Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:

- No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_ICMP6_DEBUG

Enable ICMP6 debug messages

Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:

- No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_TCP_DEBUG

Enable TCP debug messages

Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:

- No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_SNTP_DEBUG

Enable SNTP debug messages

Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:

- No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_DNS_DEBUG

Enable DNS debug messages

Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:

- No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_BRIDGEIF_DEBUG

Enable bridge generic debug messages

Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:

- No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_BRIDGEIF_FDB_DEBUG

Enable bridge FDB debug messages

Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:

- No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_BRIDGEIF_FW_DEBUG

Enable bridge forwarding debug messages

Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:

- No (disabled) if *CONFIG_LWIP_DEBUG*

mbedTLS Contains:

- *CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN*
- *Certificate Bundle*
- *Certificates*
- *CONFIG_MBEDTLS_CHACHA20_C*
- *CONFIG_MBEDTLS_DHM_C*
- *CONFIG_MBEDTLS_ECP_C*
- *CONFIG_MBEDTLS_ECDH_C*

- *CONFIG_MBEDTLS_ECJPAKE_C*
- *CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED*
- *CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED*
- *CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED*

- *CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN*
- *CONFIG_MBEDTLS_TLS_MODE*
- *CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS*
- *CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS*
- *CONFIG_MBEDTLS_ROM_MD5*
- *CONFIG_MBEDTLS_DYNAMIC_BUFFER*

CONFIG_MBEDTLS_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > mbedTLS

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only

- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls_platform_set_calloc_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal memory (MBEDTLS_INTERNAL_MEM_ALLOC)
- External SPIRAM (MBEDTLS_EXTERNAL_MEM_ALLOC)
- Default alloc mode (MBEDTLS_DEFAULT_MEM_ALLOC)
- Custom alloc mode (MBEDTLS_CUSTOM_MEM_ALLOC)
- Internal IRAM (MBEDTLS_IRAM_8BIT_MEM_ALLOC)
  Allows to use IRAM memory region as 8bit accessible region.
  TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN

TLS maximum message content length

Found in: Component config > mbedTLS

Maximum TLS message length (in bytes) supported by mbedTLS.

16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max_fragment_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS_ERR_SSL_INVALID_RECORD (-0x7200).

Range:

- from 512 to 16384

Default value:

- 16384

CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN

Asymmetric in/out fragment length

Found in: Component config > mbedTLS

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN

TLS maximum incoming fragment length

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

Range:
- from 512 to 16384

Default value:
- 16384

CONFIG_MBEDTLS_SSL_OUT_CONTENT_LEN

TLS maximum outgoing fragment length

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

Range:
- from 512 to 16384

Default value:
- 4096

CONFIG_MBEDTLS_DYNAMIC_BUFFER

Using dynamic TX/RX buffer

Found in: Component config > mbedTLS

Using dynamic TX/RX buffer. After enabling this option, mbedTLS will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of "MBEDTLS_SSL_OUT_CONTENT_LEN" or "MBEDTLS_SSL_IN_CONTENT_LEN" , so to save more heap, users can set the options to be an appropriate value.

Default value:
- No (disabled) if *CONFIG_MBEDTLS_SSL_PROTO_DTLS* && *CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH*

CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

Free private key and DHM data after its usage

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Becasue all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

Default value:
- No (disabled) if *CONFIG_MBEDTLS_DYNAMIC_BUFFER*

CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT

Free SSL CA certificate after its usage

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER > CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

Default value:

- Yes (enabled) if *CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA*

CONFIG_MBEDTLS_DEBUG

Enable mbedTLS debugging

Found in: Component config > mbedTLS

Enable mbedTLS debugging functions at compile time.

If this option is enabled, you can include "mbedtls/esp_debug.h" and call mbedtls_esp_enable_debug_log() at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

Default value:

- No (disabled)

CONFIG_MBEDTLS_DEBUG_LEVEL

Set mbedTLS debugging level

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DEBUG

Set mbedTLS debugging level

Available options:

- Warning (MBEDTLS_DEBUG_LEVEL_WARN)
- Info (MBEDTLS_DEBUG_LEVEL_INFO)
- Debug (MBEDTLS_DEBUG_LEVEL_DEBUG)
- Verbose (MBEDTLS_DEBUG_LEVEL_VERBOSE)

mbedTLS v3.x related

Contains:

- *DTLS-based configurations*
- *CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION*
- *CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK*
- *CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE*
- *CONFIG_MBEDTLS_SSL_PROTO_TLS1_3*
- *CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT*
- *CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH*

CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

Support TLS 1.3 protocol

Found in: Component config > mbedTLS > mbedTLS v3.x related

Default value:

- No (disabled) if *CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE* && *CONFIG_MBEDTLS_DYNAMIC_BUFFER*

CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE

Enable TLS 1.3 middlebox compatibility mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

Default value:

- Yes (enabled) if *CONFIG_MBEDTLS_SSL_PROTO_TLS1_3*

CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH

Variable SSL buffer length

Found in: Component config > mbedTLS > mbedTLS v3.x related

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

Default value:

- No (disabled)

CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT

Use a backward compatible ECDH context (Experimental)

Found in: Component config > mbedTLS > mbedTLS v3.x related

Use the legacy ECDH context format. Define this option only if you enable MBEDTLS_ECP_RESTARTABLE or if you want to access ECDH context fields directly.

Default value:

- No (disabled) if *CONFIG_MBEDTLS_ECDH_C* && *CONFIG_MBEDTLS_ECP_RESTARTABLE*

CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK

Enable trusted certificate callbacks

Found in: Component config > mbedTLS > mbedTLS v3.x related

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedTLS documentation for required API and more details.

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION

Enable serialization of the TLS context structures

Found in: Component config > mbedTLS > mbedTLS v3.x related

Enable serialization of the TLS context structures This is a local optimization in handling a single, potentially long-lived connection.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE

Keep peer certificate after handshake completion

Found in: Component config > mbedTLS > mbedTLS v3.x related

Keep the peer's certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedTLS documentation for required API and more details.

Default value:

- Yes (enabled) if MBEDTLS_DYNAMIC_FREE_PEER_CERT

DTLS-based configurations Contains:

- *CONFIG_MBEDTLS_SSL_DTLS_SRTP*
- *CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Support for the DTLS Connection ID extension

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport. The Connection ID extension is still in draft state. Refer: version draft-ietf-tls-dtls-connection-id-05

Default value:

- No (disabled) if *CONFIG_MBEDTLS_SSL_PROTO_DTLS*

CONFIG_MBEDTLS_SSL_CID_IN_LEN_MAX

Maximum length of CIDs used for incoming DTLS messages

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Maximum length of CIDs used for incoming DTLS messages

Range:

- from 0 to 32 if *CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

Default value:

- 32 if *CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

CONFIG_MBEDTLS_SSL_CID_OUT_LEN_MAX

Maximum length of CIDs used for outgoing DTLS messages

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Maximum length of CIDs used for outgoing DTLS messages

Range:

- from 0 to 32 if *CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

Default value:

- 32 if *CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY

Record plaintext padding (for DTLS 1.2)

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Controls the use of record plaintext padding when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

Notes: A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

Range:

- from 0 to 32 if *CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

Default value:

- 16 if *CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

CONFIG_MBEDTLS_SSL_DTLS_SRTP

Enable support for negotiation of DTLS-SRTP (RFC 5764)

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use_srtp extension.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

Default value:

- No (disabled) if *CONFIG_MBEDTLS_SSL_PROTO_DTLS*

Certificate Bundle Contains:

- *CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Enable trusted root certificate bundle

Found in: Component config > mbedTLS > Certificate Bundle

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE

Default certificate bundle options

Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Available options:

- Use the full default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL)
- Use only the most common certificates from the default bundles (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN)
  Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE

Add custom certificates to the default bundle

Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Default value:

- No (disabled)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH

Custom certificate bundle path

Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_MAX_CERTS

Maximum no of certificates allowed in certificate bundle

Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Default value:

- 200

CONFIG_MBEDTLS_ECP_RESTARTABLE

Enable mbedTLS ecp restartable

Found in: Component config > mbedTLS

Enable "non-blocking" ECC operations that can return early and be resumed.

Default value:

- No (disabled)

CONFIG_MBEDTLS_CMAC_C

Enable CMAC mode for block ciphers

Found in: Component config > mbedTLS

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

Default value:

- No (disabled)

CONFIG_MBEDTLS_HARDWARE_AES

Enable hardware AES acceleration

Found in: Component config > mbedTLS

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

Default value:

- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_AES_USE_INTERRUPT

Use interrupt for long AES operations

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_AES

Use an interrupt to coordinate long AES operations.

This allows other code to run on the CPU while an AES operation is pending. Otherwise the CPU busy-waits.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_HARDWARE_GCM

Enable partially hardware accelerated GCM

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_AES

Enable partially hardware accelerated GCM. GHASH calculation is still done in software.

If MBEDTLS_HARDWARE_GCM is disabled and MBEDTLS_HARDWARE_AES is enabled then mbedTLS will still use the hardware accelerated AES block operation, but on a single block at a time.

Default value:

- Yes (enabled) if SOC_AES_SUPPORT_GCM && *CONFIG_MBEDTLS_HARDWARE_AES*

CONFIG_MBEDTLS_HARDWARE_MPI

Enable hardware MPI (bignum) acceleration

Found in: Component config > mbedTLS

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC_RSA_MAX_BIT_LEN bit results.

These operations are used by RSA.

Default value:

- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_MPI_USE_INTERRUPT

Use interrupt for MPI exp-mod operations

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_MPI

Use an interrupt to coordinate long MPI operations.

This allows other code to run on the CPU while an MPI operation is pending. Otherwise the CPU busy-waits.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_HARDWARE_SHA

Enable hardware SHA acceleration

Found in: Component config > mbedTLS

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedTLS.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

Default value:

- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_HARDWARE_ECC

Enable hardware ECC acceleration

Found in: Component config > mbedTLS

Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedTLS

Default value:

- Yes (enabled) if SOC_ECC_SUPPORTED

CONFIG_MBEDTLS_ECC_OTHER_CURVES_SOFT_FALLBACK

Fallback to software implementation for curves not supported in hardware

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_ECC

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

Default value:

- Yes (enabled) if *CONFIG_MBEDTLS_HARDWARE_ECC*

CONFIG_MBEDTLS_ROM_MD5

Use MD5 implementation in ROM

Found in: Component config > mbedTLS

Use ROM MD5 in mbedTLS.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN

Enable hardware ECDSA sign acceleration when using ATECC608A

Found in: Component config > mbedTLS

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

Default value:

- No (disabled)

CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY

Enable hardware ECDSA verify acceleration when using ATECC608A

Found in: Component config > mbedTLS

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

Default value:

- No (disabled)

CONFIG_MBEDTLS_HAVE_TIME

Enable mbedtls time support

Found in: Component config > mbedTLS

Enable use of time.h functions (time() and gmtime()) by mbedTLS.

This option doesn't require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn't call any standard timekeeeping functions.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_PLATFORM_TIME_ALT

Enable mbedtls time support: platform-specific

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME

Enabling this config will provide users with a function "mbedtls_platform_set_time()" that allows to set an alternative time function pointer.

Default value:

- No (disabled)

CONFIG_MBEDTLS_HAVE_TIME_DATE

Enable mbedtls certificate expiry check

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME

Enables X.509 certificate expiry checks in mbedTLS.

If this option is disabled (default) then X.509 certificate "valid from" and "valid to" timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS_X509_BADCERT_FUTURE or MBEDTLS_X509_BADCERT_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF's SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

Default value:

- No (disabled)

CONFIG_MBEDTLS_ECDSA_DETERMINISTIC

Enable deterministic ECDSA

Found in: Component config > mbedTLS

Standard ECDSA is "fragile" in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SHA512_C

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

Found in: Component config > mbedTLS

Enable MBEDTLS_SHA512_C adds support for SHA-384 and SHA-512.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_TLS_MODE

TLS Protocol Role

Found in: Component config > mbedTLS

mbedTLS can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

Available options:

- Server & Client (MBEDTLS_TLS_SERVER_AND_CLIENT)
- Server (MBEDTLS_TLS_SERVER_ONLY)
- Client (MBEDTLS_TLS_CLIENT_ONLY)
- None (MBEDTLS_TLS_DISABLED)

TLS Key Exchange Methods

Contains:

- *CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA*
- *CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE*
- *CONFIG_MBEDTLS_PSK_MODES*
- *CONFIG_MBEDTLS_KEY_EXCHANGE_RSA*
- *CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

CONFIG_MBEDTLS_PSK_MODES

Enable pre-shared-key ciphersuites

Found in: Component config > mbedTLS > TLS Key Exchange Methods

Enable to show configuration for different types of pre-shared-key TLS authentatication methods.

Leaving this options disabled will save code size if they are not used.

Default value:

- No (disabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_PSK

Enable PSK based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

Default value:

- No (disabled) if *CONFIG_MBEDTLS_PSK_MODES*

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK

Enable DHE-PSK based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

Default value:

- Yes (enabled) if *CONFIG_MBEDTLS_PSK_MODES* && *CONFIG_MBEDTLS_DHM_C*

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK

Enable ECDHE-PSK based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

Default value:

- Yes (enabled) if *CONFIG_MBEDTLS_PSK_MODES* && *CONFIG_MBEDTLS_ECDH_C*

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK

Enable RSA-PSK based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

Default value:

- Yes (enabled) if *CONFIG_MBEDTLS_PSK_MODES*

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA

Enable RSA-only based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods

Enable to support ciphersuites with prefix TLS-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA

Enable DHE-RSA based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

Default value:

- Yes (enabled) if *CONFIG_MBEDTLS_DHM_C*

CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Support Elliptic Curve based ciphersuites

Found in: Component config > mbedTLS > TLS Key Exchange Methods

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA

Enable ECDHE-RSA based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA

Enable ECDHE-ECDSA based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA

Enable ECDH-ECDSA based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA

Enable ECDH-RSA based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE

Enable ECJPAKE based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

Default value:

- No (disabled) if *CONFIG_MBEDTLS_ECJPAKE_C* && *CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED*

CONFIG_MBEDTLS_SSL_RENEGOTIATION

Support TLS renegotiation

Found in: Component config > mbedTLS

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don't need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_2

Support TLS 1.2 protocol

Found in: Component config > mbedTLS

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_GMTSSL1_1

Support GM/T SSL 1.1 protocol

Found in: Component config > mbedTLS

Provisions for GM/T SSL 1.1 support

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_PROTO_DTLS

Support DTLS protocol (all versions)

Found in: Component config > mbedTLS

Requires TLS 1.2 to be enabled for DTLS 1.2

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_ALPN

Support ALPN (Application Layer Protocol Negotiation)

Found in: Component config > mbedTLS

Disabling this option will save some code size if it is not needed.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS

TLS: Client Support for RFC 5077 SSL session tickets

Found in: Component config > mbedTLS

Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS

TLS: Server Support for RFC 5077 SSL session tickets

Found in: Component config > mbedTLS

Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

Default value:

- Yes (enabled)

Symmetric Ciphers Contains:

- *CONFIG_MBEDTLS_AES_C*
- *CONFIG_MBEDTLS_BLOWFISH_C*
- *CONFIG_MBEDTLS_CAMELLIA_C*
- *CONFIG_MBEDTLS_CCM_C*
- *CONFIG_MBEDTLS_DES_C*
- *CONFIG_MBEDTLS_GCM_C*
- *CONFIG_MBEDTLS_NIST_KW_C*
- *CONFIG_MBEDTLS_XTEA_C*

CONFIG_MBEDTLS_AES_C

AES block cipher

Found in: Component config > mbedTLS > Symmetric Ciphers

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_CAMELLIA_C

Camellia block cipher

Found in: Component config > mbedTLS > Symmetric Ciphers

Default value:

- No (disabled)

CONFIG_MBEDTLS_DES_C

DES block cipher (legacy, insecure)

Found in: Component config > mbedTLS > Symmetric Ciphers

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

Default value:

- No (disabled)

CONFIG_MBEDTLS_BLOWFISH_C

Blowfish block cipher (read help)

Found in: Component config > mbedTLS > Symmetric Ciphers

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedTLS TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

Default value:

- No (disabled)

CONFIG_MBEDTLS_XTEA_C

XTEA block cipher

Found in: Component config > mbedTLS > Symmetric Ciphers

Enables the XTEA block cipher.

Default value:

- No (disabled)

CONFIG_MBEDTLS_CCM_C

CCM (Counter with CBC-MAC) block cipher modes

Found in: Component config > mbedTLS > Symmetric Ciphers

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_GCM_C

GCM (Galois/Counter) block cipher modes

Found in: Component config > mbedTLS > Symmetric Ciphers

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_NIST_KW_C

NIST key wrapping (KW) and KW padding (KWP)

Found in: Component config > mbedTLS > Symmetric Ciphers

Enable NIST key wrapping and key wrapping padding.

Default value:

- No (disabled)

CONFIG_MBEDTLS_RIPEMD160_C

Enable RIPEMD-160 hash algorithm

Found in: Component config > mbedTLS

Enable the RIPEMD-160 hash algorithm.

Default value:

- No (disabled)

Certificates Contains:

- *CONFIG_MBEDTLS_PEM_PARSE_C*
- *CONFIG_MBEDTLS_PEM_WRITE_C*
- *CONFIG_MBEDTLS_X509_CRL_PARSE_C*
- *CONFIG_MBEDTLS_X509_CSR_PARSE_C*

CONFIG_MBEDTLS_PEM_PARSE_C

Read & Parse PEM formatted certificates

Found in: Component config > mbedTLS > Certificates

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_PEM_WRITE_C

Write PEM formatted certificates

Found in: Component config > mbedTLS > Certificates

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_X509_CRL_PARSE_C

X.509 CRL parsing

Found in: Component config > mbedTLS > Certificates

Support for parsing X.509 Certifiificate Revocation Lists.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_X509_CSR_PARSE_C

X.509 CSR parsing

Found in: Component config > mbedTLS > Certificates

Support for parsing X.509 Certifiificate Signing Requests

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECP_C

Elliptic Curve Ciphers

Found in: Component config > mbedTLS

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_DHM_C

Diffie-Hellman-Merkle key exchange (DHM)

Found in: Component config > mbedTLS

Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file *mbedtls/dhm.h* file.

Default value:

- No (disabled)

CONFIG_MBEDTLS_ECDH_C

Elliptic Curve Diffie-Hellman (ECDH)

Found in: Component config > mbedTLS

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECDSA_C

Elliptic Curve DSA

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECDH_C

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECJPAKE_C

Elliptic curve J-PAKE

Found in: Component config > mbedTLS

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

Default value:

- No (disabled)

CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED

Enable SECP192R1 curve

Found in: Component config > mbedTLS

Enable support for SECP192R1 Elliptic Curve.

Default value:

- Yes (enabled) if (*CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN* || *CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY*) && *CONFIG_MBEDTLS_ECP_C*

CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED

Enable SECP224R1 curve

Found in: Component config > mbedTLS

Enable support for SECP224R1 Elliptic Curve.

Default value:

- Yes (enabled) if (*CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN* || *CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY*) && *CONFIG_MBEDTLS_ECP_C*

CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED

Enable SECP256R1 curve

Found in: Component config > mbedTLS

Enable support for SECP256R1 Elliptic Curve.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED

Enable SECP384R1 curve

Found in: Component config > mbedTLS

Enable support for SECP384R1 Elliptic Curve.

Default value:

- Yes (enabled) if (*CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN* || *CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY*) && *CONFIG_MBEDTLS_ECP_C*

CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED

Enable SECP521R1 curve

Found in: Component config > mbedTLS

Enable support for SECP521R1 Elliptic Curve.

Default value:

- Yes (enabled) if (*CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN* || *CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY*) && *CONFIG_MBEDTLS_ECP_C*

CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED

Enable SECP192K1 curve

Found in: Component config > mbedTLS

Enable support for SECP192K1 Elliptic Curve.

Default value:

- Yes (enabled) if (*CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN* || *CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY*) && *CONFIG_MBEDTLS_ECP_C*

CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED

Enable SECP224K1 curve

Found in: Component config > mbedTLS

Enable support for SECP224K1 Elliptic Curve.

Default value:

- Yes (enabled) if (*CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN* || *CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY*) && *CONFIG_MBEDTLS_ECP_C*

CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED

Enable SECP256K1 curve

Found in: Component config > mbedTLS

Enable support for SECP256K1 Elliptic Curve.

Default value:

- Yes (enabled) if (*CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN* || *CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY*) && *CONFIG_MBEDTLS_ECP_C*

CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED

Enable BP256R1 curve

Found in: Component config > mbedTLS

support for DP Elliptic Curve.

Default value:

- Yes (enabled) if (*CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN* || *CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY*) && *CONFIG_MBEDTLS_ECP_C*

CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED

Enable BP384R1 curve

Found in: Component config > mbedTLS

support for DP Elliptic Curve.

Default value:

- Yes (enabled) if (*CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN* || *CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY*) && *CONFIG_MBEDTLS_ECP_C*

CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED

Enable BP512R1 curve

Found in: Component config > mbedTLS

support for DP Elliptic Curve.

Default value:

- Yes (enabled) if (*CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN* || *CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY*) && *CONFIG_MBEDTLS_ECP_C*

CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED

Enable CURVE25519 curve

Found in: Component config > mbedTLS

Enable support for CURVE25519 Elliptic Curve.

Default value:

- Yes (enabled) if (*CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN* || *CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY*) && *CONFIG_MBEDTLS_ECP_C*

CONFIG_MBEDTLS_ECP_NIST_OPTIM

NIST ‘modulo p’ optimisations

Found in: Component config > mbedTLS

NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.

Disabling this option saves some code size.

end of Elliptic Curve options

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_POLY1305_C

Poly1305 MAC algorithm

Found in: Component config > mbedTLS

Enable support for Poly1305 MAC algorithm.

Default value:

- No (disabled)

CONFIG_MBEDTLS_CHACHA20_C

Chacha20 stream cipher

Found in: Component config > mbedTLS

Enable support for Chacha20 stream cipher.

Default value:

- No (disabled)

CONFIG_MBEDTLS_CHACHAPOLY_C

ChaCha20-Poly1305 AEAD algorithm

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_CHACHA20_C

Enable support for ChaCha20-Poly1305 AEAD algorithm.

Default value:

- No (disabled) if *CONFIG_MBEDTLS_CHACHA20_C* && *CONFIG_MBEDTLS_POLY1305_C*

CONFIG_MBEDTLS_HKDF_C

HKDF algorithm (RFC 5869)

Found in: Component config > mbedTLS

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

Default value:

- No (disabled)

CONFIG_MBEDTLS_THREADING_C

Enable the threading abstraction layer

Found in: Component config > mbedTLS

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

Default value:

- No (disabled)

CONFIG_MBEDTLS_THREADING_ALT

Enable threading alternate implementation

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C

Enable threading alt to allow your own alternate threading implementation.

Default value:

- Yes (enabled) if *CONFIG_MBEDTLS_THREADING_C*

CONFIG_MBEDTLS_THREADING_PTHREAD

Enable threading pthread implementation

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C

Enable the pthread wrapper layer for the threading layer.

Default value:

- No (disabled) if *CONFIG_MBEDTLS_THREADING_C*

CONFIG_MBEDTLS_LARGE_KEY_SOFTWARE_MPI

Fallback to software implementation for larger MPI values

Found in: Component config > mbedTLS

Fallback to software implementation for RSA key lengths larger than SOC_RSA_MAX_BIT_LEN. If this is not active then the ESP will be unable to process keys greater than SOC_RSA_MAX_BIT_LEN.

Default value:

- Yes (enabled)
- No (disabled)

CONFIG_MBEDTLS_SECURITY_RISKS

Show configurations with potential security risks

Found in: Component config > mbedTLS

Default value:

- No (disabled)

Contains:

- *CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT*

CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT

X.509 CRT parsing with unsupported critical extensions

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_SECURITY_RISKS

Allow the X.509 certificate parser to load certificates with unsupported critical extensions

Default value:

- No (disabled) if *CONFIG_MBEDTLS_SECURITY_RISKS*

ESP-MQTT Configurations Contains:

- *CONFIG_MQTT_CUSTOM_OUTBOX*
- *CONFIG_MQTT_TRANSPORT_SSL*
- *CONFIG_MQTT_TRANSPORT_WEBSOCKET*
- *CONFIG_MQTT_PROTOCOL_311*
- *CONFIG_MQTT_PROTOCOL_5*
- *CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED*
- *CONFIG_MQTT_USE_CUSTOM_CONFIG*
- *CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS*
- *CONFIG_MQTT_REPORT_DELETED_MESSAGES*
- *CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED*
- *CONFIG_MQTT_MSG_ID_INCREMENTAL*

CONFIG_MQTT_PROTOCOL_311

Enable MQTT protocol 3.1.1

Found in: Component config > ESP-MQTT Configurations

If not, this library will use MQTT protocol 3.1

Default value:

- Yes (enabled)

CONFIG_MQTT_PROTOCOL_5

Enable MQTT protocol 5.0

Found in: Component config > ESP-MQTT Configurations

If not, this library will not support MQTT 5.0

Default value:

- No (disabled)

CONFIG_MQTT_TRANSPORT_SSL

Enable MQTT over SSL

Found in: Component config > ESP-MQTT Configurations

Enable MQTT transport over SSL with mbedtls

Default value:

- Yes (enabled)

CONFIG_MQTT_TRANSPORT_WEBSOCKET

Enable MQTT over Websocket

Found in: Component config > ESP-MQTT Configurations

Enable MQTT transport over Websocket.

Default value:

- Yes (enabled)

CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE

Enable MQTT over Websocket Secure

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TRANSPORT_WEBSOCKET

Enable MQTT transport over Websocket Secure.

Default value:

- Yes (enabled)

CONFIG_MQTT_MSG_ID_INCREMENTAL

Use Incremental Message Id

Found in: Component config > ESP-MQTT Configurations

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather then a random value (used by default)

Default value:

- No (disabled)

CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED

Skip publish if disconnected

Found in: Component config > ESP-MQTT Configurations

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT_SKIP_PUBLISH_IF_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

Default value:

- No (disabled)

CONFIG_MQTT_REPORT_DELETED_MESSAGES

Report deleted messages

Found in: Component config > ESP-MQTT Configurations

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

Default value:

- No (disabled)

CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT Using custom configurations

Found in: Component config > ESP-MQTT Configurations

Custom MQTT configurations.

Default value:

- No (disabled)

CONFIG_MQTT_TCP_DEFAULT_PORT

Default MQTT over TCP port

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over TCP port

Default value:

- 1883 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

CONFIG_MQTT_SSL_DEFAULT_PORT

Default MQTT over SSL port

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over SSL port

Default value:

- 8883 if *CONFIG_MQTT_USE_CUSTOM_CONFIG* && *CONFIG_MQTT_TRANSPORT_SSL*

CONFIG_MQTT_WS_DEFAULT_PORT

Default MQTT over Websocket port

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over Websocket port

Default value:

- 80 if *CONFIG_MQTT_USE_CUSTOM_CONFIG* && *CONFIG_MQTT_TRANSPORT_WEBSOCKET*

CONFIG_MQTT_WSS_DEFAULT_PORT

Default MQTT over Websocket Secure port

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over Websocket Secure port

Default value:

- 443 if *CONFIG_MQTT_USE_CUSTOM_CONFIG* && *CONFIG_MQTT_TRANSPORT_WEBSOCKET* && *CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE*

CONFIG_MQTT_BUFFER_SIZE

Default MQTT Buffer Size

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

This buffer size using for both transmit and receive

Default value:

- 1024 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

CONFIG_MQTT_TASK_STACK_SIZE

MQTT task stack size

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT task stack size

Default value:

- 6144 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

CONFIG_MQTT_DISABLE_API_LOCKS

Disable API locks

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn't access MQTT API from multiple concurrent tasks

Default value:

- No (disabled) if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

CONFIG_MQTT_TASK_PRIORITY

MQTT task priority

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT task priority. Higher number denotes higher priority.

Default value:

- 5 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED

Enable MQTT task core selection

Found in: Component config > ESP-MQTT Configurations

This will enable core selection

CONFIG_MQTT_TASK_CORE_SELECTION

Core to use ?

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED

Available options:

- Core 0 (MQTT_USE_CORE_0)
- Core 1 (MQTT_USE_CORE_1)

CONFIG_MQTT_CUSTOM_OUTBOX

Enable custom outbox implementation

Found in: Component config > ESP-MQTT Configurations

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources: idf_component_get_property(mqtt mqtt COMPONENT_LIB) set_property(TARGET ${mqtt} PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)

Default value:

- No (disabled)

CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS

Outbox message expired timeout[ms]

Found in: Component config > ESP-MQTT Configurations

Messages which stays in the outbox longer than this value before being published will be discarded.

Default value:

- 30000 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

Newlib Contains:

- *CONFIG_NEWLIB_NANO_FORMAT*
- *CONFIG_NEWLIB_STDIN_LINE_ENDING*
- *CONFIG_NEWLIB_STDOUT_LINE_ENDING*
- *CONFIG_NEWLIB_TIME_SYSCALL*

CONFIG_NEWLIB_STDOUT_LINE_ENDING

Line ending for UART output

Found in: Component config > Newlib

This option allows configuring the desired line endings sent to UART when a newline ('n', LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR

LF: no modification is applied, stdout is sent as is

CR: each occurence of LF is replaced with CR

This option doesn't affect behavior of the UART driver (drivers/uart.h).

Available options:

- CRLF (NEWLIB_STDOUT_LINE_ENDING_CRLF)
- LF (NEWLIB_STDOUT_LINE_ENDING_LF)
- CR (NEWLIB_STDOUT_LINE_ENDING_CR)

CONFIG_NEWLIB_STDIN_LINE_ENDING

Line ending for UART input

Found in: Component config > Newlib

This option allows configuring which input sequence on UART produces a newline ('n', LF) on stdin. Three options are possible:

CRLF: CRLF is converted to LF

LF: no modification is applied, input is sent to stdin as is

CR: each occurence of CR is replaced with LF

This option doesn't affect behavior of the UART driver (drivers/uart.h).

Available options:

- CRLF (NEWLIB_STDIN_LINE_ENDING_CRLF)
- LF (NEWLIB_STDIN_LINE_ENDING_LF)
- CR (NEWLIB_STDIN_LINE_ENDING_CR)

CONFIG_NEWLIB_NANO_FORMAT

Enable 'nano' formatting options for printf/scanf family

Found in: Component config > Newlib

ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called "nano" formatting option. This option doesn't support 64-bit integer formats and C99 features, such as positional arguments.

For more details about "nano" formatting option, please see newlib readme file, search for '–enable-newlib-nano-formatted-io': https://sourceware.org/newlib/README

If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

CONFIG_NEWLIB_TIME_SYSCALL

Timers used for gettimeofday function

Found in: Component config > Newlib

This setting defines which hardware timers are used to implement 'gettimeofday' and 'time' functions in C library.

- **If both high-resolution (systimer for all targets except ESP32)** and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- **If only high-resolution timer (systimer) is used, gettimeofday will** provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- **If only RTC timer is used, timekeeping will continue in** deep sleep, but time will be measured at 6.(6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- **If no timers are used, gettimeofday and time functions** return -1 and set errno to ENOSYS.
- **When RTC is used for timekeeping, two RTC_STORE registers are** used to keep time in deep sleep mode.

Available options:

- RTC and high-resolution timer (NEWLIB_TIME_SYSCALL_USE_RTC_HRT)
- RTC (NEWLIB_TIME_SYSCALL_USE_RTC)
- High-resolution timer (NEWLIB_TIME_SYSCALL_USE_HRT)
- None (NEWLIB_TIME_SYSCALL_USE_NONE)

NVS

Contains:

- *CONFIG_NVS_ENCRYPTION*
- *CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG*
- *CONFIG_NVS_ASSERT_ERROR_CHECK*

CONFIG_NVS_ENCRYPTION

Enable NVS encryption

Found in: Component config > NVS

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

Default value:

- Yes (enabled) if *CONFIG_SECURE_FLASH_ENC_ENABLED*

CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG

NVS partition encrypted flag compatible with ESP-IDF before v4.3

Found in: Component config > NVS

Enabling this will ignore "encrypted" flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have "encrypted" flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

CONFIG_NVS_ASSERT_ERROR_CHECK

Use assertions for error checking

Found in: Component config > NVS

This option switches error checking type between assertions (y) or return codes (n).

Default value:

- No (disabled)

OpenThread Contains:

- *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_ENABLED

OpenThread

Found in: Component config > OpenThread

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

Default value:

- No (disabled)

CONFIG_OPENTHREAD_RADIO_TYPE

Config the Thread radio type

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Configure how OpenThread connects to the 15.4 radio

Available options:

- Native 15.4 radio (OPENTHREAD_RADIO_NATIVE)
  Select this to use the native 15.4 radio.
- Connect via UART (OPENTHREAD_RADIO_SPINEL_UART)
  Select this to connect to a Radio Co-Processor via UART.

CONFIG_OPENTHREAD_DEVICE_TYPE

Config the Thread device type

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

OpenThread can be configured to different device types (FTD, MTD, Radio)

Available options:

- Full Thread Device (OPENTHREAD_FTD)
  Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (OPENTHREAD_MTD)
  Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (OPENTHREAD_RADIO)
  Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

CONFIG_OPENTHREAD_DIAG

Enable diag

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

Default value:

- Yes (enabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_COMMISSIONER

Enable Commissioner

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_JOINER

Enable Joiner

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_SRP_CLIENT

Enable SRP Client

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_BORDER_ROUTER

Enable Border Router

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select this option to enable border router features in OpenThread.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS

The number of openthread message buffers

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Range:
- from 50 to 100 if *CONFIG_OPENTHREAD_ENABLED*

Default value:
- 65 if *CONFIG_OPENTHREAD_ENABLED*

Protocomm Contains:

- *CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0*
- *CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1*
- *CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2*

CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0

Support protocomm security version 0 (no security)

Found in: Component config > Protocomm

Enable support of security version 0. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

Default value:
- Yes (enabled)

CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1

Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption)

Found in: Component config > Protocomm

Enable support of security version 1. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

Default value:
- Yes (enabled)

CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2

Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption)

Found in: Component config > Protocomm

Enable support of security version 2. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

Default value:
- No (disabled)

PThreads Contains:

- *CONFIG_PTHREAD_TASK_NAME_DEFAULT*
- *CONFIG_PTHREAD_TASK_CORE_DEFAULT*
- *CONFIG_PTHREAD_TASK_PRIO_DEFAULT*
- *CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT*

- *CONFIG_PTHREAD_STACK_MIN*

CONFIG_PTHREAD_TASK_PRIO_DEFAULT

Default task priority

Found in: Component config > PThreads

Priority used to create new tasks with default pthread parameters.

Range:
- from 0 to 255

Default value:
- 5

CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT

Default task stack size

Found in: Component config > PThreads

Stack size used to create new tasks with default pthread parameters.

Default value:
- 3072

CONFIG_PTHREAD_STACK_MIN

Minimum allowed pthread stack size

Found in: Component config > PThreads

Minimum allowed pthread stack size set in attributes passed to pthread_create

Default value:
- 768

CONFIG_PTHREAD_TASK_CORE_DEFAULT

Default pthread core affinity

Found in: Component config > PThreads

The default core to which pthreads are pinned.

Available options:
- No affinity (PTHREAD_DEFAULT_CORE_NO_AFFINITY)
- Core 0 (PTHREAD_DEFAULT_CORE_0)
- Core 1 (PTHREAD_DEFAULT_CORE_1)

CONFIG_PTHREAD_TASK_NAME_DEFAULT

Default name of pthreads

Found in: Component config > PThreads

The default name of pthreads.

Default value:
- “pthread”

SPI Flash driver Contains:

- *CONFIG_SPI_FLASH_AUTO_SUSPEND*
- *Auto-detect flash chips*
- *CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE*
- *CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE*
- *CONFIG_SPI_FLASH_ENABLE_COUNTERS*
- *CONFIG_SPI_FLASH_ROM_DRIVER_PATCH*
- *CONFIG_SPI_FLASH_YIELD_DURING_ERASE*
- *CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED*
- *CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE*
- *CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST*
- *CONFIG_SPI_FLASH_SIZE_OVERRIDE*
- *SPI Flash behavior when brownout*
- *CONFIG_SPI_FLASH_SHARE_SPI1_BUS*
- *CONFIG_SPI_FLASH_ROM_IMPL*
- *CONFIG_SPI_FLASH_VERIFY_WRITE*
- *CONFIG_SPI_FLASH_DANGEROUS_WRITE*

CONFIG_SPI_FLASH_VERIFY_WRITE

Verify SPI flash writes

Found in: Component config > SPI Flash driver

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

Default value:

- No (disabled)

CONFIG_SPI_FLASH_LOG_FAILED_WRITE

Log errors if verification fails

Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

Default value:

- No (disabled) if *CONFIG_SPI_FLASH_VERIFY_WRITE*

CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE

Log warning if writing zero bits to ones

Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

Default value:

- No (disabled) if *CONFIG_SPI_FLASH_VERIFY_WRITE*

CONFIG_SPI_FLASH_ENABLE_COUNTERS

Enable operation counters

Found in: Component config > SPI Flash driver

This option enables the following APIs:

- spi_flash_reset_counters
- spi_flash_dump_counters
- spi_flash_get_counters

These APIs may be used to collect performance data for spi_flash APIs and to help understand behaviour of libraries which use SPI flash.

Default value:

- 0

CONFIG_SPI_FLASH_ROM_DRIVER_PATCH

Enable SPI flash ROM driver patched functions

Found in: Component config > SPI Flash driver

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_ROM_IMPL

Use esp_flash implementation in ROM

Found in: Component config > SPI Flash driver

Enable this flag to use new SPI flash driver functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. But you can use all of our flash features.

If making this as "y" in your project, you will increase free IRAM. But you may miss out on some flash features and support for new flash chips.

Currently the ROM cannot support the following features:

- SPI_FLASH_AUTO_SUSPEND (C3, S3)

Default value:

- No (disabled)

CONFIG_SPI_FLASH_DANGEROUS_WRITE

Writing to dangerous flash regions

Found in: Component config > SPI Flash driver

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the esp_rom_xxx SPI flash ROM functions. These functions should not be called directly from IDF applications.

Available options:

- Aborts (SPI_FLASH_DANGEROUS_WRITE_ABORTS)
- Fails (SPI_FLASH_DANGEROUS_WRITE_FAILS)
- Allowed (SPI_FLASH_DANGEROUS_WRITE_ALLOWED)

CONFIG_SPI_FLASH_SHARE_SPI1_BUS

Support other devices attached to SPI1 bus

Found in: Component config > SPI Flash driver

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of esp_flash driver access to the main flash chip.

If you only need to use esp_flash driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.

Default value:

- No (disabled)

CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE

Bypass a block erase and always do sector erase

Found in: Component config > SPI Flash driver

Some flash chips can have very high "max" erase times, especially for block erase (32KB or 64KB). This option allows to bypass "block erase" and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

Default value:

- No (disabled)

CONFIG_SPI_FLASH_YIELD_DURING_ERASE

Enables yield operation during flash erase

Found in: Component config > SPI Flash driver

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks. Please use this configuration together with `SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS` and `SPI\_FLASH\_ERASE\_YIELD\_TICKS` after carefully checking flash datasheet to avoid a watchdog timeout. For more information, please check *SPI Flash API* reference documenation under section *OS Function*.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS

Duration of erasing to yield CPUs (ms)

Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

Default value:

- 20

CONFIG_SPI_FLASH_ERASE_YIELD_TICKS

CPU release time (tick) for an erase operation

Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE

Defines how many ticks will be before returning to continue a erasing.

Default value:

- 1

CONFIG_SPI_FLASH_AUTO_SUSPEND

Auto suspend long erase/write operations (READ DOCS FIRST)

Found in: Component config > SPI Flash driver

This option is default n before ESP32-C3, because it needs bootloader support.

CAUTION: If you want to OTA to an app with this feature turned on, please make sure the bootloader has the support for it. (later than IDF v4.3)

Auto-suspend feature only supported by XMC chip. If you are using an official module, please contact Espressif Business support. Also reading auto suspend part in *SPI Flash API* document before you enable this function.

Default value:

- No (disabled) if *CONFIG_SPI_FLASH_ROM_IMPL*

CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE

Flash write chunk size

Found in: Component config > SPI Flash driver

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

Range:

- from 256 to 8192

Default value:

- 8192

CONFIG_SPI_FLASH_SIZE_OVERRIDE

Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

Found in: Component config > SPI Flash driver

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

Default value:

- No (disabled)

CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED

Flash timeout checkout disabled

Found in: Component config > SPI Flash driver

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

Default value:

- No (disabled)

CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST

Override default chip driver list

Found in: Component config > SPI Flash driver

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the *default_registered_chips* structure must be provided by the user.

See example: custom_chip_driver under examples/storage for more details.

Default value:

- No (disabled)

SPI Flash behavior when brownout

Contains:

- *CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC*

CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC

Enable sending reset when brownout for XMC flash chips

Found in: Component config > SPI Flash driver > SPI Flash behavior when brownout

When this option is selected, the patch will be enabled for XMC. Follow the recommended flow by XMC for better stability.

DO NOT DISABLE UNLESS YOU KNOW WHAT YOU ARE DOING.

Default value:

- Yes (enabled)

Auto-detect flash chips

Contains:

- *CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP*
- *CONFIG_SPI_FLASH_SUPPORT_GD_CHIP*
- *CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP*
- *CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP*
- *CONFIG_SPI_FLASH_SUPPORT_TH_CHIP*
- *CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP*

CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP

ISSI

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP

MXIC

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_GD_CHIP

GigaDevice

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip\_drv` member of the chip struct. If you are using Wrover modules, please don't disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP

Winbond

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP

BOYA

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_TH_CHIP

TH

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of TH chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE

Enable encrypted partition read/write operations

Found in: Component config > SPI Flash driver

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

Default value:

- Yes (enabled)

SPIFFS Configuration Contains:

- *Debug Configuration*
- *CONFIG_SPIFFS_USE_MAGIC*
- *CONFIG_SPIFFS_GC_STATS*
- *CONFIG_SPIFFS_PAGE_CHECK*
- *CONFIG_SPIFFS_FOLLOW_SYMLINKS*
- *CONFIG_SPIFFS_MAX_PARTITIONS*
- *CONFIG_SPIFFS_USE_MTIME*
- *CONFIG_SPIFFS_GC_MAX_RUNS*
- *CONFIG_SPIFFS_OBJ_NAME_LEN*
- *CONFIG_SPIFFS_META_LENGTH*
- *SPIFFS Cache Configuration*
- *CONFIG_SPIFFS_PAGE_SIZE*
- *CONFIG_SPIFFS_MTIME_WIDE_64_BITS*

CONFIG_SPIFFS_MAX_PARTITIONS

Maximum Number of Partitions

Found in: Component config > SPIFFS Configuration

Define maximum number of partitions that can be mounted.

Range:

- from 1 to 10

Default value:

- 3

SPIFFS Cache Configuration Contains:

- *CONFIG_SPIFFS_CACHE*

CONFIG_SPIFFS_CACHE

Enable SPIFFS Cache

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration

Enables/disable memory read caching of nucleus file system operations.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_CACHE_WR

Enable SPIFFS Write Caching

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE

Enables memory write caching for file descriptors in hydrogen.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_CACHE_STATS

Enable SPIFFS Cache Statistics

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE

Enable/disable statistics on caching. Debug/test purpose only.

Default value:

- No (disabled)

CONFIG_SPIFFS_PAGE_CHECK

Enable SPIFFS Page Check

Found in: Component config > SPIFFS Configuration

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_GC_MAX_RUNS

Set Maximum GC Runs

Found in: Component config > SPIFFS Configuration

Define maximum number of GC runs to perform to reach desired free pages.

Range:

- from 1 to 10000

Default value:

- 10

CONFIG_SPIFFS_GC_STATS

Enable SPIFFS GC Statistics

Found in: Component config > SPIFFS Configuration

Enable/disable statistics on gc. Debug/test purpose only.

Default value:

- No (disabled)

CONFIG_SPIFFS_PAGE_SIZE

SPIFFS logical page size

Found in: Component config > SPIFFS Configuration

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

Range:
- from 256 to 1024

Default value:
- 256

CONFIG_SPIFFS_OBJ_NAME_LEN

Set SPIFFS Maximum Name Length

Found in: Component config > SPIFFS Configuration

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

Range:
- from 1 to 256

Default value:
- 32

CONFIG_SPIFFS_FOLLOW_SYMLINKS

Enable symbolic links for image creation

Found in: Component config > SPIFFS Configuration

If this option is enabled, symbolic links are taken into account during partition image creation.

Default value:
- No (disabled)

CONFIG_SPIFFS_USE_MAGIC

Enable SPIFFS Filesystem Magic

Found in: Component config > SPIFFS Configuration

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

Default value:
- Yes (enabled)

CONFIG_SPIFFS_USE_MAGIC_LENGTH

Enable SPIFFS Filesystem Length Magic

Found in: Component config > SPIFFS Configuration > CONFIG_SPIFFS_USE_MAGIC

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_META_LENGTH

Size of per-file metadata field

Found in: Component config > SPIFFS Configuration

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

Default value:

- 4

CONFIG_SPIFFS_USE_MTIME

Save file modification time

Found in: Component config > SPIFFS Configuration

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_MTIME_WIDE_64_BITS

The time field occupies 64 bits in the image instead of 32 bits

Found in: Component config > SPIFFS Configuration

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with 64-bit time_t support.

Default value:

- No (disabled) if *CONFIG_SPIFFS_META_LENGTH* >= 8

Debug Configuration

Contains:

- *CONFIG_SPIFFS_DBG*
- *CONFIG_SPIFFS_API_DBG*
- *CONFIG_SPIFFS_CACHE_DBG*
- *CONFIG_SPIFFS_CHECK_DBG*
- *CONFIG_SPIFFS_TEST_VISUALISATION*
- *CONFIG_SPIFFS_GC_DBG*

CONFIG_SPIFFS_DBG

Enable general SPIFFS debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print general debug mesages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_API_DBG

Enable SPIFFS API debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print API debug mesages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_GC_DBG

Enable SPIFFS Garbage Cleaner debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print GC debug mesages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_CACHE_DBG

Enable SPIFFS Cache debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print cache debug mesages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_CHECK_DBG

Enable SPIFFS Filesystem Check debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print Filesystem Check debug mesages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_TEST_VISUALISATION

Enable SPIFFS Filesystem Visualization

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enable this option to enable SPIFFS_vis function in the API.

Default value:

- No (disabled)

TCP Transport Contains:

- *Websocket*

Websocket Contains:

- *CONFIG_WS_TRANSPORT*

CONFIG_WS_TRANSPORT

Enable Websocket Transport

Found in: Component config > TCP Transport > Websocket

Enable support for creating websocket transport.

Default value:

- Yes (enabled)

CONFIG_WS_BUFFER_SIZE

Websocket transport buffer size

Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT

Size of the buffer used for constructing the HTTP Upgrade request during connect

Default value:

- 1024

CONFIG_WS_DYNAMIC_BUFFER

Using dynamic websocket transport buffer

Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT

If enable this option, websocket transport buffer will be freed after connection succeed to save more heap.

Default value:

- No (disabled)

Ultra Low Power (ULP) Co-processor

Contains:

- *CONFIG_ULP_COPROC_ENABLED*

CONFIG_ULP_COPROC_ENABLED

Enable Ultra Low Power (ULP) Co-processor

Found in: Component config > Ultra Low Power (ULP) Co-processor

Enable this feature if you plan to use the ULP Co-processor. Once this option is enabled, further ULP co-processor configuration will appear in the menu.

Default value:

- No (disabled) if SOC_ULP_SUPPORTED || SOC_RISCV_COPROC_SUPPORTED

CONFIG_ULP_COPROC_TYPE

ULP Co-processor type

Found in: Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED

Choose the ULP Coprocessor type: ULP FSM (Finite State Machine) or ULP RISC-V. Please note that ESP32 only supports ULP FSM.

Available options:

- ULP FSM (Finite State Machine) (ULP_COPROC_TYPE_FSM)
- ULP RISC-V (ULP_COPROC_TYPE_RISCV)

CONFIG_ULP_COPROC_RESERVE_MEM

RTC slow memory reserved for coprocessor

Found in: Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED

Bytes of memory to reserve for ULP Co-processor firmware & data. Data is reserved at the beginning of RTC slow memory.

Range:

- from 32 to 8176 if *CONFIG_ULP_COPROC_ENABLED* && (SOC_ULP_SUPPORTED || SOC_RISCV_COPROC_SUPPORTED)

Unity unit testing library

Contains:

- *CONFIG_UNITY_ENABLE_COLOR*
- *CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER*
- *CONFIG_UNITY_ENABLE_FIXTURE*
- *CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL*
- *CONFIG_UNITY_ENABLE_64BIT*
- *CONFIG_UNITY_ENABLE_DOUBLE*
- *CONFIG_UNITY_ENABLE_FLOAT*

CONFIG_UNITY_ENABLE_FLOAT

Support for float type

Found in: Component config > Unity unit testing library

If not set, assertions on float arguments will not be available.

Default value:

- Yes (enabled)

CONFIG_UNITY_ENABLE_DOUBLE

Support for double type

Found in: Component config > Unity unit testing library

If not set, assertions on double arguments will not be available.

Default value:

- Yes (enabled)

CONFIG_UNITY_ENABLE_64BIT

Support for 64-bit integer types

Found in: Component config > Unity unit testing library

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to UNITY_ASSERT_EQUAL, as that will cause pointer-to-int-cast warnings.

Default value:

- No (disabled)

CONFIG_UNITY_ENABLE_COLOR

Colorize test output

Found in: Component config > Unity unit testing library

If set, Unity will colorize test results using console escape sequences.

Default value:

- No (disabled)

CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER

Include ESP-IDF test registration/running helpers

Found in: Component config > Unity unit testing library

If set, then the following features will be available:

- TEST_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: unity_run_all_tests, unity_run_tests_with_filter, unity_run_single_test_by_name.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via unity_run_menu function.

Disable if a different test registration mechanism is used.

Default value:

- Yes (enabled)

CONFIG_UNITY_ENABLE_FIXTURE

Include Unity test fixture

Found in: Component config > Unity unit testing library

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

Default value:

- No (disabled)

CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL

Print a backtrace when a unit test fails

Found in: Component config > Unity unit testing library

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

Default value:

- No (disabled)

Virtual file system

Contains:

- *CONFIG_VFS_SUPPORT_IO*

CONFIG_VFS_SUPPORT_IO

Provide basic I/O functions

Found in: Component config > Virtual file system

If enabled, the following functions are provided by the VFS component.

open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:

close, read, write, ioctl, fcntl.

Default value:

- Yes (enabled)

CONFIG_VFS_SUPPORT_DIR

Provide directory related functions

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO

If enabled, the following functions are provided by the VFS component.

stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Default value:

- Yes (enabled)

CONFIG_VFS_SUPPORT_SELECT

Provide select function

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for "select" on UART file descriptors is not required.

Default value:

- Yes (enabled) if *CONFIG_VFS_SUPPORT_IO* && *CONFIG_LWIP_USE_ONLY_LWIP_SELECT*

CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT

Suppress select() related debug outputs

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT

Select() related functions might produce an unconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

Default value:

- Yes (enabled)

CONFIG_VFS_SUPPORT_TERMIOS

Provide termios.h functions

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO

Disabling this option can save memory when the support for termios.h is not required.

Default value:

- Yes (enabled)

Host File System I/O (Semihosting) Contains:

- *CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS*

CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS

Host FS: Maximum number of the host filesystem mount points

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)

Define maximum number of host filesystem mount points.

Default value:

- 1

Wear Levelling Contains:

- *CONFIG_WL_SECTOR_MODE*
- *CONFIG_WL_SECTOR_SIZE*

CONFIG_WL_SECTOR_SIZE

Wear Levelling library sector size

Found in: Component config > Wear Levelling

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

Available options:

- 512 (WL_SECTOR_SIZE_512)
- 4096 (WL_SECTOR_SIZE_4096)

CONFIG_WL_SECTOR_MODE

Sector store mode

Found in: Component config > Wear Levelling

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.

- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

Available options:
- Perfomance (WL_SECTOR_MODE_PERF)
- Safety (WL_SECTOR_MODE_SAFE)

Wi-Fi Provisioning Manager Contains:

- *CONFIG_WIFI_PROV_BLE_BONDING*
- *CONFIG_WIFI_PROV_BLE_SEC_CONN*
- *CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION*
- *CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV*
- *CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES*
- *CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT*

CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES

Max Wi-Fi Scan Result Entries

Found in: Component config > Wi-Fi Provisioning Manager

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

Range:
- from 1 to 255

Default value:
- 16

CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT

Provisioning auto-stop timeout

Found in: Component config > Wi-Fi Provisioning Manager

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

Range:
- from 5 to 600

Default value:
- 30

CONFIG_WIFI_PROV_BLE_BONDING

Enable BLE bonding

Found in: Component config > Wi-Fi Provisioning Manager

This option is applicable only when provisioning transport is BLE.

Default value:
- Yes (enabled) if *CONFIG_BT_ENABLED*

CONFIG_WIFI_PROV_BLE_SEC_CONN

Enable BLE Secure connection flag

Found in: Component config > Wi-Fi Provisioning Manager

Used to enable Secure connection support when provisioning transport is BLE.

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION

Force Link Encryption during characteristic Read / Write

Found in: Component config > Wi-Fi Provisioning Manager

Used to enforce link encryption when attempting to read / write characteristic

Default value:

- Yes (enabled)

CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

Keep BT on after provisioning is done

Found in: Component config > Wi-Fi Provisioning Manager

CONFIG_WIFI_PROV_DISCONNECT_AFTER_PROV

Terminate connection after provisioning is done

Found in: Component config > Wi-Fi Provisioning Manager > CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

Default value:

- Yes (enabled) if *CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV*

Supplicant Contains:

- *CONFIG_WPA_TESTING_OPTIONS*
- *CONFIG_WPA_WPS_SOFTAP_REGISTRAR*
- *CONFIG_WPA_11KV_SUPPORT*
- *CONFIG_WPA_11R_SUPPORT*
- *CONFIG_WPA_DPP_SUPPORT*
- *CONFIG_WPA_MBO_SUPPORT*
- *CONFIG_WPA_SUITE_B_192*
- *CONFIG_WPA_WAPI_PSK*
- *CONFIG_WPA_DEBUG_PRINT*
- *CONFIG_WPA_WPS_STRICT*
- *CONFIG_WPA_MBEDTLS_CRYPTO*

CONFIG_WPA_MBEDTLS_CRYPTO

Use MbedTLS crypto APIs

Found in: Component config > Supplicant

Select this option to use MbedTLS crypto APIs which utilize hardware acceleration.

Default value:

- Yes (enabled)

CONFIG_WPA_MBEDTLS_TLS_CLIENT

Use MbedTLS TLS client for WiFi Enterprise connection

Found in: Component config > Supplicant > CONFIG_WPA_MBEDTLS_CRYPTO

Select this option to use MbedTLS TLS client for WPA2 enterprise connection. Please note that from MbedTLS-3.0 onwards, MbedTLS does not support SSL-3.0 TLS-v1.0, TLS-v1.1 versions. Incase your server is using one of these version, it is advisable to update your server. Please disable this option for compatibilty with older TLS versions.

Default value:

- Yes (enabled)

CONFIG_WPA_WAPI_PSK

Enable WAPI PSK support

Found in: Component config > Supplicant

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

Default value:

- No (disabled)

CONFIG_WPA_SUITE_B_192

Enable NSA suite B support with 192 bit key

Found in: Component config > Supplicant

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

Default value:

- No (disabled)

CONFIG_WPA_DEBUG_PRINT

Print debug messages from WPA Supplicant

Found in: Component config > Supplicant

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

Default value:

- No (disabled)

CONFIG_WPA_TESTING_OPTIONS

Add DPP testing code

Found in: Component config > Supplicant

Select this to enable unity test for DPP.

Default value:

- No (disabled)

CONFIG_WPA_WPS_STRICT

Strictly validate all WPS attributes

Found in: Component config > Supplicant

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workaorunds with various APs. Enabling this may cause inter operability issues with some APs.

Default value:

- No (disabled)

CONFIG_WPA_11KV_SUPPORT

Enable 802.11k, 802.11v APIs Support

Found in: Component config > Supplicant

Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

Default value:

- No (disabled)

CONFIG_WPA_SCAN_CACHE

Keep scan results in cache

Found in: Component config > Supplicant > CONFIG_WPA_11KV_SUPPORT

Keep scan results in cache, if not enabled, those will be flushed immediately.

Default value:

- No (disabled) if *CONFIG_WPA_11KV_SUPPORT*

CONFIG_WPA_MBO_SUPPORT

Enable Multi Band Operation Certification Support

Found in: Component config > Supplicant

Select this option to enable WiFi Multiband operation certification support.

Default value:

- No (disabled)

CONFIG_WPA_DPP_SUPPORT

Enable DPP support

Found in: Component config > Supplicant

Select this option to enable WiFi Easy Connect Support.

Default value:

- No (disabled)

CONFIG_WPA_11R_SUPPORT

Enable 802.11R (Fast Transition) Support

Found in: Component config > Supplicant

Select this option to enable WiFi Fast Transition Support.

Default value:

- No (disabled)

CONFIG_WPA_WPS_SOFTAP_REGISTRAR

Add WPS Registrar support in SoftAP mode

Found in: Component config > Supplicant

Select this option to enable WPS registrar support in softAP mode.

Default value:

- No (disabled)

2.8 配网 API

2.8.1 Protocol Communication

Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

Following features are available for provisioning :

- **Communication security at application level -**
    - protocomm_security0 (no security)
    - protocomm_security1 (Curve25519 key exchange + AES-CTR encryption/decryption)
    - protocomm_security2 (SRP6a-based key exchange + AES-GCM encryption/decryption)
- Proof-of-possession (support with protocomm_security1 only)
- Salt and Verifier (support with protocomm_security2 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (for protocomm_security1 and protocomm_security2) by performing the two way handshake. See *Unified Provisioning* for more details about the secure handshake logic.

Enabling protocomm security version

Protocomm component provides project configuration menu to enable/disable support of respective security versions. The respective configuration options can be found as follows:

- Support protocomm security version 0 (no security): *CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0* (this option is enabled by default)
- Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption): *CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1* (this option is enabled by default)
- Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption): *CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2*

备注: Enabling multiple security versions allow to control them dynamically but also increases firmware size.

Transport Example (SoftAP + HTTP) with Security 2

For sample usage, see wifi_provisioning/src/scheme_softap.c

```
/* Endpoint handler to be registered with protocomm.
 * This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                            const uint8_t *inbuf, ssize_t inlen,
                            uint8_t **outbuf, ssize_t *outlen,
                            void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen;            /* Output data length updated */
    *outbuf = malloc(inlen);    /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

    /* Private data passed to the endpoint must be valid throughout the scope
     * of protocomm endpoint. This need not be static, ie. could be dynamically
     * allocated and freed at the time of endpoint removal */
    static uint32_t priv_data = 1234;

    /* Add a new endpoint for the protocomm instance, identified by a unique name
     * and register a handler function along with private data to be passed at the
     * time of handler execution. Multiple endpoints can be added as long as they
     * are identified by unique names */
    protocomm_add_endpoint(pc, "echo_req_endpoint",
                           echo_req_handler, (void *) &priv_data);
    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it's name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);

    /* Delete (deallocate) the protocomm instance */
    protocomm_delete(pc);
}
```

Transport Example (BLE) with Security 0

For sample usage, see wifi_provisioning/src/scheme_ble.c

```
/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };

    /* Config for protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <---------------------------------------
            * ---------------------------------------> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
            0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_
↪table[0]),
        .nu_lookup = nu_lookup_table
    };

    /* Start protocomm layer on top of BLE */
    protocomm_ble_start(pc, &config);

    /* For protocomm_security0, Proof of Possession is not used, and can␣
↪be kept NULL */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security0,␣
↪NULL);
    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler,␣
↪NULL);
    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop BLE protocomm service */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}
```

API Reference

Header File

- components/protocomm/include/common/protocomm.h

Functions

protocomm_t ***protocomm_new**(void)

Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t structure initialized to NULL.

返回

- protocomm_t* : On success
- NULL : No memory for allocating new instance

void **protocomm_delete**(*protocomm_t* *pc)

Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using `protocomm_new()`.

参数 **pc** –**[in]** Pointer to the protocomm instance to be deleted

esp_err_t **protocomm_add_endpoint**(*protocomm_t* *pc, const char *ep_name, *protocomm_req_handler_t* h, void *priv_data)

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

备注:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the protocomm_t instance structure.

参数

- **pc** –**[in]** Pointer to the protocomm instance
- **ep_name** –**[in]** Endpoint identifier(name) string
- **h** –**[in]** Endpoint handler function
- **priv_data** –**[in]** Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

返回

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

esp_err_t **protocomm_remove_endpoint**(*protocomm_t* *pc, const char *ep_name)

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

备注:

- This function internally calls the registered `remove_endpoint()` function which is a member of the protocomm_t instance structure.

参数

- **pc** –**[in]** Pointer to the protocomm instance
- **ep_name** –**[in]** Endpoint identifier(name) string

返回

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’ t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_open_session** (*protocomm_t* *pc, uint32_t session_id)

Allocates internal resources for new transport session.

备注:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

参数

- **pc** –**[in]** Pointer to the protocomm instance
- **session_id** –**[in]** Unique ID for a communication session

返回

- ESP_OK : Request handled successfully
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_close_session** (*protocomm_t* *pc, uint32_t session_id)

Frees internal resources used by a transport session.

备注:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

参数

- **pc** –**[in]** Pointer to the protocomm instance
- **session_id** –**[in]** Unique ID for a communication session

返回

- ESP_OK : Request handled successfully
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_req_handle** (*protocomm_t* *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

备注:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

参数

- **pc** –**[in]** Pointer to the protocomm instance
- **ep_name** –**[in]** Endpoint identifier(name) string
- **session_id** –**[in]** Unique ID for a communication session
- **inbuf** –**[in]** Input buffer contains input request data which is to be processed by the registered handler
- **inlen** –**[in]** Length of the input buffer
- **outbuf** –**[out]** Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **outlen** –**[out]** Buffer length of the allocated output buffer

返回

- ESP_OK : Request handled successfully
- ESP_FAIL : Internal error in execution of registered handler
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’ t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_set_security** (*protocomm_t* *pc, const char *ep_name, const *protocomm_security_t* *sec, const void *sec_params)

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

备注:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` and `protocomm_security2` are readily available.

参数

- **pc** –**[in]** Pointer to the protocomm instance
- **ep_name** –**[in]** Endpoint identifier(name) string
- **sec** –**[in]** Pointer to endpoint security instance
- **sec_params** –**[in]** Pointer to security params (NULL if not needed) The pointer should contain the security params struct of appropriate security version. For protocomm security version 1 and 2 sec_params should contain pointer to struct of type protocomm_security1_params_t and protocmm_security2_params_t respectively.

返回

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Security endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

esp_err_t **protocomm_unset_security** (*protocomm_t* *pc, const char *ep_name)

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

参数

- **pc** –**[in]** Pointer to the protocomm instance
- **ep_name** –**[in]** Endpoint identifier(name) string

返回

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’ t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_set_version** (*protocomm_t* *pc, const char *ep_name, const char *version)

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

备注:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

参数

- **pc** –**[in]** Pointer to the protocomm instance
- **ep_name** –**[in]** Endpoint identifier(name) string
- **version** –**[in]** Version identifier(name) string

返回

- ESP_OK : Success

- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Version endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

esp_err_t **protocomm_unset_version** (*protocomm_t* *pc, const char *ep_name)

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

参数

- **pc** –**[in]** Pointer to the protocomm instance
- **ep_name** –**[in]** Endpoint identifier(name) string

返回

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’ t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

Type Definitions

typedef *esp_err_t* (***protocomm_req_handler_t**)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Function prototype for protocomm endpoint handler.

typedef struct protocomm **protocomm_t**

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

备注： Structure of the protocomm object is kept private

Header File

- components/protocomm/include/security/protocomm_security.h

Structures

struct **protocomm_security1_params**

Protocomm Security 1 parameters: Proof Of Possession.

Public Members

const uint8_t ***data**

Pointer to buffer containing the proof of possession data

uint16_t **len**

Length (in bytes) of the proof of possession data

struct **protocomm_security2_params**

Protocomm Security 2 parameters: Salt and Verifier.

Public Members

const char ***salt**

Pointer to the buffer containing the salt

uint16_t **salt_len**

Length (in bytes) of the salt

const char ***verifier**

Pointer to the buffer containing the verifier

uint16_t **verifier_len**

Length (in bytes) of the verifier

struct **protocomm_security**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

备注: This structure should not have any dynamic members to allow re-entrancy

---

Public Members

int **ver**

Unique version number of security implementation

esp_err_t (***init**)(*protocomm_security_handle_t* *handle)

Function for initializing/allocating security infrastructure

esp_err_t (***cleanup**)(*protocomm_security_handle_t* handle)

Function for deallocating security infrastructure

esp_err_t (***new_transport_session**)(*protocomm_security_handle_t* handle, uint32_t session_id)

Starts new secure transport session with specified ID

esp_err_t (***close_transport_session**)(*protocomm_security_handle_t* handle, uint32_t session_id)

Closes a secure transport session with specified ID

esp_err_t (***security_req_handler**)(*protocomm_security_handle_t* handle, const void *sec_params, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler function for authenticating connection request and establishing secure session

esp_err_t (***encrypt**)(*protocomm_security_handle_t* handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Function which implements the encryption algorithm

esp_err_t (***decrypt**)(*protocomm_security_handle_t* handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Function which implements the decryption algorithm

Type Definitions

typedef struct *protocomm_security1_params* **protocomm_security1_params_t**

Protocomm Security 1 parameters: Proof Of Possession.

typedef *protocomm_security1_params_t* **protocomm_security_pop_t**

typedef struct *protocomm_security2_params* **protocomm_security2_params_t**

Protocomm Security 2 parameters: Salt and Verifier.

typedef void ***protocomm_security_handle_t**

typedef struct *protocomm_security* **protocomm_security_t**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

备注： This structure should not have any dynamic members to allow re-entrancy

---

Header File

- components/protocomm/include/security/protocomm_security0.h

Header File

- components/protocomm/include/security/protocomm_security1.h

Header File

- components/protocomm/include/transports/protocomm_httpd.h

Functions

esp_err_t **protocomm_httpd_start** (*protocomm_t* *pc, const *protocomm_httpd_config_t* *config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

备注： This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

参数

- **pc** –**[in]** Protocomm instance pointer obtained from protocomm_new()
- **config** –**[in]** Pointer to config structure for initializing HTTP server

返回

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_SUPPORTED : Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE : Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM : Memory allocation for server resource failed
- ESP_ERR_HTTPD_* : HTTP server error on start

esp_err_t **protocomm_httpd_stop** (*protocomm_t* *pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

参数 **pc** –**[in]** Same protocomm instance that was passed to protocomm_httpd_start()

返回

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

Unions

union **protocomm_httpd_config_data_t**

#include <protocomm_httpd.h> Protocomm HTTPD Configuration Data

Public Members

void ***handle**

HTTP Server Handle, if ext_handle_provided is set to true

protocomm_http_server_config_t **config**

HTTP Server Configuration, if a server is not already active

Structures

struct **protocomm_http_server_config_t**

Config parameters for protocomm HTTP server.

Public Members

uint16_t **port**

Port on which the HTTP server will listen

size_t **stack_size**

Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned **task_priority**

Priority of server task

struct **protocomm_httpd_config_t**

Config parameters for protocomm HTTP server.

Public Members

bool **ext_handle_provided**

Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t **data**

Protocomm HTTPD Configuration Data

Macros

PROTOCOMM_HTTPD_DEFAULT_CONFIG()

Header File

- components/protocomm/include/transports/protocomm_ble.h

Functions

esp_err_t **protocomm_ble_start**(*protocomm_t* *pc, const *protocomm_ble_config_t* *config)

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

参数

- **pc** –**[in]** Protocomm instance pointer obtained from protocomm_new()
- **config** –**[in]** Pointer to config structure for initializing BLE

返回

- ESP_OK : Success
- ESP_FAIL : Simple BLE start error
- ESP_ERR_NO_MEM : Error allocating memory for internal resources
- ESP_ERR_INVALID_STATE : Error in ble config
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **protocomm_ble_stop**(*protocomm_t* *pc)

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

---

备注: You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

参数 **pc** –**[in]** Same protocomm instance that was passed to protocomm_ble_start()

返回

- ESP_OK : Success
- ESP_FAIL : Simple BLE stop error
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance

Structures

struct **name_uuid**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

Public Members

const char ***name**

Name of the handler, which is passed to protocomm layer

uint16_t **uuid**

UUID to be assigned to the BLE characteristic which is mapped to the handler

struct **protocomm_ble_config**

Config parameters for protocomm BLE service.

Public Members

char **device_name**[MAX_BLE_DEVNAME_LEN]

BLE device name being broadcast at the time of provisioning

uint8_t **service_uuid**[BLE_UUID128_VAL_LENGTH]

128 bit UUID of the provisioning service

uint8_t ***manufacturer_data**

BLE device manufacturer data pointer in advertisement

ssize_t **manufacturer_data_len**

BLE device manufacturer data length in advertisement

ssize_t **nu_lookup_count**

Number of entries in the Name-UUID lookup table

protocomm_ble_name_uuid_t ***nu_lookup**

Pointer to the Name-UUID lookup table

unsigned **ble_bonding**

BLE bonding

unsigned **ble_sm_sc**

BLE security flag

Macros

MAX_BLE_DEVNAME_LEN

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

BLE_UUID128_VAL_LENGTH

MAX_BLE_MANUFACTURER_DATA_LEN

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

Type Definitions

typedef struct *name_uuid* **protocomm_ble_name_uuid_t**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct *protocomm_ble_config* **protocomm_ble_config_t**

Config parameters for protocomm BLE service.

2.8.2 Unified Provisioning

Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. *Extensible Protocol:* The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.
2. *Transport Flexibility:* The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.
3. *Security Scheme Flexibility:* It's understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that's WPA2 protected or BLE with "just-works" security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.
4. *Compact Data Representation:* The protocol uses Google Protobufs as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

Typical Provisioning Process

Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.
2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app
3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.
5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases
6. SoftAP based provisioning requires the phone app user to go to "System Settings" to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be

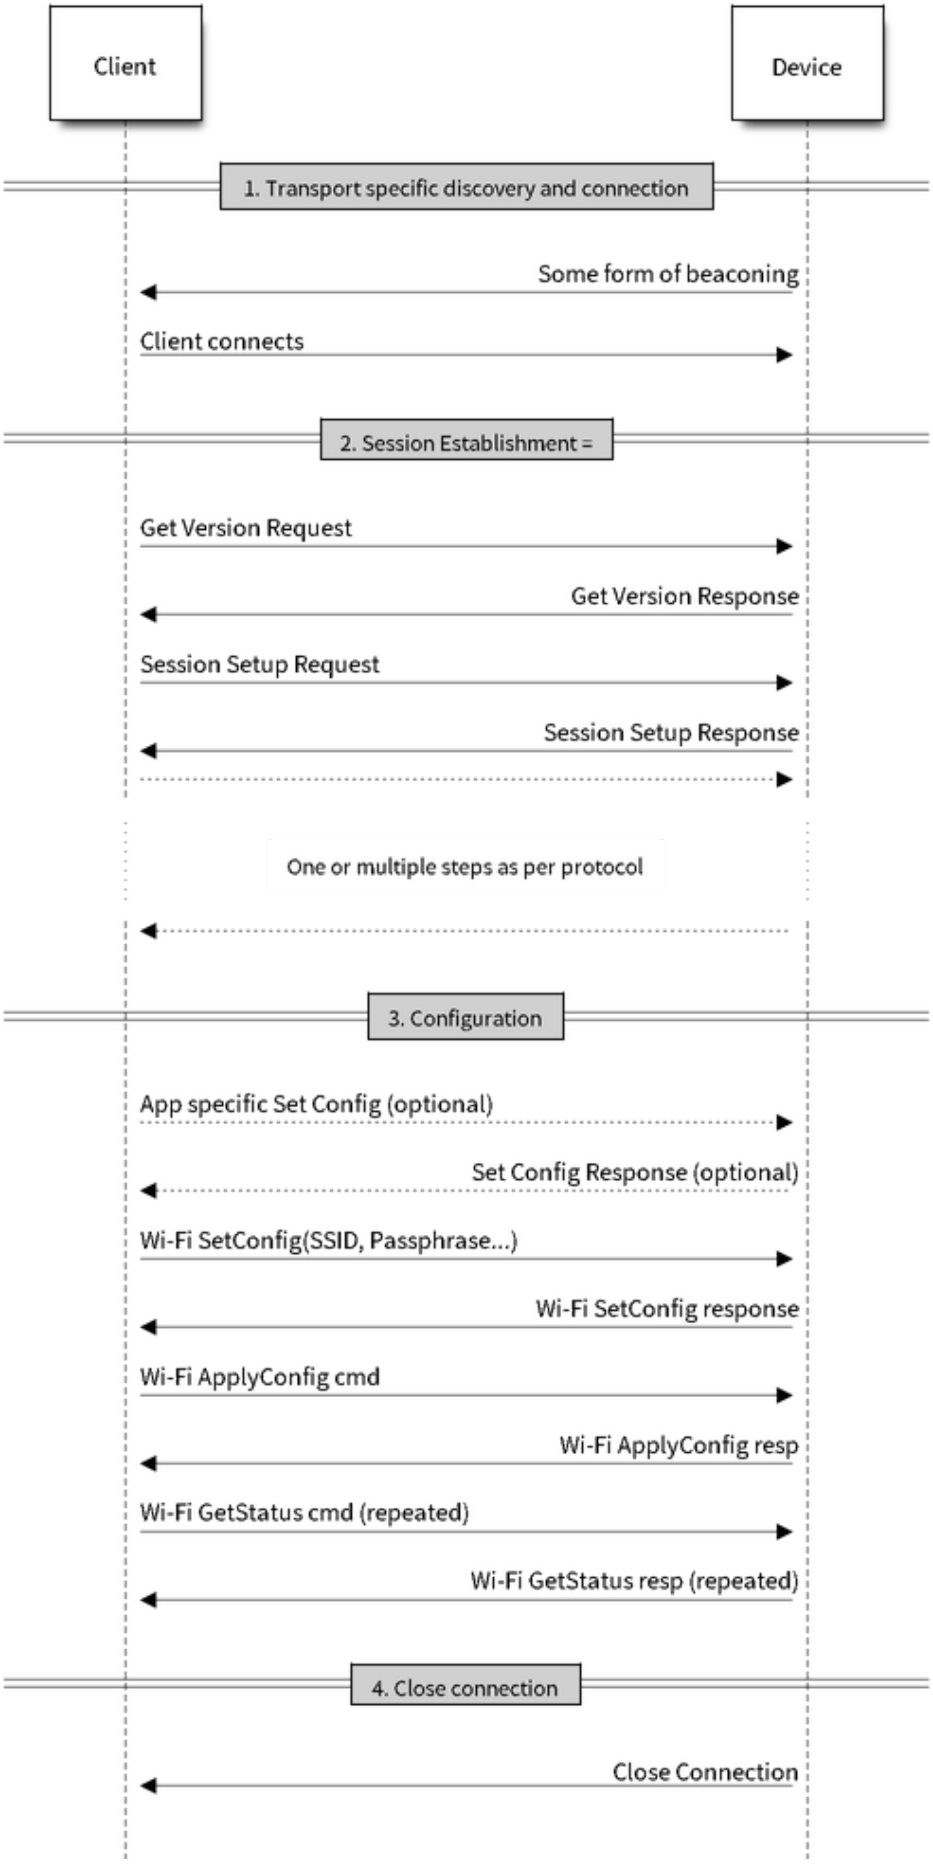

图 19: Typical Provisioning Process

entered on the provisioning client as a security measure to make sure that the user can provisions the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. *Transport Security:* SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, "just-works" security can be used as a transport level security after understanding the level of security it provides.
2. *Application Security:* The unified provisioning subsystem provides application level security (*security1*) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

Architecture

The below diagram shows architecture of unified provisioning.

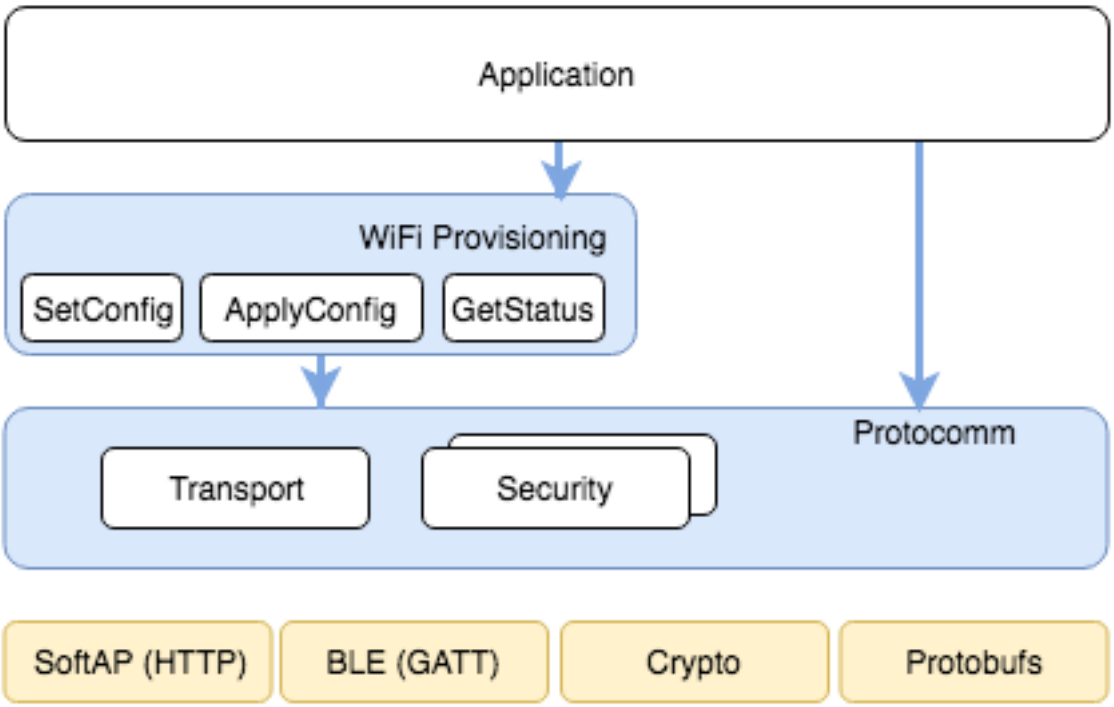

图 20: Unified Provisioning Architecture

It relies on the base layer called *Protocol Communication* (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an "end-point" which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

Security Schemes

At present, unified provisioning supports the following security schemes:

1. Security0 - No security (No encryption)
2. **Security1 - Curve25519-based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It s**
    a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
    b. No Auth (Null PoP) - Shared key derived through key exchange only
3. Security2 - SRP6a-based shared key derivation and AES256-GCM mode encryption of the data.

备注: The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocom security version section in *Protocol Communication* (Protocol Communication) for more details.

Security1 Scheme

Security1 scheme details are shown in the below sequence diagram -

---

备注: We shall soon migrate to `Security2 scheme` as the default scheme in our examples as it provides enhanced security. This change shall be done once we have our phone apps (Android/iOS) upgraded to handle `Security2 scheme`.

Security2 Scheme

Security2 scheme is based on the Secure Remote Password (SRP6a) protocol - RFC 5054. The protocol requires the Salt and Verifier to be generated beforehand with help of the identifying username `I` and the plaintext password `p`. The Salt and Verifier are then stored on ESP32-C3. - The password `p` and username `I` are to be provided to the Phone App (Provisioning entity) by suitable means for example QR code sticker.

Security2 scheme details are shown in the below sequence diagram -

Sample Code

Please refer to *Protocol Communication* and *Wi-Fi Provisioning* for API guides and code snippets on example usage.

Application implementation can be found as an example under provisioning.

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
    - BLE Provisioning app on Play Store.
    - SoftAP Provisioning app on Play Store.

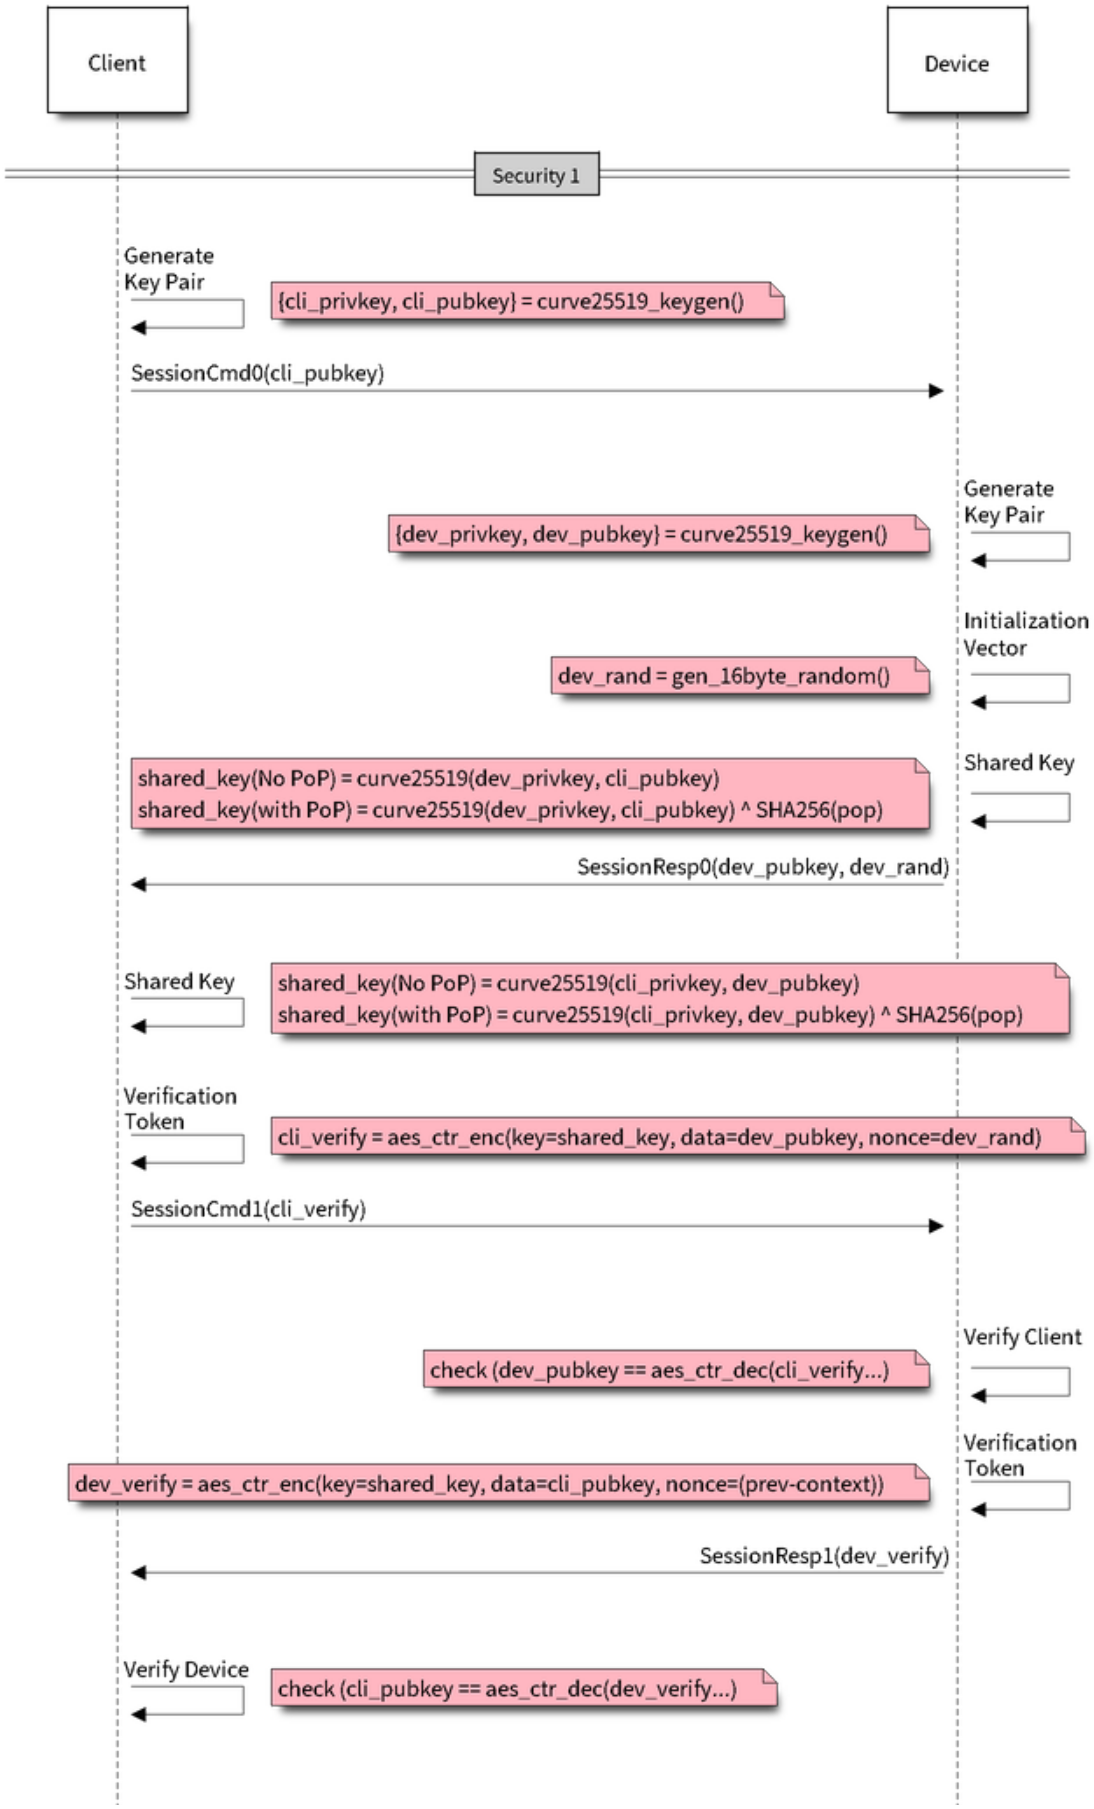

图 21: Security1

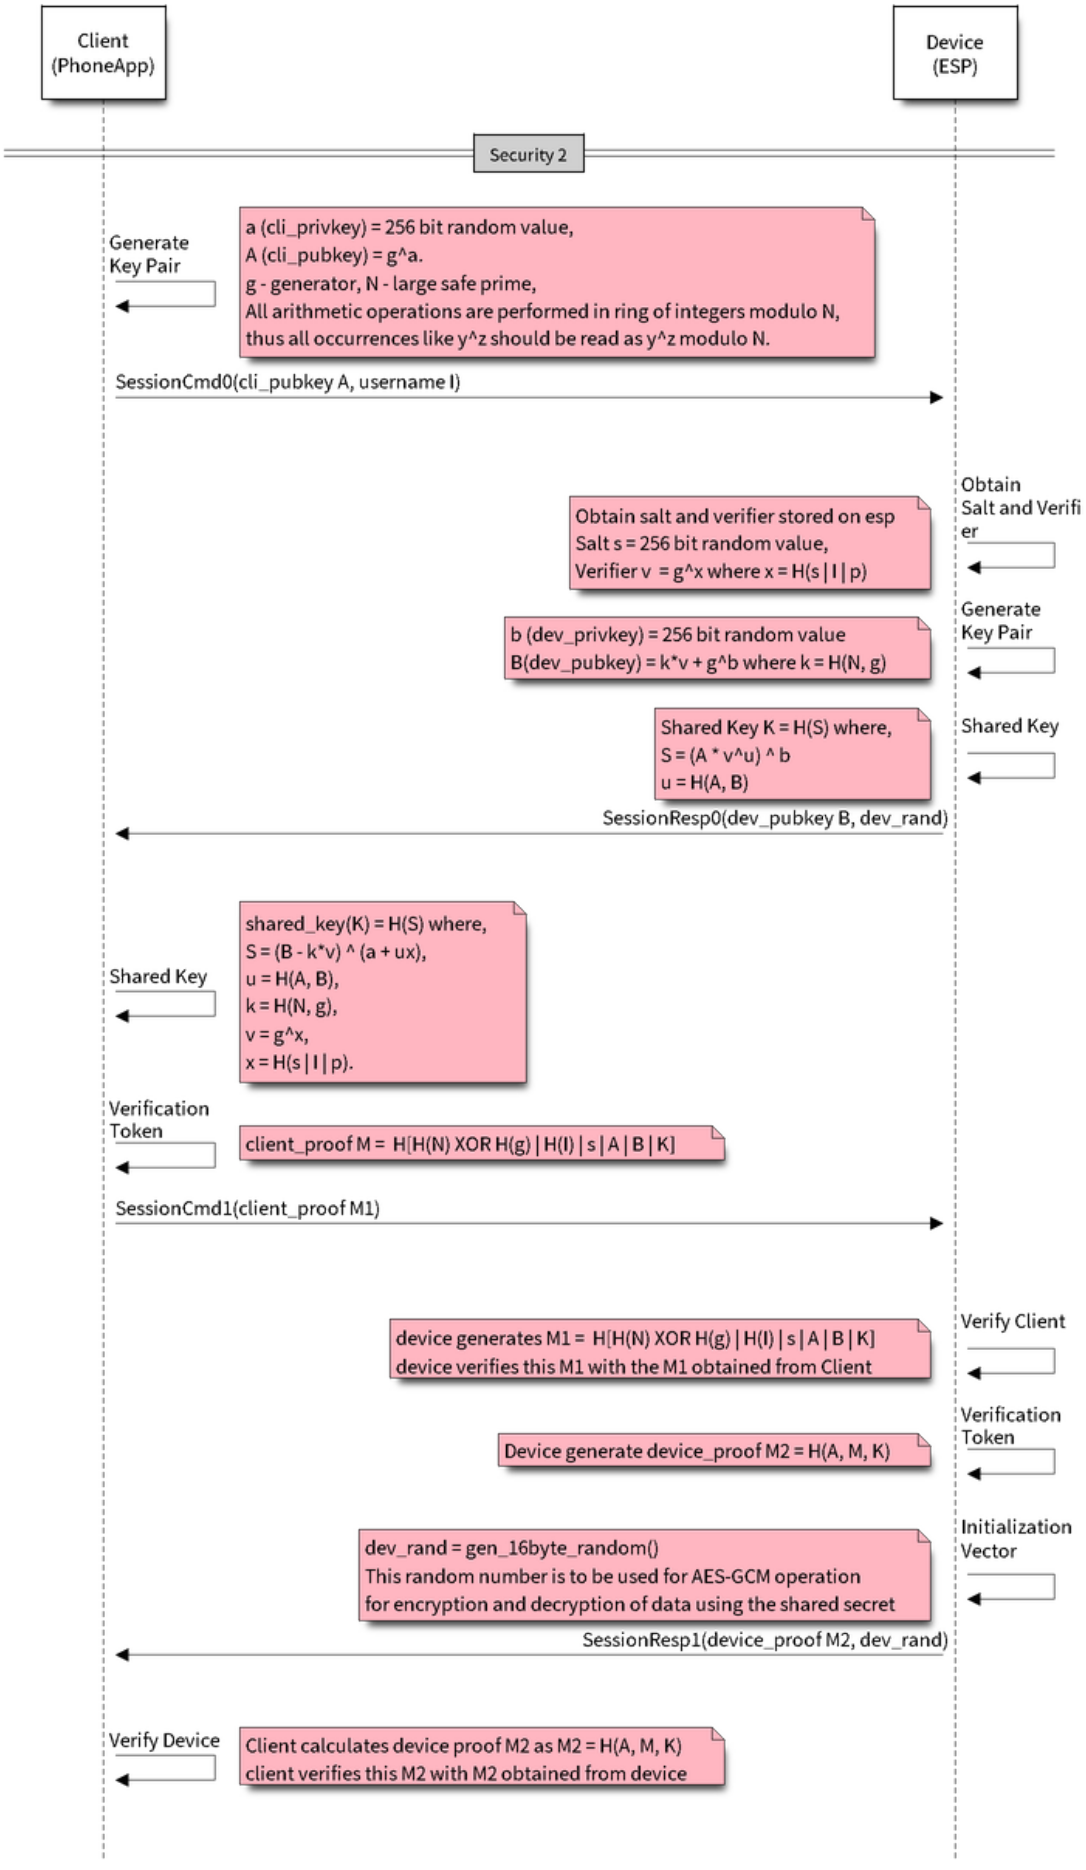

图 22: Security2

  - Source code on GitHub: esp-idf-provisioning-android.
- **iOS:**
  - BLE Provisioning app on app store.
  - SoftAP Provisioning app on app Store.
  - Source code on GitHub: esp-idf-provisioning-ios.
- Linux/MacOS/Windows : tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

2.8.3 Wi-Fi Provisioning

Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure *Protocol Communication (protocomm)* sessions. The set of `wifi_prov_mgr_` APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

Initialization *`wifi_prov_mgr_init()`* is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other `wifi_prov_mgr_` APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to *`wifi_prov_mgr_deinit()`*.

```
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};

ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager :

- *scheme* : This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options :
  - `wifi_prov_scheme_ble` : BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap` : Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console` : Serial transport and console for handling provisioning commands
- *scheme_event_handler* : An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn't require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only BLE memory. Used when main application requires classic BT.

  - WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
  - WIFI_PROV_EVENT_HANDLER_NONE - Don't use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.
- *app_event_handler* (Deprecated) : It is now recommended to catch WIFI_PROV_EVENT``s that are emitted to the default event loop handler. See definition of ``wifi_prov_cb_event_t for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV: {
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t␣
↪*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials"
                         "\n\tSSID     : %s\n\tPassword : %s",
                         (const char *) wifi_sta_cfg->ssid,
                         (const char *) wifi_sta_cfg->password);
                break;
            }
            case WIFI_PROV_CRED_FAIL: {
                wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
↪reason_t *)event_data;
                ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
                         "\n\tPlease reset to factory and retry␣
↪provisioning",
                         (*reason == WIFI_PROV_STA_AUTH_ERROR) ?
                         "Wi-Fi station authentication failed" : "Wi-Fi␣
↪access-point not found");
                break;
            }
            case WIFI_PROV_CRED_SUCCESS:
                ESP_LOGI(TAG, "Provisioning successful");
                break;
            case WIFI_PROV_END:
                /* De-initialize manager once provisioning is finished */
                wifi_prov_mgr_deinit();
                break;
            default:
                break;
        }
    }
}
```

The manager can be de-initialized at any moment by making a call to *wifi_prov_mgr_deinit()*.

Check Provisioning State Whether device is provisioned or not can be checked at runtime by calling *wifi_prov_mgr_is_provisioned()*. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the esp_wifi_ APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken :

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

Start Provisioning Service At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to :

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses *protocomm*, we have the option of choosing one of the security features provided by it :

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (*pop*), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the *pop* is simply ignored

See *Provisioning* for details about the security features.

```
const char *service_name = "my_device";
const char *service_key  = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );
```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to *`wifi_prov_mgr_stop_provisioning()`*.

备注: If the device fails to connect with the provided credentials, it won't accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in *Check Provisioning State*.

Waiting For Completion Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to *`wifi_prov_mgr_wait()`*.

```
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();
```

(下页继续)

(续上页)

```
// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch ``WIFI_PROV_EVENT``s and call :cpp:func:`wifi_prov_mgr_deinit()` when event ID is ``WIFI_PROV_END``:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

User Side Implementation When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to *_esp_wifi_prov*.

When using BLE transport, a custom 128 bit UUID should be set using *wifi_prov_scheme_ble_set_service_uuid()*. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn't be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to *55cc035e-fb27-4f80-be02-3c60828b7451*, each endpoint characteristic will be assigned a UUID like *55cc____-fb27-4f80-be02-3c60828b7451*, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows :

表 7: Endpoints provided by Provisioning Service

Endpoint Name (BLE + GATT Server)	URI (SoftAP + HTTP Server + mDNS)	Description
prov-session	http://<mdns-hostname>.local/prov-session	Security endpoint used for session establishment
prov-scan	http://wifi-prov.local/prov-scan	Endpoint used for starting Wi-Fi scan and receiving scan results
prov-config	http://<mdns-hostname>.local/prov-config	Endpoint used for configuring Wi-Fi credentials on device
proto-ver	http://<mdns-hostname>.local/proto-ver	Endpoint for retrieving version info

Immediately after connecting, the client application may fetch the version / capabilities information from the *proto-ver* endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like : `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] },....` Here label *prov* provides provisioning service version (*ver*) and capabilities (*cap*). For now, only *no_pop* capability is supported, which indicates that the service doesn't require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like *my_app* in this example). These additional fields are set using *wifi_prov_mgr_set_app_info()*.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the *.proto* files found under protocomm/proto, which define the Protobuf message structures supported by *prov-session* endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of *wifi_config* commands, serialized as Protobuf messages (the corresponding *.proto* files can be found under wifi_provisioning/proto) :

- *get_status* - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- *set_config* - For setting the Wi-Fi connection credentials
- *apply_config* - For applying the credentials saved during *set_config* and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the *wifi_config* commands described above. The *wifi_scan* endpoint supports the following protobuf commands :

- *scan_start* - For starting Wi-Fi scan with various options :
  - *blocking* (input) - If true, the command returns only when the scanning is finished
  - *passive* (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - *group_channels* (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for atleast 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting group_channels to 4, will create 5 groups, with each group having 3 channels, except the last one which will have 14 % 3 = 2 channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.
  - *period_ms* (input) - Scan parameter specifying how long to wait on each channel
- *scan_status* - Gives the status of scanning process :
  - *scan_finished* (output) - When scan has finished this returns true
  - *result_count* (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- *scan_result* - For fetching scan results. This can be called even if scan is still on going
  - *start_index* (input) - Starting index from where to fetch the entries from the results list
  - *count* (input) - Number of entries to fetch from the starting index
  - *entries* (output) - List of entries returned. Each entry consists of *ssid*, *channel* and *rssi* information

Additional Endpoints In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See *protocomm* for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_
↪key);
```

(下页继续)

(续上页)

```
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler,␣
↪custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call *wifi_prov_mgr_endpoint_unregister()* to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

When / How To Stop Provisioning Service? The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the *apply_config* command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next *get_status* command. If *get_status* command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and *get_status* will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling *wifi_prov_mgr_disable_auto_stop()*. Now the provisioning service will only be stopped after an explicit call to *wifi_prov_mgr_stop_provisioning()*, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified by the argument to *wifi_prov_mgr_disable_auto_stop()*.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling *wifi_prov_mgr_stop_provisioning()* inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

Application Examples

For complete example implementation see provisioning/wifi_prov_mgr

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.
- **iOS:**
  - BLE Provisioning app on app store.
  - SoftAP Provisioning app on app Store.
  - Source code on GitHub: esp-idf-provisioning-ios.
- Linux/MacOS/Windows : tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

API Reference

Header File

- components/wifi_provisioning/include/wifi_provisioning/manager.h

Functions

esp_err_t **wifi_prov_mgr_init** (*wifi_prov_mgr_config_t* config)

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI_PROV_INIT is emitted right after initialization is complete

参数 **config** –**[in]** Configuration structure

返回

- ESP_OK : Success
- ESP_FAIL : Fail

void **wifi_prov_mgr_deinit** (void)

Stop provisioning (if running) and release resource used by the manager.

Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization

esp_err_t **wifi_prov_mgr_is_provisioned** (bool *provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component

If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

备注: Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

参数 **provisioned** –**[out]** True if provisioned, else false

返回

- ESP_OK : Retrieved provision state successfully
- ESP_FAIL : Wi-Fi not initialized
- ESP_ERR_INVALID_ARG : Null argument supplied
- ESP_ERR_INVALID_STATE : Manager not initialized

esp_err_t **wifi_prov_mgr_start_provisioning** (*wifi_prov_security_t* security, const void *wifi_prov_sec_params, const char *service_name, const char *service_key)

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- wifi_prov_scheme_ble : This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- wifi_prov_scheme_softap : This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)

Event WIFI_PROV_START is emitted right after provisioning starts without failure

备注: This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true

参数

- **security** –**[in]** Specify which protocomm security scheme to use :
  - WIFI_PROV_SECURITY_0 : For no security
  - WIFI_PROV_SECURITY_1 : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
  - WIFI_PROV_SECURITY_2: SRP6a based authentication and key exchange followed by AES-GCM encryption/decryption of provisioning messages
- **wifi_prov_sec_params** –**[in]** Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type wifi_prov_security1_params_t for protocomm security 1 and wifi_prov_security2_params_t for protocomm security 2 respectively.
- **service_name** –**[in]** Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- **service_key** –**[in]** Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

返回

- ESP_OK : Provisioning started successfully
- ESP_FAIL : Failed to start provisioning service
- ESP_ERR_INVALID_STATE : Provisioning manager not initialized or already started

void **wifi_prov_mgr_stop_provisioning**(void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with wifi_prov_mgr_disable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleaup_delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

void **wifi_prov_mgr_wait**(void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.

This will not block if provisioning is not started or not initialized.

esp_err_t **wifi_prov_mgr_disable_auto_stop**(uint32_t cleanup_delay)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

备注： This must be called before executing wifi_prov_mgr_start_provisioning()

参数 **cleanup_delay** –**[in]** Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

返回

- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started

esp_err_t **wifi_prov_mgr_set_app_info**(const char *label, const char *version, const char **capabilities, size_t total_capabilities)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label "prov", containing only provisioning service version and capabilities. Application services should use a label other than "prov" so as not to overwrite this.

备注： This must be called before executing wifi_prov_mgr_start_provisioning()

参数

- **label** –**[in]** String indicating the application name.
- **version** –**[in]** String indicating the application version. There is no constraint on format.
- **capabilities** –**[in]** Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- **total_capabilities** –**[in]** Size of capabilities array

返回

- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started
- ESP_ERR_NO_MEM : Failed to allocate memory for version string
- ESP_ERR_INVALID_ARG : Null argument

esp_err_t **wifi_prov_mgr_endpoint_create**(const char *ep_name)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using wifi_prov_mgr_endpoint_register() after provisioning has started.

备注： This API can only be called BEFORE provisioning is started

备注： Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

备注： After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

参数 **ep_name** –**[in]** unique name of the endpoint

返回

- ESP_OK : Success
- ESP_FAIL : Failure

esp_err_t **wifi_prov_mgr_endpoint_register**(const char *ep_name, *protocomm_req_handler_t* handler, void *user_ctx)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using wifi_prov_mgr_endpoint_create().

备注： This API can only be called AFTER provisioning has started

备注： Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

备注： After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

参数

- **ep_name** –**[in]** Name of the endpoint
- **handler** –**[in]** Endpoint handler function
- **user_ctx** –**[in]** User data

返回

- ESP_OK : Success
- ESP_FAIL : Failure

void **wifi_prov_mgr_endpoint_unregister**(const char *ep_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

参数 **ep_name** –**[in]** Name of the endpoint

esp_err_t **wifi_prov_mgr_get_wifi_state**(*wifi_prov_sta_state_t* *state)

Get state of Wi-Fi Station during provisioning.

参数 **state** –**[out]** Pointer to wifi_prov_sta_state_t variable to be filled

返回

- ESP_OK : Successfully retrieved Wi-Fi state

- ESP_FAIL : Provisioning app not running

esp_err_t **wifi_prov_mgr_get_wifi_disconnect_reason**(*wifi_prov_sta_fail_reason_t* *reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

参数 **reason** –**[out]** Pointer to wifi_prov_sta_fail_reason_t variable to be filled

返回

- ESP_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL : Provisioning app not running

esp_err_t **wifi_prov_mgr_configure_sta**(*wifi_config_t* *wifi_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

参数 **wifi_cfg** –**[in]** Pointer to Wi-Fi configuration structure

返回

- ESP_OK : Wi-Fi configured and started successfully
- ESP_FAIL : Failed to set configuration

esp_err_t **wifi_prov_mgr_reset_provisioning**(void)

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

返回

- ESP_OK : Reset provisioning config successfully
- ESP_FAIL : Failed to reset provisioning config

esp_err_t **wifi_prov_mgr_reset_sm_state_on_failure**(void)

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

返回

- ESP_OK : Reset provisioning state machine successfully
- ESP_FAIL : Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE : Manager not initialized

Structures

struct **wifi_prov_event_handler_t**

Event handler that is used by the manager while provisioning service is active.

Public Members

wifi_prov_cb_func_t **event_cb**

Callback function to be executed on provisioning events

void ***user_data**

User context data to pass as parameter to callback function

struct **wifi_prov_scheme**

Structure for specifying the provisioning scheme to be followed by the manager.

备注: Ready to use schemes are available:

- wifi_prov_scheme_ble : for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap : for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console : for provisioning over Serial UART transport + Console (for debugging)

Public Members

esp_err_t (***prov_start**)(*protocomm_t* *pc, void *config)

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

esp_err_t (***prov_stop**)(*protocomm_t* *pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

void *(***new_config**)(void)

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to *prov_start()*

void (***delete_config**)(void *config)

Function which is to be called by the manager to delete a configuration generated using *new_config()*

esp_err_t (***set_config_service**)(void *config, const char *service_name, const char *service_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure

esp_err_t (***set_config_endpoint**)(void *config, const char *endpoint_name, uint16_t uuid)

Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

wifi_mode_t **wifi_mode**

Sets mode of operation of Wi-Fi during provisioning This is set to :

- WIFI_MODE_APSTA for SoftAP transport
- WIFI_MODE_STA for BLE transport

struct **wifi_prov_mgr_config_t**

Structure for specifying the manager configuration.

Public Members

wifi_prov_scheme_t **scheme**

Provisioning scheme to use. Following schemes are already available:

- wifi_prov_scheme_ble : for provisioning over BLE transport + GATT server

- wifi_prov_scheme_softap : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- wifi_prov_scheme_console : for provisioning over Serial UART transport + Console (for debugging)

wifi_prov_event_handler_t **scheme_event_handler**

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use WIFI_PROV_EVENT_HANDLER_NONE when not used. When using scheme wifi_prov_scheme_ble, the following options are available:

- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

wifi_prov_event_handler_t **app_event_handler**

Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI_PROV_EVENT_HANDLER_NONE when not used.

Macros

WIFI_PROV_EVENT_HANDLER_NONE

Event handler can be set to none if not used.

Type Definitions

typedef void (***wifi_prov_cb_func_t**)(void *user_data, *wifi_prov_cb_event_t* event, void *event_data)

typedef struct *wifi_prov_scheme* **wifi_prov_scheme_t**

Structure for specifying the provisioning scheme to be followed by the manager.

备注: Ready to use schemes are available:

- wifi_prov_scheme_ble : for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap : for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console : for provisioning over Serial UART transport + Console (for debugging)

---

typedef enum *wifi_prov_security* **wifi_prov_security_t**

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

typedef *protocomm_security1_params_t* **wifi_prov_security1_params_t**

typedef *protocomm_security2_params_t* **wifi_prov_security2_params_t**

Enumerations

enum **wifi_prov_cb_event_t**

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and deinitialization of the manager, each event is signaled only once

Values:

enumerator **WIFI_PROV_INIT**

Emitted when the manager is initialized

enumerator **WIFI_PROV_START**

Indicates that provisioning has started

enumerator **WIFI_PROV_CRED_RECV**

Emitted when Wi-Fi AP credentials are received via `protocomm` endpoint `wifi_config`. The event data in this case is a pointer to the corresponding *`wifi_sta_config_t`* structure

enumerator **WIFI_PROV_CRED_FAIL**

Emitted when device fails to connect to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`. The event data in this case is a pointer to the disconnection reason code with type `wifi_prov_sta_fail_reason_t`

enumerator **WIFI_PROV_CRED_SUCCESS**

Emitted when device successfully connects to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`

enumerator **WIFI_PROV_END**

Signals that provisioning service has stopped

enumerator **WIFI_PROV_DEINIT**

Signals that manager has been de-initialized

enum **wifi_prov_security**

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

Values:

enumerator **WIFI_PROV_SECURITY_0**

No security (plain-text communication)

enumerator **WIFI_PROV_SECURITY_1**

This secure communication mode consists of X25519 key exchange

- proof of possession (pop) based authentication
- AES-CTR encryption

enumerator **WIFI_PROV_SECURITY_2**

This secure communication mode consists of SRP6a based authentication and key exchange

- AES-GCM encryption/decryption

Header File

- components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h

Functions

void **wifi_prov_scheme_ble_event_cb_free_btdm**(void *user_data, *wifi_prov_cb_event_t* event, void *event_data)

void **wifi_prov_scheme_ble_event_cb_free_ble**(void *user_data, *wifi_prov_cb_event_t* event, void *event_data)

void **wifi_prov_scheme_ble_event_cb_free_bt**(void *user_data, *wifi_prov_cb_event_t* event, void *event_data)

esp_err_t **wifi_prov_scheme_ble_set_service_uuid**(uint8_t *uuid128)

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

备注: The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwords.

参数 **uuid128** –**[in]** A custom 128 bit UUID

返回

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

esp_err_t **wifi_prov_scheme_ble_set_mfg_data**(uint8_t *mfg_data, ssize_t mfg_data_len)

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning().

备注: It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. (mfg_data_len + 2) < 31 - (device_name_length + 2). If the mfg_data length exceeds this limit, the length will be truncated.

参数

- **mfg_data** –**[in]** Custom manufacturer data
- **mfg_data_len** –**[in]** Manufacturer data length

返回

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

Macros

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

Header File

- components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h

Functions

void **wifi_prov_scheme_softap_set_httpd_handle**(void *handle)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

备注: This API should be called before wifi_prov_mgr_start_provisioning()

参数 **handle** –**[in]** Handle to HTTPD server instance

Header File

- components/wifi_provisioning/include/wifi_provisioning/scheme_console.h

Header File

- components/wifi_provisioning/include/wifi_provisioning/wifi_config.h

Functions

esp_err_t **wifi_prov_config_data_handler**(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (protocomm `protocomm_req_handler_t`) using `protocomm_add_endpoint()`

Structures

struct **wifi_prov_sta_conn_info_t**

WiFi STA connected status information.

Public Members

char **ip_addr**[IP4ADDR_STRLEN_MAX]

IP Address received by station

char **bssid**[6]

BSSID of the AP to which connection was estalished

char **ssid**[33]

SSID of the to which connection was estalished

uint8_t **channel**

Channel of the AP

uint8_t **auth_mode**

Authorization mode of the AP

struct **wifi_prov_config_get_data_t**

WiFi status data to be sent in response to `get_status` request from master.

Public Members

wifi_prov_sta_state_t **wifi_state**
WiFi state of the station

wifi_prov_sta_fail_reason_t **fail_reason**
Reason for disconnection (valid only when `wifi_state` is `WIFI_STATION_DISCONNECTED`)

wifi_prov_sta_conn_info_t **conn_info**
Connection information (valid only when `wifi_state` is `WIFI_STATION_CONNECTED`)

struct **wifi_prov_config_set_data_t**
WiFi config data received by slave during `set_config` request from master.

Public Members

char **ssid**[33]
SSID of the AP to which the slave is to be connected

char **password**[64]
Password of the AP

char **bssid**[6]
BSSID of the AP

uint8_t **channel**
Channel of the AP

struct **wifi_prov_config_handlers**
Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

Public Members

esp_err_t (***get_status_handler**)(*wifi_prov_config_get_data_t* *resp_data, *wifi_prov_ctx_t* **ctx)
Handler function called when connection status of the slave (in WiFi station mode) is requested

esp_err_t (***set_config_handler**)(const *wifi_prov_config_set_data_t* *req_data, *wifi_prov_ctx_t* **ctx)
Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

esp_err_t (***apply_config_handler**)(*wifi_prov_ctx_t* **ctx)
Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.

wifi_prov_ctx_t ***ctx**
Context pointer to be passed to above handler functions upon invocation

Type Definitions

typedef struct wifi_prov_ctx **wifi_prov_ctx_t**

Type of context data passed to each get/set/apply handler function set in *wifi_prov_config_handlers* structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

typedef struct *wifi_prov_config_handlers* **wifi_prov_config_handlers_t**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

Enumerations

enum **wifi_prov_sta_state_t**

WiFi STA status for conveying back to the provisioning master.

Values:

enumerator **WIFI_PROV_STA_CONNECTING**

enumerator **WIFI_PROV_STA_CONNECTED**

enumerator **WIFI_PROV_STA_DISCONNECTED**

enum **wifi_prov_sta_fail_reason_t**

WiFi STA connection fail reason.

Values:

enumerator **WIFI_PROV_STA_AUTH_ERROR**

enumerator **WIFI_PROV_STA_AP_NOT_FOUND**

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 provisioning 目录下。

本部分的 API 示例代码存放在 wifi/smart_config 目录下。

本部分的 API 示例代码存放在 wifi/wifi_easy_connect/dpp-enrollee 目录下。

2.9 存储 API

2.9.1 FAT 文件系统

ESP-IDF 使用 FatFs 库来实现 FAT 文件系统。FatFs 库位于 `fatfs` 组件中，您可以直接使用，也可以借助 C 标准库和 POSIX API 通过 VFS（虚拟文件系统）使用 FatFs 库的大多数功能。

此外，我们对 FatFs 库进行了扩展，新增了支持可插拔磁盘 I/O 调度层，从而允许在运行时将 FatFs 驱动映射到物理磁盘。

FatFs 与 VFS 配合使用

头文件 fatfs/vfs/esp_vfs_fat.h 定义了连接 FatFs 和 VFS 的函数。

函数*esp_vfs_fat_register()* 分配一个 FATFS 结构，并在 VFS 中注册特定路径前缀。如果文件路径以此前缀开头，则对此文件的后续操作将转至 FatFs API。

函数*esp_vfs_fat_unregister_path()* 删除在 VFS 中的注册，并释放 FATFS 结构。

多数应用程序在使用 esp_vfs_fat_ 函数时，采用如下步骤：

1. **调用*esp_vfs_fat_register()*，指定：**
   - 挂载文件系统的路径前缀（例如，"/sdcard" 或 "/spiflash"）
   - FatFs 驱动编号
   - 一个用于接收指向 FATFS 结构指针的变量
2. 调用*ff_diskio_register()*，为步骤 1 中的驱动编号注册磁盘 I/O 驱动；
3. 调用 FatFs 函数 f_mount，随后调用 f_fdisk 或 f_mkfs，并使用与传递到*esp_vfs_fat_register()* 相同的驱动编号挂载文件系统。请参考 FatFs 文档，查看更多信息；
4. 调用 C 标准库和 POSIX API 对路径中带有步骤 1 中所述前缀的文件（例如，"/sdcard/hello.txt"）执行打开、读取、写入、擦除、复制等操作。文件系统默认使用 8.3 文件名 格式 (SFN)。若您需要使用长文件名 (LFN)，启用*CONFIG_FATFS_LONG_FILENAMES* 选项。请参考 here，查看更多信息；
5. 您可以选择启用*CONFIG_FATFS_USE_FASTSEEK* 选项，使用 POSIX lseek 来快速执行。快速查找不适用于编辑模式下的文件，所以，使用快速查找时，应在只读模式下打开（或者关闭然后重新打开）文件；
6. 您也可以选择直接调用 FatFs 库函数，但需要使用没有 VFS 前缀的路径（例如，"/hello.txt"）；
7. 关闭所有打开的文件；
8. 调用 FatFs 函数 f_mount 并使用 NULL FATFS* 参数，为与上述编号相同的驱动卸载文件系统；
9. 调用 FatFs 函数*ff_diskio_register()* 并使用 NULL ff_diskio_impl_t* 参数和相同的驱动编号，来释放注册的磁盘 I/O 驱动；
10. 调用*esp_vfs_fat_unregister_path()* 并使用文件系统挂载的路径将 FatFs 从 VFS 中移除，并释放步骤 1 中分配的 FATFS 结构。

便捷函数 esp_vfs_fat_sdmmc_mount、esp_vfs_fat_sdspi_mount 和 esp_vfs_fat_sdmmc_unmount 对上述步骤进行了封装，并加入了对 SD 卡初始化的处理。我们将在下一章节详细介绍以上函数。

esp_err_t **esp_vfs_fat_register**(const char *base_path, const char *fat_drive, size_t max_files, FATFS **out_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, fat_drive argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for f_mount call.

备注： This function doesn’t mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

参数

- **base_path** –path prefix where FATFS should be registered
- **fat_drive** –FATFS drive specification; if only one drive is used, can be an empty string
- **max_files** –maximum number of files which can be open at the same time
- **out_fs** –**[out]** pointer to FATFS structure which can be used for FATFS f_mount call is returned via this argument.

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_register was already called
- ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

esp_err_t **esp_vfs_fat_unregister_path**(const char *base_path)

Un-register FATFS from VFS.

备注: FATFS structure returned by esp_vfs_fat_register is destroyed after this call. Make sure to call f_mount function to unmount it before calling esp_vfs_fat_unregister_ctx. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

---

参数 **base_path** –path prefix where FATFS is registered. This is the same used when esp_vfs_fat_register was called

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

FatFs 与 VFS 和 SD 卡配合使用

头文件 fatfs/vfs/esp_vfs_fat.h 定义了便捷函数*esp_vfs_fat_sdmmc_mount()*、*esp_vfs_fat_sdspi_mount()* 和*esp_vfs_fat_sdcard_unmount()*。这些函数分别执行上一章节的步骤 1-3 和步骤 7-9，并初始化 SD 卡，但仅提供有限的错误处理功能。我们鼓励开发人员查看源代码，将更多高级功能集成到产品应用中。

便捷函数*esp_vfs_fat_sdmmc_unmount()* 用于卸载文件系统并释放从*esp_vfs_fat_sdmmc_mount()* 函数获取的资源。

esp_err_t **esp_vfs_fat_sdmmc_mount**(const char *base_path, const *sdmmc_host_t* *host_config, const void *slot_config, const *esp_vfs_fat_mount_config_t* *mount_config, *sdmmc_card_t* **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in host_config
- initializes SD card with configuration in slot_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

备注: Use this API to mount a card through SDSPI is deprecated. Please call `esp_vfs_fat_sdspi_mount()` instead for that case.

参数

- **base_path** –path where partition should be registered (e.g. “/sdcard”)
- **host_config** –Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SDSPI_HOST_DEFAULT() macro.
- **slot_config** –Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to sdmmc_slot_config_t structure initialized using SDMMC_SLOT_CONFIG_DEFAULT.
- **mount_config** –pointer to structure with extra parameters for mounting FATFS
- **out_card** –**[out]** if not NULL, pointer to the card information structure will be returned via this argument

返回

- ESP_OK on success

- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

esp_err_t **esp_vfs_fat_sdmmc_unmount**(void)

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount.

Deprecated:

Use `esp_vfs_fat_sdcard_unmount()` instead.

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn't been called

esp_err_t **esp_vfs_fat_sdspi_mount**(const char *base_path, const *sdmmc_host_t* *host_config_input, const *sdspi_device_config_t* *slot_config, const *esp_vfs_fat_mount_config_t* *mount_config, *sdmmc_card_t* **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in slot_config, and attach it to an initialized SPI bus.
- initializes SD card with configuration in host_config_input
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

备注: This function try to attach the new SD SPI device to the bus specified in host_config. Make sure the SPI bus specified in `host_config->slot` have been initialized by `spi_bus_initialize()` before.

参数

- **base_path** –path where partition should be registered (e.g. "/sdcard")
- **host_config_input** –Pointer to structure describing SDMMC host. This structure can be initialized using SDSPI_HOST_DEFAULT() macro.
- **slot_config** –Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to *sdspi_device_config_t* structure initialized using SDSPI_DEVICE_CONFIG_DEFAULT().
- **mount_config** –pointer to structure with extra parameters for mounting FATFS
- **out_card** –**[out]** If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it's not suggested to use more than one card at the same time and unmount one of them in your application.

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

struct **esp_vfs_fat_mount_config_t**

Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount_rw_wl functions.

Public Members

bool **format_if_mount_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int **max_files**

Max number of open files.

size_t **allocation_unit_size**

If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear_levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

bool **disk_status_check_enable**

Enables real ff_disk_status function implementation for SD cards (ff_sdmmc_status). Possibly slows down IO performance.

Try to enable if you need to handle situations when SD cards are not unmounted properly before physical removal or you are experiencing issues with SD cards.

Doesn't do anything for other memory storage media.

esp_err_t **esp_vfs_fat_sdcard_unmount**(const char *base_path, *sdmmc_card_t* *card)

Unmount an SD card from the FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount()` or `esp_vfs_fat_sdspi_mount()`

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the card argument is unregistered
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn't been called

FatFs 与 VFS 配合使用（只读模式下）

头文件 fatfs/vfs/esp_vfs_fat.h 也定义了两个便捷函数*esp_vfs_fat_spiflash_mount_ro()*和*esp_vfs_fat_spiflash_unmount_ro()*。上述两个函数分别对 FAT 只读分区执行步骤 1-3 和步骤 7-9。有些数据分区仅在工厂配置时写入一次，之后在整个硬件生命周期内都不会再有任何改动。利用上述两个函数处理这种数据分区非常方便。

esp_err_t **esp_vfs_fat_spiflash_mount_ro**(const char *base_path, const char *partition_label, const *esp_vfs_fat_mount_config_t* *mount_config)

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library

- registers FATFS library with VFS, with prefix given by base_prefix variable

备注： Wear levelling is not used when FAT is mounted in read-only mode using this function.

参数

- **base_path** –path where FATFS partition should be mounted (e.g. “/spiflash”)
- **partition_label** –label of the partition which should be used
- **mount_config** –pointer to structure with extra parameters for mounting FATFS

返回

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_ro was already called for the same partition
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

esp_err_t **esp_vfs_fat_spiflash_unmount_ro**(const char *base_path, const char *partition_label)

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_ro.

参数

- **base_path** –path where partition should be registered (e.g. “/spiflash”)
- **partition_label** –label of partition to be unmounted

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl hasn’t been called

FatFs 磁盘 I/O 层

我们对 FatFs API 函数进行了扩展，实现了运行期间注册磁盘 I/O 驱动。

上述 API 为 SD/MMC 卡提供了磁盘 I/O 函数实现方式，可使用 `ff_diskio_register_sdmmc()` 函数注册指定的 FatFs 驱动编号。

void **ff_diskio_register**(BYTE pdrv, const *ff_diskio_impl_t* *discio_impl)

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in discio_impl for given pdrv will be called.

参数

- **pdrv** –drive number
- **discio_impl** –pointer to *ff_diskio_impl_t* structure with diskio functions or NULL to unregister and free previously registered drive

struct **ff_diskio_impl_t**

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

Public Members

DSTATUS (***init**)(unsigned char pdrv)

disk initialization function

DSTATUS (***status**)(unsigned char pdrv)

disk status check function

DRESULT (***read**)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)

sector read function

DRESULT (***write**)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)

sector write function

DRESULT (***ioctl**)(unsigned char pdrv, unsigned char cmd, void *buff)

function to get info about disk and do some misc operations

void **ff_diskio_register_sdmmc**(unsigned char pdrv, *sdmmc_card_t* *card)

Register SD/MMC diskio driver

参数

- **pdrv** –drive number
- **card** –pointer to *sdmmc_card_t* structure describing a card; card should be initialized before calling f_mount.

esp_err_t **ff_diskio_register_wl_partition**(unsigned char pdrv, *wl_handle_t* flash_handle)

Register spi flash partition

参数

- **pdrv** –drive number
- **flash_handle** –handle of the wear levelling partition.

esp_err_t **ff_diskio_register_raw_partition**(unsigned char pdrv, const *esp_partition_t* *part_handle)

Register spi flash partition

参数

- **pdrv** –drive number
- **part_handle** –pointer to raw flash partition.

FatFs 分区生成器

我们为 FatFs (wl_fatfsgen.py) 提供了分区生成器，该生成器集成在构建系统中，方便用户在自己的项目中使用。

该生成器可以在主机上创建文件系统镜像，并用指定的主机文件夹内容对其进行填充。

该脚本是建立在分区生成器的基础上 (fatfsgen.py)，目前除了可以生成分区外，也可以初始化磨损均衡。

目前的最新版本支持短文件名、长文件名、FAT12 和 FAT16。长文件名的上限是 255 个字符，文件名中可以包含多个 . 字符以及其他字符，如 +、,、;、=、[and] 等。

构建系统中使用 FatFs 分区生成器 通过调用 `fatfs_create_partition_image` 可以直接从 CMake 构建系统中调用 FatFs 分区生成器:

```
fatfs_create_spiflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

如果不希望在生成分区时使用磨损均衡，可以使用 `fatfs_create_rawflash_image`:

```
fatfs_create_rawflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

`fatfs_create_spiflash_image` 以及 `fatfs_create_rawflash_image` 必须从项目的 CMakeLists.txt 中调用。

如果您决定使用 `fatfs_create_rawflash_image`（不支持磨损均衡），请注意它仅支持在设备中以只读模式安装。

该函数的参数如下：

1. partition - 分区的名称，需要在分区表中定义（如 storage/fatfsgen/partitions_example.csv）。
2. base_dir - 目录名称，该目录会被编码为 FatFs 分区，也可以选择将其被烧录进设备。但注意必须在分区表中指定合适的分区大小。
3. `FLASH_IN_PROJECT` 标志 - 用户可以通过指定 `FLASH_IN_PROJECT`，选择在执行 `idf.py flash -p <PORT>` 时让分区镜像自动与应用程序二进制文件、分区表等一同烧录进设备。

例如:

```
fatfs_create_partition_image(my_fatfs_partition my_folder FLASH_IN_PROJECT)
```

没有指定 FLASH_IN_PROJECT 时也可以生成分区镜像，但是用户需要使用 `esptool.py` 或自定义的构建系统目标对其手动烧录。

相关示例请查看 storage/fatfsgen。

FatFs 分区分析器

我们为 FatFs 提供分区分析器 (fatfsparse.py)。

该分析器为 FatFs 分区生成器 (fatfsgen.py) 的逆向工具，可以根据 FatFs 镜像在主机上生成文件夹结构。

您可以使用:

```
./fatfsparse.py [-h] [--long-name-support] fatfs_image.img
```

2.9.2 量产程序

介绍

这一程序主要用于量产时为每一设备创建工厂 NVS（非易失性存储器）分区镜像。NVS 分区镜像由 CSV（逗号分隔值）文件生成，文件中包含了用户提供的配置项及配置值。

注意，该程序仅创建用于量产的二进制镜像，您需要使用以下工具将镜像烧录到设备上：

- esptool.py
- Flash 下载工具（仅适用于 Windows）。下载后解压，然后按照 doc 文件夹中的说明操作。
- 使用定制的生产工具直接烧录程序

准备工作

该程序依赖于 esp-idf 的 NVS 分区程序

- **操作系统要求：**
  - Linux、MacOS 或 Windows（标准版）
- **安装依赖包：**
  - Python

备注:

使用该程序之前，请确保：

- Python 路径已添加到 PATH 环境变量中；
- 已经安装 *requirement.txt* 中的软件包，*requirement.txt* 在 esp-idf 根目录下。

具体流程

CSV 配置文件

CSV 配置文件中包含设备待烧录的配置信息，定义了待烧录的配置项。

配置文件中数据格式如下（*REPEAT* 标签可选）：

```
name1,namespace,     <-- 第一个条目应该为 "namespace" 类型
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

备注： 文件第一行应始终为 `namespace` 条目。

每行应包含三个参数：`key`、`type` 和 `encoding`，并以逗号分隔。如果有 `REPEAT` 标签，则主 CSV 文件中所有设备此键值均相同。

有关各个参数的详细说明，请参阅 *NVS 分区生成程序的 README 文件*。

CSV 配置文件示例如下:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

备注:

请确保：

- 逗号‘,’前后无空格；
- CSV 文件每行末尾无空格。

主 CSV 文件

主 CSV 文件中包含设备待烧录的详细信息，文件中每行均对应一个设备实体。

主 CSV 文件的数据格式如下:

```
key1,key2,key3,.....
value1,value2,value3,....
```

备注： 文件中键 (key) 名应始终置于文件首行。从配置文件中获取的键，在此文件中的排列顺序应与其在配置文件中的排列顺序相同。主 CSV 文件同时可以包含其它列（键），这些列将被视为元数据，而不会编译进最终二进制文件。

每行应包含相应键的键值 (value)，并用逗号隔开。如果某键带有 REPEAT 标签，则仅需在第二行（即第一个条目）输入对应的值，后面其他行为空。

参数描述如下：

value Data value

value 是与键对应的键值。

主 CSV 文件示例如下:

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6feeff,,103
```

备注： 如果出现 *REPEAT* 标签，则会在相同目录下生成一个新的主 CSV 文件用作主输入文件，并在每行为带有 *REPEAT* 标签的键插入键值。

量产程序还会创建中间 CSV 文件，NVS 分区程序将使用此 CSV 文件作为输入，然后生成二进制文件。

中间 CSV 文件的格式如下:

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

此步骤将为每一设备生成一个中间 CSV 文件。

运行量产程序

使用方法:

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

可选参数:

序号	参数	描述
1	-h, –help	显示帮助信息并退出

命令:

运行 mfg_gen.py {command} -h 查看更多帮助信息

序号	参数	描述
1	generate	生成 NVS 分区
2	generate-key	生成加密密钥

为每个设备生成工厂镜像（默认）

使用方法:

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
                           [--keyfile KEYFILE] [--inputkey INPUTKEY]
                           [--outdir OUTDIR]
                           conf values prefix size
```

位置参数:

参数	描述
conf	待解析的 CSV 配置文件路径
values	待解析的主 CSV 文件路径
prefix	每个输出文件名前缀的唯一名称
size	NVS 分区大小（以字节为单位，且为 4096 的整数倍）

可选参数:

参数	描述
-h, –help	显示帮助信息并退出
–fileid FILEID	每个文件名后缀的唯一文件标识符（主 CSV 文件中的任意键），默认为数值 1、2、3…
–version {1,2}	• 设置多页 Blob 版本。 • 版本 1 - 禁用多页 Blob； • 版本 2 - 启用多页 Blob； • 默认版本：版本 2
–keygen	生成 NVS 分区加密密钥
–inputkey INPUTKEY	内含 NVS 分区加密密钥的文件
–outdir OUTDIR	输出目录，用于存储创建的文件（默认当前目录）

请运行以下命令为每个设备生成工厂镜像，量产程序同时提供了一个 CSV 示例文件:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000
```

主 CSV 文件应在 `file` 类型下设置一个相对路径，相对于运行该程序的当前目录。

为每个设备生成工厂加密镜像

运行以下命令为每一设备生成工厂加密镜像，量产程序同时提供了一个 CSV 示例文件。

- 通过量产程序生成加密密钥来进行加密:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --keygen
```

备注: 创建的加密密钥格式为 `<outdir>/keys/keys-<prefix>-<fileid>.bin`。加密密钥存储于新建文件的 `keys/` 目录下，与 NVS 密钥分区结构兼容。更多信息请参考*NVS 密钥分区*。

- 提供加密密钥用作二进制输入文件来进行加密:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

仅生成加密密钥

使用方法:

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

可选参数：

参数	描述
-h, --help	显示帮助信息并退出
--keyfile KEYFILE	加密密钥文件的输出路径
--outdir OUTDIR	输出目录，用于存储创建的文件（默认当前目录）

运行以下命令仅生成加密密钥:

```
python mfg_gen.py generate-key
```

备注： 创建的加密密钥格式为 `<outdir>/keys/keys-<timestamp>.bin`。时间戳格式为: `%m-%d_%H-%M`。如需自定义目标文件名，请使用–keyfile 参数。

生成的加密密钥二进制文件还可以用于为每个设备的工厂镜像加密。

`fileid` 参数的默认值为 1、2、3…，与主 CSV 文件中的行一一对应，内含设备配置值。

运行量产程序时，将在指定的 `outdir` 目录下创建以下文件夹:

- `bin/` 存储生成的二进制文件
- `csv/` 存储生成的中间 CSV 文件
- `keys/` 存储加密密钥（创建工厂加密镜像时会用到）

2.9.3 非易失性存储库

简介

非易失性存储 (NVS) 库主要用于在 flash 中存储键值格式的数据。本文档将详细介绍 NVS 常用的一些概念。

底层存储 NVS 库通过调用*esp_partition* API 使用主 flash 的部分空间，即类型为 `data` 且子类型为 `nvs` 的所有分区。应用程序可调用*`nvs_open()`* API 选择使用带有 `nvs` 标签的分区，也可以通过调用*`nvs_open_from_partition()`* API 选择使用指定名称的任意分区。

NVS 库后续版本可能会增加其他存储器后端，来将数据保存至其他 flash 芯片（SPI 或 I2C 接口）、RTC 或 FRAM 中。

备注： 如果 NVS 分区被截断（例如，更改分区表布局时），则应擦除分区内容。可以使用 ESP-IDF 构建系统中的 `idf.py erase-flash` 命令擦除 flash 上的所有内容。

备注： NVS 最适合存储一些较小的数据，而非字符串或二进制大对象 (BLOB) 等较大的数据。如需存储较大的 BLOB 或者字符串，请考虑使用基于磨损均衡库的 FAT 文件系统。

键值对 NVS 的操作对象为键值对，其中键是 ASCII 字符串，当前支持的最大键长为 15 个字符。值可以为以下几种类型:

- 整数型: `uint8_t`、`int8_t`、`uint16_t`、`int16_t`、`uint32_t`、`int32_t`、`uint64_t` 和 `int64_t`;
- 以 0 结尾的字符串;
- 可变长度的二进制数据 (BLOB)

备注： 字符串值当前上限为 4000 字节，其中包括空终止符。BLOB 值上限为 508,000 字节或分区大小的 97.6% 减去 4000 字节，以较低值为准。

后续可能会增加对 `float` 和 `double` 等其他类型数据的支持。

键必须唯一。为现有的键写入新的值可能产生如下结果：

- 如果新旧值数据类型相同，则更新值；
- 如果新旧值数据类型不同，则返回错误。

读取值时也会执行数据类型检查。如果读取操作的数据类型与该值的数据类型不匹配，则返回错误。

命名空间 为了减少不同组件之间键名的潜在冲突，NVS 将每个键值对分配给一个命名空间。命名空间的命名规则遵循键名的命名规则，例如，最多可占 15 个字符。命名空间的名称在调用 *`nvs_open()`* 或 *`nvs_open_from_partition`* 中指定，调用后将返回一个不透明句柄，用于后续调用 `nvs_get_*`、`nvs_set_*` 和 `nvs_commit` 函数。这样，一个句柄关联一个命名空间，键名便不会与其他命名空间中相同键名冲突。请注意，不同 NVS 分区中具有相同名称的命名空间将被视为不同的命名空间。

NVS 迭代器 迭代器允许根据指定的分区名称、命名空间和数据类型轮询 NVS 中存储的键值对。

您可以使用以下函数，执行相关操作：

- `nvs_entry_find`：创建一个不透明句柄，用于后续调用 `nvs_entry_next` 和 `nvs_entry_info` 函数；
- `nvs_entry_next`：让迭代器指向下一个键值对；
- `nvs_entry_info`：返回每个键值对的信息。

总的来说，所有通过 *`nvs_entry_find()`* 获得的迭代器（包括 `NULL` 迭代器）都必须使用 *`nvs_release_iterator()`* 释放。一般情况下，*`nvs_entry_find()`* 和 *`nvs_entry_next()`* 会将给定的迭代器设置为 `NULL` 或为一个有效的迭代器。但如果出现参数错误（如返回 `ESP_ERR_NVS_NOT_FOUND`），给定的迭代器不会被修改。因此，在调用 *`nvs_entry_find()`* 之前最好将迭代器初始化为 `NULL`，这样可以避免在释放迭代器之前进行复杂的错误检查。

安全性、篡改性及鲁棒性 NVS 与 ESP32-C3 flash 加密系统不直接兼容。但如果 NVS 加密与 ESP32-C3 flash 加密一起使用时，数据仍可以加密形式存储。详情请参阅 *NVS 加密*。

如果未启用 NVS 加密，任何对 flash 芯片有物理访问权限的用户都可以修改、擦除或添加键值对。NVS 加密启用后，如果不知道相应的 NVS 加密密钥，则无法修改或添加键值对并将其识别为有效键值对。但是，针对擦除操作没有相应的防篡改功能。

当 flash 处于不一致状态时，NVS 库会尝试恢复。在任何时间点关闭设备电源，然后重新打开电源，不会导致数据丢失；但如果关闭设备电源时正在写入新的键值对，这一键值对可能会丢失。该库还应该能够在 flash 中存在任何随机数据的情况下正常初始化。

NVS 加密

NVS 分区内存储的数据可使用 AES-XTS 进行加密，类似于 IEEE P1619 磁盘加密标准中提到的加密方式。为了实现加密，每个条目被均视为一个扇区，并将条目相对地址（相对于分区开头）传递给加密算法，用作扇区号。可通过 *CONFIG_NVS_ENCRYPTION* 启用 NVS 加密。NVS 加密所需的密钥存储于其他分区，并且被 *Flash 加密* 保护。因此，在使用 NVS 加密前应先启用 *Flash 加密*。

启用 *Flash 加密* 时，默认启用 NVS 加密。这是因为 Wi-Fi 驱动在默认的 NVS 分区中存储了凭证（如 SSID 和密码）。如已启用平台级加密，那么同时默认启用 NVS 加密有其必要性。

使用 NVS 加密，分区表必须包含 *NVS 密钥分区*。在分区表选项 (menuconfig->Partition Table) 下，为 NVS 加密提供了两个包含 *NVS 密钥分区* 的分区表，您可以通过工程配置菜单 (`idf.py menuconfig`) 进行选择。请参考 security/flash_encryption 中的例子，了解如何配置和使用 NVS 加密功能。

NVS 密钥分区

应用程序如果想使用 NVS 加密，则需要编译进一个类型为 *data*，子类型为 *key* 的密钥分区。该分区应标记为 已加密且最小为 4096 字节。如需了解更多详细信息，请参考分区表。在分区表选项 (menuconfig->Partition Table) 下提供了两个包含*NVS 密钥分区* 的额外分区表，可以直接用于*NVS 加密*。这些分区的具体结构见下表：

```
+-----------+-------------+-------------+----+
|               XTS encryption key (32)        |
+----------------------------------------------+
|               XTS tweak key (32)             |
+----------------------------------------------+
|                   CRC32 (4)                  |
+----------------------------------------------+
```

可以通过以下两种方式生成*NVS 密钥分区* 中的 XTS 加密密钥：

1. 在 ESP 芯片上生成密钥：
   启用 NVS 加密时，可用`nvs_flash_init()` API 函数来初始化加密的默认 NVS 分区，在内部生成 ESP 芯片上的 XTS 加密密钥。在找到*NVS 密钥分区* 后，API 函数利用 nvs_flash/include/nvs_flash.h 提供的`nvs_flash_generate_keys()` 函数，自动生成并存储该分区中的 NVS 密钥。只有当各自的密钥分区为空时，才会生成并存储新的密钥。可以借助`nvs_flash_secure_init_partition()` 用同一个密钥分区来读取安全配置，以初始化一个定制的加密 NVS 分区。
   API 函数`nvs_flash_secure_init()` 和`nvs_flash_secure_init_partition()` 不在内部产生密钥。当这些 API 函数用于初始化加密的 NVS 分区时，可以在启动后使用 *nvs_flash.h* 提供的`nvs_flash_generate_keys()` API 函数生成密钥，以加密的形式把密钥写到密钥分区上。
2. 使用预先生成的密钥分区：
   若*NVS 密钥分区* 中的密钥不是由应用程序生成，则需要使用预先生成的密钥分区。可以使用*NVS 分区生成工具* 生成包含 XTS 加密密钥的*NVS 密钥分区*。用户可以借助以下两个命令，将预先生成的密钥分区储存在 flash 上：
   i) 建立并烧录分区表

   ```
   idf.py partition-table partition-table-flash
   ```

   ii) 调用 parttool.py，将密钥存储在 flash 上的*NVS 密钥分区* 中。详见:doc:‘ 分区表 </api-guides/partition-tables>‘ 的分区工具部分。

   ```
   parttool.py --port PORT --partition-table-offset PARTITION_TABLE_
   ↪OFFSET write_partition --partition-name="name of nvs_key partition" -
   ↪-input NVS_KEY_PARTITION_FILE
   ```

   备注： 如需在设备处于 flash 加密开发模式时更新 NVS 密钥分区，请调用 parttool.py 对 NVS 密钥分区进行加密。同时，由于设备上的分区表也已加密，您还需要在构建目录（build/partition_table）中提供一个指向未加密分区表的指针。您可以使用如下命令：

   ```
   parttool.py --esptool-write-args encrypt --port PORT --partition-table-
   ↪file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE_
   ↪OFFSET write_partition --partition-name="name of nvs_key partition" -
   ↪-input NVS_KEY_PARTITION_FILE
   ```

由于分区已标记为 已加密，而且启用了*Flash 加密*，引导程序在首次启动时将使用 flash 加密对密钥分区进行加密。

应用程序可以使用不同的密钥对不同的 NVS 分区进行加密，这样就会需要多个加密密钥分区。应用程序应为加解密操作提供正确的密钥或密钥分区。

加密读取/写入 `nvs_get_*` 和 `nvs_set_*` 等 NVS API 函数同样可以对 NVS 加密分区执行读写操作。

加密默认的 NVS 分区： 无需额外步骤即可启用默认 NVS 分区的加密。启用*CONFIG_NVS_ENCRYPTION* 时，*nvs_flash_init()* API 函数会在内部使用找到的第一个*NVS 密钥分区* 执行额外步骤，以启用默认 NVS 分区的加密（详情请参考 API 文档）。另外，*nvs_flash_secure_init()* API 函数也可以用来启用默认 NVS 分区的加密。

加密一个自定义的 NVS 分区： 使用*nvs_flash_secure_init_partition()* API 函数启用自定义 NVS 分区的加密，而非*nvs_flash_init_partition()*。

使用*nvs_flash_secure_init()* 和*nvs_flash_secure_init_partition()* API 函数时，应用程序如需在加密状态下执行 NVS 读写操作，应遵循以下步骤：

1. 使用 esp_partition_find* API 查找密钥分区和 NVS 数据分区；
2. 使用 nvs_flash_read_security_cfg 或 nvs_flash_generate_keys API 填充 nvs_sec_cfg_t 结构；
3. 使用 nvs_flash_secure_init 或 nvs_flash_secure_init_partition API 初始化 NVS flash 分区；
4. 使用 nvs_open 或 nvs_open_from_partition API 打开命名空间；
5. 使用 nvs_get_* 或 nvs_set_* API 执行 NVS 读取/写入操作；
6. 使用 nvs_flash_deinit API 释放已初始化的 NVS 分区。

NVS 分区生成程序

NVS 分区生成程序帮助生成 NVS 分区二进制文件，可使用烧录程序将二进制文件单独烧录至特定分区。烧录至分区上的键值对由 CSV 文件提供，详情请参考*NVS 分区生成程序*。

应用示例

ESP-IDF storage 目录下提供了数个代码示例：

storage/nvs_rw_value

演示如何读取及写入 NVS 单个整数值。

此示例中的值表示 ESP32-C3 模组重启次数。NVS 中数据不会因为模组重启而丢失，因此只有将这一值存储于 NVS 中，才能起到重启次数计数器的作用。

该示例也演示了如何检测读取/写入操作是否成功，以及某个特定值是否在 NVS 中尚未初始化。诊断程序以纯文本形式提供，帮助您追踪程序流程，及时发现问题。

storage/nvs_rw_blob

演示如何读取及写入 NVS 单个整数值和 BLOB（二进制大对象），并在 NVS 中存储这一数值，即便 ESP32-C3 模组重启也不会消失。

- value - 记录 ESP32-C3 模组软重启次数和硬重启次数。
- blob - 内含记录模组运行次数的表格。此表格将被从 NVS 读取至动态分配的 RAM 上。每次手动软重启后，表格内运行次数即增加一次，新加的运行次数被写入 NVS。下拉 GPIO0 即可手动软重启。

该示例也演示了如何执行诊断程序以检测读取/写入操作是否成功。

storage/nvs_rw_value_cxx

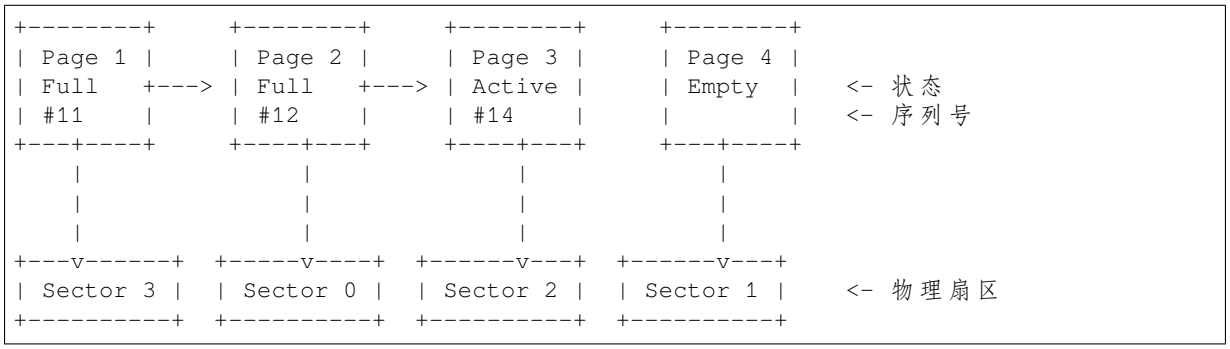
这个例子与 storage/nvs_rw_value 完全一样，只是使用了 C++ 的 NVS 句柄类。

内部实现

键值对日志 NVS 按顺序存储键值对，新的键值对添加在最后。因此，如需更新某一键值对，实际是在日志最后增加一对新的键值对，同时将旧的键值对标记为已擦除。

页面和条目 NVS 库在其操作中主要使用两个实体：页面和条目。页面是一个逻辑结构，用于存储部分的整体日志。逻辑页面对应 flash 的一个物理扇区，正在使用中的页面具有与之相关联的 序列号。序列号赋予了页面顺序，较高的序列号对应较晚创建的页面。页面有以下几种状态：

空或未初始化 页面对应的 flash 扇区为空白状态（所有字节均为 `0xff`）。此时，页面未存储任何数据且没有关联的序列号。

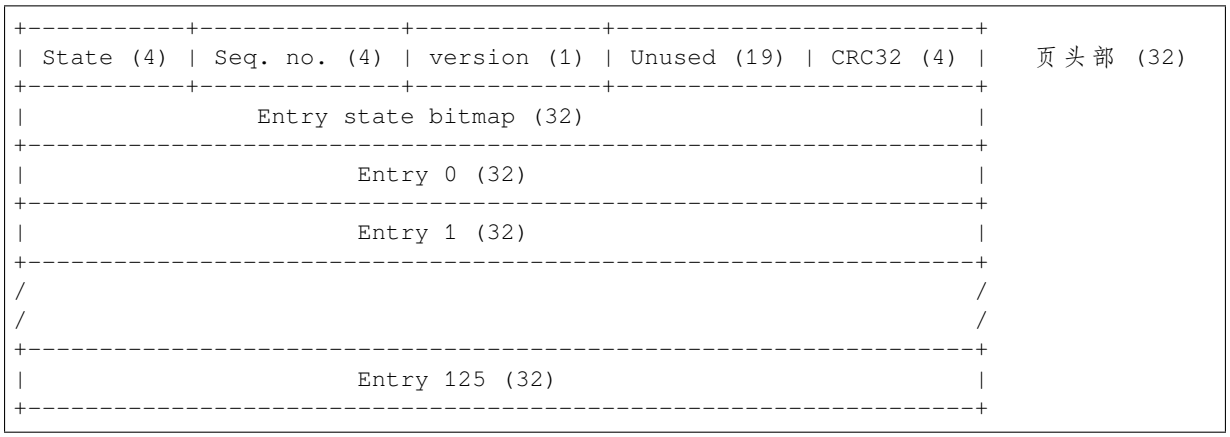


活跃状态 此时 flash 已完成初始化，页头部写入 flash，页面已具备有效序列号。页面中存在一些空条目，可写入数据。任意时刻，至多有一个页面处于活跃状态。

写满状态 Flash 已写满键值对，状态不再改变。用户无法向写满状态下的页面写入新键值对，但仍可将一些键值对标记为已擦除。

擦除状态 未擦除的键值对将移至其他页面，以便擦除当前页面。这一状态仅为暂时性状态，即 API 调用返回时，页面应脱离这一状态。如果设备突然断电，下次开机时，设备将继续把未擦除的键值对移至其他页面，并继续擦除当前页面。

损坏状态 页头部包含无效数据，无法进一步解析该页面中的数据，因此之前写入该页面的所有条目均无法访问。相应的 flash 扇区并不会被立即擦除，而是与其他处于未初始化状态的扇区一起等待后续使用。这一状态可能对调试有用。



Flash 扇区映射至逻辑页面并没有特定的顺序，NVS 库会检查存储在 flash 扇区的页面序列号，并根据序列号组织页面。

页面结构 当前，我们假设 flash 扇区大小为 4096 字节，并且 ESP32-C3 flash 加密硬件在 32 字节块上运行。未来有可能引入一些编译时可配置项（可通过 menuconfig 进行配置），以适配具有不同扇区大小的 flash 芯片。但目前尚不清楚 SPI flash 驱动和 SPI flash cache 之类的系统组件是否支持其他扇区大小。

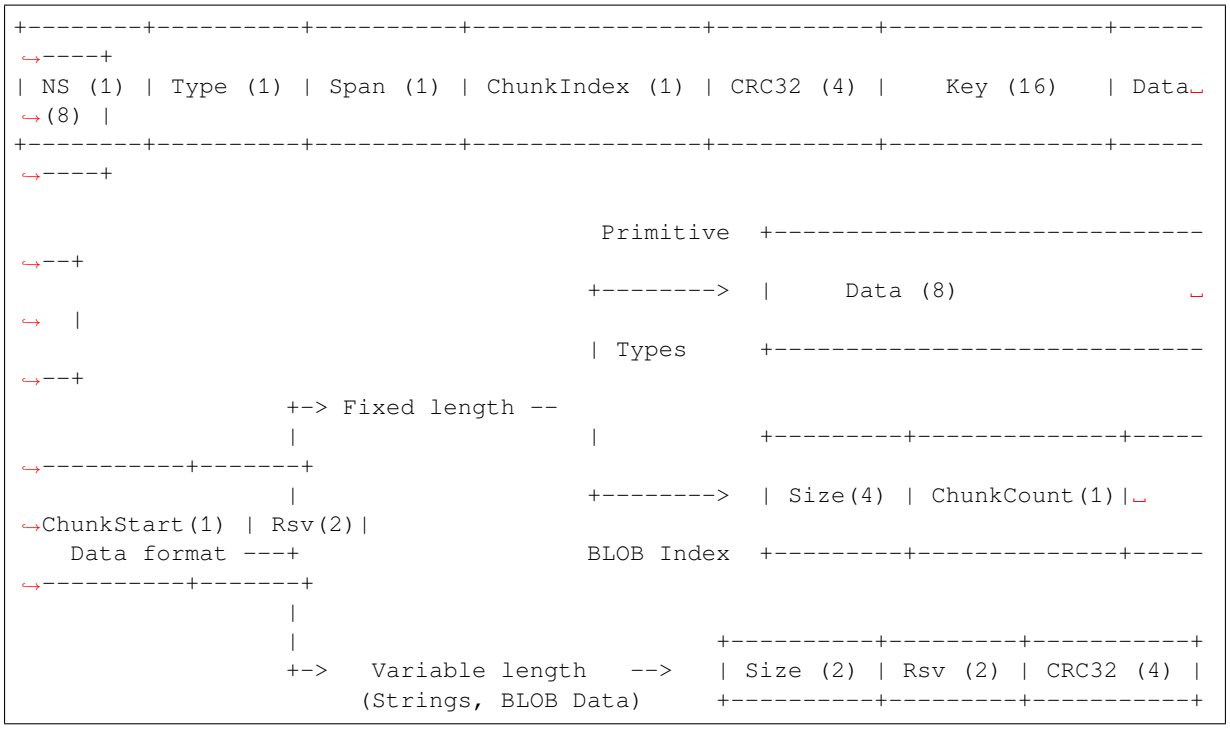
页面由头部、条目状态位图和条目三部分组成。为了实现与 ESP32-C3 flash 加密功能兼容，条目大小设置为 32 字节。如果键值为整数型，条目则保存一个键值对；如果键值为字符串或 BLOB 类型，则条目仅保存一个键值对的部分内容（更多信息详见条目结构描述）。

页面结构如下图所示，括号内数字表示该部分的大小（以字节为单位）。

头部和条目状态位图写入 flash 时不加密。如果启用了 ESP32-C3 flash 加密功能，则条目写入 flash 时将会加密。

通过将 0 写入某些位可以定义页面状态值，表示状态改变。因此，如果需要变更页面状态，并不一定要擦除页面，除非要将其变更为 擦除状态。

头部中的 `version` 字段反映了所用的 NVS 格式版本。为实现向后兼容，版本升级从 0xff 开始依次递减（例如，version-1 为 0xff，version-2 为 0xfe，以此类推）。



头部中 CRC32 值是由不包含状态值的条目计算所得（4 到 28 字节）。当前未使用的条目用 `0xff` 字节填充。

条目结构和条目状态位图的详细信息见下文描述。

条目和条目状态位图 每个条目可处于以下三种状态之一，每个状态在条目状态位图中用两位表示。位图中的最后四位 (256 - 2 * 126) 未使用。

空 (2’b11) 条目还未写入任何内容，处于未初始化状态（全部字节为 `0xff`）。
写入（2’b10） 一个键值对（或跨多个条目的键值对的部分内容）已写入条目中。
擦除（2’b00） 条目中的键值对已丢弃，条目内容不再解析。

条目结构 如果键值类型为基础类型，即 1 - 8 个字节长度的整数型，条目将保存一个键值对；如果键值类型为字符串或 BLOB 类型，条目将保存整个键值对的部分内容。另外，如果键值为字符串类型且跨多个条目，则键值所跨的所有条目均保存在同一页面。BLOB 则可以切分为多个块，实现跨多个页面。BLOB 索引是一个附加的固定长度元数据条目，用于追踪 BLOB 块。目前条目仍支持早期 BLOB 格式（可读取可修改），但这些 BLOB 一经修改，即以新格式储存至条目。

条目结构中各个字段含义如下：

命名空间 (NS, NameSpace) 该条目的命名空间索引，详细信息参见命名空间实现章节。
类型 (Type) 一个字节表示的值的数据类型，nvs_flash/include/nvs_handle.hpp 下的 `ItemType` 枚举了可能的类型。
跨度 (Span) 该键值对所用的条目数量。如果键值为整数型，条目数量即为 1。如果键值为字符串或 BLOB，则条目数量取决于值的长度。
块索引 (ChunkIndex) 用于存储 BLOB 类型数据块的索引。如果键值为其他数据类型，则此处索引应写入 `0xff`。
CRC32 对条目下所有字节进行校验后，所得的校验和（CRC32 字段不计算在内）。
键 (Key) 即以零结尾的 ASCII 字符串，字符串最长为 15 字节，不包含最后一个字节的零终止符。
数据 (Data) 如果键值类型为整数型，则数据字段仅包含键值。如果键值小于八个字节，使用 `0xff` 填充未使用的部分（右侧）。
如果键值类型为 BLOB 索引条目，则该字段的八个字节将保存以下数据块信息：

- **块大小** 整个 BLOB 数据的大小（以字节为单位）。该字段仅用于 BLOB 索引类型条目。

- **ChunkCount** 存储过程中 BLOB 分成的数据块总量。该字段仅用于 BLOB 索引类型条目。
- **ChunkStart** BLOB 第一个数据块的块索引，后续数据块索引依次递增，步长为 1。该字段仅用于 BLOB 索引类型条目。

如果键值类型为字符串或 BLOB 数据块，数据字段的这八个字节将保存该键值的一些附加信息，如下所示：

- **数据大小** 实际数据的大小（以字节为单位）。如果键值类型为字符串，此字段也应将零终止符包含在内。此字段仅用于字符串和 BLOB 类型条目。
- **CRC32** 数据所有字节的校验和，该字段仅用于字符串和 BLOB 类型条目。

可变长度值（字符串和 BLOB）写入后续条目，每个条目 32 字节。第一个条目的 *Span* 字段将指明使用了多少条目。

命名空间 如上所述，每个键值对属于一个命名空间。命名空间标识符（字符串）也作为键值对的键，存储在索引为 0 的命名空间中。与这些键对应的值就是这些命名空间的索引。

```
+-----------------------------------------+
| NS=0 Type=uint8_t Key="wifi" Value=1    |   Entry describing namespace "wifi"
+-----------------------------------------+
| NS=1 Type=uint32_t Key="channel" Value=6  |   Key "channel" in namespace "wifi"
+-----------------------------------------+
| NS=0 Type=uint8_t Key="pwm" Value=2     |   Entry describing namespace "pwm"
+-----------------------------------------+
| NS=2 Type=uint16_t Key="channel" Value=20 |   Key "channel" in namespace "pwm"
+-----------------------------------------+
```

条目哈希列表 为了减少对 flash 执行的读操作次数，Page 类对象均设有一个列表，包含一对数据：条目索引和条目哈希值。该列表可大大提高检索速度，而无需迭代所有条目并逐个从 flash 中读取。`Page::findItem` 首先从哈希列表中检索条目哈希值，如果条目存在，则在页面内给出条目索引。由于哈希冲突，在哈希列表中检索条目哈希值可能会得到不同的条目，对 flash 中条目再次迭代可解决这一冲突。

哈希列表中每个节点均包含一个 24 位哈希值和 8 位条目索引。哈希值根据条目命名空间、键名和块索引由 CRC32 计算所得，计算结果保留 24 位。为减少将 32 位条目存储在链表中的开销，链表采用了数组的双向链表。每个数组占用 128 个字节，包含 29 个条目、两个链表指针和一个 32 位计数字段。因此，每页额外需要的 RAM 最少为 128 字节，最多为 640 字节。

API 参考

Header File

- components/nvs_flash/include/nvs_flash.h

Functions

esp_err_t **nvs_flash_init** (void)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

a. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)
b. If the NVS key partiton obtained in the previous step is empty, generate and store new keys in that NVS key partiton.
c. Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

返回

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs_flash_read_security_cfg API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_generate_keys API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_secure_init_partition API (when “NVS_ENCRYPTION” is enabled) .

esp_err_t **nvs_flash_init_partition**(const char *partition_label)

Initialize NVS flash storage for the specified partition.

参数 **partition_label** –**[in]** Label of the partition. Must be no longer than 16 characters.

返回

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_init_partition_ptr**(const *esp_partition_t* *partition)

Initialize NVS flash storage for the partition specified by partition pointer.

参数 **partition** –**[in]** pointer to a partition obtained by the ESP partition API.

返回

- ESP_OK if storage was successfully initialized
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_INVALID_ARG in case partition is NULL
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_deinit**(void)

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

返回

- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

esp_err_t **nvs_flash_deinit_partition**(const char *partition_label)

Deinitialize NVS storage for the given NVS partition.

参数 **partition_label** –**[in]** Label of the partition

返回

- ESP_OK on success
- ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

esp_err_t **nvs_flash_erase**(void)

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

备注: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

返回

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition labeled "nvs" in the partition table
- different error in case de-initialization fails (shouldn't happen)

esp_err_t **nvs_flash_erase_partition**(const char *part_name)

Erase specified NVS partition.

Erase all content of a specified NVS partition

备注: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

参数 **part_name** –**[in]** Name (label) of the partition which should be erased

返回

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn't happen)

esp_err_t **nvs_flash_erase_partition_ptr**(const *esp_partition_t* *partition)

Erase custom partition.

Erase all content of specified custom partition.

备注: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

参数 **partition** –**[in]** pointer to a partition obtained by the ESP partition API.

返回

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_secure_init**(*nvs_sec_cfg_t* *cfg)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled "nvs" in the partition table.

参数 **cfg** –**[in]** Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption is used.

返回

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label "nvs" is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures

- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_secure_init_partition**(const char *partition_label, *nvs_sec_cfg_t* *cfg)

Initialize NVS flash storage for the specified partition.

参数

- **partition_label** –**[in]** Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- **cfg** –**[in]** Security configuration (keys) to be used for NVS encryption/decryption. If cfg is null, no encryption/decryption is used.

返回

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_generate_keys**(const *esp_partition_t* *partition, *nvs_sec_cfg_t* *cfg)

Generate and store NVS keys in the provided esp partition.

参数

- **partition** –**[in]** Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **cfg** –**[out]** Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

返回 -ESP_OK, if cfg was read successfully; -ESP_INVALID_ARG, if partition or cfg; -or error codes from esp_partition_write/erase APIs.

esp_err_t **nvs_flash_read_security_cfg**(const *esp_partition_t* *partition, *nvs_sec_cfg_t* *cfg)

Read NVS security configuration from a partition.

备注: Provided partition is assumed to be marked ‘encrypted’.

参数

- **partition** –**[in]** Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **cfg** –**[out]** Pointer to nvs security configuration structure. Pointer must be non-NULL.

返回 -ESP_OK, if cfg was read successfully; -ESP_INVALID_ARG, if partition or cfg; -ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys. -ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt -or error codes from esp_partition_read API.

Structures

struct **nvs_sec_cfg_t**

Key for encryption and decryption.

Public Members

uint8_t **eky**[NVS_KEY_SIZE]

XTS encryption and decryption key

uint8_t **tky**[NVS_KEY_SIZE]

XTS tweak key

Header File

- components/nvs_flash/include/nvs.h

Functions

esp_err_t **nvs_set_i8** (*nvs_handle_t* handle, const char *key, int8_t value)

set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

参数

- **handle** –**[in]** Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- **key** –**[in]** Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **value** –**[in]** The value to set.

返回

- ESP_OK if value was set successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

esp_err_t **nvs_set_u8** (*nvs_handle_t* handle, const char *key, uint8_t value)

set uint8_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t **nvs_set_i16** (*nvs_handle_t* handle, const char *key, int16_t value)

set int16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t **nvs_set_u16** (*nvs_handle_t* handle, const char *key, uint16_t value)

set uint16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t **nvs_set_i32** (*nvs_handle_t* handle, const char *key, int32_t value)

set int32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t **nvs_set_u32** (*nvs_handle_t* handle, const char *key, uint32_t value)

set uint32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t **nvs_set_i64** (*nvs_handle_t* handle, const char *key, int64_t value)

set int64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t **nvs_set_u64** (*nvs_handle_t* handle, const char *key, uint64_t value)

set uint64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

esp_err_t **nvs_set_str** (*nvs_handle_t* handle, const char *key, const char *value)

set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

参数

- **handle** –**[in]** Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- **key** –**[in]** Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **value** –**[in]** The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

返回

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

esp_err_t **nvs_get_i8** (*nvs_handle_t* handle, const char *key, int8_t *out_value)

get int8_t value for given key

These functions retrieve value for the key, given its name. If `key` does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

`out_value` has to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

参数

- **handle** –**[in]** Handle obtained from nvs_open function.
- **key** –**[in]** Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **out_value** –Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.

返回

- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL

- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

esp_err_t **nvs_get_u8**(*nvs_handle_t* handle, const char *key, uint8_t *out_value)

get uint8_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_i16**(*nvs_handle_t* handle, const char *key, int16_t *out_value)

get int16_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_u16**(*nvs_handle_t* handle, const char *key, uint16_t *out_value)

get uint16_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_i32**(*nvs_handle_t* handle, const char *key, int32_t *out_value)

get int32_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_u32**(*nvs_handle_t* handle, const char *key, uint32_t *out_value)

get uint32_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_i64**(*nvs_handle_t* handle, const char *key, int64_t *out_value)

get int64_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_u64**(*nvs_handle_t* handle, const char *key, uint64_t *out_value)

get uint64_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_str**(*nvs_handle_t* handle, const char *key, char *out_value, size_t *length)

get string value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

All functions expect out_value to be a pointer to an already allocated variable of the given type.

nvs_get_str and nvs_get_blob functions support WinAPI-style length queries. To get the size necessary to store the value, call nvs_get_str or nvs_get_blob with zero out_value and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For nvs_get_str, this length includes the zero terminator. When calling nvs_get_str and nvs_get_blob with non-zero out_value, length has to be non-zero and has to point to the length available in out_value. It is suggested that nvs_get/set_str is used for zero-terminated C strings, and nvs_get/set_blob used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into␣
↪dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
into a static array:
```

(下页继续)

(续上页)

```
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

参数

- **handle** –**[in]** Handle obtained from nvs_open function.
- **key** –**[in]** Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **out_value** –**[out]** Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.
- **length** –**[inout]** A non-zero pointer to the variable holding the length of out_value. In case out_value a zero, will be set to the length required to hold the value. In case out_value is not zero, will be set to the actual length of the value written. For nvs_get_str this includes zero terminator.

返回

- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if `length` is not sufficient to store data

esp_err_t **nvs_get_blob**(*nvs_handle_t* handle, const char *key, void *out_value, size_t *length)

get blob value for given key

This function behaves the same as `nvs_get_str`, except for the data type.

esp_err_t **nvs_open**(const char *namespace_name, *nvs_open_mode_t* open_mode, *nvs_handle_t* *out_handle)

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled "nvs" in the partition table.

参数

- **namespace_name** –**[in]** Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **open_mode** –**[in]** NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** –**[out]** If successful (return code is zero), handle will be returned in this argument.

返回

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label "nvs" is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn't exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn't satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

esp_err_t **nvs_open_from_partition**(const char *part_name, const char *namespace_name, *nvs_open_mode_t* open_mode, *nvs_handle_t* *out_handle)

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.

参数

- **part_name** –**[in]** Label (name) of the partition of interest for object read/write/erase
- **namespace_name** –**[in]** Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **open_mode** –**[in]** NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** –**[out]** If successful (return code is zero), handle will be returned in this argument.

返回

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn't exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn't satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

esp_err_t **nvs_set_blob**(*nvs_handle_t* handle, const char *key, const void *value, size_t length)

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until nvs_commit function is called.

参数

- **handle** –**[in]** Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- **key** –**[in]** Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **value** –**[in]** The value to set.
- **length** –**[in]** length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

返回

- ESP_OK if value was set successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

esp_err_t **nvs_erase_key**(*nvs_handle_t* handle, const char *key)

Erase key-value pair with given key name.

Note that actual storage may not be updated until nvs_commit function is called.

参数

- **handle** –**[in]** Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

- **key** –**[in]** Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.

返回

- ESP_OK if erase operation was successful
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
- other error codes from the underlying storage driver

esp_err_t **nvs_erase_all**(*nvs_handle_t* handle)

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until nvs_commit function is called.

参数 **handle** –**[in]** Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

返回

- ESP_OK if erase operation was successful
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

esp_err_t **nvs_commit**(*nvs_handle_t* handle)

Write any pending changes to non-volatile storage.

After setting any values, nvs_commit() must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

参数 **handle** –**[in]** Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

返回

- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

void **nvs_close**(*nvs_handle_t* handle)

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with nvs_open once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using nvs_commit function. Once this function is called on a handle, the handle should no longer be used.

参数 **handle** –**[in]** Storage handle to close

esp_err_t **nvs_get_stats**(const char *part_name, *nvs_stats_t* *nvs_stats)

Fill structure *nvs_stats_t*. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```
// Example of nvs_get_stats() to get the number of used entries and free␣
↪entries:
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
       nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_
↪entries);
```

参数

- **part_name** –**[in]** Partition name NVS in the partition table. If pass a NULL than will use NVS_DEFAULT_PART_NAME (“nvs”).
- **nvs_stats** –**[out]** Returns filled structure nvs_states_t. It provides info about used memory the partition.

返回

- ESP_OK if the changes have been written successfully. Return param nvs_stats will be filled.
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “name” is not found. Return param nvs_stats will be filled 0.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param nvs_stats will be filled 0.
- ESP_ERR_INVALID_ARG if nvs_stats equal to NULL.
- ESP_ERR_INVALID_STATE if there is page with the status of INVALID. Return param nvs_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

esp_err_t **nvs_get_used_entry_count** (*nvs_handle_t* handle, size_t *used_entries)

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value used_entries (if err is equal to ESP_OK). Because the name space entry takes one entry.

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs␣
↪in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}
```

参数

- **handle** –**[in]** Handle obtained from nvs_open function.
- **used_entries** –**[out]** Returns amount of used entries from a namespace.

返回

- ESP_OK if the changes have been written successfully. Return param used_entries will be filled valid value.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param used_entries will be filled 0.
- ESP_ERR_INVALID_ARG if used_entries equal to NULL.
- Other error codes from the underlying storage driver. Return param used_entries will be filled 0.

esp_err_t **nvs_entry_find** (const char *part_name, const char *namespace_name, *nvs_type_t* type, *nvs_iterator_t* *output_iterator)

Create an iterator to enumerate NVS entries based on one or more parameters.

```
// Example of listing all the key-value pairs of any type under specified partition and namespace
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_ANY, &it);
while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);
```

参数

- **part_name** –**[in]** Partition name
- **namespace_name** –**[in]** Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **type** –**[in]** One of nvs_type_t values.
- **output_iterator** –**[out]** Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except ESP_ERR_INVALID_ARG occurs, `output_iterator` is NULL, too. If ESP_ERR_INVALID_ARG occurs, `output_iterator` is not changed. If a valid iterator is obtained through this function, it has to be released using `nvs_release_iterator` when not used any more, unless ESP_ERR_INVALID_ARG is returned.

返回

- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no element of specified criteria has been found.
- ESP_ERR_NO_MEM if memory has been exhausted during allocation of internal structures.
- ESP_ERR_INVALID_ARG if any of the parameters is NULL. Note: don't release `output_iterator` in case ESP_ERR_INVALID_ARG has been returned

esp_err_t **nvs_entry_next** (*nvs_iterator_t* *iterator)

Advances the iterator to next item matching the iterator criteria.

Note that any copies of the iterator will be invalid after this call.

参数 **iterator** –**[inout]** Iterator obtained from nvs_entry_find function. Must be non-NULL. If any error except ESP_ERR_INVALID_ARG occurs, `iterator` is set to NULL. If ESP_ERR_INVALID_ARG occurs, `iterator` is not changed.

返回

- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no next element matching the iterator criteria.
- ESP_ERR_INVALID_ARG if `iterator` is NULL.
- Possibly other errors in the future for internal programming or flash errors.

esp_err_t **nvs_entry_info** (const *nvs_iterator_t* iterator, *nvs_entry_info_t* *out_info)

Fills *nvs_entry_info_t* structure with information about entry pointed to by the iterator.

参数

- **iterator** –**[in]** Iterator obtained from nvs_entry_find function. Must be non-NULL.
- **out_info** –**[out]** Structure to which entry information is copied.

返回

- ESP_OK if all parameters are valid; current iterator data has been written to out_info
- ESP_ERR_INVALID_ARG if one of the parameters is NULL.

void **nvs_release_iterator** (*nvs_iterator_t* iterator)

Release iterator.

参数 **iterator** –**[in]** Release iterator obtained from nvs_entry_find function. NULL argument is allowed.

Structures

struct **nvs_entry_info_t**

information about entry obtained from nvs_entry_info function

Public Members

char **namespace_name**[16]

Namespace to which key-value belong

char **key**[NVS_KEY_NAME_MAX_SIZE]

Key of stored key-value pair

nvs_type_t **type**

Type of stored key-value pair

struct **nvs_stats_t**

备注: Info about storage space NVS.

Public Members

size_t **used_entries**

Amount of used entries.

size_t **free_entries**

Amount of free entries.

size_t **total_entries**

Amount all available entries.

size_t **namespace_count**

Amount name space.

Macros

ESP_ERR_NVS_BASE

Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED

The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND

A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH

The type of set or get operation doesn’t match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY

Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE

There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME

Namespace name doesn’t satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE

Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED

The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

ESP_ERR_NVS_KEY_TOO_LONG

Key name is too long

ESP_ERR_NVS_PAGE_FULL

Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE

NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

ESP_ERR_NVS_INVALID_LENGTH

String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES

NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

ESP_ERR_NVS_VALUE_TOO_LONG

Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND

Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND

NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED

XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED

XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED

XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND

XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED

NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED

NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART

NVS key partition is corrupt

ESP_ERR_NVS_WRONG_ENCRYPTION

NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_NVS_CONTENT_DIFFERS

Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME

Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE

maximum length of partition name (excluding null terminator)

NVS_KEY_NAME_MAX_SIZE

Maximum length of NVS key name (including null terminator)

Type Definitions

typedef uint32_t **nvs_handle_t**

Opaque pointer type representing non-volatile storage handle

typedef *nvs_handle_t* **nvs_handle**

typedef *nvs_open_mode_t* **nvs_open_mode**

typedef struct nvs_opaque_iterator_t ***nvs_iterator_t**

Opaque pointer type representing iterator to nvs entries

Enumerations

enum **nvs_open_mode_t**

Mode of opening the non-volatile storage.

Values:

enumerator **NVS_READONLY**

Read only

enumerator **NVS_READWRITE**

Read and write

enum **nvs_type_t**

Types of variables.

Values:

enumerator **NVS_TYPE_U8**

Type uint8_t

enumerator **NVS_TYPE_I8**

Type int8_t

enumerator **NVS_TYPE_U16**

Type uint16_t

enumerator **NVS_TYPE_I16**

Type int16_t

enumerator **NVS_TYPE_U32**

Type uint32_t

enumerator **NVS_TYPE_I32**

Type int32_t

enumerator **NVS_TYPE_U64**

Type uint64_t

enumerator **NVS_TYPE_I64**

Type int64_t

enumerator **NVS_TYPE_STR**

Type string

enumerator **NVS_TYPE_BLOB**

Type blob

enumerator **NVS_TYPE_ANY**

Must be last

2.9.4 NVS 分区生成程序

介绍

NVS 分区生成程序 (nvs_flash/nvs_partition_generator/nvs_partition_gen.py) 根据 CSV 文件中的键值对生成二进制文件。该二进制文件与非易失性存储器 *(NVS)* 中定义的 NVS 结构兼容。NVS 分区生成程序适合用于生成二进制数据（Blob），其中包括设备生产时可从外部烧录的 ODM/OEM 数据。这也使得生产制造商在使用同一个应用固件的基础上，通过自定义参数，如序列号，为每个设备生成不同配置的二进制 NVS 分区。

准备工作

在加密模式下使用该程序，需安装下列软件包：

- cryptography package

根目录下的 *requirements.txt* 包含必需 python 包，请预先安装。

CSV 文件格式

CSV 文件每行需包含四个参数，以逗号隔开。具体参数描述见下表：

序号	参数	描述	说明
1	Key	主键，应用程序可通过查询此键来获取数据。	
2	Type	支持 `file`、`data` 和 `namespace`。	
3	Encoding	支持 `u8`、`i8`、`u16`、`i16`、`u32`、`i32`、`u64`、`i64`、`string`、`hex2bin`、`base64` 和 `binary`。决定二进制 `bin` 文件中 value 被编码成的类型。`string` 和 `binary` 编码的区别在于，`string` 数据以 NULL 字符结尾，`binary` 数据则不是。	`file` 类型当前仅支持 `hex2bin`、`base64`、`string` 和 `binary` 编码。
4	Value	Data value	`namespace` 字段的 `encoding` 和 `value` 应为空。`namespace` 的 `encoding` 和 `value` 为固定值，不可设置。这些单元格中的所有值都会被忽视。

备注： CSV 文件的第一行应始终为列标题，不可设置。

此类 CSV 文件的 Dump 示例如下:

```
key,type,encoding,value      <-- 列标题
namespace_name,namespace,,   <-- 第一个条目为 "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

备注:

请确保：

- 逗号‘,’前后无空格；
- CSV 文件每行末尾无空格。

NVS 条目和命名空间 (namespace) 的关联

如 CSV 文件中出现命名空间条目，后续条目均会被视为该命名空间的一部分，直至找到下一个命名空间条目。找到新命名空间条目后，后续所有条目都会被视为新命名空间的一部分。

备注： CSV 文件中第一个条目应始终为 `namespace`。

支持多页 Blob

默认情况下，二进制 Blob 可跨多页，格式参考*条目结构* 章节。如需使用旧版格式，可在程序中禁用该功能。

支持加密

NVS 分区生成程序还可使用 AES-XTS 加密生成二进制加密文件。更多信息详见*NVS 加密*。

支持解密

如果 NVS 二进制文件采用了 AES-XTS 加密，该程序还可对此类文件进行解密，更多信息详见*NVS 加密*。

运行程序

使用方法:

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

可选参数:

序号	参数	描述
1	-h, –help	显示帮助信息并退出

命令:

```
运行 nvs_partition_gen.py {command} -h 查看更多帮助信息
```

序号	参数	描述
1	generate	生成 NVS 分区
2	generate-key	生成加密密钥
3	encrypt	加密 NVS 分区
4	decrypt	解密 NVS 分区

生成 NVS 分区（默认模式） 使用方法:

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR]
                                     input output size
```

位置参数:

参数	描述
input	待解析的 CSV 文件路径
output	NVS 二进制文件的输出路径
size	NVS 分区大小（以字节为单位，且为 4096 的整数倍）

可选参数:

参数	描述
-h, –help	显示帮助信息并退出
–version {1,2}	• 设置多页 Blob 版本。 • 版本 1：禁用多页 Blob； • 版本 2：启用多页 Blob； • 默认版本：版本 2。
–outdir OUTDIR	输出目录，用于存储创建的文件。(默认当前目录)

运行如下命令创建 NVS 分区，该程序同时会提供 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

仅生成加密密钥分区　使用方法:

```
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE]
                                         [--outdir OUTDIR]
```

可选参数:

参数	描述
-h, –help	显示帮助信息并退出
–keyfile KEYFILE	加密密钥分区文件的输出路径
–outdir OUTDIR	输出目录，用于存储创建的文件（默认当前目录）

运行以下命令仅生成加密密钥分区:

```
python nvs_partition_gen.py generate-key
```

生成 NVS 加密分区　使用方法:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
                                    [--keyfile KEYFILE] [--inputkey INPUTKEY]
                                    [--outdir OUTDIR]
                                    input output size
```

位置参数:

参数	描述
input	待解析 CSV 文件的路径
output	NVS 二进制文件的输出路径
size	NVS 分区大小（以字节为单位，且为 4096 的整数倍）

可选参数:

参数	描述
-h, –help	显示帮助信息并退出
–version {1,2}	• 设置多页 Blob 版本。 • 版本 1：禁用多页 Blob； • 版本 2：启用多页 Blob； • 默认版本：版本 2。
–keygen	生成 NVS 分区加密密钥
–keyfile KEYFILE	密钥文件的输出路径
–inputkey INPUTKEY	内含 NVS 分区加密密钥的文件
–outdir OUTDIR	输出目录，用于存储创建的文件（默认当前目录）

运行以下命令加密 NVS 分区，该程序同时会提供一个 CSV 示例文件。

- 通过 NVS 分区生成程序生成加密密钥来加密:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin␣
↪0x3000 --keygen
```

备注： 创建的加密密钥格式为 `<outdir>/keys/keys-<timestamp>.bin`。

- 通过 NVS 分区生成程序生成加密密钥，并将密钥存储于自定义的文件中:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin␣
↪0x3000 --keygen --keyfile sample_keys.bin
```

备注： 创建的加密密钥格式为 `<outdir>/keys/keys-<timestamp>.bin`。

备注： 加密密钥存储于新建文件的 `keys/` 目录下，与 NVS 密钥分区结构兼容。更多信息请参考*NVS 密钥分区*。

- 将加密密钥用作二进制输入文件来进行加密:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin␣
↪0x3000 --inputkey sample_keys.bin
```

解密 NVS 分区　使用方法:

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

位置参数:

参数	描述
input	待解析的 NVS 加密分区文件路径
key	含有解密密钥的文件路径
output	已解密的二进制文件输出路径

可选参数:

参数	描述
-h, –help	显示帮助信息并退出
–outdir OUTDIR	输出目录，用于存储创建的文件（默认当前目录）

运行以下命令解密已加密的 NVS 分区:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

您可以自定义格式版本号：- 版本 1：禁用多页 Blob - 版本 2：启用多页 Blob

版本 1：禁用多页 Blob 如需禁用多页 Blob，请按照如下命令将版本参数设置为 1，以此格式运行分区生成程序。该程序同时会提供一个 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --
↪version 1
```

版本 2：启用多页 Blob 如需启用多页 Blob，请按照如下命令将版本参数设置为 2，以此格式运行分区生成程序。该程序同时会提供一个 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --
↪version 2
```

备注： NVS 分区最小为 0x3000 字节。

备注： 将二进制文件烧录至设备时，请确保与应用的 sdkconfig 设置一致。

说明

- 分区生成程序不会对重复键进行检查，而将数据同时写入这两个重复键中。请注意不要使用同名的键；
- 新页面创建后，前一页的空白处不会再写入数据。CSV 文件中的字段须按次序排列以优化内存；
- 暂不支持 64 位数据类型。

2.9.5 SD/SDIO/MMC 驱动程序

概述

SD/SDIO/MMC 驱动是一种基于 SDMMC 和 SD SPI 主机驱动的协议级驱动程序，目前已支持 SD 存储器、SDIO 卡和 eMMC 芯片。

SDMMC 主机驱动和 SD SPI 主机驱动（driver/include/driver/sdmmc_host.h 和 driver/include/driver/sdspi_host.h）为以下功能提供 API:

- 发送命令至从设备
- 接收和发送数据
- 处理总线错误

初始化函数及配置函数:

- 如需初始化和配置 SD SPI 主机，请参阅*SD SPI 主机 API*

应用示例

ESP-IDF storage/sd_card 目录下提供了 SDMMC 驱动与 FatFs 库组合使用的示例，演示了先初始化卡，然后使用 POSIX 和 C 库 API 向卡读写数据。请参考示例目录下 README.md 文件，查看更多详细信息。

复合卡（存储 + IO） 该驱动程序不支持 SD 复合卡，复合卡会被视为 IO 卡。

线程安全 多数应用程序仅需在一个任务中使用协议层。因此，协议层在`sdmmc_card_t` 结构体或在访问 SDMMC 或 SD SPI 主机驱动程序时不使用任何类型的锁。这种锁通常在较高层级实现，例如文件系统驱动程序。

API 参考

Header File

- components/sdmmc/include/sdmmc_cmd.h

Functions

esp_err_t **sdmmc_card_init**(const *sdmmc_host_t* *host, *sdmmc_card_t* *out_card)

Probe and initialize SD/MMC card using given host

备注： Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

参数

- **host** –pointer to structure defining host controller
- **out_card** –pointer to structure which will receive information about the card when the function completes

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

void **sdmmc_card_print_info**(FILE *stream, const *sdmmc_card_t* *card)

Print information about the card to a stream.

参数

- **stream** –stream obtained using fopen or fdopen
- **card** –card information structure initialized using sdmmc_card_init

esp_err_t **sdmmc_get_status**(*sdmmc_card_t* *card)

Get status of SD/MMC card

参数 **card** –pointer to card information structure previously initialized using sdmmc_card_init

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_write_sectors**(*sdmmc_card_t* *card, const void *src, size_t start_sector, size_t sector_count)

Write given number of sectors to SD/MMC card

参数

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **src** –pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
- **start_sector** –sector where to start writing

- **sector_count** –number of sectors to write

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_read_sectors**(*sdmmc_card_t* *card, void *dst, size_t start_sector, size_t sector_count)

Read given number of sectors from the SD/MMC card

参数

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **dst** –pointer to data buffer to write into; buffer size must be at least sector_count * card->csd.sector_size
- **start_sector** –sector where to start reading
- **sector_count** –number of sectors to read

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_erase_sectors**(*sdmmc_card_t* *card, size_t start_sector, size_t sector_count, *sdmmc_erase_arg_t* arg)

Erase given number of sectors from the SD/MMC card

备注： When sdmmc_erase_sectors used with cards in SDSPI mode, it was observed that card requires re-init after erase operation.

参数

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **start_sector** –sector where to start erase
- **sector_count** –number of sectors to erase
- **arg** –erase command (CMD38) argument

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_can_discard**(*sdmmc_card_t* *card)

Check if SD/MMC card supports discard

参数 **card** –pointer to card information structure previously initialized using sdmmc_card_init

返回

- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

esp_err_t **sdmmc_can_trim**(*sdmmc_card_t* *card)

Check if SD/MMC card supports trim

参数 **card** –pointer to card information structure previously initialized using sdmmc_card_init

返回

- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

esp_err_t **sdmmc_mmc_can_sanitize**(*sdmmc_card_t* *card)

Check if SD/MMC card supports sanitize

参数 **card** –pointer to card information structure previously initialized using sdmmc_card_init

返回

- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

esp_err_t **sdmmc_mmc_sanitize**(*sdmmc_card_t* *card, uint32_t timeout_ms)

Sanitize the data that was unmapped by a Discard command

备注: Discard command has to precede sanitize operation. To discard, use MMC_DICARD_ARG with sdmmc_erase_sectors argument

参数

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **timeout_ms** –timeout value in milliseconds required to sanitize the selected range of sectors.

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_full_erase**(*sdmmc_card_t* *card)

Erase complete SD/MMC card

参数 **card** –pointer to card information structure previously initialized using sdmmc_card_init

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_byte**(*sdmmc_card_t* *card, uint32_t function, uint32_t reg, uint8_t *out_byte)

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

参数

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **function** –IO function number
- **reg** –byte address within IO function
- **out_byte** –**[out]** output, receives the value read from the card

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_byte**(*sdmmc_card_t* *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

参数

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **function** –IO function number
- **reg** –byte address within IO function
- **in_byte** –value to be written
- **out_byte** –**[out]** if not NULL, receives new byte value read from the card (read-after-write).

返回

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_bytes**(*sdmmc_card_t* *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see sdmmc_io_read_blocks.

参数

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **function** –IO function number

- **addr** –byte address within IO function where reading starts
- **dst** –buffer which receives the data read from card
- **size** –number of bytes to read

返回

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_bytes**(*sdmmc_card_t* *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see sdmmc_io_write_blocks.

参数

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **function** –IO function number
- **addr** –byte address within IO function where writing starts
- **src** –data to be written
- **size** –number of bytes to write

返回

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_blocks**(*sdmmc_card_t* *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see sdmmc_io_read_bytes.

参数

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **function** –IO function number
- **addr** –byte address within IO function where writing starts
- **dst** –buffer which receives the data read from card
- **size** –number of bytes to read, must be divisible by the card block size.

返回

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_blocks**(*sdmmc_card_t* *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see sdmmc_io_write_bytes.

参数

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **function** –IO function number
- **addr** –byte address within IO function where writing starts
- **src** –data to be written
- **size** –number of bytes to read, must be divisible by the card block size.

返回

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_enable_int**(*sdmmc_card_t* *card)

Enable SDIO interrupt in the SDMMC host

参数 **card** –pointer to card information structure previously initialized using sdmmc_card_init

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

esp_err_t **sdmmc_io_wait_int**(*sdmmc_card_t* *card, TickType_t timeout_ticks)

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

参数

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **timeout_ticks** –time to wait for the interrupt, in RTOS ticks

返回

- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in timeout_ticks

esp_err_t **sdmmc_io_get_cis_data**(*sdmmc_card_t* *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

参数

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **out_buffer** –Output buffer of the CIS data
- **buffer_size** –Size of the buffer.
- **inout_cis_size** –Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than buffer_size. The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if CIS_CODE_END is found.

返回

- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but buffer_size is less than required size, which is stored in the inout_cis_size then.
- ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of inout_cis_size or set it to 0, if you still want to search for the end; output value of inout_cis_size is invalid in this case.
- and other error code return from sdmmc_io_read_bytes

esp_err_t **sdmmc_io_print_cis_info**(uint8_t *buffer, size_t buffer_size, FILE *fp)

Parse and print the CIS information of an SDIO card.

备注: Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in sdmmc_io.c and contribute to the IDF through the Github repository.

```
        using sdmmc_card_init
```

参数

- **buffer** –Buffer to parse
- **buffer_size** –Size of the buffer.
- **fp** –File pointer to print to, set to NULL to print to stdout.

返回

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP_ERR_INVALID_SIZE: if the CIS size fields are not correct.

Header File

- components/driver/include/driver/sdmmc_types.h

Structures

struct **sdmmc_csd_t**

Decoded values from SD card Card Specific Data register

Public Members

int **csd_ver**

CSD structure format

int **mmc_ver**

MMC version (for CID format)

int **capacity**

total number of sectors

int **sector_size**

sector size in bytes

int **read_block_len**

block length for reads

int **card_command_class**

Card Command Class for SD

int **tr_speed**

Max transfer speed

struct **sdmmc_cid_t**

Decoded values from SD card Card IDentification register

Public Members

int **mfg_id**

manufacturer identification number

int **oem_id**

OEM/product identification number

char **name**[8]

product name (MMC v1 has the longest)

int **revision**

product revision

int **serial**

product serial number

int **date**

manufacturing date

struct **sdmmc_scr_t**

Decoded values from SD Configuration Register Note: When new member is added, update reserved bits accordingly

Public Members

uint32_t **sd_spec**

SD Physical layer specification version, reported by card

uint32_t **erase_mem_state**

data state on card after erase whether 0 or 1 (card vendor dependent)

uint32_t **bus_width**

bus widths supported by card: BIT(0) —1-bit bus, BIT(2) —4-bit bus

uint32_t **reserved**

reserved for future expansion

uint32_t **rsvd_mnf**

reserved for manufacturer usage

struct **sdmmc_ssr_t**

Decoded values from SD Status Register Note: When new member is added, update reserved bits accordingly

Public Members

uint32_t **alloc_unit_kb**

Allocation unit of the card, in multiples of kB (1024 bytes)

uint32_t **erase_size_au**

Erase size for the purpose of timeout calculation, in multiples of allocation unit

uint32_t **cur_bus_width**

SD current bus width

uint32_t **discard_support**

SD discard feature support

uint32_t **fule_support**

SD FULE (Full User Area Logical Erase) feature support

uint32_t **erase_timeout**

Timeout (in seconds) for erase of a single allocation unit

uint32_t **erase_offset**

Constant timeout offset (in seconds) for any erase operation

uint32_t **reserved**

reserved for future expansion

struct **sdmmc_ext_csd_t**

Decoded values of Extended Card Specific Data

Public Members

uint8_t **rev**

Extended CSD Revision

uint8_t **power_class**

Power class used by the card

uint8_t **erase_mem_state**

data state on card after erase whether 0 or 1 (card vendor dependent)

uint8_t **sec_feature**

secure data management features supported by the card

struct **sdmmc_switch_func_rsp_t**

SD SWITCH_FUNC response buffer

Public Members

uint32_t **data**[512 / 8 / sizeof(uint32_t)]

response data

struct **sdmmc_command_t**

SD/MMC command information

Public Members

uint32_t **opcode**

SD or MMC command index

uint32_t **arg**

SD/MMC command argument

sdmmc_response_t **response**

response buffer

void ***data**

buffer to send or read into

size_t **datalen**

length of data buffer

size_t **blklen**

block length

int **flags**

see below

esp_err_t **error**

error returned from transfer

uint32_t **timeout_ms**

response timeout, in milliseconds

struct **sdmmc_host_t**

SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

Public Members

uint32_t **flags**

flags defining host properties

int **slot**

slot number, to be passed to host functions

int **max_freq_khz**

max frequency supported by the host

float **io_voltage**

I/O voltage used by the controller (voltage switching is not supported)

esp_err_t (***init**)(void)

Host function to initialize the driver

esp_err_t (***set_bus_width**)(int slot, size_t width)
host function to set bus width

size_t (***get_bus_width**)(int slot)
host function to get bus width

esp_err_t (***set_bus_ddr_mode**)(int slot, bool ddr_enable)
host function to set DDR mode

esp_err_t (***set_card_clk**)(int slot, uint32_t freq_khz)
host function to set card clock frequency

esp_err_t (***do_transaction**)(int slot, *sdmmc_command_t* *cmdinfo)
host function to do a transaction

esp_err_t (***deinit**)(void)
host function to deinitialize the driver

esp_err_t (***deinit_p**)(int slot)
host function to deinitialize the driver, called with the `slot`

esp_err_t (***io_int_enable**)(int slot)
Host function to enable SDIO interrupt line

esp_err_t (***io_int_wait**)(int slot, TickType_t timeout_ticks)
Host function to wait for SDIO interrupt line to be active

int **command_timeout_ms**
timeout, in milliseconds, of a single command. Set to 0 to use the default value.

struct **sdmmc_card_t**
SD/MMC card information structure

Public Members

sdmmc_host_t **host**
Host with which the card is associated

uint32_t **ocr**
OCR (Operation Conditions Register) value

sdmmc_cid_t **cid**
decoded CID (Card IDentification) register value

sdmmc_response_t **raw_cid**
raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

sdmmc_csd_t **csd**

decoded CSD (Card-Specific Data) register value

sdmmc_scr_t **scr**

decoded SCR (SD card Configuration Register) value

sdmmc_ssr_t **ssr**

decoded SSR (SD Status Register) value

sdmmc_ext_csd_t **ext_csd**

decoded EXT_CSD (Extended Card Specific Data) register value

uint16_t **rca**

RCA (Relative Card Address)

uint16_t **max_freq_khz**

Maximum frequency, in kHz, supported by the card

uint32_t **is_mem**

Bit indicates if the card is a memory card

uint32_t **is_sdio**

Bit indicates if the card is an IO card

uint32_t **is_mmc**

Bit indicates if the card is MMC

uint32_t **num_io_functions**

If is_sdio is 1, contains the number of IO functions on the card

uint32_t **log_bus_width**

log2(bus width supported by card)

uint32_t **is_ddr**

Card supports DDR mode

uint32_t **reserved**

Reserved for future expansion

Macros

SDMMC_HOST_FLAG_1BIT

host supports 1-line SD and MMC protocol

SDMMC_HOST_FLAG_4BIT

host supports 4-line SD and MMC protocol

SDMMC_HOST_FLAG_8BIT

host supports 8-line MMC protocol

SDMMC_HOST_FLAG_SPI

host supports SPI protocol

SDMMC_HOST_FLAG_DDR

host supports DDR mode for SD/MMC

SDMMC_HOST_FLAG_DEINIT_ARG

host `deinit` function called with the slot argument

SDMMC_FREQ_DEFAULT

SD/MMC Default speed (limited by clock divider)

SDMMC_FREQ_HIGHSPEED

SD High speed (limited by clock divider)

SDMMC_FREQ_PROBING

SD/MMC probing speed

SDMMC_FREQ_52M

MMC 52MHz speed

SDMMC_FREQ_26M

MMC 26MHz speed

Type Definitions

typedef uint32_t **sdmmc_response_t**[4]

SD/MMC command response buffer

Enumerations

enum **sdmmc_erase_arg_t**

SD/MMC erase command(38) arguments SD: ERASE: Erase the write blocks, physical/hard erase.

DISCARD: Card may deallocate the discarded blocks partially or completely. After discard operation the previously written data may be partially or fully read by the host depending on card implementation.

MMC: ERASE: Does TRIM, applies erase operation to write blocks instead of Erase Group.

DISCARD: The Discard function allows the host to identify data that is no longer required so that the device can erase the data if necessary during background erase events. Applies to write blocks instead of Erase Group After discard operation, the original data may be remained partially or fully accessible to the host dependent on device.

Values:

enumerator **SDMMC_ERASE_ARG**

Erase operation on SD, Trim operation on MMC

enumerator **SDMMC_DISCARD_ARG**

Discard operation for SD/MMC

2.9.6 SPI Flash API

概述

spi_flash 组件提供外部 flash 数据读取、写入、擦除和内存映射相关的 API 函数，同时也提供了更高层级的、面向分区的 API 函数（定义在分区表 中）。

与 ESP-IDF V4.0 之前的 API 不同，这一版 *esp_flash_** API 功能并不局限于主 SPI flash 芯片（即运行程序的 SPI flash 芯片）。使用不同的芯片指针，您可以访问连接到 SPI0/1 或 SPI2 总线的外部 flash 芯片。

备注： 大多数 *esp_flash_** API 使用 SPI1，SPI2 等外设而非通过 SPI0 上的 cache。这使得它们不仅能访问主 flash，也能访问外部 flash 。

而由于 cache 的限制，所有经过 cache 的操作都只能对主 flash 进行。这些操作的地址同样受到 cache 能力的限制。Cache 无法访问外部 flash 或者高于它能力的地址段。这些 cache 操作包括：mmap ，加密读写，执行代码或者访问在 flash 中的变量。

备注： ESP-IDF V4.0 之后的 flash API 不再是 原子的。因此，如果读操作执行过程中发生写操作，且读操作和写操作的 flash 地址出现重叠，读操作返回的数据可能会包含旧数据和新数据 (新数据为写操作更新产生的数据)。

备注： 仅有主 flash 芯片支持加密操作，外接（经 SPI1 使用其他不同片选访问，或经其它 SPI 总线访问）的 flash 芯片则不支持加密操作。硬件的限制也决定了仅有主 flash 支持从 cache 当中读取。

Flash 功能支持情况

支持的 Flash 列表 不同厂家的 flash 特性有不同的操作方式，因此需要特殊的驱动支持。当前驱动支持大多数厂家 flash 24 位地址范围内的快速/慢速读，以及二线模式 (DIO/DOUT)，因为他们不需要任何厂家的自定义命令。

当前驱动支持以下厂家/型号的 flash 的四线模式 (QIO/QOUT)：

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

Flash 可选的功能

Optional features for flash Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- *Auto Suspend & Resume*
- *Flash unique ID*
- *High performance mode*
- *OPI flash support*
- *32-bit Address Flash Chips*

备注:

- The features listed above needs to be supported by both esp chips and flash chips.
- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact Espressif's business team to know if we can supply such products for you.
- If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.

注意: This document only shows that IDF code has supported the features of those flash chips. It's not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own brought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

Auto Suspend & Resume You can refer to 当使能 *flash* 擦除的自动暂停 for more information about this feature. The support list is as follows.

ESP Chips List:

1. ESP32C3

Flash Chips List:

1. XM25QxxC series.

Flash unique ID Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

ESP Chips Lists:

ALL

Flash Chips List:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

High performance mode

备注: This section is provided for Dual mode (DOUT/DIO) and Quad mode (QIO/QOUT) flash chips. Octal flash used on ESP-chips support High performance mode by default so far, you can refer to the octal flash support list below.

High performance mode (HPM) means that the SPI1 and flash chip works under high frequency. Usually, when the operating frequency of the flash is greater than 80MHz, it is considered that the flash works under HPM. As far as we acknowledged, flash chips have more than two different coping strategies when flash work under HPM. For some flash chips, HPM is controlled by high performance flag (HPF) in status register and for some flash chips, HPM is controlled by dummy cycle bit.

For following conditions, IDF start code deals with HPM internally.

ESP Chips List:

1. ESP32S3

Flash Chips (name & ID) List:

1. GD25Q64C (ID: 0xC84017)
2. GD25Q32C (ID: 0xC84016)

注意： It is hard to create several strategies to cover all situations, so all flash chips using HPM need to be supported explicitly. Therefore, if you try to use a flash not listed as supported under high performance mode, it might cause some error. So, when you try to use the flash chip beyond supported list, please test properly.

OPI flash support OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

ESP Chips List:

1. ESP32S3

Flash Chips List:

1. MX25UM25645G

32-bit Address Flash Chips Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regretfully, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

ESP Chips List:

ALL ESP Chips support this.

Flash Chips List:

1. W25Q256
2. GD25Q256

有一些功能可能不是所有的 flash 芯片都支持，或不是所有的 ESP 芯片都支持。这些功能包括：

- 32 比特地址的 flash 支持 - 通常意味着拥有大于 16MB 内存空间的大容量 flash 需要更长的地址去访问。
- flash 的私有 ID (unique ID) - 表示 flash 支持它自己的 64-bits 独有 ID 。
- 暂停与恢复 - 表示 flash 可以在读/写的过程中接受暂停/恢复的命令。ESP32-C3 可以在 flash 正在写/擦除的过程中保持 cache 开启，并能随机读取 flash 中的内容。

如果您想使用这些功能，则需保证 ESP32-C3 支持这些功能，且产品里所使用的 flash 芯片也要支持这些功能。请参阅*Optional features for flash*，查看更多信息。

您也可以自定义 flash 芯片驱动。请参阅*Overriding Default Chip Drivers*，查看详细信息。

警告： Customizing SPI Flash Chip Drivers is considered an "expert" feature. Users should only do so at their own risk. (See the notes below)

Overriding Default Chip Drivers During the SPI Flash driver's initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated in together with each IDF version. However IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List

1. Enable the *CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST* config option. This will prevent compilation and linking of the Default Chip Driver List (*default_registered_chips*) provided by IDF. Instead, the linker will search for the structure of the same name (*default_registered_chips*) that must be provided by the user.
2. Add a new component in your project, e.g. *custom_chip_driver*.
3. Copy the necessary chip driver files from the *spi_flash* component in IDF. This may include:
   - *spi_flash_chip_drivers.c* (to provide the *default_registered_chips* structure)
   - Any of the *spi_flash_chip_*.c* files that matches your own flash model best
   - *CMakeLists.txt* and *linker.lf* files

   Modify the files above properly.

