Using the `idf.py` sub-commands `size`, `size-components` and `size-files` provides a summary of memory used by the project:

### Size Summary (`idf.py size`)

```
$ idf.py size
[...]
Total sizes:
DRAM .data size: 11584 bytes
DRAM .bss size: 19624 bytes
Used static DRAM: 0 bytes ( 0 available, nan% used)
Used static IRAM: 0 bytes ( 0 available, nan% used)
Used stat D/IRAM: 136276 bytes ( 519084 available, 20.8% used)
  Flash code: 630508 bytes
  Flash rodata: 177048 bytes
Total image size:~ 924208 bytes (.bin may be padded larger)
```

This output breaks down the size of all static memory regions in the firmware binary:

- `DRAM .data size` is statically allocated RAM that is assigned to non-zero values at startup. This uses RAM (DRAM) at runtime and also uses space in the binary file.
- `DRAM .bss size` is statically allocated RAM that is assigned zero at startup. This uses RAM (DRAM) at runtime but doesn't use any space in the binary file.
- `Used static DRAM, Used static IRAM` - these options are kept for compatibility with ESP32 target, and currently read 0.
- `Used stat D/IRAM` - This is total internal RAM usage, the sum of static DRAM `.data` + `.bss`, and also static `IRAM` (指令 RAM) used by the application for executable code. The `available` size is the estimated amount of DRAM which will be available as heap memory at runtime (due to metadata overhead and implementation constraints, and heap allocations done by ESP-IDF during startup, the actual free heap at startup will be lower than this).
- `Flash code` is the total size of executable code executed from flash cache (`IROM`). This uses space in the binary file.
- `Flash rodata` is the total size of read-only data loaded from flash cache (`DROM`). This uses space in the binary file.
- `Total image size` is the estimated total binary file size, which is the total of all the used memory types except for `.bss`.

**Component Usage Summary (idf.py size-components)** The summary output provided by `idf.py size` does not give enough detail to find the main contributor to excessive binary size. To analyze in more detail, use `idf.py size-components`

```
$ idf.py size-components

```

The first lines of output from `idf.py size-components` are the same as `idf.py size`. After this a table is printed of “per-archive contributions to ELF file”. This means how much each static library archive has contributed to the final binary size.

Generally, one static library archive is built per component, although some are binary libraries included by a particular component (for example, `libnet80211.a` is included by `esp_wifi` component). There are also toolchain libraries such as `libc.a` and `libgcc.a` listed here, these provide Standard C/C++ Library and toolchain built-in functionality.

If your project is simple and only has a “main” component, then all of the project’s code will be shown under `libmain.a`. If your project includes its own components (see [构建系统 \(CMake 版\)](#)), then they will each be shown on a separate line.

The table is sorted in descending order of the total contribution to the binary size.

The columns are as follows:

- DRAM `.data` & `.bss` & other - `.data` and `.bss` are the same as for the totals shown above (static variables, these both reduce total available RAM at runtime but `.bss` doesn’t contribute to the binary file size). “other” is a column for any custom section types that also contribute to RAM size (usually this value is 0).
- IRAM - is the same as for the totals shown above (code linked to execute from IRAM, uses space in the binary file and also reduces DRAM available as heap at runtime).
- Flash code & rodata - these are the same as the totals above, IROM and DROM space accessed from flash cache that contribute to the binary size.

**Source File Usage Summary (`idf.py size-files`)** For even more detail, run `idf.py size-files` to get a summary of the contribution each object file has made to the final binary size. Each object file corresponds to a single source file.

```

| [... additional lines removed ...] |       |                    |     |     |   |      |   |       |   |

After the summary of total sizes, a table of “Per-file contributions to ELF file” is printed.

The columns are the same as shown above for `idf.py size-components`, but this time the granularity is the contribution of each individual object file to the binary size.

For example, we can see that the file `x509_crt_bundle.S.o` contributed 64212 bytes to the total firmware size, all as `.rodata` in flash. Therefore we can guess that this application is using the *ESP x509 Certificate Bundle* feature and not using this feature would save at least this many bytes from the firmware size.

Some of the object files are linked from binary libraries and therefore you won't find a corresponding source file. To locate which component a source file belongs to, it's generally possible to search in the ESP-IDF source tree or look in the *Linker Map File* for the full path.

**Comparing Two Binaries** If making some changes that affect binary size, it's possible to use an ESP-IDF tool to break down the exact differences in size.

This operation isn't part of `idf.py`, it's necessary to run the `idf-size.py` Python tool directly.

To do so, first locate the linker map file in the build directory. It will have the name `PROJECTNAME.map`. The `idf-size.py` tool performs its analysis based on the output of the linker map file.

To compare with another binary, you will also need its corresponding `.map` file saved from the build directory.

For example, to compare two builds: one with the default `CONFIG_COMPILER_OPTIMIZATION` setting “Debug (-Og)” configuration and one with “Optimize for size (-Os)” :

```
$ $IDF_PATH/tools/idf_size.py --diff build_Og/https_request.map build_Os/https_
↪request.map
<CURRENT> MAP file: build_Os/https_request.map
<REFERENCE> MAP file: build_Og/https_request.map
Difference is counted as <CURRENT> - <REFERENCE>, i.e. a positive number means_
↪that <CURRENT> is larger.
Total sizes of <CURRENT>:
↪<REFERENCE>      Difference
DRAM .data size:  14516 bytes
↪14956            -440
DRAM .bss size:   15792 bytes
↪15808           -16
Used static DRAM:  30308 bytes ( 150428 available, 16.8% used)
↪30764           -456 (  +456 available,    +0 total)
Used static IRAM:  78498 bytes ( 52574 available, 59.9% used)
↪83918           -5420 ( +5420 available,    +0 total)
    Flash code:    509183 bytes
↪559943          -50760
    Flash rodata:  170592 bytes
↪176736          -6144
Total image size:~ 772789 bytes (.bin may be padded larger)
↪835553          -62764
```

We can see from the “Difference” column that changing this one setting caused the whole binary to be over 60 KB smaller and over 5 KB more RAM is available.

It’s also possible to use the “diff” mode to output a table of component-level (static library archive) differences:

```
$ $IDF_PATH/tools/idf_size.py --archives --diff build_Og/https_request.map build_
↪Oshttps_request.map
```

Also at the individual source file level:

```
$ $IDF_PATH/tools/idf_size.py --files --diff build_Og/https_request.map build_
↪Oshttps_request.map
```

Other options (like writing the output to a file) are available, pass `--help` to see the full list.

**Showing Size When Linker Fails** If too much static memory is used, then the linker will fail with an error such as DRAM segment data does not fit, region ``iram0_0_seg'` overflowed by 44 bytes, or similar.

In these cases, `idf.py size` will not succeed either. However it is possible to run `idf_size.py` manually in order to view the *partial static memory usage* (the memory usage will miss the variables which could not be linked, so there still appears to be some free space.)

The map file argument is `<projectname>.map` in the build directory

```
$ $IDF_PATH/tools/idf_size.py build/project_name.map
```

It is also possible to view the equivalent of `size-components` or `size-files` output:

```
$ $IDF_PATH/tools/idf_size.py --archives build/project_name.map
$ $IDF_PATH/tools/idf_size.py --files build/project_name.map
```

**Linker Map File** *This is an advanced analysis method, but it can be very useful. Feel free to skip ahead to `:ref:reducing-overall-size` and possibly come back to this later.*

The `idf.py` size analysis tools all work by parsing the GNU binutils “linker map file”, which is a summary of everything the linker did when it created (“linked”) the final firmware binary file

Linker map files themselves are plain text files, so it’s possible to read them and find out exactly what the linker did. However, they are also very complex and long - often 100,000 or more lines!

The map file itself is broken into parts and each part has a heading. The parts are:

- `Archive member included to satisfy reference by file (symbol)`. This shows you: for each object file included in the link, what symbol (function or variable) was the linker searching for when it included that object file. If you’re wondering why some object file in particular was included in the binary, this part may give a clue. This part can be used in conjunction with the `Cross Reference Table` at the end of the file. Note that not every object file shown in this list ends up included in the final binary, some end up in the `Discarded input sections` list instead.
- `Allocating common symbols` - This is a list of (some) global variables along with their sizes. Common symbols have a particular meaning in ELF binary files, but ESP-IDF doesn’t make much use of them.
- `Discarded input sections` - These sections were read by the linker as part of an object file to be linked into the final binary, but then nothing else referred to them so they were discarded from the final binary. For ESP-IDF this list can be very long, as we compile each function and static variable to a unique section in order to minimize the final binary size (specifically ESP-IDF uses compiler options `-ffunction-sections` `-fdata-sections` and linker option `--gc-sections`). Items mentioned in this list *do not* contribute to the final binary.
- `Memory Configuration, Linker script and memory map` These two parts go together. Some of the output comes directly from the linker command line and the Linker Script, both provided by the [构建系统 \(CMake 版\)](#). The linker script is partially generated from the ESP-IDF project using the [链接器脚本生成机制](#) feature. As the output of the Linker script and memory map part of the map unfolds, you can see each symbol (function or static variable) linked into the final binary along with its address (as a 16 digit hex number), its length (also in hex), and the library and object file it was linked from (which can be used to determine the component and the source file). Following all of the output sections that take up space in the final `.bin` file, the `memory map` also includes some sections in the ELF file that are only used for debugging (ELF sections `.debug_*`, etc.). These don’t contribute to the final binary size. You’ll notice the address of these symbols is a very low number (starting from `0x0000000000000000` and counting up).
- `Cross Reference Table`. This table shows for each symbol (function or static variable), the list of object file(s) that referred to it. If you’re wondering why a particular thing is included in the binary, this will help determine what included it.

---

**备注:** Unfortunately, the `Cross Reference Table` doesn’t only include symbols that made it into the final binary. It also includes symbols in discarded sections. Therefore, just because something is shown here doesn’t mean that it was included in the final binary - this needs to be checked separately.

---

---

**备注:** Linker map files are generated by the GNU binutils linker “ld”, not ESP-IDF. You can find additional information online about the linker map file format. This quick summary is written from the perspective of ESP-IDF build system in particular.

---

**Reducing Overall Size** The following configuration options will reduce the final binary size of almost any ESP-IDF project:

- Set `CONFIG_COMPILER_OPTIMIZATION` to “Optimize for size (-Os)”. In some cases, “Optimize for performance (-O2)” will also reduce the binary size compared to the default. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise don’t happen.
- Reduce the compiled-in log output by lowering the app `CONFIG_LOG_DEFAULT_LEVEL`. If the `CONFIG_LOG_MAXIMUM_LEVEL` is changed from the default then this setting controls the binary size instead.

Reducing compiled-in logging reduces the number of strings in the binary, and also the code size of the calls to logging functions.

- Set the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` to “Silent”. This avoids compiling in a dedicated assertion string and source file name for each assert that may fail. It’s still possible to find the failed assert in the code by looking at the memory address where the assertion failed.
- Besides the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`, you can disable or silent the assertion for HAL component separately by setting `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL`.
- Set `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`. This removes specific error messages for particular internal ESP-IDF error check macros. This may make it harder to debug some error conditions by reading the log output.
- Don’t enable `CONFIG_COMPILER_CXX_EXCEPTIONS`, `CONFIG_COMPILER_CXX_RTTI`, or set the `CONFIG_COMPILER_STACK_CHECK_MODE` to Overall. All of these options are already disabled by default, but they have a large impact on binary size.
- Disabling `CONFIG_ESP_ERR_TO_NAME_LOOKUP` will remove the lookup table to translate user-friendly names for error values (see [错误处理](#)) in error logs, etc. This saves some binary size, but error values will be printed as integers only.
- Setting `CONFIG_ESP_SYSTEM_PANIC` to “Silent reboot” will save a small amount of binary size, however this is *only* recommended if no one will use UART output to debug the device.

---

**备注:** In addition to the many configuration items shown here, there are a number of configuration options where changing the option from the default will increase binary size. These are not noted here. Where the increase is significant, this is usually noted in the configuration item help text.

---

**Targeted Optimizations** The following binary size optimizations apply to a particular component or a function:

#### Wi-Fi

- Disabling `CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE` will save some Wi-Fi binary size if WPA3 support is not needed. (Note that WPA3 is mandatory for new Wi-Fi device certifications.)
- Disabling `CONFIG_ESP_WIFI_SOFTAP_SUPPORT` will save some Wi-Fi binary size if soft-AP support is not needed.

**Bluetooth NimBLE** If using *NimBLE Bluetooth Host* then the following modifications can reduce binary size:

- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS` to 1 if only one BLE connection is needed.
- Disable either `CONFIG_BT_NIMBLE_ROLE_CENTRAL` or `CONFIG_BT_NIMBLE_ROLE_OBSERVER` if these roles are not needed.
- Reducing `CONFIG_BT_NIMBLE_LOG_LEVEL` can reduce binary size. Note that if the overall log level has been reduced as described above in *Reducing Overall Size* then this also reduces the NimBLE log level.

#### lwIP IPv6

- Setting `CONFIG_LWIP_IPV6` to false will reduce the size of the lwIP TCP/IP stack, at the cost of only supporting IPv4.

---

**备注:** IPv6 is required by some components such as `coap` and *ASIO port*, These components will not be available if IPV6 is disabled.

---

**Newlib nano formatting** By default, ESP-IDF uses newlib “full” formatting for I/O (`printf`, `scanf`, etc.)

Enabling the config option `CONFIG_NEWLIB_NANO_FORMAT` will switch newlib to the “nano” formatting mode. This both smaller in code size and a large part of the implementation is compiled into the ESP32-S3 ROM, so it doesn’t need to be included in the binary at all.

The exact difference in binary size depends on which features the firmware uses, but 25 KB ~ 50 KB is typical.

Enabling Nano formatting also reduces the stack usage of each function that calls `printf()` or another string formatting function, see [Reducing Stack Sizes](#).

“Nano” formatting doesn’t support 64-bit integers, or C99 formatting features. For a full list of restrictions, search for `--enable-newlib-nano-formatted-io` in the [Newlib README file](#).

**MBEDTLS features** Under *Component Config* -> *MBEDTLS* there are multiple mbedTLS features which are enabled by default but can be disabled if not needed to save code size.

These include:

- [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)
- [CONFIG\\_MBEDTLS\\_ECDSA\\_DETERMINISTIC](#)
- [CONFIG\\_MBEDTLS\\_SHA512\\_C](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_1](#)
- [CONFIG\\_MBEDTLS\\_CLIENT\\_SSL\\_SESSION\\_TICKETS](#)
- [CONFIG\\_MBEDTLS\\_SERVER\\_SSL\\_SESSION\\_TICKETS](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_ALPN](#)
- [CONFIG\\_MBEDTLS\\_CCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_GCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_ECP\\_C](#) (Alternatively: Leave this option enabled but disable some of the elliptic curves listed in the sub-menu.)
- [CONFIG\\_MBEDTLS\\_SSL\\_RENEGOTIATION](#)
- Change [CONFIG\\_MBEDTLS\\_TLS\\_MODE](#) if both Server & Client are not needed
- Consider disabling some ciphersuites listed in the “TLS Key Exchange Methods” sub-menu (i.e. [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_RSA](#))

The help text for each option has some more information.

---

**重要:** It is **strongly not recommended to disable all these mbedTLS options**. Only disable options where you understand the functionality and are certain that it is not needed in the application. In particular:

- Ensure that any TLS server(s) the device connects to can still be used. If the server is controlled by a third party or a cloud service, recommend ensuring that the firmware supports at least two of the supported cipher suites in case one is disabled in a future update.
- Ensure that any TLS client(s) that connect to the device can still connect with supported/recommended cipher suites. Note that future versions of client operating systems may remove support for some features, so it is recommended to enable multiple supported cipher suites or algorithms for redundancy.

If depending on third party clients or servers, always pay attention to announcements about future changes to supported TLS features. If not, the ESP32-S3 device may become inaccessible if support changes.

---

**备注:** Not every combination of mbedTLS compile-time config is tested in ESP-IDF. If you find a combination that fails to compile or function as expected, please report the details on GitHub.

---

**FreeModBus** If using Modbus, enable or disable [CONFIG\\_FMB\\_COMM\\_MODE\\_TCP\\_EN](#), [CONFIG\\_FMB\\_COMM\\_MODE\\_RTU\\_EN](#), [CONFIG\\_FMB\\_COMM\\_MODE\\_ASCII\\_EN](#) as applicable for the necessary functionality.

**VFS** *Virtual filesystem* feature in ESP-IDF allows multiple filesystem drivers and file-like peripheral drivers to be accessed using standard I/O functions (`open`, `read`, `write`, etc.) and C library functions (`fopen`, `fread`, `fwrite`, etc.). When filesystem or file-like peripheral driver functionality is not used in the application this feature can be fully or partially disabled. VFS component provides the following configuration options:

- `CONFIG_VFS_SUPPORT_TERMIOS` —can be disabled if the application doesn't use `termios` family of functions. Currently, these functions are implemented only for UART VFS driver. Most applications can disable this option. Disabling this option reduces the code size by about 1.8 kB.
- `CONFIG_VFS_SUPPORT_SELECT` — can be disabled if the application doesn't use `select` function with file descriptors. Currently, only the UART and eventfd VFS drivers implement `select` support. Note that when this option is disabled, `select` can still be used for socket file descriptors. Disabling this option reduces the code size by about 2.7 kB.
- `CONFIG_VFS_SUPPORT_DIR` —can be disabled if the application doesn't use directory related functions, such as `readdir` (see the description of this option for the complete list). Applications which only open, read and write specific files and don't need to enumerate or create directories can disable this option, reducing the code size by 0.5 kB or more, depending on the filesystem drivers in use.
- `CONFIG_VFS_SUPPORT_IO` —can be disabled if the application doesn't use filesystems or file-like peripheral drivers. This disables all VFS functionality, including the three options mentioned above. When this option is disabled, `console` can't be used. Note that the application can still use standard I/O functions with socket file descriptors when this option is disabled. Compared to the default configuration, disabling this option reduces code size by about 9.4 kB.

**Bootloader Size** This document deals with the size of an ESP-IDF app binary only, and not the ESP-IDF [二级引导程序](#).

For a discussion of ESP-IDF bootloader binary size, see [引导加载程序大小](#).

**IRAM Binary Size** If the IRAM section of a binary is too large, this issue can be resolved by reducing IRAM memory usage. See [Optimizing IRAM Usage](#).

### Minimizing RAM Usage

In some cases, a firmware application's available RAM may run low or run out entirely. In these cases, it's necessary to tune the memory usage of the firmware application.

In general, firmware should aim to leave some “headroom” of free internal RAM in order to deal with extraordinary situations or changes in RAM usage in future updates.

**Background** Before optimizing ESP-IDF RAM usage, it's necessary to understand the basics of ESP32-S3 memory types, the difference between static and dynamic memory usage in C, and the way ESP-IDF uses stack and heap. This information can all be found in [Heap Memory Allocation](#).

**Measuring Static Memory Usage** The `idf.py` tool can be used to generate reports about the static memory usage of an application. Refer to [the Binary Size chapter for more information](#).

**Measuring Dynamic Memory Usage** ESP-IDF contains a range of heap APIs for measuring free heap at runtime. See [Heap Memory Debugging](#).

---

**备注:** In embedded systems, heap fragmentation can be a significant issue alongside total RAM usage. The heap measurement APIs provide ways to measure the “largest free block”. Monitoring this value along with the total number of free bytes can give a quick indication of whether heap fragmentation is becoming an issue.

---

### Reducing Static Memory Usage

- Reducing the static memory usage of the application increases the amount of RAM available for heap at runtime, and vice versa.
- Generally speaking, minimizing static memory usage requires monitoring the `.data` and `.bss` sizes. For tools to do this, see [Measuring Static Sizes](#).

- Internal ESP-IDF functions do not make heavy use of static RAM allocation in C. In many instances (including: Wi-Fi library, Bluetooth controller) “static” buffers are still allocated from heap, but the allocation is done once when the feature is initialized and will be freed if the feature is deinitialized. This is done in order to maximize the amount of free memory at different points in the application life-cycle.

To minimize static memory use:

- Declare structures, buffers, or other variables `const` whenever possible. Constant data can be stored in flash not RAM. This may require changing functions in the firmware to take `const *` arguments instead of mutable pointer arguments. These changes can also reduce the stack usage of some functions.
- If using Bluetooth, setting the option `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY` will cause Bluetooth to allocate memory on initialization and free it on deinitialization. This doesn't necessarily reduce the peak memory usage, but changes it from static memory usage to runtime memory usage.
- If `Coredump` component is enabled, `ESP_COREDUMP_LOG` macros will use ~5KB internal memory to place strings into DRAM. By disabling `CONFIG_ESP_COREDUMP_LOGS` option, these logs are disabled and the memory is reclaimed.

**Reducing Stack Sizes** In FreeRTOS, task stacks are usually allocated from the heap. The stack size for each task is fixed (passed as an argument to `xTaskCreate()`). Each task can use up to its allocated stack size, but using more than this will cause an otherwise valid program to crash with a stack overflow or heap corruption.

Therefore, determining the optimum sizes of each task stack can substantially reduce RAM usage.

To determine optimum task stack sizes:

- Combine tasks. The best task stack size is 0 bytes, achieved by combining a task with another existing task. Anywhere that the firmware can be structured to perform multiple functions sequentially in a single task will increase free memory. In some cases, using a “worker task” pattern where jobs are serialized into a FreeRTOS queue (or similar) and then processed by generic worker tasks may help.
- Consolidate task functions. String formatting functions (like `printf`) are particularly heavy users of stack, so any task which doesn't ever call these can usually have its stack size reduced.
- Enabling `Newlib nano formatting` will reduce the stack usage of any task that calls `printf()` or other C string formatting functions.
- Avoid allocating large variables on the stack. In C, any large struct or array allocated as an “automatic” variable (i.e. default scope of a C declaration) will use space on the stack. Minimize the sizes of these, allocate them statically and/or see if you can save memory by allocating them from the heap only when they are needed.
- Avoid deep recursive function calls. Individual recursive function calls don't always add a lot of stack usage each time they are called, but if each function includes large stack-based variables then the overhead can get quite high.
- At runtime, call the function `uxTaskGetStackHighWaterMark()` with the handle of any task where you think there is unused stack memory. This function returns the minimum lifetime free stack memory in bytes. The easiest time to call this is from the task itself: call `uxTaskGetStackHighWaterMark(NULL)` to get the current task's high water mark after the time that the task has achieved its peak stack usage (i.e. if there is a main loop, execute the main loop a number of times with all possible states and then call `uxTaskGetStackHighWaterMark()`). Often, it's possible to subtract almost the entire value returned here from the total stack size of a task, but allow some safety margin to account for unexpected small increases in stack usage at runtime.
- Call `uxTaskGetSystemState()` at runtime to get a summary of all tasks in the system. This includes their individual stack “high watermark” values.
- When debugger watchpoints are not being used, set the `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` option to trigger an immediate panic if a task writes the word at the end of its assigned stack. This is slightly more reliable than the default `CONFIG_FREERTOS_CHECK_STACKOVERFLOW` option of “Check using canary bytes”, because the panic happens immediately, not on the next RTOS context switch. Neither option is perfect, it's possible in some cases for stack pointer to skip the watchpoint or canary bytes and corrupt another region of RAM, instead.

**Internal Stack Sizes** ESP-IDF allocates a number of internal tasks for housekeeping purposes or operating system functions. Some are created during the startup process, and some are created at runtime when particular features are

initialized.

The default stack sizes for these tasks are usually set conservatively high, to allow all common usage patterns. Many of the stack sizes are configurable, and it may be possible to reduce them to match the real runtime stack usage of the task.

---

**重要:** If internal task stack sizes are set too small, ESP-IDF will crash unpredictably. Even if the root cause is task stack overflow, this is not always clear when debugging. It is recommended that internal stack sizes are only reduced carefully (if at all), with close attention to “high water mark” free space under load. If reporting an issue that occurs when internal task stack sizes have been reduced, please always include this information and the specific configuration that is being used.

---

- *Main task that executes `app_main` function* has stack size `CONFIG_ESP_MAIN_TASK_STACK_SIZE`.
- *High Resolution Timer* system task which executes callbacks has stack size `CONFIG_ESP_TIMER_TASK_STACK_SIZE`.
- FreeRTOS Timer Task to handle FreeRTOS timer callbacks has stack size `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`.
- *Event Handling* system task to execute callbacks for the default system event loop has stack size `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`.
- *lwIP* TCP/IP task has stack size `CONFIG_LWIP_TCPIP_TASK_STACK_SIZE`
- *Bluedroid Bluetooth Host* have task stack sizes `CONFIG_BT_BTC_TASK_STACK_SIZE`, `CONFIG_BT_BTU_TASK_STACK_SIZE`.
- *NimBLE Bluetooth Host* has task stack size `CONFIG_BT_NIMBLE_TASK_STACK_SIZE`
- The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config `ETH_MAC_DEFAULT_CONFIG` then the task stack size is 4 KB. This setting can be changed by passing a custom `eth_mac_config_t` struct when initializing the Ethernet MAC.
- FreeRTOS idle task stack size is configured by `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE`.
- If using the *mDNS* and/or *MQTT* components, they create tasks with stack sizes configured by `CONFIG_MDNS_TASK_STACK_SIZE` and `CONFIG_MQTT_TASK_STACK_SIZE`, respectively. MQTT stack size can also be configured using `task_stack` field of `esp_mqtt_client_config_t`.

---

**备注:** Aside from built-in system features such as `esp-timer`, if an ESP-IDF feature is not initialized by the firmware then no associated task is created. In those cases, the stack usage is zero and the stack size configuration for the task is not relevant.

---

**Reducing Heap Usage** For functions that assist in analyzing heap usage at runtime, see [Heap Memory Debugging](#).

Normally, optimizing heap usage consists of analyzing the usage and removing calls to `malloc()` that aren't being used, reducing the corresponding sizes, or freeing previously allocated buffers earlier.

There are some ESP-IDF configuration options that can reduce heap usage at runtime:

- *lwIP* documentation has a section to configure [Minimum RAM usage](#).
- *Wi-Fi* [缓冲区使用情况](#) describes options to either reduce numbers of “static” buffers or reduce the maximum number of “dynamic” buffers in use, in order to minimize memory usage at possible cost of performance. Note that “static” Wi-Fi buffers are still allocated from heap when Wi-Fi is initialized and will be freed if Wi-Fi is deinitialized.
- *mbedTLS* TLS session memory usage can be minimized by enabling the ESP-IDF feature `CONFIG_MBEDTLS_DYNAMIC_BUFFER`.

---

**备注:** There are other configuration options that will increase heap usage at runtime if changed from the defaults. These are not listed here, but the help text for the configuration item will mention if there is some memory impact.

---

**Optimizing IRAM Usage** The available DRAM at runtime (for heap usage) is also reduced by the static IRAM usage. Therefore, one way to increase available DRAM is to reduce IRAM usage.

If the app allocates more static IRAM than is available then the app will fail to build and linker errors such as section ``.iram0.text'` will not fit in region ``.iram0_0_seg'`, IRAM0 segment data does not fit and region ``.iram0_0_seg'` overflowed by 84 bytes will be seen. If this happens, it is necessary to find ways to reduce static IRAM usage in order to link the application.

To analyze the IRAM usage in the firmware binary, use *Measuring Static Sizes*. If the firmware failed to link, steps to analyze are shown at *Showing Size When Linker Fails*.

The following options will reduce IRAM usage of some ESP-IDF features:

- Enable `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`. Provided these functions are not (incorrectly) used from ISRs, this option is safe to enable in all configurations.
- Enable `CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNCS_INTO_FLASH`. Enabling this option will place snapshot-related functions, such as `vTaskGetSnapshot` or `uxTaskGetSnapshotAll`, in flash.
- Enable `CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`. Provided these functions are not (incorrectly) used from ISRs, this option is safe to enable in all configurations.
- Enable `CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH`. This option is not safe to use if the ISR ringbuf functions are used from an IRAM interrupt context, e.g. if `CONFIG_UART_ISR_IN_IRAM` is enabled. For the IDF drivers where this is the case you will get an error at run-time when installing the driver in question.
- Disable Wi-Fi options `CONFIG_ESP32_WIFI_IRAM_OPT` and/or `CONFIG_ESP32_WIFI_RX_IRAM_OPT`. Disabling these options will free available IRAM at the cost of Wi-Fi performance.
- `CONFIG_SPI_FLASH_ROM_IMPL` enabling this option will free some IRAM but will mean that `esp_flash` bugfixes and new flash chip support is not available.
- Disabling `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR` prevents posting `esp_event` events from *IRAM 安全中断处理程序* but will save some IRAM.
- Disabling `CONFIG_SPI_MASTER_ISR_IN_IRAM` prevents `spi_master` interrupts from being serviced while writing to flash, and may otherwise reduce `spi_master` performance, but will save some IRAM.
- Setting `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` to disable assertion for HAL component will save some IRAM especially for HAL code who calls `HAL_ASSERT` a lot and resides in IRAM.

---

**备注:** Moving frequently-called functions from IRAM to flash may increase their execution time.

---

**备注:** Other configuration options exist that will increase IRAM usage by moving some functionality into IRAM, usually for performance, but the default option is not to do this. These are not listed here. The IRAM size impact of enabling these options is usually noted in the configuration item help text.

---

## 4.27 RF calibration

ESP32-S3 supports three RF calibration methods during RF initialization:

1. Partial calibration
2. Full calibration
3. No calibration

### 4.27.1 Partial calibration

During RF initialization, the partial calibration method is used by default for RF calibration. It is done based on the full calibration data which is stored in the NVS. To use this method, please go to `menuconfig` and enable `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`.

### 4.27.2 Full calibration

Full calibration is triggered in the following conditions:

1. NVS does not exist.
2. The NVS partition to store calibration data is erased.
3. Hardware MAC address is changed.
4. PHY library version is changed.
5. The RF calibration data loaded from the NVS partition is broken.

It takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. To switch to the full calibration method, go to `menuconfig` and disable `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`. If you use the default method of RF calibration, there are two ways to add the function of triggering full calibration as a last-resort remedy.

1. Erase the NVS partition if you don't mind all of the data stored in the NVS partition is erased. That is indeed the easiest way.
2. Call API `esp_phy_erase_cal_data_in_nvs()` before initializing WiFi and BT/BLE based on some conditions (e.g. an option provided in some diagnostic mode). In this case, only phy namespace of the NVS partition is erased.

### 4.27.3 No calibration

No calibration method is only used when the device wakes up from deep sleep.

### 4.27.4 PHY initialization data

The PHY initialization data is used for RF calibration. There are two ways to get the PHY initialization data.

One is the default initialization data which is located in the header file `components/esp_phy/esp32s3/include/phy_init_data.h`.

It is embedded into the application binary after compiling and then stored into read-only memory (DROM). To use the default initialization data, please go to `menuconfig` and disable `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`.

Another is the initialization data which is stored in a partition. When using a custom partition table, make sure that PHY data partition is included (type: `data`, subtype: `phy`). With default partition table, this is done automatically. If initialization data is stored in a partition, it has to be flashed there, otherwise runtime error will occur. To switch to the initialization data stored in a partition, go to `menuconfig` and enable `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`.

## 4.28 Secure Boot V2

---

**重要:** This document is about Secure Boot V2, supported on the following chips: ESP32 (ECO3 onwards), ESP32-S2, ESP32-S3 and ESP32-C3 (ECO3 onwards). Except for ESP32, it is the only supported Secure Boot scheme.

Secure Boot V2 uses RSA based app and bootloader verification. This document can also be used as a reference for signing apps using the RSA scheme without signing the bootloader.

---

### 4.28.1 Background

Secure Boot protects a device from running any unauthorized (i.e., unsigned) code by checking that each piece of software that is being booted is signed. On an ESP32-S3, these pieces of software include the second stage bootloader and each application binary. Note that the first stage bootloader does not require signing as it is ROM code thus cannot be changed.

A new RSA based Secure Boot verification scheme (Secure Boot V2) has been introduced on the ESP32 (ECO3 onwards), ESP32-S2, ESP32-S3 and ESP32-C3 (ECO3 onwards).

The Secure Boot process on the ESP32-S3 involves the following steps: 1. When the first stage bootloader loads the second stage bootloader, the second stage bootloader's RSA-PSS signature is verified. If the verification is successful, the second stage bootloader is executed. 2. When the second stage bootloader loads a particular application image, the application's RSA-PSS signature is verified. If the verification is successful, the application image is executed.

### 4.28.2 Advantages

- The RSA public key is stored on the device. The corresponding RSA private key is kept at a secret place and is never accessed by the device.
- Up to three public keys can be generated and stored in the chip during manufacturing.
- ESP32-S3 provides the facility to permanently revoke individual public keys. This can be configured conservatively or aggressively.
- Conservatively - The old key is revoked after the bootloader and application have successfully migrated to a new key. Aggressively - The key is revoked as soon as verification with this key fails.
- Same image format and signature verification method is applied for applications and software bootloader.
- No secrets are stored on the device. Therefore, it is immune to passive side-channel attacks (timing or power analysis, etc.)

### 4.28.3 Secure Boot V2 Process

This is an overview of the Secure Boot V2 Process. Instructions how to enable Secure Boot are supplied in section [How To Enable Secure Boot V2](#).

Secure Boot V2 verifies the bootloader image and application binary images using a dedicated *signature block*. Each image has a separately generated signature block which is appended to the end of the image.

Up to 3 signature blocks can be appended to the bootloader or application image in ESP32-S3.

Each signature block contains a signature of the preceding image as well as the corresponding RSA-3072 public key. For more details about the format, refer to [Signature Block Format](#). A digest of the RSA-3072 public key is stored in the eFuse.

The application image is not only verified on every boot but also on each over the air (OTA) update. If the currently selected OTA app image cannot be verified, the bootloader will fall back and look for another correctly signed application image.

The Secure Boot V2 process follows these steps:

1. On startup, the ROM code checks the Secure Boot V2 bit in the eFuse. If Secure Boot is disabled, a normal boot will be executed. If Secure Boot is enabled, the boot will proceed according to the following steps.
2. The ROM code verifies the bootloader's signature block ([Verifying a Signature Block](#)). If this fails, the boot process will be aborted.
3. The ROM code verifies the bootloader image using the raw image data, its corresponding signature block(s), and the eFuse ([Verifying an Image](#)). If this fails, the boot process will be aborted.
4. The ROM code executes the bootloader.
5. The bootloader verifies the application image's signature block ([Verifying a Signature Block](#)). If this fails, the boot process will be aborted.
6. The bootloader verifies the application image using the raw image data, its corresponding signature blocks and the eFuse ([Verifying an Image](#)). If this fails, the boot process will be aborted. If the verification fails but another application image is found, the bootloader will then try to verify that other image using steps 5 to 7. This repeats until a valid image is found or no other images are found.
7. The bootloader executes the verified application image.

#### 4.28.4 Signature Block Format

The bootloader and application images are padded to the next 4096 byte boundary, thus the signature has a flash sector of its own. The signature is calculated over all bytes in the image including the padding bytes.

The content of each signature block is shown in the following table:

表 27: Content of a Signature Block

| Offset | Size (bytes) | Description   |
|--------|--------------|---|
| 0      | 1            | Magic byte  |
| 1      | 1            | Version number byte (currently 0x02), 0x01 is for Secure Boot V1.   |
| 2      | 2            | Padding bytes, Reserved. Should be zero.  |
| 4      | 32           | SHA-256 hash of only the image content, not including the signature block.  |
| 36     | 384          | RSA Public Modulus used for signature verification. (value ‘n’ in RFC8017).   |
| 420    | 4            | RSA Public Exponent used for signature verification (value ‘e’ in RFC8017).   |
| 424    | 384          | Pre-calculated R, derived from ‘n’.   |
| 808    | 4            | Pre-calculated M’, derived from ‘n’.  |
| 812    | 384          | RSA-PSS Signature result (section 8.1.1 of RFC8017) of image content, computed using following PSS parameters: SHA256 hash, MFG1 function, 0 length salt, default trailer field (0xBC). |
| 1196   | 4            | CRC32 of the preceding 1095 bytes.  |
| 1200   | 16           | Zero padding to length 1216 bytes.  |

备注: R and M’ are used for hardware-assisted Montgomery Multiplication.

The remainder of the signature sector is erased flash (0xFF) which allows writing other signature blocks after previous signature block.

#### 4.28.5 Verifying a Signature Block

A signature block is “valid” if the first byte is 0xe7 and a valid CRC32 is stored at offset 1196. Otherwise it’s invalid.

#### 4.28.6 Verifying an Image

An image is “verified” if the public key stored in any signature block is valid for this device, and if the stored signature is valid for the image data read from flash.

1. Compare the SHA-256 hash digest of the public key embedded in the bootloader’s signature block with the digest(s) saved in the eFuses. If public key’s hash doesn’t match any of the hashes from the eFuses, the verification fails.
2. Generate the application image digest and match it with the image digest in the signature block. If the digests don’t match, the verification fails.
3. Use the public key to verify the signature of the bootloader image, using RSA-PSS (section 8.1.2 of RFC8017) with the image digest calculated in step (2) for comparison.

#### 4.28.7 Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See [引导加载程序大小](#).

### 4.28.8 eFuse usage

- `SECURE_BOOT_EN` - Enables Secure Boot protection on boot.
- `KEY_PURPOSE_X` - Set the purpose of the key block on ESP32-S3 by programming `SECURE_BOOT_DIGESTX` ( $X = 0, 1, 2$ ) into `KEY_PURPOSE_X` ( $X = 0, 1, 2, 3, 4, 5$ ). Example: If `KEY_PURPOSE_2` is set to `SECURE_BOOT_DIGEST1`, then `BLOCK_KEY2` will have the Secure Boot V2 public key digest. The write-protection bit must be set (this field does not have a read-protection bit).
- `BLOCK_KEYX` - The block contains the data corresponding to its purpose programmed in `KEY_PURPOSE_X`. Stores the SHA-256 digest of the public key. SHA-256 hash of public key modulus, exponent, pre-calculated  $R$  &  $M'$  values (represented as 776 bytes –offsets 36 to 812 - as per the [Signature Block Format](#)) is written to an eFuse key block. The write-protection bit must be set, but the read-protection bit must not.
- `KEY_REVOKEY` - The revocation bits corresponding to each of the 3 key block. Ex. Setting `KEY_REVOKE2` revokes the key block whose key purpose is `SECURE_BOOT_DIGEST2`.
- `SECURE_BOOT_AGGRESSIVE_REVOKE` - Enables aggressive revocation of keys. The key is revoked as soon as verification with this key fails.

To ensure no trusted keys can be added later by an attacker, each unused key digest slot should be revoked (`KEY_REVOKEY`). It will be checked during app startup in `esp_secure_boot_init_checks()` and fixed unless [CONFIG\\_SECURE\\_BOOT\\_ALLOW\\_UNUSED\\_DIGEST\\_SLOTS](#) is enabled.

The key(s) must be readable in order to give software access to it. If the key(s) is read-protected then the software reads the key(s) as all zeros and the signature verification process will fail, and the boot process will be aborted.

### 4.28.9 How To Enable Secure Boot V2

1. Open the [Project Configuration Menu](#), in “Security features” set “Enable hardware Secure Boot in bootloader” to enable Secure Boot.
2. The “Secure Boot V2” option will be selected and the “App Signing Scheme” would be set to RSA by default.
3. Specify the path to Secure Boot signing key, relative to the project directory.
4. Select the desired UART ROM download mode in “UART ROM download mode” . By default, it is set to “Permanently switch to Secure mode” which is generally recommended. For production devices, the most secure option is to set it to “Permanently disabled” .
5. Set other menuconfig options (as desired). Then exit menuconfig and save your configuration.
6. The first time you run `make` or `idf.py build`, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

---

**重要:** A signing key generated this way will use the best random number source available to the OS and its Python installation (`/dev/urandom` on OSX/Linux and `CryptGenRandom()` on Windows). If this random number source is weak, then the private key will be weak.

---

---

**重要:** For production environments, we recommend generating the key pair using openssl or another industry standard encryption program. See [Generating Secure Boot Signing Key](#) for more details.

---

7. Run `idf.py bootloader` to build a Secure Boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.
8. When you’re ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by the build system) and then wait for flashing to complete.
9. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 4.

---

**备注:** `idf.py flash` doesn’t flash the bootloader if Secure Boot is enabled.

---

10. Reset the ESP32-S3 and it will boot the software bootloader you flashed. The software bootloader will enable Secure Boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32-S3 to verify that Secure Boot is enabled and no errors have occurred due to the build configuration.

---

**备注:** Secure boot won't be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

---

---

**备注:** If the ESP32-S3 is reset or powered down during the first boot, it will start the process again on the next boot.

---

11. On subsequent boots, the Secure Boot hardware will verify the software bootloader has not changed and the software bootloader will verify the signed app image (using the validated public key portion of its appended signature block).

### 4.28.10 Restrictions after Secure Boot is enabled

- Any updated bootloader or app will need to be signed with a key matching the digest already stored in eFuse.
- After Secure Boot is enabled, no further eFuses can be read protected. (If *Flash 加密* is enabled then the bootloader will ensure that any flash encryption key generated on first boot will already be read protected.) If `CONFIG_SECURE_BOOT_INSECURE` is enabled then this behavior can be disabled, but this is not recommended.

### 4.28.11 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via `espsecure.py generate_signing_key`. The `-version 2` parameter will generate the RSA 3072 private key for Secure Boot V2.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available RSA key generation utilities.

For example, to generate a signing key using the `openssl` command line:

```
` openssl genrsa -out my_secure_boot_signing_key.pem 3072 `
```

Remember that the strength of the Secure Boot system depends on keeping the signing key private.

### 4.28.12 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default `esp-idf` Secure Boot configuration). The `espsecure.py` command line program can be used to sign app images & partition table data for Secure Boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system.

After the app image and partition table are built, the build system will print signing steps using `espsecure.py`:

```
espsecure.py sign_data BINARY_FILE --version 2 --keyfile PRIVATE_SIGNING_KEY
```

The above command appends the image signature to the existing binary. You can use the `-output` argument to write the signed binary to a separate file:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY --output SIGNED_
↪BINARY_FILE BINARY_FILE
```

### 4.28.13 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the Secure Boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using `espsecure.py`. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all Secure Boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use Secure Boot in combination with *flash encryption* to prevent local readout of the flash contents.

### 4.28.14 Key Management

- Between 1 and 3 RSA-3072 public key pairs (Keys #0, #1, #2) should be computed independently and stored separately.
- The KEY\_DIGEST eFuses should be write protected after being programmed.
- The unused KEY\_DIGEST slots must have their corresponding KEY\_REVOKE eFuse burned to permanently disable them. This must happen before the device leaves the factory.
- The eFuses can either be written by the software bootloader during first boot after enabling “Secure Boot V2” from menuconfig or can be done using `espfuse.py` which communicates with the serial bootloader program in ROM.
- The KEY\_DIGESTs should be numbered sequentially beginning at key digest #0. (i.e., if key digest #1 is used, key digest #0 should be used. If key digest #2 is used, key digest #0 & #1 must be used.)
- The software bootloader (non OTA upgradeable) is signed using at least one, possibly all three, private keys and flashed in the factory.
- Apps should only be signed with a single private key (the others being stored securely elsewhere), however they may be signed with multiple private keys if some are being revoked (see Key Revocation, below).

### 4.28.15 Multiple Keys

- The bootloader should be signed with all the private key(s) that are needed for the life of the device, before it is flashed.
- The build system can sign with at most one private key, user has to run manual commands to append more signatures if necessary.
- **You can use the append functionality of `espsecure.py`, this command would also printed at the end of the Secure B**  

```
espsecure.py sign_data -k secure_boot_signing_key2.pem -v 2 --append_signatures -o signed_bootloader.bin build/bootloader/bootloader.bin
```
- While signing with multiple private keys, it is recommended that the private keys be signed independently, if possible on different servers and stored separately.
- **You can check the signatures attached to a binary using -** `espsecure.py signature_info_v2 datafile.bin`

### 4.28.16 Key Revocation

- Keys are processed in a linear order. (key #0, key #1, key #2).
- Applications should be signed with only one key at a time, to minimize the exposure of unused private keys.
- The bootloader can be signed with multiple keys from the factory.

#### Conservative approach:

Assuming a trusted private key (N-1) has been compromised, to update to new key pair (N).

1. Server sends an OTA update with an application signed with the new private key (#N).
2. The new OTA update is written to an unused OTA app partition.
3. The new application's signature block is validated. The public keys are checked against the digests programmed in the eFuse & the application is verified using the verified public key.
4. The active partition is set to the new OTA application's partition.

5. Device resets, loads the bootloader (verified with key #N-1) which then boots new app (verified with key #N).
6. The new app verifies bootloader with key #N (as a final check) and then runs code to revoke key #N-1 (sets KEY\_REVOKE eFuse bit).
7. The API `esp_ota_revoke_secure_boot_public_key()` can be used to revoke the key #N-1.
  - A similar approach can also be used to physically re-flash with a new key. For physical re-flashing, the bootloader content can also be changed at the same time.

### Aggressive approach:

ROM code has an additional feature of revoking a public key digest if the signature verification fails.

To enable this feature, you need to burn `SECURE_BOOT_AGGRESSIVE_REVOKE` efuse or enable `CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE`

Key revocation is not applicable unless secure boot is successfully enabled. Also, a key is not revoked in case of invalid signature block or invalid image digest, it is only revoked in case the signature verification fails, i.e. revoke key only if failure in step 3 of *Verifying an Image*

Once a key is revoked, it can never be used for verifying a signature of an image. This feature provides strong resistance against physical attacks on the device. However, this could also brick the device permanently if all the keys are revoked because of signature verification failure.

## 4.28.17 Technical Details

The following sections contain low-level reference descriptions of various Secure Boot elements:

### Manual Commands

Secure boot is integrated into the `esp-idf` build system, so `make` or `idf.py build` will sign an app image and `idf.py bootloader` will produce a signed bootloader if secure signed binaries on build is enabled.

