

图 45: 手动暂停目标

看成单个源码行，单步就能将其运行结束。

在继续演示此功能之前，请参照上文所述确保目前只在 `blink.c` 文件的第 36 行设置了一个断点。

按下 F8 键让程序继续运行然后在断点处停止运行，多次按下“Step Over (F6)”按钮，观察调试器是如何单步执行一行代码的。

图 46: 使用“Step Over (F6)”单步执行代码

如果你改用“Step Into (F5)”，那么调试器将会进入调用的子程序内部。

在上述例子中，调试器进入 `gpio_set_level(BLINK_GPIO, 0)` 代码内部，同时代码窗口快速切换到 `gpio.c` 驱动文件。

请参阅“[next](#)”命令无法跳过子程序的原因 文档以了解 `next` 命令的潜在局限。

查看并设置内存 要显示或者设置内存的内容，请使用“调试”视图中位于底部的“Memory”选项卡。

在“Memory”选项卡下，我们将在内存地址 `0x3FF44004` 处读取和写入内容。该地址也是 `GPIO_OUT_REG` 寄存器的地址，可以用来控制（设置或者清除）某个 GPIO 的电平。

关于该寄存器的更多详细信息，请参阅 *ESP32-S3 技术参考手册 > IO MUX 和 GPIO Matrix (GPIO, IO_MUX) [PDF]* 章节。

同样在 `blink.c` 项目文件中，在两个 `gpio_set_level` 语句的后面各设置一个断点，单击“Memory”选项卡，然后单击“Add Memory Monitor”按钮，在弹出的对话框中输入 `0x3FF44004`。

按下 F8 按键恢复程序运行，并观察“Monitor”选项卡。

每按一下 F8，你就会看到在内存 `0x3FF44004` 地址处的一个比特位被翻转（并且 LED 会改变状态）。

要修改内存的数值，请在“Monitor”选项卡中找到待修改的内存地址，如前面观察的结果一样，输入特定比特翻转后的值。当按下回车键后，将立即看到 LED 的状态发生了改变。

图 47: 使用“Step Into (F5)”单步执行代码

图 48: 观察内存地址 0x3FF44004 处的某个比特被置高

图 49: 观察内存地址 0x3FF44004 处的某个比特被置低

观察和设置程序变量 常见的调试任务是在程序运行期间检查程序中某个变量的值，为了演示这个功能，更新 `blink.c` 文件，在 `blink_task` 函数的上面添加一个全局变量的声明 `int i`，然后在 `while(1)` 里添加 `i++`，这样每次 LED 改变状态的时候，变量 `i` 都会增加 1。

退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32-S3 中，接着重启调试器。注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，在代码 `i++` 处添加一个断点。

下一步，在“Breakpoints”所在的窗口中，选择“Expressions”选项卡。如果该选项卡不存在，请在顶部菜单栏的 `Window > Show View > Expressions` 中添加这一选项卡。然后在该选项卡中单击“Add new expression”，并输入 `i`。

按下 F8 继续运行程序，每次程序停止时，都会看到变量 `i` 的值在递增。

如想更改 `i` 的值，可以在“Value”一栏中输入新的数值。按下“Resume (F8)”后，程序将从新输入的数字开始递增 `i`。

设置条件断点 接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点，然后让程序停止运行。右击断点打开上下文菜单，选择“Breakpoint Properties”，将“Type:”改选为“Hardware”然后在“Condition:”一栏中输入条件表达式，例如 `i == 2`。

如果当前 `i` 的值小于 2（如果有需要也可以更改这个阈值）并且程序被恢复运行，那么 LED 就会循环闪烁，直到 `i == 2` 条件成立，最后程序停止在该处。

使用命令行的调试示例 请检查您的目标板是否已经准备好，并加载了 `get-started/blink` 示例代码，然后按照 `使用命令行调试` 中介绍的步骤配置和启动调试器，最后选择让应用程序在 `app_main()` 建立的断点处停止运行

```
Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/./blink.c:43
43      xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5, NULL);
(gdb)
```

本小节的示例

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 暂停和恢复应用程序的运行
4. 单步执行代码
5. 查看并设置内存

图 50: 观察程序变量 “i”

图 51: 设置条件断点

6. 观察和设置程序变量
7. 设置条件断点

浏览代码，查看堆栈和线程 当看到 (gdb) 提示符的时候，应用程序已停止运行，LED 也停止闪烁。

要找到代码暂停的位置，输入 `l` 或者 `list` 命令，调试器会打印出暂停点 (`blink.c` 代码文件的第 43 行) 附近的几行代码

```
(gdb) l
38         }
39     }
40
41     void app_main()
42     {
43         xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5, NULL);
44     }
(gdb)
```

也可以通过输入 `l 30, 40` 等命令来查看特定行号范围内的代码。

使用 `bt` 或者 `backtrace` 来查看哪些函数最终导致了此代码被调用:

```
(gdb) bt
#0  app_main () at /home/user-name/esp/blink/main/./blink.c:43
#1  0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/esp32s3/./cpu_start.c:339
(gdb)
```

输出的第 0 行表示应用程序暂停之前调用的最后一个函数，即我们之前列出的 `app_main ()`。`app_main ()` 又被位于 `cpu_start.c` 文件第 339 行的 `main_task` 函数调用。

想查看 `cpu_start.c` 文件中 `main_task` 函数的上下文，需要输入 `frame N`，其中 `N=1`，因为根据前面的输出，`main_task` 位于 #1 下:

```
(gdb) frame 1
#1  0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/esp32s3/./cpu_start.c:339
339     app_main();
(gdb)
```

输入 `l` 将显示一段名为 `app_main()` 的代码 (在第 339 行):

```
(gdb) l
334         ;
335     }
336 #endif
337     //Enable allocation in region where the startup stacks were located.
338     heap_caps_enable_nonos_stack_heaps();
339     app_main();
340     vTaskDelete(NULL);
341 }
342
(gdb)
```

通过打印前面的一些行，你会看到我们一直在寻找的 `main_task` 函数:

```
(gdb) l 326, 341
326     static void main_task(void* args)
327     {
328         // Now that the application is about to start, disable boot watchdogs
329         REG_CLR_BIT(TIMG_WDTCONFIG0_REG(0), TIMG_WDT_FLASHBOOT_MOD_EN_S);
```

(下页继续)

(续上页)

```

330     REG_CLR_BIT(RTC_CNTL_WDTCONFIG0_REG, RTC_CNTL_WDT_FLASHBOOT_MOD_EN);
331     #if !CONFIG_FREERTOS_UNICORE
332     // Wait for FreeRTOS initialization to finish on APP CPU, before
↳replacing its startup stack
333     while (port_xSchedulerRunning[1] == 0) {
334         ;
335     }
336     #endif
337     //Enable allocation in region where the startup stacks were located.
338     heap_caps_enable_nonos_stack_heaps();
339     app_main();
340     vTaskDelete(NULL);
341 }
(gdb)

```

如果要查看其他代码，可以输入 `i threads` 命令，则会输出目标板上运行的线程列表：

```

(gdb) i threads
  Id  Target Id      Frame
   8   Thread 1073411336 (dport) 0x400d0848 in dport_access_init_core (arg=
↳<optimized out>)
      at /home/user-name/esp/esp-idf/components/esp32s3/./dport_access.c:170
   7   Thread 1073408744 (ipc0) xQueueGenericReceive (xQueue=0x3ffae694,
↳pvBuffer=0x0, xTicksToWait=1644638200,
      xJustPeeking=0) at /home/user-name/esp/esp-idf/components/freertos/./queue.
↳c:1452
   6   Thread 1073431096 (Tmr Svc) prvTimerTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos/./timers.c:445
   5   Thread 1073410208 (ipc1 : Running) 0x4000bfea in ?? ()
   4   Thread 1073432224 (dport) dport_access_init_core (arg=0x0)
      at /home/user-name/esp/esp-idf/components/esp32s3/./dport_access.c:150
   3   Thread 1073413156 (IDLE) prvIdleTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
   2   Thread 1073413512 (IDLE) prvIdleTask (pvParameters=0x0)
      at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
*  1   Thread 1073411772 (main : Running) app_main () at /home/user-name/esp/blink/
↳main/./blink.c:43
(gdb)

```

线程列表显示了每个线程最后一个被调用的函数以及所在的 C 源文件名（如果存在的话）。

您可以通过输入 `thread N` 进入特定的线程，其中 `N` 是线程 ID。我们进入 5 号线程来看一下它是如何工作的：

```

(gdb) thread 5
[Switching to thread 5 (Thread 1073410208)]
#0  0x4000bfea in ?? ()
(gdb)

```

然后查看回溯：

```

(gdb) bt
#0  0x4000bfea in ?? ()
#1  0x40083a85 in vPortCPUReleaseMutex (mux=<optimized out>) at /home/user-name/
↳esp/esp-idf/components/freertos/./port.c:415
#2  0x40083fc8 in vTaskSwitchContext () at /home/user-name/esp/esp-idf/components/
↳freertos/./tasks.c:2846
#3  0x4008532b in _frxt_dispatch ()
#4  0x4008395c in xPortStartScheduler () at /home/user-name/esp/esp-idf/components/
↳freertos/./port.c:222
#5  0x4000000c in ?? ()

```

(下页继续)

```
#6 0x4000000c in ?? ()
#7 0x4000000c in ?? ()
#8 0x4000000c in ?? ()
(gdb)
```

如上所示，回溯可能会包含多个条目，方便查看直至目标停止运行的函数调用顺序。如果找不到某个函数的源码文件，将会使用问号 ?? 替代，这表示该函数是以二进制格式提供的。像 0x4000bfea 这样的值是被调用函数所在的内存地址。

使用诸如 `bt`、`i threads`、`thread N` 和 `list` 命令可以浏览整个应用程序的代码。这给单步调试代码和设置断点带来很大的便利，下面将一一展开来讨论。

设置和清除断点 在调试时，我们希望能够在关键的代码行停止应用程序，然后检查特定的变量、内存、寄存器和外设的状态。为此我们需要使用断点，以便在特定某行代码处快速访问和停止应用程序。

我们在控制 LED 状态发生变化的两处代码行分别设置一个断点。基于以上代码列表，这两处分别为第 33 和 36 代码行。使用命令 `break M` 设置断点，其中 `M` 是具体的代码行：

```
(gdb) break 33
Breakpoint 2 at 0x400db6f6: file /home/user-name/esp/blink/main/./blink.c, line 33.
(gdb) break 36
Breakpoint 3 at 0x400db704: file /home/user-name/esp/blink/main/./blink.c, line 36.
```

输入命令 `c`，处理器将运行并在断点处停止。再次输入 `c` 将使其再次运行，并在第二个断点处停止，依此类推：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F6 (active)    APP_CPU: PC=0x400D10D8

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:33
33      gpio_set_level(BLINK_GPIO, 0);
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F8 (active)    APP_CPU: PC=0x400D10D8
Target halted. PRO_CPU: PC=0x400DB704 (active)    APP_CPU: PC=0x400D10D8

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:36
36      gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

只有在输入命令 `c` 恢复程序运行后才能看到 LED 改变状态。

查看已设置断点的数量和位置，请使用命令 `info break`：

```
(gdb) info break
Num   Type           Disp Enb Address          What
2     breakpoint     keep y   0x400db6f6 in blink_task at /home/user-name/esp/
↪blink/main/./blink.c:33
      breakpoint already hit 1 time
3     breakpoint     keep y   0x400db704 in blink_task at /home/user-name/esp/
↪blink/main/./blink.c:36
      breakpoint already hit 1 time
(gdb)
```

请注意，断点序号（在 Num 栏列出）从 2 开始，这是因为在调试器启动时执行 `thb app_main` 命令已经在 `app_main()` 函数处建立了第一个断点。由于它是一个临时断点，已经被自动删除，所以没有被列出。

要删除一个断点，请输入 `delete N` 命令（或者简写成 `d N`），其中 `N` 代表断点序号：

```
(gdb) delete 1
No breakpoint number 1.
(gdb) delete 2
(gdb)
```

更多关于断点的信息，请参阅[可用的断点和观察点](#)和[关于断点的补充知识](#)。

暂停和恢复应用程序的运行 在调试时，可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。对于后者，想要返回调试模式，可以通过输入 **Ctrl+C** 手动中断程序的运行。

在此之前，请删除所有的断点，然后输入 **c** 恢复程序运行。接着输入 **Ctrl+C**，应用程序会停止在某个随机的位置，此时 **LED** 也将停止闪烁。调试器会打印如下信息：

```
(gdb) c
Continuing.
^CTarget halted. PRO_CPU: PC=0x400D0C00          APP_CPU: PC=0x400D0C00 (active)
[New Thread 1073433352]

Program received signal SIGINT, Interrupt.
[Switching to Thread 1073413512]
0x400d0c00 in esp_vApplicationIdleHook () at /home/user-name/esp/esp-idf/
↳components/esp32s3/./freertos_hooks.c:52
52             asm("waiti 0");
(gdb)
```

在上图所示的情况下，应用程序已经在 `freertos_hooks.c` 文件的第 52 行暂停运行，现在您可以通过输入 **c** 再次将其恢复运行或者进行如下所述的一些调试工作。

备注：在 `MSYS2` 的 `shell` 中输入 **Ctrl+C** 并不会暂停目标的运行，而是会退出调试器。解决这个问题方法可以通过[使用 Eclipse 来调试](#)或者参考http://www.mingw.org/wiki/Workaround_for_GDB_Ctrl_C_Interrupt里的解决方案。

单步执行代码 我们还可以使用 `step` 和 `next` 命令（可以简写成 `s` 和 `n`）单步执行代码，这两者之间的区别是执行“`step`”命令会进入调用的子程序内部，而执行“`next`”命令则会直接将子程序看成单个源码行，单步就能将其运行结束。

在继续演示此功能之前，请使用前面介绍的 `break` 和 `delete` 命令，确保目前只在 `blink.c` 文件的第 36 行设置了一个断点：

```
(gdb) info break
Num      Type           Disp Enb Address      What
3        breakpoint      keep y  0x400db704 in blink_task at /home/user-name/esp/
↳blink/main/./blink.c:36
breakpoint already hit 1 time
(gdb)
```

输入 **c** 恢复程序运行然后等它在断点处停止运行：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB754 (active)  APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:36
36             gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

然后输入 **n** 多次，观察调试器是如何单步执行一行代码的：

```
(gdb) n
Target halted. PRO_CPU: PC=0x400DB756 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB758 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active) APP_CPU: PC=0x400D1128
37         vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) n
Target halted. PRO_CPU: PC=0x400DB75E (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400846FC (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB761 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB746 (active) APP_CPU: PC=0x400D1128
33         gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

如果你输入 `s`，那么调试器将进入子程序：

```
(gdb) s
Target halted. PRO_CPU: PC=0x400DB748 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74B (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04F (active) APP_CPU: PC=0x400D1128
gpio_set_level (gpio_num=GPIO_NUM_4, level=0) at /home/user-name/esp/esp-idf/
↳components/driver/./gpio.c:183
183     GPIO_CHECK(GPIO_IS_VALID_OUTPUT_GPIO(gpio_num), "GPIO output gpio_num error
↳", ESP_ERR_INVALID_ARG);
(gdb)
```

上述例子中，调试器进入 `gpio_set_level(BLINK_GPIO, 0)` 代码内部，同时代码窗口快速切换到 `gpio.c` 驱动文件。

请参阅 [“next”命令无法跳过子程序的原因](#) 文档以了解 `next` 命令的潜在局限。

查看并设置内存 使用命令 `x` 可以显示内存的内容，配合其余参数还可以调整所显示内存位置的格式和数量。运行 `help x` 可以查看更多相关细节。与 `x` 命令配合使用的命令是 `set`，它允许你将值写入内存。

为了演示 `x` 和 `set` 的使用，我们将在内存地址 `0x3FF44004` 处读取和写入内容。该地址也是 `GPIO_OUT_REG` 寄存器的地址，可以用来控制（设置或者清除）某个 `GPIO` 的电平。

关于该寄存器的更多详细信息，请参阅 [ESP32-S3 技术参考手册 > IO MUX 和 GPIO Matrix \(GPIO, IO_MUX\) \[PDF\]](#) 章节。

同样在 `blink.c` 项目文件中，在两个 `gpio_set_level` 语句的后面各设置一个断点。输入两次 `c` 命令后停止在断点处，然后输入 `x /1wx 0x3FF44004` 来显示 `GPIO_OUT_REG` 寄存器的值：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB75E (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74E (active) APP_CPU: PC=0x400D1128

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main./
↳blink.c:34
34         vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active) APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main./
↳blink.c:37
37         vTaskDelay(1000 / portTICK_PERIOD_MS);
```

(下页继续)

(续上页)

```
(gdb) x /1wx 0x3FF44004
0x3fff44004: 0x00000010
(gdb)
```

如果闪烁的 LED 连接到了 GPIO4，那么每次 LED 改变状态时你会看到第 4 比特被翻转：

```
0x3fff44004: 0x00000000
...
0x3fff44004: 0x00000010
```

现在，当 LED 熄灭时，与之对应地会显示 0x3fff44004: 0x00000000，尝试使用 set 命令向相同的内存地址写入 0x00000010 来将该比特置高：

```
(gdb) x /1wx 0x3FF44004
0x3fff44004: 0x00000000
(gdb) set {unsigned int}0x3FF44004=0x000010
```

在输入 set {unsigned int}0x3FF44004=0x000010 命令后，你会立即看到 LED 亮起。

观察和设置程序变量 常见的调试任务是在程序运行期间检查程序中某个变量的值，为了能够演示这个功能，更新 blink.c 文件，在 blink_task 函数的上面添加一个全局变量的声明 int i，然后在 while(1) 里添加 i++，这样每次 LED 改变状态的时候，变量 i 都会增加 1。

退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32-S3 中，接着重启调试器。注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，输入命令 watch i：

```
(gdb) watch i
Hardware watchpoint 2: i
(gdb)
```

这会在所有变量 i 发生改变的代码处插入所谓的“观察点”。现在输入 continue 命令来恢复应用程序的运行并观察它停止：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active) APP_CPU: PC=0x400D0811
[New Thread 1073432196]

Program received signal SIGTRAP, Trace/breakpoint trap.
[Switching to Thread 1073432196]
0x400db751 in blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.
↳blink.c:33
33      i++;
(gdb)
```

多次恢复程序运行后，变量 i 的值会增加，现在你可以输入 print i（简写 p i）来查看当前 i 的值：

```
(gdb) p i
$1 = 3
(gdb)
```

要修改 i 的值，请使用 set 命令，如下所示（可以将其打印输出出来查看是否确已修改）：

```
(gdb) set var i = 0
(gdb) p i
$3 = 0
(gdb)
```

最多可以使用两个观察点，详细信息请参阅[可用的断点和观察点](#)。

设置条件断点 接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点。请先删除已有的断点，然后尝试如下命令：

```
(gdb) break blink.c:34 if (i == 2)
Breakpoint 3 at 0x400db753: file /home/user-name/esp/blink/main/./blink.c, line 34.
(gdb)
```

以上命令在 `blink.c` 文件的 34 处设置了一个条件断点，当 `i == 2` 条件满足时，程序会停止运行。

如果当前 `i` 的值小于 2 并且程序被恢复运行，那么 LED 就会循环闪烁，直到 `i == 2` 条件成立，最后程序停止在该处：

```
(gdb) set var i = 0
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active) APP_CPU: PC=0x400D112C

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↪blink.c:34
34      gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

获得命令的帮助信息 目前所介绍的都是些非常基础的命令，目的在于让您快速上手 JTAG 调试。如果想获得特定命令的语法和功能相关的信息，请在 (gdb) 提示符下输入 `help` 和命令名：

```
(gdb) help next
Step program, proceeding through subroutine calls.
Usage: next [N]
Unlike "step", if the current source line calls a subroutine,
this command does not enter the subroutine, but instead steps over
the call, in effect treating it as a single source line.
(gdb)
```

只需输入 `help` 命令，即可获得高级命令列表，帮助你了解更多详细信息。此外，还可以参考一些 GDB 命令速查表，比如 <https://darkdust.net/files/GDB%20Cheat%20Sheet.pdf>。虽然不是所有命令都适用于嵌入式环境，但还是会有所裨益。

结束调试会话 输入命令 `q` 可以退出调试器：

```
(gdb) q
A debugging session is active.

    Inferior 1 [Remote target] will be detached.

Quit anyway? (y or n) y
Detaching from program: /home/user-name/esp/blink/build/blink.elf, Remote target
Ending remote debugging.
user-name@computer-name:~/esp/blink$
```

4.21 链接器脚本生成机制

4.21.1 概述

ESP32-S3 中有多个用于存放代码和数据的内存区域。代码和只读数据默认存放在 flash 中，可写数据存放在 RAM 中。不过有时，用户必须更改默认存放区域。

例如：

- 将关键代码存放到 RAM 中以提高性能；
- 将可执行代码存放到 IRAM 中，以便在缓存被禁用时运行这些代码；
- 将代码存放到 RTC 存储器中，以便在 wake stub 中使用；
- 将代码存放到 RTC 内存中，以便 ULP 协处理器使用。

链接器脚本生成机制可以让用户指定代码和数据在 ESP-IDF 组件中的存放区域。组件包含如何存放符号、目标或完整库的信息。在构建应用程序时，组件中的这些信息会被收集、解析并处理；生成的存放规则用于链接应用程序。

4.21.2 快速上手

本段将指导如何使用 ESP-IDF 的即用方案，快速将代码和数据放入 RAM 和 RTC 存储器中。

假设用户有：

```
components
├── my_component
│   ├── CMakeLists.txt
│   ├── Kconfig
│   ├── src/
│   │   ├── my_src1.c
│   │   ├── my_src2.c
│   │   └── my_src3.c
│   └── my_linker_fragment_file.lf
```

- 名为 my_component 的组件，在构建过程中存储为 libmy_component.a 库文件
- 库文件包含的三个源文件：my_src1.c、my_src2.c 和 my_src3.c，编译后分别为 my_src1.o、my_src2.o 和 my_src3.o
- 在 my_src1.o 中定义 my_function1 功能；在 my_src2.o 中定义 my_function2 功能
- 在 my_component 下 Kconfig 中存在布尔类型配置 PERFORMANCE_MODE (y/n) 和整数类型配置 PERFORMANCE_LEVEL (范围是 0-3)

创建和指定链接器片段文件

首先，用户需要创建链接器片段文件。链接器片段文件是一个扩展名为 .lf 的文本文件，想要存放的位置信息会写入该文件内。文件创建成功后，需要将其呈现在构建系统中。ESP-IDF 支持的构建系统指南如下：

在组件目录的 CMakeLists.txt 文件中，指定 idf_component_register 调用引数 LDFRAGMENTS 的值。LDFRAGMENTS 可以为绝对路径，也可作为组件目录的相对路径，指向已创建的链接器片段文件。

```
# 相对于组件的 CMakeLists.txt 的文件路径
idf_component_register(...
    LDFRAGMENTS "path/to/linker_fragment_file.lf" "path/to/
    ↪another_linker_fragment_file.lf"
```

(下页继续)

```
...
)
```

指定存放区域

可以按照下列粒度指定存放区域：

- 目标文件（.obj 或 .o 文件）
- 符号（函数/变量）
- 库（.a 文件）

存放目标文件 假设整个 my_src1.o 目标文件对性能至关重要，所以最好把该文件放在 RAM 中。另外，my_src2.o 目标文件包含从深度睡眠唤醒所需的符号，因此需要将其存放到 RTC 存储器中。

在链接器片段文件中可以写入以下内容：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1 (noflash)      # 将所有 my_src1 代码和只读数据存放在 IRAM 和 DRAM 中
    my_src2 (rtc)         # 将所有 my_src2 代码、数据和只读数据存放到 RTC 快速 RAM_
↪和 RTC 慢速 RAM 中
```

那么 my_src3.o 放在哪里呢？由于未指定存放区域，my_src3.o 会存放到默认区域。更多关于默认存放区域的信息，请查看[这里](#)。

存放符号 继续上文的例子，假设 object1.o 目标文件定义的功能中，只有 my_function1 影响到性能；object2.o 目标文件中只有 my_function2 需要在芯片从深度睡眠中唤醒后运行。要实现该目的，可在链接器片段文件中写入以下内容：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1:my_function1 (noflash)
    my_src2:my_function2 (rtc)
```

my_src1.o 和 my_src2.o 中的其他函数以及整个 object3.o 目标文件会存放到默认区域。要指定数据的存放区域，仅需将上文的函数名替换为变量名即可，如：

```
my_src1:my_variable (noflash)
```

注意：按照符号粒度存放代码和数据有一定的局限。为确保存放区域合适，您也可以将相关代码和数据集中在源文件中，参考[使用目标文件的存放规则](#)。

存放整个库 在这个例子中，假设整个组件库都需存放到 RAM 中，可以写入以下内容存放整个库：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    * (noflash)
```

类似的，写入以下内容可以将整个组件存放到 RTC 存储器中：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    * (rtc)
```

根据具体配置存放 假设只有在某个条件为真时，比如 `CONFIG_PERFORMANCE_MODE == y` 时，整个组件库才有特定存放区域，可以写入以下内容实现：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_MODE = y:
        * (noflash)
    else:
        * (default)
```

来看一种更复杂的情况。假设“`CONFIG_PERFORMANCE_LEVEL == 1`”时，只有 `object1.o` 存放到 **RAM** 中；`CONFIG_PERFORMANCE_LEVEL == 2` 时，`object1.o` 和 `object2.o` 会存放到 **RAM** 中；`CONFIG_PERFORMANCE_LEVEL == 3` 时，库中的所有目标文件都会存放到 **RAM** 中。以上三个条件为假时，整个库会存放到 **RTC** 存储器中。虽然这种使用场景很罕见，不过，还是可以通过以下方式实现：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL = 1:
        my_src1 (noflash)
    elif PERFORMANCE_LEVEL = 2:
        my_src1 (noflash)
        my_src2 (noflash)
    elif PERFORMANCE_LEVEL = 3:
        my_src1 (noflash)
        my_src2 (noflash)
        my_src3 (noflash)
    else:
        * (rtc)
```

也可以嵌套条件检查。以下内容与上述片段等效：

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL <= 3 && PERFORMANCE_LEVEL > 0:
        if PERFORMANCE_LEVEL >= 1:
            object1 (noflash)
            if PERFORMANCE_LEVEL >= 2:
                object2 (noflash)
            if PERFORMANCE_LEVEL >= 3:
                object2 (noflash)
    else:
        * (rtc)
```

默认存放区域

到目前为止，“默认存放区域”在未指定 `rtc` 和 `noflash` 存放规则时才会作为备选方案使用。需要注意的是，`noflash` 或者 `rtc` 标记不仅仅是关键字，实际上还是被称作片段的实体，确切地说是[协议](#)。

与 `rtc` 和 `noflash` 类似，还有一个默认协议，定义了默认存放规则。顾名思义，该协议规定了代码和数据通常存放的区域，即代码和常量存放在 **flash** 中，变量存放在 **RAM** 中。更多关于默认协议的信息，请见[这里](#)。

备注： 使用链接器脚本生成机制的 IDF 组件示例，请参阅 [freertos/CMakeLists.txt](#)。为了提高性能，freertos 使用链接器脚本生成机制，将其目标文件存放到 RAM 中。

快速入门指南到此结束，下文将详述这个机制的内核，有助于创建自定义存放区域或修改默认方式。

4.21.3 链接器脚本生成机制内核

链接是将 C/C++ 源文件转换成可执行文件的最后一步。链接由工具链的链接器完成，接受指定代码和数据存放区域等信息的链接脚本。链接器脚本生成机制的转换过程类似，区别在于传输给链接器的链接脚本根据 (1) 收集的[链接器片段文件](#)和 (2) [链接器脚本模板](#)动态生成。

备注： 执行链接器脚本生成机制的工具存放在 [tools/ldgen](#) 之下。

链接器片段文件

如快速入门指南所述，片段文件是拓展名为 `.lf` 的简单文本文件，内含想要存放区域的信息。不过，这是对片段文件所包含内容的简化版描述。实际上，片段文件内包含的是“片段”。片段是实体，包含多条信息，这些信息放在一起组成了存放规则，说明目标文件各个段在二进制输出文件中的存放位置。片段一共有三种，分别是[段](#)、[协议](#)和[映射](#)。

语法 三种片段类型使用同一种语法：

```
[type:name]
key: value
key:
  value
  value
  value
  ...
```

- 类型：片段类型，可以为段、协议或映射。
- 名称：片段名称，指定片段类型的片段名称应唯一。
- 键值：片段内容。每个片段类型可支持不同的键值和不同的键值语法。
 - 在[段](#)和[协议](#)中，仅支持 `entries` 键。
 - 在[映射](#)中，支持 `archive` 和 `entries` 键。

备注： 多个片段的类型和名称相同时会引发异常。

备注： 片段名称和键值只能使用字母、数字和下划线。

条件检查

条件检查使得链接器脚本生成机制可以感知配置。含有配置值的表达式是否为真，决定了使用哪些特定键值。检查使用的是 `kconfiglib` 脚本的 `eval_string`，遵循该脚本要求的语法和局限性，支持：

- 比较
 - 小于 `<`
 - 小于等于 `<=`
 - 大于 `>`
 - 大于等于 `>=`
 - 等于 `=`
 - 不等于 `!=`

- **逻辑**
 - 或 ||
 - 和 &&
 - 取反 !
- **分组**
 - 圆括号 ()

条件检查和其他语言中的 `if...elseif/elif...else` 块作用一样。键值和完整片段都可以进行条件检查。以下两个示例效果相同：

```
# 键值取决于配置
[type:name]
key_1:
    if CONDITION = y:
        value_1
    else:
        value_2
key_2:
    if CONDITION = y:
        value_a
    else:
        value_b
```

```
# 完整片段的定义取决于配置
if CONDITION = y:
    [type:name]
    key_1:
        value_1
    key_2:
        value_a
else:
    [type:name]
    key_1:
        value_2
    key_2:
        value_b
```

注释

链接器片段文件中的注释以 # 开头。和在其他语言中一样，注释提供了有用的描述和资料，在处理过程中会被忽略。

类型 段

段定义了 GCC 编译器输出的一系列目标文件段，可以是默认段（如 `.text`、`.data`），也可以是用户通过 `__attribute__` 关键字定义的段。

‘+’ 表示段列表开始，且当前段为列表中的第一个段。这种表达方式更加推荐。

```
[sections:name]
entries:
    .section+
    .section
    ...
```

示例：

```
# 不推荐的方式
[sections:text]
entries:
    .text
    .text.*
```

(下页继续)

```
.literal
.literal.*

# 推荐的方式, 效果与上面等同
[sections:text]
entries:
    .text+           # 即 .text 和 .text.*
    .literal+       # 即 .literal 和 .literal.*
```

协议

协议定义了每个段对应的目标。

```
[scheme:name]
entries:
    sections -> target
    sections -> target
    ...
```

示例:

```
[scheme:noflash]
entries:
    text -> iram0_text           # text 段下的所有条目均归入 iram0_text
    rodata -> dram0_data       # rodata 段下的所有条目均归入 dram0_data
```

默认协议

注意, 有一个默认的协议很特殊, 特殊在于包罗存放规则都是根据这个协议中的条目生成的。这意味着, 如果该协议有一条条目是 `text -> flash_text`, 则将为目标 `flash_text` 生成如下的存放规则:

```
*(.literal .literal.* .text .text.*)
```

这些生成的包罗规则将用于未指定映射规则的情况。

默认协议在 `esp_system/app.lf` 文件中定义。快速上手指南中提到的内置 `noflash` 协议和 `rtc` 协议也在该文件中定义。

映射

映射定义了可映射实体（即目标文件、函数名、变量名和库）对应的协议。

```
[mapping]
archive: archive           # 构建后输出的库文件名称 (即 libxxx.a)
entries:
    object:symbol (scheme) # 符号
    object (scheme)        # 目标
    * (scheme)             # 库
```

有三种存放粒度:

- 符号: 指定了目标文件名称和符号名称。符号名称可以是函数名或变量名。
- 目标: 只指定目标文件名称。
- 库: 指定 *, 即某个库下面所有目标文件的简化表达法。

为了更好地理解条目的含义, 请看一个按目标存放的例子。

```
object (scheme)
```

根据条目定义, 将这个协议展开:

```
object (sections -> target,
        sections -> target,
        ...)
```

再根据条目定义，将这个段展开：

```
object (.section,
       .section,
       ... -> target, # 根据目标文件将这里所列出的所有段放在该目标位置

       .section,
       .section,
       ... -> target, # 同样的方法指定其他段

       ...)          # 直至所有段均已展开
```

示例：

```
[mapping:map]
archive: libfreertos.a
entries:
    * (noflash)
```

除了实体和协议，条目中也支持指定如下标志：（注：<> = 参数名称，[] = 可选参数）

1. ALIGN(<alignment>[, pre, post])

根据 alignment 中指定的数字对齐存放区域，根据是否指定 pre 和 post，或两者都指定，在输入段描述（生成于映射条目）的前面和/或后面生成：

2. SORT([<sort_by_first>, <sort_by_second>])

在输入段描述中输出 SORT_BY_NAME, SORT_BY_ALIGNMENT, SORT_BY_INIT_PRIORITY 或 SORT。

sort_by_first 和 sort_by_second 的值可以是：name、alignment、init_priority。

如果既没指定 sort_by_first 也没指定 sort_by_second，则输入段会按照名称排序，如果两者都指定了，那么嵌套排序会遵循 <https://sourceware.org/binutils/docs/ld/Input-Section-Wildcards.html> 中的规则。

3. KEEP()

用 KEEP 命令包围输入段描述，从而防止链接器丢弃存放区域。更多细节请参考 <https://sourceware.org/binutils/docs/ld/Input-Section-Keep.html>

4. SURROUND(<name>)

在存放区域的前面和后面生成符号，生成的符号遵循 _<name>_start 和 _<name>_end 的命名方式，例如，如果 name == sym1

在添加标志时，协议中需要指定具体的 section -> target。对于多个 section -> target，使用逗号作为分隔符，例如：

```
# 注意
# A. entity-scheme 后使用分号
# B. section2 -> target2 前使用逗号
# C. 在 scheme1 条目中定义 section1 -> target1 和 section2 -> target2
entity1 (scheme1);
    section1 -> target1 KEEP() ALIGN(4, pre, post),
    section2 -> target2 SURROUND(sym) ALIGN(4, post) SORT()
```

合并后，如下的映射：

```
[mapping:name]
archive: lib1.a
entries:
    obj1 (noflash);
        rodata -> dram0_data KEEP() SORT() ALIGN(8) SURROUND(my_sym)
```

会在链接器脚本上生成如下输出：

```
. = ALIGN(8)
_my_sym_start = ABSOLUTE(.)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
_my_sym_end = ABSOLUTE(.)
```

注意，正如在 `flag` 描述中提到的，`ALIGN` 和 `SURROUND` 的使用对顺序敏感，因此如果将两者顺序调换后用到相同的映射片段，则会生成：

```
_my_sym_start = ABSOLUTE(.)
. = ALIGN(8)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
_my_sym_end = ABSOLUTE(.)
```

按符号存放 按符号存放可通过编译器标志 `-ffunction-sections` 和 `-ffdata-sections` 实现。ESP-IDF 默认用这些标志编译。用户若选择移除标志，便不能按符号存放。另外，即便有标志，也会其他限制，具体取决于编译器输出的段。

比如，使用 `-ffunction-sections`，针对每个功能会输出单独的段。段的名称可以预测，即 `.text.{func_name}` 和 `.literal.{func_name}`。但是功能内的字符串并非如此，因为字符串会进入字符串池，或者使用生成的段名称。

使用 `-ffdata-sections`，对全局数据来说编译器可输出 `.data.{var_name}`、`.rodata.{var_name}` 或 `.bss.{var_name}`；因此类型 I 映射词条可以适用。但是，功能中声明的静态数据并非如此，生成的段名称是将变量名称和其他信息混合。

链接器脚本模板

链接器脚本模板是指定存放规则的存放位置的框架，与其他链接器脚本没有本质区别，但带有特定的标记语法，可以指示存放生成的存放规则的位置。

如需引用一个目标标记下的所有存放规则，请使用以下语法：

```
mapping[target]
```

示例：

以下示例是某个链接器脚本模板的摘录，定义了输出段 `.iram0.text`，该输出段包含一个引用目标 `iram0_text` 的标记。

```
.iram0.text :
{
    /* 标记 IRAM 空间不足 */
    _iram_text_start = ABSOLUTE(.);

    /* 引用 iram0_text */
    mapping[iram0_text]

    _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg
```

假设链接器脚本生成器收集到了以下片段定义：

```
[sections:text]
    .text+
    .literal+

[sections:iram]
    .iram1+

[scheme:default]
```

(下页继续)

```

entries:
    text -> flash_text
    iram -> iram0_text

[scheme:noflash]
entries:
    text -> iram0_text

[mapping:freertos]
archive: libfreertos.a
entries:
    * (noflash)

```

然后生成的链接器脚本的相应摘录如下:

```

.iram0.text :
{
    /* 标记 IRAM 空间不足 */
    _iram_text_start = ABSOLUTE(.);

    /* 处理片段生成的存放规则, 存放在模板标记的位置处 */
    *(.iram1 .iram1.*)
    *libfreertos.a:(.literal .text .literal.* .text.*)

    _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg

```

```
*libfreertos.a:(.literal .text .literal.* .text.*)
```

这是根据 freertos 映射的 * (noflash) 条目生成的规则。libfreertos.a 库下所有目标文件的所有 text 段会收集到 iram0_text 目标下 (按照 noflash 协议), 并放在模板中被 iram0_text 标记的地方。

```
*(.iram1 .iram1.*)
```

这是根据默认协议条目 iram -> iram0_text 生成的规则。默认协议指定了 iram -> iram0_text 条目, 因此生成的规则同样也放在被 iram0_text 标记的地方。由于该规则是根据默认协议生成的, 因此在同一目标下收集的所有规则下排在第一位。

目前使用的链接器脚本模板是 [esp_system/ld/esp32s3/sections.ld.in](#), 生成的脚本存放在构建目录下。

将链接器脚本片段文件语法迁移至 ESP-IDF v5.0 适应版本

ESP-IDF v5.0 中将不再支持 ESP-IDF v3.x 中链接器脚本片段文件的旧式语法。在迁移的过程中需注意以下几点:

- 必须缩进, 缩进不当的文件会产生解析异常; 旧版本不强制缩进, 但之前的文档和示例均遵循了正确的缩进语法
- 条件改用 if...elif...else 结构, 可以参照[之前的章节](#)
- 映射片段和其他片段类型一样, 需有名称

4.22 lwIP

ESP-IDF uses the open source [lwIP lightweight TCP/IP stack](#). The ESP-IDF version of lwIP ([esp-lwip](#)) has some modifications and additions compared to the upstream project.

4.22.1 Supported APIs

ESP-IDF supports the following lwIP TCP/IP stack functions:

- [BSD Sockets API](#)
- [Netconn API](#) is enabled but not officially supported for ESP-IDF applications

Adapted APIs

警告: When using any lwIP API (other than [BSD Sockets API](#)), please make sure that it is thread safe. To check if a given API call is safe, enable `CONFIG_LWIP_CHECK_THREAD_SAFETY` and run the application. This way lwIP asserts the TCP/IP core functionality to be correctly accessed; the execution aborts if it is not locked properly or accessed from the correct task ([lwIP FreeRTOS Task](#)). The general recommendation is to use [ESP-NETIF](#) component to interact with lwIP.

Some common lwIP “app” APIs are supported indirectly by ESP-IDF:

- DHCP Server & Client are supported indirectly via the [ESP-NETIF](#) functionality
- Simple Network Time Protocol (SNTP) is supported via the [lwip/include/apps/sntp/sntp.h](#) [lwip/lwip/src/include/lwip/apps/sntp.h](#) functions (see also [SNTP 时间同步](#))
- ICMP Ping is supported using a variation on the lwIP ping API. See [ICMP Echo](#).
- NetBIOS lookup is available using the standard lwIP API. [protocols/http_server/restful_server](#) has an option to demonstrate using NetBIOS to look up a host on the LAN.
- mDNS uses a different implementation to the lwIP default mDNS (see [mDNS 服务](#)), but lwIP can look up mDNS hosts using standard APIs such as `gethostbyname()` and the convention `hostname.local`, provided the `CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES` setting is enabled.

4.22.2 BSD Sockets API

The BSD Sockets API is a common cross-platform TCP/IP sockets API that originated in the Berkeley Standard Distribution of UNIX but is now standardized in a section of the POSIX specification. BSD Sockets are sometimes called POSIX Sockets or Berkeley Sockets.

As implemented in ESP-IDF, lwIP supports all of the common usages of the BSD Sockets API.

References

A wide range of BSD Sockets reference material is available, including:

- [Single UNIX Specification BSD Sockets page](#)
- [Berkeley Sockets Wikipedia page](#)

Examples

A number of ESP-IDF examples show how to use the BSD Sockets APIs:

- [protocols/sockets/tcp_server](#)
- [protocols/sockets/tcp_client](#)
- [protocols/sockets/udp_server](#)
- [protocols/sockets/udp_client](#)
- [protocols/sockets/udp_multicast](#)
- [protocols/http_request](#) (Note: this is a simplified example of using a TCP socket to send an HTTP request. The [ESP HTTP Client](#) is a much better option for sending HTTP requests.)

Supported functions

The following BSD socket API functions are supported. For full details see [lwip/lwip/src/include/lwip/sockets.h](#).

- `socket()`
- `bind()`
- `accept()`
- `shutdown()`
- `getpeername()`
- `getsockopt()` & `setsockopt()` (see *Socket Options*)
- `close()` (via [虚拟文件系统组件](#))
- `read()`, `readv()`, `write()`, `writew()` (via [虚拟文件系统组件](#))
- `recv()`, `recvmsg()`, `recvfrom()`
- `send()`, `sendmsg()`, `sendto()`
- `select()` (via [虚拟文件系统组件](#))
- `poll()` (Note: on ESP-IDF, `poll()` is implemented by calling `select` internally, so using `select()` directly is recommended if a choice of methods is available.)
- `fcntl()` (see *fcntl*)

Non-standard functions:

- `ioctl()` (see *ioctls*)

备注: Some lwIP application sample code uses prefixed versions of BSD APIs, for example `lwip_socket()` instead of the standard `socket()`. Both forms can be used with ESP-IDF, but using standard names is recommended.

Socket Error Handling

BSD Socket error handling code is very important for robust socket applications. Normally the socket error handling involves the following aspects:

- Detecting the error.
- Getting the error reason code.
- Handle the error according to the reason code.

In lwIP, we have two different scenarios of handling socket errors:

- Socket API returns an error. For more information, see *Socket API Errors*.
- `select(int maxfdp1, fd_set *readset, fd_set *writeset, fd_set *exceptset, struct timeval *timeout)` has exception descriptor indicating that the socket has an error. For more information, see *select() Errors*.

Socket API Errors

The error detection

- We can know that the socket API fails according to its return value.

Get the error reason code

- When socket API fails, the return value doesn't contain the failure reason and the application can get the error reason code by accessing `errno`. Different values indicate different meanings. For more information, see [<Socket Error Reason Code>](#).

Example:

```
int err;
int sockfd;

if (sockfd = socket(AF_INET, SOCK_STREAM, 0) < 0) {
    // the error code is obtained from errno
}
```

(下页继续)

```
err = errno;
return err;
}
```

select() Errors

The error detection

- Socket error when `select()` has exception descriptor

Get the error reason code

- If the `select` indicates that the socket fails, we can't get the error reason code by accessing `errno`, instead we should call `getsockopt()` to get the failure reason code. Because `select()` has exception descriptor, the error code will not be given to `errno`.

备注: `getsockopt` function prototype `int getsockopt(int s, int level, int optname, void *optval, socklen_t *optlen)`. Its function is to get the current value of the option of any type, any state socket, and store the result in `optval`. For example, when you get the error code on a socket, you can get it by `getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen)`.

Example:

```
int err;

if (select(sockfd + 1, NULL, NULL, &exfds, &tval) <= 0) {
    err = errno;
    return err;
} else {
    if (FD_ISSET(sockfd, &exfds)) {
        // select() exception set using getsockopt()
        int optlen = sizeof(int);
        getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen);
        return err;
    }
}
```

Socket Error Reason Code Below is a list of common error codes. For more detailed list of standard POSIX/C error codes, please see [newlib errno.h](#) and the platform-specific extensions [newlib/platform_include/errno.h](#)

Error code	Description
ECONNREFUSED	Connection refused
EADDRINUSE	Address already in use
ECONNABORTED	Software caused connection abort
ENETUNREACH	Network is unreachable
ENETDOWN	Network interface is not configured
ETIMEDOUT	Connection timed out
EHOSTDOWN	Host is down
EHOSTUNREACH	Host is unreachable
EINPROGRESS	Connection already in progress
EALREADY	Socket already connected
EDESTADDRREQ	Destination address required
EPROTONOSUPPORT	Unknown protocol

Socket Options

The `getsockopt()` and `setsockopt()` functions allow getting/setting per-socket options.

Not all standard socket options are supported by lwIP in ESP-IDF. The following socket options are supported:

Common options Used with level argument `SOL_SOCKET`.

- `SO_REUSEADDR` (available if `CONFIG_LWIP_SO_REUSE` is set, behavior can be customized by setting `CONFIG_LWIP_SO_REUSE_RXTOALL`)
- `SO_KEEPALIVE`
- `SO_BROADCAST`
- `SO_ACCEPTCONN`
- `SO_RCVBUF` (available if `CONFIG_LWIP_SO_RCVBUF` is set)
- `SO_SNDTIMEO` / `SO_RCVTIMEO`
- `SO_ERROR` (this option is only used with `select()`, see [Socket Error Handling](#))
- `SO_TYPE`
- `SO_NO_CHECK` (for UDP sockets only)

IP options Used with level argument `IPPROTO_IP`.

- `IP_TOS`
- `IP_TTL`
- `IP_PKTINFO` (available if `CONFIG_LWIP_NETBUF_RECVINFO` is set)

For multicast UDP sockets:

- `IP_MULTICAST_IF`
- `IP_MULTICAST_LOOP`
- `IP_MULTICAST_TTL`
- `IP_ADD_MEMBERSHIP`
- `IP_DROP_MEMBERSHIP`

TCP options TCP sockets only. Used with level argument `IPPROTO_TCP`.

- `TCP_NODELAY`

Options relating to TCP keepalive probes:

- `TCP_KEEPALIVE` (int value, TCP keepalive period in milliseconds)
- `TCP_KEEPIDLE` (same as `TCP_KEEPALIVE`, but the value is in seconds)
- `TCP_KEEPINTVL` (int value, interval between keepalive probes in seconds)
- `TCP_KEEPCNT` (int value, number of keepalive probes before timing out)

IPv6 options IPv6 sockets only. Used with level argument `IPPROTO_IPV6`

- `IPV6_CHECKSUM`
- `IPV6_V6ONLY`

For multicast IPv6 UDP sockets:

- `IPV6_JOIN_GROUP` / `IPV6_ADD_MEMBERSHIP`
- `IPV6_LEAVE_GROUP` / `IPV6_DROP_MEMBERSHIP`
- `IPV6_MULTICAST_IF`
- `IPV6_MULTICAST_HOPS`
- `IPV6_MULTICAST_LOOP`

fcntl

The `fcntl()` function is a standard API for manipulating options related to a file descriptor. In ESP-IDF, the [虚拟文件系统组件](#) layer is used to implement this function.

When the file descriptor is a socket, only the following `fcntl()` values are supported:

- `O_NONBLOCK` to set/clear non-blocking I/O mode. Also supports `O_NDELAY`, which is identical to `O_NONBLOCK`.
- `O_RDONLY`, `O_WRONLY`, `O_RDWR` flags for different read/write modes. These can read via `F_GETFL` only, they cannot be set using `F_SETFL`. A TCP socket will return a different mode depending on whether the connection has been closed at either end or is still open at both ends. UDP sockets always return `O_RDWR`.

ioctls

The `ioctl()` function provides a semi-standard way to access some internal features of the TCP/IP stack. In ESP-IDF, the [虚拟文件系统组件](#) layer is used to implement this function.

When the file descriptor is a socket, only the following `ioctl()` values are supported:

- `FIONREAD` returns the number of bytes of pending data already received in the socket's network buffer.
- `FIONBIO` is an alternative way to set/clear non-blocking I/O status for a socket, equivalent to `fcntl(fd, F_SETFL, O_NONBLOCK, ...)`.

4.22.3 Netconn API

lwIP supports two lower level APIs as well as the BSD Sockets API: the Netconn API and the Raw API.

The lwIP Raw API is designed for single threaded devices and is not supported in ESP-IDF.

The Netconn API is used to implement the BSD Sockets API inside lwIP, and it can also be called directly from ESP-IDF apps. This API has lower resource usage than the BSD Sockets API, in particular it can send and receive data without needing to first copy it into internal lwIP buffers.

重要: Espressif does not test the Netconn API in ESP-IDF. As such, this functionality is *enabled but not supported*. Some functionality may only work correctly when used from the BSD Sockets API.

For more information about the Netconn API, consult [lwip/lwip/src/include/lwip/api.h](#) and [this wiki page which is part of the unofficial lwIP Application Developers Manual](#).

4.22.4 lwIP FreeRTOS Task

lwIP creates a dedicated TCP/IP FreeRTOS task to handle socket API requests from other tasks.

A number of configuration items are available to modify the task and the queues (“mailboxes”) used to send data to/from the TCP/IP task:

- `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE`
- `CONFIG_LWIP_TCPIP_TASK_STACK_SIZE`
- `CONFIG_LWIP_TCPIP_TASK_AFFINITY`

4.22.5 IPv6 Support

Both IPv4 and IPv6 are supported as dual stack and enabled by default (IPv6 may be disabled if it's not needed, see [Minimum RAM usage](#)). IPv6 support is limited to *Stateless Autoconfiguration* only, *Stateful configuration* is not supported in ESP-IDF (not in upstream lwip). IPv6 Address configuration is defined by means of these protocols or services:

- **SLAAC** IPv6 Stateless Address Autoconfiguration (RFC-2462)
- **DHCPv6** Dynamic Host Configuration Protocol for IPv6 (RFC-8415)

None of these two types of address configuration is enabled by default, so the device uses only Link Local addresses or statically defined addresses.

Stateless Autoconfiguration Process

To enable address autoconfiguration using Router Advertisement protocol please enable:

- `CONFIG_LWIP_IPV6_AUTOCONFIG`

This configuration option enables IPv6 autoconfiguration for all network interfaces (in contrast to the upstream lwIP, where the autoconfiguration needs to be explicitly enabled for each netif with `netif->ip6_autoconfig_enabled=1`)

DHCPv6

DHCPv6 in lwIP is very simple and support only stateless configuration. It could be enabled using:

- `CONFIG_LWIP_IPV6_DHCP6`

Since the DHCPv6 works only in its stateless configuration, the *Stateless Autoconfiguration Process* has to be enabled, too, by means of `CONFIG_LWIP_IPV6_AUTOCONFIG`. Moreover, the DHCPv6 needs to be explicitly enabled from the application code using

```
dhcp6_enable_stateless(netif);
```

DNS servers in IPv6 autoconfiguration

In order to autoconfigure DNS server(s), especially in IPv6 only networks, we have these two options

- Recursive domain name system –this belongs to the Neighbor Discovery Protocol (NDP), uses *Stateless Autoconfiguration Process*. Number of servers must be set `CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS`, this is option is disabled (set to 0) by default.
- DHCPv6 stateless configuration –uses *DHCPv6* to configure DNS servers. Note that the this configuration assumes IPv6 Router Advertisement Flags (RFC-5175) to be set to
 - Managed Address Configuration Flag = 0
 - Other Configuration Flag = 1

4.22.6 esp-lwip custom modifications

Additions

The following code is added which is not present in the upstream lwIP release:

Thread-safe sockets It is possible to `close()` a socket from a different thread to the one that created it. The `close()` call will block until any function calls currently using that socket from other tasks have returned.

It is, however, not possible to delete a task while it is actively waiting on `select()` or `poll()` APIs. It is always necessary that these APIs exit before destroying the task, as this might corrupt internal structures and cause subsequent crashes of the lwIP. (These APIs allocate globally referenced callback pointers on stack, so that when the task gets destroyed before unrolling the stack, the lwIP would still hold pointers to the deleted stack)

On demand timers lwIP IGMP and MLD6 features both initialize a timer in order to trigger timeout events at certain times.

The default lwIP implementation is to have these timers enabled all the time, even if no timeout events are active. This increases CPU usage and power consumption when using automatic light sleep mode. `esp-lwip` default behaviour is to set each timer “on demand” so it is only enabled when an event is pending.

To return to the default lwIP behaviour (always-on timers), disable `CONFIG_LWIP_TIMERS_ONDEMAND`.

Lwip timers API When users are not using WiFi, these APIs provide users with the ability to turn off LwIP timer to reduce power consumption.

The following API functions are supported. For full details see [lwip/lwip/src/include/lwip/timeouts.h](#).

- `sys_timeouts_init()`
- `sys_timeouts_deinit()`

Additional Socket Options

- Some standard IPV4 and IPV6 multicast socket options are implemented (see *Socket Options*).
- Possible to set IPV6-only UDP and TCP sockets with `IPV6_V6ONLY` socket option (normal lwIP is TCP only).

IP layer features

- IPV4 source based routing implementation is different.
- IPV4 mapped IPV6 addresses are supported.

Customized lwIP hooks The original lwIP supports implementing custom compile-time modifications via `LWIP_HOOK_FILENAME`. This file is already used by the IDF port layer, but IDF users could still include and implement any custom additions via a header file defined by the macro `ESP_IDF_LWIP_HOOK_FILENAME`. Here is an example of adding a custom hook file to the build process (the hook is called `my_hook.h` and located in the project's main folder):