备注:

- When writing your own flash chip driver, you can set your flash chip capabilities through *spi_flash_chip_***(vendor)_get_caps* and points the function pointer *get_chip_caps* for protection to the *spi_flash_chip_***_get_caps* function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in *spi_flash_caps_t* by checking the flash datasheet.
  2. Write a function named *spi_flash_chip_***(vendor)_get_caps*. Take the example below as a reference. (if the flash support *suspend* and *read unique id*).
  3. Points the the pointer *get_chip_caps* (in *spi_flash_chip_t*) to the function mentioned above.

```
spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash-suspend is supported
    caps_flags |= SPI_FLAHS_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example storage/custom_flash_driver.

---

4. Add linking dependency from *spi_flash* component to the new *custom_chip_driver* component, by adding the following lines after the *idf_component_register*, in the *CMakeLists.txt* file of the *custom_chip_driver* component:

   idf_component_get_property(spi_flash_lib spi_flash COMPONENT_LIB)
   set_property(TARGET ${spi_flash_lib} APPEND PROPERTY INTERFACE_LINK_LIBRARIES $<LINK_ONLY:${COMPONENT_LIB}>)
5. The *linker.lf* is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See 链接器脚本生成机制 for more details. Make sure this file covers all the source files that you add.

6. Build your project, and you will see the new flash driver is used.

Example See also storage/custom_flash_driver.

初始化 Flash 设备

在使用 esp_flash_* API 之前，您需要在 SPI 总线上初始化芯片，步骤如下：

1. 调用 *spi_bus_initialize()* 初始化 SPI 总线。此函数将初始化总线上设备间共享的资源，如 I/O、DMA、中断等。
2. 调用 *spi_bus_add_flash_device()* 将 flash 设备连接到总线上。然后分配内存，填充 esp_flash_t 结构体，同时初始化 CS I/O。
3. 调用 *esp_flash_init()* 与芯片进行通信。后续操作会依据芯片类型不同而有差异。

备注： 当前，已支持多个 flash 芯片连接到同一总线。

SPI Flash 访问 API

如下所示为处理 flash 中数据的函数集：

- *esp_flash_read()*：将数据从 flash 读取到 RAM；
- *esp_flash_write()*：将数据从 RAM 写入到 flash；
- *esp_flash_erase_region()*：擦除 flash 中指定区域的数据；
- *esp_flash_erase_chip()*：擦除整个 flash；
- esp_flash_get_chip_size()：返回 menuconfig 中设置的 flash 芯片容量（以字节为单位）。

一般来说，请尽量避免对主 SPI flash 芯片直接使用原始 SPI flash 函数。如需对主 SPI flash 芯片进行操作，请使用分区专用函数。

SPI Flash 容量

SPI flash 容量由引导加载程序镜像头部（烧录偏移量为 0x1000）的一个字段进行配置。

默认情况下，引导程序被写入 flash 时，esptool.py 会自动检测 SPI flash 容量，同时使用正确容量更新引导程序的头部。您也可以在工程配置中设置 CONFIG_ESPTOOLPY_FLASHSIZE，生成固定的 flash 容量。

如需在运行时覆盖已配置的 flash 容量，请配置 g_rom_flashchip 结构中的 chip_size。esp_flash_* 函数使用此容量（于软件和 ROM 中）进行边界检查。

SPI1 Flash 并发约束

SPI1 Flash 并发约束 指令/数据 cache（用以执行固件）与 SPI1 外设（由像 SPI Flash 驱动一样的驱动程序控制）共享 SPI0/1 总线。因此，对 SPI1 外设的操作会对整个系统造成显著的影响。这类操作包括调用 SPI Flash API 或者其他 SPI1 总线上的驱动，任何 flash 操作（如读取、写入、擦除）或者其他用户定义的 SPI 操作，无论是对主 flash 或者其他各类的 SPI 从机。

在 ESP32-C3 上，默认启用的配置选项 *CONFIG_SPI_FLASH_AUTO_SUSPEND* 允许 flash/PSRAM 的 cache 访问和 SPI1 的操作存并发地执行。请参阅当使能 *flash* 擦除的自动暂停，查看详细信息。

在该选项被禁用的情况下，读取/写入/擦除 flash 时，cache 必须被禁用。使用驱动访问 SPI1 的相关约束参见当 *cache* 被禁用时。这些约束会带来更多的 IRAM/DRAM 消耗。

当 cache 被禁用时 此时，在 flash 擦写操作中，所有的 CPU 都只能执行 IRAM 中的代码，而且必须从 DRAM 中读取数据。如果您使用本文档中 API 函数，上述限制将自动生效且透明（无需您额外关注），但这些限制可能会影响系统中的其他任务的性能。

然而，启用*CONFIG_SPI_FLASH_AUTO_SUSPEND* 时，cache 不会被禁用，其中的操作将通过硬件来协调。

为避免意外读取 flash cache，在 flash 操作完成前，所有 CPU 上，所有的非 IRAM 安全的中断都会被禁用。

另请参阅*OS 函数* 和*SPI 总线锁*。

除 SPI0/1 以外，SPI 总线上的其它 flash 芯片则不受这种限制。

请参阅*应用程序内存分布*，查看内部 RAM（如 IRAM、DRAM）和 flash cache 的区别。

IRAM 安全中断处理程序 如果您需要在 flash 操作期间运行中断处理程序（比如低延迟操作），请在*注册中断处理程序* 时设置 `ESP_INTR_FLAG_IRAM`。

请确保中断处理程序访问的所有数据和函数（包括其调用的数据和函数）都存储在 IRAM 或 DRAM 中。参见*如何将代码放入 IRAM*。

在函数或符号未被正确放入 IRAM/DRAM 的情况下，中断处理程序在 flash 操作期间从 flash cache 中读取数据时，会导致程序崩溃。这可能是因为代码未被正确放入 IRAM 而产生非法指令异常，也可能是因为常数未被正确放入 DRAM 而读取到垃圾数据。

备注： 在 ISRs 中处理字符串时，不建议使用 *printf* 和其他输出函数。为了方便调试，在从 ISRs 中获取数据时，请使用 `ESP_DRAM_LOGE()` 和类似的宏。请确保 `TAG` 和格式字符串都放置于 `DRAM` 中。

非 IRAM 安全中断处理程序 如果在注册时没有设置 *ESP_INTR_FLAG_IRAM* 标志，当 cache 被禁用时，将不会执行中断处理程序。一旦 cache 恢复，非 IRAM 安全的中断将重新启用，中断处理程序随即再次正常运行。这意味着，只要 cache 被禁用，将不会发生相应的硬件事件。

当使能 flash 擦除的自动暂停 当使能 flash 擦除的自动暂停，访问 SPI1 时（如擦除、写入、读取主 flash）cache 便无需被禁用。硬件会负责仲裁二者的访问。

当 SPI1 操作较短时（如读取操作），CPU 和 cache 会等待直到 SPI1 的操作结束。然而对于一个擦除操作，自动暂停会发生并打断擦除操作，允许 CPU 能够在有限时间内从 cache 读取数据。

因此，部分的代码及变量便可以放入 flash / PSRAM 而非 IRAM / DRAM，同时仍然能够在 flash 擦除期间被执行。这样就减少了 IRAM / DRAM 的消耗。

请注意这个功能会带来 flash 暂停及恢复时的额外开销。如果被频繁打断，flash 的擦除时间可能异常的长。为了确保 flash 擦除操作在一个合理的时间内完成，请调整 FreeRTOS 任务优先级，这样仅有那些高于擦除任务优先级的任务，会在擦除进行过程中会被执行。

换句话说，代码可以分为以下三类：

1. 关键代码：放置在 IRAM / DRAM 中。这类代码通常有较高的性能要求，与 cache / flash / PSRAM 相关，或者被频繁调用。
2. cache 访问的代码：放置在 flash / PSRAM 中。这类代码的性能要求较低，或者较少被调用。他们会在 flash 擦除的时候被执行，带来一定的开销。
3. 低优先级代码：放置在 flash / PSRAM 中，并且在 flash 擦除的期间被禁止运行。这类代码的任务优先级应被设置的低于擦除任务，从而避免影响 flash 擦除的速度。

注意： 指令/数据 cache（用以执行固件）与 SPI1 外设（由像 SPI flash 驱动一样的驱动程序控制）共享 SPI0/1 总线。因此，在 SPI1 总线上调用 SPI flash API（包括访问主 flash）会对整个系统造成显著的影响。请参阅*SPI1 Flash 并发约束*，查看详细信息。

分区表 API

ESP-IDF 工程使用分区表保存 SPI flash 各区信息，包括引导程序、各种应用程序二进制文件、数据及文件系统等。请参阅分区表，查看详细信息。

该组件在 `esp_partition.h` 中声明了一些 API 函数，用以枚举在分区表中找到的分区，并对这些分区执行操作：

- *`esp_partition_find()`*：在分区表中查找特定类型的条目，返回一个不透明迭代器；
- *`esp_partition_get()`*：返回一个结构体，描述给定迭代器的分区；
- *`esp_partition_next()`*：将迭代器移至下一个找到的分区；
- *`esp_partition_iterator_release()`*：释放 `esp_partition_find` 中返回的迭代器；
- *`esp_partition_find_first()`*：返回描述 `esp_partition_find` 中找到的第一个分区的结构；
- *`esp_partition_read()`*、*`esp_partition_write()`* 和*`esp_partition_erase_range()`* 等同于*`esp_flash_read()`*、*`esp_flash_write()`* 和*`esp_flash_erase_region()`*，但在分区边界内执行。

备注： 请在应用程序代码中使用上述 `esp_partition_*` API 函数，而非低层级的 `esp_flash_*` API 函数。分区表 API 函数根据存储在分区表中的数据，进行边界检查并计算在 flash 中的正确偏移量。

SPI Flash 加密

您可以对 SPI flash 内容进行加密，并在硬件层对其进行透明解密。

请参阅*flash 加密*，查看详细信息。

内存映射 API

ESP32-C3 的内存硬件可以将 flash 部分区域映射到指令地址空间和数据地址空间。此映射仅用于读操作，不能通过写入 flash 映射的存储区域来改变 flash 中的内容。

Flash 在 64 KB 页进行映射。内存映射硬件既可将 flash 映射到数据地址空间，也能映射到指令地址空间。请查看技术参考手册，了解内存映射硬件的详细信息及有关限制。

请注意，有些页被用于将应用程序映射到内存中，因此实际可用的页会少于硬件提供的总数。

启用*Flash 加密* 时，使用内存映射区域从 flash 读取数据是解密 flash 的唯一方法，解密需在硬件层进行。

内存映射 API 在 `spi_flash_mmap.h` 和 `esp_partition.h` 中声明：

- *`spi_flash_mmap()`*：将 flash 物理地址区域映射到 CPU 指令空间或数据空间；
- *`spi_flash_munmap()`*：取消上述区域的映射；
- *`esp_partition_mmap()`*：将分区的一部分映射至 CPU 指令空间或数据空间；

  `spi_flash_mmap()` 和*`esp_partition_mmap()`* 的区别如下：

- *`spi_flash_mmap()`*：需要给定一个 64 KB 对齐的物理地址；
- *`esp_partition_mmap()`*：给定分区内任意偏移量即可，此函数根据需要将返回的指针调整至指向映射内存。

内存映射以页为单位，即使传递给 `esp_partition_mmap` 的是一个分区，分区外的数据也是也是可以被读取到的，不会受到分区边界的影响。

备注： 由于 mmap 是由 cache 支持的，因此，mmap 也仅能用在主 flash 上。

SPI Flash 实现

esp_flash_t 结构体包含芯片数据和该 API 的三个重要部分：

1. 主机驱动，为访问芯片提供硬件支持；
2. 芯片驱动，为不同芯片提供兼容性服务；
3. OS 函数，在不同阶段（一级或二级 Boot 或者应用程序阶段）为部分 OS 函数（如锁、延迟）提供支持。

主机驱动 主机驱动依赖 hal/include/hal 文件夹下 spi_flash_types.h 定义的 spi_flash_host_driver_t 接口。该接口提供了一些常用的函数，用于与芯片通信。

在 SPI HAL 文件中，有些函数是基于现有的 ESP32-C3 memory-spi 来实现的。但是，由于 ESP32-C3 的速度限制，HAL 层无法提供某些读命令的高速实现（所以这些命令根本没有在 HAL 的文件中被实现）。memspi_host_driver.h 和 .c 文件使用 HAL 提供的 common_command 函数实现上述读命令的高速版本，并将所有它实现的以及 HAL 函数封装为 spi_flash_host_driver_t 供更上层调用。

您甚至可以仅通过 GPIO 来实现自己的主机驱动。只要实现了 spi_flash_host_driver_t 中所有函数，不管底层硬件是什么，esp_flash API 都可以访问 flash。

芯片驱动 芯片驱动在 spi_flash_chip_driver.h 中进行定义，并将主机驱动提供的基本函数进行封装以供 API 层使用。

有些操作需在执行前先发送命令，或在执行后读取状态，因此有些芯片需要不同的命令或值以及通信方式。

generic chip 芯片代表了常见的 flash 芯片，其他芯片驱动可以在这种通用芯片的基础上进行开发。

芯片驱动依赖主机驱动。

OS 函数 OS 函数层目前支持访问锁和延迟的方法。

锁（见*SPI 总线锁*）用于解决同一 SPI 总线上的设备访问和 SPI flash 芯片访问之间的冲突。例如：

1. 经 SPI1 总线访问 flash 芯片时，应当禁用 cache（平时用于获取代码和 PSRAM 数据）。
2. 经其他总线访问 flash 芯片时，应当禁用 flash 上 SPI 主驱动器注册的 ISR 以避免冲突。
3. SPI 主驱动器上某些没有 CS 线或者 CS 线受软件（如 SDSPI）控制的设备需要在一段时间内独占总线。

延时则用于某些长时操作，需要主机处于等待状态或执行轮询。

顶层 API 将芯片驱动和 OS 函数封装成一个完整的组件，并提供参数检查。

使用 OS 函数还可以在一定程度上避免在擦除大块 flash 区域时出现看门狗超时的情况。在这段时间内，CPU 将被 flash 擦除任务占用，从而阻止其他任务的执行，包括为看门狗定时器 (WDT) 供电的空闲任务。若已选中配置选项*CONFIG_ESP_TASK_WDT_PANIC*，并且 flash 操作时间长于看门狗的超时时间，系统将重新启动。

不过，由于不同的 flash 芯片擦除时间不同，flash 驱动几乎无法兼容，很难完全规避超时的风险。因此，您需要格外注意这一点。请遵照以下指南：

1. 建议启用*CONFIG_SPI_FLASH_YIELD_DURING_ERASE* 选项，允许调度器在擦除 flash 时进行重新调度。此外，还可以使用下列参数。
   - 在 menuconfig 中增加*CONFIG_SPI_FLASH_ERASE_YIELD_TICKS* 或减少*CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS* 的时间。
   - 您也可以在 menuconfig 中增加*CONFIG_ESP_TASK_WDT_TIMEOUT_S* 的时间以设置更长的看门狗超时周期。然而，看门狗超时周期拉长后，可能无法再检测到以前可检测到的超时。
2. 请注意，在进行长时间的 SPI flash 操作时，启用*CONFIG_ESP_TASK_WDT_PANIC* 选项将会在超时时触发恐慌处理程序。不过，启用该选项也可以帮助处理应用程序中的意外异常，您可以根据实际情况决定是否需要启用这个选项。

3. 在开发过程中，请根据项目对擦除 flash 的具体要求和时间限制，谨慎进行 flash 操作。在配置 flash 擦除超时周期时，请在实际产品要求的基础上留出合理的冗余时间，从而提高产品的可靠性。

另请参考

- 分区表
- *OTA API* 提供了高层 API 用于更新存储在 flash 中的 app 固件。
- *NVS API* 提供了结构化 API 用于存储 SPI flash 中的碎片数据。

实现细节

必须确保操作期间，两个 CPU 均未从 flash 运行代码，实现细节如下：- 单核模式下，SDK 在执行 flash 操作前将禁用中断或调度算法。- 双核模式下，SDK 需确保两个 CPU 均未运行 flash 代码。

如果有 SPI flash API 在 CPU A（PRO 或 APP）上调用，它使用 `esp_ipc_call` API 在 CPU B 上运行 `spi_flash_op_block_func` 函数。`esp_ipc_call` API 会在 CPU B 上唤醒一个高优先级任务，即运行 `spi_flash_op_block_func` 函数。运行该函数将禁用 CPU B 上的 cache，并使用 `s_flash_op_can_start` 旗帜来标志 cache 已禁用。然后，CPU A 上的任务也会禁用 cache 并继续执行 flash 操作。

执行 flash 操作时，CPU A 和 CPU B 仍然可以执行中断操作。默认中断代码均存储于 RAM 中，如果新添加了中断分配 API，则应添加一个标志位以请求在 flash 操作期间禁用该新分配的中断。

Flash 操作完成后，CPU A 上的函数将设置另一标志位，即 `s_flash_op_complete`，用以通知 CPU B 上的任务可以重新启用 cache 并释放 CPU。接着，CPU A 上的函数也重新启用 cache，并将控制权返还给调用者。

另外，所有 API 函数均受互斥量 `s_flash_op_mutex` 保护。

在单核环境中（启用*CONFIG_FREERTOS_UNICORE*），您需要禁用上述两个 cache 以防发生 CPU 间通信。

SPI Flash API 参考

Header File

- components/spi_flash/include/esp_flash_spi_init.h

Functions

esp_err_t **spi_bus_add_flash_device**(*esp_flash_t* **out_chip, const *esp_flash_spi_device_config_t* *config)

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

参数

- **out_chip** –Pointer to hold the initialized chip.
- **config** –Configuration of the chips to initialize.

返回

- ESP_ERR_INVALID_ARG: out_chip is NULL, or some field in the config is invalid.
- ESP_ERR_NO_MEM: failed to allocate memory for the chip structures.
- ESP_OK: success.

esp_err_t **spi_bus_remove_flash_device**(*esp_flash_t* *chip)

Remove a SPI Flash device from the SPI bus.

参数 **chip** –The flash device to remove.

返回

- ESP_ERR_INVALID_ARG: The chip is invalid.
- ESP_OK: success.

Structures

struct **esp_flash_spi_device_config_t**

Configurations for the SPI Flash to init.

Public Members

spi_host_device_t **host_id**

Bus to use.

int **cs_io_num**

GPIO pin to output the CS signal.

esp_flash_io_mode_t **io_mode**

IO mode to read from the Flash.

enum *esp_flash_speed_s* **speed**

Speed of the Flash clock. Replaced by freq_mhz.

int **input_delay_ns**

Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs_id**

CS line ID, ignored when not `host_id` is not SPI1_HOST, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

int **freq_mhz**

The frequency of flash chip(MHZ)

Header File

- components/spi_flash/include/esp_flash.h

Functions

esp_err_t **esp_flash_init**(*esp_flash_t* *chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

备注： Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

备注： If the chip->drv pointer is NULL, chip chip_drv will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

参数 **chip** –Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.
返回 ESP_OK on success, or a flash error code if initialisation fails.

bool **esp_flash_chip_driver_initialized**(const *esp_flash_t* *chip)

Check if appropriate chip driver is set.

参数 **chip** –Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.
返回 true if set, otherwise false.

esp_err_t **esp_flash_read_id**(*esp_flash_t* *chip, uint32_t *out_id)

Read flash ID via the common "RDID" SPI flash command.

ID is a 24-bit value. Lower 16 bits of 'id' are the chip ID, upper 8 bits are the manufacturer ID.

参数
- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_id** –**[out]** Pointer to receive ID value.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_size**(*esp_flash_t* *chip, uint32_t *out_size)

Detect flash size based on flash ID.

备注: Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

参数
- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_size** –**[out]** Detected size in bytes.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_read_unique_chip_id**(*esp_flash_t* *chip, uint64_t *out_id)

Read flash unique ID via the common "RDUID" SPI flash command.

ID is a 64-bit value.

参数
- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().
- **out_id** –**[out]** Pointer to receive unique ID value.

返回
- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn't support read id.

esp_err_t **esp_flash_erase_chip**(*esp_flash_t* *chip)

Erase flash chip contents.

参数 **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()

返回
- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_erase_region**(*esp_flash_t* *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.

Sector size is specifyed in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

参数

- **chip** –Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **start** –Address to start erasing flash. Must be sector aligned.
- **len** –Length of region to erase. Must also be sector aligned.

返回

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_get_chip_write_protect**(*esp_flash_t* *chip, bool *write_protected)

Read if the entire chip is write protected.

备注: A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

参数

- **chip** –Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **write_protected** –**[out]** Pointer to boolean, set to the value of the write protect flag.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_set_chip_write_protect**(*esp_flash_t* *chip, bool write_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

备注: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

参数

- **chip** –Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **write_protect** –Boolean value for the write protect flag

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protectable_regions**(const *esp_flash_t* *chip, const *esp_flash_region_t* **out_regions, uint32_t *out_num_regions)

Read the list of individually protectable regions of this SPI flash chip.

备注: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

参数

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_regions** –**[out]** Pointer to receive a pointer to the array of protectable regions of the chip.
- **out_num_regions** –**[out]** Pointer to an integer receiving the count of protectable regions in the array returned in ‘regions’.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protected_region**(*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool *out_protected)

Detect if a region of the SPI flash chip is protected.

备注: It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

备注: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

参数

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **region** –Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- **out_protected** –**[out]** Pointer to a flag which is set based on the protected status for this region.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_set_protected_region**(*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool protect)

Update the protected status for a region of the SPI flash chip.

备注: It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

备注: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

参数

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **region** –Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- **protect** –Write protection flag to set.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_read**(*esp_flash_t* *chip, void *buffer, uint32_t address, uint32_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

备注： If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

参数

- **chip** –Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **buffer** –Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** –Address on flash to read from. Must be less than chip->size field.
- **length** –Length (in bytes) of data to read.

返回

- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

esp_err_t **esp_flash_write**(*esp_flash_t* *chip, const void *buffer, uint32_t address, uint32_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

参数

- **chip** –Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **address** –Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** –Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** –Length (in bytes) of data to write.

返回

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_write_encrypted**(*esp_flash_t* *chip, uint32_t address, const void *buffer, uint32_t length)

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

备注： Both address & length must be 16 byte aligned, as this is the encryption block size

参数

- **chip** –Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** –Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** –Pointer to a buffer with the data to write.
- **length** –Length (in bytes) of data to write. 16 byte aligned.

返回

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.

esp_err_t **esp_flash_read_encrypted**(*esp_flash_t* *chip, uint32_t address, void *out_buffer, uint32_t length)

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

参数

- **chip** –Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** –Address on flash to read from.
- **out_buffer** –Pointer to a buffer for the data to read to.
- **length** –Length (in bytes) of data to read.

返回

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.

static inline bool **esp_flash_is_quad_mode**(const *esp_flash_t* *chip)

Returns true if chip is configured for Quad I/O or Quad Fast Read.

参数 **chip** –Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

返回 true if flash works in quad mode, otherwise false

Structures

struct **esp_flash_region_t**

Structure for describing a region of flash.

Public Members

uint32_t **offset**

Start address of this region.

uint32_t **size**

Size of the region.

struct **esp_flash_os_functions_t**

OS-level integration hooks for accessing flash chips inside a running OS.

It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

esp_err_t (***start**)(void *arg)

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).

esp_err_t (***end**)(void *arg)

Called after completing any flash operation.

esp_err_t (***region_protected**)(void *arg, size_t start_addr, size_t size)

Called before any erase/write operations to check whether the region is limited by the OS

esp_err_t (***delay_us***)(void *arg, uint32_t us)

Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’.

void *(***get_temp_buffer***)(void *arg, size_t reqest_size, size_t *out_size)

Called for get temp buffer when buffer from application cannot be directly read into/write from.

void (***release_temp_buffer***)(void *arg, void *temp_buf)

Called for release temp buffer.

esp_err_t (***check_yield***)(void *arg, uint32_t chip_status, uint32_t *out_request)

Yield to other tasks. Called during erase operations.

Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

esp_err_t (***yield***)(void *arg, uint32_t *out_status)

Yield to other tasks. Called during erase operations.

int64_t (***get_system_time***)(void *arg)

Called for get system time.

void (***set_flash_op_status***)(uint32_t op_status)

Call to set flash operation status

struct **esp_flash_t**

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to esp_flash_init()). It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

spi_flash_host_inst_t ***host**

Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

const *spi_flash_chip_t* ***chip_drv**

Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

const *esp_flash_os_functions_t* ***os_func**

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void ***os_func_data**

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

esp_flash_io_mode_t **read_mode**

Configured SPI flash read mode. Set before `esp_flash_init` is called.

uint32_t **size**

Size of SPI flash in bytes. If 0, size will be detected during initialisation.

uint32_t **chip_id**

Detected chip id.

uint32_t **busy**

This flag is used to verify chip’ s status.

uint32_t **hpm_dummy_ena**

This flag is used to verify whether flash works under HPM status.

uint32_t **reserved_flags**

reserved.

Macros

SPI_FLASH_YIELD_REQ_YIELD

SPI_FLASH_YIELD_REQ_SUSPEND

SPI_FLASH_YIELD_STA_RESUME

SPI_FLASH_OS_IS_ERASING_STATUS_FLAG

Type Definitions

typedef struct *spi_flash_chip_t* **spi_flash_chip_t**

typedef struct *esp_flash_t* **esp_flash_t**

Header File

- components/spi_flash/include/spi_flash_mmap.h

Functions

esp_err_t **spi_flash_mmap**(size_t src_addr, size_t size, *spi_flash_mmap_memory_t* memory, const void **out_ptr, *spi_flash_mmap_handle_t* *out_handle)

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if mmap/munmap are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use spi_flash_mmap_dump() function.

参数

- **src_addr** –Physical address in flash where requested region starts. This address *must* be aligned to 64kB boundary (SPI_FLASH_MMU_PAGE_SIZE)
- **size** –Size of region to be mapped. This size will be rounded up to a 64kB boundary
- **memory** –Address space where the region should be mapped (data or instruction)
- **out_ptr** –**[out]** Output, pointer to the mapped memory region
- **out_handle** –**[out]** Output, handle which should be used for spi_flash_munmap call

返回 ESP_OK on success, ESP_ERR_NO_MEM if pages can not be allocated

esp_err_t **spi_flash_mmap_pages**(const int *pages, size_t page_count, *spi_flash_mmap_memory_t* memory, const void **out_ptr, *spi_flash_mmap_handle_t* *out_handle)

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as spi_flash_mmap() but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

参数

- **pages** –An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- **page_count** –Number of entries in the pages array
- **memory** –Address space where the region should be mapped (instruction or data)
- **out_ptr** –**[out]** Output, pointer to the mapped memory region
- **out_handle** –**[out]** Output, handle which should be used for spi_flash_munmap call

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if pages can not be allocated
- ESP_ERR_INVALID_ARG if pagecount is zero or pages array is not in internal memory

void **spi_flash_munmap**(*spi_flash_mmap_handle_t* handle)

Release region previously obtained using spi_flash_mmap.

备注: Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

参数 **handle** –Handle obtained from spi_flash_mmap

void **spi_flash_mmap_dump**(void)

Display information about mapped regions.

This function lists handles obtained using spi_flash_mmap, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

uint32_t **spi_flash_mmap_get_free_pages**(*spi_flash_mmap_memory_t* memory)

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual spi_flash_mmap (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

参数 **memory** –memory type of MMU table free page
返回 number of free pages which can be mmaped

size_t **spi_flash_cache2phys**(const void *cached)

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have have been assigned via spi_flash_mmap(), any address in memory mapped flash space can be looked up.

参数 **cached** –Pointer to flashed cached memory.
返回

- SPI_FLASH_CACHE2PHYS_FAIL If cache address is outside flash cache region, or the address is not mapped.
- Otherwise, returns physical offset in flash

const void *`spi_flash_phys2cache`(size_t phys_offs, *spi_flash_mmap_memory_t* memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via spi_flash_mmap(), any address in flash can be looked up.

备注： Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

备 注： This function doesn' t impose any alignment constraints, but if memory argument is SPI_FLASH_MMAP_INST and phys_offs is not 4-byte aligned, then reading from the returned pointer will result in a crash.

参数

- **`phys_offs`** –Physical offset in flash memory to look up.
- **`memory`** –Address space type to look up a flash cache address mapping for (instruction or data)

返回

- NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
- Cached memory address (in IROM or DROM space) corresponding to phys_offs.

Macros

`ESP_ERR_FLASH_OP_FAIL`

This file contains `spi_flash_mmap_xx` APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

`ESP_ERR_FLASH_OP_TIMEOUT`

`SPI_FLASH_SEC_SIZE`

SPI Flash sector size

`SPI_FLASH_MMU_PAGE_SIZE`

Flash cache MMU mapping page size

`SPI_FLASH_CACHE2PHYS_FAIL`

Type Definitions

typedef uint32_t **`spi_flash_mmap_handle_t`**

Opaque handle for memory region obtained from spi_flash_mmap.

Enumerations

enum **`spi_flash_mmap_memory_t`**

Enumeration which specifies memory space requested in an mmap call.

Values:

enumerator **SPI_FLASH_MMAP_DATA**

map to data memory (Vaddr0), allows byte-aligned access, 4 MB total

enumerator **SPI_FLASH_MMAP_INST**

map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total

Header File

- components/hal/include/hal/spi_flash_types.h

Structures

struct **spi_flash_trans_t**

Definition of a common transaction. Also holds the return value.

Public Members

uint8_t **reserved**

Reserved, must be 0.

uint8_t **mosi_len**

Output data length, in bytes.

uint8_t **miso_len**

Input data length, in bytes.

uint8_t **address_bitlen**

Length of address in bits, set to 0 if command does not need an address.

uint32_t **address**

Address to perform operation on.

const uint8_t ***mosi_data**

Output data to salve.

uint8_t ***miso_data**

[out] Input data from slave, little endian

uint32_t **flags**

Flags for this transaction. Set to 0 for now.

uint16_t **command**

Command to send.

uint8_t **dummy_bitlen**

Basic dummy bits to use.

uint32_t **io_mode**

Flash working mode when `SPI_FLASH_IGNORE_BASEIO` is specified.

struct **spi_flash_sus_cmd_conf**

Configuration structure for the flash chip suspend feature.

Public Members

uint32_t **sus_mask**

SUS/SUS1/SUS2 bit in flash register.

uint32_t **cmd_rdsr**

Read flash status register(2) command.

uint32_t **sus_cmd**

Flash suspend command.

uint32_t **res_cmd**

Flash resume command.

uint32_t **reserved**

Reserved, set to 0.

struct **spi_flash_encryption_t**

Structure for flash encryption operations.

Public Members

void (***flash_encryption_enable**)(void)

Enable the flash encryption.

void (***flash_encryption_disable**)(void)

Disable the flash encryption.

void (***flash_encryption_data_prepare**)(uint32_t address, const uint32_t *buffer, uint32_t size)

Prepare flash encryption before operation.

备注： address and buffer must be 8-word aligned.

Param address The destination address in flash for the write operation.
Param buffer Data for programming
Param size Size to program.

void (***flash_encryption_done**)(void)

flash data encryption operation is done.

void (***flash_encryption_destroy**)(void)

Destroy encrypted result

bool (*`flash_encryption_check`)(uint32_t address, uint32_t length)

Check if is qualified to encrypt the buffer

Param address the address of written flash partition.
Param length Buffer size.

struct `spi_flash_host_inst_t`

SPI Flash Host driver instance

Public Members

const struct *spi_flash_host_driver_s* *`driver`

Pointer to the implementation function table.

struct `spi_flash_host_driver_s`

Host driver configuration and context structure.

Public Members

esp_err_t (*`dev_config`)(*spi_flash_host_inst_t* *host)

Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

esp_err_t (*`common_command`)(*spi_flash_host_inst_t* *host, *spi_flash_trans_t* *t)

Send an user-defined spi transaction to the device.

esp_err_t (*`read_id`)(*spi_flash_host_inst_t* *host, uint32_t *id)

Read flash ID.

void (*`erase_chip`)(*spi_flash_host_inst_t* *host)

Erase whole flash chip.

void (*`erase_sector`)(*spi_flash_host_inst_t* *host, uint32_t start_address)

Erase a specific sector by its start address.

void (*`erase_block`)(*spi_flash_host_inst_t* *host, uint32_t start_address)

Erase a specific block by its start address.

esp_err_t (*`read_status`)(*spi_flash_host_inst_t* *host, uint8_t *out_sr)

Read the status of the flash chip.

esp_err_t (*`set_write_protect`)(*spi_flash_host_inst_t* *host, bool wp)

Disable write protection.

void (*`program_page`)(*spi_flash_host_inst_t* *host, const void *buffer, uint32_t address, uint32_t length)

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

bool (*`supports_direct_write`)(*spi_flash_host_inst_t* *host, const void *p)

Check whether the SPI host supports direct write.

When cache is disabled, SPI1 doesn't support directly write when buffer isn't internal.

int (*`write_data_slicer`)(*spi_flash_host_inst_t* *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

Param address Beginning flash address to write
Param len Length request to write
Param align_addr Output of the aligned address to write to
Param page_size Physical page size of the flash chip
Return Length that can be actually written in one `program_page` call

esp_err_t (*`read`)(*spi_flash_host_inst_t* *host, void *buffer, uint32_t address, uint32_t read_len)

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

bool (*`supports_direct_read`)(*spi_flash_host_inst_t* *host, const void *p)

Check whether the SPI host supports direct read.

When cache is disabled, SPI1 doesn't support directly read when the given buffer isn't internal.

int (*`read_data_slicer`)(*spi_flash_host_inst_t* *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for read data. The `read` should be called iteratively with the return value of this function.

Param address Beginning flash address to read
Param len Length request to read
Param align_addr Output of the aligned address to read
Param page_size Physical page size of the flash chip
Return Length that can be actually read in one `read` call

uint32_t (*`host_status`)(*spi_flash_host_inst_t* *host)

Check the host status, 0:busy, 1:idle, 2:suspended.

esp_err_t (*`configure_host_io_mode`)(*spi_flash_host_inst_t* *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, *esp_flash_io_mode_t* io_mode)

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (*`poll_cmd_done`)(*spi_flash_host_inst_t* *host)

Internal use, poll the HW until the last operation is done.

esp_err_t (*`flush_cache`)(*spi_flash_host_inst_t* *host, uint32_t addr, uint32_t size)

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

void (*`check_suspend`)(*spi_flash_host_inst_t* *host)

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (*`resume`)(*spi_flash_host_inst_t* *host)

Resume flash from suspend manually

void (***suspend**)(*spi_flash_host_inst_t* *host)

Set flash in suspend status manually

esp_err_t (***sus_setup**)(*spi_flash_host_inst_t* *host, const *spi_flash_sus_cmd_conf* *sus_conf)

Suspend feature setup for setting cmd and status register mask.

Macros

SPI_FLASH_TRANS_FLAG_CMD16

Send command of 16 bits.

SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO

Not applying the basic io mode configuration for this transaction.

SPI_FLASH_TRANS_FLAG_BYTE_SWAP

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

SPI_FLASH_CONFIG_CONF_BITS

OR the io_mode with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

SPI_FLASH_OPI_FLAG

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

SPI_FLASH_READ_MODE_MIN

Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions

typedef enum *esp_flash_speed_s* **esp_flash_speed_t**

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLSH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

typedef struct *spi_flash_host_driver_s* **spi_flash_host_driver_t**

Enumerations

enum **esp_flash_speed_s**

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLSH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

enumerator **ESP_FLASH_5MHZ**

The flash runs under 5MHz.

enumerator **ESP_FLASH_10MHZ**

The flash runs under 10MHz.

enumerator **ESP_FLASH_20MHZ**

The flash runs under 20MHz.

enumerator **ESP_FLASH_26MHZ**

The flash runs under 26MHz.

enumerator **ESP_FLASH_40MHZ**

The flash runs under 40MHz.

enumerator **ESP_FLASH_80MHZ**

The flash runs under 80MHz.

enumerator **ESP_FLASH_120MHZ**

The flash runs under 120MHz, 120MHZ can only be used by main flash after timing tuning in system. Do not use this directely in any API.

enumerator **ESP_FLASH_SPEED_MAX**

The maximum frequency supported by the host is `ESP_FLASH_SPEED_MAX-1`.

enum **esp_flash_io_mode_t**

Mode used for reading from SPI flash.

Values:

enumerator **SPI_FLASH_SLOWRD**

Data read using single I/O, some limits on speed.

enumerator **SPI_FLASH_FASTRD**

Data read using single I/O, no limit on speed.

enumerator **SPI_FLASH_DOUT**

Data read using dual I/O.

enumerator **SPI_FLASH_DIO**

Both address & data transferred using dual I/O.

enumerator **SPI_FLASH_QOUT**

Data read using quad I/O.

enumerator **SPI_FLASH_QIO**

Both address & data transferred using quad I/O.

enumerator **SPI_FLASH_OPI_STR**

Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI_FLASH_OPI_DTR**

Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI_FLASH_READ_MODE_MAX**

The fastest io mode supported by the host is `ESP_FLASH_READ_MODE_MAX-1`.

Header File

- components/hal/include/hal/esp_flash_err.h

Macros

ESP_ERR_FLASH_NOT_INITIALISED

esp_flash_chip_t structure not correctly initialised by esp_flash_init().

ESP_ERR_FLASH_UNSUPPORTED_HOST

Requested operation isn't supported via this host SPI bus (chip->spi field).

ESP_ERR_FLASH_UNSUPPORTED_CHIP

Requested operation isn't supported by this model of SPI flash chip.

ESP_ERR_FLASH_PROTECTED

Write operation failed due to chip's write protection being enabled.

Enumerations

enum **[anonymous]**

Values:

enumerator **ESP_ERR_FLASH_SIZE_NOT_MATCH**

The chip doesn't have enough space for the current partition table.

enumerator **ESP_ERR_FLASH_NO_RESPONSE**

Chip did not respond to the command, or timed out.

分区表 API 参考

Header File

- components/spi_flash/include/esp_partition.h

Functions

esp_partition_iterator_t **esp_partition_find**(*esp_partition_type_t* type, *esp_partition_subtype_t* subtype, const char *label)

Find partition based on one or more parameters.

参数

- **type** –Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
- **subtype** –Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- **label** –(optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

返回 iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found. Iterator obtained through this function has to be released using esp_partition_iterator_release when not used any more.

const *esp_partition_t* ***esp_partition_find_first**(*esp_partition_type_t* type, *esp_partition_subtype_t* subtype, const char *label)

Find first partition based on one or more parameters.

参数

- **type** –Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
- **subtype** –Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- **label** –(optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

返回 pointer to *esp_partition_t* structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

const *esp_partition_t* ***esp_partition_get**(*esp_partition_iterator_t* iterator)

Get *esp_partition_t* structure for given partition.

参数 **iterator** –Iterator obtained using esp_partition_find. Must be non-NULL.

返回 pointer to *esp_partition_t* structure. This pointer is valid for the lifetime of the application.

esp_partition_iterator_t **esp_partition_next**(*esp_partition_iterator_t* iterator)

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

参数 **iterator** –Iterator obtained using esp_partition_find. Must be non-NULL.

返回 NULL if no partition was found, valid esp_partition_iterator_t otherwise.

void **esp_partition_iterator_release**(*esp_partition_iterator_t* iterator)

Release partition iterator.

参数 **iterator** –Iterator obtained using esp_partition_find. The iterator is allowed to be NULL, so it is not necessary to check its value before calling this function.

const *esp_partition_t* ***esp_partition_verify**(const *esp_partition_t* *partition)

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from *esp_partition_get()*, as a test for equality.

参数 **partition** –Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

返回

- If partition not found, returns NULL.
- If found, returns a pointer to the *esp_partition_t* structure in flash. This pointer is always valid for the lifetime of the application.

esp_err_t **esp_partition_read**(const *esp_partition_t* *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition.

Partitions marked with an encryption flag will automatically be be read and decrypted via a cache mapping.

参数

- **partition** –Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.

- **dst** –Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src_offset** –Address of the data to be read, relative to the beginning of the partition.
- **size** –Size of data to be read, in bytes.

返回 ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_write**(const *esp_partition_t* *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

Partitions marked with an encryption flag will automatically be written via the esp_flash_write_encrypted() function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the esp_flash_write_encrypted() function for more details. Unencrypted partitions do not have this restriction.

备注: Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

参数

- **partition** –Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **dst_offset** –Address where the data should be written, relative to the beginning of the partition.
- **src** –Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** –Size of data to be written, in bytes.

返回 ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_read_raw**(const *esp_partition_t* *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition without any transformation/decryption.

备注: This function is essentially the same as *esp_partition_read()* above. It just never decrypts data but returns it as is.

参数

- **partition** –Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **dst** –Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src_offset** –Address of the data to be read, relative to the beginning of the partition.
- **size** –Size of data to be read, in bytes.

返回 ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_write_raw**(const *esp_partition_t* *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

备注： This function is essentially the same as *esp_partition_write()* above. It just never encrypts data but writes it as is.

备注： Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

参数

- **partition** –Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **dst_offset** –Address where the data should be written, relative to the beginning of the partition.
- **src** –Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **size** –Size of data to be written, in bytes.

返回 ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

esp_err_t **esp_partition_erase_range**(const *esp_partition_t* *partition, size_t offset, size_t size)

Erase part of the partition.

参数

- **partition** –Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **offset** –Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- **size** –Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

返回 ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or dst are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_mmap**(const *esp_partition_t* *partition, size_t offset, size_t size, *spi_flash_mmap_memory_t* memory, const void **out_ptr, *spi_flash_mmap_handle_t* *out_handle)

Configure MMU to map partition into data memory.

Unlike spi_flash_mmap function, which requires a 64kB aligned base address, this function doesn't impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via out_ptr argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via out_handle argument to spi_flash_munmap function.

参数

- **partition** –Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **offset** –Offset from the beginning of partition where mapping should start.
- **size** –Size of the area to be mapped.
- **memory** –Memory space where the region should be mapped
- **out_ptr** –Output, pointer to the mapped memory region
- **out_handle** –Output, handle which should be used for spi_flash_munmap call

返回 ESP_OK, if successful

esp_err_t **esp_partition_get_sha256**(const *esp_partition_t* *partition, uint8_t *sha_256)

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

参数

- **partition** –**[in]** Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- **sha_256** –**[out]** Returned SHA-256 digest for a given partition.

返回

- ESP_OK: In case of successful operation.
- ESP_ERR_INVALID_ARG: The size was 0 or the sha_256 was NULL.
- ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
- ESP_ERR_IMAGE_INVALID: App partition doesn’ t contain a valid app image.
- ESP_FAIL: An allocation error occurred.

bool **esp_partition_check_identity**(const *esp_partition_t* *partition_1, const *esp_partition_t* *partition_2)

Check for the identity of two partitions by SHA-256 digest.

参数

- **partition_1** –**[in]** Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- **partition_2** –**[in]** Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

返回

- True: In case of the two firmware is equal.
- False: Otherwise

esp_err_t **esp_partition_register_external**(*esp_flash_t* *flash_chip, size_t offset, size_t size, const char *label, *esp_partition_type_t* type, *esp_partition_subtype_t* subtype, const *esp_partition_t* **out_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the *esp_flash_t* structure) as partitions. This allows using them with components which access SPI flash through the esp_partition API.

参数

- **flash_chip** –Pointer to the structure identifying the flash chip
- **offset** –Address in bytes, where the partition starts
- **size** –Size of the partition in bytes
- **label** –Partition name
- **type** –One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications can not be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
- **subtype** –One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.
- **out_partition** –**[out]** Output, if non-NULL, receives the pointer to the resulting *esp_partition_t* structure

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if memory allocation has failed
- ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
- ESP_ERR_INVALID_SIZE if the partition doesn’ t fit into the flash chip size

esp_err_t **esp_partition_deregister_external**(const *esp_partition_t* *partition)

Deregister the partition previously registered using esp_partition_register_external.

参数 **partition** –pointer to the partition structure obtained from esp_partition_register_external,

返回

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition pointer is not found
- ESP_ERR_INVALID_ARG if the partition comes from the partition table
- ESP_ERR_INVALID_ARG if the partition was not registered using esp_partition_register_external function.

Structures

struct **esp_partition_t**

partition information structure

This is not the format in flash, that format is esp_partition_info_t.

However, this is the format used by this API.

Public Members

esp_flash_t ***flash_chip**

SPI flash chip on which the partition resides

esp_partition_type_t **type**

partition type (app/data)

esp_partition_subtype_t **subtype**

partition subtype

uint32_t **address**

starting address of the partition in flash

uint32_t **size**

size of the partition, in bytes

char **label**[17]

partition label, zero-terminated ASCII string

bool **encrypted**

flag is set to true if partition is encrypted

Macros

ESP_PARTITION_SUBTYPE_OTA(i)

Convenience macro to get esp_partition_subtype_t value for the i-th OTA partition.

Type Definitions

typedef struct esp_partition_iterator_opaque_ ***esp_partition_iterator_t**

Opaque partition iterator type.

Enumerations

enum **esp_partition_type_t**

Partition type.

备注： Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

Values:

enumerator **ESP_PARTITION_TYPE_APP**

Application partition type.

enumerator **ESP_PARTITION_TYPE_DATA**

Data partition type.

enumerator **ESP_PARTITION_TYPE_ANY**

Used to search for partitions with any type.

enum **esp_partition_subtype_t**

Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

备注： These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP and ESP_PARTITION_TYPE_DATA.

Values:

enumerator **ESP_PARTITION_SUBTYPE_APP_FACTORY**

Factory application partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MIN**

Base for OTA partition subtypes.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_0**

OTA partition 0.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_1**

OTA partition 1.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_2**

OTA partition 2.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_3**

OTA partition 3.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_4**

OTA partition 4.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_5**
OTA partition 5.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_6**
OTA partition 6.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_7**
OTA partition 7.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_8**
OTA partition 8.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_9**
OTA partition 9.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_10**
OTA partition 10.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_11**
OTA partition 11.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_12**
OTA partition 12.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_13**
OTA partition 13.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_14**
OTA partition 14.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_15**
OTA partition 15.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MAX**
Max subtype of OTA partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_TEST**
Test application partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_OTA**
OTA selection partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_PHY**
PHY init data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS**
NVS partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_COREDUMP**

COREDUMP partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS**

Partition for NVS keys.

enumerator **ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM**

Partition for emulate eFuse bits.

enumerator **ESP_PARTITION_SUBTYPE_DATA_UNDEFINED**

Undefined (or unspecified) data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD**

ESPHTTPD partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_FAT**

FAT partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_SPIFFS**

SPIFFS partition.

enumerator **ESP_PARTITION_SUBTYPE_ANY**

Used to search for partitions with any subtype.

Flash 加密 API 参考

Header File

- components/bootloader_support/include/esp_flash_encrypt.h

Functions

bool **esp_flash_encryption_enabled**(void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

返回 true if flash encryption is enabled.

esp_err_t **esp_flash_encrypt_check_and_update**(void)

bool **esp_flash_encrypt_state**(void)

Returns the Flash Encryption state and prints it.

返回 True - Flash Encryption is enabled False - Flash Encryption is not enabled

bool **esp_flash_encrypt_initialized_once**(void)

Checks if the first initialization was done.

If the first initialization was done then FLASH_CRYPT_CNT != 0

返回 true - the first initialization was done false - the first initialization was NOT done

esp_err_t **esp_flash_encrypt_init**(void)

The first initialization of Flash Encryption key and related eFuses.

返回 ESP_OK if all operations succeeded

esp_err_t **esp_flash_encrypt_contents**(void)

Encrypts flash content.

返回 ESP_OK if all operations succeeded

esp_err_t **esp_flash_encrypt_enable**(void)

Activates Flash encryption on the chip.

It burns FLASH_CRYPT_CNT eFuse based on the CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE option.

返回 ESP_OK if all operations succeeded

bool **esp_flash_encrypt_is_write_protected**(bool print_error)

Returns True if the write protection of FLASH_CRYPT_CNT is set.

参数 **print_error** –Print error if it is write protected
返回 true - if FLASH_CRYPT_CNT is write protected

esp_err_t **esp_flash_encrypt_region**(uint32_t src_addr, size_t data_length)

Encrypt-in-place a block of flash sectors.

备注: This function resets RTC_WDT between operations with sectors.

参数

- **src_addr** –Source offset in flash. Should be multiple of 4096 bytes.
- **data_length** –Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

返回 ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

void **esp_flash_write_protect_crypt_cnt**(void)

Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

备注: On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

esp_flash_enc_mode_t **esp_get_flash_encryption_mode**(void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

返回

void **esp_flash_encryption_init_checks**(void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

备注： This function is called automatically during app startup, it doesn't need to be called from the app.

esp_err_t **esp_flash_encryption_enable_secure_features**(void)

Set all secure eFuse features related to flash encryption.

返回

- ESP_OK - Successfully

void **esp_flash_encryption_set_release_mode**(void)

Switches Flash Encryption from "Development" to "Release".

If already in "Release" mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- " disable encrypt in dl mode"
- set FLASH_CRYPT_CNT efuse to max

Enumerations

enum **esp_flash_enc_mode_t**

Values:

enumerator **ESP_FLASH_ENC_MODE_DISABLED**

enumerator **ESP_FLASH_ENC_MODE_DEVELOPMENT**

enumerator **ESP_FLASH_ENC_MODE_RELEASE**

2.9.7 SPIFFS 文件系统

概述

SPIFFS 是一个用于 SPI NOR flash 设备的嵌入式文件系统，支持磨损均衡、文件系统一致性检查等功能。

说明

- 目前，SPIFFS 尚不支持目录，但可以生成扁平结构。如果 SPIFFS 挂载在 `/spiffs` 下，在 `/spiffs/tmp/myfile.txt` 路径下创建一个文件则会在 SPIFFS 中生成一个名为 `/tmp/myfile.txt` 的文件，而不是在 `/spiffs/tmp` 下生成名为 `myfile.txt` 的文件；
- SPIFFS 并非实时栈，每次写操作耗时不等；
- 目前，SPIFFS 尚不支持检测或处理已损坏的块。
- SPIFFS 只能稳定地使用约 75% 的指定分区容量。
- 当文件系统空间不足时，垃圾收集器会尝试多次扫描文件系统来寻找可用空间。根据所需空间的不同，写操作会被调用多次，每次函数调用将花费几秒。同一操作可能会花费不同时长的问题缘于 SPIFFS 的设计，且已在官方的 SPIFFS github 仓库 或是 <https://github.com/espressif/esp-idf/issues/1737>‘_ 中被多次报告。这个问题可以通过 SPIFFS 配置 部分缓解。
- 被删除文件通常不会被完全清除，会在文件系统中遗留下无法使用的部分。
- 如果 ESP32 在文件系统操作期间断电，可能会导致 SPIFFS 损坏。但是仍可通过 `esp_spiffs_check` 函数恢复文件系统。详情请参阅官方 SPIFFS *FAQ <https://github.com/pellepl/spiffs/wiki/FAQ>*。

工具

spiffsgen.py spiffsgen.py:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

参数（必选）说明如下：

- **image_size**：分区大小，用于烧录生成的 SPIFFS 镜像；
- **base_dir**：创建 SPIFFS 镜像的目录；
- **output_file**：SPIFFS 镜像输出文件。

其他参数（可选）也参与控制镜像的生成，用户可以运行以下帮助命令，查看这些参数的具体信息:

```
python spiffsgen.py --help
```

上述可选参数对应 SPIFFS 构建配置选项。若想顺利生成可用的镜像，请确保使用的参数或配置与构建 SPIFFS 时所用的参数或配置相同。运行帮助命令将显示参数所对应的 SPIFFS 构建配置。如未指定参数，将使用帮助信息中的默认值。

镜像生成后，用户可以使用 `esptool.py` 或 `parttool.py` 烧录镜像。

用户可以在命令行或脚本中手动单独调用 `spiffsgen.py`，也可以直接从构建系统调用 `spiffs_create_partition_image` 来使用 `spiffsgen.py`:

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS␣
↪dep dep dep...])
```

在构建系统中使用 `spiffsgen.py` 更为方便，构建配置会自动传递给 `spiffsgen.py` 工具，确保生成的镜像可用于构建。比如，单独调用 `spiffsgen.py` 时需要用到 *image_size* 参数，但在构建系统中调用 `spiffs_create_partition_image` 时，仅需要 *partition* 参数，镜像大小将直接从工程分区表中获取。

使用 `spiffs_create_partition_image`，必须从组件 CMakeLists.txt 文件调用。

用户也可以指定 `FLASH_IN_PROJECT`，然后使用 `idf.py flash` 将镜像与应用程序二进制文件、分区表等一起自动烧录至设备，例如:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

不指定 FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT 也可以生成镜像，但须使用 `esptool.py`、`parttool.py` 或自定义构建系统目标手动烧录。

有时基本目录中的内容是在构建时生成的，用户可以使用 DEPENDS/SPIFFS_IMAGE_DEPENDS 指定目标，因此可以在生成镜像之前执行此目标:

```
add_custom_target(dep COMMAND ...)

spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

请参考 storage/spiffsgen，查看示例。

mkspiffs 用户也可以使用 mkspiffs 工具创建 SPIFFS 分区镜像。与 `spiffsgen.py` 相似，mkspiffs 也可以用于从指定文件夹中生成镜像，然后使用 `esptool.py` 烧录镜像。

该工具需要获取以下参数：

- **Block Size**：4096（SPI flash 标准）
- **Page Size**：256（SPI flash 标准）
- **Image Size**：分区大小（以字节为单位，可从分区表中获取）
- **Partition Offset**：分区起始地址（可从分区表中获取）

运行以下命令，将文件夹打包成 1 MB 大小的镜像:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

运行以下命令，将镜像烧录到 ESP32-C3（偏移量：0x110000）：

```
python esptool.py --chip esp32c3 --port [port] --baud [baud] write_flash -z␣
↪0x110000 spiffs.bin
```

选择合适的 SPIFFS 工具 上面介绍的两款 SPIFFS 工具功能相似，需根据实际情况，选择合适的一款。

以下情况优先选用 `spiffsgen.py` 工具：

1. 仅需在构建时简单生成 SPIFFS 镜像，请选择使用 `spiffsgen.py`，因为 `spiffsgen.py` 可以直接在构建系统中使用函数或命令生成 SPIFFS 镜像。
2. 主机没有可用的 C/C++ 编译器时，可以选择使用 `spiffsgen.py` 工具，因为 `spiffsgen.py` 不需要编译。

以下情况优先选用 `mkspiffs` 工具：

1. 如果用户除了需要生成镜像外，还需要拆包 SPIFFS 镜像，请选择使用 `mkspiffs` 工具，因为 `spiffsgen.py` 目前尚不支持此功能。
2. 如果用户当前环境中 Python 解释器不可用，但主机编译器可用，或者有预编译的 `mkspiffs` 二进制文件，此时请选择使用 `mkspiffs` 工具。但是，`mkspiffs` 没有集成到构建系统，用户必须自己完成以下工作：在构建期间编译 `mkspiffs`（如果未使用预编译的二进制文件），为输出文件创建构建规则或目标，将适当的参数传递给工具等。

另请参阅

- 分区表

应用示例

storage/spiffs 目录下提供了 SPIFFS 应用示例。该示例初始化并挂载了一个 SPIFFS 分区，然后使用 POSIX 和 C 库 API 写入和读取数据。请参考 `example` 目录下的 README.md 文件，获取详细信息。

高级 API 参考

Header File

- components/spiffs/include/esp_spiffs.h

Functions

esp_err_t **esp_vfs_spiffs_register**(const *esp_vfs_spiffs_conf_t* *conf)

Register and mount SPIFFS to VFS with given path prefix.

参数 **conf** –Pointer to *esp_vfs_spiffs_conf_t* configuration structure

返回

- ESP_OK if success
- ESP_ERR_NO_MEM if objects could not be allocated
- ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
- ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
- ESP_FAIL if mount or format fails

esp_err_t **esp_vfs_spiffs_unregister**(const char *partition_label)

Unregister and unmount SPIFFS from VFS

参数 **partition_label** –Same label as passed to esp_vfs_spiffs_register.

返回

- ESP_OK if successful

- ESP_ERR_INVALID_STATE already unregistered

bool **esp_spiffs_mounted**(const char *partition_label)

Check if SPIFFS is mounted

参数 **partition_label** –Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

返回

- true if mounted
- false if not mounted

esp_err_t **esp_spiffs_format**(const char *partition_label)

Format the SPIFFS partition

参数 **partition_label** –Same label as passed to esp_vfs_spiffs_register.

返回

- ESP_OK if successful
- ESP_FAIL on error

esp_err_t **esp_spiffs_info**(const char *partition_label, size_t *total_bytes, size_t *used_bytes)

Get information for SPIFFS

参数

- **partition_label** –Same label as passed to esp_vfs_spiffs_register
- **total_bytes** –**[out]** Size of the file system
- **used_bytes** –**[out]** Current used bytes in the file system

返回

- ESP_OK if success
- ESP_ERR_INVALID_STATE if not mounted

esp_err_t **esp_spiffs_check**(const char *partition_label)

Check integrity of SPIFFS

参数 **partition_label** –Same label as passed to esp_vfs_spiffs_register

返回

- ESP_OK if successful
- ESP_ERR_INVALID_STATE if not mounted
- ESP_FAIL on error

esp_err_t **esp_spiffs_gc**(const char *partition_label, size_t size_to_gc)

Perform garbage collection in SPIFFS partition.

Call this function to run GC and ensure that at least the given amount of space is available in the partition. This function will fail with ESP_ERR_NOT_FINISHED if it is not possible to reclaim the requested space (that is, not enough free or deleted pages in the filesystem). This function will also fail if it fails to reclaim the requested space after CONFIG_SPIFFS_GC_MAX_RUNS number of GC iterations. On one GC iteration, SPIFFS will erase one logical block (4kB). Therefore the value of CONFIG_SPIFFS_GC_MAX_RUNS should be set at least to the maximum expected size_to_gc, divided by 4096. For example, if the application expects to make room for a 1MB file and calls esp_spiffs_gc(label, 1024 * 1024), CONFIG_SPIFFS_GC_MAX_RUNS should be set to at least 256. On the other hand, increasing CONFIG_SPIFFS_GC_MAX_RUNS value increases the maximum amount of time for which any SPIFFS GC or write operation may potentially block.

参数

- **partition_label** –Label of the partition to be garbage-collected. The partition must be already mounted.
- **size_to_gc** –The number of bytes that the GC process should attempt to make available.

返回

- ESP_OK on success
- ESP_ERR_NOT_FINISHED if GC fails to reclaim the size given by size_to_gc
- ESP_ERR_INVALID_STATE if the partition is not mounted
- ESP_FAIL on all other errors

Structures

struct **esp_vfs_spiffs_conf_t**

Configuration structure for esp_vfs_spiffs_register.

Public Members

const char ***base_path**

File path prefix associated with the filesystem.

const char ***partition_label**

Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

size_t **max_files**

Maximum files that could be open at the same time.

bool **format_if_mount_failed**

If true, it will format the file system if it fails to mount.

2.9.8 虚拟文件系统组件

概述

虚拟文件系统 (VFS) 组件为驱动程序提供一个统一接口，可以操作类文件对象。这类驱动程序可以是 FAT、SPIFFS 等真实文件系统，也可以是提供文件类接口的设备驱动程序。

VFS 组件支持 C 库函数（如 fopen 和 fprintf 等）与文件系统 (FS) 驱动程序协同工作。在高层级，每个 FS 驱动程序均与某些路径前缀相关联。当一个 C 库函数需要打开文件时，VFS 组件将搜索与该文件所在文件路径相关联的 FS 驱动程序，并将调用传递给该驱动程序。针对该文件的读取、写入等其他操作的调用也将传递给这个驱动程序。

例如，您可以使用 `/fat` 前缀注册 FAT 文件系统驱动，之后即可调用 `fopen("/fat/file.txt", "w")`。之后，VFS 将调用 FAT 驱动的 `open` 函数，并将参数 `/file.txt` 和合适的打开模式传递给 `open` 函数；后续对返回的 `FILE*` 数据流调用 C 库函数也同样会传递给 FAT 驱动。

注册 FS 驱动程序

如需注册 FS 驱动程序，应用程序首先要定义一个*esp_vfs_t* 结构体实例，并用指向 FS API 的函数指针填充它。

```
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};

ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

在上述代码中需要用到 read、write 或 read_p、write_p，具体使用哪组函数由 FS 驱动程序 API 的声明方式决定。

示例 1：声明 API 函数时不带额外的上下文指针参数，即 FS 驱动程序为单例模式，此时使用 write

```
ssize_t myfs_write(int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

示例 2：声明 API 函数时需要一个额外的上下文指针作为参数，即可支持多个 FS 驱动程序实例，此时使用 write_p

```
ssize_t myfs_write(myfs_t* fs, int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

同步输入/输出多路复用 VFS 组件支持通过 select() 进行同步输入/输出多路复用，其实现方式如下：

1. 调用 select()，使用时提供的文件描述符可以属于不同的 VFS 驱动。
2. 文件描述符被分为几组，每组属于一个 VFS 驱动。
3. 非套接字 VFS 驱动的文件描述符由 start_select() 移交给指定的 VFS 驱动，后文会对此进行详述。该函数代表指定驱动 select() 的实现。这是一个非阻塞的调用，意味着在设置好检查与指定文件描述符相关事件的环境后，该函数应该立即返回。
4. 套接字 VFS 驱动的文件描述符由 socket_select() 移交给套接字 VFS 驱动，后文会对此进行详述。这是一个阻塞调用，意味着只有当有一个与套接字文件描述符相关的事件或非套接字驱动发出信号让 socket_select() 退出时，它才会返回。
5. 从各个 VFS 驱动程序收集结果，并通过对事件检查环境取消初始化来终止所有驱动程序。
6. select() 调用结束并返回适当的结果。

非套接字 VFS 驱动 如果要使用非套接字 VFS 驱动的文件描述符调用 select()，那么需要用函数 start_select() 和 end_select() 注册该驱动，具体如下：

```
// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
// ... other members initialized
```

调用 start_select() 函数可以设置环境，检测指定 VFS 驱动的文件描述符读取/写入/错误条件。

调用 end_select() 函数可以终止/取消初始化/释放由 start_select() 设置的环境。

备注: 在少数情况下，在调用 `end_select()` 之前可能并没有调用过 `start_select()`。因此 `end_select()` 的实现必须在该情况下返回错误而不能崩溃。

如需获取更多信息，请参考 vfs/vfs_uart.c 中 UART 外设的 VFS 驱动，尤其是函数 *esp_vfs_dev_uart_register()*、`uart_start_select()` 和 `uart_end_select()`。

请参考以下示例，查看如何使用 VFS 文件描述符调用 `select()`：

- peripherals/uart/uart_select
- system/select

套接字 VFS 驱动 套接字 VFS 驱动会使用自实现的 `socket_select()` 函数，在读取/写入/错误条件时，非套接字 VFS 驱动会通知该函数。

可通过定义以下函数注册套接字 VFS 驱动：

```
// In definition of esp_vfs_t:
    .socket_select = &lwip_select,
    .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
    .stop_socket_select = &lwip_stop_socket_select,
    .stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

函数 `socket_select()` 是套接字驱动对 `select()` 的内部实现。该函数只对套接字 VFS 驱动的文件描述符起作用。

`get_socket_select_semaphore()` 返回信号对象 (semaphore)，用于非套接字驱动程序中，以终止 `socket_select()` 的等待。

`stop_socket_select()` 通过传递 `get_socket_select_semaphore()` 函数返回的对象来终止 `socket_select()` 函数的等待。

`stop_socket_select_isr()` 与 `stop_socket_select()` 的作用相似，但是前者可在 ISR 中使用。

请参考 lwip/port/esp32/vfs_lwip.c 以了解使用 LWIP 的套接字驱动参考实现。

备注: 如果 `select()` 用于套接字文件描述符，您可以禁用 *CONFIG_VFS_SUPPORT_SELECT* 选项来减少代码量，提高性能。不要在 `select()` 调用过程中更改套接字驱动，否则会出现一些未定义行为。

路径

已注册的 FS 驱动程序均有一个路径前缀与之关联，此路径前缀即为分区的挂载点。

如果挂载点中嵌套了其他挂载点，则在打开文件时使用具有最长匹配路径前缀的挂载点。例如，假设以下文件系统已在 VFS 中注册：

- 在 /data 下注册 FS 驱动程序 1
- 在 /data/static 下注册 FS 驱动程序 2

那么：

- 打开 `/data/log.txt` 会调用驱动程序 FS 1；
- 打开 `/data/static/index.html` 需调用 FS 驱动程序 2；
- 即便 FS 驱动程序 2 中没有 `/index.html`，也不会在 FS 驱动程序 1 中查找 `/static/index.html`。

挂载点名称必须以路径分隔符 (/) 开头，且分隔符后至少包含一个字符。但在以下情况中，VFS 同样支持空的挂载点名称：1. 应用程序需要提供一个”最后方案“下使用的文件系统；2. 应用程序需要同时覆盖 VFS 功能。如果没有与路径匹配的前缀，就会使用到这种文件系统。

VFS 不会对路径中的点 (.) 进行特殊处理，也不会将 .. 视为对父目录的引用。在上述示例中，使用 /data/static/../log.txt 路径不会调用 FS 驱动程序 1 打开 /log.txt。特定的 FS 驱动程序（如 FATFS）可能以不同的方式处理文件名中的点。

执行打开文件操作时，FS 驱动程序仅得到文件的相对路径（挂载点前缀已经被去除）：

1. 以 /data 为路径前缀注册 myfs 驱动；
2. 应用程序调用 fopen("/data/config.json", ...)；
3. VFS 调用 myfs_open("/config.json", ...)；
4. myfs 驱动打开 /config.json 文件。

VFS 对文件路径长度没有限制，但文件系统路径前缀受 ESP_VFS_PATH_MAX 限制，即路径前缀上限为 ESP_VFS_PATH_MAX。各个文件系统驱动则可能会对自己的文件名长度设置一些限制。

文件描述符

文件描述符是一组很小的正整数，从 0 到 FD_SETSIZE - 1，FD_SETSIZE 在 newlib sys/types.h 中定义。最大文件描述符由 CONFIG_LWIP_MAX_SOCKETS 定义，且为套接字保留。VFS 中包含一个名为 s_fd_table 的查找表，用于将全局文件描述符映射至 s_vfs 数组中注册的 VFS 驱动索引。

标准 IO 流 (stdin, stdout, stderr)

如果 menuconfig 中 UART for console output 选项没有设置为 None，则 stdin、stdout 和 stderr 将默认从 UART 读取或写入。UART0 或 UART1 可用作标准 IO。默认情况下，UART0 使用 115200 波特率，TX 管脚为 GPIO1，RX 管脚为 GPIO3。您可以在 menuconfig 中更改上述参数。

对 stdout 或 stderr 执行写入操作将会向 UART 发送 FIFO 发送字符，对 stdin 执行读取操作则会从 UART 接收 FIFO 中取出字符。

默认情况下，VFS 使用简单的函数对 UART 进行读写操作。在所有数据放进 UART FIFO 之前，写操作将处于 busy-wait 状态，读操处于非阻塞状态，仅返回 FIFO 中已有数据。由于读操作为非阻塞，高层级 C 库函数调用（如 fscanf("%d\n", &var);）可能获取不到所需结果。

如果应用程序使用 UART 驱动，则可以调用 esp_vfs_dev_uart_use_driver 函数来指导 VFS 使用驱动中断、读写阻塞功能等。您也可以调用 esp_vfs_dev_uart_use_nonblocking 来恢复非阻塞函数。

VFS 还为输入和输出提供换行符转换功能（可选）。多数应用程序在程序内部发送或接收以 LF（'\n'）结尾的行，但不同的终端程序可能需要不同的换行符，比如 CR 或 CRLF。应用程序可以通过 menuconfig 或者调用 esp_vfs_dev_uart_port_set_rx_line_endings 和 esp_vfs_dev_uart_port_set_tx_line_endings 为输入输出配置换行符。

标准流和 FreeRTOS 任务 stdin、stdout 和 stderr 的 FILE 对象在所有 FreeRTOS 任务之间共享，指向这些对象的指针分别存储在每个任务的 struct _reent 中。

预处理器把如下代码解释为 fprintf(__getreent()->_stderr, "42\n");：

```
fprintf(stderr, "42\n");
```

其中 __getreent() 函数将为每个任务返回一个指向 newlib libc 中 struct _reent 的指针。每个任务的 TCB 均拥有一个 struct _reent 结构体，任务初始化后，struct _reent 结构体中的 _stdin、_stdout 和 _stderr 将会被赋予 _GLOBAL_REENT 中 _stdin、_stdout 和 _stderr 的值，_GLOBAL_REENT 即为 FreeRTOS 启动之前所用结构体。

这样设计带来的结果是：

- 允许设置给定任务的 stdin、stdout 和 stderr，而不影响其他任务，例如通过 stdin = fopen("/dev/uart/1", "r");
- 但使用 fclose 关闭默认 stdin、stdout 或 stderr 将同时关闭相应的 FILE 流对象，因此会影响其他任务；

- 如需更改新任务的默认 stdin、stdout 和 stderr 流，请在创建新任务之前修改 _GLOBAL_REENT->_stdin (_stdout、_stderr)。

Event fds

eventfd() 是一个很强大的工具，可以循环通知基于 select() 的自定义事件。在 ESP-IDF 中，eventfd() 的实现大体上与 man(2) eventfd 中的描述相同，主要区别如下：

- 在调用 eventfd() 之前必须先调用 esp_vfs_eventfd_register()；
- 标志中没有 EFD_CLOEXEC、EFD_NONBLOCK 和 EFD_SEMAPHORE 选项；
- EFD_SUPPORT_ISR 选项已经被添加到标志中。在中断处理程序中读取和写入 eventfd 需要这个标志。

注意，用 EFD_SUPPORT_ISR 创建 eventfd 将导致在读取、写入文件时，以及在设置这个文件的 select() 开始和结束时，暂时禁用中断。

API 参考

Header File

- components/vfs/include/esp_vfs.h

Functions

ssize_t **esp_vfs_write** (struct _reent *r, int fd, const void *data, size_t size)

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

off_t **esp_vfs_lseek** (struct _reent *r, int fd, off_t size, int mode)

ssize_t **esp_vfs_read** (struct _reent *r, int fd, void *dst, size_t size)

int **esp_vfs_open** (struct _reent *r, const char *path, int flags, int mode)

int **esp_vfs_close** (struct _reent *r, int fd)

int **esp_vfs_fstat** (struct _reent *r, int fd, struct stat *st)

int **esp_vfs_stat** (struct _reent *r, const char *path, struct stat *st)

int **esp_vfs_link** (struct _reent *r, const char *n1, const char *n2)

int **esp_vfs_unlink** (struct _reent *r, const char *path)

int **esp_vfs_rename** (struct _reent *r, const char *src, const char *dst)

int **esp_vfs_utime** (const char *path, const struct utimbuf *times)

esp_err_t **esp_vfs_register** (const char *base_path, const *esp_vfs_t* *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

参数

- **base_path** –file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to ESP_VFS_PATH_MAX characters long, and at least 2 characters long. Name must start with a "/" and must not end with "/". For example, "/data" or "/dev/spi" are valid. These VFSes would then be called to handle file paths such as "/data/myfile.txt" or "/dev/spi/0". In the special case of an empty base_path, a "fallback" VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
- **vfs** –Pointer to *esp_vfs_t*, a structure which maps syscalls to the filesystem driver functions. VFS component doesn't assume ownership of this pointer.

- **ctx** –If vfs->flags has ESP_VFS_FLAG_CONTEXT_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.

返回 ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

esp_err_t **esp_vfs_register_fd_range**(const *esp_vfs_t* *vfs, void *ctx, int min_fd, int max_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min_fd; max_fd).

This is a special-purpose function intended for registering LWIP sockets to VFS.

参数

- **vfs** –Pointer to *esp_vfs_t*. Meaning is the same as for esp_vfs_register().
- **ctx** –Pointer to context structure. Meaning is the same as for esp_vfs_register().
- **min_fd** –The smallest file descriptor this VFS will use.
- **max_fd** –Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

返回 ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

esp_err_t **esp_vfs_register_with_id**(const *esp_vfs_t* *vfs, void *ctx, *esp_vfs_id_t* *vfs_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn't pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp_vfs_register_fd.

参数

- **vfs** –Pointer to *esp_vfs_t*. Meaning is the same as for esp_vfs_register().
- **ctx** –Pointer to context structure. Meaning is the same as for esp_vfs_register().
- **vfs_id** –Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.

返回 ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

esp_err_t **esp_vfs_unregister**(const char *base_path)

Unregister a virtual filesystem for given path prefix

参数 **base_path** –file prefix previously used in esp_vfs_register call

返回 ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn't been registered

esp_err_t **esp_vfs_unregister_with_id**(*esp_vfs_id_t* vfs_id)

Unregister a virtual filesystem with the given index

参数 **vfs_id** –The VFS ID returned by esp_vfs_register_with_id

返回 ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for the given index hasn't been registered

esp_err_t **esp_vfs_register_fd**(*esp_vfs_id_t* vfs_id, int *fd)

Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id.

参数

- **vfs_id** –VFS identificator returned by esp_vfs_register_with_id.
- **fd** –The registered file descriptor will be written to this address.

返回 ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

esp_err_t **esp_vfs_register_fd_with_local_fd**(*esp_vfs_id_t* vfs_id, int local_fd, bool permanent, int *fd)

Special function for registering another file descriptor with given local_fd for a VFS registered by esp_vfs_register_with_id.

参数

- **vfs_id** –VFS identificator returned by esp_vfs_register_with_id.
- **local_fd** –The fd in the local vfs. Passing -1 will set the local fd as the (*fd) value.

- **permanent** –Whether the fd should be treated as permannet (not removed after close())
- **fd** –The registered file descriptor will be written to this address.

返回 ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

esp_err_t **esp_vfs_unregister_fd**(*esp_vfs_id_t* vfs_id, int fd)

Special function for unregistering a file descriptor belonging to a VFS registered by esp_vfs_register_with_id.

参数

- **vfs_id** –VFS identificator returned by esp_vfs_register_with_id.
- **fd** –File descriptor which should be unregistered.

返回 ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

int **esp_vfs_select**(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)

Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

参数

- **nfds** –Specifies the range of descriptors which should be checked. The first nfds descriptors will be checked in each set.
- **readfds** –If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- **writefds** –If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- **errorfds** –If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- **timeout** –If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

返回 The number of descriptors set in the descriptor sets, or -1 when an error (specified by errno) have occurred.

void **esp_vfs_select_triggered**(*esp_vfs_select_sem_t* sem)

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

参数 **sem** –semaphore structure which was passed to the driver by the start_select call

void **esp_vfs_select_triggered_isr**(*esp_vfs_select_sem_t* sem, BaseType_t *woken)

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

参数

- **sem** –semaphore structure which was passed to the driver by the start_select call
- **woken** –is set to pdTRUE if the function wakes up a task with higher priority

ssize_t **esp_vfs_pread**(int fd, void *dst, size_t size, off_t offset)

Implements the VFS layer of POSIX pread()

参数

- **fd** –File descriptor used for read
- **dst** –Pointer to the buffer where the output will be written
- **size** –Number of bytes to be read
- **offset** –Starting offset of the read

返回 A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

ssize_t **esp_vfs_pwrite**(int fd, const void *src, size_t size, off_t offset)

Implements the VFS layer of POSIX pwrite()

参数

- **fd** –File descriptor used for write
- **src** –Pointer to the buffer from where the output will be read
- **size** –Number of bytes to write
- **offset** –Starting offset of the write

返回 A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

Structures

struct **esp_vfs_select_sem_t**

VFS semaphore type for select()

Public Members

bool **is_sem_local**

type of "sem" is SemaphoreHandle_t when true, defined by socket driver otherwise

void ***sem**

semaphore instance

struct **esp_vfs_t**

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have _p suffix, set flags member to ESP_VFS_FLAG_CONTEXT_PTR and provide the context pointer to esp_vfs_register function. If the implementation doesn't use this extra argument, populate the members without _p suffix and set flags member to ESP_VFS_FLAG_DEFAULT.

If the FS driver doesn't provide some of the functions, set corresponding members to NULL.

Public Members

int **flags**

ESP_VFS_FLAG_CONTEXT_PTR or ESP_VFS_FLAG_DEFAULT

ssize_t (***write_p**)(void *p, int fd, const void *data, size_t size)

Write with context pointer

ssize_t (***write**)(int fd, const void *data, size_t size)

Write without context pointer

off_t (***lseek_p**)(void *p, int fd, off_t size, int mode)
Seek with context pointer

off_t (***lseek**)(int fd, off_t size, int mode)
Seek without context pointer

ssize_t (***read_p**)(void *ctx, int fd, void *dst, size_t size)
Read with context pointer

ssize_t (***read**)(int fd, void *dst, size_t size)
Read without context pointer

ssize_t (***pread_p**)(void *ctx, int fd, void *dst, size_t size, off_t offset)
pread with context pointer

ssize_t (***pread**)(int fd, void *dst, size_t size, off_t offset)
pread without context pointer

ssize_t (***pwrite_p**)(void *ctx, int fd, const void *src, size_t size, off_t offset)
pwrite with context pointer

ssize_t (***pwrite**)(int fd, const void *src, size_t size, off_t offset)
pwrite without context pointer

int (***open_p**)(void *ctx, const char *path, int flags, int mode)
open with context pointer

int (***open**)(const char *path, int flags, int mode)
open without context pointer

int (***close_p**)(void *ctx, int fd)
close with context pointer

int (***close**)(int fd)
close without context pointer

int (***fstat_p**)(void *ctx, int fd, struct *stat* *st)
fstat with context pointer

int (***fstat**)(int fd, struct *stat* *st)
fstat without context pointer

int (***stat_p**)(void *ctx, const char *path, struct *stat* *st)
stat with context pointer

int (***stat**)(const char *path, struct *stat* *st)
stat without context pointer

int (***link_p**)(void *ctx, const char *n1, const char *n2)
link with context pointer

int (***link**)(const char *n1, const char *n2)
link without context pointer

int (***unlink_p**)(void *ctx, const char *path)
unlink with context pointer

int (***unlink**)(const char *path)
unlink without context pointer

int (***rename_p**)(void *ctx, const char *src, const char *dst)
rename with context pointer

int (***rename**)(const char *src, const char *dst)
rename without context pointer

DIR *(***opendir_p**)(void *ctx, const char *name)
opendir with context pointer

DIR *(***opendir**)(const char *name)
opendir without context pointer

struct dirent *(***readdir_p**)(void *ctx, DIR *pdir)
readdir with context pointer

struct dirent *(***readdir**)(DIR *pdir)
readdir without context pointer

int (***readdir_r_p**)(void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
readdir_r with context pointer

int (***readdir_r**)(DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
readdir_r without context pointer

long (***telldir_p**)(void *ctx, DIR *pdir)
telldir with context pointer

long (***telldir**)(DIR *pdir)
telldir without context pointer

void (***seekdir_p**)(void *ctx, DIR *pdir, long offset)
seekdir with context pointer

void (***seekdir**)(DIR *pdir, long offset)
seekdir without context pointer

int (***closedir_p**)(void *ctx, DIR *pdir)
closedir with context pointer

int (***closedir**)(DIR *pdir)
closedir without context pointer

int (***mkdir_p**)(void *ctx, const char *name, mode_t mode)
mkdir with context pointer

int (***mkdir**)(const char *name, mode_t mode)
mkdir without context pointer

int (***rmdir_p**)(void *ctx, const char *name)
rmdir with context pointer

int (***rmdir**)(const char *name)
rmdir without context pointer

int (***fcntl_p**)(void *ctx, int fd, int cmd, int arg)
fcntl with context pointer

int (***fcntl**)(int fd, int cmd, int arg)
fcntl without context pointer

int (***ioctl_p**)(void *ctx, int fd, int cmd, va_list args)
ioctl with context pointer

int (***ioctl**)(int fd, int cmd, va_list args)
ioctl without context pointer

int (***fsync_p**)(void *ctx, int fd)
fsync with context pointer

int (***fsync**)(int fd)
fsync without context pointer

int (***access_p**)(void *ctx, const char *path, int amode)
access with context pointer

int (***access**)(const char *path, int amode)
access without context pointer

int (***truncate_p**)(void *ctx, const char *path, off_t length)
truncate with context pointer

int (***truncate**)(const char *path, off_t length)
truncate without context pointer

int (*`ftruncate_p`)(void *ctx, int fd, off_t length)
: ftruncate with context pointer

int (*`ftruncate`)(int fd, off_t length)
: ftruncate without context pointer

int (*`utime_p`)(void *ctx, const char *path, const struct utimbuf *times)
: utime with context pointer

int (*`utime`)(const char *path, const struct utimbuf *times)
: utime without context pointer

int (*`tcsetattr_p`)(void *ctx, int fd, int optional_actions, const struct termios *p)
: tcsetattr with context pointer

int (*`tcsetattr`)(int fd, int optional_actions, const struct termios *p)
: tcsetattr without context pointer

int (*`tcgetattr_p`)(void *ctx, int fd, struct termios *p)
: tcgetattr with context pointer

int (*`tcgetattr`)(int fd, struct termios *p)
: tcgetattr without context pointer

int (*`tcdrain_p`)(void *ctx, int fd)
: tcdrain with context pointer

int (*`tcdrain`)(int fd)
: tcdrain without context pointer

int (*`tcflush_p`)(void *ctx, int fd, int select)
: tcflush with context pointer

int (*`tcflush`)(int fd, int select)
: tcflush without context pointer

int (*`tcflow_p`)(void *ctx, int fd, int action)
: tcflow with context pointer

int (*`tcflow`)(int fd, int action)
: tcflow without context pointer

pid_t (*`tcgetsid_p`)(void *ctx, int fd)
: tcgetsid with context pointer

pid_t (*`tcgetsid`)(int fd)
: tcgetsid without context pointer

int (*`tcsendbreak_p`)(void *ctx, int fd, int duration)

tcsendbreak with context pointer

int (*`tcsendbreak`)(int fd, int duration)

tcsendbreak without context pointer

esp_err_t (*`start_select`)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds, *esp_vfs_select_sem_t* sem, void **end_select_args)

start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (*`socket_select`)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)

socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (*`stop_socket_select`)(void *sem)

called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (*`stop_socket_select_isr`)(void *sem, BaseType_t *woken)

stop_socket_select which can be called from ISR; set only for the socket driver

void *(*`get_socket_select_semaphore`)(void)

end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select for the given VFS

esp_err_t (*`end_select`)(void *end_select_args)

get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

Macros

`MAX_FDS`

Maximum number of (global) file descriptors.

`ESP_VFS_PATH_MAX`

Maximum length of path prefix (not including zero terminator)

`ESP_VFS_FLAG_DEFAULT`

Default value of flags member in *esp_vfs_t* structure.

`ESP_VFS_FLAG_CONTEXT_PTR`

Flag which indicates that FS needs extra context pointer in syscalls.

Type Definitions

typedef int **`esp_vfs_id_t`**

Header File

- components/vfs/include/esp_vfs_dev.h

Functions

void **esp_vfs_dev_uart_register**(void)

add /dev/uart virtual filesystem driver

This function is called from startup code to enable serial output

void **esp_vfs_dev_uart_set_rx_line_endings**(esp_line_endings_t mode)

Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines (‘ ’ , LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification

备注： this function is not thread safe w.r.t. reading from UART

参数 **mode** –line endings expected on UART

void **esp_vfs_dev_uart_set_tx_line_endings**(esp_line_endings_t mode)

Set the line endings to sent to UART.

This specifies the conversion between newlines (‘ ’ , LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

备注： this function is not thread safe w.r.t. writing to UART

参数 **mode** –line endings to send to UART

int **esp_vfs_dev_uart_port_set_rx_line_endings**(int uart_num, esp_line_endings_t mode)

Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines (‘ ’ , LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification

备注： this function is not thread safe w.r.t. reading from UART

参数

- **uart_num** –the UART number
- **mode** –line endings to send to UART

返回 0 if successed, or -1 when an error (specified by errno) have occurred.

int **esp_vfs_dev_uart_port_set_tx_line_endings**(int uart_num, esp_line_endings_t mode)

Set the line endings to sent to specified UART.

This specifies the conversion between newlines (‘

’ , LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

备注: this function is not thread safe w.r.t. writing to UART

参数

- **uart_num** –the UART number
- **mode** –line endings to send to UART

返回 0 if successed, or -1 when an error (specified by errno) have occurred.

void **esp_vfs_dev_uart_use_nonblocking**(int uart_num)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

参数 **uart_num** –UART peripheral number

void **esp_vfs_dev_uart_use_driver**(int uart_num)

set VFS to use UART driver for reading and writing

备注: application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

参数 **uart_num** –UART peripheral number

void **esp_vfs_usb_serial_jtag_use_driver**(void)

set VFS to use USB-SERIAL-JTAG driver for reading and writing

备注: application must configure USB-SERIAL-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

void **esp_vfs_usb_serial_jtag_use_nonblocking**(void)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

Header File

- components/vfs/include/esp_vfs_eventfd.h

Functions

esp_err_t **esp_vfs_eventfd_register**(const *esp_vfs_eventfd_config_t* *config)

Registers the event vfs.

返回 ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

esp_err_t **esp_vfs_eventfd_unregister**(void)

Unregisters the event vfs.

返回 ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn't been registered

int **eventfd**(unsigned int initval, int flags)

Structures

struct **esp_vfs_eventfd_config_t**

Eventfd vfs initialization settings.

Public Members

size_t **max_fds**

The maxinum number of eventfds supported

Macros

EFD_SUPPORT_ISR

ESP_VFS_EVENTD_CONFIG_DEFAULT()

2.9.9 磨损均衡 API

概述

ESP32-C3 所使用的 flash，特别是 SPI flash，多数具备扇区结构，且每个扇区仅允许有限次数的擦除/修改操作。为了避免过度使用某一扇区，乐鑫提供了磨损均衡组件，无需用户介入即可帮助用户均衡各个扇区之间的磨损。

磨损均衡组件包含了通过分区组件对外部 SPI flash 进行数据读取、写入、擦除和存储器映射相关的 API 函数。磨损均衡组件还具有软件上更高级别的 API 函数，与*FAT 文件系统* 协同工作。

磨损均衡组件与 FAT 文件系统组件共用 FAT 文件系统的扇区，扇区大小为 4096 字节，是标准 flash 扇区的大小。在这种模式下，磨损均衡组件性能达到最佳，但需要在 RAM 中占用更多内存。

为了节省内存，磨损均衡组件还提供了另外两种模式，均使用 512 字节大小的扇区：

- **性能模式**：先将数据保存在 RAM 中，擦除扇区，然后将数据存储回 flash。如果设备在扇区擦写过程中突然断电，则整个扇区（4096 字节）数据将全部丢失。
- **安全模式**：数据先保存在 flash 中空余扇区，擦除扇区后，数据即存储回去。如果设备断电，上电后可立即恢复数据。

设备默认设置如下：

- 定义扇区大小为 512 字节
- 默认使用性能模式

您可以使用配置菜单更改设置。

磨损均衡组件不会将数据缓存在 RAM 中。写入和擦除函数直接修改 flash，函数返回后，flash 即完成修改。

磨损均衡访问 API

处理 flash 数据常用的 API 如下所示：

- `wl_mount` - 为指定分区挂载并初始化磨损均衡模块
- `wl_unmount` - 卸载分区并释放磨损均衡模块
- `wl_erase_range` - 擦除 flash 中指定的地址范围
- `wl_write` - 将数据写入分区
- `wl_read` - 从分区读取数据
- `wl_size` - 返回可用内存的大小（以字节为单位）
- `wl_sector_size` - 返回一个扇区的大小

请尽量避免直接使用原始磨损均衡函数，建议您使用文件系统特定的函数。

内存大小

内存大小是根据分区参数在磨损均衡模块中计算所得，由于模块使用 flash 部分扇区存储内部数据，因此计算所得内存大小有少许偏差。

另请参阅

- *FAT 文件系统*
- 分区表

应用示例

storage/wear_levelling 中提供了一款磨损均衡驱动与 FatFs 库结合使用的示例。该示例初始化磨损均衡驱动，挂载 FAT 文件系统分区，并使用 POSIX（可移植操作系统接口）和 C 库 API 从中写入和读取数据。如需了解更多信息，请参考 storage/wear_levelling/README.md。

高级 API 参考

头文件

- fatfs/vfs/esp_vfs_fat.h

函数

esp_err_t **esp_vfs_fat_spiflash_mount_rw_wl**(const char *base_path, const char *partition_label, const *esp_vfs_fat_mount_config_t* *mount_config, *wl_handle_t* *wl_handle)

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

参数

- **base_path** –path where FATFS partition should be mounted (e.g. “/spiflash”)
- **partition_label** –label of the partition which should be used
- **mount_config** –pointer to structure with extra parameters for mounting FATFS
- **wl_handle** –**[out]** wear levelling driver handle

返回

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

struct **esp_vfs_fat_mount_config_t**

Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount_rw_wl functions.

Public Members

bool **format_if_mount_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int **max_files**

Max number of open files.

size_t **allocation_unit_size**

If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear_levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

bool **disk_status_check_enable**

Enables real ff_disk_status function implementation for SD cards (ff_sdmmc_status). Possibly slows down IO performance.

Try to enable if you need to handle situations when SD cards are not unmounted properly before physical removal or you are experiencing issues with SD cards.

Doesn’t do anything for other memory storage media.

esp_err_t **esp_vfs_fat_spiflash_unmount_rw_wl**(const char *base_path, *wl_handle_t* wl_handle)

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_rw_wl.

参数

- **base_path** –path where partition should be registered (e.g. “/spiflash”)
- **wl_handle** –wear levelling driver handle returned by esp_vfs_fat_spiflash_mount_rw_wl

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl hasn’t been called

中层 API 参考

Header File

- components/wear_levelling/include/wear_levelling.h

Functions

esp_err_t **wl_mount**(const *esp_partition_t* *partition, *wl_handle_t* *out_handle)

Mount WL for defined partition.

参数

- **partition** –that will be used for access
- **out_handle** –handle of the WL instance

返回

- ESP_OK, if the allocation was successfully;
- ESP_ERR_INVALID_ARG, if WL allocation was unsuccessful;
- ESP_ERR_NO_MEM, if there was no memory to allocate WL components;

esp_err_t **wl_unmount**(*wl_handle_t* handle)

Unmount WL for defined partition.

参数 **handle** –WL partition handle

返回

- ESP_OK, if the operation completed successfully;
- or one of error codes from lower-level flash driver.

esp_err_t **wl_erase_range**(*wl_handle_t* handle, size_t start_addr, size_t size)

Erase part of the WL storage.

参数

- **handle** –WL handle that are related to the partition
- **start_addr** –Address where erase operation should start. Must be aligned to the result of function wl_sector_size(…).
- **size** –Size of the range which should be erased, in bytes. Must be divisible by result of function wl_sector_size(…)..

返回

- ESP_OK, if the range was erased successfully;
- ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
- ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

esp_err_t **wl_write**(*wl_handle_t* handle, size_t dest_addr, const void *src, size_t size)

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using wl_erase_range function.

备注: Prior to writing to WL storage, make sure it has been erased with wl_erase_range call.

参数

- **handle** –WL handle that are related to the partition
- **dest_addr** –Address where the data should be written, relative to the beginning of the partition.
- **src** –Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** –Size of data to be written, in bytes.

返回

- ESP_OK, if data was written successfully;
- ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;

- ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

esp_err_t **wl_read**(*wl_handle_t* handle, size_t src_addr, void *dest, size_t size)

Read data from the WL storage.

参数

- **handle** –WL module instance that was initialized before
- **dest** –Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src_addr** –Address of the data to be read, relative to the beginning of the partition.
- **size** –Size of data to be read, in bytes.

返回

- ESP_OK, if data was read successfully;
- ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

size_t **wl_size**(*wl_handle_t* handle)

Get size of the WL storage.

参数 **handle** –WL module handle that was initialized before
返回 usable size, in bytes

size_t **wl_sector_size**(*wl_handle_t* handle)

Get sector size of the WL instance.

参数 **handle** –WL module handle that was initialized before
返回 sector size, in bytes

Macros

WL_INVALID_HANDLE

Type Definitions

typedef int32_t **wl_handle_t**

wear levelling handle

2.10 System API

2.10.1 App Image Format

An application image consists of the following structures:

1. The *esp_image_header_t* structure describes the mode of SPI flash and the count of memory segments.
2. The *esp_image_segment_header_t* structure describes each segment, its length, and its location in ESP32-C3’s memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:

- offset for 0 Segment = sizeof(*esp_image_header_t*) + sizeof(*esp_image_segment_header_t*).
- offset for 1 Segment = offset for 0 Segment + length of 0 Segment + sizeof(*esp_image_segment_header_t*).

- offset for 2 Segment = offset for 1 Segment + length of 1 Segment + sizeof(*esp_image_segment_header_t*).
- ...

The count of each segment is defined in the `segment_count` field that is stored in *esp_image_header_t*. The count cannot be more than *ESP_IMAGE_MAX_SEGMENTS*.

To get the list of your image segments, please run the following command:

```
esptool.py --chip esp32c3 image_info build/app.bin
```

```
esptool.py v2.3.1
Image version: 1
Entry point: 40080ea4
13 segments
Segment 1: len 0x13ce0 load 0x3f400020 file_offs 0x00000018 SOC_DROM

↪0) load
```

For more details on the type of memory segments and their address ranges, see *ESP32-C3 Technical Reference Manual* > *System and Memory* > *Internal Memory* [PDF].

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded

boundary, so the application image might need padding.

4. If the `hash_appended` field from *esp_image_header_t* is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from the first byte and up to this field. The length of this field is 32 bytes.
5. If the options *CONFIG_SECURE_SIGNED_APPS_SCHEME* is set to ECDSA then the application image will have additional 68 bytes for an ECDSA signature, which includes:

- version word (4 bytes),
- signature data (64 bytes).

Application Description

The `DROM` segment starts with the *esp_app_desc_t* structure which carries specific fields describing the application:

- `magic_word` - the magic word for the esp_app_desc structure.
- `secure_version` - see *Anti-rollback*.
- `version` - see *App version*. *
- `project_name` is filled from `PROJECT_NAME`. *
- `time` and `date` - compile time and date.
- `idf_ver` - version of ESP-IDF. *
- `app_elf_sha256` - contains sha256 for the elf application file.

* - The maximum length is 32 characters, including null-termination character. For example, if the length of `PROJECT_NAME` exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = sizeof(*esp_image_header_t*) + sizeof(*esp_image_segment_header_t*). As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

Adding a Custom Structure to an Application

Users also have the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_
↪app_desc = { ... }
```

Offset for custom structure is sizeof(*esp_image_header_t*) + sizeof(*esp_image_segment_header_t*) + sizeof(*esp_app_desc_t*).

To guarantee that the custom structure is located in the image even if it is not used, you need to add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into `CMakeLists.txt`.

API Reference

Header File

- components/bootloader_support/include/esp_app_format.h

Structures

struct **esp_image_header_t**

Main header of binary image.

Public Members

uint8_t **magic**

Magic word ESP_IMAGE_HEADER_MAGIC

uint8_t **segment_count**

Count of memory segments

uint8_t **spi_mode**

flash read mode (esp_image_spi_mode_t as uint8_t)

uint8_t **spi_speed**

flash frequency (esp_image_spi_freq_t as uint8_t)

uint8_t **spi_size**

flash chip size (esp_image_flash_size_t as uint8_t)

uint32_t **entry_addr**

Entry address

uint8_t **wp_pin**

WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)

uint8_t **spi_pin_drv**[3]

Drive settings for the SPI flash pins (read by ROM bootloader)

esp_chip_id_t **chip_id**

Chip identification number

uint8_t **min_chip_rev**

Minimum chip revision supported by image

uint8_t **reserved**[8]

Reserved bytes in additional header space, currently unused

uint8_t **hash_appended**

If 1, a SHA256 digest "simple hash" (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

struct **esp_image_segment_header_t**

Header of binary image segment.

Public Members

uint32_t **load_addr**

Address of segment

uint32_t **data_len**

Length of data

struct **esp_app_desc_t**

Description about application.

Public Members

uint32_t **magic_word**

Magic word ESP_APP_DESC_MAGIC_WORD

uint32_t **secure_version**

Secure version

uint32_t **reserv1**[2]

reserv1

char **version**[32]

Application version

char **project_name**[32]

Project name

char **time**[16]

Compile time

char **date**[16]

Compile date

char **idf_ver**[32]

Version IDF

uint8_t **app_elf_sha256**[32]

sha256 of elf file

uint32_t **reserv2**[20]

reserv2

Macros

ESP_IMAGE_HEADER_MAGIC

The magic word for the *esp_image_header_t* structure.

ESP_IMAGE_MAX_SEGMENTS

Max count of segments in the image.

ESP_APP_DESC_MAGIC_WORD

The magic word for the esp_app_desc structure that is in DROM.

Enumerations

enum **esp_chip_id_t**

ESP chip ID.

Values:

enumerator **ESP_CHIP_ID_ESP32**

chip ID: ESP32

enumerator **ESP_CHIP_ID_ESP32S2**

chip ID: ESP32-S2

enumerator **ESP_CHIP_ID_ESP32C3**

chip ID: ESP32-C3

enumerator **ESP_CHIP_ID_ESP32S3**

chip ID: ESP32-S3

enumerator **ESP_CHIP_ID_ESP32C2**

chip ID: ESP32-C2

enumerator **ESP_CHIP_ID_INVALID**

Invalid chip ID (we defined it to make sure the esp_chip_id_t is 2 bytes size)

enum **esp_image_spi_mode_t**

SPI flash mode, used in *esp_image_header_t*.

Values:

enumerator **ESP_IMAGE_SPI_MODE_QIO**

SPI mode QIO

enumerator **ESP_IMAGE_SPI_MODE_QOUT**

SPI mode QOUT

enumerator **ESP_IMAGE_SPI_MODE_DIO**

SPI mode DIO

enumerator **ESP_IMAGE_SPI_MODE_DOUT**

SPI mode DOUT

enumerator **ESP_IMAGE_SPI_MODE_FAST_READ**

SPI mode FAST_READ

enumerator **ESP_IMAGE_SPI_MODE_SLOW_READ**

SPI mode SLOW_READ

enum **esp_image_spi_freq_t**

SPI flash clock division factor.

Values:

enumerator **ESP_IMAGE_SPI_SPEED_DIV_2**

The SPI flash clock frequency is divided by 2 of the clock source

enumerator **ESP_IMAGE_SPI_SPEED_DIV_3**

The SPI flash clock frequency is divided by 3 of the clock source

enumerator **ESP_IMAGE_SPI_SPEED_DIV_4**

The SPI flash clock frequency is divided by 4 of the clock source

enumerator **ESP_IMAGE_SPI_SPEED_DIV_1**

The SPI flash clock frequency equals to the clock source

enum **esp_image_flash_size_t**

Supported SPI flash sizes.

Values:

enumerator **ESP_IMAGE_FLASH_SIZE_1MB**

SPI flash size 1 MB

enumerator **ESP_IMAGE_FLASH_SIZE_2MB**

SPI flash size 2 MB

enumerator **ESP_IMAGE_FLASH_SIZE_4MB**

SPI flash size 4 MB

enumerator **ESP_IMAGE_FLASH_SIZE_8MB**

SPI flash size 8 MB

enumerator **ESP_IMAGE_FLASH_SIZE_16MB**

SPI flash size 16 MB

enumerator **ESP_IMAGE_FLASH_SIZE_32MB**

SPI flash size 32 MB

enumerator **ESP_IMAGE_FLASH_SIZE_64MB**

SPI flash size 64 MB

enumerator **ESP_IMAGE_FLASH_SIZE_128MB**

SPI flash size 128 MB

enumerator **ESP_IMAGE_FLASH_SIZE_MAX**

SPI flash size MAX

2.10.2 Application Level Tracing

Overview

IDF provides a useful feature for program behavior analysis called **Application Level Tracing**. The feature can be enabled in menuconfig and allows transfer of arbitrary data between the host and ESP32-C3 via JTAG interface

with minimal overhead on program execution. Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see 特定应用程序的跟踪
2. Lightweight logging to the host, see 记录日志到主机
3. System behaviour analysis, see 基于 *SEGGER SystemView* 的系统行为分析

API Reference

Header File

- components/app_trace/include/esp_app_trace.h

Functions

esp_err_t **esp_apptrace_init**(void)

Initializes application tracing module.

备注: Should be called before any esp_apptrace_xxx call.

返回 ESP_OK on success, otherwise see esp_err_t

void **esp_apptrace_down_buffer_config**(uint8_t *buf, uint32_t size)

Configures down buffer.

备注: Needs to be called before attempting to receive any data using esp_apptrace_down_buffer_get and esp_apptrace_read. This function does not protect internal data by lock.

参数

- **buf** –Address of buffer to use for down channel (host to target) data.
- **size** –Size of the buffer.

uint8_t *__esp_apptrace_buffer_get__(*esp_apptrace_dest_t* dest, uint32_t size, uint32_t tmo)

Allocates buffer for trace data. Once the data in the buffer is ready to be sent, esp_apptrace_buffer_put must be called to indicate it.

参数

- **dest** –Indicates HW interface to send data.
- **size** –Size of data to write to trace buffer.
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 non-NULL on success, otherwise NULL.

esp_err_t **esp_apptrace_buffer_put**(*esp_apptrace_dest_t* dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in the buffer is ready to be sent. This function is a counterpart of and must be preceded by esp_apptrace_buffer_get.

参数

- **dest** –Indicates HW interface to send data. Should be identical to the same parameter in call to esp_apptrace_buffer_get.
- **ptr** –Address of trace buffer to release. Should be the value returned by call to esp_apptrace_buffer_get.
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

esp_err_t **esp_apptrace_write**(*esp_apptrace_dest_t* dest, const void *data, uint32_t size, uint32_t tmo)

Writes data to trace buffer.

参数

- **dest** –Indicates HW interface to send data.
- **data** –Address of data to write to trace buffer.
- **size** –Size of data to write to trace buffer.
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

int **esp_apptrace_vprintf_to**(*esp_apptrace_dest_t* dest, uint32_t tmo, const char *fmt, va_list ap)

vprintf-like function to send log messages to host via specified HW interface.

参数

- **dest** –Indicates HW interface to send data.
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
- **fmt** –Address of format string.
- **ap** –List of arguments.

返回 Number of bytes written.

int **esp_apptrace_vprintf**(const char *fmt, va_list ap)

vprintf-like function to send log messages to host.

参数

- **fmt** –Address of format string.
- **ap** –List of arguments.

返回 Number of bytes written.

esp_err_t **esp_apptrace_flush**(*esp_apptrace_dest_t* dest, uint32_t tmo)

Flushes remaining data in trace buffer to host.

参数

- **dest** –Indicates HW interface to flush data on.
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

esp_err_t **esp_apptrace_flush_nolock**(*esp_apptrace_dest_t* dest, uint32_t min_sz, uint32_t tmo)

Flushes remaining data in trace buffer to host without locking internal data. This is a special version of esp_apptrace_flush which should be called from panic handler.

参数

- **dest** –Indicates HW interface to flush data on.
- **min_sz** –Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

esp_err_t **esp_apptrace_read**(*esp_apptrace_dest_t* dest, void *data, uint32_t *size, uint32_t tmo)

Reads host data from trace buffer.

参数

- **dest** –Indicates HW interface to read the data on.
- **data** –Address of buffer to put data from trace buffer.
- **size** –Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

uint8_t ***esp_apptrace_down_buffer_get***(*esp_apptrace_dest_t* dest, uint32_t *size, uint32_t tmo)

Retrieves incoming data buffer if any. Once data in the buffer is processed, esp_apptrace_down_buffer_put must be called to indicate it.

参数

- **dest** –Indicates HW interface to receive data.
- **size** –Address to store size of available data in down buffer. Must be initialized with requested value.
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 non-NULL on success, otherwise NULL.

esp_err_t **esp_apptrace_down_buffer_put**(*esp_apptrace_dest_t* dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in the down buffer is processed. This function is a counterpart of and must be preceded by esp_apptrace_down_buffer_get.

参数

- **dest** –Indicates HW interface to receive data. Should be identical to the same parameter in call to esp_apptrace_down_buffer_get.
- **ptr** –Address of trace buffer to release. Should be the value returned by call to esp_apptrace_down_buffer_get.
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

bool **esp_apptrace_host_is_connected**(*esp_apptrace_dest_t* dest)

Checks whether host is connected.

参数 **dest** –Indicates HW interface to use.

返回 true if host is connected, otherwise false

void ***esp_apptrace_fopen***(*esp_apptrace_dest_t* dest, const char *path, const char *mode)

Opens file on host. This function has the same semantic as ‘fopen’ except for the first argument.

参数

- **dest** –Indicates HW interface to use.
- **path** –Path to file.
- **mode** –Mode string. See fopen for details.

返回 non zero file handle on success, otherwise 0

int **esp_apptrace_fclose**(*esp_apptrace_dest_t* dest, void *stream)

Closes file on host. This function has the same semantic as ‘fclose’ except for the first argument.

参数

- **dest** –Indicates HW interface to use.
- **stream** –File handle returned by esp_apptrace_fopen.

返回 Zero on success, otherwise non-zero. See fclose for details.

size_t **esp_apptrace_fwrite**(*esp_apptrace_dest_t* dest, const void *ptr, size_t size, size_t nmemb, void *stream)

Writes to file on host. This function has the same semantic as ‘fwrite’ except for the first argument.

参数

- **dest** –Indicates HW interface to use.
- **ptr** –Address of data to write.
- **size** –Size of an item.
- **nmemb** –Number of items to write.
- **stream** –File handle returned by esp_apptrace_fopen.

返回 Number of written items. See fwrite for details.

size_t **esp_apptrace_fread**(*esp_apptrace_dest_t* dest, void *ptr, size_t size, size_t nmemb, void *stream)

Read file on host. This function has the same semantic as ‘fread’ except for the first argument.

参数

- **dest** –Indicates HW interface to use.
- **ptr** –Address to store read data.
- **size** –Size of an item.
- **nmemb** –Number of items to read.
- **stream** –File handle returned by esp_apptrace_fopen.

返回 Number of read items. See fread for details.

int **esp_apptrace_fseek**(*esp_apptrace_dest_t* dest, void *stream, long offset, int whence)

Set position indicator in file on host. This function has the same semantic as 'fseek' except for the first argument.

参数

- **dest** –Indicates HW interface to use.
- **stream** –File handle returned by esp_apptrace_fopen.
- **offset** –Offset. See fseek for details.
- **whence** –Position in file. See fseek for details.

返回 Zero on success, otherwise non-zero. See fseek for details.

int **esp_apptrace_ftell**(*esp_apptrace_dest_t* dest, void *stream)

Get current position indicator for file on host. This function has the same semantic as 'ftell' except for the first argument.

参数

- **dest** –Indicates HW interface to use.
- **stream** –File handle returned by esp_apptrace_fopen.

返回 Current position in file. See ftell for details.

int **esp_apptrace_fstop**(*esp_apptrace_dest_t* dest)

Indicates to the host that all file operations are complete. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

参数 **dest** –Indicates HW interface to use.

返回 ESP_OK on success, otherwise see esp_err_t

void **esp_gcov_dump**(void)

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations

enum **esp_apptrace_dest_t**

Application trace data destinations bits.

Values:

enumerator **ESP_APPTRACE_DEST_JTAG**

JTAG destination.

enumerator **ESP_APPTRACE_DEST_TRAX**

xxx_TRAX name is obsolete, use more common xxx_JTAG

enumerator **ESP_APPTRACE_DEST_UART**

UART destination.

enumerator **ESP_APPTRACE_DEST_MAX**

enumerator **ESP_APPTRACE_DEST_NUM**

Header File

- components/app_trace/include/esp_sysview_trace.h

Functions

static inline *esp_err_t* **esp_sysview_flush**(uint32_t tmo)

Flushes remaining data in SystemView trace buffer to host.

参数 **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinetly.

返回 ESP_OK.

int **esp_sysview_vprintf**(const char *format, va_list args)

vprintf-like function to sent log messages to the host.

参数

- **format** –Address of format string.
- **args** –List of arguments.

返回 Number of bytes written.

esp_err_t **esp_sysview_heap_trace_start**(uint32_t tmo)

Starts SystemView heap tracing.

参数 **tmo** –Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

返回 ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.

esp_err_t **esp_sysview_heap_trace_stop**(void)

Stops SystemView heap tracing.

返回 ESP_OK.

void **esp_sysview_heap_trace_alloc**(void *addr, uint32_t size, const void *callers)

Sends heap allocation event to the host.

参数

- **addr** –Address of allocated block.
- **size** –Size of allocated block.
- **callers** –Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

void **esp_sysview_heap_trace_free**(void *addr, const void *callers)

Sends heap de-allocation event to the host.

参数

- **addr** –Address of de-allocated block.
- **callers** –Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

2.10.3 Call function with external stack

Overview

A given function can be executed with a user allocated stack space which is independent of current task stack, this mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as *printf*. The given function can be called inside the shared stack space which is a callback function deferred by calling `esp_execute_shared_stack_function()`, passing that function as parameter.

Usage

`esp_execute_shared_stack_function()` takes four arguments:

- a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack
- a pointer to the top of stack used for that fuction
- the size of stack in bytes
- a pointer to the shared stack function

The user defined function will be deferred as a callback and can be called using the user allocated space without taking space from current task stack.

The usage may look like the code below:

```
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let's suppose we want to call printf using a separated stack space
//allowing the app to reduce its stack size.
void app_main()
{
    //Allocate a stack buffer, from heap or as a static form:
    portSTACK_TYPE *shared_stack = malloc(8192 * sizeof(portSTACK_TYPE));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //Call the desired function using the macro helper:
    esp_execute_shared_stack_function(printf_lock,
                                      shared_stack,
                                      8192,
                                      external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}
```

API Reference

Header File

- components/esp_system/include/esp_expression_with_stack.h

Functions

void **esp_execute_shared_stack_function**(*SemaphoreHandle_t* lock, void *stack, size_t stack_size, *shared_stack_function* function)

Calls user defined shared stack space function.

备注: if either lock, stack or stack size is invalid, the expression will be called using the current stack.

参数

- **lock** –Mutex object to protect in case of shared stack
- **stack** –Pointer to user alocated stack
- **stack_size** –Size of current stack in bytes
- **function** –pointer to the shared stack function to be executed

Macros

ESP_EXECUTE_EXPRESSION_WITH_STACK(lock, stack, stack_size, expression)

Type Definitions

typedef void (***shared_stack_function**)(void)

2.10.4 控制台终端

ESP-IDF 提供了 `console` 组件，它包含了开发基于串口的交互式控制终端所需要的所有模块，主要支持以下功能：

- 行编辑，由 linenoise 库具体实现，它支持处理退格键和方向键，支持回看命令的历史记录，支持命令的自动补全和参数提示。
- 将命令行拆分为参数列表。
- 参数解析，由 argtable3 库具体实现，该库提供解析 GNU 样式的命令行参数的 API。
- 用于注册和调度命令的函数。
- 帮助创建 REPL (Read-Evaluate-Print-Loop) 环境的函数。

备注： 这些功能模块可以一起使用也可以独立使用，例如仅使用行编辑和命令注册的功能，然后使用 `getopt` 函数或者自定义的函数来实现参数解析，而不是直接使用 argtable3 库。同样地，还可以使用更简单的命令输入方法（比如 `fgets` 函数）和其他用于命令分割和参数解析的方法。

行编辑

行编辑功能允许用户通过按键输入来编辑命令，使用退格键删除符号，使用左/右键在命令中移动光标，使用上/下键导航到之前输入的命令，使用制表键（“Tab”）来自动补全命令。

备注： 此功能依赖于终端应用程序对 ANSI 转义符的支持。因此，显示原始 UART 数据的串口监视器不能与行编辑库一同使用。如果运行 system/console 示例程序的时候看到的输出结果是 `[6n` 或者类似的转义字符而不是命令行提示符 `esp>` ``` 时，就表明当前的串口监视器不支持 ANSI 转义字符。已知可用的串口监视程序有 GNU screen、minicom 和 idf_monitor.py（可以通过在项目目录下执行 ``idf.py monitor` 来调用）。

前往这里可以查看 linenoise 库提供的所有函数的描述。

配置 Linenoise 库不需要显式地初始化，但是在调用行编辑函数之前，可能需要对某些配置的默认值稍作修改。

`linenoiseClearScreen()`

使用转义字符清除终端屏幕，并将光标定位在左上角。

`linenoiseSetMultiLine()`

在单行和多行编辑模式之间进行切换。单行模式下，如果命令的长度超过终端的宽度，会在行内滚动命令文本以显示文本的结尾，在这种情况下，文本的开头部分会被隐藏。单行模式在每次按下按键时发送给屏幕刷新的数据比较少，与多行模式相比更不容易发生故障。另一方面，在单行模式下编辑命令和复制命令将变得更加困难。默认情况下开启的是单行模式。

`linenoiseAllowEmpty()`

设置 linenoise 库收到空行的解析行为，设置为 `true` 时返回长度为零的字符串 (`""`)，设置为 `false` 时返回 `NULL`。默认情况下，将返回长度为零的字符串。

`linenoiseSetMaxLineLen()`

设置 linenoise 库中每行的最大长度。默认长度为 4096。如果需要优化 RAM 内存的使用，则可以通过这个函数设置一个小于默认 4 KB 的值来实现。

主循环 `linenoise()`

在大多数情况下，控制台应用程序都会具有相同的工作形式——在某个循环中不断读取输入的内容，然后解析再处理。`linenoise()` 是专门用来获取用户按键输入的函数，当回车键被按下后会便返回完整的一行内容。因此可以用它来完成前面循环中的“读取”任务。

`linenoiseFree()`

必须调用此函数才能释放从 `linenoise()` 函数获取的命令行缓冲区。

提示和补全 `linenoiseSetCompletionCallback()`

当用户按下制表键时，linenoise 会调用 **补全回调函数**，该回调函数会检查当前已经输入的内容，然后调用 `linenoiseAddCompletion()` 函数来提供所有可能的补全后的命令列表。启用补全功能，需要事先调用 `linenoiseSetCompletionCallback()` 函数来注册补全回调函数。

`console` 组件提供了一个现成的函数来为注册的命令提供补全功能*esp_console_get_completion()*（见下文）。

`linenoiseAddCompletion()`

补全回调函数会通过调用此函数来通知 linenoise 库当前键入命令所有可能的补全结果。

`linenoiseSetHintsCallback()`

每当用户的输入改变时，linenoise 就会调用此回调函数，检查到目前为止输入的命令行内容，然后提供带有提示信息的字符串（例如命令参数列表），然后会在同一行上用不同的颜色显示出该文本。

`linenoiseSetFreeHintsCallback()`

如果 **提示回调函数**返回的提示字符串是动态分配的或者需要以其它方式回收，就需要使用 `linenoiseSetFreeHintsCallback()` 注册具体的清理函数。

历史记录 `linenoiseHistorySetMaxLen()`

该函数设置要保留在内存中的最近输入的命令的数量。用户通过使用向上/向下箭头来导航历史记录。

`linenoiseHistoryAdd()`

Linenoise 不会自动向历史记录中添加命令，应用程序需要调用此函数来将命令字符串添加到历史记录中。

`linenoiseHistorySave()`

该函数将命令的历史记录从 RAM 中保存为文本文件，例如保存到 SD 卡或者 Flash 的文件系统中。

`linenoiseHistoryLoad()`

与 `linenoiseHistorySave` 相对应，从文件中加载历史记录。

`linenoiseHistoryFree()`

释放用于存储命令历史记录的内存。当使用完 linenoise 库后需要调用此函数。

将命令行拆分成参数列表

`console` 组件提供*esp_console_split_argv()* 函数来将命令行字符串拆分为参数列表。该函数会返回参数的数量（`argc`）和一个指针数组，该指针数组可以作为 `argv` 参数传递给任何接受 `argc`，`argv` 格式参数的函数。

根据以下规则来将命令行拆分成参数列表：

- 参数由空格分隔

- 如果参数本身需要使用空格，可以使用 \ （反斜杠）对它们进行转义
- 其它能被识别的转义字符有 \\ （显示反斜杠本身）和 \" （显示双引号）
- 可以使用双引号来引用参数，引号只可能出现在参数的开头和结尾。参数中的引号必须如上所述进行转义。参数周围的引号会被*esp_console_split_argv()* 函数删除

示例：

- `abc def 1 20 .3` → [`abc`, `def`, `1`, `20`, `.3`]
- `abc "123 456" def` → [`abc`, `123 456`, `def`]
- `` `a\ b\\c\" `` → [`a b\c"`]

参数解析

对于参数解析，`console` 组件使用 argtable3 库。有关 argtable3 的介绍请查看 教程 或者 Github 仓库中的 示例代码 。

命令的注册与调度

`console` 组件包含了一些工具函数，用来注册命令，将用户输入的命令和已经注册的命令进行匹配，使用命令行输入的参数调用命令。

应用程序首先调用*esp_console_init()* 来初始化命令注册模块，然后调用*esp_console_cmd_register()* 函数注册命令处理程序。

对于每个命令，应用程序需要提供以下信息（需要以 `esp_console_cmd_t` 结构体的形式给出）：

- 命令名字（不含空格的字符串）
- 帮助文档，解释该命令的用途
- 可选的提示文本，列出命令的参数。如果应用程序使用 `Argtable3` 库来解析参数，则可以通过提供指向 argtable 参数定义结构体的指针来自动生成提示文本
- 命令处理函数

命令注册模块还提供了其它函数：

esp_console_run()

> 该函数接受命令行字符串，使用*esp_console_split_argv()* 函数将其拆分为 argc/argv 形式的参数列表，在已经注册的组件列表中查找命令，如果找到，则执行其对应的处理程序。

esp_console_register_help_command()

> 将 `help` 命令添加到已注册命令列表中，此命令将会以列表的方式打印所有注册的命令及其参数和帮助文本。

esp_console_get_completion()

> 与 linenoise 库中的 `linenoiseSetCompletionCallback()` 一同使用的回调函数，根据已经注册的命令列表为 linenoise 提供补全功能。

esp_console_get_hint()

> 与 linenoise 库中 `linenoiseSetHintsCallback()` 一同使用的回调函数，为 linenoise 提供已经注册的命令的参数提示功能。

初始化 REPL 环境

除了上述的各种函数，`console` 组件还提供了一些 API 来帮助创建一个基本的 REPL 环境。

在一个典型的 console 应用中，你只需要调用*esp_console_new_repl_uart()*，它会为你初始化好构建在 UART 基础上的 REPL 环境，其中包括安装 UART 驱动，基本的 console 配置，创建一个新的线程来执行 REPL 任务，注册一些基本的命令（比如 *help* 命令）。

之后你可以使用*esp_console_cmd_register()* 来注册其它命令。REPL 环境在初始化后需要再调用*esp_console_start_repl()* 函数才能开始运行。

同样，如果 REPL 环境是构建在 USB_SERIAL_JTAG 设备基础上，你只需要先调用 `esp_console_new_repl_usb_serial_jtag()` 函数进行初始化，然后再照常调用其它函数。

应用程序示例

system/console 目录下提供了 `console` 组件的示例应用程序，展示了具体的使用方法。该示例介绍了如何初始化 UART 和 VFS 的功能，设置 linenoise 库，从 UART 中读取命令并加以处理，然后将历史命令存储到 Flash 中。更多信息，请参阅示例代码目录中的 README.md 文件。

此外，ESP-IDF 还提供了众多基于 *console* 组件的示例程序，它们可以辅助应用程序的开发。例如，peripherals/i2c/i2c_tools，wifi/iperf 等等。

API 参考

Header File

- components/console/esp_console.h

Functions

esp_err_t **esp_console_init** (const *esp_console_config_t* *config)

initialize console module

备注： Call this once before using other console module features

参数 **config** –console configuration

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_STATE if already initialized
- ESP_ERR_INVALID_ARG if the configuration is invalid

esp_err_t **esp_console_deinit** (void)

de-initialize console module

备注： Call this once when done using console module functions

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized yet

esp_err_t **esp_console_cmd_register** (const *esp_console_cmd_t* *cmd)

Register console command.

参数 **cmd** –pointer to the command description; can point to a temporary value

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if command description includes invalid arguments

esp_err_t **esp_console_run** (const char *cmdline, int *cmd_ret)

Run command line.

参数

- **cmdline** –command line (command name followed by a number of arguments)
- **cmd_ret** –**[out]** return code from the command (set if command was run)

返回

- ESP_OK, if command was run
- ESP_ERR_INVALID_ARG, if the command line is empty, or only contained whitespace
- ESP_ERR_NOT_FOUND, if command with given name wasn't registered
- ESP_ERR_INVALID_STATE, if esp_console_init wasn't called

size_t **esp_console_split_argv**(char *line, char **argv, size_t argv_size)

Split command line into arguments in place.

```
* - This function finds whitespace-separated arguments in the given input line.
*
*     'abc def 1 20 .3' -> [ 'abc', 'def', '1', '20', '.3' ]
*
* - Argument which include spaces may be surrounded with quotes. In this case
*   spaces are preserved and quotes are stripped.
*
*     'abc "123 456" def' -> [ 'abc', '123 456', 'def' ]
*
* - Escape sequences may be used to produce backslash, double quote, and space:
*
*     'a\ b\\c\"' -> [ 'a b\c"' ]
*
```

备注: Pointers to at most argv_size - 1 arguments are returned in argv array. The pointer after the last one (i.e. argv[argc]) is set to NULL.

参数

- **line** –pointer to buffer to parse; it is modified in place
- **argv** –array where the pointers to arguments are written
- **argv_size** –number of elements in argv_array (max. number of arguments)

返回 number of arguments found (argc)

void **esp_console_get_completion**(const char *buf, *linenoiseCompletions* *lc)

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

linenoiseSetCompletionCallback(&esp_console_get_completion);

参数

- **buf** –the string typed by the user
- **lc** –linenoiseCompletions to be filled in

const char ***esp_console_get_hint**(const char *buf, int *color, int *bold)

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:

linenoiseSetHintsCallback((linenoiseHintsCallback*) &esp_console_get_hint);

The extra cast is needed because linenoiseHintsCallback is defined as returning a char* instead of const char*.

参数

- **buf** –line typed by the user
- **color** –**[out]** ANSI color code to be used when displaying the hint
- **bold** –**[out]** set to 1 if hint has to be displayed in bold

返回 string containing the hint text. This string is persistent and should not be freed (i.e. linenoiseSetFreeHintsCallback should not be used).

esp_err_t **esp_console_register_help_command**(void)

Register a ‘help’ command.

Default ‘help’ command prints the list of registered commands along with hints and help strings.

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

esp_err_t **esp_console_new_repl_uart**(const *esp_console_dev_uart_config_t* *dev_config, const *esp_console_repl_config_t* *repl_config, *esp_console_repl_t* **ret_repl)

Establish a console REPL environment over UART driver.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

备注: This is an all-in-one function to establish the environment needed for REPL, includes:

- Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)
- Configures the stdin/stdout to go through the UART driver
- Initializes linenoise
- Spawn new thread to run REPL in the background

参数

- **dev_config** – **[in]** UART device configuration
- **repl_config** – **[in]** REPL configuration
- **ret_repl** – **[out]** return REPL handle after initialization succeed, return NULL otherwise

返回

- ESP_OK on success
- ESP_FAIL Parameter error

esp_err_t **esp_console_new_repl_usb_cdc**(const *esp_console_dev_usb_cdc_config_t* *dev_config, const *esp_console_repl_config_t* *repl_config, *esp_console_repl_t* **ret_repl)

Establish a console REPL environment over USB CDC.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

备注: This is a all-in-one function to establish the environment needed for REPL, includes:

- Initializes linenoise
- Spawn new thread to run REPL in the background

参数

- **dev_config** – **[in]** USB CDC configuration
- **repl_config** – **[in]** REPL configuration
- **ret_repl** – **[out]** return REPL handle after initialization succeed, return NULL otherwise

返回

- ESP_OK on success
- ESP_FAIL Parameter error

esp_err_t **esp_console_start_repl**(*esp_console_repl_t* *repl)

Start REPL environment.

备注: Once the REPL gets started, it won't be stopped until the user calls repl->del(repl) to destroy the REPL environment.

参数 **repl** – **[in]** REPL handle returned from esp_console_new_repl_xxx

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE, if repl has started already

Structures

struct **esp_console_config_t**

Parameters for console initialization.

Public Members

size_t **max_cmdline_length**

length of command line buffer, in bytes

size_t **max_cmdline_args**

maximum number of command line arguments to parse

int **hint_color**

ASCII color code of hint text.

int **hint_bold**

Set to 1 to print hint text in bold.

struct **esp_console_repl_config_t**

Parameters for console REPL (Read Eval Print Loop)

Public Members

uint32_t **max_history_len**

maximum length for the history

const char ***history_save_path**

file path used to save history commands, set to NULL won't save to file system

uint32_t **task_stack_size**

repl task stack size

uint32_t **task_priority**

repl task priority

const char *`prompt`

prompt (NULL represents default: “esp> “)

size_t `max_cmdline_length`

maximum length of a command line. If 0, default value will be used

struct `esp_console_dev_uart_config_t`

Parameters for console device: UART.

Public Members

int `channel`

UART channel number (count from zero)

int `baud_rate`

Comunication baud rate.

int `tx_gpio_num`

GPIO number for TX path, -1 means using default one.

int `rx_gpio_num`

GPIO number for RX path, -1 means using default one.

struct `esp_console_dev_usb_cdc_config_t`

Parameters for console device: USB CDC.

备注: It’s an empty structure for now, reserved for future

struct `esp_console_cmd_t`

Console command description.

Public Members

const char *`command`

Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to esp_console_deinit.

const char *`help`

Help text for the command, shown by help command. If set, the pointer must be valid until the call to esp_console_deinit. If not set, the command will not be listed in ‘help’ output.

const char *`hint`

Hint text, usually lists possible arguments. If set to NULL, and ‘argtable’ field is non-NULL, hint will be generated automatically

esp_console_cmd_func_t `func`

Pointer to a function which implements the command.

void ***argtable**

Array or structure of pointers to arg_xxx structures, may be NULL. Used to generate hint text if 'hint' is set to NULL. Array/structure which this field points to must end with an arg_end. Only used for the duration of esp_console_cmd_register call.

struct **esp_console_repl_s**

Console REPL base structure.

Public Members

esp_err_t (***del**)(*esp_console_repl_t* *repl)

Delete console REPL environment.

Param repl **[in]** REPL handle returned from esp_console_new_repl_xxx
Return
- ESP_OK on success
- ESP_FAIL on errors

Macros

ESP_CONSOLE_CONFIG_DEFAULT()

Default console configuration value.

ESP_CONSOLE_REPL_CONFIG_DEFAULT()

Default console repl configuration value.

ESP_CONSOLE_DEV_UART_CONFIG_DEFAULT()

ESP_CONSOLE_DEV_CDC_CONFIG_DEFAULT()

Type Definitions

typedef struct *linenoiseCompletions* **linenoiseCompletions**

typedef int (***esp_console_cmd_func_t**)(int argc, char **argv)

Console command main function.

Param argc number of arguments
Param argv array with argc entries, each pointing to a zero-terminated string argument
Return console command return code, 0 indicates "success"

typedef struct *esp_console_repl_s* **esp_console_repl_t**

Type defined for console REPL.

2.10.5 eFuse Manager

Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

Hardware description

The ESP32-C3 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0).

For more details, see *ESP32-C3 Technical Reference Manual* > *eFuse Controller (eFuse)* [PDF]. Some eFuse bits are available for user applications.

ESP32-C3 has 11 eFuse blocks each of the size of 256 bits (not all bits are available):

- EFUSE_BLK0 is used entirely for system purposes;
- EFUSE_BLK1 is used entirely for system purposes;
- EFUSE_BLK2 is used entirely for system purposes;
- EFUSE_BLK3 (also named EFUSE_BLK_USER_DATA) can be used for user purposes;
- EFUSE_BLK4 (also named EFUSE_BLK_KEY0) can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK5 (also named EFUSE_BLK_KEY1) can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK6 (also named EFUSE_BLK_KEY2) can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK7 (also named EFUSE_BLK_KEY3) can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK8 (also named EFUSE_BLK_KEY4) can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK9 (also named EFUSE_BLK_KEY5) can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK10 (also named EFUSE_BLK_SYS_DATA_PART2) is reseved for system purposes.

Each block is divided into 8 32-bits registers.

eFuse Manager component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool *efuse_table_gen.py*. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a *custom* file from the user's project directory, the utility will check with the *common* CSV file.

CSV files:

- common (*esp_efuse_table.csv*) - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse-common-table`). Note that changes in this file can lead to incorrect operation.
- custom - (optional and can be enabled by *CONFIG_EFUSE_CUSTOM_TABLE*) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse-custom-table`.

Description CSV file

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name,  efuse_block(EFUSE_BLK0..EFUSE_BLK10), bit_start(0..255),    bit_
↪count(1..256),         comment
```

Individual params in CSV file the following meanings:

field_name Name of field. The prefix *ESP_EFUSE_* will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see `MAC_FACTORY` field in the common table). The field_name supports structured format using . to show that the field belongs to another field (see `WR_DIS` and `RD_DIS` in the common table).

efuse_block Block number. It determines where the eFuse bits will be placed for this field. Available EFUSE_BLK0..EFUSE_BLK10.

bit_start Start bit number (0..255). The bit_start field can be omitted. In this case, it will be set to bit_start + bit_count from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.

bit_count The number of bits to use in this field (1..-). This parameter can not be omitted. This field also may be `MAX_BLK_LEN` in this case, the field length will have the maximum block length.

comment This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields MAC_FACTORY and MAC_FACTORY_CRC:

```
# Factory MAC address #
#######################
MAC_FACTORY,            EFUSE_BLK0,     72,     8,    Factory MAC addr [0]
,                       EFUSE_BLK0,     64,     8,    Factory MAC addr [1]
,                       EFUSE_BLK0,     56,     8,    Factory MAC addr [2]
,                       EFUSE_BLK0,     48,     8,    Factory MAC addr [3]
,                       EFUSE_BLK0,     40,     8,    Factory MAC addr [4]
,                       EFUSE_BLK0,     32,     8,    Factory MAC addr [5]
MAC_FACTORY_CRC,        EFUSE_BLK0,     80,     8,    CRC8 for factory MAC address
```

This field will available in code as ESP_EFUSE_MAC_FACTORY and ESP_EFUSE_MAC_FACTORY_CRC.

Structured efuse fields

```
WR_DIS,                             EFUSE_BLK0,    0,     32,      Write protection
WR_DIS.RD_DIS,                      EFUSE_BLK0,    0,     1,       Write protection for␣
↪RD_DIS
WR_DIS.FIELD_1,                     EFUSE_BLK0,    1,     1,       Write protection for␣
↪FIELD_1
WR_DIS.FIELD_2,                     EFUSE_BLK0,    2,     4,       Write protection for␣
↪FIELD_2 (includes B1 and B2)
WR_DIS.FIELD_2.B1,                  EFUSE_BLK0,    2,     2,       Write protection for␣
↪FIELD_2.B1
WR_DIS.FIELD_2.B2,                  EFUSE_BLK0,    4,     2,       Write protection for␣
↪FIELD_2.B2
WR_DIS.FIELD_3,                     EFUSE_BLK0,    5,     1,       Write protection for␣
↪FIELD_3
WR_DIS.FIELD_3.ALIAS,               EFUSE_BLK0,    5,     1,       Write protection for␣
↪FIELD_3 (just a alias for WR_DIS.FIELD_3)
WR_DIS.FIELD_4,                     EFUSE_BLK0,    7,     1,       Write protection for␣
↪FIELD_4
```

The structured eFuse field looks like `WR_DIS.RD_DIS` where the dot points that this field belongs to the parent field - `WR_DIS` and can not be out of the parent's range.

It is possible to use some levels of structured fields as WR_DIS.FIELD_2.B1 and B2. These fields should not be crossed each other and should be in the range of two fields: `WR_DIS` and `WR_DIS.FIELD_2`.

It is possible to create aliases for fields with the same range, see `WR_DIS.FIELD_3` and `WR_DIS.FIELD_3.ALIAS`.

The IDF names for structured efuse fields should be unique. The `efuse_table_gen` tool will generate the final names where the dot will be replaced by _. The names for using in IDF are ESP_EFUSE_WR_DIS, ESP_EFUSE_WR_DIS_RD_DIS, ESP_EFUSE_WR_DIS_FIELD_2_B1, etc.

The `efuse_table_gen` tool checks that the fields do not overlap each other and must be within the range of a field if there is a violation, then throws the following error:

```
Field at USER_DATA, EFUSE_BLK3, 0, 256  intersected with  SERIAL_NUMBER, EFUSE_
↪BLK3, 0, 32
```

Solution: Describe `SERIAL_NUMBER` to be included in `USER_DATA`. (`USER_DATA.SERIAL_NUMBER`).

```
Field at FEILD, EFUSE_BLK3, 0, 50  out of range  FEILD.MAJOR_NUMBER, EFUSE_BLK3,␣
↪60, 32
```

Solution: Change `bit_start` for `FIELD.MAJOR_NUMBER` from 60 to 0, so `MAJOR_NUMBER` is in the `FEILD` range.

efuse_table_gen.py tool

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional *custom* file is used, it will be checked with the existing *common* file (esp_efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type *esp_efuse_desc_t*.

To generate a *common* files, use the following command `idf.py efuse-common-table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py --idf_target esp32c3 esp32c3/esp_efuse_table.csv
```

After generation in the folder $IDF_PATH/components/efuse/*esp32c3* create:

- *esp_efuse_table.c* file.
- In *include* folder *esp_efuse_table.c* file.

To generate a *custom* files, use the following command `idf.py efuse-custom-table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py --idf_target esp32c3 esp32c3/esp_efuse_table.csv PROJECT_PATH/
↪main/esp_efuse_custom_table.csv
```

After generation in the folder PROJECT_PATH/main create:

- *esp_efuse_custom_table.c* file.
- In *include* folder *esp_efuse_custom_table.c* file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" // or "esp_efuse_custom_table.h"
```

Supported coding scheme

Coding schemes are used to protect against data corruption. ESP32-C3 supports two coding schemes:

- `None`. EFUSE_BLK0 is stored with four backups, meaning each bit is stored four times. This backup scheme is automatically applied by the hardware and is not visible to software. EFUSE_BLK0 can be written many times.
- `RS`. EFUSE_BLK1 - EFUSE_BLK10 use Reed-Solomon coding scheme that supports up to 5 bytes of automatic error correction. Software will encode the 32-byte EFUSE_BLKx using RS (44, 32) to generate a 12-byte check code, and then burn the EFUSE_BLKx and the check code into eFuse at the same time. The

eFuse Controller automatically decodes the RS encoding and applies error correction when reading back the eFuse block. Because the RS check codes are generated across the entire 256-bit eFuse block, each block can only be written to one time.

To write some fields into one block, or different blocks in one time, you need to use `the batch writing mode`. Firstly set this mode through *esp_efuse_batch_write_begin()* function then write some fields as usual using the `esp_efuse_write_...` functions. At the end to burn them, call the *esp_efuse_batch_write_commit()* function. It burns prepared data to the eFuse blocks and disables the `batch recording mode`.

备注： If there is already pre-written data in the eFuse block using the `Reed-Solomon` encoding scheme, then it is not possible to write anything extra (even if the required bits are empty) without breaking the previous encoding data. This encoding data will be overwritten with new encoding data and completely destroyed (however, the payload eFuses are not damaged). It can be related to: CUSTOM_MAC, SPI_PAD_CONFIG_HD, SPI_PAD_CONFIG_CS, etc. Please contact Espressif to order the required pre-burnt eFuses.

FOR TESTING ONLY (NOT RECOMMENDED): You can ignore or suppress errors that violate encoding scheme data in order to burn the necessary bits in the eFuse block.

---

eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- *esp_efuse_read_field_blob()* - returns an array of read eFuse bits.
- *esp_efuse_read_field_cnt()* - returns the number of bits programmed as “1”.
- *esp_efuse_write_field_blob()* - writes an array.
- *esp_efuse_write_field_cnt()* - writes a required count of bits as “1”.
- *esp_efuse_get_field_size()* - returns the number of bits by the field name.
- *esp_efuse_read_reg()* - returns value of eFuse register.
- *esp_efuse_write_reg()* - writes value to eFuse register.
- *esp_efuse_get_coding_scheme()* - returns eFuse coding scheme for blocks.
- *esp_efuse_read_block()* - reads key to eFuse block starting at the offset and the required size.
- *esp_efuse_write_block()* - writes key to eFuse block starting at the offset and the required size.
- *esp_efuse_batch_write_begin()* - set the batch mode of writing fields.
- *esp_efuse_batch_write_commit()* - writes all prepared data for batch writing mode and reset the batch writing mode.
- *esp_efuse_batch_write_cancel()* - reset the batch writing mode and prepared data.
- *esp_efuse_get_key_dis_read()* - Returns a read protection for the key block.
- *esp_efuse_set_key_dis_read()* - Sets a read protection for the key block.
- *esp_efuse_get_key_dis_write()* - Returns a write protection for the key block.
- *esp_efuse_set_key_dis_write()* - Sets a write protection for the key block.
- *esp_efuse_get_key_purpose()* - Returns the current purpose set for an eFuse key block.
- *esp_efuse_write_key()* - Programs a block of key data to an eFuse block
- *esp_efuse_write_keys()* - Programs keys to unused eFuse blocks
- *esp_efuse_find_purpose()* - Finds a key block with the particular purpose set.
- *esp_efuse_get_keypurpose_dis_write()* - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- *esp_efuse_key_block_unused()* - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this *esp_efuse_get_pkg_ver()*.

eFuse API for keys

EFUSE_BLK_KEY0 - EFUSE_BLK_KEY5 are intended to keep up to 6 keys with a length of 256-bits. Each key has an `ESP_EFUSE_KEY_PURPOSE_x` field which defines the purpose of these keys. The purpose field is described in *esp_efuse_purpose_t*.

The purposes like `ESP_EFUSE_KEY_PURPOSE_XTS_AES_...` are used for flash encryption.

The purposes like `ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST...` are used for secure boot.

There are some eFuse APIs useful to work with states of keys.

- *esp_efuse_get_purpose_field()* - Returns a pointer to a key purpose for an eFuse key block.
- *esp_efuse_get_key()* - Returns a pointer to a key block.
- *esp_efuse_set_key_purpose()* - Sets a key purpose for an eFuse key block.
- *esp_efuse_set_keypurpose_dis_write()* - Sets a write protection of the key purpose field for an eFuse key block.
- *esp_efuse_find_unused_key_block()* - Search for an unused key block and return the first one found.
- *esp_efuse_count_unused_key_blocks()* - Returns the number of unused eFuse key blocks in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
- *esp_efuse_get_digest_revoke()* - Returns the status of the Secure Boot public key digest revocation bit.
- *esp_efuse_set_digest_revoke()* - Sets the Secure Boot public key digest revocation bit.
- *esp_efuse_get_write_protect_of_digest_revoke()* - Returns a write protection of the Secure Boot public key digest revocation bit.
- *esp_efuse_set_write_protect_of_digest_revoke()* - Sets a write protection of the Secure Boot public key digest revocation bit.

How to add a new field

1. Find a free bits for field. Show *esp_efuse_table.csv* file or run `idf.py show-efuse-table` or the next command:

```
$ ./efuse_table_gen.py esp32c3/esp_efuse_table.csv --info

Max number of bits in BLK 256
Sorted efuse table:

```
EFUSE_BLK7
[0 255]

EFUSE_BLK8
[0 255]

EFUSE_BLK9
[0 255]

Note: Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for␣
↪Espressif)
Parsing efuse CSV input file $IDF_PATH/components/efuse/esp32c3/esp_efuse_table.
↪csv ...
Verifying efuse table...
```

The number of bits not included in square brackets is free (some bits are reserved for Espressif). All fields are checked for overlapping.

To add fields to an existing field, use the *Structured efuse fields* technique. For example, adding the fields: SERIAL_NUMBER, MODEL_NUMBER and HARDWARE REV to an existing `USER_DATA` field. Use `.` (dot) to show an attachment in a field.

```
USER_DATA.SERIAL_NUMBER,                  EFUSE_BLK3,     0,  32,
USER_DATA.MODEL_NUMBER,                   EFUSE_BLK3,     32, 10,
USER_DATA.HARDWARE_REV,                   EFUSE_BLK3,     42, 10,
```

2. Fill a line for field: field_name, efuse_block, bit_start, bit_count, comment.
3. Run a `show_efuse_table` command to check eFuse table. To generate source files run `efuse_common_table` or `efuse_custom_table` command.

You may get errors such as `intersects with` or `out of range`. Please see how to solve them in the *Structured efuse fields* article.

Bit Order

The eFuses bit order is little endian (see the example below), it means that eFuse bits are read and written from LSB to MSB:

```
$ espefuse.py dump

USER_DATA       (BLOCK3          ) [3 ] read_regs: 03020100 07060504 0B0A0908␣
↪0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C
BLOCK4          (BLOCK4          ) [4 ] read_regs: 03020100 07060504 0B0A0908␣
↪0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C

where is the register representation:

EFUSE_RD_USR_DATA0_REG = 0x03020100
EFUSE_RD_USR_DATA1_REG = 0x07060504
EFUSE_RD_USR_DATA2_REG = 0x0B0A0908
EFUSE_RD_USR_DATA3_REG = 0x0F0E0D0C
EFUSE_RD_USR_DATA4_REG = 0x13121111
EFUSE_RD_USR_DATA5_REG = 0x17161514
EFUSE_RD_USR_DATA6_REG = 0x1B1A1918
EFUSE_RD_USR_DATA7_REG = 0x1F1E1D1C

where is the byte representation:

byte[0] = 0x00, byte[1] = 0x01, ... byte[3] = 0x03, byte[4] = 0x04, ..., byte[31]␣
↪= 0x1F
```

For example, csv file describes the USER_DATA field, which occupies all 256 bits (a whole block).

```
USER_DATA,           EFUSE_BLK3,     0,  256,     User data
USER_DATA.FIELD1,    EFUSE_BLK3,     16,  16,     Field1

ID,                  EFUSE_BLK4,     8,  3,       ID bit[0..2]
,                    EFUSE_BLK4,     16, 2,       ID bit[3..4]
,                    EFUSE_BLK4,     32, 3,       ID bit[5..7]
```

Thus, reading the eFuse USER_DATA block written as above gives the following results:

```
uint8_t buf[32] = { 0 };
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &buf, sizeof(buf) * 8);
// buf[0] = 0x00, buf[1] = 0x01, ... buf[31] = 0x1F

uint32_t field1 = 0;
size_t field1_size = ESP_EFUSE_USER_DATA[0]->bit_count; // can be used for this␣
↪case because it only consists of one entry
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1, field1_size);
// field1 = 0x0302

uint32_t field1_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1_1, 2); // reads only first␣
↪2 bits
// field1 = 0x0002

uint8_t id = 0;
size_t id_size = esp_efuse_get_field_size(ESP_EFUSE_ID); // returns 6
// size_t id_size = ESP_EFUSE_USER_DATA[0]->bit_count; // can NOT be used because␣
↪it consists of 3 entries. It returns 3 not 6.
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id, id_size);
// id = 0x91
// b'100 10  001
//   [3] [2] [3]

uint8_t id_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id_1, 3);
// id = 0x01
// b'001
```

Debug eFuse & Unit tests

Virtual eFuses The Kconfig option *CONFIG_EFUSE_VIRTUAL* will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the *CONFIG_EFUSE_VIRTUAL* option there is *CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH* option that adds a feature to keep eFuses in flash memory. To use this mode the partition_table should have the *efuse* partition. partition.csv: "efuse_em, data, efuse, , 0x2000,". During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test secure_boot and flash_encryption features with this option).

espefuse.py esptool includes a useful tool for reading/writing ESP32-C3 eFuse bits - espefuse.py.

```
espefuse.py -p PORT summary

    Connecting....
Detecting chip type... ESP32-C3
espefuse.py v3.1-dev

enumerator **EFUSE_BLK_KEY3**

Number of eFuse BLOCK7. KEY3

enumerator **EFUSE_BLK8**

Number of eFuse BLOCK8. KEY4

enumerator **EFUSE_BLK_KEY4**

Number of eFuse BLOCK8. KEY4

enumerator **EFUSE_BLK9**

Number of eFuse BLOCK9. KEY5

enumerator **EFUSE_BLK_KEY5**

Number of eFuse BLOCK9. KEY5

enumerator **EFUSE_BLK_KEY_MAX**

enumerator **EFUSE_BLK10**

Number of eFuse BLOCK10. SYS_DATA_PART2

enumerator **EFUSE_BLK_SYS_DATA_PART2**

Number of eFuse BLOCK10. SYS_DATA_PART2

enumerator **EFUSE_BLK_MAX**

enum **esp_efuse_coding_scheme_t**

Type of coding scheme.

Values:

enumerator **EFUSE_CODING_SCHEME_NONE**

None

enumerator **EFUSE_CODING_SCHEME_RS**

Reed-Solomon coding

enum **esp_efuse_purpose_t**

Type of key purpose.

Values:

enumerator **ESP_EFUSE_KEY_PURPOSE_USER**

User purposes (software-only use)

enumerator **ESP_EFUSE_KEY_PURPOSE_RESERVED**

Reserved

enumerator **ESP_EFUSE_KEY_PURPOSE_XTS_AES_128_KEY**

XTS_AES_128_KEY (flash/PSRAM encryption)

enumerator **ESP_EFUSE_KEY_PURPOSE_HMAC_DOWN_ALL**

HMAC Downstream mode

enumerator **ESP_EFUSE_KEY_PURPOSE_HMAC_DOWN_JTAG**

JTAG soft enable key (uses HMAC Downstream mode)

enumerator **ESP_EFUSE_KEY_PURPOSE_HMAC_DOWN_DIGITAL_SIGNATURE**

Digital Signature peripheral key (uses HMAC Downstream mode)

enumerator **ESP_EFUSE_KEY_PURPOSE_HMAC_UP**

HMAC Upstream mode

enumerator **ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST0**

SECURE_BOOT_DIGEST0 (Secure Boot key digest)

enumerator **ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST1**

SECURE_BOOT_DIGEST1 (Secure Boot key digest)

enumerator **ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST2**

SECURE_BOOT_DIGEST2 (Secure Boot key digest)

enumerator **ESP_EFUSE_KEY_PURPOSE_MAX**

MAX PURPOSE

Header File

- components/efuse/include/esp_efuse.h

Functions

esp_err_t **esp_efuse_read_field_blob**(const *esp_efuse_desc_t* *field[], void *dst, size_t dst_size_bits)

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in "field" structure or "dst_size_bits" required size. Use "esp_efuse_get_field_size()" function to determine the length of the field.

备注: Please note that reading in the batch mode does not show uncommitted changes.

参数

- **field** –**[in]** A pointer to the structure describing the fields of efuse.
- **dst** –**[out]** A pointer to array that will contain the result of reading.
- **dst_size_bits** –**[in]** The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

返回

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

bool **esp_efuse_read_field_bit**(const *esp_efuse_desc_t* *field[])

Read a single bit eFuse field as a boolean value.

备注: The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call esp_efuse_read_field_blob() and check the returned value instead.

备注: If assertions are enabled and the parameter is invalid, execution will abort

备注: Please note that reading in the batch mode does not show uncommitted changes.

参数 **field** –**[in]** A pointer to the structure describing the fields of efuse.

返回

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

esp_err_t **esp_efuse_read_field_cnt**(const *esp_efuse_desc_t* *field[], size_t *out_cnt)

Reads bits from EFUSE field and returns number of bits programmed as "1".

If the bits are set not sequentially, they will still be counted.

备注: Please note that reading in the batch mode does not show uncommitted changes.

参数

- **field** –**[in]** A pointer to the structure describing the fields of efuse.
- **out_cnt** –**[out]** A pointer that will contain the number of programmed as "1" bits.

返回

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

esp_err_t **esp_efuse_write_field_blob**(const *esp_efuse_desc_t* *field[], const void *src, size_t src_size_bits)

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in "field" structure or "src_size_bits" required size. Use "esp_efuse_get_field_size()" function to determine the length of the field. After the function is completed, the writing registers are cleared.

参数

- **field** –**[in]** A pointer to the structure describing the fields of efuse.
- **src** –**[in]** A pointer to array that contains the data for writing.
- **src_size_bits** –**[in]** The number of bits required to write.

返回

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_write_field_cnt**(const *esp_efuse_desc_t* *field[], size_t cnt)

Writes a required count of bits as "1" to EFUSE field.

If there are no free bits in the field to set the required number of bits to "1", ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

参数

- **field** –**[in]** A pointer to the structure describing the fields of efuse.
- **cnt** –**[in]** Required number of programmed as "1" bits.

返回

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

esp_err_t **esp_efuse_write_field_bit**(const *esp_efuse_desc_t* *field[])

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp_efuse_write_field_cnt() with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

参数 **field** –**[in]** Pointer to the structure describing the efuse field.
返回
- ESP_OK: The operation was successfully completed, or the bit was already set to value 1.
- ESP_ERR_INVALID_ARG: Error in the passed arugments, including if the efuse field is not 1 bit wide.

esp_err_t **esp_efuse_set_write_protect** (*esp_efuse_block_t* blk)

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

参数 **blk** –**[in]** Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)
返回
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

esp_err_t **esp_efuse_set_read_protect** (*esp_efuse_block_t* blk)

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

参数 **blk** –**[in]** Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)
返回
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

int **esp_efuse_get_field_size** (const *esp_efuse_desc_t* *field[])

Returns the number of bits used by field.

参数 **field** –**[in]** A pointer to the structure describing the fields of efuse.
返回 Returns the number of bits used by field.

uint32_t **esp_efuse_read_reg** (*esp_efuse_block_t* blk, unsigned int num_reg)

Returns value of efuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

备注: Please note that reading in the batch mode does not show uncommitted changes.

参数
- **blk** –**[in]** Block number of eFuse.
- **num_reg** –**[in]** The register number in the block.

返回 Value of register

esp_err_t **esp_efuse_write_reg** (*esp_efuse_block_t* blk, unsigned int num_reg, uint32_t val)

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

参数
- **blk** –**[in]** Block number of eFuse.
- **num_reg** –**[in]** The register number in the block.
- **val** –**[in]** Value to write.

返回
- ESP_OK: The operation was successfully completed.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

esp_efuse_coding_scheme_t **esp_efuse_get_coding_scheme**(*esp_efuse_block_t* blk)

Return efuse coding scheme for blocks.

Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

参数 **blk** –**[in]** Block number of eFuse.
返回 Return efuse coding scheme for blocks

esp_err_t **esp_efuse_read_block**(*esp_efuse_block_t* blk, void *dst_key, size_t offset_in_bits, size_t size_bits)

Read key to efuse block starting at the offset and the required size.

备注: Please note that reading in the batch mode does not show uncommitted changes.

参数
- **blk** –**[in]** Block number of eFuse.
- **dst_key** –**[in]** A pointer to array that will contain the result of reading.
- **offset_in_bits** –**[in]** Start bit in block.
- **size_bits** –**[in]** The number of bits required to read.

返回
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_write_block**(*esp_efuse_block_t* blk, const void *src_key, size_t offset_in_bits, size_t size_bits)

Write key to efuse block starting at the offset and the required size.

参数
- **blk** –**[in]** Block number of eFuse.
- **src_key** –**[in]** A pointer to array that contains the key for writing.
- **offset_in_bits** –**[in]** Start bit in block.
- **size_bits** –**[in]** The number of bits required to write.

返回
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits

uint32_t **esp_efuse_get_pkg_ver**(void)

Returns chip package from efuse.

返回 chip package

void **esp_efuse_reset**(void)

Reset efuse write registers.

Efuse write registers are written to zero, to negate any changes that have been staged here.

备注: This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller's responsibility to serialise.

esp_err_t **esp_efuse_disable_rom_download_mode**(void)

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

备注： Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

备注： If ROM Download Mode is already disabled, this function does nothing and returns success.

返回

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode
- ESP_ERR_INVALID_STATE (ESP32 only) This eFuse is write protected and cannot be written

esp_err_t **esp_efuse_set_rom_log_scheme**(*esp_efuse_rom_log_scheme_t* log_scheme)

Set boot ROM log scheme via eFuse.

备注： By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can't be changed again.

参数 **log_scheme** –Supported ROM log scheme

返回

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme
- ESP_ERR_INVALID_STATE This eFuse is write protected or has been burned already

esp_err_t **esp_efuse_enable_rom_secure_download_mode**(void)

Switch ROM Download Mode to Secure Download mode via eFuse.

Permanently enables Secure Download mode. This mode limits the use of ROM Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.

备注： If Secure Download mode is already enabled, this function does nothing and returns success.

备注： Disabling the ROM Download Mode also disables Secure Download Mode.

返回

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_INVALID_STATE ROM Download Mode has been disabled via eFuse, so Secure Download mode is unavailable.

uint32_t **esp_efuse_read_secure_version**(void)

Return secure_version from efuse field.

返回 Secure version from efuse field

bool **esp_efuse_check_secure_version**(uint32_t secure_version)

Check secure_version from app and secure_version and from efuse field.

参数 **secure_version** –Secure version from app.

返回

- True: If version of app is equal or more then secure_version from efuse.

esp_err_t **esp_efuse_update_secure_version**(uint32_t secure_version)

Write efuse field by secure_version value.

Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

参数 **secure_version** –**[in]** Secure version from app.

返回

- ESP_OK: Successful.
- ESP_FAIL: secure version of app cannot be set to efuse field.
- ESP_ERR_NOT_SUPPORTED: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

esp_err_t **esp_efuse_batch_write_begin**(void)

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call begin() then perform as usually the necessary operations read and write and at the end call commit() to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

```
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3);  // ESP_EFUSE_1 == 1, here we write a new␣
↪value = 3. The changes will be burn by the commit() function.
esp_efuse_read_...(ESP_EFUSE_1);  // this function returns ESP_EFUSE_1 == 1␣
↪because uncommitted changes are not readable, it will be available only␣
↪after commit.
...

// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be␣
↪done in the last commit().

...

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read_...(ESP_EFUSE_1);  // this function returns ESP_EFUSE_1 == 3.
```

备注： Please note that reading in the batch mode does not show uncommitted changes.

返回

- ESP_OK: Successful.

esp_err_t **esp_efuse_batch_write_cancel**(void)

Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: Tha batch mode was not set.

esp_err_t **esp_efuse_batch_write_commit**(void)

Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The deferred writing mode was not set.

bool **esp_efuse_block_is_empty**(*esp_efuse_block_t* block)

Checks that the given block is empty.

返回

- True: The block is empty.
- False: The block is not empty or was an error.

bool **esp_efuse_get_key_dis_read**(*esp_efuse_block_t* block)

Returns a read protection for the key block.

参数 **block** – **[in]** A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
返回 True: The key block is read protected False: The key block is readable.

esp_err_t **esp_efuse_set_key_dis_read**(*esp_efuse_block_t* block)

Sets a read protection for the key block.

参数 **block** – **[in]** A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool **esp_efuse_get_key_dis_write**(*esp_efuse_block_t* block)

Returns a write protection for the key block.

参数 **block** – **[in]** A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
返回 True: The key block is write protected False: The key block is writeable.

esp_err_t **esp_efuse_set_key_dis_write**(*esp_efuse_block_t* block)

Sets a write protection for the key block.

参数 **block** – **[in]** A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool **esp_efuse_key_block_unused**(*esp_efuse_block_t* block)

Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0 (ESP_EFUSE_KEY_PURPOSE_USER)

参数 **block** –key block to check.

返回

- True if key block is unused,
- False if key block is used or the specified block index is not a key block.

bool **esp_efuse_find_purpose**(*esp_efuse_purpose_t* purpose, *esp_efuse_block_t* *block)

Find a key block with the particular purpose set.

参数

- **purpose** –**[in]** Purpose to search for.
- **block** –**[out]** Pointer in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX which will be set to the key block if found. Can be NULL, if only need to test the key block exists.

返回

- True: If found,
- False: If not found (value at block pointer is unchanged).

bool **esp_efuse_get_keypurpose_dis_write**(*esp_efuse_block_t* block)

Returns a write protection of the key purpose field for an efuse key block.

备注: For ESP32: no keypurpose, it returns always True.

参数 **block** –**[in]** A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回 True: The key purpose is write protected. False: The key purpose is writeable.

esp_efuse_purpose_t **esp_efuse_get_key_purpose**(*esp_efuse_block_t* block)

Returns the current purpose set for an efuse key block.

参数 **block** –**[in]** A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回

- Value: If Successful, it returns the value of the purpose related to the given key block.
- ESP_EFUSE_KEY_PURPOSE_MAX: Otherwise.

const *esp_efuse_desc_t* ****esp_efuse_get_purpose_field**(*esp_efuse_block_t* block)

Returns a pointer to a key purpose for an efuse key block.

To get the value of this field use esp_efuse_read_field_blob() or esp_efuse_get_key_purpose().

参数 **block** –**[in]** A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回 Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

const *esp_efuse_desc_t* ****esp_efuse_get_key**(*esp_efuse_block_t* block)

Returns a pointer to a key block.

参数 **block** –**[in]** A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回 Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

esp_err_t **esp_efuse_set_key_purpose**(*esp_efuse_block_t* block, *esp_efuse_purpose_t* purpose)

Sets a key purpose for an efuse key block.

参数

- **block** –**[in]** A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
- **purpose** –**[in]** Key purpose.

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_set_keypurpose_dis_write**(*esp_efuse_block_t* block)

Sets a write protection of the key purpose field for an efuse key block.

参数 **block** –**[in]** A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_efuse_block_t **esp_efuse_find_unused_key_block**(void)

Search for an unused key block and return the first one found.

See esp_efuse_key_block_unused for a description of an unused key block.

返回 First unused key block, or EFUSE_BLK_KEY_MAX if no unused key block is found.

unsigned **esp_efuse_count_unused_key_blocks**(void)

Return the number of unused efuse key blocks in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX.

bool **esp_efuse_get_digest_revoke**(unsigned num_digest)

Returns the status of the Secure Boot public key digest revocation bit.

参数 **num_digest** –**[in]** The number of digest in range 0..2

返回

- True: If key digest is revoked,
- False; If key digest is not revoked.

esp_err_t **esp_efuse_set_digest_revoke**(unsigned num_digest)

Sets the Secure Boot public key digest revocation bit.

参数 **num_digest** –**[in]** The number of digest in range 0..2

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool **esp_efuse_get_write_protect_of_digest_revoke**(unsigned num_digest)

Returns a write protection of the Secure Boot public key digest revocation bit.

参数 **num_digest** –**[in]** The number of digest in range 0..2

返回 True: The revocation bit is write protected. False: The revocation bit is writeable.

esp_err_t **esp_efuse_set_write_protect_of_digest_revoke**(unsigned num_digest)

Sets a write protection of the Secure Boot public key digest revocation bit.

参数 **num_digest** –**[in]** The number of digest in range 0..2

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_write_key**(*esp_efuse_block_t* block, *esp_efuse_purpose_t* purpose, const void *key, size_t key_size_bytes)

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

参数

- **block** –**[in]** Block to read purpose for. Must be in range EFUSE_BLK_KEY0 to EFUSE_BLK_KEY_MAX. Key block must be unused (esp_efuse_key_block_unused).
- **purpose** –**[in]** Purpose to set for this key. Purpose must be already unset.
- **key** –**[in]** Pointer to data to write.
- **key_size_bytes** –**[in]** Bytes length of data to write.

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_write_keys**(const *esp_efuse_purpose_t* purposes[], uint8_t keys[][32], unsigned number_of_keys)

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

参数

- **purposes** –**[in]** Array of purposes (purpose[number_of_keys]).
- **keys** –**[in]** Array of keys (uint8_t keys[number_of_keys][32]). Each key is 32 bytes long.
- **number_of_keys** –**[in]** The number of keys to write (up to 6 keys).

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS: Error not enough unused key blocks available
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_secure_boot_read_key_digests**(*esp_secure_boot_key_digests_t* *trusted_key_digests)

Read key digests from efuse. Any revoked/missing digests will be marked as NULL.

参数 **trusted_key_digests** –**[out]** Trusted keys digests, stored in this parameter after successfully completing this function. The number of digests depends on the SOC’s capabilities.

返回

- ESP_OK: Successful.
- ESP_FAIL: If trusted_keys is NULL or there is no valid digest.

esp_err_t **esp_efuse_check_errors**(void)

Checks eFuse errors in BLOCK0.

It does a BLOCK0 check if eFuse EFUSE_ERR_RST_ENABLE is set. If BLOCK0 has an error, it prints the error and returns ESP_FAIL, which should be treated as esp_restart.

备注： Refers to ESP32-C3 only.

返回

- ESP_OK: No errors in BLOCK0.
- ESP_FAIL: Error in BLOCK0 requiring reboot.

Structures

struct **esp_efuse_desc_t**

Type definition for an eFuse field.

Public Members

esp_efuse_block_t **efuse_block**

Block of eFuse

uint8_t **bit_start**

Start bit [0..255]

uint16_t **bit_count**

Length of bit field [1..-]

struct **esp_secure_boot_key_digests_t**

Pointers to the trusted key digests.

The number of digests depends on the SOC’ s capabilities.

Public Members

const void ***key_digests**[3]

Pointers to the key digests

Macros

ESP_ERR_EFUSE

Base error code for efuse api.

ESP_OK_EFUSE_CNT

OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL

Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG

Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING

Error while a encoding operation.

ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS

Error not enough unused key blocks available

ESP_ERR_DAMAGED_READING

Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

Enumerations

enum **esp_efuse_rom_log_scheme_t**

Type definition for ROM log scheme.

Values:

enumerator **ESP_EFUSE_ROM_LOG_ALWAYS_ON**

Always enable ROM logging

enumerator **ESP_EFUSE_ROM_LOG_ON_GPIO_LOW**

ROM logging is enabled when specific GPIO level is low during start up

enumerator **ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH**

ROM logging is enabled when specific GPIO level is high during start up

enumerator **ESP_EFUSE_ROM_LOG_ALWAYS_OFF**

Disable ROM logging permanently

2.10.6 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see *Error Handling*.

For the full list of error codes defined in ESP-IDF, see *Error Code Reference*.

API Reference

Header File

- components/esp_common/include/esp_check.h

Macros

ESP_RETURN_ON_ERROR(x, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns. In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros. The first one is using the GNU extension ##__VA_ARGS__. The second one is using the C++20 feature **VA_OPT**(,). This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven't found any good alternative to using ##__VA_ARGS__. Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns.

ESP_RETURN_ON_ERROR_ISR(x, log_tag, format, ...)

A version of ESP_RETURN_ON_ERROR() macro that can be called from ISR.

ESP_GOTO_ON_ERROR(x, goto_tag, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message, sets the local variable 'ret' to the code, and then exits by jumping to 'goto_tag'.

ESP_GOTO_ON_ERROR_ISR (x, goto_tag, log_tag, format, ...)

A version of ESP_GOTO_ON_ERROR() macro that can be called from ISR.

ESP_RETURN_ON_FALSE (a, err_code, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message and returns with the supplied ‘err_code’.

ESP_RETURN_ON_FALSE_ISR (a, err_code, log_tag, format, ...)

A version of ESP_RETURN_ON_FALSE() macro that can be called from ISR.

ESP_GOTO_ON_FALSE (a, err_code, goto_tag, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message, sets the local variable ‘ret’ to the supplied ‘err_code’, and then exits by jumping to ‘goto_tag’.

ESP_GOTO_ON_FALSE_ISR (a, err_code, goto_tag, log_tag, format, ...)

A version of ESP_GOTO_ON_FALSE() macro that can be called from ISR.

Header File

- components/esp_common/include/esp_err.h

Functions

const char ***esp_err_to_name** (*esp_err_t* code)

Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

参数 **code** –esp_err_t error code
返回 string error message

const char ***esp_err_to_name_r** (*esp_err_t* code, char *buf, size_t buflen)

Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

参数

- **code** –esp_err_t error code
- **buf** –**[out]** buffer where the error message should be written
- **buflen** –Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

返回 buf containing the string error message

Macros

ESP_OK

esp_err_t value indicating success (no error)

ESP_FAIL

Generic esp_err_t code indicating failure

ESP_ERR_NO_MEM

Out of memory

ESP_ERR_INVALID_ARG
Invalid argument

ESP_ERR_INVALID_STATE
Invalid state

ESP_ERR_INVALID_SIZE
Invalid size

ESP_ERR_NOT_FOUND
Requested resource not found

ESP_ERR_NOT_SUPPORTED
Operation or feature not supported

ESP_ERR_TIMEOUT
Operation timed out

ESP_ERR_INVALID_RESPONSE
Received response was invalid

ESP_ERR_INVALID_CRC
CRC or checksum was invalid

ESP_ERR_INVALID_VERSION
Version was invalid

ESP_ERR_INVALID_MAC
MAC address was invalid

ESP_ERR_NOT_FINISHED
There are items remained to retrieve

ESP_ERR_WIFI_BASE
Starting number of WiFi error codes

ESP_ERR_MESH_BASE
Starting number of MESH error codes

ESP_ERR_FLASH_BASE
Starting number of flash error codes

ESP_ERR_HW_CRYPTO_BASE
Starting number of HW cryptography module error codes

ESP_ERR_MEMPROT_BASE
Starting number of Memory Protection API error codes

ESP_ERROR_CHECK(x)

Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK. Prints the error code, error location, and the failed statement to serial output.

Disabled if assertions are disabled.

ESP_ERROR_CHECK_WITHOUT_ABORT(x)

Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn't terminating the program.

Type Definitions

typedef int **esp_err_t**

2.10.7 ESP HTTPS OTA

Overview

`esp_https_ota` provides simplified APIs to perform firmware upgrades over HTTPS. It's an abstraction layer over existing OTA APIs.

Application Example

```
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_https_ota_config_t ota_config = {
        .http_config = &config,
    };
    esp_err_t ret = esp_https_ota(&ota_config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

Server Verification

Please refer to *ESP-TLS: TLS Server Verification* for more information on server verification. The root certificate (in PEM format) needs to be provided to the *esp_http_client_config_t::cert_pem* member.

备注: The server-endpoint **root** certificate should be used for verification instead of any intermediate ones from the certificate chain. The reason being that the root certificate has the maximum validity and usually remains the same for a long period of time. Users can also use the `ESP x509 Certificate Bundle` feature for verification, which covers most of the trusted root certificates (using the *esp_http_client_config_t::crt_bundle_attach* member).

Partial Image Download over HTTPS

To use partial image download feature, enable `partial_http_download` configuration in `esp_https_ota_config_t`. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified size. Maximum content length of each request can be specified by setting `max_http_request_size` to required value.

This option is useful while fetching image from a service like AWS S3, where mbedTLS Rx buffer size (*CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN*) can be set to lower value which is not possible without enabling this configuration.

Default value of mbedTLS Rx buffer size is set to 16K. By using partial_http_download with max_http_request_size of 4K, size of mbedTLS Rx buffer can be reduced to 4K. With this configuration, memory saving of around 12K is expected.

Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer *没有安全启动的安全 OTA 升级*

Advanced APIs

`esp_https_ota` also provides advanced APIs which can be used if more information and control is needed during the OTA process.

Example that uses advanced ESP_HTTPS_OTA APIs: system/ota/advanced_https_ota.

OTA Upgrades with Pre-Encrypted Firmware

To perform OTA upgrades with Pre-Encrypted Firmware, please enable *CONFIG_ESP_HTTPS_OTA_DECRYPT_CB* in component menuconfig.

Example that performs OTA upgrade with Pre-Encrypted Firmware: system/ota/pre_encrypted_ota.

API Reference

Header File

- components/esp_https_ota/include/esp_https_ota.h

Functions

esp_err_t **esp_https_ota**(const *esp_https_ota_config_t* *ota_config)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `ota_config->http_config`.

备注: This API handles the entire OTA operation, so if this API is being used then no other APIs from `esp_https_ota` component should be called. If more information and control is needed during the HTTPS OTA process, then one can use `esp_https_ota_begin` and subsequent APIs. If this API returns successfully, esp_restart() must be called to boot from the new firmware image.

参数 **ota_config** –**[in]** pointer to *esp_https_ota_config_t* structure.

返回

- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf ' s app_update component.

esp_err_t **esp_https_ota_begin** (const *esp_https_ota_config_t* *ota_config, *esp_https_ota_handle_t* *handle)

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then `esp_https_ota_perform` should be called to continue with the OTA process and there should be a call to `esp_https_ota_finish` on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `http_config`, which is a part of `ota_config`. In case of error, this API explicitly sets `handle` to NULL.

备注: This API is blocking, so setting `is_async` member of `http_config` structure will result in an error.

参数

- **ota_config** –**[in]** pointer to *esp_https_ota_config_t* structure
- **handle** –**[out]** pointer to an allocated data of type `esp_https_ota_handle_t` which will be initialised in this function

返回

- ESP_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in app_update component and esp_http_client component in esp-idf.

esp_err_t **esp_https_ota_perform** (*esp_https_ota_handle_t* https_ota_handle)

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if esp_https_ota_begin() returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

参数 **https_ota_handle** –**[in]** pointer to esp_https_ota_handle_t structure

返回

- ESP_ERR_HTTPS_OTA_IN_PROGRESS: OTA update is in progress, call this API again to continue.
- ESP_OK: OTA update was successful
- ESP_FAIL: OTA update failed
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_VERSION: Invalid chip revision in image header
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf ' s app_update component.

bool **esp_https_ota_is_complete_data_received** (*esp_https_ota_handle_t* https_ota_handle)

Checks if complete data was received or not.

备注： This API can be called just before esp_https_ota_finish() to validate if the complete image was indeed received.

参数 **https_ota_handle** –**[in]** pointer to esp_https_ota_handle_t structure

返回

- false
- true

esp_err_t **esp_https_ota_finish**(*esp_https_ota_handle_t* https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

备注： If this API returns successfully, esp_restart() must be called to boot from the new firmware image esp_https_ota_finish should not be called after calling esp_https_ota_abort

参数 **https_ota_handle** –**[in]** pointer to esp_https_ota_handle_t structure

返回

- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image

esp_err_t **esp_https_ota_abort**(*esp_https_ota_handle_t* https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

备注： esp_https_ota_abort should not be called after calling esp_https_ota_finish

参数 **https_ota_handle** –**[in]** pointer to esp_https_ota_handle_t structure

返回

- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE: Invalid ESP HTTPS OTA state
- ESP_FAIL: OTA not started
- ESP_ERR_NOT_FOUND: OTA handle not found
- ESP_ERR_INVALID_ARG: Invalid argument

esp_err_t **esp_https_ota_get_img_desc**(*esp_https_ota_handle_t* https_ota_handle, *esp_app_desc_t* *new_app_info)

Reads app description from image header. The app description provides information like the "Firmware version" of the image.

备注： This API can be called only after esp_https_ota_begin() and before esp_https_ota_perform(). Calling this API is not mandatory.

参数

- **https_ota_handle** –**[in]** pointer to esp_https_ota_handle_t structure
- **new_app_info** –**[out]** pointer to an allocated *esp_app_desc_t* structure

返回

- ESP_ERR_INVALID_ARG: Invalid arguments

- ESP_ERR_INVALID_STATE: Invalid state to call this API. esp_https_ota_begin() not called yet.
- ESP_FAIL: Failed to read image descriptor
- ESP_OK: Successfully read image descriptor

int **esp_https_ota_get_image_len_read**(*esp_https_ota_handle_t* https_ota_handle)

This function returns OTA image data read so far.

备注: This API should be called only if `esp_https_ota_perform()` has been called atleast once or if `esp_https_ota_get_img_desc` has been called before.

参数 **https_ota_handle** –**[in]** pointer to esp_https_ota_handle_t structure

返回

- -1 On failure
- total bytes read so far

int **esp_https_ota_get_image_size**(*esp_https_ota_handle_t* https_ota_handle)

This function returns OTA image total size.

备注: This API should be called after esp_https_ota_begin() has been already called. This can be used to create some sort of progress indication (in combination with esp_https_ota_get_image_len_read())

参数 **https_ota_handle** –**[in]** pointer to esp_https_ota_handle_t structure

返回

- -1 On failure or chunked encoding
- total bytes of image

Structures

struct **esp_https_ota_config_t**

ESP HTTPS OTA configuration.

Public Members

const *esp_http_client_config_t* ***http_config**

ESP HTTP client configuration

http_client_init_cb_t **http_client_init_cb**

Callback after ESP HTTP client is initialised

bool **bulk_flash_erase**

Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

bool **partial_http_download**

Enable Firmware image to be downloaded over multiple HTTP requests

int **max_http_request_size**

Maximum request size for partial HTTP download

Macros

ESP_ERR_HTTPS_OTA_BASE

ESP_ERR_HTTPS_OTA_IN_PROGRESS

Type Definitions

typedef void ***esp_https_ota_handle_t**

typedef *esp_err_t* (***http_client_init_cb_t**)(*esp_http_client_handle_t*)

2.10.8 Event Loop Library

Overview

The event loop library allows components to declare events to which other components can register handlers –code which will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the Wi-Fi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

Using `esp_event` APIs

There are two objects of concern for users of this library: events and event loops.

Events are occurrences of note. For example, for Wi-Fi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more *here*. Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop library APIs.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as *esp_event_handler_t*.
2. An event loop is created using *esp_event_loop_create()*, which outputs a handle to the loop of type *esp_event_loop_handle_t*. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed *here*.
3. Components register event handlers to the loop using *esp_event_handler_register_with()*. Handlers can be registered with multiple loops, more on that *here*.
4. Event sources post an event to the loop using *esp_event_post_to()*.
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using *esp_event_handler_unregister_with()*.
6. Event loops which are no longer needed can be deleted using *esp_event_loop_delete()*.

In code, the flow above may look like as follows:

```
// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void*␣
↪event_data)
{
    // Event handler logic
}

void app_main()
{
    // 2. A configuration structure of type esp_event_loop_args_t is needed to␣
↪specify the properties of the loop to be
```

(下页继续)

(续上页)

```
    // created. A handle of type esp_event_loop_handle_t is obtained, which is␣
↪needed by the other APIs to reference the loop
    // to perform their operations on.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...
        .task_priority = ...,
        .task_stack_size = ...,
        .task_core_id = ...
    };

    esp_event_loop_handle_t loop_handle;

    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID␣
↪specifies a hypothetical
    // event that handler run_on_event should execute on when it gets posted to␣
↪the loop.
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↪on_event, ...);

    ...

    // 4. Post events to the loop. This queues the event on the event loop. At␣
↪some point in time
    // the event loop executes the event handler registered to the posted event,␣
↪in this case run_on_event.
    // For simplicity sake this example calls esp_event_post_to from app_main, but␣
↪posting can be done from
    // any other tasks (which is the more interesting use case).
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

    ...

    // 5. Unregistering an unneeded handler
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↪on_event);

    ...

    // 6. Deleting an unneeded event loop
    esp_event_loop_delete(loop_handle);
}
```

Declaring and defining events

As mentioned previously, events consists of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person's last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```

Event base definition:

```
ESP_EVENT_DEFINE_BASE(EVENT_BASE)
```

备注： In IDF, the base identifiers for system events are uppercase and are postfixed with _EVENT. For example, the base for Wi-Fi events is declared and defined as WIFI_EVENT, the ethernet event base ETHERNET_EVENT, and so on. The purpose is to have event bases look like constants (although they are global variables considering the defintions of macros ESP_EVENT_DECLARE_BASE and ESP_EVENT_DEFINE_BASE).

For event ID's, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

Default Event Loop

The default event loop is a special type of loop used for system events (Wi-Fi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loops equivalent.

User Event Loops	Default Event Loops
esp_event_loop_create()	*esp_event_loop_create_default()*
esp_event_loop_delete()	*esp_event_loop_delete_default()*
esp_event_handler_register_with()	*esp_event_handler_register()*
esp_event_handler_unregister_with()	*esp_event_handler_unregister()*
esp_event_post_to()	*esp_event_post()*

If you compare the signatures for both, they are mostly similar except the for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

Notes on Handler Registration

It is possible to register a single handler to multiple events individually, i.e. using multiple calls to *esp_event_handler_register_with()*. For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier ESP_EVENT_ANY_BASE and special event ID ESP_EVENT_ANY_ID. These special identifiers may be passed as the event base and event ID arguments for *esp_event_handler_register_with()*.

Therefore, the valid arguments to *esp_event_handler_register_with()* are:

1. <event base>, <event ID> - handler executes when the event with base <event base> and event ID <event ID> gets posted to the loop
2. <event base>, ESP_EVENT_ANY_ID - handler executes when any event with base <event base> gets posted to the loop

3. ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_
↪event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_
↪on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID,␣
↪run_on_event_3, ...);
```

If the hypothetical event `MY_EVENT_BASE, MY_EVENT_ID` is posted, all three handlers `run_on_event_1`, `run_on_event_2`, and `run_on_event_3` would execute.

If the hypothetical event `MY_EVENT_BASE, MY_OTHER_EVENT_ID` is posted, only `run_on_event_2` and `run_on_event_3` would execute.

If the hypothetical event `MY_OTHER_EVENT_BASE, MY_OTHER_EVENT_ID` is posted, only `run_on_event_3` would execute.

Handler Registration and Handler Dispatch Order The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also gets executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the 'first registered, first executed' behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

Event loop profiling

A configuration option *CONFIG_ESP_EVENT_LOOP_PROFILING* can be enabled in order to activate statistics collection for all event loops created. The function *esp_event_dump()* can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the *esp_event_dump()* API Reference.

Application Example

Examples on using the `esp_event` library can be found in system/esp_event. The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt esp_event library:

- NMEA Parser , which will decode the statements received from GPS.

API Reference

Header File

- components/esp_event/include/esp_event.h

Functions

esp_err_t **esp_event_loop_create**(const *esp_event_loop_args_t* *event_loop_args, *esp_event_loop_handle_t* *event_loop)

Create a new event loop.

参数

- **event_loop_args** –**[in]** configuration structure for the event loop to create
- **event_loop** –**[out]** handle to the created event loop

返回

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: event_loop_args or event_loop was NULL
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

esp_err_t **esp_event_loop_delete**(*esp_event_loop_handle_t* event_loop)

Delete an existing event loop.

参数 **event_loop** –**[in]** event loop to delete, must not be NULL

返回

- ESP_OK: Success
- Others: Fail

esp_err_t **esp_event_loop_create_default**(void)

Create default event loop.

返回

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

esp_err_t **esp_event_loop_delete_default**(void)

Delete the default event loop.

返回

- ESP_OK: Success
- Others: Fail

esp_err_t **esp_event_loop_run**(*esp_event_loop_handle_t* event_loop, TickType_t ticks_to_run)

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all the allotted time waiting on the event queue. Once an event has been dequeued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the dequeued event, and (2) during dispatch of the dequeued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last dequeued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

备注： encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

参数

- **event_loop** –**[in]** event loop to dispatch posted events from, must not be NULL
- **ticks_to_run** –**[in]** number of ticks to run the loop

返回

- ESP_OK: Success
- Others: Fail

esp_err_t **esp_event_handler_register**(esp_event_base_t event_base, int32_t event_id, *esp_event_handler_t* event_handler, void *event_handler_arg)

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

备注： This function is obsolete and will be deprecated soon, please use esp_event_handler_instance_register() instead.

备注： the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

参数

- **event_base** –**[in]** the base ID of the event to register the handler for
- **event_id** –**[in]** the ID of the event to register the handler for
- **event_handler** –**[in]** the handler function which gets called when the event is dispatched
- **event_handler_arg** –**[in]** data, aside from event data, that is passed to the handler when it is called

返回

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_handler_register_with**(*esp_event_loop_handle_t* event_loop, esp_event_base_t event_base, int32_t event_id, *esp_event_handler_t* event_handler, void *event_handler_arg)

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as esp_event_handler_register, except the additional specification of the event loop to register the handler to.

备 注： This function is obsolete and will be deprecated soon, please use esp_event_handler_instance_register_with() instead.

备注： the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

参数

- **event_loop** –**[in]** the event loop to register this handler function to, must not be NULL
- **event_base** –**[in]** the base ID of the event to register the handler for
- **event_id** –**[in]** the ID of the event to register the handler for
- **event_handler** –**[in]** the handler function which gets called when the event is dispatched
- **event_handler_arg** –**[in]** data, aside from event data, that is passed to the handler when it is called

返回

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_handler_instance_register_with**(*esp_event_loop_handle_t* event_loop, esp_event_base_t event_base, int32_t event_id, *esp_event_handler_t* event_handler, void *event_handler_arg, *esp_event_handler_instance_t* *instance)

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

备注： the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

---

参数

- **event_loop** –**[in]** the event loop to register this handler function to, must not be NULL
- **event_base** –**[in]** the base ID of the event to register the handler for
- **event_id** –**[in]** the ID of the event to register the handler for
- **event_handler** –**[in]** the handler function which gets called when the event is dispatched
- **event_handler_arg** –**[in]** data, aside from event data, that is passed to the handler when it is called
- **instance** –**[out]** An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

返回

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler

- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

esp_err_t **esp_event_handler_instance_register**(esp_event_base_t event_base, int32_t event_id, *esp_event_handler_t* event_handler, void *event_handler_arg, *esp_event_handler_instance_t* *instance)

Register an instance of event handler to the default loop.

This function does the same as esp_event_handler_instance_register_with, except that it registers the handler to the default event loop.

备注: the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

---

参数

- **event_base** –**[in]** the base ID of the event to register the handler for
- **event_id** –**[in]** the ID of the event to register the handler for
- **event_handler** –**[in]** the handler function which gets called when the event is dispatched
- **event_handler_arg** –**[in]** data, aside from event data, that is passed to the handler when it is called
- **instance** –**[out]** An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

返回

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

esp_err_t **esp_event_handler_unregister**(esp_event_base_t event_base, int32_t event_id, *esp_event_handler_t* event_handler)

Unregister a handler with the system event loop (legacy).

Unregisters a handler, so it will no longer be called during dispatch. Handlers can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler, the event_base and event_id arguments must match exactly the arguments passed to esp_event_handler_register() when that handler was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handlers that were registered with the same wildcard arguments.

备 注: This function is obsolete and will be deprecated soon, please use esp_event_handler_instance_unregister() instead.

备注: When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

参数

- **event_base** –**[in]** the base of the event with which to unregister the handler
- **event_id** –**[in]** the ID of the event with which to unregister the handler
- **event_handler** –**[in]** the handler to unregister

返回 ESP_OK success

返回 ESP_ERR_INVALID_ARG invalid combination of event base and event ID

返回 others fail

esp_err_t **esp_event_handler_unregister_with**(*esp_event_loop_handle_t* event_loop, esp_event_base_t event_base, int32_t event_id, *esp_event_handler_t* event_handler)

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as esp_event_handler_unregister, except the additional specification of the event loop to unregister the handler with.

备 注: This function is obsolete and will be deprecated soon, please use esp_event_handler_instance_unregister_with() instead.

参数

- **event_loop** –**[in]** the event loop with which to unregister this handler function, must not be NULL
- **event_base** –**[in]** the base of the event with which to unregister the handler
- **event_id** –**[in]** the ID of the event with which to unregister the handler
- **event_handler** –**[in]** the handler to unregister

返回

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_handler_instance_unregister_with**(*esp_event_loop_handle_t* event_loop, esp_event_base_t event_base, int32_t event_id, *esp_event_handler_instance_t* instance)

Unregister a handler instance from a specific event loop.

Unregisters a handler instance, so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler instance, the event_base and event_id arguments must match exactly the arguments passed to esp_event_handler_instance_register() when that handler instance was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handler instances that were registered with the same wildcard arguments.

备注: When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

参数

- **event_loop** –**[in]** the event loop with which to unregister this handler function, must not be NULL
- **event_base** –**[in]** the base of the event with which to unregister the handler
- **event_id** –**[in]** the ID of the event with which to unregister the handler
- **instance** –**[in]** the instance object of the registration to be unregistered

返回

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_handler_instance_unregister**(esp_event_base_t event_base, int32_t event_id, *esp_event_handler_instance_t* instance)

Unregister a handler from the system event loop.

This function does the same as esp_event_handler_instance_unregister_with, except that it unregisters the handler instance from the default event loop.

参数

- **event_base** –**[in]** the base of the event with which to unregister the handler
- **event_id** –**[in]** the ID of the event with which to unregister the handler
- **instance** –**[in]** the instance object of the registration to be unregistered

返回

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_post**(esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)

Posts an event to the system default event loop. The event loop library keeps a copy of event_data and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

参数

- **event_base** –**[in]** the event base that identifies the event
- **event_id** –**[in]** the event ID that identifies the event
- **event_data** –**[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** –**[in]** the size of the event data
- **ticks_to_wait** –**[in]** number of ticks to block on a full event queue

返回

- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_post_to**(*esp_event_loop_handle_t* event_loop, esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp_event_post_to, except the additional specification of the event loop to post the event to.

参数

- **event_loop** –**[in]** the event loop to post to, must not be NULL
- **event_base** –**[in]** the event base that identifies the event
- **event_id** –**[in]** the event ID that identifies the event
- **event_data** –**[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** –**[in]** the size of the event data
- **ticks_to_wait** –**[in]** number of ticks to block on a full event queue

返回

- ESP_OK: Success

- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_isr_post**(esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, BaseType_t *task_unblocked)

Special variant of esp_event_post for posting events from interrupt handlers.

备注： this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

---

备注： when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

参数

- **event_base** –**[in]** the event base that identifies the event
- **event_id** –**[in]** the event ID that identifies the event
- **event_data** –**[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** –**[in]** the size of the event data; max is 4 bytes
- **task_unblocked** –**[out]** an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

返回

- ESP_OK: Success
- ESP_FAIL: Event queue for the default event loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

esp_err_t **esp_event_isr_post_to**(*esp_event_loop_handle_t* event_loop, esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, BaseType_t *task_unblocked)

Special variant of esp_event_post_to for posting events from interrupt handlers.

备注： this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

---

备注： when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

参数

- **event_loop** –**[in]** the event loop to post to, must not be NULL
- **event_base** –**[in]** the event base that identifies the event
- **event_id** –**[in]** the event ID that identifies the event
- **event_data** –**[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** –**[in]** the size of the event data
- **task_unblocked** –**[out]** an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

返回

- ESP_OK: Success

- ESP_FAIL: Event queue for the loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

esp_err_t **esp_event_dump**(FILE *file)

Dumps statistics of all event loops.

Dumps event loop info in the format:

```
      event loop
          handler
          handler
          ...
      event loop
          handler
          handler
          ...

 where:

  event loop
      format: address,name rx:total_received dr:total_dropped
      where:
          address - memory address of the event loop
          name - name of the event loop, 'none' if no dedicated task
          total_received - number of successfully posted events
          total_dropped - number of events unsuccessfully posted due to queue␣
↪being full

  handler
      format: address ev:base,id inv:total_invoked run:total_runtime
      where:
          address - address of the handler function
          base,id - the event specified by event base and ID this handler␣
↪executes
          total_invoked - number of times this handler has been invoked
          total_runtime - total amount of time used for invoking this handler
```

备注: this function is a noop when CONFIG_ESP_EVENT_LOOP_PROFILING is disabled

参数 **file** – **[in]** the file stream to output to

返回

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- Others: Fail

Structures

struct **esp_event_loop_args_t**

Configuration for creating event loops.

Public Members

int32_t **queue_size**

size of the event loop queue

const char ***task_name**

name of the event loop task; if NULL, a dedicated task is not created for event loop

UBaseType_t **task_priority**

priority of the event loop task, ignored if task name is NULL

uint32_t **task_stack_size**

stack size of the event loop task, ignored if task name is NULL

BaseType_t **task_core_id**

core to which the event loop task is pinned to, ignored if task name is NULL

Header File

- components/esp_event/include/esp_event_base.h

Macros

ESP_EVENT_DECLARE_BASE(id)

ESP_EVENT_DEFINE_BASE(id)

ESP_EVENT_ANY_BASE

register handler for any event base

ESP_EVENT_ANY_ID

register handler for any event id

Type Definitions

typedef void ***esp_event_loop_handle_t**

a number that identifies an event with respect to a base

typedef void (***esp_event_handler_t**)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)

function called when an event is posted to the queue

2.10.9 FreeRTOS

Overview

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

备注： ESP-IDF FreeRTOS is based on Vanilla FreeRTOS v10.4.3

- For more information about the SMP changes of ESP-IDF FreeRTOS, see *ESP-IDF FreeRTOS (SMP)*
- For more information about the features added to ESP-IDF FreeRTOS, see *FreeRTOS Supplemental Features*.

Configuration

Vanilla FreeRTOS allows ports and applications to configure the kernel by adding various `#define config...` macros to `FreeRTOSConfig.h`. Through these macros, the kernel's scheduling behavior and various kernel features can be enabled or disabled. **However, in ESP-IDF FreeRTOS, the "FreeRTOSConfig.h" file is considered a private and must not be modified by users**. Any FreeRTOS configuration that is exposed to the user will be done so via menuconfig.

ESP-IDF FreeRTOS can be configured in the project configuration menu (`idf.py menuconfig`) under `Component Config/FreeRTOS`. The following section highlights some of the ESP-IDF FreeRTOS configuration options. For a full list of ESP-IDF FreeRTOS configurations, see *Project Configuration*

- *CONFIG_FREERTOS_UNICORE* will run ESP-IDF FreeRTOS only on CPU0. Note that this is **not equivalent to running Vanilla FreeRTOS**. Futhermore, this option may affect behavior of components other than freertos. For more details regarding the effects of running ESP-IDF FreeRTOS on a single core, refer to *ESP-IDF FreeRTOS Single Core*. Alternatively, users can also search for occurrences of `CONFIG_FREERTOS_UNICORE` in the ESP-IDF components.
- *CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION* will trigger a halt in functions in ESP-IDF FreeRTOS that have not been fully tested in an SMP context.
- *CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER* will enclose all task functions within a wrapper function. In the case that a task function mistakenly returns (i.e. does not call *`vTaskDelete()`*), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application, as illustrated below:

```
E (25) FreeRTOS: FreeRTOS task should not return. Aborting now!
abort() was called at PC 0x40085c53 on core 0
```

备注： As ESP32-C3 is a single core SoC, the *CONFIG_FREERTOS_UNICORE* configuration is always set.

ESP-IDF FreeRTOS Applications

Unlike Vanilla FreeRTOS, users must not call *`vTaskStartScheduler()`*. Instead, ESP-IDF FreeRTOS is started automatically. The entry point is a user defined `void app_main(void)` function.

- Typically, users would spawn the rest of their applications task from `app_main`.
- The `app_main` function is allowed to return at any point (i.e., before the application terminates).
- The `app_main` function is called from the `main` task.

The `main` task is one of multiple tasks that are automatically spawned by ESP-IDF during startup. These tasks are:

表 8: List of Tasks Created During Startup

Task Name	Affinity	Priority	Description
Main Task (`main`)	CPU0	1	Task that simply calls `app_main`. This task will self delete when `app_main` returns
Idle Tasks (`IDLEx`)	CPU0 and CPU1	0	Idle task created for (and pinned to) each CPU

备注： Low priority numbers denote low priority tasks.

Task API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/task.h

Functions

BaseType_t **xTaskCreatePinnedToCore**(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t usStackDepth, void *const pvParameters, UBaseType_t uxPriority, *TaskHandle_t* *const pvCreatedTask, const BaseType_t xCoreID)

Create a new task with a specified affinity.

This function is similar to xTaskCreate, but allows setting task affinity in SMP system.

参数

- **pvTaskCode** –Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** –A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- **usStackDepth** –The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** –Pointer that will be used as the parameter for the task being created.
- **uxPriority** –The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- **pvCreatedTask** –Used to pass back a handle by which the created task can be referenced.
- **xCoreID** –If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

返回 pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

static inline BaseType_t **xTaskCreate**(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t usStackDepth, void *const pvParameters, UBaseType_t uxPriority, *TaskHandle_t* *const pxCreatedTask)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

See xTaskCreateStatic() for a version that does not use any dynamic memory allocation.

xTaskCreate() can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using xTaskCreateRestricted().

Example usage:

```
// Task to be created.
void vTaskCode( void * pvParameters )
{
  for( ;; )
  {
      // Task code goes here.
  }
}

// Function that creates a task.
void vOtherFunction( void )
{
static uint8_t ucParameterToPass;
TaskHandle_t xHandle = NULL;

  // Create the task, storing the handle.  Note that the passed parameter␣
↪ucParameterToPass
  // must exist for the lifetime of the task, so in this case is declared␣
↪static.  If it was just an
  // an automatic stack variable it might no longer exist, or at least have␣
↪been corrupted, by the time
  // the new task attempts to access it.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
↪PRIORITY, &xHandle );
  configASSERT( xHandle );

  // Use the handle to delete the task.
  if( xHandle != NULL )
  {
     vTaskDelete( xHandle );
  }
}
```

备注： If program uses thread local variables (ones specified with "__thread" keyword) then storage for them will be allocated on the task's stack.

参数

- **pvTaskCode** –Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** –A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- **usStackDepth** –The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** –Pointer that will be used as the parameter for the task being created.
- **uxPriority** –The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- **pxCreatedTask** –Used to pass back a handle by which the created task can be referenced.

返回 pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

TaskHandle_t **xTaskCreateStaticPinnedToCore**(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)

Create a new task with a specified affinity.

This function is similar to xTaskCreateStatic, but allows specifying task affinity in an SMP system.

参数

- **pvTaskCode** –Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** –A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- **ulStackDepth** –The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** –Pointer that will be used as the parameter for the task being created.
- **uxPriority** –The priority at which the task will run.
- **pxStackBuffer** –Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task's stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** –Must point to a variable of type StaticTask_t, which will then be used to hold the task's data structures, removing the need for the memory to be allocated dynamically.
- **xCoreID** –If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

返回 If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

static inline *TaskHandle_t* **xTaskCreateStatic**(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const puxStackBuffer, StaticTask_t *const pxTaskBuffer)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see http://www.freertos.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```
// Dimensions the buffer that the task being created will use as its stack.
// NOTE:  This is the number of bytes the stack will hold, not the number of
// words as found in vanilla FreeRTOS.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack.  Note this is
// an array of StackType_t variables.  The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
```

(下页继续)

(续上页)

```
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic(
                  vTaskCode,       // Function that implements the task.
                  "NAME",          // Text name for the task.
                  STACK_SIZE,      // Stack size in bytes, not words.
                  ( void * ) 1,    // Parameter passed into the task.
                  tskIDLE_PRIORITY,// Priority at which the task is created.
                  xStack,          // Array to use as the task's stack.
                  &xTaskBuffer );  // Variable to hold the task's data␣
↪structure.

    // puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
    // been created, and xHandle will be the task's handle.  Use the handle
    // to suspend the task.
    vTaskSuspend( xHandle );
}
```

备注： If program uses thread local variables (ones specified with "__thread" keyword) then storage for them will be allocated on the task's stack.

参数

- **pvTaskCode** –Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** –A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- **ulStackDepth** –The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** –Pointer that will be used as the parameter for the task being created.
- **uxPriority** –The priority at which the task will run.
- **puxStackBuffer** –Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task's stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** –Must point to a variable of type StaticTask_t, which will then be used to hold the task's data structures, removing the need for the memory to be allocated dynamically.

返回 If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

BaseType_t **xTaskCreateRestricted**(const TaskParameters_t *const pxTaskDefinition, *TaskHandle_t* *pxCreatedTask)

Only available when configSUPPORT_DYNAMIC_ALLOCATION is set to 1.

xTaskCreateRestricted() should only be used in systems that include an MPU implementation.

Create a new task and add it to the list of tasks that are ready to run. The function parameters define the memory regions and associated access permissions allocated to the task.

See xTaskCreateRestrictedStatic() for a version that does not use any dynamic memory allocation.

return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Example usage:

```
// Create an TaskParameters_t structure that defines the task to be created.
static const TaskParameters_t xCheckTaskParameters =
{
 vATask,      // pvTaskCode - the function that implements the task.
 "ATask",     // pcName - just a text name for the task to assist debugging.
 100,         // usStackDepth - the stack size DEFINED IN WORDS.
 NULL,        // pvParameters - passed into the task function as the function␣
↪parameters.
 ( 1UL | portPRIVILEGE_BIT ),// uxPriority - task priority, set the␣
↪portPRIVILEGE_BIT if the task should run in a privileged state.
 cStackBuffer,// puxStackBuffer - the buffer to be used as the task stack.

 // xRegions - Allocate up to three separate memory regions for access by
 // the task, with appropriate access permissions.  Different processors have
 // different memory alignment requirements - refer to the FreeRTOS␣
↪documentation
 // for full information.
 {
     // Base address                 Length  Parameters
     { cReadWriteArray,              32,     portMPU_REGION_READ_WRITE },
     { cReadOnlyArray,               32,     portMPU_REGION_READ_ONLY },
     { cPrivilegedOnlyAccessArray,   128,    portMPU_REGION_PRIVILEGED_READ_
↪WRITE }
 }
};

int main( void )
{
TaskHandle_t xHandle;

 // Create a task from the const structure defined above.  The task handle
 // is requested (the second parameter is not NULL) but in this case just for
 // demonstration purposes as its not actually used.
 xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

 // Start the scheduler.
 vTaskStartScheduler();

 // Will only get here if there was insufficient memory to create the idle
 // and/or timer task.
 for( ;; );
}
```

参数

- **pxTaskDefinition** –Pointer to a structure that contains a member for each of the normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an optional stack buffer and the memory region definitions.
- **pxCreatedTask** –Used to pass back a handle by which the created task can be referenced.

void **vTaskAllocateMPURegions**(*TaskHandle_t* xTask, const MemoryRegion_t *const pxRegions)

Only available when configSUPPORT_STATIC_ALLOCATION is set to 1.

xTaskCreateRestrictedStatic() should only be used in systems that include an MPU implementation.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using xTaskCreateRestricted() then the stack is provided by the application writer, and the memory used to hold the task's data structure is automatically dynamically allocated inside the xTaskCreateRestricted() function. If a task is created using xTaskCreateRestrictedStatic() then the application writer must provide the memory used to hold the task's data structures too. xTaskCreateRestrictedStatic() therefore allows a memory protected task to be created without using any dynamic memory allocation.

return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Example usage:

```
// Create an TaskParameters_t structure that defines the task to be created.
// The StaticTask_t variable is only included in the structure when
// configSUPPORT_STATIC_ALLOCATION is set to 1.  The PRIVILEGED_DATA macro can
// be used to force the variable into the RTOS kernel's privileged data area.
static PRIVILEGED_DATA StaticTask_t xTaskBuffer;
static const TaskParameters_t xCheckTaskParameters =
{
 vATask,      // pvTaskCode - the function that implements the task.
 "ATask",     // pcName - just a text name for the task to assist debugging.
  100,        // usStackDepth - the stack size DEFINED IN BYTES.
 NULL,        // pvParameters - passed into the task function as the function␣
↪parameters.
 ( 1UL | portPRIVILEGE_BIT ),// uxPriority - task priority, set the␣
↪portPRIVILEGE_BIT if the task should run in a privileged state.
 cStackBuffer,// puxStackBuffer - the buffer to be used as the task stack.

 // xRegions - Allocate up to three separate memory regions for access by
 // the task, with appropriate access permissions.  Different processors have
 // different memory alignment requirements - refer to the FreeRTOS␣
↪documentation
 // for full information.
 {
     // Base address                 Length  Parameters
     { cReadWriteArray,              32,     portMPU_REGION_READ_WRITE },
     { cReadOnlyArray,               32,     portMPU_REGION_READ_ONLY },
     { cPrivilegedOnlyAccessArray,   128,    portMPU_REGION_PRIVILEGED_READ_
↪WRITE }
 }

 &xTaskBuffer; // Holds the task's data structure.
};

int main( void )
{
TaskHandle_t xHandle;

 // Create a task from the const structure defined above.  The task handle
 // is requested (the second parameter is not NULL) but in this case just for
 // demonstration purposes as its not actually used.
 xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

 // Start the scheduler.
 vTaskStartScheduler();
```

(下页继续)

(续上页)

```
 // Will only get here if there was insufficient memory to create the idle
 // and/or timer task.
 for( ;; );
}
```

Memory regions are assigned to a restricted task when the task is created by a call to xTaskCreateRestricted(). These regions can be redefined using vTaskAllocateMPURegions().

Example usage:

```
// Define an array of MemoryRegion_t structures that configures an MPU region
// allowing read/write access for 1024 bytes starting at the beginning of the
// ucOneKByte array.  The other two of the maximum 3 definable regions are
// unused so set to zero.
static const MemoryRegion_t xAltRegions[ portNUM_CONFIGURABLE_REGIONS ] =
{
 // Base address      Length      Parameters
 { ucOneKByte,        1024,       portMPU_REGION_READ_WRITE },
 { 0,                 0,          0 },
 { 0,                 0,          0 }
};

void vATask( void *pvParameters )
{
 // This task was created such that it has access to certain regions of
 // memory as defined by the MPU configuration.  At some point it is
 // desired that these MPU regions are replaced with that defined in the
 // xAltRegions const struct above.  Use a call to vTaskAllocateMPURegions()
 // for this purpose.  NULL is used as the task handle to indicate that this
 // function should modify the MPU regions of the calling task.
 vTaskAllocateMPURegions( NULL, xAltRegions );

 // Now the task can continue its function, but from this point on can only
 // access its stack and the ucOneKByte array (unless any other statically
 // defined or shared regions have been declared elsewhere).
}
```

参数

- **pxTaskDefinition** –Pointer to a structure that contains a member for each of the normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an optional stack buffer and the memory region definitions. If configSUPPORT_STATIC_ALLOCATION is set to 1 the structure contains an additional member, which is used to point to a variable of type StaticTask_t - which is then used to hold the task's data structure.
- **pxCreatedTask** –Used to pass back a handle by which the created task can be referenced.
- **xTask** –The handle of the task being updated.
- **pxRegions** –A pointer to an MemoryRegion_t structure that contains the new memory region definitions.

void **vTaskDelete**(*TaskHandle_t* xTaskToDelete)

INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

Remove a task from the RTOS real time kernel's management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted.

It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete (). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file death.c for sample code that utilises vTaskDelete ().

Example usage:

```
void vOtherFunction( void )
{
TaskHandle_t xHandle;

  // Create the task, storing the handle.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle␣
↪);

  // Use the handle to delete the task.
  vTaskDelete( xHandle );
}
```

参数 xTaskToDelete –The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

void **vTaskDelay**(const TickType_t xTicksToDelay)

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDE_vTaskDelay must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See xTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```
void vTaskFunction( void * pvParameters )
{
// Block for 500ms.
const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

  for( ;; )
  {
      // Simply toggle the LED every 500ms, blocking between each toggle.
      vToggleLED();
      vTaskDelay( xDelay );
  }
}
```

参数 xTicksToDelay –The amount of time, in tick periods, that the calling task should block.

BaseType_t **xTaskDelayUntil**(TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement)

INCLUDE_xTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from vTaskDelay () in one important aspect: vTaskDelay () will cause a task to block for the specified number of ticks from the time vTaskDelay () is called. It is therefore difficult to use vTaskDelay () by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling vTaskDelay () may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas vTaskDelay () specifies a wake time relative to the time at which the function is called, xTaskDelayUntil () specifies the absolute (exact) time at which it wishes to unblock.

The macro pdMS_TO_TICKS() can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
TickType_t xLastWakeTime;
const TickType_t xFrequency = 10;
BaseType_t xWasDelayed;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount ();
    for( ;; )
    {
        // Wait for the next cycle.
        xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here. xWasDelayed value can be used to determine
        // whether a deadline was missed if the code here took too long.
    }
}
```

参数

- **pxPreviousWakeTime** –Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within xTaskDelayUntil ().
- **xTimeIncrement** –The cycle time period. The task will be unblocked at time *pxPreviousWakeTime + xTimeIncrement. Calling xTaskDelayUntil with the same xTimeIncrement parameter value will cause the task to execute with a fixed interface period.

返回 Value which can be used to check whether the task was actually delayed. Will be pdTRUE if the task way delayed and pdFALSE otherwise. A task will not be delayed if the next expected wake time is in the past.

BaseType_t **xTaskAbortDelay** (*TaskHandle_t* xTask)

INCLUDE_xTaskAbortDelay must be defined as 1 in FreeRTOSConfig.h for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when vTaskDelay() is called, or an event on an object, such as when xQueueReceive() or ulTaskNotifyTake() is called. If the handle of a task that is in the Blocked state is used in a call to xTaskAbortDelay() then the task will leave the Blocked state, and return from whichever function call placed the task into the Blocked state.

There is no 'FromISR' version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.

参数 **xTask** –The handle of the task to remove from the Blocked state.
返回 If the task referenced by xTask was not in the Blocked state then pdFAIL is returned. Otherwise pdPASS is returned.

UBaseType_t **uxTaskPriorityGet**(const *TaskHandle_t* xTask)

INCLUDE_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the priority of any task.

Example usage:

```
void vAFunction( void )
{
TaskHandle_t xHandle;

  // Create a task, storing the handle.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle␣
↪);

  // ...

  // Use the handle to obtain the priority of the created task.
  // It was created with tskIDLE_PRIORITY, but may have changed
  // it itself.
  if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
  {
      // The task has changed it's priority.
  }

  // ...

  // Is our priority higher than the created task?
  if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
  {
      // Our priority (obtained using NULL handle) is higher.
  }
}
```

参数 **xTask** –Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.
返回 The priority of xTask.

UBaseType_t **uxTaskPriorityGetFromISR**(const *TaskHandle_t* xTask)

A version of uxTaskPriorityGet() that can be used from an ISR.

eTaskState **eTaskGetState**(*TaskHandle_t* xTask)

INCLUDE_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the state of any task. States are encoded by the eTaskState enumerated type.

参数 **xTask** –Handle of the task to be queried.
返回 The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

void **vTaskGetInfo**(*TaskHandle_t* xTask, TaskStatus_t *pxTaskStatus, BaseType_t xGetFreeStackSpace, *eTaskState* eState)

configUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus_t structure with information about a task.

Example usage:

```
void vAFunction( void )
{
TaskHandle_t xHandle;
TaskStatus_t xTaskDetails;

 // Obtain the handle of a task from its name.
 xHandle = xTaskGetHandle( "Task_Name" );

 // Check the handle is not NULL.
 configASSERT( xHandle );

 // Use the handle to obtain further information about the task.
 vTaskGetInfo( xHandle,
               &xTaskDetails,
               pdTRUE, // Include the high water mark in xTaskDetails.
               eInvalid ); // Include the task state in xTaskDetails.
}
```

参数

- **xTask** –Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus** –A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSpace** –The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus_t structure if xGetFreeStackSpace is not set to pdFALSE;
- **eState** –The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus_t structure.

void **vTaskPrioritySet**(*TaskHandle_t* xTask, UBaseType_t uxNewPriority)

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```
void vAFunction( void )
{
TaskHandle_t xHandle;
```

(下页继续)

(续上页)

```
  // Create a task, storing the handle.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle␣
↪);

  // ...

  // Use the handle to raise the priority of the created task.
  vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

  // ...

  // Use a NULL handle to raise our priority to the same value.
  vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}
```

参数

- **xTask** –Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- **uxNewPriority** –The priority to which the task will be set.

void **vTaskSuspend**(*TaskHandle_t* xTaskToSuspend)

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to vTaskSuspend are not accumulative - i.e. calling vTaskSuspend () twice on the same task still only requires one call to vTaskResume () to ready the suspended task.

Example usage:

```
void vAFunction( void )
{
TaskHandle_t xHandle;

  // Create a task, storing the handle.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle␣
↪);

  // ...

  // Use the handle to suspend the created task.
  vTaskSuspend( xHandle );

  // ...

  // The created task will not run during this period, unless
  // another task calls vTaskResume( xHandle ).

  //...

  // Suspend ourselves.
  vTaskSuspend( NULL );

  // We cannot get here unless another task calls vTaskResume
```

(下页继续)

(续上页)

```
  // with our handle as the parameter.
}
```

参数 xTaskToSuspend –Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

void **vTaskResume**(*TaskHandle_t* xTaskToResume)

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Resumes a suspended task.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to vTaskResume ().

Example usage:

```
void vAFunction( void )
{
TaskHandle_t xHandle;

  // Create a task, storing the handle.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle␣
↪);

  // ...

  // Use the handle to suspend the created task.
  vTaskSuspend( xHandle );

  // ...

  // The created task will not run during this period, unless
  // another task calls vTaskResume( xHandle ).

  //...

  // Resume the suspended task ourselves.
  vTaskResume( xHandle );

  // The created task will once again get microcontroller processing
  // time in accordance with its priority within the system.
}
```

参数 xTaskToResume –Handle to the task being readied.

BaseType_t **xTaskResumeFromISR**(*TaskHandle_t* xTaskToResume)

INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of vTaskResume() that can be called from within an ISR.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to xTaskResumeFromISR ().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

参数 **xTaskToResume** –Handle to the task being readied.
返回 pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

void **vTaskStartScheduler**(void)

Starts the real time kernel tick processing. After calling the kernel has control over which tasks are executed and when.

NOTE: In ESP-IDF the scheduler is started automatically during application startup, vTaskStartScheduler() should not be called from ESP-IDF applications.

See the demo application file main.c for an example of creating tasks and starting the kernel.

Example usage:

```
void vAFunction( void )
{
  // Create at least one task before starting the kernel.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

  // Start the real time kernel with preemption.
  vTaskStartScheduler ();

  // Will not get here unless a task calls vTaskEndScheduler ()
}
```

void **vTaskEndScheduler**(void)

NOTE: At the time of writing only the x86 real mode port, which runs on a PC in place of DOS, implements this function.

Stops the real time kernel tick. All created tasks will be automatically deleted and multitasking (either preemptive or cooperative) will stop. Execution then resumes from the point where vTaskStartScheduler () was called, as if vTaskStartScheduler () had just returned.

See the demo application file main. c in the demo/PC directory for an example that uses vTaskEndScheduler ().

vTaskEndScheduler () requires an exit function to be defined within the portable layer (see vPortEndScheduler () in port. c for the PC port). This performs hardware specific operations such as stopping the kernel tick.

vTaskEndScheduler () will cause all of the resources allocated by the kernel to be freed - but will not free resources allocated by application tasks.

Example usage:

```
void vTaskCode( void * pvParameters )
{
  for( ;; )
  {
      // Task code goes here.

      // At some point we want to end the real time kernel processing
      // so call ...
      vTaskEndScheduler ();
  }
}

void vAFunction( void )
{
  // Create at least one task before starting the kernel.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

  // Start the real time kernel with preemption.
  vTaskStartScheduler ();
```

(下页继续)

(续上页)

```
  // Will only get here when the vTaskCode () task has called
  // vTaskEndScheduler ().  When we get here we are back to single task
  // execution.
}
```

void **vTaskSuspendAll** (void)

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is suspended.

After calling vTaskSuspendAll () the calling task will continue to execute without risk of being swapped out until a call to xTaskResumeAll () has been made.

API functions that have the potential to cause a context switch (for example, vTaskDelayUntil(), xQueueSend(), etc.) must not be called while the scheduler is suspended.

Example usage:

```
void vTask1( void * pvParameters )
{
  for( ;; )
  {
      // Task code goes here.

      // ...

      // At some point the task wants to perform a long operation during
      // which it does not want to get swapped out.  It cannot use
      // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
      // operation may cause interrupts to be missed - including the
      // ticks.

      // Prevent the real time kernel swapping out the task.
      vTaskSuspendAll ();

      // Perform the operation here.  There is no need to use critical
      // sections as we have all the microcontroller processing time.
      // During this time interrupts will still operate and the kernel
      // tick count will be maintained.

      // ...

      // The operation is complete.  Restart the kernel.
      xTaskResumeAll ();
  }
}
```

BaseType_t **xTaskResumeAll** (void)

Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().

xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to vTaskSuspend().

Example usage:

```
void vTask1( void * pvParameters )
{
  for( ;; )
  {
      // Task code goes here.
```

(下页继续)

(续上页)

```
        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out.  It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here.  There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the real
        // time kernel tick count will be maintained.

        // ...

        // The operation is complete.  Restart the kernel.  We want to force
        // a context switch - but there is no point if resuming the scheduler
        // caused a context switch already.
        if( !xTaskResumeAll () )
        {
             taskYIELD ();
        }
    }
}
```

返回 If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise pdFALSE is returned.

TickType_t **xTaskGetTickCount** (void)

返回 The count of ticks since vTaskStartScheduler was called.

TickType_t **xTaskGetTickCountFromISR** (void)

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being used.

返回 The count of ticks since vTaskStartScheduler was called.

UBaseType_t **uxTaskGetNumberOfTasks** (void)

返回 The number of tasks that the real time kernel is currently managing. This includes all ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle task will also be included in the count.

char ***pcTaskGetName** (*TaskHandle_t* xTaskToQuery)

返回 The text (human readable) name of the task referenced by the handle xTaskToQuery. A task can query its own name by either passing in its own handle, or by setting xTaskToQuery to NULL.

TaskHandle_t **xTaskGetHandle** (const char *pcNameToQuery)

NOTE: This function takes a relatively long time to complete and should be used sparingly.

返回 The handle of the task that has the human readable name pcNameToQuery. NULL is returned if no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in FreeRTOSConfig.h for pcTaskGetHandle() to be available.

UBaseType_t **uxTaskGetStackHighWaterMark** (*TaskHandle_t* xTask)

Returns the high water mark of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

参数 **xTask** –Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

返回 The smallest amount of free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task referenced by xTask was created.

configSTACK_DEPTH_TYPE **uxTaskGetStackHighWaterMark2** (*TaskHandle_t* xTask)

Returns the start of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

参数 **xTask** –Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

返回 The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

uint8_t ***pxTaskGetStackStart** (*TaskHandle_t* xTask)

Returns the start of the stack associated with xTask.

INCLUDE_pxTaskGetStackStart must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the lowest stack memory address, regardless of whether the stack grows up or down.

参数 **xTask** –Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.

返回 A pointer to the start of the stack.

void **vTaskSetApplicationTaskTag** (*TaskHandle_t* xTask, *TaskHookFunction_t* pxHookFunction)

Sets pxHookFunction to be the task hook function used by the task xTask.

参数

- **xTask** –Handle of the task to set the hook function for Passing xTask as NULL has the effect of setting the calling tasks hook function.
- **pxHookFunction** –Pointer to the hook function.

TaskHookFunction_t **xTaskGetApplicationTaskTag** (*TaskHandle_t* xTask)

Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine - call xTaskGetApplicationTaskTagFromISR() instead.

TaskHookFunction_t **xTaskGetApplicationTaskTagFromISR** (*TaskHandle_t* xTask)

Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.

void **vTaskSetThreadLocalStoragePointer**(*TaskHandle_t* xTaskToSet, BaseType_t xIndex, void *pvValue)

Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

参数

- **xTaskToSet** –Task to set thread local storage pointer for
- **xIndex** –The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
- **pvValue** –Pointer value to set.

void ***pvTaskGetThreadLocalStoragePointer**(*TaskHandle_t* xTaskToQuery, BaseType_t xIndex)

Get local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

参数

- **xTaskToQuery** –Task to get thread local storage pointer for
- **xIndex** –The index of the pointer to get, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

返回 Pointer value

void **vTaskSetThreadLocalStoragePointerAndDelCallback**(*TaskHandle_t* xTaskToSet, BaseType_t xIndex, void *pvValue, *TlsDeleteCallbackFunction_t* pvDelCallback)

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

参数

- **xTaskToSet** –Task to set thread local storage pointer for
- **xIndex** –The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
- **pvValue** –Pointer value to set.
- **pvDelCallback** –Function to call to dispose of the local storage pointer when the task is deleted.

void **vApplicationGetIdleTaskMemory**(StaticTask_t **ppxIdleTaskTCBBuffer, StackType_t **ppxIdleTaskStackBuffer, uint32_t *pulIdleTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

参数

- **ppxIdleTaskTCBBuffer** –A handle to a statically allocated TCB buffer
- **ppxIdleTaskStackBuffer** –A handle to a statically allocated Stack buffer for thie idle task
- **pulIdleTaskStackSize** –A pointer to the number of elements that will fit in the allocated stack buffer

BaseType_t **xTaskCallApplicationTaskHook**(*TaskHandle_t* xTask, void *pvParameter)

Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

参数

- **xTask** –Handle of the task to call the hook for.
- **pvParameter** –Parameter passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

TaskHandle_t **xTaskGetIdleTaskHandle**(void)

xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the idle task. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has been started.

UBaseType_t **uxTaskGetSystemState**(TaskStatus_t *const pxTaskStatusArray, const UBaseType_t uxArraySize, uint32_t *const pulTotalRunTime)

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to be available.

uxTaskGetSystemState() populates an TaskStatus_t structure for each task in the system. TaskStatus_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the TaskStatus_t structure definition in this file for the full member list.

NOTE: This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

Example usage:

```
// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
TaskStatus_t *pxTaskStatusArray;
volatile UBaseType_t uxArraySize, x;
uint32_t ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
*pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
    // function is executing.
    uxArraySize = uxTaskGetNumberOfTasks();

    // Allocate a TaskStatus_t structure for each task.  An array could be
    // allocated statically at compile time.
    pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

    if( pxTaskStatusArray != NULL )
    {
        // Generate raw status information about each task.
        uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &
↪ulTotalRunTime );

        // For percentage calculations.
        ulTotalRunTime /= 100UL;
```

(下页继续)

(续上页)

```
        // Avoid divide by zero errors.
        if( ulTotalRunTime > 0 )
        {
            // For each populated position in the pxTaskStatusArray array,
            // format the raw data as human readable ASCII data
            for( x = 0; x < uxArraySize; x++ )
            {
                // What percentage of the total run time has the task used?
                // This will always be rounded down to the nearest integer.
                // ulTotalRunTimeDiv100 has already been divided by 100.
                ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter␣
↪/ ulTotalRunTime;

                if( ulStatsAsPercentage > 0UL )
                {
                    sprintf( pcWriteBuffer, "%s\t\t%lu\t\t%lu%%\r\n",␣
↪pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,␣
↪ulStatsAsPercentage );
                }
                else
                {
                    // If the percentage is zero here then the task has
                    // consumed less than 1% of the total run time.
                    sprintf( pcWriteBuffer, "%s\t\t%lu\t\t<1%%\r\n",␣
↪pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
                }

                pcWriteBuffer += strlen( ( char * ) pcWriteBuffer );
            }
        }

        // The array is no longer needed, free the memory it consumes.
        vPortFree( pxTaskStatusArray );
    }
}
```

参数

- **pxTaskStatusArray** –A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.
- **uxArraySize** –The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.
- **pulTotalRunTime** –If configGENERATE_RUN_TIME_STATS is set to 1 in FreeRTOSConfig.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see https://www.FreeRTOS.org/rtos-run-time-stats.html) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

返回 The number of TaskStatus_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberOfTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.

void **vTaskList**(char *pcWriteBuffer)

List all the current tasks.

configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark.

Tasks are reported as blocked ('B'), ready ('R'), deleted ('D') or suspended ('S').

PLEASE NOTE:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task names, states and stack usage.

vTaskList() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

参数 `pcWriteBuffer` –A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

void **`vTaskGetRunTimeStats`**(char *pcWriteBuffer)

Get the state of running tasks as a string

configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. Calling vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

NOTE 2:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskGetRunTimeStats() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

vTaskGetRunTimeStats() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskGetRunTimeStats().

参数 `pcWriteBuffer` –A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

uint32_t **ulTaskGetIdleRunTimeCounter**(void)

configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. While uxTaskGetSystemState() and vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, ulTaskGetIdleRunTimeCounter() returns the total execution time of just the idle task.

返回 The total run time of the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() macros.

BaseType_t **xTaskGenericNotify**(*TaskHandle_t* xTaskToNotify, UBaseType_t uxIndexToNotify, uint32_t ulValue, *eNotifyAction* eAction, uint32_t *pulPreviousNotificationValue)

See https://www.FreeRTOS.org/RTOS-task-notifications.html for details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotify() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotify() is equivalent to calling xTaskNotifyIndexed() with the uxIndexToNotify parameter set to 0.

eSetBits - The target notification value is bitwise ORed with ulValue. xTaskNotifyIndexed() always returns pdPASS in this case.

eIncrement - The target notification value is incremented. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

eSetValueWithOverwrite - The target notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). xTaskNotifyIndexed() always returns pdPASS in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending at the same array index then the target notification value is set to ulValue and xTaskNotifyIndexed() will return pdPASS. If the task being notified already had a notification pending at the same array index then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification at the specified array index without the notification value at that index being updated. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

参数

- **`xTaskToNotify`** –The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **`uxIndexToNotify`** –The index within the target task's array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotify() does not have this parameter and always sends notifications to index 0.
- **`ulValue`** –Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- **`eAction`** –Specifies how the notification updates the task's notification value, if at all. Valid values for eAction are as follows:
- **`pulPreviousNotificationValue`** –- Can be used to pass out the subject task's notification value before any bits are modified by the notify function.

返回 Dependent on the value of eAction. See the description of the eAction parameter.

BaseType_t **`xTaskGenericNotifyFromISR`**(*TaskHandle_t* xTaskToNotify, UBaseType_t uxIndexToNotify, uint32_t ulValue, *eNotifyAction* eAction, uint32_t *pulPreviousNotificationValue, BaseType_t *pxHigherPriorityTaskWoken)

See https://www.FreeRTOS.org/RTOS-task-notifications.html for details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

A version of xTaskNotifyIndexed() that can be used from an interrupt service routine (ISR).

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyFromISR() is equivalent to calling xTaskNotifyIndexedFromISR() with the uxIndexToNotify parameter set to 0.

eSetBits - The task's notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.

eIncrement - The task's notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

eSetValueWithOverwrite - The task's notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). xTaskNotify() always returns pdPASS in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending then the task's notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

参数

- **uxIndexToNotify** –The index within the target task's array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyFromISR() does not have this parameter and always sends notifications to index 0.
- **xTaskToNotify** –The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **ulValue** –Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- **eAction** –Specifies how the notification updates the task's notification value, if at all. Valid values for eAction are as follows:
- **pulPreviousNotificationValue** –- Can be used to pass out the subject task's notification value before any bits are modified by the notify function.
- **pxHigherPriorityTaskWoken** –xTaskNotifyFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If xTaskNotifyFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

返回 Dependent on the value of eAction. See the description of the eAction parameter.

BaseType_t **xTaskGenericNotifyWait**(UBaseType_t uxIndexToWaitOn, uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t *pulNotificationValue, TickType_t xTicksToWait)

Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications.

See https://www.FreeRTOS.org/RTOS-task-notifications.html for details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task ' s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value" , and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyWait() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyWait() is equivalent to calling xTaskNotifyWaitIndexed() with the uxIndexToWaitOn parameter set to 0.

参数

- **uxIndexToWaitOn** –The index within the calling task ' s array of notification values on which the calling task will wait for a notification to be received. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyWait() does not have this parameter and always waits for notifications on index 0.
- **ulBitsToClearOnEntry** –Bits that are set in ulBitsToClearOnEntry value will be cleared in the calling task ' s notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting ulBitsToClearOnEntry to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task ' s notification value to 0. Setting ulBitsToClearOnEntry to 0 will leave the task ' s notification value unchanged.
- **ulBitsToClearOnExit** –If a notification is pending or received before the calling task exits the xTaskNotifyWait() function then the task ' s notification value (see the xTaskNotify() API function) is passed out using the pulNotificationValue parameter. Then any bits that are set in ulBitsToClearOnExit will be cleared in the task ' s notification value (note *pulNotificationValue is set before any bits are cleared). Setting ulBitsToClearOnExit to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task ' s notification value to 0 before the function exits. Setting ulBitsToClearOnExit to 0 will leave the task ' s notification value unchanged when the function exits (in which case the value passed out in pulNotificationValue will match the task ' s notification value).
- **pulNotificationValue** –Used to pass the task ' s notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by ulBitsToClearOnExit being non-zero.
- **xTicksToWait** –The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when xTaskNotifyWait() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(value_in_ms) can be used to convert a time specified in milliseconds to a time specified in ticks.

返回 If a notification was received (including notifications that were already pending when xTaskNotifyWait was called) then pdPASS is returned. Otherwise pdFAIL is returned.

void **vTaskGenericNotifyGiveFromISR**(*TaskHandle_t* xTaskToNotify, UBaseType_t uxIndexToNotify, BaseType_t *pxHigherPriorityTaskWoken)

A version of xTaskNotifyGiveIndexed() that can be called from an interrupt service routine (ISR).

See https://www.FreeRTOS.org/RTOS-task-notifications.html for more details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this macro to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

vTaskNotifyGiveIndexedFromISR() is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the xSemaphoreGiveFromISR() API function, the equivalent action that instead uses a task notification is vTaskNotifyGiveIndexedFromISR().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTakeIndexed() API function rather than the xTaskNotifyWaitIndexed() API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyGiveFromISR() is equivalent to calling xTaskNotifyGiveIndexedFromISR() with the uxIndexToNotify parameter set to 0.

参数

- **`xTaskToNotify`** –The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **`uxIndexToNotify`** –The index within the target task's array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGiveFromISR() does not have this parameter and always sends notifications to index 0.
- **`pxHigherPriorityTaskWoken`** –vTaskNotifyGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If vTaskNotifyGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

uint32_t **`ulTaskGenericNotifyTake`**(UBaseType_t uxIndexToWaitOn, BaseType_t xClearCountOnExit, TickType_t xTicksToWait)

Waits for a direct to task notification on a particular index in the calling task's notification array in a manner similar to taking a counting semaphore.

See https://www.FreeRTOS.org/RTOS-task-notifications.html for details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

ulTaskNotifyTakeIndexed() is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the xSemaphoreTake() API function, the equivalent action that instead uses a task notification is ulTaskNotifyTakeIndexed().

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the xTaskNotifyGiveIndexed() macro, or xTaskNotifyIndex() function with the eAction parameter set to eIncrement.

ulTaskNotifyTakeIndexed() can either clear the task's notification value at the array index specified by the uxIndexToWaitOn parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use ulTaskNotifyTakeIndexed() to [optionally] block to wait for the task's notification value to be non-zero. The task does not consume any CPU time while it is in the Blocked state.

Where as xTaskNotifyWaitIndexed() will return when a notification is pending, ulTaskNotifyTakeIndexed() will return when the task's notification value is not zero.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyTake() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling ulTaskNotifyTake() is equivalent to calling ulTaskNotifyTakeIndexed() with the uxIndexToWaitOn parameter set to 0.

参数

- **`uxIndexToWaitOn`** –The index within the calling task's array of notification values on which the calling task will wait for a notification to be non-zero. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyTake() does not have this parameter and always waits for notifications on index 0.
- **`xClearCountOnExit`** –if xClearCountOnExit is pdFALSE then the task's notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If xClearCountOnExit is not pdFALSE then the task's notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.
- **`xTicksToWait`** –The maximum amount of time that the task should wait in the Blocked state for the task's notification value to be greater than zero, should the count not already be greater than zero when ulTaskNotifyTake() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(value_in_ms) can be used to convert a time specified in milliseconds to a time specified in ticks.

返回 The task's notification count before it is either cleared to zero or decremented (see the xClearCountOnExit parameter).

BaseType_t **`xTaskGenericNotifyStateClear`**(*TaskHandle_t* xTask, UBaseType_t uxIndexToClear)

See https://www.FreeRTOS.org/RTOS-task-notifications.html for details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be 'pending' until it is read or explicitly cleared by the receiving task. xTaskNotifyStateClearIndexed() is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set xTask to NULL to clear the notification state of the calling task.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyStateClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyStateClear() is equivalent to calling xTaskNotifyStateClearIndexed() with the uxIndexToNotify parameter set to 0.

参数

- **xTask** –The handle of the RTOS task that will have a notification state cleared. Set xTask to NULL to clear a notification state in the calling task. To obtain a task's handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task's name in a call to xTaskGetHandle().
- **uxIndexToClear** –The index within the target task's array of notification values to act upon. For example, setting uxIndexToClear to 1 will clear the state of the notification at index 1 within the array. uxIndexToClear must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyStateClear() does not have this parameter and always acts on the notification at index 0.

返回 pdTRUE if the task's notification state was set to eNotWaitingNotification, otherwise pdFALSE.

uint32_t **ulTaskGenericNotifyValueClear**(*TaskHandle_t* xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)

See https://www.FreeRTOS.org/RTOS-task-notifications.html for details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

ulTaskNotifyValueClearIndexed() clears the bits specified by the ulBitsToClear bit mask in the notification value at array index uxIndexToClear of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyValueClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling ulTaskNotifyValueClear() is equivalent to calling ulTaskNotifyValueClearIndexed() with the uxIndexToClear parameter set to 0.

参数

- **xTask** –The handle of the RTOS task that will have bits in one of its notification values cleared. Set xTask to NULL to clear bits in a notification value of the calling task. To obtain a task's handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task's name in a call to xTaskGetHandle().
- **uxIndexToClear** –The index within the target task's array of notification values in which to clear the bits. uxIndexToClear must be less than config-

TASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyValueClear() does not have this parameter and always clears bits in the notification value at index 0.

- **ulBitsToClear** –Bit mask of the bits to clear in the notification value of xTask. Set a bit to 1 to clear the corresponding bits in the task's notification value. Set ulBitsToClear to 0xffffffff (UINT_MAX on 32-bit architectures) to clear the notification value to 0. Set ulBitsToClear to 0 to query the task's notification value without clearing any bits.

返回 The value of the target task's notification value before the bits specified by ulBitsToClear were cleared.

void **vTaskSetTimeOutState**(TimeOut_t *const pxTimeOut)

BaseType_t **xTaskCheckForTimeOut**(TimeOut_t *const pxTimeOut, TickType_t *const pxTicksToWait)

Determines if pxTicksToWait ticks has passed since a time was captured using a call to vTaskSetTimeOutState(). The captured time includes the tick count and the number of times the tick count has overflowed.

Example Usage:

```
// Driver library function used to receive uxWantedBytes from an Rx buffer
// that is filled by a UART interrupt. If there are not enough bytes in the
// Rx buffer then the task enters the Blocked state until it is notified that
// more data has been placed into the buffer. If there is still not enough
// data then the task re-enters the Blocked state, and xTaskCheckForTimeOut()
// is used to re-calculate the Block time to ensure the total amount of time
// spent in the Blocked state does not exceed MAX_TIME_TO_WAIT. This
// continues until either the buffer contains at least uxWantedBytes bytes,
// or the total amount of time spent in the Blocked state reaches
// MAX_TIME_TO_WAIT – at which point the task reads however many bytes are
// available up to a maximum of uxWantedBytes.

size_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
size_t uxReceived = 0;
TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
TimeOut_t xTimeOut;

    // Initialize xTimeOut.  This records the time at which this function
    // was entered.
    vTaskSetTimeOutState( &xTimeOut );

    // Loop until the buffer contains the wanted number of bytes, or a
    // timeout occurs.
    while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
    {
        // The buffer didn't contain enough data so this task is going to
        // enter the Blocked state. Adjusting xTicksToWait to account for
        // any time that has been spent in the Blocked state within this
        // function so far to ensure the total amount of time spent in the
        // Blocked state does not exceed MAX_TIME_TO_WAIT.
        if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
        {
            //Timed out before the wanted number of bytes were available,
            // exit the loop.
            break;
        }

        // Wait for a maximum of xTicksToWait ticks to be notified that the
        // receive interrupt has placed more data into the buffer.
        ulTaskNotifyTake( pdTRUE, xTicksToWait );
    }

    // Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
```

(下页继续)

(续上页)

```
    // The actual number of bytes read (which might be less than
    // uxWantedBytes) is returned.
    uxReceived = UART_read_from_receive_buffer( pxUARTInstance,
                                                pucBuffer,
                                                uxWantedBytes );

    return uxReceived;
}
```

参见:

https://www.FreeRTOS.org/xTaskCheckForTimeOut.html

参数

- **pxTimeOut** –The time status as captured previously using vTaskSetTimeOutState. If the timeout has not yet occurred, it is updated to reflect the current time status.
- **pxTicksToWait** –The number of ticks to check for timeout i.e. if pxTicksToWait ticks have passed since pxTimeOut was last updated (either by vTaskSetTimeOutState() or xTaskCheckForTimeOut()), the timeout has occurred. If the timeout has not occurred, pxTicksToWait is updated to reflect the number of remaining ticks.

返回 If timeout has occurred, pdTRUE is returned. Otherwise pdFALSE is returned and pxTicksToWait is updated to reflect the number of remaining ticks.

xTaskNotifyGiveIndexed(xTaskToNotify, uxIndexToNotify)

Sends a direct to task notification to a particular index in the target task's notification array in a manner similar to giving a counting semaphore.

See https://www.FreeRTOS.org/RTOS-task-notifications.html for more details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these macros to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

xTaskNotifyGiveIndexed() is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the xSemaphoreGive() API function, the equivalent action that instead uses a task notification is xTaskNotifyGiveIndexed().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTakeIndexed() API function rather than the xTaskNotifyWaitIndexed() API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyGive() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyGive() is equivalent to calling xTaskNotifyGiveIndexed() with the uxIndexToNotify parameter set to 0.

参数

- **xTaskToNotify** –The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **uxIndexToNotify** –The index within the target task's array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGive() does not have this parameter and always sends notifications to index 0.

返回 xTaskNotifyGive() is a macro that calls xTaskNotify() with the eAction parameter set to eIncrement - so pdPASS is always returned.

Functions

BaseType_t **xQueueGenericSend**(*QueueHandle_t* xQueue, const void *const pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition)

It is preferred that the macros xQueueSend(), xQueueSendToFront() and xQueueSendToBack() are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```
struct AMessage
{
 char ucMessageID;
 char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
```

(下页继续)

(续上页)

```
QueueHandle_t xQueue1, xQueue2;
struct AMessage *pxMessage;

 // Create a queue capable of containing 10 uint32_t values.
 xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

 // Create a queue capable of containing 10 pointers to AMessage structures.
 // These should be passed by pointer as they contain a lot of data.
 xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

 // ...

 if( xQueue1 != 0 )
 {
     // Send an uint32_t.  Wait for 10 ticks for space to become
     // available if necessary.
     if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10,␣
↪queueSEND_TO_BACK ) != pdPASS )
     {
         // Failed to post the message, even after 10 ticks.
     }
 }

 if( xQueue2 != 0 )
 {
     // Send a pointer to a struct AMessage object.  Don't block if the
     // queue is already full.
     pxMessage = & xMessage;
     xQueueGenericSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0,␣
↪queueSEND_TO_BACK );
 }

 // ... Rest of task code.
}
```

参数

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** –The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.
- **xCopyPosition** –Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

返回 pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

BaseType_t **xQueuePeek**(*QueueHandle_t* xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

This macro must not be used in an interrupt service routine. See xQueuePeekFromISR() for an alternative that can be called from an interrupt service routine.

Example usage:

```
struct AMessage
{
 char ucMessageID;
 char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
struct AMessage *pxMessage;

 // Create a queue capable of containing 10 pointers to AMessage structures.
 // These should be passed by pointer as they contain a lot of data.
 xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
 if( xQueue == 0 )
 {
     // Failed to create the queue.
 }

 // ...

 // Send a pointer to a struct AMessage object.  Don't block if the
 // queue is already full.
 pxMessage = & xMessage;
 xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

 // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
struct AMessage *pxRxedMessage;

 if( xQueue != 0 )
 {
     // Peek a message on the created queue.  Block for 10 ticks if a
     // message is not immediately available.
     if( xQueuePeek( xQueue, &( pxRxedMessage ), ( TickType_t ) 10 ) )
     {
         // pcRxedMessage now points to the struct AMessage variable posted
         // by vATask, but the item still remains on the queue.
     }
 }

 // ... Rest of task code.
}
```

参数

- **xQueue** –The handle to the queue from which the item is to be received.
- **pvBuffer** –Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** –The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

返回 pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t **xQueuePeekFromISR**(*QueueHandle_t* xQueue, void *const pvBuffer)

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

参数

- **xQueue** –The handle to the queue from which the item is to be received.
- **pvBuffer** –Pointer to the buffer into which the received item will be copied.

返回 pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t **xQueueReceive**(*QueueHandle_t* xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```
struct AMessage
{
 char ucMessageID;
 char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
struct AMessage *pxMessage;

 // Create a queue capable of containing 10 pointers to AMessage structures.
 // These should be passed by pointer as they contain a lot of data.
 xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
 if( xQueue == 0 )
 {
     // Failed to create the queue.
 }

 // ...

 // Send a pointer to a struct AMessage object.  Don't block if the
 // queue is already full.
 pxMessage = & xMessage;
 xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

 // ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask( void *pvParameters )
{
struct AMessage *pxRxedMessage;
```

(下页继续)

(续上页)

```
if( xQueue != 0 )
{
    // Receive a message on the created queue.  Block for 10 ticks if a
    // message is not immediately available.
    if( xQueueReceive( xQueue, &( pxRxedMessage ), ( TickType_t ) 10 ) )
    {
        // pcRxedMessage now points to the struct AMessage variable posted
        // by vATask.
    }
}

// ... Rest of task code.
}
```

参数

- **xQueue** –The handle to the queue from which the item is to be received.
- **pvBuffer** –Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** –The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. xQueueReceive() will return immediately if xTicksToWait is zero and the queue is empty. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

返回 pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

UBaseType_t **uxQueueMessagesWaiting**(const *QueueHandle_t* xQueue)

Return the number of messages stored in a queue.

参数 **xQueue** –A handle to the queue being queried.
返回 The number of messages available in the queue.

UBaseType_t **uxQueueSpacesAvailable**(const *QueueHandle_t* xQueue)

Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

参数 **xQueue** –A handle to the queue being queried.
返回 The number of spaces available in the queue.

void **vQueueDelete**(*QueueHandle_t* xQueue)

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

参数 **xQueue** –A handle to the queue to be deleted.

BaseType_t **xQueueGenericSendFromISR**(*QueueHandle_t* xQueue, const void *const pvItemToQueue, BaseType_t *const pxHigherPriorityTaskWoken, const BaseType_t xCopyPosition)

It is preferred that the macros xQueueSendFromISR(), xQueueSendToFrontFromISR() and xQueueSendToBackFromISR() be used in place of calling this function directly. xQueueGiveFromISR() is an equivalent for use by semaphores that don't actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
char cIn;
```

(下页继续)

(续上页)

```
BaseType_t xHigherPriorityTaskWokenByPost;

 // We have not woken a task at the start of the ISR.
 xHigherPriorityTaskWokenByPost = pdFALSE;

 // Loop until the buffer is empty.
 do
 {
     // Obtain a byte from the buffer.
     cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

     // Post each byte.
     xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost,
↪ queueSEND_TO_BACK );

 } while( portINPUT_BYTE( BUFFER_COUNT ) );

 // Now the buffer is empty we can switch context if necessary.  Note that the
 // name of the yield function required is port specific.
 if( xHigherPriorityTaskWokenByPost )
 {
     taskYIELD_YIELD_FROM_ISR();
 }
}
```

参数

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –**[out]** xQueueGenericSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueGenericSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.
- **xCopyPosition** –Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

返回 pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

BaseType_t **xQueueGiveFromISR**(*QueueHandle_t* xQueue, BaseType_t *const pxHigherPriorityTaskWoken)

BaseType_t **xQueueReceiveFromISR**(*QueueHandle_t* xQueue, void *const pvBuffer, BaseType_t *const pxHigherPriorityTaskWoken)

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

```
QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction( void *pvParameters )
{
char cValueToPost;
const TickType_t xTicksToWait = ( TickType_t )0xff;

 // Create a queue capable of containing 10 characters.
```

(下页继续)

(续上页)

```
 xQueue = xQueueCreate( 10, sizeof( char ) );
 if( xQueue == 0 )
 {
     // Failed to create the queue.
 }

 // ...

 // Post some characters that will be used within an ISR.  If the queue
 // is full then this task will block for xTicksToWait ticks.
 cValueToPost = 'a';
 xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
 cValueToPost = 'b';
 xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

 // ... keep posting characters ... this task may block when the queue
 // becomes full.

 cValueToPost = 'c';
 xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
BaseType_t xTaskWokenByReceive = pdFALSE;
char cRxedChar;

 while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxedChar, &
↪xTaskWokenByReceive) )
 {
     // A character was received.  Output the character now.
     vOutputCharacter( cRxedChar );

     // If removing the character from the queue woke the task that was
     // posting onto the queue cTaskWokenByReceive will have been set to
     // pdTRUE.  No matter how many times this loop iterates only one
     // task will be woken.
 }

 if( cTaskWokenByPost != ( char ) pdFALSE;
 {
     taskYIELD ();
 }
}
```

参数

- **xQueue** –The handle to the queue from which the item is to be received.
- **pvBuffer** –Pointer to the buffer into which the received item will be copied.
- **pxHigherPriorityTaskWoken** –**[out]** A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock *pxTaskWoken will get set to pdTRUE, otherwise *pxTaskWoken will remain unchanged.

返回 pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t **xQueueIsQueueEmptyFromISR**(const *QueueHandle_t* xQueue)

BaseType_t **xQueueIsQueueFullFromISR**(const *QueueHandle_t* xQueue)

UBaseType_t **uxQueueMessagesWaitingFromISR**(const *QueueHandle_t* xQueue)

void **vQueueAddToRegistry**(*QueueHandle_t* xQueue, const char *pcQueueName)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

configQUEUE_REGISTRY_SIZE defines the maximum number of handles the registry can hold. configQUEUE_REGISTRY_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not effect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

参数

- **xQueue** –The handle of the queue being added to the registry. This is the handle returned by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.
- **pcQueueName** –The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

void **vQueueUnregisterQueue**(*QueueHandle_t* xQueue)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and vQueueUnregisterQueue() to remove the queue, semaphore or mutex from the register. If you are not using a kernel aware debugger then this function can be ignored.

参数 **xQueue** –The handle of the queue being removed from the registry.

const char ***pcQueueGetName**(*QueueHandle_t* xQueue)

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call pcQueueGetName() to look up and return the name of a queue in the queue registry from the queue's handle.

参数 **xQueue** –The handle of the queue the name of which will be returned.
返回 If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

QueueHandle_t **xQueueGenericCreate**(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, const uint8_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

QueueHandle_t **xQueueGenericCreateStatic**(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, uint8_t *pucQueueStorage, StaticQueue_t *pxStaticQueue, const uint8_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

QueueSetHandle_t **xQueueCreateSet**(const UBaseType_t uxEventQueueLength)

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to xQueueCreateSet() before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to xQueueAddToSet(). xQueueSelectFromSet() is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on https://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

参数 **uxEventQueueLength** –Queue sets store events that occur on the queues and semaphores contained in the set. uxEventQueueLength specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost uxEventQueueLength should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:

- If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then uxEventQueueLength should be set to (5 + 12 + 1), or 18.
- If a queue set is to hold three binary semaphores then uxEventQueueLength should be set to (1 + 1 + 1), or 3.
- If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then uxEventQueueLength should be set to (5 + 3), or 8.

返回 If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

BaseType_t **xQueueAddToSet**(*QueueSetMemberHandle_t* xQueueOrSemaphore, *QueueSetHandle_t* xQueueSet)

Adds a queue or semaphore to a queue set that was previously created by a call to xQueueCreateSet().

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

参数

- **xQueueOrSemaphore** –The handle of the queue or semaphore being added to the queue set (cast to an QueueSetMemberHandle_t type).
- **xQueueSet** –The handle of the queue set to which the queue or semaphore is being added.

返回 If the queue or semaphore was successfully added to the queue set then pdPASS is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then pdFAIL is returned.

BaseType_t **xQueueRemoveFromSet**(*QueueSetMemberHandle_t* xQueueOrSemaphore, *QueueSetHandle_t* xQueueSet)

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

参数

- **xQueueOrSemaphore** –The handle of the queue or semaphore being removed from the queue set (cast to an QueueSetMemberHandle_t type).
- **xQueueSet** –The handle of the queue set in which the queue or semaphore is included.

返回 If the queue or semaphore was successfully removed from the queue set then pdPASS is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then pdFAIL is returned.

QueueSetMemberHandle_t **xQueueSelectFromSet**(*QueueSetHandle_t* xQueueSet, const TickType_t xTicksToWait)

xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet()

effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: See the documentation on https://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

参数

- **xQueueSet** –The queue set on which the task will (potentially) block.
- **xTicksToWait** –The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

返回 xQueueSelectFromSet() will return the handle of a queue (cast to a QueueSetMemberHandle_t type) contained in the queue set that contains data, or the handle of a semaphore (cast to a QueueSetMemberHandle_t type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before before the specified block time expires.

QueueSetMemberHandle_t **xQueueSelectFromSetFromISR**(*QueueSetHandle_t* xQueueSet)

A version of xQueueSelectFromSet() that can be used from an ISR.

Macros

xQueueCreate(uxQueueLength, uxItemSize)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

https://www.FreeRTOS.org/Embedded-RTOS-Queues.html

Example usage:

```
struct AMessage
{
 char ucMessageID;
 char ucData[ 20 ];
};

void vATask( void *pvParameters )
{
QueueHandle_t xQueue1, xQueue2;

 // Create a queue capable of containing 10 uint32_t values.
 xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
 if( xQueue1 == 0 )
 {
     // Queue was not created and must not be used.
 }

 // Create a queue capable of containing 10 pointers to AMessage structures.
```

(下页继续)

(续上页)

```
 // These should be passed by pointer as they contain a lot of data.
 xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
 if( xQueue2 == 0 )
 {
     // Queue was not created and must not be used.
 }

 // ... Rest of task code.
}
```

参数

- **uxQueueLength** –The maximum number of items that the queue can contain.
- **uxItemSize** –The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

返回 If the queue is successfully create then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

xQueueCreateStatic(uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

https://www.FreeRTOS.org/Embedded-RTOS-Queues.html

Example usage:

```
struct AMessage
{
 char ucMessageID;
 char ucData[ 20 ];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue.  Must be at least
// [(queue length) * ( queue item size)] bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
QueueHandle_t xQueue1;

 // Create a queue capable of containing 10 uint32_t values.
 xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can␣
↪hold.
                         ITEM_SIZE     // The size of each item in the queue
                         &( ucQueueStorage[ 0 ] ), // The buffer that will␣
↪hold the items in the queue.
                         &xQueueBuffer ); // The buffer that will hold the␣
↪queue structure.
```

(下页继续)

(续上页)

```
 // The queue is guaranteed to be created successfully as no dynamic memory
 // allocation is used.  Therefore xQueue1 is now a handle to a valid queue.

 // ... Rest of task code.
}
```

参数

- **uxQueueLength** –The maximum number of items that the queue can contain.
- **uxItemSize** –The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
- **pucQueueStorage** –If uxItemSize is not zero then pucQueueStorageBuffer must point to a uint8_t array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is (uxQueueLength * uxItemsSize) bytes. If uxItemSize is zero then pucQueueStorageBuffer can be NULL.
- **pxQueueBuffer** –Must point to a variable of type StaticQueue_t, which will be used to hold the queue's data structure.

返回 If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL then NULL is returned.

xQueueSendToFront(xQueue, pvItemToQueue, xTicksToWait)

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```
struct AMessage
{
 char ucMessageID;
 char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
QueueHandle_t xQueue1, xQueue2;
struct AMessage *pxMessage;

 // Create a queue capable of containing 10 uint32_t values.
 xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

 // Create a queue capable of containing 10 pointers to AMessage structures.
 // These should be passed by pointer as they contain a lot of data.
 xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

 // ...

 if( xQueue1 != 0 )
 {
     // Send an uint32_t.  Wait for 10 ticks for space to become
     // available if necessary.
     if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) !=␣
↪pdPASS )
     {
```

(下页继续)

(续上页)

```
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object.  Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}
```

参数

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** –The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

返回 pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueSendToBack(xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```
struct AMessage
{
 char ucMessageID;
 char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
QueueHandle_t xQueue1, xQueue2;
struct AMessage *pxMessage;

 // Create a queue capable of containing 10 uint32_t values.
 xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

 // Create a queue capable of containing 10 pointers to AMessage structures.
 // These should be passed by pointer as they contain a lot of data.
 xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

 // ...

 if( xQueue1 != 0 )
```

(下页继续)

(续上页)

```
{
    // Send an uint32_t.  Wait for 10 ticks for space to become
    // available if necessary.
    if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) !=␣
↪pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object.  Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}
```

参数

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** –The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

返回 pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueSend (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equivalent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```
struct AMessage
{
 char ucMessageID;
 char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
QueueHandle_t xQueue1, xQueue2;
struct AMessage *pxMessage;

 // Create a queue capable of containing 10 uint32_t values.
 xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
```

(下页继续)

(续上页)

```
// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...

if( xQueue1 != 0 )
{
    // Send an uint32_t.  Wait for 10 ticks for space to become
    // available if necessary.
    if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS␣
↪)
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object.  Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}
```

参数

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** –The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

返回 pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueOverwrite(xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See xQueueOverwriteFromISR () for an alternative which may be used in an ISR.

Example usage:

```
void vFunction( void *pvParameters )
{
QueueHandle_t xQueue;
uint32_t ulVarToSend, ulValReceived;

 // Create a queue to hold one uint32_t value.  It is strongly
 // recommended *not* to use xQueueOverwrite() on queues that can
 // contain more than one value, and doing so will trigger an assertion
```

(下页继续)

(续上页)

```
// if configASSERT() is defined.
xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

// Write the value 10 to the queue using xQueueOverwrite().
ulVarToSend = 10;
xQueueOverwrite( xQueue, &ulVarToSend );

// Peeking the queue should now return 10, but leave the value 10 in
// the queue.  A block time of zero is used as it is known that the
// queue holds a value.
ulValReceived = 0;
xQueuePeek( xQueue, &ulValReceived, 0 );

if( ulValReceived != 10 )
{
    // Error unless the item was removed by a different task.
}

// The queue is still full.  Use xQueueOverwrite() to overwrite the
// value held in the queue with 100.
ulVarToSend = 100;
xQueueOverwrite( xQueue, &ulVarToSend );

// This time read from the queue, leaving the queue empty once more.
// A block time of 0 is used again.
xQueueReceive( xQueue, &ulValReceived, 0 );

// The value read should be the last value written, even though the
// queue was already full when the value was written.
if( ulValReceived != 100 )
{
    // Error!
}

// ...
}
```

参数

- **xQueue** –The handle of the queue to which the data is being sent.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.