However, it is possible to use the `espsecure.py` tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --version 2 --keyfile ./my_signing_key.pem --output ./image_
↳signed.bin image-unsigned.bin
```

Keyfile is the PEM file containing an RSA-3072 private signing key.

## 4.28.18 Secure Boot & Flash Encryption

If Secure Boot is used without *Flash Encryption*, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

## 4.28.19 Signed App Verification Without Hardware Secure Boot

The Secure Boot V2 signature of apps can be checked on OTA update, without enabling the hardware Secure Boot option. This option uses the same app signature scheme as Secure Boot V2, but unlike hardware Secure Boot it does not prevent an attacker who can write to flash from bypassing the signature protection.

This may be desirable in cases where the delay of Secure Boot verification on startup is unacceptable, and/or where the threat model does not include physical access or attackers writing to bootloader or app partitions in flash.

In this mode, the public key which is present in the signature block of the currently running app will be used to verify the signature of a newly updated app. (The signature on the running app isn't verified during the update process, it's assumed to be valid.) In this way the system creates a chain of trust from the running app to the newly updated app.

For this reason, it's essential that the initial app flashed to the device is also signed. A check is run on app startup and the app will abort if no signatures are found. This is to try and prevent a situation where no update is possible. The app should have only one valid signature block in the first position. Note again that, unlike hardware Secure Boot V2, the signature of the running app isn't verified on boot. The system only verifies a signature block in the first position and ignores any other appended signatures.

Although multiple trusted keys are supported when using hardware Secure Boot, only the first public key in the signature block is used to verify updates if signature checking without Secure Boot is configured. If multiple trusted public keys are required, it's necessary to enable the full Secure Boot feature instead.

---

**备注:** In general, it's recommended to use full hardware Secure Boot unless certain that this option is sufficient for application security needs.

---

### How To Enable Signed App Verification

1. Open *Project Configuration Menu* -> Security features
2. Ensure *App Signing Scheme* is RSA
3. Enable *CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT*
4. By default, "Sign binaries during build" will be enabled on selecting "Require signed app images" option, which will sign binary files as a part of build process. The file named in "Secure boot private signing key" will be used to sign the image.
5. If you disable "Sign binaries during build" option then all app binaries must be manually signed by following instructions in *Remote Signing of Images*.

**警告:** It is very important that all apps flashed have been signed, either during the build or after the build.

## 4.28.20 Advanced Features

### JTAG Debugging

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See *JTAG 与闪存加密和安全引导* for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

## 4.29 Thread Local Storage

### 4.29.1 Overview

Thread-local storage (TLS) is a mechanism by which variables are allocated such that there is one instance of the variable per extant thread. ESP-IDF provides three ways to make use of such variables:

- *FreeRTOS Native API*: ESP-IDF FreeRTOS native API.
- *Pthread API*: ESP-IDF's pthread API.
- *C11 Standard*: C11 standard introduces special keyword to declare variables as thread local.

### 4.29.2 FreeRTOS Native API

The ESP-IDF FreeRTOS provides the following API to manage thread local variables:

- `vTaskSetThreadLocalStoragePointer()`
- `pvTaskGetThreadLocalStoragePointer()`
- `vTaskSetThreadLocalStoragePointerAndDelCallback()`

In this case maximum number of variables that can be allocated is limited by `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS` configuration value. Variables are kept in the task control block (TCB) and accessed by their index. Note that index 0 is reserved for ESP-IDF internal uses.

Using that API user can allocate thread local variables of an arbitrary size and assign them to any number of tasks. Different tasks can have different sets of TLS variables.

If size of the variable is more than 4 bytes then user is responsible for allocating/deallocating memory for it. Variable's deallocation is initiated by FreeRTOS when task is deleted, but user must provide function (callback) to do proper cleanup.

### 4.29.3 Pthread API

The ESP-IDF provides the following *pthread API* to manage thread local variables:

- `pthread_key_create()`
- `pthread_key_delete()`
- `pthread_getspecific()`
- `pthread_setspecific()`

This API has all benefits of the one above, but eliminates some its limits. The number of variables is limited only by size of available memory on the heap. Due to the dynamic nature this API introduces additional performance overhead compared to the native one.

### 4.29.4 C11 Standard

The ESP-IDF FreeRTOS supports thread local variables according to C11 standard (ones specified with `__thread` keyword). For details on this GCC feature please see <https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local>. Storage for that kind of variables is allocated on the task's stack. Note that area for all such variables in the program will be allocated on the stack of every task in the system even if that task does not use such variables at all. For example ESP-IDF system tasks (like `ipc`, `timer` tasks etc.) will also have that extra stack space allocated. So this feature should be used with care. There is a tradeoff: C11 thread local variables are quite handy to use in programming and can be accessed using minimal CPU instructions, but this benefit goes with the cost of additional stack usage for all tasks in the system. Due to static nature of variables allocation all tasks in the system have the same sets of C11 thread local variables.

## 4.30 工具

### 4.30.1 Downloadable Tools

ESP-IDF build process relies on a number of tools: cross-compiler toolchains, CMake build system, and others.

Installing the tools using an OS-specific package manager (like `apt`, `yum`, `brew`, etc.) is the preferred method when the required version of the tool is available. This recommendation is reflected in the Getting Started guide. For example, on Linux and macOS it is recommended to install CMake using an OS package manager.

However, some of the tools are IDF-specific and are not available in OS package repositories. Furthermore, different versions of ESP-IDF require different versions of the tools to operate correctly. To solve these two problems, ESP-IDF provides a set of scripts for downloading and installing the correct versions of tools, and exposing them in the environment.

The rest of the document refers to these downloadable tools simply as “tools”. Other kinds of tools used in ESP-IDF are:

- Python scripts bundled with ESP-IDF (such as `idf.py`)
- Python packages installed from PyPI.

The following sections explain the installation method, and provide the list of tools installed on each platform.

---

**备注:** This document is provided for advanced users who need to customize their installation, users who wish to understand the installation process, and ESP-IDF developers.

If you are looking for instructions on how to install the tools, see the [Getting Started Guide](#).

---

### Tools metadata file

The list of tools and tool versions required for each platform is located in [tools/tools.json](#). The schema of this file is defined by [tools/tools\\_schema.json](#).

This file is used by [tools/idf\\_tools.py](#) script when installing the tools or setting up the environment variables.

### Tools installation directory

`IDF_TOOLS_PATH` environment variable specifies the location where the tools are to be downloaded and installed. If not set, `IDF_TOOLS_PATH` defaults to `HOME/.espressif` on Linux and macOS, and `%USER_PROFILE%\espressif` on Windows.

Inside `IDF_TOOLS_PATH`, the scripts performing tools installation create the following directories:

- `dist` — where the archives of the tools are downloaded.
- `tools` — where the tools are extracted. The tools are extracted into subdirectories: `tools/TOOL_NAME/VERSION/`. This arrangement allows different versions of tools to be installed side by side.

### GitHub Assets Mirror

Most of the tools downloaded by the tools installer are GitHub Release Assets, which are files attached to a software release on GitHub.

If GitHub downloads are inaccessible or slow to access, it’s possible to configure a GitHub assets mirror.

To use Espressif’s download server, set the environment variable `IDF_GITHUB_ASSETS` to `dl.espressif.com/github_assets`. When the install process is downloading a tool from `github.com`, the URL will be rewritten to use this server instead.

Any mirror server can be used provided the URL matches the `github.com` download URL format: the install process will replace `https://github.com` with `https://${IDF_GITHUB_ASSETS}` for any GitHub asset URL that it downloads.

---

**备注:** The Espressif download server doesn’t currently mirror everything from GitHub, it only mirrors files attached as Assets to some releases as well as source archives for some releases.

---

### `idf_tools.py` script

[tools/idf\\_tools.py](#) script bundled with ESP-IDF performs several functions:

- `install`: Download the tool into `${IDF_TOOLS_PATH}/dist` directory, extract it into `${IDF_TOOLS_PATH}/tools/TOOL_NAME/VERSION`. `install` command accepts the list of tools to install, in `TOOL_NAME` or `TOOL_NAME@VERSION` format. If all is given, all the tools (required and optional ones) are installed. If no argument or `required` is given, only the required tools are installed.
- `download`: Similar to `install` but doesn't extract the tools. An optional `--platform` argument may be used to download the tools for the specific platform.
- `export`: Lists the environment variables which need to be set to use the installed tools. For most of the tools, setting `PATH` environment variable is sufficient, but some tools require extra environment variables. The environment variables can be listed in either of `shell` or `key-value` formats, set by `--format` parameter:
  - `shell` produces output suitable for evaluation in the shell. For example,

```
export PATH="/home/user/.espressif/tools/tool/v1.0.0/bin:$PATH"
```

on Linux and macOS, and

```
set "PATH=C:\Users\user\.espressif\tools\v1.0.0\bin;%PATH%"
```

on Windows.

**备注:** Exporting environment variables in Powershell format is not supported at the moment. `key-value` format may be used instead.

The output of this command may be used to update the environment variables, if the shell supports this. For example:

```
eval $(${IDF_PATH}/tools/idf_tools.py export)
```

- `key-value` produces output in `VARIABLE=VALUE` format, suitable for parsing by other scripts:

```
PATH=/home/user/.espressif/tools/tool/v1.0.0:$PATH
```

Note that the script consuming this output has to perform expansion of `$VAR` or `%VAR%` patterns found in the output.

- `list`: Lists the known versions of the tools, and indicates which ones are installed.
- `check`: For each tool, checks whether the tool is available in the system path and in `IDF_TOOLS_PATH`.

## Install scripts

Shell-specific user-facing scripts are provided in the root of ESP-IDF repository to facilitate tools installation. These are:

- `install.bat` for Windows Command Prompt
- `install.ps1` for Powershell
- `install.sh` for Bash

Aside from downloading and installing the tools into `IDF_TOOLS_PATH`, these scripts prepare a Python virtual environment, and install the required packages into that environment.

## Export scripts

Since the installed tools are not permanently added into the user or system `PATH` environment variable, an extra step is required to use them in the command line. The following scripts modify the environment variables in the current shell to make the correct versions of the tools available:

- `export.bat` for Windows Command Prompt
- `export.ps1` for Powershell
- `export.sh` for Bash

**备注:** To modify the shell environment in Bash, `export.sh` must be “sourced” : `./export.sh` (note the leading dot and space).

`export.sh` may be used with shells other than Bash (such as zsh). However in this case the `IDF_PATH` environment variable must be set before running the script. When used in Bash, the script will guess the `IDF_PATH` value from its own location.

---

In addition to calling `idf_tools.py`, these scripts list the directories which have been added to the `PATH`.

### Other installation methods

Depending on the environment, more user-friendly wrappers for `idf_tools.py` are provided:

- *IDF Tools installer for Windows* can download and install the tools. Internally the installer uses `idf_tools.py`.
- *Eclipse plugin for ESP-IDF* includes a menu item to set up the tools. Internally the plugin calls `idf_tools.py`.
- Visual Studio Code extension for ESP-IDF includes an onboarding flow. This flow helps setting up the tools. Although the extension does not rely on `idf_tools.py`, the same installation method is used.

### Custom installation

Although the methods above are recommended for ESP-IDF users, they are not a must for building ESP-IDF applications. ESP-IDF build system expects that all the necessary tools are installed somewhere, and made available in the `PATH`.

### List of IDF Tools

**xtensa-esp-elf-gdb** GDB for Xtensa

### 4.30.2 IDF Docker Image

IDF Docker image ( `espressif/idf` ) is intended for building applications and libraries with specific versions of ESP-IDF, when doing automated builds.

The image contains:

- Common utilities such as `git`, `wget`, `curl`, `zip`.
- Python 3.6 or newer.
- A copy of a specific version of ESP-IDF (see below for information about versions). `IDF_PATH` environment variable is set, and points to ESP-IDF location in the container.
- All the build tools required for the specific version of ESP-IDF: `CMake`, `make`, `ninja`, cross-compiler toolchains, etc.
- All Python packages required by ESP-IDF are installed in a virtual environment.

The image entrypoint sets up `PATH` environment variable to point to the correct version of tools, and activates the Python virtual environment. As a result, the environment is ready to use the ESP-IDF build system.

The image can also be used as a base for custom images, if additional utilities are required.

#### Tags

Multiple tags of this image are maintained:

- `latest`: tracks master branch of ESP-IDF
- `vX.Y`: corresponds to ESP-IDF release `vX.Y`
- `release-vX.Y`: tracks `release/vX.Y` branch of ESP-IDF

---

**备注:** Versions of ESP-IDF released before this feature was introduced do not have corresponding Docker image versions. You can check the up-to-date list of available tags at <https://hub.docker.com/r/espressif/idf/tags>.

---

#### Usage

**Setting up Docker** Before using the  `espressif/idf`  Docker image locally, make sure you have Docker installed. Follow the instructions at <https://docs.docker.com/install/>, if it is not installed yet.

If using the image in CI environment, consult the documentation of your CI service on how to specify the image used for the build process.

**Building a project with CMake** In the project directory, run:

```
docker run --rm -v $PWD:/project -w /project espressif/idf idf.py build
```

The above command explained:

- `docker run`: runs a Docker image. It is a shorter form of the command `docker container run`.
- `--rm`: removes the container when the build is finished
- `-v $PWD:/project`: mounts the current directory on the host (`$PWD`) as `/project` directory in the container
- `espressif/idf` : uses Docker image  `espressif/idf`  with tag `latest` (implicitly added by Docker when no tag is specified)
- `idf.py build`: runs this command inside the container

To build with a specific docker image tag, specify it as  `espressif/idf :TAG` , for example:

```
docker run --rm -v $PWD:/project -w /project espressif/idf:release-v4.4 idf.py ↵
↳ build
```

You can check the up-to-date list of available tags at <https://hub.docker.com/r/espressif/idf/tags>.

**Building a project with GNU Make** Same as for CMake, except that the build command is different:

```
docker run --rm -v $PWD:/project -w /project espressif/idf make defconfig all -j4
```

---

**备注:** If the `sdkconfig` file does not exist, the default behavior of GNU Make build system is to open the menuconfig UI. This may be not desired in automated build environments. To ensure that the `sdkconfig` file exists, `defconfig` target is added before `all`.

---

If you intend to build the same project repeatedly, you may bind the `tools/kconfig` directory of ESP-IDF to a named volume. This will prevent Kconfig tools, located in ESP-IDF directory, from being rebuilt, causing a rebuild of the rest of the project:

```
docker run --rm -v $PWD:/project -v kconfig:/opt/esp/idf/tools/kconfig -w /project_
↳espressif/idf make defconfig all -j4
```

If you need clean up the `kconfig` volume, run `docker volume rm kconfig`.

Binding the `tools/kconfig` directory to a volume is not necessary when using the CMake build system.

**Using the image interactively** It is also possible to do builds interactively, to debug build issues or test the automated build scripts. Start the container with `-i -t` flags:

```
docker run --rm -v $PWD:/project -w /project -it espressif/idf
```

Then inside the container, use `idf.py` as usual:

```
idf.py menuconfig
idf.py build
```

---

**备注:** Commands which communicate with the development board, such as `idf.py flash` and `idf.py monitor` will not work in the container unless the serial port is passed through into the container. However currently this is not possible with Docker for Windows (<https://github.com/docker/for-win/issues/1018>) and Docker for Mac (<https://github.com/docker/for-mac/issues/900>).

---

## Building custom images

The Dockerfile in ESP-IDF repository provides several build arguments which can be used to customize the Docker image:

- `IDF_CLONE_URL`: URL of the repository to clone ESP-IDF from. Can be set to a custom URL when working with a fork of ESP-IDF. Default is `https://github.com/espressif/esp-idf.git`.
- `IDF_CLONE_BRANCH_OR_TAG`: Name of a git branch or tag use when cloning ESP-IDF. This value is passed to `git clone` command using the `--branch` argument. Default is `master`.
- `IDF_CHECKOUT_REF`: If this argument is set to a non-empty value, `git checkout $IDF_CHECKOUT_REF` command will be performed after cloning. This argument can be set to the SHA of the specific commit to check out, for example if some specific commit on a release branch is desired.
- `IDF_CLONE_SHALLOW`: If this argument is set to a non-empty value, `--depth=1 --shallow-submodules` arguments will be used when performing `git clone`. This significantly reduces the amount of data downloaded and the size of the resulting Docker image. However, if switching to a different branch in such a “shallow” repository is necessary, an additional `git fetch origin <branch>` command must be executed first.
- `IDF_INSTALL_TARGETS`: Comma-separated list of IDF targets to install toolchains for, or `all` to install toolchains for all targets. Selecting specific targets reduces the amount of data downloaded and the size of the resulting Docker image. Default is `all`.

To use these arguments, pass them via the `--build-arg` command line option. For example, the following command will build a Docker image with a shallow clone of ESP-IDF v4.4.1 and tools for ESP32-C3, only:

```
docker build -t idf-custom:v4.4.1-esp32c3 \
  --build-arg IDF_CLONE_BRANCH_OR_TAG=v4.4.1 \
  --build-arg IDF_CLONE_SHALLOW=1 \
  --build-arg IDF_INSTALL_TARGETS=esp32c3 \
  tools/docker
```

### 4.30.3 IDF Windows Installer

#### Command-line parameters

Windows Installer `esp-idf-tools-setup` provides the following command-line parameters:

- `/CONFIG=[PATH]` - Path to `ini` configuration file to override default configuration of the installer. Default: `config.ini`.
- `/GITCLEAN=[yes|no]` - Perform git clean and remove untracked directories in Offline mode installation. Default: `yes`.
- `/GITRECURSIVE=[yes|no]` - Clone recursively all git repository submodules. Default: `yes`
- `/GITREPO=[URL|PATH]` - URL of repository to clone ESP-IDF. Default: <https://github.com/espressif/esp-idf.git>
- `/GITRESET=[yes|no]` - Enable/Disable git reset of repository during installation. Default: `yes`.
- `/HELP` - Display command line options provided by Inno Setup installer.
- `/IDFDIR=[PATH]` - Path to directory where it will be installed. Default: `{userdesktop}\esp-idf`
- `/IDFVERSION=[v4.3|v4.1|master]` - Use specific IDF version. E.g. `v4.1`, `v4.2`, `master`. Default: empty, pick the first version in the list.
- `/IDFVERSIONSURL=[URL]` - Use URL to download list of IDF versions. Default: [https://dl.espressif.com/dl/esp-idf/idf\\_versions.txt](https://dl.espressif.com/dl/esp-idf/idf_versions.txt)
- `/LOG=[PATH]` - Store installation log file in specific directory. Default: empty.
- `/OFFLINE=[yes|no]` - Execute installation of Python packages by PIP in offline mode. The same result can be achieved by setting the environment variable `PIP_NO_INDEX`. Default: `no`.
- `/USEEMBEDDEDPYTHON=[yes|no]` - Use Embedded Python version for the installation. Set to `no` to allow Python selection screen in the installer. Default: `yes`.
- `/PYTHONNOUSERSITE=[yes|no]` - Set `PYTHONNOUSERSITE` variable before launching any Python command to avoid loading Python packages from `AppDataRoaming`. Default: `yes`.
- `/PYTHONWHEELSURL=[URL]` - Specify URLs to PyPi repositories for resolving binary Python Wheel dependencies. The same result can be achieved by setting the environment variable `PIP_EXTRA_INDEX_URL`. Default: <https://dl.espressif.com/pypi>
- `/SKIPSYSTEMCHECK=[yes|no]` - Skip System Check page. Default: `no`.
- `/VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL` - Perform silent installation.

#### Unattended installation

The unattended installation of IDF can be achieved by following command-line parameters:

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
```

The installer detaches its process from the command-line. Waiting for installation to finish could be achieved by following PowerShell script:

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
$InstallerProcess = Get-Process esp-idf-tools-setup
Wait-Process -Id $InstallerProcess.id
```

### Custom Python and custom location of Python wheels

The IDF installer is using by default embedded Python with reference to Python Wheel mirror.

Following parameters allows to select custom Python and custom location of Python wheels:

```
esp-idf-tools-setup-x.x.exe /USEEMBEDDEDPYTHON=no /PYTHONWHEELSURL=https://pypi.
↳org/simple/
```

#### 4.30.4 IDF Component Manager

The IDF Component manager is a tool that downloads dependencies for any ESP-IDF CMake project. The download happens automatically during a run of CMake. It can source components either from [the component registry](#) or from a git repository.

A list of components can be found on <https://components.espressif.com/>

#### Using with a project

Dependencies for each component in the project are defined in a separate manifest file named `idf_component.yml` placed in the root of the component. The manifest file template can be created for a component by running `idf.py create-manifest --component=my_component`. When a new manifest is added to one of the components in the project it's necessary to reconfigure it manually by running `idf.py reconfigure`. Then build will track changes in `idf_component.yml` manifests and automatically triggers CMake when necessary.

There is an example application: `example:build_system/cmake/component_manager` that uses components installed by the component manager.

It's not necessary to have a manifest for components that don't need any managed dependencies.

When CMake configures the project (e.g. `idf.py reconfigure`) component manager does a few things:

- Processes `idf_component.yml` manifests for every component in the project and recursively solves dependencies
- Creates a `dependencies.lock` file in the root of the project with a full list of dependencies
- Downloads all dependencies to the `managed_components` directory

The lock-file `dependencies.lock` and content of `managed_components` directory is not supposed to be modified by a user. When the component manager runs it always make sure they are up to date. If these files were accidentally modified it's possible to re-run the component manager by triggering CMake with `idf.py reconfigure`

#### Defining dependencies in the manifest

```
dependencies:
  # Required IDF version
  idf: ">=4.1"
  # Defining a dependency from the registry:
  # https://components.espressif.com/component/example/cmp
  example/cmp: ">=1.0.0"

  # # Other ways to define dependencies
  #
  # # For components maintained by Espressif only name can be used.
  # # Same as `espressif/cmp`
  # component: "~1.0.0"
  #
  # # Or in a longer form with extra parameters
  # component2:
```

(下页继续)

```
# version: ">=2.0.0"
#
# # For transient dependencies `public` flag can be set.
# # `public` flag doesn't affect the `main` component.
# # All dependencies of `main` are public by default.
# public: true
#
# # For components hosted on non-default registry:
# service_url: "https://componentregistry.company.com"
#
# # For components in git repository:
# test_component:
#   path: test_component
#   git: ssh://git@gitlab.com/user/components.git
#
# # For test projects during component development
# # components can be used from a local directory
# # with relative or absolute path
# some_local_component:
#   path: ../../projects/component
```

### Disabling the Component Manager

The component manager can be explicitly disabled by setting `IDF_COMPONENT_MANAGER` environment variable to 0.

### 4.30.5 IDF Clang Tidy

The IDF Clang Tidy is a tool that uses [clang-tidy](#) to run static analysis on your current app.

**警告:** This functionality and the toolchain it relies on are still under development. There may be breaking changes before a final release.

### Prerequisites

If you have never run this tool before, take the following steps to get this tool prepared.

1. Run the export scripts (`export.sh / export.bat / ...`) to set up the environment variables.
2. Run `pip install --upgrade pyclang` to install this plugin. The extra commands would be activated in `idf.py` automatically.
3. Run `idf_tools.py install xtensa-clang` to install the clang-tidy required binaries

---

**备注:** This toolchain is still under development. After the final release, you don't have to install them manually.

---

4. Get file from the [llvm repository](#) and add the folder of this script to the `$PATH`. Or you could pass an optional argument `--run-clang-tidy-py` later when you call `idf.py clang-check`.

---

**备注:** This file would be bundled in future toolchain releases. This is a temporary workaround.

---

5. Run the export scripts (`export.sh / export.bat / ...`) again to refresh the environment variables.

## Extra Commands

**clang-check** Run `idf.py clang-check` to re-generate the compilation database and run `clang-tidy` under your current project folder. The output would be written to `<project_dir>/warnings.txt`.

Run `idf.py clang-check --help` to see the full documentation.

## clang-html-report

1. Run `pip install codereport` to install the additional dependency.
2. Run `idf.py clang-html-report` to generate an HTML report in folder `<project_dir>/html_report` according to the `warnings.txt`. Please open the `<project_dir>/html_report/index.html` in your browser to check the report.

## Bug Report

This tool is hosted in [espressif/clang-tidy-runner](#). If you faced any bugs or have any feature request, please report them via [github issues](#).

## 4.31 ULP 协处理器编程

ULP (Ultra Low Power, 超低功耗) 协处理器是一种简单的有限状态机 (FSM), 可以在主处理器处于深度睡眠模式时, 使用 ADC、温度传感器和外部 I2C 传感器执行测量操作。ULP 协处理器可以访问 `RTC_SLOW_MEM` 内存区域及 `RTC_CNTL`、`RTC_IO`、`SARADC` 外设中的寄存器。ULP 协处理器使用 32 位固定宽度的指令, 32 位内存寻址, 配备 4 个 16 位通用寄存器。在 ESP-IDF 项目中, 此协处理器被称作 *ULP FSM*。

ESP32-S3 基于 RISC-V 指令集架构提供另一种 ULP 协处理器。关于 *ULP RISC-V* 的详细信息, 请参考 [ULP-RISC-V Coprocessor](#)。

### 4.31.1 安装工具链

ULP FSM 协处理器代码由汇编语言编写, 使用 [binutils-esp32ulp 工具链](#) 进行编译。

如果您已经按照[快速入门指南](#)中的介绍安装好了 ESP-IDF 及其 CMake 构建系统, 那么 ULP 工具链已经被默认安装到了您的开发环境中。

### 4.31.2 编写 ULP FSM

使用受支持的指令集即可编写 ULP FSM 协处理器, 此外也可使用主处理器上的 C 语言宏进行编程。以下小节分别介绍了这两种方法:

#### ESP32-S3 ULP coprocessor instruction set

This document provides details about the instructions used by ESP32-S3 ULP FSM coprocessor assembler.

ULP FSM coprocessor has 4 16-bit general purpose registers, labeled R0, R1, R2, R3. It also has an 8-bit counter register (`stage_cnt`) which can be used to implement loops. Stage count register is accessed using special instructions.

ULP coprocessor can access 8k bytes of `RTC_SLOW_MEM` memory region. Memory is addressed in 32-bit word units. It can also access peripheral registers in `RTC_CNTL`, `RTC_IO`, and `SENS` peripherals.

All instructions are 32-bit. Jump instructions, ALU instructions, peripheral register and memory access instructions are executed in 1 cycle. Instructions which work with peripherals (TSENS, ADC, I2C) take variable number of cycles, depending on peripheral operation.

The instruction syntax is case insensitive. Upper and lower case letters can be used and intermixed arbitrarily. This is true both for register names and instruction names.

**Note about addressing** ESP32-S3 ULP FSM coprocessor's JUMP, ST, LD family of instructions expect the address argument to be expressed in the following way depending on the type of address argument used:

- When the address argument is presented as a label then the instruction expects the address to be expressed as 32-bit words.

Consider the following example program:

```
entry:
    NOP
    NOP
    NOP
    NOP
loop:
    MOVE R1, loop
    JUMP R1
```

When this program is assembled and linked, address of label `loop` will be equal to 16 (expressed in bytes). However *JUMP* instruction expects the address stored in register R1 to be expressed in 32-bit words. To account for this common use case, the assembler will convert the address of label `loop` from bytes to words, when generating the MOVE instruction. Hence, the code generated code will be equivalent to:

```
0000    NOP
0004    NOP
0008    NOP
000c    NOP
0010    MOVE R1, 4
0014    JUMP R1
```

- The other case is when the argument of MOVE instruction is not a label but a constant. In this case assembler will **use the value as is**, without any conversion:

```
.set      val, 0x10
MOVE     R1, val
```

In this case, value loaded into R1 will be 0x10.

However, when an immediate value is used as an offset in LD and ST instructions, the assembler considers the address argument in bytes and converts it to 32-bit words before executing the instruction:

```
ST R1, R2, 4          // offset = 4 bytes; Mem[R2 + 4 / 4] = R1
```

In this case, the value in R1 is stored at the memory location pointed by  $[R2 + \text{offset} / 4]$

Consider the following code:

```
.global array
array: .long 0
       .long 0
       .long 0
       .long 0

MOVE R1, array
MOVE R2, 0x1234
ST R2, R1, 0      // write value of R2 into the first array element,
                  // i.e. array[0]

ST R2, R1, 4      // write value of R2 into the second array element
                  // (4 byte offset), i.e. array[1]
```

(下页继续)

```

ADD R1, R1, 2    // this increments address by 2 words (8 bytes)
ST R2, R1, 0    // write value of R2 into the third array element,
                // i.e. array[2]

```

**Note about instruction execution time** ULP coprocessor is clocked from RTC\_FAST\_CLK, which is normally derived from the internal 8MHz oscillator. Applications which need to know exact ULP clock frequency can calibrate it against the main XTAL clock:

```

#include "soc/rtc.h"

// calibrate 8M/256 clock against XTAL, get 8M/256 clock period
uint32_t rtc_8md256_period = rtc_clk_cal(RTC_CAL_8MD256, 100);
uint32_t rtc_fast_freq_hz = 1000000ULL * (1 << RTC_CLK_CAL_FRACT) * 256 / rtc_
↪8md256_period;

```

ULP coprocessor needs certain number of clock cycles to fetch each instruction, plus certain number of cycles to execute it, depending on the instruction. See description of each instruction below for details on the execution time.

Instruction fetch time is:

- 2 clock cycles —for instructions following ALU and branch instructions.
- 4 clock cycles —in other cases.

Note that when accessing RTC memories and RTC registers, ULP coprocessor has lower priority than the main CPUs. This means that ULP coprocessor execution may be suspended while the main CPUs access same memory region as the ULP.

The detailed description of all instructions is presented below:

**Difference between ESP32 ULP and ESP32-S3 ULP Instruction sets** Compared to the ESP32 ULP FSM coprocessor, the ESP32-S3 ULP FSM coprocessor has an extended instruction set. The ESP32-S3 ULP FSM is not binary compatible with ESP32 ULP FSM, but a ESP32 ULP FSM assembled program is expected to work on the ESP32-S3 ULP FSM after rebuilding. The list of the new instructions that was added to the ESP32-S3 ULP FSM is: LDL, LDH, STL, STH, ST32, STO, STI, STI32.

## NOP - no operation

**Syntax** NOP

**Operands** None

**Cycles** 2 cycle to execute, 4 cycles to fetch next instruction

**Description** No operation is performed. Only the PC is incremented.

**Example:**

```
1:    NOP
```

## ADD - Add to register

**Syntax** ADD *Rdst*, *Rsrc1*, *Rsrc2*

ADD *Rdst*, *Rsrc1*, *imm*

**Operands**

- *Rdst* - Register R[0..3]
- *Rsrc1* - Register R[0..3]
- *Rsrc2* - Register R[0..3]
- *Imm* - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction adds source register to another source register or to a 16-bit signed value and stores the result in the destination register.

**Examples:**

```

1:   ADD R1, R2, R3           // R1 = R2 + R3
2:   Add R1, R2, 0x1234      // R1 = R2 + 0x1234
3:   .set value1, 0x03       // constant value1=0x03
    Add R1, R2, value1       // R1 = R2 + value1
4:   .global label           // declaration of variable label
    add R1, R2, label        // R1 = R2 + label
    ...
    label: nop               // definition of variable label

```

### SUB - Subtract from register

**Syntax** SUB *Rdst*, *Rsrc1*, *Rsrc2*

SUB *Rdst*, *Rsrc1*, *imm*

**Operands**

- *Rdst* - Register R[0..3]
- *Rsrc1* - Register R[0..3]
- *Rsrc2* - Register R[0..3]
- *Imm* - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction subtracts the source register from another source register or subtracts a 16-bit signed value from a source register, and stores the result to the destination register.

**Examples:**

```

1:   SUB R1, R2, R3           // R1 = R2 - R3
2:   sub R1, R2, 0x1234      // R1 = R2 - 0x1234
3:   .set value1, 0x03       // constant value1=0x03
    SUB R1, R2, value1       // R1 = R2 - value1
4:   .global label           // declaration of variable label
    SUB R1, R2, label        // R1 = R2 - label
    ...
    label: nop               // definition of variable label

```

### AND - Logical AND of two operands

**Syntax** AND *Rdst*, *Rsrc1*, *Rsrc2*

AND *Rdst*, *Rsrc1*, *imm*

**Operands**

- *Rdst* - Register R[0..3]
- *Rsrc1* - Register R[0..3]
- *Rsrc2* - Register R[0..3]
- *Imm* - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction does a logical AND of a source register and another source register or a 16-bit signed value and stores the result to the destination register.

**Examples:**

```

1:   AND R1, R2, R3           // R1 = R2 & R3

```

(下页继续)

```

2:      AND R1, R2, 0x1234      // R1 = R2 & 0x1234
3:      .set value1, 0x03      // constant value1=0x03
      AND R1, R2, value1      // R1 = R2 & value1
4:      .global label         // declaration of variable label
      AND R1, R2, label       // R1 = R2 & label
      ...
label:  nop                    // definition of variable label

```

### OR - Logical OR of two operands

**Syntax** `OR Rdst, Rsrc1, Rsrc2`

`OR Rdst, Rsrc1, imm`

#### Operands

- *Rdst* - Register R[0..3]
- *Rsrc1* - Register R[0..3]
- *Rsrc2* - Register R[0..3]
- *Imm* - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction does a logical OR of a source register and another source register or a 16-bit signed value and stores the result to the destination register.

#### Examples:

```

1:      OR R1, R2, R3          // R1 = R2 || R3
2:      OR R1, R2, 0x1234     // R1 = R2 || 0x1234
3:      .set value1, 0x03     // constant value1=0x03
      OR R1, R2, value1      // R1 = R2 || value1
4:      .global label         // declaration of variable label
      OR R1, R2, label       // R1 = R2 || label
      ...
label:  nop                    // definition of variable label

```

### LSH - Logical Shift Left

**Syntax** `LSH Rdst, Rsrc1, Rsrc2`

`LSH Rdst, Rsrc1, imm`

#### Operands

- *Rdst* - Register R[0..3]
- *Rsrc1* - Register R[0..3]
- *Rsrc2* - Register R[0..3]
- *Imm* - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction does a logical shift to left of the source register by the number of bits from another source register or a 16-bit signed value and stores the result to the destination register.

---

**备注:** Shift operations which are greater than 15 bits will have an undefined result.

---

#### Examples:

```

1:      LSH R1, R2, R3        // R1 = R2 << R3

```

```

2:      LSH R1, R2, 0x03          // R1 = R2 << 0x03
3:      .set value1, 0x03        // constant value1=0x03
      LSH R1, R2, value1        // R1 = R2 << value1
4:      .global label           // declaration of variable label
      LSH R1, R2, label        // R1 = R2 << label
      ...
label:  nop                    // definition of variable label

```

**RSH - Logical Shift Right****Syntax** RSH *Rdst, Rsrc1, Rsrc2*RSH *Rdst, Rsrc1, imm***Operands** *Rdst* - Register R[0..3] *Rsrc1* - Register R[0..3] *Rsrc2* - Register R[0..3] *Imm* - 16-bit signed value**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction**Description** The instruction does a logical shift to right of a source register by the number of bits from another source register or a 16-bit signed value and stores the result to the destination register.**备注:** Shift operations which are greater than 15 bits will have an undefined result.**Examples:**

```

1:      RSH R1, R2, R3           // R1 = R2 >> R3
2:      RSH R1, R2, 0x03        // R1 = R2 >> 0x03
3:      .set value1, 0x03       // constant value1=0x03
      RSH R1, R2, value1       // R1 = R2 >> value1
4:      .global label          // declaration of variable label
      RSH R1, R2, label        // R1 = R2 >> label
label:  nop                    // definition of variable label

```

**MOVE –Move to register****Syntax** MOVE *Rdst, Rsrc*MOVE *Rdst, imm***Operands**

- *Rdst* –Register R[0..3]
- *Rsrc* –Register R[0..3]
- *Imm* –16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction**Description** The instruction moves the value from the source register or a 16-bit signed value to the destination register.**备注:** Note that when a label is used as an immediate, the address of the label will be converted from bytes to words. This is because LD, ST, and JUMP instructions expect the address register value to be expressed in words rather than bytes. See the section *Note about addressing* for more details.**Examples:**

```

1:      MOVE      R1, R2          // R1 = R2
2:      MOVE      R1, 0x03       // R1 = 0x03

```

(下页继续)

```

3:      .set      value1, 0x03      // constant value1=0x03
      MOVE      R1, value1        // R1 = value1

4:      .global   label            // declaration of label
      MOVE      R1, label         // R1 = address_of(label) / 4
      ...
label:  nop                       // definition of label

```

### ST –Store data to the memory

**Syntax** ST *Rsrc, Rdst, offset*

#### Operands

- *Rsrc* –Register R[0..3], holds the 16-bit value to store
- *Rdst* –Register R[0..3], address of the destination, in 32-bit words
- *Offset* –13-bit signed value, offset in bytes

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction stores the 16-bit value of *Rsrc* to the lower half-word of memory with address *Rdst*+*offset*. The upper half-word is written with the current program counter (PC) (expressed in words, shifted left by 5 bits) OR' d with *Rdst* (0..3):

```
Mem[Rdst + offset / 4]{31:0} = {PC[10:0], 3'b0, Rdst, Rsrc[15:0]}
```

The application can use the higher 16 bits to determine which instruction in the ULP program has written any particular word into memory.

**备注:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section [Note about addressing](#) for more details.

#### Examples:

```

1:      ST   R1, R2, 0x12      // MEM[R2 + 0x12 / 4] = R1

2:      .data                // Data section definition
Addr1:  .word   123          // Define label Addr1 16 bit
      .set     offs, 0x00    // Define constant offs
      .text                // Text section definition
      MOVE    R1, 1         // R1 = 1
      MOVE    R2, Addr1     // R2 = Addr1
      ST      R1, R2, offs  // MEM[R2 + 0 / 4] = R1
                          // MEM[Addr1 + 0] will be 32'h600001

```

### STL –Store data to the lower 16 bits of 32-bit memory

**Syntax** STL *Rsrc, Rdst, offset, Label*

#### Operands

- *Rsrc* –Register R[0..3], holds the 16-bit value to store
- *Rdst* –Register R[0..3], address of the destination, in 32-bit words
- *Offset* –11-bit signed value, offset in bytes
- *Label* –2-bit user defined unsigned value

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction stores the 16-bit value of *Rsrc* to the lower half-word of the memory with address [*Rdst* + *offset* / 4]:

```
Mem[Rdst + offset / 4]{15:0} = {Rsrc[15:0]}
Mem[Rdst + offset / 4]{15:0} = {Label[1:0], Rsrc[13:0]}
```

The ST and the STL commands can be used interchangeably and have been provided to maintain backward compatibility with previous versions of the ULP core.

**备注:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section [Note about addressing](#) for more details.

#### Examples:

```

1:      STL  R1, R2, 0x12          // MEM[R2 + 0x12 / 4] = R1

2:      .data                    // Data section definition
Addr1:  .word    123              // Define label Addr1 16 bit
        .set     offs, 0x00      // Define constant offs
        .text    // Text section definition
        MOVE    R1, 1            // R1 = 1
        MOVE    R2, Addr1        // R2 = Addr1
        STL     R1, R2, offs     // MEM[R2 + 0 / 4] = R1
                                           // MEM[Addr1 + 0] will be 32'hxxxx0001

3:      MOVE    R1, 1            // R1 = 1
        STL     R1, R2, 0x12, 1 // MEM[R2 + 0x12 / 4] = 0xxxxx4001

```

### STH –Store data to the higher 16 bits of 32-bit memory

**Syntax** `STH Rsrc, Rdst, offset, Label`

#### Operands

- *Rsrc* –Register R[0..3], holds the 16-bit value to store
- *Rdst* –Register R[0..3], address of the destination, in 32-bit words
- *Offset* –11-bit signed value, offset in bytes
- *Label* –2-bit user defined unsigned value

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction stores the 16-bit value of *Rsrc* to the upper half-word of memory with address  $[Rdst + offset / 4]$ :

```

Mem[Rdst + offset / 4]{31:16} = {Rsrc[15:0]}
Mem[Rdst + offset / 4]{31:16} = {Label[1:0],Rsrc[13:0]}

```

**备注:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section [Note about addressing](#) for more details.

#### Examples:

```

1:      STH  R1, R2, 0x12          // MEM[R2 + 0x12 / 4][31:16] = R1

2:      .data                    // Data section definition
Addr1:  .word    123              // Define label Addr1 16 bit
        .set     offs, 0x00      // Define constant offs
        .text    // Text section definition
        MOVE    R1, 1            // R1 = 1
        MOVE    R2, Addr1        // R2 = Addr1
        STH     R1, R2, offs     // MEM[R2 + 0 / 4] = R1
                                           // MEM[Addr1 + 0] will be 32'h0001xxxx

3:      MOVE    R1, 1            // R1 = 1
        STH     R1, R2, 0x12, 1 // MEM[R2 + 0x12 / 4] 0x4001xxxx

```

### ST32 –Store 32-bits data to the 32-bits memory

**Syntax** ST32 *Rsrc, Rdst, offset, Label*

**Operands**

- *Rsrc* – Register R[0..3], holds the 16-bit value to store
- *Rdst* – Register R[0..3], address of the destination, in 32-bit words
- *Offset* – 11-bit signed value, offset in bytes
- *Label* – 2-bit user defined unsigned value

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction stores 11 bits of the PC value, label value and the 16-bit value of Rsrc to the 32-bit memory with address [Rdst + offset / 4]:

```
Mem[Rdst + offset / 4]{31:0} = {PC[10:0], 0[2:0], Label[1:0], Rsrc[15:0]}
```

**备注:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section [Note about addressing](#) for more details.

**Examples:**

```
1:          ST32  R1, R2, 0x12, 0          // MEM[R2 + 0x12 / 4][31:0] = {PC[10:0],
↪0[2:0], Label[1:0], Rsrc[15:0]}
```

```
2:          .data                          // Data section definition
Addr1:     .word    123                    // Define label Addr1 16 bit
           .set     offs, 0x00            // Define constant offs
           .text    // Text section definition
           MOVE     R1, 1                  // R1 = 1
           MOVE     R2, Addr1              // R2 = Addr1
           ST32     R1, R2, offs, 1        // MEM[R2 + 0] = {PC[10:0], 0[2:0],
↪Label[1:0], Rsrc[15:0]}
                                           // MEM[Addr1 + 0] will be 32'h00010001
```

**STO –Set offset value for auto increment operation**

**Syntax** STO *offset*

**Operands**

- *Offset* – 11-bit signed value, offset in bytes

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction sets the 16-bit value to the offset register:

```
offset = value / 4
```

**备注:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section [Note about addressing](#) for more details.

**Examples:**

```
1:          STO  0x12                      // Offset = 0x12 / 4
```

```
2:          .data                          // Data section definition
Addr1:     .word    123                    // Define label Addr1 16 bit
           .set     offs, 0x00            // Define constant offs
           .text    // Text section definition
           STO     offs                    // Offset = 0x00
```

**STI –Store data to the 32-bits memory with auto increment of predefined offset address**

**Syntax** STI *Rsrc, Rdst, Label*

**Operands**

- *Rsrc* –Register R[0..3], holds the 16-bit value to store
- *Rdst* –Register R[0..3], address of the destination, in 32-bit words
- *Label* –2-bit user defined unsigned value

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction stores the 16-bit value of *Rsrc* to the lower and upper half-word of memory with address  $[Rdst + offset / 4]$ . The offset value is auto incremented when the STI instruction is called twice. Make sure to execute the STO instruction to set the offset value before executing the STI instruction:

```
Mem[Rdst + offset / 4]{15:0/31:16} = {Rsrc[15:0]}
Mem[Rdst + offset / 4]{15:0/31:16} = {Label[1:0],Rsrc[13:0]}
```

**Examples:**

```
1:      STO    4                // Set offset to 4
        STI   R1, R2          // MEM[R2 + 4 / 4][15:0] = R1
        STI   R1, R2          // MEM[R2 + 4 / 4][31:16] = R1
                                // offset += (1 * 4) //offset is incremented by
↪1 word
        STI   R1, R2          // MEM[R2 + 8 / 4][15:0] = R1
        STI   R1, R2          // MEM[R2 + 8 / 4][31:16] = R1
```

**STI32 –Store 32-bits data to the 32-bits memory with auto increment of adress offset**

**Syntax** STI32 *Rsrc, Rdst, Label*

**Operands**

- *Rsrc* –Register R[0..3], holds the 16-bit value to store
- *Rdst* –Register R[0..3], address of the destination, in 32-bit words
- *Label* –2-bit user defined unsigned value

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction stores 11 bits of the PC value, label value and the 16-bit value of *Rsrc* to the 32-bit memory with address  $[Rdst + offset / 4]$ . The offset value is auto incremented each time the STI32 instruction is called. Make sure to execute the STO instruction to set the offset value before executing the STI32 instruction:

```
Mem[Rdst + offset / 4]{31:0} = {PC[10:0],0[2:0],Label[1:0],Rsrc[15:0]}
```

**Examples:**

```
1:      STO    0x12
        STI32  R1, R2, 0      // MEM[R2 + 0x12 / 4][31:0] = {PC[10:0],0[2:0],
↪Label[1:0],Rsrc[15:0]}
                                // offset += (1 * 4) //offset is incremented by 1
↪word
        STI32  R1, R2, 0      // MEM[R2 + 0x16 / 4][31:0] = {PC[10:0],0[2:0],
↪Label[1:0],Rsrc[15:0]}
```

**LD –Load data from the memory**

**Syntax** LD *Rdst, Rsrc, offset*

**Operands**

- *Rdst* –Register R[0..3], destination
- *Rsrc* –Register R[0..3], holds address of destination, in 32-bit words
- *Offset* –13-bit signed value, offset in bytes

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction loads the lower 16-bit half-word from memory with address  $[Rsrc + offset / 4]$  into the destination register *Rdst*:

```
Rdst[15:0] = Mem[Rsrc + offset / 4][15:0]
```

**备注:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section [Note about addressing](#) for more details.

**Examples:**

```

1:      LD   R1, R2, 0x12           // R1 = MEM[R2 + 0x12 / 4]

2:      .data                       // Data section definition
Addr1:  .word    123                // Define label Addr1 16 bit
        .set     offs, 0x00        // Define constant offs
        .text    // Text section definition
        MOVE    R1, 1              // R1 = 1
        MOVE    R2, Addr1         // R2 = Addr1 / 4 (address of label is_
↳converted into words)
        LD      R1, R2, offs      // R1 = MEM[R2 + 0]
                                       // R1 will be 123

```

**LDL –Load data from the lower half-word of the 32-bit memory**

**Syntax** `LDL Rdst, Rsrc, offset`

**Operands**

- *Rdst* –Register R[0..3], destination
- *Rsrc* –Register R[0..3], holds address of destination, in 32-bit words
- *Offset* –13-bit signed value, offset in bytes

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction loads the lower 16-bit half-word from memory with address  $[Rsrc + offset / 4]$  into the destination register *Rdst*:

$$Rdst[15:0] = Mem[Rsrc + offset / 4][15:0]$$

The LD and the LDL commands can be used interchangeably and have been provided to maintain backward compatibility with previous versions of the ULP core.

**备注:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section [Note about addressing](#) for more details.

**Examples:**

```

1:      LDL  R1, R2, 0x12           // R1 = MEM[R2 + 0x12 / 4]

2:      .data                       // Data section definition
Addr1:  .word    123                // Define label Addr1 16 bit
        .set     offs, 0x00        // Define constant offs
        .text    // Text section definition
        MOVE    R1, 1              // R1 = 1
        MOVE    R2, Addr1         // R2 = Addr1 / 4 (address of label is_
↳converted into words)
        LDL    R1, R2, offs      // R1 = MEM[R2 + 0]
                                       // R1 will be 123

```

**LDH –Load data from upper half-word of the 32-bit memory**

**Syntax** `LDH Rdst, Rsrc, offset`

**Operands**

- *Rdst* –Register R[0..3], destination
- *Rsrc* –Register R[0..3], holds address of destination, in 32-bit words
- *Offset* –13-bit signed value, offset in bytes

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction loads the upper 16-bit half-word from memory with address  $[Rsrc + offset / 4]$  into the destination register *Rdst*:

```
Rdst[15:0] = Mem[Rsrc + offset / 4][15:0]
```

**备注:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section [Note about addressing](#) for more details.

#### Examples:

```
1:      LDH   R1, R2, 0x12           // R1 = MEM[R2 + 0x12 / 4]

2:      .data                               // Data section definition
Addr1:  .word 0x12345678                // Define label Addr1 16 bit
        .set  offs, 0x00                // Define constant offs
        .text                               // Text section definition
        MOVE  R1, 1                       // R1 = 1
        MOVE  R2, Addr1                   // R2 = Addr1 / 4 (address of label is_
↳converted into words)
        LDH   R1, R2, offs                // R1 = MEM[R2 + 0]
                                           // R1 will be 0x1234
```

### JUMP –Jump to an absolute address

**Syntax** **JUMP** *Rdst*

**JUMP** *ImmAddr*

**JUMP** *Rdst, Condition*

**JUMP** *ImmAddr, Condition*

#### Operands

- *Rdst* –Register R[0..3] containing address to jump to (expressed in 32-bit words)
- *ImmAddr* –13 bits address (expressed in bytes), aligned to 4 bytes
- **Condition:**
  - EQ –jump if last ALU operation result was zero
  - OV –jump if last ALU has set overflow flag

**Cycles** 2 cycles to execute, 2 cycles to fetch next instruction

**Description** The instruction makes jump to the specified address. Jump can be either unconditional or based on an ALU flag.

#### Examples:

```
1:      JUMP   R1                       // Jump to address in R1 (address in R1 is in_
↳32-bit words)

2:      JUMP   0x120, EQ                 // Jump to address 0x120 (in bytes) if ALU_
↳result is zero

3:      JUMP   label                     // Jump to label
        ...
label:  nop                               // Definition of label

4:      .global label                   // Declaration of global label

        MOVE  R1, label                  // R1 = label (value loaded into R1 is in words)
        JUMP  R1                         // Jump to label
        ...
label:  nop                               // Definition of label
```

**JUMPR –Jump to a relative offset (condition based on R0)****Syntax** JUMPR *Step, Threshold, Condition***Operands**

- *Step* –relative shift from current position, in bytes
- *Threshold* –threshold value for branch condition
- **Condition:**
  - *EQ* (equal) –jump if value in R0 == threshold
  - *LT* (less than) –jump if value in R0 < threshold
  - *LE* (less or equal) –jump if value in R0 <= threshold
  - *GT* (greater than) –jump if value in R0 > threshold
  - *GE* (greater or equal) –jump if value in R0 >= threshold

**Cycles**Conditions *EQ*, *GT* and *LT*: 2 cycles to execute, 2 cycles to fetch next instructionConditions *LE* and *GE* are implemented in the assembler using two **JUMPR** instructions:

```
// JUMPR target, threshold, LE is implemented as:
    JUMPR target, threshold, EQ
    JUMPR target, threshold, LT

// JUMPR target, threshold, GE is implemented as:
    JUMPR target, threshold, EQ
    JUMPR target, threshold, GT
```

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of R0 register value and the threshold value.

**Examples:**

```
1:pos:    JUMPR    16, 20, GE    // Jump to address (position + 16 bytes) if
↳value in R0 >= 20

2:        // Down counting loop using R0 register
        MOVE     R0, 16        // load 16 into R0
label:    SUB     R0, R0, 1     // R0--
        NOP     // do something
        JUMPR   label, 1, GE  // jump to label if R0 >= 1
```

**JUMPS –Jump to a relative address (condition based on stage count)****Syntax** JUMPS *Step, Threshold, Condition***Operands**

- *Step* –relative shift from current position, in bytes
- *Threshold* –threshold value for branch condition
- **Condition:**
  - *EQ* (equal) –jump if value in stage\_cnt == threshold
  - *LT* (less than) –jump if value in stage\_cnt < threshold
  - *LE* (less or equal) –jump if value in stage\_cnt <= threshold
  - *GT* (greater than) –jump if value in stage\_cnt > threshold
  - *GE* (greater or equal) –jump if value in stage\_cnt >= threshold

**Cycles**

2 cycles to execute, 2 cycles to fetch next instruction

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of count register value and threshold value.

**Examples:**

```
1:pos:    JUMPS    16, 20, EQ    // Jump to (position + 16 bytes) if stage_cnt
↔== 20

2:        // Up counting loop using stage count register
          STAGE_RST           // set stage_cnt to 0
label:    STAGE_INC 1         // stage_cnt++
          NOP                 // do something
          JUMPS    label, 16, LT // jump to label if stage_cnt < 16
```

### STAGE\_RST –Reset stage count register

**Syntax** STAGE\_RST

**Operands** No operands

**Description** The instruction sets the stage count register to 0

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Examples:**

```
1:        STAGE_RST           // Reset stage count register
```

### STAGE\_INC –Increment stage count register

**Syntax** STAGE\_INC *Value*

**Operands**

- *Value* –8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction increments the stage count register by the given value.

**Examples:**

```
1:        STAGE_INC    10         // stage_cnt += 10

2:        // Up counting loop example:
          STAGE_RST           // set stage_cnt to 0
label:    STAGE_INC 1         // stage_cnt++
          NOP                 // do something
          JUMPS    label, 16, LT // jump to label if stage_cnt < 16
```

### STAGE\_DEC –Decrement stage count register

**Syntax** STAGE\_DEC *Value*

**Operands**

- *Value* –8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction decrements the stage count register by the given value.

**Examples:**

```
1:        STAGE_DEC    10         // stage_cnt -= 10;

2:        // Down counting loop example
          STAGE_RST           // set stage_cnt to 0
          STAGE_INC 16         // increment stage_cnt to 16
label:    STAGE_DEC 1         // stage_cnt--;
          NOP                 // do something
          JUMPS    label, 0, GT // jump to label if stage_cnt > 0
```

**HALT –End the program****Syntax** HALT**Operands** No operands**Cycles** 2 cycles to execute**Description** The instruction halts the ULP coprocessor and restarts the ULP wakeup timer, if it is enabled.**Examples:**

```
1:      HALT      // Halt the coprocessor
```

**WAKE –Wake up the chip****Syntax** WAKE**Operands** No operands**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction**Description** The instruction sends an interrupt from the ULP coprocessor to the RTC controller.

- If the SoC is in deep sleep mode, and ULP wakeup is enabled, this causes the SoC to wake up.
- If the SoC is not in deep sleep mode, and ULP interrupt bit (RTC\_CNTL\_ULP\_CP\_INT\_ENA) is set in RTC\_CNTL\_INT\_ENA\_REG register, RTC interrupt will be triggered.

Note that before using WAKE instruction, ULP program may needs to wait until RTC controller is ready to wake up the main CPU. This is indicated using RTC\_CNTL\_RDY\_FOR\_WAKEUP bit of RTC\_CNTL\_LOW\_POWER\_ST\_REG register. If WAKE instruction is executed while RTC\_CNTL\_RDY\_FOR\_WAKEUP is zero, it has no effect (wake up does not occur).

**Examples:**

```
1: is_rdy_for_wakeup:      // Read RTC_CNTL_RDY_FOR_WAKEUP bit
    READ_RTC_FIELD(RTC_CNTL_LOW_POWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
    AND r0, r0, 1
    JUMP is_rdy_for_wakeup, eq // Retry until the bit is set
    WAKE // Trigger wake up
    REG_WR 0x006, 24, 24, 0 // Stop ULP timer (clear RTC_CNTL_ULP_CP_
↪SLP_TIMER_EN)
    HALT // Stop the ULP program
    // After these instructions, SoC will wake up,
    // and ULP will not run again until started by the main program.
```

**WAIT –wait some number of cycles****Syntax** WAIT *Cycles***Operands**

- *Cycles* –number of cycles for wait

**Cycles** 2 + *Cycles* cycles to execute, 4 cycles to fetch next instruction**Description** The instruction delays for given number of cycles.**Examples:**

```
1:      WAIT      10      // Do nothing for 10 cycles

2:      .set wait_cnt, 10 // Set a constant
    WAIT wait_cnt // wait for 10 cycles
```

**TSENS –do measurement with temperature sensor****Syntax**

- **TSENS** *Rdst*, *Wait\_Delay*

**Operands**

- *Rdst* –Destination Register R[0..3], result will be stored to this register
- *Wait\_Delay* –number of cycles used to perform the measurement

**Cycles**  $2 + \text{Wait\_Delay} + 3 * \text{TSENS\_CLK}$  to execute, 4 cycles to fetch next instruction

**Description** The instruction performs measurement using TSENS and stores the result into a general purpose register.

**Examples:**