```
idf_component_get_property(lwip lwip COMPONENT_LIB)
target_compile_options(${lwip} PRIVATE "-I${PROJECT_DIR}/main")
target_compile_definitions(${lwip} PRIVATE "-DESP_IDF_LWIP_HOOK_FILENAME=\"my_hook.
↪h\"")
```

Limitations

Calling `send()` or `sendto()` repeatedly on a UDP socket may eventually fail with `errno` equal to `ENOMEM`. This is a limitation of buffer sizes in the lower layer network interface drivers. If all driver transmit buffers are full then UDP transmission will fail. Applications sending a high volume of UDP datagrams who don't wish for any to be dropped by the sender should check for this error code and re-send the datagram after a short delay.

Increasing the number of TX buffers in the *Wi-Fi* project configuration may also help.

4.22.7 Performance Optimization

TCP/IP performance is a complex subject, and performance can be optimized towards multiple goals. The default settings of ESP-IDF are tuned for a compromise between throughput, latency, and moderate memory usage.

Maximum throughput

Espressif tests ESP-IDF TCP/IP throughput using the [wifi/iperf](#) example in an RF sealed enclosure.

The [wifi/iperf/sdkconfig.defaults](#) file for the iperf example contains settings known to maximize TCP/IP throughput, usually at the expense of higher RAM usage. To get maximum TCP/IP throughput in an application at the expense of other factors then suggest applying settings from this file into the project `sdkconfig`.

重要: Suggest applying changes a few at a time and checking the performance each time with a particular application workload.

- If a lot of tasks are competing for CPU time on the system, consider that the lwIP task has configurable CPU affinity (`CONFIG_LWIP_TCPIP_TASK_AFFINITY`) and runs at fixed priority `ESP_TASK_TCPIP_PRIO` (18). Configure competing tasks to be pinned to a different core, or to run at a lower priority. See also [Built-In Task Priorities](#).
- If using `select()` function with socket arguments only, disabling `CONFIG_VFS_SUPPORT_SELECT` will make `select()` calls faster.
- If there is enough free IRAM, select `CONFIG_LWIP_IRAM_OPTIMIZATION` to improve TX/RX throughput

If using a Wi-Fi network interface, please also refer to [Wi-Fi 缓冲区使用情况](#).

Minimum latency

Except for increasing buffer sizes, most changes which increase throughput will also decrease latency by reducing the amount of CPU time spent in lwIP functions.

- For TCP sockets, lwIP supports setting the standard `TCP_NODELAY` flag to disable Nagle's algorithm.

Minimum RAM usage

Most lwIP RAM usage is on-demand, as RAM is allocated from the heap as needed. Therefore, changing lwIP settings to reduce RAM usage may not change RAM usage at idle but can change it at peak.

- Reducing `CONFIG_LWIP_MAX_SOCKETS` reduces the maximum number of sockets in the system. This will also cause TCP sockets in the `WAIT_CLOSE` state to be closed and recycled more rapidly (if needed to open a new socket), further reducing peak RAM usage.
- Reducing `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE`, `CONFIG_LWIP_TCP_RECVMBOX_SIZE` and `CONFIG_LWIP_UDP_RECVMBOX_SIZE` reduce memory usage at the expense of throughput, depending on usage.
- Reducing `CONFIG_LWIP_TCP_MSL`, `CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT` reduces the maximum segment lifetime in the system. This will also cause TCP sockets in the `TIME_WAIT`, `FIN_WAIT_2` state to be closed and recycled more rapidly
- Disable `CONFIG_LWIP_IPV6` can save about 39 KB for firmware size and 2KB RAM when system power up and 7KB RAM when TCPIP stack running. If there is no requirement for supporting IPV6 then it can be disabled to save flash and RAM footprint.

If using Wi-Fi, please also refer to [Wi-Fi 缓冲区使用情况](#).

Peak Buffer Usage The peak heap memory that lwIP consumes is the **theoretically-maximum memory** that the lwIP driver consumes. Generally, the peak heap memory that lwIP consumes depends on:

- the memory required to create a UDP connection: `lwip_udp_conn`
- the memory required to create a TCP connection: `lwip_tcp_conn`
- the number of UDP connections that the application has: `lwip_udp_con_num`
- the number of TCP connections that the application has: `lwip_tcp_con_num`
- the TCP TX window size: `lwip_tcp_tx_win_size`
- the TCP RX window size: `lwip_tcp_rx_win_size`

So, the peak heap memory that the LwIP consumes can be calculated with the following formula:

$$\text{lwip_dynamic_peek_memory} = (\text{lwip_udp_con_num} * \text{lwip_udp_conn}) + (\text{lwip_tcp_con_num} * (\text{lwip_tcp_tx_win_size} + \text{lwip_tcp_rx_win_size} + \text{lwip_tcp_conn}))$$

Some TCP-based applications need only one TCP connection. However, they may choose to close this TCP connection and create a new one when an error (such as a sending failure) occurs. This may result in multiple TCP connections existing in the system simultaneously, because it may take a long time for a TCP connection to close, according to the TCP state machine (refer to RFC793).

4.23 存储器类型

ESP32-S3 芯片具有不同类型的存储器和灵活的存储器映射特性，本小节将介绍 ESP-IDF 默认如何使用这些功能。

ESP-IDF 区分了指令总线 (IRAM、IROM、RTC FAST memory) 和数据总线 (DRAM、DROM)。指令存储器是可执行的，只能通过 4 字节对齐字读取或写入。数据存储器不可执行，可以通过单独的字节操作访问。有关总线的更多信息，请参阅 [ESP32-S3 技术参考手册 > 系统和存储器 \[PDF\]](#)。

4.23.1 DRAM (数据 RAM)

非常量静态数据 (.data 段) 和零初始化数据 (.bss 段) 由链接器放入内部 SRAM 作为数据存储。此区域中的剩余空间可在程序运行时用作堆。

通过应用 EXT_RAM_BSS_ATTR 宏，零初始化数据也可以放入外部 RAM。使用这个宏需要启用 [CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY](#)。详情请见 [允许 .bss 段放入片外存储器](#)。

备注：静态分配的 DRAM 的最大值也会因编译应用程序的 [IRAM \(指令 RAM\)](#) 大小而减小。运行时可用的堆内存会因应用程序的总静态 IROM 和 DRAM 使用而减少。

常量数据也可能被放入 DRAM，例如当它被用于 non-flash-safe ISR 时 (具体请参考 [如何将代码放入 IROM](#))。

“noinit” DRAM

可以将 __NOINIT_ATTR 宏用作属性，从而将数据放入 .noinit 部分。放入该部分的值在启动时不会被初始化，在软件重启后也会保持值不变。

示例:

```
__NOINIT_ATTR uint32_t noinit_data;
```

4.23.2 IROM (指令 RAM)

备注：内部 SRAM 中不用于指令 RAM 的部分都会作为 [DRAM \(数据 RAM\)](#) 供静态数据和动态分配 (堆) 使用。

何时需要将代码放入 IROM

以下情况时应将部分应用程序放入 IROM:

- 如果在注册中断处理程序时使用了 ESP_INTR_FLAG_IROM，则中断处理程序必须要放入 IROM。更多信息可参考 [IROM 安全中断处理程序](#)。
- 可将一些时序关键代码放入 IROM，以减少从 flash 中加载代码造成的相关损失。ESP32-S3 通过 MMU 缓存从 flash 中读取代码和数据。在某些情况下，将函数放入 IROM 可以减少由缓存未命中造成的延迟，从而显著提高函数的性能。

如何将代码放入 IROM

借助链接器脚本，一些代码会被自动放入 IROM 区域中。

如果需要将某些特定的应用程序代码放入 IROM，可以使用 [链接器脚本生成机制](#) 功能并在组件中添加链接器脚本片段文件，在该片段文件中，可以给整个目标源文件或其中的个别函数打上 noflash 标签。更多信息可参考 [链接器脚本生成机制](#)。

或者，也可以通过使用 IROM_ATTR 宏在源代码中指定需要放入 IROM 的代码:

```
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

放入 IRAM 后可能会导致 IRAM 安全中断处理程序出现问题：

- IRAM_ATTR 函数中的字符串或常量可能没有自动放入 RAM 中，这时可以使用 DRAM_ATTR 属性进行标记，或者也可以使用链接器脚本方法将它们自动放入 RAM 中。

```
void IRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };
    const static char *MSG = DRAM_STR("I am a string stored in RAM");
}
```

注意，具体哪些数据需要被标记为 DRAM_ATTR 可能很难确定。如果没有被标记为 DRAM_ATTR，某些变量或表达式有时会被编译器别为常量（即使它们没有被标记为 const）并将其放入 flash 中。

- GCC 的优化会自动生成跳转表或 switch/case 查找表，并将这些表放在 flash 中。IDF 默认在编译所有文件时使用 `-fno-jump-tables -fno-tree-switch-conversion` 标志来避免这种情况。

可以为不需要放置在 IRAM 中的单个源文件重新启用跳转表优化。关于如何在编译单个源文件时添加 `-fno-jump-tables -fno-tree-switch-conversion` 选项，请参考[组件编译控制](#)。

4.2.3 IROM（代码从 flash 中运行）

如果一个函数没有被显式地声明放在 IRAM 或者 RTC 存储器中，则它会放在 flash 中。由于 IRAM 空间有限，应用程序的大部分二进制代码都需要放入 IROM 中。

在启动过程中，从 IRAM 中运行的引导加载程序配置 MMU flash 缓存，将应用程序的指令代码区域映射到指令空间。通过 MMU 访问的 flash 使用一些内部 SRAM 进行缓存，访问缓存的 flash 数据与访问其他类型的内部存储器一样快。

4.2.4 DROM（数据存储在 flash 中）

默认情况下，链接器将常量数据放入一个映射到 MMU flash 缓存的区域中。这与 IROM（代码从 flash 中运行）部分相同，但此处用于只读数据而不是可执行代码。

唯一没有默认放入 DROM 的常量数据是被编译器嵌入到应用程序代码中的字面常量。这些被放置在周围函数的可执行指令中。

DRAM_ATTR 属性可以用来强制将常量从 DRAM 放入 DRAM（数据 RAM）部分（见上文）。

4.2.5 RTC Slow memory（RTC 慢速存储器）

从 RTC 存储器运行的代码中使用的全局和静态变量必须放入 RTC Slow memory 中。例如深度睡眠变量可以放在 RTC Slow memory 中，而不是 RTC FAST memory，或者也可以放入由 ULP 协处理器编程访问的代码和变量。

RTC_NOINIT_ATTR 属性宏可以用来将数据放入 RTC Slow memory。放入此类型存储器的值从深度睡眠模式中醒来后会保持值不变。

示例：

```
RTC_NOINIT_ATTR uint32_t rtc_noinit_data;
```

4.23.6 RTC FAST memory (RTC 快速存储器)

RTC FAST memory 的同一区域既可以作为指令存储器也可以作为数据存储器进行访问。从深度睡眠模式唤醒后必须要运行的代码要放在 RTC 存储器中，更多信息请查阅文档[深度睡眠](#)。

除非禁用 `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP` 选项，否则剩余的 RTC FAST memory 会被添加到堆中。该部分内存可以和 `DRAM` (数据 RAM) 互换使用，但是访问速度稍慢一点。

4.23.7 具备 DMA 功能

大多数的 DMA 控制器 (比如 SPI、sdmmc 等) 都要求发送/接收缓冲区放在 DRAM 中，并且按字对齐。我们建议将 DMA 缓冲区放在静态变量而不是堆栈中。使用 `DMA_ATTR` 宏可以声明该全局/本地的静态变量具备 DMA 功能，例如：

```
DMA_ATTR uint8_t buffer[]="I want to send something";

void app_main()
{
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

或者：

```
void app_main()
{
    DMA_ATTR static uint8_t buffer[] = "I want to send something";
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

也可以通过使用 `MALLOC_CAP_DMA` 标志来动态分配具备 DMA 能力的内存缓冲区。

4.23.8 在堆栈中放置 DMA 缓冲区

可以在堆栈中放置 DMA 缓冲区，但建议尽量避免。如果实在有需要的话，请注意以下几点：

- 如果堆栈在 PSRAM 中，则不建议将 DRAM 缓冲区放在堆栈上。如果任务堆栈在 PSRAM 中，则必须执行[片外 RAM](#)中描述的几个步骤。
- 在函数中使用 `WORD_ALIGNED_ATTR` 宏来修饰变量，将其放在适当的位置上，比如：

```
void app_main()
{
    uint8_t stuff;
    WORD_ALIGNED_ATTR uint8_t buffer[] = "I want to send something"; //否则 ↪
    ↪buffer 会被存储在 stuff 变量后面
    // 初始化代码
    spi_transaction_t temp = {
```

(下页继续)

```
.tx_buffer = buffer,  
.length = 8 * sizeof(buffer),  
};  
spi_device_transmit(spi, &temp);  
// 其它程序  
}
```

4.24 OpenThread

OpenThread is a IP stack running on the 802.15.4 MAC layer which features mesh network and low power consumption.

4.24.1 Mode of the OpenThread stack

OpenThread can run under the following modes on Espressif chips:

Standalone node

The full OpenThread stack and the application layer runs on the same chip. This mode is available on chips with 15.4 radio such as ESP32-H2.

Radio Co-Processor (RCP)

The chip will be connected to another host running the OpenThread IP stack. It will send and received 15.4 packets on behalf of the host. This mode is available on chips with 15.4 radio such as ESP32-H2. The underlying transport between the chip and the host can be SPI or UART. For sake of latency, we recommend to use SPI as the underlying transport.

OpenThread host

For chips without 15.4 radio, it can be connected to an RCP and run OpenThread under host mode. This mode enables OpenThread on Wi-Fi chips such as ESP32, ESP32-S2, ESP32-S3 and ESP32-C3. The following diagram shows how devices work under different modes:

图 52: OpenThread device modes

4.24.2 How To Write an OpenThread Application

The OpenThread `openthread/ot_cli` example will be a good place to start at. It demonstrates basic OpenThread initialization and simple socket-based server and client.

Before OpenThread initialization

- s1.1 The main task calls `esp_vfs_eventfd_register()` to initialize the eventfd virtual filesystem. The eventfd file system is used for task notification in the OpenThread driver.
- s1.2 The main task calls `nvs_flash_init()` to initialize the NVS where the Thread network data is stored.
- s1.3 **Optional**, The main task calls `esp_netif_init()` only when it wants to create the network interface for Thread.
- s1.4: The main task calls `esp_event_loop_create()` to create the system Event task and initialize an application event's callback function.

OpenThread stack initialization

- s2.1: Call `esp_openthread_init()` to initialize the OpenThread stack.

OpenThread network interface initialization

The whole stage is **optional** and only required if the application wants to create the network interface for Thread.

- s3.1: Call `esp_netif_new()` with `ESP_NETIF_DEFAULT_OPENTHREAD` to create the interface.
- s3.2: Call `esp_openthread_netif_glue_init()` to create the OpenThread interface handlers.
- s3.3: Call `esp_netif_attach()` to attach the handlers to the interface.

The OpenThread main loop

- s4.3: Call `esp_openthread_launch_mainloop()` to launch the OpenThread main loop. Note that this is a busy loop and will not return until the OpenThread stack is terminated.

Calling OpenThread APIs

The OpenThread APIs are not thread-safe. When calling OpenThread APIs from other tasks, make sure to hold the lock with `esp_openthread_lock_acquire()` and release the lock with `esp_openthread_lock_release()` afterwards.

Deinitialization

The following steps are required to deinitialize the OpenThread stack:

- Call `esp_netif_destroy()` and `esp_openthread_netif_glue_deinit()` to deinitialize the OpenThread network interface if you have created one.
- Call `esp_openthread_deinit()` to deinitialize the OpenThread stack.

4.24.3 The OpenThread border router

The OpenThread border router connects the Thread network with other IP networks. It will provide IPv6 connectivity, service registration and commission functionality. To launch an OpenThread border router on a ESP chip, you need to connect an RCP to a Wi-Fi capable chip such as ESP32. Call `esp_openthread_border_router_init()` during the initialization will launch all the border routing functionalities.

You may refer to the `openthread/ot_br` example and the README for further border router details.

4.25 分区表

4.25.1 概述

每片 ESP32-S3 的 flash 可以包含多个应用程序，以及多种不同类型的数据（例如校准数据、文件系统数据、参数存储数据等）。因此，我们在 flash 的默认偏移地址 0x8000 处烧写一张分区表。

分区表的长度为 0xC00 字节（最多可以保存 95 条分区表条目）。分区表数据后还保存着该表的 MD5 校验和，用于验证分区表的完整性。此外，如果芯片使能了安全启动功能，则该分区表后还会保存签名信息。

分区表中的每个条目都包括以下几个部分：Name（标签）、Type（app、data 等）、SubType 以及在 flash 中的偏移量（分区的加载地址）。

在使用分区表时，最简单的方法就是打开项目配置菜单（idf.py menuconfig），并在 `CONFIG_PARTITION_TABLE_TYPE` 下选择一个预定义的分区表：

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

在以上两种选项中，出厂应用程序均将被烧录至 flash 的 0x10000 偏移地址处。这时，运行 `idf.py partition-table`，即可以打印当前使用分区表的信息摘要。

4.25.2 内置分区表

以下是“Single factory app, no OTA”选项的分区表信息摘要：

```
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
```

- flash 的 0x10000 (64 KB) 偏移地址处存放一个标记为“factory”的二进制应用程序，且启动加载器将默认加载这个应用程序。
- 分区表中还定义了两个数据区域，分别用于存储 NVS 库专用分区和 PHY 初始化数据。

以下是“Factory app, two OTA definitions”选项的分区表信息摘要：

```
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000,
otadata, data, ota, 0xd000, 0x2000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
ota_0, app, ota_0, 0x110000, 1M,
ota_1, app, ota_1, 0x210000, 1M,
```

- 分区表中定义了三个应用程序分区，这三个分区的类型都被设置为“app”，但具体 app 类型不同。其中，位于 0x10000 偏移地址处的为出厂应用程序（factory），其余两个为 OTA 应用程序（ota_0, ota_1）。
- 新增了一个名为“otadata”的数据分区，用于保存 OTA 升级时需要的数据。启动加载器会查询该分区的数据，以判断该从哪个 OTA 应用程序分区加载程序。如果“otadata”分区为空，则会执行出厂程序。

4.25.3 创建自定义分区表

如果在 menuconfig 中选择了“Custom partition table CSV”，则还需要输入该分区表的 CSV 文件在项目中的路径。CSV 文件可以根据需要，描述任意数量的分区信息。

CSV 文件的格式与上面摘要中打印的格式相同，但是在 CSV 文件中并非所有字段都是必需的。例如下面是一个自定义的 OTA 分区表的 CSV 文件：

```
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000
otadata, data, ota, 0xd000, 0x2000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
ota_0, app, ota_0, , 1M
ota_1, app, ota_1, , 1M
nvs_key, data, nvs_keys, , 0x1000
```

- 字段之间的空格会被忽略，任何以 # 开头的行（注释）也会被忽略。
- CSV 文件中的每个非注释行均为一个分区定义。
- 每个分区的 Offset 字段可以为空，gen_esp32part.py 工具会从分区表位置的后面开始自动计算并填充该分区的偏移地址，同时确保每个分区的偏移地址正确对齐。

Name 字段

Name 字段可以是任何有意义的名称，但不能超过 16 个字符（之后的内容将被截断）。该字段对 ESP32-S3 并不是特别重要。

Type 字段

Type 字段可以指定为 app (0x00) 或者 data (0x01)，也可以直接使用数字 0-254（或者十六进制 0x00-0xFE）。注意，0x00-0x3F 不得使用（预留给 esp-idf 的核心功能）。

如果您的应用程序需要以 ESP-IDF 尚未支持的格式存储数据，请在 0x40-0xFE 内添加一个自定义分区类型。

参考 [esp_partition_type_t](#) 关于 app 和 data 分区的枚举定义。

如果用 C++ 编写，那么指定一个应用程序定义的分类型，需要在 [esp_partition_type_t](#) 中使用整数，从而与分区 API 一起使用。例如：

```
static const esp_partition_type_t APP_PARTITION_TYPE_A = (esp_partition_type_t)0x40;
```

注意，启动加载器将忽略 app (0x00) 和 data (0x01) 以外的其他分区类型。

SubType 字段

SubType 字段长度为 8 bit，内容与具体分区 Type 有关。目前，esp-idf 仅仅规定了“app”和“data”两种分区类型的子类型含义。

参考 [esp_partition_subtype_t](#)，以了解 ESP-IDF 定义的全部子类型列表，包括：

- 当 Type 定义为 app 时，SubType 字段可以指定为 factory (0x00)、ota_0 (0x10) … ota_15 (0x1F) 或者 test (0x20)。
 - factory (0x00) 是默认的 app 分区。启动加载器将默认加载该应用程序。但如果存在类型为 data/ota 分区，则启动加载器将加载 data/ota 分区中的数据，进而判断启动哪个 OTA 镜像文件。
 - * OTA 升级永远都不会更新 factory 分区中的内容。
 - * 如果您希望在 OTA 项目中预留更多 flash，可以删除 factory 分区，转而使用 ota_0 分区。
 - ota_0 (0x10) … ota_15 (0x1F) 为 OTA 应用程序分区，启动加载器将根据 OTA 数据分区中的数据来决定加载哪个 OTA 应用程序分区中的程序。在使用 OTA 功能时，应用程序应至少拥有 2 个 OTA 应用程序分区 (ota_0 和 ota_1)。更多详细信息，请参考 [OTA 文档](#)。
 - test (0x20) 为预留的子类型，用于工厂测试流程。如果没有其他有效 app 分区，test 将作为备选启动分区使用。也可以配置启动加载器在每次启动时读取 GPIO，如果 GPIO 被拉低则启动该分区。详细信息请查阅 [从测试固件启动](#)。

- 当 Type 定义为 data 时, SubType 字段可以指定为 ota (0x00)、phy (0x01)、nvs (0x02)、nvs_keys (0x04) 或者其他组件特定的子类型 (请参考子类型枚举)。
 - ota (0) 即 **OTA 数据分区**, 用于存储当前所选的 OTA 应用程序的信息。这个分区的大小需要设定为 0x2000。更多详细信息, 请参考 [OTA 文档](#)。
 - phy (1) 分区用于存放 PHY 初始化数据, 从而保证可以为每个设备单独配置 PHY, 而非必须采用固件中的统一 PHY 初始化数据。
 - * 默认配置下, phy 分区并不启用, 而是直接将 phy 初始化数据编译至应用程序中, 从而节省分区表空间 (直接将此分区删掉)。
 - * 如果需从此分区加载 phy 初始化数据, 请打开项目配置菜单 (idf.py menuconfig), 并且使能 `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION` 选项。此时, 您还需要手动将 phy 初始化数据烧至设备 flash (esp-idf 编译系统并不会自动完成该操作)。
 - nvs (2) 是专门给 **非易失性存储 (NVS) API** 使用的分区。
 - * 用于存储每台设备的 PHY 校准数据 (注意, 并不是 PHY 初始化数据)。
 - * 用于存储 Wi-Fi 数据 (如果使用了 `esp_wifi_set_storage(WIFI_STORAGE_FLASH)` 初始化函数)。
 - * NVS API 还可以用于其他应用程序数据。
 - * 强烈建议您应为 NVS 分区分配至少 0x3000 字节空间。
 - * 如果使用 NVS API 存储大量数据, 请增加 NVS 分区的大小 (默认是 0x6000 字节)。
 - nvs_keys (4) 是 NVS 密钥分区。详细信息, 请参考 [非易失性存储 \(NVS\) API](#) 文档。
 - * 用于存储加密密钥 (如果启用了 NVS 加密功能)。
 - * 此分区应至少设定为 4096 字节。
 - ESP-IDF 还支持其它预定义的子类型用于数据存储, 包括 **FAT 文件系统** (`ESP_PARTITION_SUBTYPE_DATA_FAT`), **SPIFFS** (`ESP_PARTITION_SUBTYPE_DATA_SPIFFS`) 等。
其它数据子类型已预留给 esp-idf 未来使用。
- 如果分区类型是由应用程序定义的任意值 (0x40-0xFE), 那么 subtype 字段可以是由应用程序选择的任何值 (0x00-0xFE)。

请注意如果用 C++ 编写, 应用程序定义的子类型值需要转换为 `esp_partition_type_t`, 从而与 [分区 API](#) 一起使用。

Offset 和 Size 字段

分区若偏移地址为空, 则会紧跟着前一个分区之后开始; 若为首个分区, 则将紧跟着分区表开始。

app 分区的偏移地址必须要与 0x10000 (64K) 对齐, 如果将偏移字段留空, `gen_esp32part.py` 工具会自动计算得到一个满足对齐要求的偏移地址。如果 app 分区的偏移地址没有与 0x10000 (64K) 对齐, 则该工具会报错。

app 分区的大小和偏移地址可以采用十进制数、以 0x 为前缀的十六进制数, 且支持 K 或 M 的倍数单位 (分别代表 1024 和 1024*1024 字节)。

如果您希望允许分区表中的分区采用任意起始偏移量 (`CONFIG_PARTITION_TABLE_OFFSET`), 请将分区表 (CSV 文件) 中所有分区的偏移字段都留空。注意, 此时, 如果您更改了分区表中任意分区的偏移地址, 则其他分区的偏移地址也会跟着改变。这种情况下, 如果您之前还曾设定某个分区采用固定偏移地址, 则可能造成分区表冲突, 从而导致报错。

Flags 字段

当前仅支持 encrypted 标记。如果 Flags 字段设置为 encrypted, 且已启用 [Flash 加密](#) 功能, 则该分区将会被加密。

备注: app 分区始终会被加密, 不管 Flags 字段是否设置。

4.25.4 生成二进制分区表

烧写到 ESP32-S3 中的分区表采用二进制格式，而不是 CSV 文件本身。此时，[partition_table/gen_esp32part.py](#) 工具可以实现 CSV 和二进制文件之间的转换。

如果您在项目配置菜单 (`idf.py menuconfig`) 中设置了分区表 CSV 文件的名称，然后构建项目或执行 `idf.py partition-table`。这时，转换将在编译过程中自动完成。

手动将 CSV 文件转换为二进制文件：

```
python gen_esp32part.py input_partitions.csv binary_partitions.bin
```

手动将二进制文件转换为 CSV 文件：

```
python gen_esp32part.py binary_partitions.bin input_partitions.csv
```

在标准输出 (`stdout`) 上，打印二进制分区表的内容（运行 `idf.py partition-table` 时展示的信息摘要也是这样生成的）：

```
python gen_esp32part.py binary_partitions.bin
```

4.25.5 分区大小检查

ESP-IDF 构建系统将自动检查生成的二进制文件大小与可用的分区大小是否匹配，如果二进制文件太大，则会构建失败并报错。

目前会对以下二进制文件进行检查：

- 引导加载程序的二进制文件的大小要适合分区表前的区域大小（分区表前的区域都分配给了引导加载程序），具体请参考[引导加载程序大小](#)。
- 应用程序二进制文件应至少适合一个“app”类型的分区。如果不适合任何应用程序分区，则会构建失败。如果只适合某些应用程序分区，则会打印相关警告。

备注：即使分区大小检查返回错误并导致构建失败，仍然会生成可以烧录的二进制文件（它们对于可用空间来说过大，因此无法正常工作）。

MD5 校验和

二进制格式的分区表中含有一个 MD5 校验和。这个 MD5 校验和是根据分区表内容计算的，可在设备启动阶段，用于验证分区表的完整性。

用户可通过 `gen_esp32part.py` 的 `--disable-md5sum` 选项或者 `CONFIG_PARTITION_TABLE_MD5` 选项关闭 MD5 校验。

4.25.6 烧写分区表

- `idf.py partition-table-flash`：使用 `esptool.py` 工具烧写分区表。
- `idf.py flash`：会烧写所有内容，包括分区表。

在执行 `idf.py partition-table` 命令时，手动烧写分区表的命令也将打印在终端上。

备注：分区表的更新并不会擦除根据旧分区表存储的数据。此时，您可以使用 `idf.py erase-flash` 命令或者 `esptool.py erase_flash` 命令来擦除 `flash` 中的所有内容。

4.25.7 分区工具 (parttool.py)

`partition_table` 组件中有分区工具 `parttool.py`，可以在目标设备上完成分区相关操作。该工具有如下用途：

- 读取分区，将内容存储到文件中 (`read_partition`)
- 将文件中的内容写至分区 (`write_partition`)
- 擦除分区 (`erase_partition`)
- 检索特定分区的名称、偏移、大小和 flag (“加密”) 标志等信息 (`get_partition_info`)

用户若想通过编程方式完成相关操作，可从另一个 Python 脚本导入并使用分区工具，或者从 Shell 脚本调用分区工具。前者可使用工具的 Python API，后者可使用命令行界面。

Python API

首先请确保已导入 `parttool` 模块。

```
import sys
import os

idf_path = os.environ["IDF_PATH"] # 从环境中获取 IDF_PATH 的值
parttool_dir = os.path.join(idf_path, "components", "partition_table") # parttool.
↪py 位于 $IDF_PATH/components/partition_table 下

sys.path.append(parttool_dir) # 使能 Python 寻找 parttool 模块
from parttool import * # 导入 parttool 模块内的所有名称
```

要使用分区工具的 Python API，第一步是创建 `ParttoolTarget`：

```
# 创建 parttool.py 的目标设备，并将目标设备连接到串行端口 /dev/ttyUSB1
target = ParttoolTarget("/dev/ttyUSB1")
```

现在，可使用创建的 `ParttoolTarget` 在目标设备上完成操作：

```
# 擦除名为 'storage' 的分区
target.erase_partition(PartitionName("storage"))

# 读取类型为 'data'、子类型为 'spiffs' 的分区，保存至文件 'spiffs.bin'
target.read_partition(PartitionType("data", "spiffs"), "spiffs.bin")

# 将 'factory.bin' 文件的内容写至 'factory' 分区
target.write_partition(PartitionName("factory"), "factory.bin")

# 打印默认启动分区的大小
storage = target.get_partition_info(PARTITION_BOOT_DEFAULT)
print(storage.size)
```

使用 `PartitionName`、`PartitionType` 或 `PARTITION_BOOT_DEFAULT` 指定要操作的分区。顾名思义，这三个参数可以指向拥有特定名称的分区、特定类型和子类型的分区或默认启动分区。

更多关于 Python API 的信息，请查看分区工具的代码注释。

命令行界面

`parttool.py` 的命令行界面具有如下结构：

```
parttool.py [command-args] [subcommand] [subcommand-args]

- command-args - 执行主命令 (parttool.py) 所需的实际参数，多与目标设备有关
- subcommand - 要执行的操作
- subcommand-args - 所选操作的实际参数
```

```
# 擦除名为 'storage' 的分区
parttool.py --port "/dev/ttyUSB1" erase_partition --partition-name=storage

# 读取类型为 'data'、子类型为 'spiffs' 的分区，保存到 'spiffs.bin' 文件
parttool.py --port "/dev/ttyUSB1" read_partition --partition-type=data --partition-
↳subtype=spiffs --output "spiffs.bin"

# 将 'factory.bin' 文件中的内容写入到 'factory' 分区
parttool.py --port "/dev/ttyUSB1" write_partition --partition-name=factory --input
↳"factory.bin"

# 打印默认启动分区的大小
parttool.py --port "/dev/ttyUSB1" get_partition_info --partition-boot-default --
↳info size
```

更多信息可用 `-help` 指令查看：

```
# 显示可用的子命令和主命令描述
parttool.py --help

# 显示子命令的描述
parttool.py [subcommand] --help
```

4.26 Performance

ESP-IDF ships with default settings that are designed for a trade-off between performance, resource usage, and available functionality.

These guides describe how to optimize a firmware application for a particular aspect of performance. Usually this involves some trade-off in terms of limiting available functions, or swapping one aspect of performance (such as execution speed) for another (such as RAM usage).

4.26.1 How to Optimize Performance

1. Decide what the performance-critical aspects of your application are (for example: a particular response time to a certain network operation, a particular startup time limit, particular peripheral data throughput, etc.).
2. Find a way to measure this performance (some methods are outlined in the guides below).
3. Modify the code and project configuration and compare the new measurement to the old measurement.
4. Repeat step 3 until the performance meets the requirements set out in step 1.

4.26.2 Guides

Maximizing Execution Speed

Overview Optimizing execution speed is a key element of software performance. Code that executes faster can also have other positive effects, like reducing overall power consumption. However, improving execution speed may have trade-offs with other aspects of performance such as *Minimizing Binary Size*.

Choose What To Optimize If a function in the application firmware is executed once per week in the background, it may not matter if that function takes 10 ms or 100 ms to execute. If a function is executed constantly at 10 Hz, it matters greatly if it takes 10 ms or 100 ms to execute.

Most application firmwares will only have a small set of functions which require optimal performance. Perhaps those functions are executed very often, or have to meet some application requirements for latency or throughput. Optimization efforts should be targeted at these particular functions.

Measuring Performance The first step to improving something is to measure it.

Basic Performance Measurements If measuring performance relative to an external interaction with the world, you may be able to measure this directly (for example see the examples [wifi/iperf](#) and [ethernet/iperf](#) for measuring general network performance, or you can use an oscilloscope or logic analyzer to measure timing of an interaction with a device peripheral.)

Otherwise, one way to measure performance is to augment the code to take timing measurements:

```
#include "esp_timer.h"

void measure_important_function(void) {
    const unsigned MEASUREMENTS = 5000;
    uint64_t start = esp_timer_get_time();

    for (int retries = 0; retries < MEASUREMENTS; retries++) {
        important_function(); // This is the thing you need to measure
    }

    uint64_t end = esp_timer_get_time();

    printf("%u iterations took %llu milliseconds (%llu microseconds per_
    ↪invocation)\n",
           MEASUREMENTS, (end - start)/1000, (end - start)/MEASUREMENTS);
}
```

Executing the target multiple times can help average out factors like RTOS context switches, overhead of measurements, etc.

- Using `esp_timer_get_time()` generates “wall clock” timestamps with microsecond precision, but has moderate overhead each time the timing functions are called.
- It’s also possible to use the standard Unix `gettimeofday()` and `utime()` functions, although the overhead is slightly higher.
- Otherwise, including `hal/cpu_hal.h` and calling the HAL function `cpu_hal_get_cycle_count()` will return the number of CPU cycles executed. This function has lower overhead than the others. It is good for measuring very short execution times with high precision. The CPU cycles are counted per-core, so only use this method from an interrupt handler, or a task that is pinned to a single core.
- If making “microbenchmarks” (i.e. benchmarking only a very small routine of code that runs in less than 1-2 milliseconds) then flash cache performance can sometimes cause big variations in timing measurements depending on the binary. This happens because binary layout can cause different patterns of cache misses in a particular sequence of execution. If the test code is larger then this effect usually averages out. Executing a small function multiple times when benchmarking can help reduce the impact of flash cache misses. Alternatively, move this code to IRAM (see [Targeted Optimizations](#)).

External Tracing The [应用层跟踪库](#) allows measuring code execution with minimal impact on the code itself.

Tasks If the option `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS` is enabled then the FreeRTOS API `vTaskGetRunTimeStats()` can be used to retrieve runtime information about the processor time used by each FreeRTOS task.

[SEGGER SystemView](#) is an excellent tool for visualizing task execution and looking for performance issues or improvements in the system as a whole.

Improving Overall Speed The following optimizations will improve the execution of nearly all code - including boot times, throughput, latency, etc:

- Set `CONFIG_ESPTOOLPY_FLASHMODE` to QIO or QOUT mode (Quad I/O). Both will almost double the speed at which code is loaded or executed from flash compared to the default DIO mode. QIO is slightly faster than QOUT if both are supported. Note that both the flash chip model and the electrical connections between the ESP32-S3 and the flash chip must support quad I/O modes or the SoC will not work correctly.
- Set `CONFIG_COMPILER_OPTIMIZATION` to “Optimize for performance (-O2)”. This may slightly increase binary size compared to the default setting, but will almost certainly increase performance of some code. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise are not seen.
- Avoid using floating point arithmetic (`float`). Even though ESP32-S3 has a single precision hardware floating point unit, floating point calculations are always slower than integer calculations. If possible then use fixed point representations, a different method of integer representation, or convert part of the calculation to be integer only before switching to floating point.
- Avoid using double precision floating point arithmetic (`double`). These calculations are emulated in software and are very slow. If possible then use an integer-based representation, or single-precision floating point.

Reduce Logging Overhead Although standard output is buffered, it’s possible for an application to be limited by the rate at which it can print data to log output once buffers are full. This is particularly relevant for startup time if a lot of output is logged, but can happen at other times as well. There are multiple ways to solve this problem:

- Reduce the volume of log output by lowering the app `CONFIG_LOG_DEFAULT_LEVEL` (the equivalent boot-loader setting is `CONFIG_BOOTLOADER_LOG_LEVEL`). This also reduces the binary size, and saves some CPU time spent on string formatting.
- Increase the speed of logging output by increasing the `CONFIG_ESP_CONSOLE_UART_BAUDRATE`. (Unless using internal USB-CDC for serial console, in which case the serial throughput doesn’t depend on the configured baud rate.)

Not Recommended The following options will also increase execution speed, but are not recommended as they also reduce the debuggability of the firmware application and may increase the severity of any bugs.

- Set `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` to disabled. This also reduces firmware binary size by a small amount. However, it may increase the severity of bugs in the firmware including security-related bugs. If necessary to do this to optimize a particular function, consider adding `#define NDEBUG` in the top of that single source file instead.

Targeted Optimizations The following changes will increase the speed of a chosen part of the firmware application:

- Move frequently executed code to IRAM. By default, all code in the app is executed from flash cache. This means that it’s possible for the CPU to have to wait on a “cache miss” while the next instructions are loaded from flash. Functions which are copied into IRAM are loaded once at boot time, and then will always execute at full speed.
IRAM is a limited resource, and using more IRAM may reduce available DRAM, so a strategic approach is needed when moving code to IRAM. See [IRAM \(指令 RAM\)](#) for more information.
- Jump table optimizations can be re-enabled for individual source files that don’t need to be placed in IRAM. For hot paths in large switch cases this will improve performance. For instructions on how to add the `-fjumptables -ftree-switch-conversion` options when compiling individual source files, see [组件编译控制](#)

Improving Startup Time In addition to the overall performance improvements shown above, the following options can be tweaked to specifically reduce startup time:

- Minimizing the `CONFIG_LOG_DEFAULT_LEVEL` and `CONFIG_BOOTLOADER_LOG_LEVEL` has a large impact on startup time. To enable more logging after the app starts up, set the `CONFIG_LOG_MAXIMUM_LEVEL` as well and then call `esp_log_level_set()` to restore higher level logs. The `system/startup_time` main function shows how to do this.
- If using deep sleep, setting `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` allows a faster wake from sleep. Note that if using Secure Boot this represents a security compromise, as Secure Boot validation will not be performed on wake.
- Setting `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON` will skip verifying the binary on every boot from power-on reset. How much time this saves depends on the binary size and the flash settings. Note that this setting carries some risk if the flash becomes corrupt unexpectedly. Read the help text of the `config item` for an explanation and recommendations if using this option.
- It's possible to save a small amount of time during boot by disabling RTC slow clock calibration. To do so, set `CONFIG_RTC_CLK_CAL_CYCLES` to 0. Any part of the firmware that uses RTC slow clock as a timing source will be less accurate as a result.

The example project `system/startup_time` is pre-configured to optimize startup time. The file `system/startup_time/sdkconfig.defaults` contain all of these settings. You can append these to the end of your project's own `sdkconfig` file to merge the settings, but please read the documentation for each setting first.

Task Priorities As ESP-IDF FreeRTOS is a real-time operating system, it's necessary to ensure that high throughput or low latency tasks are granted a high priority in order to run immediately. Priority is set when calling `xTaskCreate()` or `xTaskCreatePinnedToCore()` and can be changed at runtime by calling `vTaskPrioritySet()`.

It's also necessary to ensure that tasks yield CPU (by calling `vTaskDelay()`, `sleep()`, or by blocking on semaphores, queues, task notifications, etc) in order to not starve lower priority tasks and cause problems for the overall system. The *Task Watchdog Timer (TWDT)* provides a mechanism to automatically detect if task starvation happens, however note that a Task WDT timeout does not always indicate a problem (sometimes the correct operation of the firmware requires some long-running computation). In these cases tweaking the Task WDT timeout or even disabling the Task WDT may be necessary.

Built-In Task Priorities ESP-IDF starts a number of system tasks at fixed priority levels. Some are automatically started during the boot process, some are started only if the application firmware initializes a particular feature. To optimize performance, structure application task priorities so that they are not delayed by system tasks, while also not starving system tasks and impacting other functions of the system.

This may require splitting up a particular task. For example, perform a time-critical operation in a high priority task or an interrupt handler and do the non-time-critical part in a lower priority task.

Header `components/esp_system/include/esp_task.h` contains macros for the priority levels used for built-in ESP-IDF tasks system.

Common priorities are:

- *Main task that executes `app_main` function* has minimum priority (1). This task is pinned to Core 0 by default (*configurable*).
- *High Resolution Timer (ESP Timer)* system task to manage high precision timer events and execute callbacks has high priority (22, `ESP_TASK_TIMER_PRI0`). This task is pinned to Core 0.
- FreeRTOS Timer Task to handle FreeRTOS timer callbacks is created when the scheduler initializes and has minimum task priority (1, *configurable*). This task is pinned to Core 0.
- *Event Handling* system task to manage the default system event loop and execute callbacks has high priority (20, `ESP_TASK_EVENT_PRI0`) and pinned to Core 0. This configuration is only used if the application calls `esp_event_loop_create_default()`, it's possible to call `esp_event_loop_create()` with a custom task configuration instead.
- *lwIP TCP/IP* task has high priority (18, `ESP_TASK_TCPIP_PRI0`) and is not pinned to any core (*configurable*).
- *Wi-Fi Driver* task has high priority (23) and is pinned to Core 0 by default (*configurable*).

- Wi-Fi wpa_supplicant component may create dedicated tasks while the Wi-Fi Protected Setup (WPS), WPA2 EAP-TLS, Device Provisioning Protocol (DPP) or BSS Transition Management (BTM) features are in use. These tasks all have low priority (2) and are not pinned to any core.
 - *Bluetooth Controller* task has high priority (23, `ESP_TASK_BT_CONTROLLER_PRIO`) and is pinned to Core 0 by default (*configurable*). The Bluetooth Controller needs to respond to requests with low latency, so it should always be close to the highest priority task assigned to a single CPU.
 - *NimBLE Bluetooth Host* host task has high priority (21) and is pinned to Core 0 by default (*configurable*).
 - Stack event callback task (“BTC”) has high priority (19).
 - Stack BTU layer task has high priority (20).
 - Host HCI host task has high priority (22).
- All Bluebird Tasks are pinned to the same core, which is Core 0 by default (*configurable*).
- The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config `ETH_MAC_DEFAULT_CONFIG` then the priority is medium-high (15) and the task is not pinned to any core. These settings can be changed by passing a custom `eth_mac_config_t` struct when initializing the Ethernet MAC.
 - If using the *MQTT* component, it creates a task with default priority 5 (*configurable*, depends on `CONFIG_MQTT_USE_CUSTOM_CONFIG`) and not pinned to any core (*configurable*).
 - To see what is the task priority for mDNS service, please check [Performance Optimization](#).

Choosing application task priorities With a few exceptions (most importantly the lwIP TCP/IP task), in the default configuration most built-in tasks are pinned to Core 0. This makes it quite easy for the application to place high priority tasks on Core 1. Using priority 19 or higher will guarantee an application task can run on Core 1 without being preempted by any built-in task. To further isolate the tasks running on each CPU, configure the *lwIP task* to only run on Core 0 instead of either core (this may reduce total TCP/IP throughput depending on what other tasks are running).

In general, it’s not recommended to set task priorities on Core 0 higher than the built-in Wi-Fi/BT operations as starving them of CPU may make the system unstable. Choosing priority 19 and Core 0 will allow lower layer Wi-Fi/BT functionality to run without delays, but still pre-empts the lwIP TCP/IP stack and other less time-critical internal functionality - this is an option for time-critical tasks that don’t perform network operations. Any task that does TCP/IP network operations should run at lower priority than the lwIP TCP/IP task (18) to avoid priority inversion issues.

备注: Setting a task to always run in preference to built-in ESP-IDF tasks does not require pinning to Core 1. The task can be left unpinned - at priority 17 or lower - to optionally run on Core 0 as well, if no higher priority built-in task is running there. Using unpinned tasks can improve the overall CPU utilization, however it makes reasoning about task scheduling more complex.

备注: Task execution is always completely suspended when writing to the built-in SPI flash chip. Only *IRAM 安全中断处理程序* will continue executing.

Improving Interrupt Performance ESP-IDF supports dynamic *Interrupt allocation* with interrupt preemption. Each interrupt in the system has a priority, and higher priority interrupts will preempt lower priority ones.

Interrupt handlers will execute in preference to any task (provided the task is not inside a critical section). For this reason, it’s important to minimize the amount of time spent executing in an interrupt handler.

To obtain the best performance for a particular interrupt handler:

- Assign more important interrupts a higher priority using a flag such as `ESP_INTR_FLAG_LEVEL2` or `ESP_INTR_FLAG_LEVEL3` when calling `esp_intr_alloc()`.

- Assign the interrupt on a CPU where built-in Wi-Fi/BT tasks are not configured to run (this means assigning on Core 1 by default, see *Built-In Task Priorities*). Interrupts are assigned on the same CPU where the `esp_intr_alloc()` function call is made.
- If you're sure the entire interrupt handler can run from IRAM (see *IRAM 安全中断处理程序*) then set the `ESP_INTR_FLAG_IRAM` flag when calling `esp_intr_alloc()` to assign the interrupt. This prevents it being temporarily disabled if the application firmware writes to the internal SPI flash.
- Even if the interrupt handler is not IRAM safe, if it is going to be executed frequently then consider moving the handler function to IRAM anyhow. This minimizes the chance of a flash cache miss when the interrupt code is executed (see *Targeted Optimizations*). It's possible to do this without adding the `ESP_INTR_FLAG_IRAM` flag to mark the interrupt as IRAM-safe, if only part of the handler is guaranteed to be in IRAM.

Improving Network Speed

- For Wi-Fi, see *如何提高 Wi-Fi 性能* and *Wi-Fi 缓冲区使用情况*
- For lwIP TCP/IP (Wi-Fi and Ethernet), see *Performance Optimization*
- The `wifi/iperf` example contains a configuration that is heavily optimized for Wi-Fi TCP/IP throughput. Append the contents of the files `wifi/iperf/sdkconfig.defaults`, `wifi/iperf/sdkconfig.defaults.esp32s3` and `wifi/iperf/sdkconfig.ci.99` to your project `sdkconfig` file in order to add all of these options. Note that some of these options may have trade-offs in terms of reduced debuggability, increased firmware size, increased memory usage, or reduced performance of other features. To get the best result, read the documentation pages linked above and use this information to determine exactly which options are best suited for your app.

Minimizing Binary Size

The ESP-IDF build system compiles all source files in the project and ESP-IDF, but only functions and variables that are actually referenced by the program are linked into the final binary. In some cases, it is necessary to reduce the total size of the firmware binary (for example, in order to fit it into the available flash partition size).

The first step to reducing the total firmware binary size is measuring what is causing the size to increase.

Measuring Static Sizes To optimize both firmware binary size and memory usage it's necessary to measure statically allocated RAM (“data” , “bss”), code (“text”) and read-only data (“rodata”) in your project.

Using the `idf.py` sub-commands `size`, `size-components` and `size-files` provides a summary of memory used by the project:

Size Summary (idf.py size)

```
$ idf.py size
[...]
Total sizes:
DRAM .data size: 11584 bytes
DRAM .bss size: 19624 bytes
Used static DRAM: 0 bytes ( 0 available, nan% used)
Used static IRAM: 0 bytes ( 0 available, nan% used)
Used stat D/IRAM: 136276 bytes ( 519084 available, 20.8% used)
  Flash code: 630508 bytes
  Flash rodata: 177048 bytes
Total image size:~ 924208 bytes (.bin may be padded larger)
```

This output breaks down the size of all static memory regions in the firmware binary:

- `DRAM .data size` is statically allocated RAM that is assigned to non-zero values at startup. This uses RAM (DRAM) at runtime and also uses space in the binary file.
- `DRAM .bss size` is statically allocated RAM that is assigned zero at startup. This uses RAM (DRAM) at runtime but doesn't use any space in the binary file.

- Used static DRAM, Used static IRAM - these options are kept for compatibility with ESP32 target, and currently read 0.
- Used stat D/IRAM - This is total internal RAM usage, the sum of static DRAM .data + .bss, and also static *IRAM* (指令 RAM) used by the application for executable code. The available size is the estimated amount of DRAM which will be available as heap memory at runtime (due to metadata overhead and implementation constraints, and heap allocations done by ESP-IDF during startup, the actual free heap at startup will be lower than this).
- Flash code is the total size of executable code executed from flash cache (*IROM*). This uses space in the binary file.
- Flash rodata is the total size of read-only data loaded from flash cache (*DROM*). This uses space in the binary file.
- Total image size is the estimated total binary file size, which is the total of all the used memory types except for .bss.

Component Usage Summary (idf.py size-components) The summary output provided by `idf.py size` does not give enough detail to find the main contributor to excessive binary size. To analyze in more detail, use `idf.py size-components`

```

The first lines of output from `idf.py size-components` are the same as `idf.py size`. After this a table is printed of “per-archive contributions to ELF file”. This means how much each static library archive has contributed to the final binary size.

Generally, one static library archive is built per component, although some are binary libraries included by a particular component (for example, `libnet80211.a` is included by `esp_wifi` component). There are also toolchain libraries such as `libc.a` and `libgcc.a` listed here, these provide Standard C/C++ Library and toolchain built-in functionality.

If your project is simple and only has a “main” component, then all of the project’s code will be shown under `libmain.a`. If your project includes its own components (see [构建系统](#)), then they will each be shown on a separate line.

The table is sorted in descending order of the total contribution to the binary size.

The columns are as follows:

- DRAM `.data` & `.bss` & other - `.data` and `.bss` are the same as for the totals shown above (static variables, these both reduce total available RAM at runtime but `.bss` doesn’t contribute to the binary file size). “other” is a column for any custom section types that also contribute to RAM size (usually this value is 0).
- IRAM - is the same as for the totals shown above (code linked to execute from IRAM, uses space in the binary file and also reduces DRAM available as heap at runtime).
- Flash code & rodata - these are the same as the totals above, IROM and DROM space accessed from flash cache that contribute to the binary size.

Source File Usage Summary (`idf.py size-files`) For even more detail, run `idf.py size-files` to get a summary of the contribution each object file has made to the final binary size. Each object file corresponds to a single source file.

```

[... additional lines removed ...]								

After the summary of total sizes, a table of “Per-file contributions to ELF file” is printed.

The columns are the same as shown above for `idy.py size-components`, but this time the granularity is the contribution of each individual object file to the binary size.

For example, we can see that the file `x509_cert_bundle.S.o` contributed 64212 bytes to the total firmware size, all as `.rodata` in flash. Therefore we can guess that this application is using the *ESP x509 Certificate Bundle* feature and not using this feature would save at least this many bytes from the firmware size.

Some of the object files are linked from binary libraries and therefore you won't find a corresponding source file. To locate which component a source file belongs to, it's generally possible to search in the ESP-IDF source tree or look in the *Linker Map File* for the full path.

Comparing Two Binaries If making some changes that affect binary size, it's possible to use an ESP-IDF tool to break down the exact differences in size.

This operation isn't part of `idf.py`, it's necessary to run the `idf-size.py` Python tool directly.

To do so, first locate the linker map file in the build directory. It will have the name `PROJECTNAME.map`. The `idf-size.py` tool performs its analysis based on the output of the linker map file.

To compare with another binary, you will also need its corresponding `.map` file saved from the build directory.

For example, to compare two builds: one with the default `CONFIG_COMPILER_OPTIMIZATION` setting “Debug (-Og)” configuration and one with “Optimize for size (-Os)” :

```
$ $IDF_PATH/tools/idf_size.py --diff build_Og/https_request.map build_Os/https_
↪request.map
<CURRENT> MAP file: build_Os/https_request.map
<REFERENCE> MAP file: build_Og/https_request.map
Difference is counted as <CURRENT> - <REFERENCE>, i.e. a positive number means
↪that <CURRENT> is larger.
Total sizes of <CURRENT>:
↪<REFERENCE>      Difference
DRAM .data size:  14516 bytes
↪14956            -440
DRAM .bss size:   15792 bytes
↪15808           -16
Used static DRAM: 30308 bytes ( 150428 available, 16.8% used)
↪30764           -456 ( +456 available, +0 total)
Used static IRAM: 78498 bytes ( 52574 available, 59.9% used)
↪83918          -5420 ( +5420 available, +0 total)
Flash code:      509183 bytes
↪559943         -50760
Flash rodata:    170592 bytes
↪176736         -6144
Total image size:~ 772789 bytes (.bin may be padded larger)
↪835553         -62764
```

We can see from the “Difference” column that changing this one setting caused the whole binary to be over 60 KB smaller and over 5 KB more RAM is available.

It's also possible to use the “diff” mode to output a table of component-level (static library archive) differences:

```
$IDF_PATH/tools/idf_size.py --archives --diff build_Og/https_request.map build_
↪Oshttps_request.map
```

Also at the individual source file level:

```
$IDF_PATH/tools/idf_size.py --files --diff build_Og/https_request.map build_
↪Oshttps_request.map
```

Other options (like writing the output to a file) are available, pass `--help` to see the full list.

Showing Size When Linker Fails If too much static memory is used, then the linker will fail with an error such as `DRAM segment data does not fit, region `iram0_0_seg' overflowed by 44 bytes, or similar.`

In these cases, `idf.py size` will not succeed either. However it is possible to run `idf_size.py` manually in order to view the *partial static memory usage* (the memory usage will miss the variables which could not be linked, so there still appears to be some free space.)

The map file argument is `<projectname>.map` in the build directory

```
$IDF_PATH/tools/idf_size.py build/project_name.map
```

It is also possible to view the equivalent of `size-components` or `size-files` output:

```
$IDF_PATH/tools/idf_size.py --archives build/project_name.map
$IDF_PATH/tools/idf_size.py --files build/project_name.map
```

Linker Map File *This is an advanced analysis method, but it can be very useful. Feel free to skip ahead to :ref:'reducing-overall-size' and possibly come back to this later.*

The `idf.py size` analysis tools all work by parsing the GNU binutils “linker map file”, which is a summary of everything the linker did when it created (“linked”) the final firmware binary file

Linker map files themselves are plain text files, so it’s possible to read them and find out exactly what the linker did. However, they are also very complex and long - often 100,000 or more lines!

The map file itself is broken into parts and each part has a heading. The parts are:

- `Archive member included to satisfy reference by file (symbol)`. This shows you: for each object file included in the link, what symbol (function or variable) was the linker searching for when it included that object file. If you’re wondering why some object file in particular was included in the binary, this part may give a clue. This part can be used in conjunction with the `Cross Reference Table` at the end of the file. Note that not every object file shown in this list ends up included in the final binary, some end up in the `Discarded input sections` list instead.
- `Allocating common symbols` - This is a list of (some) global variables along with their sizes. Common symbols have a particular meaning in ELF binary files, but ESP-IDF doesn’t make much use of them.
- `Discarded input sections` - These sections were read by the linker as part of an object file to be linked into the final binary, but then nothing else referred to them so they were discarded from the final binary. For ESP-IDF this list can be very long, as we compile each function and static variable to a unique section in order to minimize the final binary size (specifically ESP-IDF uses compiler options `-ffunction-sections` `-fdata-sections` and linker option `--gc-sections`). Items mentioned in this list *do not* contribute to the final binary.
- `Memory Configuration, Linker script and memory map` These two parts go together. Some of the output comes directly from the linker command line and the Linker Script, both provided by the [构建系统](#). The linker script is partially generated from the ESP-IDF project using the [链接器脚本生成机制](#) feature. As the output of the Linker script and memory map part of the map unfolds, you can see each symbol (function or static variable) linked into the final binary along with its address (as a 16 digit hex number), its length (also in hex), and the library and object file it was linked from (which can be used to determine the component and the source file).
Following all of the output sections that take up space in the final `.bin` file, the `memory map` also includes some sections in the ELF file that are only used for debugging (ELF sections `.debug_*`, etc.). These don’t contribute to the final binary size. You’ll notice the address of these symbols is a very low number (starting from `0x0000000000000000` and counting up).
- `Cross Reference Table`. This table shows for each symbol (function or static variable), the list of object file(s) that referred to it. If you’re wondering why a particular thing is included in the binary, this will help determine what included it.