返回 xQueueOverwrite() is a macro that calls xQueueGenericSend(), and therefore has the same return values as xQueueSendToFront(). However, pdPASS is the only value that can be returned because xQueueOverwrite() will write to the queue even when the queue is already full.

xQueueSendToFrontFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
```

(下页继续)

(续上页)

```
char cIn;
BaseType_t xHigherPrioritTaskWoken;

 // We have not woken a task at the start of the ISR.
 xHigherPriorityTaskWoken = pdFALSE;

 // Loop until the buffer is empty.
 do
 {
     // Obtain a byte from the buffer.
     cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

     // Post the byte.
     xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

 } while( portINPUT_BYTE( BUFFER_COUNT ) );

 // Now the buffer is empty we can switch context if necessary.
 if( xHigherPriorityTaskWoken )
 {
     portYIELD_FROM_ISR ();
 }
}
```

参数

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –**[out]** xQueueSendToFrontFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToFromFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueSendToBackFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
char cIn;
BaseType_t xHigherPriorityTaskWoken;

 // We have not woken a task at the start of the ISR.
 xHigherPriorityTaskWoken = pdFALSE;

 // Loop until the buffer is empty.
 do
 {
     // Obtain a byte from the buffer.
```

(下页继续)

(续上页)

```
    cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

    // Post the byte.
    xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
    portYIELD_FROM_ISR ();
}
}
```

参数

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –**[out]** xQueueSendToBackFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueOverwriteFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```
QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
 // Create a queue to hold one uint32_t value.  It is strongly
 // recommended *not* to use xQueueOverwriteFromISR() on queues that can
 // contain more than one value, and doing so will trigger an assertion
 // if configASSERT() is defined.
 xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler( void )
{
// xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
BaseType_t xHigherPriorityTaskWoken = pdFALSE;
uint32_t ulVarToSend, ulValReceived;

 // Write the value 10 to the queue using xQueueOverwriteFromISR().
 ulVarToSend = 10;
 xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

 // The queue is full, but calling xQueueOverwriteFromISR() again will still
```

(下页继续)

(续上页)

```
// pass because the value held in the queue will be overwritten with the
// new value.
ulVarToSend = 100;
xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

// Reading from the queue will now return 100.

// ...

if( xHigherPrioritytaskWoken == pdTRUE )
{
    // Writing to the queue caused a task to unblock and the unblocked task
    // has a priority higher than or equal to the priority of the currently
    // executing task (the task this interrupt interrupted).  Perform a␣
↪context
    // switch so this interrupt returns directly to the unblocked task.
    portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
}
}
```

参数

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –**[out]** xQueueOverwriteFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

xQueueSendFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
char cIn;
BaseType_t xHigherPriorityTaskWoken;

 // We have not woken a task at the start of the ISR.
 xHigherPriorityTaskWoken = pdFALSE;

 // Loop until the buffer is empty.
 do
 {
```

(下页继续)

(续上页)

```
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        // Actual macro used here is port specific.
        portYIELD_FROM_ISR ();
    }
}
```

参数

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –**[out]** xQueueSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueReset(xQueue)

Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.

Type Definitions

typedef struct QueueDefinition ***QueueHandle_t**

typedef struct QueueDefinition ***QueueSetHandle_t**

Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an xQueueSet variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.

typedef struct QueueDefinition ***QueueSetMemberHandle_t**

Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle_t is defined as a type to be used where a parameter or return value can be either an QueueHandle_t or an SemaphoreHandle_t.

Semaphore API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/semphr.h

Macros

semBINARY_SEMAPHORE_QUEUE_LENGTH

semSEMAPHORE_QUEUE_ITEM_LENGTH

semGIVE_BLOCK_TIME

vSemaphoreCreateBinary(xSemaphore)

xSemaphoreCreateBinary()

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! https://www.FreeRTOS.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see https://www.FreeRTOS.org/a00111.html). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old vSemaphoreCreateBinary() macro is now deprecated in favour of this xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to 'take' the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the the semaphore must first be 'given' before it can be 'taken'.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously 'give' the semaphore while another continuously 'takes' the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
 // Semaphore cannot be used before a call to vSemaphoreCreateBinary().
 // This is a macro so pass the variable in directly.
 xSemaphore = xSemaphoreCreateBinary();

 if( xSemaphore != NULL )
 {
     // The semaphore was created successfully.
     // The semaphore can now be used.
 }
}
```

返回 Handle to the created semaphore, or NULL if the memory required to hold the semaphore's data structures could not be allocated.

xSemaphoreCreateBinaryStatic(pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! https://www.FreeRTOS.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see https://www.FreeRTOS.org/a00111.html). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously 'give' the semaphore while another continuously 'takes' the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
 // Semaphore cannot be used before a call to xSemaphoreCreateBinary() or
 // xSemaphoreCreateBinaryStatic().
 // The semaphore's data structures will be placed in the xSemaphoreBuffer
 // variable, the address of which is passed into the function.  The
 // function's parameter is not NULL, so the function will not attempt any
 // dynamic memory allocation, and therefore the function will not return
 // return NULL.
 xSemaphore = xSemaphoreCreateBinaryStatic( &xSemaphoreBuffer );

 // Rest of task code goes here.
}
```

参数

- **pxStaticSemaphore** –Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore's data structure, removing the need for the memory to be allocated dynamically.

返回 If the semaphore is created then a handle to the created semaphore is returned. If pxSemaphoreBuffer is NULL then NULL is returned.

xSemaphoreTake(xSemaphore, xBlockTime)

Macro to obtain a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

param xSemaphore A handle to the semaphore being taken - obtained when the semaphore was created.

param xBlockTime The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
 // Create the semaphore to guard a shared resource.
 vSemaphoreCreateBinary( xSemaphore );
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
 // ... Do other things.
```

(下页继续)

(续上页)

```
 if( xSemaphore != NULL )
 {
     // See if we can obtain the semaphore.  If the semaphore is not available
     // wait 10 ticks to see if it becomes free.
     if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
     {
         // We were able to obtain the semaphore and can now access the
         // shared resource.

         // ...

         // We have finished accessing the shared resource.  Release the
         // semaphore.
         xSemaphoreGive( xSemaphore );
     }
     else
     {
         // We could not obtain the semaphore and can therefore not access
         // the shared resource safely.
     }
 }
}
```

返回 pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

xSemaphoreTakeRecursive(xMutex, xBlockTime)

Macro to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
 // Create the mutex to guard a shared resource.
 xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
 // ... Do other things.

 if( xMutex != NULL )
 {
     // See if we can obtain the mutex.  If the mutex is not available
```

(下页继续)

(续上页)

```
    // wait 10 ticks to see if it becomes free.
    if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
    {
        // We were able to obtain the mutex and can now access the
        // shared resource.

        // ...
        // For some reason due to the nature of the code further calls to
        // xSemaphoreTakeRecursive() are made on the same mutex.  In real
        // code these would not be just sequential calls as this would make
        // no sense.  Instead the calls are likely to be buried inside
        // a more complex call structure.
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

        // The mutex has now been 'taken' three times, so will not be
        // available to another task until it has also been given back
        // three times.  Again it is unlikely that real code would have
        // these calls sequentially, but instead buried in a more complex
        // call structure.  This is just for illustrative purposes.
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );

        // Now the mutex can be taken by other tasks.
    }
    else
    {
        // We could not obtain the mutex and can therefore not access
        // the shared resource safely.
    }
 }
}
```

参数

- **xMutex** –A handle to the mutex being obtained. This is the handle returned by xSemaphoreCreateRecursiveMutex();
- **xBlockTime** –The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. If the task already owns the semaphore then xSemaphoreTakeRecursive() will return immediately no matter what the value of xBlock-Time.

返回 pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

xSemaphoreGive(xSemaphore)

Macro to release a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting(). and obtained using sSemaphoreTake().

This macro must not be used from an ISR. See xSemaphoreGiveFromISR () for an alternative which can be used from an ISR.

This macro must also not be used on semaphores created using xSemaphoreCreateRecursiveMutex().

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
 // Create the semaphore to guard a shared resource.
 vSemaphoreCreateBinary( xSemaphore );

 if( xSemaphore != NULL )
 {
     if( xSemaphoreGive( xSemaphore ) != pdTRUE )
     {
         // We would expect this call to fail because we cannot give
         // a semaphore without first "taking" it!
     }

     // Obtain the semaphore - don't block if the semaphore is not
     // immediately available.
     if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
     {
         // We now have the semaphore and can access the shared resource.

         // ...

         // We have finished accessing the shared resource so can free the
         // semaphore.
         if( xSemaphoreGive( xSemaphore ) != pdTRUE )
         {
             // We would not expect this call to fail because we must have
             // obtained the semaphore to get here.
         }
     }
 }
}
```

参数

- **xSemaphore** –A handle to the semaphore being released. This is the handle returned when the semaphore was created.

返回 pdTRUE if the semaphore was released. pdFALSE if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

xSemaphoreGiveRecursive(xMutex)

Macro to recursively release, or ‘give’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
```

(下页继续)

(续上页)

```
{
 // Create the mutex to guard a shared resource.
 xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
 // ... Do other things.

 if( xMutex != NULL )
 {
     // See if we can obtain the mutex.  If the mutex is not available
     // wait 10 ticks to see if it becomes free.
     if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
     {
         // We were able to obtain the mutex and can now access the
         // shared resource.

         // ...
         // For some reason due to the nature of the code further calls to
         // xSemaphoreTakeRecursive() are made on the same mutex.  In real
         // code these would not be just sequential calls as this would make
         // no sense.  Instead the calls are likely to be buried inside
         // a more complex call structure.
         xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
         xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

         // The mutex has now been 'taken' three times, so will not be
         // available to another task until it has also been given back
         // three times.  Again it is unlikely that real code would have
         // these calls sequentially, it would be more likely that the calls
         // to xSemaphoreGiveRecursive() would be called as a call stack
         // unwound.  This is just for demonstrative purposes.
         xSemaphoreGiveRecursive( xMutex );
         xSemaphoreGiveRecursive( xMutex );
         xSemaphoreGiveRecursive( xMutex );

         // Now the mutex can be taken by other tasks.
     }
     else
     {
         // We could not obtain the mutex and can therefore not access
         // the shared resource safely.
     }
 }
}
```

参数

- **xMutex** –A handle to the mutex being released, or ‘given’. This is the handle returned by xSemaphoreCreateMutex();

返回 pdTRUE if the semaphore was given.

xSemaphoreGiveFromISR (xSemaphore, pxHigherPriorityTaskWoken)

Macro to release a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR.

Example usage:

```
#define LONG_TIME 0xffff
#define TICKS_TO_WAIT  10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
void vATask( void * pvParameters )
{
 for( ;; )
 {
     // We want this task to run every 10 ticks of a timer.  The semaphore
     // was created before this task was started.

     // Block waiting for the semaphore to become available.
     if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
     {
         // It is time to execute.

         // ...

         // We have finished our task.  Return to the top of the loop where
         // we will block on the semaphore until it is time to execute
         // again.  Note when using the semaphore for synchronisation with an
         // ISR in this manner there is no need to 'give' the semaphore back.
     }
 }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
static uint8_t ucLocalTickCount = 0;
static BaseType_t xHigherPriorityTaskWoken;

 // A timer tick has occurred.

 // ... Do other time functions.

 // Is it time for vATask () to run?
 xHigherPriorityTaskWoken = pdFALSE;
 ucLocalTickCount++;
 if( ucLocalTickCount >= TICKS_TO_WAIT )
 {
     // Unblock the task by releasing the semaphore.
     xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

     // Reset the count so we release the semaphore again in 10 ticks time.
     ucLocalTickCount = 0;
 }

 if( xHigherPriorityTaskWoken != pdFALSE )
 {
     // We can force a context switch here.  Context switching from an
     // ISR uses port specific syntax.  Check the demo task for your port
     // to find the syntax required.
 }
}
```

参数

- **xSemaphore** –A handle to the semaphore being released. This is the handle returned

when the semaphore was created.

- **pxHigherPriorityTaskWoken** –xSemaphoreGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.

xSemaphoreTakeFromISR(xSemaphore, pxHigherPriorityTaskWoken)

Macro to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

参数

- **xSemaphore** –A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** –**[out]** xSemaphoreTakeFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

xSemaphoreCreateMutex()

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
 // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
 // This is a macro so pass the variable in directly.
 xSemaphore = xSemaphoreCreateMutex();
```

(下页继续)

(续上页)

```
 if( xSemaphore != NULL )
 {
     // The semaphore was created successfully.
     // The semaphore can now be used.
 }
}
```

返回 If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.

xSemaphoreCreateMutexStatic(pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
 // A mutex cannot be used before it has been created.  xMutexBuffer is
 // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
 // attempted.
 xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

 // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
 // so there is no need to check it.
}
```

参数

- **pxMutexBuffer** –Must point to a variable of type StaticSemaphore_t, which will be used to hold the mutex’s data structure, removing the need for the memory to be allocated dynamically.

返回 If the mutex was successfully created then a handle to the created mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

xSemaphoreCreateCounting(uxMaxCount, uxInitialCount)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexs use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see http://www.freertos.org/a00111.html). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See vSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
   // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
   // This is a macro so pass the variable in directly.
   xSemaphore = xSemaphoreCreateRecursiveMutex();

   if( xSemaphore != NULL )
   {
       // The semaphore was created successfully.
       // The semaphore can now be used.
   }
}
```

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexs use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
   // A recursive semaphore cannot be used before it is created.  Here a
   // recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
   // The address of xMutexBuffer is passed into the function, and will hold
   // the mutexes data structures - so no dynamic memory allocation will be
   // attempted.
   xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

   // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
   // so there is no need to check it.
}
```

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! https://www.FreeRTOS.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreate-Counting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreate-Counting() function. (see https://www.FreeRTOS.org/a00111.html). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer can instead optionally provide the memory that will get used by the counting semaphore. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will 'give' a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will 'take' a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it 'gives' the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
```

(下页继续)

(续上页)

```
{
SemaphoreHandle_t xSemaphore = NULL;

 // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
 // The max value to which the semaphore can count should be 10, and the
 // initial value assigned to the count should be 0.
 xSemaphore = xSemaphoreCreateCounting( 10, 0 );

 if( xSemaphore != NULL )
 {
     // The semaphore was created successfully.
     // The semaphore can now be used.
 }
}
```

返回 xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle_t.

参数

- **pxStaticSemaphore** –Must point to a variable of type StaticSemaphore_t, which will then be used to hold the recursive mutex's data structure, removing the need for the memory to be allocated dynamically.
- **uxMaxCount** –The maximum count value that can be reached. When the semaphore reaches this value it can no longer be 'given'.
- **uxInitialCount** –The count value assigned to the semaphore when it is created.

返回 If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

返回 Handle to the created semaphore. Null if the semaphore could not be created.

xSemaphoreCreateCountingStatic(uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! https://www.FreeRTOS.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCounting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateCounting() function. (see https://www.FreeRTOS.org/a00111.html). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer must provide the memory. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will 'give' a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will 'take' a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it 'gives' the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
SemaphoreHandle_t xSemaphore = NULL;

 // Counting semaphore cannot be used before they have been created.  Create
 // a counting semaphore using xSemaphoreCreateCountingStatic().  The max
 // value to which the semaphore can count is 10, and the initial value
 // assigned to the count will be 0.  The address of xSemaphoreBuffer is
 // passed in and will be used to hold the semaphore structure, so no dynamic
 // memory allocation will be used.
 xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

 // No memory allocation was attempted so xSemaphore cannot be NULL, so there
 // is no need to check its value.
}
```

参数

- **uxMaxCount** –The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- **uxInitialCount** –The count value assigned to the semaphore when it is created.
- **pxSemaphoreBuffer** –Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

返回 If the counting semaphore was successfully created then a handle to the created counting semaphore is returned. If pxSemaphoreBuffer was NULL then NULL is returned.

vSemaphoreDelete(xSemaphore)

Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore if the mutex is held by a task.

参数

- **xSemaphore** –A handle to the semaphore to be deleted.

xSemaphoreGetMutexHolder(xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of determining the identity of the mutex holder as the holder may change between the function exiting and the returned value being tested.

xSemaphoreGetMutexHolderFromISR(xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

uxSemaphoreGetCount(xSemaphore)

If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

Type Definitions

typedef *QueueHandle_t* **SemaphoreHandle_t**

Timer API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/timers.h

Functions

TimerHandle_t **xTimerCreate**(const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, *TimerCallbackFunction_t* pxCallbackFunction)

TimerHandle_t xTimerCreate(const char * const pcTimerName, TickType_t xTimerPeriodInTicks, UBaseType_t uxAutoReload, void * pvTimerID, TimerCallbackFunction_t pxCallbackFunction);

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```
* #define NUM_TIMERS 5
*
* // An array to hold handles to the created timers.
* TimerHandle_t xTimers[ NUM_TIMERS ];
*
* // An array to hold a count of the number of times each timer expires.
* int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };
*
* // Define a callback function that will be used by multiple timer instances.
* // The callback function does nothing but count the number of times the
* // associated timer expires, and stop the timer once the timer has expired
* // 10 times.
* void vTimerCallback( TimerHandle_t pxTimer )
* {
* int32_t lArrayIndex;
* const int32_t xMaxExpiryCountBeforeStopping = 10;
*
*     // Optionally do something if the pxTimer parameter is NULL.
*     configASSERT( pxTimer );
*
*     // Which timer expired?
*     lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );
*
*     // Increment the number of times that pxTimer has expired.
*     lExpireCounters[ lArrayIndex ] += 1;
*
*     // If the timer has expired 10 times then stop it from running.
*     if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
*     {
*         // Do not use a block time if calling a timer API function from a
*         // timer callback function, as doing so could cause a deadlock!
```

(下页继续)

(续上页)

```
*          xTimerStop( pxTimer, 0 );
*      }
* }
*
* void main( void )
* {
* int32_t x;
*
*      // Create then start some timers.  Starting the timers before the␣
↪scheduler
*      // has been started means the timers will start running immediately that
*      // the scheduler starts.
*      for( x = 0; x < NUM_TIMERS; x++ )
*      {
*          xTimers[ x ] = xTimerCreate(    "Timer",       // Just a text name,␣
↪not used by the kernel.
*                                          ( 100 * x ),   // The timer period␣
↪in ticks.
*                                          pdTRUE,        // The timers will␣
↪auto-reload themselves when they expire.
*                                          ( void * ) x,  // Assign each timer␣
↪a unique id equal to its array index.
*                                          vTimerCallback // Each timer calls␣
↪the same callback when it expires.
*                                      );
*
*          if( xTimers[ x ] == NULL )
*          {
*              // The timer was not created.
*          }
*          else
*          {
*              // Start the timer.  No block time is specified, and even if one␣
↪was
*              // it would be ignored because the scheduler has not yet been
*              // started.
*              if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
*              {
*                  // The timer could not be set into the Active state.
*              }
*          }
*      }
*
*      // ...
*      // Create tasks here.
*      // ...
*
*      // Starting the scheduler will start the timers running as they have␣
↪already
*      // been set into the active state.
*      vTaskStartScheduler();
*
*      // Should not reach here.
*      for( ;; );
* }
*
```

参数

- **pcTimerName** –A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.

- **xTimerPeriodInTicks** –The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. Time timer period must be greater than 0.
- **uxAutoReload** –If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** –An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** –The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is "void vCallbackFunction(TimerHandle_t xTimer);" .

返回 If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created (because either there is insufficient FreeRTOS heap remaining to allocate the timer structures, or the timer period was set to 0) then NULL is returned.

TimerHandle_t **xTimerCreateStatic**(const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, *TimerCallbackFunction_t* pxCallbackFunction, StaticTimer_t *pxTimerBuffer)

TimerHandle_t xTimerCreateStatic(const char * const pcTimerName, TickType_t xTimerPeriodInTicks, UBaseType_t uxAutoReload, void * pvTimerID, TimerCallbackFunction_t pxCallbackFunction, StaticTimer_t *pxTimerBuffer);

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```
*
* // The buffer used to hold the software timer's data structure.
* static StaticTimer_t xTimerBuffer;
*
* // A variable that will be incremented by the software timer's callback
* // function.
* UBaseType_t uxVariableToIncrement = 0;
*
* // A software timer callback function that increments a variable passed to
* // it when the software timer was created.  After the 5th increment the
* // callback function stops the software timer.
* static void prvTimerCallback( TimerHandle_t xExpiredTimer )
* {
* UBaseType_t *puxVariableToIncrement;
* BaseType_t xReturned;
```

(下页继续)

(续上页)

```
*
*     // Obtain the address of the variable to increment from the timer ID.
*     puxVariableToIncrement = ( UBaseType_t * ) pvTimerGetTimerID( xExpiredTimer );
*
*     // Increment the variable to show the timer callback has executed.
*     ( *puxVariableToIncrement )++;
*
*     // If this callback has executed the required number of times, stop the
*     // timer.
*     if( *puxVariableToIncrement == 5 )
*     {
*         // This is called from a timer callback so must not block.
*         xTimerStop( xExpiredTimer, staticDONT_BLOCK );
*     }
* }
*
*
* void main( void )
* {
*     // Create the software time.  xTimerCreateStatic() has an extra parameter
*     // than the normal xTimerCreate() API function.  The parameter is a pointer
*     // to the StaticTimer_t structure that will hold the software timer
*     // structure.  If the parameter is passed as NULL then the structure will be
*     // allocated dynamically, just as if xTimerCreate() had been called.
*     xTimer = xTimerCreateStatic( "T1",             // Text name for the task.  Helps debugging only.  Not used by FreeRTOS.
*                                  xTimerPeriod,     // The period of the timer in ticks.
*                                  pdTRUE,           // This is an auto-reload timer.
*                                  ( void * ) &uxVariableToIncrement,    // A variable incremented by the software timer's callback function
*                                  prvTimerCallback, // The function to execute when the timer expires.
*                                  &xTimerBuffer );  // The buffer that will hold the software timer structure.
*
*     // The scheduler has not started yet so a block time is not used.
*     xReturned = xTimerStart( xTimer, 0 );
*
*     // ...
*     // Create tasks here.
*     // ...
*
*     // Starting the scheduler will start the timers running as they have already
*     // been set into the active state.
*     vTaskStartScheduler();
*
*     // Should not reach here.
*     for( ;; );
* }
*
```

参数

- **pcTimerName** –A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.

- **xTimerPeriodInTicks** –The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. The timer period must be greater than 0.
- **uxAutoReload** –If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** –An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** –The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is "void vCallbackFunction(TimerHandle_t xTimer);" .
- **pxTimerBuffer** –Must point to a variable of type StaticTimer_t, which will be then be used to hold the software timer's data structures, removing the need for the memory to be allocated dynamically.

返回 If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

void ***pvTimerGetTimerID**(const *TimerHandle_t* xTimer)

void *pvTimerGetTimerID(TimerHandle_t xTimer);

Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer, and by calling the vTimerSetTimerID() API function.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

参数 **xTimer** –The timer being queried.
返回 The ID assigned to the timer being queried.

void **vTimerSetTimerID**(*TimerHandle_t* xTimer, void *pvNewID)

void vTimerSetTimerID(TimerHandle_t xTimer, void *pvNewID);

Sets the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

参数

- **xTimer** –The timer being updated.
- **pvNewID** –The ID to assign to the timer.

BaseType_t **xTimerIsTimerActive**(*TimerHandle_t* xTimer)

BaseType_t xTimerIsTimerActive(TimerHandle_t xTimer);

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```
* // This function assumes xTimer has already been created.
* void vAFunction( TimerHandle_t xTimer )
* {
*     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and␣
↪equivalently "if( xTimerIsTimerActive( xTimer ) )"
*     {
*         // xTimer is active, do something.
*     }
*     else
*     {
*         // xTimer is not active, do something else.
*     }
* }
*
```

参数 **xTimer** –The timer being queried.

返回 pdFALSE will be returned if the timer is dormant. A value other than pdFALSE will be returned if the timer is active.

TaskHandle_t **xTimerGetTimerDaemonTaskHandle**(void)

TaskHandle_t xTimerGetTimerDaemonTaskHandle(void);

Simply returns the handle of the timer service/daemon task. It it not valid to call xTimerGetTimerDaemonTaskHandle() before the scheduler has been started.

BaseType_t **xTimerPendFunctionCallFromISR**(*PendedFunction_t* xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken)

BaseType_t xTimerPendFunctionCallFromISR(PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken);

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases xTimerPendFunctionCallFromISR() can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

```
*
*  // The callback function that will execute in the context of the daemon␣
↪task.
*  // Note callback functions must all use this same prototype.
*  void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
*  {
*      BaseType_t xInterfaceToService;
*
*      // The interface that requires servicing is passed in the second
*      // parameter.  The first parameter is not used in this case.
*      xInterfaceToService = ( BaseType_t ) ulParameter2;
*
*      // ...Perform the processing here...
*  }
*
*  // An ISR that receives data packets from multiple interfaces
*  void vAnISR( void )
*  {
*      BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;
*
*      // Query the hardware to determine which interface needs processing.
*      xInterfaceToService = prvCheckInterfaces();
*
*      // The actual processing is to be deferred to a task.  Request the
*      // vProcessInterface() callback function is executed, passing in the
*      // number of the interface that needs processing.  The interface to
*      // service is passed in the second parameter.  The first parameter is
*      // not used in this case.
*      xHigherPriorityTaskWoken = pdFALSE;
*      xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )␣
↪xInterfaceToService, &xHigherPriorityTaskWoken );
*
*      // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
*      // switch should be requested.  The macro used is port specific and will
*      // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
*      // the documentation page for the port being used.
*      portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
*
*  }
*
```

参数

- **xFunctionToPend** –The function to execute from the timer service/ daemon task. The function must conform to the PendedFunction_t prototype.
- **pvParameter1** –The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2** –The value of the callback function’s second parameter.
- **pxHigherPriorityTaskWoken** –As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER_TASK_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

返回 pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

BaseType_t **xTimerPendFunctionCall**(*PendedFunction_t* xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait)

BaseType_t xTimerPendFunctionCall(PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait);

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

参数

- **xFunctionToPend** –The function to execute from the timer service/ daemon task. The function must conform to the PendedFunction_t prototype.
- **pvParameter1** –The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2** –The value of the callback function’s second parameter.
- **xTicksToWait** –Calling this function will result in a message being sent to the timer daemon task on a queue. xTicksToWait is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

返回 pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

const char ***pcTimerGetName**(*TimerHandle_t* xTimer)

const char * const pcTimerGetName(TimerHandle_t xTimer);

Returns the name that was assigned to a timer when the timer was created.

参数 **xTimer** –The handle of the timer being queried.
返回 The name assigned to the timer specified by the xTimer parameter.

void **vTimerSetReloadMode**(*TimerHandle_t* xTimer, const UBaseType_t uxAutoReload)

void vTimerSetReloadMode(TimerHandle_t xTimer, const UBaseType_t uxAutoReload);

Updates a timer to be either an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

参数

- **xTimer** –The handle of the timer being updated.
- **uxAutoReload** –If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the timer’s period (see the xTimerPeriodInTicks parameter of the xTimerCreate() API function). If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

UBaseType_t **uxTimerGetReloadMode**(*TimerHandle_t* xTimer)

UBaseType_t uxTimerGetReloadMode(TimerHandle_t xTimer);

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

参数 **xTimer** –The handle of the timer being queried.
返回 If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

TickType_t **xTimerGetPeriod**(*TimerHandle_t* xTimer)

TickType_t xTimerGetPeriod(TimerHandle_t xTimer);

Returns the period of a timer.

参数 **xTimer** –The handle of the timer being queried.
返回 The period of the timer in ticks.

TickType_t **xTimerGetExpiryTime**(*TimerHandle_t* xTimer)

TickType_t xTimerGetExpiryTime(TimerHandle_t xTimer);

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

参数 **xTimer** –The handle of the timer being queried.
返回 If the timer is running then the time in ticks at which the timer will next expire is returned. If the timer is not running then the return value is undefined.

void **vApplicationGetTimerTaskMemory**(StaticTask_t **ppxTimerTaskTCBBuffer, StackType_t **ppxTimerTaskStackBuffer, uint32_t *pulTimerTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Timer Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

参数

- **ppxTimerTaskTCBBuffer** –A handle to a statically allocated TCB buffer
- **ppxTimerTaskStackBuffer** –A handle to a statically allocated Stack buffer for thie idle task
- **pulTimerTaskStackSize** –A pointer to the number of elements that will fit in the allocated stack buffer

xTimerStart(xTimer, xTicksToWait)

BaseType_t xTimerStart(TimerHandle_t xTimer, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The

timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after xTimerStart() was called, where ‘n’ is the timers defined period.

It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerStart() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.

Example usage:

See the xTimerCreate() API function example usage scenario.

参数

- **xTimer** –The handle of the timer being started/restarted.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when xTimerStart() was called. xTicksToWait is ignored if xTimerStart() is called before the scheduler is started.

返回 pdFAIL will be returned if the start command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerStop(xTimer, xTicksToWait)

BaseType_t xTimerStop(TimerHandle_t xTimer, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStop() stops a timer that was previously started using either of the The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() or xTimerChangePeriodFromISR() API functions.

Stopping a timer ensures the timer is not in the active state.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStop() to be available.

Example usage:

See the xTimerCreate() API function example usage scenario.

参数

- **xTimer** –The handle of the timer being stopped.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when xTimerStop() was called. xTicksToWait is ignored if xTimerStop() is called before the scheduler is started.

返回 pdFAIL will be returned if the stop command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerChangePeriod(xTimer, xNewPeriod, xTicksToWait)

BaseType_t xTimerChangePeriod(TimerHandle_t xTimer, TickType_t xNewPeriod, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerChangePeriod() changes the period of a timer that was previously created using the xTimerCreate() API function.

xTimerChangePeriod() can be called to change the period of an active or dormant state timer.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerChangePeriod() to be available.

Example usage:

```
* // This function assumes xTimer has already been created.  If the timer
* // referenced by xTimer is already active when it is called, then the timer
* // is deleted.  If the timer referenced by xTimer is not active when it is
* // called, then the period of the timer is set to 500ms and the timer is
* // started.
* void vAFunction( TimerHandle_t xTimer )
* {
*     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and␣
↪equivalently "if( xTimerIsTimerActive( xTimer ) )"
*     {
*         // xTimer is already active - delete it.
*         xTimerDelete( xTimer );
*     }
*     else
*     {
*         // xTimer is not active, change its period to 500ms.  This will also
*         // cause the timer to start.  Block for a maximum of 100 ticks if the
*         // change period command cannot immediately be sent to the timer
*         // command queue.
*         if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) ==␣
↪pdPASS )
*         {
*             // The command was successfully sent.
*         }
*         else
*         {
*             // The command could not be sent, even after waiting for 100␣
↪ticks
*             // to pass.  Take appropriate action here.
*         }
*     }
* }
*
```

参数

- **xTimer** –The handle of the timer that is having its period changed.

- **xNewPeriod** –The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when xTimerChangePeriod() was called. xTicksToWait is ignored if xTimerChangePeriod() is called before the scheduler is started.

返回 pdFAIL will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerDelete (xTimer, xTicksToWait)

BaseType_t xTimerDelete(TimerHandle_t xTimer, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerDelete() deletes a timer that was previously created using the xTimerCreate() API function.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerDelete() to be available.

Example usage:

See the xTimerChangePeriod() API function example usage scenario.

参数

- **xTimer** –The handle of the timer being deleted.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when xTimerDelete() was called. xTicksToWait is ignored if xTimerDelete() is called before the scheduler is started.

返回 pdFAIL will be returned if the delete command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerReset (xTimer, xTicksToWait)

BaseType_t xTimerReset(TimerHandle_t xTimer, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerReset() re-starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerReset() will cause the timer to re-evaluate its expiry time so that it is relative to when xTimerReset() was called. If the timer was in the dormant state then xTimerReset() has equivalent functionality to the xTimerStart() API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after xTimerReset() was called, where ‘n’ is the timers defined period.

It is valid to call xTimerReset() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerReset() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerReset() to be available.

Example usage:

```
* // When a key is pressed, an LCD back-light is switched on.  If 5 seconds␣
↪pass
* // without a key being pressed, then the LCD back-light is switched off.  In
* // this case, the timer is a one-shot timer.
*
* TimerHandle_t xBacklightTimer = NULL;
*
* // The callback function assigned to the one-shot timer.  In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed.  Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press event handler.
* void vKeyPressEventHandler( char cKey )
* {
*     // Ensure the LCD back-light is on, then reset the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity.  Wait 10 ticks for the command to be successfully sent
*     // if it cannot be sent immediately.
*     vSetBacklightState( BACKLIGHT_ON );
*     if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
*     {
*         // The reset command was not executed successfully.  Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
* }
*
* void main( void )
* {
* int32_t x;
*
*     // Create then start the one-shot timer that is responsible for turning
*     // the back-light off if no keys are pressed within a 5 second period.
*     xBacklightTimer = xTimerCreate( "BacklightTimer",           // Just a␣
↪text name, not used by the kernel.
*                                     ( 5000 / portTICK_PERIOD_MS), // The␣
↪timer period in ticks.
*                                     pdFALSE,                    // The timer␣
↪is a one-shot timer.
*                                     0,                          // The id is␣
↪not used by the callback so can take any value.
*                                     vBacklightTimerCallback     // The␣
↪callback function that switches the LCD back-light off.
*                                   );
```

```
*
*     if( xBacklightTimer == NULL )
*     {
*         // The timer was not created.
*     }
*     else
*     {
*         // Start the timer.  No block time is specified, and even if one was
*         // it would be ignored because the scheduler has not yet been
*         // started.
*         if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
*         {
*             // The timer could not be set into the Active state.
*         }
*     }
*
*     // ...
*     // Create tasks here.
*     // ...
*
*     // Starting the scheduler will start the timer running as it has already
*     // been set into the active state.
*     vTaskStartScheduler();
*
*     // Should not reach here.
*     for( ;; );
* }
*
```

参数

- **xTimer** –The handle of the timer being reset/started/restarted.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

返回 pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerStartFromISR(xTimer, pxHigherPriorityTaskWoken)

BaseType_t xTimerStartFromISR(TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken);

A version of xTimerStart() that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xBacklightTimer has already been created.  When a
* // key is pressed, an LCD back-light is switched on.  If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off.  In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
*
* // The callback function assigned to the one-shot timer.  In this case the

*
```

参数

- **xTimer** –The handle of the timer being started/restarted.
- **pxHigherPriorityTaskWoken** –The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStartFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStartFromISR() function. If xTimerStartFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

返回 pdFAIL will be returned if the start command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer ser-

vice/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStartFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerStopFromISR(xTimer, pxHigherPriorityTaskWoken)

BaseType_t xTimerStopFromISR(TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken);

A version of xTimerStop() that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xTimer has already been created and started.  When
* // an interrupt occurs, the timer should be simply stopped.
*
* // The interrupt service routine that stops the timer.
* void vAnExampleInterruptServiceRoutine( void )
* {
* BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // The interrupt has occurred - simply stop the timer.
*     // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
*     // (within this function).  As this is an interrupt service routine, only
*     // FreeRTOS API functions that end in "FromISR" can be used.
*     if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
*     {
*         // The stop command was not executed successfully.  Take appropriate
*         // action here.
*     }
*
*     // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*     // should be performed.  The syntax required to perform a context switch
*     // from inside an ISR varies from port to port, and from compiler to
*     // compiler.  Inspect the demos for the port you are using to find the
*     // actual syntax required.
*     if( xHigherPriorityTaskWoken != pdFALSE )
*     {
*         // Call the interrupt safe yield function here (actual function
*         // depends on the FreeRTOS port being used).
*     }
* }
*
```

参数

- **xTimer** –The handle of the timer being stopped.
- **pxHigherPriorityTaskWoken** –The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStopFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStopFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStopFromISR() function. If xTimerStopFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

返回 pdFAIL will be returned if the stop command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerChangePeriodFromISR(xTimer, xNewPeriod, pxHigherPriorityTaskWoken)

BaseType_t xTimerChangePeriodFromISR(TimerHandle_t xTimer, TickType_t xNewPeriod, BaseType_t *pxHigherPriorityTaskWoken);

A version of xTimerChangePeriod() that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xTimer has already been created and started.  When
* // an interrupt occurs, the period of xTimer should be changed to 500ms.
*
* // The interrupt service routine that changes the period of xTimer.
* void vAnExampleInterruptServiceRoutine( void )
* {
* BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // The interrupt has occurred - change the period of xTimer to 500ms.
*     // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
*     // (within this function).  As this is an interrupt service routine, only
*     // FreeRTOS API functions that end in "FromISR" can be used.
*     if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) !=␣
↪pdPASS )
*     {
*         // The command to change the timers period was not executed
*         // successfully.  Take appropriate action here.
*     }
*
*     // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*     // should be performed.  The syntax required to perform a context switch
*     // from inside an ISR varies from port to port, and from compiler to
*     // compiler.  Inspect the demos for the port you are using to find the
*     // actual syntax required.
*     if( xHigherPriorityTaskWoken != pdFALSE )
*     {
*         // Call the interrupt safe yield function here (actual function
*         // depends on the FreeRTOS port being used).
*     }
* }
*
```

参数

- **xTimer** –The handle of the timer that is having its period changed.
- **xNewPeriod** –The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000.
- **pxHigherPriorityTaskWoken** –The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerChangePeriodFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/ daemon task out of the Blocked state. If calling xTimerChangePeriodFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerChangePeriodFromISR() function. If xTimerChangePeriodFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

返回 pdFAIL will be returned if the command to change the timers period could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the

timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerResetFromISR (xTimer, pxHigherPriorityTaskWoken)

BaseType_t xTimerResetFromISR(TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken);

A version of xTimerReset() that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xBacklightTimer has already been created.  When a
* // key is pressed, an LCD back-light is switched on.  If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off.  In
* // this case, the timer is a one-shot timer, and unlike the example given for

Event Group API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/event_groups.h

Functions

EventGroupHandle_t **xEventGroupCreate**(void)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see https://www.FreeRTOS.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

返回 If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See https://www.FreeRTOS.org/a00111.html

EventGroupHandle_t **xEventGroupCreateStatic**(StaticEventGroup_t *pxEventGroupBuffer)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see https://www.FreeRTOS.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure.  It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals.  This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group's data structures
StaticEventGroup_t xEventGroupBuffer;

// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );
```

参数 **pxEventGroupBuffer** –pxEventGroupBuffer must point to a variable of type StaticEventGroup_t, which will be then be used to hold the event group's data structures, removing the need for the memory to be allocated dynamically.

返回 If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

EventBits_t **xEventGroupWaitBits** (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToWaitFor, const BaseType_t xClearOnExit, const BaseType_t xWaitForAllBits, TickType_t xTicksToWait)

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
EventBits_t uxBits;
const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

     // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
     // the event group.  Clear the bits before exiting.
     uxBits = xEventGroupWaitBits(
                 xEventGroup,    // The event group being tested.
                 BIT_0 | BIT_4,  // The bits within the event group to wait␣
↪for.
                 pdTRUE,         // BIT_0 and BIT_4 should be cleared before␣
↪returning.
                 pdFALSE,        // Don't wait for both bits, either bit will␣
↪do.
                 xTicksToWait ); // Wait a maximum of 100ms for either bit to␣
↪be set.

     if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
     {
         // xEventGroupWaitBits() returned because both bits were set.
     }
     else if( ( uxBits & BIT_0 ) != 0 )
     {
         // xEventGroupWaitBits() returned because just BIT_0 was set.
     }
     else if( ( uxBits & BIT_4 ) != 0 )
     {
         // xEventGroupWaitBits() returned because just BIT_4 was set.
     }
     else
     {
         // xEventGroupWaitBits() returned because xTicksToWait ticks passed
         // without either BIT_0 or BIT_4 becoming set.
     }
}
```

参数

- **xEventGroup** –The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- **uxBitsToWaitFor** –A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and/or bit 1 and/or bit 2 set uxBitsToWaitFor to 0x07. Etc.
- **xClearOnExit** –If xClearOnExit is set to pdTRUE then any bits within uxBitsToWaitFor that are set within the event group will be cleared before xEventGroupWaitBits() returns if the wait condition was met (if the function returns for a reason other than a timeout). If xClearOnExit is set to pdFALSE then the bits set in the event group are not altered when the call to xEventGroupWaitBits() returns.

- **xWaitForAllBits** –If xWaitForAllBits is set to pdTRUE then xEventGroupWaitBits() will return when either all the bits in uxBitsToWaitFor are set or the specified block time expires. If xWaitForAllBits is set to pdFALSE then xEventGroupWaitBits() will return when any one of the bits set in uxBitsToWaitFor is set or the specified block time expires. The block time is specified by the xTicksToWait parameter.
- **xTicksToWait** –The maximum amount of time (specified in 'ticks') to wait for one/all (depending on the xWaitForAllBits value) of the bits specified by uxBitsToWaitFor to become set.

返回 The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupWaitBits() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupWaitBits() returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that xClearOnExit parameter was set to pdTRUE.

EventBits_t **xEventGroupClearBits** (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToClear)

Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
EventBits_t uxBits;

    // Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits(
                            xEventGroup,    // The event group being updated.
                            BIT_0 | BIT_4 );// The bits being cleared.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 were set before xEventGroupClearBits() was
        // called.  Both will now be clear (not set).
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 was set before xEventGroupClearBits() was called.  It will
        // now be clear.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 was set before xEventGroupClearBits() was called.  It will
        // now be clear.
    }
    else
    {
        // Neither bit 0 nor bit 4 were set in the first place.
    }
}
```

参数

- **xEventGroup** –The event group in which the bits are to be cleared.
- **uxBitsToClear** –A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

返回 The value of the event group before the specified bits were cleared.

EventBits_t **xEventGroupSetBits**(*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToSet)

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBitsFromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
EventBits_t uxBits;

    // Set bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupSetBits(
                        xEventGroup,    // The event group being updated.
                        BIT_0 | BIT_4 );// The bits being set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 remained set when the function returned.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 remained set when the function returned, but bit 4 was
        // cleared.  It might be that bit 4 was cleared automatically as a
        // task that was waiting for bit 4 was removed from the Blocked
        // state.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 remained set when the function returned, but bit 0 was
        // cleared.  It might be that bit 0 was cleared automatically as a
        // task that was waiting for bit 0 was removed from the Blocked
        // state.
    }
    else
    {
        // Neither bit 0 nor bit 4 remained set.  It might be that a task
        // was waiting for both of the bits to be set, and the bits were
        // cleared as the task left the Blocked state.
    }
}
```

参数

- **xEventGroup** –The event group in which the bits are to be set.
- **uxBitsToSet** –A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

返回 The value of the event group at the time the call to xEventGroupSetBits() returns. There are two reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called xEventGroupSetBits() will execute and may change the event group value before the call to xEventGroupSetBits() returns.

EventBits_t **xEventGroupSync**(*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToSet, const *EventBits_t* uxBitsToWaitFor, TickType_t xTicksToWait)

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the uxBitsToWait parameter are set, or become set within that time. In this case all the bits specified by uxBitsToWait will be automatically cleared before the function returns.

Example usage:

```
// Bits used by the three tasks.
#define TASK_0_BIT      ( 1 << 0 )
#define TASK_1_BIT      ( 1 << 1 )
#define TASK_2_BIT      ( 1 << 2 )

#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks.  It is assumed this event
// group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
EventBits_t uxReturn;
TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

  for( ;; )
  {
     // Perform task functionality here.

     // Set bit 0 in the event flag to note this task has reached the
     // sync point.  The other two tasks will set the other two bits defined
     // by ALL_SYNC_BITS.  All three tasks have reached the synchronisation
     // point when all the ALL_SYNC_BITS are set.  Wait a maximum of 100ms
     // for this to happen.
     uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS,␣
↪xTicksToWait );

     if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
     {
         // All three tasks reached the synchronisation point before the call
         // to xEventGroupSync() timed out.
     }
 }
}

void vTask1( void *pvParameters )
{
  for( ;; )
  {
     // Perform task functionality here.

     // Set bit 1 in the event flag to note this task has reached the
     // synchronisation point.  The other two tasks will set the other two
     // bits defined by ALL_SYNC_BITS.  All three tasks have reached the
     // synchronisation point when all the ALL_SYNC_BITS are set.  Wait
     // indefinitely for this to happen.
     xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );
```

(下页继续)

(续上页)

```
        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}

void vTask2( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 2 in the event flag to note this task has reached the
        // synchronisation point.  The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS.  All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set.  Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}
```

参数

- **xEventGroup** –The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- **uxBitsToSet** –The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the uxBitsToWait parameter are set.
- **uxBitsToWaitFor** –A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and bit 1 and bit 2 set uxBitsToWaitFor to 0x07. Etc.
- **xTicksToWait** –The maximum amount of time (specified in 'ticks') to wait for all of the bits specified by uxBitsToWaitFor to become set.

返回 The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupSync() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupSync() returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

EventBits_t **xEventGroupGetBitsFromISR**(*EventGroupHandle_t* xEventGroup)

A version of xEventGroupGetBits() that can be called from an ISR.

参数 **xEventGroup** –The event group being queried.

返回 The event group bits at the time xEventGroupGetBitsFromISR() was called.

void **vEventGroupDelete**(*EventGroupHandle_t* xEventGroup)

Delete an event group that was previously created by a call to xEventGroupCreate(). Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group's value.

参数 **xEventGroup** –The event group being deleted.

Macros

xEventGroupClearBitsFromISR(xEventGroup, uxBitsToClear)

A version of xEventGroupClearBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be

performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore xEventGroupClearBitsFromISR() sends a message to the timer task to have the clear operation performed in the context of the timer task.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
     // Clear bit 0 and bit 4 in xEventGroup.
     xResult = xEventGroupClearBitsFromISR(
                         xEventGroup,     // The event group being updated.
                         BIT_0 | BIT_4 ); // The bits being set.

     if( xResult == pdPASS )
     {
         // The message was posted successfully.
     }
}
```

参数

- **xEventGroup** –The event group in which the bits are to be cleared.
- **uxBitsToClear** –A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

返回 If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

xEventGroupSetBitsFromISR(xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)

A version of xEventGroupSetBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore xEventGroupSetBitsFromISR() sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
BaseType_t xHigherPriorityTaskWoken, xResult;

     // xHigherPriorityTaskWoken must be initialised to pdFALSE.
     xHigherPriorityTaskWoken = pdFALSE;
```

(下页继续)

(续上页)

```
    // Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR(
                        xEventGroup,    // The event group being updated.
                        BIT_0 | BIT_4   // The bits being set.
                        &xHigherPriorityTaskWoken );

    // Was the message posted successfully?
    if( xResult == pdPASS )
    {
        // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
        // switch should be requested.  The macro used is port specific and
        // will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
        // refer to the documentation page for the port being used.
        portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
    }
}
```

参数

- **xEventGroup** –The event group in which the bits are to be set.
- **uxBitsToSet** –A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.
- **pxHigherPriorityTaskWoken** –As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE by xEventGroupSetBitsFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

返回 If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

xEventGroupGetBits(xEventGroup)

Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

参数

- **xEventGroup** –The event group being queried.

返回 The event group bits at the time xEventGroupGetBits() was called.

Type Definitions

typedef struct EventGroupDef_t ***EventGroupHandle_t**

typedef TickType_t **EventBits_t**

Stream Buffer API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/stream_buffer.h

Functions

size_t **xStreamBufferSend**(*StreamBufferHandle_t* xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, TickType_t xTicksToWait)

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( StreamBufferHandle_t xStreamBuffer )
{
size_t xBytesSent;
uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
char *pcStringToSend = "String to send";
const TickType_t x100ms = pdMS_TO_TICKS( 100 );

 // Send an array to the stream buffer, blocking for a maximum of 100ms to
 // wait for enough space to be available in the stream buffer.
 xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend,␣
↪sizeof( ucArrayToSend ), x100ms );

 if( xBytesSent != sizeof( ucArrayToSend ) )
 {
     // The call to xStreamBufferSend() times out before there was enough
     // space in the buffer for the data to be written, but it did
     // successfully write xBytesSent bytes.
 }

 // Send the string to the stream buffer.  Return immediately if there is not
 // enough space in the buffer.
 xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend,␣
↪strlen( pcStringToSend ), 0 );

 if( xBytesSent != strlen( pcStringToSend ) )
 {
     // The entire string could not be added to the stream buffer because
     // there was not enough free space in the buffer, but xBytesSent bytes
     // were sent.  Could try again to send the remaining bytes.
 }
}
```

参数

- **xStreamBuffer** –The handle of the stream buffer to which a stream is being sent.
- **pvTxData** –A pointer to the buffer that holds the bytes to be copied into the stream buffer.
- **xDataLengthBytes** –The maximum number of bytes to copy from pvTxData into the stream buffer.
- **xTicksToWait** –The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold the another xDataLengthBytes bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided IN-

CLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.

返回 The number of bytes written to the stream buffer. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible.

size_t **xStreamBufferSendFromISR**(*StreamBufferHandle_t* xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
// A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
size_t xBytesSent;
char *pcStringToSend = "String to send";
BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

 // Attempt to send the string to the stream buffer.
 xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
                                        ( void * ) pcStringToSend,
                                        strlen( pcStringToSend ),
                                        &xHigherPriorityTaskWoken );

 if( xBytesSent != strlen( pcStringToSend ) )
 {
     // There was not enough free space in the stream buffer for the entire
     // string to be written, ut xBytesSent bytes were written.
 }

 // If xHigherPriorityTaskWoken was set to pdTRUE inside
 // xStreamBufferSendFromISR() then a task that has a priority above the
 // priority of the currently executing task was unblocked and a context
 // switch should be performed to ensure the ISR returns to the unblocked
 // task.  In most FreeRTOS ports this is done by simply passing
 // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
 // variables value, and perform the context switch if necessary.  Check the
 // documentation for the port in use for port specific instructions.
 taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

参数

- **xStreamBuffer** –The handle of the stream buffer to which a stream is being sent.
- **pvTxData** –A pointer to the data that is to be copied into the stream buffer.

- **xDataLengthBytes** –The maximum number of bytes to copy from pvTxData into the stream buffer.
- **pxHigherPriorityTaskWoken** –It is possible that a stream buffer will have a task blocked on it waiting for data. Calling xStreamBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xStreamBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the example code below for an example.

返回 The number of bytes actually written to the stream buffer, which will be less than xDataLengthBytes if the stream buffer didn’ t have enough free space for all the bytes to be written.

size_t **xStreamBufferReceive**(*StreamBufferHandle_t* xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, TickType_t xTicksToWait)

Receives bytes from a stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferReceive() to read from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read from a stream buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( StreamBuffer_t xStreamBuffer )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

 // Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
 // Wait in the Blocked state (so not using any CPU processing time) for a
 // maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
 // available.
 xReceivedBytes = xStreamBufferReceive( xStreamBuffer,
                                        ( void * ) ucRxData,
                                        sizeof( ucRxData ),
                                        xBlockTime );

 if( xReceivedBytes > 0 )
 {
     // A ucRxData contains another xRecievedBytes bytes of data, which can
     // be processed here....
 }
}
```

参数

- **xStreamBuffer** –The handle of the stream buffer from which bytes are to be received.

- **pvRxData** –A pointer to the buffer into which the received bytes will be copied.
- **xBufferLengthBytes** –The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **xTicksToWait** –The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. xStreamBufferReceive() will return immediately if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. A task does not use any CPU time when it is in the Blocked state.

返回 The number of bytes actually read from the stream buffer, which will be less than xBufferLengthBytes if the call to xStreamBufferReceive() timed out before xBufferLengthBytes were available.

size_t **xStreamBufferReceiveFromISR**(*StreamBufferHandle_t* xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives bytes from a stream buffer.

Use xStreamBufferReceive() to read bytes from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```
// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
BaseType_t xHigherPriorityTaskWoken = pdFALSE;  // Initialised to pdFALSE.

 // Receive the next stream from the stream buffer.
 xReceivedBytes = xStreamBufferReceiveFromISR( xStreamBuffer,
                                               ( void * ) ucRxData,
                                               sizeof( ucRxData ),
                                               &xHigherPriorityTaskWoken );

 if( xReceivedBytes > 0 )
 {
     // ucRxData contains xReceivedBytes read from the stream buffer.
     // Process the stream here....
 }

 // If xHigherPriorityTaskWoken was set to pdTRUE inside
 // xStreamBufferReceiveFromISR() then a task that has a priority above the
 // priority of the currently executing task was unblocked and a context
 // switch should be performed to ensure the ISR returns to the unblocked
 // task.  In most FreeRTOS ports this is done by simply passing
 // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
 // variables value, and perform the context switch if necessary.  Check the
 // documentation for the port in use for port specific instructions.
 taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

参数

- **xStreamBuffer** –The handle of the stream buffer from which a stream is being received.
- **pvRxData** –A pointer to the buffer into which the received bytes are copied.
- **xBufferLengthBytes** –The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **pxHigherPriorityTaskWoken** –It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling xStreamBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xStreamBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

返回 The number of bytes read from the stream buffer, if any.

void **vStreamBufferDelete**(*StreamBufferHandle_t* xStreamBuffer)

Deletes a stream buffer that was previously created using a call to xStreamBufferCreate() or xStreamBufferCreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

参数 **xStreamBuffer** –The handle of the stream buffer to be deleted.

BaseType_t **xStreamBufferIsFull**(*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

参数 **xStreamBuffer** –The handle of the stream buffer being queried.
返回 If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferIsEmpty**(*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

参数 **xStreamBuffer** –The handle of the stream buffer being queried.
返回 If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferReset**(*StreamBufferHandle_t* xStreamBuffer)

Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

参数 **xStreamBuffer** –The handle of the stream buffer being reset.
返回 If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

size_t **xStreamBufferSpacesAvailable**(*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see how much free space it contains, which is equal to the amount of data that can be sent to the stream buffer before it is full.

参数 **xStreamBuffer** –The handle of the stream buffer being queried.
返回 The number of bytes that can be written to the stream buffer before the stream buffer would be full.

size_t **xStreamBufferBytesAvailable**(*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see how much data it contains, which is equal to the number of bytes that can be read from the stream buffer before the stream buffer would be empty.

参数 **xStreamBuffer** –The handle of the stream buffer being queried.

返回 The number of bytes that can be read from the stream buffer before the stream buffer would be empty.

BaseType_t **xStreamBufferSetTriggerLevel**(*StreamBufferHandle_t* xStreamBuffer, size_t xTriggerLevel)

A stream buffer's trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

参数

- **xStreamBuffer** –The handle of the stream buffer being updated.
- **xTriggerLevel** –The new trigger level for the stream buffer.

返回 If xTriggerLevel was less than or equal to the stream buffer's length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferSendCompletedFromISR**(*StreamBufferHandle_t* xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

参数

- **xStreamBuffer** –The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** –*pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferSendCompletedFromISR(). If calling xStreamBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

返回 If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferReceiveCompletedFromISR**(*StreamBufferHandle_t* xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

参数

- **xStreamBuffer** –The handle of the stream buffer from which data was read.

- **pxHigherPriorityTaskWoken** –*pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferReceiveCompletedFromISR(). If calling xStreamBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

返回 If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

Macros

xStreamBufferCreate(xBufferSizeBytes, xTriggerLevelBytes)

Creates a new stream buffer using dynamically allocated memory. See xStreamBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xStreamBufferCreate() to be available.

Example use:

```
void vAFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

 // Create a stream buffer that can hold 100 bytes.  The memory used to hold
 // both the stream buffer structure and the data in the stream buffer is
 // allocated dynamically.
 xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes, xTriggerLevel );

 if( xStreamBuffer == NULL )
 {
     // There was not enough heap memory space available to create the
     // stream buffer.
 }
 else
 {
     // The stream buffer was created successfully and can now be used.
 }
}
```

参数

- **xBufferSizeBytes** –The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes** –The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

返回 If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

xStreamBufferCreateStatic(xBufferSizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea, pxStaticStreamBuffer)

Creates a new stream buffer using statically allocated memory. See xStreamBufferCreate() for a version that uses dynamically allocated memory.

configSUPPORT_STATIC_ALLOCATION must be set to 1 in FreeRTOSConfig.h for xStreamBufferCreateStatic() to be available.

Example use:

```
// Used to dimension the array used to hold the streams.  The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the stream buffer structure.
StaticStreamBuffer_t xStreamBufferStruct;

void MyFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xTriggerLevel = 1;

 xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucBufferStorage ),
                                            xTriggerLevel,
                                            ucBufferStorage,
                                            &xStreamBufferStruct );

 // As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
 // parameters were NULL, xStreamBuffer will not be NULL, and can be used to
 // reference the created stream buffer in other stream buffer API calls.

 // Other code that uses the stream buffer can go here.
}
```

参数

- **xBufferSizeBytes** –The size, in bytes, of the buffer pointed to by the pucStreamBufferStorageArea parameter.
- **xTriggerLevelBytes** –The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pucStreamBufferStorageArea** –Must point to a uint8_t array that is at least xBufferSizeBytes + 1 big. This is the array to which streams are copied when they are written to the stream buffer.
- **pxStaticStreamBuffer** –Must point to a variable of type StaticStreamBuffer_t, which will be used to hold the stream buffer's data structure.

返回 If the stream buffer is created successfully then a handle to the created stream buffer is returned. If either pucStreamBufferStorageArea or pxStaticstreamBuffer are NULL then NULL

is returned.

Type Definitions

typedef struct StreamBufferDef_t ***StreamBufferHandle_t**

Message Buffer API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/message_buffer.h

Macros

xMessageBufferCreate(xBufferSizeBytes)

Creates a new message buffer using dynamically allocated memory. See xMessageBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xMessageBufferCreate() to be available.

Example use:

```
void vAFunction( void )
{
MessageBufferHandle_t xMessageBuffer;
const size_t xMessageBufferSizeBytes = 100;

 // Create a message buffer that can hold 100 bytes.  The memory used to hold
 // both the message buffer structure and the messages themselves is allocated
 // dynamically.  Each message added to the buffer consumes an additional 4
 // bytes which are used to hold the lengh of the message.
 xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

 if( xMessageBuffer == NULL )
 {
     // There was not enough heap memory space available to create the
     // message buffer.
 }
 else
 {
     // The message buffer was created successfully and can now be used.
 }
```

参数

- **xBufferSizeBytes** –The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message' s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.

返回 If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.

xMessageBufferCreateStatic(xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMessageBuffer)

Creates a new message buffer using statically allocated memory. See xMessageBufferCreate() for a version that uses dynamically allocated memory.

Example use:

```
// Used to dimension the array used to hold the messages.  The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
MessageBufferHandle_t xMessageBuffer;

 xMessageBuffer = xMessageBufferCreateStatic( sizeof( ucBufferStorage ),
                                              ucBufferStorage,
                                              &xMessageBufferStruct );

 // As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer
 // parameters were NULL, xMessageBuffer will not be NULL, and can be used to
 // reference the created message buffer in other message buffer API calls.

 // Other code that uses the message buffer can go here.
}
```

参数

- **xBufferSizeBytes** –The size, in bytes, of the buffer pointed to by the pucMessageBufferStorageArea parameter. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message's length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually (xBufferSizeBytes - 1).
- **pucMessageBufferStorageArea** –Must point to a uint8_t array that is at least xBufferSizeBytes + 1 big. This is the array to which messages are copied when they are written to the message buffer.
- **pxStaticMessageBuffer** –Must point to a variable of type StaticMessageBuffer_t, which will be used to hold the message buffer's data structure.

返回 If the message buffer is created successfully then a handle to the created message buffer is returned. If either pucMessageBufferStorageArea or pxStaticmessageBuffer are NULL then NULL is returned.

xMessageBufferSend(xMessageBuffer, pvTxData, xDataLengthBytes, xTicksToWait)

Sends a discrete message to the message buffer. The message can be any length that fits within the buffer's free space, and is copied into the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers

then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( MessageBufferHandle_t xMessageBuffer )
{
size_t xBytesSent;
uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
char *pcStringToSend = "String to send";
const TickType_t x100ms = pdMS_TO_TICKS( 100 );

 // Send an array to the message buffer, blocking for a maximum of 100ms to
 // wait for enough space to be available in the message buffer.
 xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend,␣
↪sizeof( ucArrayToSend ), x100ms );

 if( xBytesSent != sizeof( ucArrayToSend ) )
 {
     // The call to xMessageBufferSend() times out before there was enough
     // space in the buffer for the data to be written.
 }

 // Send the string to the message buffer.  Return immediately if there is
 // not enough space in the buffer.
 xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend,␣
↪strlen( pcStringToSend ), 0 );

 if( xBytesSent != strlen( pcStringToSend ) )
 {
     // The string could not be added to the message buffer because there was
     // not enough free space in the buffer.
 }
}
```

参数

- **xMessageBuffer** –The handle of the message buffer to which a message is being sent.
- **pvTxData** –A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** –The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message’ s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **xTicksToWait** –The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when xMessageBufferSend() is called. The calling task will never block if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

返回 The number of bytes written to the message buffer. If the call to xMessageBufferSend() times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then xDataLengthBytes is returned.

xMessageBufferSendFromISR(xMessageBuffer, pvTxData, xDataLengthBytes, pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer's free space, and is copied into the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
size_t xBytesSent;
char *pcStringToSend = "String to send";
BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

 // Attempt to send the string to the message buffer.
 xBytesSent = xMessageBufferSendFromISR( xMessageBuffer,
                                         ( void * ) pcStringToSend,
                                         strlen( pcStringToSend ),
                                         &xHigherPriorityTaskWoken );

 if( xBytesSent != strlen( pcStringToSend ) )
 {
     // The string could not be added to the message buffer because there was
     // not enough free space in the buffer.
 }

 // If xHigherPriorityTaskWoken was set to pdTRUE inside
 // xMessageBufferSendFromISR() then a task that has a priority above the
 // priority of the currently executing task was unblocked and a context
 // switch should be performed to ensure the ISR returns to the unblocked
 // task.  In most FreeRTOS ports this is done by simply passing
 // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
 // variables value, and perform the context switch if necessary.  Check the
 // documentation for the port in use for port specific instructions.
 portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

参数

- **xMessageBuffer** –The handle of the message buffer to which a message is being sent.
- **pvTxData** –A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** –The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message's length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20

bytes of message data and 4 bytes to hold the message length).

- **pxHigherPriorityTaskWoken** –It is possible that a message buffer will have a task blocked on it waiting for data. Calling xMessageBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xMessageBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

返回 The number of bytes actually written to the message buffer. If the message buffer didn't have enough free space for the message to be stored then 0 is returned, otherwise xDataLengthBytes is returned.

xMessageBufferReceive(xMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)

Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( MessageBuffer_t xMessageBuffer )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

 // Receive the next message from the message buffer.  Wait in the Blocked
 // state (so not using any CPU processing time) for a maximum of 100ms for
 // a message to become available.
 xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
                                         ( void * ) ucRxData,
                                         sizeof( ucRxData ),
                                         xBlockTime );

 if( xReceivedBytes > 0 )
 {
     // A ucRxData contains a message that is xReceivedBytes long.  Process
     // the message here....
 }
}
```

参数

- **xMessageBuffer** –The handle of the message buffer from which a message is being received.

- **pvRxData** –A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** –The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **xTicksToWait** –The maximum amount of time the task should remain in the Blocked state to wait for a message, should the message buffer be empty. xMessageBufferReceive() will return immediately if xTicksToWait is zero and the message buffer is empty. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

返回 The length, in bytes, of the message read from the message buffer, if any. If xMessageBufferReceive() times out before a message became available then zero is returned. If the length of the message is greater than xBufferLengthBytes then the message will be left in the message buffer and zero is returned.

xMessageBufferReceiveFromISR(xMessageBuffer, pvRxData, xBufferLengthBytes, pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```
// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
BaseType_t xHigherPriorityTaskWoken = pdFALSE;  // Initialised to pdFALSE.

 // Receive the next message from the message buffer.
 xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
                                                ( void * ) ucRxData,
                                                sizeof( ucRxData ),
                                                &xHigherPriorityTaskWoken );

 if( xReceivedBytes > 0 )
 {
     // A ucRxData contains a message that is xReceivedBytes long.  Process
     // the message here....
 }
```

(下页继续)

(续上页)

```
    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task.  In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary.  Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

参数

- **xMessageBuffer** –The handle of the message buffer from which a message is being received.
- **pvRxData** –A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** –The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **pxHigherPriorityTaskWoken** –It is possible that a message buffer will have a task blocked on it waiting for space to become available. Calling xMessageBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xMessageBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

返回 The length, in bytes, of the message read from the message buffer, if any.

vMessageBufferDelete(xMessageBuffer)

Deletes a message buffer that was previously created using a call to xMessageBufferCreate() or xMessageBufferCreateStatic(). If the message buffer was created using dynamic memory (that is, by xMessageBufferCreate()), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

参数

- **xMessageBuffer** –The handle of the message buffer to be deleted.

xMessageBufferIsFull(xMessageBuffer)

Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any size, until space is made available by a message being removed from the message buffer.

参数

- **xMessageBuffer** –The handle of the message buffer being queried.

返回 If the message buffer referenced by xMessageBuffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferIsEmpty(xMessageBuffer)

Tests to see if a message buffer is empty (does not contain any messages).

参数

- **xMessageBuffer** –The handle of the message buffer being queried.

返回 If the message buffer referenced by xMessageBuffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferReset(xMessageBuffer)

Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

参数

- **xMessageBuffer** –The handle of the message buffer being reset.

返回 If the message buffer was reset then pdPASS is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a a message to be available, then pdFAIL is returned.

xMessageBufferSpaceAvailable(xMessageBuffer)

Returns the number of bytes of free space in the message buffer.

参数

- **xMessageBuffer** –The handle of the message buffer being queried.

返回 The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message' s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so if xMessageBufferSpacesAvailable() returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

xMessageBufferSpacesAvailable(xMessageBuffer)

xMessageBufferNextLengthBytes(xMessageBuffer)

Returns the length (in bytes) of the next message in a message buffer. Useful if xMessageBufferReceive() returned 0 because the size of the buffer passed into xMessageBufferReceive() was too small to hold the next message.

参数

- **xMessageBuffer** –The handle of the message buffer being queried.

返回 The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.

xMessageBufferSendCompletedFromISR(xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

参数

- **xMessageBuffer** –The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** –*pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xMessageBufferSendCompletedFromISR(). If calling xMessageBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

返回 If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferReceiveCompletedFromISR(xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it

from the Blocked state. xMessageBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

参数

- **xMessageBuffer** –The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken** –*pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xMessageBufferReceiveCompletedFromISR(). If calling xMessageBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

返回 If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

Type Definitions

typedef void ***MessageBufferHandle_t**

Type by which message buffers are referenced. For example, a call to xMessageBufferCreate() returns an MessageBufferHandle_t variable that can then be used as a parameter to xMessageBufferSend(), xMessageBufferReceive(), etc.

2.10.10 FreeRTOS Supplemental Features

ESP-IDF uses a modified version of FreeRTOS v10.4.3 that contains significant changes for SMP compatibility (see *ESP-IDF FreeRTOS SMP Changes*). However, in addition to ESP-IDF FreeRTOS, various features are also provided by ESP-IDF to supplement the features offered by FreeRTOS.

This document describes these supplemental features added to ESP-IDF. This document is split into the following sections:

Contents

- *FreeRTOS Supplemental Features*
  - *Overview*
  - *Ring Buffers*
  - *ESP-IDF Tick and Idle Hooks*
  - *TLSP Deletion Callbacks*
  - *Component Specific Properties*
  - *API Reference*

Overview

ESP-IDF FreeRTOS is modified version of based on the Xtensa port of FreeRTOS v10.4.3 with significant modifications for SMP compatibility (see *ESP-IDF FreeRTOS SMP Changes*). However, various new features specific to ESP-IDF FreeRTOS have been added. The features are as follows:

- **Ring buffers**: Ring buffers provide a FIFO buffer that can accept entries of arbitrary lengths.
- **ESP-IDF Tick and Idle Hooks**: ESP-IDF provides multiple custom tick interrupt hooks and idle task hooks that are more numerous and more flexible when compared to FreeRTOS tick and idle hooks.
- **Thread Local Storage Pointer (TLSP) Deletion Callbacks**: TLSP Deletion callbacks are run automatically when a task is deleted, thus allowing users to clean up their TLSPs automatically.
- **Component Specific Properties**: Currently added only one component specific property `ORIG_INCLUDE_PATH`.

Ring Buffers

The ESP-IDF FreeRTOS ring buffer is a strictly FIFO buffer that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items. The ring buffer provides API to send an item, or to allocate space for an item in the ring buffer to be filled manually by the user. For efficiency reasons, **items are always retrieved from the ring buffer by reference**. As a result, all retrieved items *must also be returned* to the ring buffer by using `vRingbufferReturnItem()` or `vRingbufferReturnItemFromISR()`, in order for them to be removed from the ring buffer completely. The ring buffers are split into the three following types:

No-Split buffers will guarantee that an item is stored in contiguous memory and will not attempt to split an item under any circumstances. Use No-Split buffers when items must occupy contiguous memory. *Only this buffer type allows you to get the data item address and write to the item by yourself.* Refer the documentation of the functions `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` for more details.

Allow-Split buffers will allow an item to be split in two parts when wrapping around the end of the buffer if there is enough space at the tail and the head of the buffer combined to store the item. Allow-Split buffers are more memory efficient than No-Split buffers but can return an item in two parts when retrieving.

Byte buffers do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes can be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained (e.g. a byte stream).

备注： No-Split buffers and Allow-Split buffers will always store items at 32-bit aligned addresses. Therefore, when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

备注： Each item stored in No-Split or Allow-Split buffers will **require an additional 8 bytes for a header**. Item sizes will also be rounded up to a 32-bit aligned size (multiple of 4 bytes), however the true item size is recorded within the header. The sizes of No-Split and Allow-Split buffers will also be rounded up when created.

Usage The following example demonstrates the usage of `xRingbufferCreate()` and `xRingbufferSend()` to create a ring buffer and then send an item to it.

```
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";

...

    //Create ring buffer
    RingbufHandle_t buf_handle;
    buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
    if (buf_handle == NULL) {
        printf("Failed to create ring buffer\n");
    }

    //Send an item
    UBaseType_t res =  xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_
↪TO_TICKS(1000));
    if (res != pdTRUE) {
        printf("Failed to send item\n");
    }
```

The following example demonstrates the usage of `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` instead of `xRingbufferSend()` to acquire memory on the ring buffer (of type *RINGBUF_TYPE_NOSPLIT*) and then send an item to it. This adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+(((N)+3)&(~3)))

...

    //Retrieve space for DMA descriptor and corresponding data buffer
    //This has to be done with SendAcquire, or the address may be different when we copy
    dma_item_t item;
    UBaseType_t res =  xRingbufferSendAcquire(buf_handle,
                        &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
    if (res != pdTRUE) {
        printf("Failed to acquire memory for item\n");
    }
    item->dma_desc = (lldesc_t) {
        .size = buffer_size,
        .length = buffer_size,
        .eof = 0,
        .owner = 1,
        .buf = &item->buf,
    };
    //Actually send to the ring buffer for consumer to use
    res = xRingbufferSendComplete(buf_handle, &item);
    if (res != pdTRUE) {
        printf("Failed to send item\n");
    }
```

The following example demonstrates retrieving and returning an item from a **No-Split ring buffer** using *xRingbufferReceive()* and *vRingbufferReturnItem()*

```
...

    //Receive an item from no-split ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_TICKS(1000));

    //Check received item
    if (item != NULL) {
        //Print item
        for (int i = 0; i < item_size; i++) {
            printf("%c", item[i]);
        }
        printf("\n");
        //Return Item
        vRingbufferReturnItem(buf_handle, (void *)item);
    } else {
        //Failed to receive item
        printf("Failed to receive item\n");
    }
```

The following example demonstrates retrieving and returning an item from an **Allow-Split ring buffer** using *xRingbufferReceiveSplit()* and *vRingbufferReturnItem()*

```
...

    //Receive an item from allow-split ring buffer
    size_t item_size1, item_size2;
    char *item1, *item2;
    BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)&item1, (void
↪**)&item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

    //Check received item
    if (ret == pdTRUE && item1 != NULL) {
        for (int i = 0; i < item_size1; i++) {
            printf("%c", item1[i]);
        }
        vRingbufferReturnItem(buf_handle, (void *)item1);
        //Check if item was split
        if (item2 != NULL) {
            for (int i = 0; i < item_size2; i++) {
                printf("%c", item2[i]);
            }
            vRingbufferReturnItem(buf_handle, (void *)item2);
        }
        printf("\n");
    } else {
        //Failed to receive item
        printf("Failed to receive item\n");
    }
```

The following example demonstrates retrieving and returning an item from a **byte buffer** using *xRingbufferReceiveUpTo()* and *vRingbufferReturnItem()*

```
...

    //Receive data from byte buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_
↪TICKS(1000), sizeof(tx_item));

    //Check received data
    if (item != NULL) {
        //Print item
        for (int i = 0; i < item_size; i++) {
            printf("%c", item[i]);
        }
        printf("\n");
        //Return Item
        vRingbufferReturnItem(buf_handle, (void *)item);
    } else {
        //Failed to receive item
        printf("Failed to receive item\n");
    }
```

For ISR safe versions of the functions used above, call *xRingbufferSendFromISR()*, *xRingbufferReceiveFromISR()*, *xRingbufferReceiveSplitFromISR()*, *xRingbufferReceiveUpToFromISR()*, and *vRingbufferReturnItemFromISR()*

备注: Two calls to RingbufferReceive[UpTo][FromISR]() are required if the bytes wraps around the end of the ring buffer.

Sending to Ring Buffer The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers with regard to sending items/data. The diagrams assume that three items of sizes **18, 3, and 27 bytes** are sent respectively to a **buffer of 128 bytes**.

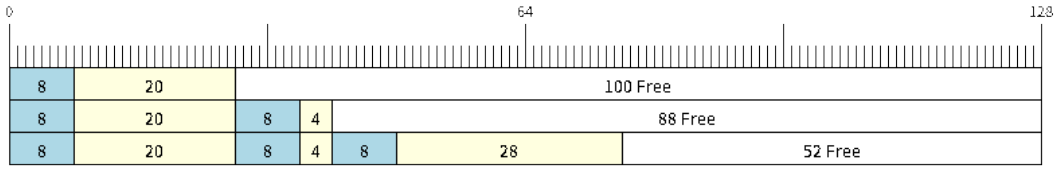

图 23: Sending items to No-Split or Allow-Split ring buffers

For No-Split and Allow-Split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is **rounded up to the nearest 32-bit aligned size** in order to maintain overall 32-bit alignment. However, the true size of the item is recorded inside the header which will be returned when the item is retrieved.

Referring to the diagram above, the 18, 3, and 27 byte items are **rounded up to 20, 4, and 28 bytes** respectively. An 8 byte header is then added in front of each item.

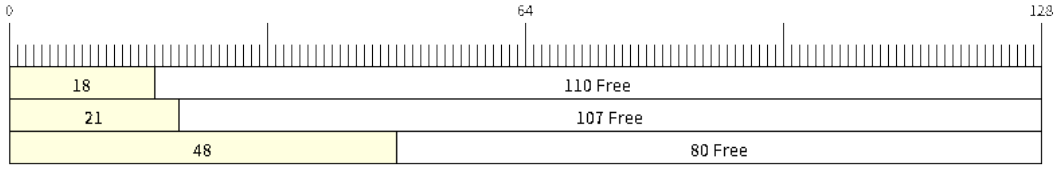

图 24: Sending items to byte buffers

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and **merged into a single item of 48 bytes**.

Using SendAcquire and SendComplete Items in No-Split buffers are acquired (by `SendAcquire`) in strict FIFO order and must be sent to the buffer by `SendComplete` for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling `SendComplete`, and the items do not necessarily need to be completed in the order they were acquired. However, the receiving of data items must occur in FIFO order, therefore not calling `SendComplete` for the earliest acquired item will prevent the subsequent items from being received.

The following diagrams illustrate what will happen when `SendAcquire` and `SendComplete` don't happen in the same order. At the beginning, there is already a data item of 16 bytes sent to the ring buffer. Then `SendAcquire` is called to acquire space of 20, 8, 24 bytes on the ring buffer.

After that, we fill (use) the buffers, and send them to the ring buffer by `SendComplete` in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Hence, if `SendComplete` is not called for the 20 bytes, it will not be available, nor will the data items following the 20 bytes item.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-Split buffers and byte buffers do not allow using `SendAcquire` or `SendComplete` since acquired buffers are required to be complete (not wrapped).

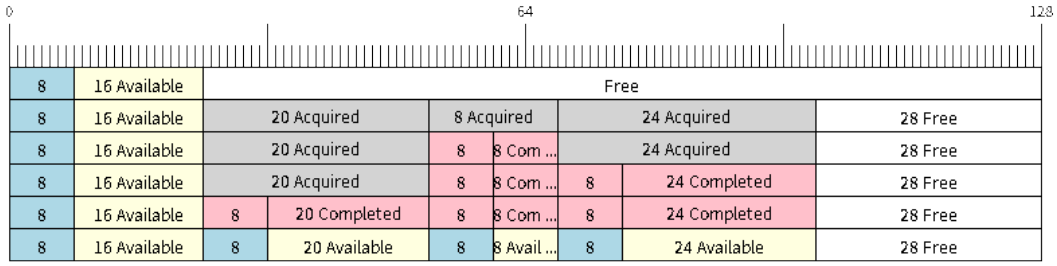

图 25: SendAcquire/SendComplete items in No-Split ring buffers

Wrap around The following diagrams illustrate the differences between No-Split, Allow-Split, and byte buffers when a sent item requires a wrap around. The diagrams assume a buffer of **128 bytes** with **56 bytes of free space that wraps around** and a sent item of **28 bytes**.

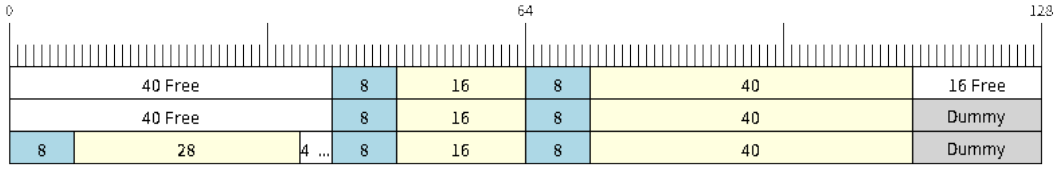

图 26: Wrap around in No-Split buffers

No-Split buffers will **only store an item in continuous free space and will not split an item under any circumstances**. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be **marked as dummy data**. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

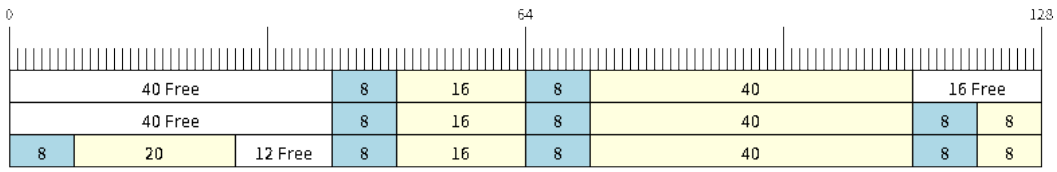

图 27: Wrap around in Allow-Split buffers

Allow-Split buffers will attempt to **split the item into two parts** when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers (therefore incurring an extra 8 bytes of overhead).

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

备 注: Allow-Split buffers treat both parts of the split item as two separate items, therefore call `xRingbufferReceiveSplit()` instead of `xRingbufferReceive()` to receive both parts of a split item

in a thread safe manner.

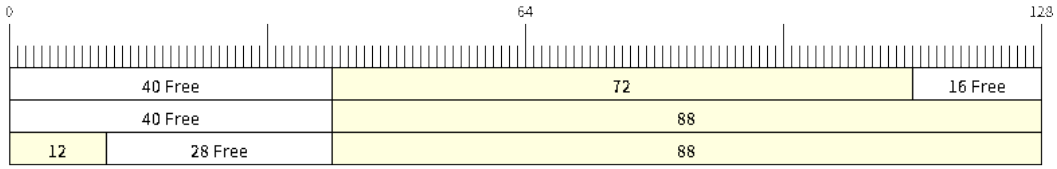

图 28: Wrap around in byte buffers

Byte buffers will **store as much data as possible into the free space at the tail of buffer**. The remaining data will then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore, the 16 bytes of free space is filled with data, and the remaining 12 bytes are written to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each continuous part will be treated as a separate item by the byte buffer.

Retrieving/Returning The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers in retrieving and returning data.

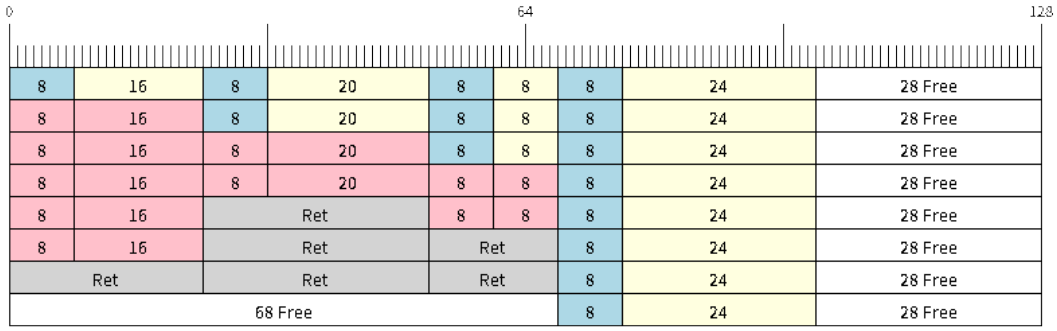

图 29: Retrieving/Returning items in No-Split and Allow-Split ring buffers

Items in No-Split buffers and Allow-Split buffers are **retrieved in strict FIFO order** and **must be returned** for the occupied space to be freed. Multiple items can be retrieved before returning, and the items do not necessarily need to be returned in the order they were retrieved. However, the freeing of space must occur in FIFO order, therefore not returning the earliest retrieved item will prevent the space of subsequent items from being freed.

Referring to the diagram above, the **16, 20, and 8 byte items are retrieved in FIFO order**. However, the items are not returned in the order they were retrieved. First, the 20 byte item is returned followed by the 8 byte and the 16 byte items. The space is not freed until the first item, i.e., the 16 byte item is returned.

Byte buffers **do not allow multiple retrievals before returning** (every retrieval must be followed by a return before another retrieval is permitted). When using *xRingbufferReceive()* or *xRingbufferReceiveFromISR()*, all continuous stored data will be retrieved. *xRingbufferReceiveUpTo()* or *xRingbufferReceiveUpToFromISR()* can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space will be freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned,

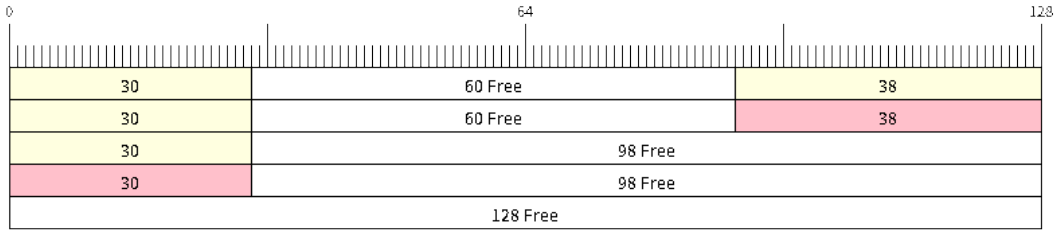

图 30: Retrieving/Returning data in byte buffers

and freed. The next call to *xRingbufferReceive()* or *xRingbufferReceiveFromISR()* then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.

Ring Buffers with Queue Sets Ring buffers can be added to FreeRTOS queue sets using *xRingbufferAddToQueueSetRead()* such that every time a ring buffer receives an item or data, the queue set is notified. Once added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to *xQueueSelectFromSet()*. To check whether the selected queue set member is the ring buffer, call *xRingbufferCanRead()*.

The following example demonstrates queue set usage with ring buffers.

```
#include "freertos/queue.h"
#include "freertos/ringbuf.h"

...

    //Create ring buffer and queue set
    RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
    QueueSetHandle_t queue_set = xQueueCreateSet(3);

    //Add ring buffer to queue set
    if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
        printf("Failed to add to queue set\n");
    }

...

    //Block on queue set
    QueueSetMemberHandle_t member = xQueueSelectFromSet(queue_set, pdMS_TO_
↪TICKS(1000));

    //Check if member is ring buffer
    if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
        //Member is ring buffer, receive item from ring buffer
        size_t item_size;
        char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);

        //Handle item
        ...

    } else {
        ...
    }
```

Ring Buffers with Static Allocation The *xRingbufferCreateStatic()* can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory

used by a ring buffer must be manually allocated beforehand then passed to the *xRingbufferCreateStatic()* to be initialized as a ring buffer. These blocks include the following:

- The ring buffer's data structure of type *StaticRingbuffer_t*
- The ring buffer's storage area of size `xBufferSize`. Note that `xBufferSize` must be 32-bit aligned for No-Split and Allow-Split buffers.

The manner in which these blocks are allocated will depend on the users requirements (e.g. all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

备 注: When deleting a ring buffer created via *xRingbufferCreateStatic()*, the function *vRingbufferDelete()* will not free any of the memory blocks. This must be done manually by the user after *vRingbufferDelete()* is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.

```
#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"

#define BUFFER_SIZE     400      //32-bit aligned size
#define BUFFER_TYPE     RINGBUF_TYPE_NOSPLIT
...

//Allocate ring buffer data structure and storage area into external RAM
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_
↪malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t)*BUFFER_SIZE,␣
↪MALLOC_CAP_SPIRAM);

//Create a ring buffer with manually allocated memory
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_
↪storage, buffer_struct);

...

//Delete the ring buffer after used
vRingbufferDelete(handle);

//Manually free all blocks of memory
free(buffer_struct);
free(buffer_storage);
```

Priority Inversion Ideally, ring buffers can be used with multiple tasks in an SMP fashion where the **highest priority task will always be serviced first.** However due to the usage of binary semaphores in the ring buffer's underlying implementation, priority inversion may occur under very specific circumstances.

The ring buffer governs sending by a binary semaphore which is given whenever space is freed on the ring buffer. The highest priority task waiting to send will repeatedly take the semaphore until sufficient free space becomes available or until it times out. Ideally this should prevent any lower priority tasks from being serviced as the semaphore should always be given to the highest priority task.

However, in between iterations of acquiring the semaphore, there is a **gap in the critical section** which may permit another task (on the other core or with an even higher priority) to free some space on the ring buffer and as a result give the semaphore. Therefore, the semaphore will be given before the highest priority task can re-acquire the semaphore. This will result in the **semaphore being acquired by the second-highest priority task** waiting to send, hence causing priority inversion.

This side effect will not affect ring buffer performance drastically given if the number of tasks using the ring buffer simultaneously is low, and the ring buffer is not operating near maximum capacity.

ESP-IDF Tick and Idle Hooks

FreeRTOS allows applications to provide a tick hook and an idle hook at compile time:

- FreeRTOS tick hook can be enabled via the *CONFIG_FREERTOS_USE_TICK_HOOK* option. The application must provide the `void vApplicationTickHook( void )` callback.
- FreeRTOS idle hook can be enabled via the *CONFIG_FREERTOS_USE_IDLE_HOOK* option. The application must provide the `void vApplicationIdleHook( void )` callback.

However, the FreeRTOS tick hook and idle hook have the following draw backs:

- The FreeRTOS hooks are registered at compile time
- Only one of each hook can be registered
- On multi-core targets, the FreeRTOS hooks are symmetric, meaning each CPU's tick interrupt and idle tasks ends up calling the same hook.

Therefore, ESP-IDF tick and idle hooks are provided to supplement the features of FreeRTOS tick and idle hooks. The ESP-IDF hooks have the following features:

- The hooks can be registered and deregistered at run-time
- Multiple hooks can be registered (with a maximum of 8 hooks of each type per CPU)
- On multi-core targets, the hooks can be asymmetric, meaning different hooks can be registered to each CPU

ESP-IDF hooks can be registered and deregistered using the following API:

- For tick hooks:
  - Register using *esp_register_freertos_tick_hook()* or *esp_register_freertos_tick_hook_for_cpu()*
  - Deregister using *esp_deregister_freertos_tick_hook()* or *esp_deregister_freertos_tick_hook_for_cpu()*
- For idle hooks:
  - Register using *esp_register_freertos_idle_hook()* or *esp_register_freertos_idle_hook_for_cpu()*
  - Deregister using *esp_deregister_freertos_idle_hook()* or *esp_deregister_freertos_idle_hook_for_cpu()*

备注： The tick interrupt stays active while the cache is disabled, therefore any tick hook (FreeRTOS or ESP-IDF) functions must be placed in internal RAM. Please refer to the *SPI flash API documentation* for more details.

TLSP Deletion Callbacks

Vanilla FreeRTOS provides a Thread Local Storage Pointers (TLSP) feature. These are pointers stored directly in the Task Control Block (TCB) of a particular task. TLSPs allow each task to have its own unique set of pointers to data structures. Vanilla FreeRTOS expects users to…

- set a task's TLSPs by calling *vTaskSetThreadLocalStoragePointer()* after the task has been created.
- get a task's TLSPs by calling *pvTaskGetThreadLocalStoragePointer()* during the task's lifetime.
- free the memory pointed to by the TLSPs before the task is deleted.

However, there can be instances where users may want the freeing of TLSP memory to be automatic. Therefore, ESP-IDF FreeRTOS provides the additional feature of TLSP deletion callbacks. These user provided deletion callbacks are called automatically when a task is deleted, thus allows the TLSP memory to be cleaned up without needing to add the cleanup logic explicitly to the code of every task.

The TLSP deletion callbacks are set in a similar fashion to the TLSPs themselves.

- *vTaskSetThreadLocalStoragePointerAndDelCallback()* sets both a particular TLSP and its associated callback.

- Calling the Vanilla FreeRTOS function `vTaskSetThreadLocalStoragePointer()` will simply set the TLSP's associated Deletion Callback to *NULL* meaning that no callback will be called for that TLSP during task deletion.

When implementing TLSP callbacks, users should note the following:

- The callback **must never attempt to block or yield** and critical sections should be kept as short as possible
- The callback is called shortly before a deleted task's memory is freed. Thus, the callback can either be called from `vTaskDelete()` itself, or from the idle task.

Component Specific Properties

Besides standard component variables that are available with basic cmake build properties, FreeRTOS component also provides arguments (only one so far) for simpler integration with other modules:

- *ORIG_INCLUDE_PATH* - contains an absolute path to freertos root include folder. Thus instead of *#include* "*freertos/FreeRTOS.h*" you can refer to headers directly: *#include* "*FreeRTOS.h*".

API Reference

Ring Buffer API

Header File

- components/esp_ringbuf/include/freertos/ringbuf.h

Functions

RingbufHandle_t **xRingbufferCreate**(size_t xBufferSize, *RingbufferType_t* xBufferType)

Create a ring buffer.

备注: xBufferSize of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

参数

- **xBufferSize** –**[in]** Size of the buffer in bytes. Note that items require space for a header in no-split/allow-split buffers
- **xBufferType** –**[in]** Type of ring buffer, see documentation.

返回 A handle to the created ring buffer, or NULL in case of error.

RingbufHandle_t **xRingbufferCreateNoSplit**(size_t xItemSize, size_t xItemNum)

Create a ring buffer of type RINGBUF_TYPE_NOSPLIT for a fixed item_size.

This API is similar to xRingbufferCreate(), but it will internally allocate additional space for the headers.

参数

- **xItemSize** –**[in]** Size of each item to be put into the ring buffer
- **xItemNum** –**[in]** Maximum number of items the buffer needs to hold simultaneously

返回 A RingbufHandle_t handle to the created ring buffer, or NULL in case of error.

RingbufHandle_t **xRingbufferCreateStatic**(size_t xBufferSize, *RingbufferType_t* xBufferType, uint8_t *pucRingbufferStorage, *StaticRingbuffer_t* *pxStaticRingbuffer)

Create a ring buffer but manually provide the required memory.

备注: xBufferSize of no-split/allow-split buffers MUST be 32-bit aligned.

参数

- **xBufferSize** –**[in]** Size of the buffer in bytes.
- **xBufferType** –**[in]** Type of ring buffer, see documentation
- **pucRingbufferStorage** –**[in]** Pointer to the ring buffer’ s storage area. Storage area must have the same size as specified by xBufferSize
- **pxStaticRingbuffer** –**[in]** Pointed to a struct of type StaticRingbuffer_t which will be used to hold the ring buffer’ s data structure

返回 A handle to the created ring buffer

BaseType_t **xRingbufferSend**(*RingbufHandle_t* xRingbuffer, const void *pvItem, size_t xItemSize, TickType_t xTicksToWait)

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.

备注: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

参数

- **xRingbuffer** –**[in]** Ring buffer to insert the item into
- **pvItem** –**[in]** Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **xItemSize** –**[in]** Size of data to insert.
- **xTicksToWait** –**[in]** Ticks to wait for room in the ring buffer.

返回

- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType_t **xRingbufferSendFromISR**(*RingbufHandle_t* xRingbuffer, const void *pvItem, size_t xItemSize, BaseType_t *pxHigherPriorityTaskWoken)

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

备注: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

参数

- **xRingbuffer** –**[in]** Ring buffer to insert the item into
- **pvItem** –**[in]** Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **xItemSize** –**[in]** Size of data to insert.
- **pxHigherPriorityTaskWoken** –**[out]** Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

返回

- pdTRUE if succeeded
- pdFALSE when the ring buffer does not have space.

BaseType_t **xRingbufferSendAcquire**(*RingbufHandle_t* xRingbuffer, void **ppvItem, size_t xItemSize, TickType_t xTicksToWait)

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items `SendAcquire` or `Send` after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

备注： Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

参数

- **`xRingbuffer`** –**[in]** Ring buffer to allocate the memory
- **`ppvItem`** –**[out]** Double pointer to memory acquired (set to NULL if no memory were retrieved)
- **`xItemSize`** –**[in]** Size of item to acquire.
- **`xTicksToWait`** –**[in]** Ticks to wait for room in the ring buffer.

返回

- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType_t **`xRingbufferSendComplete`**(*RingbufHandle_t* xRingbuffer, void *pvItem)

Actually send an item into the ring buffer allocated before by `xRingbufferSendAcquire`.

备 注： Only applicable for no-split ring buffers. Only call for items allocated by `xRingbufferSendAcquire`.

参数

- **`xRingbuffer`** –**[in]** Ring buffer to insert the item into
- **`pvItem`** –**[in]** Pointer to item in allocated memory to insert.

返回

- pdTRUE if succeeded
- pdFALSE if fail for some reason.

void ***`xRingbufferReceive`**(*RingbufHandle_t* xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait)

Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

备注： A call to vRingbufferReturnItem() is required after this to free the item retrieved.

参数

- **`xRingbuffer`** –**[in]** Ring buffer to retrieve the item from
- **`pxItemSize`** –**[out]** Pointer to a variable to which the size of the retrieved item will be written.
- **`xTicksToWait`** –**[in]** Ticks to wait for items in the ring buffer.

返回

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

void ***`xRingbufferReceiveFromISR`**(*RingbufHandle_t* xRingbuffer, size_t *pxItemSize)

Retrieve an item from the ring buffer in an ISR.

Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval

备注： A call to vRingbufferReturnItemFromISR() is required after this to free the item retrieved.

备注： Byte buffers do not allow multiple retrievals before returning an item

备注： Two calls to RingbufferReceiveFromISR() are required if the bytes wrap around the end of the ring buffer.

参数

- **xRingbuffer** –**[in]** Ring buffer to retrieve the item from
- **pxItemSize** –**[out]** Pointer to a variable to which the size of the retrieved item will be written.

返回

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

BaseType_t **xRingbufferReceiveSplit**(*RingbufHandle_t* xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize, TickType_t xTicksToWait)

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retried. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

备注： Call(s) to vRingbufferReturnItem() is required after this to free up the item(s) retrieved.

备注： This function should only be called on allow-split buffers

参数

- **xRingbuffer** –**[in]** Ring buffer to retrieve the item from
- **ppvHeadItem** –**[out]** Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** –**[out]** Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** –**[out]** Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** –**[out]** Pointer to size of second part (unmodified if item is not split)
- **xTicksToWait** –**[in]** Ticks to wait for items in the ring buffer.

返回

- pdTRUE if an item (split or unsplit) was retrieved
- pdFALSE when no item was retrieved

BaseType_t **xRingbufferReceiveSplitFromISR**(*RingbufHandle_t* xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize)

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retried. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval

备注： Calls to vRingbufferReturnItemFromISR() is required after this to free up the item(s) retrieved.

备注： This function should only be called on allow-split buffers

参数

- **xRingbuffer** –**[in]** Ring buffer to retrieve the item from
- **ppvHeadItem** –**[out]** Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** –**[out]** Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** –**[out]** Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** –**[out]** Pointer to size of second part (unmodified if item is not split)

返回

- pdTRUE if an item (split or unsplit) was retrieved
- pdFALSE when no item was retrieved

void ***xRingbufferReceiveUpTo**(*RingbufHandle_t* xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

备注： A call to vRingbufferReturnItem() is required after this to free up the data retrieved.

备注： This function should only be called on byte buffers

备注： Byte buffers do not allow multiple retrievals before returning an item

备注： Two calls to RingbufferReceiveUpTo() are required if the bytes wrap around the end of the ring buffer.

参数

- **xRingbuffer** –**[in]** Ring buffer to retrieve the item from
- **pxItemSize** –**[out]** Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** –**[in]** Ticks to wait for items in the ring buffer.
- **xMaxSize** –**[in]** Maximum number of bytes to return.

返回

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

void ***xRingbufferReceiveUpToFromISR**(*RingbufHandle_t* xRingbuffer, size_t *pxItemSize, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

备注： A call to vRingbufferReturnItemFromISR() is required after this to free up the data received.

备注： This function should only be called on byte buffers

备注： Byte buffers do not allow multiple retrievals before returning an item

参数

- **xRingbuffer** –**[in]** Ring buffer to retrieve the item from
- **pxItemSize** –**[out]** Pointer to a variable to which the size of the retrieved item will be written.
- **xMaxSize** –**[in]** Maximum number of bytes to return.

返回

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

void **vRingbufferReturnItem**(*RingbufHandle_t* xRingbuffer, void *pvItem)

Return a previously-retrieved item to the ring buffer.

备注： If a split item is retrieved, both parts should be returned by calling this function twice

参数

- **xRingbuffer** –**[in]** Ring buffer the item was retrieved from
- **pvItem** –**[in]** Item that was received earlier

void **vRingbufferReturnItemFromISR**(*RingbufHandle_t* xRingbuffer, void *pvItem, BaseType_t *pxHigherPriorityTaskWoken)

Return a previously-retrieved item to the ring buffer from an ISR.

备注： If a split item is retrieved, both parts should be returned by calling this function twice

参数

- **xRingbuffer** –**[in]** Ring buffer the item was retrieved from
- **pvItem** –**[in]** Item that was received earlier
- **pxHigherPriorityTaskWoken** –**[out]** Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

void **vRingbufferDelete**(*RingbufHandle_t* xRingbuffer)

Delete a ring buffer.

备注： This function will not deallocate any memory if the ring buffer was created using xRingbufferCreateStatic(). Deallocation must be done manually be the user.

参数 **xRingbuffer** –**[in]** Ring buffer to delete

size_t **xRingbufferGetMaxItemSize**(*RingbufHandle_t* xRingbuffer)

Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

备注： The max item size for a no-split buffer is limited to ((buffer_size/2)-header_size). This limit is imposed so that an item of max item size can always be sent to an empty no-split buffer regardless of the internal positions of the buffer’s read/write/free pointers.

参数 **xRingbuffer** –**[in]** Ring buffer to query
返回 Maximum size, in bytes, of an item that can be placed in a ring buffer.

size_t **xRingbufferGetCurFreeSize**(*RingbufHandle_t* xRingbuffer)

Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

备注： An empty no-split buffer has a max current free size for an item that is limited to ((buffer_size/2)-header_size). See API reference for xRingbufferGetMaxItemSize().

警告： This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application’s responsibility to ensure atomic access to this API and the subsequent Send

参数 **xRingbuffer** –**[in]** Ring buffer to query
返回 Current free size, in bytes, available for an entry

BaseType_t **xRingbufferAddToQueueSetRead**(*RingbufHandle_t* xRingbuffer, *QueueSetHandle_t* xQueueSet)

Add the ring buffer’s read semaphore to a queue set.

The ring buffer’s read semaphore indicates that data has been written to the ring buffer. This function adds the ring buffer’s read semaphore to a queue set.

参数

- **xRingbuffer** –**[in]** Ring buffer to add to the queue set
- **xQueueSet** –**[in]** Queue set to add the ring buffer’s read semaphore to

返回

- pdTRUE on success, pdFALSE otherwise

BaseType_t **xRingbufferCanRead**(*RingbufHandle_t* xRingbuffer, *QueueSetMemberHandle_t* xMember)

Check if the selected queue set member is the ring buffer’s read semaphore.

This API checks if queue set member returned from xQueueSelectFromSet() is the read semaphore of this ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

参数

- **xRingbuffer** –**[in]** Ring buffer which should be checked
- **xMember** –**[in]** Member returned from xQueueSelectFromSet

返回

- pdTRUE when semaphore belongs to ring buffer
- pdFALSE otherwise.

BaseType_t **xRingbufferRemoveFromQueueSetRead**(*RingbufHandle_t* xRingbuffer, *QueueSetHandle_t* xQueueSet)

Remove the ring buffer’s read semaphore from a queue set.

This specifically removes a ring buffer’s read semaphore from a queue set. The read semaphore is used to indicate when data has been written to the ring buffer

参数

- **xRingbuffer** –**[in]** Ring buffer to remove from the queue set
- **xQueueSet** –**[in]** Queue set to remove the ring buffer's read semaphore from

返回

- pdTRUE on success
- pdFALSE otherwise

void **vRingbufferGetInfo**(*RingbufHandle_t* xRingbuffer, UBaseType_t *uxFree, UBaseType_t *uxRead, UBaseType_t *uxWrite, UBaseType_t *uxAcquire, UBaseType_t *uxItemsWaiting)

Get information about ring buffer status.

Get information of a ring buffer's current status such as free/read/write/acquire pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

参数

- **xRingbuffer** –**[in]** Ring buffer to remove from the queue set
- **uxFree** –**[out]** Pointer use to store free pointer position
- **uxRead** –**[out]** Pointer use to store read pointer position
- **uxWrite** –**[out]** Pointer use to store write pointer position
- **uxAcquire** –**[out]** Pointer use to store acquire pointer position
- **uxItemsWaiting** –**[out]** Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

void **xRingbufferPrintInfo**(*RingbufHandle_t* xRingbuffer)

Debugging function to print the internal pointers in the ring buffer.

参数 **xRingbuffer** –Ring buffer to show

Structures

struct **xSTATIC_RINGBUFFER**

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

Type Definitions

typedef void ***RingbufHandle_t**

Type by which ring buffers are referenced. For example, a call to xRingbufferCreate() returns a RingbufHandle_t variable that can then be used as a parameter to xRingbufferSend(), xRingbufferReceive(), etc.

typedef struct *xSTATIC_RINGBUFFER* **StaticRingbuffer_t**

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

Enumerations

enum **RingbufferType_t**

Values:

enumerator **RINGBUF_TYPE_NOSPLIT**

No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

enumerator **RINGBUF_TYPE_ALLOWSPLIT**

Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

enumerator **RINGBUF_TYPE_BYTEBUF**

Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

enumerator **RINGBUF_TYPE_MAX**

Hooks API

Header File

- components/esp_system/include/esp_freertos_hooks.h

Functions

esp_err_t **esp_register_freertos_idle_hook_for_cpu**(*esp_freertos_idle_cb_t* new_idle_cb, UBaseType_t cpuid)

Register a callback to be called from the specified core's idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

警告: Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

参数

- **new_idle_cb** –**[in]** Callback to be called
- **cpuid** –**[in]** id of the core

返回

- ESP_OK: Callback registered to the specified core's idle hook
- ESP_ERR_NO_MEM: No more space on the specified core's idle hook to register callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

esp_err_t **esp_register_freertos_idle_hook**(*esp_freertos_idle_cb_t* new_idle_cb)

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

警告: Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

参数 **new_idle_cb** –**[in]** Callback to be called

返回

- ESP_OK: Callback registered to the calling core's idle hook
- ESP_ERR_NO_MEM: No more space on the calling core's idle hook to register callback

esp_err_t **esp_register_freertos_tick_hook_for_cpu**(*esp_freertos_tick_cb_t* new_tick_cb, UBaseType_t cpuid)

Register a callback to be called from the specified core’s tick hook.

参数

- **new_tick_cb** –**[in]** Callback to be called
- **cpuid** –**[in]** id of the core

返回

- ESP_OK: Callback registered to specified core’s tick hook
- ESP_ERR_NO_MEM: No more space on the specified core’s tick hook to register the callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

esp_err_t **esp_register_freertos_tick_hook**(*esp_freertos_tick_cb_t* new_tick_cb)

Register a callback to be called from the calling core’s tick hook.

参数 **new_tick_cb** –**[in]** Callback to be called

返回

- ESP_OK: Callback registered to the calling core’s tick hook
- ESP_ERR_NO_MEM: No more space on the calling core’s tick hook to register the callback

void **esp_deregister_freertos_idle_hook_for_cpu**(*esp_freertos_idle_cb_t* old_idle_cb, UBaseType_t cpuid)

Unregister an idle callback from the idle hook of the specified core.

参数

- **old_idle_cb** –**[in]** Callback to be unregistered
- **cpuid** –**[in]** id of the core

void **esp_deregister_freertos_idle_hook**(*esp_freertos_idle_cb_t* old_idle_cb)

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

参数 **old_idle_cb** –**[in]** Callback to be unregistered

void **esp_deregister_freertos_tick_hook_for_cpu**(*esp_freertos_tick_cb_t* old_tick_cb, UBaseType_t cpuid)

Unregister a tick callback from the tick hook of the specified core.

参数

- **old_tick_cb** –**[in]** Callback to be unregistered
- **cpuid** –**[in]** id of the core

void **esp_deregister_freertos_tick_hook**(*esp_freertos_tick_cb_t* old_tick_cb)

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

参数 **old_tick_cb** –**[in]** Callback to be unregistered

Type Definitions

typedef bool (***esp_freertos_idle_cb_t**)(void)

typedef void (***esp_freertos_tick_cb_t**)(void)

2.10.11 Heap Memory Allocation

Stack and Heap

ESP-IDF applications use the common computer architecture patterns of *stack* (dynamic memory allocated by program control flow) and *heap* (dynamic memory allocated by function calls), as well as statically allocated memory (allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. (See `xTaskCreateStatic()` for the alternative where stacks are statically allocated.)

Because ESP32-C3 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the standard libc `malloc()` and `free()` functions can be used for heap allocation without any special consideration.

However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have memory with certain properties (for example, *DMA-Capable Memory* or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.

Memory Capabilities

The ESP32-C3 contains multiple types of RAM:

- DRAM (Data RAM) is memory used to hold data. This is the most common kind of memory accessed as heap.
- IRAM (Instruction RAM) usually holds executable data only. If accessed as generic memory, all accesses must be *32-bit aligned*.
- D/IRAM is RAM which can be used as either Instruction or Data RAM.

For more details on these internal memory types, see 存储器类型.

DRAM uses capability `MALLOC_CAP_8BIT` (accessible in single byte reads and writes). When calling `malloc()`, the ESP-IDF `malloc()` implementation internally calls `heap_caps_malloc(size, MALLOC_CAP_8BIT)` in order to allocate DRAM that is byte-addressable. To test the free DRAM heap size at runtime, call cpp:func:*heap_caps_get_free_size(MALLOC_CAP_8BIT)*.

Because malloc uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.

Available Heap

DRAM At startup, the DRAM heap contains all data memory which is not statically allocated by the app. Reducing statically allocated buffers will increase the amount of available free heap.

To find the amount of statically allocated memory, use the *idf.py size* command.

备注： At runtime, the available heap DRAM may be less than calculated at compile time, because at startup some memory is allocated from the heap before the FreeRTOS scheduler is started (including memory for the stacks of initial FreeRTOS tasks).

IRAM At startup, the IRAM heap contains all instruction memory which is not used by the app executable code.

The *idf.py size* command can be used to find the amount of IRAM used by the app.

D/IRAM Some memory in the ESP32-C3 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.

Heap Sizes At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

```
I (252) heap_init: Initializing. RAM available for dynamic allocation:
I (259) heap_init: At 3FFAE6E0 len 00001920 (6 KiB): DRAM
I (265) heap_init: At 3FFB2EC8 len 0002D138 (180 KiB): DRAM
I (272) heap_init: At 3FFE0440 len 00003AE0 (14 KiB): D/IRAM
I (278) heap_init: At 3FFE4350 len 0001BCB0 (111 KiB): D/IRAM
I (284) heap_init: At 4008944C len 00016BB4 (90 KiB): IRAM
```

Finding available heap See *Heap Information*.

Special Capabilities

DMA-Capable Memory Use the `MALLOC_CAP_DMA` flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

32-Bit Accessible Memory If a certain memory structure is only addressed in 32-bit units, for example an array of ints or pointers, it can be useful to allocate it with the `MALLOC_CAP_32BIT` flag. This also allows the allocator to give out IRAM memory; something which it can't do for a normal malloc() call. This can help to use all the available memory in the ESP32-C3.

Memory allocated with `MALLOC_CAP_32BIT` can *only* be accessed via 32-bit reads and writes, any other type of access will generate a fatal LoadStoreError exception.

API Reference - Heap Allocation

Header File

- components/heap/include/esp_heap_caps.h

Functions

esp_err_t **heap_caps_register_failed_alloc_callback**(*esp_alloc_failed_hook_t* callback)

registers a callback function to be invoked if a memory allocation operation fails

参数 **callback** –caller defined callback to be invoked
返回 ESP_OK if callback was registered.

void ***heap_caps_malloc**(size_t size, uint32_t caps)

Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to libc malloc(), for capability-aware memory.

In IDF, `malloc(p)` is equivalent to `heap_caps_malloc(p, MALLOC_CAP_8BIT)`.

参数

- **size** –Size, in bytes, of the amount of memory to allocate
- **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

返回 A pointer to the memory allocated on success, NULL on failure

void **heap_caps_free**(void *ptr)

Free memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc free(), for capability-aware memory.

In IDF, `free(p)` is equivalent to `heap_caps_free(p)`.

参数 **ptr** –Pointer to memory previously returned from heap_caps_malloc() or heap_caps_realloc(). Can be NULL.

void ***heap_caps_realloc**(void *ptr, size_t size, uint32_t caps)

Reallocate memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc realloc(), for capability-aware memory.

In IDF, `realloc(p, s)` is equivalent to `heap_caps_realloc(p, s, MALLOC_CAP_8BIT)`.

'caps' parameter can be different to the capabilities that any original 'ptr' was allocated with. In this way, realloc can be used to "move" a buffer if necessary to ensure it meets a new set of capabilities.

参数

- **ptr** –Pointer to previously allocated memory, or NULL for a new allocation.
- **size** –Size of the new buffer requested, or 0 to free the buffer.
- **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory desired for the new allocation.

返回 Pointer to a new buffer of size 'size' with capabilities 'caps', or NULL if allocation failed.

void ***heap_caps_aligned_alloc**(size_t alignment, size_t size, uint32_t caps)

Allocate an aligned chunk of memory which has the given capabilities.

Equivalent semantics to libc aligned_alloc(), for capability-aware memory.

参数

- **alignment** –How the pointer received needs to be aligned must be a power of two
- **size** –Size, in bytes, of the amount of memory to allocate
- **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

返回 A pointer to the memory allocated on success, NULL on failure

void **heap_caps_aligned_free**(void *ptr)

Used to deallocate memory previously allocated with heap_caps_aligned_alloc.

备注: This function is deprecated, please consider using heap_caps_free() instead

---

参数 **ptr** –Pointer to the memory allocated

void ***heap_caps_aligned_calloc**(size_t alignment, size_t n, size_t size, uint32_t caps)

Allocate an aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

参数

- **alignment** –How the pointer received needs to be aligned must be a power of two
- **n** –Number of continuing chunks of memory to allocate
- **size** –Size, in bytes, of a chunk of memory to allocate
- **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

返回 A pointer to the memory allocated on success, NULL on failure

void ***heap_caps_calloc**(size_t n, size_t size, uint32_t caps)

Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to libc calloc(), for capability-aware memory.

In IDF, `calloc(p)` is equivalent to `heap_caps_calloc(p, MALLOC_CAP_8BIT)`.

参数

- **n** –Number of continuing chunks of memory to allocate
- **size** –Size, in bytes, of a chunk of memory to allocate
- **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

返回 A pointer to the memory allocated on success, NULL on failure

size_t **heap_caps_get_total_size**(uint32_t caps)

Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

参数 **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
返回 total size in bytes

size_t **heap_caps_get_free_size**(uint32_t caps)

Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

备注: Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use heap_caps_get_largest_free_block() for this purpose.

参数 **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
返回 Amount of free bytes in the regions

size_t **heap_caps_get_minimum_free_size**(uint32_t caps)

Get the total minimum free memory of all regions with the given capabilities.

This adds all the low watermarks of the regions capable of delivering the memory with the given capabilities.

备注: Note the result may be less than the global all-time minimum available heap of this kind, as "low watermarks" are tracked per-region. Individual regions' heaps may have reached their "low watermarks" at different points in time. However, this result still gives a "worst case" indication for all-time minimum free heap.

参数 **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
返回 Amount of free bytes in the regions

size_t **heap_caps_get_largest_free_block**(uint32_t caps)

Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of `s` for which `heap_caps_malloc(s, caps)` will succeed.

参数 **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
返回 Size of the largest free block in bytes.

void **heap_caps_get_info**(*multi_heap_info_t* *info, uint32_t caps)

Get heap info for all regions with the given capabilities.

Calls multi_heap_info() on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for *multi_heap_info_t*, except that `minimum_free_bytes` has the same caveats described in heap_caps_get_minimum_free_size().

参数

- **info** –Pointer to a structure which will be filled with relevant heap metadata.
- **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void **heap_caps_print_heap_info**(uint32_t caps)

Print a summary of all memory with the given capabilities.

Calls multi_heap_info on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

参数 **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

bool **heap_caps_check_integrity_all**(bool print_errors)

Check integrity of all heap memory in the system.

Calls multi_heap_check on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling heap_caps_check_integrity with the caps argument set to MALLOC_CAP_INVALID.

参数 **print_errors** –Print specific errors if heap corruption is found.
返回 True if all heaps are valid, False if at least one heap is corrupt.

bool **heap_caps_check_integrity**(uint32_t caps, bool print_errors)

Check integrity of all heaps with the given capabilities.

Calls multi_heap_check on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also heap_caps_check_integrity_all to check all heap memory in the system and heap_caps_check_integrity_addr to check memory around a single address.

参数

- **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
- **print_errors** –Print specific errors if heap corruption is found.

返回 True if all heaps are valid, False if at least one heap is corrupt.

bool **heap_caps_check_integrity_addr**(intptr_t addr, bool print_errors)

Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won't work, and you should call heap_caps_check_integrity or heap_caps_check_integrity_all instead.

备注: The entire heap region around the address is checked, not only the adjacent heap blocks.

参数

- **addr** –Address in memory. Check for corruption in region containing this address.
- **print_errors** –Print specific errors if heap corruption is found.

返回 True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn't belong to a heap region.

void **heap_caps_malloc_extmem_enable**(size_t limit)

Enable malloc() in external memory and set limit below which malloc() attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

参数 **limit** –Limit, in bytes.

void ***heap_caps_malloc_prefer**(size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

Attention The variable parameters are bitwise OR of MALLOC_CAP_* flags indicating the type of memory. This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

参数

- **size** –Size, in bytes, of the amount of memory to allocate
- **num** –Number of variable parameters

返回 A pointer to the memory allocated on success, NULL on failure

void ***heap_caps_realloc_prefer**(void *ptr, size_t size, size_t num, ...)

Reallocate a chunk of memory as preference in decreasing order.

参数

- **ptr** –Pointer to previously allocated memory, or NULL for a new allocation.
- **size** –Size of the new buffer requested, or 0 to free the buffer.
- **num** –Number of variable paramters

返回 Pointer to a new buffer of size ‘size’, or NULL if allocation failed.

void ***heap_caps_calloc_prefer**(size_t n, size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

参数

- **n** –Number of continuing chunks of memory to allocate
- **size** –Size, in bytes, of a chunk of memory to allocate
- **num** –Number of variable paramters

返回 A pointer to the memory allocated on success, NULL on failure

void **heap_caps_dump**(uint32_t caps)

Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr). For each (variable sized) block in each matching heap, the following output is printed on a single line:

- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).
- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

参数 **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void **heap_caps_dump_all**(void)

Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for heap_caps_dump.

size_t **heap_caps_get_allocated_size**(void *ptr)

Return the size that a particular pointer was allocated with.

备注: The app will crash with an assertion failure if the pointer is not valid.

参数 **ptr** –Pointer to currently allocated heap memory. Must be a pointer value previously returned by heap_caps_malloc, malloc, calloc, etc. and not yet freed.

返回 Size of the memory allocated at this block.

Macros

MALLOC_CAP_EXEC

Flags to indicate the capabilities of the various memory systems.

Memory must be able to run executable code

MALLOC_CAP_32BIT

Memory must allow for aligned 32-bit data accesses.

MALLOC_CAP_8BIT

Memory must allow for 8/16/…-bit data accesses.

MALLOC_CAP_DMA

Memory must be able to accessed by DMA.

MALLOC_CAP_PID2

Memory must be mapped to PID2 memory space (PIDs are not currently used)

MALLOC_CAP_PID3

Memory must be mapped to PID3 memory space (PIDs are not currently used)

MALLOC_CAP_PID4

Memory must be mapped to PID4 memory space (PIDs are not currently used)

MALLOC_CAP_PID5

Memory must be mapped to PID5 memory space (PIDs are not currently used)

MALLOC_CAP_PID6

Memory must be mapped to PID6 memory space (PIDs are not currently used)

MALLOC_CAP_PID7

Memory must be mapped to PID7 memory space (PIDs are not currently used)

MALLOC_CAP_SPIRAM

Memory must be in SPI RAM.

MALLOC_CAP_INTERNAL

Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

MALLOC_CAP_DEFAULT

Memory can be returned in a non-capability-specific memory allocation (e.g. malloc(), calloc()) call.

MALLOC_CAP_IRAM_8BIT

Memory must be in IRAM and allow unaligned access.

MALLOC_CAP_RETENTION

MALLOC_CAP_RTCRAM

Memory must be in RTC fast memory.

MALLOC_CAP_INVALID

Memory can't be used / list end marker.

Type Definitions

typedef void (***esp_alloc_failed_hook_t**)(size_t size, uint32_t caps, const char *function_name)

callback called when an allocation operation fails, if registered

Param size in bytes of failed allocation
Param caps capabilities requested of failed allocation
Param function_name function which generated the failure

Thread Safety Heap functions are thread safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call `malloc`, `free`, and related functions from interrupt handler (ISR) context. However this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

Heap Tracing & Debugging

The following features are documented on the *Heap Memory Debugging* page:

- *Heap Information* (free space, etc.)
- *Heap Corruption Detection*
- *Heap Tracing* (memory leak detection, monitoring, etc.)

API Reference - Initialisation

Header File

- components/heap/include/esp_heap_caps_init.h

Functions

void **heap_caps_init**(void)

Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

void **heap_caps_enable_nonos_stack_heaps**(void)

Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

esp_err_t **heap_caps_add_region**(intptr_t start, intptr_t end)

Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in soc_memory_layout.c for the SoC, and are registered via heap_caps_init(). Some regions can't be used immediately and are later enabled via heap_caps_enable_nonos_stack_heaps().

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the "reserved" regions or other data in soc_memory_layout, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in soc_memory_layout.c.

Use heap_caps_add_region_with_caps() to register a region with custom capabilities.

备注： Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

```
Existing region: 0x1000 <-> 0x3000
New region:      0x1000 <-> 0x3000 (Allowed)
New region:      0x1000 <-> 0x2000 (Allowed)
New region:      0x0000 <-> 0x1000 (Allowed)
New region:      0x3000 <-> 0x4000 (Allowed)
New region:      0x0000 <-> 0x2000 (NOT Allowed)
New region:      0x0000 <-> 0x4000 (NOT Allowed)
New region:      0x1000 <-> 0x4000 (NOT Allowed)
New region:      0x2000 <-> 0x4000 (NOT Allowed)
```

参数

- **start** –Start address of new region.
- **end** –End address of new region.

返回 ESP_OK on success, ESP_ERR_INVALID_ARG if a parameter is invalid, ESP_ERR_NOT_FOUND if the specified start address doesn't reside in a known region, or any error returned by heap_caps_add_region_with_caps().

esp_err_t **heap_caps_add_region_with_caps**(const uint32_t caps[], intptr_t start, intptr_t end)

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to heap_caps_add_region(), only custom memory capabilities are specified by the caller.

备注： Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

```
Existing region: 0x1000 <-> 0x3000
New region:      0x1000 <-> 0x3000 (Allowed)
New region:      0x1000 <-> 0x2000 (Allowed)
New region:      0x0000 <-> 0x1000 (Allowed)
New region:      0x3000 <-> 0x4000 (Allowed)
New region:      0x0000 <-> 0x2000 (NOT Allowed)
New region:      0x0000 <-> 0x4000 (NOT Allowed)
New region:      0x1000 <-> 0x4000 (NOT Allowed)
New region:      0x2000 <-> 0x4000 (NOT Allowed)
```

参数

- **caps** –Ordered array of capability masks for the new region, in order of priority. Must have length SOC_MEMORY_TYPE_NO_PRIOS. Does not need to remain valid after the call returns.
- **start** –Start address of new region.
- **end** –End address of new region.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if a parameter is invalid
- ESP_ERR_NO_MEM if no memory to register new heap.
- ESP_ERR_INVALID_SIZE if the memory region is too small to fit a heap
- ESP_FAIL if region overlaps the start and/or end of an existing region

Implementation Notes

Knowledge about the regions of memory in the chip comes from the "soc" component, which contains memory layout information for the chip, and the different capabilities of each region. Each region's capabilities are prioritised,

so that (for example) dedicated DRAM and IRAM regions will be used for allocations ahead of the more versatile D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the *multi_heap* functionality. multi_heap allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation (based on desired capabilities, available space, and preferences for each region's use) and then calling `multi_heap_malloc()` for the heap situated in that particular region.

Calling `free()` involves finding the particular heap corresponding to the freed address, and then calling `multi_heap_free()` on that particular multi_heap instance.

API Reference - Multi Heap API

(Note: The multi heap API is used internally by the heap capabilities allocator. Most IDF programs will never need to call this API directly.)

Header File

- components/heap/include/multi_heap.h

Functions

void ***multi_heap_aligned_alloc**(*multi_heap_handle_t* heap, size_t size, size_t alignment)

allocate a chunk of memory with specific alignment

参数

- **heap** –Handle to a registered heap.
- **size** –size in bytes of memory chunk
- **alignment** –how the memory must be aligned

返回 pointer to the memory allocated, NULL on failure

void ***multi_heap_malloc**(*multi_heap_handle_t* heap, size_t size)

malloc() a buffer in a given heap

Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

参数

- **heap** –Handle to a registered heap.
- **size** –Size of desired buffer.

返回 Pointer to new memory, or NULL if allocation fails.

void **multi_heap_aligned_free**(*multi_heap_handle_t* heap, void *p)

free() a buffer aligned in a given heap.

备注: This function is deprecated, consider using multi_heap_free() instead

---

参数

- **heap** –Handle to a registered heap.
- **p** –NULL, or a pointer previously returned from multi_heap_aligned_alloc() for the same heap.

void **multi_heap_free**(*multi_heap_handle_t* heap, void *p)

free() a buffer in a given heap.

Semantics are the same as standard free(), only the argument 'p' must be NULL or have been allocated in the specified heap.

参数

- **heap** –Handle to a registered heap.
- **p** –NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

void ***multi_heap_realloc**(*multi_heap_handle_t* heap, void *p, size_t size)

realloc() a buffer in a given heap.

Semantics are the same as standard realloc(), only the argument ‘p’ must be NULL or have been allocated in the specified heap.

参数

- **heap** –Handle to a registered heap.
- **p** –NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.
- **size** –Desired new size for buffer.

返回 New buffer of ‘size’ containing contents of ‘p’, or NULL if reallocation failed.

size_t **multi_heap_get_allocated_size**(*multi_heap_handle_t* heap, void *p)

Return the size that a particular pointer was allocated with.

参数

- **heap** –Handle to a registered heap.
- **p** –Pointer, must have been previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

返回 Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

multi_heap_handle_t **multi_heap_register**(void *start, size_t size)

Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

参数

- **start** –Start address of the memory to use for a new heap.
- **size** –Size (in bytes) of the new heap.

返回 Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

void **multi_heap_set_lock**(*multi_heap_handle_t* heap, void *lock)

Associate a private lock pointer with a heap.

The lock argument is supplied to the MULTI_HEAP_LOCK() and MULTI_HEAP_UNLOCK() macros, defined in multi_heap_platform.h.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

参数

- **heap** –Handle to a registered heap.
- **lock** –Optional pointer to a locking structure to associate with this heap.

void **multi_heap_dump**(*multi_heap_handle_t* heap)

Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

参数 **heap** –Handle to a registered heap.

bool **multi_heap_check**(*multi_heap_handle_t* heap, bool print_errors)

Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining MULTI_CHECK_FAIL_PRINTF in multi_heap_platform.h.

参数

- **heap** –Handle to a registered heap.
- **print_errors** –If true, errors will be printed to stderr.

返回 true if heap is valid, false otherwise.

size_t **multi_heap_free_size**(*multi_heap_handle_t* heap)

Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the total_free_bytes member returned by multi_heap_get_heap_info().

Note that the heap may be fragmented, so the actual maximum size for a single malloc() may be lower. To know this size, see the largest_free_block member returned by multi_heap_get_heap_info().

参数 **heap** –Handle to a registered heap.
返回 Number of free bytes.

size_t **multi_heap_minimum_free_size**(*multi_heap_handle_t* heap)

Return the lifetime minimum free heap size.

Equivalent to the minimum_free_bytes member returned by multi_heap_get_info().

Returns the lifetime "low watermark"of possible values returned from multi_free_heap_size(), for the specified heap.

参数 **heap** –Handle to a registered heap.
返回 Number of free bytes.

void **multi_heap_get_info**(*multi_heap_handle_t* heap, *multi_heap_info_t* *info)

Return metadata about a given heap.

Fills a *multi_heap_info_t* structure with information about the specified heap.

参数

- **heap** –Handle to a registered heap.
- **info** –Pointer to a structure to fill with heap metadata.

Structures

struct **multi_heap_info_t**

Structure to access heap metadata via multi_heap_get_info.

Public Members

size_t **total_free_bytes**

Total free bytes in the heap. Equivalent to multi_free_heap_size().

size_t **total_allocated_bytes**

Total bytes allocated to data in the heap.

size_t **largest_free_block**

Size of the largest free block in the heap. This is the largest malloc-able size.

size_t **minimum_free_bytes**

Lifetime minimum free heap size. Equivalent to multi_minimum_free_heap_size().

size_t **allocated_blocks**

Number of (variable size) blocks allocated in the heap.

size_t **free_blocks**

Number of (variable size) free blocks in the heap.

size_t **total_blocks**

Total number of (variable size) blocks in the heap.

Type Definitions

typedef struct multi_heap_info ***multi_heap_handle_t**

Opaque handle to a registered heap.

2.10.12 Heap Memory Debugging

Overview

ESP-IDF integrates tools for requesting *heap information*, *detecting heap corruption*, and *tracing memory leaks*. These can help track down memory-related bugs.

For general information about the heap memory allocator, see the *Heap Memory Allocation* page.

Heap Information

To obtain information about the state of the heap:

- `xPortGetFreeHeapSize()` is a FreeRTOS function which returns the number of free bytes in the (data memory) heap. This is equivalent to calling `heap_caps_get_free_size(MALLOC_CAP_8BIT)`.
- *`heap_caps_get_free_size()`* can also be used to return the current free memory for different memory capabilities.
- *`heap_caps_get_largest_free_block()`* can be used to return the largest free block in the heap. This is the largest single allocation which is currently possible. Tracking this value and comparing to total free heap allows you to detect heap fragmentation.
- `xPortGetMinimumEverFreeHeapSize()` and the related *`heap_caps_get_minimum_free_size()`* can be used to track the heap "low watermark" since boot.
- *`heap_caps_get_info()`* returns a *`multi_heap_info_t`* structure which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- *`heap_caps_print_heap_info()`* prints a summary to stdout of the information returned by *`heap_caps_get_info()`*.
- *`heap_caps_dump()`* and *`heap_caps_dump_all()`* will output detailed information about the structure of each block in the heap. Note that this can be large amount of output.

Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

- Out of bounds writes & buffer overflow.
- Writes to freed memory.
- Reads from freed or uninitialized memory,

Assertions The heap implementation (`multi_heap.c`, etc.) includes a lot of assertions which will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration menu under `Compiler options` -> *CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL*.

If a heap integrity assertion fails, a line will be printed like `CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c`. The memory address which is printed is the address of the heap structure which has corrupt content.

It's also possible to manually check heap integrity by calling *`heap_caps_check_integrity_all()`* or related functions. This function checks all of requested heap memory for integrity, and can be used even if assertions are disabled. If the integrity check prints an error, it will also contain the address(es) of corrupt heap structures.

Memory Allocation Failed Hook Users can use *`heap_caps_register_failed_alloc_callback()`* to register a callback that will be invoked every time an allocation operation fails.

Additionally, users can enable the generation of a system abort if an allocation operation fails by following the steps below: - In the project configuration menu, navigate to `Component config` -> `Heap Memory Debugging` and select `Abort if memory allocation fails` option (see *CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS*).

The example below shows how to register an allocation failure callback:

```
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char␣
↪*function_name)
{
  printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n
↪",function_name, requested_size, caps);
}

void app_main()
{
    ...
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_
↪failed_hook);
    ...
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
    ...
}
```

Finding Heap Corruption Memory corruption can be one of the hardest classes of bugs to find and fix, as one area of memory can be corrupted from a totally different place. Some tips:

- A crash with a `CORRUPT HEAP:` message will usually include a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realises the heap is corrupt, but usually the corruption happened elsewhere and earlier in time.
- Increasing the Heap memory debugging *Configuration* level to "Light impact" or "Comprehensive" can give you a more accurate message with the first corrupt memory address.
- Adding regular calls to *`heap_caps_check_integrity_all()`* or *`heap_caps_check_integrity_addr()`* in your code will help you pin down the exact time that the corruption happened. You can move these checks around to "close in on" the section of code that corrupted the heap.
- Based on the memory address which is being corrupted, you can use *JTAG debugging* to set a watchpoint on this address and have the CPU halt when it is written to.
- If you don't have JTAG, but you do know roughly when the corruption happens, then you can set a watchpoint in software just beforehand via *`esp_cpu_set_watchpoint()`*. A fatal exception will occur when the watchpoint triggers. The following is an example of how to use the function - `esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE)`. Note that watchpoints are per-CPU and are set on the current running CPU only, so if you don't know which CPU is corrupting memory then you will need to call this function on both CPUs.

- For buffer overflows, *heap tracing* in `HEAP_TRACE_ALL` mode lets you see which callers are allocating which addresses from the heap. See *Heap Tracing To Find Heap Corruption* for more details. If you can find the function which allocates memory with an address immediately before the address which is corrupted, this will probably be the function which overflows the buffer.
- Calling *`heap_caps_dump()`* or *`heap_caps_dump_all()`* can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed/underflowed/etc.

Configuration Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.

In the project configuration menu, under `Component config` there is a menu `Heap memory debugging`. The setting *CONFIG_HEAP_CORRUPTION_DETECTION* can be set to one of three levels:

Basic (no poisoning) This is the default level. No special heap corruption features are enabled, but provided assertions are enabled (the default configuration) then a heap corruption error will be printed if any of the heap's internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out of bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice).

Calling *`heap_caps_check_integrity()`* in Basic mode will check the integrity of all heap structures, and print errors if any appear to be corrupted.

Light Impact At this level, heap memory is additionally "poisoned" with head and tail "canary bytes" before and after each block which is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted and the integrity check will fail.

The head canary word is 0xABBA1234 (3412BAAB in byte order), and the tail canary word is 0xBAAD5678 (7856ADBA in byte order).

"Basic" heap corruption checks can also detect most out of bounds writes, but this setting is more precise as even a single byte overrun can be detected. With Basic heap checks, the number of overrun bytes before a failure is detected will depend on the properties of the heap.

Enabling "Light Impact" checking increases memory usage, each individual allocation will use 9 to 12 additional bytes of memory (depending on alignment).

Each time `free()` is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When *`heap_caps_check_integrity()`* is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

In both cases, the check is that the first 4 bytes of an allocated block (before the buffer returned to the user) should be the word 0xABBA1234. Then the last 4 bytes of the allocated block (after the buffer returned to the user) should be the word 0xBAAD5678.

Different values usually indicate buffer underrun or overrun, respectively.

Comprehensive This level incorporates the "light impact" detection features plus additional checks for uninitialised-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling "Comprehensive" detection has a substantial runtime performance impact (as all memory needs to be set to the allocation patterns each time a malloc/free completes, and the memory also needs to be checked each time.) However, it allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.

Crashes in Comprehensive Mode If an application crashes reading/writing an address related to 0xCECECECE in Comprehensive mode, this indicates it has read uninitialized memory. The application should be changed to either use calloc() (which zeroes memory), or initialize the memory before using it. The value 0xCECECECE may also be seen in stack-allocated automatic variables, because in IDF most task stacks are originally allocated from the heap and in C stack memory is uninitialized by default.

If an application crashes and the exception register dump indicates that some addresses or values were 0xFEFEFEFE, this indicates it is reading heap memory after it has been freed (a "use after free bug".) The application should be changed to not access heap memory after it has been freed.

If a call to malloc() or realloc() causes a crash because it expected to find the pattern 0xFEFEFEFE in free memory and a different pattern was found, then this indicates the app has a use-after-free bug where it is writing to memory which has already been freed.

Manual Heap Checks in Comprehensive Mode Calls to *heap_caps_check_integrity()* may print errors relating to 0xFEFEFEFE, 0xABBA1234 or 0xBAAD5678. In each case the checker is expecting to find a given pattern, and will error out if this is not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behaviour is the same as for *Light Impact* mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun/underrun.

Heap Task Tracking

Heap Task Tracking can be used to get per task info for heap memory allocation. Application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in system/heap_task_tracking

Heap Tracing

Heap Tracing allows tracing of code which allocates/frees memory. Two tracing modes are supported:

- Standalone. In this mode trace data are kept on-board, so the size of gathered information is limited by the buffer assigned for that purposes. Analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- Host-based. This mode does not have the limitation of the standalone mode, because trace data are sent to the host over JTAG connection using app_trace library. Later on they can be analysed using special tools.

Heap tracing can perform two functions:

- Leak checking: find memory which is allocated and never freed.
- Heap use analysis: show all functions that are allocating/freeing memory while the trace is running.

How To Diagnose Memory Leaks If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the `xPortGetFreeHeapSize()`, *heap_caps_get_free_size()*, or *related functions* to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.

Standalone Mode Once you've identified the code which you think is leaking:

- In the project configuration menu, navigate to `Component settings` -> `Heap Memory Debugging` -> `Heap tracing` and select `Standalone` option (see *CONFIG_HEAP_TRACING_DEST*).
- Call the function *heap_trace_init_standalone()* early in the program, to register a buffer which can be used to record the memory trace.

- Call the function *heap_trace_start()* to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- Call the function *heap_trace_stop()* to stop the trace once the suspect piece of code has finished executing.
- Call the function *heap_trace_dump()* to dump the results of the heap trace.

An example:

```
#include "esp_heap_trace.h"

#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in␣
↪internal RAM

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );

    do_something_you_suspect_is_leaking();

    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}
```

The output from the heap trace will look something like this:

```
2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccount 0x2e9b7384 caller
8 bytes (@ 0x3ffaf804) allocated CPU 0 ccount 0x2e9b79c0 caller
40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0
```

(Above example output is using *IDF Monitor* to automatically decode PC addresses to their source files & line number.)

The first line indicates how many allocation entries are in the buffer, compared to its total size.

In `HEAP_TRACE_LEAKS` mode, for each traced memory allocation which has not already been freed a line is printed with:

- `XX bytes` is the number of bytes allocated
- `@ 0x...` is the heap address returned from malloc/calloc.
- `CPU x` is the CPU (0 or 1) running when the allocation was made.
- `ccount 0x...` is the CCOUNT (CPU cycle count) register value when the allocation was mode. Is different for CPU 0 vs CPU 1.

Finally, the total number of ‘leaked’ bytes (bytes allocated but not freed while trace was running) is printed, and the total number of allocations this represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations which happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

Host-Based Mode Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to `Component settings` -> `Heap Memory Debugging` -> *CONFIG_HEAP_TRACING_DEST* and select `Host-Based`.
- In the project configuration menu, navigate to `Component settings` -> `Application Level Tracing` -> *CONFIG_APPTRACE_DESTINATION1* and select `Trace memory`.
- In the project configuration menu, navigate to `Component settings` -> `Application Level Tracing` -> `FreeRTOS SystemView Tracing` and enable *CONFIG_APPTRACE_SV_ENABLE*.
- Call the function *heap_trace_init_tohost()* early in the program, to initialize JTAG heap tracing module.
- Call the function *heap_trace_start()* to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode, the argument to this function is ignored, and the heap tracing module behaves like `HEAP_TRACE_ALL` was passed: all allocations and deallocations are sent to the host.
- Call the function *heap_trace_stop()* to stop the trace once the suspect piece of code has finished executing.

An example:

```
#include "esp_heap_trace.h"

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );

    do_something_you_suspect_is_leaking();

    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```

To gather and analyse heap trace do the following on the host:

1. Build the program and download it to the target as described in *Getting Started Guide*.
2. Run OpenOCD (see *JTAG Debugging*).

备注： In order to use this feature you need OpenOCD version *v0.10.0-esp32-20181105* or later.

3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare special `gdbinit` file:

```
target remote :3333

mon reset halt
flushregs

tb heap_trace_start
commands
mon esp sysview start file:///tmp/heap.svdat
c
end

tb heap_trace_stop
```

(下页继续)

(续上页)

```
commands
mon esp sysview stop
end

c
```

Using this file GDB will connect to the target, reset it, and start tracing when program hits breakpoint at *heap_trace_start()*. Trace data will be saved to `/tmp/heap_log.svdat`. Tracing will be stopped when program hits breakpoint at *heap_trace_stop()*.

4. Run GDB using the following command `riscv32-esp-elf-gdb -x gdbinit </path/to/program/elf>`
5. Quit GDB when program stops at *heap_trace_stop()*. Trace data are saved in `/tmp/heap.svdat`
6. Run processing script `$IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b </path/to/program/elf> /tmp/heap_log.svdat`

The output from the heap trace will look something like this:

```
Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '['/tmp/heap.svdat']'...

Found 10 leaked bytes in 4 blocks.
```

Heap Tracing To Find Heap Corruption Heap tracing can also be used to help track down heap corruption. When a region in heap is corrupted, it may be from some other part of the program which allocated memory at a nearby address.

If you have some idea at what time the corruption occurred, enabling heap tracing in `HEAP_TRACE_ALL` mode allows you to record all the functions which allocated memory, and the addresses of the allocations.

Using heap tracing in this way is very similar to memory leak detection as described above. For memory which is

allocated and not freed, the output is the same. However, records will also be shown for memory which has been freed.

Performance Impact Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on performance of heap allocation/free operations even when heap tracing is not running.

When heap tracing is running, heap allocation/free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) will also increase this performance impact.

False-Positive Memory Leaks Not everything printed by *heap_trace_dump()* is necessarily a memory leak. Among things which may show up here, but are not memory leaks:

- Any memory which is allocated after *heap_trace_start()* but then freed after *heap_trace_stop()* will appear in the leak dump.
- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it's quite possible this memory is freed after *heap_trace_stop()* is called.
- The first time a task uses stdio - for example, when it calls `printf()` - a lock (RTOS mutex semaphore) is allocated by the libc. This allocation lasts until the task is deleted.
- Certain uses of `printf()`, such as printing floating point numbers, will allocate some memory from the heap on demand. These allocations last until the task is deleted.
- The Bluetooth, Wi-Fi, and TCP/IP libraries will allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short-lived, but some may be shown in the heap leak trace if the data was received/transmitted by the lower levels of the network while the leak trace was running.
- TCP connections will continue to use some memory after they are closed, because of the `TIME_WAIT` state. After the `TIME_WAIT` period has completed, this memory will be freed.

One way to differentiate between "real" and "false positive" memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

API Reference - Heap Tracing

Header File

- components/heap/include/esp_heap_trace.h

Functions

esp_err_t **heap_trace_init_standalone** (*heap_trace_record_t* *record_buffer, size_t num_records)

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call heap_trace_init_standalone(NULL, 0);

参数

- **record_buffer** –Provide a buffer to use for heap trace data. Must remain valid any time heap tracing is enabled, meaning it must be allocated from internal memory not in PSRAM.
- **num_records** –Size of the heap trace buffer, as number of record structures.

返回

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

esp_err_t **heap_trace_init_tohost** (void)

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

返回

- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

esp_err_t **heap_trace_start** (*heap_trace_mode_t* mode)

Start heap tracing. All heap allocations & frees will be traced, until heap_trace_stop() is called.

备注: heap_trace_init_standalone() must be called to provide a valid buffer, before this function is called.

备注: Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

参数 **mode** –Mode for tracing.

- HEAP_TRACE_ALL means all heap allocations and frees are traced.
- HEAP_TRACE_LEAKS means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

返回

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE A non-zero-length buffer has not been set via heap_trace_init_standalone().
- ESP_OK Tracing is started.

esp_err_t **heap_trace_stop** (void)

Stop heap tracing.

返回

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not in progress.
- ESP_OK Heap tracing stopped..

esp_err_t **heap_trace_resume** (void)

Resume heap tracing which was previously stopped.

Unlike heap_trace_start(), this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when heap_trace_start() was last called (or HEAP_TRACE_ALL if heap_trace_start() was never called).

返回

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was already started.
- ESP_OK Heap tracing resumed.

size_t **heap_trace_get_count** (void)

Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.

esp_err_t **heap_trace_get** (size_t index, *heap_trace_record_t* *record)

Return a raw record from the heap trace buffer.

备注: It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode record indexing may skip entries unless heap tracing is stopped first.

参数

- **index** –Index (zero-based) of the record to return.
- **record** –**[out]** Record where the heap trace record will be copied.

返回

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not initialised.
- ESP_ERR_INVALID_ARG Index is out of bounds for current heap trace record count.
- ESP_OK Record returned successfully.

void **heap_trace_dump**(void)

Dump heap trace record data to stdout.

备注: It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode the dump may skip entries unless heap tracing is stopped first.

Structures

struct **heap_trace_record_t**

Trace record data type. Stores information about an allocated region of memory.

Public Members

uint32_t **ccount**

CCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

void ***address**

Address which was allocated.

size_t **size**

Size of the allocation.

void ***alloced_by**[CONFIG_HEAP_TRACING_STACK_DEPTH]

Call stack of the caller which allocated the memory.

void ***freed_by**[CONFIG_HEAP_TRACING_STACK_DEPTH]

Call stack of the caller which freed the memory (all zero if not freed.)

Macros

CONFIG_HEAP_TRACING_STACK_DEPTH

Enumerations

enum **heap_trace_mode_t**

Values:

enumerator **HEAP_TRACE_ALL**

enumerator **HEAP_TRACE_LEAKS**

2.10.13 High Resolution Timer (ESP Timer)

Overview

Although FreeRTOS provides software timers, these timers have a few limitations:

- Maximum resolution is equal to RTOS tick period
- Timer callbacks are dispatched from a low-priority task

Hardware timers are free from both of the limitations, but often they are less convenient to use. For example, application components may need timer events to fire at certain times in the future, but the hardware timer only contains one "compare" value used for interrupt generation. This means that some facility needs to be built on top of the hardware timer to manage the list of pending events can dispatch the callbacks for these events as corresponding hardware interrupts happen.

An interrupt level of the handler depends on the *CONFIG_ESP_TIMER_INTERRUPT_LEVEL* option. It allows to set this: 1, 2 or 3 level (by default 1). Raising the level, the interrupt handler can reduce the timer processing delay.

`esp_timer` set of APIs provides one-shot and periodic timers, microsecond time resolution, and 52-bit range.

Internally, `esp_timer` uses a 52-bit hardware timer, where the implementation depends on the target. SYSTIMER is used for ESP32-C3.

Timer callbacks can be dispatched by two methods:

- `ESP_TIMER_TASK`
- `ESP_TIMER_ISR`. Available only if *CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD* is enabled (by default disabled).

`ESP_TIMER_TASK`. Timer callbacks are dispatched from a high-priority `esp_timer` task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower priority task using a queue instead.

If other tasks with priority higher than `esp_timer` are running, callback dispatching will be delayed until `esp_timer` task has a chance to run. For example, this will happen if an SPI Flash operation is in progress.

`ESP_TIMER_ISR`. Timer callbacks are dispatched directly from the timer interrupt handler. This method is useful for some simple callbacks which aim for lower latency.

Creating and starting a timer, and dispatching the callback takes some time. Therefore, there is a lower limit to the timeout value of one-shot `esp_timer`. If *esp_timer_start_once()* is called with a timeout value less than 20us, the callback will be dispatched only after approximately 20us.

Periodic `esp_timer` also imposes a 50us restriction on the minimal timer period. Periodic software timers with period of less than 50us are not practical since they would consume most of the CPU time. Consider using dedicated hardware peripherals or DMA features if you find that a timer with small period is required.

Using `esp_timer` APIs

Single timer is represented by *esp_timer_handle_t* type. Timer has a callback function associated with it. This callback function is called from the `esp_timer` task each time the timer elapses.

- To create a timer, call *esp_timer_create()*.
- To delete the timer when it is no longer needed, call *esp_timer_delete()*.

The timer can be started in one-shot mode or in periodic mode.

- To start the timer in one-shot mode, call *esp_timer_start_once()*, passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.
- To start the timer in periodic mode, call *esp_timer_start_periodic()*, passing the period with which the callback should be called. The timer keeps running until *esp_timer_stop()* is called.

Note that the timer must not be running when *esp_timer_start_once()* or *esp_timer_start_periodic()* is called. To restart a running timer, call *esp_timer_stop()* first, then call one of the start functions.

Callback functions

备注： Keep the callback functions as short as possible otherwise it will affect all timers.

Timer callbacks which are processed by `ESP_TIMER_ISR` method should not call the context switch call - `portYIELD_FROM_ISR()`, instead of this you should use the *`esp_timer_isr_dispatch_need_yield()`* function. The context switch will be done after all ISR dispatch timers have been processed, if required by the system.

esp_timer during the light sleep

During light sleep, the esp_timer counter stops and no callback functions are called. Instead, the time is counted by the RTC counter. Upon waking up, the system gets the difference between the counters and calls a function that advances the esp_timer counter. Since the counter has been advanced, the system starts calling callbacks that were not called during sleep. The number of callbacks depends on the duration of the sleep and the period of the timers. It can lead to overflow of some queues. This only applies to periodic timers, one-shot timers will be called once.

This behavior can be changed by calling *`esp_timer_stop()`* before sleeping. In some cases, this can be inconvenient, and instead of the stop function, you can use the *skip_unhandled_events* option during *`esp_timer_create()`*. When the *skip_unhandled_events* is true, if a periodic timer expires one or more times during light sleep then only one callback is called on wake.

Using the *skip_unhandled_events* option with *automatic light sleep* (see *Power Management APIs*) helps to reduce the consumption of the system when it is in light sleep. The duration of light sleep is also determined by esp_timers. Timers with *skip_unhandled_events* option will not wake up the system.

Handling callbacks

esp_timer is designed to achieve a high-resolution low latency timer and the ability to handle delayed events. If the timer is late then the callback will be called as soon as possible, it will not be lost. In the worst case, when the timer has not been processed for more than one period (for periodic timers), in this case the callbacks will be called one after the other without waiting for the set period. This can be bad for some applications, and the *skip_unhandled_events* option was introduced to eliminate this behavior. If *skip_unhandled_events* is set then a periodic timer that has expired multiple times without being able to call the callback will still result in only one callback event once processing is possible.

Obtaining Current Time

`esp_timer` also provides a convenience function to obtain the time passed since start-up, with microsecond precision: *`esp_timer_get_time()`*. This function returns the number of microseconds since `esp_timer` was initialized, which usually happens shortly before `app_main` function is called.

Unlike *gettimeofday* function, values returned by *`esp_timer_get_time()`*:

- Start from zero after the chip wakes up from deep sleep
- Do not have timezone or DST adjustments applied

Application Example

The following example illustrates usage of `esp_timer` APIs: system/esp_timer.

API Reference

Header File

- components/esp_timer/include/esp_timer.h

Functions

esp_err_t **esp_timer_early_init**(void)

Minimal initialization of esp_timer.

This function can be called very early in startup process, after this call only esp_timer_get_time function can be used.

备注: This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs.

返回

- ESP_OK on success

esp_err_t **esp_timer_init**(void)

Initialize esp_timer library.

备注: This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs. Before calling this function, esp_timer_early_init must be called by the startup code.

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized
- other errors from interrupt allocator

esp_err_t **esp_timer_deinit**(void)

De-initialize esp_timer library.

备注: Normally this function should not be called from applications

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not yet initialized

esp_err_t **esp_timer_create**(const *esp_timer_create_args_t* *create_args, *esp_timer_handle_t* *out_handle)

Create an esp_timer instance.

备注: When done using the timer, delete it with esp_timer_delete function.

参数

- **create_args** –Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- **out_handle** –**[out]** Output, pointer to esp_timer_handle_t variable which will hold the created timer handle.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if some of the create_args are not valid
- ESP_ERR_INVALID_STATE if esp_timer library is not initialized yet

- ESP_ERR_NO_MEM if memory allocation fails

esp_err_t **esp_timer_start_once**(*esp_timer_handle_t* timer, uint64_t timeout_us)

Start one-shot timer.

Timer should not be running when this function is called.

参数

- **timer** –timer handle created using esp_timer_create
- **timeout_us** –timer timeout, in microseconds relative to the current moment

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

esp_err_t **esp_timer_start_periodic**(*esp_timer_handle_t* timer, uint64_t period)

Start a periodic timer.

Timer should not be running when this function is called. This function will start the timer which will trigger every ‘period’ microseconds.

参数

- **timer** –timer handle created using esp_timer_create
- **period** –timer period, in microseconds

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

esp_err_t **esp_timer_stop**(*esp_timer_handle_t* timer)

Stop the timer.

This function stops the timer previously started using esp_timer_start_once or esp_timer_start_periodic.

参数 **timer** –timer handle created using esp_timer_create

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is not running

esp_err_t **esp_timer_delete**(*esp_timer_handle_t* timer)

Delete an esp_timer instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

参数 **timer** –timer handle allocated using esp_timer_create

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is running

int64_t **esp_timer_get_time**(void)

Get time in microseconds since boot.

返回 number of microseconds since underlying timer has been started

int64_t **esp_timer_get_next_alarm**(void)

Get the timestamp when the next timeout is expected to occur.

返回 Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

int64_t **esp_timer_get_next_alarm_for_wake_up**(void)

Get the timestamp when the next timeout is expected to occur skipping those which have skip_unhandled_events flag.

返回 Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

esp_err_t **esp_timer_get_period**(*esp_timer_handle_t* timer, uint64_t *period)

Get the period of a timer.

This function fetches the timeout period of a timer.

备注: The timeout period is the time interval with which a timer restarts after expiry. For one-shot timers, the period is 0 as there is no periodicity associated with such timers.

参数

- **timer** –timer handle allocated using esp_timer_create
- **period** –memory to store the timer period value in microseconds

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid

esp_err_t **esp_timer_get_expiry_time**(*esp_timer_handle_t* timer, uint64_t *expiry)

Get the expiry time of a one-shot timer.

This function fetches the expiry time of a one-shot timer.

备注: This API returns a valid expiry time only for a one-shot timer. It returns an error if the timer handle passed to the function is for a periodic timer.

参数

- **timer** –timer handle allocated using esp_timer_create
- **expiry** –memory to store the timeout value in microseconds

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid
- ESP_ERR_NOT_SUPPORTED if the timer type is periodic

esp_err_t **esp_timer_dump**(FILE *stream)

Dump the list of timers to a stream.

If CONFIG_ESP_TIMER_PROFILING option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.

The format is:

name period alarm times_armed times_triggered total_callback_run_time

where:

name —timer name (if CONFIG_ESP_TIMER_PROFILING is defined), or timer pointer period —period of timer, in microseconds, or 0 for one-shot timer alarm - time of the next alarm, in microseconds since boot, or 0 if the timer is not started

The following fields are printed if CONFIG_ESP_TIMER_PROFILING is defined:

times_armed —number of times the timer was armed via esp_timer_start_X times_triggered - number of times the callback was called total_callback_run_time - total time taken by callback to execute, across all calls

参数 **stream** –stream (such as stdout) to dump the information to

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if can not allocate temporary buffer for the output

void **esp_timer_isr_dispatch_need_yield**(void)

Requests a context switch from a timer callback function.

This only works for a timer that has an ISR dispatch method. The context switch will be called after all ISR dispatch timers have been processed.

bool **esp_timer_is_active**(*esp_timer_handle_t* timer)

Returns status of a timer, active or not.

This function is used to identify if the timer is still active or not.

参数 **timer** –timer handle created using esp_timer_create

返回

- 1 if timer is still active
- 0 if timer is not active.

Structures

struct **esp_timer_create_args_t**

Timer configuration passed to esp_timer_create.

Public Members

esp_timer_cb_t **callback**

Function to call when timer expires.

void ***arg**

Argument to pass to the callback.

esp_timer_dispatch_t **dispatch_method**

Call the callback from task or from ISR.

const char ***name**

Timer name, used in esp_timer_dump function.

bool **skip_unhandled_events**

Skip unhandled events for periodic timers.

Type Definitions

typedef struct esp_timer ***esp_timer_handle_t**

Opaque type representing a single esp_timer.

typedef void (***esp_timer_cb_t**)(void *arg)

Timer callback function type.

Param arg pointer to opaque user-specific data

Enumerations

enum **esp_timer_dispatch_t**

Method for dispatching timer callback.

Values:

enumerator **ESP_TIMER_TASK**

Callback is called from timer task.

enumerator **ESP_TIMER_MAX**

Count of the methods for dispatching timer callback.

2.10.14 Internal and Unstable APIs

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.

API Reference

Header File

- components/esp_rom/include/esp_rom_sys.h

Functions

int **esp_rom_printf**(const char *fmt, ...)

Print formated string to console device.

备注: float and long long data are not supported!

参数

- **fmt** –Format string
- **...** –Additional arguments, depending on the format string

返回 int: Total number of characters written on success; A negative number on failure.

void **esp_rom_delay_us**(uint32_t us)

Pauses execution for us microseconds.

参数 **us** –Number of microseconds to pause

void **esp_rom_install_channel_putc**(int channel, void (*putc)(char c))

esp_rom_printf can print message to different channels simultaneously. This function can help install the low level putc function for esp_rom_printf.

参数

- **channel** –Channel number (startting from 1)
- **putc** –Function pointer to the putc implementation. Set NULL can disconnect esp_rom_printf with putc.

void **esp_rom_install_uart_printf**(void)

Install UART1 as the default console channel, equivalent to `esp_rom_install_channel_putc(1, esp_rom_uart_putc)`

soc_reset_reason_t **esp_rom_get_reset_reason**(int cpu_no)

Get reset reason of CPU.

参数 **cpu_no** –CPU number

返回 Reset reason code (see in soc/reset_reasons.h)

void **esp_rom_route_intr_matrix**(int cpu_core, uint32_t periph_intr_id, uint32_t cpu_intr_num)

Route peripheral interrupt sources to CPU’s interrupt port by matrix.

Usually there’re 4 steps to use an interrupt:

a. Route peripheral interrupt source to CPU. e.g. esp_rom_route_intr_matrix(0, ETS_WIFI_MAC_INTR_SOURCE, ETS_WMAC_INUM)
b. Set interrupt handler for CPU
c. Enable CPU interupt
d. Enable peripheral interrupt

参数

- **cpu_core** –The CPU number, which the peripheral interupt will inform to
- **periph_intr_id** –The peripheral interrupt source number
- **cpu_intr_num** –The CPU interrupt number

uint32_t **esp_rom_get_cpu_ticks_per_us**(void)

Get the real CPU ticks per us.

返回 CPU ticks per us

2.10.15 Interrupt allocation

Overview

The ESP32-C3 has one core, with 31 interrupts. Each interrupt has a programmable priority level.

Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The *esp_intr_alloc()* abstraction exists to hide all these implementation details.

A driver can allocate an interrupt for a certain peripheral by calling *esp_intr_alloc()* (or *esp_intr_alloc_intrstatus()*). It can use the flags passed to this function to set the type of interrupt allocated, specifying a particular level or trigger method. The interrupt allocation code will then find an applicable interrupt, use the interrupt mux to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

This code presents two different types of interrupts, handled differently: shared interrupts and non-shared interrupts. The simplest ones are non-shared interrupts: a separate interrupt is allocated per *esp_intr_alloc()* call and this interrupt is solely used for the peripheral attached to it, with only one ISR that will get called. On the other hand, shared interrupts can have multiple peripherals triggering them, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to check if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts due to the chance of missed interrupts when edge interrupts are used.

For example, let's say DevA and DevB share an interrupt. DevB signals an interrupt, so INT line goes high. The ISR handler calls code for DevA but does nothing. Then, ISR handler calls code for DevB, but while doing that, DevA signals an interrupt. DevB's ISR is done, it clears interrupt status for DevB and exits interrupt code. Now, an interrupt for DevA is still pending, but because the INT line never went low, as DevA kept it high even when the interrupt for DevB was cleared, the interrupt is never serviced.

IRAM-Safe Interrupt Handlers

The `ESP_INTR_FLAG_IRAM` flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erases can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses.

Refer to the *SPI flash API documentation* for more details.

Multiple Handlers Sharing A Source

Several handlers can be assigned to a same source, given that all handlers are allocated using the `ESP_INTR_FLAG_SHARED` flag. They will all be allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while **its source may still be triggered** if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework support this feature, you have to use it *very carefully*. There usually exist two ways to stop an interrupt from being triggered: *disable the source* or *mask peripheral interrupt status*. IDF only handles enabling and disabling of the source itself, leaving status and mask bits to be handled by users. **Status bits shall either be masked before the handler responsible for it is disabled, either be masked and then properly handled in another enabled interrupt**. Please note that leaving some status bits unhandled without masking them, while disabling the handlers for them, will cause the interrupt(s) to be triggered indefinitely, resulting therefore in a system crash.

API Reference

Header File

- components/esp_hw_support/include/esp_intr_alloc.h

Functions

esp_err_t **esp_intr_mark_shared**(int intno, int cpu, bool is_in_iram)

Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

参数

- **intno** –The number of the interrupt (0-31)
- **cpu** –CPU on which the interrupt should be marked as shared (0 or 1)
- **is_in_iram** –Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

返回 ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

esp_err_t **esp_intr_reserve**(int intno, int cpu)

Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

参数

- **intno** –The number of the interrupt (0-31)
- **cpu** –CPU on which the interrupt should be marked as shared (0 or 1)

返回 ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

esp_err_t **esp_intr_alloc**(int source, int flags, *intr_handler_t* handler, void *arg, *intr_handle_t* *ret_handle)

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

参数

- **source** –The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags** –An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **handler** –The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- **arg** –Optional argument for passed to the interrupt handler
- **ret_handle** –Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

返回 ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

esp_err_t **esp_intr_alloc_intrstatus**(int source, int flags, uint32_t intrstatusreg, uint32_t intrstatusmask, *intr_handler_t* handler, void *arg, *intr_handle_t* *ret_handle)

Allocate an interrupt with the given parameters.

This essentially does the same as esp_intr_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped

参数

- **source** –The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags** –An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **intrstatusreg** –The address of an interrupt status register
- **intrstatusmask** –A mask. If a read of address intrstatusreg has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- **handler** –The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- **arg** –Optional argument for passed to the interrupt handler
- **ret_handle** –Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

返回 ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

esp_err_t **esp_intr_free**(*intr_handle_t* handle)

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

备注: When the handler shares its source with other handlers, the interrupt status bits it's responsible for should be managed properly before freeing it. see `esp_intr_disable` for more details. Please do not call this function in `esp_ipc_call_blocking`.

参数 **handle** –The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
返回 ESP_ERR_INVALID_ARG the handle is NULL ESP_FAIL failed to release this handle ESP_OK otherwise

int **esp_intr_get_cpu**(*intr_handle_t* handle)

Get CPU number an interrupt is tied to.

参数 **handle** –The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
返回 The core number where the interrupt is allocated

int **esp_intr_get_intno**(*intr_handle_t* handle)

Get the allocated interrupt for a certain handle.

参数 **handle** –The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
返回 The interrupt number

esp_err_t **esp_intr_disable**(*intr_handle_t* handle)

Disable the interrupt associated with the handle.

备注:

a. For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
b. When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.

参数 **handle** –The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
返回 ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

esp_err_t **esp_intr_enable**(*intr_handle_t* handle)

Enable the interrupt associated with the handle.

备注: For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

参数 **handle** –The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
返回 ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

esp_err_t **esp_intr_set_in_iram**(*intr_handle_t* handle, bool is_in_iram)

Set the "in IRAM" status of the handler.

备注: Does not work on shared interrupts.

参数

- **handle** –The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
- **is_in_iram** –Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

返回 ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

void **esp_intr_noniram_disable**(void)

Disable interrupts that aren't specifically marked as running from IRAM.

void **esp_intr_noniram_enable**(void)

Re-enable interrupts disabled by esp_intr_noniram_disable.

void **esp_intr_enable_source**(int inum)

enable the interrupt source based on its number

参数 inum –interrupt number from 0 to 31

void **esp_intr_disable_source**(int inum)

disable the interrupt source based on its number

参数 inum –interrupt number from 0 to 31

static inline int **esp_intr_flags_to_level**(int flags)

Get the lowest interrupt level from the flags.

参数 flags –The same flags that pass to `esp_intr_alloc_intrstatus` API

Macros

ESP_INTR_FLAG_LEVEL1

Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling esp_intr_alloc* needs. Accept a Level 1 interrupt vector (lowest priority)

ESP_INTR_FLAG_LEVEL2

Accept a Level 2 interrupt vector.

ESP_INTR_FLAG_LEVEL3

Accept a Level 3 interrupt vector.

ESP_INTR_FLAG_LEVEL4

Accept a Level 4 interrupt vector.

ESP_INTR_FLAG_LEVEL5

Accept a Level 5 interrupt vector.

ESP_INTR_FLAG_LEVEL6

Accept a Level 6 interrupt vector.

ESP_INTR_FLAG_NMI

Accept a Level 7 interrupt vector (highest priority)

ESP_INTR_FLAG_SHARED

Interrupt can be shared between ISRs.

ESP_INTR_FLAG_EDGE

Edge-triggered interrupt.

ESP_INTR_FLAG_IRAM

ISR can be called if cache is disabled.

ESP_INTR_FLAG_INTRDISABLED

Return with this interrupt disabled.

ESP_INTR_FLAG_LOWMED

Low and medium prio interrupts. These can be handled in C.

ESP_INTR_FLAG_HIGH

High level interrupts. Need to be handled in assembly.

ESP_INTR_FLAG_LEVELMASK

Mask for all level flags.

ETS_INTERNAL_TIMER0_INTR_SOURCE

Platform timer 0 interrupt source.

The esp_intr_alloc* functions can allocate an int for all ETS_*_INTR_SOURCE interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.

ETS_INTERNAL_TIMER1_INTR_SOURCE

Platform timer 1 interrupt source.

ETS_INTERNAL_TIMER2_INTR_SOURCE

Platform timer 2 interrupt source.

ETS_INTERNAL_SW0_INTR_SOURCE

Software int source 1.

ETS_INTERNAL_SW1_INTR_SOURCE

Software int source 2.

ETS_INTERNAL_PROFILING_INTR_SOURCE

Int source for profiling.

ETS_INTERNAL_INTR_SOURCE_OFF

Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly

ESP_INTR_ENABLE(inum)

Enable interrupt by interrupt number

ESP_INTR_DISABLE(inum)

Disable interrupt by interrupt number

Type Definitions

typedef void (***intr_handler_t**)(void *arg)

Function prototype for interrupt handler function

typedef struct *intr_handle_data_t* **intr_handle_data_t**

Interrupt handler associated data structure

typedef *intr_handle_data_t* ***intr_handle_t**

Handle to an interrupt handler

2.10.16 Logging library

Overview

The logging library provides two ways for setting log verbosity:

- **At compile time**: in menuconfig, set the verbosity level using the option *CONFIG_LOG_DEFAULT_LEVEL*.
- Optionally, also in menuconfig, set the maximum verbosity level using the option *CONFIG_LOG_MAXIMUM_LEVEL*. By default this is the same as the default level, but it can be set higher in order to compile more optional logs into the firmware.
- **At runtime**: all logs for verbosity levels lower than *CONFIG_LOG_DEFAULT_LEVEL* are enabled by default. The function *esp_log_level_set()* can be used to set a logging level on a per module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

备注: The function *esp_log_level_set()* cannot set logging levels higher than specified by *CONFIG_LOG_MAXIMUM_LEVEL*. To increase log level for a specific file above this maximum at compile time, use the macro *LOG_LOCAL_LEVEL* (see the details below).

How to use this library

In each C file that uses logging functionality, define the TAG variable as shown below:

```
static const char* TAG = "MyModule";
```

Then use one of logging macros to produce output, e.g:

```
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error␣
↪* 100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- `ESP_LOGE` - error (lowest)
- `ESP_LOGW` - warning
- `ESP_LOGI` - info
- `ESP_LOGD` - debug
- `ESP_LOGV` - verbose (highest)

Additionally, there are `ESP_EARLY_LOGx` versions for each of these macros, e.g. *ESP_EARLY_LOGE*. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal `ESP_LOGx` macros can also be used while compiling the bootloader, but they will fall back to the same implementation as `ESP_EARLY_LOGx` macros.

There are also `ESP_DRAM_LOGx` versions for each of these macros, e.g. *ESP_DRAM_LOGE*. These versions are used in some places where logging may occur with interrupts disabled or with flash cache inaccessible. Use of this macros should be as sparing as possible, as logging in these types of code should be avoided for performance reasons.

备注: Inside critical sections interrupts are disabled so it's only possible to use `ESP_DRAM_LOGx` (preferred) or `ESP_EARLY_LOGx`. Even though it's possible to log in these situations, it's better if your program can be structured not to require it.

To override default verbosity level at file or component scope, define the `LOG_LOCAL_LEVEL` macro.

At file scope, define it before including `esp_log.h`, e.g.:

```
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component makefile:

```
target_compile_definitions(${COMPONENT_LIB} PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG_
↪VERBOSE")
```

To configure logging output per module at runtime, add calls to the function *esp_log_level_set()* as follows:

```
esp_log_level_set("*", ESP_LOG_ERROR);        // set all components to ERROR level
esp_log_level_set("wifi", ESP_LOG_WARN);      // enable WARN logs from WiFi stack
esp_log_level_set("dhcpc", ESP_LOG_INFO);     // enable INFO logs from DHCP client
```

备注: The "DRAM" and "EARLY" log macro variants documented above do not support per module setting of log verbosity. These macros will always log at the "default" verbosity level, which can only be changed at runtime by calling `esp_log_level("*", level)`.

Logging to Host via JTAG By default, the logging library uses the vprintf-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section 记录日志到主机.

Application Example

The logging library is commonly used by most esp-idf components and examples. For demonstration of log functionality, check ESP-IDF's examples directory. The most relevant examples that deal with logging are the following:

- system/ota
- storage/sd_card
- protocols/https_request

API Reference

Header File

- components/log/include/esp_log.h

Functions

void **esp_log_level_set**(const char *tag, *esp_log_level_t* level)

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

备 注: Note that this function can not raise log level above the level set using CONFIG_LOG_MAXIMUM_LEVEL setting in menuconfig. To raise log level above the default one for a given file, define LOG_LOCAL_LEVEL to one of the ESP_LOG_* values, before including esp_log.h in this file.

参数

- **tag** –Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "*" resets log level for all tags to the given value.

- **level** –Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

esp_log_level_t **esp_log_level_get**(const char *tag)

Get log level for a given tag, can be used to avoid expensive log statements.

参数 **tag** –Tag of the log to query current level. Must be a non-NULL zero terminated string.
返回 The current log level for the given tag

vprintf_like_t **esp_log_set_vprintf**(*vprintf_like_t* func)

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

备注: Please note that function callback here must be re-entrant as it can be invoked in parallel from multiple thread context.

参数 **func** –new Function used for output. Must have same signature as vprintf.
返回 func old Function used for output.

uint32_t **esp_log_timestamp**(void)

Function which returns timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

返回 timestamp, in milliseconds

char ***esp_log_system_timestamp**(void)

Function which returns system timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros to print the system time as "HH:MM:SS.sss". The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently, this will not get used in logging from binary blobs (i.e. Wi-Fi & Bluetooth libraries), these will still print the RTOS tick time.

返回 timestamp, in "HH:MM:SS.sss"

uint32_t **esp_log_early_timestamp**(void)

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

返回 timestamp, in milliseconds

void **esp_log_write**(*esp_log_level_t* level, const char *tag, const char *format, ...)

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.

This function or these macros should not be used from an interrupt.

void **esp_log_writev**(*esp_log_level_t* level, const char *tag, const char *format, va_list args)

Write message into the log, va_list variant.

This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.

参见:

esp_log_write()

Macros

ESP_LOG_BUFFER_HEX_LEVEL(tag, buffer, buff_len, level)

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

参数

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff_len** –length of buffer in bytes
- **level** –level of the log

ESP_LOG_BUFFER_CHAR_LEVEL(tag, buffer, buff_len, level)

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

参数

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff_len** –length of buffer in bytes
- **level** –level of the log

ESP_LOG_BUFFER_HEXDUMP(tag, buffer, buff_len, level)

Dump a buffer to the log at specified level.

The dump log shows just like the one below:

```
W (195) log_example: 0x3ffb4280   45 53 50 33 32 20 69 73  20 67 72 65 61 74␣
↪2c 20  |ESP32 is great, |
W (195) log_example: 0x3ffb4290   77 6f 72 6b 69 6e 67 20  61 6c 6f 6e 67 20␣
↪77 69  |working along wi|
W (205) log_example: 0x3ffb42a0   74 68 20 74 68 65 20 49  44 46 2e 00       ␣
↪      |th the IDF..|
```

It is highly recommended to use terminals with over 102 text width.

参数

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff_len** –length of buffer in bytes
- **level** –level of the log

ESP_LOG_BUFFER_HEX(tag, buffer, buff_len)

Log a buffer of hex bytes at Info level.

参见:

esp_log_buffer_hex_level

参数

- **tag** –description tag
- **buffer** –Pointer to the buffer array

- **buff_len** –length of buffer in bytes

ESP_LOG_BUFFER_CHAR(tag, buffer, buff_len)

Log a buffer of characters at Info level. Buffer should contain only printable characters.

参见:

`esp_log_buffer_char_level`

参数

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff_len** –length of buffer in bytes

ESP_EARLY_LOGE(tag, format, ...)

macro to output logs in startup code, before heap allocator and syscalls have been initialized. Log at `ESP_LOG_ERROR` level.

参见:

`printf`,`ESP_LOGE`,`ESP_DRAM_LOGE` In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension ##__VA_ARGS__. The second one is using the C++20 feature **VA_OPT**(,). This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven't found any good alternative to using ##__VA_ARGS__.

ESP_EARLY_LOGW(tag, format, ...)

macro to output logs in startup code at `ESP_LOG_WARN` level.

参见:

`ESP_EARLY_LOGE`,`ESP_LOGE`, `printf`

ESP_EARLY_LOGI(tag, format, ...)

macro to output logs in startup code at `ESP_LOG_INFO` level.

参见:

`ESP_EARLY_LOGE`,`ESP_LOGE`, `printf`

ESP_EARLY_LOGD(tag, format, ...)

macro to output logs in startup code at `ESP_LOG_DEBUG` level.

参见:

`ESP_EARLY_LOGE`,`ESP_LOGE`, `printf`

ESP_EARLY_LOGV(tag, format, ...)

macro to output logs in startup code at `ESP_LOG_VERBOSE` level.

参见:

`ESP_EARLY_LOGE`,`ESP_LOGE`, `printf`

_ESP_LOG_EARLY_ENABLED(log_level)

ESP_LOG_EARLY_IMPL(tag, format, log_level, log_tag_letter, ...)

ESP_LOGE(tag, format, ...)

ESP_LOGW(tag, format, ...)

ESP_LOGI(tag, format, ...)

ESP_LOGD(tag, format, ...)

ESP_LOGV(tag, format, ...)

ESP_LOG_LEVEL(level, tag, format, ...)

runtime macro to output logs at a specified level.

参见:

`printf`

参数

- **tag** –tag of the log, which can be used to change the log level by `esp_log_level_set` at runtime.
- **level** –level of the output log.
- **format** –format of the output log. See `printf`
- `...` –variables to be replaced into the log. See `printf`

ESP_LOG_LEVEL_LOCAL(level, tag, format, ...)

runtime macro to output logs at a specified level. Also check the level with `LOG_LOCAL_LEVEL`.

参见:

`printf`, `ESP_LOG_LEVEL`

ESP_DRAM_LOGE(tag, format, ...)

Macro to output logs when the cache is disabled. Log at `ESP_LOG_ERROR` level.

Similar to

Usage: `ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format",` orESP_DRAM_LOGE(TAG, “format”, ⋯)‘, where TAG is a char* that points to a str in the DRAM.

参见:

`ESP_EARLY_LOGE`, the log level cannot be changed per-tag, however esp_log_level_set(“*”, level) will set the default level which controls these log lines also.

参见:

`esp_rom_printf`,`ESP_LOGE`

备注: Unlike normal logging macros, it’s possible to use this macro when interrupts are disabled or inside an ISR.

备注: Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

ESP_DRAM_LOGW(tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_WARN` level.

参见:

`ESP_DRAM_LOGW`,`ESP_LOGW`, `esp_rom_printf`

ESP_DRAM_LOGI(tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_INFO` level.

参见:

`ESP_DRAM_LOGI`,`ESP_LOGI`, `esp_rom_printf`

ESP_DRAM_LOGD(tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_DEBUG` level.

参见:

`ESP_DRAM_LOGD`,`ESP_LOGD`, `esp_rom_printf`

ESP_DRAM_LOGV(tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_VERBOSE` level.

参见:

`ESP_DRAM_LOGV`,`ESP_LOGV`, `esp_rom_printf`

Type Definitions

typedef int (***vprintf_like_t**)(const char*, va_list)

Enumerations

enum **esp_log_level_t**

Log level.

Values:

enumerator **ESP_LOG_NONE**

No log output

enumerator **ESP_LOG_ERROR**

Critical errors, software module can not recover on its own

enumerator **ESP_LOG_WARN**

Error conditions from which recovery measures have been taken

enumerator **ESP_LOG_INFO**

Information messages which describe normal flow of events

enumerator **ESP_LOG_DEBUG**

Extra information which is not necessary for normal use (values, pointers, sizes, etc).

enumerator **ESP_LOG_VERBOSE**

Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

2.10.17 杂项系统 API

软件复位

函数*esp_restart()* 用于执行芯片的软件复位。调用此函数时，程序停止执行，CPU 复位，应用程序由 bootloader 加载并重启。

函数*esp_register_shutdown_handler()* 用于注册复位前会自动调用的例程（复位过程由*esp_restart()* 函数触发），这与 `atexit` POSIX 函数的功能类似。

复位原因

ESP-IDF 应用程序启动或复位的原因有多种。调用*esp_reset_reason()* 函数可获取最近一次复位的原因。复位的所有可能原因，请查看*esp_reset_reason_t* 中的描述。

堆内存

ESP-IDF 中有两个与堆内存相关的函数：

- 函数*esp_get_free_heap_size()* 用于查询当前可用的堆内存大小。
- 函数*esp_get_minimum_free_heap_size()* 用于查询整个过程中可用的最小堆内存大小（例如应用程序生命周期内可用的最小堆内存大小）。

请注意，ESP-IDF 支持功能不同的的多个堆。上文中函数返回的堆内存大小可使用 `malloc` 函数族来进行分配。有关堆内存的更多信息，请参阅堆内存分配。

MAC 地址

以下 API 用于查询和自定义支持的网络接口（如 Wi-Fi、蓝牙、以太网）的 MAC 地址。

要获取特定接口（如 Wi-Fi、蓝牙、以太网）的 MAC 地址，请调用函数*esp_read_mac()*。

在 ESP-IDF 中，各个网络接口的 MAC 地址是根据单个 基准 *MAC* 地址 *(Base MAC address)* 计算出来的。默认情况下使用乐鑫指定的基准 MAC 地址，该基准地址在产品生产过程中已预烧录至 ESP32-C3 eFuse。

接口	MAC 地址（默认 4 个全局地址）	MAC 地址（2 个全局地址）
Wi-Fi Station	base_mac	base_mac
Wi-Fi SoftAP	base_mac 最后一组字节后加 1	本地 *MAC*（由 Wi-Fi Station MAC 生成）
蓝牙	base_mac 最后一组字节后加 2	base_mac 最后一组字节后加 1
以太网	base_mac 最后一组字节后加 3	本地 *MAC*（由蓝牙 MAC 生成）

备注： 配置选项 配置了乐鑫提供的全局 MAC 地址的数量。

备注： ESP32-C3 内部未集成以太网 MAC 地址，但仍可以计算得出该地址。不过，以太网 MAC 地址只能与外部以太网接口（如 SPI 以太网设备）一起使用，具体请参阅以太网。

自定义基准 MAC 乐鑫已将默认的基准 MAC 地址预烧录至 eFuse BLK1 中。如需设置自定义基准 MAC 地址，请在初始化任一网络接口或调用*esp_read_mac()* 函数前调用*esp_base_mac_addr_set()* 函数。自定义基准 MAC 地址可以存储在任何支持的存储设备中（例如 flash、NVS）。

分配自定义基准 MAC 地址时，应避免 MAC 地址重叠。请根据上面的表格配置选项*CONFIG_ESP32C3_UNIVERSAL_MAC_ADDRESSES*，设置可从自定义基准 MAC 地址生成的有效全局 MAC 地址。

备注： 也可以调用函数*esp_netif_set_mac()*，在网络初始化后设置网络接口使用的特定 MAC。但建议使用此处介绍的自定义基准 MAC 地址的方法，以避免原始 MAC 地址在更改前短暂出现在网络上。

---

eFuse 中的自定义 MAC 地址 ESP-IDF 提供了*esp_efuse_mac_get_custom()* 函数。从 eFuse 读取自定义 MAC 地址时，调用该函数将从 eFuse BLK3 加载 MAC 地址。此函数假定自定义基准 MAC 地址的存储格式如下：

字段	比特数	比特范围
MAC address	48	200:248

备注： eFuse BLK3 在烧写时使用 RS 编码，这意味着必须同时烧写该块中的所有 eFuse 字段。

调用*esp_efuse_mac_get_custom()* 函数获得 MAC 地址后，请调用*esp_base_mac_addr_set()* 函数将此 MAC 地址设置为基准 MAC 地址。

本地 MAC 地址和全局 MAC 地址 在 ESP32-C3 中，乐鑫已预烧录足够数量的有效乐鑫全局 MAC 地址，供所有内部接口使用。上文中的表格已经介绍了如何根据基准 MAC 地址计算出具体接口的 MAC 地址。

当使用自定义 MAC 地址时，可能并非所有接口都能被分配到一个全局 MAC 地址。此时，接口会被分配一个本地 MAC 地址。请注意，这些地址仅用于单个本地网络。

本地 MAC 地址和全局 MAC 地址的定义，请参见 此处。

内部调用函数*esp_derive_local_mac()*，可从全局 MAC 地址生成本地 MAC 地址。具体流程如下：

1. 在全局 MAC 地址的第一个字节组中设置 U/L 位（位值为 0x2），创建本地 MAC 地址。
2. 如果该位已存在于全局 MAC 地址中（即现有的“全局”MAC 地址实际上已经是本地 MAC 地址），则本地 MAC 地址的第一个字节组与 0x4 异或。

芯片版本

esp_chip_info() 函数用于填充*esp_chip_info_t* 结构体中的芯片信息，包括芯片版本、CPU 数量和芯片中已启用功能的位掩码。

SDK 版本

调用函数*esp_get_idf_version()* 可返回一个字符串，该字符串包含了用于编译应用程序的 ESP-IDF 版本，与构建系统中通过 `IDF_VER` 变量所获得的值相同。该版本字符串的格式即 `git describe` 命令的运行结果。

也有其它的版本宏可用于在构建过程中获取 ESP-IDF 版本，它们可根据 ESP-IDF 版本启用或禁用部分程序。

- *ESP_IDF_VERSION_MAJOR*、*ESP_IDF_VERSION_MINOR* 和*ESP_IDF_VERSION_PATCH* 分别被定义为代表主要版本、次要版本和补丁版本的整数。
- *ESP_IDF_VERSION_VAL* 和*ESP_IDF_VERSION* 可在确认版本时使用：

```
#include "esp_idf_version.h"

#if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
    // 启用 ESP-IDF v4.0 中的功能
#endif
```

应用程序版本

应用程序版本存储在*esp_app_desc_t* 结构体中。该结构体位于 DROM 扇区，有一个从二进制文件头部计算的固定偏移值。该结构体位于*esp_image_header_t* 和*esp_image_segment_header_t* 结构体之后。字段 Version 类型为字符串，最大长度为 32 字节。

若需手动设置版本，需要在项目的 `CMakeLists.txt` 文件中设置 `PROJECT_VER` 变量，即在 `CMakeLists.txt` 文件中，在包含 `project.cmake` 之前添加 `set(PROJECT_VER "0.1.0.1")`。

如果设置了*CONFIG_APP_PROJECT_VER_FROM_CONFIG* 选项，则将使用*CONFIG_APP_PROJECT_VER* 的值。否则，如果在项目中未设置 `PROJECT_VER` 变量，则该变量将从 `$(PROJECT_PATH)/version.txt` 文件（若有）中检索，或使用 git 命令 `git describe` 检索。如果两者都不可用，则 `PROJECT_VER` 将被设置为“1”。应用程序可通过调用*esp_ota_get_app_description()* 或*esp_ota_get_partition_description()* 函数来获取应用程序的版本信息。

API 参考

Header File

- components/esp_system/include/esp_system.h

Functions

esp_err_t **esp_register_shutdown_handler**(*shutdown_handler_t* handle)

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using esp_restart function.

参数 **handle** –function to execute on restart

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the handler has already been registered
- ESP_ERR_NO_MEM if no more shutdown handler slots are available

esp_err_t **esp_unregister_shutdown_handler**(*shutdown_handler_t* handle)

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using esp_register_shutdown_handler function.

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the given handler hasn’t been registered before

void **esp_restart**(void)

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be SW_CPU_RESET. Peripherals (except for Wi-Fi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

esp_reset_reason_t **esp_reset_reason**(void)

Get reason of last reset.

返回 See description of esp_reset_reason_t for explanation of each value.

uint32_t **esp_get_free_heap_size**(void)

Get the size of available heap.

备注: Note that the returned value may be larger than the maximum contiguous block which can be allocated.

返回 Available heap size, in bytes.

uint32_t **esp_get_free_internal_heap_size**(void)

Get the size of available internal heap.

备注: Note that the returned value may be larger than the maximum contiguous block which can be allocated.

返回 Available internal heap size, in bytes.

uint32_t **esp_get_minimum_free_heap_size**(void)

Get the minimum heap that has ever been available.

返回 Minimum free heap ever available

void **esp_system_abort**(const char *details)

Trigger a software abort.

参数 **details** –Details that will be displayed during panic handling.

Type Definitions

typedef void (***shutdown_handler_t**)(void)

Shutdown handler type

Enumerations

enum **esp_reset_reason_t**

Reset reasons.

Values:

enumerator **ESP_RST_UNKNOWN**

Reset reason can not be determined.

enumerator **ESP_RST_POWERON**

Reset due to power-on event.

enumerator **ESP_RST_EXT**

Reset by external pin (not applicable for ESP32)

enumerator **ESP_RST_SW**

Software reset via esp_restart.

enumerator **ESP_RST_PANIC**

Software reset due to exception/panic.

enumerator **ESP_RST_INT_WDT**

Reset (software or hardware) due to interrupt watchdog.

enumerator **ESP_RST_TASK_WDT**

Reset due to task watchdog.

enumerator **ESP_RST_WDT**

Reset due to other watchdogs.

enumerator **ESP_RST_DEEPSLEEP**

Reset after exiting deep sleep mode.

enumerator **ESP_RST_BROWNOUT**

Brownout reset (software or hardware)

enumerator **ESP_RST_SDIO**

Reset over SDIO.

Header File

- components/esp_common/include/esp_idf_version.h

Functions

const char ***esp_get_idf_version**(void)

Return full IDF version string, same as ‘git describe’ output.

备注: If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don’t differentiate between development, pre-release and release versions, but the output of this function does.

返回 constant string from IDF_VER

Macros

ESP_IDF_VERSION_MAJOR

Major version number (X.x.x)

ESP_IDF_VERSION_MINOR

Minor version number (x.X.x)

ESP_IDF_VERSION_PATCH

Patch version number (x.x.X)

ESP_IDF_VERSION_VAL(major, minor, patch)

Macro to convert IDF version number into an integer

To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)

ESP_IDF_VERSION

Current IDF version, as an integer

To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)

Header File

- components/esp_hw_support/include/esp_mac.h

Functions

esp_err_t **esp_base_mac_addr_set**(const uint8_t *mac)

Set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage e.g. flash and EEPROM.

Base MAC address is used to generate the MAC addresses used by network interfaces.

If using a custom base MAC address, call this API before initializing any network interfaces. Refer to the ESP-IDF Programming Guide for details about how the Base MAC is used.

备注： Base MAC must be a unicast MAC (least significant bit of first byte must be zero).

备注： If not using a valid OUI, set the "locally administered" bit (bit value 0x02 in the first byte) to avoid collisions.

参数 **mac** –base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4)

返回 ESP_OK on success ESP_ERR_INVALID_ARG If mac is NULL or is not a unicast MAC

esp_err_t **esp_base_mac_addr_get**(uint8_t *mac)

Return base MAC address which is set using esp_base_mac_addr_set.

备注： If no custom Base MAC has been set, this returns the pre-programmed Espressif base MAC address.

参数 **mac** –base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4)

返回 ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL ESP_ERR_INVALID_MAC base MAC address has not been set

esp_err_t **esp_efuse_mac_get_custom**(uint8_t *mac)

Return base MAC address which was previously written to BLK3 of EFUSE.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. This API returns the custom base MAC address which was previously written to EFUSE BLK3 in a specified format.

Writing this EFUSE allows setting of a different (non-Espressif) base MAC address. It is also possible to store a custom base MAC address elsewhere, see esp_base_mac_addr_set() for details.

备注： This function is currently only supported on ESP32.

参数 **mac** –base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4)

返回 ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL ESP_ERR_INVALID_MAC CUSTOM_MAC address has not been set, all zeros (for esp32-xx) ESP_ERR_INVALID_VERSION An invalid MAC version field was read from BLK3 of EFUSE (for esp32) ESP_ERR_INVALID_CRC An invalid MAC CRC was read from BLK3 of EFUSE (for esp32)

esp_err_t **esp_efuse_mac_get_default**(uint8_t *mac)

Return base MAC address which is factory-programmed by Espressif in EFUSE.

参数 **mac** –base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4)

返回 ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL

esp_err_t **esp_read_mac**(uint8_t *mac, *esp_mac_type_t* type)

Read base MAC address and set MAC address of the interface.

This function first get base MAC address using esp_base_mac_addr_get(). Then calculates the MAC address of the specific interface requested, refer to ESP-IDF Programming Guide for the algorithm.

参数

- **mac** –base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4)
- **type** –Type of MAC address to return

返回 ESP_OK on success

esp_err_t **esp_derive_local_mac**(uint8_t *local_mac, const uint8_t *universal_mac)

Derive local MAC address from universal MAC address.

This function copies a universal MAC address and then sets the "locally

administered" bit (bit 0x2) in the first octet, creating a locally administered MAC address.

If the universal MAC address argument is already a locally administered MAC address, then the first octet is XORed with 0x4 in order to create a different locally administered MAC address.

参数

- **local_mac** –base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4)
- **universal_mac** –Source universal MAC address, length: 6 bytes.

返回 ESP_OK on success

Macros

MAC2STR(a)

MACSTR

Enumerations

enum **esp_mac_type_t**

Values:

enumerator **ESP_MAC_WIFI_STA**

enumerator **ESP_MAC_WIFI_SOFTAP**

enumerator **ESP_MAC_BT**

enumerator **ESP_MAC_ETH**

enumerator **ESP_MAC_IEEE802154**

Header File

- components/esp_hw_support/include/esp_chip_info.h

Functions

void **esp_chip_info**(*esp_chip_info_t* *out_info)

Fill an *esp_chip_info_t* structure with information about the chip.

参数 **out_info** – **[out]** structure to be filled

Structures

struct **esp_chip_info_t**

The structure represents information about the chip.

Public Members

esp_chip_model_t **model**

chip model, one of esp_chip_model_t

uint32_t **features**

bit mask of CHIP_FEATURE_x feature flags

uint16_t **revision**

chip revision number (in format MXX; where M - wafer major version, XX - wafer minor version)

uint8_t **cores**

number of CPU cores

Macros

CHIP_FEATURE_EMB_FLASH

Chip has embedded flash memory.

CHIP_FEATURE_WIFI_BGN

Chip has 2.4GHz WiFi.

CHIP_FEATURE_BLE

Chip has Bluetooth LE.

CHIP_FEATURE_BT

Chip has Bluetooth Classic.

CHIP_FEATURE_IEEE802154

Chip has IEEE 802.15.4.

CHIP_FEATURE_EMB_PSRAM

Chip has embedded psram.

Enumerations

enum **esp_chip_model_t**

Chip models.

Values:

enumerator **CHIP_ESP32**

ESP32.

enumerator **CHIP_ESP32S2**

ESP32-S2.

enumerator **CHIP_ESP32S3**

ESP32-S3.

enumerator **CHIP_ESP32C3**

ESP32-C3.

enumerator **CHIP_ESP32H2**

ESP32-H2.

enumerator **CHIP_ESP32C2**

ESP32-C2.

Header File

- components/esp_hw_support/include/esp_cpu.h

Functions

void **esp_cpu_stall**(int core_id)

Stall a CPU core.

参数 **core_id** –The core’s ID

void **esp_cpu_unstall**(int core_id)

Resume a previously stalled CPU core.

参数 **core_id** –The core’s ID

void **esp_cpu_reset**(int core_id)

Reset a CPU core.

参数 **core_id** –The core’s ID

void **esp_cpu_wait_for_intr**(void)

Wait for Interrupt.

This function causes the current CPU core to execute its Wait For Interrupt (WFI or equivalent) instruction. After executing this function, the CPU core will stop execution until an interrupt occurs.

int **esp_cpu_get_core_id**(void)

Get the current core’s ID.

This function will return the ID of the current CPU (i.e., the CPU that calls this function).

返回 The current core’s ID [0..SOC_CPU_CORES_NUM - 1]

void *esp_cpu_get_sp(void)

Read the current stack pointer address.

返回 Stack pointer address

esp_cpu_cycle_count_t esp_cpu_get_cycle_count(void)

Get the current CPU core's cycle count.

Each CPU core maintains an internal counter (i.e., cycle count) that increments every CPU clock cycle.

返回 Current CPU's cycle count, 0 if not supported.

void esp_cpu_set_cycle_count(*esp_cpu_cycle_count_t* cycle_count)

Set the current CPU core's cycle count.

Set the given value into the internal counter that increments every CPU clock cycle.

参数 **cycle_count** –CPU cycle count

void *esp_cpu_pc_to_addr(uint32_t pc)

Convert a program counter (PC) value to address.

If the architecture does not store the true virtual address in the CPU's PC or return addresses, this function will convert the PC value to a virtual address. Otherwise, the PC is just returned

参数 **pc** –PC value
返回 Virtual address

void esp_cpu_intr_get_desc(int core_id, int intr_num, *esp_cpu_intr_desc_t* *intr_desc_ret)

Get a CPU interrupt's descriptor.

Each CPU interrupt has a descriptor describing the interrupt's capabilities and restrictions. This function gets the descriptor of a particular interrupt on a particular CPU.

参数

- **core_id** –**[in]** The core's ID
- **intr_num** –**[in]** Interrupt number
- **intr_desc_ret** –**[out]** The interrupt's descriptor

void esp_cpu_intr_set_ivt_addr(const void *ivt_addr)

Set the base address of the current CPU's Interrupt Vector Table (IVT)

参数 **ivt_addr** –Interrupt Vector Table's base address

void esp_cpu_intr_set_type(int intr_num, *esp_cpu_intr_type_t* intr_type)

Set the interrupt type of a particular interrupt.

Set the interrupt type (Level or Edge) of a particular interrupt on the current CPU.

参数

- **intr_num** –Interrupt number (from 0 to 31)
- **intr_type** –The interrupt's type

esp_cpu_intr_type_t esp_cpu_intr_get_type(int intr_num)

Get the current configured type of a particular interrupt.

Get the currently configured type (i.e., level or edge) of a particular interrupt on the current CPU.

参数 **intr_num** –Interrupt number (from 0 to 31)
返回 Interrupt type

void esp_cpu_intr_set_priority(int intr_num, int intr_priority)

Set the priority of a particular interrupt.

Set the priority of a particular interrupt on the current CPU.

参数

- **intr_num** –Interrupt number (from 0 to 31)

- **intr_priority** –The interrupt’ s priority

int **esp_cpu_intr_get_priority**(int intr_num)

Get the current configured priority of a particular interrupt.

Get the currently configured priority of a particular interrupt on the current CPU.

参数 **intr_num** –Interrupt number (from 0 to 31)
返回 Interrupt’ s priority

bool **esp_cpu_intr_has_handler**(int intr_num)

Check if a particular interrupt already has a handler function.

Check if a particular interrupt on the current CPU already has a handler function assigned.

备注: This function simply checks if the IVT of the current CPU already has a handler assigned.

参数 **intr_num** –Interrupt number (from 0 to 31)
返回 True if the interrupt has a handler function, false otherwise.

void **esp_cpu_intr_set_handler**(int intr_num, *esp_cpu_intr_handler_t* handler, void *handler_arg)

Set the handler function of a particular interrupt.

Assign a handler function (i.e., ISR) to a particular interrupt on the current CPU.

备注: This function simply sets the handler function (in the IVT) and does not actually enable the interrupt.

参数

- **intr_num** –Interrupt number (from 0 to 31)
- **handler** –Handler function
- **handler_arg** –Argument passed to the handler function

void ***esp_cpu_intr_get_handler_arg**(int intr_num)

Get a handler function’ s argument of.

Get the argument of a previously assigned handler function on the current CPU.

参数 **intr_num** –Interrupt number (from 0 to 31)
返回 The the argument passed to the handler function

void **esp_cpu_intr_enable**(uint32_t intr_mask)

Enable particular interrupts on the current CPU.

参数 **intr_mask** –Bit mask of the interrupts to enable

void **esp_cpu_intr_disable**(uint32_t intr_mask)

Disable particular interrupts on the current CPU.

参数 **intr_mask** –Bit mask of the interrupts to disable

uint32_t **esp_cpu_intr_get_enabled_mask**(void)

Get the enabled interrupts on the current CPU.

返回 Bit mask of the enabled interrupts

void **esp_cpu_intr_edge_ack**(int intr_num)

Acknowledge an edge interrupt.

参数 **intr_num** –Interrupt number (from 0 to 31)

void **esp_cpu_configure_region_protection**(void)

Configure the CPU to disable access to invalid memory regions.

esp_err_t **esp_cpu_set_breakpoint**(int bp_num, const void *bp_addr)

Set and enable a hardware breakpoint on the current CPU.

备注： This function is meant to be called by the panic handler to set a breakpoint for an attached debugger during a panic.

备注： Overwrites previously set breakpoint with same breakpoint number.

参数

- **bp_num** –Hardware breakpoint number [0..SOC_CPU_BREAKPOINTS_NUM - 1]
- **bp_addr** –Address to set a breakpoint on

返回 ESP_OK if breakpoint is set. Failure otherwise

esp_err_t **esp_cpu_clear_breakpoint**(int bp_num)

Clear a hardware breakpoint on the current CPU.

备注： Clears a breakpoint regardless of whether it was previously set

---

参数 **bp_num** –Hardware breakpoint number [0..SOC_CPU_BREAKPOINTS_NUM - 1]

返回 ESP_OK if breakpoint is cleared. Failure otherwise

esp_err_t **esp_cpu_set_watchpoint**(int wp_num, const void *wp_addr, size_t size, *esp_cpu_watchpoint_trigger_t* trigger)

Set and enable a hardware watchpoint on the current CPU.

Set and enable a hardware watchpoint on the current CPU, specifying the memory range and trigger operation. Watchpoints will break/panic the CPU when the CPU accesses (according to the trigger type) on a certain memory range.

备注： Overwrites previously set watchpoint with same watchpoint number.

参数

- **wp_num** –Hardware watchpoint number [0..SOC_CPU_WATCHPOINTS_NUM - 1]
- **wp_addr** –Watchpoint’s base address
- **size** –Size of the region to watch. Must be one of 2^n, with n in [0..6].
- **trigger** –Trigger type

返回 ESP_ERR_INVALID_ARG on invalid arg, ESP_OK otherwise

esp_err_t **esp_cpu_clear_watchpoint**(int wp_num)

Clear a hardware watchpoint on the current CPU.

备注： Clears a watchpoint regardless of whether it was previously set

---

参数 **wp_num** –Hardware watchpoint number [0..SOC_CPU_WATCHPOINTS_NUM - 1]

返回 ESP_OK if watchpoint was cleared. Failure otherwise.

bool **esp_cpu_dbgr_is_attached**(void)

Check if the current CPU has a debugger attached.

返回 True if debugger is attached, false otherwise

void **esp_cpu_dbgr_break**(void)

Trigger a call to the current CPU' s attached debugger.

intptr_t **esp_cpu_get_call_addr**(intptr_t return_address)

Given the return address, calculate the address of the preceding call instruction This is typically used to answer the question "where was the function called from?".

参数 **return_address** –The value of the return address register. Typically set to the value of __builtin_return_address(0).

返回 Address of the call instruction preceding the return address.

bool **esp_cpu_compare_and_set**(volatile uint32_t *addr, uint32_t compare_value, uint32_t new_value)

Atomic compare-and-set operation.

参数

- **addr** –Address of atomic variable
- **compare_value** –Value to compare the atomic variable to
- **new_value** –New value to set the atomic variable to

返回 Whether the atomic variable was set or not

Structures

struct **esp_cpu_intr_desc_t**

CPU interrupt descriptor.

Each particular CPU interrupt has an associated descriptor describing that particular interrupt' s characteristics. Call esp_cpu_intr_get_desc() to get the descriptors of a particular interrupt.

Public Members

int **priority**

Priority of the interrupt if it has a fixed priority, (-1) if the priority is configurable.

esp_cpu_intr_type_t **type**

Whether the interrupt is an edge or level type interrupt, ESP_CPU_INTR_TYPE_NA if the type is configurable.

uint32_t **flags**

Flags indicating extra details.

Macros

ESP_CPU_INTR_DESC_FLAG_SPECIAL

Interrupt descriptor flags of *esp_cpu_intr_desc_t*.

The interrupt is a special interrupt (e.g., a CPU timer interrupt)

ESP_CPU_INTR_DESC_FLAG_RESVD

The interrupt is reserved for internal use

Type Definitions

typedef uint32_t **esp_cpu_cycle_count_t**

CPU cycle count type.

This data type represents the CPU’ s clock cycle count

typedef void (***esp_cpu_intr_handler_t**)(void *arg)

CPU interrupt handler type.

Enumerations

enum **esp_cpu_intr_type_t**

CPU interrupt type.

Values:

enumerator **ESP_CPU_INTR_TYPE_LEVEL**

enumerator **ESP_CPU_INTR_TYPE_EDGE**

enumerator **ESP_CPU_INTR_TYPE_NA**

enum **esp_cpu_watchpoint_trigger_t**

CPU watchpoint trigger type.