```
1:      TSENS      R1, 1000      // Measure temperature sensor for 1000 cycles,
                                     // and store result to R1
```

### ADC –do measurement with ADC

**Syntax**

- **ADC** *Rdst, Sar\_sel, Mux*
- **ADC** *Rdst, Sar\_sel, Mux, 0* —deprecated form

**Operands**

- *Rdst* –Destination Register R[0..3], result will be stored to this register
- *Sar\_sel* –Select ADC: 0 = SARADC1, 1 = SARADC2
- *Mux* - selected PAD, SARADC Pad[Mux-1] is enabled. If the user passes Mux value 1, then ADC pad 0 gets used.

**Cycles**  $23 + \max(1, \text{SAR\_AMP\_WAIT1}) + \max(1, \text{SAR\_AMP\_WAIT2}) + \max(1, \text{SAR\_AMP\_WAIT3}) + \text{SARx\_SAMPLE\_CYCLE} + \text{SARx\_SAMPLE\_BIT}$  cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction makes measurements from ADC.

**Examples:**

```
.. only:: esp32
```

```
1: ADC R1, 0, 1 // Measure value using ADC1 channel 0 and store result into R1
```

```
1: ADC R1, 0, 1 // Measure value using ADC1 pad 2 and store result into R1
```

### REG\_RD –read from peripheral register

**Syntax** **REG\_RD** *Addr, High, Low*

**Operands**

- *Addr* –Register address, in 32-bit words
- *High* –Register end bit number
- *Low* –Register start bit number

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction reads up to 16 bits from a peripheral register into a general purpose register:  $R0 = \text{REG}[\text{Addr}][\text{High}:\text{Low}]$ .

This instruction can access registers in RTC\_CNTL, RTC\_IO, SENS, and RTC\_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the PerIBUS1 as follows:

```
addr_ulp = (addr_peribus1 - DR_REG_RTC_CNTL_BASE) / 4
```

**Examples:**

```
1:      REG_RD      0x120, 7, 4      // load 4 bits: R0 = {12'b0, REG[0x120][7:4]}
```

### REG\_WR –write to peripheral register

**Syntax** **REG\_WR** *Addr, High, Low, Data*

**Operands**

- *Addr* –Register address, in 32-bit words.
- *High* –Register end bit number
- *Low* –Register start bit number

- *Data* –Value to write, 8 bits

**Cycles** 8 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction writes up to 8 bits from an immediate data value into a peripheral register:  
 $\text{REG}[\text{Addr}][\text{High}:\text{Low}] = \text{data}.$

This instruction can access registers in RTC\_CNTL, RTC\_IO, SENS, and RTC\_I2C peripherals. Address of the the register, as seen from the ULP, can be calculated from the address of the same register on the PeriBUS1 as follows:

```
addr_ulp = (addr_peribus1 - DR_REG_RTCCNTL_BASE) / 4
```

**Examples:**

```
1:      REG_WR      0x120, 7, 0, 0x10 // set 8 bits: REG[0x120][7:0] = 0x10
```

**Convenience macros for peripheral registers access** ULP source files are passed through C preprocessor before the assembler. This allows certain macros to be used to facilitate access to peripheral registers.

Some existing macros are defined in `soc/soc_ulp.h` header file. These macros allow access to the fields of peripheral registers by their names. Peripheral registers names which can be used with these macros are the ones defined in `soc/rtc_cntl_reg.h`, `soc/rtc_io_reg.h`, `soc/sens_reg.h`, and `soc/rtc_i2c_reg.h`.

**READ\_RTC\_REG(*rtc\_reg*, *low\_bit*, *bit\_width*)** Read up to 16 bits from `rtc_reg[low_bit + bit_width - 1 : low_bit]` into R0. For example:

```
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Read 16 lower bits of RTC_CNTL_TIME0_REG into R0 */
READ_RTC_REG(RTC_CNTL_TIME0_REG, 0, 16)
```

**READ\_RTC\_FIELD(*rtc\_reg*, *field*)** Read from a field in `rtc_reg` into R0, up to 16 bits. For example:

```
#include "soc/soc_ulp.h"
#include "soc/sens_reg.h"

/* Read 8-bit SENS_TSENS_OUT field of SENS_SAR_SLAVE_ADDR3_REG into R0 */
READ_RTC_FIELD(SENS_SAR_SLAVE_ADDR3_REG, SENS_TSENS_OUT)
```

**WRITE\_RTC\_REG(*rtc\_reg*, *low\_bit*, *bit\_width*, *value*)** Write immediate value into `rtc_reg[low_bit + bit_width - 1 : low_bit]`, `bit_width <= 8`. For example:

```
#include "soc/soc_ulp.h"
#include "soc/rtc_io_reg.h"

/* Set BIT(2) of RTC_GPIO_OUT_DATA_W1TS field in RTC_GPIO_OUT_W1TS_REG */
WRITE_RTC_REG(RTC_GPIO_OUT_W1TS_REG, RTC_GPIO_OUT_DATA_W1TS_S + 2, 1, 1)
```

**WRITE\_RTC\_FIELD(*rtc\_reg*, *field*, *value*)** Write immediate value into a field in `rtc_reg`, up to 8 bits. For example:

```
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Set RTC_CNTL_ULP_CP_SLP_TIMER_EN field of RTC_CNTL_STATE0_REG to 0 */
WRITE_RTC_FIELD(RTC_CNTL_STATE0_REG, RTC_CNTL_ULP_CP_SLP_TIMER_EN, 0)
```

### Programming ULP FSM coprocessor using C macros (legacy)

In addition to the existing binutils port for the ESP32-S3 ULP coprocessor, it is possible to generate programs for the ULP FSM coprocessor by embedding assembly-like macros into an ESP32-S3 application. Here is an example how this can be done:

```

const ulp_insn_t program[] = {
    I_MOVI(R3, 16),          // R3 <- 16
    I_LD(R0, R3, 0),        // R0 <- RTC_SLOW_MEM[R3 + 0]
    I_LD(R1, R3, 1),        // R1 <- RTC_SLOW_MEM[R3 + 1]
    I_ADDR(R2, R0, R1),     // R2 <- R0 + R1
    I_ST(R2, R3, 2),        // R2 -> RTC_SLOW_MEM[R2 + 2]
    I_HALT()
};
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);

```

The `program` array is an array of `ulp_insn_t`, i.e. ULP coprocessor instructions. Each `I_XXX` preprocessor define translates into a single 32-bit instruction. Arguments of these preprocessor defines can be register numbers (R0—R3) and literal constants. See the API reference section at the end of this guide for descriptions of instructions and arguments they take.

---

**备注:** Because some of the instruction macros expand to inline function calls, defining such array in global scope will cause the compiler to produce an “initializer element is not constant” error. To fix this error, move the definition of instructions array into local scope.

---

---

**备注:** Load, store and move instructions use **addresses expressed in 32-bit words**. Address 0 corresponds to the first word of `RTC_SLOW_MEM`. This is different to how address arguments are handled in assembly code of the same instructions. See the section [Note about addressing](#) for more details for reference.

---

To generate branch instructions, special `M_` preprocessor defines are used. `M_LABEL` define can be used to define a branch target. Label identifier is a 16-bit integer. `M_Bxxx` defines can be used to generate branch instructions with target set to a particular label.

Implementation note: these `M_` preprocessor defines will be translated into two `ulp_insn_t` values: one is a token value which contains label number, and the other is the actual instruction. `ulp_process_macros_and_load` function resolves the label number to the address, modifies the branch instruction to use the correct address, and removes the the extra `ulp_insn_t` token which contains the label number.

Here is an example of using labels and branches:

```

const ulp_insn_t program[] = {
    I_MOVI(R0, 34),          // R0 <- 34
    M_LABEL(1),             // label_1
    I_MOVI(R1, 32),          // R1 <- 32
    I_LD(R1, R1, 0),         // R1 <- RTC_SLOW_MEM[R1]
    I_MOVI(R2, 33),          // R2 <- 33
    I_LD(R2, R2, 0),         // R2 <- RTC_SLOW_MEM[R2]
    I_SUBR(R3, R1, R2),      // R3 <- R1 - R2
    I_ST(R3, R0, 0),         // R3 -> RTC_SLOW_MEM[R0 + 0]
    I_ADDI(R0, R0, 1),       // R0++
    M_BL(1, 64),            // if (R0 < 64) goto label_1
    I_HALT()
};
RTC_SLOW_MEM[32] = 42;
RTC_SLOW_MEM[33] = 18;
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);

```

## API Reference

## Header File

- [components/ulp/include/esp32s3/ulp.h](#)

## Functions

static inline uint32\_t **SOC\_REG\_TO\_ULP\_PERIPH\_SEL** (uint32\_t reg)

Map SoC peripheral register to periph\_sel field of RD\_REG and WR\_REG instructions.

**参数** **reg** – peripheral register in RTC\_CNTL\_, RTC\_IO\_, SENS\_, RTC\_I2C peripherals.

**返回** periph\_sel value for the peripheral to which this register belongs.

## Unions

union **ulp\_insn**

*#include <ulp.h>* Instruction format structure.

All ULP instructions are 32 bit long. This union contains field layouts used by all of the supported instructions. This union also includes a special “macro” instruction layout. This is not a real instruction which can be executed by the CPU. It acts as a token which is removed from the program by the `ulp_process_macros_and_load` function.

These structures are not intended to be used directly. Preprocessor definitions provided below fill the fields of these structure with the right arguments.

## Public Members

uint32\_t **cycles**

Number of cycles to sleep

TBD, cycles used for measurement

uint32\_t **unused**

Unused

uint32\_t **opcode**

Opcode (OPCODE\_DELAY)

Opcode (OPCODE\_ST)

Opcode (OPCODE\_LD)

Opcode (OPCODE\_HALT)

Opcode (OPCODE\_BRANCH)

Opcode (OPCODE\_ALU)

Opcode (OPCODE\_WR\_REG)

Opcode (OPCODE\_RD\_REG)

Opcode (OPCODE\_ADC)

Opcode (OPCODE\_TSENS)

Opcode (OPCODE\_I2C)

Opcode (OPCODE\_END)

Opcode (OPCODE\_MACRO)

struct *ulp\_insn*::[anonymous] **delay**

Format of DELAY instruction

uint32\_t **dreg**

Register which contains data to store

Register where the data should be loaded to

Register which contains target PC, expressed in words (used if .reg == 1)

Destination register

Register where to store ADC result

Register where to store temperature measurement result

uint32\_t **sreg**

Register which contains address in RTC memory (expressed in words)

Register with operand A

uint32\_t **label**

Data label, 2-bit user defined unsigned value

Label number

uint32\_t **upper**

0: write the low half-word; 1: write the high half-word

uint32\_t **wr\_way**

0: write the full-word; 1: with the label; 3: without the label

uint32\_t **unused1**

Unused

uint32\_t **offset**

Offset to add to sreg

Absolute value of target PC offset w.r.t. current PC, expressed in words

uint32\_t **unused2**

Unused

uint32\_t **sub\_opcode**

Sub opcode (SUB\_OPCODE\_ST)

Sub opcode (SUB\_OPCODE\_BX)

Sub opcode (SUB\_OPCODE\_B)

Sub opcode (SUB\_OPCODE\_ALU\_REG)

Sub opcode (SUB\_OPCODE\_ALU\_IMM)

Sub opcode (SUB\_OPCODE\_ALU\_CNT)

Sub opcode (SUB\_OPCODE\_WAKEUP)

SUB\_OPCODE\_MACRO\_LABEL or SUB\_OPCODE\_MACRO\_BRANCH

struct *ulp\_insn*::[anonymous] **st**

Format of ST instruction

uint32\_t **rd\_upper**

0: read the high half-word; 1: read the low half-word

struct *ulp\_insn*::[anonymous] **ld**

Format of LD instruction

struct *ulp\_insn*::[anonymous] **halt**

Format of HALT instruction

uint32\_t **addr**

Target PC, expressed in words (used if .reg == 0)

Address within either RTC\_CNTL, RTC\_IO, or SARADC

uint32\_t **reg**

Target PC in register (1) or immediate (0)

uint32\_t **type**

Jump condition (BX\_JUMP\_TYPE\_XXX)

struct *ulp\_insn*::[anonymous] **bx**

Format of BRANCH instruction (absolute address)

uint32\_t **imm**

Immediate value to compare against

Immediate value of operand B

Immediate value

uint32\_t **cmp**

Comparison to perform: B\_CMP\_L or B\_CMP\_GE

uint32\_t **sign**

Sign of target PC offset: 0: positive, 1: negative

struct *ulp\_insn*::[anonymous] **b**

Format of BRANCH instruction (relative address)

uint32\_t **treg**

Register with operand B

uint32\_t **sel**

Operation to perform, one of ALU\_SEL\_XXX

struct *ulp\_insn*::[anonymous] **alu\_reg**

Format of ALU instruction (both sources are registers)

struct *ulp\_insn*::[anonymous] **alu\_imm**

Format of ALU instruction (one source is an immediate)

uint32\_t **unused3**

Unused

struct *ulp\_insn*::[anonymous] **alu\_cnt**

Format of ALU instruction with stage count register and an immediate

uint32\_t **periph\_sel**

Select peripheral: RTC\_CNTL (0), RTC\_IO(1), SARADC(2)

uint32\_t **data**

8 bits of data to write

Data to read or write

uint32\_t **low**

Low bit

uint32\_t **high**

High bit

struct *ulp\_insn*::[anonymous] **wr\_reg**

Format of WR\_REG instruction

struct *ulp\_insn*::[anonymous] **rd\_reg**

Format of RD\_REG instruction

uint32\_t **mux**

Select SARADC pad (mux + 1)

uint32\_t **sar\_sel**

Select SARADC0 (0) or SARADC1 (1)

struct *ulp\_insn*::[anonymous] **adc**

Format of ADC instruction

uint32\_t **wait\_delay**

Cycles to wait after measurement is done

uint32\_t **reserved**

Reserved, set to 0

struct *ulp\_insn*::[anonymous] **tsens**

Format of TSENS instruction

uint32\_t **i2c\_addr**

I2C slave address

`uint32_t low_bits`

TBD

`uint32_t high_bits`

TBD

`uint32_t i2c_sel`

TBD, select `reg_i2c_slave_address[7:0]`

`uint32_t rw`

Write (1) or read (0)

struct `ulp_insn::[anonymous] i2c`

Format of I2C instruction

`uint32_t wakeup`

Set to 1 to wake up chip

struct `ulp_insn::[anonymous] end`

Format of END instruction with wakeup

struct `ulp_insn::[anonymous] macro`

Format of tokens used by LABEL and BRANCH macros

## Macros

**R0**

general purpose register 0

**R1**

general purpose register 1

**R2**

general purpose register 2

**R3**

general purpose register 3

**OPCODE\_WR\_REG**

Instruction: write peripheral register (RTC\_CNTL/RTC\_IO/SARADC) (not implemented yet)

**OPCODE\_RD\_REG**

Instruction: read peripheral register (RTC\_CNTL/RTC\_IO/SARADC) (not implemented yet)

**RD\_REG\_PERIPH\_RTC\_CNTL**

Identifier of RTC\_CNTL peripheral for RD\_REG and WR\_REG instructions

**RD\_REG\_PERIPH\_RTC\_IO**

Identifier of RTC\_IO peripheral for RD\_REG and WR\_REG instructions

**RD\_REG\_PERIPH\_SENS**

Identifier of SARADC peripheral for RD\_REG and WR\_REG instructions

**RD\_REG\_PERIPH\_RTC\_I2C**

Identifier of RTC\_I2C peripheral for RD\_REG and WR\_REG instructions

**OPCODE\_I2C**

Instruction: read/write I2C (not implemented yet)

**OPCODE\_DELAY**

Instruction: delay (nop) for a given number of cycles

**OPCODE\_ADC**

Instruction: SAR ADC measurement (not implemented yet)

**OPCODE\_ST**

Instruction: store indirect to RTC memory

**SUB\_OPCODE\_ST\_AUTO**

Automatic Storage Mode - Access continuous addresses. Use SUB\_OPCODE\_ST\_OFFSET to configure the initial address before using this instruction.

**SUB\_OPCODE\_ST\_OFFSET**

Automatic Storage Mode - Configure the initial address.

**SUB\_OPCODE\_ST**

Manual Storage Mode. Store 32 bits, 16 MSBs contain PC, 16 LSBs contain value from source register

**OPCODE\_ALU**

Arithmetic instructions

**SUB\_OPCODE\_ALU\_REG**

Arithmetic instruction, both source values are in register

**SUB\_OPCODE\_ALU\_IMM**

Arithmetic instruction, one source value is an immediate

**SUB\_OPCODE\_ALU\_CNT**

Arithmetic instruction between counter register and an immediate (not implemented yet)

**ALU\_SEL\_ADD**

Addition

**ALU\_SEL\_SUB**

Subtraction

**ALU\_SEL\_AND**

Logical AND

**ALU\_SEL\_OR**

Logical OR

**ALU\_SEL\_MOV**

Copy value (immediate to destination register or source register to destination register)

**ALU\_SEL\_LSH**

Shift left by given number of bits

**ALU\_SEL\_RSH**

Shift right by given number of bits

**ALU\_SEL\_STAGE\_INC**

Increment stage count register

**ALU\_SEL\_STAGE\_DEC**

Decrement stage count register

**ALU\_SEL\_STAGE\_RST**

Reset stage count register

**OPCODE\_BRANCH**

Branch instructions

**SUB\_OPCODE\_B**

Branch to a relative offset

**SUB\_OPCODE\_BX**

Branch to absolute PC (immediate or in register)

**SUB\_OPCODE\_BS**

Branch to a relative offset by comparing the stage\_cnt register

**BX\_JUMP\_TYPE\_DIRECT**

Unconditional jump

**BX\_JUMP\_TYPE\_ZERO**

Branch if last ALU result is zero

**BX\_JUMP\_TYPE\_OVF**

Branch if last ALU operation caused and overflow

**B\_CMP\_L**

Branch if R0 is less than an immediate

**B\_CMP\_G**

Branch if R0 is greater than an immediate

**B\_CMP\_E**

Branch if R0 is equal to an immediate

**BS\_CMP\_L**

Branch if stage\_cnt is less than an immediate

**BS\_CMP\_GE**

Branch if stage\_cnt is greater than or equal to an immediate

**BS\_CMP\_LE**

Branch if stage\_cnt is less than or equal to an immediate

**OPCODE\_END**

Stop executing the program

**SUB\_OPCODE\_END**

Stop executing the program and optionally wake up the chip

**SUB\_OPCODE\_SLEEP**

Stop executing the program and run it again after selected interval

**OPCODE\_TSENS**

Instruction: temperature sensor measurement (not implemented yet)

**OPCODE\_HALT**

Halt the coprocessor

**OPCODE\_LD**

Indirect load lower 16 bits from RTC memory

**OPCODE\_MACRO**

Not a real opcode. Used to identify labels and branches in the program

**SUB\_OPCODE\_MACRO\_LABEL**

Label macro

**SUB\_OPCODE\_MACRO\_BRANCH**

Branch macro

**SUB\_OPCODE\_MACRO\_LABELPC**

Label pointer macro

**I\_DELAY** (cycles\_)

Delay (nop) for a given number of cycles

**I\_HALT** ()

Halt the coprocessor.

This instruction halts the coprocessor, but keeps ULP timer active. As such, ULP program will be restarted again by timer. To stop the program and prevent the timer from restarting the program, use I\_END(0) instruction.

**I\_WR\_REG** (reg, low\_bit, high\_bit, val)

Write literal value to a peripheral register

reg[high\_bit : low\_bit] = val This instruction can access RTC\_CNTL\_, RTC\_IO\_, SENS\_, and RTC\_I2C peripheral registers.

**I\_RD\_REG** (reg, low\_bit, high\_bit)

Read from peripheral register into R0

R0 = reg[high\_bit : low\_bit] This instruction can access RTC\_CNTL\_, RTC\_IO\_, SENS\_, and RTC\_I2C peripheral registers.

**I\_WR\_REG\_BIT** (reg, shift, val)

Set or clear a bit in the peripheral register.

Sets bit (1 << shift) of register reg to value val. This instruction can access RTC\_CNTL\_, RTC\_IO\_, SENS\_, and RTC\_I2C peripheral registers.

**I\_WAKE** ()

Wake the SoC from deep sleep.

This instruction initiates wake up from deep sleep. Use esp\_deep\_sleep\_enable\_ulp\_wakeup to enable deep sleep wakeup triggered by the ULP before going into deep sleep. Note that ULP program will still keep running until the I\_HALT instruction, and it will still be restarted by timer at regular intervals, even when the SoC is woken up.

To stop the ULP program, use I\_HALT instruction.

To disable the timer which start ULP program, use I\_END() instruction. I\_END instruction clears the RTC\_CNTL\_ULP\_CP\_SLP\_TIMER\_EN\_S bit of RTC\_CNTL\_ULP\_CP\_TIMER\_REG register, which controls the ULP timer.

**I\_END** ()

Stop ULP program timer.

This is a convenience macro which disables the ULP program timer. Once this instruction is used, ULP program will not be restarted anymore until ulp\_run function is called.

ULP program will continue running after this instruction. To stop the currently running program, use I\_HALT().

**I\_TSENS** (reg\_dest, delay)

Perform temperature sensor measurement and store it into reg\_dest.

Delay can be set between 1 and ((1 << 14) - 1). Higher values give higher measurement resolution.

**I\_ADC** (reg\_dest, adc\_idx, pad\_idx)

Perform ADC measurement and store result in reg\_dest.

adc\_idx selects ADC (0 or 1). pad\_idx selects ADC pad (0 - 7).

**I\_ST\_MANUAL** (reg\_val, reg\_addr, offset\_, label\_, upper\_, wr\_way\_)

Store lower half-word, upper half-word or full-word data from register reg\_val into RTC memory address.

This instruction can be used to write data to discontinuous addresses in the RTC\_SLOW\_MEM. The value is written to an offset calculated by adding the value of reg\_addr register and offset\_field (this offset is expressed in 32-bit words). The storage method is dictated by the wr\_way and upper field settings as summarized in the following table:

(下页继续)

**I\_STO** (offset\_)

Set the initial address offset for auto-store operation

This instruction sets the initial address of the RTC\_SLOW\_MEM to be used by the auto-store operation. The offset is incremented automatically. Refer I\_ST\_AUTO() for detailed explanation.

SUB\_OPCODE\_ST\_OFFSET = manual\_en:0, offset\_set:1, wr\_auto:1

**I\_STI** (reg\_val, reg\_addr)

Store value from register reg\_val to 32 bit word of the RTC memory address.

This instruction is equivalent to calling I\_ST\_AUTO() instruction with label = 0 and wr\_way = 3. The data in reg\_val will be either written to the lower half-word or the upper half-word of the RTC memory address depending on the count of the number of times the I\_STI() instruction is called. The initial offset is automatically incremented with I\_STI() is called twice. Refer I\_ST\_AUTO() for detailed explanation.

**I\_STI\_LABEL** (reg\_val, reg\_addr, label\_)

Store value from register reg\_val with label to 32 bit word of the RTC memory address.

This instruction is equivalent to calling I\_ST\_AUTO() instruction with label = label\_ and wr\_way = 1. The data in reg\_val will be either written to the lower half-word or the upper half-word of the RTC memory address depending on the count of the number of times the I\_STI\_LABEL() instruction is called. The initial offset is automatically incremented with I\_STI\_LABEL() is called twice. Refer I\_ST\_AUTO() for detailed explanation.

**I\_STI32** (reg\_val, reg\_addr, label\_)

Store value from register reg\_val to full 32 bit word of the RTC memory address.

This instruction is equivalent to calling I\_ST\_AUTO() instruction with label = label\_ and wr\_way = 0. The data in reg\_val will be written to the RTC memory address along with the label and the PC. The initial offset is automatically incremented each time the I\_STI32() instruction is called. Refer I\_ST\_AUTO() for detailed explanation.

**I\_LD\_MANUAL** (reg\_dest, reg\_addr, offset\_, rd\_upper\_)

Load lower half-word, upper half-word or full-word data from RTC memory address into the register reg\_dest.

This instruction reads the lower half-word or upper half-word of the RTC memory address depending on the value of rd\_upper\_. The following table summarizes the loading method:

|   |  |  |   |
|---|--|--|---|
| *  ----- ----- -----  |  |  |   |
| ↪-----  |  |  |   |
| *   rd_upper   data   |  |  | ↪ |

| *   |  |  |   |

**I\_LD** (reg\_dest, reg\_addr, offset\_)

Load lower 16 bits value from RTC memory into reg\_dest register.

Loads 16 LSBs (`rd_upper = 1`) from RTC memory word given by the sum of value in `reg_addr` and value of `offset_`. `I_LD()` instruction provides backward compatibility for code written for esp32 to be run on esp32s2.

**I\_LDL** (`reg_dest`, `reg_addr`, `offset_`)

Load lower 16 bits value from RTC memory into `reg_dest` register.

`I_LDL()` instruction and `I_LD()` instruction can be used interchangeably.

**I\_LDH** (`reg_dest`, `reg_addr`, `offset_`)

Load upper 16 bits value from RTC memory into `reg_dest` register.

Loads 16 MSBs (`rd_upper = 0`) from RTC memory word given by the sum of value in `reg_addr` and value of `offset_`.

**I\_BL** (`pc_offset`, `imm_value`)

Branch relative if R0 register less than the immediate value.

`pc_offset` is expressed in words, and can be from -127 to 127 `imm_value` is a 16-bit value to compare R0 against

**I\_BG** (`pc_offset`, `imm_value`)

Branch relative if R0 register greater than the immediate value.

`pc_offset` is expressed in words, and can be from -127 to 127 `imm_value` is a 16-bit value to compare R0 against

**I\_BE** (`pc_offset`, `imm_value`)

Branch relative if R0 register is equal to the immediate value.

`pc_offset` is expressed in words, and can be from -127 to 127 `imm_value` is a 16-bit value to compare R0 against

**I\_BXR** (`reg_pc`)

Unconditional branch to absolute PC, address in register.

`reg_pc` is the register which contains address to jump to. Address is expressed in 32-bit words.

**I\_BXI** (`imm_pc`)

Unconditional branch to absolute PC, immediate address.

Address `imm_pc` is expressed in 32-bit words.

**I\_BXZR** (`reg_pc`)

Branch to absolute PC if ALU result is zero, address in register.

`reg_pc` is the register which contains address to jump to. Address is expressed in 32-bit words.

**I\_BXZI** (`imm_pc`)

Branch to absolute PC if ALU result is zero, immediate address.

Address `imm_pc` is expressed in 32-bit words.

**I\_BXFR** (`reg_pc`)

Branch to absolute PC if ALU overflow, address in register

`reg_pc` is the register which contains address to jump to. Address is expressed in 32-bit words.

**I\_BXFI** (`imm_pc`)

Branch to absolute PC if ALU overflow, immediate address

Address `imm_pc` is expressed in 32-bit words.

**I\_BSLE** (`pc_offset`, `imm_value`)

Branch relative if `stage_cnt` is less than or equal to the immediate value.

`pc_offset` is expressed in words, and can be from -127 to 127 `imm_value` is a 16-bit value to compare R0 against

**I\_BSGE** (pc\_offset, imm\_value)

Branch relative if stage\_cnt register is greater than or equal to the immediate value.

pc\_offset is expressed in words, and can be from -127 to 127 imm\_value is a 16-bit value to compare R0 against

**I\_BSL** (pc\_offset, imm\_value)

Branch relative if stage\_cnt register is less than the immediate value.

pc\_offset is expressed in words, and can be from -127 to 127 imm\_value is a 16-bit value to compare R0 against

**I\_ADDR** (reg\_dest, reg\_src1, reg\_src2)

Addition:  $dest = src1 + src2$

**I\_SUBR** (reg\_dest, reg\_src1, reg\_src2)

Subtraction:  $dest = src1 - src2$

**I\_ANDR** (reg\_dest, reg\_src1, reg\_src2)

Logical AND:  $dest = src1 \& src2$

**I\_ORR** (reg\_dest, reg\_src1, reg\_src2)

Logical OR:  $dest = src1 | src2$

**I\_MOVR** (reg\_dest, reg\_src)

Copy:  $dest = src$

**I\_LSHR** (reg\_dest, reg\_src, reg\_shift)

Logical shift left:  $dest = src \ll shift$

**I\_RSHR** (reg\_dest, reg\_src, reg\_shift)

Logical shift right:  $dest = src \gg shift$

**I\_ADDI** (reg\_dest, reg\_src, imm\_)

Add register and an immediate value:  $dest = src1 + imm$

**I\_SUBI** (reg\_dest, reg\_src, imm\_)

Subtract register and an immediate value:  $dest = src - imm$

**I\_ANDI** (reg\_dest, reg\_src, imm\_)

Logical AND register and an immediate value:  $dest = src \& imm$

**I\_ORI** (reg\_dest, reg\_src, imm\_)

Logical OR register and an immediate value:  $dest = src | imm$

**I\_MOVI** (reg\_dest, imm\_)

Copy an immediate value into register:  $dest = imm$

**I\_LSHI** (reg\_dest, reg\_src, imm\_)

Logical shift left register value by an immediate:  $dest = src \ll imm$

**I\_RSHI** (reg\_dest, reg\_src, imm\_)

Logical shift right register value by an immediate:  $dest = val \gg imm$

**I\_STAGE\_INC** (reg\_dest, reg\_src, imm\_)

Increment stage\_cnt register by an immediate:  $stage\_cnt = stage\_cnt + imm$

**I\_STAGE\_DEC** (reg\_dest, reg\_src, imm\_)

Decrement stage\_cnt register by an immediate:  $stage\_cnt = stage\_cnt - imm$

**I\_STAGE\_RST** (reg\_dest, reg\_src, imm\_)

Reset stage\_cnt register by an immediate:  $stage\_cnt = 0$

**M\_LABEL** (label\_num)

Define a label with number label\_num.

This is a macro which doesn't generate a real instruction. The token generated by this macro is removed by `ulp_process_macros_and_load` function. Label defined using this macro can be used in branch macros defined below.

**M\_BRANCH** (label\_num)

Token macro used by `M_B` and `M_BX` macros. Not to be used directly.

**M\_BL** (label\_num, imm\_value)

Macro: branch to label label\_num if R0 is less than immediate value.

This macro generates two `ulp_insn_t` values separated by a comma, and should be used when defining contents of `ulp_insn_t` arrays. First value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**M\_BG** (label\_num, imm\_value)

Macro: branch to label label\_num if R0 is greater than immediate value

This macro generates two `ulp_insn_t` values separated by a comma, and should be used when defining contents of `ulp_insn_t` arrays. First value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**M\_BE** (label\_num, imm\_value)

Macro: branch to label label\_num if R0 equal to the immediate value

This macro generates two `ulp_insn_t` values separated by a comma, and should be used when defining contents of `ulp_insn_t` arrays. First value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**M\_BX** (label\_num)

Macro: unconditional branch to label

This macro generates two `ulp_insn_t` values separated by a comma, and should be used when defining contents of `ulp_insn_t` arrays. First value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**M\_BXZ** (label\_num)

Macro: branch to label if ALU result is zero

This macro generates two `ulp_insn_t` values separated by a comma, and should be used when defining contents of `ulp_insn_t` arrays. First value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**M\_BXF** (label\_num)

Macro: branch to label if ALU overflow

This macro generates two `ulp_insn_t` values separated by a comma, and should be used when defining contents of `ulp_insn_t` arrays. First value is not a real instruction; it is a token which is removed by `ulp_process_macros_and_load` function.

**RTC\_SLOW\_MEM**

RTC slow memory, 8k size

### 4.31.3 编译 ULP 代码

若需要将 ULP FSM 代码编译为某组件的一部分，则必须执行以下步骤：

1. 用汇编语言编写的 ULP FSM 代码必须导入到一个或多个 `.S` 扩展文件中，且这些文件必须放在组件目录中一个独立的目录中，例如 `ulp/`。
2. 注册后从组件 `CMakeLists.txt` 中调用 `ulp_embed_binary` 示例如下：

```

...
idf_component_register()

set(ulp_app_name ulp_${COMPONENT_NAME})
set(ulp_s_sources ulp/ulp_assembly_source_file.S)
set(ulp_exp_dep_srcs "ulp_c_source_file.c")

ulp_embed_binary(${ulp_app_name} "${ulp_s_sources}" "${ulp_exp_dep_srcs}")

```

`ulp_embed_binary` 的第一个参数为 ULP 二进制文件命名。指定的此名称也用于生成的其他文件，如：ELF 文件、.map 文件、头文件和链接器导出文件。第二个参数指定 ULP FSM 程序集源文件。最后，第三个参数指定组件源文件列表，其中包括被生成的头文件。此列表用以建立正确的依赖项，并确保在编译这些文件之前先创建生成的头文件。有关 ULP FSM 应用程序生成的头文件等相关概念，请参考下文。

### 3. 使用常规方法（例如 `idf.py app`）编译应用程序。

在内部，构建系统将按照以下步骤编译 ULP FSM 程序：

1. 通过 C 预处理器运行每个程序集文件 (`foo.S`)。此步骤在组件编译目录中生成预处理的程序集文件 (`foo.ulp.S`)，同时生成依赖文件 (`foo.ulp.d`)。
2. 通过汇编器运行预处理过的汇编源码。此步骤会生成目标文件 (`foo.ulp.o`) 和清单 (`foo.ulp.lst`)。清单文件仅用于调试，不用于编译进程的后续步骤。
3. 通过 C 预处理器运行链接器脚本模板。模板位于 `components/ulp/ld` 目录中。
4. 将目标文件链接到 ELF 输出文件 (`ulp_app_name.elf`)。此步骤生成的 .map 文件 (`ulp_app_name.map`) 默认用于调试。
5. 将 ELF 文件中的内容转储为二进制文件 (`ulp_app_name.bin`)，以便嵌入到应用程序中。
6. 使用 `esp32ulp-elf-nm` 在 ELF 文件中生成全局符号列表 (`ulp_app_name.sym`)。
7. 创建 LD 导出脚本和头文件 (`ulp_app_name.ld` 和 `ulp_app_name.h`)，包含来自 `ulp_app_name.sym` 的符号。此步骤可借助 `esp32ulp_mapgen.py` 工具来完成。
8. 将生成的二进制文件添加到要嵌入应用程序的二进制文件列表中。

## 4.31.4 访问 ULP FSM 程序变量

在 ULP FSM 程序中定义的全局符号也可以在主程序中使用。

例如，ULP FSM 程序可以定义 `measurement_count` 变量，此变量可以定义程序从深度睡眠中唤醒芯片之前需要进行的 ADC 测量的次数：

```

.global measurement_count
measurement_count:
    .long 0

    // later, use measurement_count
    move r3, measurement_count
    ld r3, r3, 0

```

主程序需要在启动 ULP 程序之前初始化 `measurement_count` 变量，构建系统通过生成定义 ULP 编程中全局符号的 `${ULP_APP_NAME}.h` 和 `${ULP_APP_NAME}.ld` 文件实现上述操作。这些文件包含了在 ULP 程序中定义的所有全局符号，文件以 `ulp_` 开头。

头文件包含对此类符号的声明：

```
extern uint32_t ulp_measurement_count;
```

注意，所有符号（包括变量、数组、函数）均被声明为 `uint32_t`。对于函数和数组，先获取符号地址，然后转换为适当的类型。

生成的链接器脚本文件定义了 `RTC_SLOW_MEM` 中的符号位置：

```
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

如果要从主程序访问 ULP 程序变量，应先使用 `include` 语句包含生成的头文件，这样，就可以像访问常规变量一样访问 `ulp` 程序变量。操作如下：

```
#include "ulp_app_name.h"

// later
void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

### 4.31.5 启动 ULP FSM 程序

要运行 ULP FSM 程序，主应用程序需要调用 `ulp_load_binary()` 函数将 ULP 程序加载到 RTC 内存中，然后调用 `ulp_run()` 函数，启动 ULP 程序。

注意，在 `menuconfig` 中必须启用 Enable Ultra Low Power (ULP) Coprocessor 选项，以便正常运行 ULP，并且必须设置 ULP Co-processor type 选项，以便选择要使用的 ULP 类型。RTC slow memory reserved for coprocessor 选项设置的值必须足够储存 ULP 代码和数据。如果应用程序组件包含多个 ULP 程序，则 RTC 内存必须足以容纳最大的程序。

每个 ULP 程序均以二进制 BLOB 的形式嵌入到 ESP-IDF 应用程序中。应用程序可以引用此 BLOB，并以下面的方式加载此 BLOB（假设 `ULP_APP_NAME` 已被定义为 `ulp_app_name`）：

```
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[]   asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK( ulp_load_binary(
        0 // load address, set to 0 when using default linker scripts
        bin_start,
        (bin_end - bin_start) / sizeof(uint32_t) ));
}
```

一旦上述程序加载到 RTC 内存后，应用程序即可启动此程序，并将入口点的地址传递给 `ulp_run` 函数：

```
ESP_ERROR_CHECK( ulp_run(&ulp_entry - RTC_SLOW_MEM) );
```

上述生成的头文件 `_${ULP_APP_NAME}.h` 声明了入口点符号。在 ULP 应用程序的汇编源代码中，此符号必须标记为 `.global`：

```
.global entry
entry:
    // code starts here
```

### 4.31.6 ESP32-S3 ULP 程序流

ESP32-S3 ULP 协处理器由定时器启动，调用 `ulp_run()` 则可启动此定时器。定时器为 `RTC_SLOW_CLK` 的 Tick 事件计数（默认情况下，Tick 由内部 90 KHz RC 振荡器生成）。使用 `RTC_CNTL_ULP_CP_TIMER_1_REG` 寄存器设置 Tick 数值。

此应用程序可以调用 `ulp_set_wakeup_period()` 函数来设置 ULP 定时器周期值。

一旦定时器计数到 `RTC_CNTL_ULP_CP_TIMER_1_REG` 寄存器设定的 Tick 数值，ULP 协处理器就会启动，并调用 `ulp_run()` 的入口点开始运行程序。

程序保持运行，直到遇到 `halt` 指令或非法指令。一旦程序停止，ULP 协处理器电源关闭，定时器再次启动。

如果想禁用定时器（有效防止 ULP 程序再次运行），可在 ULP 代码或主程序中清除 `RTC_CNTL_ULP_CP_TIMER_REG` 寄存器中的 `RTC_CNTL_ULP_CP_SLP_TIMER_EN` 位。

### 4.31.7 应用示例

- 主处理器处于 Deep-sleep 状态时，ULP FSM 协处理器对 IO 脉冲进行计数：[system/ulp\\_fsm/ulp](#)。
- 主处理器处于 Deep-sleep 状态时，ULP FSM 协处理器轮询 ADC：[system/ulp\\_fsm/ulp\\_adc](#)。

### 4.31.8 API 参考

#### Header File

- [components/ulp/include/ulp\\_common.h](#)

#### Functions

*esp\_err\_t* **ulp\_process\_macros\_and\_load** (uint32\_t load\_addr, const *ulp\_insn\_t* \*program, size\_t \*psize)

Resolve all macro references in a program and load it into RTC memory.

##### 参数

- **load\_addr** –address where the program should be loaded, expressed in 32-bit words
- **program** –ulp\_insn\_t array with the program
- **psize** –size of the program, expressed in 32-bit words

##### 返回

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if auxiliary temporary structure can not be allocated
- one of ESP\_ERR\_ULP\_XXX if program is not valid or can not be loaded

*esp\_err\_t* **ulp\_load\_binary** (uint32\_t load\_addr, const uint8\_t \*program\_binary, size\_t program\_size)

Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):

- MAGIC, (value 0x00706c75, 4 bytes)
- TEXT\_OFFSET, offset of .text section from binary start (2 bytes)
- TEXT\_SIZE, size of .text section (2 bytes)
- DATA\_SIZE, size of .data section (2 bytes)
- BSS\_SIZE, size of .bss section (2 bytes)
- (TEXT\_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
- .text section
- .data section

Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with load\_addr == 0.

##### 参数

- **load\_addr** –address where the program should be loaded, expressed in 32-bit words
- **program\_binary** –pointer to program binary
- **program\_size** –size of the program binary

##### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if load\_addr is out of range
- ESP\_ERR\_INVALID\_SIZE if program\_size doesn't match (TEXT\_OFFSET + TEXT\_SIZE + DATA\_SIZE)
- ESP\_ERR\_NOT\_SUPPORTED if the magic number is incorrect

*esp\_err\_t* **ulp\_run** (uint32\_t entry\_point)

Run the program loaded into RTC memory.

参数 **entry\_point** –entry point, expressed in 32-bit words

返回 ESP\_OK on success

`esp_err_t ulp_set_wakeup_period` (size\_t period\_index, uint32\_t period\_us)

Set one of ULP wakeup period values.

ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into SENS\_ULP\_CP\_SLEEP\_CYCx\_REG registers, x = 0..4 for ESP32, and one period value which can be programmed into RTC\_CNTL\_ULP\_CP\_TIMER\_1\_REG register for ESP32-S2. By default, for ESP32, wakeup timer will use the period set into SENS\_ULP\_CP\_SLEEP\_CYC0\_REG, i.e. period number 0. ULP program code can use SLEEP instruction to select which of the SENS\_ULP\_CP\_SLEEP\_CYCx\_REG should be used for subsequent wakeups.

However, please note that SLEEP instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

For ESP32-s2 the SLEEP instruction not exist. Instead a WAKE instruction will be used.

---

**备注:** The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

---

#### 参数

- **period\_index** –wakeup period setting number (0 - 4)
- **period\_us** –wakeup period, us

#### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if period\_index is out of range

void `ulp_timer_stop` (void)

Stop the ULP timer.

---

**备注:** This will stop the ULP from waking up if halted, but will not abort any program currently executing on the ULP.

---

void `ulp_timer_resume` (void)

Resume the ULP timer.

---

**备注:** This will resume an already configured timer, but does no other configuration

---

## Macros

**ESP\_ERR\_ULP\_BASE**

Offset for ULP-related error codes

**ESP\_ERR\_ULP\_SIZE\_TOO\_BIG**

Program doesn't fit into RTC memory reserved for the ULP

**ESP\_ERR\_ULP\_INVALID\_LOAD\_ADDR**

Load address is outside of RTC memory reserved for the ULP

**ESP\_ERR\_ULP\_DUPLICATE\_LABEL**

More than one label with the same number was defined

**ESP\_ERR\_ULP\_UNDEFINED\_LABEL**

Branch instructions references an undefined label

**ESP\_ERR\_ULP\_BRANCH\_OUT\_OF\_RANGE**

Branch target is out of range of B instruction (try replacing with BX)

**Type Definitions**

```
typedef union ulp_insn ulp_insn_t
```

## 4.32 ULP RISC-V 协处理器编程

ULP RISC-V 协处理器是 ULP 的一种变体，用于 ESP32-S3。与 ULP FSM 类似，ULP RISC-V 协处理器可以在主处理器处于低功耗模式时执行传感器读数等任务。其与 ULP FSM 的主要区别在于，ULP RISC-V 可以通过标准 GNU 工具使用 C 语言进行编程。ULP RISC-V 可以访问 RTC\_SLOW\_MEM 内存区域及 RTC\_CNTL、RTC\_IO、SARADC 等外设的寄存器。RISC-V 处理器是一种 32 位定点处理器，指令集基于 RV32IMC，包括硬件乘除法和压缩指令。

### 4.32.1 安装 ULP RISC-V 工具链

ULP RISC-V 协处理器代码以 C 语言（或汇编语言）编写，使用基于 GCC 的 RISC-V 工具链进行编译。

如果您已依照[快速入门指南](#)中的介绍安装好了 ESP-IDF 及其 CMake 构建系统，那么 ULP RISC-V 工具链已经被默认安装到了您的开发环境中。

### 4.32.2 编译 ULP RISC-V 代码

要将 ULP RISC-V 代码编译为某组件的一部分，必须执行以下步骤：

1. ULP RISC-V 代码以 C 语言或汇编语言编写（必须使用 .S 扩展名），必须放在组件目录中一个独立的目录中，例如 *ulp/*。
2. 注册后从组件 CMakeLists.txt 中调用 `ulp_embed_binary` 示例如下：

```
...
idf_component_register()

set(ulp_app_name ulp_${COMPONENT_NAME})
set(ulp_sources "ulp/ulp_c_source_file.c" "ulp/ulp_assembly_source_file.S")
set(ulp_exp_dep_srcs "ulp_c_source_file.c")

ulp_embed_binary(${ulp_app_name} "${ulp_sources}" "${ulp_exp_dep_srcs}")
```

`ulp_embed_binary` 的第一个参数指定生成的 ULP 二进制文件名。生成的其他文件，如 ELF 文件、.map 文件、头文件和链接器导出文件等也可使用此名称。第二个参数指定 ULP 源文件。最后，第三个参数指定组件源文件列表，其中包括生成的头文件。此列表用以正确构建依赖，并确保在构建过程中先生成后编译包含头文件的源文件。请参考下文，查看为 ULP 应用程序生成的头文件等相关概念。

3. 使用常规方法（例如 `idf.py app`）编译应用程序。

在内部，构建系统将按照以下步骤编译 ULP 程序：

1. 通过 C 编译器和汇编器运行每个源文件。此步骤在组件编译目录中生成目标文件（.obj.c 或 .obj.S，取决于处理的源文件）。
2. 通过 C 预处理器运行链接器脚本模版。模版位于 `components/ulp/ld` 目录中。
3. 将目标文件链接到 ELF 输出文件（`ulp_app_name.elf`）。此步骤生成的 .map 文件默认用于调试（`ulp_app_name.map`）。
4. 将 ELF 文件中的内容转储为二进制文件（`ulp_app_name.bin`），以便嵌入到应用程序中。
5. 使用 `riscv32-esp-elf-nm` 在 ELF 文件中生成全局符号列表（`ulp_app_name.sym`）。
6. 创建 LD 导出脚本和头文件（`ulp_app_name.ld` 和 `ulp_app_name.h`），包含来自 `ulp_app_name.sym` 的符号。此步骤可借助 `esp32ulp_mapgen.py` 工具来完成。
7. 将生成的二进制文件添加到要嵌入应用程序的二进制文件列表中。

### 4.32.3 访问 ULP RISC-V 程序变量

在 ULP RISC-V 程序中定义的全局符号也可以在主程序中使用。

例如，ULP RISC-V 程序可以定义 `measurement_count` 变量，此变量可以定义程序从深度睡眠中唤醒芯片之前需要进行的 ADC 测量的次数。

```
volatile int measurement_count;

int some_function()
{
    //read the measurement count for use it later.
    int temp = measurement_count;

    ...do something.
}
```

构建系统生成定义 ULP 编程中全局符号的 `${ULP_APP_NAME}.h` 和 `${ULP_APP_NAME}.ld` 文件，使主程序能够访问全局 ULP RISC-V 程序变量。上述两个文件包含 ULP RISC-V 程序中定义的所有全局符号，且这些符号均以 `ulp_` 开头。

头文件包含对此类符号的声明：

```
extern uint32_t ulp_measurement_count;
```

注意，所有符号（包括变量、数组、函数）均被声明为 `uint32_t`。函数和数组需要先获取符号地址，再转换为适当的类型。

生成的链接器文本定义了符号在 `RTC_SLOW_MEM` 中的位置：

```
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

要从主程序访问 ULP RISC-V 程序变量，需使用 `include` 语句包含生成的头文件。这样，就可以像访问常规变量一样访问 ULP RISC-V 程序变量。

```
#include "ulp_app_name.h"

void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

### 4.32.4 启动 ULP RISC-V 程序

要运行 ULP RISC-V 程序，主程序需要调用 `ulp_riscv_load_binary()` 函数，将 ULP 程序加载到 RTC 内存中，然后调用 `ulp_riscv_run()` 函数，启动 ULP RISC-V 程序。

注意，必须在 `menuconfig` 中启用 `CONFIG_ESP32S3_ULP_COPROC_ENABLED` 和 `CONFIG_ESP32S3_ULP_COPROC_RISCV` 选项，以便正常运行 ULP RISC-V 程序。RTC slow memory reserved for coprocessor 选项设置的值必须足够存储 ULP RISC-V 代码和数据。如果应用程序组件包含多个 ULP 程序，RTC 内存必须足以容纳最大的程序。

每个 ULP RISC-V 程序均以二进制 BLOB 的形式嵌入到 ESP-IDF 应用程序中。应用程序可以引用此 BLOB，并以下面的方式加载此 BLOB（假设 `ULP_APP_NAME` 已被定义为 `ulp_app_name`）：

```
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[]   asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK(ulp_riscv_load_binary(bin_start,
        (bin_end - bin_start)));
}
```

一旦上述程序加载到 RTC 内存后，应用程序即可调用 `ulp_riscv_run()` 函数启动此程序：

```
ESP_ERROR_CHECK(ulp_riscv_run());
```

### 4.32.5 ULP RISC-V 程序流

ULP RISC-V 协处理器由定时器启动，调用 `ulp_riscv_run()` 即可启动定时器。定时器为 `RTC_SLOW_CLK` 的 Tick 事件计数（默认情况下，Tick 由内部 90 kHz RC 振荡器产生）。Tick 数值使用 `RTC_CNTL_ULP_CP_TIMER_1_REG` 寄存器设置。启用 ULP 时，使用 `RTC_CNTL_ULP_CP_TIMER_1_REG` 设置定时器 Tick 数值。

此应用程序可以调用 `ulp_set_wakeup_period()` 函数来设置 ULP 定时器周期值 (`RTC_CNTL_ULP_CP_TIMER_1_REG`)。

一旦定时器数到 `RTC_CNTL_ULP_CP_TIMER_1_REG` 寄存器中设置的 Tick 数，ULP RISC-V 协处理器就会启动，并调用 `ulp_riscv_run()` 的入口点开始运行程序。

程序保持运行，直至 `RTC_CNTL_COCPU_CTRL_REG` 寄存器中的 `RTC_CNTL_COCPU_DONE` 字段被置位或因非法处理器状态出现陷阱。一旦程序停止，ULP RISC-V 协处理器会关闭电源，定时器再次启动。

如需禁用定时器（有效防止 ULP 程序再次运行），请清除 `RTC_CNTL_STATE0_REG` 寄存器中的 `RTC_CNTL_ULP_CP_SLP_TIMER_EN` 位，此项操作可在 ULP 代码或主程序中进行。

### 4.32.6 应用示例

- 主处理器处于 Deep-sleep 状态时，ULP RISC-V 协处理器轮询 GPIO：[system/ulp\\_riscv/gpio](#)。
- 主处理器处于 Deep-sleep 状态时，ULP RISC-V 协处理器读取外部温度传感器：[system/ulp\\_riscv/ds18b20\\_onewire](#)。

### 4.32.7 API 参考

#### Header File

- `components/ulp/include/esp32s3/ulp_riscv.h`

#### Functions

`esp_err_t ulp_riscv_run` (void)

Run the program loaded into RTC memory.

返回 ESP\_OK on success

`esp_err_t ulp_riscv_load_binary` (const uint8\_t \*program\_binary, size\_t program\_size\_bytes)

Load ULP-RISC-V program binary into RTC memory.

Different than ULP FSM, the binary program has no special format, it is the ELF file generated by RISC-V toolchain converted to binary format using objcopy.

Linker script in components/ulp/ld/esp32s3.ulp.riscv.ld produces ELF files which correspond to this format. This linker script produces binaries with `load_addr == 0`.

#### 参数

- `program_binary` – pointer to program binary
- `program_size_bytes` – size of the program binary

#### 返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_SIZE` if `program_size_bytes` is more than 8KiB

## 4.33 ESP32-S3 中的单元测试

ESP-IDF 提供以下方法测试软件。

- 一种是在目标芯片上运行并基于 Unity 测试框架的应用程序。这些单元测试用例都保存在 ESP-IDF 仓库中，分别存放在每个组件的 `test` 子目录中。本文主要介绍这种单元测试方法。
- 另一种是基于 Linux 主机的单元测试，其中所有硬件行为都通过 Mock 组件进行模拟。此测试方法目前仍在开发中，只有一小部分 IDF 组件支持了 Mock，具体请参考[基于 Linux 主机的单元测试](#)。

### 4.33.1 添加常规测试用例

单元测试被添加在相应组件的 `test` 子目录中，测试用例写在 C 文件中，一个 C 文件可以包含多个测试用例。测试文件的名字要以 “test” 开头。

测试文件需要包含 `unity.h` 头文件，此外还需要包含待测试 C 模块需要的头文件。

测试用例需要通过 C 文件中特定的函数来添加，如下所示：