备注: Unfortunately, the `Cross Reference Table` doesn’t only include symbols that made it into the final binary. It also includes symbols in discarded sections. Therefore, just because something is shown here doesn’t mean that it was included in the final binary - this needs to be checked separately.

备注: Linker map files are generated by the GNU binutils linker “ld”, not ESP-IDF. You can find additional information online about the linker map file format. This quick summary is written from the perspective of ESP-IDF

build system in particular.

Reducing Overall Size The following configuration options will reduce the final binary size of almost any ESP-IDF project:

- Set `CONFIG_COMPILER_OPTIMIZATION` to “Optimize for size (-Os)” . In some cases, “Optimize for performance (-O2)” will also reduce the binary size compared to the default. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise don't happen.
- Reduce the compiled-in log output by lowering the app `CONFIG_LOG_DEFAULT_LEVEL`. If the `CONFIG_LOG_MAXIMUM_LEVEL` is changed from the default then this setting controls the binary size instead. Reducing compiled-in logging reduces the number of strings in the binary, and also the code size of the calls to logging functions.
- Set the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` to “Silent” . This avoids compiling in a dedicated assertion string and source file name for each assert that may fail. It's still possible to find the failed assert in the code by looking at the memory address where the assertion failed.
- Besides the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`, you can disable or silent the assertion for HAL component separately by setting `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL`. It is to notice that ESP-IDF lowers HAL assertion level in bootloader to be silent even if `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` is set to full-assertion level. This is to reduce the bootloader size.
- Set `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`. This removes specific error messages for particular internal ESP-IDF error check macros. This may make it harder to debug some error conditions by reading the log output.
- Don't enable `CONFIG_COMPILER_CXX_EXCEPTIONS`, `CONFIG_COMPILER_CXX_RTTI`, or set the `CONFIG_COMPILER_STACK_CHECK_MODE` to Overall. All of these options are already disabled by default, but they have a large impact on binary size.
- Disabling `CONFIG_ESP_ERR_TO_NAME_LOOKUP` will remove the lookup table to translate user-friendly names for error values (see [错误处理](#)) in error logs, etc. This saves some binary size, but error values will be printed as integers only.
- Setting `CONFIG_ESP_SYSTEM_PANIC` to “Silent reboot” will save a small amount of binary size, however this is *only* recommended if no one will use UART output to debug the device.
- If the application binary uses only one of the security versions of the protocomm component, then the support for others can be disabled to save some code size. The support can be disabled through `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`, `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1` or `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2` respectively.

备注: In addition to the many configuration items shown here, there are a number of configuration options where changing the option from the default will increase binary size. These are not noted here. Where the increase is significant, this is usually noted in the configuration item help text.

Targeted Optimizations The following binary size optimizations apply to a particular component or a function:

Wi-Fi

- Disabling `CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE` will save some Wi-Fi binary size if WPA3 support is not needed. (Note that WPA3 is mandatory for new Wi-Fi device certifications.)
- Disabling `CONFIG_ESP_WIFI_SOFTAP_SUPPORT` will save some Wi-Fi binary size if soft-AP support is not needed.

Bluetooth NimBLE If using `NimBLE Bluetooth Host` then the following modifications can reduce binary size:

- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS` to 1 if only one BLE connection is needed.
- Disable either `CONFIG_BT_NIMBLE_ROLE_CENTRAL` or `CONFIG_BT_NIMBLE_ROLE_OBSERVER` if these roles are not needed.
- Reducing `CONFIG_BT_NIMBLE_LOG_LEVEL` can reduce binary size. Note that if the overall log level has been reduced as described above in *Reducing Overall Size* then this also reduces the NimBLE log level.

lwIP IPv6

- Setting `CONFIG_LWIP_IPV6` to false will reduce the size of the lwIP TCP/IP stack, at the cost of only supporting IPv4.

备注: IPv6 is required by some components such as `coap` and `ASIO port`, These components will not be available if IPV6 is disabled.

Newlib nano formatting By default, ESP-IDF uses newlib “full” formatting for I/O (`printf`, `scanf`, etc.)

Enabling the config option `CONFIG_NEWLIB_NANO_FORMAT` will switch newlib to the “nano” formatting mode. This both smaller in code size and a large part of the implementation is compiled into the ESP32-S3 ROM, so it doesn't need to be included in the binary at all.

The exact difference in binary size depends on which features the firmware uses, but 25 KB ~ 50 KB is typical.

Enabling Nano formatting also reduces the stack usage of each function that calls `printf()` or another string formatting function, see *Reducing Stack Sizes*.

“Nano” formatting doesn't support 64-bit integers, or C99 formatting features. For a full list of restrictions, search for `--enable-newlib-nano-formatted-io` in the [Newlib README file](#).

mbedTLS features Under *Component Config -> mbedTLS* there are multiple mbedTLS features which are enabled by default but can be disabled if not needed to save code size.

These include:

- `CONFIG_MBEDTLS_HAVE_TIME`
- `CONFIG_MBEDTLS_ECDSA_DETERMINISTIC`
- `CONFIG_MBEDTLS_SHA512_C`
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION`
- `CONFIG_MBEDTLS_SSL_ALPN`
- `CONFIG_MBEDTLS_SSL_RENEGOTIATION`
- `CONFIG_MBEDTLS_CCM_C`
- `CONFIG_MBEDTLS_GCM_C`
- `CONFIG_MBEDTLS_ECP_C` (Alternatively: Leave this option enabled but disable some of the elliptic curves listed in the sub-menu.)
- Change `CONFIG_MBEDTLS_TLS_MODE` if both server & client functionalities are not needed
- Consider disabling some ciphersuites listed in the “TLS Key Exchange Methods” sub-menu (i.e. `CONFIG_MBEDTLS_KEY_EXCHANGE_RSA`)

The help text for each option has some more information.

重要: It is **strongly not recommended to disable all these mbedTLS options**. Only disable options where you understand the functionality and are certain that it is not needed in the application. In particular:

- Ensure that any TLS server(s) the device connects to can still be used. If the server is controlled by a third party or a cloud service, recommend ensuring that the firmware supports at least two of the supported cipher suites in case one is disabled in a future update.

- Ensure that any TLS client(s) that connect to the device can still connect with supported/recommended cipher suites. Note that future versions of client operating systems may remove support for some features, so it is recommended to enable multiple supported cipher suites or algorithms for redundancy.

If depending on third party clients or servers, always pay attention to announcements about future changes to supported TLS features. If not, the ESP32-S3 device may become inaccessible if support changes.

备注: Not every combination of mbedTLS compile-time config is tested in ESP-IDF. If you find a combination that fails to compile or function as expected, please report the details on GitHub.

VFS *Virtual filesystem* feature in ESP-IDF allows multiple filesystem drivers and file-like peripheral drivers to be accessed using standard I/O functions (`open`, `read`, `write`, etc.) and C library functions (`fopen`, `fread`, `fwrite`, etc.). When filesystem or file-like peripheral driver functionality is not used in the application this feature can be fully or partially disabled. VFS component provides the following configuration options:

- `CONFIG_VFS_SUPPORT_TERMIOS` — can be disabled if the application doesn't use `termios` family of functions. Currently, these functions are implemented only for UART VFS driver. Most applications can disable this option. Disabling this option reduces the code size by about 1.8 kB.
- `CONFIG_VFS_SUPPORT_SELECT` — can be disabled if the application doesn't use `select` function with file descriptors. Currently, only the UART and eventfd VFS drivers implement `select` support. Note that when this option is disabled, `select` can still be used for socket file descriptors. Disabling this option reduces the code size by about 2.7 kB.
- `CONFIG_VFS_SUPPORT_DIR` — can be disabled if the application doesn't use directory related functions, such as `readdir` (see the description of this option for the complete list). Applications which only open, read and write specific files and don't need to enumerate or create directories can disable this option, reducing the code size by 0.5 kB or more, depending on the filesystem drivers in use.
- `CONFIG_VFS_SUPPORT_IO` — can be disabled if the application doesn't use filesystems or file-like peripheral drivers. This disables all VFS functionality, including the three options mentioned above. When this option is disabled, `console` can't be used. Note that the application can still use standard I/O functions with socket file descriptors when this option is disabled. Compared to the default configuration, disabling this option reduces code size by about 9.4 kB.

Bootloader Size This document deals with the size of an ESP-IDF app binary only, and not the ESP-IDF [二级引导程序](#).

For a discussion of ESP-IDF bootloader binary size, see [引导加载程序大小](#).

IRAM Binary Size If the IRAM section of a binary is too large, this issue can be resolved by reducing IRAM memory usage. See [Optimizing IRAM Usage](#).

Minimizing RAM Usage

In some cases, a firmware application's available RAM may run low or run out entirely. In these cases, it's necessary to tune the memory usage of the firmware application.

In general, firmware should aim to leave some “headroom” of free internal RAM in order to deal with extraordinary situations or changes in RAM usage in future updates.

Background Before optimizing ESP-IDF RAM usage, it's necessary to understand the basics of ESP32-S3 memory types, the difference between static and dynamic memory usage in C, and the way ESP-IDF uses stack and heap. This information can all be found in [Heap Memory Allocation](#).

Measuring Static Memory Usage The `idf.py` tool can be used to generate reports about the static memory usage of an application. Refer to [the Binary Size chapter for more information](#).

Measuring Dynamic Memory Usage ESP-IDF contains a range of heap APIs for measuring free heap at runtime. See [Heap Memory Debugging](#).

备注: In embedded systems, heap fragmentation can be a significant issue alongside total RAM usage. The heap measurement APIs provide ways to measure the “largest free block”. Monitoring this value along with the total number of free bytes can give a quick indication of whether heap fragmentation is becoming an issue.

Reducing Static Memory Usage

- Reducing the static memory usage of the application increases the amount of RAM available for heap at runtime, and vice versa.
- Generally speaking, minimizing static memory usage requires monitoring the `.data` and `.bss` sizes. For tools to do this, see [Measuring Static Sizes](#).
- Internal ESP-IDF functions do not make heavy use of static RAM allocation in C. In many instances (including: Wi-Fi library, Bluetooth controller) “static” buffers are still allocated from heap, but the allocation is done once when the feature is initialized and will be freed if the feature is deinitialized. This is done in order to maximize the amount of free memory at different points in the application life-cycle.

To minimize static memory use:

- Declare structures, buffers, or other variables `const` whenever possible. Constant data can be stored in flash not RAM. This may require changing functions in the firmware to take `const *` arguments instead of mutable pointer arguments. These changes can also reduce the stack usage of some functions.
- If using Bluedroid, setting the option `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY` will cause Bluedroid to allocate memory on initialization and free it on deinitialization. This doesn't necessarily reduce the peak memory usage, but changes it from static memory usage to runtime memory usage.

Reducing Stack Sizes In FreeRTOS, task stacks are usually allocated from the heap. The stack size for each task is fixed (passed as an argument to `xTaskCreate()`). Each task can use up to its allocated stack size, but using more than this will cause an otherwise valid program to crash with a stack overflow or heap corruption.

Therefore, determining the optimum sizes of each task stack can substantially reduce RAM usage.

To determine optimum task stack sizes:

- Combine tasks. The best task stack size is 0 bytes, achieved by combining a task with another existing task. Anywhere that the firmware can be structured to perform multiple functions sequentially in a single task will increase free memory. In some cases, using a “worker task” pattern where jobs are serialized into a FreeRTOS queue (or similar) and then processed by generic worker tasks may help.
- Consolidate task functions. String formatting functions (like `printf`) are particularly heavy users of stack, so any task which doesn't ever call these can usually have its stack size reduced.
- Enabling [Newlib nano formatting](#) will reduce the stack usage of any task that calls `printf()` or other C string formatting functions.
- Avoid allocating large variables on the stack. In C, any large struct or array allocated as an “automatic” variable (i.e. default scope of a C declaration) will use space on the stack. Minimize the sizes of these, allocate them statically and/or see if you can save memory by allocating them from the heap only when they are needed.
- Avoid deep recursive function calls. Individual recursive function calls don't always add a lot of stack usage each time they are called, but if each function includes large stack-based variables then the overhead can get quite high.
- At runtime, call the function `uxTaskGetStackHighWaterMark()` with the handle of any task where you think there is unused stack memory. This function returns the minimum lifetime free stack memory in bytes. The easiest time to call this is from the task itself: call `uxTaskGetStackHighWaterMark(NULL)` to get the current task's high water mark after the time that the task has achieved its peak stack usage (i.e. if there is a main loop, execute the main loop a number of times with all possible states and then call `uxTaskGetStackHighWaterMark()`). Often, it's possible to subtract almost the entire value returned here from the total stack size of a task, but allow some safety margin to account for unexpected small increases in stack usage at runtime.

- Call `uxTaskGetSystemState()` at runtime to get a summary of all tasks in the system. This includes their individual stack “high watermark” values.
- When debugger watchpoints are not being used, set the `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` option to trigger an immediate panic if a task writes the word at the end of its assigned stack. This is slightly more reliable than the default `CONFIG_FREERTOS_CHECK_STACKOVERFLOW` option of “Check using canary bytes”, because the panic happens immediately, not on the next RTOS context switch. Neither option is perfect, it’s possible in some cases for stack pointer to skip the watchpoint or canary bytes and corrupt another region of RAM, instead.

Internal Stack Sizes ESP-IDF allocates a number of internal tasks for housekeeping purposes or operating system functions. Some are created during the startup process, and some are created at runtime when particular features are initialized.

The default stack sizes for these tasks are usually set conservatively high, to allow all common usage patterns. Many of the stack sizes are configurable, and it may be possible to reduce them to match the real runtime stack usage of the task.

重要: If internal task stack sizes are set too small, ESP-IDF will crash unpredictably. Even if the root cause is task stack overflow, this is not always clear when debugging. It is recommended that internal stack sizes are only reduced carefully (if at all), with close attention to “high water mark” free space under load. If reporting an issue that occurs when internal task stack sizes have been reduced, please always include this information and the specific configuration that is being used.

- *Main task that executes `app_main` function* has stack size `CONFIG_ESP_MAIN_TASK_STACK_SIZE`.
- *High Resolution Timer (ESP Timer) system task* which executes callbacks has stack size `CONFIG_ESP_TIMER_TASK_STACK_SIZE`.
- *FreeRTOS Timer Task* to handle FreeRTOS timer callbacks has stack size `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`.
- *Event Handling* system task to execute callbacks for the default system event loop has stack size `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`.
- *lwIP TCP/IP task* has stack size `CONFIG_LWIP_TCPIP_TASK_STACK_SIZE`
- *Bluedroid Bluetooth Host* have task stack sizes `CONFIG_BT_BTC_TASK_STACK_SIZE`, `CONFIG_BT_BTU_TASK_STACK_SIZE`.
- *NimBLE Bluetooth Host* has task stack size `CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE`
- The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config `ETH_MAC_DEFAULT_CONFIG` then the task stack size is 4 KB. This setting can be changed by passing a custom `eth_mac_config_t` struct when initializing the Ethernet MAC.
- FreeRTOS idle task stack size is configured by `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE`.
- If using the `MQTT` component, it creates a task with stack size configured by `CONFIG_MQTT_TASK_STACK_SIZE`. MQTT stack size can also be configured using `task_stack` field of `esp_mqtt_client_config_t`.
- To see how to optimize RAM usage when using mDNS, please check [Performance Optimization](#).

备注: Aside from built-in system features such as esp-timer, if an ESP-IDF feature is not initialized by the firmware then no associated task is created. In those cases, the stack usage is zero and the stack size configuration for the task is not relevant.

Reducing Heap Usage For functions that assist in analyzing heap usage at runtime, see [Heap Memory Debugging](#).

Normally, optimizing heap usage consists of analyzing the usage and removing calls to `malloc()` that aren’t being used, reducing the corresponding sizes, or freeing previously allocated buffers earlier.

There are some ESP-IDF configuration options that can reduce heap usage at runtime:

- lwIP documentation has a section to configure *Minimum RAM usage*.
- *Wi-Fi 缓冲区使用情况* describes options to either reduce numbers of “static” buffers or reduce the maximum number of “dynamic” buffers in use, in order to minimize memory usage at possible cost of performance. Note that “static” Wi-Fi buffers are still allocated from heap when Wi-Fi is initialized and will be freed if Wi-Fi is deinitialized.
- Several Mbed TLS configuration options can be used to reduce heap memory usage. See the *Mbed TLS* docs for details.

备注: There are other configuration options that will increase heap usage at runtime if changed from the defaults. These are not listed here, but the help text for the configuration item will mention if there is some memory impact.

Optimizing IRAM Usage The available DRAM at runtime (for heap usage) is also reduced by the static IRAM usage. Therefore, one way to increase available DRAM is to reduce IRAM usage.

If the app allocates more static IRAM than is available then the app will fail to build and linker errors such as section ``.iram0.text'` will not fit in region ``.iram0_0_seg'`, IRAM0 segment data does not fit and region ``.iram0_0_seg'` overflowed by 84 bytes will be seen. If this happens, it is necessary to find ways to reduce static IRAM usage in order to link the application.

To analyze the IRAM usage in the firmware binary, use *Measuring Static Sizes*. If the firmware failed to link, steps to analyze are shown at *Showing Size When Linker Fails*.

The following options will reduce IRAM usage of some ESP-IDF features:

- Enable *CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH*. Provided these functions are not (incorrectly) used from ISRs, this option is safe to enable in all configurations.
- Enable *CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS_INTO_FLASH*. Enabling this option will place snapshot-related functions, such as `vTaskGetSnapshot` or `uxTaskGetSnapshotAll`, in flash.
- Enable *CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH*. Provided these functions are not (incorrectly) used from ISRs, this option is safe to enable in all configurations.
- Enable *CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH*. This option is not safe to use if the ISR ringbuf functions are used from an IRAM interrupt context, e.g. if *CONFIG_UART_ISR_IN_IRAM* is enabled. For the IDF drivers where this is the case you will get an error at run-time when installing the driver in question.
- Disable Wi-Fi options *CONFIG_ESP32_WIFI_IRAM_OPT* and/or *CONFIG_ESP32_WIFI_RX_IRAM_OPT*. Disabling these options will free available IRAM at the cost of Wi-Fi performance.
- *CONFIG_SPI_FLASH_ROM_IMPL* enabling this option will free some IRAM but will mean that `esp_flash` bugfixes and new flash chip support is not available.
- Disabling *CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR* prevents posting `esp_event` events from *IRAM 安全中断处理程序* but will save some IRAM.
- Disabling *CONFIG_SPI_MASTER_ISR_IN_IRAM* prevents `spi_master` interrupts from being serviced while writing to flash, and may otherwise reduce `spi_master` performance, but will save some IRAM.
- Setting *CONFIG_HAL_DEFAULT_ASSERTION_LEVEL* to disable assertion for HAL component will save some IRAM especially for HAL code who calls `HAL_ASSERT` a lot and resides in IRAM.

备注: Moving frequently-called functions from IRAM to flash may increase their execution time.

备注: Other configuration options exist that will increase IRAM usage by moving some functionality into IRAM, usually for performance, but the default option is not to do this. These are not listed here. The IRAM size impact of enabling these options is usually noted in the configuration item help text.

4.27 RF calibration

ESP32-S3 supports three RF calibration methods during RF initialization:

1. Partial calibration
2. Full calibration
3. No calibration

4.27.1 Partial calibration

During RF initialization, the partial calibration method is used by default for RF calibration. It is done based on the full calibration data which is stored in the NVS. To use this method, please go to `menuconfig` and enable `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`.

4.27.2 Full calibration

Full calibration is triggered in the following conditions:

1. NVS does not exist.
2. The NVS partition to store calibration data is erased.
3. Hardware MAC address is changed.
4. PHY library version is changed.
5. The RF calibration data loaded from the NVS partition is broken.

It takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. To switch to the full calibration method, go to `menuconfig` and disable `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`. If you use the default method of RF calibration, there are two ways to add the function of triggering full calibration as a last-resort remedy.

1. Erase the NVS partition if you don't mind all of the data stored in the NVS partition is erased. That is indeed the easiest way.
2. Call API `esp_phy_erase_cal_data_in_nvs()` before initializing WiFi and BT/BLE based on some conditions (e.g. an option provided in some diagnostic mode). In this case, only phy namespace of the NVS partition is erased.

4.27.3 No calibration

No calibration method is only used when the device wakes up from deep sleep.

4.27.4 PHY initialization data

The PHY initialization data is used for RF calibration. There are two ways to get the PHY initialization data.

One is the default initialization data which is located in the header file `components/esp_phy/esp32s3/include/phy_init_data.h`.

It is embedded into the application binary after compiling and then stored into read-only memory (DROM). To use the default initialization data, please go to `menuconfig` and disable `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`.

Another is the initialization data which is stored in a partition. When using a custom partition table, make sure that PHY data partition is included (type: `data`, subtype: `phy`). With default partition table, this is done automatically. If initialization data is stored in a partition, it has to be flashed there, otherwise runtime error will occur. To switch to the initialization data stored in a partition, go to `menuconfig` and enable `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`.

4.27.5 API Reference

Header File

- components/esp_phy/include/esp_phy_init.h

Functions

const *esp_phy_init_data_t* ***esp_phy_get_init_data** (void)

Get PHY init data.

If “Use a partition to store PHY init data” option is set in menuconfig, This function will load PHY init data from a partition. Otherwise, PHY init data will be compiled into the application itself, and this function will return a pointer to PHY init data located in read-only memory (DROM).

If “Use a partition to store PHY init data” option is enabled, this function may return NULL if the data loaded from flash is not valid.

备注: Call `esp_phy_release_init_data` to release the pointer obtained using this function after the call to `esp_wifi_init`.

返回 pointer to PHY init data structure

void **esp_phy_release_init_data** (const *esp_phy_init_data_t* *data)

Release PHY init data.

参数 data –pointer to PHY init data structure obtained from `esp_phy_get_init_data` function

esp_err_t **esp_phy_load_cal_data_from_nvs** (*esp_phy_calibration_data_t* *out_cal_data)

Function called by `esp_phy_load_cal_and_init` to load PHY calibration data.

This is a convenience function which can be used to load PHY calibration data from NVS. Data can be stored to NVS using `esp_phy_store_cal_data_to_nvs` function.

If calibration data is not present in the NVS, or data is not valid (was obtained for a chip with a different MAC address, or obtained for a different version of software), this function will return an error.

参数 out_cal_data –pointer to calibration data structure to be filled with loaded data.

返回 ESP_OK on success

esp_err_t **esp_phy_store_cal_data_to_nvs** (const *esp_phy_calibration_data_t* *cal_data)

Function called by `esp_phy_load_cal_and_init` to store PHY calibration data.

This is a convenience function which can be used to store PHY calibration data to the NVS. Calibration data is returned by `esp_phy_load_cal_and_init` function. Data saved using this function to the NVS can later be loaded using `esp_phy_store_cal_data_to_nvs` function.

参数 cal_data –pointer to calibration data which has to be saved.

返回 ESP_OK on success

esp_err_t **esp_phy_erase_cal_data_in_nvs** (void)

Erase PHY calibration data which is stored in the NVS.

This is a function which can be used to trigger full calibration as a last-resort remedy if partial calibration is used. It can be called in the application based on some conditions (e.g. an option provided in some diagnostic mode).

返回 ESP_OK on success

返回 others on fail. Please refer to NVS API return value error number.

bool **esp_phy_is_initialized** (void)

Get phy initialize status.

返回 return true if phy is already initialized.

void **esp_phy_enable** (void)

Enable PHY and RF module.

PHY and RF module should be enabled in order to use WiFi or BT. Now PHY and RF enabling job is done automatically when start WiFi or BT. Users should not call this API in their application.

void **esp_phy_disable** (void)

Disable PHY and RF module.

PHY module should be disabled in order to shutdown WiFi or BT. Now PHY and RF disabling job is done automatically when stop WiFi or BT. Users should not call this API in their application.

void **esp_phy_load_cal_and_init** (void)

Load calibration data from NVS and initialize PHY and RF module.

void **esp_phy_modem_init** (void)

Initialize backup memory for Phy power up/down.

void **esp_phy_modem_deinit** (void)

Deinitialize backup memory for Phy power up/down Set phy_init_flag if all modems deinit on ESP32C3.

void **esp_phy_common_clock_enable** (void)

Enable WiFi/BT common clock.

void **esp_phy_common_clock_disable** (void)

Disable WiFi/BT common clock.

int64_t **esp_phy_rf_get_on_ts** (void)

Get the time stamp when PHY/RF was switched on.

返回 return 0 if PHY/RF is never switched on. Otherwise return time in microsecond since boot when phy/rf was last switched on

esp_err_t **esp_phy_update_country_info** (const char *country)

Update the corresponding PHY init type according to the country code of Wi-Fi.

参数 **country** –country code

返回 ESP_OK on success.

返回 esp_err_t code describing the error on fail

char ***get_phy_version_str** (void)

Get PHY lib version.

返回 PHY lib version.

Structures

struct **esp_phy_init_data_t**

Structure holding PHY init parameters.

Public Members

uint8_t **params**[128]

opaque PHY initialization parameters

struct **esp_phy_calibration_data_t**

Opaque PHY calibration data.

Public Members

uint8_t **version**[4]

PHY version

uint8_t **mac**[6]

The MAC address of the station

uint8_t **opaque**[1894]

calibration data

Enumerations

enum **esp_phy_calibration_mode_t**

PHY calibration mode.

Values:

enumerator **PHY_RF_CAL_PARTIAL**

Do part of RF calibration. This should be used after power-on reset.

enumerator **PHY_RF_CAL_NONE**

Don't do any RF calibration. This mode is only suggested to be used after deep sleep reset.

enumerator **PHY_RF_CAL_FULL**

Do full RF calibration. Produces best results, but also consumes a lot of time and current. Suggested to be used once.

4.28 Secure Boot V2

重要: This document is about Secure Boot V2, supported on the following chips: ESP32 (ECO3 onwards), ESP32-S2, ESP32-S3, ESP32-C3 (ECO3 onwards), and ESP32-C2. Except for ESP32, it is the only supported Secure Boot scheme.

Secure Boot V2 uses RSA-PSS based app and bootloader verification. This document can also be used as a reference for signing apps using the RSA-PSS scheme without signing the bootloader.

4.28.1 Background

Secure Boot protects a device from running any unauthorized (i.e., unsigned) code by checking that each piece of software that is being booted is signed. On an ESP32-S3, these pieces of software include the second stage bootloader and each application binary. Note that the first stage bootloader does not require signing as it is ROM code thus cannot be changed.

A new RSA based Secure Boot verification scheme (Secure Boot V2) has been introduced on the ESP32 (ECO3 onwards), ESP32-S2, ESP32-S3 and ESP32-C3 (ECO3 onwards).

The Secure Boot process on the ESP32-S3 involves the following steps:

1. When the first stage bootloader loads the second stage bootloader, the second stage bootloader's RSA-PSS signature is verified. If the verification is successful, the second stage bootloader is executed.
2. When the second stage bootloader loads a particular application image, the application's RSA-PSS signature is verified. If the verification is successful, the application image is executed.

4.28.2 Advantages

- The RSA-PSS public key is stored on the device. The corresponding RSA-PSS private key is kept at a secret place and is never accessed by the device.
- Up to three public keys can be generated and stored in the chip during manufacturing.
- ESP32-S3 provides the facility to permanently revoke individual public keys. This can be configured conservatively or aggressively.
- Conservatively - The old key is revoked after the bootloader and application have successfully migrated to a new key. Aggressively - The key is revoked as soon as verification with this key fails.
- Same image format and signature verification method is applied for applications and software bootloader.
- No secrets are stored on the device. Therefore, it is immune to passive side-channel attacks (timing or power analysis, etc.)

4.28.3 Secure Boot V2 Process

This is an overview of the Secure Boot V2 Process. Instructions how to enable Secure Boot are supplied in section [How To Enable Secure Boot V2](#).

Secure Boot V2 verifies the bootloader image and application binary images using a dedicated *signature block*. Each image has a separately generated signature block which is appended to the end of the image.

Up to 3 signature blocks can be appended to the bootloader or application image in ESP32-S3.

Each signature block contains a signature of the preceding image as well as the corresponding RSA-3072 public key. For more details about the format, refer to [Signature Block Format](#). A digest of the RSA-3072 public key is stored in the eFuse.

The application image is not only verified on every boot but also on each over the air (OTA) update. If the currently selected OTA app image cannot be verified, the bootloader will fall back and look for another correctly signed application image.

The Secure Boot V2 process follows these steps:

1. On startup, the ROM code checks the Secure Boot V2 bit in the eFuse. If Secure Boot is disabled, a normal boot will be executed. If Secure Boot is enabled, the boot will proceed according to the following steps.
2. The ROM code verifies the bootloader's signature block ([Verifying a Signature Block](#)). If this fails, the boot process will be aborted.
3. The ROM code verifies the bootloader image using the raw image data, its corresponding signature block(s), and the eFuse ([Verifying an Image](#)). If this fails, the boot process will be aborted.
4. The ROM code executes the bootloader.
5. The bootloader verifies the application image's signature block ([Verifying a Signature Block](#)). If this fails, the boot process will be aborted.
6. The bootloader verifies the application image using the raw image data, its corresponding signature blocks and the eFuse ([Verifying an Image](#)). If this fails, the boot process will be aborted. If the verification fails but another application image is found, the bootloader will then try to verify that other image using steps 5 to 7. This repeats until a valid image is found or no other images are found.
7. The bootloader executes the verified application image.

4.28.4 Signature Block Format

The signature block starts on a 4KB aligned boundary and has a flash sector of its own. The signature is calculated over all bytes in the image including the padding bytes (*Secure Padding*).

The content of each signature block is shown in the following table:

表 27: Content of a Signature Block

Offset	Size (bytes)	Description
0	1	Magic byte
1	1	Version number byte (currently 0x02), 0x01 is for Secure Boot V1.
2	2	Padding bytes, Reserved. Should be zero.
4	32	SHA-256 hash of only the image content, not including the signature block.
36	384	RSA Public Modulus used for signature verification. (value 'n' in RFC8017).
420	4	RSA Public Exponent used for signature verification (value 'e' in RFC8017).
424	384	Pre-calculated R, derived from 'n'.
808	4	Pre-calculated M', derived from 'n'
812	384	RSA-PSS Signature result (section 8.1.1 of RFC8017) of image content, computed using following PSS parameters: SHA256 hash, MFG1 function, salt length 32 bytes, default trailer field (0xBC).
1196	4	CRC32 of the preceding 1196 bytes.
1200	16	Zero padding to length 1216 bytes.

备注: R and M' are used for hardware-assisted Montgomery Multiplication.

The remainder of the signature sector is erased flash (0xFF) which allows writing other signature blocks after previous signature block.

4.28.5 Secure Padding

In Secure Boot V2 scheme, the application image is padded to the flash MMU page size boundary to ensure that only verified contents are mapped in the internal address space. This is known as secure padding. Signature of the image is calculated after padding and then signature block (4KB) gets appended to the image.

- Default flash MMU page size is 64KB
- Secure padding is applied through the option `--secure-pad-v2` in the `elf2image` conversion using `esptool.py`

Following table explains the Secure Boot V2 signed image with secure padding and signature block appended:

表 28: Contents of a signed application

Offset	Size (KB)	Description
0	580	Unsigned application size (as an example)
580	60	Secure padding (aligned to next 64KB boundary)
640	4	Signature block

备注: Please note that the application image always starts on the next flash MMU page size boundary (default 64KB) and hence the space left over after the signature block shown above can be utilized to store any other data partitions

(e.g., nvs).

4.28.6 Verifying a Signature Block

A signature block is “valid” if the first byte is 0xe7 and a valid CRC32 is stored at offset 1196. Otherwise it’s invalid.

4.28.7 Verifying an Image

An image is “verified” if the public key stored in any signature block is valid for this device, and if the stored signature is valid for the image data read from flash.

1. Compare the SHA-256 hash digest of the public key embedded in the bootloader’s signature block with the digest(s) saved in the eFuses. If public key’s hash doesn’t match any of the hashes from the eFuses, the verification fails.
2. Generate the application image digest and match it with the image digest in the signature block. If the digests don’t match, the verification fails.
3. Use the public key to verify the signature of the bootloader image, using RSA-PSS (section 8.1.2 of RFC8017) with the image digest calculated in step (2) for comparison.

4.28.8 Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See [引导加载程序大小](#).

In the case when `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES` is disabled, the bootloader is sector padded (4KB) using the `--pad-to-size` option in `elf2image` command of `esptool`.

4.28.9 eFuse usage

- `SECURE_BOOT_EN` - Enables Secure Boot protection on boot.
- `KEY_PURPOSE_X` - Set the purpose of the key block on ESP32-S3 by programming `SECURE_BOOT_DIGESTX` ($X = 0, 1, 2$) into `KEY_PURPOSE_X` ($X = 0, 1, 2, 3, 4, 5$). Example: If `KEY_PURPOSE_2` is set to `SECURE_BOOT_DIGEST1`, then `BLOCK_KEY2` will have the Secure Boot V2 public key digest. The write-protection bit must be set (this field does not have a read-protection bit).
- `BLOCK_KEYX` - The block contains the data corresponding to its purpose programmed in `KEY_PURPOSE_X`. Stores the SHA-256 digest of the public key. SHA-256 hash of public key modulus, exponent, pre-calculated R & M’ values (represented as 776 bytes –offsets 36 to 812 - as per the [Signature Block Format](#)) is written to an eFuse key block. The write-protection bit must be set, but the read-protection bit must not.
- `KEY_REVOKEY` - The revocation bits corresponding to each of the 3 key block. Ex. Setting `KEY_REVOKE2` revokes the key block whose key purpose is `SECURE_BOOT_DIGEST2`.
- `SECURE_BOOT_AGGRESSIVE_REVOKE` - Enables aggressive revocation of keys. The key is revoked as soon as verification with this key fails.

To ensure no trusted keys can be added later by an attacker, each unused key digest slot should be revoked (`KEY_REVOKEY`). It will be checked during app startup in `esp_secure_boot_init_checks()` and fixed unless `CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS` is enabled.

The key(s) must be readable in order to give software access to it. If the key(s) is read-protected then the software reads the key(s) as all zeros and the signature verification process will fail, and the boot process will be aborted.

4.28.10 How To Enable Secure Boot V2

1. Open the *Project Configuration Menu*, in “Security features” set “Enable hardware Secure Boot in bootloader” to enable Secure Boot.
2. The “Secure Boot V2” option will be selected and the “App Signing Scheme” would be set to RSA by default.
3. Specify the path to Secure Boot signing key, relative to the project directory.
4. Select the desired UART ROM download mode in “UART ROM download mode” . By default, it is set to “Permanently switch to Secure mode” which is generally recommended. For production devices, the most secure option is to set it to “Permanently disabled” .
5. Set other menuconfig options (as desired). Then exit menuconfig and save your configuration.
6. The first time you run `idf.py build`, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

重要: A signing key generated this way will use the best random number source available to the OS and its Python installation (`/dev/urandom` on OSX/Linux and `CryptGenRandom()` on Windows). If this random number source is weak, then the private key will be weak.

重要: For production environments, we recommend generating the key pair using openssl or another industry standard encryption program. See *Generating Secure Boot Signing Key* for more details.

7. Run `idf.py bootloader` to build a Secure Boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.
8. When you’re ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by the build system) and then wait for flashing to complete.
9. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 6.

备注: `idf.py flash` doesn’t flash the bootloader if Secure Boot is enabled.

10. Reset the ESP32-S3 and it will boot the software bootloader you flashed. The software bootloader will enable Secure Boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32-S3 to verify that Secure Boot is enabled and no errors have occurred due to the build configuration.

备注: Secure boot won’t be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

备注: If the ESP32-S3 is reset or powered down during the first boot, it will start the process again on the next boot.

11. On subsequent boots, the Secure Boot hardware will verify the software bootloader has not changed and the software bootloader will verify the signed app image (using the validated public key portion of its appended signature block).

4.28.11 Restrictions after Secure Boot is enabled

- Any updated bootloader or app will need to be signed with a key matching the digest already stored in eFuse.
- After Secure Boot is enabled, no further eFuses can be read protected. (If *Flash 加密* is enabled then the bootloader will ensure that any flash encryption key generated on first boot will already be read protected.)

If `CONFIG_SECURE_BOOT_INSECURE` is enabled then this behavior can be disabled, but this is not recommended.

4.28.12 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via `espsecure.py generate_signing_key`.

The `--version 2` parameter will generate the RSA 3072 private key for Secure Boot V2.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available RSA-PSS key generation utilities.

For example, to generate a signing key using the `openssl` command line:

```
` openssl genrsa -out my_secure_boot_signing_key.pem 3072 `
```

Remember that the strength of the Secure Boot system depends on keeping the signing key private.

4.28.13 Remote Signing of Images

Signing using `espsecure.py`

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default `esp-idf` Secure Boot configuration). The `espsecure.py` command line program can be used to sign app images & partition table data for Secure Boot, on a remote system.

To use remote signing, disable the option `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES` and build the firmware. The private signing key does not need to be present on the build system.

After the app image and partition table are built, the build system will print signing steps using `espsecure.py`:

```
espsecure.py sign_data BINARY_FILE --version 2 --keyfile PRIVATE_SIGNING_KEY
```

The above command appends the image signature to the existing binary. You can use the `-output` argument to write the signed binary to a separate file:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY --output SIGNED_  
↪BINARY_FILE BINARY_FILE
```

Signing using Pre-calculated Signatures

If you have valid pre-calculated signatures generated for an image and their corresponding public keys, you can use these signatures to generate a signature sector and append it to the image. Note that the pre-calculated signature should be calculated over all bytes in the image including the secure-padding bytes.

In such cases, the firmware image should be built by disabling the option `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`. This image will be secure-padded and to generate a signed binary use the following command:

```
espsecure.py sign_data --version 2 --pub-key PUBLIC_SIGNING_KEY --signature_  
↪SIGNATURE_FILE --output SIGNED_BINARY_FILE BINARY_FILE
```

The above command verifies the signature, generates a signature block (refer to *Signature Block Format*) and appends it to the binary file.

Signing using an External Hardware Security Module (HSM)

For security reasons, you might also use an external Hardware Security Module (HSM) to store your private signing key, which cannot be accessed directly but has an interface to generate the signature of a binary file and its corresponding public key.

In such cases, disable the option `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES` and build the firmware. This secure-padded image then can be used to supply the external HSM for generating a signature. Refer to [Signing using an External HSM](#) to generate a signed image.

备注: For all the above three remote signing workflows, the signed binary is written to the filename provided to the `--output` argument and the option `--append_signatures` allows us to append multiple signatures (up to 3) the image.

4.28.14 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the Secure Boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using `espsecure.py`. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all Secure Boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use Secure Boot in combination with *flash encryption* to prevent local readout of the flash contents.

4.28.15 Key Management

- Between 1 and 3 RSA-3072 public key pairs (Keys #0, #1, #2) should be computed independently and stored separately.
- The KEY_DIGEST eFuses should be write protected after being programmed.
- The unused KEY_DIGEST slots must have their corresponding KEY_REVOKE eFuse burned to permanently disable them. This must happen before the device leaves the factory.
- The eFuses can either be written by the software bootloader during first boot after enabling “Secure Boot V2” from menuconfig or can be done using `espfuse.py` which communicates with the serial bootloader program in ROM.
- The KEY_DIGESTs should be numbered sequentially beginning at key digest #0. (i.e., if key digest #1 is used, key digest #0 should be used. If key digest #2 is used, key digest #0 & #1 must be used.)
- The software bootloader (non OTA upgradeable) is signed using at least one, possibly all three, private keys and flashed in the factory.
- Apps should only be signed with a single private key (the others being stored securely elsewhere), however they may be signed with multiple private keys if some are being revoked (see Key Revocation, below).

4.28.16 Multiple Keys

- The bootloader should be signed with all the private key(s) that are needed for the life of the device, before it is flashed.
- The build system can sign with at most one private key, user has to run manual commands to append more signatures if necessary.
- **You can use the append functionality of `espsecure.py`, this command would also printed at the end of the Secure B**
`espsecure.py sign_data -k secure_boot_signing_key2.pem -v 2 --append_signatures -o signed_bootloader.bin build/bootloader/bootloader.bin`
- While signing with multiple private keys, it is recommended that the private keys be signed independently, if possible on different servers and stored separately.
- **You can check the signatures attached to a binary using -** `espsecure.py signature_info_v2 datafile.bin`

4.28.17 Key Revocation

- Keys are processed in a linear order. (key #0, key #1, key #2).
- Applications should be signed with only one key at a time, to minimize the exposure of unused private keys.
- The bootloader can be signed with multiple keys from the factory.

Conservative approach:

Assuming a trusted private key (N-1) has been compromised, to update to new key pair (N).

1. Server sends an OTA update with an application signed with the new private key (#N).
 2. The new OTA update is written to an unused OTA app partition.
 3. The new application's signature block is validated. The public keys are checked against the digests programmed in the eFuse & the application is verified using the verified public key.
 4. The active partition is set to the new OTA application's partition.
 5. Device resets, loads the bootloader (verified with key #N-1) which then boots new app (verified with key #N).
 6. The new app verifies bootloader with key #N (as a final check) and then runs code to revoke key #N-1 (sets KEY_REVOKE eFuse bit).
 7. The API `esp_ota_revoke_secure_boot_public_key()` can be used to revoke the key #N-1.
- A similar approach can also be used to physically re-flash with a new key. For physical re-flashing, the bootloader content can also be changed at the same time.

Aggressive approach:

ROM code has an additional feature of revoking a public key digest if the signature verification fails.

To enable this feature, you need to burn `SECURE_BOOT_AGGRESSIVE_REVOKE` efuse or enable `CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE`

Key revocation is not applicable unless secure boot is successfully enabled. Also, a key is not revoked in case of invalid signature block or invalid image digest, it is only revoked in case the signature verification fails, i.e. revoke key only if failure in step 3 of [Verifying an Image](#)

Once a key is revoked, it can never be used for verifying a signature of an image. This feature provides strong resistance against physical attacks on the device. However, this could also brick the device permanently if all the keys are revoked because of signature verification failure.

4.28.18 Technical Details

The following sections contain low-level reference descriptions of various Secure Boot elements:

Manual Commands

Secure boot is integrated into the `esp-idf` build system, so `idf.py build` will sign an app image and `idf.py bootloader` will produce a signed bootloader if secure signed binaries on build is enabled.

However, it is possible to use the `espsecure.py` tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --version 2 --keyfile ./my_signing_key.pem --output ./image_
→signed.bin image-unsigned.bin
```

Keyfile is the PEM file containing an RSA-3072 private signing key.

4.28.19 Secure Boot & Flash Encryption

If Secure Boot is used without *Flash Encryption*, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

4.28.20 Signed App Verification Without Hardware Secure Boot

The Secure Boot V2 signature of apps can be checked on OTA update, without enabling the hardware Secure Boot option. This option uses the same app signature scheme as Secure Boot V2, but unlike hardware Secure Boot it does not prevent an attacker who can write to flash from bypassing the signature protection.

This may be desirable in cases where the delay of Secure Boot verification on startup is unacceptable, and/or where the threat model does not include physical access or attackers writing to bootloader or app partitions in flash.

In this mode, the public key which is present in the signature block of the currently running app will be used to verify the signature of a newly updated app. (The signature on the running app isn't verified during the update process, it's assumed to be valid.) In this way the system creates a chain of trust from the running app to the newly updated app.

For this reason, it's essential that the initial app flashed to the device is also signed. A check is run on app startup and the app will abort if no signatures are found. This is to try and prevent a situation where no update is possible. The app should have only one valid signature block in the first position. Note again that, unlike hardware Secure Boot V2, the signature of the running app isn't verified on boot. The system only verifies a signature block in the first position and ignores any other appended signatures.

Although multiple trusted keys are supported when using hardware Secure Boot, only the first public key in the signature block is used to verify updates if signature checking without Secure Boot is configured. If multiple trusted public keys are required, it's necessary to enable the full Secure Boot feature instead.

备注: In general, it's recommended to use full hardware Secure Boot unless certain that this option is sufficient for application security needs.

How To Enable Signed App Verification

1. Open *Project Configuration Menu* -> Security features
2. Ensure *App Signing Scheme* is *RSA*
3. Enable *CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT*
4. By default, “Sign binaries during build” will be enabled on selecting “Require signed app images” option, which will sign binary files as a part of build process. The file named in “Secure boot private signing key” will be used to sign the image.
5. If you disable “Sign binaries during build” option then all app binaries must be manually signed by following instructions in *Remote Signing of Images*.

警告: It is very important that all apps flashed have been signed, either during the build or after the build.

4.28.21 Advanced Features

JTAG Debugging

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See *JTAG 与闪存加密和安全引导* for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

4.29 片外 RAM

4.29.1 简介

ESP32-S3 提供了好几百 KB 的片上 RAM，可以满足大部分需求。但有些场景可能需要更多 RAM，因此 ESP32-S3 另外提供了高达 16 MB 的片外 SPI RAM 存储器供用户使用。片外 RAM 已经集成到内存映射中，在某些范围内与片上 RAM 使用方式相同。

4.29.2 硬件

ESP32-S3 支持与 SPI Flash 芯片并联的 SPI PSRAM（伪静态随机存储器）。虽然 ESP32-S3 支持多种类型的 RAM 芯片，但 ESP-IDF 当前仅支持乐鑫品牌的 PSRAM 芯片，如 ESP-PSRAM32、ESP-PSRAM64 等。

备注：PSRAM 芯片的工作电压分为 1.8 V 和 3.3 V。其工作电压必须与 flash 的工作电压匹配。请查询您 PSRAM 芯片以及 ESP32-S3 的技术规格书获取准确的工作电压。对于 1.8 V 的 PSRAM 芯片，请确保在启动时将 MTDI 管脚设置为高电平，或者将 ESP32-S3 中的 eFuses 设置为始终使用 1.8 V 的 VDD_SIO 电平，否则有可能会损坏 PSRAM 和/或 flash 芯片。

备注：乐鑫同时提供模组和系统级封装芯片，集成了兼容的 PSRAM 和 flash，可直接用于终端产品 PCB 中。如需了解更多信息，请前往乐鑫官网。

有关将 SoC 或模组管脚连接到片外 PSRAM 芯片的具体细节，请查阅 SoC 或模组技术规格书。

4.29.3 配置片外 RAM

ESP-IDF 完全支持将片外 RAM 集成到您的应用程序中。在启动并完成片外 RAM 初始化后，可以将 ESP-IDF 配置为用多种方式处理片外 RAM：

- 集成片外 RAM 到 ESP32-S3 内存映射
- 添加片外 RAM 到堆内存分配器
- 调用 `malloc()` 分配片外 RAM (default)

集成片外 RAM 到 ESP32-S3 内存映射

在 `CONFIG_SPIRAM_USE` 中选择 “Integrate RAM into memory map (集成片外 RAM 到 ESP32-S3 内存映射)” 选项。

这是集成片外 RAM 最基础的设置选项，大多数用户需要用到其他更高级的选项。

ESP-IDF 启动过程中，片外 RAM 被映射到以 0x3D000000 起始的数据地址空间（字节可寻址），空间大小正好为 SPI RAM 的大小 (16 MB)。

应用程序可以通过创建指向该区域的指针手动将数据放入片外存储器，同时应用程序全权负责管理片外 SPI RAM，包括协调 Buffer 的使用、防止发生损坏等。

添加片外 RAM 到堆内存分配器

在 `CONFIG_SPIRAM_USE` 中选择 “Make RAM allocatable using heap_caps_malloc(..., MALLOC_CAP_SPIRAM)” 选项。

启用上述选项后，片外 RAM 被映射到地址 0x3D000000，并将这个区域添加到携带 `MALLOC_CAP_SPIRAM` 标志的堆内存分配器。

程序如果想从片外存储器分配存储空间，则需要调用 `heap_caps_malloc(size, MALLOC_CAP_SPIRAM)`，之后可以调用 `free()` 函数释放这部分存储空间。

调用 malloc() 分配片外 RAM

在 `CONFIG_SPIRAM_USE` 中选择 “Make RAM allocatable using malloc() as well” 选项，该选项为默认选项。

启用此选项后，片外存储器将被添加到内存分配程序（与上一选项相同），同时也将被添加到由标准 `malloc()` 函数返回的 RAM 中。

应用程序因此可以使用片外 RAM，无需重写代码就能使用 `heap_caps_malloc(..., MALLOC_CAP_SPIRAM)`。

如果某次内存分配偏向于片外存储器，您也可以使用 `CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL` 设置分配空间的大小阈值，控制分配结果：

- 如果分配的空间小于阈值，分配程序将首先选择内部存储器。
- 如果分配的空间等于或大于阈值，分配程序将首先选择外部存储器。

如果优先考虑的内部或外部存储器中没有可用的存储块，分配程序则会选择其他类型存储。

由于有些内存缓冲器仅可在内部存储器中分配，因此需要使用第二个配置项 `CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL` 定义一个内部内存池，仅限显式的内部存储器分配使用（例如用于 DMA 的存储器）。常规 `malloc()` 将不会从该池中分配，但可以使用 `MALLOC_CAP_DMA` 和 `MALLOC_CAP_INTERNAL` 标志从该池中分配存储器。

允许.bss 段放入片外存储器

通过勾选 `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY` 启用该选项，此选项配置与其它三个选项互不影响。

启用该选项后，从 0x3D000000 起始的地址空间将用于存储来自 `lwip`、`net80211`、`libpp` 和 `bluedroid` ESP-IDF 库中零初始化的数据（BSS 段）。

`EXT_RAM_BSS_ATTR` 宏应用于任何静态声明（未初始化为非零值）之后，可以将附加数据从内部 BSS 段移到片外 RAM。

也可以使用链接器片段方案 `extram_bss` 将组件或库的 BSS 段放到片外 RAM 中。

启用此选项可以减少 BSS 段占用的内部静态存储。

剩余的片外 RAM 也可以通过上述方法添加到堆分配器中。

4.29.4 片外 RAM 使用限制

使用片外 RAM 有下面一些限制：

- Flash cache 禁用时（比如，正在写入 flash），片外 RAM 将无法访问；同样，对片外 RAM 的读写操作也将导致 cache 访问异常。出于这个原因，ESP-IDF 不会在片外 RAM 中分配任务堆栈（详见下文）。
- 片外 RAM 不能用于储存 DMA 事务描述符，也不能用作 DMA 读写操作的缓冲区 (Buffer)。因此，当片外 RAM 启用时，与 DMA 搭配使用的 Buffer 必须先使用 `heap_caps_malloc(size, MALLOC_CAP_DMA | MALLOC_CAP_INTERNAL)` 进行分配，之后可以调用标准 `free()` 回调释放 Buffer。

注意，尽管 ESP32-S3 中已有硬件支持 DMA 与片外 RAM，但在 ESP-IDF 中，尚未提供软件支持。

- 片外 RAM 与片外 flash 使用相同的 cache 区域，这意味着频繁在片外 RAM 访问的变量可以像在片上 RAM 中一样快速读取和修改。但访问大块数据时（大于 32 KB），cache 空间可能会不足，访问速度将回落到片外 RAM 访问速度。此外，访问大块数据会挤出 flash cache，可能降低代码执行速度。
- 一般来说，片外 RAM 不会用作任务堆栈存储器。`xTaskCreate()` 及类似函数始终会为堆栈和任务 TCB 分配片上存储器。

可以使用 `CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY` 选项将任务堆栈放入片外存储器。这时，必须使用 `xTaskCreateStatic()` 指定从片外存储器分配的任务堆栈缓冲区，否则任务堆栈将会从片上存储器分配。

4.29.5 初始化失败

默认情况下，片外 RAM 初始化失败将终止 ESP-IDF 启动。如果想禁用此功能，可启用 `CONFIG_SPIRAM_IGNORE_NOTFOUND` 配置选项。

4.29.6 加密

可以为存储在外部 RAM 中的数据启用自动加密功能。启用该功能后，通过缓存读写的任何数据将被外部存储器加密硬件自动加密/解密。

只要启用了 flash 加密功能，就会启用这个功能。关于如何启用 flash 加密以及其工作原理，请参考 [Flash 加密](#)。

4.30 Thread Local Storage

4.30.1 Overview

Thread-local storage (TLS) is a mechanism by which variables are allocated such that there is one instance of the variable per extant thread. ESP-IDF provides three ways to make use of such variables:

- *FreeRTOS Native API*: ESP-IDF FreeRTOS native API.
- *Pthread API*: ESP-IDF's pthread API.
- *C11 Standard*: C11 standard introduces special keyword to declare variables as thread local.

4.30.2 FreeRTOS Native API

The ESP-IDF FreeRTOS provides the following API to manage thread local variables:

- `vTaskSetThreadLocalStoragePointer()`
- `pvTaskGetThreadLocalStoragePointer()`
- `vTaskSetThreadLocalStoragePointerAndDelCallback()`

In this case maximum number of variables that can be allocated is limited by `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS` configuration value. Variables are kept in the task control block (TCB) and accessed by their index. Note that index 0 is reserved for ESP-IDF internal uses.

Using that API user can allocate thread local variables of an arbitrary size and assign them to any number of tasks. Different tasks can have different sets of TLS variables.

If size of the variable is more than 4 bytes then user is responsible for allocating/deallocating memory for it. Variable's deallocation is initiated by FreeRTOS when task is deleted, but user must provide function (callback) to do proper cleanup.

4.30.3 Pthread API

The ESP-IDF provides the following *pthread API* to manage thread local variables:

- `pthread_key_create()`
- `pthread_key_delete()`
- `pthread_getspecific()`
- `pthread_setspecific()`

This API has all benefits of the one above, but eliminates some its limits. The number of variables is limited only by size of available memory on the heap. Due to the dynamic nature this API introduces additional performance overhead compared to the native one.

4.30.4 C11 Standard

The ESP-IDF FreeRTOS supports thread local variables according to C11 standard (ones specified with `__thread` keyword). For details on this GCC feature please see <https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local>. Storage for that kind of variables is allocated on the task's stack. Note that area for all such variables in the program will be allocated on the stack of every task in the system even if that task does not use such variables at all. For example ESP-IDF system tasks (like `ipc`, `timer` tasks etc.) will also have that extra stack space allocated. So this feature should be used with care. There is a tradeoff: C11 thread local variables are quite handy to use in programming and can be accessed using minimal CPU instructions, but this benefit goes with the cost of additional stack usage for all tasks in the system. Due to static nature of variables allocation all tasks in the system have the same sets of C11 thread local variables.

4.31 工具

4.31.1 IDF Frontend - `idf.py`

The `idf.py` command-line tool provides a front-end for easily managing your project builds, deployment and debugging, and more. It manages several tools, for example:

- **CMake**, which configures the project to be built
- **Ninja** which builds the project
- `esptool.py` for flashing the target.

The *getting started guide* contains a brief introduction to how to set up `idf.py` to configure, build, and flash projects.

重要: `idf.py` should be run in an ESP-IDF “project” directory, i.e. one containing a `CMakeLists.txt` file. Older style projects with a `Makefile` will not work with `idf.py`.

Commands

Start a new project: `create-project`

```
idf.py create-project <project name>
```

This will create a new ESP-IDF project, additionally folder where the project will be created can be specified by the `--path` option.

Create a new component: `create-component` This command creates a new component, which will have a minimum set of files necessary for building.

```
idf.py create-component <component name>
```

The `-C` option can be used to specify the directory the component will be created in. For more information about components see the [build system page](#).