Values:

enumerator **ESP_CPU_WATCHPOINT_LOAD**

enumerator **ESP_CPU_WATCHPOINT_STORE**

enumerator **ESP_CPU_WATCHPOINT_ACCESS**

2.10.18 空中升级 (OTA)

OTA 流程概览

OTA 升级机制可以让设备在固件正常运行时根据接收数据（如通过 Wi-Fi 或蓝牙）进行自我更新。

要运行 OTA 机制，需配置设备的分区表，该分区表至少包括两个 OTA 应用程序分区（即 *ota_0* 和 *ota_1*）和一个 OTA 数据分区。

OTA 功能启动后，向当前未用于启动的 OTA 应用分区写入新的应用固件镜像。镜像验证后，OTA 数据分区更新，指定在下一次启动时使用该镜像。

OTA 数据分区

所有使用 OTA 功能项目，其分区表 必须包含一个 OTA 数据分区（类型为 `data`，子类型为 `ota`）。

工厂启动设置下，OTA 数据分区中应没有数据（所有字节擦写成 0xFF）。如果分区表中有工厂应用程序，ESP-IDF 软件引导加载程序会启动工厂应用程序。如果分区表中没有工厂应用程序，则启动第一个可用的 OTA 分区（通常是 `ota_0`）。

第一次 OTA 升级后，OTA 数据分区更新，指定下一次启动哪个 OTA 应用程序分区。

OTA 数据分区是两个 0x2000 字节大小的 flash 扇区，防止写入时电源故障引发问题。两个扇区单独擦除、写入匹配数据，若存在不一致，则用计数器字段判定哪个扇区为最新数据。

应用程序回滚

应用程序回滚的主要目的是确保设备在更新后正常工作。如果新版应用程序出现严重错误，该功能可使设备回滚到之前正常运行的应用版本。在使能回滚并且 OTA 升级应用程序至新版本后，可能出现的结果如下：

- 应用程序运行正常，*esp_ota_mark_app_valid_cancel_rollback()* 将正在运行的应用程序状态标记为 ESP_OTA_IMG_VALID，启动此应用程序无限制。
- 应用程序出现严重错误，无法继续工作，必须回滚到此前的版本，*esp_ota_mark_app_invalid_rollback_and_reboot()* 将正在运行的版本标记为 ESP_OTA_IMG_INVALID 然后复位。引导加载程序不会选取此版本，而是启动此前正常运行的版本。
- 如果*CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* 使能，则无需调用函数便可复位，回滚至之前的应用版本。

注解：应用程序的状态不是写到程序的二进制镜像，而是写到 otadata 分区。该分区有一个 ota_seq 计数器，该计数器是 OTA 应用分区的指针，指向下次启动时选取应用所在的分区 (ota_0, ota_1, ···)。

应用程序 OTA 状态 状态控制了选取启动应用程序的过程：

状态	引导加载程序选取启动应用程序的限制
ESP_OTA_IMG_VALID	没有限制，可以选取。
ESP_OTA_IMG_UNDEFINED	没有限制，可以选取。
ESP_OTA_IMG_INVALID	不会选取。
ESP_OTA_IMG_ABORTED	不会选取。
ESP_OTA_IMG_NEW	如使能*CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*，则仅会选取一次。在引导加载程序中，状态立即变为 ESP_OTA_IMG_PENDING_VERIFY。
ESP_OTA_IMG_PENDING_VERIFY	如使能*CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*，则不会选取，状态变为 “ESP_OTA_IMG_ABORTED“。

如果*CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* 没有使能（默认情况），则*esp_ota_mark_app_valid_cancel_rollback()* 和*esp_ota_mark_app_invalid_rollback_and_reboot()* 为可选功能，ESP_OTA_IMG_NEW 和 ESP_OTA_IMG_PENDING_VERIFY 不会使用。

Kconfig 中的*CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* 可以帮助用户追踪新版应用程序的第一次启动。应用程序需调用*esp_ota_mark_app_valid_cancel_rollback()* 函数确认可以运行，否则将会在重启时回滚至旧版本。该功能可让用户在启动阶段控制应用程序的可操作性。新版应用程序仅有一次机会尝试是否能成功启动。

回滚过程 *CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* 使能时，回滚过程如下：

- 新版应用程序下载成功，*esp_ota_set_boot_partition()* 函数将分区设为可启动，状态设为 ESP_OTA_IMG_NEW。该状态表示应用程序为新版本，第一次启动需要监测。
- 重新启动*esp_restart()*。
- 引导加载程序检查 ESP_OTA_IMG_PENDING_VERIFY 状态，如有设置，则将其写入 ESP_OTA_IMG_ABORTED。
- 引导加载程序选取一个新版应用程序来引导，这样应用程序状态就不会设置为 ESP_OTA_IMG_INVALID 或 ESP_OTA_IMG_ABORTED。
- 引导加载程序检查所选取的新版应用程序，若状态设置为 ESP_OTA_IMG_NEW，则写入 ESP_OTA_IMG_PENDING_VERIFY。该状态表示，需确认应用程序的可操作性，如不确认，发生重启，则状态会重写为 ESP_OTA_IMG_ABORTED （见上文），该应用程序不可再启动，将回滚至上一版本。

- 新版应用程序启动，应进行自测。
- 若通过自测，则必须调用函数*esp_ota_mark_app_valid_cancel_rollback()*，因为新版应用程序在等待确认其可操作性 (ESP_OTA_IMG_PENDING_VERIFY 状态)。
- 若未通过自测，则调用函数*esp_ota_mark_app_invalid_rollback_and_reboot()*，回滚至之前能正常工作的应用程序版本，同时将无效的新版本应用程序设置为 ESP_OTA_IMG_INVALID。
- 如果新版应用程序可操作性没有确认，则状态一直为 ESP_OTA_IMG_PENDING_VERIFY。下一次启动时，状态变更为 ESP_OTA_IMG_ABORTED，阻止其再次启动，之后回滚到之前的版本。

意外复位 如果在新版应用第一次启动时发生断电或意外崩溃，则会回滚至之前正常运行的版本。

建议：尽快完成自测，防止因断电回滚。

只有 OTA 分区可以回滚。工厂分区不会回滚。

启动无效/中止的应用程序 用户可以启动此前设置为 ESP_OTA_IMG_INVALID 或 ESP_OTA_IMG_ABORTED 的应用程序：

- 获取最后一个无效应用分区*esp_ota_get_last_invalid_partition()*。
- 将获取的分区传递给*esp_ota_set_boot_partition()*，更新 otadata。
- 重启*esp_restart()*。引导加载程序会启动指定应用程序。

要确定是否在应用程序启动时进行自测，可以调用*esp_ota_get_state_partition()* 函数。如果结果为 ESP_OTA_IMG_PENDING_VERIFY，则需要自测，后续确认应用程序的可操作性。

如何设置状态 下文简单描述了如何设置应用程序状态：

- ESP_OTA_IMG_VALID 由函数*esp_ota_mark_app_valid_cancel_rollback()* 设置。
- 如果*CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* 没有使能，ESP_OTA_IMG_UNDEFINED 由函数*esp_ota_set_boot_partition()* 设置。
- 如果*CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* 没有使能，ESP_OTA_IMG_NEW 由函数*esp_ota_set_boot_partition()* 设置。
- ESP_OTA_IMG_INVALID 由函数*esp_ota_mark_app_invalid_rollback_and_reboot()* 设置。
- 如果应用程序的可操作性无法确认，发生重启（*CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* 使能），则设置 ESP_OTA_IMG_ABORTED。
- 如果*CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* 使能，选取的应用程序状态为 ESP_OTA_IMG_NEW，则在引导加载程序中设置 ESP_OTA_IMG_PENDING_VERIFY。

防回滚

防回滚机制可以防止回滚到安全版本号低于芯片 eFuse 中烧录程序的应用程序版本。

设置*CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*，启动防回滚机制。在引导加载程序中选取可启动的应用程序，会额外检查芯片和应用程序镜像的安全版本号。可启动固件中的应用安全版本号必须等于或高于芯片中的应用安全版本号。

CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK 和*CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* 一起使用。此时，只有安全版本号等于或高于芯片中的应用安全版本号时才会回滚。

典型的防回滚机制

- 新发布的固件解决了此前版本的安全问题。
- 开发者在确保固件可以运行之后，增加安全版本号，发布固件。
- 下载新版应用程序。
- 运行函数*esp_ota_set_boot_partition()*，将新版应用程序设为可启动。如果新版应用程序的安全版本号低于芯片中的应用安全版本号，新版应用程序会被擦除，无法更新到新固件。
- 重新启动。

- 在引导加载程序中选取安全版本号等于或高于芯片中应用安全版本号的应用程序。如果 otadata 处于初始阶段，通过串行通道加载了安全版本号高于芯片中应用安全版本号的固件，则引导加载程序中 eFuse 的安全版本号会立即更新。
- 新版应用程序启动，之后进行可操作性检测，如果通过检测，则调用函数*esp_ota_mark_app_valid_cancel_rollback()*，将应用程序标记为 ESP_OTA_IMG_VALID，更新芯片中应用程序的安全版本号。注意，如果调用函数*esp_ota_mark_app_invalid_rollback_and_reboot()*，可能会因为设备中没有可启动的应用程序而回滚失败，返回 ESP_ERR_OTA_ROLLBACK_FAILED 错误，应用程序状态一直为 ESP_OTA_IMG_PENDING_VERIFY。
- 如果运行的应用程序处于 ESP_OTA_IMG_VALID 状态，则可再次更新。

建议：

如果想避免因服务器应用程序的安全版本号低于运行的应用程序，造成不必要的下载和擦除，必须从镜像的第一个包中获取 new_app_info.secure_version，和 eFuse 的安全版本号比较。如果 esp_efuse_check_secure_version(new_app_info.secure_version) 函数为真，则下载继续，反之则中断。

```
....
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_
↪header_t) + sizeof(esp_app_desc_t)) {
                // check current version with downloading
                if (esp_efuse_check_secure_version(new_app_info.secure_version) ==␣
↪false) {
                    ESP_LOGE(TAG, "This a new app can not be downloaded due to a␣
↪secure version is lower than stored in efuse.");
                    http_cleanup(client);
                    task_fatal_error();
                }

                image_header_was_checked = true;

                esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
            }
        }
        esp_ota_write( update_handle, (const void *)ota_write_data, data_read);
    }
}
...
```

限制：

- secure_version 字段最多有 16 位。也就是说，防回滚最多可以做 16 次。用户可以使用*CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD* 减少该 eFuse 字段的长度。
- 防回滚不支持工厂和测试分区，因此分区表中不应有设置为 工厂或 测试的分区。

security_version:

- 存储在应用程序镜像中的 esp_app_desc 里。版本号用*CONFIG_BOOTLOADER_APP_SECURE_VERSION* 设置。

没有安全启动的安全 OTA 升级

即便硬件安全启动没有使能，也可验证已签名的 OTA 升级。可通过设置*CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT* 和*CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT* 实现。

OTA 工具 (otatool.py)

app_update 组件中有 otatool.py 工具，用于在目标设备上完成下列 OTA 分区相关操作：

- 读取 otadata 分区 (read_otadata)
- 擦除 otadata 分区，将设备复位至工厂应用程序 (erase_otadata)
- 切换 OTA 分区 (switch_ota_partition)
- 擦除 OTA 分区 (erase_ota_partition)
- 写入 OTA 分区 (write_ota_partition)
- 读取 OTA 分区 (read_ota_partition)

用户若想通过编程方式完成相关操作，可从另一个 Python 脚本导入并使用该 OTA 工具，或者从 Shell 脚本调用该 OTA 工具。前者可使用工具的 Python API，后者可使用命令行界面。

Python API 首先，确保已导入 *otatool* 模块。

```
import sys
import os

idf_path = os.environ["IDF_PATH"]  # 从环境中获取 IDF_PATH 的值
otatool_dir = os.path.join(idf_path, "components", "app_update")  # otatool.py␣
↪位于 $IDF_PATH/components/app_update 下

sys.path.append(otatool_dir)  # 使能 Python 寻找 otatool 模块
from otatool import *  # 导入 otatool 模块内的所有名称
```

要使用 OTA 工具的 Python API，第一步是创建 *OtatoolTarget* 对象：

```
# 创建 partool.py 的目标设备，并将目标设备连接到串行端口 /dev/ttyUSB1
target = OtatoolTarget("/dev/ttyUSB1")
```

现在，可使用创建的 *OtatoolTarget* 在目标设备上完成操作：

```
# 擦除 otadata，将设备复位至工厂应用程序
target.erase_otadata()

# 擦除 OTA 应用程序分区 0
target.erase_ota_partition(0)

# 将启动分区切换至 OTA 应用程序分区 1
target.switch_ota_partition(1)

# 读取 OTA 分区 'ota_3'，将内容保存至文件 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

要操作的 OTA 分区通过应用程序分区序号或分区名称指定。

更多关于 Python API 的信息，请查看 OTA 工具的代码注释。

命令行界面 *otatool.py* 的命令行界面具有如下结构：

```
otatool.py [command-args] [subcommand] [subcommand-args]

- command-args - 执行主命令 (otatool.py) 所需的实际参数，多与目标设备有关
- subcommand - 要执行的操作
- subcommand-args - 所选操作的实际参数
```

```
# 擦除 otadata，将设备复位至工厂应用程序
otatool.py --port "/dev/ttyUSB1" erase_otadata

# 擦除 OTA 应用程序分区 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0

# 将启动分区切换至 OTA 应用程序分区 1
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1

# 读取 OTA 分区 'ota_3'，将内容保存至文件 'ota_3.bin'
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin
```

更多信息可用 *–help* 指令查看：

```
# 显示可用的子命令和主命令描述
otatool.py --help

# 显示子命令的描述
otatool.py [subcommand] --help
```

API 参考

Header File

- components/app_update/include/esp_ota_ops.h

Functions

const *esp_app_desc_t* ***esp_ota_get_app_description**(void)

Return esp_app_desc structure. This structure includes app version.

Return description for running app.

返回 Pointer to esp_app_desc structure.

int **esp_ota_get_app_elf_sha256**(char *dst, size_t size)

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

参数

- **dst** –Destination buffer
- **size** –Size of the buffer

返回 Number of bytes written to dst (including null terminator)

esp_err_t **esp_ota_begin**(const *esp_partition_t* *partition, size_t image_size, *esp_ota_handle_t* *out_handle)

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass OTA_SIZE_UNKNOWN which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until esp_ota_end() is called with the returned handle.

Note: If the rollback option is enabled and the running application has the ESP_OTA_IMG_PENDING_VERIFY state then it will lead to the ESP_ERR_OTA_ROLLBACK_INVALID_STATE error. Confirm the running app before to run download a new app, use esp_ota_mark_app_valid_cancel_rollback() function for it (this should be done as early as possible when you first download a new application).

参数

- **partition** –Pointer to info for partition which will receive the OTA update. Required.
- **image_size** –Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or OTA_SIZE_UNKNOWN, the entire partition is erased.
- **out_handle** –On success, returns a handle which should be used for subsequent esp_ota_write() and esp_ota_end() calls.

返回

- ESP_OK: OTA operation commenced successfully.
- ESP_ERR_INVALID_ARG: partition or out_handle arguments were NULL, or partition doesn’t point to an OTA app partition.
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_OTA_PARTITION_CONFLICT: Partition holds the currently running firmware, cannot update in place.
- ESP_ERR_NOT_FOUND: Partition argument not found in partition table.
- ESP_ERR_OTA_SELECT_INFO_INVALID: The OTA data partition contains invalid data.
- ESP_ERR_INVALID_SIZE: Partition doesn’t fit in configured flash size.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_ROLLBACK_INVALID_STATE: If the running app has not confirmed state. Before performing an update, the application must be valid.

esp_err_t **esp_ota_write**(*esp_ota_handle_t* handle, const void *data, size_t size)

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

参数

- **handle** –Handle obtained from esp_ota_begin
- **data** –Data buffer to write
- **size** –Size of data buffer in bytes.

返回

- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

esp_err_t **esp_ota_write_with_offset**(*esp_ota_handle_t* handle, const void *data, size_t size, uint32_t offset)

Write OTA update data to partition at an offset.

This function can write data in non-contiguous manner. If flash encryption is enabled, data should be 16 bytes aligned.

备注： While performing OTA, if the packets arrive out of order, esp_ota_write_with_offset() can be used to write data in non-contiguous manner. Use of esp_ota_write_with_offset() in combination with esp_ota_write() is not recommended.

参数

- **handle** –Handle obtained from esp_ota_begin
- **data** –Data buffer to write
- **size** –Size of data buffer in bytes
- **offset** –Offset in flash partition

返回

- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

esp_err_t **esp_ota_end**(*esp_ota_handle_t* handle)

Finish OTA update and validate newly written app image.

备注： After calling esp_ota_end(), the handle is no longer valid and any memory associated with it is freed (regardless of result).

参数 **handle** –Handle obtained from esp_ota_begin().

返回

- ESP_OK: Newly written OTA app image is valid.
- ESP_ERR_NOT_FOUND: OTA handle was not found.
- ESP_ERR_INVALID_ARG: Handle was never written to.
- ESP_ERR_OTA_VALIDATE_FAILED: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- ESP_ERR_INVALID_STATE: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

esp_err_t **esp_ota_abort**(*esp_ota_handle_t* handle)

Abort OTA update, free the handle and memory associated with it.

参数 **handle** –obtained from esp_ota_begin().

返回

- ESP_OK: Handle and its associated memory is freed successfully.
- ESP_ERR_NOT_FOUND: OTA handle was not found.

esp_err_t **esp_ota_set_boot_partition**(const *esp_partition_t* *partition)

Configure OTA data for a new boot partition.

备注： If this function returns ESP_OK, calling esp_restart() will boot the newly configured app partition.

参数 **partition** –Pointer to info for partition containing app image to boot.

返回

- ESP_OK: OTA data updated, next reboot will use specified partition.

- ESP_ERR_INVALID_ARG: partition argument was NULL or didn’t point to a valid OTA partition of type “app”.
- ESP_ERR_OTA_VALIDATE_FAILED: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- ESP_ERR_NOT_FOUND: OTA data partition not found.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash erase or write failed.

const *esp_partition_t* ***esp_ota_get_boot_partition**(void)

Get partition info of currently configured boot app.

If esp_ota_set_boot_partition() has been called, the partition which was set by that function will be returned.

If esp_ota_set_boot_partition() has not been called, the result is usually the same as esp_ota_get_running_partition(). The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use esp_image_verify(ESP_IMAGE_VERIFY, ···) to verify if the returned partition contains a bootable image.

返回 Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

const *esp_partition_t* ***esp_ota_get_running_partition**(void)

Get partition info of currently running app.

This function is different to esp_ota_get_boot_partition() in that it ignores any change of selected boot partition caused by esp_ota_set_boot_partition(). Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from esp_ota_get_boot_partition() if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

返回 Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

const *esp_partition_t* ***esp_ota_get_next_update_partition**(const *esp_partition_t* *start_from)

Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to esp_ota_begin().

Finds next partition round-robin, starting from the current running partition.

参数 **start_from** –If set, treat this partition info as describing the current running partition. Can be NULL, in which case esp_ota_get_running_partition() is used to find the currently running partition. The result of this function is never the same as this argument.

返回 Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

esp_err_t **esp_ota_get_partition_description**(const *esp_partition_t* *partition, *esp_app_desc_t* *app_desc)

Returns esp_app_desc structure for app partition. This structure includes app version.

Returns a description for the requested app partition.

参数

- **partition** –**[in]** Pointer to app partition. (only app partition)
- **app_desc** –**[out]** Structure of info about app.

返回

- ESP_OK Successful.

- ESP_ERR_NOT_FOUND app_desc structure is not found. Magic word is incorrect.
- ESP_ERR_NOT_SUPPORTED Partition is not application.
- ESP_ERR_INVALID_ARG Arguments is NULL or if partition ' s offset exceeds partition size.
- ESP_ERR_INVALID_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

uint8_t **esp_ota_get_app_partition_count**(void)

Returns number of ota partitions provided in partition table.

返回

- Number of OTA partitions

esp_err_t **esp_ota_mark_app_valid_cancel_rollback**(void)

This function is called to indicate that the running app is working well.

返回

- ESP_OK: if successful.

esp_err_t **esp_ota_mark_app_invalid_rollback_and_reboot**(void)

This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

返回

- ESP_FAIL: if not successful.
- ESP_ERR_OTA_ROLLBACK_FAILED: The rollback is not possible due to flash does not have any apps.

const *esp_partition_t* ***esp_ota_get_last_invalid_partition**(void)

Returns last partition with invalid state (ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED).

返回 partition.

esp_err_t **esp_ota_get_state_partition**(const *esp_partition_t* *partition, esp_ota_img_states_t *ota_state)

Returns state for given partition.

参数

- **partition** –**[in]** Pointer to partition.
- **ota_state** –**[out]** state of partition (if this partition has a record in otadata).

返回

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: partition or ota_state arguments were NULL.
- ESP_ERR_NOT_SUPPORTED: partition is not ota.
- ESP_ERR_NOT_FOUND: Partition table does not have otadata or state was not found for given partition.

esp_err_t **esp_ota_erase_last_boot_app_partition**(void)

Erase previous boot app partition and corresponding otadata select for this partition.

When current app is marked to as valid then you can erase previous app partition.

返回

- ESP_OK: Successful, otherwise ESP_ERR.

bool **esp_ota_check_rollback_is_possible**(void)

Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in otadata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure_version of app >= secure_version of efuse (if anti-rollback is enabled).

返回

- True: Returns true if the slots have at least one app (except the running app).
- False: The rollback is not possible.

esp_err_t **esp_ota_revoke_secure_boot_public_key**(*esp_ota_secure_boot_public_key_index_t* index)

Revokes the old signature digest. To be called in the application after the rollback logic.

Relevant for Secure boot v2 on ESP32-S2, ESP32-S3, ESP32-C3, ESP32-H2 where upto 3 key digests can be stored (Key #N-1, Key #N, Key #N+1). When key #N-1 used to sign an app is invalidated, an OTA update is to be sent with an app signed with key #N-1 & Key #N. After successfully booting the OTA app should call this function to revoke Key #N-1.

参数 **index** -- The index of the signature block to be revoked

返回

- ESP_OK: If revocation is successful.
- ESP_ERR_INVALID_ARG: If the index of the public key to be revoked is incorrect.
- ESP_FAIL: If secure boot v2 has not been enabled.

Macros

OTA_SIZE_UNKNOWN

Used for esp_ota_begin() if new image size is unknown

OTA_WITH_SEQUENTIAL_WRITES

Used for esp_ota_begin() if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)

ESP_ERR_OTA_BASE

Base error code for ota_ops api

ESP_ERR_OTA_PARTITION_CONFLICT

Error if request was to write or erase the current running partition

ESP_ERR_OTA_SELECT_INFO_INVALID

Error if OTA data partition contains invalid content

ESP_ERR_OTA_VALIDATE_FAILED

Error if OTA app image is invalid

ESP_ERR_OTA_SMALL_SEC_VER

Error if the firmware has a secure version less than the running firmware.

ESP_ERR_OTA_ROLLBACK_FAILED

Error if flash does not have valid firmware in passive partition and hence rollback is not possible

ESP_ERR_OTA_ROLLBACK_INVALID_STATE

Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

Type Definitions

typedef uint32_t **esp_ota_handle_t**

Opaque handle for an application OTA update.

esp_ota_begin() returns a handle which is then used for subsequent calls to esp_ota_write() and esp_ota_end().

Enumerations

enum **esp_ota_secure_boot_public_key_index_t**

Secure Boot V2 public key indexes.

Values:

enumerator **SECURE_BOOT_PUBLIC_KEY_INDEX_0**

Points to the 0th index of the Secure Boot v2 public key

enumerator **SECURE_BOOT_PUBLIC_KEY_INDEX_1**

Points to the 1st index of the Secure Boot v2 public key

enumerator **SECURE_BOOT_PUBLIC_KEY_INDEX_2**

Points to the 2nd index of the Secure Boot v2 public key

OTA 升级失败排查

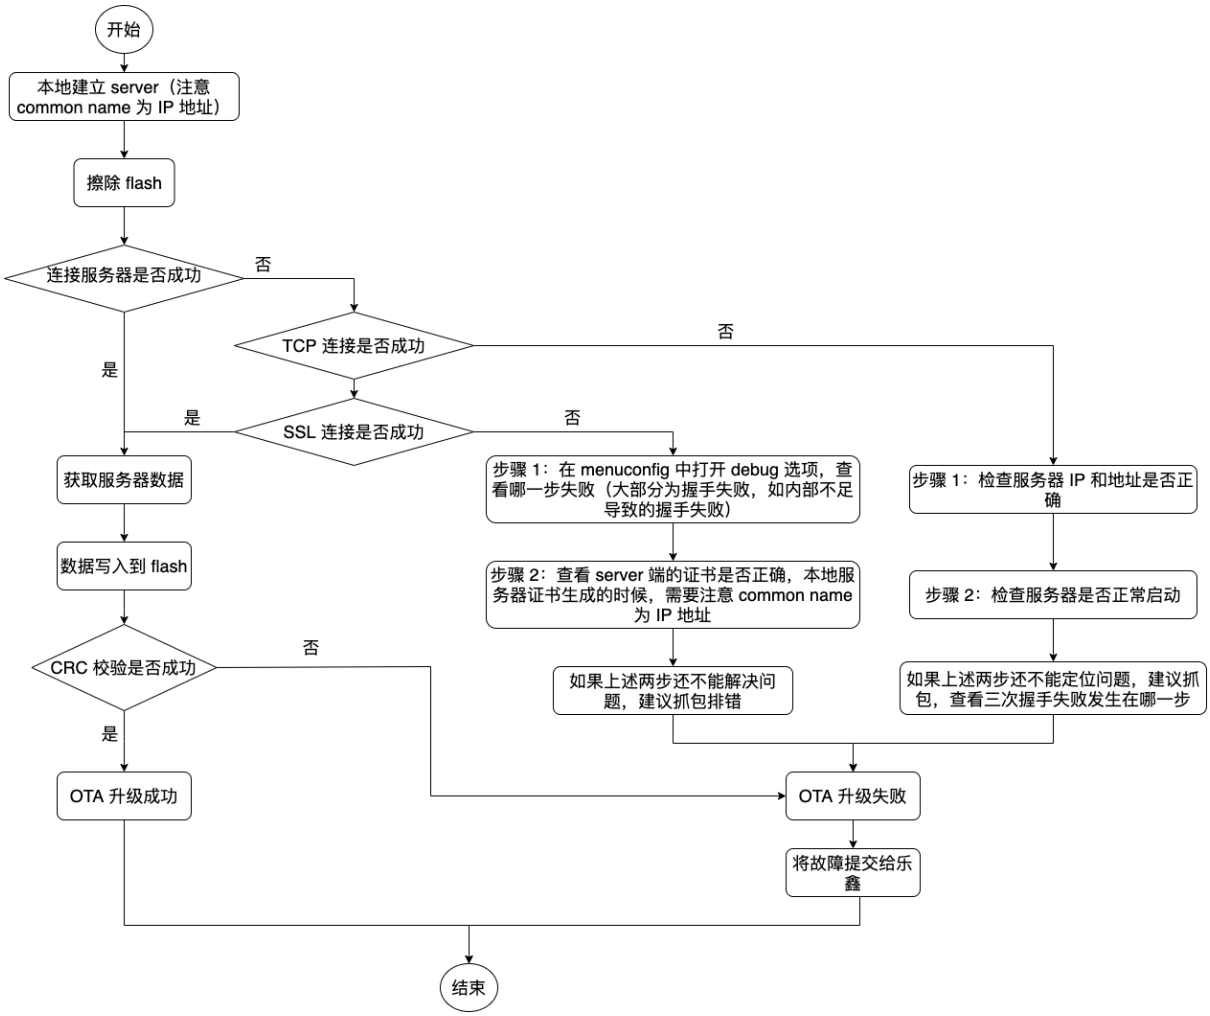

图 31: OTA 升级失败时如何排查（点击放大）

2.10.19 电源管理

概述

ESP-IDF 中集成的电源管理算法可以根据应用程序组件的需求，调整外围总线 (APB) 频率和 CPU 频率，并使芯片进入 Light-sleep 模式，尽可能减少运行应用程序的功耗。

应用程序组件可以通过创建和获取电源管理锁来控制功耗。

例如：

- 对于从 APB 获得时钟频率的外设，其驱动可以要求在使用该外设时，将 APB 频率设置为 80 MHz。
- RTOS 可以要求 CPU 在有任务准备开始运行时以最高配置频率工作。
- 一些外设可能需要中断才能启用，因此其驱动也会要求禁用 Light-sleep 模式。

请求较高的 APB 频率或 CPU 频率以及禁用 Light-sleep 模式会增加功耗，因此请将组件使用的电源管理锁降到最少。

电源管理配置

编译时可使用*CONFIG_PM_ENABLE* 选项启用电源管理功能。

启用电源管理功能将会增加中断延迟。额外延迟与多个因素有关，例如：CPU 频率、单/双核模式、是否需要进行频率切换等。CPU 频率为 240 MHz 且未启用频率调节时，最小额外延迟为 0.2 us；如果启用频率调节，且在中断入口将频率由 40 MHz 调节至 80 MHz，则最大额外延迟为 40 us。

通过调用`esp_pm_configure()` 函数可以在应用程序中启用动态调频 (DFS) 功能和自动 Light-sleep 模式。此函数的参数`esp_pm_config_esp32c3_t` 定义了频率调节的相关设置。在此参数结构中，需要初始化以下三个字段：

- `max_freq_mhz`：最大 CPU 频率 (MHz)，即获取 `ESP_PM_CPU_FREQ_MAX` 锁后所使用的频率。该字段通常设置为*CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ*。
- `min_freq_mhz`：最小 CPU 频率 (MHz)，即仅获取 `ESP_PM_APB_FREQ_MAX` 锁后所使用的频率。该字段可设置为晶振 (XTAL) 频率值，或者 XTAL 频率值除以整数。注意，10 MHz 是生成 1 MHz 的 REF_TICK 默认时钟所需的最小频率。
- `light_sleep_enable`：没有获取任何管理锁时，决定系统是否需要自动进入 Light-sleep 状态 (`true`/`false`)。
  如果在 menuconfig 中启用了*CONFIG_PM_DFS_INIT_AUTO* 选项，最大 CPU 频率将由*CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ* 设置决定，最小 CPU 频率将锁定为 XTAL 频率。

备注： 自动 Light-sleep 模式基于 FreeRTOS Tickless Idle 功能，因此如果在 menuconfig 中没有启用*CONFIG_FREERTOS_USE_TICKLESS_IDLE* 选项，在请求自动 Light-sleep 时，`esp_pm_configure()` 将会返回 *ESP_ERR_NOT_SUPPORTED* 错误。

备注： Light-sleep 状态下，外设设有时钟门控，不会产生来自 GPIO 和内部外设的中断。睡眠模式 文档中所提到的唤醒源可用于从 Light-sleep 状态触发唤醒。

电源管理锁

应用程序可以通过获取或释放管理锁来控制电源管理算法。应用程序获取电源管理锁后，电源管理算法的操作将受到下面的限制。释放电源管理锁后，限制解除。

电源管理锁设有获取/释放计数器，如果已多次获取电源管理锁，则需要将电源管理锁释放相同次数以解除限制。

ESP32-C3 支持下表中三种电源管理锁。

电源管理锁	描述
ESP_PM_CPU_FREQ_MAX	请求使用*esp_pm_configure()* 将 CPU 频率设置为最大值。ESP32-C3 可以将该值设置为 80 MHz、160 MHz 或 240 MHz。
ESP_PM_APB_FREQ_MAX	请求将 APB 频率设置为最大值，ESP32-C3 支持的最大频率为 80 MHz。
ESP_PM_NO_LIGHT_SLEEP	禁止自动切换至 Light-sleep 模式。

ESP32-C3 电源管理算法

下表列出了启用动态调频时如何切换 CPU 频率和 APB 频率。您可以使用*esp_pm_configure()* 或者*CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ* 指定 CPU 最大频率。

CPU 最高频率	电源管理锁获取情况	APB 频率和 CPU 频率
240	获取 ESP_PM_CPU_FREQ_MAX	CPU: 240 MHz APB: 80 MHz
	获取 ESP_PM_APB_FREQ_MAX，未获得 ESP_PM_CPU_FREQ_MAX	CPU: 80 MHz APB: 80 MHz
	无	使用*esp_pm_configure()* 为二者设置最小值
160	获取 ESP_PM_CPU_FREQ_MAX	CPU: 160 MHz APB: 80 MHz
	获取 ESP_PM_APB_FREQ_MAX，未获得 ESP_PM_CPU_FREQ_MAX	CPU: 80 MHz APB: 80 MHz
	无	使用*esp_pm_configure()* 为二者设置最小值
80	获取 ESP_PM_CPU_FREQ_MAX 或 ESP_PM_APB_FREQ_MAX	CPU: 80 MHz APB: 80 MHz
	无	使用*esp_pm_configure()* 为二者设置最小值

如果没有获取任何管理锁，调用*esp_pm_configure()* 将启动 Light-sleep 模式。Light-sleep 模式持续时间由以下因素决定：

- 处于阻塞状态的 FreeRTOS 任务数（有限超时）
- 高分辨率定时器 API 注册的计数器数量

您也可以设置 Light-sleep 模式在最近事件（任务解除阻塞，或计时器超时）之前持续多久才唤醒芯片。

为了跳过不必要的唤醒，可以将 *skip_unhandled_events* 选项设置为 true 来初始化 esp_timer。带有此标志的定时器不会唤醒系统，有助于减少功耗。

动态调频和外设驱动

启用动态调频后，APB 频率可在一个 RTOS 滴答周期内多次更改。有些外设不受 APB 频率变更的影响，但有些外设可能会出现问题。例如，Timer Group 外设定时器会继续计数，但定时器计数的速度将随 APB 频率的变更而变更。

以下外设不受 APB 频率变更的影响：

- **UART**：如果 REF_TICK 或者 XTAL 用作时钟源，则 UART 不受 APB 频率变更影响。请查看*uart_config_t::source_clk*。
- **LEDC**：如果 REF_TICK 用作时钟源，则 LEDC 不受 APB 频率变更影响。请查看*ledc_timer_config()* 函数。
- **RMT**：如果 REF_TICK 或者 XTAL 被用作时钟源，则 RMT 不受 APB 频率变更影响。请查看 `rmt_config_t::flags` 以及 *RMT_CHANNEL_FLAGS_AWARE_DFS* 宏。
- **GPTimer**：如果 XTAL 用作时钟源，则 GPTimer 不受 APB 频率变更影响。请查看*gptimer_config_t::clk_src*。
- **TSENS**：XTAL 或 RTC_8M 用作时钟源，因此不受 APB 频率变化影响。

目前以下外设驱动程序可感知动态调频，并在调频期间使用 `ESP_PM_APB_FREQ_MAX` 锁：

- SPI master
- I2C
- I2S（如果 APLL 锁在使用中，I2S 则会启用 `ESP_PM_NO_LIGHT_SLEEP` 锁）
- SDMMC

启用以下驱动程序时，将占用 `ESP_PM_APB_FREQ_MAX` 锁：

- **SPI slave**：从调用*spi_slave_initialize()* 至*spi_slave_free()* 期间。
- **Ethernet**：从调用 `esp_eth_driver_install()` 至 `esp_eth_driver_uninstall()` 期间。
- **WiFi**：从调用*esp_wifi_start()* 至*esp_wifi_stop()* 期间。如果启用了调制解调器睡眠模式，广播关闭时将释放此管理锁。
- **TWAI**：从调用*twai_driver_install()* 至*twai_driver_uninstall()* 期间。
- **Bluetooth**：从调用*esp_bt_controller_enable()* 至*esp_bt_controller_disable()* 期间。如果启用了蓝牙调制解调器，广播关闭时将释放此管理锁。但依然占用 `ESP_PM_NO_LIGHT_SLEEP` 锁。

以下外设驱动程序无法感知动态调频，应用程序需自己获取/释放管理锁：

- PCNT
- Sigma-delta
- 旧版定时器驱动（Timer Group）

API 参考

Header File

- components/esp_pm/include/esp_pm.h

Functions

esp_err_t **esp_pm_configure**(const void *config)

Set implementation-specific power management configuration.

参数 **config** – pointer to implementation-specific configuration structure (e.g. esp_pm_config_esp32)

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the configuration values are not correct
- ESP_ERR_NOT_SUPPORTED if certain combination of values is not supported, or if CONFIG_PM_ENABLE is not enabled in sdkconfig

esp_err_t **esp_pm_get_configuration**(void *config)

Get implementation-specific power management configuration.

参数 **config** –pointer to implementation-specific configuration structure (e.g. esp_pm_config_esp32)

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the pointer is null

esp_err_t **esp_pm_lock_create**(*esp_pm_lock_type_t* lock_type, int arg, const char *name, *esp_pm_lock_handle_t* *out_handle)

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call esp_pm_lock_acquire to take the lock.

This function must not be called from an ISR.

参数

- **lock_type** –Power management constraint which the lock should control
- **arg** –argument, value depends on lock_type, see esp_pm_lock_type_t
- **name** –arbitrary string identifying the lock (e.g. "wifi" or "spi"). Used by the esp_pm_dump_locks function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
- **out_handle** –**[out]** handle returned from this function. Use this handle when calling esp_pm_lock_delete, esp_pm_lock_acquire, esp_pm_lock_release. Must not be NULL.

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if the lock structure can not be allocated
- ESP_ERR_INVALID_ARG if out_handle is NULL or type argument is not valid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

esp_err_t **esp_pm_lock_acquire**(*esp_pm_lock_handle_t* handle)

Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to esp_pm_lock_create, or any of the lower power modes (higher numeric values of 'mode').

The lock is recursive, in the sense that if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

参数 **handle** –handle obtained from esp_pm_lock_create function

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

esp_err_t **esp_pm_lock_release**(*esp_pm_lock_handle_t* handle)

Release the lock taken using esp_pm_lock_acquire.

Call to this functions removes power management restrictions placed when taking the lock.

Locks are recursive, so if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

参数 **handle** –handle obtained from esp_pm_lock_create function

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if lock is not acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

esp_err_t **esp_pm_lock_delete**(*esp_pm_lock_handle_t* handle)

Delete a lock created using esp_pm_lock.

The lock must be released before calling this function.

This function must not be called from an ISR.

参数 **handle** –handle obtained from esp_pm_lock_create function

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle argument is NULL
- ESP_ERR_INVALID_STATE if the lock is still acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

esp_err_t **esp_pm_dump_locks**(FILE *stream)

Dump the list of all locks to stderr

This function dumps debugging information about locks created using esp_pm_lock_create to an output stream.

This function must not be called from an ISR. If esp_pm_lock_acquire/release are called while this function is running, inconsistent results may be reported.

参数 **stream** –stream to print information to; use stdout or stderr to print to the console; use fmemopen/open_memstream to print to a string buffer.

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

Type Definitions

typedef struct esp_pm_lock ***esp_pm_lock_handle_t**

Opaque handle to the power management lock.

Enumerations

enum **esp_pm_lock_type_t**

Power management constraints.

Values:

enumerator **ESP_PM_CPU_FREQ_MAX**

Require CPU frequency to be at the maximum value set via esp_pm_configure. Argument is unused and should be set to 0.

enumerator **ESP_PM_APB_FREQ_MAX**

Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

enumerator **ESP_PM_NO_LIGHT_SLEEP**

Prevent the system from going into light sleep. Argument is unused and should be set to 0.

Header File

- components/esp_pm/include/esp32c3/pm.h

Structures

struct **esp_pm_config_esp32c3_t**

Power management config for ESP32C3.

Pass a pointer to this structure as an argument to esp_pm_configure function.

Public Members

int **max_freq_mhz**

Maximum CPU frequency, in MHz

int **min_freq_mhz**

Minimum CPU frequency to use when no locks are taken, in MHz

bool **light_sleep_enable**

Enter light sleep when no locks are taken

2.10.20 POSIX Threads Support

Overview

ESP-IDF is based on FreeRTOS but offers a range of POSIX-compatible APIs that allow easy porting of third party code. This includes support for common parts of the POSIX Threads "pthreads" API.

POSIX Threads are implemented in ESP-IDF as wrappers around equivalent FreeRTOS features. The runtime memory or performance overhead of using the pthreads API is quite low, but not every feature available in either pthreads or FreeRTOS is available via the ESP-IDF pthreads support.

Pthreads can be used in ESP-IDF by including standard `pthread.h` header, which is included in the toolchain libc. An additional ESP-IDF specific header, `esp_pthread.h`, provides additional non-POSIX APIs for using some ESP-IDF features with pthreads.

C++ Standard Library implementations for `std::thread`, `std::mutex`, `std::condition_variable`, etc. are implemented using pthreads (via GCC libstdc++). Therefore, restrictions mentioned here also apply to the equivalent C++ standard library functionality.

RTOS Integration

Unlike many operating systems using POSIX Threads, ESP-IDF is a real-time operating system with a real-time scheduler. This means that a thread will only stop running if a higher priority task is ready to run, the thread blocks on an OS synchronization structure like a mutex, or the thread calls any of the functions `sleep`, *`vTaskDelay()`*, or `usleep`.

备注: If calling a standard libc or C++ sleep function, such as `usleep` defined in `unistd.h`, then the task will only block and yield the CPU if the sleep time is longer than *one FreeRTOS tick period*. If the time is shorter, the thread will busy-wait instead of yielding to another RTOS task.

By default, all POSIX Threads have the same RTOS priority, but it is possible to change this by calling a *custom API*.

Standard features

The following standard APIs are implemented in ESP-IDF.

Refer to standard POSIX Threads documentation, or pthread.h, for details about the standard arguments and behaviour of each function. Differences or limitations compared to the standard APIs are noted below.

Thread APIs

- `pthread_create()` - The `attr` argument is supported for setting stack size and detach state only. Other attribute fields are ignored. - Unlike FreeRTOS task functions, the `start_routine` function is allowed to return. A "detached" type thread is automatically deleted if the function returns. The default "joinable" type thread will be suspended until pthread_join() is called on it.
- `pthread_join()`
- `pthread_detach()`
- `pthread_exit()`
- `sched_yield()`
- `pthread_self()` - An assert will fail if this function is called from a FreeRTOS task which is not a pthread.
- `pthread_equal()`

Thread Attributes

- `pthread_attr_init()`
- `pthread_attr_destroy()` - This function doesn't need to free any resources and instead resets the `attr` structure to defaults (implementation is same as `pthread_attr_init()`).
- `pthread_attr_getstacksize()` / `pthread_attr_setstacksize()`
- `pthread_attr_getdetachstate()` / `pthread_attr_setdetachstate()`

Once

- `pthread_once()`

Static initializer constant `PTHREAD_ONCE_INIT` is supported.

备注： This function can be called from tasks created using either pthread or FreeRTOS APIs

---

Mutexes POSIX Mutexes are implemented as FreeRTOS Mutex Semaphores (normal type for "fast" or "error check" mutexes, and Recursive type for "recursive" mutexes). This means that they have the same priority inheritance behaviour as mutexes created with `xSemaphoreCreateMutex()`.

- `pthread_mutex_init()`
- `pthread_mutex_destroy()`
- `pthread_mutex_lock()`
- `pthread_mutex_timedlock()`
- `pthread_mutex_trylock()`
- `pthread_mutex_unlock()`
- `pthread_mutexattr_init()`
- `pthread_mutexattr_destroy()`
- `pthread_mutexattr_gettype()` / `pthread_mutexattr_settype()`

Static initializer constant `PTHREAD_MUTEX_INITIALIZER` is supported, but the non-standard static initializer constants for other mutex types are not supported.

备注： These functions can be called from tasks created using either pthread or FreeRTOS APIs

---

Condition Variables

- `pthread_cond_init()` - The `attr` argument is not implemented and is ignored.
- `pthread_cond_destroy()`
- `pthread_cond_signal()`
- `pthread_cond_broadcast()`
- `pthread_cond_wait()`
- `pthread_cond_timedwait()`

Static initializer constant `PTHREAD_COND_INITIALIZER` is supported.

- The resolution of `pthread_cond_timedwait()` timeouts is the RTOS tick period (see *CONFIG_FREERTOS_HZ*). Timeouts may be delayed up to one tick period after the requested timeout.

备注： These functions can be called from tasks created using either pthread or FreeRTOS APIs

---

Read/Write Locks

- `pthread_rwlock_init()` - The `attr` argument is not implemented and is ignored.
- `pthread_rwlock_destroy()`
- `pthread_rwlock_rdlock()`
- `pthread_rwlock_wrlock()`
- `pthread_rwlock_unlock()`

Static initializer constant `PTHREAD_RWLOCK_INITIALIZER` is supported.

备注： These functions can be called from tasks created using either pthread or FreeRTOS APIs

---

Thread-Specific Data

- `pthread_key_create()` - The `destr_function` argument is supported and will be called if a thread function exits normally, calls `pthread_exit()`, or if the underlying task is deleted directly using the FreeRTOS function *`vTaskDelete()`*.
- `pthread_key_delete()`
- `pthread_setspecific()` / `pthread_getspecific()`

备注： These functions can be called from tasks created using either pthread or FreeRTOS APIs

---

备注： There are other options for thread local storage in ESP-IDF, including options with higher performance. See *Thread Local Storage*.

Not Implemented

The `pthread.h` header is a standard header and includes additional APIs and features which are not implemented in ESP-IDF. These include:

- `pthread_cancel()` returns `ENOSYS` if called.
- `pthread_condattr_init()` returns `ENOSYS` if called.

Other POSIX Threads functions (not listed here) are not implemented and will produce either a compiler or a linker error if referenced from an ESP-IDF application. If you identify a useful API that you would like to see implemented in ESP-IDF, please open a *feature request on GitHub <https://github.com/espressif/esp-idf/issues>* with the details.

ESP-IDF Extensions

The API *esp_pthread_set_cfg()* defined in the esp_pthreads.h header offers custom extensions to control how subsequent calls to pthread_create() will behave. Currently, the following configuration can be set:

- Default stack size of new threads, if not specified when calling pthread_create() (overrides *CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT*).
- RTOS priority of new threads (overrides *CONFIG_PTHREAD_TASK_PRIO_DEFAULT*).
- FreeRTOS task name for new threads (overrides *CONFIG_PTHREAD_TASK_NAME_DEFAULT*)

This configuration is scoped to the calling thread (or FreeRTOS task), meaning that *esp_pthread_set_cfg()* can be called independently in different threads or tasks. If the inherit_cfg flag is set in the current configuration then any new thread created will inherit the creator's configuration (if that thread calls pthread_create() recursively), otherwise the new thread will have the default configuration.

Examples

- system/pthread demonstrates using the pthreads API to create threads
- cxx/pthread demonstrates using C++ Standard Library functions with threads

API Reference

Header File

- components/pthread/include/esp_pthread.h

Functions

esp_pthread_cfg_t **esp_pthread_get_default_config**(void)

Creates a default pthread configuration based on the values set via menuconfig.

返回 A default configuration structure.

esp_err_t **esp_pthread_set_cfg**(const *esp_pthread_cfg_t* *cfg)

Configure parameters for creating pthread.

This API allows you to configure how the subsequent pthread_create() call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the 'inherit' flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

备注: Passing non-NULL attributes to pthread_create() will override the stack_size parameter set using this API

参数 **cfg** –The pthread config parameters

返回

- ESP_OK if configuration was successfully set
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if stack_size is less than PTHREAD_STACK_MIN

esp_err_t **esp_pthread_get_cfg**(*esp_pthread_cfg_t* *p)

Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

参数 **p** – Pointer to the pthread config structure that will be updated with the currently configured parameters

返回

- ESP_OK if the configuration was available
- ESP_ERR_NOT_FOUND if a configuration wasn't previously set

esp_err_t **esp_pthread_init**(void)

Initialize pthread library.

Structures

struct **esp_pthread_cfg_t**

pthread configuration structure that influences pthread creation

Public Members

size_t **stack_size**

The stack size of the pthread.

size_t **prio**

The thread's priority.

bool **inherit_cfg**

Inherit this configuration further.

const char ***thread_name**

The thread name.

int **pin_to_core**

The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

Macros

PTHREAD_STACK_MIN

2.10.21 Random Number Generation

ESP32-C3 contains a hardware random number generator, values from it can be obtained using the APIs `esp_random()` and `esp_fill_random()`.

The hardware RNG produces true random numbers under any of the following conditions:

- RF subsystem is enabled (i.e. Wi-Fi or Bluetooth are enabled).
- An internal entropy source has been enabled by calling `bootloader_random_enable()` and not yet disabled by calling `bootloader_random_disable()`.
- While the ESP-IDF 二级引导程序 is running. This is because the default ESP-IDF bootloader implementation calls `bootloader_random_enable()` when the bootloader starts, and `bootloader_random_disable()` before executing the app.

When any of these conditions are true, samples of physical noise are continuously mixed into the internal hardware RNG state to provide entropy. Consult the *ESP32-C3 Technical Reference Manual* > *Random Number Generator (RNG)* [PDF] chapter for more details.

If none of the above conditions are true, the output of the RNG should be considered pseudo-random only.

Startup

During startup, ESP-IDF bootloader temporarily enables a non-RF entropy source (internal reference voltage noise) that provides entropy for any first boot key generation. However, after the app starts executing then normally only pseudo-random numbers are available until Wi-Fi or Bluetooth are initialized.

To re-enable the entropy source temporarily during app startup, or for an application that does not use Wi-Fi or Bluetooth, call the function `bootloader_random_enable()` to re-enable the internal entropy source. The function `bootloader_random_disable()` must be called to disable the entropy source again before using ADC, Wi-Fi or Bluetooth.

备注： The entropy source enabled during the boot process by the ESP-IDF Second Stage Bootloader will seed the internal RNG state with some entropy. However, the internal hardware RNG state is not large enough to provide a continuous stream of true random numbers. This is why a continuous entropy source must be enabled whenever true random numbers are required.

备注： If an application requires a source of true random numbers but it is not possible to permanently enable a hardware entropy source, consider using a strong software DRBG implementation such as the mbedTLS CTR-DRBG or HMAC-DRBG, with an initial seed of entropy from hardware RNG true random numbers.

Secondary Entropy

ESP32-C3 RNG contains a secondary entropy source, based on sampling an asynchronous 8MHz internal oscillator (see the Technical Reference Manual for details). This entropy source is always enabled in ESP-IDF and continuously mixed into the RNG state by hardware. In testing, this secondary entropy source was sufficient to pass the Dieharder random number test suite without the main entropy source enabled (test input was created by concatenating short samples from a continuously resetting ESP32-C3). However, it is currently only guaranteed that true random numbers will be produced when the main entropy source is also enabled as described above.

API Reference

Header File

- components/esp_hw_support/include/esp_random.h

Functions

uint32_t **esp_random**(void)

Get one random 32-bit word from hardware RNG.

If Wi-Fi or Bluetooth are enabled, this function returns true random numbers. In other situations, if true random numbers are required then consult the ESP-IDF Programming Guide "Random Number Generation" section for necessary prerequisites.

This function automatically busy-waits to ensure enough external entropy has been introduced into the hardware RNG state, before returning a new random number. This delay is very short (always less than 100 CPU cycles).

返回 Random value between 0 and UINT32_MAX

void **esp_fill_random**(void *buf, size_t len)

Fill a buffer with random bytes from hardware RNG.

备注： This function is implemented via calls to esp_random(), so the same constraints apply.

参数

- **buf** –Pointer to buffer to fill with random numbers.
- **len** –Length of buffer in bytes

Header File

- components/bootloader_support/include/bootloader_random.h

Functions

void **bootloader_random_enable**(void)

Enable an entropy source for RNG if RF subsystem is disabled.

The exact internal entropy source mechanism depends on the chip in use but all SoCs use the SAR ADC to continuously mix random bits (an internal noise reading) into the HWRNG. Consult the SoC Technical Reference Manual for more information.

Can also be called from app code, if true random numbers are required without initialized RF subsystem. This might be the case in early startup code of the application when the RF subsystem has not started yet or if the RF subsystem should not be enabled for power saving.

Consult ESP-IDF Programming Guide "Random Number Generation" section for details.

警告: This function is not safe to use if any other subsystem is accessing the RF subsystem or the ADC at the same time!

void **bootloader_random_disable**(void)

Disable entropy source for RNG.

Disables internal entropy source. Must be called after bootloader_random_enable() and before RF subsystem features, ADC, or I2S (ESP32 only) are initialized.

Consult the ESP-IDF Programming Guide "Random Number Generation" section for details.

void **bootloader_fill_random**(void *buffer, size_t length)

Fill buffer with 'length' random bytes.

备注: If this function is being called from app code only, and never from the bootloader, then it's better to call esp_fill_random().

参数

- **buffer** –Pointer to buffer
- **length** –This many bytes of random data will be copied to buffer

getrandom

A compatible version of the Linux `getrandom()` function is also provided for ease of porting:

```
#include <sys/random.h>

ssize_t getrandom(void *buf, size_t buflen, unsigned int flags);
```

This function is implemented by calling *esp_fill_random()* internally.

The `flags` argument is ignored, this function is always non-blocking but the strength of any random numbers is dependent on the same conditions described above.

Return value is -1 (with `errno` set to `EFAULT`) if the `buf` argument is NULL, and equal to `buflen` otherwise.

2.10.22 睡眠模式

概述

ESP32-C3 具有 Light-sleep 和 Deep-sleep 两种睡眠节能模式。

在 Light-sleep 模式下，数字外设、CPU、以及大部分 RAM 都使用时钟门控，同时电源电压降低。退出该模式后，数字外设、CPU 和 RAM 恢复运行，内部状态保持不变。

在 Deep-sleep 模式下，CPU、大部分 RAM、以及所有由时钟 APB_CLK 驱动的数字外设都会被断电。芯片上继续处于供电状态的部分仅包括：

- RTC 控制器
- RTC 外设
- RTC 高速内存

Light-sleep 和 Deep-sleep 模式有多种唤醒源。这些唤醒源也可以组合在一起，此时任何一个唤醒源都可以触发唤醒。通过 API `esp_sleep_enable_X_wakeup` 可启用唤醒源，通过 API *`esp_sleep_disable_wakeup_source()`* 可禁用唤醒源，详见下一小节。在系统进入 Light-sleep 或 Deep-sleep 模式前，可以在任意时刻配置唤醒源。

此外，应用程序可以使用 API *`esp_sleep_pd_config()`* 强制 RTC 外设和 RTC 内存进入特定断电模式。

配置唤醒源后，应用程序就可以使用 API *`esp_light_sleep_start()`* 或*`esp_deep_sleep_start()`* 进入睡眠模式。此时，系统将按照被请求的唤醒源配置硬件，同时 RTC 控制器会给 CPU 和数字外设断电。

如需保持 Wi-Fi 连接，请启用 Wi-Fi Modem-sleep 模式和自动 Light-sleep 模式（请参阅*电源管理 API*）。在这两种模式下，Wi-Fi 驱动程序发出请求时，系统将自动从睡眠中被唤醒，从而保持与 AP 的连接。

睡眠模式下的 Wi-Fi 和 Bluetooth 功能

在 Light-sleep 和 Deep-sleep 模式下，无线外设会被断电。因此，在进入这两种睡眠模式前，应用程序必须调用恰当的函数（*`esp_bluedroid_disable()`*、*`esp_bt_controller_disable()`* 或*`esp_wifi_stop()`*）来禁用 Wi-Fi 和 Bluetooth。在 Light-sleep 或 Deep-sleep 模式下，即使不调用这些函数也无法连接 Wi-Fi 和 Bluetooth。

唤醒源

定时器 RTC 控制器中内嵌定时器，可用于在预定义的时间到达后唤醒芯片。时间精度为微秒，但其实际分辨率依赖于为 RTC SLOW_CLK 所选择的时钟源。

在这种唤醒模式下，无需为睡眠模式中的 RTC 外设或内存供电。

调用*`esp_sleep_enable_timer_wakeup()`* 函数可启用使用定时器唤醒睡眠模式。

UART 唤醒（仅适用于 Light-sleep 模式） 当 ESP32-C3 从外部设备接收 UART 输入时，通常需要在输入数据可用时唤醒芯片。UART 外设支持在 RX 管脚上观测到一定数量的上升沿时，将芯片从 Light-sleep 模式中唤醒。调用*`uart_set_wakeup_threshold()`* 函数可设置被观测上升沿的数量。请注意，触发唤醒的字符（及该字符前的所有字符）在唤醒后不会被 UART 接收，因此在发送数据之前，外部设备通常需要首先向 ESP32-C3 额外发送一个字符以触发唤醒。

可调用*`esp_sleep_enable_uart_wakeup()`* 函数来启用此唤醒源。

RTC 外设和内存断电

默认情况下，调用函数*esp_deep_sleep_start()* 和*esp_light_sleep_start()* 后，所有唤醒源不需要的 RTC 电源域都会被断电。可调用函数*esp_sleep_pd_config()* 来修改这一设置。

ESP32-C3 中只有 RTC 高速内存，因此，如果程序中的某些值被标记为 RTC_DATA_ATTR、RTC_SLOW_ATTR 或 RTC_FAST_ATTR 属性，那么所有这些值都将被存入 RTC 高速内存，默认情况下保持供电。如果有需要，您也可以使用函数*esp_sleep_pd_config()* 对其进行修改。

Flash 断电

默认情况下，调用函数*esp_light_sleep_start()* 后，**不会**断电 flash。在 sleep 过程中断电 flash 存在风险。因为 flash 断电需要时间，但是在此期间，系统有可能被唤醒。此时 flash 重新被上电，断电尚未完成又重新上电的硬件行为有概率导致 flash 不能正常工作。如果用户为 flash 供电电路添加了滤波电容，断电所需时间可能会更长。此外，即使可以预知 flash 彻底断电所需的时间，有时也不能通过设置足够长的睡眠时间来确保 flash 断电的安全（比如，突发的异步唤醒源会使得实际的睡眠时间不可控）。

警告： 如果在 flash 的供电电路上添加了滤波电容，那么应当尽一切可能避免 flash 断电。

因为这些不可控的因素，ESP-IDF 很难保证 flash 断电的绝对安全。因此 ESP-IDF 不推荐用户断电 flash。对于一些功耗敏感型应用，可以通过设置 Kconfig 配置项*CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND* 来减少 light sleep 期间 flash 的功耗。这种方式在几乎所有场景下都要比断电 flash 更好，兼顾了安全性和功耗。

考虑到有些用户能够充分评估断电 flash 的风险，并希望通过断电 flash 来获得更低的功耗，因此 ESP-IDF 提供了两种断电 flash 的机制：

- 设置 Kconfig 配置项*CONFIG_ESP_SLEEP_POWER_DOWN_FLASH* 将使 ESP-IDF 以一个严格的条件来断电 flash。严格的条件具体指的是，RTC timer 是唯一的唤醒源 **且**睡眠时间比 flash 彻底断电所需时间更长。
- 调用函数 `esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_OFF)` 将使 ESP-IDF 以一个宽松的条件来断电 flash。宽松的条件具体指的是 RTC timer 唤醒源未被使能 **或**睡眠时间比 flash 彻底断电所需时间更长。

备注：

- Light sleep 时，ESP-IDF 并未提供保证 flash 一定会被断电的机制。
- 不管用户的配置如何，函数*esp_deep_sleep_start()* 都会强制断电 flash。

进入 Light-sleep 模式

函数*esp_light_sleep_start()* 可用于在配置唤醒源后进入 Light-sleep 模式，也可用于在未配置唤醒源的情况下进入 Light-sleep 模式。在后一种情况中，芯片将一直处于睡眠模式，直到从外部被复位。

进入 Deep-sleep 模式

函数*esp_deep_sleep_start()* 可用于在配置唤醒源后进入 Deep-sleep 模式，也可用于在未配置唤醒源的情况下进入 Deep-sleep 模式模式。在后一种情况中，芯片将一直处于睡眠模式，直到从外部被复位。

配置 IO

一些 ESP32-C3 IO 在默认情况下启用内部上拉或下拉电阻。如果这些管脚在 Deep-sleep 模式下中受外部电路驱动，电流流经这些上下拉电阻时，可能会增加电流消耗。

在 Deep-sleep 模式中：

- 数字 GPIO (GPIO6 ~ 21) 处于高阻态。
- **RTC GPIO (GPIO0 ~ 5) 可能处于以下状态：**
  - 如果未启用保持 (hold) 功能，RTC GPIO 将处于高阻态。
  - 如果启用保持功能，RTC GPIO 管脚将会在保持功能开启时处于锁存状态。

UART 输出处理

在进入睡眠模式之前，调用函数`esp_deep_sleep_start()`会冲刷掉 UART FIFO 缓存。

当使用函数`esp_light_sleep_start()`进入 Light-sleep 模式时，UART FIFO 将不会被冲刷。与之相反，UART 输出将被暂停，FIFO 中的剩余字符将在 Light-sleep 唤醒后被发送。

检查睡眠唤醒原因

`esp_sleep_get_wakeup_cause()`函数可用于检测是何种唤醒源在睡眠期间被触发。

禁用睡眠模式唤醒源

调用 API `esp_sleep_disable_wakeup_source()`可以禁用给定唤醒源的触发器，从而禁用该唤醒源。此外，如果将参数设置为 `ESP_SLEEP_WAKEUP_ALL`，该函数可用于禁用所有触发器。

应用程序示例

- protocols/sntp：如何实现 Deep-sleep 模式的基本功能，周期性唤醒 ESP 模块，以从 NTP 服务器获取时间。
- wifi/power_save：如何实现 Modem-sleep 模式。
- system/deep_sleep：如何通过定时器触发 Deep-sleep 唤醒。

API 参考

Header File

- components/esp_hw_support/include/esp_sleep.h

Functions

esp_err_t **esp_sleep_disable_wakeup_source**(*esp_sleep_source_t* source)

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

备 注： This function does not modify wake up configuration in RTC. It will be performed in esp_deep_sleep_start/esp_light_sleep_start function.

参数 **source** -- number of source to disable of type esp_sleep_source_t

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if trigger was not active

esp_err_t **esp_sleep_enable_timer_wakeup**(uint64_t time_in_us)

Enable wakeup by timer.

参数 **time_in_us** –time before wakeup, in microseconds

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if value is out of range (TBD)

bool **esp_sleep_is_valid_wakeup_gpio**(*gpio_num_t* gpio_num)

Returns true if a GPIO number is valid for use as wakeup source.

备注: For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

参数 **gpio_num** –Number of the GPIO to test for wakeup source capability

返回 True if this GPIO number will be accepted as a sleep wakeup source.

esp_err_t **esp_deep_sleep_enable_gpio_wakeup**(uint64_t gpio_pin_mask, *esp_deepsleep_gpio_wake_up_mode_t* mode)

Enable wakeup using specific gpio pins.

This function enables an IO pin to wake up the chip from deep sleep.

备 注: This function does not modify pin configuration. The pins are configured in esp_deep_sleep_start/esp_light_sleep_start, immediately before entering sleep mode.

备注: You don’ t need to care to pull-up or pull-down before using this function, because this will be done in esp_deep_sleep_start/esp_light_sleep_start based on param mask you give. BTW, when you use low level to wake up the chip, we strongly recommand you to add external registors (pull-up).

参数

- **gpio_pin_mask** –Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which are have RTC functionality can be used in this bit map.
- **mode** –Select logic function used to determine wakeup condition:
  - ESP_GPIO_WAKEUP_GPIO_LOW: wake up when the gpio turn to low.
  - ESP_GPIO_WAKEUP_GPIO_HIGH: wake up when the gpio turn to high.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio num is more than 5 or mode is invalid,

esp_err_t **esp_sleep_enable_gpio_wakeup**(void)

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wakeup from light sleep though.

To enable wakeup, first call gpio_wakeup_enable, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

备注: In revisions 0 and 1 of the ESP32, GPIO wakeup source can not be used together with touch or ULP wakeup sources.

返回

- ESP_OK on success

- ESP_ERR_INVALID_STATE if wakeup triggers conflict

esp_err_t **esp_sleep_enable_uart_wakeup**(int uart_num)

Enable wakeup from light sleep using UART.

Use uart_set_wakeup_threshold function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

备注： ESP32 does not support wakeup from UART2.

参数 **uart_num** –UART port to wake up from

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if wakeup from given UART is not supported

esp_err_t **esp_sleep_enable_bt_wakeup**(void)

Enable wakeup by bluetooth.

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if wakeup from bluetooth is not supported

esp_err_t **esp_sleep_disable_bt_wakeup**(void)

Disable wakeup by bluetooth.

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if wakeup from bluetooth is not supported

esp_err_t **esp_sleep_enable_wifi_wakeup**(void)

Enable wakeup by WiFi MAC.

返回

- ESP_OK on success

esp_err_t **esp_sleep_disable_wifi_wakeup**(void)

Disable wakeup by WiFi MAC.

返回

- ESP_OK on success

uint64_t **esp_sleep_get_ext1_wakeup_status**(void)

Get the bit mask of GPIOs which caused wakeup (ext1)

If wakeup was caused by another source, this function will return 0.

返回 bit mask, if GPIOn caused wakeup, BIT(n) will be set

uint64_t **esp_sleep_get_gpio_wakeup_status**(void)

Get the bit mask of GPIOs which caused wakeup (gpio)

If wakeup was caused by another source, this function will return 0.

返回 bit mask, if GPIOn caused wakeup, BIT(n) will be set

esp_err_t **esp_sleep_pd_config**(*esp_sleep_pd_domain_t* domain, *esp_sleep_pd_option_t* option)

Set power down mode for an RTC power domain in sleep mode.

If not set set using this API, all power domains default to ESP_PD_OPTION_AUTO.

参数

- **domain** –power domain to configure

- **option** –power down option (ESP_PD_OPTION_OFF, ESP_PD_OPTION_ON, or ESP_PD_OPTION_AUTO)

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if either of the arguments is out of range

void **esp_deep_sleep_start**(void)

Enter deep sleep with the configured wakeup options.

This function does not return.

esp_err_t **esp_light_sleep_start**(void)

Enter light sleep with the configured wakeup options.

返回

- ESP_OK on success (returned after wakeup)
- ESP_ERR_INVALID_STATE if WiFi or BT is not stopped

void **esp_deep_sleep**(uint64_t time_in_us)

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to esp_deep_sleep_enable_timer_wakeup followed by a call to esp_deep_sleep_start.

esp_deep_sleep does not shut down WiFi, BT, and higher level protocol connections gracefully. Make sure relevant WiFi and BT stack functions are called to close any connections and deinitialize the peripherals. These include:

- esp_bluedroid_disable
- esp_bt_controller_disable
- esp_wifi_stop

This function does not return.

备注: The device will wake up immediately if the deep-sleep time is set to 0

参数 **time_in_us** –deep-sleep time, unit: microsecond

esp_sleep_wakeup_cause_t **esp_sleep_get_wakeup_cause**(void)

Get the wakeup source which caused wakeup from sleep.

返回 cause of wake up from last sleep (deep sleep or light sleep)

void **esp_wake_deep_sleep**(void)

Default stub to run on wake from deep sleep.

Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.

This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.

See docs/deep-sleep-stub.rst for details.

void **esp_set_deep_sleep_wake_stub**(*esp_deep_sleep_wake_stub_fn_t* new_stub)

Install a new stub at runtime to run on wake from deep sleep.

If implementing esp_wake_deep_sleep() then it is not necessary to call this function.

However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked RTC_IRAM_ATTR, and must obey the same rules given for esp_wake_deep_sleep().

esp_deep_sleep_wake_stub_fn_t **esp_get_deep_sleep_wake_stub**(void)

Get current wake from deep sleep stub.

返回 Return current wake from deep sleep stub, or NULL if no stub is installed.

void **esp_default_wake_deep_sleep**(void)

The default esp-idf-provided esp_wake_deep_sleep() stub.

See docs/deep-sleep-stub.rst for details.

void **esp_deep_sleep_disable_rom_logging**(void)

Disable logging from the ROM code after deep sleep.

Using LSB of RTC_STORE4.

esp_err_t **esp_sleep_cpu_pd_low_init**(bool enable)

CPU Power down low-level initialize.

参数 **enable** –enable or disable CPU power down during light sleep

返回

- ESP_OK on success
- ESP_ERR_NO_MEM not enough retention memory

void **esp_sleep_config_gpio_isolate**(void)

Configure to isolate all GPIO pins in sleep state.

void **esp_sleep_enable_gpio_switch**(bool enable)

Enable or disable GPIO pins status switching between slept status and waked status.

参数 **enable** –decide whether to switch status or not

Type Definitions

typedef *esp_sleep_source_t* **esp_sleep_wakeup_cause_t**

typedef void (***esp_deep_sleep_wake_stub_fn_t**)(void)

Function type for stub to run on wake from sleep.

Enumerations

enum **esp_sleep_ext1_wakeup_mode_t**

Logic function used for EXT1 wakeup mode.

Values:

enumerator **ESP_EXT1_WAKEUP_ALL_LOW**

Wake the chip when all selected GPIOs go low.

enumerator **ESP_EXT1_WAKEUP_ANY_HIGH**

Wake the chip when any of the selected GPIOs go high.

enum **esp_deepsleep_gpio_wake_up_mode_t**

Values:

enumerator **ESP_GPIO_WAKEUP_GPIO_LOW**

enumerator **ESP_GPIO_WAKEUP_GPIO_HIGH**

enum **esp_sleep_pd_domain_t**

Power domains which can be powered down in sleep mode.

Values:

enumerator **ESP_PD_DOMAIN_XTAL**

XTAL oscillator.

enumerator **ESP_PD_DOMAIN_CPU**

CPU core.

enumerator **ESP_PD_DOMAIN_RTC8M**

Internal 8M oscillator.

enumerator **ESP_PD_DOMAIN_VDDSDIO**

VDD_SDIO.

enumerator **ESP_PD_DOMAIN_MAX**

Number of domains.

enum **esp_sleep_pd_option_t**

Power down options.

Values:

enumerator **ESP_PD_OPTION_OFF**

Power down the power domain in sleep mode.

enumerator **ESP_PD_OPTION_ON**

Keep power domain enabled during sleep mode.

enumerator **ESP_PD_OPTION_AUTO**

Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

enum **esp_sleep_source_t**

Sleep wakeup cause.

Values:

enumerator **ESP_SLEEP_WAKEUP_UNDEFINED**

In case of deep sleep, reset was not caused by exit from deep sleep.

enumerator **ESP_SLEEP_WAKEUP_ALL**

Not a wakeup cause, used to disable all wakeup sources with esp_sleep_disable_wakeup_source.

enumerator **ESP_SLEEP_WAKEUP_EXT0**

Wakeup caused by external signal using RTC_IO.

enumerator **ESP_SLEEP_WAKEUP_EXT1**

Wakeup caused by external signal using RTC_CNTL.

enumerator **ESP_SLEEP_WAKEUP_TIMER**

Wakeup caused by timer.

enumerator **ESP_SLEEP_WAKEUP_TOUCHPAD**

Wakeup caused by touchpad.

enumerator **ESP_SLEEP_WAKEUP_ULP**

Wakeup caused by ULP program.

enumerator **ESP_SLEEP_WAKEUP_GPIO**

Wakeup caused by GPIO (light sleep only)

enumerator **ESP_SLEEP_WAKEUP_UART**

Wakeup caused by UART (light sleep only)

enumerator **ESP_SLEEP_WAKEUP_WIFI**

Wakeup caused by WIFI (light sleep only)

enumerator **ESP_SLEEP_WAKEUP_COCPU**

Wakeup caused by COCPU int.

enumerator **ESP_SLEEP_WAKEUP_COCPU_TRAP_TRIG**

Wakeup caused by COCPU crash.

enumerator **ESP_SLEEP_WAKEUP_BT**

Wakeup caused by BT (light sleep only)

2.10.23 SoC Capabilities

This section lists definitions of the ESP32-C3 ' s SoC hardware capabilities. These definitions are commonly used in IDF to control which hardware dependent features are supported and thus compiled into the binary.

备注： These defines are currently not considered to be part of the public API, and may be changed at any time.

SOC_RMT_GROUPS
One RMT group

SOC_RMT_TX_CANDIDATES_PER_GROUP
Number of channels that capable of Transmit

SOC_RMT_RX_CANDIDATES_PER_GROUP
Number of channels that capable of Receive

SOC_RMT_CHANNELS_PER_GROUP
Total 4 channels

SOC_RMT_MEM_WORDS_PER_CHANNEL
Each channel owns 48 words memory (1 word = 4 Bytes)

SOC_RMT_SUPPORT_RX_PINGPONG

Support Ping-Pong mode on RX path

SOC_RMT_SUPPORT_RX_DEMODULATION

Support signal demodulation on RX path (i.e. remove carrier)

SOC_RMT_SUPPORT_TX_ASYNC_STOP

Support stop transmission asynchronously

SOC_RMT_SUPPORT_TX_LOOP_COUNT

Support transmit specified number of cycles in loop mode

SOC_RMT_SUPPORT_TX_SYNCHRO

Support coordinate a group of TX channels to start simultaneously

SOC_RMT_SUPPORT_TX_CARRIER_DATA_ONLY

TX carrier can be modulated to data phase only

SOC_RMT_SUPPORT_XTAL

Support set XTAL clock as the RMT clock source

SOC_RMT_SUPPORT_APB

Support set APB as the RMT clock source

SOC_RMT_SUPPORT_RC_FAST

Support set RC_FAST clock as the RMT clock source

SOC_RTC_CNTL_CPU_PD_DMA_BUS_WIDTH

SOC_RTC_CNTL_CPU_PD_REG_FILE_NUM

SOC_RTC_CNTL_CPU_PD_DMA_ADDR_ALIGN

SOC_WIFI_HW_TSF
Support hardware TSF

SOC_WIFI_FTM_SUPPORT
Support FTM

SOC_WIFI_GCMP_SUPPORT
Support GCMP(GCMP128 and GCMP256)

SOC_WIFI_WAPI_SUPPORT
Support WAPI

SOC_WIFI_CSI_SUPPORT
Support CSI

SOC_WIFI_MESH_SUPPORT
Support WIFI MESH

2.10.24 系统时间

概述

ESP32-C3 使用两种硬件时钟源建立和保持系统时间。根据应用目的及对系统时间的精度要求，既可以仅使用其中一种时钟源，也可以同时使用两种时钟源。这两种硬件时钟源为：

- **RTC 定时器**：RTC 定时器在任何睡眠模式下及在任何复位后均可保持系统时间（上电复位除外，因为上电复位会重置 RTC 定时器）。时钟频率偏差取决于*RTC 定时器时钟源*，该偏差只会在睡眠模式下影响时间精度。睡眠模式下，时间分辨率为 6.667 µs。
- **高分辨率定时器**：高分辨率定时器在睡眠模式下及在复位后不可用，但其时间精度更高。该定时器使用 APB_CLK 时钟源（通常为 80 MHz），时钟频率偏差小于 ±10 ppm，时间分辨率为 1 µs。

可供选择的硬件时钟源组合如下所示：

- RTC 和高分辨率定时器（默认）
- RTC
- 高分辨率定时器
- 无

默认时钟源的时间精度最高，建议使用该配置。此外，用户也可以通过配置选项*CONFIG_NEWLIB_TIME_SYSCALL* 来选择其他时钟源。

RTC 定时器时钟源

RTC 定时器有以下时钟源：

- 内置 136 kHz RC 振荡器（默认）：Deep-sleep 模式下电流消耗最低，不依赖任何外部元件。但由于温度波动会影响该时钟源的频率稳定性，在 Deep-sleep 和 Light-sleep 模式下都有可能发生时间偏移。
- 外置 32 kHz 晶振：需要将一个 32 kHz 晶振连接到 XTAL_32K_P 和 XTAL_32K_N 管脚。频率稳定性更高，但在 Deep-sleep 模式下电流消耗略高（比默认模式高 1 μA）。
- 管脚 XTAL_32K_P 外置 32 kHz 振荡器：允许使用由外部电路产生的 32 kHz 时钟。外部时钟信号必须连接到管脚 XTAL_32K_P。正弦波信号的振幅应小于 1.2 V，方波信号的振幅应小于 1 V。正常模式下，电压范围应为 0.1 < Vcm < 0.5 xVamp，其中 Vamp 代表信号振幅。使用此时钟源时，管脚 XTAL_32K_P 无法用作 GPIO 管脚。
- 内置 17.5 MHz 振荡器的 256 分频时钟 (~68 kHz)：频率稳定性优于内置 136 kHz RC 振荡器，同样无需外部元件，但 Deep-sleep 模式下电流消耗更高（比默认模式高 5 μA）。

时钟源的选择取决于系统时间精度要求和睡眠模式下的功耗要求。要修改 RTC 时钟源，请在项目配置中设置*CONFIG_RTC_CLK_SRC*。

想要了解外置晶振或外置振荡器的更多布线要求，请参考 ESP32-C3 硬件设计指南。

获取当前时间

要获取当前时间，请使用 POSIX 函数 `gettimeofday()`。此外，您也可以使用以下标准 C 库函数来获取时间并对其进行操作：

```
gettimeofday
time
asctime
clock
ctime
difftime
gmtime
localtime
mktime
strftime
adjtime*
```

如需立即更新当前时间，并暂停平滑时间校正，请使用 POSIX 函数 `settimeofday()`。

若要求时间的分辨率为 1 s，请使用以下代码片段：

```
time_t now;
char strftime_buf[64];
struct tm timeinfo;

time(&now);
// 将时区设置为中国标准时间
setenv("TZ", "CST-8", 1);
tzset();

localtime_r(&now, &timeinfo);
strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
```

若要求时间的分辨率为 1 μs，请使用以下代码片段：

```
struct timeval tv_now;
gettimeofday(&tv_now, NULL);
int64_t time_us = (int64_t)tv_now.tv_sec * 1000000L + (int64_t)tv_now.tv_usec;
```

SNTP 时间同步

要设置当前时间，可以使用 POSIX 函数 `settimeofday()` 和 `adjtime()`。lwIP 中的 SNTP 库会在收到 NTP 服务器的响应报文后，调用这两个函数以更新当前的系统时间。当然，用户可以在 lwIP SNTP 库之外独立地使用这两个函数。

在 lwIP SNTP 库内部调用的函数依赖于系统时间的同步模式。可使用函数*sntp_set_sync_mode()* 来设置下列同步模式之一。

- *SNTP_SYNC_MODE_IMMED*（默认）：使用函数 `settimeofday()` 后，收到 SNTP 服务器响应时立即更新系统时间。
- *SNTP_SYNC_MODE_SMOOTH*：使用函数 `adjtime()` 后，通过逐渐减小时间误差，平滑地更新时间。如果 SNTP 响应报文中的时间与当前系统时间相差大于 35 分钟，则会通过 `settimeofday()` 立即更新系统时间。

lwIP SNTP 库提供了 API 函数，用于设置某个事件的回调函数。您可能需要使用以下函数：

- *sntp_set_time_sync_notification_cb()*：用于设置回调函数，通知时间同步的过程。
- *sntp_get_sync_status()* 和*sntp_set_sync_status()*：用于获取或设置时间同步状态。

通过 SNTP 开始时间同步，只需调用以下三个函数：

```
sntp_setoperatingmode(SNTP_OPMODE_POLL);
sntp_setservername(0, "pool.ntp.org");
sntp_init();
```

添加此初始化代码后，应用程序将定期同步时间。时间同步周期由*CONFIG_LWIP_SNTP_UPDATE_DELAY* 设置（默认为一小时）。如需修改，请在项目配置中设置*CONFIG_LWIP_SNTP_UPDATE_DELAY*。

如需查看示例代码，请前往 protocols/sntp 目录。该目录下的示例展示了如何基于 lwIP SNTP 库实现时间同步。

时区

要设置本地时区，请使用以下 POSIX 函数：

1. 调用 `setenv()`，将 `TZ` 环境变量根据设备位置设置为正确的值。时间字符串的格式与 GNU libc 文档 中描述的相同（但实现方式不同）。
2. 调用 `tzset()`，为新的时区更新 C 库的运行数据。

完成上述步骤后，请调用标准 C 库函数 `localtime()`。该函数将返回排除时区偏差和夏令时干扰后的准确本地时间。

64 位 `time_t`

ESP-IDF 默认使用 32 位的 `time_t` 类型。为解决 Y2K38 漏洞，您在构建应用程序时可能需要使用 64 位的 `time_t` 类型。

目前，完成这一操作需要从头开始构建交叉编译器工具链，具体步骤请参阅*Linux 和 macOS 平台工具链的标准设置*。要在工具链中启用对 64 位 `time_t` 的支持，您需要在构建工具链之前从 `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` 文件中删除 `--enable-newlib-long-time_t` 选项。

如需使程序同时兼容 32 位和 64 位的 `time_t`，可以使用以下方法：

- 在 C 或 C++ 源文件中，如果 `time_t` 是 32 位的，编译器会预定义 `_USE_LONG_TIME_T` 宏，该宏定义在 `<sys/types.h>` 中。

- 在 CMake 文件中，ESP-IDF 构建属性 `TIME_T_SIZE` 将被设置为 `time_t` 的大小，单位为字节。您可以调用 `idf_build_get_property(var TIME_T_SIZE)` 来获取该属性的值，并将其放入 CMake 变量 `var` 中。了解更多关于 `idf_build_get_property` 的信息，参见*ESP-IDF CMake 构建系统 API*。

注意，`time_t` 类型的大小也会影响其他类型的大小，例如 `struct timeval`、`struct stat` 和 `struct utimbuf`。

API 参考

Header File

- components/lwip/include/apps/esp_sntp.h

Functions

void **sntp_sync_time**(struct timeval *tv)

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a sntp_sync_time() function in the app firmware source. If the default implementation is used, calling sntp_set_sync_mode() allows the time synchronization mode to be changed to instant or smooth. If a callback function is registered via sntp_set_time_sync_notification_cb(), it will be called following time synchronization.

参数 **tv** –Time received from SNTP server.

void **sntp_set_sync_mode**(*sntp_sync_mode_t* sync_mode)

Set the sync mode.

Modes allowed: SNTP_SYNC_MODE_IMMED and SNTP_SYNC_MODE_SMOOTH.

参数 **sync_mode** –Sync mode.

sntp_sync_mode_t **sntp_get_sync_mode**(void)

Get set sync mode.

返回 SNTP_SYNC_MODE_IMMED: Update time immediately. SNTP_SYNC_MODE_SMOOTH: Smooth time updating.

sntp_sync_status_t **sntp_get_sync_status**(void)

Get status of time sync.

After the update is completed, the status will be returned as SNTP_SYNC_STATUS_COMPLETED. After that, the status will be reset to SNTP_SYNC_STATUS_RESET. If the update operation is not completed yet, the status will be SNTP_SYNC_STATUS_RESET. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be SNTP_SYNC_STATUS_IN_PROGRESS.

返回 SNTP_SYNC_STATUS_RESET: Reset status. SNTP_SYNC_STATUS_COMPLETED: Time is synchronized. SNTP_SYNC_STATUS_IN_PROGRESS: Smooth time sync in progress.

void **sntp_set_sync_status**(*sntp_sync_status_t* sync_status)

Set status of time sync.

参数 **sync_status** –status of time sync (see sntp_sync_status_t)

void **sntp_set_time_sync_notification_cb**(*sntp_sync_time_cb_t* callback)

Set a callback function for time synchronization notification.

参数 **callback** –a callback function

void **sntp_set_sync_interval**(uint32_t interval_ms)

Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in the next attempt update time throught SNTP. To apply the new sync interval call the sntp_restart() function, otherwise, it will be applied after the last interval expired.

参数 **interval_ms** –The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds will be set.

uint32_t **sntp_get_sync_interval**(void)

Get the sync interval of SNTP operation.

返回 the sync interval

bool **sntp_restart**(void)

Restart SNTP.

返回 True - Restart False - SNTP was not initialized yet

Type Definitions

typedef void (***sntp_sync_time_cb_t**)(struct timeval *tv)

SNTP callback function for notifying about time sync event.

Param tv Time received from SNTP server.

Enumerations

enum **sntp_sync_mode_t**

SNTP time update mode.

Values:

enumerator **SNTP_SYNC_MODE_IMMED**

Update system time immediately when receiving a response from the SNTP server.

enumerator **SNTP_SYNC_MODE_SMOOTH**

Smooth time updating. Time error is gradually reduced using adjtime function. If the difference between SNTP response time and system time is large (more than 35 minutes) then update immediately.

enum **sntp_sync_status_t**

SNTP sync status.

Values:

enumerator **SNTP_SYNC_STATUS_RESET**

enumerator **SNTP_SYNC_STATUS_COMPLETED**

enumerator **SNTP_SYNC_STATUS_IN_PROGRESS**

2.10.25 The Async memcpy API

Overview

ESP32-C3 has a DMA engine which can help to offload internal memory copy operations from the CPU in a asynchronous way.

The async memcpy API wraps all DMA configurations and operations, the signature of *esp_async_memcpy()* is almost the same to the standard libc one.

Thanks to the benefit of the DMA, we don't have to wait for each memory copy to be done before we issue another memcpy request. By the way, it's still possible to know when memcpy is finished by listening in the memcpy callback function.

Configure and Install driver

esp_async_memcpy_install() is used to install the driver with user's configuration. Please note that async memcpy has to be called with the handle returned from *esp_async_memcpy_install()*.

Driver configuration is described in *async_memcpy_config_t*:

- `backlog`: This is used to configure the maximum number of DMA operations being processed at the same time.
- `sram_trans_align`: Declare SRAM alignment for both data address and copy size, set to zero if the data has no restriction in alignment. If set to a quadruple value (i.e. 4X), the driver will enable the burst mode internally, which is helpful for some performance related application.
- `psram_trans_align`: Declare PSRAM alignment for both data address and copy size. User has to give it a valid value (only 16, 32, 64 are supported) if the destination of memcpy is located in PSRAM. The default alignment (i.e. 16) will be applied if it's set to zero. Internally, the driver configures the size of block used by DMA to access PSRAM, according to the alignment.
- `flags`: This is used to enable some special driver features.

ASYNC_MEMCPY_DEFAULT_CONFIG provides a default configuration, which specifies the backlog to 8.

```
async_memcpy_config_t config = ASYNC_MEMCPY_DEFAULT_CONFIG();
// update the maximum data stream supported by underlying DMA engine
config.backlog = 16;
async_memcpy_t driver = NULL;
ESP_ERROR_CHECK(esp_async_memcpy_install(&config, &driver)); // install driver,␣
↪return driver handle
```

Send memory copy request

esp_async_memcpy() is the API to send memory copy request to DMA engine. It must be called after driver is installed successfully. This API is thread safe, so it can be called from different tasks.

Different from the libc version of *memcpy*, user should also pass a callback to *esp_async_memcpy()*, if it's necessary to be notified when the memory copy is done. The callback is executed in the ISR context, make sure you won't violate the the restriction applied to ISR handler.

Besides that, the callback function should reside in IRAM space by applying *IRAM_ATTR* attribute. The prototype of the callback function is *async_memcpy_isr_cb_t*, please note that, the callback function should return true if it wakes up a high priority task by some API like `xSemaphoreGiveFromISR()`.

```
Semphr_Handle_t semphr; //already initialized in somewhere

// Callback implementation, running in ISR context
static IRAM_ATTR bool my_async_memcpy_cb(async_memcpy_t mcp_hdl, async_memcpy_
↪event_t *event, void *cb_args)
{
    SemaphoreHandle_t sem = (SemaphoreHandle_t)cb_args;
    BaseType_t high_task_wakeup = pdFALSE;
```

(下页继续)

(续上页)

```
    SemphrGiveInISR(semphr, &high_task_wakeup); // high_task_wakeup set to pdTRUE␣
↪if some high priority task unblocked
    return high_task_wakeup == pdTRUE;
}

// Called from user's context
ESP_ERROR_CHECK(esp_async_memcpy(driver_handle, to, from, copy_len, my_async_
↪memcpy_cb, my_semaphore));
//Do something else here
SemphrTake(my_semaphore, ...); //wait until the buffer copy is done
```

Uninstall driver (optional)

esp_async_memcpy_uninstall() is used to uninstall asynchronous memcpy driver. It's not necessary to uninstall the driver after each memcpy operation. If you know your application won't use this driver anymore, then this API can recycle the memory for you.

API Reference

Header File

- components/esp_hw_support/include/esp_async_memcpy.h

Functions

esp_err_t **esp_async_memcpy_install** (const *async_memcpy_config_t* *config, *async_memcpy_t* *asmcp)

Install async memcpy driver.

参数

- **config** –**[in]** Configuration of async memcpy
- **asmcp** –**[out]** Handle of async memcpy that returned from this API. If driver installation is failed, asmcp would be assigned to NULL.

返回

- ESP_OK: Install async memcpy driver successfully
- ESP_ERR_INVALID_ARG: Install async memcpy driver failed because of invalid argument
- ESP_ERR_NO_MEM: Install async memcpy driver failed because out of memory
- ESP_FAIL: Install async memcpy driver failed because of other error

esp_err_t **esp_async_memcpy_uninstall** (*async_memcpy_t* asmcp)

Uninstall async memcpy driver.

参数 **asmcp** –**[in]** Handle of async memcpy driver that returned from esp_async_memcpy_install

返回

- ESP_OK: Uninstall async memcpy driver successfully
- ESP_ERR_INVALID_ARG: Uninstall async memcpy driver failed because of invalid argument
- ESP_FAIL: Uninstall async memcpy driver failed because of other error

esp_err_t **esp_async_memcpy** (*async_memcpy_t* asmcp, void *dst, void *src, size_t n, *async_memcpy_isr_cb_t* cb_isr, void *cb_args)

Send an asynchronous memory copy request.

备注: The callback function is invoked in interrupt context, never do blocking jobs in the callback.

参数

- **asmcp** –**[in]** Handle of async memcpy driver that returned from esp_async_memcpy_install
- **dst** –**[in]** Destination address (copy to)
- **src** –**[in]** Source address (copy from)
- **n** –**[in]** Number of bytes to copy
- **cb_isr** –**[in]** Callback function, which got invoked in interrupt context. Set to NULL can bypass the callback.
- **cb_args** –**[in]** User defined argument to be passed to the callback function

返回

- ESP_OK: Send memory copy request successfully
- ESP_ERR_INVALID_ARG: Send memory copy request failed because of invalid argument
- ESP_FAIL: Send memory copy request failed because of other error

Structures

struct **async_memcpy_event_t**

Type of async memcpy event object.

Public Members

void ***data**

Event data

struct **async_memcpy_config_t**

Type of async memcpy configuration.

Public Members

uint32_t **backlog**

Maximum number of streams that can be handled simultaneously

size_t **sram_trans_align**

DMA transfer alignment (both in size and address) for SRAM memory

size_t **psram_trans_align**

DMA transfer alignment (both in size and address) for PSRAM memory

uint32_t **flags**

Extra flags to control async memcpy feature

Macros

ASYNC_MEMCPY_DEFAULT_CONFIG()

Default configuration for async memcpy.

Type Definitions

typedef struct async_memcpy_context_t ***async_memcpy_t**

Type of async memcpy handle.

typedef bool (***async_memcpy_isr_cb_t**)(*async_memcpy_t* mcp_hdl, *async_memcpy_event_t* *event, void *cb_args)

Type of async memcpy interrupt callback function.

备注： User can call OS primitives (semaphore, mutex, etc) in the callback function. Keep in mind, if any OS primitive wakes high priority task up, the callback should return true.

Param mcp_hdl Handle of async memcpy
Param event Event object, which contains related data, reserved for future
Param cb_args User defined arguments, passed from esp_async_memcpy function
Return Whether a high priority task is woken up by the callback function

2.10.26 Watchdogs

Overview

The ESP-IDF has support for multiple types of watchdogs, with the two main ones being: The Interrupt Watchdog Timer and the Task Watchdog Timer (TWDT). The Interrupt Watchdog Timer and the TWDT can both be enabled using *Project Configuration Menu*, however the TWDT can also be enabled during runtime. The Interrupt Watchdog is responsible for detecting instances where FreeRTOS task switching is blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

ESP-IDF has support for the following types of watchdog timers:

- Interrupt Watchdog Timer (IWDT)
- Task Watchdog Timer (TWDT)
- Crystal 32K Watchdog Timer (XTWDT)

The various watchdog timers can be enabled using the *Project Configuration Menu*. However, the TWDT can also be enabled during runtime.

Interrupt Watchdog Timer (IWDT)

The purpose of the IWDT is to ensure that interrupt service routines (ISRs) are not blocked from running for a prolonged period of time (i.e., the IWDT timeout period). Blocking ISRs from running in a timely manner is undesirable as it can increases ISR latency, and also prevents task switching (as task switching is executed form an ISR). The things that can block ISRs from running include:

- Disabling interrupts
- Critical Sections (also disables interrupts)
- Other same/higher priority ISRs (will block same/lower priority ISRs from running it completes execution)

The IWDT utilizes the watchdog timer in Timer Group 1 as its underlying hardware timer and leverages the FreeRTOS tick interrupt on each CPU to feed the watchdog timer. If the tick interrupt on a particular CPU is not run at within the IWDT timeout period, it is indicative that something is blocking ISRs from being run on that CPU (see the list of reasons above).

When the IWDT times out, the default action is to invoke the panic handler and display the panic reason as `Interrupt wdt timeout on CPU0` or `Interrupt wdt timeout on CPU1` (as applicable). Depending on the panic handler's configured behavior (see *CONFIG_ESP_SYSTEM_PANIC*), users can then debug the source of the IWDT timeout (via the backtrace, OpenOCD, gdbstub etc) or simply reset the chip (which may be preferred in a production environment).

If for whatever reason the panic handler is unable to run after an IWDT timeout, the IWDT has a secondary timeout that will hard-reset the chip (i.e., a system reset).

Configuration

- The IWDT is enabled by default via the *CONFIG_ESP_INT_WDT* option.
- The IWDT's timeout is configured by setting the *CONFIG_ESP_INT_WDT_TIMEOUT_MS* option.
  - Note that the default timeout is higher if PSRAM support is enabled, as a critical section or interrupt routine that accesses a large amount of PSRAM will take longer to complete in some circumstances.
  - The timeout should always at least twice longer than the period between FreeRTOS ticks (see *CONFIG_FREERTOS_HZ*).

Tuning If you find the IWDT timeout is triggered because an interrupt or critical section is running longer than the timeout period, consider rewriting the code:

- Critical sections should be made as short as possible. Any non-critical code/computation should be placed outside the critical section.
- Interrupt handlers should also perform the minimum possible amount of computation. Users can consider deferring any computation to a task by having the ISR push data to a task using queues.

Neither critical sections or interrupt handlers should ever block waiting for another event to occur. If changing the code to reduce the processing time is not possible or desirable, it's possible to increase the *CONFIG_ESP_INT_WDT_TIMEOUT_MS* setting instead.

Task Watchdog Timer (TWDT)

The Task Watchdog Timer (TWDT) is used to monitor particular tasks, ensuring that they are able to execute within a given timeout period. The TWDT primarily watches the Idle task, however any task can subscribe to be watched by the TWDT. By watching the Idle task, the TWDT can detect instances of tasks running for a prolonged period of time wihtout yielding. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

The TWDT is built around the Hardware Watchdog Timer in Timer Group 0. When a timeout occurs, an interrupt is triggered. Users can redefine the function *esp_task_wdt_isr_user_handler* in the user code, in order to receive the timeout event and handle it differently.

Usage The following functions can be used to watch tasks using the TWDT:

- `esp_task_wdt_init()` to initialize the TWDT and subscribe the idle tasks.
- `esp_task_wdt_add()` subscribes other tasks to the TWDT.
- Once subscribed, `esp_task_wdt_reset()` should be called from the task to feed the TWDT.
- `esp_task_wdt_delete()` unsubscribes a previously subscribed task
- `esp_task_wdt_deinit()` unsubscribes the idle tasks and deinitializes the TWDT

In the case where applications need to watch at a more granular level (i.e., ensure that a particular functions/stub/code-path is called), the TWDT allows subscription of "users".

- `esp_task_wdt_add_user()` to subscribe an arbitrary user of the TWDT. This function will return a user handle to the added user.
- `esp_task_wdt_reset_user()` must be called using the user handle in order to prevent a TWDT timeout.
- `esp_task_wdt_delete_user()` unsubscribes an arbitrary user of the TWDT.

Configuration The default timeout period for the TWDT is set using config item *CONFIG_ESP_TASK_WDT_TIMEOUT_S*. This should be set to at least as long as you expect any single task will need to monopolize the CPU (for example, if you expect the app will do a long intensive calculation and should not yield to other tasks). It is also possible to change this timeout at runtime by calling `esp_task_wdt_init()`.

备注: Erasing large flash areas can be time consuming and can cause a task to run continuously, thus triggering a TWDT timeout. The following two methods can be used to avoid this:

- Increase *CONFIG_ESP_TASK_WDT_TIMEOUT_S* in menuconfig for a larger watchdog timeout period.

- You can also call `esp_task_wdt_init()` to increase the watchdog timeout period before erasing a large flash area.

For more information, you can refer to *SPI Flash*.

The following config options control TWDT configuration at startup. They are all enabled by default:

- *CONFIG_ESP_TASK_WDT* - the TWDT is initialized automatically during startup. If this option is disabled, it is still possible to initialize the Task WDT at runtime by calling `esp_task_wdt_init()`.
- *CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0* - Idle task is subscribed to the TWDT during startup. If this option is disabled, it is still possible to subscribe the idle task by calling `esp_task_wdt_init()` again.

XTAL32K Watchdog Timer (XTWDT)

One of the optional clock inputs to the ESP32-C3 is an external 32 KHz crystal or oscillator (XTAL32K) that is used as a clock source (`XTAL32K_CLK`) to various subsystems (such as the RTC).

The XTWDT is a dedicated watchdog timer used to ensure that the XTAL32K is functioning correctly. When `XTAL32K_CLK` works as the clock source of `RTC_SLOW_CLK` and stops oscillating, the XTWDT will detect this and generate an interrupt. It also provides functionality for automatically switching over to the internal, but less accurate oscillator as the *RTC_SLOW_CLK* source.

> Since the switch to the backup clock is done in hardware it can also happen during deep sleep. This means that even if `XTAL32K_CLK` stops functioning while the chip in deep sleep, waiting for a timer to expire, it will still be able to wake-up as planned.

If the `XTAL32K_CLK` starts functioning normally again, you can call `esp_xt_wdt_restore_clk` to switch back to this clock source and re-enable the watchdog timer.

Configuration

- When the external 32KHz crystal or oscillator is selected (*CONFIG_RTC_CLK_SRC*) the XTWDT can be enabled via the *CONFIG_ESP_XT_WDT* configuration option.
- The timeout is configured by setting the *CONFIG_ESP_XT_WDT_TIMEOUT* option.
- The automatic backup clock functionality is enabled via the ref:*CONFIG_ESP_XT_WDT_BACKUP_CLK_ENABLE* configuration option.

JTAG & Watchdogs

While debugging using OpenOCD, the CPUs will be halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not reenable them upon leaving the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32-C3 is connected to OpenOCD via JTAG.

API Reference

Task Watchdog A full example using the Task Watchdog is available in esp-idf: system/task_watchdog

Header File

- components/esp_system/include/esp_task_wdt.h

Functions

esp_err_t **esp_task_wdt_init** (const *esp_task_wdt_config_t* *config)

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. If the TWDT is already initialized when this function is called, this function will update the TWDT' s current configuration. This funciton will also subscribe the idle tasks if configured to do so. For other tasks, users can subscribe them using esp_task_wdt_add() or esp_task_wdt_add_user().

备注: esp_task_wdt_init() must only be called after the scheduler is started

参数 **config** –**[in]** Configuration structure

返回

- ESP_OK: Initialization was successful
- Other: Failed to initialize TWDT

esp_err_t **esp_task_wdt_deinit** (void)

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT, and unsubscribe any idle tasks. Calling this function whilst other tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

返回

- ESP_OK: TWDT successfully deinitialized
- Other: Failed to deinitialize TWDT

esp_err_t **esp_task_wdt_add** (*TaskHandle_t* task_handle)

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call esp_task_wdt_reset() to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

参数 **task_handle** –Handle of the task. Input NULL to subscribe the current running task to the TWDT

返回

- ESP_OK: Successfully subscribed the task to the TWDT
- Other: Failed to subscribe task

esp_err_t **esp_task_wdt_add_user** (const char *user_name, *esp_task_wdt_user_handle_t* *user_handle_ret)

Subscribe a user to the Task Watchdog Timer (TWDT)

This function subscribes a user to the TWDT. A user of the TWDT is usually a function that needs to run periodically. Each subscribed user must periodically call esp_task_wdt_reset_user() to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

参数

- **user_name** –**[in]** String to identify the user
- **user_handle_ret** –**[out]** Handle of the user

返回

- ESP_OK: Successfully subscribed the user to the TWDT
- Other: Failed to subscribe user

esp_err_t **esp_task_wdt_reset** (void)

Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

返回

- ESP_OK: Successfully reset the TWDT on behalf of the currently running task
- Other: Failed to reset

esp_err_t **esp_task_wdt_reset_user**(*esp_task_wdt_user_handle_t* user_handle)

Reset the Task Watchdog Timer (TWDT) on behalf of a user.

This function will reset the TWDT on behalf of a user. Each subscribed user must periodically call this function to prevent the TWDT from timing out. If one or more subscribed users fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

参数 **user_handle** – **[in]** User handle
- ESP_OK: Successfully reset the TWDT on behalf of the user
- Other: Failed to reset

esp_err_t **esp_task_wdt_delete**(*TaskHandle_t* task_handle)

Unsubscribes a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call esp_task_wdt_reset().

参数 **task_handle** – **[in]** Handle of the task. Input NULL to unsubscribe the current running task.

返回
- ESP_OK: Successfully unsubscribed the task from the TWDT
- Other: Failed to unsubscribe task

esp_err_t **esp_task_wdt_delete_user**(*esp_task_wdt_user_handle_t* user_handle)

Unsubscribes a user from the Task Watchdog Timer (TWDT)

This function will unsubscribe a user from the TWDT. After being unsubscribed, the user should no longer call esp_task_wdt_reset_user().

参数 **user_handle** – **[in]** User handle

返回
- ESP_OK: Successfully unsubscribed the user from the TWDT
- Other: Failed to unsubscribe user

esp_err_t **esp_task_wdt_status**(*TaskHandle_t* task_handle)

Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

参数 **task_handle** – **[in]** Handle of the task. Input NULL to query the current running task.

返回 :
- ESP_OK: The task is currently subscribed to the TWDT
- ESP_ERR_NOT_FOUND: The task is not subscribed
- ESP_ERR_INVALID_STATE: TWDT was never initialized

Structures

struct **esp_task_wdt_config_t**

Task Watchdog Timer (TWDT) configuration structure.

Public Members

uint32_t **timeout_ms**

TWDT timeout duration in milliseconds

uint32_t **idle_core_mask**

Mask of the cores who’s idle task should be subscribed on initialization

bool **trigger_panic**

Trigger panic when timeout occurs

Type Definitions

typedef struct esp_task_wdt_user_handle_s ***esp_task_wdt_user_handle_t**

Task Watchdog Timer (TWDT) user handle.

此部分 API 代码示例存放在 ESP-IDF 示例项目的 system 目录下。

4.1 应用层跟踪库

4.1.1 概述

ESP-IDF 中提供了应用层跟踪功能，用于分析应用程序的行为。这一功能在相应的库中实现，可以通过 menuconfig 开启。此功能允许用户在程序运行开销很小的前提下，通过 JTAG、UART 或 USB 接口在主机和 ESP32-C3 之间传输任意数据。用户也可同时使用 JTAG 和 UART 接口。UART 接口主要用于连接 SEGGER SystemView 工具（参见 SystemView）。

开发人员可以使用这一功能库将应用程序的运行状态发送给主机，在运行时接收来自主机的命令或者其他类型的信息。该库的主要使用场景有：

1. 收集来自特定应用程序的数据。具体请参阅特定应用程序的跟踪。
2. 记录到主机的轻量级日志。具体请参阅记录日志到主机。
3. 系统行为分析。具体请参阅基于 *SEGGER SystemView* 的系统行为分析。
4. 获取源代码覆盖率。具体请参阅*Gcov*（源代码覆盖）。

使用 JTAG 接口的跟踪组件工作示意图如下所示：

4.1.2 运行模式

该库支持两种运行模式：

后验模式： 后验模式为默认模式，该模式不需要和主机进行交互。在这种模式下，跟踪模块不会检查主机是否已经从 *HW UP BUFFER* 缓冲区读走所有数据，而是直接使用新数据覆盖旧数据。如果用户仅对最新的跟踪数据感兴趣，例如想要分析程序在崩溃之前的行为，则推荐使用该模式。主机可以稍后根据用户的请求来读取数据，例如在使用 JTAG 接口的情况下，通过特殊的 OpenOCD 命令进行读取。

流模式： 当主机连接到 ESP32-C3 时，跟踪模块会进入此模式。在这种模式下，跟踪模块在新数据写入 *HW UP BUFFER* 之前会检查其中是否有足够的空间，并在必要的时候等待主机读取数据并释放足够的内存。最大等待时间是由用户传递给相应 API 函数的超时时间参数决定的。因此当应用程序尝试使用有限的最大等待时间值来将数据写入跟踪缓冲区时，这些数据可能会被丢弃。尤其需要注意的是，如果在对时效要求严格的代码中（如中断处理函数、操作系统调度等）指定了无限的超时时间，将会导致系统故障。为了避免丢失此类关键数据，开发人员可以在 menuconfig 中开启*CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX* 选项，以启用额外的数据缓冲区。此宏还指定了在上述条件下可以缓冲的数据大小，它有助于缓解由于 USB 总线拥塞等原因导致的向主机传输数据间歇性减缓的状况。但是，当跟踪数据流的平均比特率超出硬件接口的能力时，该选项无法发挥作用。

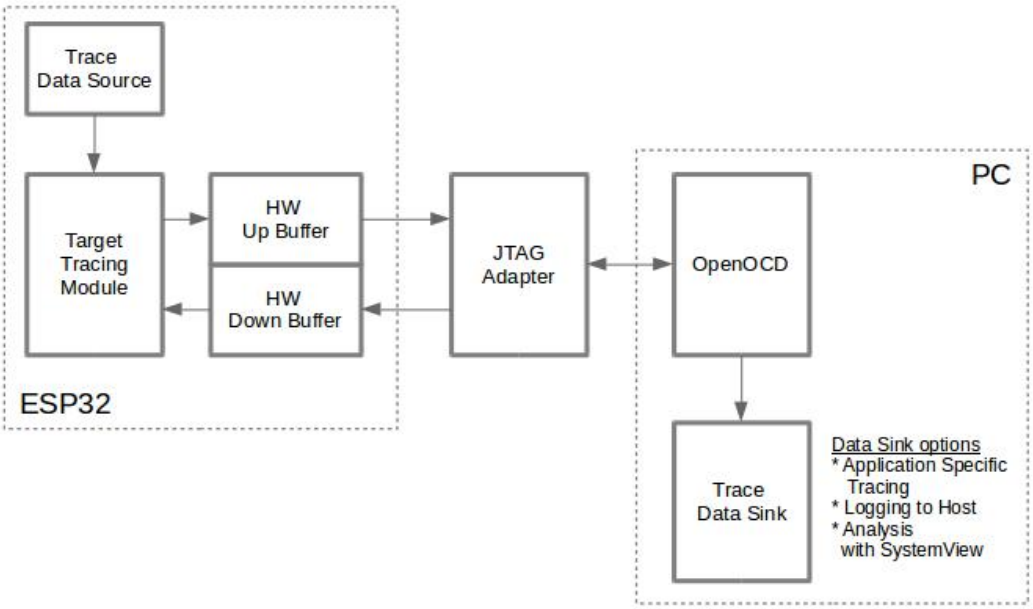

图 1: 使用 JTAG 接口的跟踪组件

4.1.3 配置选项与依赖项

使用此功能需要在主机端和目标端进行以下配置：

1. **主机端：** 应用程序跟踪通过 JTAG 来完成，因此需要在主机上安装并运行 OpenOCD。详细信息请参阅*JTAG 调试*。
2. **目标端：** 在 menuconfig 中开启应用程序跟踪功能。前往 `Component config > Application Level Tracing` 菜单，选择跟踪数据的传输目标（具体用于传输的硬件接口：JTAG 和/或 UART），选择任一非 None 的目标都会自动开启 `CONFIG_APPTRACE_ENABLE` 这个选项。对于 UART 接口，用户必须定义波特率、TX 和 RX 管脚及其他相关参数。

备注： 为了实现更高的数据速率并降低丢包率，建议优化 JTAG 的时钟频率，使其达到能够稳定运行的最大值。详细信息请参阅*优化 JTAG 的速度*。

以下为前述未提及的另外两个 menuconfig 选项：

1. *Threshold for flushing last trace data to host on panic* (*CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH*)。使用 JTAG 接口时，此选项是必选项。在该模式下，跟踪数据以 16 KB 数据块的形式暴露给主机。在后验模式中，一个块被填充后会被暴露给主机，同时之前的块不再可用。也就是说，跟踪数据以 16 KB 的粒度进行覆盖。发生 Panic 时，当前输入块的最新数据将会被暴露给主机，主机可以读取数据以进行后续分析。如果系统发生 Panic 时，仍有少量数据还没来得及暴露给主机，那么之前收集的 16 KB 数据将丢失，主机只能获取少部分的最新跟踪数据，从而可能无法诊断问题。此 menuconfig 选项有助于避免此类情况，它可以控制发生 Panic 时刷新数据的阈值。例如，用户可以设置需要不少于 512 字节的最新跟踪数据，如果在发生 Panic 时待处理的数据少于 512 字节，则数据不会被刷新，也不会覆盖之前的 16 KB 数据。该选项仅在后验模式和使用 JTAG 工作时可发挥作用。
2. *Timeout for flushing last trace data to host on panic* (*CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO*)。该选项仅在流模式下才可发挥作用，它可用于控制跟踪模块在发生 Panic 时等待主机读取最新数据的最长时间。
3. *UART RX/TX ring buffer size* (*CONFIG_APPTRACE_UART_TX_BUFF_SIZE*)。缓冲区的大小取决于通过 UART 传输的数据量。

4. *UART TX message size* (： ref:*CONFIG_APPTRACE_UART_TX_MSG_size*)。要传输的单条消息的最大尺寸。

4.1.4 如何使用此库

该库提供了用于在主机和 ESP32-C3 之间传输任意数据的 API。在 menuconfig 中启用该库后，目标应用程序的跟踪模块会在系统启动时自动初始化。因此，用户需要做的就是调用相应的 API 来发送、接收或者刷新数据。

特定应用程序的跟踪

通常，用户需要决定在每个方向上待传输数据的类型以及如何解析（处理）这些数据。要想在目标和主机之间传输数据，则需执行以下几个步骤：

1. 在目标端，用户需要实现将跟踪数据写入主机的算法。下面的代码片段展示了如何执行此操作。

```
#include "esp_app_trace.h"
...
char buf[] = "Hello World!";
esp_err_t res = esp_apptrace_write(ESP_APPTRACE_DEST_TRAX, buf, strlen(buf),␣
↪ESP_APPTRACE_TMO_INFINITE);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to write data to host!");
    return res;
}
```

`esp_apptrace_write()` 函数使用 memcpy 把用户数据复制到内部缓存中。在某些情况下，使用 `esp_apptrace_buffer_get()` 和 `esp_apptrace_buffer_put()` 函数会更加理想，它们允许开发人员自行分配缓冲区并填充。下面的代码片段展示了如何执行此操作。

```
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)esp_apptrace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32, 100/
↪*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
sprintf(ptr, "Here is the number %d", number);
esp_err_t res = esp_apptrace_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/*tmo␣
↪in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report␣
↪incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

另外，根据实际项目的需要，用户可能希望从主机接收数据。下面的代码片段展示了如何执行此操作。

```
#include "esp_app_trace.h"
...
char buf[32];
char down_buf[32];
size_t sz = sizeof(buf);

/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
```

(下页继续)

(续上页)

```
esp_err_t res = esp_apptrace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/*do not␣
↪wait*/);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
    ...
}
```

esp_apptrace_read() 函数使用 memcpy 把主机端的数据复制到用户缓存区。在某些情况下，使用 esp_apptrace_down_buffer_get() 和 esp_apptrace_down_buffer_put() 函数可能更为理想。它们允许开发人员占用一块读缓冲区并就地进行有关处理操作。下面的代码片段展示了如何执行此操作。

```
#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
size_t sz = 32;

/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_apptrace_down_buffer_get(ESP_APPTRACE_DEST_TRAX, &sz,␣
↪100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 4) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}
esp_err_t res = esp_apptrace_down_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/
↪*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report␣
↪incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

2. 下一步是编译应用程序的镜像，并将其下载到目标板上。这一步可以参考文档构建并烧写。
3. 运行 OpenOCD（参见*JTAG 调试*）。
4. 连接到 OpenOCD 的 telnet 服务器。用户可在终端执行命令 telnet <oocd_host> 4444。如果用户是在运行 OpenOCD 的同一台机器上打开 telnet 会话，可以使用 localhost 替换上面命令中的 <oocd_host>。
5. 使用特殊的 OpenOCD 命令开始收集待跟踪的命令。此命令将传输跟踪数据并将其重定向到指定的文件或套接字（当前仅支持文件作为跟踪数据目标）。相关命令的说明，请参阅启动调试器。
6. 最后，处理接收到的数据。由于数据格式由用户自己定义，本文档中省略数据处理的具体流程。数据处理的范例可以参考位于 $IDF_PATH/tools/esp_app_trace 下的 Python 脚本 apptrace_proc.py（用于功能测试）和 logtrace_proc.py（请参阅记录日志到主机 章节中的详细信息）。

OpenOCD 应用程序跟踪命令 *HW UP BUFFER* 在用户数据块之间共享，并且会代替 API 调用者（在任务或者中断上下文中）填充分配到的内存。在多线程环境中，正在填充缓冲区的任务/中断可能会被另一个高优先级的任务/中断抢占，因此主机可能会读取到还未准备好的用户数据。对此，跟踪模块在所有用户数据块之前添加一个数据头，其中包含有分配的用户缓冲区的大小（2 字节）和实际写入的数据长度

(2 字节)，也就是说数据头总共长 4 字节。负责读取跟踪数据的 OpenOCD 命令在读取到不完整的用户数据块时会报错，但是无论如何，它都会将整个用户数据块（包括还未填充的区域）的内容放到输出文件中。

下文介绍了如何使用 OpenOCD 应用程序跟踪命令。

备注： 目前，OpenOCD 还不支持将任意用户数据发送到目标的命令。

命令用法：

```
esp apptrace [start <options>] | [stop] | [status] | [dump <cores_num>
<outfile>]
```

子命令：

start 开始跟踪（连续流模式）。
stop 停止跟踪。
status 获取跟踪状态。
dump 转储所有后验模式的数据。

Start 子命令的语法：

```
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt
[skip_size]]]]
```

outfile 用于保存来自两个 CPU 的数据文件的路径，该参数需要具有以下格式：`file://path/to/file`。
poll_period 轮询跟踪数据的周期（单位：毫秒），如果大于 0 则以非阻塞模式运行。默认为 1 毫秒。
trace_size 最多要收集的数据量（单位：字节），接收到指定数量的数据后将会停止跟踪。默认为 -1（禁用跟踪大小停止触发器）。
stop_tmo 空闲超时（单位：秒），如果指定的时间段内都没有数据就会停止跟踪。默认为 -1（禁用跟踪超时停止触发器）。还可以将其设置为比目标跟踪命令之间的最长暂停值更长的值（可选）。
wait4halt 如果设置为 0 则立即开始跟踪，否则命令会先等待目标停止（复位、打断点等），然后对其进行自动恢复并开始跟踪。默认值为 0。
skip_size 开始时要跳过的字节数，默认为 0。

备注： 如果 `poll_period` 为 0，则在跟踪停止之前，OpenOCD 的 telnet 命令将不可用。必须通过复位电路板或者在 OpenOCD 的窗口中（非 telnet 会话窗口）使用快捷键 Ctrl+C。另一种选择是设置 `trace_size` 并等待，当收集到指定数据量时，跟踪会自动停止。

命令使用示例：

1. 将 2048 个字节的跟踪数据收集到 `trace.log` 文件中，该文件将保存在 `openocd-esp32` 目录中。

   ```
   esp apptrace start file://trace.log 1 2048 5 0 0
   ```

   跟踪数据会被检索并以非阻塞的模式保存到文件中，如果收集满 2048 字节的数据或者在 5 秒内都没有新的数据，那么该过程就会停止。

   备注： 在将数据提供给 OpenOCD 之前，会对其进行缓冲。如果看到 “Data timeout!” 的消息，则表示目标可能在超时之前没有向 OpenOCD 发送足够的数据以清空缓冲区。要解决这个问题，可以增加超时时间或者使用函数 `esp_apptrace_flush()` 以特定间隔刷新数据。

2. 在非阻塞模式下无限地检索跟踪数据。

   ```
   esp apptrace start file://trace.log 1 -1 -1 0 0
   ```

   对收集数据的大小没有限制，也不设置超时时间。要停止此过程，可以在 OpenOCD 的 telnet 会话窗口中发送 `esp apptrace stop` 命令，或者在 OpenOCD 窗口中使用快捷键 Ctrl+C。
3. 检索跟踪数据并无限期保存。

```
esp apptrace start file://trace.log 0 -1 -1 0 0
```

在跟踪停止之前，OpenOCD 的 telnet 会话窗口将不可用。要停止跟踪，请在 OpenOCD 的窗口中使用快捷键 Ctrl+C。

4. 等待目标停止，然后恢复目标的操作并开始检索数据。当收集满 2048 字节的数据后就停止：

```
esp apptrace start file://trace.log 0 2048 -1 1 0
```

想要复位后立即开始跟踪，请使用 OpenOCD 的 `reset halt` 命令。

记录日志到主机

记录日志到主机是 ESP-IDF 中一个非常实用的功能：通过应用层跟踪库将日志保存到主机端。某种程度上，这也算是一种半主机 (semihosting) 机制，相较于调用 `ESP_LOGx` 将待打印的字符串发送到 UART 的日志记录方式，此功能将大部分工作转移到了主机端，从而减少了本地工作量。

ESP-IDF 的日志库会默认使用类 vprintf 的函数将格式化的字符串输出到专用的 UART，一般来说涉及以下几个步骤：

1. 解析格式字符串以获取每个参数的类型。
2. 根据其类型，将每个参数都转换为字符串。
3. 格式字符串与转换后的参数一起发送到 UART。

虽然可以对类 vprintf 函数进行一定程度的优化，但由于在任何情况下都必须执行上述步骤，并且每个步骤都会消耗一定的时间（尤其是步骤 3），所以经常会发生以下这种情况：向程序中添加额外的打印信息以诊断问题，却改变了应用程序的行为，使得问题无法复现。在最严重的情况下，程序无法正常工作，最终导致报错甚至挂起。

想要解决此类问题，可以使用更高的波特率或者其他更快的接口，并将字符串格式化的工作转移到主机端。

通过应用层跟踪库的 `esp_apptrace_vprintf` 函数，可以将日志信息发送到主机，该函数不执行格式字符串和参数的完全解析，而仅仅计算传递参数的数量，并将它们与格式字符串地址一起发送给主机。主机端会通过一个特殊的 Python 脚本来处理并打印接收到的日志数据。

局限 目前通过 JTAG 实现记录日志还存在以下几点局限：

1. 不支持使用 `ESP_EARLY_LOGx` 宏进行跟踪。
2. 不支持大小超过 4 字节的 printf 参数（例如 `double` 和 `uint64_t`）。
3. 仅支持.rodata 段中的格式字符串和参数。
4. 最多支持 256 个 printf 参数。

如何使用 为了使用跟踪模块来记录日志，用户需要执行以下步骤：

1. 在目标端，需要安装特殊的类 vprintf 函数 `esp_apptrace_vprintf`，该函数负责将日志数据发送给主机。示例代码参见 system/app_trace_to_host 。
2. 按照特定应用程序的跟踪 章节中的第 2-5 步进行操作。
3. 打印接收到的日志记录，请在终端运行以下命令：`$IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file`。

Log Trace Processor 命令选项 命令用法：

```
logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>
```

位置参数（必要）：

`trace_file` 日志跟踪文件的路径。
`elf_file` 程序 ELF 文件的路径。

可选参数：

`-h, --help` 显示此帮助信息并退出。

--no-errors, -n 不打印错误信息。

基于 SEGGER SystemView 的系统行为分析

ESP-IDF 中另一个基于应用层跟踪库的实用功能是系统级跟踪，它会生成与 SEGGER SystemView 工具相兼容的跟踪信息。SEGGER SystemView 是一款实时记录和可视化工具，用来分析应用程序运行时的行为，可通过 UART 接口实时查看事件。

如何使用 若需使用这个功能，需要在 menuconfig 中开启*CONFIG_APPTRACE_SV_ENABLE* 选项，具体路径为 `Component config > Application Level Tracing > FreeRTOS SystemView Tracing`。同一菜单栏下还开启了其它几个选项：

1. *SytemView destination*。选择需要使用的接口：JTAG 或 UART。使用 UART 接口时，可以将 SystemView 应用程序直接连接到 ESP32-C3 并实时接收数据。
2. *ESP32-C3 timer to use as SystemView timestamp source*（*CONFIG_APPTRACE_SV_TS_SOURCE*）。选择 SystemView 事件使用的时间戳来源。在单核模式下，使用 ESP32-C3 内部的循环计数器生成时间戳，其最大的工作频率是 240 MHz（时间戳粒度大约为 4 ns）。在双核模式下，使用工作在 40 MHz 的外部定时器，因此时间戳粒度为 25 ns。
3. 可以单独启用或禁用的 SystemView 事件集合 (`CONFIG_APPTRACE_SV_EVT_XXX`)：
   - Trace Buffer Overflow Event
   - ISR Enter Event
   - ISR Exit Event
   - ISR Exit to Scheduler Event
   - Task Start Execution Event
   - Task Stop Execution Event
   - Task Start Ready State Event
   - Task Stop Ready State Event
   - Task Create Event
   - Task Terminate Event
   - System Idle Event
   - Timer Enter Event
   - Timer Exit Event

ESP-IDF 中已经包含了所有用于生成兼容 SystemView 跟踪信息的代码，用户只需配置必要的项目选项（如上所示），然后构建、烧写映像到目标板，接着参照前面的介绍，使用 OpenOCD 收集数据。

4. 想要通过 UART 接口进行实时跟踪，请在菜单配置选项 `Component config > Application Level Tracing > FreeRTOS SystemView Tracing` 中选择 Pro 或 App CPU。

OpenOCD SystemView 跟踪命令选项 命令用法：

```
esp sysview [start <options>] | [stop] | [status]
```

子命令：

start 开启跟踪（连续流模式）。
stop 停止跟踪。
status 获取跟踪状态。

Start 子命令语法：

```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

outfile1 保存 PRO CPU 数据的文件路径。此参数需要具有如下格式：`file://path/to/file`。
outfile2 保存 APP CPU 数据的文件路径。此参数需要具有如下格式：`file://path/to/file`。
poll_period 跟踪数据的轮询周期（单位：毫秒）。如果该值大于 0，则命令以非阻塞的模式运行。默认为 1 毫秒。
trace_size 最多要收集的数据量（单位：字节）。当收到指定数量的数据后，将停止跟踪。默认值是 -1（禁用跟踪大小停止触发器）。

stop_tmo 空闲超时（单位：秒）。如果指定的时间内没有数据，将停止跟踪。默认值是 -1（禁用跟踪超时停止触发器）。

备注： 如果 poll_period 为 0，则在跟踪停止之前，OpenOCD 的 telnet 命令行将不可用。您需要复位板卡或者在 OpenOCD 的窗口（非 telnet 会话窗口）输入 Ctrl+C 命令来手动停止跟踪。另一个办法是设置 trace_size，等到收集满指定数量的数据后自动停止跟踪。

命令使用示例：

1. 将 SystemView 跟踪数据收集到文件 pro-cpu.SVDat 和 pro-cpu.SVDat 中。这些文件会被保存在 openocd-esp32 目录中。

```
esp sysview start file://pro-cpu.SVDat file://app-cpu.SVDat
```

   跟踪数据被检索并以非阻塞的方式保存。要停止此过程，需要在 OpenOCD 的 telnet 会话窗口输入 esp sysview stop 命令，也可以在 OpenOCD 窗口中按下快捷键 Ctrl+C。
2. 检索跟踪数据并无限保存。

```
esp32 sysview start file://pro-cpu.SVDat file://app-cpu.SVDat 0 -1 -1
```

   OpenOCD 的 telnet 命令行在跟踪停止前会无法使用，要停止跟踪，请在 OpenOCD 窗口使用 Ctrl+C 快捷键。

数据可视化 收集到跟踪数据后，用户可以使用特殊的工具对结果进行可视化并分析程序行为。

在工具中单独分析每个核的跟踪数据是比较棘手的，但是 Eclipse 提供了 *Impulse* 插件，该插件可以加载多个跟踪文件，并且可以在同一视图中检查来自两个内核的事件。此外，与免费版的 SystemView 相比，此插件没有 1,000,000 个事件的限制。

关于如何安装、配置 Impulse 并使用它来可视化来自单个核心的跟踪数据，请参阅 官方教程 。

备 注： ESP-IDF 使用自己的 SystemView FreeRTOS 事件 ID 映射，因此用户需要将 $SYSVIEW_INSTALL_DIR/Description/SYSVIEW_FreeRTOS.txt 替换成 $IDF_PATH/docs/api-guides/SYSVIEW_FreeRTOS.txt。在使用上述链接配置 SystemView 序列化程序时，也应该使用该特定文件的内容。

Gcov（源代码覆盖）

Gcov 和 Gcovr 简介 源代码覆盖率显示程序运行时间内执行的每一条程序执行路径的数量和频率。Gcov 是一款 GCC 工具，与编译器协同使用时，可生成日志文件，显示源文件每行的执行次数。Gcovr 是管理 Gcov 和生成代码覆盖率总结的工具。

一般来说，使用 Gcov 在主机上编译和运行程序会经过以下步骤：

1. 使用 GCC 以及 --coverage 选项编译源代码。编译器会在编译过程中生成一个 .gcno 注释文件，该文件包含重建执行路径块图以及将每个块映射到源代码行号等信息。每个用 --coverage 选项编译的源文件都会生成自己的同名 .gcno 文件（如 main.c 在编译时会生成 main.gcno）。
2. 执行程序。在执行过程中，程序会生成 .gcda 数据文件。这些数据文件包含了执行路径的次数统计。程序将为每个用 --coverage 选项编译的源文件生成一个 .gcda 文件（如 main.c 将生成 main.gcda）。
3. Gcov 或 Gcovr 可用于生成基于 .gcno、.gcda 和源文件的代码覆盖。Gcov 将以 .gcov 文件的形式为每个源文件生成基于文本的覆盖报告，而 Gcovr 将以 HTML 格式生成覆盖报告。

ESP-IDF 中的 Gcov 和 Gcovr 应用 在 ESP-IDF 中使用 Gcov 的过程比较复杂，因为程序不在主机上运行，而在目标机上运行。代码覆盖率数据（即 .gcda 文件）最初存储在目标机上，OpenOCD 在运行时通过 JTAG 将代码覆盖数据从目标机转储到主机上。在 ESP-IDF 中使用 Gcov 可以分为以下几个步骤：

1. *为 Gcov 设置项目*

2. 转储代码覆盖数据
3. 生成代码覆盖报告

为 Gcov 设置项目

编译器选项 为了获取项目中的代码覆盖率数据，必须用 `--coverage` 选项编译项目中的一个或多个源文件。在 ESP-IDF 中，这可以在组件级或单个源文件级实现：

- 在组件的 `CMakeLists.txt` 文件中添加 `target_compile_options(${COMPONENT_LIB} PRIVATE --coverage)` 可确保使用 `--coverage` 选项编译组件中的所有源文件。
- 在组件的 `CMakeLists.txt` 文件中添加 `set_source_files_properties(source1.c source2.c PROPERTIES COMPILE_FLAGS --coverage)` 可确保使用 `--coverage` 选项编译同一组件中选定的一些源文件（如 `source1.c` 和 `source2.c`）。

当一个源文件用 `--coverage` 选项编译时（例如 `gcov_example.c`），编译器会在项目的构建目录下生成 `gcov_example.gcno` 文件。

项目配置 在构建有源代码覆盖的项目之前，请运行 `idf.py menuconfig` 以启用以下项目配置选项。

- 通过*CONFIG_APPTRACE_DESTINATION1* 选项选择 `Trace Memory` 来启用应用程序跟踪模块。
- 通过*CONFIG_APPTRACE_GCOV_ENABLE* 选项启用 Gcov 主机。

转储代码覆盖数据 一旦项目使用 `--coverage` 选项编译并烧录到目标机上，在应用程序运行时，代码覆盖数据将存储在目标机内部（即在跟踪存储器中）。将代码覆盖率数据从目标机转移到主机上的过程称为转储。

覆盖率数据的转储通过 OpenOCD 进行（关于如何设置和运行 OpenOCD，请参考*JTAG 调试*）。由于该过程需要通过向 OpenOCD 发出命令来触发转储，因此必须打开 telnet 会话，以向 OpenOCD 发出这些命令（运行 `telnet localhost 4444`）。GDB 也可以代替 telnet 来向 OpenOCD 发出命令，但是所有从 GDB 发出的命令都需要以 `mon <oocd_command>` 为前缀。

当目标机转储代码覆盖数据时，`.gcda` 文件存储在项目的构建目录中。例如，如果 `main` 组件的 `gcov_example_main.c` 在编译时使用了 `--coverage` 选项，那么转储代码覆盖数据将在 `build/esp-idf/main/CMakeFiles/__idf_main.dir/gcov_example_main.c.gcda` 中生成 `gcov_example_main.gcda` 文件。注意，编译过程中产生的 `.gcno` 文件也放在同一目录下。

代码覆盖数据的转储可以在应用程序的整个生命周期内多次进行。每次转储都会用最新的代码覆盖信息更新 `.gcda` 文件。代码覆盖数据是累积的，因此最新的数据将包含应用程序整个生命周期中每个代码路径的总执行次数。

ESP-IDF 支持两种将代码覆盖数据从目标机转储到主机的方法：

- 运行中实时转储
- 硬编码转储

运行中实时转储 通过 telnet 会话调用 OpenOCD 命令 `ESP32-C3 gcov` 来触发运行时的实时转储。一旦被调用，OpenOCD 将立即抢占 ESP32-C3 的当前状态，并执行内置的 ESP-IDF Gcov 调试存根函数。调试存根函数将数据转储到主机。完成后，ESP32-C3 将恢复当前状态。

硬编码转储 硬编码转储是由应用程序本身从程序内部调用*esp_gcov_dump()* 函数触发的。在调用时，应用程序将停止并等待 OpenOCD 连接，同时检索代码覆盖数据。一旦*esp_gcov_dump()* 函数被调用，主机将通过 telnet 会话执行 `esp gcov dump` OpenOCD 命令，该命令会将 OpenOCD 连接到 ESP32-C3，检索代码覆盖数据，然后断开与 ESP32-C3 的连接，从而恢复应用程序。在应用程序的生命周期中可多次触发硬编码转储。

在必要时（如应用程序初始化后或是应用程序主循环的每次迭代期间）放置*esp_gcov_dump()*，当应用程序在生命周期的某刻需要代码覆盖率数据时，硬编码转储会非常有用。

GDB 可以用来在*esp_gcov_dump()* 上设置断点，然后使用 gdbinit 脚本自动调用 mon esp gcov dump （关于 GDB 的使用可参考*使用命令行调试*）。

以下 GDB 脚本将在*esp_gcov_dump()* 处添加一个断点，然后调用 mon esp gcov dump OpenOCD 命令。

```
b esp_gcov_dump
commands
mon esp gcov dump
end
```

备注： 注意，所有的 OpenOCD 命令都应该在 GDB 中以 mon <oocd_command> 方式调用。

生成代码覆盖报告 一旦代码覆盖数据被转储，.gcno、.gcda 和源文件可以用来生成代码覆盖报告。该报告会显示源文件中每行被执行的次数。

Gcov 和 Gcovr 都可以用来生成代码覆盖报告。安装 Xtensa 工具链时会一起安装 Gcov，但 Gcovr 可能需要单独安装。关于如何使用 Gcov 或 Gcovr，请参考 Gcov 文档 和 Gcovr 文档。

在工程中添加 Gcovr 构建目标 用户可以在自己的工程中定义额外的构建目标，从而通过一个简单的构建命令即可更方便地生成报告。

请在您工程的 CMakeLists.txt 文件中添加以下内容：

```
include($ENV{IDF_PATH}/tools/cmake/gcov.cmake)
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

您可使用以下命令：

- cmake --build build/ --target gcovr-report：在 $(BUILD_DIR_BASE)/coverage_report/html 目录下生成 HTML 格式代码覆盖报告。
- cmake --build build/ --target cov-data-clean：删除所有代码覆盖数据文件。

4.2 应用程序的启动流程

本文将会介绍 ESP32-C3 从上电到运行 app_main 函数中间所经历的步骤（即启动流程）。

宏观上，该启动流程可以分为如下 3 个步骤：

1. *一级引导程序* 被固化在了 ESP32-C3 内部的 ROM 中，它会从 flash 的 0x0 偏移地址处加载二级引导程序至 RAM (IRAM & DRAM) 中。
2. *二级引导程序* 从 flash 中加载分区表和主程序镜像至内存中，主程序中包含了 RAM 段和通过 flash 高速缓存映射的只读段。
3. *应用程序启动阶段* 运行，这时第二个 CPU 和 RTOS 的调度器启动。

下面会对上述过程进行更为详细的阐述。

4.2.1 一级引导程序

SoC 复位后，CPU 会立即开始运行，执行所有的初始化操作。复位向量代码位于 ESP32-C3 芯片掩膜 ROM 处，且不能被修改。

复位向量调用的启动代码会根据 GPIO_STRAP_REG 寄存器的值来确定 ESP32-C3 的启动模式，该寄存器保存着复位后 bootstrap 引脚的电平状态。根据不同的复位原因，程序会执行如下操作：

1. 从深度睡眠模式复位：如果 RTC_CNTL_STORE6_REG 寄存器的值非零，且 RTC_CNTL_STORE7_REG 寄存器中的 RTC 内存的 CRC 校验值有效，那么程序会使用 RTC_CNTL_STORE6_REG 寄存器的值作为入口地址，并立即跳转到该地址运行。如果 RTC_CNTL_STORE6_REG 的值为零，或 RTC_CNTL_STORE7_REG 中的 CRC 校验值无效，又或通过 RTC_CNTL_STORE6_REG 调用的代码返回，那么则像上电复位一样继续启动。**注意**：如果想在这里运行自定义的代码，可以参考深度睡眠 文档里面介绍的深度睡眠存根机制方法。
2. 上电复位、软件 SoC 复位、看门狗 SoC 复位：检查 GPIO_STRAP_REG 寄存器，判断是否请求自定义启动模式，如 UART 下载模式。如果是，ROM 会执行此自定义加载器模式。否则程会像软件 CPU 复位一样继续启动。请参考 ESP32-C3 技术规格书了解 SoC 启动模式以及具体执行过程。
3. 软件 CPU 复位、看门狗 CPU 复位：根据 EFUSE 中的值配置 SPI flash，然后尝试从 flash 中加载代码，这部分将会在后面一小节详细介绍。

备注： 正常启动模式下会使能 RTC 看门狗，因此，如果进程中断或停止，看门狗将自动重置 SOC 并重复启动过程。如果 strapping GPIOs 已更改，则可能导致 SoC 陷入新的启动模式。

4.2.2 二级引导程序

在 ESP-IDF 中，存放在 flash 的 0x0 偏移地址处的二进制镜像就是二级引导程序。二级引导程序的源码可以在 ESP-IDF 的 components/bootloader 目录下找到。ESP-IDF 使用二级引导程序可以增加 flash 分区的灵活性（使用分区表），并且方便实现 flash 加密，安全引导和空中升级（OTA）等功能。

当一级引导程序校验并加载完二级引导程序后，它会从二进制镜像的头部找到二级引导程序的入口点，并跳转过去运行。

二级引导程序默认从 flash 的 0x8000 偏移地址处（可配置的值）读取分区表。请参考分区表 获取详细信息。引导程序会寻找工厂分区和 OTA 应用程序分区。如果在分区表中找到了 OTA 应用程序分区，引导程序将查询 otadata 分区以确定应引导哪个分区。更多信息请参考空中升级 *(OTA)*。

关于 ESP-IDF 引导程序可用的配置选项，请参考*引导加载程序 (Bootloader)*。

对于选定的分区，二级引导程序将从 flash 逐段读取二进制镜像：

- 对于在内部*IRAM（指令 RAM）* 或*DRAM（数据 RAM）* 中具有加载地址的段，将把数据从 flash 复制到它们的加载地址处。
- 对于一些加载地址位于*DROM（数据存储在 flash 中）* 或*IROM（代码从 flash 中运行）* 区域的段，通过配置 flash MMU，可为从 flash 到加载地址提供正确的映射。

一旦处理完所有段（即加载了代码并设置了 flash MMU），二级引导程序将验证应用程序的完整性，并从二进制镜像文件的头部寻找入口地址，然后跳转到该地址处运行。

4.2.3 应用程序启动阶段

应用程序启动包含了从应用程序开始执行到 app_main 函数在主任务内部运行前的所有过程。可分为三个阶段：

- 硬件和基本 C 语言运行环境的端口初始化。
- 软件服务和 FreeRTOS 的系统初始化。
- 运行主任务并调用 app_main。

备注： 通常不需要了解 ESP-IDF 应用程序初始化的所有阶段。如果需要仅从应用程序开发人员的角度了解初始化，请跳至运行主任务。

端口初始化

ESP-IDF 应用程序的入口是 components/esp_system/port/cpu_start.c 文件中的 `call_start_cpu0` 函数。这个函数由二级引导加载程序执行，并且从不返回。

该端口层的初始化功能会初始化基本的 C 运行环境（“CRT”），并对 SoC 的内部硬件进行了初始配置。

- 为应用程序重新配置 CPU 异常（允许应用程序中断处理程序运行，并使用为应用程序配置的选项来处理严重错误，而不是使用 ROM 提供的简易版错误处理程序处理。
- 如果没有设置选项*CONFIG_BOOTLOADER_WDT_ENABLE*，则不使能 RTC 看门狗定时器。
- 初始化内部存储器（数据和 bss）。
- 完成 MMU 高速缓存配置。
- 将 CPU 时钟设置为项目配置的频率。
- 如果配置了内存保护，则初始化内存保护。

`call_start_cpu0` 完成运行后，将调用在 components/esp_system/startup.c 中找到的“系统层”初始化函数 `start_cpu0`。

系统初始化

主要的系统初始化函数是 `start_cpu0`。默认情况下，这个函数与 `start_cpu0_default` 函数弱链接。这意味着可以覆盖这个函数，增加一些额外的初始化步骤。

主要的系统初始化阶段包括：

- 如果默认的日志级别允许，则记录该应用程序的相关信息（项目名称、应用程序版本 等）。
- 初始化堆分配器（在这之前，所有分配必须是静态的或在堆栈上）。
- 初始化 newlib 组件的系统调用和时间函数。
- 配置断电检测器。
- 根据串行控制台配置 设置 libc stdin、stdout、和 stderr。
- 执行与安全有关的检查，包括为该配置烧录 efuse（包括永久限制 *ROM* 下载模式）。
- 初始化 SPI flash API 支持。
- 调用全局 C++ 构造函数和任何标有 `__attribute__((constructor))` 的 C 函数。

二级系统初始化允许单个组件被初始化。如果一个组件有一个用 `ESP_SYSTEM_INIT_FN` 宏注释的初始化函数，它将作为二级初始化的一部分被调用。

运行主任务

在所有其他组件都初始化后，主任务会被创建，FreeRTOS 调度器开始运行。

做完一些初始化任务后（需要启动调度器），主任务在固件中运行应用程序提供的函数 `app_main`。

运行 `app_main` 的主任务有一个固定的 RTOS 优先级（比最小值高）和一个可配置的堆栈大小。

与普通的 FreeRTOS 任务（或嵌入式 C 的 `main` 函数）不同，`app_main` 任务可以返回。如果 “app_main“ 函数返回，那么主任务将会被删除。系统将继续运行其他的 RTOS 任务。因此可以将 `app_main` 实现为一个创建其他应用任务然后返回的函数，或主应用任务本身。

4.3 BluFi

4.3.1 概览

BluFi 是一项基于蓝牙通道的 Wi-Fi 网络配置功能，适用于 ESP32-C3。它通过安全协议将 Wi-Fi 的 SSID、密码等配置信息传输到 ESP32-C3。基于这些信息，ESP32-C3 可进而连接到 AP 或建立 SoftAP。

BluFi 流程的关键部分包括数据的分片、加密以及校验和验证。

用户可按需自定义用于对称加密、非对称加密以及校验的算法。此处，我们采用 DH 算法进行密钥协商，128-AES 算法用于数据加密，CRC16 算法用于校验和验证。

4.3.2 BluFi 流程

BluFi 配网流程包含配置 SoftAP 和配置 Station 两部分。

下面以配置 Station 为例，介绍了广播、连接、服务发现、协商共享密钥、传输数据、回传连接状态等关键步骤。

1. ESP32-C3 开启 GATT Server 模式，发送带有特定 *advertising data* 的广播。该广播不属于 BluFi Profile，您可以按需对其进行自定义。
2. 使用手机应用程序搜索到该广播后，手机将作为 GATT Client 连接 ESP32-C3。该步骤对具体使用哪款手机应用程序并无特殊要求。
3. 成功建立 GATT 连接后，手机会向 ESP32-C3 发送数据帧进行密钥协商（详见*BluFi 中定义的帧格式* ）。
4. ESP32-C3 收到密钥协商的数据帧后，会按照您自定义的协商方法进行解析。
5. 手机与 ESP32-C3 进行密钥协商。协商过程可使用 DH/RSA/ECC 等加密算法。
6. 协商结束后，手机端向 ESP32-C3 发送控制帧，用于设置安全模式。
7. ESP32-C3 收到控制帧后，使用共享密钥以及安全配置对通信数据进行加密和解密。
8. 手机向 ESP32-C3 发送*BluFi 中定义的帧格式* 中定义的数据帧，包括 SSID、密码等 Wi-Fi 配置信息。
9. 手机向 ESP32-C3 发送 Wi-Fi 连接请求的控制帧。ESP32-C3 收到控制帧后，即默认手机已完成必要信息的传输，准备连接 Wi-Fi。
10. 连接到 Wi-Fi 后，ESP32-C3 发送 Wi-Fi 连接状态报告的控制帧到手机。至此，配网结束。

备注:

1. ESP32-C3 收到安全模式配置的控制帧后，会根据定义的安全模式进行相关操作。
2. 进行对称加密和解密时，加密和解密前后的数据长度必须一致。支持原地加密和解密。

4.3.3 BluFi 流程图

4.3.4 BluFi 中定义的帧格式

手机应用程序与 ESP32-C3 之间的 BluFi 通信格式定义如下：

帧不分片格式：

字段	值（字节）
类型（最低有效位）	1
帧控制	1
序列号	1
数据长度	1
数据	${Data Length}
校验（最高有效位）	2

如果使能 **帧控制**字段中的分片位，则 **数据**字段中会出现 2 字节的 **内容总长度**。该 **内容总长度**表示帧的剩余部分的总长度，并用于报告终端需要分配的内存大小。

帧分片格式：

图 2: BluFi Flow Chart

字段	值（字节）
类型（最低有效位）	1
帧控制（分片）	1
序列号	1
数据长度	1
数据	• 内容总长度：2 • 数据内容长度：${Data Length} - 2
校验（最高有效位）	2

通常情况下，控制帧不包含数据位，ACK 帧类型除外。

ACK 帧格式（8 bit）：

字段	值（字节）
类型 - ACK（最低有效位）	1
帧控制	1
序列号	1
数据长度	1
数据	ACK 序列号: 2
校验（最高有效位）	2

1. 类型字段
   类型字段占 1 字节，分为 **类型**和 **子类型**两部分。其中，**类型**占低 2 位，表明该帧为数据帧或是控制帧；**子类型**占高 6 位，表示此数据帧或者控制帧的具体含义。
   - 控制帧，暂不进行加密，可校验。
   - 数据帧，可加密，可校验。

1.1 控制帧（二进制：0x0 b’00）

控制帧	含义	解释	备注
0x0 (b’000000)	ACK	ACK 帧的数据字段使用回复对象帧的序列值。	数据字段占用 1 字节，其序列值与回复对象帧的序列值相同。
0x1 (b’000001)	将 ESP 设备设置为安全模式。	通知 ESP 设备发送数据时使用的安全模式，在数据发送过程中可多次重置。设置后，将影响后续使用的安全模式。 如果不设置，ESP 设备将默认发送不带校验和加密的控制帧和数据帧。从手机到 ESP 设备的数据传输是由这个控制帧控制的。	数据字段占一个字节。高 4 位用于控制帧的安全模式设置，低 4 位用于数据帧的安全模式设置。 • b’0000：无校验、无加密； • b’0001：有校验、无加密； • b’0010：无校验、有加密； • b’0011：有校验、有加密。
0x2 (b’000010)	设置 Wi-Fi 的 opmode。	该帧包含设置 ESP 设备 Wi-Fi 模式 (opmode) 的设置信息。	data[0] 用于设置 opmode，包括： • 0x00: NULL • 0x01: STA • 0x02: SoftAP • 0x03: SoftAP & STA 如果设置中包含 AP，请尽量优先设置 AP 模式的 SSID/密码/最大连接数等。
0x3 (b’000011)	将 ESP 设备连接至 AP。	通知 ESP 设备必要的信息已经发送完毕，可以连接至 AP。	不包含数据字段。
0x4 (b’000100)	断开 ESP 设备与 AP 的连接。		不包含数据字段。
0x5 (b’000101)	获取 ESP 设备的 Wi-Fi 模式和状态等信息。		• 不包含数据字段。ESP 设备收到此控制帧后，会向手机回发一个报告 Wi-Fi 连接状态的帧来告知手机端当前所处的 opmode、连接状态、SSID 等信息。 • 提供给手机端的信息类型由手机上的应用程序决定。
0x6 (b’000110)	断开 STA 设备与 SoftAP 的连接（SoftAP 模式）。		data[0~5] 为 STA 设备的 MAC 地址。如有多个 STA 设备，则第二个使用 data[6-11]，依次类推。
0x7 (b’000111)	获取版本信息。		
0x8 (b’001000)	断开 BLE GATT 连接。		ESP 设备收到该指令后主动断开 BLE GATT 连接。
0x9 (b’001001)	获取 Wi-Fi 列表。	通知 ESP 设备扫描周围的 Wi-Fi 热点。	不包含数据字段。ESP 设备收到此控制帧后，会向手机回发一个包含 Wi-Fi 热点报告的帧。

1.2 数据帧 (二进制：0x1 b’01)

数据帧	含义	解释	备注
0x0 (b’000000)	发送协商数据。	协商数据会发送到应用层注册的回调函数中。	数据的长度取决于数据长度字段。
0x1 (b’000001)	发送 STA 模式的 BSSID。	在 SSID 隐藏的情况下，发送 STA 设备要连接的 AP 的 BSSID。	请参考备注 1。
0x2 (b’000010)	发送 STA 模式的 SSID	发送 STA 设备要连接的 AP 的 SSID。	请参考备注 1。
0x3 (b’000011)	发送 STA 模式的密码。	发送 STA 设备要连接的 AP 的密码。	请参考备注 1。
0x4 (b’000100)	发送 SoftAP 模式的 SSID。		请参考备注 1。
0x5 (b’000101)	发送 SoftAPmode 模式的密码。		请参考备注 1。
0x6 (b’000110)	设置 SoftAPmode 模式的最大连接数。		data[0] 为连接数的值，范围从 1 到 4。当传输方向是 ESP 设备到手机时，表示向手机端提供所需信息。
0x7 (b’000111)	设置 SoftAP 的认证模式。		data[0] 包括： • 0x00: OPEN • 0x01: WEP • 0x02: WPA_PSK • 0x03: WPA2_PSK • 0x04: WPA_WPA2_PSK 若传输方向是从 ESP 设备到手机，则表示向手机端提供所需信息。
0x8 (b’001000)	设置 SoftAP 模式的通道数量。		data[0] 代表支持的通道的数量，范围从 1 到 14。若传输方向是从 ESP 设备到手机，则表示向手机端提供所需信息。
0x9 (b’001001)	用户名	在进行企业级加密时提供 GATT 客户端的用户名。	数据的长度取决于数据长度字段。
0xa (b’001010)	CA 认证	在进行企业级加密时提供 CA 认证。	请参考备注 2。
0xb (b’001011)	客户端认证	在进行企业级加密时提供客户端认证。是否包含私钥，取决于认证的内容。	请参考备注 2。
0xc (b’001100)	服务端认证	在进行企业级加密时提供服务端认证。是否包含私钥，取决于认证的内容。	请参考备注 2。
0xd (b’001101)	客户端私钥	在进行企业级加密时提供客户端私钥。	请参考备注 2。
0xe (b’001110)	服务端私钥	在进行企业级加密时提供服务端私钥。	请参考备注 2。
0xf (b’001111)	Wi-Fi 连接状态报告	通知手机 ESP 设备的 Wi-Fi 状态，包括 STA 状态和 SoftAP 状态。用于 STA 设备连接手机或 SoftAP。但是，当手机接收到 Wi-Fi 状态时，除了本帧之外，还可以回复其他帧。	data[0] 表示 opmode，包括： • 0x00: NULL • 0x01: STA • 0x02: SoftAP • 0x03: SoftAP & STA data[1]：STA 设备的连接状态。0x0 表示处于连接状态，其他表示处于非连接状态。 data[2]：SoftAP 的连接状态，即表示有多少 STA 设备已经连接。 data[3] 及后面的数据是按照 SSID/BSSID

备注:

- 备注 1: 数据的长度取决于数据长度字段。若传输方向是从 ESP 设备到手机，则表示向手机端提供所需信息。
- 备注 2: 数据的长度取决于数据长度字段。如果数据长度不够，该帧可用分片。

2. Frame Control
   帧控制字段，占 1 字节，每个位表示不同含义。

位	含义
0x01	表示帧是否加密。 • 1 表示加密。 • 0 表示未加密。 该帧的加密部分包括数据字段加密之前的完整明文数据（不包括校验部分）。控制帧暂不加密，故控制帧此位为 0。
0x02	该数据字段表示帧尾是否包含校验位，如 SHA1、MD5、CRC 等。该数据字段包含序列、数据长度以及明文。控制帧和数据帧都可以选择包含或不包含校验位。
0x04	表示数据方向。 • 0 表示传输方向是从手机到 ESP 设备。 • 1 表示传输方向是从 ESP 设备到手机。
0x08	表示是否要求对方回复 ACK。 • 0 表示不要求回复 ACK。 • 1 表示要求回复 ACK。
0x10	表示是否有后续的数据分片。 • 0 表示此帧没有后续数据分片。 • 1 表示还有后续数据分片，用来传输较长的数据。 对于分片帧，在数据字段的前两个字节中，会给定当前内容部分和随后内容部分的总长度（即最大支持 64 K 的数据内容）。
0x10~0x80	保留

3. 序列控制
   序列控制字段。帧发送时，无论帧的类型是什么，序列都会自动加 1，用来防止重放攻击 (Replay Attack)。每次重新连接后，序列清零。
4. 长度
   数据字段的长度，不包含校验部分。
5. 数据
   对于不同的类型或子类型，数据字段的含义均不同。请参考上方表格。
6. 校验
   此字段占两个字节，用来校验序列、数据长度以及明文。

4.3.5 ESP32-C3 端的安全实现

1. 数据安全
   为了保证 Wi-Fi SSID 和密码的传输过程是安全的，需要使用对称加密算法（例如 AES、DES 等）对报文进行加密。在使用对称加密算法之前，需要使用非对称加密算法（DH、RSA、ECC 等）协商出（或生成出）一个共享密钥。
2. 保证数据完整性
   为了保证数据完整性，需要加入校验算法，例如 SHA1、MD5、CRC 等。
3. 身份安全（签名）
   某些算法如 RSA 可以保证身份安全。但如 DH 这类的算法，本身不能保证身份安全，需要添加其他算法来签名。
4. 防止重放攻击 (Replay Attack)
   添加其到序列字段中，并且在数据校验过程中使用。

在 ESP32-C3 端的代码中，你可以决定和开发如密钥协商等安全处理的流程。手机应用向 ESP32-C3 发送协商数据，数据会传送给应用层处理。如果应用层不处理，可使用 BluFi 提供的 DH 加密算法来协商密钥。
应用层需向 BluFi 注册以下几个与安全相关的函数：

```
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t␣
↪**output_data, int *output_len, bool *need_free)
```

该函数用来接收协商期间的正常数据 (normal data)。数据处理完成后，需要将待发送的数据使用 output_data 和 output_len 传出。

BluFi 会在调用完 Negotiate_data_handler 后，发送 Negotiate_data_handler 传出的 output_data。

这里的两个 “*” 是因为需要发出去的数据长度未知，所以需要函数自行分配 (malloc) 或者指向全局变量，并告知是否需要通过 NEED_FREE 释放内存。

```
typedef int (* esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int␣
↪crypt_len)
```

加密和解密的数据长度必须一致。其中 IV8 为帧的 8 位序列，可作为 IV 的某 8 个位来使用。

```
typedef int (* esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int␣
↪crypt_len)
```

加密和解密的数据长度必须一致。其中 IV8 为帧的 8 位序列，可作为 IV 的某 8 个位来使用。

```
typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
```

该函数用来进行校验，返回值为校验的值。BluFi 会使用该函数返回值与帧的校验值进行比较。

4.3.6 GATT 相关说明

UUID

BluFi Service UUID：0xFFFF，16 bit

BluFi （手机 -> ESP32-C3）特性：0xFF01，主要权限：可写

BluFi （ESP32-C3 -> 手机）特性：0xFF02，主要权限：可读可通知

4.4 引导加载程序 (Bootloader)

ESP-IDF 软件引导加载程序 (Bootloader) 主要执行以下任务：

1. 内部模块的最小化初始配置；
2. 如果配置了*Flash 加密* 和/或*Secure*，则对其进行初始化。
3. 根据分区表和 ota_data（如果存在）选择需要引导的应用程序 (app) 分区；
4. 将此应用程序镜像加载到 RAM（IRAM 和 DRAM）中，最后把控制权转交给此应用程序。

引导加载程序位于 flash 的 0x0 偏移地址处。

关于启动过程以及 ESP-IDF 引导加载程序的更多信息，请参考*应用程序的启动流程*。

4.4.1 引导加载程序兼容性

建议使用最新发布的*ESP-IDF 版本*。OTA（空中升级）更新可以在现场烧录新的应用程序，但不能烧录一个新的引导加载程序。因此，引导加载程序支持引导从 ESP-IDF 新版本中构建的应用程序。

但不支持引导从 ESP-IDF 旧版本中构建的程序。如果现有产品可能需要将应用程序降级到旧版本，那么在手动更新 ESP-IDF 时，请继续使用旧版本 ESP-IDF 引导加载程序的二进制文件。

备注： 如果在生产中测试现有产品的 OTA 更新，请确保测试中使用的 ESP-IDF 引导加载程序二进制文件与生产中部署的相同。

配置 SPI Flash

每个 ESP-IDF 应用程序或引导加载程序的二进制文件中都包含一个文件头，其中内置了*CONFIG_ESPTOOLPY_FLASHMODE*、*CONFIG_ESPTOOLPY_FLASHFREQ*、和*CONFIG_ESPTOOLPY_FLASHSIZE*。这些是用于在启动时配置 SPI flash。

ROM 中的一级引导程序 从 flash 中读取二级引导程序 文件头中的配置信息，并使用这些信息来加载剩余的二级引导程序。然而，此时系统的时钟速度低于其被配置的速度，并且在这个阶段，只支持部分 flash 模式。因此，当二级引导程序 运行时，它会从当前应用程序的二进制文件头中读取数据（而不是从引导加载程序的文件头中读取数据），并使用这些数据重新配置 flash。这样的配置流程可让 OTA 更新去更改当前使用的 SPI flash 的配置。

4.4.2 日志级别

引导加载程序日志的级别默认为 “Info”。通过设置*CONFIG_BOOTLOADER_LOG_LEVEL* 选项，可以增加或减少这个等级。这个日志级别与应用程序中使用的日志级别是分开的（见*Logging library*）。

降低引导加载程序日志的详细程度可以稍微缩短整个项目的启动时间。

4.4.3 恢复出厂设置

在更新出现问题时，最好能有一种方法让设备回到已知的正常状态，这时可选择恢复出厂设置。

要回到原始出厂设置并清除所有用户设置，请在引导加载程序中配置*CONFIG_BOOTLOADER_FACTORY_RESET*。

以下两种方式可以将设备恢复出厂设置。

- 清除一个或多个数据分区。*CONFIG_BOOTLOADER_DATA_FACTORY_RESET* 选项允许用户选择哪些数据分区在恢复出厂设置时需要被擦除。
  用户可以使用以逗号分隔的列表形式指定分区的名称，为了提高可读性，可以选择添加空格（如：`nvs, phy_init, nvs_custom`）。
  请确保选项里指定的分区名称和分区表中的名称相同。此处不能指定 “app” 类型的分区。
- 从 “工厂” 应用分区启动。当启用*CONFIG_BOOTLOADER_OTA_DATA_ERASE* 选项，恢复出厂设置后，设备将从默认的 “工厂” 应用分区启动（如果分区表中没有 “工厂” 应用分区，则从默认的 OTA 应用分区启动）。这个恢复过程是通过擦除 OTA 数据分区来完成的，OTA 数据分区中保存了当前选择的 OTA 分区槽。“工厂” 应用分区槽（如果存在）永远不会通过 OTA 更新，因此重置为从 “工厂” 应用分区启动则意味着让固件应用程序恢复正常状态。

这两个配置选项都可以独立启用。

此外，以下配置选项用于配置触发恢复出厂设置的条件：

- *CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET*- 输入管脚 (GPIO) 的编号，该管脚用于触发恢复出厂设置。必须在重置时将此管脚拉低或拉高（可配置）才能触发出厂重置事件。
- *CONFIG_BOOTLOADER_HOLD_TIME_GPIO*- 管脚电平保持时间（默认为 5 秒）。设备重置后，管脚电平必须保持该设定的时间，才能执行恢复出厂设置或引导测试分区（如适用）。
- *CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL* - 设置管脚电平高低。设备重置后，根据此设置将管脚拉高或拉低，才能触发出厂重置事件。如果管脚具有内部上拉，则上拉会在管脚采样前生效。有关管脚内部上拉的详细信息，请参考 ESP32-C3 的技术规格书。

4.4.4 从测试固件启动

用户可以编写特殊固件用于生产环境中测试，并在需要的时候运行。此时需要在项目分区表中专门申请一块分区用于保存该测试固件，其类型为 app，子类型为 test（详情请参考分区表）。

实现该测试应用固件需要为测试应用创建一个完全独立的 ESP-IDF 项目（ESP-IDF 中的每个项目仅构建一个应用）。该测试应用可以独立于主项目进行开发和测试，然后在生成测试时作为一个预编译.bin 文件集成到主项目的测试应用程序分区的地址。

为了使主项目的引导加载程序支持这个功能，请设置*CONFIG_BOOTLOADER_APP_TEST* 并配置以下两个选项：

- *CONFIG_BOOTLOADER_NUM_PIN_APP_TEST* - 设置启动 TEST 分区的管脚编号。选中的管脚将被配置为启用了内部上拉的输入。要触发测试应用，必须在重置时将此管脚拉低。
  当管脚输入被释放（则被拉高）并将设备重新启动后，正常配置的应用程序将启动（工厂或任意 OTA 应用分区槽）。
- *CONFIG_BOOTLOADER_HOLD_TIME_GPIO* - 设置 GPIO 电平保持的时间（默认为 5 秒）。设备重置后，管脚在设定的时间内必须持续保持低电平，然后才会执行出厂重置或引导测试分区（如适用）。

4.4.5 回滚

回滚和反回滚功能也必须在引导程序中配置。

请参考*OTA API 参考文档* 中的应用程序回滚 和防回滚 章节。

4.4.6 看门狗

默认情况下，硬件 RTC 看门狗定时器在引导加载程序运行时保持运行，如果 9 秒后没有应用程序成功启动，它将自动重置芯片。

- 可以通过设置*CONFIG_BOOTLOADER_WDT_TIME_MS* 并重新编译引导加载程序来调整超时时间。
- 可以通过调整应用程序的行为使 RTC 看门狗在应用程序启动后保持启用。看门狗需要由应用程序显示地重置（即“喂狗”），以避免重置。为此，请设置*CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE* 选项，根据需要修改应用程序，然后重新编译应用程序。
- 通过禁用*CONFIG_BOOTLOADER_WDT_ENABLE* 设置并重新编译引导加载程序，可以在引导加载程序中禁用 RTC 看门狗，但并不建议这样做。

4.4.7 引导加载程序大小

当需要启用额外的引导加载程序功能，包括*Flash 加密* 或安全启动，尤其是设置高级别*CONFIG_BOOTLOADER_LOG_LEVEL* 时，监控引导加载程序.bin 文件的大小变得非常重要。

当使用默认的*CONFIG_PARTITION_TABLE_OFFSET* 值 0x8000 时，二进制文件最大可为 0x8000 (32768) 字节。

如果引导加载程序二进制文件过大，则引导加载程序会构建将失败并显示“Bootloader binary size [..] is too large for partition table offset”的错误。如果此二进制文件已经被烧录，那么 ESP32-C3 将无法启动 - 日志中将记录无效分区表或无效引导加载程序校验和的错误。

可以使用如下方法解决此问题：

- 将*bootloader 编译器优化* 重新设置回默认值“Size”。
- 降低引导加载程序日志级别。将日志级别设置为 Warning, Error 或 None 都会显著减少最终二进制文件的大小（但也可能会让调试变得更加困难）。
- 将*CONFIG_PARTITION_TABLE_OFFSET* 设置为高于 0x8000 的值，以便稍后将分区表放置在 flash 中，这样可以增加引导加载程序的可用空间。如果分区表 的 CSV 文件包含明确的分区偏移量，则需要修改这些偏移量，从而保证没有分区的偏移量低于 `CONFIG_PARTITION_TABLE_OFFSET + 0x1000`。（这包括随 ESP-IDF 提供的默认分区 CSV 文件）

当启用 Secure Boot V2 时，由于引导加载程序最先加载到固定大小的缓冲区中进行验证，对二进制文件大小的绝对限制为 64KB (0x10000 bytes)（不包括 4 KB 签名）。

4.4.8 从深度睡眠中快速启动

引导加载程序有*CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP* 选项，可以减少从深度睡眠中唤醒的时间（有利于降低功耗）。当*CONFIG_SECURE_BOOT* 选项禁用时，该选项可用。由于无需镜像校验，唤醒时间减少。在第一次启动时，引导加载程序将启动的应用程序的地址存储在 RTC FAST 存储器中。而在唤醒过程中，这个地址用于启动而无需任何检查，从而实现了快速加载。

4.4.9 自定义引导加载程序

用户可以扩展或修改当前的引导加载程序，具体有两种方法：使用钩子实现或重写覆盖当前程序。这两种方法在 ESP-IDF 示例的 custom_bootloader 文件夹中都有呈现。

- *bootloader_hooks* 介绍了如何将钩子与引导加载程序初始化连接。
- *bootloader_override* 介绍了如何覆盖引导加载程序的实现。

在引导加载程序的代码中，用户不能使用其他组件提供的驱动和函数，如果确实需要，请将该功能的实现部分放在项目的 *bootloader_components* 目录中（注意，这会增加引导加载程序的大小）。

如果引导加载程序过大，则可能与内存中的分区表重叠，分区表默认烧录在偏移量 0x8000 处。增加分区表偏移量，将分区表放在 flash 中靠后的区域，这样可以增加引导程序的可用空间。

4.5 构建系统

本文档主要介绍 ESP-IDF 构建系统的实现原理以及 组件等相关概念。如需您想了解如何组织和构建新的 ESP-IDF 项目或组件，请阅读本文档。

4.5.1 概述

一个 ESP-IDF 项目可以看作是多个不同组件的集合，例如一个显示当前湿度的网页服务器会包含以下组件：

- ESP-IDF 基础库，包括 libc、ROM bindings 等
- Wi-Fi 驱动
- TCP/IP 协议栈
- FreeRTOS 操作系统
- 网页服务器
- 湿度传感器的驱动
- 负责将上述组件整合到一起的主程序

ESP-IDF 可以显式地指定和配置每个组件。在构建项目的时候，构建系统会前往 ESP-IDF 目录、项目目录和用户自定义组件目录（可选）中查找所有组件，允许用户通过文本菜单系统配置 ESP-IDF 项目中用到的每个组件。在所有组件配置结束后，构建系统开始编译整个项目。

概念

- 项目特指一个目录，其中包含了构建可执行应用程序所需的全部文件和配置，以及其他支持型文件，例如分区表、数据/文件系统分区和引导程序。
- 项目配置保存在项目根目录下名为 `sdkconfig` 的文件中，可以通过 `idf.py menuconfig` 进行修改，且一个项目只能包含一个项目配置。
- 应用程序是由 ESP-IDF 构建得到的可执行文件。一个项目通常会构建两个应用程序：项目应用程序（可执行的主文件，即用户自定义的固件）和引导程序（启动并初始化项目应用程序）。

- 组件是模块化且独立的代码，会被编译成静态库（.a 文件）并链接到应用程序。部分组件由 ESP-IDF 官方提供，其他组件则来源于其它开源项目。
- 目标特指运行构建后应用程序的硬件设备。运行 *idf.py –list-targets* 可以查看当前 ESP-IDF 版本中支持目标的完整列表。

请注意，以下内容并不属于项目的组成部分：

- ESP-IDF 并不是项目的一部分，它独立于项目，通过 IDF_PATH 环境变量（保存 esp-idf 目录的路径）链接到项目，从而将 IDF 框架与项目分离。
- 交叉编译工具链并不是项目的组成部分，它应该被安装在系统 PATH 环境变量中。

4.5.2 使用构建系统

idf.py

idf.py 命令行工具提供了一个前端，可以帮助您轻松管理项目的构建过程，它管理了以下工具：

- CMake，配置待构建的项目
- Ninja，用于构建项目
- esptool.py，烧录目标硬件设备

可通过 idf.py 配置构建系统，具体可参考相关文档。

直接使用 CMake

为了方便，*idf.py* 已经封装了 CMake 命令，但是您愿意，也可以直接调用 CMake。

当 idf.py 在执行某些操作时，它会打印出其运行的每条命令以便参考。例如运行 idf.py build 命令与在 bash shell（或者 Windows Command Prompt）中运行以下命令是相同的：

```
mkdir -p build
cd build
cmake .. -G Ninja    # 或者 'Unix Makefiles'
ninja
```

在上面的命令列表中，cmake 命令对项目进行配置，并生成用于最终构建工具的构建文件。在这个例子中，最终构建工具是 Ninja: 运行 ninja 来构建项目。

没有必要多次运行 cmake。第一次构建后，往后每次只需运行 ninja 即可。如果项目需要重新配置，ninja 会自动重新调用 cmake。

若在 CMake 中使用 ninja 或 make，则多数 idf.py 子命令也会有其对应的目标，例如在构建目录下运行 make menuconfig 或 ninja menuconfig 与运行 idf.py menuconfig 是相同的。

备注： 如果您已经熟悉了 CMake，那么可能会发现 ESP-IDF 的 CMake 构建系统不同寻常，为了减少样板文件，该系统封装了 CMake 的许多功能。请参考编写纯 *CMake* 组件 以编写更多“CMake 风格”的组件。

使用 Ninja/Make 来烧录 您可以直接使用 ninja 或 make 运行如下命令来构建项目并烧录：

```
ninja flash
```

或：

```
make app-flash
```

可用的目标还包括：flash、app-flash （仅用于 app）、bootloader-flash （仅用于 bootloader）。

以这种方式烧录时，可以通过设置 ESPPORT 和 ESPBAUD 环境变量来指定串口设备和波特率。您可以在操作系统或 IDE 项目中设置该环境变量，或者直接在命令行中进行设置：

```
ESPPORT=/dev/ttyUSB0 ninja flash
```

备注： 在命令的开头为环境变量赋值属于 Bash shell 的语法，可在 Linux 、macOS 和 Windows 的类 Bash shell 中运行，但在 Windows Command Prompt 中无法运行。

或:

```
make -j3 app-flash ESPPORT=COM4 ESPBAUD=2000000
```

备注： 在命令末尾为变量赋值属于 `make` 的语法，适用于所有平台的 `make`。

在 IDE 中使用 CMake

您还可以使用集成了 CMake 的 IDE，仅需将项目 `CMakeLists.txt` 文件的路径告诉 IDE 即可。集成 CMake 的 IDE 通常会有自己的构建工具（CMake 称之为“生成器”），它是组成 IDE 的一部分，用来构建源文件。

向 IDE 中添加除 `build` 目标以外的自定义目标（如添加“Flash”目标到 IDE）时，建议调用 `idf.py` 命令来执行这些“特殊”的操作。

有关将 ESP-IDF 同 CMake 集成到 IDE 中的详细信息，请参阅*构建系统的元数据*。

设置 Python 解释器

ESP-IDF 适用于 Python 3.7 以上版本。

`idf.py` 和其他的 Python 脚本会使用默认的 Python 解释器运行，如 `python`。您可以通过 `python3 $IDF_PATH/tools/idf.py ...` 命令切换到别的 Python 解释器，或者您可以通过设置 shell 别名或其他脚本来简化该命令。

如果直接使用 CMake，运行 `cmake -D PYTHON=python3 ...`，CMake 会使用传入的值覆盖默认的 Python 解释器。

如果使用集成 CMake 的 IDE，可以在 IDE 的图形用户界面中给名为 `PYTHON` 的 CMake cache 变量设置新的值来覆盖默认的 Python 解释器。

如果想在命令行中更优雅地管理 Python 的各个版本，请查看 pyenv 或 virtualenv 工具，它们会帮助您更改默认的 python 版本。

潜在问题 使用 `idf.py` 可能会出现如下 `ImportError` 错误:

```
Traceback (most recent call last):
  File "/Users/user_name/e/esp-idf/tools/kconfig_new/confgen.py", line 27, in
↪<module>
    import kconfiglib
ImportError: bad magic number in 'kconfiglib': b'\x03\xf3\r\n'
```

该错误通常是由不同 Python 版本生成的 `.pyc` 文件引起的，可以通过运行以下命令解决该问题:

```
idf.py python-clean
```

4.5.3 示例项目

示例项目的目录树结构可能如下所示:

```
- myProject/
             - CMakeLists.txt
             - sdkconfig
             - components/ - component1/ - CMakeLists.txt
                                         - Kconfig
                                         - src1.c
                           - component2/ - CMakeLists.txt
                                         - Kconfig
                                         - src1.c
                                         - include/ - component2.h
             - main/       - CMakeLists.txt
                           - src1.c
                           - src2.c

             - build/
```

该示例项目“myProject”包含以下组成部分：

- 顶层项目 CMakeLists.txt 文件，这是 CMake 用于学习如何构建项目的主要文件，可以在这个文件中设置项目全局的 CMake 变量。顶层项目 CMakeLists.txt 文件会导入 /tools/cmake/project.cmake 文件，由它负责实现构建系统的其余部分。该文件最后会设置项目的名称，并定义该项目。
- “sdkconfig”项目配置文件，执行 `idf.py menuconfig` 时会创建或更新此文件，文件中保存了项目中所有组件（包括 ESP-IDF 本身）的配置信息。`sdkconfig` 文件可能会也可能不会被添加到项目的源码管理系统中。
- 可选的“components”目录中包含了项目的部分自定义组件，并不是每个项目都需要这种自定义组件，但它有助于构建可复用的代码或者导入第三方（不属于 ESP-IDF）的组件。或者，您也可以在顶层 CMakeLists.txt 中设置 `EXTRA_COMPONENT_DIRS` 变量以查找其他指定位置处的组件。有关详细信息，请参阅*重命名 main 组件*。如果项目中源文件较多，建议将其归于组件中，而不是全部放在“main”中。
- “main”目录是一个特殊的组件，它包含项目本身的源代码。”main”是默认名称，CMake 变量 `COMPONENT_DIRS` 默认包含此组件，但您可以修改此变量。
- “build”目录是存放构建输出的地方，如果没有此目录，`idf.py` 会自动创建。CMake 会配置项目，并在此目录下生成临时的构建文件。随后，在主构建进程的运行期间，该目录还会保存临时目标文件、库文件以及最终输出的二进制文件。此目录通常不会添加到项目的源码管理系统中，也不会随项目源码一同发布。

每个组件目录都包含一个 `CMakeLists.txt` 文件，里面会定义一些变量以控制该组件的构建过程，以及其与整个项目的集成。更多详细信息请参阅*组件 CMakeLists 文件*。

每个组件还可以包含一个 `Kconfig` 文件，它用于定义 `menuconfig` 时展示的*组件配置*选项。某些组件可能还会包含 `Kconfig.projbuild` 和 `project_include.cmake` 特殊文件，它们用于*覆盖项目的部分设置*。

4.5.4 项目 CMakeLists 文件

每个项目都有一个顶层 `CMakeLists.txt` 文件，包含整个项目的构建设置。默认情况下，项目 CMakeLists 文件会非常小。

最小 CMakeLists 文件示例

最小项目：

```
cmake_minimum_required(VERSION 3.16)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
```

必要部分

每个项目都要按照上面显示的顺序添加上述三行代码：

- `cmake_minimum_required(VERSION 3.16)` 必须放在 CMakeLists.txt 文件的第一行，它会告诉 CMake 构建该项目所需要的最小版本号。ESP-IDF 支持 CMake 3.16 或更高的版本。
- `include($ENV{IDF_PATH}/tools/cmake/project.cmake)` 会导入 CMake 的其余功能来完成配置项目、检索组件等任务。
- `project(myProject)` 会创建项目本身，并指定项目名称。该名称会作为最终输出的二进制文件的名字，即 `myProject.elf` 和 `myProject.bin`。每个 CMakeLists 文件只能定义一个项目。

可选的项目变量

以下这些变量都有默认值，用户可以覆盖这些变量值以自定义构建行为。更多实现细节，请参阅 /tools/cmake/project.cmake 文件。

- `COMPONENT_DIRS`：组件的搜索目录，默认为 `IDF_PATH/components`、`PROJECT_DIR/components`、和 `EXTRA_COMPONENT_DIRS`。如果您不想在这些位置搜索组件，请覆盖此变量。
- `EXTRA_COMPONENT_DIRS`：用于搜索组件的其它可选目录列表。路径可以是相对于项目目录的相对路径，也可以是绝对路径。
- `COMPONENTS`：要构建进项目中的组件名称列表，默认为 `COMPONENT_DIRS` 目录下检索到的所有组件。使用此变量可以“精简”项目以缩短构建时间。请注意，如果一个组件通过 `COMPONENT_REQUIRES` 指定了它依赖的另一个组件，则会自动将其添加到 `COMPONENTS` 中，所以 `COMPONENTS` 列表可能会非常短。

以上变量中的路径可以是绝对路径，或者是相对于项目目录的相对路径。

请使用 cmake 中的 set 命令 来设置这些变量，如 `set(VARIABLE "VALUE")`。请注意，`set()` 命令需放在 `include(...)` 之前，`cmake_minimum(...)` 之后。

重命名 `main` 组件

构建系统会对 `main` 组件进行特殊处理。假如 `main` 组件位于预期的位置（即 *${PROJECT_PATH}/main*），那么它会被自动添加到构建系统中。其他组件也会作为其依赖项被添加到构建系统中，这使用户免于处理依赖关系，并提供即时可用的构建功能。重命名 `main` 组件会减轻上述这些幕后工作量，但要求用户指定重命名后的组件位置，并手动为其添加依赖项。重命名 `main` 组件的步骤如下：

1. 重命名 `main` 目录。
2. 在项目 CMakeLists.txt 文件中设置 `EXTRA_COMPONENT_DIRS`，并添加重命名后的 `main` 目录。
3. 在组件的 CMakeLists.txt 文件中设置 `COMPONENT_REQUIRES` 或 `COMPONENT_PRIV_REQUIRES` 以指定依赖项。

覆盖默认的构建规范

构建系统设置了一些全局的构建规范（编译标志、定义等），这些规范可用于编译来自所有组件的所有源文件。

例如，其中一个默认的构建规范是编译选项 `Wextra`。假设一个用户想用 `Wno-extra` 来覆盖这个选项，应在 `project()` 之后进行：

```
cmake_minimum_required(VERSION 3.16)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)

idf_build_set_property(COMPILE_OPTIONS "-Wno-error" APPEND)
```

这确保了用户设置的编译选项不会被默认的构建规范所覆盖，因为默认的构建规范是在 `project()` 内设置的。

4.5.5 组件 CMakeLists 文件

每个项目都包含一个或多个组件，这些组件可以是 ESP-IDF 的一部分，可以是项目自身组件目录的一部分，也可以从自定义组件目录添加（见上文）。

组件是 COMPONENT_DIRS 列表中包含 CMakeLists.txt 文件的任何目录。

搜索组件

搜索 COMPONENT_DIRS 中的目录列表以查找项目的组件，此列表中的目录可以是组件自身（即包含 *CMakeLists.txt* 文件的目录），也可以是子目录为组件的顶级目录。

当 CMake 运行项目配置时，它会记录本次构建包含的组件列表，它可用于调试某些组件的添加/排除。

同名组件

ESP-IDF 在搜索所有待构建的组件时，会按照 COMPONENT_DIRS 指定的顺序依次进行，这意味着在默认情况下，首先搜索 ESP-IDF 内部组件（IDF_PATH/components），然后是 EXTRA_COMPONENT_DIRS 中的组件，最后是项目组件（PROJECT_DIR/components）。如果这些目录中的两个或者多个包含具有相同名字的组件，则使用搜索到的最后一个位置的组件。这就允许将组件复制到项目目录中再修改以覆盖 ESP-IDF 组件，如果使用这种方式，ESP-IDF 目录本身可以保持不变。

备注： 如果在现有项目中通过将组件移动到一个新位置来覆盖它，项目不会自动看到新组件的路径。请运行 idf.py reconfigure 命令后（或删除项目构建文件夹）再重新构建。

最小组件 CMakeLists 文件

最小组件 CMakeLists.txt 文件通过使用 idf_component_register 将组件添加到构建系统中。

```
idf_component_register(SRCS "foo.c" "bar.c" INCLUDE_DIRS "include" REQUIRES
    mbedtls)
```

- SRCS 是源文件列表（*.c、*.cpp、*.cc、*.S），里面所有的源文件都将会编译进组件库中。
- INCLUDE_DIRS 是目录列表，里面的路径会被添加到所有需要该组件的组件（包括 main 组件）全局 include 搜索路径中。
- REQUIRES 实际上并不是必需的，但通常需要它来声明该组件需要使用哪些其它组件，请参考组件依赖。

上述命令会构建生成与组件同名的库，并最终被链接到应用程序中。

上述目录通常设置为相对于 CMakeLists.txt 文件的相对路径，当然也可以设置为绝对路径。

还有其它参数可以传递给 idf_component_register，具体可参考*here*。

有关更完整的 CMakeLists.txt 示例，请参阅组件依赖示例 和组件 *CMakeLists* 示例。

预设的组件变量

以下专用于组件的变量可以在组件 CMakeLists 中使用，但不建议修改：

- COMPONENT_DIR：组件目录，即包含 CMakeLists.txt 文件的绝对路径，它与 CMAKE_CURRENT_SOURCE_DIR 变量一样，路径中不能包含空格。
- COMPONENT_NAME：组件名，与组件目录名相同。
- COMPONENT_ALIAS：库别名，由构建系统在内部为组件创建。
- COMPONENT_LIB：库名，由构建系统在内部为组件创建。

以下变量在项目级别中被设置，但可在组件 CMakeLists 中使用：

- CONFIG_*：项目配置中的每个值在 cmake 中都对应一个以 CONFIG_ 开头的变量。更多详细信息请参阅*Kconfig*。
- ESP_PLATFORM：ESP-IDF 构建系统处理 CMake 文件时，其值设为 1。

构建/项目变量

以下是可作为构建属性的构建/项目变量，可通过组件 CMakeLists.txt 中的 idf_build_get_property 查询其变量值。

- PROJECT_NAME：项目名，在项目 CMakeLists.txt 文件中设置。
- PROJECT_DIR：项目目录（包含项目 CMakeLists 文件）的绝对路径，与 CMAKE_SOURCE_DIR 变量相同。
- COMPONENTS：此次构建中包含的所有组件的名称，具体格式为用分号隔开的 CMake 列表。
- IDF_VER：ESP-IDF 的 git 版本号，由 git describe 命令生成。
- IDF_VERSION_MAJOR、IDF_VERSION_MINOR、IDF_VERSION_PATCH: ESP-IDF 的组件版本，可用于条件表达式。请注意这些信息的精确度不如 IDF_VER 变量，版本号 v4.0-dev-*，v4.0-beta1，v4.0-rc1 和 v4.0 对应的 IDF_VERSION_* 变量值是相同的，但是 IDF_VER 的值是不同的。
- IDF_TARGET：项目的硬件目标名称。
- PROJECT_VER：项目版本号。
  - 如果设置*CONFIG_APP_PROJECT_VER_FROM_CONFIG* 选项，将会使用*CONFIG_APP_PROJECT_VER* 的值。
  - 或者，如果在项目 CMakeLists.txt 文件中设置了 PROJECT_VER 变量，则该变量值可以使用。
  - 或者，如果 PROJECT_DIR/version.txt 文件存在，其内容会用作 PROJECT_VER 的值。
  - 或者，如果项目位于某个 Git 仓库中，则使用 git describe 命令的输出作为 PROJECT_VER 的值。
  - 否则，PROJECT_VER 的值为 1。

其它与构建属性有关的信息请参考这里。

组件编译控制

在编译特定组件的源文件时，可以使用 target_compile_options 函数来传递编译器选项:

```
target_compile_options(${COMPONENT_LIB} PRIVATE -Wno-unused-variable)
```

如果给单个源文件指定编译器标志，可以使用 CMake 的 set_source_files_properties 命令:

```
set_source_files_properties(mysrc.c
    PROPERTIES COMPILE_FLAGS
    -Wno-unused-variable
)
```

如果上游代码在编译的时候发出了警告，那这么做可能会很有效。

请注意，上述两条命令只能在组件 CMakeLists 文件的 idf_component_register 命令之后调用。

4.5.6 组件配置

每个组件都可以包含一个 Kconfig 文件，和 CMakeLists.txt 放在同一目录下。Kconfig 文件中包含要添加到该组件配置菜单中的一些配置设置信息。

运行 menuconfig 时，可以在 Component Settings 菜单栏下找到这些设置。

创建一个组件的 Kconfig 文件，最简单的方法就是使用 ESP-IDF 中现有的 Kconfig 文件作为模板，在这基础上进行修改。

有关示例请参阅添加条件配置。

4.5.7 预处理器定义

ESP-IDF 构建系统会在命令行中添加以下 C 预处理器定义：

- ESP_PLATFORM：可以用来检测在 ESP-IDF 内发生了构建行为。
- IDF_VER：定义 git 版本字符串，例如：v2.0 用于标记已发布的版本，v1.0-275-g0efaa4f 则用于标记任意某次的提交记录。

4.5.8 组件依赖

编译各个组件时，ESP-IDF 系统会递归评估其依赖项。这意味着每个组件都需要声明它所依赖的组件，即“requires”。

编写组件

```
idf_component_register(...
                       REQUIRES mbedtls
                       PRIV_REQUIRES console spiffs)
```

- REQUIRES 需要包含所有在当前组件的 *公共头文件* 里 *#include* 的头文件所在的组件。
- PRIV_REQUIRES 需要包含被当前组件的源文件 *#include* 的头文件所在的组件（除非已经被设置在了 REQUIRES 中）。以及是当前组件正常工作必须要链接的组件。
- REQUIRES 和 PRIV_REQUIRES 的值不能依赖于任何配置选项 (CONFIG_xxx 宏)。这是因为在配置加载之前，依赖关系就已经被展开。其它组件变量（比如包含路径或源文件）可以依赖配置选择。
- 如果当前组件除了通用组件依赖项 中设置的通用组件（比如 RTOS、libc 等）外，并不依赖其它组件，那么对于上述两个 REQUIRES 变量，可以选择其中一个或是两个都不设置。

如果组件仅支持某些硬件目标（IDF_TARGET 的值），则可以在 idf_component_register 中指定 REQUIRED_IDF_TARGETS 来声明这个需求。在这种情况下，如果构建系统导入了不支持当前硬件目标的组件时就会报错。

备注： 在 CMake 中，REQUIRES 和 PRIV_REQUIRES 是 CMake 函数 target_link_libraries(... PUBLIC ...) 和 target_link_libraries(... PRIVATE ...) 的近似包装。

组件依赖示例

假设现在有一个 car 组件，它需要使用 engine 组件，而 engine 组件需要使用 spark_plug 组件：

```
- autoProject/
             - CMakeLists.txt
             - components/ - car/ - CMakeLists.txt
                                  - car.c
                                  - car.h
                           - engine/ - CMakeLists.txt
                                     - engine.c
                                     - include/ - engine.h
                           - spark_plug/  - CMakeLists.txt
                                          - spark_plug.c
                                          - spark_plug.h
```

Car 组件 car.h 头文件是 car 组件的公共接口。该头文件直接包含了 engine.h，这是因为它需要使用 engine.h 中的一些声明:

```
/* car.h */
#include "engine.h"

#ifdef ENGINE_IS_HYBRID
#define CAR_MODEL "Hybrid"
#endif
```

同时 car.c 也包含了 car.h:

```
/* car.c */
#include "car.h"
```

这代表文件 car/CMakeLists.txt 需要声明 car 需要 engine:

```
idf_component_register(SRCS "car.c"
                    INCLUDE_DIRS "."
                    REQUIRES engine)
```

- SRCS 提供 car 组件中源文件列表。
- INCLUDE_DIRS 提供该组件公共头文件目录列表，由于 car.h 是公共接口，所以这里列出了所有包含了 car.h 的目录。
- REQUIRES 给出该组件的公共接口所需的组件列表。由于 car.h 是一个公共头文件并且包含了来自 engine 的头文件，所以我们这里包含 engine。这样可以确保任何包含 car.h 的其他组件也能递归地包含所需的 engine.h。

Engine 组件 engine 组件也有一个公共头文件 include/engine.h，但这个头文件更为简单:

```
/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start(void);
```

在 engine.c 中执行:

```
/* engine.c */
#include "engine.h"
#include "spark_plug.h"

...
```

在该组件中，engine 依赖于 spark_plug，但这是私有依赖关系。编译 engine.c 需要 spark_plug.h 但不需要包含 engine.h。

这代表文件 engine/CMakeLists.txt 可以使用 PRIV_REQUIRES:

```
idf_component_register(SRCS "engine.c"
                    INCLUDE_DIRS "include"
                    PRIV_REQUIRES spark_plug)
```

因此，car 组件中的源文件不需要在编译器搜索路径中添加 spark_plug include 目录。这可以加快编译速度，避免编译器命令行过于的冗长。

Spark Plug 组件 spark_plug 组件没有依赖项，它有一个公共头文件 spark_plug.h，但不包含其他组件的头文件。

这代表 spark_plug/CMakeLists.txt 文件不需要任何 REQUIRES 或 PRIV_REQUIRES:

```
idf_component_register(SRCS "spark_plug.c"
                    INCLUDE_DIRS ".")
```

源文件 Include 目录

每个组件的源文件都是用这些 Include 路径目录编译的，这些路径在传递给 `idf_component_register` 的参数中指定：

```
idf_component_register(..
                       INCLUDE_DIRS "include"
                       PRIV_INCLUDE_DIRS "other")
```

- 当前组件的 `INCLUDE_DIRS` 和 `PRIV_INCLUDE_DIRS`。
- `REQUIRES` 和 `PRIV_REQUIRES` 参数指定的所有其他组件（即当前组件的所有公共和私有依赖项）所设置的 `INCLUDE_DIRS`。
- 递归列出所有组件 `REQUIRES` 列表中 `INCLUDE_DIRS` 目录（如递归展开这个组件的所有公共依赖项）。

主要组件依赖项

`main` 组件比较特别，因为它在构建过程中自动依赖所有其他组件。所以不需要向这个组件传递 `REQUIRES` 或 `PRIV_REQUIRES`。有关不再使用 `main` 组件时需要更改哪些内容，请参考*重命名 main 组件*。

通用组件依赖项

为避免重复性工作，各组件都用自动依赖一些“通用”IDF 组件，即使它们没有被明确提及。这些组件的头文件会一直包含在构建系统中。

通用组件包括：cxx、newlib、freertos、esp_hw_support、heap、log、soc、hal、esp_rom、esp_common、esp_system。

在构建中导入组件

- 默认情况下，每个组件都会包含在构建系统中。
- 如果将 `COMPONENTS` 变量设置为项目直接使用的最小组件列表，那么构建系统会扩展到包含所有组件。完整的组件列表为：
  - `COMPONENTS` 中明确提及的组件。
  - 这些组件的依赖项（以及递归运算后的组件）。
  - 每个组件都依赖的通用组件。
- 将 `COMPONENTS` 设置为所需组件的最小列表，可以显著减少项目的构建时间。

循环依赖

一个项目中可能包含组件 A 和组件 B，而组件 A 依赖（`REQUIRES` 或 `PRIV_REQUIRES`）组件 B，组件 B 又依赖组件 A。这就是所谓的依赖循环或循环依赖。

CMake 通常会在链接器命令行上重复两次组件库名称来自动处理循环依赖。然而这种方法并不总是有效，还是可能构建失败并出现关于“Undefined reference to …”的链接器错误，这通常是由于引用了循环依赖中某一组件中定义的符号。如果存在较大的循环依赖关系，即 A->B->C->D->A，这种情况极有可能发生。

最好的解决办法是重构组件以消除循环依赖关系。在大多数情况下，没有循环依赖的软件架构具有模块化和分层清晰的特性，并且从长远来看更容易维护。然而，移除循环依赖关系并不容易做到。

要绕过由循环依赖引起的链接器错误，最简单的解决方法是增加其中一个组件库的 CMake LINK_INTERFACE_MULTIPLICITY 属性。这会让 CMake 在链接器命令行上对此库及其依赖项重复两次以上。

例如：

```
set_property(TARGET ${COMPONENT_LIB} APPEND PROPERTY LINK_INTERFACE_MULTIPLICITY 3)
```

- 这一行应该放在组件 CMakeLists.txt 文件 `idf_component_register` 之后。
- 可以的话，将此行放置在因依赖其他组件而造成循环依赖的组件中。实际上，该行可以放在循环内的任何一个组件中，但建议将其放置在拥有链接器错误提示信息中显示的源文件的组件中，或是放置在定义了链接器错误提示信息中所提到的符号的组件，先从这些组件开始是个不错的选择。
- 通常将值增加到 3（默认值是 2）就足够了，但如果不起作用，可以尝试逐步增加这个数字。
- 注意，增加这个选项会使链接器的命令行变长，链接阶段变慢。

高级解决方法：未定义符号 如果只有一两个符号导致循环依赖，而所有其他依赖都是线性的，那么有一种替代方法可以避免链接器错误：在链接时将“反向”依赖所需的特定符号指定为未定义符号。

例如，如果组件 A 依赖于组件 B，但组件 B 也需要引用组件 A 的 `reverse_ops`（但不依赖组件 A 中的其他内容），那么你可以在组件 B 的 CMakeLists.txt 中添加如下一行，以在链接时避免这出现循环。

```
# 该符号是由“组件 A”在链接时提供
target_link_libraries(${COMPONENT_LIB} INTERFACE "-u reverse_ops")
```

- `-u` 参数意味着链接器将始终在链接中包含此符号，而不管依赖项顺序如何。
- 该行应该放在组件 CMakeLists.txt 文件中的 `idf_component_register` 之后。
- 如果“组件 B”不需要访问“组件 A”的任何头文件，只需链接几个符号，那么这一行可以用来代替 B 对 A 的任何“REQUIRES”。这样则进一步简化了构建系统中的组件结构。

请参考 target_link_libraries 文档以了解更多关于此 CMake 函数的信息。

构建系统中依赖处理的实现细节

- 在 CMake 配置进程的早期阶段会运行 `expand_requirements.cmake` 脚本。该脚本会对所有组件的 CMakeLists.txt 文件进行局部的运算，得到一张组件依赖关系图（此图可能会有闭环）。此图用于在构建目录中生成 `component_depends.cmake` 文件。
- CMake 主进程会导入该文件，并以此来确定要包含到构建系统中的组件列表（内部使用的 `BUILD_COMPONENTS` 变量）。`BUILD_COMPONENTS` 变量已排好序，依赖组件会排在前面。由于组件依赖关系图中可能存在闭环，因此不能保证每个组件都满足该排序规则。如果给定相同的组件集和依赖关系，那么最终的排序结果应该是确定的。
- CMake 会将 `BUILD_COMPONENTS` 的值以“Component names:”的形式打印出来。
- 然后执行构建系统中包含的每个组件的配置。
- 每个组件都被正常包含在构建系统中，然后再次执行 CMakeLists.txt 文件，将组件库加入构建系统。

组件依赖顺序 `BUILD_COMPONENTS` 变量中组件的顺序决定了构建过程中的其它顺序，包括：

- 项目导入*project_include.cmake* 文件的顺序。
- 生成用于编译（通过 `-I` 参数）的头文件路径列表的顺序。请注意，对于给定组件的源文件，仅需将该组件的依赖组件的头文件路径告知编译器。

覆盖项目的部分设置

project_include.cmake 如果组件的某些构建行为需要在组件 CMakeLists 文件之前被执行，您可以在组件目录下创建名为 `project_include.cmake` 的文件，`project.cmake` 在运行过程中会导入此 CMake 文件。

`project_include.cmake` 文件在 ESP-IDF 内部使用，以定义项目范围内的构建功能，比如 `esptool.py` 的命令行参数和 `bootloader` 这个特殊的应用程序。

与组件 `CMakeLists.txt` 文件有所不同，在导入“project_include.cmake“ 文件的时候，当前源文件目录（即 `CMAKE_CURRENT_SOURCE_DIR`` 和工作目录）为项目目录。如果想获得当前组件的绝对路径，可以使用 ``COMPONENT_PATH` 变量。

请注意，`project_include.cmake` 对于大多数常见的组件并不是必需的。例如给项目添加 include 搜索目录，给最终的链接步骤添加 `LDFLAGS` 选项等等都可以通过 `CMakeLists.txt` 文件来自定义。详细信息请参考可选的项目变量。

project_include.cmake 文件会按照 BUILD_COMPONENTS 变量中组件的顺序（由 CMake 记录）依次导入。即只有在当前组件所有依赖组件的 project_include.cmake 文件都被导入后，当前组件的 project_include.cmake 文件才会被导入，除非两个组件在同一个依赖闭环中。如果某个 project_include.cmake 文件依赖于另一组件设置的变量，则要特别注意上述情况。更多详情请参阅构建系统中依赖处理的实现细节。

在 project_include.cmake 文件中设置变量或目标时要格外小心，这些值被包含在项目的顶层 CMake 文件中，因此他们会影响或破坏所有组件的功能。

KConfig.projbuild 与 project_include.cmake 类似，也可以为组件定义一个 KConfig 文件以实现全局的组件配置。如果要在 menuconfig 的顶层添加配置选项，而不是在 “Component Configuration” 子菜单中，则可以在 CMakeLists.txt 文件所在目录的 KConfig.projbuild 文件中定义这些选项。

在此文件中添加配置时要小心，因为这些配置会包含在整个项目配置中。在可能的情况下，请为组件配置 创建 KConfig 文件。

project_include.cmake 文件在 ESP-IDF 内部使用，以定义项目范围内的构建功能，比如 esptool.py 的命令行参数和 bootloader 这个特殊的应用程序。

仅配置组件 仅配置组件是一类不包含源文件的特殊组件，仅包含 Kconfig.projbuild、KConfig 和 CMakeLists.txt 文件，该 CMakeLists.txt 文件仅有一行代码，调用了 idf_component_register() 函数。此函数会将组件导入到项目构建中，但不会构建任何库，也不会将头文件添加到任何 include 搜索路径中。

CMake 调试

请查看 CMake v3.16 官方文档 获取更多关于 CMake 和 CMake 命令的信息。

调试 ESP-IDF CMake 构建系统的一些技巧：

- CMake 运行时，会打印大量诊断信息，包括组件列表和组件路径。
- 运行 cmake -DDEBUG=1，IDF 构建系统会生成更详细的诊断输出。
- 运行 cmake 时指定 --trace 或 --trace-expand 选项会提供大量有关控制流信息。详情请参考 CMake 命令行文档。

当从项目 CMakeLists 文件导入时，project.cmake 文件会定义工具模块和全局变量，并在系统环境中没有设置 IDF_PATH 时设置 IDF_PATH。

同时还定义了一个自定义版本的内置 CMake project 函数，这个函数被覆盖，以添加所有 ESP-IDF 特定的项目功能。

警告未定义的变量 默认情况下，idf.py 在调用 CMake 时会给它传递 --warn-uninitialized 标志，如果在构建的过程中引用了未定义的变量，CMake 会打印警告。这对查找有错误的 CMake 文件非常有用。

如果您不想启用此功能，可以给 idf.py 传递 --no-warnings 标志。

更多信息，请参考文件 /tools/cmake/project.cmake 以及 /tools/cmake/ 中支持的函数。

4.5.9 组件 CMakeLists 示例

因为构建环境试图设置大多数情况都能工作的合理默认值，所以组件 CMakeLists.txt 文件可能非常小，甚至是空的，请参考最小组件 *CMakeLists* 文件。但有些功能往往需要覆盖预设的组件变量 才能实现。

以下是组件 CMakeLists 文件的更高级的示例。

添加条件配置

配置系统可用于根据项目配置中选择的选项有条件地编译某些文件。

Kconfig:

```
config FOO_ENABLE_BAR
    bool "Enable the BAR feature."
    help
        This enables the BAR feature of the FOO component.
```

CMakeLists.txt:

```
 set(srcs "foo.c" "more_foo.c")

 if(CONFIG_FOO_ENABLE_BAR)
     list(APPEND srcs "bar.c")
 endif()

idf_component_register(SRCS "${srcs}"
                       ...)
```

上述示例使用了 CMake 的 if 函数和 list APPEND 函数。

也可用于选择或删除某一实现，如下所示：

Kconfig:

```
config ENABLE_LCD_OUTPUT
    bool "Enable LCD output."
    help
        Select this if your board has a LCD.

config ENABLE_LCD_CONSOLE
    bool "Output console text to LCD"
    depends on ENABLE_LCD_OUTPUT
    help
        Select this to output debugging output to the lcd

config ENABLE_LCD_PLOT
    bool "Output temperature plots to LCD"
    depends on ENABLE_LCD_OUTPUT
    help
        Select this to output temperature plots
```

CMakeLists.txt:

```
if(CONFIG_ENABLE_LCD_OUTPUT)
   set(srcs lcd-real.c lcd-spi.c)
else()
   set(srcs lcd-dummy.c)
endif()

# 如果启用了控制台或绘图功能，则需要加入字体
if(CONFIG_ENABLE_LCD_CONSOLE OR CONFIG_ENABLE_LCD_PLOT)
   list(APPEND srcs "font.c")
endif()

idf_component_register(SRCS "${srcs}"
                       ...)
```

硬件目标的条件判断

CMake 文件可以使用 IDF_TARGET 变量来获取当前的硬件目标。

此外，如果当前的硬件目标是 xyz （即 IDF_TARGET=xyz），那么 Kconfig 变量 CONFIG_IDF_TARGET_XYZ 同样也会被设置。

请注意，组件可以依赖 IDF_TARGET 变量，但不能依赖这个 Kconfig 变量。同样也不可在 CMake 文件的 include 语句中使用 Kconfig 变量，在这种上下文中可以使用 IDF_TARGET。

生成源代码

有些组件的源文件可能并不是由组件本身提供，而必须从另外的文件生成。假设组件需要一个头文件，该文件由 BMP 文件转换后（使用 bmp2h 工具）的二进制数据组成，然后将头文件包含在名为 graphics_lib.c 的文件中:

```
add_custom_command(OUTPUT logo.h
     COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o log.h
     DEPENDS ${COMPONENT_DIR}/logo.bmp
     VERBATIM)

add_custom_target(logo DEPENDS logo.h)
add_dependencies(${COMPONENT_LIB} logo)

set_property(DIRECTORY "${COMPONENT_DIR}" APPEND PROPERTY
     ADDITIONAL_MAKE_CLEAN_FILES logo.h)
```

这个示例改编自 CMake 的一则 FAQ，其中还包含了一些同样适用于 ESP-IDF 构建系统的示例。

这个示例会在当前目录（构建目录）中生成 logo.h 文件，而 logo.bmp 会随组件一起提供在组件目录中。因为 logo.h 是一个新生成的文件，一旦项目需要清理，该文件也应该要被清除。因此，要将该文件添加到 ADDITIONAL_MAKE_CLEAN_FILES 属性中。

备注: 如果需要生成文件作为项目 CMakeLists.txt 的一部分，而不是作为组件 CMakeLists.txt 的一部分，此时需要使用 ${PROJECT_PATH} 替代 ${COMPONENT_DIR}，使用 ${PROJECT_NAME}.elf 替代 ${COMPONENT_LIB}。

如果某个源文件是从其他组件中生成，且包含 logo.h 文件，则需要调用 add_dependencies，在这两个组件之间添加一个依赖项，以确保组件源文件按照正确顺序进行编译。

嵌入二进制数据

有时您的组件希望使用一个二进制文件或者文本文件，但是您又不希望将它们重新格式化为 C 源文件。

这时，您可以在组件注册中指定 EMBED_FILES 参数，用空格分隔要嵌入的文件名称:

```
idf_component_register(...
                       EMBED_FILES server_root_cert.der)
```

或者，如果文件是字符串，则可以使用 EMBED_TXTFILES 变量，把文件的内容转成以 null 结尾的字符串嵌入:

```
idf_component_register(...
                       EMBED_TXTFILES server_root_cert.pem)
```

文件的内容会被添加到 Flash 的.rodata 段，用户可以通过符号名来访问，如下所示:

```
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_
↪pem_start");
extern const uint8_t server_root_cert_pem_end[]   asm("_binary_server_root_cert_
↪pem_end");
```

符号名会根据文件全名生成，如 EMBED_FILES 中所示，字符 /、. 等都会被下划线替代。符号名称中的 _binary 前缀由 objcopy 命令添加，对文本文件和二进制文件都是如此。

如果要将文件嵌入到项目中，而非组件中，可以调用 target_add_binary_data 函数:

```
target_add_binary_data(myproject.elf "main/data.bin" TEXT)
```

并将这行代码放在项目 CMakeLists.txt 的 project() 命令之后，修改 myproject.elf 为你自己的项目名。如果最后一个参数是 TEXT，那么构建系统会嵌入以 null 结尾的字符串，如果最后一个参数被设置为 BINARY，则将文件内容按照原样嵌入。

有关使用此技术的示例，请查看 file_serving 示例 protocols/http_server/file_serving/main/CMakeLists.txt 中的 main 组件，两个文件会在编译时加载并链接到固件中。

也可以嵌入生成的文件:

```
add_custom_command(OUTPUT my_processed_file.bin
                   COMMAND my_process_file_cmd my_unprocessed_file.bin)
target_add_binary_data(my_target "my_processed_file.bin" BINARY)
```

上述示例中，my_processed_file.bin 是通过命令 my_process_file_cmd 从文件 my_unprocessed_file.bin 中生成，然后嵌入到目标中。

使用 DEPENDS 参数来指明对目标的依赖性:

```
add_custom_target(my_process COMMAND ...)
target_add_binary_data(my_target "my_embed_file.bin" BINARY DEPENDS my_process)
```

target_add_binary_data 的 DEPENDS 参数确保目标首先执行。

代码和数据的存放

ESP-IDF 还支持自动生成链接脚本，它允许组件通过链接片段文件定义其代码和数据在内存中的存放位置。构建系统会处理这些链接片段文件，并将处理后的结果扩充进链接脚本，从而指导应用程序二进制文件的链接过程。更多详细信息与快速上手指南，请参阅链接脚本生成机制。

完全覆盖组件的构建过程

当然，在有些情况下，上面提到的方法不一定够用。如果组件封装了另一个第三方组件，而这个第三方组件并不能直接在 ESP-IDF 的构建系统中工作，在这种情况下，就需要放弃 ESP-IDF 的构建系统，改为使用 CMake 的 ExternalProject 功能。组件 CMakeLists 示例如下:

```
# 用于 quirc 的外部构建过程，在源目录中运行
# 并生成 libquirc.a
externalproject_add(quirc_build
    PREFIX ${COMPONENT_DIR}
    SOURCE_DIR ${COMPONENT_DIR}/quirc
    CONFIGURE_COMMAND ""
    BUILD_IN_SOURCE 1
    BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
    INSTALL_COMMAND ""
    )

# 将 libquirc.a 添加到构建系统中
add_library(quirc STATIC IMPORTED GLOBAL)
```

(下页继续)

(续上页)

```
add_dependencies(quirc quirc_build)

set_target_properties(quirc PROPERTIES IMPORTED_LOCATION
    ${COMPONENT_DIR}/quirc/libquirc.a)
set_target_properties(quirc PROPERTIES INTERFACE_INCLUDE_DIRECTORIES
    ${COMPONENT_DIR}/quirc/lib)

set_directory_properties( PROPERTIES ADDITIONAL_MAKE_CLEAN_FILES
    "${COMPONENT_DIR}/quirc/libquirc.a")
```

（上述 CMakeLists.txt 可用于创建名为 `quirc` 的组件，该组件使用自己的 Makefile 构建 quirc 项目。）

- `externalproject_add` 定义了一个外部构建系统。
  - 设置 `SOURCE_DIR`、`CONFIGURE_COMMAND`、`BUILD_COMMAND` 和 `INSTALL_COMMAND`。如果外部构建系统没有配置这一步骤，可以将 `CONFIGURE_COMMAND` 设置为空字符串。在 ESP-IDF 的构建系统中，一般会将 `INSTALL_COMMAND` 变量设置为空。
  - 设置 `BUILD_IN_SOURCE`，即构建目录与源目录相同。否则，您也可以设置 `BUILD_DIR` 变量。
  - 有关 `externalproject_add()` 命令的详细信息，请参阅 ExternalProject。
- 第二组命令添加了一个目标库，指向外部构建系统生成的库文件。为了添加 include 目录，并告知 CMake 该文件的位置，需要再设置一些属性。
- 最后，生成的库被添加到 ADDITIONAL_MAKE_CLEAN_FILES 中。即执行 `make clean` 后会删除该库。请注意，构建系统中的其他目标文件不会被删除。

ExternalProject 的依赖与构建清理 对于外部项目的构建，CMake 会有一些不同寻常的行为：

- ADDITIONAL_MAKE_CLEAN_FILES 仅在使用 Make 构建系统时有效。如果使用 Ninja 或 IDE 自带的构建系统，执行项目清理时，这些文件不会被删除。
- ExternalProject 会在 clean 运行后自动重新运行配置和构建命令。
- 可以采用以下两种方法来配置外部构建命令：
  1. 将外部 `BUILD_COMMAND` 命令设置为对所有源代码完整的重新编译。如果传递给 `externalproject_add` 命令的 `DEPENDS` 的依赖项发生了改变，或者当前执行的是项目清理操作（即运行了 `idf.py clean`、`ninja clean` 或者 `make clean`），那么就会执行该命令。
  2. 将外部 `BUILD_COMMAND` 命令设置为增量式构建命令，并给 `externalproject_add` 传递 `BUILD_ALWAYS 1` 参数。即不管实际的依赖情况，每次构建时，都会构建外部项目。这种方式仅当外部构建系统具备增量式构建的能力，且运行时间不会很长时才推荐。

构建外部项目的最佳方法取决于项目本身、其构建系统，以及是否需要频繁重新编译项目。

4.5.10 自定义 sdkconfig 的默认值

对于示例工程或者其他您不想指定完整 sdkconfig 配置的项目，但是您确实希望覆盖 ESP-IDF 默认值中的某些键值，则可以在项目中创建 `sdkconfig.defaults` 文件。重新创建新配置时将会用到此文件，另外在 `sdkconfig` 没有设置新配置值时，上述文件也会被用到。

如若需要覆盖此文件的名称或指定多个文件，请设置 `SDKCONFIG_DEFAULTS` 环境变量或在顶层 CMakeLists.txt 文件中设置 `SDKCONFIG_DEFAULTS`。非绝对路径的文件名将以当前项目的相对路径来解析。

在指定多个文件时，使用分号作为分隔符。先列出的文件将会先应用。如果某个键值在多个文件里定义，后面文件的定义会覆盖前面文件的定义。

一些 IDF 示例中包含了 `sdkconfig.ci` 文件。该文件是 CI（持续集成）测试框架的一部分，在正常构建过程中会被忽略。

依赖于硬件目标的 sdkconfig 默认值

除了 sdkconfig.defaults 之外，构建系统还将从 sdkconfig.defaults.TARGET_NAME 文件加载默认值，其中 IDF_TARGET 的值为 TARGET_NAME。例如，对于 ESP32 这个硬件目标，sdkconfig 的默认值会首先从 sdkconfig.defaults 获取，然后再从 sdkconfig.defaults.esp32 获取。

如果使用 SDKCONFIG_DEFAULTS 覆盖默认文件的名称，则硬件目标的默认文件名也会从 SDKCONFIG_DEFAULTS 值中派生。如果 SDKCONFIG_DEFAULTS 中有多个文件，硬件目标文件会在引入该硬件目标文件的文件之后应用，而 SDKCONFIG_DEFAULTS 中所有其它后续文件则会在硬件目标文件之后应用。

例如，如果 SDKCONFIG_DEFAULTS="sdkconfig.defaults;sdkconfig_devkit1"，并且在同一文件夹中有一个 sdkconfig.defaults.esp32 文件，那么这些文件将按以下顺序应用：(1) sdkconfig.defaults (2) sdkconfig.defaults.esp32 (3) sdkconfig_devkit1。

4.5.11 Flash 参数

有些情况下，我们希望在没有 IDF 时也能烧写目标板，为此，我们希望可以保存已构建的二进制文件、esptool.py 和 esptool write_flash 命令的参数。可以通过编写一段简单的脚本来保存二进制文件和 esptool.py。

运行项目构建之后，构建目录将包含项目二进制输出文件（.bin 文件），同时也包含以下烧录数据文件：

- flash_project_args 包含烧录整个项目的参数，包括应用程序 (app)、引导程序 (bootloader)、分区表，如果设置了 PHY 数据，也会包含此数据。
- flash_app_args 只包含烧录应用程序的参数。
- flash_bootloader_args 只包含烧录引导程序的参数。

您可以参照如下命令将任意烧录参数文件传递给 esptool.py:

```
python esptool.py --chip esp32c3 write_flash @build/flash_project_args
```

也可以手动复制参数文件中的数据到命令行中执行。

构建目录中还包含生成的 flasher_args.json 文件，此文件包含 JSON 格式的项目烧录信息，可用于 idf.py 和其它需要项目构建信息的工具。

4.5.12 构建 Bootloader

引导程序是 /components/bootloader/subproject 内部独特的“子项目”，它有自己的项目 CMakeLists.txt 文件，能够构建独立于主项目的 .ELF 和 .BIN 文件，同时它又与主项目共享配置和构建目录。

子项目通过 /components/bootloader/project_include.cmake 文件作为外部项目插入到项目的顶层，主构建进程会运行子项目的 CMake，包括查找组件（主项目使用的组件的子集），生成引导程序专用的配置文件（从主 sdkconfig 文件中派生）。

4.5.13 编写纯 CMake 组件

ESP-IDF 构建系统用“组件”的概念“封装”了 CMake，并提供了很多帮助函数来自动将这些组件集成到项目构建当中。

然而，“组件”概念的背后是一个完整的 CMake 构建系统，因此可以制作纯 CMake 组件。

下面是使用纯 CMake 语法为 json 组件编写的最小 CMakeLists 文件的示例：

```
add_library(json STATIC
cJSON/cJSON.c
cJSON/cJSON_Utils.c)

target_include_directories(json PUBLIC cJSON)
```

- 这实际上与 IDF 中的 json 组件 是等效的。

- 因为组件中的源文件不多，所以这个 CMakeLists 文件非常简单。对于具有大量源文件的组件而言，ESP-IDF 支持的组件通配符，可以简化组件 CMakeLists 的样式。
- 每当组件中新增一个与组件同名的库目标时，ESP-IDF 构建系统会自动将其添加到构建中，并公开公共的 include 目录。如果组件想要添加一个与组件不同名的库目标，就需要使用 CMake 命令手动添加依赖关系。

4.5.14 组件中使用第三方 CMake 项目

CMake 在许多开源的 C/C++ 项目中广泛使用，用户可以在自己的应用程序中使用开源代码。CMake 构建系统的一大好处就是可以导入这些第三方的项目，有时候甚至不用做任何改动。这就允许用户使用当前 ESP-IDF 组件尚未提供的功能，或者使用其它库来实现相同的功能。

假设 `main` 组件需要导入一个假想库 `foo`，相应的组件 CMakeLists 文件如下所示:

```
# 注册组件
idf_component_register(...)

# 设置 `foo` 项目中的一些 CMake 变量，以控制 `foo` 的构建过程
set(FOO_BUILD_STATIC OFF)
set(FOO_BUILD_TESTS OFF)

# 创建并导入第三方库目标
add_subdirectory(foo)

# 将 `foo` 目标公开链接至 `main` 组件
target_link_libraries(main PUBLIC foo)
```

实际的案例请参考 build_system/cmake/import_lib。请注意，导入第三方库所需要做的工作可能会因库的不同而有所差异。建议仔细阅读第三方库的文档，了解如何将其导入到其它项目中。阅读第三方库的 CMakeLists.txt 文件以及构建结构也会有所帮助。

用这种方式还可以将第三方库封装成 ESP-IDF 的组件。例如 mbedtls 组件就是封装了 mbedtls 项目 得到的。详情请参考 mbedtls 组件的 CMakeLists.txt 文件 。

每当使用 ESP-IDF 构建系统时，CMake 变量 `ESP_PLATFORM` 都会被设置为 1。如果要在通用的 CMake 代码加入 IDF 特定的代码时，可以采用 `if (ESP_PLATFORM)` 的形式加以分隔。

外部库中使用 ESP-IDF 组件

上述示例中假设的是外部库 `foo` （或 `import_lib` 示例中的 `tinyxml` 库）除了常见的 API 如 libc、libstdc++ 等外不需要使用其它 ESP-IDF API。如果外部库需要使用其它 ESP-IDF 组件提供的 API，则需要在外部 CMakeLists.txt 文件中通过添加对库目标 `idf::<componentname>` 的依赖关系。

例如，在 `foo/CMakeLists.txt` 文件:

```
add_library(foo bar.c fizz.cpp buzz.cpp)

if(ESP_PLATFORM)
  # 在 ESP-IDF 中， bar.c 需要包含 spi_flash 组件中的 esp_flash.h
  target_link_libraries(foo PRIVATE idf::spi_flash)
endif()
```

4.5.15 组件中使用预建库

还有一种情况是您有一个由其它构建过程生成预建静态库（`.a` 文件）。

ESP-IDF 构建系统为用户提供了一个实用函数 `add_prebuilt_library`，能够轻松导入并使用预建库:

```
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...] [PRIV_REQUIRES␣
↪req1 req2 ...])
```

其中：

- target_name- 用于引用导入库的名称，如链接到其它目标时
- lib_path- 预建库的路径，可以是绝对路径或是相对于组件目录的相对路径

可选参数 REQUIRES 和 PRIV_REQUIRES 指定对其它组件的依赖性。这些参数与 idf_component_register 的参数的意义相同。

注意预建库的编译目标需与目前的项目相同。预建库的相关参数也要匹配。如果不特别注意，这两个因素可能会导致应用程序中出现 bug。

请查看示例 build_system/cmake/import_prebuilt。

4.5.16 在自定义 CMake 项目中使用 ESP-IDF

ESP-IDF 提供了一个模板 CMake 项目，可以基于此轻松创建应用程序。然而在有些情况下，用户可能已有一个现成的 CMake 项目，或者想自己创建一个 CMake 项目，此时就希望将 IDF 中的组件以库的形式链接到用户目标（库/可执行文件）。

可以通过 tools/cmake/idf.cmake 提供的*build system APIs* 实现该目标。例如：

```
cmake_minimum_required(VERSION 3.16)
project(my_custom_app C)

# 导入提供 ESP-IDF CMake 构建系统 API 的 CMake 文件
include($ENV{IDF_PATH}/tools/cmake/idf.cmake)

# 在构建中导入 ESP-IDF 组件，可以视作等同 add_subdirectory()
# 但为 ESP-IDF 构建增加额外的构建过程
# 具体构建过程
idf_build_process(esp32)

# 创建项目可执行文件
# 使用其别名 idf::newlib 将其链接到 newlib 组件
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

# 让构建系统知道项目到可执行文件是什么，从而添加更多的目标以及依赖关系等
idf_build_executable(${CMAKE_PROJECT_NAME}.elf)
```

build_system/cmake/idf_as_lib 中的示例演示了如何在自定义的 CMake 项目创建一个类似于 Hello World 的应用程序。

4.5.17 ESP-IDF CMake 构建系统 API

idf 构建命令

```
idf_build_get_property(var property [GENERATOR_EXPRESSION])
```

检索一个构建属性 *property*，并将其存储在当前作用域可访问的 var 中。特定 *GENERATOR_EXPRESSION* 将检索该属性的生成器表达式字符串（不是实际值），它可与支持生成器表达式的 CMake 命令一起使用。

```
idf_build_set_property(property val [APPEND])
```

设置构建属性 *property* 的值为 *val*。特定 *APPEND* 将把指定的值附加到属性当前值之后。如果该属性之前不存在或当前为空，则指定的值将变为第一个元素/成员。

```
idf_build_component(component_dir)
```

向构建系统提交一个包含组件的 *component_dir* 目录。相对路径会被转换为相对于当前目录的绝对路径。所有对该命令的调用必须在 'idf_build_process'之前执行。

该命令并不保证组件在构建过程中会被处理（参见 *idf_build_process* 中 *COMPONENTS* 参数说明）

```
idf_build_process(target
                  [PROJECT_DIR project_dir]
                  [PROJECT_VER project_ver]
                  [PROJECT_NAME project_name]
                  [SDKCONFIG sdkconfig]
                  [SDKCONFIG_DEFAULTS sdkconfig_defaults]
                  [BUILD_DIR build_dir]
                  [COMPONENTS component1 component2 ...])
```

为导入 ESP-IDF 组件执行大量的幕后工作，包括组件配置、库创建、依赖性扩展和解析。在这些功能中，对于用户最重要的可能是通过调用每个组件的 `idf_component_register` 来创建库。该命令为每个组件创建库，这些库可以使用别名来访问，其形式为 idf::*component_name*。这些别名可以用来将组件链接到用户自己的目标、库或可执行文件上。

该调用要求用 *target* 参数指定目标芯片。调用的可选参数包括：

- PROJECT_DIR - 项目目录，默认为 CMAKE_SOURCE_DIR。
- PROJECT_NAME - 项目名称，默认为 CMAKE_PROJECT_NAME。
- PROJECT_VER - 项目的版本/版本号，默认为“1”。
- SDKCONFIG - 生成的 sdkconfig 文件的输出路径，根据是否设置 PROJECT_DIR，默认为 PROJECT_DIR/sdkconfig 或 CMAKE_SOURCE_DIR/sdkconfig。
- SDKCONFIG_DEFAULTS - 包含默认配置的文件列表（列表中必须包含完整的路径），默认为空；对于列表中的每个值 *filename*，如果存在的话，也会加载文件 *filename.target* 中的配置。对于列表中的 *filename* 的每一个值，也会加载文件 *filename.target* （如果存在的话）中的配置。
- BUILD_DIR - 用于放置 ESP-IDF 构建相关工具的目录，如生成的二进制文件、文本文件、组件；默认为 CMAKE_BINARY_DIR。
- COMPONENTS - 从构建系统已知的组件中选择要处理的组件（通过 `idf_build_component` 添加）。这个参数用于精简构建过程。如果在依赖链中需要其它组件，则会自动添加，即自动添加这个列表中组件的公共和私有依赖项，进而添加这些依赖项的公共和私有依赖，以此类推。如果不指定，则会处理构建系统已知的所有组件。

```
idf_build_executable(executable)
```

指定 ESP-IDF 构建的可执行文件 *executable*。这将添加额外的目标，如与 flash 相关的依赖关系，生成额外的二进制文件等。应在 `idf_build_process` 之后调用。

```
idf_build_get_config(var config [GENERATOR_EXPRESSION])
```

获取指定配置的值。就像构建属性一样，特定 *GENERATOR_EXPRESSION* 将检索该配置的生成器表达式字符串，而不是实际值，即可以与支持生成器表达式的 CMake 命令一起使用。然而，实际的配置值只有在调用 `idf_build_process` 后才能知道。

idf 构建属性

可以通过使用构建命令 `idf_build_get_property` 来获取构建属性的值。例如，以下命令可以获取构建过程中使用的 Python 解释器的相关信息。

```
idf_build_get_property(python PYTHON)
message(STATUS "The Python intepreter is: ${python}")
```

- BUILD_DIR - 构建目录；由 `idf_build_process` 的 BUILD_DIR 参数设置。
- BUILD_COMPONENTS - 包含在构建中的组件列表；由 `idf_build_process` 设置。

- BUILD_COMPONENT_ALIASES - 包含在构建中的组件的库别名列表；由 idf_build_process 设置。
- C_COMPILE_OPTIONS - 适用于所有组件的 C 源代码文件的编译选项。
- COMPILE_OPTIONS - 适用于所有组件的源文件（无论是 C 还是 C++）的编译选项。
- COMPILE_DEFINITIONS - 适用于所有组件源文件的编译定义。
- CXX_COMPILE_OPTIONS - 适用于所有组件的 C++ 源文件的编译选项。
- EXECUTABLE - 项目可执行文件；通过调用 idf_build_executable 设置。
- EXECUTABLE_NAME - 不含扩展名的项目可执行文件的名称；通过调用 idf_build_executable 设置。
- EXECUTABLE_DIR - 输出的可执行文件的路径
- IDF_COMPONENT_MANAGER - 默认启用组件管理器，但如果设置这个属性为 "0"，则会被 IDF_COMPONENT_MANAGER 环境变量禁用。
- IDF_PATH - ESP-IDF 路径；由 IDF_PATH 环境变量设置，或者从 idf.cmake 的位置推断。
- IDF_TARGET - 构建的目标芯片；由 idf_build_process 的目标参数设置。
- IDF_VER - ESP-IDF 版本；由版本文件或 IDF_PATH 仓库的 Git 版本设置。
- INCLUDE_DIRECTORIES - 包含所有组件源文件的目录。
- KCONFIGS - 构建过程中组件里的 Kconfig 文件的列表；由 idf_build_process 设置。
- KCONFIG_PROJBUILDS - 构建过程中组件中的 Kconfig.projbuild 文件的列表；由 idf_build_process 设置。
- PROJECT_NAME - 项目名称；由 idf_build_process 的 PROJECT_NAME 参数设置。
- PROJECT_DIR - 项目的目录；由 idf_build_process 的 PROJECT_DIR 参数设置。
- PROJECT_VER - 项目的版本；由 idf_build_process 的 PROJECT_VER 参数设置。
- PYTHON - 用于构建的 Python 解释器；如果有则从 PYTHON 环境变量中设置，如果没有，则使用 "python"。
- SDKCONFIG - 输出的配置文件的完整路径；由 idf_build_process SDKCONFIG 参数设置。
- SDKCONFIG_DEFAULTS - 包含默认配置的文件列表；由 idf_build_process SDKCONFIG_DEFAULTS 参数设置。
- SDKCONFIG_HEADER - 包含组件配置的 C/C++ 头文件的完整路径；由 idf_build_process 设置。
- SDKCONFIG_CMAKE - 包含组件配置的 CMake 文件的完整路径；由 idf_build_process 设置。
- SDKCONFIG_JSON - 包含组件配置的 JSON 文件的完整路径；由 idf_build_process 设置。
- SDKCONFIG_JSON_MENUS - 包含配置菜单的 JSON 文件的完整路径；由 idf_build_process 设置。

idf 组件命令

```
idf_component_get_property(var component property [GENERATOR_EXPRESSION])
```

检索一个指定的 *component* 的组件属性 *property*，并将其存储在当前作用域可访问的 *var* 中。指定 *GENERATOR_EXPRESSION* 将检索该属性的生成器表达式字符串（不是实际值），它可以在支持生成器表达式的 CMake 命令中使用。

```
idf_component_set_property(component property val [APPEND])
```

设置指定的 *component* 的组件属性，*property* 的值为 *val*。特定 *APPEND* 将把指定的值追加到属性的当前值后。如果该属性之前不存在或当前为空，指定的值将成为第一个元素/成员。

```
idf_component_register([[SRCS src1 src2 ...] | [[SRC_DIRS dir1 dir2 ...] [EXCLUDE_
↪SRCS src1 src2 ...]]
                       [INCLUDE_DIRS dir1 dir2 ...]
                       [PRIV_INCLUDE_DIRS dir1 dir2 ...]
                       [REQUIRES component1 component2 ...]
                       [PRIV_REQUIRES component1 component2 ...]
                       [LDFRAGMENTS ldfragment1 ldfragment2 ...]
                       [REQUIRED_IDF_TARGETS target1 target2 ...]
                       [EMBED_FILES file1 file2 ...]
                       [EMBED_TXTFILES file1 file2 ...]
                       [KCONFIG kconfig]
```

(下页继续)

(续上页)

```
                    [KCONFIG_PROJBUILD kconfig_projbuild]
                    [WHOLE_ARCHIVE])
```

将一个组件注册到构建系统中。就像 `project()` CMake 命令一样，该命令应该直接从组件的 CMakeLists.txt 中调用（而不是通过函数或宏），且建议在其他命令之前调用该命令。下面是一些关于在 `idf_component_register` 之前 不能调用哪些命令的指南：

- 在 CMake 脚本模式下无效的命令。
- 在 project_include.cmake 中定义的自定义命令。
- 除了 `idf_build_get_property` 之外，构建系统的 API 命令；但要考虑该属性是否有被设置。

对变量进行设置和操作的命令，一般可在 `idf_component_register` 之前调用。

`idf_component_register` 的参数包括：

- SRCS - 组件的源文件，用于为组件创建静态库；如果没有指定，组件将被视为仅配置组件，从而创建接口库。
- SRC_DIRS、EXCLUDE_SRCS - 用于通过指定目录来 glob 源文件 (.c、.cpp、.S)，而不是通过 SRCS 手动指定源文件。请注意，这受*CMake 中通配符的限制*。在 EXCLUDE_SRCS 中指定的源文件会从被 glob 的文件中移除。
- INCLUDE_DIRS - 相对于组件目录的路径，该路径将被添加到需要当前组件的所有其他组件的 include 搜索路径中。
- PRIV_INCLUDE_DIRS - 必须是相对于组件目录的目录路径，它仅被添加到这个组件源文件的 include 搜索路径中。
- REQUIRES - 组件的公共组件依赖项。
- PRIV_REQUIRES - 组件的私有组件依赖项；在仅用于配置的组件上会被忽略。
- LDFRAGMENTS - 组件链接器片段文件。
- REQUIRED_IDF_TARGETS - 指定该组件唯一支持的目标。
- KCONFIG - 覆盖默认的 Kconfig 文件。
- KCONFIG_PROJBUILD - 覆盖默认的 Kconfig.projbuild 文件。
- WHOLE_ARCHIVE - 如果指定了此参数，链接时会在组件库的前后分别添加 `-Wl,--whole-archive` 和 `-Wl,--no-whole-archive`。这与设置 `WHOLE_ARCHIVE` 组件属性的效果一致。

以下内容用于*将数据嵌入到组件中*，并在确定组件是否仅用于配置时被视为源文件。这意味着，即使组件没有指定源文件，如果组件指定了以下其中之一，仍然会在内部为组件创建一个静态库。

- EMBED_FILES - 嵌入组件的二进制文件
- EMBED_TXTFILES - 嵌入组件的文本文件

idf 组件属性

组件的属性值可以通过使用构建命令 `idf_component_get_property` 来获取。例如，以下命令可以获取 `freertos` 组件的目录。

```
idf_component_get_property(dir freertos COMPONENT_DIR)
message(STATUS "The 'freertos' component directory is: ${dir}")
```

- COMPONENT_ALIAS - COMPONENT_LIB 的别名，用于将组件链接到外部目标；由 `idf_build_component` 设置，别名库本身由 `idf_component_register` 创建。
- COMPONENT_DIR - 组件目录；由 `idf_build_component` 设置。
- COMPONENT_OVERRIDEN_DIR - 如果*这个组件覆盖了另一个组件*，则包含原组件的目录。
- COMPONENT_LIB - 所创建的组件静态/接口库的名称；由 `idf_build_component` 设置，库本身由 `idf_component_register` 创建。
- COMPONENT_NAME - 组件的名称；由 `idf_build_component` 根据组件的目录名设置。
- COMPONENT_TYPE - 组件的类型（LIBRARY 或 CONFIG_ONLY）。如果一个组件指定了源文件或嵌入了一个文件，那么它的类型就是 LIBRARY。
- EMBED_FILES - 要嵌入组件的文件列表；由 `idf_component_register` EMBED_FILES 参数设置。

- EMBED_TXTFILES - 要嵌入组件的文本文件列表；由 idf_component_register EMBED_TXTFILES 参数设置。
- INCLUDE_DIRS - 组件 include 目录列表；由 idf_component_register INCLUDE_DIRS 参数设置。
- KCONFIG - 组件 Kconfig 文件；由 idf_build_component 设置。
- KCONFIG_PROJBUILD - 组件 Kconfig.projbuild；由 idf_build_component 设置。
- LDFRAGMENTS - 组件链接器片段文件列表；由 idf_component_register LDFRAGMENTS 参数设置。
- MANAGED_PRIV_REQUIRES - IDF 组件管理器从 “idf_component.yml“清单文件中的依赖关系中添加的私有组件依赖关系列表。
- MANAGED_REQUIRES - IDF 组件管理器从 idf_component.yml 清单文件的依赖关系中添加的公共组件依赖关系列表。
- PRIV_INCLUDE_DIRS - 组件私有 include 目录列表；在 LIBRARY 类型的组件 idf_component_register PRIV_INCLUDE_DIRS 参数中设置。
- PRIV_REQUIRES - 私有组件依赖关系列表；根据 idf_component_register PRIV_REQUIRES 参数的值以及 idf_component.yml 清单文件中的依赖关系设置。
- REQUIRED_IDF_TARGETS - 组件支持的目标列表；由 idf_component_register EMBED_TXTFILES 参数设置。
- REQUIRES - 公共组件依赖关系列表；根据 idf_component_register REQUIRES 参数的值以及 idf_component.yml 清单文件中的依赖关系设置。
- SRCS - 组件源文件列表；由 idf_component_register 的 SRCS 或 SRC_DIRS/EXCLUDE_SRCS 参数设置。
- WHOLE_ARCHIVE - 如果该属性被设置为 TRUE（或是其他 CMake 布尔“真”值：1、ON、YES、Y 等），链接时会在组件库的前后分别添加 -Wl,--whole-archive 和 -Wl,--no-whole-archive 选项。这可以强制链接器将每个目标文件包含到可执行文件中，即使该目标文件没有解析来自应用程序其余部分的任何引用。当组件中包含依赖链接时注册的插件或模块时，通常会使用该方法。默认情况下，此属性为 FALSE。可以从组件的 CMakeLists.txt 文件中将其设置为 TRUE。

4.5.18 文件通配 & 增量构建

在 ESP-IDF 组件中添加源文件的首选方法是在 COMPONENT_SRCS 中手动列出它们:

```
idf_component_register(SRCS library/a.c library/b.c platform/platform.c
                       ...)
```

这是在 CMake 中手动列出源文件的 最佳实践。然而，当有许多源文件都需要添加到构建中时，这种方法就会很不方便。ESP-IDF 构建系统因此提供了另一种替代方法，即使用 SRC_DIRS 来指定源文件:

```
idf_component_register(SRC_DIRS library platform
                       ...)
```

后台会使用通配符在指定的目录中查找源文件。但是请注意，在使用这种方法的时候，如果组件中添加了一个新的源文件，CMake 并不知道重新运行配置，最终该文件也没有被加入构建中。

如果是自己添加的源文件，这种折衷还是可以接受的，因为用户可以触发一次干净的构建，或者运行 idf.py reconfigure 来手动重启 CMake。但是，如果你需要与其他使用 Git 等版本控制工具的开发人员共享项目时，问题就会变得更加困难，因为开发人员有可能会拉取新的版本。

ESP-IDF 中的组件使用了第三方的 Git CMake 集成模块(/tools/cmake/third_party/GetGitRevisionDescription.cmake)，任何时候源码仓库的提交记录发生了改变，该模块就会自动重新运行 CMake。即只要拉取了新的 ESP-IDF 版本，CMake 就会重新运行。

对于不属于 ESP-IDF 的项目组件，有以下几个选项供参考：

- 如果项目文件保存在 Git 中，ESP-IDF 会自动跟踪 Git 修订版本，并在它发生变化时重新运行 CMake。
- 如果一些组件保存在第三方 Git 仓库中（不在项目仓库或 ESP-IDF 仓库），则可以在组件 CMakeLists 文件中调用 git_describe 函数，以便在 Git 修订版本发生变化时自动重启 CMake。
- 如果没有使用 Git，请记住在源文件发生变化时手动运行 idf.py reconfigure。

- 使用 `idf_component_register` 的 `SRCS` 参数来列出项目组件中的所有源文件则可以完全避免这一问题。

具体选择哪一方式，就要取决于项目本身，以及项目用户。

4.5.19 构建系统的元数据

为了将 ESP-IDF 集成到 IDE 或者其它构建系统中，CMake 在构建的过程中会在 `build/` 目录下生成大量元数据文件。运行 `cmake` 或 `idf.py reconfigure`（或任何其它 `idf.py` 构建命令），可以重新生成这些元数据文件。

- `compile_commands.json` 是标准格式的 JSON 文件，它描述了在项目中参与编译的每个源文件。CMake 其中的一个功能就是生成此文件，许多 IDE 都知道如何解析此文件。
- `project_description.json` 包含有关 ESP-IDF 项目、已配置路径等的一些常规信息。
- `flasher_args.json` 包含 esptool.py 工具用于烧录项目二进制文件的参数，此外还有 `flash_*_args` 文件，可直接与 esptool.py 一起使用。更多详细信息请参阅*Flash 参数*。
- `CMakeCache.txt` 是 CMake 的缓存文件，包含 CMake 进程、工具链等其它信息。
- `config/sdkconfig.json` 包含 JSON 格式的项目配置结果。
- `config/kconfig_menus.json` 是在 menuconfig 中显示菜单的 JSON 格式版本，用于外部 IDE 的 UI。

JSON 配置服务器

`confserver.py` 工具可以帮助 IDE 轻松地与配置系统的逻辑进行集成，它运行在后台，通过使用 stdin 和 stdout 读写 JSON 文件的方式与调用进程交互。

您可以通过 `idf.py confserver` 或 `ninja confserver` 从项目中运行 `confserver.py`，也可以使用不同的构建生成器来触发类似的目标。

有关 confserver.py 的更多信息，请参阅 tools/kconfig_new/README.md

4.5.20 构建系统内部

构建脚本

ESP-IDF 构建系统的列表文件位于 /tools/cmake 中。实现构建系统核心功能的模块如下

- build.cmake - 构建相关命令，即构建初始化、检索/设置构建属性、构建处理。
- component.cmake - 组件相关的命令，如添加组件、检索/设置组件属性、注册组件。
- kconfig.cmake - 从 Kconfig 文件中生成配置文件（sdkconfig、sdkconfig.h、sdkconfig.cmake 等）。
- ldgen.cmake - 从链接器片段文件生成最终链接器脚本。
- target.cmake - 设置构建目标和工具链文件。
- utilities.cmake - 其它帮助命令。

除了这些文件，还有两个重要的 CMake 脚本在 /tools/cmake 中：

- idf.cmake - 设置构建参数并导入上面列出的核心模块。之所以包括在 CMake 项目中，是为了方便访问 ESP-IDF 构建系统功能。
- project.cmake - 导入 `idf.cmake`，并提供了一个自定义的 “project()“命令，该命令负责处理建立可执行文件时所有的繁重工作。包含在标准 ESP-IDF 项目的顶层 CMakeLists.txt 中。

/tools/cmake 中的其它文件都是构建过程中的支持性文件或第三方脚本。

构建过程

本节介绍了标准的 ESP-IDF 应用构建过程。构建过程可以大致分为四个阶段：

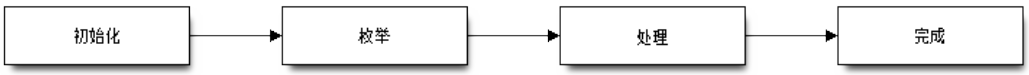

图 3: ESP-IDF Build System Process

初始化

该阶段为构建设置必要的参数。

- **在将 `idf.cmake` 导入 `project.cmake` 后，将执行以下步骤：**
  - 在环境变量中设置 `IDF_PATH` 或从顶层 CMakeLists.txt 中包含的 `project.cmake` 路径推断相对路径。
  - 将 /tools/cmake 添加到 `CMAKE_MODULE_PATH` 中，并导入核心模块和各种辅助/第三方脚本。
  - 设置构建工具/可执行文件，如默认的 Python 解释器。
  - 获取 ESP-IDF git 修订版，并存储为 `IDF_VER`。
  - 设置全局构建参数，即编译选项、编译定义、包括所有组件的 include 目录。
  - 将 components 中的组件添加到构建中。
- **自定义 `project()` 命令的初始部分执行以下步骤：**
  - 在环境变量或 CMake 缓存中设置 `IDF_TARGET` 以及设置相应要使用的 “CMAKE_TOOLCHAIN_FILE“。
  - 添加 `EXTRA_COMPONENTS_DIRS` 中的组件至构建中
  - 从 `COMPONENTS`/`EXCLUDE_COMPONENTS`、`SDKCONFIG`、`SDKCONFIG_DEFAULTS` 等变量中为调用命令 `idf_build_process()` 准备参数。

调用 `idf_build_process()` 命令标志着这个阶段的结束。

枚举

这个阶段会建立一个需要在构建过程中处理的组件列表，该阶段在 `idf_build_process()` 的前半部分进行。

- 检索每个组件的公共和私有依赖。创建一个子进程，以脚本模式执行每个组件的 CMakeLists.txt。`idf_component_register` REQUIRES 和 PRIV_REQUIRES 参数的值会返回给父进程。这就是所谓的早期扩展。在这一步中定义变量 `CMAKE_BUILD_EARLY_EXPANSION`。
- 根据公共和私有的依赖关系，递归地导入各个组件。

处理

该阶段处理构建中的组件，是 `idf_build_process()` 的后半部分。

- 从 sdkconfig 文件中加载项目配置，并生成 sdkconfig.cmake 和 sdkconfig.h 头文件。这两个文件分别定义了可以从构建脚本和 C/C++ 源文件/头文件中访问的配置变量/宏。
- 导入各组件的 `project_include.cmake`。
- 将每个组件添加为一个子目录，处理其 CMakeLists.txt。组件 CMakeLists.txt 调用注册命令 `idf_component_register` 添加源文件、导入目录、创建组件库、链接依赖关系等。

完成

该阶段是 `idf_build_process()` 剩余的步骤。

- 创建可执行文件并将其链接到组件库中。
- 生成 project_description.json 等项目元数据文件并且显示所建项目等相关信息。

请参考 /tools/cmake/project.cmake 获取更多信息。

4.5.21 从 ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统

ESP-IDF CMake 构建系统与旧版的 GNU Make 构建系统在某些方面非常相似，开发者都需要提供 include 目录、源文件等。然而，有一个语法上的区别，即对于 ESP-IDF CMake 构建系统，开发者需要将这些作为参数传递给注册命令 `idf_component_register`。

自动转换工具

在 ESP-IDF v4.x 版本中，*tools/cmake/convert_to_cmake.py* 提供了项目自动转换工具。由于该脚本依赖于 *make* 构建系统，所以 v5.0 版本中不包含该脚本。

CMake 中不可用的功能

有些功能已从 CMake 构建系统中移除，或者已经发生很大改变。GNU Make 构建系统中的以下变量已从 CMake 构建系统中删除：

- `COMPONENT_BUILD_DIR`：由 `CMAKE_CURRENT_BINARY_DIR` 替代。
- `COMPONENT_LIBRARY`：默认为 `$(COMPONENT_NAME).a` 但是库名可以被组件覆盖。在 CMake 构建系统中，组件库名称不可再被组件覆盖。
- `CC`、`LD`、`AR`、`OBJCOPY`：gcc xtensa 交叉工具链中每个工具的完整路径。CMake 使用 `CMAKE_C_COMPILER`、`CMAKE_C_LINK_EXECUTABLE` 和 `CMAKE_OBJCOPY` 进行替代。完整列表请参阅 CMake 语言变量。
- `HOSTCC`、`HOSTLD`、`HOSTAR`：宿主机本地工具链中每个工具的全名。CMake 系统不再提供此变量，外部项目需要手动检测所需的宿主机工具链。
- `COMPONENT_ADD_LDFLAGS`：用于覆盖链接标志。CMake 中使用 target_link_libraries 命令替代。
- `COMPONENT_ADD_LINKER_DEPS`：链接过程依赖的文件列表。target_link_libraries 通常会自动推断这些依赖。对于链接脚本，可以使用自定义的 CMake 函数 `target_linker_scripts`。
- `COMPONENT_SUBMODULES`：不再使用。CMake 会自动枚举 ESP-IDF 仓库中所有的子模块。
- `COMPONENT_EXTRA_INCLUDES`：曾是 `COMPONENT_PRIV_INCLUDEDIRS` 变量的替代版本，仅支持绝对路径。CMake 系统中统一使用 `COMPONENT_PRIV_INCLUDEDIRS`（可以是相对路径，也可以是绝对路径）。
- `COMPONENT_OBJS`：以前，可以以目标文件列表的方式指定组件源，现在，可以通过 `COMPONENT_SRCS` 以源文件列表的形式指定组件源。
- `COMPONENT_OBJEXCLUDE`：已被 `COMPONENT_SRCEXCLUDE` 替换。用于指定源文件（绝对路径或组件目录的相对路径）。
- `COMPONENT_EXTRA_CLEAN`：已被 `ADDITIONAL_MAKE_CLEAN_FILES` 属性取代，注意，*CMake 对此项功能有部分限制*。
- `COMPONENT_OWNBUILDTARGET` & `COMPONENT_OWNCLEANTARGET`：已被 CMake 外部项目 *<ExternalProject_>* 替代，详细内容请参阅完全覆盖组件的构建过程。
- `COMPONENT_CONFIG_ONLY`：已被 `register_config_only_component()` 函数替代，请参阅仅配置组件。
- `CFLAGS`、`CPPFLAGS`、`CXXFLAGS`：已被相应的 CMake 命令替代，请参阅组件编译控制。

无默认值的变量

以下变量不再具有默认值：

- 源目录（Make 中的 `COMPONENT_SRCDIRS` 变量，CMake 中 `idf_component_register` 的 `SRC_DIRS` 参数）
- include 目录（Make 中的 `COMPONENT_ADD_INCLUDEDIRS` 变量，CMake 中 `idf_component_register` 的 `INCLUDE_DIRS` 参数)

不再需要的变量

在 CMake 构建系统中，如果设置了 `COMPONENT_SRCS`，就不需要再设置 `COMPONENT_SRCDIRS`。实际上，CMake 构建系统中如果设置了 `COMPONENT_SRCDIRS`，那么 `COMPONENT_SRCS` 就会被忽略。

从 Make 中烧录

仍然可以使用 `make flash` 或者类似的目标来构建和烧录，但是项目 `sdkconfig` 不能再用来指定串口和波特率。可以使用环境变量来覆盖串口和波特率的设置，详情请参阅*使用 Ninja/Make 来烧录*。

4.6 Core Dump

4.6.1 Overview

ESP-IDF provides support to generate core dumps on unrecoverable software errors. This useful technique allows post-mortem analysis of software state at the moment of failure. Upon the crash system enters panic state, prints some information and halts or reboots depending configuration. User can choose to generate core dump in order to analyse the reason of failure on PC later on. Core dump contains snapshots of all tasks in the system at the moment of failure. Snapshots include tasks control blocks (TCB) and stacks. So it is possible to find out what task, at what instruction (line of code) and what callstack of that task lead to the crash. It is also possible dumping variables content on demand if previously attributed accordingly. ESP-IDF provides special script *espcoredump.py* to help users to retrieve and analyse core dumps. This tool provides two commands for core dumps analysis:

- `info_corefile` - prints crashed task's registers, callstack, list of available tasks in the system, memory regions and contents of memory stored in core dump (TCBs and stacks)
- `dbg_corefile` - creates core dump ELF file and runs GDB debug session with this file. User can examine memory, variables and tasks states manually. Note that since not all memory is saved in core dump only values of variables allocated on stack will be meaningful

For more information about core dump internals see the - *Core dump internals*

4.6.2 Configurations

There are a number of core dump related configuration options which user can choose in project configuration menu (`idf.py menuconfig`).

Core dump data destination (Components -> Core dump -> Data destination)

- Save core dump to Flash (Flash)
- Print core dump to UART (UART)
- Disable core dump generation (None)

Core dump data format (Components -> Core dump -> Core dump data format)

- ELF format (Executable and Linkable Format file for core dump)
- Binary format (Basic binary format for core dump)

The ELF format contains extended features and allow to save more information about broken tasks and crashed software but it requires more space in the flash memory. This format of core dump is recommended for new software designs and is flexible enough to extend saved information for future revisions.

The Binary format is kept for compatibility reasons, it uses less space in the memory to keep data and provides better performance.

Core dump data integrity check (Components -> Core dump -> Core dump data integrity check)

- Use CRC32 for core dump integrity verification

Maximum number of tasks snapshots in core dump (Components -> Core dump -> Maximum number of tasks)

Delay before core dump is printed to UART (Components -> Core dump -> Delay before print to UART)

The value is in ms.

Handling of UART core dumps in IDF Monitor (Components -> Core dump -> Delay before print to UART)

The value is base64 encoded.

- Decode and show summary (info_corefile)
- Don’t decode

Reserved stack size (Components -> Core dump -> Reserved stack size)

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800.

4.6.3 Save core dump to flash

When this option is selected core dumps are saved to special partition on flash. When using default partition table files which are provided with ESP-IDF it automatically allocates necessary space on flash, But if user wants to use its own layout file together with core dump feature it should define separate partition for core dump as it is shown below:

```
# Name,   Type, SubType, Offset,  Size
# Note: if you have increased the bootloader size, make sure to update the offsets␣
↪to avoid overlap
nvs,      data, nvs,     0x9000,  0x6000
phy_init, data, phy,     0xf000,  0x1000
factory,  app,  factory, 0x10000, 1M
coredump, data, coredump,,        64K
```

There are no special requirements for partition name. It can be chosen according to the user application needs, but partition type should be ‘data’ and sub-type should be ‘coredump’. Also when choosing partition size note that core dump data structure introduces constant overhead of 20 bytes and per-task overhead of 12 bytes. This overhead does not include size of TCB and stack for every task. So partition size should be at least 20 + max tasks number x (12 + TCB size + max task stack size) bytes.

The example of generic command to analyze core dump from flash is:

```
espcoredump.py -p </path/to/serial/port> info_corefile </path/to/program/elf/file>
```

or

```
espcoredump.py -p </path/to/serial/port> dbg_corefile </path/to/program/elf/file>
```

4.6.4 Print core dump to UART

When this option is selected base64-encoded core dumps are printed on UART upon system panic. In this case user should save core dump text body to some file manually and then run the following command:

```
espcoredump.py --chip esp32c3 info_corefile -t b64 -c </path/to/saved/base64/text>
↪</path/to/program/elf/file>
```

or

```
espcoredump.py --chip esp32c3 dbg_corefile -t b64 -c </path/to/saved/base64/text>
↪</path/to/program/elf/file>
```

Base64-encoded body of core dump will be between the following header and footer:

```
================= CORE DUMP START =================
<body of base64-encoded core dump, save it to file on disk>
================= CORE DUMP END ===================
```

The `CORE DUMP START` and `CORE DUMP END` lines must not be included in core dump text file.

4.6.5 ROM Functions in Backtraces

It is possible situation that at the moment of crash some tasks or/and crashed task itself have one or more ROM functions in their callstacks. Since ROM is not part of the program ELF it will be impossible for GDB to parse such callstacks, because it tries to analyse functions' prologues to accomplish that. In that case callstack printing will be broken with error message at the first ROM function. To overcome this issue you can use ROM ELF provided by Espressif (https://dl.espressif.com/dl/esp32c3_rev3_rom.elf) and pass it to `espcoredump.py`.

4.6.6 Dumping variables on demand

Sometimes you want to read the last value of a variable to understand the root cause of a crash. Core dump supports retrieving variable data over GDB by attributing special notations declared variables.

Supported notations and RAM regions

- `COREDUMP_DRAM_ATTR` places variable into DRAM area which will be included into dump.
- `COREDUMP_RTC_ATTR` places variable into RTC area which will be included into dump.
- `COREDUMP_RTC_FAST_ATTR` places variable into RTC_FAST area which will be included into dump.

Example

1. In *Project Configuration Menu*, enable *COREDUMP TO FLASH*, then save and exit.
2. In your project, create a global variable in DRAM area as such as:

```
// uint8_t global_var;
COREDUMP_DRAM_ATTR uint8_t global_var;
```

3. In main application, set the variable to any value and `assert(0)` to cause a crash.