```
TEST_CASE("test name", "[module name]")
{
    // 在这里添加测试用例
}
```

- 第一个参数是此测试的描述性名称。
- 第二个参数用方括号中的标识符来表示，标识符用来对相关测试或具有特定属性的测试进行分组。

**备注：** 没有必要在每个测试用例中使用 `UNITY_BEGIN()` 和 `UNITY_END()` 来声明主函数的区域，`unity_platform.c` 会自动调用 `UNITY_BEGIN()`，然后运行测试用例，最后调用 `UNITY_END()`。

`test` 子目录应包含组件 `CMakeLists.txt`，因为他们本身就是一种组件（即测试组件）。ESP-IDF 使用了 Unity 测试框架，位于 `unity` 组件里。因此，每个测试组件都需要通过 `REQUIRES` 参数将 `unity` 组件设为依赖项。通常，组件需要手动指定待编译的源文件，但是，对于测试组件来说，这个要求被放宽为仅建议将参数 `SRC_DIRS` 用于 `idf_component_register`。

总的来说，`test` 子目录下最小的 `CMakeLists.txt` 文件可能如下所示：

```
idf_component_register(SRC_DIRS "."
                      INCLUDE_DIRS "."
                      REQUIRES unity)
```

更多关于如何在 Unity 下编写测试用例的信息，请查阅 <http://www.throwtheswitch.org/unity>。

### 4.33.2 添加多设备测试用例

常规测试用例会在一个 DUT（Device Under Test，在试设备）上执行。但是，那些需要互相通信的组件（比如 GPIO、SPI）需要其他设备与其通信，因此不能使用常规测试用例进行测试。多设备测试用例包括写入多个测试函数，并在多个 DUT 进行运行测试。

以下是一个多设备测试用例：

```
void gpio_master_test()
{
    gpio_config_t slave_config = {
        .pin_bit_mask = 1 << MASTER_GPIO_PIN,
        .mode = GPIO_MODE_INPUT,
    };
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
    gpio_config_t master_config = {
        .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
        .mode = GPIO_MODE_OUTPUT,
    };
    gpio_config(&master_config);
    gpio_set_level(SLAVE_GPIO_PIN, 1);
    unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", "[driver]", gpio_
↪master_test, gpio_slave_test);
```

宏 TEST\_CASE\_MULTIPLE\_DEVICES 用来声明多设备测试用例。

- 第一个参数指定测试用例的名字。
- 第二个参数是测试用例的描述。
- 从第三个参数开始，可以指定最多 5 个测试函数，每个函数都是单独运行在一个 DUT 上的测试入口点。

在不同的 DUT 上运行的测试用例，通常会要求它们之间进行同步。我们提供 `unity_wait_for_signal` 和 `unity_send_signal` 这两个函数来使用 UART 去支持同步操作。如上例中的场景，`slave` 应该在 `master` 设置好 GPIO 电平后再去读取 GPIO 电平，DUT 的 UART 终端会打印提示信息，并要求用户进行交互。

DUT1 (master) 终端:

```
Waiting for signal: [output high level]!
Please press "Enter" key once any board send this signal.
```

DUT2 (slave) 终端:

```
Send signal: [output high level]!
```

一旦 DUT2 发送了该信号，您需要在 DUT1 的终端按回车键，然后 DUT1 会从 `unity_wait_for_signal` 函数中解除阻塞，并开始更改 GPIO 的电平。

### 4.33.3 添加多阶段测试用例

常规的测试用例无需重启就会结束（或者仅需要检查是否发生了重启），可有些时候我们想在某些特定类型的重启事件后运行指定的测试代码，例如，我们想在深度睡眠唤醒后检查复位的原因是否正确。首先

我们需要触发深度睡眠复位事件，然后检查复位的原因。为了实现这一点，我们可以定义多阶段测试用例来将这些测试函数组合在一起：

```
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    soc_reset_reason_t reason = esp_rom_get_reset_reason(0);
    TEST_ASSERT(reason == RESET_REASON_CORE_DEEP_SLEEP);
}

TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", "[esp32s3]", trigger_
↳deepsleep, check_deepsleep_reset_reason);
```

多阶段测试用例向用户呈现了一组测试函数，它需要用户进行交互（选择用例并选择不同的阶段）来运行。

#### 4.33.4 应用于不同芯片的单元测试

某些测试（尤其与硬件相关的）无法在所有的芯片上执行。请参照本节让你的单元测试只在其中一部分芯片上执行。

1. 使用宏 `!(TEMPORARY_)DISABLED_FOR_TARGETS()` 包装你的测试代码，并将其放于原始的测试文件中，或将代码分成按功能分组的文件。但请确保所有这些文件都会由编译器处理。例：

```
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
TEST_CASE("a test that is not ready for esp32 and esp8266 yet", "[ ]")
{
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
```

一旦你需要其中一个测试在某个芯片上被编译，只需要修改禁止的芯片列表。我们更鼓励使用一些通用的概念（能在 `soc_caps.h` 中被清楚描述）来禁止某些单元测试。如果你已经这样做，但有一些测试还没有在新的芯片版本中被调试通过，请同时使用上述两种方法，当调试完成后再移除 `!(TEMPORARY_)DISABLED_FOR_TARGETS()`。例：

```
#if SOC_SDIO_SLAVE_SUPPORTED
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
TEST_CASE("a sdio slave tests that is not ready for esp64 yet", "[sdio_slave]")
{
    //available for esp32 now, and will be available for esp64 in the future
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
#endif //SOC_SDIO_SLAVE_SUPPORTED
```

2. 对于某些你确定不会支持的测试（例如，芯片根本没有该外设），使用 `DISABLED_FOR_TARGETS` 来禁止该测试；对于其他只是临时性需要关闭的（例如，没有 `runner` 资源等），使用 `TEMPORARY_DISABLED_FOR_TARGETS` 来暂时关闭该测试。

一些禁用目标芯片测试用例的旧方法，由于它们具有明显的缺陷，已经被废弃，请勿继续使用：

- 请勿将测试代码放在 `test/芯片版本目录` 下面，然后用 `CMakeLists.txt` 来选择其中一个进行编译。这是因为测试代码比实现代码更容易被复用。如果你将一些代码放在 `test/esp32` 目录下来避免 `esp32s2` 芯片执行它，一旦你需要在新的芯片（比如 `esp32s3`）中启用该测试，你会发现这种结构非常难以保持代码的整洁。
- 请勿继续使用 `CONFIG_IDF_TARGET_xxx` 宏来禁止某些测试在一些芯片上编译。这种方法会让被禁止的测试项目难以追踪和重新打开。并且，相比于白名单式的 `#if CONFIG_IDF_TARGET_xxx`，黑名单式的 `#if !disabled` 能避免新芯片引入时这些测试被自动关闭。但对于用于测试的一些

实现，`#if CONFIG_IDF_TARGET_xxx` 仍可用于给不同芯片版本选择实现代码。测试项目和测试实现区分如下：

- 测试项目：那些会在一些芯片上执行，而在另外一些上跳过的项目，例如：  
有三个测试项目 `SD 1-bit`、`SD 4-bit` 和 `SDSPI`。对于不支持 `SD Host` 外设的 `ESP32-S2` 芯片，只有 `SDSPI` 一个项目需要被执行。
- 测试实现：一些始终会发生的代码，但采取不同的实现方式。例如：  
`ESP8266` 芯片没有 `SDIO_PKT_LEN` 寄存器。如果在测试过程中需要获取从设备的数据长度，你可以用不同方式读取的 `#if CONFIG_IDF_TARGET_` 宏来保护不同的实现代码。但请注意避免使用 `#else` 宏。这样当新芯片被引入时，测试就会在编译阶段失败，提示维护者去显示选择一个正确的测试实现。

### 4.33.5 编译单元测试程序

按照 `esp-idf` 顶层目录的 `README` 文件中的说明进行操作，请确保 `IDF_PATH` 环境变量已经被设置指向了 `esp-idf` 的顶层目录。

切换到 `tools/unit-test-app` 目录下进行配置和编译：

- `idf.py menuconfig` - 配置单元测试程序。
- `idf.py -T all build` - 编译单元测试程序，测试每个组件 `test` 子目录下的用例。
- `idf.py -T "xxx yyy" build` - 编译单元测试程序，测试指定的组件。（如 `idf.py -T heap build` - 仅对 `heap` 组件目录下的单元测试程序进行编译）
- `idf.py -T all -E "xxx yyy" build` - 编译单元测试程序，测试除指定组件之外的所有组件。（例如 `idf.py -T all -E "ulp mbedt1s" build` - 编译所有的单元测试，不包括 `ulp` 和 `mbedt1s` 组件。）

**备注：**由于 Windows 命令提示符固有限制，需使用以下语法来编译多个组件的单元测试程序：`idf.py -T xxx -T yyy build` 或者在 PowerShell 中使用 `idf.py -T \"xxx yyy\" build`，在 Windows 命令提示符中使用 `idf.py -T \"^\"ssd1306 hts221\"^\" build`。

当编译完成时，它会打印出烧写芯片的指令。您只需要运行 `idf.py flash` 即可烧写所有编译输出的文件。

您还可以运行 `idf.py -T all flash` 或者 `idf.py -T xxx flash` 来编译并烧写，所有需要的文件都会在烧写之前自动重新编译。

使用 `menuconfig` 可以设置烧写测试程序所使用的串口。

### 4.33.6 运行单元测试

烧写完成后重启 `ESP32-S3`，它将启动单元测试程序。

当单元测试应用程序空闲时，输入回车键，它会打印出测试菜单，其中包含所有的测试项目：

```
Here's the test menu, pick your combo:
(1)  "esp_ota_begin() verifies arguments" [ota]
(2)  "esp_ota_get_next_update_partition logic" [ota]
(3)  "Verify bootloader image in flash" [bootloader_support]
(4)  "Verify unit test app image" [bootloader_support]
(5)  "can use new and delete" [cxx]
(6)  "can call virtual functions" [cxx]
(7)  "can use static initializers for non-POD types" [cxx]
(8)  "can use std::vector" [cxx]
(9)  "static initialization guards work as expected" [cxx]
(10) "global initializers run in the correct order" [cxx]
(11) "before scheduler has started, static initializers work correctly" [cxx]
(12) "adc2 work with wifi" [adc]
(13) "gpio master/slave test example" [ignore][misc][test_env=UT_T2_1][multi_
↵device]
```

(下页继续)

```

(1)      "gpio_master_test"
(2)      "gpio_slave_test"
(14)     "SPI Master clockdiv calculation routines" [spi]
(15)     "SPI Master test" [spi][ignore]
(16)     "SPI Master test, interaction of multiple devs" [spi][ignore]
(17)     "SPI Master no response when switch from host1 (SPI2) to host2 (SPI3)"
→[spi]
(18)     "SPI Master DMA test, TX and RX in different regions" [spi]
(19)     "SPI Master DMA test: length, start, not aligned" [spi]
(20)     "reset reason check for deepsleep" [esp32s3][test_env=UT_T2_1][multi_stage]
(1)      "trigger_deepsleep"
(2)      "check_deepsleep_reset_reason"

```

常规测试用例会打印用例名字和描述，主从测试用例还会打印子菜单（已注册的测试函数的名字）。

可以输入以下任意一项来运行测试用例：

- 引号中写入测试用例的名字，运行单个测试用例。
- 测试用例的序号，运行单个测试用例。
- 方括号中的模块名字，运行指定模块所有的测试用例。
- 星号，运行所有测试用例。

[multi\_device] 和 [multi\_stage] `` 标签告诉测试运行者该用例是多设备测试还是多阶段测试。这些标签由 ``TEST\_CASE\_MULTIPLE\_STAGES 和 TEST\_CASE\_MULTIPLE\_DEVICES 宏自动生成。

一旦选择了多设备测试用例，它会打印一个子菜单：

```

Running gpio master/slave test example...
gpio master/slave test example
(1)      "gpio_master_test"
(2)      "gpio_slave_test"

```

您需要输入数字以选择在 DUT 上运行的测试。

与多设备测试用例相似，多阶段测试用例也会打印子菜单：

```

Running reset reason check for deepsleep...
reset reason check for deepsleep
(1)      "trigger_deepsleep"
(2)      "check_deepsleep_reset_reason"

```

第一次执行此用例时，输入 1 来运行第一阶段（触发深度睡眠）。在重启 DUT 并再次选择运行此用例后，输入 2 来运行第二阶段。只有在最后一个阶段通过并且之前所有的阶段都成功触发了复位的情况下，该测试才算通过。

### 4.33.7 带缓存补偿定时器的定时代码

存储在外部存储器（如 SPI Flash 和 SPI RAM）中的指令和数据是通过 CPU 的统一指令和数据缓存来访问的。当代码或数据在缓存中时，访问速度会非常快（即缓存命中）。

然而，如果指令或数据不在缓存中，则需要从外部内存中获取（即缓存缺失）。访问外部存储器的速度明显较慢，因为 CPU 在等待从外部存储器获取指令或数据时会陷入停滞。这导致整体代码执行速度会依据缓存命中或缓存缺失的次数而变化。

在不同的编译中，代码和数据的位置可能会有所不同，一些可能会更有利于缓存访问（即，最大限度地减少缓存缺失）。理论上说这会影响执行速度，但这些因素通常却是无关紧要，因为它们的影响会在设备的运行过程中“平均化”。

然而，高速缓存对执行速度的影响可能与基准测试场景（尤其是微基准测试）有关。每次运行和构建时的测量时间可能会有所差异，消除部分差异的方法之一是将代码和数据分别放在指令或数据 RAM (IRAM/DRAM) 中。CPU 可以直接访问 IIRAM 和 DRAM，从而消除了高速缓存的影响因素。然而，由于 IIRAM 和 DRAM 容量有限，该方法并不总是可行。

缓存补偿定时器是将要基准测试的代码/数据放置在 IRAM/DRAM 中的替代方法，该计时器使用处理器的内部事件计数器来确定在发生高速缓存未命中时等待代码/数据所花费的时间，然后从记录的实时时间中减去该时间。

```
// Start the timer
ccomp_timer_start();

// Function to time
func_code_to_time();

// Stop the timer, and return the elapsed time in microseconds relative to
// ccomp_timer_start
int64_t t = ccomp_timer_stop();
```

缓存补偿定时器的限制之一是基准功能必须固定在一个内核上。这是由于每个内核都有自己的事件计数器，这些事件计数器彼此独立。例如，如果在一个内核上调用 `ccomp_timer_start`，使调度器进入睡眠状态，唤醒并在另一个内核上重新调度，那么对应的 `ccomp_timer_stop` 将无效。

### 4.33.8 Mocks

嵌入式系统中单元测试的最大问题之一是硬件依赖性极强。所以 ESP-IDF 有一个集成了 **CMock** mocking 框架的组件。理想情况下，除了需要被测试的组件（待测组件）之外的所有组件都要被模拟。这样，测试环境就可以完全控制与被测组件之间的所有交互。但是，在模拟过程中如果遇到过于具体而导致的困难，用户可以在测试代码中包含“真正”（非模拟）代码。

除了常规的 IDF 要求，`ruby` 是生成 Mock 的必要条件，具体请参考 [cmock/CMock/docs/CMock\\_Summary.md](#) 了解 CMock 工作原理以及如何创建和使用 Mock。

在 IDF 中，与编写普通组件或不需要 Mock 的单元测试相比，需要 Mock 的组件以及单元测试内部需要进行一些修改。

#### 修改需要模拟的组件

要被模拟的组件需要一个单独的 mock 目录，用来包含实现模拟的文件。最重要的是，该目录下要包含用于配置 CMock 的 `mock_config.yaml` 文件。关于此配置文件中选项的含义以及如何编写自己的配置文件，请参考 [CMock 文档](#)。mock 目录中可能还需要包括其它与 Mock 有关的文件。

此外，组件的 `CMakeLists.txt` 文件中需要一个“开关”来决定是否编译 Mock。通常可以通过检查特定组件的属性 `USE MOCK` 来实现。例如，`spi_flash` 组件在其 `CMakeLists.txt` 中执行以下代码，以检查是否应该编译 Mock。

```
idf_component_get_property(spi_flash_mock ${COMPONENT_NAME} USE MOCK)
```

在组件的 `CMakeLists.txt` 中创建组件的 Mock 的 CMake 编译命令可能如下所示：

```
add_custom_command(
  OUTPUT ${MOCK_OUTPUT}
  COMMAND ruby ${CMOCK_DIR}/lib/cmock.rb -o${CMAKE_CURRENT_SOURCE_DIR}/mock/mock_
↪config.yaml ${MOCK_HEADERS}
  COMMAND ${CMAKE_COMMAND} -E env "UNITY_DIR=${IDF_PATH}/components/unity/unity"
↪ruby ${CMOCK_DIR}/lib/cmock.rb -o${CMAKE_CURRENT_SOURCE_DIR}/mock/mock_config.
↪yaml ${MOCK_HEADERS}
)
```

`${MOCK_OUTPUT}` 包含所有 CMock 生成的输出文件，`${MOCK_HEADERS}` 包含所有要 Mock 的头文件，`${CMOCK_DIR}` 需要设置为 IDF 内的 CMock 目录。`${CMAKE_COMMAND}` 会由 IDF 构建系统自动设置。

使用 CMock 要特别注意的一个方面是：CMock 通常使用 Unity 作为一个子模块，但由于一些 Espressif 内部 CI 的限制，我们仍然将 Unity 作为 ESP-IDF 中的一个普通模块。要使用 IDF 提供的 Unity 组件（不是子模块），构建系统需要传递一个环境变量 `UNITY_IDR` 给 CMock。该变量仅包含 IDF 中 Unity 目录的路径，

如 `export "UNITY_DIR=${IDF_PATH}/components/unity/unity"`。关于 CMock 中 Unity 目录是如何确定的，请参考 [cmock/CMock/lib/cmock\\_generator.rb](#)。

更多细节可参考 [spi\\_flash](#) 目录下启用 Mock 的 `CMakeLists.txt` 示例文件。

### 修改单元测试文件

单元测试要为需要模拟的组件设置 `USE MOCK` 组件属性。这会让依赖组件编译 Mock，而不是实际的组件。例如，在 NVS 主机测试的 `CMakeLists.txt` 中，以下代码用于启用 `spi_flash` Mock。

```
idf_component_set_property(spi_flash USE MOCK 1)
```

关于如何在单元测试中使用及控制 CMock，请参考 [NVS 主机单元测试](#)。

## 4.34 Unit Testing on Linux

---

**备注：** Host testing with IDF is experimental for now. We try our best to keep interfaces stable but can't guarantee it for now. Feedback via github or the forum on esp32.com is highly welcome, though and may influence the future design of the host-based tests.

---

This article provides an overview of unit tests with IDF on Linux. For using unit tests on the target, please refer to [target based unit testing](#).

### 4.34.1 Embedded Software Tests

Embedded software tests are challenging due to the following factors:

- Difficulties running tests efficiently.
- Lack of many operating system abstractions when interfacing with hardware, making it difficult to isolate code under test.

To solve these two problems, Linux host-based tests with CMock are introduced. Linux host-based tests are more efficient than unit tests on the target since they:

- Compile the necessary code only
- Don't need time to upload to a target
- Run much faster on a host-computer, compared to an ESP

Using the CMock framework also solves the problem of hardware dependencies. Through mocking, hardware details are emulated and specified at run time, but only if necessary.

Of course, using code on the host and using mocks does not fully represent the target device. Thus, two kinds of tests are recommended:

1. Unit tests which test program logic on a Linux machine, isolated through mocks.
2. System/Integration tests which test the interaction of components and the whole system. They run on the target, where irrelevant components and code may as well be emulated via mocks.

This documentation is about the first kind of tests. Refer to [target based unit testing](#) for more information on target tests (the second kind of tests).

### 4.34.2 IDF Unit Tests on Linux Host

The current focus of the Linux host tests is on creating isolated unit tests of components, while mocking the component's dependencies with CMock.

A complete implementation of IDF to run on Linux does not exist currently.

There are currently two examples for running IDF-built code on Linux host:

- An example [hello-world application](#)
- A [unit test for NVS](#) .

Inside the component which should be tested, there is a separate directory `host_test`, besides the “traditional” test directory or the `test_apps` directory. It has one or more subdirectories:

```

- host_test/
    - fixtures/
        contains test fixtures (structs/functions to do test case set-up_
↪and tear-down).
        If there are no fixtures, this can be omitted.
    - <test_name>/
        IDF applications which run the tests
    - <test_name2>/
        Further tests are possible.

```

The IDF applications inside `host_test` set the mocking configuration as described in the [IDF unit test documentation](#).

The [NVS page unit test](#) provides some illustration of how to control the mocks.

### Requirements

- Installed IDF including all IDF requirements
- CMock requirements (Ruby)
- `libbsd`

The host tests have been tested on Ubuntu 20.04 with GCC version 9 and 10.

## 4.35 USB OTG Console

On chips with an integrated USB peripheral, it is possible to use USB Communication Device Class (CDC) to implement the serial console, instead of using UART with an external USB-UART bridge chip. ESP32-S3 ROM code contains a USB CDC implementation, which supports for some basic functionality without requiring the application to include the USB stack:

- Bidirectional serial console, which can be used with [IDF Monitor](#) or another serial monitor
- Flashing using `esptool.py` and `idf.py flash`.
- [Device Firmware Update \(DFU\)](#) interface for flashing the device using `dfu-util` and `idf.py dfu`.

**备注:** At the moment, this “USB Console” feature is incompatible with TinyUSB stack. However, if TinyUSB is used, it can provide its own CDC implementation.

### 4.35.1 Hardware Requirements

Connect ESP32-S3 to the USB port as follows

| GPIO | USB         |
|------|-------------|
| 20   | D+ (green)  |
| 19   | D- (white)  |
| GND  | GND (black) |
|      | +5V (red)   |

Some development boards may offer a USB connector for the internal USB peripheral—in that case, no extra connections are required.

By default, `USB_SERIAL_JTAG` module is connected to the internal PHY of the ESP32-S3, while USB\_OTG peripheral can be used only if the external USB PHY is connected. Since CDC console is provided via USB\_OTG peripheral, it cannot be used through the internal PHY in this configuration.

You can permanently switch the internal USB PHY to work with USB\_OTG peripheral instead of `USB_SERIAL_JTAG` by burning `USB_PHY_SEL` eFuse. See ESP32-S3 Technical Reference Manual for more details about `USB_SERIAL_JTAG` and `USB_OTG`.

Note however that `USB_SERIAL_JTAG` also provides a CDC console, so enabling the CDC console shouldn't be the primary reason for switching from `USB_SERIAL_JTAG` to `USB_CDC`.

### 4.35.2 Software Configuration

USB console feature can be enabled using `CONFIG_ESP_CONSOLE_USB_CDC` option in menuconfig tool (see [CONFIG\\_ESP\\_CONSOLE\\_UART](#)).

Once the option is enabled, build the project as usual.

### 4.35.3 Uploading the Application

#### Initial Upload

If the ESP32-S3 is not yet flashed with a program which enables USB console, we can not use `idf.py flash` command with the USB CDC port. There are 3 alternative options to perform the initial upload listed below.

Once the initial upload is done, the application will start up and a USB CDC port will appear in the system.

---

**备注:** The port name may change after the initial upload, so check the port list again before running `idf.py monitor`.

---

#### Initial upload using the ROM download mode, over USB CDC

- Place ESP32-S3 into download mode. To do this, keep GPIO0 low while toggling reset. On many development boards, the “Boot” button is connected to GPIO0, and you can press “Reset” button while holding “Boot” button.
- A serial port will appear in the system. On most operating systems (Windows 8 and later, Linux, macOS) driver installation is not required. Find the port name using Device Manager (Windows) or by listing `/dev/ttyACM*` devices on Linux or `/dev/cu*` devices on macOS.
- Run `idf.py flash -p PORT` to upload the application, with `PORT` determined in the previous step

#### Initial upload using the ROM download mode, over USB DFU

- Place ESP32-S3 into download mode. To do this, keep GPIO0 low while toggling reset. On many development boards, the “Boot” button is connected to GPIO0, and you can press “Reset” button while holding “Boot” button.
- Run `idf.py dfu-flash`.

See [Flashing the Chip with the DFU Image](#) for details about DFU flashing.

**Initial upload using UART** On development boards with a USB-UART bridge, upload the application over UART: `idf.py flash -p PORT` where `PORT` is the name of the serial port provided by the USB-UART bridge.

## Subsequent Usage

Once the application is uploaded for the first time, you can run `idf.py flash` and `idf.py monitor` as usual.

### 4.35.4 Limitations

There are several limitations to the USB console feature. These may or may not be significant, depending on the type of application being developed, and the development workflow. Most of these limitations stem from the fact that USB CDC is implemented in software, so the console working over USB CDC is more fragile and complex than a console working over UART.

1. If the application crashes, panic handler output may not be sent over USB CDC in some cases. If the memory used by the CDC driver is corrupted, or there is some other system-level issue, CDC may not work for sending panic handler messages over USB. This does work in many situations, but is not guaranteed to work as reliably as the UART output does. Similarly, if the application enters a boot loop before the USB CDC driver has a chance to start up, there will be no console output.
2. If the application accidentally reconfigures the USB peripheral pins, or disables the USB peripheral, USB CDC device will disappear from the system. After fixing the issue in the application, you will need to follow the [Initial Upload](#) process to flash the application again.
3. If the application enters light sleep (including automatic light sleep) or deep sleep mode, USB CDC device will disappear from the system.
4. USB CDC driver reserves some amount of RAM and increases application code size. Keep this in mind if trying to optimize application memory usage.
5. By default, the low-level `esp_rom_printf` feature and `ESP_EARLY_LOG` are disabled when USB CDC is used. These can be enabled using `CONFIG_ESP_CONSOLE_USB_CDC_SUPPORT_ETS_PRINTF` option. With this option enabled, `esp_rom_printf` can be used, at the expense of increased IRAM usage. Keep in mind that the cost of `esp_rom_printf` and `ESP_EARLY_LOG` over USB CDC is significantly higher than over UART. This makes these logging mechanisms much less suitable for “printf debugging”, especially in the interrupt handlers.
6. If you are developing an application which uses the USB peripheral with the TinyUSB stack, this USB Console feature can not be used. This is mainly due to the following reasons:
  - This feature relies on a different USB CDC software stack in ESP32-S3 ROM.
  - USB descriptors used by the ROM CDC stack may be different from the descriptors used by TinyUSB.
  - When developing applications which use USB peripheral, it is very likely that USB functionality will not work or will not fully work at some moments during development. This can be due to misconfigured USB descriptors, errors in the USB stack usage, or other reasons. In this case, using the UART console for flashing and monitoring provides a much better development experience.
7. When debugging the application using JTAG, USB CDC may stop working if the CPU is stopped on a breakpoint. USB CDC operation relies on interrupts from the USB peripheral being serviced periodically. If the host computer doesn't receive valid responses from the USB device side for some time, it may decide to disconnect the device. The actual time depends on the OS and the driver, and ranges from a few hundred milliseconds to a few seconds.

## 4.36 USB Serial/JTAG Controller Console

On chips with an integrated USB Serial/JTAG Controller, it is possible to use the part of this controller that implements a serial port (CDC) to implement the serial console, instead of using UART with an external USB-UART bridge chip. ESP32-S3 contains this controller, providing the following functions:

- Bidirectional serial console, which can be used with [IDF Monitor](#) or another serial monitor
- Flashing using `esptool.py` and `idf.py flash`.
- JTAG debugging using e.g. OpenOCD, simultaneous with serial operations

Note that, in contrast with the USB OTG peripheral found in some Espressif chips, the USB Serial/JTAG Controller is a fixed function device, implemented entirely in hardware. This means it cannot be reconfigured to perform any function other than to provide a serial channel and JTAG debugging functionality.

### 4.36.1 Hardware Requirements

Connect ESP32-S3 to the USB port as follows:

| GPIO | USB         |
|------|-------------|
| 20   | D+ (green)  |
| 19   | D- (white)  |
| GND  | GND (black) |
|      | +5V (red)   |

Some development boards may offer a USB connector for the USB Serial/JTAG Controller—in that case, no extra connections are required.

### 4.36.2 Software Configuration

USB console feature can be enabled using `CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG` option in menuconfig tool (see [CONFIG\\_ESP\\_CONSOLE\\_UART](#)).

Once the option is enabled, build the project as usual.

### 4.36.3 Uploading the Application

The USB Serial/JTAG Controller is able to put the ESP32-S3 into download mode automatically. Simply flash as usual, but specify the USB Serial/JTAG Controller port on your system: `idf.py flash -p PORT` where `PORT` is the name of the proper port.

### 4.36.4 Limitations

There are several limitations to the USB Serial/JTAG console feature. These may or may not be significant, depending on the type of application being developed, and the development workflow.

1. If the application accidentally reconfigures the USB peripheral pins, or disables the USB Serial/JTAG Controller, the device will disappear from the system. After fixing the issue in the application, you will need to manually put the ESP32-S3 into download mode by pulling low GPIO0 and resetting the chip.
2. If the application enters deep sleep mode, the USB Serial/JTAG device will disappear from the system.
3. For data sent in the direction of ESP32-S3 to PC Terminal (e.g. `stdout`, logs), the ESP32-S3 first writes to a small internal buffer. If this buffer becomes full (for example, if no PC Terminal is connected), the ESP32-S3 will do a one-time wait of 50ms hoping for the PC Terminal to request the data. This can appear as a very brief ‘pause’ in your application.
4. For data sent in the PC Terminal to ESP32-S3 direction (e.g. console commands), many PC Terminals will wait for the ESP32-S3 to ingest the bytes before allowing you to send more data. This is in contrast to using a USB-to-Serial (UART) bridge chip, which will always ingest the bytes and send them to a (possibly not listening) ESP32-S3.
5. The USB Serial/JTAG device won’t work in sleep modes as normal due to the lack of APB clock in sleep modes. This includes deep-sleep, light-sleep (automatic light-sleep as well).
6. The power consumption in sleep modes will be higher if the USB Serial/JTAG device is in use. This is because we want to keep the USB Serial/JTAG device alive during software reset by default. However there is an issue that this might also increase the power consumption in sleep modes. This is because the software keeps a clock source on during the reset to keep the USB Serial/JTAG device alive. As a side-effect, the clock is also kept on during sleep modes. There is one exception: the clock will only be kept on when your USB Serial/JTAG port is really in use (like data transaction), therefore, if your USB Serial/JTAG is connected to power bank or battery, etc., instead of a valid USB host (for example, a PC), the power consumption will not increase.

If you still want to keep low power consumption in sleep modes:

1. If you are not using the USB Serial/JTAG port, you don't need to do anything. Software will detect if the USB Serial/JTAG is connected to a valid host before going to sleep, and keep the clocks only when the host is connected. Otherwise the clocks will be turned off as normal.
2. If you are using the USB Serial/JTAG port, please disable the menuconfig option `CONFIG_RTC_CLOCK_BBPLL_POWER_ON_WITH_USB`. The clock will be switched off as normal during software reset and in sleep modes. In these cases, the USB Serial/JTAG device may be unplugged from the host.

## 4.37 Wi-Fi 驱动程序

### 4.37.1 ESP32-S3 Wi-Fi 功能列表

- 支持 4 个虚拟接口，即 STA、AP、Sniffer 和 reserved。
- 支持仅 station 模式、仅 AP 模式、station/AP 共存模式
- 支持使用 IEEE 802.11B、IEEE 802.11G、IEEE 802.11N 和 API 配置协议模式
- 支持 WPA/WPA2/WPA3/WPA2-企业版和 WPS
- 支持 AMSDU、AMPDU、HT40、QoS 以及其它主要功能
- 支持 Modem-sleep
- 支持乐鑫专属协议，可实现 **1 km** 数据通信量
- 空中数据传输最高可达 20 MBit/s TCP 吞吐量和 30 MBit/s UDP 吞吐量
- 支持 Sniffer
- 支持用于 Wi-Fi 连接的 fast\_crypto 算法与普通算法的切换
- 支持快速扫描和全信道扫描
- 支持多个天线
- 支持获取信道状态信息

### 4.37.2 如何编写 Wi-Fi 应用程序

#### 准备工作

一般来说，要编写自己的 Wi-Fi 应用程序，最高效的方式是先选择一个相似的应用程序示例，然后将其中可用的部分移植到自己的项目中。如果您希望编写一个强健的 Wi-Fi 应用程序，强烈建议您在开始之前先阅读本文。非强制要求，请依个人情况而定。

本文将补充说明 Wi-Fi API 和 Wi-Fi 示例的相关信息，重点描述使用 Wi-Fi API 的原则、当前 Wi-Fi API 实现的限制以及使用 Wi-Fi 时的常见错误。同时，本文还介绍了 Wi-Fi 驱动程序的一些设计细节。建议您选择一个示例 [example](#) 进行参考。

#### 设置 Wi-Fi 编译时选项

请参阅 [Wi-Fi menuconfig](#)。

#### Wi-Fi 初始化

请参阅 [ESP32-S3 Wi-Fi station 一般情况](#)、[ESP32-S3 Wi-Fi AP 一般情况](#)。

#### 启动/连接 Wi-Fi

请参阅 [ESP32-S3 Wi-Fi station 一般情况](#)、[ESP32-S3 Wi-Fi AP 一般情况](#)。

## 事件处理

通常，在晴好环境下编写代码难度并不大，如 `WIFI_EVENT_STA_START`、`WIFI_EVENT_STA_CONNECTED` 中所述。难度在于如何在阴翳的困难环境下编写代码，如 `WIFI_EVENT_STA_DISCONNECTED` 中所述。能否在后者情况下完美地解决各类事件冲突，是编写一个强健的 Wi-Fi 应用程序的根本。请参阅 [ESP32-S3 Wi-Fi station 一般情况](#)、[ESP32-S3 Wi-Fi AP 一般情况](#)。另可参阅 ESP-IDF 中的事件处理概述 [Event Handling](#)。

## 编写错误恢复程序

除了在能在比较差的环境下工作，错误恢复能力也对一个强健的 Wi-Fi 应用程序至关重要。请参阅 [ESP32-S3 Wi-Fi API 错误代码](#)。

### 4.37.3 ESP32-S3 Wi-Fi API 错误代码

所有 ESP32-S3 Wi-Fi API 都有定义好的返回值，即错误代码。这些错误代码可分类为：

- 无错误，例如：返回值 `ESP_OK` 代表 API 成功返回
- 可恢复错误，例如：`ESP_ERR_NO_MEM`
- 不可恢复的非关键性错误
- 不可恢复的关键性错误

一个错误是否为关键性取决于其 API 和应用场景，并且由 API 用户定义。

**要使用 Wi-Fi API 编写一个强健的应用程序，根本原则便是要时刻检查错误代码并编写相应的错误处理代码。**一般来说，错误处理代码可用于解决：

- 可恢复错误，您可以编写一个可恢复错误处理代码解决该类错误。例如，当 `esp_wifi_start()` 返回 `ESP_ERR_NO_MEM` 时，调用可恢复错误处理代码 `vTaskDelay` 可以获取几微秒的重试时间。
- 不可恢复非关键性错误，打印错误代码可以帮助您更好地处理该类错误。
- 不可恢复关键性错误，可使用“assert”语句处理该类错误。例如，如果 `esp_wifi_set_mode()` 返回 `ESP_ERR_WIFI_NOT_INIT`，该值意为 `esp_wifi_init()` 未成功初始化 Wi-Fi 驱动程序。您可以在应用程序开发阶段非常快速地检测到此类错误。

在 `esp_err.h` 中，`ESP_ERROR_CHECK` 负责检查返回值。这是一个较为常见的错误处理代码，可在应用程序开发阶段作为默认的错误处理代码。但是，我们强烈建议 API 的使用者自己编写错误处理代码。

### 4.37.4 初始化 ESP32-S3 Wi-Fi API 参数

初始化 API 的结构参数时，应遵循以下两种方式之一：

- 设置该参数的所有字段
- 先使用 `get` API 获取当前配置，然后只设置特定于应用程序的字段

初始化或获取整个结构这一步至关重要，因为大多数情况下，返回值 0 意味着程序使用了默认值。未来，我们将会在该结构中加入更多字段，并将这些字段初始化为 0，确保即使 IDF 版本升级后您的应用程序依然能够正常运行。

### 4.37.5 ESP32-S3 Wi-Fi 编程模型

ESP32-S3 Wi-Fi 编程模型如下图所示：

Wi-Fi 驱动程序可以看作是一个无法感知上层代码（如 TCP/IP 堆栈、应用程序任务、事件任务等）的黑匣子。通常，应用程序任务（代码）负责调用 [Wi-Fi 驱动程序 APIs](#) 来初始化 Wi-Fi，并在必要时处理 Wi-Fi 事件。然后，Wi-Fi 驱动程序接收并处理 API 数据，并在应用程序中插入事件。

Wi-Fi 事件处理是在 [esp\\_event](#) 库的基础上进行的。Wi-Fi 驱动程序将事件发送至 [默认事件循环](#)，应用程序便可以使用 `esp_event_handler_register()` 中的回调函数处理这些事件。除此之外，[esp\\_netif](#) 组件也负责处理 Wi-Fi 事件，并产生一系列默认行为。例如，当 Wi-Fi station 连接至一个 AP 时，`esp_netif` 将自动开启 DHCP 客户端服务（系统默认）。

图 50: Wi-Fi 编程模型

### 4.37.6 ESP32-S3 Wi-Fi 事件描述

#### WIFI\_EVENT\_WIFI\_READY

Wi-Fi 驱动程序永远不会生成此事件，因此，应用程序的事件回调函数可忽略此事件。在未来的版本中，此事件可能会被移除。

#### WIFI\_EVENT\_SCAN\_DONE

扫描完成事件，由 `esp_wifi_scan_start()` 函数触发，将在以下情况下产生：

- 扫描已完成，例如：Wi-Fi 已成功找到目标 AP 或已扫描所有信道。
- 当前扫描因函数 `esp_wifi_scan_stop()` 而终止。
- 在当前扫描完成之前调用了函数 `esp_wifi_scan_start()`。此时，新的扫描将覆盖当前扫描过程，并生成一个扫描完成事件。

以下情况下将不会产生扫描完成事件：

- 当前扫描被阻止。
- 当前扫描是由函数 `esp_wifi_connect()` 触发的。

接收到此事件后，事件任务暂不做任何响应。首先，应用程序的事件回调函数需调用 `esp_wifi_scan_get_ap_num()` 和 `esp_wifi_scan_get_ap_records()` 获取已扫描的 AP 列表，然后触发 Wi-Fi 驱动程序释放在扫描过程中占用的内存空间（**切记该步骤**）。更多详细信息，请参阅 [ESP32-S3 Wi-Fi 扫描](#)。

#### WIFI\_EVENT\_STA\_START

如果调用函数 `esp_wifi_start()` 后接收到返回值 `ESP_OK`，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将初始化 LwIP 网络接口 (netif)。通常，应用程序的事件回调函数需调用 `esp_wifi_connect()` 来连接已配置的 AP。

#### WIFI\_EVENT\_STA\_STOP

如果调用函数 `esp_wifi_stop()` 后接收到返回值 `ESP_OK`，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将进行释放 station IP 地址、终止 DHCP 客户端服务、移除 TCP/UDP 相关连接并清除 LwIP station netif 等动作。此时，应用程序的事件回调函数通常不需做任何响应。

## WIFI\_EVENT\_STA\_CONNECTED

如果调用函数 `esp_wifi_connect()` 后接收到返回值 `ESP_OK`，且 `station` 已成功连接目标 AP，则将产生此连接事件。接收到此事件后，事件任务将启动 DHCP 客户端服务并开始获取 IP 地址。此时，Wi-Fi 驱动程序已准备就绪，可发送和接收数据。如果您的应用程序不依赖于 LwIP（即 IP 地址），则此刻便可以开始应用程序开发工作。但是，如果您的应用程序需基于 LwIP 进行，则还需等待 `got ip` 事件发生后才可开始。

## WIFI\_EVENT\_STA\_DISCONNECTED

此事件将在以下情况下产生：

- 调用了函数 `esp_wifi_disconnect()`、`esp_wifi_stop()` 或 `esp_wifi_deinit()`，且 Wi-Fi `station` 已成功连接至 AP。
- 调用了函数 `esp_wifi_connect()`，但 Wi-Fi 驱动程序因为某些原因未能成功连接至 AP，例如：未扫描到目标 AP、验证超时等。或存在多个 SSID 相同的 AP，`station` 无法连接所有已找到的 AP，也将产生该事件。
- Wi-Fi 连接因为某些原因而中断，例如：`station` 连续多次丢失 N beacon、AP 脱离 `station` 连接、AP 验证模式改变等。

接收到此事件后，事件任务的默认动作为：

- 关闭 `station` 的 LwIP netif。
- 通知 LwIP 任务清除导致所有套接字状态错误的 UDP/TCP 连接。针对基于套接字编写的应用程序，其回调函数可以在接收到此事件时（如有必要）关闭并重新创建所有套接字。

应用程序处理此事件最常用的方法为：调用函数 `esp_wifi_connect()` 重新连接 Wi-Fi。但是，如果此事件是由函数 `esp_wifi_disconnect()` 引发的，则应用程序不应调用 `esp_wifi_connect()` 来重新连接。应用程序须明确区分此事件的引发原因，因为某些情况下应使用其它更好的方式进行重新连接。请参阅 [Wi-Fi 重新连接](#) 和 [连接 Wi-Fi 时扫描](#)。

需要注意的另一点是：接收到此事件后，LwIP 的默认动作为终止所有 TCP 套接字连接。大多数情况下，该动作不会造成影响。但对某些特殊应用程序可能除外。例如：

- 应用程序创建了一个 TCP 连接，以维护每 60 秒发送一次的应用程序级、保持活动状态的数据。
- 由于某些原因，Wi-Fi 连接被切断并引发了 `WIFI_EVENT_STA_DISCONNECTED` 事件。根据当前实现，此时所有 TCP 连接都将被移除，且保持活动的套接字将处于错误的状态中。但是，由于应用程序设计者认为网络层不应考虑这个 Wi-Fi 层的错误，因此应用程序不会关闭套接字。
- 5 秒后，因为在应用程序的事件回调函数中调用了 `esp_wifi_connect()`，Wi-Fi 连接恢复。同时，`station` 连接至同一个 AP 并获得与之前相同的 IPV4 地址。
- 60 秒后，当应用程序发送具有保持活动状态的套接字的数据时，套接字将返回错误，应用程序将关闭套接字并在必要时重新创建。

在上述场景中，理想状态下应用程序套接字和网络层将不会受到影响，因为在此过程中 Wi-Fi 连接只是短暂地断开然后快速恢复。应用程序可通过 LwIP `menuconfig` 启动“IP 改变时保持 TCP 连接”的功能。

## IP\_EVENT\_STA\_GOT\_IP

当 DHCP 客户端成功从 DHCP 服务器获取 IPV4 地址或 IPV4 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

IPV4 地址可能由于以下原因而发生改变：

- DHCP 客户端无法重新获取/绑定 IPV4 地址，且 `station` 的 IPV4 重置为 0。
- DHCP 客户端重新绑定了其它地址。
- 静态配置的 IPV4 地址已发生改变。

函数 `ip_event_got_ip_t` 中的字段 `ip_change` 说明了 IPV4 地址是否发生改变。

套接字的状态是基于 IPV4 地址的，这意味着，如果 IPV4 地址发生改变，则所有与此 IPV4 相关的套接字都将变为异常。接收到此事件后，应用程序需关闭所有套接字，并在 IPV4 变为有效地址时重新创建应用程序。

### IP\_EVENT\_GOT\_IP6

当 IPV6 SLAAC 支持自动为 ESP32-S3 配置一个地址，或 ESP32-S3 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

### IP\_EVENT\_STA\_LOST\_IP

当 IPV4 地址失效时，将引发此事件。

此事件不会在 Wi-Fi 断连后立刻出现。Wi-Fi 连接断开后，首先将启动一个 IPV4 地址丢失计时器，如果 station 在该计时器超时之前成功获取了 IPV4 地址，则不会发生此事件。否则，此事件将在计时器超时发生时。

一般来说，应用程序可忽略此事件。这只是一个调试事件，主要使应用程序获知 IPV4 地址已丢失。

### WIFI\_EVENT\_AP\_START

与 `WIFI_EVENT_STA_START` 事件相似。

### WIFI\_EVENT\_AP\_STOP

与 `WIFI_EVENT_STA_STOP` 事件相似。

### WIFI\_EVENT\_AP\_STACONNECTED

每当有一个 station 成功连接 ESP32-S3 AP 时，将引发此事件。接收到此事件后，事件任务将不做任何响应，应用程序的回调函数也可忽略这一事件。但是，您可以在此时进行一些操作，例如：获取已连接 STA 的信息等。

### WIFI\_EVENT\_AP\_STADISCONNECTED

此事件将在以下情况下发生：

- 应用程序通过调用函数 `esp_wifi_disconnect()` 或 `esp_wifi_deinit_sta()` 手动断开 station 连接。
- Wi-Fi 驱动程序出于某些原因断开 station 连接，例如：AP 在过去 5 分钟（可通过函数 `esp_wifi_set_inactive_time()` 修改该时间）内未接收到任何数据包等。
- station 断开与 AP 之间的连接。

发生此事件时，事件任务将不做任何响应，但应用程序的事件回调函数需执行一些操作，例如：关闭与此 station 相关的套接字等。

### WIFI\_EVENT\_AP\_PROBEREQRCVD

默认情况下，此事件处于禁用状态，应用程序可以通过调用 API `esp_wifi_set_event_mask()` 启用。启用后，每当 AP 接收到 probe request 时都将引发此事件。

### WIFI\_EVENT\_STA\_BEACON\_TIMEOUT

如果 station 在 inactive 时间内未收到所连接 AP 的 beacon，将发生 beacon 超时，将引发此事件。inactive 时间通过调用函数 `esp_wifi_set_inactive_time()` 设置。

### 4.37.7 ESP32-S3 Wi-Fi station 一般情况

下图为 station 模式下的宏观场景，其中包含不同阶段的具体描述：

#### 1.Wi-Fi/LwIP 初始化阶段

- s1.1: 主任务通过调用函数 `esp_netif_init()` 创建一个 LwIP 核心任务，并初始化 LwIP 相关工作。
- s1.2: 主任务通过调用函数 `esp_event_loop_create()` 创建一个系统事件任务，并初始化应用程序事件的回调函数。在此情况下，该回调函数唯一的动作就是将事件中继到应用程序任务中。
- s1.3: 主任务通过调用函数 `esp_netif_create_default_wifi_ap()` 或 `esp_netif_create_default_wifi_sta()` 创建有 TCP/IP 堆栈的默认网络接口实例绑定 station 或 AP。
- s1.4: 主任务通过调用函数 `esp_wifi_init()` 创建 Wi-Fi 驱动程序任务，并初始化 Wi-Fi 驱动程序。
- s1.5: 主任务通过调用 OS API 创建应用程序任务。

推荐按照 s1.1 ~ s1.5 的步骤顺序针对基于 Wi-Fi/LwIP 的应用程序进行初始化。但这一顺序并非强制，您可以在第 s1.1 步创建应用程序任务，然后在应用程序任务中进行所有其它初始化操作。不过，如果您的应用程序任务依赖套接字，那么在初始化阶段创建应用程序任务可能并不适用。此时，您可以在接收到 IP 后再进行任务创建。

#### 2.Wi-Fi 配置阶段

Wi-Fi 驱动程序初始化成功后，可以进入到配置阶段。该场景下，Wi-Fi 驱动程序处于 station 模式。因此，首先您需调用函数 `esp_wifi_set_mode()` (`WIFI_MODE_STA`) 将 Wi-Fi 模式配置为 station 模式。可通过调用其它 `esp_wifi_set_xxx` API 进行更多设置，例如：协议模式、国家代码、带宽等。请参阅 [ESP32-S3 Wi-Fi 配置](#)。

一般情况下，我们会在建立 Wi-Fi 连接之前配置 Wi-Fi 驱动程序，但这并非强制要求。也就是说，只要 Wi-Fi 驱动程序已成功初始化，您可以在任意阶段进行配置。但是，如果您的 Wi-Fi 在建立连接后不需要更改配置，则应先在此阶段完成配置。因为调用配置 API（例如 `esp_wifi_set_protocol()`）将会导致 Wi-Fi 连接断开，为您的操作带来不便。

如果 menuconfig 已使能 Wi-Fi NVS flash，则不论当前阶段还是后续的 Wi-Fi 配置信息都将被存储至该 flash 中。那么，当主板上电/重新启动时，就不需从头开始配置 Wi-Fi 驱动程序。您只需调用函数 `esp_wifi_get_xxx` API 获取之前存储的配置信息。当然，如果不想使用之前的配置，您依然可以重新配置 Wi-Fi 驱动程序。

#### 3.Wi-Fi 启动阶段

- s3.1: 调用函数 `esp_wifi_start()` 启动 Wi-Fi 驱动程序。
- s3.2: Wi-Fi 驱动程序将事件 `WIFI_EVENT_STA_START` 发布到事件任务中，然后，事件任务将执行一些正常操作并调用应用程序的事件回调函数。
- s3.3: 应用程序的事件回调函数将事件 `WIFI_EVENT_STA_START` 中继到应用程序任务中。推荐您此时调用函数 `esp_wifi_connect()` 进行 Wi-Fi 连接。当然，您也可以等待在 `WIFI_EVENT_STA_START` 事件发生后的其它阶段再调用此函数。

#### 4.Wi-Fi 连接阶段

- s4.1: 调用函数 `esp_wifi_connect()` 后，Wi-Fi 驱动程序将启动内部扫描/连接过程。
- s4.2: 如果内部扫描/连接过程成功，将产生 `WIFI_EVENT_STA_CONNECTED` 事件。然后，事件任务将启动 DHCP 客户端服务，最终触发 DHCP 程序。
- s4.3: 在此情况下，应用程序的事件回调函数会将 `WIFI_EVENT_STA_CONNECTED` 事件中继到应用程序任务中。通常，应用程序不需进行操作，而您可以执行任何动作，例如：打印日志等。

图 51: station 模式下 Wi-Fi 事件场景示例

步骤 s4.2 中 Wi-Fi 连接可能会由于某些原因而失败，例如：密码错误、未找到 AP 等。这种情况下，将引发 `WIFI_EVENT_STA_DISCONNECTED` 事件并提示连接错误原因。有关如何处理中断 Wi-Fi 连接的事件，请参阅下文阶段 6 的描述。

## 5. Wi-Fi 获取 IP 阶段

- s5.1: 一旦步骤 4.2 中的 DHCP 客户端初始化完成，Wi-Fi 驱动程序将进入 获取 IP 阶段。
- s5.2: 如果 Wi-Fi 成功从 DHCP 服务器接收到 IP 地址，则将引发 `IP_EVENT_STA_GOT_IP` 事件，事件任务将执行正常处理。
- s5.3: 应用程序的事件回调函数将事件 `IP_EVENT_STA_GOT_IP` 中继到应用程序任务中。对于那些基于 LwIP 构建的应用程序，此事件较为特殊，因为它意味着应用程序已准备就绪，可以开始任务，例如：创建 TCP/UDP 套接字等。此时较为容易犯的一个错误就是在接收到 `IP_EVENT_STA_GOT_IP` 事件之前就初始化套接字。**切忌在接收到 IP 之前启动任何套接字相关操作。**

## 6. Wi-Fi 断开阶段

- s6.1: 当 Wi-Fi 因为某些原因（例如：AP 掉电、RSSI 较弱等）连接中断时，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件。此事件也可能在上文阶段 3 中发生。在这里，事件任务将通知 LwIP 任务清除/移除所有 UDP/TCP 连接。然后，所有应用程序套接字都将处于错误状态。也就是说，`WIFI_EVENT_STA_DISCONNECTED` 事件发生时，任何套接字都无法正常工作。
- s6.2: 上述情况下，应用程序的事件回调函数会将 `WIFI_EVENT_STA_DISCONNECTED` 事件中继到应用程序任务中。推荐您调用函数 `esp_wifi_connect()` 重新连接 Wi-Fi，关闭所有套接字，并在必要时重新创建套接字。请参阅 `WIFI_EVENT_STA_DISCONNECTED`。

## 7. Wi-Fi IP 更改阶段

- s7.1: 如果 IP 地址发生更改，将引发 `IP_EVENT_STA_GOT_IP` 事件，其中 “ip\_change” 被置为 “true”。
- s7.2: **此事件对应用程序至关重要。这一事件发生时，适合关闭所有已创建的套接字并进行重新创建。**

## 8. Wi-Fi 清理阶段

- s8.1: 调用函数 `esp_wifi_disconnect()` 断开 Wi-Fi 连接。
- s8.2: 调用函数 `esp_wifi_stop()` 终止 Wi-Fi 驱动程序。
- s8.3: 调用函数 `esp_wifi_deinit()` 清理 Wi-Fi 驱动程序。

### 4.37.8 ESP32-S3 Wi-Fi AP 一般情况

下图为 AP 模式下的宏观场景，其中包含不同阶段的具体描述：

### 4.37.9 ESP32-S3 Wi-Fi 扫描

目前，仅 station 或 station/AP 共存模式支持 `esp_wifi_scan_start()` API。

图 52: AP 模式下 Wi-Fi 事件场景示例

## 扫描类型

| 模式     | 描述   |
|--------|--|
| 主动扫描   | 通过发送 probe request 进行扫描。该模式为默认的扫描模式。   |
| 被动扫描   | 跳至某一特定信道并等待 beacon。应用程序可通过 wifi_scan_config_t 中的 scan_type 字段使能被动扫描。                       |
| 前端扫描   | 不发出 probe request。在 station 模式下 Wi-Fi 未连接时，可进行前端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描，应用程序无法配置这两种模式。 |
| 后端扫描   | 在 station 模式或 station/AP 共存模式下 Wi-Fi 已连接时，可进行后端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描，应用程序无法配置这两种模式。  |
| 全信道扫描  | 扫描所有信道。wifi_scan_config_t 中的 channel 字段为 0 时，当前模式为全信道扫描。                                   |
| 特定信道扫描 | 仅扫描特定的信道。wifi_scan_config_t 中的 channel 字段为 1 时，当前模式为特定信道扫描。                                |

上表中的扫描模式可以任意组合，因此共有 8 种不同扫描方式：

- 全信道后端主动扫描
- 全信道后端被动扫描
- 全信道前端主动扫描
- 全信道后端被动扫描
- 特定信道后端主动扫描
- 特定信道后端被动扫描
- 特定信道前端主动扫描
- 特定信道前端被动扫描

## 扫描配置

扫描类型与其他扫描属性通过函数 `esp_wifi_scan_start()` 进行配置。下表详细描述了函数 `wifi_scan_config_t` 各字段信息。

| 字段          | 描述  |
|-------------|---|
| ssid        | 如果该字段的值不为 NULL，则仅可扫描到具有相同 SSID 值的 AP。   |
| bssid       | 如果该字段的值不为 NULL，则仅可扫描到具有相同 BSSID 值的 AP。  |
| channel     | 如果该字段值为 0，将进行全信道扫描；反之，将针对特定信道进行扫描。  |
| show_hidden | 如果该字段值为 0，本次扫描将忽略具有隐藏 SSID 的 AP；反之，这些 AP 也会在扫描时被视为正常 AP。  |
| scan_type   | 如果该字段值为 WIFI_SCAN_TYPE_ACTIVE，则本次扫描为主动扫描；反之，将被视为被动扫描。   |
| scan_time   | 该字段用于控制每个信道的扫描时间。<br>被动扫描时，scan_time.passive 字段负责为每个信道指定扫描时间。<br>主动扫描时，每个信道的扫描时间如下列表所示。其中，min 代表 scan_time_active_min，max 代表 scan_time_active_max。 <ul style="list-style-type: none"> <li>• min=0, max=0: 每个信道的扫描时间为 120 ms。</li> <li>• min&gt;0, max=0: 每个信道的扫描时间为 120 ms。</li> <li>• min=0, max&gt;0: 每个信道的扫描时间为 max ms。</li> <li>• min&gt;0, max&gt;0: 每个信道扫描的最短时间为 min ms。如果在这段时间内未找到 AP，将跳转至下一个信道。如这段时间内找到 AP，则该信道的扫描时间为 max ms。</li> </ul> 如希望提升 Wi-Fi 扫描性能，则可修改上述两个参数。 |

调用 API `esp_wifi_set_config()` 可全局配置一些扫描属性，请参阅[station 基本配置](#)。

### 在所有信道中扫描全部 AP（前端）

场景：

上述场景中描述了全信道前端扫描过程。仅 station 模式支持前端扫描，该模式下 station 未连接任何 AP。前端扫描还是后端扫描完全由 Wi-Fi 驱动程序决定，应用程序无法配置这一模式。

详细描述：

#### 扫描配置阶段

- s1.1: 如果默认的国家信息有误，调用函数 `esp_wifi_set_country()` 进行配置。请参阅[Wi-Fi 国家/地区代码](#)。
- s1.2: 调用函数 `esp_wifi_scan_start()` 配置扫描信息，可参阅[扫描配置](#)。该场景为全信道扫描，将 SSID/BSSID/channel 设置为 0 即可。

#### Wi-Fi 驱动程序内部扫描阶段

- s2.1: Wi-Fi 驱动程序切换至信道 1，此时的扫描类型为 WIFI\_SCAN\_TYPE\_ACTIVE，同时发送一个 probe request。反之，Wi-Fi 将等待接收 AP beacon。Wi-Fi 驱动程序将在信道 1 停留一段时间。min/max 扫描时间中定义了 Wi-Fi 在信道 1 中停留的时间长短，默认为 120 ms。
- s2.2: Wi-Fi 驱动程序跳转至信道 2，并重复进行 s2.1 中的步骤。
- s2.3: Wi-Fi 驱动程序扫描最后的信道 N，N 的具体数值由步骤 s1.1 中配置的国家代码决定。

图 53: 所有 Wi-Fi 信道的前端扫描

### 扫描完成后事件处理阶段

- s3.1: 当所有信道扫描全部完成后, 将产生 `WIFI_EVENT_SCAN_DONE` 事件。
- s3.2: 应用程序的事件回调函数告知应用程序任务已接收到 `WIFI_EVENT_SCAN_DONE` 事件。调用函数 `esp_wifi_scan_get_ap_num()` 获取在本次扫描中找到的 AP 数量。然后, 分配出足够的事物槽, 并调用函数 `esp_wifi_scan_get_ap_records()` 获取 AP 记录。请注意, 一旦调用 `esp_wifi_scan_get_ap_records()`, Wi-Fi 驱动程序中的 AP 记录将被释放。但是, 请不要在单个扫描完成事件中重复调用两次 `esp_wifi_scan_get_ap_records()`。反之, 如果扫描完成事件发生后未调用 `esp_wifi_scan_get_ap_records()`, 则 Wi-Fi 驱动程序中的 AP 记录不会被释放。因此, 请务必确保调用函数 `esp_wifi_scan_get_ap_records()`, 且仅调用一次。

### 在所有信道上扫描全部 AP (后端)

场景:

上述场景为一次全信道后端扫描。与在**所有信道中扫描全部 AP (前端)**相比, 全信道后端扫描的不同之处在于: 在跳至下一个信道之前, Wi-Fi 驱动程序会先返回主信道进行 30 ms 扫描, 以便 Wi-Fi 连接有一定的时间发送/接收数据。

### 在所有信道中扫描特定 AP

场景:

该扫描过程与在**所有信道中扫描全部 AP (前端)**相似。区别在于:

- s1.1: 在步骤 1.2 中, 目标 AP 将配置为 SSID/BSSID。
- s2.1 ~ s2.N: 每当 Wi-Fi 驱动程序扫描某个 AP 时, 它将检查该 AP 是否为目标 AP。如果本次扫描类型为 `WIFI_FAST_SCAN`, 且确认已找到目标 AP, 则将产生扫描完成事件, 同时结束本次扫描; 反之, 扫描将继续。请注意, 第一个扫描的信道可能不是信道 1, 因为 Wi-Fi 驱动程序会优化扫描顺序。

如果有多个匹配目标 AP 信息的 AP, 例如: 碰巧扫描到两个 SSID 为 “ap” 的 AP。如果本次扫描类型为 `WIFI_FAST_SCAN`, 则仅可找到第一个扫描到的 “ap”; 如果本次扫描类型为 `WIFI_ALL_CHANNEL_SCAN`, 则两个 “ap” 都将被找到, 且 station 将根据配置规则连接至其需要连接的 “ap”, 请参阅 [station 基本配置](#)。

您可以在任意信道中扫描某个特定的 AP, 或扫描该信道中的所有 AP。这两种扫描过程也较为相似。

### 在 Wi-Fi 连接模式下扫描

调用函数 `esp_wifi_connect()` 后, Wi-Fi 驱动程序将首先尝试扫描已配置的 AP。Wi-Fi 连接模式下的扫描过程与在**所有信道中扫描特定 AP**过程相同, 但连接模式下扫描结束后将不会产生扫描完成事件。如果已找到目标 AP, 则 Wi-Fi 驱动程序将开始 Wi-Fi 连接; 反之, 将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件。请参阅在**所有信道中扫描特定 AP**。

### 在禁用模式下扫描

如果函数 `esp_wifi_scan_start()` 中的禁用参数为 “true”, 则本次扫描为禁用模式下的扫描。在该次扫描完成之前, 应用程序任务都将被禁用。禁用模式下的扫描和正常扫描相似, 不同之处在于, 禁用模式下扫描完成之后将不会出现扫描完成事件。

### 并行扫描

有时, 可能会有两个应用程序任务同时调用函数 `esp_wifi_scan_start()`, 或者某个应用程序任务在获取扫描完成事件之前再次调用了函数 `esp_wifi_scan_start()`。这两种情况都有可能发生。但是, Wi-Fi 驱动程序并不足以支持多个并行的扫描。因此, 应避免上述并行扫描。随着 ESP32-S3 的 Wi-Fi 功能不断提升, 未来的版本中可能会增加并行扫描支持。

图 54: 所有 Wi-Fi 信道的后端扫描

图 55: 扫描特定的 Wi-Fi 信道

## 连接 Wi-Fi 时扫描

如果 Wi-Fi 正在连接，则调用函数 `esp_wifi_scan_start()` 后扫描将立即失败，因为 Wi-Fi 连接优先级高于扫描。如果扫描是因为 Wi-Fi 连接而失败的，此时推荐采取的策略为：等待一段时间后重试。因为一旦 Wi-Fi 连接完成后，扫描将立即成功。

但是，延时重试策略并非万无一失。试想以下场景：

- 如果 station 正在连接一个不存在的 AP，或正在使用错误的密码连接一个 AP，此时将产生事件 `WIFI_EVENT_STA_DISCONNECTED`。
- 接收到断开连接事件后，应用程序调用函数 `esp_wifi_connect()` 进行重新连接。
- 而另一个应用程序任务（如，控制任务）调用了函数 `esp_wifi_scan_start()` 进行扫描。这种情况下，每一次扫描都会立即失败，因为 station 一直处于正在连接状态。
- 扫描失败后，应用程序将等待一段时间后进行重新扫描。

上述场景中的扫描永远不会成功，因为 Wi-Fi 一直处于正在连接过程中。因此，如果您的应用程序也可能发生类似的场景，那么就需要为其配置一个更佳的重重新连接策略。例如：

- 应用程序可以定义一个连续重新连接次数的最大值，当重新连接的次数达到这个最大值时，立刻停止重新连接。
- 应用程序可以在首轮连续重新连接 N 次后立即进行重新连接，然后延时一段时间后再进行下一次重新连接。

可以给应用程序定义其特殊的重重新连接策略，以防止扫描无法成功。请参阅 [Wi-Fi 重新连接](#)。

### 4.37.10 ESP32-S3 Wi-Fi station 连接场景

该场景仅针对在扫描阶段只找到一个目标 AP 的情况，对于多个相同 SSID AP 的情况，请参阅 [找到多个 AP 时的 ESP32-S3 Wi-Fi station 连接](#)。

通常，应用程序无需关心这一连接过程。如感兴趣，可参看下述简介。

场景：

#### 扫描阶段

- s1.1: Wi-Fi 驱动程序开始在“Wi-Fi 连接”模式下扫描。详细信息请参阅 [在 Wi-Fi 连接模式下扫描](#)。
- s1.2: 如果未找到目标 AP，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_NO_AP_FOUND`。请参阅 [Wi-Fi 原因代码](#)。

#### 认证阶段

- s2.1: 发送认证请求数据包并使能认证计时器。
- s1.2: 如果在认证计时器超时之前未接收到认证响应数据包，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_AUTH_EXPIRE`。请参阅 [Wi-Fi 原因代码](#)。
- s2.3: 接收到认证响应数据包，且认证计时器终止。
- s2.4: AP 在响应中拒绝认证且产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，原因代码为 `WIFI_REASON_AUTH_FAIL` 或为 AP 指定的其它原因。请参阅 [Wi-Fi 原因代码](#)。

#### 关联阶段

- s3.1: 发送关联请求并使能关联计时器。
- s3.2: 如果在关联计时器超时之前未接收到关联响应，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_ASSOC_EXPIRE`。请参阅 [Wi-Fi 原因代码](#)。
- s3.3: 接收到关联响应，且关联计时器终止。
- s3.4: AP 在响应中拒绝关联且产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，原因代码将在关联响应中指定。请参阅 [Wi-Fi 原因代码](#)。

图 56: Wi-Fi station 连接过程

## 四次握手阶段

- s4.1: 使能握手定时器，定时器终止之前未接收到 1/4 EAPOL，此时将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_HANDSHAKE_TIMEOUT`。请参阅 [Wi-Fi 原因代码](#)。
- s4.2: 接收到 1/4 EAPOL。
- s4.3: station 回复 2/4 EAPOL。
- s4.4: 如果在握手定时器终止之前未接收到 3/4 EAPOL，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_HANDSHAKE_TIMEOUT`。请参阅 [Wi-Fi 原因代码](#)。
- s4.5: 接收到 3/4 EAPOL。
- s4.6: station 回复 4/4 EAPOL。
- s4.7: station 产生 `WIFI_EVENT_STA_CONNECTED` 事件。

## Wi-Fi 原因代码

下表罗列了 ESP32-S3 中定义的原因代码。其中，第一列为 `esp_wifi_types.h` 中定义的宏名称。名称中省去了前缀 `WIFI_REASON`，也就是说，名称 `UNSPECIFIED` 实际应为 `WIFI_REASON_UNSPECIFIED`，以此类推。第二列为原因代码的相应数值。第三列为该原因映射到 IEEE 802.11-2020 中 9.4.1.7 段的标准值。（更多信息，请参阅前文描述。）最后一列为这一原因的描述。

| 原因代码          | 数值 | 映射值 | 描述  |
|---------------|----|-----|---|
| UN-SPECIFIED  | 1  | 1   | 出现内部错误，例如：内存已满，内部发送失败，或该原因已被远端接收等。  |
| AUTH_EXPIRE   |    | 2   | 先前的 authentication 已失效。<br>对于 ESP station，出现以下情况时将报告该代码： <ul style="list-style-type: none"> <li>• authentication 超时；</li> <li>• 从 AP 接收到该代码。</li> </ul> 对于 ESP AP，出现以下情况时将报告该代码： <ul style="list-style-type: none"> <li>• 在过去五分钟之内，AP 未从 station 接收到任何数据包；</li> <li>• 由于调用了函数 <code>esp_wifi_stop()</code> 导致 AP 终止；</li> <li>• 由于调用了函数 <code>esp_wifi_deinit_sta()</code> 导致 station 的 authentication 取消。</li> </ul> |
| AUTH_BEAVE    |    | 3   | authentication 取消，因为发送 station 正在离开（或已经离开）。<br>对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> <li>• 从 AP 接收到该代码。</li> </ul>  |
| AS-SOC_EXPIRE | 4  | 4   | 因为 AP 不活跃，association 取消。<br>对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> <li>• 从 AP 接收到该代码。</li> </ul> 对于 ESP AP，出现以下情况时将报告该代码： <ul style="list-style-type: none"> <li>• 在过去五分钟之内，AP 未从 station 接收到任何数据包；</li> <li>• 由于调用了函数 <code>esp_wifi_stop()</code> 导致 AP 终止；</li> <li>• 由于调用了函数 <code>esp_wifi_deinit_sta()</code> 导致 station 的 authentication 取消。</li> </ul>                              |

表 28 - 续上页

| 原因代码                                   | 数值      | 映射值     | 描述   |
|--|---------|---------|--|
| NOT_AUTHORIZED_TSCATION                |         | TS_LO   | 请求的服务在此位置未得到授权。  |
| SERVICE_CHANGE_PRECLUDES_TS            | 31      | 31      | TS 被删除，原因是：BSS 服务特性或者运行模式改变导致 QoS AP 缺少足够的带宽给 QoS STA 使用（例如：一个 HT BSS 从 40 MHz 的信道切换到 20 MHz 的信道）。 |
| UNSPECIFIED_QOS                        | 32      | 32      | association 取消，由于不明确的 QoS 相关原因。  |
| NOT_ENOUGH_BANDWIDTH                   |         |         | association 取消，由于 QoS AP 缺少足够的带宽给该 QoS STA 使用。   |
| MISSING_ACKS                           | 34      | 34      | association 取消，原因是：大量的帧需要被确认，但由于 AP 传输或者糟糕的信道条件而没有被确认。   |
| EXCEEDED_TXOP                          | 35      | 35      | association 取消，由于 STA 的传输超过了 TXOPs 的限制。  |
| STA_LEAVING                            | 36      | 36      | 请求 STA 离开了 BSS 或者重置了。  |
| END_BA                                 | 37      | 37      | 请求 STA 不再使用该流或者会话。   |
| UNKNOWN_BA                             | 38      | 38      | 请求 STA 使用一种尚未完成的机制接收帧。   |
| TIMEOUT                                | 39      | 39      | 对端 STA 的请求超时。  |
| Reserved                               | 40 ~ 45 | 40 ~ 45 | 保留   |
| PEER_INITIATED                         | 46      | 46      | 在 Disassociation 帧中：已达到授权访问限制。   |
| AP_INITIATED                           | 47      | 47      | 在 Disassociation 帧中：外部服务需求。  |
| INVALID_FT_ACTION_FRAME_COUNT          | 48      | 48      | 无效的 FT Action 帧计数。   |
| INVALID_PMKID                          | 49      | 49      | 无效的成对主密钥标识符（PMKID）。  |
| INVALID_MDE                            | 50      | 50      | 无效的 MDE。   |
| INVALID_FTE                            | 51      | 51      | 无效的 FTE。   |
| TRANSMISSION_LINK_ESTABLISHMENT_FAILED | 67      | 67      | 在备用信道中建立传输链路失败。  |
| ALTERNATIVE_CHANNEL_OCCUPIED           | 68      | 68      | 备用信道被占用。   |
| BEACON_TIMEOUT                         | 200     | 保留      | 乐鑫特有的 Wi-Fi 原因代码：当 station 连续失去 N 个 beacon，将中断连接并报告该代码。  |
| NO_AP_FOUND                            | 201     | 保留      | 乐鑫特有的 Wi-Fi 原因代码：当 station 未扫描到目标 AP 时，将报告该代码。   |
| AUTH_FAIL                              | 202     | 保留      | 乐鑫特有的 Wi-Fi 原因代码：authentication 失败，但并非由超时而引发。  |
| ASSOC_FAIL                             | 203     | 保留      | 乐鑫特有的 Wi-Fi 原因代码：association 失败，但并非由 ASSOC_EXPIRE 或 ASSOC_TOOMANY 引发。                              |
| HANDSHAKE_TIMEOUT                      | 204     | 保留      | 乐鑫特有的 Wi-Fi 原因代码：握手失败，与 WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT 中失败原因相同。                                |
| CONNECTION_FAIL                        | 205     | 保留      | 乐鑫特有的 Wi-Fi 原因代码：AP 连接失败。  |

### 与密码错误有关的 Wi-Fi 原因代码

下表罗列了与密码错误相关的 Wi-Fi 原因代码。

| 原因代码                   | 数值  | 描述  |
|------------------------|-----|---|
| 4WAY_HANDSHAKE_TIMEOUT | 204 | 四次握手超时。STA 在连接加密的 AP 的时候输入了错误的密码  |
| NO_AP_FOUND            | 204 | 密码错误会出现这个原因代码的场景有如下两个： <ul style="list-style-type: none"> <li>• STA 在连接加密的 AP 的时候没有输入密码</li> <li>• STA 在连接非加密的 AP 的时候输入了密码</li> </ul> |
| HANDSHAKE_TIMEOUT      | 204 | 握手超时。   |

### 与低 RSSI 有关的 Wi-Fi 原因代码

下表罗列了与低 RSSI 相关的 Wi-Fi 原因代码。

| 原因代码              | 数值  | 描述                           |
|-------------------|-----|------------------------------|
| NO_AP_FOUND       | 204 | 低 RSSI 导致 station 无法扫描到目标 AP |
| HANDSHAKE_TIMEOUT | 204 | 握手超时。                        |

#### 4.37.11 找到多个 AP 时的 ESP32-S3 Wi-Fi station 连接

该场景与 *ESP32-S3 Wi-Fi station 连接场景* 相似，不同之处在于该场景中不会产生 *WIFI\_EVENT\_STA\_DISCONNECTED* 事件，除非 station 无法连接所有找到的 AP。

#### 4.37.12 Wi-Fi 重新连接

出于多种原因，station 可能会断开连接，例如：连接的 AP 重新启动等。应用程序应负责重新连接。推荐使用的方法为：在接收到 *WIFI\_EVENT\_STA\_DISCONNECTED* 事件后调用函数 `esp_wifi_connect()`。

但有时，应用程序需要更复杂的方式进行重新连接：

- 如果断开连接事件是由调用函数 `esp_wifi_disconnect()` 引发的，那么应用程序可能不希望进行重新连接。
- 如果 station 随时可能调用函数 `esp_wifi_scan_start()` 开始扫描，此时就需要一个更佳的重新连接方法，请参阅 [连接 Wi-Fi 时扫描](#)。

另一点需要注意的是，如果存在多个具有相同 SSID 的 AP，那么重新连接后可能不会连接到之前的同一个 AP。重新连接时，station 将永远选择最佳的 AP 进行连接。

#### 4.37.13 Wi-Fi beacon 超时

ESP32-S3 使用 beacon 超时机制检测 AP 是否活跃。如果 station 在 inactive 时间内未收到所连接 AP 的 beacon，将发生 beacon 超时。inactive 时间通过调用函数 `esp_wifi_set_inactive_time()` 设置。

beacon 超时发生后，station 将向 AP 发送 5 个 probe request，如果仍未从 AP 接收到 probe response 或 beacon，station 将与 AP 断开连接并产生 *WIFI\_EVENT\_STA\_DISCONNECTED* 事件。

需要注意的是，扫描过程中会重置 beacon 超时所使用的定时器，即扫描过程会影响 *WIFI\_EVENT\_STA\_BEACON\_TIMEOUT* 事件的触发。

### 4.37.14 ESP32-S3 Wi-Fi 配置

使能 Wi-Fi NVS 时，所有配置都将存储到 flash 中；反之，请参阅 *Wi-Fi NVS Flash*。

#### Wi-Fi 模式

调用函数 `esp_wifi_set_mode()` 设置 Wi-Fi 模式。

| 模式               | 描述   |
|------------------|--|
| WIFI_MODE_NULL   | NULL 模式：此模式下，内部数据结构不分配给 station 和 AP，同时，station 和 AP 接口不会为发送/接收 Wi-Fi 数据进行初始化。通常，此模式用于 Sniffer，或者您不想通过调用函数 <code>esp_wifi_deinit()</code> 卸载整个 Wi-Fi 驱动程序来同时停止 station 和 AP。 |
| WIFI_MODE_STA    | Station 模式：此模式下， <code>esp_wifi_start()</code> 将初始化内部 station 数据，同时 station 接口准备发送/接收 Wi-Fi 数据。调用函数 <code>esp_wifi_connect()</code> 后，station 将连接到目标 AP。                     |
| WIFI_MODE_AP     | AP 模式：在此模式下， <code>esp_wifi_start()</code> 将初始化内部 AP 数据，同时 AP 接口准备发送/接收 Wi-Fi 数据。随后，Wi-Fi 驱动程序开始广播 beacon，AP 即可与其它 station 连接。   |
| WIFI_MODE_STA_AP | Station/AP 共存模式：在此模式下，函数 <code>esp_wifi_start()</code> 将同时初始化 station 和 AP。该步骤在 Station 模式和 AP 模式下完成。请注意 ESP Station 所连外部 AP 的信道优先于 ESP AP 信道。                               |

#### Station 基本配置

API `esp_wifi_set_config()` 可用于配置 station。配置的参数信息会保存到 NVS 中。下表详细介绍了各个字段。

| 字段          | 描述  |
|-------------|---|
| ssid        | station 想要连接的目标 AP 的 SSID。  |
| password    | 目标 AP 的密码。  |
| scanmode    | 在 WIFI_FAST_SCAN 模式下，扫描到一个匹配的 AP 时即结束。WIFI_ALL_CHANNEL_SCAN 模式下，在所有信道扫描所有匹配的 AP。默认扫描模式是 WIFI_FAST_SCAN。   |
| bssid_set   | 如果 bssid_set 为 0，station 连接 SSID 与 “ssid” 字段相同的 AP，同时忽略字段 “bssid”。其他情况下，station 连接 SSID 与 “ssid” 字段相同、BSSID 与 “bssid” 字段也相同的 AP。  |
| bssid       | 只有当 bssid_set 为 1 时有效。见字段 “bssid_set”。  |
| channel     | 该字段为 0 时，station 扫描信道 1~N 寻找目标 AP；否则，station 首先扫描值与 “channel” 字段相同的信道，再扫描其他信道。比如，当该字段设置为 3 时，扫描顺序为 3, 1, 2, 4, …; N。如果您不知道目标 AP 在哪个信道，请将该字段设置为 0。   |
| sort_method | 该字段仅用于 WIFI_ALL_CHANNEL_SCAN 模式。如果设置为 WIFI_CONNECT_AP_BY_SIGNAL，所有匹配的 AP 将会按照信号强度排序，信号最好的 AP 会被首先连接。比如，如果 station 想要连接 ssid 为 “apxx” 的 AP，且扫描到两个这样的 AP。第一个 AP 的信号为 -90 dBm，第二个 AP 的信号为 -30 dBm，station 首先连接第二个 AP。除非失败，才会连接第一个。如果设置为 WIFI_CONNECT_AP_BY_SECURITY，所有匹配的 AP 将会按照安全性排序。比如，如果 station 想要连接 ssid 为 “apxx” 的 AP，并且扫描到两个这样的 AP。第一个 AP 为开放式，第二个 AP 为 WPA2 加密，station 首先连接第二个 AP。除非失败，才会连接第一个。 |
| threshold   | 该字段用来筛选找到的 AP，如果 AP 的 RSSI 或安全模式小于配置的阈值，则不会被连接。如果 RSSI 设置为 0，则取 RSSI 的默认阈值 -127 dBm。如果 authmode 设置为 0，则取 authmode 默认阈值无授权。  |

**注意：**WEP/WPA 安全模式在 IEEE802.11-2016 协议中已弃用，建议不要使用。可使用 authmode 阈值代替，通过将 threshold.authmode 设置为 WIFI\_AUTH\_WPA2\_PSK 使用 WPA2 模式

## AP 基本配置

API `esp_wifi_set_config()` 可用于配置 AP。配置的参数信息会保存到 NVS 中。下表详细介绍了各个字段。

| 字段              | 描述   |
|-----------------|--|
| ssid            | 指 AP 的 SSID。如果 ssid[0] 和 ssid[1] 均为 0xFF, AP 默认 SSID 为 ESP_aabbcc, "aabbcc" 是 AP MAC 的最后三个字节。  |
| password        | AP 的密码。如果身份验证模式为 WIFI_AUTH_OPEN, 此字段将被忽略。  |
| ssid_len        | SSID 的长度。如果 ssid_len 为 0, 则检查 SSID 直至出现终止字符。如果 ssid_len 大于 32, 请更改为 32, 或者根据 ssid_len 设置 SSID 长度。  |
| channel         | AP 的信道。如果信道超出范围, Wi-Fi 驱动程序将默认该信道为信道 1。所以, 请确保信道在要求的范围内。有关详细信息, 请参阅 <a href="#">Wi-Fi 国家/地区代码</a> 。  |
| authmode        | ESP AP 的身份验证模式。目前, ESP AP 不支持 AUTH_WEP。如果 authmode 是一个无效值, AP 默认该值为 WIFI_AUTH_OPEN。  |
| ssid_hidden     | 如果 ssid_hidden 为 1, AP 不广播 SSID。若为其他值, 则广播。  |
| max_connection  | 允许连接 station 的最大数目, 默认值是 10。目前, ESP Wi-Fi 支持 15 (ESP_WIFI_MAX_CONN_NUM) 个 Wi-Fi 连接。请注意, ESP AP 和 ESP-NOW 共享同一块加密硬件 keys, 因此 max_connection 参数将受到 <code>CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM</code> 的影响。加密硬件 keys 的总数是 17, 如果 <code>CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM</code> 小于等于 2, 那么 max_connection 最大可以设置为 15, 否则 max_connection 最大可以设置为 $(17 - CONFIG\_ESP\_WIFI\_ESPNOW\_MAX\_ENCRYPT\_NUM)$ 。 |
| beacon_interval | beacon 间隔。值为 100 ~ 60000 ms, 默认值为 100 ms。如果该值不在上述范围, AP 默认取 100 ms。  |

## Wi-Fi 协议模式

目前, ESP-IDF 支持以下协议模式:

| 协议模式         | 描述  |
|--------------|---|
| 802.11b      | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B)</code> , 将 station/AP 设置为仅 802.11b 模式。   |
| 802.11bg     | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G)</code> , 将 station/AP 设置为 802.11bg 模式。   |
| 802.11g      | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G)</code> 和 <code>esp_wifi_config_11b_rate(ifx, true)</code> , 将 station/AP 设置为 802.11g 模式。                     |
| 802.11bgn    | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11GN)</code> , 将 station/AP 设置为 802.11bgn 模式。   |
| 802.11gn     | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11GN)</code> 和 <code>esp_wifi_config_11b_rate(ifx, true)</code> , 将 station/AP 设置为 802.11gn 模式。 |
| 802.11 BGNLR | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11GN WIFI_PROTOCOL_LR)</code> , 将 station/AP 设置为 802.11bgn 和 LR 模式。                             |
| 802.11 LR    | 调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_LR)</code> , 将 station/AP 设置为 LR 模式。<br>此模式是乐鑫的专利模式, 可以达到 1 公里视线范围。请确保 station 和 AP 同时连接至 ESP 设备。                                   |

## 长距离 (LR)

长距离 (LR) 模式是乐鑫的一项专利 Wi-Fi 模式, 可达到 1 公里视线范围。与传统 802.11b 模式相比, 接收灵敏度更高, 抗干扰能力更强, 传输距离更长。

**LR 兼容性** 由于 LR 是乐鑫的独有 Wi-Fi 模式，只有 ESP32-S3 设备才能传输和接收 LR 数据。也就是说，如果连接的设备不支持 LR，ESP32-S3 设备则不会以 LR 数据速率传输数据。可通过配置适当的 Wi-Fi 模式使您的应用程序实现这一功能。如果协商的模式支持 LR，ESP32-S3 可能会以 LR 速率传输数据，否则，ESP32-S3 将以传统 Wi-Fi 数据速率传输所有数据。

下表是 Wi-Fi 模式协商：

| APSTA | BGN | BG | B | BGNLR | BGLR | BLR | LR |
|-------|-----|----|---|-------|------|-----|----|
| BGN   | BGN | BG | B | BGN   | BG   | B   | .  |
| BG    | BG  | BG | B | BG    | BG   | B   | .  |
| B     | B   | B  | B | B     | B    | B   | .  |
| BGNLR | .   | .  | . | BGNLR | BGLR | BLR | LR |
| BGLR  | .   | .  | . | BGLR  | BGLR | BLR | LR |
| BLR   | .   | .  | . | BLR   | BLR  | BLR | LR |
| LR    | .   | .  | . | LR    | LR   | LR  | LR |

上表中，行是 AP 的 Wi-Fi 模式，列是 station 的 Wi-Fi 模式。”-” 表示 AP 和 station 的 Wi-Fi 模式不兼容。

根据上表，得出以下结论：

- 对于已使能 LR 的 ESP32-S3 AP，由于不是以 LR 模式发送 beacon，因此与传统的 802.11 模式不兼容。
- 对于已使能 LR 且并非仅 LR 模式的 ESP32-S3 station，与传统 802.11 模式兼容。
- 如果 station 和 AP 都是 ESP32-S3 设备，并且两者都使能 LR 模式，则协商的模式支持 LR。

如果协商的 Wi-Fi 模式同时支持传统的 802.11 模式和 LR 模式，则 Wi-Fi 驱动程序会在不同的 Wi-Fi 模式下自动选择最佳数据速率，应用程序无需任何操作。

**LR 对传统 Wi-Fi 设备的影响** 以 LR 速率进行的数据传输不会影响传统 Wi-Fi 设备，因为：

- LR 模式下的 CCA 和回退过程符合 802.11 协议。
- 传统的 Wi-Fi 设备可以通过 CCA 检测 LR 信号并进行回退。

也就是说，LR 模式下传输效果与 802.11b 模式相似。

**LR 传输距离** LR 的接收灵敏度比传统的 802.11B 模式高 4 dB，理论上，传输距离约为 802.11B 的 2 至 2.5 倍。

**LR 吞吐量** 因为原始 PHY 数据传输速率为 1/2 Mbps 和 1/4 Mbps，LR 的吞吐量有限。

**何时使用 LR** 通常使用 LR 的场景包括：

- AP 和 station 都是乐鑫设备。
- 需要长距离 Wi-Fi 连接和数据传输。
- 数据吞吐量要求非常小，例如远程设备控制等。

## Wi-Fi 国家/地区代码

调用 `esp_wifi_set_country()`，设置国家/地区信息。下表详细介绍了各个字段，请在配置这些字段之前参考当地的 2.4 GHz RF 操作规定。

| 字段     | 描述  |
|--------|---|
| cc[3]  | 国家/地区代码字符串，此属性标识 station/AP 位于的国家/地区或非国家/地区实体。如果是一个国家/地区，该字符串的前两个八位字节是 ISO/IEC3166-1 中规定的国家/地区两位字母代码。第三个八位字节应是下述之一： <ul style="list-style-type: none"> <li>• ASCII 码空格字符，代表 station/AP 所处国家/地区的规定允许当前频段所需的所有环境。</li> <li>• ASCII 码 ‘O’ 字符，代表 station/AP 所处国家/地区的规定仅允许室外环境。</li> <li>• ASCII 码 ‘I’ 字符，代表 station/AP 所处国家/地区的规定仅允许室内环境。</li> <li>• ASCII 码 ‘X’ 字符，代表 station/AP 位于非国家/地区实体。非国家实体的前两个八位字节是两个 ASCII 码 ‘XX’ 字符。</li> <li>• 当前使用的操作类表编号的二进制形式。见 IEEE Std 802.11-2020 附件 E。</li> </ul> |
| schan  | 起始信道，station/AP 所处国家/地区规定的最小信道值。  |
| nchan  | 规定的总信道数，比如，如果 schan=1，nchan=13，那么 station/AP 可以从信道 1 至 13 发送数据。   |
| policy | 国家/地区策略，当配置的国家/地区信息与所连 AP 的国家/地区信息冲突时，该字段决定使用哪一信息。更多策略相关信息，可参见下文。   |

默认国家/地区信息为：

```
wifi_country_t config = {
    .cc = "CN",
    .schan = 1,
    .nchan = 13,
    .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

如果 Wi-Fi 模式为 station/AP 共存模式，则它们配置的国家/地区信息相同。有时，station 所连 AP 的国家/地区信息与配置的不同。例如，配置的 station 国家/地区信息为：

```
wifi_country_t config = {
    .cc = "JP",
    .schan = 1,
    .nchan = 14,
    .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

但所连 AP 的国家/地区信息为：

```
wifi_country_t config = {
    .cc = "CN",
    .schan = 1,
    .nchan = 13,
};
```

此时，使用所连 AP 的国家/地区信息。

下表描述了在不同 Wi-Fi 模式和不同国家/地区策略下使用的国家/地区信息，并描述了对主动扫描的影响。

| Wi-Fi 模式        | 策略                          | 描述  |
|-----------------|-----------------------------|---|
| station 模式      | WIFI_COUNTRY_POLICY_DEFAULT | 如果 AP 的 beacon 中有国家/地区的 IE，使用的国家/地区信息为 beacon 中的信息，否则，使用默认信息。<br>扫描时：<br>主动扫描信道 1 至信道 11，被动扫描信道 12 至信道 14。<br>请记住，如果带有隐藏 SSID 的 AP 和 station 被设置在被动扫描信道上，被动扫描将无法找到该 AP。也就是说，如果应用程序希望在每个信道中找到带有隐藏 SSID 的 AP，国家/地区信息应该配置为 WIFI_COUNTRY_POLICY_MANUAL。 |
| station 模式      | WIFI_COUNTRY_POLICY_MANUAL  | 总是使用配置的国家/地区信息。<br>扫描时：<br>主动扫描信道 schan 至信道 schan+nchan-1。  |
| AP 模式           | WIFI_COUNTRY_POLICY_DEFAULT | 总是使用配置的国家/地区信息。   |
| AP 模式           | WIFI_COUNTRY_POLICY_MANUAL  | 总是使用配置的国家/地区信息。   |
| station/AP 共存模式 | WIFI_COUNTRY_POLICY_AUTO    | station 与 station 模式、WIFI_COUNTRY_POLICY_AUTO 策略下使用的国家/地区信息相同。如果 station 不连接任何外部 AP，AP 使用配置的国家/地区信息。如果 station 连接一个外部 AP，该 AP 的国家/地区信息与该 station 相同。  |
| station/AP 共存模式 | WIFI_COUNTRY_POLICY_MANUAL  | station 与 station 模式、WIFI_COUNTRY_POLICY_MANUAL 策略下使用的国家/地区信息相同。该 AP 与 AP 模式、WIFI_COUNTRY_POLICY_MANUAL 策略下使用的国家/地区信息相同。  |

**主信道** AP 模式下，AP 的信道定义为主信道。Station 模式下，station 所连 AP 的信道定义为主信道。Station/AP 共存模式下，AP 和 station 的主信道必须相同。如果不同，station 的主信道始终优先。比如，初始时，AP 位于信道 6，但 station 连接信道 9 的 AP。因为 station 的主信道具有优先性，该 AP 需要将信道从 6 切换至 9，确保与 station 主信道相同。切换信道时，SoftAP 模式下的 ESP32-S3 将使用信道切换公告 (CSA) 通知连接的 station。支持信道切换的 station 将直接通过，无需与 SoftAP 断连再重新连接。

### Wi-Fi 供应商 IE 配置

默认情况下，所有 Wi-Fi 管理帧都由 Wi-Fi 驱动程序处理，应用程序不需要任何操作。但是，某些应用程序可能需要处理 beacon、probe request、probe response 和其他管理帧。例如，如果在管理帧中插入一些只针对供应商的 IE，则只有包含此 IE 的管理帧才能得到处理。ESP32-S3 中，`esp_wifi_set_vendor_ie()` 和 `esp_wifi_set_vendor_ie_cb()` 负责此类任务。

### 4.37.15 Wi-Fi 安全性

除了传统的安全保障方法 (WEP/WPA-TKIP/WPA2-CCMP)，ESP32-S3 Wi-Fi 如今还支持最先进的安全协议，即基于 802.11w 标准的“受保护的管理帧” (PMF) 和 Wi-Fi Protected Access 3 (WPA3-Personal) 技术。PMF 与 WPA3 一道，提供更好的隐私性，也能更强烈地抵御传统模式下的已知攻击。

#### 受保护的管理帧 (PMF)

在 Wi-Fi 中，非 AP station 使用 beacon、探测器、(de)authentication、(dis)association 等管理帧来扫描和连接 AP。与数据帧不同，这些帧发送时未加密。攻击者可以使用窃听和数据包注入等方式在恰当的时间发送虚假的 (de)authentication 和 (dis)association 帧，如果未受保护的管理帧发生改变，将出现以下攻击。

- 在攻击者范围内对一个或所有 client 进行 DOS 攻击。
- 通过发送关联请求取消 AP 端的现有关联。
- 如果 PSK 遭到破坏，强制 client 再次执行 4 次握手，以获得 PTK。
- 从关联请求获取隐藏网络的 SSID。
- 强制 client 从合法 AP 中 (de)authentication，并关联到流氓 AP，发起中间人攻击。

PMF 通过对单播管理帧进行加密，并检查广播管理帧的完整性，阻止上述攻击。其中包括 (de)authentication、(dis)association 和强奸的管理帧。PMF 同样提供“安全关联”(SA) 拆解机制，阻止欺骗 association/authentication frame 断开已连接的 client。

关于 PMF，ESP32-S3 支持以下三种操作模式。

- 不支持 PMF：此模式下，ESP32-S3 向 AP 表示在关联过程中不能支持管理保护。实际上，此模式下的安全性与传统模式相同。
- 支持但未要求使用 PMF：此模式下，ESP32-S3 向 AP 表示能够支持 PMF。如果 AP 授权 PMF 或至少能支持 PMF，将使用管理保护。
- 支持且需要 PMF：此模式下，如果 AP 支持 PMF，ESP32-S3 将仅连接该 AP。如果不支持，ESP32-S3 将拒绝连接该 AP。

通过在 `pmf_cfg` 参数中设置适当标志，`esp_wifi_set_config()` 可以用来配置 PMF 模式。目前，仅 station 模式支持 PMF。

### WPA3-Personal

Wi-Fi Protected Access-3 (WPA3) 是一套增强 Wi-Fi 接入安全性的措施，旨在取代目前的 WPA2 标准。为了提供更强健的认证方式，WPA3 采用了等值同时认证 (SAE) 算法，即基于 Diffie-Hellman 密钥交换的密码认证密钥协议方法。与 WPA2 不同，该技术可以抵御离线字典攻击，即攻击者试图在没有任何进一步网络交互的情况下，根据捕获的 4 次握手来确定共享密码。WPA3 还提供前向保密功能，即数据传输后，即使密码泄露，也无法对捕获的数据进行解密。更多详细信息，请见 Wi-Fi 联盟官方网站 [Security](#) 一章。

要启用 WPA3-Personal，请在 `menuconfig` 中选择“Enable WPA3-Personal”。启用后，如果 AP 支持，ESP32-S3 会使用 SAE 进行身份认证。由于 WPA3 强制要求 PMF，ESP32-S3 要使用 WPA3 模式，至少应该将 PMF 模式设置为“PMF capable, but not required”（支持但未要求使用 PMF）。应用程序的安全模式已经选用最高级别，因此开发者无需担心。请注意，使用 WPA3 时，Wi-Fi 协议栈大小要求将增加约 3 k。目前，仅 Station 模式支持 WPA3。

## 4.37.16 ESP32-S3 Wi-Fi 节能模式

### Station 睡眠

目前，ESP32-S3 Wi-Fi 支持 Modem-sleep 模式，该模式是 IEEE 802.11 协议中的传统节能模式。仅 Station 模式支持该模式，station 必须先连接到 AP。如果启用了 Modem-sleep 模式，station 将定期在活动状态和睡眠状态之间切换。在睡眠状态下，RF、PHY 和 BB 处于关闭状态，以减少功耗。Modem-sleep 模式下，station 可以与 AP 保持连接。

Modem-sleep 模式包括最小和最大节能模式。在最小节能模式下，每个 DTIM 间隔，station 都将唤醒以接收 beacon。广播数据在 DTIM 之后传输，因此不会丢失。但是，由于 DTIM 间隔长短由 AP 决定，如果该间隔时间设置较短，则省电效果不大。

在最大节能模式下，每个监听间隔，station 都将唤醒以接收 beacon。可以设置该监听间隔长于 AP 的 DTIM 周期。在 DTIM 期间内，station 可能处于睡眠状态，广播数据会丢失。如果监听间隔较长，则可以节省更多电量，但广播数据更容易丢失。连接 AP 前，可以通过调用 API `esp_wifi_set_config()` 配置监听间隔。

调用 `esp_wifi_init()` 后，调用 `esp_wifi_set_ps(WIFI_PS_MIN_MODEM)` 可启用 Modem-sleep 最小节能模式。调用 `esp_wifi_set_ps(WIFI_PS_MAX_MODEM)` 可启用 Modem-sleep 最大节能模式。station 连接到 AP 时，Modem-sleep 模式将启动。station 与 AP 断开连接时，Modem-sleep 模式将停止。

调用 `esp_wifi_set_ps(WIFI_PS_NONE)` 可以完全禁用 Modem-sleep 模式。禁用会增大功耗，但可以最大限度减少实时接收 Wi-Fi 数据的延迟。启用 Modem-sleep 时，接收 Wi-Fi 数据的延迟时间可能与

DTIM 周期（最小节能模式）或监听间隔（最大节能模式）相同。在 Wi-Fi 与 Bluetooth LE 共存模式下，无法完全禁用 modem-sleep 模式。

默认的 Modem-sleep 模式是 WIFI\_PS\_MIN\_MODEM。

## AP 睡眠

目前，ESP32-S3 AP 不支持 Wi-Fi 协议中定义的所有节能功能。具体来说，AP 只缓存所连 station 单播数据，不缓存组播数据。如果 ESP32-S3 AP 所连的 station 已使能节能功能，可能发生组播数据包丢失。

未来，ESP32-S3 AP 将支持所有节能功能。

### 4.37.17 ESP32-S3 Wi-Fi 吞吐量

下表是我们在 Espressif 实验室和屏蔽箱中获得的最佳吞吐量结果。

| 类型/吞吐量            | 实验室空气状况   | 屏蔽箱               | 测试工具          | IDF 版本 (commit ID) |
|-------------------|-----------|-------------------|---------------|--------------------|
| 原始 802.11 数据包接收数据 | N/A       | <b>130 MBit/s</b> | 内部工具          | N/A                |
| 原始 802.11 数据包发送数据 | N/A       | <b>130 MBit/s</b> | 内部工具          | N/A                |
| UDP 接收数据          | 30 MBit/s | 88 MBit/s         | iperf example | 15575346           |
| UDP 发送数据          | 30 MBit/s | 98 MBit/s         | iperf example | 15575346           |
| TCP 接收数据          | 20 MBit/s | 73 MBit/s         | iperf example | 15575346           |
| TCP 发送数据          | 20 MBit/s | 83 MBit/s         | iperf example | 15575346           |

使用 iperf example 测试吞吐量时，sdkconfig 是:idf\_file:‘示例/wifi/iperf/sdkconfig.defaults.esp32s3’。

### 4.37.18 Wi-Fi 80211 数据包发送

**重要说明：** API `esp_wifi_80211_tx()` 在 IDF 2.1 中不可用，即将发布的版本将可以使用。

`esp_wifi_80211_tx()` API 可用于：

- 发送 beacon、probe request、probe response 和 action 帧。
- 发送非 QoS 数据帧。

不能用于发送加密或 QoS 帧。

#### 使用 `esp_wifi_80211_tx()` 的前提条件

- Wi-Fi 模式为 station 模式，AP 模式，或 station/AP 共存模式。
- API `esp_wifi_set_promiscuous(true)` 或 `esp_wifi_start()`，或者二者都返回 ESP\_OK。这是为确保在调用函数 `esp_wifi_80211_tx()` 前，Wi-Fi 硬件已经初始化。对于 ESP32-S3，`esp_wifi_set_promiscuous(true)` 和 `esp_wifi_start()` 都可以触发 Wi-Fi 硬件初始化。
- 提供正确的 `esp_wifi_80211_tx()` 参数。

## 传输速率

- 默认传输速率为 1 Mbps。
- 可以通过函数 `esp_wifi_config_80211_tx_rate()` 设置任意速率。
- 可以通过函数 `esp_wifi_set_bandwidth()` 设置任意带宽。

## 在不同情况下需要避免的副作用

理论上，如果不考虑 API 对 Wi-Fi 驱动程序或其他 station 或 AP 的副作用，可以通过空中发送一个原始的 802.11 数据包，包括任何目的地址的 MAC、任何源地址的 MAC、任何 BSSID、或任何其他类型的数据包。但是，一个具有强健、有用的应用程序应该避免这种副作用。下表针对如何避免 `esp_wifi_80211_tx()` 的副作用提供了一些提示或建议。

| 场景         | 描述  |
|------------|---|
| 无 Wi-Fi 连接 | <p>在这种情况下，因为没有 Wi-Fi 连接，Wi-Fi 驱动程序不会受到副作用影响。如果 <code>en_sys_seq==true</code>，则 Wi-Fi 驱动程序负责序列控制。如果 <code>en_sys_seq==false</code>，应用程序需要确保缓冲区的序列正确。</p> <p>理论上，MAC 地址可以是任何地址。但是，这样可能会影响其他使用相同 MAC/BSSID 的 station/AP。例如，AP 模式下，应用程序调用函数 <code>esp_wifi_80211_tx()</code> 发送带有 BSSID == <code>mac_x</code> 的 beacon，但是 <code>mac_x</code> 并非 AP 接口的 MAC。而且，还有另一个 AP（我们称之为“other-AP”）的 bssid 是 <code>mac_x</code>。因此，连接到“other-AP”的 station 无法分辨 beacon 来自“other-AP”还是 <code>esp_wifi_80211_tx()</code>，就会出现“意外行为”。</p> <p>为了避免上述副作用，我们建议：</p> <ul style="list-style-type: none"> <li>-如果在 Station 模式下调用函数 <code>esp_wifi_80211_tx()</code>，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 station 接口的 MAC。</li> <li>-如果在 AP 模式下调用函数 <code>esp_wifi_80211_tx</code>，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 AP 接口的 MAC。</li> </ul> <p>上述建议仅供避免副作用，在有充分理由的情况下可以忽略。</p>                                    |
| 有 Wi-Fi 连接 | <p>当 Wi-Fi 已连接，且序列由应用程序控制，应用程序可能会影响整个 Wi-Fi 连接的序列控制。因此，<code>en_sys_seq</code> 要为 <code>true</code>，否则将返回 <code>ESP_ERR_INVALID_ARG</code>。</p> <p>“无 Wi-Fi 连接”情况下的 MAC 地址建议也适用于此情况。如果 Wi-Fi 模式是 Station 模式，MAC 的地址 1 是 station 所连 AP 的 MAC，地址 2 是 station 接口的 MAC，那么就称数据包是从 station 发送到 AP。另一方面，如果 Wi-Fi 模式是 AP 模式，且 MAC 地址 1 是该 AP 所连 station 的 MAC，地址 2 是 AP 接口的 MAC，那么就称数据包是从 AP 发送到 station。为避免与 Wi-Fi 连接冲突，可采用以下检查方法：</p> <ul style="list-style-type: none"> <li>-如果数据包类型是数据，且是从 station 发送到 AP，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 1，FromDS 位为 0，否则，Wi-Fi 驱动程序不接受该数据包。</li> <li>-如果数据包类型是数据，且是从 AP 发送到 station，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 0，FromDS 位为 1，否则，Wi-Fi 驱动程序不接受该数据包。</li> <li>-如果数据包是从 station 发送到 AP，或从 AP 到 station，Power Management、More Data 和 Re-Transmission 位应该为 0，否则，Wi-Fi 驱动程序不接受该数据包。</li> </ul> <p>如果任何检查失败，将返回 <code>ESP_ERR_INVALID_ARG</code>。</p> |

### 4.37.19 Wi-Fi Sniffer 模式

Wi-Fi Sniffer 模式可以通过 `esp_wifi_set_promiscuous()` 使能。如果使能 Sniffer 模式，可以向应用程序转储以下数据包。

- 802.11 管理帧
- 802.11 数据帧，包括 MPDU、AMPDU、AMSDU 等
- 802.11 MIMO 帧，Sniffer 模式仅转储 MIMO 帧的长度。
- 802.11 控制帧

不可以向应用程序转储以下数据包。

- 802.11 错误帧，如有 CRC 错误的帧等。

对于 Sniffer 模式可以转储的帧，应用程序可以另外使用 `esp_wifi_set_promiscuous_filter()` 和 `esp_wifi_set_promiscuous_ctrl_filter()` 决定筛选哪些特定类型的数据包。应用程序默认筛选所有 802.11 数据和管理帧。

可以在 `WIFI_MODE_NULL`、`WIFI_MODE_STA`、`WIFI_MODE_AP`、`WIFI_MODE_APSTA` 等 Wi-Fi 模式下使能 Wi-Fi Sniffer 模式。也就是说，当 station 连接到 AP，或者 AP 有 Wi-Fi 连接时，就可以使能。请注意，Sniffer 模式对 station/AP Wi-Fi 连接的吞吐量有 **很大影响**。通常，除非有特别原因，当 station/AP Wi-Fi 连接出现大量流量，不应使能。

该模式下还应注意回调函数 `wifi_promiscuous_cb_t` 的使用。该回调将直接在 Wi-Fi 驱动程序任务中进行，所以如果应用程序需处理大量过滤的数据包，建议在回调中向应用程序任务发布一个事件，把真正的工作推迟到应用程序任务中完成。

### 4.37.20 Wi-Fi 多根天线

下图描述 Wi-Fi 多根天线的选择过程：

ESP32-S3 通过外部天线开关，最多支持 16 根天线。天线开关最多可由四个地址管脚控制 - `antenna_select[0:3]`。向 `antenna_select[0:3]` 输入不同的值，以选择不同的天线。例如，输入值 ‘0b1011’ 表示选中天线 11。 `antenna_select[3:0]` 的默认值为 “0b0000”，表示默认选择了天线 0。

四个高电平有效 `antenna_select` 管脚有多达四个 GPIO 连接。ESP32-S3 可以通过控制 GPIO[0:3] 选择天线。API `esp_wifi_set_ant_gpio()` 用于配置 `antenna_selects` 连接哪些 GPIO。如果 GPIO[x] 连接到 `antenna_select[x]`，`gpio_config->gpio_cfg[x].gpio_select` 应设置为 1，且要提供 `gpio_config->gpio_cfg[x].gpio_num` 的值。

天线开关的具体实现不同，`antenna_select[0:3]` 的输入值中可能存在非法值，即 ESP32-S3 通过外部天线开关支持的天线数可能小于 16 根。例如，ESP32-WROOM-DA 使用 RTC6603SP 作为天线开关，仅支持 2 根天线。两个天线选择输入管脚为高电平有效，连接到两个 GPIO。’0b01’ 表示选中天线 0，’0b10’ 表示选中天线 1。输入值 ‘0b00’ 和 ‘0b11’ 为非法值。

尽管最多支持 16 根天线，发送和接收数据时，最多仅能同时使能两根天线。API `esp_wifi_set_ant()` 用于配置使能哪些天线。

使能天线后，选择算法的过程同样可由 `esp_wifi_set_ant()` 配置。接收/发送数据源的天线模式可以是 `WIFI_ANT_MODE_ANT0`、`WIFI_ANT_MODE_ANT1` 或 `WIFI_ANT_MODE_AUTO`。如果天线模式为 `WIFI_ANT_MODE_ANT0`，使能的天线 0 用于接收/发送数据。如果天线模式为 `WIFI_ANT_MODE_ANT1`，使能天线 1 用于接收/发送数据。否则，Wi-Fi 会自动选择使能天线中信号较好的天线。

如果接收数据的天线模式为 `WIFI_ANT_MODE_AUTO`，还需要设置默认天线模式。只有在满足某些条件时，接收数据天线才会切换，例如，如果 RSSI 低于 -65 dBm，或另一根天线信号更好。如果条件不满足，接收数据使用默认天线。如果默认天线模式为 `WIFI_ANT_MODE_ANT1`，则使能的天线 1 是默认接收数据天线，否则是使能的天线 0。

有一些限制情况需要考虑：

- 因为发送数据天线基于 `WIFI_ANT_MODE_AUTO` 类型的接收数据天线选择算法，只有接收数据的天线模式为 `WIFI_ANT_MODE_AUTO` 时，发送数据天线才能设置为 `WIFI_ANT_MODE_AUTO`。
- 目前，Bluetooth® 不支持多根天线功能，请不要使用与多根天线有关的 API。
- 目前不支持 Bluetooth/Bluetooth LE SoftAP 共存模式。

推荐在以下场景中使用多根天线：

- Wi-Fi 模式 `WIFI_MODE_STA` 下，接收/发送数据的天线模式均配置为 `WIFI_ANT_MODE_AUTO`。Wi-Fi 驱动程序自动选择更好的接收/发送数据天线。
- 接收数据天线模式配置为 `WIFI_ANT_MODE_AUTO`。发送数据的天线模式配置为 `WIFI_ANT_MODE_ANT0` 或 `WIFI_ANT_MODE_ANT1`。应用程序可以始终选择指定的天线用于发送数据，也可以执行自身发送数据天线选择算法，如根据信道切换信息选择发送数据的天线模式等。
- 接收/发送数据的天线模式均配置为 `WIFI_ANT_MODE_ANT0` 或 `WIFI_ANT_MODE_ANT1`。

## Wi-Fi 多根天线配置

通常，可以执行以下步骤来配置多根天线：

- 配置 `antenna_selects` 连接哪些 GPIOs，例如，如果支持四根天线，且 GPIO20/GPIO21 连接到 `antenna_select[0]`/`antenna_select[1]`，配置如下所示：