Select the Target Chip: `set-target` ESP-IDF supports multiple targets (chips). A full list of supported targets in your version of ESP-IDF can be seen by running `idf.py --list-targets`.

This sets the current project target:

```
idf.py set-target <target>
```

重要: `idf.py set-target` will clear the build directory and re-generate the `sdkconfig` file from scratch. The old `sdkconfig` file will be saved as `sdkconfig.old`.

备注: The behavior of `idf.py set-target` command is equivalent to:

1. clearing the build directory (`idf.py fullclean`)
 2. removing the `sdkconfig` file (`mv sdkconfig sdkconfig.old`)
 3. configuring the project with the new target (`idf.py -DIDF_TARGET=esp32 reconfigure`)
-

It is also possible to pass the desired `IDF_TARGET` as an environment variable (e.g. `export IDF_TARGET=esp32s2`) or as a CMake variable (e.g. `-DIDF_TARGET=esp32s2` argument to CMake or `idf.py`). Setting the environment variable is a convenient method if you mostly work with one type of the chip.

To specify the `_default_` value of `IDF_TARGET` for a given project, add `CONFIG_IDF_TARGET` value to `sdkconfig.defaults`. For example, `CONFIG_IDF_TARGET="esp32s2"`. This value will be used if `IDF_TARGET` is not specified by other method: using an environment variable, CMake variable, or `idf.py set-target` command.

If the target has not been set by any of these methods, the build system will default to `esp32` target.

Start the graphical configuration tool: `menuconfig`

```
idf.py menuconfig
```

Build the project: `build`

```
idf.py build
```

Running this command will build the project found in the current directory. This can involve multiple steps:

- Create the build directory if needed. The sub-directory `build` is used to hold build output, although this can be changed with the `-B` option.
- Run [CMake](#) as necessary to configure the project and generate build files for the main build tool.
- Run the main build tool ([Ninja](#) or [GNU Make](#)). By default, the build tool is automatically detected but it can be explicitly set by passing the `-G` option to `idf.py`.

Building is incremental so if no source files or configuration has changed since the last build, nothing will be done.

Additionally, the command can be run with `app`, `bootloader` and `partition-table` arguments to build only the app, bootloader or partition table as applicable.

Remove the build output: `clean` It is possible to remove the project build output files from the build directory by using:

```
idf.py clean
```

The project will be fully rebuilt on next build. Using this does not remove the CMake configuration output inside the build folder.

Delete the entire build contents: `fullclean`

```
idf.py fullclean
```

Running this command will delete the entire “build” directory contents. This includes all CMake configuration output. The next time the project is built, CMake will configure it from scratch. Note that this option recursively deletes *all* files in the build directory, so use with care. Project configuration is not deleted.

Flash the project: `flash` Running the following command:

```
idf.py flash
```

will automatically build the project if necessary, and then flash it to the target. You can use `-p` and `-b` options to set serial port name and flasher baud rate, respectively.

备注: The environment variables `ESPPORT` and `ESPBAUD` can be used to set default values for the `-p` and `-b` options, respectively. Providing these options on the command line overrides the default.

Similarly to the `build` command, the command can be run with `app`, `bootloader` and `partition-table` arguments to flash only the `app`, `bootloader` or `partition table` as applicable.

Hints on how to resolve errors

`idf.py` will try to suggest hints on how to resolve errors. It works with a database of hints stored in [tools/idf_py_actions/hints.yml](#) and the hints will be printed if a match is found for the given error. The `menuconfig`, `gdb` and `opencd` targets are not supported at the moment by automatic hints on resolving errors.

The `--no-hints` argument of `idf.py` can be used to turn the hints off in case they are not desired.

Important notes

Multiple `idf.py` commands can be combined into one. For example, `idf.py -p COM4 clean flash monitor` will clean the source tree, then build the project and flash it to the target before running the serial monitor.

The order of multiple `idf.py` commands on the same invocation is not important, they will automatically be executed in the correct order for everything to take effect (i.e. building before flashing, erasing before flashing, etc.).

For commands that are not known to `idf.py` an attempt to execute them as a build system target will be made.

The command `idf.py` supports [shell autocompletion](#) for bash, zsh and fish shells.

In order to make [shell autocompletion](#) supported, please make sure you have at least Python 3.5 and [click 7.1](#) or newer ([see also](#)).

To enable autocompletion for `idf.py` use the `export` command ([see this](#)). Autocompletion is initiated by pressing the TAB key. Type `idf.py -` and press the TAB key to autocomplete options.

The autocomplete support for PowerShell is planned in the future.

Advanced Commands

Open the documentation: `docs` Using the following command the documentation for the projects target and version will be opened in the browser:

```
idf.py docs
```

Show size: size

```
idf.py size
```

Will print app size information including occupied RAM and FLASH and section sizes.

```
idf.py size
```

Similarly, this will print the same information for each component used in the project.

```
idf.py size-files
```

Will print size information per source file in the project.

If you define variable `-DOUTPUT_JSON=1` when running CMake (or `idf.py`), the output will be formatted as JSON not as human readable text. See `idf.py-size` for more information.

Reconfigure the project: reconfigure

```
idf.py reconfigure
```

This command re-runs **CMake** even if it doesn't seem to need re-running. This isn't necessary during normal usage, but can be useful after adding/removing files from the source tree, or when modifying CMake cache variables. For example, `idf.py -DNAME='VALUE' reconfigure` can be used to set variable `NAME` in CMake cache to value `VALUE`.

Clean the python byte code: python-clean Generated python byte code can be deleted from the IDF directory using:

```
idf.py python-clean
```

The byte code may cause issues when switching between IDF and Python versions. It is advised to run this target after switching versions of Python.

Global Options

To list all available root level options, run `idf.py --help`. To list options that are specific for a subcommand, run `idf.py <command> --help`, for example `idf.py monitor --help`. Here is a list of some useful options:

- `-C <dir>` allows overriding the project directory from the default current working directory.
- `-B <dir>` allows overriding the build directory from the default `build` subdirectory of the project directory.
- `--ccache` flag can be used to enable **CCache** when compiling source files, if the **CCache** tool is installed. This can dramatically reduce some build times.

Note that some older versions of **CCache** may exhibit bugs on some platforms, so if files are not rebuilt as expected then try disabling **CCache** and build again. **CCache** can be enabled by default by setting the `IDF_CCACHE_ENABLE` environment variable to a non-zero value.

- `-v` flag causes both `idf.py` and the build system to produce verbose build output. This can be useful for debugging build problems.
- `--cmake-warn-uninitialized` (or `-w`) will cause CMake to print uninitialized variable warnings found in the project directory only. This only controls CMake variable warnings inside CMake itself, not other types of build warnings. This option can also be set permanently by setting the `IDF_CMAKE_WARN_UNINITIALIZED` environment variable to a non-zero value.
- `--no-hints` flag to disable hints on resolving errors and disable capturing output.

4.31.2 IDF Docker Image

IDF Docker image (`espressif/idf`) is intended for building applications and libraries with specific versions of ESP-IDF, when doing automated builds.

The image contains:

- Common utilities such as `git`, `wget`, `curl`, `zip`.
- Python 3.7 or newer.
- A copy of a specific version of ESP-IDF (see below for information about versions). `IDF_PATH` environment variable is set, and points to ESP-IDF location in the container.
- All the build tools required for the specific version of ESP-IDF: `CMake`, `ninja`, `cross-compiler toolchains`, etc.
- All Python packages required by ESP-IDF are installed in a virtual environment.

The image entrypoint sets up `PATH` environment variable to point to the correct version of tools, and activates the Python virtual environment. As a result, the environment is ready to use the ESP-IDF build system.

The image can also be used as a base for custom images, if additional utilities are required.

Tags

Multiple tags of this image are maintained:

- `latest`: tracks `master` branch of ESP-IDF
- `vX.Y`: corresponds to ESP-IDF release `vX.Y`
- `release-vX.Y`: tracks `release/vX.Y` branch of ESP-IDF

备注: Versions of ESP-IDF released before this feature was introduced do not have corresponding Docker image versions. You can check the up-to-date list of available tags at <https://hub.docker.com/r/espressif/idf/tags>.

Usage

Setting up Docker Before using the `espressif/idf` Docker image locally, make sure you have Docker installed. Follow the instructions at <https://docs.docker.com/install/>, if it is not installed yet.

If using the image in CI environment, consult the documentation of your CI service on how to specify the image used for the build process.

Building a project with CMake In the project directory, run:

```
docker run --rm -v $PWD:/project -w /project espressif/idf idf.py build
```

The above command explained:

- `docker run`: runs a Docker image. It is a shorter form of the command `docker container run`.
- `--rm`: removes the container when the build is finished
- `-v $PWD:/project`: mounts the current directory on the host (`$PWD`) as `/project` directory in the container
- `espressif/idf` : uses Docker image `espressif/idf` with tag `latest` (implicitly added by Docker when no tag is specified)
- `idf.py build`: runs this command inside the container

To build with a specific docker image tag, specify it as `espressif/idf :TAG` , for example:

```
docker run --rm -v $PWD:/project -w /project espressif/idf:release-v4.4 idf.py ↵  
↵build
```

You can check the up-to-date list of available tags at <https://hub.docker.com/r/espressif/idf/tags>.

Using the image interactively It is also possible to do builds interactively, to debug build issues or test the automated build scripts. Start the container with `-i -t` flags:

```
docker run --rm -v $PWD:/project -w /project -it espressif/idf
```

Then inside the container, use `idf.py` as usual:

```
idf.py menuconfig
idf.py build
```

备注: Commands which communicate with the development board, such as `idf.py flash` and `idf.py monitor` will not work in the container unless the serial port is passed through into the container. However currently this is not possible with Docker for Windows (<https://github.com/docker/for-win/issues/1018>) and Docker for Mac (<https://github.com/docker/for-mac/issues/900>).

Building custom images

The Dockerfile in ESP-IDF repository provides several build arguments which can be used to customize the Docker image:

- `IDF_CLONE_URL`: URL of the repository to clone ESP-IDF from. Can be set to a custom URL when working with a fork of ESP-IDF. Default is `https://github.com/espressif/esp-idf.git`.
- `IDF_CLONE_BRANCH_OR_TAG`: Name of a git branch or tag use when cloning ESP-IDF. This value is passed to `git clone` command using the `--branch` argument. Default is `master`.
- `IDF_CHECKOUT_REF`: If this argument is set to a non-empty value, `git checkout $IDF_CHECKOUT_REF` command will be performed after cloning. This argument can be set to the SHA of the specific commit to check out, for example if some specific commit on a release branch is desired.
- `IDF_CLONE_SHALLOW`: If this argument is set to a non-empty value, `--depth=1 --shallow-submodules` arguments will be used when performing `git clone`. This significantly reduces the amount of data downloaded and the size of the resulting Docker image. However, if switching to a different branch in such a “shallow” repository is necessary, an additional `git fetch origin <branch>` command must be executed first.
- `IDF_INSTALL_TARGETS`: Comma-separated list of IDF targets to install toolchains for, or `all` to install toolchains for all targets. Selecting specific targets reduces the amount of data downloaded and the size of the resulting Docker image. Default is `all`.

To use these arguments, pass them via the `--build-arg` command line option. For example, the following command will build a Docker image with a shallow clone of ESP-IDF v4.4.1 and tools for ESP32-C3, only:

```
docker build -t idf-custom:v4.4.1-esp32c3 \
  --build-arg IDF_CLONE_BRANCH_OR_TAG=v4.4.1 \
  --build-arg IDF_CLONE_SHALLOW=1 \
  --build-arg IDF_INSTALL_TARGETS=esp32c3 \
  tools/docker
```

4.31.3 IDF Windows Installer

Command-line parameters

Windows Installer `esp-idf-tools-setup` provides the following command-line parameters:

- `/CONFIG=[PATH]` - Path to `ini` configuration file to override default configuration of the installer. Default: `config.ini`.
- `/GITCLEAN=[yes|no]` - Perform git clean and remove untracked directories in Offline mode installation. Default: `yes`.
- `/GITRECURSIVE=[yes|no]` - Clone recursively all git repository submodules. Default: `yes`

- /GITREPO=[URL|PATH] - URL of repository to clone ESP-IDF. Default: <https://github.com/espressif/esp-idf.git>
- /GITRESET=[yes|no] - Enable/Disable git reset of repository during installation. Default: yes.
- /HELP - Display command line options provided by Inno Setup installer.
- /IDFDIR=[PATH] - Path to directory where it will be installed. Default: {userdesktop}\esp-idf}
- /IDFVERSION=[v4.3|v4.1|master] - Use specific IDF version. E.g. v4.1, v4.2, master. Default: empty, pick the first version in the list.
- /IDFVERSIONSURL=[URL] - Use URL to download list of IDF versions. Default: https://dl.espressif.com/dl/esp-idf/idf_versions.txt
- /LOG=[PATH] - Store installation log file in specific directory. Default: empty.
- /OFFLINE=[yes|no] - Execute installation of Python packages by PIP in offline mode. The same result can be achieved by setting the environment variable PIP_NO_INDEX. Default: no.
- /USEEMBEDDEDPYTHON=[yes|no] - Use Embedded Python version for the installation. Set to no to allow Python selection screen in the installer. Default: yes.
- /PYTHONNOUSERSITE=[yes|no] - Set PYTHONNOUSERSITE variable before launching any Python command to avoid loading Python packages from AppDataRoaming. Default: yes.
- /PYTHONWHEELSURL=[URL] - Specify URLs to PyPi repositories for resolving binary Python Wheel dependencies. The same result can be achieved by setting the environment variable PIP_EXTRA_INDEX_URL. Default: <https://dl.espressif.com/pypi>
- /SKIPSYSTEMCHECK=[yes|no] - Skip System Check page. Default: no.
- /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL - Perform silent installation.

Unattended installation

The unattended installation of IDF can be achieved by following command-line parameters:

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
```

The installer detaches its process from the command-line. Waiting for installation to finish could be achieved by following PowerShell script:

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
$InstallerProcess = Get-Process esp-idf-tools-setup
Wait-Process -Id $InstallerProcess.id
```

Custom Python and custom location of Python wheels

The IDF installer is using by default embedded Python with reference to Python Wheel mirror.

Following parameters allows to select custom Python and custom location of Python wheels:

```
esp-idf-tools-setup-x.x.exe /USEEMBEDDEDPYTHON=no /PYTHONWHEELSURL=https://pypi.
↳org/simple/
```

4.31.4 IDF Component Manager

The IDF Component manager is a tool that downloads dependencies for any ESP-IDF CMake project. The download happens automatically during a run of CMake. It can source components either from [the component registry](#) or from a git repository.

A list of components can be found on <https://components.espressif.com/>

Using with a project

Dependencies for each component in the project are defined in a separate manifest file named `idf_component.yml` placed in the root of the component. The manifest file template can be created for a component by running

`idf.py create-manifest --component=my_component`. When a new manifest is added to one of the components in the project it's necessary to reconfigure it manually by running `idf.py reconfigure`. Then build will track changes in `idf_component.yml` manifests and automatically triggers CMake when necessary.

There is an example application: `example:build_system/cmake/component_manager` that uses components installed by the component manager.

It's not necessary to have a manifest for components that don't need any managed dependencies.

When CMake configures the project (e.g. `idf.py reconfigure`) component manager does a few things:

- Processes `idf_component.yml` manifests for every component in the project and recursively solves dependencies
- Creates a `dependencies.lock` file in the root of the project with a full list of dependencies
- Downloads all dependencies to the `managed_components` directory

The lock-file `dependencies.lock` and content of `managed_components` directory is not supposed to be modified by a user. When the component manager runs it always make sure they are up to date. If these files were accidentally modified it's possible to re-run the component manager by triggering CMake with `idf.py reconfigure`

Defining dependencies in the manifest

```
dependencies:
  # Required IDF version
  idf: ">=4.1"
  # Defining a dependency from the registry:
  # https://components.espressif.com/component/example/cmp
  example/cmp: ">=1.0.0"

  # # Other ways to define dependencies
  #
  # # For components maintained by Espressif only name can be used.
  # # Same as `espressif/cmp`
  # component: "~1.0.0"
  #
  # # Or in a longer form with extra parameters
  # component2:
  #   version: ">=2.0.0"
  #
  # # For transient dependencies `public` flag can be set.
  # # `public` flag doesn't affect the `main` component.
  # # All dependencies of `main` are public by default.
  # public: true
  #
  # # For components hosted on non-default registry:
  # service_url: "https://componentregistry.company.com"
  #
  # # For components in git repository:
  # test_component:
  #   path: test_component
  #   git: ssh://git@gitlab.com/user/components.git
  #
  # # For test projects during component development
  # # components can be used from a local directory
  # # with relative or absolute path
  # some_local_component:
  #   path: ../../projects/component
```

Disabling the Component Manager

The component manager can be explicitly disabled by setting `IDF_COMPONENT_MANAGER` environment variable to 0.

4.31.5 IDF Clang Tidy

The IDF Clang Tidy is a tool that uses [clang-tidy](#) to run static analysis on your current app.

警告: This functionality and the toolchain it relies on are still under development. There may be breaking changes before a final release.

Prerequisites

If you have never run this tool before, take the following steps to get this tool prepared.

1. Run the export scripts (`export.sh / export.bat / ...`) to set up the environment variables.
2. Run `pip install --upgrade pyclang` to install this plugin. The extra commands would be activated in `idf.py` automatically.
3. Run `idf_tools.py install xtensa-clang` to install the clang-tidy required binaries

备注: This toolchain is still under development. After the final release, you don't have to install them manually.

4. Get file from the [llvm repository](#) and add the folder of this script to the `$PATH`. Or you could pass an optional argument `--run-clang-tidy-py` later when you call `idf.py clang-check`. Please don't forget to make the script executable.

备注: This file would be bundled in future toolchain releases. This is a temporary workaround.

5. Run the export scripts (`export.sh / export.bat / ...`) again to refresh the environment variables.

Extra Commands

clang-check Run `idf.py clang-check` to re-generate the compilation database and run `clang-tidy` under your current project folder. The output would be written to `<project_dir>/warnings.txt`.

Run `idf.py clang-check --help` to see the full documentation.

clang-html-report

1. Run `pip install codereport` to install the additional dependency.
2. Run `idf.py clang-html-report` to generate an HTML report in folder `<project_dir>/html_report` according to the `warnings.txt`. Please open the `<project_dir>/html_report/index.html` in your browser to check the report.

Bug Report

This tool is hosted in [espressif/clang-tidy-runner](#). If you faced any bugs or have any feature request, please report them via [github issues](#).

4.31.6 Downloadable Tools

ESP-IDF build process relies on a number of tools: cross-compiler toolchains, CMake build system, and others.

Installing the tools using an OS-specific package manager (like apt, yum, brew, etc.) is the preferred method when the required version of the tool is available. This recommendation is reflected in the Getting Started guide. For example, on Linux and macOS it is recommended to install CMake using an OS package manager.

However, some of the tools are IDF-specific and are not available in OS package repositories. Furthermore, different versions of ESP-IDF require different versions of the tools to operate correctly. To solve these two problems, ESP-IDF provides a set of scripts for downloading and installing the correct versions of tools, and exposing them in the environment.

The rest of the document refers to these downloadable tools simply as “tools”. Other kinds of tools used in ESP-IDF are:

- Python scripts bundled with ESP-IDF (such as `idf.py`)
- Python packages installed from PyPI.

The following sections explain the installation method, and provide the list of tools installed on each platform.

备注: This document is provided for advanced users who need to customize their installation, users who wish to understand the installation process, and ESP-IDF developers.

If you are looking for instructions on how to install the tools, see the [Getting Started Guide](#).

Tools metadata file

The list of tools and tool versions required for each platform is located in [tools/tools.json](#). The schema of this file is defined by [tools/tools_schema.json](#).

This file is used by [tools/idf_tools.py](#) script when installing the tools or setting up the environment variables.

Tools installation directory

`IDF_TOOLS_PATH` environment variable specifies the location where the tools are to be downloaded and installed. If not set, `IDF_TOOLS_PATH` defaults to `HOME/.espressif` on Linux and macOS, and `%USER_PROFILE%\espressif` on Windows.

Inside `IDF_TOOLS_PATH`, the scripts performing tools installation create the following directories and files:

- `dist` —where the archives of the tools are downloaded.
- `tools` —where the tools are extracted. The tools are extracted into subdirectories: `tools/TOOL_NAME/VERSION/`. This arrangement allows different versions of tools to be installed side by side.
- `idf-env.json` —user install options (targets, features) are stored in this file. Targets are selected chip targets for which tools are installed and kept up-to-date. Features determine the Python package set which should be installed. These options will be discussed later.
- `python_env` —not tools related; virtual Python environments are installed in the sub-directories. Note that the Python environment directory can be placed elsewhere by setting the `IDF_PYTHON_ENV_PATH` environment variable.
- `espidf.constraints.*.txt` —one constraint file for each ESP-IDF release containing Python package version requirements.

GitHub Assets Mirror

Most of the tools downloaded by the tools installer are GitHub Release Assets, which are files attached to a software release on GitHub.

If GitHub downloads are inaccessible or slow to access, it’s possible to configure a GitHub assets mirror.

To use Espressif's download server, set the environment variable `IDF_GITHUB_ASSETS` to `dl.espressif.com/github_assets`. When the install process is downloading a tool from `github.com`, the URL will be rewritten to use this server instead.

Any mirror server can be used provided the URL matches the `github.com` download URL format: the install process will replace `https://github.com` with `https://${IDF_GITHUB_ASSETS}` for any GitHub asset URL that it downloads.

备注: The Espressif download server doesn't currently mirror everything from GitHub, it only mirrors files attached as Assets to some releases as well as source archives for some releases.

idf_tools.py script

`tools/idf_tools.py` script bundled with ESP-IDF performs several functions:

- `install`: Download the tool into `${IDF_TOOLS_PATH}/dist` directory, extract it into `${IDF_TOOLS_PATH}/tools/TOOL_NAME/VERSION`. `install` command accepts the list of tools to install, in `TOOL_NAME` or `TOOL_NAME@VERSION` format. If `all` is given, all the tools (required and optional ones) are installed. If no argument or `required` is given, only the required tools are installed.
- `download`: Similar to `install` but doesn't extract the tools. An optional `--platform` argument may be used to download the tools for the specific platform.
- `export`: Lists the environment variables which need to be set to use the installed tools. For most of the tools, setting `PATH` environment variable is sufficient, but some tools require extra environment variables. The environment variables can be listed in either of `shell` or `key-value` formats, set by `--format` parameter:

- `export` optional parameters:
 - * `--unset` Creates statement that `unset` some global variables, so the environment gets to the state it was before calling `export`. {sh/fish}.
 - * `--add_paths_extras` Adds extra ESP-IDF-related paths of `$PATH` to `${IDF_TOOLS_PATH}/esp-idf.json`, which is used to remove global variables when the active ESP-IDF environment is deactivated. Example: While processing `export`. {sh/fish} script, new paths are added to global variable `$PATH`. This option is used to save these new paths to the `${IDF_TOOLS_PATH}/esp-idf.json`.
- `shell` produces output suitable for evaluation in the shell. For example,

```
export PATH="/home/user/.espressif/tools/tool/v1.0.0/bin:$PATH"
```

on Linux and macOS, and

```
set "PATH=C:\Users\user\.espressif\tools\v1.0.0\bin;%PATH%"
```

on Windows.

备注: Exporting environment variables in Powershell format is not supported at the moment. `key-value` format may be used instead.

The output of this command may be used to update the environment variables, if the shell supports this. For example:

```
eval $(${IDF_PATH}/tools/idf_tools.py export)
```

- `key-value` produces output in `VARIABLE=VALUE` format, suitable for parsing by other scripts:

```
PATH=/home/user/.espressif/tools/tool/v1.0.0:$PATH
```

Note that the script consuming this output has to perform expansion of `$VAR` or `%VAR%` patterns found in the output.

- `list`: Lists the known versions of the tools, and indicates which ones are installed.
- `check`: For each tool, checks whether the tool is available in the system path and in `IDF_TOOLS_PATH`.

- `install-python-env`: Create a Python virtual environment in the `${IDF_TOOLS_PATH}/python_env` directory (or directly in the directory set by the `IDF_PYTHON_ENV_PATH` environment variable) and install there the required Python packages. An optional `--features` argument allows one to specify a comma-separated list of features to be added or removed. Feature that begins with `-` will be removed and features with `+` or without any sign will be added. Example syntax for removing feature `XY` is `--features=-XY` and for adding `--features=+XY` or `--features=XY`. If both removing and adding options are provided with the same feature, no operation is performed. For each feature a requirements file must exist. For example, feature `XY` is a valid feature if `${IDF_PATH}/tools/requirements/requirements.XY.txt` is an existing file with a list of Python packages to be installed. There is one mandatory `core` feature ensuring core functionality of ESP-IDF (`build`, `flash`, `monitor`, `debug in console`). There can be an arbitrary number of optional features. The selected list of features is stored in `idf-env.json`. The requirement files contain a list of the desired Python packages to be installed and `espidf.constraints.*.txt` downloaded from <https://dl.espressif.com> and stored in `${IDF_TOOLS_PATH}` the package version requirements for a given ESP-IDF version. Although it is not recommended, the download and use of constraint files can be disabled with the `--no-constraints` argument or setting the `IDF_PYTHON_CHECK_CONSTRAINTS` environment variable to `no`.
- `check-python-dependencies`: Checks if all required Python packages are installed. Packages from `${IDF_PATH}/tools/requirements/requirements.*.txt` files selected by the feature list of `idf-env.json` are checked with the package versions specified in the `espidf.constraints.*.txt` file. The constraint file is downloaded with `install-python-env` command. The use of constraints files can be disabled similarly to the `install-python-env` command.
- `uninstall`: Print and remove tools, that are currently not used by active ESP-IDF version.
 - `--dry-run` Print installed unused tools.
 - `--remove-archives` Additionally remove all older versions of previously downloaded installation packages.

Install scripts

Shell-specific user-facing scripts are provided in the root of ESP-IDF repository to facilitate tools installation. These are:

- `install.bat` for Windows Command Prompt
- `install.ps1` for Powershell
- `install.sh` for Bash
- `install.fish` for Fish

Aside from downloading and installing the tools into `IDF_TOOLS_PATH`, these scripts prepare a Python virtual environment, and install the required packages into that environment.

These scripts accept optionally a comma separated list of chip targets and `--enable-*` arguments for enabling features. These arguments are passed to the `idf_tools.py` script which stores them in `idf-env.json`. Therefore, chip targets and features can be enabled incrementally.

Running the scripts without any optional arguments will install tools for all chip targets (by running `idf_tools.py install --targets=all`) and Python packages for core ESP-IDF functionality (by running `idf_tools.py install-python-env --features=core`).

Or for example, `install.sh esp32` will install tools only for ESP32. See the *Getting Started Guide* for more examples.

`install.sh --enable-XY` will enable feature `XY` (by running `idf_tools.py install-python-env --features=core,XY`).

Export scripts

Since the installed tools are not permanently added into the user or system `PATH` environment variable, an extra step is required to use them in the command line. The following scripts modify the environment variables in the current shell to make the correct versions of the tools available:

- `export.bat` for Windows Command Prompt

- `export.ps1` for Powershell
- `export.sh` for Bash
- `export.fish` for Fish

备注: To modify the shell environment in Bash, `export.sh` must be “sourced” : `./export.sh` (note the leading dot and space).

`export.sh` may be used with shells other than Bash (such as zsh). However in this case the `IDF_PATH` environment variable must be set before running the script. When used in Bash, the script will guess the `IDF_PATH` value from its own location.

In addition to calling `idf_tools.py`, these scripts list the directories which have been added to the `PATH`.

Other installation methods

Depending on the environment, more user-friendly wrappers for `idf_tools.py` are provided:

- *IDF Tools installer for Windows* can download and install the tools. Internally the installer uses `idf_tools.py`.
- *Eclipse Plugin* includes a menu item to set up the tools. Internally the plugin calls `idf_tools.py`.
- *VSCoDe Extension* for ESP-IDF includes an onboarding flow. This flow helps setting up the tools. Although the extension does not rely on `idf_tools.py`, the same installation method is used.

Custom installation

Although the methods above are recommended for ESP-IDF users, they are not a must for building ESP-IDF applications. ESP-IDF build system expects that all the necessary tools are installed somewhere, and made available in the `PATH`.

List of IDF Tools

xtensa-esp-elf-gdb GDB for Xtensa

4.32 ESP32-S3 中的单元测试

ESP-IDF 提供以下方法测试软件。

- 一种是基于目标的测试，该测试使用运行在 esp32s3 上的中央单元测试应用程序。这些测试使用的是基于 **Unity** 的单元测试框架。通过把测试用例放在组件的 `test` 子目录，可以将其集成到 ESP-IDF 组件中。本文档主要介绍这种基于目标的测试方法。
- 另一种是基于 Linux 主机的单元测试，其中所有硬件行为都通过 **Mock** 组件进行模拟。此测试方法目前仍在开发中，暂且只有一小部分 IDF 组件支持 **Mock**，具体请参考基于 [Linux 主机的单元测试](#)。

4.32.1 添加常规测试用例

单元测试被添加在相应组件的 `test` 子目录中，测试用例写在 C 文件中，一个 C 文件可以包含多个测试用例。测试文件的名字要以 “test” 开头。

测试文件需要包含 `unity.h` 头文件，此外还需要包含待测试 C 模块需要的头文件。

测试用例需要通过 C 文件中特定的函数来添加，如下所示：

```
TEST_CASE("test name", "[module name]")
{
    // 在这里添加测试用例
}
```

- 第一个参数是此测试的描述性名称。
- 第二个参数是用方括号括起来的标识符。标识符用来对相关测试或具有特定属性的测试进行分组。

备注： 没有必要在每个测试用例中使用 `UNITY_BEGIN()` 和 `UNITY_END()` 来声明主函数的区域，`unity_platform.c` 会自动调用 `UNITY_BEGIN()`，然后运行测试用例，最后调用 `UNITY_END()`。

`test` 子目录应包含组件 `CMakeLists.txt`，因为他们本身就是一种组件（即测试组件）。ESP-IDF 使用了 **Unity** 测试框架，位于 `unity` 组件里。因此，每个测试组件都需要通过 `REQUIRES` 参数将 `unity` 组件设为依赖项。通常，组件需要手动指定待编译的源文件，但是，对于测试组件来说，这个要求被放宽为仅建议将参数 `SRC_DIRS` 用于 `idf_component_register`。

总的来说，`test` 子目录下最小的 `CMakeLists.txt` 文件可能如下所示：

```
idf_component_register(SRC_DIRS "."
                      INCLUDE_DIRS "."
                      REQUIRES unity)
```

更多关于如何在 **Unity** 下编写测试用例的信息，请查阅 <http://www.throwtheswitch.org/unity>。

4.32.2 添加多设备测试用例

常规测试用例会在一个在试设备 (Device Under Test, DUT) 上执行。但是，由于要求互相通信的组件（比如 GPIO、SPI）需要与其他设备进行通信，因此不能使用常规测试用例进行测试。多设备测试用例包括写入多个测试函数，并在多个 DUT 运行测试。

以下是一个多设备测试用例：

```
void gpio_master_test()
{
    gpio_config_t slave_config = {
        .pin_bit_mask = 1 << MASTER_GPIO_PIN,
        .mode = GPIO_MODE_INPUT,
    };
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
    gpio_config_t master_config = {
        .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
        .mode = GPIO_MODE_OUTPUT,
    };
    gpio_config(&master_config);
    gpio_set_level(SLAVE_GPIO_PIN, 1);
    unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", "[driver]", gpio_
↪master_test, gpio_slave_test);
```

宏 TEST_CASE_MULTIPLE_DEVICES 用来声明多设备测试用例。

- 第一个参数指定测试用例的名字。
- 第二个参数是测试用例的描述。
- 从第三个参数开始，可以指定最多 5 个测试函数，每个函数都是单独运行在一个 DUT 上的测试入口点。

在不同的 DUT 上运行的测试用例需要相互之间进行同步。可以通过 `unity_wait_for_signal` 和 `unity_send_signal` 这两个函数使用 UART 进行同步操作。上例的场景中，slave 应该在 master 设置好 GPIO 电平后再去读取 GPIO 电平，DUT 的 UART 终端会打印提示信息，并要求用户进行交互。

DUT1 (master) 终端:

```
Waiting for signal: [output high level]!
Please press "Enter" key once any board send this signal.
```

DUT2 (slave) 终端:

```
Send signal: [output high level]!
```

一旦 DUT2 发送了该信号，您需要在 DUT1 的终端按回车键，然后 DUT1 会从 `unity_wait_for_signal` 函数中解除阻塞，并开始更改 GPIO 的电平。

4.32.3 添加多阶段测试用例

常规的测试用例无需重启就会结束（或者仅需要检查是否发生了重启），可有些时候我们想在某些特定类型的重启事件后运行指定的测试代码。例如，在深度睡眠唤醒后检查复位的原因是否正确。首先我们需要触发深度睡眠复位事件，然后检查复位的原因。为了实现这一点，可以通过定义多阶段测试用例来将这些测试函数组合在一起：

```

static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    soc_reset_reason_t reason = esp_rom_get_reset_reason(0);
    TEST_ASSERT(reason == RESET_REASON_CORE_DEEP_SLEEP);
}

TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", "[esp32s3]", trigger_
↪deepsleep, check_deepsleep_reset_reason);

```

多阶段测试用例向用户呈现了一组测试函数，它需要用户进行交互（选择用例并选择不同的阶段）来运行。

4.32.4 应用于不同芯片的单元测试

某些测试（尤其与硬件相关的）不支持在所有的芯片上执行。请参照本节，让您的单元测试只在其中一部分芯片上执行。

1. 使用宏 `!(TEMPORARY_)DISABLED_FOR_TARGETS()` 包装您的测试代码，并将其放于原始的测试文件中，或将代码分成按功能分组的文件。但请确保所有这些文件都会由编译器处理。例：

```

#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
TEST_CASE("a test that is not ready for esp32 and esp8266 yet", "[ ]")
{
}
#endif // !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)

```

如果您需要将其中某个测试在特定芯片上编译，只需要修改禁止的芯片列表。推荐使用一些能在 `soc_caps.h` 中被清楚描述的通用概念来禁止某些单元测试。如果您已经进行上述操作，但一些测试在芯片中的调试暂未通过，请同时使用上述两种方法，当调试完成后再移除 `!(TEMPORARY_)DISABLED_FOR_TARGETS()`。例：

```

#if SOC_SDIO_SLAVE_SUPPORTED
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
TEST_CASE("a sdio slave tests that is not ready for esp64 yet", "[sdio_slave]")
{
    //available for esp32 now, and will be available for esp64 in the future
}
#endif // !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
#endif //SOC_SDIO_SLAVE_SUPPORTED

```

2. 对于某些您确定不会支持的测试（例如，芯片根本没有该外设），使用 `DISABLED_FOR_TARGETS` 来禁止该测试；对于其他只是临时性需要关闭的（例如，没有 `runner` 资源等），使用 `TEMPORARY_DISABLED_FOR_TARGETS` 来暂时关闭该测试。

一些禁用目标芯片测试用例的旧方法，由于它们具有明显的缺陷，已经被废弃，请勿继续使用：

- 请勿将测试代码放在 `test/target` 目录下并用 `CMakeLists.txt` 来选择其中一个进行编译。这是因为测试代码比实现代码更容易被复用。如果您将一些代码放在 `test/esp32` 目录下来避免 `esp32s2` 芯片执行它，一旦您需要在新的芯片（比如 `esp32s3`）中启用该测试，这种结构很难保持代码整洁。
- 请勿继续使用 `CONFIG_IDF_TARGET_XXX` 宏来禁用测试。这种方法会让被禁用的测试项目难以追踪和重新打开。并且，相比于白名单式的 `#if CONFIG_IDF_TARGET_XXX`，黑名单式的 `#if !disabled` 不会导致在新芯片引入时这些测试被自动禁用。但对于测试实现，仍可使用 `#if CONFIG_IDF_TARGET_XXX` 给不同芯片版本选择实现代码。测试项目和测试实现区分如下：
 - 测试项目：那些会在一些芯片上执行，而在另外一些上跳过的项目，例如：

有三个测试项目 SD 1-bit、SD 4-bit 和 SDSPI。对于不支持 SD Host 外设的 ESP32-S2 芯片，只有 SDSPI 一个项目需要被执行。

- 测试实现：一些始终会发生的代码，但采取的实现方式不同。例如：ESP8266 芯片没有 SDIO_PKT_LEN 寄存器。如果在测试过程中需要从 slave 设备的数据长度，您可以用不同方式读取的 #if CONFIG_IDF_TARGET_ 宏来保护不同的实现代码。但请注意避免使用 #else 宏。这样当新芯片被引入时，测试就会在编译阶段失败，提示维护者去显示选择一个正确的测试实现。

4.32.5 编译单元测试程序

按照 esp-idf 顶层目录的 README 文件中的说明进行操作，请确保 IDF_PATH 环境变量已经被设置指向了 esp-idf 的顶层目录。

切换到 tools/unit-test-app 目录下进行配置和编译：

- idf.py menuconfig - 配置单元测试程序。
- idf.py -T all build - 编译单元测试程序，测试每个组件 test 子目录下的用例。
- idf.py -T "xxx yyy" build - 编译单元测试程序，对以空格分隔的特定组件进行测试（如 idf.py -T heap build - 仅对 heap 组件目录下的单元测试程序进行编译）。
- idf.py -T all -E "xxx yyy" build - 编译单元测试程序，测试除指定组件之外的所有组件（例如 idf.py -T all -E "ulp mbedtls" build - 编译所有的单元测试，不包括 ulp 和 mbedtls 组件。）。

备注：由于 Windows 命令提示符固有限制，需使用以下语法来编译多个组件的单元测试程序：idf.py -T xxx -T yyy build 或者在 PowerShell 中使用 idf.py -T \"xxx yyy\" build，在 Windows 命令提示符中使用 idf.py -T \"^\"ssd1306 hts221\"^\" build。

当编译完成时，它会打印出烧写芯片的指令。您只需要运行 idf.py flash 即可烧写所有编译输出的文件。

您还可以运行 idf.py -T all flash 或者 idf.py -T xxx flash 来编译并烧写，所有需要的文件都会在烧写之前自动重新编译。

使用 menuconfig 可以设置烧写测试程序所使用的串口。更多信息，见 <tools/unit-test-app/README.md>。

4.32.6 运行单元测试

烧写完成后重启 ESP32-S3，它将启动单元测试程序。

当单元测试应用程序空闲时，输入回车键，它会打印出测试菜单，其中包含所有的测试项目：

```
Here's the test menu, pick your combo:
(1)    "esp_ota_begin() verifies arguments" [ota]
(2)    "esp_ota_get_next_update_partition logic" [ota]
(3)    "Verify bootloader image in flash" [bootloader_support]
(4)    "Verify unit test app image" [bootloader_support]
(5)    "can use new and delete" [cxx]
(6)    "can call virtual functions" [cxx]
(7)    "can use static initializers for non-POD types" [cxx]
(8)    "can use std::vector" [cxx]
(9)    "static initialization guards work as expected" [cxx]
(10)   "global initializers run in the correct order" [cxx]
(11)   "before scheduler has started, static initializers work correctly" [cxx]
(12)   "adc2 work with wifi" [adc]
(13)   "gpio master/slave test example" [ignore][misc][test_env=UT_T2_1][multi_
↪device]
      (1)    "gpio_master_test"
      (2)    "gpio_slave_test"
(14)   "SPI Master clockdiv calculation routines" [spi]
```

(下页继续)

```
(15) "SPI Master test" [spi][ignore]
(16) "SPI Master test, interaction of multiple devs" [spi][ignore]
(17) "SPI Master no response when switch from host1 (SPI2) to host2 (SPI3)"_
→[spi]
(18) "SPI Master DMA test, TX and RX in different regions" [spi]
(19) "SPI Master DMA test: length, start, not aligned" [spi]
(20) "reset reason check for deepsleep" [esp32s3][test_env=UT_T2_1][multi_stage]
      (1) "trigger_deepsleep"
      (2) "check_deepsleep_reset_reason"
```

常规测试用例会打印用例名字和描述，主从测试用例还会打印子菜单（已注册的测试函数的名字）。

可以输入以下任意一项来运行测试用例：

- 引号中写入测试用例的名字，运行单个测试用例。
- 测试用例的序号，运行单个测试用例。
- 方括号中的模块名字，运行指定模块所有的测试用例。
- 星号，运行所有测试用例。

[multi_device] 和 [multi_stage] `` 标签告诉测试运行者该用例是多设备测试还是多阶段测试。这些标签由 ``TEST_CASE_MULTIPLE_STAGES 和 TEST_CASE_MULTIPLE_DEVICES 宏自动生成。

一旦选择了多设备测试用例，它会打印一个子菜单：

```
Running gpio master/slave test example...
gpio master/slave test example
      (1) "gpio_master_test"
      (2) "gpio_slave_test"
```

您需要输入数字以选择在 DUT 上运行的测试。

与多设备测试用例相似，多阶段测试用例也会打印子菜单：

```
Running reset reason check for deepsleep...
reset reason check for deepsleep
      (1) "trigger_deepsleep"
      (2) "check_deepsleep_reset_reason"
```

第一次执行此用例时，输入 1 来运行第一阶段（触发深度睡眠）。在重启 DUT 并再次选择运行此用例后，输入 2 来运行第二阶段。只有在最后一个阶段通过并且之前所有的阶段都成功触发了复位的情况下，该测试才算通过。

4.32.7 带缓存补偿定时器的定时代码

存储在外部存储器（如 SPI Flash 和 SPI RAM）中的指令和数据是通过 CPU 的统一指令和数据缓存来访问的。当代码或数据在缓存中时，访问速度会非常快（即缓存命中）。

然而，如果指令或数据不在缓存中，则需要从外部存储器中获取（即缓存缺失）。访问外部存储器的速度明显较慢，因为 CPU 在等待从外部存储器获取指令或数据时会陷入停滞，从而导致整体代码执行速度会依据缓存命中或缓存缺失的次数而变化。

在不同的编译中，代码和数据的位置可能会有所不同，一些可能会更有利于缓存访问（即最大限度地减少缓存缺失）。理论上，这会影响执行速度，但这些因素通常无关紧要，因为它们的影响会在设备的运行过程中“平均化”。

然而，高速缓存对执行速度的影响可能与基准测试场景（尤其是微基准测试）有关。每次运行时间和构建时的测量时间可能会有所差异，减少差异的方法之一是将代码和数据分别放在指令或数据 RAM (IRAM/DRAM) 中。CPU 可以直接访问 IIRAM 和 DRAM，从而消除了高速缓存的影响因素。然而，由于 IIRAM 和 DRAM 容量有限，该方法并不总是可行。

缓存补偿定时器是上述方法的替代方法，该定时器使用处理器的内部事件计数器来确定在发生高速缓存未命中时等待代码/数据所花费的时间，然后从记录的实时时间中减去该时间。

```

// Start the timer
ccomp_timer_start();

// Function to time
func_code_to_time();

// Stop the timer, and return the elapsed time in microseconds relative to
// ccomp_timer_start
int64_t t = ccomp_timer_stop();

```

缓存补偿定时器的限制之一是基准功能必须固定在一个内核上。这是由于每个内核都有自己的事件计数器，这些事件计数器彼此独立。例如，如果在一个内核上调用 `ccomp_timer_start`，使调度器进入睡眠状态，唤醒并在在另一个内核上重新调度，那么对应的 `ccomp_timer_stop` 将无效。

4.32.8 Mocks

备注：目前，只有一些特定的组件在 Linux 主机上运行时才能 Mock。未来我们计划，无论是在 Linux 主机上运行还是在目标芯片 ESP32-S3 上运行，IDF 所有重要的组件都可以实现 Mock。

嵌入式系统中单元测试的最大问题之一是对硬件依赖性极强。直接在 ESP32-S3 上运行单元测试对于上层组件来说存在极大的困难，原因如下：

- 受下层组件和/或硬件设置的影响，测试可靠性降低。
- 由于下层组件和/或硬件设置的限制，测试边缘案例的难度提高。
- 由于数量庞大的依赖关系影响了行为，识别根本难度的提高。

当测试一个特定的组件（即被测组件）时，通过软件进行 Mock 能让所有被测组件的依赖在软件中被完全替换（即 Mock）。为了实现该功能，ESP-IDF 集成了 CMock 的 Mock 框架作为组件。通过在 ESP-IDF 的构建系统中添加一些 CMake 函数，可以方便地 Mock 整个（或部分）IDF 组件。

理想情况下，被测组件所依赖的所有组件都应该被 Mock，从而让测试环境完全控制与被测组件之间的所有交互。然而，如果 Mock 所有的组件过于复杂或冗长（例如需要模拟过多的函数调用），以下做法可能会有帮助：

- 在测试代码中包含更多“真正”（非模拟）代码。这样做可能有效，但同时也会增加对“真正”代码行为的依赖。此外，一旦测试失败，很难判断失败原因是因为实际测试代码还是“真正”地 IDF 代码。
- 重新评估被测代码的设计，尝试将被测代码划分为更易于管理的组件来减少其依赖性。这可能看起来很麻烦，但众所周知，单元测试经常暴露软件设计的弱点。修复设计上的弱点不仅在短期内有助于进行单元测试，而且还有助于长期的代码维护。

请参考 [cmock/CMock/docs/CMock_Summary.md](#) 了解 CMock 工作原理以及如何创建和使用 Mock。

要求

目前 Mock 只支持基于 Linux 主机的单元测试。生成 Mock 需要满足如下要求：

- Installed IDF including all IDF requirements
- CMock requirements (Ruby)
- System package requirements (`libbsd`, `libbsd-dev`)

对组件进行 Mock

要创建组件的 Mock 版本（也称为“组件模拟”），需要以特定方式覆盖组件。覆盖组件时需要创建一个与原始组件名称完全相同的组件，然后让构建系统先发现原始组件再发现这个具有相同名称的新组件。具体可参考[同名组件](#)。

在组件模拟中需要指定如下部分：

- 头文件，头文件中提供了需要生成模拟的函数
- 上述头文件的路径
- 模拟组件的依赖（如果头文件中包含了其他组件的文件，那么这点非常必要）

以上这些部分都需要使用 IDF 构建系统函数 `idf_component_mock` 指定。您可以使用 IDF 构建系统函数 `idf_component_get_property`，并加上标签 `COMPONENT_OVERRIDEN_DIR` 来访问原始组件的组件目录，然后使用 `idf_component_mock` 注册模拟组件。

```
idf_component_get_property(original_component_dir <original-component-name>↵
↵COMPONENT_OVERRIDEN_DIR)
...
idf_component_mock(INCLUDE_DIRS "${original_component_dir}/include"
  REQUIRES freertos
  MOCK_HEADER_FILES ${original_component_dir}/include/header_containing_
↵functions_to_mock.h)
```

组件模拟还需要一个单独的 mock 目录，里面包含一个 `mock_config.yaml` 文件用于配置 CMock。以下是一份简单的 `mock_config.yaml` 文件：

```
:cmock:
  :plugins:
    - expect
    - expect_any_args
```

更多关于 CMock yaml 类型配置文件的详细信息，请查看 [cmock/CMock/docs/CMock_Summary.md](#)。

请注意，组件模拟不一定要对原始组件进行整体模拟。只要组件模拟满足测试项目的依赖以及其他代码对原始组件的依赖，部分模拟就足够了。事实上，IDF 中 `tools/mocks` 中的大多数组件模拟都只是部分地模拟了原始组件。

可在 IDF 目录的 [tools/mocks](#) 下找到组件模拟的示例。有关如何覆盖 IDF 组件，可查看[同名组件](#)。

修改单元测试文件

单元测试需要通知 cmake 构建系统对依赖的组件进行模拟（即用模拟组件来覆盖原始组件）。这可以通过将组件模拟放到项目的 `components` 目录，或者在项目的根目录 `CMakeLists.txt` 文件中使用以下代码来添加模拟组件的目录来实现：

```
list(APPEND EXTRA_COMPONENT_DIRS "<mock_component_dir>")
```

这两种方法都会让组件模拟覆盖 ESP-IDF 中的现有组件。如果您使用的是 IDF 提供的组件模拟，则第二个方法更加方便。

您可参考 `esp_event` 基于主机的单元测试及其 [esp_event/host_test/esp_event_unit_test/CMakeLists.txt](#) 作为组件模拟的示例。

4.33 Unit Testing on Linux

备注： Host testing with IDF is experimental for now. We try our best to keep interfaces stable but can't guarantee it for now. Feedback via github or the forum on esp32.com is highly welcome, though and may influence the future design of the host-based tests.

This article provides an overview of unit tests with IDF on Linux. For using unit tests on the target, please refer to [target based unit testing](#).

4.33.1 Embedded Software Tests

Embedded software tests are challenging due to the following factors:

- Difficulties running tests efficiently.
- Lack of many operating system abstractions when interfacing with hardware, making it difficult to isolate code under test.

To solve these two problems, Linux host-based tests with [CMock](#) are introduced. Linux host-based tests are more efficient than unit tests on the target since they:

- Compile the necessary code only
- Don't need time to upload to a target
- Run much faster on a host-computer, compared to an ESP

Using the [CMock](#) framework also solves the problem of hardware dependencies. Through mocking, hardware details are emulated and specified at run time, but only if necessary.

Of course, using code on the host and using mocks does not fully represent the target device. Thus, two kinds of tests are recommended:

1. Unit tests which test program logic on a Linux machine, isolated through mocks.
2. System/Integration tests which test the interaction of components and the whole system. They run on the target, where irrelevant components and code may as well be emulated via mocks.

This documentation is about the first kind of tests. Refer to [target based unit testing](#) for more information on target tests (the second kind of tests).

4.33.2 IDF Unit Tests on Linux Host

The current focus of the Linux host tests is on creating isolated unit tests of components, while mocking the component's dependencies with CMock.

A complete implementation of IDF to run on Linux does not exist currently.

There are currently two examples for running IDF-built code on Linux host:

- An example [hello-world application](#)
- A [unit test for NVS](#) .

Inside the component which should be tested, there is a separate directory `host_test`, besides the “traditional” test directory or the `test_apps` directory. It has one or more subdirectories:

```

- host_test/
    - fixtures/
        contains test fixtures (structs/functions to do test case set-up_
↔and tear-down) .
        If there are no fixtures, this can be omitted.
    - <test_name>/
        IDF applications which run the tests
    - <test_name2>/
        Further tests are possible.

```

The IDF applications inside `host_test` set the mocking configuration as described in the [IDF unit test documentation](#).

The [NVS page unit test](#) provides some illustration of how to control the mocks.

Requirements

- Installed IDF including all IDF requirements
- CMock requirements (Ruby)

- System package requirements (`libbsd`, `libbsd-dev`)

The host tests have been tested on Ubuntu 20.04 with GCC version 9 and 10.

4.34 USB OTG Console

On chips with an integrated USB peripheral, it is possible to use USB Communication Device Class (CDC) to implement the serial console, instead of using UART with an external USB-UART bridge chip. ESP32-S3 ROM code contains a USB CDC implementation, which supports for some basic functionality without requiring the application to include the USB stack:

- Bidirectional serial console, which can be used with *IDF Monitor* or another serial monitor
- Flashing using `esptool.py` and `idf.py flash`.
- *Device Firmware Update (DFU)* interface for flashing the device using `dfu-util` and `idf.py dfu`.

备注: At the moment, this “USB Console” feature is incompatible with TinyUSB stack. However, if TinyUSB is used, it can provide its own CDC implementation.

4.34.1 Hardware Requirements

Connect ESP32-S3 to the USB port as follows

GPIO	USB
20	D+ (green)
19	D- (white)
GND	GND (black)
	+5V (red)

Some development boards may offer a USB connector for the internal USB peripheral—in that case, no extra connections are required.

By default, `USB_SERIAL_JTAG` module is connected to the internal PHY of the ESP32-S3, while USB_OTG peripheral can be used only if the external USB PHY is connected. Since CDC console is provided via USB_OTG peripheral, it cannot be used through the internal PHY in this configuration.

You can permanently switch the internal USB PHY to work with USB_OTG peripheral instead of USB_SERIAL_JTAG by burning `USB_PHY_SEL` eFuse. See ESP32-S3 Technical Reference Manual for more details about USB_SERIAL_JTAG and USB_OTG.

Note however that USB_SERIAL_JTAG also provides a CDC console, so enabling the CDC console shouldn't be the primary reason for switching from USB_SERIAL_JTAG to USB_CDC.

4.34.2 Software Configuration

USB console feature can be enabled using `CONFIG_ESP_CONSOLE_USB_CDC` option in menuconfig tool (see [CONFIG_ESP_CONSOLE_UART](#)).

Once the option is enabled, build the project as usual.

4.34.3 Uploading the Application

Initial Upload

If the ESP32-S3 is not yet flashed with a program which enables USB console, we can not use `idf.py flash` command with the USB CDC port. There are 3 alternative options to perform the initial upload listed below.

Once the initial upload is done, the application will start up and a USB CDC port will appear in the system.

备注: The port name may change after the initial upload, so check the port list again before running `idf.py monitor`.

Initial upload using the ROM download mode, over USB CDC

- Press ESP32-S3 into download mode. To do this, keep GPIO0 low while toggling reset. On many development boards, the “Boot” button is connected to GPIO0, and you can press “Reset” button while holding “Boot” button.
- A serial port will appear in the system. On most operating systems (Windows 8 and later, Linux, macOS) driver installation is not required. Find the port name using Device Manager (Windows) or by listing `/dev/ttyACM*` devices on Linux or `/dev/cu*` devices on macOS.
- Run `idf.py flash -p PORT` to upload the application, with `PORT` determined in the previous step

Initial upload using the ROM download mode, over USB DFU

- Press ESP32-S3 into download mode. To do this, keep GPIO0 low while toggling reset. On many development boards, the “Boot” button is connected to GPIO0, and you can press “Reset” button while holding “Boot” button.
- Run `idf.py dfu-flash`.

See [烧录 DFU 镜像](#) for details about DFU flashing.

Initial upload using UART On development boards with a USB-UART bridge, upload the application over UART: `idf.py flash -p PORT` where `PORT` is the name of the serial port provided by the USB-UART bridge.

Subsequent Usage

Once the application is uploaded for the first time, you can run `idf.py flash` and `idf.py monitor` as usual.

4.34.4 Limitations

There are several limitations to the USB console feature. These may or may not be significant, depending on the type of application being developed, and the development workflow. Most of these limitations stem from the fact that USB CDC is implemented in software, so the console working over USB CDC is more fragile and complex than a console working over UART.

1. If the application crashes, panic handler output may not be sent over USB CDC in some cases. If the memory used by the CDC driver is corrupted, or there is some other system-level issue, CDC may not work for sending panic handler messages over USB. This does work in many situations, but is not guaranteed to work as reliably as the UART output does. Similarly, if the application enters a boot loop before the USB CDC driver has a chance to start up, there will be no console output.
2. If the application accidentally reconfigures the USB peripheral pins, or disables the USB peripheral, USB CDC device will disappear from the system. After fixing the issue in the application, you will need to follow the [Initial Upload](#) process to flash the application again.
3. If the application enters light sleep (including automatic light sleep) or deep sleep mode, USB CDC device will disappear from the system.
4. USB CDC driver reserves some amount of RAM and increases application code size. Keep this in mind if trying to optimize application memory usage.
5. By default, the low-level `esp_rom_printf` feature and `ESP_EARLY_LOG` are disabled when USB CDC is used. These can be enabled using `CONFIG_ESP_CONSOLE_USB_CDC_SUPPORT_ETS_PRINTF` option. With this option enabled, `esp_rom_printf` can be used, at the expense of increased IRAM usage. Keep in mind that the cost of `esp_rom_printf` and `ESP_EARLY_LOG` over USB CDC is significantly higher

than over UART. This makes these logging mechanisms much less suitable for “printf debugging”, especially in the interrupt handlers.

