multiple of mclk to sample rate.

Values:

enumerator **I2S_MCLK_MULTIPLE_DEFAULT**

Default value. $mclk = sample_rate * 256$

enumerator **I2S_MCLK_MULTIPLE_128**

$mclk = sample_rate * 128$

enumerator **I2S_MCLK_MULTIPLE_256**

$mclk = sample_rate * 256$

enumerator **I2S_MCLK_MULTIPLE_384**

$mclk = sample_rate * 384$

enum **i2s_dac_mode_t**

I2S DAC mode for `i2s_set_dac_mode`.

备注: Built-in DAC functions are only supported on I2S0 for current ESP32 chip.

Values:

enumerator **I2S_DAC_CHANNEL_DISABLE**

Disable I2S built-in DAC signals

enumerator **I2S_DAC_CHANNEL_RIGHT_EN**

Enable I2S built-in DAC right channel, maps to DAC channel 1 on GPIO25

enumerator **I2S_DAC_CHANNEL_LEFT_EN**

Enable I2S built-in DAC left channel, maps to DAC channel 2 on GPIO26

enumerator **I2S_DAC_CHANNEL_BOTH_EN**

Enable both of the I2S built-in DAC channels.

enumerator **I2S_DAC_CHANNEL_MAX**

I2S built-in DAC mode max index

enum **i2s_pdm_dsr_t**

I2S PDM RX downsample mode.

Values:

enumerator **I2S_PDM_DSR_8S**

downsampling number is 8 for PDM RX mode

enumerator **I2S_PDM_DSR_16S**

downsampling number is 16 for PDM RX mode

enumerator **I2S_PDM_DSR_MAX**

enum **i2s_pdm_sig_scale_t**

Values:

enumerator **I2S_PDM_SIG_SCALING_DIV_2**

I2S TX PDM sigmadelta signal scaling: /2

enumerator **I2S_PDM_SIG_SCALING_MUL_1**

I2S TX PDM sigmadelta signal scaling: x1

enumerator **I2S_PDM_SIG_SCALING_MUL_2**

I2S TX PDM sigmadelta signal scaling: x2

enumerator **I2S_PDM_SIG_SCALING_MUL_4**

I2S TX PDM sigmadelta signal scaling: x4

2.3.7 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- `RGB LCD panel` - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- `Controller based LCD panel` involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.

Application Example

LCD examples are located under: [peripherals/lcd](#):

- Jpeg decoding and LCD display - [peripherals/lcd/tjpgd](#)
- LVGL porting and animation UI - [peripherals/lcd/lvgl](#)

API Reference

Header File

Enumerations

enum **lcd_clock_source_t**

LCD clock source.

备注: User should select the clock source based on the real requirement:

LCD clock source	Features	Power Management
LCD_CLK_SRC_PLL160M	High resolution	ESP_PM_APB_FREQ_MAX lock
LCD_CLK_SRC_PLL240M	High resolution	ESP_PM_APB_FREQ_MAX lock
LCD_CLK_SRC_APLL	Configurable resolution	ESP_PM_NO_LIGHT_SLEEP lock
LCD_CLK_SRC_XTAL	Medium resolution	No PM lock

Values:

enumerator **LCD_CLK_SRC_PLL160M**

Select PLL160M as the source clock

enumerator **LCD_CLK_SRC_PLL240M**

Select PLL240M as the source clock

enumerator **LCD_CLK_SRC_APLL**

Select APLL as the source clock

enumerator **LCD_CLK_SRC_XTAL**

Select XTAL as the source clock

enum **lcd_color_space_t**

LCD color space.

Values:

enumerator **LCD_COLOR_SPACE_RGB**

Color space: RGB

enumerator **LCD_COLOR_SPACE_YUV**

Color space: YUV

enum **lcd_color_range_t**

LCD color range.

Values:

enumerator **LCD_COLOR_RANGE_LIMIT**

Limited color range

enumerator **LCD_COLOR_RANGE_FULL**

Full color range

enum **lcd_yuv_sample_t**

YUV sampling method.

Values:

enumerator **LCD_YUV_SAMPLE_422**

YUV 4:2:2 sampling

enumerator **LCD_YUV_SAMPLE_420**

YUV 4:2:0 sampling

enumerator **LCD_YUV_SAMPLE_411**

YUV 4:1:1 sampling

enum **lcd_yuv_conv_std_t**

The standard used for conversion between RGB and YUV.

Values:

enumerator **LCD_YUV_CONV_STD_BT601**

YUV<->RGB conversion standard: BT.601

enumerator **LCD_YUV_CONV_STD_BT709**

YUV<->RGB conversion standard: BT.709

Type Definitions

typedef struct esp_lcd_panel_io_t ***esp_lcd_panel_io_handle_t**

Type of LCD panel IO handle

typedef struct esp_lcd_panel_t ***esp_lcd_panel_handle_t**

Type of LCD panel handle

Enumerations

enum **esp_lcd_color_space_t**

LCD color space type definition.

Values:

enumerator **ESP_LCD_COLOR_SPACE_RGB**

Color space: RGB

enumerator **ESP_LCD_COLOR_SPACE_BGR**

Color space: BGR

enumerator **ESP_LCD_COLOR_SPACE_MONOCHROME**

Color space: monochrome

Functions

esp_err_t **esp_lcd_panel_io_rx_param** (*esp_lcd_panel_io_handle_t* io, int lcd_cmd, void *param, size_t param_size)

Transmit LCD command and receive corresponding parameters.

备注: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

参数

- **io** **-[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** **-[in]** The specific LCD command, set to -1 if no command needed
- **param** **-[out]** Buffer for the command data
- **param_size** **-[in]** Size of param buffer

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if read is not supported by transport
- `ESP_OK` on success

esp_err_t **esp_lcd_panel_io_tx_param** (*esp_lcd_panel_io_handle_t* io, int lcd_cmd, const void *param, size_t param_size)

Transmit LCD command and corresponding parameters.

备注: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

参数

- **io** **-[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** **-[in]** The specific LCD command, set to -1 if no command needed

- **param** **-[in]** Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param_size** **-[in]** Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_panel_io_tx_color** (*esp_lcd_panel_io_handle_t* io, int lcd_cmd, const void *color, size_t color_size)

Transmit LCD RGB data.

备注: This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

参数

- **io** **-[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** **-[in]** The specific LCD command, set to -1 if no command needed
- **color** **-[in]** Buffer that holds the RGB color data
- **color_size** **-[in]** Size of `color` in memory, in bytes

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_panel_io_del** (*esp_lcd_panel_io_handle_t* io)

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

参数 **io** **-[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_panel_io_register_event_callbacks** (*esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_io_callbacks_t* *cbs, void *user_ctx)

Register LCD panel IO callbacks.

参数

- **io** **-[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **cbs** **-[in]** structure with all LCD panel IO callbacks
- **user_ctx** **-[in]** User private data, passed directly to callback's `user_ctx`

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_io_spi** (*esp_lcd_spi_bus_handle_t* bus, const *esp_lcd_panel_io_spi_config_t* *io_config, *esp_lcd_panel_io_handle_t* *ret_io)

Create LCD panel IO handle, for SPI interface.

参数

- **bus** **-[in]** SPI bus handle
- **io_config** **-[in]** IO configuration, for SPI interface
- **ret_io** **-[out]** Returned IO handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```
esp_err_t esp_lcd_new_panel_io_i2c (esp_lcd_i2c_bus_handle_t bus, const
                                     esp_lcd_panel_io_i2c_config_t *io_config,
                                     esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for I2C interface.

参数

- **bus** **–[in]** I2C bus handle
- **io_config** **–[in]** IO configuration, for I2C interface
- **ret_io** **–[out]** Returned IO handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```
esp_err_t esp_lcd_new_i80_bus (const esp_lcd_i80_bus_config_t *bus_config, esp_lcd_i80_bus_handle_t
                                 *ret_bus)
```

Create Intel 8080 bus handle.

参数

- **bus_config** **–[in]** Bus configuration
- **ret_bus** **–[out]** Returned bus handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_NOT_FOUND if no free bus is available
- ESP_OK on success

```
esp_err_t esp_lcd_del_i80_bus (esp_lcd_i80_bus_handle_t bus)
```

Destroy Intel 8080 bus handle.

参数 **bus** **–[in]** Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if there still be some device attached to the bus
- ESP_OK on success

```
esp_err_t esp_lcd_new_panel_io_i80 (esp_lcd_i80_bus_handle_t bus, const
                                     esp_lcd_panel_io_i80_config_t *io_config,
                                     esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO, for Intel 8080 interface.

参数

- **bus** **–[in]** Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`
- **io_config** **–[in]** IO configuration, for i80 interface
- **ret_io** **–[out]** Returned panel IO handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if some configuration can't be satisfied, e.g. pixel clock out of the range
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Structures

```
struct esp_lcd_panel_io_event_data_t
```

Type of LCD panel IO event data.

struct **esp_lcd_panel_io_callbacks_t**

Type of LCD panel IO callbacks.

Public Members

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

struct **esp_lcd_panel_io_spi_config_t**

Panel IO configuration structure, for SPI interface.

Public Members

int **cs_gpio_num**

GPIO used for CS line

int **dc_gpio_num**

GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

int **spi_mode**

Traditional SPI mode (0~3)

unsigned int **pclk_hz**

Frequency of pixel clock

size_t **trans_queue_depth**

Size of internal transaction queue

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

void ***user_ctx**

User private data, passed directly to `on_color_trans_done`'s `user_ctx`

int **lcd_cmd_bits**

Bit-width of LCD command

int **lcd_param_bits**

Bit-width of LCD parameter

unsigned int **dc_as_cmd_phase**

D/C line value is encoded into SPI transaction command phase

unsigned int **dc_low_on_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **octal_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **lsb_first**

transmit LSB bit first

struct *esp_lcd_panel_io_spi_config_t*::[anonymous] **flags**

Extra flags to fine-tune the SPI device

struct **esp_lcd_panel_io_i2c_config_t**

Panel IO configuration structure, for I2C interface.

Public Members

uint32_t **dev_addr**

I2C device address

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

void ***user_ctx**

User private data, passed directly to *on_color_trans_done*'s *user_ctx*

size_t **control_phase_bytes**

I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc_bit_offset**

Offset of the D/C selection bit in control phase

int **lcd_cmd_bits**

Bit-width of LCD command

int **lcd_param_bits**

Bit-width of LCD parameter

unsigned int **dc_low_on_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable_control_phase**

If this flag is enabled, the control phase isn't used

struct *esp_lcd_panel_io_i2c_config_t*::[anonymous] **flags**

Extra flags to fine-tune the I2C device

struct **esp_lcd_i80_bus_config_t**

LCD Intel 8080 bus configuration structure.

Public Members**int dc_gpio_num**

GPIO used for D/C line

int wr_gpio_num

GPIO used for WR line

lcd_clock_source_t **clk_src**

Clock source for the I80 LCD peripheral

int data_gpio_nums[(24)]

GPIOs used for data lines

size_t bus_width

Number of data lines, 8 or 16

size_t max_transfer_bytes

Maximum transfer size, this determines the length of internal DMA link

size_t psram_trans_align

DMA transfer alignment for data allocated from PSRAM

size_t sram_trans_align

DMA transfer alignment for data allocated from SRAM

struct **esp_lcd_panel_io_i80_config_t**

Panel IO configuration structure, for intel 8080 interface.

Public Members**int cs_gpio_num**

GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

unsigned int pclk_hz

Frequency of pixel clock

size_t trans_queue_depth

Transaction queue size, larger queue, higher throughput

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data was transferred done

void *user_ctxUser private data, passed directly to `on_color_trans_done`'s `user_ctx`**int lcd_cmd_bits**

Bit-width of LCD command

int **lcd_param_bits**
Bit-width of LCD parameter

unsigned int **dc_idle_level**
Level of DC line in IDLE phase

unsigned int **dc_cmd_level**
Level of DC line in CMD phase

unsigned int **dc_dummy_level**
Level of DC line in DUMMY phase

unsigned int **dc_data_level**
Level of DC line in DATA phase

struct *esp_lcd_panel_io_i80_config_t*::[anonymous] **dc_levels**
Each i80 device might have its own D/C control logic

unsigned int **cs_active_high**
If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int **reverse_color_bits**
Reverse the data bits, D[N:0] -> D[0:N]

unsigned int **swap_color_bytes**
Swap adjacent two color bytes

unsigned int **pclk_active_neg**
The display will write data lines when there's a falling edge on WR signal (a.k.a the PCLK)

unsigned int **pclk_idle_low**
The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

struct *esp_lcd_panel_io_i80_config_t*::[anonymous] **flags**
Panel IO config flags

Type Definitions

typedef void ***esp_lcd_spi_bus_handle_t**
Type of LCD SPI bus handle

typedef void ***esp_lcd_i2c_bus_handle_t**
Type of LCD I2C bus handle

typedef struct esp_lcd_i80_bus_t ***esp_lcd_i80_bus_handle_t**
Type of LCD intel 8080 bus handle

typedef bool (***esp_lcd_panel_io_color_trans_done_cb_t**)(*esp_lcd_panel_io_handle_t* panel_io, *esp_lcd_panel_io_event_data_t* *edata, void *user_ctx)
Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

Param panel_io [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
Param edata [in] Panel IO event data, fed by driver
Param user_ctx [in] User data, passed from `esp_lcd_panel_io_XXX_config_t`
Return Whether a high priority task has been waken up by this function

Header File

- `components/esp_lcd/include/esp_lcd_panel_ops.h`

Functions

esp_err_t **esp_lcd_panel_reset** (*esp_lcd_panel_handle_t* panel)

Reset LCD panel.

备注: Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

参数 panel **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_init** (*esp_lcd_panel_handle_t* panel)

Initialize LCD panel.

备注: Before calling this function, make sure the LCD panel has finished the reset stage by `esp_lcd_panel_reset()`.

参数 panel **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_del** (*esp_lcd_panel_handle_t* panel)

Deinitialize the LCD panel.

参数 panel **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_draw_bitmap** (*esp_lcd_panel_handle_t* panel, int x_start, int y_start, int x_end, int y_end, const void *color_data)

Draw bitmap on LCD panel.

参数

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_start** **-[in]** Start index on x-axis (x_start included)
- **y_start** **-[in]** Start index on y-axis (y_start included)
- **x_end** **-[in]** End index on x-axis (x_end not included)
- **y_end** **-[in]** End index on y-axis (y_end not included)
- **color_data** **-[in]** RGB color data that will be dumped to the specific window range

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_mirror** (*esp_lcd_panel_handle_t* panel, bool mirror_x, bool mirror_y)

Mirror the LCD panel on specific axis.

备注: Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

参数

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror_x** **–[in]** Whether the panel will be mirrored about the x axis
- **mirror_y** **–[in]** Whether the panel will be mirrored about the y axis

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_swap_xy** (*esp_lcd_panel_handle_t* panel, bool swap_axes)

Swap/Exchange x and y axis.

备注: Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

参数

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap_axes** **–[in]** Whether to swap the x and y axis

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_set_gap** (*esp_lcd_panel_handle_t* panel, int x_gap, int y_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

备注: Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

参数

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_gap** **–[in]** Extra gap on x axis, in pixels
- **y_gap** **–[in]** Extra gap on y axis, in pixels

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_invert_color** (*esp_lcd_panel_handle_t* panel, bool invert_color_data)

Invert the color (bit-wise invert the color data line)

参数

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert_color_data** **–[in]** Whether to invert the color data

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_disp_on_off** (*esp_lcd_panel_handle_t* panel, bool on_off)

Turn on or off the display.

参数

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on_off** **–[in]** True to turns on display, False to turns off display

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_disp_off** (*esp_lcd_panel_handle_t* panel, bool off)

Turn off the display.

Deprecated:

This function has similar functionality to `esp_lcd_panel_disp_on_off`.

参数

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** **–[in]** Whether to turn off the screen

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Create LCD panel for model NT35510.

参数

- **io** **–[in]** LCD panel IO handle
- **panel_dev_config** **–[in]** general panel device configuration
- **ret_panel** **–[out]** Returned LCD panel handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_ssd1306** (const *esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_dev_config_t* *panel_dev_config, *esp_lcd_panel_handle_t* *ret_panel)

Create LCD panel for model SSD1306.

参数

- **io** –[in] LCD panel IO handle
- **panel_dev_config** –[in] general panel device configuration
- **ret_panel** –[out] Returned LCD panel handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Structures

struct **esp_lcd_panel_dev_config_t**

Configuration structure for panel device.

Public Members

int **reset_gpio_num**

GPIO used to reset the LCD panel, set to -1 if it's not used

esp_lcd_color_space_t **color_space**

Set the color space used by the LCD panel

unsigned int **bits_per_pixel**

Color depth, in bpp

unsigned int **reset_active_high**

Setting this if the panel reset is high level active

struct *esp_lcd_panel_dev_config_t*::[anonymous] **flags**

LCD panel config flags

void ***vendor_config**

vendor specific configuration, optional, left as NULL if not used

2.3.8 LED PWM 控制器

概述

LED 控制器 (LEDC) 主要用于控制 LED，也可产生 PWM 信号用于其他设备的控制。该控制器有 16 路通道，可以产生独立的波形来驱动 RGB LED 等设备。

LEDC 通道共有两组，分别为 8 路高速通道和 8 路低速通道。高速通道模式在硬件中实现，可以自动且无干扰地改变 PWM 占空比。低速通道模式下，PWM 占空比需要由软件中的驱动器改变。每组通道都可以使用不同的时钟源。

LED PWM 控制器可在无需 CPU 干预的情况下自动改变占空比，实现亮度和颜色渐变。

功能概览

设置 LEDC 通道在高速模式或低速模式下运行，需要进行如下配置：

1. **定时器配置** 指定 PWM 信号的频率和占空比分辨率。
2. **通道配置** 绑定定时器和输出 PWM 信号的 GPIO。
3. **改变 PWM 信号** 输出 PWM 信号来驱动 LED。可通过软件控制或使用硬件渐变功能来改变 LED 的亮度。

另一个可选步骤是可以在渐变终端设置一个中断。

图 9: LED PWM 控制器 API 的关键配置

定时器配置 要设置定时器，可调用函数 `ledc_timer_config()`，并将包括如下配置参数的数据结构 `ledc_timer_config_t` 传递给该函数：

- 速度模式 `ledc_mode_t`
- 定时器索引 `ledc_timer_t`
- PWM 信号频率
- PWM 占空比分辨率

频率和占空比分辨率相互关联。PWM 频率越高，占空比分辨率越低，反之亦然。如果 API 不是用来改变 LED 亮度，而是用于其它目的，这种相互关系可能会很重要。更多信息详见 [频率和占空比分辨率支持范围](#) 一节。

通道配置 定时器设置好后，请配置所需的通道 (`ledc_channel_t` 之一)。配置通道需调用函数 `ledc_channel_config()`。

通道的配置与定时器设置类似，需向通道配置函数传递包括通道配置参数的结构体 `ledc_channel_config_t`。

此时，通道会按照 `ledc_channel_config_t` 的配置开始运作，并在选定的 GPIO 上生成由定时器设置指定的频率和占空比的 PWM 信号。在通道运作过程中，可以随时通过调用函数 `ledc_stop()` 将其暂停。

改变 PWM 信号 通道开始运行、生成具有恒定占空比和频率的 PWM 信号之后，有几种方式可以改变该信号。驱动 LED 时，主要通过改变占空比来变化光线亮度。

以下两节介绍了如何使用软件和硬件改变占空比。如有需要，PWM 信号的频率也可更改，详见 [改变 PWM 频率](#) 一节。

使用软件改变 PWM 占空比 调用函数 `ledc_set_duty()` 可以设置新的占空比。之后，调用函数 `ledc_update_duty()` 使新配置生效。要查看当前设置的占空比，可使用 `_get_` 函数 `ledc_get_duty()`。

另外一种设置占空比和其他通道参数的方式是调用 [通道配置](#) 一节提到的函数 `ledc_channel_config()`。

传递给函数的占空比数值范围取决于选定的 `duty_resolution`，应为 0 至 $(2 ** \text{duty_resolution})$ 。例如，如选定的占空比分辨率为 10，则占空比的数值范围为 0 至 1024。此时分辨率为 ~0.1%。

警告： 在 ESP32 上，当通道绑定的定时器配置了其最大 PWM 占空比分辨率 (`MAX_DUTY_RES`)，通道的占空比不能被设置到 $(2 ** \text{MAX_DUTY_RES})$ 。否则，硬件内部占空比计数器会溢出，并导致占空比计算错误。

使用硬件改变 PWM 占空比 LED PWM 控制器硬件可逐渐改变占空比的数值。要使用此功能，需用函数 `ledc_fade_func_install()` 使能渐变，之后用下列可用渐变函数之一配置：

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

最后需要调用 `ledc_fade_start()` 开启渐变。渐变可以在阻塞或非阻塞模式下运行，具体区别请查看 `ledc_fade_mode_t`。需要特别注意的是，不管在哪种模式下，下一次渐变或单次占空比配置的指令生效都必须等到前一次渐变结束。

此外，在使能渐变后，每个通道都可以额外通过调用 `ledc_cb_register()` 注册一个回调函数用以获得渐变完成的事件通知。回调函数的原型被定义在 `ledc_cb_t`。每个回调函数都应当返回一个布尔值给驱动的中断处理函数，用以表示是否有高优先级任务被其唤醒。此外，值得注意的是，由于驱动的中断处理函数被放在了 IRAM 中，回调函数和其调用的函数也需要被放在 IRAM 中。`ledc_cb_register()` 会检查回调函数及函数上下文的指针地址是否在正确的存储区域。

如不需要渐变和渐变中断，可用函数 `ledc_fade_func_uninstall()` 关闭。

改变 PWM 频率 LED PWM 控制器 API 有多种方式即时改变 PWM 频率：

- 通过调用函数 `ledc_set_freq()` 设置频率。可用函数 `ledc_get_freq()` 查看当前频率。
- 通过调用函数 `ledc_bind_channel_timer()` 将其他定时器绑定到该通道来改变频率和占空比分辨率。
- 通过调用函数 `ledc_channel_config()` 改变通道的定时器。

控制 PWM 的更多方式 有一些较底层的定时器特定函数可用于更改 PWM 设置：

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

前两个功能可通过函数 `ledc_channel_config()` 在后台运行，在定时器配置后启动。

使用中断 配置 LED PWM 控制器通道时，可在 `ledc_channel_config_t` 中选取参数 `ledc_intr_type_t`，在渐变完成时触发中断。

要注册处理程序来处理中断，可调用函数 `ledc_isr_register()`。

LED PWM 控制器高速和低速模式

高速模式的优点是可平稳地改变定时器设置。也就是说，高速模式下如定时器设置改变，此变更会自动应用于定时器的下一次溢出中断。而更新低速定时器时，设置变更应由软件显式触发。LED PWM 驱动的设置将在硬件层面被修改，比如在调用函数 `ledc_timer_config()` 或 `ledc_timer_set()` 时。

更多关于速度模式的详细信息请参阅 *ESP32 技术参考手册 > LED PWM 控制器 (LEDC) [PDF]*。注意，该手册中提到的支持 SLOW_CLOCK 暂不适用于 LED PWM 驱动。

频率和占空比分辨率支持范围

LED PWM 控制器主要用于驱动 LED。该控制器 PWM 占空比设置的分辨率范围较广。比如，PWM 频率为 5 kHz 时，占空比分辨率最大可为 13 位。这意味着占空比可为 0 至 100% 之间的任意值，分辨率为 ~0.012% ($2^{13} = 8192$ LED 亮度的离散电平)。然而，这些参数取决于为 LED PWM 控制器定时器计时的时钟信号，LED PWM 控制器为通道提供时钟（具体可参考[定时器配置](#)和 *ESP32 技术参考手册 > LED PWM 计时器 (LEDC) [PDF]*）。

LED PWM 控制器可用于生成频率较高的信号，足以为数码相机模组等其他设备提供时钟。此时，最大频率可为 40 MHz，占空比分辨率为 1 位。也就是说，占空比固定为 50%，无法调整。

LED PWM 控制器 API 会在设定的频率和占空比分辨率超过 LED PWM 控制器硬件范围时报错。例如，试图将频率设置为 20 MHz、占空比分辨率设置为 3 位时，串行端口监视器上会报告如下错误：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪reducing freq_hz or duty_resolution. div_param=128
```

此时，占空比分辨率或频率必须降低。比如，将占空比分辨率设置为 2 会解决这一问题，让占空比设置为 25% 的倍数，即 25%、50% 或 75%。

如设置的频率和占空比分辨率低于所支持的最低值，LED PWM 驱动器也会反映并报告，如：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪increasing freq_hz or duty_resolution. div_param=128000000
```

占空比分辨率通常用 `ledc_timer_bit_t` 设置，范围是 10 至 15 位。如需较低的占空比分辨率（上至 10，下至 1），可直接输入相应数值。

应用实例

使用 LEDC 改变占空比和渐变控制的实例请参照 [peripherals/ledc/ledc_fade](#)。

使用 LEDC 基本实例请参照 [peripherals/ledc/ledc_basic](#)。

API 参考

Header File

- [components/driver/include/driver/ledc.h](#)

Functions

esp_err_t **ledc_channel_config** (const *ledc_channel_config_t* *ledc_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

参数 ledc_conf –Pointer of LEDC channel configure struct

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_timer_config** (const *ledc_timer_config_t* *timer_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

参数 timer_conf –Pointer of LEDC timer configure struct

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

esp_err_t **ledc_update_duty** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC update channel parameters.

备注: Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

备注: `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_set_pin** (int gpio_num, *ledc_mode_t* speed_mode, *ledc_channel_t* ledc_channel)

Set LEDC output gpio.

Deprecated:

This function is redundant, please use `ledc_channel_config` to set gpio pins.

参数

- **gpio_num** –The LEDC output gpio
- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc_channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_stop** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t idle_level)

LEDC stop. Disable LEDC output, and set idle level.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*
- **idle_level** –Set output idle level after LEDC stops.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_set_freq** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_num, uint32_t freq_hz)

LEDC set channel frequency (Hz)

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** –LEDC timer index (0-3), select from *ledc_timer_t*
- **freq_hz** –Set the LEDC frequency

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

uint32_t **ledc_get_freq** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_num)

LEDC get channel frequency (Hz)

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** –LEDC timer index (0-3), select from *ledc_timer_t*

返回

- 0 error
- Others Current LEDC frequency

esp_err_t **ledc_set_duty_with_hpoint** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, uint32_t hpoint)

LEDC set duty and hpoint value Only after calling *ledc_update_duty* will the duty update.

备注: *ledc_set_duty*, *ledc_set_duty_with_hpoint* and *ledc_update_duty* are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is *ledc_set_duty_and_update*

备注: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- **hpoint** –Set the LEDC hpoint value, the range is [0, (2**duty_resolution)-1]

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

int **ledc_get_hpoint** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC get hpoint value, the counter value when the output is set high level.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*

返回

- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

esp_err_t **ledc_set_duty** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call *ledc_set_duty_with_hpoint*. only after calling *ledc_update_duty* will the duty update.

备注: *ledc_set_duty*, *ledc_set_duty_with_hpoint* and *ledc_update_duty* are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is *ledc_set_duty_and_update*.

备注: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

uint32_t **ledc_get_duty** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling *ledc_update_duty*, because duty update doesn't take effect until the next cycle.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*

返回

- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

esp_err_t **ledc_set_fade** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, *ledc_duty_direction_t* fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)

LEDC set gradient Set LEDC gradient, After the function calls the *ledc_update_duty* function, the function can take effect.

备注: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **duty** –Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution)]
- **fade_direction** –Set the direction of the gradient
- **step_num** –Set the number of the gradient
- **duty_cycle_num** –Set how many LEDC tick each time the gradient lasts
- **duty_scale** –Set gradient change amplitude

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t ledc_isr_register` (void (*fn)(void*), void *arg, int intr_alloc_flags, `ledc_isr_handle_t` *handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

参数

- **fn** –Interrupt handler function.
- **arg** –User-supplied argument passed to the handler function.
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Failed to find available interrupt source

`esp_err_t ledc_timer_set` (`ledc_mode_t` speed_mode, `ledc_timer_t` timer_sel, uint32_t clock_divider, uint32_t duty_resolution, `ledc_clk_src_t` clk_src)

Configure LEDC settings.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –Timer index (0-3), there are 4 timers in LEDC module
- **clock_divider** –Timer clock divide value, the timer clock is divided from the selected clock source
- **duty_resolution** –Resolution of duty setting in number of bits. The range is [1, SOC_LEDC_TIMER_BIT_WIDTH]
- **clk_src** –Select LEDC source clock.

返回

- (-1) Parameter error
- Other Current LEDC duty

`esp_err_t ledc_timer_rst` (`ledc_mode_t` speed_mode, `ledc_timer_t` timer_sel)

Reset LEDC timer.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –LEDC timer index (0-3), select from `ledc_timer_t`

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_timer_pause** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Pause LEDC timer counter.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –LEDC timer index (0-3), select from *ledc_timer_t*

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_timer_resume** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Resume LEDC timer.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –LEDC timer index (0-3), select from *ledc_timer_t*

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_bind_channel_timer** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_timer_t* timer_sel)

Bind LEDC channel with the selected timer.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*
- **timer_sel** –LEDC timer index (0-3), select from *ledc_timer_t*

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_set_fade_with_step** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)

Set LEDC fade function.

备注: Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

备注: `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

备注: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** –Target duty of fading [0, (2**duty_resolution)]
- **scale** –Controls the increase or decrease step scale.
- **cycle_num** –increase or decrease the duty every cycle_num cycles

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

`esp_err_t ledc_set_fade_with_time` (`ledc_mode_t` speed_mode, `ledc_channel_t` channel, `uint32_t` target_duty, `int` max_fade_time_ms)

Set LEDC fade function, with a limited time.

备注: Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

备注: `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

备注: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** –Target duty of fading [0, (2**duty_resolution)]
- **max_fade_time_ms** –The maximum time of the fading (ms).

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

`esp_err_t ledc_fade_func_install` (`int` intr_alloc_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

参数 `intr_alloc_flags` –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Intr flag error
- ESP_ERR_NOT_FOUND Failed to find available interrupt source
- ESP_ERR_INVALID_STATE Fade function already installed

`void ledc_fade_func_uninstall` (`void`)

Uninstall LEDC fade function.

esp_err_t **ledc_fade_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_fade_mode_t* fade_mode)

Start LEDC fading.

备注: Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

备注: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel number
- **fade_mode** –Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized or fade function not installed.
- `ESP_ERR_INVALID_ARG` Parameter error.

esp_err_t **ledc_set_duty_and_update** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, `uint32_t` duty, `uint32_t` hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

备注: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2**`duty_resolution`)]
- **hpoint** –Set the LEDC hpoint value, the range is [0, (2**`duty_resolution`)-1]

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Fade function init error

esp_err_t **ledc_set_fade_time_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, `uint32_t` target_duty, `uint32_t` max_fade_time_ms, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

备注: Call `ledc_fade_func_install()` once, before calling this function.

备注: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped.

Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** –Target duty of fading [0, (2**duty_resolution)]
- **max_fade_time_ms** –The maximum time of the fading (ms).
- **fade_mode** –choose blocking or non-blocking mode

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_step_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function.

备注: Call `ledc_fade_func_install()` once before calling this function.

备注: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** –Target duty of fading [0, (2**duty_resolution)]
- **scale** –Controls the increase or decrease step scale.
- **cycle_num** –increase or decrease the duty every cycle_num cycles
- **fade_mode** –choose blocking or non-blocking mode

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_cb_register** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_cbs_t* *cbs, void *user_arg)

LEDC callback registration function.

备注: The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **cbs** –Group of LEDC callback functions
- **user_arg** –user registered data for the callback function

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_FAIL` Fade function init error

Structures

struct `ledc_channel_config_t`

Configuration parameters of LEDC channel for `ledc_channel_config` function.

Public Members

int `gpio_num`

the LEDC output `gpio_num`, if you want to use `gpio16`, `gpio_num = 16`

`ledc_mode_t` `speed_mode`

LEDC speed `speed_mode`, high-speed mode (only exists on esp32) or low-speed mode

`ledc_channel_t` `channel`

LEDC channel (0 - 7)

`ledc_intr_type_t` `intr_type`

configure interrupt, Fade interrupt enable or Fade interrupt disable

`ledc_timer_t` `timer_sel`

Select the timer source of channel (0 - 3)

uint32_t `duty`

LEDC channel duty, the range of duty setting is $[0, (2^{**duty_resolution})]$

int `hpoint`

LEDC channel `hpoint` value, the range is $[0, (2^{**duty_resolution})-1]$

unsigned int `output_invert`

Enable (1) or disable (0) `gpio` output invert

struct `ledc_channel_config_t::[anonymous]` `flags`

LEDC flags

struct `ledc_timer_config_t`

Configuration parameters of LEDC Timer `timer` for `ledc_timer_config` function.

Public Members

***ledc_mode_t* speed_mode**

LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

***ledc_timer_bit_t* duty_resolution**

LEDC channel duty resolution

***ledc_timer_bit_t* bit_num**

Deprecated in ESP-IDF 3.0. This is an alias to ‘duty_resolution’ for backward compatibility with ESP-IDF 2.1

***ledc_timer_t* timer_num**

The timer source of channel (0 - 3)

uint32_t freq_hz

LEDC timer frequency (Hz)

***ledc_clk_cfg_t* clk_cfg**

Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using LEDC_USE_REF_TICK, LEDC_USE_APB_CLK or LEDC_AUTO_CLK. For low speed channels, you can also specify the source clock using LEDC_USE_RTC8M_CLK, in this case, all low speed channel’s source clock must be RTC8M_CLK

struct **ledc_cb_param_t**

LEDC callback parameter.

Public Members***ledc_cb_event_t* event**

Event name

uint32_t speed_mode

Speed mode of the LEDC channel group

uint32_t channel

LEDC channel (0 - LEDC_CHANNEL_MAX-1)

uint32_t duty

LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution)]

struct **ledc_cbs_t**

Group of supported LEDC callbacks.

备注: The callbacks are all running under ISR environment

Public Members***ledc_cb_t* fade_cb**

LEDC fade_end callback function

Macros

`LEDC_APB_CLK_HZ`

`LEDC_REF_CLK_HZ`

`LEDC_ERR_DUTY`

`LEDC_ERR_VAL`

Type Definitions

typedef *intr_handle_t* `ledc_isr_handle_t`

typedef bool (*`ledc_cb_t`)(const *ledc_cb_param_t* *param, void *user_arg)

Type of LEDC event callback.

Param param LEDC callback parameter

Param user_arg User registered data

Return Whether a high priority task has been waken up by this function

Enumerations

enum `ledc_cb_event_t`

LEDC callback event type.

Values:

enumerator `LEDC_FADE_END_EVT`

LEDC fade end event

Header File

- [components/hal/include/hal/ledc_types.h](#)

Enumerations

enum `ledc_mode_t`

Values:

enumerator `LEDC_HIGH_SPEED_MODE`

LEDC high speed speed_mode

enumerator `LEDC_LOW_SPEED_MODE`

LEDC low speed speed_mode

enumerator `LEDC_SPEED_MODE_MAX`

LEDC speed limit

enum `ledc_intr_type_t`

Values:

enumerator **LEDC_INTR_DISABLE**

Disable LEDC interrupt

enumerator **LEDC_INTR_FADE_END**

Enable LEDC interrupt

enumerator **LEDC_INTR_MAX**

enum **ledc_duty_direction_t**

Values:

enumerator **LEDC_DUTY_DIR_DECREASE**

LEDC duty decrease direction

enumerator **LEDC_DUTY_DIR_INCREASE**

LEDC duty increase direction

enumerator **LEDC_DUTY_DIR_MAX**

enum **ledc_slow_clk_sel_t**

Values:

enumerator **LEDC_SLOW_CLK_RTC8M**

LEDC low speed timer clock source is 8MHz RTC clock

enumerator **LEDC_SLOW_CLK_APB**

LEDC low speed timer clock source is 80MHz APB clock

enum **ledc_clk_cfg_t**

In theory, the following enumeration shall be placed in LEDC driver's header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

Values:

enumerator **LEDC_AUTO_CLK**

The driver will automatically select the source clock(REF_TICK or APB) based on the giving resolution and duty parameter when init the timer

enumerator **LEDC_USE_APB_CLK**

LEDC timer select APB clock as source clock

enumerator **LEDC_USE_RTC8M_CLK**

LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

enumerator **LEDC_USE_REF_TICK**

LEDC timer select REF_TICK clock as source clock

enum **ledc_clk_src_t**

Values:

enumerator **LEDC_REF_TICK**

LEDC timer clock divided from reference tick (1Mhz)

enumerator **LEDC_APB_CLK**

LEDC timer clock divided from APB clock (80Mhz)

enumerator **LEDC_SCLK**

Selecting this value for **LEDC_TICK_SEL_TIMER** let the hardware take its source clock from **LEDC_APB_CLK_SEL**

enum **ledc_timer_t**

Values:

enumerator **LEDC_TIMER_0**

LEDC timer 0

enumerator **LEDC_TIMER_1**

LEDC timer 1

enumerator **LEDC_TIMER_2**

LEDC timer 2

enumerator **LEDC_TIMER_3**

LEDC timer 3

enumerator **LEDC_TIMER_MAX**

enum **ledc_channel_t**

Values:

enumerator **LEDC_CHANNEL_0**

LEDC channel 0

enumerator **LEDC_CHANNEL_1**

LEDC channel 1

enumerator **LEDC_CHANNEL_2**

LEDC channel 2

enumerator **LEDC_CHANNEL_3**

LEDC channel 3

enumerator **LEDC_CHANNEL_4**

LEDC channel 4

enumerator **LEDC_CHANNEL_5**

LEDC channel 5

enumerator **LEDC_CHANNEL_6**

LEDC channel 6

enumerator **LEDC_CHANNEL_7**

LEDC channel 7

enumerator **LEDC_CHANNEL_MAX**

enum **ledc_timer_bit_t**

Values:

enumerator **LEDC_TIMER_1_BIT**

LEDC PWM duty resolution of 1 bits

enumerator **LEDC_TIMER_2_BIT**

LEDC PWM duty resolution of 2 bits

enumerator **LEDC_TIMER_3_BIT**

LEDC PWM duty resolution of 3 bits

enumerator **LEDC_TIMER_4_BIT**

LEDC PWM duty resolution of 4 bits

enumerator **LEDC_TIMER_5_BIT**

LEDC PWM duty resolution of 5 bits

enumerator **LEDC_TIMER_6_BIT**

LEDC PWM duty resolution of 6 bits

enumerator **LEDC_TIMER_7_BIT**

LEDC PWM duty resolution of 7 bits

enumerator **LEDC_TIMER_8_BIT**

LEDC PWM duty resolution of 8 bits

enumerator **LEDC_TIMER_9_BIT**

LEDC PWM duty resolution of 9 bits

enumerator **LEDC_TIMER_10_BIT**

LEDC PWM duty resolution of 10 bits

enumerator **LEDC_TIMER_11_BIT**

LEDC PWM duty resolution of 11 bits

enumerator **LEDC_TIMER_12_BIT**

LEDC PWM duty resolution of 12 bits

enumerator **LEDC_TIMER_13_BIT**
LEDC PWM duty resolution of 13 bits

enumerator **LEDC_TIMER_14_BIT**
LEDC PWM duty resolution of 14 bits

enumerator **LEDC_TIMER_15_BIT**
LEDC PWM duty resolution of 15 bits

enumerator **LEDC_TIMER_16_BIT**
LEDC PWM duty resolution of 16 bits

enumerator **LEDC_TIMER_17_BIT**
LEDC PWM duty resolution of 17 bits

enumerator **LEDC_TIMER_18_BIT**
LEDC PWM duty resolution of 18 bits

enumerator **LEDC_TIMER_19_BIT**
LEDC PWM duty resolution of 19 bits

enumerator **LEDC_TIMER_20_BIT**
LEDC PWM duty resolution of 20 bits

enumerator **LEDC_TIMER_BIT_MAX**

enum **ledc_fade_mode_t**

Values:

enumerator **LEDC_FADE_NO_WAIT**
LEDC fade function will return immediately

enumerator **LEDC_FADE_WAIT_DONE**
LEDC fade function will block until fading to the target duty

enumerator **LEDC_FADE_MAX**

2.3.9 Motor Control Pulse Width Modulator (MCPWM)

ESP32 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.

Further in documentation the outputs of a single unit are labeled `PWMxA` / `PWMxB`.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as `SYNC SIGNALS`, detect `FAULT SIGNALS` like motor overcurrent or overvoltage, as well as obtain feedback with `CAPTURE SIGNALS` on e.g. a rotor position.

Description of this API starts with configuration of MCPWM's **Timer** and **Generator** submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a **Fault Handler**, signal **Capture** and **Carrier**.

图 10: MCPWM Overview

图 11: MCPWM Block Diagram

Contents

- *Configure* a basic functionality of the outputs
- *Operate* the outputs to drive a motor
- *Adjust* how the motor is driven
- *Synchronize* sync timers to work together
- *Capture* external signals to provide additional control over the outputs
- Use *Fault Handler* to detect and manage faults
- Add a higher frequency *Carrier*, if output signals are passed through an isolation transformer
- Extra configuration of *Resolution*.

Configure

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM's resources. An example circuit is shown below. It includes a **H-Bridge** to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

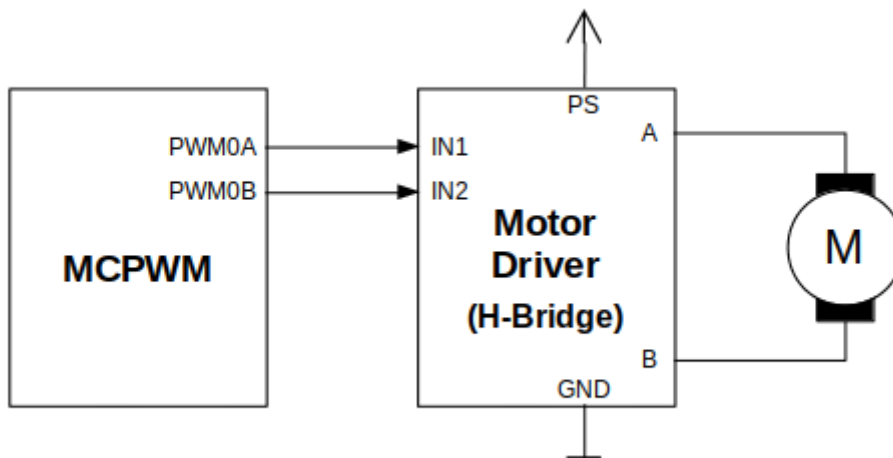

图 12: Example of Brushed DC Motor Control with MCPWM

Configuration covers the following steps:

1. Selection of a MCPWM unit that will be used to drive the motor. There are two units available on-board of ESP32 and enumerated in `mcpwm_unit_t`.
2. Initialization of two GPIOs as output signals within selected unit by calling `mcpwm_gpio_init()`. The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in `mcpwm_io_signals_t`. To set more than a single pin at a time, use function `mcpwm_set_pin()` together with `mcpwm_pin_config_t`.
3. Selection of a timer. There are three timers available within the unit. The timers are listed in `mcpwm_timer_t`.
4. Setting of the timer frequency and initial duty within `mcpwm_config_t` structure.
5. Setting timer resolution if necessary, by calling `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`
6. Calling of `mcpwm_init()` with the above parameters to make the configuration effective.

Operate

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit's outputs. The outputs are organized into three pairs. Within a pair they are labeled "A" and "B" and each driven by a submodule called an "Generator". To provide a PWM signal, the Operator itself, which contains two Generator, should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.
- To vary PWM's duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section *Configure*, and selecting one of options from `mcpwm_duty_type_t`.

备注: Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.

Adjust

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.
- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the *block diagram* of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_configure()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

备注: Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_configure()` or `mcpwm_sync_disable()`.

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section *Configure*, and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated, see *ESP32 Technical Reference Manual > Motor Control PWM (MCPWM)* [PDF].

Synchronize

Each PWM timer has a synchronization input and a synchronization output. The synchronization input can be selected from other timers' synchronization outputs or GPIO signals via the GPIO matrix. Timer' s synchronization signal can be generated from either the input sync signal or when the count value reaches peak/zero. Thus, the PWM timers can be chained together with their phase-locked. During synchronization, the PWM timer clock prescaler will reset its counter in order to synchronize the PWM timer clock.

The functionality is enabled in following steps:

1. Make sure the PWM timer and operator are already configured so that sync will inherit its config (count mode, freq and duty).
2. Enabling sync input of the timer by invoking `mcpwm_sync_configure()`, selecting desired signal input from `mcpwm_sync_signal_t`, and setting the desired phase range from 0 to 999 which is mapped to 0%~99.9%. 0 means zero phase is applied and output is fired at the same time. And selecting desired counting direction.
3. Enabling one of sync event source from another timer or from external GPIO input.

To sync with another timer:

Enabling sync output of another timer by invoking `mcpwm_set_timer_sync_output()` and selecting desired event to generate sync output from `mcpwm_timer_sync_trigger_t`.

To sync with GPIO positive edge input (negative edge requires `mcpwm_sync_invert_gpio_synchro()`):

Configuring GPIOs to act as the sync signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, which were described in section *Configure*.

It' s normal condition that chained sync signal may have tens or even hundreds of nanoseconds of delay between each timer output due to hardware limitation. To sync two timers accurately it is required to have the third timer occupied to produce sync event that can be consumed parallel by other two timer, so that those two timer will have no delay between each other but have the same delay between the timer which provides events. Another solution is introducing an external GPIO event source so that all three timers can be synced together with no delay.

If not required anymore, the capture functionality may be disabled with `mcpwm_sync_disable()`.

Capture

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal' s edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section *Configure*.
2. Enabling of the functionality itself by invoking `mcpwm_capture_enable_channel()`, selecting desired signal input from `mcpwm_capture_channel_id_t`, setting the signal edge, signal count prescaler and user callback within `mcpwm_capture_config_t`

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer' s value is stored in time-stamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`. Those data are also provided inside callback function as event data `cap_event_data_t`

If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable_channel()`.

Capture prescale is different from other modules as it is applied to the input signal, not the timer source. Prescaler has maintained its own level state with the initial value set to low and is detecting the positive edge of the input signal to change its internal state. That means if two pairs of positive and negative edges are passed to input, the prescaler' s internal state will change twice. ISR will report on this internal state change, not the input signal.

图 13: Example of Brushless DC Motor Control with MCPWM

For example, setting prescale to 2 will generate ISR callback on each positive edge of input if both edge is selected via `mcpwm_capture_config_t`. Or each 2 positive edges of input if only one edge is selected through `mcpwm_capture_config_t`.

Fault Handler

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output
- set the output low
- set the output high
- toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.
2. Initialization of the fault handler by calling either `mcpwm_fault_set_one_shot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
 - State of MCPWM unit will be locked until reset - `mcpwm_fault_set_one_shot_mode()`.
 - The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`.

Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

Carrier

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then altered at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the career with `mcpwm_carrier_oneshot_mode_enable()`. For more details, see *ESP32 Technical Reference Manual > Motor Control PWM (MCPWM) > PWM Carrier Submodule* [PDF].

To disable carrier functionality call `mcpwm_carrier_disable()`.

Interrupts

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`. Note if `mcpwm_capture_enable_channel()` is used then a default ISR routine will be installed hence please do not call this function to register any more.

Resolution

The default resolution for MCPWM group and MCPWM timer are configured to **10MHz** and **1MHz** in `mcpwm_init()`, which might be not enough for some applications. The driver also provides two APIs that can be used to override the default resolution: `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.

Note that, these two APIs won't update the frequency and duty automatically, to achieve that, one has to call `mcpwm_set_frequency()` and `mcpwm_set_duty()` accordingly.

To get PWM pulse that is below 15Hz, please set the resolution to a lower value. For high frequency PWM with limited step range, please set them with higher value.

Application Example

MCPWM example are located under: [peripherals/mcpwm](#):

- Control of BLDC (brushless DC) motor with hall sensor feedback - [peripherals/mcpwm/mcpwm_bldc_hall_control](#)
- Brushed DC motor control - [peripherals/mcpwm/mcpwm_brushed_dc_control](#)
- Servo motor control - [peripherals/mcpwm/mcpwm_servo_control](#)

Enumerations

enum **mcpwm_timer_direction_t**

Values:

enumerator **MCPWM_TIMER_DIRECTION_UP**

Counting direction: Increase

enumerator **MCPWM_TIMER_DIRECTION_DOWN**

Counting direction: Decrease

enum **mcpwm_timer_event_t**

Values:

enumerator **MCPWM_TIMER_EVENT_ZERO**

MCPWM timer counts to zero

enumerator **MCPWM_TIMER_EVENT_PEAK**

MCPWM timer counts to peak

enum **mcpwm_timer_count_mode_t**

Values:

enumerator **MCPWM_TIMER_COUNT_MODE_PAUSE**

MCPWM timer paused

enumerator **MCPWM_TIMER_COUNT_MODE_UP**

MCPWM timer counting up

enumerator **MCPWM_TIMER_COUNT_MODE_DOWN**

MCPWM timer counting down

enumerator **MCPWM_TIMER_COUNT_MODE_UP_DOWN**

MCPWM timer counting up and down

enum **mcpwm_timer_execute_cmd_t**

Values:

enumerator **MCPWM_TIMER_STOP_AT_ZERO**

MCPWM timer stops when counting to zero

enumerator **MCPWM_TIMER_STOP_AT_PEAK**

MCPWM timer stops when counting to peak

enumerator **MCPWM_TIMER_START_NO_STOP**

MCPWM timer starts counting

enumerator **MCPWM_TIMER_START_STOP_AT_ZERO**

MCPWM timer starts counting and stops when counting to zero

enumerator **MCPWM_TIMER_START_STOP_AT_PEAK**

MCPWM timer starts counting and stops when counting to peak

enum **mcpwm_generator_action_t**

Values:

enumerator **MCPWM_GEN_ACTION_KEEP**

Generator action: Keep the same level

enumerator **MCPWM_GEN_ACTION_LOW**

Generator action: Force to low level

enumerator **MCPWM_GEN_ACTION_HIGH**

Generator action: Force to high level

enumerator **MCPWM_GEN_ACTION_TOGGLE**

Generator action: Toggle level

enum **mcpwm_trip_type_t**

Values:

enumerator **MCPWM_TRIP_TYPE_CBC**

CBC trip type, shut down the operator cycle by cycle

enumerator **MCPWM_TRIP_TYPE_OST**

OST trip type, shut down the operator in one shot

Functions

esp_err_t **mcpwm_gpio_init** (*mcpwm_unit_t* mcpwm_num, *mcpwm_io_signals_t* io_signal, int gpio_num)

This function initializes each gpio signal for MCPWM.