```
wifi_ant_gpio_config_t config = {
    { .gpio_select = 1, .gpio_num = 20 },
    { .gpio_select = 1, .gpio_num = 21 }
};
```

- 配置使能哪些天线、以及接收/发送数据如何使用使能的天线，例如，如果使能了天线 1 和天线 3，接收数据需要自动选择较好的天线，并将天线 1 作为默认天线，发送数据始终选择天线 3。配置如下所示：

```
wifi_ant_config_t config = {
    .rx_ant_mode = WIFI_ANT_MODE_AUTO,
    .rx_ant_default = WIFI_ANT_ANT0,
    .tx_ant_mode = WIFI_ANT_MODE_ANT1,
    .enabled_ant0 = 1,
    .enabled_ant1 = 3
};
```

### 4.37.21 Wi-Fi 信道状态信息

信道状态信息 (CSI) 是指 Wi-Fi 连接的信道信息。ESP32-S3 中，CSI 由子载波的信道频率响应组成，CSI 从发送端接收数据包时开始估计。每个子载波信道频率响应由两个字节的有符号字符记录，第一个字节是虚部，第二个字节是实部。根据接收数据包的类型，信道频率响应最多有三个字段。分别是 LLTF、HT-LTF 和 STBC-HT-LTF。对于在不同状态的信道上接收到的不同类型的数据包，CSI 的子载波索引和总字节数如下表所示。

| 信道    | 辅助信道        | 下          |            |            |        |        |        |            |            | 上      |      |        |            |            |            |      |
|-------|-------------|------------|------------|------------|--------|--------|--------|------------|------------|--------|------|--------|------------|------------|------------|------|
|       |             | 非 HT       | HT         |            |        | 非 HT   | HT     |            | 40 MHz     |        |      | 非 HT   | HT         |            |            |      |
| 数据包信息 | 信号模式        | 20 MHz     | 20 MHz     |            |        | 20 MHz | 20 MHz |            | 40 MHz     |        |      | 20 MHz | 20 MHz     |            | 40 MHz     |      |
|       | STBC        | 非 STBC     | 非 STBC     | STBC       | 非 STBC | 非 STBC | STBC   | 非 STBC     | STBC       | 非 STBC | STBC | 非 STBC | 非 STBC     | STBC       | 非 STBC     | STBC |
| 子载波索引 | LLTF        | 0~31, 32~1 | 0~31, 32~1 | 0~31, 32~1 | 0~63   | 0~63   | 0~63   | 0~63       | 0~63       | -      | -    | -      | -          | -          |            |      |
|       | HT-LTF      | —          | 0~31, 32~1 | 0~31, 32~1 | —      | 0~63   | 0~62   | 0~63, 64~1 | 0~60, 60~1 | —      | -    | -      | 0~63, 64~1 | 0~60, 60~1 |            |      |
|       | STBC-HT-LTF | —          | —          | 0~31, 32~1 | —      | —      | 0~62   | —          | 0~60, 60~1 | —      | —    | -      | 62~1       | —          | 0~60, 60~1 |      |
| 总字节数  |             | 128        | 256        | 384        | 128    | 256    | 380    | 384        | 612        | 128    | 256  | 376    | 384        | 612        |            |      |

表中的所有信息可以在 `wifi_csi_info_t` 结构中找到。

- 辅助信道指 `rx_ctrl` 字段的 `secondary_channel` 字段。
- 数据包的信号模式指 `rx_ctrl` 字段的 `sig_mode` 字段。
- 信道带宽指 `rx_ctrl` 字段中的 `cwb` 字段。
- STBC 指 `rx_ctrl` 字段的 `stbc` 字段。
- 总字节数指 `len` 字段。
- 每个长训练字段 (LTF) 类型对应的 CSI 数据存储在与从 `buf` 字段开始的缓冲区中。每个元素以两个字节的形式存储：虚部和实部。每个元素的顺序与表中的子载波相同。LTF 的顺序是 LLTF、HT-LTF 和 STBC-HT-LTF。但是，根据信道和数据包的信息，3 个 LTF 可能都不存在（见上文）。
- 如果 `wifi_csi_info_t` 的 `first_word_invalid` 字段为 `true`，表示由于 ESP32-S3 的硬件限制，CSI 数据的前四个字节无效。
- 更多信息，如 RSSI，射频的噪声底，接收时间和天线 `rx_ctrl` 领域。

子载波的虚部和实部的使用请参考下表。

| PHY 标准         | 子载波范围      | 导频子载波                        | 子载波个数 (总数/数据子载波)      |
|----------------|------------|------------------------------|-----------------------|
| 802.11a/g      | -26 to +26 | -21, -7, +7, +21             | 52 total, 48 usable   |
| 802.11n, 20MHz | -28 to +28 | -21, -7, +7, +21             | 56 total, 52 usable   |
| 802.11n, 40MHz | -57 to +57 | -53, -25, -11, +11, +25, +53 | 114 total, 108 usable |

#### 备注:

- 对于 STBC 数据包，每个空时流都提供了 CSI，不会出现 CSD（循环移位延迟）。由于附加链上的每一次循环移位为 -200 ns，因为子载波 0 中没有信道频率响应，在 HT-LTF 和 STBC-HT-LTF 中只记录第一空时流的 CSD 角度。CSD[10:0] 是 11 位，范围从  $-\pi$  到  $\pi$ 。
- 如果调用 API `esp_wifi_set_csi_config()` 没有使能 LLTF、HT-LTF 或 STBC-HT-LTF，则 CSI 数据的总字节数会比表中的少。例如，如果没有使能 LLTF 和 HT-LTF，而使能 STBC-HT-LTF，当接收到上述条件、HT、40 MHz 或 STBC 的数据包时，CSI 数据的总字节数为 244 ( $(61+60)*2+2=244$ ，结果对齐为四个字节，最后两个字节无效)。

### 4.37.22 Wi-Fi 信道状态信息配置

要使用 Wi-Fi CSI，需要执行以下步骤。

- 在菜单配置中选择 Wi-Fi CSI。方法是“菜单配置 -> 组件配置 -> Wi-Fi -> Wi-Fi CSI（信道状态信息）”。

- 调用 API `esp_wifi_set_csi_rx_cb()` 设置 CSI 接收回调函数。
- 调用 API `esp_wifi_set_csi_config()` 配置 CSI。
- 调用 API `esp_wifi_set_csi()` 使能 CSI。

CSI 接收回调函数从 Wi-Fi 任务中运行。因此，不要在回调函数中进行冗长的操作。可以将需要的数据发布到队列中，并从一个较低优先级的任务中处理。由于 station 在断开连接时不会收到任何数据包，只有在连接时才会收到来自 AP 的数据包，因此建议通过调用函数 `esp_wifi_set_promiscuous()` 使能 Sniffer 模式接收更多 CSI 数据。

### 4.37.23 Wi-Fi HT20/40

ESP32-S3 支持 Wi-Fi 带宽 HT20 或 HT40，不支持 HT20/40 共存，调用函数 `esp_wifi_set_bandwidth()` 可改变 station/AP 的默认带宽。ESP32-S3 station 和 AP 的默认带宽为 HT40。

Station 模式下，实际带宽首先在 Wi-Fi 连接时协商。只有当 station 和所连 AP 都支持 HT40 时，带宽才为 HT40，否则为 HT20。如果所连的 AP 的带宽发生变化，则在不断开 Wi-Fi 连接的情况下再次协商实际带宽。

同样，在 AP 模式下，在 AP 与所连 station 协商实际带宽。如果 AP 和其中一个 station 支持 HT40，则为 HT40，否则为 HT20。

在 Station/AP 共存模式下，station 和 AP 都可独立配置为 HT20/40。如果 station 和 AP 都协商为 HT40，由于 ESP32-S3 中，station 的优先级总高于 AP，HT40 信道是 station 的信道。例如，AP 的配置带宽为 HT40，配置的主信道为 6，配置的辅助信道为 10。如果，station 所连路由器的主信道为 6、辅助信道为 2，AP 的实际信道将自动更改为主 6 和辅 2。

理论上，HT40 可以获得更大的吞吐量，因为 HT40 的最大原始 PHY 数据速率为 150Mbps，而 HT20 为 72Mbps。但是，如果设备在某些特殊环境中使用，例如，ESP32-S3 周围其他 Wi-Fi 设备过多，HT40 的性能可能会降低。因此，如果应用程序需要支持相同或类似的情况，建议始终将带宽配置为 HT20。

### 4.37.24 Wi-Fi QoS

ESP32-S3 支持 WFA Wi-Fi QoS 认证所要求的所有必备功能。

Wi-Fi 协议中定义了四个 AC（访问类别），每个 AC 有各自的优先级访问 Wi-Fi 信道。此外，还定义了映射规则以映射其他协议的 QoS 优先级，例如 802.11D 或 TCP/IP 到 Wi-Fi AC。

下表描述 ESP32-S3 中 IP 优先级如何映射到 Wi-Fi AC，还指明此 AC 是否支持 AMPDU。该表按优先级降序排列，即 AC\_VO 拥有最高优先级。

| IP 优先级 | Wi-Fi AC            | 是否支持 AMPDU |
|--------|---------------------|------------|
| 6, 7   | AC_VO (Voice)       | 否          |
| 4, 5   | AC_VI (Video)       | 是          |
| 3, 0   | AC_BE (Best Effort) | 是          |
| 1, 2   | AC_BK (Background)  | 是          |

应用程序可以通过套接字选项 `IP_TOS` 配置 IP 优先级使用 QoS 功能。下面是使套接字使用 VI 队列的示例：

```
const int ip_precedence_vi = 4;
const int ip_precedence_offset = 5;
int priority = (ip_precedence_vi << ip_precedence_offset);
setsockopt(socket_id, IPPROTO_IP, IP_TOS, &priority, sizeof(priority));
```

理论上，高优先级的 AC 比低优先级 AC 具有更好的性能，但并非总是如此，下面是一些关于如何使用 Wi-Fi QoS 的建议：

- 可以把一些真正重要的应用程序流量放到 AC\_VO 队列中。避免通过 AC\_VO 队列发送大流量。一方面，AC\_VO 队列不支持 AMPDU，如果流量很大，性能不会优于其他队列。另一方面，可能会影响同样使用 AC\_VO 队列的管理帧。
- 避免使用 AMPDU 支持的、两个以上的不同优先级，比如 socket A 使用优先级 0，socket B 使用优先级 1，socket C 使用优先级 2。因为可能需要更多的内存，不是好的设计。具体来说，Wi-Fi 驱动程序可能会为每个优先级生成一个 Block Ack 会话，如果设置了 Block Ack 会话，则需要更多内存。

### 4.37.25 Wi-Fi AMSDU

ESP32-S3 支持接收和发送 AMSDU。开启 AMSDU 发送比较消耗内存，默认不开启 AMSDU 发送。可通过选项 `CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED` 使能 AMSDU 发送功能，但是使能 AMSDU 发送依赖于 `CONFIG_ESP32S3_SPIRAM_SUPPORT`。

### 4.37.26 Wi-Fi 分片

ESP32-S3 支持 Wi-Fi 接收和发送分片。

### 4.37.27 WPS 注册

在 Wi-Fi 模式 `WIFI_MODE_STA` 或 `WIFI_MODE_APSTA` 下，ESP32-S3 支持 WPS 注册功能。目前，ESP32-S3 支持的 WPS enrollee 类型有 PBC 和 PIN。

### 4.37.28 Wi-Fi 缓冲区使用情况

本节只介绍动态缓冲区配置。

#### 缓冲区配置的重要性

为了获得一个具有强健、高性能的系统，我们需要非常谨慎地考虑内存的使用或配置情况，因为：

- ESP32-S3 的可用内存有限。
- 目前，LwIP 和 Wi-Fi 驱动程序中默认的缓冲区类型是“动态”，意味着 **LwIP 和 Wi-Fi 都与应用程序共享内存**。程序员应该时刻牢记这一点，否则将面临如“堆内存耗尽”等的内存问题。
- “堆耗尽”情况非常危险，会导致 ESP32-S3 出现“未定义行为”。因此，应该为应用程序预留足够的堆内存，防止耗尽。
- Wi-Fi 的吞吐量很大程度上取决于与内存相关的配置，如 TCP 窗口大小、Wi-Fi 接收/发送数据动态缓冲区数量等。
- ESP32-S3 LwIP/Wi-Fi 可能使用的堆内存峰值取决于许多因素，例如应用程序可能拥有的最大 TCP/UDP 连接等。
- 在考虑内存配置时，应用程序所需的总内存也是一个重要因素。

由于这些原因，不存在一个适合所有应用程序的配置。相反，我们必须为每个不同的应用程序考虑不同的内存配置。

#### 动态与静态缓冲区

Wi-Fi 驱动程序中默认的缓存类型是“动态”。大多数情况下，动态缓冲区可以极大地节省内存。但是因为应用程序需要考虑 Wi-Fi 的内存使用情况，会给应用程序编程造成一定的难度。

LwIP 还在 TCP/IP 层分配缓冲区，这种缓冲区分配也是动态的。具体内容，见 [lwIP 文档内存使用和性能部分](#)。

## Wi-Fi 动态缓冲区峰值

Wi-Fi 驱动程序支持多种类型的缓冲区（参考 [Wi-Fi 缓冲区配置](#)）。但本节只介绍 Wi-Fi 动态缓冲的使用方法。Wi-Fi 使用的堆内存峰值是 Wi-Fi 驱动程序 **理论上消耗的最大内存**。通常，该内存峰值取决于：

- 配置的动态接收数据缓冲区数：wifi\_rx\_dynamic\_buf\_num
- 配置的动态发送数据缓冲区数：wifi\_tx\_dynamic\_buf\_num
- Wi-Fi 驱动程序可以接收的最大数据包：wifi\_rx\_pkt\_size\_max
- Wi-Fi 驱动程序可以发送的最大数据包：wifi\_tx\_pkt\_size\_max

因此，Wi-Fi 驱动程序消耗的内存峰值可以用下面的公式计算：

$$\text{wifi\_dynamic\_peek\_memory} = (\text{wifi\_rx\_dynamic\_buf\_num} * \text{wifi\_rx\_pkt\_size\_max}) + (\text{wifi\_tx\_dynamic\_buf\_num} * \text{wifi\_tx\_pkt\_size\_max})$$

一般情况下，不需要关心动态发送数据长缓冲区和超长缓冲区，因为它们是管理帧，对系统的影响很小。

### 4.37.29 如何提高 Wi-Fi 性能

ESP32-S3 Wi-Fi 的性能收到许多参数的影响，各参数之间存在相互制约。如果配置地合理，不仅可以提高性能，还可以增加应用程序的可用内存，提高稳定性。

在本节中，我们将简单介绍 Wi-Fi/LWIP 协议栈的工作模式，并说明各个参数的作用。我们将推荐几种配置等级，您可以根据使用场景选择合适的等级。

#### 协议栈工作模式

图 57: ESP32-S3 数据路径

ESP32-S3 协议栈分为四层，分别为应用层、LWIP 层、Wi-Fi 层和硬件层。

- 在接收过程中，硬件将接收到的数据包放入 DMA 缓冲区，然后依次传送到 Wi-Fi 的接收数据缓冲区、LWIP 的接收数据缓冲区进行相关协议处理，最后传送到应用层。Wi-Fi 的接收数据缓冲区和 LWIP 的接收数据缓冲区默认共享同一个缓冲区。也就是说，Wi-Fi 默认将数据包转发到 LWIP 作为参考。
- 在发送过程中，应用程序首先将要发送的消息复制到 LWIP 层的发送数据缓冲区，进行 TCP/IP 封装。然后将消息发送到 Wi-Fi 层的发送数据缓冲区进行 MAC 封装，最后等待发送。

#### 参数

适当增加上述缓冲区的大小或数量，可以提高 Wi-Fi 性能，但同时，会减少应用程序的可用内存。下面我们将介绍您需要配置的参数：

**接收数据方向:**

- ***CONFIG\_ESP32\_WIFI\_STATIC\_RX\_BUFFER\_NUM*** 该参数表示硬件层的 DMA 缓冲区数量。提高该参数将增加发送方的一次性接收吞吐量，从而提高 Wi-Fi 协议栈处理突发流量的能力。
- ***CONFIG\_ESP32\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM*** 该参数表示 Wi-Fi 层中接收数据缓冲区的数量。提高该参数可以增强数据包的接收性能。该参数需要与 LWIP 层的接收数据缓冲区大小相匹配。
- ***CONFIG\_ESP32\_WIFI\_RX\_BA\_WIN*** 该参数表示接收端 AMPDU BA 窗口的大小，应配置为 ***CONFIG\_ESP32\_WIFI\_STATIC\_RX\_BUFFER\_NUM*** 和 ***CONFIG\_ESP32\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM*** 的二倍数值中较小的数值。
- ***CONFIG\_LWIP\_TCP\_WND\_DEFAULT*** 该参数表示 LWIP 层用于每个 TCP 流的接收数据缓冲区大小，应配置为 ***WIFI\_DYNAMIC\_RX\_BUFFER\_NUM***(KB) 的值，从而实现高稳定性能。同时，在有多个流的情况下，应相应降低该参数。

**发送数据方向:**

- ***CONFIG\_ESP32\_WIFI\_STATIC\_TX\_BUFFER\_NUM*** 该参数表示发送数据缓冲区的类型，建议配置为动态缓冲区，该配置可以充分利用内存。
- ***CONFIG\_ESP32\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM*** 该参数表示 Wi-Fi 层发送数据缓冲区数量。提高该参数可以增强数据包发送的性能。该参数值需要与 LWIP 层的发送数据缓冲区大小相匹配。
- ***CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT*** 该参数表示 LWIP 层用于每个 TCP 流的发送数据缓冲区大小，应配置为 ***WIFI\_DYNAMIC\_TX\_BUFFER\_NUM***(KB) 的值，从而实现高稳定性能。在有多个流的情况下，应相应降低该参数。

**通过在 IRAM 中放置代码优化吞吐量:****缓存:**

- ***CONFIG\_ESP32S3\_INSTRUCTION\_CACHE\_SIZE*** 配置指令缓存的大小。
- ***CONFIG\_ESP32S3\_INSTRUCTION\_CACHE\_LINE\_SIZE*** 配置指令缓存总线的宽度。
- ***CONFIG\_ESP32S3\_ICACHE\_ASSOCIATED\_WAYS*** 配置指令缓存相连方式。
- ***CONFIG\_ESP32S3\_DATA\_CACHE\_SIZE*** 配置数据缓存的大小。
- ***CONFIG\_ESP32S3\_DATA\_CACHE\_LINE\_SIZE*** 配置数据缓存行大小。
- ***CONFIG\_ESP32S3\_DCACHE\_ASSOCIATED\_WAYS*** 配置数据缓存相连方式。

---

**备注:** 上述的缓冲区大小固定为 1.6 KB。

---

**如何配置参数**

ESP32-S3 的内存由协议栈和应用程序共享。

在这里，我们给出了几种配置等级。在大多数情况下，您应根据应用程序所占用内存的大小，选择合适的等级进行参数配置。

下表中未提及的参数应设置为默认值。

| 等级                         | Iperf | 默认    | 最小    |
|----------------------------|-------|-------|-------|
| 可用内存 (KB)                  | 133.9 | 183.9 | 273.6 |
| WIFI_STATIC_RX_BUFFER_NUM  | 24    | 8     | 3     |
| WIFI_DYNAMIC_RX_BUFFER_NUM | 64    | 32    | 6     |
| WIFI_DYNAMIC_TX_BUFFER_NUM | 64    | 32    | 6     |
| WIFI_RX_BA_WIN             | 32    | 16    | 6     |
| TCP_SND_BUF_DEFAULT (KB)   | 64    | 32    | 6     |
| TCP_WND_DEFAULT (KB)       | 64    | 32    | 6     |
| WIFI_IRAM_OPT              | 15    | 15    | 15    |
| WIFI_RX_IRAM_OPT           | 16    | 16    | 16    |
| LWIP_IRAM_OPTIMIZATION     | 13    | 13    | 0     |
| INSTRUCTION_CACHE          | 32    | 32    | 16    |
| INSTRUCTION_CACHE_LINE     | 32    | 32    | 32    |
| INSTRUCTION_CACHE_WAYS     | 8     | 8     | 4     |
| TCP 发送数据吞吐量 (Mbit/s)       | 83.93 | 64.28 | 23.17 |
| TCP 接收数据吞吐量 (Mbit/s)       | 73.98 | 60.39 | 18.11 |
| UDP 发送数据吞吐量 (Mbit/s)       | 98.69 | 96.28 | 48.78 |
| UDP 接收数据吞吐量 (Mbit/s)       | 88.58 | 86.57 | 59.45 |

**备注：** 以上结果使用华硕 RT-N66U 路由器，在屏蔽箱中进行单流测试得出。ESP32-S3 的 CPU 为双核，频率为 240 MHz，flash 为 QIO 模式，频率为 80 MHz。

#### 等级：

- **Iperf 等级** ESP32-S3 极端性能等级，用于测试极端性能。
- **默认等级** IDF\_TARGET\_NAME} 的默认配置等级、兼顾可用内存和性能。
- **最小等级** ESP32-S3 的最小配置等级。协议栈只使用运行所需的内存。适用于对性能没有要求，而应用程序需要大量内存的场景。

#### 使用 PSRAM

PSRAM 一般在应用程序占用大量内存时使用。在该模式下，`CONFIG_ESP32_WIFI_TX_BUFFER` 被强制为静态。`CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM` 表示硬件层 DMA 缓冲区数量，提高这一参数可以增强性能。我们推荐以下 PSRAM 等级。

#### 四线 PSRAM:

| 等级                         | lperf | 默认    | 节省内存  | 最小    |
|----------------------------|-------|-------|-------|-------|
| 可用内存 (KB)                  | 50.3  | 158.7 | 198.2 | 228.9 |
| WIFI_STATIC_RX_BUFFER_NUM  | 24    | 8     | 6     | 4     |
| WIFI_DYNAMIC_RX_BUFFER_NUM | 85    | 64    | 32    | 32    |
| WIFI_STATIC_TX_BUFFER_NUM  | 32    | 32    | 6     | 4     |
| WIFI_RX_BA_WIN             | 32    | 16    | 12    | 禁用    |
| TCP_SND_BUF_DEFAULT (KB)   | 85    | 32    | 32    | 32    |
| TCP_WND_DEFAULT (KB)       | 85    | 32    | 32    | 32    |
| WIFI_IRAM_OPT              | 15    | 15    | 15    | 0     |
| WIFI_RX_IRAM_OPT           | 16    | 16    | 0     | 0     |
| LWIP_IRAM_OPTIMIZATION     | 13    | 0     | 0     | 0     |
| LWIP_UDP_RECVMBOX_SIZE     | 16    | 16    | 16    | 16    |
| INSTRUCTION_CACHE          | 32    | 16    | 16    | 16    |
| INSTRUCTION_CACHE_LINE     | 32    | 16    | 16    | 16    |
| INSTRUCTION_CACHE_WAYS     | 8     | 8     | 8     | 8     |
| DATA_CACHE                 | 64    | 16    | 16    | 16    |
| DATA_CACHE_LINE            | 32    | 32    | 32    | 32    |
| DATA_CACHE_WAYS            | 8     | 8     | 8     | 8     |
| TCP 发送数据吞吐量 (Mbit/s)       | 93.1  | 62.5  | 41.3  | 42.7  |
| TCP 接收数据吞吐量 (Mbit/s)       | 88.9  | 46.5  | 46.2  | 37.9  |
| UDP 发送数据吞吐量 (Mbit/s)       | 106.4 | 106.2 | 60.7  | 50.0  |
| UDP 接收数据吞吐量 (Mbit/s)       | 99.8  | 92.6  | 94.3  | 53.3  |

#### 八线 PSRAM:

| 等级                         | lperf | 默认    | 节省内存  | 最小    |
|----------------------------|-------|-------|-------|-------|
| 可用内存 (KB)                  | 49.1  | 151.3 | 215.3 | 243.6 |
| WIFI_STATIC_RX_BUFFER_NUM  | 24    | 8     | 6     | 4     |
| WIFI_DYNAMIC_RX_BUFFER_NUM | 85    | 64    | 32    | 32    |
| WIFI_STATIC_TX_BUFFER_NUM  | 32    | 32    | 6     | 4     |
| WIFI_RX_BA_WIN             | 32    | 16    | 12    | 禁用    |
| TCP_SND_BUF_DEFAULT (KB)   | 85    | 32    | 32    | 32    |
| TCP_WND_DEFAULT (KB)       | 85    | 32    | 32    | 32    |
| WIFI_IRAM_OPT              | 15    | 15    | 15    | 0     |
| WIFI_RX_IRAM_OPT           | 16    | 16    | 0     | 0     |
| LWIP_IRAM_OPTIMIZATION     | 13    | 0     | 0     | 0     |
| LWIP_UDP_RECVMBOX_SIZE     | 16    | 16    | 16    | 16    |
| INSTRUCTION_CACHE          | 32    | 16    | 16    | 16    |
| INSTRUCTION_CACHE_LINE     | 32    | 16    | 16    | 16    |
| INSTRUCTION_CACHE_WAYS     | 8     | 8     | 8     | 8     |
| DATA_CACHE                 | 64    | 16    | 16    | 16    |
| DATA_CACHE_LINE            | 32    | 32    | 32    | 32    |
| DATA_CACHE_WAYS            | 8     | 8     | 8     | 8     |
| TCP 发送数据吞吐量 (Mbit/s)       | 93.3  | 58.4  | 37.1  | 35.6  |
| TCP 接收数据吞吐量 (Mbit/s)       | 86.1  | 43.6  | 42.5  | 35.0  |
| UDP 发送数据吞吐量 (Mbit/s)       | 104.7 | 82.2  | 60.4  | 47.9  |
| UDP 接收数据吞吐量 (Mbit/s)       | 104.6 | 104.8 | 104.0 | 55.7  |

### 4.37.30 Wi-Fi Menuconfig

#### Wi-Fi 缓冲区配置

如果您要修改默认的缓冲区数量或类型，最好也了解缓冲区在数据路径中是如何分配或释放的。下图显示了发送数据方向的这一过程。

图 58: TX Buffer Allocation

描述:

- 应用程序分配需要发送的数据。
- 应用程序调用 TCPIP 或套接字相关的 API 发送用户数据。这些 API 会分配一个在 LwIP 中使用的 PBUF，并复制用户数据。
- 当 LwIP 调用 Wi-Fi API 发送 PBUF 时，Wi-Fi API 会分配一个“动态发送数据缓冲区”或“静态发送数据缓冲区”，并复制 LwIP PBUF，最后发送数据。

下图展示了如何在接收数据方向分配或释放缓冲区:

图 59: 接收数据缓冲区分配

描述:

- Wi-Fi 硬件在空中接收到数据包后，将数据包内容放到“静态接收数据缓冲区”，也就是“接收数据 DMA 缓冲区”。
- Wi-Fi 驱动程序分配一个“动态接收数据缓冲区”、复制“静态接收数据缓冲区”，并将“静态接收数据缓冲区”返回给硬件。
- Wi-Fi 驱动程序将数据包传送到上层 (LwIP)，并分配一个 PBUF 用于存放“动态接收数据缓冲区”。
- 应用程序从 LwIP 接收数据。

下表是 Wi-Fi 内部缓冲区的配置情况。

| 缓冲区类型                    | 分配类型 | 默认              | 是否可配置 | 描述  |
|--------------------------|------|-----------------|-------|---|
| 静态接收数据缓冲区<br>(硬件接收数据缓冲区) | 静态   | 10 * 1600 Bytes | 是     | 这是一种 DMA 内存，在函数 <code>esp_wifi_init()</code> 中初始化，在函数 <code>esp_wifi_deinit()</code> 中释放。该缓冲区形成硬件接收列表。当通过空中接收到一个帧时，硬件将该帧写入缓冲区，并向 CPU 发起一个中断。然后，Wi-Fi 驱动程序从缓冲区中读取内容，并将缓冲区返回到列表中。如果应用程序希望减少 Wi-Fi 静态分配的内存，可以将该值从 10 减少到 6，从而节省 6400 Bytes 的内存。除非禁用 AMPDU 功能，否则不建议将该值降低到 6 以下。 |
| 动态接收数据缓冲区                | 动态   | 32              | 是     | 缓冲区的长度可变，取决于所接收帧的长度。当 Wi-Fi 驱动程序从“硬件接收数据缓冲区”接收到一帧时，需要从堆中分配“动态接收数据缓冲区”。在 Menuconfig 中配置的“动态接收数据缓冲区”数量用来限制未释放的“动态接收数据缓冲区”总数量。   |
| 动态发送数据缓冲区                | 动态   | 32              | 是     | 这是一种 DMA 内存，位于堆内存中。当上层 (LwIP) 向 Wi-Fi 驱动程序发送数据包时，该缓冲区首先分配一个“动态发送数据缓冲区”，并复制上层缓冲区。动态发送数据缓冲区和静态发送数据缓冲区相互排斥。  |
| 静态发送数据缓冲区                | 静态   | 16 * 1600 Bytes | 是     | 这是一种 DMA 内存，在函数 <code>esp_wifi_init()</code> 中初始化，在函数 <code>esp_wifi_deinit()</code> 中释放。当上层 (LwIP) 向 Wi-Fi 驱动程序发送数据包时，该缓冲区首先分配一个“静态发送数据缓冲区”，并复制上层缓冲区。动态发送数据缓冲区和静态发送数据缓冲区相互排斥。由于发送数据缓冲区必须是 DMA 缓冲区，所以当使能 PSRAM 时，发送数据缓冲区必须是静态的。   |
| 管理短缓冲区                   | 动态   | 8               | 否     | Wi-Fi 驱动程序的内部缓冲区。   |
| 管理长缓冲区                   | 动态   | 32              | 否     | Wi-Fi 驱动程序的内部缓冲区。   |
| 管理超长缓冲区                  | 动态   | 32              | 否     | Wi-Fi 驱动程序的内部缓冲区。   |

### Wi-Fi NVS Flash

如果使能 Wi-Fi NVS flash，所有通过 Wi-Fi API 设置的 Wi-Fi 配置都会被存储到 flash 中，Wi-Fi 驱动程序在下次开机或重启时将自动加载这些配置。但是，应用程序可视情况禁用 Wi-Fi NVS flash，例如：其配置信息不需要存储在非易失性内存中、其配置信息已安全备份，或仅出于某些调试原因等。

### Wi-Fi AMPDU

ESP32-S3 同时支持接收和发送 AMPDU，AMPDU 可以大大提高 Wi-Fi 的吞吐量。

通常，应使能 AMPDU。禁用 AMPDU 通常用于调试目的。

#### 4.37.31 如何使用低功耗模式

对于物联网应用场景，终端的待机性能表现十分重要，本文档旨在介绍 ESP32-S3 低功耗的基本原理，同时介绍 ESP32-S3 支持的低功耗模式，需注意本文档主要针对 `station mode`。文档还会具体给出每种模式的配置步骤、推荐配置和功耗表现，以帮助用户根据实际需求快速配置适合的低功耗模式。

## 纯系统下低功耗模式介绍

低功耗模式不仅涉及到系统相关问题，还涉及到芯片具体的工作场景，如处在 Wi-Fi 工作场景就会与处在蓝牙工作场景时产生不同。为此本节将首先介绍纯系统角度，即不涉及具体场景的低功耗模式，主要有 DFS、light sleep、deep sleep。纯系统下的低功耗模式主要思想就是在休眠时关闭或门控一些功能模块来降低功耗。

### DFS

DFS (Dynamic frequency scaling) 即动态频率切换，是 ESP-IDF 中集成的电源管理机制的基础功能。DFS 可以根据应用程序持有电源锁的情况，调整外围总线 (APB) 频率和 CPU 频率。持有高性能锁就使用高频，空闲状态不持有电源锁时则使用低频来降低功耗，以此来尽可能减少运行应用程序的功耗。

DFS 的调频机制即根据持有电源锁的最大频率需求来调整频率，同时，freertos tick rates 的数值也会对 DFS 调频产生影响。系统任务调度的灵敏度越大，则意味着系统能更及时的根据需求调整频率。有关调频机制的详细信息，请参见[电源管理](#)。

下图为 DFS 调频机制运行的理想电流情况。

图 60: 理想 DFS 机制调频电流图

DFS 适用于 CPU 必须处于工作状态但是对低功耗有需求的场景，因此 DFS 经常与其他低功耗模式共同开启，下文会详细介绍。

### Light-sleep

Light-sleep 模式是 ESP32-S3 预设的一种低功耗模式，其核心思想就是在休眠时关闭或门控一些功能模块来降低功耗。从纯系统方面来说，Light-sleep 模式有两种进入方式，一种是通过 API 调用进入休眠，一种是自动进入的 auto 模式。两种模式都需要配置唤醒源进行唤醒，同时在进入休眠后会门控或关闭一些模块。这里主要介绍 Auto Light-sleep 模式。

Auto Light-sleep 模式是 ESP-IDF 电源管理机制和 Light-sleep 模式的结合。开启电源管理机制是其前置条件，auto 体现在系统进入空闲状态 (IDLE) 超过设定时间后，自动进入 Light-sleep。空闲状态下，应用程序释放所有电源锁，此时，DFS 将降频以减小功耗。

Auto Light-sleep 依赖于电源管理机制，系统经过提前判断，发现空闲时间超过设定时间时，则直接进入休眠。该过程为自动进行。休眠时会自动关闭 RF、8 MHz 振荡器、40 MHz 高速晶振、PLL、门控数字内核时钟，暂停 CPU 工作。

Auto Light-sleep 模式需配置唤醒源。该模式拥有多种唤醒源，支持相互组合，此时任何一个唤醒源都可以触发唤醒。唤醒后，会从进入休眠的位置继续执行程序。若不配置唤醒源，进入 Light-sleep 休眠后，芯片将一直处在睡眠状态，直到外部复位。具体唤醒源有 RTC 定时器、触摸传感器、外部唤醒 (ext0)、外部唤醒 (ext1)、ULP 协处理器、SDIO、GPIO、UART、Wi-Fi、BT 唤醒等。

Auto Light-sleep 模式工作流程相对复杂，但是进入休眠状态是自动进行，同时需注意在进入前配置好唤醒源，防止芯片一直处在休眠状态。

图 61: Auto Light-sleep 模式工作流程图

根据 Auto Light-sleep 的工作流程可得其理想电流图，关键节点均在图上标出。

图 62: Auto Light-sleep 模式理想电流图

**备注：**为更加清晰地展现出 Auto Light-sleep 的主要变化，图中省略了 DFS 降频过程。

Auto Light-sleep 模式适用于不需要实时响应外界需求的场景。

### Deep-sleep

Deep-sleep 模式是为了追求更好的功耗表现所设计，休眠时仅保留 RTC 控制器、RTC 外设（可配置）、ULP 协处理器、RTC 高速内存、RTC 低速内存，其余模块全部关闭。与 Light-sleep 类似，Deep-sleep 同样通过 API 进入，且需要配置唤醒源进行唤醒。

Deep-sleep 通过调用 API 进入，休眠时会关闭除 RTC 控制器、RTC 外设、ULP 协处理器、RTC 高速内存、RTC 低速内存外的所有模块。

Deep-sleep 模式需配置唤醒源，其拥有多种唤醒源，这些唤醒源也可以组合在一起，此时任何一个唤醒源都可以触发唤醒。若不配置唤醒源进入 Deep-sleep 模式，芯片将一直处在睡眠状态，直到外部复位。具体唤醒源有 RTC 定时器、触摸传感器、外部唤醒 (ext0)、外部唤醒 (ext1)、ULP 协处理器、GPIO 唤醒等。

Deep-sleep 模式工作流程如下图所示：

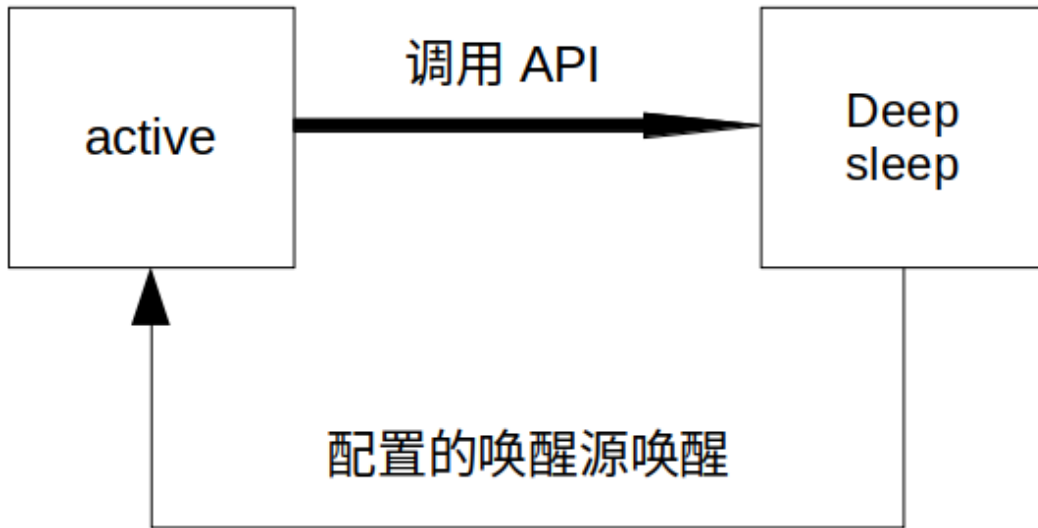

图 63: Deep-sleep 模式工作流程图

Deep-sleep 模式主要应用场景决定了系统很长时间才会苏醒一次，完成工作后又会继续进入 Deep-sleep，所以其理想电流图如下。

Deep-sleep 可以用于低功耗的传感器应用，或是大部分时间都不需要进行数据传输的情况，也就是通常所说的待机模式。设备可以每隔一段时间从 Deep-sleep 状态醒来测量数据并上传，之后重新进入 Deep-sleep；也可以将多个数据存储于 RTC memory，然后一次性发送出去。

### 如何配置纯系统下低功耗模式

介绍完纯系统下的低功耗模式后，本节将介绍公共配置选项、每种模式独有的配置选项，以及相应低功耗模式 API 的使用说明，同时给出相应模式推荐的配置。

#### 公共配置选项

- 单双核工作模式对于多核心芯片，可以选择单核工作模式。
- RTOS Tick rate (Hz) 该参数表示系统周期任务调度的频率。例如，当 RTOS Tick rate 配置为 1000 时，系统每毫秒都会进行一次任务调度；空闲时，系统也能够更敏锐的感知到空闲状态。

图 64: Deep-sleep 模式理想电流图

## DFS 配置

DFS 有如下可配置选项：

- **max\_freq\_mhz** 该参数表示最大 CPU 频率 (MHz)，即 CPU 最高性能工作时候的频率，一般设置为芯片参数的最大值。
- **min\_freq\_mhz** 该参数表示最小 CPU 频率 (MHz)，即系统处在空闲状态时 CPU 的工作频率。该字段可设置为晶振 (XTAL) 频率值，或者 XTAL 频率值除以整数。
- **light\_sleep\_enable** 使能该选项，系统将在空闲状态下自动进入 Light-sleep 状态，即 Auto Light-sleep 使能，上文已经具体介绍。

具体配置方法如下：

1. 使能 CONFIG\_PM\_ENABLE
2. 配置 max\_freq\_mhz 和 min\_freq\_mhz，方式如下：

```
esp_pm_config_t pm_config = {
    .max_freq_mhz = CONFIG_EXAMPLE_MAX_CPU_FREQ_MHZ,
    .min_freq_mhz = CONFIG_EXAMPLE_MIN_CPU_FREQ_MHZ,
    .light_sleep_enable = flase
};
ESP_ERROR_CHECK( esp_pm_configure(&pm_config) );
```

推荐配置：

| 配置名称                | 设置情况  |
|---------------------|-------|
| CONFIG_PM_ENABLE    | ON    |
| RTOS Tick rate (Hz) | 1000  |
| max_freq_mhz        | 160   |
| min_freq_mhz        | 40    |
| light_sleep_enable  | false |

备注：上表中不涉及的配置均是默认。

## Light-sleep 配置

本节介绍 Auto Light-sleep 的推荐配置和配置步骤。

Auto Light-sleep 有如下可配置选项：

- **Minimum step to enter sleep mode** 该参数表示系统自动进入休眠的阈值。该参数单位为 RTOS Tick，故其表示的时间与 RTOS Tick rate 相关，例该参数值为 3，RTOS Tick rate 配置为 1000 Hz 时，即当系统空闲时间大于等于 3 ms 时进入休眠。
- **Put light sleep related codes in internal RAM** 如果使能该选项，一些 light-sleep 功能将被移至 IRAM，减少代码运行时间，降低系统功耗，IRAM 使用量将增加 1.8kB。
- **Put RTOS IDLE related codes in internal RAM** 如果使能该选项，一些 RTOS IDLE 功能将被移至 IRAM，减少代码运行时间，降低系统功耗，IRAM 使用量将增加 260B。
- **RTC slow clock source** 该参数表示 RTC 慢速时钟源。系统休眠时计时器模块的时钟被门控，此时使用 RTC Timer 进行计时，唤醒后使用 RTC Timer 的计数值对系统时间进行补偿。

| 时钟源                 | 精度             | 频偏 |
|---------------------|----------------|----|
| Internal 150kHz OSC | 约 6.7us/cycle  | 大  |
| External 32kHz XTAL | 约 30.5us/cycle | 小  |

- **Disable all GPIO when chip at sleep** 如果使能该选项，系统将在休眠过程中禁用所有 GPIO 管脚，消除 GPIO 漏电，降低功耗，但是休眠过程中 GPIO 无法进行信号输入和输出。
- **Power down MAC and baseband** 如果使能该选项，系统将在休眠时关闭 WiFi 和蓝牙的 MAC 和 baseband 来降低功耗，休眠电流约降低 100 uA，但是为保存上下文信息，将额外消耗 5.3K DRAM。
- **Power down CPU** 如果使能该选项，系统将在休眠时将关闭 CPU 来降低功耗，对于 esp32c3，休眠电流减小 100 uA 左右，对于 esp32s3，休眠电流减小 650 uA 左右。但是为保存上下文信息，对于 esp32c3，将消耗 1.6 KB 的 DRAM 空间，对于 esp32s3，将消耗 8.58 KB 的 DRAM 空间。
- **Power down I/D-cache tag memory** 如果使能该选项，系统将在休眠时关闭 I/D cache tag memory 来降低功耗，但是为保存 tag memory 信息，将额外消耗最大约 9 KB DRAM，同时因为 tag memory 信息特殊性，如需打开该选项，建议多进行测试。
- **Power down flash in light-sleep** 如果使能该选项，系统将在 light-sleep 休眠时关闭 flash，降低系统功耗，该选项的前提是系统没有使用 PSRAM。

唤醒源：

- RTC Timer Wakeup
- GPIO Wakeup
- UART Wakeup
- Touchpad Wakeup
- External Wakeup (ext0)
- External Wakeup (ext1)
- ULP Coprocessor Wakeup

**备注：** 以上仅列出可配置唤醒源，详细介绍请参考 doc: 睡眠模式 <./api-reference/system/sleep\_modes>。

配置方法：

1. 配置唤醒源
2. 使能 CONFIG\_PM\_ENABLE
3. 使能 CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE
4. 配置 DFS 参数
5. light\_sleep\_enable = true，具体如下：