6. If you are developing an application which uses the USB peripheral with the TinyUSB stack, this USB Console feature can not be used. This is mainly due to the following reasons:
 - This feature relies on a different USB CDC software stack in ESP32-S3 ROM.
 - USB descriptors used by the ROM CDC stack may be different from the descriptors used by TinyUSB.
 - When developing applications which use USB peripheral, it is very likely that USB functionality will not work or will not fully work at some moments during development. This can be due to misconfigured USB descriptors, errors in the USB stack usage, or other reasons. In this case, using the UART console for flashing and monitoring provides a much better development experience.
7. When debugging the application using JTAG, USB CDC may stop working if the CPU is stopped on a breakpoint. USB CDC operation relies on interrupts from the USB peripheral being serviced periodically. If the host computer doesn't receive valid responses from the USB device side for some time, it may decide to disconnect the device. The actual time depends on the OS and the driver, and ranges from a few hundred milliseconds to a few seconds.

4.35 USB Serial/JTAG Controller Console

On chips with an integrated USB Serial/JTAG Controller, it is possible to use the part of this controller that implements a serial port (CDC) to implement the serial console, instead of using UART with an external USB-UART bridge chip. ESP32-S3 contains this controller, providing the following functions:

- Bidirectional serial console, which can be used with *IDF Monitor* or another serial monitor.
- Flashing using `esptool.py` and `idf.py flash`.
- JTAG debugging using e.g. OpenOCD, simultaneous with serial operations.

Note that, in contrast with the USB OTG peripheral in some Espressif chips, the USB Serial/JTAG Controller is a fixed function device, implemented entirely in hardware. This means it cannot be reconfigured to perform any function other than to provide a serial channel and JTAG debugging functionality.

4.35.1 Hardware Requirements

Connect ESP32-S3 to the USB port as follows:

GPIO	USB
20	D+ (green)
19	D- (white)
GND	GND (black)
	+5V (red)

Some development boards may offer a USB connector for the USB Serial/JTAG Controller—in that case, no extra connections are required.

4.35.2 Software Configuration

USB console feature can be enabled using `CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG` option in `menuconfig` tool (see [CONFIG_ESP_CONSOLE_UART](#)).

Once the option is enabled, build the project as usual.

Alternatively, you can access the output through `usb_serial_jtag` port but make sure the option `CONFIG_ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG` in choice `ESP_CONSOLE_SECONDARY` is selected.

警告: Besides output, if you also want to input or use REPL with console, please select `CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG`.

4.35.3 Uploading the Application

The USB Serial/JTAG Controller is able to put the ESP32-S3 into download mode automatically. Simply flash as usual, but specify the USB Serial/JTAG Controller port on your system: `idf.py flash -p PORT` where `PORT` is the name of the proper port.

4.35.4 Limitations

There are several limitations to the USB Serial/JTAG console feature. These may or may not be significant, depending on the type of application being developed, and the development workflow.

1. If the application accidentally reconfigures the USB peripheral pins, or disables the USB Serial/JTAG Controller, the device will disappear from the system. After fixing the issue in the application, you will need to manually put the ESP32-S3 into download mode by pulling low GPIO0 and resetting the chip.
2. If the application enters deep sleep mode, the USB Serial/JTAG device will disappear from the system.
3. For data sent in the direction of ESP32-S3 to PC Terminal (e.g. `stdout`, logs), the ESP32-S3 first writes to a small internal buffer. If this buffer becomes full (for example, if no PC Terminal is connected), the ESP32-S3 will do a one-time wait of 50ms hoping for the PC Terminal to request the data. This can appear as a very brief ‘pause’ in your application.
4. For data sent in the PC Terminal to ESP32-S3 direction (e.g. console commands), many PC Terminals will wait for the ESP32-S3 to ingest the bytes before allowing you to sending more data. This is in contrast to using a USB-to-Serial (UART) bridge chip, which will always ingest the bytes and send them to a (possibly not listening) ESP32-S3.
5. The USB Serial/JTAG device won’t work in sleep modes as normal due to the lack of APB clock in sleep modes. This includes deep-sleep, light-sleep (automatic light-sleep as well).
6. The power consumption in sleep modes will be higher if the USB Serial/JTAG device is in use. This is because we want to keep the USB Serial/JTAG device alive during software reset by default. However there is an issue that this might also increase the power consumption in sleep modes. This is because the software keeps a clock source on during the reset to keep the USB Serial/JTAG device alive. As a side-effect, the clock is also kept on during sleep modes. There is one exception: the clock will only be kept on when your USB Serial/JTAG port is really in use (like data transaction), therefore, if your USB Serial/JTAG is connected to power bank or battery, etc., instead of a valid USB host (for example, a PC), the power consumption will not increase.

If you still want to keep low power consumption in sleep modes:

1. If you are not using the USB Serial/JTAG port, you don’t need to do anything. Software will detect if the USB Serial/JTAG is connected to a valid host before going to sleep, and keep the clocks only when the host is connected. Otherwise the clocks will be turned off as normal.
2. If you are using the USB Serial/JTAG port, please disable the menuconfig option `CONFIG_RTC_CLOCK_BBPLL_POWER_ON_WITH_USB`. The clock will be switched off as normal during software reset and in sleep modes. In these cases, the USB Serial/JTAG device may be unplugged from the host.

4.36 Wi-Fi 驱动程序

4.36.1 ESP32-S3 Wi-Fi 功能列表

ESP32-S3 支持以下 Wi-Fi 功能:

- 支持 4 个虚拟接口，即 STA、AP、Sniffer 和 reserved。
- 支持仅 station 模式、仅 AP 模式、station/AP 共存模式
- 支持使用 IEEE 802.11b、IEEE 802.11g、IEEE 802.11n 和 API 配置协议模式
- 支持 WPA/WPA2/WPA3/WPA2-企业版/WPA3-企业版/WAPI/WPS 和 DPP
- 支持 AMSDU、AMPDU、HT40、QoS 以及其它主要功能
- 支持 Modem-sleep
- 支持乐鑫专属协议，可实现 **1 km** 数据通信量
- 空中数据传输最高可达 20 MBit/s TCP 吞吐量和 30 MBit/s UDP 吞吐量
- 支持 Sniffer
- 支持快速扫描和全信道扫描
- 支持多个天线
- 支持获取信道状态信息

4.36.2 如何编写 Wi-Fi 应用程序

准备工作

一般来说，要编写自己的 Wi-Fi 应用程序，最高效的方式是先选择一个相似的应用程序示例，然后将其中可用的部分移植到自己的项目中。如果您希望编写一个强健的 Wi-Fi 应用程序，强烈建议您在开始之前先阅读本文。非强制要求，请依个人情况而定。

本文将补充说明 Wi-Fi API 和 Wi-Fi 示例的相关信息，重点描述使用 Wi-Fi API 的原则、当前 Wi-Fi API 实现的限制以及使用 Wi-Fi 时的常见错误。同时，本文还介绍了 Wi-Fi 驱动程序的一些设计细节。建议您选择一个示例 [example](#) 进行参考。

设置 Wi-Fi 编译时选项

请参阅 [Wi-Fi menuconfig](#)。

Wi-Fi 初始化

请参阅 [ESP32-S3 Wi-Fi station 一般情况](#)、[ESP32-S3 Wi-Fi AP 一般情况](#)。

启动/连接 Wi-Fi

请参阅 [ESP32-S3 Wi-Fi station 一般情况](#)、[ESP32-S3 Wi-Fi AP 一般情况](#)。

事件处理

通常，在理想环境下编写代码难度并不大，如 [WIFI_EVENT_STA_START](#)、[WIFI_EVENT_STA_CONNECTED](#) 中所述。难度在于如何在现实的困难环境下编写代码，如 [WIFI_EVENT_STA_DISCONNECTED](#) 中所述。能否在后者情况下完美地解决各类事件冲突，是编写一个强健的 Wi-Fi 应用程序的根本。请参阅 [ESP32-S3 Wi-Fi 事件描述](#)、[ESP32-S3 Wi-Fi station 一般情况](#)、[ESP32-S3 Wi-Fi AP 一般情况](#)。另可参阅 ESP-IDF 中的 [事件处理概述](#)。

编写错误恢复程序

除了在能在比较差的环境下工作，错误恢复能力也对一个强健的 Wi-Fi 应用程序至关重要。请参阅 [ESP32-S3 Wi-Fi API 错误代码](#)。

4.36.3 ESP32-S3 Wi-Fi API 错误代码

所有 ESP32-S3 Wi-Fi API 都有定义好的返回值，即错误代码。这些错误代码可分类为：

- 无错误，例如：返回值 ESP_OK 代表 API 成功返回
- 可恢复错误，例如：ESP_ERR_NO_MEM
- 不可恢复的非关键性错误
- 不可恢复的关键性错误

一个错误是否为关键性取决于其 API 和应用场景，并且由 API 用户定义。

要使用 Wi-Fi API 编写一个强健的应用程序，根本原则便是要时刻检查错误代码并编写相应的错误处理代码。一般来说，错误处理代码可用于解决：

- 可恢复错误，您可以编写一个可恢复错误处理代码解决该类错误。例如，当 `esp_wifi_start()` 返回 ESP_ERR_NO_MEM 时，调用可恢复错误处理代码 `vTaskDelay` 可以获取几微秒的重试时间。
- 不可恢复非关键性错误，打印错误代码可以帮助您更好地处理该类错误。
- 不可恢复关键性错误，可使用“assert”语句处理该类错误。例如，如果 `esp_wifi_set_mode()` 返回 ESP_ERR_WIFI_NOT_INIT，该值意为 `esp_wifi_init()` 未成功初始化 Wi-Fi 驱动程序。您可以在应用程序开发阶段非常快速地检测到此类错误。

在 `esp_err.h` 中，ESP_ERROR_CHECK 负责检查返回值。这是一个较为常见的错误处理代码，可在应用程序开发阶段作为默认的错误处理代码。但是，我们强烈建议 API 的使用者编写自己的错误处理代码。

4.36.4 初始化 ESP32-S3 Wi-Fi API 参数

初始化 API 的结构参数时，应遵循以下两种方式之一：

- 设置该参数的所有字段
- 先使用 `get` API 获取当前配置，然后只设置特定于应用程序的字段

初始化或获取整个结构这一步至关重要，因为大多数情况下，返回值 0 意味着程序使用了默认值。未来，我们将会在该结构中加入更多字段，并将这些字段初始化为 0，确保即使 IDF 版本升级后您的应用程序依然能够正常运行。

4.36.5 ESP32-S3 Wi-Fi 编程模型

ESP32-S3 Wi-Fi 编程模型如下图所示：

图 53: Wi-Fi 编程模型

Wi-Fi 驱动程序可以看作是一个无法感知上层代码（如 TCP/IP 堆栈、应用程序任务、事件任务等）的黑匣子。通常，应用程序任务（代码）负责调用 *Wi-Fi 驱动程序 APIs* 来初始化 Wi-Fi，并在必要时处理 Wi-Fi 事件。然后，Wi-Fi 驱动程序接收并处理 API 数据，并在应用程序中插入事件。

Wi-Fi 事件处理是在 `esp_event` 库的基础上进行的。Wi-Fi 驱动程序将事件发送至默认事件循环，应用程序便可以使用 `esp_event_handler_register()` 中的回调函数处理这些事件。除此之外，`esp_netif` 组件也负责处理 Wi-Fi 事件，并产生一系列默认行为。例如，当 Wi-Fi station 连接至一个 AP 时，`esp_netif` 将自动开启 DHCP 客户端服务（系统默认）。

4.36.6 ESP32-S3 Wi-Fi 事件描述

WIFI_EVENT_WIFI_READY

Wi-Fi 驱动程序永远不会生成此事件，因此，应用程序的事件回调函数可忽略此事件。在未来的版本中，此事件可能会被移除。

WIFI_EVENT_SCAN_DONE

扫描完成事件，由 `esp_wifi_scan_start()` 函数触发，将在以下情况下产生：

- 扫描已完成，例如：Wi-Fi 已成功找到目标 AP 或已扫描所有信道。
- 当前扫描因函数 `esp_wifi_scan_stop()` 而终止。
- 在当前扫描完成之前调用了函数 `esp_wifi_scan_start()`。此时，新的扫描将覆盖当前扫描过程，并生成一个扫描完成事件。

以下情况下将不会产生扫描完成事件：

- 当前扫描被阻止。
- 当前扫描是由函数 `esp_wifi_connect()` 触发的。

接收到此事件后，事件任务暂不做任何响应。首先，应用程序的事件回调函数需调用 `esp_wifi_scan_get_ap_num()` 和 `esp_wifi_scan_get_ap_records()` 获取已扫描的 AP 列表，然后触发 Wi-Fi 驱动程序释放在扫描过程中占用的内存空间（**切记该步骤**）。更多详细信息，请参阅 [ESP32-S3 Wi-Fi 扫描](#)。

WIFI_EVENT_STA_START

如果调用函数 `esp_wifi_start()` 后接收到返回值 ESP_OK，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将初始化 LwIP 网络接口 (`netif`)。通常，应用程序的事件回调函数需调用 `esp_wifi_connect()` 来连接已配置的 AP。

WIFI_EVENT_STA_STOP

如果调用函数 `esp_wifi_stop()` 后接收到返回值 ESP_OK，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将进行释放 station IP 地址、终止 DHCP 客户端服务、移除 TCP/UDP 相关连接并清除 LwIP station `netif` 等动作。此时，应用程序的事件回调函数通常不需做任何响应。

WIFI_EVENT_STA_CONNECTED

如果调用函数 `esp_wifi_connect()` 后接收到返回值 ESP_OK，且 station 已成功连接目标 AP，则将产生此连接事件。接收到此事件后，事件任务将启动 DHCP 客户端服务并开始获取 IP 地址。此时，Wi-Fi 驱动程序已准备就绪，可发送和接收数据。如果您的应用程序不依赖于 LwIP（即 IP 地址），则此刻便可以开始应用程序开发工作。但是，如果您的应用程序需基于 LwIP 进行，则还需等待 `got ip` 事件发生后才可开始。

WIFI_EVENT_STA_DISCONNECTED

此事件将在以下情况下产生：

- 调用了函数 `esp_wifi_disconnect()` 或 `esp_wifi_stop()`，且 Wi-Fi station 已成功连接至 AP。
- 调用了函数 `esp_wifi_connect()`，但 Wi-Fi 驱动程序因为某些原因未能成功连接至 AP，例如：未扫描到目标 AP、验证超时等。或存在多个 SSID 相同的 AP，station 无法连接所有已找到的 AP，也将产生该事件。
- Wi-Fi 连接因为某些原因而中断，例如：station 连续多次丢失 N beacon、AP 踢掉 station、AP 认证模式改变等。

接收到此事件后，事件任务的默认动作为：

- 关闭 station 的 LwIP netif。
- 通知 LwIP 任务清除导致所有套接字状态错误的 UDP/TCP 连接。针对基于套接字编写的应用程序，其回调函数可以在接收到此事件时（如有必要）关闭并重新创建所有套接字。

应用程序处理此事件最常用的方法为：调用函数 `esp_wifi_connect()` 重新连接 Wi-Fi。但是，如果此事件是由函数 `esp_wifi_disconnect()` 引发的，则应用程序不应调用 `esp_wifi_connect()` 来重新连接。应用程序须明确区分此事件的引发原因，因为某些情况下应使用其它更好的方式进行重新连接。请参阅 [Wi-Fi 重新连接](#) 和 [连接 Wi-Fi 时扫描](#)。

需要注意的另一点是：接收到此事件后，LwIP 的默认动作是终止所有 TCP 套接字连接。大多数情况下，该动作不会造成影响。但对某些特殊应用程序可能除外。例如：

- 应用程序创建了一个 TCP 连接，以维护每 60 秒发送一次的应用程序级、保持活动状态的数据。
- 由于某些原因，Wi-Fi 连接被切断并引发了 `WIFI_EVENT_STA_DISCONNECTED` 事件。根据当前实现，此时所有 TCP 连接都将被移除，且保持活动的套接字将处于错误的状态中。但是，由于应用程序设计者认为网络层 **不应** 考虑这个 Wi-Fi 层的错误，因此应用程序不会关闭套接字。
- 5 秒后，因为在应用程序的事件回调函数中调用了 `esp_wifi_connect()`，Wi-Fi 连接恢复。**同时，station 连接至同一个 AP 并获得与之前相同的 IPV4 地址。**
- 60 秒后，当应用程序发送具有保持活动状态的套接字的数据时，套接字将返回错误，应用程序将关闭套接字并在必要时重新创建。

在上述场景中，理想状态下应用程序套接字和网络层将不会受到影响，因为在此过程中 Wi-Fi 连接只是短暂地断开然后快速恢复。应用程序可通过 LwIP menuconfig 启动“IP 改变时保持 TCP 连接”的功能。

IP_EVENT_STA_GOT_IP

当 DHCP 客户端成功从 DHCP 服务器获取 IPV4 地址或 IPV4 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

IPV4 地址可能由于以下原因而发生改变：

- DHCP 客户端无法重新获取/绑定 IPV4 地址，且 station 的 IPV4 重置为 0。
- DHCP 客户端重新绑定了其它地址。
- 静态配置的 IPV4 地址已发生改变。

函数 `ip_event_got_ip_t` 中的字段 `ip_change` 说明了 IPV4 地址是否发生改变。

套接字的状态是基于 IPV4 地址的，这意味着，如果 IPV4 地址发生改变，则所有与此 IPV4 相关的套接字都将变为异常。接收到此事件后，应用程序需关闭所有套接字，并在 IPV4 变为有效地址时重新创建应用程序。

IP_EVENT_GOT_IP6

当 IPV6 SLAAC 支持自动为 ESP32-S3 配置一个地址，或 ESP32-S3 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

IP_EVENT_STA_LOST_IP

当 IPv4 地址失效时，将引发此事件。

此事件不会在 Wi-Fi 断连后立刻出现。Wi-Fi 连接断开后，首先将启动一个 IPv4 地址丢失计时器，如果 station 在该计时器超时之前成功获取了 IPv4 地址，则不会发生此事件。否则，此事件将在计时器超时发生时。

一般来说，应用程序可忽略此事件。这只是一个调试事件，主要使应用程序获知 IPv4 地址已丢失。

WIFI_EVENT_AP_START

与 `WIFI_EVENT_STA_START` 事件相似。

WIFI_EVENT_AP_STOP

与 `WIFI_EVENT_STA_STOP` 事件相似。

WIFI_EVENT_AP_STACONNECTED

每当有一个 station 成功连接 ESP32-S3 AP 时，将引发此事件。接收到此事件后，事件任务将不做任何响应，应用程序的回调函数也可忽略这一事件。但是，您可以在此时进行一些操作，例如：获取已连接 station 的信息等。

WIFI_EVENT_AP_STADISCONNECTED

此事件将在以下情况下发生：

- 应用程序通过调用函数 `esp_wifi_disconnect()` 或 `esp_wifi_deinit_sta()` 手动断开 station 连接。
- Wi-Fi 驱动程序出于某些原因断开 station 连接，例如：AP 在过去 5 分钟（可通过函数 `esp_wifi_set_inactive_time()` 修改该时间）内未接收到任何数据包等。
- station 断开与 AP 之间的连接。

发生此事件时，事件任务将不做任何响应，但应用程序的事件回调函数需执行一些操作，例如：关闭与此 station 相关的套接字等。

WIFI_EVENT_AP_PROBEREQRCVED

默认情况下，此事件处于禁用状态，应用程序可以通过调用 API `esp_wifi_set_event_mask()` 启用。启用后，每当 AP 接收到 probe request 时都将引发此事件。

WIFI_EVENT_STA_BEACON_TIMEOUT

如果 station 在 inactive 时间内未收到所连接 AP 的 beacon，将发生 beacon 超时，将引发此事件。inactive 时间通过调用函数 `esp_wifi_set_inactive_time()` 设置。

WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START

非连接模块在 *Interval* 开始时触发此事件。请参考 [非连接模块功耗管理](#)。

4.36.7 ESP32-S3 Wi-Fi station 一般情况

下图为 station 模式下的宏观场景，其中包含不同阶段的具体描述：

图 54: station 模式下 Wi-Fi 事件场景示例

1. Wi-Fi/LwIP 初始化阶段

- s1.1: 主任务通过调用函数 `esp_netif_init()` 创建一个 LwIP 核心任务, 并初始化 LwIP 相关工作。
- s1.2: 主任务通过调用函数 `esp_event_loop_create()` 创建一个系统事件任务, 并初始化应用程序事件的回调函数。在此情况下, 该回调函数唯一的动作就是将事件中继到应用程序任务中。
- s1.3: 主任务通过调用函数 `esp_netif_create_default_wifi_ap()` 或 `esp_netif_create_default_wifi_sta()` 创建有 TCP/IP 堆栈的默认网络接口实例绑定 station 或 AP。
- s1.4: 主任务通过调用函数 `esp_wifi_init()` 创建 Wi-Fi 驱动程序任务, 并初始化 Wi-Fi 驱动程序。
- s1.5: 主任务通过调用 OS API 创建应用程序任务。

推荐按照 s1.1 ~ s1.5 的步骤顺序针对基于 Wi-Fi/LwIP 的应用程序进行初始化。但这一顺序并非强制, 您可以在第 s1.1 步创建应用程序任务, 然后在应用程序任务中进行所有其它初始化操作。不过, 如果您的应用程序任务依赖套接字, 那么在初始化阶段创建应用程序任务可能并不适用。此时, 您可以在接收到 IP 后再进行任务创建。

2. Wi-Fi 配置阶段

Wi-Fi 驱动程序初始化成功后, 可以进入到配置阶段。该场景下, Wi-Fi 驱动程序处于 station 模式。因此, 首先您需调用函数 `esp_wifi_set_mode()` (WIFI_MODE_STA) 将 Wi-Fi 模式配置为 station 模式。可通过调用其它 `esp_wifi_set_xxx` API 进行更多设置, 例如: 协议模式、国家代码、带宽等。请参阅 [ESP32-S3 Wi-Fi 配置](#)。

一般情况下, 我们会在建立 Wi-Fi 连接之前配置 Wi-Fi 驱动程序, 但这并非强制要求。也就是说, 只要 Wi-Fi 驱动程序已成功初始化, 您可以在任意阶段进行配置。但是, 如果您的 Wi-Fi 在建立连接后不需要更改配置, 则应先在此阶段完成配置。因为调用配置 API (例如 `esp_wifi_set_protocol()`) 将会导致 Wi-Fi 连接断开, 为您的操作带来不便。

如果 menuconfig 已使能 Wi-Fi NVS flash, 则不论当前阶段还是后续的 Wi-Fi 配置信息都将被存储至该 flash 中。那么, 当主板上电/重新启动时, 就不需从头开始配置 Wi-Fi 驱动程序。您只需调用函数 `esp_wifi_get_xxx` API 获取之前存储的配置信息。当然, 如果不想使用之前的配置, 您依然可以重新配置 Wi-Fi 驱动程序。

3. Wi-Fi 启动阶段

- s3.1: 调用函数 `esp_wifi_start()` 启动 Wi-Fi 驱动程序。
- s3.2: Wi-Fi 驱动程序将事件 `WIFI_EVENT_STA_START` 发布到事件任务中, 然后, 事件任务将执行一些正常操作并调用应用程序的事件回调函数。
- s3.3: 应用程序的事件回调函数将事件 `WIFI_EVENT_STA_START` 中继到应用程序任务中。推荐您此时调用函数 `esp_wifi_connect()` 进行 Wi-Fi 连接。当然, 您也可以等待在 `WIFI_EVENT_STA_START` 事件发生后的其它阶段再调用此函数。

4. Wi-Fi 连接阶段

- s4.1: 调用函数 `esp_wifi_connect()` 后, Wi-Fi 驱动程序将启动内部扫描/连接过程。
- s4.2: 如果内部扫描/连接过程成功, 将产生 `WIFI_EVENT_STA_CONNECTED` 事件。然后, 事件任务将启动 DHCP 客户端服务, 最终触发 DHCP 程序。
- s4.3: 在此情况下, 应用程序的事件回调函数会将 `WIFI_EVENT_STA_CONNECTED` 事件中继到应用程序任务中。通常, 应用程序不需进行操作, 而您可以执行任何动作, 例如: 打印日志等。

步骤 s4.2 中 Wi-Fi 连接可能会由于某些原因而失败, 例如: 密码错误、未找到 AP 等。这种情况下, 将引发 `WIFI_EVENT_STA_DISCONNECTED` 事件并提示连接错误原因。有关如何处理中断 Wi-Fi 连接的事件, 请参阅下文阶段 6 的描述。

5. Wi-Fi 获取 IP 阶段

- s5.1: 一旦步骤 4.2 中的 DHCP 客户端初始化完成, Wi-Fi 驱动程序将进入 获取 IP 阶段。
- s5.2: 如果 Wi-Fi 成功从 DHCP 服务器接收到 IP 地址, 则将引发 `IP_EVENT_STA_GOT_IP` 事件, 事件任务将执行正常处理。
- s5.3: 应用程序的事件回调函数将事件 `IP_EVENT_STA_GOT_IP` 中继到应用程序任务中。对于那些基于 LwIP 构建的应用程序, 此事件较为特殊, 因为它意味着应用程序已准备就绪, 可以开始任务, 例如: 创建 TCP/UDP 套接字等。此时较为容易犯的一个错误就是在接收到 `IP_EVENT_STA_GOT_IP` 事件之前就初始化套接字。**切忌在接收到 IP 之前启动任何套接字相关操作。**

6. Wi-Fi 断开阶段

- s6.1: 当 Wi-Fi 因为某些原因 (例如: AP 掉电、RSSI 较弱等) 连接中断时, 将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件。此事件也可能在上文阶段 3 中发生。在这里, 事件任务将通知 LwIP 任务清除/移除所有 UDP/TCP 连接。然后, 所有应用程序套接字都将处于错误状态。也就是说, `WIFI_EVENT_STA_DISCONNECTED` 事件发生时, 任何套接字都无法正常工作。
- s6.2: 上述情况下, 应用程序的事件回调函数会将 `WIFI_EVENT_STA_DISCONNECTED` 事件中中继到应用程序任务中。推荐您调用函数 `esp_wifi_connect()` 重新连接 Wi-Fi, 关闭所有套接字, 并在必要时重新创建套接字。请参阅 `WIFI_EVENT_STA_DISCONNECTED`。

7. Wi-Fi IP 更改阶段

- s7.1: 如果 IP 地址发生更改, 将引发 `IP_EVENT_STA_GOT_IP` 事件, 其中 “ip_change” 被置为 “true”。
- s7.2: **此事件对应用程序至关重要。这一事件发生时, 适合关闭所有已创建的套接字并进行重新创建。**

8. Wi-Fi 清理阶段

- s8.1: 调用函数 `esp_wifi_disconnect()` 断开 Wi-Fi 连接。
- s8.2: 调用函数 `esp_wifi_stop()` 终止 Wi-Fi 驱动程序。
- s8.3: 调用函数 `esp_wifi_deinit()` 清理 Wi-Fi 驱动程序。

4.36.8 ESP32-S3 Wi-Fi AP 一般情况

下图为 AP 模式下的宏观场景, 其中包含不同阶段的具体描述:

4.36.9 ESP32-S3 Wi-Fi 扫描

目前, 仅 station 或 station/AP 共存模式支持 `esp_wifi_scan_start()` API。

图 55: AP 模式下 Wi-Fi 事件场景示例

扫描类型

模式	描述
主动扫描	通过发送 probe request 进行扫描。该模式为默认的扫描模式。
被动扫描	不发送 probe request。跳至某一特定信道并等待 beacon。应用程序可通过 <code>wifi_scan_config_t</code> 中的 <code>scan_type</code> 字段使能被动扫描。
前端扫描	在 station 模式下 Wi-Fi 未连接时，可进行前端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描，应用程序无法配置这两种模式。
后端扫描	在 station 模式或 station/AP 共存模式下 Wi-Fi 已连接时，可进行后端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描，应用程序无法配置这两种模式。
全信道扫描	扫描所有信道。 <code>wifi_scan_config_t</code> 中的 <code>channel</code> 字段为 0 时，当前模式为全信道扫描。
特定信道扫描	仅扫描特定的信道。 <code>wifi_scan_config_t</code> 中的 <code>channel</code> 字段为 1-14 时，当前模式为特定信道扫描。

上表中的扫描模式可以任意组合，因此共有 8 种不同扫描方式：

- 全信道后端主动扫描
- 全信道后端被动扫描
- 全信道前端主动扫描
- 全信道后端被动扫描
- 特定信道后端主动扫描
- 特定信道后端被动扫描
- 特定信道前端主动扫描
- 特定信道前端被动扫描

扫描配置

扫描类型与其他扫描属性通过函数 `esp_wifi_scan_start()` 进行配置。下表详细描述了函数 `wifi_scan_config_t` 各字段信息。

字段	描述
<code>ssid</code>	如果该字段的值不为 NULL，则仅可扫描到具有相同 SSID 值的 AP。
<code>bssid</code>	如果该字段的值不为 NULL，则仅可扫描到具有相同 BSSID 值的 AP。
<code>channel</code>	如果该字段值为 0，将进行全信道扫描；反之，将针对特定信道进行扫描。
<code>show_hidden</code>	如果该字段值为 0，本次扫描将忽略具有隐藏 SSID 的 AP；反之，这些 AP 也会在扫描时被视为正常 AP。
<code>scan_type</code>	如果该字段值为 <code>WIFI_SCAN_TYPE_ACTIVE</code> ，则本次扫描为主动扫描；反之，将被视为被动扫描。
<code>scan_time</code>	该字段用于控制每个信道的扫描时间。 被动扫描时， <code>scan_time.passive</code> 字段负责为每个信道指定扫描时间。 主动扫描时，每个信道的扫描时间如下列表所示。其中， <code>min</code> 代表 <code>scan_time_active_min</code> ， <code>max</code> 代表 <code>scan_time_active_max</code> 。 <ul style="list-style-type: none"> • <code>min=0, max=0</code>：每个信道的扫描时间为 120 ms。 • <code>min>0, max=0</code>：每个信道的扫描时间为 120 ms。 • <code>min=0, max>0</code>：每个信道的扫描时间为 <code>max</code> ms。 • <code>min>0, max>0</code>：每个信道扫描的最短时间为 <code>min</code> ms。如果在这段时间内未找到 AP，将跳转至下一个信道。如这段时间内找到 AP，则该信道的扫描时间为 <code>max</code> ms。 如希望提升 Wi-Fi 扫描性能，则可修改上述两个参数。

调用 API `esp_wifi_set_config()` 可全局配置一些扫描属性，请参阅 [station 基本配置](#)。

在所有信道中扫描全部 AP（前端）

场景：

图 56: 所有 Wi-Fi 信道的前端扫描

上述场景中描述了全信道前端扫描过程。仅 station 模式支持前端扫描，该模式下 station 未连接任何 AP。前端扫描还是后端扫描完全由 Wi-Fi 驱动程序决定，应用程序无法配置这一模式。

详细描述：

扫描配置阶段

- s1.1: 如果默认的国家信息有误，调用函数 `esp_wifi_set_country()` 进行配置。请参阅 [Wi-Fi 国家/地区代码](#)。
- s1.2: 调用函数 `esp_wifi_scan_start()` 配置扫描信息，可参阅 [扫描配置](#)。该场景为全信道扫描，将 SSID/BSSID/channel 设置为 0 即可。

Wi-Fi 驱动程序内部扫描阶段

- s2.1: Wi-Fi 驱动程序切换至信道 1，此时的扫描类型为 `WIFI_SCAN_TYPE_ACTIVE`，同时发送一个 probe request。反之，Wi-Fi 将等待接收 AP beacon。Wi-Fi 驱动程序将在信道 1 停留一段时间。min/max 扫描时间中定义了 Wi-Fi 在信道 1 中停留的时间长短，默认为 120 ms。
- s2.2: Wi-Fi 驱动程序跳转至信道 2，并重复进行 s2.1 中的步骤。
- s2.3: Wi-Fi 驱动程序扫描最后的信道 N，N 的具体数值由步骤 s1.1 中配置的国家代码决定。

扫描完成后事件处理阶段

- s3.1: 当所有信道扫描全部完成后，将产生 `WIFI_EVENT_SCAN_DONE` 事件。
- s3.2: 应用程序的事件回调函数告知应用程序任务已接收到 `WIFI_EVENT_SCAN_DONE` 事件。调用函数 `esp_wifi_scan_get_ap_num()` 获取在本次扫描中找到的 AP 数量。然后，分配出足够的事物槽，并调用函数 `esp_wifi_scan_get_ap_records()` 获取 AP 记录。请注意，一旦调用 `esp_wifi_scan_get_ap_records()`，Wi-Fi 驱动程序中的 AP 记录将被释放。但是，请不要在单个扫描完成事件中重复调用两次 `esp_wifi_scan_get_ap_records()`。反之，如果扫描完成事件发生后未调用 `esp_wifi_scan_get_ap_records()`，则 Wi-Fi 驱动程序中的 AP 记录不会被释放。因此，请务必确保调用函数 `esp_wifi_scan_get_ap_records()`，且仅调用一次。

在所有信道上扫描全部 AP (后端)

场景：

上述场景为一次全信道后端扫描。与在[所有信道中扫描全部 AP \(前端\)](#) 相比，全信道后端扫描的不同之处在于：在跳至下一个信道之前，Wi-Fi 驱动程序会先返回主信道停留 30 ms，以便 Wi-Fi 连接有一定的时间发送/接收数据。

在所有信道中扫描特定 AP

场景：

该扫描过程与在[所有信道中扫描全部 AP \(前端\)](#) 相似。区别在于：

- s1.1: 在步骤 1.2 中，目标 AP 将配置为 SSID/BSSID。
- s2.1 ~ s2.N: 每当 Wi-Fi 驱动程序扫描某个 AP 时，它将检查该 AP 是否为目标 AP。如果本次扫描类型为 `WIFI_FAST_SCAN`，且确认已找到目标 AP，则将产生扫描完成事件，同时结束本次扫描；反之，扫描将继续。请注意，第一个扫描的信道可能不是信道 1，因为 Wi-Fi 驱动程序会优化扫描顺序。

如果有多个匹配目标 AP 信息的 AP，例如：碰巧扫描到两个 SSID 为 “ap” 的 AP。如果本次扫描类型为 `WIFI_FAST_SCAN`，则仅可找到第一个扫描到的 “ap”；如果本次扫描类型为 `WIFI_ALL_CHANNEL_SCAN`，则两个 “ap” 都将被找到，且 station 将根据配置规则连接至其需要连接的 “ap”，请参阅[station 基本配置](#)。

您可以在任意信道中扫描某个特定的 AP，或扫描该信道中的所有 AP。这两种扫描过程也较为相似。

在 Wi-Fi 连接模式下扫描

调用函数 `esp_wifi_connect()` 后，Wi-Fi 驱动程序将首先尝试扫描已配置的 AP。Wi-Fi 连接模式下的扫描过程与在[所有信道中扫描特定 AP](#) 过程相同，但连接模式下扫描结束后将不会产生扫描完成事件。如果已找到目标 AP，则 Wi-Fi 驱动程序将开始 Wi-Fi 连接；反之，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件。请参阅在[所有信道中扫描特定 AP](#)。

在禁用模式下扫描

如果函数 `esp_wifi_scan_start()` 中的禁用参数为 “true”，则本次扫描为禁用模式下的扫描。在该次扫描完成之前，应用程序任务都将被禁用。禁用模式下的扫描和正常扫描相似，不同之处在于，禁用模式下扫描完成之后将不会出现扫描完成事件。

图 57: 所有 Wi-Fi 信道的后端扫描

图 58: 扫描特定的 Wi-Fi 信道

并行扫描

有时，可能会有两个应用程序任务同时调用函数 `esp_wifi_scan_start()`，或者某个应用程序任务在获取扫描完成事件之前再次调用了函数 `esp_wifi_scan_start()`。这两种情况都有可能发生。但是，Wi-Fi 驱动程序并不足以支持多个并行的扫描。因此，应避免上述并行扫描。随着 ESP32-S3 的 Wi-Fi 功能不断提升，未来的版本中可能会增加并行扫描支持。

连接 Wi-Fi 时扫描

如果 Wi-Fi 正在连接，则调用函数 `esp_wifi_scan_start()` 后扫描将立即失败，因为 Wi-Fi 连接优先级高于扫描。如果扫描是因为 Wi-Fi 连接而失败的，此时推荐采取的策略为：等待一段时间后重试。因为一旦 Wi-Fi 连接完成后，扫描将立即成功。

但是，延时重试策略并非万无一失。试想以下场景：

- 如果 station 正在连接一个不存在的 AP，或正在使用错误的密码连接一个 AP，此时将产生事件 `WIFI_EVENT_STA_DISCONNECTED`。
- 接收到断开连接事件后，应用程序调用函数 `esp_wifi_connect()` 进行重新连接。
- 而另一个应用程序任务（如，控制任务）调用了函数 `esp_wifi_scan_start()` 进行扫描。这种情况下，每一次扫描都会立即失败，因为 station 一直处于正在连接状态。
- 扫描失败后，应用程序将等待一段时间后进行重新扫描。

上述场景中的扫描永远不会成功，因为 Wi-Fi 一直处于正在连接过程中。因此，如果您的应用程序也可能发生类似的场景，那么就需要为其配置一个更佳的重新连接策略。例如：

- 应用程序可以定义一个连续重新连接次数的最大值，当重新连接的次数达到这个最大值时，立刻停止重新连接。
- 应用程序可以在首轮连续重新连接 N 次后立即进行重新连接，然后延时一段时间后再进行下一次重新连接。

可以给应用程序定义其特殊的重新连接策略，以防止扫描无法成功。请参阅 [Wi-Fi 重新连接](#)。

4.36.10 ESP32-S3 Wi-Fi station 连接场景

该场景仅针对在扫描阶段只找到一个目标 AP 的情况，对于多个相同 SSID AP 的情况，请参阅 [找到多个 AP 时的 ESP32-S3 Wi-Fi station 连接](#)。

通常，应用程序无需关心这一连接过程。如感兴趣，可参看下述简介。

场景：

扫描阶段

- s1.1: Wi-Fi 驱动程序开始在“Wi-Fi 连接”模式下扫描。详细信息请参阅在 [Wi-Fi 连接模式下扫描](#)。
- s1.2: 如果未找到目标 AP，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_NO_AP_FOUND`。请参阅 [Wi-Fi 原因代码](#)。

认证阶段

- s2.1: 发送认证请求数据包并使能认证计时器。
- s1.2: 如果在认证计时器超时之前未接收到认证响应数据包，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_AUTH_EXPIRE`。请参阅 [Wi-Fi 原因代码](#)。
- s2.3: 接收到认证响应数据包，且认证计时器终止。
- s2.4: AP 在响应中拒绝认证且产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，原因代码为 `WIFI_REASON_AUTH_FAIL` 或为 AP 指定的其它原因。请参阅 [Wi-Fi 原因代码](#)。

图 59: Wi-Fi station 连接过程

关联阶段

- s3.1: 发送关联请求并使能关联计时器。
- s3.2: 如果在关联计时器超时之前未接收到关联响应，将产生 *WIFI_EVENT_STA_DISCONNECTED* 事件，且原因代码为 *WIFI_REASON_ASSOC_EXPIRE*。请参阅 *Wi-Fi 原因代码*。
- s3.3: 接收到关联响应，且关联计时器终止。
- s3.4: AP 在响应中拒绝关联且产生 *WIFI_EVENT_STA_DISCONNECTED* 事件，原因代码将在关联响应中指定。请参阅 *Wi-Fi 原因代码*。

四次握手阶段

- s4.1: 使能握手定时器，定时器终止之前未接收到 1/4 EAPOL，此时将产生 *WIFI_EVENT_STA_DISCONNECTED* 事件，且原因代码为 *WIFI_REASON_HANDSHAKE_TIMEOUT*。请参阅 *Wi-Fi 原因代码*。
- s4.2: 接收到 1/4 EAPOL。
- s4.3: station 回复 2/4 EAPOL。
- s4.4: 如果在握手定时器终止之前未接收到 3/4 EAPOL，将产生 *WIFI_EVENT_STA_DISCONNECTED* 事件，且原因代码为 *WIFI_REASON_HANDSHAKE_TIMEOUT*。请参阅 *Wi-Fi 原因代码*。
- s4.5: 接收到 3/4 EAPOL。
- s4.6: station 回复 4/4 EAPOL。
- s4.7: station 产生 *WIFI_EVENT_STA_CONNECTED* 事件。

Wi-Fi 原因代码

下表罗列了 ESP32-S3 中定义的原因代码。其中，第一列为 *esp_wifi_types.h* 中定义的宏名称。名称中省去了前缀 *WIFI_REASON*，也就是说，名称 *UNSPECIFIED* 实际应为 *WIFI_REASON_UNSPECIFIED*，以此类推。第二列为原因代码的相应数值。第三列为该原因映射到 IEEE 802.11-2020 中 9.4.1.7 段的标准值。（更多详细信息，请参阅前文描述。）最后一列为这一原因的描述。

原因代码	数值	映射值	描述
UNSPECIFIED	1	1	出现内部错误，例如：内存已满，内部发送失败，或该原因已被远端接收等。
AUTH_EXPIRE		2	先前的 authentication 已失效。 对于 ESP station，出现以下情况时将报告该代码： <ul style="list-style-type: none"> • authentication 超时； • 从 AP 接收到该代码。 对于 ESP AP，出现以下情况时将报告该代码： <ul style="list-style-type: none"> • 在过去五分钟之内，AP 未从 station 接收到任何数据包； • 由于调用了函数 <i>esp_wifi_stop()</i> 导致 AP 终止； • 由于调用了函数 <i>esp_wifi_deauth_sta()</i> 导致 station 的 authentication 取消。
AUTH_BEAVE		3	authentication 取消，因为发送 station 正在离开（或已经离开）。 对于 ESP station，出现以下情况时报告该代码： <ul style="list-style-type: none"> • 从 AP 接收到该代码。

表 29 - 续上页

原因代码	数值	映射值	描述
IE_INVALID		13	无效元素,即内容不符合 Wi-Fi 协议中帧格式 (Frame formats) 章节所描述标准的元素。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> AP 解析了一个错误的 WPA 或 RSN IE。
MIC_FAILURE		14	消息完整性代码 (MIC) 出错。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。
4WAY_HANDSHAKE_TIMEOUT			四次握手超时。由于某些历史原因, 在 ESP 中该原因代码实为 WIFI_REASON_HANDSHAKE_TIMEOUT。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 握手超时。 从 AP 接收到该代码。
GROUP_KEY_UPDATE_TIMEOUT			组密钥 (Group-Key) 握手超时。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。
IE_IN_4WAY_DIFFERS	17		四次握手中产生的元素与 (re-)association 后的 request/probe 以及 response/beacon frame 中的信息不同。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。 station 发现四次握手的 IE 与 (re-)association 后的 request/probe 以及 response/beacon frame 中的 IE 不同。
GROUP_CIPHER_INVALID			无效组密文。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。
PAIRWISE_CIPHER_INVALID	19	19	无效成对密文。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。
AKMP_INVALID		20	无效 AKMP。 对于 ESP station, 出现以下情况时报告该代码: - 从 AP 接收到该代码。
UNSUPPORTED_RSN_IE_VERSION	21	21	不支持的 RSNE 版本。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。
INVALID_RSN_IE_CAP	22	22	无效的 RSNE 性能。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。
802_1X_AUTH_FAILED	23	23	IEEE 802.1X. authentication 失败。 对于 ESP station, 出现以下情况时报告该代码: <ul style="list-style-type: none"> 从 AP 接收到该代码。 对于 ESP AP, 出现以下情况时将报告该代码: <ul style="list-style-type: none"> IEEE 802.1X. authentication 失败。

下页继续

表 29 - 续上页

原因代码	数值	映射值	描述
CI-PHER_SUITE_REJECTED	24	24	因安全策略，安全密钥算法套件 (cipher suite) 被拒。 对于 ESP station，出现以下情况时报告该代码： • 从 AP 接收到该代码。
TDLS_CIPHER_UNREACHABLE	25	25	通过 TDLS 直连无法到达 TDLS 对端 STA，导致 TDLS 直连中断。
TDLS_UNSPECIFIED	26	26	不明原因的 TDLS 直连中断。
SSP_REQUESTED_DISASSOC	27	27	association 取消，由于会话被 SSP request 终止。
NO_SSP2ROAMING_AGREEMENT	28	28	association 取消，由于缺乏 SSP 漫游认证。
BAD_CIPHER_OR_AKM	29	29	请求的服务被拒绝，由于 SSP 密码套件或者 AKM 的需求。
NOT_AUTHORIZED_TBS_LO CATION	30	30	请求的服务在此位置未得到授权。
SERVICE_CHANGE_PRECLUDES_TS	31	31	TS 被删除，原因是：BSS 服务特性或者运行模式改变导致 QoS AP 缺少足够的带宽给 QoS STA 使用（例如：一个 HT BSS 从 40 MHz 的信道切换到 20 MHz 的信道）。
UNSPECIFIED_QOS	32	32	association 取消，由于不明确的 QoS 相关原因。
NOT_ENOUGH_BANDWIDTH	33	33	association 取消，由于 QoS AP 缺少足够的带宽给该 QoS STA 使用。
MISSING_ACKS	34	34	association 取消，原因是：大量的帧需要被确认，但由于 AP 传输或者糟糕的信道条件而没有被确认。
EXCEEDED_TXOP	35	35	association 取消，由于 STA 的传输超过了 TXOPs 的限制。
STA_LEAVING	36	36	请求 STA 离开了 BSS 或者重置了。
END_BA	37	37	请求 STA 不再使用该流或者会话。
UNKNOWN_BA	38	38	请求 STA 使用一种尚未完成的机制接收帧。
TIMEOUT	39	39	对端 STA 的请求超时。
Reserved	40 ~ 45	40 ~ 45	保留
PEER_INITIATED	46	46	在 Disassociation 帧中：已达到授权访问限制。
AP_INITIATED	47	47	在 Disassociation 帧中：外部服务需求。
INVALID_FT_ACTION_FRAME_COUNT	48	48	无效的 FT Action 帧计数。
INVALID_PMKID	49	49	无效的成对主密钥标识符 (PMKID)。
INVALID_MDE	50	50	无效的 MDE。
INVALID_FTE	51	51	无效的 FTE。
TRANSMISSION_LINK_ESTABLISHMENT_FAILED	67	67	在备用信道中建立传输链路失败。
ALTERNATIVE_CHANNEL_OCCUPIED	68	68	备用信道被占用。
BEACON_TIMEOUT	200	保留	乐鑫特有的 Wi-Fi 原因代码：当 station 连续失去 N 个 beacon，将中断连接并报告该代码。
NO_AP_FOUND	200	保留	乐鑫特有的 Wi-Fi 原因代码：当 station 未扫描到目标 AP 时，将报告该代码。

下页继续

表 29 - 续上页

原因代码	数值	映射值	描述
AUTH_FAIL	201	保留	乐鑫特有的 Wi-Fi 原因代码: authentication 失败, 但并非由超时而引发。
AS-SOC_FAIL	203	保留	乐鑫特有的 Wi-Fi 原因代码: association 失败, 但并非由 ASSOC_EXPIRE 或 ASSOC_TOOMANY 引发。
HAND-SHAKE_TIMEOUT	204	保留	乐鑫特有的 Wi-Fi 原因代码: 握手失败, 与 WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT 中失败原因相同。
CON-NEC-TION_FAIL	205	保留	乐鑫特有的 Wi-Fi 原因代码: AP 连接失败。

与密码错误有关的 Wi-Fi 原因代码

下表罗列了与密码错误相关的 Wi-Fi 原因代码。

原因代码	数值	描述
4WAY_HANDSHAKE_TIMEOUT	204	四次握手超时。STA 在连接加密的 AP 的时候输入了错误的密码
NO_AP_FOUND	保留	密码错误会出现这个原因代码的场景有如下两个: <ul style="list-style-type: none"> • STA 在连接加密的 AP 的时候没有输入密码 • STA 在连接非加密的 AP 的时候输入了密码
HAND-SHAKE_TIMEOUT	204	握手超时。

与低 RSSI 有关的 Wi-Fi 原因代码

下表罗列了与低 RSSI 相关的 Wi-Fi 原因代码。

原因代码	数值	描述
NO_AP_FOUND	保留	低 RSSI 导致 station 无法扫描到目标 AP
HAND-SHAKE_TIMEOUT	204	握手超时。

4.36.11 找到多个 AP 时的 ESP32-S3 Wi-Fi station 连接

该场景与 *ESP32-S3 Wi-Fi station 连接场景* 相似, 不同之处在于该场景中不会产生 *WIFI_EVENT_STA_DISCONNECTED* 事件, 除非 station 无法连接所有找到的 AP。

4.36.12 Wi-Fi 重新连接

出于多种原因, station 可能会断开连接, 例如: 连接的 AP 重新启动等。应用程序应负责重新连接。推荐使用的方法为: 在接收到 *WIFI_EVENT_STA_DISCONNECTED* 事件后调用函数 `esp_wifi_connect()`。

但有时, 应用程序需要更复杂的方式进行重新连接:

- 如果断开连接事件是由调用函数 `esp_wifi_disconnect()` 引发的, 那么应用程序可能不希望进行重新连接。
- 如果 station 随时可能调用函数 `esp_wifi_scan_start()` 开始扫描, 此时就需要一个更佳的重新连接方法, 请参阅 [连接 Wi-Fi 时扫描](#)。

另一点需要注意的是，如果存在多个具有相同 SSID 的 AP，那么重新连接后可能不会连接到之前的同一个 AP。重新连接时，station 将永远选择最佳的 AP 进行连接。

4.36.13 Wi-Fi beacon 超时

ESP32-S3 使用 beacon 超时机制检测 AP 是否活跃。如果 station 在 inactive 时间内未收到所连接 AP 的 beacon，将发生 beacon 超时。inactive 时间通过调用函数 `esp_wifi_set_inactive_time()` 设置。

beacon 超时发生后，station 将向 AP 发送 5 个 probe request，如果仍未从 AP 接收到 probe response 或 beacon，station 将与 AP 断开连接并产生 `WIFI_EVENT_STA_DISCONNECTED` 事件。

需要注意的是，扫描过程中会重置 beacon 超时所使用的定时器，即扫描过程会影响 `WIFI_EVENT_STA_BEACON_TIMEOUT` 事件的触发。

4.36.14 ESP32-S3 Wi-Fi 配置

使能 Wi-Fi NVS 时，所有配置都将存储到 flash 中；反之，请参阅 *Wi-Fi NVS Flash*。

Wi-Fi 模式

调用函数 `esp_wifi_set_mode()` 设置 Wi-Fi 模式。

模式	描述
WIFI_MODE_NULL	NULL 模式：此模式下，内部数据结构不分配给 station 和 AP，同时，station 和 AP 接口不会为发送/接收 Wi-Fi 数据进行初始化。通常，此模式用于 Sniffer，或者您不想通过调用函数 <code>esp_wifi_deinit()</code> 卸载整个 Wi-Fi 驱动程序来同时停止 station 和 AP。
WIFI_MODE_STA	station 模式：此模式下， <code>esp_wifi_start()</code> 将初始化内部 station 数据，同时 station 接口准备发送/接收 Wi-Fi 数据。调用函数 <code>esp_wifi_connect()</code> 后，station 将连接到目标 AP。
WIFI_MODE_AP	AP 模式：在此模式下， <code>esp_wifi_start()</code> 将初始化内部 AP 数据，同时 AP 接口准备发送/接收 Wi-Fi 数据。随后，Wi-Fi 驱动程序开始广播 beacon，AP 即可与其它 station 连接。
WIFI_MODE_APSTA	station/AP 共存模式：在此模式下，函数 <code>esp_wifi_start()</code> 将同时初始化 station 和 AP。该步骤在 station 模式和 AP 模式下完成。请注意 ESP station 所连外部 AP 的信道优先于 ESP AP 信道。

station 基本配置

API `esp_wifi_set_config()` 可用于配置 station。配置的参数信息会保存到 NVS 中。下表详细介绍了各个字段。

字段	描述
ssid	station 想要连接的目标 AP 的 SSID。
password	目标 AP 的密码。
scan_method	WIFI_FAST_SCAN 模式下，扫描到一个匹配的 AP 时即结束。WIFI_ALL_CHANNEL_SCAN 模式下，在所有信道扫描所有匹配的 AP。默认扫描模式是 WIFI_FAST_SCAN。
bssid_set	如果 bssid_set 为 0，station 连接 SSID 与 “ssid” 字段相同的 AP，同时忽略字段 “bssid”。其他情况下，station 连接 SSID 与 “ssid” 字段相同、BSSID 与 “bssid” 字段也相同的 AP。
bssid	只有当 bssid_set 为 1 时有效。见字段 “bssid_set”。
channel	该字段为 0 时，station 扫描信道 1 ~ N 寻找目标 AP；否则，station 首先扫描值与 “channel” 字段相同的信道，再扫描其他信道。比如，当该字段设置为 3 时，扫描顺序为 3, 1, 2, …, N。如果您不知道目标 AP 在哪个信道，请将该字段设置为 0。
sort_method	该字段仅用于 WIFI_ALL_CHANNEL_SCAN 模式。 如果设置为 WIFI_CONNECT_AP_BY_SIGNAL，所有匹配的 AP 将会按照信号强度排序，信号最好的 AP 会被首先连接。比如，如果 station 想要连接 ssid 为 “apxx” 的 AP，且扫描到两个这样的 AP。第一个 AP 的信号为 -90 dBm，第二个 AP 的信号为 -30 dBm，station 首先连接第二个 AP。除非失败，才会连接第一个。 如果设置为 WIFI_CONNECT_AP_BY_SECURITY，所有匹配的 AP 将会按照安全性排序。比如，如果 station 想要连接 ssid 为 “apxx” 的 AP，并且扫描到两个这样的 AP。第一个 AP 为开放式，第二个 AP 为 WPA2 加密，station 首先连接第二个 AP。除非失败，才会连接第一个。
threshold	该字段用来筛选找到的 AP，如果 AP 的 RSSI 或安全模式小于配置的阈值，则不会被连接。 如果 RSSI 设置为 0，则表示默认阈值、默认 RSSI 阈值为 -127 dBm。如果 authmode 阈值设置为 0，则表示默认阈值，默认 authmode 阈值无授权。

注意：WEP/WPA 安全模式在 IEEE802.11-2016 协议中已弃用，建议不要使用。可使用 authmode 阈值代替，通过将 threshold.authmode 设置为 WIFI_AUTH_WPA2_PSK 使用 WPA2 模式