备注: This function initializes one gpio at a time.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **io_signal** –set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(SYNC_X, FAULT_X, CAP_X) ‘X’ is timer_num(0-2)
- **gpio_num** –set this to configure gpio for MCPWM, if you want to use gpio16, gpio_num = 16

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_set_pin** (*mcpwm_unit_t* mcpwm_num, const *mcpwm_pin_config_t* *mcpwm_pin)

Initialize MCPWM gpio structure.

备注: This function initialize a group of MCPWM GPIOs at a time.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **mcpwm_pin** –MCPWM pin structure

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_init** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, const *mcpwm_config_t* *mcpwm_conf)

Initialize MCPWM parameters.

备注: The default resolution configured for MCPWM group and timer are $160\text{M} / 16 = 10\text{M}$ and $10\text{M} / 10 = 1\text{M}$. The default resolution can be changed by calling `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`, before calling this function.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers.
- **mcpwm_conf** –configure structure *mcpwm_config_t*

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_group_set_resolution** (*mcpwm_unit_t* mcpwm_num, unsigned long int resolution)

Set resolution of the MCPWM group.

备注: This will override default resolution of group(=10,000,000). This WILL NOT automatically update frequency and duty. Call `mcpwm_set_frequency()` and `mcpwm_set_duty()` manually to set them back. The group resolution must be an integral multiple of timer resolution.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **resolution** –set expected frequency resolution

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_timer_set_resolution** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, unsigned long int resolution)

Set resolution of each timer.

备注: This WILL override default resolution of timer(=1,000,000). This WILL NOT automatically update frequency and duty. Call `mcpwm_set_frequency()` and `mcpwm_set_duty()` manually to set them back. The

group resolution must be an integral multiple of timer resolution.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **resolution** –set expected frequency resolution

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_set_frequency** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, uint32_t frequency)

Set frequency(in Hz) of MCPWM timer.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **frequency** –set the frequency in Hz of each timer

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_set_duty** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_generator_t* gen, float duty)

Set duty cycle of each operator(MCPWMXA/MCPWMXB)

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- **duty** –set duty cycle in % (i.e for 62.3% duty cycle, duty = 62.3) of each operator

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_set_duty_in_us** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_generator_t* gen, uint32_t duty_in_us)

Set duty cycle of each operator(MCPWMXA/MCPWMXB) in us.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected
- **duty_in_us** –set duty value in microseconds of each operator

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_set_duty_type** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_generator_t* gen, *mcpwm_duty_type_t* duty_type)

Set duty either active high or active low(out of phase/inverted)

备注: Call this function every time after `mcpwm_set_signal_high` or `mcpwm_set_signal_low` to resume with previously set duty cycle

参数

- **mcpwm_num** –set MCPWM unit(0-1)

- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected
- **duty_type** –set active low or active high duty type

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

uint32_t **mcpwm_get_frequency** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num)

Get frequency of timer.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

返回

- frequency of timer

float **mcpwm_get_duty** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_operator_t* gen)

Get duty cycle of each operator.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

返回

- duty cycle in % of each operator(56.7 means duty is 56.7%)

uint32_t **mcpwm_get_duty_in_us** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_operator_t* gen)

Get duty cycle of each operator in us.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

返回

- duty cycle in us of each operator

esp_err_t **mcpwm_set_signal_high** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_generator_t* gen)

Use this function to set MCPWM signal high.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_set_signal_low** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_generator_t* gen)

Use this function to set MCPWM signal low.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **gen** –set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_start** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num)

Start MCPWM signal on timer 'x' .

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_stop** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num)

Start MCPWM signal on timer 'x' .

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_carrier_init** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, const *mcpwm_carrier_config_t* *carrier_conf)

Initialize carrier configuration.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **carrier_conf** –configure structure *mcpwm_carrier_config_t*

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_carrier_enable** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num)

Enable MCPWM carrier submodule, for respective timer.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_carrier_disable** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num)

Disable MCPWM carrier submodule, for respective timer.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_carrier_set_period** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, uint8_t carrier_period)

Set period of carrier.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **carrier_period** –set the carrier period of each timer, carrier period = (carrier_period + 1)*800ns (carrier_period <= 15)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_carrier_set_duty_cycle** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, uint8_t carrier_duty)

Set duty_cycle of carrier.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **carrier_duty** –set duty_cycle of carrier , carrier duty cycle = carrier_duty*12.5% (chop_duty <= 7)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_carrier_oneshot_mode_enable** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, uint8_t pulse_width)

Enable and set width of first pulse in carrier oneshot mode.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **pulse_width** –set pulse width of first pulse in oneshot mode, width = (carrier period)*(pulse_width + 1) (pulse_width <= 15)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_carrier_oneshot_mode_disable** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num)

Disable oneshot mode, width of first pulse = carrier period.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_carrier_output_invert** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_carrier_out_ivt_t* carrier_ivt_mode)

Enable or disable carrier output inversion.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **carrier_ivt_mode** –enable or disable carrier output inversion

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_deadtime_enable** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_deadtime_type_t* dt_mode, uint32_t red, uint32_t fed)

Enable and initialize deadtime for each MCPWM timer.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **dt_mode** –set deadtime mode
- **red** –set rising edge delay = red*100ns
- **fed** –set rising edge delay = fed*100ns

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_deadtime_disable** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num)

Disable deadtime on MCPWM timer.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_fault_init** (*mcpwm_unit_t* mcpwm_num, *mcpwm_fault_input_level_t* input_level, *mcpwm_fault_signal_t* fault_sig)

Initialize fault submodule, currently low level triggering is not supported.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **input_level** –set fault signal level, which will cause fault to occur
- **fault_sig** –set the fault pin, which needs to be enabled

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_fault_set_oneshot_mode** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_fault_signal_t* fault_sig, *mcpwm_output_action_t* action_on_pwmxa, *mcpwm_output_action_t* action_on_pwmxb)

Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

备注: currently low level triggering is not supported

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **fault_sig** –set the fault pin, which needs to be enabled for oneshot mode
- **action_on_pwmxa** –action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- **action_on_pwmxb** –action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_fault_set_cyc_mode** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_fault_signal_t* fault_sig, *mcpwm_output_action_t* action_on_pwmxa, *mcpwm_output_action_t* action_on_pwmxb)

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

备注: currently low level triggering is not supported

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **fault_sig** –set the fault pin, which needs to be enabled for cyc mode
- **action_on_pwmxa** –action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- **action_on_pwmxb** –action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_fault_deinit** (*mcpwm_unit_t* mcpwm_num, *mcpwm_fault_signal_t* fault_sig)

Disable fault signal.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **fault_sig** –fault pin, which needs to be disabled

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_capture_enable** (*mcpwm_unit_t* mcpwm_num, *mcpwm_capture_signal_t* cap_sig, *mcpwm_capture_on_edge_t* cap_edge, *uint32_t* num_of_pulse)

Initialize capture submodule.

备注: Enabling capture feature would also enable the capture interrupt event, users have to register an interrupt handler by `mcpwm_isr_register`, and in there, query the capture data.

备注: The capture timer uses APB_CLK (typically 80MHz) as the count source.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **cap_edge** –set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- **cap_sig** –capture pin, which needs to be enabled
- **num_of_pulse** –Input capture signal prescaling, ranges from 0 to 255, representing prescaling from 1 to 256.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_capture_disable** (*mcpwm_unit_t* mcpwm_num, *mcpwm_capture_signal_t* cap_sig)

Disable capture signal.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **cap_sig** –capture pin, which needs to be disabled

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_capture_enable_channel** (*mcpwm_unit_t* mcpwm_num, *mcpwm_capture_channel_id_t* cap_channel, *const mcpwm_capture_config_t* *cap_conf)

Enable capture channel.

参数

- **mcpwm_num** –set MCPWM unit(0-1)

- **cap_channel** –capture channel, which needs to be enabled
- **cap_conf** –capture channel configuration

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_capture_disable_channel** (*mcpwm_unit_t* mcpwm_num, *mcpwm_capture_channel_id_t* cap_channel)

Disable capture channel.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **cap_channel** –capture channel, which needs to be disabled

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

uint32_t **mcpwm_capture_signal_get_value** (*mcpwm_unit_t* mcpwm_num, *mcpwm_capture_signal_t* cap_sig)

Get capture value.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **cap_sig** –capture channel on which value is to be measured

返回 Captured value

uint32_t **mcpwm_capture_signal_get_edge** (*mcpwm_unit_t* mcpwm_num, *mcpwm_capture_signal_t* cap_sig)

Get edge of capture signal.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **cap_sig** –capture channel of whose edge is to be determined

返回 Capture signal edge: 1 - positive edge, 2 - negative edge, 0 - Invalid

esp_err_t **mcpwm_sync_enable** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_sync_signal_t* sync_sig, *uint32_t* phase_val)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

备注: Count direction is undefined within this API

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **sync_sig** –set the synchronization input signal
- **phase_val** –phase value in 1/1000 (for 86.7%, phase_val = 867) which timer moves to on sync signal

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_sync_configure** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, const *mcpwm_sync_config_t* *sync_conf)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **sync_conf** –sync configuration on this timer

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_sync_disable** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num)

Disable sync submodule on given timer.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_set_timer_sync_output** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num, *mcpwm_timer_sync_trigger_t* trigger)

Set sync output on given timer Configures what event triggers MCPWM timer to output a sync signal.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **trigger** –set the trigger that will cause the timer to generate a software sync signal. Specifically, MCPWM_SWSYNC_SOURCE_DISABLED will disable the timer from generating sync signal.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mcpwm_timer_trigger_soft_sync** (*mcpwm_unit_t* mcpwm_num, *mcpwm_timer_t* timer_num)

Trigger a software sync event and sends it to a specific timer.

备注: This software sync event will have the same effect as hw one, except that:

- On esp32s3 the soft sync event can be routed to its output if MCPWM_SWSYNC_SOURCE_SYNCIN is selected via `mcpwm_set_timer_sync_output()`
 - On esp32 there is no such behavior and soft sync event will only take effect on this timer and can not be propagated to others.
-

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **timer_num** –set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

esp_err_t **mcpwm_sync_invert_gpio_synchro** (*mcpwm_unit_t* mcpwm_num, *mcpwm_sync_signal_t* sync_sig, bool invert)

Set external GPIO sync input inverter.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **sync_sig** –set sync signal of MCPWM, only supports GPIO sync signal
- **invert** –whether GPIO sync source input is inverted (to get negative edge trigger)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

esp_err_t **mcpwm_isr_register** (*mcpwm_unit_t* mcpwm_num, void (*fn)(void*), void *arg, int intr_alloc_flags, *intr_handle_t* *handle)

Register MCPWM interrupt handler, the handler is an ISR. the handler will be attached to the same CPU core that this function is running on.

参数

- **mcpwm_num** –set MCPWM unit(0-1)
- **fn** –interrupt handler function.
- **arg** –user-supplied argument passed to the handler function.
- **intr_alloc_flags** –flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. see esp_intr_alloc.h for more info.
- **handle** –pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

Structures

struct **mcpwm_pin_config_t**
pin number for MCPWM

Public Members

int **mcpwm0a_out_num**
MCPWM0A out pin

int **mcpwm0b_out_num**
MCPWM0A out pin

int **mcpwm1a_out_num**

int **mcpwm1b_out_num**
MCPWM0A out pin

int **mcpwm2a_out_num**
MCPWM0A out pin

int **mcpwm2b_out_num**
MCPWM0A out pin

int **mcpwm_sync0_in_num**
SYNC0 in pin

int **mcpwm_sync1_in_num**
SYNC1 in pin

int **mcpwm_sync2_in_num**
SYNC2 in pin

int **mcpwm_fault0_in_num**
FAULT0 in pin

int **mcpwm_fault1_in_num**
FAULT1 in pin

int **mcpwm_fault2_in_num**
FAULT2 in pin

int **mcpwm_cap0_in_num**
CAP0 in pin

int **mcpwm_cap1_in_num**
CAP1 in pin

int **mcpwm_cap2_in_num**
CAP2 in pin

struct **cap_event_data_t**
event data that will be passed into ISR callback

Public Members

mcpwm_capture_on_edge_t **cap_edge**
Which signal edge is detected

uint32_t **cap_value**
Corresponding timestamp when event occurs. Clock rate = APB(usually 80M)

struct **mcpwm_config_t**
MCPWM config structure.

Public Members

uint32_t **frequency**
Set frequency of MCPWM in Hz

float **cmpr_a**
Set % duty cycle for operator a(MCPWMXA), i.e for 62.3% duty cycle, duty_a = 62.3

float **cmpr_b**
Set % duty cycle for operator b(MCPWMXB), i.e for 48% duty cycle, duty_b = 48.0

mcpwm_duty_type_t **duty_mode**
Set type of duty cycle

mcpwm_counter_type_t **counter_mode**
Set type of MCPWM counter

struct **mcpwm_carrier_config_t**

MCPWM carrier configuration structure.

Public Members

uint8_t **carrier_period**

Set carrier period = (carrier_period + 1)*800ns, carrier_period should be < 16

uint8_t **carrier_duty**

Set carrier duty cycle, carrier_duty should be less than 8 (increment every 12.5%)

uint8_t **pulse_width_in_os**

Set pulse width of first pulse in one shot mode = (carrier period)*(pulse_width_in_os + 1), should be less than 16

mcpwm_carrier_os_t **carrier_os_mode**

Enable or disable carrier oneshot mode

mcpwm_carrier_out_ivt_t **carrier_ivt_mode**

Invert output of carrier

struct **mcpwm_capture_config_t**

MCPWM config capture structure.

Public Members

mcpwm_capture_on_edge_t **cap_edge**

Set capture edge

uint32_t **cap_prescale**

Prescale of capture signal, ranging from 1 to 256

cap_isr_cb_t **capture_cb**

User defined capture event callback, running under interrupt context

void ***user_data**

User defined ISR callback function args

struct **mcpwm_sync_config_t**

MCPWM config sync structure.

Public Members

mcpwm_sync_signal_t **sync_sig**

Set sync input signal that will cause timer to sync

`uint32_t timer_val`

Counter value to be set after sync, in 0 ~ 999, unit: 1 / 1000 * peak

`mcpwm_timer_direction_t count_direction`

Counting direction to be set after sync

Deprecated:

MCPWM select action to be taken on MCPWMXB when fault occurs

typedef *mcpwm_capture_signal_t* *mcpwm_capture_channel_id_t*

MCPWM capture channel ID alias.

typedef bool (**cap_isr_cb_t*)(*mcpwm_unit_t* mcpwm, *mcpwm_capture_channel_id_t* cap_channel, const *cap_event_data_t* *edata, void *user_data)

Type of capture event callback.

备注: Since this an ISR callback so do not do anything that may block and call APIs that is designed to be used within ISR(usually has ‘_ISR’ postfix)

Param mcpwm MCPWM unit(0-1)

Param cap_channel capture channel ID

Param edata Capture event data, contains capture edge and capture value, fed by the driver

Param user_data User registered data, passed from *mcpwm_capture_config_t*

Return Whether a task switch is needed after the callback function returns, this is usually due to the callback wakes up some high priority task.

Enumerations

enum *mcpwm_io_signals_t*

IO signals for the MCPWM.

- 6 MCPWM output pins that generate PWM signals
- 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.

- 3 MCPWM sync input pins to synchronize MCPWM outputs signals
- 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

Values:

enumerator **MCPWM0A**

PWM0A output pin

enumerator **MCPWM0B**

PWM0B output pin

enumerator **MCPWM1A**

PWM1A output pin

enumerator **MCPWM1B**

PWM1B output pin

enumerator **MCPWM2A**

PWM2A output pin

enumerator **MCPWM2B**

PWM2B output pin

enumerator **MCPWM_SYNC_0**

SYNC0 input pin

enumerator **MCPWM_SYNC_1**

SYNC1 input pin

enumerator **MCPWM_SYNC_2**

SYNC2 input pin

enumerator **MCPWM_FAULT_0**

FAULT0 input pin

enumerator **MCPWM_FAULT_1**

FAULT1 input pin

enumerator **MCPWM_FAULT_2**

FAULT2 input pin

enumerator **MCPWM_CAP_0**

CAP0 input pin

enumerator **MCPWM_CAP_1**

CAP1 input pin

enumerator **MCPWM_CAP_2**

CAP2 input pin

enum **mcpwm_unit_t**

Select MCPWM unit.

Values:

enumerator **MCPWM_UNIT_0**

MCPWM unit0 selected

enumerator **MCPWM_UNIT_1**

MCPWM unit1 selected

enumerator **MCPWM_UNIT_MAX**

Max number of MCPWM units

enum **mcpwm_timer_t**

Select MCPWM timer.

Values:

enumerator **MCPWM_TIMER_0**

Select MCPWM timer0

enumerator **MCPWM_TIMER_1**

Select MCPWM timer1

enumerator **MCPWM_TIMER_2**

Select MCPWM timer2

enumerator **MCPWM_TIMER_MAX**

Max number of timers in a unit

enum **mcpwm_generator_t**

Select MCPWM operator.

Values:

enumerator **MCPWM_GEN_A**

Select MCPWMXA, where 'X' is operator number

enumerator **MCPWM_GEN_B**

Select MCPWMXB, where 'X' is operator number

enumerator **MCPWM_GEN_MAX**

Num of generators to each operator of MCPWM

enum **mcpwm_carrier_os_t**

MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.

Values:

enumerator **MCPWM_ONESHOT_MODE_DIS**

Enable oneshot mode

enumerator **MCPWM_ONESHOT_MODE_EN**

Disable oneshot mode

enum **mcpwm_carrier_out_ivt_t**

MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.

Values:

enumerator **MCPWM_CARRIER_OUT_IVT_DIS**

Enable carrier output inversion

enumerator **MCPWM_CARRIER_OUT_IVT_EN**

Disable carrier output inversion

enum **mcpwm_fault_signal_t**

MCPWM select fault signal input.

Values:

enumerator **MCPWM_SELECT_F0**

Select F0 as input

enumerator **MCPWM_SELECT_F1**

Select F1 as input

enumerator **MCPWM_SELECT_F2**

Select F2 as input

enum **mcpwm_sync_signal_t**

MCPWM select sync signal input.

Values:

enumerator **MCPWM_SELECT_NO_INPUT**

No sync input selected

enumerator **MCPWM_SELECT_TIMER0_SYNC**

Select software sync signal from timer0 as input

enumerator **MCPWM_SELECT_TIMER1_SYNC**

Select software sync signal from timer1 as input

enumerator **MCPWM_SELECT_TIMER2_SYNC**

Select software sync signal from timer2 as input

enumerator **MCPWM_SELECT_GPIO_SYNC0**

Select GPIO SYNC0 as input

enumerator **MCPWM_SELECT_GPIO_SYNC1**

Select GPIO SYNC1 as input

enumerator **MCPWM_SELECT_GPIO_SYNC2**

Select GPIO SYNC2 as input

enum **mcpwm_timer_sync_trigger_t**

MCPWM timer sync event trigger.

Values:

enumerator **MCPWM_SWSYNC_SOURCE_SYNCIN**

the input sync signal will be routed to its sync output path

enumerator **MCPWM_SWSYNC_SOURCE_TEZ**

sync signal generated when timer counts to zero

enumerator **MCPWM_SWSYNC_SOURCE_TEP**

sync signal generated when timer counts to peak

enumerator **MCPWM_SWSYNC_SOURCE_DISABLED**

timer does not generate sync signals

enum **mcpwm_fault_input_level_t**

MCPWM select triggering level of fault signal.

Values:

enumerator **MCPWM_LOW_LEVEL_TGR**

Fault condition occurs when fault input signal goes from high to low

enumerator **MCPWM_HIGH_LEVEL_TGR**

Fault condition occurs when fault input signal goes low to high

enum **mcpwm_capture_on_edge_t**

MCPWM select capture starts from which edge.

Values:

enumerator **MCPWM_NEG_EDGE**

Capture the negative edge

enumerator **MCPWM_POS_EDGE**

Capture the positive edge

enumerator **MCPWM_BOTH_EDGE**

Capture both edges

enum **mcpwm_intr_t**

Interrupt masks for MCPWM capture.

Values:

enumerator **MCPWM_LL_INTR_CAP0**

Capture 0 happened.

enumerator **MCPWM_LL_INTR_CAP1**

Capture 1 happened.

enumerator **MCPWM_LL_INTR_CAP2**

Capture 2 happened.

enum **mcpwm_counter_type_t**

Select type of MCPWM counter.

Values:

enumerator **MCPWM_FREEZE_COUNTER**

Counter freeze

enumerator **MCPWM_UP_COUNTER**

For asymmetric MCPWM

enumerator **MCPWM_DOWN_COUNTER**

For asymmetric MCPWM

enumerator **MCPWM_UP_DOWN_COUNTER**

For symmetric MCPWM, frequency is half of MCPWM frequency set

enumerator **MCPWM_COUNTER_MAX**

Maximum counter mode

enum **mcpwm_duty_type_t**

Select type of MCPWM duty cycle mode.

Values:

enumerator **MCPWM_DUTY_MODE_0**

Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM

enumerator **MCPWM_DUTY_MODE_1**

Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM

enumerator **MCPWM_HAL_GENERATOR_MODE_FORCE_LOW**

enumerator **MCPWM_HAL_GENERATOR_MODE_FORCE_HIGH**

enumerator **MCPWM_DUTY_MODE_MAX**

Num of duty cycle modes

enum **mcpwm_deadtime_type_t**

MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.

Values:

enumerator **MCPWM_DEADTIME_BYPASS**

Bypass the deadtime

enumerator **MCPWM_BYPASS_RED**

MCPWMXA Out = MCPWMXA In with no delay, MCPWMXB Out = MCPWMXA In with falling edge delay

enumerator **MCPWM_BYPASS_FED**

MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXB In with no delay

enumerator **MCPWM_ACTIVE_HIGH_MODE**

MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

enumerator **MCPWM_ACTIVE_LOW_MODE**

MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with compliment of falling edge delay

enumerator **MCPWM_ACTIVE_HIGH_COMPLIMENT_MODE**

MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB = MCPWMXA In with compliment of falling edge delay

enumerator **MCPWM_ACTIVE_LOW_COMPLIMENT_MODE**

MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

enumerator **MCPWM_ACTIVE_RED_FED_FROM_PWMXA**

MCPWMXA Out = MCPWMXB Out = MCPWMXA In with rising edge delay as well as falling edge delay

enumerator **MCPWM_ACTIVE_RED_FED_FROM_PWMXB**

MCPWMXA Out = MCPWMXB Out = MCPWMXB In with rising edge delay as well as falling edge delay

enumerator **MCPWM_DEADTIME_TYPE_MAX**

Maximum number of supported dead time modes

enum **mcpwm_output_action_t**

MCPWM select action to be taken on the output when event happens.

Values:

enumerator **MCPWM_ACTION_NO_CHANGE**

No change in the output

enumerator **MCPWM_ACTION_FORCE_LOW**

Make output low

enumerator **MCPWM_ACTION_FORCE_HIGH**

Make output high

enumerator **MCPWM_ACTION_TOGGLE**

Make output toggle

enum **mcpwm_capture_signal_t**

MCPWM select capture signal input.

Values:

enumerator **MCPWM_SELECT_CAP0**

Select CAP0 as input

enumerator **MCPWM_SELECT_CAP1**

Select CAP1 as input

enumerator **MCPWM_SELECT_CAP2**

Select CAP2 as input

2.3.10 Pulse Counter (PCNT)

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

Functionality Overview

Description of functionality of this API has been broken down into four sections:

- *Configuration* - describes counter's configuration parameters and how to setup the counter.
- *Operating the Counter* - provides information on control functions to pause, measure and clear the counter.
- *Filtering Pulses* - describes options to filtering pulses and the counter control signals.
- *Using Interrupts* - presents how to trigger interrupts on specific states of the counter.

Configuration

The PCNT module has 8 independent counting “units” numbered from 0 to 7. In the API they are referred to using `pcnt_unit_t`. Each unit has two independent channels numbered as 0 and 1 and specified with `pcnt_channel_t`.

The configuration is provided separately per unit's channel using `pcnt_config_t` and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.

Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

Operating the Counter

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.

There are couple of functions that allow to control the counter's operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`. To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

备注: For the counter not to miss any pulses, the pulse duration should be longer than one APB_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a *filer*.

Filtering Pulses

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.

The length of ignored pulses is provided in APB_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable()` / `pcnt_filter_disable()`.

Using Interrupts

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in *Configuration*
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`. and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.

In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

Application Example

- Pulse counter with control signal and event interrupt example: `peripherals/pcnt/pulse_count_event`.
- Parse the signal generated from rotary encoder: `peripherals/pcnt/rotary_encoder`.

API Reference

Header File

- `components/driver/include/driver/pcnt.h`

Functions

esp_err_t **pcnt_unit_config** (const *pcnt_config_t* *pcnt_config)

Configure Pulse Counter unit.

备注: This function will disable three events: PCNT_EVT_L_LIM, PCNT_EVT_H_LIM, PCNT_EVT_ZERO.

参数 `pcnt_config` –Pointer of Pulse Counter unit configure parameter

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_get_counter_value** (*pcnt_unit_t* pcnt_unit, int16_t *count)

Get pulse counter value.

参数

- `pcnt_unit` –Pulse Counter unit number
- `count` –Pointer to accept counter value

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_counter_pause** (*pcnt_unit_t* pcnt_unit)

Pause PCNT counter of PCNT unit.

参数 `pcnt_unit` –PCNT unit number

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_counter_resume** (*pcnt_unit_t* pcnt_unit)

Resume counting for PCNT counter.

参数 `pcnt_unit` –PCNT unit number, select from `pcnt_unit_t`

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_counter_clear** (*pcnt_unit_t* pcnt_unit)

Clear and reset PCNT counter value to zero.

参数 `pcnt_unit` –PCNT unit number, select from `pcnt_unit_t`

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_intr_enable** (*pcnt_unit_t* pcnt_unit)

Enable PCNT interrupt for PCNT unit.

备注: Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with `pcnt_event_enable()` and `pcnt_event_disable()`

参数 *pcnt_unit* –PCNT unit number

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_intr_disable** (*pcnt_unit_t* pcnt_unit)

Disable PCNT interrupt for PCNT unit.

参数 *pcnt_unit* –PCNT unit number

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_event_enable** (*pcnt_unit_t* unit, *pcnt_evt_type_t* evt_type)

Enable PCNT event of PCNT unit.

参数

- **unit** –PCNT unit number
- **evt_type** –Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_event_disable** (*pcnt_unit_t* unit, *pcnt_evt_type_t* evt_type)

Disable PCNT event of PCNT unit.

参数

- **unit** –PCNT unit number
- **evt_type** –Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_set_event_value** (*pcnt_unit_t* unit, *pcnt_evt_type_t* evt_type, *int16_t* value)

Set PCNT event value of PCNT unit.

参数

- **unit** –PCNT unit number
- **evt_type** –Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- **value** –Counter value for PCNT event

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_get_event_value** (*pcnt_unit_t* unit, *pcnt_evt_type_t* evt_type, int16_t *value)

Get PCNT event value of PCNT unit.

参数

- **unit** –PCNT unit number
- **evt_type** –Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- **value** –Pointer to accept counter value for PCNT event

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_get_event_status** (*pcnt_unit_t* unit, uint32_t *status)

Get PCNT event status of PCNT unit.

参数

- **unit** –PCNT unit number
- **status** –Pointer to accept event status word

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_isr_unregister** (*pcnt_isr_handle_t* handle)

Unregister PCNT interrupt handler (registered by `pcnt_isr_register`), the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. If the interrupt service is registered by `pcnt_isr_service_install`, please call `pcnt_isr_service_uninstall` instead.

参数 **handle** –handle to unregister the ISR service.

返回

- ESP_OK Success
- ESP_ERR_NOT_FOUND Can not find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

esp_err_t **pcnt_isr_register** (void (*fn)(void*), void *arg, int intr_alloc_flags, *pcnt_isr_handle_t* *handle)

Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use `pcnt_isr_service_install` if this function was called.

参数

- **fn** –Interrupt handler function.
- **arg** –Parameter for handler function
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling `pcnt_isr_unregister` to unregister this ISR service if needed, but only if the handle is not NULL.

返回

- ESP_OK Success
- ESP_ERR_NOT_FOUND Can not find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

esp_err_t **pcnt_set_pin** (*pcnt_unit_t* unit, *pcnt_channel_t* channel, int pulse_io, int ctrl_io)

Configure PCNT pulse signal input pin and control input pin.

备注: Set the signal input to PCNT_PIN_NOT_USED if unused.

参数

- **unit** –PCNT unit number

- **channel** –PCNT channel number
- **pulse_io** –Pulse signal input GPIO
- **ctrl_io** –Control signal input GPIO

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_filter_enable** (*pcnt_unit_t* unit)

Enable PCNT input filter.

参数 **unit** –PCNT unit number

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_filter_disable** (*pcnt_unit_t* unit)

Disable PCNT input filter.

参数 **unit** –PCNT unit number

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_set_filter_value** (*pcnt_unit_t* unit, uint16_t filter_val)

Set PCNT filter value.

备注: filter_val is a 10-bit value, so the maximum filter_val should be limited to 1023.

参数

- **unit** –PCNT unit number
- **filter_val** –PCNT signal filter value, counter in APB_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_get_filter_value** (*pcnt_unit_t* unit, uint16_t *filter_val)

Get PCNT filter value.

参数

- **unit** –PCNT unit number
- **filter_val** –Pointer to accept PCNT filter value.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_set_mode** (*pcnt_unit_t* unit, *pcnt_channel_t* channel, *pcnt_count_mode_t* pos_mode, *pcnt_count_mode_t* neg_mode, *pcnt_ctrl_mode_t* hctrl_mode, *pcnt_ctrl_mode_t* lctrl_mode)

Set PCNT counter mode.

参数

- **unit** –PCNT unit number
- **channel** –PCNT channel number

- **pos_mode** –Counter mode when detecting positive edge
- **neg_mode** –Counter mode when detecting negative edge
- **hctrl_mode** –Counter mode when control signal is high level
- **lctrl_mode** –Counter mode when control signal is low level

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_isr_handler_add** (*pcnt_unit_t* unit, void (*isr_handler)(void*), void *args)

Add ISR handler for specified unit.

Call this function after using `pcnt_isr_service_install()` to install the PCNT driver's ISR handler service.

The ISR handlers do not need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `pcnt_isr_service_install()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

参数

- **unit** –PCNT unit number
- **isr_handler** –Interrupt handler function.
- **args** –Parameter for handler function

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **pcnt_isr_service_install** (int intr_alloc_flags)

Install PCNT ISR service.

备注: We can manage different interrupt service for each unit. This function will use the default ISR handle service, Calling `pcnt_isr_service_uninstall` to uninstall the default service if needed. Please do not use `pcnt_isr_register` if this function was called.

参数 **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed

void **pcnt_isr_service_uninstall** (void)

Uninstall PCNT ISR service, freeing related resources.

esp_err_t **pcnt_isr_handler_remove** (*pcnt_unit_t* unit)

Delete ISR handler for specified unit.

参数 **unit** –PCNT unit number

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Structures

struct **pcnt_config_t**

Pulse Counter configuration for a single channel.

Public Members

int **pulse_gpio_num**

Pulse input GPIO number, if you want to use GPIO16, enter pulse_gpio_num = 16, a negative value will be ignored

int **ctrl_gpio_num**

Control signal input GPIO number, a negative value will be ignored

pcnt_ctrl_mode_t **lctrl_mode**

PCNT low control mode

pcnt_ctrl_mode_t **hctrl_mode**

PCNT high control mode

pcnt_count_mode_t **pos_mode**

PCNT positive edge count mode

pcnt_count_mode_t **neg_mode**

PCNT negative edge count mode

int16_t **counter_h_lim**

Maximum counter value

int16_t **counter_l_lim**

Minimum counter value

pcnt_unit_t **unit**

PCNT unit number

pcnt_channel_t **channel**

the PCNT channel

Macros

PCNT_PIN_NOT_USED

When selected for a pin, this pin will not be used

PCNT_MODE_KEEP

Control mode: won't change counter mode

PCNT_MODE_REVERSE

Control mode: invert counter mode(increase -> decrease, decrease -> increase)

PCNT_MODE_DISABLE

Control mode: Inhibit counter(counter value will not change in this condition)

PCNT_MODE_MAX

PCNT_COUNT_DIS

Counter mode: Inhibit counter(counter value will not change in this condition)

PCNT_COUNT_INC

Counter mode: Increase counter value

PCNT_COUNT_DEC

Counter mode: Decrease counter value

PCNT_COUNT_MAX

Type Definitions

typedef *intr_handle_t* **pcnt_isr_handle_t**

typedef *pcnt_channel_level_action_t* **pcnt_ctrl_mode_t**

Selection of available modes that determine the counter's action depending on the state of the control signal's input GPIO.

备注: Configuration covers two actions, one for high, and one for low level on the control input

typedef *pcnt_channel_edge_action_t* **pcnt_count_mode_t**

Selection of available modes that determine the counter's action on the edge of the pulse signal's input GPIO.

备注: Configuration covers two actions, one for positive, and one for negative edge on the pulse input

Enumerations

enum **pcnt_port_t**

PCNT port number, the max port number is (PCNT_PORT_MAX - 1).

Values:

enumerator **PCNT_PORT_0**

PCNT port 0

enumerator **PCNT_PORT_MAX**

PCNT port max

enum **pcnt_unit_t**

Selection of all available PCNT units.

Values:

enumerator **PCNT_UNIT_0**

PCNT unit 0

enumerator **PCNT_UNIT_1**

PCNT unit 1

enumerator **PCNT_UNIT_2**

PCNT unit 2

enumerator **PCNT_UNIT_3**

PCNT unit 3

enumerator **PCNT_UNIT_4**

PCNT unit 4

enumerator **PCNT_UNIT_5**

PCNT unit 5

enumerator **PCNT_UNIT_6**

PCNT unit 6

enumerator **PCNT_UNIT_7**

PCNT unit 7

enumerator **PCNT_UNIT_MAX**

enum **pcnt_channel_t**

Selection of channels available for a single PCNT unit.

Values:

enumerator **PCNT_CHANNEL_0**

PCNT channel 0

enumerator **PCNT_CHANNEL_1**

PCNT channel 1

enumerator **PCNT_CHANNEL_MAX**

enum **pcnt_evt_type_t**

Selection of counter's events that may trigger an interrupt.

Values:

enumerator **PCNT_EVT_THRES_1**

PCNT watch point event: threshold1 value event

enumerator **PCNT_EVT_THRES_0**

PCNT watch point event: threshold0 value event

enumerator **PCNT_EVT_L_LIM**

PCNT watch point event: Minimum counter value

enumerator **PCNT_EVT_H_LIM**
PCNT watch point event: Maximum counter value

enumerator **PCNT_EVT_ZERO**
PCNT watch point event: counter value zero event

enumerator **PCNT_EVT_MAX**

Header File

- [components/hal/include/hal/pcnt_types.h](#)

Enumerations

enum **pcnt_channel_level_action_t**

PCNT channel action on control level.

Values:

enumerator **PCNT_CHANNEL_LEVEL_ACTION_KEEP**
Keep current count mode

enumerator **PCNT_CHANNEL_LEVEL_ACTION_INVERSE**
Invert current count mode (increase -> decrease, decrease -> increase)

enumerator **PCNT_CHANNEL_LEVEL_ACTION_HOLD**
Hold current count value

enum **pcnt_channel_edge_action_t**

PCNT channel action on signal edge.

Values:

enumerator **PCNT_CHANNEL_EDGE_ACTION_HOLD**
Hold current count value

enumerator **PCNT_CHANNEL_EDGE_ACTION_INCREASE**
Increase count value

enumerator **PCNT_CHANNEL_EDGE_ACTION_DECREASE**
Decrease count value

enum **pcnt_unit_count_sign_t**

PCNT unit counter value's sign.

Values:

enumerator **PCNT_UNIT_COUNT_SIGN_ZERO_POS**
positive value to zero

enumerator **PCNT_UNIT_COUNT_SIGN_ZERO_NEG**
negative value to zero

enumerator `PCNT_UNIT_COUNT_SIGN_NEG`

counter value negative

enumerator `PCNT_UNIT_COUNT_SIGN_POS`

counter value positive

2.3.11 Remote Control (RMT)

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT's transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

图 14: RMT Transmitter Overview

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

图 15: RMT Receiver Overview

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. [Configure Driver](#)
2. [Transmit Data or Receive Data](#)
3. [Change Operation Parameters](#)
4. [Use Interrupts](#)

The RMT has eight channels numbered from zero to seven. Each channel is able to independently transmit or receive data. They are referred to using indexes defined in structure `rmt_channel_t`.

Configure Driver

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

Common Parameters

- The **channel** to be configured, select one from the `rmt_channel_t` enumerator.
- The RMT **operation mode** - whether this channel is used to transmit or receive data, selected by setting a **rmt_mode** members to one of the values from `rmt_mode_t`.
- What is the **pin number** to transmit or receive RMT signals, selected by setting **gpio_num**.
- How many **memory blocks** will be used by the channel, set with **mem_block_num**.
- Extra miscellaneous parameters for the channel can be set in the **flags**.
 - When **RMT_CHANNEL_FLAGS_AWARE_DFS** is set, RMT channel will take REF_TICK or XTAL as source clock. The benefit is, RMT channel can continue work even when APB clock is changing. See [power_management](#) for more information.
 - When **RMT_CHANNEL_FLAGS_INVERT_SIG** is set, the driver will invert the RMT signal sending to or receiving from the channel. It just works like an external inverter connected to the GPIO of certain RMT channel.
- A **clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting **clk_div** to a value within [1 .. 255] range. The RMT source clock is typically APB CLK, 80Mhz by default. But when **RMT_CHANNEL_FLAGS_AWARE_DFS** is set in **flags**, RMT source clock is changed to REF_TICK or XTAL.

备注: The period of a square wave after the clock divider is called a ‘tick’ . The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’ .

There are also couple of specific parameters that should be set up depending if selected channel is configured in [Transmit Mode](#) or [Receive Mode](#):

Transmit Mode When configuring channel in transmit mode, set **tx_config** and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - **loop_en**
- Enable the RMT carrier signal - **carrier_en**
- Frequency of the carrier in Hz - **carrier_freq_hz**
- Duty cycle of the carrier signal in percent (%) - **carrier_duty_percent**
- Level of the RMT output, when the carrier is applied - **carrier_level**
- Enable the RMT output if idle - **idle_output_en**
- Set the signal level on the RMT output if idle - **idle_level**

Receive Mode In receive mode, set **rx_config** and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - **filter_en**
- A threshold of the filter, set in the number of ticks - **filter_ticks_thresh**. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - **idle_threshold**. The receiver will ignore pulses longer than this setting.

Finalize Configuration Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is > 0 , then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in [Use Interrupts](#).

Now, depending on how the channel is configured, we are ready to either [Transmit Data](#) or [Receive Data](#). This is described in next two sections.

Transmit Data

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure `rmt_item32_t`. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

图 16: Structure of RMT items (L - signal level)

For a simple example how to define a block of items see [peripherals/rmt/morse_code](#).

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see `rmt_set_mem_block_num()`.

Receive Data

警告: RMT RX channel can’t receive packet whose items are larger than its memory block size. If you set the memory block number to 1, then this RX channel can’t receive packet with more than 64 items. This is a hardware limitation.

Before starting the receiver we need some storage for incoming items. The RMT controller has 512 x 32-bits of internal RAM shared between all eight channels.

In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what's inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in [peripherals/rmt/ir_protocols](#).

To stop the receiver, call `rmt_rx_stop()`.

Change Operation Parameters

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have `_get_` counterpart to read back the currently configured value.

Parameters Common to Transmit and Receive Mode

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_gpio()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

Transmit Mode Parameters

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`

Receive Mode Parameters

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT's memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

Use Interrupts

Registering of an interrupt handler for the RMT controller is done by calling `rmt_isr_register()`.

The RMT controller triggers interrupts on four specific events describes below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
- The number of events the transmitter has sent matches a threshold value `rmt_set_tx_thr_intr_en()`
- Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling `rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as `RMT.int_clr.val.chN_event_name` and defined as a volatile struct in

`soc/esp32/include/soc/rmt_struct.h`, where `N` is the RMT channel number [0, n] and the `event_name` is one of four events described above.

If you do not need an ISR anymore, you can de-register it by calling a function `rmt_isr_deregister()`.

警告: `rmt_isr_register()` is provided as a public API by mistake. It's not recommended to use it directly. Even if you have registered a customized ISR handler with that, you still don't have the context of the RMT driver object. The driver has registered a dedicated ISR handler called `rmt_driver_isr_default` within `rmt_driver_install()`.

If you want to get a notification at some specific event (for example, “transaction done”), you can register callback functions like `rmt_register_tx_end_callback()`.

Uninstall Driver

If the RMT driver has been installed with `rmt_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `rmt_driver_uninstall()`.

Application Examples

- Using RMT to send morse code: [peripherals/rmt/morse_code](#).
- Using RMT to drive RGB LED strip: [peripherals/rmt/led_strip](#).
- NEC remote control TX and RX example: [peripherals/rmt/ir_protocols](#).
- Musical buzzer example: [peripherals/rmt/musical_buzzer](#).

API Reference

Header File

- `components/driver/include/driver/rmt.h`

Functions

`esp_err_t rmt_set_clk_div(rmt_channel_t channel, uint8_t div_cnt)`

Set RMT clock divider, channel clock is divided from source clock.

参数

- **channel** –RMT channel
- **div_cnt** –RMT counter clock divider

返回

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

`esp_err_t rmt_get_clk_div(rmt_channel_t channel, uint8_t *div_cnt)`

Get RMT clock divider, channel clock is divided from source clock.

参数

- **channel** –RMT channel
- **div_cnt** –pointer to accept RMT counter divider

返回

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

`esp_err_t rmt_set_rx_idle_thresh(rmt_channel_t channel, uint16_t thresh)`

Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than `idle_thres` channel clock cycles, the receive process is finished.

参数

- **channel** –RMT channel
- **thresh** –RMT RX idle threshold

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_rx_idle_thresh** (*rmt_channel_t* channel, uint16_t *thresh)

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

参数

- **channel** –RMT channel
- **thresh** –pointer to accept RMT RX idle threshold value

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_mem_block_num** (*rmt_channel_t* channel, uint8_t rmt_mem_num)

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start_addr_CHn to end_addr_CHn, which are defined by: Memory block start address is RMT_CHANNEL_MEM(n) (in soc/rmt_reg.h), that is, start_addr_chn = RMT base address + 0x800 + 64 * 4 * n, and end_addr_chn = RMT base address + 0x800 + 64 * 4 * n + 64 * 4 * RMT_MEM_SIZE_CHn mod 512 * 4

备注: If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

参数

- **channel** –RMT channel
- **rmt_mem_num** –RMT RX memory block number, one block has 64 * 32 bits.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_mem_block_num** (*rmt_channel_t* channel, uint8_t *rmt_mem_num)

Get RMT memory block number.

参数

- **channel** –RMT channel
- **rmt_mem_num** –Pointer to accept RMT RX memory block number

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_tx_carrier** (*rmt_channel_t* channel, bool carrier_en, uint16_t high_level, uint16_t low_level, *rmt_carrier_level_t* carrier_level)

Configure RMT carrier for TX signal.

Set different values for carrier_high and carrier_low to set different frequency of carrier. The unit of carrier_high/low is the source clock tick, not the divided channel counter clock.

参数

- **channel** –RMT channel
- **carrier_en** –Whether to enable output carrier.
- **high_level** –High level duration of carrier
- **low_level** –Low level duration of carrier.
- **carrier_level** –Configure the way carrier wave is modulated for channel.
 - 1' b1:transmit on low output level
 - 1' b0:transmit on high output level

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_mem_pd** (*rmt_channel_t* channel, bool pd_en)

Set RMT memory in low power mode.

Reduce power consumed by memory. 1:memory is in low power state.

参数

- **channel** –RMT channel
- **pd_en** –RMT memory low power enable.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_mem_pd** (*rmt_channel_t* channel, bool *pd_en)

Get RMT memory low power mode.

参数

- **channel** –RMT channel
- **pd_en** –Pointer to accept RMT memory low power mode.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_tx_start** (*rmt_channel_t* channel, bool tx_idx_rst)

Set RMT start sending data from memory.

参数

- **channel** –RMT channel
- **tx_idx_rst** –Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_tx_stop** (*rmt_channel_t* channel)

Set RMT stop sending.

参数 **channel** –RMT channel

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_rx_start** (*rmt_channel_t* channel, bool rx_idx_rst)

Set RMT start receiving data.

参数

- **channel** –RMT channel
- **rx_idx_rst** –Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_rx_stop** (*rmt_channel_t* channel)

Set RMT stop receiving data.

参数 **channel** –RMT channel

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_tx_memory_reset** (*rmt_channel_t* channel)

Reset RMT TX memory.

参数 **channel** –RMT channel

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_rx_memory_reset** (*rmt_channel_t* channel)

Reset RMT RX memory.

参数 **channel** –RMT channel

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_memory_owner** (*rmt_channel_t* channel, *rmt_mem_owner_t* owner)

Set RMT memory owner.

备注: Setting memroy is only valid for RX channel.

参数

- **channel** –RMT channel
- **owner** –To set when the transmitter or receiver can process the memory of channel.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_memory_owner** (*rmt_channel_t* channel, *rmt_mem_owner_t* *owner)

Get RMT memory owner.

参数

- **channel** –RMT channel
- **owner** –Pointer to get memory owner.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_tx_loop_mode** (*rmt_channel_t* channel, bool loop_en)

Set RMT tx loop mode.

参数

- **channel** –RMT channel
- **loop_en** –Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_tx_loop_mode** (*rmt_channel_t* channel, bool *loop_en)

Get RMT tx loop mode.

参数

- **channel** –RMT channel
- **loop_en** –Pointer to accept RMT transmitter loop sending mode.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_rx_filter** (*rmt_channel_t* channel, bool rx_filter_en, uint8_t thresh)

Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

参数

- **channel** –RMT channel
- **rx_filter_en** –To enable RMT receiver filter.
- **thresh** –Threshold of pulse width for receiver.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_source_clk** (*rmt_channel_t* channel, *rmt_source_clk_t* base_clk)

Set RMT source clock.

RMT module has two clock sources:

- APB clock which is 80Mhz
- REF tick clock, which would be 1Mhz (not supported in this version).

参数

- **channel** –RMT channel
- **base_clk** –To choose source clock for RMT module.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_source_clk** (*rmt_channel_t* channel, *rmt_source_clk_t* *src_clk)

Get RMT source clock.

RMT module has two clock sources:

- APB clock which is 80Mhz
- REF tick clock, which would be 1Mhz (not supported in this version).

参数

- **channel** –RMT channel
- **src_clk** –Pointer to accept source clock for RMT module.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_idle_level** (*rmt_channel_t* channel, bool idle_out_en, *rmt_idle_level_t* level)

Set RMT idle output level for transmitter.

参数

- **channel** –RMT channel
- **idle_out_en** –To enable idle level output.
- **level** –To set the output signal's level for channel in idle state.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_idle_level** (*rmt_channel_t* channel, bool *idle_out_en, *rmt_idle_level_t* *level)

Get RMT idle output level for transmitter.

参数

- **channel** –RMT channel
- **idle_out_en** –Pointer to accept value of enable idle.
- **level** –Pointer to accept value of output signal' s level in idle state for specified channel.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_status** (*rmt_channel_t* channel, uint32_t *status)

Get RMT status.

参数

- **channel** –RMT channel
- **status** –Pointer to accept channel status. Please refer to RMT_CHnSTATUS_REG(n=0~7) in `rmt_reg.h` for more details of each field.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_rx_intr_en** (*rmt_channel_t* channel, bool en)

Set RMT RX interrupt enable.

参数

- **channel** –RMT channel
- **en** –enable or disable RX interrupt.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_err_intr_en** (*rmt_channel_t* channel, bool en)

Set RMT RX error interrupt enable.

参数

- **channel** –RMT channel
- **en** –enable or disable RX err interrupt.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_tx_intr_en** (*rmt_channel_t* channel, bool en)

Set RMT TX interrupt enable.

参数

- **channel** –RMT channel
- **en** –enable or disable TX interrupt.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_tx_thr_intr_en** (*rmt_channel_t* channel, bool en, uint16_t evt_thresh)

Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value

参数

- **channel** –RMT channel
- **en** –enable or disable TX event interrupt.
- **evt_thresh** –RMT event interrupt threshold value

返回

- ESP_ERR_INVALID_ARG Parameter error

- ESP_OK Success

esp_err_t **rmt_set_gpio** (*rmt_channel_t* channel, *rmt_mode_t* mode, *gpio_num_t* gpio_num, bool invert_signal)

Configure the GPIO used by RMT channel.

参数

- **channel** –RMT channel
- **mode** –RMT mode, either RMT_MODE_TX or RMT_MODE_RX
- **gpio_num** –GPIO number, which is connected with certain RMT signal
- **invert_signal** –Invert RMT signal physically by GPIO matrix

返回

- ESP_ERR_INVALID_ARG Configure RMT GPIO failed because of wrong parameter
- ESP_OK Configure RMT GPIO successfully

esp_err_t **rmt_config** (const *rmt_config_t* *rmt_param)

Configure RMT parameters.

参数 **rmt_param** –RMT parameter struct

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_isr_register** (void (*fn)(void*), void *arg, int intr_alloc_flags, *rmt_isr_handle_t* *handle)

Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

备注: If you already called `rmt_driver_install` to use system RMT driver, please do not register ISR handler again.