```
esp_pm_config_t pm_config = {
    .max_freq_mhz = CONFIG_EXAMPLE_MAX_CPU_FREQ_MHZ,
    .min_freq_mhz = CONFIG_EXAMPLE_MIN_CPU_FREQ_MHZ,
    #if CONFIG_FREERTOS_USE_TICKLESS_IDLE
    .light_sleep_enable = true

```

(下页继续)

```
#endif
};
ESP_ERROR_CHECK( esp_pm_configure(&pm_config) );
```

- 6. 配置介绍的其余相关参数

推荐配置：

| 配置名称                                | 设置情况                |
|-------------------------------------|---------------------|
| CONFIG_PM_ENABLE                    | ON                  |
| CONFIG_FREERTOS_USE_TICKLESS_IDLE   | ON                  |
| max_freq_mhz                        | 160                 |
| min_freq_mhz                        | 40                  |
| RTOS Tick rate (Hz)                 | 1000                |
| light_sleep_enable                  | true                |
| Minimum step to enter sleep mode    | 3                   |
| Put light sleep codes in IRAM       | OFF                 |
| Put RTOS IDLE codes in IRAM         | OFF                 |
| RTC slow clock source               | Internal 150kHz OSC |
| Disable all GPIO when chip at sleep | ON                  |
| Power down MAC and baseband         | ON                  |
| Power down I/D-cache tag memory     | ON                  |
| Power down CPU                      | ON                  |
| Power down flash in light sleep     | OFF                 |

备注：上表中不涉及的配置均是默认

## Deep-sleep 配置

对 Deep-sleep 模式来说，除了唤醒源相关配置，其余配置意义已经不大。

Deep-sleep 有如下可配置选项：

- RTC Timer wakeup
- EXT0/1 wakeup
- Touchpad wakeup
- ULP wakeup

备注：以上仅列出可配置唤醒源，详细介绍请参考:doc: 睡眠模式 <./api-reference/system/sleep\_modes>。

配置步骤：

- 配置唤醒源
- 调用 API，具体如下：

```
/* Enter deep sleep */
esp_deep_sleep_start();
```

用户可以通过下列配置选项，让一些特定模块在休眠时保持开启状态：

- **Power up External 40MHz XTAL** 在一些特殊应用中，部分模块对休眠时的时钟精度及稳定度有很高要求（例如 BT）。这种情况下，可以考虑在休眠过程中打开 External 40MHz XTAL。打开和关闭代码如下：

```
ESP_ERROR_CHECK(esp_sleep_pd_config(ESP_PD_DOMAIN_XTAL, ESP_PD_OPTION_ON));
ESP_ERROR_CHECK(esp_sleep_pd_config(ESP_PD_DOMAIN_XTAL, ESP_PD_OPTION_
↪OFF));
```

- **Power up Internal 8MHz OSC** 在一些特殊应用中，部分模块（例如 LEDC）将 Internal 8 MHz OSC 作为时钟源，并且希望在 Light-sleep 休眠过程中也可以正常使用。这种情况下，可以考虑在休眠过程中打开 Internal 8 MHz OSC。打开和关闭代码如下：

```
ESP_ERROR_CHECK(esp_sleep_pd_config(ESP_PD_DOMAIN_RTC8M, ESP_PD_OPTION_
↪ON));
ESP_ERROR_CHECK(esp_sleep_pd_config(ESP_PD_DOMAIN_RTC8M, ESP_PD_OPTION_
↪OFF));
```

## Wi-Fi 场景下低功耗模式介绍

上文介绍了纯系统方向下的低功耗模式，但在实际应用中还需结合具体应用场景。本节将结合纯系统下的功耗模式来介绍在 WiFi 场景下的低功耗模式。因为 WiFi 场景的复杂性，本节会首先介绍 WiFi 省电的基本原理，然后再介绍具体的低功耗模式，同时本节主要针对 station 模式。

### Wi-Fi 省电的基本原理

首先，在 station 的工作过程中，为在接收发送过程中避免冲突，需要长时间监听信道，能耗较大的 RF 模块会一直处于工作中，浪费电量。为此，Wi-Fi 协议引入省电模式。

省电模式的基本原理是通过减少不必要的监听时间来降低耗能。AP 会缓存进入省电模式的 station 的包，同时周期发送包含 TIM 信息的 Beacon 帧，TIM 会指示 AP 缓存的单播包。TIM 中，DTIM 较为特殊，其会缓存广播包，并以  $n$  个（由 AP 决定）TIM 为周期发送。对 station 来说，TIM 非必听，而 DTIM 为必听。因此，station 可以选择只在每一个 DTIM 帧前醒来打开 Wi-Fi 相关模块（RF 模块），而不必时刻处于监听状态，这样就能有效降低功耗。

图 65: DTIM4 省电模式示意图

其次，station 从打开到再次关闭 Wi-Fi 相关模块的时间也会影响功耗。除必要的数据传输处理时间外，主要有四项配置会影响时间长短：

- 时钟准确性导致的 time offset，主要原因是时钟或多或少都会与理想的时间存在偏移，同时偏移的正负不定。

- 处理 Beacon 漏听后的时间，如漏听后持续监听时间、允许最多丢失 Beacon 数目等，这段时间存不存在以及存在多久都不定，但是可以配置范围。
- 为了确保能够接受突发数据包而添加的 active 时间，可由配置决定。
- ILDE 时间是具体某些功耗模式进入条件要求。因此在满足通信需求的情况下，降低工作时间可以改善功耗表现。

|             |        |               |          |        |
|-------------|--------|---------------|----------|--------|
| time offset | 必要处理时间 | Beacon 漏听处理时间 | active时间 | IDLE时间 |
|-------------|--------|---------------|----------|--------|

图 66: 芯片工作时间组成图

此外，在 station 没有处于 Wi-Fi 接收或发送状态时，影响功耗的因素变成了芯片的其他模块。不同的功耗模式会配置不同的时钟源，或者动态调整一些模块的工作频率如 CPU，同时还会关闭不同数量的功能模块，这将有效降低芯片的功耗。其实也就是纯系统相关的模式，用户可根据需求自己选择合适的配置。

如果以时间为横轴，电流大小为纵轴建立坐标轴，那么处在低功耗模式下芯片的理想工作电流图可以简化成下图：

图 67: 理想情况下 WiFi 场景低功耗模式电流图

其中 station 要进行 Wi-Fi 通信时，Wi-Fi 相关模块（PHY）开启，电流会显著上升，在工作完成前，电流会一直维持在一个较高的水平。工作完成后，芯片会关闭 Wi-Fi 相关模块，这时电流又会降低到一个较低水平。

可以看出影响功耗表现的主要有三点：interval、period 和 base current。

- Interval 是 station Wi-Fi 相关模块工作的间隔，既可以由低功耗模式自定义，也可根据 Wi-Fi 协议省电机制（3.1 第一点介绍），由 DTIM 周期决定。可以看出在同等情况下，interval 越大，功耗表现会更好，但是响应会更慢，影响通信的及时性。
- Period 可以看作每次 station Wi-Fi 工作的时间，这段时间的长度也会影响功耗的表现。period 不是一个固定的时长（3.1 第二点介绍），在保证 WiFi 通信正常的情况下，period 持续时间越短，功耗表现越好。但是减少 period 时间，必然会影响通信的可靠性。
- Base current 是 Wi-Fi 相关模块不工作时芯片的电流，影响其大小的因素很多，不同的功耗模式下休眠策略不同。所以，在满足功能的情况下，优化配置降低该电流大小可以提高功耗表现，但同时关闭其余模块会影响相关功能和芯片的唤醒时间。

知道了影响功耗的三点因素之后，要想降低功耗应从这三点入手，接下来介绍两种低功耗模式，Modem sleep、Auto Light-sleep。两种模式主要区别就是对三点因素的优化不同。

## Modem sleep

Modem sleep 模式主要工作原理基于 DTIM 机制，周期性的醒来处理 Wi-Fi 相关工作，又在周期间隔之间进入休眠，关闭 PHY (RF 模块) 来降低功耗。同时通过 DTIM 机制，station 可以与 AP 保持 Wi-Fi 连接，数据传输。

Modem sleep 模式会在 WiFi task 结束后自动进入休眠无需调用 API，休眠时仅会关闭 Wi-Fi 相关模块 (PHY)，其余模块均处在正常上电状态。

Modem sleep 模式默认会根据 DTIM 周期或 listen interval (下文介绍) 醒来，相当于系统自动设置了一个 Wi-Fi 唤醒源，因此用户无需再配置唤醒源，同时系统主动发包时也可以唤醒。

Modem sleep 是一个开关型的模式，调用 API 开启后一直自动运行，其工作流程十分简单，具体如下图。

图 68: Modem sleep 工作流程图

根据上文的基本电流图，结合 Modem sleep 的工作原理，以 Min Modem (下文介绍) 为例可得理想情况下电流变化图。

图 69: Min Modem sleep 理想电流图

Modem-sleep 一般用于 CPU 持续处于工作状态并需要保持 Wi-Fi 连接的应用场景，例如，使用 ESP32-S3 本地语音唤醒功能，CPU 需要持续采集和处理音频数据。

## DFS+Modem sleep

Modem sleep 模式休眠状态中 CPU 仍处在工作状态，而 DFS 机制主要作用于 CPU 和 APB 工作频率来降低功耗，因此 DFS+Modem sleep 可以进一步优化功耗表现，又因为 Wi-Fi task 会申请 ESP\_PM\_CPU\_FREQ\_MAX 电源锁来保证 Wi-Fi 任务快速运行，所以 DFS+Modem sleep 产生调频只会发生在 base current 阶段，即 Wi-Fi task 结束后。

在 Wi-Fi 场景下，为了介绍的简化，让用户抓住主要的变化，DFS 可以进行一定的状态简化。具体来说，虽然 DFS 主要根据 CPU 和 APB 两把锁的最高需求来调频，但是 Wi-Fi 场景都需要 CPU 的频率最大化来工作，同时 Wi-Fi task 结束后，也可以理想化的认为，没有其余的工作要完成，这样就可以简单认为经过一段时间会释放两把锁进入空闲状态（IDLE 状态），也同时忽略这段时间锁的变化导致的电流变化，简化状态。

在 Wi-Fi 场景下，DFS 最终简化为如下流程：

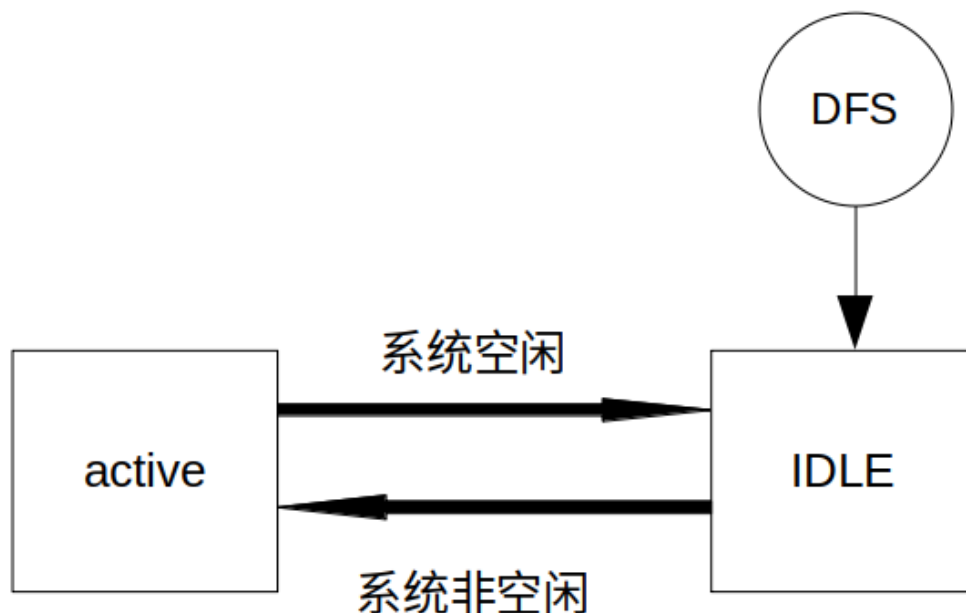

图 70: Wi-Fi 场景 DFS 简化流程图

在 Wi-Fi 工作的 active 状态与系统空闲的 IDLE 状态转换，Wi-Fi task 结束后，系统经过一段时间释放了所有锁进入 IDLE 状态，此时 DFS 机制降低频率到设定最低值，忽略了转换状态期间的调频动作，方便理解。

简化过后的 DFS+Modem sleep 模式理想状态下的电流大小如下图所示：

### Auto Light-sleep+Wi-Fi 场景

Auto Light-sleep 模式在 Wi-Fi 场景下是 ESP-IDF 电源管理机制、DTIM 机制和 light-sleep 的结合。开启电源管理是其前置条件，auto 体现在系统进入 IDLE 状态超过设定值后自动进入 light-sleep。同时 auto light sleep 模式同样遵循 DTIM 机制，会自动苏醒，可以与 AP 保持 Wi-Fi 连接。

Auto Light-sleep 模式在 Wi-Fi 场景下休眠机制与纯系统下一样，仍然依赖于电源管理机制，进入休眠的条件为系统处于 IDLE 状态的时间超过设定时间，并且系统会提前判断空闲时间是否满足条件，若满足直接休眠。该过程为自动进行。休眠时会自动关闭 RF、8 MHz 振荡器、40 MHz 高速晶振、PLL，门控数字内核时钟，暂停 CPU 工作。

Auto Light-sleep 模式在 Wi-Fi 场景下遵循 DTIM 机制，自动在 DTIM 帧到来前苏醒，相当于系统自动设置了一个 Wi-Fi 唤醒源，因此用户无需再配置唤醒源。同时系统主动发包时也可以唤醒。

Auto Light-sleep 模式在 Wi-Fi 场景下工作流程较为复杂，但全程都是自动进行，具体如下图所示。

Auto Light-sleep 模式在 Wi-Fi 场景下经常与 modem sleep 同时开启，这里给出 modem+auto light-sleep 模式的理想电流图，关键节点均在图上标出。

Auto Light-sleep 模式在 Wi-Fi 场景下可用于需要保持 WiFi 连接，可以实时响应 AP 发来数据的场景。并且在未接收到命令时，CPU 可以处于空闲状态。比如 Wi-Fi 开关的应用，大部分时间 CPU 都是空闲的，

图 71: DFS+Modem sleep 模式理想电流图

图 72: Auto Light-sleep 工作流程图

图 73: modem+auto light-sleep 模式理想电流图

直到收到控制命令，CPU 才需要进行 GPIO 的操作。

### Deep-sleep+Wi-Fi 场景

Deep-sleep 模式在 Wi-Fi 场景下与纯系统下基本相同，详情可以参考 ([Deep-sleep](#)) 这里不再介绍。

### 如何配置 Wi-Fi 场景下低功耗模式

介绍完 Wi-Fi 场景下低功耗模式后，本节将介绍公共配置选项、每种模式独有的配置选项，以及相应低功耗模式 API 的使用说明，同时给出相应模式推荐的配置 (包含纯系统下的低功耗推荐配置) 以及该配置的具体表现。

公共配置选项：

- 功耗类：
  - **Max Wi-Fi TX power (dBm)** 该参数表示最大 TX 功率，降低该参数会减小发包功耗，但会影响 Wi-Fi 性能，默认设置最大 20。
- IRAM 类：
  - **Wi-Fi IRAM speed optimization** 如果使能该选项，一些 Wi-Fi 功能将被移至 IRAM，减少代码运行时间，降低系统功耗，IRAM 使用量将增加，默认开启。
  - **Wi-Fi RX IRAM speed optimization** 如果使能该选项，一些 Wi-Fi RX 功能将被移至 IRAM，减少代码运行时间，降低系统功耗，IRAM 使用量将增加，默认开启。
  - **Wi-Fi Sleep IRAM speed optimization** 如果使能该选项，一些 Wi-Fi sleep 功能将被移至 IRAM，减少代码运行时间，降低系统功耗，IRAM 使用量将增加，默认关闭。
- Wi-Fi 协议类：
  - **Minimum active time** 该参数表示 Station 接收完一次数据后需要等待时间。当终端与 AP 进行通信时，AP 发送到终端的数据经常是突发形式的，为确保后续的突发数据能够正常接收到，需要等待一段时间。默认 50。
  - **Maximum keep alive time** 该参数表示周期性的发送 sleep null data 来通告 AP 维持连接的时间。在 DTIM 机制下，若 AP 长时间没有某个 station 的包，可能会断开连接，因此需要 station 需要周期发送 sleep null data 维持连接。默认 10。
  - **Send gratuitous ARP periodically** 如果使能该选项，Station 将周期性的发送 gratuitous ARP 请求更新 AP ARP 缓存表。如无该需求，可以关闭。
  - **Wi-Fi sleep optimize when beacon lost** 如果使能该选项，Station 在检测到已经错过或者丢失 beacon 时，会立即关闭 RF 进入低功耗状态。

Modem sleep 配置方法如下：

- 可配置选项
  - **Min Modem** 该参数表示 station 按照 DTIM 周期工作，在每个 DTIM 前醒来接收 Beacon，这样不会漏掉广播信息，但是 DTIM 周期由 AP 决定，如果 DTIM 周期较短，省电效果会降低。
  - **Max Modem** 该参数表示 station 会自定义一个 listen interval，并以 listen interval 为周期醒来接受 Beacon。这样在 listen interval 较大时会省电，但是容易漏听 DTIM，错过广播数据。
- 配置方法：
  - 调用 API，选择模式参数：

```
typedef enum {
    WIFI_PS_NONE,
    WIFI_PS_MIN_MODEM,
    WIFI_PS_MAX_MODEM,
} wifi_ps_type_t;
esp_err_t esp_wifi_set_ps(wifi_ps_type_t type);
```

若选择 WIFI\_PS\_MAX\_MODEM，还需配置 listen interval，示例如下：

```
#define LISTEN_INTERVAL 3
wifi_config_t wifi_config = {
    .sta = {
        .ssid = "SSID",
        .password = "Password",
        .listen_interval = LISTEN_INTERVAL,
    },
};
ESP_ERROR_CHECK(esp_wifi_set_mode(WIFI_MODE_STA));
ESP_ERROR_CHECK(esp_wifi_set_config(ESP_IF_WIFI_STA, &wifi_config));
ESP_ERROR_CHECK(esp_wifi_start());
```

配置推荐：

这里给出的配置推荐是 Min Modem sleep+DFS 开启的配置

| 配置名称                | 设置情况  |
|---------------------|-------|
| WIFI_PS_MIN_MODEM   | ON    |
| CONFIG_PM_ENABLE    | ON    |
| RTOS Tick rate (Hz) | 1000  |
| max_freq_mhz        | 160   |
| min_freq_mhz        | 40    |
| light_sleep_enable  | false |

配置表现：

| CPU frequency | DFS | DTIM | Average current(mA) | Max current(mA) | Min current(mA) |
|---------------|-----|------|---------------------|-----------------|-----------------|
| 160 MHz       | ON  | 1    | 20.7                | 113.5           | 15.0            |
| 160 MHz       | OFF | 1    | 40.1                | 235.8           | 37.8            |
| 160 MHz       | ON  | 3    | 19.9                | 113.4           | 15.0            |
| 160 MHz       | OFF | 3    | 38.7                | 267.2           | 37.9            |
| 160 MHz       | ON  | 10   | 19.5                | 113.4           | 15.0            |
| 160 MHz       | OFF | 10   | 38.2                | 259.7           | 37.9            |

Auto Light-sleep+Wi-Fi 场景配置：

Auto Light-sleep 在 Wi-Fi 场景下的配置比纯系统下少了唤醒源的配置要求，其余几乎与纯系统下配置一致，因此可配置选项、配置步骤、推荐配置的详细介绍可以参考上文 ([Light-sleep](#))。同时 Wi-Fi 相关配置保持默认。

配置表现：

该配置表现为 Auto Light-sleep 纯系统推荐配置 + 默认的 Wi-Fi 相关配置在 Wi-Fi 场景的表现。

| CPU frequency | DTIM | Average current(mA) | Max current(mA) | Min current(mA) |
|---------------|------|---------------------|-----------------|-----------------|
| 160 MHz       | 1    | 2.45                | 120.21          | 0.28            |
| 160 MHz       | 3    | 1.33                | 120.25          | 0.28            |
| 160 MHz       | 10   | 0.93                | 120.04          | 0.28            |

Deep-sleep+Wi-Fi 场景配置:

Deep-sleep 模式在 Wi-Fi 场景下的配置与纯系统下配置基本一致, 因此可配置选项、配置步骤、推荐配置的详细介绍可以参考上文 ([Deep-sleep](#))。同时 Wi-Fi 相关配置保持默认。

配置表现:

该配置表现为 Deep-sleep 纯系统推荐配置 + 默认的 Wi-Fi 相关配置在 Wi-Fi 场景的表现。

平均电流约 6.9  $\mu$ A

### Wi-Fi 场景如何选择低功耗模式

为方便用户选择合适的低功耗模式, 现给出 Wi-Fi 场景下低功耗模式总结表, 用户可根据需求选择。

| 项目       | Modem Sleep | Modem Sleep+DFS | auto light Sleep | Deep Sleep  |
|----------|-------------|-----------------|------------------|-------------|
| 休眠       | 自动          | 自动              | 自动               | 手动          |
| 唤醒       | 自动          | 自动              | 自动               | 配置唤醒源       |
| Wi-Fi 连接 | 保持          | 保持              | 保持               | 断开          |
| CPU      | 开           | 开/降频            | 暂停               | 关           |
| 系统时钟     | 开           | 开               | 关                | 关           |
| 外设       | 开           | 开               | 开                | 关           |
| DTIM1    | 40.1        | 20.7            | 2.45             | /           |
| DTIM3    | 38.7        | 19.9            | 1.33             | /           |
| DTIM10   | 38.2        | 19.5            | 0.93             | /           |
| 平均电流     | /           | /               | /                | 6.8 $\mu$ A |

备注: 上表中所有电流均为平均电流

## 4.37.32 故障排除

请见乐鑫 [Wireshark 使用指南](#)。

### 乐鑫 Wireshark 使用指南

#### 1. 概述

**1.1 什么是 Wireshark?** Wireshark (原称 Ethereal) 是一个网络封包分析软件。网络封包分析软件的功能是截取网络封包, 并尽可能显示出最为详细的网络封包资料。Wireshark 使用 WinPCAP 作为接口, 直接与网卡进行数据报文交换。

网络封包分析软件的功能可想像成“电工技师使用电表来量测电流、电压、电阻”的工作, 只是将场景移植到网络上, 并将电线替换成网线。

在过去, 网络封包分析软件是非常昂贵, 或是专门属于营利用的软件。Wireshark 的出现改变了这一切。

在 GNU GPL 通用许可证的保障范围内，使用者可以以免费的代价取得软件与其源代码，并拥有针对其源代码修改及定制化的权利。

Wireshark 是目前全世界最广泛的网络封包分析软件之一。

**1.2 Wireshark 的主要应用** 下面是 Wireshark 一些应用的举例：

- 网络管理员用来解决网络问题
- 网络安全工程师用来检测安全隐患
- 开发人员用来测试协议执行情况
- 用来学习网络协议

除了上面提到的，Wireshark 还可以用在其它许多场合。

**1.3 Wireshark 的特性**

- 支持 UNIX 和 Windows 平台
- 在接口实时捕捉包
- 能详细显示包的详细协议信息
- 可以打开/保存捕捉的包
- 可以导入导出其他捕捉程序支持的包数据格式
- 可以通过多种方式过滤包
- 多种方式查找包
- 通过过滤以多种色彩显示包
- 创建多种统计分析
- 等等

**1.4 Wireshark 的“能”与“不能”？**

- **捕捉多种网络接口**  
Wireshark 可以捕捉多种网络接口类型的包，哪怕是无线局域网接口。
- **支持多种其它程序捕捉的文件**  
Wireshark 可以打开多种网络分析软件捕捉的包。
- **支持多格式输出**  
Wireshark 可以将捕捉文件输出为多种其他捕捉软件支持的格式。
- **对多种协议解码提供支持**  
Wireshark 可以支持许多协议的解码。
- **Wireshark 不是入侵检测系统**  
如果您的网络中存在任何可疑活动，Wireshark 并不会主动发出警告。不过，当您希望对这些可疑活动一探究竟时，Wireshark 可以发挥作用。
- **Wireshark 不会处理网络事务，它仅仅是“测量”（监视）网络**  
Wireshark 不会发送网络包或做其它交互性的事情（名称解析除外，但您也可以禁止解析）。

**2. 如何获取 Wireshark** 官网链接：<https://www.wireshark.org/download.html>

Wireshark 支持多种操作系统，请在下载安装文件时，注意选择与您所用操作系统匹配的安装文件。

**3. 使用步骤** 本文档仅以 Linux 系统下的 Wireshark（版本号：2.2.6）为例。

### 1) 启动 Wireshark

Linux 下，可编写一个 Shell 脚本，运行该文件即可启动 Wireshark 配置抓包网卡和信道。Shell 脚本如下：

```
ifconfig $1 down
iwconfig $1 mode monitor
iwconfig $1 channel $2
ifconfig $1 up
Wireshark&
```

脚本中有两个参数：\$1 和 \$2，分别表示网卡和信道，例如，./xxx.sh wlan0 6（此处，wlan0 即为抓包使用的网卡，后面的数字 6 即为 AP 或 soft-AP 所在的 channel）。

## 2) 运行 Shell 脚本打开 Wireshark，会出现 Wireshark 抓包开始界面

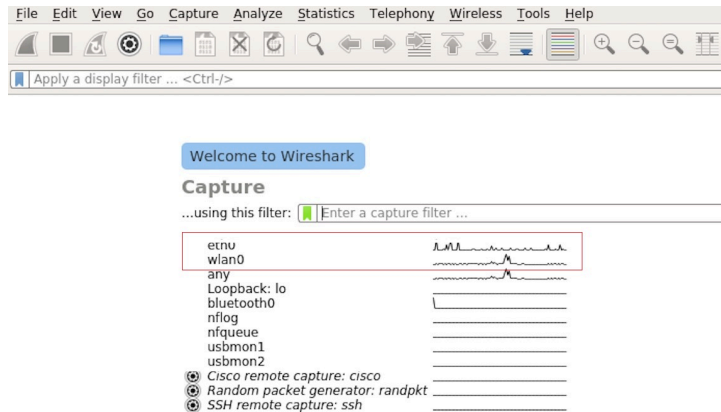

图 74: Wireshark 抓包界面

## 3) 选择接口，开始抓包

从上图红色框中可以看到有多个接口，第一个为本地网卡，第二个为无线网络。

可根据自己的需求选取相应的网卡，本文是以利用无线网卡抓取空中包为例进行简单说明。

双击 `wlan0` 即可开始抓包。

## 4) 设置过滤条件

抓包过程中会抓取到同信道所有的空中包，但其实很多都是我们不需要的，因此很多时候我们会设置抓包的过滤条件从而得到我们想要的包。

下图中红色框内即为设置 filter 的位置。

图 75: 设置 Wireshark 过滤条件

点击 *Filter* 按钮（下图的左上角蓝色按钮）会弹出 *display filter* 对话框。

点击 *Expression* 按钮，会出现 *Filter Expression* 对话框，在此你可以根据需求进行 filter 的设置。

**最直接的方法：**直接在工具栏上输入过滤条件。

点击在此区域输入或修改显示的过滤字符，在输入过程中会进行语法检查。如果您输入的格式不正确，或者未输入完成，则背景显示为红色。直到您输入合法的表达式，背景会变为绿色。你可以点击下拉列表选择您先前键入的过滤字符。列表会一直保留，即使您重新启动程序。

例如：下图所示，直接输入 2 个 MAC 作为过滤条件，点击 *Apply*（即图中的蓝色箭头），则表示只抓取 2 个此 MAC 地址之间的交互的包。

图 76: Display Filter 对话框

图 77: Filter Expression 对话框

图 78: 过滤条件工具栏

图 79: 在过滤条件工具栏中运用 MAC 地址过滤示例

### 5) 封包列表

若想查看包的具体的信息只需要选中要查看的包，在界面的下方会显示出包的具体的格式和包的内容。

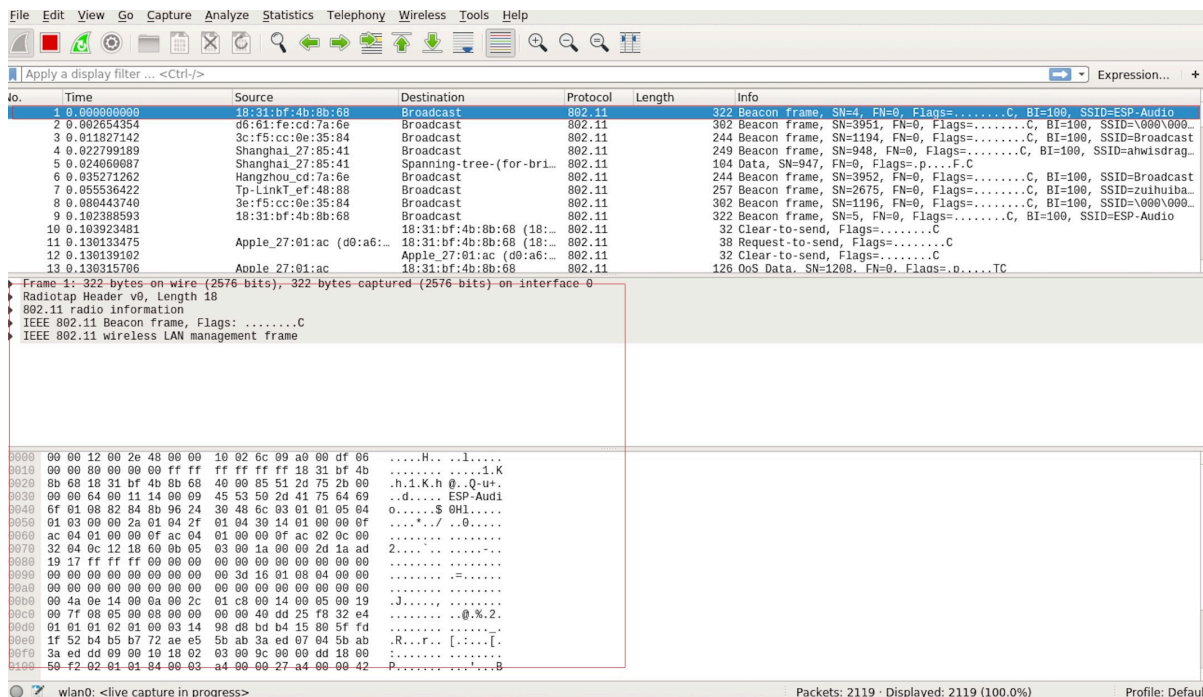

图 80: 封包列表具体信息示例

如上图所示，我要查看第 1 个包，选中此包，图中红色框中即为包的具体内容。

### 6) 停止/开始包的捕捉

若要停止当前抓包，点击下图的红色按钮即可。

图 81: 停止包的捕捉

若要重新开始抓包，点击下图左上角的蓝色按钮即可。

### 7) 保存当前捕捉包

Linux 下，可以通过依次点击“File” -> “Export Packet Dissections” -> “As Plain Text File” 进行保存。

上图中，需要注意的是，选择 *All packets*、*Displayed* 以及 *All expanded* 三项。

Wireshark 捕捉的包可以保存为其原生格式文件 (libpcap)，也可以保存为其他格式 (如.txt 文件) 供其他工具进行读取分析。

## 4.38 Wi-Fi Security

图 82: 开始或继续包的捕捉

图 83: 保存捕捉包

### 4.38.1 ESP32-S3 Wi-Fi Security Features

- Support for Protected Management Frames (PMF)
- Support for WPA3-Personal

In addition to traditional security methods (WEP/WPA-TKIP/WPA2-CCMP), ESP32-S3 Wi-Fi supports state-of-the-art security protocols, namely Protected Management, Wi-Fi Protected Access 3. WPA3 provides better privacy and robustness against known attacks on traditional modes.

### 4.38.2 Protected Management Frames (PMF)

#### Introduction

In Wi-Fi, management frames such as beacons, probes, (de)authentication, (dis)association are used by non-AP stations to scan and connect to an AP. Unlike data frames, these frames are sent unencrypted. An attacker can use eavesdropping and packet injection to send spoofed (de)authentication/(dis)association frames at the right time, leading to attacks such as Denial-of-Service (DOS) and man-in-the-middle

PMF provides protection against these attacks by encrypting unicast management frames and providing integrity checks for broadcast management frames. These include deauthentication, disassociation and robust management frames. It also provides Secure Association (SA) teardown mechanism to prevent spoofed association/authentication frames from disconnecting already connected clients.

**There are 3 types of PMF configuration modes on Station side -**

- PMF Optional
- PMF Required
- PMF Disabled

#### API & Usage

ESP32-S3 supports PMF only in Station mode. Station defaults to PMF Optional mode and disabling PMF is not possible. For even higher security, PMF required mode can be enabled by setting the `required` flag in `pmf_cfg` while using the `esp_wifi_set_config()` API. This will result in Station only connecting to a PMF enabled AP and rejecting all other AP's.

**注意:** `capable` flag in `pmf_cfg` is deprecated and set to true internally. This is to take the additional security benefit of PMF whenever possible.

### 4.38.3 WiFi Enterprise

#### Introduction

Enterprise security is the secure authentication mechanism for enterprise wireless networks. It uses RADIUS server for authentication of network users before connecting to the Access Point. The authentication process is based on 802.1X policy and comes with different Extended Authentication Protocol (EAP) methods such as TLS, TTLS, PEAP and EAP-FAST. RADIUS server authenticates the users based on their credentials (username and password), digital certificates or both.

**ESP32-S3 supports WiFi Enterprise only in station mode.**

ESP32-S3 Supports **WPA2-Enterprise** and **WPA3-Enterprise**. WPA3-Enterprise builds upon the foundation of WPA2-Enterprise with the additional requirement of using Protected Management Frames (PMF) and server certificate validation on all WPA3 connections. **WPA3-Enterprise also offers an addition secure mode using 192-bit minimum-strength security protocols and cryptographic tools to better protect sensitive data.** The 192-bit security mode offered by WPA3-Enterprise ensures the right combination of cryptographic tools are used and sets a

consistent baseline of security within a WPA3 network. WPA3-Enterprise 192-bit mode is only supported by modules having `CONFIG_ESP_WIFI_GMAC_SUPPORT CONFIG_ESP_WIFI_GMAC_SUPPORT` support. Enable `CONFIG_WIFI_WPA_SUITE_B_192` flag to support WPA3-Enterprise with 192-bit mode.

#### ESP32-S3 supports the following EAP methods:

- EAP-TLS: This is a certificate-based method and only requires SSID and EAP-IDF.
- PEAP: This is a Protected EAP method. Username and password are mandatory.
- **EAP-TTLS: This is a credential-based method. Only server authentication is mandatory while user authentication is optional.**
  - PAP: Password Authentication Protocol.
  - CHAP: Challenge Handshake Authentication Protocol.
  - MSCHAP and MSCHAP-V2.
- EAP-FAST: This is an authentication method based on Protected Access Credentials (PAC) which also uses identity and password.

Example `wifi/wifi_enterprise` demonstrates all the supported WiFi Enterprise methods except EAP-FAST. Please refer `wifi/wifi_eap_fast` for EAP-FAST example. EAP method can be selected from the Example Configuration menu in `idf.py menuconfig`. Refer to `examples/wifi/wifi_enterprise/README.md` for information on how to generate certificates and run the example.

## 4.38.4 WPA3-Personal

### Introduction

Wi-Fi Protected Access-3 (WPA3) is a set of enhancements to Wi-Fi access security intended to replace the current WPA2 standard. It includes new features and capabilities that offer significantly better protection against different types of attacks. It improves upon WPA2-Personal in following ways:

- WPA3 uses Simultaneous Authentication of Equals (SAE), which is password-authenticated key agreement method based on Diffie-Hellman key exchange. Unlike WPA2, the technology is resistant to offline-dictionary attack, where the attacker attempts to determine shared password based on captured 4-way handshake without any further network interaction.
- Disallows outdated protocols such as TKIP, which is susceptible to simple attacks like MIC key recovery attack.
- Mandates Protected Management Frames (PMF), which provides protection for unicast and multicast robust management frames which include Disassoc and Deauth frames. This means that the attacker cannot disrupt an established WPA3 session by sending forged Assoc frames to the AP or Deauth/Disassoc frames to the Station.
- Provides forward secrecy, which means the captured data cannot be decrypted even if password is compromised after data transmission.

#### ESP32-S3 station also supports following additional Wi-Fi CERTIFIED WPA3™ features.

- **Transition Disable** : WPA3 defines transition modes for client devices so that they can connect to a network even when some of the APs in that network do not support the strongest security mode. Client device implementations typically configure network profiles in a transition mode by default. However, such a client device could be subject to an active downgrade attack in which the attacker causes the client device to use a lower security mode in order to exploit a vulnerability with that mode. WPA3 has introduced the Transition Disable feature to mitigate such attacks, by enabling client devices to change from a transition mode to an “only” mode when connecting to a network, once that network indicates it fully supports the higher security mode. Enable `transition_disable` in `wifi_sta_config_t` to enable this feature for ESP32-S3 station.
- **SAE PWE Methods**: ESP32-S3 station supports SAE Password Element derivation method *Hunting And Pecking* and *Hash to Element (H2E)*. H2E is computationally efficient as it uses less iterations than Hunt and Peck, also it mitigates side channel attacks. These can be configured using parameter `sae_pwe_h2e` from `wifi_sta_config_t` for station. Hunt and peck, H2E both can be enabled by using `WPA3_SAE_PWE_BOTH` configuration.

Please refer to [Security](#) section of Wi-Fi Alliance’s official website for further details.

### Setting up WPA3 Personal with ESP32-S3

A config option `CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE` is provided to Enable/Disable WPA3 for station. By default it is kept enabled, if disabled ESP32-S3 will not be able to establish a WPA3 connection. Additionally, since PMF is mandated by WPA3 protocol, PMF Mode Optional is set by default for station. PMF Required can be configured using WiFi config.

Refer to *Protected Management Frames (PMF)* on how to set this mode.

After configuring all required settings for WPA3-Personal station, application developers need not worry about the underlying security mode of the AP. WPA3-Personal is now the highest supported protocol in terms of security, so it will be automatically selected for the connection whenever available. For example, if an AP is configured to be in WPA3 Transition Mode, where it will advertise as both WPA2 and WPA3 capable, Station will choose WPA3 for the connection with above settings. Note that Wi-Fi stack size requirement will increase 3kB when “Enable WPA3-Personal” is used.

## Chapter 5

# Libraries and Frameworks

### 5.1 Cloud Frameworks

ESP32-S3 supports multiple cloud frameworks using agents built on top of ESP-IDF. Here are the pointers to various supported cloud frameworks' agents and examples:

#### 5.1.1 ESP RainMaker

ESP RainMaker is a complete solution for accelerated AIoT development. [ESP RainMaker on GitHub](#).

#### 5.1.2 AWS IoT

<https://github.com/espressif/esp-aws-iot> is an open source repository for ESP32-S3 based on Amazon Web Services' `aws-iot-device-sdk-embedded-C`.

#### 5.1.3 Azure IoT

<https://github.com/espressif/esp-azure> is an open source repository for ESP32-S3 based on Microsoft Azure' s `azure-iot-sdk-c` SDK.

#### 5.1.4 Google IoT Core

<https://github.com/espressif/esp-google-iot> is an open source repository for ESP32-S3 based on Google' s `iot-device-sdk-embedded-c` SDK.

#### 5.1.5 Aliyun IoT

<https://github.com/espressif/esp-aliyun> is an open source repository for ESP32-S3 based on Aliyun' s `iotkit-embedded` SDK.

#### 5.1.6 Joylink IoT

<https://github.com/espressif/esp-joylink> is an open source repository for ESP32-S3 based on Joylink' s `joylink_dev_sdk` SDK.

### 5.1.7 Tencent IoT

<https://github.com/espressif/esp-welink> is an open source repository for ESP32-S3 based on Tencent's [welink SDK](#).

### 5.1.8 Tencentyun IoT

<https://github.com/espressif/esp-qcloud> is an open source repository for ESP32-S3 based on Tencentyun's [qcloud-iot-sdk-embedded-c SDK](#).

### 5.1.9 Baidu IoT

<https://github.com/espressif/esp-baidu-iot> is an open source repository for ESP32-S3 based on Baidu's [iot-sdk-c SDK](#).

## 5.2 Espressif's Frameworks

Here you will find a collection of the official Espressif libraries and frameworks.

### 5.2.1 Espressif Audio Development Framework

The ESP-ADF is a comprehensive framework for audio applications including:

- CODEC's HAL
- Music Players and Recorders
- Audio Processing
- Bluetooth Speakers
- Internet Radios
- Hands-free devices
- Speech Recognition

This framework is available at GitHub: [ESP-ADF](#).

### 5.2.2 ESP-CSI

ESP-CSI is an experimental implementation that uses the Wi-Fi Channel State Information to detect the presence of a human body.

See [ESP-CSI](#) project for more information about it.

### 5.2.3 Espressif DSP Library

The library provides algorithms optimized specifically for digital signal processing applications. This library supports:

- Matrix multiplication
- Dot product
- FFT (Fast Fourier Transform)
- IIR (Infinite Impulse Response)
- FIR (Finite Impulse Response)
- Vector math operations

This library is available here: [ESP-DSP library](#).

## 5.2.4 ESP-WIFI-MESH Development Framework

This framework is based on the ESP-WIFI-MESH protocol with the following features:

- Fast network configuration
- Stable upgrade
- Efficient debugging
- LAN control
- Various application demos

[ESP-MDF](#).

## 5.2.5 ESP-WHO

The ESP-WHO is a face detection and recognition framework using the ESP32 and camera. To know more about the project, see [ESP-WHO](#) on GitHub.

## 5.2.6 ESP RainMaker

[ESP RainMaker](#) is a complete solution for accelerated AIoT development. Using ESP RainMaker, you can create AIoT devices from the firmware to the integration with voice-assistant, phone apps and cloud backend.

[ESP RainMaker on GitHub](#).

## 5.2.7 ESP-IoT-Solution

[ESP-IoT-Solution](#) contains commonly used device drivers and code frameworks when developing IoT systems. The device drivers and code frameworks within the ESP-IoT-Solution are organized as separate components, allowing them to be easily integrated into an ESP-IDF project.

ESP-IoT-Solution includes:

- Device drivers for sensors, display, audio, GUI, input, actuators, etc.
- Framework and documentation for low power, security, storage, etc.
- Guide for Espressif open source solutions from practical application point.

[ESP-IoT-Solution on GitHub](#).

## Chapter 6

# Contributions Guide

We welcome contributions to the esp-idf project!

### 6.1 How to Contribute

Contributions to esp-idf - fixing bugs, adding features, adding documentation - are welcome. We accept contributions via [Github Pull Requests](#).

### 6.2 Before Contributing

Before sending us a Pull Request, please consider this list of points:

- Is the contribution entirely your own work, or already licensed under an Apache License 2.0 compatible Open Source License? If not then we unfortunately cannot accept it.
- Does any new code conform to the esp-idf *Style Guide*?
- Have you installed the *pre-commit hook* for esp-idf project?
- Does the code documentation follow requirements in *Documenting Code*?
- Is the code adequately commented for people to understand how it is structured?
- Is there documentation or examples that go with code contributions? There are additional suggestions for writing good examples in [examples](#) readme.
- Are comments and documentation written in clear English, with no spelling or grammar errors?
- Example contributions are also welcome. Please check the [创建示例项目](#) guide for these.
- If the contribution contains multiple commits, are they grouped together into logical changes (one major change per pull request)? Are any commits with names like “fixed typo” [squashed into previous commits](#)?
- If you’re unsure about any of these points, please open the Pull Request anyhow and then ask us for feedback.

### 6.3 Pull Request Process

After you open the Pull Request, there will probably be some discussion in the comments field of the request itself.

Once the Pull Request is ready to merge, it will first be merged into our internal git system for in-house automated testing.

If this process passes, it will be merged onto the public github repository.

## 6.4 Legal Part

Before a contribution can be accepted, you will need to sign our *Contributor Agreement*. You will be prompted for this automatically as part of the Pull Request process.

## 6.5 Related Documents

### 6.5.1 Espressif IoT Development Framework Style Guide

#### About This Guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF.

Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

#### C Code Formatting

##### Naming

- Any variable or function which is only used in a single source file should be declared `static`.
- Public names (non-static variables and functions) should be namespaced with a per-component or per-unit prefix, to avoid naming collisions. ie `esp_vfs_register()` or `esp_console_run()`. Starting the prefix with `esp_` for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with `s_` for easy identification. For example, `static bool s_invert`.
- Avoid unnecessary abbreviations (ie shortening `data` to `dat`), unless the resulting name would otherwise be very long.

**Indentation** Use 4 spaces for each indentation level. Don't use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

**Vertical Space** Place one empty line between functions. Don't begin or end a function with an empty line.

```
void function1()
{
    do_one_thing();
    do_another_thing();
}
// INCORRECT, don't place empty line here
// place empty line here
void function2()
{
    // INCORRECT, don't use an empty line here
    int var = 0;
    while (var < SOME_CONSTANT) {
        do_stuff(&var);
    }
}
```

(下页继续)

```
}
}
```

The maximum line length is 120 characters as long as it doesn't seriously affect the readability.

**Horizontal Space** Always add single space after conditional and loop keywords:

```
if (condition) {      // correct
    // ...
}

switch (n) {          // correct
    case 0:
        // ...
}

for(int i = 0; i < CONST; ++i) {    // INCORRECT
    // ...
}
```

Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);    // correct
const int y = y0 + (x - x0)*(y1 - y0)/(x1 - x0);      // also okay
int y_cur = -y;                                       // correct
++y_cur;
const int y = y0+(x-x0)*(y1-y0)/(x1-x0);              // INCORRECT
```

No space is necessary around `.` and `->` operators.

Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```
esp_rom_gpio_connect_in_signal(PIN_CAM_D6,    I2S0I_DATA_IN14_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_D7,    I2S0I_DATA_IN15_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_HREF,  I2S0I_H_ENABLE_IDX,  false);
esp_rom_gpio_connect_in_signal(PIN_CAM_PCLK,  I2S0I_DATA_IN15_IDX, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g. `PIN_CAM_VSYNC`), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.

Never add trailing whitespace at the end of the line.

## Braces

- Function definition should have a brace on a separate line:

```
// This is correct:
void function(int arg)
{
}
}
```

```
// NOT like this:
void function(int arg) {
}
```

- Within a function, place opening brace on the same line with conditional and loop statements:

```
if (condition) {
    do_one();
} else if (other_condition) {
    do_two();
}
```

**Comments** Use `//` for single line comments. For multi-line comments it is okay to use either `//` on each line or a `/* */` block.

Although not directly related to formatting, here are a few notes about using comments effectively.

- Don't use single comments to disable some functionality:

```
void init_something()
{
    setup_dma();
    // load_resources();           // WHY is this thing commented, asks_
    ↪the reader?
    start_timer();
}
```

- If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

```
void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated_
    ↪yet.
    // load_resources();
    start_timer();
}
```

- Same goes for `#if 0 ... #endif` blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Don't use `#if 0 ... #endif` or comments to store code snippets which you may need in the future.
- Don't add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g. this comment adds clutter to the code without adding any useful information:

```
void init_something()
{
    setup_dma();
    // XXX add 2016-09-01
    init_dma_list();
    fill_dma_item(0);
    // end XXX add
    start_timer();
}
```

**Line Endings** Commits should only contain files with LF (Unix style) endings.

Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the `core.autocrlf` setting. *Github has a document about setting this option <github-line-endings>*. However because MSYS2 uses Unix-style line endings, it is often easier to configure your text editor to use LF (Unix style) endings when editing ESP-IDF source files.

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

```
git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs ↵
↳dos2unix && git commit -a --amend --no-edit --allow-empty' master
```

(Note that this line rebases on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it's possible to run `dos2unix FILENAME` and then run `git commit --amend`

**Formatting Your Code** You can use `astyle` program to format your code according to the above recommendations.

If you are writing a file from scratch, or doing a complete rewrite, feel free to re-format the entire file. If you are changing a small portion of file, don't re-format the code you didn't change. This will help others when they review your changes.

To re-format a file, run:

```
tools/format.sh components/my_component/file.c
```

**Type Definitions** Should be snake\_case, ending with `_t` suffix:

```
typedef int signed_32_bit_t;
```

**Enum** Enums should be defined through the `typedef` and be namespaced:

```
typedef enum
{
    MODULE_FOO_ONE,
    MODULE_FOO_TWO,
    MODULE_FOO_THREE
} module_foo_t;
```

**Assertions** The standard C `assert()` function, defined in `assert.h` should be used to check conditions that should be true in source code. In the default configuration, an assert condition that returns `false` or `0` will call `abort()` and trigger a *Fatal Error*.

`assert()` should only be used to detect unrecoverable errors due to a serious internal logic bug or corruption, where it's not possible for the program to continue. For recoverable errors, including errors that are possible due to invalid external input, an *error value should be returned*.

---

**备注:** When asserting a value of type `esp_err_t` is equal to `ESP_OK`, use the `ESP_ERROR_CHECK` 宏 instead of an `assert()`.

---

It's possible to configure ESP-IDF projects with assertions disabled (see `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`). Therefore, functions called in an `assert()` statement should not have side-effects.

It's also necessary to use particular techniques to avoid “variable set but not used” warnings when assertions are disabled, due to code patterns such as:

```
int res = do_something();
assert(res == 0);
```

Once the `assert` is optimized out, the `res` value is unused and the compiler will warn about this. However the function `do_something()` must still be called, even if assertions are disabled.