AP 基本配置

API `esp_wifi_set_config()` 可用于配置 AP。配置的参数信息会保存到 NVS 中。下表详细介绍了各个字段。

字段	描述
ssid	指 AP 的 SSID。如果 ssid[0] 和 ssid[1] 均为 0xFF，AP 默认 SSID 为 ESP_aabbcc，”aabbcc” 是 AP MAC 的最后三个字节。
password	AP 的密码。如果身份验证模式为 WIFI_AUTH_OPEN，此字段将被忽略。
ssid_len	SSID 的长度。如果 ssid_len 为 0，则检查 SSID 直至出现终止字符。如果 ssid_len 大于 32，请更改为 32，或者根据 ssid_len 设置 SSID 长度。
channel	AP 的信道。如果信道超出范围，Wi-Fi 驱动程序将默认为信道 1。所以，请确保信道在要求的范围内。有关详细信息，请参阅 Wi-Fi 国家/地区代码 。
authmode	ESP AP 的身份验证模式。目前，ESP AP 不支持 AUTH_WEP。如果 authmode 是一个无效值，AP 默认该值为 WIFI_AUTH_OPEN。
ssid_hidden	如果 ssid_hidden 为 1，AP 不广播 SSID。若为其他值，则广播。
max_connection	允许连接 station 的最大数目，默认值是 10。ESP Wi-Fi 支持 15 (ESP_WIFI_MAX_CONN_NUM) 个 Wi-Fi 连接。请注意，ESP AP 和 ESP-NOW 共享同一块加密硬件 keys，因此 max_connection 参数将受到 CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM 的影响。加密硬件 keys 的总数是 17，如果 CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM 小于等于 2，那么 max_connection 最大可以设置为 15，否则 max_connection 最大可以设置为 (17 - CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM)。
beacon_interval	beacon 间隔。值为 100 ~ 60000 ms，默认值为 100 ms。如果该值不在上述范围，AP 默认取 100 ms。

Wi-Fi 协议模式

目前，IDF 支持以下协议模式：

协议模式	描述
802.11b	调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B)</code> ，将 station/AP 设置为仅 802.11b 模式。
802.11bg	调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G)</code> ，将 station/AP 设置为 802.11bg 模式。
802.11g	调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G)</code> 和 <code>esp_wifi_config_11b_rate(ifx, true)</code> ，将 station/AP 设置为 802.11g 模式。
802.11bgn	调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11N)</code> ，将 station/AP 设置为 802.11bgn 模式。
802.11gn	调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11N)</code> 和 <code>esp_wifi_config_11b_rate(ifx, true)</code> ，将 station/AP 设置为 802.11gn 模式。
802.11 BGNLR	调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11N WIFI_PROTOCOL_LR)</code> ，将 station/AP 设置为 802.11bgn 和 LR 模式。
802.11 LR	调用函数 <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_LR)</code> ，将 station/AP 设置为 LR 模式。 此模式是乐鑫的专利模式，可以达到 1 公里视线范围。请确保 station 和 AP 同时连接至 ESP 设备。

长距离 (LR)

长距离 (LR) 模式是乐鑫的一项专利 Wi-Fi 模式，可达到 1 公里视线范围。与传统 802.11b 模式相比，接收灵敏度更高，抗干扰能力更强，传输距离更长。

LR 兼容性 由于 LR 是乐鑫的独有 Wi-Fi 模式，只有 ESP32-S3 设备才能传输和接收 LR 数据。也就是说，如果连接的设备不支持 LR，ESP32-S3 设备则不会以 LR 数据速率传输数据。可通过配置适当的 Wi-Fi 模式使您的应用程序实现这一功能。如果协商的模式支持 LR，ESP32-S3 可能会以 LR 速率传输数据，否则，ESP32-S3 将以传统 Wi-Fi 数据速率传输所有数据。

下表是 Wi-Fi 模式协商：

APSTA	BGN	BG	B	BGNLR	BGLR	BLR	LR
BGN	BGN	BG	B	BGN	BG	B	.
BG	BG	BG	B	BG	BG	B	.
B	B	B	B	B	B	B	.
BGNLR	.	.	.	BGNLR	BGLR	BLR	LR
BGLR	.	.	.	BGLR	BGLR	BLR	LR
BLR	.	.	.	BLR	BLR	BLR	LR
LR	.	.	.	LR	LR	LR	LR

上表中，行是 AP 的 Wi-Fi 模式，列是 station 的 Wi-Fi 模式。”-” 表示 AP 和 station 的 Wi-Fi 模式不兼容。

根据上表，得出以下结论：

- 对于已使能 LR 的 ESP32-S3 AP，由于以 LR 模式发送 beacon，因此与传统的 802.11 模式不兼容。
- 对于已使能 LR 且并非仅 LR 模式的 ESP32-S3 station，与传统 802.11 模式兼容。
- 如果 station 和 AP 都是 ESP32-S3 设备，并且两者都使能 LR 模式，则协商的模式支持 LR。

如果协商的 Wi-Fi 模式同时支持传统的 802.11 模式和 LR 模式，则 Wi-Fi 驱动程序会在不同的 Wi-Fi 模式下自动选择最佳数据速率，应用程序无需任何操作。

LR 对传统 Wi-Fi 设备的影响 以 LR 速率进行的数据传输不会影响传统 Wi-Fi 设备，因为：

- LR 模式下的 CCA 和回退过程符合 802.11 协议。
- 传统的 Wi-Fi 设备可以通过 CCA 检测 LR 信号并进行回退。

也就是说，LR 模式下传输效果与 802.11b 模式相似。

LR 传输距离 LR 的接收灵敏度比传统的 802.11b 模式高 4 dB，理论上，传输距离约为 802.11b 的 2 至 2.5 倍。

LR 吞吐量 因为原始 PHY 数据传输速率为 1/2 Mbps 和 1/4 Mbps，LR 的吞吐量有限。

何时使用 LR 通常使用 LR 的场景包括：

- AP 和 station 都是乐鑫设备。
- 需要长距离 Wi-Fi 连接和数据传输。
- 数据吞吐量要求非常小，例如远程设备控制等。

Wi-Fi 国家/地区代码

调用 `esp_wifi_set_country()`，设置国家/地区信息。下表详细介绍了各个字段，请在配置这些字段之前参考当地的 2.4 GHz RF 操作规定。

字段	描述
cc[3]	<p>国家/地区代码字符串，此属性标识 station/AP 位于的国家/地区或非国家/地区实体。如果是一个国家/地区，该字符串的前两个八位字节是 ISO/IEC3166-1 中规定的国家/地区两位字母代码。第三个八位字节应是下述之一：</p> <ul style="list-style-type: none"> • ASCII 码空格字符，代表 station/AP 所处国家/地区的规定允许当前频段所需的所有环境。 • ASCII 码 ‘O’ 字符，代表 station/AP 所处国家/地区的规定仅允许室外环境。 • ASCII 码 ‘I’ 字符，代表 station/AP 所处国家/地区的规定仅允许室内环境。 • ASCII 码 ‘X’ 字符，代表 station/AP 位于非国家/地区实体。非国家实体的前两个八位字节是两个 ASCII 码 ‘XX’ 字符。 • 当前使用的操作类表编号的二进制形式。见 IEEE Std 802.11-2020 附件 E。
schan	起始信道，station/AP 所处国家/地区规定的最小信道值。
nchan	规定的总信道数，比如，如果 schan=1，nchan=13，那么 station/AP 可以从信道 1 至 13 发送数据。
policy	国家/地区策略，当配置的国家/地区信息与所连 AP 的国家/地区信息冲突时，该字段决定使用哪一信息。更多策略相关信息，可参见下文。

默认国家/地区信息为:

```
wifi_country_t config = {
    .cc = "01",
    .schan = 1,
    .nchan = 11,
    .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

如果 Wi-Fi 模式为 station/AP 共存模式，则它们配置的国家/地区信息相同。有时，station 所连 AP 的国家/地区信息与配置的不同。例如，配置的 station 国家/地区信息为:

```
wifi_country_t config = {
    .cc = "JP",
    .schan = 1,
    .nchan = 14,
    .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

但所连 AP 的国家/地区信息为:

```
wifi_country_t config = {
    .cc = "CN",
    .schan = 1,
    .nchan = 13,
};
```

此时，使用所连 AP 的国家/地区信息。

下表描述了在不同 Wi-Fi 模式和不同国家/地区策略下使用的国家/地区信息，并描述了对主动扫描的影响。

Wi-Fi 模式	策略	描述
station 模式	WIFI_COUNTRY_POLICY_AUTO	如果 AP 的 beacon 中有国家/地区的 IE，使用的国家/地区信息为 beacon 中的信息，否则，使用默认信息。 扫描时： 主动扫描信道 1 至信道 11，被动扫描信道 12 至信道 14。 请记住，如果带有隐藏 SSID 的 AP 和 station 被设置在被动扫描信道上，被动扫描将无法找到该 AP。也就是说，如果应用程序希望在每个信道中找到带有隐藏 SSID 的 AP，国家/地区信息应该配置为 WIFI_COUNTRY_POLICY_MANUAL。
station 模式	WIFI_COUNTRY_POLICY_MANUAL	总是使用配置的国家/地区信息。 扫描时： 主动扫描信道 schan 至信道 schan+nchan-1。
AP 模式	WIFI_COUNTRY_POLICY_AUTO	总是使用配置的国家/地区信息。
AP 模式	WIFI_COUNTRY_POLICY_MANUAL	总是使用配置的国家/地区信息。
station/AP 共存模式	WIFI_COUNTRY_POLICY_AUTO	station 与 station 模式、WIFI_COUNTRY_POLICY_AUTO 策略下使用的国家/地区信息相同。如果 station 不连接任何外部 AP，AP 使用配置的国家/地区信息。如果 station 连接一个外部 AP，该 AP 的国家/地区信息与该 station 相同。
station/AP 共存模式	WIFI_COUNTRY_POLICY_MANUAL	station 与 station 模式、WIFI_COUNTRY_POLICY_MANUAL 策略下使用的国家/地区信息相同。该 AP 与 AP 模式、WIFI_COUNTRY_POLICY_MANUAL 策略下使用的国家/地区信息相同。

主信道 AP 模式下，AP 的信道定义为主信道。station 模式下，station 所连 AP 的信道定义为主信道。station/AP 共存模式下，AP 和 station 的主信道必须相同。如果不同，station 的主信道始终优先。比如，初始时，AP 位于信道 6，但 station 连接信道 9 的 AP。因为 station 的主信道具有优先性，该 AP 需要将信道从 6 切换至 9，确保与 station 主信道相同。切换信道时，AP 模式下的 ESP32-S3 将使用信道切换公告 (CSA) 通知连接的 station。支持信道切换的 station 将直接通过，无需与 AP 断连再重新连接。

Wi-Fi 供应商 IE 配置

默认情况下，所有 Wi-Fi 管理帧都由 Wi-Fi 驱动程序处理，应用程序不需要任何操作。但是，某些应用程序可能需要处理 beacon、probe request、probe response 和其他管理帧。例如，如果在管理帧中插入一些只针对供应商的 IE，则只有包含此 IE 的管理帧才能得到处理。ESP32-S3 中，`esp_wifi_set_vendor_ie()` 和 `esp_wifi_set_vendor_ie_cb()` 负责此类任务。

4.36.15 Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™（也称为设备配置协议）是一个安全且标准化的配置协议，用于配置 Wi-Fi 设备。更多信息请参考 [esp_dpp](#)。

WPA2-Enterprise

WPA2-Enterprise 是企业无线网络的安全认证机制。在连接到接入点之前，它使用 RADIUS 服务器对网络用户进行身份验证。身份验证过程基于 802.1X 标准，并有不同的扩展身份验证协议 (EAP) 方法，如 TLS、TTLS、PEAP 等。RADIUS 服务器根据用户的凭据（用户名和密码）、数字证书或两者对用户进行身份验证。当处于 station 模式的 ESP32-S3 尝试连接到企业模式的 AP 时，它会向 AP 发送身份验证请求，AP

会将该请求发送到 RADIUS 服务器以对 station 进行身份验证。根据不同的 EAP 方式，可以通过 `idf.py menuconfig` 打开配置，并在配置中设置参数。ESP32-S3 仅在 station 模式下支持 WPA2_Enterprise。

为了建立安全连接，AP 和 station 协商并就要使用的最佳密码套件达成一致。ESP32-S3 支持 AKM 的 802.1X/EAP (WPA) 方法和 AES-CCM (高级加密标准-带密码块链消息验证码协议的计数器模式) 支持的密码套件。如果设置了 `USE_MBEDTLS_CRYPT` 标志，ESP32-S3 也支持 mbedtls 支持的密码套件。

目前，ESP32-S3 支持以下 EAP 方法：

- EAP-TLS: 这是基于证书的方法，只需要 SSID 和 EAP-IDF。
- PEAP: - PEAP: 这是受保护的 EAP 方法。用户名和密码是必填项。
- EAP-TTLS: 这是基于凭据的方法。只有服务器身份验证是强制性的，而用户身份验证是可选的。用户名和密码
 - PAP: 密码认证协议
 - CHAP: 询问握手身份验证协议
 - MSCHAP 和 MSCHAP-V2
- EAP-FAST: 这是一种基于受保护的访问凭据 (PAC) 的认证方法，使用身份验证和密码。目前使用此功能时需要禁用 `USE_MBEDTLS_CRYPT` 标志。

请查看 [wifi/wifi_enterprise](#) 获取关于证书创建以及如何 ESP32-S3 上运行 `wpa2_enterprise` 示例的详细信息。

4.36.16 无线网络管理

无线网络管理让客户端设备能够交换有关网络拓扑结构的信息，包括与射频环境相关的信息。这使每个客户端都能感知网络状况，从而促进无线网络性能的整体改进。这是 802.11v 规范的一部分。它还使客户端能够支持网络辅助漫游。网络辅助漫游让 WLAN 能够向关联的客户端发送消息，从而使客户端与具有更好链路指标的 AP 关联。这对于促进负载均衡以及引导连接不良的客户端都很有用。

目前 802.11v 的实现支持 BSS 过渡管理帧。

4.36.17 无线资源管理

无线电资源测量 (802.11k) 旨在改善网络内流量的分配方式。在无线局域网中，一般情况下，无线设备会连接发射信号最强的接入点 (AP)。根据用户的数量和地理位置，这种分配方式有时会导致某个接入点超负荷而其它接入点利用不足，从而导致整体网络性能下降。在符合 802.11k 规范的网络中，如果信号最强的 AP 已满负荷加载，无线设备则转移到其它未充分利用的 AP。尽管信号可能较弱，但由于更有效地利用了网络资源，总体吞吐量会更大。

目前 802.11k 的实现支持信标测量报告、链路测量报告和邻居请求。

请参考 IDF 示例程序 [examples/wifi/roaming/README.md](#) 来设置和使用这些 API。示例代码只演示了如何使用这些 API，应用程序应根据需要定义自己的算法和案例。

4.36.18 Wi-Fi Location

Wi-Fi Location 将提高 AP 以外设备位置数据的准确性，这有助于创建新的、功能丰富的应用程序和服务，例如地理围栏、网络管理、导航等。用于确定设备相对于接入点的位置的协议之一是精细定时测量 (FTM)，它会计算 Wi-Fi 帧的飞行时间。

精细定时测量 (FTM)

FTM 用于测量 Wi-Fi 往返时间 (Wi-Fi RTT)，即 Wi-Fi 信号从一个设备到另一个设备并返回所需的时间。使用 Wi-Fi RTT，设备之间的距离可以用一个简单的公式 $RTT * c / 2$ 来计算，其中 c 是光速。

对于设备之间交换的帧，FTM 在帧到达或离开时使用时间戳，这个时间戳由 Wi-Fi 接口硬件提供。FTM 发起方 (主要是 station 设备) 发现 FTM 响应方 (可以是 station 或 AP)，并协商启动 FTM 程序。该程序以突发形式发送的多个动作帧及其 ACK 来收集时间戳数据。FTM 发起方最后收集数据以计算平均往返时间。

ESP32-S3 在以下配置中支持 FTM:

- ESP32-S3 在 station 模式下为 FTM 发起方。
- ESP32-S3 在 AP 模式下为 FTM 响应方。

使用 RTT 的距离测量并不准确，RF 干扰、多径传播、天线方向和缺乏校准等因素会增加这些不准确度。为了获得更好的结果，建议在两个 ESP32-S3 设备之间执行 FTM，这两个设备可分别设置为 station 和 AP 模式。

请参考 IDF 示例 [examples/wifi/ftm/README.md](#) 了解设置和执行 FTM 的详细步骤。

4.36.19 ESP32-S3 Wi-Fi 节能模式

station 睡眠

目前，ESP32-S3 Wi-Fi 支持 Modem-sleep 模式，该模式是 IEEE 802.11 协议中的传统节能模式。仅 station 模式支持该模式，station 必须先连接到 AP。如果使能了 Modem-sleep 模式，station 将定期在活动状态和睡眠状态之间切换。在睡眠状态下，RF、PHY 和 BB 处于关闭状态，以减少功耗。Modem-sleep 模式下，station 可以与 AP 保持连接。

Modem-sleep 模式包括最小和最大节能模式。在最小节能模式下，每个 DTIM 间隔，station 都将唤醒以接收 beacon。广播数据在 DTIM 之后传输，因此不会丢失。但是，由于 DTIM 间隔长短由 AP 决定，如果该间隔时间设置较短，则省电效果不大。

在最大节能模式下，每个监听间隔，station 都将唤醒以接收 beacon。可以设置该监听间隔长于 AP 的 DTIM 周期。在 DTIM 期间内，station 可能处于睡眠状态，广播数据会丢失。如果监听间隔较长，则可以节省更多电量，但广播数据更容易丢失。连接 AP 前，可以通过调用 API `esp_wifi_set_config()` 配置监听间隔。

调用 `esp_wifi_init()` 后，调用 `esp_wifi_set_ps(WIFI_PS_MIN_MODEM)` 可使能 Modem-sleep 最小节能模式。调用 `esp_wifi_set_ps(WIFI_PS_MAX_MODEM)` 可使能 Modem-sleep 最大节能模式。station 连接到 AP 时，Modem-sleep 模式将启动。station 与 AP 断开连接时，Modem-sleep 模式将停止。

调用 `esp_wifi_set_ps(WIFI_PS_NONE)` 可以完全禁用 Modem-sleep 模式。禁用会增大功耗，但可以最大限度减少实时接收 Wi-Fi 数据的延迟。使能 Modem-sleep 时，接收 Wi-Fi 数据的延迟时间可能与 DTIM 周期（最小节能模式）或监听间隔（最大节能模式）相同。在 Wi-Fi 与 Bluetooth LE 共存模式下，无法完全禁用 modem-sleep 模式。

默认的 Modem-sleep 模式是 `WIFI_PS_MIN_MODEM`。

AP 睡眠

目前，ESP32-S3 AP 不支持 Wi-Fi 协议中定义的所有节能功能。具体来说，AP 只缓存所连 station 单播数据，不缓存组播数据。如果 ESP32-S3 AP 所连的 station 已使能节能功能，可能发生组播数据包丢失。

未来，ESP32-S3 AP 将支持所有节能功能。

非连接状态下的休眠

非连接状态指的是 `esp_wifi_start()` 至 `esp_wifi_stop()` 期间内，没有建立 Wi-Fi 连接的阶段。

目前，ESP32-S3 Wi-Fi 支持以 station 模式运行时，在非连接状态下休眠。可以通过选项 `CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE` 配置该功能。

如果打开配置选项 `CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE`，则在该阶段内，RF、PHY and BB 将在空闲时被关闭，电流将会等同于 Modem-sleep 模式下的休眠电流。

配置选项 `CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE` 默认情况下将会被打开，共存模式下被 Menuconfig 强制打开。

非连接模块功耗管理

非连接模块指的是有些不依赖于 Wi-Fi 连接的 Wi-Fi 模块，例如 ESP-NOW，DPP，FTM。这些模块从 `esp_wifi_start()` 开始工作至 `esp_wifi_stop()` 结束。

目前，ESP-NOW 以 station 模式工作时，既支持在连接状态下休眠，也支持在非连接状态下休眠。

非连接模块发包 对于任何非连接模块，在开启了休眠的任何时间点都可以发包，不需要进行任何额外的配置。

此外，`esp_wifi_80211_tx()` 也在休眠时被支持。

非连接模块收包 对于非连接模块，在开启休眠时如果需要进行收包，需要配置两个参数，分别为 *Window* 和 *Interval*。

在每个 *Interval* 开始时，RF, PHY and BB 将会被打开并保持 *Window* 的时间。非连接模块可以在此时间内收包。

Interval

- 全局只有一个 *Interval* 参数，所有非连接模块共享它。其数值由 API `esp_wifi_set_connectionless_interval()` 配置，单位为毫秒。
- *Interval* 的默认值为 `ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE`。
- 在 *Interval* 开始时，将会给出 `WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START` 事件，由于 *Window* 将在此时开始，可以在此事件内布置发包动作。
- 在连接状态下，*Interval* 开始的时间点将会与 TBTT 时间点对齐。

Window

- 每个非连接模块在启动后都有其自身的 *Window* 参数，休眠模块将取所有模块 *Window* 的最大值运作。
- 其数值由 API `module_name_set_wake_window()` 配置，单位为毫秒。
- 模块 *Window* 的默认值为最大值。

表 30: 不同 Window 与 Interval 组合下的 RF, PHY and BB 使用情况

		Interval	
		ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE	
Win- dow	0	not used	
	1 - max- imum	default mode	used periodically (Window < Interval) / used all time (Window ≥ Interval)

默认模式 当 *Interval* 参数被配置为 `ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE`，且有非零的 *Window* 参数时，非连接模块功耗管理将会按默认模式运行。

在没有与非 Wi-Fi 协议共存时，RF, PHY and BB 将会在默认模式下被一直打开。

在与非 Wi-Fi 协议共存时，RF, PHY and BB 资源被共存模块分时划给 Wi-Fi 非连接模块和非 Wi-Fi 协议使用。在默认模式下，Wi-Fi 非连接模块被允许周期性使用 RF, PHY and BB，并且具有稳定性能。

推荐在与非 Wi-Fi 协议共存时将非连接模块功耗管理配置为默认模式。

4.36.20 ESP32-S3 Wi-Fi 吞吐量

下表是我们在 Espressif 实验室和屏蔽箱中获得的最佳吞吐量结果。

类型/吞吐量	实验室空气状况	屏蔽箱	测试工具	IDF 版本 (commit ID)
原始 802.11 数据包接收数据	N/A	130 MBit/s	内部工具	N/A
原始 802.11 数据包发送数据	N/A	130 MBit/s	内部工具	N/A
UDP 接收数据	30 MBit/s	88 MBit/s	iperf example	15575346
UDP 发送数据	30 MBit/s	98 MBit/s	iperf example	15575346
TCP 接收数据	20 MBit/s	73 MBit/s	iperf example	15575346
TCP 发送数据	20 MBit/s	83 MBit/s	iperf example	15575346

使用 iperf example 测试吞吐量时, sdkconfig 是:idf_file:‘示例/wifi/iperf/sdkconfig.defaults.esp32s3’。

4.36.21 Wi-Fi 80211 数据包发送

`esp_wifi_80211_tx()` API 可用于:

- 发送 beacon、probe request、probe response 和 action 帧。
- 发送非 QoS 数据帧。

不能用于发送加密或 QoS 帧。

使用 `esp_wifi_80211_tx()` 的前提条件

- Wi-Fi 模式为 station 模式, AP 模式, 或 station/AP 共存模式。
- API `esp_wifi_set_promiscuous(true)` 或 `esp_wifi_start()`, 或者二者都返回 ESP_OK。这是为确保在调用函数 `esp_wifi_80211_tx()` 前, Wi-Fi 硬件已经初始化。对于 ESP32-S3, `esp_wifi_set_promiscuous(true)` 和 `esp_wifi_start()` 都可以触发 Wi-Fi 硬件初始化。
- 提供正确的 `esp_wifi_80211_tx()` 参数。

传输速率

- 默认传输速率为 1 Mbps。
- 可以通过函数 `esp_wifi_config_80211_tx_rate()` 设置任意速率。
- 可以通过函数 `esp_wifi_set_bandwidth()` 设置任意带宽。

在不同情况下需要避免的副作用

理论上, 如果不考虑 API 对 Wi-Fi 驱动程序或其他 station 或 AP 的副作用, 可以通过空中发送一个原始的 802.11 数据包, 包括任何目的地址的 MAC、任何源地址的 MAC、任何 BSSID、或任何其他类型的数据包。但是, 一个具有强健、有用的应用程序应该避免这种副作用。下表针对如何避免 `esp_wifi_80211_tx()` 的副作用提供了一些提示或建议。

场景	描述
无 Wi-Fi 连接	<p>在这种情况下，因为没有 Wi-Fi 连接，Wi-Fi 驱动程序不会受到副作用影响。如果 <code>en_sys_seq==true</code>，则 Wi-Fi 驱动程序负责序列控制。如果 <code>en_sys_seq==false</code>，应用程序需要确保缓冲区的序列正确。</p> <p>理论上，MAC 地址可以是任何地址。但是，这样可能会影响其他使用相同 MAC/BSSID 的 station/AP。</p> <p>例如，AP 模式下，应用程序调用函数 <code>esp_wifi_80211_tx()</code> 发送带有 <code>BSSID == mac_x</code> 的 beacon，但是 <code>mac_x</code> 并非 AP 接口的 MAC。而且，还有另一个 AP（我们称之为“other-AP”）的 <code>bssid</code> 是 <code>mac_x</code>。因此，连接到“other-AP”的 station 无法分辨 beacon 来自“other-AP”还是 <code>esp_wifi_80211_tx()</code>，就会出现“意外行为”。</p> <p>为了避免上述副作用，我们建议：</p> <ul style="list-style-type: none"> • 如果在 station 模式下调用函数 <code>esp_wifi_80211_tx()</code>，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 station 接口的 MAC。 • 如果在 AP 模式下调用函数 <code>esp_wifi_80211_tx</code>，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 AP 接口的 MAC。 <p>上述建议仅供避免副作用，在有充分理由的情况下可以忽略。</p>
有 Wi-Fi 连接	<p>当 Wi-Fi 已连接，且序列由应用程序控制，应用程序可能会影响整个 Wi-Fi 连接的序列控制。因此，<code>en_sys_seq</code> 要为 <code>true</code>，否则将返回 <code>ESP_ERR_WIFI_ARG</code>。</p> <p>“无 Wi-Fi 连接”情况下的 MAC 地址建议也适用于此情况。</p> <p>如果 Wi-Fi 模式是 station 模式，MAC 的地址 1 是 station 所连 AP 的 MAC，地址 2 是 station 接口的 MAC，那么就称数据包是从 station 发送到 AP。另一方面，如果 Wi-Fi 模式是 AP 模式，且 MAC 地址 1 是该 AP 所连 station 的 MAC，地址 2 是 AP 接口的 MAC，那么就称数据包是从 AP 发送到 station。为避免与 Wi-Fi 连接冲突，可采用以下检查方法：</p> <ul style="list-style-type: none"> • 如果数据包类型是数据，且是从 station 发送到 AP，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 1，FromDS 位为 0，否则，Wi-Fi 驱动程序不接受该数据包。 • 如果数据包类型是数据，且是从 AP 发送到 station，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 0，FromDS 位为 1，否则，Wi-Fi 驱动程序不接受该数据包。 • 如果数据包是从 station 发送到 AP，或从 AP 到 station，Power Management、More Data 和 Re-Transmission 位应该为 0，否则，Wi-Fi 驱动程序不接受该数据包。 <p>如果任何检查失败，将返回 <code>ESP_ERR_WIFI_ARG</code>。</p>

4.36.22 Wi-Fi Sniffer 模式

Wi-Fi Sniffer 模式可以通过 `esp_wifi_set_promiscuous()` 使能。如果使能 Sniffer 模式，可以向应用程序转储以下数据包。

- 802.11 管理帧
- 802.11 数据帧，包括 MPDU、AMPDU、AMSDU 等
- 802.11 MIMO 帧，Sniffer 模式仅转储 MIMO 帧的长度。
- 802.11 控制帧
- 802.11 CRC 错误帧

不可以向应用程序转储以下数据包。

- 802.11 其它错误帧

对于 Sniffer 模式可以转储的帧，应用程序可以另外使用 `esp_wifi_set_promiscuous_filter()` 和 `esp_wifi_set_promiscuous_ctrl_filter()` 决定筛选哪些特定类型的数据包。应用程序默认筛选所有 802.11 数据和管理帧。

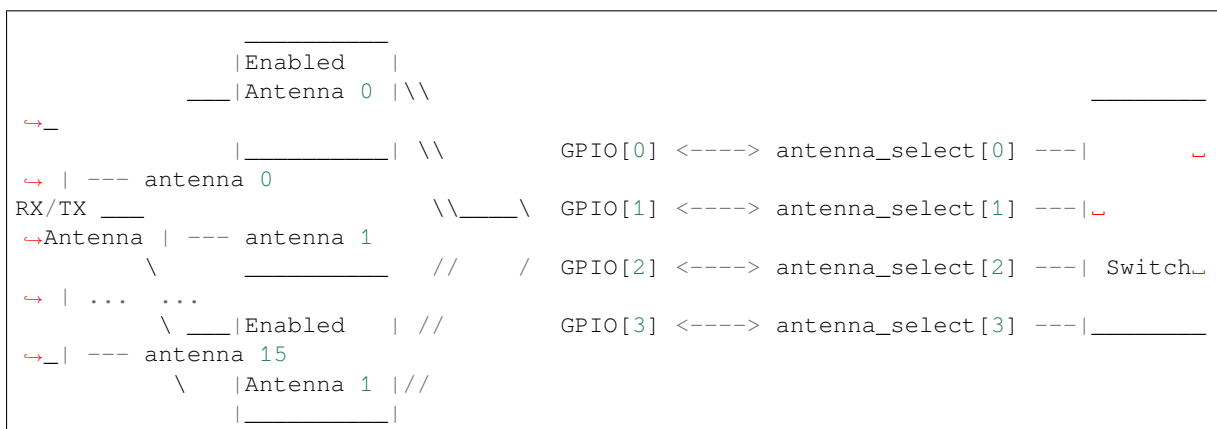

可以在 `WIFI_MODE_NULL`、`WIFI_MODE_STA`、`WIFI_MODE_AP`、`WIFI_MODE_APSTA` 等 Wi-Fi 模式下使能 Wi-Fi Sniffer 模式。也就是说，当 station 连接到 AP，或者 AP 有 Wi-Fi 连接时，就可以使能。请注意，Sniffer 模式对 station/AP Wi-Fi 连接的吞吐量有 **很大影响**。通常，除非有特别原因，当 station/AP Wi-Fi 连接出现大量流量，不应使能。

该模式下还应注意回调函数 `wifi_promiscuous_cb_t` 的使用。该回调将直接在 Wi-Fi 驱动程序任务中进行，

所以如果应用程序需处理大量过滤的数据包，建议在回调中向应用程序任务发布一个事件，把真正的工作推迟到应用程序任务中完成。

4.36.23 Wi-Fi 多根天线

下图描述 Wi-Fi 多根天线的选择过程:

ESP32-S3 通过外部天线开关，最多支持 16 根天线。天线开关最多可由四个地址管脚控制 - `antenna_select[0:3]`。向 `antenna_select[0:3]` 输入不同的值，以选择不同的天线。例如，输入值 ‘0b1011’ 表示选中天线 11。`antenna_select[3:0]` 的默认值为 “0b0000”，表示默认选择了天线 0。

四个高电平有效 `antenna_select` 管脚有多达四个 GPIO 连接。ESP32-S3 可以通过控制 GPIO[0:3] 选择天线。API `esp_wifi_set_ant_gpio()` 用于配置 `antenna_selects` 连接哪些 GPIO。如果 GPIO[x] 连接到 `antenna_select[x]`，`gpio_config->gpio_cfg[x].gpio_select` 应设置为 1，且要提供 `gpio_config->gpio_cfg[x].gpio_num` 的值。

天线开关的具体实现不同，`antenna_select[0:3]` 的输入值中可能存在非法值，即 ESP32-S3 通过外部天线开关支持的天线数可能小于 16 根。例如，ESP32-WROOM-DA 使用 RTC6603SP 作为天线开关，仅支持 2 根天线。两个天线选择输入管脚为高电平有效，连接到两个 GPIO。’0b01’ 表示选中天线 0，’0b10’ 表示选中天线 1。输入值 ‘0b00’ 和 ‘0b11’ 为非法值。

尽管最多支持 16 根天线，发送和接收数据时，最多仅能同时使能两根天线。API `esp_wifi_set_ant()` 用于配置使能哪些天线。

使能天线后，选择算法的过程同样可由 `esp_wifi_set_ant()` 配置。接收/发送数据源的天线模式可以是 `WIFI_ANT_MODE_ANT0`、`WIFI_ANT_MODE_ANT1` 或 `WIFI_ANT_MODE_AUTO`。如果天线模式为 `WIFI_ANT_MODE_ANT0`，使能的天线 0 用于接收/发送数据。如果天线模式为 `WIFI_ANT_MODE_ANT1`，使能天线 1 用于接收/发送数据。否则，Wi-Fi 会自动选择使能天线中信号较好的天线。

如果接收数据的天线模式为 `WIFI_ANT_MODE_AUTO`，还需要设置默认天线模式。只有在满足某些条件时，接收数据天线才会切换，例如，如果 RSSI 低于 -65 dBm，或另一根天线信号更好。如果条件不满足，接收数据使用默认天线。如果默认天线模式为 `WIFI_ANT_MODE_ANT1`，则使能的天线 1 是默认接收数据天线，否则是使能的天线 0。

有一些限制情况需要考虑：

- 因为发送数据天线基于 `WIFI_ANT_MODE_AUTO` 类型的接收数据天线选择算法，只有接收数据的天线模式为 `WIFI_ANT_MODE_AUTO` 时，发送数据天线才能设置为 `WIFI_ANT_MODE_AUTO`。
- 目前，Bluetooth® 不支持多根天线功能，请不要使用与多根天线有关的 API。

推荐在以下场景中使用多根天线：

- Wi-Fi 模式 `WIFI_MODE_STA` 下，接收/发送数据的天线模式均配置为 `WIFI_ANT_MODE_AUTO`。Wi-Fi 驱动程序自动选择更好的接收/发送数据天线。
- 接收数据天线模式配置为 `WIFI_ANT_MODE_AUTO`。发送数据的天线模式配置为 `WIFI_ANT_MODE_ANT0` 或 `WIFI_ANT_MODE_ANT1`。应用程序可以始终选择指定的天线用于发送数据，也可以执行自身发送数据天线选择算法，如根据信道切换信息选择发送数据的天线模式等。

- 接收/发送数据的天线模式均配置为 WIFI_ANT_MODE_ANT0 或 WIFI_ANT_MODE_ANT1。

Wi-Fi 多根天线配置

通常，可以执行以下步骤来配置多根天线：

- 配置 antenna_selects 连接哪些 GPIOs，例如，如果支持四根天线，且 GPIO20/GPIO21 连接到 antenna_select[0]/antenna_select[1]，配置如下所示：

```
wifi_ant_gpio_config_t config = {
    { .gpio_select = 1, .gpio_num = 20 },
    { .gpio_select = 1, .gpio_num = 21 }
};
```

- 配置使能哪些天线、以及接收/发送数据如何使用使能的天线，例如，如果使能了天线 1 和天线 3，接收数据需要自动选择较好的天线，并将天线 1 作为默认天线，发送数据始终选择天线 3。配置如下所示：

```
wifi_ant_config_t config = {
    .rx_ant_mode = WIFI_ANT_MODE_AUTO,
    .rx_ant_default = WIFI_ANT_ANT0,
    .tx_ant_mode = WIFI_ANT_MODE_ANT1,
    .enabled_ant0 = 1,
    .enabled_ant1 = 3
};
```

4.36.24 Wi-Fi 信道状态信息

信道状态信息 (CSI) 是指 Wi-Fi 连接的信道信息。ESP32-S3 中，CSI 由子载波的信道频率响应组成，CSI 从发送端接收数据包时开始估计。每个子载波信道频率响应由两个字节的有符号字符记录，第一个字节是虚部，第二个字节是实部。根据接收数据包的类型，信道频率响应最多有三个字段。分别是 LLTF、HT-LTF 和 STBC-HT-LTF。对于在不同状态的信道上接收到的不同类型的数据包，CSI 的子载波索引和总字节数如下表所示。

信道	辅助信道	下								上						
		非 HT		HT			非 HT		HT			非 HT		HT		
数据包信息	信号模式	20 MHz	20 MHz			20 MHz	20 MHz		40 MHz		20 MHz	20 MHz		40 MHz		
	信道带宽	20 MHz	20 MHz			20 MHz	20 MHz		40 MHz		20 MHz	20 MHz		40 MHz		
	STBC	非 STBC	非 STBC	STBC	非 STBC	非 STBC	STBC	非 STBC	STBC	非 STBC	STBC	非 STBC	非 STBC	STBC	非 STBC	STBC
子载波索引	LLTF	0~31, 32~1	0~31, 32~1	0~31, 32~1	0~63	0~63	0~63	0~63	0~63	-	-	-	-	-		
	HT-LTF	—	0~31, 32~1	0~31, 32~1	—	0~63	0~62	0~63, 64~1	0~60, 60~1	—	-	-	0~63, 64~1	0~60, 60~1		
	STBC-HT-LTF	—	—	0~31, 32~1	—	—	0~62	—	0~60, 60~1	—	—	-	62~1	—	0~60, 60~1	
总字节数		128	256	384	128	256	380	384	612	128	256	376	384	612		

表中的所有信息可以在 wifi_csi_info_t 结构中找到。

- 辅助信道指 rx_ctrl 字段的 secondary_channel 字段。
- 数据包的信号模式指 rx_ctrl 字段的 sig_mode 字段。
- 信道带宽指 rx_ctrl 字段中的 cwb 字段。

- STBC 指 `rx_ctrl` 字段的 `stbc` 字段。
- 总字节数指 `len` 字段。
- 每个长训练字段 (LTF) 类型对应的 CSI 数据存储在从 `buf` 字段开始的缓冲区中。每个元素以两个字节的形式存储：虚部和实部。每个元素的顺序与表中的子载波相同。LTF 的顺序是 LLTF、HT-LTF 和 STBC-HT-LTF。但是，根据信道和数据包的信息，3 个 LTF 可能都不存在（见上文）。
- 如果 `wifi_csi_info_t` 的 `first_word_invalid` 字段为 `true`，表示由于 ESP32-S3 的硬件限制，CSI 数据的前四个字节无效。
- 更多信息，如 RSSI，射频的噪声底，接收时间和天线 `rx_ctrl` 领域。

子载波的虚部和实部的使用请参考下表。

PHY 标准	子载波范围	导频子载波	子载波个数 (总数/数据子载波)
802.11a/g	-26 to +26	-21, -7, +7, +21	52 total, 48 usable
802.11n, 20MHz	-28 to +28	-21, -7, +7, +21	56 total, 52 usable
802.11n, 40MHz	-57 to +57	-53, -25, -11, +11, +25, +53	114 total, 108 usable

备注:

- 对于 STBC 数据包，每个空时流都提供了 CSI，不会出现 CSD（循环移位延迟）。由于附加链上的每一次循环移位为 -200 ns，因为子载波 0 中没有信道频率响应，在 HT-LTF 和 STBC-HT-LTF 中只记录第一空时流的 CSD 角度。CSD[10:0] 是 11 位，范围从 $-\pi$ 到 π 。
- 如果调用 API `esp_wifi_set_csi_config()` 没有使能 LLTF、HT-LTF 或 STBC-HT-LTF，则 CSI 数据的总字节数会比表中的少。例如，如果没有使能 LLTF 和 HT-LTF，而使能 STBC-HT-LTF，当接收到上述条件、HT、40 MHz 或 STBC 的数据包时，CSI 数据的总字节数为 244 $((61+60)*2+2=244$ ，结果对齐为四个字节，最后两个字节无效)。

4.36.25 Wi-Fi 信道状态信息配置

要使用 Wi-Fi CSI，需要执行以下步骤。

- 在菜单配置中选择 Wi-Fi CSI。方法是“菜单配置 -> 组件配置-> Wi-Fi -> Wi-Fi CSI（信道状态信息）”。
- 调用 API `esp_wifi_set_csi_rx_cb()` 设置 CSI 接收回调函数。
- 调用 API `esp_wifi_set_csi_config()` 配置 CSI。
- 调用 API `esp_wifi_set_csi()` 使能 CSI。

CSI 接收回调函数从 Wi-Fi 任务中运行。因此，不要在回调函数中进行冗长的操作。可以将需要的数据发布到队列中，并从一个较低优先级的任务中处理。由于 `station` 在断开连接时不会收到任何数据包，只有在连接时才会收到来自 AP 的数据包，因此建议通过调用函数 `esp_wifi_set_promiscuous()` 使能 Sniffer 模式接收更多 CSI 数据。

4.36.26 Wi-Fi HT20/40

ESP32-S3 支持 Wi-Fi 带宽 HT20 或 HT40，不支持 HT20/40 共存，调用函数 `esp_wifi_set_bandwidth()` 可改变 `station/AP` 的默认带宽。ESP32-S3 `station` 和 AP 的默认带宽为 HT40。

`station` 模式下，实际带宽首先在 Wi-Fi 连接时协商。只有当 `station` 和所连 AP 都支持 HT40 时，带宽才为 HT40，否则为 HT20。如果所连的 AP 的带宽发生变化，则在不断开 Wi-Fi 连接的情况下再次协商实际带宽。

同样，在 AP 模式下，在 AP 与所连 `station` 协商实际带宽。如果 AP 和其中一个 `station` 支持 HT40，则为 HT40，否则为 HT20。

在 `station/AP` 共存模式下，`station` 和 AP 都可独立配置为 HT20/40。如果 `station` 和 AP 都协商为 HT40，由于 ESP32-S3 中，`station` 的优先级总高于 AP，HT40 信道是 `station` 的信道。例如，AP 的配置带宽为 HT40，

配置的主信道为 6，配置的辅助信道为 10。如果，station 所连路由器的主信道为 6、辅助信道为 2，AP 的实际信道将自动更改为主 6 和辅 2。

理论上，HT40 可以获得更大的吞吐量，因为 HT40 的最大原始 PHY 数据速率为 150 Mbps，而 HT20 为 72 Mbps。但是，如果设备在某些特殊环境中使用，例如，ESP32-S3 周围其他 Wi-Fi 设备过多，HT40 的性能可能会降低。因此，如果应用程序需要支持相同或类似的情况，建议始终将带宽配置为 HT20。

4.36.27 Wi-Fi QoS

ESP32-S3 支持 WFA Wi-Fi QoS 认证所要求的所有必备功能。

Wi-Fi 协议中定义了四个 AC（访问类别），每个 AC 有各自的优先级访问 Wi-Fi 信道。此外，还定义了映射规则以映射其他协议的 QoS 优先级，例如 802.11D 或 TCP/IP 到 Wi-Fi AC。

下表描述 ESP32-S3 中 IP 优先级如何映射到 Wi-Fi AC，还指明此 AC 是否支持 AMPDU。该表按优先级降序排列，即 AC_VO 拥有最高优先级。

IP 优先级	Wi-Fi AC	是否支持 AMPDU
6, 7	AC_VO (Voice)	否
4, 5	AC_VI (Video)	是
3, 0	AC_BE (Best Effort)	是
1, 2	AC_BK (Background)	是

应用程序可以通过套接字选项 IP_TOS 配置 IP 优先级使用 QoS 功能。下面是使套接字使用 VI 队列的示例：

```
const int ip_precedence_vi = 4;
const int ip_precedence_offset = 5;
int priority = (ip_precedence_vi << ip_precedence_offset);
setsockopt(socket_id, IPPROTO_IP, IP_TOS, &priority, sizeof(priority));
```

理论上，高优先级的 AC 比低优先级 AC 具有更好的性能，但并非总是如此，下面是一些关于如何使用 Wi-Fi QoS 的建议：

- 可以把一些真正重要的应用程序流量放到 AC_VO 队列中。避免通过 AC_VO 队列发送大流量。一方面，AC_VO 队列不支持 AMPDU，如果流量很大，性能不会优于其他队列。另一方面，可能会影响同样使用 AC_VO 队列的管理帧。
- 避免使用 AMPDU 支持的、两个以上的不同优先级，比如 socket A 使用优先级 0，socket B 使用优先级 1，socket C 使用优先级 2。因为可能需要更多的内存，不是好的设计。具体来说，Wi-Fi 驱动程序可能会为每个优先级生成一个 Block Ack 会话，如果设置了 Block Ack 会话，则需要更多内存。

4.36.28 Wi-Fi AMSDU

ESP32-S3 支持接收和发送 AMSDU。开启 AMSDU 发送比较消耗内存，默认不开启 AMSDU 发送。可通过选项 `CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED` 使能 AMSDU 发送功能，但是使能 AMSDU 发送依赖于 `CONFIG_SPIRAM`。

4.36.29 Wi-Fi 分片

ESP32-S3 支持 Wi-Fi 接收和发送分片。

4.36.30 WPS 注册

在 Wi-Fi 模式 `WIFI_MODE_STA` 或 `WIFI_MODE_APSTA` 下，ESP32-S3 支持 WPS 注册功能。目前，ESP32-S3 支持的 WPS enrollee 类型有 PBC 和 PIN。

4.36.31 Wi-Fi 缓冲区使用情况

本节只介绍动态缓冲区配置。

缓冲区配置的重要性

为了获得一个具有强健、高性能的系统，我们需要非常谨慎地考虑内存的使用或配置情况，因为：

- ESP32-S3 的可用内存有限。
- 目前，LwIP 和 Wi-Fi 驱动程序中默认的缓冲区类型是“动态”，意味着 **LwIP 和 Wi-Fi 都与应用程序共享内存**。程序员应该时刻牢记这一点，否则将面临如“堆内存耗尽”等的内存问题。
- “堆耗尽”情况非常危险，会导致 ESP32-S3 出现“未定义行为”。因此，应该为应用程序预留足够的堆内存，防止耗尽。
- Wi-Fi 的吞吐量很大程度上取决于与内存相关的配置，如 TCP 窗口大小、Wi-Fi 接收/发送数据动态缓冲区数量等。
- ESP32-S3 LwIP/Wi-Fi 可能使用的堆内存峰值取决于许多因素，例如应用程序可能拥有的最大 TCP/UDP 连接等。
- 在考虑内存配置时，应用程序所需的总内存也是一个重要因素。

由于这些原因，不存在一个适合所有应用程序的配置。相反，我们必须为每个不同的应用程序考虑不同的内存配置。

动态与静态缓冲区

Wi-Fi 驱动程序中默认的缓存类型是“动态”。大多数情况下，动态缓冲区可以极大地节省内存。但是因为应用程序需要考虑 Wi-Fi 的内存使用情况，会给应用程序编程造成一定的难度。

lwIP 还在 TCP/IP 层分配缓冲区，这种缓冲区分配也是动态的。具体内容，见 [lwIP 文档内存使用和性能部分](#)。

Wi-Fi 动态缓冲区峰值

Wi-Fi 驱动程序支持多种类型的缓冲区（参考 [Wi-Fi 缓冲区配置](#)）。但本节只介绍 Wi-Fi 动态缓冲的使用方法。Wi-Fi 使用的堆内存峰值是 Wi-Fi 驱动程序 **理论上消耗的最大内存**。通常，该内存峰值取决于：

- 配置的动态接收数据缓冲区数：wifi_rx_dynamic_buf_num
- 配置的动态发送数据缓冲区数：wifi_tx_dynamic_buf_num
- Wi-Fi 驱动程序可以接收的最大数据包：wifi_rx_pkt_size_max
- Wi-Fi 驱动程序可以发送的最大数据包：wifi_tx_pkt_size_max

因此，Wi-Fi 驱动程序消耗的内存峰值可以用下面的公式计算：

$$\text{wifi_dynamic_peek_memory} = (\text{wifi_rx_dynamic_buf_num} * \text{wifi_rx_pkt_size_max}) + (\text{wifi_tx_dynamic_buf_num} * \text{wifi_tx_pkt_size_max})$$

一般情况下，不需要关心动态发送数据长缓冲区和超长缓冲区，因为它们是管理帧，对系统的影响很小。

4.36.32 如何提高 Wi-Fi 性能

ESP32-S3 Wi-Fi 的性能受许多参数的影响，各参数之间存在相互制约。如果配置地合理，不仅可以提高性能，还可以增加应用程序的可用内存，提高稳定性。

在本节中，我们将简单介绍 Wi-Fi/LWIP 协议栈的工作模式，并说明各个参数的作用。我们将推荐几种配置等级，您可以根据使用场景选择合适的等级。

图 60: ESP32-S3 数据路径

协议栈工作模式

ESP32-S3 协议栈分为四层，分别为应用层、LWIP 层、Wi-Fi 层和硬件层。

- 在接收过程中，硬件将接收到的数据包放入 DMA 缓冲区，然后依次传送到 Wi-Fi 的接收数据缓冲区、LWIP 的接收数据缓冲区进行相关协议处理，最后传送到应用层。Wi-Fi 的接收数据缓冲区和 LWIP 的接收数据缓冲区默认共享同一个缓冲区。也就是说，Wi-Fi 默认将数据包转发到 LWIP 作为参考。
- 在发送过程中，应用程序首先将要发送的消息复制到 LWIP 层的发送数据缓冲区，进行 TCP/IP 封装。然后将消息发送到 Wi-Fi 层的发送数据缓冲区进行 MAC 封装，最后等待发送。

参数

适当增加上述缓冲区的大小或数量，可以提高 Wi-Fi 性能，但同时，会减少应用程序的可用内存。下面我们将介绍您需要配置的参数：

接收数据方向：

- [`CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM`](#) 该参数表示硬件层的 DMA 缓冲区数量。提高该参数将增加发送方的一次性接收吞吐量，从而提高 Wi-Fi 协议栈处理突发流量的能力。
- [`CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM`](#) 该参数表示 Wi-Fi 层中接收数据缓冲区的数量。提高该参数可以增强数据包的接收性能。该参数需要与 LWIP 层的接收数据缓冲区大小相匹配。
- [`CONFIG_ESP32_WIFI_RX_BA_WIN`](#) 该参数表示接收端 AMPDU BA 窗口的大小，应配置为 [`CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM`](#) 和 [`CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM`](#) 的二倍数值中较小的数值。
- [`CONFIG_LWIP_TCP_WND_DEFAULT`](#) 该参数表示 LWIP 层用于每个 TCP 流的接收数据缓冲区大小，应配置为 [`WIFI_DYNAMIC_RX_BUFFER_NUM`](#) (KB) 的值，从而实现高稳定性能。同时，在有多个流的情况下，应相应降低该参数值。

发送数据方向：

- [`CONFIG_ESP32_WIFI_TX_BUFFER`](#) 该参数表示发送数据缓冲区的类型，建议配置为动态缓冲区，该配置可以充分利用内存。
- [`CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM`](#) 该参数表示 Wi-Fi 层发送数据缓冲区数量。提高该参数可以增强数据包发送的性能。该参数值需要与 LWIP 层的发送数据缓冲区大小相匹配。
- [`CONFIG_LWIP_TCP_SND_BUF_DEFAULT`](#) 该参数表示 LWIP 层用于每个 TCP 流的发送数据缓冲区大小，应配置为 [`WIFI_DYNAMIC_TX_BUFFER_NUM`](#) (KB) 的值，从而实现高稳定性能。在有多个流的情况下，应相应降低该参数值。

通过在 IRAM 中放置代码优化吞吐量：

缓存：

- `CONFIG_ESP32S3_INSTRUCTION_CACHE_SIZE` 配置指令缓存的大小。
- `CONFIG_ESP32S3_INSTRUCTION_CACHE_LINE_SIZE` 配置指令缓存总线的宽度。
- `CONFIG_ESP32S3_ICACHE_ASSOCIATED_WAYS` 配置指令缓存相连方式。
- `CONFIG_ESP32S3_DATA_CACHE_SIZE` 配置数据缓存的大小。
- `CONFIG_ESP32S3_DATA_CACHE_LINE_SIZE` 配置数据缓存行大小。
- `CONFIG_ESP32S3_DCACHE_ASSOCIATED_WAYS` 配置数据缓存相连方式。

备注：上述的缓冲区大小固定为 1.6 KB。

如何配置参数

ESP32-S3 的内存由协议栈和应用程序共享。

在这里，我们给出了几种配置等级。在大多数情况下，您应根据应用程序所占用内存的大小，选择合适的等级进行参数配置。

下表中未提及的参数应设置为默认值。

等级	Iperf	默认	最小
可用内存 (KB)	133.9	183.9	273.6
WIFI_STATIC_RX_BUFFER_NUM	24	8	3
WIFI_DYNAMIC_RX_BUFFER_NUM	16	32	6
WIFI_DYNAMIC_TX_BUFFER_NUM	16	32	6
WIFI_RX_BA_WIN	32	16	6
TCP_SND_BUF_DEFAULT (KB)	64	32	6
TCP_WND_DEFAULT (KB)	64	32	6
WIFI_IRAM_OPT	15	15	15
WIFI_RX_IRAM_OPT	16	16	16
LWIP_IRAM_OPTIMIZATION	13	13	0
INSTRUCTION_CACHE	32	32	16
INSTRUCTION_CACHE_LINE	32	32	32
INSTRUCTION_CACHE_WAYS	8	8	4
TCP 发送数据吞吐量 (Mbit/s)	83.93	64.28	23.17
TCP 接收数据吞吐量 (Mbit/s)	73.98	60.39	18.11
UDP 发送数据吞吐量 (Mbit/s)	98.69	96.28	48.78
UDP 接收数据吞吐量 (Mbit/s)	88.58	86.57	59.45

备注：以上结果使用华硕 RT-N66U 路由器，在屏蔽箱中进行单流测试得出。ESP32-S3 的 CPU 为双核，频率为 240 MHz，flash 为 QIO 模式，频率为 80 MHz。

等级：

- **Iperf 等级** ESP32-S3 极端性能等级，用于测试极端性能。
- **默认等级** ESP32-S3 的默认配置等级、兼顾可用内存和性能。

- **最小等级** ESP32-S3 的最小配置等级。协议栈只使用运行所需的内存。适用于对性能没有要求，而应用程序需要大量内存的场景。

使用 PSRAM

PSRAM 一般在应用程序占用大量内存时使用。在该模式下，`CONFIG_ESP32_WIFI_TX_BUFFER` 被强制为静态。`CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM` 表示硬件层 DMA 缓冲区数量，提高这一参数可以增强性能。以下是使用 PSRAM 时的推荐等级。

四线 PSRAM:

等级	lperf	默认	节省内存	最小
可用内存 (KB)	50.3	158.7	198.2	228.9
WIFI_STATIC_RX_BUFFER_NUM	8	16	6	4
WIFI_DYNAMIC_RX_BUFFER_NUM	16	32	32	32
WIFI_STATIC_TX_BUFFER_NUM	32	32	6	4
WIFI_RX_BA_WIN	32	16	12	禁用
TCP_SND_BUF_DEFAULT (KB)	DEFAULT	32	32	32
TCP_WND_DEFAULT (KB)	32	32	32	32
WIFI_IRAM_OPT	15	15	15	0
WIFI_RX_IRAM_OPT	16	16	0	0
LWIP_IRAM_OPTIMIZATION	0	0	0	0
LWIP_UDP_RECV_MAX_BOX_SIZE	16	16	16	16
INSTRUCTION_CACHE	32	16	16	16
INSTRUCTION_CACHE_LINE	32	16	16	16
INSTRUCTION_CACHE_WAYS	8	8	8	8
DATA_CACHE	64	16	16	16
DATA_CACHE_LINE	32	32	32	32
DATA_CACHE_WAYS	8	8	8	8
TCP 发送数据吞吐量 (Mbit/s)	93.1	62.5	41.3	42.7
TCP 接收数据吞吐量 (Mbit/s)	88.9	46.5	46.2	37.9
UDP 发送数据吞吐量 (Mbit/s)	106.4	106.2	60.7	50
UDP 接收数据吞吐量 (Mbit/s)	99.8	92.6	94.3	53.3

八线 PSRAM:

等级	lperf	默认	节省内存	最小
可用内存 (KB)	49.1	151.3	215.3	243.6
WIFI_STATIC_RX_BUFFER_NUM	8	6	4	4
WIFI_DYNAMIC_RX_BUFFER_NUM	32	32	32	32
WIFI_STATIC_TX_BUFFER_NUM	32	6	4	4
WIFI_RX_BA_WIN	32	16	12	禁用
TCP_SND_BUF_DEFAULT (KB)	DEFAULT	32	32	32
TCP_WND_DEFAULT (KB)	DEFAULT	32	32	32
WIFI_IRAM_OPT	15	15	15	0
WIFI_RX_IRAM_OPT	16	16	0	0
LWIP_IRAM_OPTIMIZATION	0	0	0	0
LWIP_UDP_RECV_MBOX_SIZE	16	16	16	16
INSTRUCTION_CACHE	32	16	16	16
INSTRUCTION_CACHE_LINE	32	16	16	16
INSTRUCTION_CACHE_WAYS	8	8	8	8
DATA_CACHE	64	16	16	16
DATA_CACHE_LINE	32	32	32	32
DATA_CACHE_WAYS	8	8	8	8
TCP 发送数据吞吐量 (Mbit/s)	93.3	58.4	37.1	35.6
TCP 接收数据吞吐量 (Mbit/s)	86.1	43.6	42.5	35
UDP 发送数据吞吐量 (Mbit/s)	104.7	82.2	60.4	47.9
UDP 接收数据吞吐量 (Mbit/s)	104.6	104.8	104	55.7

4.36.33 Wi-Fi Menuconfig

Wi-Fi 缓冲区配置

如果您要修改默认的缓冲区数量或类型，最好也了解缓冲区在数据路径中是如何分配或释放的。下图显示了发送数据方向的这一过程。

图 61: TX Buffer Allocation

描述:

- 应用程序分配需要发送的数据。

- 应用程序调用 TCPIP 或套接字相关的 API 发送用户数据。这些 API 会分配一个在 LwIP 中使用的 PBUF，并复制用户数据。
- 当 LwIP 调用 Wi-Fi API 发送 PBUF 时，Wi-Fi API 会分配一个“动态发送数据缓冲区”或“静态发送数据缓冲区”，并复制 LwIP PBUF，最后发送数据。

下图展示了如何在接收数据方向分配或释放缓冲区：

图 62: 接收数据缓冲区分配

描述：

- Wi-Fi 硬件在空中接收到数据包后，将数据包内容放到“静态接收数据缓冲区”，也就是“接收数据 DMA 缓冲区”。
- Wi-Fi 驱动程序分配一个“动态接收数据缓冲区”、复制“静态接收数据缓冲区”，并将“静态接收数据缓冲区”返回给硬件。
- Wi-Fi 驱动程序将数据包传送到上层 (LwIP)，并分配一个 PBUF 用于存放“动态接收数据缓冲区”。
- 应用程序从 LwIP 接收数据。

下表是 Wi-Fi 内部缓冲区的配置情况。

缓冲区类型	分配类型	默认	是否可配置	描述
静态接收数据缓冲区(硬件接收数据缓冲区)	静态	10 * 1600 Bytes	是	这是一种 DMA 内存，在函数 <code>esp_wifi_init()</code> 中初始化，在函数 <code>esp_wifi_deinit()</code> 中释放。该缓冲区形成硬件接收列表。当通过空中接收到一个帧时，硬件将该帧写入缓冲区，并向 CPU 发起一个中断。然后，Wi-Fi 驱动程序从缓冲区中读取内容，并将缓冲区返回到列表中。 如果应用程序希望减少 Wi-Fi 静态分配的内存，可以将该值从 10 减少到 6，从而节省 6400 Bytes 的内存。除非禁用 AMPDU 功能，否则不建议将该值降低到 6 以下。
动态接收数据缓冲区	动态	32	是	缓冲区的长度可变，取决于所接收帧的长度。当 Wi-Fi 驱动程序从“硬件接收数据缓冲区”接收到一帧时，需要从堆中分配“动态接收数据缓冲区”。在 Menuconfig 中配置的“动态接收数据缓冲区”数量用来限制未释放的“动态接收数据缓冲区”总数量。
动态发送数据缓冲区	动态	32	是	这是一种 DMA 内存，位于堆内存中。当上层 (LwIP) 向 Wi-Fi 驱动程序发送数据包时，该缓冲区首先分配一个“动态发送数据缓冲区”，并复制上层缓冲区。 动态发送数据缓冲区和静态发送数据缓冲区相互排斥。
静态发送数据缓冲区	静态	16 * 1600 Bytes	是	这是一种 DMA 内存，在函数 <code>esp_wifi_init()</code> 中初始化，在函数 <code>esp_wifi_deinit()</code> 中释放。当上层 (LwIP) 向 Wi-Fi 驱动程序发送数据包时，该缓冲区首先分配一个“静态发送数据缓冲区”，并复制上层缓冲区。 动态发送数据缓冲区和静态发送数据缓冲区相互排斥。 由于发送数据缓冲区必须是 DMA 缓冲区，所以当使能 PSRAM 时，发送数据缓冲区必须是静态的。
管理短缓冲区	动态	8	否	Wi-Fi 驱动程序的内部缓冲区。
管理长缓冲区	动态	32	否	Wi-Fi 驱动程序的内部缓冲区。
管理超长缓冲区	动态	32	否	Wi-Fi 驱动程序的内部缓冲区。

Wi-Fi NVS Flash

如果使能 Wi-Fi NVS flash，所有通过 Wi-Fi API 设置的 Wi-Fi 配置都会被存储到 flash 中，Wi-Fi 驱动程序在下次开机或重启时将自动加载这些配置。但是，应用程序可视情况禁用 Wi-Fi NVS flash，例如：其配置信息不需要存储在非易失性内存中、其配置信息已安全备份，或仅出于某些调试原因等。

Wi-Fi AMPDU

ESP32-S3 同时支持接收和发送 AMPDU，AMPDU 可以大大提高 Wi-Fi 的吞吐量。

通常，应使能 AMPDU。禁用 AMPDU 通常用于调试目的。

4.36.34 故障排除

请见乐鑫 [Wireshark 使用指南](#)。

乐鑫 Wireshark 使用指南

1. 概述

1.1 什么是 Wireshark？ Wireshark（原称 Ethereal）是一个网络封包分析软件。网络封包分析软件的功能是撷取网络封包，并尽可能显示出最为详细的网络封包资料。Wireshark 使用 WinPCAP 作为接口，直接与网卡进行数据报文交换。

网络封包分析软件的功能可想像成“电工技师使用电表来量测电流、电压、电阻”的工作，只是将场景移植到网络上，并将电线替换成网线。

在过去，网络封包分析软件是非常昂贵，或是专门属于营利用的软件。Wireshark 的出现改变了这一切。

在 GNU GPL 通用许可证的保障范围内，使用者可以以免费的代价取得软件与其源代码，并拥有针对其源代码修改及客制化的权利。

Wireshark 是目前全世界最广泛的网络封包分析软件之一。

1.2 Wireshark 的主要应用 下面是 Wireshark 一些应用的举例：

- 网络管理员用来解决网络问题
- 网络安全工程师用来检测安全隐患
- 开发人员用来测试协议执行情况
- 用来学习网络协议

除了上面提到的，Wireshark 还可以用在其它许多场合。

1.3 Wireshark 的特性

- 支持 UNIX 和 Windows 平台
- 在接口实时捕捉包
- 能详细显示包的详细协议信息
- 可以打开/保存捕捉的包
- 可以导入导出其他捕捉程序支持的包数据格式
- 可以通过多种方式过滤包
- 多种方式查找包
- 通过过滤以多种色彩显示包
- 创建多种统计分析
- 等等

1.4 Wireshark 的“能”与“不能”？

- **捕捉多种网络接口**
Wireshark 可以捕捉多种网络接口类型的包，哪怕是无线局域网接口。
- **支持多种其它程序捕捉的文件**
Wireshark 可以打开多种网络分析软件捕捉的包。
- **支持多格式输出**
Wireshark 可以将捕捉文件输出为多种其他捕捉软件支持的格式。
- **对多种协议解码提供支持**
Wireshark 可以支持许多协议的解码。
- **Wireshark 不是入侵检测系统**
如果您的网络中存在任何可疑活动，Wireshark 并不会主动发出警告。不过，当您希望对这些可疑活动一探究竟时，Wireshark 可以发挥作用。
- **Wireshark 不会处理网络事务，它仅仅是“测量”（监视）网络**
Wireshark 不会发送网络包或做其它交互性的事情（名称解析除外，但您也可以禁止解析）。

2. 如何获取 Wireshark 官网链接：<https://www.wireshark.org/download.html>

Wireshark 支持多种操作系统，请在下载安装文件时，注意选择与您所用操作系统匹配的安装文件。

3. 使用步骤 本文档仅以 Linux 系统下的 Wireshark（版本号：2.2.6）为例。

1) 启动 Wireshark

Linux 下，可编写一个 Shell 脚本，运行该文件即可启动 Wireshark 配置抓包网卡和信道。Shell 脚本如下：

```
ifconfig $1 down
iwconfig $1 mode monitor
iwconfig $1 channel $2
ifconfig $1 up
Wireshark&
```

脚本中有两个参数：\$1 和 \$2，分别表示网卡和信道，例如，./xxx.sh wlan0 6（此处，wlan0 即为抓包使用的网卡，后面的数字 6 即为 AP 或 soft-AP 所在的 channel）。

2) 运行 Shell 脚本打开 Wireshark，会出现 Wireshark 抓包开始界面

图 63: Wireshark 抓包界面

3) 选择接口，开始抓包

从上图红色框中可以看到有多个接口，第一个为本地网卡，第二个为无线网络。

可根据自己的需求选取相应的网卡，本文是以利用无线网卡抓取空中包为例进行简单说明。

双击 `wlan0` 即可开始抓包。

4) 设置过滤条件

抓包过程中会抓取到同信道所有的空中包，但其实很多都是我们不需要的，因此很多时候我们会设置抓包的过滤条件从而得到我们想要的包。

下图中红色框内即为设置 filter 的位置。

图 64: 设置 Wireshark 过滤条件

点击 *Filter* 按钮（下图的左上角蓝色按钮）会弹出 *display filter* 对话框。

图 65: *Display Filter* 对话框

点击 *Expression* 按钮，会出现 *Filter Expression* 对话框，在此你可以根据需求进行 filter 的设置。

最直接的方法：直接在工具栏上输入过滤条件。

点击在此区域输入或修改显示的过滤字符，在输入过程中会进行语法检查。如果您输入的格式不正确，或者未输入完成，则背景显示为红色。直到您输入合法的表达式，背景会变为绿色。你可以点击下拉列表选择您先前键入的过滤字符。列表会一直保留，即使您重新启动程序。

例如：下图所示，直接输入 2 个 MAC 作为过滤条件，点击 *Apply*（即图中的蓝色箭头），则表示只抓取 2 个此 MAC 地址之间的交互的包。

5) 封包列表

若想查看包的具体的信息只需要选中要查看的包，在界面的下方会显示出包的具体的格式和包的内容。

如上图所示，我要查看第 1 个包，选中此包，图中红色框中即为包的具体内容。

6) 停止/开始包的捕捉

若要停止当前抓包，点击下图的红色按钮即可。

图 66: Filter Expression 对话框

图 67: 过滤条件工具栏

图 68: 在过滤条件工具栏中运用 MAC 地址过滤示例

图 69: 封包列表具体信息示例

图 70: 停止包的捕捉

图 71: 开始或继续包的捕捉

若要重新开始抓包，点击下图左上角的蓝色按钮即可。

7) 保存当前捕捉包

Linux 下，可以通过依次点击“File”->“Export Packet Dissections”->“As Plain Text File”进行保存。

图 72: 保存捕捉包

上图中，需要注意的是，选择 *All packets*、*Displayed* 以及 *All expanded* 三项。

Wireshark 捕捉的包可以保存为其原生格式文件 (libpcap)，也可以保存为其他格式 (如.txt 文件) 供其他工具进行读取分析。

4.37 Wi-Fi Security

4.37.1 ESP32-S3 Wi-Fi Security Features

- Support for Protected Management Frames (PMF)
- Support for WPA3-Personal

In addition to traditional security methods (WEP/WPA-TKIP/WPA2-CCMP), ESP32-S3 Wi-Fi supports state-of-the-art security protocols, namely Protected Management Frames based on 802.11w standard and Wi-Fi Protected Access 3 (WPA3-Personal). Together, PMF and WPA3 provide better privacy and robustness against known attacks on traditional modes.

4.37.2 Protected Management Frames (PMF)

Introduction

In Wi-Fi, management frames such as beacons, probes, (de)authentication, (dis)association are used by non-AP stations to scan and connect to an AP. Unlike data frames, these frames are sent unencrypted. An attacker can use eavesdropping and packet injection to send spoofed (de)authentication/(dis)association frames at the right time, leading to the following attacks in case of unprotected management frame exchanges.

- DOS attack on one or all clients in the range of the attacker.
- Tearing down existing association on AP side by sending association request.
- Forcing a client to perform 4-way handshake again in case PSK is compromised in order to get PTK.
- Getting SSID of hidden network from association request.

- Launching man-in-the-middle attack by forcing clients to deauth from legitimate AP and associating to a rogue one.

PMF provides protection against these attacks by encrypting unicast management frames and providing integrity checks for broadcast management frames. These include deauthentication, disassociation and robust management frames. It also provides Secure Association (SA) teardown mechanism to prevent spoofed association/authentication frames from disconnecting already connected clients.

There are 3 types of PMF configuration modes on both station and AP side -

- PMF Optional
- PMF Required
- PMF Disabled

Depending on PMF configurations on Station and AP side, the resulting connection will behave differently. The table below summarises all possible outcomes -

STA Setting	AP Setting	Outcome
PMF Optional	PMF Optional/Required	Mgmt Frames Protected
PMF Optional	PMF Disabled	Mgmt Frames Not Protected
PMF Required	PMF Optional/Required	Mgmt Frames Protected
PMF Required	PMF Disabled	STA refuses Connection
PMF Disabled	PMF Optional/Disabled	Mgmt Frames Not Protected
PMF Disabled	PMF Required	AP refuses Connection

API & Usage

ESP32-S3 supports PMF in both Station and SoftAP mode. For both, the default mode is PMF Optional and disabling PMF is not possible. For even higher security, PMF required mode can be enabled by setting the `required` flag in `pmf_cfg` while using the `esp_wifi_set_config()` API. This will result in the device only connecting to a PMF enabled device and rejecting others.

注意: `capable` flag in `pmf_cfg` is deprecated and set to true internally. This is to take the additional security benefit of PMF whenever possible.

4.37.3 WPA3-Personal

Introduction

Wi-Fi Protected Access-3 (WPA3) is a set of enhancements to Wi-Fi access security intended to replace the current WPA2 standard. It includes new features and capabilities that offer significantly better protection against different types of attacks. It improves upon WPA2-Personal in following ways:

- WPA3 uses Simultaneous Authentication of Equals (SAE), which is password-authenticated key agreement method based on Diffie-Hellman key exchange. Unlike WPA2, the technology is resistant to offline-dictionary attack, where the attacker attempts to determine shared password based on captured 4-way handshake without any further network interaction.
- Disallows outdated protocols such as TKIP, which is susceptible to simple attacks like MIC key recovery attack.
- Mandates Protected Management Frames (PMF), which provides protection for unicast and multicast robust management frames which include Disassoc and Deauth frames. This means that the attacker cannot disrupt an established WPA3 session by sending forged Assoc frames to the AP or Deauth/Disassoc frames to the Station.
- Provides forward secrecy, which means the captured data cannot be decrypted even if password is compromised after data transmission.

Please refer to [Security](#) section of Wi-Fi Alliance's official website for further details.

Setting up WPA3 with ESP32-S3

In IDF Menuconfig under Wi-Fi component, a config option “Enable WPA3-Personal” is provided to Enable/Disable WPA3. By default it is kept enabled, if disabled ESP32-S3 will not be able to establish a WPA3 connection. Currently, WPA3 is supported only in the Station mode. Additionally, since PMF is mandated by WPA3 protocol, PMF Mode should be set to either Optional or Required while setting WiFi config.

Refer to *Protected Management Frames (PMF)* on how to set this mode.

After these settings are done, Station is ready to use WPA3-Personal. Application developers need not worry about the underlying security mode of the AP. WPA3-Personal is now the highest supported protocol in terms of security, so it will be automatically selected for the connection whenever available. For example, if an AP is configured to be in WPA3 Transition Mode, where it will advertise as both WPA2 and WPA3 capable, Station will choose WPA3 for the connection with above settings. Note that Wi-Fi stack size requirement will increase 3kB when WPA3 is used.

4.38 RF 共存

4.38.1 概览

ESP32-S3 只支持一路 RF，Bluetooth (BT 和 BLE) 和 Wi-Fi 共享这一路 RF，无法同时收发数据，因此采用时分复用的方法进行收发数据包。

4.38.2 ESP32-S3 支持的共存场景

表 31: 表 1 Wi-Fi 和 BLE 共存支持功能

			BLE			
			Scan	Advertising	Connecting	Connected
Wi-Fi	STA	Scan	Y	Y	Y	Y
		Connecting	Y	Y	Y	Y
		Connected	Y	Y	Y	Y
	SOFTAP	TX Beacon	Y	Y	Y	Y
		Connecting	C1	C1	C1	C1
		Connected	C1	C1	C1	C1
	Sniffer	RX	C1	C1	C1	C1
	ESP-NOW	RX	S	S	S	S
		TX	Y	Y	Y	Y

备注: Y: 支持且性能稳定。C1: 不能保证性能处于稳定状态。X: 不支持。S: 在 STA 模式下支持且性能稳定，否则不支持。

4.38.3 共存机制与策略

共存机制

基于优先级抢占的 RF 资源分配机制，如下图所示，Bluetooth 模块和 Wi-Fi 模块向共存模块申请 RF 资源，共存模块根据二者的优先级高低裁决 RF 归谁使用。

图 73: 共存机制

共存策略

共存周期和时间片 Wi-Fi、BLE 二者对于 RF 的使用，主要是按照时间片来划分的。在 Wi-Fi 的时间片内，Wi-Fi 会向共存仲裁模块发出较高优先级的请求，在 Bluetooth 的时间片内，BLE 会具有较高优先级。共存周期大小和各个时间片占比根据 Wi-Fi 的状态分成四类：

- 1) IDLE 状态：RF 模块由 Bluetooth 模块控制。
- 2) CONNECTED 状态：共存周期以目标信标传输时间 (Target Beacon Transmission Time, TBTT) 点为起始点，周期大于 100 ms。
- 3) SCAN 状态：Wi-Fi 时间片以及共存周期都比在 CONNECTED 状态下的长。为了确保蓝牙的性能，蓝牙的时间片也会做相应的调整。
- 4) CONNECTING 状态：Wi-Fi 时间片比在 CONNECTED 状态下的长。为了确保蓝牙的性能，蓝牙的时间片也会做相应的调整。

共存逻辑会根据当前 Wi-Fi 和 Bluetooth 的使用场景来选取不同的共存周期和共存时间片的划分策略。对应一个使用场景的共存策略，我们称之为“共存模板”。比如，Wi-Fi CONNECTED 与 BLE CONNECTED 的场景，就对应有一个共存模板。在这个共存模板中，一个共存周期内 Wi-Fi 和 BLE 的时间片各占 50%，时间分配如下图所示：

图 74: Wi-Fi CONNECTED 和 BLE CONNECTED 共存状态下时间片划分图

动态优先级 共存模块对 Wi-Fi 和 Bluetooth 不同的状态赋予其不同的优先级。每种状态下的优先级并不是一成不变的，例如每 N 个广播事件 (Advertising event) 中会有一个广播事件使用高优先级。如果高优先级的广播事件发生在 Wi-Fi 时间片内，RF 的使用权可能会被 BLE 抢占。

Wi-Fi 非连接模块的共存 在一定程度上，某些 Wi-Fi 非连接模块功耗参数 Window 与 Interval 的组合会导致共存模块在 Wi-Fi 时间片外申请共存优先级。这是为了按设定的功耗参数在共存时获取 RF 资源，但这会影响既定的蓝牙性能。

如果 Wi-Fi 非连接模块功耗参数为默认值时，上述动作不会发生，共存模块会按照性能稳定的模式运行。因此，除非您对特定非连接功耗参数下的共存性能有足够的测试，请在共存场景下将 Wi-Fi 非连接模块

功耗参数配置为默认参数。

请参考[非连接模块功耗管理](#) 获取更多信息。

4.38.4 如何使用共存功能

共存 API 的使用

在大多数共存情况下，ESP32-S3 会自动进行共存状态切换，无需调用 API 对其进行干预。但是对于 BLE MESH 和 Wi-Fi 的共存，ESP32-S3 对其提供了两个 API。当 BLE MESH 的状态发生变化时，应先调用 `esp_coex_status_bit_clear` 对上一个状态进行清除，然后调用 `esp_coex_status_bit_set` 设置当前状态。

BLE MESH 共存状态描述 由于 Wi-Fi 和 Bluetooth 固件无法获知当前的上层应用的场景，一些共存模板需要应用代码调用共存的 API 才能生效。BLE MESH 的工作状态就需要由应用层通知给共存模块，用于选择共存模板。

- `ESP_COEX_BLE_ST_MESH_CONFIG`: 正在组网。
- `ESP_COEX_BLE_ST_MESH_TRAFFIC`: 正在传输数据。
- `ESP_COEX_BLE_ST_MESH_STANDBY`: 处于空闲状态，无大量数据交互。

共存 API 错误代码

所有共存 API 都有自定义的返回值，即错误代码。这些代码可分类为：

- 无错误，例如：返回值为 `ESP_OK` 代表 API 成功返回。
- 可恢复错误，例如：返回值为 `ESP_ERR_INVALID_ARG` 代表 API 参数错误。

设置共存编译时选项

- 在完成共存程序编写的时候，您必须通过 `menuconfig` 选择 `CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE` 打开软件共存配置选项，否则就无法使用上文中提到的共存功能。
- 为了在共存情况下获得更好的 Wi-Fi 和蓝牙的通信性能，建议将 Wi-Fi 协议栈的 task 和蓝牙 Controller 以及 Host 协议栈的 task 运行在不同的 CPU 上，您可以通过 `CONFIG_BT_CTRL_PINNED_TO_CORE_CHOICE` 和 `CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE` (或者 `CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE`) 选择将蓝牙 controller 以及 host 协议栈的 task 放在同一个 CPU 上，再通过 `CONFIG_ESP32_WIFI_TASK_CORE_ID` 选择将 Wi-Fi 协议栈 task 放在另一个 CPU 上。
- 在 BLE 连接过程中使用了 LE Coded PHY 时，为了防止蓝牙数据包持续时间较长而对 Wi-Fi 的性能产生严重影响，您可以在 `CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM` 的子选项中选择 `BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_EN` 选择打开对 TX/RX 最大时间的限制配置选项。
- 您可以通过修改以下 `menuconfig` 选项，以减小内存开销：
 - 1) `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY` 选择打开蓝牙协议栈动态内存配置选项。
 - 2) `CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM` 选择减少 Wi-Fi 静态接收数据缓冲区的数量。
 - 3) `CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM` 选择减少 Wi-Fi 动态接收数据缓冲区的数量。
 - 4) `CONFIG_ESP32_WIFI_TX_BUFFER` 选择使用动态分配发送数据缓冲区配置选项。
 - 5) `CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM` 选择减少 Wi-Fi 动态发送数据缓冲区的数量。
 - 6) `CONFIG_ESP32_WIFI_TX_BA_WIN` 选择减少 Wi-Fi Block Ack TX 窗口的数量。
 - 7) `CONFIG_ESP32_WIFI_RX_BA_WIN` 选择减少 Wi-Fi Block Ack RX 窗口的数量。
 - 8) `CONFIG_ESP32_WIFI_MGMT_SBUF_NUM` 选择减少 Wi-Fi 管理短缓冲区的数量。
 - 9) `CONFIG_ESP32_WIFI_RX_IRAM_OPT` 选择关闭此配置选项，关闭此配置选项将会减少大约 17 KB 的 IRAM 内存。

- 10) `CONFIG_LWIP_TCP_SND_BUF_DEFAULT` 选择减小 TCP 套接字默认发送缓存区大小。
- 11) `CONFIG_LWIP_TCP_WND_DEFAULT` 选择减小 TCP 套接字默认接收窗口的大小。
- 12) `CONFIG_LWIP_TCP_RECVMBOX_SIZE` 选择减小 TCP 接收邮箱的大小。
- 13) `CONFIG_LWIP_UDP_RECVMBOX_SIZE` 选择减小 UDP 接收邮箱的大小。
- 14) `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE` 选择减小 TCPIP 任务接收邮箱大小。

备注： 由于共存配置选项依赖于蓝牙配置选项，所以请先打开蓝牙配置选项，然后在 Wi-Fi 配置选项中打开共存配置选项。

4.39 Reproducible Builds

4.39.1 Introduction

ESP-IDF build system has support for [reproducible builds](#).

When reproducible builds are enabled, the application built with ESP-IDF doesn't depend on the build environment. Both the .elf file and .bin files of the application remains exactly the same, even if the following variables change:

- Directory where the project is located
- Directory where ESP-IDF is located (`IDF_PATH`)
- Build time

4.39.2 Reasons for non-reproducible builds

There are several reasons why an application may depend on the build environment, even when the same source code and tools versions are used.

- In C code, `__FILE__` preprocessor macro is expanded to the full path of the source file.
- `__DATE__` and `__TIME__` preprocessor macros are expanded to compilation date and time.
- When the compiler generates object files, it adds sections with debug information. These sections help debuggers, like GDB, to locate the source code which corresponds to a particular location in the machine code. These sections typically contain paths of relevant source files. These paths may be absolute, and will include the path to ESP-IDF or to the project.

There are also other possible reasons, such as unstable order of inputs and non-determinism in the build system.

4.39.3 Enabling reproducible builds in ESP-IDF

Reproducible builds can be enabled in ESP-IDF using `CONFIG_APP_REPRODUCIBLE_BUILD` option.

This option is disabled by default. It can be enabled in `menuconfig`.

The option may also be added into `sdkconfig.defaults`. If adding the option into `sdkconfig.defaults`, delete the `sdkconfig` file and run the build again. See [自定义 `sdkconfig` 的默认值](#) for more information.

4.39.4 How reproducible builds are achieved

ESP-IDF achieves reproducible builds using the following measures:

- In ESP-IDF source code, `__DATE__` and `__TIME__` macros are not used when reproducible builds are enabled. Note, if the application source code uses these macros, the build will not be reproducible.
- ESP-IDF build system passes a set of `-fmacro-prefix-map` and `-fdebug-prefix-map` flags to replace base paths with placeholders:
 - Path to ESP-IDF is replaced with `/IDF`
 - Path to the project is replaced with `/IDF_PROJECT`

- Path to the build directory is replaced with `/IDF_BUILD`
- Paths to components are replaced with `/COMPONENT_NAME_DIR` (where `NAME` is the name of the component)
- Build date and time are not included into the *application metadata structure* if `CONFIG_APP_REPRODUCIBLE_BUILD` is enabled.
- ESP-IDF build system ensures that source file lists, component lists and other sequences are sorted before passing them to CMake. Various other parts of the build system, such as the linker script generator also perform sorting to ensure that same output is produced regardless of the environment.

4.39.5 Reproducible builds and debugging

When reproducible builds are enabled, file names included in debug information sections are altered as shown in the previous section. Due to this fact, the debugger (GDB) is not able to locate the source files for the given code location.

This issue can be solved using GDB `set substitute-path` command. For example, by adding the following command to GDB init script, the altered paths can be reverted to the original ones:

```
set substitute-path /COMPONENT_FREERTOS_DIR /home/user/esp/esp-idf/components/  
↪freertos
```

ESP-IDF build system generates a file with the list of such `set substitute-path` commands automatically during the build process. The file is called `prefix_map_gdbinit` and is located in the project `build` directory.

When `idf.py gdb` is used to start debugging, this additional `gdbinit` file is automatically passed to GDB. When launching GDB manually or from an IDE, please pass this additional `gdbinit` script to GDB using `-x build/prefix_map_gdbinit` argument.

4.39.6 Factors which still affect reproducible builds

Note that the built application still depends on:

- ESP-IDF version
- Versions of the build tools (CMake, Ninja) and the cross-compiler

IDF Docker Image can be used to ensure that these factors do not affect the build.

Chapter 5

迁移指南

5.1 迁移到 ESP-IDF 5.x

5.1.1 从 4.4 迁移到 5.0

Bluetooth Low Energy

Bluedroid

The following Bluedroid macros, types, and functions have been renamed:

- [bt/host/bluedroid/api/include/api/esp_gap_ble_api.h](#)
 - In [esp_gap_ble_cb_event_t](#)
 - * `ESP_GAP_BLE_SET_PREFERED_DEFAULT_PHY_COMPLETE_EVT` renamed to `ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT`
 - * `ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT` renamed to `ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT`
 - * `ESP_GAP_BLE_CHANNEL_SELETE_ALGORITHM_EVT` renamed to `ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT`
 - `esp_ble_wl_opration_t` renamed to [esp_ble_wl_operation_t](#)
 - `esp_ble_gap_cb_param_t.pkt_data_lenth_cmpl` renamed to `pkt_data_length_cmpl`
 - `esp_ble_gap_cb_param_t.update_whitelist_cmpl.wl_opration` renamed to `wl_operation`
 - `esp_ble_gap_set_prefered_default_phy` renamed to [esp_ble_gap_set_preferred_default_phy\(\)](#)
 - `esp_ble_gap_set_prefered_phy` renamed to [esp_ble_gap_set_preferred_phy\(\)](#)
- [bt/host/bluedroid/api/include/api/esp_gatt_defs.h](#)
 - In [esp_gatt_status_t](#)
 - * `ESP_GATT_ENCRYPED_MITM` renamed to `ESP_GATT_ENCRYPTED_MITM`
 - * `ESP_GATT_ENCRYPED_NO_MITM` renamed to `ESP_GATT_ENCRYPTED_NO_MITM`

Nimble

The following Nimble APIs have been removed:

- [bt/host/nimble/esp-hci/include/esp_nimble_hci.h](#)

- Remove : `esp_err_t esp_nimble_hci_and_controller_init(void);`
 - * Controller initialization, enable and HCI initialization calls have been moved to `nimble_port_init`. This function can be deleted directly.
- Remove : `esp_err_t esp_nimble_hci_and_controller_deinit(void);`
 - * Controller deinitialization, disable and HCI deinitialization calls have been moved to `nimble_port_deinit`. This function can be deleted directly.

ESP-BLE-MESH

The following ESP-BLE-MESH macro has been renamed:

- `bt/esp_ble_mesh/api/esp_ble_mesh_defs.h`
 - In `esp_ble_mesh_prov_cb_event_t`:
 - * `ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT` renamed to `ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT`

迁移构建系统至 ESP-IDF v5.0

从 GNU Make 构建系统迁移至 ESP-IDF v5.0 ESP-IDF v5.0 已不再支持基于 Make 的工程，请参考从 [ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统](#) 进行迁移。

更新片段文件语法 请参考[将链接器脚本片段文件语法迁移至 ESP-IDF v5.0 适应版本](#) 对 v3.x 的语法进行更新。

明确指定组件依赖 在之前的 ESP-IDF 版本中，除了通用组件依赖项，还有一些组件总是作为公共依赖项在构建中被添加至每个组件中，如：

- driver
- efuse
- esp_timer
- lwip
- vfs
- esp_wifi
- esp_event
- esp_netif
- esp_eth
- esp_phy

这意味着可以直接包含这些组件的头文件，而无需在 `idf_component_register` 中将它们指定为依赖。此行为是由各种常见组件的传递依赖关系引起的。

在 ESP-IDF v5.0 中，此行为已修复，这些组件不再默认作为公共依赖项添加。

如果组件所依赖的某个组件不属于通用组件依赖项，则必须显式地声明此依赖关系。可以通过在组件的 `CMakeLists.txt` 中的 `idf_component_register` 调用中添加 `REQUIRES <component_name>` 或 `PRIV_REQUIRES <component_name>` 来完成。有关指定组件依赖的更多信息，请参阅[组件依赖](#)。

设置 COMPONENT_DIRS 和 EXTRA_COMPONENT_DIRS 变量 为了实现构建项目时的路径能够包含空格，ESP-IDF v5.0 做了一系列改进，其中包括改进了 `CMakeLists.txt` 文件中的 `COMPONENT_DIRS` 和 `EXTRA_COMPONENT_DIRS` 变量。

ESP-IDF v5.0 版本中，不再支持添加不存在的目录到变量 `COMPONENT_DIRS` 或 `EXTRA_COMPONENT_DIRS` 中，否则会出现报错。

同时，ESP-IDF v5.0 中也不再支持使用字符串拼接的方式定义 `COMPONENT_DIRS` 或 `EXTRA_COMPONENT_DIRS` 变量。这些变量应该定义为 CMake 列表。例如：

```
set(EXTRA_COMPONENT_DIRS path1 path2)
list(APPEND EXTRA_COMPONENT_DIRS path3)
```

不支持:

```
set(EXTRA_COMPONENT_DIRS "path1 path2")
set(EXTRA_COMPONENT_DIRS "${EXTRA_COMPONENT_DIRS} path3")
```

将这些变量定义为 CMake 列表的方式兼容之前的 ESP-IDF 版本。

更新 target_link_libraries 用法 ESP-IDF v5.0 修复了组件的 CMake 变量传播问题。此问题导致本应该只应用于某一组件的编译器标志和定义应用到了项目中的每个组件。

该修复也带来一定的副作用，从 ESP-IDF v5.0 开始，用户项目在使用 target_link_libraries 时必须明确指定 project_elf，同时自定义 CMake 项目必须指定 PRIVATE、PUBLIC 或 INTERFACE 参数。这是一项重大变更，不兼容以前的 ESP-IDF 版本。

例如:

```
target_link_libraries(${project_elf} PRIVATE "-Wl,--wrap=esp_panic_handler")
```

不支持:

```
target_link_libraries(${project_elf} "-Wl,--wrap=esp_panic_handler")
```

更新 CMake 版本 在 ESP-IDF v5.0 中，最低 CMake 版本已更新到 3.16，并且不再支持低于 3.16 的版本。如果您的操作系统没有安装 CMake，请运行 tools/idf_tools.py install cmake 来安装合适的版本。

该变更会影响到使用系统提供的 CMake 以及自定义 CMake 的 ESP-IDF 用户。

重新定义特定目标配置文件的应用顺序 ESP-IDF v5.0 重新安排了特定目标配置文件和 SDKCONFIG_DEFAULTS 中所有其他文件的应用顺序。现在，特定目标的配置文件将在引入它的文件之后、在 SDKCONFIG_DEFAULTS 中后续的其他文件之前应用。

例如:

```
如果 ``SDKCONFIG_DEFAULTS="sdkconfig.defaults;sdkconfig_devkit1
↳``，且同一文件夹内有 ``sdkconfig.defaults.esp32``
↳文件，那么文件的应用顺序为：(1) sdkconfig.defaults (2) sdkconfig.defaults.esp32
↳(3) sdkconfig_devkit1
```

如果某个键在不同的特定目标配置文件中有不同的值，那么后者的值会覆盖前者。例如在以上案例中，如果某个键在 sdkconfig.defaults.esp32 和 sdkconfig_devkit1 中的值不同，则在 sdkconfig_devkit1 中的值会覆盖在 sdkconfig.defaults.esp32 中的值。

如果确实需要设置特定目标的配置值，请将其放到后应用的特定目标文件中，如 sdkconfig_devkit1.esp32。

GCC

GCC 版本 ESP-IDF 之前使用的 GCC 版本为 8.4.0，现已针对所有芯片目标升级至 GCC 11.2.0。若需要将您的代码从 GCC 8.4.0 迁移到 GCC 11.2.0，请参考以下官方 GCC 迁移指南。

- 迁移至 GCC 9
- 迁移至 GCC 10
- 迁移至 GCC 11

警告 升级至 GCC 11.2.0 后会触发新警告，或是导致原有警告内容发生变化。所有 GCC 警告的详细内容，请参考 [GCC 警告选项](#)。建议用户仔细检查代码，并设法解决这些警告。但由于某些警告的特殊性及用户代码的复杂性，有些警告可能为误报，需要进行关键修复。在这种情况下，用户可以采取多种方式来抑制这些警告。本节介绍了用户可能遇到的常见警告及如何抑制这些警告。

注意： 建议用户在抑制警告之前仔细确认该警告是否确实为误报。

-Wstringop-overflow、**-Wstringop-overread**、**-Wstringop-truncation** 和 **-Warray-bounds** 如果编译器不能准确判断内存或字符串的大小，使用 `memory/string copy/compare` 函数的用户会遇到某种 `-Wstringop` 警告。下文展示了触发这些警告的代码，并介绍了如何抑制这些警告。

```
#pragma GCC diagnostic push
#pragma GCC diagnostic ignored "-Wstringop-overflow"
#pragma GCC diagnostic ignored "-Warray-bounds"
    memset(RTC_SLOW_MEM, 0, CONFIG_ULP_COPROC_RESERVE_MEM); // <<-- 此行触发了警告
#pragma GCC diagnostic pop
```

```
#pragma GCC diagnostic push
#if __GNUC__ >= 11
#pragma GCC diagnostic ignored "-Wstringop-overread" // <<-- 此键从 GCC 11 开始引入
#endif
#pragma GCC diagnostic ignored "-Warray-bounds" (-Warray-bounds) 。
    memcpy(backup_write_data, (void *)EFUSE_PGM_DATA0_REG, sizeof(backup_
    ↪write_data)); // <<-- 此行触发了警告
#pragma GCC diagnostic pop
```

-Waddress-of-packed-member 当访问打包 struct 中的某个未对齐成员时，由于非对齐内存访问会对性能产生影响，GCC 会触发 `-Waddress-of-packed-member` 警告。然而，所有基于 Xtensa 或 RISC-V 架构的 ESP 芯片都允许非对齐内存访问，并且不会产生额外的性能影响。因此，在大多数情况下，可以忽略此问题。

```
components/bt/host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c: In function
    ↪'btc_to_bta_gatt_id':
components/bt/host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c:105:21: warning:↪
    ↪taking address of packed member of 'struct <anonymous>' may result in an↪
    ↪unaligned pointer value [-Waddress-of-packed-member]
    105 |         btc_to_bta_uuid(&p_dest->uuid, &p_src->uuid);
        |                ^~~~~~
```

如果该警告在多个源文件中多次出现，可以在 CMake 级别抑制该警告，如下所示。

```
set_source_files_properties(
    "host/bluedroid/bta/gatt/bta_gattc_act.c"
    "host/bluedroid/bta/gatt/bta_gattc_cache.c"
    "host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c"
    "host/bluedroid/btc/profile/std/gatt/btc_gatts.c"
    PROPERTIES COMPILE_FLAGS -Wno-address-of-packed-member)
```

但如果只有一或两处警告，可以直接在源代码中进行抑制，如下所示。

```
#pragma GCC diagnostic push
#if __GNUC__ >= 9
#pragma GCC diagnostic ignored "-Waddress-of-packed-member" <<-- 此键从 GCC 11↪
    ↪开始引入
#endif
    uint32_t* reg_ptr = (uint32_t*)src;
#pragma GCC diagnostic pop
```

llabs () 用于 64 位整数 `stdlib.h` 中的函数 `abs ()` 需要使用 `int` 参数。请在计划为 64 位的类型中使用 `llabs ()`，尤其是 `time_t`。

乐鑫工具链更新

Xtensa 编译器中的 `int32_t` 和 `uint32_t` 在 Xtensa 编译器中，`int32_t` 和 `uint32_t` 类型已分别从 `int` 和 `unsigned int` 更新为 `long` 和 `unsigned long`。此更新现与上游 GCC 相匹配，上游 GCC 在 Xtensa、RISC-V 和其他架构上使用 `long` 整数来表示 `int32_t` 和 `uint32_t`。

	2021r2 及以上版本, GCC 8	2022r1, GCC 11
Xtensa	(unsigned) int	(unsigned) long
riscv32	(unsigned) long	(unsigned) long

上述变化主要影响到使用 `<inttypes.h>` 提供的类型来格式化字符串的代码。请使用 `PRi32`、`PRiXX` 等占位符来分别替换 `%i`、`%x` 等。

在其他情况下，请注意枚举支持 `int` 类型。

通常，`int32_t` 和 `int` 为不同的类型。同样，`uint32_t` 和 `unsigned int` 也为不同的类型。

移除构建选项 `CONFIG_COMPILER_DISABLE_GCC8_WARNINGS` 原有的 `CONFIG_COMPILER_DISABLE_GCC8_WARNINGS` 选项用于构建使用现已僵化的 GCC 5 工具链编写的陈旧代码。但由于已经过去较长时间，现在可以对警告进行修复，因此该选项已被移除。

目前，在 GCC 11 中，建议用户仔细检查代码，尽量解决编译器警告。

网络

Wi-Fi

回调函数类型 `esp_now_recv_cb_t` 先前，`esp_now_recv_cb_t` 的第一个参数的类型是 `const uint8_t *mac_addr`，它只包含对端 ESP-NOW 设备的地址。

类型定义已更新。第一个参数的类型是 `esp_now_recv_info_t`，它包含三个成员变量 `src_addr`、`des_addr` 和 `rx_ctrl`。因此，以下更新是需要的：

- 重新定义的 ESP-NOW 收包回调函数。
- `src_addr` 可以等价替换原来的 `mac_addr`。
- `des_addr` 是 ESP-NOW 包的目的 MAC 地址，它可以是单播地址或广播地址。有了 `des_addr`，可以区分单播和广播的 ESP-NOW，其中广播的 ESP-NOW 包在加密的 ESP-NOW 配置中也可以是非加密的。
- `rx_ctrl` 是 ESP-NOW 包的 Rx control info，它包含此包的更多有用信息。

请参考 ESP-NOW 样例：[wifi/espnow/main/espnow_example_main.c](https://github.com/espressif/esp8266/blob/master/examples/wifi/espnow/main/espnow_example_main.c)

以太网

`esp_eth_ioctl()` API 此前，`esp_eth_ioctl()` API 存在以下问题：

- 在某些情况下，第三个参数（数据类型为 `void /**`）可以接受 `int/bool` 类型实参（而非指针）作为输入。然而，文档中未描述这些情况。
- 为了将 `int/bool` 类型实参作为第三个参数传递，实参将被强制转换为 `void *` 类型，以防出现如下所示的编译器警告。此等转换可能引起 `esp_eth_ioctl()` 函数的滥用。

```
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, (void *)true);
```

因此，我们统一了 `esp_eth_ioctl()` 的用法。现在，该结构体的第三个参数在传递时必须作为指向特定数据类型的指针，表示 `esp_eth_ioctl()` 读取/存储数据的位置。`esp_eth_ioctl()` 的用法如下列代码所示。

设置以太网配置的用例如下：

```
eth_duplex_t new_duplex_mode = ETH_DUPLEX_HALF;
esp_eth_ioctl(eth_handle, ETH_CMD_S_DUPLEX_MODE, &new_duplex_mode);
```

获取以太网配置的用例如下：

```
eth_duplex_t duplex_mode;
esp_eth_ioctl(eth_handle, ETH_CMD_G_DUPLEX_MODE, &duplex_mode);
```

KSZ8041/81 和 LAN8720 驱动更新 KSZ8041/81 和 LAN8720 驱动现已更新，以支持相关产品系列中的更多设备（如新一代设备）。上述驱动能够识别特定芯片编号及驱动提供的潜在支持。

更新之后，通用函数将替代特定“芯片编号”函数得以调用：

- 删除 `esp_eth_phy_new_ksz8041()` 以及 `esp_eth_phy_new_ksz8081()`，转而使用 `esp_eth_phy_new_ksz80xx()`
- 删除 `esp_eth_phy_new_lan8720()`，转而使用 `esp_eth_phy_new_lan87xx()`

ESP NETIF Glue 时间处理程序 `esp_eth_set_default_handlers()` 和 `esp_eth_clear_default_handlers()` 函数现已删除。现在可以自动处理以太网默认 IP 层处理程序的注册。如您在注册以太网/IP 事件处理程序之前已经按照建议完全初始化以太网驱动和网络接口，则无需执行任何操作（除了删除受影响的函数）。否则，在注册用户事件处理程序后，应随即启动以太网驱动。

PHY 地址自动检测 以太网 PHY 地址自动检测函数 `esp_eth_detect_phy_addr()` 已重命名为 `esp_eth_phy_802_3_detect_phy_addr()`，其声明移至 `esp_eth/include/esp_eth_phy_802_3.h`。

SPI 以太网模块初始化 SPI 以太网模块的初始化过程已经简化。此前，您需要在实例化 SPI 以太网 MAC 之前，使用 `spi_bus_add_device()` 手动分配 SPI 设备。

现在，由于 SPI 设备已在内部分配，您无需再调用 `spi_bus_add_device()`。`eth_dm9051_config_t`、`eth_w5500_config_t` 和 `eth_ksz8851snl_config_t` 配置结构体现已包含 SPI 设备配置成员（例如，可以微调可能依赖 PCB 设计的 SPI 时序）。`ETH_DM9051_DEFAULT_CONFIG`、`ETH_W5500_DEFAULT_CONFIG` 和 `ETH_KSZ8851SNL_DEFAULT_CONFIG` 配置初始化宏也已接受新的参数输入。了解 SPI 以太网模块初始化示例，请查看[以太网 API 参考指南](#)。

TCP/IP 适配器 TCP/IP 适配器是在 ESP-IDF v4.1 之前使用的网络接口抽象组件。本文档概述了从 `tcpip_adapter` API 迁移至 `ESP-NETIF` 的过程。

更新网络连接代码

网络软件栈初始化

- 您只需用 `esp_netif_init()` 替换 `tcpip_adapter_init()`，注意 `esp_netif_init()` 函数将返回标准错误代码。了解详细信息，请参考[ESP-NETIF](#)。
- `esp_netif_deinit()` 函数用于反初始化网络软件栈。
- 您还需用 `#include "esp_netif.h"` 替换 `#include "tcpip_adapter.h"`。

创建网络接口 更新之前，TCP/IP 适配器静态定义了以下三个接口：

- Wi-Fi Station
- Wi-Fi AP
- 以太网

接口定义现已更新。网络接口的设计应严格参考 *ESP-NETIF*，使其能够连接至 TCP/IP 软件栈。例如，在 TCP/IP 软件栈和事件循环初始化完成后，Wi-Fi 的初始化代码必须显示调用 `esp_netif_create_default_wifi_sta()`；或 `esp_netif_create_default_wifi_ap()`；。

请参考上述三个接口的初始化代码示例：

- Wi-Fi Station: [wifi/getting_started/station/main/station_example_main.c](#)
- Wi-Fi AP: [wifi/getting_started/softAP/main/softap_example_main.c](#)
- 以太网: [ethernet/basic/main/ethernet_example_main.c](#)

其他 tcpip_adapter API 更换 所有 `tcpip_adapter` 函数都有对应的 `esp-netif`。请参考以下章节中的 `esp_netif.h` 部分，了解更多信息：

- [Setters/Getters](#)
- [DHCP](#)
- [DNS](#)
- [IP address](#)

默认事件处理程序 事件处理程序已从 `tcpip_adapter` 移至相应驱动程序代码。从应用程序的角度来看，这一变更不会产生任何影响，所有事件仍将以相同的方式处理。请注意，在与 IP 相关的事件处理程序中，应用程序代码通常以 `esp-netif` 结构体而非 LwIP 结构体的形式接收 IP 地址。两种结构体均兼容二进制格式。

打印地址的首选方式如下所示：

```
ESP_LOGI(TAG, "got ip:" IPSTR "\n", IP2STR(&event->ip_info.ip));
```

不建议使用下述方式：

```
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

`ip4addr_ntoa()` 为 LwIP API，因此 `esp-netif` 还提供了替代函数 `esp_ip4addr_ntoa()`，然而总的来说仍推荐使用 `IP2STR()` 这一方法。

IP 地址 推荐使用 `esp-netif` 定义的 IP 结构。请注意，在启用默认兼容性时，LwIP 结构体仍然可以工作。

- [esp-netif IP address definitions](#)

后续步骤 为了令移植应用程序可以使用 *ESP-NETIF*，还需在组件配置中禁用 `tcpip_adapter` 兼容层。请前往 `ESP NETIF Adapter > Enable backward compatible tcpip_adapter interface` 进行设置，并检查项目是否编译成功。

TCP/IP 适配器涉及大量依赖项，禁用兼容层可能有助于将应用程序与使用特定 TCP/IP 软件栈的 API 分离开来。

外设

外设时钟门控 与更新之前相同，外设的时钟仍由驱动处理，用户无需对外设模块的时钟门控进行设置。但是，如果用户想基于组件 `hal` 和 `soc` 开发自己的驱动，请注意时钟门控的头文件引用路径已由 `driver/periph_ctrl.h` 更新为 `esp_private/periph_ctrl.h`。

RTC 子系统控制 RTC 控制 API 已经从 `driver/rtc_cntl.h` 移动到了 `esp_private/rtc_ctrl.h`。

ADC

ADC 单次模式及连续模式驱动 ADC 单次模式的驱动已更新。

- 新的驱动位于组件 `esp_adc` 中，头文件引用路径为 `esp_adc/adc_oneshot.h`。
- 旧版驱动仍然可用，其头文件引用路径为 `driver/adc.h`。

对于 ADC 连续模式驱动，其位置已由组件 `driver` 更新为 `esp_adc`。

- 头文件引用路径由 `driver/adc.h` 更新为 `esp_adc/adc_continuous.h`。

但是，引用两种模式的旧版路径 `driver/adc.h` 会默认触发如下编译警告，可通过配置 Kconfig 选项 `CONFIG_ADC_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

```
legacy adc driver is deprecated, please migrate to use esp_adc/adc_oneshot.h and
↳esp_adc/adc_continuous.h for oneshot mode and continuous mode drivers
↳respectively
```

ADC 校准驱动 ADC 校准驱动已更新。

- 新的驱动位于组件 `esp_adc` 中，头文件引用路径为 `esp_adc/adc_cali.h` 和 `esp_adc/adc_cali_scheme.h`。

旧版驱动仍然可用，其头文件引用路径为 `esp_adc_cal.h`。如果用户要使用旧版路径，需要将组件 `esp_adc` 添加到文件 `CMakeLists.txt` 的组件需求表中。

默认情况下，引用路径 `esp_adc_cal.h` 会默认触发如下编译警告，可通过配置 Kconfig 选项 `CONFIG_ADC_CALI_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

```
legacy adc calibration driver is deprecated, please migrate to use esp_adc/adc_
↳cali.h and esp_adc/adc_cali_scheme.h
```

API 更新

- ADC 电源管理 API `adc_power_acquire` 和 `adc_power_release` 已被移至 `esp_private/adc_share_hw_ctrl.h`，用于内部功能。
 - 更新前，由于硬件勘误表的工作原理，这两个 API 可以被用户调用。
 - 更新后，ADC 电源管理完全由驱动在内部实现。
 - 如果用户仍需调用这个 API，可以通过引用路径 `esp_private/adc_share_hw_ctrl.h` 来调用它。
- 更新后，`driver/adc2_wifi_private.h` 已被移至 `esp_private/adc_share_hw_ctrl.h`。
- `adc_unit_t` 中的枚举 `ADC_UNIT_BOTH`，`ADC_UNIT_ALTER` 及 `ADC_UNIT_MAX` 已被删除。
- 由于只有部分芯片支持下列枚举的某些取值，因此将下列枚举删除。如果用户使用了不支持的取值，会造成驱动运行错误。
 - 枚举 `ADC_CHANNEL_MAX`
 - 枚举 `ADC_ATTEN_MAX`
 - 枚举 `ADC_CONV_UNIT_MAX`
- ESP32 中的 API `hall_sensor_read` 已被删除，因此 ESP32 不再支持霍尔传感器。
- API `adc_set_i2s_data_source` 和 `adc_i2s_mode_init` 已被弃用，相关的枚举 `adc_i2s_source_t` 也已被弃用，请使用 `esp_adc/adc_continuous.h` 进行迁移。
- API `adc_digi_filter_reset`，`adc_digi_filter_set_config`，`adc_digi_filter_get_config` 和 `adc_digi_filter_enable` 已被移除。这些接口的行为不被保证。枚举 `adc_digi_filter_idx_t`，`adc_digi_filter_mode_t` 和结构体 `adc_digi_iir_filter_t` 已被移除。

GPIO

- 之前的 Kconfig 选项 `RTCIO_SUPPORT_RTC_GPIO_DESC` 已被删除，因此数组 `rtc_gpio_desc` 已不可用，请使用替代数组 `rtc_io_desc`。
- 更新后，用户回调函数无法再通过读取 GPIO 中断的状态寄存器来获取用于触发中断的 GPIO 管脚的编号。但是，用户可以通过使用回调函数变量来确定该管脚编号。
 - 更新前，GPIO 中断发生时，GPIO 中断状态寄存器调用用户回调函数之后，会被清空。因此，用户可以在回调函数中读取 GPIO 中断状态寄存器，以便确定触发中断的 GPIO 管脚。
 - 但是，在调用回调函数后清空中断状态寄存器可能会导致边沿触发的中断丢失。例如，在调用用户回调函数时，如果某个边沿触发的中断 (re) 被触发，该中断会被清除，并且其注册的用户回调函数还未被处理。
 - 更新后，GPIO 的中断状态寄存器在调用用户回调函数 **之前** 被清空。因此，用户无法读取 GPIO 中断状态寄存器来确定哪个管脚触发了中断。但是，用户可以通过回调函数变量来传递被触发的管脚编号。

Sigma-Delta 调制器 Sigma-Delta 调制器的驱动现已更新为 *SDM*。

- 新驱动中实现了工厂模式，SDM 通道都位于内部通道池中，因此用户无需手动将 SDM 通道配置到 GPIO 管脚。
- SDM 通道会被自动分配。

尽管我们推荐用户使用新的驱动 API，旧版驱动仍然可用，位于头文件引用路径 `driver/sigmadelta.h` 中。但是，引用 `driver/sigmadelta.h` 会默认触发如下编译警告，可通过配置 Kconfig 选项 `CONFIG_SDM_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