参数

- **fn** –Interrupt handler function.
- **arg** –Parameter for the handler function
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.
- **handle** –If non-zero, a handle to later clean up the ISR gets stored here.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.
- ESP_FAIL System driver installed, can not register ISR handler for RMT

esp_err_t **rmt_isr_deregister** (*rmt_isr_handle_t* handle)

Deregister previously registered RMT interrupt handler.

参数 **handle** –Handle obtained from `rmt_isr_register`

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Handle invalid

esp_err_t **rmt_fill_tx_items** (*rmt_channel_t* channel, const *rmt_item32_t* *item, *uint16_t* item_num, *uint16_t* mem_offset)

Fill memory data of channel with given RMT items.

参数

- **channel** –RMT channel
- **item** –Pointer of items.
- **item_num** –RMT sending items number.
- **mem_offset** –Index offset of memory.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_driver_install** (*rmt_channel_t* channel, size_t rx_buf_size, int intr_alloc_flags)

Initialize RMT driver.

参数

- **channel** –RMT channel
- **rx_buf_size** –Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- **intr_alloc_flags** –Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp_intr_alloc.h for details. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.

返回

- ESP_ERR_INVALID_STATE Driver is already installed, call rmt_driver_uninstall first.
- ESP_ERR_NO_MEM Memory allocation failure
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_driver_uninstall** (*rmt_channel_t* channel)

Uninstall RMT driver.

参数 **channel** –RMT channel

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_channel_status** (*rmt_channel_status_result_t* *channel_status)

Get the current status of eight channels.

备注: Do not call this function if it is possible that rmt_driver_uninstall will be called at the same time.

参数 **channel_status** –[out] store the current status of each channel

返回

- ESP_ERR_INVALID_ARG Parameter is NULL
- ESP_OK Success

esp_err_t **rmt_get_counter_clock** (*rmt_channel_t* channel, uint32_t *clock_hz)

Get speed of channel' s internal counter clock.

参数

- **channel** –RMT channel
- **clock_hz** –[out] counter clock speed, in hz

返回

- ESP_ERR_INVALID_ARG Parameter is NULL
- ESP_OK Success

esp_err_t **rmt_write_items** (*rmt_channel_t* channel, const rmt_item32_t *rmt_item, int item_num, bool wait_tx_done)

RMT send waveform from rmt_item array.

This API allows user to send waveform with any length.

备注: This function will not copy data, instead, it will point to the original items, and send the waveform items. If wait_tx_done is set to true, this function will block and will not return until all items have been sent out. If wait_tx_done is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

参数

- **channel** –RMT channel
- **rmt_item** –head point of RMT items array. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.
- **item_num** –RMT data item number.
- **wait_tx_done** –
 - If set 1, it will block the task and wait for sending done.
 - If set 0, it will not wait and return immediately.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_wait_tx_done** (*rmt_channel_t* channel, TickType_t wait_time)

Wait RMT TX finished.

参数

- **channel** –RMT channel
- **wait_time** –Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP_ERR_TIMEOUT if TX is busy (polling).

返回

- ESP_OK RMT Tx done successfully
- ESP_ERR_TIMEOUT Exceeded the ‘wait_time’ given
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

esp_err_t **rmt_get_ringbuf_handle** (*rmt_channel_t* channel, *RingbufHandle_t* *buf_handle)

Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

参数

- **channel** –RMT channel
- **buf_handle** –Pointer to buffer handle to accept RX ringbuffer handle.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_translator_init** (*rmt_channel_t* channel, *sample_to_rmt_t* fn)

Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

参数

- **channel** –RMT channel .
- **fn** –Point to the data conversion function.

返回

- ESP_FAIL Init fail.
- ESP_OK Init success.

esp_err_t **rmt_translator_set_context** (*rmt_channel_t* channel, void *context)

Set user context for the translator of specific channel.

参数

- **channel** –RMT channel number
- **context** –User context

返回

- ESP_FAIL Set context fail
- ESP_OK Set context success

esp_err_t **rmt_translator_get_context** (const size_t *item_num, void **context)

Get the user context set by ‘rmt_translator_set_context’ .

备注: This API must be invoked in the RMT translator callback function, and the first argument must be the actual parameter ‘item_num’ you got in that callback function.

参数

- **item_num** –Address of the memory which contains the number of translated items (It’s from driver’s internal memroy)
- **context** –Returned User context

返回

- ESP_FAIL Get context fail
- ESP_OK Get context success

esp_err_t **rmt_write_sample** (*rmt_channel_t* channel, const uint8_t *src, size_t src_size, bool wait_tx_done)

Translate uint8_t type of data into rmt format and send it out. Requires rmt_translator_init to init the translator first.

参数

- **channel** –RMT channel .
- **src** –Pointer to the raw data.
- **src_size** –The size of the raw data.
- **wait_tx_done** –Set true to wait all data send done.

返回

- ESP_FAIL Send fail
- ESP_OK Send success

rmt_tx_end_callback_t **rmt_register_tx_end_callback** (*rmt_tx_end_fn_t* function, void *arg)

Registers a callback that will be called when transmission ends.

Called by rmt_driver_isr_default in interrupt context.

备注: Requires rmt_driver_install to install the default ISR handler.

参数

- **function** –Function to be called from the default interrupt handler or NULL.
- **arg** –Argument which will be provided to the callback when it is called.

返回 the previous callback settings (members will be set to NULL if there was none)

esp_err_t **rmt_memory_rw_rst** (*rmt_channel_t* channel)

Reset RMT TX/RX memory index.

参数 **channel** –RMT channel

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

void **rmt_set_intr_enable_mask** (uint32_t mask)

Set mask value to RMT interrupt enable register.

参数 **mask** –Bit mask to set to the register

void **rmt_clr_intr_enable_mask** (uint32_t mask)

Clear mask value to RMT interrupt enable register.

参数 **mask** –Bit mask to clear the register

esp_err_t **rmt_set_pin** (*rmt_channel_t* channel, *rmt_mode_t* mode, *gpio_num_t* gpio_num)

Set RMT pin.

参数

- **channel** –RMT channel
- **mode** –TX or RX mode for RMT
- **gpio_num** –GPIO number to transmit or receive the signal.

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Structures

struct **rmt_tx_config_t**

Data struct of RMT TX configure parameters.

Public Members

uint32_t **carrier_freq_hz**

RMT carrier frequency

rmt_carrier_level_t **carrier_level**

Level of the RMT output, when the carrier is applied

rmt_idle_level_t **idle_level**

RMT idle level

uint8_t **carrier_duty_percent**

RMT carrier duty (%)

bool **carrier_en**

RMT carrier enable

bool **loop_en**

Enable sending RMT items in a loop

bool **idle_output_en**

RMT idle level output enable

struct **rmt_rx_config_t**

Data struct of RMT RX configure parameters.

Public Members

uint16_t **idle_threshold**

RMT RX idle threshold

uint8_t **filter_ticks_thresh**

RMT filter tick number

bool **filter_en**

RMT receiver filter enable

struct **rmt_config_t**

Data struct of RMT configure parameters.

Public Members

rmt_mode_t **rmt_mode**

RMT mode: transmitter or receiver

rmt_channel_t **channel**

RMT channel

gpio_num_t **gpio_num**

RMT GPIO number

uint8_t **clk_div**

RMT channel counter divider

uint8_t **mem_block_num**

RMT memory block number

uint32_t **flags**

RMT channel extra configurations, OR'ed with RMT_CHANNEL_FLAGS_[*]

rmt_tx_config_t **tx_config**

RMT TX parameter

rmt_rx_config_t **rx_config**

RMT RX parameter

struct **rmt_tx_end_callback_t**

Structure encapsulating a RMT TX end callback.

Public Members

rmt_tx_end_fn_t **function**

Function which is called on RMT TX end

void ***arg**

Optional argument passed to function

Macros

RMT_CHANNEL_FLAGS_AWARE_DFS

Channel can work during APB clock scaling

RMT_CHANNEL_FLAGS_INVERT_SIG

Invert RMT signal

RMT_MEM_ITEM_NUM

Define memory space of each RMT channel (in words = 4 bytes)

RMT_DEFAULT_CONFIG_TX (gpio, channel_id)

Default configuration for Tx channel.

RMT_DEFAULT_CONFIG_RX (gpio, channel_id)

Default configuration for RX channel.

Type Definitions

```
typedef intr_handle_t rmt_isr_handle_t
```

RMT interrupt handle.

```
typedef void (*rmt_tx_end_fn_t)(rmt_channel_t channel, void *arg)
```

Type of RMT Tx End callback function.

```
typedef void (*sample_to_rmt_t)(const void *src, rmt_item32_t *dest, size_t src_size, size_t wanted_num, size_t *translated_size, size_t *item_num)
```

User callback function to convert uint8_t type data to rmt format(*rmt_item32_t*).

This function may be called from an ISR, so, the code should be short and efficient.

备注: In fact, *item_num* should be a multiple of *translated_size*, e.g. : When we convert each byte of uint8_t type data to rmt format data, the relation between *item_num* and *translated_size* should be $item_num = translated_size * 8$.

Param src Pointer to the buffer storing the raw data that needs to be converted to rmt format.

Param dest [out] Pointer to the buffer storing the rmt format data.

Param src_size The raw data size.

Param wanted_num The number of rmt format data that wanted to get.

Param translated_size [out] The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.

Param item_num [out] The number of the rmt format data that actually converted to, it can be less than *wanted_num* if there is not enough raw data, but cannot exceed *wanted_num*. it should return 0 if no data was converted.

Header File

- [components/hal/include/hal/rmt_types.h](#)

Structures

```
struct rmt_channel_status_result_t
```

Data struct of RMT channel status.

Public Members

```
rmt_channel_status_t status[RMT_CHANNEL_MAX]
```

Store the current status of each channel

Enumerations

enum **rmt_channel_t**

RMT channel ID.

Values:

enumerator **RMT_CHANNEL_0**

RMT channel number 0

enumerator **RMT_CHANNEL_1**

RMT channel number 1

enumerator **RMT_CHANNEL_2**

RMT channel number 2

enumerator **RMT_CHANNEL_3**

RMT channel number 3

enumerator **RMT_CHANNEL_4**

RMT channel number 4

enumerator **RMT_CHANNEL_5**

RMT channel number 5

enumerator **RMT_CHANNEL_6**

RMT channel number 6

enumerator **RMT_CHANNEL_7**

RMT channel number 7

enumerator **RMT_CHANNEL_MAX**

Number of RMT channels

enum **rmt_mem_owner_t**

RMT Internal Memory Owner.

Values:

enumerator **RMT_MEM_OWNER_TX**

RMT RX mode, RMT transmitter owns the memory block

enumerator **RMT_MEM_OWNER_RX**

RMT RX mode, RMT receiver owns the memory block

enumerator **RMT_MEM_OWNER_MAX**

enum **rmt_source_clk_t**

Clock Source of RMT Channel.

Values:

enumerator **RMT_BASECLK_REF**

RMT source clock is REF_TICK, 1MHz by default

enumerator **RMT_BASECLK_APB**

RMT source clock is APB CLK, 80Mhz by default

enumerator **RMT_BASECLK_MAX**

enum **rmt_data_mode_t**

RMT Data Mode.

备注: We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.

Values:

enumerator **RMT_DATA_MODE_FIFO**

enumerator **RMT_DATA_MODE_MEM**

enumerator **RMT_DATA_MODE_MAX**

enum **rmt_mode_t**

RMT Channel Working Mode (TX or RX)

Values:

enumerator **RMT_MODE_TX**

RMT TX mode

enumerator **RMT_MODE_RX**

RMT RX mode

enumerator **RMT_MODE_MAX**

enum **rmt_idle_level_t**

RMT Idle Level.

Values:

enumerator **RMT_IDLE_LEVEL_LOW**

RMT TX idle level: low Level

enumerator **RMT_IDLE_LEVEL_HIGH**

RMT TX idle level: high Level

enumerator **RMT_IDLE_LEVEL_MAX**

enum **rmt_carrier_level_t**

RMT Carrier Level.

Values:

enumerator **RMT_CARRIER_LEVEL_LOW**

RMT carrier wave is modulated for low Level output

enumerator **RMT_CARRIER_LEVEL_HIGH**

RMT carrier wave is modulated for high Level output

enumerator **RMT_CARRIER_LEVEL_MAX**

enum **rmt_channel_status_t**

RMT Channel Status.

Values:

enumerator **RMT_CHANNEL_UNINIT**

RMT channel uninitialized

enumerator **RMT_CHANNEL_IDLE**

RMT channel status idle

enumerator **RMT_CHANNEL_BUSY**

RMT channel status busy

2.3.12 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see [MTDI Strapping Pin](#) below.

This document has the following structure:

- [Overview of compatibility](#) between the default pull states on pins of Espressif's products and the states required by the SD bus
- [Solutions](#) - ideas on how to resolve compatibility issues
- [Related information](#) - other relevant information

Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

Systems on a Chip (SoCs)

- ESP32 (except for D2WD versions, see [ESP32 datasheet](#)):
 - *No Pull-ups*
 - *Conflicts Between Bootstrap and SDIO on DAT2* for models with 3.3 V flash chip
- ESP32-D2WD:
 - *No Pull-ups*
 - *No Pull-up on GPIO12*

Systems in Packages (SIP)

- ESP32-PICO-D4:
 - *No Pull-ups*
 - *Conflicts Between Bootstrap and SDIO on DAT2*

Modules

- ESP32-WROOM-32 Series, including ESP32-WROOM-32, ESP32-WROOM-32D, ESP32-WROOM-32U, and ESP32-SOLO-1
 - *No Pull-ups*
 - *Conflicts Between Bootstrap and SDIO on DAT2*
- ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
 - *No Pull-ups*
- ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
 - *No Pull-ups*
 - *Conflicts Between Bootstrap and SDIO on DAT2*

Development Boards

- ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
 - *No Pull-ups*
 - *Conflicts Between Bootstrap and SDIO on DAT2*
 - *Download Mode Not Working (minor issue)*
- ESP32-DevKitC, including ESP32-DevKitC v4 and v2
 - *No Pull-ups*
 - *Conflicts Between Bootstrap and SDIO on DAT2*
 - *Download Mode Not Working (minor issue)*
- ESP-WROVER-KIT
 - Required pull-ups are provided
 - *Pull-up Conflicts on GPIO13* (v4.1, v3, v2, and v1)
 - *Conflicts Between Bootstrap and SDIO on DAT2* (v4.1, v2, and v1)
 - *Download Mode Not Working (minor issue)* (v2, v1)

You can determine the version of your ESP23-WROVER-KIT by checking which module is mounted on it:

- ESP32-WROVER-B on v4.1
 - ESP32-WROVER on v3
 - ESP32-WROOM-32 on v1 and v2
- ESP32-LyraTD-MSCL
 - Required pull-ups are provided
 - *Conflicts Between Bootstrap and SDIO on DAT2*
 - ESP32-LyraT
 - Required pull-ups are provided
 - *Pull-up Conflicts on GPIO13*

Non-Espressif Hosts Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.

Solutions

No Pull-ups If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif's development boards with pull-ups, go to [Development Boards](#).
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

Pull-up Conflicts on GPIO13 If DAT3 of your device is not properly pulled up, you have the following options:

- Use 1-bit SD mode and tie the device's DAT3 to VDD
- Use SPI mode
- **Perform one of the following actions on the GPIO13 pin:**
 - Remove the pull-down resistors
 - Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
 - Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

Conflicts Between Bootstrap and SDIO on DAT2 There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see [MTDI Strapping Pin](#).

To resolve the conflict, you have the following options:

1. (Recommended) Burn the flash voltage selection eFuses. This will permanently configure the internal regulator's output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

警告: Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on <http://www.espressif.com/>. If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command will burn the `XPD_SDIO_TIEH`, `XPD_SDIO_FORCE`, and `XPD_SDIO_REG` eFuses. After all the three eFuses are burned to value 1, the internal VDD_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

```
espefuse.py v2.6
Connecting...

Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.
The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH.
This is an irreversible operation.
Type 'BURN' (all capitals) to continue.
BURN
VDD_SDIO setting complete.
```

To check the status of the eFuses, run:

```
`` components/esptool_py/esptool/espefuse.py summary ``
```

If running from an automated flashing script, `espefuse.py` has an option `--do-not-confirm`.

For more details, see [ESP32 Technical Reference Manual \[PDF\]](#).

2. **If using 1-bit SD mode or SPI mode**, disconnect the DAT2 pin and make sure it is pulled high. For this, do one the following:
 - Leave the host's DAT2 floating and directly connect the slave's DAT2 to VDD.

- For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and re-flash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host's side.

No Pull-up on GPIO12 Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

Download Mode Not Working (minor issue) When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:

- For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
- For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
 - **LEDs** would not affect operation in most cases.
 - **Pull-down resistors** can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

Related Information

MTDI Strapping Pin MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low level at startup, which will lead to selecting the default 3.3 V operation.

All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
- On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif's boards with the SD card operation, see [Overview of Compatibility](#).

Internal Pull-ups and Strapping Requirements Using external resistors is always preferable. However, Espressif's products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups / pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:

- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC

表 4: Default pull-up and pull-down states of the CMD and DATA pins

GPIO number	Pin Name	Startup State	Strapping Requirement
15	CMD	WPU	
2	DAT0	WPD	Low for Download mode
4	DAT1	WPD	
12	DAT2	PU for 1.8 V flash; WPD for 3.3 V flash	High for 1.8 V flash; Low for 3.3 V flash
13	DAT3	WPU	

2.3.13 SDMMC Host Driver

Overview

ESP32's SDMMC host peripheral has two slots. Each slot can be used independently to connect to an SD card, SDIO device or eMMC chip.

- Slot 0 (`SDMMC_HOST_SLOT_0`) is an 8-bit slot. It uses `HS1_*` signals in the PIN MUX.
- Slot 1 (`SDMMC_HOST_SLOT_1`) is a 4-bit slot. It uses `HS2_*` signals in the PIN MUX.

The slots are connected to ESP32 GPIOs using IO MUX. Pin mappings of these slots are given in the table below.

Signal	Slot 0	Slot 1
CMD	GPIO11	GPIO15
CLK	GPIO6	GPIO14
D0	GPIO7	GPIO2
D1	GPIO8	GPIO4
D2	GPIO9	GPIO12
D3	GPIO10	GPIO13
D4	GPIO16	
D5	GPIO17	
D6	GPIO5	
D7	GPIO18	
CD	any input via GPIO matrix	
WP	any input via GPIO matrix	

The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the `cd` and `wp` members of the `sdmmc_slot_config_t` structure before calling `sdmmc_host_init_slot()`. Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

警告: Pins used by Slot 0 (`HS1_*`) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:

- High Speed DDR mode, 8-line eMMC

- UHS-I 1.8 V modes, 4-line SD cards

Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (`SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

DDR Mode for eMMC chips

By default, DDR mode will be used if:

- SDMMC host frequency is set to `SDMMC_FREQ_HIGHSPEED` in `sdmmc_host_t` structure, and
- eMMC chip reports DDR mode support in its CSD register

DDR mode places higher requirements for signal integrity. To disable DDR mode while keeping `SDMMC_FREQ_HIGHSPEED` frequency, clear `SDMMC_HOST_FLAG_DDR` bit in `flags` field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

See also

See [SD/SDIO/MMC Driver](#) for the higher level driver which implements the protocol layer.

See [SD SPI Host Driver](#) for a similar driver which uses the SPI controller and is limited to SD protocol's SPI mode.

See [SD Pull-up Requirements](#) for pullup support and compatibilities of modules and development kits.

API Reference

Header File

- `components/driver/include/driver/sdmmc_host.h`

Functions

`esp_err_t sdmmc_host_init` (void)

Initialize SDMMC host peripheral.

备注: This function is not thread safe

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `sdmmc_host_init` was already called
- ESP_ERR_NO_MEM if memory can not be allocated

`esp_err_t sdmmc_host_init_slot` (int slot, const `sdmmc_slot_config_t` *slot_config)

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

备注: This function is not thread safe

参数

- **slot** –slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **slot_config** –additional configuration for the slot

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using `sdmmc_host_init`

`esp_err_t sdmmc_host_set_bus_width` (int slot, size_t width)

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

备注: This function is not thread safe

参数

- **slot** –slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **width** –bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if slot number or width is not valid

size_t `sdmmc_host_get_slot_width` (int slot)

Get bus width configured in `sdmmc_host_init_slot` to be used for data transfer.

参数 **slot** –slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

返回 configured bus width of the specified slot.

esp_err_t **sdmmc_host_set_card_clk** (int slot, uint32_t freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

备注: This function is not thread safe

参数

- **slot** –slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **freq_khz** –card clock frequency, in kHz

返回

- ESP_OK on success
- other error codes may be returned in the future

esp_err_t **sdmmc_host_set_bus_ddr_mode** (int slot, bool ddr_enabled)

Enable or disable DDR mode of SD interface.

参数

- **slot** –slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **ddr_enabled** –enable or disable DDR mode

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

esp_err_t **sdmmc_host_set_cclk_always_on** (int slot, bool cclk_always_on)

Enable or disable always-on card clock When `cclk_always_on` is false, the host controller is allowed to shut down the card clock between the commands. When `cclk_always_on` is true, the clock is generated even if no command is in progress.

参数

- **slot** –slot number
- **cclk_always_on** –enable or disable always-on clock

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the slot number is invalid

esp_err_t **sdmmc_host_do_transaction** (int slot, *sdmmc_command_t* *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Attention Data buffer passed in `cmdinfo->data` must be in DMA capable memory

备注: This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdmmc_host_do_transaction` as long as other `sdmmc_host_*` functions are not called.

参数

- **slot** –slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **cmdinfo** –pointer to structure describing command and data to transfer

返回

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed

- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
- ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
- ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

esp_err_t **sdmmc_host_io_int_enable** (int slot)

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

参数 **slot** –slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

返回 returns ESP_OK, other errors possible in the future

esp_err_t **sdmmc_host_io_int_wait** (int slot, TickType_t timeout_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

参数

- **slot** –slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **timeout_ticks** –number of RTOS ticks to wait for the interrupt

返回

- ESP_OK on success (interrupt received)
- ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks

esp_err_t **sdmmc_host_deinit** (void)

Disable SDMMC host and release allocated resources.

备注: This function is not thread safe

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

esp_err_t **sdmmc_host_pullup_en** (int slot, int width)

Enable the pull-ups of sd pins.

This function is deprecated. Please set SDMMC_SLOT_FLAG_INTERNAL_PULLUP flag in *sdmmc_slot_config_t::flags* instead.

备注: You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

参数

- **slot** –Slot to use, normally set it to 1.
- **width** –Bit width of your configuration, 1 or 4.

返回

- ESP_OK: if success
- ESP_ERR_INVALID_ARG: if configured width larger than maximum the slot can support

Structures

struct **sdmmc_slot_config_t**

Extra configuration for SDMMC peripheral slot

Public Members

gpio_num_t **gpio_cd**

GPIO number of card detect signal.

gpio_num_t **cd**

GPIO number of card detect signal; shorter name.

gpio_num_t **gpio_wp**

GPIO number of write protect signal.

gpio_num_t **wp**

GPIO number of write protect signal; shorter name.

uint8_t **width**

Bus width used by the slot (might be less than the max width supported)

uint32_t **flags**

Features used by this slot.

Macros

SDMMC_HOST_SLOT_0

SDMMC slot 0.

SDMMC_HOST_SLOT_1

SDMMC slot 1.

SDMMC_HOST_DEFAULT ()

Default *sdmmc_host_t* structure initializer for SDMMC peripheral.

Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz

SDMMC_SLOT_FLAG_INTERNAL_PULLUP

Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

SDMMC_SLOT_NO_CD

indicates that card detect line is not used

SDMMC_SLOT_NO_WP

indicates that write protect line is not used

SDMMC_SLOT_WIDTH_DEFAULT

use the maximum possible width for the slot

SDMMC_SLOT_CONFIG_DEFAULT ()

Macro defining default configuration of SDMMC host slot

2.3.14 SD SPI Host Driver

Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an `sdspi_dev_handle_t spi_handle` returned when attaching the device to an SPI bus by calling `sdspi_host_init_device`. The bus should be already initialized before (by `spi_bus_initialize`).

This driver's naming pattern was adopted from the *SDMMC Host* driver due to their similarity. Likewise, the APIs of both drivers are also very similar.

SD SPI driver (access the SD card in SPI mode) offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral's signals can be routed to any ESP32 pin. Otherwise, if SDMMC host driver is used (See *SDMMC Host*) to access the card in SD 1-bit/4-bit mode, higher throughput can be reached but it requires routing the signals through their dedicated IO_MUX pins only.

With the help of *SPI Master driver* based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize a structure `sdmmc_slot_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the `slot` parameter of the structure to the SD SPI device `spi_handle` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver's API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see *the SD/SDIO/MMC Driver*.

备注: SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

API Reference

Header File

- `components/driver/include/driver/sds_pi_host.h`

Functions***esp_err_t* sdspi_host_init** (void)

Initialize SD SPI driver.

备注: This function is not thread safe

返回

- ESP_OK on success
- other error codes may be returned in future versions

***esp_err_t* sdspi_host_init_device** (const *sdspi_device_config_t* *dev_config, *sdspi_dev_handle_t* *out_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

备注: This function is not thread safe

备注: Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

备注: The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

参数

- **dev_config** –pointer to device configuration structure
- **out_handle** –Output of the handle to the sdspi device.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `sdspi_host_init_device` has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

***esp_err_t* sdspi_host_remove_device** (*sdspi_dev_handle_t* handle)

Remove an SD SPI device.

参数 **handle** –Handle of the SD SPI device**返回** Always ESP_OK***esp_err_t* sdspi_host_do_transaction** (*sdspi_dev_handle_t* handle, *sdmmc_command_t* *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

备注: This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

参数

- **handle** –Handle of the sdspi device
- **cmdinfo** –pointer to structure describing command and data to transfer

返回

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed

- `ESP_ERR_INVALID_RESPONSE` if the card has sent an invalid response

`esp_err_t sdspi_host_set_card_clk` (*sdspi_dev_handle_t* host, uint32_t freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

备注: This function is not thread safe

参数

- **host** –Handle of the sdspi device
- **freq_khz** –card clock frequency, in kHz

返回

- `ESP_OK` on success
- other error codes may be returned in the future

`esp_err_t sdspi_host_deinit` (void)

Release resources allocated using `sdspi_host_init`.

备注: This function is not thread safe

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `sdspi_host_init` function has not been called

`esp_err_t sdspi_host_io_int_enable` (*sdspi_dev_handle_t* handle)

Enable SDIO interrupt.

参数 **handle** –Handle of the sdspi device

返回

- `ESP_OK` on success

`esp_err_t sdspi_host_io_int_wait` (*sdspi_dev_handle_t* handle, TickType_t timeout_ticks)

Wait for SDIO interrupt until timeout.

参数

- **handle** –Handle of the sdspi device
- **timeout_ticks** –Ticks to wait before timeout.

返回

- `ESP_OK` on success

`esp_err_t sdspi_host_init_slot` (int slot, const *sdspi_slot_config_t* *slot_config)

Initialize SD SPI driver for the specific SPI controller.

Deprecated:

Use `sdspi_host_init_device` instead.

备注: This function is not thread safe

备注: The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

参数

- **slot** –SPI controller to use (SPI2_HOST or SPI3_HOST)
- **slot_config** –pointer to slot configuration structure

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `sdspi_init_slot` has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

Structures

struct **sdspi_device_config_t**

Extra configuration for SD SPI device.

Public Members

spi_host_device_t **host_id**

SPI host to use, SPIx_HOST (see `spi_types.h`).

gpio_num_t **gpio_cs**

GPIO number of CS signal.

gpio_num_t **gpio_cd**

GPIO number of card detect signal.

gpio_num_t **gpio_wp**

GPIO number of write protect signal.

gpio_num_t **gpio_int**

GPIO number of interrupt line (input) for SDIO card.

struct **sdspi_slot_config_t**

Extra configuration for SPI host.

Deprecated:

Use *sdspi_device_config_t* and corresponding `sdspi_host_init_device()` instead.

Public Members

gpio_num_t **gpio_cs**

GPIO number of CS signal.

gpio_num_t **gpio_cd**

GPIO number of card detect signal.

gpio_num_t **gpio_wp**

GPIO number of write protect signal.

gpio_num_t **gpio_int**

GPIO number of interrupt line (input) for SDIO card.

gpio_num_t **gpio_miso**

GPIO number of MISO signal.

gpio_num_t **gpio_mosi**

GPIO number of MOSI signal.

gpio_num_t **gpio_sck**

GPIO number of SCK signal.

int **dma_channel**

DMA channel to be used by SPI driver (1 or 2).

Macros

SDSPI_DEFAULT_HOST

SDSPI_DEFAULT_DMA

SDSPI_HOST_DEFAULT ()

Default *sdmmc_host_t* structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

‘slot’ should be set to an sdspi device initialized by `sdspi_host_init_device()`.

SDSPI_SLOT_NO_CD

indicates that card detect line is not used

SDSPI_SLOT_NO_WP

indicates that write protect line is not used

SDSPI_SLOT_NO_INT

indicates that interrupt line is not used

SDSPI_DEVICE_CONFIG_DEFAULT ()

Macro defining default configuration of SD SPI device.

SDSPI_SLOT_CONFIG_DEFAULT ()

Macro defining default configuration of SPI host

Type Definitions

typedef int **sdspi_dev_handle_t**

Handle representing an SD SPI device.

2.3.15 SDIO Card Slave Driver

Overview

The ESP32 SDIO Card peripherals (Host, Slave) shares two sets of pins as below table. The first set is usually occupied by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only runs on the second set of pins while SDIO host is not using it.

The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit or SPI mode.

Connections

Pin Name	Corresponding pins in SPI mode	Slot1	Slot2
		GPIO Number	
CLK	SCLK	6	14
CMD	MOSI	11	15
DAT0	MISO	7	2
DAT1	Interrupt	8	4
DAT2	N.C. (pullup)	9	12
DAT3	#CS	10	13

- 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins and the ground.
- 4-bit SD mode: Connect all pins and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins and the ground.

备注: Please check if CMD and DATA lines D0-D3 of the card are properly pulled up by 10 KOhm resistors. This should be ensured even in 1-bit mode or SPI mode. Most official modules don't offer these pullups internally. If you are using official development boards, check [Overview of Compatibility](#) to see whether your development boards have such pullups.

备注: Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using a ESP32 module with 3.3 V flash inside, you have to burn the EFUSE when you are developing on the module for the first time. See [Overview of Compatibility](#) to see how to make your modules compatible with the SDIO.

Here is a list for modules/kits with 3.3 V flash:

- Modules: ESP32-PICO-D4, ESP32-WROOM-32 series (including ESP32-SOLO-1), ESP32-WROVER-B and ESP32-WROVER-IB
- Kits: ESP32-PICO-KIT, ESP32-DevKitC (till v4), ESP32-WROVER-KIT (v4.1 (also known as ESP32-WROVER-KIT-VB), v2, v1 (also known as DevKitJ v1))

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

Refer to [SD Pull-up Requirements](#) for more technical details of the pullups.

The host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, or in SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

Terminology The SDIO slave driver uses the following terms:

- Transfer: a transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- Sending: slave to host transfers.
- Receiving: host to slave transfers.

备注: Register names in *ESP32 Technical Reference Manual > SDIO Slave Controller* [PDF] are oriented from the point of view of the host, i.e. ‘rx’ registers refer to sending, while ‘tx’ registers refer to receiving. We’re not using *tx* or *rx* in the driver to avoid ambiguities.

- FIFO: specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The address is related to the length requested to read from/write to the slave in a single transfer: *requested length* = 0x1F800-address.
- Ownership: When the driver takes ownership of a buffer, it means the driver can randomly read/write the buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- Requested length: The length requested in one transfer determined by the FIFO address.
- Transfer length: The length requested in one transfer determined by the CMD53 byte/block count field.

备注: Requested length is different from the transfer length. ESP32 slave DMA base on the *requested length* rather than the *transfer length*. The *transfer length* should be no shorter than the *requested length*, and the rest part will be filled with 0 (sending) or discard (receiving).

- Receiving buffer size: The buffer size is pre-defined between the host and the slave before communication starts. Slave application has to set the buffer size during initialization by the `recv_buffer_size` member of `sdio_slave_config_t`.
- Interrupts: the esp32 slave support interrupts in two directions: from host to slave (called slave interrupts below) and from slave to host (called host interrupts below). See more in [Interrupts](#).
- Registers: specific address in Function 1 access by CMD52 or CMD53.

Communication with ESP SDIO Slave The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of [SDIO Simplified Specification](#)), which is described briefly in [ESP SDIO Slave Initialization](#).

Furthermore, there’s an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func 1. Please refer to [ESP SDIO Slave Protocol](#). There is also a component [ESP Serial Slave Link](#) for ESP32 master to communicate with ESP32 SDIO slave, see example [peripherals/sdio](#) when programming your host.

Interrupts There are interrupts from host to slave, and from slave to host to help communicating conveniently.

Slave Interrupts The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the `slave_intr_cb` member in the `sdio_slave_config_t` structure.

备注: The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

There’s another set of functions can be used. You can call `sdio_slave_wait_int` to wait for an interrupt within a certain time, or call `sdio_slave_clear_int` to clear interrupts from host. The callback function can work with the wait functions perfectly.

Host Interrupts The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source.

Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see `sdio_slave_hostint_t` for more information.

Shared Registers There are 52 8-bit R/W shared registers to share information between host and slave. The slave can write or read the registers at any time by `sdio_slave_read_reg` and `sdio_slave_write_reg`. The host can access (R/W) the register by `CMD52` or `CMD53`.

Receiving FIFO When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling `sdio_slave_recv_register_buf`, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware. The size of these buffers should equal to the Receiving buffer size.
2. Load buffers onto the driver by passing the buffer handle to `sdio_slave_recv_load_buf`.
3. Get the received data by calling `sdio_slave_recv` or `sdio_slave_recv_packet`. If non-blocking call is needed, set `wait=0`.

The difference between two APIs is that, `sdio_slave_recv_packet` gives more information about packet, which can consist of several buffers. When `ESP_ERR_NOT_FINISHED` is returned by this API, you should call this API iteratively until the return value is `ESP_OK`. All the continuous buffers returned with `ESP_ERR_NOT_FINISHED`, together with the last buffer returned with `ESP_OK`, belong to one packet from the host. Call `sdio_slave_recv_get_buf` to get the address of the received data, and the actual length received in each buffer. The packet length is the sum of received length of all the buffers in the packet.

If the host never send data longer than the Receiving buffer size, or you don't care about the packet boundary (e.g. the data is only a byte stream), you can call the simpler version `sdio_slave_recv` instead.

4. Pass the handle of processed buffer back to the driver by `sdio_recv_load_buf` again.

备注: To avoid overhead from copying data, the driver itself doesn't have any buffer inside, the application is responsible to offer new buffers in time. The DMA will automatically store received data to the buffer.

Sending FIFO Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- Stream Mode: when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.
- Packet Mode: the packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.

备注: To avoid overhead from copying data, the driver itself doesn't have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished.

The sending mode can be set in the `sending_mode` member of `sdio_slave_config_t`, and the buffer numbers can be set in the `send_queue_size`. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call `sdio_slave_transmit` to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an arg indicating the buffer) to `sdio_slave_send_queue`. If non-blocking call is needed, set `wait=0`. If the wait is not `portMAX_DELAY` (wait until success), application has to check the result to know whether the data is put in to the queue or discard.
2. Call `sdio_slave_send_get_finished` to get and deal with a finished transfer. A buffer should be keep unmodified until returned from `sdio_slave_send_get_finished`. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the `arg` in the queue parameter:

1. Directly point `arg` to a dynamic-allocated buffer, and use the `arg` to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point `arg` to the structure. You can use the structure to do more things like:

```
typedef struct {
    uint8_t* buffer;
    size_t size;
    int id;
}sdio_transfer_t;

//and send as:
sdio_transfer_t trans = {
    .buffer = ADDRESS_TO_SEND,
    .size = 8,
    .id = 3, //the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

//... maybe more transfers are sent here

//and deal with finished transfer as:
sdio_transfer_t* arg = NULL;
sdio_slave_send_get_finished((void*)&arg, portMAX_DELAY);
ESP_LOGI("tag", "(%d) successfully send %d bytes of %p", arg->id, arg->size,
↵arg->buffer);
some_post_callback(arg); //do more things
```

3. Working with the receiving part of this driver, point `arg` to the receive buffer handle of this buffer. So that we can directly use the buffer to receive data when it's sent:

```
uint8_t buffer[256]={1,2,3,4,5,6,7,8};
sdio_slave_buf_handle_t handle = sdio_slave_rcv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

//... maybe more transfers are sent here

//and load finished buffer to receive as
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void*)&handle, portMAX_DELAY);
sdio_slave_rcv_load_buf(handle);
```

More about this, see [peripherals/sdio](#).

Application Example

Slave/master communication: [peripherals/sdio](#).

API Reference

Header File

- `components/hal/include/hal/sdio_slave_types.h`

Enumerations

enum **sdio_slave_hostint_t**

Mask of interrupts sending to the host.

Values:

enumerator **SDIO_SLAVE_HOSTINT_BIT0**

General purpose interrupt bit 0.

enumerator **SDIO_SLAVE_HOSTINT_BIT1**

enumerator **SDIO_SLAVE_HOSTINT_BIT2**

enumerator **SDIO_SLAVE_HOSTINT_BIT3**

enumerator **SDIO_SLAVE_HOSTINT_BIT4**

enumerator **SDIO_SLAVE_HOSTINT_BIT5**

enumerator **SDIO_SLAVE_HOSTINT_BIT6**

enumerator **SDIO_SLAVE_HOSTINT_BIT7**

enumerator **SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET**

New packet available.

enum **sdio_slave_timing_t**

Timing of SDIO slave.

Values:

enumerator **SDIO_SLAVE_TIMING_PSEND_PSAMPLE**

Send at posedge, and sample at posedge. Default value for HS mode. Normally there's no problem using this to work in DS mode.

enumerator **SDIO_SLAVE_TIMING_NSEND_PSAMPLE**

Send at negedge, and sample at posedge. Default value for DS mode and below.

enumerator **SDIO_SLAVE_TIMING_PSEND_NSAMPLE**

Send at posedge, and sample at negedge.

enumerator **SDIO_SLAVE_TIMING_NSEND_NSAMPLE**

Send at negedge, and sample at negedge.

enum **sdio_slave_sending_mode_t**

Configuration of SDIO slave mode.

Values:

enumerator **SDIO_SLAVE_SEND_STREAM**

Stream mode, all packets to send will be combined as one if possible.

enumerator **SDIO_SLAVE_SEND_PACKET**

Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).

Header File

- [components/driver/include/driver/sdio_slave.h](#)

Functions

esp_err_t **sdio_slave_initialize** (*sdio_slave_config_t* *config)

Initialize the sdio slave driver

参数 config – Configuration of the sdio slave driver.

返回

- ESP_ERR_NOT_FOUND if no free interrupt found.
- ESP_ERR_INVALID_STATE if already initialized.
- ESP_ERR_NO_MEM if fail due to memory allocation failed.
- ESP_OK if success

void **sdio_slave_deinit** (void)

De-initialize the sdio slave driver to release the resources.

esp_err_t **sdio_slave_start** (void)

Start hardware for sending and receiving, as well as set the IOREADY1 to 1.

备注: The driver will continue sending from previous data and PKT_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See `sdio_slave_reset`.

返回

- ESP_ERR_INVALID_STATE if already started.
- ESP_OK otherwise.

void **sdio_slave_stop** (void)

Stop hardware from sending and receiving, also set IOREADY1 to 0.

备注: this will not clear the data already in the driver, and also not reset the PKT_LEN and TOKEN1 counting. Call `sdio_slave_reset` to do that.

esp_err_t **sdio_slave_reset** (void)

Clear the data still in the driver, as well as reset the PKT_LEN and TOKEN1 counting.

返回 always return ESP_OK.

sdio_slave_buf_handle_t **sdio_slave_recv_register_buf** (uint8_t *start)

Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

备注: The driver will use and only use the amount of space specified in the `recv_buffer_size` member set in the `sdio_slave_config_t`. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

参数 start – The start address of the buffer.

返回 The buffer handle if success, otherwise NULL.

esp_err_t **sdio_slave_recv_unregister_buf** (*sdio_slave_buf_handle_t* handle)

Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

参数 handle –Handle to the buffer to release.

返回 ESP_OK if success, ESP_ERR_INVALID_ARG if the handle is NULL or the buffer is being used.

esp_err_t **sdio_slave_recv_load_buf** (*sdio_slave_buf_handle_t* handle)

Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

参数 handle –Handle to the buffer ready to receive data.

返回

- ESP_ERR_INVALID_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returned by `sdio_slave_recv` can you load it again.
- ESP_OK if success

esp_err_t **sdio_slave_recv_packet** (*sdio_slave_buf_handle_t* *handle_ret, TickType_t wait)

Get buffer of received data if exist with packet information. The driver returns the ownership of the buffer to the app.

When you see return value is ESP_ERR_NOT_FINISHED, you should call this API iteratively until the return value is ESP_OK. All the continuous buffers returned with ESP_ERR_NOT_FINISHED, together with the last buffer returned with ESP_OK, belong to one packet from the host.

You can call simpler `sdio_slave_recv` instead, if the host never send data longer than the Receiving buffer size, or you don't care about the packet boundary (e.g. the data is only a byte stream).

备注: Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

参数

- **handle_ret** –Handle of the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf()` to receive in the same buffer again.
- **wait** –Time to wait before data received.

返回

- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_ERR_NOT_FINISHED if returned buffer is not the end of a packet from the host, should call this API again until the end of a packet
- ESP_OK if success

esp_err_t **sdio_slave_recv** (*sdio_slave_buf_handle_t* *handle_ret, uint8_t **out_addr, size_t *out_len, TickType_t wait)

Get received data if exist. The driver returns the ownership of the buffer to the app.

备注: Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

参数

- **handle_ret** –Handle to the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf` to receive in the same buffer again.
- **out_addr** –[out] Output of the start address, set to NULL if not needed.
- **out_len** –[out] Actual length of the data in the buffer, set to NULL if not needed.
- **wait** –Time to wait before data received.

返回

- `ESP_ERR_INVALID_ARG` if `handle_ret` is `NULL`
- `ESP_ERR_TIMEOUT` if timeout before receiving new data
- `ESP_OK` if success

`uint8_t *sdio_slave_recv_get_buf` (*sdio_slave_buf_handle_t* handle, `size_t *len_o`)

Retrieve the buffer corresponding to a handle.

参数

- **handle** –Handle to get the buffer.
- **len_o** –Output of buffer length

返回 buffer address if success, otherwise `NULL`.

esp_err_t `sdio_slave_send_queue` (`uint8_t *addr`, `size_t len`, `void *arg`, `TickType_t wait`)

Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

参数

- **addr** –Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- **len** –Length of the data, should not be longer than 4092 bytes (may support longer in the future).
- **arg** –Argument to returned in `sdio_slave_send_get_finished`. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to `NULL` if not needed.
- **wait** –Time to wait if the buffer is full.

返回

- `ESP_ERR_INVALID_ARG` if the length is not greater than 0.
- `ESP_ERR_TIMEOUT` if the queue is still full until timeout.
- `ESP_OK` if success.

esp_err_t `sdio_slave_send_get_finished` (`void **out_arg`, `TickType_t wait`)

Return the ownership of a finished transaction.

参数

- **out_arg** –Argument of the finished transaction. Set to `NULL` if unused.
- **wait** –Time to wait if there' s no finished sending transaction.

返回 `ESP_ERR_TIMEOUT` if no transaction finished, or `ESP_OK` if succeed.

esp_err_t `sdio_slave_transmit` (`uint8_t *addr`, `size_t len`)

Start a new sending transfer, and wait for it (blocked) to be finished.

参数

- **addr** –Start address of the buffer to send
- **len** –Length of buffer to send.

返回

- `ESP_ERR_INVALID_ARG` if the length of descriptor is not greater than 0.
- `ESP_ERR_TIMEOUT` if the queue is full or host do not start a transfer before timeout.
- `ESP_OK` if success.

`uint8_t sdio_slave_read_reg` (`int pos`)

Read the spi slave register shared with host.

备注: register 28 to 31 are reserved for interrupt vector.

参数 `pos` –register address, 0-27 or 32-63.

返回 value of the register.

esp_err_t **sdio_slave_write_reg** (int pos, uint8_t reg)

Write the spi slave register shared with host.

备注: register 29 and 31 are used for interrupt vector.

参数

- **pos** –register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
- **reg** –the value to write.

返回 ESP_ERR_INVALID_ARG if address wrong, otherwise ESP_OK.

sdio_slave_hostint_t **sdio_slave_get_host_intena** (void)

Get the interrupt enable for host.

返回 the interrupt mask.

void **sdio_slave_set_host_intena** (*sdio_slave_hostint_t* mask)

Set the interrupt enable for host.

参数 **mask** –Enable mask for host interrupt.

esp_err_t **sdio_slave_send_host_int** (uint8_t pos)

Interrupt the host by general purpose interrupt.

参数 **pos** –Interrupt num, 0-7.

返回

- ESP_ERR_INVALID_ARG if interrupt num error
- ESP_OK otherwise

void **sdio_slave_clear_host_int** (*sdio_slave_hostint_t* mask)

Clear general purpose interrupt to host.

参数 **mask** –Interrupt bits to clear, by bit mask.

esp_err_t **sdio_slave_wait_int** (int pos, TickType_t wait)

Wait for general purpose interrupt from host.

备注: this clears the interrupt at the same time.

参数

- **pos** –Interrupt source number to wait for. is set.
- **wait** –Time to wait before interrupt triggered.

返回 ESP_OK if success, ESP_ERR_TIMEOUT if timeout.

Structures

struct **sdio_slave_config_t**

Configuration of SDIO slave.

Public Members

sdio_slave_timing_t **timing**

timing of sdio_slave. see sdio_slave_timing_t.

***sdio_slave_sending_mode_t* sending_mode**

mode of `sdio_slave`. `SDIO_SLAVE_MODE_STREAM` if the data needs to be sent as much as possible; `SDIO_SLAVE_MODE_PACKET` if the data should be sent in packets.

int send_queue_size

max buffers that can be queued before sending.

size_t recv_buffer_size

If `buffer_size` is too small, it costs more CPU time to handle larger number of buffers. If `buffer_size` is too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers are easily run out. Should be set according to length of data really transferred. All data that do not fully fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given to the driver should be larger than this.

***sdio_event_cb_t* event_cb**

when the host interrupts slave, this callback will be called with interrupt number (0-7).

uint32_t flags

Features to be enabled for the slave, combinations of `SDIO_SLAVE_FLAG_*`.

Macros**SDIO_SLAVE_RECV_MAX_BUFFER****SDIO_SLAVE_FLAG_DAT2_DISABLED**

It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don't support 4-bit mode anymore, please do this at your own risk.

SDIO_SLAVE_FLAG_HOST_INTR_DISABLED

The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don't support 4-bit mode anymore, please do this at your own risk.

SDIO_SLAVE_FLAG_INTERNAL_PULLUP

Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.

Type Definitions

```
typedef void (*sdio_event_cb_t)(uint8_t event)
```

```
typedef void *sdio_slave_buf_handle_t
```

Handle of a receive buffer, register a handle by calling `sdio_slave_recv_register_buf`. Use the handle to load the buffer to the driver, or call `sdio_slave_recv_unregister_buf` if it is no longer used.

2.3.16 Sigma-delta Modulation

Introduction

ESP32 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

Functionality Overview

There are 8 independent sigma-delta modulation channels identified with `sigmadelta_channel_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in `sigmadelta_config_t` and then applying this configuration with `sigmadelta_config()`.

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - `sigmadelta_set_prescale()`
- **Duty** of the output signal - `sigmadelta_set_duty()`
- **GPIO pin** to output modulated signal - `sigmadelta_set_pin()`

The range of the 'duty' input parameter of `sigmadelta_set_duty()` is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal's duty will be about 50%, see description of `sigmadelta_set_duty()`.

Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don't have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following [Sallen-Key topology Low Pass Filter](#) as a reference.

图 17: Sallen-Key Low Pass Filter

Application Example

Sigma-delta Modulation example: [peripherals/sigmadelta](#).

API Reference

Header File

- [components/driver/include/driver/sigmadelta.h](#)

Functions

esp_err_t **sigmadelta_config** (const *sigmadelta_config_t* *config)

Configure Sigma-delta channel.

参数 config –Pointer of Sigma-delta channel configuration struct

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **sigmadelta_set_duty** (*sigmadelta_channel_t* channel, int8_t duty)

Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty, If you add a capacitor between the output pin and ground, the average output voltage will be $V_{dc} = VDDIO / 256 * duty + VDDIO/2$, where VDDIO is the power supply voltage.

参数

- **channel** –Sigma-delta channel number
- **duty** –Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **sigmadelta_set_prescale** (*sigmadelta_channel_t* channel, uint8_t prescale)

Set Sigma-delta channel's clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP_CLK / pre_scale.

参数

- **channel** –Sigma-delta channel number
- **prescale** –The divider of source clock, ranges from 0 to 255

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **sigmadelta_set_pin** (*sigmadelta_channel_t* channel, *gpio_num_t* gpio_num)

Set Sigma-delta signal output pin.

参数

- **channel** –Sigma-delta channel number
- **gpio_num** –GPIO number of output pin.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Header File

- [components/hal/include/hal/sigmadelta_types.h](#)

Structures

struct **sigmadelta_config_t**

Sigma-delta configure struct.

Public Members

sigmadelta_channel_t **channel**

Sigma-delta channel number

int8_t **sigmadelta_duty**

Sigma-delta duty, duty ranges from -128 to 127.

uint8_t **sigmadelta_prescale**

Sigma-delta prescale, prescale ranges from 0 to 255.

uint8_t **sigmadelta_gpio**

Sigma-delta output io number, refer to gpio.h for more details.

Enumerations

enum **sigmadelta_port_t**

SIGMADELTA port number, the max port number is (SIGMADELTA_NUM_MAX -1).

Values:

enumerator **SIGMADELTA_PORT_0**

SIGMADELTA port 0

enumerator **SIGMADELTA_PORT_MAX**

SIGMADELTA port max

enum **sigmadelta_channel_t**

Sigma-delta channel list.