```
global_var = 25;
assert(0);
```

4. Build, flash and run the application on a target device and wait for the dumping information.
5. Run the command below to start core dumping in GDB, where `PORT` is the device USB port:

```
espcoredump.py -p PORT dbg_corefile <path/to/elf>
```

6. In GDB shell, type `p global_var` to get the variable content:

```
(gdb) p global_var
$1 = 25 '\031'
```

4.6.7 Running `espcoredump.py`

Generic command syntax: `espcoredump.py [options] command [args]`

Script Options

–**chip {auto,esp32,esp32s2,esp32s3,esp32c2,esp32c3}** Target chip type. Default value is "auto"

--port PORT, -p PORT Serial port device. Either "chip" or "port" need to be specified to determine the port when you have multi-target connected at the same time.

--baud BAUD, -b BAUD Serial port baud rate used when flashing/reading

--gdb-timeout-sec GDB_TIMEOUT_SEC Overwrite the default internal delay for gdb responses

Commands **dbg_corefile** Starts GDB debugging session with specified corefile

info_corefile Print core dump info from file

Command Arguments

--debug DEBUG, -d DEBUG Log level (0..3)

--gdb GDB, -g GDB Path to gdb

--core CORE, -c CORE Path to core dump file (if skipped core dump will be read from flash)

–**core-format {b64,elf,raw}, -t {b64,elf,raw}** File specified with "-c" is an ELF ("elf"), raw (raw) or base64-encoded (b64) binary

--off OFF, -o OFF Offset of coredump partition in flash (type "idf.py partition-table" to see).

--save-core SAVE_CORE, -s SAVE_CORE Save core to file. Otherwise temporary core file will be deleted. Does not work with "-c"

--rom-elf ROM_ELF, -r ROM_ELF Path to ROM ELF file. Will use "<target>_rom.elf" if not specified

--print-mem, -m Print memory dump. Only valid when info_corefile.

<prog> Path to program ELF file.

Related Documents

Anatomy of core dump image Core dump component can be configured to use old legacy binary format or the new ELF one. The ELF format is recommended for new designs. It provides more information about the CPU and memory state of a program at the moment when panic handler is entered. The memory state embeds a snapshot of all tasks mapped in the memory space of the program. The CPU state contains register values when the core dump has been generated. Core dump file uses a subset of the ELF structures to register these information. Loadable ELF segments are used for the memory state of the process while ELF notes (ELF.PT_NOTE) are used for process metadata (pid, registers, signal, ⋯). Especially, the CPU status is stored in a note with a special name and type (`CORE`, `NT_PRSTATUS type`).

Here is an overview of coredump layout:

Note: The format of image file showed on the above pictures represents current version of image and can be changed in future releases.

Overview of implementation The figure below describes some basic aspects related to implementation of core dump:

Note: The diagram above hide some details and represents current implementation of the core dump and can be changed later.

4.7 Deep Sleep Wake Stubs

ESP32-C3 supports running a "deep sleep wake stub" when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialisation, bootloader, or ESP-IDF code has run. After the wake stub runs, the SoC can go back to sleep or continue to start ESP-IDF normally.

Deep sleep wake stub code is loaded into "RTC Fast Memory" and any data which it uses must also be loaded into RTC memory. RTC memory regions hold their contents during deep sleep.

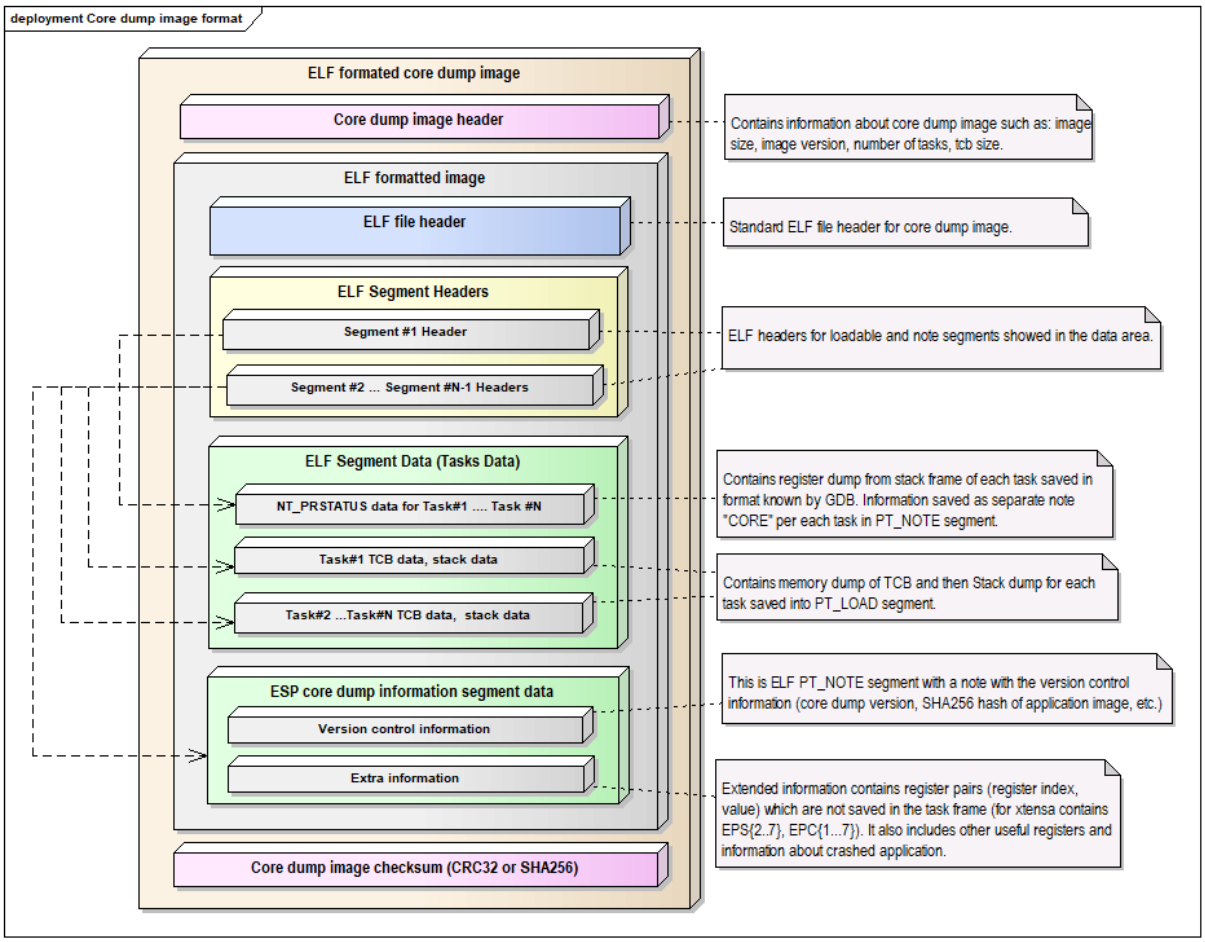

图 4: Core dump ELF image format

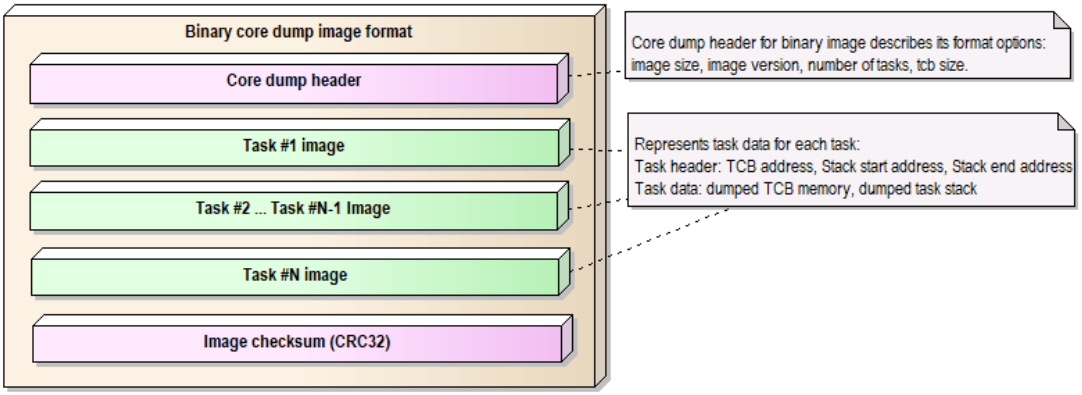

图 5: Core dump binary image format

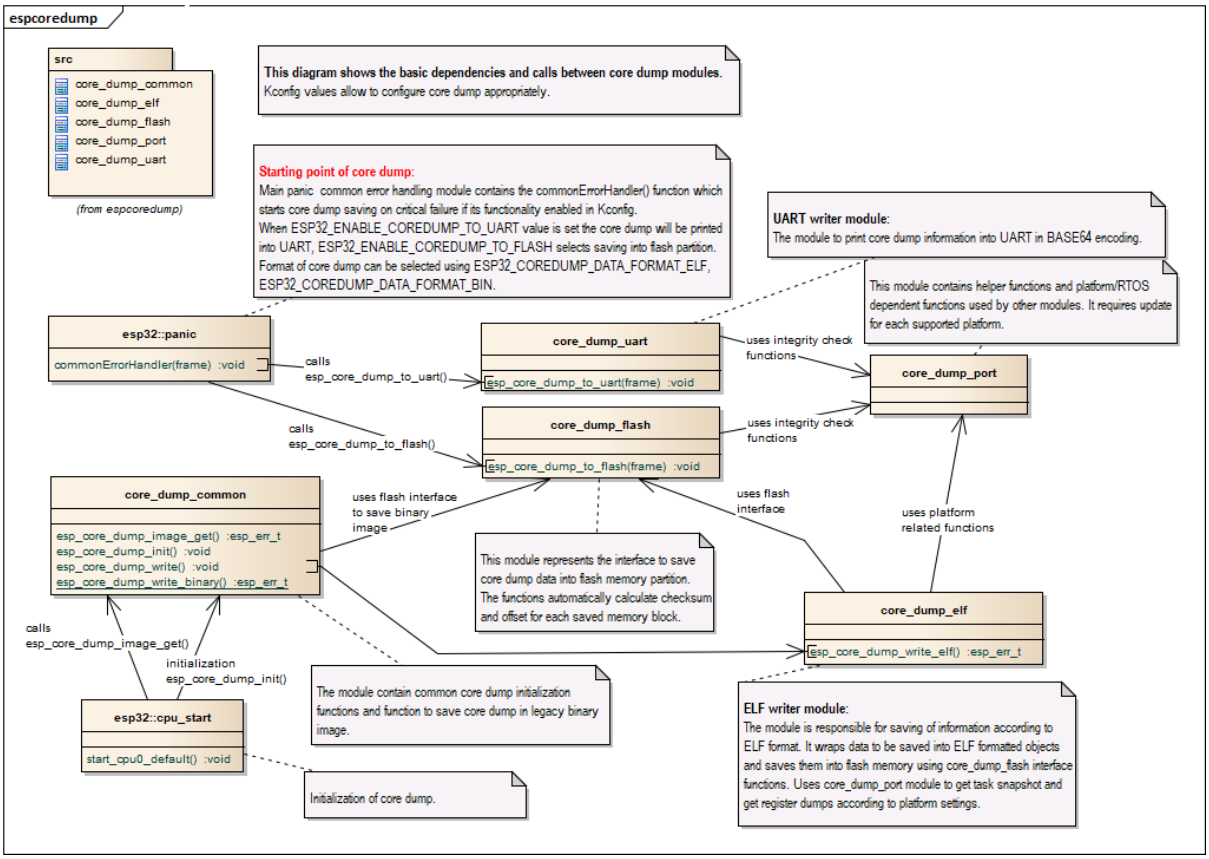

图 6: Core dump implementation overview

4.7.1 Rules for Wake Stubs

Wake stub code must be carefully written:

- As the SoC has freshly woken from sleep, most of the peripherals are in reset states. The SPI flash is unmapped.
- The wake stub code can only call functions implemented in ROM or loaded into RTC Fast Memory (see below.)
- The wake stub code can only access data loaded in RTC memory. All other RAM will be unintiailised and have random contents. The wake stub can use other RAM for temporary storage, but the contents will be overwritten when the SoC goes back to sleep or starts ESP-IDF.
- RTC memory must include any read-only data (.rodata) used by the stub.
- Data in RTC memory is initialised whenever the SoC restarts, except when waking from deep sleep. When waking from deep sleep, the values which were present before going to sleep are kept.
- Wake stub code is a part of the main esp-idf app. During normal running of esp-idf, functions can call the wake stub functions or access RTC memory. It is as if these were regular parts of the app.

4.7.2 Implementing A Stub

The wake stub in esp-idf is called `esp_wake_deep_sleep()`. This function runs whenever the SoC wakes from deep sleep. There is a default version of this function provided in esp-idf, but the default function is weak-linked so if your app contains a function named `esp_wake_deep_sleep()` then this will override the default.

If supplying a custom wake stub, the first thing it does should be to call `esp_default_wake_deep_sleep()`.

It is not necessary to implement `esp_wake_deep_sleep()` in your app in order to use deep sleep. It is only necessary if you want to have special behaviour immediately on wake.

If you want to swap between different deep sleep stubs at runtime, it is also possible to do this by calling the `esp_set_deep_sleep_wake_stub()` function. This is not necessary if you only use the default `esp_wake_deep_sleep()` function.

All of these functions are declared in the `esp_sleep.h` header under components/esp32c3.

4.7.3 Loading Code Into RTC Memory

Wake stub code must be resident in RTC Fast Memory. This can be done in one of two ways.

The first way is to use the `RTC_IRAM_ATTR` attribute to place a function into RTC memory:

```
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The second way is to place the function into any source file whose name starts with `rtc_wake_stub`. Files names `rtc_wake_stub*` have their contents automatically put into RTC memory by the linker.

The first way is simpler for very short and simple code, or for source files where you want to mix "normal" and "RTC" code. The second way is simpler when you want to write longer pieces of code for RTC memory.

4.7.4 Loading Data Into RTC Memory

Data used by stub code must be resident in RTC memory.

Specifying this data can be done in one of two ways:

The first way is to use the `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` to specify any data (writeable or read-only, respectively) which should be loaded into RTC memory:

```
RTC_DATA_ATTR int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count %d\n";
    esp_rom_printf(fmt_str, wake_count++);
}
```

The attributes `RTC_FAST_ATTR` and `RTC_SLOW_ATTR` can be used to specify data that will be force placed into RTC_FAST and RTC_SLOW memory respectively, but for ESP32-C3 there is only RTC fast memory, so both attributes will map to this region.

Unfortunately, any string constants used in this way must be declared as arrays and marked with RTC_RODATA_ATTR, as shown in the example above.

The second way is to place the data into any source file whose name starts with `rtc_wake_stub`.

For example, the equivalent example in `rtc_wake_stub_counter.c`:

```
int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    esp_rom_printf("Wake count %d\n", wake_count++);
}
```

The second way is a better option if you need to use strings, or write other more complex code.

To reduce wake-up time use the *CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP* Kconfig option, see more information in *Fast boot from Deep Sleep*.

4.7.5 CRC Check For Wake Stubs

During deep sleep, all RTC Fast memory areas will be validated with CRC. When ESP32-C3 wakes up from deep sleep, the RTC fast memory will be validated with CRC again. If the validation passes, the wake stubs code will be executed. Otherwise, the normal initialization, bootloader and esp-idf codes will be executed.

备注： When the *CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP* option is enabled, all the RTC fast memory except the wake stubs area is added to the heap.

4.8 错误处理

4.8.1 概述

在应用程序开发中，及时发现并处理在运行时期的错误，对于保证应用程序的健壮性非常重要。常见的运行时错误有如下几种：

- 可恢复的错误：
  - 通过函数的返回值（错误码）表示的错误
  - 使用 `throw` 关键字抛出的 C++ 异常
- 不可恢复（严重）的错误：
  - 断言失败（使用 `assert` 宏或者其它类似方法，可参考*Assertions*）或者直接调用 `abort()` 函数造成的错误
  - CPU 异常：访问受保护的内存区域、非法指令等
  - 系统级检查：看门狗超时、缓存访问错误、堆栈溢出、堆栈粉碎、堆栈损坏等

本文将介绍 ESP-IDF 中针对可恢复错误的错误处理机制，并提供一些常见错误的处理模式。

关于如何处理不可恢复的错误，请查阅不可恢复错误。

4.8.2 错误码

ESP-IDF 中大多数函数会返回*esp_err_t* 类型的错误码，*esp_err_t* 实质上是带符号的整型，`ESP_OK` 代表成功（没有错误），具体值定义为 0。

在 ESP-IDF 中，许多头文件都会使用预处理器，定义可能出现的错误代码。这些错误代码通常均以 `ESP_ERR_` 前缀开头，一些常见错误（比如内存不足、超时、无效参数等）的错误代码则已经在 `esp_err.h` 文件中定义好了。此外，ESP-IDF 中的各种组件 (component) 也都可以针对具体情况，自行定义更多错误代码。

完整错误代码列表，请见错误代码参考 中查看完整的错误列表。

4.8.3 错误码到错误消息

错误代码并不直观，因此 ESP-IDF 还可以使用*esp_err_to_name()* 或者*esp_err_to_name_r()* 函数，将错误代码转换为具体的错误消息。例如，我们可以向*esp_err_to_name()* 函数传递错误代码 `0x101`，可以得到返回字符串 “ESP_ERR_NO_MEM”。这样一来，我们可以在日志中输出更加直观的错误消息，而不是简单的错误码，从而帮助研发人员更快理解发生了何种错误。

此外，如果出现找不到匹配的 `ESP_ERR_` 值的情况，函数*esp_err_to_name_r()* 则会尝试将错误码作为一种 标准 POSIX 错误代码 进行解释。具体过程为：POSIX 错误代码（例如 `ENOENT`，`ENOMEM`）定义在 `errno.h` 文件中，可以通过 `errno` 变量获得，进而调用 `strerror_r` 函数实现。在 ESP-IDF 中，`errno` 是一个基于线程的局部变量，即每个 FreeRTOS 任务都有自己的 `errno` 副本，通过函数修改 `errno` 也只会作用于当前任务中的 `errno` 变量值。

该功能（即在无法匹配 ESP_ERR_ 值时，尝试用标准 POSIX 解释错误码）默认启用。用户也可以禁用该功能，从而减小应用程序的二进制文件大小，详情可见*CONFIG_ESP_ERR_TO_NAME_LOOKUP*。注意，该功能对禁用并不影响*esp_err_to_name()* 和*esp_err_to_name_r()* 函数的定义，用户仍可调用这两个函数转化错误码。在这种情况下，*esp_err_to_name()* 函数在遇到无法匹配错误码的情况会返回 UNKNOWN ERROR，而*esp_err_to_name_r()* 函数会返回 Unknown error 0xXXXX(YYYYY)，其中 0xXXXX 和 YYYYY 分别代表错误代码的十六进制和十进制表示。

4.8.4 ESP_ERROR_CHECK 宏

宏*ESP_ERROR_CHECK* 的功能和 assert 类似，不同之处在于：这个宏会检查*esp_err_t* 的值，而非判断 bool 条件。如果传给*ESP_ERROR_CHECK* 的参数不等于*ESP_OK*，则会在控制台上打印错误消息，然后调用 abort() 函数。

错误消息通常如下所示:

```
ESP_ERROR_CHECK failed: esp_err_t 0x107 (ESP_ERR_TIMEOUT) at 0x400d1fdf

file: "/Users/user/esp/example/main/main.c" line 20
func: app_main
expression: sdmmc_card_init(host, &card)

Backtrace: 0x40086e7c:0x3ffb4ff0 0x40087328:0x3ffb5010 0x400d1fdf:0x3ffb5030␣
↪0x400d0816:0x3ffb5050
```

备注： 如果使用*IDF 监视器*，则最后一行回溯结果中的地址将会被自动解析为相应的文件名和行号。

- 第一行打印错误代码的十六进制表示，及该错误在源代码中的标识符。这个标识符取决于*CONFIG_ESP_ERR_TO_NAME_LOOKUP* 选项的设定。最后，第一行还会打印程序中该错误发生的具体位置。
- 下面几行显示了程序中调用*ESP_ERROR_CHECK* 宏的具体位置，以及传递给该宏的参数。
- 最后一行打印回溯结果。对于所有不可恢复错误，这里在应急处理程序中打印的内容都是一样的。更多有关回溯结果的详细信息，请参阅*不可恢复错误* 。

4.8.5 ESP_ERROR_CHECK_WITHOUT_ABORT 宏

宏*ESP_ERROR_CHECK_WITHOUT_ABORT* 的功能和 ESP_ERROR_CHECK 类似, 不同之处在于它不会调用 abort().

4.8.6 ESP_RETURN_ON_ERROR 宏

宏*ESP_RETURN_ON_ERROR* 用于错误码检查, 如果错误码不等于*ESP_OK*, 该宏会打印错误信息，并使原函数立刻返回。

4.8.7 ESP_GOTO_ON_ERROR 宏

宏*ESP_GOTO_ON_ERROR* 用于错误码检查, 如果错误码不等于*ESP_OK*, 该宏会打印错误信息，将局部变量 *ret* 赋值为该错误码, 并使原函数跳转至给定的 *goto_tag*.

4.8.8 ESP_RETURN_ON_FALSE 宏

宏*ESP_RETURN_ON_FALSE* 用于条件检查, 如果给定条件不等于 *true*, 该宏会打印错误信息，并使原函数立刻返回，返回值为给定的 *err_code*.

4.8.9 ESP_GOTO_ON_FALSE 宏

宏*ESP_GOTO_ON_FALSE* 用于条件检查, 如果给定条件不等于 *true*, 该宏会打印错误信息，将局部变量 *ret* 赋值为给定的 *err_code*, 并使原函数跳转至给定的 *goto_tag*.

4.8.10 CHECK 宏使用示例

示例:

```
static const char* TAG = "Test";

esp_err_t test_func(void)
{
    esp_err_t ret = ESP_OK;

    ESP_ERROR_CHECK(x);                                          // err message␣
↪printed if `x` is not `ESP_OK`, and then `abort()`.
    ESP_ERROR_CHECK_WITHOUT_ABORT(x);                            // err message␣
↪printed if `x` is not `ESP_OK`, without `abort()`.
    ESP_RETURN_ON_ERROR(x, TAG, "fail reason 1");                // err message␣
↪printed if `x` is not `ESP_OK`, and then function returns with code `x`.
    ESP_GOTO_ON_ERROR(x, err, TAG, "fail reason 2");             // err message␣
↪printed if `x` is not `ESP_OK`, `ret` is set to `x`, and then jumps to `err`.
    ESP_RETURN_ON_FALSE(a, err_code, TAG, "fail reason 3");      // err message␣
↪printed if `a` is not `true`, and then function returns with code `err_code`.
    ESP_GOTO_ON_FALSE(a, err_code, err, TAG, "fail reason 4");   // err message␣
↪printed if `a` is not `true`, `ret` is set to `err_code`, and then jumps to␣
↪`err`.

err:
    // clean up
    return ret;
}
```

备注: 如果 Kconfig 中的*CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT* 选项被打开, CHECK 宏将不会打印错误信息，其他功能不变。

ESP_RETURN_xx 和 ESP_GOTO_xx 宏不可以在中断服务程序里被调用。如需要在中断中使用类似功能，请使用 xx_ISR 宏，如 ESP_RETURN_ON_ERROR_ISR 等。

4.8.11 错误处理模式

1. 尝试恢复。根据具体情况不同，我们具体可以:
   - 在一段时间后，重新调用该函数;
   - 尝试删除该驱动，然后重新进行 “初始化”;
   - 采用其他带外机制，修改导致错误发生的条件（例如，对一直没有响应的外设进行复位等）。

   示例:

```
esp_err_t err;
do {
    err = sdio_slave_send_queue(addr, len, arg, timeout);
    // 如果发送队列已满就不断重试
} while (err == ESP_ERR_TIMEOUT);
if (err != ESP_OK) {
    // 处理其他错误
}
```

2. 将错误传递回调用程序。在某些中间件组件中，采用此类处理模式代表函数必须以相同的错误码退出，这样才能确保所有分配的资源都能得到释放。
   示例:

```
sdmmc_card_t* card = calloc(1, sizeof(sdmmc_card_t));
if (card == NULL) {
    return ESP_ERR_NO_MEM;
}
esp_err_t err = sdmmc_card_init(host, &card);
if (err != ESP_OK) {
    // 释放内存
    free(card);
    // 将错误码传递给上层（例如通知用户）
    // 或者，应用程序可以自定义错误代码并返回
    return err;
}
```

3. 转为不可恢复错误，比如使用 ESP_ERROR_CHECK。详情请见*ESP_ERROR_CHECK 宏* 章节。
   对于中间件组件而言，通常并不希望在发生错误时中止应用程序。不过，有时在应用程序级别，这种做法是可以接受的。
   在 ESP-IDF 的示例代码中，很多都会使用 ESP_ERROR_CHECK 来处理各种 API 引发的错误，虽然这不是应用程序的最佳做法，但可以让示例代码看起来更加简洁。
   示例:

```
ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));
```

4.8.12 C++ 异常

默认情况下，ESP-IDF 会禁用对 C++ 异常的支持，但是可以通过*CONFIG_COMPILER_CXX_EXCEPTIONS* 选项启用。

通常情况下，启用异常处理会让应用程序的二进制文件增加几 KB。此外，启用该功能时还应为异常事故池预留一定内存。当应用程序无法从堆中分配异常对象时，就可以使用这个池中的内存。该内存池的大小可以通过*CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE* 来设定。

如果 C++ 程序抛出了异常，但是程序中并没有 `catch` 代码块来捕获该异常，那么程序的运行就会被 `abort` 函数中止，然后打印回溯信息。有关回溯的更多信息，请参阅 不可恢复错误 。

C++ 异常处理示例，请参考 cxx/exceptions。

4.9 ESP-BLE-MESH

4.9.1 概述

蓝牙 mesh 网络实现了无线设备的“多对多”通讯，其可用于建立包含大量设备的网络。

设备能将数据中继至不在初始设备无线电覆盖范围内的其他设备。这样，mesh 网络就能够覆盖非常大的物理区域，并且囊括大量设备。Mesh 网络非常适用于楼宇自动化、传感器网络和其他物联网解决方案，这些情景下数以十计、百计、千计的设备需要与其他设备进行安全可靠的通信。

蓝牙 mesh 并非无线通信技术，而是一种网络技术。该技术基于一种无线通讯协议栈，即低功耗蓝牙。

ESP-BLE-MESH 基于 Zephyr 蓝牙 Mesh 协议栈的顶端，其实现支持设备配网和节点控制，同时也实现了代理、中继、低功耗和朋友等节点功能。

有关 ESP-BLE-MESH 架构实现的信息，请参见*ESP-BLE-MESH 架构*；有关各自 API 的信息，请参见*ESP-BLE-MESH API Reference*。

ESP-BLE-MESH 的实现和认证基于最新的 Mesh Profile v1.0.1 。有关 ESP-BLE-MESH 认证的细节，请参考 此处 。

备注： 如果您在寻找 ESP32 基于 Wi-Fi 的 mesh 方案，请查阅乐鑫的另一款产品 ESP-WIFI-MESH。更多相关信息及文档，请参见*ESP-WIFI-MESH*。

4.9.2 ESP-BLE-MESH 快速入门

该章节旨在帮助您基于乐鑫的 ESP32 开发板搭建 ESP-BLE-MESH 网络。

我们将会展示如何搭建并运行一个包含 3 个节点的小型 ESP-BLE-MESH 网络，其中包含设备配网、节点配置，以及向特定节点上的 Generic OnOff Server Model 发送开关灯命令。

如果您是第一次接触 ESP-IDF，请参见 esp-idf 快速入门 来设置开发环境，编译、烧写和运行示例应用程序。

硬件及软件准备

硬件：

- 3 块 ESP32 开发板，请参见*options*。
- 连接开发板的 USB 线。
- ESP-IDF 开发环境。
- 运行 Android 或 iOS 的手机或平板。

软件：

- 下载至 ESP32 开发板的示例应用 bluetooth/esp_ble_mesh/ble_mesh_node。
- 手机 App: **nRF Mesh** Android 或 iOS 版本。除 nRF Mesh 的 App，以下 App 也支持 ESP-BLE-MESH：
  - EspBleMesh Android App
  - Silicon Labs Android 或 iOS App

安装

以下详细步骤可指导您完成安装过程。

步骤 1. 检查硬件 ESP32-DevKitC 和 ESP-WROVER-KIT 开发板均支持 ESP-BLE-MESH。您可以通过 menuconfig: `idf.py menuconfig` > `Example Configuration` > `Board selection for ESP-BLE-MESH` 选择特定的开发板。

备注： 如果您打算使用 ESP32-DevKitC 开发板，请将 RGB 灯焊接至 GPIO 管脚 25、26 和 27。

步骤 2. 配置软件 进入 bluetooth/esp_ble_mesh/ble_mesh_node 示例文件夹，运行 `idf.py menuconfig` 选择所使用的开发板，然后运行 `idf.py build` 编译示例。

步骤 3. 下载应用

bluetooth/esp_ble_mesh/ble_mesh_node 示例编译成功后，用户可以运行 `idf.py flash` 将编译生成的二进制文件下载至 3 块开发板中。

当开发板上电后，RGB 灯会变为 **绿色**。

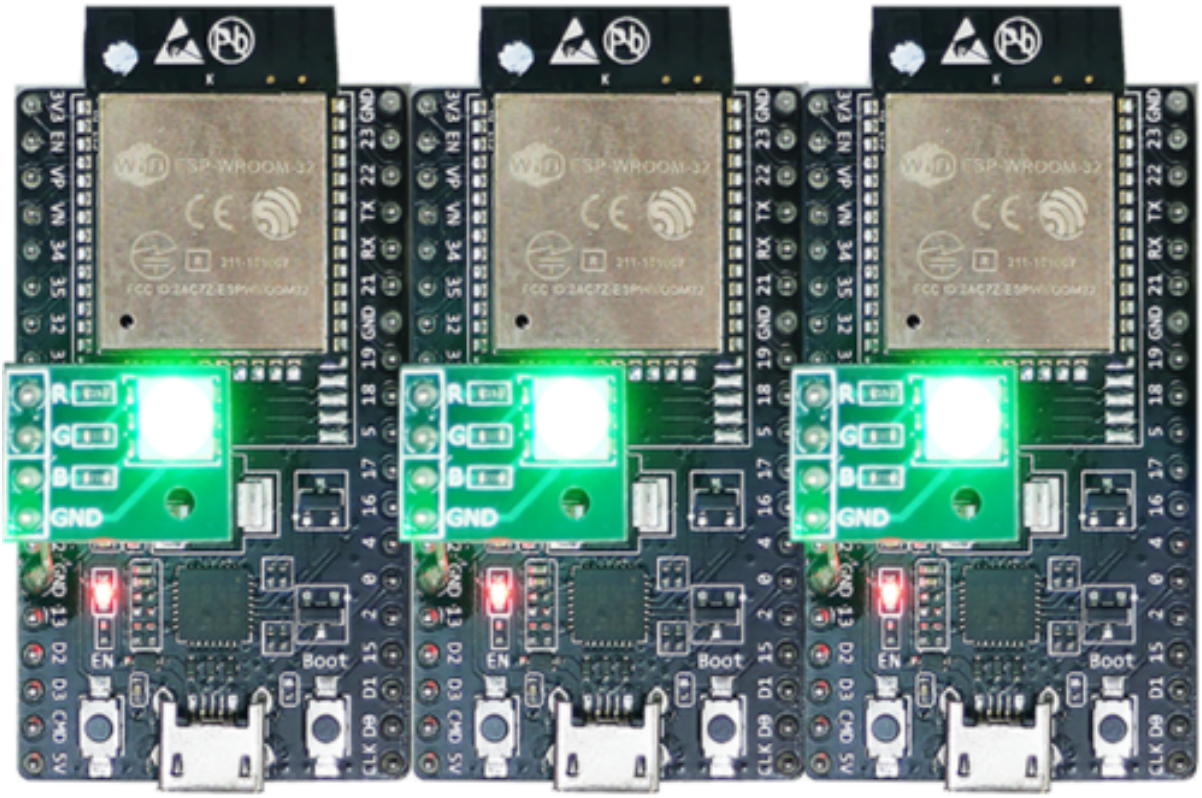

图 7: ESP-BLE-MESH 设备上电

步骤 4. 设备配网 在该章节中，我们将使用 **nRF Mesh Android** App 演示如何配网设备。用户也可以从 App Store 下载其 iOS 版本。

4.1 扫描 (scanner) 扫描 (Scanner) 是 nRF Mesh App 搜索蓝牙通信范围内未配网设备的功能。打开 App，点击底部的扫描按钮 **Scanner**。App 就会开始扫描设备，很快，我们便可在屏幕上看到 3 个未配网设备。

4.2 识别 用户可以选择任何一个未配网设备，此时 App 会尝试和该设备建立连接。连接成功（有时可能需要尝试多次），且发现相应的 ESP-BLE-MESH GATT 服务后，用户可以在屏幕中看到识别按钮 **IDENTIFY**。IDENTIFY 操作告诉用户哪个设备将被配网。

备注： IDENTIFY 需要设备侧的支持，然后才能用来识别当前正在配网的设备。当前如果点击识别按钮 **IDENTIFY**，除了串口输出的 log，在当前的 example 中设备侧不会有其他现象。

点击识别按钮 **IDENTIFY** 后，用户可以看到配网按钮 **PROVISION**。

4.3 配网 点击配网按钮 **PROVISION**，App 会开始配网设备。当设备配网成功后，开发板上的 RGB 灯会熄灭，此时 App 会执行以下几个步骤：

1. 和该节点（设备配网后成为节点）断开连接
2. 尝试和该节点重新建立连接
3. 连接成功并且发现了相应的 ESP-BLE-MESH GATT 服务
4. 获取节点的 Composition Data 并且给该节点添加 AppKey

当以上所有的步骤完成后，节点初始配置完成. 此时点击 **OK**，用户可以看见节点的单播地址分配成功，并且其 Composition Data 也被成功解析.

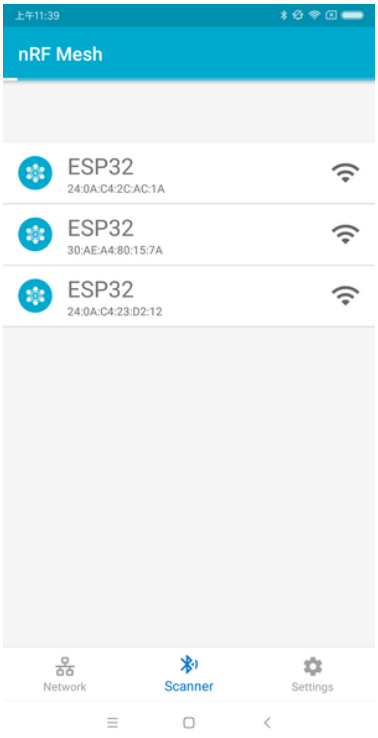

图 8: nRF Mesh - 扫描

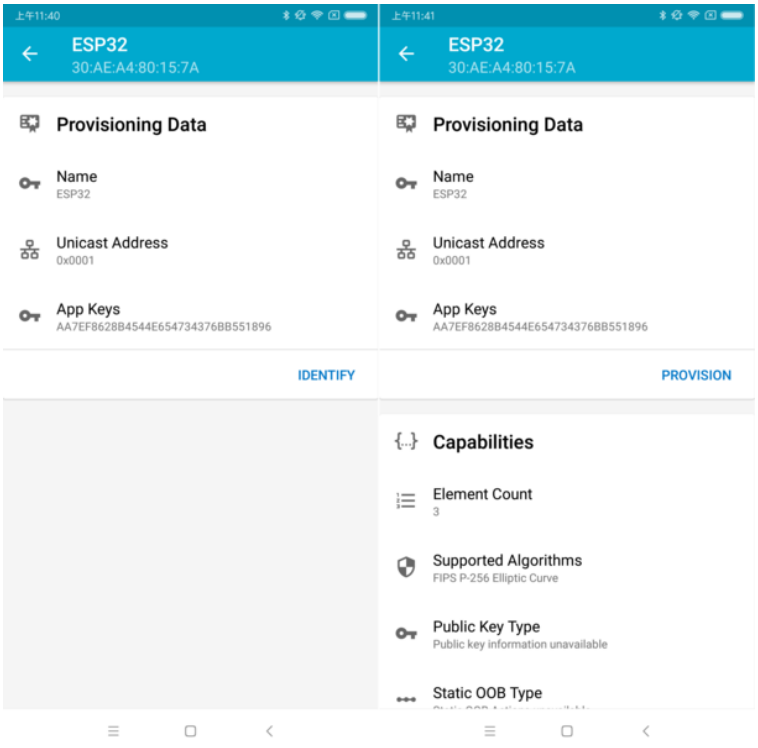

图 9: nRF Mesh - 识别 - 配网

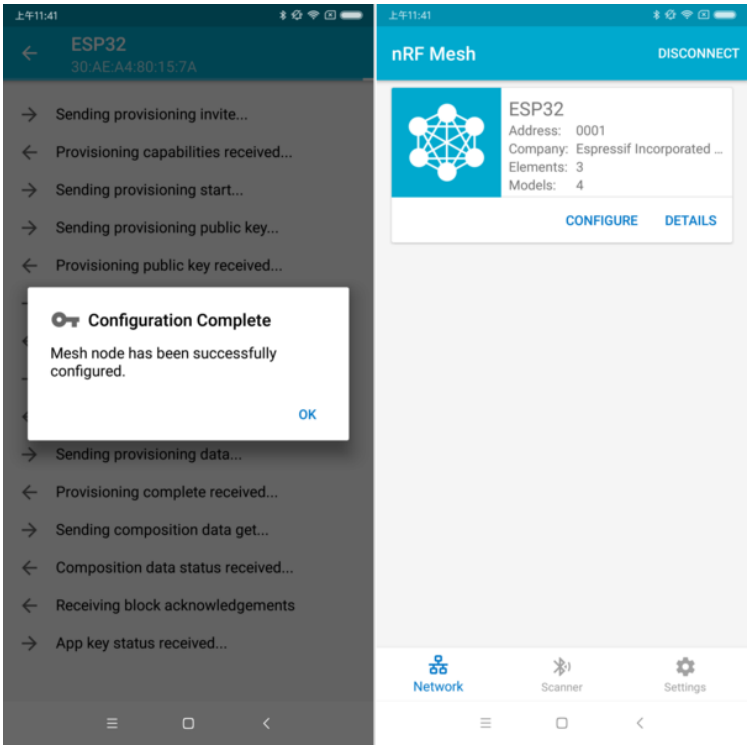

图 10: nRF Mesh - 配置完成

有时在上述步骤 2 中，App 可能与节点连接失败。这种情况下，用户点击 **OK** 后可以看到，节点只有单播地址被成功分配，Composition data 并没有被成功获取。此时用户需要点击右上角的连接按钮 **CONNECT**，屏幕上会显示原先配网的节点，用户需要选择该节点并与其建立连接。

连接成功后，App 会显示获取 Composition Data 以及添加 AppKey 的按钮。

如果该设备是 App 配网的第二个或第三个节点，此时点击连接按钮 **CONNECT** 后，用户可以在屏幕中看到 2 个或 3 个节点。这种情况下，用户可以选择其中的任何一个节点建立连接，连接成功后可以返回至主界面选择需要配置的节点。

这里给出了一个 3 个节点的示例。

- 左侧图片表示第三个设备成功配网，但是 App 没有和其成功建立连接。当 App 尝试去重新连接第三个节点时，界面上会出现 3 个节点。
- 右侧图片表示和节点成功建立连接后，App 显示这 3 个节点的信息。用户可以看到 App 已经获取了第一个和第二个节点的 Composition Data，但是对于第三个节点，只有单播地址被成功分配而节点的 Composition Data 未知。

4.4 配置 当成功配网和初始配置完成后，用户可以配置节点的其余信息，例如将 AppKey 绑定至每个元素 (element) 的每个模型 (model) 中、设置模型的发布信息等。

下图展示了如何将 AppKey 绑定至 Primary Element 中的 Generic OnOff Server Model 上。

备注： 用户不需要将 AppKey 绑定至 Configuration Server Model，因为该模型使用 DevKey 在 Upper Transport Layer 中对消息进行加密。

Step 5. 运行网络 当 3 个元素中的 Generic OnOff Server Models 均成功绑定 AppKey 后，用户可以使用 App 开关 RBG 灯。

在 bluetooth/esp_ble_mesh/ble_mesh_node 示例中，第一个 Generic OnOff Server Model 用来控制 **红色**，第二个用来控制 **绿色**，同时第三个用来控制 **蓝色**.

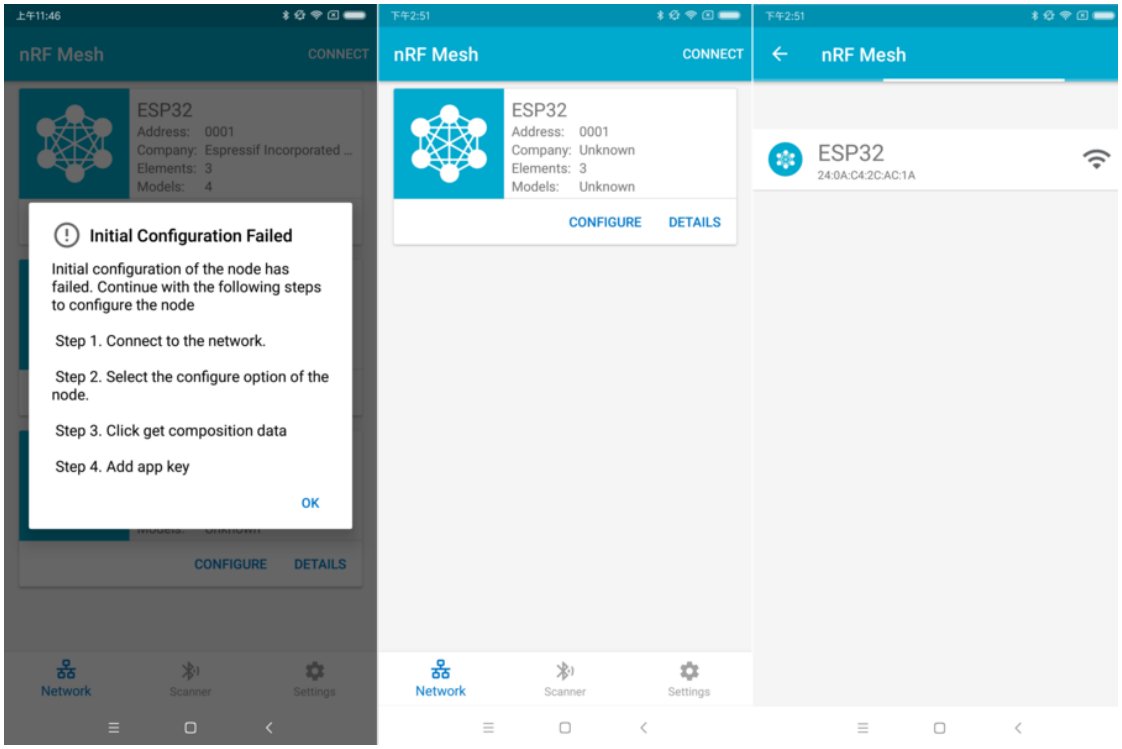

图 11: nRF Mesh - 初始配置失败

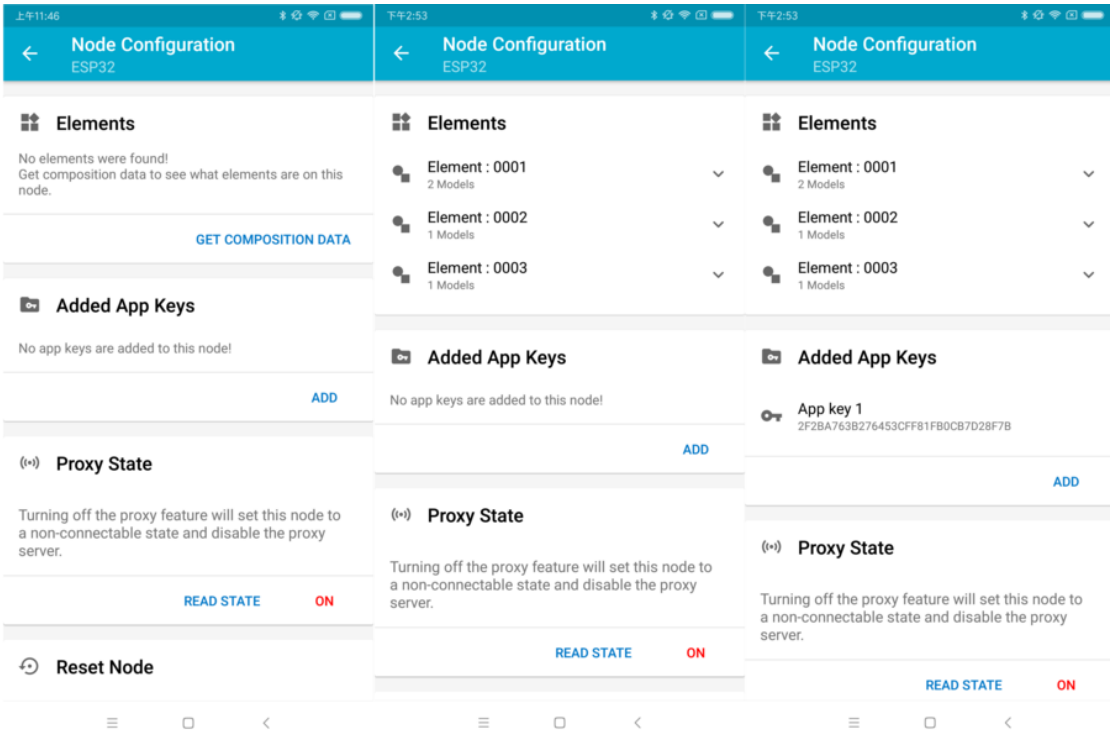

图 12: nRF Mesh - 重连 - 初始配置

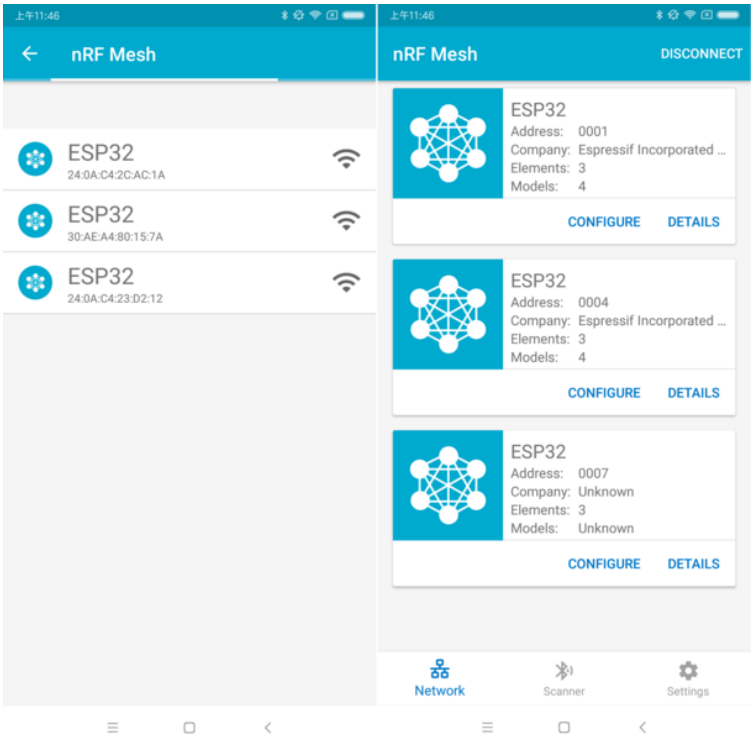

图 13: nRF Mesh - 重连 - 3 个节点

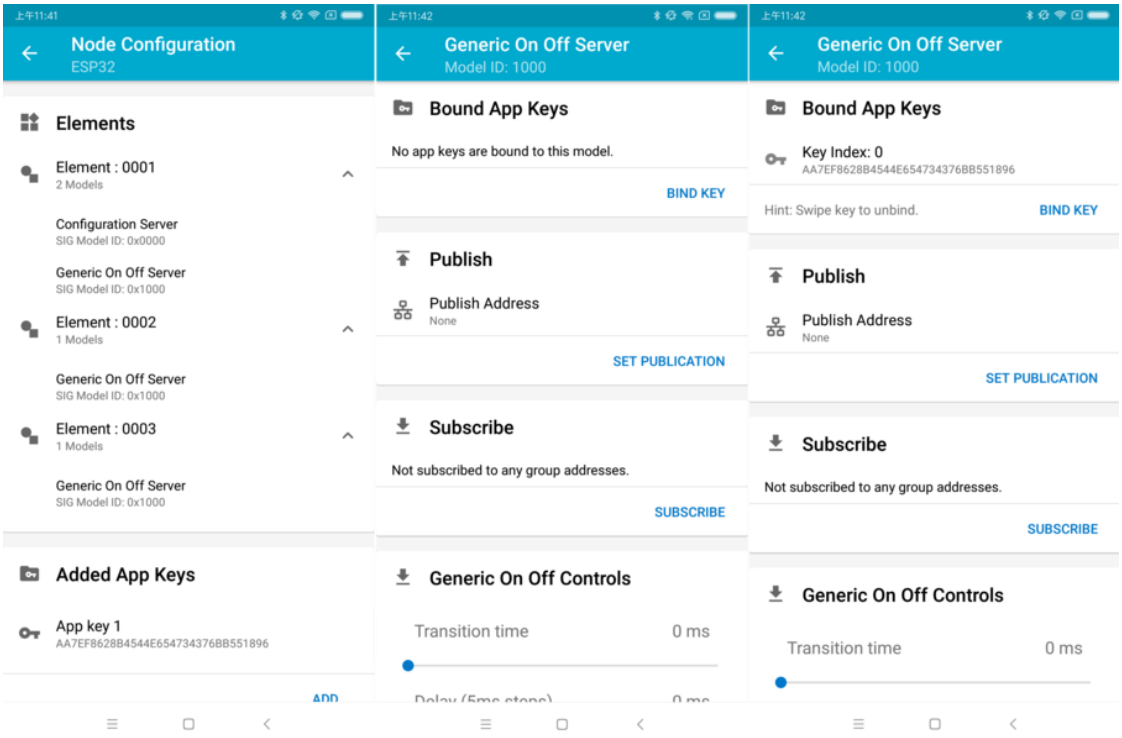

图 14: nRF Mesh - Model Bind AppKey

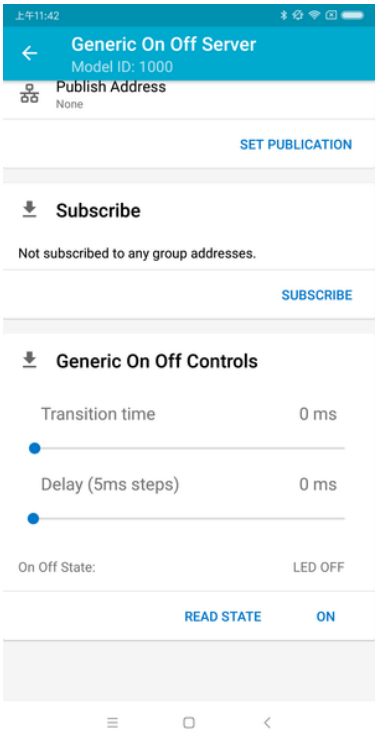

图 15: nRF Mesh - 通用开关控制

下图展示了打开了不同色灯的开发板。

备注： 对于 **nRF Mesh** iOS App [version 1.0.4]，当节点包含超过一个元素时，App 表现不正确。如果用户尝试打开或者关闭第 2 个或第 3 个 Generic OnOff Server Model，App 会将相应的消息发送至第 1 个 Generic OnOff Server Model。

4.9.3 ESP-BLE-MESH 示例

- ESP-BLE-MESH 节点 - 展示了将 ESP-BLE-MESH 作为拥有 Configuration Server model 和 Generic OnOff Server model 的节点设备的用法。然后，ESP-BLE-MESH Provisioner 可以配网设备，控制表示开/关状态的 RGB 灯，示例请见 example code 。
- ESP-BLE-MESH 客户端模型 - 展示了 Generic OnOff Client model 如何在节点内工作。节点拥有 Configuration Server model、Generic OnOff Server model 和 Generic OnOff Client model，示例请见：example code 。
- ESP-BLE-MESH Provisioner - 展示了设备如何充当 ESP-BLE-MESH Provisioner 以配网设备。Provisioner 拥有 Configuration Server model、Configuration Client model 和 Generic OnOff Client model，示例请见 example code 。
- ESP-BLE-MESH 快速配网 - Client 和 Server - 该示例用于演示快速配网。配网 100 个设备费时不超过 60 秒，示例请见：example client code 和 example server code 。
- Wi-Fi 和 ESP-BLE-MESH 共存 - 该示例用于演示 Wi-Fi 和 ESP-BLE-MESH 共存的功能。简而言之，用户可在运行 ESP-BLE-MESH 时使用 Wi-Fi，示例请见 example code 。
- ESP-BLE-MESH 节点控制台 - 该演示实现 ESP-BLE-MESH 节点的基本功能。在演示中，Provisioner and Node 可以扫描、验证节点，节点可以回复 Provisioner 的获取/设置消息，示例请见：example code 。

ESP-BLE-MESH Feature List

Supported Features

Mesh Core

- **Provisioning: Node Role**
  - PB-ADV and PB-GATT
  - OOB Authentication
- **Provisioning: Provisioner Role**
  - PB-ADV and PB-GATT
  - OOB Authentication

- **Networking**
  - Relay
  - Segmentation and Reassembly
  - Key Refresh Procedure
  - IV Update Procedure
  - Friend
  - Low Power
  - Proxy Server
  - Proxy Client
- **Multiple Client Models Run Simultaneously**
  - Support multiple client models send packets to different nodes simultaneously
  - No blocking between client model and server model
- **NVS Storing**
  - Store provisioning and configuration information of ESP-BLE-MESH Node

Mesh Models

- **Foundation models**
  - Configuration Server model
  - Configuration Client model
  - Health Server model
  - Health Client model
- **Generic client models**
  - Generic OnOff Client
  - Generic Level Client
  - Generic Default Transition Time Client
  - Generic Power OnOff Client
  - Generic Power Level Client
  - Generic Battery Client
  - Generic Location Client
  - Generic Property Client
- **Sensor client models**
  - Sensor Client
- **Time and Scenes client models**
  - Time Client
  - Scene Client
  - Scheduler Client
- **Lighting client models**
  - Light Lightness Client
  - Light CTL Client
  - Light HSL Client
  - Light xyL Client
  - Light LC Client
- **Generic server models**
  - Generic OnOff Server
  - Generic Level Server
  - Generic Default Transition Time Server
  - Generic Power OnOff Server
  - Generic Power OnOff Setup Server
  - Generic Power Level Server
  - Generic Power Level Setup Server
  - Generic Battery Server
  - Generic Location Server
  - Generic Location Setup Server
  - Generic User Property Server
  - Generic Admin Property Server
  - Generic Manufacturer Property Server
  - Generic Client Property Server

- **Sensor server models**
  - Sensor Server
  - Sensor Setup Server
- **Time and Scenes server models**
  - Time Server
  - Time Setup Server
  - Scene Server
  - Scene Setup Server
  - Scheduler Server
  - Scheduler Setup Server
- **Lighting server models**
  - Light Lightness Server
  - Light Lightness Setup Server
  - Light CTL Server
  - Light CTL Temperature Server
  - Light CTL Setup Server
  - Light HSL Server
  - Light HSL Hue Server
  - Light HSL Saturation Server
  - Light HSL Setup Server
  - Light xyL Server
  - Light xyL Setup Server
  - Light LC Server
  - Light LC Setup Server

ESP-BLE-MESH 架构

本文档将介绍 ESP-BLE-MESH 的架构概览、架构实现和辅助程序。

- ESP-BLE-MESH 架构概览
  - 描述了 ESP-BLE-MESH 架构的 5 大部分及每个部分的功能。
- ESP-BLE-MESH 架构实现
  - 描述了 ESP-BLE-MESH 文件的基本功能、文件与 ESP-BLE-MESH 架构的对应关系及文件间调用的接口。
- ESP-BLE-MESH 辅助程序
  - 描述了 ESP-BLE-MESH 的辅助程序，比如 Mesh 网络管理，Mesh 特性等。

1. ESP-BLE-MESH 架构概览 目前，ESP-BLE-MESH 已经实现了 Mesh Profile 的大多数功能及 Mesh Model 规范中定义的所有 Client Model。未支持的功能/模型尚在开发中，会尽快提供。ESP-BLE-MESH 已通过 Bluetooth SIG 蓝牙技术联盟的 认证。

ESP-BLE-MESH 架构主要由以下 5 大部分组成：

- `Mesh 协议栈`
  - `Mesh Networking` 负责 ESP-BLE-MESH 节点的网络消息处理等。
  - `Mesh Provisioning` 负责 ESP-BLE-MESH 设备的启动配置流程。
  - `Mesh Models` 负责实现 SIG 定义的模型。
- `网络管理`
  - 负责实现网络管理程序，包括节点删除程序、网络索引 (IV Index) 恢复程序等。
- `特性`
  - 包括 ESP-BLE-MESH 特性，如低功耗特性、好友特性、中继特性等。
- `Mesh 承载层`
  - 包括 `广播承载层` 和 `GATT 承载层`。承载层对于 ESP-BLE-MESH 协议栈至关重要，因为协议栈基于蓝牙低功耗技术构建而成，其必须利用承载层通过 BLE 广播通道和连接通道进行数据传输。
- `应用程序`
  - 基于 ESP-BLE-MESH 协议栈和 `Mesh Models`。
  - 通过调用 API 和处理事件，`Applications` 实现了与 ESP-BLE-MESH 协议栈中的 `Mesh Networking` 和 `Mesh Provisioning` 的交互，也实现了与 `Mesh Models` 中一系列模型的交互。

1.1 Mesh 协议栈

1.1.1 Mesh Networking 协议栈架构中的 `Mesh Networking` 实现了如下功能：

- Mesh 网络中节点间的通讯。
- Mesh 网络中消息的加解密。
- Mesh 网络资源的管理，如网络秘钥 (NetKey)、网络索引等。
- Mesh 网络消息的分包与重组。
- 消息在不同模型间的模型映射。
- 更多功能，请参见*ESP-BLE-MESH Feature List*。

`Mesh Networking` 功能的实现是基于层级结构的。每一层的功能如表 1.1 所示：

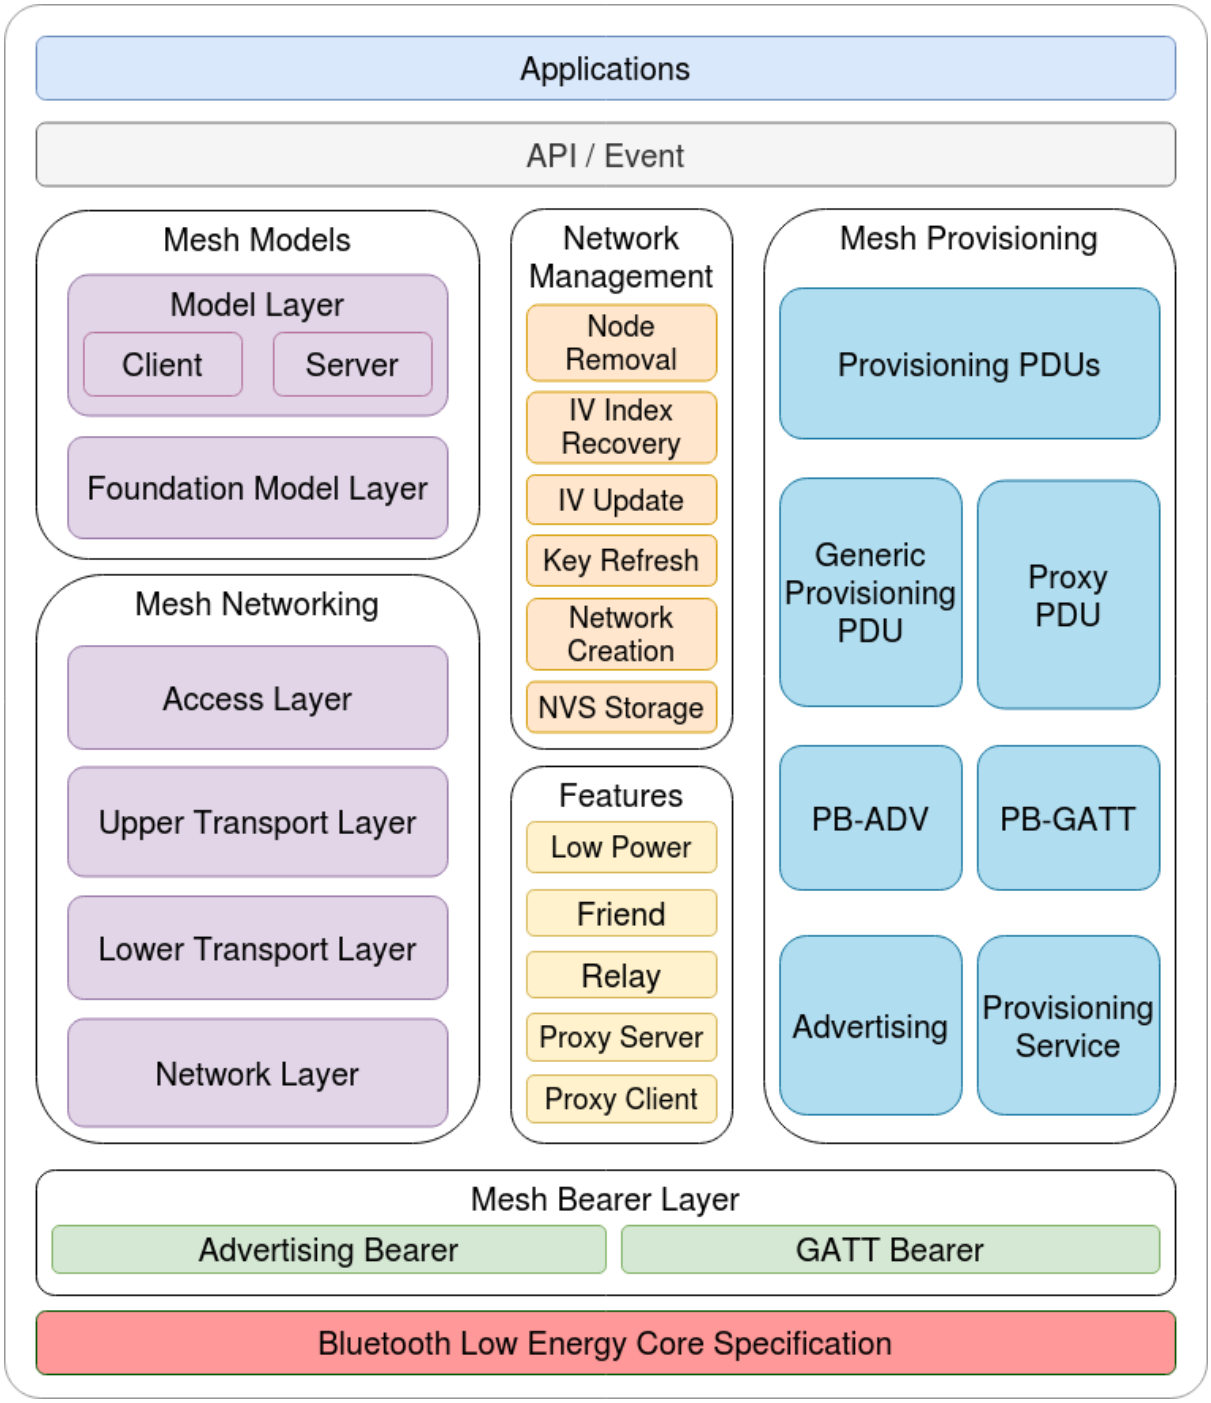

图 17: 图 1.1 ESP-BLE-MESH 架构图

表 1: 表 1.1 Mesh Networking 框架描述

层级	功能
接入层	接入层定义应用程序数据的格式，还对上层传输层对数据包的加密和解密进行定义和控制。
上层传输层	上层传输层对接入层进出的应用数据进行加密、解密和认证，同时也处理被称为“传输控制消息”的特殊消息，这种消息包括了与“友谊”和心跳包相关的消息。
底层传输层	底层传输层处理 PDU 的分包和重组。
网络层	网络层定义网络消息的地址类型和格式，实现设备的中继功能。

1.1.2 Mesh Provisioning 协议栈架构中的 `Mesh Provisioning` 实现了如下功能：

- 对未配网设备的配网。
- Mesh 网络资源的分配 (单播地址、网络索引和网络秘钥)。
- 配网期间对 4 种验证方法的支持。
- 更多功能，请参见*ESP-BLE-MESH Feature List*。

`Mesh Provisioning` 功能的实现是基于层级结构的。每一层的功能如表 1.2 所示：

表 2: 表 1.2 Mesh Provisioning 框架描述

层级	功能
Provisioning PDUs	通过配网协议处理不同层级的 Provisioning PDUs。
Generic Provisioning PDU/Proxy PDU	使用 Generic Provisioning 层或代理协议层将 Provisioning PDU 传输到未配网的设备。
PB-ADV/PB-GATT	这些层级定义了 Provisioning PDUs 作为可分包和重组的消息进行传输的方式。
Advertising/Provisioning Service	Provisioning bearer 定义了会话建立的方式，该方式用来将 Generic Provisioning 层的传输包传送到设备。

1.1.3 Mesh Models 协议栈架构中的 `Mesh Models` 实现了如下功能：

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

每一层的功能如表 1.3 所示：

表 3: 表 1.3 Mesh Models 框架描述

层级	功能
模型层	模型层实现用于标准化典型用户场景操作的模型，包括 Generic Client/Server Models、Sensor Client/Server Models、Time and Scenes Client/Server Models、Lighting Client/Server Models 和若干自定义模型。
基础模型层	基础模型层实现与 ESP-BLE-MESH 网络配置、管理和自我诊断等相关的模型。

1.2 Mesh 网络管理 网络管理实现了如下功能：

- 节点移除程序：用于将节点从网络中移除。
- 网络索引恢复程序：用于恢复节点的网络索引。
- 网络索引更新程序：用于更新节点的网络索引。
- 秘钥更新程序：用于更新节点的网络秘钥、应用秘钥 (AppKey) 等。
- 网络创建程序：用于创建 mesh 网络。
- NVS 存储器：用于存储节点的网络信息。

1.3 Mesh 特性 特性包括以下几项：

- 低功耗特性：用于降低节点的能耗。
- 好友特性：用于为低功耗节点存储消息。
- 中继特性：用于中继/转发节点通过广播承载层收到的网络 PDU.
- Proxy Server/Client 是代理协议中的两个节点角色，其使节点可以通过面向连接的承载层收发 Network PDUs、mesh beacons、代理配置消息和 Provisioning PDU。

1.4 Mesh 承载层 协议栈框架中的 承载层负责 ESP-BLE-MESH 协议栈和低功耗蓝牙核心协议间的数据传输。

承载层可视为是基于蓝牙低功耗核心协议的载体层，其实现了 ESP-BLE-MESH 协议栈数据的接收和传输。

表 4: 表 1.3 Mesh 承载层描述

层级	功能
GATT 承载层	GATT 承载层使用代理协议通过 GATT 连接在两个设备之间发送和接收 `Proxy PDUs`。
广播承载层	使用广播承载层时，必须使用低功耗蓝牙广播通道来发送 mesh 数据包, 数据包中的 AD Type 需要设置为 mesh 数据包的类型。

1.5 Mesh 应用层 协议栈框架图中的 应用层通过调用 ESP-BLE-MESH 协议栈提供的 API 并处理协议栈上报的事件来实现相应的功能，有一些常见应用，比如网关、照明等。

应用层和 `API / 事件`之间的交互

- 应用层调用 API
  - 调用配网相关的 API 进行配网。
  - 调用模型相关的 API 发送消息。
  - 调用设备属性相关的 API 获取设备的本地信息。
- 应用层处理事件
  应用层的设计基于事件设计，事件将参数传输给应用层。事件主要分为两大类。
  - **调用 API 完成的事件**。
    - 比如接收消息的节点。
  - **协议栈主动上报给应用层的事件**。
    - 协议栈主动上报的事件。
    - 模型主动上报的事件。
- 事件通过应用层注册的回调函数进行上报，同时回调函数中也会包含对事件的相应处理。

`API /`事件与 ESP-BLE-MESH 协议栈的交互

- 用户使用的 API 主要调用 “Mesh Networking“、`Mesh Provisioning` 和 `Mesh Models` 提供的函数。
- `API /`事件和协议栈的交互不会跨越协议栈的层级进行操作。比如 API 不会调用 `Network Layer` 相关的函数。

2. ESP-BLE-MESH 架构实现 ESP-BLE-MESH 架构的设计和实现是基于层级和模块的。具体而言，第 2.1 节（Mesh 网络的实现），第 2.2 节（Mesh 配网实现）和第 2.3 节（Mesh 层级实现）基于层级思想，第 2.4 节（网格模型的实现）基于模块思想。

- **层级思想**: 基于层级思想，网络架构根据 Mesh Profile Specification 中指定的层级设计而成。每层都有独特的文件，文件包括该层的 API 等。具体设计如图 2.1 所示。
- **模块思想**: 每个文件实现一个独立的功能，供其它程序调用。

ESP-BLE-MESH 架构采用分层的方式进行设计，数据包的处理所经过的层级顺序是固定的，也就是数据包的处理过程会形成一个 消息流。因此，我们可以从图 2.1 的协议栈接口图中看到消息流。

2.1 Mesh 协议栈的实现

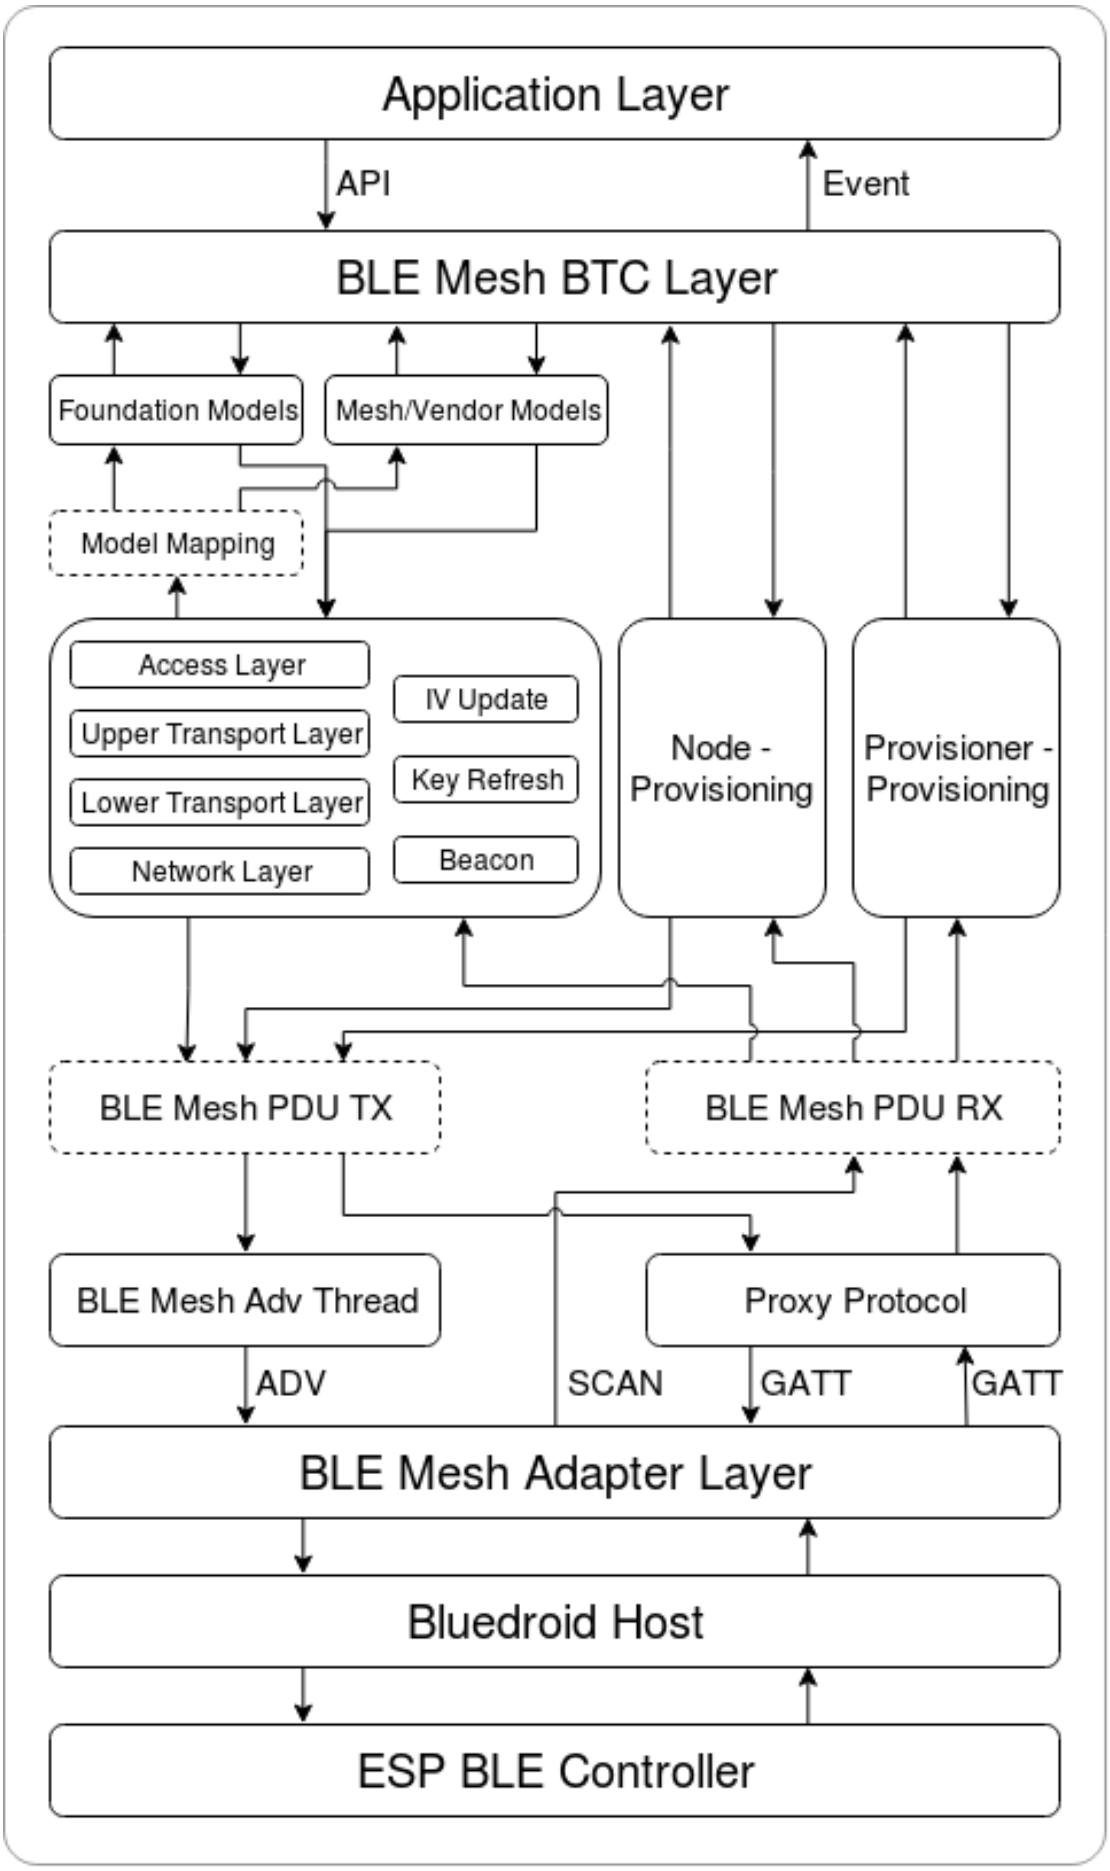

图 18: 图 2.1 ESP-BLE-MESH 架构实现图

2.1.1 Mesh Networking 实现 `Mesh Networking` 中的文件列表和每个文件实现的功能如表 2.1 所示：

表 5: 表 2.1 Mesh Networking 文件描述

文件	功能
access.c	ESP-BLE-MESH 接入层
transport.c	ESP-BLE-MESH 底层/上层传输层
net.c	ESP-BLE-MESH 网络层
adv.c	用于发送 ESP-BLE-MESH 广播包的任务，一个用于处理收到的广播包的回调以及用于分配 adv 缓冲区的 API

2.1.2 Mesh Provisioning 实现 由于 Node/Provisioner 共存的限制，Mesh Provisioning 的实现分为两大模块。实现 Node 启动配置的特定文件如表 2.2 所示：

表 6: 表 2.2 Mesh Provisioning（节点）文件描述

文件	功能
prov.c	ESP-BLE-MESH 节点配网 (PB-ADV & PB-GATT)
proxy_server.c	ESP-BLE-MESH 节点代理服务器相关功能
beacon.c	用于处理 ESP-BLE-MESH Beacon 的 API

实现 Provisioner 配置功能的特定文件如表 2.3 所示：

表 7: 表 2.3 Mesh Provisioning (Provisioner) 文件描述

文件	功能
provisioner_prov.c	ESP-BLE-MESH Provisioner 配置入网 (PB-ADV & PB-GATT)
proxy_client.c	ESP-BLE-MESH 代理客户端相关功能
provisioner_main.c	ESP-BLE-MESH Provisioner 网络相关功能

2.1.3 Mesh Models 实现 Mesh Models 用于实现节点中所包含的模型的具体功能。服务器模型主要用于维护节点状态。客户端模型主要用于获取和修改节点状态。

表 8: Table 2.4 Mesh Models 文件描述

文件	功能
cfg_cli.c	发送 Configuration Client 消息，接收相应应答消息
cfg_srv.c	接收 Configuration Client 消息，发送适当应答消息
health_cli.c	发送 Health Client 消息，接收相应应答消息
health_srv.c	接收 Health Client 消息，发送适当应答消息
client_common.c	ESP-BLE-MESH 模型相关操作
generic_client.c	发送 ESP-BLE-MESH Generic Client 消息，接收相应应答消息
lighting_client.c	发送 ESP-BLE-MESH Lighting Client 消息，接收相应应答消息
sensor_client.c	发送 ESP-BLE-MESH Sensor Client 消息，接收相应应答消息
time_scene_client.c	发送 ESP-BLE-MESH Time Scene Client 消息，接收相应应答消息
generic_server.c	发送 ESP-BLE-MESH Generic Client 消息，发送相应应答消息
lighting_server.c	接收 ESP-BLE-MESH Lighting Client 消息，发送相应应答消息
sensor_server.c	接收 ESP-BLE-MESH Sensor Client 消息，发送相应应答消息
time_scene_server.c	接收 ESP-BLE-MESH Time Scene Client 消息，发送相应应答消息

2.2 Mesh Bearers 实现 Mesh Bearers 在实现时充分考虑了可移植性。当 ESP-BLE-MESH 协议栈需要移植到其它平台时，用户只需要修改 mesh_bearer_adapt.c 就能移植成功。

表 9: 表 2.5 Mesh Bearers 文件描述

文件	功能
mesh_bearer_adapt.c	ESP-BLE-MESH 承载层适配文件。此文件提供用于接收和发送 ESP-BLE-MESH ADV 和 GATT 相关数据包的接口。

备注： mesh_bearer_adapt.c 是对 Mesh 网络框架中 `Advertising Bearer` 和 `GATT Bearer` 的实现。

2.3 Mesh Applications 实现 我们提供了一系列用于客户开发的应用示例，用户可以基于*ESP-BLE-MESH 示例* 开发产品。

1. ESP-BLE-MESH 辅助程序 辅助程序指的是 ESP-BLE-MESH 协议栈中可选的功能。辅助程序的设计通常通过*CONFIG_BLE_MESH* 来实现代码的裁剪。

3.1 特性

- 低功耗
- 好友
- 中继
- 代理客户端/代理服务器

3.2 网络管理

- 节点移除程序
- 网络索引恢复程序
- 网络索引更新程序
- 秘钥更新程序
- 网络创建程序
- NVS 存储器

3.3 辅助程序实现 采用独立模块的设计主要考虑到两个因素：

- 该模块不具备分层实现的条件，其实现可以完全独立，不需要依赖其它模块。
- 模块中的函数会被反复使用到，因此最好设计成独立模块。独立模块如表 3.1 所示：

表 10: 表 3.1 模块文件描述

文件	功能
lpn.c	ESP-BLE-MESH 低功耗功能
friend.c	ESP-BLE-MESH 好友功能
net.c	ESP-BLE-MESH 中继功能、网络创建、网络索引更新程序、网络索引恢复程序、秘钥更新程序相关功能
proxy_server.c	ESP-BLE-MESH 代理服务器相关功能
proxy_client.c	ESP-BLE-MESH 代理客户端相关功能
settings.c	ESP-BLE-MESH NVS 存储器功能
main.c	ESP-BLE-MESH 协议栈初始化，协议栈使能，节点移除相关功能

ESP-BLE-MESH 常见问题手册

本文汇总了 ESP-BLE-MESH 协议栈开发的常见问题及解答，全文分为 7 个章节。

- *1. Provisioner 开发*

- *2. 节点开发*
- *3. ESP-BLE-MESH 和 Wi-Fi 共存*
- *4. 快速配网*
- *5. Log 帮助*
- *6. 示例帮助*
- *7. 其他*

用户可以参考这些章节，快速找到问题的答案。该文档会根据各种渠道收集的反馈进行更新。

1. Provisioner 开发 通常而言，Provisioner 用于配网未配网设备并形成 mesh 网络。组网后，设备的角色变成节点。

1.1 未配网设备加入 ESP-BLE-MESH 网络的流程是什么？

设备通过 Provisioner 加入 ESP-BLE-MESH 网络分为两个阶段，配网阶段和配置阶段。

- 配网阶段：为设备分配单播地址、添加网络密钥 (NetKey) 等。通过配网，设备加入 ESP-BLE-MESH 网络，身份从未配网设备变为节点。
- 配置阶段：为节点添加应用密钥 (AppKey), 并将应用密钥绑定到相应模型。配置期间，有些选项是可选的，比如为节点添加订阅地址、设置发布地址等。通过配置，该节点实际上可以向 Provisioner 发送消息，也可以接收来自 Provisioner 的消息。

1.2 如果 Provisioner 想要改变节点状态，其需满足什么条件？

- 需要有和节点的服务器模型相对应的客户端模型。
- 需要和节点有相同的、可用于加密消息的网络密钥和应用密钥。
- 需要知道节点的地址，可以是单播地址，也可以是订阅地址。

1.3 如何使用网络密钥和应用密钥？

- 网络密钥用于加密网络层的消息。具有相同网络密钥的节点视作在同一网络中，具有不同网络密钥的节点相互之间不能进行通信。
- 应用密钥用于加密上层传输层中的消息。如果服务器模型和客户端模型绑定的应用密钥不同，则无法实现相互通信。

1.4 如何生成网络密钥或应用密钥？是否可以采用固定的网络密钥或应用密钥？

- API *esp_ble_mesh_provisioner_add_local_net_key()* 可以用来添加包含固定值或随机值的网络密钥。
- API *esp_ble_mesh_provisioner_add_local_app_key()* 可以用来添加包含固定值或随机值的应用密钥。

1.5 Provisioner 的单播地址是不是固定的？

esp_ble_mesh_prov_t 中 `prov_unicast_addr` 的值用于设置 Provisioner 的单播地址，只能在初始化期间设置一次，此后不能更改。

1.6 Provisioner 的地址是否可以作为节点上报状态消息的目的地址？

Provisioner 的单播地址只能在初始化期间设置一次，此后不能更改。理论而言，只要节点知道 Provisioner 的单播地址，此地址便可用作节点上报状态消息的目的地址。节点在网络配置的过程中可以知道 Provisioner 的单播地址，因为 Provisioner 往节点发送消息时，消息的源地址就是 Provisioner 的单播地址。

订阅地址也可使用。Provisioner 订阅组地址或者虚拟地址，节点向该订阅地址发送消息。

1.7 被 Provisioner 配网到 ESP-BLE-MESH 网络中的第一个节点的单播地址是不是固定的？

esp_ble_mesh_prov_t 中 prov_start_address 的值用于设置 Provisioner 配网未配网设备的起始地址，即其首先配网的节点的单播地址。单播地址只能在初始化期间设置一次，此后不能修改。

1.8 手机 App 首先配置的节点的单播地址是不是固定的？

该 App 将确定单播地址，目前大多数单播地址是固定的。

1.9 如何知道当前 Provisioner 正在配网哪个未配网设备？

esp_ble_mesh_prov_t 中 prov_attention 的值由 Provisioner 在配网过程中设置给未配网设备。该值只能在初始化期间设置一次，此后不能修改。未配网设备加入 mesh 网络后可以用特定的方式来显示自己正在配网，比如灯光闪烁，以告知 Provisioner 其正在配网。

1.10 配网过程中，认证设备共有多少种方法？提供的范例中 provided examples 使用了什么方法？

共有四种设备认证方法，即 No OOB、Static OOB、Output OOB 和 Input OOB。提供的范例使用了 No OOB 的方式。

1.11 配置入网前，未配网设备的广播包可以携带哪些信息？

- Device UUID
- OOB Info
- URL Hash (可选的)

1.12 这些信息可以用于设备识别吗？

是的。每个设备都有独一无二的 Device UUID, 用户可以通过 Device UUID 识别设备。

1.13 当 Provisioner 配网的节点包含多个元素时，单播地址是如何分配的？

- Provisioner 会给设备的主元素分配一个单播地址，其余元素的单播地址在此基础上递增。
- 比如：如果一个未配网设备有三个元素，即主要元素、第二元素和第三元素。配网完成后，节点主元素的单播地址为 0x0002，节点第二元素的单播地址为 0x0003，节点第三元素的单播地址为 0x0004。

1.14 Provisioner 如何通过 Configuration Client Model 获取并且解析节点的构成数据？

- Provisioner 可以调用*Configuration Client Model* API *esp_ble_mesh_config_client_set_state()* 设置参数，调用*esp_ble_mesh_cfg_client_get_state_t* 中的 comp_data_get 获取节点的构成数据。
- 用户可以参考以下代码解析 Composition Data:

```
#include <stdio.h>
#include <string.h>
#include <stdint.h>

//test date: 0C001A0001000800030000010501000000800100001003103F002A00
//0C00 1A00 0100 0800 0300 0001 05 01 0000 0080 0100 0010 0310 3F002A00

// CID is 0x000C
// PID is 0x001A
// VID is 0x0001
// CRPL is 0x0008
// Features is 0x0003 - Relay and Friend features.
// Loc is  “front”  - 0x0100
```

(下页继续)

(续上页)

```
// NumS is 5
// NumV is 1
// The Bluetooth SIG Models supported are: 0x0000, 0x8000, 0x0001, 0x1000,
↪ 0x1003
// The Vendor Models supported are: Company Identifier 0x003F and Model␣
↪Identifier 0x002A

typedef struct {
    int16_t cid;
    int16_t pid;
    int16_t vid;
    int16_t crpl;
    int16_t features;
    int16_t all_models;
    uint8_t sig_models;
    uint8_t vnd_models;
} esp_ble_mesh_composition_head;

typedef struct {
    uint16_t model_id;
    uint16_t vendor_id;
} tsModel;

typedef struct {
    // reserve space for up to 20 SIG models
    uint16_t SIG_models[20];
    uint8_t numSIGModels;

    // reserve space for up to 4 vendor models
    tsModel Vendor_models[4];
    uint8_t numVendorModels;
} esp_ble_mesh_composition_decode;

int decode_comp_data(esp_ble_mesh_composition_head *head, esp_ble_mesh_
↪composition_decode *data, uint8_t *mystr, int size)
{
    int pos_sig_base;
    int pos_vnd_base;
    int i;

    memcpy(head, mystr, sizeof(*head));

    if(size < sizeof(*head) + head->sig_models * 2 + head->vnd_models *␣
↪4) {
        return -1;
    }

    pos_sig_base = sizeof(*head) - 1;

    for(i = 1; i < head->sig_models * 2; i = i + 2) {
        data->SIG_models[i/2] = mystr[i + pos_sig_base] | (mystr[i + pos_
↪sig_base + 1] << 8);
        printf("%d: %4.4x\n", i/2, data->SIG_models[i/2]);
    }

    pos_vnd_base = head->sig_models * 2 + pos_sig_base;

    for(i = 1; i < head->vnd_models * 2; i = i + 2) {
        data->Vendor_models[i/2].model_id = mystr[i + pos_vnd_base] |␣
↪(mystr[i + pos_vnd_base + 1] << 8);
        printf("%d: %4.4x\n", i/2, data->Vendor_models[i/2].model_id);
```

(下页继续)

(续上页)

```
        data->Vendor_models[i/2].vendor_id = mystr[i + pos_vnd_base + 2]␣
↪| (mystr[i + pos_vnd_base + 3] << 8);
        printf("%d: %4.4x\n", i/2, data->Vendor_models[i/2].vendor_id);
    }

    return 0;
}

void app_main(void)
{
    esp_ble_mesh_composition_head head = {0};
    esp_ble_mesh_composition_decode data = {0};
    uint8_t mystr[] = { 0x0C, 0x00, 0x1A, 0x00,
                        0x01, 0x00, 0x08, 0x00,
                        0x03, 0x00, 0x00, 0x01,
                        0x05, 0x01, 0x00, 0x00,
                        0x00, 0x80, 0x01, 0x00,
                        0x00, 0x10, 0x03, 0x10,
                        0x3F, 0x00, 0x2A, 0x00};
    int ret;

    ret = decode_comp_data(&head, &data, mystr, sizeof(mystr));
    if (ret == -1) {
        printf("decode_comp_data error");
    }
}
```

1.15 Provisioner 如何通过获取的 Composition Data 进一步配置节点？

Provisioner 通过调用*Configuration Client Model* API *esp_ble_mesh_config_client_set_state()* 来进行如下配置。

- 正确设置参数*esp_ble_mesh_cfg_client_set_state_t* 中的 app_key_add，将应用密钥添加到节点中。
- 正确设置参数*esp_ble_mesh_cfg_client_set_state_t* 中的 model_sub_add，将订阅地址添加到节点的模型中。
- 正确设置参数*esp_ble_mesh_cfg_client_set_state_t* 中的 model_pub_set，将发布地址添加到节点的模型中。

1.16 节点可以自己添加相应的配置吗？

本法可用于特殊情况，如测试阶段。

- 此示例展示了节点如何为自己的模型添加新的组地址。

```
esp_err_t example_add_fast_prov_group_address(uint16_t model_id, uint16_t␣
↪group_addr)
{
    const esp_ble_mesh_comp_t *comp = NULL;
    esp_ble_mesh_elem_t *element = NULL;
    esp_ble_mesh_model_t *model = NULL;
    int i, j;

    if (!ESP_BLE_MESH_ADDR_IS_GROUP(group_addr)) {
        return ESP_ERR_INVALID_ARG;
    }

    comp = esp_ble_mesh_get_composition_data();
    if (!comp) {
```

(下页继续)

(续上页)

```
        return ESP_FAIL;
    }

    for (i = 0; i < comp->element_count; i++) {
        element = &comp->elements[i];
        model = esp_ble_mesh_find_sig_model(element, model_id);
        if (!model) {
            continue;
        }
        for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
            if (model->groups[j] == group_addr) {
                break;
            }
        }
        if (j != ARRAY_SIZE(model->groups)) {
            ESP_LOGW(TAG, "%s: Group address already exists, element␣
↪index: %d", __func__, i);
            continue;
        }
        for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
            if (model->groups[j] == ESP_BLE_MESH_ADDR_UNASSIGNED) {
                model->groups[j] = group_addr;
                break;
            }
        }
        if (j == ARRAY_SIZE(model->groups)) {
            ESP_LOGE(TAG, "%s: Model is full of group addresses, element␣
↪index: %d", __func__, i);
        }
    }

    return ESP_OK;
}
```

备注： 使能了节点的 NVS 存储器后，通过该方式添加的组地址以及绑定的应用密钥在设备掉电的情况下不能保存。这些配置信息只有通过 Configuration Client Model 配置时才会保存。

1.17 Provisioner 如何通过分组的方式控制节点？

通常而言，在 ESP-BLE-MESH 网络中实现组控制有两种方法，即组地址方法和虚拟地址方法。假设有 10 个设备，即 5 个带蓝灯的设备和 5 个带红灯的设备。

- 方案一：5 个蓝灯设备订阅一个组地址，5 个红灯设备订阅另一个组地址。Provisioner 往不同的组地址发送消息，即可实现分组控制设备。
- 方案二：5 个蓝灯设备订阅一个虚拟地址，5 个红灯设备订阅另一个虚拟地址，Provisioner 往不同的虚拟地址发送消息，即可实现分组控制设备。

1.18 Provisioner 如何将节点添加至多个子网？

节点配置期间，Provisioner 可以为节点添加多个网络密钥，拥有相同网络密钥的节点属于同一子网。Provisioner 可以通过不同的网络密钥与不同子网内的节点进行通信。

1.19 Provisioner 如何知道网络中的某个设备是否离线？

节点离线通常定义为：电源故障或其他原因导致的节点无法与 mesh 网络中的其他节点正常通信的情况。

ESP-BLE-MESH 网络中的节点间彼此不连接，它们通过广播通道进行通信。

此示例展示了如何通过 Provisioner 检测节点是否离线。

- 节点定期给 Provisioner 发送心跳包。如果 Provisioner 超过一定的时间未接收到心跳包，则视该节点离线。

备注： 心跳包的设计应该采用单包（字节数小于 11 个字节）的方式，这样收发效率会更高。

1.20 Provisioner 删除网络中的节点时，需要进行哪些操作？

通常而言，Provisioner 从网络中移除节点主要涉及三个步骤：

- 首先，Provisioner 将需要移除的节点添加至“黑名单”。
- 其次，Provisioner 启动密钥更新程序。
- 最后，节点执行节点重置程序，切换自身身份为未配网设备。

1.21 在密钥更新的过程中，Provisioner 如何更新节点的网络密钥？

- 通过正确设置参数*esp_ble_mesh_cfg_client_set_state_t* 中的 net_key_update，使用*Configuration Client Model* API *esp_ble_mesh_config_client_set_state()*，Provisioner 更新节点的网络密钥。
- 通过正确设置参数*esp_ble_mesh_cfg_client_set_state_t* 中的 app_key_update，使用*Configuration Client Model* API *esp_ble_mesh_config_client_set_state()*，Provisioner 更新节点的应用密钥。

1.22 Provisioner 如何管理 mesh 网络中的节点？

ESP-BLE-MESH 在示例中实现了一些基本的节点管理功能，比如 esp_ble_mesh_store_node_info()。ESP-BLE-MESH 还提供可用于设置节点本地名称的 API *esp_ble_mesh_provisioner_set_node_name()* 和可用于获取节点本地名称的 API *esp_ble_mesh_provisioner_get_node_name()*。

1.23 Provisioner 想要控制节点的服务器模型时需要什么？

Provisioner 在控制节点的服务器模型前，必须包括相应的客户端模型。

Provisioner 应当添加本地的网络密钥和应用密钥。

- Provisioner 调用 API *esp_ble_mesh_provisioner_add_local_net_key()* 以添加网络密钥。
- Provisioner 调用 API *esp_ble_mesh_provisioner_add_local_app_key()* 以添加应用密钥。

Provisioner 应当配置自己的客户端模型。

- Provisioner 调用 API *esp_ble_mesh_provisioner_bind_app_key_to_local_model()* 以绑定应用密钥至自己的客户端模型。

1.24 Provisoner 如何控制节点的服务器模型？

ESP-BLE-MESH 支持所有 SIG 定义的客户端模型。Provisioner 可以使用这些客户端模型控制节点的服务器模型。客户端模型分为 6 类，每类有相应的功能。

- Configuration Client Model
  - API *esp_ble_mesh_config_client_get_state()* 可用于获取 Configuration Server Model 的*esp_ble_mesh_cfg_client_get_state_t* 值。
  - API *esp_ble_mesh_config_client_set_state()* 可用于设置 Configuration Server Model 的*esp_ble_mesh_cfg_client_set_state_t* 值。
- Health Client Model

  - API *esp_ble_mesh_health_client_get_state()* 可用于获取 Health Server Model 的*esp_ble_mesh_health_client_get_state_t* 值。
  - API *esp_ble_mesh_health_client_set_state()* 可用于设置 Health Server Model 的*esp_ble_mesh_health_client_set_state_t* 值。
- Generic Client Models
  - API *esp_ble_mesh_generic_client_get_state()* 可用于获取 Generic Server Model 的*esp_ble_mesh_generic_client_get_state_t* 值。
  - API *esp_ble_mesh_generic_client_set_state()* 可用于设置 Generic Server Model 的*esp_ble_mesh_generic_client_set_state_t* 值。
- Lighting Client Models
  - API *esp_ble_mesh_light_client_get_state()* 可用于获取 Lighting Server Model 的*esp_ble_mesh_light_client_get_state_t* 值。
  - API *esp_ble_mesh_light_client_set_state()* 可用于设置 Lighting Server Model 的*esp_ble_mesh_light_client_set_state_t* 值。
- Sensor Client Models
  - API *esp_ble_mesh_sensor_client_get_state()* 可用于获取 Sensor Server Model 的*esp_ble_mesh_sensor_client_get_state_t* 值。
  - API *esp_ble_mesh_sensor_client_set_state()* 可用于设置 Sensor Server Model 的*esp_ble_mesh_sensor_client_set_state_t* 值。
- **Time and Scenes Client Models**
  - API *esp_ble_mesh_time_scene_client_get_state()* 可用于获取 Time and Scenes Server Model 的*esp_ble_mesh_time_scene_client_get_state_t* 值。
  - API *esp_ble_mesh_time_scene_client_set_state()* 可用于设置 Time and Scenes Server Model 的*esp_ble_mesh_time_scene_client_set_state_t* 值。

2. 节点开发

2.1 节点包含什么样的模型？

- ESP-BLE-MESH 中，节点由一系列的模型组成，每个模型实现节点的某些功能。
- 模型分为两种，客户端模型和服务器模型。客户端模型可以获取并设置服务器模型的状态。
- 模型也可以分为 SIG 模型和自定义模型。SIG 模型的所有行为都由官方定义，而自定义模型的行为均由用户定义。

2.2 每个模型对应的消息格式是不是固定的？

- 消息由 opcode 和 payload 组成，通过 opcode 进行区分。
- 与模型对应的消息的类型和格式都是固定的，这意味着模型之间传输的消息是固定的。

2.3 节点的模型可以使用哪些函数发送消息？

- 对于客户端模型，用户可以调用 API *esp_ble_mesh_client_model_send_msg()* 发送消息。
- 对于服务器模型，用户可以调用 API *esp_ble_mesh_server_model_send_msg()* 发送消息。
- 对于发布，用户可以调用 API *esp_ble_mesh_model_publish()* 发布消息。

2.4 如何实现消息传输不丢包？

如果用户要实现消息传输不丢包，则需有应答的消息。等待应答的默认时间在*CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT* 中设置。如果发送端等待应答超时，就会触发对应的超时事件。

备注： API *esp_ble_mesh_client_model_send_msg()* 中可以设置应答的超时时间。如果参数 `msg_timeout` 设为 **0**，那么超时时间便会采用默认值（4 秒）。

2.5 如何发送无应答的消息？

对于客户端模型，用户可以调用 API *esp_ble_mesh_client_model_send_msg()* with the parameter `need_rsp` set to `false` 发送无应答消息。

对于服务器模型，调用 API *esp_ble_mesh_server_model_send_msg()* 发送的消息总是无应答的消息。

2.6 如何为模型添加订阅地址？

通过 Configuration Client Model 添加订阅地址。

2.7 模型发送的消息和发布的消息有何不同？

调用 API *esp_ble_mesh_client_model_send_msg()* 或*esp_ble_mesh_server_model_send_msg()* 发送的消息会在 Network Transmit 状态规定的期限内发送。

调用 API *esp_ble_mesh_model_publish()* 发布的消息将由模型发布状态决定是否发布。消息的发布一般是周期性的，或者有固定次数。发布周期和发布次数由模型发布状态控制，并且可以通过 Configuration Client Model 进行配置。

2.8 发送不分包消息时，最多可携带多少有效字节？

不分包消息的总有效载荷长度（可由用户设置）为 11 个八位位组，因此，如果消息的 opcode 为 2 个八位位组，则该消息可以携带 9 个八位位组的有效信息。对于 vendor 消息，由于 opcode 是 3 个八位位组，剩余的有效负载长度为 8 个八位位组。

2.9 什么时候应该使能节点的 Relay 功能？

如果 mesh 网络中检测到的节点很稀疏，用户可以使能节点的 Relay 功能。

如果 mesh 网络中检测到的节点很密集，用户可以选择仅使能一些节点的 Relay 功能。

如果 mesh 网络大小未知，用户可以默认使能 Relay 功能。

2.10 什么时候应该使能节点的 Proxy 功能？

如果未配网设备将由电话配网，则未配网设备应该使能 Proxy 功能，因为当前几乎所有电话都不支持通过广播承载层发送 ESP-BLE-MESH 数据包。并且，未配网设备成功配网成为 Proxy 节点后，其会通过 GATT 承载层和广播承载层与 mesh 网络中的其他节点通信。

2.11 如何使用代理过滤器?

代理过滤器用于减少 Proxy Client（如手机）和 Proxy Server（如节点）之间交换的 Network PDU 的数量。另外，通过代理过滤器，Proxy Client 可以明确请求仅接收来自 Proxy Server 的某些目标地址的 mesh 消息。

2.12 Relay 节点什么时候可以中继消息？

如果要中继消息，消息需满足以下要求。

- 消息存在于 mesh 网络中。
- 消息的目的地址不是节点的单播地址。
- 消息的 TTL 值需大于 1。

2.13 如果一条消息分成几段，那么其他 Relay 节点是接收到一段消息就中继还是等接收到完整的数据包才中继？

Relay 节点收到其中一段消息时就中继，而非一直等到接收所有的消息。

2.14 使用 Low Power 功能降低功耗的原理是什么？

- 开启无线电进行收听时，设备消耗能量。使能节点的低功耗功能后，它将在大多数时间内关闭无线电功能。
- 低功耗节点和好友节点需要合作，因此低功耗节点可以以适当或较低的频率接收消息，而无需一直收听。
- 当低功耗节点有一些新消息时，好友节点将为其存储消息。低功耗节点可以间隔固定时间轮询好友节点，以查看是否有新的消息。

2.15 设备断电后上电，如何能继续在网络中进行通讯？

在 *menuconfig* 中启用配置 `Store BLE Mesh Node configuration persistently`。

2.16 如何实现将节点自检的信息发送出来？

推荐节点通过 Health Server Model 定期发布其自检结果。

2.17 节点间如何传输消息？

节点间传输信息的可能应用场景是，一旦烟雾警报检测到高浓度的烟雾，就会触发喷淋设备。有两种实现方法。

- 方法 1：喷淋设备订阅组地址。当烟雾警报器检测到高浓度的烟雾时，它会发布一条消息，该消息的目标地址是喷淋设备已订阅的组地址。
- 方法 2：Provisioner 可以配置喷淋设备的单播地址为烟雾报警器的地址。当检测到高浓度的烟雾时，烟雾警报器以喷淋设备的单播地址为目标地址，将消息发送到喷淋设备。

2.18 设备通信必须要网关吗？

- 情况 1：节点仅在 mesh 网络内通信。这种情况下，不需要网关。ESP-BLE-MESH 网络是一个泛洪的网络，网络中的消息没有固定的路径，节点与节点之间可以随意通信.
- 情况 2：如果用户想要远程控制网络，比如在到家之前打开某些节点，则需要网关。

2.19 何时使用 IV Update 更新程序？

一旦节点的底层检测到发送的消息的序列号达到临界值，IV Update 更新程序便会启用。

2.20 如何启用 IV Update 更新程序？

节点可以使用带有 Secure Network Beacon 的 IV Update 更新程序。

3. ESP-BLE-MESH 和 Wi-Fi 共存

3.1 Wi-Fi 和 ESP-BLE-MESH 共存时，支持哪些模式？

目前，只有 Wi-Fi STA 模式支持共存。

3.2 Wi-Fi 和 ESP-BLE-MESH 共存时，为什么 Wi-Fi 吞吐量很低？

应使能 menuconfig 中的一些配置来支持 PSRAM。

- `ESP32-C3-specific --> Support for external,SPI-connected RAM --> Try to allocate memories of Wi-Fi and LWIP...`
- `Bluetooth --> Bluedriod Enable --> BT/BLE will first malloc the memory from the PSRAM`
- `Bluetooth --> Bluedriod Enable --> Use dynamic memory allocation in BT/BLE stack.`

- `Bluetooth --> Blutooth controller --> BLE full scan feature supported.`
- `Wi-Fi --> Software controls Wi-Fi/Bluetooth coexistence --> Wi-Fi`

4. 快速配网

4.1 为什么需要快速配网？

通常而言，存在少量未配网设备时，用户可以逐个配置。但是如果有大量未配网设备（比如 100 个）时，逐个配置会耗费大量时间。通过快速配网，用户可以在约 50 秒内配网 100 个未配网设备。

4.2 为什么会出现 EspBleMesh App 在快速配网期间长时间等待的情况？

快速配网期间，代理节点在配置完一个节点后会断开与 APP 的连接，待所有节点配网完成后再与 APP 重新建立连接。

4.3 为什么 APP 中显示的节点地址的数量比现有的节点地址更多？

每完成一次快速配网后、开始新一次快速配网前，APP 会存有上次配网的数据，因此 APP 中显示的节点地址的数量比现有的节点地址更多。

4.4 在 EspBleMesh App 中输入的 ** count ** 值有什么用途？

此 **count** 值提供给 App 配置的代理节点，以决定何时提前开始 Proxy 广播信息。

4.5 运行以下示例 fast_prov_server 的节点的 Configuration Client Model 何时开始工作？

使能了 Temporary Provisioner 功能后，Configuration Client Model 会开始工作。

4.6 Temporary Provisioner 功能会一直处于使能的状态吗？

节点收到打开/关闭电灯的消息后，所有节点会禁用其 Temporary Provisioner 功能并且转化为一般节点。

5. Log 帮助 当 ESP-BLE-MESH 协议栈底层出现错误或者警告时，您可以在这儿找到这些错误和警告的含义。

5.1 `ran out of retransmit attempts` 代表什么？

节点发送分段消息时，由于某些原因，接收端未收到完整的消息。节点会重传消息。当重传次数达到最大重传数时，会出现该警告，当前最大重传数为 4。

5.2 `Duplicate found in Network Message Cache` 代表什么？

当节点收到一条消息时，它会把该消息与网络缓存中存储的消息进行比较。如果在缓存中找到相同的消息，这意味着之前已接受过该消息，则该消息会被丢弃。

5.3 `Incomplete timer expired` 代表什么？

当节点在一定时间段（比如 10 秒）内未收到分段消息的所有段时，则 Incomplete 计时器到时，并且出现该警告。

5.4 No matching TX context for ack 代表什么？

当节点收到一个分段 ack 且不能找到任何自己发送的与该 ack 相关的消息时，会出现该警告。

5.5 No free slots for new incoming segmented messages 代表什么？

当节点没有空间来接收新的分段消息时，会出现该警告。用户可以通过配置*CONFIG_BLE_MESH_RX_SEG_MSG_COUNT* 扩大空间。

5.6 Model not bound to AppKey 0x0000 代表什么？

当节点发送带有模型的消息且该模型尚未绑定到索引为 0x000 的应用密钥时，会出现该报错。

5.7 Busy sending message to DST xxxx 代表什么？

该错误表示节点的客户端模型已将消息发送给目标节点，并且正在等待响应，用户无法将消息发送到单播地址相同的同一节点。接收到相应的响应或计时器到时后，可以发送另一条消息。

6. 示例帮助

6.1 ESP-BLE-MESH 回调函数如何分类？

- API *esp_ble_mesh_register_prov_callback()* 用于注册处理配网和入网相关事件的回调函数。
- API *esp_ble_mesh_register_config_client_callback()* 用于注册处理 Configuration Client Model 相关事件的回调函数。
- API *esp_ble_mesh_register_config_server_callback()* 用于注册处理 Configuration Server Model 相关事件的回调函数。
- API *esp_ble_mesh_register_health_client_callback()* 用于注册处理 Health Client Model 相关事件的回调函数。
- API *esp_ble_mesh_register_health_server_callback()* 用于注册处理 Health Server Model 相关事件的回调函数。
- API *esp_ble_mesh_register_generic_client_callback()* 用于注册处理 Generic Client Models 相关事件的回调函数。
- API *esp_ble_mesh_register_light_client_callback()* 用于注册处理 Lighting Client Models 相关事件的回调函数。
- API *esp_ble_mesh_register_sensor_client_callback()* 用于注册处理 Sensor Client Model 相关事件的回调函数。
- API *esp_ble_mesh_register_time_scene_client_callback()* 用于注册处理 Time and Scenes Client Models 相关事件的回调函数。
- API *esp_ble_mesh_register_custom_model_callback()* 用于注册处理自定义模型和未实现服务器模型的相关事件的回调函数。

7. 其他

7.1 如何打印数据包？

示例使用如下函数 `ESP_LOG_BUFFER_HEX()` 打印信息语境，而 ESP-BLE-MESH 协议栈使用 `bt_hex()` 打印。

7.2 重启 ESP32 应使用哪个 API？

API *esp_restart()*.

7.3 如何监测任务栈的剩余空间？

API `vTaskList()` 可以用于定期打印任务栈的剩余空间。

7.4 如何在不更改 menuconfig 输出级别的情况下改变 log 级别？

无需使用 menuconfig，可以通过 API `esp_log_level_set()` 修改 log 的输出级别。

ESP-BLE-MESH Terminology

表 11: 表 1 ESP-BLE-MESH 术语 - 身份

术语	官方定义	详细说明
未配网设备	“A device that is not a member of a mesh network is known as an unprovisioned device.”	示例：照明装置、温控设备、制造设备和电动门等。
节点	“A node is a provisioned device.”	经配网加入 ESP-BLE-MESH 网络后，未配网设备的身份转变成节点。节点（如照明装置、温控设备、制造设备和电动门）是指能在蓝牙 ESP-BLE-MESH 网络中发送、接收或中继消息的设备，且节点可以选择性地支持一个或多个子网。
中继节点	“A node that supports the Relay feature and has the Relay feature enabled is known as a Relay node.”	中继节点接收并中继 ESP-BLE-MESH 消息，因此消息可以传输得更远。用户可以根据节点的状态来决定是否使能节点的中继功能。消息可以中继多次，每次中继为“一跳”，消息最多可有 126 跳，足以让消息在广阔的区域内传输。
代理节点	“A node that supports the Proxy feature and has the Proxy feature enabled is known as a Proxy node.”	代理节点从一个承载层（通常包括广播承载层和 GATT 承载层）接收消息，并通过另一个承载层重新发送消息。其目的是将只支持 GATT 承载层的通讯设备接入到 ESP-BLE-MESH 网络中。通常而言，手机 App 需要一个代理节点才能接入 Mesh 网络。没有代理节点，手机 App 无法与 Mesh 网络中成员通信。
好友节点	“A node that supports the Friend feature, has the Friend feature enabled, and has a friendship with a node that supports the Low Power feature is known as a Friend node.”	好友节点相当于低功耗节点（LPN）的备份，可存储发往低功耗节点的消息及安全更新信息；当低功耗节点需要这些存储的信息时，这些信息便会被传输至低功耗节点。低功耗节点必须与支持好友特性的另一节点建立“友谊”，以减少其接收器的占空比，从而降低低功耗节点的功耗。低功耗节点需要找到好友节点，与其建立友谊关系，其中涉及的过程称为“友谊建立”。低功耗节点与好友节点的搭配可让低功耗节点规划对无线电的使用，从而以适当或较低的频率接收消息，无需保持收听状态。低功耗节点会轮询好友节点以查看是否有新的消息。
低功耗节点	“A node that supports the Low Power feature and has a friendship with a node that supports the Friend feature is known as a Low Power node.”	低功耗节点通过轮询从好友节点获取信息，比如消息、安全更新等。
启动配置设备（以下称为 Provisioner）	“A node that is capable of adding a device to a mesh network.”	能够配网未配网设备的设备称为启动配置设备。这一流程通常需要通过产品制造商的提供的 App 来实现，并可在网关、智能手机、平板电脑和其他载体上使用。

表 12: 表 2 ESP-BLE-MESH 术语 - 节点构成

术语	官方定义	详细说明
状态	“A value representing a condition of an element that is exposed by an element of a node.”	ESP-BLE-MESH 网络中的每台设备都具有一组独立的状态值，表示设备的某些状态，比如照明设备的亮度、颜色等状态。更改状态值会修改设备本身的物理状态，比如更改设备的开关状态值实际是在打开或关闭设备。
模型	“A model defines the basic functionality of a node.”	一个节点可能包含多个模型，而每个模型定义了节点的基本功能，比如节点所需要的状态、控制状态的消息以及处理消息所产生的动作等。节点功能的实现是基于模型的，模型可分为 SIG 模型和自定义模型，前者由 SIG 定义，而后者由用户定义。
元素	“An addressable entity within a device.”	一个节点可以包含一个或多个元素，每个元素都有一个单播地址和一个或多个模型，并且同一元素所包含的模型不可以出现重复。
节点构成状态	“The Composition Data state contains information about a node, the elements it includes, and the supported models.”	通过读取节点构成状态的值，用户可以了解节点的基本信息，比如元素的数量及每个元素中的模型。Provisioner 通过获取这个消息对设备进一步配置，比如配置节点的订阅地址与发布地址。

表 13: 表 3 ESP-BLE-MESH 术语 - 特性

术语	官方定义	详细说明
低功耗特性	“The ability to operate within a mesh network at significantly reduced receiver duty cycles only in conjunction with a node supporting the Friend feature.”	低功耗功能可降低节点的功耗。当低功耗节点寻找好友节点、且附近有多个好友节点时，它会通过算法选择最适合的好友节点。
好友特性	“The ability to help a node supporting the Low Power feature to operate by storing messages destined for those nodes.”	通过使能好友特性，节点可以帮助存储低功耗节点的信息。使能了好友特性的节点可能会产生更大的功耗和内存消耗。
中继特性	“The ability to receive and retransmit mesh messages over the advertising bearer to enable larger networks.”	中继特性能让 ESP-BLE-MESH 的消息在节点之间实现多次跳跃，传输距离可超过两个节点之间直接进行无线电传输的范围，从而覆盖整个网络。使能了中继特性的节点中继消息时，只中继其所在子网的消息，不中继其它子网的消息。使能了中继特性的节点中继分段消息时不考虑数据的完整性。节点每收到一条分段消息便直接中继，不会等待收到完整的消息。
代理特性	“The ability to receive and retransmit mesh messages between GATT and advertising bearers.”	代理特性的目的是允许不具备广播承载层的节点访问 ESP-BLE-MESH 网络。代理特性通常为需要和手机 App 连接的节点所用。

表 14: 表 4 ESP-BLE-MESH 术语 - 配置入网

术语	官方定义	详细说明
PB-ADV	“PB-ADV is a provisioning bearer used to provision a device using Generic Provisioning PDUs over the advertising channels.”	PB-ADV 通过广播通道传输配网过程中产生的数据包。只有 Provisioner 和未配网设备都支持 PB-ADV 时才可使用这种方法进行配网。
PB-GATT	“PB-GATT is a provisioning bearer used to provision a device using Proxy PDUs to encapsulate Provisioning PDUs within the Mesh Provisioning Service.”	PB-GATT 通过连接通道传输配网过程中产生的数据包。如果未配网设备想使用此方式进行配网，其需要实现相关的 Mesh Provisioning Service。未实现此服务的未配网设备不能通过 PB-GATT 承载层配网接入 mesh 网络。
配置入网	“Provisioning is a process of adding an unprovisioned device to a mesh network, managed by a Provisioner.”	经过配网，“未配网设备”的身份转变为“节点”，成为 ESP-BLE-MESH 网络中的一员。
认证方式	“Authentication is a step during the provisioning of nodes.”	未配网设备有四种认证方法：输入带外 (Input OOB)、输出带外 (Output OOB)、静态带外 (Static OOB) 和无带外 (No OOB)。
输入带外 (Input OOB)	Input Out-of-Band	比如，Provisioner 生成并显示随机数，然后提示用户采取适当操作将随机数输入未配网的设备中。以照明开关为例，用户可以在一定时间内数次按下按钮，以这种形式输入 Provisioner 端显示的随机数。输入带外认证方法与输出带外的认证方法类似，但设备的角色相反。
输出带外 (Output OOB)	Output Out-of-Band	比如，未配网设备会选择一个随机数，并通过与其功能兼容的方式输出该数字。如果未配网设备是一个灯泡，则其能够闪烁指定的次数。如果未配网设备有 LCD 屏幕，则可以将随机数显示为多位数值。启动 Provisioner 的用户需要输入观察到的数字，来认证未配网的设备。
静态带外 (Static OOB)	Static Out-of-Band	静态 OOB 的认证方法：使用静态 OOB 信息。如果需要使用无 OOB 信息，请将静态 OOB 字段赋值为 0。如果需要使用 OOB 信息，请使用静态 OOB 信息认证正在配网的设备。
无带外 (No OOB)	No Out-of-Band	无 OOB 的认证方法：将“静态 OOB”字段赋值为 0。采用这种方式相当于不认证未配网的设备。

表 15: 表 5 ESP-BLE-MESH 术语 - 地址

术语	官方定义	详细说明
未分配地址	“This is a special address type, with a value of 0x0000. Its use indicates that an Element has not yet been configured or had a Unicast Address assigned to it.”	未配置的元素地址或未分配的元素地址都称为未分配地址。鉴于这些元素没有固定的地址，它们不会用于消息的传输。建议在设置用户代码的地址之前，将该地址的值设为未分配地址。
单播地址	“A unicast address is a unique address allocated to each element.”	在配网期间，Provisioner 会给网络中处于生命周期内节点的每个元素分配一个单播地址。单播地址可能会出现在消息的源/目标地址字段中。发送到单播地址的消息只能由拥有该单播地址的元素进行处理。
虚拟地址	“A virtual address represents a set of destination addresses. Each virtual address logically represents a Label UUID, which is a 128-bit value that does not have to be managed centrally.”	虚拟地址与特定的 UUID 标签相关联，可以用作模型的发布地址或订阅地址。UUID 标签是与一个或多个节点的元素相关联的 128 位值。虚拟地址的第 15 位和第 14 位分别设置为 1 和 0。从第 13 位到第 0 位设置为散列值（提供 16384 个散列值）。散列是 UUID 标签的派生。使用订阅元素检查完整的 128 位 UUID 十分低效，而散列值提供了一种更有效的方法来确定最终将哪些消息发送到哪些元素。
群组地址	“A group address is an address that is programmed into zero or more elements.”	群组地址是 ESP-BLE-MESH 网络中的另一种多播地址，通常用于将节点进行分组。发送到 all-proxies 地址的信息应由启用了代理功能的所有节点的主要元素处理。发送到 all-friends 地址的消息应由启用了好友功能的所有节点的主要元素处理。发送到 all-relays 地址的消息应由启用了中继功能的所有节点的主要元素处理。发送到 all-nodes 地址的消息应由所有节点的主要元素处理。

表 16: 表 6 ESP-BLE-MESH 术语 - 安全

术语	官方定义	详细说明
设备密钥 (DevKey)	“There is also a device key, which is a special application key that is unique to each node, is known only to the node and a Configuration Client, and is used to secure communications between the node and a Configuration Client.”	设备密钥让您能够配网未配网设备、配置节点。设备密钥用来加密配置信息，即配置设备时 Provisioner 和节点之间传输的消息。
应用密钥 (AppKey)	“Application keys are used to secure communications at the upper transport layer.”	应用密钥用于应用数据传递至应用层过程中对应用数据的解密，和应用层下发过程中对数据的加密。网络中的一些节点有特定的用途，并且可以根据应用程序的需求对一些潜在敏感数据的访问进行限制。通过特定的应用密钥，这些节点与特定应用程序相关联。通常而言，使用不同应用密钥的领域有安全（楼宇门禁、机房门禁和 CEO 办公室门禁）、照明（工厂、外部楼宇和人行道）和 HVAC 系统。应用密钥绑定在网络密钥上，这意味着应用密钥仅在绑定网络密钥的情况下使用。每一个应用密钥仅可绑定到一个网络密钥。
主安全资料	“The master security material is derived from the network key (NetKey) and can be used by other nodes in the same network. Messages encrypted with master security material can be decoded by any node in the same network. “	使用好友安全材料加密的相应友谊消息有：1. 好友轮询 (Friend Poll)，2. 好友更新 (Friend Update)，3. 好友订阅列表 (Friend Subscription List)，添加/删除/确认，4. 好友节点发送到低功耗节点的“已存储消息”，使用主安全材料加密的相应友谊消息有：1. 好友清除 (Friend Clear)，2. 好友清除确认 (Friend Clear Confirm)。根据应用程序的设置，从低功耗节点发送到好友节点的消息会使用友谊安全材料或主安全材料进行加密，前者用于低功耗节点与好友节点之间的消息传输，而后者用于其他网络消息。

表 17: 表 7 ESP-BLE-MESH 术语 - 消息

术语	官方定义	详细说明
重组 / 分包	“Segmentation and reassembly (SAR) is a method of communication network, which is divided into small units before transmitting packets and reassembled in a proper order at the communication receiving end.”	底层传输层会自动分包过大的消息。接收端会回复一条应答消息，根据应答消息，发送端会重新向接收端发送其未接收到的数据包。这些都是底层传输层自动完成的。未分包的消息最多携带 15 个字节，其中 4 个字节是 transMIC，所以剩余 11 个字节；在分包的情况下，前面的包中每包有 12 个有效字节，最后一个包中有 8 个有效字节。特殊情况：一个较短的包需要底层传输端强制分包，这种情况下有 8 个有效字节。
无应答 / 有应答	“There are two types of messages: Unacknowledged or Acknowledged.”	根据接收端是否需要发送应答消息，发送的消息可分为两种。发送端需要设置最大重传次数。

表 18: 表 8 ESP-BLE-MESH 术语 - 基础模型

术语	官方定义	详细说明
Configuration Server Model	“This model is used to represent a mesh network configuration of a device.”	节点必须包含 Configuration Server Model，其负责维护配置相关的状态。Configuration Server Model 维护的状态包含：网络密钥名单 (NetKey List)、应用密钥名单 (AppKey List)、模型绑定的应用密钥名单 (Model to AppKey List)、节点身份 (Node Identity)、密钥更新阶段 (Key Refresh Phase)、心跳消息发布 (Heartbeat Publish)、心跳消息订阅 (Heartbeat Subscription)、网络传输 (Network Transmit) 和中继重传 (Relay Retransmit) 等。
Configuration Client Model	“The model is used to represent an element that can control and monitor the configuration of a node.”	Configuration Client Model 通过消息控制 Configuration Server Model 维护的状态。Provisioner 必须包含 Configuration Client Model，有了该模型才可发送“Configuration Composition Data Get” 等配置消息。
Health Server Model	“This model is used to represent a mesh network diagnostics of a device.”	Health Server Model 主要用于设备检查自身状态，查看自身是否发生错误。Health Server model 维护的状态包含：当前故障 (Current Fault)、已登记故障 (Registered Fault)、健康周期 (Health Period) 和关注计时器 (Attention Timer)。
Health Client Model	“The model is used to represent an element that can control and monitor the health of a node.”	Health Client Model 通过消息控制 Health Server Model 维护的状态。该模型可通过消息 “Health Fault Get” 获取其他节点的自检信息。

表 19: 表 9 ESP-BLE-MESH 术语 - 网络管理

术语	官方定义	详细说明
密钥更新程序	“This procedure is used when the security of one or more network keys and/or one or more of the application keys has been compromised or could be compromised.”	密钥更新程序用于更新 ESP-BLE-MESH 网络的网络密钥和应用密钥。当一个或多个网络密钥和/或一个或多个应用密钥的安全受到威胁或可能受到威胁时，会启动密钥更新程序。通常而言，在网络中某些节点移除后可以进行密钥更新。
IV 更新程序	“A node can also use an IV Update procedure to signal to peer nodes that it is updating the IV Index.”	IV 更新程序用于更新 ESP-BLE-MESH 网络的 IV Index 的值，这个值和消息加密时所需的随机数相关。为了保证随机数的值不重复，所以将这个值定期增加。IV Index 是一个 32 位的值，是一种共享网络资源，比如一个 mesh 网中的所有节点共享一个 IV Index 值。IV Index 从 0x00000000 开始，在 IV 更新过程中递增，并由特定的进程维护，以保证整个 Mesh 网内共享一个 IV Index。当节点认为它有耗尽其序列号的风险，或它确定另一个节点即将耗尽其序列号时，可以启动该程序。注意：每次的更新时间不得低于 96 小时。节点接收到 secure network beacon 或者确定自己的序列号大于特定值时，会触发 IV 更新程序。

4.10 ESP-IDF FreeRTOS (SMP)

备注: This document assumes that the reader has a requisite understanding of Vanilla FreeRTOS (its features, behavior, and API usage). Refer to the Vanilla FreeRTOS documentation for more details.

This document describes the API and behavioral differences between Vanilla FreeRTOS and ESP-IDF FreeRTOS that were made in order to support Symmetric Multiprocessing (SMP). This document is split into the following parts.

Contents

- *ESP-IDF FreeRTOS (SMP)*
  - *Overview*
  - *Symmetric Multiprocessing*
    - *Basic Concepts*
    - *SMP on an ESP Target*
  - *Tasks*
    - *Creation*
    - *Execution*
    - *Deletion*

- *SMP Scheduler*
  - *Fixed Priority*
  - *Preemption*
  - *Time Slicing*
  - *Tick Interrupts*
  - *Idle Tasks*
  - *Scheduler Suspension*
  - *Disabling Interrupts*
  - *Startup and Termination*
- *Critical Sections*
  - *API Changes*
  - *Implementation*
  - *Restrictions and Considerations*
- *Misc*
  - *Floating Point Usage*
  - *ESP-IDF FreeRTOS Single Core*

4.10.1 Overview

The original FreeRTOS (hereinafter referred to as Vanilla FreeRTOS) is a small and efficient Real Time Operating System supported on many single-core MCUs and SoCs. However, numerous ESP targets (such as the ESP32 and ESP32-S3) are capable of dual core symmetric multiprocessing (SMP). Therefore, the version of FreeRTOS used in ESP-IDF (hereinafter referred to as ESP-IDF FreeRTOS) is a modified version of Vanilla FreeRTOS v10.4.3. Theses modifications allow ESP-IDF FreeRTOS to utilize the dual core SMP capabilities of ESP SoCs.

备注： Some ESP targets (such as the ESP32-S2 and ESP32-C3) are single core SoCs. ESP-IDF applications built for these targets will be built with **ESP-IDF FreeRTOS instead of Vanilla FreeRTOS**. However, the builds for these single core targets will always have the *CONFIG_FREERTOS_UNICORE* configuration enabled. See *ESP-IDF FreeRTOS Single Core* for more details.

备注:

- For information regarding features that have been added to ESP-IDF FreeRTOS, see *ESP-IDF FreeRTOS Additions*.
- For a detailed ESP-IDF FreeRTOS API Reference, see *FreeRTOS API reference*.

4.10.2 Symmetric Multiprocessing

Basic Concepts

SMP (Symmetric Multiprocessing) is a computing architecture where two or more identical CPUs (cores) are connected to a single shared main memory and controlled by a single operating system. In general, an SMP system …

- has multiple cores running independently. Each core has its own register file, interrupts, and interrupt handling.
- presents an identical view of memory to each core. Thus a piece of code that accesses a particular memory address will have the same effect regardless of which core it runs on.

The main advantages of an SMP system compared to single core or Asymmetric Multiprocessing systems are that…

- the presence of multiple CPUs allows for multiple hardware threads, thus increases overall processing throughput.
- having symmetric memory means that threads can switch cores during execution. This in general can lead to better CPU utilization.

Although an SMP system allows threads to switch cores, there are scenarios where a thread must/should only run on a particular core. Therefore, threads in an SMP systems will also have a core affinity that specifies which particular core the thread is allowed to run on.

- A thread that is pinned to a particular core will only be able to run on that core
- A thread that is unpinned will be allowed to switch between cores during execution instead of being pinned to a particular core.

SMP on an ESP Target

ESP targets (such as the ESP32, ESP32-S3) are dual core SMP SoCs. These targets have the following hardware features that make them SMP capable:

- Two identical cores known as CPU0 (i.e., Protocol CPU or PRO_CPU) and CPU1 (i.e., Application CPU or APP_CPU). This means that the execution of a piece of code is identical regardless of which core it runs on.
- Symmetric memory (with some small exceptions).
  - If multiple cores access the same memory address, their access will be serialized at the memory bus level.
  - True atomic access to the same memory address is achieved via an atomic compare-and-swap instruction provided by the ISA.
- Cross-core interrupts that allow one CPU to trigger and interrupt on another CPU. This allows cores to signal each other.

备注： The "PRO_CPU" and "APP_CPU" aliases for CPU0 and CPU1 exist in ESP-IDF as they reflect how typical IDF applications will utilize the two CPUs. Typically, the tasks responsible for handling wireless networking (e.g., WiFi or Bluetooth) will be pinned to CPU0 (thus the name PRO_CPU), whereas the tasks handling the remainder of the application will be pinned to CPU1 (thus the name APP_CPU).

4.10.3 Tasks

Creation

Vanilla FreeRTOS provides the following functions to create a task:

- *`xTaskCreate()`* creates a task. The task's memory is dynamically allocated
- *`xTaskCreateStatic()`* creates a task. The task's memory is statically allocated (i.e., provided by the user)

However, in an SMP system, tasks need to be assigned a particular affinity. Therefore, ESP-IDF provides a `PinnedToCore` version of Vanilla FreeRTOS's task creation functions:

- *`xTaskCreatePinnedToCore()`* creates a task with a particular core affinity. The task's memory is dynamically allocated.
- *`xTaskCreateStaticPinnedToCore()`* creates a task with a particular core affinity. The task's memory is statically allocated (i.e., provided by the user)

The `PinnedToCore` versions of the task creation functions API differ from their vanilla counter parts by having an extra `xCoreID` parameter that is used to specify the created task's core affinity. The valid values for core affinity are:

- `0` which pins the created task to CPU0
- `1` which pins the created task to CPU1
- `tskNO_AFFINITY` which allows the task to be run on both CPUs

Note that ESP-IDF FreeRTOS still supports the vanilla versions of the task creation functions. However, they have been modified to simply call their `PinnedToCore` counterparts with `tskNO_AFFINITY`.

备注： ESP-IDF FreeRTOS also changes the units of `ulStackDepth` in the task creation functions. Task stack sizes in Vanilla FreeRTOS are specified in number of words, whereas in ESP-IDF FreeRTOS, the task stack sizes

are specified in bytes.

Execution

The anatomy of a task in ESP-IDF FreeRTOS is the same as Vanilla FreeRTOS. More specifically, ESP-IDF FreeRTOS tasks:

- Can only be in one of following states: Running, Ready, Blocked, or Suspended.
- Task functions are typically implemented as an infinite loop
- Task functions should never return

Deletion

Task deletion in Vanilla FreeRTOS is called via *vTaskDelete()*. The function allows deletion of another task or the currently running task (if the provided task handle is `NULL`). The actual freeing of the task's memory is sometimes delegated to the idle task (if the task being deleted is the currently running task).

ESP-IDF FreeRTOS provides the same *vTaskDelete()* function. However, due to the dual core nature, there are some behavioral differences when calling *vTaskDelete()* in ESP-IDF FreeRTOS:

- When deleting a task that is pinned to the other core, that task's memory is always freed by the idle task of the other core (due to the need to clear FPU registers).
- When deleting a task that is currently running on the other core, a yield is triggered on the other core and the task's memory is freed by one of the idle tasks (depending on the task's core affinity)
- A deleted task's memory is freed immediately if…
  - The tasks is currently running on this core and is also pinned to this core
  - The task is not currently running and is not pinned to any core

Users should avoid calling *vTaskDelete()* on a task that is currently running on the other core. This is due to the fact that it is difficult to know what the task currently running on the other core is executing, thus can lead to unpredictable behavior such as…

- Deleting a task that is holding a mutex
- Deleting a task that has yet to free memory it previously allocated

Where possible, users should design their application such that *vTaskDelete()* is only ever called on tasks in a known state. For example:

- Tasks self deleting (via `vTaskDelete(NULL)`) when their execution is complete and have also cleaned up all resources used within the task.
- Tasks placing themselves in the suspend state (via *vTaskSuspend()*) before being deleted by another task.

4.10.4 SMP Scheduler

The Vanilla FreeRTOS scheduler is best described as a **Fixed Priority Preemptive scheduler with Time Slicing** meaning that:

- Each tasks is given a constant priority upon creation. The scheduler executes highest priority ready state task
- The scheduler can switch execution to another task without the cooperation of the currently running task
- The scheduler will periodically switch execution between ready state tasks of the same priority (in a round robin fashion). Time slicing is governed by a tick interrupt.

The ESP-IDF FreeRTOS scheduler supports the same scheduling features (i.e., Fixed Priority, Preemption, and Time Slicing) albeit with some small behavioral differences.

Fixed Priority

In Vanilla FreeRTOS, when scheduler selects a new task to run, it will always select the current highest priority ready state task. In ESP-IDF FreeRTOS, each core will independently schedule tasks to run. When a particular core selects a task, the core will select the highest priority ready state task that can be run by the core. A task can be run by the core if:

- The task has a compatible affinity (i.e., is either pinned to that core or is unpinned)
- The task is not currently being run by another core

However, users should not assume that the two highest priority ready state tasks are always run by the scheduler as a task's core affinity must also be accounted for. For example, given the following tasks:

- Task A of priority 10 pinned to CPU0
- Task B of priority 9 pinned to CPU0
- Task C of priority 8 pinned to CPU1

The resulting schedule will have Task A running on CPU0 and Task C running on CPU1. Task B is not run even though it is the second highest priority task.

Preemption

In Vanilla FreeRTOS, the scheduler can preempt the currently running task if a higher priority task becomes ready to execute. Likewise in ESP-IDF FreeRTOS, each core can be individually preempted by the scheduler if the scheduler determines that a higher priority task can run on that core.

However, there are some instances where a higher priority task that becomes ready can be run on multiple cores. In this case, the scheduler will only preempt one core. The scheduler always gives preference to the current core when multiple cores can be preempted. In other words, if the higher priority ready task is unpinned and has a higher priority than the current priority of both cores, the scheduler will always choose to preempt the current core. For example, given the following tasks:

- Task A of priority 8 currently running on CPU0
- Task B of priority 9 currently running on CPU1
- Task C of priority 10 that is unpinned and was unblocked by Task B

The resulting schedule will have Task A running on CPU0 and Task C preempting Task B given that the scheduler always gives preference to the current core.

Time Slicing

The Vanilla FreeRTOS scheduler implements time slicing meaning that if current highest ready priority contains multiple ready tasks, the scheduler will switch between those tasks periodically in a round robin fashion.

However, in ESP-IDF FreeRTOS, it is not possible to implement perfect Round Robin time slicing due to the fact that a particular task may not be able to run on a particular core due to the following reasons:

- The task is pinned to the another core.
- For unpinned tasks, the task is already being run by another core.

Therefore, when a core searches the ready state task list for a task to run, the core may need to skip over a few tasks in the same priority list or drop to a lower priority in order to find a ready state task that the core can run.

The ESP-IDF FreeRTOS scheduler implements a Best Effort Round Robin time slicing for ready state tasks of the same priority by ensuring that tasks that have been selected to run will be placed at the back of the list, thus giving unselected tasks a higher priority on the next scheduling iteration (i.e., the next tick interrupt or yield)

The following example demonstrates the Best Effort Round Robin time slicing in action. Assume that:

- There are four ready state tasks of the same priority `AX`, `B0`, `C1`, `D1` where: - The priority is the current highest priority with ready state tasks - The first character represents the task's names (i.e., `A`, `B`, `C`, `D`) - And the second character represents the tasks core pinning (and `X` means unpinned)
- The task list is always searched from the head

```
-------------------------------------------------------------------------------

1. Starting state. None of the ready state tasks have been selected to run

Head [ AX , B0 , C1 , D0 ] Tail

-------------------------------------------------------------------------------

2. Core 0 has tick interrupt and searches for a task to run.
  Task A is selected and is moved to the back of the list

Core0--|
Head [ AX , B0 , C1 , D0 ] Tail

                       0
Head [ B0 , C1 , D0 , AX ] Tail

-------------------------------------------------------------------------------

3. Core 1 has a tick interrupt and searches for a task to run.
  Task B cannot be run due to incompatible affinity, so core 1 skips to Task C.
  Task C is selected and is moved to the back of the list

Core1-------|          0
Head [ B0 , C1 , D0 , AX ] Tail

                  0    1
Head [ B0 , D0 , AX , C1 ] Tail

-------------------------------------------------------------------------------

4. Core 0 has another tick interrupt and searches for a task to run.
  Task B is selected and moved to the back of the list

Core0--|              1
Head [ B0 , D0 , AX , C1 ] Tail

                  1    0
Head [ D0 , AX , C1 , B0 ] Tail

-------------------------------------------------------------------------------

5. Core 1 has another tick and searches for a task to run.
  Task D cannot be run due to incompatible affinity, so core 1 skips to Task A
  Task A is selected and moved to the back of the list

Core1-------|          0
Head [ D0 , AX , C1 , B0 ] Tail

                  0    1
Head [ D0 , C1 , B0 , AX ] Tail
```

The implications to users regarding the Best Effort Round Robin time slicing:

- Users cannot expect multiple ready state tasks of the same priority to run sequentially (as is the case in Vanilla FreeRTOS). As demonstrated in the example above, a core may need to skip over tasks.
- However, given enough ticks, a task will eventually be given some processing time.
- If a core cannot find a task runnable task at the highest ready state priority, it will drop to a lower priority to search for tasks.
- To achieve ideal round robin time slicing, users should ensure that all tasks of a particular priority are pinned to the same core.

Tick Interrupts

Vanilla FreeRTOS requires that a periodic tick interrupt occurs. The tick interrupt is responsible for:

- Incrementing the scheduler's tick count
- Unblocking any blocked tasks that have timed out
- Checking if time slicing is required (i.e., triggering a context switch)
- Executing the application tick hook

In ESP-IDF FreeRTOS, each core will receive a periodic interrupt and independently run the tick interrupt. The tick interrupts on each core are of the same period but can be out of phase. However, the tick responsibilities listed above are not run by all cores:

- CPU0 will execute all of the tick interrupt responsibilities listed above
- CPU1 will only check for time slicing and execute the application tick hook

---

备注： CPU0 is solely responsible for keeping time in ESP-IDF FreeRTOS. Therefore anything that prevents CPU0 from incrementing the tick count (such as suspending the scheduler on CPU0) will cause the entire schedulers time keeping to lag behind.

Idle Tasks

Vanilla FreeRTOS will implicitly create an idle task of priority 0 when the scheduler is started. The idle task runs when no other task is ready to run, and it has the following responsibilities:

- Freeing the memory of deleted tasks
- Executing the application idle hook

In ESP-IDF FreeRTOS, a separate pinned idle task is created for each core. The idle tasks on each core have the same responsibilities as their vanilla counterparts.

Scheduler Suspension

Vanilla FreeRTOS allows the scheduler to be suspended/resumed by calling `vTaskSuspendAll()` and `xTaskResumeAll()` respectively. While the scheduler is suspended:

- Task switching is disabled but interrupts are left enabled.
- Calling any blocking/yielding function is forbidden, and time slicing is disabled.
- The tick count is frozen (but the tick interrupt will still occur to execute the application tick hook)

On scheduler resumption, `xTaskResumeAll()` will catch up all of the lost ticks and unblock any timed out tasks.

In ESP-IDF FreeRTOS, suspending the scheduler across multiple cores is not possible. Therefore when `vTaskSuspendAll()` is called on a particular core (e.g., core A):

- Task switching is disabled only on core A but interrupts for core A are left enabled
- Calling any blocking/yielding function on core A is forbidden. Time slicing is disabled on core A.
- If an interrupt on core A unblocks any tasks, those tasks will go into core A's own pending ready task list
- If core A is CPU0, the tick count is frozen and a pended tick count is incremented instead. However, the tick interrupt will still occur in order to execute the application tick hook.

When `xTaskResumeAll()` is called on a particular core (e.g., core A):

- Any tasks added to core A's pending ready task list will be resumed
- If core A is CPU0, the pended tick count is unwound to catch up the lost ticks.

警告： Given that scheduler suspension on ESP-IDF FreeRTOS will only suspend scheduling on a particular core, scheduler suspension is **NOT** a valid method ensuring mutual exclusion between tasks when accessing shared data. Users should use proper locking primitives such as mutexes or spinlocks if they require mutual exclusion.

Disabling Interrupts

Vanilla FreeRTOS allows interrupts to be disabled and enabled by calling *taskDISABLE_INTERRUPTS* and *taskENABLE_INTERRUPTS* respectively.

ESP-IDF FreeRTOS provides the same API, however interrupts will only disabled or enabled on the current core.

警告： Disabling interrupts is a valid method of achieve mutual exclusion in Vanilla FreeRTOS (and single core systems in general). However, in an SMP system, disabling interrupts is **NOT** a valid method ensuring mutual exclusion. Refer to Critical Sections for more details.

Startup and Termination

ESP-IDF FreeRTOS **does not** require users to call *vTaskStartScheduler()* to start the scheduler. The startup flow of an ESP-IDF application will already call this automatically. The entry point for user code is a user defined `void app_main(void)` function. For more details regarding the startup of ESP-IDF FreeRTOS applications, see *ESP-IDF FreeRTOS Applications*.

ESP-IDF FreeRTOS **does not** support scheduler termination. Calling *vTaskEndScheduler()* will simply cause the application to abort.

4.10.5 Critical Sections

API Changes

Vanilla FreeRTOS implements critical sections by disabling interrupts, This prevents preemptive context switches and the servicing of ISRs during a critical section. Thus a task/ISR that enters a critical section is guaranteed to be the sole entity to access a shared resource. Critical sections in Vanilla FreeRTOS have the following API:

- `taskENTER_CRITICAL()` enters a critical section by disabling interrupts
- `taskEXIT_CRITICAL()` exits a critical section by reenabling interrupts
- `taskENTER_CRITICAL_FROM_ISR()` enters a critical section from an ISR by disabling interrupt nesting
- `taskEXIT_CRITICAL_FROM_ISR()` exits a critical section from an ISR by reenabling interrupt nesting

However, in an SMP system, merely disabling interrupts does not constitute a critical section as the presence of other cores means that a shared resource can still be concurrently accessed. Therefore, critical sections in ESP-IDF FreeRTOS are implemented using spinlocks. To accommodate the spinlocks, the ESP-IDF FreeRTOS critical section APIs contain an additional spinlock parameter as shown below:

- Spinlocks are of `portMUX_TYPE` (**not to be confused to FreeRTOS mutexes**)
- `taskENTER_CRITICAL(&mux)` enters a critical from a task context
- `taskEXIT_CRITICAL(&mux)` exits a critical section from a task context
- `taskENTER_CRITICAL_ISR(&mux)` enters a critical section from an interrupt context
- `taskEXIT_CRITICAL_ISR(&mux)` exits a critical section from an interrupt context

备注： The critical section API can be called recursively (i.e., nested critical sections). Entering a critical section multiple times recursively is valid so long as the critical section is exited the same number of times it was entered. However, given that critical sections can target different spinlocks, users should take care to avoid dead locking when entering critical sections recursively.

Implementation

In ESP-IDF FreeRTOS, the process of a particular core entering and exiting a critical section is as follows:

- For `taskENTER_CRITICAL(&mux)` (or `taskENTER_CRITICAL_ISR(&mux)`)

1. The core disables its interrupts (or interrupt nesting) up to `configMAX_SYSCALL_INTERRUPT_PRIORITY`
2. The core then spins on the spinlock using an atomic compare-and-set instruction until it acquires the lock. A lock is acquired when the core is able to set the lock's owner value to the core's ID.
3. Once the spinlock is acquired, the function returns. The remainder of the critical section runs with interrupts (or interrupt nesting) disabled.

- For `taskEXIT_CRITICAL(&mux)` (or `taskEXIT_CRITICAL_ISR(&mux)`)
  1. The core releases the spinlock by clearing the spinlock's owner value
  2. The core re-enables interrupts (or interrupt nesting)

Restrictions and Considerations

Given that interrupts (or interrupt nesting) are disabled during a critical section, there are multiple restrictions regarding what can be done within a critical sections. During a critical section, users should keep the following restrictions and considerations in mind:

- Critical sections should be as kept as short as possible
  - The longer the critical section lasts, the longer a pending interrupt can be delayed.
  - A typical critical section should only access a few data structures and/or hardware registers
  - If possible, defer as much processing and/or event handling to the outside of critical sections.
- FreeRTOS API should not be called from within a critical section
- Users should never call any blocking or yielding functions within a critical section

4.10.6 Misc

Floating Point Usage

Usually, when a context switch occurs:

- the current state of a CPU's registers are saved to the stack of task being switch out
- the previously saved state of the CPU's registers are loaded from the stack of the task being switched in

However, ESP-IDF FreeRTOS implements Lazy Context Switching for the FPU (Floating Point Unit) registers of a CPU. In other words, when a context switch occurs on a particular core (e.g., CPU0), the state of the core's FPU registers are not immediately saved to the stack of the task getting switched out (e.g., Task A). The FPU's registers are left untouched until:

- A different task (e.g., Task B) runs on the same core and uses the FPU. This will trigger an exception that will save the FPU registers to Task A's stack.
- Task A get's scheduled to the same core and continues execution. Saving and restoring the FPU's registers is not necessary in this case.

However, given that tasks can be unpinned thus can be scheduled on different cores (e.g., Task A switches to CPU1), it is unfeasible to copy and restore the FPU's registers across cores. Therefore, when a task utilizes the FPU (by using a `float` type in its call flow), ESP-IDF FreeRTOS will automatically pin the task to the current core it is running on. This ensures that all tasks that uses the FPU are always pinned to a particular core.

Furthermore, ESP-IDF FreeRTOS by default does not support the usage of the FPU within an interrupt context given that the FPU's register state is tied to a particular task.

备注: ESP targets that contain an FPU do not support hardware acceleration for double precision floating point arithmetic (`double`). Instead `double` is implemented via software hence the behavioral restrictions regarding the `float` type do not apply to `double`. Note that due to the lack of hardware acceleration, `double` operations may consume significantly more CPU time in comparison to `float`.

ESP-IDF FreeRTOS Single Core

Although ESP-IDF FreeRTOS is an SMP scheduler, some ESP targets are single core (such as the ESP32-S2 and ESP32-C3). When building ESP-IDF applications for these targets, ESP-IDF FreeRTOS is still used but the number of cores will be set to *1* (i.e., the *CONFIG_FREERTOS_UNICORE* will always be enabled for single core targets).

For multicore targets (such as the ESP32 and ESP32-S3), *CONFIG_FREERTOS_UNICORE* can also be set. This will result in ESP-IDF FreeRTOS only running on CPU0, and all other cores will be inactive.

备注: Users should bear in mind that enabling *CONFIG_FREERTOS_UNICORE* **is NOT equivalent to running Vanilla FreeRTOS**. The additional API of ESP-IDF FreeRTOS can still be called, and the behavior changes of ESP-IDF FreeRTOS will incur a small amount of overhead even when compiled for only a single core.

4.11 ESP-WIFI-MESH

本指南提供有关 ESP-WIFI-MESH 协议的介绍。更多有关 API 使用的信息，请见*ESP-WIFI-MESH API 参考*。

4.11.1 概述

ESP-WIFI-MESH 是一套建立在 Wi-Fi 协议之上的网络协议。ESP-WIFI-MESH 允许分布在大范围区域内（室内和室外）的大量设备（下文称节点）在同一个 WLAN（无线局域网）中相互连接。ESP-WIFI-MESH 具有自组网和自修复的特性，也就是说 mesh 网络可以自主地构建和维护。

本 ESP-WIFI-MESH 指南分为以下几个部分：

1. 简介
2. *ESP-WIFI-MESH* 概念
3. 建立网络
4. 管理网络
5. 数据传输
6. 信道切换
7. 性能
8. 更多注意事项

4.11.2 简介

传统基础设施 Wi-Fi 网络是一个“单点对多点”的网络。这种网络架构的中心节点为接入点 (AP)，其他节点 (station) 均与 AP 直接相连。其中，AP 负责各个 station 之间的仲裁和转发，一些 AP 还会通过路由器与外部 IP 网络交换数据。在传统 Wi-Fi 网络架构中，1）由于所有 station 均需与 AP 直接相连，不能距离 AP 太远，因此覆盖区域相对有限；2）受到 AP 容量的限制，因此网络中允许的 station 数量相对有限，很容易超载。

ESP-WIFI-MESH 与传统 Wi-Fi 网络的不同之处在于：网络中的节点不需要连接到中心节点，而是可以与相邻节点连接。各节点均负责相连节点的数据中继。由于无需受限于距离中心节点的位置，所有节点仍可互连，因此 ESP-WIFI-MESH 网络的覆盖区域更广。类似地，由于不再受限于中心节点的容量限制，ESP-WIFI-MESH 允许更多节点接入，也不易于超载。

4.11.3 ESP-WIFI-MESH 概念

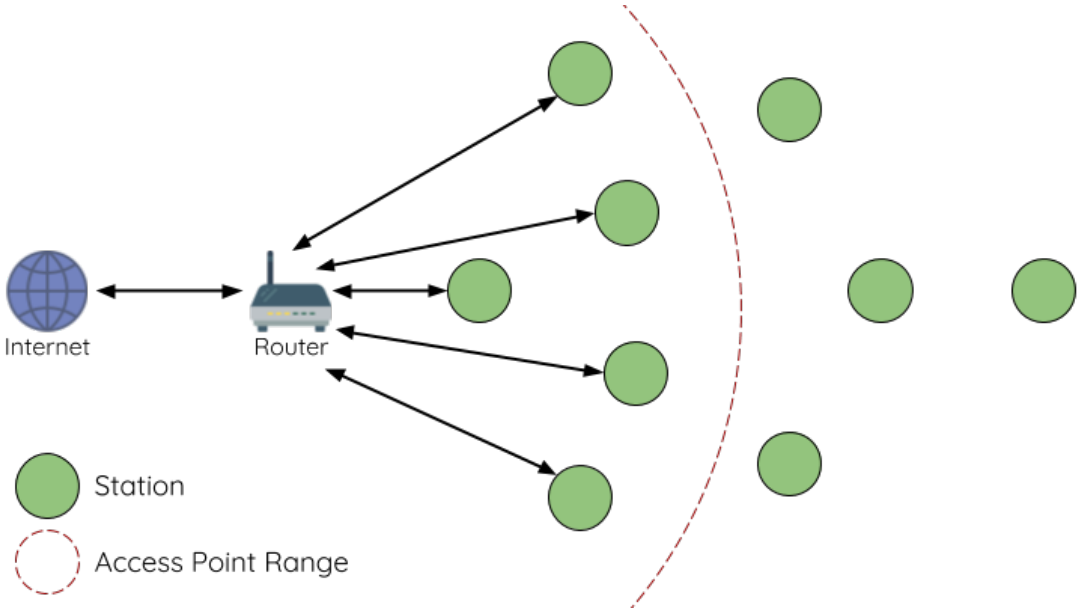

图 19: 传统 Wi-Fi 网络架构

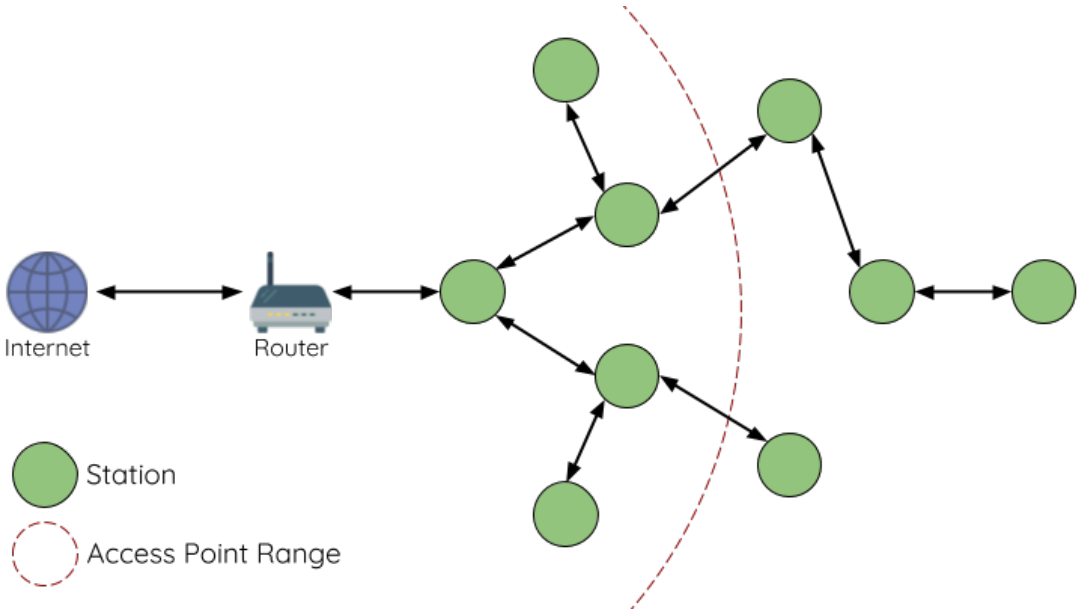

图 20: ESP-WIFI-MESH 网络架构示意图

术语

术语	描述
节点	任何 **属于**或 **可以成为** ESP-WIFI-MESH 网络一部分的设备
根节点	网络顶部的节点
子节点	如节点 X 连接至节点 Y，且 X 相较 Y 与根节点的距离更远（跨越的连接数量更多），则称 X 为 Y 的子节点。
父节点	与子节点对应的概念
后裔节点	任何可以从根节点追溯到的节点
兄弟节点	连接至同一个父节点的所有节点
连接	AP 和 station 之间的传统 Wi-Fi 关联。ESP-WIFI-MESH 中的节点使用 station 接口与另一个节点的 SoftAP 接口产生关联，进而形成连接。连接包括 Wi-Fi 网络中的身份验证和关联过程。
上行连接	从节点到其父节点的连接
下行连接	从父节点到其一个子节点的连接
无线 hop	源节点和目标节点间无线连接路径中的一部分。**单跳**指遍历单个连接的数据包，**多跳**指遍历多个连接的数据包。
子网	子网指 ESP-WIFI-MESH 网络的一部分，包括一个节点及其所有后代节点。因此，根节点的子网包括 ESP-WIFI-MESH 网络中的所有节点。
MAC 地址	在 ESP-WIFI-MESH 网络中用于区别每个节点或路由器的唯一地址
DS	分布式系统（外部 IP 网络）

树型拓扑

ESP-WIFI-MESH 建立在传统 Wi-Fi 协议之上，可被视为一种将多个独立 Wi-Fi 网络组合为一个单一 WLAN 网络的组网协议。在 Wi-Fi 网络中，station 在任何时候都仅限于与 AP 建立单个连接（上行连接），而 AP 则可以同时连接到多个 station（下行连接）。然而，ESP-WIFI-MESH 网络则允许节点同时充当 station 和 AP。因此，ESP-WIFI-MESH 中的节点可以使用 **其 SoftAP 接口建立多个下行连接**，同时使用 **其 station 接口建立一个上行连接**。这将自然产生一个由多层父子结构组成的树型网络拓扑结构。

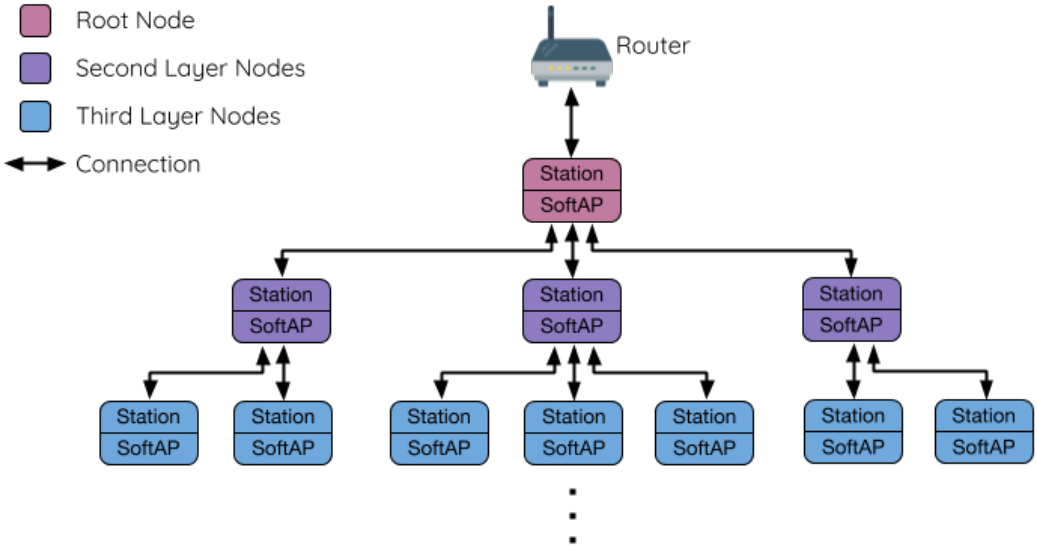

图 21: ESP-WIFI-MESH 树型拓扑

ESP-WIFI-MESH 是一个多跳网络，也就是说网络中的节点可以通过单跳或多跳向网络中的其他节点传送数据包。因此，ESP-WIFI-MESH 中的节点不仅传输自己的数据包，而且同时充当其他节点的中继。假设 ESP-WIFI-MESH 网络中的任意两个节点存在物理层上连接（通过单跳或多跳），则这两个节点可以进行通信。

备注： ESP-WIFI-MESH 网络中的大小（节点总数）取决于网络中允许的最大层级，以及每个节点可以具有的最大下行连接数。因此，这两个变量可用于配置 ESP-WIFI-MESH 网络的大小。

节点类型

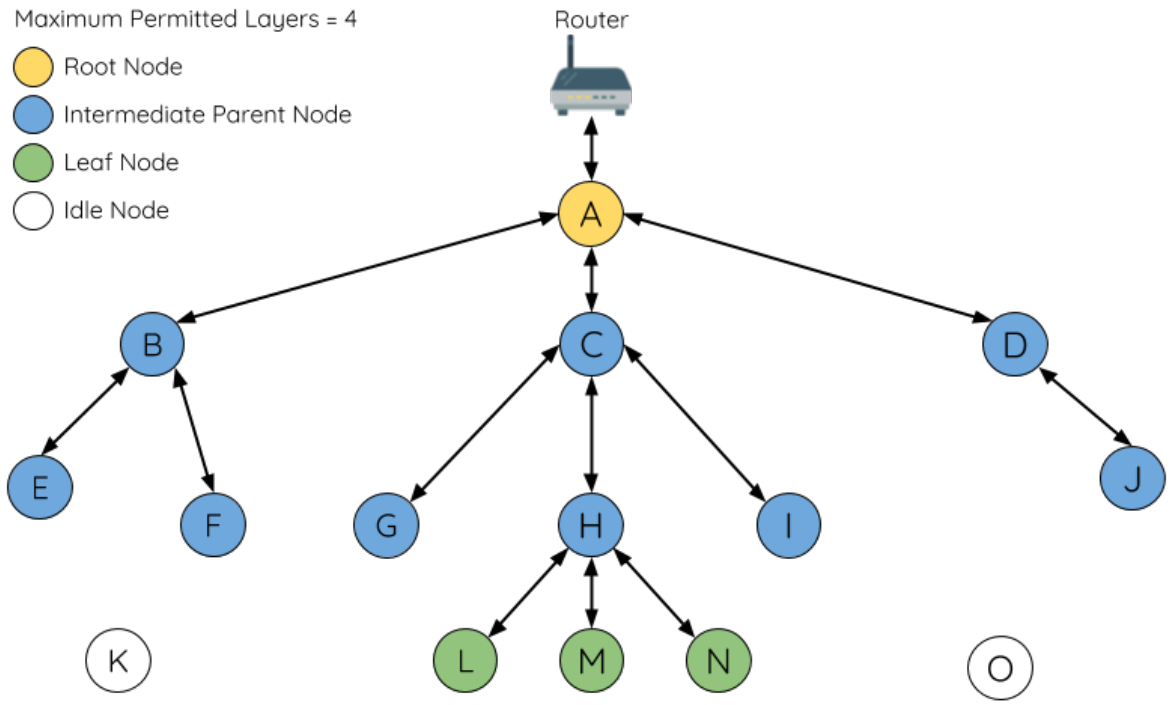

图 22: ESP-WIFI-MESH 节点类型

根节点：指网络顶部的节点，是 ESP-WIFI-MESH 网络和外部 IP 网络之间的唯一接口。根节点直接连接至传统的 Wi-Fi 路由器，并在 ESP-WIFI-MESH 网络的节点和外部 IP 网络之间中继数据包。**ESP-WIFI-MESH 网络中只能有一个根节点**，且根节点的上行连接只能是路由器。如上图所示，节点 A 即为该 ESP-WIFI-MESH 网络的根节点。

叶子节点：指不允许拥有任何子节点（即无下行连接）的节点。因此，叶子节点只能传输或接收自己的数据包，但不能转发其他节点的数据包。如果节点处于 ESP-WIFI-MESH 网络的最大允许层级，则该节点将成为叶子节点。叶子节点不回再产生下行连接，这可以防止节点继续生成下行连接，从而确保网络层级不会超出限制。由于建立下行连接必须使用 SoftAP 接口，因此一些没有 SoftAP 接口的节点（仅有 station 接口）也将被分配为叶子节点。如上图所示，位于网络最外层的 L/M/N 节点即为叶子节点。

中间父节点：既不是属于根节点也不属于叶子节点的节点即为中间父节点。中间父节点必须有且仅有一个上行连接（即一个父节点），但可以具有 0 个或多个下行连接（即 0 个或多个子节点）。因此，中间父节点可以发送和接收自己的数据包，也可以转发其上行和下行连接的数据包。如上图所示，节点 B 到 J 即为中间父节点。**注意，E/F/G/I/J 等没有下行连接的中间父节点并不等同于叶子节点**，原因在于这些节点仍允许形成下行连接。

空闲节点：尚未加入网络的节点即为空闲节点。空闲节点将尝试与中间父节点形成上行连接，或者在有条件的情况下（参见 *自动根节点选择* ）成为一个根节点。如上图所示，K 和 O 节点即为空闲节点。

信标帧和 RSSI 阈值

ESP-WIFI-MESH 中能够形成下行连接的每个节点（即具有 SoftAP 接口）都会定期传输 Wi-Fi 信标帧。节点可以通过信标帧让其他节点检测自己的存在和状态。空闲节点将侦听信标帧以生成一个潜在父节点列

表，并与其中一个潜在父节点形成上行连接。ESP-WIFI-MESH 使用“供应商信息元素”来存储元数据，例如：

- 节点类型（根节点、中间父节点、叶子节点、空闲节点）
- 节点当前所处的层级
- 网络中允许的最大层级
- 当前子节点数量
- 可接受的最大下行连接数量

潜在上行连接的信号强度可由潜在父节点信标帧的 RSSI 表示。为了防止节点形成弱上行连接，ESP-WIFI-MESH 采用了针对信标帧的 RSSI 阈值控制机制。如果节点检测到某节点的信标帧 RSSI 过低（即低于预设阈值），则会在尝试形成上行连接时忽略该节点。

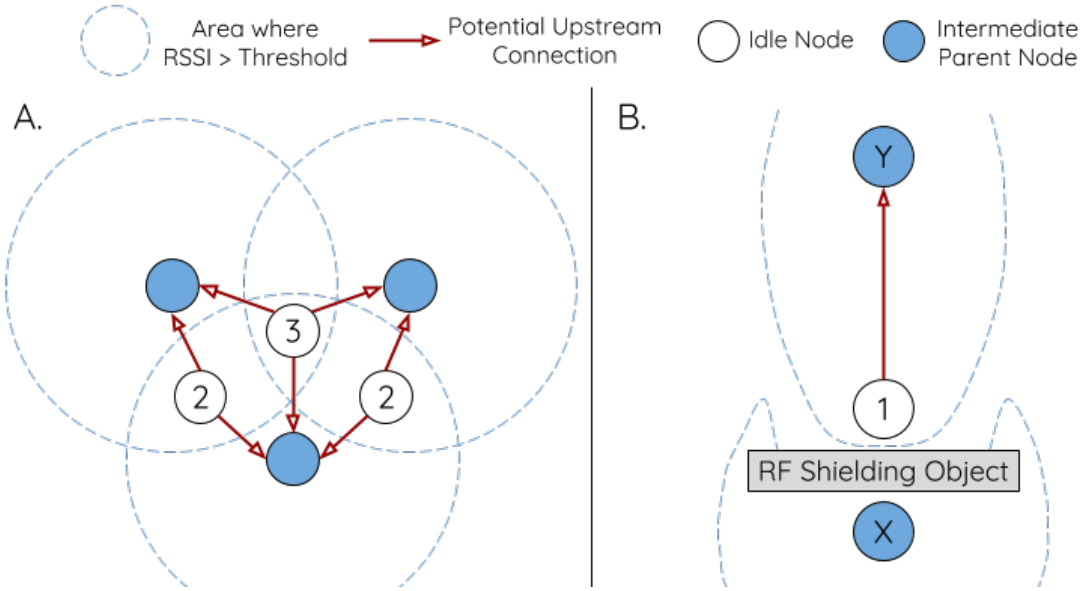

图 23: RSSI 阈值的影响

上图（A 侧）展示了 RSSI 阈值将如何影响空闲节点的候选父节点数量。

上图（B 侧）展示了 RF 屏蔽物将如何降低潜在父节点的 RSSI。由于存在 RF 屏蔽物，节点 X 的 RSSI 高于阈值的区域显著减小。这会导致空闲节点忽略节点 X，即使从地理位置上看 X 就在空闲节点附近。相反，该空闲节点将从更远的地方找到一个 RSSI 更强的节点 Y 形成上行连接。

备注： 事实上，ESP-WIFI-MESH 网络中的节点在 MAC 层仍可以接收所有的信标帧，但 RSSI 阈值控制功能可以过滤掉所有 RSSI 低于预设阈值的信标帧。

首选父节点

当一个空闲节点有多个候选父节点（潜在父节点）时，空闲节点将与其中的 **首选父节点**形成上行连接。首选父节点基于以下条件确定：

- 候选父节点所处的层级
- 候选父节点当前具有的下行连接（子节点）数量

在网络中所处层级较浅的候选父节点（包括根节点）将优先成为首选父节点。这有助于在形成上行连接时控制 ESP-WIFI-MESH 网络中的总层级使之最小。例如，在位于第二层和第三层的候选父节点间选择时，位于第二层的候选父节点将始终优先成为首选父节点。

如果同一层上存在多个候选父节点，则子节点最少的候选父节点将优先成为首选父节点。这有助于平衡同一层节点的下行连接数量。

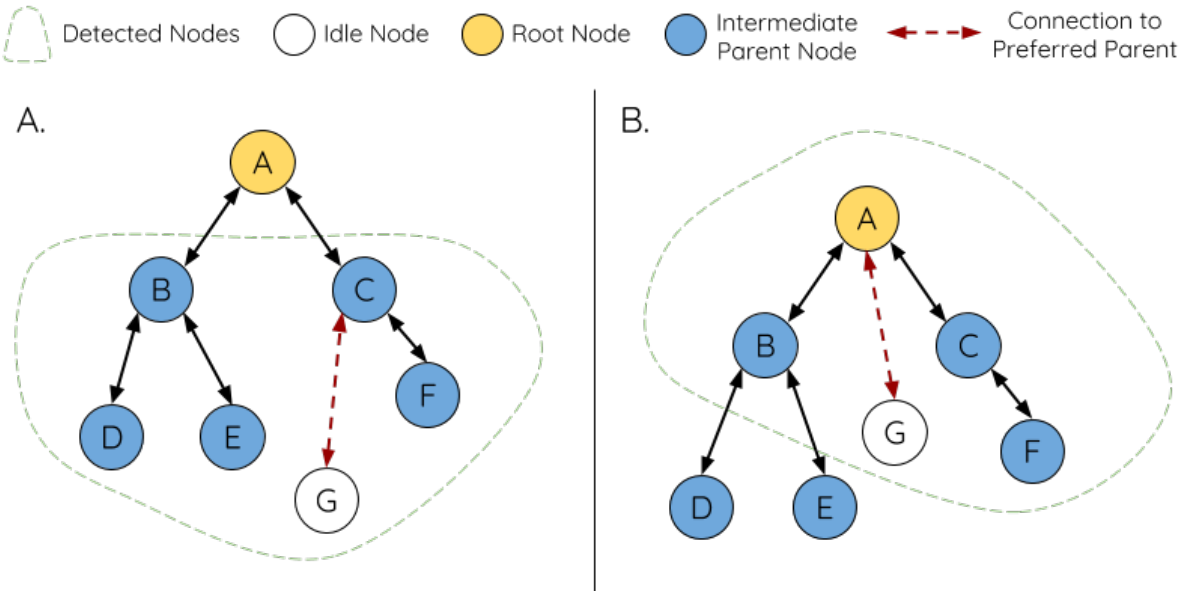

图 24: 首选父节点选择

上图（A 侧）展示了空闲节点 G 如何在 B/C/D/E/F 五个候选父节点中选择首选父节点：首先，B/C 节点优于 D/E/F 节点，因为这两个节点所处的层级更浅。其次，C 节点优于 B 节点，因为 C 节点的下行连接数量（子节点数量）更少。

上图（B 侧）展示了空闲节点 G 如何在根节点 A 和其他候选父节点中选择首选父节点，此时根节点 A 处于空闲节点 G 范围之内（即空闲节点 G 接收到的根节点 A 信标帧 RSSI 强度高于预设阈值）：由于根节点 A 处于网络中最浅的层，因此将成为首选父节点。

备注： 用户还可以自行定义首选父节点的选择规则，也可以直接指定某个节点为首选父节点（见 Mesh 手动配网示例 ）。

路由表

ESP-WIFI-MESH 网络中的每个节点均会维护自己的路由表，并按路由表将数据包（请见*ESP-WIFI-MESH 数据包*）沿正确的路线发送至正确的目标节点。某个特定节点的路由表将包含 **该节点的子网中所有节点的 MAC 地址**，也包括该节点自己的 MAC 地址。每个路由表会划分为多个子路由表，与每个子节点的子网对应。

以上图为例，节点 B 的路由表中将包含节点 B 到节点 I 的 MAC 地址（即相当于节点 B 的子网）。节点 B 的路由表可划分为节点 C 和 G 的子路由表，分别包含节点 C 到节点 F 的 MAC 地址、节点 G 到节点 I 的 MAC 地址。

ESP-WIFI-MESH 利用路由表来使用以下规则进行转发，确定 ESP-WIFI-MESH 数据包应根据向上行转发还是向下行转发。

1. 如果数据包的目标 MAC 地址处于当前节点的路由表中且不是当前节点本身，则选择包含目标 MAC 地址的子路由表，并将数据包向下转发给子路由表对应的子节点。

2. 如果数据包的目标 MAC 地址不在当前节点的路由表内，则将数据包向上转发给当前节点的父节点，并重复执行该操作直至数据包达到目标地址。此步骤可重复至根节点（根节点包含整个网络的全部节点）。

备注： 用户可以通过调用`esp_mesh_get_routing_table()` 获取一个节点的路由表，调用`esp_mesh_get_routing_table_size()` 获取一个路由表的大小，也可

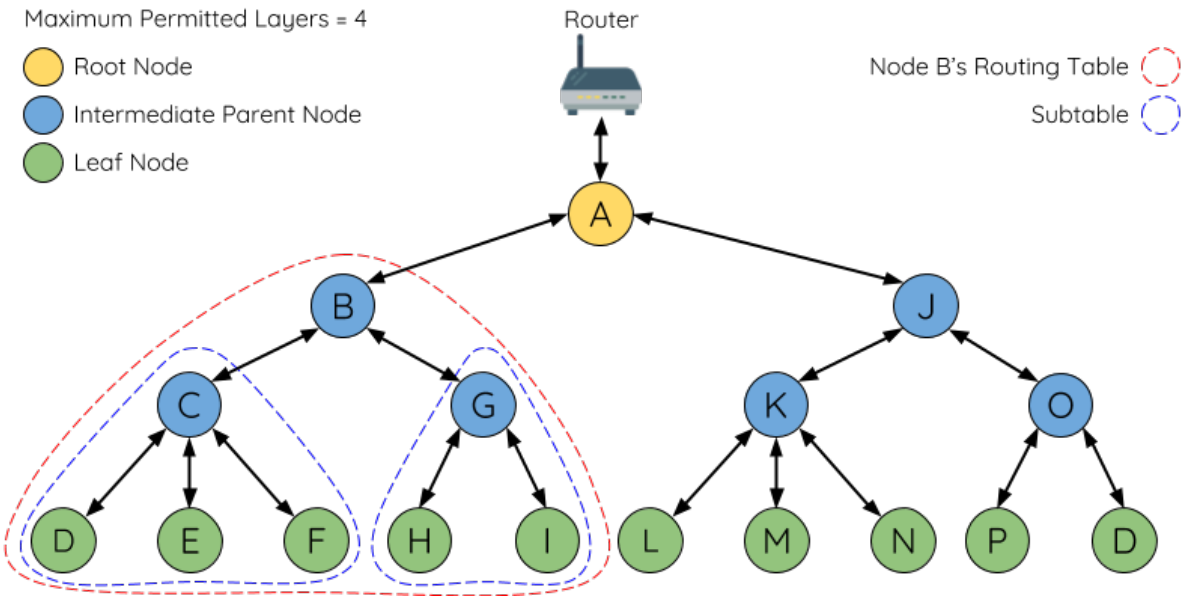

图 25: ESP-WIFI-MESH 路由表示例

通过调用*esp_mesh_get_subnet_nodes_list()* 获取某个子节点的子路由表，调用*esp_mesh_get_subnet_nodes_num()* 获取子路由表的大小。

4.11.4 建立网络

一般过程

警告： ESP-WIFI-MESH 正式开始构建网络前，必须确保网络中所有节点具有相同的配置（见*mesh_cfg_t*）。每个节点必须配置 **相同 MESH 网络 ID、路由器配置和 SoftAP 配置**。

ESP-WIFI-MESH 网络将首先选择根节点，然后逐层形成下行连接，直到所有节点均加入网络。网络的布局可能取决于诸如根节点选择、父节点选择和异步上电复位等因素。但简单来说，一个 ESP-WIFI-MESH 网络的构建过程可以概括为以下步骤：

1. 根节点选择 根节点直接进行指定（见*用户指定根节点*）或通过选举由信号强度最强的节点担任（见*自动根节点选择*）。一旦选定，根节点将与路由器连接，并开始允许下行连接形成。如上图所示，节点 A 被选为根节点，因此节点 A 上行连接到路由器。

2. 第二层形成 一旦根节点连接到路由器，根节点范围内的空闲节点将开始与根节点连接，从而形成第二层网络。一旦连接，第二层节点成为中间父节点（假设最大允许层级大于 2 层），并进而形成下一层。如上图所示，节点 B 到节点 D 都在根节点的连接范围内。因此，节点 B 到节点 D 将与根节点形成上行连接，并成为中间父节点。

3. 其余层形成 剩余的空闲节点将与所处范围内的中间父节点连接，并形成新的层。一旦连接，根据网络的最大允许层级，空闲节点成为中间父节点或叶子节点。此后重复该步骤，直到网络中的所有空闲节点均加入网络或达到网络最大允许层级。如上图所示，节点 E/F/G 分别与节点 B/C/D 连接，并成为中间父节点。

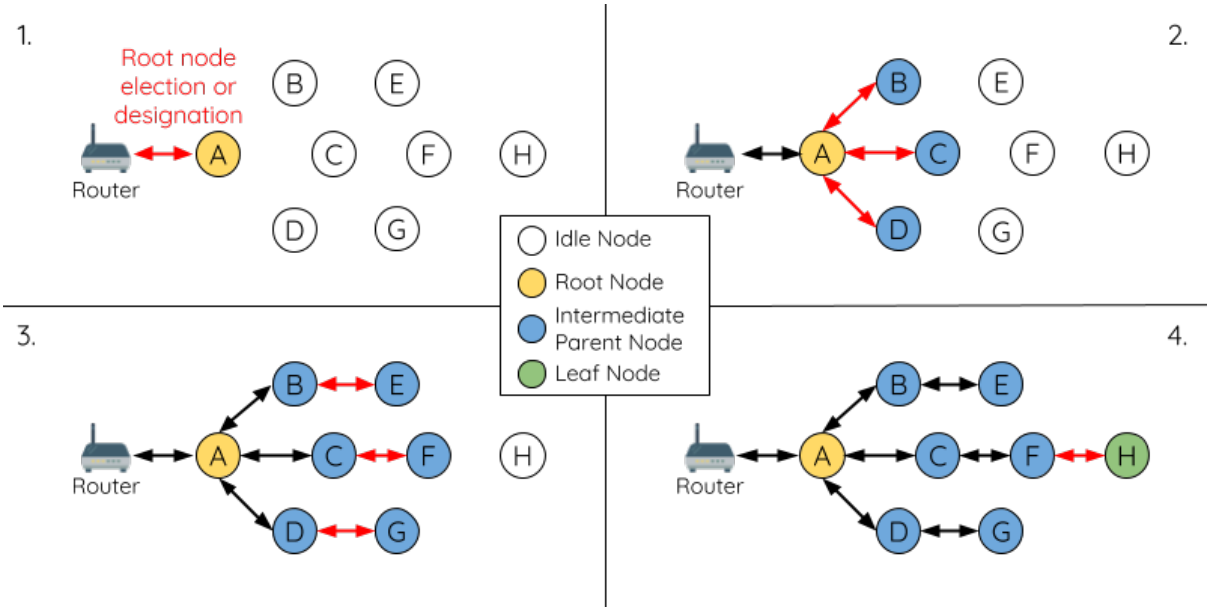

图 26: ESP-WIFI-MESH 网络构建过程

4. 限制树深度 为了防止网络超过最大允许层级，最大允许层级上的节点将在完成连接后成为叶子节点。这样一来，其他空闲节点将无法与这些最大允许层上的叶子节点形成连接，因此不会超过最大允许层级。然而，如果空闲节点无法找到其他潜在父节点，则将无限期地保持空闲状态。如上图所示，网络的最大允许层级为四。因此，节点 H 在完成连接后将成为叶子节点，以防止任何下行连接的形成。

自动根节点选择

在自动模式下，根节点的选择取决于相对于路由器的信号强度。每个空闲节点将通过 Wi-Fi 信标帧发送自己的 MAC 地址和路由器 RSSI 值。**MAC 地址可以表示网络中的唯一节点**，而 **路由器 RSSI 值**代表相对于路由器的信号强度。

此后，每个节点将同时扫描来自其他空闲节点的信标帧。如果节点检测到具有更强的路由器 RSSI 的信标帧，则节点将开始传输该信标帧的内容（相当于为这个节点投票）。经过最小迭代次数（可预先设置，默认为 10 次）将选举出路由器 RSSI 值最强的信标帧。

在达到预设迭代次数后，每个节点将单独检查其 **得票百分比**（得票数/总票数）以确定它是否应该成为根节点。**如果节点的得票百分比大于预设的阈值（默认为 90%），则该节点将成为根节点**。

下图展示了在 ESP-WIFI-MESH 网络中，根节点的自动选择过程。

1. 上电复位时，每个节点开始传输自己的信标帧（包括 MAC 地址和路由器 RSSI 值）。

2. 在多次传输和扫描迭代中，路由器 RSSI 最强的信标帧将在整个网络中传播。节点 C 具有最强的路由器 RSSI 值 (-10 dB)，因此它的信标帧将在整个网络中传播。所有参与选举的节点均给节点 C 投票，因此节点 C 的得票百分比为 100%。因此，节点 C 成为根节点，并与路由器连接。

3. 一旦节点 C 与路由器连接，节点 C 将成为节点 A/B/D/E 的首选父节点（即最浅的节点），并与这些节点连接。节点 A/B/D/E 将形成网络的第二层。

4. 节点 F 和节点 G 分别连接节点 D 和节点 E，并完成网络构建过程。

备注： 用户可以通过 `esp_mesh_set_attempts()` 配置选举的最小迭代次数。用户应根据网络内的节点数量配置迭代次数（即 mesh 网络越大，所需的迭代次数越高）。

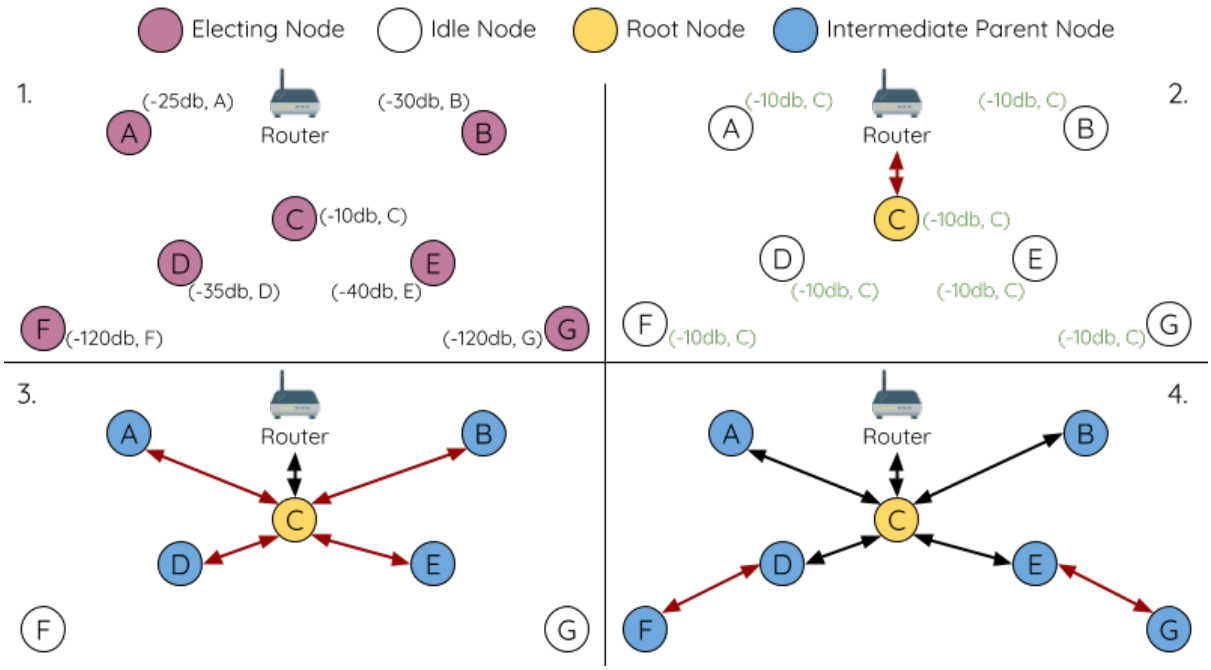

图 27: 根节点选举示例

警告： **得票百分比阈值**也可以使用`esp_mesh_set_vote_percentage()`进行配置。得票百分比阈值过低 **可能导致同一 mesh 网络中两个或多个节点成为根节点**，进而分化为多个 mesh 网络。如果发生这种情况，ESP-WIFI-MESH 具有内部机制，可自主解决 **根节点冲突**。这些具有多个根节点的网络将围绕一个根节点形成一个网络。然而，两个或多个路由器 SSID 相同但路由器 BSSID 不同的根节点冲突尚无法解决。

用户指定根节点

根节点也可以由用户指定，即直接让指定的根节点与路由器连接，并放弃选举过程。当根节点指定后，网络内的所有其他节点也必须放弃选举过程，以防止根节点冲突的发生。下图展示了在 ESP-WIFI-MESH 网络中，根节点的手动选择过程。

1. 节点 A 是由用户指定的根节点，因此直接与路由器连接。此时，所有其他节点放弃选举过程。

2. 节点 C 和节点 D 将节点 A 选为自己的首选父节点，并与其形成连接。这两个节点将形成网络的第二层。

3. 类似地，节点 B 和节点 E 将与节点 C 连接，节点 F 将与节点 D 连接。这三个节点将形成网络的第三层。

4. 节点 G 将与节点 E 连接，形成网络的第四层。然而，由于该网络的最大允许层级已配置为 4，因此节点 G 将成为叶子节点，以防止形成任何新层。

备注： 一旦指定根节点，该根节点应调用`esp_mesh_set_parent()`使其直接与路由器连接。类似地，所有其他节点都应该调用`esp_mesh_fix_root()`放弃选举过程。

选择父节点

默认情况下，ESP-WIFI-MESH 具有可以自组网的特点，也就是每个节点都可以自主选择与其形成上行连接的潜在父节点。自主选择出的父节点被称为首选父节点。用于选择首选父节点的标准旨在减少 ESP-WIFI-MESH 网络的层级，并平衡各个潜在父节点的下行连接数（参见首选父节点）。

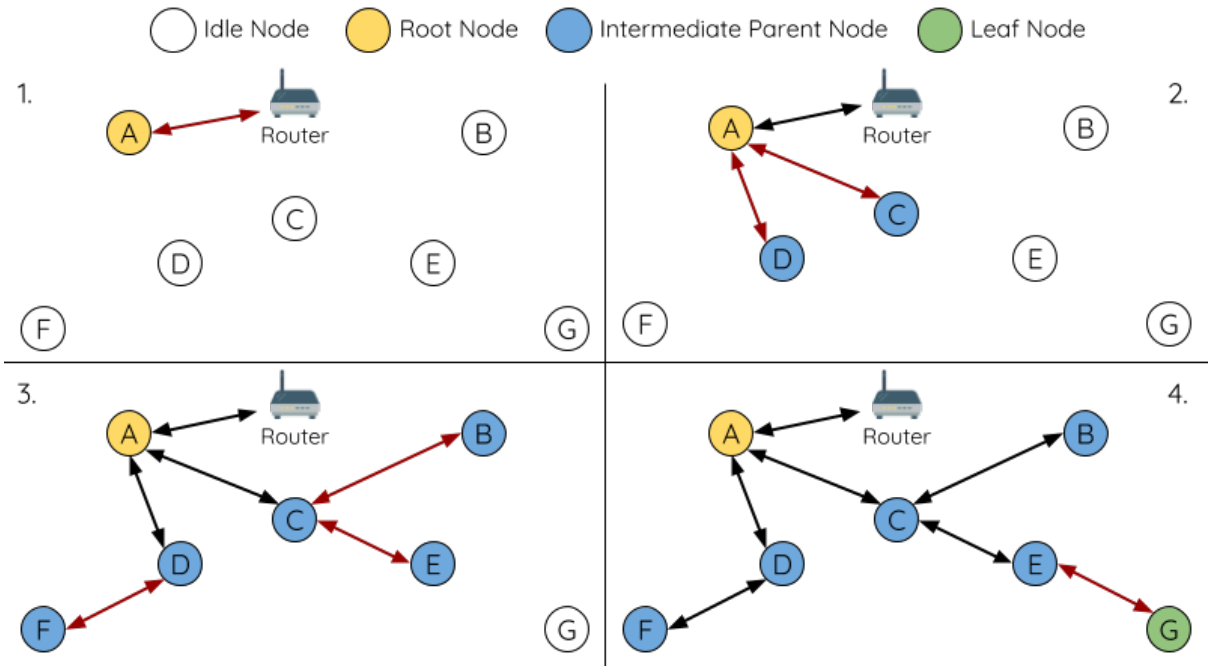

图 28: 根节点指定示例（根节点 = A，最大层级 = 4)

不过，ESP-WIFI-MESH 也允许用户禁用自组网功能，即允许用户自己定义父节点选择标准，或直接指定某个节点为父节点（见：Mesh 手动组网示例)。

异步上电复位

ESP-WIFI-MESH 网络构建可能会受到节点上电顺序的影响。如果网络中的某些节点为异步上电（即相隔几分钟上电），**网络的最终结构可能与所有节点同步上电时的理想情况不同**。延迟上电的节点将遵循以下规则：

规则 1：如果网络中已存在根节点，则延迟节点不会尝试选举成为新的根节点，即使自身的路由器 RSSI 更强。相反，延迟节点与任何其他空闲节点无异，将通过与首选父节点连接来加入网络。如果该延迟节点为用户指定的根节点，则网络中的所有其他节点将保持空闲状态，直到延迟节点完成上电。

规则 2：如果延迟节点形成上行连接，并成为中间父节点，则后续也可能成为其他节点（即其他更浅的节点）的新首选父节点。此时，其他节点切换上行连接至该延迟节点（见父节点切换)。

规则 3：如果空闲节点的指定父节点上电延迟了，则该空闲节点在没有找到指定父节点前不会尝试形成任何上行连接。空闲节点将无限期地保持空闲，直到其指定的父节点上电完成。

下方示例展示了异步上电对网络构建的影响。

1. 节点 A/C/D/F/G/H 同步上电，并通过广播其 MAC 地址和路由器 RSSI 开始选举根节点。节点 A 的 RSSI 最强，因此当选为根节点。

2. 一旦节点 A 成为根节点，其余的节点就开始与其首选父节点逐层形成上行连接，并最终形成一个具有五层的网络。

3. 节点 B/E 由于存在上电延迟，因此即使路由器 RSSI 比节点 A 更强（-20 dB 和 -10 dB）也不会尝试成为根节点。相反，这两个上电延迟节点均将与对应的首选父节点 A 和 C 形成上行连接。加入网络后，节点 B/E 均将成为中间父节点。

4. 节点 B 由于所处层级变化（现为第二层）而成为新的首选父节点，因此节点 D/G 将切换其上行连接从而选择新的首选父节点。由于切换的发生，最终的网络层级从原来的五层减少至三层。

同步上电：如果所有节点均同步上电，节点 E （-10 dB）由于路由器 RSSI 最强而成为根节点。此时形成的网络结构将与异步上电的情况截然不同。**但是，如果用户手动切换根节点，则仍可以达到同步上电的网络结构**（请见`esp_mesh_waive_root()`)。

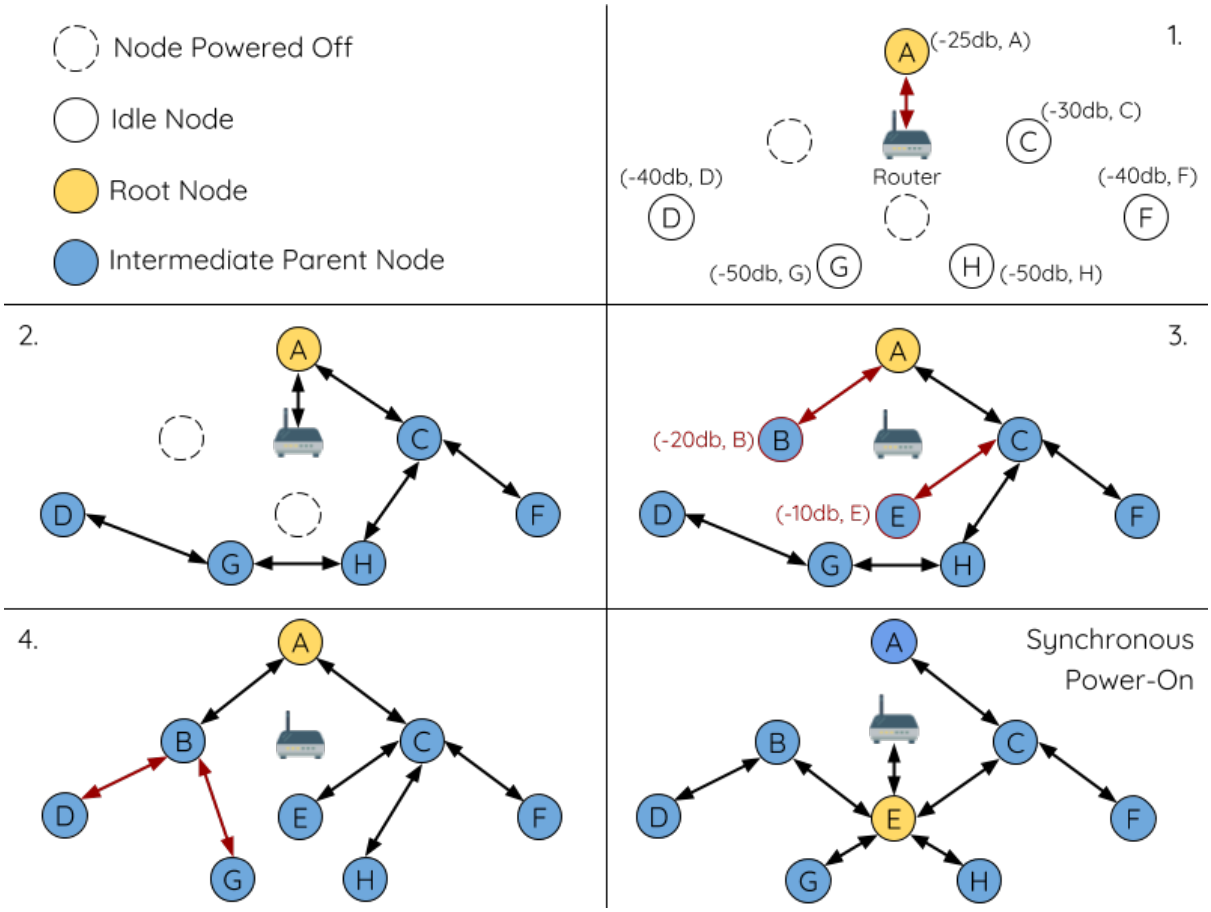

图 29: 网络构建（异步电源）示例

备注： 从某种程度上，ESP-WIFI-MESH 可以自动修复部分因异步上电引起的父节点选择的偏差（请见父节点切换）

环路避免、检测和处理

环路是指特定节点与其后代节点（特定节点子网中的节点）形成上行连接的情况。因此产生的循环连接路径将打破 mesh 网络的树型拓扑结构。ESP-WIFI-MESH 的节点在选择父节点时将主动排除路由表（见路由表）中的节点，从而避免与其子网中的节点建立上行连接并形成环路。

在存在环路的情况下，ESP-WIFI-MESH 可利用路径验证机制和能量传递机制来检测环路的产生。因与子节点建立上行连接而导致环路形成的父节点将通知子节点环路的存在，并主动断开连接。

4.11.5 管理网络

作为一个自修复网络，ESP-WIFI-MESH 可以检测并修正网络路由中的故障。当具有一个或多个子节点的父节点断开或父节点与其子节点之间的连接不稳定时，会发生故障。ESP-WIFI-MESH 中的子节点将自主选择一个新的父节点，并与其形成上行连接，以维持网络互连。ESP-WIFI-MESH 可以处理根节点故障和中间父节点故障。

根节点故障

如果根节点断开，则与其连接的节点（第二层节点）将及时检测到该根节点故障。第二层节点将主动尝试与根节点重连。但是在多次尝试失败后，第二层节点将启动新一轮的根节点选举。**第二层中 RSSI 最强的节点将当选为新的根节点**，而剩余的第二层节点将与新的根节点（如果不在范围内的话，也可与相邻父节点连接）形成上行连接。

如果根节点和下面多层的节点（例如根节点、第二层节点和第三层节点）同时断开，则位于最浅层的仍在正常工作的节点将发起根节点选举。下方示例展示了网络从根节点断开故障中进行自修复。

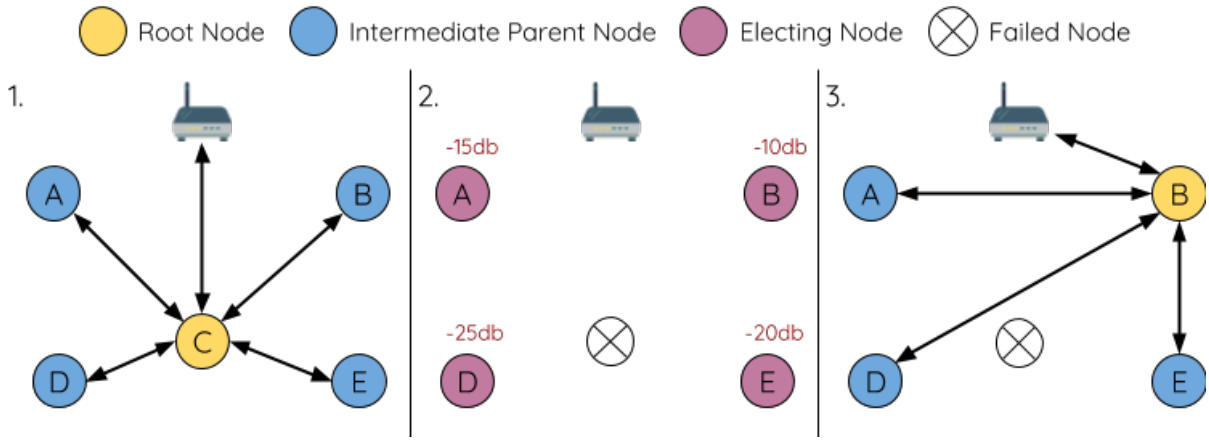

图 30: 根节点故障的自修复示意

1. 节点 C 是网络的根节点。节点 A/B/D/E 是连接到节点 C 的第二层节点。

2. 节点 C 断开。在多次重连尝试失败后，第二层节点开始通过广播其路由器 RSSI 开始新一轮的选举。此时，节点 B 的路由器 RSSI 最强。

3. 节点 B 被选为根节点，并开始接受下行连接。剩余的第二层节点 A/D/E 形成与节点 B 的上行连接，因此网络已经恢复，并且可以继续正常运行。

备注： 如果是手动指定的根节点断开，则无法进行自动修复。**任何节点不会在存在指定根节点的情况下开始选举过程**。

中间父节点故障

如果中间父节点断开，则与之断开的子节点将主动尝试与该父节点重连。在多次重连尝试失败后，每个子节点开始扫描潜在父节点（请见信标帧和 *RSSI* 阈值）。

如果存在其他可用的潜在父节点，每个子节点将分别给自己选择一个新的首选父节点（请见首选父节点），并与它形成上行连接。如果特定子节点没有其他潜在的父节点，则将无限期地保持空闲状态。

下方示例展示了网络从中间父节点断开故障中进行自修复。

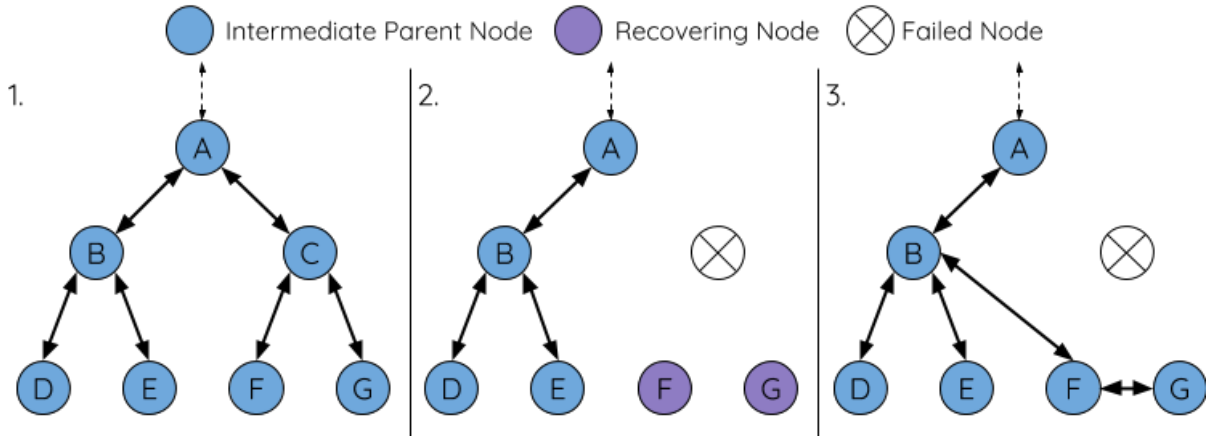

图 31: 中间父节点故障的自修复

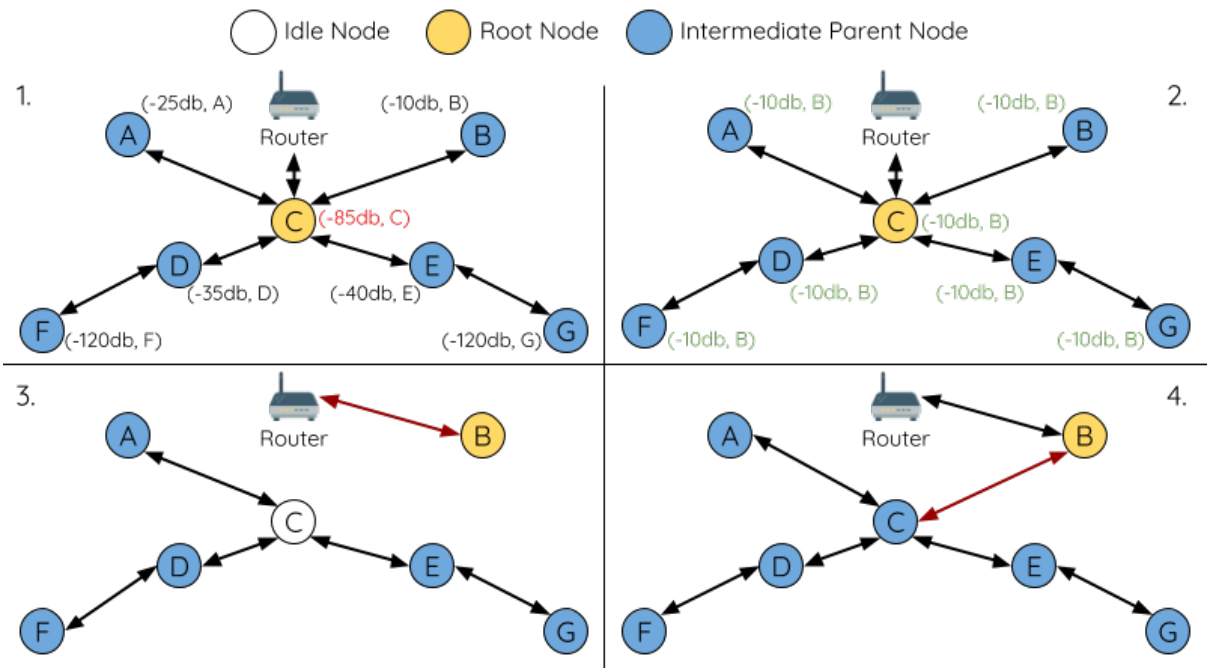
1. 网络中存在节点 A 至 G。

2. 节点 C 断开。节点 F/G 检测到节点 C 的断开故障，并尝试与节点 C 重新连接。在多次重连尝试失败后，节点 F/G 将开始选择新的首选父节点。

3. 节点 G 因其范围内不存在任何父节点而暂时保持空闲。节点 F 的范围中有 B 和 E 两个节点，但节点 B 因为所处层级更浅而当选新的父节点。节点 F 将与节点 B 连接后，并成为一个中间父节点，节点 G 将于节点 F 相连。这样一来，网络已经恢复了，但结构发生了变化（网络层级增加了 1 层）。

备注： 如果子节点的父节点已被指定，则子节点不会尝试与其他潜在父节点连接。此时，该子节点将无限期地保持空闲状态。

根节点切换



除非根节点断开，否则 ESP-WIFI-MESH 不会自动切换根节点。即使根节点的路由器 RSSI 降低至必须断开的情况，根节点也将保持不变。根节点切换是指明确启动新选举过程的行为，即具有更强路由器 RSSI 的节点选为新的根节点。这可以用于应对根节点性能降低的情况。

要触发根节点切换，当前根节点必须明确调用`esp_mesh_waive_root()`以触发新的选举。当下根节点将指示网络中的所有节点开始发送并扫描信标帧（见自动根节点选择），**但与此同时一直保持联网（即不会变为空闲节点）**。如果另一个节点收到的票数超过当前根节点，则将启动根节点切换过程，**否则根节点将保持不变**。

新选出的根节点向当前的根节点发送 **切换请求**，而原先的根节点将返回一个应答通知，表示已经准备好切换。一旦接收到应答，新选出的根节点将与其父节点断开连接，并迅速与路由器形成上行连接，进而

成为网络的新根节点。原先的根节点将断开与路由器的连接，**并与此同时保持其所有下行连接**并进入空闲状态。之前的根节点将开始扫描潜在的父节点并选择首选父节点。

下图说明了根节点切换的示例。

切换根节点示例

1. 节点 C 是当前的根节点，但路由器 RSSI 值 (-85 dB) 降低至较低水平。此时，新的选举过程被触发了。所有节点开始传输和扫描信标帧（**此时仍保持连接**）。

2. 经过多轮传输和扫描后，节点 B 被选为新的根节点。节点 B 向节点 C 发送了一个 **切换请求**，节点 C 回复一个应答。

3. 节点 B 与其父节点断开连接，并与路由器连接，成为网络中的新根节点。节点 C 与路由器断开连接，进入空闲状态，并开始扫描并选择新的首选父节点。**节点 C 在整个过程中仍保持其所有的下行连接**。

4. 节点 C 选择节点 B 作为其的首选父节点，与之形成上行连接，并成为一个第二层节点。由于节点 C 仍保持相同的子网，因此根节点切换后的网络结构没有变化。然后，由于切换的发生，节点 C 子网中每个节点的所处层级均增加了一层。如果根节点切换过程中产生了新的根节点，则父节点切换 可以随后调整网络结构。

备注： 根节点切换必须要求选举，因此只有在使用自组网 ESP-WIFI-MESH 网络时才支持。换句话说，如果使用指定的根节点，则不能进行根节点切换。

父节点切换

父节点切换是指一个子节点将其上行连接切换到更浅一层的另一个父节点。**父节点切换是自动的**，这意味着如果较浅层出现了可用的潜在父节点（因“异步上电复位”产生），子节点将自动更改其上行连接。

所有潜在的父节点将定期发送信标帧（参见信标帧和 *RSSI* 阈值），从而允许子节点扫描较浅层的父节点的可用性。由于父节点切换，自组网 ESP-WIFI-MESH 网络可以动态调整其网络结构，以确保每个连接均具有良好的 RSSI 值，并且网络中的层级最小。

4.11.6 数据传输

ESP-WIFI-MESH 数据包

ESP-WIFI-MESH 网络使用 ESP-WIFI-MESH 数据包传输数据。ESP-WIFI-MESH 数据包 **完全包含在 Wi-Fi 数据帧**中。ESP-WIFI-MESH 网络中的多跳数据传输将涉及通过不同 Wi-Fi 数据帧在每个无线跳上传输的单个 ESP-WIFI-MESH 数据包。

下图显示了 ESP-WIFI-MESH 数据包的结构及其与 Wi-Fi 数据帧的关系。

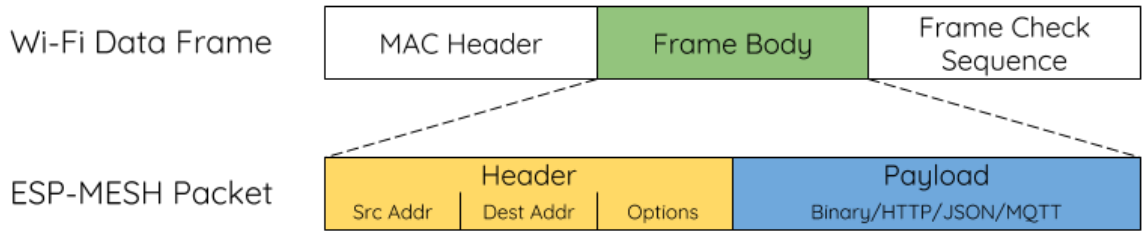


图 32: ESP-WIFI-MESH 数据包

ESP-WIFI-MESH 数据包的 **报头**包含源节点和目标节点的 MAC 地址。**选项 (option)** 字段包含有关特殊类型 ESP-WIFI-MESH 数据包的信息，例如组传输或来自外部 IP 网络的数据包（请参阅*MESH_OPT_SEND_GROUP* 和*MESH_OPT_RECV_DS_ADDR*）。

ESP-WIFI-MESH 数据包的 **有效载荷**包含实际的应用数据。该数据可以为原始二进制数据，也可以是使用 HTTP、MQTT 和 JSON 等应用层协议的编码数据（请见：*mesh_proto_t*）。

备注： 当向外部 IP 网络发送 ESP-WIFI-MESH 数据包时，报头的目标地址字段将包含目标服务器的 IP 地址和端口号，而不是节点的 MAC 地址（请见：*mesh_addr_t*）。此外，根节点将处理外发 TCP/IP 数据包的形成。

组控制和组播

组播功能允许将单个 ESP-WIFI-MESH 数据包同时发送给网络中的多个节点。ESP-WIFI-MESH 中的组播可以通过“指定一个目标节点列表”或“预配置一个节点组”来实现。这两种组播方式均需调用*esp_mesh_send()* 实现。

如果通过“指定目标节点列表”实现组播，用户必须首先将 ESP-WIFI-MESH 数据包的目标地址设置为 **组播组地址**（比如 `01:00:5E:xx:xx:xx`）。这表明 ESP-WIFI-MESH 数据包是一个拥有一组地址的组播数据包，且该地址应该从报头选项中获得。然后，用户必须将目标节点的 MAC 地址列为选项（请见：*mesh_opt_t* 和*MESH_OPT_SEND_GROUP*）。这种组播方法不需要进行提前设置，但由于每个目标节点的 MAC 地址均需列为报头的选项字段，因此会产生大量开销数据。

分组组播允许 ESP-WIFI-MESH 数据包被发送到一个预先配置的节点组。每个分组都有一个具有唯一性的 ID 标识。用户可通过*esp_mesh_set_group_id()* 将节点加入一个组。分组组播需要将 ESP-WIFI-MESH 数据包的目标地址设置为目标组的 ID，还必须设置*MESH_DATA_GROUP* 标志位。分组组播产生的开销更小，但必须提前将节点加入分组中。

备注： 在组播期间，网络中的所有节点在 MAC 层都会收到 ESP-WIFI-MESH 数据包。然而，不包括在 MAC 地址列表或目标组中的节点将简单地过滤掉这些数据包。

广播

广播功能允许将单个 ESP-WIFI-MESH 数据包同时发送给网络中的所有节点。每个节点可以将一个广播包转发至其所有上行和下行连接，使得数据包尽可能快地在整个网络中传播。但是，ESP-WIFI-MESH 利

用以下方法来避免在广播期间浪费带宽。

1. 当中间父节点收到来自其父节点的广播包时，它会将该数据包转发给自己的各个子节点，同时为自己保存一份数据包的副本。

2. 当中间父节点是广播的源节点时，它会将该数据包向上发送至其父节点，并向下发送给自己的各个子节点。

3. 当中间父节点接收到一个来自其子节点的广播包时，它会将该数据包转发给其父节点和其余子节点，同时为自己保存一份数据包的副本。

4. 当叶子节点是广播的源节点时，它会直接将该数据包发送至其父节点。

5. 当根节点是广播的源节点时，它会将该数据包发送至自己的所有子节点。

6. 当根节点收到来自其子节点的广播包时，它会将该数据包转发给其余子节点，同时为自己保存一份数据包的副本。

7. 当节点接收到一个源地址与自身 MAC 地址匹配的广播包时，它会将该广播包丢弃。

8. 当中间父节点收到一个来自其父节点的广播包时（该数据包最初来自该父节点的一个子节点），它会将该广播包丢弃。

上行流量控制

ESP-WIFI-MESH 依赖父节点来控制其直接子节点的上行数据流。为了防止父节点的消息缓冲因上行传输过载而溢出，父节点将为每个子节点分配一个称为 **接收窗口** 的上行传输配额。**每个子节点均必须申请接收窗口才允许进行上行传输**。接收窗口的大小可以动态调整。完成从子节点到父节点的上行传输包括以下步骤：

1. 在每次传输之前，子节点向其父节点发送窗口请求。窗口请求中包括一个序号，与子节点的待传输数据包相对应。

2. 父节点接收窗口请求，并将序号与子节点发送的前一个数据包的序号进行比较，用于计算返回给子节点的接收窗口大小。

3. 子节点根据父节点指定的窗口大小发送数据包。如果子节点的接收窗口耗尽，它必须通过发送请求获得另一个接收窗口，然后才允许继续发送。

备注： ESP-WIFI-MESH 不支持任何下行流量控制。

警告： 由于父节点切换，数据包可能会在上行传输期间丢失。

由于根节点是通向外部 IP 网络的唯一接口，因此下行节点必须了解根节点与外部 IP 网络的连接状态。否则，节点可能会尝试向一个已经与 IP 网络断开连接的根节点发送数据，从而造成不必要的传输和数据包丢失。ESP-WIFI-MESH 可以基于监测根节点和外部 IP 网络的连接状态，提供一种稳定外发数据吞吐量的机制。根节点可以通过调用 `esp_mesh_post_toDS_state()` 将自身与外部 IP 网络的连接状态广播给所有其他节点。

双向数据流

下图展示了 ESP-WIFI-MESH 双向数据流涉及的各种网络层。

由于使用路由表，**ESP-WIFI-MESH 能够在 mesh 层中完全处理数据包的转发**。TCP/IP 层仅与 mesh 网络的根节点有关，可帮助根节点与外部 IP 网络的数据包传送。

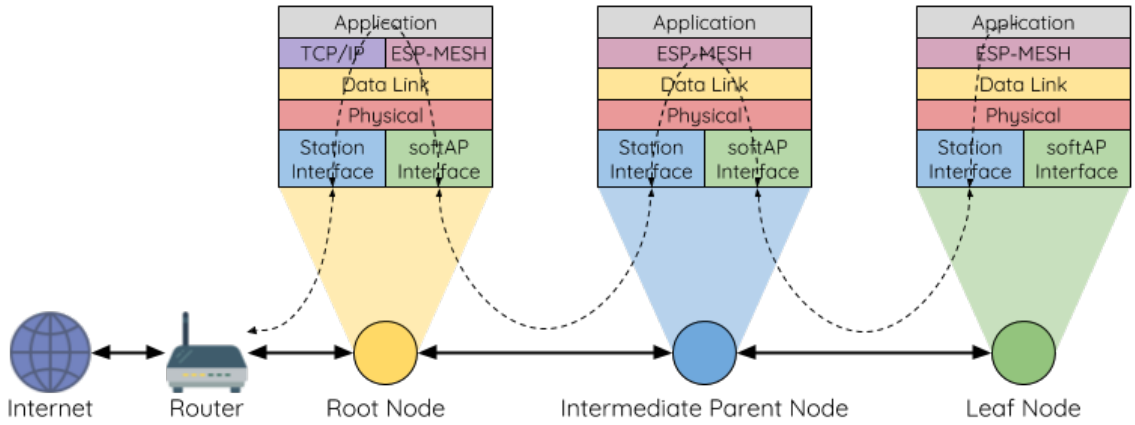

图 33: ESP-WIFI-MESH 双向数据流

4.11.7 信道切换

背景

在传统的 Wi-Fi 网络中，**信道**代表预设的频率范围。在基础设施基本服务集 (BSS) 中，工作 AP 及与之相连的 station 必须处于传输信标的工作信道（1 到 14）中。物理上相邻的 BSS 使用相同的工作信道会导致干扰产生和性能下降。

为了允许 BSS 适应不断变化的物理层条件并保持性能，Wi-Fi 网络中增加了 **网络信道切换**的机制。网络信道切换是将 BSS 移至新的工作信道，并同时最大限度地减少期间对 BSS 的影响。然而，我们应该认识到，网络信道切换可能不会成功，无法将原信道中的所有 station 均移动至新的信道。

在基础设施 Wi-Fi 网络中，网络信道切换由 AP 触发，目的是将该 AP 及与之相连的所有 station 同步切换到新的信道。网络信道切换是通过在 AP 的周期性发送信标帧内嵌入一个 **信道切换公告 (CSA)** 元素来实现的。在网络信号切换前，该 CSA 元素用于向所有连接的 station 广播有关即将发生的网络信道切换，并且将包含在多个信标帧中。

一个 CSA 元素包含有关 **新信道号**和 **信道切换计数**的信息。其中，**信道切换计数**指示在网络信道切换之前剩余的信标帧间隔 (TBTT) 数量。因此，**信道切换计数**依每个信标帧递减，并且允许与之连接的 station 与 AP 同步进行信道切换。

ESP-WIFI-MESH 网络信道切换

ESP-WIFI-MESH 网络信道切换还利用包含 CSA 元素的信标帧。然而，ESP-WIFI-MESH 作为一个多跳网络，其信标帧可能无法到达网络中的所有节点（这点与单跳网络不同），因此信道切换过程更加复杂。因此，ESP-WIFI-MESH 网络依赖于通过节点转发 CSA 元素，从而实现在整个网络中的传播。

当具有一个或多个子节点的中间父节点接收到包含 CSA 元素的信标帧时，该节点会将该元素包含在其下一个发送的信标帧（即具有相同的 **新信道号**和 **信道切换计数**）中，从而实现该 CSA 元素的转发。鉴于 ESP-WIFI-MESH 网络中的所有节点都接收到相同的 CSA 元素，这些节点可以使用 **信道切换计数**来同步其信道切换，但也会经历因 CSA 元素转发造成的延迟。

ESP-WIFI-MESH 网络信道切换可以由路由器或根节点触发。

根节点触发 **由根节点触发的信道切换只能在 ESP-WIFI-MESH 网络未连接到路由器**时才会发生。通过调用`esp_mesh_switch_channel()`，根节点将设置一个初始 **信道切换计数**值，并开始在其信标帧中包含 CSA 元素。接着，每个 CSA 元素将抵达第二层节点，并通过第二层节点自己的信标帧继续进行向下转发。

路由器触发 当 ESP-WIFI-MESH 网络连接到路由器时，整个网络必须与路由器采用同一个信道。因此，**根节点在连接到路由器时无法触发信道切换**。

当根节点从路由器接收到包含 CSA 元素的信标帧时，**根节点将 CSA 元素中的信道切换计数值设置为自定义值，然后再通过信标帧继续向下转发**。此后，该 **信道切换计数**将依转发次数相对于自定义值依次递减。该自定义值可以基于诸如网络层级、当前节点数等因素。

ESP-WIFI-MESH 网络及其路由器可能具有不同且变化的信标间隔，因此需要将 **信道切换计数**值设置为自定义值。也就是说，路由器提供的 **信道切换计数**值与 ESP-WIFI-MESH 网络无关。通过使用自定义值，ESP-WIFI-MESH 网络中的节点能够相对于 ESP-WIFI-MESH 网络的信标间隔同步切换信道。也正因如此，ESP-WIFI-MESH 网络也会出现信道与路由器及其连接 station 的信道切换不同步的情况。

网络信道切换的影响

- **由于 ESP-WIFI-MESH 网络信道切换与路由器的信道切换不同步，ESP-WIFI-MESH 网络和路由器之间会出现 临**
  - ESP-WIFI-MESH 网络的信道切换时间取决于 ESP-WIFI-MESH 网络的信标间隔和根节点的自定义 **信道切换计数**。
  - 在 ESP-WIFI-MESH 网络切换期间，信道差异将阻止根节点和路由器之间的任何数据交换。
  - 在 ESP-WIFI-MESH 网络中，根节点和中间父节点将请求与其连接的子节点停止传输，直至信道切换发生（通过将 CSA 元素的 **信道切换模式**字段置为 1）。
  - 频繁的路由器触发网络信道切换可能会降低 ESP-WIFI-MESH 网络的性能。请注意，这可能是由 ESP-WIFI-MESH 网络本身造成的（例如由于 ESP-WIFI-MESH 网络的无线介质争用等原因）。此时，用户应该禁用路由器触发的自主信道切换，并直接指定一个信道。
- **当存在 临时信道差异时，根节点从技术上来说仍保持连接至路由器**。
  - 如果根节点经过一定数量信标间隔仍无法接到信标帧或探测来自路由器的响应，则会断开连接。
  - 断开连接时，根节点将自动重新扫描所有信道以确定是否存在路由器。
- **如果根节点无法接收任何路由器的 CSA 信标帧（例如短暂的路由器切换时间），则路由器将在没有 ESP-WIFI-MES**
  - 在路由器切换信道后，根节点将不再能够接收路由器的信标帧和探测响应，并导致在一定数量的信标间隔后断开连接。
  - 在断开连接后，根节点将重新所有信道，寻找路由器。
  - 根节点将在整个过程中维护与之相连的下行连接。

备注： 虽然 ESP-WIFI-MESH 网络信道切换的目的是将网络内的所有节点移动到新的工作信道，但也应该认识到，信道切换可能无法成功移动所有节点（比如由于节点故障等原因）。

信道和路由器切换配置

ESP-WIFI-MESH 允许通过配置启用或禁用自主信道切换。同样，也可以通过配置启用或禁用自主路由器切换（即当根节点自主连接到另一个路由器时）。自主信道切换和自主路由器切换取决于以下配置参数和运行时间条件。

允许信道切换：本参数决定是否允许 ESP-WIFI-MESH 网络进行自主信道切换，具体可通过*mesh_cfg_t* 结构体中的 `allow_channel_switch` 字段进行配置。

预设信道：ESP-WIFI-MESH 网络可以将*mesh_cfg_t* 结构体中的 `channel` 字段设置为相应的信道号，而具备一个预设信道。如果未设置此字段，则 `allow_channel_switch` 的设置将被覆盖，即始终允许信道切换。

允许路由器切换：本参数决定是否允许 ESP-WIFI-MESH 网络进行自主路由器切换，具体可通过*mesh_router_t* 结构体中的 `allow_router_switch` 字段进行配置。

预设路由器 BSSID：ESP-WIFI-MESH 网络可以将*mesh_router_t* 结构体的 `bssid` 字段设置为目标路由器的 BSSID，而预设一个路由器。如果未设置此字段，则 `allow_router_switch` 的设置将被覆盖，即始终允许路由器切换。

存在根节点：根节点的存在也会影响是否允许信道或路由器切换。

下表说明了在不同参数/条件组合下是否允许信道切换和路由器切换。请注意，*X* 代表参数“不关心”。

预设信道	允许信道切换	预置路由器 BSSID	允许路由器切换	存在根节点	允许切换？
N	X	N	X	X	信道与路由器
N	X	Y	N	X	仅信道
N	X	Y	Y	X	信道与路由器
Y	Y	N	X	X	信道与路由器
Y	N	N	X	N	仅路由器
Y	N	N	X	Y	信道与路由器
Y	Y	Y	N	X	仅信道
Y	N	Y	N	N	无
Y	N	Y	N	Y	仅信道
Y	Y	Y	Y	X	信道与路由器
Y	N	Y	Y	N	仅路由器
Y	N	Y	Y	Y	信道与路由器

4.11.8 性能

ESP-WIFI-MESH 网络的性能可以基于以下多个指标进行评估：

组网时长：从头开始构建 ESP-WIFI-MESH 网络所需的总时长。

修复时间：从网络检测到节点断开到执行适当操作（例如生成新的根节点或形成新的连接等）以修复网络所需的时间。

每跳延迟：数据每经过一次无线 hop 而经历的延迟，即从父节点向子节点（或从子节点向父节点）发送一个数据包所需的时间。

网络节点容量：ESP-WIFI-MESH 网络可以同时支持的节点总数。该指标取决于节点可以接受到的最大下行连接数和网络中允许的最大层级。

ESP-WIFI-MESH 网络的常见性能指标如下表所示：

- 组网时长：< 60 秒
- **修复时间**
  - 根节点断开：< 10 秒
  - 子节点断开：< 5 秒
- 每条延迟：10 到 30 毫秒

备注： 上述性能指标的测试条件见下。

- 测试设备数量：**100**
- 最大允许下行连接数量：**6**
- 最大允许层级：**6**

备注： 吞吐量取决于数据包错误率和 hop 数量。

备注： 根节点访问外部 IP 网络的吞吐量直接受到 ESP-WIFI-MESH 网络中节点数量和路由器带宽的影响。

备注： 用户应注意，ESP-WIFI-MESH 网络的性能与网络配置和工作环境密切相关。

4.11.9 更多注意事项

- 数据传输使用 Wi-Fi WPA2-PSK 加密
- Mesh 网络 IE 使用 AES 加密

本文图片中使用的路由器与互联网图标来自 www.flaticon.com 的 Smashicons。

4.12 Event Handling

Several ESP-IDF components use *events* to inform application about state changes, such as connection or disconnection. This document gives an overview of these event mechanisms.

4.12.1 Wi-Fi, Ethernet, and IP Events

Before the introduction of *esp_event library*, events from Wi-Fi driver, Ethernet driver, and TCP/IP stack were dispatched using the so-called *legacy event loop*. The following sections explain each of the methods.

esp_event Library Event Loop

esp_event library is designed to supersede the legacy event loop for the purposes of event handling in ESP-IDF. In the legacy event loop, all possible event types and event data structures had to be defined in `system_event_id_t` enumeration and `system_event_info_t` union, which made it impossible to send custom events to the event loop, and use the event loop for other kinds of events (e.g. Mesh). Legacy event loop also supported only one event handler function, therefore application components could not handle some of Wi-Fi or IP events themselves, and required application to forward these events from its event handler function.

See *esp_event library API reference* for general information on using this library. Wi-Fi, Ethernet, and IP events are sent to the *default event loop* provided by this library.

Legacy Event Loop

This event loop implementation is started using `esp_event_loop_init()` function. Application typically supplies an *event handler*, a function with the following signature:

```
esp_err_t event_handler(void *ctx, system_event_t *event)
{
}
```

Both the pointer to event handler function, and an arbitrary context pointer are passed to `esp_event_loop_init()`.