When the variable is declared and initialized in a single statement, a good strategy is to cast it to `void` on a new line. The compiler will not produce a warning, and the variable can still be optimized out of the final binary:

```
int res = do_something();
assert(res == 0);
(void)res;
```

If the variable is declared separately, for example if it is used for multiple assertions, then it can be declared with the GCC attribute `__attribute__((unused))`. The compiler will not produce any unused variable warnings, but the variable can still be optimized out:

```
int res __attribute__((unused));

res = do_something();
assert(res == 0);

res = do_something_else();
assert(res != 0);
```

## Header file guards

All public facing header files should have preprocessor guards. A `pragma` is preferred:

```
#pragma once
```

over the following pattern:

```
#ifndef FILE_NAME_H
#define FILE_NAME_H
...
#endif // FILE_NAME_H
```

In addition to guard macros, all C header files should have `extern "C"` guards to allow the header to be used from C++ code. Note that the following order should be used: `pragma once`, then any `#include` statements, then `extern "C"` guards:

```
#pragma once

#include <stdint.h>

#ifdef __cplusplus
extern "C" {
#endif

/* declarations go here */

#ifdef __cplusplus
}
#endif
```

## Include statements

When writing `#include` statements, try to maintain the following order:

- C standard library headers.
- Other POSIX standard headers and common extensions to them (such as `sys/queue.h`.)
- Common IDF headers (`esp_log.h`, `esp_system.h`, `esp_timer.h`, `esp_sleep.h`, etc.)
- Headers of other components, such as FreeRTOS.
- Public headers of the current component.
- Private headers.

Use angle brackets for C standard library headers and other POSIX headers (`#include <stdio.h>`).

Use double quotes for all other headers (`#include "esp_log.h"`).

## C++ Code Formatting

The same rules as for C apply. Where they are not enough, apply the following rules.

**File Naming** C++ Header files have the extension `.hpp`. C++ source files have the extension `.cpp`. The latter is important for the compiler to distinguish them from normal C source files.

## Naming

- **Class and struct** names shall be written in CamelCase with a capital letter as beginning. Member variables and methods shall be in snake\_case.
- **Namespaces** shall be in lower snake\_case.
- **Templates** are specified in the line above the function declaration.
- Interfaces in terms of Object-Oriented Programming shall be named without the suffix `...Interface`. Later, this makes it easier to extract interfaces from normal classes and vice versa without making a breaking change.

**Member Order in Classes** In order of precedence:

- First put the public members, then the protected, then private ones. Omit public, protected or private sections without any members.
- First put constructors/destructors, then member functions, then member variables.

For example:

```
class ForExample {
public:
    // first constructors, then default constructor, then destructor
    ForExample(double example_factor_arg);
    ForExample();
    ~ForExample();

    // then remaining public methods
    set_example_factor(double example_factor_arg);

    // then public member variables
    uint32_t public_data_member;

private:
    // first private methods
    void internal_method();

    // then private member variables
    double example_factor;
};
```

## Spacing

- Don't indent inside namespaces.
- Put public, protected and private labels at the same indentation level as the corresponding class label.

## Simple Example

```
// file spaceship.h
#ifndef SPACESHIP_H_
#define SPACESHIP_H_
#include <cstdlib>

namespace spaceships {

class SpaceShip {
public:
    SpaceShip(size_t crew);
    size_t get_crew_size() const;

private:
    const size_t crew;
};

class SpaceShuttle : public SpaceShip {
public:
    SpaceShuttle();
};

class Sojuz : public SpaceShip {
public:
    Sojuz();
};

template <typename T>
class CargoShip {
public:
    CargoShip(const T &cargo);

private:
    T cargo;
};

} // namespace spaceships

#endif // SPACESHIP_H_

// file spaceship.cpp
#include "spaceship.h"

namespace spaceships {

// Putting the curly braces in the same line for constructors is OK if it only
↪initializes
// values in the initializer list
SpaceShip::SpaceShip(size_t crew) : crew(crew) { }

size_t SpaceShip::get_crew_size() const
{
    return crew;
}

}
```

(下页继续)

```
SpaceShuttle::SpaceShuttle() : SpaceShip(7)
{
    // doing further initialization
}

Sojuz::Sojuz() : SpaceShip(3)
{
    // doing further initialization
}

template <typename T>
CargoShip<T>::CargoShip(const T &cargo) : cargo(cargo) { }

} // namespace spaceships
```

### CMake Code Style

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Don't put anything in the optional parentheses after `foreach()`, `endif()`, etc.
- Use lowercase (`with_underscores`) for command, function, and macro names.
- For locally scoped variables, use lowercase (`with_underscores`).
- For globally scoped variables, use uppercase (`WITH_UNDERSCORES`).
- Otherwise follow the defaults of the [cmake-lint](#) project.

### Configuring the Code Style for a Project Using EditorConfig

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see [EditorConfig Website](#).

### Documenting Code

Please see the guide here: [Documenting Code](#).

### Structure

To be written.

### Language Features

To be written.

## 6.5.2 Install pre-commit Hook for ESP-IDF Project

### Required Dependency

Python 3.6.1 or above. This is our recommendation python version for IDF developers.

If you still have python versions not compatible, please do not install pre-commit hook and update your python versions.

### Install pre-commit

Run `pip install pre-commit`

### Install pre-commit hook

1. Go to the IDF Project Directory
2. Run `pre-commit install --allow-missing-config`. Install hook by this approach will let you commit successfully even in branches without the `.pre-commit-config.yaml`
3. pre-commit hook will run automatically when you' re running `git commit` command

### Uninstall pre-commit

Run `pre-commit uninstall`

### What' s More?

For detailed usage, please refer to the documentation of [pre-commit](#).

### Common Problems For Windows Users

`/usr/bin/env: python: Permission denied.`

If you' re in Git Bash or MSYS terminal, please check the python executable location by run `which python`.

If the executable is under `~/AppData/Local/Microsoft/WindowsApps/`, then it' s a link to Windows AppStore, not a real one.

Please install python manually and update this in your PATH environment variable.

Your `%USERPROFILE%` contains non-ASCII characters

`pre-commit` may fail when initializing an environment for a particular hook when the path of `pre-commit`' s cache contains non-ASCII characters. The solution is to set `PRE_COMMIT_HOME` to a path containing only standard characters before running `pre-commit`.

- CMD: `set PRE_COMMIT_HOME=C:\somepath\pre-commit`
- PowerShell: `$Env:PRE_COMMIT_HOME = "C:\somepath\pre-commit"`
- git bash: `export PRE_COMMIT_HOME="/c/somepath/pre-commit"`

## 6.5.3 Documenting Code

The purpose of this description is to provide quick summary on documentation style used in [espressif/esp-idf](#) repository and how to add new documentation.

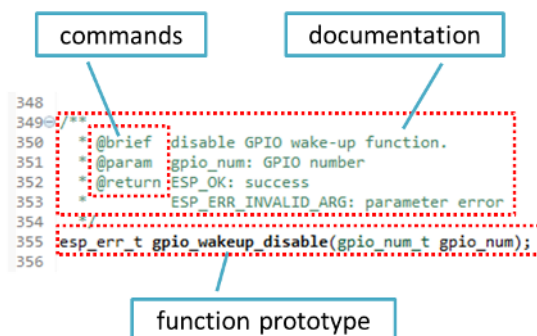

## Introduction

When documenting code for this repository, please follow [Doxygen style](#). You are doing it by inserting special commands, for instance `@param`, into standard comments blocks, for example:

```
/**
 * @param ratio this is oxygen to air ratio
 */
```

Doxygen is phrasing the code, extracting the commands together with subsequent text, and building documentation out of it.

Typical comment block, that contains documentation of a function, looks like below.

Doxygen supports couple of formatting styles. It also gives you great flexibility on level of details to include in documentation. To get familiar with available features, please check data rich and very well organized [Doxygen Manual](#).

## Why we need it?

The ultimate goal is to ensure that all the code is consistently documented, so we can use tools like [Sphinx](#) and [Breathe](#) to aid preparation and automatic updates of API documentation when the code changes.

With these tools the above piece of code renders like below:

## Go for it!

When writing code for this repository, please follow guidelines below.

1. Document all building blocks of code: functions, structs, typedefs, enums, macros, etc. Provide enough information about purpose, functionality and limitations of documented items, as you would like to see them documented when reading the code by others.
2. Documentation of function should describe what this function does. If it accepts input parameters and returns some value, all of them should be explained.
3. Do not add a data type before parameter or any other characters besides spaces. All spaces and line breaks are compressed into a single space. If you like to break a line, then break it twice.

```

41 @ /**
42  * @brief Set log level for given tag
43  *
44  * If logging for given component has already been enabled, changes previous setting.
45  *
46  * @param tag Tag of the log entries to enable. Must be a non-NULL zero terminated string.
47  *           Value "" resets log level for all tags to the given value.
48  *
49  * @param level Selects log level to enable.
50  *             Only logs at this and lower levels will be shown.
51  */
52 void esp_log_level_set(const char* tag, esp_log_level_t level);

```

```

void esp_log_level_set(const char* tag, esp_log_level_t level)

```

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

**Parameters**

- **tag** - Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "" resets log level for all tags to the given value.
- **level** - Selects log level to enable. Only logs at this and lower levels will be shown.

4. If function has void input or does not return any value, then skip @param or @return

```

26 @ /**
27  * @brief Initialize BT controller
28  *
29  * This function should be called only once,
30  * before any other BT functions are called.
31  */
32 void bt_controller_init(void);

```

```

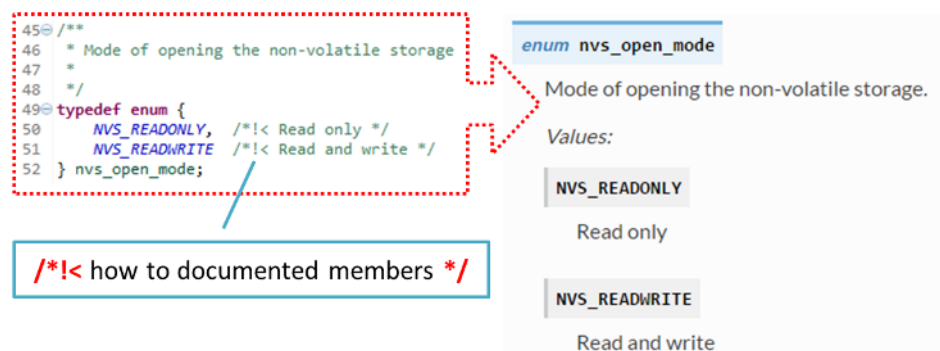

void bt_controller_init(void)

```

Initialize BT controller.

This function should be called only once, before any other BT functions are called.

5. When documenting a define as well as members of a struct or enum, place specific comment like below after each member.

6. To provide well formatted lists, break the line after command (like @return in example below).

```

*
* @return
*   - ESP_OK if erase operation was successful
*   - ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
*   - ESP_ERR_NVS_READ_ONLY if handle was opened as read only
*   - ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
*   - other error codes from the underlying storage driver
*

```

7. Overview of functionality of documented header file, or group of files that make a library, should be placed in a separate README.rst file of the same directory. If this directory contains header files for different APIs, then the file name should be apiname-readme.rst.

### Go one extra mile

Here are a couple of tips on how you can make your documentation even better and more useful to the reader and writer.

When writing codes, please follow the guidelines below:

1. Add code snippets to illustrate implementation. To do so, enclose snippet using @code{c} and @endcode commands.

```

*
* @code{c}
* // Example of using nvs_get_i32:
* int32_t max_buffer_size = 4096; // default value
* esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
* assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
* // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
* // have its default value.
* @endcode
*

```

The code snippet should be enclosed in a comment block of the function that it illustrates.

2. To highlight some important information use command @attention or @note.

```

*
* @attention
*   1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
*   2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to
*   ↪disconnect.
*

```

Above example also shows how to use a numbered list.

3. To provide common description to a group of similar functions, enclose them using /\*\*@{ \*/ and /\*\*@} \*/ markup commands:

```

/**@{ */
/**
 * @brief common description of similar functions
 *
 */
void first_similar_function (void);
void second_similar_function (void);
/**@} */

```

For practical example see [nvs\\_flash/include/nvs.h](#).

4. You may want to go even further and skip some code like repetitive defines or enumerations. In such case, enclose the code within `/** @cond */` and `/** @endcond */` commands. Example of such implementation is provided in [driver/include/driver/gpio.h](#).
5. Use markdown to make your documentation even more readable. You will add headers, links, tables and more.

```

*
* [ESP32-S3 Technical Reference Manual] (https://www.espressif.com/sites/default/files/documentation/esp32-s3\_technical\_reference\_manual\_en.pdf)
*

```

**备注:** Code snippets, notes, links, etc. will not make it to the documentation, if not enclosed in a comment block associated with one of documented objects.

6. Prepare one or more complete code examples together with description. Place description to a separate file `README.md` in specific folder of `examples` directory.

### Standardize Document Format

When it comes to text, please follow guidelines below to provide well formatted Markdown (.md) or reST (.rst) documents.

1. Please ensure that one paragraph is written in one line. Don't break lines like below. Breaking lines to enhance readability is only suitable for writing codes. To make the text easier to read, it is recommended to place an empty line to separate the paragraph.

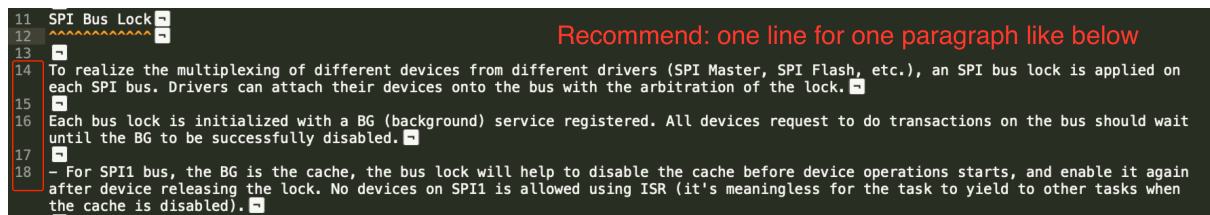

图 1: One line for one paragraph (click to enlarge)

图 2: No line breaks within the same paragraph (click to enlarge)

- Please make the line number of CN and EN documents consistent like below. The benefit of this approach is that it can save time for both writers and translators. When non-bilingual writers need to update text, they only need to update the same line in the corresponding CN or EN document. For translators, if documents are updated in English, then translators can quickly locate where to update in the corresponding CN document later. Besides, by comparing the total number of lines in EN and CN documents, you can quickly find out whether the CN version lags behind the EN version.

图 3: Keep the line number for EN and CN documents consistent (click to enlarge)

## Building Documentation

The documentation is built with the *esp-docs* Python package, which is a wrapper around [Sphinx](#)

To install it simply do:

```
pip install esp-docs
```

After a successful install then the documentation can be built from the docs folder with:

```
build-docs build
```

or for specific target and language with:

```
build-docs -t esp32 -l en build
```

For more in-depth documentation about *esp-docs* features please see the *esp-doc* documentation.

## Wrap up

We love good code that is doing cool things. We love it even better, if it is well documented, so we can quickly make it run and also do the cool things.

Go ahead, contribute your code and documentation!

## 6.5.4 创建示例项目

每个 ESP-IDF 的示例都是一个完整的项目，其他人可以将示例复制至本地，并根据实际情况进行一定修改。请注意，示例项目主要是为了展示 ESP-IDF 的功能。

### 示例项目结构

- main 目录需要包含一个名为 `(something)_example_main.c` 的源文件，里面包含示例项目的主要功能。
- 如果该示例项目的子任务比较多，请根据逻辑将其拆分为 main 目录下的多个 C 或者 C++ 源文件，并将对应的头文件也放在同一目录下。
- 如果该示例项目具有多种功能，可以考虑在项目中增加一个 components 子目录，通过库功能，将示例项目的不同功能划分为不同的组件。注意，如果该组件提供的功能相对完整，且具有一定的通用性，则应该将它们添加到 ESP-IDF 的 components 目录中，使其成为 ESP-IDF 的一部分。
- 示例项目需要包含一个 README.md 文件，建议使用 [示例项目 README 模板](#)，并根据项目实际情况进行修改。
- 示例项目需要包含一个 example\_test.py 文件，用于进行自动化测试。如果在 GitHub 上初次提交 Pull Request 时，可以先不包含这个脚本文件。具体细节，请见有关 [Pull Request](#) 的相关内容。

### 一般准则

示例代码需要遵循 [《乐鑫物联网开发框架风格指南》](#)。

### 检查清单

提交一个新的示例项目之前，需要检查以下内容：

- 示例项目的名字（包括 Makefile 和 README.md 中）应使用 example，而不要写“demo”，“test”等词汇。
- 每个示例项目只能有一个主要功能。如果某个示例项目有多个主要功能，请将其拆分为两个或更多示例项目。
- 每个示例项目应包含一个 README.md 文件，建议使用 [示例项目 README 模板](#)。
- 示例项目中的函数和变量的命令要遵循[命名规范](#)中的要求。对于仅在示例项目源文件中使用的非静态变量/函数，请使用 example 或其他类似的前缀。
- 示例项目中的所有代码结构良好，关键代码要有详细注释。
- 示例项目中所有不必要的代码（旧的调试日志，注释掉的代码等）都必须清除掉。
- 示例项目中使用的选项（比如网络名称，地址等）不得直接硬编码，应尽可能地使用配置项，或者定义为宏或常量。
- 配置项可见 KConfig.projbuild 文件，该文件中包含一个名为“Example Configuration”的菜单。具体情况，请查看现有示例项目。
- 所有的源代码都需要在文件开头指定许可信息（表示该代码是 in the public domain CC0）和免责声明。或者，源代码也可以应用 Apache License 2.0 许可条款。请查看现有示例项目的许可信息和免责声明，并根据实际情况进行修改。
- 任何第三方代码（无论是直接使用，还是进行了一些改进）均应保留原始代码中的许可信息，且这些代码的许可必须兼容 Apache License 2.0 协议。

## 6.5.5 API Documentation Template

### 备注：INSTRUCTIONS

1. Use this file ([docs/en/api-reference/template.rst](#)) as a template to document API.
2. Change the file name to the name of the header file that represents documented API.
3. Include respective files with descriptions from the API folder using `..include::`

- README.rst
  - example.rst
  - ...
4. Optionally provide description right in this file.
  5. Once done, remove all instructions like this one and any superfluous headers.
- 

## Overview

---

### 备注: INSTRUCTIONS

1. Provide overview where and how this API may be used.
  2. Where applicable include code snippets to illustrate functionality of particular functions.
  3. To distinguish between sections, use the following [heading levels](#):
    - # with overline, for parts
    - \* with overline, for chapters
    - =, for sections
    - -, for subsections
    - ^, for subsubsections
    - ", for paragraphs
- 

## Application Example

---

### 备注: INSTRUCTIONS

1. Prepare one or more practical examples to demonstrate functionality of this API.
  2. Each example should follow pattern of projects located in `esp-idf/examples/` folder.
  3. Place example in this folder complete with `README.md` file.
  4. Provide overview of demonstrated functionality in `README.md`.
  5. With good overview reader should be able to understand what example does without opening the source code.
  6. Depending on complexity of example, break down description of code into parts and provide overview of functionality of each part.
  7. Include flow diagram and screenshots of application output if applicable.
  8. Finally add in this section synopsis of each example together with link to respective folder in `esp-idf/examples/`.
- 

## API Reference

---

### 备注: INSTRUCTIONS

1. This repository provides for automatic update of API reference documentation using [code markup retrieved by Doxygen from header files](#).
1. Update is done on each documentation build by invoking Sphinx extension `:esp_extensions/run_doxygen.py` for all header files listed in the `INPUT` statement of `docs/doxygen/Doxyfile`.
1. Each line of the `INPUT` statement (other than a comment that begins with `##`) contains a path to header file `*.h` that will be used to generate corresponding `*.inc` files:

```
##  
## Wi-Fi - API Reference  
##  
../components/esp32/include/esp_wifi.h \  
../components/esp32/include/esp_smartconfig.h \  

```

1. When the headers are expanded, any macros defined by default in `sdkconfig.h` as well as any macros defined in SOC-specific `include/soc/*_caps.h` headers will be expanded. This allows the headers to include/exclude material based on the `IDF_TARGET` value.
1. The `*.inc` files contain formatted reference of API members generated automatically on each documentation build. All `*.inc` files are placed in Sphinx `_build` directory. To see directives generated for e.g. `esp_wifi.h`, run `python gen-dxd.py esp32/include/esp_wifi.h`.
1. To show contents of `*.inc` file in documentation, include it as follows:

```
.. include-build-file:: inc/esp_wifi.inc
```

For example see [docs/en/api-reference/network/esp\\_wifi.rst](#)

1. Optionally, rather than using `*.inc` files, you may want to describe API in your own way. See [docs/en/api-reference/storage/fatfs.rst](#) for example.

Below is the list of common `.. doxygen...::` directives:

- Functions - `.. doxygenfunction:: name_of_function`
- Unions - `.. doxygenunion:: name_of_union`
- Structures - `.. doxygenstruct:: name_of_structure` together with `:members:`
- Macros - `.. doxygendefine:: name_of_define`
- Type Definitions - `.. doxygentypedef:: name_of_type`
- Enumerations - `.. doxygenenum:: name_of_enumeration`

See [Breathe documentation](#) for additional information.

To provide a link to header file, use the `link custom role` directive as follows:

```
* :component_file:`path_to/header_file.h`
```

1. In any case, to generate API reference, the file [docs/doxygen/Doxyfile](#) should be updated with paths to `*.h` headers that are being documented.
1. When changes are committed and documentation is built, check how this section has been rendered. [Correct annotations](#) in respective header files, if required.

## 6.5.6 Contributor Agreement

### Individual Contributor Non-Exclusive License Agreement including the Traditional Patent License OPTION

Thank you for your interest in contributing to this Espressif project hosted on GitHub ( “We” or “Us” ).

The purpose of this contributor agreement ( “Agreement” ) is to clarify and document the rights granted by contributors to Us. To make this document effective, please follow the instructions in the [Contributions Guide](#).

**1. DEFINITIONS** “You” means the Individual Copyright owner who submits a Contribution to Us. If You are an employee and submit the Contribution as part of your employment, You have had Your employer approve this Agreement or sign the Entity version of this document.

“**Contribution**” means any original work of authorship (software and/or documentation) including any modifications or additions to an existing work, Submitted by You to Us, in which You own the Copyright. If You do not own the Copyright in the entire work of authorship, please contact Us by submitting a comment on GitHub.

“**Copyright**” means all rights protecting works of authorship owned or controlled by You, including copyright, moral and neighboring rights, as appropriate, for the full term of their existence including any extensions by You.

“**Material**” means the software or documentation made available by Us to third parties. When this Agreement covers more than one software project, the Material means the software or documentation to which the Contribution was Submitted. After You Submit the Contribution, it may be included in the Material.

“**Submit**” means any form of physical, electronic, or written communication sent to Us, including but not limited to electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of,

Us, but excluding communication that is conspicuously marked or otherwise designated in writing by You as “Not a Contribution.”

“**Submission Date**” means the date You Submit a Contribution to Us.

“**Documentation**” means any non-software portion of a Contribution.

## **2. LICENSE GRANT** 2.1 Copyright License to Us

Subject to the terms and conditions of this Agreement, You hereby grant to Us a worldwide, royalty-free, NON-exclusive, perpetual and irrevocable license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, under the Copyright covering the Contribution to use the Contribution by all means, including, but not limited to:

- to publish the Contribution,
- to modify the Contribution, to prepare derivative works based upon or containing the Contribution and to combine the Contribution with other software code,
- to reproduce the Contribution in original or modified form,
- to distribute, to make the Contribution available to the public, display and publicly perform the Contribution in original or modified form.

2.2 Moral Rights remain unaffected to the extent they are recognized and not waivable by applicable law. Notwithstanding, You may add your name in the header of the source code files of Your Contribution and We will respect this attribution when using Your Contribution.

## **3. PATENTS** 3.1 Patent License

Subject to the terms and conditions of this Agreement You hereby grant to us a worldwide, royalty-free, non-exclusive, perpetual and irrevocable (except as stated in Section 3.2) patent license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, to make, have made, use, sell, offer for sale, import and otherwise transfer the Contribution and the Contribution in combination with the Material (and portions of such combination). This license applies to all patents owned or controlled by You, whether already acquired or hereafter acquired, that would be infringed by making, having made, using, selling, offering for sale, importing or otherwise transferring of Your Contribution(s) alone or by combination of Your Contribution(s) with the Material.

### 3.2 Revocation of Patent License

You reserve the right to revoke the patent license stated in section 3.1 if we make any infringement claim that is targeted at your Contribution and not asserted for a Defensive Purpose. An assertion of claims of the Patents shall be considered for a “Defensive Purpose” if the claims are asserted against an entity that has filed, maintained, threatened, or voluntarily participated in a patent infringement lawsuit against Us or any of Our licensees.

**4. DISCLAIMER** THE CONTRIBUTION IS PROVIDED “AS IS” . MORE PARTICULARLY, ALL EXPRESS OR IMPLIED WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT ARE EXPRESSLY DISCLAIMED BY YOU TO US AND BY US TO YOU. TO THE EXTENT THAT ANY SUCH WARRANTIES CANNOT BE DISCLAIMED, SUCH WARRANTY IS LIMITED IN DURATION TO THE MINIMUM PERIOD PERMITTED BY LAW.

**5. Consequential Damage Waiver** TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT WILL YOU OR US BE LIABLE FOR ANY LOSS OF PROFITS, LOSS OF ANTICIPATED SAVINGS, LOSS OF DATA, INDIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL AND EXEMPLARY DAMAGES ARISING OUT OF THIS AGREEMENT REGARDLESS OF THE LEGAL OR EQUITABLE THEORY (CONTRACT, TORT OR OTHERWISE) UPON WHICH THE CLAIM IS BASED.

**6. Approximation of Disclaimer and Damage Waiver** IF THE DISCLAIMER AND DAMAGE WAIVER MENTIONED IN SECTION 4 AND SECTION 5 CANNOT BE GIVEN LEGAL EFFECT UNDER APPLICABLE LOCAL LAW, REVIEWING COURTS SHALL APPLY LOCAL LAW THAT MOST CLOSELY APPROX-

IMATES AN ABSOLUTE WAIVER OF ALL CIVIL LIABILITY IN CONNECTION WITH THE CONTRIBUTION.

**7. Term** 7.1 This Agreement shall come into effect upon Your acceptance of the terms and conditions.

7.2 In the event of a termination of this Agreement Sections 4, 5, 6, 7 and 8 shall survive such termination and shall remain in full force thereafter. For the avoidance of doubt, Contributions that are already licensed under a free and open source license at the date of the termination shall remain in full force after the termination of this Agreement.

**8. Miscellaneous** 8.1 This Agreement and all disputes, claims, actions, suits or other proceedings arising out of this agreement or relating in any way to it shall be governed by the laws of People's Republic of China excluding its private international law provisions.

8.2 This Agreement sets out the entire agreement between You and Us for Your Contributions to Us and overrides all other agreements or understandings.

8.3 If any provision of this Agreement is found void and unenforceable, such provision will be replaced to the extent possible with a provision that comes closest to the meaning of the original provision and that is enforceable. The terms and conditions set forth in this Agreement shall apply notwithstanding any failure of essential purpose of this Agreement or any limited remedy to the maximum extent possible under law.

8.4 You agree to notify Us of any facts or circumstances of which you become aware that would make this Agreement inaccurate in any respect.

**You**

## Chapter 7

# ESP-IDF 版本简介

ESP-IDF 的 GitHub 仓库时常更新，特别是用于开发新特性的 `master` 分支。  
如有量产需求，请使用稳定版本。

### 7.1 发布版本

您可以通过以下链接访问各个版本的配套文档：

- 最新稳定版 ESP-IDF： [https://docs.espressif.com/projects/esp-idf/zh\\_CN/stable/](https://docs.espressif.com/projects/esp-idf/zh_CN/stable/)
- 最新版 ESP-IDF（即 `master` 分支）： [https://docs.espressif.com/projects/esp-idf/zh\\_CN/latest/](https://docs.espressif.com/projects/esp-idf/zh_CN/latest/)

ESP-IDF 在 GitHub 平台上的完整发布历史请见 [发布说明页面](#)。您可以在该页面查看各个版本的发布说明、配套文档及相应获取方式。

### 7.2 我该选择哪个版本？

- 如有量产需求，请使用 [最新稳定版本](#)。稳定版本已通过人工测试，后续更新仅修复 `bug`，主要特性不受影响（更多详情，请见 [版本管理](#)）。请访问 [发布说明页面](#) 界面查看每一个稳定发布版本。
- 如需尝试/测试 ESP-IDF 的最新特性，请使用 [最新版本（在 `master` 分支上）](#)。最新版本包含 ESP-IDF 的所有最新特性，已通过自动化测试，但尚未全部完成人工测试（因此存在一定风险）。
- 如需使用稳定版本中没有的新特性，但同时又不希望受到 `master` 分支更新的影响，您可以将一个最适合您的稳定版本 [更新至一个预发布版本](#) 或 [更新至一个发布分支](#)。

有关如何更新 ESP-IDF 本地副本的内容，请参考 [更新 ESP-IDF](#) 章节。

### 7.3 版本管理

ESP-IDF 采用了 [语义版本管理方法](#)，即您可以从字面含义理解每个版本的差异。其中

- 主要版本（例 `v3.0`）代表有重大更新，包括增加新特性、改变现有特性及移除已弃用的特性。  
升级至一个新的主要版本（例 `v2.1` 升级至 `v3.0`）意味着您可能需要更新您的工程代码，并重新测试您的工程，具体可参考 [发布说明页面](#) 的重大变更 (**Breaking Change**) 部分。
- 次要版本（例 `v3.1`）代表有新增特性和 `bug` 修复，但现有特性不受影响，公开 API 的使用也不受影响。  
升级至一个新的次要版本（例 `v3.0` 升级至 `v3.1`）意味着您可能不需要更新您的工程代码，但需重新测试您的工程，特别是 [发布说明页面](#) 中专门提到的部分。
- `Bugfix` 版本（例 `v3.0.1`）仅修复 `bug`，并不增加任何新特性。

升级至一个新的 **Bugfix** 版本（例 v3.0 升级至 v3.0.1）意味着您不需要更新您的工程代码，仅需测试与本次发布修复 **bug**（列表见 [发布说明页面](#)）直接相关的特性。

## 7.4 支持期限

ESP-IDF 的每个主要版本和次要版本都有相应的支持期限。支持期限满后，版本停止更新维护，将不再提供支持。

[支持期限政策](#) 对此有具体描述，并介绍了每个版本的支持期限是如何界定的。

[发布说明页面](#) 界面上的每一个发布版本都提供了该版本的支持期限信息。

一般而言：

- 如您刚开始一个新项目，建议使用最新稳定版本。
- 如您有 [GitHub](#) 账号，请点击 [发布说明页面](#) 界面右上角的“Watch”按钮，并选中“Releases only”选项。[GitHub](#) 将会在新版本发布的时候通知您。当您所使用的版本有 **Bugfix** 版本发布时，请做好升级至该 **Bugfix** 版本的规划。
- 如可能，请定期（如每年一次）将项目的 **IDF** 版本升级至一个新的主要版本或次要版本。对于次要版本更新，更新过程应该比较简单，但对于主要版本更新，可能需要细致查看发布说明并做对应的更新规划。
- 请确保您所使用的版本停止更新维护前，已做好升级至新版本的规划。

ESP-IDF 的每个主要版本和次要版本（V4.1、V4.2 等）的支持期限为 30 个月，从最初的稳定版发布日期算起。

在支持期限内意味着 ESP-IDF 团队将继续在 [GitHub](#) 的发布分支上进行 **bug** 修复、安全修复等，并根据需要定期发布新的 **Bugfix** 版本。

支持期限分为“服务期”和“维护期”：

| 周期  | 时长    | 是否推荐新工程使用 |
|-----|-------|-----------|
| 服务期 | 12 个月 | 是         |
| 维护期 | 18 个月 | 否         |

在服务期内，**Bugfix** 版本的发布更为频繁。某些情况下，在服务期内会增加新特性，这些特性主要是为了满足新产品特定监管要求或标准，并且回归风险非常低。

在维护期内，该版本仍受支持，但只会对严重性较高的问题或安全问题进行 **bug** 修复。

当开始一个新项目时，建议使用在服务期内的版本。

鼓励用户在您所用的版本支持期限结束之前，将所有的工程升级到最新的 ESP-IDF 版本。在版本支持期限满后，我们将不再继续进行 **bug** 修复。

支持期限不包括预发布版本（betas、预览版、*-rc* 和 *-dev* 版等），有时会将某个特性在发布版中标记为“预览版”，这意味着该特性也不在支持期限内。

关于 [不同版本的 ESP-IDF](#)（主要版本、次要版本、**Bugfix** 版本等）的更多信息，请参考 [ESP-IDF 编程指南](#)。

## 7.5 查看当前版本

查看 ESP-IDF 本地副本的版本，请使用 `idf.py` 命令：

```
idf.py --version
```

此外，由于 ESP-IDF 的版本也已编译至固件中，因此您也可以使用宏 `IDF_VER` 查看 ESP-IDF 的版本（以字符串的格式）。ESP-IDF 默认引导程序会在设备启动时打印 ESP-IDF 的版本。请注意，在 GitHub 仓库中的代码更新时，代码中的版本信息仅会在源代码重新编译或在清除编译时才会更新，因此打印出来的版本可能并不是最新的。

如果编写的代码需要支持多个 ESP-IDF 版本，可以在编译时使用 *compile-time macros* 检查版本。

几个 ESP-IDF 版本的例子：

| 版本字符串                    | 含义   |
|--------------------------|--|
| v3.2-dev-306-gbeb3611ca  | <p>master 分支上的预发布版本。</p> <ul style="list-style-type: none"> <li>- v3.2-dev: 为 v3.2 进行的开发。</li> <li>- 306: v3.2 开发启动后的 commit 数量。</li> <li>- beb3611ca: commit 标识符。</li> </ul>                              |
| v3.0.2                   | 稳定版本，标签为 v3.0.2。   |
| v3.1-beta1-75-g346d6b0ea | <p>v3.1 的 beta 测试版本（可参考<a href="#">更新至一个发布分支</a>）。</p> <ul style="list-style-type: none"> <li>- v3.1-beta1 - 预发布标签。</li> <li>- 75: 添加预发布 beta 标签后的 commit 数量。</li> <li>- 346d6b0ea: commit 标识符。</li> </ul> |
| v3.0.1-dirty             | <p>稳定版本，标签为 v3.0.1。</p> <ul style="list-style-type: none"> <li>- dirty 代表 ESP-IDF 的本地副本有修改。</li> </ul>   |

## 7.6 Git 工作流

乐鑫 ESP-IDF 团队的 (Git) 开发工作流程如下：

- 新的改动总是在 `master` 分支（最新版本）上进行。`master` 分支上的 ESP-IDF 版本总带有 `-dev` 标签，表示“正在开发中”，例 `v3.1-dev`。
- 这些改动将首先在乐鑫的内部 Git 仓库进行代码审阅与测试，而后在自动化测试完成后推至 GitHub。
- 新版本一旦完成特性开发（在 `master` 分支上进行）并达到进入 `beta` 测试的标准，则将该版本切换至一个新分支（例 `release/v3.1`）。此外，该分支还打上预发布标签（例 `v3.1-beta1`）。您可以在 GitHub 平台上查看 ESP-IDF 的完整 [分支列表](#) 和 [标签列表](#)。`Beta` 预发布版本可能仍存在大量“已知问题”（Known Issue）。
- 随着对 `beta` 版本的不断测试，`bug` 修复将同时增加至该发布分支和 `master` 分支。而且，`master` 分支可能也已经开始为下个版本开发新特性了。
- 当测试快结束时，该发布分支上将增加一个 `rc` 标签，代表候选发布（Release Candidate），例 `v3.1-rc1`。此时，该分支仍属于预发布版本。
- 如果一直未发现或报告重大 `bug`，则该预发布版本将最终增加“主要版本”（例 `v4.0`）或“次要版本”标记（例 `v3.1`），成为正式发布版本，并体现在 [发布说明页面](#)。
- 后续，该版本中发现的 `bug` 都将在该发布分支上进行修复。人工测试完成后，该分支将增加一个 `Bugfix` 版本标签（例 `v3.1.1`），并体现在 [发布说明页面](#)。

## 7.7 更新 ESP-IDF

请根据您的实际情况，对 ESP-IDF 进行更新。

- 如有量产用途，建议参考[更新至一个稳定发布版本](#)。
- 如需测试/研发/尝试最新特性，建议参考[更新至 `master` 分支](#)。
- 两者折衷建议参考[更新至一个发布分支](#)。

---

**备注：** 在参考本指南时，请首先获得 ESP-IDF 的本地副本，具体步骤请参考[入门指南](#) 中的介绍。

---

### 7.7.1 更新至一个稳定发布版本

对于量产用户，推荐更新至一个新的 ESP-IDF 发布版本，请参考以下步骤：

- 请定期查看 [发布说明页面](#)，了解最新发布情况。
- 如有新发布的 `Bugfix` 版本（例 `v3.0.1` 或 `v3.0.2`）时，请将新的 `Bugfix` 版本更新至您的 ESP-IDF 目录：

```
cd $IDF_PATH
git fetch
git checkout vX.Y.Z
git submodule update --init --recursive
```

- 在主要版本或次要版本新发布时，请查看发布说明中的具体描述，并决定是否升级您的版本。具体命令与上方描述一致。

---

**备注：** 如果您之前在安装 ESP-IDF 时使用了 `zip` 文件包，而非通过 `Git` 命令，则您将无法使用 `Git` 命令进行版本升级，此属正常情况。这种情况下，请重新下载最新 `zip` 文件包，并替换掉之前 `IDF_PATH` 下的全部内容。

---

## 7.7.2 更新至一个预发布版本

您也可以将您的本地副本切换（命令 `git checkout`）至一个预发布版本或 rc 版本，具体方法请参考[更新至一个稳定发布版本](#)中的描述。

预发布版本通常不体现在[发布说明页面](#)。更多详情，请查看完整[标签列表](#)。使用预发布版本的注意事项，请参考[更新至一个发布分支](#)中的描述。

## 7.7.3 更新至 master 分支

---

**备注：**ESP-IDF 中 master 分支上的代码会时时更新，因此使用 master 分支相当在“流血的边缘试探”，存在一定风险。

---

如需使用 ESP-IDF 的 master 分支，请参考以下步骤：

- 本地切换至 master 分支：

```
cd $IDF_PATH
git checkout master
git pull
git submodule update --init --recursive
```

- 此外，您还应在后续工作中不时使用 `git pull` 命令，将远端 master 上的更新同步到本地。注意，在更新 master 分支后，您可能需要更改工程代码，也可能遇到新的 bug。
- 如需从 master 分支切换至一个发布分支或稳定版本，请使用 `git checkout` 命令。

---

**重要：**强烈建议您定期使用 `git pull` 和 `git submodule update --init --recursive` 命令，确保本地副本的及时更新。旧的 master 分支相当于一个“快照”，可能存在未记录的问题，且无法获得支持。对于半稳定版本，请参考[更新至一个发布分支](#)。

---

## 7.7.4 更新至一个发布分支

从稳定性来说，使用“发布分支”相当于在使用 master 分支和稳定版本之间进行折衷，包含一些 master 分支上的新特性，但也同时保证可通过 beta 测试且基本完成了 bug 修复。

更多详情，请前往 GitHub 查看完整[标签列表](#)。

举例，您可以关注 ESP-IDF v3.1 分支，随时关注该分支上的 Bugfix 版本发布（例 v3.1.1 等）：

```
cd $IDF_PATH
git fetch
git checkout release/v3.1
git pull
git submodule update --init --recursive
```

您每次在该分支上使用 `git pull` 时都相当于把最新的 Bugfix 版本发布更新至您的本地副本中。

---

**备注：**发布分支并不会会有专门的配套文档，建议您使用与本分支最接近版本的文档。

---

## Chapter 8

# 资源

### 8.1 PlatformIO

- [What is PlatformIO?](#)
- [Installation](#)
- [Configuration](#)
- [Tutorials](#)
- [Project Examples](#)
- [Next Steps](#)

#### 8.1.1 What is PlatformIO?

PlatformIO is a cross-platform embedded development environment with out-of-the-box support for ESP-IDF.

Since ESP-IDF support within PlatformIO is not maintained by the Espressif team, please report any issues with PlatformIO directly to its developers in [the official PlatformIO repositories](#).

A detailed overview of the PlatformIO ecosystem and its philosophy can be found in [the official PlatformIO documentation](#).

#### 8.1.2 Installation

- [PlatformIO IDE](#) is a toolset for embedded C/C++ development available on Windows, macOS and Linux platforms
- [PlatformIO Core \(CLI\)](#) is a command-line tool that consists of multi-platform build system, platform and library managers and other integration components. It can be used with a variety of code development environments and allows integration with cloud platforms and web services

### 8.1.3 Configuration

Please go through [the official PlatformIO configuration guide](#) for ESP-IDF.

### 8.1.4 Tutorials

- [ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis](#)

### 8.1.5 Project Examples

Please check ESP-IDF page in [the official PlatformIO documentation](#)

### 8.1.6 Next Steps

Here are some useful links for exploring the PlatformIO ecosystem:

- Learn more about [integrations with other IDEs/Text Editors](#)
- Get help from [PlatformIO community](#)

## 8.2 有用的链接

- 您可以在 [ESP32 论坛](#) 中提出您的问题，访问社区资源。
- 您可以通过 [GitHub](#) 的 [Issues](#) 版块提交 bug 或功能请求。在提交新 Issue 之前，请先查看现有的 [Issues](#)。
- 您可以在 [ESP IoT Solution](#) 库中找到基于 ESP-IDF 的 [解决方案](#)、[应用实例](#)、[组件和驱动](#) 等内容。多数文档均提供中英文版本。
- 通过 [Arduino](#) 平台开发应用，请参考 [ESP32 Wi-Fi 芯片的 Arduino 内核](#)。
- 关于 ESP32 的书籍列表，请查看 [乐鑫](#) 网站。
- 如果您有兴趣参与到 ESP-IDF 的开发，请查阅 [Contributions Guide](#)。
- 关于 ESP32-S3 的其它信息，请查看官网 [文档](#) 版块。
- 关于本文档的 PDF 和 HTML 格式下载（最新版本和早期版本），请点击 [下载](#)。

## Copyrights and Licenses

### 9.1 Software Copyrights

All original source code in this repository is Copyright (C) 2015-2022 Espressif Systems. This source code is licensed under the Apache License 2.0 as described in the file LICENSE.

Additional third party copyrighted code is included under the following licenses.

Where source code headers specify Copyright & License information, this information takes precedence over the summaries made here.

#### 9.1.1 Firmware Components

These third party libraries can be included into the application (firmware) produced by ESP-IDF.

- [Newlib](#) is licensed under the BSD License and is Copyright of various parties, as described in [COPYING.NEWLIB](#).
- [Xtensa header files](#) are Copyright (C) 2013 Tensilica Inc and are licensed under the MIT License as reproduced in the individual header files.
- Original parts of [FreeRTOS](#) (components/freertos) are Copyright (C) 2017 Amazon.com, Inc. or its affiliates are licensed under the MIT License, as described in [license.txt](#).
- Original parts of [LWIP](#) (components/lwip) are Copyright (C) 2001, 2002 Swedish Institute of Computer Science and are licensed under the BSD License as described in [COPYING file](#).
- [wpa\\_supplicant](#) Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- [Fast PBKDF2](#) Copyright (c) 2015 Joseph Birr-Pixton and licensed under CC0 Public Domain Dedication license.
- [FreeBSD net80211](#) Copyright (c) 2004-2008 Sam Leffler, Errno Consulting and licensed under the BSD license.
- [JSMN](#) JSON Parser (components/jsmn) Copyright (c) 2010 Serge A. Zaitsev and licensed under the MIT license.
- [argtable3](#) argument parsing library Copyright (C) 1998-2001,2003-2011,2013 Stewart Heitmann and licensed under 3-clause BSD license. [argtable3](#) also includes the following software components. For details, please see [argtable3 LICENSE file](#).
  - C Hash Table library, Copyright (c) 2002, Christopher Clark and licensed under 3-clause BSD license.
  - The Better String library, Copyright (c) 2014, Paul Hsieh and licensed under 3-clause BSD license.
  - TCL library, Copyright the Regents of the University of California, Sun Microsystems, Inc., Scriptics Corporation, ActiveState Corporation and other parties, and licensed under TCL/TK License.
- [linenoise](#) line editing library Copyright (c) 2010-2014 Salvatore Sanfilippo, Copyright (c) 2010-2013 Pieter Noordhuis, licensed under 2-clause BSD license.
- [libcoap](#) COAP library Copyright (c) 2010-2017 Olaf Bergmann and others, is licensed under 2-clause BSD license as described in [LICENSE file](#) and [COPYING file](#) .

- [libexpat](#) XML parsing library Copyright (c) 1998-2000 Thai Open Source Software Center Ltd and Clark Cooper, Copyright (c) 2001-2017 Expat maintainers, is licensed under MIT license as described in [COPYING file](#) .
- [FatFS](#) library, Copyright (C) 2017 ChaN, is licensed under a [BSD-style license](#) .
- [cJSON](#) library, Copyright (c) 2009-2017 Dave Gamble and cJSON contributors, is licensed under MIT license as described in [LICENSE file](#) .
- [libsodium](#) library, Copyright (c) 2013-2018 Frank Denis, is licensed under ISC license as described in [LICENSE file](#) .
- [micro-ecc](#) library, Copyright (c) 2014 Kenneth MacKay, is licensed under 2-clause BSD license.
- [nghttp2](#) library, Copyright (c) 2012, 2014, 2015, 2016 Tatsuhiro Tsujikawa, Copyright (c) 2012, 2014, 2015, 2016 nghttp2 contributors, is licensed under MIT license as described in [COPYING file](#) .
- [Mbed TLS](#) library, Copyright (C) 2006-2018 ARM Limited, is licensed under Apache License 2.0 as described in [LICENSE file](#) .
- [SPIFFS](#) library, Copyright (c) 2013-2017 Peter Andersson, is licensed under MIT license as described in [LICENSE file](#) .
- [TinyCBOR](#) library, Copyright (c) 2017 Intel Corporation, is licensed under MIT License as described in [LICENSE file](#) .
- [SD/MMC driver](#) is derived from [OpenBSD SD/MMC driver](#), Copyright (c) 2006 Uwe Stuehler, and is licensed under BSD license.
- [Asio](#) , Copyright (c) 2003-2018 Christopher M. Kohlhoff is licensed under the Boost Software License as described in [COPYING file](#).
- [ESP-MQTT](#) MQTT Package (contiki-mqtt) - Copyright (c) 2014, Stephen Robinson, MQTT-ESP - Tuan PM <tuanpm at live dot com> is licensed under Apache License 2.0 as described in [LICENSE file](#) .
- [BLE Mesh](#) is adapted from Zephyr Project, Copyright (c) 2017-2018 Intel Corporation and licensed under Apache License 2.0
- [mynewt-nimble](#) Apache Mynewt NimBLE, Copyright 2015-2018, The Apache Software Foundation, is licensed under Apache License 2.0 as described in [LICENSE file](#).
- [cryptoauthlib](#) Microchip CryptoAuthentication Library - Copyright (c) 2015 - 2018 Microchip Technology Inc, is licensed under common Microchip software License as described in [LICENSE file](#)
- [TLSF allocator](#) Two Level Segregated Fit memory allocator, Copyright (c) 2006-2016, Matthew Conte, and licensed under the BSD license.
- [qrcode](#) QR Code generator library Copyright (c) Project Nayuki, is licensed under MIT license.
- [openthread](#), Copyright (c) The OpenThread Authors, is licensed under Apache License 2.0 as described in [LICENSE file](#).
- [UBSAN runtime](#) —Copyright (c) 2016, Linaro Limited and Jiří Závěručky, licensed under the BSD 2-clause license.
- [freemodbus](#) Copyright (c) 2006-2013 Christian Walter, Armink and licensed under the BSD license.

## 9.1.2 Build Tools

This is the list of licenses for tools included in this repository, which are used to build applications. The tools do not become part of the application (firmware), so their license does not affect licensing of the application.

- [esptool.py](#) is Copyright (C) 2014-2016 Fredrik Ahlberg, Angus Gratton and is licensed under the GNU General Public License v2, as described in [LICENSE file](#).
- [KConfig](#) is Copyright (C) 2002 Roman Zippel and others, and is licensed under the GNU General Public License V2.

## 9.1.3 Documentation

- HTML version of the [ESP-IDF Programming Guide](#) uses the Sphinx theme [sphinx\\_idf\\_theme](#), which is Copyright (c) 2013-2020 Dave Snider, Read the Docs, Inc. & contributors, and Espressif Systems (Shanghai) CO., LTD. It is based on [sphinx\\_rtd\\_theme](#). Both are licensed under MIT license.

## 9.2 ROM Source Code Copyrights

ESP32, ESP32-S and ESP32-C Series SoCs mask ROM hardware includes binaries compiled from portions of the following third party software:

- [Newlib](#) , licensed under the BSD License and is Copyright of various parties, as described in [COPYING.NEWLIB](#).
- Xtensa libhal, Copyright (c) Tensilica Inc and licensed under the MIT license (see below).
- [TinyBasic Plus](#), Copyright Mike Field & Scott Lawrence and licensed under the MIT license (see below).
- [miniz](#), by Rich Geldreich - placed into the public domain.
- [wpa\\_supplicant](#) Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- [TJpgDec](#) Copyright (C) 2011, ChaN, all right reserved. See below for license.

## 9.3 Xtensa libhal MIT License

Copyright (c) 2003, 2006, 2010 Tensilica Inc.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software” ), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

## 9.4 TinyBasic Plus MIT License

Copyright (c) 2012-2013

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software” ), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

## 9.5 TJpgDec License

TJpgDec - Tiny JPEG Decompressor R0.01 (C)ChaN, 2011 The TJpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

- The TjpgDec module is a free software and there is NO WARRANTY.
- No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.
- Redistributions of source code must retain the above copyright notice.

## Chapter 10

# 关于本指南

本指南为 ESP32-S3 官方应用开发框架 **ESP-IDF** 的配套文档。

ESP32-S3 是一款支持 2.4 GHz Wi-Fi 和低功耗蓝牙的芯片，搭载 Xtensa® 32 位 LX7 处理器。

图 1: 乐鑫物联网综合开发框架

ESP-IDF 即乐鑫物联网开发框架，可为在 Windows、Linux 和 macOS 系统平台上开发 ESP32-S3 应用程序提供工具链、API、组件和工作流程的支持。

## Chapter 11

# 切换语言

《ESP-IDF 编程指南》部分文档现在有两种语言的版本。如有出入请以英文版本为准。

- 英文
- 中文

如下图所示，如果该文档两种语言版本均具备，您可以通过点击文档上方的语言链接轻松进行语言切换。

The screenshot shows a web page for 'Fatal Errors' in the ESP-IDF documentation. At the top, there is a breadcrumb trail: 'API Guides » Fatal Errors' and a link to 'Edit on GitHub'. Below the breadcrumb, the title 'Fatal Errors' is displayed. Underneath the title, there is a link labeled '[中文]' (Chinese), which is circled in red in the image. Below this link, the section 'Overview' is visible, followed by a paragraph of text: 'In certain situations, execution of the program can not be continued in a well defined way. In ESP-IDF, these situations include:'. At the bottom of the screenshot, a bulleted list starts with 'genindex'.

- genindex