Values:

enumerator **SIGMADELTA_CHANNEL_0**

Sigma-delta channel 0

enumerator **SIGMADELTA_CHANNEL_1**

Sigma-delta channel 1

enumerator **SIGMADELTA_CHANNEL_2**

Sigma-delta channel 2

enumerator **SIGMADELTA_CHANNEL_3**

Sigma-delta channel 3

enumerator **SIGMADELTA_CHANNEL_4**

Sigma-delta channel 4

enumerator **SIGMADELTA_CHANNEL_5**

Sigma-delta channel 5

enumerator **SIGMADELTA_CHANNEL_6**

Sigma-delta channel 6

enumerator **SIGMADELTA_CHANNEL_7**

Sigma-delta channel 7

enumerator **SIGMADELTA_CHANNEL_MAX**

Sigma-delta channel max

2.3.17 SPI Master Driver

SPI Master driver is a program that controls ESP32's SPI peripherals while they function as masters.

Overview of ESP32's SPI peripherals

ESP32 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32's attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. There are quite a few limitations when using SPI Master driver on the SPI1 bus, see [Notes on Using the SPI Master driver on SPI1 Bus](#).
- SPI2 and SPI3 are general purpose SPI controllers, sometimes referred to as HSPI and VSPI, respectively. They are open to users. SPI2 and SPI3 have independent bus signals with the same respective names. Each bus has three CS lines to drive up to same number of SPI slaves.

Terminology

The terms used in relation to the SPI master driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral inside ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.
De-vice	SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device' s individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.
SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.
QUADHD	Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.
DATA4	Data4 signal in Octal/OPI mode.
DATA5	Data5 signal in Octal/OPI mode.
DATA6	Data6 signal in Octal/OPI mode.
DATA7	Data7 signal in Octal/OPI mode.
As- ser- tion	The action of activating a line.
De- asser- tion	The action of returning the line back to inactive (back to idle) status.
Trans- ac- tion	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launc- edge	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
Latch edge	Edge of the clock at which the destination register <i>latches in</i> the signal.

Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see [SPI Bus Lock](#).

警告: The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using [xSemaphoreCreateMutex](#).

SPI Features

SPI Master

SPI Bus Lock To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock are initialized with a BG (background) service registered, all devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI1 bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI1 is allowed using ISR (it' s meaningless for the task to yield to other tasks when the cache is disabled).
There are quite a few limitations when using SPI Master driver on the SPI1 bus, see [Notes on Using the SPI Master driver on SPI1 Bus](#).
- For other buses, the driver may register its ISR as the BG. The bus lock will block a device task when it requests for exclusive use of the bus, try to disable the ISR, and unblock the device task allowed to exclusively use the bus when the ISR is successfully disabled. When the task releases the lock, the lock will also try to resume the ISR if there are pending transactions to be done in the ISR.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
Com-mand	In this phase, a command (0-16 bit) is written to the bus by the Host.
Ad-dress	In this phase, an address (0-64 bit) is transmitted over the bus by the Host.
Write	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
Dummy	This phase is configurable and is used to meet the timing requirements.
Read	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device' s configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see [Notes on Sending Mixed Transactions to the Same Device](#).

Interrupt Transactions Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

Polling Transactions Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see [Bus Acquiring](#).

Transaction Line Mode Supported line modes for ESP32 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the *Transaction Flag* column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the *Bus IO setting Flag* column.

Mode name	Command Line Width	Address Line Width	Data Line Width	Transaction Flag	Bus IO setting Flag
Normal SPI	1	1	1	0	0
Dual Output	1	1	2	SPI_TRANS_MODE_DIO	SPICOMMON_BUSFLAG_DUAL
Dual I/O	1	2	2	SPI_TRANS_MODE_DIO SPI_TRANS_MULTILINE_ADDR	
Quad Output	1	1	4	SPI_TRANS_MODE_QIO	SPICOMMON_BUSFLAG_QUAD
Quad I/O	1	4	4	SPI_TRANS_MODE_QIO SPI_TRANS_MULTILINE_ADDR	

Command and Address Phases During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`.

If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see [Transaction Line Mode](#).

Write and Read Phases Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in [Transaction Line Mode](#).

备注: Half-duplex transactions with both read and write phases are not supported when using DMA. For details and workarounds, see [Known Issues](#).

Bus Acquiring Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
 - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
 - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the [peripherals/spi_master](#) directory of ESP-IDF examples.

Transactions with Data Not Exceeding 32 Bits When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA`

flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`.

Transactions with Integers Other Than `uint8_t` An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

Notes on Sending Mixed Transactions to the Same Device To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Notes on Using the SPI Master driver on SPI1 Bus

备注: Though the *SPI Bus Lock* feature makes it possible to use SPI Master driver on the SPI1 bus, it's still tricky and needs a lot of special treatment. It's a feature for advanced developers.

To use SPI Master driver on SPI1 bus, you have to take care of two problems:

1. The code and data, required at the meanwhile the driver is operating SPI1 bus, should be in the internal memory. SPI1 bus is shared among devices and the cache for data (code) in the Flash as well as the PSRAM. The cache should be disabled during the other drivers are operating the SPI1 bus. Hence the data (code) in the flash as well as the PSRAM cannot be fetched at the meanwhile the driver acquires the SPI1 bus by:
 - Explicit bus acquiring between `spi_device_acquire_bus()` and `spi_device_release_bus()`.
 - Implicit bus acquiring between `spi_device_polling_start()` and `spi_device_polling_end()` (or inside `spi_device_polling_transmit()`).

During the time above, all other tasks and most ISRs will be disabled (see *IRAM 安全中断处理程序*). Application code and data used by current task should be placed in internal memory (DRAM or IRAM), or already in the ROM. Access to external memory (flash code, const data in the flash, and static/heap data in the

PSRAM) will cause a *Cache disabled but cached memory region accessed* exception. For differences between IRAM, DRAM, and flash cache, please refer to the [application memory layout](#) documentation.

To place functions into the IRAM, you can either:

1. Add `IRAM_ATTR` (include “esp_attr.h”) to the function like:

```
IRAM_ATTR void foo(void) { }
```

Please note that when a function is inlined, it will follow its caller’s segment, and the attribute will not take effect. You may need to use `NOLINE_ATTR` to avoid this.

2. Use the `noflash` placement in the `linker.lf`. See more in [链接器脚本生成机制](#). Please note that, some code may be transformed into lookup table in the const data by the compiler, so `noflash_text` is not safe.

Please do take care that the optimization level may affect the compiler behavior of inline, or transforming some code into lookup table in the const data, etc.

To place data into the DRAM, you can either:

1. Add `DRAM_ATTR` (include “esp_attr.h”) to the data definition like:

```
DRAM_ATTR int g_foo = 3;
```

2. Use the `noflash` placement in the `linker.lf`. See more in [链接器脚本生成机制](#).

Please also see the example [peripherals/spi_master/hd_eeprom](#).

GPIO Matrix and IO_MUX Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO_MUX pins are used.

备注: For more details about the influence of the MISO input delay on the maximum clock frequency, see [Timing Considerations](#).

The IO_MUX pins for SPI buses are given below.

Pin Name	SPI2	SPI3
	GPIO Number	
CS0*	15	5
SCLK	14	18
MISO	12	19
MOSI	13	23
QUADWP	2	22
QUADHD	4	21

- Only the first Device attached to the bus can use the CS0 pin.

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See [Interrupt Transactions](#). For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see [Polling Transactions](#).

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 μ s.
- Interrupt Transaction via CPU: 25 μ s.
- Polling Transaction via DMA: 10 μ s.
- Polling Transaction via CPU: 8 μ s.

SPI Clock Frequency Transferring each byte takes eight times the clock period $8/f_{spi}$.

If the clock frequency is too high, the use of some functions might be limited. See [Timing Considerations](#).

Cache Miss The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select [CONFIG_SPI_MASTER_IN_IRAM](#) to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is $20+8n/f_{spi}[MHz]$ [us] for n bytes transferred in one transaction. Hence, the transferring speed is: $n/(20+8n/f_{spi})$. An example of transferring speed at 8 MHz clock speed is given in the following table.

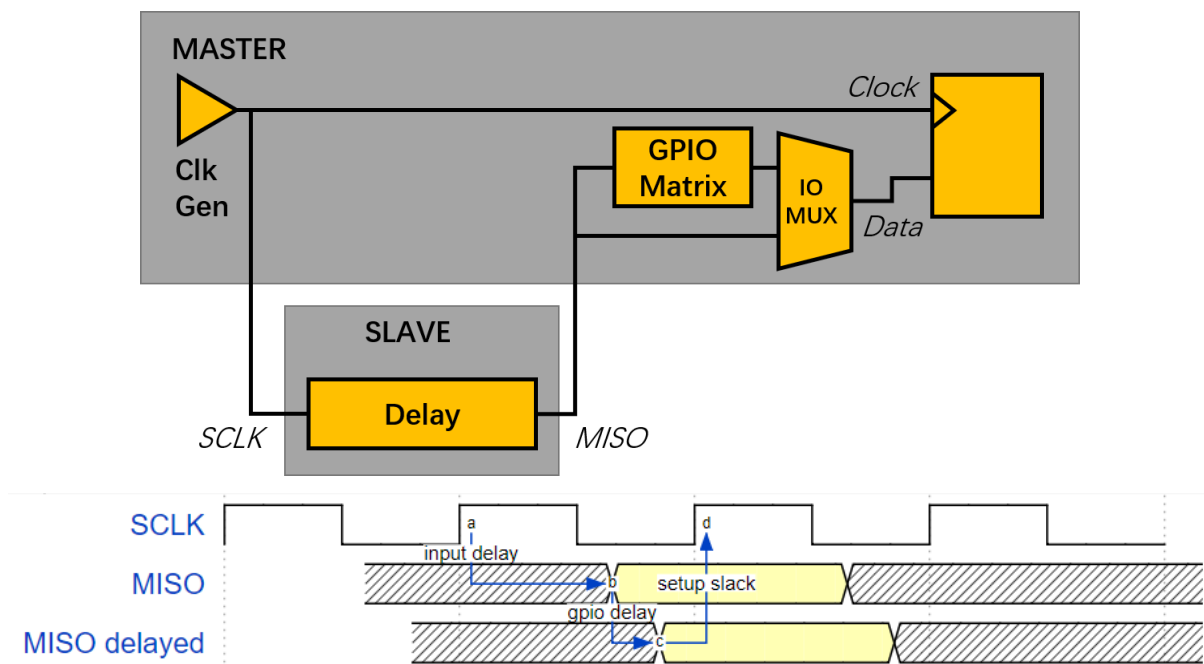

Frequency (MHz)	Transaction Interval (us)	Transaction Length (bytes)	Total Time (us)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable [CONFIG_SPI_MASTER_ISR_IN_IRAM](#) and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see [IRAM 安全中断处理程序](#).

Timing Considerations

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed. When the delay is too long, the setup slack is < 0 , which means the setup timing requirement is violated and the reading might be incorrect.

The maximum allowed frequency is dependent on:

- `input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33~77% in comparison to the existing *input delay*. To retain a higher frequency, you have to use the IO_MUX pins or the *dummy bit workaround*. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.

Dummy bit workaround: Dummy clocks, during which the Host does not read data, can be inserted before the read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

Frequency Limit (MHz)		Dummy Bits Used By Driver	Comments
GPIO matrix	IO_MUX pins		
26.6	80	No	
40	–	Yes	Half-duplex, no DMA allowed

If the Host only writes data, the *dummy bit workaround* and the frequency check can be disabled by setting the bit `SPI_DEVICE_NO_DUMMY` in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80MHz, even if the GPIO matrix is used.

`spi_device_interface_config_t::flags`

The SPI master driver still works even if the `input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions

You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device's specification or measure the time using an oscilloscope or logic analyzer.

Please note that the actual PCB layout design and excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to input delay values exceeding the values given in the Device specification or measured while the bus is floating.

Some typical delay values are shown in the following table. (These data are retrieved when the slave device is on a different physical chip)

Device	Input delay (ns)
Ideal Device	0
ESP32 slave using IO_MUX*	50
ESP32 slave using GPIO_MUX*	75

The MISO path delay (valid time) consists of a slave's *input delay* plus master's *GPIO matrix delay*. This delay determines the frequency limit above which full-duplex transfers will not work as well as the dummy bits used in the half-duplex transactions. The frequency limit is:

$$Freq\ limit\ [MHz] = 80 / (\text{floor}(MISO\ delay[ns]/12.5) + 1)$$

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.

Corresponding frequency limits for different Devices with different *input delay* times are shown in the table below.

Master	Input delay (ns)	MISO path delay (ns)	Freq. limit (MHz)
IO_MUX (0ns)	0	0	80
	50	50	16
	75	75	11.43
GPIO (25ns)	0	25	26.67
	50	75	11.43
	75	100	8.89

Known Issues

1. Half-duplex transactions are not compatible with DMA when both writing and reading phases are used.

If such transactions are required, you have to use one of the alternative solutions:

1. Use full-duplex transactions instead.
2. **Disable DMA by setting the bus initialization function' s last parameter to 0 as follows:**

```
ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
```

This can prohibit you from transmitting and receiving data longer than 64 bytes. 3. Try using the command and address fields to replace the write phase.

2. Full-duplex transactions are not compatible with the *dummy bit workaround*, hence the frequency is limited. See *dummy bit speed-up workaround*.
3. `dummy_bits` in `spi_device_interface_config_t` and `spi_transaction_ext_t` are not available when SPI read and write phases are both enabled (regardless of full duplex or half duplex mode).
4. `cs_ena_pretrans` is not compatible with the command and address phases of full-duplex transactions.

Application Example

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the [peripherals/spi_master/hd_eeprom](#) directory of ESP-IDF examples.

API Reference - SPI Common

Header File

- [components/hal/include/hal/spi_types.h](#)

Structures

struct **spi_line_mode_t**

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

Public Members

uint8_t **cmd_lines**

The line width of command phase, e.g. 2-line-cmd-phase.

uint8_t **addr_lines**

The line width of address phase, e.g. 1-line-addr-phase.

uint8_t **data_lines**

The line width of data phase, e.g. 4-line-data-phase.

Enumerations

enum **spi_host_device_t**

Enum with the three SPI peripherals that are software-accessible in it.

Values:

enumerator **SPI1_HOST**

SPI1.

enumerator **SPI2_HOST**

SPI2.

enumerator **SPI3_HOST**

SPI3.

enum **spi_event_t**

SPI Events.

Values:

enumerator **SPI_EV_BUF_TX**

The buffer has sent data to master.

enumerator **SPI_EV_BUF_RX**

The buffer has received data from master.

enumerator **SPI_EV_SEND_DMA_READY**

Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI_EV_SEND**

Master has received certain number of the data, the number is determined by Master.

enumerator **SPI_EV_RECV_DMA_READY**

Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI_EV_RECV**

Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI_EV_CMD9**

Received CMD9 from master.

enumerator **SPI_EV_CMDA**

Received CMDA from master.

enumerator **SPI_EV_TRANS**

A transaction has done.

enum **spi_command_t**

SPI command.

Values:

enumerator **SPI_CMD_HD_WRBUF**

enumerator **SPI_CMD_HD_RDBUF**

enumerator **SPI_CMD_HD_WRDMA**

enumerator **SPI_CMD_HD_RDDMA**

enumerator **SPI_CMD_HD_SEG_END**

enumerator `SPI_CMD_HD_EN_QPI`

enumerator `SPI_CMD_HD_WR_END`

enumerator `SPI_CMD_HD_INT0`

enumerator `SPI_CMD_HD_INT1`

enumerator `SPI_CMD_HD_INT2`

Functions

esp_err_t **spi_bus_initialize** (*spi_host_device_t* host_id, const *spi_bus_config_t* *bus_config, *spi_dma_chan_t* dma_chan)

Initialize a SPI bus.

警告: SPI0/1 is not supported

警告: If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

警告: The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

参数

- **host_id** –SPI peripheral that controls this bus
- **bus_config** –Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- **dma_chan** -- Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
 - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
 - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
 - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

返回

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

esp_err_t **spi_bus_free** (*spi_host_device_t* host_id)

Free a SPI bus.

警告: In order for this to succeed, all devices have to be removed first.

参数 `host_id` –SPI peripheral to free

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if bus hasn't been initialized before, or not all devices on the bus are freed
- `ESP_OK` on success

Structures

struct `spi_bus_config_t`

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

备注: Be advised that the slave driver does not use the quadwp/quadhd lines and fields in [spi_bus_config_t](#) referring to these lines will be ignored and can thus safely be left uninitialized.

Public Members

int `mosi_io_num`

GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

int `data0_io_num`

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int `miso_io_num`

GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

int `data1_io_num`

GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int `sclk_io_num`

GPIO pin for SPI Clock signal, or -1 if not used.

int `quadwp_io_num`

GPIO pin for WP (Write Protect) signal, or -1 if not used.

int `data2_io_num`

GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int `quadhd_io_num`

GPIO pin for HD (Hold) signal, or -1 if not used.

int `data3_io_num`

GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int `data4_io_num`

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int **data5_io_num**

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int **data6_io_num**

GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int **data7_io_num**

GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int **max_transfer_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

uint32_t **flags**

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

int **intr_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the `EDGE`, `INTRDISABLED` attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros

SPI_MAX_DMA_LEN

SPI_SWAP_DATA_TX (DATA, LEN)

Transform unsigned integer of length ≤ 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

参数

- **DATA** –Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** –Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)

Transform received data of length ≤ 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

参数

- **DATA** –Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** –Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE

Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER

Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_GPIO_PINS

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

SPICOMMON_BUSFLAG_SCLK

Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO

Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI

Check existing of MOSI pin. Or indicates MOSI line initialized.

SPICOMMON_BUSFLAG_DUAL

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_IO4_IO7

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

SPICOMMON_BUSFLAG_OCTAL

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

SPICOMMON_BUSFLAG_NATIVE_PINS**Type Definitions**

```
typedef spi_common_dma_t spi_dma_chan_t
```

Enumerations

```
enum spi_common_dma_t
```

SPI DMA channels.

Values:

```
enumerator SPI_DMA_DISABLED
```

Do not enable DMA for SPI.

enumerator **SPI_DMA_CH1**

Enable DMA, select DMA Channel 1.

enumerator **SPI_DMA_CH2**

Enable DMA, select DMA Channel 2.

enumerator **SPI_DMA_CH_AUTO**

Enable DMA, channel is automatically selected by driver.

API Reference - SPI Master

Header File

- [components/driver/include/driver/spi_master.h](#)

Functions

esp_err_t **spi_bus_add_device** (*spi_host_device_t* host_id, const *spi_device_interface_config_t* *dev_config, *spi_device_handle_t* *handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

备注: While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

参数

- **host_id** –SPI peripheral to allocate device on
- **dev_config** –SPI interface protocol config for the device
- **handle** –Pointer to variable to hold the device handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn't have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **spi_bus_remove_device** (*spi_device_handle_t* handle)

Remove a device from the SPI bus.

参数 **handle** –Device handle to free

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

esp_err_t **spi_device_queue_trans** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

备注: Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

参数

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Description of transaction to execute
- **ticks_to_wait** –Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- `ESP_ERR_TIMEOUT` if there was no room in the queue before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

`esp_err_t spi_device_get_trans_result` (`spi_device_handle_t` handle, `spi_transaction_t` **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

参数

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- **ticks_to_wait** –Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if there was no completed transaction before `ticks_to_wait` expired
- `ESP_OK` on success

`esp_err_t spi_device_transmit` (`spi_device_handle_t` handle, `spi_transaction_t` *trans_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

备注: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

参数

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Description of transaction to execute

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

`esp_err_t spi_device_polling_start` (`spi_device_handle_t` handle, `spi_transaction_t` *trans_desc, TickType_t ticks_to_wait)

Immediately start a polling transaction.

备注: Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a

device cannot start a new polling transaction if another polling transaction is not finished.

参数

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Description of transaction to execute
- **ticks_to_wait** –Ticks to wait until there's room in the queue; currently only port-MAX_DELAY is supported.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

esp_err_t **spi_device_polling_end** (*spi_device_handle_t* handle, TickType_t ticks_to_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

参数

- **handle** –Device handle obtained using `spi_host_add_dev`
- **ticks_to_wait** –Ticks to wait until there's a returned item; use portMAX_DELAY to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before `ticks_to_wait` expired
- ESP_OK on success

esp_err_t **spi_device_polling_transmit** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

备注: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

参数

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Description of transaction to execute

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the device cannot get control of the bus
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions of same device are not finished
- ESP_OK on success

esp_err_t **spi_device_acquire_bus** (*spi_device_handle_t* device, TickType_t wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

备注: The function will wait until all the existing transactions have been sent.

参数

- **device** –The device to occupy the bus.
- **wait** –Time to wait before the the bus is occupied by the device. Currently MUST set to portMAX_DELAY.

返回

- **ESP_ERR_INVALID_ARG** : `wait` is not set to portMAX_DELAY.
- **ESP_OK** : Success.

void **spi_device_release_bus** (*spi_device_handle_t* dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

参数 dev –The device to release the bus.

int **spi_cal_clock** (int fapb, int hz, int duty_cycle, uint32_t *reg_o)

Calculate the working frequency that is most close to desired frequency, and also the register value.

Deprecated:

The app shouldn't care about the register. Call `spi_get_actual_clock` instead.

参数

- **fapb** –The frequency of apb clock, should be APB_CLK_FREQ.
- **hz** –Desired working frequency
- **duty_cycle** –Duty cycle of the spi clock
- **reg_o** –Output of value to be set in clock register, or NULL if not needed.

返回 Actual working frequency that most fit.

int **spi_get_actual_clock** (int fapb, int hz, int duty_cycle)

Calculate the working frequency that is most close to desired frequency.

参数

- **fapb** –The frequency of apb clock, should be APB_CLK_FREQ.
- **hz** –Desired working frequency
- **duty_cycle** –Duty cycle of the spi clock

返回 Actual working frequency that most fit.

void **spi_get_timing** (bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)

Calculate the timing settings of specified frequency and settings.

备注: If `**dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

参数

- **gpio_is_used** –True if using GPIO matrix, or False if iomux pins are used.
- **input_delay_ns** –Input delay from SCLK launch edge to MISO data valid.
- **eff_clk** –Effective clock frequency (in Hz) from `spi_cal_clock`.
- **dummy_o** –Address of dummy bits used output. Set to NULL if not needed.
- **cycles_remain_o** –Address of cycles remaining (after dummy bits are used) output.
 - -1 If too many cycles remaining, suggest to compensate half a clock.
 - 0 If no remaining cycles or dummy bits are not used.
 - positive value: cycles suggest to compensate.

int **spi_get_freq_limit** (bool gpio_is_used, int input_delay_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

参数

- **gpio_is_used** –True if using GPIO matrix, or False if native pins are used.
- **input_delay_ns** –Input delay from SCLK launch edge to MISO data valid.

返回 Frequency limit of current configurations.

esp_err_t **spi_bus_get_max_transaction_len** (*spi_host_device_t* host_id, size_t *max_bytes)

Get max length (in bytes) of one transaction.

参数

- **host_id** –SPI peripheral
- **max_bytes** –[out] Max length of one transaction, in bytes

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument

Structures

struct **spi_device_interface_config_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

Public Members

uint8_t **command_bits**

Default amount of bits in command phase (0-16), used when SPI_TRANS_VARIABLE_CMD is not used, otherwise ignored.

uint8_t **address_bits**

Default amount of bits in address phase (0-64), used when SPI_TRANS_VARIABLE_ADDR is not used, otherwise ignored.

uint8_t **dummy_bits**

Amount of dummy bits to insert between address and data phase.

uint8_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint16_t **duty_cycle_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t **cs_ena_pretrans**

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t **cs_ena_posttrans**

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int **clock_speed_hz**

Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.

int **input_delay_ns**

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

int **spics_io_num**

CS GPIO pin for this device, or -1 if not used.

uint32_t **flags**

Bitwise OR of `SPI_DEVICE_*` flags.

int **queue_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

transaction_cb_t **pre_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

transaction_cb_t **post_cb**

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

struct **spi_transaction_t**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members

uint32_t **flags**

Bitwise OR of `SPI_TRANS_*` flags.

uint16_t **cmd**

Command data, of which the length is set in the `command_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be "command" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

uint64_t **addr**

Address data, of which the length is set in the `address_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t **length**

Total data length, in bits.

size_t **rxlength**

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

void ***user**

User-defined variable. Can be used to store eg transaction ID.

const void ***tx_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t **tx_data**[4]

If `SPI_TRANS_USE_TXDATA` is set, data set here is sent directly from this variable.

void ***rx_buffer**

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t **rx_data**[4]

If `SPI_TRANS_USE_RXDATA` is set, data is received directly to this variable.

struct **spi_transaction_ext_t**

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to `SPI_TRANS_VARIABLE_CMD_ADR` to use the bit length here.

Public Members

struct *spi_transaction_t* **base**

Transaction data, so that pointer to *spi_transaction_t* can be converted into *spi_transaction_ext_t*.

uint8_t **command_bits**

The command length in this transaction, in bits.

uint8_t **address_bits**

The address length in this transaction, in bits.

uint8_t **dummy_bits**

The dummy length in this transaction, in bits.

Macros**SPI_MASTER_FREQ_8M**

SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).
8MHz

SPI_MASTER_FREQ_9M

8.89MHz

SPI_MASTER_FREQ_10M

10MHz

SPI_MASTER_FREQ_11M

11.43MHz

SPI_MASTER_FREQ_13M

13.33MHz

SPI_MASTER_FREQ_16M

16MHz

SPI_MASTER_FREQ_20M

20MHz

SPI_MASTER_FREQ_26M

26.67MHz

SPI_MASTER_FREQ_40M

40MHz

SPI_MASTER_FREQ_80M

80MHz

SPI_DEVICE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_DEVICE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_DEVICE_3WIRE

Use MOSI (=spid) for both sending and receiving data.

SPI_DEVICE_POSITIVE_CS

Make CS positive during a transaction instead of negative.

SPI_DEVICE_HALFDUPLEX

Transmit data before receiving it, instead of simultaneously.

SPI_DEVICE_CLK_AS_CS

Output clock on CS line if CS is active.

SPI_DEVICE_NO_DUMMY

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you' re going to work with output only, or read without dummy bits at your own risk.

SPI_DEVICE_DDRCLK**SPI_TRANS_MODE_DIO**

Transmit/receive data in 2-bit mode.

SPI_TRANS_MODE_QIO

Transmit/receive data in 4-bit mode.

SPI_TRANS_USE_RXDATA

Receive into rx_data member of *spi_transaction_t* instead into memory at rx_buffer.

SPI_TRANS_USE_TXDATA

Transmit tx_data member of *spi_transaction_t* instead of data at tx_buffer. Do not set tx_buffer when using this.

SPI_TRANS_MODE_DIOQIO_ADDR

Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

SPI_TRANS_VARIABLE_CMD

Use the command_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

SPI_TRANS_VARIABLE_ADDR

Use the address_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

SPI_TRANS_VARIABLE_DUMMY

Use the dummy_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

SPI_TRANS_CS_KEEP_ACTIVE

Keep CS active after data transfer.

SPI_TRANS_MULTILINE_CMD

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

SPI_TRANS_MODE_OCT

Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

Type Definitions

```
typedef struct spi_transaction_t spi_transaction_t
```

```
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

2.3.18 SPI Slave Driver

SPI Slave driver is a program that controls ESP32' s SPI peripherals while they function as slaves.

Overview of ESP32' s SPI peripherals

ESP32 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master

- SPI2, sometimes referred to as HSPI
- SPI3, sometimes referred to as VSPI

SPI2 and SPI3 have independent signal buses with the same respective names.

Terminology

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral external to ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.
Device	SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
• MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
• MOSI	Master Out, Slave in, a.k.a. D. Data transmission from a Host to Device.
• SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
• CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
• QUADWP	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
• QUADHD	Hold signal. Only used for 4-bit (qio/qout) transactions.
• Assertion	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <i>de-assertion</i> .
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch edge	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
Latch edge	Edge of the clock at which the destination register <i>latches in</i> the signal.

Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

备注: A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `cpp:func:spi_slave_initialize`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`.

If transactions will be longer than 32 bytes, allow a DMA channel 1 or 2 by setting the parameter `dma_chan` to 1 or 2 respectively. Otherwise, set `dma_chan` to 0.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

GPIO Matrix and IO_MUX

Most of ESP32's peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.

If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. The GPIO matrix samples all signals at 80 MHz and transmits them between the GPIO and the peripheral.

If the driver is configured so that all SPI signals are either routed to their dedicated IO_MUX pins or are not connected at all, the GPIO matrix will be bypassed.

The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.

备注: For more details about the influence of the MISO input delay on the maximum clock frequency, see [Timing Considerations](#).

The IO_MUX pins for SPI buses are given below.

Pin Name	SPI2	SPI3
	GPIO Number	
CS0*	15	5
SCLK	14	18
MISO	12	19
MOSI	13	23
QUADWP	2	22
QUADHD	4	21

- Only the first Device attached to the bus can use the CS0 pin.

Speed and Timing Considerations

Transaction Interval The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi_slave](#).

SCLK Frequency Requirements The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.
- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

	Output delay of MISO (ns)	Freq. limit (MHz)
IO_MUX	43.75	<11.4
GPIO matrix	68.75	<7.2

Note: 1. If the frequency is equal to the limitation, it can lead to random errors. 2. The clock uncertainty between Host and Device (12.5ns) is included. 3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.

Exception: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g., latch data at the next edge, or configurable latching time.

Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.
Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.
2. Furthermore, DMA requires SPI modes 1 and 3. For SPI modes 0 and 2, the MISO signal has to be launched half a clock cycle earlier to meet the timing. The new timing is as follows:

If DMA is enabled, a Device's launch edge is half of an SPI clock cycle ahead of the normal time, shifting to the Master's actual latch edge. In this case, if the GPIO matrix is bypassed, the hold time for data sampling is 68.75 ns and no longer a half of an SPI clock cycle. If the GPIO matrix is used, the hold time will increase to 93.75 ns. The Host should sample the data immediately at the latch edge or communicate in SPI modes 1 or 3. If your Host cannot meet these timing requirements, initialize your Device without DMA.

Application Example

The code example for Device/Host communication can be found in the [peripherals/spi_slave](#) directory of ESP-IDF examples.

API Reference

Header File

- `components/driver/include/driver/spi_slave.h`

Functions

`esp_err_t spi_slave_initialize` (`spi_host_device_t` host, const `spi_bus_config_t` *bus_config, const `spi_slave_interface_config_t` *slave_config, `spi_dma_chan_t` dma_chan)

Initialize a SPI bus as a slave interface.

警告: SPI0/1 is not supported

警告: If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

警告: The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

参数

- **host** –SPI peripheral to use as a SPI slave interface

- **bus_config** –Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- **slave_config** –Pointer to a *spi_slave_interface_config_t* struct specifying the details for the slave interface
- **dma_chan** – Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
 - Selecting SPI_DMA_DISABLED limits the size of transactions.
 - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
 - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

返回

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **spi_slave_free** (*spi_host_device_t* host)

Free a SPI bus claimed as a SPI slave interface.

参数 **host** –SPI peripheral to free

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

esp_err_t **spi_slave_queue_trans** (*spi_host_device_t* host, const *spi_slave_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via *spi_slave_initialize*.) This function may block if the queue is full (depending on the *ticks_to_wait* parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in *trans_desc* to the SPI slave driver; the application is not to access this memory until *spi_slave_queue_trans* is called to hand ownership back to the application.

参数

- **host** –SPI peripheral that is acting as a slave
- **trans_desc** –Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** –Ticks to wait until there's room in the queue; use port-MAX_DELAY to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **spi_slave_get_trans_result** (*spi_host_device_t* host, *spi_slave_transaction_t* **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with *spi_slave_queue_trans*) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by *spi_slave_queue_trans*.

参数

- **host** –SPI peripheral to that is acting as a slave
- **trans_desc** –[out] Pointer to variable able to contain a pointer to the description of the transaction that is executed

- **ticks_to_wait** –Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **spi_slave_transmit** (*spi_host_device_t* host, *spi_slave_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Do a SPI transaction.

Essentially does the same as spi_slave_queue_trans followed by spi_slave_get_trans_result. Do not use this when there is still a transaction queued that hasn’t been finalized using spi_slave_get_trans_result.

参数

- **host** –SPI peripheral to that is acting as a slave
- **trans_desc** –Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** –Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Structures

struct **spi_slave_interface_config_t**

This is a configuration for a SPI host acting as a slave device.

Public Members

int **spics_io_num**

CS GPIO pin for this device.

uint32_t **flags**

Bitwise OR of SPI_SLAVE_* flags.

int **queue_size**

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

uint8_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

slave_transaction_cb_t **post_setup_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

***slave_transaction_cb_t* post_trans_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

struct *spi_slave_transaction_t*

This structure describes one SPI transaction

Public Members**size_t length**

Total data length, in bits.

size_t trans_len

Transaction data length, in bits.

const void *tx_buffer

Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

void *user

User-defined variable. Can be used to store eg transaction ID.

Macros**SPI_SLAVE_TXBIT_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST

Transmit and receive LSB first.

Type Definitions

```
typedef struct spi_slave_transaction_t spi_slave_transaction_t
```

```
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)
```

2.3.19 ESP32-WROOM-32SE (Secure Element)**Overview**

The ESP32-WROOM-32SE has integrated Microchip’s ATECC608A cryptoauth chip in the module. ATECC608A is secure element which would generate and store ECC private key in the hardware. The ECC private key can be used

to enhance security to connect to IoT cloud services with use of X.509 based mutual authentication. The application example demonstrates ECDSA sign and verify functions using ECC private key stored in ATECC608A

Application Example

Secure Element ECDSA Sign/Verify example: [peripherals/secure_element/atecc608_ecdsa](#).

How to configure and provision ESP32-WROOM-32SE for TLS

To configure and provision ATECC608A chip on ESP32-WROOM-32SE please visit [esp_cryptoauth_utility](#)

How to use ATECC608A of ESP32-WROOM-32SE for TLS

ATECC608A can be used for TLS connections using ESP-TLS. To configure ESP-TLS for using secure element please refer *ATECC608A with ESP-TLS* in *ESP-TLS documentation*.

2.3.20 触摸传感器

概述

触摸传感器系统由保护覆盖层、触摸电极、绝缘基板和走线组成，保护覆盖层位于最上层，绝缘基板上设有电极及走线。用户触摸覆盖层将产生电容变化，根据电容变化判断此次触摸是否为有效触摸行为。

ESP32 最多可支持 10 个电容式触摸传感器通道/GPIO。

触摸传感器可以以矩阵或滑条等方式组合使用，从而覆盖更大触感区域及更多触点。触摸传感由软件或专用硬件计时器发起，由有限状态机 (FSM) 硬件控制。

如需了解触摸传感器设计、操作及其控制寄存器等相关信息，请参考《ESP32 技术参考手册》(PDF) 中“片上传感器与模拟信号处理”章节。

请参考 [触摸传感器应用方案简介](#)，查看触摸传感器设计详情和固件开发指南。

如果想评估触摸传感器的多种应用场景，请查看 [ESP32 触摸功能开发套件](#)。

功能介绍

下面将 API 分解成几个函数组进行介绍，帮助用户快速了解以下功能：

- 初始化触摸传感器驱动程序
- 配置触摸传感器 GPIO 管脚
- 触摸状态测量
- 调整测量参数（优化测量）
- 滤波采样
- 触摸监测方式
- 设置中断信号监测触碰动作
- 中断触发，唤醒睡眠模式

请前往 [API 参考](#) 章节，查看某一函数的具体描述。[应用示例](#) 章节则介绍了此 API 的具体实现。

初始化触摸传感器驱动程序 使用触摸传感器之前，需要先调用 `touch_pad_init()` 函数初始化触摸传感器驱动程序。此函数设置了 [API 参考](#) 项下的 *Macros* 中列出的几项 `.._DEFAULT` 驱动程序参数，同时删除之前设置过的触摸传感器信息（如有），并禁用中断。

如果不再需要该驱动程序，可以调用 `touch_pad_deinit()` 释放已初始化的驱动程序。

配置触摸传感器 GPIO 管脚 调用 `touch_pad_config()` 使能某一 GPIO 的触感功能。

使用 `touch_pad_set_fsm_mode()` 选择触摸传感器测量（由 FSM 操作）是由硬件定时器自动启动，还是由软件自动启动。如果选择软件模式，请使用 `touch_pad_sw_start()` 启动 FSM。

触摸状态测量 借助以下两个函数从传感器读取原始数据和滤波后的数据：

- `touch_pad_read_raw_data()`
- `touch_pad_read_filtered()`

这两个函数也可以用于检查触碰和释放触摸传感器时传感器读数变化范围，然后根据这些信息设定触摸传感器的触摸阈值。

备注：使用 `touch_pad_read_filtered()` 之前，需要先调用滤波采样中特定的滤波器函数来初始化并配置该滤波器。

请参考应用示例 `peripherals/touch_sensor/touch_sensor_v1/touch_pad_read`，查看如何使用读取触摸传感器数据。

优化测量 触摸传感器设有数个可配置参数，以适应触摸传感器设计特点。例如，如果需要感知较细微的电容变化，则可以缩小触摸传感器充放电的参考电压范围。用户可以使用 `touch_pad_set_voltage()` 函数设置电压参考低值和参考高值。

优化测量除了可以识别细微的电容变化之外，还可以降低应用程序功耗，但可能会增加测量噪声干扰。如果得到的动态读数范围结果比较理想，则可以调用 `touch_pad_set_meas_time()` 函数来减少测量时间，从而进一步降低功耗。

可用的测量参数及相应的‘set’函数总结如下：

- 触摸传感器充放电参数：
 - 电压门限： `touch_pad_set_voltage()`
 - 速率（斜率） `touch_pad_set_cnt_mode()`
- 测量时间： `touch_pad_set_meas_time()`

电压门限（参考低值/参考高值）、速率（斜率）与测量时间的关系如下图所示：

图 18: 触摸传感器 - 测量参数之间的关系

上图中的 *Output* 代表触摸传感器读值，即一个测量周期内测得的脉冲计数值。

所有函数均成对出现,用于设定某一特定参数,并获取当前参数值。例如: `touch_pad_set_voltage()` 和 `touch_pad_get_voltage()`。

滤波采样 如果测量中存在噪声,可以使用提供的 API 函数对采样进行滤波。使用滤波器之前,请先调用 `touch_pad_filter_start()` 启动该滤波器。

滤波器类型为 IIR (无限脉冲响应滤波器),用户可以调用 `touch_pad_set_filter_period()` 配置此类滤波器的采样周期。

如需停止滤波器,请调用 `touch_pad_filter_stop()` 函数。如果不再使用该滤波器,请调用 `touch_pad_filter_delete()` 删除此滤波器。

触摸监测 触摸监测基于用户配置的阈值和 FSM 执行的原始测量,并由 ESP32 硬件实现。用户可以调用 `touch_pad_get_status()` 查看被触碰的触摸传感器,或调用 `touch_pad_clear_status()` 清除触摸状态信息。

用户也可以将硬件触摸监测连接至中断,详细介绍见下一章节。

如果测量中存在噪声,且电容变化幅度较小,硬件触摸监测结果可能就不太理想。如需解决这一问题,不建议使用硬件监测或中断信号,建议用户在自己的应用程序中进行采样滤波,并执行触摸监测。请参考 [peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt](#),查看以上两种触摸监测的实现方式。

中断触发 在对触摸监测启用中断之前,请先设置一个触摸监测阈值。然后使用 [触摸状态测量](#) 中所述的函数读取并显示触摸和释放触摸传感器时测得的结果。如果测量中存在噪声且相对电容变化较小,请使用滤波器。用户也可以根据应用程序和环境条件,测试温度和电源电压变化对测量值的影响。

确定监测阈值后就可以在初始化时调用 `touch_pad_config()` 设置此阈值,或在运行时调用 `touch_pad_set_thresh()` 设置此阈值。

下一步就是设置如何触发中断。用户可以设置在阈值以下或以上触发中断,具体触发模式由函数 `touch_pad_set_trigger_mode()` 设置。

最后用户可以使用以下函数配置和管理中断调用:

- `touch_pad_isr_register() / touch_pad_isr_deregister()`
- `touch_pad_intr_enable() / touch_pad_intr_disable()`

中断配置完成后,用户可以调用 `touch_pad_get_status()` 查看中断信号来自哪个触摸传感器,也可以调用 `touch_pad_clear_status()` 清除触摸传感器状态信息。

备注: 触摸监测中的中断信号基于原始/未经滤波的采样 (对比用户设置的阈值),并在硬件中实现。启用软件滤波 API (请参考 [滤波采样](#)) 并不会影响这一过程。

从睡眠模式唤醒 如果使用触摸传感器中断将芯片从睡眠模式唤醒,用户可以选择配置一些触摸传感器,例如 SET1 或 SET1 和 SET2,触摸这些触摸传感器将触发中断并唤醒芯片。请调用 `touch_pad_set_trigger_source()` 实现上述操作。

用户可以使用以下函数管理 ‘SET’ 中触摸传感器所需的位模式配置:

- `touch_pad_set_group_mask() / touch_pad_get_group_mask()`
- `touch_pad_clear_group_mask()`

应用示例

- 触摸传感器读值示例: [peripherals/touch_sensor/touch_sensor_v1/touch_pad_read](#)
- 触摸传感器中断示例: [peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt](#)

API 参考

Header File

- `components/driver/esp32/include/driver/touch_sensor.h`

Functions

`esp_err_t touch_pad_config(touch_pad_t touch_num, uint16_t threshold)`

Configure touch pad interrupt threshold.

备注: If FSM mode is set to TOUCH_FSM_MODE_TIMER, this function will be blocked for one measurement cycle and wait for data to be valid.

参数

- **touch_num** –touch pad index
- **threshold** –interrupt threshold,

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG if argument wrong
- ESP_FAIL if touch pad not initialized

`esp_err_t touch_pad_read(touch_pad_t touch_num, uint16_t *touch_value)`

get touch sensor counter value. Each touch sensor has a counter to count the number of charge/discharge cycles. When the pad is not ‘touched’, we can get a number of the counter. When the pad is ‘touched’, the value in counter will get smaller because of the larger equivalent capacitance.

备注: This API requests hardware measurement once. If IIR filter mode is enabled, please use ‘touch_pad_read_raw_data’ interface instead.

参数

- **touch_num** –touch pad index
- **touch_value** –pointer to accept touch sensor value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

`esp_err_t touch_pad_read_filtered(touch_pad_t touch_num, uint16_t *touch_value)`

get filtered touch sensor counter value by IIR filter.

备注: touch_pad_filter_start has to be called before calling touch_pad_read_filtered. This function can be called from ISR

参数

- **touch_num** –touch pad index
- **touch_value** –pointer to accept touch sensor value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.

- ESP_FAIL Touch pad not initialized

esp_err_t **touch_pad_read_raw_data** (*touch_pad_t* touch_num, uint16_t *touch_value)

get raw data (touch sensor counter value) from IIR filter process. Need not request hardware measurements.

备注: touch_pad_filter_start has to be called before calling touch_pad_read_raw_data. This function can be called from ISR

参数

- **touch_num** –touch pad index
- **touch_value** –pointer to accept touch sensor value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

esp_err_t **touch_pad_set_filter_read_cb** (*filter_cb_t* read_cb)

Register the callback function that is called after each IIR filter calculation.

备注: The ‘read_cb’ callback is called in timer task in each filtering cycle.

参数 **read_cb** –Pointer to filtered callback function. If the argument passed in is NULL, the callback will stop.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG set error

esp_err_t **touch_pad_isr_register** (*intr_handler_t* fn, void *arg)

Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

参数

- **fn** –Pointer to ISR handler
- **arg** –Parameter for ISR

返回

- ESP_OK Success ;
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NO_MEM No memory

esp_err_t **touch_pad_set_meas_time** (uint16_t sleep_cycle, uint16_t meas_cycle)

Set touch sensor measurement and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

备注: The touch sensor on ESP32 will fix measuring cycles (specified by the second parameter) and then record the count of charge and discharge cycles during the sensing period as the raw value. That means the raw value will decrease as the capacity of the touch pad increasing.

备注: The greater the duty cycle of the measurement time, the more system power is consumed.

参数

- **sleep_cycle** –The touch sensor will sleep after each measurement. `sleep_cycle` decide the interval between each measurement. $t_{sleep} = sleep_cycle / (RTC_SLOW_CLK \text{ frequency})$. The approximate frequency value of `RTC_SLOW_CLK` can be obtained using `rtc_clk_slow_freq_get_hz` function.
- **meas_cycle** –The duration of the touch sensor measurement. $t_{meas} = meas_cycle / 8M$, the maximum measure time is $0xffff / 8M = 8.19 \text{ ms}$

返回

- `ESP_OK` on success

esp_err_t **touch_pad_get_meas_time** (*uint16_t* *sleep_cycle, *uint16_t* *meas_cycle)

Get touch sensor measurement and sleep time.

参数

- **sleep_cycle** –Pointer to accept sleep cycle number
- **meas_cycle** –Pointer to accept measurement cycle count.

返回

- `ESP_OK` on success

esp_err_t **touch_pad_sw_start** (void)

Trigger a touch sensor measurement, only support in SW mode of FSM.

返回

- `ESP_OK` on success

esp_err_t **touch_pad_set_thresh** (*touch_pad_t* touch_num, *uint16_t* threshold)

Set touch sensor interrupt threshold.

参数

- **touch_num** –touch pad index
- **threshold** –threshold of touchpad count, refer to `touch_pad_set_trigger_mode` to see how to set trigger mode.

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if argument is wrong

esp_err_t **touch_pad_get_thresh** (*touch_pad_t* touch_num, *uint16_t* *threshold)

Get touch sensor interrupt threshold.

参数

- **touch_num** –touch pad index
- **threshold** –pointer to accept threshold

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if argument is wrong

esp_err_t **touch_pad_set_trigger_mode** (*touch_trigger_mode_t* mode)

Set touch sensor interrupt trigger mode. Interrupt can be triggered either when counter result is less than threshold or when counter result is more than threshold.

参数 **mode** –touch sensor interrupt trigger mode

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if argument is wrong

esp_err_t **touch_pad_get_trigger_mode** (*touch_trigger_mode_t* *mode)

Get touch sensor interrupt trigger mode.

参数 **mode** –pointer to accept touch sensor interrupt trigger mode

返回

- `ESP_OK` on success

***esp_err_t* touch_pad_set_trigger_source** (*touch_trigger_src_t* src)

Set touch sensor interrupt trigger source. There are two sets of touch signals. Set1 and set2 can be mapped to several touch signals. Either set will be triggered if at least one of its touch signal is ‘touched’. The interrupt can be configured to be generated if set1 is triggered, or only if both sets are triggered.

参数 **src** –touch sensor interrupt trigger source

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

***esp_err_t* touch_pad_get_trigger_source** (*touch_trigger_src_t* *src)

Get touch sensor interrupt trigger source.

参数 **src** –pointer to accept touch sensor interrupt trigger source

返回

- ESP_OK on success

***esp_err_t* touch_pad_set_group_mask** (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)

Set touch sensor group mask. Touch pad module has two sets of signals, ‘Touched’ signal is triggered only if at least one of touch pad in this group is “touched”. This function will set the register bits according to the given bitmask.

参数

- **set1_mask** –bitmask of touch sensor signal group1, it’ s a 10-bit value
- **set2_mask** –bitmask of touch sensor signal group2, it’ s a 10-bit value
- **en_mask** –bitmask of touch sensor work enable, it’ s a 10-bit value

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

***esp_err_t* touch_pad_get_group_mask** (uint16_t *set1_mask, uint16_t *set2_mask, uint16_t *en_mask)

Get touch sensor group mask.

参数

- **set1_mask** –pointer to accept bitmask of touch sensor signal group1, it’ s a 10-bit value
- **set2_mask** –pointer to accept bitmask of touch sensor signal group2, it’ s a 10-bit value
- **en_mask** –pointer to accept bitmask of touch sensor work enable, it’ s a 10-bit value

返回

- ESP_OK on success

***esp_err_t* touch_pad_clear_group_mask** (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)

Clear touch sensor group mask. Touch pad module has two sets of signals, Interrupt is triggered only if at least one of touch pad in this group is “touched”. This function will clear the register bits according to the given bitmask.

参数

- **set1_mask** –bitmask touch sensor signal group1, it’ s a 10-bit value
- **set2_mask** –bitmask touch sensor signal group2, it’ s a 10-bit value
- **en_mask** –bitmask of touch sensor work enable, it’ s a 10-bit value

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

***esp_err_t* touch_pad_intr_enable** (void)

To enable touch pad interrupt.

返回

- ESP_OK on success

***esp_err_t* touch_pad_intr_disable** (void)

To disable touch pad interrupt.

返回

- ESP_OK on success

esp_err_t **touch_pad_intr_clear** (void)

To clear touch pad interrupt.

返回

- ESP_OK on success

esp_err_t **touch_pad_set_filter_period** (uint32_t new_period_ms)

set touch pad filter calibration period, in ms. Need to call touch_pad_filter_start before all touch filter APIs

参数 **new_period_ms** –filter period, in ms

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

esp_err_t **touch_pad_get_filter_period** (uint32_t *p_period_ms)

get touch pad filter calibration period, in ms Need to call touch_pad_filter_start before all touch filter APIs

参数 **p_period_ms** –pointer to accept period

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

esp_err_t **touch_pad_filter_start** (uint32_t filter_period_ms)

start touch pad filter function This API will start a filter to process the noise in order to prevent false triggering when detecting slight change of capacitance. Need to call touch_pad_filter_start before all touch filter APIs

备注: This filter uses FreeRTOS timer, which is dispatched from a task with priority 1 by default on CPU 0. So if some application task with higher priority takes a lot of CPU0 time, then the quality of data obtained from this filter will be affected. You can adjust FreeRTOS timer task priority in menuconfig.

参数 **filter_period_ms** –filter calibration period, in ms

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter error
- ESP_ERR_NO_MEM No memory for driver
- ESP_ERR_INVALID_STATE driver state error

esp_err_t **touch_pad_filter_stop** (void)

stop touch pad filter function Need to call touch_pad_filter_start before all touch filter APIs

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error

esp_err_t **touch_pad_filter_delete** (void)

delete touch pad filter driver and release the memory Need to call touch_pad_filter_start before all touch filter APIs

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error

Type Definitions