When Wi-Fi, Ethernet, or IP stack generate an event, this event is sent to a high-priority `event` task via a queue. Application-provided event handler function is called in the context of this task. Event task stack size and event queue size can be adjusted using *CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE* and *CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE* options, respectively.

Event handler receives a pointer to the event structure (`system_event_t`) which describes current event. This structure follows a *tagged union* pattern: `event_id` member indicates the type of event, and `event_info` member is a union of description structures. Application event handler will typically use `switch(event->event_id)` to handle different kinds of events.

If application event handler needs to relay the event to some other task, it is important to note that event pointer passed to the event handler is a pointer to temporary structure. To pass the event to another task, application has to make a copy of the entire structure.

Event IDs and Corresponding Data Structures

Event ID (legacy event ID)	Event data structure
Wi-Fi	
WIFI_EVENT_WIFI_READY (SYSTEM_EVENT_WIFI_READY)	n/a
WIFI_EVENT_SCAN_DONE (SYSTEM_EVENT_SCAN_DONE)	*wifi_event_sta_scan_done_t*
WIFI_EVENT_STA_START (SYSTEM_EVENT_STA_START)	n/a
WIFI_EVENT_STA_STOP (SYSTEM_EVENT_STA_STOP)	n/a
WIFI_EVENT_STA_CONNECTED (SYSTEM_EVENT_STA_CONNECTED)	*wifi_event_sta_connected_t*
WIFI_EVENT_STA_DISCONNECTED (SYSTEM_EVENT_STA_DISCONNECTED)	*wifi_event_sta_disconnected_t*
WIFI_EVENT_STA_AUTHMODE_CHANGE (SYSTEM_EVENT_STA_AUTHMODE_CHANGE)	*wifi_event_sta_authmode_change_t*
WIFI_EVENT_STA_WPS_ER_SUCCESS (SYSTEM_EVENT_STA_WPS_ER_SUCCESS)	n/a
WIFI_EVENT_STA_WPS_ER_FAILED (SYSTEM_EVENT_STA_WPS_ER_FAILED)	*wifi_event_sta_wps_fail_reason_t*
WIFI_EVENT_STA_WPS_ER_TIMEOUT (SYSTEM_EVENT_STA_WPS_ER_TIMEOUT)	n/a
WIFI_EVENT_STA_WPS_ER_PIN (SYSTEM_EVENT_STA_WPS_ER_PIN)	*wifi_event_sta_wps_er_pin_t*

ETHERNET_EVENT_STOP (SYSTEM_EVENT_ETH_STOP)	n/a
ETHERNET_EVENT_CONNECTED (SYSTEM_EVENT_ETH_CONNECTED)	n/a
ETHERNET_EVENT_DISCONNECTED (SYSTEM_EVENT_ETH_DISCONNECTED)	n/a
IP	
IP_EVENT_STA_GOT_IP (SYSTEM_EVENT_STA_GOT_IP)	*ip_event_got_ip_t*
IP_EVENT_STA_LOST_IP (SYSTEM_EVENT_STA_LOST_IP)	n/a
IP_EVENT_AP_STAIPASSIGNED (SYSTEM_EVENT_AP_STAIPASSIGNED)	n/a
IP_EVENT_GOT_IP6 (SYSTEM_EVENT_GOT_IP6)	*ip_event_got_ip6_t*
IP_EVENT_ETH_GOT_IP (SYSTEM_EVENT_ETH_GOT_IP)	*ip_event_got_ip_t*
IP_EVENT_ETH_LOST_IP (SYSTEM_EVENT_ETH_LOST_IP)	n/a

4.12.2 Mesh Events

ESP-WIFI-MESH uses a system similar to the *Legacy Event Loop* to deliver events to the application. See 系统事件 for details.

4.12.3 Bluetooth Events

Various modules of the Bluetooth stack deliver events to applications via dedicated callback functions. Callback functions receive the event type (enumerated value) and event data (union of structures for each event type). The following list gives the registration API name, event enumeration type, and event parameters type.

- BLE GAP: *esp_ble_gap_register_callback()*, *esp_gap_ble_cb_event_t*, *esp_ble_gap_cb_param_t*.
- BT GAP: esp_bt_gap_register_callback(), esp_bt_gap_cb_event_t, esp_bt_gap_cb_param_t.
- GATTC: *esp_ble_gattc_register_callback()*, esp_ble_gattc_cb_event_t, *esp_ble_gattc_cb_param_t*.
- GATTS: *esp_ble_gatts_register_callback()*, esp_ble_gatts_cb_event_t, *esp_ble_gatts_cb_param_t*.
- SPP: esp_spp_register_callback(), esp_spp_cb_event_t, esp_spp_cb_param_t.
- Blufi: *esp_blufi_register_callbacks()*, *esp_blufi_cb_event_t*, *esp_blufi_cb_param_t*.
- A2DP: esp_a2d_register_callback(), esp_a2d_cb_event_t, esp_a2d_cb_param_t.
- AVRC: esp_avrc_ct_register_callback(), esp_avrc_ct_cb_event_t, esp_avrc_ct_cb_param_t.
- HFP Client: esp_hf_client_register_callback(), esp_hf_client_cb_event_t, esp_hf_client_cb_param_t.
- HFP AG: esp_bt_hf_register_callback(), esp_hf_cb_event_t, esp_hf_cb_param_t.

4.13 严重错误

4.13.1 概述

在某些情况下，程序并不会按照我们的预期运行，在 ESP-IDF 中，这些情况包括：

- CPU 异常：非法指令，加载/存储时的内存对齐错误，加载/存储时的访问权限错误。
- 系统级检查错误：
  - 中断看门狗 超时
  - 任务看门狗 超时（只有开启*CONFIG_ESP_TASK_WDT_PANIC* 后才会触发严重错误）
  - 高速缓存访问错误
  - 内存保护故障
  - 掉电检测事件
  - 堆栈溢出
  - 堆栈粉碎保护检查
  - 堆完整性检查
  - 未定义行为清理器 (UBSAN) 检查
- 使用 assert、configASSERT 等类似的宏断言失败。

本指南会介绍 ESP-IDF 中这类错误的处理流程，并给出对应的解决建议。

4.13.2 紧急处理程序

概述 中列举的所有错误都会由 紧急处理程序（*Panic Handler*）负责处理。

紧急处理程序首先会将出错原因打印到控制台，例如 CPU 异常的错误信息通常会类似于

```
Guru Meditation Error: Core 0 panic'ed (Illegal instruction). Exception␣
↪was unhandled.
```

对于一些系统级检查错误（如中断看门狗超时，高速缓存访问错误等），错误信息会类似于

```
Guru Meditation Error: Core 0 panic'ed (Cache error). Exception was␣
↪unhandled.
```

不管哪种情况，错误原因都会被打印在括号中。请参阅*Guru Meditation 错误* 以查看所有可能的出错原因。

紧急处理程序接下来的行为将取决于*CONFIG_ESP_SYSTEM_PANIC* 的设置，支持的选项包括：

- 打印 CPU 寄存器，然后重启（CONFIG_ESP_SYSTEM_PANIC_PRINT_REBOOT）- 默认选项
  打印系统发生异常时 CPU 寄存器的值，打印回溯，最后重启芯片。
- 打印 CPU 寄存器，然后暂停（CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT）
  与上一个选项类似，但不会重启，而是选择暂停程序的运行。重启程序需要外部执行复位操作。
- 静默重启（CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT）
  不打印 CPU 寄存器的值，也不打印回溯，立即重启芯片。
- 调用 GDB Stub（CONFIG_ESP_SYSTEM_PANIC_GDBSTUB）
  启动 GDB 服务器，通过控制台 UART 接口与 GDB 进行通信。该选项只提供只读调试或者事后调试，详细信息请参阅*GDB Stub*。
- 调用动态 GDB Stub (ESP_SYSTEM_GDBSTUB_RUNTIME)
  启动 GDB 服务器，通过控制台 UART 接口与 GDB 进行通信。该选项允许用户在程序运行时对其进行调试、设置断点和改变其执行方式等，详细信息请参阅*GDB Stub*。

紧急处理程序的行为还受到另外两个配置项的影响：

- 如果使能了*CONFIG_ESP_DEBUG_OCDAWARE*（默认），紧急处理程序会检测 ESP32-C3 是否已经连接 JTAG 调试器。如果检测成功，程序会暂停运行，并将控制权交给调试器。在这种情况下，寄存器和回溯不会被打印到控制台，并且也不会使用 GDB Stub 和 Core Dump 的功能。
- 如果使能了*内核转储* 功能，系统状态（任务堆栈和寄存器）会被转储到 flash 或者 UART 以供后续分析。
- 如果*CONFIG_ESP_PANIC_HANDLER_IRAM* 被禁用（默认情况下禁用），紧急处理程序的代码会放置在 flash 而不是 IRAM 中。这意味着，如果 ESP-IDF 在 flash 高速缓存禁用时崩溃，在运行 GDB Stub 和内核转储之前紧急处理程序会自动重新使能 flash 高速缓存。如果 flash 高速缓存也崩溃了，这样做会增加一些小风险。
  如果使能了该选项，紧急处理程序的代码（包括所需的 UART 函数）会放置在 IRAM 中，导致 SRAM 中的可用内存空间变小。当禁用 flash 高速缓存（如写入 SPI flash）时或触发异常导致 flash 高速缓存崩溃时，可用此选项调试一些复杂的崩溃问题。

下图展示了紧急处理程序的行为：

4.13.3 寄存器转储与回溯

除非启用了 CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT 否则紧急处理程序会将 CPU 寄存器和回溯打印到控制台

```
Core  0 register dump:
MEPC    : 0x420048b4  RA      : 0x420048b4  SP      : 0x3fc8f2f0  GP      :␣

↪0x00000000
MHARTID : 0x00000000
```

仅会打印异常帧中 CPU 寄存器的值，即引发 CPU 异常或者其它严重错误时刻的值。

紧急处理程序如果是因 abort() 而调用，则不会打印寄存器转储。

如果使用了*IDF 监视器*，该工具会将程序计数器的值转换为对应的代码位置（函数名，文件名，行号），并加以注释：

```
Core  0 register dump:

↪0x00000000
S8      : 0x00000000  S9      : 0x00000000  S10     : 0x00000000  S11     :␣
↪0x00000000
T3      : 0x00000000  T4      : 0x00000000  T5      : 0x00000000  T6      :␣
↪0x00000000
MSTATUS : 0x00001881  MTVEC   : 0x40380001  MCAUSE  : 0x00000007  MTVAL   :␣
↪0x00000000
MHARTID : 0x00000000
```

此外，由于紧急处理程序中提供了堆栈转储，因此*IDF 监视器* 也可以生成并打印回溯。输出结果如下：

```
Backtrace:

0x42006686 in bar (ptr=ptr@entry=0x0) at ../main/hello_world_main.c:18
18          *ptr = 0x42424242;
#0  0x42006686 in bar (ptr=ptr@entry=0x0) at ../main/hello_world_main.c:18
#1  0x42006692 in foo () at ../main/hello_world_main.c:22
#2  0x420066ac in app_main () at ../main/hello_world_main.c:28
#3  0x42015ece in main_task (args=<optimized out>) at /Users/user/esp/components/
↪freertos/port/port_common.c:142
#4  0x403859b8 in vPortEnterCritical () at /Users/user/esp/components/freertos/
↪port/riscv/port.c:130
#5  0x00000000 in ?? ()
Backtrace stopped: frame did not save the PC
```

虽然以上的回溯信息非常方便，但要求用户使用*IDF 监视器*。因此，如果用户希望使用其它的串口监控软件也能显示堆栈回溯信息，则需要在 menuconfig 中启用*CONFIG_ESP_SYSTEM_USE_EH_FRAME* 选项。

该选项会让编译器为项目的每个函数生成 DWARF 信息。然后，当 CPU 异常发生时，紧急处理程序将解析这些数据并生成出错任务的堆栈回溯信息。输出结果如下：

```
Backtrace: 0x42009e9a:0x3fc92120 0x42009ea6:0x3fc92120 0x42009ec2:0x3fc92130␣
↪0x42024620:0x3fc92150 0x40387d7c:0x3fc92160 0xfffffffe:0x3fc92170
```

这些 PC:SP 对代表当前任务每一个栈帧的程序计数器值（Program Counter）和栈顶地址（Stack Pointer）。

CONFIG_ESP_SYSTEM_USE_EH_FRAME 选项的主要优点是，回溯信息可以由程序自己解析生成并打印(而不依靠*IDF 监视器*)。但是该选项会导致编译后的二进制文件更大（增幅可达 20% 甚至 100%）。此外，该选项会将调试信息也保存在二进制文件里。因此，强烈不建议用户在量产/生产版本中启用该选项。

若要查找发生严重错误的代码位置，请查看“Backtrace”的后面几行，发生严重错误的代码显示在顶行，后续几行显示的是调用堆栈。

4.13.4 GDB Stub

如果启用了 CONFIG_ESP_SYSTEM_PANIC_GDBSTUB 选项，在发生严重错误时，紧急处理程序不会复位芯片，相反，它将启动 GDB 远程协议服务器，通常称为 GDB Stub。发生这种情况时，可以让主机上运行的 GDB 实例通过 UART 端口连接到 ESP32。

如果使用了*IDF 监视器*，该工具会在 UART 端口检测到 GDB Stub 提示符后自动启动 GDB，输出会类似于:

```
Entering gdb stub now.
$T0b#e6GNU gdb (crosstool-NG crosstool-ng-1.22.0-80-gff1f415) 7.10
Copyright (C) 2015 Free Software Foundation, Inc.
License GPLv3+: GNU GPL version 3 or later <http://gnu.org/licenses/gpl.html>
This is free software: you are free to change and redistribute it.
There is NO WARRANTY, to the extent permitted by law.  Type "show copying"
and "show warranty" for details.
This GDB was configured as "--host=x86_64-build_apple-darwin16.3.0 --
↪target=riscv32-esp-elf".
Type "show configuration" for configuration details.
For bug reporting instructions, please see:
<http://www.gnu.org/software/gdb/bugs/>.
Find the GDB manual and other documentation resources online at:
<http://www.gnu.org/software/gdb/documentation/>.
For help, type "help".
Type "apropos word" to search for commands related to "word"...
Reading symbols from /Users/user/esp/example/build/example.elf...done.
Remote debugging using /dev/cu.usbserial-31301
0x400e1b41 in app_main ()
    at /Users/user/esp/example/main/main.cpp:36
36      *((int*) 0) = 0;
(gdb)
```

在 GDB 会话中，我们可以检查 CPU 寄存器，本地和静态变量以及内存中任意位置的值。但是不支持设置断点，改变 PC 值或者恢复程序的运行。若要复位程序，请退出 GDB 会话，在 IDF 监视器中连续输入 Ctrl-T Ctrl-R，或者按下开发板上的复位按键也可以重新运行程序。

4.13.5 Guru Meditation 错误

本节将对打印在 Guru Meditation Error: Core panic'ed 后面括号中的致错原因进行逐一解释。

备注: 想要了解“Guru Meditation”的历史渊源，请参阅 维基百科 。

Illegal instruction

此 CPU 异常表示当前执行的指令不是有效指令，引起此错误的常见原因包括:

- FreeRTOS 中的任务函数已返回。在 FreeRTOS 中，如果想终止任务函数，需要调用 *vTaskDelete()* 函数释放当前任务的资源，而不是直接返回。

- 无法从 SPI flash 中读取下一条指令，这通常发生在：
  - 应用程序将 SPI flash 的管脚重新配置为其它功能（如 GPIO、UART 等）。有关 SPI flash 管脚的详细信息，请参阅硬件设计指南和芯片/模组的数据手册。
  - 某些外部设备意外连接到 SPI flash 的管脚上，干扰了 ESP32-C3 和 SPI flash 之间的通信。
- 在 C++ 代码中，退出 non-void 函数而无返回值被认为是未定义的行为。启用优化后，编译器通常会忽略此类函数的结尾，导致 Illegal instruction 异常。默认情况下，ESP-IDF 构建系统启用 `-Werror=return-type`，这意味着缺少返回语句会被视为编译时错误。但是，如果应用程序项目禁用了编译器警告，可能就无法检测到该问题，在运行时就会出现 Illegal instruction 异常。

Instruction address misaligned

此 CPU 异常表示要执行的指令地址非 2 字节对齐。

Instruction access fault, Load access fault, Store access fault

当应用程序尝试读取或写入无效的内存位置时，会发生此类 CPU 异常。此类无效内存地址可以在寄存器转储的 `MTVAL` 中找到。如果该地址为零，通常意味着应用程序正尝试解引用一个 NULL 指针。如果该地址接近于零，则通常意味着应用程序尝试访问某个结构体的成员，但是该结构体的指针为 NULL。如果该地址是其它非法值（不在 `0x3fxxxxxx` - `0x6xxxxxxx` 的范围内），则可能意味着用于访问数据的指针未初始化或者已经损坏。

Breakpoint

当执行 `EBREAK` 指令时，会发生此 CPU 异常。

Load address misaligned, Store address misaligned

应用程序尝试读取/写入的内存位置不符合加载/存储指令对字节对齐大小的要求，例如，32 位加载指令只能访问 4 字节对齐的内存地址，而 16 位加载指令只能访问 2 字节对齐的内存地址。

Interrupt wdt timeout on CPU0 / CPU1

这表示发生了中断看门狗超时，详细信息请查阅*看门狗* 文档。

Cache error

在某些情况下，ESP-IDF 会暂时禁止通过高速缓存访问外部 SPI flash 和 SPI RAM，例如在使用 spi_flash API 读取/写入/擦除/映射 SPI flash 的时候。在这些情况下，任务会被挂起，并且未使用 `ESP_INTR_FLAG_IRAM` 注册的中断处理程序会被禁用。请确保任何使用此标志注册的中断处理程序所访问的代码和数据分别位于 IRAM 和 DRAM 中。更多详细信息请参阅*SPI flash API 文档*。

Memory protection fault

ESP-IDF 中使用 ESP32-C3 的权限控制功能来防止以下类型的内存访问：

- 程序加载后向指令 RAM 写入代码
- 从数据 RAM （用于堆、静态.data 和.bss 区域）执行代码

该类操作对于大多数程序来说并不必要，禁止此类操作往往使软件漏洞更难被利用。依赖动态加载或自修改代码的应用程序可以使用*CONFIG_ESP_SYSTEM_MEMPROT_FEATURE* 选项来禁用此项保护。

发生故障时，紧急处理程序会报告故障的地址和引起故障的内存访问的类型。

4.13.6 其他严重错误

掉电

ESP32-C3 内部集成掉电检测电路，并且会默认启用。如果电源电压低于安全值，掉电检测器可以触发系统复位。掉电检测器可以使用*CONFIG_ESP_BROWNOUT_DET* 和*CONFIG_ESP_BROWNOUT_DET_LVL_SEL* 这两个选项进行设置。

当掉电检测器被触发时，会打印如下信息:

```
Brownout detector was triggered
```

芯片会在该打印信息结束后复位。

请注意，如果电源电压快速下降，则只能在控制台上看到部分打印信息。

堆不完整

ESP-IDF 堆的实现包含许多运行时的堆结构检查，可以在 menuconfig 中开启额外的检查（“Heap Poisoning”）。如果其中的某项检查失败，则会打印类似如下信息:

```
CORRUPT HEAP: Bad tail at 0x3ffe270a. Expected 0xbaad5678 got 0xbaac5678
assertion "head != NULL" failed: file "/Users/user/esp/esp-idf/components/heap/
↪multi_heap_poisoning.c", line 201, function: multi_heap_free
abort() was called at PC 0x400dca43 on core 0
```

更多详细信息，请查阅堆内存调试 文档。

堆栈粉碎

堆栈粉碎保护（基于 GCC `-fstack-protector*` 标志）可以通过 ESP-IDF 中的*CONFIG_COMPILER_STACK_CHECK_MODE* 选项来开启。如果检测到堆栈粉碎，则会打印类似如下的信息:

```
Stack smashing protect failure!

abort() was called at PC 0x400d2138 on core 0

Backtrace: 0x4008e6c0:0x3ffc1780 0x4008e8b7:0x3ffc17a0 0x400d2138:0x3ffc17c0␣
↪0x400e79d5:0x3ffc17e0 0x400e79a7:0x3ffc1840 0x400e79df:0x3ffc18a0␣
↪0x400e2235:0x3ffc18c0 0x400e1916:0x3ffc18f0 0x400e19cd:0x3ffc1910␣
↪0x400e1a11:0x3ffc1930 0x400e1bb2:0x3ffc1950 0x400d2c44:0x3ffc1a80
0
```

回溯信息会指明发生堆栈粉碎的函数，建议检查函数中是否有代码访问局部数组时发生了越界。

未定义行为清理器（UBSAN）检查

未定义行为清理器 (UBSAN) 是一种编译器功能，它会为可能不正确的操作添加运行时检查，例如:

- 溢出（乘法溢出、有符号整数溢出）
- 移位基数或指数错误（如移位超过 32 位）
- 整数转换错误

请参考 GCC 文档 中的 “-fsanitize=undefined“ 选项，查看支持检查的完整列表。

使能 UBSAN 默认情况下未启用 UBSAN。可以通过在构建系统中添加编译器选项 `-fsanitize=undefined` 在文件、组件或项目级别上使能 UBSAN。

在对使用 SoC 硬件寄存器头文件（`soc/xxx_reg.h`）的代码使能 UBSAN 时，建议使用 `-fno-sanitize=shift-base` 选项禁用移位基数清理器。这是由于 ESP-IDF 寄存器头文件目前包含的模式会对这个特定的清理器选项造成误报。

要在项目级使能 UBSAN，请在项目 CMakeLists.txt 文件的末尾添加以下内容:

```
idf_build_set_property(COMPILE_OPTIONS "-fsanitize=undefined" "-fno-sanitize=shift-
↪base" APPEND)
```

或者，通过 `EXTRA_CFLAGS` 和 `EXTRA_CXXFLAGS` 环境变量来传递这些选项。

使能 UBSAN 会明显增加代码量和数据大小。当为整个应用程序使能 UBSAN 时，微控制器的可用 RAM 无法容纳大多数应用程序（除了一些微小程序）。因此，建议为特定的待测组件使能 UBSAN。

要为项目 CMakeLists.txt 文件中的特定组件（`component_name`）启用 UBSAN，请在文件末尾添加以下内容:

```
idf_component_get_property(lib component_name COMPONENT_LIB)
target_compile_options(${lib} PRIVATE "-fsanitize=undefined" "-fno-sanitize=shift-
↪base")
```

注意: 关于构建属性 和组件属性 的更多信息，请查看构建系统文档。

要为同一组件的 CMakeLists.txt 中的特定组件（`component_name`）使能 UBSAN，在文件末尾添加以下内容:

```
target_compile_options(${COMPONENT_LIB} PRIVATE "-fsanitize=undefined" "-fno-
↪sanitize=shift-base")
```

UBSAN 输出 当 UBSAN 检测到一个错误时，会打印一个信息和回溯，例如:

```
Undefined behavior of type out_of_bounds

Backtrace:0x4008b383:0x3ffcd8b0 0x4008c791:0x3ffcd8d0 0x4008c587:0x3ffcd8f0␣
↪0x4008c6be:0x3ffcd950 0x400db74f:0x3ffcd970 0x400db99c:0x3ffcd9a0
```

当使用*IDF 监视器* 时，回溯会被解码为函数名以及源代码位置，并指向问题发生的位置（这里是 `main.c:128`）:

```
0x4008b383: panic_abort at /path/to/esp-idf/components/esp_system/panic.c:367

0x4008c791: esp_system_abort at /path/to/esp-idf/components/esp_system/system_api.
↪c:106

0x4008c587: __ubsan_default_handler at /path/to/esp-idf/components/esp_system/
↪ubsan.c:152

0x4008c6be: __ubsan_handle_out_of_bounds at /path/to/esp-idf/components/esp_system/
↪ubsan.c:223

0x400db74f: test_ub at main.c:128

0x400db99c: app_main at main.c:56 (discriminator 1)
```

UBSAN 报告的错误类型为以下几种:

名称	含义
type_mismatch、type_mismatch_v1	指针值不正确：空、未对齐、或与给定类型不兼容
add_overflow、sub_overflow、mul_overflow、negate_overflow	加法、减法、乘法、求反过程中的整数溢出
divrem_overflow	整数除以 0 或 INT_MIN
shift_out_of_bounds	左移或右移运算符导致的溢出
out_of_bounds	访问超出数组范围
unreachable	执行无法访问的代码
missing_return	Non-void 函数已结束而没有返回值（仅限 C++）
vla_bound_not_positive	可变长度数组的大小不是正数
load_invalid_value	bool 或 enum（仅 C++）变量的值无效（超出范围）
nonnull_arg	对于 nonnull 属性的函数，传递给函数的参数为空
nonnull_return	对于 returns_nonnull 属性的函数，函数返回值为空
builtin_unreachable	调用 __builtin_unreachable 函数
pointer_overflow	指针运算过程中的溢出

4.14 Flash 加密

本文档旨在引导用户快速了解 ESP32-C3 的 flash 加密功能，通过应用程序代码示例向用户演示如何在开发及生产过程中测试及验证 flash 加密的相关操作。

4.14.1 概述

flash 加密功能用于加密与 ESP32-C3 搭载使用的片外 flash 中的内容。启用 flash 加密功能后，固件会以明文形式烧录，然后在首次启动时将数据进行加密。因此，物理读取 flash 将无法恢复大部分 flash 内容。

启用 flash 加密后，系统将默认加密下列类型的 flash 数据：

- 固件引导加载程序
- 分区表
- 所有“app”类型的分区

其他类型的数据将视情况进行加密：

- 任何在分区表中标有“加密”标志的分区。详情请见加密分区标志。
- 如果启用了安全启动，则可以加密安全启动引导程序摘要（见下文）。

重要： 对于生产用途，flash 加密仅应在“发布”模式下启用。

重要： 启用 flash 加密将限制后续 ESP32-C3 更新。在使用 flash 加密功能前，请务必阅读本文档了解其影响。

4.14.2 相关 eFuses

Flash 加密操作由 ESP32-C3 上的多个 eFuse 控制。以下是这些 eFuse 列表及其描述，下表中的各 eFuse 名称也在 espefuse.py 工具中使用，为了能在 eFuse API 中使用，请在名称前加上 ESP_EFUSE_，如：esp_efuse_read_field_bit(ESP_EFUSE_DISABLE_DL_ENCRYPT)。

表 20: Flash 加密过程中使用的 eFuses

eFuse	描述	位深
BLOCK_KEYN	AES 密钥存储，N 在 0-5 之间。	256 位密钥块
KEY_PURPOSE_N	控制 eFuse 块 BLOCK_KEYN 的目的，其中 N 在 0 到 5 之间。对于 flash 加密，唯一的有效值是 4，代表 XTS_AES_128_KEY。	4
DIS_DOWNLOAD_MANUAL_ENCRYPT	设置后，则在下载引导模式时禁用 flash 加密。	1
SPI_BOOT_CRYPT_CNT	设置 SPI 启动模式后，可启用加密和解密。如果在 eFuse 中设置 1 或 3 个比特位，则启用该功能，否则将禁用。	3

备注:

- 上表中列出的所有 eFuse 位都提供读/写访问控制。
- 这些位的默认值是 0。

对上述 eFuse 位的读写访问由 WR_DIS 和 RD_DIS 寄存器中的相应字段控制。有关 ESP32-C3 eFuse 的详细信息，请参考*eFuse 管理器*。要使用 espefuse.py 更改 eFuse 字段的保护位，请使用以下两个命令：read_protect_efuse 和 write_protect_efuse。例如 `espefuse.py write_protect_efuse DISABLE_DL_ENCRYPT`。

4.14.3 Flash 的加密过程

假设 eFuse 值处于默认状态，且固件的引导加载程序编译为支持 flash 加密，则 flash 加密的具体过程如下：

1. 第一次开机复位时，flash 中的所有数据都是未加密的（明文）。ROM 引导加载程序加载固件引导加载程序。
2. 固件的引导加载程序将读取 SPI_BOOT_CRYPT_CNT eFuse 值 (0b000)。因为该值为 0（偶数位），固件引导加载程序将配置并启用 flash 加密块。关于 flash 加密块的更多信息，请参考 ESP32-C3 技术参考手册。
3. 固件的引导加载程序使用 RNG（随机数生成）模块生成 256 位密钥，然后将其写入 *BLOCK_KEYN* eFuse。软件也为存储密钥的块更新了 KEY_PURPOSE_N。由于 BLOCK_KEYN eFuse 已设置编写和读取保护位，故无法通过软件访问密钥。KEY_PURPOSE_N 字段也受写保护。Flash 加密操作完全在硬件中完成，无法通过软件访问密钥。
4. Flash 加密块将加密 flash 的内容（固件的引导加载程序、应用程序、以及标有“加密”标志的分区）。就地加密可能会耗些时间（对于大分区最多需要一分钟）。
5. 固件引导加载程序将在 SPI_BOOT_CRYPT_CNT (0b001) 中设置第一个可用位来对已加密的 flash 内容进行标记。设置奇数位。
6. 对于*开发模式*，固件引导加载程序允许 UART 引导加载程序重新烧录加密后的二进制文件。同时，SPI_BOOT_CRYPT_CNT eFuse 位不受写入保护。此外，默认情况下，固件引导加载程序设置 DIS_DOWNLOAD_ICACHE、DIS_PAD_JTAG、DIS_USB_JTAG 和 DIS_LEGACY_SPI_BOOT eFuse 位。
7. 对于*发布模式*，固件引导加载程序设置所有在开发模式下设置的 eFuse 位以及 DIS_DOWNLOAD_MANUAL_ENCRYPT。它还写保护 SPI_BOOT_CRYPT_CNT eFuse 位。要修改此行为，请参阅*启用 UART 引导加载程序加密/解密*。
8. 重新启动设备以开始执行加密镜像。固件引导加载程序调用 flash 解密块来解密 flash 内容，然后将解密的内容加载到 IRAM 中。

在开发阶段常需编写不同的明文 flash 镜像并测试 flash 的加密过程。这要求固件下载模式能够根据需求不断加载新的明文镜像。但是，在制造和生产过程中，出于安全考虑，固件下载模式不应有权限访问 flash 内容。

因此需要有两种不同的 flash 加密配置：一种用于开发，另一种用于生产。详情请参考*Flash 加密设置* 小节。

4.14.4 Flash 加密设置

提供以下 flash 加密模式：

- 开发模式 - 建议仅在开发过程中使用。因为在这种模式下，仍然可以将新的明文固件烧录到设备，并且引导加载程序将使用存储在硬件中的密钥对该固件进行透明加密。此操作间接允许从 flash 中读出固件明文。
- 发布模式 - 推荐用于制造和生产。因为在这种模式下，如果不知道加密密钥，则不可能将明文固件烧录到设备。

本节将详细介绍上述 flash 加密模式，并且逐步说明如何使用它们。

开发模式

在开发过程中，可使用 ESP32-C3 内部生成的密钥或外部主机生成的密钥进行 flash 加密。

使用 ESP32-C3 生成的密钥 开发模式允许用户使用固件下载模式下载多个明文镜像。

测试 flash 加密过程需完成以下步骤：

1. 确保您的 ESP32-C3 设备有相关 *eFuses* 中所示的 flash 加密 eFuse 的默认设置。

   请参考如何检查*ESP32-C3 flash 加密状态*。

2. 在项目配置菜单，执行以下操作：

   - 启动时使能 *flash* 加密。
   - 选择加密模式 （默认是 **开发模式**）。
   - 选择 *UART ROM* 下载模式 （默认是 **启用**）。
   - 选择适当详细程度的引导加载程序日志。
   - 保存配置并退出。

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考引导加载程序大小。

3. 运行以下命令来构建和烧录完整的镜像。

```
idf.py flash monitor
```

> **备注：** 这个命令不包括任何应该写入 flash 分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32-C3 将复位。在下一次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为“加密”的分区，然后复位。就地加密可能需要时间，对于大分区最多需要一分钟。之后，应用程序在运行时解密并执行命令。

下面是启用 flash 加密后 ESP32-C3 首次启动时的样例输出：

```

This is esp32c3 chip with 1 CPU core(s), WiFi/BLE, silicon revision 0, 2MB␣
↪external flash
FLASH_CRYPT_CNT eFuse value is 1
Flash encryption feature is enabled in DEVELOPMENT mode
```

在此阶段，如果用户需要更新或重新烧录二进制文件，请参考*重新烧录更新后的分区*。

使用主机生成的密钥 可在主机中预生成 flash 加密密钥，并将其烧录到 eFuse 密钥块中。这样，无需明文 flash 更新便可以在主机上预加密数据并将其烧录。该功能可在*开发模式* 和*发布模式* 两模式下使用。如果没有预生成的密钥，数据将以明文形式烧录，然后 ESP32-C3 对数据进行就地加密。

备注： 不建议在生产中使用该方法，除非为每个设备都单独生成一个密钥。

使用主机生成的密钥需完成以下步骤：

1. 确保您的 ESP32-C3 设备有*相关 eFuses* 中所示的 flash 加密 eFuse 的默认设置。

   请参考如何检查*ESP32-C3 flash 加密状态*。

2. 通过运行以下命令生成一个随机密钥：

   ```
   espsecure.py generate_flash_encryption_key my_flash_encryption_key.bin
   ```

3. **在第一次加密启动前**，使用以下命令将该密钥烧录到设备上，这个操作只能执行 **一次**。

   ```
   espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin XTS_
   ↪AES_128_KEY
   ```

   其中 BLOCK 是 BLOCK_KEY0 和 BLOCK_KEY5 之间的一个空闲密钥区。

   如果未烧录密钥并在启用 flash 加密后启动设备，ESP32-C3 将生成一个软件无法访问或修改的随机密钥。

4. 在*项目配置菜单* 中进行如下设置：
   - *启动时启用 flash 加密功能*
   - *选择加密模式*（默认为 **开发模式**）
   - *选择适当详细程度的引导加载程序日志*
   - 保存配置并退出

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考*引导加载程序大小*。

5. 运行以下命令来构建并烧录完整的镜像：

   ```
   idf.py flash monitor
   ```

   备注： 这个命令不包括任何应该被写入 flash 上的分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

   该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32-C3 将复位。在下一次启动时，固件引导加载程序会加密：固件引导加载程序、应用程

序分区和标记为 加密的分区，然后复位。就地加密可能需要时间，对于大的分区来说可能耗时一分钟。之后，应用程序在运行时被解密并执行。

如果使用开发模式，那么更新和重新烧录二进制文件最简单的方法是重新烧录更新后的分区。

如果使用发布模式，那么可以在主机上预先加密二进制文件，然后将其作为密文烧录。具体请参考手动加密文件。

重新烧录更新后的分区 如果用户以明文方式更新了应用程序代码并需要重新烧录，则需要在烧录前对其进行加密。请运行以下命令一次完成应用程序的加密与烧录：

```
idf.py encrypted-app-flash monitor
```

如果所有分区都需要以加密形式更新，请运行：

```
idf.py encrypted-flash monitor
```

发布模式

在发布模式下，UART 引导加载程序无法执行 flash 加密操作，**只能**使用 OTA 方案下载新的明文镜像，该方案将在写入 flash 前加密明文镜像。

使用该模式需要执行以下步骤：

1. 确保您的 ESP32-C3 设备有相关 *eFuses* 中所示的 flash 加密 eFuse 的默认设置。

   请参考如何检查*ESP32-C3 flash 加密状态*。

2. 在项目配置菜单，执行以下操作：

   - 启动时使能 *flash* 加密
   - 选择发布模式（注意一旦选择了发布模式，EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT eFuse 位将被编程为在 ROM 下载模式下禁用 flash 加密硬件。）
   - 选择 *UART ROM* 下载（推荐永久性的切换到安全模式）。这是默认且推荐使用的选项。如果不需要该模式，也可以改变此配置设置永久地禁用 UART ROM 下载模式。
   - 选择适当详细程度的引导加载程序日志
   - 保存配置并退出

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考引导加载程序大小。

3. 运行以下命令来构建并烧录完整的镜像：

   ```
   idf.py flash monitor
   ```

   备注： 这个命令不包括任何应该被写入 flash 分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

   该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32-C3 将复位。在下一次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为 加密的分区，然后复位。就地加密可能需要时间，对于大的分区来说可能耗时一分钟。之后，应用程序在运行时被解密并执行。

一旦在发布模式下启用 flash 加密，引导加载程序将写保护 SPI_BOOT_CRYPT_CNT eFuse。

请使用*OTA 方案* 对字段中的明文进行后续更新。

备注： 如果用户已经预先生成了 flash 加密密钥并存储了一个副本，并且 UART 下载模式没有通过*CONFIG_SECURE_UART_ROM_DL_MODE* 永久禁用，那么可以通过使用 espsecure.py

`encrypt_flash_data --aes_xts` 预加密文件，从而在在本地更新 flash，然后烧录密文。请参考*手动加密文件*。

最佳实践

在生产中使用 flash 加密时：

- 不要在多个设备之间重复使用同一个 flash 加密密钥，这样攻击者就无法从一台设备上复制加密数据后再将其转移到第二台设备上。
- 如果不需要 UART ROM 下载模式，则应完全禁用该模式，或者永久设置为“安全下载模式”。安全下载模式永久性地将可用的命令限制在基本的 flash 只读和只写。默认在发布模式下第一次启动时设置为安全下载模式。要完全禁用下载模式，请选择*CONFIG_SECURE_UART_ROM_DL_MODE* 为“永久禁用 ROM 下载模式（推荐）”或在运行时调用*esp_efuse_disable_rom_download_mode()*。
- 启用*安全启动* 作为额外的保护层，防止攻击者在启动前有选择地破坏 flash 中某部分。

4.14.5 可能出现的错误

一旦启用 flash 加密，`SPI_BOOT_CRYPT_CNT` 的 eFuse 值将设置为奇数位。这意味着所有标有加密标志的分区都会包含加密的密本。如果 ESP32-C3 错误地加载了明文数据，则会出现以下三种典型的错误情况：

1. 如果通过 **明文固件引导加载程序镜像**重新烧录了引导加载程序分区，则 ROM 加载器将无法加载固件引导加载程序，并会显示以下错误类型：

```
rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
```

备注： 不同应用程序中无效头文件的值不同。

备注： 如果 flash 内容被擦除或损坏，也会出现这个错误。

2. 如果固件的引导加载程序已加密，但通过 **明文分区表镜像**重新烧录了分区表，引导加载程序将无法读取分区表，从而出现以下错误：

```
rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0xee

4.14.6 ESP32-C3 flash 加密状态

1. 确保您的 ESP32-C3 设备有相关 *eFuses* 中所示的 flash 加密 eFuse 的默认设置。

要检查您的 ESP32-C3 设备上是否启用了 flash 加密，请执行以下操作之一：

- 将应用示例 security/flash_encryption 烧录到您的设备上。此应用程序会打印 SPI_BOOT_CRYPT_CNT eFuse 值，以及是否启用了 flash 加密。
- 查询设备所连接的串口名称，在以下命令中将 PORT 替换为串口名称后运行：

```
espefuse.py -p PORT summary
```

4.14.7 在加密的 flash 中读写数据

ESP32-C3 应用程序代码可以通过调用函数 *esp_flash_encryption_enabled()* 来检查当前是否启用了 flash 加密。此外，设备可以通过调用函数 *esp_get_flash_encryption_mode()* 来识别 flash 加密模式。

一旦启用 flash 加密，使用代码访问 flash 内容时要更加小心。

Flash 加密范围

当 SPI_BOOT_CRYPT_CNT eFuse 设置为奇数位的值，所有通过 MMU 的 flash 缓存访问的 flash 内容都将被透明解密。包括：

- Flash 中可执行的应用程序代码 (IROM)。
- 所有存储于 flash 中的只读数据 (DROM)。
- 通过函数*spi_flash_mmap()* 访问的任意数据。
- ROM 引导加载程序读取的固件引导加载程序镜像。

重要： MMU flash 缓存将无条件解密所有数据。Flash 中未加密存储的数据将通过 flash 缓存“被透明解密”，并在软件中存储为随机垃圾数据。

读取加密的 flash

如果需要在不使用 flash 缓存 MMU 映射的情况下读取数据，推荐使用分区读取函数*esp_partition_read()*。该函数只会解密从加密分区读取的数据。从未加密分区读取的数据不会被解密。这样，软件便能以相同的方式访问加密和未加密的 flash。

也可以使用以下 SPI flash API 函数:

- 通过函数*esp_flash_read()* 读取不会被解密的原（加密）数据。
- 通过函数*esp_flash_read_encrypted()* 读取和解密数据。

使用非易失性存储器 (NVS) API 存储的数据始终从 flash 加密的角度进行存储和读取解密。如有需要，则由库提供加密功能。详情可参考*NVS 加密*。

写入加密的 flash

推荐使用分区写入函数*esp_partition_write()*。此函数只会在将数据写入加密分区时加密数据，而写入未加密分区的数据不会被加密。通过这种方式，软件可以以相同的方式访问加密和非加密 flash。

也可以使用函数*esp_flash_write_encrypted()* 预加密和写入数据。

此外，esp-idf 应用程序中存在但不支持以下 ROM 函数：

- esp_rom_spiflash_write_encrypted 预加密并将数据写入 flash
- SPIWrite 将未加密的数据写入 flash

由于数据是按块加密的，加密数据最小的写入大小为 16 字节，对齐也是 16 字节。

4.14.8 更新加密的 flash

OTA 更新

如果使用函数*esp_partition_write()*，对加密分区的 OTA 更新将自动以加密形式写入。

在为已加密设备的 OTA 更新构建应用程序镜像之前，启用项目配置菜单中的*启动时使能 flash 加密* 选项。

请参考*OTA* 获取更多关于 ESP-IDF OTA 更新的信息。

通过串口更新加密 flash

通过串行引导加载程序烧录加密设备，需要串行引导加载程序下载接口没有通过 eFuse 被永久禁用。

在开发模式下，推荐的方法是*重新烧录更新后的分区*。

在发布模式下，如果主机上有存储在 eFuse 中的相同密钥的副本，那么就可以在主机上对文件进行预加密，然后进行烧录，具体请参考*手动加密文件*。

4.14.9 关闭 flash 加密

如果意外启用了 flash 加密，则明文数据的 flash 会使 ESP32-C3 无法正常启动。设备将不断重启，并报错 `flash read err, 1000` 或 `invalid header: 0xXXXXXX`。

对于开发模式下的 flash 加密，可以通过烧录 `SPI_BOOT_CRYPT_CNT` efuse 来关闭加密。每个芯片仅有 1 次机会，请执行以下步骤：

1. 在*项目配置菜单* 中，禁用*启动时使能 flash 加密* 选项，然后保存并退出。
2. 再次打开项目配置菜单，再次检查你是否已经禁用了该选项，如果这个选项仍被启用，引导加载程序在启动时将立即重新启用加密功能。
3. 在禁用 flash 加密后，通过运行 `idf.py flash` 来构建和烧录新的引导加载程序和应用程序。
4. 使用 `espefuse.py`（在 `components/esptool_py/esptool` 中）以关闭 `SPI_BOOT_CRYPT_CNT`，运行：

```
espefuse.py burn_efuse SPI_BOOT_CRYPT_CNT
```

重置 ESP32-C3，flash 加密应处于关闭状态，引导加载程序将正常启动。

4.14.10 Flash 加密的要点

- 使用 XTS-AES-128 加密 flash。Flash 加密密钥为 256 位，存储于芯片内部的 `BLOCK_KEYN` eFuse 中，并（默认）受保护，防止软件访问。
- 通过 ESP32-C3 的 flash 缓存映射功能，flash 可支持透明访问——任何映射到地址空间的 flash 区域在读取时都将被透明地解密。

  为便于访问，某些数据分区最好保持未加密状态，或者也可使用对已加密数据无效的 flash 友好型更新算法。由于 NVS 库无法与 flash 加密直接兼容，因此无法加密非易失性存储器的 NVS 分区。详情可参见*NVS 加密*。
- 如果以后可能需要启用 flash 加密，则编程人员在编写*使用加密 flash* 代码时需小心谨慎。
- 如果已启用安全启动，重新烧录加密设备的引导加载程序则需要“可重新烧录”的安全启动摘要（可参考*Flash 加密与安全启动*）。

启用 flash 加密将增大引导加载程序，因此可能需更新分区表偏移量。请参考*引导加载程序大小*。

重要： 在首次启动加密过程中，请勿切断 ESP32-C3 的电源。如果电源被切断，flash 的内容将受到破坏，并需要重新烧录未加密数据。而这类重新烧录将不计入烧录限制次数。

4.14.11 Flash 加密的局限性

flash 加密可以保护固件，防止未经授权的读取与修改。了解 flash 加密系统的局限之处亦十分重要：

- Flash 加密功能与密钥同样稳固。因而，推荐您首次启动设备时在设备上生成密钥（默认行为）。如果在设备外生成密钥，请确保遵循正确的后续步骤，不要在所有生产设备之间使用相同的密钥。
- 并非所有数据都是加密存储。因而在 flash 上存储数据时，请检查您使用的存储方式（库、API 等）是否支持 flash 加密。
- Flash 加密无法防止攻击者获取 flash 的高层次布局信息。这是因为每对相邻的 16 字节 AES 块都使用相邻的 AES 密钥。当这些相邻的 16 字节块中包含相同内容时（如空白或填充区域），这些字节块将加密以产生匹配的加密块对。这让攻击者可在加密设备间进行高层次对比（例如，确认两设备是否可能运行相同的固件版本）。
- 单独使用 flash 加密可能无法防止攻击者修改本设备的固件。为防止设备上运行未经授权的固件，可搭配 flash 加密使用*安全启动*。

4.14.12 Flash 加密与安全启动

推荐 flash 加密与安全启动搭配使用。但是，如果已启用安全启动，则重新烧录设备时会受到其他限制：

- 如果新的应用程序已使用安全启动签名密钥正确签名，则*OTA 更新* 不受限制。

4.14.13 Flash 加密的高级功能

以下部分介绍了 flash 加密的高级功能。

加密分区标志

部分分区默认为已加密。通过在分区的标志字段中添加 “encrypted” 标志，可在分区表描述中将其他分区标记为需要加密。在这些标记分区中的数据会和应用程序分区一样视为加密数据。

```
# Name,   Type, SubType, Offset,  Size, Flags
nvs,      data, nvs,     0x9000,  0x6000
phy_init, data, phy,     0xf000,  0x1000
factory,  app,  factory, 0x10000, 1M
secret_data, 0x40, 0x01, 0x20000, 256K, encrypted
```

请参考分区表 获取更多关于分区表描述的具体信息。

关于分区加密您还需要了解以下信息：

- 默认分区表都不包含任何加密数据分区。
- 启用 flash 加密后，” app” 分区一般都视为加密分区，因此无需标记。
- 如果未启用 flash 加密，则 “encrypted” 标记无效。
- 将可选 `phy` 分区标记为 “encrypted”，可以防止物理访问读取或修改 `phy_init` 数据。
- `nvs` 分区无法标记为 “encrypted” 因为 NVS 库与 flash 加密不直接兼容。

启用 UART 引导加载程序加密/解密

在第一次启动时，flash 加密过程默认会烧录以下 eFuse：

- `DIS_DOWNLOAD_MANUAL_ENCRYPT` 在 UART 引导加载程序启动模式下运行时，禁止 flash 加密操作。
- `DIS_DOWNLOAD_ICACHE` 在 UART 引导加载程序模式下运行时禁止整个 MMU flash 缓存。
- `DIS_PAD_JTAG` 和 `DIS_USB_JTAG` 禁用 JTAG。
- `DIS_DIRECT_BOOT`` （即之前的 ``DIS_LEGACY_SPI_BOOT`）禁用传统的 SPI 启动模式。

为了能启用这些功能，可在首次启动前仅烧录部分 eFuse，并用未设置值 0 写保护其他部分。例如：

```
espefuse.py --port PORT burn_efuse DIS_DOWNLOAD_MANUAL_ENCRYPT
espefuse.py --port PORT write_protect_efuse DIS_DOWNLOAD_MANUAL_ENCRYPT
```

备注： 请注意在写保护前设置所有适当的位！

一个位可以控制三个 eFuse 的写保护，这意味着写保护一个 eFuse 位将写保护所有未设置的 eFuse 位。

由于 `esptool.py` 目前不支持读取加密 flash，所以对这些 eFuse 进行写保护从而使其保持未设置目前来说并不是很有用。

JTAG 调试

默认情况下，当启用 flash 加密（开发或发布模式）时，将通过 eFuse 禁用 JTAG 调试。引导加载程序在首次启动时执行此操作，同时启用 flash 加密。

请参考*JTAG 与闪存加密和安全引导* 了解更多关于使用 JTAG 调试与 flash 加密的信息。

手动加密文件

手动加密或解密文件需要在 eFuse 中预烧录 flash 加密密钥（请参阅使用主机生成的密钥）并在主机上保留一份副本。如果 flash 加密配置在开发模式下，那么则不需要保留密钥的副本或遵循这些步骤，可以使用更简单的重新烧录更新后的分区 步骤。

密钥文件应该是单个原始二进制文件（例如：`key.bin`）。

例如，以下是将文件 `build/my-app.bin` 进行加密、烧录到偏移量 0x10000 的步骤。运行 `espsecure.py`，如下所示:

```
espsecure.py encrypt_flash_data --aes_xts --keyfile /path/to/key.bin --address␣
↪0x10000 --output my-app-ciphertext.bin build/my-app.bin
```

然后可以使用 `esptool.py` 将文件 `my-app-ciphertext.bin` 写入偏移量 0x10000。关于为 `esptool.py` 推荐的所有命令行选项，请查看 idf.py build 成功时打印的输出。

备注:

如果 ESP32-C3 在启动时无法识别烧录进去的密文文件，请检查密钥是否匹配以及命令行参数是否完全匹配，包括偏移量是否正确。

`espsecure.py decrypt_flash_data` 命令可以使用同样的选项（和不同的输入/输出文件）来解密 flash 密文或之前加密的文件。

4.14.14 技术细节

以下章节将提供 flash 加密操作的相关信息。

- 有关在 Python 中实现的完整 flash 加密算法，可参见 `espsecure.py` 源代码中的函数 `_flash_encryption_operation()`。

Flash 加密算法

- ESP32-C3 使用 XTS-AES 块密码模式进行 flash 加密，密钥大小为 256 位。
- XTS-AES 是一种专门为光盘加密设计的块密码模式，它解决了其它潜在模式如 AES-CTR 在此使用情景下的不足。有关 XTS-AES 算法的详细描述，请参考 IEEE Std 1619-2007。
- Flash 加密的密钥存储于一个 `BLOCK_KEYN` eFuse 中，默认受保护防止进一步写入或软件读取。
- 有关在 Python 中实现的完整 flash 加密算法，可参见 `espsecure.py` 源代码中的函数 `_flash_encryption_operation()`。

4.15 Hardware Abstraction

Hardware abstraction in ESP-IDF are a group of API that allow users to control peripherals at differing levels of abstraction, as opposed to interfacing with hardware using only the ESP-IDF drivers. ESP-IDF Hardware abstraction will likely be useful for users writing high performance bare-metal drivers, or for those attempting to port an ESP chip to another platform.

This guide is split into the following sections:

1. *Architecture*
2. *LL (Low Level) Layer*
3. *HAL (Hardware Abstraction Layer)*

警告: Hardware abstraction API (excluding the driver and `xxx_types.h`) should be considered an experimental feature, thus cannot be considered public API. Hardware abstraction API do not adhere to the API name changing restrictions of ESP-IDF's versioning scheme. In other words, it is possible that Hardware Abstraction API may change in between non-major release versions.

备注: Although this document mainly focuses on hardware abstraction of peripherals (e.g., UART, SPI, I2C), certain layers of hardware abstraction extend to other aspects of hardware as well (e.g., some of the CPU's features are partially abstracted).

4.15.1 Architecture

Hardware abstraction in ESP-IDF is comprised of the following layers, ordered from low level (closer to hardware) to high level (further away from hardware) of abstraction.

- Low Level (LL) Layer
- Hardware Abstraction Layer (HAL)
- Driver Layers

The LL Layer, and HAL are entirely contained within the `hal` component. Each layer is dependent on the layer below it (i.e, driver depends on HAL, HAL depends on LL, LL depends on the register header files).

For a particular peripheral `xxx`, its hardware abstraction will generally consist of the header files described in the table below. Files that are **Target Specific** will have a separate implementation for each target (i.e., a separate copy for each chip). However, the `#include` directive will still be target-independent (i.e., will be the same for different targets) as the build system will automatically include the correct version of the header and source files.

表 21: Hardware Abstraction Header Files

Include Directive	Target Specific	Description
`#include 'soc/xxx_caps.h"`	Y	This header contains a list of C macros specifying the various capabilities of the ESP32-C3's peripheral `xxx`. Hardware capabilities of a peripheral include things such as the number of channels, DMA support, hardware FIFO/buffer lengths, etc.
`#include "soc/xxx_struct.h"` `#include "soc/xxx_reg.h"`	Y	The two headers contain a representation of a peripheral's registers in C structure and C macro format respectively. Users can operate a peripheral at the register level via either of these two header files.
`#include "soc/xxx_pins.h"`	Y	If certain signals of a peripheral are mapped to a particular pin of the ESP32-C3, their mappings are defined in this header as C macros.
`#include "soc/xxx_periph.h"`	N	This header is mainly used as a convenience header file to automatically include `xxx_caps.h`, `xxx_struct.h`, and `xxx_reg.h`.
`#include "hal/xxx_types.h`	N	This header contains type definitions and macros that are shared among the LL, HAL, and driver layers. Moreover, it is considered public API thus can be included by the application level. The shared types and definitions usually related to non-implementation specific concepts such as the following: • Protocol related types/macros such a frames, modes, common bus speeds, etc. • Features/characteristics of an `xxx` peripheral that are likely to be present on any implementation (implementation-independent) such as channels, operating modes, signal amplification or attenuation intensities, etc.
`#include "hal/xxx_ll.h"`	Y	This header contains the Low Level (LL) Layer of hardware abstraction. LL Layer API are primarily used to abstract away register operations into readable functions.
`#include "hal/xxx_hal.h"`	Y	The Hardware Abstraction Layer (HAL) is used to abstract away peripheral operation steps into functions (e.g., reading a buffer, starting a transmission, handling an event, etc). The HAL is built on top of the LL Layer.
`#include "driver/xxx.h"`	N	The driver layer is the highest level of ESP-IDF's hardware abstraction. Driver layer API are meant to be called from ESP-IDF applications, and internally utilize OS primitives. Thus, driver layer API are event-driven, and can used in a multi-threaded environment.

4.15.2 LL (Low Level) Layer

The primary purpose of the LL Layer is to abstract away register field access into more easily understandable functions. LL functions essentially translate various in/out arguments into the register fields of a peripheral in the form of get/set functions. All the necessary bit shifting, masking, offsetting, and endianness of the register fields should be handled by the LL functions.

```
//Inside xxx_ll.h

static inline void xxx_ll_set_baud_rate(xxx_dev_t *hw,
                                        xxx_ll_clk_src_t clock_source,
                                        uint32_t baud_rate) {
    uint32_t src_clk_freq = (source_clk == XXX_SCLK_APB) ? APB_CLK_FREQ : REF_CLK_
↪FREQ;
    uint32_t clock_divider = src_clk_freq / baud;
    // Set clock select field
    hw->clk_div_reg.divider = clock_divider >> 4;
    // Set clock divider field
```

(下页继续)

(续上页)

```
    hw->config.clk_sel = (source_clk == XXX_SCLK_APB) ? 0 : 1;
}

static inline uint32_t xxx_ll_get_rx_byte_count(xxx_dev_t *hw) {
    return hw->status_reg.rx_cnt;
}
```

The code snippet above illustrates typical LL functions for a peripheral `xxx`. LL functions typically have the following characteristics:

- All LL functions are defined as `static inline` so that there is minimal overhead when calling these functions due to compiler optimization. These functions are not guaranteed to be inlined by the compiler, so any LL function that will be called when the cache is disabled (e.g. from an IRAM ISR context) should be marked with `__attribute__((always_inline))`.
- The first argument should be a pointer to a `xxx_dev_t` type. The `xxx_dev_t` type is a structure representing the peripheral's registers, thus the first argument is always a pointer to the starting address of the peripheral's registers. Note that in some cases where the peripheral has multiple channels with identical register layouts, `xxx_dev_t *hw` may point to the registers of a particular channel instead.
- LL functions should be short and in most cases are deterministic. In other words, the worst case runtime of the LL function can be determined at compile time. Thus, any loops in LL functions should be finite bounded; however, there are currently a few exceptions to this rule.
- LL functions are not thread safe, it is the responsibility of the upper layers (driver layer) to ensure that registers or register fields are not accessed concurrently.

4.15.3 HAL (Hardware Abstraction Layer)

The HAL layer models the operational process of a peripheral as a set of general steps, where each step has an associated function. For each step, the details of a peripheral's register implementation (i.e., which registers need to be set/read) are hidden (abstracted away) by the HAL. By modeling peripheral operation as a set of functional steps, any minor hardware implementation differences of the peripheral between different targets or chip versions can be abstracted away by the HAL (i.e., handled transparently). In other words, the HAL API for a particular peripheral will remain mostly the same across multiple targets/chip versions.

The following HAL function examples are selected from the Watchdog Timer HAL as each function maps to one of the steps in a WDT's operation life cycle, thus illustrating how a HAL abstracts a peripheral's operation into functional steps.

```
// Initialize one of the WDTs
void wdt_hal_init(wdt_hal_context_t *hal, wdt_inst_t wdt_inst, uint32_t prescaler,␣
↪bool enable_intr);

// Configure a particular timeout stage of the WDT
void wdt_hal_config_stage(wdt_hal_context_t *hal, wdt_stage_t stage, uint32_t␣
↪timeout, wdt_stage_action_t behavior);

// Start the WDT
void wdt_hal_enable(wdt_hal_context_t *hal);

// Feed (i.e., reset) the WDT
void wdt_hal_feed(wdt_hal_context_t *hal);

// Handle a WDT timeout
void wdt_hal_handle_intr(wdt_hal_context_t *hal);

// Stop the WDT
void wdt_hal_disable(wdt_hal_context_t *hal);

// De-initialize the WDT
void wdt_hal_deinit(wdt_hal_context_t *hal);
```

HAL functions will generally have the following characteristics:

- The first argument to a HAL function has the `xxx_hal_context_t *` type. The HAL context type is used to store information about a particular instance of the peripheral (i.e. the context instance). A HAL context is initialized by the `xxx_hal_init()` function and can store information such as the following:
  - The channel number of this instance
  - Pointer to the peripheral's (or channel's) registers (i.e., a `xxx_dev_t *` type)
  - Information about an ongoing transaction (e.g., pointer to DMA descriptor list in use)
  - Some configuration values for the instance (e.g., channel configurations)
  - Variables to maintain state information regarding the instance (e.g., a flag to indicate if the instance is waiting for transaction to complete)
- HAL functions should not contain any OS primitives such as queues, semaphores, mutexes, etc. All synchronization/concurrency should be handled at higher layers (e.g., the driver).
- Some peripherals may have steps that cannot be further abstracted by the HAL, thus will end up being a direct wrapper (or macro) for an LL function.
- Some HAL functions may be placed in IRAM thus may carry an `IRAM_ATTR` or be placed in a separate `xxx_hal_iram.c` source file.

4.16 JTAG 调试

本文将介绍如何安装 ESP32-C3 的 OpenOCD 调试环境，以及如何使用 GDB 来调试 ESP32-C3 的应用程序。本文结构如下：

引言 介绍本指南主旨。
工作原理 介绍 ESP32-C3、JTAG（Joint Test Action Group）接口、OpenOCD 和 GDB 如何相互连接，从而实现 ESP32-C3 的调试功能。
选择 *JTAG* 适配器 介绍有关 JTAG 硬件适配器的选择及参照标准。
安装 *OpenOCD* 介绍如何安装官方预编译好的 OpenOCD 软件包并验证是否安装成功。
配置 *ESP32-C3* 目标板 介绍如何设置 OpenOCD 软件并安装 JTAG 硬件，两项共同构成调试目标.
启动调试器 介绍如何从*Eclipse 集成开发环境* 和*命令行终端* 启动 GDB 调试会话。
调试范例 如果您不熟悉 GDB，请查看此小节以获取*Eclipse 集成开发环境* 以及*命令行终端* 提供的调试示例。
从源码构建 *OpenOCD* 介绍如何在*Windows*，*Linux* 和*macOS* 操作系统上从源码构建 OpenOCD。
注意事项和补充内容 介绍使用 OpenOCD 和 GDB 通过 JTAG 接口调试 ESP32-C3 时的注意事项和补充内容。

4.16.1 引言

乐鑫已完成 OpenOCD 移植，以支持 ESP32-C3 处理器和多核 FreeRTOS 架构（大多数 ESP32-C3 应用程序的基础）。此外，乐鑫还提供了一些 OpenOCD 本身并不支持的工具，以进一步丰富调试功能。

本文将介绍如何在 Linux、Windows 和 macOS 环境下为 ESP32-C3 安装 OpenOCD，并使用 GDB 进行软件调试。除部分安装流程有所不同外，所有操作系统的软件用户界面和使用流程都是相同的。

备注： 本文使用的图片素材来自于 Ubuntu 16.04 LTS 上 Eclipse Neon 3 软件的截图，不同的操作系统（Windows、macOS 或 Linux）或不同的 Eclipse 软件版本在用户界面上可能会有细微差别。

4.16.2 工作原理

通过 JTAG（Joint Test Action Group）接口使用 OpenOCD 调试 ESP32-C3 时所需要的关键软件和硬件包括 **riscv32-esp-elf-gdb 调试器**、**OpenOCD 片上调试器**和连接到 **ESP32-C3** 目标的 **JTAG 适配器**，如下图“Application Loading and Monitoring”标志所示。

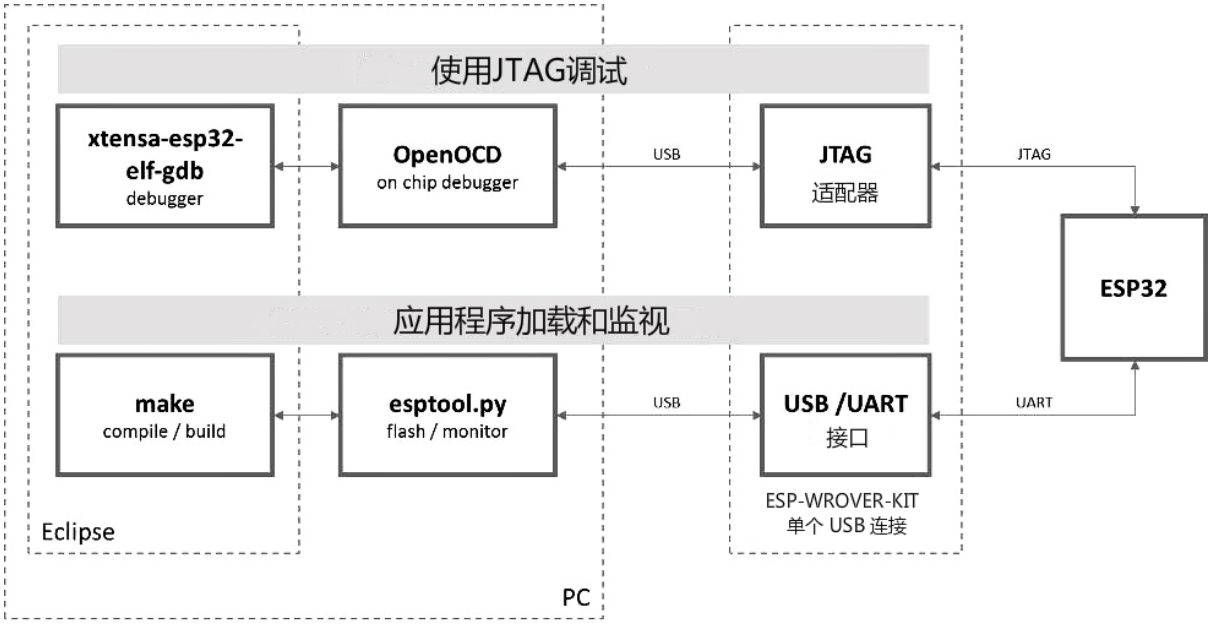

图 35: JTAG 调试 - 概述图

“Application Loading and Monitoring”标志显示一组关键的软件和硬件组件，可用于编译、构建和烧写应用程序到 ESP32-C3 上，以及监视来自 ESP32-C3 的运行诊断信息。

Eclipse 环境集成了 JTAG 调试和应用程序加载、监视的功能，使得软件从编写、编译、加载到调试的迭代过程变得更加快速简单。Eclipse IDE 及其集成的调试软件均适用于 Windows、Linux 和 macOS 平台。根据用户喜好，除了使用 Eclipse 集成开发环境，还可以直接在命令行终端运行 *debugger* 和 *idf.py build*。

仅需一根 USB 线即可高效连接 PC 与 ESP32-C3，因为 ESP32-C3 芯片本身提供了两路 USB 通道，一路连接到 JTAG，另一路连接到 USB 终端。应将 USB 线连接到 ESP32-C3 的 D+/D- USB 管脚，而非通过 USB-UART 芯片连接到串行 RxD/TxD。后文中*配置 ESP32-C3 目标板* 小节将对此进行解释。

备注： ESP32-C3 中的 USB 接口只能用于调试版本 3 或更新版本的芯片，对于版本 1 或 2 的芯片，请使用其他调试板（例如 ESP-Prog）。确定芯片版本最简单的方法是通过 *idf.py flash* 完成芯片烧写，并在底部寻找类似 *芯片为 ESP32-C3 (版本 3)* 信息。

4.16.3 选择 JTAG 适配器

上手 JTAG 最快速便捷的方式是将一根 USB 线连接到 ESP32-C3 的 D+/D- USB 管脚，无需使用外部 JTAG 适配器和额外线缆。

如果您想使用单独的 JTAG 适配器，请确保其与 ESP32-C3 的电平电压和 OpenOCD 软件都兼容。ESP32-C3 使用的是业界标准的 JTAG 接口，它未使用（实际上也并不需要）TRST 信号脚。JTAG 使用的 IO 管脚由 VDD_3P3_RTC 电源管脚供电（通常连接到外部 3.3 V 的电源轨），因此 JTAG 硬件适配器的管脚需要能够在该电压范围内正常工作。

在软件方面，OpenOCD 支持相当多数量的 JTAG 适配器，请参阅 OpenOCD 支持的适配器列表（请注意这一列表并不完整），其中还列出了兼容 SWD 接口的适配器，但请注意，ESP32-C3 目前并不支持 SWD。此外，硬编码为只支持特定产品线的 JTAG 适配器也无法在 ESP32-C3 上工作，例如仅针对 STM32 系列产品的 ST-LINK 适配器。

保证 JTAG 正常工作需要连接的信号线包括：TDI、TDO、TCK、TMS 和 GND。一些 JTAG 适配器还需要 ESP32-C3 提供一路电源到适配器的某个管脚上（比如 Vtar），用于设置适配器的工作电压。您也可以选择将 SRST 信号线连接到 ESP32-C3 的 CH_PD 管脚上，但请注意，目前 OpenOCD 对该信号线提供的支持相当有限。

ESP-Prog 中展示了使用外部电路板进行调试的实例，方法是将其连接到 ESP32-C3 的 JTAG 管脚上。

4.16.4 安装 OpenOCD

如果您已经按照快速入门 完成了 ESP-IDF 及其 CMake 构建系统的安装，那么 OpenOCD 已经被默认安装到了您的开发系统中。在设置开发环境 结束后，您应该能够在终端中运行如下 OpenOCD 命令:

```
openocd --version
```

终端会输出以下信息（实际版本号可能会更新）：

```
Open On-Chip Debugger  v0.10.0-esp32-20190708 (2019-07-08-11:04)
Licensed under GNU GPL v2
For bug reports, read
    https://openocd.org/doc/doxygen/bugs.html
```

您还可以检查 `OPENOCD_SCRIPTS` 环境变量的值，以确认 OpenOCD 配置文件的路径，Linux 和 macOS 用户可以在终端输入 `echo $OPENOCD_SCRIPTS`，Windows 用户需要输入 `echo %OPENOCD_SCRIPTS%`。如果终端输出了有效路径，则表明您已经正确安装 OpenOCD。

如果无法执行上述步骤，请再次阅读快速入门手册，参考设置安装工具 章节。

备注: 另外也可以从源代码编译 OpenOCD 工具，详细信息请参阅从源码构建 *OpenOCD* 章节。

4.16.5 配置 ESP32-C3 目标板

OpenOCD 安装完成后就可以配置 ESP32-C3 目标（即带 JTAG 接口的 ESP32-C3 板），具体分为以下三个步骤:

- 配置并连接 *JTAG* 接口
- 运行 *OpenOCD*
- 上传待调试的应用程序

配置并连接 JTAG 接口

此步骤取决于使用的 JTAG 和 ESP32-C3 板，请参考以下两种情况。

Configure ESP32-C3 built-in JTAG Interface ESP32-C3 has a built-in JTAG circuitry and can be debugged without any additional chip. Only an USB cable connected to the D+/D- pins is necessary. The necessary connections are shown in the following section.

Configure Hardware

表 22: ESP32-C3 pins and USB signals

ESP32-C3 Pin	USB Signal
GPIO18	D-
GPIO19	D+
5V	V_BUS
GND	Ground

Please verify that the ESP32-C3 pins used for USB communication are not connected to some other HW that may disturb the JTAG operation.

Configure USB Drivers JTAG communication should work on all supported platforms. Windows users might get *LIBUSB_ERROR_NOT_FOUND* errors. Please use version 2.8 (or newer) of the *ESP-IDF 工具安装器* and select the driver "Espressif - WinUSB support for JTAG (ESP32-C3/S3)" in order to resolve this issue. If you don't want to re-run the installer then the same can be achieved with idf-env by running the following command from PowerShell:

```
Invoke-WebRequest 'https://dl.espressif.com/dl/idf-env/idf-env.exe' -OutFile .\idf-
↪env.exe; .\idf-env.exe driver install --espressif
```

配置其它 JTAG 接口

关于适配 OpenOCD 和 ESP32-C3 的 JTAG 接口选择问题，请参考*选择 JTAG 适配器* 章节，确保 JTAG 适配器能够与 OpenOCD 和 ESP32-C3 一同工作。然后按照以下三个步骤进行设置，使其正常工作。

配置 eFuses ESP32-C3 JTAG 接口默认连接至*内置 USB_SERIAL_JTAG 外设*。要使用外部 JTAG 适配器，需将 JTAG 接口切换至 GPIO 管脚。您可以使用 *espefuse.py* 工具来烧录 eFuse，以完成接口转换。

烧录 eFuse 是一项不可逆的操作，所以在开始之前，请考虑以下两点：

- 烧录 *DIS_USB_JTAG* eFuse 后，USB_SERIAL_JTAG 和 CPU 的 JTAG 接口之间的连接将被永久禁用，此后您可以将 JTAG 接口连接到 GPIO4-GPIO7。注意，烧录后，USB_SERIAL_JTAG 的 USB CDC 功能仍然可用，即仍然可以通过 USB CDC 进行烧录和 log 查看。
- 烧录 `JTAG_SEL_ENABLE` eFuse 后，JTAG 接口的选择将由 strapping 管脚 GPIO10 来决定。ESP32-C3 复位时，如果该 strapping 管脚为低电平，JTAG 接口将使用 GPIO4-GPIO7，如果为高电平，USB_SERIAL_JTAG 将被用作 JTAG 接口。

配置硬件

1. 找到 JTAG 接口和 ESP32-C3 板上需要相互连接并建立通信的所有管脚或信号。

表 23: ESP32-C3 管脚和 JTAG 接口信号

ESP32-C3 管脚	JTAG 信号
MTDO / GPIO7	TDO
MTDI / GPIO5	TDI
MTCK / GPIO6	TCK
MTMS / GPIO4	TMS

2. 检查 ESP32-C3 上用于 JTAG 通信的管脚是否被连接到了其它硬件上，这可能会影响 JTAG 的工作。
3. 连接 ESP32-C3 和 JTAG 接口上的管脚或信号。

配置驱动 您可能还需要安装软件驱动，才能使 JTAG 在计算机上正常工作，请参阅您所使用的 JTAG 适配器的有关文档，获取相关详细信息。

连接 将 JTAG 接口连接到计算机，打开 ESP32-C3 和 JTAG 接口板上的电源，然后检查计算机是否可以识别到 JTAG 接口。

要继续设置调试环境，请前往*运行 OpenOCD* 章节。

运行 OpenOCD

配置完目标并将其连接到电脑后，即可启动 OpenOCD。

打开终端，按照快速入门指南中的*设置好开发环境* 章节进行操作，然后运行如下命令，以启动 OpenOCD（该命令适用于 Windows、Linux 和 macOS）：

```
openocd -f board/esp32c3-builtin.cfg
```

备注： 上述命令中 `-f` 选项后跟的配置文件专用于通过内置 USB 连接的 ESP32-C3。基于具体使用的硬件，您可能需要选择不同的配置文件，具体内容请参阅*根据目标芯片配置 OpenOCD*。

例如，对于带有用于 JTAG 连接的 FT2232H 或 FT232H 芯片的定制板，或带有 ESP-Prog 的定制板，可使用 `board/esp32c3-ftdi.cfg`。

现在您应该可以看到如下输出（此日志来自通过内置 USB 连接的 ESP32-C3）：

```
user-name@computer-name:~/esp/esp-idf$ openocd -f board/esp32c3-builtin.cfg
Open On-Chip Debugger v0.10.0-esp32-20201202-26-g05a036c2 (2021-03-15-17:18)
Licensed under GNU GPL v2
For bug reports, read
    http://openocd.org/doc/doxygen/bugs.html
Info : only one transport option; autoselect 'jtag'
Warn : Transport "jtag" was already selected
force hard breakpoints
Info : Listening on port 6666 for tcl connections
Info : Listening on port 4444 for telnet connections
Info : esp_usb_jtag: Device found. Base speed 40000KHz, div range 1 to 255
Info : clock speed 40000 kHz
Info : JTAG tap: esp32c3.cpu tap/device found: 0x00005c25 (mfg: 0x612 (Espressif␣
↪Systems), part: 0x0005, ver: 0x0)
Info : datacount=2 progbufsize=16
Info : Examined RISC-V core; found 1 harts
Info :  hart 0: XLEN=32, misa=0x40101104
Info : Listening on port 3333 for gdb connections
```

- 如果出现指示权限问题的错误，请打开 `~/esp/openocd-esp32` 目录，参阅 OpenOCD README 文件中关于 “Permissions delegation” 的说明。
- 如果遇到无法找到配置文件的错误，例如 `Can't find board/esp32c3-builtin.cfg`，请检查 `OPENOCD_SCRIPTS` 环境变量是否设置正确，OpenOCD 根据此变量来查找 `-f` 指定的文件，详见*安装 OpenOCD*。此外，还需要检查配置文件是否确实位于该路径下。
- 如果出现 JTAG 错误（例如输出为 `...all ones` 或 `...all zeroes`），请检查硬件连接是否正确，除了 ESP32-C3 的管脚之外是否还有其他信号连接到了 JTAG，并查看是否所有器件都已经上电。

上传待调试的应用程序

按照正常步骤构建并上传 ESP32-C3 应用程序，具体请参阅*第五步：开始使用 ESP-IDF 吧* 章节。

除此以外，您还可以使用 OpenOCD 通过 JTAG 接口将应用程序镜像烧写到 flash 中，命令如下：

```
openocd -f board/esp32c3-builtin.cfg -c "program_esp filename.bin 0x10000 verify␣
↪exit"
```

其中 OpenOCD 的烧写命令 `program_esp` 格式如下：

```
program_esp <image_file> <offset> [verify] [reset] [exit]
```

- `image_file` - 程序镜像文件存放的路径
- `offset` - 镜像烧写到 flash 中的偏移地址
- `verify` - 烧写完成后校验 flash 中的内容（可选）
- `reset` - 烧写完成后重启目标（可选）
- `exit` - 烧写完成后退出 OpenOCD（可选）

现在可以调试应用程序了，请按照以下章节中的步骤进行操作。

4.16.6 启动调试器

ESP32-C3 的工具链中带有 GNU 调试器（简称 GDB），它和其它工具链软件共同存放于 riscv32-esp-elf-gdb 中。除了直接在命令行终端中调用并操作 GDB 外，也可以在 IDE (例如 Eclipse、Visual Studio Code 等）中进行调用，使用图形用户界面间接操作 GDB，这一方法无需在终端中输入任何命令。

关于以上两种调试器的使用方法，详见以下链接。

- 使用 *Eclipse* 调试
- 使用命令行调试

建议首先检查调试器能否在命令行终端 下正常工作，然后再使用 Eclipse 集成开发环境 进行调试工作。

4.16.7 调试范例

本节适用于不熟悉 GDB 的用户，下文将使用 get-started/blink 下简单的应用程序来演示调试会话的工作流程，同时会介绍以下常用的调试操作：

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 手动暂停目标
4. 单步执行代码
5. 查看并设置内存
6. 观察和设置程序变量
7. 设置条件断点

此外还会提供在命令行终端进行调试 下使用 GDB 调试的案例。

在演示之前，请完成 ESP32-C3 目标板设置并加载 get-started/blink 至 ESP32-C3 中。

4.16.8 从源码构建 OpenOCD

以下文档分别介绍了如何在各操作系统平台上从源码构建 OpenOCD。

Windows 环境下从源码编译 OpenOCD

备注： 本文介绍了如何从 OpenOCD 源文件构建二进制文件。如果您想要更快速地构建，也可以从 乐鑫 GitHub 直接下载 OpenOCD 的预构建二进制文件，而无需自己编译（详细信息，请参阅安装 *OpenOCD*）。

备注： 本文涉及的命令行操作均在装有 MINGW32 子系统的 MSYS2 shell 环境中进行了验证。

安装依赖的软件包 安装编译 OpenOCD 所需的软件包：

```
pacman -S --noconfirm --needed autoconf automake git make \
mingw-w64-i686-gcc \
mingw-w64-i686-toolchain \
mingw-w64-i686-libtool \
mingw-w64-i686-pkg-config \
mingw-w64-cross-winpthreads-git \
p7zip
```

下载 OpenOCD 源码 支持 ESP32-C3 的 OpenOCD 源码可以从乐鑫官方 GitHub 获取，网址为 https://github.com/espressif/openocd-esp32。您可以在 Git 中使用以下命令来拉取源代码：

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码保存在 `~/esp/openocd-esp32` 目录下。

下载 libusb 构建 OpenOCD 需使用 libusb 库。请执行以下命令来下载特定版本的 libusb，并将其解压至当前目录。

```
wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
```

现在需要导出以下变量，以便将 libusb 库与 OpenOCD 构建相关联。

```
export CPPFLAGS="$CPPFLAGS -I${PWD}/libusb/include/libusb-1.0"
export LDFLAGS="$LDFLAGS -L${PWD}/libusb/MinGW32/.libs/dll"
```

构建 OpenOCD 配置和构建 OpenOCD，请参考以下命令：

```
cd ~/esp/openocd-esp32
export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="
↪$CFLAGS -Wno-error"
./bootstrap
./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --
↪build=i686-w64-mingw32 --host=i686-w64-mingw32
make
cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src
cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src
```

构建完成后，OpenOCD 的二进制文件将被保存于 `~/esp/openocd-esp32/src/` 目录下。

您也可以调用 `make install`，将其复制到指定位置。

- 您可以在配置 OpenOCD 时指定这一位置，也可以在调用 `make install` 前设置 `export DESTDIR="/custom/install/dir"`。
- 如果您已经安装过其他开发平台的 OpenOCD，请跳过此步骤，否则原来的 OpenOCD 可能会被覆盖。

备注:

- 如果发生错误，请解决后再次尝试编译，直到 `make` 成功为止。
- 如果 OpenOCD 存在子模块问题，请 `cd` 到 `openocd-esp32` 目录，并输入 `git submodule update --init` 命令。
- 如果 `./configure` 成功运行，JTAG 被使能的信息会被打印在 `OpenOCD configuration summary` 下面。
- 如果您的设备信息未显示在日志中，请根据 `../openocd-esp32/doc/INSTALL.txt` 文中的描述使用 `./configure` 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 `openocd-esp32/README.Windows`。
- 请记得将 *libusb-1.0.dll* 和 *libwinpthread-1.dll* 从 `~/esp/openocd-esp32/src` 复制到 *OOCD_INSTALLDIR/bin*。

一旦 `make` 过程完成，OpenOCD 的可执行文件会被保存到 `~/esp/openocd-esp32/src/openocd` 目录下。

完整编译过程 OpenOCD 编译过程中所调用的所有命令都已包含在以下代码片段中，您可以将其复制到 shell 脚本中，以便快速执行：

```
pacman -S --noconfirm --needed autoconf automake git make mingw-w64-i686-gcc mingw-
↪w64-i686-toolchain mingw-w64-i686-libtool mingw-w64-i686-pkg-config mingw-w64-
↪cross-winpthreads-git p7zip
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git

wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
export CPPFLAGS="$CPPFLAGS -I${PWD}/libusb/include/libusb-1.0"; export LDFLAGS="
↪$LDFLAGS -L${PWD}/libusb/MinGW32/.libs/dll"

export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="
↪$CFLAGS -Wno-error"
cd ~/esp/openocd-esp32
./bootstrap
./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --
↪build=i686-w64-mingw32 --host=i686-w64-mingw32
make
cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src
cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src

# # optional
# export DESTDIR="$PWD"
# make install
# cp ./src/libusb-1.0.dll $DESTDIR/mingw32/bin
# cp ./src/libwinpthread-1.dll $DESTDIR/mingw32/bin
```

下一步 想要进一步配置调试环境，请前往*配置 ESP32-C3 目标板* 章节。

Linux 环境下从源码编译 OpenOCD

除了从 Espressif 官方 直接下载 OpenOCD 可执行文件，你还可以选择从源码编译得到 OpenOCD。如果想要快速设置 OpenOCD 而不是自行编译，请备份好当前文件，前往*安装 OpenOCD* 章节查阅。

下载 OpenOCD 源码 支持 ESP32-C3 的 OpenOCD 源代码可以从乐鑫官方的 GitHub 获得，网址为 https://github.com/espressif/openocd-esp32。请使用以下命令来下载源代码:

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码被保存在 `~/esp/openocd-esp32` 目录中。

安装依赖的软件包 安装编译 OpenOCD 所需的软件包。

备注: 依次安装以下软件包，检查安装是否成功，然后继续下一个软件包的安装。在进行下一步操作之前，要先解决当前报告的问题。

```
sudo apt-get install make
sudo apt-get install libtool
sudo apt-get install pkg-config
sudo apt-get install autoconf
sudo apt-get install automake
sudo apt-get install texinfo
sudo apt-get install libusb-1.0
```

备注:

- pkg-config 应为 0.2.3 或以上的版本。
- autoconf 应为 2.6.4 或以上的版本。
- automake 应为 1.9 或以上的版本。
- 当使用 USB-Blaster，ASIX Presto，OpenJTAG 和 FT2232 作为适配器时，需要下载安装 libFTDI 和 FTD2XX 的驱动。
- 当使用 CMSIS-DAP 时，需要安装 HIDAPI。

构建 OpenOCD 配置和构建 OpenOCD 的流程如下:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

你可以选择最后再执行 `sudo make install`，如果你已经安装过别的开发平台的 OpenOCD，请跳过这个步骤，因为它可能会覆盖掉原来的 OpenOCD。

备注:

- 如果发生错误，请解决后再次尝试编译，直到 `make` 成功为止。
- 如果 OpenOCD 存在子模块问题，请 `cd` 到 `openocd-esp32` 目录，并输入 `git submodule update --init` 命令。
- 如果 `./configure` 成功运行，JTAG 被使能的信息会被打印在 `OpenOCD configuration summary` 下面。
- 如果您的设备信息未显示在日志中，请根据 `../openocd-esp32/doc/INSTALL.txt` 文中的描述使用 `./configure` 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 `openocd-esp32/README`。

一旦 `make` 过程成功结束，OpenOCD 的可执行文件会被保存到 `~/openocd-esp32/bin` 目录中。

下一步 想要进一步配置调试环境，请前往*配置 ESP32-C3 目标板* 章节。

MacOS 环境下从源码编译 OpenOCD

除了从 Espressif 官方 直接下载 OpenOCD 可执行文件，你还可以选择从源码编译得到 OpenOCD。如果想要快速设置 OpenOCD 而不是自行编译，请备份好当前文件，前往*安装 OpenOCD* 章节查阅。

下载 OpenOCD 源码 支持 ESP32-C3 的 OpenOCD 源代码可以从乐鑫官方的 GitHub 获得，网址为 https://github.com/espressif/openocd-esp32。请使用以下命令来下载源代码:

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码被保存在 `~/esp/openocd-esp32` 目录中。

安装依赖的软件包 使用 Homebrew 安装编译 OpenOCD 所需的软件包:

```
brew install automake libtool libusb wget gcc@4.9 pkg-config
```

构建 OpenOCD 配置和构建 OpenOCD 的流程如下:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

你可以选择最后再执行 `sudo make install`，如果你已经安装过别的开发平台的 OpenOCD，请跳过这个步骤，因为它可能会覆盖掉原来的 OpenOCD。

备注:

- 如果发生错误，请解决后再次尝试编译，直到 `make` 成功为止。
- 如果 OpenOCD 存在子模块问题，请 `cd` 到 `openocd-esp32` 目录，并输入 `git submodule update --init` 命令。
- 如果 `./configure` 成功运行，JTAG 被使能的信息会被打印在 `OpenOCD configuration summary` 下面。
- 如果您的设备信息未显示在日志中，请根据 `../openocd-esp32/doc/INSTALL.txt` 文中的描述使用 `./configure` 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 `openocd-esp32/README.OSX`。

一旦 `make` 过程成功结束，OpenOCD 的可执行文件会被保存到 `~/esp/openocd-esp32/src/openocd` 目录中。

下一步 想要进一步配置调试环境，请前往配置 *ESP32-C3* 目标板 章节。

本文档在演示中所使用的 OpenOCD 是预编译好的二进制发行版，在安装 *OpenOCD* 章节中有所介绍。

如果要使用本地从源代码编译的 OpenOCD 程序，需要将相应可执行文件的路径修改为 `src/openocd`，并设置 `OPENOCD_SCRIPTS` 环境变量，使得 OpenOCD 能够找到配置文件。Linux 和 macOS 用户可以执行:

```
cd ~/esp/openocd-esp32
export OPENOCD_SCRIPTS=$PWD/tcl
```

Windows 用户可以执行:

```
cd %USERPROFILE%\esp\openocd-esp32
set "OPENOCD_SCRIPTS=%CD%\tcl"
```

针对 Linux 和 macOS 用户，运行本地编译的 OpenOCD 的示例:

```
src/openocd -f board/esp32c3-builtin.cfg
```

Windows 用户的示例如下:

```
src\openocd -f board/esp32c3-builtin.cfg
```

4.16.9 注意事项和补充内容

本节列出了上文中提到的所有注意事项和补充内容的链接。

注意事项和补充内容

本节提供了本指南中各部分提到的一些注意事项和补充内容。

可用的断点和观察点 ESP32-C3 调试器支持 2 个硬件断点和 64 个软件断点。硬件断点是由 ESP32-C3 芯片内部的逻辑电路实现的，能够设置在代码的任何位置：闪存或者 IRAM 的代码区域。除此以外，OpenOCD 实现了两种软件断点：闪存断点（最多 32 个）和 IRAM 断点（最多 32 个）。目前 GDB 无法在闪存中设置软件断点，因此除非解决此限制，否则这些断点只能由 OpenOCD 模拟为硬件断点。（详细信息可以参阅下面）。ESP32-C3 还支持 2 个观察点，所以可以观察两个变量的变化或者通过 GDB 命令 `watch myVariable` 来读取变量的值。请注意 menuconfig 中的*CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK* 选项会使用第二个观察点，如果你想在 OpenOCD 或者 GDB 中再次尝试使用这个观察点，可能不会得到预期的结果。详情请查看 menuconfig 中的帮助文档。

关于断点的补充知识 使用软件闪存模拟部分硬件断点的意思就是当使用 GDB 命令 `hb myFunction` 给某个函数设置硬件断点时，如果该函数位于闪存中，并且此时还有可用的硬件断点，那调试器就会使用硬件断点，否则就使用 32 个软件闪存断点中的一个来模拟。这个规则同样适用于 `b myFunction` 之类的命令，在这种情况下，GDB 会自己决定该使用哪种类型的断点。如果 `myFunction` 位于可写区域（IRAM），那就会使用软件 IRAM 断点，否则就会像处理 `hb` 命令一样使用硬件断点或者软件闪存断点。

闪存映射 vs 软件闪存断点 为了在闪存中设置或者清除软件断点，OpenOCD 需要知道它们在闪存中的地址。为了完成从 ESP32-C3 的地址空间到闪存地址的转换，OpenOCD 使用闪存中程序代码区域的映射。这些映射被保存在程序映像的头部，位于二进制数据（代码段和数据段）之前，并且特定于写入闪存的每一个应用程序的映像。因此，为了支持软件闪存断点，OpenOCD 需要知道待调试的应用程序映像在闪存中的位置。默认情况下，OpenOCD 会在 0x8000 处读取分区表并使用第一个找到的应用程序映像的映射，但是也可能会存在无法工作的情况，比如分区表不在标准的闪存位置，甚至可能有多个映像：一个出厂映像和两个 OTA 映像，你可能想要调试其中的任意一个。为了涵盖所有可能的调试情况，OpenOCD 支持特殊的命令，用于指定待调试的应用程序映像在闪存中的具体位置。该命令具有以下格式：

```
esp appimage_offset <offset>
```

偏移量应为十六进制格式，如果要恢复默认行为，可以将偏移地址设置为 `-1` 。

备注： 由于 GDB 在连接 OpenOCD 时仅仅请求一次内存映射，所以可以在 TCL 配置文件中指定该命令，或者通过命令行传递给 OpenOCD。对于后者，命令行示例如下：

```
openocd -f board/esp32c3-builtin.cfg -c "init; halt; esp appimage_offset 0x210000"
```

另外还可以通过 OpenOCD 的 telnet 会话执行该命令，然后再连接 GDB，不过这种方式似乎没有那么便捷。

“next” 命令无法跳过子程序的原因 当使用 `next` 命令单步执行代码时，GDB 会在子程序的前面设置一个断点（两个中可用的一个），这样就可以跳过进入子程序内部的细节。如果这两个断点已经用在代码的其它位置，那么 `next` 命令将不起作用。在这种情况下，请删掉一个断点以使其中一个变得可用。当两个断点都已经被使用时，`next` 命令会像 `step` 命令一样工作，调试器就会进入子程序内部。

OpenOCD 支持的编译时的选项 ESP-IDF 有一些针对 OpenOCD 调试功能的选项可以在编译时进行设置：

- *CONFIG_ESP_DEBUG_OCDAWARE* 默认会被使能。如果程序抛出了不可修复或者未处理的异常，并且此时已经连接上了 JTAG 调试器（即 OpenOCD 正在运行），那么 ESP-IDF 将会进入调试器工作模式。
- *CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK* 默认没有使能。在所有任务堆栈的末尾设置观察点，从 1 号开始索引。这是调试任务堆栈溢出的最准确的方式。

更多有关设置编译时的选项的信息，请参阅项目配置菜单。

支持 FreeRTOS OpenOCD 完全支持 ESP-IDF 自带的 FreeRTOS 操作系统，GDB 会将 FreeRTOS 中的任务当做线程。使用 GDB 命令 `i threads` 可以查看所有的线程，使用命令 `thread n` 可以切换到某个具体任务的堆栈，其中 `n` 是线程的编号。检测 FreeRTOS 的功能可以在配置目标时被禁用。更多详细信息，请参阅根据目标芯片配置 *OpenOCD*.

优化 JTAG 的速度 为了实现更高的数据通信速率同时最小化丢包数，建议优化 JTAG 时钟频率的设置，使其达到 JTAG 能稳定运行的最大值。为此，请参考以下建议。

1. 如果 CPU 以 80 MHz 运行，则 JTAG 时钟频率的上限为 20 MHz；如果 CPU 以 160 MHz 或者 240 MHz 运行，则上限为 26 MHz。
2. 根据特定的 JTAG 适配器和连接线缆的长度，你可能需要将 JTAG 的工作频率降低至 20 / 26 MHz 以下。
3. 在某些特殊情况下，如果你看到 DSR/DIR 错误（并且它并不是由 OpenOCD 试图从一个没有物理存储器映射的地址空间读取数据而导致的），请降低 JTAG 的工作频率。
4. ESP-WROVER-KIT 能够稳定运行在 20 / 26 MHz 频率下。

调试器的启动命令的含义 在启动时，调试器发出一系列命令来复位芯片并使其在特定的代码行停止运行。这个命令序列（如下所示）支持自定义，用户可以选择在最方便合适的代码行开始调试工作。

- `set remote hardware-watchpoint-limit 2` —限制 GDB 仅使用 ESP32-C3 支持的两个硬件观察点。更多详细信息，请查阅 GDB 配置远程目标 。
- `mon reset halt` —复位芯片并使 CPU 停止运行。
- `flushregs` —monitor (`mon`) 命令无法通知 GDB 目标状态已经更改，GDB 会假设在 `mon reset halt` 之前所有的任务堆栈仍然有效。实际上，复位后目标状态将发生变化。执行 `flushregs` 是一种强制 GDB 从目标获取最新状态的方法。
- `thb app_main` —在 `app_main` 处插入一个临时的硬件断点，如果有需要，可以将其替换为其他函数名。
- `c` —恢复程序运行，它将会在 `app_main` 的断点处停止运行。

根据目标芯片配置 OpenOCD OpenOCD 有很多种配置文件（`*.cfg`），它们位于 OpenOCD 安装目录的 `share/openocd/scripts` 子目录中（或者在 OpenOCD 源码目录的 `tcl/scripts` 目录中）。本文主要介绍 `board`，`interface` 和 `target` 这三个目录。

- `interface` 包含了例如 ESPProg、J-Link 这些 JTAG 适配器的配置文件。
- `target` 包含了目标芯片或者模组的配置文件。
- `board` 包含有内置了 JTAG 适配器的开发板的配置文件，这些配置文件会根据实际的 JTAG 适配器和芯片/模组来导入某个具体的 `interface` 和 `target` 的配置。

ESP32-C3 可以使用的配置文件如下表所示:

表 24: ESP32-C3 相关的 OpenOCD 配置文件

名称	描述
`board/esp32c3-builtin.cfg`	通过内置 USB 连接的 ESP32-C3 系列开发板配置文件，包含 ESP32-C3 目标配置和 JTAG 适配器配置。
`board/esp32c3-ftdi.cfg`	通过与 ESP-Prog 兼容的 FTDI 对 ESP32-C3 调试的配置文件，包括 ESP32-C3 目标配置和 JTAG 适配器配置。
`target/esp32c3.cfg`	ESP32-C3 目标配置文件。可以和某个 `interface/` 下的配置文件一同使用。
`interface/esp_usb_jtag.cfg`	适用于 ESP32-C3 的 JTAG 适配器配置文件。
`interface/ftdi/esp32_devkitj_v1.cfg`	适用于 ESP-Prog 的 JTAG 适配器配置文件。

如果你使用的开发板已经有了一份预定义好的配置文件，你只须将该文件通过 `-f` 参数告诉 OpenOCD。

如果你的开发板不在上述列表中，你需要使用多个 `-f` 参数来告诉 OpenOCD 你选择的 `interface` 和 `target` 配置文件。

自定义配置文件 OpenOCD 的配置文件是用 TCL 语言编写的，包含了定制和编写脚本的各种选项。这在非标准调试的场景中非常有用，更多关于 TCL 脚本的内容请参考 OpenOCD 参考手册。

OpenOCD 中的配置变量 你还可以视情况在导入 `target` 配置文件之前，设定如下变量的值。可以写在自定义配置文件中，或者通过命令行传递。

TCL 语言中为变量赋值的语法是:

```
set VARIABLE_NAME value
```

在命令行中为变量赋值请参考如下示例（请把.cfg 配置文件替换成你自己的开发板配置）：

```
openocd -c 'set VARIABLE_NAME value' -f board/esp-xxxxx-kit.cfg
```

请切记，一定要在导入配置文件之前设置这些变量，否则变量的值将不会生效。为多个变量赋值需要重复多次 `-c` 选项。

表 25: 通用的 ESP 相关的 OpenOCD 变量

变量名	描述
ESP_RTOS	设置成 `none` 可以关闭 OpenOCD 对 RTOS 的支持，这样的话，你将无法在 GDB 中查看到线程列表。这个功能在调试 FreeRTOS 本身的时候会很有用，可以单步调试调度器的代码。
ESP_FLASH_SIZE	设置成 `0` 可以关闭对 Flash 断点的支持。
ESP_SEMIHOST_BASEDI	设置 semihosting 在主机端的默认目录。

复位 ESP32-C3 通过在 GDB 中输入 `mon reset` 或者 `mon reset halt` 来复位板子。

不要将 JTAG 引脚用于其他功能 如果除了 ESP32-C3 模组和 JTAG 适配器之外的其他硬件也连接到了 JTAG 引脚，那么 JTAG 的操作可能会受到干扰。ESP32-C3 JTAG 使用以下引脚:

表 26: ESP32-C3 管脚和 JTAG 接口信号

ESP32-C3 管脚	JTAG 信号
MTDO / GPIO7	TDO
MTDI / GPIO5	TDI
MTCK / GPIO6	TCK
MTMS / GPIO4	TMS

如果用户应用程序更改了 JTAG 引脚的配置，JTAG 通信可能会失败。如果 OpenOCD 正确初始化（检测到两个 Tensilica 内核），但在程序运行期间失去了同步并报出大量 DTR/DIR 错误，则应用程序可能将 JTAG 引脚重新配置为其他功能或者用户忘记将 Vtar 连接到 JTAG 适配器。

下面是 GDB 在应用程序进入重新配置 MTDO/GPIO15 作为输入代码后报告的一系列错误摘录:

```
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated␣
↪an exception!
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated␣
↪an overrun!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated␣
↪an exception!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated␣
↪an overrun!
```

JTAG 与闪存加密和安全引导 默认情况下，开启了闪存加密和（或者）安全引导后，系统在首次启动时，引导程序会烧写 eFuse 的某个比特，从而将 JTAG 永久关闭。

Kconfig 配置项*CONFIG_SECURE_BOOT_ALLOW_JTAG* 可以改变这个默认行为，使得用户即使开启了安全引导或者闪存加密，仍会保留 JTAG 的功能。

然而，因为设置软件断点 的需要，OpenOCD 会尝试自动读写 Flash 中的内容，这会带来两个问题:

- 软件断点和闪存加密是不兼容的，目前 OpenOCD 尚不支持对 Flash 中的内容进行加密和解密。
- 如果开启了安全引导功能，设置软件断点会改变被签名的程序的摘要，从而使得签名失效。这也意味着，如果设置了软件断点，系统会在下次重启时的签名验证阶段失败，导致无法启动。

关闭 JTAG 的软件断点功能，可以在启动 OpenOCD 时在命令行额外加一项配置参数 `-c 'set ESP_FLASH_SIZE 0'`，请参考*OpenOCD 中的配置变量*。

备注： 同样地，当启用该选项，并且调试过程中打了软件断点，之后引导程序将无法校验通过应用程序的签名。

报告 OpenOCD / GDB 的问题 如果你遇到 OpenOCD 或者 GDB 程序本身的问题，并且在网上没有找到可用的解决方案，请前往 https://github.com/espressif/openocd-esp32/issues 新建一个议题。

1. 请在问题报告中提供你使用的配置的详细信息：
   a. JTAG 适配器类型。
   b. 用于编译和加载正在调试的应用程序的 ESP-IDF 版本号。
   c. 用于调试的操作系统的详细信息。
   d. 操作系统是在本地计算机运行还是在虚拟机上运行？
2. 创建一个能够演示问题的简单示例工程，描述复现该问题的步骤。且这个调试示例不能受到 Wi-Fi 协议栈引入的非确定性行为的影响，因而再次遇到同样问题时，更容易复现。
3. 在启动命令中添加额外的参数来输出调试日志。
   OpenOCD 端：

   ```
   openocd -l openocd_log.txt -d3 -f board/esp32c3-builtin.cfg
   ```

   这种方式会将日志输出到文件，但是它会阻止调试信息打印在终端上。当有大量信息需要输出的时候（比如调试等级提高到 `-d3`）这是个不错的选择。如果你仍然希望在屏幕上看到调试日志，请改用以下命令：

   ```
   openocd -d3 -f board/esp32c3-builtin.cfg 2>&1 | tee openocd.log
   ```

   Debugger 端：

   ```
   riscv32-esp-elf-gdb -ex "set remotelogfile gdb_log.txt" <all other options>
   ```

   也可以将命令 `remotelogfile gdb_log.txt` 添加到 `gdbinit` 文件中。
4. 请将 `openocd_log.txt` 和 `gdb_log.txt` 文件附在你的问题报告中。

使用调试器

本节介绍以下几种配置和运行调试器的方法：

- *使用 Eclipse 调试*
- *使用命令行调试*
- *使用 idf.py 进行调试*

使用 Eclipse 调试

备注： 建议您首先通过*idf.py* 或*命令行* 检查调试器是否正常工作，然后再转到使用*Eclipse* 平台。

标准的 Eclipse 安装流程默认安装调试功能，另外您还可以使用插件来调试，比如 “GDB Hardware Debugging”。这个插件用起来非常方便，本指南会详细介绍该插件的使用方法。

首先，打开 Eclipse 并转到 “Help” > “Install New Software” 来安装 “GDB Hardware Debugging” 插件。

安装完成后，按照以下步骤配置调试会话。请注意，一些配置参数是通用的，有些则针对特定项目。我们会通过配置“blink”示例项目的调试环境来进行展示，请先按照 Eclipse Plugin 介绍的方法将该示例项目添加到 Eclipse 的工作空间。示例项目 get-started/blink 的源代码可以在 ESP-IDF 仓库的 examples 目录下找到。

1. 在 Eclipse 中，进入 *Run* > *Debug Configuration*，会出现一个新的窗口。在窗口的左侧窗格中，双击“GDB Hardware Debugging”（或者选择“GDB Hardware Debugging”然后按下“New”按钮）来新建一个配置。
2. 在右边显示的表单中，“Name:”一栏中输入配置的名称，例如：“Blink checking”。
3. 在下面的“Main”选项卡中，点击“Project:”边上的“Browse”按钮，然后选择当前的“blink”项目。
4. 在下一行的“C/C++ Application:”中，点击“Browse”按钮，选择“blink.elf”文件。如果“blink.elf”文件不存在，那么很有可能该项目还没有编译，请参考 Eclipse Plugin 指南中的介绍。
5. 最后，在“Build (if required) before launching”下面点击“Disable auto build”。

   上述步骤 1 - 5 的示例输入如下图所示。

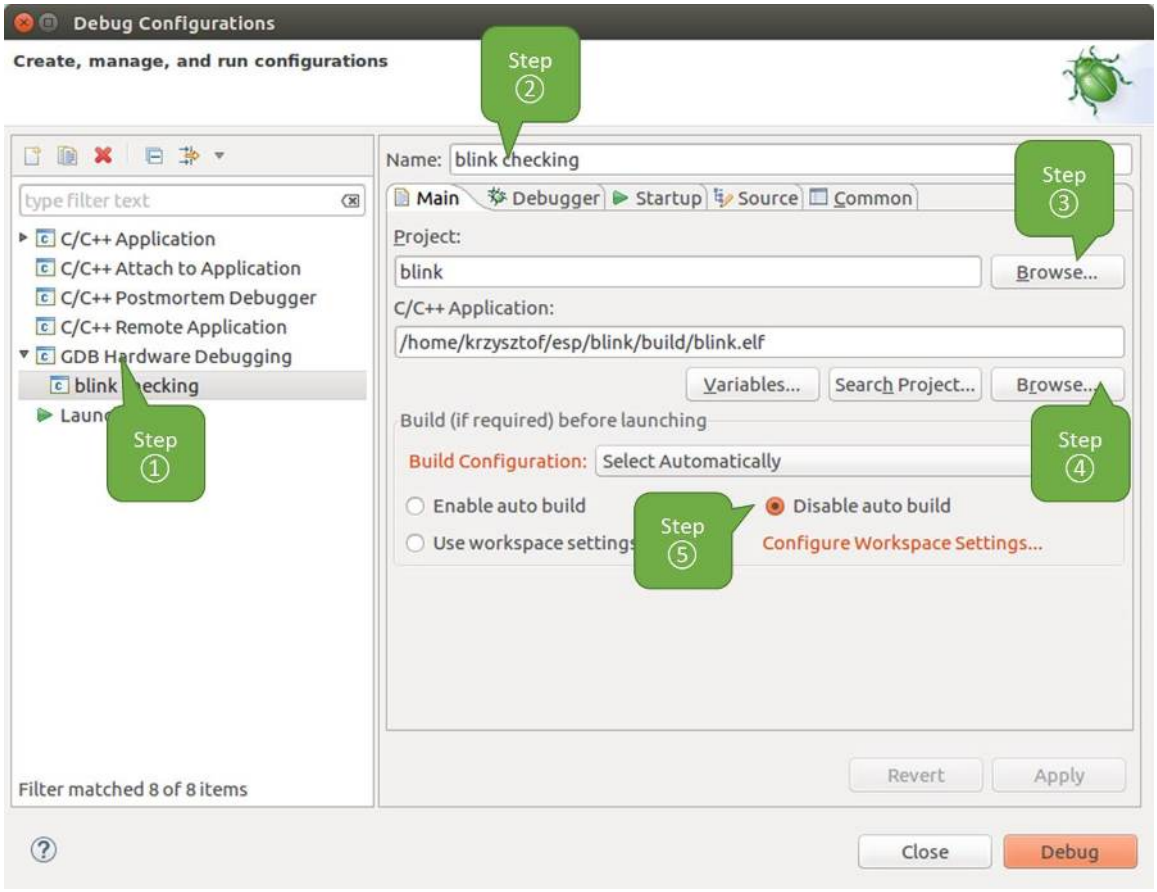

图 36: GDB 硬件调试的配置 - Main 选项卡

6. 点击“Debugger”选项卡，在“GDB Command”栏中输入 `riscv32-esp-elf-gdb` 来调用调试器。
7. 更改“Remote host”的默认配置，在“Port number”下面输入 `3333`。

   上述步骤 6 - 7 的示例输入如下图所示。
8. 最后一个需要更改默认配置的选项卡是“Startup”选项卡。在“Initialization Commands”下，取消选中“Reset and Delay (seconds)”和“Halt”，然后在下面一栏中输入以下命令：

```
mon reset halt
flushregs
set remote hardware-watchpoint-limit 2
```

备注： 如果您想在启动新的调试会话之前自动更新闪存中的镜像，请在“Initialization Commands”文本框的开头添加以下命令行：

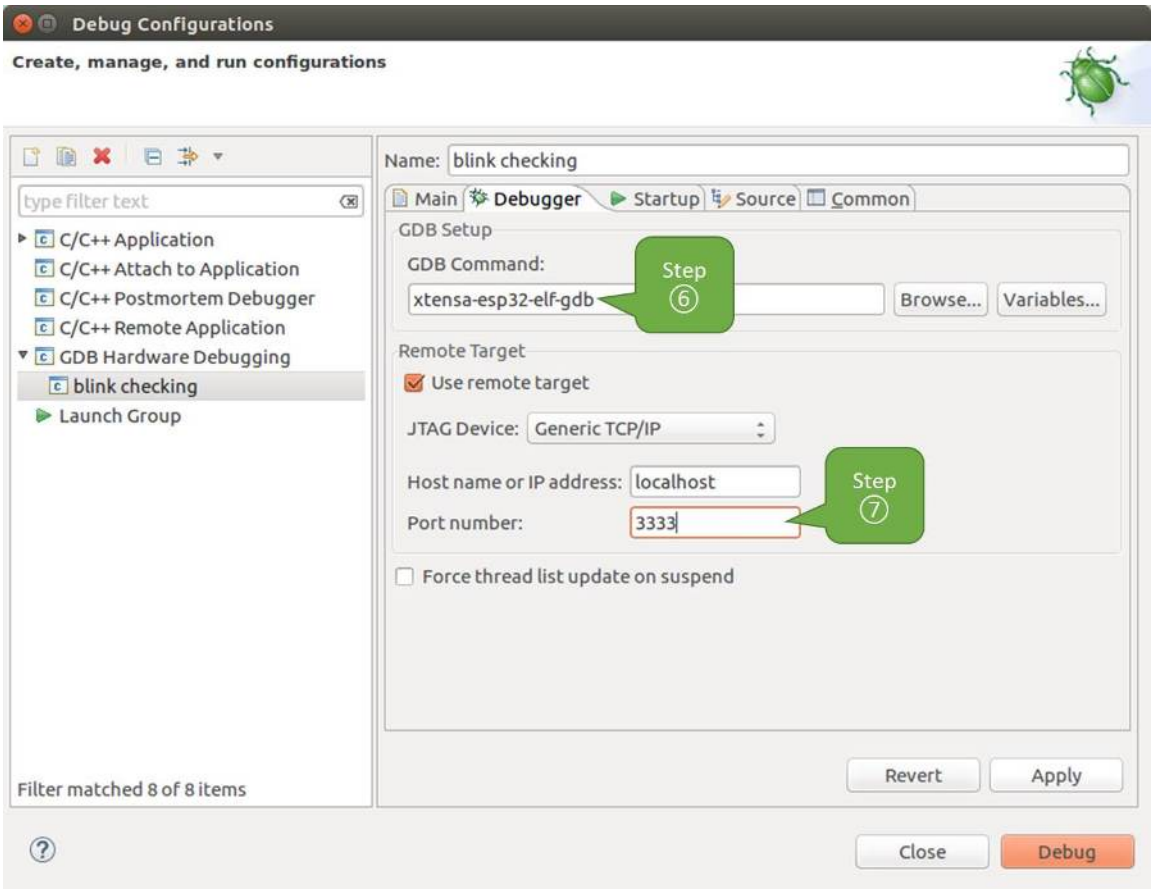

图 37: GDB 硬件调试的配置 - Debugger 选项卡

```
mon reset halt
mon program_esp ${workspace_loc:blink/build/blink.bin} 0x10000 verify
```

有关 `program_esp` 命令的说明请参考*上传待调试的应用程序* 章节。

9. 在 “Load Image and Symbols” 下，取消选中 “Load image” 选项。
10. 在同一个选项卡中继续往下浏览，建立一个初始断点用来在调试器复位后暂停 CPU。插件会根据 “Set break point at:” 一栏中输入的函数名，在该函数的开头设置断点。选中这一选项，并在相应的字段中输入 `app_main`。
11. 选中 “Resume” 选项，这会使得程序在每次调用步骤 8 中的 `mon reset halt` 后恢复，然后在 `app_main` 的断点处停止。
    上述步骤 8 - 11 的示例输入如下图所示。

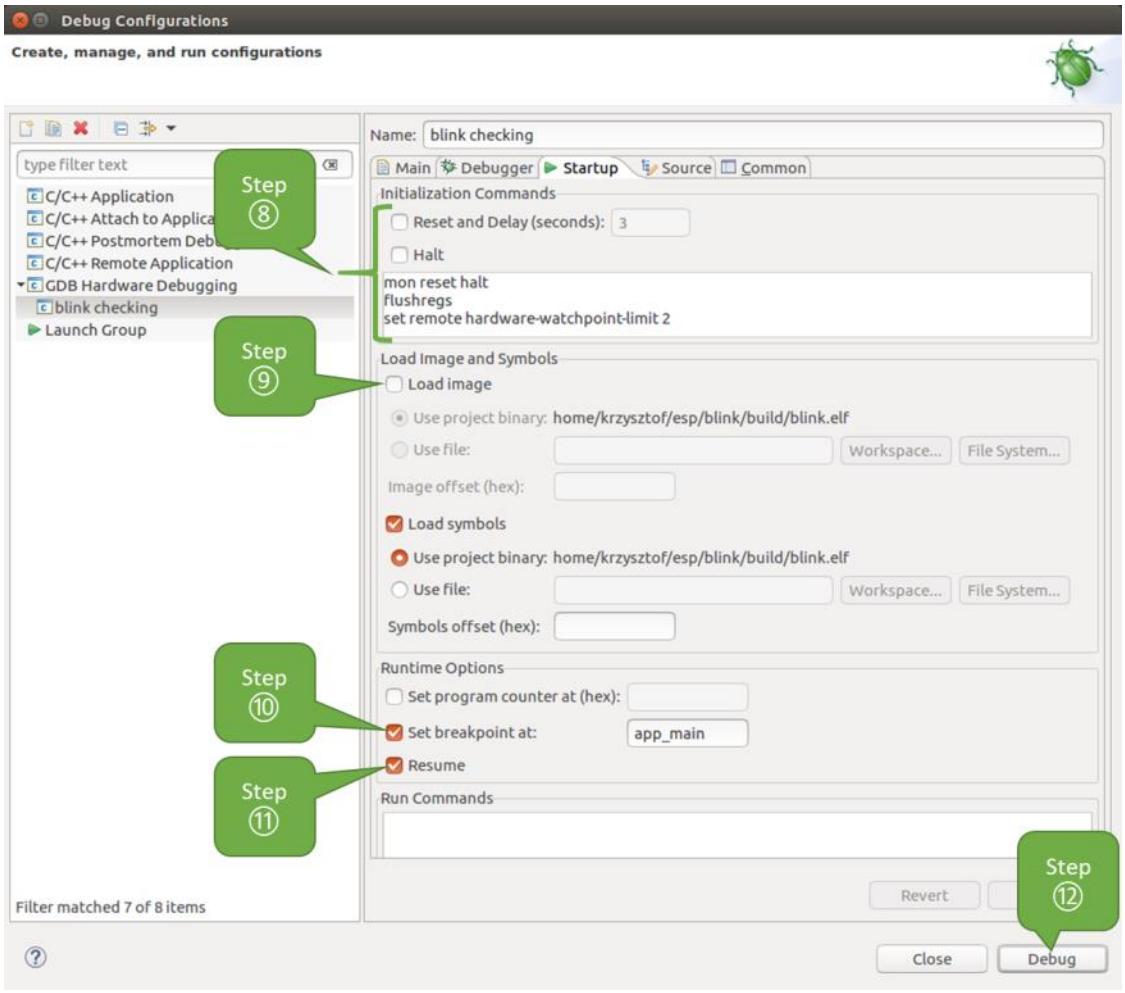

图 38: GDB 硬件调试的配置 - Startup 选项卡

上面的启动序列看起来有些复杂，如果您对其中的初始化命令不太熟悉，请查阅*调试器的启动命令的含义* 章节获取更多说明。

12. 如果您前面已经完成*配置 ESP32-C3 目标板* 中介绍的步骤，那么目标正在运行并准备与调试器进行对话。按下 “Debug” 按钮就可以直接调试。否则请按下 “Apply” 按钮保存配置，返回*配置 ESP32-C3 目标板* 章节进行配置，最后再回到这里开始调试。

一旦所有 1 - 12 的配置步骤都已经完成，Eclipse 就会打开 “Debug” 视图，如下图所示。

如果您不太了解 GDB 的常用方法，请查阅*使用 Eclipse 的调试示例* 文章中的调试示例章节*调试范例*。

使用命令行调试

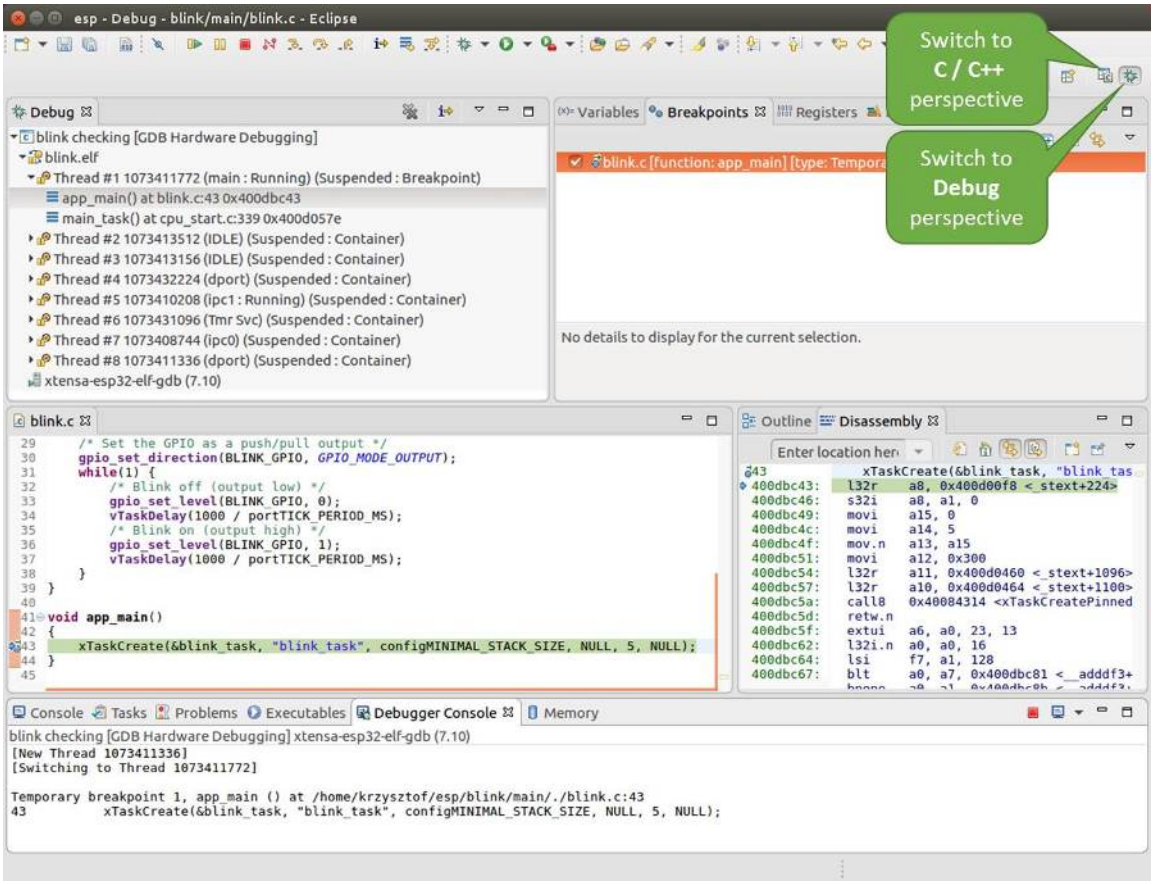

图 39: Eclipse 中的调试视图

1. 为了能够启动调试会话，需要先启动并运行目标，如果还没有完成，请按照配置 *ESP32-C3* 目标板 中的介绍进行操作。
2. 打开一个新的终端会话并前往待调试的项目目录，比如：

```
cd ~/esp/blink
```

3. 当启动调试器时，通常需要提供几个配置参数和命令，为了避免每次都在命令行中逐行输入这些命令，您可以新建一个配置文件，并将其命名为 gdbinit：

```
target remote :3333
set remote hardware-watchpoint-limit 2
mon reset halt
flushregs
thb app_main
c
```

将此文件保存在当前目录中。
有关 gdbinit 文件内部的更多详细信息，请参阅调试器的启动命令的含义 章节。

4. 准备好启动 GDB，请在终端中输入以下内容：

```
riscv32-esp-elf-gdb -x gdbinit build/blink.elf
```

5. 如果前面的步骤已经正确完成，您会看到如下所示的输出日志，在日志的最后会出现（gdb）提示符：

```
user-name@computer-name:~/esp/blink$ riscv32-esp-elf-gdb -x gdbinit build/
↪blink.elf

(gdb)
```

注意上面日志的倒数第三行显示了调试器已经在 `app_main()` 函数的断点处停止，该断点在 `gdbinit` 文件中设定。由于处理器已经暂停运行，LED 也不会闪烁。如果这也是您看到的现象，您可以开始调试了。

如果您不太了解 GDB 的常用方法，请查阅使用命令行的调试示例 文章中的调试示例章节调试范例。

使用 idf.py 进行调试 您还可以使用 `idf.py` 更方便地执行上述提到的调试命令，可以使用以下命令:

1. `idf.py openocd`
   在终端中运行 OpenOCD，其配置信息来源于环境变量或者命令行。默认会使用 `OPENOCD_SCRIPTS` 环境变量中指定的脚本路径，它是由 ESP-IDF 项目仓库中的导出脚本（`export.sh` or `export.bat`）添加到系统环境变量中的。当然，您可以在命令行中通过 `--openocd-scripts` 参数来覆盖这个变量的值。
   至于当前开发板的 JTAG 配置，请使用环境变量 `OPENOCD_COMMANDS` 或命令行参数 `--openocd-commands`。如果这两者都没有被定义，那么 OpenOCD 会使用 `-f board/esp32c3-builtin.cfg` 参数来启动。
2. `idf.py gdb`
   根据当前项目的 elf 文件自动生成 GDB 启动脚本，然后会按照使用命令行调试 中所描述的步骤启动 GDB。
3. `idf.py gdbtui`
   和步骤 2 相同，但是会在启动 GDB 的时候传递 `tui` 参数，这样可以方便在调试过程中查看源代码。
4. `idf.py gdbgui`
   启动 gdbgui，在浏览器中打开调试器的前端界面。请在运行安装脚本时添加 “–enable-gdbgui” 参数，即运行 `install.sh --enable-gdbgui`，从而确保支持 “gdbgui” 选项。
   上述这些命令也可以合并到一起使用，`idf.py` 会自动将后台进程（比如 openocd）最先运行，交互式进程（比如 GDB，monitor）最后运行。
   常用的组合命令如下所示:

   ```
   idf.py openocd gdbgui monitor
   ```

   上述命令会将 OpenOCD 运行至后台，然后启动 gdbgui 打开一个浏览器窗口，显示调试器的前端界面，最后在活动终端打开串口监视器。

调试示例

本节将介绍如何在*Eclipse* 和命令行 中使用 GDB 进行调试的示例。

使用 Eclipse 的调试示例 请检查目标板是否已经准备好，并加载了 get-started/blink 示例代码，然后按照使用 *Eclipse* 调试 中介绍的步骤配置和启动调试器，最后选择让应用程序在 `app_main()` 建立的断点处停止。

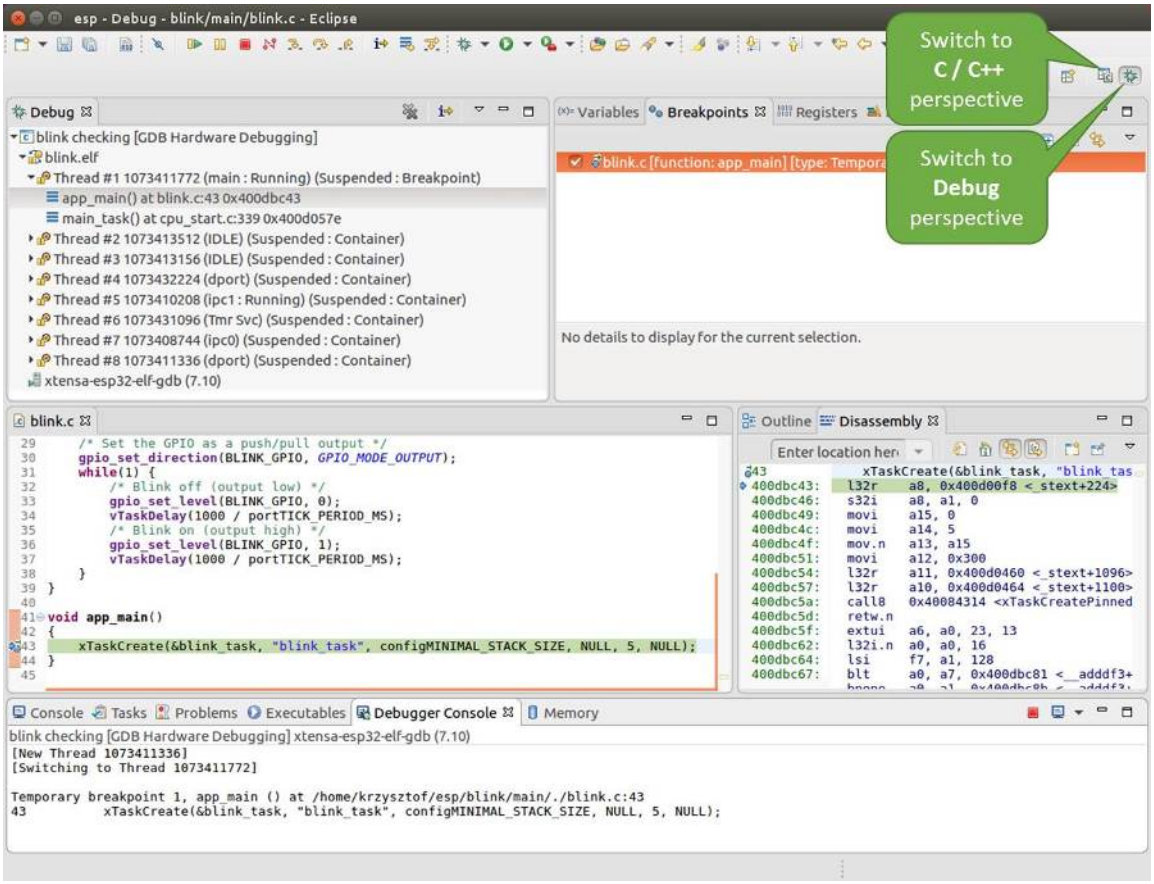

图 40: Eclipse 中的 Debug 视图

本小节的示例

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 手动暂停目标
4. 单步执行代码
5. 查看并设置内存
6. 观察和设置程序变量
7. 设置条件断点

浏览代码，查看堆栈和线程 当目标暂停时，调试器会在“Debug”窗口中显示线程的列表，程序暂停的代码行在下面的另一个窗口中被高亮显示，如下图所示。此时板子上的 LED 停止了闪烁。

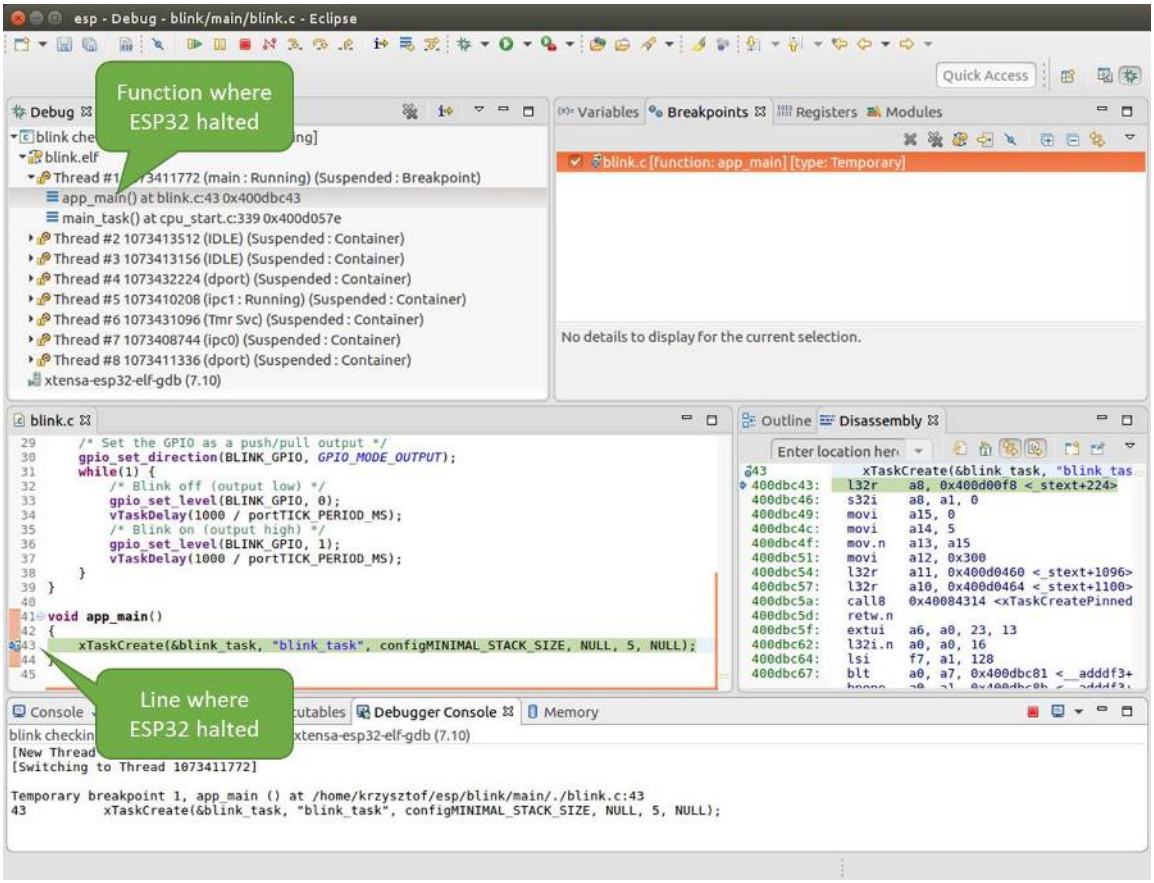

图 41: 调试时目标停止

暂停的程序所在线程也会被展开，显示函数调用的堆栈，它表示直到目标暂停所在代码行（下图高亮处）为止的相关函数的调用关系。1 号线程下函数调用堆栈的第一行包含了最后一个调用的函数 `app_main()`，根据下一行显示，它又是在函数 `main_task()` 中被调用的。堆栈的每一行还包含调用函数的文件名和行号。通过单击每个堆栈的条目，在下面的窗口中，你将看到此文件的内容。

通过展开线程，你可以浏览整个应用程序。展开 5 号线程，它包含了更长的函数调用堆栈，你可以看到函数调用旁边的数字，比如 `0x4000000c`，它们代表未以源码形式提供的二进制代码所在的内存地址。

无论项目是以源代码还是仅以二进制形式提供，在右边一个窗口中，都可以看到反汇编后的机器代码。

回到 1 号线程中的 `app_main()` 函数所在的 `blink.c` 源码文件，下面的示例将会以该文件为例介绍调试的常用功能。调试器可以轻松浏览整个应用程序的代码，这给单步调试代码和设置断点带来了很大的便利，下面将一一展开讨论。

设置和清除断点 在调试时，我们希望能够在关键的代码行停止应用程序，然后检查特定的变量、内存、寄存器和外设的状态。为此我们需要使用断点，以便在特定某行代码处快速访问和停止应用程序。

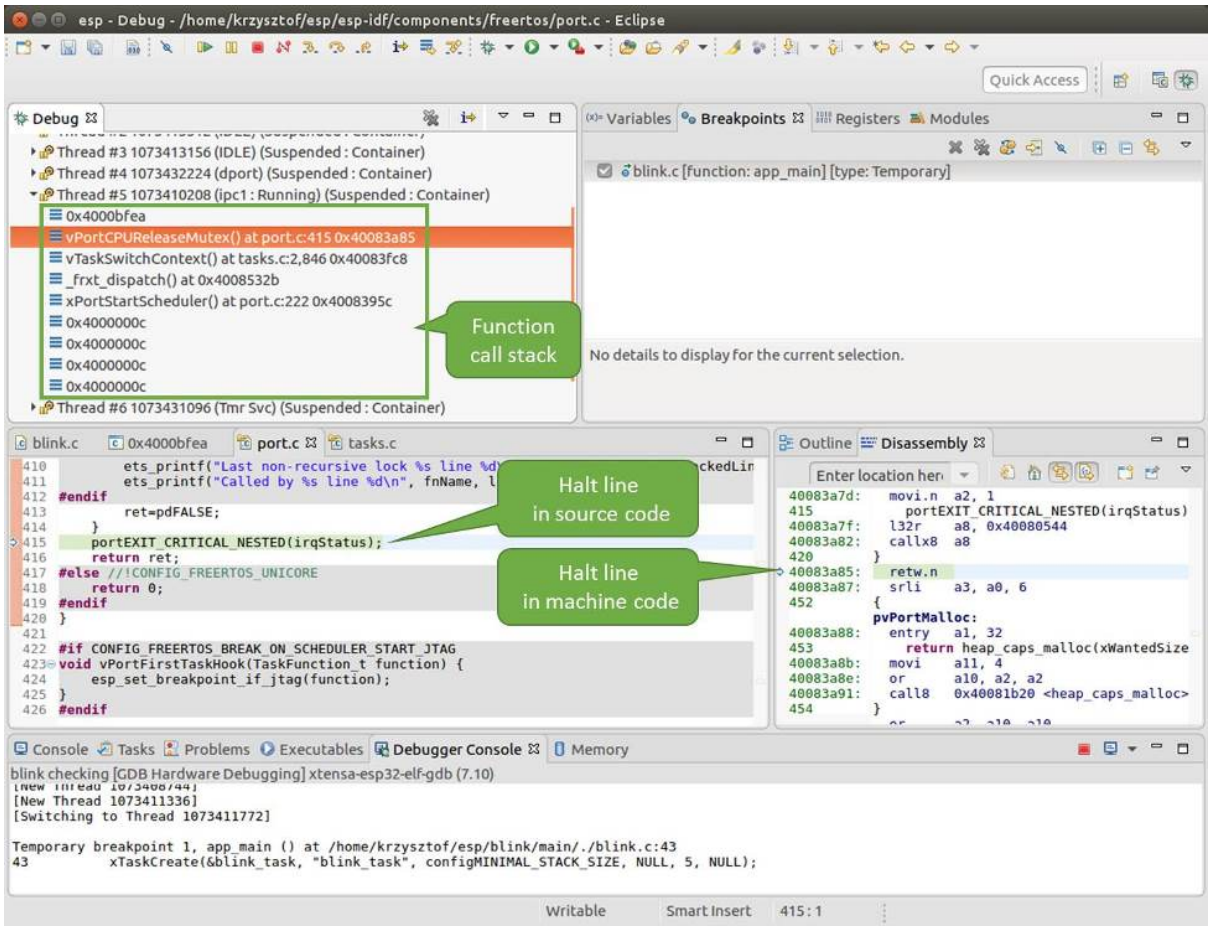

图 42: 浏览函数调用堆栈

我们在控制 LED 状态发生变化的两处代码行分别设置一个断点。基于以上代码列表，这两处分别为第 33 和 36 代码行。按住键盘上的“Control”键，双击 blink.c 文件中的行号 33，并在弹出的对话框中点击“OK”按钮进行确定。如果你不想看到此对话框，双击行号即可。执行同样操作，在第 36 行设置另外一个断点。

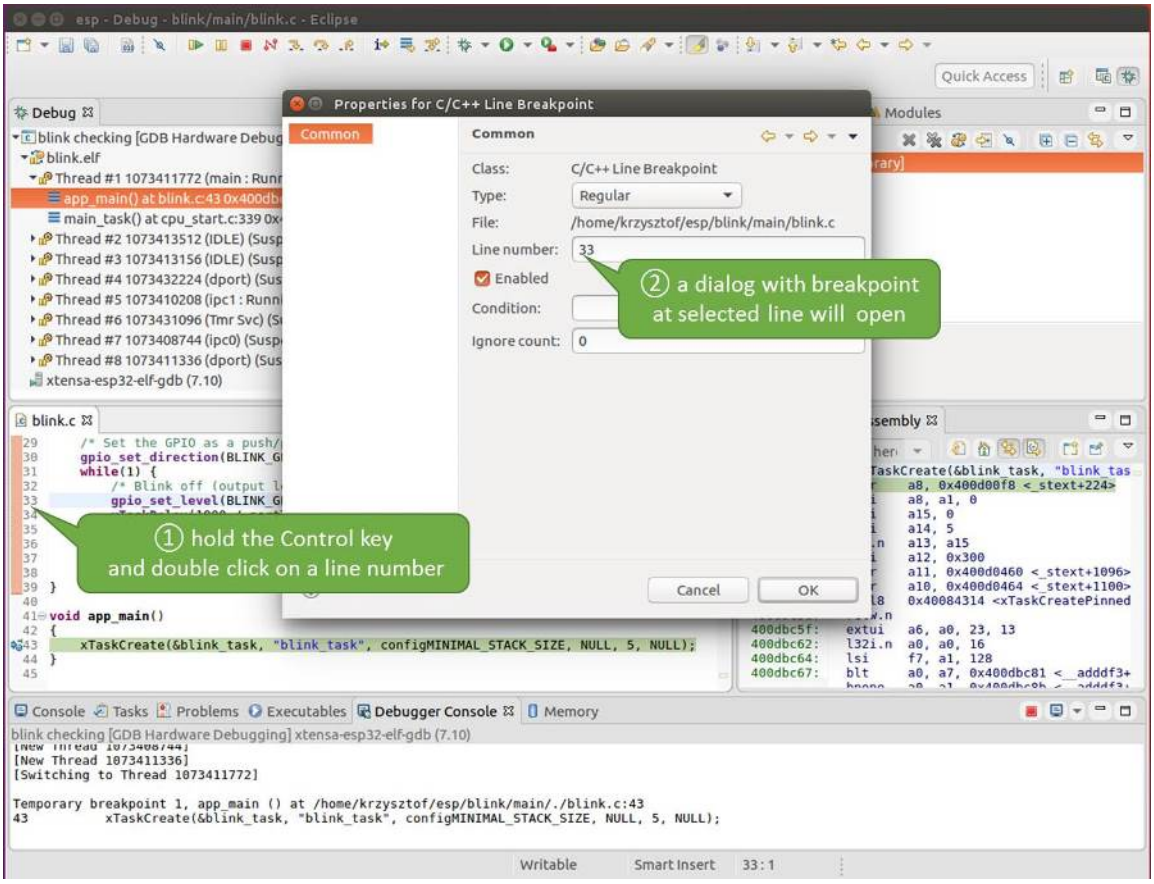

图 43: 设置断点

断点的数量和位置信息会显示在右上角的“断点”窗口中。单击“Show Breakpoints Supported by Selected Target”图标可以刷新此列表。除了刚才设置的两个断点外，列表中可能还包含在调试器启动时设置在 `app_main()` 函数处的临时断点。由于最多只允许设置两个断点（详细信息请参阅可用的断点和观察点），你需要将其删除，否则调试会失败。

单击“Resume”（如果“Resume”按钮是灰色的，请先单击 8 号线程的 `blink_task()` 函数）后处理器将开始继续运行，并在断点处停止。再一次单击“Resume”按钮，使程序再次运行，然后停在第二个断点处，依次类推。

每次单击“Resume”按钮恢复程序运行后，都会看到 LED 切换状态。

更多关于断点的信息，请参阅可用的断点和观察点 和关于断点的补充知识。

手动暂停目标 在调试时，你可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。后者，如果想要返回调试模式，可以通过单击“Suspend”按钮来手动中断程序的运行。

在此之前，请删除所有的断点，然后单击“Resume”按钮。接着单击“Suspend”按钮，应用程序会停止在某个随机的位置，此时 LED 也将停止闪烁。调试器将展开线程并高亮显示停止的代码行。

在上图所示的情况中，应用程序已经在 `freertos_hooks.c` 文件的第 52 行暂停运行，现在你可以通过单击“Resume”按钮再次将其恢复运行或者进行下面要介绍的调试工作。

单步执行代码 我们还可以使用“Step Into (F5)”和“Step Over (F6)”命令单步执行代码，这两者之间的区别是执行“Step Into (F5)”命令会进入调用的子程序，而执行“Step Over (F6)”命令则会直接将子程序

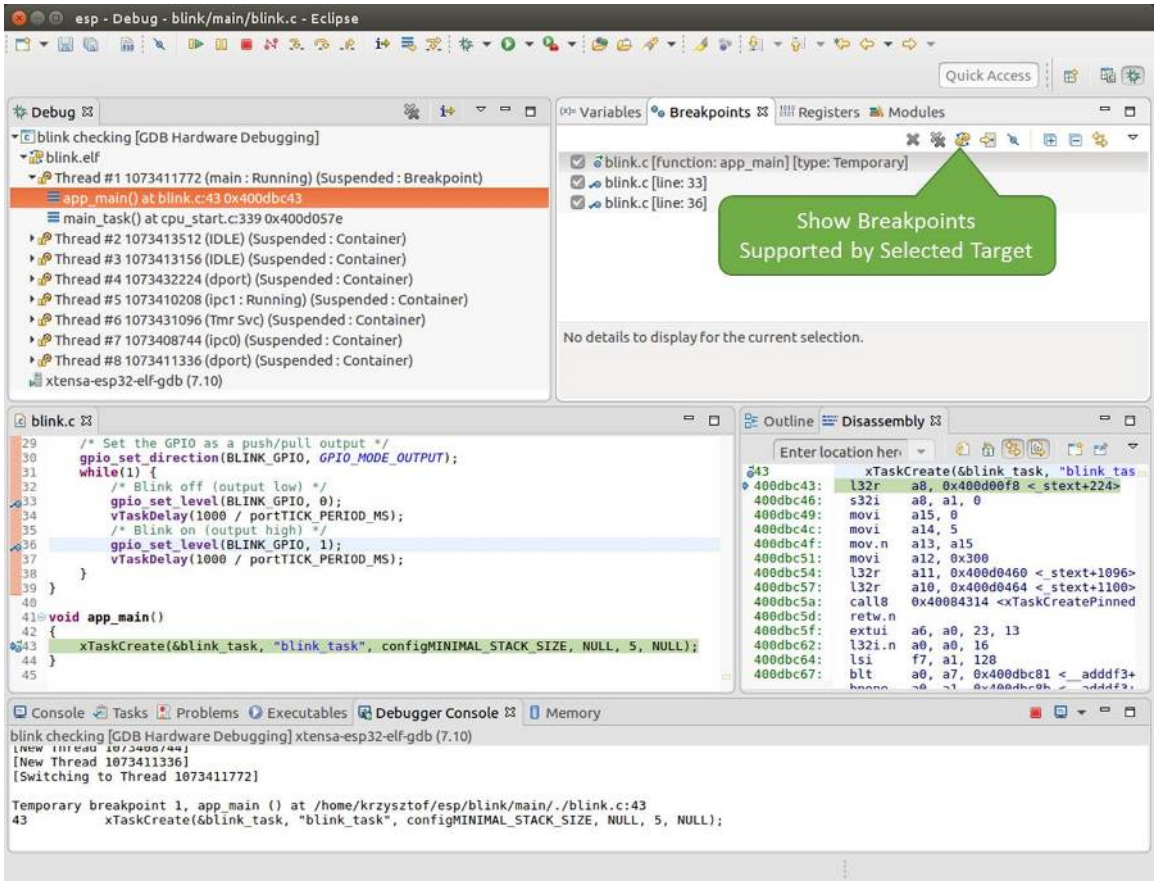

图 44: 设置了三个断点 / 最多允许两个断点

gpio_set_level(BLINK_GPIO, 1);
Program received signal SIGINT, Interrupt.
[Switching to Thread 1073413156]
0x400d0c00 in esp_vApplicationIdleHook () at /home/krzysztof/esp/esp-idf/components/esp32/./freertos_hooks.c:52
asm("waiti 0");

图 45: 手动暂停目标

看成单个源码行，单步就能将其运行结束。

在继续演示此功能之前，请参照上文所述确保目前只在 `blink.c` 文件的第 36 行设置了一个断点。

按下 F8 键让程序继续运行然后在断点处停止运行，多次按下“Step Over (F6)”按钮，观察调试器是如何单步执行一行代码的。

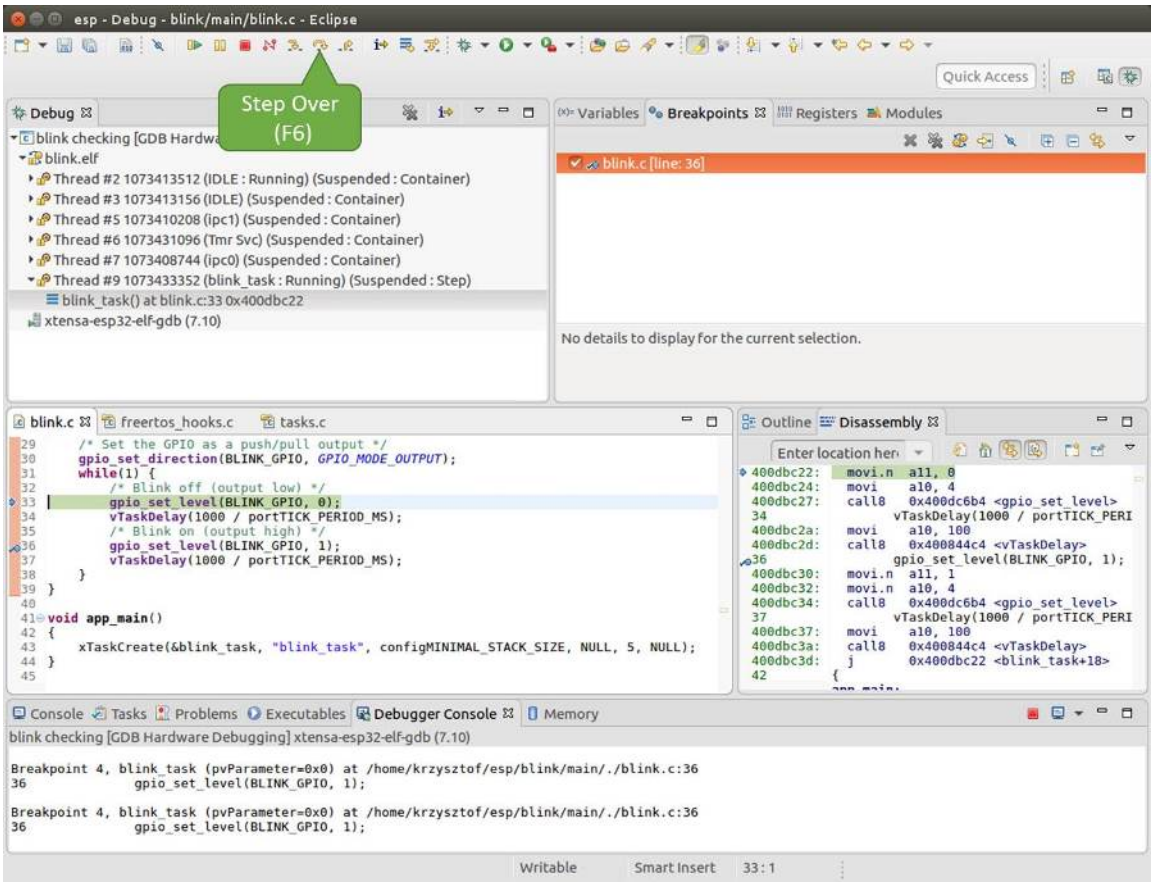

图 46: 使用“Step Over (F6)”单步执行代码

如果你改用“Step Into (F5)”，那么调试器将会进入调用的子程序内部。

在上述例子中，调试器进入 `gpio_set_level(BLINK_GPIO, 0)` 代码内部，同时代码窗口快速切换到 `gpio.c` 驱动文件。

请参阅 *“next”命令无法跳过子程序的原因* 文档以了解 `next` 命令的潜在局限。

查看并设置内存 要显示或者设置内存的内容，请使用“调试”视图中位于底部的“Memory”选项卡。

在“Memory”选项卡下，我们将在内存地址 `0x3FF44004` 处读取和写入内容。该地址也是 `GPIO_OUT_REG` 寄存器的地址，可以用来控制（设置或者清除）某个 GPIO 的电平。

关于该寄存器的更多详细信息，请参阅 *ESP32-C3 技术参考手册* > *IO MUX 和 GPIO Matrix (GPIO, IO_MUX)* [PDF] 章节。

同样在 `blink.c` 项目文件中，在两个 `gpio_set_level` 语句的后面各设置一个断点，单击“Memory”选项卡，然后单击“Add Memory Monitor”按钮，在弹出的对话框中输入 `0x3FF44004`。

按下 F8 按键恢复程序运行，并观察“Monitor”选项卡。

每按一下 F8，你就会看到在内存 `0x3FF44004` 地址处的一个比特位被翻转（并且 LED 会改变状态）。

要修改内存的数值，请在“Monitor”选项卡中找到待修改的内存地址，如前面观察的结果一样，输入特定比特翻转后的值。当按下回车键后，将立即看到 LED 的状态发生了改变。

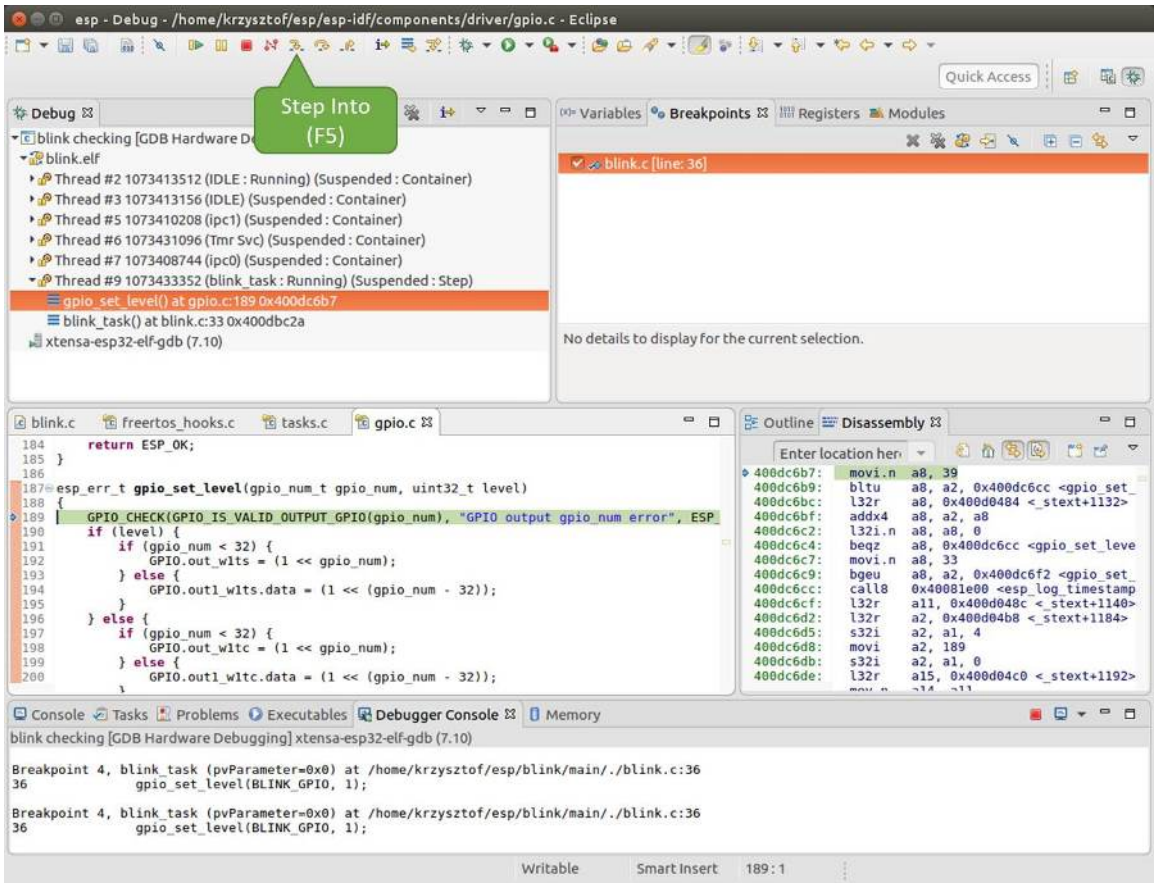

图 47: 使用“Step Into (F5)”单步执行代码

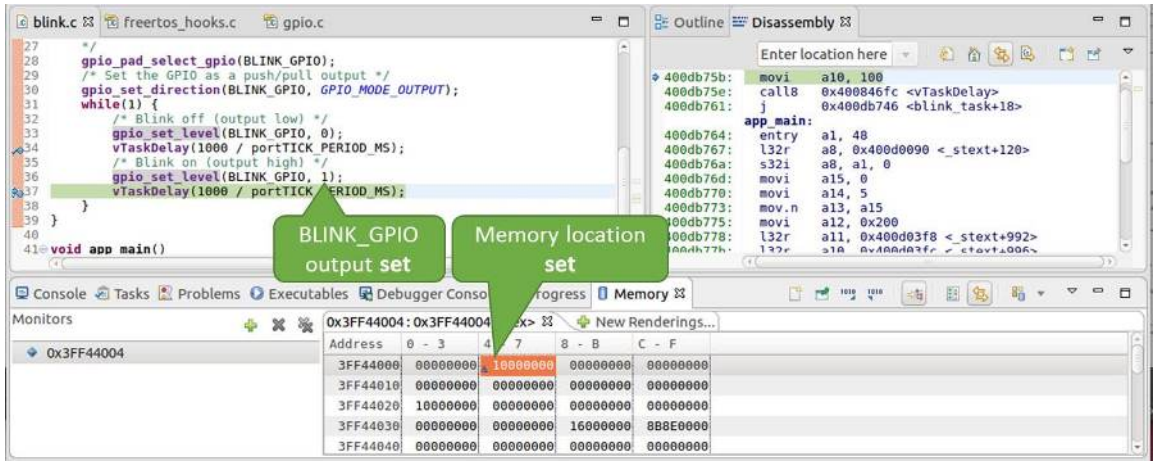

图 48: 观察内存地址 0x3FF44004 处的某个比特被置高

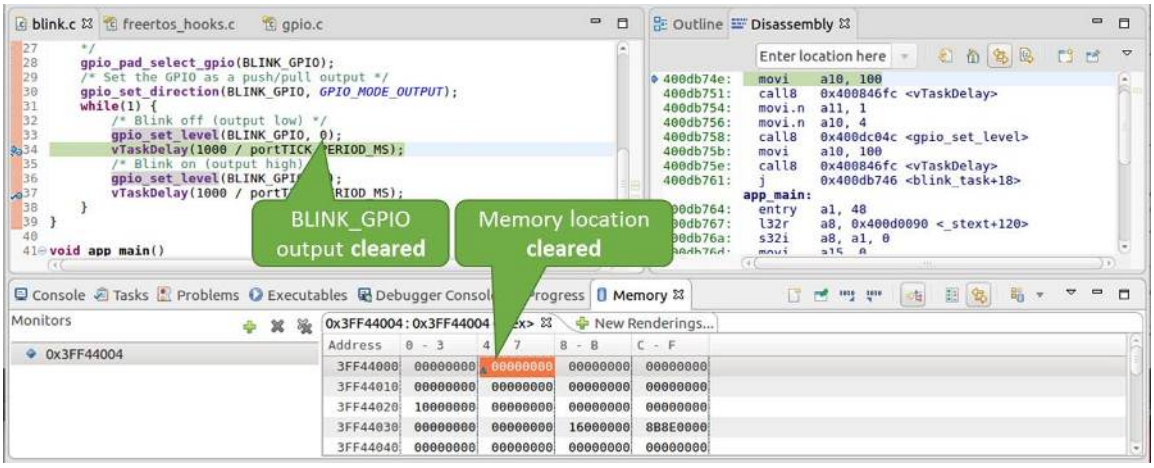

图 49: 观察内存地址 0x3FF44004 处的某个比特被置低

观察和设置程序变量 常见的调试任务是在程序运行期间检查程序中某个变量的值，为了演示这个功能，更新 `blink.c` 文件，在 `blink_task` 函数的上面添加一个全局变量的声明 `int i`，然后在 `while(1)` 里添加 `i++`，这样每次 LED 改变状态的时候，变量 `i` 都会增加 1。

退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32-C3 中，接着重启调试器。注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，在代码 `i++` 处添加一个断点。

下一步，在 “Breakpoints” 所在的窗口中，选择 “Expressions” 选项卡。如果该选项卡不存在，请在顶部菜单栏的 Window > Show View > Expressions 中添加这一选项卡。然后在该选项卡中单击 “Add new expression”，并输入 `i`。

按下 F8 继续运行程序，每次程序停止时，都会看到变量 `i` 的值在递增。

如想更改 `i` 的值，可以在 “Value” 一栏中输入新的数值。按下 “Resume (F8)” 后，程序将从新输入的数字开始递增 `i`。

设置条件断点 接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点，然后让程序停止运行。右击断点打开上下文菜单，选择 “Breakpoint Properties”，将 “Type:” 改选为 “Hardware” 然后在 “Condition:” 一栏中输入条件表达式，例如 `i == 2`。

如果当前 `i` 的值小于 2（如果有需要也可以更改这个阈值）并且程序被恢复运行，那么 LED 就会循环闪烁，直到 `i == 2` 条件成立，最后程序停止在该处。

使用命令行的调试示例 请检查您的目标板是否已经准备好，并加载了 get-started/blink 示例代码，然后按照使用命令行调试 中介绍的步骤配置和启动调试器，最后选择让应用程序在 `app_main()` 建立的断点处停止运行

```
Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/./blink.c:43
43          xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL,␣
↪5, NULL);
(gdb)
```

本小节的示例

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 暂停和恢复应用程序的运行
4. 单步执行代码
5. 查看并设置内存

7. 设置条件断点

浏览代码，查看堆栈和线程 当看到 (gdb) 提示符的时候，应用程序已停止运行，LED 也停止闪烁。

要找到代码暂停的位置，输入 `l` 或者 `list` 命令，调试器会打印出暂停点（`blink.c` 代码文件的第 43 行）附近的几行代码

```
(gdb) l
38          }
39      }
40
41      void app_main()
42      {
43          xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL,␣
↪5, NULL);
44      }
(gdb)
```

也可以通过输入 `l 30, 40` 等命令来查看特定行号范围内的代码。

使用 `bt` 或者 `backtrace` 来查看哪些函数最终导致了此代码被调用:

```
(gdb) bt
#0  app_main () at /home/user-name/esp/blink/main/./blink.c:43
#1  0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
↪esp32c3/./cpu_start.c:339
(gdb)
```

输出的第 0 行表示应用程序暂停之前调用的最后一个函数，即我们之前列出的 `app_main ()`。`app_main ()` 又被位于 `cpu_start.c` 文件第 339 行的 `main_task` 函数调用。

想查看 `cpu_start.c` 文件中 `main_task` 函数的上下文，需要输入 `frame N`，其中 N = 1，因为根据前面的输出，`main_task` 位于 #1 下:

```
(gdb) frame 1
#1  0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
↪esp32c3/./cpu_start.c:339
339         app_main();
(gdb)
```

输入 `l` 将显示一段名为 `app_main()` 的代码（在第 339 行）:

```
(gdb) l
334             ;
335         }
336     #endif
337         //Enable allocation in region where the startup stacks were located.
338         heap_caps_enable_nonos_stack_heaps();
339         app_main();
340         vTaskDelete(NULL);
341     }
342
(gdb)
```

通过打印前面的一些行，你会看到我们一直在寻找的 `main_task` 函数:

```
(gdb) l 326, 341
326     static void main_task(void* args)
327     {
328         // Now that the application is about to start, disable boot watchdogs
329         REG_CLR_BIT(TIMG_WDTCONFIG0_REG(0), TIMG_WDT_FLASHBOOT_MOD_EN_S);
```

(下页继续)

(续上页)

```
330         REG_CLR_BIT(RTC_CNTL_WDTCONFIG0_REG, RTC_CNTL_WDT_FLASHBOOT_MOD_EN);
331     #if !CONFIG_FREERTOS_UNICORE
332         // Wait for FreeRTOS initialization to finish on APP CPU, before␣
↪replacing its startup stack
333         while (port_xSchedulerRunning[1] == 0) {
334             ;
335         }
336     #endif
337         //Enable allocation in region where the startup stacks were located.
338         heap_caps_enable_nonos_stack_heaps();
339         app_main();
340         vTaskDelete(NULL);
341     }
(gdb)
```

如果要查看其他代码，可以输入 `i threads` 命令，则会输出目标板上运行的线程列表:

```
(gdb) i threads
  Id   Target Id         Frame
  8    Thread 1073411336 (dport) 0x400d0848 in dport_access_init_core (arg=
↪<optimized out>)
    at /home/user-name/esp/esp-idf/components/esp32c3/./dport_access.c:170
  7    Thread 1073408744 (ipc0) xQueueGenericReceive (xQueue=0x3ffae694,␣
↪pvBuffer=0x0, xTicksToWait=1644638200,
    xJustPeeking=0) at /home/user-name/esp/esp-idf/components/freertos/./queue.
↪c:1452
  6    Thread 1073431096 (Tmr Svc) prvTimerTask (pvParameters=0x0)
    at /home/user-name/esp/esp-idf/components/freertos/./timers.c:445
  5    Thread 1073410208 (ipc1 : Running) 0x4000bfea in ?? ()
  4    Thread 1073432224 (dport) dport_access_init_core (arg=0x0)
    at /home/user-name/esp/esp-idf/components/esp32c3/./dport_access.c:150
  3    Thread 1073413156 (IDLE) prvIdleTask (pvParameters=0x0)
    at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
  2    Thread 1073413512 (IDLE) prvIdleTask (pvParameters=0x0)
    at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
* 1    Thread 1073411772 (main : Running) app_main () at /home/user-name/esp/blink/
↪main/./blink.c:43
(gdb)
```

线程列表显示了每个线程最后一个被调用的函数以及所在的 C 源文件名（如果存在的话）。

您可以通过输入 `thread N` 进入特定的线程，其中 `N` 是线程 ID。我们进入 5 号线程来看一下它是如何工作的:

```
(gdb) thread 5
[Switching to thread 5 (Thread 1073410208)]
#0  0x4000bfea in ?? ()
(gdb)
```

然后查看回溯:

```
(gdb) bt
#0  0x4000bfea in ?? ()
#1  0x40083a85 in vPortCPUReleaseMutex (mux=<optimized out>) at /home/user-name/
↪esp/esp-idf/components/freertos/./port.c:415
#2  0x40083fc8 in vTaskSwitchContext () at /home/user-name/esp/esp-idf/components/
↪freertos/./tasks.c:2846
#3  0x4008532b in _frxt_dispatch ()
#4  0x4008395c in xPortStartScheduler () at /home/user-name/esp/esp-idf/components/
↪freertos/./port.c:222
#5  0x4000000c in ?? ()
```

(下页继续)

(续上页)

```
#6  0x4000000c in ?? ()
#7  0x4000000c in ?? ()
#8  0x4000000c in ?? ()
(gdb)
```

如上所示，回溯可能会包含多个条目，方便查看直至目标停止运行的函数调用顺序。如果找不到某个函数的源码文件，将会使用问号 `??` 替代，这表示该函数是以二进制格式提供的。像 `0x4000bfea` 这样的值是被调用函数所在的内存地址。

使用诸如 `bt`，`i threads`，`thread N` 和 `list` 命令可以浏览整个应用程序的代码。这给单步调试代码和设置断点带来很大的便利，下面将一一展开来讨论。

设置和清除断点 在调试时，我们希望能够在关键的代码行停止应用程序，然后检查特定的变量、内存、寄存器和外设的状态。为此我们需要使用断点，以便在特定某行代码处快速访问和停止应用程序。

我们在控制 LED 状态发生变化的两处代码行分别设置一个断点。基于以上代码列表，这两处分别为第 33 和 36 代码行。使用命令 `break M` 设置断点，其中 M 是具体的代码行:

```
(gdb) break 33
Breakpoint 2 at 0x400db6f6: file /home/user-name/esp/blink/main/./blink.c, line 33.
(gdb) break 36
Breakpoint 3 at 0x400db704: file /home/user-name/esp/blink/main/./blink.c, line 36.
```

输入命令 `c`，处理器将运行并在断点处停止。再次输入 `c` 将使其再次运行，并在第二个断点处停止，依此类推:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F6 (active)    APP_CPU: PC=0x400D10D8

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:33
33          gpio_set_level(BLINK_GPIO, 0);
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F8 (active)    APP_CPU: PC=0x400D10D8
Target halted. PRO_CPU: PC=0x400DB704 (active)    APP_CPU: PC=0x400D10D8

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:36
36          gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

只有在输入命令 `c` 恢复程序运行后才能看到 LED 改变状态。

查看已设置断点的数量和位置，请使用命令 `info break`:

```
(gdb) info break
Num     Type           Disp Enb Address    What
2       breakpoint     keep y   0x400db6f6 in blink_task at /home/user-name/esp/
↪blink/main/./blink.c:33
    breakpoint already hit 1 time
3       breakpoint     keep y   0x400db704 in blink_task at /home/user-name/esp/
↪blink/main/./blink.c:36
    breakpoint already hit 1 time
(gdb)
```

请注意，断点序号（在 `Num` 栏列出）从 2 开始，这是因为在调试器启动时执行 `thb app_main` 命令已经在 `app_main()` 函数处建立了第一个断点。由于它是一个临时断点，已经被自动删除，所以没有被列出。

要删除一个断点，请输入 `delete N` 命令（或者简写成 `d N`），其中 `N` 代表断点序号:

```
(gdb) delete 1
No breakpoint number 1.
(gdb) delete 2
(gdb)
```

更多关于断点的信息，请参阅可用的断点和观察点 和关于断点的补充知识。

暂停和恢复应用程序的运行 在调试时，可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。对于后者，想要返回调试模式，可以通过输入 Ctrl+C 手动中断程序的运行。

在此之前，请删除所有的断点，然后输入 c 恢复程序运行。接着输入 Ctrl+C，应用程序会停止在某个随机的位置，此时 LED 也将停止闪烁。调试器会打印如下信息:

```
(gdb) c
Continuing.
^CTarget halted. PRO_CPU: PC=0x400D0C00             APP_CPU: PC=0x400D0C00 (active)
[New Thread 1073433352]

Program received signal SIGINT, Interrupt.
[Switching to Thread 1073413512]
0x400d0c00 in esp_vApplicationIdleHook () at /home/user-name/esp/esp-idf/
↪components/esp32c3/./freertos_hooks.c:52
52              asm("waiti 0");
(gdb)
```

在上图所示的情况下，应用程序已经在 freertos_hooks.c 文件的第 52 行暂停运行，现在您可以通过输入 c 再次将其恢复运行或者进行如下所述的一些调试工作。

备注: 在 MSYS2 的 shell 中输入 Ctrl+C 并不会暂停目标的运行，而是会退出调试器。解决这个问题的方法可以通过使用 *Eclipse* 来调试 或者参考 http://www.mingw.org/wiki/Workaround_for_GDB_Ctrl_C_Interrupt 里的解决方案。

单步执行代码 我们还可以使用 step 和 next 命令（可以简写成 s 和 n）单步执行代码，这两者之间的区别是执行 “step” 命令会进入调用的子程序内部，而执行 “next” 命令则会直接将子程序看成单个源码行，单步就能将其运行结束。

在继续演示此功能之前，请使用前面介绍的 break 和 delete 命令，确保目前只在 blink.c 文件的第 36 行设置了一个断点:

```
(gdb) info break
Num     Type           Disp Enb Address    What
3       breakpoint     keep y   0x400db704 in blink_task at /home/user-name/esp/
↪blink/main/./blink.c:36
    breakpoint already hit 1 time
(gdb)
```

输入 c 恢复程序运行然后等它在断点处停止运行:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB754 (active)    APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:36
36          gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

然后输入 n 多次，观察调试器是如何单步执行一行代码的:

```
(gdb) n
Target halted. PRO_CPU: PC=0x400DB756 (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB758 (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active)    APP_CPU: PC=0x400D1128
37          vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) n
Target halted. PRO_CPU: PC=0x400DB75E (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400846FC (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB761 (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB746 (active)    APP_CPU: PC=0x400D1128
33          gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

如果你输入 `s`，那么调试器将进入子程序:

```
(gdb) s
Target halted. PRO_CPU: PC=0x400DB748 (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74B (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04F (active)    APP_CPU: PC=0x400D1128
gpio_set_level (gpio_num=GPIO_NUM_4, level=0) at /home/user-name/esp/esp-idf/
↪components/driver/./gpio.c:183
183     GPIO_CHECK(GPIO_IS_VALID_OUTPUT_GPIO(gpio_num), "GPIO output gpio_num error
↪", ESP_ERR_INVALID_ARG);
(gdb)
```

上述例子中，调试器进入 `gpio_set_level(BLINK_GPIO, 0)` 代码内部，同时代码窗口快速切换到 `gpio.c` 驱动文件。

请参阅 *"next" 命令无法跳过子程序的原因* 文档以了解 `next` 命令的潜在局限。

查看并设置内存 使用命令 `x` 可以显示内存的内容，配合其余参数还可以调整所显示内存位置的格式和数量。运行 `help x` 可以查看更多相关细节。与 `x` 命令配合使用的命令是 `set`，它允许你将值写入内存。

为了演示 `x` 和 `set` 的使用，我们将在内存地址 `0x3FF44004` 处读取和写入内容。该地址也是 `GPIO_OUT_REG` 寄存器的地址，可以用来控制（设置或者清除）某个 GPIO 的电平。

关于该寄存器的更多详细信息，请参阅 *ESP32-C3 技术参考手册* > *IO MUX 和 GPIO Matrix (GPIO, IO_MUX)* [PDF] 章节。

同样在 `blink.c` 项目文件中，在两个 `gpio_set_level` 语句的后面各设置一个断点。输入两次 `c` 命令后停止在断点处，然后输入 `x /1wx 0x3FF44004` 来显示 `GPIO_OUT_REG` 寄存器的值:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB75E (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74E (active)    APP_CPU: PC=0x400D1128

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:34
34          vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active)    APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:37
37          vTaskDelay(1000 / portTICK_PERIOD_MS);
```

(下页继续)

(续上页)

```
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000010
(gdb)
```

如果闪烁的 LED 连接到了 GPIO4，那么每次 LED 改变状态时你会看到第 4 比特被翻转:

```
0x3ff44004: 0x00000000
...
0x3ff44004: 0x00000010
```

现在，当 LED 熄灭时，与之对应地会显示 `0x3ff44004: 0x00000000`，尝试使用 `set` 命令向相同的内存地址写入 `0x00000010` 来将该比特置高:

```
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) set {unsigned int}0x3FF44004=0x000010
```

在输入 `set {unsigned int}0x3FF44004=0x000010` 命令后，你会立即看到 LED 亮起。

观察和设置程序变量 常见的调试任务是在程序运行期间检查程序中某个变量的值，为了能够演示这个功能，更新 `blink.c` 文件，在 `blink_task` 函数的上面添加一个全局变量的声明 `int i`，然后在 `while(1)` 里添加 `i++`，这样每次 LED 改变状态的时候，变量 `i` 都会增加 1。

退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32-C3 中，接着重启调试器。注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，输入命令 `watch i`:

```
(gdb) watch i
Hardware watchpoint 2: i
(gdb)
```

这会在所有变量 `i` 发生改变的代码处插入所谓的 “观察点”。现在输入 `continue` 命令来恢复应用程序的运行并观察它停止:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active)    APP_CPU: PC=0x400D0811
[New Thread 1073432196]

Program received signal SIGTRAP, Trace/breakpoint trap.
[Switching to Thread 1073432196]
0x400db751 in blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:33
33          i++;
(gdb)
```

多次恢复程序运行后，变量 `i` 的值会增加，现在你可以输入 `print i`（简写 `p i`）来查看当前 `i` 的值:

```
(gdb) p i
$1 = 3
(gdb)
```

要修改 `i` 的值，请使用 `set` 命令，如下所示（可以将其打印输出来查看是否确已修改）:

```
(gdb) set var i = 0
(gdb) p i
$3 = 0
(gdb)
```

最多可以使用两个观察点，详细信息请参阅可用的断点和观察点。

设置条件断点 接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点。请先删除已有的断点，然后尝试如下命令:

```
(gdb) break blink.c:34 if (i == 2)
Breakpoint 3 at 0x400db753: file /home/user-name/esp/blink/main/./blink.c, line 34.
(gdb)
```

以上命令在 `blink.c` 文件的 `34` 处设置了一个条件断点，当 `i == 2` 条件满足时，程序会停止运行。

如果当前 `i` 的值小于 `2` 并且程序被恢复运行，那么 LED 就会循环闪烁，直到 `i == 2` 条件成立，最后程序停止在该处:

```
(gdb) set var i = 0
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB755 (active)    APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active)    APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active)    APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active)    APP_CPU: PC=0x400D112C

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:34
34          gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

获得命令的帮助信息 目前所介绍的都是些非常基础的命令，目的在于让您快速上手 JTAG 调试。如果想获得特定命令的语法和功能相关的信息，请在 `(gdb)` 提示符下输入 `help` 和命令名:

```
(gdb) help next
Step program, proceeding through subroutine calls.
Usage: next [N]
Unlike "step", if the current source line calls a subroutine,
this command does not enter the subroutine, but instead steps over
the call, in effect treating it as a single source line.
(gdb)
```

只需输入 `help` 命令，即可获得高级命令列表，帮助你了解更多详细信息。此外，还可以参考一些 GDB 命令速查表，比如 https://darkdust.net/files/GDB%20Cheat%20Sheet.pdf。虽然不是所有命令都适用于嵌入式环境，但还是会有所裨益。

结束调试会话 输入命令 `q` 可以退出调试器:

```
(gdb) q
A debugging session is active.

    Inferior 1 [Remote target] will be detached.

Quit anyway? (y or n) y
Detaching from program: /home/user-name/esp/blink/build/blink.elf, Remote target
Ending remote debugging.
user-name@computer-name:~/esp/blink$
```

4.17 链接器脚本生成机制

4.17.1 概述

ESP32-C3 中有多个用于存放代码和数据的内存区域。代码和只读数据默认存放在 flash 中，可写数据存放在 RAM 中。不过有时，用户必须更改默认存放区域。

例如为了提高性能，将关键代码存放到 RAM 中，或者将代码存放到 RTC 存储器中以便在 wake up stub 中使用。

链接器脚本生成机制可以让用户指定代码和数据在 ESP-IDF 组件中的存放区域。组件包含如何存放符号、目标或完整库的信息。在构建应用程序时，组件中的这些信息会被收集、解析并处理；生成的存放规则用于链接应用程序。

4.17.2 快速上手

本段将指导如何使用 ESP-IDF 的即用方案，快速将代码和数据放入 RAM 和 RTC 存储器中。

假设用户有:

```
components
└── my_component
    ├── CMakeLists.txt
    ├── Kconfig
    ├── src/
    │   ├── my_src1.c
    │   ├── my_src2.c
    │   └── my_src3.c
    └── my_linker_fragment_file.lf
```

- 名为 `my_component` 的组件，在构建过程中存储为 `libmy_component.a` 库文件
- 库文件包含的三个源文件：`my_src1.c`、`my_src2.c` 和 `my_src3.c`，编译后分别为 `my_src1.o`、`my_src2.o` 和 `my_src3.o`
- 在 `my_src1.o` 中定义 `my_function1` 功能；在 `my_src2.o` 中定义 `my_function2` 功能
- 在 `my_component` 下 Kconfig 中存在布尔类型配置 `PERFORMANCE_MODE` (y/n) 和整数类型配置 `PERFORMANCE_LEVEL` （范围是 0-3）

创建和指定链接器片段文件

首先，用户需要创建链接器片段文件。链接器片段文件是一个扩展名为 `.lf` 的文本文件，想要存放的位置信息会写入该文件内。文件创建成功后，需要将其呈现在构建系统中。ESP-IDF 支持的构建系统指南如下：

在组件目录的 `CMakeLists.txt` 文件中，指定 `idf_component_register` 调用引数 `LDFRAGMENTS` 的值。`LDFRAGMENTS` 可以为绝对路径，也可为组件目录的相对路径，指向已创建的链接器片段文件。

```
# 相对于组件的 CMakeLists.txt 的文件路径
idf_component_register(...
                       LDFRAGMENTS "path/to/linker_fragment_file.lf" "path/to/
↪another_linker_fragment_file.lf"
                       ...
                       )
```

指定存放区域

可以按照下列粒度指定存放区域：

- 目标文件（.obj 或 .o 文件）
- 符号（函数/变量）
- 库（.a 文件）

存放目标文件 假设整个 my_src1.o 目标文件对性能至关重要，所以最好把该文件放在 RAM 中。另外，my_src2.o 目标文件包含从深度睡眠唤醒所需的符号，因此需要将其存放到 RTC 存储器中。

在链接器片段文件中可以写入以下内容：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1 (noflash)      # 将所有 my_src1 代码和只读数据存放在 IRAM 和 DRAM 中
    my_src2 (rtc)          # 将所有 my_src2 代码、数据和只读数据存放到 RTC 快速 RAM␣
↪和 RTC 慢速 RAM 中
```

那么 my_src3.o 放在哪里呢？由于未指定存放区域，my_src3.o 会存放到默认区域。更多关于默认存放区域的信息，请查看这里。

存放符号 继续上文的例子，假设 object1.o 目标文件定义的功能中，只有 my_function1 影响到性能；object2.o 目标文件中只有 my_function2 需要在芯片从深度睡眠中唤醒后运行。要实现该目的，可在链接器片段文件中写入以下内容：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1:my_function1 (noflash)
    my_src2:my_function2 (rtc)
```

my_src1.o 和 my_src2.o 中的其他函数以及整个 object3.o 目标文件会存放到默认区域。要指定数据的存放区域，仅需将上文的函数名替换为变量名即可，如:

```
my_src1:my_variable (noflash)
```

注意: 按照符号粒度存放代码和数据有一定的局限。为确保存放区域合适，您也可以将相关代码和数据集中在源文件中，参考使用目标文件的存放规则。

存放整个库 在这个例子中，假设整个组件库都需存放到 RAM 中，可以写入以下内容存放整个库：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    * (noflash)
```

类似的，写入以下内容可以将整个组件存放到 RTC 存储器中：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    * (rtc)
```

根据具体配置存放 假设只有在某个条件为真时，比如 CONFIG_PERFORMANCE_MODE == y 时，整个组件库才有特定存放区域，可以写入以下内容实现：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_MODE = y:
        * (noflash)
    else:
        * (default)
```

来看一种更复杂的情况。假设 "CONFIG_PERFORMANCE_LEVEL == 1" 时，只有 object1.o 存放到 RAM 中；CONFIG_PERFORMANCE_LEVEL == 2 时，object1.o 和 object2.o 会存放到 RAM 中；CONFIG_PERFORMANCE_LEVEL == 3 时，库中的所有目标文件都会存放到 RAM 中。以上三个条件为假时，整个库会存放到 RTC 存储器中。虽然这种使用场景很罕见，不过，还是可以通过以下方式实现：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL = 1:
        my_src1 (noflash)
    elif PERFORMANCE_LEVEL = 2:
        my_src1 (noflash)
        my_src2 (noflash)
    elif PERFORMANCE_LEVEL = 3:
        my_src1 (noflash)
        my_src2 (noflash)
        my_src3 (noflash)
    else:
        * (rtc)
```

也可以嵌套条件检查。以下内容与上述片段等效：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL <= 3 && PERFORMANCE_LEVEL > 0:
        if PERFORMANCE_LEVEL >= 1:
            object1 (noflash)
            if PERFORMANCE_LEVEL >= 2:
                object2 (noflash)
                if PERFORMANCE_LEVEL >= 3:
                    object2 (noflash)
    else:
        * (rtc)
```

默认存放区域

到目前为止，"默认存放区域" 在未指定 rtc 和 noflash 存放规则时才会作为备选方案使用。需要注意的是，noflash 或者 rtc 标记不仅仅是关键字，实际上还是被称作片段的实体，确切地说是协议。

与 rtc 和 noflash 类似，还有一个 默认协议，定义了默认存放规则。顾名思义，该协议规定了代码和数据通常存放的区域，即代码和恒量存放在 flash 中，变量存放在 RAM 中。更多关于默认协议的信息，请见这里。

备注: 使用链接器脚本生成机制的 IDF 组件示例，请参阅 freertos/CMakeLists.txt。为了提高性能，freertos 使用链接器脚本生成机制，将其目标文件存放到 RAM 中。

快速入门指南到此结束，下文将详述这个机制的内核，有助于创建自定义存放区域或修改默认方式。

4.17.3 链接器脚本生成机制内核

链接是将 C/C++ 源文件转换成可执行文件的最后一步。链接由工具链的链接器完成，接受指定代码和数据存放区域等信息的链接脚本。链接器脚本生成机制的转换过程类似，区别在于传输给链接器的链接脚本根据 (1) 收集的链接器片段文件 和 (2) 链接器脚本模板 动态生成。

备注： 执行链接器脚本生成机制的工具存放在 tools/ldgen 之下。

链接器片段文件

如快速入门指南所述，片段文件是拓展名为 `.lf` 的简单文本文件，内含想要存放区域的信息。不过，这是对片段文件所包含内容的简化版描述。实际上，片段文件内包含的是“片段”。片段是实体，包含多条信息，这些信息放在一起组成了存放规则，说明目标文件各个段在二进制输出文件中的存放位置。片段一共有三种，分别是段、协议 和映射。

语法 三种片段类型使用同一种语法：

```
[type:name]
key: value
key:
    value
    value
    value
    ...
```

- 类型：片段类型，可以为 段、协议或 映射。
- 名称：片段名称，指定片段类型的片段名称应唯一。
- 键值：片段内容。每个片段类型可支持不同的键值和不同的键值语法。
  - 在段 和协议 中，仅支持 `entries` 键。
  - 在映射 中，支持 `archive` 和 `entries` 键。

备注： 多个片段的类型和名称相同时会引发异常。

备注： 片段名称和键值只能使用字母、数字和下划线。

条件检查

条件检查使得链接器脚本生成机制可以感知配置。含有配置值的表达式是否为真，决定了使用哪些特定键值。检查使用的是 kconfiglib 脚本的 `eval_string`，遵循该脚本要求的语法和局限性，支持：

- **比较**
  - 小于 <
  - 小于等于 <=
  - 大于 >
  - 大于等于 >=
  - 等于 =
  - 不等于 !=
- **逻辑**
  - 或 ||
  - 和 &&
  - 取反 !
- **分组**
  - 圆括号 ()

条件检查和其他语言中的 `if...elseif/elif...else` 块作用一样。键值和完整片段都可以进行条件检查。以下两个示例效果相同：

```
# 键值取决于配置
[type:name]
key_1:
    if CONDITION = y:
        value_1
    else:
        value_2
key_2:
    if CONDITION = y:
        value_a
    else:
        value_b
```

```
# 完整片段的定义取决于配置
if CONDITION = y:
    [type:name]
    key_1:
        value_1
    key_2:
        value_a
else:
    [type:name]
    key_1:
        value_2
    key_2:
        value_b
```

注释

链接器片段文件中的注释以 # 开头。和在其他语言中一样，注释提供了有用的描述和资料，在处理过程中会被忽略。

类型　段

段定义了 GCC 编译器输出的一系列目标文件段，可以是默认段（如 `.text`、`.data`），也可以是用户通过 `__attribute__` 关键字定义的段。

‘+’表示段列表开始，且当前段为列表中的第一个段。这种表达方式更加推荐。

```
[sections:name]
entries:
    .section+
    .section
    ...
```

示例：

```
# 不推荐的方式
[sections:text]
entries:
    .text
    .text.*
    .literal
    .literal.*

# 推荐的方式，效果与上面等同
[sections:text]
entries:
```

(下页继续)

(续上页)

```
    .text+              # 即 .text 和 .text.*
    .literal+           # 即 .literal 和 .literal.*
```

协议

协议定义了每个段对应的 目标。

```
[scheme:name]
entries:
    sections -> target
    sections -> target
    ...
```

示例：

```
[scheme:noflash]
entries:
    text -> iram0_text          # text 段下的所有条目均归入 iram0_text
    rodata -> dram0_data        # rodata 段下的所有条目均归入 dram0_data
```

默认协议

注意，有一个 默认的协议很特殊，特殊在于包罗存放规则都是根据这个协议中的条目生成的。这意味着，如果该协议有一条条目是 `text -> flash_text`，则将为目标 `flash_text` 生成如下的存放规则:

```
*(.literal .literal.* .text .text.*)
```

这些生成的包罗规则将用于未指定映射规则的情况。

默认协议在 esp_system/app.lf 文件中定义。快速上手指南中提到的内置 `noflash` 协议和 `rtc` 协议也在该文件中定义。

映射

映射定义了可映射实体（即目标文件、函数名、变量名和库）对应的协议。

```
[mapping]
archive: archive                # 构建后输出的库文件名称（即 libxxx.a）
entries:
    object:symbol (scheme)      # 符号
    object (scheme)             # 目标
    * (scheme)                  # 库
```

有三种存放粒度：

- 符号：指定了目标文件名称和符号名称。符号名称可以是函数名或变量名。
- 目标：只指定目标文件名称。
- 库：指定 `*`，即某个库下面所有目标文件的简化表达法。

为了更好地理解条目的含义，请看一个按目标存放的例子。

```
object (scheme)
```

根据条目定义，将这个协议展开：

```
object (sections -> target,
        sections -> target,
        ...)
```

再根据条目定义，将这个段展开：

```
object (.section,
        .section,
        ... -> target, # 根据目标文件将这里所列出的所有段放在该目标位置

        .section,
        .section,
        ... -> target, # 同样的方法指定其他段

        ...)           # 直至所有段均已展开
```

示例：

```
[mapping:map]
archive: libfreertos.a
entries:
    * (noflash)
```

除了实体和协议，条目中也支持指定如下标志：（注：<> = 参数名称，[] = 可选参数）

1. ALIGN(<alignment>[, pre, post])
   根据 alignment 中指定的数字对齐存放区域，根据是否指定 pre 和 post，或两者都指定，在输入段描述（生成于映射条目）的前面和/或后面生成：
2. SORT([<sort_by_first>, <sort_by_second>])
   在输入段描述中输出 SORT_BY_NAME, SORT_BY_ALIGNMENT, SORT_BY_INIT_PRIORITY 或 SORT。
   sort_by_first 和 sort_by_second 的值可以是：name、alignment、init_priority。
   如果既没指定 sort_by_first 也没指定 sort_by_second，则输入段会按照名称排序，如果两者都指定了，那么嵌套排序会遵循 https://sourceware.org/binutils/docs/ld/Input-Section-Wildcards.html 中的规则。
3. KEEP()
   用 KEEP 命令包围输入段描述，从而防止链接器丢弃存放区域。更多细节请参考 https://sourceware.org/binutils/docs/ld/Input-Section-Keep.html

4.SURROUND(<name>)

在存放区域的前面和后面生成符号，生成的符号遵循 _<name>_start 和 _<name>_end 的命名方式，例如，如果 name == sym1

在添加标志时，协议中需要指定具体的 section -> target。对于多个 section -> target，使用逗号作为分隔符，例如：

```
# 注意
# A. entity-scheme 后使用分号
# B. section2 -> target2 前使用逗号
# C. 在 scheme1 条目中定义 section1 -> target1 和 section2 -> target2
entity1 (scheme1);
    section1 -> target1 KEEP() ALIGN(4, pre, post),
    section2 -> target2 SURROUND(sym) ALIGN(4, post) SORT()
```

合并后，如下的映射：

```
[mapping:name]
archive: lib1.a
entries:
    obj1 (noflash);
        rodata -> dram0_data KEEP() SORT() ALIGN(8) SURROUND(my_sym)
```

会在链接器脚本上生成如下输出：

```
. = ALIGN(8)
_my_sym_start = ABSOLUTE(.)
```

(下页继续)

(续上页)

```
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
_my_sym_end = ABSOLUTE(.)
```

注意，正如在 flag 描述中提到的，ALIGN 和 SURROUND 的使用对顺序敏感，因此如果将两者顺序调换后用到相同的映射片段，则会生成：

```
_my_sym_start = ABSOLUTE(.)
. = ALIGN(8)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
_my_sym_end = ABSOLUTE(.)
```

按符号存放 按符号存放可通过编译器标志 `-ffunction-sections` 和 `-fdata-sections` 实现。ESP-IDF 默认用这些标志编译。用户若选择移除标志，便不能按符号存放。另外，即便有标志，也会其他限制，具体取决于编译器输出的段。

比如，使用 `-ffunction-sections`，针对每个功能会输出单独的段。段的名称可以预测，即 `.text.{func_name}` 和 `.literal.{func_name}`。但是功能内的字符串并非如此，因为字符串会进入字符串池，或者使用生成的段名称。

使用 `-fdata-sections`，对全局数据来说编译器可输出 `.data.{var_name}`、`.rodata.{var_name}` 或 `.bss.{var_name}`；因此类型 `I` 映射词条可以适用。但是，功能中声明的静态数据并非如此，生成的段名称是将变量名称和其他信息混合。

链接器脚本模板

链接器脚本模板是指定存放规则的存放位置的框架，与其他链接器脚本没有本质区别，但带有特定的标记语法，可以指示存放生成的存放规则的位置。

如需引用一个目标标记下的所有存放规则，请使用以下语法：

```
mapping[target]
```

示例：

以下示例是某个链接器脚本模板的摘录，定义了输出段 `.iram0.text`，该输出段包含一个引用目标 `iram0_text` 的标记。

```
.iram0.text :
{
    /* 标记 IRAM 空间不足 */
    _iram_text_start = ABSOLUTE(.);

    /* 引用 iram0_text */
    mapping[iram0_text]

    _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg
```

假设链接器脚本生成器收集到了以下片段定义：

```
[sections:text]
    .text+
    .literal+

[sections:iram]
    .iram1+

[scheme:default]
entries:
```

(下页继续)

(续上页)

```
    text -> flash_text
    iram -> iram0_text

[scheme:noflash]
entries:
    text -> iram0_text

[mapping:freertos]
archive: libfreertos.a
entries:
    * (noflash)
```

然后生成的链接器脚本的相应摘录如下：

```
.iram0.text :
{
    /* 标记 IRAM 空间不足 */
    _iram_text_start = ABSOLUTE(.);

    /* 处理片段生成的存放规则，存放在模板标记的位置处 */
    *(.iram1 .iram1.*)
    *libfreertos.a:(.literal .text .literal.* .text.*)

    _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg
```

`*libfreertos.a:(.literal .text .literal.* .text.*)`

这是根据 `freertos` 映射的 `* (noflash)` 条目生成的规则。`libfreertos.a` 库下所有目标文件的所有 `text` 段会收集到 `iram0_text` 目标下（按照 `noflash` 协议），并放在模板中被 `iram0_text` 标记的地方。

`*(.iram1 .iram1.*)`

这是根据默认协议条目 `iram -> iram0_text` 生成的规则。默认协议指定了 `iram -> iram0_text` 条目，因此生成的规则同样也放在被 `iram0_text` 标记的地方。由于该规则是根据默认协议生成的，因此在同一目标下收集的所有规则下排在第一位。

目前使用的链接器脚本模板是 esp_system/ld/esp32c3/sections.ld.in，生成的脚本存放在构建目录下。

将链接器脚本片段文件语法迁移至 ESP-IDF v5.0 适应版本

ESP-IDF v5.0 中将不再支持 ESP-IDF v3.x 中链接器脚本片段文件的旧式语法。在迁移的过程中需注意以下几点：

- 必须缩进，缩进不当的文件会产生解析异常；旧版本不强制缩进，但之前的文档和示例均遵循了正确的缩进语法
- 条件改用 `if...elif...else` 结构，可以参照之前的章节
- 映射片段和其他片段类型一样，需有名称

4.18 lwIP

ESP-IDF uses the open source lwIP lightweight TCP/IP stack. The ESP-IDF version of lwIP (esp-lwip) has some modifications and additions compared to the upstream project.

4.18.1 Supported APIs

ESP-IDF supports the following lwIP TCP/IP stack functions:

- *BSD Sockets API*
- *Netconn API* is enabled but not officially supported for ESP-IDF applications

Adapted APIs

Some common lwIP "app" APIs are supported indirectly by ESP-IDF:

- DHCP Server & Client are supported indirectly via the *ESP-NETIF* functionality
- Simple Network Time Protocol (SNTP) is supported via the lwip/include/apps/sntp/sntp.h lwip/lwip/src/include/lwip/apps/sntp.h functions (see also *SNTP 时间同步*)
- ICMP Ping is supported using a variation on the lwIP ping API. See *ICMP Echo*.
- NetBIOS lookup is available using the standard lwIP API. protocols/http_server/restful_server has an option to demonstrate using NetBIOS to look up a host on the LAN.
- mDNS uses a different implementation to the lwIP default mDNS (see *mDNS 服务*), but lwIP can look up mDNS hosts using standard APIs such as `gethostbyname()` and the convention `hostname.local`, provided the *CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES* setting is enabled.

4.18.2 BSD Sockets API

The BSD Sockets API is a common cross-platform TCP/IP sockets API that originated in the Berkeley Standard Distribution of UNIX but is now standardized in a section of the POSIX specification. BSD Sockets are sometimes called POSIX Sockets or Berkeley Sockets.

As implemented in ESP-IDF, lwIP supports all of the common usages of the BSD Sockets API.

References

A wide range of BSD Sockets reference material is available, including:

- Single UNIX Specification BSD Sockets page
- Berkeley Sockets Wikipedia page

Examples

A number of ESP-IDF examples show how to use the BSD Sockets APIs:

- protocols/sockets/tcp_server
- protocols/sockets/tcp_client
- protocols/sockets/udp_server
- protocols/sockets/udp_client
- protocols/sockets/udp_multicast
- protocols/http_request (Note: this is a simplified example of using a TCP socket to send an HTTP request. The *ESP HTTP Client* is a much better option for sending HTTP requests.)

Supported functions

The following BSD socket API functions are supported. For full details see lwip/lwip/src/include/lwip/sockets.h.

- `socket()`
- `bind()`
- `accept()`
- `shutdown()`
- `getpeername()`

- `getsockopt()` & `setsockopt()` (see *Socket Options*)
- `close()` (via 虚拟文件系统组件)
- `read()`, `readv()`, `write()`, `writev()` (via 虚拟文件系统组件)
- `recv()`, `recvmsg()`, `recvfrom()`
- `send()`, `sendmsg()`, `sendto()`
- `select()` (via 虚拟文件系统组件)
- `poll()` (Note: on ESP-IDF, `poll()` is implemented by calling select internally, so using `select()` directly is recommended if a choice of methods is available.)
- `fcntl()` (see *fcntl*)

Non-standard functions:

- `ioctl()` (see *ioctls*)

备注: Some lwIP application sample code uses prefixed versions of BSD APIs, for example `lwip_socket()` instead of the standard `socket()`. Both forms can be used with ESP-IDF, but using standard names is recommended.

Socket Error Handling

BSD Socket error handling code is very important for robust socket applications. Normally the socket error handling involves the following aspects:

- Detecting the error.
- Geting the error reason code.
- Handle the error according to the reason code.

In lwIP, we have two different scenarios of handling socket errors:

- Socket API returns an error. For more information, see *Socket API Errors*.
- `select(int maxfdp1, fd_set *readset, fd_set *writeset, fd_set *exceptset, struct timeval *timeout)` has exception descriptor indicating that the socket has an error. For more information, see *select() Errors*.

Socket API Errors

The error detection

- We can know that the socket API fails according to its return value.

Get the error reason code

- When socket API fails, the return value doesn't contain the failure reason and the application can get the error reason code by accessing errno. Different values indicate different meanings. For more information, see <*Socket Error Reason Code*>.

Example:

```
int err;
int sockfd;

if (sockfd = socket(AF_INET,SOCK_STREAM,0) < 0) {
    // the error code is obtained from errno
    err = errno;
    return err;
}
```

select() Errors

The error detection

- Socket error when `select()` has exception descriptor

Get the error reason code

- If the `select` indicates that the socket fails, we can't get the error reason code by accessing errno, instead we should call `getsockopt()` to get the failure reason code. Because `select()` has exception descriptor, the error code will not be given to errno.

备注: `getsockopt` function prototype `int getsockopt(int s, int level, int optname, void *optval, socklen_t *optlen)`. Its function is to get the current value of the option of any type, any state socket, and store the result in optval. For example, when you get the error code on a socket, you can get it by `getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen)`.

Example:

```
int err;

if (select(sockfd + 1, NULL, NULL, &exfds, &tval) <= 0) {
    err = errno;
    return err;
} else {
    if (FD_ISSET(sockfd, &exfds)) {
        // select() exception set using getsockopt()
        int optlen = sizeof(int);
        getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen);
        return err;
    }
}
```

Socket Error Reason Code Below is a list of common error codes. For more detailed list of standard POSIX/C error codes, please see *newlib errno.h <https://github.com/espressif/newlib-esp32/blob/master/newlib/libc/include/sys/errno.h>* and the platform-specific extensions newlib/platform_include/errno.h

Error code	Description
ECONNREFUSED	Connection refused
EADDRINUSE	Address already in use
ECONNABORTED	Software caused connection abort
ENETUNREACH	Network is unreachable
ENETDOWN	Network interface is not configured
ETIMEDOUT	Connection timed out
EHOSTDOWN	Host is down
EHOSTUNREACH	Host is unreachable
EINPROGRESS	Connection already in progress
EALREADY	Socket already connected
EDESTADDRREQ	Destination address required
EPROTONOSUPPORT	Unknown protocol

Socket Options

The `getsockopt()` and `setsockopt()` functions allow getting/setting per-socket options.

Not all standard socket options are supported by lwIP in ESP-IDF. The following socket options are supported:

Common options Used with level argument `SOL_SOCKET`.

- `SO_REUSEADDR` (available if *CONFIG_LWIP_SO_REUSE* is set, behavior can be customized by setting *CONFIG_LWIP_SO_REUSE_RXTOALL*)
- `SO_KEEPALIVE`
- `SO_BROADCAST`

- SO_ACCEPTCONN
- SO_RCVBUF (available if *CONFIG_LWIP_SO_RCVBUF* is set)
- SO_SNDTIMEO / SO_RCVTIMEO
- SO_ERROR (this option is only used with select(), see *Socket Error Handling*)
- SO_TYPE
- SO_NO_CHECK (for UDP sockets only)

IP options Used with level argument IPPROTO_IP.

- IP_TOS
- IP_TTL
- IP_PKTINFO (available if *CONFIG_LWIP_NETBUF_RECVINFO* is set)

For multicast UDP sockets:

- IP_MULTICAST_IF
- IP_MULTICAST_LOOP
- IP_MULTICAST_TTL
- IP_ADD_MEMBERSHIP
- IP_DROP_MEMBERSHIP

TCP options TCP sockets only. Used with level argument IPPROTO_TCP.

- TCP_NODELAY

Options relating to TCP keepalive probes:

- TCP_KEEPALIVE (int value, TCP keepalive period in milliseconds)
- TCP_KEEPIDLE (same as TCP_KEEPALIVE, but the value is in seconds)
- TCP_KEEPINTVL (int value, interval between keepalive probes in seconds)
- TCP_KEEPCNT (int value, number of keepalive probes before timing out)

IPv6 options IPv6 sockets only. Used with level argument IPPROTO_IPV6

- IPV6_CHECKSUM
- IPV6_V6ONLY

For multicast IPv6 UDP sockets:

- IPV6_JOIN_GROUP / IPV6_ADD_MEMBERSHIP
- IPV6_LEAVE_GROUP / IPV6_DROP_MEMBERSHIP
- IPV6_MULTICAST_IF
- IPV6_MULTICAST_HOPS
- IPV6_MULTICAST_LOOP

fcntl

The fcntl() function is a standard API for manipulating options related to a file descriptor. In ESP-IDF, the 虚拟文件系统组件 layer is used to implement this function.

When the file descriptor is a socket, only the following fcntl() values are supported:

- O_NONBLOCK to set/clear non-blocking I/O mode. Also supports O_NDELAY, which is identical to O_NONBLOCK.
- O_RDONLY, O_WRONLY, O_RDWR flags for different read/write modes. These can read via F_GETFL only, they cannot be set using F_SETFL. A TCP socket will return a different mode depending on whether the connection has been closed at either end or is still open at both ends. UDP sockets always return O_RDWR.

ioctls

The `ioctl()` function provides a semi-standard way to access some internal features of the TCP/IP stack. In ESP-IDF, the 虚拟文件系统组件 layer is used to implement this function.

When the file descriptor is a socket, only the following `ioctl()` values are supported:

- `FIONREAD` returns the number of bytes of pending data already received in the socket's network buffer.
- `FIONBIO` is an alternative way to set/clear non-blocking I/O status for a socket, equivalent to `fcntl(fd, F_SETFL, O_NONBLOCK, ...)`.

4.18.3 Netconn API

lwIP supports two lower level APIs as well as the BSD Sockets API: the Netconn API and the Raw API.

The lwIP Raw API is designed for single threaded devices and is not supported in ESP-IDF.

The Netconn API is used to implement the BSD Sockets API inside lwIP, and it can also be called directly from ESP-IDF apps. This API has lower resource usage than the BSD Sockets API, in particular it can send and receive data without needing to first copy it into internal lwIP buffers.

重要： Espressif does not test the Netconn API in ESP-IDF. As such, this functionality is *enabled but not supported*. Some functionality may only work correctly when used from the BSD Sockets API.

For more information about the Netconn API, consult lwip/lwip/src/include/lwip/api.h and this wiki page which is part of the unofficial lwIP Application Developers Manual.

4.18.4 lwIP FreeRTOS Task

lwIP creates a dedicated TCP/IP FreeRTOS task to handle socket API requests from other tasks.

A number of configuration items are available to modify the task and the queues ("mailboxes") used to send data to/from the TCP/IP task:

- *CONFIG_LWIP_TCPIP_RECVMBOX_SIZE*
- *CONFIG_LWIP_TCPIP_TASK_STACK_SIZE*
- *CONFIG_LWIP_TCPIP_TASK_AFFINITY*

4.18.5 IPv6 Support

Both IPv4 and IPv6 are supported as dual stack and enabled by default (IPv6 may be disabled if it's not needed, see *Minimum RAM usage*). IPv6 support is limited to *Stateless Autoconfiguration* only, *Stateful configuration* is not supported in ESP-IDF (not in upstream lwip). IPv6 Address configuration is defined by means of these protocols or services:

- **SLAAC** IPv6 Stateless Address Autoconfiguration (RFC-2462)
- **DHCPv6** Dynamic Host Configuration Protocol for IPv6 (RFC-8415)

None of these two types of address configuration is enabled by default, so the device uses only Link Local addresses or statically defined addresses.

Stateless Autoconfiguration Process

To enable address autoconfiguration using Router Advertisement protocol please enable:

- *CONFIG_LWIP_IPV6_AUTOCONFIG*

This configuration option enables IPv6 autoconfiguration for all network interfaces (in contrast to the upstream lwIP, where the autoconfiguration needs to be explicitly enabled for each netif with `netif->ip6_autoconfig_enabled=1`

DHCPv6

DHCPv6 in lwIP is very simple and support only stateless configuration. It could be enabled using:

- *CONFIG_LWIP_IPV6_DHCP6*

Since the DHCPv6 works only in its stateless configuration, the *Stateless Autoconfiguration Process* has to be enabled, too, by means of *CONFIG_LWIP_IPV6_AUTOCONFIG*. Moreover, the DHCPv6 needs to be explicitly enabled form the application code using

```
dhcp6_enable_stateless(netif);
```

DNS servers in IPv6 autoconfiguration

In order to autoconfigure DNS server(s), especially in IPv6 only networks, we have these two options

- Recursive domain name system –this belongs to the Neighbor Discovery Protocol (NDP), uses *Stateless Autoconfiguration Process*. Number of servers must be set *CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS*, this is option is disabled (set to 0) by default.
- DHCPv6 stateless configuration –uses *DHCPv6* to configure DNS servers. Note that the this configuration assumes IPv6 Router Advertisement Flags (RFC-5175) to be set to
  - Managed Address Configuration Flag = 0
  - Other Configuration Flag = 1

4.18.6 esp-lwip custom modifications

Additions

The following code is added which is not present in the upstream lwIP release:

Thread-safe sockets It is possible to `close()` a socket from a different thread to the one that created it. The `close()` call will block until any function calls currently using that socket from other tasks have returned.

It is, however, not possible to delete a task while it is actively waiting on `select()` or `poll()` APIs. It is always necessary that these APIs exit before destroying the task, as this might corrupt internal structures and cause subsequent crashes of the lwIP. (These APIs allocate globally referenced callback pointers on stack, so that when the task gets destroyed before unrolling the stack, the lwIP would still hold pointers to the deleted stack)

On demand timers lwIP IGMP and MLD6 features both initialize a timer in order to trigger timeout events at certain times.

The default lwIP implementation is to have these timers enabled all the time, even if no timeout events are active. This increases CPU usage and power consumption when using automatic light sleep mode. `esp-lwip` default behaviour is to set each timer "on demand" so it is only enabled when an event is pending.

To return to the default lwIP behaviour (always-on timers), disable *CONFIG_LWIP_TIMERS_ONDEMAND*.

Lwip timers API When users are not using WiFi, these APIs provide users with the ability to turn off LwIP timer to reduce power consumption.

The following API functions are supported. For full details see lwip/lwip/src/include/lwip/timeouts.h.

- `sys_timeouts_init()`
- `sys_timeouts_deinit()`

Additional Socket Options

- Some standard IPV4 and IPV6 multicast socket options are implemented (see *Socket Options*).
- Possible to set IPV6-only UDP and TCP sockets with `IPV6_V6ONLY` socket option (normal lwIP is TCP only).

IP layer features

- IPV4 source based routing implementation is different.
- IPV4 mapped IPV6 addresses are supported.

Customized lwIP hooks The original lwIP supports implementing custom compile-time modifications via `LWIP_HOOK_FILENAME`. This file is already used by the IDF port layer, but IDF users could still include and implement any custom additions via a header file defined by the macro `ESP_IDF_LWIP_HOOK_FILENAME`. Here is an exmaple of adding a custom hook file to the build process (the hook is called `my_hook.h` and located in the project's `main` folder):

```
idf_component_get_property(lwip lwip COMPONENT_LIB)
target_compile_options(${lwip} PRIVATE "-I${PROJECT_DIR}/main")
target_compile_definitions(${lwip} PRIVATE "-DESP_IDF_LWIP_HOOK_FILENAME=\"my_hook.
↪h\"")
```

Limitations

Calling `send()` or `sendto()` repeatedly on a UDP socket may eventually fail with `errno` equal to `ENOMEM`. This is a limitation of buffer sizes in the lower layer network interface drivers. If all driver transmit buffers are full then UDP transmission will fail. Applications sending a high volume of UDP datagrams who don't wish for any to be dropped by the sender should check for this error code and re-send the datagram after a short delay.

Increasing the number of TX buffers in the *Wi-Fi* project configuration may also help.

4.18.7 Performance Optimization

TCP/IP performance is a complex subject, and performance can be optimized towards multiple goals. The default settings of ESP-IDF are tuned for a compromise between throughput, latency, and moderate memory usage.

Maximum throughput

Espressif tests ESP-IDF TCP/IP throughput using the wifi/iperf example in an RF sealed enclosure.

The wifi/iperf/sdkconfig.defaults file for the iperf example contains settings known to maximize TCP/IP throughput, usually at the expense of higher RAM usage. To get maximum TCP/IP throughput in an application at the expense of other factors then suggest applying settings from this file into the project sdkconfig.

重要： Suggest applying changes a few at a time and checking the performance each time with a particular application workload.

- If a lot of tasks are competing for CPU time on the system, consider that the lwIP task has configurable CPU affinity (*CONFIG_LWIP_TCPIP_TASK_AFFINITY*) and runs at fixed priority `ESP_TASK_TCPIP_PRIO` (18). Configure competing tasks to be pinned to a different core, or to run at a lower priority. See also *Built-In Task Priorities*.
- If using `select()` function with socket arguments only, disabling *CONFIG_VFS_SUPPORT_SELECT* will make `select()` calls faster.
- If there is enough free IRAM, select *CONFIG_LWIP_IRAM_OPTIMIZATION* to improve TX/RX throughput

If using a Wi-Fi network interface, please also refer to *Wi-Fi 缓冲区使用情况*.

Minimum latency

Except for increasing buffer sizes, most changes which increase throughput will also decrease latency by reducing the amount of CPU time spent in lwIP functions.

- For TCP sockets, lwIP supports setting the standard `TCP_NODELAY` flag to disable Nagle's algorithm.

Minimum RAM usage

Most lwIP RAM usage is on-demand, as RAM is allocated from the heap as needed. Therefore, changing lwIP settings to reduce RAM usage may not change RAM usage at idle but can change it at peak.

- Reducing *CONFIG_LWIP_MAX_SOCKETS* reduces the maximum number of sockets in the system. This will also cause TCP sockets in the `WAIT_CLOSE` state to be closed and recycled more rapidly (if needed to open a new socket), further reducing peak RAM usage.
- Reducing *CONFIG_LWIP_TCPIP_RECVMBOX_SIZE*, *CONFIG_LWIP_TCP_RECVMBOX_SIZE* and *CONFIG_LWIP_UDP_RECVMBOX_SIZE* reduce memory usage at the expense of throughput, depending on usage.
- Disable *CONFIG_LWIP_IPV6* can save about 39 KB for firmware size and 2KB RAM when system power up and 7KB RAM when TCPIP stack running. If there is no requirement for supporting IPV6 then it can be disabled to save flash and RAM footprint.

If using Wi-Fi, please also refer to *Wi-Fi 缓冲区使用情况*.

Peak Buffer Usage The peak heap memory that lwIP consumes is the **theoretically-maximum memory** that the lwIP driver consumes. Generally, the peak heap memory that lwIP consumes depends on:

- the memory required to create a UDP connection: lwip_udp_conn
- the memory required to create a TCP connection: lwip_tcp_conn
- the number of UDP connections that the application has: lwip_udp_con_num
- the number of TCP connections that the application has: lwip_tcp_con_num
- the TCP TX window size: lwip_tcp_tx_win_size
- the TCP RX window size: lwip_tcp_rx_win_size

So, the peak heap memory that the LwIP consumes can be calculated with the following formula:

lwip_dynamic_peek_memory = (lwip_udp_con_num * lwip_udp_conn) + (lwip_tcp_con_num * (lwip_tcp_tx_win_size + lwip_tcp_rx_win_size + lwip_tcp_conn))

Some TCP-based applications need only one TCP connection. However, they may choose to close this TCP connection and create a new one when an error (such as a sending failure) occurs. This may result in multiple TCP connections existing in the system simultaneously, because it may take a long time for a TCP connection to close, according to the TCP state machine (refer to RFC793).