```
typedef void (*filter_cb_t)(uint16_t *raw_value, uint16_t *filtered_value)
```

Callback function that is called after each IIR filter calculation.

备注: This callback is called in timer task in each filtering cycle.

备注: This callback should not be blocked.

Param raw_value The latest raw data(touch sensor counter value) that points to all channels(`raw_value[0..TOUCH_PAD_MAX-1]`).

Param filtered_value The latest IIR filtered data(calculated from raw data) that points to all channels(`filtered_value[0..TOUCH_PAD_MAX-1]`).

Header File

- [components/driver/include/driver/touch_sensor_common.h](#)

Functions

esp_err_t **touch_pad_init** (void)

Initialize touch module.

备注: If default parameter don't match the usage scenario, it can be changed after this function.

返回

- ESP_OK Success
- ESP_ERR_NO_MEM Touch pad init error
- ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL

esp_err_t **touch_pad_deinit** (void)

Un-install touch pad driver.

备注: After this function is called, other touch functions are prohibited from being called.

返回

- ESP_OK Success
- ESP_FAIL Touch pad driver not initialized

esp_err_t **touch_pad_io_init** (*touch_pad_t* touch_num)

Initialize touch pad GPIO.

参数 touch_num –touch pad index

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t **touch_pad_set_voltage** (*touch_high_volt_t* refh, *touch_low_volt_t* refl, *touch_volt_atten_t* atten)

Set touch sensor high voltage threshold of chanrge. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

参数

- **refh** –the value of DREFH
- **refl** –the value of DREFL

- **atten** –the attenuation on DREFH
- 返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t **touch_pad_get_voltage** (*touch_high_volt_t* *refh, *touch_low_volt_t* *refl, *touch_volt_atten_t* *atten)

Get touch sensor reference voltage,.

参数

- **refh** –pointer to accept DREFH value
- **refl** –pointer to accept DREFL value
- **atten** –pointer to accept the attenuation on DREFH

返回

- ESP_OK on success

esp_err_t **touch_pad_set_cnt_mode** (*touch_pad_t* touch_num, *touch_cnt_slope_t* slope, *touch_tie_opt_t* opt)

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

备注: The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

参数

- **touch_num** –touch pad index
- **slope** –touch pad charge/discharge speed
- **opt** –the initial voltage

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t **touch_pad_get_cnt_mode** (*touch_pad_t* touch_num, *touch_cnt_slope_t* *slope, *touch_tie_opt_t* *opt)

Get touch sensor charge/discharge speed for each pad.

参数

- **touch_num** –touch pad index
- **slope** –pointer to accept touch pad charge/discharge slope
- **opt** –pointer to accept the initial voltage

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t **touch_pad_isr_deregister** (void (*fn)(void*), void *arg)

Deregister the handler previously registered using touch_pad_isr_handler_register.

参数

- **fn** –handler function to call (as passed to touch_pad_isr_handler_register)
- **arg** –argument of the handler (as passed to touch_pad_isr_handler_register)

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if a handler matching both fn and arg isn't registered

esp_err_t **touch_pad_get_wakeup_status** (*touch_pad_t* *pad_num)

Get the touch pad which caused wakeup from deep sleep.

参数 **pad_num** –pointer to touch pad which caused wakeup

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

esp_err_t **touch_pad_set_fsm_mode** (*touch_fsm_mode_t* mode)

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

参数 mode –FSM mode

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t **touch_pad_get_fsm_mode** (*touch_fsm_mode_t* *mode)

Get touch sensor FSM mode.

参数 mode –pointer to accept FSM mode

返回

- ESP_OK on success

esp_err_t **touch_pad_clear_status** (void)

To clear the touch sensor channel active status.

备注: The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

返回

- ESP_OK on success

uint32_t **touch_pad_get_status** (void)

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

返回

- The touch sensor status. e.g. Touch1 trigger status is `status_mask & (BIT1)`.

bool **touch_pad_meas_is_done** (void)

Check touch sensor measurement status.

返回

- True measurement is under way
- False measurement done

GPIO 宏查找表 用户可以使用宏定义某一触摸传感器通道的 GPIO，或定义某一 GPIO 的通道。例如：

1. TOUCH_PAD_NUM5_GPIO_NUM 定义了通道 5 的 GPIO（即 GPIO 12）；
2. TOUCH_PAD_GPIO4_CHANNEL 定义了 GPIO 4 的通道（即通道 0）。

The wakeup trigger source can be SET1 or both SET1 and SET2

Enumerations

enum **touch_pad_t**

Touch pad channel

Values:

enumerator **TOUCH_PAD_NUM0**

Touch pad channel 0 is GPIO4(ESP32)

enumerator **TOUCH_PAD_NUM1**

Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

enumerator **TOUCH_PAD_NUM2**

Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

enumerator **TOUCH_PAD_NUM3**

Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

enumerator **TOUCH_PAD_NUM4**

Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

enumerator **TOUCH_PAD_NUM5**

Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

enumerator **TOUCH_PAD_NUM6**

Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

enumerator **TOUCH_PAD_NUM7**

Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

enumerator **TOUCH_PAD_NUM8**

Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

enumerator **TOUCH_PAD_NUM9**

Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

enumerator **TOUCH_PAD_MAX**

enum **touch_high_volt_t**

Touch sensor high reference voltage

Values:

enumerator **TOUCH_HVOLT_KEEP**

Touch sensor high reference voltage, no change

enumerator **TOUCH_HVOLT_2V4**

Touch sensor high reference voltage, 2.4V

enumerator **TOUCH_HVOLT_2V5**

Touch sensor high reference voltage, 2.5V

enumerator **TOUCH_HVOLT_2V6**

Touch sensor high reference voltage, 2.6V

enumerator **TOUCH_HVOLT_2V7**

Touch sensor high reference voltage, 2.7V

enumerator **TOUCH_HVOLT_MAX**

enum **touch_low_volt_t**

Touch sensor low reference voltage

Values:

enumerator **TOUCH_LVOLT_KEEP**

Touch sensor low reference voltage, no change

enumerator **TOUCH_LVOLT_0V5**
Touch sensor low reference voltage, 0.5V

enumerator **TOUCH_LVOLT_0V6**
Touch sensor low reference voltage, 0.6V

enumerator **TOUCH_LVOLT_0V7**
Touch sensor low reference voltage, 0.7V

enumerator **TOUCH_LVOLT_0V8**
Touch sensor low reference voltage, 0.8V

enumerator **TOUCH_LVOLT_MAX**

enum **touch_volt_atten_t**
Touch sensor high reference voltage attenuation

Values:

enumerator **TOUCH_HVOLT_ATTEN_KEEP**
Touch sensor high reference voltage attenuation, no change

enumerator **TOUCH_HVOLT_ATTEN_1V5**
Touch sensor high reference voltage attenuation, 1.5V attenuation

enumerator **TOUCH_HVOLT_ATTEN_1V**
Touch sensor high reference voltage attenuation, 1.0V attenuation

enumerator **TOUCH_HVOLT_ATTEN_0V5**
Touch sensor high reference voltage attenuation, 0.5V attenuation

enumerator **TOUCH_HVOLT_ATTEN_0V**
Touch sensor high reference voltage attenuation, 0V attenuation

enumerator **TOUCH_HVOLT_ATTEN_MAX**

enum **touch_cnt_slope_t**
Touch sensor charge/discharge speed

Values:

enumerator **TOUCH_PAD_SLOPE_0**
Touch sensor charge / discharge speed, always zero

enumerator **TOUCH_PAD_SLOPE_1**
Touch sensor charge / discharge speed, slowest

enumerator **TOUCH_PAD_SLOPE_2**
Touch sensor charge / discharge speed

enumerator **TOUCH_PAD_SLOPE_3**

Touch sensor charge / discharge speed

enumerator **TOUCH_PAD_SLOPE_4**

Touch sensor charge / discharge speed

enumerator **TOUCH_PAD_SLOPE_5**

Touch sensor charge / discharge speed

enumerator **TOUCH_PAD_SLOPE_6**

Touch sensor charge / discharge speed

enumerator **TOUCH_PAD_SLOPE_7**

Touch sensor charge / discharge speed, fast

enumerator **TOUCH_PAD_SLOPE_MAX**

enum **touch_tie_opt_t**

Touch sensor initial charge level

Values:

enumerator **TOUCH_PAD_TIE_OPT_LOW**

Initial level of charging voltage, low level

enumerator **TOUCH_PAD_TIE_OPT_HIGH**

Initial level of charging voltage, high level

enumerator **TOUCH_PAD_TIE_OPT_MAX**

enum **touch_fsm_mode_t**

Touch sensor FSM mode

Values:

enumerator **TOUCH_FSM_MODE_TIMER**

To start touch FSM by timer

enumerator **TOUCH_FSM_MODE_SW**

To start touch FSM by software trigger

enumerator **TOUCH_FSM_MODE_MAX**

enum **touch_trigger_mode_t**

Values:

enumerator **TOUCH_TRIGGER_BELOW**

Touch interrupt will happen if counter value is less than threshold.

enumerator **TOUCH_TRIGGER_ABOVE**

Touch interrupt will happen if counter value is larger than threshold.

enumerator **TOUCH_TRIGGER_MAX**

enum **touch_trigger_src_t**

Values:

enumerator **TOUCH_TRIGGER_SOURCE_BOTH**

wakeup interrupt is generated if both SET1 and SET2 are “touched”

enumerator **TOUCH_TRIGGER_SOURCE_SET1**

wakeup interrupt is generated if SET1 is “touched”

enumerator **TOUCH_TRIGGER_SOURCE_MAX**

2.3.21 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32’s peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

警告: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

1. *TWAI Protocol Summary*
2. *Signals Lines and Transceiver*
3. *Driver Configuration*
4. *Driver Operation*
5. *Examples*

TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

Asynchronous: The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

Error Detection and Signalling: Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

Message Priorities: Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

TWAI Messages TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

Error States and Counters The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

Error Active: A node is Error Active when **both TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

Error Passive: A node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

Bus-Off: A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required**. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32’s GPIO pads.

TX and RX: The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

BUS-OFF: The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

CLKOUT: The CLKOUT signal line is **optional** and outputs a prescaled version of the controller’s source clock (APB Clock).

备注: An external transceiver **must internally loopback the TX to RX** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

图 19: Signal lines of the TWAI controller

Driver Configuration

This section covers how to configure the TWAI driver.

Operating Modes The TWAI driver supports the following modes of operations:

Normal Mode: The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

No Ack Mode: The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

Listen Only Mode: This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

Alerts The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

表 5: TWAI Driver Alerts

Alert Flag	Description
TWAI_ALERT_TX_IDLE	No more messages queued for transmission
TWAI_ALERT_TX_SUCCESS	The previous transmission was successful
TWAI_ALERT_RX_DATA	A frame has been received and added to the RX queue
TWAI_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
TWAI_ALERT_ERR_ACTIVE	TWAI controller has become error active
TWAI_ALERT_RECOVERY_IN_PROGRESS	TWAI controller is undergoing bus recovery
TWAI_ALERT_BUS_RECOVERED	TWAI controller has successfully completed bus recovery
TWAI_ALERT_ARB_LOST	The previous transmission lost arbitration
TWAI_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
TWAI_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
TWAI_ALERT_TX_FAILED	The previous transmission has failed
TWAI_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
TWAI_ALERT_ERR_PASS	TWAI controller has become error passive
TWAI_ALERT_BUS_OFF	Bus-off condition occurred. TWAI controller can no longer influence bus

备注: The TWAI controller's **error warning limit** is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the **error warning limit** to **96**. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below **96**.

备注: When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the [CONFIG_TWAI_ISR_IN_IRAM](#) option is enabled (see [Placing ISR into IRAM](#)).

备注: The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

Bit Timing The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quantum** is determined by a prescaled version of the TWAI controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller's source clock (80 MHz APB clock). On the ESP32, the `brp` can be **any even number from 2 to 128**.

If the ESP32 is a revision 2 or later chip, the `brp` will **also support any multiple of 4 from 132 to 256**, and can be enabled by setting the [CONFIG_ESP32_REV_MIN](#) to revision 2 or higher.

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

图 20: Bit timing configuration for 500kbit/s given BRP = 8

备注: Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay**, **node information processing time**, and **phase errors**.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS()`
- `TWAI_TIMING_CONFIG_800KBITS()`
- `TWAI_TIMING_CONFIG_500KBITS()`
- `TWAI_TIMING_CONFIG_250KBITS()`
- `TWAI_TIMING_CONFIG_125KBITS()`
- `TWAI_TIMING_CONFIG_100KBITS()`
- `TWAI_TIMING_CONFIG_50KBITS()`
- `TWAI_TIMING_CONFIG_25KBITS()`

Revision 2 or later of the ESP32 also supports the following bit rates:

- `TWAI_TIMING_CONFIG_20KBITS()`
- `TWAI_TIMING_CONFIG_16KBITS()`
- `TWAI_TIMING_CONFIG_12_5KBITS()`

Acceptance Filter The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Dual Filter Mode will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Disabling TX Queue The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

图 21: Bit layout of single filter mode (Right side MSBit)

图 22: Bit layout of dual filter mode (Right side MSBit)

Placing ISR into IRAM The TWAI driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver's RX queue.
- Load messages pending transmission from the driver's TX queue and write them into the TX buffer.

To place the TWAI driver's ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

备注: When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

图 23: State transition diagram of the TWAI driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled -> Stopped	<code>twai_driver_install()</code>
B	Stopped -> Uninstalled	<code>twai_driver_uninstall()</code>
C	Stopped -> Running	<code>twai_start()</code>
D	Running -> Stopped	<code>twai_stop()</code>
E	Running -> Bus-Off	Transmit Error Counter \geq 256
F	Bus-Off -> Uninstalled	<code>twai_driver_uninstall()</code>
G	Bus-Off -> Recovering	<code>twai_initiate_recovery()</code>
H	Recovering -> Stopped	128 occurrences of 11 consecutive recessive bits.

Driver States Uninstalled: In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

Stopped: In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

Running: In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

Bus-Off: The bus-off state is automatically entered when the TWAI controller's Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

Recovering: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

Message Fields and Flags The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:

Message Flag	Description
<code>TWAI_MSG_FLAG_EXTD</code>	Message is in Extended Frame Format (29bit ID)
<code>TWAI_MSG_FLAG_RTR</code>	Message is a Remote Frame (Remote Transmission Request)
<code>TWAI_MSG_FLAG_SS</code>	Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.
<code>TWAI_MSG_FLAG_SELF</code>	Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.
<code>TWAI_MSG_FLAG_DLC_NON</code>	Message's Data length code is larger than 8. This will break compliance with TWAI
<code>TWAI_MSG_FLAG_NONE</code>	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

Examples

Configuration & Installation The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```

#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
↪NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}

```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

Message Transmission The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```

#include "driver/twai.h"

...

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

```

Message Reception The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```

#include "driver/twai.h"

...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

```

Reconfiguring and Reading Alerts The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```

#include "driver/twai.h"

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

```

Stop and Uninstall The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```

#include "driver/twai.h"

...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

```

(下页继续)

```
//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101
```

Application Examples **Network Example:** The TWAI Network example demonstrates communication between two ESP32s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via [peripherals/twai/twai_network](#).

Alert and Recovery Example: This example demonstrates how to use the TWAI driver's alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/twai/twai_alert_and_recovery](#).

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via [peripherals/twai/twai_self_test](#).

API Reference

Header File

- [components/hal/include/hal/twai_types.h](#)

Structures

struct `twai_message_t`

Structure to store a TWAI message.

备注: The flags member is deprecated

Public Members

uint32_t **extd**

Extended Frame Format (29bit ID)

uint32_t **rtr**

Message is a Remote Frame

uint32_t **ss**

Transmit as a Single Shot Transmission. Unused for received.

uint32_t **self**

Transmit as a Self Reception Request. Unused for received.

uint32_t **dlc_non_comp**

Message's Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32_t **reserved**

Reserved bits

uint32_t **flags**

Deprecated: Alternate way to set bits using message flags

uint32_t **identifier**

11 or 29 bit identifier

uint8_t **data_length_code**

Data length code

uint8_t **data**[8]

Data bytes (not relevant in RTR frame)

struct **twai_timing_config_t**

Structure for bit timing configuration of the TWAI driver.

备注: Macro initializers are available for this structure

Public Members

uint32_t **brp**

Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8_t **tseg_1**

Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t **tseg_2**

Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t **sjw**

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool **triple_sampling**

Enables triple sampling when the TWAI controller samples a bit

struct **twai_filter_config_t**

Structure for acceptance filter configuration of the TWAI driver (see documentation)

备注: Macro initializers are available for this structure

Public Members

uint32_t **acceptance_code**

32-bit acceptance code

uint32_t **acceptance_mask**

32-bit acceptance mask

bool **single_filter**

Use Single Filter Mode (see documentation)

Macros

TWAI_EXTD_ID_MASK

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

TWAI_STD_ID_MASK

Bit mask for 11 bit Standard Frame Format ID

TWAI_FRAME_MAX_DLC

Max data bytes allowed in TWAI

TWAI_FRAME_EXTD_ID_LEN_BYTES

EFF ID requires 4 bytes (29bit)

TWAI_FRAME_STD_ID_LEN_BYTES

SFF ID requires 2 bytes (11bit)

TWAI_ERR_PASS_THRESH

Error counter threshold for error passive

Enumerations

enum **twai_mode_t**

TWAI Controller operating modes.

Values:

enumerator **TWAI_MODE_NORMAL**

Normal operating mode where TWAI controller can send/receive/acknowledge messages

enumerator **TWAI_MODE_NO_ACK**

Transmission does not require acknowledgment. Use this mode for self testing

enumerator **TWAI_MODE_LISTEN_ONLY**

The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File

Functions

esp_err_t **twai_driver_install** (const *twai_general_config_t* *g_config, const *twai_timing_config_t* *t_config, const *twai_filter_config_t* *f_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

备注: Macro initializers are available for the configuration structures (see documentation)

备注: To reinstall the TWAI driver, call `twai_driver_uninstall()` first

参数

- **g_config** –[in] General configuration structure
- **t_config** –[in] Timing configuration structure
- **f_config** –[in] Filter configuration structure

返回

- **ESP_OK**: Successfully installed TWAI driver
- **ESP_ERR_INVALID_ARG**: Arguments are invalid
- **ESP_ERR_NO_MEM**: Insufficient memory
- **ESP_ERR_INVALID_STATE**: Driver is already installed

esp_err_t **twai_driver_uninstall** (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

警告: The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

返回

- **ESP_OK**: Successfully uninstalled TWAI driver
- **ESP_ERR_INVALID_STATE**: Driver is not in stopped/bus-off state, or is not installed

esp_err_t twai_start (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

返回

- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

esp_err_t twai_stop (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until twai_start() is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

警告: A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

返回

- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

esp_err_t twai_transmit (const *twai_message_t* *message, TickType_t ticks_to_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

备注: This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

备注: The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

参数

- **message** **–[in]** Message to transmit
- **ticks_to_wait** **–[in]** Number of FreeRTOS ticks to block on the TX queue

返回

- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

esp_err_t **twai_receive** (*twai_message_t* *message, TickType_t ticks_to_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

警告: The flags field of the received message should be checked to determine if the received message contains any data bytes.

参数

- **message** –[out] Received message
- **ticks_to_wait** –[in] Number of FreeRTOS ticks to block on RX queue

返回

- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_read_alerts** (uint32_t *alerts, TickType_t ticks_to_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

备注: Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

参数

- **alerts** –[out] Bit field of raised alerts (see documentation for alert flags)
- **ticks_to_wait** –[in] Number of FreeRTOS ticks to block for alert

返回

- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_reconfigure_alerts** (uint32_t alerts_enabled, uint32_t *current_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

参数

- **alerts_enabled** –[in] Bit field of alerts to enable (see documentation for alert flags)
- **current_alerts** –[out] Bit field of currently raised alerts. Set to NULL if unused

返回

- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_initiate_recovery** (void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

备注: The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

返回

- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

esp_err_t **twai_get_status_info** (*twai_status_info_t* *status_info)

Get current status information of the TWAI driver.

参数 *status_info* –[out] Status information

返回

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_clear_transmit_queue** (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

备注: The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

返回

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

esp_err_t **twai_clear_receive_queue** (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

备注: The receive queue is automatically cleared when `twai_start()` is called.

返回

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

Structures

struct **twai_general_config_t**

Structure for general configuration of the TWAI driver.

备注: Macro initializers are available for this structure

Public Members

twai_mode_t **mode**

Mode of TWAI controller

gpio_num_t **tx_io**

Transmit GPIO number

gpio_num_t **rx_io**

Receive GPIO number

gpio_num_t **clkout_io**

CLKOUT GPIO number (optional, set to -1 if unused)

gpio_num_t **bus_off_io**

Bus off indicator GPIO number (optional, set to -1 if unused)

uint32_t **tx_queue_len**

Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32_t **rx_queue_len**

Number of messages RX queue can hold

uint32_t **alerts_enabled**

Bit field of alerts to enable (see documentation)

uint32_t **clkout_divider**

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int **intr_flags**

Interrupt flags to set the priority of the driver's ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

struct **twai_status_info_t**

Structure to store status information of TWAI driver.

Public Members

twai_state_t **state**

Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32_t **msgs_to_tx**

Number of messages queued for transmission or awaiting transmission completion

uint32_t **msgs_to_rx**

Number of messages in RX queue waiting to be read

uint32_t **tx_error_counter**

Current value of Transmit Error Counter

uint32_t **rx_error_counter**

Current value of Receive Error Counter

uint32_t **tx_failed_count**

Number of messages that failed transmissions

uint32_t **rx_missed_count**

Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t **rx_overrun_count**

Number of messages that were lost due to a RX FIFO overrun

uint32_t **arb_lost_count**

Number of instances arbitration was lost

uint32_t **bus_error_count**

Number of instances a bus error has occurred

Macros

TWAI_IO_UNUSED

Marks GPIO as unused in TWAI configuration

Enumerations

enum **twai_state_t**

TWAI driver states.

Values:

enumerator **TWAI_STATE_STOPPED**

Stopped state. The TWAI controller will not participate in any TWAI bus activities

enumerator **TWAI_STATE_RUNNING**

Running state. The TWAI controller can transmit and receive messages

enumerator **TWAI_STATE_BUS_OFF**

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

enumerator **TWAI_STATE_RECOVERING**

Recovering state. The TWAI controller is undergoing bus recovery

2.3.22 Universal Asynchronous Receiver/Transmitter (UART)

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32 chip has three UART controllers (UART0, UART1, and UART2), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

Functional Overview

The following overview describes how to establish communication between an ESP32 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. *Setting Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Setting Communication Pins* - Assigning pins for connection to a device.
3. *Driver Installation* - Allocating ESP32's resources for the UART driver.
4. *Running UART Communication* - Sending / receiving data
5. *Using Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver's functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

Setting Communication Parameters UART communication parameters can be configured all in a single step or individually in multiple steps.

Single Step Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to [peripherals/uart/uart_echo](#).

Multiple Steps Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

表 6: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

Setting Communication Pins After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

Driver Installation Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

Running UART Communication Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

Transmitting After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

Receiving Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

Software Flow Control If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

Communication Mode Selection The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

Using Interrupts There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in *ESP32 Technical Reference Manual > UART Controller (UART) > UART Interrupts* and *UHCI Interrupts [PDF]*. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

By default, the `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection:** There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in *Driver Installation*. An example of using Event detection can be found in `peripherals/uart/uart_events`.
- **FIFO space threshold or transmission timeout reached:** The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
 - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
 - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
 - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`
- **Pattern detection:** An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
 - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
 - Disable the interrupt using `uart_disable_pattern_det_intr()`

Macros The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

Deleting a Driver If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

Overview of RS485 specific communication options

备注: The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see *ESP32 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]*. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section *Interface Connection Options*). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the

user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the \sim RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

Interface Connection Options This section provides example schematics to demonstrate the basic aspects of ESP32's RS485 interface connection.

备注:

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

Circuit A: Collision Detection Circuit

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

Circuit C: Auto Switching Transmitter/Receiver

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

Application Examples

The table below describes the code examples available in the directory `peripherals/uart/`.

Code Example	Description
peripherals/uart/uart_echo	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
peripherals/uart/uart_events	Reporting various communication events, using pattern detection interrupts.
peripherals/uart/uart_async_rxtxtasks	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
peripherals/uart/uart_select	Using synchronous I/O multiplexing for UART file descriptors.
peripherals/uart/uart_echo_rs485	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to peripherals/uart/uart_echo but allows communication through an RS485 interface chip connected to ESP32 pins.
peripherals/uart/nmea0183_parser	Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.

API Reference

Header File

- `components/driver/include/driver/uart.h`

Functions

esp_err_t **uart_driver_install** (*uart_port_t* uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, *QueueHandle_t* *uart_queue, int intr_alloc_flags)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

备注: Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **rx_buffer_size** –UART RX ring buffer size.
- **tx_buffer_size** –UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue_size** –UART event queue size/depth.
- **uart_queue** –UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver's ISR handler is not located in IRAM)

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_driver_delete** (*uart_port_t* uart_num)

Uninstall UART driver.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

bool **uart_is_driver_installed** (*uart_port_t* uart_num)

Checks whether the driver is installed or not.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- true driver is installed
- false driver is not installed

esp_err_t **uart_set_word_length** (*uart_port_t* uart_num, *uart_word_length_t* data_bit)

Set UART data bits.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **data_bit** –UART data bits

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_word_length** (*uart_port_t* uart_num, *uart_word_length_t* *data_bit)

Get the UART data bit configuration.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **data_bit** –Pointer to accept value of UART data bits.

返回

- ESP_FAIL Parameter error

- ESP_OK Success, result will be put in (*data_bit)

esp_err_t **uart_set_stop_bits** (*uart_port_t* uart_num, *uart_stop_bits_t* stop_bits)

Set UART stop bits.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits** –UART stop bits

返回

- ESP_OK Success
- ESP_FAIL Fail

esp_err_t **uart_get_stop_bits** (*uart_port_t* uart_num, *uart_stop_bits_t* *stop_bits)

Get the UART stop bit configuration.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits** –Pointer to accept value of UART stop bits.

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

esp_err_t **uart_set_parity** (*uart_port_t* uart_num, *uart_parity_t* parity_mode)

Set UART parity mode.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **parity_mode** –the enum of uart parity configuration

返回

- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t **uart_get_parity** (*uart_port_t* uart_num, *uart_parity_t* *parity_mode)

Get the UART parity mode configuration.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **parity_mode** –Pointer to accept value of UART parity mode.

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

esp_err_t **uart_set_baudrate** (*uart_port_t* uart_num, uint32_t baudrate)

Set UART baud rate.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** –UART baud rate.

返回

- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t **uart_get_baudrate** (*uart_port_t* uart_num, uint32_t *baudrate)

Get the UART baud rate configuration.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** –Pointer to accept value of UART baud rate

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

esp_err_t **uart_set_line_inverse** (*uart_port_t* uart_num, uint32_t inverse_mask)

Set UART line inverse mode.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **inverse_mask** –Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_hw_flow_ctrl** (*uart_port_t* uart_num, *uart_hw_flowcontrol_t* flow_ctrl, uint8_t rx_thresh)

Set hardware flow control.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** –Hardware flow control mode
- **rx_thresh** –Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_sw_flow_ctrl** (*uart_port_t* uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)

Set software flow control.

参数

- **uart_num** –UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **enable** –switch on or off
- **rx_thresh_xon** –low water mark
- **rx_thresh_xoff** –high water mark

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_hw_flow_ctrl** (*uart_port_t* uart_num, *uart_hw_flowcontrol_t* *flow_ctrl)

Get the UART hardware flow control configuration.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** –Option for different flow control mode.

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

esp_err_t **uart_clear_intr_status** (*uart_port_t* uart_num, uint32_t clr_mask)

Clear UART interrupt status.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **clr_mask** –Bit mask of the interrupt status to be cleared.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_intr_mask** (*uart_port_t* uart_num, uint32_t enable_mask)

Set UART interrupt enable.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

- **enable_mask** –Bit mask of the enable bits.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_intr_mask** (*uart_port_t* uart_num, uint32_t disable_mask)

Clear UART interrupt enable bits.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **disable_mask** –Bit mask of the disable bits.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_rx_intr** (*uart_port_t* uart_num)

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_rx_intr** (*uart_port_t* uart_num)

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_tx_intr** (*uart_port_t* uart_num)

Disable UART TX interrupt (TXFIFO_EMPTY INTERRUPT)

参数 **uart_num** –UART port number

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_tx_intr** (*uart_port_t* uart_num, int enable, int thresh)

Enable UART TX interrupt (TXFIFO_EMPTY INTERRUPT)

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **enable** –1: enable; 0: disable
- **thresh** –Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_isr_register** (*uart_port_t* uart_num, void (*fn)(void*), void *arg, int intr_alloc_flags, *uart_isr_handle_t* *handle)

Register UART interrupt handler (ISR).

备注: UART ISR handler will be attached to the same CPU core that this function is running on.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **fn** –Interrupt handler function.
- **arg** –parameter for handler function

- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_isr_free** (*uart_port_t* uart_num)

Free UART interrupt handler registered by `uart_isr_register`. Must be called on the same core as `uart_isr_register` was called.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_pin** (*uart_port_t* uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)

Assign signals of a UART peripheral to GPIO pins.

备注: If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0's default TX pin and GPIO3 is UART0's default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

备注: Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **tx_io_num** –UART TX pin GPIO number.
- **rx_io_num** –UART RX pin GPIO number.
- **rts_io_num** –UART RTS pin GPIO number.
- **cts_io_num** –UART CTS pin GPIO number.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_rts** (*uart_port_t* uart_num, int level)

Manually set the UART RTS pin level.

备注: UART must be configured with hardware flow control disabled.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **level** –1: RTS output low (active); 0: RTS output high (block)

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_dtr** (*uart_port_t* uart_num, int level)

Manually set the UART DTR pin level.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **level** –1: DTR output low; 0: DTR output high

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_tx_idle_num** (*uart_port_t* uart_num, uint16_t idle_num)

Set UART idle interval after tx FIFO is empty.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **idle_num** –idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_param_config** (*uart_port_t* uart_num, const *uart_config_t* *uart_config)

Set UART configuration parameters.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **uart_config** –UART parameter settings

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_intr_config** (*uart_port_t* uart_num, const *uart_intr_config_t* *intr_conf)

Configure UART interrupts.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **intr_conf** –UART interrupt settings

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_wait_tx_done** (*uart_port_t* uart_num, TickType_t ticks_to_wait)

Wait until UART TX FIFO is empty.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **ticks_to_wait** –Timeout, count in RTOS ticks

返回

- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

int **uart_tx_chars** (*uart_port_t* uart_num, const char *buffer, uint32_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

备注: This function should only be used when UART TX buffer is not enabled.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **buffer** –data buffer address
- **len** –data length to send

返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_write_bytes** (*uart_port_t* uart_num, const void *src, size_t size)

Send data to the UART port from a given buffer and length,.

If the UART driver' s parameter 'tx_buffer_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **src** –data buffer address
- **size** –data length to send

返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_write_bytes_with_break** (*uart_port_t* uart_num, const void *src, size_t size, int brk_len)

Send data to the UART port from a given buffer and length,.

If the UART driver' s parameter 'tx_buffer_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **src** –data buffer address
- **size** –data length to send
- **brk_len** –break signal duration(unit: the time it takes to send one bit at current baudrate)

返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_read_bytes** (*uart_port_t* uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)

UART read bytes from UART buffer.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **buf** –pointer to the buffer.
- **length** –data length
- **ticks_to_wait** –sTimeout, count in RTOS ticks

返回

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

esp_err_t **uart_flush** (*uart_port_t* uart_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

备注: Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
 返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_flush_input** (*uart_port_t* uart_num)

Clear input buffer, discard all the data is in the ring-buffer.

备注: In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
 返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_buffered_data_len** (*uart_port_t* uart_num, *size_t* *size)

UART get RX ring buffer cached data length.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **size** –Pointer of *size_t* to accept cached data length

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_tx_buffer_free_size** (*uart_port_t* uart_num, *size_t* *size)

UART get TX ring buffer free space size.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **size** –Pointer of *size_t* to accept the free space size

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_disable_pattern_det_intr** (*uart_port_t* uart_num)

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
 返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_pattern_det_intr** (*uart_port_t* uart_num, *char* pattern_chr, *uint8_t* chr_num, *int* chr_tout, *int* post_idle, *int* pre_idle)

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

备注: This function only works for esp32. And this function is deprecated, please use `uart_enable_pattern_det_baud_intr` instead.

参数

- **uart_num** –UART port number.
- **pattern_chr** –character of the pattern.
- **chr_num** –number of the character, 8bit value.

- **chr_tout** –timeout of the interval between each pattern characters, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take this data as at_cmd char.
- **post_idle** –idle time after the last pattern character, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take the previous data as the last at_cmd char
- **pre_idle** –idle time before the first pattern character, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take this data as the first at_cmd char.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_pattern_det_baud_intr** (*uart_port_t* uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)

UART enable pattern detect function. Designed for applications like ‘AT commands’ . When the hardware detect a series of one same character, the interrupt will be triggered.

参数

- **uart_num** –UART port number.
- **pattern_chr** –character of the pattern.
- **chr_num** –number of the character, 8bit value.
- **chr_tout** –timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- **post_idle** –idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char
- **pre_idle** –idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

int **uart_pattern_pop_pos** (*uart_port_t* uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

备注: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

int **uart_pattern_get_pos** (*uart_port_t* uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos`. It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

备注: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

参数 `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

esp_err_t `uart_pattern_queue_reset` (*uart_port_t* uart_num, int queue_length)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

参数

- `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).
- `queue_length` –Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

返回

- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t `uart_set_mode` (*uart_port_t* uart_num, *uart_mode_t* mode)

UART set communication mode.

备注: This function must be executed after `uart_driver_install()`, when the driver object is initialized.

参数

- `uart_num` –Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `mode` –UART UART mode to set

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t `uart_set_rx_full_threshold` (*uart_port_t* uart_num, int threshold)

Set uart threshold value for RX fifo full.

备注: If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

参数

- `uart_num` –UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `threshold` –Threshold value above which RX fifo full interrupt is generated

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_set_tx_empty_threshold** (*uart_port_t* uart_num, int threshold)

Set uart threshold values for TX fifo empty.

参数

- **uart_num** –UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **threshold** –Threshold value below which TX fifo empty interrupt is generated

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_set_rx_timeout** (*uart_port_t* uart_num, const uint8_t tout_thresh)

UART set threshold timeout for TOUT feature.

参数

- **uart_num** –Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **tout_thresh** –This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_get_collision_flag** (*uart_port_t* uart_num, bool *collision_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

参数

- **uart_num** –Uart number to configure the max port number is (UART_NUM_MAX -1).
- **collision_flag** –Pointer to variable of type bool to return collision flag.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_set_wakeup_threshold** (*uart_port_t* uart_num, int wakeup_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting use_ref_tick field in *uart_config_t* to true.

备注: in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

参数

- **uart_num** –UART number, the max port number is (UART_NUM_MAX -1).
- **wakeup_threshold** –number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

esp_err_t **uart_get_wakeup_threshold** (*uart_port_t* uart_num, int *out_wakeup_threshold)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

参数

- **uart_num** –UART number, the max port number is (UART_NUM_MAX -1).
- **out_wakeup_threshold** –[out] output, set to the current value of wakeup threshold for the given UART.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

esp_err_t **uart_wait_tx_idle_polling** (*uart_port_t* uart_num)

Wait until UART tx memory empty and the last char send ok (polling mode).

•

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

参数 **uart_num** –UART number

esp_err_t **uart_set_loop_back** (*uart_port_t* uart_num, bool loop_back_en)

Configure TX signal loop back to RX module, just for the test usage.

•

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

参数

- **uart_num** –UART number
- **loop_back_en** –Set ture to enable the loop back function, else set it false.

void **uart_set_always_rx_timeout** (*uart_port_t* uart_num, bool always_rx_timeout_en)

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

参数

- **uart_num** –UART number
- **always_rx_timeout_en** –Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures

struct **uart_intr_config_t**

UART interrupt configuration parameters for `uart_intr_config` function.

Public Members

uint32_t **intr_enable_mask**

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

uint8_t **rx_timeout_thresh**

UART timeout interrupt threshold (unit: time of sending one byte)

uint8_t **txfifo_empty_intr_thresh**

UART TX empty interrupt threshold.

uint8_t **rxfifo_full_thresh**

UART RX full interrupt threshold.

struct **uart_event_t**

Event structure used in UART event queue.

Public Members

uart_event_type_t **type**

UART event type

size_t **size**

UART data size for `UART_DATA` event

bool **timeout_flag**

UART data read timeout flag for `UART_DATA` event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

Macros

UART_NUM_0

UART port 0

UART_NUM_1

UART port 1

UART_NUM_2

UART port 2

UART_NUM_MAX

UART port max

UART_PIN_NO_CHANGE

UART_FIFO_LEN

Length of the UART HW FIFO.

UART_BITRATE_MAX

Maximum configurable bitrate.

Type Definitions

typedef *intr_handle_t* **uart_isr_handle_t**

Enumerations

enum **uart_event_type_t**

UART event types used in the ring buffer.

Values:

enumerator **UART_DATA**

UART data event

enumerator **UART_BREAK**

UART break event

enumerator **UART_BUFFER_FULL**

UART RX buffer full event

enumerator **UART_FIFO_OVF**

UART FIFO overflow event

enumerator **UART_FRAME_ERR**

UART RX frame error event

enumerator **UART_PARITY_ERR**

UART RX parity event

enumerator **UART_DATA_BREAK**

UART TX data and break event

enumerator **UART_PATTERN_DET**

UART pattern detected

enumerator **UART_EVENT_MAX**

UART event max index

Header File

- [components/hal/include/hal/uart_types.h](#)

Structures

struct **uart_at_cmd_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

Public Members

uint8_t **cmd_char**

UART AT cmd char

uint8_t **char_num**

AT cmd char repeat number

uint32_t **gap_tout**

gap time(in baud-rate) between AT cmd char

uint32_t **pre_idle**

the idle time(in baud-rate) between the non AT char and first AT char

uint32_t **post_idle**

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart_sw_flowctrl_t**

UART software flow control configuration parameters.

Public Members

uint8_t **xon_char**

Xon flow control char

uint8_t **xoff_char**

Xoff flow control char

uint8_t **xon_thrd**

If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t **xoff_thrd**

If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

struct **uart_config_t**

UART configuration parameters for uart_param_config function.

Public Members

int **baud_rate**

UART baud rate

`uart_word_length_t data_bits`

UART byte size

`uart_parity_t parity`

UART parity mode

`uart_stop_bits_t stop_bits`

UART stop bits

`uart_hw_flowcontrol_t flow_ctrl`

UART HW flow control mode (cts/rts)

`uint8_t rx_flow_ctrl_thresh`

UART HW RTS threshold

`uart_sclk_t source_clk`

UART source clock selection

bool `use_ref_tick`

Deprecated method to select ref tick clock source, set `source_clk` field instead

Type Definitions

typedef int `uart_port_t`

UART port number, can be `UART_NUM_0 ~ (UART_NUM_MAX - 1)`.

Enumerations

enum `uart_mode_t`

UART mode selection.

Values:

enumerator `UART_MODE_UART`

mode: regular UART mode

enumerator `UART_MODE_RS485_HALF_DUPLEX`

mode: half duplex RS485 UART mode control by RTS pin

enumerator `UART_MODE_IRDA`

mode: IRDA UART mode

enumerator `UART_MODE_RS485_COLLISION_DETECT`

mode: RS485 collision detection UART mode (used for test purposes)

enumerator `UART_MODE_RS485_APP_CTRL`

mode: application control RS485 UART mode (used for test purposes)

enum **uart_word_length_t**

UART word length constants.

Values:

enumerator **UART_DATA_5_BITS**

word length: 5bits

enumerator **UART_DATA_6_BITS**

word length: 6bits

enumerator **UART_DATA_7_BITS**

word length: 7bits

enumerator **UART_DATA_8_BITS**

word length: 8bits

enumerator **UART_DATA_BITS_MAX**

enum **uart_stop_bits_t**

UART stop bits number.

Values:

enumerator **UART_STOP_BITS_1**

stop bit: 1bit

enumerator **UART_STOP_BITS_1_5**

stop bit: 1.5bits

enumerator **UART_STOP_BITS_2**

stop bit: 2bits

enumerator **UART_STOP_BITS_MAX**

enum **uart_parity_t**

UART parity constants.

Values:

enumerator **UART_PARITY_DISABLE**

Disable UART parity

enumerator **UART_PARITY_EVEN**

Enable UART even parity

enumerator **UART_PARITY_ODD**

Enable UART odd parity

enum **uart_hw_flowcontrol_t**

UART hardware flow control modes.

Values:

enumerator **UART_HW_FLOWCTRL_DISABLE**

disable hardware flow control

enumerator **UART_HW_FLOWCTRL_RTS**

enable RX hardware flow control (rts)

enumerator **UART_HW_FLOWCTRL_CTS**

enable TX hardware flow control (cts)

enumerator **UART_HW_FLOWCTRL_CTS_RTS**

enable hardware flow control

enumerator **UART_HW_FLOWCTRL_MAX**

enum **uart_signal_inv_t**

UART signal bit map.

Values:

enumerator **UART_SIGNAL_INV_DISABLE**

Disable UART signal inverse

enumerator **UART_SIGNAL_IRDA_TX_INV**

inverse the UART irda_tx signal

enumerator **UART_SIGNAL_IRDA_RX_INV**

inverse the UART irda_rx signal

enumerator **UART_SIGNAL_RXD_INV**

inverse the UART rxd signal

enumerator **UART_SIGNAL_CTS_INV**

inverse the UART cts signal

enumerator **UART_SIGNAL_DSR_INV**

inverse the UART dsr signal

enumerator **UART_SIGNAL_TXD_INV**

inverse the UART txd signal

enumerator **UART_SIGNAL_RTS_INV**

inverse the UART rts signal

enumerator **UART_SIGNAL_DTR_INV**

inverse the UART dtr signal

enum **uart_sclk_t**

UART source clock.

Values:

enumerator **UART_SCLK_APB**

UART source clock from APB

enumerator **UART_SCLK_REF_TICK**

UART source clock from REF_TICK

GPIO Lookup Macros The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

备注: These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

Header File

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 [peripherals](#) 目录下。

2.4 应用层协议

2.4.1 mDNS 服务

概述

mDNS 是一种组播 UDP 服务，用来提供本地网络服务和主机发现。

绝大多数的操作系统默认都会安装 mDNS 服务，或者提供单独的安装包。Mac OS 默认会安装名为 Bonjour 的服务（该服务基于 mDNS），此外 Apple 还发布了适用于 Windows 系统的安装程序，可以在 [官方支持](#) 找到。在 Linux 上，mDNS 服务由 [avahi](#) 提供，通常也会被默认安装。

mDNS 属性

- `hostname`: 设备会去响应的主机名，如果没有设置，会根据设备的网络接口名定义 `hostname`。例如，`my-esp32` 会被解析为 `my-esp32.local`。
- `default_instance`: 默认实例名（即易记的设备名），例如 `Jhon's ESP32 Thing`。如果没有设置，将会使用 `hostname`。

以下为 STA 接口启动 mDNS 服务并设置 `hostname` 和 `default_instance` 的示例方法：

```
void start_mdns_service()
{
    // 初始化 mDNS 服务
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    // 设置 hostname
    mdns_hostname_set("my-esp32");
    // 设置默认实例
    mdns_instance_name_set("Jhon's ESP32 Thing");
}
```

mDNS 服务 mDNS 可以广播设备能够提供的网络服务的相关信息，每个服务会由以下属性构成。

- `instance_name`: 实例名 (即易记的服务名), 例如 Jhon's ESP32 Web Server。如果没有定义, 会使用 `default_instance`。
- `service_type`: (必需) 服务类型, 以下划线为前缀, [这里](#) 列出了常见的类型。
- `proto`: (必需) 服务运行所依赖的协议, 以下划线为前缀, 例如 `_tcp` 或者 `_udp`。
- `port`: (必需) 服务运行所用的端口号。
- `txt`: 形如 `{var, val}` 的字符串数组, 用于定义服务的属性。

添加一些服务和不同属性的示例方法:

```
void add_mdns_services()
{
    // 添加服务
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    // 注意: 必须先添加服务, 然后才能设置其属性
    // web 服务器使用自定义的实例名
    mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board", "esp32"},
        {"u", "user"},
        {"p", "password"}
    };
    // 设置服务的文本数据 (会释放并替换当前数据)
    mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

    // 修改服务端口号
    mdns_service_port_set("_myservice", "_udp", 4321);
}
```

mDNS 查询 mDNS 提供查询服务和解析主机 IP/IPv6 地址的方法。

服务查询的结果会作为 `mdns_result_t` 类型对象的链表返回。

解析主机 IP 地址的示例方法:

```
void resolve_mdns_host(const char * host_name)
{
    printf("Query A: %s.local", host_name);

    struct ip4_addr addr;
    addr.addr = 0;

    esp_err_t err = mdns_query_a(host_name, 2000, &addr);
    if(err){
        if(err == ESP_ERR_NOT_FOUND){
            printf("Host was not found!");
            return;
        }
        printf("Query Failed");
        return;
    }

    printf(IPSTR, IP2STR(&addr));
}
```

解析本地服务的示例方法:

```

static const char * if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char * ip_protocol_str[] = {"V4", "V6", "MAX"};

void mdns_print_results(mdns_result_t * results){
    mdns_result_t * r = results;
    mdns_ip_addr_t * a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_
↪protocol_str[r->ip_protocol]);
        if(r->instance_name){
            printf(" PTR : %s\n", r->instance_name);
        }
        if(r->hostname){
            printf(" SRV : %s.local:%u\n", r->hostname, r->port);
        }
        if(r->txt_count){
            printf(" TXT : [%u] ", r->txt_count);
            for(t=0; t<r->txt_count; t++){
                printf("%s=%s; ", r->txt[t].key, r->txt[t].value);
            }
            printf("\n");
        }
        a = r->addr;
        while(a){
            if(a->addr.type == IPADDR_TYPE_V6){
                printf(" AAAA: " IPV6STR "\n", IPV62STR(a->addr.u_addr.ip6));
            } else {
                printf(" A : " IPSTR "\n", IP2STR(&(a->addr.u_addr.ip4)));
            }
            a = a->next;
        }
        r = r->next;
    }
}

void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local", service_name, proto);

    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if(err){
        ESP_LOGE(TAG, "Query Failed");
        return;
    }
    if(!results){
        ESP_LOGW(TAG, "No results found!");
        return;
    }

    mdns_print_results(results);
    mdns_query_results_free(results);
}

```

使用上述方法的示例:

```

void my_app_some_method(){
    // 搜索 esp32-mdns.local
    resolve_mdns_host("esp32-mdns");
}

```

(下页继续)

```
// 搜索 HTTP 服务器
find_mdns_service("_http", "_tcp");
// 或者搜索文件服务器
find_mdns_service("_smb", "_tcp"); // Windows 系统的共享服务
find_mdns_service("_afpovertcp", "_tcp"); // Apple AFP 文件共享服务
find_mdns_service("_nfs", "_tcp"); // NFS 服务器
find_mdns_service("_ftp", "_tcp"); // FTP 服务器
// 或者网络打印机
find_mdns_service("_printer", "_tcp");
find_mdns_service("_ipp", "_tcp");
}
```

应用示例

有关 mDNS 服务器和查询器的应用示例请参考 [protocols/mdns](#)。

API 参考

Header File

- [components/mdns/include/mdns.h](#)

Functions

esp_err_t **mdns_init** (void)

Initialize mDNS on given interface.

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE when failed to register event handler
- ESP_ERR_NO_MEM on memory error
- ESP_FAIL when failed to start mdns task

void **mdns_free** (void)

Stop and free mDNS server.

esp_err_t **mdns_hostname_set** (const char *hostname)

Set the hostname for mDNS server required if you want to advertise services.

参数 *hostname* –Hostname to set

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_delegate_hostname_add** (const char *hostname, const *mdns_ip_addr_t* *address_list)

Adds a hostname and address to be delegated A/AAAA queries will be replied for the hostname and services can be added to this host.

参数

- **hostname** –Hostname to add
- **address_list** –The IP address list of the host

返回

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_delegate_hostname_remove** (const char *hostname)

Remove a delegated hostname All the services added to this host will also be removed.

参数 **hostname** –Hostname to remove

返回

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

bool **mdns_hostname_exists** (const char *hostname)

Query whether a hostname has been added.

参数 **hostname** –Hostname to query

返回

- true The hostname has been added.
- false The hostname has not been added.

esp_err_t **mdns_instance_name_set** (const char *instance_name)

Set the default instance name for mDNS server.

参数 **instance_name** –Instance name to set

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_service_add** (const char *instance_name, const char *service_type, const char *proto, uint16_t port, *mdns_txt_item_t* txt[], size_t num_items)

Add service to mDNS server.

备注: The value length of txt items will be automatically decided by strlen

参数

- **instance_name** –instance name to set. If NULL, global instance name or hostname will be used. Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **port** –service port
- **txt** –string array of TXT data (eg. {{ “var” ,” val” },{ “other” ,” 2” }})
- **num_items** –number of items in TXT data

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

esp_err_t **mdns_service_add_for_host** (const char *instance_name, const char *service_type, const char *proto, const char *hostname, uint16_t port, *mdns_txt_item_t* txt[], size_t num_items)

Add service to mDNS server with a delegated hostname.

备注: The value length of txt items will be automatically decided by strlen

参数

- **instance_name** –instance name to set. If NULL, global instance name or hostname will be used Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **port** –service port
- **txt** –string array of TXT data (eg. `{{ “var” ,” val” },{ “other” ,” 2” }}`)
- **num_items** –number of items in TXT data

返回

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` memory error
- `ESP_FAIL` failed to add service

bool **mdns_service_exists** (const char *service_type, const char *proto, const char *hostname)

Check whether a service has been added.

参数

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If NULL, checks for the local hostname.

返回

- true Correspondding service has been added.
- false Service not found.

bool **mdns_service_exists_with_instance** (const char *instance, const char *service_type, const char *proto, const char *hostname)

Check whether a service has been added.

参数

- **instance** –instance name
- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If NULL, checks for the local hostname.

返回

- true Correspondding service has been added.
- false Service not found.

[esp_err_t](#) **mdns_service_remove** (const char *service_type, const char *proto)

Remove service from mDNS server.

参数

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)

返回

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

[esp_err_t](#) **mdns_service_remove_for_host** (const char *service_type, const char *proto, const char *hostname)

Remove service from mDNS server with hostname.

参数

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If NULL, local hostname will be used.

返回

- `ESP_OK` success

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

esp_err_t `mdns_service_instance_name_set` (const char *service_type, const char *proto, const char *instance_name)

Set instance name for service.

参数

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **instance_name** –instance name to set

返回

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

esp_err_t `mdns_service_instance_name_set_for_host` (const char *service_type, const char *proto, const char *hostname, const char *instance_name)

Set instance name for service with hostname.

参数

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If `NULL`, local hostname will be used.
- **instance_name** –instance name to set

返回

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

esp_err_t `mdns_service_port_set` (const char *service_type, const char *proto, uint16_t port)

Set service port.

参数

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **port** –service port

返回

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

esp_err_t `mdns_service_port_set_for_host` (const char *service_type, const char *proto, const char *hostname, uint16_t port)

Set service port with hostname.

参数

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If `NULL`, local hostname will be used.
- **port** –service port

返回

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

`esp_err_t mdns_service_txt_set` (const char *service_type, const char *proto, *mdns_txt_item_t* txt[], uint8_t num_items)

Replace all TXT items for service.

备注: The value length of txt items will be automatically decided by strlen

参数

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **txt** –array of TXT data (eg. {{ “var” ,” val” },{ “other” ,” 2” }})
- **num_items** –number of items in TXT data

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

`esp_err_t mdns_service_txt_set_for_host` (const char *service_type, const char *proto, const char *hostname, *mdns_txt_item_t* txt[], uint8_t num_items)

Replace all TXT items for service with hostname.

备注: The value length of txt items will be automatically decided by strlen

参数

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **txt** –array of TXT data (eg. {{ “var” ,” val” },{ “other” ,” 2” }})
- **num_items** –number of items in TXT data

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

`esp_err_t mdns_service_txt_item_set` (const char *service_type, const char *proto, const char *key, const char *value)

Set/Add TXT item for service TXT record.

备注: The value length will be automatically decided by strlen

参数

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **key** –the key that you want to add/update
- **value** –the new value of the key

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t `mdns_service_txt_item_set_with_explicit_value_len` (const char *service_type, const char *proto, const char *key, const char *value, uint8_t value_len)

Set/Add TXT item for service TXT record.

参数

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **key** –the key that you want to add/update
- **value** –the new value of the key
- **value_len** –the length of the value

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t `mdns_service_txt_item_set_for_host` (const char *service_type, const char *proto, const char *hostname, const char *key, const char *value)

Set/Add TXT item for service TXT record with hostname.

备注: The value length will be automatically decided by strlen

参数

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **key** –the key that you want to add/update
- **value** –the new value of the key

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t `mdns_service_txt_item_set_for_host_with_explicit_value_len` (const char *service_type, const char *proto, const char *hostname, const char *key, const char *value, uint8_t value_len)

Set/Add TXT item for service TXT record with hostname and txt value length.

参数

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **key** –the key that you want to add/update
- **value** –the new value of the key
- **value_len** –the length of the value

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_service_txt_item_remove** (const char *service_type, const char *proto, const char *key)

Remove TXT item for service TXT record.

参数

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **key** –the key that you want to remove

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_service_txt_item_remove_for_host** (const char *service_type, const char *proto, const char *hostname, const char *key)

Remove TXT item for service TXT record with hostname.

参数

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **key** –the key that you want to remove

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_service_remove_all** (void)

Remove and free all services from mDNS server.

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mdns_query_async_delete** (*mdns_search_once_t* *search)

Deletes the finished query. Call this only after the search has ended!

参数 **search** –pointer to search object

返回

- ESP_OK success
- ESP_ERR_INVALID_STATE search has not finished
- ESP_ERR_INVALID_ARG pointer to search object is NULL

bool **mdns_query_async_get_results** (*mdns_search_once_t* *search, uint32_t timeout, *mdns_result_t* **results)

Get results from search pointer. Results available as a pointer to the output parameter. Pointer to search object has to be deleted via `mdns_query_async_delete` once the query has finished. The results although have to be freed manually.

参数

- **search** –pointer to search object
- **timeout** –time in milliseconds to wait for answers
- **results** –pointer to the results of the query

返回 True if search has finished before or at timeout False if search timeout is over

mdns_search_once_t ***mdns_query_async_new** (const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, *mdns_query_notify_t* notifier)

Query mDNS for host or service asynchronously. Search has to be tested for progress and deleted manually!

参数

- **name** –service instance or host name (NULL for PTR queries)
- **service_type** –service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- **proto** –service protocol (_tcp, _udp, etc.) (NULL for host queries)
- **type** –type of query (MDNS_TYPE_*)
- **timeout** –time in milliseconds during which mDNS query is active
- **max_results** –maximum results to be collected
- **notifier** –Notification function to be called when the result is ready, can be NULL

返回 *mdns_search_once_s* pointer to new search object if query initiated successfully. NULL otherwise.

esp_err_t **mdns_query** (const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, *mdns_result_t* **results)

Query mDNS for host or service All following query methods are derived from this one.

参数

- **name** –service instance or host name (NULL for PTR queries)
- **service_type** –service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- **proto** –service protocol (_tcp, _udp, etc.) (NULL for host queries)
- **type** –type of query (MDNS_TYPE_*)
- **timeout** –time in milliseconds to wait for answers.
- **max_results** –maximum results to be collected
- **results** –pointer to the results of the query results must be freed using *mdns_query_results_free* below

返回

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG timeout was not given

void **mdns_query_results_free** (*mdns_result_t* *results)

Free query results.

参数 **results** –linked list of results to be freed

esp_err_t **mdns_query_ptr** (const char *service_type, const char *proto, uint32_t timeout, size_t max_results, *mdns_result_t* **results)

Query mDNS for service.

参数

- **service_type** –service type (_http, _arduino, _ftp etc.)
- **proto** –service protocol (_tcp, _udp, etc.)
- **timeout** –time in milliseconds to wait for answer.
- **max_results** –maximum results to be collected
- **results** –pointer to the results of the query

返回

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

esp_err_t **mdns_query_srv** (const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, *mdns_result_t* **result)

Query mDNS for SRV record.

参数

- **instance_name** –service instance name
- **service_type** –service type (`_http`, `_arduino`, `_ftp` etc.)
- **proto** –service protocol (`_tcp`, `_udp`, etc.)
- **timeout** –time in milliseconds to wait for answer.
- **result** –pointer to the result of the query

返回

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

`esp_err_t mdns_query_txt` (const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, `mdns_result_t` **result)

Query mDNS for TXT record.

参数

- **instance_name** –service instance name
- **service_type** –service type (`_http`, `_arduino`, `_ftp` etc.)
- **proto** –service protocol (`_tcp`, `_udp`, etc.)
- **timeout** –time in milliseconds to wait for answer.
- **result** –pointer to the result of the query

返回

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

`esp_err_t mdns_query_a` (const char *host_name, uint32_t timeout, `esp_ip4_addr_t` *addr)

Query mDNS for A record.

参数

- **host_name** –host name to look for
- **timeout** –time in milliseconds to wait for answer.
- **addr** –pointer to the resulting IP4 address

返回

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

`esp_err_t mdns_query_aaaa` (const char *host_name, uint32_t timeout, `esp_ip6_addr_t` *addr)

Query mDNS for A record.

Please note that hostname must not contain domain name, as mDNS uses ‘.local’ domain.

参数

- **host_name** –host name to look for
- **timeout** –time in milliseconds to wait for answer. If 0, `max_results` needs to be defined
- **addr** –pointer to the resulting IP6 address

返回

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

`esp_err_t mdns_handle_system_event` (void *ctx, `system_event_t` *event)

System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

Please note that hostname must not contain domain name, as mDNS uses ‘.local’ domain.

参数

- **ctx** –The system event context
- **event** –The system event

Structures

struct **mdns_txt_item_t**

mDNS basic text item structure Used in `mdns_service_add()`

Public Members

const char ***key**
item key name

const char ***value**
item value string

struct **mdns_ip_addr_s**

mDNS query linked list IP item

Public Members

esp_ip_addr_t **addr**
IP address

struct *mdns_ip_addr_s* ***next**
next IP, or NULL for the last IP in the list

struct **mdns_result_s**

mDNS query result structure

Public Members

struct *mdns_result_s* ***next**
next result, or NULL for the last result in the list

mdns_if_t **tcpip_if**
interface index

uint32_t **ttl**
time to live

mdns_ip_protocol_t **ip_protocol**
ip_protocol type of the interface (v4/v6)

char ***instance_name**
instance name

char ***service_type**
service type

char ***proto**
service protocol

char ***hostname**
hostname

uint16_t **port**
service port

mdns_txt_item_t ***txt**
txt record

uint8_t ***txt_value_len**
array of txt value len of each record

size_t **txt_count**
number of txt items

mdns_ip_addr_t ***addr**
linked list of IP addresses found

Macros

MDNS_TYPE_A

MDNS_TYPE_PTR

MDNS_TYPE_TXT

MDNS_TYPE_AAAA

MDNS_TYPE_SRV

Values:

```
    enumerator MDNS_IF_STA
```

```
    enumerator MDNS_IF_AP
```

```
    enumerator MDNS_IF_ETH
```

```
    enumerator MDNS_IF_MAX
```

2.4.2 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_conn_new()`: for opening a new TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_delete()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https_request](#).

Tree structure for ESP-TLS component

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between `mbedtls` and `wolfssl` for its operation. API specific to `mbedtls` are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to `wolfssl` are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **ca_cert_buf** and **ca_cert_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
 - `ca_cert_buf` - pointer to the buffer which contains the CA cert.
 - `ca_cert_bytes` - size of the CA certificate in bytes.
- **use_global_ca_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **cert_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#)
- **psk_hint_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. *WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.*

Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use `mbedtls` or `wolfssl` as their underlying SSL/TLS library. By default only `mbedtls` is available and is used, `wolfssl` SSL/TLS library is available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides `wolfssl` component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using `wolfssl` in your project.

备注: *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

- 1) Directly add wolfssl as a component in your project with following three commands.:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

- 2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt/Makefile of your project as done in [wolfssl/examples](#). For reference see Optional Project variables in [build-system](#).

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py/make menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when [protocols/https_request](#) example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

备注: These values are subject to change with change in configuration options and version of respective libraries.

ATECC608A (Secure Element) with ESP-TLS

ESP-TLS provides support for using ATECC608A cryptoauth chip with ESP32-WROOM-32SE. Use of ATECC608A is supported only when ESP-TLS is used with mbedTLS as its underlying SSL/TLS stack. ESP-TLS uses mbedtls as its underlying TLS/SSL stack by default unless changed manually.

备注: ATECC608A chip on ESP32-WROOM-32SE must be already configured and provisioned, for details refer [esp_cryptoauth_utility](#)

To enable the secure element support, and use it in you project for TLS connection, you will have to follow below steps

- 1) Add [esp-cryptoauthlib](#) in your project, for details please refer [esp-cryptoauthlib with ESP_IDF](#)
- 2) Enable following menuconfig option:

```
menuconfig->Component config->ESP-TLS->Use Secure Element (ATECC608A) with ESP-
↔ TLS
```

3) Select type of ATECC608A chip with following option:

```
menuconfig->Component config->esp-cryptoauthlib->Choose Type of ATECC608A chip
```

to know more about different types of ATECC608A chips and how to obtain type of ATECC608A connected to your ESP module please visit [ATECC608A chip type](#)

4) Enable use of ATECC608A in ESP-TLS by providing following config option in `esp_tls_cfg_t`

```
esp_tls_cfg_t cfg = {
    /* other configurations options */
    .use_secure_element = true,
};
```

API Reference

Header File

- `components/esp-tls/esp_tls.h`

Functions

`esp_tls_t *esp_tls_init` (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

返回 `tls` Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

`esp_tls_t *esp_tls_conn_new` (const char *hostname, int hostlen, int port, const `esp_tls_cfg_t` *cfg)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_new_sync` (and its asynchronous version `esp_tls_conn_new_async`)

参数

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t`. At a minimum, this structure should be zero-initialized.

返回 pointer to `esp_tls_t`, or NULL if connection couldn't be opened.

int `esp_tls_conn_new_sync` (const char *hostname, int hostlen, int port, const `esp_tls_cfg_t` *cfg, `esp_tls_t` *tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

参数

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t`. At a minimum, this structure should be zero-initialized.
- **tls** –[in] Pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 1 If connection establishment is successful.

- 0 If connection state is in progress.

`esp_tls_t *esp_tls_conn_http_new` (const char *url, const `esp_tls_cfg_t` *cfg)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new()` API. However this API accepts host’s url.

参数

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘`esp_tls_cfg_t`’. At a minimum, this structure should be zero-initialized.

返回 pointer to `esp_tls_t`, or NULL if connection couldn’t be opened.

int `esp_tls_conn_new_async` (const char *hostname, int hostlen, int port, const `esp_tls_cfg_t` *cfg, `esp_tls_t` *tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

参数

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`. `non_block` member of this structure should be set to be true.
- **tls** –[in] pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

int `esp_tls_conn_http_new_async` (const char *url, const `esp_tls_cfg_t` *cfg, `esp_tls_t` *tls)

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new()` API. However this API accepts host’s url.

参数

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`.
- **tls** –[in] pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

static inline ssize_t `esp_tls_conn_write` (`esp_tls_t` *tls, const void *data, size_t datalen)

Write from buffer ‘data’ into specified tls connection.

参数

- **tls** –[in] pointer to esp-tls as esp-tls handle.
- **data** –[in] Buffer from which data will be written.
- **datalen** –[in] Length of data buffer.

返回

- ≥ 0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- < 0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE`. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

static inline ssize_t **esp_tls_conn_read** (*esp_tls_t* *tls, void *data, size_t datalen)

Read from specified tls connection into the buffer ‘data’ .

参数

- **tls** –[in] pointer to esp-tls as esp-tls handle.
- **data** –[in] Buffer to hold read data.
- **datalen** –[in] Length of data buffer.

返回

- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

void **esp_tls_conn_delete** (*esp_tls_t* *tls)

Compatible version of esp_tls_conn_destroy() to close the TLS/SSL connection.

备注: This API will be removed in IDFv5.0

参数 **tls** –[in] pointer to esp-tls as esp-tls handle.

int **esp_tls_conn_destroy** (*esp_tls_t* *tls)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new() or esp_tls_conn_http_new() APIs.

参数 **tls** –[in] pointer to esp-tls as esp-tls handle.

返回 - 0 on success

- -1 if socket error or an invalid argument

ssize_t **esp_tls_get_bytes_avail** (*esp_tls_t* *tls)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls’s mbedtls_ssl_get_bytes_avail() API.

参数 **tls** –[in] pointer to esp-tls as esp-tls handle.

返回

- -1 in case of invalid arg
- bytes available in the application data record read buffer

esp_err_t **esp_tls_get_conn_sockfd** (*esp_tls_t* *tls, int *sockfd)

Returns the connection socket file descriptor from *esp_tls* session.

参数

- **tls** –[in] handle to *esp_tls* context
- **sockfd** –[out] int pointer to sockfd value.

返回 - ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection

- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

esp_err_t **esp_tls_init_global_ca_store** (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

返回

- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedTLS resources.

esp_err_t **esp_tls_set_global_ca_store** (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls `esp_tls_init_global_ca_store()` if it has not already been called. The application must call this function before calling `esp_tls_conn_new()`.

参数

- **cacert_pem_buf** –[in] Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- **cacert_pem_bytes** –[in] Length of the buffer.

返回

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp_tls_free_global_ca_store** (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

esp_err_t **esp_tls_get_and_clear_last_error** (esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)

Returns last error in *esp_tls* with detailed mbedtls related error codes. The error information is cleared internally upon return.

参数

- **h** –[in] esp-tls error handle.
- **esp_tls_code** –[out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`
- **esp_tls_flags** –[out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`

返回

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

esp_err_t **esp_tls_get_and_clear_error_type** (esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)

Returns the last error captured in *esp_tls* of a specific type The error information is cleared internally upon return.

参数

- **h** –[in] esp-tls error handle.
- **err_type** –[in] specific error type
- **error_code** –[out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`

返回

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

mbedtls_x509_crt ***esp_tls_get_global_ca_store** (void)

Get the pointer to the global CA store currently being used.

The application must first call `esp_tls_set_global_ca_store()`. Then the same CA store could be used by the application for APIs other than *esp_tls*.

备注: Modifying the pointer might cause a failure in verifying the certificates.

返回

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

esp_err_t **esp_tls_plain_tcp_connect** (const char *host, int hostlen, int port, const *esp_tls_cfg_t* *cfg, *esp_tls_error_handle_t* error_handle, int *sockfd)

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

参数

- **host** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] ESP-TLS configuration as *esp_tls_cfg_t*.
- **error_handle** –[out] ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** –[out] Socket descriptor if successfully connected on TCP layer

返回 ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

Structures

struct **psk_key_hint**

ESP-TLS preshared key and hint structure.

Public Members

const uint8_t ***key**

key in PSK authentication mode in binary format

const size_t **key_size**

length of the key

const char ***hint**

hint in PSK authentication mode in string format

struct **tls_keep_alive_cfg**

esp-tls client session ticket ctx

Keep alive parameters structure

Public Members

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time (second)

int **keep_alive_interval**

Keep-alive interval time (second)

int **keep_alive_count**

Keep-alive packet retry send count

struct **esp_tls_cfg**

ESP-TLS configuration parameters.

备注: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
 - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
 - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.
-

Public Members

const char ****alpn_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char ***cacert_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***cacert_pem_buf**

CA certificate buffer legacy name

unsigned int **cacert_bytes**

Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert_pem_bytes**

Size of Certificate Authority certificate legacy name

const unsigned char ***clientcert_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***clientcert_pem_buf**

Client certificate legacy name

unsigned int **clientcert_bytes**

Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert_pem_bytes**

Size of client certificate legacy name

const unsigned char ***clientkey_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***clientkey_pem_buf**

Client key legacy name

unsigned int **clientkey_bytes**

Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey_pem_bytes**

Size of client key legacy name

const unsigned char ***clientkey_password**

Client key decryption password string

unsigned int **clientkey_password_len**

String length of the password pointed to by clientkey_password

bool **non_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use_secure_element**

Enable this option to use secure element or atec608a chip (Integrated with ESP32-WROOM-32SE)

int **timeout_ms**

Network timeout in milliseconds

bool **use_global_ca_store**

Use a global ca_store for all the connections in which this bool is set.

const char ***common_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip_common_name**

Skip any validation of server certificate CN field

tls_keep_alive_cfg_t ***keep_alive_cfg**

Enable TCP keep-alive timeout for SSL connection

const *psk_hint_key_t* ***psk_hint_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (***crt_bundle_attach**)(void *conf)

Function pointer to `esp_crt_bundle_attach`. Enables the use of certification bundle for server verification, must be enabled in `menuconfig`

void ***ds_data**

Pointer for digital signature peripheral context

bool **is_plain_tcp**

Use non-TLS connection: When set to true, the `esp-tls` uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with `esp_tls_plain_tcp_connect()` API

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

struct **esp_tls**

ESP-TLS Connection Handle.

Public Members

mbedtls_ssl_context **ssl**

TLS/SSL context

mbedtls_entropy_context **entropy**

mbedTLS entropy context structure

mbedtls_ctr_drbg_context **ctr_drbg**

mbedTLS ctr drbg context structure. CTR_DRBG is deterministic random bit generation based on AES-256

mbedtls_ssl_config **conf**

TLS/SSL configuration to be shared between `mbedtls_ssl_context` structures

mbedtls_net_context **server_fd**

mbedTLS wrapper type for sockets

mbedtls_x509_crt **cacert**

Container for the X.509 CA certificate

mbedtls_x509_crt ***cacert_ptr**

Pointer to the `cacert` being used.

mbedtls_x509_crt **clientcert**

Container for the X.509 client certificate

mbedtls_pk_context **clientkey**

Container for the private key of the client certificate

int **sockfd**

Underlying socket file descriptor.

ssize_t (***read**)(struct *esp_tls* *tls, char *data, size_t datalen)

Callback function for reading data from TLS/SSL connection.

ssize_t (***write**)(struct *esp_tls* *tls, const char *data, size_t datalen)

Callback function for writing data to TLS/SSL connection.

esp_tls_conn_state_t **conn_state**

ESP-TLS Connection state

fd_set **rset**

read file descriptors

fd_set **wset**

write file descriptors

bool **is_tls**

indicates connection type (TLS or NON-TLS)

esp_tls_role_t **role**

esp-tls role

- ESP_TLS_CLIENT
- ESP_TLS_SERVER

esp_tls_error_handle_t **error_handle**

handle to error descriptor

Type Definitions

typedef enum *esp_tls_conn_state* **esp_tls_conn_state_t**

ESP-TLS Connection State.

typedef enum *esp_tls_role* **esp_tls_role_t**

typedef struct *psk_key_hint* **psk_hint_key_t**

ESP-TLS preshared key and hint structure.

typedef struct *tls_keep_alive_cfg* **tls_keep_alive_cfg_t**

esp-tls client session ticket ctx

Keep alive parameters structure

typedef struct *esp_tls_cfg* **esp_tls_cfg_t**

ESP-TLS configuration parameters.

备注: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
 - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
 - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.
-

typedef struct *esp_tls* **esp_tls_t**
ESP-TLS Connection Handle.

Enumerations

enum **esp_tls_conn_state**
ESP-TLS Connection State.

Values:

enumerator **ESP_TLS_INIT**

enumerator **ESP_TLS_CONNECTING**

enumerator **ESP_TLS_HANDSHAKE**

enumerator **ESP_TLS_FAIL**

enumerator **ESP_TLS_DONE**

enum **esp_tls_role**

Values:

enumerator **ESP_TLS_CLIENT**

enumerator **ESP_TLS_SERVER**

2.4.3 OpenSSL-APIs

备注: The OpenSSL-API will be discontinued in ESP-IDF from v5.0. Please use ESP-TLS <esp_tls> instead.

The code of this API (located in [openssl](#) directory), does not contain OpenSSL itself but is intended as a wrapper for applications using the OpenSSL API. It uses mbedTLS to do the actual work, so anyone compiling openssl code needs the mbedtls library and header file.

OpenSSL APIs not mentioned in this article are not open to public for the time, also do not have the corresponding function. If user calls it directly, it will always return an error or may show cannot link at compiling time.

Chapter Introduction

- Chapter 1. SSL Context Method Create
- Chapter 2. SSL Context Function
- Chapter 3. SSL Function
- Chapter 4. SSL X509 Certification and Private Key Function

Chapter 1. SSL Context Method Create

1.1 const SSL_METHOD* SSLv3_client_method (void)

Arguments:

none

Return:

SSLV3.0 version SSL context client method point

Description:

create the target SSL context method

Example:

```
void example(void)
{
    const SSL_METHOD *method = SSLv3_client_method();
    ...
}
```

1.2 const SSL_METHOD* TLSv1_client_method (void)

Arguments:

none

Return:

TLSV1.0 version SSL context client method point

Description:

create the target SSL context method

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_client_method();
    ...
}
```

1.3 const SSL_METHOD* TLSv1_1_client_method (void)

Arguments:

none

Return:

```
TLsv1_1 version SSL context client method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLsv1_1_client_method();
    ...
}
```

1.4 const SSL_METHOD* TLsv1_2_client_method (void)**Arguments:**

```
none
```

Return:

```
TLsv1.2 version SSL context client method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLsv1_2_client_method();
    ...
}
```

1.5 const SSL_METHOD* TLS_client_method (void)**Arguments:**

```
none
```

Return:

```
TLsv1.2 version SSL context client method point
```

Description:

```
create the default SSL context method, it's always to be TLsv1.2
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLsv1_2_client_method();
    ...
}
```

1.6 const SSL_METHOD* SSLv3_server_method (void)

Arguments:

```
none
```

Return:

```
SSLV3.0 version SSL context server method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = SSLv3_server_method();

    ...
}
```

1.7 const SSL_METHOD* TLSv1_server_method (void)**Arguments:**

```
none
```

Return:

```
TLSV1.0 version SSL context server method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_server_method();

    ...
}
```

1.8 const SSL_METHOD* TLSv1_1_server_method (void)**Arguments:**

```
none
```

Return:

```
TLSV1.1 version SSL context server method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_server_method();
```

(下页继续)

(续上页)

```
    ...  
}
```

1.9 const SSL_METHOD* TLSv1_2_server_method (void)

Arguments:

```
none
```

Return:

```
TLSV1.2 version SSL context server method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)  
{  
    const SSL_METHOD *method = TLSv1_2_server_method();  
    ...  
}
```

1.10 const SSL_METHOD* TLS_server_method (void)

Arguments:

```
none
```

Return:

```
TLSV1.2 version SSL context server method point
```

Description:

```
create the default SSL context method, it's always to be TLSV1.2
```

Example:

```
void example(void)  
{  
    const SSL_METHOD *method = TLSv1_2_server_method();  
    ...  
}
```

Chapter 2. SSL Context Function

2.1 SSL_CTX* SSL_CTX_new (const SSL_METHOD * method)

Arguments:

```
method - the SSL context method point
```

Return:

```
context point
```

Description:

```
create a SSL context
```

Example:

```
void example(void)
{
    SSL_CTX *ctx = SSL_CTX_new(SSLv3_server_method());
    ...
}
```

2.2 void SSL_CTX_free (SSL_CTX * ctx)**Arguments:**

```
ctx - the SSL context point
```

Return:

```
none
```

Description:

```
free a SSL context
```

Example:

```
void example(void)
{
    SSL_CTX *ctx;
    ... ..
    SSL_CTX_free(ctx);
}
```

2.3 int SSL_CTX_set_ssl_version (SSL_CTX * ctx, const SSL_METHOD * meth)**Arguments:**

```
ctx - SSL context point
meth - SSL method point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
set the SSL context version
```

Example:

```
void example(void)
{
    SSL_CTX *ctx;
    const SSL_METHOD *meth;
```

(下页继续)

(续上页)

```
... ..  
SSL_CTX_set_ssl_version(ctx, meth);  
}
```

2.4 const SSL_METHOD* SSL_CTX_get_ssl_method (SSL_CTX * ctx)

Arguments:

```
ctx - SSL context point
```

Return:

```
SSL context method
```

Description:

```
get the SSL context method
```

Example:

```
void example(void)  
{  
    const SSL_METHOD *method;  
    SSL_CTX *ctx;  
  
    ... ..  
  
    method = SSL_CTX_get_ssl_method(ctx);  
}
```

Chapter 3. SSL Function

3.1 SSL* SSL_new (SSL_CTX * ctx)

Arguments:

```
ctx - SSL context point
```

Return:

```
SSL method
```

Description:

```
create a SSL
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    SSL_CTX *ctx;  
  
    ... ..  
  
    ssl = SSL_new(ctx);  
}
```

3.2 void SSL_free (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
none
```

Description:

```
free SSL
```

Example:

```
void example(void)
{
    SSL *ssl;

    ... ..

    SSL_free(ssl);
}
```

3.3 int SSL_do_handshake (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
1 : OK
0 : failed, connect is close by remote
-1 : a error catch
```

Description:

```
perform the SSL handshake
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_do_handshake(ssl);
}
```

3.4 int SSL_connect (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
1 : OK
0 : failed, connect is close by remote
-1 : a error catch
```

Description:

```
connect to the remote SSL server
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_connect(ssl);
}
```

3.5 int SSL_accept (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
1 : OK
0 : failed, connect is close by remote
-1 : a error catch
```

Description:

```
accept the remote connection
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_accept(ssl);
}
```

3.6 int SSL_shutdown (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
1 : OK
0 : failed, connect is close by remote
-1 : a error catch
```

Description:

```
shutdown the connection
```

Example:

```
void example(void)
{
```

(下页继续)

(续上页)

```
SSL *ssl;
int ret;

... ..

ret = SSL_shutdown(ssl);
}
```

3.7 int SSL_clear (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
shutdown the connection
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_clear(ssl);
}
```

3.8 int SSL_read (SSL * ssl, void * buffer, int len)

Arguments:

```
ssl    - point
buffer - data buffer point
len    - data length
```

Return:

```
> 0 : OK, and return received data bytes
= 0 : no data received or connection is closed
< 0 : an error catch
```

Description:

```
read data from remote
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;
```

(下页继续)

(续上页)

```
... ..  
ret = SSL_read(ssl, buf, len);  
}
```

3.9 int SSL_write (SSL * ssl, const void * buffer, int len)

Arguments:

```
ssl    - SSL point  
buffer - data buffer point  
len    - data length
```

Return:

```
> 0 : OK, and return received data bytes  
= 0 : no data sent or connection is closed  
< 0 : an error catch
```

Description:

```
send the data to remote
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    char *buf;  
    int len;  
    int ret;  
  
    ... ..  
  
    ret = SSL_write(ssl, buf, len);  
}
```

3.10 SSL_CTX *SSL_get_SSL_CTX (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
SSL context
```

Description:

```
get SSL context of the SSL
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    SSL_CTX *ctx;  
  
    ... ..  
}
```

(下页继续)

(续上页)

```
    ctx = SSL_get_SSL_CTX(ssl);
}
```

3.11 int SSL_get_shutdown (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
shutdown mode
```

Description:

```
get SSL shutdown mode
```

Example:

```
void example(void)
{
    SSL *ssl;
    int mode;

    ... ..

    mode = SSL_get_SSL_CTX(ssl);
}
```

3.12 void SSL_set_shutdown (SSL * ssl, int mode)

Arguments:

```
ssl - SSL point
```

Return:

```
shutdown mode
```

Description:

```
set SSL shutdown mode
```

Example:

```
void example(void)
{
    SSL *ssl;
    int mode = 0;

    ... ..

    SSL_set_shutdown(ssl, mode);
}
```

3.13 const SSL_METHOD* SSL_get_ssl_method (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
SSL method
```

Description:

```
set SSL shutdown mode
```

Example:

```
void example(void)
{
    SSL *ssl;
    const SSL_METHOD *method;

    ... ..

    method = SSL_get_ssl_method(ssl);
}
```

3.14 int SSL_set_ssl_method (SSL * ssl, const SSL_METHOD * method)**Arguments:**

```
ssl - SSL point
meth - SSL method point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
set the SSL method
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
    const SSL_METHOD *method;

    ... ..

    ret = SSL_set_ssl_method(ssl, method);
}
```

3.15 int SSL_pending (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
data bytes
```

Description:

```
get received data bytes
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;

    ... ..

    ret = SSL_pending(ssl);
}
```

3.16 int SSL_has_pending (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
1 : Yes
0 : No
```

Description:

```
check if data is received
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;

    ... ..

    ret = SSL_has_pending(ssl);
}
```

3.17 int SSL_get_fd (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
>= 0 : socket id
< 0 : a error catch
```

Description:

```
get the socket of the SSL
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;

    ... ..

    ret = SSL_get_fd(ssl);
}
```

3.18 int SSL_get_rfd (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
>= 0 : socket id  
< 0 : a error catch
```

Description:

```
get the read only socket of the SSL
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
  
    ... ..  
  
    ret = SSL_get_rfd(ssl);  
}
```

3.19 int SSL_get_wfd (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
>= 0 : socket id  
< 0 : a error catch
```

Description:

```
get the write only socket of the SSL
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
  
    ... ..  
  
    ret = SSL_get_wfd(ssl);  
}
```

3.20 int SSL_set_fd (SSL * ssl, int fd)**Arguments:**

```
ssl - SSL point  
fd - socket id
```

Return:

```
1 : OK
0 : failed
```

Description:

```
set socket to SSL
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;

    ... ..

    ret = SSL_set_fd(ssl, socket);
}
```

3.21 int SSL_set_rfd (SSL * ssl, int fd)**Arguments:**

```
ssl - SSL point
fd  - socket id
```

Return:

```
1 : OK
0 : failed
```

Description:

```
set read only socket to SSL
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;

    ... ..

    ret = SSL_set_rfd(ssl, socket);
}
```

3.22 int SSL_set_wfd (SSL * ssl, int fd)**Arguments:**

```
ssl - SSL point
fd  - socket id
```

Return:

```
1 : OK
0 : failed
```

Description:

```
set write only socket to SSL
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;

    ... ..

    ret = SSL_set_wfd(ssl, socket);
}
```

3.23 int SSL_version (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
SSL version
```

Description:

```
get SSL version
```

Example:

```
void example(void)
{
    int version;
    SSL *ssl;

    ... ..

    version = SSL_version(ssl);
}
```

3.24 const char* SSL_get_version (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
SSL version string
```

Description:

```
get the SSL current version string
```

Example:

```
void example(void)
{
    char *version;
    SSL *ssl;
```

(下页继续)

(续上页)

```
... ..  
version = SSL_get_version(ssl);  
}
```

3.25 OSSL_HANDSHAKE_STATE SSL_get_state (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
SSL state
```

Description:

```
get the SSL state
```

Example:

```
void example(void)  
{  
    OSSL_HANDSHAKE_STATE state;  
    SSL *ssl;  
  
    ... ..  
  
    state = SSL_get_state(ssl);  
}
```

3.26 const char* SSL_alert_desc_string (int value)

Arguments:

```
value - SSL description
```

Return:

```
alert value string
```

Description:

```
get alert description string
```

Example:

```
void example(void)  
{  
    int val;  
    char *str;  
  
    ... ..  
  
    str = SSL_alert_desc_string(val);  
}
```

3.27 const char* SSL_alert_desc_string_long (int value)

Arguments:

```
value - SSL description
```

Return:

```
alert value long string
```

Description:

```
get alert description long string
```

Example:

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_desc_string_long(val);
}
```

3.28 const char* SSL_alert_type_string (int value)**Arguments:**

```
value - SSL type description
```

Return:

```
alert type string
```

Description:

```
get alert type string
```

Example:

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_type_string(val);
}
```

3.29 const char* SSL_alert_type_string_long (int value)**Arguments:**

```
value - SSL type description
```

Return:

```
alert type long string
```

Description:

```
get alert type long string
```

Example:

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_type_string_long(val);
}
```

3.30 const char* SSL_rstate_string (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
state string
```

Description:

```
get the state string where SSL is reading
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *str;

    ... ..

    str = SSL_rstate_string(ssl);
}
```

3.31 const char* SSL_rstate_string_long (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
state long string
```

Description:

```
get the state long string where SSL is reading
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *str;

    ... ..

    str = SSL_rstate_string_long(ssl);
}
```

3.32 const char* SSL_state_string (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
state string
```

Description:

```
get the state string
```

Example:

```
void example(void)
{
    SSL *ssl;
    const char *str;

    ... ..

    str = SSL_state_string(ssl);
}
```

3.33 char* SSL_state_string_long (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
state long string
```

Description:

```
get the state long string
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *str;

    ... ..

    str = SSL_state_string(ssl);
}
```

3.34 int SSL_get_error (const SSL * ssl, int ret_code)**Arguments:**

```
ssl      - SSL point
ret_code - SSL return code
```

Return:

```
SSL error number
```

Description:

```
get SSL error code
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;
    int err;

    ... ..

    err = SSL_get_error(ssl, ret);
}
```

3.35 int SSL_want (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
specific statement
```

Description:

```
get the SSL specific statement
```

Example:

```
void example(void)
{
    SSL *ssl;
    int state;

    ... ..

    state = SSL_want(ssl);
}
```

3.36 int SSL_want_nothing (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
0 : false
1 : true
```

Description:

```
check if SSL want nothing
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;
```

(下页继续)

(续上页)

```
... ..  
ret = SSL_want(ssl);  
}
```

3.37 int SSL_want_read (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
0 : false  
1 : true
```

Description:

```
check if SSL want to read
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    int ret;  
  
    ... ..  
  
    ret = SSL_want_read(ssl);  
}
```

3.38 int SSL_want_write (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
0 : false  
1 : true
```

Description:

```
check if SSL want to write
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    int ret;  
  
    ... ..  
  
    ret = SSL_want_write(ssl);  
}
```

Chapter 4. SSL X509 Certification and Private Key Function

4.1 X509 * d2i_X509 (X509 ** cert, const unsigned char * buffer, long len)

Arguments:

```
cert - a point pointed to X509 certification
buffer - a point pointed to the certification context memory point
length - certification bytes
```

Return:

```
X509 certification object point
```

Description:

```
load a character certification context into system context. If '*cert' is
↪pointed to the
certification, then load certification into it. Or create a new X509
↪certification object
```

Example:

```
void example(void)
{
    X509 *new;
    X509 *cert;
    unsigned char *buffer;
    long len;
    ... ..

    new = d2i_X509(&cert, buffer, len);
}
```

4.2 int SSL_add_client_CA (SSL * ssl, X509 * x)

Arguments:

```
ssl - SSL point
x - CA certification point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
add CA client certification into the SSL
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
    X509 *new;

    ... ..

    ret = SSL_add_client_CA(ssl, new);
}
```

4.3 int SSL_CTX_add_client_CA (SSL_CTX * ctx, X509 * x)

Arguments:

```
ctx - SSL context point
x   - CA certification point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
add CA client certification into the SSL context
```

Example:

```
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    X509 *new;

    ... ..

    ret = SSL_add_client_CA(ctx, new);
}
```

4.4 X509* SSL_get_certificate (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
SSL certification point
```

Description:

```
get the SSL certification point
```

Example:

```
void example(void)
{
    SSL *ssl;
    X509 *cert;

    ... ..

    cert = SSL_get_certificate(ssl);
}
```

4.5 long SSL_get_verify_result (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
the result of verifying
```

Description:

```
get the verifying result of the SSL certification
```

Example:

```
void example(void)
{
    SSL *ssl;
    long ret;

    ... ..

    ret = SSL_get_verify_result(ssl);
}
```

4.6 int SSL_CTX_use_certificate (SSL_CTX * ctx, X509 * x)**Arguments:**

```
ctx - the SSL context point
pkey - certification object point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
load the certification into the SSL_CTX or SSL object
```

Example:

```
void example(void)
{
    int ret;
    SSL_CTX *ctx
    X509 *new;

    ... ..

    ret = SSL_CTX_use_certificate(ctx, new);
}
```

4.7 int SSL_CTX_use_certificate_ASN1 (SSL_CTX * ctx, int len, const unsigned char * d)**Arguments:**

```
ctx - SSL context point
len - certification length
d - data point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
load the ASN1 certification into SSL context
```

Example:

```

void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    int len;

    ... ..

    ret = SSL_CTX_use_certificate_ASN1(ctx, len, buf);
}

```

4.8 int SSL_CTX_use_PrivateKey(SSL_CTX * ctx, EVP_PKEY * pkey)

Arguments:

```

ctx - SSL context point
pkey - private key object point

```

Return:

```

1 : OK
0 : failed

```

Description:

```

load the private key into the context object

```

Example:

```

void example(void)
{
    int ret;
    SSL_CTX *ctx;
    EVP_PKEY *pkey;

    ... ..

    ret = SSL_CTX_use_PrivateKey(ctx, pkey);
}

```

4.9 int SSL_CTX_use_PrivateKey_ASN1(int pk, SSL_CTX * ctx, const unsigned char * d, long len)

Arguments:

```

ctx - SSL context point
d   - data point
len - private key length

```

Return:

```

1 : OK
0 : failed

```

Description:

```

load the ASN1 private key into SSL context

```

Example:

```

void example(void)
{

```

(下页继续)

(续上页)

```
int ret;
int pk;
SSL_CTX *ctx;
const unsigned char *buf;
long len;

... ..

ret = SSL_CTX_use_PrivateKey_ASN1(pk, ctx, buf, len);
}
```

4.10 int SSL_CTX_use_RSAPrivateKey_ASN1 (SSL_CTX * ctx, const unsigned char * d, long len)

Arguments:

```
ctx - SSL context point
d   - data point
len - private key length
```

Return:

```
1 : OK
0 : failed
```

Description:

```
load the RSA ASN1 private key into SSL context
```

Example:

```
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    long len;

    ... ..

    ret = SSL_CTX_use_RSAPrivateKey_ASN1(ctx, buf, len);
}
```

4.11 int SSL_use_certificate_ASN1 (SSL * ssl, int len, const unsigned char * d)

Arguments:

```
ssl - SSL point
len - data bytes
d   - data point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
load certification into the SSL
```

Example:

```

void example(void)
{
    int ret;
    SSL *ssl;
    const unsigned char *buf;
    long len;

    ... ..

    ret = SSL_use_certificate_ASN1(ssl, len, buf);
}

```

4.12 X509* SSL_get_peer_certificate (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

peer certification

Description:

get peer certification

Example:

```

void example(void)
{
    SSL *ssl;
    X509 *peer;

    ... ..

    peer = SSL_get_peer_certificate(ssl);
}

```

2.4.4 ESP HTTP Client

Overview

esp_http_client provides an API for making HTTP/S requests from ESP-IDF programs. The steps to use this API for an HTTP request are:

- [*esp_http_client_init\(\)*](#): To use the HTTP client, the first thing we must do is create an `esp_http_client` by pass into this function with the [*esp_http_client_config_t*](#) configurations. Which configuration values we do not define, the library will use default.
- [*esp_http_client_perform\(\)*](#): The `esp_http_client` argument created from the init function is needed. This function performs all operations of the `esp_http_client`, from opening the connection, sending data, downloading data and closing the connection if necessary. All related events will be invoked in the `event_handle` (defined by [*esp_http_client_config_t*](#)). This function performs its job and blocks the current task until it' s done
- [*esp_http_client_cleanup\(\)*](#): After completing our `esp_http_client`' s task, this is the last function to be called. It will close the connection (if any) and free up all the memory allocated to the HTTP client

Application Example

```

esp_err_t _http_event_handle(esp_http_client_event_t *evt)
{
    switch(evt->event_id) {
        case HTTP_EVENT_ERROR:
            ESP_LOGI(TAG, "HTTP_EVENT_ERROR");
            break;
        case HTTP_EVENT_ON_CONNECTED:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_CONNECTED");
            break;
        case HTTP_EVENT_HEADER_SENT:
            ESP_LOGI(TAG, "HTTP_EVENT_HEADER_SENT");
            break;
        case HTTP_EVENT_ON_HEADER:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_HEADER");
            printf("%.*s", evt->data_len, (char*)evt->data);
            break;
        case HTTP_EVENT_ON_DATA:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_DATA, len=%d", evt->data_len);
            if (!esp_http_client_is_chunked_response(evt->client)) {
                printf("%.*s", evt->data_len, (char*)evt->data);
            }

            break;
        case HTTP_EVENT_ON_FINISH:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_FINISH");
            break;
        case HTTP_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "HTTP_EVENT_DISCONNECTED");
            break;
    }
    return ESP_OK;
}

esp_http_client_config_t config = {
    .url = "http://httpbin.org/redirect/2",
    .event_handler = _http_event_handle,
};
esp_http_client_handle_t client = esp_http_client_init(&config);
esp_err_t err = esp_http_client_perform(client);

if (err == ESP_OK) {
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
        esp_http_client_get_status_code(client),
        esp_http_client_get_content_length(client));
}
esp_http_client_cleanup(client);

```

Persistent Connections

Persistent connections means that the HTTP client can re-use the same connection for several transfers. If the server does not request to close the connection with the `Connection: close` header, the new transfer with sample ip address, port, and protocol.

To allow the HTTP client to take full advantage of persistent connections, you should do as many of your file transfers as possible using the same handle.

Persistent Connections example

```

esp_err_t err;
esp_http_client_config_t config = {
    .url = "http://httpbin.org/get",
};
esp_http_client_handle_t client = esp_http_client_init(&config);
// first request
err = esp_http_client_perform(client);

// second request
esp_http_client_set_url(client, "http://httpbin.org/anything")
esp_http_client_set_method(client, HTTP_METHOD_DELETE);
esp_http_client_set_header(client, "HeaderKey", "HeaderValue");
err = esp_http_client_perform(client);

esp_http_client_cleanup(client);

```

HTTPS

The HTTP client supports SSL connections using **mbedtls**, with the `url` configuration starting with `https` scheme (or `transport_type = HTTP_TRANSPORT_OVER_SSL`). HTTPS support can be configured via [CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS](#) (enabled by default).

备注: By providing information using HTTPS, the library will use the SSL transport type to connect to the server. If you want to verify server, then need to provide additional certificate in PEM format, and provide to `cert_pem` in `esp_http_client_config_t`

HTTPS example

```

static void https()
{
    esp_http_client_config_t config = {
        .url = "https://www.howsmyssl.com",
        .cert_pem = howsmyssl_com_root_cert_pem_start,
    };
    esp_http_client_handle_t client = esp_http_client_init(&config);
    esp_err_t err = esp_http_client_perform(client);