4.19 存储器类型

ESP32-C3 芯片具有不同类型的存储器和灵活的存储器映射特性，本小节将介绍 ESP-IDF 默认如何使用这些功能。

ESP-IDF 区分了指令总线（IRAM、IROM、RTC FAST memory）和数据总线 (DRAM、DROM)。指令存储器是可执行的，只能通过 4 字节对齐字读取或写入。数据存储器不可执行，可以通过单独的字节操作访问。有关总线的更多信息，请参阅 *ESP32-C3 技术参考手册* > *系统和存储器* [PDF]。

4.19.1 DRAM（数据 RAM）

非常量静态数据（.data 段）和零初始化数据（.bss 段）由链接器放入内部 SRAM 作为数据存储。此区域中的剩余空间可在程序运行时用作堆。

备注： 静态分配的 DRAM 的最大值也会因编译应用程序的*IRAM（指令 RAM）* 大小而减小。运行时可用的堆内存会因应用程序的总静态 IRAM 和 DRAM 使用而减少。

常量数据也可能被放入 DRAM，例如当它被用于 non-flash-safe ISR 时（具体请参考*如何将代码放入 IRAM*）。

“noinit” DRAM

可以将 `__NOINIT_ATTR` 宏用作属性，从而将数据放入 `.noinit` 部分。放入该部分的值在启动时不会被初始化，在软件重启后也会保持值不变。

示例：

```
__NOINIT_ATTR uint32_t noinit_data;
```

4.19.2 IRAM（指令 RAM）

备注： 内部 SRAM 中不用于指令 RAM 的部分都会作为*DRAM（数据 RAM）* 供静态数据和动态分配（堆）使用。

何时需要将代码放入 IRAM

以下情况时应将部分应用程序放入 IRAM：

- 如果在注册中断处理程序时使用了 `ESP_INTR_FLAG_IRAM`，则中断处理程序必须要放入 IRAM。更多信息可参考*IRAM 安全中断处理程序*。
- 可将一些时序关键代码放入 IRAM，以减少从 flash 中加载代码造成的相关损失。ESP32-C3 通过 MMU 缓存从 flash 中读取代码和数据。在某些情况下，将函数放入 IRAM 可以减少由缓存未命中造成的延迟，从而显著提高函数的性能。

如何将代码放入 IRAM

借助链接器脚本，一些代码会被自动放入 IRAM 区域中。

如果需要将某些特定的应用程序代码放入 IRAM，可以使用*链接器脚本生成机制* 功能并在组件中添加链接器脚本片段文件，在该片段文件中，可以给整个目标源文件或其中的个别函数打上 `noflash` 标签。更多信息可参考*链接器脚本生成机制*。

或者，也可以通过使用 `IRAM_ATTR` 宏在源代码中指定需要放入 IRAM 的代码：

```
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
        // ...
}
```

放入 IRAM 后可能会导致 IRAM 安全中断处理程序出现问题：

- `IRAM_ATTR` 函数中的字符串或常量可能没有自动放入 RAM 中，这时可以使用 `DRAM_ATTR` 属性进行标记，或者也可以使用链接器脚本方法将它们自动放入 RAM 中。

```
void IRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };
    const static char *MSG = DRAM_STR("I am a string stored in RAM");
}
```

注意，具体哪些数据需要被标记为 DRAM_ATTR 可能很难确定。如果没有被标记为 DRAM_ATTR，某些变量或表达式有时会被编译器别为常量（即使它们没有被标记为 const）并将其放入 flash 中。

- GCC 的优化会自动生成跳转表或 switch/case 查找表，并将这些表放在 flash 中。IDF 默认在编译所有文件时使用 `-fno-jump-tables -fno-tree-switch-conversion` 标志来避免这种情况。

可以为不需要放置在 IRAM 中的单个源文件重新启用跳转表优化。关于如何在编译单个源文件时添加 `-fno-jump-tables -fno-tree-switch-conversion` 选项，请参考组件编译控制。

4.19.3 IROM（代码从 flash 中运行）

如果一个函数没有被显式地声明放在 IRAM 或者 RTC 存储器中，则它会放在 flash 中。由于 IRAM 空间有限，应用程序的大部分二进制代码都需要放入 IROM 中。

在*启动* 过程中，从 IRAM 中运行的引导加载程序配置 MMU flash 缓存，将应用程序的指令代码区域映射到指令空间。通过 MMU 访问的 flash 使用一些内部 SRAM 进行缓存，访问缓存的 flash 数据与访问其他类型的内部存储器一样快。

4.19.4 DROM（数据存储在 flash 中）

默认情况下，链接器将常量数据放入一个映射到 MMU flash 缓存的区域中。这与*IROM（代码从 flash 中运行）* 部分相同，但此处用于只读数据而不是可执行代码。

唯一没有默认放入 DROM 的常量数据是被编译器嵌入到应用程序代码中的字面常量。这些被放置在周围函数的可执行指令中。

DRAM_ATTR 属性可以用来强制将常量从 DRAM 放入*DRAM（数据 RAM）* 部分（见上文）。

4.19.5 RTC FAST memory（RTC 快速存储器）

RTC FAST memory 的同一区域既可以作为指令存储器也可以作为数据存储器进行访问。从深度睡眠模式唤醒后必须要运行的代码要放在 RTC 存储器中，更多信息请查阅文档深度睡眠。

除非禁用*CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP* 选项，否则剩余的 RTC FAST memory 会被添加到堆中。该部分内存可以和*DRAM（数据 RAM）* 互换使用，但是访问速度稍慢一点。

4.19.6 具备 DMA 功能

大多数的 DMA 控制器（比如 SPI、sdmmc 等）都要求发送/接收缓冲区放在 DRAM 中，并且按字对齐。我们建议将 DMA 缓冲区放在静态变量而不是堆栈中。使用 DMA_ATTR 宏可以声明该全局/本地的静态变量具备 DMA 功能，例如:

```
DMA_ATTR uint8_t buffer[]="I want to send something";

void app_main()
{
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
```

(下页继续)

(续上页)

```
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

或者:

```
void app_main()
{
    DMA_ATTR static uint8_t buffer[] = "I want to send something";
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

也可以通过使用*MALLOC_CAP_DMA* 标志来动态分配具备 DMA 能力的内存缓冲区。

4.19.7 在堆栈中放置 DMA 缓冲区

可以在堆栈中放置 DMA 缓冲区，但建议尽量避免。如果实在有需要的话，请注意以下几点:

- 在函数中使用 WORD_ALIGNED_ATTR 宏来修饰变量，将其放在适当的位置上，比如:

```
void app_main()
{
    uint8_t stuff;
    WORD_ALIGNED_ATTR uint8_t buffer[] = "I want to send something";    //否则␣
↪buffer 会被存储在 stuff 变量后面
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

4.20 OpenThread

OpenThread is a IP stack running on the 802.15.4 MAC layer which features mesh network and low power consumption.

4.20.1 Mode of the OpenThread stack

OpenThread can run under the following modes on Espressif chips:

Standalone node

The full OpenThread stack and the application layer runs on the same chip. This mode is available on chips with 15.4 radio such as ESP32-H2.

Radio Co-Processor (RCP)

The chip will be connected to another host running the OpenThread IP stack. It will send and received 15.4 packets on behalf of the host. This mode is available on chips with 15.4 radio such as ESP32-H2. The underlying transport between the chip and the host can be SPI or UART. For sake of latency, we recommend to use SPI as the underlying transport.

OpenThread host

For chips without 15.4 radio, it can be connected to an RCP and run OpenThread under host mode. This mode enables OpenThread on Wi-Fi chips such as ESP32, ESP32-S2, ESP32-S3 and ESP32-C3. The following diagram shows how devices work under different modes:

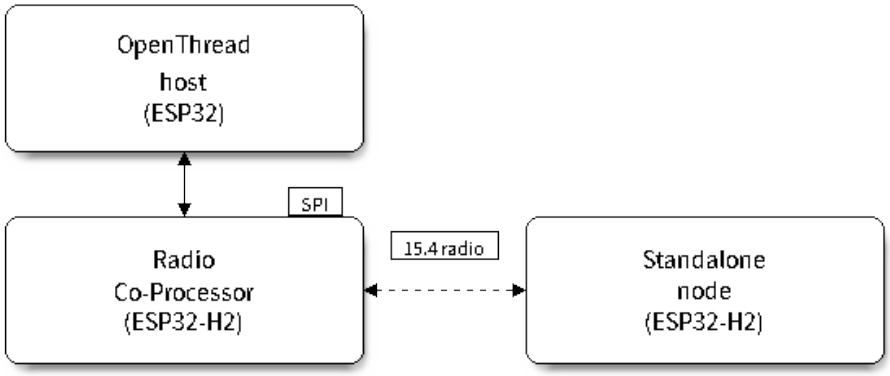

图 52: OpenThread device modes

4.20.2 How To Write an OpenThread Application

The OpenThread openthread/ot_cli example will be a good place to start at. It demonstrates basic OpenThread initialization and simple socket-based server and client.

Before OpenThread initialization

- s1.1 The main task calls `esp_vfs_eventfd_register()` to initialize the eventfd virtual filesystem. The eventfd file system is used for task notification in the OpenThread driver.
- s1.2 The main task calls `nvs_flash_init()` to initialize the NVS where the Thread network data is stored.
- s1.3 **Optional**, The main task calls `esp_netif_init()` only when it wants to create the network interface for Thread.
- s1.4: The main task calls `esp_event_loop_create()` to create the system Event task and initialize an application event' s callback function.

OpenThread stack initialization

- s2.1: Call `esp_openthread_init()` to initialize the OpenThread stack.

OpenThread network interface initialization

The whole stage is **optional** and only required if the application wants to create the network interface for Thread. - s3.1: Call `esp_netif_new()` with *ESP_NETIF_DEFAULT_OPENTHREAD* to create the interface. - s3.2: Call `esp_openthread_netif_glue_init()` to create the OpenThread interface handlers. - s3.3: Call `esp_netif_attach()` to attach the handlers to the interface.

The OpenThread main loop

- s4.3: Call `esp_openthread_launch_mainloop()` to launch the OpenThread main loop. Note that this is a busy loop and will not return until the OpenThread stack is terminated.

Calling OpenThread APIs

The OpenThread APIs are not thread-safe. When calling OpenThread APIs from other tasks, make sure to hold the lock with `esp_openthread_lock_acquire()` and release the lock with `esp_openthread_lock_release()` afterwards.

Deinitialization

The following steps are required to deintialize the OpenThread stack: - Call `esp_netif_destroy()` and `esp_openthread_netif_glue_deinit()` to deintialize the OpenThread network interface if you have created one. - Call `esp_openthread_deinit()` to deintialize the OpenThread stack.

4.20.3 The OpenThread border router

The OpenThread border router connects the Thread network with other IP networks. It will provide IPv6 connectivity, service registration and commission functionality. To launch an OpenThread border router on a ESP chip, you need to connect an RCP to a Wi-Fi capable chip such as ESP32. Call `esp_openthread_border_router_init()` during the initialization will launch all the border routing functionalities.

You may refer to the openthread/ot_br example and the README for further border router details.

4.21 分区表

4.21.1 概述

每片 ESP32-C3 的 flash 可以包含多个应用程序，以及多种不同类型的数据（例如校准数据、文件系统数据、参数存储数据等）。因此，我们在 flash 的默认偏移地址 0x8000 处烧写一张分区表。

分区表的长度为 0xC00 字节（最多可以保存 95 条分区表条目）。分区表数据后还保存着该表的 MD5 校验和，用于验证分区表的完整性。此外，如果芯片使能了安全启动 功能，则该分区表后还会保存签名信息。

分区表中的每个条目都包括以下几个部分：Name（标签）、Type（app、data 等）、SubType 以及在 flash 中的偏移量（分区的加载地址）。

在使用分区表时，最简单的方法就是打开项目配置菜单（`idf.py menuconfig`），并在*CONFIG_PARTITION_TABLE_TYPE* 下选择一个预定义的分区表：

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

在以上两种选项中，出厂应用程序均将被烧录至 flash 的 0x10000 偏移地址处。这时，运行 *idf.py partition-table*，即可以打印当前使用分区表的信息摘要。

4.21.2 内置分区表

以下是“Single factory app, no OTA”选项的分区表信息摘要:

```
# ESP-IDF Partition Table
# Name,   Type, SubType, Offset,  Size,   Flags
nvs,      data, nvs,     0x9000,  0x6000,
phy_init, data, phy,     0xf000,  0x1000,
factory,  app,  factory, 0x10000, 1M,
```

- flash 的 0x10000 (64 KB) 偏移地址处存放一个标记为“factory”的二进制应用程序，且启动加载器将默认加载这个应用程序。
- 分区表中还定义了两个数据区域，分别用于存储 NVS 库专用分区和 PHY 初始化数据。

以下是“Factory app, two OTA definitions”选项的分区表信息摘要:

```
# ESP-IDF Partition Table
# Name,   Type, SubType, Offset,  Size, Flags
nvs,      data, nvs,     0x9000,  0x4000,
otadata,  data, ota,     0xd000,  0x2000,
phy_init, data, phy,     0xf000,  0x1000,
factory,  app,  factory, 0x10000,  1M,
ota_0,    app,  ota_0,   0x110000, 1M,
ota_1,    app,  ota_1,   0x210000, 1M,
```

- 分区表中定义了三个应用程序分区，这三个分区的类型都被设置为“app”，但具体 app 类型不同。其中，位于 0x10000 偏移地址处的为出厂应用程序（factory），其余两个为 OTA 应用程序（ota_0，ota_1）。
- 新增了一个名为“otadata”的数据分区，用于保存 OTA 升级时需要的数据。启动加载器会查询该分区的数据，以判断该从哪个 OTA 应用程序分区加载程序。如果“otadata”分区为空，则会执行出厂程序。

4.21.3 创建自定义分区表

如果在 `menuconfig` 中选择了“Custom partition table CSV”，则还需要输入该分区表的 CSV 文件在项目中的路径。CSV 文件可以根据需要，描述任意数量的分区信息。

CSV 文件的格式与上面摘要中打印的格式相同，但是在 CSV 文件中并非所有字段都是必需的。例如下面是一个自定义的 OTA 分区表的 CSV 文件:

```
# Name,   Type, SubType,  Offset,   Size,  Flags
nvs,      data, nvs,      0x9000,  0x4000
otadata,  data, ota,      0xd000,  0x2000
phy_init, data, phy,      0xf000,  0x1000
factory,  app,  factory,  0x10000,  1M
ota_0,    app,  ota_0,    ,          1M
ota_1,    app,  ota_1,    ,          1M
nvs_key,  data, nvs_keys, ,         0x1000
```

- 字段之间的空格会被忽略，任何以 # 开头的行（注释）也会被忽略。
- CSV 文件中的每个非注释行均为一个分区定义。
- 每个分区的 `Offset` 字段可以为空，`gen_esp32part.py` 工具会从分区表位置的后面开始自动计算并填充该分区的偏移地址，同时确保每个分区的偏移地址正确对齐。

Name 字段

Name 字段可以是任何有意义的名称，但不能超过 16 个字符（之后的内容将被截断）。该字段对 ESP32-C3 并不是特别重要。

Type 字段

Type 字段可以指定为 app (0x00) 或者 data (0x01)，也可以直接使用数字 0-254（或者十六进制 0x00-0xFE）。注意，0x00-0x3F 不得使用（预留给 esp-idf 的核心功能）。

如果您的应用程序需要以 ESP-IDF 尚未支持的格式存储数据，请在 0x40-0xFE 内添加一个自定义分区类型。

参考*esp_partition_type_t* 关于 app``和 ``data 分区的枚举定义。

如果用 C++ 编写，那么指定一个应用程序定义的分区类型，需要在*esp_partition_type_t* 中使用整数，从而与*分区 API* 一起使用。例如:

```
static const esp_partition_type_t APP_PARTITION_TYPE_A = (esp_partition_type_
↪t)0x40;
```

注意，启动加载器将忽略 app (0x00) 和 data (0x01) 以外的其他分区类型。

SubType 字段

SubType 字段长度为 8 bit，内容与具体分区 Type 有关。目前，esp-idf 仅仅规定了“app”和“data”两种分区类型的子类型含义。

参考*esp_partition_subtype_t*，以了解 ESP-IDF 定义的全部子类型列表，包括:

- 当 Type 定义为 app 时，SubType 字段可以指定为 factory (0x00)、ota_0 (0x10) …ota_15 (0x1F) 或者 test (0x20)。
  - factory (0x00) 是默认的 app 分区。启动加载器将默认加载该应用程序。但如果存在类型为 data/ota 分区，则启动加载器将加载 data/ota 分区中的数据，进而判断启动哪个 OTA 镜像文件。
    - OTA 升级永远都不会更新 factory 分区中的内容。
    - 如果您希望在 OTA 项目中预留更多 flash，可以删除 factory 分区，转而使用 ota_0 分区。
  - ota_0 (0x10) …ota_15 (0x1F) 为 OTA 应用程序分区，启动加载器将根据 OTA 数据分区中的数据来决定加载哪个 OTA 应用程序分区中的程序。在使用 OTA 功能时，应用程序应至少拥有 2 个 OTA 应用程序分区（ota_0 和 ota_1）。更多详细信息，请参考*OTA 文档* 。
  - test (0x20) 为预留的子类型，用于工厂测试流程。如果没有其他有效 app 分区，test 将作为备选启动分区使用。也可以配置启动加载器在每次启动时读取 GPIO，如果 GPIO 被拉低则启动该分区。详细信息请查阅*从测试固件启动*。
- 当 Type 定义为 data 时，SubType 字段可以指定为 ota (0x00)、phy (0x01)、nvs (0x02)、nvs_keys (0x04) 或者其他组件特定的子类型（请参考*子类型枚举*).
  - ota (0) 即*OTA 数据分区* ，用于存储当前所选的 OTA 应用程序的信息。这个分区的大小需要设定为 0x2000。更多详细信息，请参考*OTA 文档* 。
  - phy (1) 分区用于存放 PHY 初始化数据，从而保证可以为每个设备单独配置 PHY，而非必须采用固件中的统一 PHY 初始化数据。
    - 默认配置下，phy 分区并不启用，而是直接将 phy 初始化数据编译至应用程序中，从而节省分区表空间（直接将此分区删掉）。
    - 如果需要从此分区加载 phy 初始化数据，请打开项目配置菜单（idf.py menuconfig），并且使能*CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION* 选项。此时，您还需要手动将 phy 初始化数据烧至设备 flash（esp-idf 编译系统并不会自动完成该操作）。
  - nvs (2) 是专门给*非易失性存储 (NVS) API* 使用的分区。
    - 用于存储每台设备的 PHY 校准数据（注意，并不是 PHY 初始化数据）。
    - 用于存储 Wi-Fi 数据（如果使用了*esp_wifi_set_storage(WIFI_STORAGE_FLASH)* 初始化函数）。
    - NVS API 还可以用于其他应用程序数据。
    - 强烈建议您应为 NVS 分区分配至少 0x3000 字节空间。
    - 如果使用 NVS API 存储大量数据，请增加 NVS 分区的大小（默认是 0x6000 字节）。
  - nvs_keys (4) 是 NVS 秘钥分区。详细信息，请参考*非易失性存储 (NVS) API* 文档。
    - 用于存储加密密钥（如果启用了 *NVS 加密*功能）。
    - 此分区应至少设定为 4096 字节。

  - ESP-IDF 还支持其它预定义的子类型用于数据存储，包括*FAT 文件系统* (*ESP_PARTITION_SUBTYPE_DATA_FAT*)，*SPIFFS* (*ESP_PARTITION_SUBTYPE_DATA_SPIFFS*) 等。

  其它数据子类型已预留给 esp-idf 未来使用。
- 如果分区类型是由应用程序定义的任意值（0x40-0xFE），那么 `subtype` 字段可以是由应用程序选择的任何值（0x00-0xFE）。

请注意如果用 C++ 编写，应用程序定义的子类型值需要转换为*esp_partition_type_t*，从而与*分区 API* 一起使用。

Offset 和 Size 字段

分区若偏移地址为空，则会紧跟着前一个分区之后开始；若为首个分区，则将紧跟着分区表开始。

app 分区的偏移地址必须要与 0x10000 (64K) 对齐，如果将偏移字段留空，`gen_esp32part.py` 工具会自动计算得到一个满足对齐要求的偏移地址。如果 app 分区的偏移地址没有与 0x10000 (64K) 对齐，则该工具会报错。

app 分区的大小和偏移地址可以采用十进制数、以 0x 为前缀的十六进制数，且支持 K 或 M 的倍数单位（分别代表 1024 和 1024*1024 字节）。

如果您希望允许分区表中的分区采用任意起始偏移量 (*CONFIG_PARTITION_TABLE_OFFSET*)，请将分区表（CSV 文件）中所有分区的偏移字段都留空。注意，此时，如果您更改了分区表中任意分区的偏移地址，则其他分区的偏移地址也会跟着改变。这种情况下，如果您之前还曾设定某个分区采用固定偏移地址，则可能造成分区表冲突，从而导致报错。

Flags 字段

当前仅支持 `encrypted` 标记。如果 Flags 字段设置为 `encrypted`，且已启用*Flash 加密* 功能，则该分区将会被加密。

备注： `app` 分区始终会被加密，不管 Flags 字段是否设置。

4.21.4 生成二进制分区表

烧写到 ESP32-C3 中的分区表采用二进制格式，而不是 CSV 文件本身。此时，partition_table/gen_esp32part.py 工具可以实现 CSV 和二进制文件之间的转换。

如果您在项目配置菜单（`idf.py menuconfig`）中设置了分区表 CSV 文件的名称，然后构建项目或执行 `idf.py partition-table`。这时，转换将在编译过程中自动完成。

手动将 CSV 文件转换为二进制文件:

```
python gen_esp32part.py input_partitions.csv binary_partitions.bin
```

手动将二进制文件转换为 CSV 文件:

```
python gen_esp32part.py binary_partitions.bin input_partitions.csv
```

在标准输出（stdout）上，打印二进制分区表的内容（运行 `idf.py partition-table` 时展示的信息摘要也是这样生成的）：

```
python gen_esp32part.py binary_partitions.bin
```

4.21.5 分区大小检查

ESP-IDF 构建系统将自动检查生成的二进制文件大小与可用的分区大小是否匹配，如果二进制文件太大，则会构建失败并报错。

目前会对以下二进制文件进行检查：

- 引导加载程序的二进制文件的大小要适合分区表前的区域大小（分区表前的区域都分配给了引导加载程序），具体请参考引导加载程序大小。
- 应用程序二进制文件应至少适合一个“app”类型的分区。如果不适合任何应用程序分区，则会构建失败。如果只适合某些应用程序分区，则会打印相关警告。

备注： 即使分区大小检查返回错误并导致构建失败，仍然会生成可以烧录的二进制文件（它们对于可用空间来说过大，因此无法正常工作）。

MD5 校验和

二进制格式的分区表中含有一个 MD5 校验和。这个 MD5 校验和是根据分区表内容计算的，可在设备启动阶段，用于验证分区表的完整性。

用户可通过 `gen_esp32part.py` 的 `--disable-md5sum` 选项或者*CONFIG_PARTITION_TABLE_MD5* 选项关闭 MD5 校验。

4.21.6 烧写分区表

- `idf.py partition-table-flash`：使用 esptool.py 工具烧写分区表。
- `idf.py flash`：会烧写所有内容，包括分区表。

在执行 `idf.py partition-table` 命令时，手动烧写分区表的命令也将打印在终端上。

备注： 分区表的更新并不会擦除根据旧分区表存储的数据。此时，您可以使用 `idf.py erase-flash` 命令或者 `esptool.py erase_flash` 命令来擦除 flash 中的所有内容。

4.21.7 分区工具 (parttool.py)

partition_table 组件中有分区工具 parttool.py，可以在目标设备上完成分区相关操作。该工具有如下用途：

- 读取分区，将内容存储到文件中 (read_partition)
- 将文件中的内容写至分区 (write_partition)
- 擦除分区 (erase_partition)
- 检索特定分区的名称、偏移、大小和 flag（“加密”）标志等信息 (get_partition_info)

用户若想通过编程方式完成相关操作，可从另一个 Python 脚本导入并使用分区工具，或者从 Shell 脚本调用分区工具。前者可使用工具的 Python API，后者可使用命令行界面。

Python API

首先请确保已导入 *parttool* 模块。

```
import sys
import os

idf_path = os.environ["IDF_PATH"]  # 从环境中获取 IDF_PATH 的值
parttool_dir = os.path.join(idf_path, "components", "partition_table")  # parttool.
↪py 位于 $IDF_PATH/components/partition_table 下
```

(下页继续)

(续上页)

```
sys.path.append(parttool_dir)  # 使能 Python 寻找 parttool 模块
from parttool import *  # 导入 parttool 模块内的所有名称
```

要使用分区工具的 Python API，第一步是创建 *ParttoolTarget*：

```
# 创建 partool.py 的目标设备，并将目标设备连接到串行端口 /dev/ttyUSB1
target = ParttoolTarget("/dev/ttyUSB1")
```

现在，可使用创建的 *ParttoolTarget* 在目标设备上完成操作：

```
# 擦除名为 'storage' 的分区
target.erase_partition(PartitionName("storage"))

# 读取类型为 'data'、子类型为 'spiffs' 的分区，保存至文件 'spiffs.bin'
target.read_partition(PartitionType("data", "spiffs"), "spiffs.bin")

# 将 'factory.bin' 文件的内容写至 'factory' 分区
target.write_partition(PartitionName("factory"), "factory.bin")

# 打印默认启动分区的大小
storage = target.get_partition_info(PARTITION_BOOT_DEFAULT)
print(storage.size)
```

使用 *PartitionName*、*PartitionType* 或 PARTITION_BOOT_DEFAULT 指定要操作的分区。顾名思义，这三个参数可以指向拥有特定名称的分区、特定类型和子类型的分区或默认启动分区。

更多关于 Python API 的信息，请查看分区工具的代码注释。

命令行界面

parttool.py 的命令行界面具有如下结构：

```
parttool.py [command-args] [subcommand] [subcommand-args]

- command-args - 执行主命令 (parttool.py) 所需的实际参数，多与目标设备有关
- subcommand - 要执行的操作
- subcommand-args - 所选操作的实际参数
```

```
# 擦除名为 'storage' 的分区
parttool.py --port "/dev/ttyUSB1" erase_partition --partition-name=storage

# 读取类型为 'data'、子类型为 'spiffs' 的分区，保存到 'spiffs.bin' 文件
parttool.py --port "/dev/ttyUSB1" read_partition --partition-type=data --partition-
↪subtype=spiffs --output "spiffs.bin"

# 将 'factory.bin' 文件中的内容写入到 'factory' 分区
parttool.py --port "/dev/ttyUSB1" write_partition --partition-name=factory --input
↪"factory.bin"

# 打印默认启动分区的大小
parttool.py --port "/dev/ttyUSB1" get_partition_info --partition-boot-default --
↪info size
```

更多信息可用 *–help* 指令查看：

```
# 显示可用的子命令和主命令描述
parttool.py --help
```

(下页继续)

(续上页)

```
# 显示子命令的描述
parttool.py [subcommand] --help
```

4.22 Performance

ESP-IDF ships with default settings that are designed for a trade-off between performance, resource usage, and available functionality.

These guides describe how to optimize a firmware application for a particular aspect of performance. Usually this involves some trade-off in terms of limiting available functions, or swapping one aspect of performance (such as execution speed) for another (such as RAM usage).

4.22.1 How to Optimize Performance

1. Decide what the performance-critical aspects of your application are (for example: a particular response time to a certain network operation, a particular startup time limit, particular peripheral data throughput, etc.).
2. Find a way to measure this performance (some methods are outlined in the guides below).
3. Modify the code and project configuration and compare the new measurement to the old measurement.
4. Repeat step 3 until the performance meets the requirements set out in step 1.

4.22.2 Guides

Maximizing Execution Speed

Overview Optimizing execution speed is a key element of software performance. Code that executes faster can also have other positive effects, like reducing overall power consumption. However, improving execution speed may have trade-offs with other aspects of performance such as *Minimizing Binary Size*.

Choose What To Optimize If a function in the application firmware is executed once per week in the background, it may not matter if that function takes 10 ms or 100 ms to execute. If a function is executed constantly at 10 Hz, it matters greatly if it takes 10 ms or 100 ms to execute.

Most application firmwares will only have a small set of functions which require optimal performance. Perhaps those functions are executed very often, or have to meet some application requirements for latency or throughput. Optimization efforts should be targeted at these particular functions.

Measuring Performance The first step to improving something is to measure it.

Basic Performance Measurements If measuring performance relative to an external interaction with the world, you may be able to measure this directly (for example see the examples wifi/iperf and ethernet/iperf for measuring general network performance, or you can use an oscilloscope or logic analyzer to measure timing of an interaction with a device peripheral.)

Otherwise, one way to measure performance is to augment the code to take timing measurements:

```
#include "esp_timer.h"

void measure_important_function(void) {
    const unsigned MEASUREMENTS = 5000;
    uint64_t start = esp_timer_get_time();

    for (int retries = 0; retries < MEASUREMENTS; retries++) {
```

(下页继续)

(续上页)

```
        important_function(); // This is the thing you need to measure
    }

    uint64_t end = esp_timer_get_time();

    printf("%u iterations took %llu milliseconds (%llu microseconds per␣
↪invocation)\n",
           MEASUREMENTS, (end - start)/1000, (end - start)/MEASUREMENTS);
}
```

Executing the target multiple times can help average out factors like RTOS context switches, overhead of measurements, etc.

- Using *esp_timer_get_time()* generates "wall clock" timestamps with microsecond precision, but has moderate overhead each time the timing functions are called.
- It's also possible to use the standard Unix `gettimeofday()` and `utime()` functions, although the overhead is slightly higher.
- Otherwise, including `hal/cpu_hal.h` and calling the HAL function `cpu_hal_get_cycle_count()` will return the number of CPU cycles executed. This function has lower overhead than the others. It is good for measuring very short execution times with high precision.
- If making "microbenchmarks" (i.e. benchmarking only a very small routine of code that runs in less than 1-2 milliseconds) then flash cache performance can sometimes cause big variations in timing measurements depending on the binary. This happens because binary layout can cause different patterns of cache misses in a particular sequence of execution. If the test code is larger then this effect usually averages out. Executing a small function multiple times when benchmarking can help reduce the impact of flash cache misses. Alternatively, move this code to IRAM (see *Targeted Optimizations*).

External Tracing The 应用层跟踪库 allows measuring code execution with minimal impact on the code itself.

Tasks If the option *CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS* is enabled then the FreeRTOS API *vTaskGetRunTimeStats()* can be used to retrieve runtime information about the processor time used by each FreeRTOS task.

SEGGER SystemView is an excellent tool for visualizing task execution and looking for performance issues or improvements in the system as a whole.

Improving Overall Speed The following optimizations will improve the execution of nearly all code - including boot times, throughput, latency, etc:

- Set *CONFIG_ESPTOOLPY_FLASHMODE* to QIO or QOUT mode (Quad I/O). Both will almost double the speed at which code is loaded or executed from flash compared to the default DIO mode. QIO is slightly faster than QOUT if both are supported. Note that both the flash chip model and the electrical connections between the ESP32-C3 and the flash chip must support quad I/O modes or the SoC will not work correctly.
- Set *CONFIG_COMPILER_OPTIMIZATION* to "Optimize for performance (-O2)". This may slightly increase binary size compared to the default setting, but will almost certainly increase performance of some code. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise are not seen.
- Avoid using floating point arithmetic (`float`). On ESP32-C3 these calculations are emulated in software and are very slow. If possible then use fixed point representations, a different method of integer representation, or convert part of the calculation to be integer only before switching to floating point.
- Avoid using double precision floating point arithmetic (`double`). These calculations are emulated in software and are very slow. If possible then use an integer-based representation, or single-precision floating point.

Reduce Logging Overhead Although standard output is buffered, it's possible for an application to be limited by the rate at which it can print data to log output once buffers are full. This is particularly relevant for startup time if a lot of output is logged, but can happen at other times as well. There are multiple ways to solve this problem:

- Reduce the volume of log output by lowering the app *CONFIG_LOG_DEFAULT_LEVEL* (the equivalent bootloader setting is *CONFIG_BOOTLOADER_LOG_LEVEL*). This also reduces the binary size, and saves some CPU time spent on string formatting.
- Increase the speed of logging output by increasing the *CONFIG_ESP_CONSOLE_UART_BAUDRATE*

Not Recommended The following options will also increase execution speed, but are not recommended as they also reduce the debuggability of the firmware application and may increase the severity of any bugs.

- Set *CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL* to disabled. This also reduces firmware binary size by a small amount. However, it may increase the severity of bugs in the firmware including security-related bugs. If necessary to do this to optimize a particular function, consider adding `#define NDEBUG` in the top of that single source file instead.

Targeted Optimizations The following changes will increase the speed of a chosen part of the firmware application:

- Move frequently executed code to IRAM. By default, all code in the app is executed from flash cache. This means that it's possible for the CPU to have to wait on a "cache miss" while the next instructions are loaded from flash. Functions which are copied into IRAM are loaded once at boot time, and then will always execute at full speed.
  IRAM is a limited resource, and using more IRAM may reduce available DRAM, so a strategic approach is needed when moving code to IRAM. See *IRAM（指令 RAM）* for more information.
- Jump table optimizations can be re-enabled for individual source files that don't need to be placed in IRAM. For hot paths in large switch cases this will improve performance. For instructions on how to add the -fjump-tables -ftree-switch-conversion options when compiling individual source files, see 组件编译控制

Improving Startup Time In addition to the overall performance improvements shown above, the following options can be tweaked to specifically reduce startup time:

- Minimizing the *CONFIG_LOG_DEFAULT_LEVEL* and *CONFIG_BOOTLOADER_LOG_LEVEL* has a large impact on startup time. To enable more logging after the app starts up, set the *CONFIG_LOG_MAXIMUM_LEVEL* as well and then call `esp_log_level_set()` to restore higher level logs. The system/startup_time main function shows how to do this.
- If using deep sleep, setting *CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP* allows a faster wake from sleep. Note that if using Secure Boot this represents a security compromise, as Secure Boot validation will not be performed on wake.
- Setting *CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON* will skip verifying the binary on every boot from power-on reset. How much time this saves depends on the binary size and the flash settings. Note that this setting carries some risk if the flash becomes corrupt unexpectedly. Read the help text of the *config item* for an explanation and recommendations if using this option.
- It's possible to save a small amount of time during boot by disabling RTC slow clock calibration. To do so, set *CONFIG_RTC_CLK_CAL_CYCLES* to 0. Any part of the firmware that uses RTC slow clock as a timing source will be less accurate as a result.

The example project system/startup_time is pre-configured to optimize startup time. The file system/startup_time/sdkconfig.defaults contain all of these settings. You can append these to the end of your project's own `sdkconfig` file to merge the settings, but please read the documentation for each setting first.

Task Priorities As ESP-IDF FreeRTOS is a real-time operating system, it's necessary to ensure that high throughput or low latency tasks are granted a high priority in order to run immediately. Priority is set when calling *xTaskCreate()* or *xTaskCreatePinnedToCore()* and can be changed at runtime by calling *vTaskPrioritySet()*.

It's also necessary to ensure that tasks yield CPU (by calling *vTaskDelay()*, sleep(), or by blocking on semaphores, queues, task notifications, etc) in order to not starve lower priority tasks and cause problems for the overall system. The *Task Watchdog Timer (TWDT)* provides a mechanism to automatically detect if task starvation happens, however note that a Task WDT timeout does not always indicate a problem (sometimes the correct operation of the firmware requires some long-running computation). In these cases tweaking the Task WDT timeout or even disabling the Task WDT may be necessary.

Built-In Task Priorities ESP-IDF starts a number of system tasks at fixed priority levels. Some are automatically started during the boot process, some are started only if the application firmware initializes a particular feature. To optimize performance, structure application task priorities so that they are not delayed by system tasks, while also not starving system tasks and impacting other functions of the system.

This may require splitting up a particular task. For example, perform a time-critical operation in a high priority task or an interrupt handler and do the non-time-critical part in a lower priority task.

Header components/esp_system/include/esp_task.h contains macros for the priority levels used for built-in ESP-IDF tasks system.

Common priorities are:

- *Main task that executes app_main function* has minimum priority (1).
- *High Resolution Timer (ESP Timer)* system task to manage timer events and execute callbacks has high priority (22, ESP_TASK_TIMER_PRIO)
- FreeRTOS Timer Task to handle FreeRTOS timer callbacks is created when the scheduler initializes and has minimum task priority (1, *configurable*).
- *Event Handling* system task to manage the default system event loop and execute callbacks has high priority (20, ESP_TASK_EVENT_PRIO). This configuration is only used if the application calls *esp_event_loop_create_default()*, it's possible to call *esp_event_loop_create()* with a custom task configuration instead.
- *lwIP* TCP/IP task has high priority (18, ESP_TASK_TCPIP_PRIO).
- *Wi-Fi Driver* task has high priority (23).
- Wi-Fi wpa_supplicant component may create dedicated tasks while the Wi-Fi Protected Setup (WPS), WPA2 EAP-TLS, Device Provisioning Protocol (DPP) or BSS Transition Management (BTM) features are in use. These tasks all have low priority (2).
- *Bluetooth Controller* task has high priority (23, ESP_TASK_BT_CONTROLLER_PRIO). The Bluetooth Controller needs to respond to requests with low latency, so it should always be close to the highest priority task in the system.
- *NimBLE Bluetooth Host* host task has high priority (21).
- The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config ETH_MAC_DEFAULT_CONFIG then the priority is medium-high (15). This setting can be changed by passing a custom *eth_mac_config_t* struct when initializing the Ethernet MAC.
- If using the *MQTT* component, it creates a task with default priority 5 (*configurable*, depends on *CONFIG_MQTT_USE_CUSTOM_CONFIG* (also configurable runtime by task_prio field in the *esp_mqtt_client_config_t*)
- To see what is the task priority for mDNS service, please check Performance Optimization.

Choosing application task priorities In general, it's not recommended to set task priorities higher than the built-in Wi-Fi/BT operations as starving them of CPU may make the system unstable. For very short timing-critical operations that don't use the network, use an ISR or a very restricted task (very short bursts of runtime only) at highest priority (24). Choosing priority 19 will allow lower layer Wi-Fi/BT functionality to run without delays, but still preempts the lwIP TCP/IP stack and other less time-critical internal functionality - this is the best option for time-critical tasks that don't perform network operations. Any task that does TCP/IP network operations should run at lower priority than the lwIP TCP/IP task (18) to avoid priority inversion issues.

备注： Task execution is always completely suspended when writing to the built-in SPI flash chip. Only *IRAM 安全中断处理程序* will continue executing.

Improving Interrupt Performance ESP-IDF supports dynamic *Interrupt allocation* with interrupt preemption. Each interrupt in the system has a priority, and higher priority interrupts will preempt lower priority ones.

Interrupt handlers will execute in preference to any task (provided the task is not inside a critical section). For this reason, it's important to minimize the amount of time spent executing in an interrupt handler.

To obtain the best performance for a particular interrupt handler:

- Assign more important interrupts a higher priority using a flag such as `ESP_INTR_FLAG_LEVEL2` or `ESP_INTR_FLAG_LEVEL3` when calling `esp_intr_alloc()`.
- If you're sure the entire interrupt handler can run from IRAM (see *IRAM 安全中断处理程序*) then set the `ESP_INTR_FLAG_IRAM` flag when calling `esp_intr_alloc()` to assign the interrupt. This prevents it being temporarily disabled if the application firmware writes to the internal SPI flash.
- Even if the interrupt handler is not IRAM safe, if it is going to be executed frequently then consider moving the handler function to IRAM anyhow. This minimizes the chance of a flash cache miss when the interrupt code is executed (see *Targeted Optimizations*). It's possible to do this without adding the `ESP_INTR_FLAG_IRAM` flag to mark the interrupt as IRAM-safe, if only part of the handler is guaranteed to be in IRAM.

Improving Network Speed

- For Wi-Fi, see *如何提高 Wi-Fi 性能* and *Wi-Fi 缓冲区使用情况*
- For lwIP TCP/IP (Wi-Fi and Ethernet), see *Performance Optimization*
- The wifi/iperf example contains a configuration that is heavily optimized for Wi-Fi TCP/IP throughput. Append the contents of the files wifi/iperf/sdkconfig.defaults, wifi/iperf/sdkconfig.defaults.esp32c3 and wifi/iperf/sdkconfig.ci.99 to your project `sdkconfig` file in order to add all of these options. Note that some of these options may have trade-offs in terms of reduced debuggability, increased firmware size, increased memory usage, or reduced performance of other features. To get the best result, read the documentation pages linked above and use this information to determine exactly which options are best suited for your app.

Minimizing Binary Size

The ESP-IDF build system compiles all source files in the project and ESP-IDF, but only functions and variables that are actually referenced by the program are linked into the final binary. In some cases, it is necessary to reduce the total size of the firmware binary (for example, in order to fit it into the available flash partition size).

The first step to reducing the total firmware binary size is measuring what is causing the size to increase.

Measuring Static Sizes To optimize both firmware binary size and memory usage it's necessary to measure statically allocated RAM ("data", "bss"), code ("text") and read-only data ("rodata") in your project.

Using the *idf.py* sub-commands `size`, `size-components` and `size-files` provides a summary of memory used by the project:

Size Summary (idf.py size)

```
$ idf.py size
[...]
Total sizes:
DRAM .data size:   11584 bytes
DRAM .bss  size:   19624 bytes
Used static DRAM:       0 bytes (      0 available, nan% used)
```

(下页继续)

(续上页)

```
Used static IRAM:       0 bytes (      0 available, nan% used)
Used stat D/IRAM:  136276 bytes ( 519084 available, 20.8% used)
      Flash code:  630508 bytes
    Flash rodata:  177048 bytes
Total image size:~ 924208 bytes (.bin may be padded larger)
```

This output breaks down the size of all static memory regions in the firmware binary:

- `DRAM .data size` is statically allocated RAM that is assigned to non-zero values at startup. This uses RAM (DRAM) at runtime and also uses space in the binary file.
- `DRAM .bss size` is statically allocated RAM that is assigned zero at startup. This uses RAM (DRAM) at runtime but doesn't use any space in the binary file.
- `Used static DRAM`, `Used static IRAM` - these options are kept for compatibility with ESP32 target, and currently read 0.
- `Used stat D/IRAM` - This is total internal RAM usage, the sum of static DRAM .data + .bss, and also static *IRAM*（指令 *RAM*）used by the application for executable code. The `available` size is the estimated amount of DRAM which will be available as heap memory at runtime (due to metadata overhead and implementation constraints, and heap allocations done by ESP-IDF during startup, the actual free heap at startup will be lower than this).
- `Flash code` is the total size of executable code executed from flash cache (*IROM*). This uses space in the binary file.
- `Flash rodata` is the total size of read-only data loaded from flash cache (*DROM*). This uses space in the binary file.
- `Total image size` is the estimated total binary file size, which is the total of all the used memory types except for .bss.

Component Usage Summary (idf.py size-components) The summary output provided by `idf.py size` does not give enough detail to find the main contributor to excessive binary size. To analyze in more detail, use `idf.py size-components`

```
$ idf.py size-components
[...]
    Total sizes:
 DRAM .data size:   14956 bytes
 DRAM .bss  size:   15808 bytes
Used static DRAM:   30764 bytes ( 149972 available, 17.0% used)
Used static IRAM:   83918 bytes (  47154 available, 64.0% used)
      Flash code:  559943 bytes
    Flash rodata:  176736 bytes

The first lines of output from `idf.py size-components` are the same as `idf.py size`. After this a table is printed of "per-archive contributions to ELF file". This means how much each static library archive has contributed to the final binary size.

Generally, one static library archive is built per component, although some are binary libraries included by a particular component (for example, `libnet80211.a` is included by `esp_wifi` component). There are also toolchain libraries such as `libc.a` and `libgcc.a` listed here, these provide Standard C/C++ Library and toolchain built-in functionality.

If your project is simple and only has a "main" component, then all of the project's code will be shown under `libmain.a`. If your project includes its own components (see 构建系统), then they will each be shown on a separate line.

The table is sorted in descending order of the total contribution to the binary size.

The columns are as follows:

- `DRAM .data & .bss & other` - .data and .bss are the same as for the totals shown above (static variables, these both reduce total available RAM at runtime but .bss doesn't contribute to the binary file size). "other" is a column for any custom section types that also contribute to RAM size (usually this value is 0).
- `IRAM` - is the same as for the totals shown above (code linked to execute from IRAM, uses space in the binary file and also reduces DRAM available as heap at runtime.
- `Flash code & rodata` - these are the same as the totals above, IROM and DROM space accessed from flash cache that contribute to the binary size.

Source File Usage Summary (idf.py size-files) For even more detail, run `idf.py size-files` to get a summary of the contribution each object file has made to the final binary size. Each object file corresponds to a single source file.

After the summary of total sizes, a table of "Per-file contributions to ELF file" is printed.

The columns are the same as shown above for `idy.py size-components`, but this time the granularity is the contribution of each individual object file to the binary size.

For example, we can see that the file `x509_crt_bundle.S.o` contributed 64212 bytes to the total firmware size, all as `.rodata` in flash. Therefore we can guess that this application is using the *ESP x509 Certificate Bundle* feature and not using this feature would save at last this many bytes from the firmware size.

Some of the object files are linked from binary libraries and therefore you won't find a corresponding source file. To locate which component a source file belongs to, it's generally possible to search in the ESP-IDF source tree or look in the *Linker Map File* for the full path.

Comparing Two Binaries If making some changes that affect binary size, it's possible to use an ESP-IDF tool to break down the exact differences in size.

This operation isn't part of `idf.py`, it's necessary to run the `idf-size.py` Python tool directly.

To do so, first locate the linker map file in the build directory. It will have the name `PROJECTNAME.map`. The `idf-size.py` tool performs its analysis based on the output of the linker map file.

To compare with another binary, you will also need its corresponding `.map` file saved from the build directory.

For example, to compare two builds: one with the default *CONFIG_COMPILER_OPTIMIZATION* setting "Debug (-Og)" configuration and one with "Optimize for size (-Os)":

```
$ $IDF_PATH/tools/idf_size.py --diff build_Og/https_request.map build_Os/https_
↪request.map
<CURRENT> MAP file: build_Os/https_request.map
<REFERENCE> MAP file: build_Og/https_request.map
Difference is counted as <CURRENT> - <REFERENCE>, i.e. a positive number means␣
↪that <CURRENT> is larger.
Total sizes of <CURRENT>:
↪<REFERENCE>     Difference
 DRAM .data size:   14516 bytes                                                ␣
↪14956           -440
 DRAM .bss  size:   15792 bytes                                                ␣
↪15808            -16
Used static DRAM:   30308 bytes ( 150428 available, 16.8% used)                ␣
↪30764           -456 (   +456 available,       +0 total)
Used static IRAM:   78498 bytes (  52574 available, 59.9% used)                ␣
↪83918          -5420 (  +5420 available,       +0 total)
      Flash code:  509183 bytes                                               ␣
↪559943         -50760
    Flash rodata:  170592 bytes                                               ␣
↪176736          -6144
Total image size:~ 772789 bytes (.bin may be padded larger)                    ␣
↪835553         -62764
```

We can see from the "Difference" column that changing this one setting caused the whole binary to be over 60 KB smaller and over 5 KB more RAM is available.

It's also possible to use the "diff" mode to output a table of component-level (static library archive) differences:

```
$IDF_PATH/tools/idf_size.py --archives --diff build_Og/https_request.map build_
↪Oshttps_request.map
```

Also at the individual source file level:

```
$IDF_PATH/tools/idf_size.py --files --diff build_Og/https_request.map build_
↪Oshttps_request.map
```

Other options (like writing the output to a file) are available, pass `--help` to see the full list.

Showing Size When Linker Fails If too much static memory is used, then the linker will fail with an error such as `DRAM segment data does not fit, region `iram0_0_seg' overflowed by 44 bytes`, or similar.

In these cases, `idf.py size` will not succeed either. However it is possible to run `idf_size.py` manually in order to view the *partial static memory usage* (the memory usage will miss the variables which could not be linked, so there still appears to be some free space.)

The map file argument is `<projectname>.map` in the build directory

```
$IDF_PATH/tools/idf_size.py build/project_name.map
```

It is also possible to view the equivalent of `size-components` or `size-files` output:

```
$IDF_PATH/tools/idf_size.py --archives build/project_name.map
$IDF_PATH/tools/idf_size.py --files build/project_name.map
```

Linker Map File *This is an advanced analysis method, but it can be very useful. Feel free to skip ahead to :ref:'reducing-overall-size' and possibly come back to this later.*

The `idf.py size` analysis tools all work by parsing the GNU binutils "linker map file", which is a summary of everything the linker did when it created ("linked") the final firmware binary file

Linker map files themselves are plain text files, so it's possible to read them and find out exactly what the linker did. However, they are also very complex and long - often 100,000 or more lines!

The map file itself is broken into parts and each part has a heading. The parts are:

- `Archive member included to satisfy reference by file (symbol).` This shows you: for each object file included in the link, what symbol (function or variable) was the linker searching for when it included that object file. If you're wondering why some object file in particular was included in the binary, this part may give a clue. This part can be used in conjunction with the `Cross Reference Table` at the end of the file. Note that not every object file shown in this list ends up included in the final binary, some end up in the `Discarded input sections` list instead.
- `Allocating common symbols` - This is a list of (some) global variables along with their sizes. Common symbols have a particular meaning in ELF binary files, but ESP-IDF doesn't make much use of them.
- `Discarded input sections` - These sections were read by the linker as part of an object file to be linked into the final binary, but then nothing else referred to them so they were discarded from the final binary. For ESP-IDF this list can be very long, as we compile each function and static variable to a unique section in order to minimize the final binary size (specifically ESP-IDF uses compiler options `-ffunction-sections -fdata-sections` and linker option `--gc-sections`). Items mentioned in this list *do not* contribute to the final binary.
- `Memory Configuration`, `Linker script and memory map` These two parts go together. Some of the output comes directly from the linker command line and the Linker Script, both provided by the 构建系统. The linker script is partially generated from the ESP-IDF project using the 链接器脚本生成机制 feature. As the output of the `Linker script and memory map` part of the map unfolds, you can see each symbol (function or static variable) linked into the final binary along with its address (as a 16 digit hex number), its length (also in hex), and the library and object file it was linked from (which can be used to determine the component and the source file).

Following all of the output sections that take up space in the final `.bin` file, the `memory map` also includes some sections in the ELF file that are only used for debugging (ELF sections `.debug_*`, etc.). These don't contribute to the final binary size. You'll notice the address of these symbols is a very low number (starting from 0x0000000000000000 and counting up).

- `Cross Reference Table`. This table shows for each symbol (function or static variable), the list of object file(s) that referred to it. If you're wondering why a particular thing is included in the binary, this will help determine what included it.

备注： Unfortunately, the `Cross Reference Table` doesn't only include symbols that made it into the final binary. It also includes symbols in discarded sections. Therefore, just because something is shown here doesn't mean that it was included in the final binary - this needs to be checked separately.

备注： Linker map files are generated by the GNU binutils linker "ld", not ESP-IDF. You can find additional information online about the linker map file format. This quick summary is written from the perspective of ESP-IDF build system in particular.

Reducing Overall Size The following configuration options will reduce the final binary size of almost any ESP-IDF project:

- Set *CONFIG_COMPILER_OPTIMIZATION* to "Optimize for size (-Os)". In some cases, "Optimize for performance (-O2)" will also reduce the binary size compared to the default. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise don't happen.
- Reduce the compiled-in log output by lowering the app *CONFIG_LOG_DEFAULT_LEVEL*. If the *CONFIG_LOG_MAXIMUM_LEVEL* is changed from the default then this setting controls the binary size instead. Reducing compiled-in logging reduces the number of strings in the binary, and also the code size of the calls to logging functions.
- Set the *CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL* to "Silent". This avoids compiling in a dedicated assertion string and source file name for each assert that may fail. It's still possible to find the failed assert in the code by looking at the memory address where the assertion failed.
- Besides the *CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL*, you can disable or silent the assertion for HAL component separately by setting *CONFIG_HAL_DEFAULT_ASSERTION_LEVEL*. It is to notice that ESP-IDF lowers HAL assertion level in bootloader to be silent even if *CONFIG_HAL_DEFAULT_ASSERTION_LEVEL* is set to full-assertion level. This is to reduce the bootloader size.
- Set *CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT*. This removes specific error messages for particular internal ESP-IDF error check macros. This may make it harder to debug some error conditions by reading the log output.
- If the binary needs to run on only certain revision(s) of ESP32-C3, increasing *CONFIG_ESP32C3_REV_MIN* to match can result in a reduced binary size. This is particularly true if setting ESP32-C3 minimum revision 3 and using Wi-Fi, as some functionality was moved to ROM code.
- Don't enable *CONFIG_COMPILER_CXX_EXCEPTIONS*, *CONFIG_COMPILER_CXX_RTTI*, or set the *CONFIG_COMPILER_STACK_CHECK_MODE* to Overall. All of these options are already disabled by default, but they have a large impact on binary size.
- Disabling *CONFIG_ESP_ERR_TO_NAME_LOOKUP* will remove the lookup table to translate user-friendly names for error values (see 错误处理) in error logs, etc. This saves some binary size, but error values will be printed as integers only.
- Setting *CONFIG_ESP_SYSTEM_PANIC* to "Silent reboot" will save a small amount of binary size, however this is *only* recommended if no one will use UART output to debug the device.
- Set *CONFIG_COMPILER_SAVE_RESTORE_LIBCALLS* to reduce binary size by replacing inlined prologues/epilogues with library calls.

备注： In addition to the many configuration items shown here, there are a number of configuration options where changing the option from the default will increase binary size. These are not noted here. Where the increase is

significant, this is usually noted in the configuration item help text.

Targeted Optimizations The following binary size optimizations apply to a particular component or a function:

Wi-Fi

- Disabling *CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE* will save some Wi-Fi binary size if WPA3 support is not needed. (Note that WPA3 is mandatory for new Wi-Fi device certifications.)
- Disabling *CONFIG_ESP_WIFI_SOFTAP_SUPPORT* will save some Wi-Fi binary size if soft-AP support is not needed.

Bluetooth NimBLE If using *NimBLE Bluetooth Host* then the following modifications can reduce binary size:

- *CONFIG_BT_NIMBLE_MAX_CONNECTIONS* to 1 if only one BLE connection is needed.
- Disable either *CONFIG_BT_NIMBLE_ROLE_CENTRAL* or *CONFIG_BT_NIMBLE_ROLE_OBSERVER* if these roles are not needed.
- Reducing *CONFIG_BT_NIMBLE_LOG_LEVEL* can reduce binary size. Note that if the overall log level has been reduced as described above in *Reducing Overall Size* then this also reduces the NimBLE log level.

lwIP IPv6

- Setting *CONFIG_LWIP_IPV6* to false will reduce the size of the lwIP TCP/IP stack, at the cost of only supporting IPv4.

> **备注：** IPv6 is required by some components such as `coap` and *ASIO port*, These components will not be available if IPV6 is disabled.

Newlib nano formatting By default, ESP-IDF uses newlib "full" formating for I/O (printf, scanf, etc.)

Enabling the config option *CONFIG_NEWLIB_NANO_FORMAT* will switch newlib to the "nano" formatting mode. This both smaller in code size and a large part of the implementation is compiled into the ESP32-C3 ROM, so it doesn't need to be included in the binary at all.

The exact difference in binary size depends on which features the firmware uses, but 25 KB ~ 50 KB is typical.

Enabling Nano formatting also reduces the stack usage of each function that calls printf() or another string formatting function, see *Reducing Stack Sizes*.

"Nano" formatting doesn't support 64-bit integers, or C99 formatting features. For a full list of restrictions, search for `--enable-newlib-nano-formatted-io` in the Newlib README file.

mbedTLS features Under *Component Config -> mbedTLS* there are multiple mbedTLS features which are enabled by default but can be disabled if not needed to save code size.

These include:

- *CONFIG_MBEDTLS_HAVE_TIME*
- *CONFIG_MBEDTLS_ECDSA_DETERMINISTIC*
- *CONFIG_MBEDTLS_SHA512_C*
- *CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS*
- *CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS*
- *CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION*
- *CONFIG_MBEDTLS_SSL_ALPN*
- *CONFIG_MBEDTLS_SSL_RENEGOTIATION*
- *CONFIG_MBEDTLS_CCM_C*

- *CONFIG_MBEDTLS_GCM_C*
- *CONFIG_MBEDTLS_ECP_C* (Alternatively: Leave this option enabled but disable some of the elliptic curves listed in the sub-menu.)
- Change *CONFIG_MBEDTLS_TLS_MODE* if both server & client functionalities are not needed
- Consider disabling some ciphersuites listed in the "TLS Key Exchange Methods" sub-menu (i.e. *CONFIG_MBEDTLS_KEY_EXCHANGE_RSA*)

The help text for each option has some more information.

重要： It is **strongly not recommended to disable all these mbedTLS options**. Only disable options where you understand the functionality and are certain that it is not needed in the application. In particular:

- Ensure that any TLS server(s) the device connects to can still be used. If the server is controlled by a third party or a cloud service, recommend ensuring that the firmware supports at least two of the supported cipher suites in case one is disabled in a future update.
- Ensure that any TLS client(s) that connect to the device can still connect with supported/recommended cipher suites. Note that future versions of client operating systems may remove support for some features, so it is recommended to enable multiple supported cipher suites or algorithms for redundancy.

If depending on third party clients or servers, always pay attention to announcements about future changes to supported TLS features. If not, the ESP32-C3 device may become inaccessible if support changes.

备注： Not every combination of mbedTLS compile-time config is tested in ESP-IDF. If you find a combination that fails to compile or function as expected, please report the details on GitHub.

VFS *Virtual filesystem* feature in ESP-IDF allows multiple filesystem drivers and file-like peripheral drivers to be accessed using standard I/O functions (`open`, `read`, `write`, etc.) and C library functions (`fopen`, `fread`, `fwrite`, etc.). When filesystem or file-like peripheral driver functionality is not used in the application this feature can be fully or partially disabled. VFS component provides the following configuration options:

- *CONFIG_VFS_SUPPORT_TERMIOS* —can be disabled if the application doesn't use `termios` family of functions. Currently, these functions are implemented only for UART VFS driver. Most applications can disable this option. Disabling this option reduces the code size by about 1.8 kB.
- *CONFIG_VFS_SUPPORT_SELECT* — can be disabled if the application doesn't use `select` function with file descriptors. Currently, only the UART and eventfd VFS drivers implement `select` support. Note that when this option is disabled, `select` can still be used for socket file descriptors. Disabling this option reduces the code size by about 2.7 kB.
- *CONFIG_VFS_SUPPORT_DIR* —can be disabled if the application doesn't use directory related functions, such as `readdir` (see the description of this option for the complete list). Applications which only open, read and write specific files and don't need to enumerate or create directories can disable this option, reducing the code size by 0.5 kB or more, depending on the filesystem drivers in use.
- *CONFIG_VFS_SUPPORT_IO* —can be disabled if the application doesn't use filesystems or file-like peripheral drivers. This disables all VFS functionality, including the three options mentioned above. When this option is disabled, *console* can't be used. Note that the application can still use standard I/O functions with socket file descriptors when this option is disabled. Compared to the default configuration, disabling this option reduces code size by about 9.4 kB.

Bootloader Size This document deals with the size of an ESP-IDF app binary only, and not the ESP-IDF 二级引导程序.

For a discussion of ESP-IDF bootloader binary size, see 引导加载程序大小.

IRAM Binary Size If the IRAM section of a binary is too large, this issue can be resolved by reducing IRAM memory usage. See *Optimizing IRAM Usage*.

Minimizing RAM Usage

In some cases, a firmware application's available RAM may run low or run out entirely. In these cases, it's necessary to tune the memory usage of the firmware application.

In general, firmware should aim to leave some "headroom" of free internal RAM in order to deal with extraordinary situations or changes in RAM usage in future updates.

Background Before optimizing ESP-IDF RAM usage, it's necessary to understand the basics of ESP32-C3 memory types, the difference between static and dynamic memory usage in C, and the way ESP-IDF uses stack and heap. This information can all be found in *Heap Memory Allocation*.

Measuring Static Memory Usage The *idf.py* tool can be used to generate reports about the static memory usage of an application. Refer to *the Binary Size chapter for more information*.

Measuring Dynamic Memory Usage ESP-IDF contains a range of heap APIs for measuring free heap at runtime. See *Heap Memory Debugging*.

备注: In embedded systems, heap fragmentation can be a significant issue alongside total RAM usage. The heap measurement APIs provide ways to measure the "largest free block". Monitoring this value along with the total number of free bytes can give a quick indication of whether heap fragmentation is becoming an issue.

Reducing Static Memory Usage

- Reducing the static memory usage of the application increases the amount of RAM available for heap at runtime, and vice versa.
- Generally speaking, minimizing static memory usage requires monitoring the .data and .bss sizes. For tools to do this, see *Measuring Static Sizes*.
- Internal ESP-IDF functions do not make heavy use of static RAM allocation in C. In many instances (including: Wi-Fi library, Bluetooth controller) "static" buffers are still allocated from heap, but the allocation is done once when the feature is initialized and will be freed if the feature is deinitialized. This is done in order to maximize the amount of free memory at different points in the application life-cycle.

To minimize static memory use:

- Declare structures, buffers, or other variables `const` whenever possible. Constant data can be stored in flash not RAM. This may require changing functions in the firmware to take `const *` arguments instead of mutable pointer arguments. These changes can also reduce the stack usage of some functions.
- If using Bluedroid, setting the option *CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY* will cause Bluedroid to allocate memory on initialization and free it on deinitialization. This doesn't necessarily reduce the peak memory usage, but changes it from static memory usage to runtime memory usage.

Reducing Stack Sizes In FreeRTOS, task stacks are usually allocated from the heap. The stack size for each task is fixed (passed as an argument to `xTaskCreate()`). Each task can use up to its allocated stack size, but using more than this will cause an otherwise valid program to crash with a stack overflow or heap corruption.

Therefore, determining the optimum sizes of each task stack can substantially reduce RAM usage.

To determine optimum task stack sizes:

- Combine tasks. The best task stack size is 0 bytes, achieved by combining a task with another existing task. Anywhere that the firmware can be structured to perform multiple functions sequentially in a single task will increase free memory. In some cases, using a "worker task" pattern where jobs are serialized into a FreeRTOS queue (or similar) and then processed by generic worker tasks may help.

- Consolidate task functions. String formatting functions (like `printf`) are particularly heavy users of stack, so any task which doesn't ever call these can usually have its stack size reduced.
- Enabling *Newlib nano formatting* will reduce the stack usage of any task that calls `printf()` or other C string formatting functions.
- Avoid allocating large variables on the stack. In C, any large struct or array allocated as an "automatic" variable (i.e. default scope of a C declaration) will use space on the stack. Minimize the sizes of these, allocate them statically and/or see if you can save memory by allocating them from the heap only when they are needed.
- Avoid deep recursive function calls. Individual recursive function calls don't always add a lot of stack usage each time they are called, but if each function includes large stack-based variables then the overhead can get quite high.
- At runtime, call the function *`uxTaskGetStackHighWaterMark()`* with the handle of any task where you think there is unused stack memory. This function returns the minimum lifetime free stack memory in bytes. The easiest time to call this is from the task itself: call `uxTaskGetStackHighWaterMark(NULL)` to get the current task's high water mark after the time that the task has achieved its peak stack usage (i.e. if there is a main loop, execute the main loop a number of times with all possible states and then call *`uxTaskGetStackHighWaterMark()`*). Often, it's possible to subtract almost the entire value returned here from the total stack size of a task, but allow some safety margin to account for unexpected small increases in stack usage at runtime.
- Call *`uxTaskGetSystemState()`* at runtime to get a summary of all tasks in the system. This includes their individual stack "high watermark" values.
- When debugger watchpoints are not being used, set the *CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK* option to trigger an immediate panic if a task writes the word at the end of its assigned stack. This is slightly more reliable than the default *CONFIG_FREERTOS_CHECK_STACKOVERFLOW* option of "Check using canary bytes", because the panic happens immediately, not on the next RTOS context switch. Neither option is perfect, it's possible in some cases for stack pointer to skip the watchpoint or canary bytes and corrupt another region of RAM, instead.

Internal Stack Sizes ESP-IDF allocates a number of internal tasks for housekeeping purposes or operating system functions. Some are created during the startup process, and some are created at runtime when particular features are initialized.

The default stack sizes for these tasks are usually set conservatively high, to allow all common usage patterns. Many of the stack sizes are configurable, and it may be possible to reduce them to match the real runtime stack usage of the task.

重要： If internal task stack sizes are set too small, ESP-IDF will crash unpredictably. Even if the root cause is task stack overflow, this is not always clear when debugging. It is recommended that internal stack sizes are only reduced carefully (if at all), with close attention to "high water mark" free space under load. If reporting an issue that occurs when internal task stack sizes have been reduced, please always include this information and the specific configuration that is being used.

- *Main task that executes app_main function* has stack size *CONFIG_ESP_MAIN_TASK_STACK_SIZE*.
- *High Resolution Timer (ESP Timer)* system task which executes callbacks has stack size *CONFIG_ESP_TIMER_TASK_STACK_SIZE*.
- FreeRTOS Timer Task to handle FreeRTOS timer callbacks has stack size *CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH*.
- *Event Handling* system task to execute callbacks for the default system event loop has stack size *CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE*.
- *lwIP* TCP/IP task has stack size *CONFIG_LWIP_TCPIP_TASK_STACK_SIZE*
- *Bluedroid Bluetooth Host* have task stack sizes *CONFIG_BT_BTC_TASK_STACK_SIZE*, *CONFIG_BT_BTU_TASK_STACK_SIZE*.
- *NimBLE Bluetooth Host* has task stack size *CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE*
- The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config `ETH_MAC_DEFAULT_CONFIG` then the task stack size is 4 KB. This setting can be changed by passing a custom *`eth_mac_config_t`* struct when initializing the Ethernet MAC.

- FreeRTOS idle task stack size is configured by *CONFIG_FREERTOS_IDLE_TASK_STACKSIZE*.
- If using the *MQTT* component, it creates a task with stack size configured by *CONFIG_MQTT_TASK_STACK_SIZE*. MQTT stack size can also be configured using `task_stack` field of `esp_mqtt_client_config_t`.
- To see how to optimize RAM usage when using `mDNS`, please check Performance Optimization.

备注： Aside from built-in system features such as esp-timer, if an ESP-IDF feature is not initialized by the firmware then no associated task is created. In those cases, the stack usage is zero and the stack size configuration for the task is not relevant.

Reducing Heap Usage For functions that assist in analyzing heap usage at runtime, see *Heap Memory Debugging*.

Normally, optimizing heap usage consists of analyzing the usage and removing calls to `malloc()` that aren't being used, reducing the corresponding sizes, or freeing previously allocated buffers earlier.

There are some ESP-IDF configuration options that can reduce heap usage at runtime:

- lwIP documentation has a section to configure *Minimum RAM usage*.
- *Wi-Fi 缓冲区使用情况* describes options to either reduce numbers of "static" buffers or reduce the maximum number of "dynamic" buffers in use, in order to minimize memory usage at possible cost of performance. Note that "static" Wi-Fi buffers are still allocated from heap when Wi-Fi is initialized and will be freed if Wi-Fi is deinitialized.
- Several Mbed TLS configuration options can be used to reduce heap memory usage. See the *Mbed TLS* docs for details.

备注： There are other configuration options that will increase heap usage at runtime if changed from the defaults. These are not listed here, but the help text for the configuration item will mention if there is some memory impact.

Optimizing IRAM Usage The available DRAM at runtime (for heap usage) is also reduced by the static IRAM usage. Therefore, one way to increase available DRAM is to reduce IRAM usage.

If the app allocates more static IRAM than is available then the app will fail to build and linker errors such as `section `.iram0.text' will not fit in region `iram0_0_seg', IRAM0 segment data does not fit` and `region `iram0_0_seg' overflowed by 84 bytes` will be seen. If this happens, it is necessary to find ways to reduce static IRAM usage in order to link the application.

To analyze the IRAM usage in the firmware binary, use *Measuring Static Sizes*. If the firmware failed to link, steps to analyze are shown at *Showing Size When Linker Fails*.

The following options will reduce IRAM usage of some ESP-IDF features:

- Enable *CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH*. Provided these functions are not (incorrectly) used from ISRs, this option is safe to enable in all configurations.
- Enable *CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS_INTO_FLASH*. Enabling this option will place snapshot-related functions, such as `vTaskGetSnapshot` or `uxTaskGetSnapshotAll`, in flash.
- Enable *CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH*. Provided these functions are not (incorrectly) used from ISRs, this option is safe to enable in all configurations.
- Enable *CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH*. This option is not safe to use if the ISR ringbuf functions are used from an IRAM interrupt context, e.g. if *CONFIG_UART_ISR_IN_IRAM* is enabled. For the IDF drivers where this is the case you will get an error at run-time when installing the driver in question.
- Disable Wi-Fi options *CONFIG_ESP32_WIFI_IRAM_OPT* and/or *CONFIG_ESP32_WIFI_RX_IRAM_OPT*. Disabling these options will free available IRAM at the cost of Wi-Fi performance.
- *CONFIG_SPI_FLASH_ROM_IMPL* enabling this option will free some IRAM but will mean that esp_flash bugfixes and new flash chip support is not available.

- Disabling *CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR* prevents posting `esp_event` events from *IRAM 安全中断处理程序* but will save some IRAM.
- Disabling *CONFIG_SPI_MASTER_ISR_IN_IRAM* prevents spi_master interrupts from being serviced while writing to flash, and may otherwise reduce spi_master performance, but will save some IRAM.
- Setting *CONFIG_HAL_DEFAULT_ASSERTION_LEVEL* to disable assertion for HAL component will save some IRAM especially for HAL code who calls *HAL_ASSERT* a lot and resides in IRAM.

Flash Suspend Feature When using ESP Flash APIs and other APIs based on the former (NVS, Partition APIs, etc.), the Cache will be disabled. During this period of time, any code executed must reside in internal RAM (see *SPI1 Flash 并发约束*). Hence, interrupt handlers that are not in internal RAM will not be executed.

To achieve this, ESP-IDF Drivers usually have the following two options: - an option to place the driver’ s internal ISR handler in internal RAM - an option to place some control functions in internal RAM.

User ISR callbacks (and involved variables) have to be in internal RAM if they are also used in interrupt contexts.

Placing additional code into IRAM will exacerbate the IRAM usage. For this reason, there is *CONFIG_SPI_FLASH_AUTO_SUSPEND*, which can alleviate the aforementioned kinds of IRAM usage. By enabling this feature, cache won’ t be disabled when ESP Flash and ESP-Flash-based APIs are used. Therefore, code and data in Flash can be executed or accessed normally, but with some minor delay. See *Flash Auto Suspend* for more details about this feature.

Regarding the flash suspend feature usage, and corresponding response time delay, please also see this example system/flash_suspend .

备注： Moving frequently-called functions from IRAM to flash may increase their execution time.

备注： Other configuration options exist that will increase IRAM usage by moving some functionality into IRAM, usually for performance, but the default option is not to do this. These are not listed here. The IRAM size impact of enabling these options is usually noted in the configuration item help text.

4.23 RF calibration

ESP32-C3 supports three RF calibration methods during RF initialization:

1. Partial calibration
2. Full calibration
3. No calibration

4.23.1 Partial calibration

During RF initialization, the partial calibration method is used by default for RF calibration. It is done based on the full calibration data which is stored in the NVS. To use this method, please go to `menuconfig` and enable *CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE*.

4.23.2 Full calibration

Full calibration is triggered in the follwing conditions:

1. NVS does not exist.
2. The NVS partition to store calibration data is erased.
3. Hardware MAC address is changed.
4. PHY library version is changed.
5. The RF calibration data loaded from the NVS partition is broken.

It takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. To switch to the full calibration method, go to `menuconfig` and disable *CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE*. If you use the default method of RF calibration, there are two ways to add the function of triggering full calibration as a last-resort remedy.

1. Erase the NVS partition if you don't mind all of the data stored in the NVS partition is erased. That is indeed the easiest way.
2. Call API `esp_phy_erase_cal_data_in_nvs()` before initializing WiFi and BT/BLE based on some conditions (e.g. an option provided in some diagnostic mode). In this case, only phy namespace of the NVS partition is erased.

4.23.3 No calibration

No calibration method is only used when the device wakes up from deep sleep.

4.23.4 PHY initialization data

The PHY initialization data is used for RF calibration. There are two ways to get the PHY initialization data.

One is the default initialization data which is located in the header file components/esp_phy/esp32c3/include/phy_init_data.h.

It is embedded into the application binary after compiling and then stored into read-only memory (DROM). To use the default initialization data, please go to `menuconfig` and disable *CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*.

Another is the initialization data which is stored in a partition. When using a custom partition table, make sure that PHY data partition is included (type: *data*, subtype: *phy*). With default partition table, this is done automatically. If initialization data is stored in a partition, it has to be flashed there, otherwise runtime error will occur. To switch to the initialization data stored in a partition, go to `menuconfig` and enable *CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*.

4.23.5 API Reference

Header File

- components/esp_phy/include/esp_phy_init.h

Functions

const *esp_phy_init_data_t* ***esp_phy_get_init_data**(void)

Get PHY init data.

If "Use a partition to store PHY init data" option is set in menuconfig, This function will load PHY init data from a partition. Otherwise, PHY init data will be compiled into the application itself, and this function will return a pointer to PHY init data located in read-only memory (DROM).

If "Use a partition to store PHY init data" option is enabled, this function may return NULL if the data loaded from flash is not valid.

备注: Call esp_phy_release_init_data to release the pointer obtained using this function after the call to esp_wifi_init.

返回 pointer to PHY init data structure

void **esp_phy_release_init_data**(const *esp_phy_init_data_t* *data)

Release PHY init data.

参数 **data** –pointer to PHY init data structure obtained from esp_phy_get_init_data function

esp_err_t **esp_phy_load_cal_data_from_nvs**(*esp_phy_calibration_data_t* *out_cal_data)

Function called by esp_phy_init to load PHY calibration data.

This is a convenience function which can be used to load PHY calibration data from NVS. Data can be stored to NVS using esp_phy_store_cal_data_to_nvs function.

If calibration data is not present in the NVS, or data is not valid (was obtained for a chip with a different MAC address, or obtained for a different version of software), this function will return an error.

If "Initialize PHY in startup code" option is set in menuconfig, this function will be used to load calibration data. To provide a different mechanism for loading calibration data, disable "Initialize PHY in startup code" option in menuconfig and call esp_phy_init function from the application. For an example usage of esp_phy_init and this function, see esp_phy_store_cal_data_to_nvs function in cpu_start.c

参数 **out_cal_data** –pointer to calibration data structure to be filled with loaded data.
返回 ESP_OK on success

esp_err_t **esp_phy_store_cal_data_to_nvs**(const *esp_phy_calibration_data_t* *cal_data)

Function called by esp_phy_init to store PHY calibration data.

This is a convenience function which can be used to store PHY calibration data to the NVS. Calibration data is returned by esp_phy_init function. Data saved using this function to the NVS can later be loaded using esp_phy_store_cal_data_to_nvs function.

If "Initialize PHY in startup code" option is set in menuconfig, this function will be used to store calibration data. To provide a different mechanism for storing calibration data, disable "Initialize PHY in startup code" option in menuconfig and call esp_phy_init function from the application.

参数 **cal_data** –pointer to calibration data which has to be saved.
返回 ESP_OK on success

esp_err_t **esp_phy_erase_cal_data_in_nvs**(void)

Erase PHY calibration data which is stored in the NVS.

This is a function which can be used to trigger full calibration as a last-resort remedy if partial calibration is used. It can be called in the application based on some conditions (e.g. an option provided in some diagnostic mode).

返回 ESP_OK on success
返回 others on fail. Please refer to NVS API return value error number.

void **esp_phy_enable**(void)

Enable PHY and RF module.

PHY and RF module should be enabled in order to use WiFi or BT. Now PHY and RF enabling job is done automatically when start WiFi or BT. Users should not call this API in their application.

void **esp_phy_disable**(void)

Disable PHY and RF module.

PHY module should be disabled in order to shutdown WiFi or BT. Now PHY and RF disabling job is done automatically when stop WiFi or BT. Users should not call this API in their application.

void **esp_phy_load_cal_and_init**(void)

Load calibration data from NVS and initialize PHY and RF module.

void **esp_phy_pd_mem_init**(void)

Initialize backup memory for Phy power up/down.

void **esp_phy_pd_mem_deinit**(void)

Deinitialize backup memory for Phy power up/down.

void **esp_phy_common_clock_enable**(void)

Enable WiFi/BT common clock.

void **esp_phy_common_clock_disable**(void)

Disable WiFi/BT common clock.

int64_t **esp_phy_rf_get_on_ts**(void)

Get the time stamp when PHY/RF was switched on.

返回 return 0 if PHY/RF is never switched on. Otherwise return time in microsecond since boot when phy/rf was last switched on

esp_err_t **esp_phy_update_country_info**(const char *country)

Update the corresponding PHY init type according to the country code of Wi-Fi.

参数 **country** –country code
返回 ESP_OK on success.
返回 esp_err_t code describing the error on fail

char ***get_phy_version_str**(void)

Get PHY lib version.

返回 PHY lib version.

Structures

struct **esp_phy_init_data_t**

Structure holding PHY init parameters.

Public Members

uint8_t **params**[128]

opaque PHY initialization parameters

struct **esp_phy_calibration_data_t**

Opaque PHY calibration data.

Public Members

uint8_t **version**[4]

PHY version

uint8_t **mac**[6]

The MAC address of the station

uint8_t **opaque**[1894]

calibration data

Enumerations

enum **esp_phy_calibration_mode_t**

PHY calibration mode.

Values:

enumerator **PHY_RF_CAL_PARTIAL**

Do part of RF calibration. This should be used after power-on reset.

enumerator **PHY_RF_CAL_NONE**

Don't do any RF calibration. This mode is only suggested to be used after deep sleep reset.

enumerator **PHY_RF_CAL_FULL**

Do full RF calibration. Produces best results, but also consumes a lot of time and current. Suggested to be used once.

4.24 Secure Boot V2

重要： This document is about Secure Boot V2, supported on the following chips: ESP32 (ECO3 onwards), ESP32-S2, ESP32-S3, ESP32-C3 (ECO3 onwards), and ESP32-C2. Except for ESP32, it is the only supported Secure Boot scheme.

Secure Boot V2 uses RSA-PSS based app and bootloader verification. This document can also be used as a reference for signing apps using the RSA-PSS scheme without signing the bootloader.

`Secure Boot V2` is available for ESP32-C3 from ECO3 onwards. To use these options in menuconfig, set *CONFIG_ESP32C3_REV_MIN* greater than or equal to *Rev 3*.

4.24.1 Background

Secure Boot protects a device from running any unauthorized (i.e., unsigned) code by checking that each piece of software that is being booted is signed. On an ESP32-C3, these pieces of software include the second stage bootloader and each application binary. Note that the first stage bootloader does not require signing as it is ROM code thus cannot be changed.

A new RSA based Secure Boot verification scheme (Secure Boot V2) has been introduced on the ESP32 (ECO3 onwards), ESP32-S2, ESP32-S3 and ESP32-C3 (ECO3 onwards).

The Secure Boot process on the ESP32-C3 involves the following steps:

1. When the first stage bootloader loads the second stage bootloader, the second stage bootloader's RSA-PSS signature is verified. If the verification is successful, the second stage bootloader is executed.
2. When the second stage bootloader loads a particular application image, the application's RSA-PSS signature is verified. If the verification is successful, the application image is executed.

4.24.2 Advantages

- The RSA-PSS public key is stored on the device. The corresponding RSA-PSS private key is kept at a secret place and is never accessed by the device.
- Up to three public keys can be generated and stored in the chip during manufacturing.
- ESP32-C3 provides the facility to permanently revoke individual public keys. This can be configured conservatively or aggressively.
- Conservatively - The old key is revoked after the bootloader and application have successfully migrated to a new key. Aggressively - The key is revoked as soon as verification with this key fails.

- Same image format and signature verification method is applied for applications and software bootloader.
- No secrets are stored on the device. Therefore, it is immune to passive side-channel attacks (timing or power analysis, etc.)

4.24.3 Secure Boot V2 Process

This is an overview of the Secure Boot V2 Process. Instructions how to enable Secure Boot are supplied in section *How To Enable Secure Boot V2*.

Secure Boot V2 verifies the bootloader image and application binary images using a dedicated *signature block*. Each image has a separately generated signature block which is appended to the end of the image.

Up to 3 signature blocks can be appended to the bootloader or application image in ESP32-C3.

Each signature block contains a signature of the preceding image as well as the corresponding RSA-3072 public key. For more details about the format, refer to *Signature Block Format*. A digest of the RSA-3072 public key is stored in the eFuse.

The application image is not only verified on every boot but also on each over the air (OTA) update. If the currently selected OTA app image cannot be verified, the bootloader will fall back and look for another correctly signed application image.

The Secure Boot V2 process follows these steps:

1. On startup, the ROM code checks the Secure Boot V2 bit in the eFuse. If Secure Boot is disabled, a normal boot will be executed. If Secure Boot is enabled, the boot will proceed according to the following steps.
2. The ROM code verifies the bootloader’ s signature block (*Verifying a Signature Block*). If this fails, the boot process will be aborted.
3. The ROM code verifies the bootloader image using the raw image data, its corresponding signature block(s), and the eFuse (*Verifying an Image*). If this fails, the boot process will be aborted.
4. The ROM code executes the bootloader.
5. The bootloader verifies the application image’ s signature block (*Verifying a Signature Block*). If this fails, the boot process will be aborted.
6. The bootloader verifies the application image using the raw image data, its corresponding signature blocks and the eFuse (*Verifying an Image*). If this fails, the boot process will be aborted. If the verification fails but another application image is found, the bootloader will then try to verify that other image using steps 5 to 7. This repeats until a valid image is found or no other images are found.
7. The bootloader executes the verified application image.

4.24.4 Signature Block Format

The bootloader and application images are padded to the next 4096 byte boundary, thus the signature has a flash sector of its own. The signature is calculated over all bytes in the image including the padding bytes.

The content of each signature block is shown in the following table:

表 27: Content of a Signature Block

Offset	Size (bytes)	Description
0	1	Magic byte
1	1	Version number byte (currently 0x02), 0x01 is for Secure Boot V1.
2	2	Padding bytes, Reserved. Should be zero.
4	32	SHA-256 hash of only the image content, not including the signature block.
36	384	RSA Public Modulus used for signature verification. (value ‘n’ in RFC8017).
420	4	RSA Public Exponent used for signature verification (value ‘e’ in RFC8017).
424	384	Pre-calculated R, derived from ‘n’.
808	4	Pre-calculated M’, derived from ‘n’
812	384	RSA-PSS Signature result (section 8.1.1 of RFC8017) of image content, computed using following PSS parameters: SHA256 hash, MFG1 function, salt length 32 bytes, default trailer field (0xBC).
1196	4	CRC32 of the preceding 1196 bytes.
1200	16	Zero padding to length 1216 bytes.

备注： R and M’ are used for hardware-assisted Montgomery Multiplication.

The remainder of the signature sector is erased flash (0xFF) which allows writing other signature blocks after previous signature block.

4.24.5 Verifying a Signature Block

A signature block is “valid” if the first byte is 0xe7 and a valid CRC32 is stored at offset 1196. Otherwise it’s invalid.

4.24.6 Verifying an Image

An image is “verified” if the public key stored in any signature block is valid for this device, and if the stored signature is valid for the image data read from flash.

1. Compare the SHA-256 hash digest of the public key embedded in the bootloader’s signature block with the digest(s) saved in the eFuses. If public key’s hash doesn’t match any of the hashes from the eFuses, the verification fails.
2. Generate the application image digest and match it with the image digest in the signature block. If the digests don’t match, the verification fails.
3. Use the public key to verify the signature of the bootloader image, using RSA-PSS (section 8.1.2 of RFC8017) with the image digest calculated in step (2) for comparison.

4.24.7 Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See 引导加载程序大小.

4.24.8 eFuse usage

- SECURE_BOOT_EN - Enables Secure Boot protection on boot.

- KEY_PURPOSE_X - Set the purpose of the key block on ESP32-C3 by programming SECURE_BOOT_DIGESTX (X = 0, 1, 2) into KEY_PURPOSE_X (X = 0, 1, 2, 3, 4, 5). Example: If KEY_PURPOSE_2 is set to SECURE_BOOT_DIGEST1, then BLOCK_KEY2 will have the Secure Boot V2 public key digest. The write-protection bit must be set (this field does not have a read-protection bit).
- BLOCK_KEYX - The block contains the data corresponding to its purpose programmed in KEY_PURPOSE_X. Stores the SHA-256 digest of the public key. SHA-256 hash of public key modulus, exponent, pre-calculated R & M' values (represented as 776 bytes –offsets 36 to 812 - as per the *Signature Block Format*) is written to an eFuse key block. The write-protection bit must be set, but the read-protection bit must not.
- KEY_REVOKEX - The revocation bits corresponding to each of the 3 key block. Ex. Setting KEY_REVOKE2 revokes the key block whose key purpose is SECURE_BOOT_DIGEST2.
- SECURE_BOOT_AGGRESSIVE_REVOKE - Enables aggressive revocation of keys. The key is revoked as soon as verification with this key fails.

To ensure no trusted keys can be added later by an attacker, each unused key digest slot should be revoked (KEY_REVOKEX). It will be checked during app startup in `esp_secure_boot_init_checks()` and fixed unless *CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS* is enabled.

The key(s) must be readable in order to give software access to it. If the key(s) is read-protected then the software reads the key(s) as all zeros and the signature verification process will fail, and the boot process will be aborted.

4.24.9 How To Enable Secure Boot V2

1. Open the *Project Configuration Menu*, in "Security features" set "Enable hardware Secure Boot in bootloader" to enable Secure Boot.
2. The "Secure Boot V2" option will be selected and the "App Signing Scheme" would be set to RSA by default.
3. Specify the path to Secure Boot signing key, relative to the project directory.
4. Select the desired UART ROM download mode in "UART ROM download mode". By default, it is set to "Permanently switch to Secure mode" which is generally recommended. For production devices, the most secure option is to set it to "Permanently disabled".
5. Set other menuconfig options (as desired). Then exit menuconfig and save your configuration.
6. The first time you run `idf.py build`, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

重要: A signing key generated this way will use the best random number source available to the OS and its Python installation (*/dev/urandom* on OSX/Linux and *CryptGenRandom()* on Windows). If this random number source is weak, then the private key will be weak.

重要: For production environments, we recommend generating the key pair using openssl or another industry standard encryption program. See *Generating Secure Boot Signing Key* for more details.

---

7. Run `idf.py bootloader` to build a Secure Boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.
8. When you're ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by the build system) and then wait for flashing to complete.
9. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 6.

备注: `idf.py flash` doesn't flash the bootloader if Secure Boot is enabled.

---

10. Reset the ESP32-C3 and it will boot the software bootloader you flashed. The software bootloader will enable Secure Boot on the chip, and then it verifies the app image signature and boots the app. You should watch the

serial console output from the ESP32-C3 to verify that Secure Boot is enabled and no errors have occurred due to the build configuration.

备注： Secure boot won’t be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

备注： If the ESP32-C3 is reset or powered down during the first boot, it will start the process again on the next boot.

---

11. On subsequent boots, the Secure Boot hardware will verify the software bootloader has not changed and the software bootloader will verify the signed app image (using the validated public key portion of its appended signature block).

4.24.10 Restrictions after Secure Boot is enabled

- Any updated bootloader or app will need to be signed with a key matching the digest already stored in eFuse.
- After Secure Boot is enabled, no further eFuses can be read protected. (If *Flash 加密* is enabled then the bootloader will ensure that any flash encryption key generated on first boot will already be read protected.) If *CONFIG_SECURE_BOOT_INSECURE* is enabled then this behavior can be disabled, but this is not recommended.

4.24.11 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via `espsecure.py generate_signing_key`.

The `--version 2` parameter will generate the RSA 3072 private key for Secure Boot V2.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available RSA-PSS key generation utilities.

For example, to generate a signing key using the openssl command line:

```
` openssl genrsa -out my_secure_boot_signing_key.pem 3072 `
```

Remember that the strength of the Secure Boot system depends on keeping the signing key private.

4.24.12 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default esp-idf Secure Boot configuration). The espsecure.py command line program can be used to sign app images & partition table data for Secure Boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system.

After the app image and partition table are built, the build system will print signing steps using espsecure.py:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY BINARY_FILE
```

The above command appends the image signature to the existing binary. You can use the *–output* argument to write the signed binary to a separate file:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY --output SIGNED_
↪BINARY_FILE BINARY_FILE
```

4.24.13 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the Secure Boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using espsecure.py. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all Secure Boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use Secure Boot in combination with *flash encryption* to prevent local readout of the flash contents.

4.24.14 Key Management

- Between 1 and 3 RSA-3072 public key pairs (Keys #0, #1, #2) should be computed independently and stored separately.
- The KEY_DIGEST eFuses should be write protected after being programmed.
- The unused KEY_DIGEST slots must have their corresponding KEY_REVOKE eFuse burned to permanently disable them. This must happen before the device leaves the factory.
- The eFuses can either be written by the software bootloader during during first boot after enabling "Secure Boot V2" from menuconfig or can be done using *espefuse.py* which communicates with the serial bootloader program in ROM.
- The KEY_DIGESTs should be numbered sequentially beginning at key digest #0. (i.e., if key digest #1 is used, key digest #0 should be used. If key digest #2 is used, key digest #0 & #1 must be used.)
- The software bootloader (non OTA upgradeable) is signed using at least one, possibly all three, private keys and flashed in the factory.
- Apps should only be signed with a single private key (the others being stored securely elsewhere), however they may be signed with multiple private keys if some are being revoked (see Key Revocation, below).

4.24.15 Multiple Keys

- The bootloader should be signed with all the private key(s) that are needed for the life of the device, before it is flashed.
- The build system can sign with at most one private key, user has to run manual commands to append more signatures if necessary.
- **You can use the append functionality of `espsecure.py`, this command would also printed at the end of the Secure B**
  espsecure.py sign_data -k secure_boot_signing_key2.pem -v 2 –append_signatures -o signed_bootloader.bin build/bootloader/bootloader.bin
- While signing with multiple private keys, it is recommended that the private keys be signed independently, if possible on different servers and stored separately.
- **You can check the signatures attached to a binary using -** espsecure.py signature_info_v2 datafile.bin

4.24.16 Key Revocation

- Keys are processed in a linear order. (key #0, key #1, key #2).
- Applications should be signed with only one key at a time, to minimize the exposure of unused private keys.
- The bootloader can be signed with multiple keys from the factory.

Conservative approach:

Assuming a trusted private key (N-1) has been compromised, to update to new key pair (N).

1. Server sends an OTA update with an application signed with the new private key (#N).
2. The new OTA update is written to an unused OTA app partition.
3. The new application's signature block is validated. The public keys are checked against the digests programmed in the eFuse & the application is verified using the verified public key.
4. The active partition is set to the new OTA application's partition.

5. Device resets, loads the bootloader (verified with key #N-1) which then boots new app (verified with key #N).
6. The new app verifies bootloader with key #N (as a final check) and then runs code to revoke key #N-1 (sets KEY_REVOKE eFuse bit).
7. The API *esp_ota_revoke_secure_boot_public_key()* can be used to revoke the key #N-1.

- A similar approach can also be used to physically re-flash with a new key. For physical re-flashing, the bootloader content can also be changed at the same time.

Aggressive approach:

ROM code has an additional feature of revoking a public key digest if the signature verification fails.

To enable this feature, you need to burn SECURE_BOOT_AGGRESSIVE_REVOKE efuse or enable *CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE*

Key revocation is not applicable unless secure boot is successfully enabled. Also, a key is not revoked in case of invalid signature block or invalid image digest, it is only revoked in case the signature verification fails, i.e. revoke key only if failure in step 3 of *Verifying an Image*

Once a key is revoked, it can never be used for verfying a signature of an image. This feature provides strong resistance against physical attacks on the device. However, this could also brick the device permanently if all the keys are revoked because of signature verification failure.

4.24.17 Technical Details

The following sections contain low-level reference descriptions of various Secure Boot elements:

Manual Commands

Secure boot is integrated into the esp-idf build system, so `idf.py build` will sign an app image and `idf.py bootloader` will produce a signed bootloader if secure signed binaries on build is enabled.

However, it is possible to use the `espsecure.py` tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --version 2 --keyfile ./my_signing_key.pem --output ./image_
↪signed.bin image-unsigned.bin
```

Keyfile is the PEM file containing an RSA-3072 private signing key.

4.24.18 Secure Boot & Flash Encryption

If Secure Boot is used without *Flash Encryption*, it is possible to launch "time-of-check to time-of-use" attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

4.24.19 Signed App Verification Without Hardware Secure Boot

The Secure Boot V2 signature of apps can be checked on OTA update, without enabling the hardware Secure Boot option. This option uses the same app signature scheme as Secure Boot V2, but unlike hardware Secure Boot it does not prevent an attacker who can write to flash from bypassing the signature protection.

This may be desirable in cases where the delay of Secure Boot verification on startup is unacceptable, and/or where the threat model does not include physical access or attackers writing to bootloader or app partitions in flash.

In this mode, the public key which is present in the signature block of the currently running app will be used to verify the signature of a newly updated app. (The signature on the running app isn't verified during the update process, it's assumed to be valid.) In this way the system creates a chain of trust from the running app to the newly updated app.

For this reason, it's essential that the initial app flashed to the device is also signed. A check is run on app startup and the app will abort if no signatures are found. This is to try and prevent a situation where no update is possible. The app should have only one valid signature block in the first position. Note again that, unlike hardware Secure Boot V2, the signature of the running app isn't verified on boot. The system only verifies a signature block in the first position and ignores any other appended signatures.

Although multiple trusted keys are supported when using hardware Secure Boot, only the first public key in the signature block is used to verify updates if signature checking without Secure Boot is configured. If multiple trusted public keys are required, it's necessary to enable the full Secure Boot feature instead.

备注： In general, it's recommended to use full hardware Secure Boot unless certain that this option is sufficient for application security needs.

How To Enable Signed App Verification

1. Open *Project Configuration Menu* -> Security features
2. Ensure *App Signing Scheme* is *RSA*
3. Enable *CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT*
4. By default, "Sign binaries during build" will be enabled on selecting "Require signed app images" option, which will sign binary files as a part of build process. The file named in "Secure boot private signing key" will be used to sign the image.
5. If you disable "Sign binaries during build" option then all app binaries must be manually signed by following instructions in *Remote Signing of Images*.

警告： It is very important that all apps flashed have been signed, either during the build or after the build.

4.24.20 Advanced Features

JTAG Debugging

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See *JTAG 与闪存加密和安全引导* for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

4.25 Thread Local Storage

4.25.1 Overview

Thread-local storage (TLS) is a mechanism by which variables are allocated such that there is one instance of the variable per extant thread. ESP-IDF provides three ways to make use of such variables:

- *FreeRTOS Native API*: ESP-IDF FreeRTOS native API.
- *Pthread API*: ESP-IDF's pthread API.
- *C11 Standard*: C11 standard introduces special keyword to declare variables as thread local.

4.25.2 FreeRTOS Native API

The ESP-IDF FreeRTOS provides the following API to manage thread local variables:

- *vTaskSetThreadLocalStoragePointer()*
- *pvTaskGetThreadLocalStoragePointer()*
- *vTaskSetThreadLocalStoragePointerAndDelCallback()*

In this case maximum number of variables that can be allocated is limited by *CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS* configuration value. Variables are kept in the task control block (TCB) and accessed by their index. Note that index 0 is reserved for ESP-IDF internal uses.

Using that API user can allocate thread local variables of an arbitrary size and assign them to any number of tasks. Different tasks can have different sets of TLS variables.

If size of the variable is more then 4 bytes then user is responsible for allocating/deallocating memory for it. Variable's deallocation is initiated by FreeRTOS when task is deleted, but user must provide function (callback) to do proper cleanup.

4.25.3 Pthread API

The ESP-IDF provides the following *pthread API* to manage thread local variables:

- `pthread_key_create()`
- `pthread_key_delete()`
- `pthread_getspecific()`
- `pthread_setspecific()`

This API has all benefits of the one above, but eliminates some its limits. The number of variables is limited only by size of available memory on the heap. Due to the dynamic nature this API introduces additional performance overhead compared to the native one.

4.25.4 C11 Standard

The ESP-IDF FreeRTOS supports thread local variables according to C11 standard (ones specified with `__thread` keyword). For details on this GCC feature please see https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local. Storage for that kind of variables is allocated on the task's stack. Note that area for all such variables in the program will be allocated on the stack of every task in the system even if that task does not use such variables at all. For example ESP-IDF system tasks (like `ipc`, `timer` tasks etc.) will also have that extra stack space allocated. So this feature should be used with care. There is a tradeoff: C11 thread local variables are quite handy to use in programming and can be accessed using minimal CPU instructions, but this benefit goes with the cost of additional stack usage for all tasks in the system. Due to static nature of variables allocation all tasks in the system have the same sets of C11 thread local variables.

4.26 工具

4.26.1 IDF Frontend - idf.py

The `idf.py` command-line tool provides a front-end for easily managing your project builds, deployment and debugging, and more. It manages several tools, for example:

- CMake, which configures the project to be built
- Ninja which builds the project
- esptool.py for flashing the target.

The *getting started guide* contains a brief introduction to how to set up `idf.py` to configure, build, and flash projects.

重要： `idf.py` should be run in an ESP-IDF "project" directory, i.e. one containing a `CMakeLists.txt` file. Older style projects with a `Makefile` will not work with `idf.py`.

Commands

Start a new project: create-project

```
idf.py create-project <project name>
```

This will create a new ESP-IDF project, additionally folder where the project will be created can be specified by the `--path` option.

Create a new component: create-component This command creates a new component, which will have a minimum set of files necessary for building.

```
idf.py create-component <component name>
```

The `-C` option can be used to specify the directory the component will be created in. For more information about components see the *build system page*.

Select the Target Chip: set-target ESP-IDF supports multiple targets (chips). A full list of supported targets in your version of ESP-IDF can be seen by running `idf.py --list-targets`.

This sets the current project target:

```
idf.py set-target <target>
```

重要： `idf.py set-target` will clear the build directory and re-generate the `sdkconfig` file from scratch. The old `sdkconfig` file will be saved as `sdkconfig.old`.

备注： The behavior of `idf.py set-target` command is equivalent to:

1. clearing the build directory (`idf.py fullclean`)
2. removing the sdkconfig file (`mv sdkconfig sdkconfig.old`)
3. configuring the project with the new target (`idf.py -DIDF_TARGET=esp32 reconfigure`)

It is also possible to pass the desired `IDF_TARGET` as an environment variable (e.g. `export IDF_TARGET=esp32s2`) or as a CMake variable (e.g. `-DIDF_TARGET=esp32s2` argument to CMake or idf.py). Setting the environment variable is a convenient method if you mostly work with one type of the chip.

To specify the _default_ value of `IDF_TARGET` for a given project, add `CONFIG_IDF_TARGET` value to `sdkconfig.defaults`. For example, `CONFIG_IDF_TARGET="esp32s2"`. This value will be used if `IDF_TARGET` is not specified by other method: using an environment variable, CMake variable, or `idf.py set-target` command.

If the target has not been set by any of these methods, the build system will default to `esp32` target.

Start the graphical configuration tool: menuconfig

```
idf.py menuconfig
```

Build the project: build

```
idf.py build
```

Running this command will build the project found in the current directory. This can involve multiple steps:

- Create the build directory if needed. The sub-directory `build` is used to hold build output, although this can be changed with the `-B` option.
- Run CMake as necessary to configure the project and generate build files for the main build tool.
- Run the main build tool (Ninja or *GNU Make*). By default, the build tool is automatically detected but it can be explicitly set by passing the `-G` option to `idf.py`.

Building is incremental so if no source files or configuration has changed since the last build, nothing will be done.

Additionally, the command can be run with `app`, `bootloader` and `partition-table` arguments to build only the app, bootloader or partition table as applicable.

Remove the build output: clean It is possible to remove the project build output files from the build directory by using:

```
idf.py clean
```

The project will be fully rebuilt on next build. Using this does not remove the CMake configuration output inside the build folder.

Delete the entire build contents: fullclean

```
idf.py fullclean
```

Running this command will delete the entire "build" directory contents. This includes all CMake configuration output. The next time the project is built, CMake will configure it from scratch. Note that this option recursively deletes *all* files in the build directory, so use with care. Project configuration is not deleted.

Flash the project: flash Running the following command:

```
idf.py flash
```

will automatically build the project if necessary, and then flash it to the target. You can use `-p` and `-b` options to set serial port name and flasher baud rate, respectively.

备注: The environment variables `ESPPORT` and `ESPBAUD` can be used to set default values for the `-p` and `-b` options, respectively. Providing these options on the command line overrides the default.

Similarly to the `build` command, the command can be run with `app`, `bootloader` and `partition-table` arguments to flash only the app, bootloader or partition table as applicable.

Hints on how to resolve errors

`idf.py` will try to suggest hints on how to resolve errors. It works with a database of hints stored in tools/idf_py_actions/hints.yml and the hints will be printed if a match is found for the given error. `idf.py menuconfig` is not supported by automatic hints on resolving errors.

The `--no-hints` argument of `idf.py` can be used to turn the hints off in case they are not desired.

Important notes

Multiple `idf.py` commands can be combined into one. For example, `idf.py -p COM4 clean flash monitor` will clean the source tree, then build the project and flash it to the target before running the serial monitor.

The order of multiple `idf.py` commands on the same invocation is not important, they will automatically be executed in the correct order for everything to take effect (i.e. building before flashing, erasing before flashing, etc.).

For commands that are not known to `idf.py` an attempt to execute them as a build system target will be made.

The command `idf.py` supports shell autocompletion for bash, zsh and fish shells.

In order to make shell autocompletion supported, please make sure you have at least Python 3.5 and click 7.1 or newer (*see also*).

To enable autocompletion for `idf.py` use the `export` command (*see this*). Autocompletion is initiated by pressing the TAB key. Type `idf.py -` and press the TAB key to autocomplete options.

The autocomplete support for PowerShell is planned in the future.

Advanced Commands

Open the documentation: docs Using the following command the documentation for the projects target and version will be opened in the browser:

```
idf.py docs
```

Show size: size

```
idf.py size
```

Will print app size information including occupied RAM and FLASH and section sizes.

```
idf.py size
```

Similarly, this will print the same information for each component used in the project.

```
idf.py size-files
```

Will print size information per source file in the project.

If you define variable `-DOUTPUT_JSON=1` when running CMake (or `idf.py`), the output will be formatted as JSON not as human readable text. See `idf.py-size` for more information.

Reconfigure the project: reconfigure

```
idf.py reconfigure
```

This command re-runs CMake even if it doesn't seem to need re-running. This isn't necessary during normal usage, but can be useful after adding/removing files from the source tree, or when modifying CMake cache variables. For example, `idf.py -DNAME='VALUE' reconfigure` can be used to set variable `NAME` in CMake cache to value `VALUE`.

Clean the python byte code: python-clean Generated python byte code can be deleted from the IDF directory using:

```
idf.py python-clean
```

The byte code may cause issues when switching between IDF and Python versions. It is advised to run this target after switching versions of Python.

Global Options

To list all available root level options, run `idf.py --help`. To list options that are specific for a subcommand, run `idf.py <command> --help`, for example `idf.py monitor --help`. Here is a list of some useful options:

- `-C <dir>` allows overriding the project directory from the default current working directory.
- `-B <dir>` allows overriding the build directory from the default `build` subdirectory of the project directory.
- `--ccache` flag can be used to enable CCache when compiling source files, if the CCache tool is installed. This can dramatically reduce some build times.

Note that some older versions of CCache may exhibit bugs on some platforms, so if files are not rebuilt as expected then try disabling CCache and build again. CCache can be enabled by default by setting the `IDF_CCACHE_ENABLE` environment variable to a non-zero value.

- `-v` flag causes both `idf.py` and the build system to produce verbose build output. This can be useful for debugging build problems.
- `--cmake-warn-uninitialized` (or `-w`) will cause CMake to print uninitialized variable warnings found in the project directory only. This only controls CMake variable warnings inside CMake itself, not other types of build warnings. This option can also be set permanently by setting the `IDF_CMAKE_WARN_UNINITIALIZED` environment variable to a non-zero value.
- `--no-hints` flag to disable hints on resolving errors and disable capturing output.

4.26.2 IDF Docker Image

IDF Docker image (`espressif/idf`) is intended for building applications and libraries with specific versions of ESP-IDF, when doing automated builds.

The image contains:

- Common utilities such as git, wget, curl, zip.
- Python 3.7 or newer.
- A copy of a specific version of ESP-IDF (see below for information about versions). `IDF_PATH` environment variable is set, and points to ESP-IDF location in the container.
- All the build tools required for the specific version of ESP-IDF: CMake, ninja, cross-compiler toolchains, etc.
- All Python packages required by ESP-IDF are installed in a virtual environment.

The image entrypoint sets up `PATH` environment variable to point to the correct version of tools, and activates the Python virtual environment. As a result, the environment is ready to use the ESP-IDF build system.

The image can also be used as a base for custom images, if additional utilities are required.

Tags

Multiple tags of this image are maintained:

- `latest`: tracks `master` branch of ESP-IDF
- `vX.Y`: corresponds to ESP-IDF release `vX.Y`
- `release-vX.Y`: tracks `release/vX.Y` branch of ESP-IDF

备注: Versions of ESP-IDF released before this feature was introduced do not have corresponding Docker image versions. You can check the up-to-date list of available tags at https://hub.docker.com/r/espressif/idf/tags.

Usage

Setting up Docker Before using the `espressif/idf` Docker image locally, make sure you have Docker installed. Follow the instructions at https://docs.docker.com/install/, if it is not installed yet.

If using the image in CI environment, consult the documentation of your CI service on how to specify the image used for the build process.

Building a project with CMake In the project directory, run:

```
docker run --rm -v $PWD:/project -w /project espressif/idf idf.py build
```

The above command explained:

- `docker run`: runs a Docker image. It is a shorter form of the command `docker container run`.
- `--rm`: removes the container when the build is finished
- `-v $PWD:/project`: mounts the current directory on the host (`$PWD`) as `/project` directory in the container
- `espressif/idf`: uses Docker image `espressif/idf` with tag `latest` (implicitly added by Docker when no tag is specified)
- `idf.py build`: runs this command inside the container

To build with a specific docker image tag, specify it as `espressif/idf:TAG`, for example:

```
docker run --rm -v $PWD:/project -w /project espressif/idf:release-v4.4 idf.py␣
↪build
```

You can check the up-to-date list of available tags at https://hub.docker.com/r/espressif/idf/tags.

Using the image interactively It is also possible to do builds interactively, to debug build issues or test the automated build scripts. Start the container with *-i -t* flags:

```
docker run --rm -v $PWD:/project -w /project -it espressif/idf
```

Then inside the container, use `idf.py` as usual:

```
idf.py menuconfig
idf.py build
```

备注: Commands which communicate with the development board, such as `idf.py flash` and `idf.py monitor` will not work in the container unless the serial port is passed through into the container. However currently this is not possible with Docker for Windows (https://github.com/docker/for-win/issues/1018) and Docker for Mac (https://github.com/docker/for-mac/issues/900).

Building custom images

The Dockerfile in ESP-IDF repository provides several build arguments which can be used to customize the Docker image:

- `IDF_CLONE_URL`: URL of the repository to clone ESP-IDF from. Can be set to a custom URL when working with a fork of ESP-IDF. Default is `https://github.com/espressif/esp-idf.git`.
- `IDF_CLONE_BRANCH_OR_TAG`: Name of a git branch or tag use when cloning ESP-IDF. This value is passed to `git clone` command using the `--branch` argument. Default is `master`.
- `IDF_CHECKOUT_REF`: If this argument is set to a non-empty value, `git checkout $IDF_CHECKOUT_REF` command will be performed after cloning. This argument can be set to the SHA of the specific commit to check out, for example if some specific commit on a release branch is desired.
- `IDF_CLONE_SHALLOW`: If this argument is set to a non-empty value, `--depth=1 --shallow-submodules` arguments will be used when performing `git clone`. This significantly reduces the amount of data downloaded and the size of the resulting Docker image. However, if switching to a different branch in such a "shallow" repository is necessary, an additional `git fetch origin <branch>` command must be executed first.

- `IDF_INSTALL_TARGETS`: Comma-separated list of IDF targets to install toolchains for, or `all` to install toolchains for all targets. Selecting specific targets reduces the amount of data downloaded and the size of the resulting Docker image. Default is `all`.

To use these arguments, pass them via the `--build-arg` command line option. For example, the following command will build a Docker image with a shallow clone of ESP-IDF v4.4.1 and tools for ESP32-C3, only:

```
docker build -t idf-custom:v4.4.1-esp32c3 \
    --build-arg IDF_CLONE_BRANCH_OR_TAG=v4.4.1 \
    --build-arg IDF_CLONE_SHALLOW=1 \
    --build-arg IDF_INSTALL_TARGETS=esp32c3 \
    tools/docker
```

4.26.3 IDF Windows Installer

Command-line parameters

Windows Installer *esp-idf-tools-setup* provides the following command-line parameters:

- `/CONFIG=[PATH]` - Path to `ini` configuration file to override default configuration of the installer. Default: `config.ini`.
- `/GITCLEAN=[yes|no]` - Perform git clean and remove untracked directories in Offline mode installation. Default: yes.
- `/GITRECURSIVE=[yes|no]` - Clone recursively all git repository submodules. Default: yes
- `/GITREPO=[URL|PATH]` - URL of repository to clone ESP-IDF. Default: https://github.com/espressif/esp-idf.git
- `/GITRESET=[yes|no]` - Enable/Disable git reset of repository during installation. Default: yes.
- `/HELP` - Display command line options provided by Inno Setup installer.
- `/IDFDIR=[PATH]` - Path to directory where it will be installed. Default: `{userdesktop}\esp-idf}`
- `/IDFVERSION=[v4.3|v4.1|master]` - Use specific IDF version. E.g. v4.1, v4.2, master. Default: empty, pick the first version in the list.
- `/IDFVERSIONSURL=[URL]` - Use URL to download list of IDF versions. Default: https://dl.espressif.com/dl/esp-idf/idf_versions.txt
- `/LOG=[PATH]` - Store installation log file in specific directory. Default: empty.
- `/OFFLINE=[yes|no]` - Execute installation of Python packages by PIP in offline mode. The same result can be achieved by setting the environment variable PIP_NO_INDEX. Default: no.
- `/USEEMBEDDEDPYTHON=[yes|no]` - Use Embedded Python version for the installation. Set to `no` to allow Python selection screen in the installer. Default: yes.
- `/PYTHONNOUSERSITE=[yes|no]` - Set PYTHONNOUSERSITE variable before launching any Python command to avoid loading Python packages from AppDataRoaming. Default: yes.
- `/PYTHONWHEELSURL=[URL]` - Specify URLs to PyPi repositories for resolving binary Python Wheel dependencies. The same result can be achieved by setting the environment variable PIP_EXTRA_INDEX_URL. Default: https://dl.espressif.com/pypi
- `/SKIPSYSTEMCHECK=[yes|no]` - Skip System Check page. Default: no.
- `/VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL` - Perform silent installation.

Unattended installation

The unattended installation of IDF can be achieved by following command-line parameters:

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
```

The installer detaches its process from the command-line. Waiting for installation to finish could be achieved by following PowerShell script:

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
$InstallerProcess = Get-Process esp-idf-tools-setup
Wait-Process -Id $InstallerProcess.id
```

Custom Python and custom location of Python wheels

The IDF installer is using by default embedded Python with reference to Python Wheel mirror.

Following parameters allows to select custom Python and custom location of Python wheels:

```
esp-idf-tools-setup-x.x.exe /USEEMBEDDEDPYTHON=no /PYTHONWHEELSURL=https://pypi.
↪org/simple/
```

4.26.4 IDF Component Manager

The IDF Component manager is a tool that downloads dependencies for any ESP-IDF CMake project. The download happens automatically during a run of CMake. It can source components either from the component registry or from a git repository.

A list of components can be found on https://components.espressif.com/

Using with a project

Dependencies for each component in the project are defined in a separate manifest file named `idf_component.yml` placed in the root of the component. The manifest file template can be created for a component by running `idf.py create-manifest --component=my_component`. When a new manifest is added to one of the components in the project it's necessary to reconfigure it manually by running `idf.py reconfigure`. Then build will track changes in `idf_component.yml` manifests and automatically triggers CMake when necessary.

There is an example application: example:*build_system/cmake/component_manager* that uses components installed by the component manager.

It's not necessary to have a manifest for components that don't need any managed dependencies.

When CMake configures the project (e.g. `idf.py reconfigure`) component manager does a few things:

- Processes `idf_component.yml` manifests for every component in the project and recursively solves dependencies
- Creates a `dependencies.lock` file in the root of the project with a full list of dependencies
- Downloads all dependencies to the `managed_components` directory

The lock-file `dependencies.lock` and content of `managed_components` directory is not supposed to be modified by a user. When the component manager runs it always make sure they are up to date. If these files were accidentally modified it's possible to re-run the component manager by triggering CMake with `idf.py reconfigure`

Defining dependencies in the manifest

```
dependencies:
  # Required IDF version
  idf: ">=4.1"
  # Defining a dependency from the registry:
  # https://components.espressif.com/component/example/cmp
  example/cmp: ">=1.0.0"

  # # Other ways to define dependencies
  #
  # # For components maintained by Espressif only name can be used.
  # # Same as `espressif/cmp`
  # component: "~1.0.0"
  #
  # # Or in a longer form with extra parameters
  # component2:
```

(下页继续)

(续上页)

```
#   version: ">=2.0.0"
#
#   # For transient dependencies `public` flag can be set.
#   # `public` flag doesn't affect the `main` component.
#   # All dependencies of `main` are public by default.
#   public: true
#
#   # For components hosted on non-default registry:
#   service_url: "https://componentregistry.company.com"
#
# # For components in git repository:
# test_component:
#   path: test_component
#   git: ssh://git@gitlab.com/user/components.git
#
# # For test projects during component development
# # components can be used from a local directory
# # with relative or absolute path
# some_local_component:
#   path: ../../projects/component
```

Disabling the Component Manager

The component manager can be explicitly disabled by setting `IDF_COMPONENT_MANAGER` environment variable to `0`.

4.26.5 IDF Clang Tidy

The IDF Clang Tidy is a tool that uses clang-tidy to run static analysis on your current app.

警告： This functionality and the toolchain it relies on are still under development. There may be breaking changes before a final release.

警告： This tool does not support RISC-V based chips yet. For now, we don't provide clang based toolchain for RISC-V.

Prerequisites

If you have never run this tool before, take the following steps to get this tool prepared.

1. Run the export scripts (`export.sh` / `export.bat` / ···) to set up the environment variables.
2. Run `pip install --upgrade pyclang` to install this plugin. The extra commands would be activated in `idf.py` automatically.
3. Run `idf_tools.py install xtensa-clang` to install the clang-tidy required binaries

   备注： This toolchain is still under development. After the final release, you don't have to install them manually.

4. Get file from the llvm repository and add the folder of this script to the `$PATH`. Or you could pass an optional argument `--run-clang-tidy-py` later when you call `idf.py clang-check`. Please don't forget to make the script executable.

> **备注：** This file would be bundled in future toolchain releases. This is a temporary workaround.

5. Run the export scripts (`export.sh` / `export.bat` / ···) again to refresh the environment variables.

Extra Commands

`clang-check` Run `idf.py clang-check` to re-generate the compilation database and run `clang-tidy` under your current project folder. The output would be written to `<project_dir>/warnings.txt`.

Run `idf.py clang-check --help` to see the full documentation.

`clang-html-report`

1. Run `pip install codereport` to install the additional dependency.
2. Run `idf.py clang-html-report` to generate an HTML report in folder `<project_dir>/html_report` according to the `warnings.txt`. Please open the `<project_dir>/html_report/index.html` in your browser to check the report.

Bug Report

This tool is hosted in espressif/clang-tidy-runner. If you faced any bugs or have any feature request, please report them via github issues.

4.26.6 Downloadable Tools

ESP-IDF build process relies on a number of tools: cross-compiler toolchains, CMake build system, and others.

Installing the tools using an OS-specific package manager (like apt, yum, brew, etc.) is the preferred method when the required version of the tool is available. This recommendation is reflected in the Getting Started guide. For example, on Linux and macOS it is recommended to install CMake using an OS package manager.

However, some of the tools are IDF-specific and are not available in OS package repositories. Furthermore, different versions of ESP-IDF require different versions of the tools to operate correctly. To solve these two problems, ESP-IDF provides a set of scripts for downloading and installing the correct versions of tools, and exposing them in the environment.

The rest of the document refers to these downloadable tools simply as "tools". Other kinds of tools used in ESP-IDF are:

- Python scripts bundled with ESP-IDF (such as `idf.py`)
- Python packages installed from PyPI.

The following sections explain the installation method, and provide the list of tools installed on each platform.

> **备注：** This document is provided for advanced users who need to customize their installation, users who wish to understand the installation process, and ESP-IDF developers.
>
> If you are looking for instructions on how to install the tools, see the *Getting Started Guide*.

Tools metadata file

The list of tools and tool versions required for each platform is located in tools/tools.json. The schema of this file is defined by tools/tools_schema.json.

This file is used by tools/idf_tools.py script when installing the tools or setting up the environment variables.

Tools installation directory

IDF_TOOLS_PATH environment variable specifies the location where the tools are to be downloaded and installed. If not set, IDF_TOOLS_PATH defaults to HOME/.espressif on Linux and macOS, and %USER_PROFILE%\.espressif on Windows.

Inside IDF_TOOLS_PATH, the scripts performing tools installation create the following directories and files:

- dist —where the archives of the tools are downloaded.
- tools —where the tools are extracted. The tools are extracted into subdirectories: tools/TOOL_NAME/VERSION/. This arrangement allows different versions of tools to be installed side by side.
- idf-env.json —user install options (targets, features) are stored in this file. Targets are selected chip targets for which tools are installed and kept up-to-date. Features determine the Python package set which should be installed. These options will be discussed later.
- python_env —not tools related; virtual Python environments are installed in the sub-directories.
- espidf.constraints.*.txt —one constraint file for each ESP-IDF release containing Python package version requirements.

GitHub Assets Mirror

Most of the tools downloaded by the tools installer are GitHub Release Assets, which are files attached to a software release on GitHub.

If GitHub downloads are inaccessible or slow to access, it's possible to configure a GitHub assets mirror.

To use Espressif's download server, set the environment variable IDF_GITHUB_ASSETS to dl.espressif.com/github_assets. When the install process is downloading a tool from github.com, the URL will be rewritten to use this server instead.

Any mirror server can be used provided the URL matches the github.com download URL format: the install process will replace https://github.com with https://${IDF_GITHUB_ASSETS} for any GitHub asset URL that it downloads.

备注： The Espressif download server doesn't currently mirror everything from GitHub, it only mirrors files attached as Assets to some releases as well as source archives for some releases.

---

idf_tools.py script

tools/idf_tools.py script bundled with ESP-IDF performs several functions:

- install: Download the tool into ${IDF_TOOLS_PATH}/dist directory, extract it into ${IDF_TOOLS_PATH}/tools/TOOL_NAME/VERSION.
  install command accepts the list of tools to install, in TOOL_NAME or TOOL_NAME@VERSION format. If all is given, all the tools (required and optional ones) are installed. If no argument or required is given, only the required tools are installed.
- download: Similar to install but doesn't extract the tools. An optional --platform argument may be used to download the tools for the specific platform.
- export: Lists the environment variables which need to be set to use the installed tools. For most of the tools, setting PATH environment variable is sufficient, but some tools require extra environment variables.
  The environment variables can be listed in either of shell or key-value formats, set by --format parameter:
  - export optional parameters:
    * --unset Creates statement that unset some global variables, so the environment gets to the state it was before calling export.{sh/fish}.
    * --add_paths_extras Adds extra ESP-IDF-related paths of $PATH to ${IDF_TOOLS_PATH}/esp-idf.json, which is used to remove global variables when

the active ESP-IDF environment is deactivated. Example: While processing `export.{sh/fish}` script, new paths are added to global variable `$PATH`. This option is used to save these new paths to the `${IDF_TOOLS_PATH}/esp-idf.json`.

- `shell` produces output suitable for evaluation in the shell. For example,

```
export PATH="/home/user/.espressif/tools/tool/v1.0.0/bin:$PATH"
```

on Linux and macOS, and

```
set "PATH=C:\Users\user\.espressif\tools\v1.0.0\bin;%PATH%"
```

on Windows.

备注: Exporting environment variables in Powershell format is not supported at the moment. `key-value` format may be used instead.

The output of this command may be used to update the environment variables, if the shell supports this. For example:

```
eval $($IDF_PATH/tools/idf_tools.py export)
```

- `key-value` produces output in *VARIABLE=VALUE* format, suitable for parsing by other scripts:

```
PATH=/home/user/.espressif/tools/tool/v1.0.0:$PATH
```

Note that the script consuming this output has to perform expansion of `$VAR` or `%VAR%` patterns found in the output.

- `list`: Lists the known versions of the tools, and indicates which ones are installed.
- `check`: For each tool, checks whether the tool is available in the system path and in `IDF_TOOLS_PATH`.
- `install-python-env`: Create a Python virtual environment in the `${IDF_TOOLS_PATH}/python_env` directory and install there the required Python packages. An optional `--features` argument allows one to specify a comma-separated list of features to be added or removed. Feature that begins with `-` will be removed and features with `+` or without any sign will be added. Example syntax for removing feature `XY` is `--features=-XY` and for adding `--features=+XY` or `--features=XY`. If both removing and adding options are provided with the same feature, no operation is performed. For each feature a requirements file must exist. For example, feature `XY` is a valid feature if `${IDF_PATH}/tools/requirements/requirements.XY.txt` is an existing file with a list of Python packages to be installed. There is one mandatory `core` feature ensuring core functionality of ESP-IDF (build, flash, monitor, debug in console). There can be an arbitrary number of optional features. The selected list of features is stored in `idf-env.json`. The requirement files contain a list of the desired Python packages to be installed and `espidf.constraints.*.txt` downloaded from https://dl.espressif.com and stored in `${IDF_TOOLS_PATH}` the package version requirements for a given ESP-IDF version. Althought it is not recommended, the download and use of constraint files can be disabled with the `--no-constraints` argument or setting the `IDF_PYTHON_CHECK_CONSTRAINTS` environment variable to `no`.
- `check-python-dependencies`: Checks if all required Python packages are installed. Packages from `${IDF_PATH}/tools/requirements/requirements.*.txt` files selected by the feature list of `idf-env.json` are checked with the package versions specified in the `espidf.constraints.*.txt` file. The constraint file will be downloaded from https://dl.espressif.com if this step hasn't been done already in the last day. The use of constraints files can be disabled similarly to the `install-python-env` command.
- `uninstall`: Print and remove tools, that are currently not used by active ESP-IDF version.
  - `--dry-run` Print installed unused tools.
  - `--remove-archives` Additionally remove all older versions of previously downloaded installation packages.

Install scripts

Shell-specific user-facing scripts are provided in the root of ESP-IDF repository to facilitate tools installation. These are:

- `install.bat` for Windows Command Prompt
- `install.ps1` for Powershell

- `install.sh` for Bash
- `install.fish` for Fish

Aside from downloading and installing the tools into `IDF_TOOLS_PATH`, these scripts prepare a Python virtual environment, and install the required packages into that environment.

These scripts accept optionally a comma separated list of chip targets and `--enable-*` arguments for enabling features. These arguments are passed to the `idf_tools.py` script which stores them in `idf-env.json`. Therefore, chip targets and features can be enabled incrementally.

Running the scripts without any optional arguments will install tools for all chip targets (by running `idf_tools.py install --targets=all`) and Python packages for core ESP-IDF functionality (by running `idf_tools.py install-python-env --features=core`).

Or for example, `install.sh esp32` will install tools only for ESP32. See the *Getting Started Guide* for more examples.

`install.sh --enable-XY` will enable feature `XY` (by running `idf_tools.py install-python-env --features=core,XY`).

Export scripts

Since the installed tools are not permanently added into the user or system `PATH` environment variable, an extra step is required to use them in the command line. The following scripts modify the environment variables in the current shell to make the correct versions of the tools available:

- `export.bat` for Windows Command Prompt
- `export.ps1` for Powershell
- `export.sh` for Bash
- `export.fish` for Fish

备注： To modify the shell environment in Bash, `export.sh` must be "sourced" : `. ./export.sh` (note the leading dot and space).

`export.sh` may be used with shells other than Bash (such as zsh). However in this case the `IDF_PATH` environment variable must be set before running the script. When used in Bash, the script will guess the `IDF_PATH` value from its own location.

In addition to calling `idf_tools.py`, these scripts list the directories which have been added to the `PATH`.

Other installation methods

Depending on the environment, more user-friendly wrappers for `idf_tools.py` are provided:

- *IDF Tools installer for Windows* can download and install the tools. Internally the installer uses `idf_tools.py`.
- Eclipse Plugin includes a menu item to set up the tools. Internally the plugin calls `idf_tools.py`.
- VSCode Extension for ESP-IDF includes an onboarding flow. This flow helps setting up the tools. Although the extension does not rely on `idf_tools.py`, the same installation method is used.

Custom installation

Although the methods above are recommended for ESP-IDF users, they are not a must for building ESP-IDF applications. ESP-IDF build system expects that all the necessary tools are installed somewhere, and made available in the `PATH`.

List of IDF Tools

xtensa-esp-elf-gdb GDB for Xtensa

License: GPL-3.0-or-later

More info: https://github.com/espressif/binutils-gdb

Platform	Required	Download

4.27 ESP32-C3 中的单元测试

ESP-IDF 提供以下方法测试软件。

- 一种是基于目标的测试，该测试使用运行在 esp32c3 上的中央单元测试应用程序。这些测试使用的是基于 Unity 的单元测试框架。通过把测试用例放在组件的 `test` 子目录，可以将其集成到 ESP-IDF 组件中。本文档主要介绍这种基于目标的测试方法。
- 另一种是基于 Linux 主机的单元测试，其中所有硬件行为都通过 Mock 组件进行模拟。此测试方法目前仍在开发中，暂且只有一小部分 IDF 组件支持 Mock，具体请参考*基于 Linux 主机的单元测试*。

4.27.1 添加常规测试用例

单元测试被添加在相应组件的 `test` 子目录中，测试用例写在 C 文件中，一个 C 文件可以包含多个测试用例。测试文件的名字要以“test”开头。

测试文件需要包含 `unity.h` 头文件，此外还需要包含待测试 C 模块需要的头文件。

测试用例需要通过 C 文件中特定的函数来添加，如下所示：

```
TEST_CASE("test name", "[module name]")
{
        // 在这里添加测试用例
}
```

- 第一个参数是此测试的描述性名称。
- 第二个参数是用方括号括起来的标识符。标识符用来对相关测试或具有特定属性的测试进行分组。

备注： 没有必要在每个测试用例中使用 UNITY_BEGIN() 和 UNITY_END() 来声明主函数的区域，unity_platform.c 会自动调用 UNITY_BEGIN()，然后运行测试用例，最后调用 UNITY_END()。

test 子目录应包含组件 *CMakeLists.txt*，因为他们本身就是一种组件（即测试组件）。ESP-IDF 使用了 Unity 测试框架，位于 unity 组件里。因此，每个测试组件都需要通过 REQUIRES 参数将 unity 组件设为依赖项。通常，组件需要手动指定待编译的源文件，但是，对于测试组件来说，这个要求被放宽为仅建议将参数 SRC_DIRS 用于 idf_component_register。

总的来说，test 子目录下最小的 CMakeLists.txt 文件可能如下所示:

```
idf_component_register(SRC_DIRS "."
                       INCLUDE_DIRS "."
                       REQUIRES unity)
```

更多关于如何在 Unity 下编写测试用例的信息，请查阅 http://www.throwtheswitch.org/unity。

4.27.2 添加多设备测试用例

常规测试用例会在一个在试设备 (Device Under Test，DUT) 上执行。但是，由于要求互相通信的组件（比如 GPIO、SPI）需要与其他设备进行通信，因此不能使用常规测试用例进行测试。多设备测试用例包括写入多个测试函数，并在多个 DUT 运行测试。

以下是一个多设备测试用例:

```
void gpio_master_test()
{
    gpio_config_t slave_config = {
            .pin_bit_mask = 1 << MASTER_GPIO_PIN,
            .mode = GPIO_MODE_INPUT,
    };
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
    gpio_config_t master_config = {
            .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
            .mode = GPIO_MODE_OUTPUT,
    };
    gpio_config(&master_config);
    gpio_set_level(SLAVE_GPIO_PIN, 1);
    unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", "[driver]", gpio_
↪master_test, gpio_slave_test);
```

宏 TEST_CASE_MULTIPLE_DEVICES 用来声明多设备测试用例。

- 第一个参数指定测试用例的名字。
- 第二个参数是测试用例的描述。
- 从第三个参数开始，可以指定最多 5 个测试函数，每个函数都是单独运行在一个 DUT 上的测试入口点。

在不同的 DUT 上运行的测试用例需要相互之间进行同步。可以通过 unity_wait_for_signal 和 unity_send_signal 这两个函数使用 UART 进行同步操作。上例的场景中，slave 应该在 master 设置

好 GPIO 电平后再去读取 GPIO 电平，DUT 的 UART 终端会打印提示信息，并要求用户进行交互。

DUT1（master）终端:

```
Waiting for signal: [output high level]!
Please press "Enter" key once any board send this signal.
```

DUT2（slave）终端:

```
Send signal: [output high level]!
```

一旦 DUT2 发送了该信号，您需要在 DUT1 的终端按回车键，然后 DUT1 会从 `unity_wait_for_signal` 函数中解除阻塞，并开始更改 GPIO 的电平。

4.27.3 添加多阶段测试用例

常规的测试用例无需重启就会结束（或者仅需要检查是否发生了重启），可有些时候我们想在某些特定类型的重启事件后运行指定的测试代码。例如，在深度睡眠唤醒后检查复位的原因是否正确。首先我们需要触发深度睡眠复位事件，然后检查复位的原因。为了实现这一点，可以通过定义多阶段测试用例来将这些测试函数组合在一起:

```
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    soc_reset_reason_t reason = esp_rom_get_reset_reason(0);
    TEST_ASSERT(reason == RESET_REASON_CORE_DEEP_SLEEP);
}

TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", "[esp32c3]", trigger_
↪deepsleep, check_deepsleep_reset_reason);
```

多阶段测试用例向用户呈现了一组测试函数，它需要用户进行交互（选择用例并选择不同的阶段）来运行。

4.27.4 应用于不同芯片的单元测试

某些测试（尤其与硬件相关的）不支持在所有的芯片上执行。请参照本节，让您的单元测试只在其中一部分芯片上执行。

1. 使用宏 `!(TEMPORARY_)DISABLED_FOR_TARGETS()` 包装您的测试代码，并将其放于原始的测试文件中，或将代码分成按功能分组的文件。但请确保所有这些文件都会由编译器处理。例:

   ```
   #if !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
   TEST_CASE("a test that is not ready for esp32 and esp8266 yet", "[]")
   {
   }
   #endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
   ```

如果您需要将其中某个测试在特定芯片上编译，只需要修改禁止的芯片列表。推荐使用一些能在 `soc_caps.h` 中被清楚描述的通用概念来禁止某些单元测试。如果您已经进行上述操作，但一些测试在芯片中的调试暂未通过，请同时使用上述两种方法，当调试完成后再移除 `!(TEMPORARY_)DISABLED_FOR_TARGETS()`。例:

```
#if SOC_SDIO_SLAVE_SUPPORTED
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
TEST_CASE("a sdio slave tests that is not ready for esp64 yet", "[sdio_slave]")
{
    //available for esp32 now, and will be available for esp64 in the future
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
#endif //SOC_SDIO_SLAVE_SUPPORTED
```

2. 对于某些您确定不会支持的测试（例如，芯片根本没有该外设），使用 `DISABLED_FOR_TARGETS` 来禁止该测试；对于其他只是临时性需要关闭的（例如，没有 runner 资源等），使用 `TEMPORARY_DISABLED_FOR_TARGETS` 来暂时关闭该测试。

一些禁用目标芯片测试用例的旧方法，由于它们具有明显的缺陷，已经被废弃，请勿继续使用：

- 请勿将测试代码放在 `test/target` 目录下并用 CMakeLists.txt 来选择其中一个进行编译。这是因为测试代码比实现代码更容易被复用。如果您将一些代码放在 `test/esp32` 目录下来避免 esp32s2 芯片执行它，一旦您需要在新的芯片（比如 esp32s3）中启用该测试，这种结构很难保持代码整洁。
- 请勿继续使用 `CONFIG_IDF_TARGET_xxx` 宏来禁用测试。这种方法会让被禁用的测试项目难以追踪和重新打开。并且，相比于白名单式的 `#if CONFIG_IDF_TARGET_xxx`，黑名单式的 `#if !disabled` 不会导致在新芯片引入时这些测试被自动禁用。但对于测试实现，仍可使用 `#if CONFIG_IDF_TARGET_xxx` 给不同芯片版本选择实现代码。测试项目和测试实现区分如下：
  - 测试项目：那些会在一些芯片上执行，而在另外一些上跳过的项目，例如：
    有三个测试项目 SD 1-bit、SD 4-bit 和 SDSPI。对于不支持 SD Host 外设的 ESP32-S2 芯片，只有 SDSPI 一个项目需要被执行。
  - 测试实现：一些始终会发生的代码，但采取的实现方式不同。例如：
    ESP8266 芯片没有 SDIO_PKT_LEN 寄存器。如果在测试过程中需要从 slave 设备的数据长度，您可以用不同方式读取的 `#if CONFIG_IDF_TARGET_` 宏来保护不同的实现代码。
    但请注意避免使用 `#else` 宏。这样当新芯片被引入时，测试就会在编译阶段失败，提示维护者去显示选择一个正确的测试实现。

4.27.5 编译单元测试程序

按照 esp-idf 顶层目录的 README 文件中的说明进行操作，请确保 `IDF_PATH` 环境变量已经被设置指向了 esp-idf 的顶层目录。

切换到 `tools/unit-test-app` 目录下进行配置和编译：

- `idf.py menuconfig` - 配置单元测试程序。
- `idf.py -T all build` - 编译单元测试程序，测试每个组件 `test` 子目录下的用例。
- `idf.py -T "xxx yyy" build` - 编译单元测试程序，对以空格分隔的特定组件进行测试（如 `idf.py -T heap build` - 仅对 `heap` 组件目录下的单元测试程序进行编译）。
- `idf.py -T all -E "xxx yyy" build` - 编译单元测试程序，测试除指定组件之外的所有组件（例如 `idf.py -T all -E "ulp mbedtls" build` - 编译所有的单元测试，不包括 `ulp` 和 `mbedtls` 组件。）。

备注： 由于 Windows 命令提示符固有限制，需使用以下语法来编译多个组件的单元测试程序：`idf.py -T xxx -T yyy build` 或者在 PowerShell 中使用 `idf.py -T \`"xxx yyy\`" build`，在 Windows 命令提示符中使用 `idf.py -T \^"ssd1306 hts221\^" build`。

当编译完成时，它会打印出烧写芯片的指令。您只需要运行 `idf.py flash` 即可烧写所有编译输出的文件。

您还可以运行 `idf.py -T all flash` 或者 `idf.py -T xxx flash` 来编译并烧写，所有需要的文件都会在烧写之前自动重新编译。

使用 `menuconfig` 可以设置烧写测试程序所使用的串口。更多信息，见 tools/unit-test-app/README.md。

4.27.6 运行单元测试

烧写完成后重启 ESP32-C3，它将启动单元测试程序。

当单元测试应用程序空闲时，输入回车键，它会打印出测试菜单，其中包含所有的测试项目:

```
Here's the test menu, pick your combo:
(1)     "esp_ota_begin() verifies arguments" [ota]
(2)     "esp_ota_get_next_update_partition logic" [ota]
(3)     "Verify bootloader image in flash" [bootloader_support]
(4)     "Verify unit test app image" [bootloader_support]
(5)     "can use new and delete" [cxx]
(6)     "can call virtual functions" [cxx]
(7)     "can use static initializers for non-POD types" [cxx]
(8)     "can use std::vector" [cxx]
(9)     "static initialization guards work as expected" [cxx]
(10)    "global initializers run in the correct order" [cxx]
(11)    "before scheduler has started, static initializers work correctly" [cxx]
(12)    "adc2 work with wifi" [adc]
(13)    "gpio master/slave test example" [ignore][misc][test_env=UT_T2_1][multi_
↪device]
        (1)     "gpio_master_test"
        (2)     "gpio_slave_test"
(14)    "SPI Master clockdiv calculation routines" [spi]
(15)    "SPI Master test" [spi][ignore]
(16)    "SPI Master test, interaction of multiple devs" [spi][ignore]
(17)    "SPI Master no response when switch from host1 (SPI2) to host2 (SPI3)"␣
↪[spi]
(18)    "SPI Master DMA test, TX and RX in different regions" [spi]
(19)    "SPI Master DMA test: length, start, not aligned" [spi]
(20)    "reset reason check for deepsleep" [esp32c3][test_env=UT_T2_1][multi_stage]
        (1)     "trigger_deepsleep"
        (2)     "check_deepsleep_reset_reason"
```

常规测试用例会打印用例名字和描述，主从测试用例还会打印子菜单（已注册的测试函数的名字）。

可以输入以下任意一项来运行测试用例:

- 引号中写入测试用例的名字，运行单个测试用例。
- 测试用例的序号，运行单个测试用例。
- 方括号中的模块名字，运行指定模块所有的测试用例。
- 星号，运行所有测试用例。

[multi_device] 和 [multi_stage]``标签告诉测试运行者该用例是多设备测试还是多阶段测试。这些标签由 ``TEST_CASE_MULTIPLE_STAGES 和 TEST_CASE_MULTIPLE_DEVICES 宏自动生成。

一旦选择了多设备测试用例，它会打印一个子菜单:

```
Running gpio master/slave test example...
gpio master/slave test example
        (1)     "gpio_master_test"
        (2)     "gpio_slave_test"
```

您需要输入数字以选择在 DUT 上运行的测试。

与多设备测试用例相似，多阶段测试用例也会打印子菜单:

```
Running reset reason check for deepsleep...
reset reason check for deepsleep
        (1)     "trigger_deepsleep"
        (2)     "check_deepsleep_reset_reason"
```

第一次执行此用例时，输入 1 来运行第一阶段（触发深度睡眠）。在重启 DUT 并再次选择运行此用例后，输入 2 来运行第二阶段。只有在最后一个阶段通过并且之前所有的阶段都成功触发了复位的情况下，该测试才算通过。

4.27.7 带缓存补偿定时器的定时代码

存储在外部存储器（如 SPI Flash 和 SPI RAM）中的指令和数据是通过 CPU 的统一指令和数据缓存来访问的。当代码或数据在缓存中时，访问速度会非常快（即缓存命中）。

然而，如果指令或数据不在缓存中，则需要从外部存储器中获取（即缓存缺失）。访问外部存储器的速度明显较慢，因为 CPU 在等待从外部存储器获取指令或数据时会陷入停滞，从而导致整体代码执行速度会依据缓存命中或缓存缺失的次数而变化。

在不同的编译中，代码和数据的位置可能会有所不同，一些可能会更有利于缓存访问（即最大限度地减少缓存缺失）。理论上，这会影响执行速度，但这些因素通常无关紧要，因为它们的影响会在设备的运行过程中“平均化”。

然而，高速缓存对执行速度的影响可能与基准测试场景（尤其是微基准测试）有关。每次运行时间和构建时的测量时间可能会有所差异，减少差异的方法之一是将代码和数据分别放在指令或数据 RAM（IRAM/DRAM）中。CPU 可以直接访问 IRAM 和 DRAM，从而消除了高速缓存的影响因素。然而，由于 IRAM 和 DRAM 容量有限，该方法并不总是可行。

缓存补偿定时器是上述方法的替代方法，该计时器使用处理器的内部事件计数器来确定在发生高速缓存未命中时等待代码/数据所花费的时间，然后从记录的实时时间中减去该时间。

```
// Start the timer
ccomp_timer_start();

// Function to time
func_code_to_time();

// Stop the timer, and return the elapsed time in microseconds relative to
// ccomp_timer_start
int64_t t = ccomp_timer_stop();
```

缓存补偿定时器的限制之一是基准功能必须固定在一个内核上。这是由于每个内核都有自己的事件计数器，这些事件计数器彼此独立。例如，如果在一个内核上调用 `ccomp_timer_start`，使调度器进入睡眠状态，唤醒并在在另一个内核上重新调度，那么对应的 `ccomp_timer_stop` 将无效。

4.27.8 Mocks

备注： 目前，只有一些特定的组件在 Linux 主机上运行时才能 Mock。未来我们计划，无论是在 Linux 主机上运行还是在目标芯片 ESP32-C3 上运行，IDF 所有重要的组件都可以实现 Mock。

嵌入式系统中单元测试的最大问题之一是对硬件依赖性极强。直接在 ESP32-C3 上运行单元测试对于上层组件来说存在极大的困难，原因如下：

- 受下层组件和/或硬件设置的影响，测试可靠性降低。
- 由于下层组件和/或硬件设置的限制，测试边缘案例的难度提高。
- 由于数量庞大的依赖关系影响了行为，识别根本原因的难度提高。

当测试一个特定的组件（即被测组件）时，通过软件进行 Mock 能让所有被测组件的依赖在软件中被完全替换（即 Mock）。为了实现该功能，ESP-IDF 集成了 CMock 的 Mock 框架作为组件。通过在 ESP-IDF 的构建系统中添加一些 CMake 函数，可以方便地 Mock 整个（或部分）IDF 组件。

理想情况下，被测组件所依赖的所有组件都应该被 Mock，从而让测试环境完全控制与被测组件之间的所有交互。然而，如果 Mock 所有的组件过于复杂或冗长（例如需要模拟过多的函数调用），以下做法可能会有帮助：

- 在测试代码中包含更多“真正”（非模拟）代码。这样做可能有效，但同时也会增加对“真正”代码行为的依赖。此外，一旦测试失败，很难判断失败原因是因为实际测试代码还是“真正”地 IDF 代码。

- 重新评估被测代码的设计，尝试将被测代码划分为更易于管理的组件来减少其依赖性。这可能看起来很麻烦，但众所周知，单元测试经常暴露软件设计的弱点。修复设计上的弱点不仅在短期内有助于进行单元测试，而且还有助于长期的代码维护。

请参考 cmock/CMock/docs/CMock_Summary.md 了解 CMock 工作原理以及如何创建和使用 Mock。

要求

目前 Mock 只支持基于 Linux 主机的单元测试。生成 Mock 需要满足如下要求：

- Installed IDF including all IDF requirements
- CMock requirements (`Ruby`)
- System package requirements (`libbsd`, `libbsd-dev`)

对组件进行 Mock

要创建组件的 Mock 版本（也称为 “组件模拟”），需要以特定方式覆盖组件。覆盖组件时需要创建一个与原始组件名称完全相同的组件，然后让构建系统先发现原始组件再发现这个具有相同名称的新组件。具体可参考同名组件。

在组件模拟中需要指定如下部分：

- 头文件，头文件中提供了需要生成模拟的函数
- 上述头文件的路径
- 模拟组件的依赖（如果头文件中包含了其他组件的文件，那么这点非常必要）

以上这些部分都需要使用 IDF 构建系统函数 `idf_component_mock` 指定。您可以使用 IDF 构建系统函数 `idf_component_get_property`，并加上标签 `COMPONENT_OVERRIDEN_DIR` 来访问原始组件的组件目录，然后使用 `idf_component_mock` 注册模拟组件。

```
idf_component_get_property(original_component_dir <original-component-name>␣
↪COMPONENT_OVERRIDEN_DIR)
...
idf_component_mock(INCLUDE_DIRS "${original_component_dir}/include"
    REQUIRES freertos
    MOCK_HEADER_FILES ${original_component_dir}/include/header_containing_
↪functions_to_mock.h)
```

组件模拟还需要一个单独的 `mock` 目录，里面包含一个 `mock_config.yaml` 文件用于配置 CMock。以下是一份简单的 `mock_config.yaml` 文件：

```
:cmock:
  :plugins:
    - expect
    - expect_any_args
```

更多关于 CMock yaml 类型配置文件的详细信息，请查看 cmock/CMock/docs/CMock_Summary.md。

请注意，组件模拟不一定要对原始组件进行整体模拟。只要组件模拟满足测试项目的依赖以及其他代码对原始组件的依赖，部分模拟就足够了。事实上，IDF 中 `tools/mocks` 中的大多数组件模拟都只是部分地模拟了原始组件。

可在 IDF 目录的 tools/mocks 下找到组件模拟的示例。有关如何 *覆盖 IDF 组件*，可查看同名组件。

修改单元测试文件

单元测试需要通知 cmake 构建系统对依赖的组件进行模拟（即用模拟组件来覆盖原始组件）。这可以通过将组件模拟放到项目的 `components` 目录，或者在项目的根目录 `CMakeLists.txt` 文件中使用以下代码来添加模拟组件的目录来实现：

```
list(APPEND EXTRA_COMPONENT_DIRS "<mock_component_dir>")
```

这两种方法都会让组件模拟覆盖 ESP-IDF 中的现有组件。如果您使用的是 IDF 提供的组件模拟，则第二个方法更加方便。

您可参考 `esp_event` 基于主机的单元测试及其 esp_event/host_test/esp_event_unit_test/CMakeLists.txt 作为组件模拟的示例。

4.28 Unit Testing on Linux

备注： Host testing with IDF is experimental for now. We try our best to keep interfaces stable but can't guarantee it for now. Feedback via github or the forum on esp32.com is highly welcome, though and may influence the future design of the host-based tests.

This article provides an overview of unit tests with IDF on Linux. For using unit tests on the target, please refer to *target based unit testing*.

4.28.1 Embedded Software Tests

Embedded software tests are challenging due to the following factors:

- Difficulties running tests efficiently.
- Lack of many operating system abstractions when interfacing with hardware, making it difficult to isolate code under test.

To solve these two problems, Linux host-based tests with CMock are introduced. Linux host-based tests are more efficient than unit tests on the target since they:

- Compile the necessary code only
- Don't need time to upload to a target
- Run much faster on a host-computer, compared to an ESP

Using the CMock framework also solves the problem of hardware dependencies. Through mocking, hardware details are emulated and specified at run time, but only if necessary.

Of course, using code on the host and using mocks does not fully represent the target device. Thus, two kinds of tests are recommended:

1. Unit tests which test program logic on a Linux machine, isolated through mocks.
2. System/Integration tests which test the interaction of components and the whole system. They run on the target, where irrelevant components and code may as well be emulated via mocks.

This documentation is about the first kind of tests. Refer to *target based unit testing* for more information on target tests (the second kind of tests).

4.28.2 IDF Unit Tests on Linux Host

The current focus of the Linux host tests is on creating isolated unit tests of components, while mocking the component's dependencies with CMock.

A complete implementation of IDF to run on Linux does not exist currently.

There are currently two examples for running IDF-built code on Linux host:

- An example hello-world application
- A unit test for NVS .

Inside the component which should be tested, there is a separate directory `host_test`, besides the "traditional" `test` directory or the `test_apps` directory. It has one or more subdirectories:

```
- host_test/

            - fixtures/
                contains test fixtures (structs/functions to do test case set-up␣
↪and tear-down).
                If there are no fixtures, this can be ommitted.
            - <test_name>/
                IDF applications which run the tests
            - <test_name2>/
                Further tests are possible.
```

The IDF applications inside `host_test` set the mocking configuration as described in the *IDF unit test documentation*.

The NVS page unit test provides some illustration of how to control the mocks.

Requirements

- Installed IDF including all IDF requirements
- CMock requirements (`Ruby`)
- System package requirements (`libbsd`, `libbsd-dev`)

The host tests have been tested on Ubuntu 20.04 with `GCC` version 9 and 10.

4.29 USB Serial/JTAG Controller Console

On chips with an integrated USB Serial/JTAG Controller, it is possible to use the part of this controller that implements a serial port (CDC) to implement the serial console, instead of using UART with an external USB-UART bridge chip. ESP32-C3 contains this controller, providing the following functions:

- Bidirectional serial console, which can be used with *IDF Monitor* or another serial monitor.
- Flashing using `esptool.py` and `idf.py flash`.
- JTAG debugging using e.g. OpenOCD, simultaneous with serial operations.

Note that, in contrast with the USB OTG peripheral in some Espressif chips, the USB Serial/JTAG Controller is a fixed function device, implemented entirely in hardware. This means it cannot be reconfigured to perform any function other than to provide a serial channel and JTAG debugging functionality.

4.29.1 Hardware Requirements

Connect ESP32-C3 to the USB port as follows:

GPIO	USB
19	D+ (green)
18	D- (white)
GND	GND (black)
	+5V (red)

Some development boards may offer a USB connector for the USB Serial/JTAG Controller —in that case, no extra connections are required.

4.29.2 Software Configuration

USB console feature can be enabled using `CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG` option in menuconfig tool (see *CONFIG_ESP_CONSOLE_UART*).

Once the option is enabled, build the project as usual.

Alternatively, you can access the output through usb_serial_jtag port but make sure the option CONFIG_ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG in choice ESP_CONSOLE_SECONDARY is selected.

警告： Besides output, if you also want to input or use REPL with console, please select CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG.

4.29.3 Uploading the Application

The USB Serial/JTAG Controller is able to put the ESP32-C3 into download mode automatically. Simply flash as usual, but specify the USB Serial/JTAG Controller port on your system: `idf.py flash -p PORT` where `PORT` is the name of the proper port.

4.29.4 Limitations

There are several limitations to the USB console feature. These may or may not be significant, depending on the type of application being developed, and the development workflow.

1. If the application accidentally reconfigures the USB peripheral pins, or disables the USB Serial/JTAG Controller, the device will disappear from the system. After fixing the issue in the application, you will need to manually put the ESP32-C3 into download mode by pulling low GPIO9 and resetting the chip.
2. If the application enters deep sleep mode, USB CDC device will disappear from the system.
3. The behavior between an actual USB-to-serial bridge chip and the USB Serial/JTAG Controller is slightly different if the ESP-IDF application does not listen for incoming bytes. An USB-to-serial bridge chip will just send the bytes to a (not listening) chip, while the USB Serial/JTAG Controller will block until the application reads the bytes. This can lead to a non-responsive looking terminal program.
4. If the application enters light-sleep (including automatic light-sleep) or software reset, etc. The USB CDC device will still work on the system. But be aware that this might increase the power consumption, if you don't need USB CDC in sleep and want to keep low power consumption, please disable the menuconfig CONFIG_RTC_CLOCK_BBPLL_POWER_ON_WITH_USB. Moreover, the power consumption will only increase when your USB CDC port is really in use (like data transaction), therefore, if your USB CDC just connects with power bank or battery, rather than something like computer, you don't need to care about the increasing power consumption mentioned above.

4.30 Wi-Fi 驱动程序

4.30.1 ESP32-C3 Wi-Fi 功能列表

- 支持 4 个虚拟接口，即 STA、AP、Sniffer 和 reserved。
- 支持仅 station 模式、仅 AP 模式、station/AP 共存模式
- 支持使用 IEEE 802.11b、IEEE 802.11g、IEEE 802.11n 和 API 配置协议模式
- 支持 WPA/WPA2/WPA3/WPA2-企业版/WPA3-企业版/WAPI/WPS 和 DPP
- 支持 AMSDU、AMPDU、HT40、QoS 以及其它主要功能
- 支持 Modem-sleep
- 支持乐鑫专属协议，可实现 **1 km** 数据通信量
- 空中数据传输最高可达 20 MBit/s TCP 吞吐量和 30 MBit/s UDP 吞吐量
- 支持 Sniffer
- 支持快速扫描和全信道扫描
- 支持多个天线

- 支持获取信道状态信息

4.30.2 如何编写 Wi-Fi 应用程序

准备工作

一般来说，要编写自己的 Wi-Fi 应用程序，最高效的方式是先选择一个相似的应用程序示例，然后将其中可用的部分移植到自己的项目中。如果您希望编写一个强健的 Wi-Fi 应用程序，强烈建议您在开始之前先阅读本文。**非强制要求，请依个人情况而定**。

本文将补充说明 Wi-Fi API 和 Wi-Fi 示例的相关信息，重点描述使用 Wi-Fi API 的原则、当前 Wi-Fi API 实现的限制以及使用 Wi-Fi 时的常见错误。同时，本文还介绍了 Wi-Fi 驱动程序的一些设计细节。建议您选择一个示例 example 进行参考。

设置 Wi-Fi 编译时选项

请参阅*Wi-Fi menuconfig*。

Wi-Fi 初始化

请参阅*ESP32-C3 Wi-Fi station 一般情况*、*ESP32-C3 Wi-Fi AP 一般情况*。

启动/连接 Wi-Fi

请参阅*ESP32-C3 Wi-Fi station 一般情况*、*ESP32-C3 Wi-Fi AP 一般情况*。

事件处理

通常，在理想环境下编写代码难度并不大，如*WIFI_EVENT_STA_START*、*WIFI_EVENT_STA_CONNECTED* 中所述。难度在于如何在现实的困难环境下编写代码，如*WIFI_EVENT_STA_DISCONNECTED* 中所述。能否在后者情况下完美地解决各类事件冲突，是编写一个强健的 Wi-Fi 应用程序的根本。请参阅*ESP32-C3 Wi-Fi 事件描述*, *ESP32-C3 Wi-Fi station 一般情况*, *ESP32-C3 Wi-Fi AP 一般情况*。另可参阅 ESP-IDF 中的事件处理概述。

编写错误恢复程序

除了在能在比较差的环境下工作，错误恢复能力也对一个强健的 Wi-Fi 应用程序至关重要。请参阅*ESP32-C3 Wi-Fi API 错误代码*。

4.30.3 ESP32-C3 Wi-Fi API 错误代码

所有 ESP32-C3 Wi-Fi API 都有定义好的返回值，即错误代码。这些错误代码可分类为：

- 无错误，例如：返回值 ESP_OK 代表 API 成功返回
- 可恢复错误，例如：ESP_ERR_NO_MEM
- 不可恢复的非关键性错误
- 不可恢复的关键性错误

一个错误是否为关键性取决于其 API 和应用场景，并且由 API 用户定义。

要使用 Wi-Fi API 编写一个强健的应用程序，根本原则便是要时刻检查错误代码并编写相应的错误处理代码。一般来说，错误处理代码可用于解决：

- 可恢复错误，您可以编写一个可恢复错误处理代码解决该类错误。例如，当`esp_wifi_start()` 返回 ESP_ERR_NO_MEM 时，调用可恢复错误处理代码 vTaskDelay 可以获取几微秒的重试时间。

- 不可恢复非关键性错误，打印错误代码可以帮助您更好地处理该类错误。
- 不可恢复关键性错误，可使用“assert”语句处理该类错误。例如，如果`esp_wifi_set_mode()`返回 ESP_ERR_WIFI_NOT_INIT，该值意为`esp_wifi_init()`未成功初始化 Wi-Fi 驱动程序。您可以在应用程序开发阶段非常快速地检测到此类错误。

在 esp_err.h 中，ESP_ERROR_CHECK 负责检查返回值。这是一个较为常见的错误处理代码，可在应用程序开发阶段作为默认的错误处理代码。但是，我们强烈建议 API 的使用者编写自己的错误处理代码。

4.30.4 初始化 ESP32-C3 Wi-Fi API 参数

初始化 API 的结构参数时，应遵循以下两种方式之一：

- 设置该参数的所有字段
- 先使用 get API 获取当前配置，然后只设置特定于应用程序的字段

初始化或获取整个结构这一步至关重要，因为大多数情况下，返回值 0 意味着程序使用了默认值。未来，我们将会在该结构中加入更多字段，并将这些字段初始化为 0，确保即使 IDF 版本升级后您的应用程序依然能够正常运行。

4.30.5 ESP32-C3 Wi-Fi 编程模型

ESP32-C3 Wi-Fi 编程模型如下图所示：

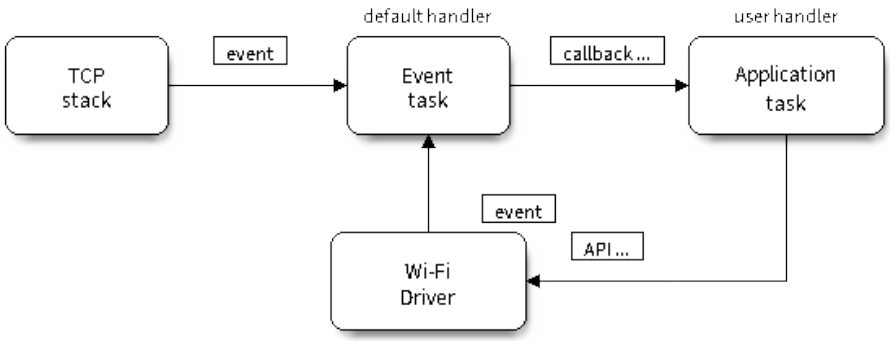

图 53: Wi-Fi 编程模型

Wi-Fi 驱动程序可以看作是一个无法感知上层代码（如 TCP/IP 堆栈、应用程序任务、事件任务等）的黑匣子。通常，应用程序任务（代码）负责调用 *Wi-Fi 驱动程序 APIs* 来初始化 Wi-Fi，并在必要时处理 Wi-Fi 事件。然后，Wi-Fi 驱动程序接收并处理 API 数据，并在应用程序中插入事件。

Wi-Fi 事件处理是在*esp_event 库* 的基础上进行的。Wi-Fi 驱动程序将事件发送至默认事件循环，应用程序便可以使用`esp_event_handler_register()` 中的回调函数处理这些事件。除此之外，*esp_netif 组件* 也负责处理 Wi-Fi 事件，并产生一系列默认行为。例如，当 Wi-Fi station 连接至一个 AP 时，esp_netif 将自动开启 DHCP 客户端服务（系统默认）。

4.30.6 ESP32-C3 Wi-Fi 事件描述

WIFI_EVENT_WIFI_READY

Wi-Fi 驱动程序永远不会生成此事件，因此，应用程序的事件回调函数可忽略此事件。在未来的版本中，此事件可能会被移除。

WIFI_EVENT_SCAN_DONE

扫描完成事件，由*esp_wifi_scan_start()* 函数触发，将在以下情况下产生：

- 扫描已完成，例如：Wi-Fi 已成功找到目标 AP 或已扫描所有信道。
- 当前扫描因函数*esp_wifi_scan_stop()* 而终止。
- 在当前扫描完成之前调用了函数*esp_wifi_scan_start()*。此时，新的扫描将覆盖当前扫描过程，并生成一个扫描完成事件。

以下情况下将不会产生扫描完成事件：

- 当前扫描被阻止。
- 当前扫描是由函数*esp_wifi_connect()* 触发的。

接收到此事件后，事件任务暂不做任何响应。首先，应用程序的事件回调函数需调用*esp_wifi_scan_get_ap_num()* 和*esp_wifi_scan_get_ap_records()* 获取已扫描的 AP 列表，然后触发 Wi-Fi 驱动程序释放在扫描过程中占用的内存空间（**切记该步骤**）。更多详细信息，请参阅*ESP32-C3 Wi-Fi 扫描*。

WIFI_EVENT_STA_START

如果调用函数*esp_wifi_start()* 后接收到返回值 ESP_OK，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将初始化 LwIP 网络接口 (netif)。通常，应用程序的事件回调函数需调用*esp_wifi_connect()* 来连接已配置的 AP。

WIFI_EVENT_STA_STOP

如果调用函数*esp_wifi_stop()* 后接收到返回值 ESP_OK，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将进行释放 station IP 地址、终止 DHCP 客户端服务、移除 TCP/UDP 相关连接并清除 LwIP station netif 等动作。此时，应用程序的事件回调函数通常不需做任何响应。

WIFI_EVENT_STA_CONNECTED

如果调用函数*esp_wifi_connect()* 后接收到返回值 ESP_OK，且 station 已成功连接目标 AP，则将产生此连接事件。接收到此事件后，事件任务将启动 DHCP 客户端服务并开始获取 IP 地址。此时，Wi-Fi 驱动程序已准备就绪，可发送和接收数据。如果您的应用程序不依赖于 LwIP（即 IP 地址），则此刻便可以开始应用程序开发工作。但是，如果您的应用程序需基于 LwIP 进行，则还需等待 *got ip* 事件发生后才可开始。

WIFI_EVENT_STA_DISCONNECTED

此事件将在以下情况下产生：

- 调用了函数*esp_wifi_disconnect()* 或*esp_wifi_stop()*，且 Wi-Fi station 已成功连接至 AP。
- 调用了函数*esp_wifi_connect()*，但 Wi-Fi 驱动程序因为某些原因未能成功连接至 AP，例如：未扫描到目标 AP、验证超时等。或存在多个 SSID 相同的 AP，station 无法连接所有已找到的 AP，也将产生该事件。
- Wi-Fi 连接因为某些原因而中断，例如：station 连续多次丢失 N beacon、AP 踢掉 station、AP 认证模式改变等。

接收到此事件后，事件任务的默认动作为：

- 关闭 station 的 LwIP netif。
- 通知 LwIP 任务清除导致所有套接字状态错误的 UDP/TCP 连接。针对基于套接字编写的应用程序，其回调函数可以在接收到此事件时（如有必要）关闭并重新创建所有套接字。

应用程序处理此事件最常用的方法为：调用函数`esp_wifi_connect()` 重新连接 Wi-Fi。但是，如果此事件是由函数`esp_wifi_disconnect()` 引发的，则应用程序不应调用`esp_wifi_connect()` 来重新连接。应用程序须明确区分此事件的引发原因，因为某些情况下应使用其它更好的方式进行重新连接。请参阅*Wi-Fi 重新连接* 和*连接 Wi-Fi 时扫描*。

需要注意的另一点是：接收到此事件后，LwIP 的默认动作是终止所有 TCP 套接字连接。大多数情况下，该动作不会造成影响。但对某些特殊应用程序可能除外。例如：

- 应用程序创建一个了 TCP 连接，以维护每 60 秒发送一次的应用程序级、保持活动状态的数据。
- 由于某些原因，Wi-Fi 连接被切断并引发了 *WIFI_EVENT_STA_DISCONNECTED* 事件。根据当前实现，此时所有 TCP 连接都将被移除，且保持活动的套接字将处于错误的状态中。但是，由于应用程序设计者认为网络层 **不应**考虑这个 Wi-Fi 层的错误，因此应用程序不会关闭套接字。
- 5 秒后，因为在应用程序的事件回调函数中调用了`esp_wifi_connect()`，Wi-Fi 连接恢复。**同时，station 连接至同一个 AP 并获得与之前相同的 IPV4 地址**。
- 60 秒后，当应用程序发送具有保持活动状态的套接字的数据时，套接字将返回错误，应用程序将关闭套接字并在必要时重新创建。

在上述场景中，理想状态下应用程序套接字和网络层将不会受到影响，因为在此过程中 Wi-Fi 连接只是短暂地断开然后快速恢复。应用程序可通过 LwIP menuconfig 启动“IP 改变时保持 TCP 连接”的功能。

IP_EVENT_STA_GOT_IP

当 DHCP 客户端成功从 DHCP 服务器获取 IPV4 地址或 IPV4 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

IPV4 地址可能由于以下原因而发生改变：

- DHCP 客户端无法重新获取/绑定 IPV4 地址，且 station 的 IPV4 重置为 0。
- DHCP 客户端重新绑定了其它地址。
- 静态配置的 IPV4 地址已发生改变。

函数 `ip_event_got_ip_t` 中的字段 `ip_change` 说明了 IPV4 地址是否发生改变。

套接字的状态是基于 IPV4 地址的，这意味着，如果 IPV4 地址发生改变，则所有与此 IPV4 相关的套接字都将变为异常。接收到此事件后，应用程序需关闭所有套接字，并在 IPV4 变为有效地址时重新创建应用程序。

IP_EVENT_GOT_IP6

当 IPV6 SLAAC 支持自动为 ESP32-C3 配置一个地址，或 ESP32-C3 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

IP_EVENT_STA_LOST_IP

当 IPV4 地址失效时，将引发此事件。

此事件不会在 Wi-Fi 断连后立刻出现。Wi-Fi 连接断开后，首先将启动一个 IPV4 地址丢失计时器，如果 station 在该计时器超时之前成功获取了 IPV4 地址，则不会发生此事件。否则，此事件将在计时器超时时发生。

一般来说，应用程序可忽略此事件。这只是一个调试事件，主要使应用程序获知 IPV4 地址已丢失。

WIFI_EVENT_AP_START

与*WIFI_EVENT_STA_START* 事件相似。

WIFI_EVENT_AP_STOP

与*WIFI_EVENT_STA_STOP* 事件相似。

WIFI_EVENT_AP_STACONNECTED

每当有一个 station 成功连接 ESP32-C3 AP 时，将引发此事件。接收到此事件后，事件任务将不做任何响应，应用程序的回调函数也可忽略这一事件。但是，您可以在此时进行一些操作，例如：获取已连接 station 的信息等。

WIFI_EVENT_AP_STADISCONNECTED

此事件将在以下情况下发生：

- 应用程序通过调用函数*esp_wifi_disconnect()* 或*esp_wifi_deauth_sta()* 手动断开 station 连接。
- Wi-Fi 驱动程序出于某些原因断开 station 连接，例如：AP 在过去 5 分钟（可通过函数*esp_wifi_set_inactive_time()* 修改该时间）内未接收到任何数据包等。
- station 断开与 AP 之间的连接。

发生此事件时，事件任务将不做任何响应，但应用程序的事件回调函数需执行一些操作，例如：关闭与此 station 相关的套接字等。

WIFI_EVENT_AP_PROBEREQRECVED

默认情况下，此事件处于禁用状态，应用程序可以通过调用 API *esp_wifi_set_event_mask()* 启用。启用后，每当 AP 接收到 probe request 时都将引发此事件。

WIFI_EVENT_STA_BEACON_TIMEOUT

如果 station 在 inactive 时间内未收到所连接 AP 的 beacon，将发生 beacon 超时，将引发此事件。inactive 时间通过调用函数*esp_wifi_set_inactive_time()* 设置。

4.30.7 ESP32-C3 Wi-Fi station 一般情况

下图为 station 模式下的宏观场景，其中包含不同阶段的具体描述：

1. Wi-Fi/LwIP 初始化阶段

- s1.1：主任务通过调用函数*esp_netif_init()* 创建一个 LwIP 核心任务，并初始化 LwIP 相关工作。
- s1.2：主任务通过调用函数*esp_event_loop_create()* 创建一个系统事件任务，并初始化应用程序事件的回调函数。在此情况下，该回调函数唯一的动作就是将事件中继到应用程序任务中。
- s1.3：主任务通过调用函数*esp_netif_create_default_wifi_ap()* 或*esp_netif_create_default_wifi_sta()* 创建有 TCP/IP 堆栈的默认网络接口实例绑定 station 或 AP。
- s1.4：主任务通过调用函数*esp_wifi_init()* 创建 Wi-Fi 驱动程序任务，并初始化 Wi-Fi 驱动程序。
- s1.5：主任务通过调用 OS API 创建应用程序任务。

推荐按照 s1.1 ~ s1.5 的步骤顺序针对基于 Wi-Fi/LwIP 的应用程序进行初始化。但这一顺序 **并非**强制，您可以在第 s1.1 步创建应用程序任务，然后在该应用程序任务中进行所有其它初始化操作。不过，如果您的应用程序任务依赖套接字，那么在初始化阶段创建应用程序任务可能并不适用。此时，您可以在接收到 IP 后再进行任务创建。

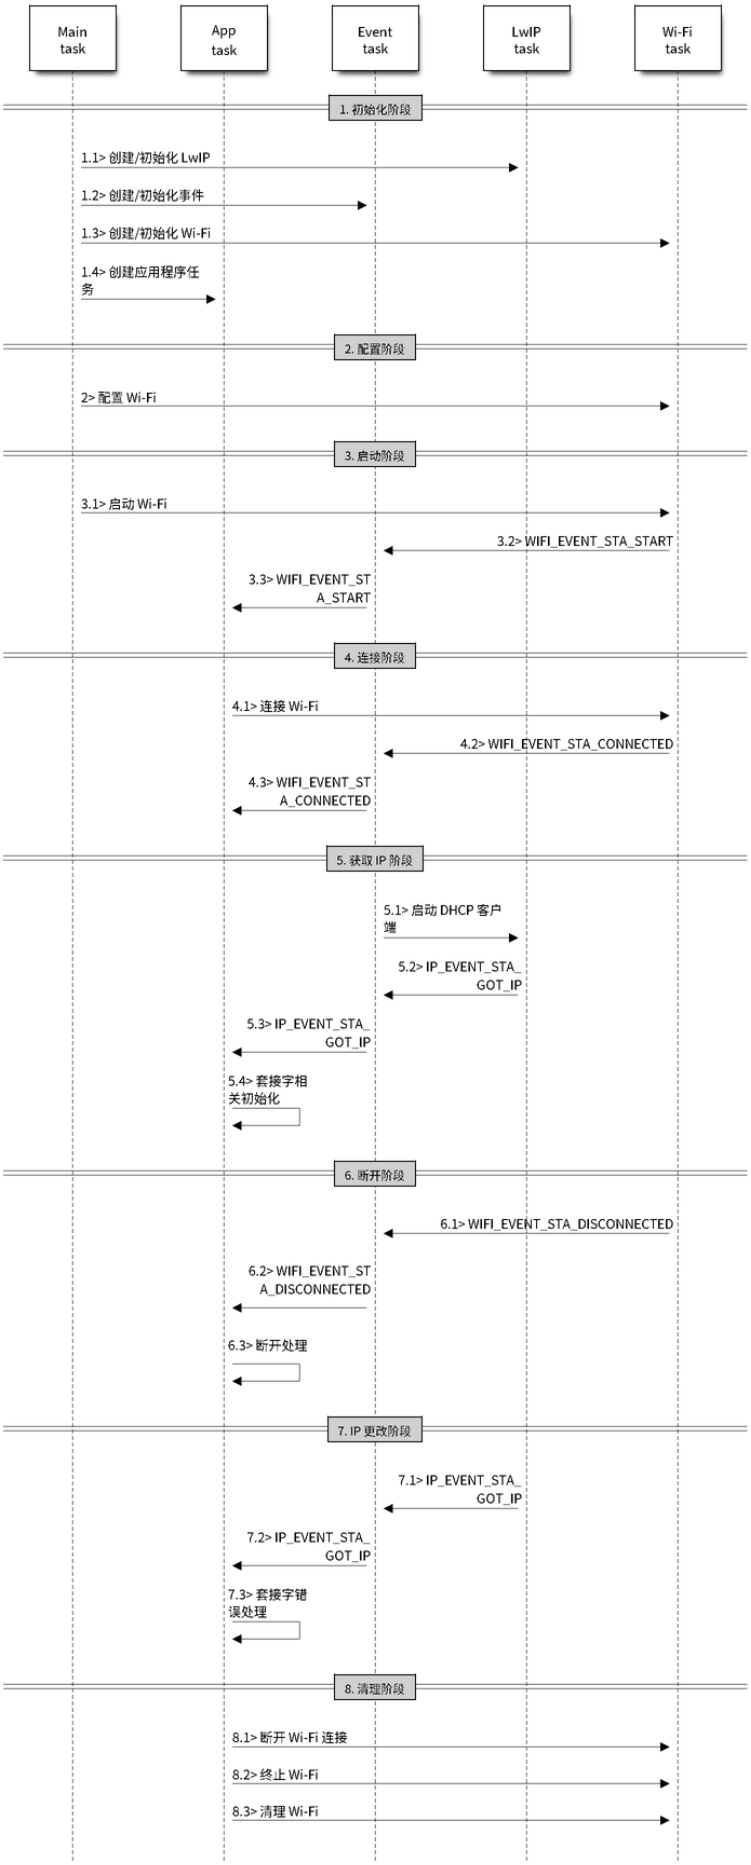

图 54: station 模式下 Wi-Fi 事件场景示例

2. Wi-Fi 配置阶段

Wi-Fi 驱动程序初始化成功后，可以进入到配置阶段。该场景下，Wi-Fi 驱动程序处于 station 模式。因此，首先您需调用函数`esp_wifi_set_mode()` (WIFI_MODE_STA) 将 Wi-Fi 模式配置为 station 模式。可通过调用其它 esp_wifi_set_xxx API 进行更多设置，例如：协议模式、国家代码、带宽等。请参阅*ESP32-C3 Wi-Fi 配置*。

一般情况下，我们会在建立 Wi-Fi 连接之前配置 Wi-Fi 驱动程序，但这 **并非**强制要求。也就是说，只要 Wi-Fi 驱动程序已成功初始化，您可以在任意阶段进行配置。但是，如果您的 Wi-Fi 在建立连接后不需要更改配置，则应先在此阶段完成配置。因为调用配置 API（例如`esp_wifi_set_protocol()`）将会导致 Wi-Fi 连接断开，为您的操作带来不便。

如果 menuconfig 已使能 Wi-Fi NVS flash，则不论当前阶段还是后续的 Wi-Fi 配置信息都将被存储至该 flash 中。那么，当主板上电/重新启动时，就不需从头开始配置 Wi-Fi 驱动程序。您只需调用函数 esp_wifi_get_xxx API 获取之前存储的配置信息。当然，如果不想使用之前的配置，您依然可以重新配置 Wi-Fi 驱动程序。

3. Wi-Fi 启动阶段

- s3.1：调用函数`esp_wifi_start()` 启动 Wi-Fi 驱动程序。
- s3.2：Wi-Fi 驱动程序将事件*WIFI_EVENT_STA_START* 发布到事件任务中，然后，事件任务将执行一些正常操作并调用应用程序的事件回调函数。
- s3.3：应用程序的事件回调函数将事件*WIFI_EVENT_STA_START* 中继到应用程序任务中。推荐您此时调用函数`esp_wifi_connect()` 进行 Wi-Fi 连接。当然，您也可以等待在*WIFI_EVENT_STA_START* 事件发生后的其它阶段再调用此函数。

4. Wi-Fi 连接阶段

- s4.1：调用函数`esp_wifi_connect()` 后，Wi-Fi 驱动程序将启动内部扫描/连接过程。
- s4.2：如果内部扫描/连接过程成功，将产生*WIFI_EVENT_STA_CONNECTED* 事件。然后，事件任务将启动 DHCP 客户端服务，最终触发 DHCP 程序。
- s4.3：在此情况下，应用程序的事件回调函数会将*WIFI_EVENT_STA_CONNECTED* 事件中继到应用程序任务中。通常，应用程序不需进行操作，而您可以执行任何动作，例如：打印日志等。

步骤 s4.2 中 Wi-Fi 连接可能会由于某些原因而失败，例如：密码错误、未找到 AP 等。这种情况下，将引发*WIFI_EVENT_STA_DISCONNECTED* 事件并提示连接错误原因。有关如何处理中断 Wi-Fi 连接的事件，请参阅下文阶段 6 的描述。

5. Wi-Fi 获取 IP 阶段

- s5.1：一旦步骤 4.2 中的 DHCP 客户端初始化完成，Wi-Fi 驱动程序将进入 *获取 IP* 阶段。
- s5.2：如果 Wi-Fi 成功从 DHCP 服务器接收到 IP 地址，则将引发*IP_EVENT_STA_GOT_IP* 事件，事件任务将执行正常处理。
- s5.3：应用程序的事件回调函数将事件*IP_EVENT_STA_GOT_IP* 中继到应用程序任务中。对于那些基于 LwIP 构建的应用程序，此事件较为特殊，因为它意味着应用程序已准备就绪，可以开始任务，例如：创建 TCP/UDP 套接字等。此时较为容易犯的一个错误就是在接收到*IP_EVENT_STA_GOT_IP* 事件之前就初始化套接字。**切忌在接收到 IP 之前启动任何套接字相关操作**。

6. Wi-Fi 断开阶段

- s6.1：当 Wi-Fi 因为某些原因（例如：AP 掉电、RSSI 较弱等）连接中断时，将产生*WIFI_EVENT_STA_DISCONNECTED* 事件。此事件也可能在上文阶段 3 中发生。在这里，事件任务将通知 LwIP 任务清除/移除所有 UDP/TCP 连接。然后，所有应用程序套接字都将处于错误状态。也就是说，*WIFI_EVENT_STA_DISCONNECTED* 事件发生时，任何套接字都无法正常工作。
- s6.2：上述情况下，应用程序的事件回调函数会将*WIFI_EVENT_STA_DISCONNECTED* 事件中继到应用程序任务中。推荐您调用函数`esp_wifi_connect()` 重新连接 Wi-Fi，关闭所有套接字，并在必要时重新创建套接字。请参阅*WIFI_EVENT_STA_DISCONNECTED*。

7. Wi-Fi IP 更改阶段

- s7.1：如果 IP 地址发生更改，将引发*IP_EVENT_STA_GOT_IP* 事件，其中 “ip_change” 被置为 “true”。
- s7.2：**此事件对应用程序至关重要。这一事件发生时，适合关闭所有已创建的套接字并进行重新创建。**

8. Wi-Fi 清理阶段

- s8.1：调用函数`esp_wifi_disconnect()` 断开 Wi-Fi 连接。
- s8.2：调用函数`esp_wifi_stop()` 终止 Wi-Fi 驱动程序。
- s8.3：调用函数`esp_wifi_deinit()` 清理 Wi-Fi 驱动程序。

4.30.8 ESP32-C3 Wi-Fi AP 一般情况

下图为 AP 模式下的宏观场景，其中包含不同阶段的具体描述：

4.30.9 ESP32-C3 Wi-Fi 扫描

目前，仅 station 或 station/AP 共存模式支持`esp_wifi_scan_start()` API。

扫描类型

模式	描述
主动扫描	通过发送 probe request 进行扫描。该模式为默认的扫描模式。
被动扫描	不发送 probe request。跳至某一特定信道并等待 beacon。应用程序可通过 wifi_scan_config_t 中的 scan_type 字段使能被动扫描。
前端扫描	在 station 模式下 Wi-Fi 未连接时，可进行前端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描，应用程序无法配置这两种模式。
后端扫描	在 station 模式或 station/AP 共存模式下 Wi-Fi 已连接时，可进行后端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描，应用程序无法配置这两种模式。
全信道扫描	扫描所有信道。wifi_scan_config_t 中的 channel 字段为 0 时，当前模式为全信道扫描。
特定信道扫描	仅扫描特定的信道。wifi_scan_config_t 中的 channel 字段为 1-14 时，当前模式为特定信道扫描。

上表中的扫描模式可以任意组合，因此共有 8 种不同扫描方式：

- 全信道后端主动扫描
- 全信道后端被动扫描
- 全信道前端主动扫描
- 全信道后端被动扫描
- 特定信道后端主动扫描
- 特定信道后端被动扫描
- 特定信道前端主动扫描
- 特定信道前端被动扫描

扫描配置

扫描类型与其他扫描属性通过函数`esp_wifi_scan_start()` 进行配置。下表详细描述了函数 wifi_scan_config_t 各字段信息。

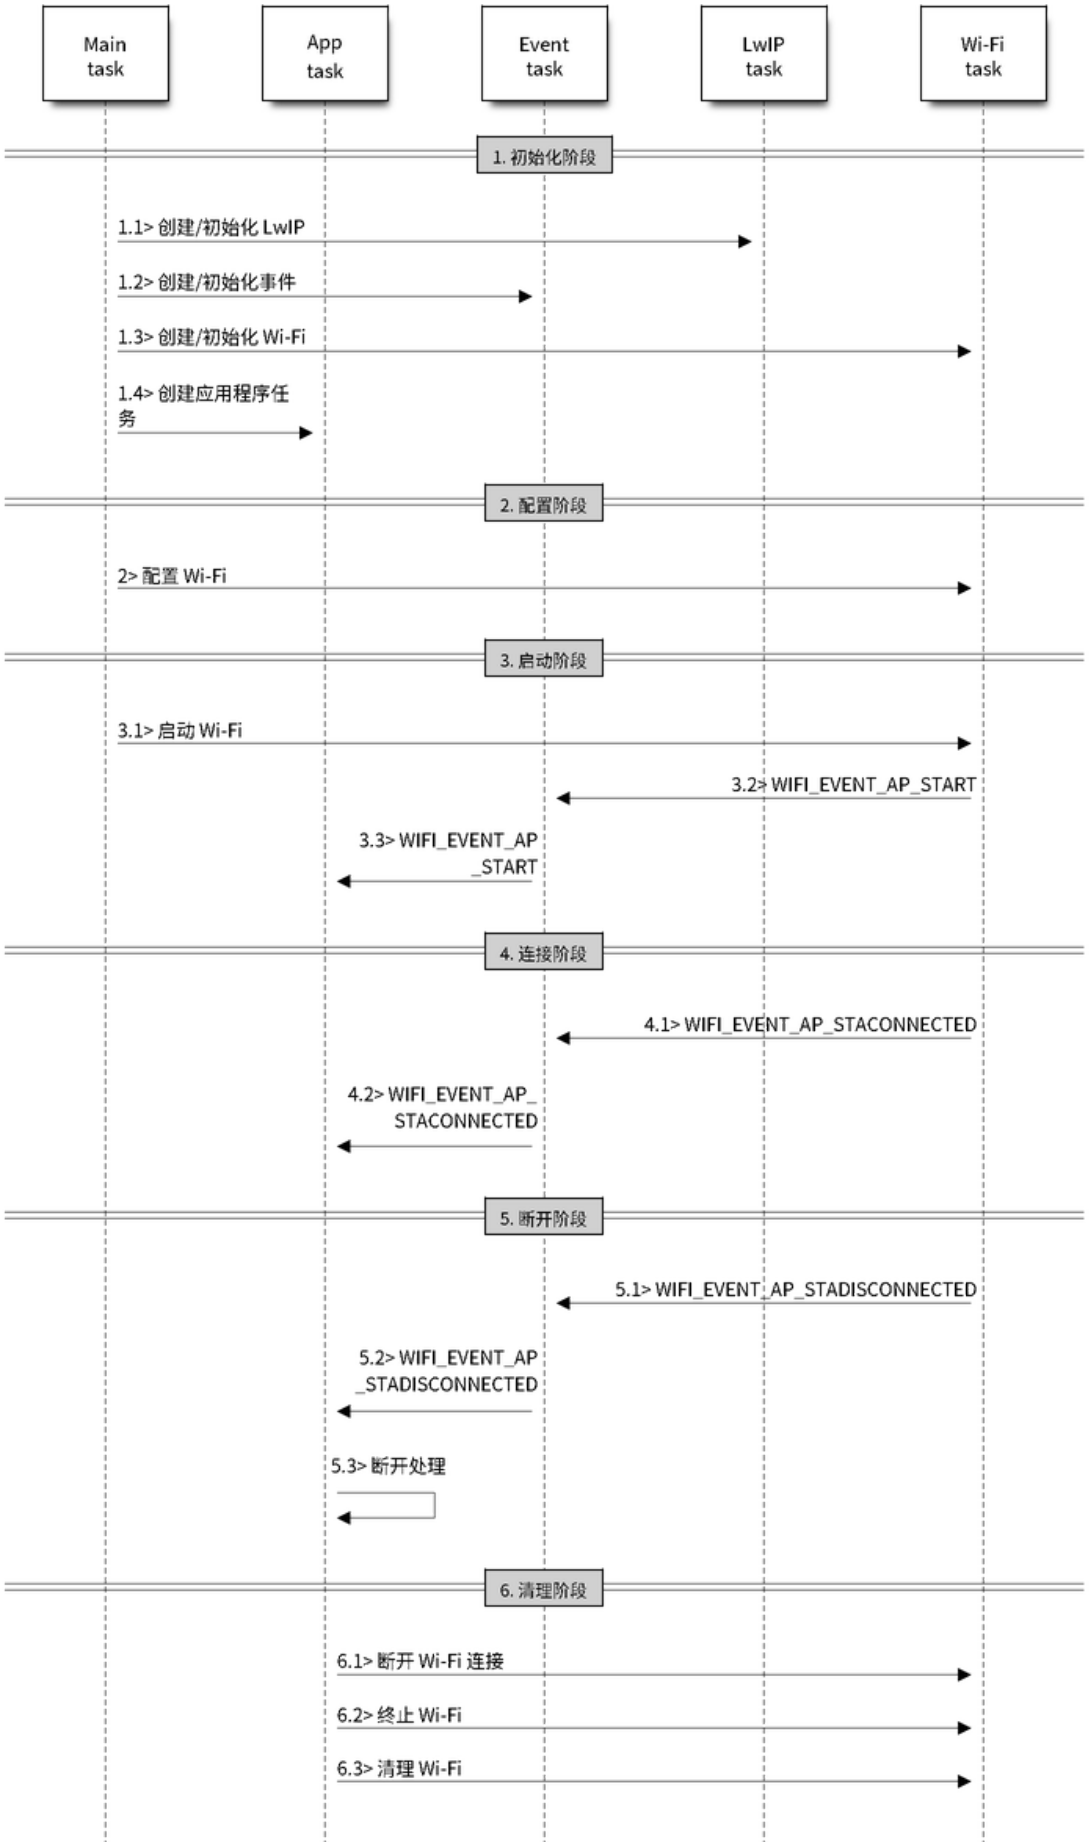

图 55: AP 模式下 Wi-Fi 事件场景示例

字段	描述
ssid	如果该字段的值不为 NULL，则仅可扫描到具有相同 SSID 值的 AP。
bssid	如果该字段的值不为 NULL，则仅可扫描到具有相同 BSSID 值的 AP。
channel	如果该字段值为 0，将进行全信道扫描；反之，将针对特定信道进行扫描。
show_hidden	如果该字段值为 0，本次扫描将忽略具有隐藏 SSID 的 AP；反之，这些 AP 也会在扫描时被视为正常 AP。
scan_type	如果该字段值为为 WIFI_SCAN_TYPE_ACTIVE，则本次扫描为主动扫描；反之，将被视为被动扫描。
scan_time	该字段用于控制每个信道的扫描时间。 被动扫描时，scan_time.passive 字段负责为每个信道指定扫描时间。 主动扫描时，每个信道的扫描时间如下列表所示。其中，min 代表 scan_time_active_min，max 代表 scan_time_active_max。 • min=0, max=0：每个信道的扫描时间为 120 ms。 • min>0, max=0：每个信道的扫描时间为 120 ms。 • min=0, max>0：每个信道的扫描时间为 `max` ms。 • min>0, max>0：每个信道扫描的最短时间为 `min` ms。如果在这段时间内未找到 AP，将跳转至下一个信道。如这段时间内找到 AP，则该信道的扫描时间为 `max` ms。 如希望提升 Wi-Fi 扫描性能，则可修改上述两个参数。

调用 API *esp_wifi_set_config()* 可全局配置一些扫描属性，请参阅*station 基本配置*。

在所有信道中扫描全部 AP（前端）

场景：

上述场景中描述了全信道前端扫描过程。仅 station 模式支持前端扫描，该模式下 station 未连接任何 AP。前端扫描还是后端扫描完全由 Wi-Fi 驱动程序决定，应用程序无法配置这一模式。

详细描述：

扫描配置阶段

- s1.1：如果默认的国家信息有误，调用函数*esp_wifi_set_country()* 进行配置。请参阅*Wi-Fi 国家/地区代码*。
- s1.2：调用函数*esp_wifi_scan_start()* 配置扫描信息，可参阅*扫描配置*。该场景为全信道扫描，将 SSID/BSSID/channel 设置为 0 即可。

Wi-Fi 驱动程序内部扫描阶段

- s2.1：Wi-Fi 驱动程序切换至信道 1，此时的扫描类型为 WIFI_SCAN_TYPE_ACTIVE，同时发送一个 probe request。反之，Wi-Fi 将等待接收 AP beacon。Wi-Fi 驱动程序将在信道 1 停留一段时间。min/max 扫描时间中定义了 Wi-Fi 在信道 1 中停留的时间长短，默认为 120 ms。
- s2.2：Wi-Fi 驱动程序跳转至信道 2，并重复进行 s2.1 中的步骤。
- s2.3:Wi-Fi 驱动程序扫描最后的信道 N，N 的具体数值由步骤 s1.1 中配置的国家代码决定。

扫描完成后事件处理阶段

- s3.1：当所有信道扫描全部完成后，将产生*WIFI_EVENT_SCAN_DONE* 事件。
- s3.2：应用程序的事件回调函数告知应用程序任务已接收到*WIFI_EVENT_SCAN_DONE* 事件。调用函数*esp_wifi_scan_get_ap_num()* 获取在本次扫描中找到的 AP 数量。然后，分配出足够的事物槽，并调用函数*esp_wifi_scan_get_ap_records()* 获取 AP 记录。请注意，一旦调用*esp_wifi_scan_get_ap_records()*，Wi-Fi 驱动程序中的 AP 记录将被释放。但是，请不要在单个扫描完成事件中重复调用两次*esp_wifi_scan_get_ap_records()*。反之，如果扫描完成事件发生后未调用*esp_wifi_scan_get_ap_records()*，则 Wi-Fi 驱动程序中的 AP 记录不会被释放。因此，请务必确保调用函数*esp_wifi_scan_get_ap_records()*，且仅调用一次。

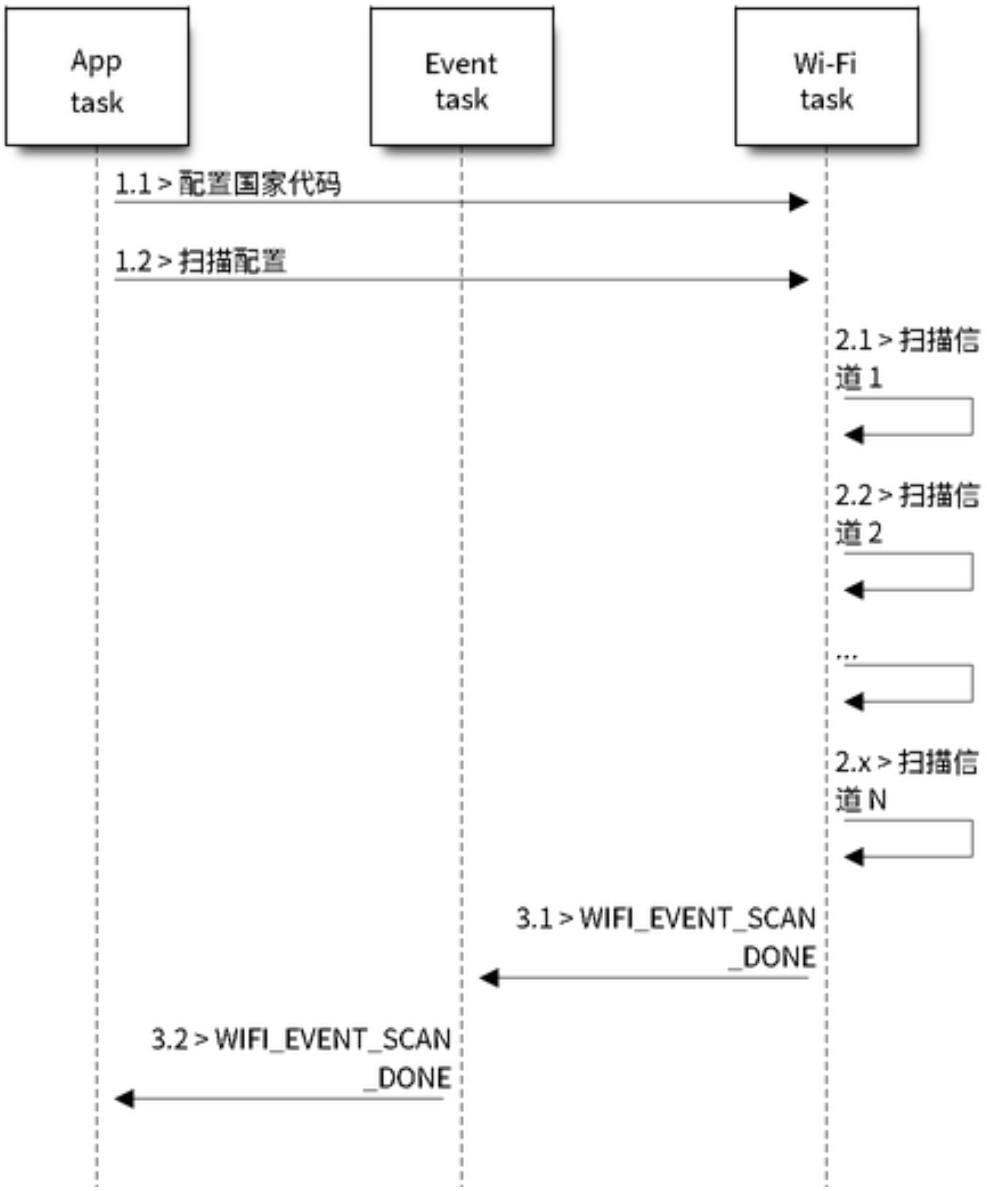

图 56: 所有 Wi-Fi 信道的前端扫描

在所有信道上扫描全部 AP（后端）

场景：

上述场景为一次全信道后端扫描。与*在所有信道中扫描全部 AP（前端）* 相比，全信道后端扫描的不同之处在于：在跳至下一个信道之前，Wi-Fi 驱动程序会先返回主信道停留 30 ms，以便 Wi-Fi 连接有一定的时间发送/接收数据。

在所有信道中扫描特定 AP

场景：

该扫描过程与*在所有信道中扫描全部 AP（前端）* 相似。区别在于：

- s1.1：在步骤 1.2 中，目标 AP 将配置为 SSID/BSSID。
- s2.1 ~ s2.N：每当 Wi-Fi 驱动程序扫描某个 AP 时，它将检查该 AP 是否为目标 AP。如果本次扫描类型为 WIFI_FAST_SCAN，且确认已找到目标 AP，则将产生扫描完成事件，同时结束本次扫描；反之，扫描将继续。请注意，第一个扫描的信道可能不是信道 1，因为 Wi-Fi 驱动程序会优化扫描顺序。

如果有多个匹配目标 AP 信息的 AP，例如：碰巧扫描到两个 SSID 为 “ap” 的 AP。如果本次扫描类型为 WIFI_FAST_SCAN，则仅可找到第一个扫描到的 “ap” ；如果本次扫描类型为 WIFI_ALL_CHANNEL_SCAN，则两个 “ap “都将被找到，且 station 将根据配置规则连接至其需要连接的 “ap”，请参阅*station 基本配置*。

您可以在任意信道中扫描某个特定的 AP，或扫描该信道中的所有 AP。这两种扫描过程也较为相似。

在 Wi-Fi 连接模式下扫描

调用函数`esp_wifi_connect()`后，Wi-Fi 驱动程序将首先尝试扫描已配置的 AP。Wi-Fi 连接模式下的扫描过程与*在所有信道中扫描特定 AP* 过程相同，但连接模式下扫描结束后将不会产生扫描完成事件。如果已找到目标 AP，则 Wi-Fi 驱动程序将开始 Wi-Fi 连接；反之，将产生*WIFI_EVENT_STA_DISCONNECTED* 事件。请参阅*在所有信道中扫描特定 AP*。

在禁用模式下扫描

如果函数`esp_wifi_scan_start()`中的禁用参数为 “true”，则本次扫描为禁用模式下的扫描。在该次扫描完成之前，应用程序任务都将被禁用。禁用模式下的扫描和正常扫描相似，不同之处在于，禁用模式下扫描完成之后将不会出现扫描完成事件。

并行扫描

有时，可能会有两个应用程序任务同时调用函数`esp_wifi_scan_start()`，或者某个应用程序任务在获取扫描完成事件之前再次调用了函数`esp_wifi_scan_start()`。这两种情况都有可能会发生。**但是，Wi-Fi 驱动程序并不足以支持多个并行的扫描。因此，应避免上述并行扫描。**随着 ESP32-C3 的 Wi-Fi 功能不断提升，未来的版本中可能会增加并行扫描支持。

连接 Wi-Fi 时扫描

如果 Wi-Fi 正在连接，则调用函数`esp_wifi_scan_start()`后扫描将立即失败，因为 Wi-Fi 连接优先级高于扫描。如果扫描是因为 Wi-Fi 连接而失败的，此时推荐采取的策略为：等待一段时间后重试。因为一旦 Wi-Fi 连接完成后，扫描将立即成功。

但是，延时重试策略并非万无一失。试想以下场景：

- 如果 station 正在连接一个不存在的 AP，或正在使用错误的密码连接一个 AP，此时将产生事件*WIFI_EVENT_STA_DISCONNECTED*。
- 接收到断开连接事件后，应用程序调用函数`esp_wifi_connect()`进行重新连接。

图 57: 所有 Wi-Fi 信道的后端扫描

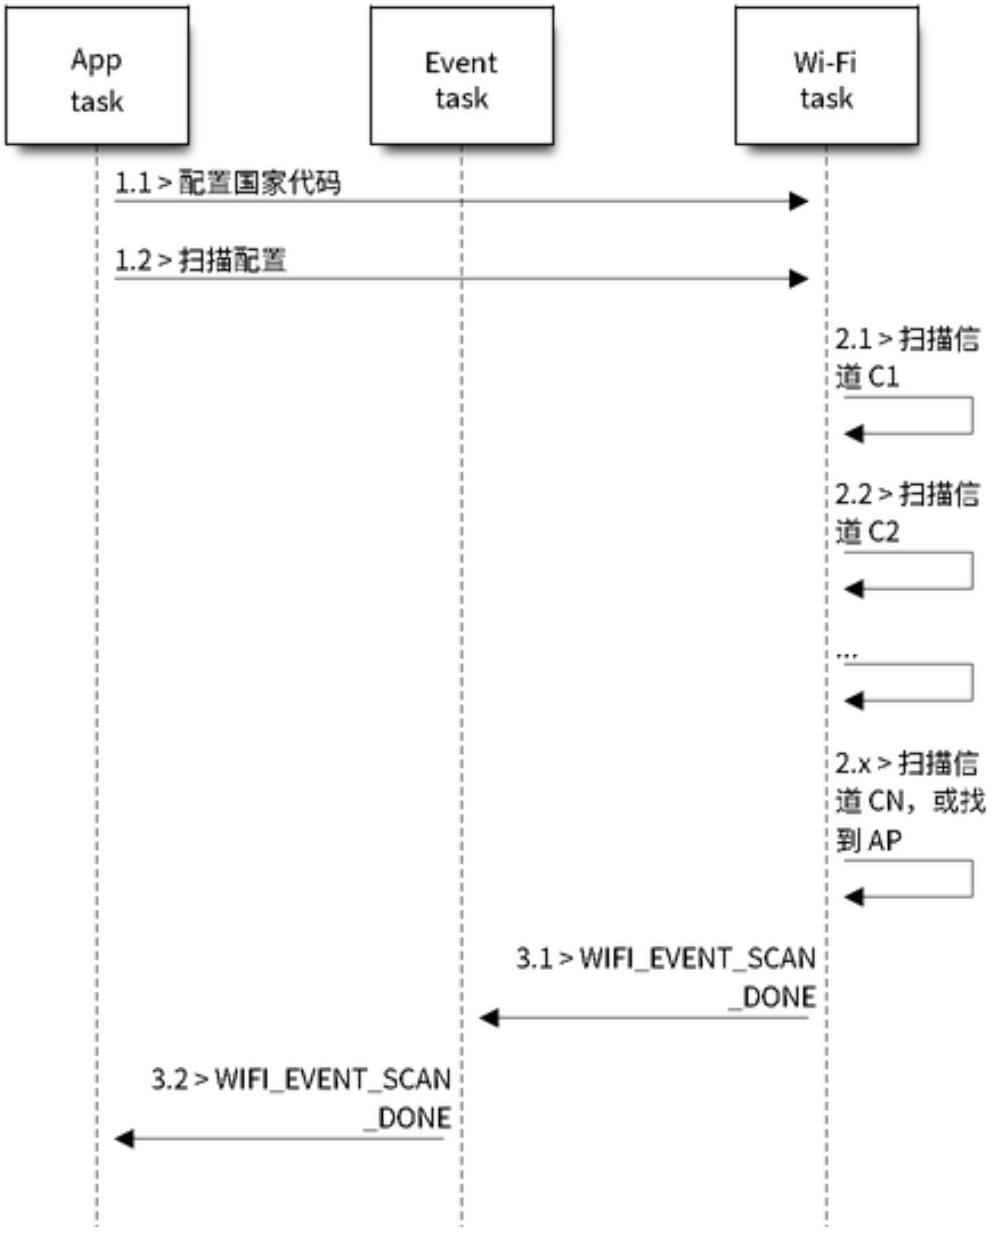

图 58: 扫描特定的 Wi-Fi 信道

- 而另一个应用程序任务（如，控制任务）调用了函数`esp_wifi_scan_start()`进行扫描。这种情况下，每一次扫描都会立即失败，因为 station 一直处于正在连接状态。
- 扫描失败后，应用程序将等待一段时间后进行重新扫描。

上述场景中的扫描永远不会成功，因为 Wi-Fi 一直处于正在连接过程中。因此，如果您的应用程序也可能发生相似的场景，那么就需要为其配置一个更佳的重新连接策略。例如：

- 应用程序可以定义一个连续重新连接次数的最大值，当重新连接的次数达到这个最大值时，立刻停止重新连接。
- 应用程序可以在首轮连续重新连接 N 次后立即进行重新连接，然后延时一段时间后再进行下一次重新连接。

可以给应用程序定义其特殊的重新连接策略，以防止扫描无法成功。请参阅*Wi-Fi 重新连接*。

4.30.10 ESP32-C3 Wi-Fi station 连接场景

该场景仅针对在扫描阶段只找到一个目标 AP 的情况，对于多个相同 SSID AP 的情况，请参阅*找到多个 AP 时的 ESP32-C3 Wi-Fi station 连接*。

通常，应用程序无需关心这一连接过程。如感兴趣，可参看下述简介。

场景：

扫描阶段

- s1.1：Wi-Fi 驱动程序开始在 “Wi-Fi 连接” 模式下扫描。详细信息请参阅*在 Wi-Fi 连接模式下扫描*。
- s1.2：如果未找到目标 AP，将产生*WIFI_EVENT_STA_DISCONNECTED* 事件，且原因代码为 WIFI_REASON_NO_AP_FOUND。请参阅*Wi-Fi 原因代码*。

认证阶段

- s2.1：发送认证请求数据包并使能认证计时器。
- s1.2：如果在认证计时器超时之前未接收到认证响应数据包，将产生*WIFI_EVENT_STA_DISCONNECTED* 事件，且原因代码为 WIFI_REASON_AUTH_EXPIRE。请参阅*Wi-Fi 原因代码*。
- s2.3：接收到认证响应数据包，且认证计时器终止。
- s2.4：AP 在响应中拒绝认证且产生*WIFI_EVENT_STA_DISCONNECTED* 事件，原因代码为 WIFI_REASON_AUTH_FAIL 或为 AP 指定的其它原因。请参阅*Wi-Fi 原因代码*。

关联阶段

- s3.1：发送关联请求并使能关联计时器。
- s3.2：如果在关联计时器超时之前未接收到关联响应，将产生*WIFI_EVENT_STA_DISCONNECTED* 事件，且原因代码为 WIFI_REASON_ASSOC_EXPIRE。请参阅*Wi-Fi 原因代码*。
- s3.3：接收到关联响应，且关联计时器终止。
- s3.4：AP 在响应中拒绝关联且产生*WIFI_EVENT_STA_DISCONNECTED* 事件，原因代码将在关联响应中指定。请参阅*Wi-Fi 原因代码*。

四次握手阶段

- s4.1：使能握手定时器，定时器终止之前未接收到 1/4 EAPOL，此时将产生*WIFI_EVENT_STA_DISCONNECTED* 事件，且原因代码为 WIFI_REASON_HANDSHAKE_TIMEOUT。请参阅*Wi-Fi 原因代码*。
- s4.2：接收到 1/4 EAPOL。
- s4.3：station 回复 2/4 EAPOL。
- s4.4：如果在握手定时器终止之前未接收到 3/4 EAPOL，将产生*WIFI_EVENT_STA_DISCONNECTED* 事件，且原因代码为 WIFI_REASON_HANDSHAKE_TIMEOUT。请参阅*Wi-Fi 原因代码*。

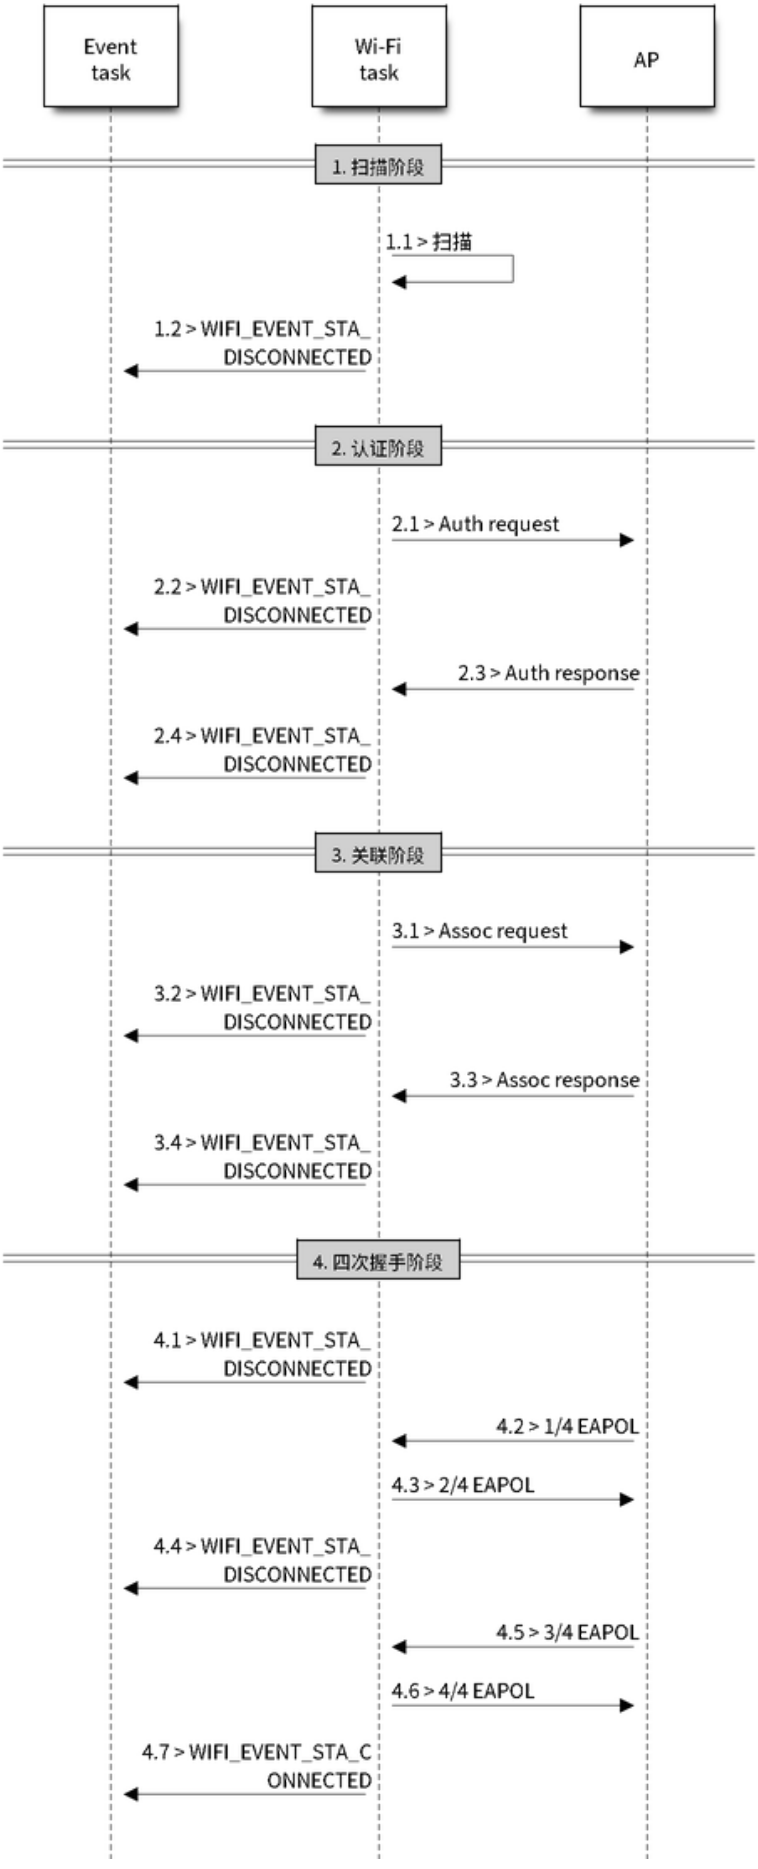

图 59: Wi-Fi station 连接过程

- s4.5：接收到 3/4 EAPOL。
- s4.6：station 回复 4/4 EAPOL。
- s4.7：station 产生 *WIFI_EVENT_STA_CONNECTED* 事件。

Wi-Fi 原因代码

下表罗列了 ESP32-C3 中定义的原因代码。其中，第一列为 esp_wifi_types.h 中定义的宏名称。名称中省去了前缀 *WIFI_REASON*，也就是说，名称 *UNSPECIFIED* 实际应为 *WIFI_REASON_UNSPECIFIED*，以此类推。第二列为原因代码的相应数值。第三列为该原因映射到 IEEE 802.11-2012 中 8.4.1.7 段的标准值。（更多详细信息，请参阅前文描述。）最后一列为这一原因的描述。

原因代码	数值	映射值	描述
UNSPECIFIED	1	1	出现内部错误，例如：内存已满，内部发送失败，或该原因已被远端接收等。
AUTH_EXPIRE	2	2	先前的 authentication 已失效。 对于 ESP station，出现以下情况时将报告该代码： • authentication 超时； • 从 AP 接收到该代码。 对于 ESP AP，出现以下情况时将报告该代码： • 在过去五分钟之内，AP 未从 station 接收到任何数据包； • 由于调用了函数*esp_wifi_stop()* 导致 AP 终止； • 由于调用了函数*esp_wifi_deauth_sta()* 导致 station 的 authentication 取消。
AUTH_LEAVE	3	3	authentication 取消，因为发送 station 正在离开（或已经离开）。 对于 ESP station，出现以下情况时报告该代码： • 从 AP 接收到该代码。
ASSOC_EXPIRE	4	4	因为 AP 不活跃，association 取消。 对于 ESP station，出现以下情况时报告该代码： • 从 AP 接收到该代码。 对于 ESP AP，出现以下情况时将报告该代码： • 在过去五分钟之内，AP 未从 station 接收到任何数据包； • 由于调用了函数*esp_wifi_stop()* 导致 AP 终止； • 由于调用了函数*esp_wifi_deauth_sta()* 导致 station 的 authentication 取消。
ASSOC_TOOMANY	5	5	association 取消，因为 AP 无法同时处理所有当前已关联的 STA。 对于 ESP station，出现以下情况时报告该代码： • 从 AP 接收到该代码。 对于 ESP AP，出现以下情况时将报告该代码： • 与 AP 相关联的 station 数量已到达 AP 可支持的最大值。
NOT_AUTHED	6	6	从一个未认证 station 接收到 class-2 frame。 对于 ESP station，出现以下情况时报告该代码： • 从 AP 接收到该代码。 对于 ESP AP，出现以下情况时将报告该代码： • AP 从一个未认证 station 接收到数据包。
NOT_ASSOCED	7	7	从一个未关联 station 接收到的 class-3 frame。 对于 ESP station，出现以下情况时报告该代码： • 从 AP 接收到该代码。 对于 ESP AP，出现以下情况时将报告该代码： • AP 从未关联 station 接收到数据包。
ASSOC_LEAVE	8	8	association 取消，因为发送 station 正在离开（或已经离开）BSS。 对于 ESP station，出现以下情况时报告该代码： • 从 AP 接收到该代码。 • 由于调用*esp_wifi_disconnect()* 和其它 API，station 断开连接。
ASSOC_NOT_AUTHED	9	9	station 请求关联(association) 请求未被响应 station 认证。 对于 ESP station，出现以下情况时报告该代码： • 从 AP 接收到该代码。 对于 ESP AP，出现以下情况时将报告该代码： • AP 从一个未关联 station 接收到数据包。

Submit Document Feedback

4.30.11 找到多个 AP 时的 ESP32-C3 Wi-Fi station 连接

该场景与*ESP32-C3 Wi-Fi station 连接场景*相似，不同之处在于该场景中不会产生*WIFI_EVENT_STA_DISCONNECTED*事件，除非 station 无法连接所有找到的 AP。

4.30.12 Wi-Fi 重新连接

出于多种原因，station 可能会断开连接，例如：连接的 AP 重新启动等。应用程序应负责重新连接。推荐使用的方法为：在接收到*WIFI_EVENT_STA_DISCONNECTED*事件后调用函数`esp_wifi_connect()`。

但有时，应用程序需要更复杂的方式进行重新连接：

- 如果断开连接事件是由调用函数`esp_wifi_disconnect()`引发的，那么应用程序可能不希望进行重新连接。
- 如果 station 随时可能调用函数`esp_wifi_scan_start()`开始扫描，此时就需要一个更佳的重新连接方法，请参阅*连接 Wi-Fi 时扫描*。

另一点需要注意的是，如果存在多个具有相同 SSID 的 AP，那么重新连接后可能不会连接到之前的同一个 AP。重新连接时，station 将永远选择最佳的 AP 进行连接。

4.30.13 Wi-Fi beacon 超时

ESP32-C3 使用 beacon 超时机制检测 AP 是否活跃。如果 station 在 inactive 时间内未收到所连接 AP 的 beacon，将发生 beacon 超时。inactive 时间通过调用函数`esp_wifi_set_inactive_time()`设置。

beacon 超时发生后，station 将向 AP 发送 5 个 probe request，如果仍未从 AP 接收到 probe response 或 beacon，station 将与 AP 断开连接并产生*WIFI_EVENT_STA_DISCONNECTED*事件。

需要注意的是，扫描过程中会重置 beacon 超时所使用的定时器，即扫描过程会影响*WIFI_EVENT_STA_BEACON_TIMEOUT*事件的触发。

4.30.14 ESP32-C3 Wi-Fi 配置

使能 Wi-Fi NVS 时，所有配置都将存储到 flash 中；反之，请参阅*Wi-Fi NVS Flash*。

Wi-Fi 模式

调用函数`esp_wifi_set_mode()`设置 Wi-Fi 模式。

模式	描述
WIFI_MODE_NULL	NULL 模式：此模式下，内部数据结构不分配给 station 和 AP，同时，station 和 AP 接口不会为发送/接收 Wi-Fi 数据进行初始化。通常，此模式用于 Sniffer，或者您不想通过调用函数 `esp_wifi_deinit()` 卸载整个 Wi-Fi 驱动程序来同时停止 station 和 AP。
WIFI_MODE_STA	station 模式：此模式下，`esp_wifi_start()` 将初始化内部 station 数据，同时 station 接口准备发送/接收 Wi-Fi 数据。调用函数`esp_wifi_connect()` 后，station 将连接到目标 AP。
WIFI_MODE_AP	AP 模式：在此模式下，`esp_wifi_start()` 将初始化内部 AP 数据，同时 AP 接口准备发送/接收 Wi-Fi 数据。随后，Wi-Fi 驱动程序开始广播 beacon，AP 即可与其它 station 连接。
WIFI_MODE_APSTA	station/AP 共存模式：在此模式下，函数 `esp_wifi_start()` 将同时初始化 station 和 AP。该步骤在 station 模式和 AP 模式下完成。请注意 ESP station 所连外部 AP 的信道优先于 ESP AP 信道。

station 基本配置

API esp_wifi_set_config() 可用于配置 station。下表详细介绍了各个字段。

字段	描述
ssid	station 想要连接的目标 AP 的 SSID。
password	目标 AP 的密码。
scan_method	WIFI_FAST_SCAN 模式下，扫描到一个匹配的 AP 时即结束。WIFI_ALL_CHANNEL_SCAN 模式下，在所有信道扫描所有匹配的 AP。默认扫描模式是 WIFI_FAST_SCAN。
bssid_set	如果 bssid_set 为 0，station 连接 SSID 与 “ssid” 字段相同的 AP，同时忽略字段 “bssid”。其他情况下，station 连接 SSID 与 “ssid” 字段相同、BSSID 与 “bssid” 字段也相同的 AP。
bssid	只有当 bssid_set 为 1 时有效。见字段 “bssid_set”。
channel	该字段为 0 时，station 扫描信道 1 ~ N 寻找目标 AP；否则，station 首先扫描值与 “channel” 字段相同的信道，再扫描其他信道。如果您不知道目标 AP 在哪个信道，请将该字段设置为 0。
sort_method	该字段仅用于 WIFI_ALL_CHANNEL_SCAN 模式。 如果设置为 WIFI_CONNECT_AP_BY_SIGNAL，所有匹配的 AP 将会按照信号强度排序，信号最好的 AP 会被首先连接。比如，如果 station 想要连接 ssid 为 “apxx” 的 AP，且扫描到两个这样的 AP。第一个 AP 的信号为 -90 dBm，第二个 AP 的信号为 -30 dBm，station 首先连接第二个 AP。除非失败，才会连接第一个。 如果设置为 WIFI_CONNECT_AP_BY_SECURITY，所有匹配的 AP 将会按照安全性排序。比如，如果 station 想要连接 ssid 为 “apxx” 的 AP，并且扫描到两个这样的 AP。第一个 AP 为开放式，第二个 AP 为 WPA2 加密，station 首先连接第二个 AP。除非失败，才会连接第一个。
threshold	该字段用来筛选找到的 AP，如果 AP 的 RSSI 或安全模式小于配置的阈值，则不会被连接。 如果 RSSI 设置为 0，则表示默认阈值、默认 RSSI 阈值为 -127 dBm。如果 authmode 阈值设置为 0，则表示默认阈值，默认 authmode 阈值无授权。

注意： WEP/WPA 安全模式在 IEEE802.11-2016 协议中已弃用，建议不要使用。可使用 authmode 阈值代替，通过将 threshold.authmode 设置为 WIFI_AUTH_WPA2_PSK 使用 WPA2 模式

AP 基本配置

API esp_wifi_set_config() 可用于配置 AP。下表详细介绍了各个字段。

字段	描述
ssid	指 AP 的 SSID。如果 ssid[0] 和 ssid[1] 均为 0xFF，AP 默认 SSID 为 ESP_aabbcc，” aabbcc” 是 AP MAC 的最后三个字节。
password	AP 的密码。如果身份验证模式为 WIFI_AUTH_OPEN，此字段将被忽略。
ssid_len	SSID 的长度。如果 ssid_len 为 0，则检查 SSID 直至出现终止字符。如果 ssid_len 大于 32，请更改为 32，或者根据 ssid_len 设置 SSID 长度。
channel	AP 的信道。如果信道超出范围，Wi-Fi 驱动程序将默认该信道为信道 1。所以，请确保信道在要求的范围内。有关详细信息，请参阅 *Wi-Fi 国家/地区代码*。
authmode	ESP AP 的身份验证模式。目前，ESP Wi-Fi 不支持 AUTH_WEP。如果 authmode 是一个无效值，AP 默认该值为 WIFI_AUTH_OPEN。
ssid_hidden	如果 ssid_hidden 为 1，AP 不广播 SSID。若为其他值，则广播。
max_connection	目前，ESP Wi-Fi 支持 10 个 Wi-Fi 连接。如果 max_connection 大于 10，AP 默认该值为 10。
beacon_interval	beacon 间隔。值为 100 ~ 60000 ms，默认值为 100 ms。如果该值不在上述范围，AP 默认取 100 ms。

Wi-Fi 协议模式

目前，IDF 支持以下协议模式：

协议模式	描述
802.11b	调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B)，将 station/AP 设置为仅 802.11b 模式。
802.11bg	调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G)，将 station/AP 设置为 802.11bg 模式。
802.11g	调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G) 和 esp_wifi_config_11b_rate(ifx, true)，将 station/AP 设置为 802.11g 模式。
802.11bgn	调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCO 将 station/AP 设置为 802.11bgn 模式。
802.11gn	调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCO 和 esp_wifi_config_11b_rate(ifx, true)，将 station/AP 设置为 802.11gn 模式。
802.11 BGNLR	调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCO 将 station/AP 设置为 802.11bgn 和 LR 模式。
802.11 LR	调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_LR)，将 station/AP 设置为 LR 模式。 **此模式是乐鑫的专利模式，可以达到 1 公里视线范围。请确保 station 和 AP 同时连接至 ESP 设备。**

长距离 (LR)

长距离 (LR) 模式是乐鑫的一项专利 Wi-Fi 模式，可达到 1 公里视线范围。与传统 802.11b 模式相比，接收灵敏度更高，抗干扰能力更强，传输距离更长。

LR 兼容性 由于 LR 是乐鑫的独有 Wi-Fi 模式，只有 ESP32-C3 设备才能传输和接收 LR 数据。也就是说，如果连接的设备不支持 LR，ESP32-C3 设备则不会以 LR 数据速率传输数据。可通过配置适当的 Wi-Fi 模式使您的应用程序实现这一功能。如果协商的模式支持 LR，ESP32-C3 可能会以 LR 速率传输数据，否则，ESP32-C3 将以传统 Wi-Fi 数据速率传输所有数据。

下表是 Wi-Fi 模式协商：

APSTA	BGN	BG	B	BGNLR	BGLR	BLR	LR
BGN	BGN	BG	B	BGN	BG	B	•
BG	BG	BG	B	BG	BG	B	•
B	B	B	B	B	B	B	•
BGNLR	•	•	•	BGNLR	BGLR	BLR	LR
BGLR	•	•	•	BGLR	BGLR	BLR	LR
BLR	•	•	•	BLR	BLR	BLR	LR
LR	•	•	•	LR	LR	LR	LR

上表中，行是 AP 的 Wi-Fi 模式，列是 station 的 Wi-Fi 模式。”-”表示 AP 和 station 的 Wi-Fi 模式不兼容。

根据上表，得出以下结论：

- 对于已使能 LR 的 ESP32-C3 AP，由于以 LR 模式发送 beacon，因此与传统的 802.11 模式不兼容。
- 对于已使能 LR 且并非仅 LR 模式的 ESP32-C3 station，与传统 802.11 模式兼容。
- 如果 station 和 AP 都是 ESP32-C3 设备，并且两者都使能 LR 模式，则协商的模式支持 LR。

如果协商的 Wi-Fi 模式同时支持传统的 802.11 模式和 LR 模式，则 Wi-Fi 驱动程序会在不同的 Wi-Fi 模式下自动选择最佳数据速率，应用程序无需任何操作。

LR 对传统 Wi-Fi 设备的影响 以 LR 速率进行的数据传输不会影响传统 Wi-Fi 设备，因为：

- LR 模式下的 CCA 和回退过程符合 802.11 协议。
- 传统的 Wi-Fi 设备可以通过 CCA 检测 LR 信号并进行回退。

也就是说，LR 模式下传输效果与 802.11b 模式相似。

LR 传输距离 LR 的接收灵敏度比传统的 802.11b 模式高 4 dB，理论上，传输距离约为 802.11b 的 2 至 2.5 倍。

LR 吞吐量 因为原始 PHY 数据传输速率为 1/2 Mbps 和 1/4 Mbps，LR 的吞吐量有限。

何时使用 LR 通常使用 LR 的场景包括：

- AP 和 station 都是乐鑫设备。
- 需要长距离 Wi-Fi 连接和数据传输。
- 数据吞吐量要求非常小，例如远程设备控制等。

Wi-Fi 国家/地区代码

调用 *esp_wifi_set_country()*，设置国家/地区信息。下表详细介绍了各个字段，请在配置这些字段之前参考当地的 2.4 GHz RF 操作规定。

字段	描述
cc[3]	国家/地区代码字符串，此属性标识 station/AP 位于的国家/地区或非国家/地区实体。如果是一个国家/地区，该字符串的前两个八位字节是 ISO/IEC3166-1 中规定的国家/地区两位字母代码。第三个八位字节应是下述之一： • ASCII 码空格字符，代表 station/AP 所处国家/地区的规定允许当前频段所需的所有环境。 • ASCII 码‘O’字符，代表 station/AP 所处国家/地区的规定仅允许室外环境。 • ASCII 码‘I’字符，代表 station/AP 所处国家/地区的规定仅允许室内环境。 • ASCII 码‘X’字符，代表 station/AP 位于非国家/地区实体。非国家实体的前两个八位字节是两个 ASCII 码‘XX’字符。 • 当前使用的操作类表编号的二进制形式。见 IEEE Std 802.11-2020 附件 E。
schan	起始信道，station/AP 所处国家/地区规定的最小信道值。
nchan	规定的总信道数，比如，如果 schan=1，nchan=13，那么 station/AP 可以从信道 1 至 13 发送数据。
policy	国家/地区策略，当配置的国家/地区信息与所连 AP 的国家/地区信息冲突时，该字段决定使用哪一信息。更多策略相关信息，可参见下文。

默认国家/地区信息为：

```
wifi_country_t config = {
    .cc = "01",
    .schan = 1,
    .nchan = 11,
```

(下页继续)

(续上页)

```
    .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

如果 Wi-Fi 模式为 station/AP 共存模式，则它们配置的国家/地区信息相同。有时，station 所连 AP 的国家/地区信息与配置的不同。例如，配置的 station 国家/地区信息为:

```
wifi_country_t config = {
    .cc = "JP",
    .schan = 1,
    .nchan = 14,
    .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

但所连 AP 的国家/地区信息为:

```
wifi_country_t config = {
    .cc = "CN",
    .schan = 1,
    .nchan = 13,
};
```

此时，使用所连 AP 的国家/地区信息。

下表描述了在不同 Wi-Fi 模式和不同国家/地区策略下使用的国家/地区信息，并描述了对主动扫描的影响。

Wi-Fi 模式	策略	描述
station 模式	WIFI_COUNTRY_POLICY_AUTO	如果所连 AP 的 beacon 中有国家/地区的 IE，使用的国家/地区信息为 beacon 中的信息，否则，使用默认信息。 扫描时: • 如果 schan+nchan-1>11: 主动扫描起始信道至信道 11，被动扫描信道 12 至信道 14。 • 如果 schan+nchan-1<=11: 主动扫描起始信道至信道 schan+nchan-1，被动扫描信道 schan+nchan 至信道 14。 请记住，如果带有隐藏 SSID 的 AP 和 station 被设置在被动扫描信道上，被动扫描将无法找到该 AP。也就是说，如果应用程序希望在每个信道中找到带有隐藏 SSID 的 AP，国家/地区信息应该配置为 WIFI_COUNTRY_POLICY_MANUAL。
station 模式	WIFI_COUNTRY_POLICY_MANUAL	总是使用配置的国家/地区信息。 扫描时: • 如果 schan+nchan-1>11: 主动扫描起始信道至信道 11，被动扫描信道 12 至信道 schan+nchan-1。 • 如果 schan+nchan-1<=11: 主动扫描起始信道至信道 schan+nchan-1。
AP 模式	WIFI_COUNTRY_POLICY_AUTO	总是使用配置的国家/地区信息。
AP 模式	WIFI_COUNTRY_POLICY_MANUAL	总是使用配置的国家/地区信息。
station/AP 共存模式	WIFI_COUNTRY_POLICY_AUTO	如果 station 不连接任何外部 AP，AP 使用配置的国家/地区信息。如果 station 连接一个外部 AP，该 AP 的国家/地区信息与该 station 相同。 与 station 模式、WIFI_COUNTRY_POLICY_AUTO 策略下使用的国家/地区信息相同。

主信道 AP 模式下，AP 的信道定义为主信道。station 模式下，station 所连 AP 的信道定义为主信道。station/AP 共存模式下，AP 和 station 的主信道必须相同。如果不同，station 的主信道始终优先。比如，初始时，AP 位于信道 6，但 station 连接信道 9 的 AP。因为 station 的主信道具有优先性，该 AP 需要将信道从 6 切换至 9，确保与 station 主信道相同。切换信道时，AP 模式下的 ESP32-C3 将使用信道切换公告 (CSA) 通知连接的 station。支持信道切换的 station 将直接通过，无需与 AP 断连再重新连接。

Wi-Fi 供应商 IE 配置

默认情况下，所有 Wi-Fi 管理帧都由 Wi-Fi 驱动程序处理，应用程序不需要任何操作。但是，某些应用程序可能需要处理 beacon、probe request、probe response 和其他管理帧。例如，如果在管理帧中插入一些只针对供应商的 IE，则只有包含此 IE 的管理帧才能得到处理。ESP32-C3 中，*esp_wifi_set_vendor_ie()* 和*esp_wifi_set_vendor_ie_cb()* 负责此类任务。

4.30.15 Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™ （也称为设备配置协议）是一个安全且标准化的配置协议，用于配置 Wi-Fi 设备。更多信息请参考*esp_dpp*。

WPA2-Enterprise

WPA2-Enterprise 是企业无线网络的安全认证机制。在连接到接入点之前，它使用 RADIUS 服务器对网络用户进行身份验证。身份验证过程基于 802.1X 标准，并有不同的扩展身份验证协议 (EAP) 方法，如 TLS、TTLS、PEAP 等。RADIUS 服务器根据用户的凭据（用户名和密码）、数字证书或两者对用户进行身份验证。当处于 station 模式的 ESP32-C3 尝试连接到企业模式的 AP 时，它会向 AP 发送身份验证请求，AP 会将该请求发送到 RADIUS 服务器以对 station 进行身份验证。根据不同的 EAP 方式，可以通过 `idf.py menuconfig` 打开配置，并在配置中设置参数。ESP32-C3 仅在 station 模式下支持 WPA2_Enterprise。

为了建立安全连接，AP 和 station 协商并就要使用的最佳密码套件达成一致。ESP32-C3 支持 AKM 的 802.1X/EAP (WPA) 方法和 AES-CCM（高级加密标准-带密码块链消息验证码协议的计数器模式）支持的密码套件。如果设置了 *USE_MBEDTLS_CRYPTO* 标志，ESP32-C3 也支持 mbedtls 支持的密码套件。

目前，ESP32-C3 支持以下 EAP 方法：

- EAP-TLS: 这是基于证书的方法，只需要 SSID 和 EAP-IDF。
- PEAP: - PEAP：这是受保护的 EAP 方法。用户名和密码是必填项。
- **EAP-TTLS: 这是基于凭据的方法。只有服务器身份验证是强制性的，而用户身份验证是可选的。用户名和密码**
  - PAP: 密码认证协议
  - CHAP: 询问握手身份验证协议
  - MSCHAP 和 MSCHAP-V2
- EAP-FAST: 这是一种基于受保护的访问凭据 (PAC) 的认证方法，使用身份验证和密码。目前使用此功能时需要禁用 USE_MBEDTLS_CRYPTO 标志。

请查看 wifi/wifi_enterprise 获取关于证书创建以及如何在 ESP32-C3 上运行 wpa2_enterprise 示例的详细信息。

4.30.16 无线网络管理

无线网络管理让客户端设备能够交换有关网络拓扑结构的信息，包括与射频环境相关的信息。这使每个客户端都能感知网络状况，从而促进无线网络性能的整体改进。这是 802.11v 规范的一部分。它还使客户端能够支持网络辅助漫游。网络辅助漫游让 WLAN 能够向关联的客户端发送消息，从而使客户端与具有更好链路指标的 AP 关联。这对于促进负载平衡以及引导连接不良的客户端都很有用。

目前 802.11v 的实现支持 BSS 过渡管理帧。

4.30.17 无线资源管理

无线电资源测量（802.11k）旨在改善网络内流量的分配方式。在无线局域网中，一般情况下，无线设备会连接发射信号最强的接入点 (AP)。根据用户的数量和地理位置，这种分配方式有时会导致某个接入点超负荷而其它接入点利用不足，从而导致整体网络性能下降。在符合 802.11k 规范的网络中，如果信号最强的 AP 已满负荷加载，无线设备则转移到其它未充分利用的 AP。尽管信号可能较弱，但由于更有效地利用了网络资源，总体吞吐量会更大。

目前 802.11k 的实现支持信标测量报告、链路测量报告和邻居请求。

请参考 IDF 示例程序 examples/wifi/roaming/README.md 来设置和使用这些 API。示例代码只演示了如何使用这些 API，应用程序应根据需要定义自己的算法和案例。

4.30.18 Wi-Fi Location

Wi-Fi Location 将提高 AP 以外设备位置数据的准确性，这有助于创建新的、功能丰富的应用程序和服务，例如地理围栏、网络管理、导航等。用于确定设备相对于接入点的位置的协议之一是精细定时测量 (FTM)，它会计算 Wi-Fi 帧的飞行时间。

精细定时测量 (FTM)

FTM 用于测量 Wi-Fi 往返时间（Wi-Fi RTT），即 Wi-Fi 信号从一个设备到另一个设备并返回所需的时间。使用 Wi-Fi RTT，设备之间的距离可以用一个简单的公式 $RTT * c / 2$ 来计算，其中 c 是光速。

对于设备之间交换的帧，FTM 在帧到达或离开时使用时间戳，这个时间戳由 Wi-Fi 接口硬件提供。FTM 发起方（主要是 station 设备）发现 FTM 响应方（可以是 station 或 AP），并协商启动 FTM 程序。该程序以突发形式发送的多个动作帧及其 ACK 来收集时间戳数据。FTM 发起方最后收集数据以计算平均往返时间。

ESP32-C3 在以下配置中支持 FTM：

- ESP32-C3 在 station 模式下为 FTM 发起方。
- ESP32-C3 在 AP 模式下为 FTM 响应方。

使用 RTT 的距离测量并不准确，RF 干扰、多径传播、天线方向和缺乏校准等因素会增加这些不准确度。为了获得更好的结果，建议在两个 ESP32-C3 设备之间执行 FTM，这两个设备可分别设置为 station 和 AP 模式。

请参考 IDF 示例 examples/wifi/ftm/README.md 了解设置和执行 FTM 的详细步骤。

4.30.19 ESP32-C3 Wi-Fi 节能模式

station 睡眠

目前，ESP32-C3 Wi-Fi 支持 Modem-sleep 模式，该模式是 IEEE 802.11 协议中的传统节能模式。仅 station 模式支持该模式，station 必须先连接到 AP。如果使能了 Modem-sleep 模式，station 将定期在活动状态和睡眠状态之间切换。在睡眠状态下，RF、PHY 和 BB 处于关闭状态，以减少功耗。Modem-sleep 模式下，station 可以与 AP 保持连接。

Modem-sleep 模式包括最小和最大节能模式。在最小节能模式下，每个 DTIM 间隔，station 都将唤醒以接收 beacon。广播数据在 DTIM 之后传输，因此不会丢失。但是，由于 DTIM 间隔长短由 AP 决定，如果该间隔时间设置较短，则省电效果不大。

在最大节能模式下，每个监听间隔，station 都将唤醒以接收 beacon。可以设置该监听间隔长于 AP 的 DTIM 周期。在 DTIM 期间内，station 可能处于睡眠状态，广播数据会丢失。如果监听间隔较长，则可以节省更多电量，但广播数据更容易丢失。连接 AP 前，可以通过调用 API `esp_wifi_set_config()` 配置监听间隔。

调用*esp_wifi_init()* 后，调用 esp_wifi_set_ps(WIFI_PS_MIN_MODEM) 可使能 Modem-sleep 最小节能模式。调用 esp_wifi_set_ps(WIFI_PS_MAX_MODEM) 可使能 Modem-sleep 最大节能模式。station 连接到 AP 时，Modem-sleep 模式将启动。station 与 AP 断开连接时，Modem-sleep 模式将停止。

调用 esp_wifi_set_ps(WIFI_PS_NONE) 可以完全禁用 Modem-sleep 模式。禁用会增大功耗，但可以最大限度减少实时接收 Wi-Fi 数据的延迟。使能 Modem-sleep 时，接收 Wi-Fi 数据的延迟时间可能与 DTIM 周期（最小节能模式）或监听间隔（最大节能模式）相同。在 Wi-Fi 与 Bluetooth LE 共存模式下，无法完全禁用 modem-sleep 模式。

默认的 Modem-sleep 模式是 WIFI_PS_MIN_MODEM。

AP 睡眠

目前，ESP32-C3 AP 不支持 Wi-Fi 协议中定义的所有节能功能。具体来说，AP 只缓存所连 station 单播数据，不缓存组播数据。如果 ESP32-C3 AP 所连的 station 已使能节能功能，可能发生组播数据包丢失。

未来，ESP32-C3 AP 将支持所有节能功能。

4.30.20 ESP32-C3 Wi-Fi 吞吐量

下表是我们在 Espressif 实验室和屏蔽箱中获得的最佳吞吐量结果。

类型/吞吐量	实验室空气状况	屏蔽箱	测试工具	IDF 版本 (commit ID)
原始 802.11 数据包接收数据	N/A	**130 MBit/s**	内部工具	N/A
原始 802.11 数据包发送数据	N/A	**130 MBit/s**	内部工具	N/A
UDP 接收数据	30 MBit/s	50 MBit/s	iperf example	15575346
UDP 发送数据	30 MBit/s	40 MBit/s	iperf example	15575346
TCP 接收数据	20 MBit/s	35 MBit/s	iperf example	15575346
TCP 发送数据	20 MBit/s	37 MBit/s	iperf example	15575346

使用 iperf example 测试吞吐量时，sdkconfig 是:idf_file:‘ 示例/wifi/iperf/sdkconfig.defaults.esp32c3‘。

4.30.21 Wi-Fi 80211 数据包发送

esp_wifi_80211_tx() API 可用于：

- 发送 beacon、probe request、probe response 和 action 帧。
- 发送非 QoS 数据帧。

不能用于发送加密或 QoS 帧。

使用 esp_wifi_80211_tx() 的前提条件

- Wi-Fi 模式为 station 模式，AP 模式，或 station/AP 共存模式。
- API esp_wifi_set_promiscuous(true) 或*esp_wifi_start()*，或者二者都返回 ESP_OK。这是为确保在调用函数*esp_wifi_80211_tx()* 前，Wi-Fi 硬件已经初始化。对于 ESP32-C3，esp_wifi_set_promiscuous(true) 和*esp_wifi_start()* 都可以触发 Wi-Fi 硬件初始化。
- 提供正确的*esp_wifi_80211_tx()* 参数。

传输速率

- 默认传输速率为 1 Mbps。
- 可以通过函数*esp_wifi_config_80211_tx_rate()* 设置任意速率。
- 可以通过函数*esp_wifi_set_bandwidth()* 设置任意带宽。

在不同情况下需要避免的副作用

理论上，如果不考虑 API 对 Wi-Fi 驱动程序或其他 station 或 AP 的副作用，可以通过空中发送一个原始的 802.11 数据包，包括任何目的地址的 MAC、任何源地址的 MAC、任何 BSSID、或任何其他类型的数据包。但是，一个具有强健、有用的应用程序应该避免这种副作用。下表针对如何避免*esp_wifi_80211_tx()* 的副作用提供了一些提示或建议。

场景	描述
无 Wi-Fi 连接	在这种情况下，因为没有 Wi-Fi 连接，Wi-Fi 驱动程序不会受到副作用影响。如果 en_sys_seq==true，则 Wi-Fi 驱动程序负责序列控制。如果 en_sys_seq==false，应用程序需要确保缓冲区的序列正确。 理论上，MAC 地址可以是任何地址。但是，这样可能会影响其他使用相同 MAC/BSSID 的 station/AP。 例如，AP 模式下，应用程序调用函数 esp_wifi_80211_tx() 发送带有 BSSID == mac_x 的 beacon，但是 mac_x 并非 AP 接口的 MAC。而且，还有另一个 AP（我们称之为“other-AP”）的 bssid 是 mac_x。因此，连接到“other-AP”的 station 无法分辨 beacon 来自“other-AP”还是 esp_wifi_80211_tx()，就会出现“意外行为”。 为了避免上述副作用，我们建议： • 如果在 station 模式下调用函数 esp_wifi_80211_tx()，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 station 接口的 MAC。 • 如果在 AP 模式下调用函数 esp_wifi_80211_tx，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 AP 接口的 MAC。 上述建议仅供避免副作用，在有充分理由的情况下可以忽略。
有 Wi-Fi 连接	当 Wi-Fi 已连接，且序列由应用程序控制，应用程序可能会影响整个 Wi-Fi 连接的序列控制。因此，en_sys_seq 要为 true，否则将返回 ESP_ERR_WIFI_ARG。 “无 Wi-Fi 连接”情况下的 MAC 地址建议也适用于此情况。 如果 Wi-Fi 模式是 station 模式，MAC 的地址 1 是 station 所连 AP 的 MAC，地址 2 是 station 接口的 MAC，那么就称数据包是从 station 发送到 AP。另一方面，如果 Wi-Fi 模式是 AP 模式，且 MAC 地址 1 是该 AP 所连 station 的 MAC，地址 2 是 AP 接口的 MAC，那么就称数据包是从 AP 发送到 station。为避免与 Wi-Fi 连接冲突，可采用以下检查方法： • 如果数据包类型是数据，且是从 station 发送到 AP，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 1，FromDS 位为 0，否则，Wi-Fi 驱动程序不接受该数据包。 • 如果数据包类型是数据，且是从 AP 发送到 station，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 0，FromDS 位为 1，否则，Wi-Fi 驱动程序不接受该数据包。 • 如果数据包是从 station 发送到 AP，或从 AP 到 station，Power Management、More Data 和 Re-Transmission 位应该为 0，否则，Wi-Fi 驱动程序不接受该数据包。 如果任何检查失败，将返回 ESP_ERR_WIFI_ARG。

4.30.22 Wi-Fi Sniffer 模式

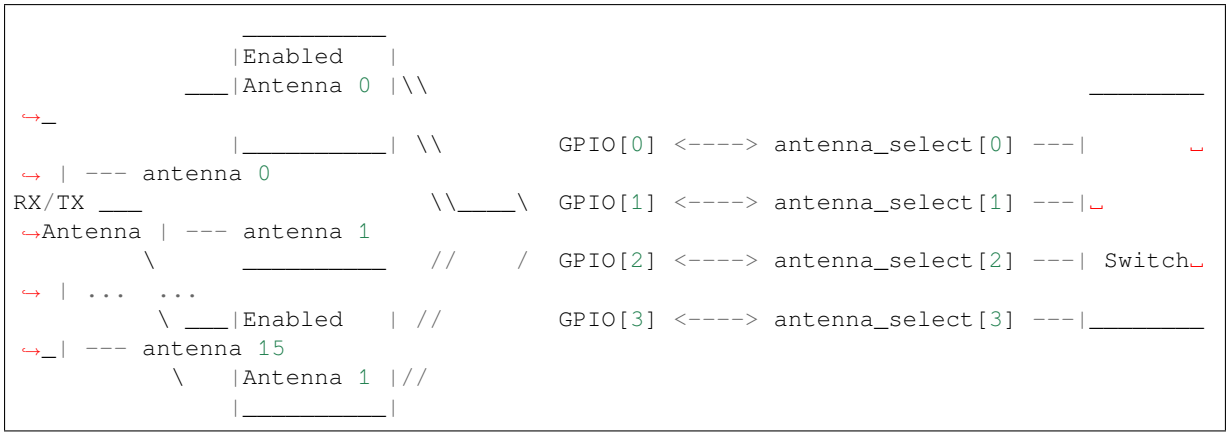
Wi-Fi Sniffer 模式可以通过*esp_wifi_set_promiscuous()* 使能。如果使能 Sniffer 模式，**可以**向应用程序转储以下数据包。

- 802.11 管理帧
- 802.11 数据帧，包括 MPDU、AMPDU、AMSDU 等
- 802.11 MIMO 帧，Sniffer 模式仅转储 MIMO 帧的长度。
- 802.11 控制帧

- 802.11 CRC 错误帧

不可以向应用程序转储以下数据包。

- 802.11 其它错误帧



对于 Sniffer 模式 **可以**转储的帧，应用程序可以另外使用*esp_wifi_set_promiscuous_filter()* 和*esp_wifi_set_promiscuous_ctrl_filter()* 决定筛选哪些特定类型的数据包。应用程序默认筛选所有 802.11 数据和管理帧。

可以在 WIFI_MODE_NULL、WIFI_MODE_STA、WIFI_MODE_AP、WIFI_MODE_APSTA 等 Wi-Fi 模式下使能 Wi-Fi Sniffer 模式。也就是说，当 station 连接到 AP，或者 AP 有 Wi-Fi 连接时，就可以使能。请注意，Sniffer 模式对 station/AP Wi-Fi 连接的吞吐量有 **很大影响**。通常，除非有特别原因，当 station/AP Wi-Fi 连接出现大量流量，不应使能。

该模式下还应注意回调函数 wifi_promiscuous_cb_t 的使用。该回调将直接在 Wi-Fi 驱动程序任务中进行，所以如果应用程序需处理大量过滤的数据包，建议在回调中向应用程序任务发布一个事件，把真正的工作推迟到应用程序任务中完成。

4.30.23 Wi-Fi 多根天线

下图描述 Wi-Fi 多根天线的选择过程:

ESP32-C3 通过外部天线开关，最多支持 16 根天线。天线开关最多可由四个地址管脚控制 - antenna_select[0:3]。向 antenna_select[0:3] 输入不同的值，以选择不同的天线。例如，输入值 ‘0b1011’ 表示选中天线 11 。antenna_select[3:0] 的默认值为 “0b0000”，表示默认选择了天线 0。

四个高电平有效 antenna_select 管脚有多达四个 GPIO 连接。ESP32-C3 可以通过控制 GPIO[0:3] 选择天线。API *esp_wifi_set_ant_gpio()* 用于配置 antenna_selects 连接哪些 GPIO。如果 GPIO[x] 连接到 antenna_select[x]，gpio_config->gpio_cfg[x].gpio_select 应设置为 1，且要提供 gpio_config->gpio_cfg[x].gpio_num 的值。

天线开关的具体实现不同，*antenna_select[0:3]* 的输入值中可能存在非法值，即 ESP32-C3 通过外部天线开关支持的天线数可能小于 16 根。例如，ESP32-WROOM-DA 使用 RTC6603SP 作为天线开关，仅支持 2 根天线。两个天线选择输入管脚为高电平有效，连接到两个 GPIO。’0b01’ 表示选中天线 0，’0b10’ 表示选中天线 1。输入值 ‘0b00’ 和 ‘0b11’ 为非法值。

尽管最多支持 16 根天线，发送和接收数据时，最多仅能同时使能两根天线。API *esp_wifi_set_ant()* 用于配置使能哪些天线。

使能天线后，选择算法的过程同样可由*esp_wifi_set_ant()* 配置。接收/发送数据源的天线模式可以是 WIFI_ANT_MODE_ANT0、WIFI_ANT_MODE_ANT1 或 WIFI_ANT_MODE_AUTO。如果天线模式为 WIFI_ANT_MODE_ANT0，使能的天线 0 用于接收/发送数据。如果天线模式为 WIFI_ANT_MODE_ANT1，使能天线 1 用于接收/发送数据。否则，Wi-Fi 会自动选择使能天线中信号较好的天线。

如果接收数据的天线模式为 WIFI_ANT_MODE_AUTO，还需要设置默认天线模式。只有在满足某些条件时，接收数据天线才会切换，例如，如果 RSSI 低于 -65 dBm，或另一根天线信号更好。如果条件不满足，接收数据使用默认天线。如果默认天线模式为 WIFI_ANT_MODE_ANT1，则使能的天线 1 是默认接收数据天线，否则是使能的天线 0。

有一些限制情况需要考虑：

- 因为发送数据天线基于 WIFI_ANT_MODE_AUTO 类型的接收数据天线选择算法，只有接收数据的天线模式为 WIFI_ANT_MODE_AUTO 时，发送数据天线才能设置为 WIFI_ANT_MODE_AUTO。
- 目前，Bluetooth® 不支持多根天线功能，请不要使用与多根天线有关的 API。

推荐在以下场景中使用多根天线：

- Wi-Fi 模式 WIFI_MODE_STA 下，接收/发送数据的天线模式均配置为 WIFI_ANT_MODE_AUTO。Wi-Fi 驱动程序自动选择更好的接收/发送数据天线。
- 接收数据天线模式配置为 WIFI_ANT_MODE_AUTO。发送数据的天线模式配置为 WIFI_ANT_MODE_ANT0 或 WIFI_ANT_MODE_ANT1。应用程序可以始终选择指定的天线用于发送数据，也可以执行自身发送数据天线选择算法，如根据信道切换信息选择发送数据的天线模式等。
- 接收/发送数据的天线模式均配置为 WIFI_ANT_MODE_ANT0 或 WIFI_ANT_MODE_ANT1。

Wi-Fi 多根天线配置

通常，可以执行以下步骤来配置多根天线：

- 配置 antenna_selects 连接哪些 GPIOs，例如，如果支持四根天线，且 GPIO20/GPIO21 连接到 antenna_select[0]/antenna_select[1]，配置如下所示：