    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Status = %d, content_length = %d",
            esp_http_client_get_status_code(client),
            esp_http_client_get_content_length(client));
    }
    esp_http_client_cleanup(client);
}

```

HTTP Stream

Some applications need to open the connection and control the reading of the data in an active manner. the HTTP client supports some functions to make this easier, of course, once you use these functions you should not use the `esp_http_client_perform()` function with that handle, and `esp_http_client_init()` always to called first to get the handle. Perform that functions in the order below:

- `esp_http_client_init()`: to create and handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: to modify the http connection information (optional)
- `esp_http_client_open()`: Open the http connection with `write_len` parameter, `write_len=0` if we only need read

- `esp_http_client_write()`: Upload data, max length equal to `write_len` of `esp_http_client_open()` function. We may not need to call it if `write_len=0`
- `esp_http_client_fetch_headers()`: After sending the headers and write data (if any) to the server, this function will read the HTTP Server response headers. Calling this function will return the `content-length` from the Server, and we can call `esp_http_client_get_status_code()` for the HTTP status of the connection.
- `esp_http_client_read()`: Now, we can read the HTTP stream by this function.
- `esp_http_client_close()`: We should the connection after finish
- `esp_http_client_cleanup()`: And release the resources

Perform HTTP request as Stream reader Check the example function `http_perform_as_stream_reader` at [protocols/esp_http_client](#).

HTTP Authentication

The HTTP client supports both **Basic** and **Digest** Authentication. By providing usernames and passwords in `url` or in the `username`, `password` of config entry. And with `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform to pass the authentication process. If `auth_type = HTTP_AUTH_TYPE_NONE`, but there are `username` and `password` in the configuration, the HTTP client takes 2 performs. The first time it connects to the server and receives the UNAUTHORIZED header. Based on this information, it will know which authentication method to choose, and perform it on the second.

Config authentication example with URI

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

Config authentication example with username, password entry

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

HTTP Client example: [protocols/esp_http_client](#).

API Reference

Header File

- [components/esp_http_client/include/esp_http_client.h](#)

Functions

`esp_http_client_handle_t esp_http_client_init` (const `esp_http_client_config_t` *config)

Start a HTTP session This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

参数 config **–[in]** The configurations, see `http_client_config_t`

返回

- `esp_http_client_handle_t`
- NULL if any errors

esp_err_t esp_http_client_perform (*esp_http_client_handle_t* client)

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of *esp_http_client_config_t* must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_*` between the invokes to set options for the following `esp_http_client_perform`.

备注: You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

参数 `client` -The `esp_http_client` handle

返回

- ESP_OK on successful
- ESP_FAIL on error

esp_err_t esp_http_client_set_url (*esp_http_client_handle_t* client, const char *url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

参数

- `client` -[in] The `esp_http_client` handle
- `url` -[in] The url

返回

- ESP_OK
- ESP_FAIL

esp_err_t esp_http_client_set_post_field (*esp_http_client_handle_t* client, const char *data, int len)

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

参数

- `client` -[in] The `esp_http_client` handle
- `data` -[in] post data pointer
- `len` -[in] post length

返回

- ESP_OK
- ESP_FAIL

int esp_http_client_get_post_field (*esp_http_client_handle_t* client, char **data)

Get current post field information.

参数

- `client` -[in] The client
- `data` -[out] Point to post data pointer

返回 Size of post data

esp_err_t esp_http_client_set_header (*esp_http_client_handle_t* client, const char *key, const char *value)

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

参数

- **client** `-[in]` The `esp_http_client` handle
- **key** `-[in]` The header key
- **value** `-[in]` The header value

返回

- ESP_OK
- ESP_FAIL

esp_err_t `esp_http_client_get_header` (*esp_http_client_handle_t* client, const char *key, char **value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

参数

- **client** `-[in]` The `esp_http_client` handle
- **key** `-[in]` The header key
- **value** `-[out]` The header value

返回

- ESP_OK
- ESP_FAIL

esp_err_t `esp_http_client_get_username` (*esp_http_client_handle_t* client, char **value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

参数

- **client** `-[in]` The `esp_http_client` handle
- **value** `-[out]` The username value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t `esp_http_client_set_username` (*esp_http_client_handle_t* client, const char *username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

参数

- **client** `-[in]` The `esp_http_client` handle
- **username** `-[in]` The username value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t `esp_http_client_get_password` (*esp_http_client_handle_t* client, char **value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

参数

- **client** `-[in]` The `esp_http_client` handle
- **value** `-[out]` The password value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t `esp_http_client_set_password` (*esp_http_client_handle_t* client, const char *password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

参数

- **client** –[in] The esp_http_client handle
- **password** –[in] The password value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_auth_type** (*esp_http_client_handle_t* client, *esp_http_client_auth_type_t* auth_type)

Set http request auth_type.

参数

- **client** –[in] The esp_http_client handle
- **auth_type** –[in] The esp_http_client auth type

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

int **esp_http_client_get_errno** (*esp_http_client_handle_t* client)

Get HTTP client session errno.

参数 **client** –[in] The esp_http_client handle

返回

- (-1) if invalid argument
- errno

esp_err_t **esp_http_client_set_method** (*esp_http_client_handle_t* client, *esp_http_client_method_t* method)

Set http request method.

参数

- **client** –[in] The esp_http_client handle
- **method** –[in] The method

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_timeout_ms** (*esp_http_client_handle_t* client, int timeout_ms)

Set http request timeout.

参数

- **client** –[in] The esp_http_client handle
- **timeout_ms** –[in] The timeout value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_delete_header** (*esp_http_client_handle_t* client, const char *key)

Delete http request header.

参数

- **client** –[in] The esp_http_client handle
- **key** –[in] The key

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_open** (*esp_http_client_handle_t* client, int write_len)

This function will be open the connection, write all header strings and return.

参数

- **client** –[in] The esp_http_client handle
- **write_len** –[in] HTTP Content length need to write to the server

返回

- ESP_OK
- ESP_FAIL

int **esp_http_client_write** (*esp_http_client_handle_t* client, const char *buffer, int len)

This function will write data to the HTTP connection previously opened by esp_http_client_open()

参数

- **client** –[in] The esp_http_client handle
- **buffer** –The buffer
- **len** –[in] This value must not be larger than the write_len parameter provided to esp_http_client_open()

返回

- (-1) if any errors
- Length of data written

int **esp_http_client_fetch_headers** (*esp_http_client_handle_t* client)

This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

参数 **client** –[in] The esp_http_client handle

返回

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked response)
- (-1: ESP_FAIL) if any errors
- Download data length defined by content-length header

bool **esp_http_client_is_chunked_response** (*esp_http_client_handle_t* client)

Check response data is chunked.

参数 **client** –[in] The esp_http_client handle

返回 true or false

int **esp_http_client_read** (*esp_http_client_handle_t* client, char *buffer, int len)

Read data from http stream.

参数

- **client** –[in] The esp_http_client handle
- **buffer** –The buffer
- **len** –[in] The length

返回

- (-1) if any errors
- Length of data was read

int **esp_http_client_get_status_code** (*esp_http_client_handle_t* client)

Get http response status code, the valid value if this function invoke after esp_http_client_perform

参数 **client** –[in] The esp_http_client handle

返回 Status code

int **esp_http_client_get_content_length** (*esp_http_client_handle_t* client)

Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

参数 **client** –[in] The esp_http_client handle

返回

- (-1) Chunked transfer
- Content-Length value as bytes

esp_err_t **esp_http_client_close** (*esp_http_client_handle_t* client)

Close http connection, still kept all http request resources.

参数 **client** –[in] The esp_http_client handle

返回

- ESP_OK

- ESP_FAIL

esp_err_t **esp_http_client_cleanup** (*esp_http_client_handle_t* client)

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

参数 **client** *–[in]* The `esp_http_client` handle

返回

- ESP_OK
- ESP_FAIL

esp_http_client_transport_t **esp_http_client_get_transport_type** (*esp_http_client_handle_t* client)

Get transport type.

参数 **client** *–[in]* The `esp_http_client` handle

返回

- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL

esp_err_t **esp_http_client_set_redirection** (*esp_http_client_handle_t* client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

参数 **client** *–[in]* The `esp_http_client` handle

返回

- ESP_OK
- ESP_FAIL

void **esp_http_client_add_auth** (*esp_http_client_handle_t* client)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

备注: There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

参数 **client** *–[in]* The `esp_http_client` handle

bool **esp_http_client_is_complete_data_received** (*esp_http_client_handle_t* client)

Checks if entire data in the response has been read without any error.

参数 **client** *–[in]* The `esp_http_client` handle

返回

- true
- false

int **esp_http_client_read_response** (*esp_http_client_handle_t* client, char *buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

参数

- **client** *–[in]* The `esp_http_client` handle
- **buffer** *–*The buffer
- **len** *–[in]* The buffer length

返回

- Length of data was read

esp_err_t **esp_http_client_flush_response** (*esp_http_client_handle_t* client, int *len)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

参数

- **client** –[in] The `esp_http_client` handle
- **len** –Length of data discarded

返回

- `ESP_OK` If successful, len will have discarded length
- `ESP_FAIL` If failed to read response
- `ESP_ERR_INVALID_ARG` If the client is NULL

esp_err_t **esp_http_client_get_url** (*esp_http_client_handle_t* client, char *url, const int len)

Get URL from client.

参数

- **client** –[in] The `esp_http_client` handle
- **url** –[inout] The buffer to store URL
- **len** –[in] The buffer length

返回

- `ESP_OK`
- `ESP_FAIL`

esp_err_t **esp_http_client_get_chunk_length** (*esp_http_client_handle_t* client, int *len)

Get Chunk-Length from client.

参数

- **client** –[in] The `esp_http_client` handle
- **len** –[out] Variable to store length

返回

- `ESP_OK` If successful, len will have length of current chunk
- `ESP_FAIL` If the server is not a chunked server
- `ESP_ERR_INVALID_ARG` If the client or len are NULL

Structures

struct **esp_http_client_event**

HTTP Client events data.

Public Members

esp_http_client_event_id_t **event_id**

event_id, to know the cause of the event

esp_http_client_handle_t **client**

`esp_http_client_handle_t` context

void ***data**

data of the event

int **data_len**

data length of data

void ***user_data**

user_data context, from *esp_http_client_config_t* user_data

char ***header_key**

For HTTP_EVENT_ON_HEADER event_id, it's store current http header key

char ***header_value**

For HTTP_EVENT_ON_HEADER event_id, it's store current http header value

struct **esp_http_client_config_t**

HTTP configuration.

Public Members

const char ***url**

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char ***host**

Domain or IP as string

int **port**

Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char ***username**

Using for Http authentication

const char ***password**

Using for Http authentication

esp_http_client_auth_type_t **auth_type**

Http authentication type, see *esp_http_client_auth_type_t*

const char ***path**

HTTP Path, if not set, default is /

const char ***query**

HTTP query

const char ***cert_pem**

SSL server certification, PEM format as string, if the client requires to verify server

size_t **cert_len**

Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char ***client_cert_pem**

SSL client certification, PEM format as string, if the server requires to verify client

size_t **client_cert_len**

Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char ***client_key_pem**

SSL client key, PEM format as string, if the server requires to verify client

size_t **client_key_len**

Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char ***client_key_password**

Client key decryption password string

size_t **client_key_password_len**

String length of the password pointed to by client_key_password

const char ***user_agent**

The User Agent string to send with HTTP requests

esp_http_client_method_t **method**

HTTP Method

int **timeout_ms**

Network timeout in milliseconds

bool **disable_auto_redirect**

Disable HTTP automatic redirects

int **max_redirection_count**

Max number of redirections on receiving HTTP redirect status code, using default value if zero

int **max_authorization_retries**

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb **event_handler**

HTTP Event Handle

esp_http_client_transport_t **transport_type**

HTTP transport type, see esp_http_client_transport_t

int **buffer_size**

HTTP receive buffer size

int **buffer_size_tx**

HTTP transmit buffer size

void ***user_data**

HTTP user_data context

bool **is_async**

Set asynchronous mode, only supported with HTTPS for now

bool **use_global_ca_store**

Use a global ca_store for all the connections in which this bool is set.

bool **skip_cert_common_name_check**

Skip any validation of server certificate CN field

esp_err_t (***crt_bundle_attach**)(void *conf)

Function pointer to esp_cert_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time. Default is 5 (second)

int **keep_alive_interval**

Keep-alive interval time. Default is 5 (second)

int **keep_alive_count**

Keep-alive packet retry send count. Default is 3 counts

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

Macros

DEFAULT_HTTP_BUF_SIZE

ESP_ERR_HTTP_BASE

Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT

The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT

Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA

Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER

Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT

There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING

HTTP connection hasn't been established yet

ESP_ERR_HTTP_EAGAIN

Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED

Read FIN from peer and the connection closed

Type Definitions

```
typedef struct esp_http_client *esp_http_client_handle_t
```

```
typedef struct esp_http_client_event *esp_http_client_event_handle_t
```

```
typedef struct esp_http_client_event esp_http_client_event_t
```

HTTP Client events data.

```
typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)
```

Enumerations

```
enum esp_http_client_event_id_t
```

HTTP Client events id.

Values:

```
enumerator HTTP_EVENT_ERROR
```

This event occurs when there are any errors during execution

```
enumerator HTTP_EVENT_ON_CONNECTED
```

Once the HTTP has been connected to the server, no data exchange has been performed

```
enumerator HTTP_EVENT_HEADERS_SENT
```

After sending all the headers to the server

```
enumerator HTTP_EVENT_HEADER_SENT
```

This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

```
enumerator HTTP_EVENT_ON_HEADER
```

Occurs when receiving each header sent from the server

```
enumerator HTTP_EVENT_ON_DATA
```

Occurs when receiving data from the server, possibly multiple portions of the packet

```
enumerator HTTP_EVENT_ON_FINISH
```

Occurs when finish a HTTP session

```
enumerator HTTP_EVENT_DISCONNECTED
```

The connection has been disconnected

enum **esp_http_client_transport_t**

HTTP Client transport.

Values:

enumerator **HTTP_TRANSPORT_UNKNOWN**

Unknown

enumerator **HTTP_TRANSPORT_OVER_TCP**

Transport over tcp

enumerator **HTTP_TRANSPORT_OVER_SSL**

Transport over ssl

enum **esp_http_client_method_t**

HTTP method.

Values:

enumerator **HTTP_METHOD_GET**

HTTP GET Method

enumerator **HTTP_METHOD_POST**

HTTP POST Method

enumerator **HTTP_METHOD_PUT**

HTTP PUT Method

enumerator **HTTP_METHOD_PATCH**

HTTP PATCH Method

enumerator **HTTP_METHOD_DELETE**

HTTP DELETE Method

enumerator **HTTP_METHOD_HEAD**

HTTP HEAD Method

enumerator **HTTP_METHOD_NOTIFY**

HTTP NOTIFY Method

enumerator **HTTP_METHOD_SUBSCRIBE**

HTTP SUBSCRIBE Method

enumerator **HTTP_METHOD_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

enumerator **HTTP_METHOD_OPTIONS**

HTTP OPTIONS Method

enumerator **HTTP_METHOD_COPY**

HTTP COPY Method

enumerator **HTTP_METHOD_MOVE**

HTTP MOVE Method

enumerator **HTTP_METHOD_LOCK**

HTTP LOCK Method

enumerator **HTTP_METHOD_UNLOCK**

HTTP UNLOCK Method

enumerator **HTTP_METHOD_PROPFIND**

HTTP PROPFIND Method

enumerator **HTTP_METHOD_PROPPATCH**

HTTP PROPPATCH Method

enumerator **HTTP_METHOD_MKCOL**

HTTP MKCOL Method

enumerator **HTTP_METHOD_MAX**

enum **esp_http_client_auth_type_t**

HTTP Authentication type.

Values:

enumerator **HTTP_AUTH_TYPE_NONE**

No authentication

enumerator **HTTP_AUTH_TYPE_BASIC**

HTTP Basic authentication

enumerator **HTTP_AUTH_TYPE_DIGEST**

HTTP Digest authentication

enum **HttpStatus_Code**

Enum for the HTTP status codes.

Values:

enumerator **HttpStatus_Ok**

enumerator **HttpStatus_MultipleChoices**

enumerator **HttpStatus_MovedPermanently**

enumerator **HttpStatus_Found**

enumerator `HttpStatus_SeeOther`

enumerator `HttpStatus_TemporaryRedirect`

enumerator `HttpStatus_PermanentRedirect`

enumerator `HttpStatus_BadRequest`

enumerator `HttpStatus_Unauthorized`

enumerator `HttpStatus_Forbidden`

enumerator `HttpStatus_NotFound`

enumerator `HttpStatus_InternalError`

2.4.5 ESP WebSocket Client

Overview

The ESP WebSocket client is an implementation of [WebSocket protocol client](#) for ESP32

Features

- Supports WebSocket over TCP, TLS with mbedtls
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

Configuration

URI

- Supports `ws`, `wss` schemes
- WebSocket samples:
 - `ws://echo.websocket.org`: WebSocket over TCP, default port 80
 - `wss://echo.websocket.org`: WebSocket over SSL, default port 443

Minimal configurations:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org",
};
```

The WebSocket client supports the use of both path and query in the URI. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org/connectionhandler?id=104",
};
```

If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567
```

TLS Configuration:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "wss://echo.websocket.org",
    .cert_pem = (const char *)websocket_org_pem_start,
};
```

备注: If you want to verify the server, then you need to provide a certificate in PEM format, and provide to `cert_pem` in `websocket_client_config_t`. If no certificate is provided then the TLS connection will default not requiring verification.

PEM certificate for this example could be extracted from an `openssl s_client` command connecting to `websocket.org`. In case a host operating system has `openssl` and `sed` packages installed, one could execute the following command to download and save the root or intermediate root certificate to a file (Note for Windows users: Both Linux like environment or Windows native packages may be used). `\ echo "" | openssl s_client -showcerts -connect websocket.org:443 | sed -n "1,/Root/d; /BEGIN/,/END/p" | openssl x509 -outform PEM >websocket_org.pem``

This command will extract the second certificate in the chain and save it as a pem-file.

Subprotocol The subprotocol field in the config struct can be used to request a subprotocol

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
    .subprotocol = "soap",
};
```

备注: The client is indifferent to the subprotocol field in the server response and will accept the connection no matter what the server replies.

For more options on `esp_websocket_client_config_t`, please refer to API reference below

Events

- **WEBSOCKET_EVENT_CONNECTED:** The client has successfully established a connection to the server. The client is now ready to send and receive data. Contains no event data.
- **WEBSOCKET_EVENT_DISCONNECTED:** The client has aborted the connection due to the transport layer failing to read data, e.g. because the server is unavailable. Contains no event data.
- **WEBSOCKET_EVENT_DATA:** The client has successfully received and parsed a WebSocket frame. The event data contains a pointer to the payload data, the length of the payload data as well as the opcode of the received frame. A message may be fragmented into multiple events if the length exceeds the buffer size. This event will also be posted for non-payload frames, e.g. pong or connection close frames.
- **WEBSOCKET_EVENT_ERROR:** Not used in the current implementation of the client.

If the client handle is needed in the event handler it can be accessed through the pointer passed to the event handler:

```
esp_websocket_client_handle_t client = (esp_websocket_client_handle_t)handler_args;
```

Limitations and Known Issues

- The client is able to request the use of a subprotocol from the server during the handshake, but does not do any subprotocol related checks on the response from the server.

Application Example

A simple WebSocket example that uses `esp_websocket_client` to establish a websocket connection and send/receive data with the [websocket.org](https://www.websocket.org) server can be found here: [protocols/websocket](https://www.websocket.org/protocols/websocket).

Sending Text Data The WebSocket client supports sending data as a text data frame, which informs the application layer that the payload data is text data encoded as UTF-8. Example:

```
esp_websocket_client_send_text(client, data, len, portMAX_DELAY);
```

API Reference

Header File

- `components/esp_websocket_client/include/esp_websocket_client.h`

Functions

`esp_websocket_client_handle_t esp_websocket_client_init` (const `esp_websocket_client_config_t` *config)

Start a Websocket session This function must be the first function to call, and it returns a `esp_websocket_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_websocket_client_destroy` when the operation is complete.

参数 `config` **–[in]** The configuration

返回

- `esp_websocket_client_handle_t`
- NULL if any errors

`esp_err_t esp_websocket_client_set_uri` (`esp_websocket_client_handle_t` client, const char *uri)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones Must stop the WebSocket client before set URI if the client has been connected.

参数

- `client` **–[in]** The client
- `uri` **–[in]** The uri

返回 `esp_err_t`

`esp_err_t esp_websocket_client_start` (`esp_websocket_client_handle_t` client)

Open the WebSocket connection.

参数 `client` **–[in]** The client

返回 `esp_err_t`

`esp_err_t esp_websocket_client_stop` (`esp_websocket_client_handle_t` client)

Stops the WebSocket connection without websocket closing handshake.

This API stops ws client and closes TCP connection directly without sending close frames. It is a good practice to close the connection in a clean way using `esp_websocket_client_close()`.

Notes:

- Cannot be called from the websocket event handler

参数 `client` **–[in]** The client

返回 `esp_err_t`

`esp_err_t esp_websocket_client_destroy` (`esp_websocket_client_handle_t` client)

Destroy the WebSocket connection and free all resources. This function must be the last function to call for an session. It is the opposite of the `esp_websocket_client_init` function and must be called with the same handle as input that a `esp_websocket_client_init` call returned. This might close all connections this handle has used.

Notes:

- Cannot be called from the websocket event handler

参数 **client** `–[in]` The client

返回 `esp_err_t`

int `esp_websocket_client_send` (`esp_websocket_client_handle_t` client, const char *data, int len, TickType_t timeout)

Generic write data to the WebSocket connection; defaults to binary send.

参数

- **client** `–[in]` The client
- **data** `–[in]` The data
- **len** `–[in]` The length
- **timeout** `–[in]` Write data timeout in RTOS ticks

返回

- Number of data was sent
- (-1) if any errors

int `esp_websocket_client_send_bin` (`esp_websocket_client_handle_t` client, const char *data, int len, TickType_t timeout)

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

参数

- **client** `–[in]` The client
- **data** `–[in]` The data
- **len** `–[in]` The length
- **timeout** `–[in]` Write data timeout in RTOS ticks

返回

- Number of data was sent
- (-1) if any errors

int `esp_websocket_client_send_text` (`esp_websocket_client_handle_t` client, const char *data, int len, TickType_t timeout)

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

参数

- **client** `–[in]` The client
- **data** `–[in]` The data
- **len** `–[in]` The length
- **timeout** `–[in]` Write data timeout in RTOS ticks

返回

- Number of data was sent
- (-1) if any errors

`esp_err_t esp_websocket_client_close` (`esp_websocket_client_handle_t` client, TickType_t timeout)

Close the WebSocket connection in a clean way.

Sequence of clean close initiated by client:

- Client sends CLOSE frame
- Client waits until server echos the CLOSE frame
- Client waits until server closes the connection

- Client is stopped the same way as by the `esp_websocket_client_stop()`

Notes:

- Cannot be called from the websocket event handler

参数

- **client** –[in] The client
- **timeout** –[in] Timeout in RTOS ticks for waiting

返回 `esp_err_t`

`esp_err_t esp_websocket_client_close_with_code` (`esp_websocket_client_handle_t` client, int code, const char *data, int len, TickType_t timeout)

Close the WebSocket connection in a clean way with custom code/data Closing sequence is the same as for `esp_websocket_client_close()`

Notes:

- Cannot be called from the websocket event handler

参数

- **client** –[in] The client
- **code** –[in] Close status code as defined in RFC6455 section-7.4
- **data** –[in] Additional data to closing message
- **len** –[in] The length of the additional data
- **timeout** –[in] Timeout in RTOS ticks for waiting

返回 `esp_err_t`

bool `esp_websocket_client_is_connected` (`esp_websocket_client_handle_t` client)

Check the WebSocket client connection state.

参数 **client** –[in] The client handle

返回

- true
- false

`esp_err_t esp_websocket_register_events` (`esp_websocket_client_handle_t` client, `esp_websocket_event_id_t` event, `esp_event_handler_t` event_handler, void *event_handler_arg)

Register the Websocket Events.

参数

- **client** –The client handle
- **event** –The event id
- **event_handler** –The callback function
- **event_handler_arg** –User context

返回 `esp_err_t`

Structures

struct `esp_websocket_event_data_t`

Websocket event data.

Public Members

const char ***data_ptr**

Data pointer

int **data_len**

Data length

uint8_t **op_code**

Received opcode

esp_websocket_client_handle_t **client**

esp_websocket_client_handle_t context

void ***user_context**

user_data context, from *esp_websocket_client_config_t* user_data

int **payload_len**

Total payload length, payloads exceeding buffer will be posted through multiple events

int **payload_offset**

Actual offset for the data associated with this event

struct **esp_websocket_client_config_t**

Websocket client setup configuration.

Public Members

const char ***uri**

Websocket URI, the information on the URI can be overrides the other fields below, if any

const char ***host**

Domain or IP as string

int **port**

Port to connect, default depend on *esp_websocket_transport_t* (80 or 443)

const char ***username**

Using for Http authentication - Not supported for now

const char ***password**

Using for Http authentication - Not supported for now

const char ***path**

HTTP Path, if not set, default is /

bool **disable_auto_reconnect**

Disable the automatic reconnect function when disconnected

void ***user_context**

HTTP user data context

int **task_prio**

Websocket task priority

int **task_stack**

Websocket task stack

int **buffer_size**

Websocket buffer size

const char ***cert_pem**

Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `cert_len`.

size_t **cert_len**

Length of the buffer pointed to by `cert_pem`. May be 0 for null-terminated pem

const char ***client_cert**

Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_key` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_cert_len`.

size_t **client_cert_len**

Length of the buffer pointed to by `client_cert`. May be 0 for null-terminated pem

const char ***client_key**

Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_cert` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_key_len`

size_t **client_key_len**

Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

esp_websocket_transport_t **transport**

Websocket transport type, see 'esp_websocket_transport_t'

const char ***subprotocol**

Websocket subprotocol

const char ***user_agent**

Websocket user-agent

const char ***headers**

Websocket additional headers

int **pingpong_timeout_sec**

Period before connection is aborted due to no PONGs received

bool **disable_pingpong_discon**

Disable auto-disconnect due to no PONG received within pingpong_timeout_sec

bool **use_global_ca_store**

Use a global ca_store for all the connections in which this bool is set.

bool **skip_cert_common_name_check**

Skip any validation of server certificate CN field

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time. Default is 5 (second)

int **keep_alive_interval**

Keep-alive interval time. Default is 5 (second)

int **keep_alive_count**

Keep-alive packet retry send count. Default is 3 counts

size_t **ping_interval_sec**

Websocket ping interval, defaults to 10 seconds if not set

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

Type Definitions

```
typedef struct esp_websocket_client *esp_websocket_client_handle_t
```

Enumerations

enum **esp_websocket_event_id_t**

Websocket Client events id.

Values:

enumerator **WEBSOCKET_EVENT_ANY**

enumerator **WEBSOCKET_EVENT_ERROR**

This event occurs when there are any errors during execution

enumerator **WEBSOCKET_EVENT_CONNECTED**

Once the Websocket has been connected to the server, no data exchange has been performed

enumerator **WEBSOCKET_EVENT_DISCONNECTED**

The connection has been disconnected

enumerator **WEBSOCKET_EVENT_DATA**

When receiving data from the server, possibly multiple portions of the packet

enumerator **WEBSOCKET_EVENT_CLOSED**

The connection has been closed cleanly

enumerator **WEBSOCKET_EVENT_MAX**

enum **esp_websocket_transport_t**

Websocket Client transport.

Values:

enumerator **WEBSOCKET_TRANSPORT_UNKNOWN**

Transport unknown

enumerator **WEBSOCKET_TRANSPORT_OVER_TCP**

Transport over tcp

enumerator **WEBSOCKET_TRANSPORT_OVER_SSL**

Transport over ssl

2.4.6 HTTP 服务器

概述

HTTP Server 组件提供了在 ESP32 上运行轻量级 Web 服务器的功能，下面介绍使用 HTTP Server 组件 API 的详细步骤：

- `httpd_start()`：创建 HTTP 服务器的实例，根据具体的配置为其分配内存和资源，并返回该服务器实例的句柄。服务器使用了两个套接字，一个用来监听 HTTP 流量（TCP 类型），另一个用来处理控制信号（UDP 类型），它们在服务器的任务循环中轮流使用。通过向 `httpd_start()` 传递 `httpd_config_t` 结构体，可以在创建服务器实例时配置任务的优先级和堆栈的大小。TCP 流量被解析为 HTTP 请求，根据请求的 URI 来调用用户注册的处理程序，在处理程序中需要发送回 HTTP 响应数据包。
- `httpd_stop()`：根据传入的句柄停止服务器，并释放相关联的内存和资源。这是一个阻塞函数，首先给服务器任务发送停止信号，然后等待其终止。期间服务器任务会关闭所有已打开的连接，删除已注册的 URI 处理程序，并将所有会话的上下文数据重置为空。
- `httpd_register_uri_handler()`：通过传入 `httpd_uri_t` 结构体类型的对象来注册 URI 处理程序。该结构体包含如下成员：`uri` 名字，`method` 类型（比如 `HTTPD_GET/HTTPD_POST/HTTPD_PUT` 等等），`esp_err_t *handler (httpd_req_t *req)` 类型的函数指针，指向用户上下文数据的 `user_ctx` 指针。

应用示例

```
/* URI 处理函数，在客户端发起 GET /uri 请求时被调用 */
esp_err_t get_handler(httpd_req_t *req)
{
    /* 发送回简单的响应数据包 */
    const char[] resp = "URI GET Response";
```

(下页继续)

```

    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI 处理函数，在客户端发起 POST /uri 请求时被调用 */
esp_err_t post_handler(httpd_req_t *req)
{
    /* 定义 HTTP POST 请求数据的目标缓存区
     * httpd_req_recv() 只接收 char*_
     →数据，但也可以是任意二进制数据（需要类型转换）
     * 对于字符串数据，null 终止符会被省略，content_len_
     →会给出字符串的长度 */
    char content[100];

    /* 如果内容长度大于缓冲区则截断 */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 返回 0 表示连接已关闭 */
        /* 检查是否超时 */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* 如果是超时，可以调用 httpd_req_recv() 重试
             * 简单起见，这里我们直接响应 HTTP_
             →408（请求超时）错误给客户端 */
            httpd_resp_send_408(req);
        }
        /* 如果发生了错误，返回 ESP_FAIL 可以确保底层套接字被关闭 */
        return ESP_FAIL;
    }

    /* 发送简单的响应数据包 */
    const char[] resp = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* GET /uri 的 URI 处理结构 */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* POST /uri 的 URI 处理结构 */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* 启动 Web 服务器的函数 */
httpd_handle_t start_webserver(void)
{
    /* 生成默认的配置参数 */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* 置空 esp_http_server 的实例句柄 */
    httpd_handle_t server = NULL;

```

(续上页)

```

/* 启动 httpd server */
if (httpd_start(&server, &config) == ESP_OK) {
    /* 注册 URI 处理程序 */
    httpd_register_uri_handler(server, &uri_get);
    httpd_register_uri_handler(server, &uri_post);
}
/* 如果服务器启动失败，返回的句柄是 NULL */
return server;
}

/* 停止 Web 服务器的函数 */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* 停止 httpd server */
        httpd_stop(server);
    }
}

```

简单 HTTP 服务器示例 请查看位于 [protocols/http_server/simple](#) 的 HTTP 服务器示例，该示例演示了如何处理任意内容长度的数据，读取请求头和 URL 查询参数，设置响应头。

HTTP 长连接

HTTP 服务器具有长连接的功能，允许重复使用同一个连接（会话）进行多次传输，同时保持会话的上下文数据。上下文数据可由处理程序动态分配，在这种情况下需要提前指定好自定义的回调函数，以便在连接/会话被关闭时释放这部分内存资源。

长连接示例

```

/* 自定义函数，用来释放上下文数据 */
void free_ctx_func(void *ctx)
{
    /* 也可以是 free 以外的代码逻辑 */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* 如果会话上下文还不存在则新建一个 */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< 指向上下文数据 */
        req->free_ctx = free_ctx_func; /*!< 释放上下文数据的函数 */
    }

    /* 访问上下文数据 */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

    /* 响应 */
    .....
    .....
    .....

    return ESP_OK;
}

```

详情请参考位于 [protocols/http_server/persistent_sockets](#) 的示例代码。

API 参考

Header File

- components/esp_http_server/include/esp_http_server.h

Functions

`esp_err_t httpd_register_uri_handler` (`httpd_handle_t` handle, const `httpd_uri_t` *uri_handler)

Registers a URI handler.

Example usage:

```
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

备注: URI handlers can be registered in real time as long as the server handle is valid.

参数

- **handle** –[in] handle to HTTPD server instance
- **uri_handler** –[in] pointer to handler that needs to be registered

返回

- ESP_OK : On successfully registering the handler
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL : If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS : If handler with same URI and method is already registered

`esp_err_t httpd_unregister_uri_handler` (`httpd_handle_t` handle, const char *uri, `httpd_method_t` method)

Unregister a URI handler.

参数

- **handle** –[in] handle to HTTPD server instance
- **uri** –[in] URI string
- **method** –[in] HTTP method

返回

- ESP_OK : On successfully deregistering the handler
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_FOUND : Handler with specified URI and method not found

esp_err_t **httpd_unregister_uri** (*httpd_handle_t* handle, const char *uri)

Unregister all URI handlers with the specified uri string.

参数

- **handle** –[in] handle to HTTPD server instance
- **uri** –[in] uri string specifying all handlers that need to be deregistered

返回

- ESP_OK : On successfully deregistering all such handlers
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_FOUND : No handler registered with specified uri string

esp_err_t **httpd_sess_set_recv_override** (*httpd_handle_t* hd, int sockfd, *httpd_recv_func_t* recv_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request packets.

备注: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
 - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
-

参数

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **recv_func** –[in] The receive function to be set for this session

返回

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_sess_set_send_override** (*httpd_handle_t* hd, int sockfd, *httpd_send_func_t* send_func)

Override web server's send function (by session FD)

This function overrides the web server's send function. This same function is used to send out any response to any HTTP request.

备注: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
 - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
-

参数

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **send_func** –[in] The send function to be set for this session

返回

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_sess_set_pending_override** (*httpd_handle_t* hd, int sockfd, *httpd_pending_func_t* pending_func)

Override web server's pending function (by session FD)

This function overrides the web server's pending function. This function is used to test for pending bytes in a socket.

备注: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
 - a URI handler where sockfd is obtained using httpd_req_to_sockfd()
-

参数

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **pending_func** –[in] The receive function to be set for this session

返回

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

int **httpd_req_to_sockfd** (*httpd_req_t* *r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : httpd_sess_get_ctx(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().

备注: This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

参数 **r** –[in] The request whose socket descriptor should be found

返回

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int **httpd_req_recv** (*httpd_req_t* *r, char *buf, size_t buf_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf_len' number of bytes, while the pointer to content data is incremented internally by the same number.

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
 - If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
 - Presently Chunked Encoding is not supported
-

参数

- **r** –[in] The request being responded to
- **buf** –[in] Pointer to a buffer that the data will be read into
- **buf_len** –[in] Length of the buffer

返回

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

size_t **httpd_req_get_hdr_value_len** (*httpd_req_t* *r, const char *field)

Search for a field in request headers and return the string length of it' s value.

备注:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
- Once *httpd_resp_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

参数

- **r** –[in] The request being responded to
- **field** –[in] The header field to be searched in the request

返回

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

esp_err_t **httpd_req_get_hdr_value_str** (*httpd_req_t* *r, const char *field, char *val, size_t val_size)

Get the value string of a field from the request headers.

备注:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
- Once *httpd_resp_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use *httpd_req_get_hdr_value_len()* to know the right buffer length

参数

- **r** –[in] The request being responded to
- **field** –[in] The field to be searched in the header
- **val** –[out] Pointer to the buffer into which the value will be copied if the field is found
- **val_size** –[in] Size of the user buffer “val”

返回

- ESP_OK : Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

size_t **httpd_req_get_url_query_len** (*httpd_req_t* *r)

Get Query string length from the request URL.

备注: This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid

参数 **r** –[in] The request being responded to
返回

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

esp_err_t **httpd_req_get_url_query_str** (*httpd_req_t* *r, char *buf, size_t buf_len)

Get Query string from the request URL.

备注:

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
 - This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
 - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
 - Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string
-

参数

- **r** –[in] The request being responded to
- **buf** –[out] Pointer to the buffer into which the query string will be copied (if found)
- **buf_len** –[in] Length of output buffer

返回

- ESP_OK : Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND : Query not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Query string truncated

esp_err_t **httpd_query_key_value** (const char *qry, const char *key, char *val, size_t val_size)

Helper function to get a URL query tag from a query string of the type param1=val1¶m2=val2.

备注:

- The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
 - If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.
-

参数

- **qry** –[in] Pointer to query string
- **key** –[in] The key to be searched in the query string
- **val** –[out] Pointer to the buffer into which the value will be copied if the key is found
- **val_size** –[in] Size of the user buffer “val”

返回

- ESP_OK : Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

esp_err_t **httpd_req_get_cookie_val** (*httpd_req_t* *req, const char *cookie_name, char *val, size_t *val_size)

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

参数

- **req** –[in] Pointer to the HTTP request
- **cookie_name** –[in] The cookie name to be searched in the request
- **val** –[out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- **val_size** –[inout] Pointer to size of the user buffer “val” . This variable will contain cookie length if ESP_OK is returned and required buffer length incase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

返回

- ESP_OK : Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated
- ESP_ERR_NO_MEM : Memory allocation failure

bool **httpd_uri_match_wildcard** (const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “?*” to make the previous character optional, and if present, allow anything to follow.

Example:

- * matches everything
- /foo/? matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?* or /foo/*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

参数

- **uri_template** –[in] URI template (pattern)
- **uri_to_match** –[in] URI to be matched
- **match_upto** –[in] how many characters of the URI buffer to test (there may be trailing query string etc.)

返回 true if a match was found

esp_err_t **httpd_resp_send** (*httpd_req_t* *r, const char *buf, ssize_t buf_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

参数

- **r** –[in] The request being responded to
- **buf** –[in] Buffer from where the content is to be fetched
- **buf_len** –[in] Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

esp_err_t **httpd_resp_send_chunk** (*httpd_req_t* *r, const char *buf, ssize_t buf_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

参数

- **r** –[in] The request being responded to
- **buf** –[in] Pointer to a buffer that stores the data
- **buf_len** –[in] Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

返回

- ESP_OK : On successfully sending the response packet chunk
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline *esp_err_t* **httpd_resp_sendstr** (*httpd_req_t* *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls `httpd_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

参数

- **r** –[in] The request being responded to
- **str** –[in] String to be sent as response body

返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

static inline *esp_err_t* **httpd_resp_sendstr_chunk** (*httpd_req_t* *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

参数

- **r** –[in] The request being responded to
- **str** –[in] String to be sent as response body (NULL to finish response packet)

返回

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

esp_err_t **httpd_resp_set_status** (*httpd_req_t* *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
 - Make sure that the lifetime of the status string is valid till send function is called.
-

参数

- **r** –[in] The request being responded to
- **status** –[in] The HTTP status code of this response

返回

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

esp_err_t **httpd_resp_set_type** (*httpd_req_t* *r, const char *type)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’ .

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
 - Make sure that the lifetime of the type string is valid till send function is called.
-

参数

- **r** –[in] The request being responded to
- **type** –[in] The Content Type of the response

返回

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

esp_err_t **httpd_resp_set_hdr** (*httpd_req_t* *r, const char *field, const char *value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

备注:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - The header isn't sent out until any of the send APIs is executed.
 - The maximum allowed number of additional headers is limited to value of *max_resp_headers* in config structure.
 - Make sure that the lifetime of the field value strings are valid till send function is called.
-

参数

- **r** –[in] The request being responded to
- **field** –[in] The field name of the HTTP header
- **value** –[in] The value of this HTTP header

返回

- *ESP_OK* : On successfully appending new header
- *ESP_ERR_INVALID_ARG* : Null arguments
- *ESP_ERR_HTTPD_RESP_HDR* : Total additional headers exceed max allowed
- *ESP_ERR_HTTPD_INVALID_REQ* : Invalid request pointer

esp_err_t **httpd_resp_send_err** (*httpd_req_t* *req, *httpd_err_code_t* error, const char *msg)

For sending out error code in response to HTTP request.

备注:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
 - If you wish to send additional data in the body of the response, please use the lower-level functions directly.
-

参数

- **req** –[in] Pointer to the HTTP request for which the response needs to be sent
- **error** –[in] Error type to send
- **msg** –[in] Error message string (pass NULL for default message)

返回

- *ESP_OK* : On successfully sending the response packet
- *ESP_ERR_INVALID_ARG* : Null arguments
- *ESP_ERR_HTTPD_RESP_SEND* : Error in raw send
- *ESP_ERR_HTTPD_INVALID_REQ* : Invalid request pointer

static inline *esp_err_t* **httpd_resp_send_404** (*httpd_req_t* *r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

备注:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.

- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

参数 **r** –[in] The request being responded to
返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline *esp_err_t* **httpd_resp_send_408** (*httpd_req_t* *r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

备注:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

参数 **r** –[in] The request being responded to
返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline *esp_err_t* **httpd_resp_send_500** (*httpd_req_t* *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

备注:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

参数 **r** –[in] The request being responded to
返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

int **httpd_send** (*httpd_req_t* *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually,

and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : `httpd_resp_send()`, `httpd_resp_send_chunk()`
-

参数

- **r** –[in] The request being responded to
- **buf** –[in] Buffer from where the fully constructed packet is to be read
- **buf_len** –[in] Length of the buffer

返回

- Bytes : Number of bytes that were sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

int `httpd_socket_send` (*httpd_handle_t* hd, int sockfd, const char *buf, size_t buf_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by `httpd_sess_set_send_override()`.

备注: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

参数

- **hd** –[in] server instance
- **sockfd** –[in] session socket file descriptor
- **buf** –[in] buffer with bytes to send
- **buf_len** –[in] data size
- **flags** –[in] flags for the send() function

返回

- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

int `httpd_socket_recv` (*httpd_handle_t* hd, int sockfd, char *buf, size_t buf_len, int flags)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by `httpd_sess_set_recv_override()`.

备注: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

参数

- **hd** –[in] server instance
- **sockfd** –[in] session socket file descriptor
- **buf** –[in] buffer with bytes to send
- **buf_len** –[in] data size
- **flags** –[in] flags for the send() function

返回

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD SOCK_ERR_INVALID : Invalid arguments
- HTTPD SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

esp_err_t **httpd_register_err_handler** (*httpd_handle_t* handle, *httpd_err_code_t* error, *httpd_err_handler_func_t* handler_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by *httpd_err_code_t*. See prototype *httpd_err_handler_func_t* above for details.

参数

- **handle** –[in] HTTP server handle
- **error** –[in] Error type
- **handler_fn** –[in] User implemented handler function (Pass NULL to unset any previously set handler)

返回

- ESP_OK : handler registered successfully
- ESP_ERR_INVALID_ARG : invalid error code or server handle

esp_err_t **httpd_start** (*httpd_handle_t* *handle, const *httpd_config_t* *config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

参数

- **config** –[in] Configuration for new instance of the server
- **handle** –[out] Handle to newly created instance of the server. NULL on error

返回

- ESP_OK : Instance created successfully
- ESP_ERR_INVALID_ARG : Null argument(s)

- ESP_ERR_HTTPD_ALLOC_MEM : Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK : Failed to launch server task

esp_err_t **httpd_stop** (*httpd_handle_t* handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

参数 handle **–[in]** Handle to server returned by `httpd_start`

返回

- ESP_OK : Server stopped successfully
- ESP_ERR_INVALID_ARG : Handle argument is Null

esp_err_t **httpd_queue_work** (*httpd_handle_t* handle, *httpd_work_fn_t* work, void *arg)

Queue execution of a function in HTTPD' s context.

This API queues a work function for asynchronous execution

备注: Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

参数

- **handle** **–[in]** Handle to server returned by `httpd_start`
- **work** **–[in]** Pointer to the function to be executed in the HTTPD' s context
- **arg** **–[in]** Pointer to the arguments that should be passed to this function

返回

- ESP_OK : On successfully queueing the work
- ESP_FAIL : Failure in ctrl socket
- ESP_ERR_INVALID_ARG : Null arguments

void ***httpd_sess_get_ctx** (*httpd_handle_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the `httpd_req_t` structure. But, there are cases where the web server' s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

参数

- **handle** **–[in]** Handle to server returned by `httpd_start`
- **sockfd** **–[in]** The socket descriptor for which the context should be extracted.

返回

- void* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd_sess_set_ctx** (*httpd_handle_t* handle, int sockfd, void *ctx, *httpd_free_ctx_fn_t* free_fn)

Set session context by socket descriptor.

参数

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor for which the context should be extracted.
- **ctx** –[in] Context object to assign to the session
- **free_fn** –[in] Function that should be called to free the context

void ***httpd_sess_get_transport_ctx** (*httpd_handle_t* handle, int sockfd)

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

参见:

`httpd_sess_get_ctx()`

参数

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor for which the context should be extracted.

返回

- void* : Pointer to the transport context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd_sess_set_transport_ctx** (*httpd_handle_t* handle, int sockfd, void *ctx, *httpd_free_ctx_fn_t* free_fn)

Set session ‘transport’ context by socket descriptor.

参见:

`httpd_sess_set_ctx()`

参数

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor for which the context should be extracted.
- **ctx** –[in] Transport context object to assign to the session
- **free_fn** –[in] Function that should be called to free the transport context

void ***httpd_get_global_user_ctx** (*httpd_handle_t* handle)

Get HTTPD global user context (it was set in the server config struct)

参数 **handle** –[in] Handle to server returned by `httpd_start`

返回 global user context

void ***httpd_get_global_transport_ctx** (*httpd_handle_t* handle)

Get HTTPD global transport context (it was set in the server config struct)

参数 **handle** –[in] Handle to server returned by `httpd_start`

返回 global transport context

esp_err_t **httpd_sess_trigger_close** (*httpd_handle_t* handle, int sockfd)

Trigger an httpd session close externally.

备注: Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

参数

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor of the session to be closed

返回

- `ESP_OK` : On successfully initiating closure
- `ESP_FAIL` : Failure to queue work
- `ESP_ERR_NOT_FOUND` : Socket fd not found
- `ESP_ERR_INVALID_ARG` : Null arguments

esp_err_t **httpd_sess_update_lru_counter** (*httpd_handle_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

备注: Calling this API is only necessary if the LRU Purge Enable option is enabled.

参数

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor of the session for which LRU counter is to be updated

返回

- `ESP_OK` : Socket found and LRU counter updated
- `ESP_ERR_NOT_FOUND` : Socket not found
- `ESP_ERR_INVALID_ARG` : Null arguments

esp_err_t **httpd_get_client_list** (*httpd_handle_t* handle, size_t *fds, int *client_fds)

Returns list of current socket descriptors of active sessions.

备注: Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with `max_open_sockets` field in `httpd_config_t` structure.

参数

- **handle** –[in] Handle to server returned by `httpd_start`
- **fds** –[inout] In: Size of provided `client_fds` array Out: Number of valid client fds returned in `client_fds`,
- **client_fds** –[out] Array of client fds

返回

- `ESP_OK` : Successfully retrieved session list
- `ESP_ERR_INVALID_ARG` : Wrong arguments or list is longer than provided array

Structures

struct **httpd_config**

HTTP Server Configuration Structure.

备注: Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

unsigned **task_priority**

Priority of FreeRTOS task which runs the server

size_t **stack_size**

The maximum stack size allowed for the server task

BaseType_t **core_id**

The core the HTTP server task will run on

uint16_t **server_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16_t **ctrl_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t **max_open_sockets**

Max number of sockets/clients connected at any time

uint16_t **max_uri_handlers**

Maximum allowed uri handlers

uint16_t **max_resp_headers**

Maximum allowed additional headers in HTTP response

uint16_t **backlog_conn**

Number of backlog connections

bool **lru_purge_enable**

Purge “Least Recently Used” connection

uint16_t **recv_wait_timeout**

Timeout for recv function (in seconds)

uint16_t **send_wait_timeout**

Timeout for send function (in seconds)

void ***global_user_ctx**

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

[*httpd_free_ctx_fn_t*](#) **global_user_ctx_free_fn**

Free function for global user context

void ***global_transport_ctx**

Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

httpd_free_ctx_fn_t **global_transport_ctx_free_fn**

Free function for global transport context

bool **enable_so_linger**

bool to enable/disable linger

int **linger_timeout**

linger timeout (in seconds)

httpd_open_func_t **open_fn**

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

httpd_close_func_t **close_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

Set the user or transport context to `NULL` if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

httpd_uri_match_func_t **uri_match_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) `NULL` : Internally do basic matching using `strncmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

struct **httpd_req**

HTTP Request Data Structure.

Public Members

***httpd_handle_t* handle**

Handle to server instance

int method

The type of HTTP request, -1 if unsupported method

const char uri[512 + 1]

The URI of this request (1 byte extra for null termination)

size_t content_len

Length of the request body

void *aux

Internally used members

void *user_ctx

User context pointer passed during URI registration.

void *sess_ctx

Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

***httpd_free_ctx_fn_t* free_ctx**

Pointer to free context hook

Function to free session context

If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

bool ignore_sess_ctx_changes

Flag indicating if Session Context changes should be ignored

By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

struct httpd_uri

Structure for URI handler.

Public Members**const char *uri**

The URI to handle

httpd_method_t **method**

Method supported by the URI

esp_err_t (***handler**)(*httpd_req_t* *r)

Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

void ***user_ctx**

Pointer to user context data which will be available to handler

Macros

HTTPD_MAX_REQ_HDR_LEN

HTTPD_MAX_URI_LEN

HTTPD_SOCK_ERR_FAIL

HTTPD_SOCK_ERR_INVALID

HTTPD_SOCK_ERR_TIMEOUT

HTTPD_200

HTTP Response 200

HTTPD_204

HTTP Response 204

HTTPD_207

HTTP Response 207

HTTPD_400

HTTP Response 400

HTTPD_404

HTTP Response 404

HTTPD_408

HTTP Response 408

HTTPD_500

HTTP Response 500

HTTPD_TYPE_JSON

HTTP Content type JSON

HTTPD_TYPE_TEXT

HTTP Content type text/HTML

HTTPD_TYPE_OCTET

HTTP Content type octext-stream

HTTPD_DEFAULT_CONFIG()**ESP_ERR_HTTPD_BASE**

Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL

All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS

URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ

Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC

Result string truncated

ESP_ERR_HTTPD_RESP_HDR

Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND

Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM

Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK

Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN**Type Definitions**typedef struct *httpd_req* **httpd_req_t**

HTTP Request Data Structure.

typedef struct *httpd_uri* **httpd_uri_t**

Structure for URI handler.

typedef int (***httpd_send_func_t**)(*httpd_handle_t* hd, int sockfd, const char *buf, size_t buf_len, int flags)

Prototype for HTTPDs low-level send function.

备注: User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD SOCK_ERR_codes`, which will eventually be conveyed as return value of `httpd_send()` function

Param `hd` [in] server instance

Param sockfd [in] session socket file descriptor

Param buf [in] buffer with bytes to send

Param buf_len [in] data size

Param flags [in] flags for the send() function

Return

- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

```
typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level recv function.

备注: User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

Param buf [in] buffer with bytes to send

Param buf_len [in] data size

Param flags [in] flags for the send() function

Return

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

```
typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
```

Prototype for HTTPDs low-level “get pending bytes” function.

备注: User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

Return

- Bytes : The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket pending()

```
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

备注:

- If implemented, the server will not automatically send out HTTP error response codes, therefore, `httpd_resp_send_err()` must be invoked inside this function if user wishes to generate HTTP error responses.
 - When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the `httpd_req_t` parameter is not guaranteed as the HTTP request may be partially received/parsed.
 - The function must return `ESP_OK` if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.
-

Param req [in] HTTP request for which the error needs to be handled

Param error [in] Error type

Return

- `ESP_OK` : error handled successful
- `ESP_FAIL` : failure indicates that the underlying socket needs to be closed

typedef void ***httpd_handle_t**

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

typedef enum http_method **httpd_method_t**

HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.

typedef void (***httpd_free_ctx_fn_t**)(void *ctx)

Prototype for freeing context data (if any)

Param ctx [in] object to free

typedef *esp_err_t* (***httpd_open_func_t**)(*httpd_handle_t* hd, int sockfd)

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

Return

- `ESP_OK` : On success
- Any value other than `ESP_OK` will signal the server to close the socket immediately

typedef void (***httpd_close_func_t**)(*httpd_handle_t* hd, int sockfd)

Function prototype for closing a session.

备注: It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

typedef bool (***httpd_uri_match_func_t**)(const char *reference_uri, const char *uri_to_match, size_t match_upto)

Function prototype for URI matching.

Param reference_uri [in] URI/template with respect to which the other URI is matched

Param uri_to_match [in] URI/template being matched to the reference URI/template

Param match_upto [in] For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

Return true on match

typedef struct *httpd_config* **httpd_config_t**

HTTP Server Configuration Structure.

备注: Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

typedef void (***httpd_work_fn_t**)(void *arg)

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

Param arg [in] The arguments for this work function

Enumerations

enum **httpd_err_code_t**

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

Values:

enumerator **HTTPD_500_INTERNAL_SERVER_ERROR**

enumerator **HTTPD_501_METHOD_NOT_IMPLEMENTED**

enumerator **HTTPD_505_VERSION_NOT_SUPPORTED**

enumerator **HTTPD_400_BAD_REQUEST**

enumerator **HTTPD_401_UNAUTHORIZED**

enumerator **HTTPD_403_FORBIDDEN**

enumerator **HTTPD_404_NOT_FOUND**

enumerator **HTTPD_405_METHOD_NOT_ALLOWED**

enumerator **HTTPD_408_REQ_TIMEOUT**

enumerator **HTTPD_411_LENGTH_REQUIRED**

enumerator **HTTPD_414_URI_TOO_LONG**

enumerator **HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE**

enumerator **HTTPD_ERR_CODE_MAX**

2.4.7 HTTPS server

Overview

This component is built on top of *esp_http_server*. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for *esp_http_server* applies also to a server you create this way.

Used APIs

The following API of *esp_http_server* should not be used with *esp_https_server*, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
 - `httpd_sess_set_send_override()`
 - `httpd_sess_set_recv_override()`
 - `httpd_sess_set_pending_override()`
- “transport context” - both global and session
 - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
 - `httpd_sess_set_transport_ctx()`
 - `httpd_get_global_transport_ctx()` - returns the shared SSL context
 - `httpd_config_t.global_transport_ctx`
 - `httpd_config_t.global_transport_ctx_free_fn`
 - `httpd_config_t.open_fn` - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example [protocols/https_server](#) to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config.transport_mode`. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

- [components/esp_https_server/include/esp_https_server.h](#)

Functions

`esp_err_t httpd_ssl_start(httpd_handle_t *handle, httpd_ssl_config_t *config)`

Create a SSL capable HTTP server (secure mode may be disabled in config)

参数

- **config** - [inout] - server config, must not be const. Does not have to stay valid after calling this function.

- **handle** `–[out]` - storage for the server handle, must be a valid pointer

返回 success

void **httpd_ssl_stop** (*httpd_handle_t* handle)

Stop the server. Blocks until the server is shut down.

参数 **handle** `–[in]`

Structures

struct **esp_https_server_user_cb_arg**

Callback data struct, contains the ESP-TLS connection handle.

Public Members

const *esp_tls_t* ***tls**

ESP-TLS connection handle

struct **httpd_ssl_config**

HTTPS server config struct

Please use `HTTPD_SSL_CONFIG_DEFAULT()` to initialize it.

Public Members

httpd_config_t **httpd**

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8_t ***cacert_pem**

CA certificate (here it is treated as server cert) Todo: Fix this change in release/v5.0 as it would be a breaking change i.e. Rename the nomenclature of variables holding different certs in https_server component as well as example 1)The cacert variable should hold the CA which is used to authenticate clients (should inherit current role of client_verify_cert_pem var) 2)There should be another variable servercert which would hold servers own certificate (should inherit current role of cacert var)

size_t **cacert_len**

CA certificate byte length

const uint8_t ***client_verify_cert_pem**

Client verify authority certificate (CA used to sign clients, or client cert itself)

size_t **client_verify_cert_len**

Client verify authority cert len

const uint8_t ***prvtkey_pem**

Private key

size_t **prvtkey_len**

Private key byte length

httpd_ssl_transport_mode_t **transport_mode**

Transport Mode (default secure)

uint16_t **port_secure**

Port used when transport mode is secure (default 443)

uint16_t **port_insecure**

Port used when transport mode is insecure (default 80)

bool **session_tickets**

Enable tls session tickets

esp_https_server_user_cb ***user_cb**

User callback for esp_https_server

Macros

HTTPD_SSL_CONFIG_DEFAULT ()

Default config struct init

(http_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to 'transport_mode'
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

Type Definitions

typedef struct *esp_https_server_user_cb_arg* **esp_https_server_user_cb_arg_t**

Callback data struct, contains the ESP-TLS connection handle.

typedef void **esp_https_server_user_cb** (*esp_https_server_user_cb_arg_t* *user_cb)

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

Param user_cb Callback data struct

typedef struct *httpd_ssl_config* **httpd_ssl_config_t**

Enumerations

enum **httpd_ssl_transport_mode_t**

Values:

enumerator **HTTPD_SSL_TRANSPORT_SECURE**

enumerator **HTTPD_SSL_TRANSPORT_INSECURE**

2.4.8 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a new ping session To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), ↪
↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, ↪
↪sizeof(transmitted));
}
```

(下页继续)

```

    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, ↪
↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;           // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↪ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, ↪
↪can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

Start and Stop ping session You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: [protocols/icmp_echo](#)

API Reference

Header File

- [components/lwip/include/apps/ping/ping_sock.h](#)

Functions

esp_err_t **esp_ping_new_session** (const *esp_ping_config_t* *config, const *esp_ping_callbacks_t* *cbs, *esp_ping_handle_t* *hdl_out)

Create a ping session.

参数

- **config** –ping configuration
- **cbs** –a bunch of callback functions invoked by internal ping task
- **hdl_out** –handle of ping session

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

esp_err_t **esp_ping_delete_session** (*esp_ping_handle_t* hdl)

Delete a ping session.

参数 **hdl** –handle of ping session

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

esp_err_t **esp_ping_start** (*esp_ping_handle_t* hdl)

Start the ping session.

参数 **hdl** –handle of ping session

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

esp_err_t **esp_ping_stop** (*esp_ping_handle_t* hdl)

Stop the ping session.

参数 **hdl** –handle of ping session

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

esp_err_t **esp_ping_get_profile** (*esp_ping_handle_t* hdl, *esp_ping_profile_t* profile, void *data, uint32_t size)

Get runtime profile of ping session.

参数

- **hdl** –handle of ping session
- **profile** –type of profile
- **data** –profile data
- **size** –profile data size

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn't match the “size” parameter
- ESP_OK: get profile successfully

Structures

struct **esp_ping_callbacks_t**

Type of “ping” callback functions.

Public Members

void ***cb_args**

arguments for callback functions

void (***on_ping_success**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (***on_ping_timeout**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (***on_ping_end**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when a ping session is finished.

struct **esp_ping_config_t**

Type of “ping” configuration.

Public Members

uint32_t **count**

A “ping” session contains count procedures

uint32_t **interval_ms**

Milliseconds between each ping procedure

uint32_t **timeout_ms**

Timeout value (in milliseconds) of each ping procedure

uint32_t **data_size**

Size of the data next to ICMP packet header

int **tos**

Type of Service, a field specified in the IP header

int **ttl**

Time to Live, a field specified in the IP header

ip_addr_t **target_addr**

Target IP address, either IPv4 or IPv6

uint32_t **task_stack_size**

Stack size of internal ping task

uint32_t **task_prio**

Priority of internal ping task

uint32_t **interface**

Netif index, interface=0 means NETIF_NO_INDEX

Macros

ESP_PING_DEFAULT_CONFIG()

Default ping configuration.

ESP_PING_COUNT_INFINITE

Set ping count to zero will ping target infinitely

Type Definitions

typedef void ***esp_ping_handle_t**

Type of “ping” session handle.

Enumerations

enum **esp_ping_profile_t**

Profile of ping session.

Values:

enumerator **ESP_PING_PROF_SEQNO**

Sequence number of a ping procedure

enumerator **ESP_PING_PROF_TOS**

Type of service of a ping procedure

enumerator **ESP_PING_PROF_TTL**

Time to live of a ping procedure

enumerator **ESP_PING_PROF_REQUEST**

Number of request packets sent out

enumerator **ESP_PING_PROF_REPLY**

Number of reply packets received

enumerator **ESP_PING_PROF_IPADDR**

IP address of replied target

enumerator **ESP_PING_PROF_SIZE**

Size of received packet

enumerator **ESP_PING_PROF_TIMEGAP**

Elapsed time between request and reply packet

enumerator **ESP_PING_PROF_DURATION**

Elapsed time of the whole ping session

2.4.9 ASIO port

Overview

Asio is a cross-platform C++ library, see <https://think-async.com>. It provides a consistent asynchronous model using a modern C++ approach.

ASIO documentation Please refer to the original asio documentation at <https://think-async.com/Asio/Documentation>. Asio also comes with a number of examples which could be find under Documentation/Examples on that web site.

Supported features ESP platform port currently supports only network asynchronous socket operations; does not support serial port. SSL/TLS support is disabled by default and could be enabled in component configuration menu by choosing TLS library from

- mbedTLS with OpenSSL translation layer (default option)
- wolfSSL

SSL support is very basic at this stage and it does include following features:

- Verification callbacks
- DH property files
- Certificates/private keys file APIs

Internal asio settings for ESP include

- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

Application Example

ESP examples are based on standard asio [protocols/asio](#):

- [protocols/asio/udp_echo_server](#)
- [protocols/asio/tcp_echo_server](#)
- [protocols/asio/asio_chat](#)
- [protocols/asio/ssl_client_server](#)

Please refer to the specific example README.md for details

2.4.10 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

- [protocols/mqtt/tcp](#): MQTT over tcp, default port 1883
- [protocols/mqtt/ssl](#): MQTT over tcp, default port 8883
- [protocols/mqtt/ssl_psk](#): MQTT over tcp using pre-shared keys for authentication, default port 8883
- [protocols/mqtt/ws](#): MQTT over Websocket, default port 80
- [protocols/mqtt/wss](#): MQTT over Websocket Secure, default port 443

Configuration

URI

- Currently support mqtt, mqtts, ws, wss schemes
- MQTT over TCP samples:
 - mqtt://mqtt.eclipseprojects.io: MQTT over TCP, default port 1883:
 - mqtt://mqtt.eclipseprojects.io:1884 MQTT over TCP, port 1884:
 - mqtt://username:password@mqtt.eclipseprojects.io:1884 MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
 - mqtt://mqtt.eclipseprojects.io: MQTT over SSL, port 8883
 - mqtt://mqtt.eclipseprojects.io:8884: MQTT over SSL, port 8884
- MQTT over Websocket samples:
 - ws://mqtt.eclipseprojects.io:80/mqtt
- MQTT over Websocket Secure samples:
 - wss://mqtt.eclipseprojects.io:443/mqtt
- Minimal configurations:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipseprojects.io",
    // .user_context = (void *)your_context
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
↪client);
esp_mqtt_client_start(client);
```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

SSL

- Get certificate from server, example: mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null|openssl x509 -outform PEM >mqtt_eclipse_org.pem
- Check the sample application: examples/mqtt_ssl
- Configuration:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipseprojects.io:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
};
```

If the certificate is not null-terminated then cert_len should also be set. Other SSL related configuration parameters are:

- use_global_ca_store: use the global certificate store to verify server certificate, see esp-tls.h for more information
- client_cert_pem: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- client_cert_len: length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem.
- client_key_pem: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- client_key_len: length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem.
- psk_hint_key: pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- alpn_protos: NULL-terminated list of protocols to be used for ALPN.

Last Will and Testament MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` struct.

- `lwt_topic`: pointer to the LWT message topic
- `lwt_msg`: pointer to the LWT message
- `lwt_msg_len`: length of the LWT message, required if `lwt_msg` is not null-terminated
- `lwt_qos`: quality of service for the LWT message
- `lwt_retain`: specifies the retain flag of the LWT message

Other Configuration Parameters

- `disable_clean_session`: determines the clean session flag for the connect message, defaults to a clean session
- `keepalive`: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- `disable_auto_reconnect`: enable to stop the client from reconnecting to server after errors or disconnects
- `user_context`: custom context that will be passed to the event handler
- `task_prio`: MQTT task priority, defaults to 5
- `task_stack`: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from menu-config
- `buffer_size`: size of MQTT send/receive buffer, default is 1024 bytes
- `username`: pointer to the username used for connecting to the broker
- `password`: pointer to the password used for connecting to the broker
- `client_id`: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format
- `host`: MQTT broker domain (ipv4 as string), setting the uri will override this
- `port`: MQTT broker port, specifying the port in the uri will override this
- `transport`: sets the transport protocol, setting the uri will override this
- `refresh_connection_after_ms`: refresh connection after this value (in milliseconds)
- `event_handle`: handle for MQTT events as a callback in legacy mode
- `event_loop_handle`: handle for MQTT event loop library

For more options on `esp_mqtt_client_config_t`, please refer to API reference below

Change settings in Project Configuration Menu The settings for MQTT can be found using `idf.py menu-config`, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL`, `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of `mqtt_outbox`, so a specific implementation can be supplied

Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client's subscribe request. The event data will contain the message ID of the subscribe message.

- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client's unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client's publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. `esp_mqtt_error_type_t` from `error_handle` in the event data can be used to further determine the type of the error. The type of error will determine which parts of the `error_handle` struct is filled.

API Reference

Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`

Functions

`esp_err_t esp_mqtt_client_init` (const `esp_mqtt_client_config_t` *config)

Creates mqtt client handle based on the configuration.

参数 `config` –mqtt configuration structure

返回 `mqtt_client_handle` if successfully created, NULL on error

`esp_err_t esp_mqtt_client_set_uri` (`esp_mqtt_client_handle_t` client, const char *uri)

Sets mqtt connection URI. This API is usually used to overrides the URI configured in `esp_mqtt_client_init`.

参数

- `client` –mqtt client handle

- `uri` –

返回 ESP_FAIL if URI parse error, ESP_OK on success

`esp_err_t esp_mqtt_client_start` (`esp_mqtt_client_handle_t` client)

Starts mqtt client with already created client handle.

参数 `client` –mqtt client handle

返回 ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

`esp_err_t esp_mqtt_client_reconnect` (`esp_mqtt_client_handle_t` client)

This api is typically used to force reconnection upon a specific event.

参数 `client` –mqtt client handle

返回 ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

`esp_err_t esp_mqtt_client_disconnect` (`esp_mqtt_client_handle_t` client)

This api is typically used to force disconnection from the broker.

参数 `client` –mqtt client handle

返回 ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

`esp_err_t esp_mqtt_client_stop` (`esp_mqtt_client_handle_t` client)

Stops mqtt client tasks.

- Notes:
- Cannot be called from the mqtt event handler

参数 **client** –mqtt client handle

返回 ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

int **esp_mqtt_client_subscribe** (*esp_mqtt_client_handle_t* client, const char *topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

参数

- **client** –mqtt client handle
- **topic** –
- **qos** –

返回 message_id of the subscribe message on success -1 on failure

int **esp_mqtt_client_unsubscribe** (*esp_mqtt_client_handle_t* client, const char *topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

参数

- **client** –mqtt client handle
- **topic** –

返回 message_id of the subscribe message on success -1 on failure

int **esp_mqtt_client_publish** (*esp_mqtt_client_handle_t* client, const char *topic, const char *data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

参数

- **client** –mqtt client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –qos of publish message
- **retain** –retain flag

返回 message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

int **esp_mqtt_client_enqueue** (*esp_mqtt_client_handle_t* client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

参数

- **client** –mqtt client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –qos of publish message
- **retain** –retain flag
- **store** –if true, all messages are enqueued; otherwise only qos1 and qos 2 are enqueued

返回 message_id if queued successfully, -1 otherwise

esp_err_t **esp_mqtt_client_destroy** (*esp_mqtt_client_handle_t* client)

Destroys the client handle.

Notes:

- Cannot be called from the mqtt event handler

参数 **client** –mqtt client handle

返回 ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

esp_err_t **esp_mqtt_set_config** (*esp_mqtt_client_handle_t* client, const *esp_mqtt_client_config_t* *config)

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event.

参数

- **client** –mqtt client handle
- **config** –mqtt configuration structure

返回 ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

esp_err_t **esp_mqtt_client_register_event** (*esp_mqtt_client_handle_t* client, *esp_mqtt_event_id_t* event, *esp_event_handler_t* event_handler, void *event_handler_arg)

Registers mqtt event.

参数

- **client** –mqtt client handle
- **event** –event type
- **event_handler** –handler callback
- **event_handler_arg** –handlers context

返回 ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

int **esp_mqtt_client_get_outbox_size** (*esp_mqtt_client_handle_t* client)

Get outbox size.

参数 **client** –mqtt client handle

返回 outbox size 0 on wrong initialization

Structures

struct **esp_mqtt_error_codes**

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

error_type	related member variables	note
MQTT_ERROR_TYPE_TCP_TRANSPORT	esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno	Error reported from tcp_transport/esp-tls
MQTT_ERROR_TYPE_CONNECTION_REFUSED	connect_return_code	Internal error reported from MQTT broker on connection

Public Members

esp_err_t **esp_tls_last_esp_err**

last esp_err code reported from esp-tls component

int **esp_tls_stack_err**

tls specific error code reported from underlying tls stack

int **esp_tls_cert_verify_flags**

tls flags reported from underlying tls stack during certificate verification

esp_mqtt_error_type_t **error_type**

error type referring to the source of the error

esp_mqtt_connect_return_code_t **connect_return_code**

connection refused error code reported from MQTT broker on connection

int **esp_transport_sock_errno**

errno from the underlying socket

struct **esp_mqtt_event_t**

MQTT event configuration structure

Public Members

esp_mqtt_event_id_t **event_id**

MQTT event type

esp_mqtt_client_handle_t **client**

MQTT client handle for this event

void ***user_context**

User context passed from MQTT client config

char ***data**

Data associated with this event

int **data_len**

Length of the data for this event

int **total_data_len**

Total length of the data (longer data are supplied with multiple events)

int **current_data_offset**

Actual offset for the data associated with this event

char ***topic**

Topic associated with this event

int **topic_len**

Length of the topic for this event associated with this event

int **msg_id**

MQTT messaged id of message

int **session_present**

MQTT session_present flag for connection event

[esp_mqtt_error_codes_t](#) ***error_handle**

esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

bool **retain**

Retained flag of the message associated with this event

int **qos**

qos of the messages associated with this event

bool **dup**

dup flag of the message associated with this event

struct **esp_mqtt_client_config_t**

MQTT client configuration structure

Public Members

[mqtt_event_callback_t](#) **event_handle**

handle for MQTT events as a callback in legacy mode

[esp_event_loop_handle_t](#) **event_loop_handle**

handle for MQTT event loop library

const char ***host**

MQTT server domain (ipv4 as string)

const char ***uri**

Complete MQTT broker URI

uint32_t **port**

MQTT server port

bool **set_null_client_id**

Selects a NULL client id

const char ***client_id**

Set client id. Ignored if set_null_client_id == true If NULL set the default client id. Default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

const char ***username**

MQTT username

const char ***password**

MQTT password

const char ***lwt_topic**

LWT (Last Will and Testament) message topic (NULL by default)

const char ***lwt_msg**

LWT message (NULL by default)

int **lwt_qos**

LWT message qos

int **lwt_retain**

LWT retained message flag

int **lwt_msg_len**

LWT message length

int **disable_clean_session**

mqtt clean session, default clean_session is true

int **keepalive**

mqtt keepalive, default is 120 seconds

bool **disable_auto_reconnect**

this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

void ***user_context**

pass user context to this option, then can receive that context in event->user_context

int **task_prio**

MQTT task priority, default is 5, can be changed in make menuconfig

int **task_stack**

MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig

int **buffer_size**

size of MQTT send/receive buffer, default is 1024 (only receive buffer size if out_buffer_size defined)

const char ***cert_pem**

Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `cert_len`.

size_t **cert_len**

Length of the buffer pointed to by `cert_pem`. May be 0 for null-terminated pem

const char ***client_cert_pem**

Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_key_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_cert_len`.

size_t **client_cert_len**

Length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem

const char ***client_key_pem**

Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_cert_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_key_len`

size_t **client_key_len**

Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

esp_mqtt_transport_t **transport**

overrides URI transport

int **refresh_connection_after_ms**

Refresh connection after this value (in milliseconds)

const struct *psk_key_hint* ***psk_hint_key**

Pointer to PSK struct defined in `esp_tls.h` to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

bool **use_global_ca_store**

Use a global `ca_store` for all the connections in which this bool is set.

esp_err_t (***cert_bundle_attach**)(void *conf)

Pointer to ESP x509 Certificate Bundle attach function for the usage of certification bundles in mqtt

int **reconnect_timeout_ms**

Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

const char ****alpn_protos**

NULL-terminated list of supported application protocols to be used for ALPN

const char ***clientkey_password**

Client key decryption password string

int **clientkey_password_len**

String length of the password pointed to by `clientkey_password`

esp_mqtt_protocol_ver_1 **protocol_ver**

MQTT protocol version used for connection, defaults to value from `menuconfig`

int **out_buffer_size**

size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as `buffer_size`

bool **skip_cert_common_name_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

bool **use_secure_element**

enable secure element for enabling SSL connection

void ***ds_data**

carrier of handle for digital signature parameters

int **network_timeout_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

bool **disable_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

const char ***path**

Path in the URI

int **message_retransmit_timeout**

timeout for retransmit of failed packet

Macros

MQTT_ERROR_TYPE_ESP_TLS

`MQTT_ERROR_TYPE_TCP_TRANSPORT` error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from `MQTT_ERROR_TYPE_ESP_TLS` layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

Type Definitions

typedef struct `esp_mqtt_client` ***esp_mqtt_client_handle_t**

typedef struct *esp_mqtt_error_codes* **esp_mqtt_error_codes_t**

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

error_type	related member variables	note
MQTT_ERROR_TYPE_TCP_TRANSPORT	<code>esp_tls_last_esp_err</code> , <code>esp_tls_stack_err</code> , <code>esp_tls_cert_verify_flags</code> , <code>sock_errno</code>	Error reported from tcp_transport/esp-tls
MQTT_ERROR_TYPE_CONNECTION_REFUSED	<code>connect_return_code</code>	Internal error reported from MQTT broker on connection

```
typedef esp_mqtt_event_t *esp_mqtt_event_handle_t
```

```
typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)
```

Enumerations

```
enum esp_mqtt_event_id_t
```

MQTT event types.

User event handler receives context data in *esp_mqtt_event_t* structure with

- `user_context` - user data from *esp_mqtt_client_config_t*
- `client` - mqtt client handle
- various other data depending on event type

Values:

```
enumerator MQTT_EVENT_ANY
```

```
enumerator MQTT_EVENT_ERROR
```

on error event, additional context: connection return code, error handle from *esp_tls* (if supported)

```
enumerator MQTT_EVENT_CONNECTED
```

connected event, additional context: `session_present` flag

```
enumerator MQTT_EVENT_DISCONNECTED
```

disconnected event

```
enumerator MQTT_EVENT_SUBSCRIBED
```

subscribed event, additional context:

- `msg_id` message id
- data pointer to the received data
- `data_len` length of the data for this event

```
enumerator MQTT_EVENT_UNSUBSCRIBED
```

unsubscribed event

```
enumerator MQTT_EVENT_PUBLISHED
```

published event, additional context: `msg_id`

```
enumerator MQTT_EVENT_DATA
```

data event, additional context:

- `msg_id` message id
- topic pointer to the received topic
- `topic_len` length of the topic

- data pointer to the received data
- data_len length of the data for this event
- current_data_offset offset of the current data for this event
- total_data_len total length of the data received
- retain retain flag of the message
- qos qos level of the message
- dup dup flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT_EVENT_BEFORE_CONNECT**

The event occurs before connecting

enumerator **MQTT_EVENT_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: `msg_id` (id of the deleted message).

enum **esp_mqtt_connect_return_code_t**

MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT_CONNECTION_ACCEPTED**

Connection accepted

enumerator **MQTT_CONNECTION_REFUSE_PROTOCOL**

MQTT connection refused reason: Wrong protocol

enumerator **MQTT_CONNECTION_REFUSE_ID_REJECTED**

MQTT connection refused reason: ID rejected

enumerator **MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE**

MQTT connection refused reason: Server unavailable

enumerator **MQTT_CONNECTION_REFUSE_BAD_USERNAME**

MQTT connection refused reason: Wrong user

enumerator **MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED**

MQTT connection refused reason: Wrong username or password

enum **esp_mqtt_error_type_t**

MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT_ERROR_TYPE_NONE**

enumerator **MQTT_ERROR_TYPE_TCP_TRANSPORT**

enumerator `MQTT_ERROR_TYPE_CONNECTION_REFUSED`

enum `esp_mqtt_transport_t`

Values:

enumerator `MQTT_TRANSPORT_UNKNOWN`

enumerator `MQTT_TRANSPORT_OVER_TCP`

MQTT over TCP, using scheme: `mqtt`

enumerator `MQTT_TRANSPORT_OVER_SSL`

MQTT over SSL, using scheme: `mqttssl`

enumerator `MQTT_TRANSPORT_OVER_WS`

MQTT over WebSocket, using scheme: `ws`

enumerator `MQTT_TRANSPORT_OVER_WSS`

MQTT over WebSocket Secure, using scheme: `wss`

enum `esp_mqtt_protocol_ver_t`

MQTT protocol version used for connection

Values:

enumerator `MQTT_PROTOCOL_UNDEFINED`

enumerator `MQTT_PROTOCOL_V_3_1`

enumerator `MQTT_PROTOCOL_V_3_1_1`

2.4.11 ESP-Modbus

The Espressif ESP-Modbus Library (`esp-modbus`) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces.

Options Of Usage

There are two options for using the ESP-Modbus library in your projects:

1. Using the `freemodbus` component included in the current release of ESP-IDF.
The ESP-IDF component `freemodbus` included in this release reflects the `esp-modbus` component of version v1.0.7. This release of the component is used by default in the existing examples mentioned below on this page.
The downside of this option is that the `freemodbus` component may not contain the latest fixes from `esp-modbus` repository. Because of this, it is recommended to use the original `esp-modbus` component for new projects (the option 2).
2. Using the `esp-modbus` component via the component manager instead of `freemodbus`.
Additional information for the ESP-Modbus component can be found in the separate repository:
 - [ESP-Modbus component on GitHub](#)

In order to use `esp-modbus` component, your application must include the statement below in its `CMakeLists.txt` file to exclude the `freemodbus` component from the build. The excluding of the `freemodbus` component is required to avoid compilation issues when `esp-modbus` is used in conjunction with the component manager.

```
set(EXCLUDE_COMPONENTS freemodbus)
```

If your project uses the make build system, the statement below needs to be added into project Makefile:

```
EXCLUDE_COMPONENTS := freemodbus
```

The main component folder of the new application shall include the component manager manifest file `idf_component.yml` as below:

```
dependencies:
  idf: ">=4.1"
  espressif/esp-modbus:
    version: "^1.0"
```

This option allows to use the latest `esp-modbus` component updates in any projects based on ESP-IDF versions from v4.1 up to v5.0. Refer to [component manager documentation](#) for more information on how to set up the component manager. The `esp-modbus` component can be found in [component manager registry](#).

Managed Documentation

The component documentation can be found on the link below:

- [ESP-Modbus documentation \(English\)](#)

Application Example

The examples below demonstrate the ESP-Modbus library of serial, TCP ports for slave and master implementations accordingly.

- [protocols/modbus/serial/mb_slave](#)
- [protocols/modbus/serial/mb_master](#)
- [protocols/modbus/tcp/mb_tcp_slave](#)
- [protocols/modbus/tcp/mb_tcp_master](#)

Please refer to the specific example README.md for details.

Protocol References

- [Modbus Organization with protocol specifications](#)

2.4.12 ESP Local Control

Overview

ESP Local Control (`esp_local_ctrl`) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the `esp_local_ctrl` service over BLE transport is performed as follows:

```
esp_local_ctrl_config_t config = {
  .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
  .transport_config = {
    .ble = & (protocomm_ble_config_t) {
```

(下页继续)

(续上页)

```

        .device_name = SERVICE_NAME,
        .service_uuid = {
            /* LSB <-----
            * -----> MSB */
            0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
            0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
        }
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx          = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

Similarly for HTTPS transport:

```

/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_
↪start");
extern const unsigned char cacert_pem_end[]   asm("_binary_cacert_pem_end
↪");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
↪start");
extern const unsigned char prvtkey_pem_end[]   asm("_binary_prvtkey_pem_
↪end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */

```

(下页继续)

(续上页)

```

        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

You may set security for transport in ESP local control using following options:

1. *PROTOCOLCOM_SEC1*: specifies that end to end encryption is used.
2. *PROTOCOLCOM_SEC0*: specifies that data will be exchanged as a plain text.
3. *PROTOCOLCOM_SEC_CUSTOM*: you can define your own security requirement. Please note that you will also have to provide *custom_handle* of type *protocomm_security_t* * in this context.

Creating a property

Now that we know how to start the **esp_local_ctrl** service, let's add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps **esp_local_ctrl** to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines *TYPE_TIMESTAMP* and *READONLY*, which are used for setting the *type* and *flags* fields here.

```

/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name         = "timestamp",
    .type         = TYPE_TIMESTAMP,
    .size         = sizeof(int32_t),
    .flags        = READONLY,
    .ctx          = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);

```

Also notice that there is a *ctx* field, which is set to point to some custom *func_get_time()*. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of *get_prop_values()* handler, which is used for retrieving the timestamp.

```

static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
→values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
    }
}

```

(下页继续)

```

    if (props[i].type == TYPE_TIMESTAMP) {
        /* Obtain the timer function from ctx */
        int32_t (*func_get_time)(void) = props[i].ctx;

        /* Use static variable for saving the value.
         * This is essential because the value has to be
         * valid even after this function returns.
         * Alternative is to use dynamic allocation
         * and set the free_fn field */
        static int32_t ts = func_get_time();
        prop_values[i].data = &ts;
    }
}
return ESP_OK;
}

```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```

static esp_err_t set_property_values(size_t props_count,
                                    const esp_local_ctrl_prop_t *props,
                                    const esp_local_ctrl_prop_val_t
↪ *prop_values,
                                    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
↪ props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                     prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}

```

For complete example see [protocols/esp_local_ctrl](#)

Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:

1. `get_prop_count` : This should simply return the total number of properties supported by the service
2. `get_prop_values` : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. `set_prop_values` : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created

mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp_local_ctrl** are listed below:

表 7: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS Server + mDNS)	Description
esp_local_ctrl_version	https://<mdns-hostname>.local/esp_local_ctrl/version	Endpoint used for retrieving version string
esp_local_ctrl_control	https://<mdns-hostname>.local/esp_local_ctrl/control	Endpoint used for sending / receiving control messages

API Reference

Header File

- components/esp_local_ctrl/include/esp_local_ctrl.h

Functions

const *esp_local_ctrl_transport_t* ***esp_local_ctrl_get_transport_ble** (void)

Function for obtaining BLE transport mode.

const *esp_local_ctrl_transport_t* ***esp_local_ctrl_get_transport_httpd** (void)

Function for obtaining HTTPD transport mode.

esp_err_t **esp_local_ctrl_start** (const *esp_local_ctrl_config_t* *config)

Start local control service.

参数 config –[in] Pointer to configuration structure

返回

- ESP_OK : Success
- ESP_FAIL : Failure

esp_err_t **esp_local_ctrl_stop** (void)

Stop local control service.

esp_err_t **esp_local_ctrl_add_property** (const *esp_local_ctrl_prop_t* *prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

参数 prop –[in] Property description structure

返回

- ESP_OK : Success
- ESP_FAIL : Failure

esp_err_t **esp_local_ctrl_remove_property** (const char *name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

参数 name –[in] Name of the property to remove

返回

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Failure

const *esp_local_ctrl_prop_t* ***esp_local_ctrl_get_property** (const char *name)

Get property description structure by name.

This API may be used to get a property's context structure *esp_local_ctrl_prop_t* when its name is known

参数 **name** **–[in]** Name of the property to find

返回

- Pointer to property
- NULL if not found

esp_err_t **esp_local_ctrl_set_handler** (const char *ep_name, *protocomm_req_handler_t* handler, void *user_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

备注: In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the *protocomm_ble_config_t* structure set in *esp_local_ctrl_config_t*, and passed to *esp_local_ctrl_start()*.

参数

- **ep_name** **–[in]** Name of the endpoint
- **handler** **–[in]** Endpoint handler function
- **user_ctx** **–[in]** User data

返回

- ESP_OK : Success
- ESP_FAIL : Failure

Unions

union **esp_local_ctrl_transport_config_t**

#include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t ***ble**

This is same as *protocomm_ble_config_t*. See *protocomm_ble.h* for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t ***httpd**

This is same as *httpd_ssl_config_t*. See *esp_https_server.h* for available configuration parameters.

Structures

struct **esp_local_ctrl_prop**

Property description data structure, which is to be populated and passed to the *esp_local_ctrl_add_property()* function.

Once a property is added, its structure is available for read-only access inside *get_prop_values()* and *set_prop_values()* handlers.

Public Members

char ***name**

Unique name of property

uint32_t **type**

Type of property. This may be set to application defined enums

size_t **size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

uint32_t **flags**

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void ***ctx**

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

void (***ctx_free_fn**)(void *ctx)

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

struct **esp_local_ctrl_prop_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

Public Members

void ***data**

Pointer to memory holding property value

size_t **size**

Size of property value

void (***free_fn**)(void *data)

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

struct **esp_local_ctrl_handlers**

Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

esp_err_t (***get_prop_values**)(size_t props_count, const *esp_local_ctrl_prop_t* props[], *esp_local_ctrl_prop_val_t* prop_values[], void *usr_ctx)

Handler function to be implemented for retrieving current values of properties.

备注: If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

Param props_count [in] Total elements in the props array

Param props [in] Array of properties, the current values for which have been requested by the client

Param prop_values [out] Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

Param usr_ctx [in] This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

Return Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

esp_err_t (***set_prop_values**)(size_t props_count, const *esp_local_ctrl_prop_t* props[], const *esp_local_ctrl_prop_val_t* prop_values[], void *usr_ctx)

Handler function to be implemented for changing values of properties.

备注: If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

Param props_count [in] Total elements in the props array

Param props [in] Array of properties, the values for which the client requests to change

Param prop_values [in] Array of property values, the elements of which need to be used for updating those properties specified by props argument

Param usr_ctx [in] This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

Return Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

void ***usr_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

void (***usr_ctx_free_fn**)(void *usr_ctx)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

struct **esp_local_ctrl_proto_sec_cfg**

Protocom security configs

Public Members

esp_local_ctrl_proto_sec_t **version**

This sets protocom security version, sec0/sec1 or custom. If custom, user must provide handle via `proto_sec_custom_handle` below.

void ***custom_handle**

Custom security handle if security is set custom via `proto_sec` above. This handle must follow `protocomm_security_t` signature.

void ***pop**

Proof of possession to be used for local control. Could be NULL.

struct **esp_local_ctrl_config**

Configuration structure to pass to `esp_local_ctrl_start()`

Public Members

const *esp_local_ctrl_transport_t* ***ttransport**

Transport layer over which service will be provided.

esp_local_ctrl_transport_config_t **transport_config**

Transport layer over which service will be provided.

esp_local_ctrl_proto_sec_cfg_t **proto_sec**

Security version and POP.

esp_local_ctrl_handlers_t **handlers**

Register handlers for responding to get/set requests on properties.

size_t **max_properties**

This limits the number of properties that are available at a time.

Macros

ESP_LOCAL_CTRL_TRANSPORT_BLE

ESP_LOCAL_CTRL_TRANSPORT_HTTPD

Type Definitions

typedef struct *esp_local_ctrl_prop* **esp_local_ctrl_prop_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

typedef struct *esp_local_ctrl_prop_val* **esp_local_ctrl_prop_val_t**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct *esp_local_ctrl_handlers* **esp_local_ctrl_handlers_t**

Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct *esp_local_ctrl_transport* **esp_local_ctrl_transport_t**

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

typedef struct *protocomm_ble_config* **esp_local_ctrl_transport_config_ble_t**

Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

typedef struct *httpd_ssl_config* **esp_local_ctrl_transport_config_httpd_t**

Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t`. To use this, application must set `CONFIG_ESP_HTTPS_SERVER_ENABLE` and include `esp_https_server.h`

typedef enum *esp_local_ctrl_proto_sec* **esp_local_ctrl_proto_sec_t**

Security types for `esp_local_control`.

typedef struct *esp_local_ctrl_proto_sec_cfg* **esp_local_ctrl_proto_sec_cfg_t**

Protocom security configs

typedef struct *esp_local_ctrl_config* **esp_local_ctrl_config_t**

Configuration structure to pass to `esp_local_ctrl_start()`

Enumerations

enum **esp_local_ctrl_proto_sec**

Security types for `esp_local_control`.

Values:

enumerator **PROTOCOL_SEC0**

enumerator **PROTOCOL_SEC1**

enumerator **PROTOCOL_SEC_CUSTOM**

2.4.13 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The `esp_serial_slave_link` component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an `esp_serial_slave_link` device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

Communication with ESP SDIO Slave This document describes the process of initialization of an ESP SDIO Slave device and then provides details on the ESP SDIO Slave protocol - a non-standard protocol that allows an SDIO Host to communicate with an ESP SDIO slave.

The ESP SDIO Slave protocol was created to implement the communication between SDIO host and slave, because the SDIO specification only shows how to access the custom region of a card (by sending CMD52 and CMD53 to Functions 1-7) without any details regarding the underlying hardware implementation.

SDIO Slave Capabilities of Espressif chips The services provided by the SDIO Slave peripheral of the ESP32 chip are listed in the table below:

Services	ESP32
SDIO slave	Y
<i>Tohost intr</i>	8
<i>Frhost intr</i>	8
<i>TX DMA</i>	Y
<i>RX DMA</i>	Y
<i>Shared registers</i>	56*

- * Not including the interrupt registers

ESP SDIO Slave Initialization The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Section 3.1.2 of [SDIO Simplified Specification](#)). In this specification as well as below, the SDIO slave is called an (SD)IO card. Here is a brief example of an ESP SDIO Slave initialization process:

- SDIO reset** CMD52 (Write 0x6=0x8)
- SD reset** CMD0
- Check whether IO card (optional)** CMD8
- Send SDIO op cond and wait for card ready** CMD5 arg = 0x00000000
 CMD5 arg = 0x00ff8000 (according to the response above, poll until ready)
Example: Arg of R4 after first CMD5 (arg=0x00000000) is 0xFFFFFFFF00.
 Keep sending CMD5 with arg=0x00FFFF00 until the R4 shows card ready (arg bit 31=1).
- Set address** CMD3
- Select card** CMD7 (arg address according to CMD3 response)
Example: Arg of R6 after CMD3 is 0x0001xxxx.
 Arg of CMD7 should be 0x00010000.
- Select 4-bit mode (optional)** CMD52 (Write 0x07=0x02)
- Enable func1** CMD52 (Write 0x02=0x02)
- Enable SDIO interrupt (required if interrupt line (DAT1) is used)** CMD52 (Write 0x04=0x03)
- Set Func0 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x10~0x11)
 CMD52/53 (Write 0x10=0x00)
 CMD52/53 (Write 0x11=0x02)
 CMD52/53 (Read 0x10~0x11, read to check the final value)
- Set Func1 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x110~0x111)
 CMD52/53 (Write 0x110=0x00)
 CMD52/53 (Write 0x111=0x02)
 CMD52/53 (Read 0x110~0x111, read to check the final value)

ESP SDIO Slave Protocol The ESP SDIO Slave protocol is based on the SDIO Specification's I/O Read/Write commands, i.e., CMD52 and CMD53. The protocol offers the following services:

- Sending FIFO and receiving FIFO
- 52 8-bit R/W registers shared by host and slave (For details, see *ESP32 Technical Reference Manual > SDIO Slave Controller > Register Summary > SDIO SLC Host registers* [PDF])
- 16 general purpose interrupt sources, 8 from host to slave and 8 from slave to host

To begin communication, the host needs to enable the I/O Function 1 in the slave and access its registers as described below.

Check the code example [peripherals/sdio](#).

The *ESP Serial Slave Link* component implements the logic of this protocol for ESP32 SDIO Host when communicating with an ESP32 SDIO slave.

Slave register table

32-bit

- 0x044 (TOKEN_RDATA): in which bit 27-16 holds the number of the receiving buffer.
- 0x058 (INT_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT_LEN): holds the accumulated data length (in bytes) already read by host plus the data copied to the buffer but yet to be read.
- 0x0D4 (INT_CLR): write 1 to clear interrupt bits corresponding to INT_ST.
- 0x0DC (INT_ENA): mask bits for interrupts from slave to host.

8-bit Shared general purpose registers:

- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers: - 0x08D (SLAVE_INT): bits for host to interrupt slave. auto clear.

FIFO (sending and receiving) 0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from or write to the slave in a single transfer, as demonstrated by the equation below:

$$\text{requested length} = 0x1F800 - \text{address}$$

The slave will respond with data that has a length equal to the length field of CMD53. In cases where the data is longer than the *requested length*, the data will be zero filled (when sending) or discarded (when receiving). This includes both the block and the byte mode of CMD53.

备注: The function number should be set to 1, OP Code should be set to 1 (for CMD53).

In order to achieve higher efficiency when accessing the FIFO by an arbitrary length, the block and byte modes of CMD53 can be used in combination. For example, given that the block size is set to 512 by default, you can write/get 1031 bytes of data from the FIFO by doing the following:

1. Send CMD53 in block mode, block count=2 (1024 bytes) to address 0x1F3F9=0x1F800-**1031**.
 2. Then send CMD53 in byte mode, byte count=8 (or 7 if your controller supports that) to address 0x1F7F9=0x1F800-7.
-

Interrupts SDIO interrupts are “level sensitive”. For host interrupts, the slave sends an interrupt by pulling the DAT1 line down at a proper time. The host detects when the interrupt line is pulled down and reads the INT_ST register to determine the source of the interrupt. After that, the host can clear the interrupt bits by writing the INT_CLR register and process the interrupt. The host can also mask unneeded sources by clearing the bits in the INT_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

On ESP32, the corresponding host_int bits are: bit 0 to bit 7.

For slave interrupts, the host sends a transfer to write the SLAVE_INT register. Once a bit is set to 1, the slave hardware and the driver will detect it and inform the application.

Receiving FIFO To write to the slave’s receiving FIFO, the host should complete the following steps:

1. **Read the TOKEN1 field (bits 27-16) of the register TOKEN_RDATA (0x044).** The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. **Make sure the buffer number is sufficient** ($buffer_size \times buffer_num$ is greater than the data to write, $buffer_size$ is pre-defined between the host and the slave before the communication starts). Otherwise, keep returning to Step 1 until the buffer size is sufficient.
3. **Write to the FIFO address with CMD53.** Note that the *requested length* should not exceed the length calculated at Step 2, and the FIFO address is related to *requested length*.
4. **Calculate used buffers.** Note that a partially used buffer at the tail is counted as used.

Sending FIFO To read the slave’s sending FIFO, the host should complete the following steps:

1. **Wait for the interrupt line to become active** (optional, low by default).
2. **Read (poll) the interrupt bits in the INT_ST register** to monitor if new packets exist.
3. **If new packets are ready, read the PKT_LEN register.** Before reading the packets, determine the length of data to be read. As the host keeps the length of data already read from the slave, subtract this value from PKT_LEN, the result will be the maximum length of data available for reading. If no data has been added to the sending FIFO yet, wait and poll until the slave is ready and update PKT_LEN.
4. **Read from the FIFO using CMD53.** Note that the *requested length* should not be greater than calculated at Step 3, and the FIFO address is related to *requested length*.
5. **Update the read length.**

警告: The driver for ESP32 hasn’t been developed yet.

ESP SPI Slave HD (Half Duplex) Mode Protocol

SPI Slave Capabilities of Espressif chips

	ESP32	ESP32-S2	ESP32-C3
SPI Slave HD	N	Y (v2)	Y (v2)
Tohost intr		N	N
Frhost intr		2 *	2 *
TX DMA		Y	Y
RX DMA		Y	Y
Shared registers		72	64

Introduction In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- Command: 8-bit, master to slave
This phase determines the rest phases of the transactions. See *Supported Commands*.
- Address: 8-bit, master to slave, optional

For some commands (WRBUF, RDBUF), this phase specifies the address of shared buffer to write to/read from. For other commands with this phase, they are meaningless, but still have to exist in the transaction.

- **Dummy:** 8-bit, floating, optional
This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- **Data:** variable length, the direction is also determined by the command.
This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP and HD pins.

Data IO Modes In some IO modes, more data wires can be use to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here' s the modes supported by ESP32-S2 SPI slave and the wire number used in corresponding modes.

Mode	command WN	address WN	dummy cycles	data WN
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined is determined by the command sent by the master (See [Supported Commands](#)), except from the QPI mode.

QPI Mode The QPI mode is a special state of the SPI Slave. The master can send ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it' s not compatible with the normal modes. The master should only send QPI commands when the slave is in the QPI mode. To exit form the QPI mode, master can send EXQPI command.

Supported Commands

备注: The command name are in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	.	.
ENQPI	Enter QPI mode	0x06	.	.
WR_DONE	Write segments done	0x07	.	.
CMD8	Interrupt	0x08	.	.
CMD9	Interrupt	0x09	.	.
CMDA	Interrupt	0x0A	.	.
EXQPI	Exit QPI mode	0xDD	.	.

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

Segment Transaction Mode Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn't have to prepare large buffer as the size of data provided by the slave. After the master finish reading/writing a buffer, it has to send corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA, and CMD8 (0x08) for the RDDMA.

Here's an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them are 512 bytes long, and reads the first 3584 bytes from the slave

3. The master do the last RDDMA transaction of 512 bytes (equal, longer or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the *esp_serial_slave_link* component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SDIO Slave Capabilities of Espressif chips* and *SPI Slave Capabilities of Espressif chips* for more details.

Initialization of ESP Serial Slave Link

ESP SDIO Slave The ESP SDIO slave link (ESSL SDIO) devices relies on the *sdmmc* component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a *sdmmc* card (see :doc:' Document of SDMMC driver </api-reference/storage/sdmmc>' structure).
2. Call *sdmmc_card_init()* to initialize the card.
3. Initialize the ESSL device with *essl_sdio_config_t*. The *card* member should be the *sdmmc_card_t* got in step 2, and the *recv_buffer_size* member should be filled correctly according to pre-negotiated value.

4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

ESP SPI Slave

备注: If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

Hasn't been supported yet.

APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

Reset counters (Optional) Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

Application Example

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

[peripherals/sdio](#).

Please refer to the specific example README.md for details.

API Reference

Header File

- `components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h`

Functions

`esp_err_t` **essl_init** (*essl_handle_t* handle, uint32_t wait_ms)

Initialize the slave.

参数

- **handle** –Handle of an ESSL device.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

`esp_err_t` **essl_wait_for_ready** (*essl_handle_t* handle, uint32_t wait_ms)

Wait for interrupt of an ESSL slave device.

参数

- **handle** –Handle of an ESSL device.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl_get_tx_buffer_num** (*essl_handle_t* handle, uint32_t *out_tx_num, uint32_t wait_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

参数

- **handle** –Handle of a ESSL device.
- **out_tx_num** –Output of buffer num that host can send data to ESSL slave.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl_get_rx_data_size** (*essl_handle_t* handle, uint32_t *out_rx_size, uint32_t wait_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

参数

- **handle** –Handle of an ESSL device.
- **out_rx_size** –Output of data size to read from slave, in bytes
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl_reset_cnt** (*essl_handle_t* handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

参数 **handle** –Handle of an ESSL device.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.

esp_err_t **essl_send_packet** (*essl_handle_t* handle, const void *start, size_t length, uint32_t wait_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

参数

- **handle** –Handle of an ESSL device.
- **start** –Start address of the packet to send
- **length** –Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

esp_err_t **essl_get_packet** (*essl_handle_t* handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)

Get a packet from ESSL slave.

参数

- **handle** –Handle of an ESSL device.
- **out_data** –[out] Data output address
- **size** –The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- **out_length** –[out] Output of length the data actually received from slave.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

esp_err_t **essl_write_reg** (*essl_handle_t* handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

备注: sdio 28-31 are reserved, the lower API helps to skip.

参数

- **handle** –Handle of an ESSL device.
- **addr** –Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** –Value to write to the register.
- **value_o** –Output of the returned written value.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

esp_err_t **essl_read_reg** (*essl_handle_t* handle, uint8_t addr, uint8_t *value_o, uint32_t wait_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

参数

- **handle** –Handle of a `essl` device.
- **add** –Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value_o** –Output value read from the register.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl_wait_int** (`essl_handle_t` handle, `uint32_t` wait_ms)

wait for an interrupt of the slave

参数

- **handle** –Handle of an ESSL device.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

`esp_err_t` **essl_clear_intr** (`essl_handle_t` handle, `uint32_t` intr_mask, `uint32_t` wait_ms)

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

参数

- **handle** –Handle of an ESSL device.
- **intr_mask** –Mask of interrupt bits to clear.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl_get_intr** (`essl_handle_t` handle, `uint32_t` *intr_raw, `uint32_t` *intr_st, `uint32_t` wait_ms)

Get interrupt bits of ESSL slave.

参数

- **handle** –Handle of an ESSL device.
- **intr_raw** –Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr_st** –Output of the masked interrupt bits. set to NULL if only raw bits are read.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_INVALID_ARG: If both `intr_raw` and `intr_st` are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl_set_intr_ena** (`essl_handle_t` handle, `uint32_t` ena_mask, `uint32_t` wait_ms)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

参数

- **handle** –Handle of an ESSL device.
- **ena_mask** –Mask of the interrupt bits to enable.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

esp_err_t **essl_get_intr_ena** (*essl_handle_t* handle, uint32_t *ena_mask_o, uint32_t wait_ms)

Get interrupt enable bits of ESSL slave.

参数

- **handle** –Handle of an ESSL device.
- **ena_mask_o** –Output of interrupt bit enable mask.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success
- One of the error codes from SDMMC host controller

esp_err_t **essl_send_slave_intr** (*essl_handle_t* handle, uint32_t intr_mask, uint32_t wait_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

参数

- **handle** –Handle of an ESSL device.
- **intr_mask** –Mask of interrupt bits to send to slave.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

Type Definitions

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

Header File

- [components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h](#)

Functions

esp_err_t **essl_sdio_init_dev** (*essl_handle_t* *out_handle, const *essl_sdio_config_t* *config)

Initialize the ESSL SDIO device and get its handle.

参数

- **out_handle** –Output of the handle.
- **config** –Configuration for the ESSL SDIO device.

返回

- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.

esp_err_t **essl_sdio_deinit_dev** (*essl_handle_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

参数 **handle** –Handle of the ESSL SDIO device to deinit.

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: wrong handle passed

Structures

```
struct essl_sdio_config_t
```

Configuration for the ESSL SDIO device.

Public Members

sdmmc_card_t ***card**

The initialized sdmmc card pointer of the slave.

int **recv_buffer_size**

The pre-negotiated recv buffer size used by both the host and the slave.

Header File

- [components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h](#)

Functions

esp_err_t **essl_spi_init_dev** (*essl_handle_t* *out_handle, const *essl_spi_config_t* *init_config)

Initialize the ESSL SPI device function list and get its handle.

参数

- **out_handle** –[out] Output of the handle
- **init_config** –Configuration for the ESSL SPI device

返回

- ESP_OK: On success
- ESP_ERR_NO_MEM: Memory exhausted
- ESP_ERR_INVALID_STATE: SPI driver is not initialized
- ESP_ERR_INVALID_ARG: Wrong register ID

esp_err_t **essl_spi_deinit_dev** (*essl_handle_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

参数 **handle** –Handle of the ESSL SPI device

返回

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI is not in use

esp_err_t **essl_spi_read_reg** (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)

Read from the shared registers.

备注: The registers for Master/Slave synchronization are reserved. Do not use them. (see *rx_sync_reg* in *essl_spi_config_t*)

参数

- **arg** –Context of the component. (Member *arg* from *essl_handle_t*)
- **addr** –Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
- **out_value** –[out] Read buffer for the shared registers.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- or other return value from `:cpp:func:spi_device_transmit`.

esp_err_t **essl_spi_get_packet** (void *arg, void *out_data, size_t size, uint32_t wait_ms)

Get a packet from Slave.

参数

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **out_data** –[out] Output data address
- **size** –The size of the output data.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

返回

- `ESP_OK`: On Success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The output data address is neither DMA capable nor 4 byte-aligned
- `ESP_ERR_INVALID_SIZE`: Master requires `size` bytes of data but Slave did not load enough bytes.

`esp_err_t` **essl_spi_write_reg** (void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)

Write to the shared registers.

备注: The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

备注: Feature of checking the actual written value (`out_value`) is not supported.

参数

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