```
wifi_ant_gpio_config_t config = {
    { .gpio_select = 1, .gpio_num = 20 },
    { .gpio_select = 1, .gpio_num = 21 }
};
```

- 配置使能哪些天线、以及接收/发送数据如何使用使能的天线，例如，如果使能了天线 1 和天线 3，接收数据需要自动选择较好的天线，并将天线 1 作为默认天线，发送数据始终选择天线 3。配置如下所示：

```
wifi_ant_config_t config = {
    .rx_ant_mode = WIFI_ANT_MODE_AUTO,
    .rx_ant_default = WIFI_ANT_ANT0,
    .tx_ant_mode = WIFI_ANT_MODE_ANT1,
    .enabled_ant0 = 1,
    .enabled_ant1 = 3
};
```

4.30.24 Wi-Fi 信道状态信息

信道状态信息 (CSI) 是指 Wi-Fi 连接的信道信息。ESP32-C3 中，CSI 由子载波的信道频率响应组成，CSI 从发送端接收数据包时开始估计。每个子载波信道频率响由两个字节的有符号字符记录，第一个字节是虚部，第二个字节是实部。根据接收数据包的类型，信道频率响应最多有三个字段。分别是 LLTF、HT-LTF 和 STBC-HT-LTF。对于在不同状态的信道上接收到的不同类型的数据包，CSI 的子载波索引和总字节数如下表所示。

信道	辅助信道				下					上				
数据包信息	信号模式	非 HT	HT		非 HT	HT				非 HT	HT			
	信道带宽	20 MHz	20 MHz		20 MHz	20 MHz		40 MHz		20 MHz	20 MHz		40 MHz	
	STBC	非 STBC	非 STBC	STBC	非 STBC	非 STBC	STBC	非 STBC	STBC	非 STBC	非 STBC	STBC	非 STBC	STBC
子载波索引	LLTF	0~31,-32~-1	0~31,-32~-1	0~31,-32~-1	0~63	0~63	0~63	0~63	0~63	-64~-1	-64~-1	-64~-1	-64~-1	-64~-1
	HT-LTF	—	0~31,-32~-1	0~31,-32~-1	—	0~63	0~62	0~63,-64~-1	0~60,-60~-1	—	-64~-1	-62~-1	0~63,-64~-1	0~60,-60~-1
	STBC-HT-LTF	—	—	0~31,-32~-1	—	—	0~62	—	0~60,-60~-1	—	—	-62~-1	—	0~60,-60~-1
总字节数		128	256	384	128	256	380	384	612	128	256	376	384	612

表中的所有信息可以在 wifi_csi_info_t 结构中找到。

- 辅助信道指 rx_ctrl 字段的 secondary_channel 字段。
- 数据包的信号模式指 rx_ctrl 字段的 sig_mode 字段。
- 信道带宽指 rx_ctrl 字段中的 cwb 字段。
- STBC 指 rx_ctrl 字段的 stbc 字段。
- 总字节数指 len 字段。
- 每个长训练字段 (LTF) 类型对应的 CSI 数据存储在从 buf 字段开始的缓冲区中。每个元素以两个字节的形式存储：虚部和实部。每个元素的顺序与表中的子载波相同。LTF 的顺序是 LLTF、HT-LTF 和 STBC-HT-LTF。但是，根据信道和数据包的信息，3 个 LTF 可能都不存在（见上文）。
- 如果 wifi_csi_info_t 的 first_word_invalid 字段为 true，表示由于 ESP32-C3 的硬件限制，CSI 数据的前四个字节无效。
- 更多信息，如 RSSI，射频的噪声底，接收时间和天线 rx_ctrl 领域。

子载波的虚部和实部的使用请参考下表。

PHY 标准	子载波范围	导频子载波	子载波个数 (总数/数据子载波)
802.11a/g	-26 to +26	-21, -7, +7, +21	52 total, 48 usable
802.11n, 20MHz	-28 to +28	-21, -7, +7, +21	56 total, 52 usable
802.11n, 40MHz	-57 to +57	-53, -25, -11, +11, +25, +53	114 total, 108 usable

备注:

- 对于 STBC 数据包，每个空时流都提供了 CSI，不会出现 CSD（循环移位延迟）。由于附加链上的每一次循环移位为 -200 ns，因为子载波 0 中没有信道频率响应，在 HT-LTF 和 STBC-HT-LTF 中只记录第一空时流的 CSD 角度。CSD[10:0] 是 11 位，范围从 -pi 到 pi。
- 如果调用 API `esp_wifi_set_csi_config()` 没有使能 LLTF、HT-LTF 或 STBC-HT-LTF，则 CSI 数据的总字节数会比表中的少。例如，如果没有使能 LLTF 和 HT-LTF，而使能 STBC-HT-LTF，当接收到上述条件、HT、40 MHz 或 STBC 的数据包时，CSI 数据的总字节数为 244（(61+60)*2+2=244，结果对齐为四个字节，最后两个字节无效）。

4.30.25 Wi-Fi 信道状态信息配置

要使用 Wi-Fi CSI，需要执行以下步骤。

- 在菜单配置中选择 Wi-Fi CSI。方法是“菜单配置 - > 组件配置–> Wi-Fi –> Wi-Fi CSI（信道状态信息）”。

- 调用 API *esp_wifi_set_csi_rx_cb()* 设置 CSI 接收回调函数。
- 调用 API *esp_wifi_set_csi_config()* 配置 CSI。
- 调用 API *esp_wifi_set_csi()* 使能 CSI。

CSI 接收回调函数从 Wi-Fi 任务中运行。因此，不要在回调函数中进行冗长的操作。可以将需要的数据发布到队列中，并从一个较低优先级的任务中处理。由于 station 在断开连接时不会收到任何数据包，只有在连接时才会收到来自 AP 的数据包，因此建议通过调用函数*esp_wifi_set_promiscuous()* 使能 Sniffer 模式接收更多 CSI 数据。

4.30.26 Wi-Fi HT20/40

ESP32-C3 支持 Wi-Fi 带宽 HT20 或 HT40，不支持 HT20/40 共存，调用函数*esp_wifi_set_bandwidth()* 可改变 station/AP 的默认带宽。ESP32-C3 station 和 AP 的默认带宽为 HT40。

station 模式下，实际带宽首先在 Wi-Fi 连接时协商。只有当 station 和所连 AP 都支持 HT40 时，带宽才为 HT40，否则为 HT20。如果所连的 AP 的带宽发生变化，则在不断开 Wi-Fi 连接的情况下再次协商实际带宽。

同样，在 AP 模式下，在 AP 与所连 station 协商实际带宽。如果 AP 和其中一个 station 支持 HT40，则为 HT40，否则为 HT20。

在 station/AP 共存模式下，station 和 AP 都可独立配置为 HT20/40。如果 station 和 AP 都协商为 HT40，由于 ESP32-C3 中，station 的优先级总高于 AP，HT40 信道是 station 的信道。例如，AP 的配置带宽为 HT40，配置的主信道为 6，配置的辅助信道为 10。如果，station 所连路由器的主信道为 6、辅助信道为 2，AP 的实际信道将自动更改为主 6 和辅 2。

理论上，HT40 可以获得更大的吞吐量，因为 HT40 的最大原始 PHY 数据速率为 150 Mbps，而 HT20 为 72 Mbps。但是，如果设备在某些特殊环境中使用，例如，ESP32-C3 周围其他 Wi-Fi 设备过多，HT40 的性能可能会降低。因此，如果应用程序需要支持相同或类似的情况，建议始终将带宽配置为 HT20。

4.30.27 Wi-Fi QoS

ESP32-C3 支持 WFA Wi-Fi QoS 认证所要求的所有必备功能。

Wi-Fi 协议中定义了四个 AC（访问类别），每个 AC 有各自的优先级访问 Wi-Fi 信道。此外，还定义了映射规则以映射其他协议的 QoS 优先级，例如 802.11D 或 TCP/IP 到 Wi-Fi AC。

下表描述 ESP32-C3 中 IP 优先级如何映射到 Wi-Fi AC，还指明此 AC 是否支持 AMPDU。该表按优先级降序排列，即 AC_VO 拥有最高优先级。

IP 优先级	Wi-Fi AC	是否支持 AMPDU
6, 7	AC_VO (Voice)	否
4, 5	AC_VI (Video)	是
3, 0	AC_BE (Best Effort)	是
1, 2	AC_BK (Background)	是

应用程序可以通过套接字选项 IP_TOS 配置 IP 优先级使用 QoS 功能。下面是使套接字使用 VI 队列的示例:

```
const int ip_precedence_vi = 4;
const int ip_precedence_offset = 5;
int priority = (ip_precedence_vi << ip_precedence_offset);
setsockopt(socket_id, IPPROTO_IP, IP_TOS, &priority, sizeof(priority));
```

理论上，高优先级的 AC 比低优先级 AC 具有更好的性能，但并非总是如此，下面是一些关于如何使用 Wi-Fi QoS 的建议：

- 可以把一些真正重要的应用程序流量放到 AC_VO 队列中。避免通过 AC_VO 队列发送大流量。一方面，AC_VO 队列不支持 AMPDU，如果流量很大，性能不会优于其他队列。另一方面，可能会影响同样使用 AC_VO 队列的管理帧。
- 避免使用 AMPDU 支持的、两个以上的不同优先级，比如 socket A 使用优先级 0，socket B 使用优先级 1，socket C 使用优先级 2。因为可能需要更多的内存，不是好的设计。具体来说，Wi-Fi 驱动程序可能会为每个优先级生成一个 Block Ack 会话，如果设置了 Block Ack 会话，则需要更多内存。

4.30.28 Wi-Fi AMSDU

ESP32-C3 支持接收和发送 AMSDU。

4.30.29 Wi-Fi 分片

ESP32-C3 支持 Wi-Fi 接收和发送分片。

4.30.30 WPS 注册

在 Wi-Fi 模式 WIFI_MODE_STA 或 WIFI_MODE_APSTA 下，ESP32-C3 支持 WPS 注册功能。目前，ESP32-C3 支持的 WPS enrollee 类型有 PBC 和 PIN。

4.30.31 Wi-Fi 缓冲区使用情况

本节只介绍动态缓冲区配置。

缓冲区配置的重要性

为了获得一个具有强健、高性能的系统，我们需要非常谨慎地考虑内存的使用或配置情况，因为：

- ESP32-C3 的可用内存有限。
- 目前，LwIP 和 Wi-Fi 驱动程序中默认的缓冲区类型是“动态”，**意味着 LwIP 和 Wi-Fi 都与应用程序共享内存**。程序员应该时刻牢记这一点，否则将面临如“堆内存耗尽”等的内存问题。
- “堆耗尽”情况非常危险，会导致 ESP32-C3 出现“未定义行为”。因此，应该为应用程序预留足够的堆内存，防止耗尽。
- Wi-Fi 的吞吐量很大程度上取决于与内存相关的配置，如 TCP 窗口大小、Wi-Fi 接收/发送数据动态缓冲区数量等。
- ESP32-C3 LwIP/Wi-Fi 可能使用的堆内存峰值取决于许多因素，例如应用程序可能拥有的最大 TCP/UDP 连接等。
- 在考虑内存配置时，应用程序所需的总内存也是一个重要因素。

由于这些原因，不存在一个适合所有应用程序的配置。相反，我们必须为每个不同的应用程序考虑不同的内存配置。

动态与静态缓冲区

Wi-Fi 驱动程序中默认的缓存类型是“动态”。大多数情况下，动态缓冲区可以极大地节省内存。但是因为应用程序需要考虑 Wi-Fi 的内存使用情况，会给应用程序编程造成一定的难度。

lwIP 还在 TCP/IP 层分配缓冲区，这种缓冲区分配也是动态的。具体内容，见 lwIP 文档内存使用和性能部分。

Wi-Fi 动态缓冲区峰值

Wi-Fi 驱动程序支持多种类型的缓冲区（参考*Wi-Fi 缓冲区配置*）。但本节只介绍 Wi-Fi 动态缓冲的使用方法 Wi-Fi 使用的堆内存峰值是 Wi-Fi 驱动程序 **理论上消耗的最大内存**。通常，该内存峰值取决于：

- 配置的动态接收数据缓冲区数：wifi_rx_dynamic_buf_num
- 配置的动态发送数据缓冲区数：wifi_tx_dynamic_buf_num
- Wi-Fi 驱动程序可以接收的最大数据包：wifi_rx_pkt_size_max
- Wi-Fi 驱动程序可以发送的最大数据包：wifi_tx_pkt_size_max

因此，Wi-Fi 驱动程序消耗的内存峰值可以用下面的公式计算：

wifi_dynamic_peek_memory = (wifi_rx_dynamic_buf_num * wifi_rx_pkt_size_max) + (wifi_tx_dynamic_buf_num * wifi_tx_pkt_size_max)

一般情况下，不需要关心动态发送数据长缓冲区和超长缓冲区，因为它们是管理帧，对系统的影响很小。

4.30.32 如何提高 Wi-Fi 性能

ESP32-C3 Wi-Fi 的性能受许多参数的影响，各参数之间存在相互制约。如果配置地合理，不仅可以提高性能，还可以增加应用程序的可用内存，提高稳定性。

在本节中，我们将简单介绍 Wi-Fi/LWIP 协议栈的工作模式，并说明各个参数的作用。我们将推荐几种配置等级，您可以根据使用场景选择合适的等级。

协议栈工作模式

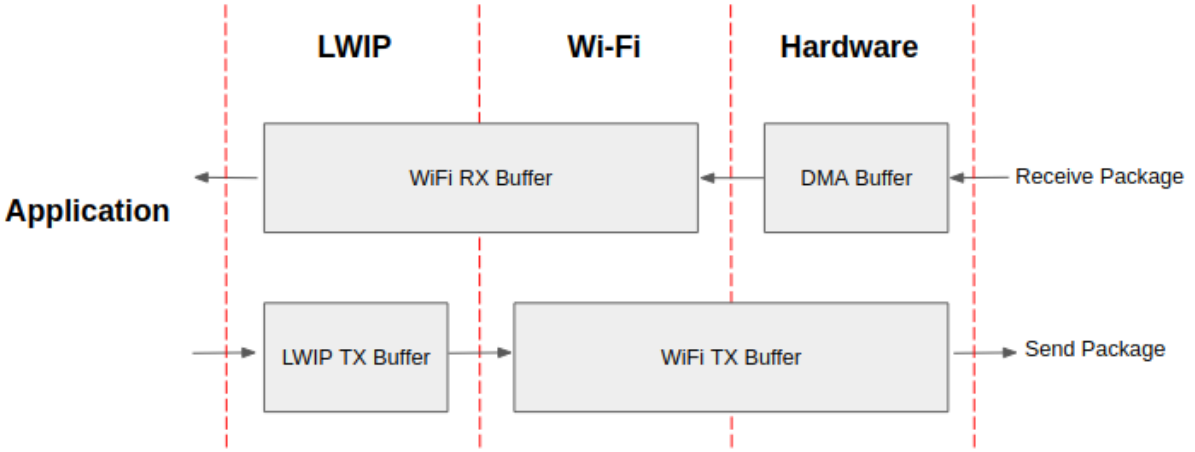


图 60: ESP32-C3 数据路径

ESP32-C3 协议栈分为四层，分别为应用层、LWIP 层、Wi-Fi 层和硬件层。

- 在接收过程中，硬件将接收到的数据包放入 DMA 缓冲区，然后依次传送到 Wi-Fi 的接收数据缓冲区、LWIP 的接收数据缓冲区进行相关协议处理，最后传送到应用层。Wi-Fi 的接收数据缓冲区和 LWIP 的接收数据缓冲区默认共享同一个缓冲区。也就是说，Wi-Fi 默认将数据包转发到 LWIP 作为参考。
- 在发送过程中，应用程序首先将要发送的消息复制到 LWIP 层的发送数据缓冲区，进行 TCP/IP 封装。然后将消息发送到 Wi-Fi 层的发送数据缓冲区进行 MAC 封装，最后等待发送。

参数

适当增加上述缓冲区的大小或数量，可以提高 Wi-Fi 性能，但同时，会减少应用程序的可用内存。下面我们将介绍您需要配置的参数：

接收数据方向：

- *CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM* 该参数表示硬件层的 DMA 缓冲区数量。提高该参数将增加发送方的一次性接收吞吐量，从而提高 Wi-Fi 协议栈处理突发流量的能力。
- *CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM* 该参数表示 Wi-Fi 层中接收数据缓冲区的数量。提高该参数可以增强数据包的接收性能。该参数需要与 LWIP 层的接收数据缓冲区大小相匹配。
- *CONFIG_ESP32_WIFI_RX_BA_WIN* 该参数表示接收端 AMPDU BA 窗口的大小，应配置为*CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM* 和*CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM* 的二倍数值中较小的数值。
- *CONFIG_LWIP_TCP_WND_DEFAULT* 该参数表示 LWIP 层用于每个 TCP 流的的接收数据缓冲区大小，应配置为 WIFI_DYNAMIC_RX_BUFFER_NUM (KB) 的值，从而实现高稳定性能。同时，在有多个流的情况下，应相应降低该参数值。

发送数据方向：

- *CONFIG_ESP32_WIFI_TX_BUFFER* 该参数表示发送数据缓冲区的类型，建议配置为动态缓冲区，该配置可以充分利用内存。
- *CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM* 该参数表示 Wi-Fi 层发送数据缓冲区数量。提高该参数可以增强数据包发送的性能。该参数值需要与 LWIP 层的发送数据缓冲区大小相匹配。
- *CONFIG_LWIP_TCP_SND_BUF_DEFAULT* 该参数表示 LWIP 层用于每个 TCP 流的的发送数据缓冲区大小，应配置为 WIFI_DYNAMIC_TX_BUFFER_NUM (KB) 的值，从而实现高稳定性能。在有多个流的情况下，应相应降低该参数值。

通过在 IRAM 中放置代码优化吞吐量：

备注： 上述的缓冲区大小固定为 1.6 KB。

如何配置参数

ESP32-C3 的内存由协议栈和应用程序共享。

在这里，我们给出了几种配置等级。在大多数情况下，您应根据应用程序所占用内存的大小，选择合适的等级进行参数配置。

下表中未提及的参数应设置为默认值。

等级	Iperf	默认	最小
可用内存 (KB)	59	160	180
WIFI_STATIC_RX_BUFFER_NUM	10	8	3
WIFI_DYNAMIC_RX_BUFFER_NUM	40	16	6
WIFI_DYNAMIC_TX_BUFFER_NUM	40	16	6
WIFI_RX_BA_WIN	32	16	6
TCP_SND_BUF_DEFAULT (KB)	40	16	6
TCP_WND_DEFAULT (KB)	40	16	6
LWIP_IRAM_OPTIMIZATION	13	13	0
TCP 发送数据吞吐量 (Mbit/s)	38.1	27.2	20.4
TCP 接收数据吞吐量 (Mbit/s)	35.3	24.2	17.4
UDP 发送数据吞吐量 (Mbit/s)	40.6	38.9	34.1
UDP 接收数据吞吐量 (Mbit/s)	52.4	44.5	44.2

备注： 以上结果使用华硕 RT-N66U 路由器，在屏蔽箱中进行单流测试得出。ESP32-C3 的 CPU 为单核，频率为 160 MHz，flash 为 QIO 模式，频率为 80 MHz。

等级：

- **Iperf 等级** ESP32-C3 极端性能等级，用于测试极端性能。
- **默认等级** ESP32-C3 的默认配置等级、兼顾可用内存和性能。
- **最小等级** ESP32-C3 的最小配置等级。协议栈只使用运行所需的内存。适用于对性能没有要求，而应用程序需要大量内存的场景。

4.30.33 Wi-Fi Menuconfig

Wi-Fi 缓冲区配置

如果您要修改默认的缓冲区数量或类型，最好也了解缓冲区在数据路径中是如何分配或释放的。下图显示了发送数据方向的这一过程。

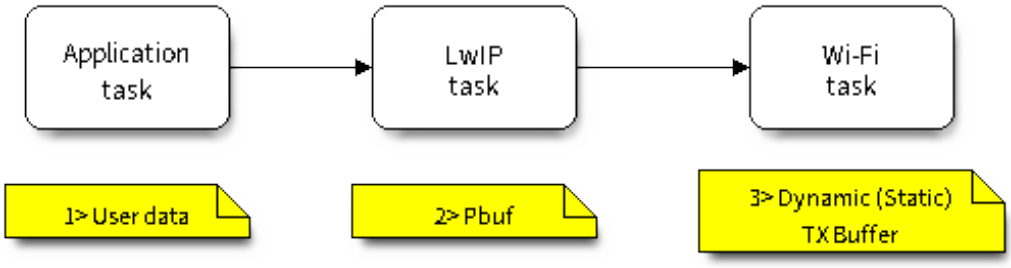

图 61: TX Buffer Allocation

描述：

- 应用程序分配需要发送的数据。
- 应用程序调用 TCPIP 或套接字相关的 API 发送用户数据。这些 API 会分配一个在 LwIP 中使用的 PBUF，并复制用户数据。
- 当 LwIP 调用 Wi-Fi API 发送 PBUF 时，Wi-Fi API 会分配一个“动态发送数据缓冲区”或“静态发送数据缓冲区”，并复制 LwIP PBUF，最后发送数据。

下图展示了如何在接收数据方向分配或释放缓冲区：

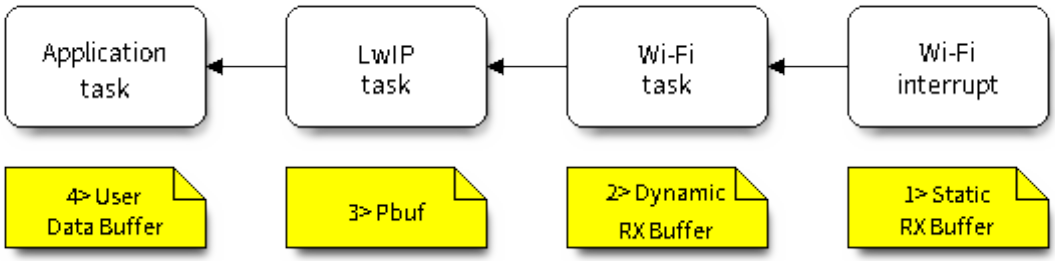

图 62: 接收数据缓冲区分配

描述：

- Wi-Fi 硬件在空中接收到数据包后，将数据包内容放到“静态接收数据缓冲区”，也就是“接收数据 DMA 缓冲区”。

- Wi-Fi 驱动程序分配一个“动态接收数据缓冲区”、复制“静态接收数据缓冲区”，并将“静态接收数据缓冲区”返回给硬件。
- Wi-Fi 驱动程序将数据包传送到上层 (LwIP)，并分配一个 PBUF 用于存放“动态接收数据缓冲区”。
- 应用程序从 LwIP 接收数据。

下表是 Wi-Fi 内部缓冲区的配置情况。

缓冲区类型	分配类型	默认	是否可配置	描述
静态接收数据缓冲区（硬件接收数据缓冲区）	静态	10 * 1600 Bytes	是	这是一种 DMA 内存，在函数 `esp_wifi_init()` 中初始化，在函数 `esp_wifi_deinit()` 中释放。该缓冲区形成硬件接收列表。当通过空中接收到一个帧时，硬件将该帧写入缓冲区，并向 CPU 发起一个中断。然后，Wi-Fi 驱动程序从缓冲区中读取内容，并将缓冲区返回到列表中。 如果应用程序希望减少 Wi-Fi 静态分配的内存，可以将该值从 10 减少到 6，从而节省 6400 Bytes 的内存。除非禁用 AMPDU 功能，否则不建议将该值降低到 6 以下。
动态接收数据缓冲区	动态	32	是	缓冲区的长度可变，取决于所接收帧的长度。当 Wi-Fi 驱动程序从“硬件接收数据缓冲区”接收到一帧时，需要从堆中分配“动态接收数据缓冲区”。在 Menuconfig 中配置的“动态接收数据缓冲区”数量用来限制未释放的“动态接收数据缓冲区”总数量。
动态发送数据缓冲区	动态	32	是	这是一种 DMA 内存，位于堆内存中。当上层 (LwIP) 向 Wi-Fi 驱动程序发送数据包时，该缓冲区首先分配一个“动态发送数据缓冲区”，并复制上层缓冲区。 动态发送数据缓冲区和静态发送数据缓冲区相互排斥。
静态发送数据缓冲区	静态	16 * 1600 Bytes	是	这是一种 DMA 内存，在函数 `esp_wifi_init()` 中初始化，在函数 `esp_wifi_deinit()` 中释放。当上层 (LwIP) 向 Wi-Fi 驱动程序发送数据包时，该缓冲区首先分配一个“静态发送数据缓冲区”，并复制上层缓冲区。 动态发送数据缓冲区和静态发送数据缓冲区相互排斥。 由于发送数据缓冲区必须是 DMA 缓冲区，所以当使能 PSRAM 时，发送数据缓冲区必须是静态的。
管理短缓冲区	动态	8	否	Wi-Fi 驱动程序的内部缓冲区。
管理长缓冲区	动态	32	否	Wi-Fi 驱动程序的内部缓冲区。
管理超长缓冲区	动态	32	否	Wi-Fi 驱动程序的内部缓冲区。

Wi-Fi NVS Flash

如果使能 Wi-Fi NVS flash，所有通过 Wi-Fi API 设置的 Wi-Fi 配置都会被存储到 flash 中，Wi-Fi 驱动程序在下次开机或重启时将自动加载这些配置。但是，应用程序可视情况禁用 Wi-Fi NVS flash，例如：其配置信息不需要存储在非易失性内存中、其配置信息已安全备份，或仅出于某些调试原因等。

Wi-Fi AMPDU

ESP32-C3 同时支持接收和发送 AMPDU，AMPDU 可以大大提高 Wi-Fi 的吞吐量。

通常，应使能 AMPDU。禁用 AMPDU 通常用于调试目的。

4.30.34 故障排除

请见*乐鑫 Wireshark 使用指南*。

乐鑫 Wireshark 使用指南

1. 概述

1.1 什么是 Wireshark？ Wireshark（原称 Ethereal）是一个网络封包分析软件。网络封包分析软件的功能是撷取网络封包，并尽可能显示出最为详细的网络封包资料。Wireshark 使用 WinPCAP 作为接口，直接与网卡进行数据报文交换。

网络封包分析软件的功能可想像成“电工技师使用电表来量测电流、电压、电阻”的工作，只是将场景移植到网络上，并将电线替换成网线。

在过去，网络封包分析软件是非常昂贵，或是专门属于营利用的软件。Wireshark 的出现改变了这一切。

在 GNU GPL 通用许可证的保障范围下，使用者可以以免费的代价取得软件与其源代码，并拥有针对其源代码修改及客制化的权利。

Wireshark 是目前全世界最广泛的网络封包分析软件之一。

1.2 Wireshark 的主要应用 下面是 Wireshark 一些应用的举例：

- 网络管理员用来解决网络问题
- 网络安全工程师用来检测安全隐患
- 开发人员用来测试协议执行情况
- 用来学习网络协议

除了上面提到的，Wireshark 还可以用在其它许多场合。

1.3 Wireshark 的特性

- 支持 UNIX 和 Windows 平台
- 在接口实时捕捉包
- 能详细显示包的详细协议信息
- 可以打开/保存捕捉的包
- 可以导入导出其他捕捉程序支持的包数据格式
- 可以通过多种方式过滤包
- 多种方式查找包
- 通过过滤以多种色彩显示包
- 创建多种统计分析
- 等等

1.4 Wireshark 的“能”与“不能”？

- **捕捉多种网络接口**
  Wireshark 可以捕捉多种网络接口类型的包，哪怕是无线局域网接口。
- **支持多种其它程序捕捉的文件**
  Wireshark 可以打开多种网络分析软件捕捉的包。
- **支持多格式输出**
  Wireshark 可以将捕捉文件输出为多种其他捕捉软件支持的格式。
- **对多种协议解码提供支持**
  Wireshark 可以支持许多协议的解码。
- **Wireshark 不是入侵检测系统**
  如果您的网络中存在任何可疑活动，Wireshark 并不会主动发出警告。不过，当您希望对这些可疑活动一探究竟时，Wireshark 可以发挥作用。
- **Wireshark 不会处理网络事务，它仅仅是“测量”（监视）网络**
  Wireshark 不会发送网络包或做其它交互性的事情（名称解析除外，但您也可以禁止解析）。

2. 如何获取 Wireshark 官网链接：https://www.wireshark.org/download.html

Wireshark 支持多种操作系统，请在下载安装文件时，注意选择与您所用操作系统匹配的安装文件。

3. 使用步骤 **本文档仅以 Linux 系统下的 Wireshark（版本号：2.2.6）为例。**

1) 启动 Wireshark

Linux 下，可编写一个 Shell 脚本，运行该文件即可启动 Wireshark 配置抓包网卡和信道。Shell 脚本如下：

```
ifconfig $1 down
iwconfig $1 mode monitor
iwconfig $1 channel $2
ifconfig $1 up
Wireshark&
```

脚本中有两个参数：`$1` 和 `$2`，分别表示网卡和信道，例如，`./xxx.sh wlan0 6`（此处，`wlan0` 即为抓包使用的网卡，后面的数字 `6` 即为 AP 或 soft-AP 所在的 channel）。

2) 运行 Shell 脚本打开 Wireshark，会出现 Wireshark 抓包开始界面

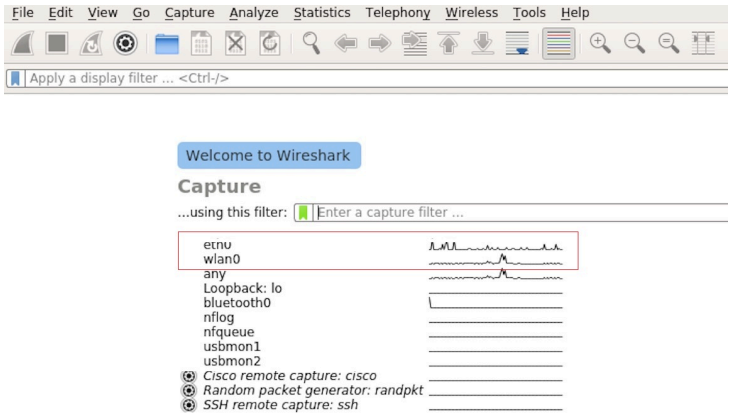

图 63: Wireshark 抓包界面

3) 选择接口，开始抓包

从上图红色框中可以看到有多个接口，第一个为本地网卡，第二个为无线网络。

可根据自己的需求选取相应的网卡，本文是以利用无线网卡抓取空中包为例进行简单说明。

双击 *wlan0* 即可开始抓包。

4) 设置过滤条件

抓包过程中会抓取到同信道所有的空中包，但其实很多都是我们不需要的，因此很多时候我们会设置抓包的过滤条件从而得到我们想要的包。

下图中红色框内即为设置 filter 的位置。

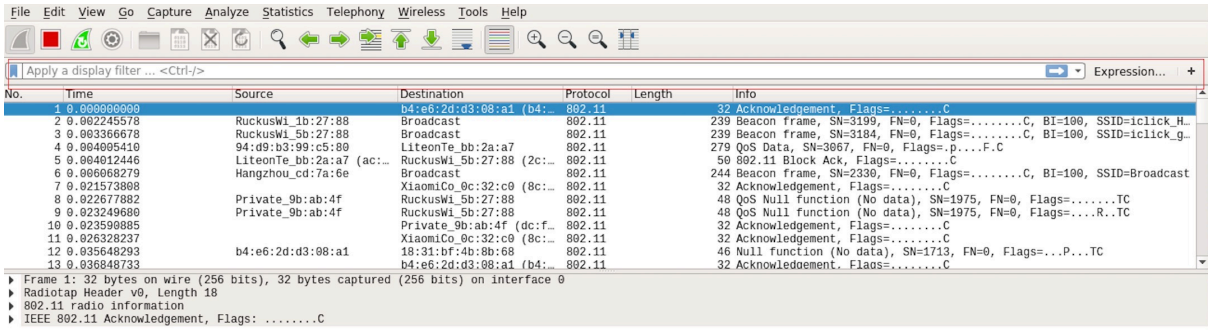

图 64: 设置 Wireshark 过滤条件

点击 *Filter* 按钮（下图的左上角蓝色按钮）会弹出 *display filter* 对话框。

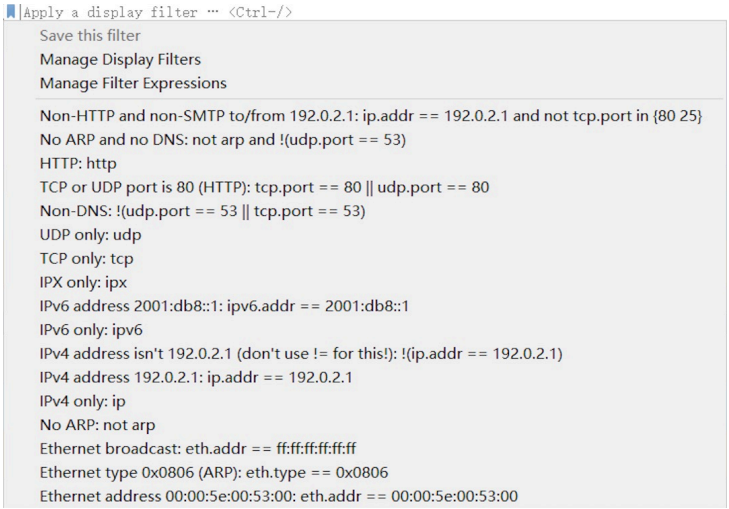

图 65: *Display Filter* 对话框

点击 *Expression* 按钮，会出现 *Filter Expression* 对话框，在此你可以根据需求进行 filter 的设置。

最直接的方法：直接在工具栏上输入过滤条件。

点击在此区域输入或修改显示的过滤字符，在输入过程中会进行语法检查。如果您输入的格式不正确，或者未输入完成，则背景显示为红色。直到您输入合法的表达式，背景会变为绿色。你可以点击下拉列表选择您先前键入的过滤字符。列表会一直保留，即使您重新启动程序。

例如：下图所示，直接输入 2 个 MAC 作为过滤条件，点击 *Apply*（即图中的蓝色箭头），则表示只抓取 2 个此 MAC 地址之间的交互的包。

5) 封包列表

若想查看包的具体的信息只需要选中要查看的包，在界面的下方会显示出包的具体的格式和包的内容。

如上图所示，我要查看第 1 个包，选中此包，图中红色框中即为包的具体内容。

6) 停止/开始包的捕捉

若要停止当前抓包，点击下图的红色按钮即可。

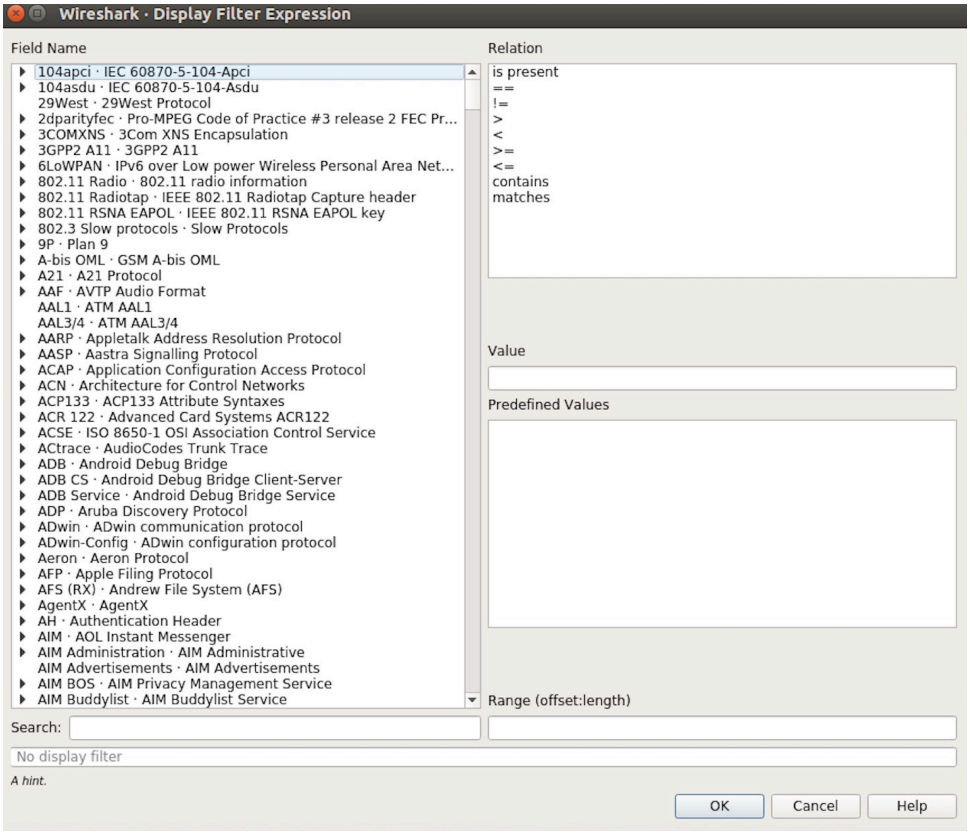

图 66: *Filter Expression* 对话框

图 67: 过滤条件工具栏

图 68: 在过滤条件工具栏中运用 MAC 地址过滤示例

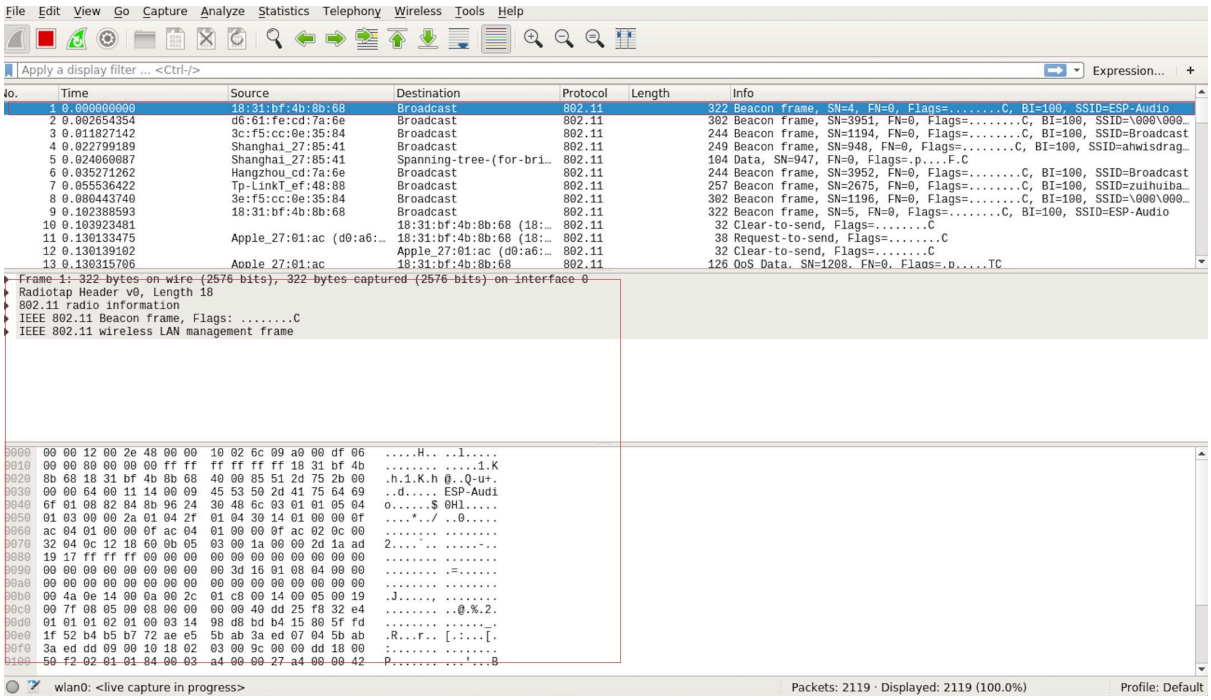

图 69: 封包列表具体信息示例

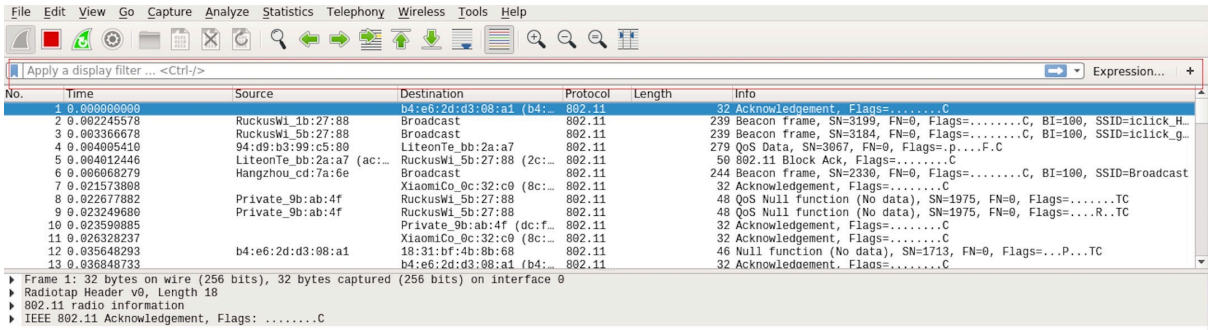

图 70: 停止包的捕捉

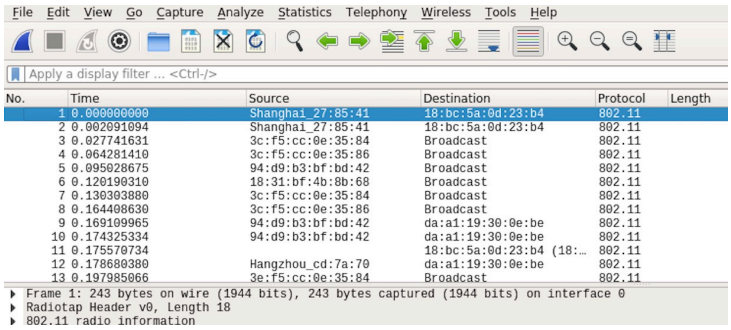

图 71: 开始或继续包的捕捉

若要重新开始抓包，点击下图左上角的蓝色按钮即可。

7) 保存当前捕捉包

Linux 下，可以通过依次点击“File” -> “Export Packet Dissections” -> “As Plain Text File”进行保存。

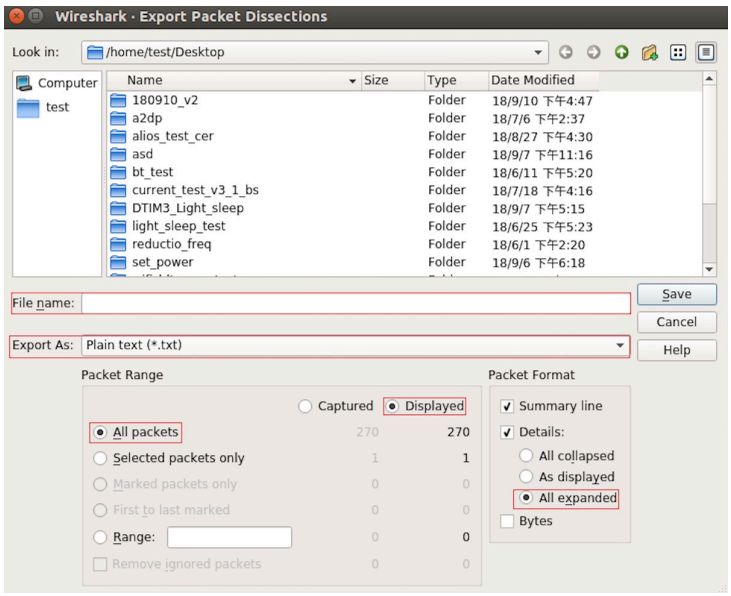

图 72: 保存捕捉包

上图中，需要注意的是，选择 *All packets*、*Displayed* 以及 *All expanded* 三项。

Wireshark 捕捉的包可以保存为其原生格式文件（libpcap），也可以保存为其他格式（如.txt 文件）供其他工具进行读取分析。

4.31 Wi-Fi Security

4.31.1 ESP32-C3 Wi-Fi Security Features

- Support for Protected Management Frames (PMF)
- Support for WPA3-Personal

In addition to traditional security methods (WEP/WPA-TKIP/WPA2-CCMP), ESP32-C3 Wi-Fi supports state-of-the-art security protocols, namely Protected Management Frames based on 802.11w standard and Wi-Fi Protected Access 3 (WPA3-Personal). Together, PMF and WPA3 provide better privacy and robustness against known attacks on traditional modes.

4.31.2 Protected Management Frames (PMF)

Introduction

In Wi-Fi, management frames such as beacons, probes, (de)authentication, (dis)association are used by non-AP stations to scan and connect to an AP. Unlike data frames, these frames are sent unencrypted. An attacker can use eavesdropping and packet injection to send spoofed (de)authentication/(dis)association frames at the right time, leading to the following attacks in case of unprotected management frame exchanges.

- DOS attack on one or all clients in the range of the attacker.
- Tearing down existing association on AP side by sending association request.
- Forcing a client to perform 4-way handshake again in case PSK is compromised in order to get PTK.
- Getting SSID of hidden network from association request.

- Launching man-in-the-middle attack by forcing clients to deauth from legitimate AP and associating to a rogue one.

PMF provides protection against these attacks by encrypting unicast management frames and providing integrity checks for broadcast management frames. These include deauthentication, disassociation and robust management frames. It also provides Secure Association (SA) teardown mechanism to prevent spoofed association/authentication frames from disconnecting already connected clients.

There are 3 types of PMF configuration modes on both station and AP side -

- PMF Optional
- PMF Required
- PMF Disabled

Depending on PMF configurations on Station and AP side, the resulting connection will behave differently. The table below summarises all possible outcomes -

STA Setting	AP Setting	Outcome
PMF Optional	PMF Optional/Required	Mgmt Frames Protected
PMF Optional	PMF Disabled	Mgmt Frames Not Protected
PMF Required	PMF Optional/Required	Mgmt Frames Protected
PMF Required	PMF Disabled	STA refuses Connection
PMF Disabled	PMF Optional/Disabled	Mgmt Frames Not Protected
PMF Disabled	PMF Required	AP refuses Connection

API & Usage

ESP32-C3 supports PMF in both Station and SoftAP mode. For both, the default mode is PMF Optional and disabling PMF is not possible. For even higher security, PMF required mode can be enabled by setting the `required` flag in *pmf_cfg* while using the *`esp_wifi_set_config()`* API. This will result in the device only connecting to a PMF enabled device and rejecting others.

> **注意：** `capable` flag in *pmf_cfg* is deprecated and set to true internally. This is to take the additional security benefit of PMF whenever possible.

4.31.3 WPA3-Personal

Introduction

Wi-Fi Protected Access-3 (WPA3) is a set of enhancements to Wi-Fi access security intended to replace the current WPA2 standard. It includes new features and capabilities that offer significantly better protection against different types of attacks. It improves upon WPA2-Personal in following ways:

- WPA3 uses Simultaneous Authentication of Equals (SAE), which is password-authenticated key agreement method based on Diffie-Hellman key exchange. Unlike WPA2, the technology is resistant to offline-dictionary attack, where the attacker attempts to determine shared password based on captured 4-way handshake without any further network interaction.
- Disallows outdated protocols such as TKIP, which is susceptible to simple attacks like MIC key recovery attack.
- Mandates Protected Management Frames (PMF), which provides protection for unicast and multicast robust management frames which include Disassoc and Deauth frames. This means that the attacker cannot disrupt an established WPA3 session by sending forged Assoc frames to the AP or Deauth/Disassoc frames to the Station.
- Provides forward secrecy, which means the captured data cannot be decrypted even if password is compromised after data transmission.

Please refer to Security section of Wi-Fi Alliance ' s official website for further details.

Setting up WPA3 with ESP32-C3

In IDF Menuconfig under Wi-Fi component, a config option "Enable WPA3-Personal" is provided to Enable/Disable WPA3. By default it is kept enabled, if disabled ESP32-C3 will not be able to establish a WPA3 connection. Currently, WPA3 is supported only in the Station mode. Additionally, since PMF is mandated by WPA3 protocol, PMF Mode should be set to either Optional or Required while setting WiFi config.

Refer to *Protected Management Frames (PMF)* on how to set this mode.

After these settings are done, Station is ready to use WPA3-Personal. Application developers need not worry about the underlying security mode of the AP. WPA3-Personal is now the highest supported protocol in terms of security, so it will be automatically selected for the connection whenever available. For example, if an AP is configured to be in WPA3 Transition Mode, where it will advertise as both WPA2 and WPA3 capable, Station will choose WPA3 for the connection with above settings. Note that Wi-Fi stack size requirement will increase 3kB when WPA3 is used.

4.32 RF 共存

4.32.1 概览

ESP32-C3 只支持一路 RF，Bluetooth (BT 和 BLE）和 Wi-Fi 共享这一路 RF，无法同时收发数据，因此采用时分复用的方法进行收发数据包。

4.32.2 ESP32-C3 支持的共存场景

表 28: 表 1 Wi-Fi 和 BLE 共存支持功能

			BLE			
			Scan	Advertising	Connecting	Connected
Wi-Fi	STA	Scan	Y	Y	Y	Y
		Connecting	Y	Y	Y	Y
		Connected	Y	Y	Y	Y
	SOFTAP	TX Beacon	Y	Y	Y	Y
		Connecting	Y	Y	Y	Y
		Connected	C1	C1	C1	C1
	Sniffer	RX	C2	C2	C2	C2
	ESP-NOW	RX	X	X	X	X
		TX	Y	Y	Y	Y

备注： Y：支持且性能稳定。C1：不能保证性能处于稳定状态。C2：sniffer 无法保证丢包率。X：不支持。

4.32.3 共存机制与策略

共存机制

基于优先级抢占的 RF 资源分配机制，如下图所示，Bluetooth 模块和 Wi-Fi 模块向共存模块申请 RF 资源，共存模块根据二者的优先级高低裁决 RF 归谁使用。

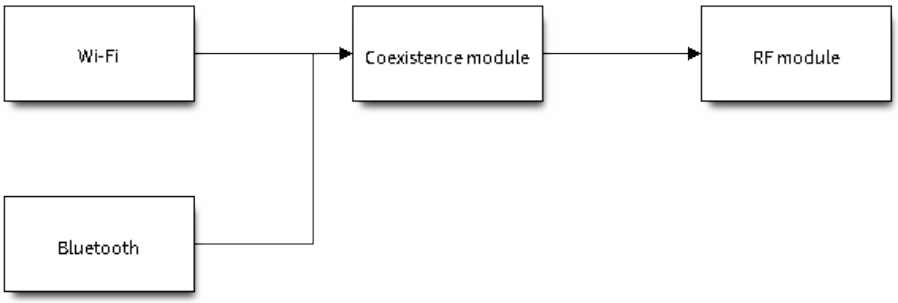

图 73: 共存机制

共存策略

共存周期和时间片 Wi-Fi、BLE 二者对于 RF 的使用，主要是按照时间片来划分的。在 Wi-Fi 的时间片内，Wi-Fi 会向共存仲裁模块发出较高优先级的请求，在 Bluetooth 的时间片内，BLE 会具有较高优先级。共存周期大小和各个时间片占比根据 Wi-Fi 的状态分成四类：

1) IDLE 状态：RF 模块由 Bluetooth 模块控制。
2) CONNECTED 状态：共存周期以目标信标传输时间 (Target Beacon Transmission Time, TBTT) 点为起始点，周期大于 100 ms。
3) SCAN 状态：Wi-Fi 时间片以及共存周期都比在 CONNECTED 状态下的长。为了确保蓝牙的性能，蓝牙的时间片也会做相应的调整。
4) CONNECTING 状态：Wi-Fi 时间片比在 CONNECTED 状态下的长。为了确保蓝牙的性能，蓝牙的时间片也会做相应的调整。

共存逻辑会根据当前 Wi-Fi 和 Bluetooth 的使用场景来选取不同的共存周期和共存时间片的划分策略。对应一个使用场景的共存策略，我们称之为“共存模板”。比如，Wi-Fi CONNECTED 与 BLE CONNECTED 的场景，就对应有一个共存模板。在这个共存模板中，一个共存周期内 Wi-Fi 和 BLE 的时间片各占 50%，时间分配如下图所示：

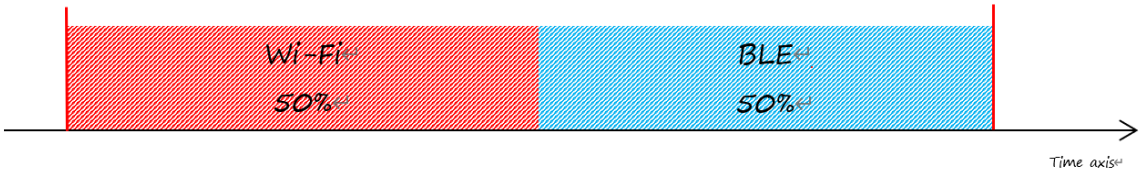

图 74: Wi-Fi CONNECTED 和 BLE CONNECTED 共存状态下时间片划分图

动态优先级 共存模块对 Wi-Fi 和 Bluetooth 不同的状态赋予其不同的优先级。每种状态下的优先级并不是一成不变的，例如每 N 个广播事件 (Advertising event) 中会有一个广播事件使用高优先级。如果高优先级的广播事件发生在 Wi-Fi 时间片内，RF 的使用权可能会被 BLE 抢占。

4.32.4 如何使用共存功能

共存 API 的使用

在大多数共存情况下，ESP32-C3 会自动进行共存状态切换，无需调用 API 对其进行干预。但是对于 BLE MESH 和 Wi-Fi 的共存，ESP32-C3 对其提供了两个 API。当 BLE MESH 的状态发生变化时，应先调用 `esp_coex_status_bit_clear` 对上一个状态进行清除，然后调用 `esp_coex_status_bit_set` 设置当前状态。

BLE MESH 共存状态描述 由于 Wi-Fi 和 Bluetooth 固件无法获知当前的上层应用的场景，一些共存模板需要应用代码调用共存的 API 才能生效。BLE MESH 的工作状态就需要由应用层通知给共存模块，用于选择共存模板。

- ESP_COEX_BLE_ST_MESH_CONFIG：正在组网。
- ESP_COEX_BLE_ST_MESH_TRAFFIC：正在传输数据。
- ESP_COEX_BLE_ST_MESH_STANDBY：处于空闲状态，无大量数据交互。

共存 API 错误代码

所有共存 API 都有自定义的返回值，即错误代码。这些代码可分类为：

- 无错误，例如：返回值为 ESP_OK 代表 API 成功返回。
- 可恢复错误，例如: 返回值为 ESP_ERR_INVALID_ARG 代表 API 参数错误。

设置共存编译时选项

- 在完成共存程序编写的时候，您必须通过 menuconfig 选择*CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE* 打开软件共存配置选项，否则就无法使用上文中提到的共存功能。
- 在 BLE 连接过程中使用了 LE Coded PHY 时，为了防止蓝牙数据包持续时间较长而对 Wi-Fi 的性能产生严重影响，您可以在*CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM* 的子选项中选择 *BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_EN* 选择打开对 TX/RX 最大时间的限制配置选项。
- 您可以通过修改以下 menuconfig 选项，以减小内存开销：
  1) *CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY* 选择打开蓝牙协议栈动态内存配置选项。
  2) *CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM* 选择减少 Wi-Fi 静态接收数据缓冲区的数量。
  3) *CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM* 选择减少 Wi-Fi 动态接收数据缓冲区的数量。
  4) *CONFIG_ESP32_WIFI_TX_BUFFER* 选择使用动态分配发送数据缓冲区配置选项。
  5) *CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM* 选择减少 Wi-Fi 动态发送数据缓冲区的数量。
  6) *CONFIG_ESP32_WIFI_TX_BA_WIN* 选择减少 Wi-Fi Block Ack TX 窗口的数量。
  7) *CONFIG_ESP32_WIFI_RX_BA_WIN* 选择减少 Wi-Fi Block Ack RX 窗口的数量。
  8) *CONFIG_ESP32_WIFI_MGMT_SBUF_NUM* 选择减少 Wi-Fi 管理短缓冲区的数量。
  9) *CONFIG_ESP32_WIFI_RX_IRAM_OPT* 选择关闭此配置选项，关闭此配置选项将会减少大约 17 KB 的 IRAM 内存。
  10) *CONFIG_LWIP_TCP_SND_BUF_DEFAULT* 选择减小 TCP 套接字默认发送缓存区大小。
  11) *CONFIG_LWIP_TCP_WND_DEFAULT* 选择减小 TCP 套接字默认接收窗口的大小。
  12) *CONFIG_LWIP_TCP_RECVMBOX_SIZE* 选择减小 TCP 接收邮箱的大小。
  13) *CONFIG_LWIP_UDP_RECVMBOX_SIZE* 选择减小 UDP 接收邮箱的大小。
  14) *CONFIG_LWIP_TCPIP_RECVMBOX_SIZE* 选择减小 TCPIP 任务接收邮箱大小。

备注： 由于共存配置选项依赖于蓝牙配置选项，所以请先打开蓝牙配置选项，然后在 Wi-Fi 配置选项中打开共存配置选项。

4.33 Reproducible Builds

4.33.1 Introduction

ESP-IDF build system has support for reproducible builds.

When reproducible builds are enabled, the application built with ESP-IDF doesn't depend on the build environment. Both the .elf file and .bin files of the application remains exactly the same, even if the following variables change:

- Directory where the project is located
- Directory where ESP-IDF is located (`IDF_PATH`)
- Build time

4.33.2 Reasons for non-reproducible builds

There are several reasons why an application may depend on the build environment, even when the same source code and tools versions are used.

- In C code, `__FILE__` preprocessor macro is expanded to the full path of the source file.
- `__DATE__` and `__TIME__` preprocessor macros are expanded to compilation date and time.
- When the compiler generates object files, it adds sections with debug information. These sections help debuggers, like GDB, to locate the source code which corresponds to a particular location in the machine code. These sections typically contain paths of relevant source files. These paths may be absolute, and will include the path to ESP-IDF or to the project.

There are also other possible reasons, such as unstable order of inputs and non-determinism in the build system.

4.33.3 Enabling reproducible builds in ESP-IDF

Reproducible builds can be enabled in ESP-IDF using *CONFIG_APP_REPRODUCIBLE_BUILD* option.

This option is disabled by default. It can be enabled in `menuconfig`.

The option may also be added into `sdkconfig.defaults`. If adding the option into `sdkconfig.defaults`, delete the `sdkconfig` file and run the build again. See 自定义 *sdkconfig* 的默认值 for more information.

4.33.4 How reproducible builds are achieved

ESP-IDF achieves reproducible builds using the following measures:

- In ESP-IDF source code, `__DATE__` and `__TIME__` macros are not used when reproducible builds are enabled. Note, if the application source code uses these macros, the build will not be reproducible.
- ESP-IDF build system passes a set of `-fmacro-prefix-map` and `-fdebug-prefix-map` flags to replace base paths with placeholders:
  - Path to ESP-IDF is replaced with `/IDF`
  - Path to the project is replaced with `/IDF_PROJECT`
  - Path to the build directory is replaced with `/IDF_BUILD`
  - Paths to components are replaced with `/COMPONENT_NAME_DIR` (where `NAME` is the name of the component)
- Build date and time are not included into the *application metadata structure* if *CONFIG_APP_REPRODUCIBLE_BUILD* is enabled.
- ESP-IDF build system ensures that source file lists, component lists and other sequences are sorted before passing them to CMake. Various other parts of the build system, such as the linker script generator also perform sorting to ensure that same output is produced regardless of the environment.

4.33.5 Reproducible builds and debugging

When reproducible builds are enabled, file names included in debug information sections are altered as shown in the previous section. Due to this fact, the debugger (GDB) is not able to locate the source files for the given code location.

This issue can be solved using GDB `set substitute-path` command. For example, by adding the following command to GDB init script, the altered paths can be reverted to the original ones:

```
set substitute-path /COMPONENT_FREERTOS_DIR /home/user/esp/esp-idf/components/
↪freertos
```

ESP-IDF build system generates a file with the list of such `set substitute-path` commands automatically during the build process. The file is called `prefix_map_gdbinit` and is located in the project `build` directory.

When *idf.py gdb* is used to start debugging, this additional gdbinit file is automatically passed to GDB. When launching GDB manually or from and IDE, please pass this additional gdbinit script to GDB using `-x build/prefix_map_gdbinit` argument.

4.33.6 Factors which still affect reproducible builds

Note that the built application still depends on:

- ESP-IDF version
- Versions of the build tools (CMake, Ninja) and the cross-compiler

IDF Docker Image can be used to ensure that these factors do not affect the build.

Chapter 5

迁移指南

5.1 迁移到 ESP-IDF 5.x

5.1.1 从 4.4 迁移到 5.0

迁移构建系统至 ESP-IDF v5.0

从 GNU Make 构建系统迁移至 ESP-IDF v5.0 ESP-IDF v5.0 已不再支持基于 Make 的工程，请参考从 *ESP-IDF GNU Make* 构建系统迁移到 *CMake* 构建系统 进行迁移。

更新片段文件语法 请参考将链接器脚本片段文件语法迁移至 *ESP-IDF v5.0* 适应版本 对 v3.x 的语法进行更新。

明确指定组件依赖 在之前的 ESP-IDF 版本中，除了通用组件依赖项，还有一些组件总是作为公共依赖项在构建中被添加至每个组件中，如：

- `driver`
- `efuse`
- `esp_timer`
- `lwip`
- `vfs`
- `esp_wifi`
- `esp_event`
- `esp_netif`
- `esp_eth`
- `esp_phy`

这意味着可以直接包含这些组件的头文件，而无需在 `idf_component_register` 中将它们指定为依赖。此行为是由各种常见组件的传递依赖关系引起的。

在 ESP-IDF v5.0 中，此行为已修复，这些组件不再默认作为公共依赖项添加。

如果组件所依赖的某个组件不属于通用组件依赖项，则必须显式地声明此依赖关系。可以通过在组件的 `CMakeLists.txt` 中的 `idf_component_register` 调用中添加 `REQUIRES <component_name>` 或 `PRIV_REQUIRES <component_name>` 来完成。有关指定组件依赖的更多信息，请参阅组件依赖。

设置 COMPONENT_DIRS 和 EXTRA_COMPONENT_DIRS 变量 为了实现构建项目时的路径能够包含空格，ESP-IDF v5.0 做了一系列改进，其中包括改进了 CMakeLists.txt 文件中的 COMPONENT_DIRS 和 EXTRA_COMPONENT_DIRS 变量。

ESP-IDF v5.0 版本中，不再支持添加不存在的目录到变量 COMPONENT_DIRS 或 EXTRA_COMPONENT_DIRS 中，否则会出现报错。

同时，ESP-IDF v5.0 中也不再支持使用字符串拼接的方式定义 COMPONENT_DIRS 或 EXTRA_COMPONENT_DIRS 变量。这些变量应该定义为 CMake 列表。例如:

```
set(EXTRA_COMPONENT_DIRS path1 path2)
list(APPEND EXTRA_COMPONENT_DIRS path3)
```

不支持:

```
set(EXTRA_COMPONENT_DIRS "path1 path2")
set(EXTRA_COMPONENT_DIRS "${EXTRA_COMPONENT_DIRS} path3")
```

将这些变量定义为 CMake 列表的方式兼容之前的 ESP-IDF 版本。

更新 target_link_libraries 用法 ESP-IDF v5.0 修复了组件的 CMake 变量传播问题。此问题导致本应该只应用于某一组件的编译器标志和定义应用到了项目中的每个组件。

该修复也带来一定的副作用，从 ESP-IDF v5.0 开始，用户项目在使用 target_link_libraries 时必须明确指定 project_elf，同时自定义 CMake 项目必须指定 PRIVATE、PUBLIC 或 INTERFACE 参数。这是一项重大变更，不兼容以前的 ESP-IDF 版本。

例如:

```
target_link_libraries(${project_elf} PRIVATE "-Wl,--wrap=esp_panic_handler")
```

不支持:

```
target_link_libraries(${project_elf} "-Wl,--wrap=esp_panic_handler")
```

更新 CMake 版本 在 ESP-IDF v5.0 中，最低 CMake 版本已更新到 3.16，并且不再支持低于 3.16 的版本。如果您的操作系统没有安装 CMake，请运行 tools/idf_tools.py install cmake 来安装合适的版本。

该变更会影响到使用系统提供的 CMake 以及自定义 CMake 的 ESP-IDF 用户。

重新定义特定目标配置文件的应用顺序 ESP-IDF v5.0 重新安排了特定目标配置文件和 SDKCONFIG_DEFAULTS 中所有其他文件的应用顺序。现在，特定目标的配置文件将在引入它的文件之后、在 SDKCONFIG_DEFAULTS 中后续的其他文件之前应用。

例如:

```
如果 ``SDKCONFIG_DEFAULTS="sdkconfig.defaults;sdkconfig_devkit1
↪"``，且同一文件夹内有 ``sdkconfig.defaults.esp32``␣
↪文件，那么文件的应用顺序为：(1) sdkconfig.defaults (2) sdkconfig.defaults.esp32␣
↪(3) sdkconfig_devkit1
```

如果某个键在不同的特定目标配置文件中有不同的值，那么后者的值会覆盖前者。例如在以上案例中，如果某个键在 sdkconfig.defaults.esp32 和 sdkconfig_devkit1 中的值不同，则在 sdkconfig_devkit1 中的值会覆盖在 sdkconfig.defaults.esp32 中的值。

如果确实需要设置特定目标的配置值，请将其放到后应用的特定目标文件中，如 sdkconfig_devkit1.esp32。

GCC

Previous GCC version was 8.4.0

Official GNU porting guides for your code

- https://gcc.gnu.org/gcc-9/porting_to.html
- https://gcc.gnu.org/gcc-10/porting_to.html
- https://gcc.gnu.org/gcc-11/porting_to.html

Espressif Toolchain changes

int32_t and uint32_t for Xtensa compiler The types `int32_t` and `uint32_t` have been changed from `int` and `unsigned int` to `long` and `unsigned long`. Upstream GCC uses `long` integers for int32_t/uint32_t on Xtensa, RISC-V and other architectures.

	2021r2 and older, GCC 8	2022r1, GCC 11
xtensa	(unsigned) int	(unsigned) long
riscv32	(unsigned) long	(unsigned) long

The most cases in code are related to the formatting. Using `%i`, `%x`, etc., should be replaced to `PRIi32`, `PRIxx`, and others from `<inttypes.h>`.

In other cases it should be noted that enums have `int` type.

In common, `int32_t` and `int` are different types, as well as `uint32_t` and `unsigned int`.

Removing of CONFIG_COMPILER_DISABLE_GCC8_WARNINGS build option `CONFIG_COMPILER_DISABLE_GCC8_WARNINGS` option was introduced to help transition from rigid GCC 5 toolchain to new ones with helping build ancient code. Enough time has passed to fix the warnings.

For now in GCC 11, the suggestion is to review your own code to comply compiler warnings.

Common cases in code

-Wstringop-overflow, -Wstringop-overread, -Wstringop-truncation, and -Warray-bounds warnings Warning details: https://gcc.gnu.org/onlinedocs/gcc-11.2.0/gcc/Warning-Options.html

Double check your code then fix please. Unfortunately, not all seemingly simple ways to satisfy the compiler will work. You can supress such warnings if the compiler worried for nothing.

```
#pragma GCC diagnostic push
#pragma GCC diagnostic ignored "-Wstringop-overflow"
#pragma GCC diagnostic ignored "-Warray-bounds"
    memset(RTC_SLOW_MEM, 0, CONFIG_ULP_COPROC_RESERVE_MEM); // <<-- This line␣
↪leads to warnings
#pragma GCC diagnostic pop
```

```
#pragma GCC diagnostic push
#if     __GNUC__ >= 11
#pragma GCC diagnostic ignored "-Wstringop-overread" // <<-- This key had been␣
↪introduced since GCC 11
#endif
#pragma GCC diagnostic ignored "-Warray-bounds"
```

(下页继续)

(续上页)

```
            memcpy(backup_write_data, (void *)EFUSE_PGM_DATA0_REG, sizeof(backup_
↪write_data)); // <<-- This line leads to warnings
#pragma GCC diagnostic pop
```

-Waddress-of-packed-member warning Warning details: https://gcc.gnu.org/onlinedocs/gcc-11.2.0/gcc/Warning-Options.html

Double check your code then fix please.

Unaligned pointer value for data doesn't have penalty for xtensa and riscv32 Espressif chips so we can ignore it in most cases.

```
components/bt/host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c: In function
↪'btc_to_bta_gatt_id':
components/bt/host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c:105:21: warning:␣
↪taking address of packed member of 'struct <anonymous>' may result in an␣
↪unaligned pointer value [-Waddress-of-packed-member]
  105 |     btc_to_bta_uuid(&p_dest->uuid, &p_src->uuid);
      |                     ^~~~~~~~~~~~
```

on CMake level for tons of cases:

```
set_source_files_properties(
    "host/bluedroid/bta/gatt/bta_gattc_act.c"
    "host/bluedroid/bta/gatt/bta_gattc_cache.c"
    "host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c"
    "host/bluedroid/btc/profile/std/gatt/btc_gatts.c"
    PROPERTIES COMPILE_FLAGS -Wno-address-of-packed-member)
```

or on code level:

```
#pragma GCC diagnostic push
#if     __GNUC__ >= 9
#pragma GCC diagnostic ignored "-Waddress-of-packed-member" <<-- This key had been␣
↪introduced since GCC 9
#endif
    uint32_t* reg_ptr = (uint32_t*)src;
#pragma GCC diagnostic pop
```

llabs() for 64-bit integers The function `abs()` from stdlib.h takes `int` argument. Please use `llabs()` for types that intended to be 64-bit. In particular it's important for `time_t`.

Networking

Ethernet

esp_eth_ioctl() API `esp_eth_ioctl()` third argument could take *int* (*bool*) number as an input in some cases. However, it was not properly documented and, in addition, the number had to be "unnaturally" type casted to *void* * datatype to prevent compiler warnings as shown in below example:

```
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, (void *)true);
```

This could lead to misuse of the `esp_eth_ioctl()`. Therefore, ESP-IDF 5.0 unified usage of `esp_eth_ioctl()`. Its third argument now always acts as pointer to a memory location of specific type from/to where the configuration option is read/stored.

Usage example to set Ethernet configuration:

```
eth_duplex_t new_duplex_mode = ETH_DUPLEX_HALF;
esp_eth_ioctl(eth_handle, ETH_CMD_S_DUPLEX_MODE, &new_duplex_mode);
```

Usage example to get Ethernet configuration:

```
eth_duplex_t duplex_mode;
esp_eth_ioctl(eth_handle, ETH_CMD_G_DUPLEX_MODE, &duplex_mode);
```

KSZ8041/81 and LAN8720 Driver Update KSZ8041/81 and LAN8720 Drivers were updated to support more devices (generations) from associated product family. The drivers are able to recognize particular chip number and its potential support by the driver.

As a result, the specific "chip number" functions calls were replaced by generic ones as follows:

- *esp_eth_phy_new_ksz8041* and *esp_eth_phy_new_ksz8081* were removed, use *esp_eth_phy_new_ksz80xx()* instead
- *esp_eth_phy_new_lan8720* was removed, use *esp_eth_phy_new_lan87xx()* instead

ESP NETIF Glue Event Handlers `esp_eth_set_default_handlers()` and `esp_eth_clear_default_handlers()` functions were removed. Registration of the default IP layer handlers for Ethernet is now handled automatically. If users have already followed the recommendation to fully initialize the Ethernet driver and network interface prior to registering their Ethernet/IP event handlers, then no action is required (except for deleting the affected functions). Otherwise, users should ensure that they register the user event handlers as the last thing prior to starting the Ethernet driver.

PHY Address Auto-detect Ethernet PHY address auto-detect function `esp_eth_detect_phy_addr` was renamed to `esp_eth_phy_802_3_detect_phy_addr()` and its header declaration was moved to esp_eth/include/esp_eth_phy_802_3.h.

TCP/IP 适配器 TCP/IP 适配器是在 ESP-IDF v4.1 之前使用的网络接口抽象组件。本文档概述了从 tcpip_adapter 移出至其后继者*ESP-NETIF* 的过程。

更新网络连接代码

网络软件栈初始化 只需将 `tcpip_adapter_init()` 替换为 `esp_netif_init()`。请注意，*ESP-NETIF* 初始化 API 可返回标准错误代码，还可以使用 `esp_netif_deinit()` 进行去初始化。

此外，还需将 `#include "tcpip_adapter.h"` 替换为 `#include "esp_netif.h"`。

创建网络接口 TCP/IP 适配器静态定义了三个接口：

- Wi-Fi Station
- Wi-Fi AP
- 以太网

网络接口的设计应严格参考*ESP-NETIF*，以使其能够连接到 TCP/IP 软件栈。例如，在 TCP/IP 软件栈和事件循环初始化完成后，Wi-Fi 的初始化代码必须显示调用 `esp_netif_create_default_wifi_sta();` 或 `esp_netif_create_default_wifi_ap();`。请参阅这三个接口的初始化代码示例：

- Wi-Fi Station: wifi/getting_started/station/main/station_example_main.c
- Wi-Fi AP: wifi/getting_started/softAP/main/softap_example_main.c

- 以太网: ethernet/basic/main/ethernet_example_main.c

更换 tcpip_adapter API 所有 tcpip_adapter 函数都有对应的 esp-netif。请参阅 esp_netif.h 查看更多信息:

- Setters/Getters
- DHCP
- DNS
- IP address

默认事件处理程序 事件处理程序已经从 tcpip_adapter 移动到相应的驱动程序代码。从应用程序的角度来看，这不会带来任何影响，所有事件仍以相同的方式处理。请注意，在与 IP 相关的事件处理程序中，应用程序代码通常以 esp-netif 结构体的形式接收 IP 地址，该结构体并非 LwIP 结构，但兼容二进制格式。打印地址的首选方式如下所示:

```
ESP_LOGI(TAG, "got ip:" IPSTR "\n", IP2STR(&event->ip_info.ip));
```

不建议使用下述方式:

```
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

由于 `ip4addr_ntoa()` 为 LwIP API，因此 esp-netif 还提供了替代函数 `esp_ip4addr_ntoa()`，但整体而言，仍推荐使用第一种方法。

IP 地址 推荐使用 esp-netif 定义的 IP 结构。请注意，在启用默认兼容性时，LwIP 结构体仍然可以工作。
* esp-netif IP address definitions

下一步 为了令移植应用程序可以使用*ESP-NETIF*，还需在组件配置中禁用 tcpip_adapter 兼容层。方法为: `ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface`，并检查工程是否编译成功。TCP/IP 适配器涉及大量依赖项，这一步可能有助于将应用程序与使用特定 TCP/IP 软件栈的 API 分离开来。

Peripherals

Peripheral Clock Gating As usual, peripheral clock gating is still handled by driver itself, users don't need to take care of the peripheral module clock gating.

However, for advanced users who implement their own drivers based on `hal` and `soc` components, the previous clock gating include path has been changed from `driver/periph_ctrl.h` to `esp_private/periph_ctrl.h`.

RTC Subsystem Control RTC control APIs have been moved from `driver/rtc_cntl.h` to `esp_private/rtc_ctrl.h`.

ADC

- ADC oneshot mode driver has been redesigned. New driver is in `esp_adc` component and the include path is `esp_adc/adc_oneshot.h`. Legacy driver is still available in the previous include path `driver/adc.h`. However, by default, including `driver/adc.h` will bring a build warning like *legacy adc driver is deprecated, please migrate to use esp_adc/adc_oneshot.h and esp_adc/adc_continuous.h for oneshot mode and continuous mode drivers respectively*. The warning can be suppressed by the Kconfig option *CONFIG_ADC_SUPPRESS_DEPRECATE_WARN*.
- ADC continuous mode driver has been moved from `driver` component to `esp_adc` component. Include path has been changed from `driver/adc.h` to `esp_adc/adc_continuous.h`. Legacy driver is still available in the previous include path `driver/adc.h`. Similarly, including it will bring a build warning, and it can be suppressed by the Kconfig option *CONFIG_ADC_SUPPRESS_DEPRECATE_WARN*.

- ADC calibration driver has been redesigned. New driver is in `esp_adc` component and the include path is `esp_adc/adc_cali.h` and `esp_adc/adc_cali_scheme.h`. Legacy driver is still available by including `esp_adc_cal.h`. However, by default, including `esp_adc_cal.h` will bring a build warning like *legacy adc calibration driver is deprecated, please migrate to use esp_adc/adc_cali.h and esp_adc/adc_cali_scheme.h*. The warning can be suppressed by the Kconfig option *CONFIG_ADC_CALI_SUPPRESS_DEPRECATE_WARN*.
- API `adc_power_acquire` and `adc_power_release` have been deprecated. These two are used by other drivers to maintain ADC power due to hardware limitation. After this change, ADC power will still be handled by the drivers. However, for users who are interested in this, the include path has been changed from `driver/adc.h` to `esp_private/adc_private.h`.
- Previous `driver/adc2_wifi_private.h` has been moved to `esp_private/adc2_wifi.h`.
- Enums `ADC_UNIT_BOTH`, `ADC_UNIT_ALTER` and `ADC_UNIT_MAX` in `adc_unit_t` have been removed.
- Enum `ADC_CHANNEL_MAX` in `adc_channel_t` has been removed. Some channels are not supported on some chips, driver will give a dynamic error if an unsupported channels are used.
- Enum `ADC_ATTEN_MAX` has been removed. Some attenuations are not supported on some chips, driver will give a dynamic error if an unsupported attenuation is used.
- Enum `ADC_CONV_UNIT_MAX` has been removed. Some convert mode are not supported on some chips, driver will give a dynamic error if an unsupported convert mode is used.
- API `hall_sensor_read` on ESP32 has been removed. Hall sensor is no more supported on ESP32.
- API `adc_set_i2s_data_source` and `adc_i2s_mode_init` have been deprecated. Related enum `adc_i2s_source_t` has been deprecated. Please migrate to use `esp_adc/adc_continuous.h`.

GPIO The previous Kconfig option *RTCIO_SUPPORT_RTC_GPIO_DESC* has been removed, thus the `rtc_gpio_desc` array is unavailable. Please use `rtc_io_desc` array instead.

Sigma-Delta Modulator The Sigma-Delta Modulator driver has been redesigned into *SDM*. The new driver implements a factory pattern, where the SDM channels are managed in a pool internally, thus you don't have to fix a SDM channel to a GPIO manually. All SDM channels can be allocated dynamically. Although it's recommended to use the new driver APIs, the legacy driver is still available in the previous include path `driver/sigmadelta.h`. However, by default, including `driver/sigmadelta.h` will bring a build warning like `The legacy sigma-delta driver is deprecated, please use driver/sdm.h`. The warning can be suppressed by Kconfig option *CONFIG_SDM_SUPPRESS_DEPRECATE_WARN*.

The major breaking changes in concept and usage are listed as follows:

Breaking Changes in Concepts

- SDM channel representation has changed from `sigmadelta_channel_t` to *`sdm_channel_handle_t`*, which is an opaque pointer.
- SDM channel configurations are stored in *`sdm_config_t`* now, instead the previous `sigmadelta_config_t`.
- In the legacy driver, you don't have to set the clock source for SDM channel. But in the new driver, you need to set a proper one in the *`sdm_config_t::clk_src`*. The available clock sources are listed in the *`soc_periph_sdm_clk_src_t`*.
- In the legacy driver, you need to set a `prescale` for the channel, which will reflected into the frequency the modulator output a pulse. In the new driver, you should use *`sdm_config_t::sample_rate_hz`*.

Breaking Changes in Usage

- Channel configuration was done by channel allocation, in *`sdm_new_channel()`*. In the new driver, only the `duty` can be changed at runtime, by *`sdm_channel_set_duty()`*. Other parameters like `gpio number` and `prescale` are only allowed to set during channel allocation.
- Before further channel operations, you should **enable** the channel in advance, by calling *`sdm_channel_enable()`*. This function will help to manage some system level services, like **Power Management**.

Timer Group Driver Timer Group driver has been redesigned into *GPTimer*, which aims to unify and simplify the usage of general purpose timer. Although it's recommended to use the the new driver APIs, the legacy driver is still available in the previous include path `driver/timer.h`. However, by default, including `driver/timer.h` will bring a build warning like `legacy timer group driver is deprecated, please migrate to driver/gptimer.h`. The warning can be suppressed by the Kconfig option *CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN*.

The major breaking changes in concept and usage are listed as follows:

Breaking Changes in Concepts

- `timer_group_t` and `timer_idx_t` which used to identify the hardware timer are removed from user's code. In the new driver, a timer is represented by *gptimer_handle_t*.
- Definition of timer source clock is moved to *gptimer_clock_source_t*, the previous `timer_src_clk_t` is not used.
- Definition of timer count direction is moved to *gptimer_count_direction_t*, the previous `timer_count_dir_t` is not used.
- Only level interrupt is supported, `timer_intr_t` and `timer_intr_mode_t` are not used.
- Auto-reload is enabled by set the *gptimer_alarm_config_t::auto_reload_on_alarm* flag. `timer_autoreload_t` is not used.

Breaking Changes in Usage

- Timer initialization is done by creating a timer instance from *gptimer_new_timer()*. Basic configurations like clock source, resolution and direction should be set in *gptimer_config_t*. Note that, alarm event specific configurations are not needed during the driver install stage.
- Alarm event is configured by *gptimer_set_alarm_action()*, with parameters set in the *gptimer_alarm_config_t*.
- Setting and getting count value are done by *gptimer_get_raw_count()* and *gptimer_set_raw_count()*. The driver doesn't help convert the raw value into UTC timestamp. Instead, the conversion should be done form user's side as the timer resolution is also known to the user.
- The driver will install the interrupt service as well if *gptimer_event_callbacks_t::on_alarm* is set to a valid callback function. In the callback, user doesn't have to deal with the low level registers (like "clear interrupt status", "re-enable alarm event" and so on). So functions like `timer_group_get_intr_status_in_isr` and `timer_group_get_auto_reload_in_isr` are not used anymore.
- To update the alarm configurations when alarm event happens, one can call *gptimer_set_alarm_action()* in the interrupt callback, then the alarm will be re-enabled again.
- Alarm will always be re-enabled by the driver if *gptimer_alarm_config_t::auto_reload_on_alarm* is set to true.

UART

Removed/Deprecated items	Replacement	Remarks
`uart_isr_register()`	None	UART interrupt handling is implemented by driver itself.
`uart_isr_free()`	None	UART interrupt handling is implemented by driver itself.
`use_ref_tick` in *uart_config_t*	*uart_config_t::source_clk*	Select the clock source.
`uart_enable_pattern_det_intr()`	*uart_enable_pattern_det_baud_intr()*	Enable pattern detection interrupt.

I2C

Removed/Deprecated items	Replacement	Remarks
`i2c_isr_register()`	None	I2C interrupt handling is implemented by driver itself.
`i2c_isr_register()`	None	I2C interrupt handling is implemented by driver itself.
`i2c_opmode_t`	None	It's not used anywhere in esp-idf.

SPI

Removed/Deprecated items	Replacement	Remarks
`spi_cal_clock()`	*`spi_get_actual_clock()`*	Get SPI real working frequency.

- The internal header file `spi_common_internal.h` has been moved to `esp_private/spi_common_internal.h`.

LEDC

Removed/Deprecated items	Replacement	Remarks
`bit_num` in *`ledc_timer_config_t`*	*`ledc_timer_config_t::duty_resolution`*	Set resolution of the duty cycle.

Temperature Sensor Driver

- Old API header `temp_sensor.h` has been redesigned as `temperature_sensor.h`, it is recommended to use the new driver and the old driver is not allowed to be used at the same time.
- Although it's recommended to use the new driver APIs, the legacy driver is still available in the previous include path `driver/temp_sensor.h`. However, by default, including `driver/temp_sensor.h` will bring a build warning like "legacy temperature sensor driver is deprecated, please migrate to driver/temperature_sensor.h". The warning can be suppressed by enabling the menuconfig option *CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN*.
- Configuration contents has been changed. In old version, user need to configure the `clk_div` and `dac_offset`. While in new version, user only need to choose `tsens_range`
- The process of using temperature sensor has been changed. In old version, user can use `config->start->read_celsius` to get value. In the new version, user must install the temperature sensor driver firstly, by `temperature_sensor_install` and uninstall it when finished. For more information, you can refer to *Temperature Sensor* .

RMT Driver RMT driver has been redesigned (see *RMT transceiver*), which aims to unify and extend the usage of RMT peripheral. Although it's recommended to use the new driver APIs, the legacy driver is still available in the previous include path `driver/rmt.h`. However, by default, including `driver/rmt.h` will bring a build warning like *The legacy RMT driver is deprecated, please use driver/rmt_tx.h and/or driver/rmt_rx.h*. The warning can be suppressed by the Kconfig option *CONFIG_RMT_SUPPRESS_DEPRECATE_WARN*.

The major breaking changes in concept and usage are listed as follows:

Breaking Changes in Concepts

- `rmt_channel_t` which used to identify the hardware channel are removed from user space. In the new driver, RMT channel is represented by *`rmt_channel_handle_t`*. The channel is dynamic allocated by the driver, instead of designated by user.
- `rmt_item32_t` is replaced by *`rmt_symbol_word_t`*, which avoids a nested union inside a struct.
- `rmt_mem_t` is removed, as we don't allow users to access RMT memory block (a.k.an RMTMEM) directly. Direct access to RMTMEM doesn't make sense but make mistakes, especially when the RMT channel also connected with a DMA channel.
- `rmt_mem_owner_t` is removed, as the ownership is controller by driver, not by user anymore.
- `rmt_source_clk_t` is replaced by *`rmt_clock_source_t`*, note they're not binary compatible.
- `rmt_data_mode_t` is removed, the RMT memory access mode is configured to always use Non-FIFO and DMA mode.

- rmt_mode_t is removed, as the driver has stand alone install functions for TX and RX channels.
- rmt_idle_level_t is removed, setting IDLE level for TX channel is available in *rmt_transmit_config_t::eot_level*.
- rmt_carrier_level_t is removed, setting carrier polarity is available in *rmt_carrier_config_t::polarity_active_low*.
- rmt_channel_status_t and rmt_channel_status_result_t are removed, they' re not used anywhere.
- transmitting by RMT channel doesn' t expect user to prepare the RMT symbols, instead, user needs to provide an RMT Encoder to tell the driver how to convert user data into RMT symbols.

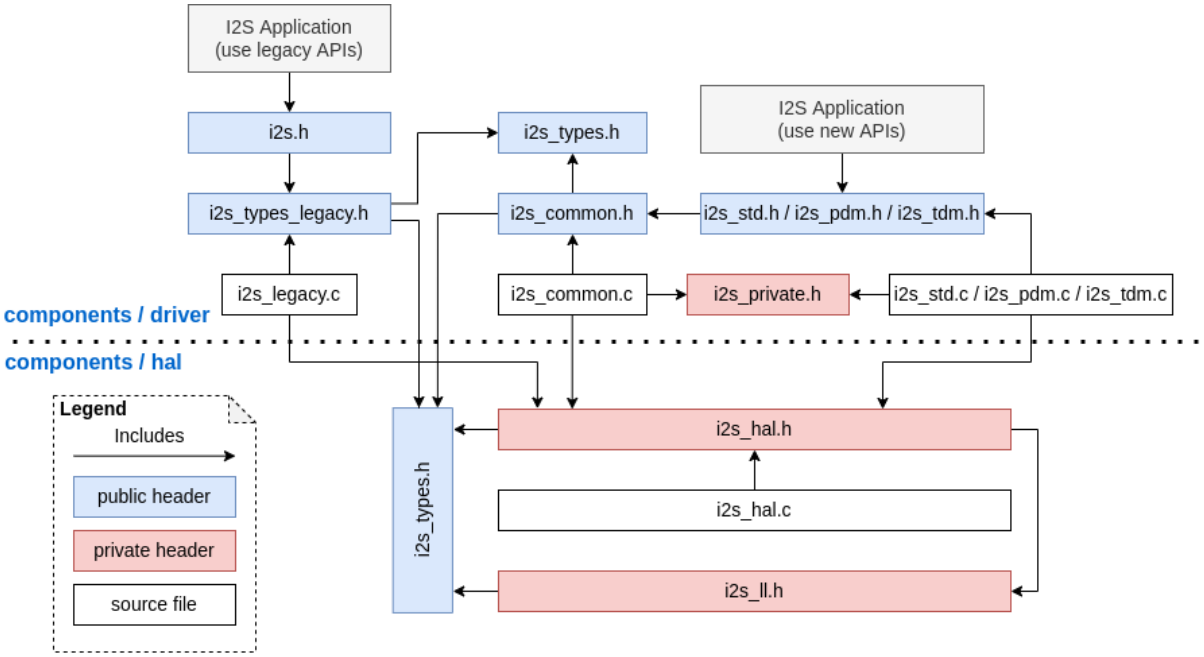
Breaking Changes in Usage

- Channel installation has been separated for TX and RX channels into *rmt_new_tx_channel()* and *rmt_new_rx_channel()*.
- rmt_set_clk_div and rmt_get_clk_div are removed. Channel clock configuration can only be done during channel installation.
- rmt_set_rx_idle_thresh and rmt_get_rx_idle_thresh are removed. In the new driver, the RX channel IDLE threshold is redesigned into a new concept *rmt_receive_config_t::signal_range_max_ns*.
- rmt_set_mem_block_num and rmt_get_mem_block_num are removed. In the new driver, the memory block number is determined by *rmt_tx_channel_config_t::mem_block_symbols* and *rmt_rx_channel_config_t::mem_block_symbols*.
- rmt_set_tx_carrier is removed, the new driver uses *rmt_apply_carrier()* to set carrier behavior.
- rmt_set_mem_pd and rmt_get_mem_pd are removed. The memory power is managed by the driver automatically.
- rmt_memory_rw_rst, rmt_tx_memory_reset and rmt_rx_memory_reset are removed. Memory reset is managed by the driver automatically.
- rmt_tx_start and rmt_rx_start are merged into a single function *rmt_enable()*, for both TX and RX channels.
- rmt_tx_stop and rmt_rx_stop are merged into a single function *rmt_disable()*, for both TX and RX channels.
- rmt_set_memory_owner and rmt_get_memory_owner are removed. RMT memory owner guard is added automatically by the driver.
- rmt_set_tx_loop_mode and rmt_get_tx_loop_mode are removed. In the new driver, the loop mode is configured in *rmt_transmit_config_t::loop_count*.
- rmt_set_source_clk and rmt_get_source_clk are removed. Configuring clock source is only possible during channel installation by *rmt_tx_channel_config_t::clk_src* and *rmt_rx_channel_config_t::clk_src*.
- rmt_set_rx_filter is removed. In the new driver, the filter threshold is redesigned into a new concept *rmt_receive_config_t::signal_range_min_ns*.
- rmt_set_idle_level and rmt_get_idle_level are removed. Setting IDLE level for TX channel is available in *rmt_transmit_config_t::eot_level*.
- rmt_set_rx_intr_en, rmt_set_err_intr_en, rmt_set_tx_intr_en, rmt_set_tx_thr_intr_en and rmt_set_rx_thr_intr_en are removed. The new driver doesn' t allow user to turn on/off interrupt from user space. Instead, it provides callback functions.
- rmt_set_gpio and rmt_set_pin are removed. The new driver doesn' t support to switch GPIO dynamically at runtime.
- rmt_config is removed. In the new driver, basic configuration is done during the channel installation stage.
- rmt_isr_register and rmt_isr_deregister are removed, the interrupt is allocated by the driver itself.
- rmt_driver_install is replaced by *rmt_new_tx_channel()* and *rmt_new_rx_channel()*.
- rmt_driver_uninstall is replaced by *rmt_del_channel()*.
- rmt_fill_tx_items, rmt_write_items and rmt_write_sample are removed. In the new driver, user needs to provide an encoder to "translate" the user data into RMT symbols.
- rmt_get_counter_clock is removed, as the channel clock resolution is configured by user from *rmt_tx_channel_config_t::resolution_hz*.
- rmt_wait_tx_done is replaced by *rmt_tx_wait_all_done()*.

- `rmt_translator_init`, `rmt_translator_set_context` and `rmt_translator_get_context` are removed. In the new driver, the translator has been replaced by the RMT encoder.
- `rmt_get_ringbuf_handle` is removed. The new driver doesn't use Ringbuffer to save RMT symbols. Instead, the incoming data are saved to the user provided buffer directly. The user buffer can even be mounted to DMA link internally.
- `rmt_register_tx_end_callback` is replaced by *`rmt_tx_register_event_callbacks()`*, where user can register *`rmt_tx_event_callbacks_t::on_trans_done`* event callback.
- `rmt_set_intr_enable_mask` and `rmt_clr_intr_enable_mask` are removed, as the interrupt is handled by the driver, user doesn't need to take care of it.
- `rmt_add_channel_to_group` and `rmt_remove_channel_from_group` are replaced by RMT sync manager. Please refer to *`rmt_new_sync_manager()`*.
- `rmt_set_tx_loop_count` is removed. The loop count in the new driver is configured in *`rmt_transmit_config_t::loop_count`*.
- `rmt_enable_tx_loop_autostop` is removed. In the new driver, TX loop auto stop is always enabled if available, it's not configurable anymore.

LCD

- The LCD panel initialization flow is slightly changed. Now the *`esp_lcd_panel_init()`* won't turn on the display automatically. User needs to call *`esp_lcd_panel_disp_on_off()`* to manually turn on the display. Note, this is different from turning on backlight. With this breaking change, user can flush a predefined pattern to the screen before turning on the screen. This can help avoid random noise on the screen after a power on reset.
- *`esp_lcd_panel_disp_off()`* is deprecated, please use *`esp_lcd_panel_disp_on_off()`* instead.
- `dc_as_cmd_phase` is removed. The SPI LCD driver currently doesn't support a 9bit SPI LCD. Please always use a dedicated GPIO to control the LCD D/C line.
- The way to register RGB panel event callbacks has been moved from the `esp_lcd_rgb_panel_config_t` into a separate API `esp_lcd_rgb_panel_register_event_callbacks()`. However, the event callback signature is not changed.
- Previous `relax_on_idle` flag in `esp_lcd_rgb_panel_config_t` has been renamed into `esp_lcd_rgb_panel_config_t::refresh_on_demand`, which expresses the same meaning but with a clear name.
- If the RGB LCD is created with the `refresh_on_demand` flag enabled, the driver won't start a refresh in the *`esp_lcd_panel_draw_bitmap()`*. Now you have to call `esp_lcd_rgb_panel_refresh()` to refresh the screen by yourself.



Dedicated GPIO Driver

- All of the dedicated GPIO related LL functionsn in `cpu_ll.h` have been moved to `dedic_gpio_cpu_ll.h` and renamed.

I2S driver Shortcomings are exposed when supporting all the new features of ESP32-C3 & ESP32-S3 by the old I2S driver, so it is re-designed to make it more compatible and flexible to all the communication modes. New APIs are available by including corresponding mode header files driver/include/driver/i2s_std.h, driver/include/driver/i2s_pdm.h or driver/include/driver/i2s_tdm.h. Meanwhile, the old APIs in driver/deprecated/driver/i2s.h are still supported for backward compatibility. But there will be warnings if you keep using the old APIs in your project, these warnings can be suppressed by the Kconfig option *CONFIG_I2S_SUPPRESS_DEPRECATE_WARN*. Here is the general overview of the current I2S files:

Breaking changes in Concepts

- The minimum control unit in new I2S driver will be tx/rx channel instead of a whole I2S controller.
  1. The tx/rx channel in a same I2S controller can be controlled separately, that means they will be initialized, started or stopped separately. Especially for ESP32-C3 and ESP32-S3, tx and rx channels in one

controller can be configured to different clocks or modes now, they are able to work in a totally separate way which can help to save the resources of I2S controller. But for ESP32 and ESP32-S2, though their tx/rx can be controlled separately, some hardware resources are still shared by tx and rx, they might affect each other if they are configured to different configurations;

2. The channels can be registered to an available I2S controller automatically by setting *i2s_port_t::I2S_NUM_AUTO* as I2S port id. The driver will help you to search for the available tx/rx channel. Of cause, driver can still support to be installed by a specific port;
3. `i2s_chan_handle_t` is the handle that used for identifying the I2S channels. All the APIs will require the channel handle, users need to maintain the channel handles by themselves;
4. In order to distinguish tx/rx channel and sound channel, now the word ‘channel’ is only stand for the tx/rx channel in new driver, meanwhile the sound channel will be called ‘slot’.

- I2S communication modes are extracted into three modes.
  1. **Standard mode**: Standard mode always has two slots, it can support Philip, MSB and PCM(short sync) format, please refer to driver/include/driver/i2s_std.h for details;
  2. **PDM mode**: PDM mode only support two slots with 16 bits data width, but the configurations of PDM TX and PDM RX are little bit different. For PDM TX, the sample rate can be set by `i2s_pdm_tx_clk_config_t::sample_rate`, and its clock frequency is depended on the up-sampling configuration. For PDM RX, the sample rate can be set by `i2s_pdm_rx_clk_config_t::sample_rate`, and its clock frequency is depended on the down-sampling configuration. Please refer to driver/include/driver/i2s_pdm.h for details;
  3. **TDM mode**: TDM mode can support upto 16 slots. It can work in Philip, MSB, PCM(short sync) and PCM(long sync) format, please refer to driver/include/driver/i2s_tdm.h for details;
  4. When allocating a new channel in a specific mode, must initialize this channel by corresponding function. It is strongly recommended to use the helper macros to generate the default configurations, in case the default values will be changed one day.
- States and state-machine are adopted in the new I2S driver to avoid APIs called in wrong state.
- The slot configurations and clock configurations can be configured separately.
  1. Calling *i2s_channel_init_std_mode()*, `i2s_channel_init_pdm_rx_mode()`, *i2s_channel_init_pdm_tx_mode()* or *i2s_channel_init_tdm_mode()* to initialize the slot/clock/gpio_pin configurations;
  2. Calling *i2s_channel_reconfig_std_slot()*, `i2s_channel_reconfig_pdm_rx_slot()`, *i2s_channel_reconfig_pdm_tx_slot()* or *i2s_channel_reconfig_tdm_slot()* can change the slot configurations after initialization;
  3. Calling *i2s_channel_reconfig_std_clock()*, `i2s_channel_reconfig_pdm_rx_clock()`, *i2s_channel_reconfig_pdm_tx_clock()* or *i2s_channel_reconfig_tdm_clock()* can change the clock configurations after initialization;

4. Calling *i2s_channel_reconfig_std_gpio()*,i2s_channel_reconfig_pdm_rx_gpio(), *i2s_channel_reconfig_pdm_tx_gpio()* or *i2s_channel_reconfig_tdm_gpio()* can change the gpio configurations after initialization.

- ADC and DAC modes are removed. They will only be supported in their own driver and legacy I2S driver.
- *i2s_channel_write()* and *i2s_channel_read()* can be aborted by i2s_channel_abort_reading_writing() now.

Breaking Changes in Usage To use the new I2S driver, please follow these steps:

1. Calling *i2s_new_channel()* to aquire the channel handles. We should specify the work role and I2S port in this step. Besides, the tx or rx channel handles will be generated by the driver. Inputting both two tx and rx handles is not necessary but at least one handle is needed. In the case of inputting both two handles, the driver will work at duplex mode, both tx and rx channel will be avaliable on a same port, and they will share the MCLK, BCLK and WS signal. But if only one of the tx or rx handle is inputted, this channel will only work in simplex mode.
2. Calling i2s_channel_init_std_mode(), i2s_channel_init_pdm_rx_mode(), i2s_channel_init_pdm_tx_mode() or i2s_channel_init_tdm_mode() to initialize the channel to the specified mode. Corresponding slot, clock and gpio configurations are needed in this step.
3. (Optional) Calling *i2s_channel_register_event_callback()* to register the ISR event callback functions. I2S events now can be received by the callback function synchronously, instead of from event queue asynchronously.
4. Calling *i2s_channel_enable()* to start the hardware of I2S channel. In the new driver, I2S won't start automatically after installed anymore, users are supposed to know clearly whether the channel has started or not.
5. Reading or writing data by *i2s_channel_read()* or *i2s_channel_write()*. Certainly, only rx channel handle is suppoesd to be inputted in *i2s_channel_read()* and tx channel handle in *i2s_channel_write()*.
6. (Optional) The slot, clock and gpio configurations can be changed by corresponding 'reconfig' functions, but *i2s_channel_disable()* must be called before updating the configurations.
7. Calling *i2s_channel_disable()* to stop the hardware of I2S channel.
8. Calling *i2s_del_channel()* to delete and release the resources of the channel if it is not needed any more, but the channel must be disabled before deleting it.

Register access macros Previously, all register access macros could be used as expressions, so the following was allowed:

```
uint32_t val = REG_SET_BITS(reg, mask);
```

In IDF v5.0, register access macros which write or read-modify-write the register can no longer be used as expressions, and can only be used as statements. This applies to the following macros: REG_WRITE, REG_SET_BIT, REG_CLR_BIT, REG_SET_BITS, REG_SET_FIELD, WRITE_PERI_REG, CLEAR_PERI_REG_MASK, SET_PERI_REG_MASK, SET_PERI_REG_BITS.

To store the value which would have been written into the register, split the operation as follows:

```
uint32_t new_val = REG_READ(reg) | mask;
REG_WRITE(reg, new_val);
```

To get the value of the register after modification (which may be different from the value written), add an explicit read:

```
REG_SET_BITS(reg, mask);
uint32_t new_val = REG_READ(reg);
```

Protocols

Mbed TLS For ESP-IDF v5.0, Mbed TLS has been updated from v2.x to v3.1.0.

The official guide for Mbed TLS to migrate from version 2.x to version 3.0 or greater can be found here.

Breaking Changes (Summary)

Most structure fields are now private

- Direct access to fields of structures (`struct` types) declared in public headers is no longer supported.
- Appropriate accessor functions (getter/setter) must be used for the same. A temporary workaround would be to use `MBEDTLS_PRIVATE` macro (**not recommended**).
- For more details, refer to the official guide here.

SSL

- Removed support for TLS 1.0, 1.1 and DTLS 1.0
- Removed support for SSL 3.0

Deprecated functions were removed from cryptography modules

- The functions `mbedtls_*_ret()` (related to MD, SHA, RIPEMD, RNG, HMAC modules) was renamed to replace the corresponding functions without `_ret` appended and updated return value.
- For more details, refer to the official guide here.

Deprecated Config Options Following are some of the important config options deprecated by this update. The configs related to and/or dependent on these have also been deprecated.

- `MBEDTLS_SSL_PROTO_SSL3` : Support for SSL 3.0
- `MBEDTLS_SSL_PROTO_TLS1` : Support for TLS 1.0
- `MBEDTLS_SSL_PROTO_TLS1_1`: Support for TLS 1.1
- `MBEDTLS_SSL_PROTO_DTLS` : Support for DTLS 1.1 (Only DTLS 1.2 is supported now)
- `MBEDTLS_DES_C` : Support for 3DES ciphersuites
- `MBEDTLS_RC4_MODE` : Support for RC4-based ciphersuites

备注： This list includes only major options configurable through `idf.py menuconfig`. For more details on deprecated options, refer to the official migration guide.

Miscellaneous

Disabled Diffie-Hellman Key Exchange modes The Diffie-Hellman Key Exchange modes have now been disabled by default due to security risks (see warning text here). Related configs are given below:

- `MBEDTLS_DHM_C` : Support for the Diffie-Hellman-Merkle module
- `MBEDTLS_KEY_EXCHANGE_DHE_PSK` : Support for Diffie-Hellman PSK (pre-shared-key) TLS authentication modes
- `MBEDTLS_KEY_EXCHANGE_DHE_RSA` : Support for cipher suites with the prefix `TLS-DHE-RSA-WITH-`

备注： During the initial step of the handshake (i.e. `client_hello`), the server selects a cipher from the list that the client publishes. As the DHE_PSK/DHE_RSA ciphers have now been disabled by the above change, the server would fall back to an alternative cipher; if in a rare case, it does not support any other cipher, the handshake would fail. To retrieve the list of ciphers supported by the server, one must attempt to connect with the server with a specific cipher from the client-side. Few utilities can help do this, e.g. `sslscan`.

Remove `certs` module from X509 library

- The `mbedtls/certs.h` header is no longer available in mbedtls 3.1, most applications can safely remove it from the list of includes.

Breaking change for `esp_crt_bundle_set` API

- The *`esp_crt_bundle_set()`* API now requires one additional argument named `bundle_size`. The return type of the API has also been changed to *`esp_err_t`* from `void`.

Breaking change for `esp_ds_rsa_sign` API

- The `esp_ds_rsa_sign()` API now requires one less argument. The argument `mode` is no longer required.

HTTPS Server

Breaking Changes (Summary) Names of variables holding different certs in *`httpd_ssl_config_t`* structure have been updated.

- *`httpd_ssl_config::servercert`* variable inherits role of *cacert_pem* variable.
- *`httpd_ssl_config::servercert_len`* variable inherits role of *cacert_len* variable
- *`httpd_ssl_config::cacert_pem`* variable inherits role of *client_verify_cert_pem* variable
- *`httpd_ssl_config::cacert_len`* variable inherits role of *client_verify_cert_len* variable

The return type of the *`httpd_ssl_stop()`* API has been changed to *`esp_err_t`* from `void`.

ESP HTTPS OTA

Breaking Changes (Summary)

- The function *`esp_https_ota()`* now requires pointer to *`esp_https_ota_config_t`* as argument instead of pointer to *`esp_http_client_config_t`*.

ESP-TLS

Breaking Changes (Summary)

`esp_tls_t` structure is now private The *`esp_tls_t`* has now been made completely private. You cannot access its internal structures directly. Any necessary data that needs to be obtained from the esp-tls handle can be done through respective getter/setter functions. If there is a requirement of a specific getter/setter function please raise an issue on ESP-IDF.

The list of newly added getter/setter function is as as follows:

- *`esp_tls_get_ssl_context()`* - Obtain the ssl context of the underlying ssl stack from the esp-tls handle.

Function deprecations and recommended alternatives Following table summarizes the deprecated functions removed and their alternatives to be used from ESP-IDF v5.0 onwards.

Function	Alternative
`esp_tls_conn_new()`	*`esp_tls_conn_new_sync()`*
`esp_tls_conn_delete()`	*`esp_tls_conn_destroy()`*

- The function *`esp_tls_conn_http_new()`* has now been termed as deprecated. Please use the alternative function *`esp_tls_conn_http_new_sync()`* (or its asynchronous *`esp_tls_conn_http_new_async()`*). Note that the alternatives need an additional parameter *`esp_tls_t`* which has to be initialized using the *`esp_tls_init()`* function.

HTTP Server

Breaking Changes (Summary)

- `http_server.h` header is no longer available in `esp_http_server`. Please use `esp_http_server.h` instead.

ESP HTTP Client

Breaking Changes (Summary)

- The functions *`esp_http_client_read()`* and *`esp_http_client_fetch_headers()`* now return an additional return value `-ESP_ERR_HTTP_EAGAIN` for timeout errors - call timed-out before any data was ready.

TCP Transport

Breaking Changes (Summary)

- The function `esp_transport_read()` now returns `0` for a connection timeout and `< 0` for other errors. Please refer `esp_tcp_transport_err_t` for all possible return values.

MQTT Client

Breaking Changes (Summary)

- *`esp_mqtt_client_config_t`* have all fields grouped in sub structs.

Most common configurations are listed below:

- Broker address now is set in `esp_mqtt_client_config_t::broker::address::uri`
- Security related to broker verification in `esp_mqtt_client_config_t::broker::verification`
- Client username is set in `esp_mqtt_client_config_t::credentials::username`

Provisioning

Protocomm The *`protocomm_set_security()`* API now takes a parameter `sec_params` as input instead of `pop` (deprecated). This parameter should contain the structure (containing the security parameters) as required by the protocol version used.

For example when using security version 2, the `sec_params` parameter should contain the pointer to the structure of type *`protocomm_security2_params_t`*.

Wi-Fi Provisioning The *wifi_prov_mgr_start_provisioning()* API now takes a parameter `wifi_prov_sec_params` as input instead of `pop`. This parameter should contain the structure (containing the security parameters) as required by the protocol version used.

For example when using security version 2, the `wifi_prov_sec_params` parameter should contain the pointer to the structure of type *wifi_prov_security2_params_t*.

ESP Local Control The *pop* field in *esp_local_ctrl_proto_sec_cfg_t* is now deprecated, use `sec_params` field instead of `pop`. This field should contain the structure (containing the security parameters) as required by the protocol version used.

For example when using security version 2, the `sec_params` field should contain pointer to the structure of type *esp_local_ctrl_security2_params_t*.

从 ESP-IDF 中移出或弃用的组件

移至 IDF Component Registry 的组件 以下组件已经从 ESP-IDF 中迁出至 IDF Component Registry：

- libsodium
- cbor
- jsmn
- esp_modem
- nghttp
- mdns
- esp_websocket_client
- asio
- freemodbus
- sh2lib
- expat
- coap

备注： 请注意，http 解析功能以前属于 `nghttp` 组件一部分，但现在属于 http_parser 组件。

可使用 `idf.py add-dependency` 命令安装以上组件。

例如，要安装 X.Y 版本的 libsodium 组件，请运行：`idf.py add-dependency libsodium==X.Y`。

根据 semver 规则安装与 X.Y 兼容的最新版本 libsodium 组件，请运行 `idf.py add-dependency libsodium~X.Y`。

可前往 https://components.espressif.com 查询每个组件有哪些版本，按名称搜索该组件，组件页面上会列出所有版本。

弃用的组件 IDF v4.x 版本中已不再使用以下组件，这些组件已弃用：

- `tcpip_adapter`。可使用*ESP-NETIF* 组件代替，具体可参考*TCP/IP 适配器*。

备注： 不再支持 OpenSSL-API 组件。IDF Component Registry 中也没有该组件。请直接使用*ESP-TLS* 或 mbedtls API。

版本更新后无需目标组件，因此以下目标组件也已经从 ESP-IDF 中删除：

- `esp32`
- `esp32s2`
- `esp32s3`
- `esp32c2`
- `esp32c3`
- `esp32h2`

Storage

Breaking changes:

f_mkfs() signature change in FATFS v0.14 New signature is `FRESULT f_mkfs (const TCHAR* path, const MKFS_PARM* opt, void* work, UINT len);` which now uses `MKFS_PARM` struct as a second argument.

Partition table generation no longer supports misaligned partitions When generating a partiton table, `esp-idf` will no longer accept partitions which offset does not align to 4kB. This change only affects generating new partition tables, reading and writing to already existing partitions remains unchanged.

esp_vfs_semihost_register() signature change New signature is `esp_err_t esp_vfs_semihost_register(const char* base_path);` Absolute path as a second parameter will no longer in use. Instead, the OpenOCD command `ESP_SEMIHOST_BASEDIR` should be used to set the full path on the host.

NVS `nvs_entry_find()`, `nvs_entry_next()` and `nvs_entry_info()` always return `esp_err_t` now instead of `void` or `nvs_iterator_t`. This provides better error reporting when parameters are invalid or something goes wrong internally than returning `nullptr` instead of a valid iterator or checking parameters with `assert`. `nvs_entry_find()` and `nvs_entry_next()` modify iterators via parameters now instead of returning an iterator.

The old programming pattern to iterate over an NVS partition was as follows:

```
nvs_iterator_t it = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_
↪ANY);
while (it != NULL) {
        nvs_entry_info_t info;
        nvs_entry_info(it, &info);
        it = nvs_entry_next(it);
        printf("key '%s', type '%d' \n", info.key, info.type);
};
```

The new programming pattern to iterate over an NVS partition is now:

```
nvs_iterator_t it = nullptr;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_ANY, &
↪it);
while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are␣
↪guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);
```

Signature Changes `nvs_iterator_t nvs_entry_find(const char *part_name, const char *namespace_name, nvs_type_t type)` changes to `esp_err_t nvs_entry_find(const char *part_name, const char *namespace_name, nvs_type_t type, nvs_iterator_t *output_iterator)`. The iterator is returned via the parameter `output_iterator` instead of a return value. This allows reporting additional errors, like e.g. memory errors, via the new return value.

`nvs_iterator_t nvs_entry_next(nvs_iterator_t iterator)` changes to `esp_err_t nvs_entry_next(nvs_iterator_t *it)`. This allows reporting parameter errors and internal errors, like e.g. flash errors.

`void nvs_entry_info(nvs_iterator_t iterator, nvs_entry_info_t *out_info)` changes to `esp_err_t nvs_entry_info(const nvs_iterator_t iterator, nvs_entry_info_t *out_info)` to allow reporting parameter errors.

Iterator Validity Note that due to the new signatures, it is possible to have an invalid iterator from `nvs_entry_find()`, if there is a parameter errors. Hence, it is important to initialize the iterator with `NULL` before using `nvs_entry_find()` to avoid complex error checking before calling `nvs_release_iterator()`. A good example is the programming pattern above.

Removed SDSPI deprecated API Removed structure `sdspi_slot_config_t` and fuction `sdspi_host_init_slot`. These were replaced by a structure `sdspi_device_config_t` and a fuction `sdspi_host_init_device` respectively.

SPI Flash Interface Version before v5.0, spi flash functions in rom can be included by `esp32**/rom/spi_flash.h`. However, your code written for different chips may be filled with ROM headers of different versions. At the meantime not all the APIs can be used on all chips.

Therefore, the common APIs are extracted to `esp_rom_spiflash.h`. Although it' s not a breaking change, it is strongly recommended to only use the functions with prefix `esp_rom_spiflash` included by `esp_rom_spiflash.h` for better cross-compatibility.

To make the API clearer, we renamed the function `esp_rom_spiflash_lock` to `esp_rom_spiflash_set_bp`. We renamed `esp_rom_spiflash_unlock` to `esp_rom_spiflash_clear_bp`.

ENUM type `esp_flash_speed_t` has been deprecated. From now on, you can directly parse the real clock frequency value to the flash initialization structure. For example, if you want the flash frequency is 80M, you can write the code like:

```
esp_flash_spi_device_config_t dev_cfg = {
    // Other members
    .freq_mhz = 80,
    // Other members
};
```

Breaking changes in legacy APIs In order to make spi_flash driver more stable, legacy spi_flash driver is removed on v5.0. Legacy spi_flash driver refers to default spi_flash driver since v3.0 and spi_flash driver with configuration option `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` switched on on v4.0 series. The major breaking change is legacy spi_flash driver is not supported on new version anymore. Therefore, the configuration option `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` is removed. After that, following functions will no longer exist. But meanwhile, you can use our new APIs instead.

Removed items	Replacement
`spi_flash_erase_sector()`	`esp_flash_erase_region`
`spi_flash_erase_range()`	`esp_flash_erase_region`
`spi_flash_write`	`esp_flash_write`
`spi_flash_read()`	`esp_flash_read`
`spi_flash_write_encrypted()`	`esp_flash_write_encrypted`
`spi_flash_read_encrypted`	`esp_flash_read_encrypted`

备注： New functions with prefix `esp_flash` accept an additional `esp_flash_t*` parameter. You can simply set it to NULL means that the function will operate the main flash(`esp_flash_default_chip`)

Header `esp_spi_flash.h` has been deprecated, system functions are no longer public. To make use of flash memory mapping APIs, you should include `spi_flash_mmap.h` instead.

系统

跨核执行 跨核执行 (Inter-Processor Call, IPC) 不再是一个独立组件，现已被包含至 `esp_system`。

因此，若项目的 `CMakeLists.txt` 文件中出现 `PRIV_REQUIRES esp_ipc` 或 `REQUIRES esp_ipc`，应删除这些选项，因为项目中已默认包含 `esp_system` 组件。

ESP 时钟 ESP 时钟 API（即以 `esp_clk` 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 `#include "ESP32-C3/clk.h"` 和 `#include "esp_clk.h"` 已被移除。如仍需使用 ESP 时钟 API（并不推荐），请使用 `#include "esp_private/esp_clk.h"` 来包含。

注意： 私有 API 不属于稳定的 API，不会遵循 ESP-IDF 的版本演进规则，因此不推荐用户在应用中使用。

缓存错误中断 缓存错误中断 API（即以 `esp_cache_err` 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 `#include "ESP32-C3/cache_err_int.h"` 已被移除。如仍需使用缓存错误中断 API（并不推荐），请使用 `#include "esp_private/cache_err_int.h"` 来包含。

bootloader_support

- 函数 `bootloader_common_get_reset_reason()` 已被移除。请使用 ROM 组件中的函数 `esp_rom_get_reset_reason()`。
- 函数 `esp_secure_boot_verify_sbv2_signature_block()` 和 `esp_secure_boot_verify_rsa_signature_block()` 已被移除，无新的替换函数。不推荐用户直接使用以上函数。如确需要，请在 GitHub 上对该功能提交请求，并解释您需要此函数的原因。

断电 断电 API（即以 `esp_brownout` 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 `#include "brownout.h"` 已被移除。如仍需使用断电 API（并不推荐），请使用 `#include "esp_private/brownout.h"` 来包含。

Trax Trax API（即以 `trax_` 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 `#include "trax.h"` 已被移除。如仍需使用 Trax API（并不推荐），请使用 `#include "esp_private/trax.h"` 来包含。

ROM `components/esp32/rom/` 路径下存放的已弃用的 ROM 相关头文件已被移除（原包含路径为 `rom/*.h`）。请使用新的特定目标的路径 `components/esp_rom/include/ESP32-C3/``（新的包含路径为 ``ESP32-C3/rom/*.h`）。

esp_hw_support

- 头文件 soc/cpu.h 及弃用的 CPU util 函数都已被移除。请包含 esp_cpu.h 来代替相同功能的函数。
- 头文件 hal/cpu_ll.h、hal/cpu_hal.h、hal/soc_ll.h、hal/soc_hal.h 和 interrupt_controller_hal.h 的 CPU API 函数已弃用。请包含 esp_cpu.h 来代替相同功能的函数。
- 头文件 compare_set.h 已被移除。请使用 esp_cpu.h 中提供的 esp_cpu_compare_and_set() 函数来代替。
- esp_cpu_get_ccount()、esp_cpu_set_ccount() 和 esp_cpu_in_ocd_debug_mode() 已从 esp_cpu.h 中移除。请分别使用 esp_cpu_get_cycle_count()、esp_cpu_set_cycle_count() 和 esp_cpu_dbgr_is_attached() 代替。
- 头文件 esp_intr.h 已被移除。请包含 esp_intr_alloc.h 以分配和操作中断。
- Panic API（即以 esp_panic 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 #include "esp_panic.h" 已被移除。如仍需使用 Panic API（并不推荐），请使用 #include "esp_private/panic_reason.h" 来包含。此外，请包含 esp_debug_helpers.h 以使用与调试有关的任意辅助函数，如打印回溯。
- 头文件 soc_log.h 现更名为 esp_hw_log.h，所有日志宏也从 SOC_LOGx 更新为 ESP_HW_LOGx。请使用更新后的格式。
- 包含头文件 spinlock.h、clk_ctrl_os.h 和 rtc_wdt.h 时不应当使用 soc 前缀，如 #include "spinlock.h"。
- esp_chip_info() 命令返回芯片版本，格式为 = 100 * 主要 eFuse 版本 + 次要 eFuse 版本。因此，为适应新格式，esp_chip_info_t 结构体中的 revision 被扩展为 uint16_t。

PSRAM

- 针对特定目标的头文件 spiram.h 及头文件 esp_spiram.h 已被移除，创建新组件 esp_psram。对于与 PSRAM 或 SPIRAM 相关的函数，请包含 esp_psram.h，并在 CMakeLists.txt 项目文件中将 esp_psram 设置为必需组件。
- esp_spiram_get_chip_size 和 esp_spiram_get_size 已被移除，请使用 esp_psram_get_size。

eFuse

- 函数 esp_secure_boot_read_key_digests() 的参数类型从 ets_secure_boot_key_digests_t* 更新为 esp_secure_boot_key_digests_t*。新类型与旧类型相同，仅移除了 allow_key_revoke 标志。在当前代码中，后者总是被设置为 true，并未提供额外信息。
- 针对 eFuse 晶圆增加主要修订版本和次要修订版本。API esp_efuse_get_chip_ver() 与新修订不兼容，因此已被移除。请使用 API efuse_hal_get_major_chip_version()、efuse_hal_get_minor_chip_version() 或 efuse_hal_chip_revision() 来代替原有 API。

esp_common EXT_RAM_ATTR 已被弃用。请使用新的宏 EXT_RAM_BSS_ATTR 以将.bss 放在 PSRAM 上。

esp_system

- 头文件 esp_random.h、esp_mac.h 和 esp_chip_info.h 以往都是通过头文件 esp_system.h 间接包含，更新后必须直接包含。已移除从 esp_system.h 中的间接包含功能。
- 回溯解析器 API（即以 esp_eh_frame_ 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 #include "eh_frame_parser.h" 已被移除。如仍需使用回溯解析器 API（并不推荐），请使用 #include "esp_private/eh_frame_parser.h" 来包含。
- 中断看门狗定时器 API（即以 esp_int_wdt_ 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 #include "esp_int_wdt.h" 已被移除。如仍需使用中断看门狗定时器 API（并不推荐），请使用 #include "esp_private/esp_int_wdt.h" 来包含。

SOC 依赖性

- Doxyfiles 中列出的公共 API 头文件中不会显示不稳定和非必要的 SOC 头文件，如 `soc/soc.h` 和 `soc/rtc.h`。这意味着，如果用户仍然需要这些“缺失”的头文件，就必须在代码中明确包含这些文件。
- Kconfig 选项 `LEGACY_INCLUDE_COMMON_HEADERS` 也已被移除。
- 头文件 `soc/soc_memory_types.h` 已被弃用。请使用 `esp_memory_utils.h`。包含 `soc/soc_memory_types.h` 将触发构建警告，如 `soc_memory_types.h is deprecated, please migrate to esp_memory_utils.h`。

应用跟踪 其中一个时间戳源已从定时器组驱动改为新的*GPTimer*。Kconfig 选项已重新命名，例如 `APPTRACE_SV_TS_SOURCE_TIMER00` 已更改为 `APPTRACE_SV_TS_SOURCE_GPTIMER`。用户已无需选择组和定时器 ID。

esp_timer 基于 FRC2 的 esp_timer 过去可用于 ESP32，现在已被移除，更新后仅可使用更简单有效的 LAC 定时器。

ESP 镜像 ESP 镜像中关于 SPI 速度的枚举成员已重新更名：

- `ESP_IMAGE_SPI_SPEED_80M` 已被重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_1`。
- `ESP_IMAGE_SPI_SPEED_40M` 已被重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_2`。
- `ESP_IMAGE_SPI_SPEED_26M` 已被重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_3`。
- `ESP_IMAGE_SPI_SPEED_20M` 已被重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_4`。

任务看门狗定时器

- API `esp_task_wdt_init()` 更新后有如下变化：
  - 以结构体的形式传递配置。
  - 可将该函数配置为订阅空闲任务。

FreeRTOS

遗留 API 及数据类型 在以往版本中，ESP-IDF 默认设置 `configENABLE_BACKWARD_COMPATIBILITY` 选项，因此可使用 FreeRTOS v8.0.0 之前的函数名称和数据类型。该选项现在已默认禁用，因此默认情况下不再支持以往的 FreeRTOS 名称或类型。用户可以选择以下一种解决方式：

- 更新代码，删除以往的 FreeRTOS 名称或类型。
- 启用*CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY* 以显式调用这些名称或类型。

任务快照 头文件 `task_snapshot.h` 已从 `freertos/task.h` 中移除。如需使用任务快照 API，请包含 `freertos/task_snapshot.h`。

函数 `vTaskGetSnapshot()` 现返回 `BaseType_t`，成功时返回值为 `pdTRUE`，失败则返回 `pdFALSE`。

FreeRTOS 断言 在以往版本中，FreeRTOS 断言通过 `FREERTOS_ASSERT` kconfig 选项独立配置，不同于系统的其他部分。该选项已被移除，现在需要通过 `COMPILER_OPTIMIZATION_ASSERTION_LEVEL` 来完成配置。

FreeRTOS 移植相关的宏 已移除用以保证弃用 API 向后兼容性的 `portmacro_deprecated.h` 文件。建议使用下列函数来代替弃用 API。

- `portENTER_CRITICAL_NESTED()` 已被移除，请使用 `portSET_INTERRUPT_MASK_FROM_ISR()` 宏。
- `portEXIT_CRITICAL_NESTED()` 已被移除，请使用 `portCLEAR_INTERRUPT_MASK_FROM_ISR()` 宏。

- `vPortCPUInitializeMutex()` 已被移除，请使用 `spinlock_initialize()` 函数。
- `vPortCPUAcquireMutex()` 已被移除，请使用 `spinlock_acquire()` 函数。
- `vPortCPUAcquireMutexTimeout()` 已被移除，请使用 `spinlock_acquire()` 函数。
- `vPortCPUReleaseMutex()` 已被移除，请使用 `spinlock_release()` 函数。

工具

IDF 监视器 IDF 监视器在波特率方面的改动如下：

- 目前，IDF 监视器默认遵循自定义的控制台波特率 (*CONFIG_ESP_CONSOLE_UART_BAUDRATE*)，而非 115200。
- ESP-IDF v5.0 不再支持通过 menuconfig 自定义波特率。
- 支持通过设置环境变量或在命令行中使用 `idf.py monitor -b <baud>` 命令自定义波特率。
- 注意，为了与全局波特率 `idf.py -b <baud>` 保持一致，波特率参数已从 `-B` 改名为 `-b`。请运行 `idf.py monitor --help` 获取更多信息。

废弃指令 ESP-IDF v5.0 已将 `idf.py` 子命令和 `cmake` 目标名中的下划线 (_) 统一为连字符 (-)。使用废弃的子命令及目标名将会触发警告，建议使用更新后的版本。具体改动如下：

表 1: 废弃子命令及目标名

废弃名	现用名
efuse_common_table	efuse-common-table
efuse_custom_table	efuse-custom-table
erase_flash	erase-flash
partition_table	partition-table
partition_table-flash	partition-table-flash
post_debug	post-debug
show_efuse_table	show-efuse-table
erase_otadata	erase-otadata
read_otadata	read-otadata

Esptool CONFIG_ESPTOOLPY_FLASHSIZE_DETECT 选项已重命名为*CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE*，且默认禁用。迁移到 ESP-IDF v5.0 的新项目和现有项目必须设置*CONFIG_ESPTOOLPY_FLASHSIZE*。若因编译时 flash 大小未知而无法设置，可启用*CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE*。但需注意的是，启用该项后，为在烧录期间使用 flash 大小更新二进制头时不会导致摘要无效，映像后将不再附加 SHA256 摘要。

Windows 环境 基于 MSYS/MinGW 的 Windows 环境支持已在 ESP-IDF v4.0 中弃用，v5.0 则完全移除了该项服务。请使用*ESP-IDF 工具安装器* 设置 Windows 兼容环境。目前支持 Windows 命令行、Power Shell 和基于 Eclipse IDE 的图形用户界面等选项。此外，还可以使用 *支持的插件 <https://github.com/espressif/vscode-esp-idf-extension>*，设置基于 VSCode 的环境。

Chapter 6

Libraries and Frameworks

6.1 Cloud Frameworks

ESP32-C3 supports multiple cloud frameworks using agents built on top of ESP-IDF. Here are the pointers to various supported cloud frameworks' agents and examples:

6.1.1 ESP RainMaker

ESP RainMaker is a complete solution for accelerated AIoT development. ESP RainMaker on GitHub.

6.1.2 AWS IoT

https://github.com/espressif/esp-aws-iot is an open source repository for ESP32-C3 based on Amazon Web Services' aws-iot-device-sdk-embedded-C.

6.1.3 Azure IoT

https://github.com/espressif/esp-azure is an open source repository for ESP32-C3 based on Microsoft Azure' s azure-iot-sdk-c SDK.

6.1.4 Google IoT Core

https://github.com/espressif/esp-google-iot is an open source repository for ESP32-C3 based on Google' s iot-device-sdk-embedded-c SDK.

6.1.5 Aliyun IoT

https://github.com/espressif/esp-aliyun is an open source repository for ESP32-C3 based on Aliyun' s iotkit-embedded SDK.

6.1.6 Joylink IoT

https://github.com/espressif/esp-joylink is an open source repository for ESP32-C3 based on Joylink' s joylink_dev_sdk SDK.

6.1.7 Tencent IoT

https://github.com/espressif/esp-welink is an open source repository for ESP32-C3 based on Tencent's welink SDK.

6.1.8 Tencentyun IoT

https://github.com/espressif/esp-qcloud is an open source repository for ESP32-C3 based on Tencentyun's qcloud-iot-sdk-embedded-c SDK.

6.1.9 Baidu IoT

https://github.com/espressif/esp-baidu-iot is an open source repository for ESP32-C3 based on Baidu's iot-sdk-c SDK.

6.2 Espressif's Frameworks

Here you will find a collection of the official Espressif libraries and frameworks.

6.2.1 Espressif Audio Development Framework

The ESP-ADF is a comprehensive framework for audio applications including:

- CODEC's HAL
- Music Players and Recorders
- Audio Processing
- Bluetooth Speakers
- Internet Radios
- Hands-free devices
- Speech Recognition

This framework is available at GitHub: ESP-ADF.

6.2.2 ESP-CSI

ESP-CSI is an experimental implementation that uses the Wi-Fi Channel State Information to detect the presence of a human body.

See ESP-CSI project for more information about it.

6.2.3 Espressif DSP Library

The library provides algorithms optimized specifically for digital signal processing applications. This library supports:

- Matrix multiplication
- Dot product
- FFT (Fast Fourier Transform)
- IIR (Infinite Impulse Response)
- FIR (Finite Impulse Response)
- Vector math operations

This library is available here: ESP-DSP library.

6.2.4 ESP-WIFI-MESH Development Framework

This framework is based on the ESP-WIFI-MESH protocol with the following features:

- Fast network configuration
- Stable upgrade
- Efficient debugging
- LAN control
- Various application demos

ESP-MDF.

6.2.5 ESP-WHO

The ESP-WHO is a face detection and recognition framework using the ESP32 and camera. To know more about the project, see ESP-WHO on GitHub.

6.2.6 ESP RainMaker

ESP RainMaker is a complete solution for accelerated AIoT development. Using ESP RainMaker, you can create AIoT devices from the firmware to the integration with voice-assistant, phone apps and cloud backend.

ESP RainMaker on GitHub.

6.2.7 ESP-IoT-Solution

ESP-IoT-Solution contains commonly used device drivers and code frameworks when developing IoT systems. The device drivers and code frameworks within the ESP-IoT-Solution are organized as separate components, allowing them to be easily integrated into an ESP-IDF project.

ESP-IoT-Solution includes:

- Device drivers for sensors, display, audio, GUI, input, actuators, etc.
- Framework and documentation for low power, security, storage, etc.
- Guide for Espressif open source solutions from practical application point.

ESP-IoT-Solution on GitHub.

6.2.8 ESP-Protocols

ESP-Protocols repository contains collection of protocol components for ESP-IDF. The code within the ESP-Protocols is organized into separate components, allowing them to be easily integrated into an ESP-IDF project. In addition to that, each component is available in IDF Component Registry.

ESP-Protocols components:

- esp_modem enables connectivity with GSM/LTE modems using AT commands or PPP protocol, see the esp_modem documentation.
- mdns (mDNS) is a multicast UDP service that is used to provide local network service and host discovery, see the mdns documentation.
- esp_websocket_client is a managed component for *esp-idf* that contains implementation of [WebSocket protocol client](https://datatracker.ietf.org/doc/html/rfc6455) for ESP32, see the esp_websocket_client documentation.
- asio is a cross-platform C++ library, see https://think-async.com/Asio/. It provides a consistent asynchronous model using a modern C++ approach. , see the asio documentation.

6.2.9 ESP-BSP

ESP-BSP repository contains Board Support Packages (BSPs) for various Espressif ' s and 3rd party development boards. BSPs are useful for quick start on a supported board. Usually they contain pinout definition and helper functions, that will initialize peripherals for the specific board. Additionally, the BSP would contain drivers for external chips populated on the development board, such as sensors, displays, audio codecs etc.

Chapter 7

Contributions Guide

We welcome contributions to the esp-idf project!

7.1 How to Contribute

Contributions to esp-idf - fixing bugs, adding features, adding documentation - are welcome. We accept contributions via Github Pull Requests.

7.2 Before Contributing

Before sending us a Pull Request, please consider this list of points:

- Is the contribution entirely your own work, or already licensed under an Apache License 2.0 compatible Open Source License? If not then we unfortunately cannot accept it. Please check the *Copyright Header Guide* for additional information.
- Does any new code conform to the esp-idf *Style Guide*?
- Have you installed the *pre-commit hook* for esp-idf project?
- Does the code documentation follow requirements in *Documenting Code*?
- Is the code adequately commented for people to understand how it is structured?
- Is there documentation or examples that go with code contributions? There are additional suggestions for writing good examples in examples readme.
- Are comments and documentation written in clear English, with no spelling or grammar errors?
- Example contributions are also welcome. Please check the 创建示例项目 guide for these.
- If the contribution contains multiple commits, are they grouped together into logical changes (one major change per pull request)? Are any commits with names like "fixed typo" squashed into previous commits?
- If you're unsure about any of these points, please open the Pull Request anyhow and then ask us for feedback.

7.3 Pull Request Process

After you open the Pull Request, there will probably be some discussion in the comments field of the request itself.

Once the Pull Request is ready to merge, it will first be merged into our internal git system for in-house automated testing.

If this process passes, it will be merged onto the public github repository.

7.4 Legal Part

Before a contribution can be accepted, you will need to sign our *Contributor Agreement*. You will be prompted for this automatically as part of the Pull Request process.

7.5.1 Espressif IoT Development Framework Style Guide

About This Guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF.

Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

C Code Formatting

Naming

- Any variable or function which is only used in a single source file should be declared `static`.
- Public names (non-static variables and functions) should be namespaced with a per-component or per-unit prefix, to avoid naming collisions. ie `esp_vfs_register()` or `esp_console_run()`. Starting the prefix with `esp_` for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with `s_` for easy identification. For example, `static bool s_invert`.
- Avoid unnecessary abbreviations (ie shortening `data` to `dat`), unless the resulting name would otherwise be very long.

Indentation Use 4 spaces for each indentation level. Don't use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

Vertical Space Place one empty line between functions. Don't begin or end a function with an empty line.

```
void function1()
{
    do_one_thing();
    do_another_thing();
                                    // INCORRECT, don't place empty line here
}
                                    // place empty line here
void function2()
{
                                    // INCORRECT, don't use an empty line here
    int var = 0;
    while (var < SOME_CONSTANT) {
        do_stuff(&var);
```

(下页继续)

(续上页)

```
    }
}
```

The maximum line length is 120 characters as long as it doesn't seriously affect the readability.

Horizontal Space Always add single space after conditional and loop keywords:

```
if (condition) {     // correct
    // ...
}

switch (n) {         // correct
    case 0:
        // ...
}

for(int i = 0; i < CONST; ++i) {     // INCORRECT
    // ...
}
```

Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);     // correct

const int y = y0 + (x - x0)*(y1 - y0)/(x1 - x0);         // also okay

int y_cur = -y;                                          // correct
++y_cur;

const int y = y0+(x-x0)*(y1-y0)/(x1-x0);                 // INCORRECT
```

No space is necessary around `.` and `->` operators.

Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```
esp_rom_gpio_connect_in_signal(PIN_CAM_D6,    I2S0I_DATA_IN14_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_D7,    I2S0I_DATA_IN15_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_HREF, I2S0I_H_ENABLE_IDX,  false);
esp_rom_gpio_connect_in_signal(PIN_CAM_PCLK, I2S0I_DATA_IN15_IDX, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g. `PIN_CAM_VSYNC`), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.

Never add trailing whitespace at the end of the line.

Braces

- Function definition should have a brace on a separate line:

```
// This is correct:
void function(int arg)
{

}
```

(下页继续)

(续上页)

```
// NOT like this:
void function(int arg) {

}
```

- Within a function, place opening brace on the same line with conditional and loop statements:

```
if (condition) {
    do_one();
} else if (other_condition) {
    do_two();
}
```

Comments Use `//` for single line comments. For multi-line comments it is okay to use either `//` on each line or a `/* */` block.

Although not directly related to formatting, here are a few notes about using comments effectively.

- Don't use single comments to disable some functionality:

```
void init_something()
{
    setup_dma();
    // load_resources();                // WHY is this thing commented, asks␣
↪the reader?
    start_timer();
}
```

- If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

```
void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated␣
↪yet.
    // load_resources();
    start_timer();
}
```

- Same goes for `#if 0 ... #endif` blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Don't use `#if 0 ... #endif` or comments to store code snippets which you may need in the future.
- Don't add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g. this comment adds clutter to the code without adding any useful information:

```
void init_something()
{
    setup_dma();
    // XXX add 2016-09-01
    init_dma_list();
    fill_dma_item(0);
    // end XXX add
    start_timer();
}
```

Line Endings Commits should only contain files with LF (Unix style) endings.

Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the `core.autocrlf` setting. *Github has a document about setting this option <github-line-endings>*.

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

```
git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs␣
↪dos2unix && git commit -a --amend --no-edit --allow-empty' master
```

(Note that this line rebases on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it's possible to run `dos2unix FILENAME` and then run `git commit --amend`

Formatting Your Code You can use `astyle` program to format your code according to the above recommendations.

If you are writing a file from scratch, or doing a complete rewrite, feel free to re-format the entire file. If you are changing a small portion of file, don't re-format the code you didn't change. This will help others when they review your changes.

To re-format a file, run:

```
tools/format.sh components/my_component/file.c
```

Type Definitions Should be snake_case, ending with _t suffix:

```
typedef int signed_32_bit_t;
```

Enum Enums should be defined through the *typedef* and be namespaced:

```
typedef enum
{
    MODULE_FOO_ONE,
    MODULE_FOO_TWO,
    MODULE_FOO_THREE
} module_foo_t;
```

Assertions The standard C `assert()` function, defined in `assert.h` should be used to check conditions that should be true in source code. In the default configuration, an assert condition that returns `false` or 0 will call `abort()` and trigger a *Fatal Error*.

`assert()` should only be used to detect unrecoverable errors due to a serious internal logic bug or corruption, where it's not possible for the program to continue. For recoverable errors, including errors that are possible due to invalid external input, an *error value should be returned*.

备注： When asserting a value of type `esp_err_t``is equal to ``ESP_OK`, use the *ESP_ERROR_CHECK 宏* instead of an `assert()`.

It's possible to configure ESP-IDF projects with assertions disabled (see *CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL*). Therefore, functions called in an `assert()` statement should not have side-effects.

It's also necessary to use particular techniques to avoid "variable set but not used" warnings when assertions are disabled, due to code patterns such as:

```
int res = do_something();
assert(res == 0);
```

Once the `assert` is optimized out, the `res` value is unused and the compiler will warn about this. However the function `do_something()` must still be called, even if assertions are disabled.

When the variable is declared and initialized in a single statement, a good strategy is to cast it to `void` on a new line. The compiler will not produce a warning, and the variable can still be optimized out of the final binary:

```
int res = do_something();
assert(res == 0);
(void)res;
```

If the variable is declared separately, for example if it is used for multiple assertions, then it can be declared with the GCC attribute `__attribute__((unused))`. The compiler will not produce any unused variable warnings, but the variable can still be optimized out:

```
int res __attribute__((unused));

res = do_something();
assert(res == 0);

res = do_something_else();
assert(res != 0);
```

Header file guards

All public facing header files should have preprocessor guards. A pragma is preferred:

```
#pragma once
```

over the following pattern:

```
#ifndef FILE_NAME_H
#define FILE_NAME_H
...
#endif // FILE_NAME_H
```

In addition to guard macros, all C header files should have `extern "C"` guards to allow the header to be used from C++ code. Note that the following order should be used: `pragma once`, then any `#include` statements, then `extern "C"` guards:

```
#pragma once

#include <stdint.h>

#ifdef __cplusplus
extern "C" {
#endif

/* declarations go here */

#ifdef __cplusplus
}
#endif
```

Include statements

When writing `#include` statements, try to maintain the following order:

- C standard library headers.
- Other POSIX standard headers and common extensions to them (such as `sys/queue.h`.)
- Common IDF headers (`esp_log.h`, `esp_system.h`, `esp_timer.h`, `esp_sleep.h`, etc.)
- Headers of other components, such as FreeRTOS.
- Public headers of the current component.
- Private headers.

Use angle brackets for C standard library headers and other POSIX headers (`#include <stdio.h>`).

Use double quotes for all other headers (`#include "esp_log.h"`).

C++ Code Formatting

The same rules as for C apply. Where they are not enough, apply the following rules.

File Naming C++ Header files have the extension `.hpp`. C++ source files have the extension `.cpp`. The latter is important for the compiler to distinguish them from normal C source files.

Naming

- **Class and struct** names shall be written in `CamelCase` with a capital letter as beginning. Member variables and methods shall be in `snake_case`.
- **Namespaces** shall be in lower `snake_case`.
- **Templates** are specified in the line above the function declaration.
- Interfaces in terms of Object-Oriented Programming shall be named without the suffix `...Interface`. Later, this makes it easier to extract interfaces from normal classes and vice versa without making a breaking change.

Member Order in Classes In order of precedence:

- First put the public members, then the protected, then private ones. Omit public, protected or private sections without any members.
- First put constructors/destructors, then member functions, then member variables.

For example:

```
class ForExample {
public:
    // first constructors, then default constructor, then destructor
    ForExample(double example_factor_arg);
    ForExample();
    ~ForExample();

    // then remaining pubic methods
    set_example_factor(double example_factor_arg);

    // then public member variables
    uint32_t public_data_member;

private:
    // first private methods
    void internal_method();

    // then private member variables
    double example_factor;
};
```

Spacing

- Don't indent inside namespaces.
- Put `public`, `protected` and `private` labels at the same indentation level as the corresponding `class` label.

Simple Example

```
// file spaceship.h
#ifndef SPACESHIP_H_
#define SPACESHIP_H_
#include <cstdlib>

namespace spaceships {

class SpaceShip {
public:
    SpaceShip(size_t crew);
    size_t get_crew_size() const;

private:
    const size_t crew;
};

class SpaceShuttle : public SpaceShip {
public:
    SpaceShuttle();
};

class Sojuz : public SpaceShip {
public:
    Sojuz();
};

template <typename T>
class CargoShip {
public:
    CargoShip(const T &cargo);

private:
    T cargo;
};

} // namespace spaceships

#endif // SPACESHIP_H_

// file spaceship.cpp
#include "spaceship.h"

namespace spaceships {

// Putting the curly braces in the same line for constructors is OK if it only␣
↪initializes
// values in the initializer list
SpaceShip::SpaceShip(size_t crew) : crew(crew) { }

size_t SpaceShip::get_crew_size() const
{
    return crew;
}
```

(下页继续)

(续上页)

```
SpaceShuttle::SpaceShuttle() : SpaceShip(7)
{
    // doing further initialization
}

Sojuz::Sojuz() : SpaceShip(3)
{
    // doing further initialization
}

template <typename T>
CargoShip<T>::CargoShip(const T &cargo) : cargo(cargo) { }

} // namespace spaceships
```

CMake Code Style

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Don't put anything in the optional parentheses after `endforeach()`, `endif()`, etc.
- Use lowercase (`with_underscores`) for command, function, and macro names.
- For locally scoped variables, use lowercase (`with_underscores`).
- For globally scoped variables, use uppercase (`WITH_UNDERSCORES`).
- Otherwise follow the defaults of the cmake-lint project.

Configuring the Code Style for a Project Using EditorConfig

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see EditorConfig Website.

Documenting Code

Please see the guide here: *Documenting Code*.

Structure

To be written.

Language Features

To be written.

7.5.2 Install pre-commit Hook for ESP-IDF Project

Required Dependency

Python 3.7.* or above. This is our recommended python version for IDF developers.

If you still have python versions not compatible, update your python versions before installing the pre-commit hook.

Install pre-commit

Run `pip install pre-commit`

Install pre-commit hook

1. Go to the IDF Project Directory
2. Run `pre-commit install --allow-missing-config`. Install hook by this approach will let you commit successfully even in branches without the `.pre-commit-config.yaml`
3. pre-commit hook will run automatically when you're running `git commit` command

Uninstall pre-commit

Run `pre-commit uninstall`

What's More?

For detailed usage, please refer to the documentation of pre-commit.

Common Problems For Windows Users

`/usr/bin/env: python: Permission denied.`

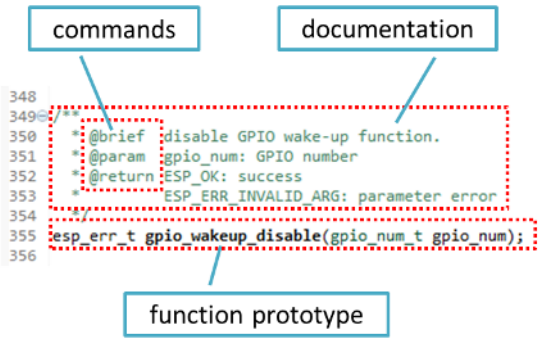
> If you're in Git Bash, please check the python executable location by run `which python`.
>
> If the executable is under `~/AppData/Local/Microsoft/WindowsApps/`, then it's a link to Windows AppStore, not a real one.
>
> Please install python manually and update this in your `PATH` environment variable.

Your %USERPROFILE% contains non-ASCII characters

> `pre-commit` may fail when initializing an environment for a particular hook when the path of `pre-commit`'s cache contains non-ASCII characters. The solution is to set `PRE_COMMIT_HOME` to a path containing only standard characters before running pre-commit.
>
> - CMD: `set PRE_COMMIT_HOME=C:\somepath\pre-commit`
> - PowerShell: `$Env:PRE_COMMIT_HOME = "C:\somepath\pre-commit"`
> - git bash: `export PRE_COMMIT_HOME="/c/somepath/pre-commit"`

7.5.3 Documenting Code

The purpose of this description is to provide quick summary on documentation style used in espressif/esp-idf repository and how to add new documentation.



Introduction

When documenting code for this repository, please follow Doxygen style. You are doing it by inserting special commands, for instance `@param`, into standard comments blocks, for example:

```
/**
 * @param ratio this is oxygen to air ratio
 */
```

Doxygen is phrasing the code, extracting the commands together with subsequent text, and building documentation out of it.

Typical comment block, that contains documentation of a function, looks like below.

```
348
349 /**
350  * @brief  disable GPIO wake-up function.
351  * @param  gpio_num: GPIO number
352  * @return ESP_OK: success
353  *         ESP_ERR_INVALID_ARG: parameter error
354  */
355 esp_err_t gpio_wakeup_disable(gpio_num_t gpio_num);
356
```

Doxygen supports couple of formatting styles. It also gives you great flexibility on level of details to include in documentation. To get familiar with available features, please check data rich and very well organized Doxygen Manual.

Why we need it?

The ultimate goal is to ensure that all the code is consistently documented, so we can use tools like Sphinx and Breathe to aid preparation and automatic updates of API documentation when the code changes.

With these tools the above piece of code renders like below:

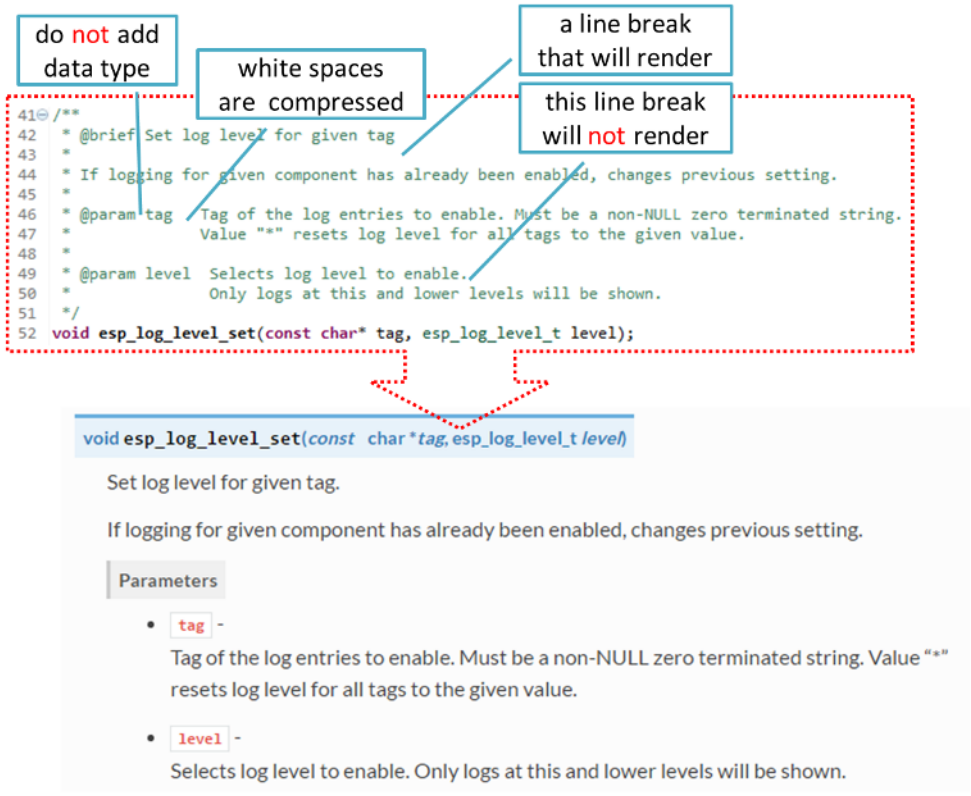
```
348
349 /**
350  * @brief  disable GPIO wake-up function.
351  * @param  gpio_num: GPIO number
352  * @return ESP_OK: success
353  *         ESP_ERR_INVALID_ARG: parameter error
354  */
355 esp_err_t gpio_wakeup_disable(gpio_num_t gpio_num);
356
```

esp_err_t **gpio_wakeup_disable**(gpio_num_t *gpio_num*)

disable GPIO wake-up function.

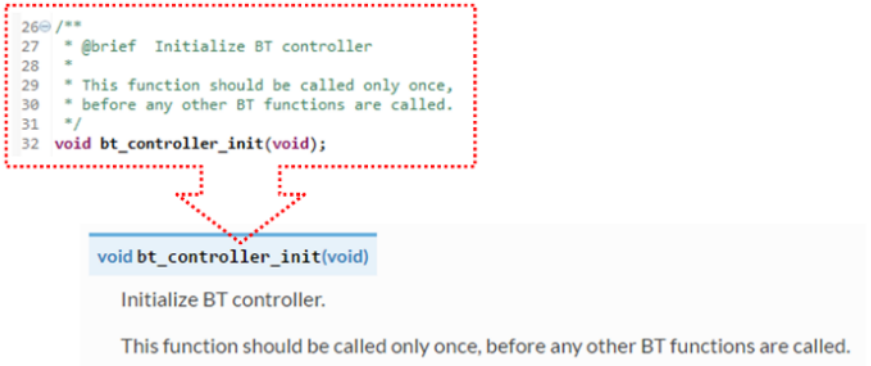
Return

ESP_OK: success ESP_ERR_INVALID_ARG: parameter error



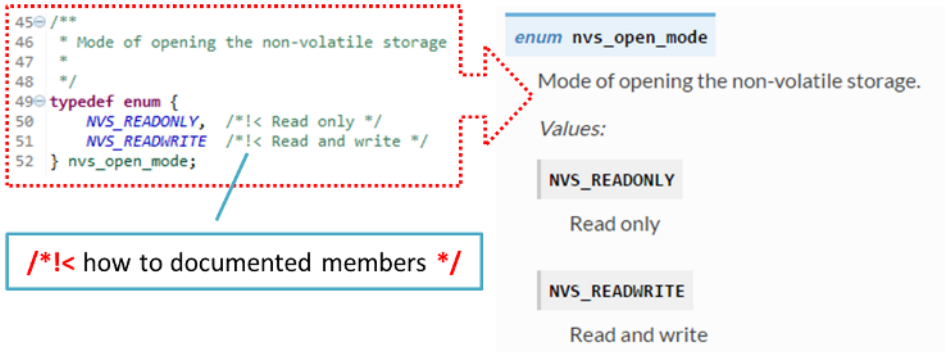
Parameters

- `gpio_num` -
  GPIO number



Go for it!

When writing code for this repository, please follow guidelines below.



1. Document all building blocks of code: functions, structs, typedefs, enums, macros, etc. Provide enough information about purpose, functionality and limitations of documented items, as you would like to see them documented when reading the code by others.
2. Documentation of function should describe what this function does. If it accepts input parameters and returns some value, all of them should be explained.
3. Do not add a data type before parameter or any other characters besides spaces. All spaces and line breaks are compressed into a single space. If you like to break a line, then break it twice.

4. If function has void input or does not return any value, then skip `@param` or `@return`

5. When documenting a `define` as well as members of a `struct` or `enum`, place specific comment like below after each member.

6. To provide well formatted lists, break the line after command (like `@return` in example below).

```
*
* @return
*     - ESP_OK if erase operation was successful
```

(下页继续)

(续上页)

```
*     - ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
*     - ESP_ERR_NVS_READ_ONLY if handle was opened as read only
*     - ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
*     - other error codes from the underlying storage driver
*
```

7. Overview of functionality of documented header file, or group of files that make a library, should be placed in a separate `README.rst` file of the same directory. If this directory contains header files for different APIs, then the file name should be `apiname-readme.rst`.

Go one extra mile

Here are a couple of tips on how you can make your documentation even better and more useful to the reader and writer.

When writing codes, please follow the guidelines below:

1. Add code snippets to illustrate implementation. To do so, enclose snippet using `@code{c}` and `@endcode` commands.

```
*
* @code{c}
* // Example of using nvs_get_i32:
* int32_t max_buffer_size = 4096; // default value
* esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
* assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
* // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
* // have its default value.
* @endcode
*
```

   The code snippet should be enclosed in a comment block of the function that it illustrates.
2. To highlight some important information use command `@attention` or `@note`.

```
*
* @attention
*     1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
*     2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to␣
↪disconnect.
*
```

   Above example also shows how to use a numbered list.
3. To provide common description to a group of similar functions, enclose them using `/**@{*/` and `/**@}*/` markup commands:

```
/**@{*/
/**
 * @brief common description of similar functions
 *
 */
void  first_similar_function (void);
void second_similar_function (void);
/**@}*/
```

   For practical example see nvs_flash/include/nvs.h.
4. You may want to go even further and skip some code like repetitive defines or enumerations. In such case, enclose the code within `/** @cond */` and `/** @endcond */` commands. Example of such implementation is provided in driver/include/driver/gpio.h.
5. Use markdown to make your documentation even more readable. You will add headers, links, tables and more.

```
*
* [ESP32-C3 Technical Reference Manual](https://www.espressif.com/sites/
↪default/files/documentation/esp32-c3_technical_reference_manual_en.pdf)
*
```

备注： Code snippets, notes, links, etc. will not make it to the documentation, if not enclosed in a comment block associated with one of documented objects.

6. Prepare one or more complete code examples together with description. Place description to a separate file `README.md` in specific folder of examples directory.

Standardize Document Format

When it comes to text, please follow guidelines below to provide well formatted Markdown (.md) or reST (.rst) documents.

1. Please ensure that one paragraph is written in one line. Don't break lines like below. Breaking lines to enhance readability is only suitable for writing codes. To make the text easier to read, it is recommended to place an empty line to separate the paragraph.

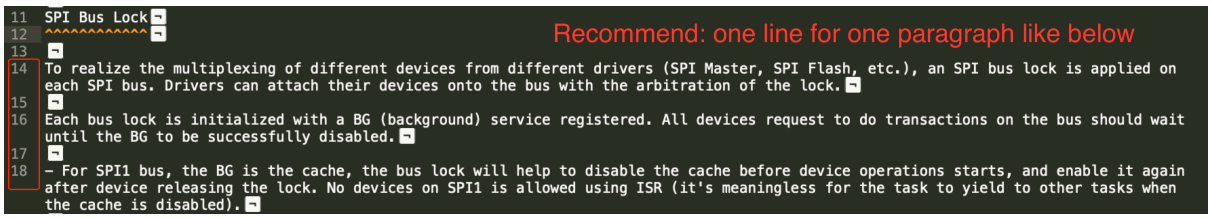


图 1: One line for one paragraph (click to enlarge)

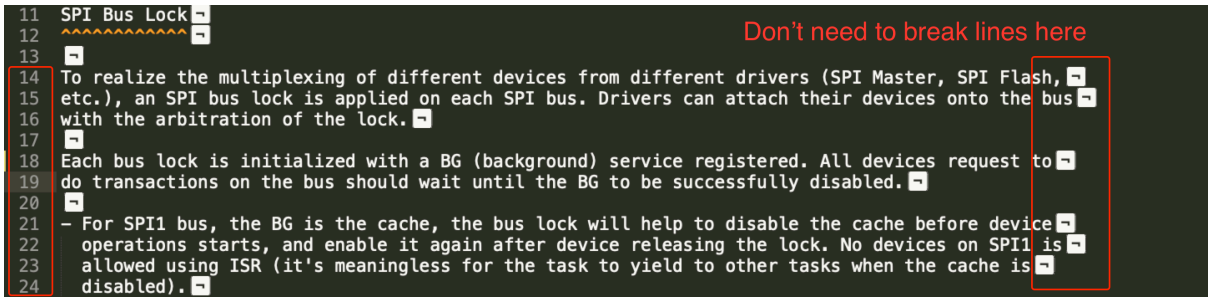

图 2: No line breaks within the same paragraph (click to enlarge)

2. Please make the line number of CN and EN documents consistent like below. The benefit of this approach is that it can save time for both writers and translators. When non-bilingual writers need to update text, they only need to update the same line in the corresponding CN or EN document. For translators, if documents are updated in English, then translators can quickly locate where to update in the corresponding CN document later. Besides, by comparing the total number of lines in EN and CN documents, you can quickly find out whether the CN version lags behind the EN version.

Building Documentation

The documentation is built with the *esp-docs* Python package, which is a wrapper around Sphinx

To install it simply do:

```
1  ********************************
2  Getting Started with VS Code IDE
3  ********************************
4
5  :link_to_translation:`zh_CN:[中文]`
6
7  We have official support for VS Code and we aim to provide complete
   end to end support for all actions related to ESP-IDF namely build,
   flash, monitor, debug, tracing, core-dump, System Trace Viewer, etc.
8
9  Quick Install Guide
10 ==================
11
12 Recommended way to install ESP-IDF Visual Studio Code Extension is by
   downloading it from `VS Code Marketplace <https://marketplace.
   visualstudio.com/items?itemName=espressif.esp-idf-extension>`_ or
   following `Quick Installation Guide <https://github.com/espressif/
   vscode-esp-idf-extension/blob/master/docs/tutorial/install.md>`_.
13
14 Review the `tutorials <https://github.com/espressif/
   vscode-esp-idf-extension/blob/master/docs/tutorial/toc.md>` for
   ESP-IDF Visual Studio Code Extension to learn how to use all features.
15
16 Supported Features

```

```
1  ********************************
2  VS Code IDE 快速入门
3  ********************************
4
5  :link_to_translation:`en:[English]`
6
7  我们支持 VS code，并且致力于为所有与 ESP-IDF 相关的操作提供完善的端到端支持，包
   括构建、烧录、监控、调试、追踪、core-dump、以及系统追踪查看器等操作。
8
9  快速安装指南
10 ==========
11
12 推荐您从 `VS Code 插件市场 <https://marketplace.visualstudio.com/items?
   itemName=espressif.esp-idf-extension>`_ 中下载 ESP-IDF VS Code 插件，或
   根据 `快速安装指南 <https://github.com/espressif/
   vscode-esp-idf-extension/blob/master/docs/tutorial/install.md>`_ 安装
   ESP-IDF VS Code 插件。
13
14 查看 ESP-IDF VS Code 插件 `教程 <https://github.com/espressif/
   vscode-esp-idf-extension/blob/master/docs/tutorial/toc.md>` 了解如何使用
   所有功能。
15
16 支持如下功能
17 ==========
18
```

图 3: Keep the line number for EN and CN documents consistent (click to enlarge)

```
pip install esp-docs
```

After a successful install then the documentation can be built from the docs folder with:

```
build-docs build
```

or for specific target and language with:

```
build-docs -t esp32 -l en build
```

For more in-depth documentation about *esp-docs* features please see the documentation in the esp-docs repository.

Wrap up

We love good code that is doing cool things. We love it even better, if it is well documented, so we can quickly make it run and also do the cool things.

Go ahead, contribute your code and documentation!

7.5.4 创建示例项目

每个 ESP-IDF 的示例都是一个完整的项目，其他人可以将示例复制至本地，并根据实际情况进行一定修改。请注意，示例项目主要是为了展示 ESP-IDF 的功能。

示例项目结构

- `main` 目录需要包含一个名为 `(something)_example_main.c` 的源文件，里面包含示例项目的主要功能。
- 如果该示例项目的子任务比较多，请根据逻辑将其拆分为 `main` 目录下的多个 C 或者 C++ 源文件，并将对应的头文件也放在同一目录下。

- 如果该示例项目具有多种功能，可以考虑在项目中增加一个 `components` 子目录，通过库功能，将示例项目的不同功能划分为不同的组件。注意，如果该组件提供的功能相对完整，且具有一定的通用性，则应该将它们添加到 ESP-IDF 的 `components` 目录中，使其成为 ESP-IDF 的一部分。
- 示例项目需要包含一个 `README.md` 文件，建议使用 示例项目 README 模板 ，并根据项目实际情况进行修改。
- 示例项目需要包含一个 `example_test.py` 文件，用于进行自动化测试。如果在 GitHub 上初次提交 Pull Request 时，可以先不包含这个脚本文件。具体细节，请见有关 Pull Request 的相关内容。

一般准则

示例代码需要遵循《乐鑫物联网开发框架风格指南》。

检查清单

提交一个新的示例项目之前，需要检查以下内容：

- 示例项目的名字（包括 `README.md` 中）应使用 `example`，而不要写 “demo”，“test” 等词汇。
- 每个示例项目只能有一个主要功能。如果某个示例项目有多个主要功能，请将其拆分为两个或更多示例项目。
- 每个示例项目应包含一个 `README.md` 文件，建议使用 示例项目 README 模板 。
- 示例项目中的函数和变量的命令要遵循命名规范 中的要求。对于仅在示例项目源文件中使用的非静态变量/函数，请使用 `example` 或其他类似的前缀。
- 示例项目中的所有代码结构良好，关键代码要有详细注释。
- 示例项目中所有不必要的代码（旧的调试日志，注释掉的代码等）都必须清除掉。
- 示例项目中使用的选项（比如网络名称，地址等）不得直接硬编码，应尽可能地使用配置项，或者定义为宏或常量。
- 配置项可见 `KConfig.projbuild` 文件，该文件中包含一个名为 “Example Configuration” 的菜单。具体情况，请查看现有示例项目。
- 所有的源代码都需要在文件开头指定许可信息（表示该代码是 `in the public domain CC0`）和免责声明。或者，源代码也可以应用 `Apache License 2.0` 许可条款。请查看现有示例项目的许可信息和免责声明，并根据实际情况进行修改。
- 任何第三方代码（无论是直接使用，还是进行了一些改进）均应保留原始代码中的许可信息，且这些代码的许可必须兼容 `Apache License 2.0` 协议。

7.5.5 API Documentation Template

备注： *INSTRUCTIONS*

1. Use this file (docs/en/api-reference/template.rst) as a template to document API.
2. Change the file name to the name of the header file that represents documented API.
3. Include respective files with descriptions from the API folder using `..include::`
   - README.rst
   - example.rst
   - …
4. Optionally provide description right in this file.
5. Once done, remove all instructions like this one and any superfluous headers.

Overview

备注： *INSTRUCTIONS*

1. Provide overview where and how this API may be used.
2. Where applicable include code snippets to illustrate functionality of particular functions.

3. To distinguish between sections, use the following heading levels:
   - # with overline, for parts
   - * with overline, for chapters
   - =, for sections
   - -, for subsections
   - ^, for subsubsections
   - ", for paragraphs

Application Example

备注： *INSTRUCTIONS*

1. Prepare one or more practical examples to demonstrate functionality of this API.
2. Each example should follow pattern of projects located in `esp-idf/examples/` folder.
3. Place example in this folder complete with `README.md` file.
4. Provide overview of demonstrated functionality in `README.md`.
5. With good overview reader should be able to understand what example does without opening the source code.
6. Depending on complexity of example, break down description of code into parts and provide overview of functionality of each part.
7. Include flow diagram and screenshots of application output if applicable.
8. Finally add in this section synopsis of each example together with link to respective folder in `esp-idf/examples/`.

API Reference

备注： *INSTRUCTIONS*

1. This repository provides for automatic update of API reference documentation using *code markup retrieved by Doxygen from header files*.

1. Update is done on each documentation build by invoking Sphinx extension *:esp_extensions/run_doxygen.py* for all header files listed in the `INPUT` statement of docs/doxygen/Doxyfile.

1. Each line of the `INPUT` statement (other than a comment that begins with `##`) contains a path to header file `*.h` that will be used to generate corresponding `*.inc` files:

```
##
## Wi-Fi - API Reference
##
../components/esp32/include/esp_wifi.h \
../components/esp32/include/esp_smartconfig.h \
```

1. When the headers are expanded, any macros defined by default in `sdkconfig.h` as well as any macros defined in SOC-specific `include/soc/*_caps.h` headers will be expanded. This allows the headers to include/exclude material based on the `IDF_TARGET` value.

1. The `*.inc` files contain formatted reference of API members generated automatically on each documentation build. All `*.inc` files are placed in Sphinx `_build` directory. To see directives generated for e.g. `esp_wifi.h`, run `python gen-dxd.py esp32/include/esp_wifi.h`.

1. To show contents of `*.inc` file in documentation, include it as follows:

```
.. include-build-file:: inc/esp_wifi.inc
```

   For example see docs/en/api-reference/network/esp_wifi.rst

1. Optionally, rather that using `*.inc` files, you may want to describe API in you own way. See docs/en/api-reference/storage/fatfs.rst for example.
   Below is the list of common `.. doxygen...::` directives:
   - Functions - `.. doxygenfunction:: name_of_function`
   - Unions - `.. doxygenunion:: name_of_union`
   - Structures - `.. doxygenstruct:: name_of_structure` together with `:members:`
   - Macros - `.. doxygendefine:: name_of_define`
   - Type Definitions - `.. doxygentypedef:: name_of_type`
   - Enumerations - `.. doxygenenum:: name_of_enumeration`

   See Breathe documentation for additional information.
   To provide a link to header file, use the *link custom role* directive as follows:

```
* :component_file:`path_to/header_file.h`
```

1. In any case, to generate API reference, the file docs/doxygen/Doxyfile should be updated with paths to `*.h` headers that are being documented.

1. When changes are committed and documentation is build, check how this section has been rendered. *Correct annotations* in respective header files, if required.

7.5.6 Contributor Agreement

Individual Contributor Non-Exclusive License Agreement including the Traditional Patent License OPTION

Thank you for your interest in contributing to Espressif IoT Development Framework (esp-idf) ("We" or "Us").

The purpose of this contributor agreement ("Agreement") is to clarify and document the rights granted by contributors to Us. To make this document effective, please follow the instructions in the *Contributions Guide*.

1. DEFINITIONS **"You"** means the Individual Copyright owner who submits a Contribution to Us. If You are an employee and submit the Contribution as part of your employment, You have had Your employer approve this Agreement or sign the Entity version of this document.

"Contribution" means any original work of authorship (software and/or documentation) including any modifications or additions to an existing work, Submitted by You to Us, in which You own the Copyright. If You do not own the Copyright in the entire work of authorship, please contact Us at marius.vikhammer@espressif.com.

"Copyright" means all rights protecting works of authorship owned or controlled by You, including copyright, moral and neighboring rights, as appropriate, for the full term of their existence including any extensions by You.

"Material" means the software or documentation made available by Us to third parties. When this Agreement covers more than one software project, the Material means the software or documentation to which the Contribution was Submitted. After You Submit the Contribution, it may be included in the Material.

"Submit" means any form of physical, electronic, or written communication sent to Us, including but not limited to electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, Us, but excluding communication that is conspicuously marked or otherwise designated in writing by You as "Not a Contribution."

"Submission Date" means the date You Submit a Contribution to Us.

"Documentation" means any non-software portion of a Contribution.

2. LICENSE GRANT 2.1 Copyright License to Us

Subject to the terms and conditions of this Agreement, You hereby grant to Us a worldwide, royalty-free, NON-exclusive, perpetual and irrevocable license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, under the Copyright covering the Contribution to use the Contribution by all means, including, but not limited to:

- to publish the Contribution,
- to modify the Contribution, to prepare derivative works based upon or containing the Contribution and to combine the Contribution with other software code,
- to reproduce the Contribution in original or modified form,
- to distribute, to make the Contribution available to the public, display and publicly perform the Contribution in original or modified form.

2.2 Moral Rights remain unaffected to the extent they are recognized and not waivable by applicable law. Notwithstanding, You may add your name in the header of the source code files of Your Contribution and We will respect this attribution when using Your Contribution.

3. PATENTS 3.1 Patent License

Subject to the terms and conditions of this Agreement You hereby grant to us a worldwide, royalty-free, non-exclusive, perpetual and irrevocable (except as stated in Section 3.2) patent license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, to make, have made, use, sell, offer for sale, import and otherwise transfer the Contribution and the Contribution in combination with the Material (and portions of such combination). This license applies to all patents owned or controlled by You, whether already acquired or hereafter acquired, that would be infringed by making, having made, using, selling, offering for sale, importing or otherwise transferring of Your Contribution(s) alone or by combination of Your Contribution(s) with the Material.

3.2 Revocation of Patent License

You reserve the right to revoke the patent license stated in section 3.1 if we make any infringement claim that is targeted at your Contribution and not asserted for a Defensive Purpose. An assertion of claims of the Patents shall be considered for a "Defensive Purpose" if the claims are asserted against an entity that has filed, maintained, threatened, or voluntarily participated in a patent infringement lawsuit against Us or any of Our licensees.

4. DISCLAIMER THE CONTRIBUTION IS PROVIDED "AS IS". MORE PARTICULARLY, ALL EXPRESS OR IMPLIED WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT ARE EXPRESSLY DISCLAIMED BY YOU TO US AND BY US TO YOU. TO THE EXTENT THAT ANY SUCH WARRANTIES CANNOT BE DISCLAIMED, SUCH WARRANTY IS LIMITED IN DURATION TO THE MINIMUM PERIOD PERMITTED BY LAW.

5. Consequential Damage Waiver TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT WILL YOU OR US BE LIABLE FOR ANY LOSS OF PROFITS, LOSS OF ANTICIPATED SAVINGS, LOSS OF DATA, INDIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL AND EXEMPLARY DAMAGES ARISING OUT OF THIS AGREEMENT REGARDLESS OF THE LEGAL OR EQUITABLE THEORY (CONTRACT, TORT OR OTHERWISE) UPON WHICH THE CLAIM IS BASED.

6. Approximation of Disclaimer and Damage Waiver IF THE DISCLAIMER AND DAMAGE WAIVER MENTIONED IN SECTION 4 AND SECTION 5 CANNOT BE GIVEN LEGAL EFFECT UNDER APPLICABLE LOCAL LAW, REVIEWING COURTS SHALL APPLY LOCAL LAW THAT MOST CLOSELY APPROXIMATES AN ABSOLUTE WAIVER OF ALL CIVIL LIABILITY IN CONNECTION WITH THE CONTRIBUTION.

7. Term 7.1 This Agreement shall come into effect upon Your acceptance of the terms and conditions.

7.2 In the event of a termination of this Agreement Sections 4, 5, 6, 7 and 8 shall survive such termination and shall remain in full force thereafter. For the avoidance of doubt, Contributions that are already licensed under a free and open source license at the date of the termination shall remain in full force after the termination of this Agreement.

8. Miscellaneous 8.1 This Agreement and all disputes, claims, actions, suits or other proceedings arising out of this agreement or relating in any way to it shall be governed by the laws of People's Republic of China excluding its private international law provisions.

8.2 This Agreement sets out the entire agreement between You and Us for Your Contributions to Us and overrides all other agreements or understandings.

8.3 If any provision of this Agreement is found void and unenforceable, such provision will be replaced to the extent possible with a provision that comes closest to the meaning of the original provision and that is enforceable. The terms and conditions set forth in this Agreement shall apply notwithstanding any failure of essential purpose of this Agreement or any limited remedy to the maximum extent possible under law.

8.4 You agree to notify Us of any facts or circumstances of which you become aware that would make this Agreement inaccurate in any respect.

7.5.7 Copyright Header Guide

ESP-IDF is released under the Apache License 2.0 with some additional third-party copyrighted code released under various licenses. For further information please refer to *the list of copyrights and licenses*.

This page explains how the source code should be properly marked with a copyright header. ESP-IDF uses The Software Package Data Exchange (SPDX) format which is short and can be easily read by humans or processed by automated tools for copyright checks.

How to Check the Copyright Headers

Please make sure you have installed *the pre-commit hooks* which contain a copyright header checker as well. The checker can suggest a header if it is not able to detect a properly formatted SPDX header.

What if the Checker's Suggestion is Incorrect?

No automated checker (no matter how good is) can replace humans. So the developer's responsibility is to modify the offered header to be in line with the law and the license restrictions of the original code on which the work is based on. Certain licenses are not compatible between each other. Such corner cases will be covered by the following examples.

The checker can be configured with the `tools/ci/check_copyright_config.yaml` configuration file. Please check the options it offers and consider updating it in order to match the headers correctly.

Common Examples of Copyright Headers

The simplest case is when the code is not based on any licensed previous work, e.g. it was written completely from scratch. Such code can be decorated with the following copyright header and put under the license of ESP-IDF:

```
/*
 * SPDX-FileCopyrightText: 2015-2022 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: Apache-2.0
 */
```

Less restrictive parts of ESP-IDF Some parts of ESP-IDF are deliberately under less restrictive licenses in order to ease their re-use in commercial closed source projects. This is the case for ESP-IDF examples which are in Public domain or under the Creative Commons Zero Universal (CC0) license. The following header can be used in such source files:

```
/*
 * SPDX-FileCopyrightText: 2015-2022 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: Unlicense OR CC0-1.0
 */
```

The option allowing multiple licenses joined with the `OR` keyword from the above example can be achieved with the definition of multiple allowed licenses in the `tools/ci/check_copyright_config.yaml` configuration file. Please use this option with care and only selectively for a limited part of ESP-IDF.

Third party licenses Code licensed under different licenses, modified by Espressif Systems and included in ESP-IDF cannot be licensed under Apache License 2.0 not even if the checker suggests it. It is advised to keep the original copyright header and add an SPDX before it.

The following example is a suitable header for a code licensed under the "GNU General Public License v2.0 or later" held by John Doe with some additional modifications done by Espressif Systems:

```
/*
 * SPDX-FileCopyrightText: 1991 John Doe
 *
 * SPDX-License-Identifier: GPL-2.0-or-later
 *
 * SPDX-FileContributor: 2019-2022 Espressif Systems (Shanghai) CO LTD
 */
```

The licenses can be identified and the short SPDX identifiers can be found in the official SPDX license list. Other very common licenses are the GPL-2.0-only, the BSD-3-Clause, and the BSD-2-Clause.

The configuration stored in `tools/ci/check_copyright_config.yaml` offers features useful for third party licenses:

- A different license can be defined for the files part of a third party library.
- The check for a selected set of files can be permanently disabled. Please use this option with care and only in cases when none of the other options are suitable.

7.5.8 ESP-IDF Tests with Pytest Guide

This documentation is a guide that introduces the following aspects:

1. The basic idea of different test types in ESP-IDF
2. How to apply the pytest framework to the test python scripts to make sure the apps are working as expected.
3. ESP-IDF CI target test process
4. Run ESP-IDF tests with pytest locally

5. Tips and tricks on pytest

Disclaimer

In ESP-IDF, we use the following plugins by default:

- pytest-embedded with default services `esp,idf`
- pytest-rerunfailures

All the introduced concepts and usages are based on the default behavior in ESP-IDF. Not all of them are available in vanilla pytest.

Installation

All dependencies could be installed by running the install script with the `--enable-pytest` argument, e.g. `$ install.sh --enable-pytest`.

Common Issues During Installation

No Package 'dbus-1' found If you're facing an error message like:

```
configure: error: Package requirements (dbus-1 >= 1.8) were not met:

No package 'dbus-1' found

Consider adjusting the PKG_CONFIG_PATH environment variable if you
installed software in a non-standard prefix.
```

If you're running a ubuntu system, you may need to run:

```
sudo apt-get install libdbus-glib-1-dev
```

or

```
sudo apt-get install libdbus-1-dev
```

For other linux distros, you may Google the error message and find the solution. This issue could be solved by installing the related header files.

Invalid command 'bdist_wheel' If you're facing an error message like:

```
error: invalid command 'bdist_wheel'
```

You may need to run:

```
python -m pip install -U pip
```

Or

```
python -m pip install wheel
```

Before running the pip commands, please make sure you're using the IDF python virtual environment.

Basic Concepts

Component-based Unit Tests Component-based unit tests are our recommended way to test your component. All the test apps should be located under `${IDF_PATH}/components/<COMPONENT_NAME>/test_apps`.

For example:

```
components/
└── my_component/
    ├── include/
    │   └── ...
    ├── test_apps/
    │   ├── test_app_1
    │   │   ├── main/
    │   │   │   └── ...
    │   │   ├── CMakeLists.txt
    │   │   └── pytest_my_component_app_1.py
    │   ├── test_app_2
    │   │   ├── ...
    │   │   └── pytest_my_component_app_2.py
    │   └── parent_folder
    │       ├── test_app_3
    │       │   ├── ...
    │       │   └── pytest_my_component_app_3.py
    │       └── ...
    ├── my_component.c
    └── CMakeLists.txt
```

Example Tests Example Tests are tests for examples that are intended to demonstrate parts of the ESP-IDF functionality to our customers.

All the test apps should be located under `${IDF_PATH}/examples`. For more information please refer to the Examples Readme .

For example:

```
examples/
└── parent_folder/
    └── example_1/
        ├── main/
        │   └── ...
        ├── CMakeLists.txt
        └── pytest_example_1.py
```

Custom Tests Custom Tests are tests that aim to run some arbitrary test internally. They are not intended to demonstrate the ESP-IDF functionality to our customers in any way.

All the test apps should be located under `${IDF_PATH}/tools/test_apps`. For more information please refer to the Custom Test Readme .

Pytest in ESP-IDF

Pytest Execution Process

1. Bootstrapping Phase
   Create session-scoped caches:
   - port-target cache
   - port-app cache
2. Collection Phase
   1. Get all the python files with the prefix `pytest_`

2. Get all the test functions with the prefix `test_`
3. Apply the params, and duplicate the test functions.
4. Filter the test cases with CLI options. Introduced detailed usages *here*

3. Test Running Phase
   1. Construct the fixtures. In ESP-IDF, the common fixtures are initialized in this order:
      1. `pexpect_proc`: pexpect instance
      2. `app`: IdfApp instance
         The information of the app, like sdkconfig, flash_files, partition_table, etc., would be parsed at this phase.
      3. `serial`: IdfSerial instance
         The port of the host which connected to the target type parsed from the app would be auto-detected. The flash files would be auto flashed.
      4. `dut`: IdfDut instance
   2. Run the real test function
   3. Deconstruct the fixtures in this order:
      1. `dut`
         1. close the `serial` port
         2. (Only for apps with unity test framework) generate junit report of the unity test cases
      2. `serial`
      3. `app`
      4. `pexpect_proc`: Close the file descriptor
   4. (Only for apps with unity test framework)
      Raise `AssertionError` when detected unity test failed if you call `dut.expect_from_unity_output()` in the test function.
4. Reporting Phase
   1. Generate junit report of the test functions
   2. Modify the junit report test case name into ESP-IDF test case ID format: `<target>.<config>.<test function name>`
5. Finalizing Phase (Only for apps with unity test framework)
   Combine the junit reports if the junit reports of the unity test cases are generated.

Example Code This code example is taken from pytest_console_basic.py .

```
@pytest.mark.esp32
@pytest.mark.esp32c3
@pytest.mark.generic
@pytest.mark.parametrize('config', [
    'history',
    'nohistory',
], indirect=True)
def test_console_advanced(config: str, dut: Dut) -> None:
    if config == 'history':
        dut.expect('Command history enabled')
    elif config == 'nohistory':
        dut.expect('Command history disabled')
```

备注: Using `expect_exact` is better here. For further reading about the different types of `expect` functions, please refer to the pytest-embedded Expecting documentation.

Use Markers to Specify the Supported Targets You can use markers to specify the supported targets and the test env in CI. You can run `pytest --markers` to get more details about different markers.

```
@pytest.mark.esp32      # <-- support esp32
@pytest.mark.esp32c3    # <-- support esp32c3
@pytest.mark.generic    # <-- test env `generic, would assign to runner with tag␣
↪`generic`
```

Besides, if the test case supports all officially ESP-IDF-supported targets, like esp32, esp32s2, esp32s3, esp32c3 for now (2022.2), you can use a special marker `supported_targets` to apply them all in one line.

This code example is taken from pytest_gptimer_example.py .

```
@pytest.mark.supported_targets
@pytest.mark.generic
def test_gptimer_example(dut: Dut) -> None:
    ...
```

Use Params to Specify the sdkconfig Files You can use `pytest.mark.parametrize` with "config" to apply the same test to different apps with different sdkconfig files. For more information about `sdkconfig.ci.xxx` files, please refer to the Configuration Files section under this readme .

```
@pytest.mark.parametrize('config', [
    'history',      # <-- run with app built by sdkconfig.ci.history
    'nohistory',    # <-- run with app built by sdkconfig.ci.nohistory
], indirect=True)   # <-- `indirect=True` is required
```

Overall, this test function would be replicated to 4 test cases:

- esp32.history.test_console_advanced
- esp32.nohistory.test_console_advanced
- esp32c3.history.test_console_advanced
- esp32c3.nohistory.test_console_advanced

Advanced Examples

Multi Dut Tests with the Same App This code example is taken from pytest_usb_host.py .

```
@pytest.mark.esp32s2
@pytest.mark.esp32s3
@pytest.mark.usb_host
@pytest.mark.parametrize('count', [
    2,
], indirect=True)
def test_usb_host(dut: Tuple[IdfDut, IdfDut]) -> None:
    device = dut[0]  # <-- assume the first dut is the device
    host = dut[1]    # <-- and the second dut is the host
    ...
```

After setting the param `count` to 2, all these fixtures are changed into tuples.

Multi Dut Tests with Different Apps This code example is taken from pytest_wifi_getting_started.py .

```
@pytest.mark.esp32
@pytest.mark.multi_dut_generic
@pytest.mark.parametrize(
    'count, app_path', [
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↪path.dirname(__file__), "station")}'),
    ], indirect=True
)
def test_wifi_getting_started(dut: Tuple[IdfDut, IdfDut]) -> None:
    softap = dut[0]
    station = dut[1]
    ...
```

Here the first dut was flashed with the app softap , and the second dut was flashed with the app station .

备注: Here the `app_path` should be set with absolute path. the `__file__` macro in python would return the absolute path of the test script itself.

Multi Dut Tests with Different Apps, and Targets This code example is taken from pytest_wifi_getting_started.py . As the comment says, for now it's not running in the ESP-IDF CI.

```
@pytest.mark.parametrize(
    'count, app_path, target', [
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↪path.dirname(__file__), "station")}',
         'esp32|esp32s2'),
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↪path.dirname(__file__), "station")}',
         'esp32s2|esp32'),
    ],
    indirect=True,
)
def test_wifi_getting_started(dut: Tuple[IdfDut, IdfDut]) -> None:
    softap = dut[0]
    station = dut[1]
    ...
```

Overall, this test function would be replicated to 2 test cases:

- softap with esp32 target, and station with esp32s2 target
- softap with esp32s2 target, and station with esp32 target

Support different targets with different sdkconfig files This code example is taken from pytest_panic.py as an advanced example.

```
CONFIGS = [
    pytest.param('coredump_flash_bin_crc', marks=[pytest.mark.esp32, pytest.mark.
↪esp32s2]),
    pytest.param('coredump_flash_elf_sha', marks=[pytest.mark.esp32]),  # sha256␣
↪only supported on esp32
    pytest.param('coredump_uart_bin_crc', marks=[pytest.mark.esp32, pytest.mark.
↪esp32s2]),
    pytest.param('coredump_uart_elf_crc', marks=[pytest.mark.esp32, pytest.mark.
↪esp32s2]),
    pytest.param('gdbstub', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
    pytest.param('panic', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
]

@pytest.mark.parametrize('config', CONFIGS, indirect=True)
...
```

Use Custom Class Usually, you can write a custom class in these conditions:

1. Add more reusable functions for a certain number of DUTs
2. Add custom setup and teardown functions in different phases described *here*

This code example is taken from panic/conftest.py

```
class PanicTestDut(IdfDut):
    ...

@pytest.fixture(scope='module')
def monkeypatch_module(request: FixtureRequest) -> MonkeyPatch:
    mp = MonkeyPatch()
    request.addfinalizer(mp.undo)
    return mp

@pytest.fixture(scope='module', autouse=True)
def replace_dut_class(monkeypatch_module: MonkeyPatch) -> None:
    monkeypatch_module.setattr('pytest_embedded_idf.dut.IdfDut', PanicTestDut)
```

`monkeypatch_module` provide a module-scoped monkeypatch fixture.

`replace_dut_class` is a module-scoped autouse fixture. This function replaces the `IdfDut` class with your custom class.

Mark Flaky Tests Sometimes, our test is based on ethernet or wifi. The network may cause the test flaky. We could mark the single test case within the code repo.

This code example is taken from pytest_esp_eth.py

```
@pytest.mark.flaky(reruns=3, reruns_delay=5)
def test_esp_eth_ip101(dut: Dut) -> None:
    ...
```

This flaky marker means that if the test function failed, the test case would rerun for a maximum of 3 times with 5 seconds delay.

Mark Known Failure Cases Sometimes a test couldn't pass for the following reasons:

- Has a bug
- The success ratio is too low because of environment issue, such as network issue. Retry couldn't help

Now you may mark this test case with marker xfail with a user-friendly readable reason.

This code example is taken from pytest_panic.py

```
@pytest.mark.xfail('config.getvalue("target") == "esp32s2"', reason='raised␣
↪IllegalInstruction instead')
def test_cache_error(dut: PanicTestDut, config: str, test_func_name: str) -> None:
```

This marker means that if the test would be a known failure one on esp32s2.

Mark Nightly Run Test Cases Some tests cases are only triggered in nightly run pipelines due to a lack of runners.

```
@pytest.mark.nightly_run
```

This marker means that the test case would only be run with env var `NIGHTLY_RUN` or `INCLUDE_NIGHTLY_RUN`.

Run the Tests in CI

The workflow in CI is simple, build jobs -> target test jobs.

Build Jobs

Build Job Names

- Component-based Unit Tests: `build_pytest_components_<target>`
- Example Tests: `build_pytest_examples_<target>`
- Custom Tests: `build_pytest_test_apps_<target>`

Build Job Command The command used by CI to build all the relevant tests is: `python $IDF_PATH/tools/ci/ci_build_apps.py <parent_dir> --target <target> -vv --pytest-apps`

All apps which supported the specified target would be built with all supported sdkconfig files under `build_<target>_<config>`.

For example, If you run `python $IDF_PATH/tools/ci/ci_build_apps.py $IDF_PATH/examples/system/console/basic --target esp32 --pytest-apps`, the folder structure would be like this:

```
basic
├── build_esp32_history/
│   └── ...
├── build_esp32_nohistory/
│   └── ...
├── main/
├── CMakeLists.txt
├── pytest_console_basic.py
└── ...
```

All the binaries folders would be uploaded as artifacts under the same directories.

Target Test Jobs

Target Test Job Names

- Component-based Unit Tests: `component_ut_pytest_<target>_<test_env>`
- Example Tests: `example_test_pytest_<target>_<test_env>`
- Custom Tests: `test_app_test_pytest_<target>_<test_env>`

Target Test Job Command The command used by CI to run all the relevant tests is: `pytest <parent_dir> --target <target> -m <test_env_marker>`

All test cases with the specified target marker and the test env marker under the parent folder would be executed.

The binaries in the target test jobs are downloaded from build jobs, the artifacts would be placed under the same directories.

Run the Tests Locally

The local executing process is the same as the CI process.

For example, if you want to run all the esp32 tests under the `$IDF_PATH/examples/system/console/basic` folder, you may:

```
$ pip install pytest-embedded-serial-esp pytest-embedded-idf
$ cd $IDF_PATH
$ . ./export.sh
$ cd examples/system/console/basic
$ python $IDF_PATH/tools/ci/ci_build_apps.py . --target esp32 -vv --pytest-apps
$ pytest --target esp32
```

Tips and Tricks

Filter the Test Cases

- filter by target with `pytest --target <target>`
  pytest would run all the test cases that support specified target.
- filter by sdkconfig file with `pytest --sdkconfig <sdkconfig>`
  if `<sdkconfig>` is `default`, pytest would run all the test cases with the sdkconfig file `sdkconfig.defaults`.
  In other cases, pytest would run all the test cases with sdkconfig file `sdkconfig.ci.<sdkconfig>`.

Add New Markers We're using two types of custom markers, target markers which indicate that the test cases should support this target, and env markers which indicate that the test case should be assigned to runners with these tags in CI.

You can add new markers by adding one line under the `${IDF_PATH}/pytest.ini markers =` section. The grammar should be: `<marker_name>: <marker_description>`

Generate JUnit Report You can call pytest with `--junitxml <filepath>` to generate the JUnit report. In ESP-IDF, the test case name would be unified as "<target>.<config>.<function_name>".

Skip Auto Flash Binary Skipping auto-flash binary every time would be useful when you're debugging your test script.

You can call pytest with `--skip-autoflash y` to achieve it.

Record Statistics Sometimes you may need to record some statistics while running the tests, like the performance test statistics.

You can use record_xml_attribute fixture in your test script, and the statistics would be recorded as attributes in the JUnit report.

Logging System Sometimes you may need to add some extra logging lines while running the test cases.

You can use python logging module to achieve this.

Known Limitations and Workarounds

Avoid Using `Thread` for Performance Test `pytest-embedded` is using some threads internally to help gather all stdout to the pexpect process. Due to the limitation of Global Interpreter Lock, if you're using threads to do performance tests, these threads would block each other and there would be great performance loss.

workaround

Use Process instead, the APIs should be almost the same as `Thread`.

- pytest-embedded documentation: https://docs.espressif.com/projects/pytest-embedded/en/latest/

Chapter 8

ESP-IDF 版本简介

ESP-IDF 的 GitHub 仓库时常更新，特别是用于开发新特性的 master 分支。

如有量产需求，请使用稳定版本。

8.1 发布版本

您可以通过以下链接访问各个版本的配套文档：

- 最新稳定版 ESP-IDF：https://docs.espressif.com/projects/esp-idf/zh_CN/stable/
- 最新版 ESP-IDF（即 master 分支）：https://docs.espressif.com/projects/esp-idf/zh_CN/latest/

ESP-IDF 在 GitHub 平台上的完整发布历史请见 发布说明页面。您可以在该页面查看各个版本的发布说明、配套文档及相应获取方式。

8.2 我该选择哪个版本？

- 如有量产需求，请使用 最新稳定版本 。稳定版本已通过人工测试，后续更新仅修复 bug，主要特性不受影响（更多详情，请见版本管理 ）。请访问 发布说明页面 界面查看每一个稳定发布版本。
- 如需尝试/测试 ESP-IDF 的最新特性，请使用 最新版本（在 master 分支上）。最新版本包含 ESP-IDF 的所有最新特性，已通过自动化测试，但尚未全部完成人工测试（因此存在一定风险）。
- 如需使用稳定版本中没有的新特性，但同时又不希望受到 master 分支更新的影响，您可以将一个最适合您的稳定版本更新至一个预发布版本 或更新至一个发布分支。
- 如需使用其他基于 ESP-IDF 的项目，请先查看该项目的文档，以确定其兼容的 ESP-IDF 版本。

有关如何更新 ESP-IDF 本地副本的内容，请参考更新 *ESP-IDF* 章节。

8.3 版本管理

ESP-IDF 采用了 语义版本管理方法，即您可以从字面含义理解每个版本的差异。其中

- 主要版本（例 `v3.0`）代表有重大更新，包括增加新特性、改变现有特性及移除已弃用的特性。
  升级至一个新的主要版本（例 `v2.1` 升级至 `v3.0`）意味着您可能需要更新工程代码，并重新测试工程，具体可参考 发布说明页面 的重大变更 (Breaking Change) 部分。
- 次要版本（例 `v3.1`）代表有新增特性和 bug 修复，但现有特性不受影响，公开 API 的使用也不受影响。
  升级至一个新的次要版本（例 `v3.0` 升级至 `v3.1`）意味着您可能不需要更新您的工程代码，但需重新测试您的工程，特别是 发布说明页面 中专门提到的部分。
- Bugfix 版本（例 `v3.0.1`）仅修复 bug，并不增加任何新特性。

升级至一个新的 Bugfix 版本（例 `v3.0` 升级至 `v3.0.1`）意味着您不需要更新您的工程代码，仅需测试与本次发布修复 bug（列表见 发布说明页面）直接相关的特性。

8.4 支持期限

ESP-IDF 的每个主要版本和次要版本都有相应的支持期限。支持期限满后，版本停止更新维护，将不再提供支持。

支持期限政策 对此有具体描述，并介绍了每个版本的支持期限是如何界定的。

发布说明页面 界面上的每一个发布版本都提供了该版本的支持期限信息。

一般而言：

- 如您刚开始一个新项目，建议使用最新稳定版本。
- 如您有 GitHub 账号，请点击 发布说明页面 界面右上角的 “Watch” 按键，并选中 “Releases only” 选项。GitHub 将会在新版本发布的时候通知您。当您所使用的版本有 Bugfix 版本发布时，请做好升级至该 Bugfix 版本的规划。
- 如可能，请定期（如每年一次）将项目的 IDF 版本升级至一个新的主要版本或次要版本。对于次要版本更新，更新过程应该比较简单，但对于主要版本更新，可能需要细致查看发布说明并做对应的更新规划。
- 请确保您所使用的版本停止更新维护前，已做好升级至新版本的规划。

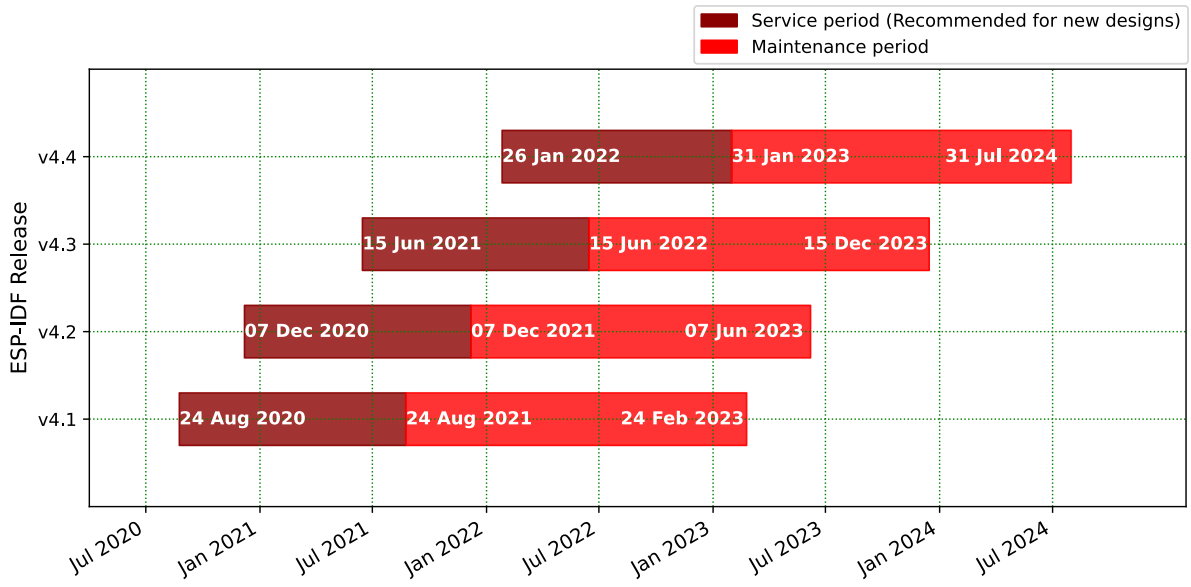
ESP-IDF 的每个主要版本和次要版本（V4.1、V4.2 等）的支持期限为 30 个月，从最初的稳定版发布日算起。

在支持期限内意味着 ESP-IDF 团队将继续在 GitHub 的发布分支上进行 bug 修复、安全修复等，并根据需要定期发布新的 Bugfix 版本。

支持期限分为 “服务期” 和 “维护期”：

周期	时长	是否推荐新工程使用
服务期	12 个月	是
维护期	18 个月	否

在服务期内，Bugfix 版本的发布更为频繁。某些情况下，在服务期内会增加新特性，这些特性主要是为了满足新产品特定监管要求或标准，并且回归风险非常低。



在维护期内，该版本仍受支持，但只会对严重性较高的问题或安全问题进行 bug 修复。

当开始一个新项目时，建议使用在服务期内的版本。

鼓励用户在您所用的版本支持期限结束之前，将所有的工程升级到最新的 ESP-IDF 版本。在版本支持期限满后，我们将不再继续进行 bug 修复。

支持期限不包括预发布版本（betas、预览版、*-rc* 和 *-dev* 版等），有时会将某个特性在发布版中标记为 “预览版”，这意味着该特性也不在支持期限内。

关于 不同版本的 ESP-IDF （主要版本、次要版本、Bugfix 版本等）的更多信息，请参考 ESP-IDF 编程指南。

8.5 查看当前版本

查看 ESP-IDF 本地副本的版本，请使用 idf.py 命令:

```
idf.py --version
```

此外，由于 ESP-IDF 的版本也已编译至固件中，因此您也可以使用宏 `IDF_VER` 查看 ESP-IDF 的版本（以字符串的格式）。ESP-IDF 默认引导程序会在设备启动时打印 ESP-IDF 的版本。请注意，在 GitHub 仓库中的代码更新时，代码中的版本信息仅会在源代码重新编译或在清除编译时才会更新，因此打印出来的版本可能并不是最新的。

如果编写的代码需要支持多个 ESP-IDF 版本，可以在编译时使用*compile-time macros* 检查版本。

几个 ESP-IDF 版本的例子:

版本字符串	含义
`v3.2-dev-306-gbeb3611ca`	master 分支上的预发布版本。 - `v3.2-dev`：为 v3.2 进行的开发。 - `306`：v3.2 开发启动后的 commit 数量。 - `beb3611ca`：commit 标识符。
`v3.0.2`	稳定版本，标签为 `v3.0.2`。
`v3.1-beta1-75-g346d6b0ea`	v3.1 的 beta 测试版本（可参考更新至一个发布分支）。 - `v3.1-beta1` - 预发布标签。 - `75`：添加预发布 beta 标签后的 commit 数量。 - `346d6b0ea`：commit 标识符。
`v3.0.1-dirty`	稳定版本，标签为 `v3.0.1`。 - `dirty` 代表 ESP-IDF 的本地副本有修改。

8.6 Git 工作流

乐鑫 ESP-IDF 团队的 (Git) 开发工作流程如下：

- 新的改动总是在 master 分支（最新版本）上进行。master 分支上的 ESP-IDF 版本总带有 `-dev` 标签，表示“正在开发中”，例 `v3.1-dev`。
- 这些改动将首先在乐鑫的内部 Git 仓库进行代码审阅与测试，而后在自动化测试完成后推至 GitHub。
- 新版本一旦完成特性开发（在 `master` 分支上进行）并达到进入 beta 测试的标准，则将该版本切换至一个新分支（例 `release/v3.1`）。此外，该分支还打上预发布标签（例 `v3.1-beta1`）。您可以在 GitHub 平台上查看 ESP-IDF 的完整 分支列表 和 标签列表。Beta 预发布版本可能仍存在大量“已知问题”(Known Issue)。
- 随着对 beta 版本的不断测试，bug 修复将同时增加至该发布分支和 `master` 分支。而且，`master` 分支可能也已经开始为下个版本开发新特性了。
- 当测试快结束时，该发布分支上将增加一个 rc 标签，代表候选发布 (Release Candidate)，例 `v3.1-rc1`。此时，该分支仍属于预发布版本。
- 如果一直未发现或报告重大 bug，则该预发布版本将最终增加“主要版本”（例 `v4.0`）或“次要版本”标记（例 `v3.1`），成为正式发布版本，并体现在 发布说明页面 。
- 后续，发布版本中发现的 bug 都将在该发布分支上进行修复。
- 发布分支上会定期进行 bug 修复，人工测试完成后，该分支将增加一个 Bugfix 版本标签（例 `v3.1.1`），并体现在 发布说明页面 。

8.7 更新 ESP-IDF

请根据您的实际情况，对 ESP-IDF 进行更新。

- 如有量产用途，建议参考*更新至一个稳定发布版本*。
- 如需测试/研发/尝试最新特性，建议参考*更新至 master 分支* 。
- 两者折衷建议参考*更新至一个发布分支*。

备注： 在参考本指南时，请首先获得 ESP-IDF 的本地副本，具体步骤请参考入门指南 中的介绍。

8.7.1 更新至一个稳定发布版本

对于量产用户，推荐更新至一个新的 ESP-IDF 发布版本，请参考以下步骤：

- 请定期查看 发布说明页面 ，了解最新发布情况。
- 如有新发布的 Bugfix 版本（例 `v3.0.1` 或 `v3.0.2`）时，请将新的 Bugfix 版本更新至您的 ESP-IDF 目录：

```
cd $IDF_PATH
git fetch
git checkout vX.Y.Z
git submodule update --init --recursive
```

- 在主要版本或次要版本新发布时，请查看发布说明中的具体描述，并决定是否升级您的版本。具体命令与上方描述一致。

备注： 如果您之前在安装 ESP-IDF 时使用了 zip 文件包，而非通过 Git 命令，则您将无法使用 Git 命令进行版本升级，此属正常情况。这种情况下，请重新下载最新 zip 文件包，并替换掉之前 `IDF_PATH` 下的全部内容。

8.7.2 更新至一个预发布版本

您也可以将您的本地副本切换（命令 `git checkout`）至一个预发布版本或 rc 版本，具体方法请参考更新至一个稳定发布版本 中的描述。

预发布版本通常不体现在 发布说明页面。更多详情，请查看完整 标签列表。使用预发布版本的注意事项，请参考更新至一个发布分支 中的描述。

8.7.3 更新至 master 分支

备注： ESP-IDF 中 master 分支上的代码会时时更新，因此使用 master 分支相当在“流血的边缘试探”，存在一定风险。

如需使用 ESP-IDF 的 master 分支，请参考以下步骤：

- 本地切换至 master 分支:

```
cd $IDF_PATH
git checkout master
git pull
git submodule update --init --recursive
```

- 此外，您还应在后续工作中不时使用 `git pull` 命令，将远端 master 上的更新同步到本地。注意，在更新 master 分支后，您可能需要更改工程代码，也可能遇到新的 bug。
- 如需从 master 分支切换至一个发布分支或稳定版本，请使用 `git checkout` 命令。

重要： 强烈建议您定期使用 `git pull` 和 `git submodule update --init --recursive` 命令，确保本地副本得到及时更新。旧的 master 分支相当于一个“快照”，可能存在未记录的问题，且无法获得支持。对于半稳定版本，请参考更新至一个发布分支。

8.7.4 更新至一个发布分支

从稳定性来说，使用“发布分支”相当于在使用 master 分支和稳定版本之间进行折衷，包含一些 master 分支上的新特性，但也同时保证可通过 beta 测试且基本完成了 bug 修复。

更多详情，请前往 GitHub 查看完整 标签列表。

举例，您可以关注 ESP-IDF v3.1 分支，随时关注该分支上的 Bugfix 版本发布（例 `v3.1.1` 等）：

```
cd $IDF_PATH
git fetch
git checkout release/v3.1
git pull
git submodule update --init --recursive
```

您每次在该分支上使用 `git pull` 时都相当于把最新的 Bugfix 版本发布更新至您的本地副本中。

备注： 发布分支并不会有专门的配套文档，建议您使用与本分支最接近版本的文档。

Chapter 9

资源

9.1 PlatformIO

- *What is PlatformIO?*
- *Installation*
- *Configuration*
- *Tutorials*
- *Project Examples*
- *Next Steps*

9.1.1 What is PlatformIO?

PlatformIO is a cross-platform embedded development environment with out-of-the-box support for ESP-IDF.

Since ESP-IDF support within PlatformIO is not maintained by the Espressif team, please report any issues with PlatformIO directly to its developers in the official PlatformIO repositories.

A detailed overview of the PlatformIO ecosystem and its philosophy can be found in the official PlatformIO documentation.

9.1.2 Installation

- PlatformIO IDE is a toolset for embedded C/C++ development available on Windows, macOS and Linux platforms
- PlatformIO Core (CLI) is a command-line tool that consists of multi-platform build system, platform and library managers and other integration components. It can be used with a variety of code development environments and allows integration with cloud platforms and web services

9.1.3 Configuration

Please go through the official PlatformIO configuration guide for ESP-IDF.

9.1.4 Tutorials

- ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis

9.1.5 Project Examples

Please check ESP-IDF page in the official PlatformIO documentation

9.1.6 Next Steps

Here are some useful links for exploring the PlatformIO ecosystem:

- Learn more about integrations with other IDEs/Text Editors
- Get help from PlatformIO community

9.2 有用的链接

- 您可以在 ESP32 论坛 中提出您的问题，访问社区资源。
- 您可以通过 GitHub 的 Issues 版块提交 bug 或功能请求。在提交新 Issue 之前，请先查看现有的 Issues。
- 您可以在 ESP IoT Solution 库中找到基于 ESP-IDF 的 解决方案、应用实例、组件和驱动 等内容。多数文档均提供中英文版本。
- 通过 Arduino 平台开发应用，请参考 ESP32、ESP32-S2 和 ESP32-C3 芯片的 Arduino 内核。
- 关于 ESP32 的书籍列表，请查看 乐鑫 网站。
- 如果您有兴趣参与到 ESP-IDF 的开发，请查阅*Contributions Guide*。
- 关于 ESP32-C3 的其它信息，请查看官网 文档 版块。
- 关于本文档的 PDF 和 HTML 格式下载（最新版本和早期版本），请点击 下载。

Chapter 10

Copyrights and Licenses

10.1 Software Copyrights

All original source code in this repository is Copyright (C) 2015-2022 Espressif Systems. This source code is licensed under the Apache License 2.0 as described in the file LICENSE.

Additional third party copyrighted code is included under the following licenses.

Where source code headers specify Copyright & License information, this information takes precedence over the summaries made here.

Some examples use external components which are not Apache licensed, please check the copyright description in each example source code.

10.1.1 Firmware Components

These third party libraries can be included into the application (firmware) produced by ESP-IDF.

- Newlib is licensed under the BSD License and is Copyright of various parties, as described in COPYING.NEWLIB.
- Xtensa header files are Copyright (C) 2013 Tensilica Inc and are licensed under the MIT License as reproduced in the individual header files.
- Original parts of FreeRTOS (components/freertos) are Copyright (C) 2017 Amazon.com, Inc. or its affiliates are licensed under the MIT License, as described in license.txt.
- Original parts of LWIP (components/lwip) are Copyright (C) 2001, 2002 Swedish Institute of Computer Science and are licensed under the BSD License as described in COPYING file.
- wpa_supplicant Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- FreeBSD net80211 Copyright (c) 2004-2008 Sam Leffler, Errno Consulting and licensed under the BSD license.
- argtable3 argument parsing library Copyright (C) 1998-2001,2003-2011,2013 Stewart Heitmann and licensed under 3-clause BSD license. argtable3 also includes the following software components. For details, please see argtable3 LICENSE file.
  - C Hash Table library, Copyright (c) 2002, Christopher Clark and licensed under 3-clause BSD license.
  - The Better String library, Copyright (c) 2014, Paul Hsieh and licensed under 3-clause BSD license.
  - TCL library, Copyright the Regents of the University of California, Sun Microsystems, Inc., Scriptics Corporation, ActiveState Corporation and other parties, and licensed under TCL/TK License.
- linenoise line editing library Copyright (c) 2010-2014 Salvatore Sanfilippo, Copyright (c) 2010-2013 Pieter Noordhuis, licensed under 2-clause BSD license.
- FatFS library, Copyright (C) 2017 ChaN, is licensed under a BSD-style license .
- cJSON library, Copyright (c) 2009-2017 Dave Gamble and cJSON contributors, is licensed under MIT license as described in LICENSE file .
- micro-ecc library, Copyright (c) 2014 Kenneth MacKay, is licensed under 2-clause BSD license.

- Mbed TLS library, Copyright (C) 2006-2018 ARM Limited, is licensed under Apache License 2.0 as described in LICENSE file .
- SPIFFS library, Copyright (c) 2013-2017 Peter Andersson, is licensed under MIT license as described in LICENSE file .
- SD/MMC driver is derived from OpenBSD SD/MMC driver, Copyright (c) 2006 Uwe Stuehler, and is licensed under BSD license.
- ESP-MQTT MQTT Package (contiki-mqtt) - Copyright (c) 2014, Stephen Robinson, MQTT-ESP - Tuan PM <tuanpm at live dot com> is licensed under Apache License 2.0 as described in LICENSE file .
- BLE Mesh is adapted from Zephyr Project, Copyright (c) 2017-2018 Intel Corporation and licensed under Apache License 2.0
- mynewt-nimble Apache Mynewt NimBLE, Copyright 2015-2018, The Apache Software Foundation, is licensed under Apache License 2.0 as described in LICENSE file.
- cryptoauthlib Microchip CryptoAuthentication Library - Copyright (c) 2015 - 2018 Microchip Technology Inc, is licensed under common Microchip software License as described in LICENSE file
- TLSF allocator Two Level Segregated Fit memory allocator, Copyright (c) 2006-2016, Matthew Conte, and licensed under the BSD license.
- qrcode QR Code generator library Copyright (c) Project Nayuki, is licensed under MIT license.
- openthread, Copyright (c) The OpenThread Authors, is licensed under BSD License as described in LICENSE file.
- UBSAN runtime —Copyright (c) 2016, Linaro Limited and Jiří Zárevúcky, licensed under the BSD 2-clause license.
- freemodbus Copyright (c) 2006-2013 Christian Walter, Armink and licensed under the BSD license.
- HTTP Parser Based on src/http/ngx_http_parse.c from NGINX copyright Igor Sysoev. Additional changes are licensed under the same terms as NGINX and Joyent, Inc. and other Node contributors. For details please check LICENSE file.
- SEGGER SystemView target-side library, Copyright (c) 2015-2017 SEGGER Microcontroller GmbH & Co. KG, is licensed under BSD 3-clause license.

10.1.2 Documentation

- HTML version of the ESP-IDF Programming Guide uses the Sphinx theme sphinx_idf_theme, which is Copyright (c) 2013-2020 Dave Snider, Read the Docs, Inc. & contributors, and Espressif Systems (Shanghai) CO., LTD. It is based on sphinx_rtd_theme. Both are licensed under MIT license.

10.2 ROM Source Code Copyrights

ESP32, ESP32-S and ESP32-C Series SoCs mask ROM hardware includes binaries compiled from portions of the following third party software:

- Newlib , licensed under the BSD License and is Copyright of various parties, as described in COPYING.NEWLIB.
- Xtensa libhal, Copyright (c) Tensilica Inc and licensed under the MIT license (see below).
- TinyBasic Plus, Copyright Mike Field & Scott Lawrence and licensed under the MIT license (see below).
- miniz, by Rich Geldreich - placed into the public domain.
- wpa_supplicant Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- TJpgDec Copyright (C) 2011, ChaN, all right reserved. See below for license.

10.3 Xtensa libhal MIT License

Copyright (c) 2003, 2006, 2010 Tensilica Inc.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

10.4 TinyBasic Plus MIT License

Copyright (c) 2012-2013

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

10.5 TJpgDec License

TJpgDec - Tiny JPEG Decompressor R0.01 (C)ChaN, 2011 The TJpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

- The TJpgDec module is a free software and there is NO WARRANTY.
- No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.
- Redistributions of source code must retain the above copyright notice.

Chapter 11

关于本指南

本指南为 ESP32-C3 官方应用开发框架 ESP-IDF 的配套文档。

ESP32-C3 是一款支持 2.4 GHz Wi-Fi 和低功耗蓝牙的芯片，搭载 RISC-V RV32IMC 32 位单核处理器。

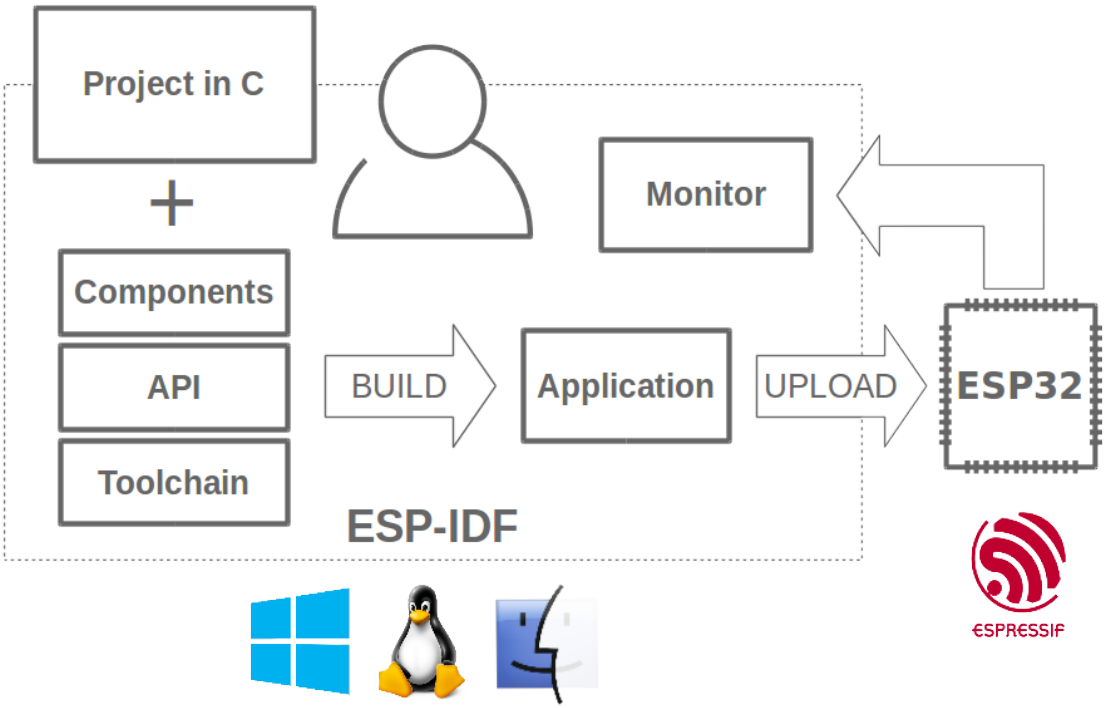


图 1: 乐鑫物联网综合开发框架

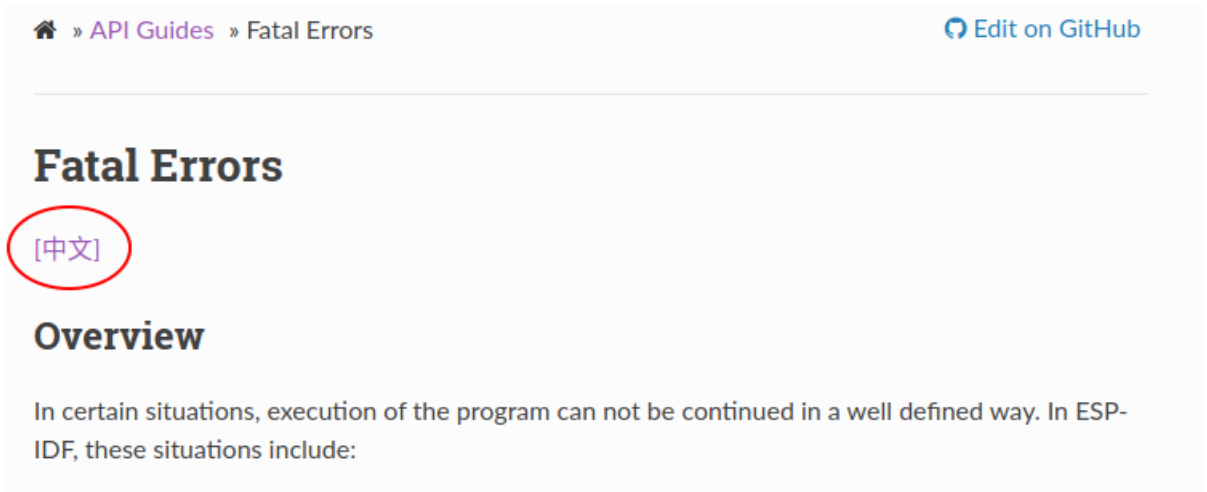
ESP-IDF 即乐鑫物联网开发框架，可为在 Windows、Linux 和 macOS 系统平台上开发 ESP32-C3 应用程序提供工具链、API、组件和工作流程的支持。



Chapter 12

切换语言

《ESP-IDF 编程指南》部分文档现在有两种语言的版本。如有出入请以英文版本为准。

- 英文
- 中文

如下图所示，如果该文档两种语言版本均具备，您可以通过点击文档上方的语言链接轻松进行语言切换。