```
The legacy sigma-delta driver is deprecated, please use driver/sdm.h
```

概念与使用方法上的主要更新如下所示：

主要概念更新

- SDM 通道名称已由 `sigmadelta_channel_t` 更新为 `sdm_channel_handle_t`，后者为一个不透明指针。
- SDM 通道配置原来存放于 `sigmadelta_config_t`，现存放于 `sdm_config_t`。
- 旧版驱动中，用户无需为 SDM 通道设置时钟源。但是在新驱动中，用户需要在 `sdm_config_t::clk_src` 为 SDM 通道设置合适的时钟源，`soc_periph_sdm_clk_src_t` 中列出了可用的时钟源。
- 旧版驱动中，用户需要为通道设置 `prescale`，该参数会影响调制器输出脉冲的频率。在新的驱动中，用户需要使用 `sdm_config_t::sample_rate_hz` 实现该功能。

主要使用方法更新

- 更新前，通道配置由通道分配在 `sdm_new_channel()` 完成。在新驱动中，只有 `duty` 可在运行时由 `sdm_channel_set_duty()` 更新。其他参数如 `gpio number`、`prescale` 只能在通道分配时进行设置。
- 在进行下一步通道操作前，用户应通过调用 `sdm_channel_enable()` 提前 **使能** 该通道。该函数有助于管理一些系统级服务，如 **电源管理**。

定时器组驱动 为统一和简化通用定时器的使用，定时器组驱动已更新为 *GPTimer*。

尽管我们推荐使用新的驱动 API，旧版驱动仍然可用，其头文件引用路径为 `driver/timer.h`。但是，引用 `driver/timer.h` 会默认触发如下编译警告，可通过配置 Kconfig 选项 `CONFIG_GPTIMER_SUPPRESS_DEPRECATED_WARN` 关闭该警告。

```
legacy timer group driver is deprecated, please migrate to driver/gptimer.h
```

概念和使用方法上的主要更新如下所示：

主要概念更新

- 用于识别定时器的 `timer_group_t` 和 `timer_idx_t` 已被删除。在新驱动中，定时器用参数 `gptimer_handle_t` 表示。
- 更新后，定时器的时钟源由 `gptimer_clock_source_t` 定义，之前的时钟源参数 `timer_src_clk_t` 不再使用。
- 更新后，定时器计数方向由 `gptimer_count_direction_t` 定义，之前的计数方向参数 `timer_count_dir_t` 不再使用。
- 更新后，仅支持电平触发的中断，`timer_intr_t` 和 `timer_intr_mode_t` 不再使用。
- 更新后，通过设置标志位 `gptimer_alarm_config_t::auto_reload_on_alarm`，可以使能自动加载。`timer_autoreload_t` 不再使用。

主要使用方法更新

- 更新后，通过从 `gptimer_new_timer()` 创建定时器示例可以初始化定时器。用户可以在 `gptimer_config_t` 进行一些基本设置，如时钟源，分辨率和计数方向。请注意，无需在驱动安装阶段进行报警事件的特殊设置。
- 更新后，报警事件在 `gptimer_set_alarm_action()` 中进行设置，参数在 `gptimer_alarm_config_t` 中进行设置。
- 更新后，通过 `gptimer_get_raw_count()` 设置计数数值，通过 `gptimer_set_raw_count()` 获取计数数值。驱动不会自动将原始数据同步到 UTC 时间戳。由于定时器的分辨率已知，用户可以自行转换数据。
- 更新后，如果 `gptimer_event_callbacks_t::on_alarm` 被设置为有效的回调函数，驱动程序也会安装中断服务。在回调函数中，用户无需配置底层寄存器，如用于“清除中断状态”，“重新使能事件”的寄存器等。因此，`timer_group_get_intr_status_in_isr` 与 `timer_group_get_auto_reload_in_isr` 这些函数不再使用。
- 更新后，当报警事件发生时，为更新报警配置，用户可以在中断回调中调用 `gptimer_set_alarm_action()`，这样报警事件会被重新使能。
- 更新后，如果用户将 `gptimer_alarm_config_t::auto_reload_on_alarm` 设置为 `true`，报警事件将会一直被驱动程序使能。

UART

删除/弃用项目	替代	备注
<code>uart_isr_register()</code>	无	更新后，UART 中断由驱动处理。
<code>uart_isr_free()</code>	无	更新后，UART 中断由驱动处理。
<code>uart_config_t</code> 中的 <code>use_ref_tick</code>	<code>uart_config_t::source_clk</code>	选择时钟源。
<code>uart_enable_pattern_detect</code>	<code>uart_enable_pattern_detect_baud</code>	使能模式检测中断。

I2C

删除/弃用项目	替代	备注
<code>i2c_isr_register()</code>	无	更新后，I2C 中断由驱动处理。
<code>i2c_isr_unregister()</code>	无	更新后，I2C 中断由驱动处理。
<code>i2c_opmode_t</code>	无	更新后，该项不再在 <code>esp-idf</code> 中使用。

SPI

删除/弃用项目	替代	备注
<code>spi_cal_clock()</code>	<code>spi_get_actual_clock()</code>	获取 SPI 真实的工作频率。

- 内部头文件 `spi_common_internal.h` 已被移至 `esp_private/spi_common_internal.h`。

SDMMC

删除/弃用项目	替代	备注
<code>sdmmc_host_pullup</code>	<code>sdmmc_slot_config_t::flags</code> 设置标志位 <code>SDMMC_SLOT_FLAG_INTERNAL_PULLUP</code>	使能内部上拉。

LEDC

删除/弃用项目	替代	备注
<code>ledc_timer_config_t</code> 中的 <code>bit_num</code>	<code>ledc_timer_config_t::duty_resolution</code>	设置占空比分辨率。

脉冲计数器 (PCNT) 驱动 为统一和简化 PCNT 外设，PCNT 驱动已更新，详见 [PCNT](#)。

尽管我们推荐使用新的驱动 API，旧版驱动仍然可用，保留在头文件引用路径 `driver/pcnt.h` 中。但是，引用路径 `driver/pcnt.h` 会默认触发如下编译警告，可通过配置 `Kconfig` 选项 `CONFIG_PCNT_SUPPRESS_DEPRECATED_WARN` 来关闭该警告。

```
legacy pcnt driver is deprecated, please migrate to use driver/pulse_cnt.h
```

主要概念和使用方法上的更新如下所示：

主要概念更新

- 更新后，`pcnt_port_t`、`pcnt_unit_t` 和 `pcnt_channel_t` 这些用于识别 PCNT 单元和通道的参数已被删除。在新的驱动中，PCNT 单元由参数 `pcnt_unit_handle_t` 表示，PCNT 通道由参数 `pcnt_channel_handle_t` 表示，这两个参数都是不透明指针。
- 更新后，不再使用 `pcnt_evt_type_t`，它们由统一的 **观察点事件** 表示。在事件回调函数 `pcnt_watch_cb_t` 中，通过 `pcnt_watch_event_data_t` 可以分辨不同观察点。
- `pcnt_count_mode_t` 更新为 `cpp:type:pcnt_channel_edge_action_t`，`pcnt_ctrl_mode_t` 更新为 `pcnt_channel_level_action_t`。

主要使用方法更新

- 更新前，PCNT 的单元配置和通道配置都通过函数 `pcnt_unit_config` 实现。更新后，PCNT 的单元配置通过工厂 API `pcnt_new_unit()` 完成，通道配置通过工厂 API `pcnt_new_channel()` 完成。
 - 只需配置计数范围即可初始化一个 PCNT 单元。更新后，GPIO 管脚分配通过 `pcnt_new_channel()` 完成。
 - 高/低电平控制模式和上升沿/下降沿计数模式分别通过函数 `pcnt_channel_set_edge_action()` 和 `pcnt_channel_set_level_action()` 进行设置。
- `pcnt_get_counter_value` 更新为 `pcnt_unit_get_count()`。
- `pcnt_counter_pause` 更新为 `pcnt_unit_stop()`。
- `pcnt_counter_resume` 更新为 `pcnt_unit_start()`。
- `pcnt_counter_clear` 更新为 `pcnt_unit_clear_count()`。
- 更新后，`pcnt_intr_enable` 与 `pcnt_intr_disable` 已被删除。新的驱动中，通过注册时间回调函数 `pcnt_unit_register_event_callbacks()` 来使能中断。
- 更新后，`pcnt_event_enable` 与 `pcnt_event_disable` 已被删除。新的驱动中，可通过 `pcnt_unit_add_watch_point()` 和 `pcnt_unit_remove_watch_point()` 来增加/删除观察点，以使能/停用 PCNT 事件。
- 更新后，`pcnt_set_event_value` 已被删除。新的驱动中，通过 `pcnt_unit_add_watch_point()` 增加观察点时，也同时设置了事件的数值。
- 更新后，`pcnt_get_event_value` 与 `pcnt_get_event_status` 已被删除。在新的驱动中，这些信息存储在 `pcnt_watch_event_data_t` 的回调函数 `pcnt_watch_cb_t` 中。
- 更新后，`pcnt_isr_register` 与 `pcnt_isr_unregister` 已被删除，不允许注册 ISR 句柄。用户可以通过调用 `cpp:func:pcnt_unit_register_event_callbacks` 来注册事件回调函数。

- 更新后, `pcnt_set_pin` 已被删除, 新的驱动不再允许在运行时切换 GPIO 管脚。如果用户想切换为其他 GPIO 管脚, 可通过 `cpp:func:pcnt_del_channel` 删除当前的 PCNT 通道, 然后通过 `cpp:func:pcnt_new_channel` 安装新的 GPIO 管脚。
- `pcnt_filter_enable`, `pcnt_filter_disable` 与 `pcnt_set_filter_value` 更新为 `pcnt_unit_set_glitch_filter()`。同时, `pcnt_get_filter_value` 已被删除。
- `pcnt_set_mode` 更新为 `pcnt_channel_set_edge_action()` 与 `pcnt_channel_set_level_action()`。
- `pcnt_isr_service_install`, `pcnt_isr_service_uninstall`, `pcnt_isr_handler_add` 与 `pcnt_isr_handler_remove` 更新为 `pcnt_unit_register_event_callbacks()`。默认的 ISR 句柄已安装在新的驱动中。

温度传感器驱动 温度传感器的驱动已更新, 推荐用户使用新驱动。旧版驱动仍然可用, 但是无法与新驱动同时使用。

新驱动的头文件引用路径为 `driver/temperature_sensor.h`。旧版驱动仍然可用, 保留在引用路径 `driver/temp_sensor.h` 中。但是, 引用路径 `driver/temp_sensor.h` 会默认触发如下编译警告, 可通过设置 Kconfig 选项 `CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATED_WARN` 来关闭该警告。

```
legacy temperature sensor driver is deprecated, please migrate to driver/
↳temperature_sensor.h
```

配置内容已更新。更新前, 用户需要设置 `clk_div` 与 `dac_offset`。更新后, 用户仅需设置 `tsens_range`。

温度传感器的使用过程也已更新。更新前, 用户可通过 `config->start->read_celsius` 获取数据。更新后, 用户需要通过 `temperature_sensor_install` 先安装温度传感器的驱动, 测量完成后需卸载驱动, 详情请参考 [Temperature Sensor](#)。

RMT 驱动 为统一和扩展 RMT 外设的使用, RMT 驱动已更新, 详见 [RMT transceiver](#)。

尽管我们建议使用新的驱动 API, 旧版驱动仍然可用, 保留在头文件引用路径 `driver/rmt.h` 中。但是, 引用路径 `driver/rmt.h` 会默认触发如下编译警告, 可通过配置 Kconfig 选项 `CONFIG_RMT_SUPPRESS_DEPRECATED_WARN` 来关闭该警告。

```
The legacy RMT driver is deprecated, please use driver/rmt_tx.h and/or driver/rmt_
↳rx.h
```

主要概念和使用方法更新如下所示:

主要概念更新

- 更新后, 用于识别硬件通道的 `rmt_channel_t` 已删除。在新的驱动中, RMT 通道用参数 `rmt_channel_handle_t` 表示, 该通道由驱动程序动态分配, 而不是由用户指定。
- `rmt_item32_t` 更新为 `rmt_symbol_word_t`, 以避免在结构体中出现嵌套的共用体。
- 更新后, `rmt_mem_t` 已被删除, 因为我们不允许用户直接访问 RMT 内存块 (即 RMTMEM)。直接访问 RMTMEM 没有意义, 反而会引发错误, 特别是当 RMT 通道与 DMA 通道相连时。
- 更新后, 由于 `rmt_mem_owner_t` 由驱动控制, 而不是用户, 因此 `rmt_mem_owner_t` 已被删除。
- `rmt_source_clk_t` 更新为 `rmt_clock_source_t`, 后者不支持二进制兼容。
- 更新后, `rmt_data_mode_t` 已被删除, RMT 内存访问模式配置为始终使用 Non-FIFO 和 DMA 模式。
- 更新后, 由于驱动有独立的发送和接收通道安装函数, 因此 `rmt_mode_t` 已被删除。
- 更新后, `rmt_idle_level_t` 已被删除, 在 `rmt_transmit_config_t::eot_level` 中可为发送通道设置空闲状态电平。
- 更新后, `rmt_carrier_level_t` 已被删除, 可在 `rmt_carrier_config_t::polarity_active_low` 设置载流子极性。
- 更新后, `rmt_channel_status_t` 与 `rmt_channel_status_result_t` 已被删除, 不再使用。
- 通过 RMT 通道发送并不需要用户提供 RMT 符号, 但是用户需要提供一个 RMT 编码器用来告诉驱动如何将用户数据转换成 RMT 符号。

主要使用方法更新

- 更新后，分别通过 `rmt_new_tx_channel()` 和 `rmt_new_rx_channel()` 安装发送通道和接收通道。
- 更新后，`rmt_set_clk_div` 和 `rmt_get_clk_div` 已被删除。通道时钟配置只能在通道安装时完成。
- 更新后，`rmt_set_rx_idle_thresh` 和 `rmt_get_rx_idle_thresh` 已被删除。新驱动中，接收通道的空闲状态阈值定义为 `rmt_receive_config_t::signal_range_max_ns`。
- 更新后，`rmt_set_mem_block_num` 和 `rmt_get_mem_block_num` 已被删除。新驱动中，内存块的数量由 `rmt_tx_channel_config_t::mem_block_symbols` 与 `rmt_rx_channel_config_t::mem_block_symbols` 决定。
- 更新后，`rmt_set_tx_carrier` 已被删除。新驱动使用 `rmt_apply_carrier()` 来设置载波动作。
- 更新后，`rmt_set_mem_pd` 和 `rmt_get_mem_pd` 已被删除，驱动程序自动调整内存的功率。
- 更新后，`rmt_memory_rw_rst`，`rmt_tx_memory_reset` 和 `rmt_rx_memory_reset` 已被删除，驱动程序自动进行内存重置。
- 更新后，`rmt_tx_start` 和 `rmt_rx_start` 被合并为函数 `rmt_enable()`，该函数同时适用于发射通道和接收通道。
- 更新后，`rmt_tx_stop` 和 `rmt_rx_stop` 被合并为函数 `rmt_disable()`，该函数同时适用于发射通道和接收通道。
- 更新后，`rmt_set_memory_owner` 和 `rmt_get_memory_owner` 已被删除，驱动程序自动添加 RMT 内存保护。
- 更新后，`rmt_set_tx_loop_mode` 和 `rmt_get_tx_loop_mode` 已被删除。新驱动中，在 `rmt_transmit_config_t::loop_count` 中设置循环模式。
- 更新后，`rmt_set_source_clk` 和 `rmt_get_source_clk` 已被删除。仅能在通道安装时通过 `rmt_tx_channel_config_t::clk_src` 和 `rmt_rx_channel_config_t::clk_src` 设置时钟源。
- 更新后，`rmt_set_rx_filter` 已被删除。新驱动中，过滤阈值定义为 `rmt_receive_config_t::signal_range_min_ns`。
- 更新后，`rmt_set_idle_level` 和 `rmt_get_idle_level` 已被删除，可在 `rmt_transmit_config_t::eot_level` 中设置发射通道的空闲状态电平。
- 更新后，`rmt_set_rx_intr_en`，`rmt_set_err_intr_en`，`rmt_set_tx_intr_en`，`rmt_set_tx_thr_intr_en` 和 `rmt_set_rx_thr_intr_en` 已被删除。新驱动不允许用户在用户端开启/关闭中断，而是提供了回调函数。
- 更新后，`rmt_set_gpio` 和 `rmt_set_pin` 已被删除。新驱动不支持运行时动态切换 GPIO 管脚。
- 更新后，`rmt_config` 已被删除。新驱动中，基础配置在通道安装阶段完成。
- 更新后，`rmt_isr_register` 和 `rmt_isr_deregister` 已被删除，驱动程序负责分配中断。
- `rmt_driver_install` 更新为 `rmt_new_tx_channel()` 与 `rmt_new_rx_channel()`。
- `rmt_driver_uninstall` 更新为 `rmt_del_channel()`。
- 更新后，`rmt_fill_tx_items`，`rmt_write_items` 和 `rmt_write_sample` 已被删除。新驱动中，用户需要提供一个编码器用来将用户数据“翻译”为 RMT 符号。
- 更新后，由于用户可以通过 `rmt_tx_channel_config_t::resolution_hz` 配置通道的时钟分辨率，`rmt_get_counter_clock` 已被删除。
- `rmt_wait_tx_done` 更新为 `rmt_tx_wait_all_done()`。
- 更新后，`rmt_translator_init`，`rmt_translator_set_context` 和 `rmt_translator_get_context` 已被删除。新驱动中，翻译器更新为 RMT 译码器。
- 更新后，`rmt_get_ringbuf_handle` 已被删除。新驱动程序不再使用 Ringbuffer 来保存 RMT 符号。输入数据会直接保存到用户提供的缓冲区中，这些缓冲区甚至可以直接被挂载到 DMA 链接内部。
- `rmt_register_tx_end_callback` 更新为 `rmt_tx_register_event_callbacks()`，用户可以在这个参数里面注册事件回调函数 `rmt_tx_event_callbacks_t::on_trans_done`。
- 更新后，`rmt_set_intr_enable_mask` 和 `rmt_clr_intr_enable_mask` 已被删除。由于驱动程序负责处理中断，因此用户无需进行处理。
- `rmt_add_channel_to_group` 和 `rmt_remove_channel_from_group` 更新为 RMT 同步管理器，详见 `rmt_new_sync_manager()`。
- 更新后，`rmt_set_tx_loop_count` 已被删除。新驱动中，循环计数在 `rmt_transmit_config_t::loop_count` 进行配置。
- 更新后，`rmt_enable_tx_loop_autostop` 已被删除。新驱动中，发射循环自动终止一直使能，用户无法进行配置。

LCD

- LCD 面板的初始化流程也有一些更新。更新后，`esp_lcd_panel_init()` 不再会自动打开显示器。用户需要调用 `esp_lcd_panel_disp_on_off()` 来手动打开显示器。请注意，打开显示器与打开背光是不同的。更新后，打开屏幕前，用户可以烧录一个预定义的图案，这可以避免开机复位后屏幕上的随机噪音。
- 更新后，`esp_lcd_panel_disp_off()` 已被弃用，请使用 `esp_lcd_panel_disp_on_off()` 作为替代。
- 更新后，`dc_as_cmd_phase` 已被删除，SPI LCD 驱动不再支持 9-bit 的 SPI LCD。请使用专用的 GPIO 管脚来控制 LCD D/C 线。
- 更新后，用于注册 RGB 面板的事件回调函数已从 `esp_lcd_rgb_panel_config_t` 更新为单独的 API `esp_lcd_rgb_panel_register_event_callbacks()`。但是，事件回调签名仍保持不变。
- 更新后，`esp_lcd_rgb_panel_config_t` 中的标志位 `relax_on_idle` 被重命名为 `esp_lcd_rgb_panel_config_t::refresh_on_demand`，后者虽表达了同样的含义，但是其命名更有意义。
- 更新后，如果创建 RGB LCD 时，标志位 `refresh_on_demand` 使能，驱动不会在 `esp_lcd_panel_draw_bitmap()` 中进行刷新，用户需要调用 `esp_lcd_rgb_panel_refresh()` 来刷新屏幕。
- 更新后，`esp_lcd_color_space_t` 已被弃用，请使用 `lcd_color_space_t` 来描述色彩空间，使用 `lcd_color_rgb_endian_t` 来描述 RGB 颜色的排列顺序。

MCPWM MCPWM 驱动已更新（详见 [MCPWM](#)）。同时，旧版驱动已被弃用。

新驱动中，每个 MCPWM 子模块相互独立，用户可以自由进行资源连接。

尽管我们推荐使用新的驱动 API，旧版驱动仍然可用，其引用路径为 `driver/mcpwm.h`。但是，使用旧版驱动会默认触发如下编译警告，可以通过配置 Kconfig 选项 `CONFIG_MCPWM_SUPPRESS_DEPRECATED_WARN` 来关闭该警告。

```
legacy MCPWM driver is deprecated, please migrate to the new driver (include_
↳driver/mcpwm_prelude.h)
```

主要概念和使用方法上的更新如下所示：

主要概念更新 更新后，MCPWM 驱动是面向对象的，大多数 MCPWM 子模块都有一个与之相关的驱动对象。驱动对象是由工厂函数创建的，如 `mcpwm_new_timer()`。IO 控制函数总是需要对象句柄。

旧版驱动有一个不恰当的假设，即 MCPWM 运算器应连接到不同的 MCPWM 定时器上。但是，硬件上并没有这样的限制。新驱动中，同一个 MCPWM 定时器可以连接多个运算器，这样运算器可以获得最佳的同步性能。

更新前，驱动将生成 PWM 波形的方法预设为所谓的 `mcpwm_duty_type_t`，但是，列出的占空比模式远远不够。类似的，旧版驱动有一些预设的 `mcpwm_deadtime_type_t` 也没有包含所有的使用场景。更重要的是，用户通常会被占空比模式和死区时间模式的名称所迷惑。更新后，驱动没有这些限制，但是用户必须从头开始构建发生器的行为。

在旧版驱动中，通过 GPIO 管脚，软件和其他定时器模块同步 MCPWM 定时器的方法并不统一。这增加了用户的学习成本，因此新驱动统一了同步 API。

旧版驱动混淆了“故障检测器”和“故障处理器”的概念。这让用户对 API 感到非常困惑。新驱动中，故障对象只代表一个故障源，而且我们引入了一个新概念，**制动器**，来表示故障处理器。而且，新驱动支持软件故障。

旧版驱动只为获取子模块提供了回调函数，而新驱动为 MCPWM 子模块提供多种回调函数，如停止定时器，比较匹配，故障进入，紧急停止等。

- 更新后，不再使用 `mcpwm_io_signals_t` 和 `mcpwm_pin_config_t`，GPIO 管脚配置被移至子模块的配置结构中。
- 更新后，不再使用 `mcpwm_timer_t` 和 `mcpwm_generator_t`，定时器和发生器分别用 `mcpwm_timer_handle_t` 和 `cpp:type:mcpwm_gen_handle_t` 表示。

- 更新后, 不再使用 `mcpwm_fault_signal_t` 和 `mcpwm_sync_signal_t`, 故障和同步源分别用 `mcpwm_fault_handle_t` 和 `cpp:type:mcpwm_sync_handle_t` 表示。
- 更新后, 不再使用 `mcpwm_capture_signal_t`, 获取通道用 `mcpwm_cap_channel_handle_t` 表示。

主要使用方法更新

- `mcpwm_gpio_init` 和 `mcpwm_set_pin`: GPIO 管脚配置在子模块配置中完成, 例如在 `mcpwm_generator_config_t::gen_gpio_num` 中设置 PWM GPIO 管脚。
- `mcpwm_init`: 为得到预期的 PWM 波形, 用户需要至少分配一个 MCPWM 定时器和 MCPWM 运算器, 然后通过调用 `mcpwm_operator_connect_timer()` 将二者连接起来。然后, 用户需要调用如 `cpp:func:mcpwm_generator_set_actions_on_timer_event`, `mcpwm_generator_set_actions_on_compare_event()` 来设置发生器对不同事件的动作。
- `mcpwm_group_set_resolution`: 新驱动中, 群组分辨率固定为最大值, 通常为 80 MHz。
- `mcpwm_timer_set_resolution`: MCPWM 定时器的分辨率在 `mcpwm_timer_config_t::resolution_hz` 中进行设置。
- `mcpwm_set_frequency`: PWM 频率由 `mcpwm_timer_config_t::resolution_hz`, `mcpwm_timer_config_t::count_mode` 和 `cpp:member:mcpwm_timer_config_t::period_ticks` 决定。
- `mcpwm_set_duty`: 为设置 PWM 占空比, 用户应调用 `mcpwm_comparator_set_compare_value()` 来改变比较器的阈值。
- `mcpwm_set_duty_type`: 新驱动中没有预设的占空比模式, 通过设置不同的发生器行为, 如 `mcpwm_generator_set_actions_on_timer_event()`, 来配置占空比模式。
- `mcpwm_set_signal_high` 和 `mcpwm_set_signal_low` 更新为 `mcpwm_generator_set_force_level()`。新驱动中, 这是通过为发生器设置力作用来实现的, 而不是在后台将占空比改为 0% 或 100%。
- `mcpwm_start` 和 `mcpwm_stop` 更新为 `mcpwm_timer_start_stop()`。用户可以用更多的模式来启动和停止 MCPWM 定时器, 详见 `mcpwm_timer_start_stop_cmd_t`。
- `mcpwm_carrier_init` 更新为 `mcpwm_operator_apply_carrier()`。
- `mcpwm_carrier_enable` 与 `mcpwm_carrier_disable`: 通过检查载波设置结构 `mcpwm_carrier_config_t` 是否为空集来自动使能和停用载波子模块。
- `mcpwm_carrier_set_period` 更新为 `mcpwm_carrier_config_t::frequency_hz`。
- `mcpwm_carrier_set_duty_cycle` 更新为 `mcpwm_carrier_config_t::duty_cycle`。
- `mcpwm_carrier_one_shot_mode_enable` 更新为 `mcpwm_carrier_config_t::first_pulse_duration`。
- 更新后, `mcpwm_carrier_one_shot_mode_disable` 被删除。硬件不支持停用第一个载波脉冲 (即一次性脉冲)。
- `mcpwm_carrier_output_invert` 更新为 `mcpwm_carrier_config_t::invert_before_modulate` 和 `mcpwm_carrier_config_t::invert_after_modulate`。
- `mcpwm_deadtime_enable` 与 `mcpwm_deadtime_disable` 更新为 `mcpwm_generator_set_dead_time()`。
- `mcpwm_fault_init` 更新为 `mcpwm_new_gpio_fault()`。
- `mcpwm_fault_set_one_shot_mode` 与 `mcpwm_fault_set_cyc_mode` 更新为 `mcpwm_operator_set_brake_on_fault()` 与 `mcpwm_generator_set_actions_on_brake_event()`。
- 由于 `mcpwm_capture_enable` 与 `mcpwm_capture_enable_channel()` 重复, 因此在更新后被删除。
- 由于 `mcpwm_capture_disable` 与 `mcpwm_capture_disable_channel()` 重复, 因此在更新后被删除。
- `mcpwm_capture_enable_channel` 与 `mcpwm_capture_disable_channel` 更新为 `mcpwm_capture_channel_enable()` 与 `mcpwm_capture_channel_disable()`。
- `mcpwm_capture_signal_get_value` 与 `mcpwm_capture_signal_get_edge`: 通过 `mcpwm_capture_event_data_t`, 获取事件回调函数中提供了计时器的数值和边缘电平。只有获取事件发生时, 获取数据才有意义, 提供单一的 API 来获取捕获数据是没有意义的。
- 由于 `mcpwm_sync_enable` 与 `mcpwm_sync_configure()` 重复, 因此更新后被删除。
- `mcpwm_sync_configure` 更新为 `mcpwm_timer_set_phase_on_sync()`。
- `mcpwm_sync_disable` 相当于将 `mcpwm_timer_sync_phase_config_t::sync_src` 设置为 NULL。
- `mcpwm_set_timer_sync_output` 更新为 `mcpwm_new_timer_sync_src()`。
- `mcpwm_timer_trigger_soft_sync` 更新为 `mcpwm_soft_sync_activate()`。
- `mcpwm_sync_invert_gpio_synchro` 与设置 `mcpwm_gpio_sync_src_config_t::active_neg`

功能相同。

- 更新后，`mcpwm_isr_register` 已被删除。用户可以注册不同的事件回调函数来替代其功能，例如，可以使用 `mcpwm_capture_channel_register_event_callbacks()` 注册获取事件注册函数。

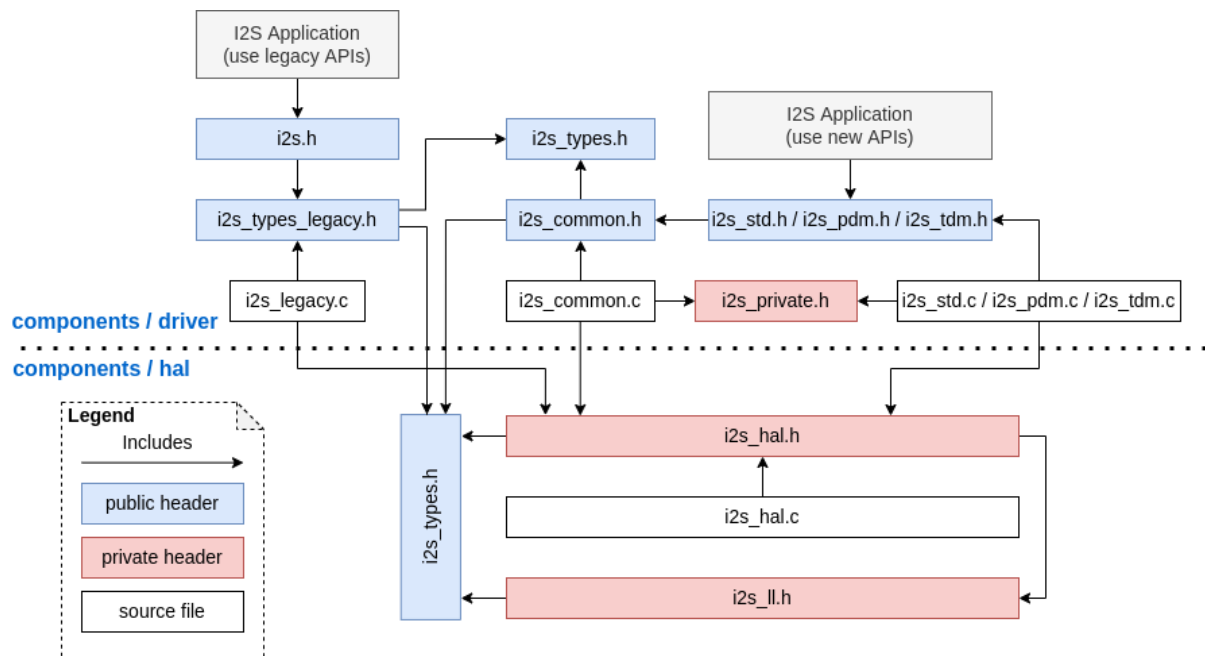

专用的 GPIO 驱动

- 更新后，所有与专用 GPIO 管脚相关的底层 (LL) 函数从 `cpu_ll.h` 中被移至 `dedic_gpio_cpu_ll.h`，并重新命名。

I2S 驱动 旧版 I2S 驱动在支持 ESP32-C3 和 ESP32-S3 新功能时暴露了很多缺点，为解决这些缺点，I2S 驱动已更新（请参考：<doc:I2S Driver <../api-reference/peripherals/i2s>>）。用户可以通过引用不同 I2S 模式对应的头文件来使用新版驱动的 API，如 `driver/include/driver/i2s_std.h`，`driver/include/driver/i2s_pdm.h` 以及 `driver/include/driver/i2s_tdm.h`。

为保证前向兼容，旧版驱动的 API 仍然在 `driver/deprecated/driver/i2s.h` 中可用。但使用旧版 API 会触发编译警告，该警告可通过配置 Kconfig 选项 `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` 来关闭。

以下是更新后的 I2S 文件概况。

主要概念更新

独立的发送通道和接收通道 更新后，I2S 驱动的最小控制单元是发送/接收通道，而不是整个 I2S 控制器（控制器包括多个通道）。

- 用户可以分别控制同一个 I2S 控制器的发送通道和接收通道，即可以通过配置实现分别开启和关闭发送通道和接收通道。
- `i2s_chan_handle_t` 句柄类型用于唯一地识别 I2S 通道。所有的 API 都需要该通道句柄，用户需要对这些通道句柄进行维护。
- 对于 ESP32-C3 和 ESP32-S3，同一个控制器中的发送通道和接收通道可以配置为不同的时钟或不同的模式。
- 但是对于 ESP32 和 ESP32-S2，同一个控制器中的发送通道和接收通道共享某些硬件资源。因此，配置可能会造成一个通道影响同一个控制器中的另一个通道。
- 通过将 `i2s_port_t::I2S_NUM_AUTO` 设置为 I2S 端口 ID，驱动会搜索可用的发送/接收通道，之后通道会被自动注册到可用的 I2S 控制器上。但是，驱动仍然支持将通道注册到一个特定的端口上。

- 为区分发送/接收通道和声音通道，在更新后的驱动中，“通道 (channel)” 一词仅代表发送/接收通道，用“声道 (slot)” 来表示声音通道。

I2S 模式分类 I2S 通信模式包括以下三种模式，请注意：

- **标准模式**：标准模式通常包括两个声道，支持 Philip, MSB 和 PCM（短帧同步）格式，详见 [driver/include/driver/i2s_std.h](#)。
- **PDM 模式**：PDM 模式仅支持两个声道，16 bit 数据位宽，但是 PDM TX 和 PDM RX 的配置略有不同。对于 PDM TX，采样率可通过 `i2s_pdm_tx_clk_config_t::sample_rate` 进行设置，其时钟频率取决于上采样的配置。对于 PDM RX，采样率可通过 `i2s_pdm_rx_clk_config_t::sample_rate` 进行设置，其时钟频率取决于下采样的配置，详见 [driver/include/driver/i2s_pdm.h](#)。
- **TDM 模式**：TDM 模式可支持高达 16 声道，该模式可工作在 Philip, MSB, PCM（短帧同步）和 PCM（长帧同步）格式下，详见 [driver/include/driver/i2s_tdm.h](#)。

在某个模式下分配新通道时，必须通过相应的函数初始化这个通道。我们强烈建议使用辅助宏来生成默认配置，以避免默认值被改动。

独立的声道配置和时钟配置 可以单独进行声道配置和时钟配置。

- 通过调用 `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()` 或 `cpp:func:i2s_channel_init_tdm_mode` 初始化声道/时钟/GPIO 管脚配置。
- 通过调用 `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_pdm_rx_slot()`, `i2s_channel_reconfig_pdm_tx_slot()` 或 `i2s_channel_reconfig_tdm_slot()` 可以在初始化之后改变声道配置。
- 通过调用 `i2s_channel_reconfig_std_clock()`, `i2s_channel_reconfig_pdm_rx_clock()`, `i2s_channel_reconfig_pdm_tx_clock()` 或 `i2s_channel_reconfig_tdm_clock()` 可以在初始化之后改变时钟配置。
- 通过调用 `i2s_channel_reconfig_std_gpio()`, `i2s_channel_reconfig_pdm_rx_gpio()`, `i2s_channel_reconfig_pdm_tx_gpio()` 或 `i2s_channel_reconfig_tdm_gpio()` 可以在初始化之后改变 GPIO 管脚配置。

Misc

- 更新后，I2S 驱动利用状态和状态机避免在错误状态下调用 API。
- 更新后，ADC 和 DAC 模式已被删除，只有它们各自专用的驱动及 I2S 旧版驱动还支持这两种模式。

主要使用方法更新 请参考以下步骤使用更新后的 I2S 驱动：

1. 通过调用 `i2s_new_channel()` 来获取通道句柄。我们应该在此步骤中指定外设为主机还是从机以及 I2S 端口。此外，驱动负责生成发送通道或接收通道的句柄。不需要同时输入发送通道和接收通道句柄，但需要输入至少一个句柄。输入两个句柄时，驱动会工作在双工模式。在同一端口上，发送通道和接收通道同时可用，并且共享 MCLK, BCLK 和 WS 信号。如果只输入了发送通道句柄或接收通道句柄，该通道只能工作在单工模式。
2. 通过调用 `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()` 或 `i2s_channel_init_tdm_mode()` 将通道初始化为指定模式。进行相应的声道、时钟和 GPIO 管脚配置。
3. （可选）通过调用 `i2s_channel_register_event_callback()` 注册 ISR 事件回调函数。I2S 事件由回调函数同步接收，而不是从事件队列中异步接收。
4. 通过调用 `i2s_channel_enable()` 来开启 I2S 通道的硬件资源。在更新后的驱动中，I2S 在安装后不会再自动开启，用户需要确定通道是否已经开启。
5. 分别通过 `i2s_channel_read()` 和 `i2s_channel_write()` 来读取和写入数据。当然，在 `i2s_channel_read()` 中只能输入接收通道句柄，在 `i2s_channel_write()` 中只能输入发送通道句柄。
6. （可选）通过相应的 ‘reconfig’ 函数可以更改声道、时钟和 GPIO 管脚配置，但是更改配置前必须调用 `i2s_channel_disable()`。
7. 通过调用 `i2s_channel_disable()` 可以停止使用 I2S 通道的硬件资源。

8. 不再使用某通道时，通过调用 `i2s_del_channel()` 可以删除和释放该通道资源，但是删除之前必须先停用该通道。

TWAI 驱动 弃用的 CAN 外设驱动已被删除，请使用 TWAI 驱动（即你需在应用程序中引用 `driver/twai.h`）。

用于访问寄存器的宏 更新前，所有用于访问寄存器的宏都可以作为表达式来使用，所以以下命令是允许的：

```
uint32_t val = REG_SET_BITS(reg, mask);
```

在 ESP-IDF v5.0 中，用于写入或读取-修改-写入寄存器的宏不能再作为表达式使用，而只能作为语句使用，这适用于以下宏：`REG_WRITE`，`REG_SET_BIT`，`REG_CLR_BIT`，`REG_SET_BITS`，`REG_SET_FIELD`，`WRITE_PERI_REG`，`CLEAR_PERI_REG_MASK`，`SET_PERI_REG_MASK`，`SET_PERI_REG_BITS`。

为存储要写入寄存器的值，请按以下步骤完成操作：

```
uint32_t new_val = REG_READ(reg) | mask;
REG_WRITE(reg, new_val);
```

要获得修改后的寄存器的值（该值可能与写入的值不同），要增加一个显示的读取命令：

```
REG_SET_BITS(reg, mask);
uint32_t new_val = REG_READ(reg);
```

协议

Mbed TLS 在 ESP-IDF v5.0 版本中，[Mbed TLS](#) 已从 v2.x 版本更新到 v3.1.0 版本。

更多有关 Mbed TLS 从 v2.x 版本迁移到 v3.0 或更高版本的详细信息，请参考 [官方指南](#)。

重大更新（概述）

增加私有结构体字段数量

- 不再支持直接访问公共头文件中声明的结构体（`struct` 类型）字段。
- 当前版本下，访问公共头文件中声明的结构体字段需要使用特定的访问函数（`getter/setter`）。另外，也可以用 `MBEDTLS_PRIVATE` 宏暂时代替，但不建议使用此种方法。
- 更多详细信息，请参考 [官方指南](#)。

SSL

- 不再支持 TLS 1.0、TLS 1.1 和 DTLS 1.0
- 不再支持 SSL 3.0

移除密码模块中的废弃函数

- 更新了与 MD、SHA、RIPEMD、RNG、HMAC 模块相关的函数 `mbedtls*_*_ret()` 的返回值，并将其重新命名，以取代未附加 `_ret` 的相应函数。
- 更多详细信息，请参考 [官方指南](#)。

废弃配置选项 下列为在此次更新中废弃的重要配置选项。与以下配置有关或是依赖于下列配置的相关配置也已相应废弃。

- `MBEDTLS_SSL_PROTO_SSL3`: 原用于支持 SSL 3.0
- `MBEDTLS_SSL_PROTO_TLS1`: 原用于支持 TLS 1.0
- `MBEDTLS_SSL_PROTO_TLS1_1`: 原用于支持 TLS 1.1
- `MBEDTLS_SSL_PROTO_DTLS`: 原用于支持 DTLS 1.1 (当前版本仅支持 DTLS 1.2)
- `MBEDTLS_DES_C`: 原用于支持 3DES 密码套件
- `MBEDTLS_RC4_MODE`: 原用于支持基于 RC4 的密码套件

备注: 上述仅列出了可通过 `idf.py menuconfig` 配置的主要选项。更多有关废弃选项的信息, 请参考 [官方指南](#)。

其他更新

禁用 Diffie-Hellman 密码交换模式 为避免 [安全风险](#), 当前版本已默认禁用 Diffie-Hellman 密码交换模式。以下为相应的禁用配置项:

- `MBEDTLS_DHM_C`: 原用于支持 Diffie-Hellman-Merkle 模块
- `MBEDTLS_KEY_EXCHANGE_DHE_PSK`: 原用于支持 Diffie-Hellman 预共享密钥 (PSK) TLS 认证模式
- `MBEDTLS_KEY_EXCHANGE_DHE_RSA`: 原用于支持带有前缀的密码套件 `TLS-DHE-RSA-WITH-`

备注: 在信号交换的初始步骤 (即 `client_hello`) 中, 服务器会在客户端提供的列表选择一个密码。由于 `DHE_PSK/DHE_RSA` 密码已在本次更新中禁用, 服务器将退回到一个替代密码。在极个别情况中, 服务器不支持任何其他的代码, 此时, 初始步骤将失败。若要检索服务器所支持的密码列表, 需要首先在客户端使用特定的密码连接服务器, 可以使用 `ssllscan` 等工具完成连接。

从 X509 库中移除 `certs` 模块

- `MBEDTLS 3.1` 不再支持 `MBEDTLS_CERTS_H` 头文件。大多数应用程序支持从包含列表中安全删除该头文件。

对 `esp_crt_bundle_set` API 的重大更新

- 更新后, 调用 `esp_crt_bundle_set()` API 需要一个额外的参数 `bundle_size`。该 API 的返回类型也从 `void` 变为了 `esp_err_t`。

对 `esp_ds_rsa_sign` API 的重大更新

- 更新后, 调用 `esp_ds_rsa_sign()` API 无需再使用参数 `mode`。

HTTPS 服务器

重大更新 (概述) 更新 `httpd_ssl_config_t` 结构体中持有不同证书的变量名。

- `httpd_ssl_config::servercert`: 原 `cacert_pem`
- `httpd_ssl_config::servercert_len`: 原 `cacert_len`
- `httpd_ssl_config::cacert_pem`: 原 `client_verify_cert_pem`
- `httpd_ssl_config::cacert_len`: 原 `client_verify_cert_len`

`httpd_ssl_stop()` API 的返回类型从 `void` 变为了 `esp_err_t`。

ESP HTTPS OTA

重大更新 (概述)

- 函数 `esp_https_ota()` 现需以指向 `esp_https_ota_config_t` 的指针作为参数，而非之前的指向 `esp_http_client_config_t` 的指针。

ESP-TLS

重大更新 (概述)

私有化 `esp_tls_t` 结构体 更新后，`esp_tls_t` 已完全私有化，用户无法直接访问其内部结构。之前需要通过 ESP-TLS 句柄获得的必要数据，现在可由对应的 getter/setter 函数获取。如需特定功能的 getter/setter 函数，请在 ESP-IDF 的 [Issue 板块](#) 提出。

下列为新增的 getter/setter 函数：

- `esp_tls_get_ssl_context()`：从 ESP-TLS 句柄获取底层 ssl 栈的 ssl 上下文。

废弃函数及推荐的替代函数 下表总结了在 ESP-IDF v5.0 中废弃的函数以及相应的替代函数。

废弃函数	替代函数
<code>esp_tls_conn_new()</code>	<code>esp_tls_conn_new_sync()</code>
<code>esp_tls_conn_delete()</code>	<code>esp_tls_conn_destroy()</code>

- 函数 `esp_tls_conn_http_new()` 现已废弃。请使用替代函数 `esp_tls_conn_http_new_sync()` (或其异步函数 `esp_tls_conn_http_new_async()`)。请注意，使用替代函数时，需要额外的参数 `esp_tls_t`，此参数必须首先通过 `esp_tls_init()` 函数进行初始化。

HTTP 服务器

重大更新 (概述)

- `esp_http_server` 现不再支持 `http_server.h` 头文件。请使用 `esp_http_server.h`。

ESP HTTP 客户端

重大更新 (概述)

- 函数 `esp_http_client_read()` 和 `esp_http_client_fetch_headers()` 现在会返回额外的返回值 `-ESP_ERR_HTTP_EAGAIN` 用于处理超时错误，即数据准备好前就已调用超时的情况。

TCP 传输

重大更新 (概述)

- 更新后，出现连接超时的情况时，函数 `esp_transport_read()` 将返回 0，对其他错误则返回 `< 0`。请参考 `esp_tcp_transport_err_t`，查看所有可能的返回值。

MQTT 客户端

重大更新 (概述)

- `esp_mqtt_client_config_t` 的所有字段都分组存放在子结构体中。

以下为较为常用的配置选项：

- 通过 `esp_mqtt_client_config_t::broker::address::uri` 配置 MQTT Broker
- 通过 `esp_mqtt_client_config_t::broker::verification` 配置 MQTT Broker 身份验证的相关安全问题
- 通过 `esp_mqtt_client_config_t::credentials::username` 配置客户端用户名
- `esp_mqtt_client_config_t` 不再支持 `user_context` 字段。之后注册事件处理程序，请使用 `esp_mqtt_client_register_event()`；最后一个参数 `event_handler_arg` 可用于将用户上下文传递给处理程序。

ESP-Modbus

重大更新 (概述) 本次更新从 ESP-IDF 中移除了组件 `freemodbus`，该组件已作为一个独立组件受到支持。可前往如下的独立仓库，查看更多有关 ESP-Modbus 的信息：

- [GitHub 中的 ESP-Modbus 组件](#)

在新版应用程序中，main 组件文件夹应包括组件管理器清单文件 `idf_component.yml`，如下所示：

```
dependencies:
  espressif/esp-modbus:
    version: "^1.0"
```

可以前往 [组件管理器注册表](#) 找到 ESP-Modbus 组件。更多有关如何设置组件管理器的信息，请参考 [组件管理器文档](#)。

对于使用 ESP-IDF v4.x 及以后版本的应用程序，需要通过添加组件管理器清单文件 `idf_component.yml` 拉取新版 ESP-Modbus 组件。同时，在编译时，应去掉已过时的 `freemodbus` 组件。此项操作可通过项目 `CMakeLists.txt` 中的以下语句实现：

```
set(EXCLUDE_COMPONENTS freemodbus)
```

配置

Protocomm `protocomm_set_security()` API 中的 `pop` 字段现已弃用。请使用 `sec_params` 字段来代替 `pop`。此参数应包含所使用的协议版本所要求的结构（包括安全参数）。

例如，当使用安全版本 2 时，`sec_params` 参数应包含指向 `protocomm_security2_params_t` 类型结构的指针。

Wi-Fi 配置 `wifi_prov_mgr_start_provisioning()` API 中的 `pop` 字段现已弃用。请使用 `wifi_prov_sec_params` 字段来代替 `pop`。此参数应包含所使用的协议版本所要求的结构（包括安全参数）。

例如，当使用安全版本 2 时，`wifi_prov_sec_params` 参数应包含指向 `wifi_prov_security2_params_t` 类型结构的指针。

ESP 本地控制 `esp_local_ctrl_proto_sec_cfg_t` API 中的 `pop` 字段现已弃用。请使用 `sec_params` 字段来代替 `pop`。此参数应包含所使用的协议版本所要求的结构（包括安全参数）。

例如，当使用安全版本 2 时，`sec_params` 字段应包含指向 `esp_local_ctrl_security2_params_t` 类型结构的指针。

从 ESP-IDF 中移出或弃用的组件

移至 IDF Component Registry 的组件 以下组件已经从 ESP-IDF 中迁出至 IDF Component Registry:

- [libsodium](#)
- [cbor](#)
- [jsmn](#)
- [esp_modem](#)
- [nghttp](#)
- [mdns](#)
- [esp_websocket_client](#)
- [asio](#)
- [freemodbus](#)
- [sh2lib](#)
- [expat](#)
- [coap](#)
- [tjpgd](#)
- [tinycss](#)

备注: 请注意, `http` 解析功能以前属于 `nghttp` 组件一部分, 但现在属于 `http_parser` 组件。

可使用 `idf.py add-dependency` 命令安装以上组件。

例如, 要安装 X.Y 版本的 `libsodium` 组件, 请运行: `idf.py add-dependency libsodium==X.Y`。

根据 [semver](#) 规则安装与 X.Y 兼容的最新版本 `libsodium` 组件, 请运行 `idf.py add-dependency libsodium~X.Y`。

可前往 <https://components.espressif.com> 查询每个组件有哪些版本, 按名称搜索该组件, 组件页面上会列出所有版本。

弃用的组件 IDF v4.x 版本中已不再使用以下组件, 这些组件已弃用:

- `tcpip_adapter`。可使用 [ESP-NETIF](#) 组件代替, 具体可参考 [TCP/IP 适配器](#)。

备注: 不再支持 OpenSSL-API 组件。IDF Component Registry 中也没有该组件。请直接使用 [ESP-TLS](#) 或 [mbedtls](#) API。

版本更新后无需目标组件, 因此以下目标组件也已经从 ESP-IDF 中删除:

- `esp32`
- `esp32s2`
- `esp32s3`
- `esp32c2`
- `esp32c3`
- `esp32h2`

存储

分区 API 的新组件 非兼容性更新: 所有的分区 API 代码都已迁移到新组件 `esp_partition` 中。如需查看所有受影响的函数及数据类型, 请参见头文件 `esp_partition.h`。

在以前, 这些 API 函数和数据类型属于 `spi_flash` 组件。因此, 在现有的应用程序中或将依赖 `spi_flash`, 这也意味着在直接使用 `esp_partition_*` API/数据类型时, 可能会导致构建过程失败 (比如, 在出现 `#include "esp_partition.h"` 的行中报错 `fatal error: esp_partition.h: No such file or directory`)。如果遇到类似问题, 请按以下步骤更新项目中的 `CMakeLists.txt` 文件:

原有的依赖性设置:

```
idf_component_register(...
    REQUIRES spi_flash)
```

更新后的依赖性设置:

```
idf_component_register(...
    REQUIRES spi_flash esp_partition)
```

备注: 请根据项目的实际情况, 更新相应的 REQUIRES 或是 PRIV_REQUIRES 部分。上述代码片段仅为范例。

如果问题仍未解决, 请联系我们, 我们将协助您进行代码迁移。

SDMMC/SDSPI 用户现可通过 `sdmmc_host_t.max_freq_khz` 将 SDMMC/SDSPI 接口上的 SD 卡频率配置为特定值, 不再局限于之前的 `SDMMC_FREQ_PROBING (400 kHz)`、`SDMMC_FREQ_DEFAULT (20 MHz)` 或是 `SDMMC_FREQ_HIGHSPEED (40 MHz)`。此前, 如果用户配置了上述三个给定频率之外的值, 用户所选频率将自动调整为与其最为接近的给定值。

更新后, 底层驱动将计算与用户配置的特定值最为接近的合适频率。相对于枚举项选择, 该频率现由可用的分频器提供。不过, 如果尚未更新现有的应用代码, 可能会导致与 SD 卡的通信过程出现问题。如发现上述问题, 请继续尝试配置与期望值接近的不同频率, 直到找到合适的频率。如需查看底层驱动的计算结果以及实际应用的频率, 请使用 `void sdmmc_card_print_info(FILE* stream, const sdmmc_card_t* card)` 函数。

FatFs FatFs 已更新至 v0.14, `f_mkfs()` 函数签名也已变更。新签名为 `FRESULT f_mkfs (const TCHAR* path, const MKFS_PARM* opt, void* work, UINT len);`, 使用 `MKFS_PARM` 结构体作为第二个实参。

分区表 分区表生成器不再支持未对齐的分区。生成分区表时, ESP-IDF 将只接受偏移量与 4 KB 对齐的分区。此变更仅影响新生成的分区表, 不影响读写现有分区。

VFS `esp_vfs_semihost_register()` 函数签名有所更改:

- 新签名为 `esp_err_t esp_vfs_semihost_register(const char* base_path);`
- 旧签名的 `host_path` 参数不再存在, 请使用 OpenOCD 命令 `ESP_SEMIHOST_BASEDIR` 设置主机上的完整路径。

函数签名更改 以下函数现将返回 `esp_err_t`, 而非 `void` 或 `nvs_iterator_t`。此前, 当参数无效或内部出现问题时, 这些函数将 `assert()` 或返回 `nullptr`。通过返回 `esp_err_t`, 您将获得更加实用的错误报告。

- `nvs_entry_find()`
- `nvs_entry_next()`
- `nvs_entry_info()`

由于 `esp_err_t` 返回类型的更改, `nvs_entry_find()` 和 `nvs_entry_next()` 的使用模式也发生了变化。上述函数现均通过参数修改迭代器, 而非返回一个迭代器。

迭代 NVS 分区的旧编程模式如下所示:

```
nvs_iterator_t it = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_
↪ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
```

(下页继续)

```

it = nvs_entry_next(it);
printf("key '%s', type '%d'", info.key, info.type);
};

```

现在，迭代 NVS 分区的编程模式已更新为：

```

nvs_iterator_t it = nullptr;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_ANY, &
↳it);
while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are
↳guaranteed to be non-NULL
    printf("key '%s', type '%d'", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);

```

迭代器有效性 请注意，由于函数签名的改动，如果存在参数错误，则可能从 `nvs_entry_find()` 获得无效迭代器。因此，请务必在使用 `nvs_entry_find()` 之前将迭代器初始化为 `NULL`，以免在调用 `nvs_release_iterator()` 之前进行复杂的错误检查。上述编程模式便是一个很好的例子。

删除 SDSPI 弃用的 API 结构体 `sdspi_slot_config_t` 和函数 `sdspi_host_init_slot()` 现已删除，并由结构体 `sdspi_device_config_t` 和函数 `sdspi_host_init_device()` 替代。

ROM SPI flash 在 v5.0 之前的版本中，ROM SPI flash 函数一般通过 `esp32**/rom/spi_flash.h` 得以体现。因此，为支持不同 ESP 芯片而编写的代码可能会填充不同目标的 ROM 头文件。此外，并非所有 API 都可以在全部的 ESP 芯片上使用。

现在，常用 API 被提取至 `esp_rom_spiflash.h`。尽管这不能算作重大变更，我们强烈建议您仅使用此头文件中的函数（即以 `esp_rom_spiflash` 为前缀并包含在 `esp_rom_spiflash.h` 中），以获得不同 ESP 芯片之间更佳的交叉兼容性。

为了提高 ROM SPI flash API 的可读性，以下函数也被重命名：

- `esp_rom_spiflash_lock()` 更名为 `esp_rom_spiflash_set_bp()`
- `esp_rom_spiflash_unlock()` 更名为 `esp_rom_spiflash_clear_bp()`

SPI flash 驱动 `esp_flash_speed_t` enum 类型现已弃用。现在，您可以直接将实际时钟频率值传递给 flash 配置结构。下为配置 80MHz flash 频率的示例：

```

esp_flash_spi_device_config_t dev_cfg = {
    // Other members
    .freq_mhz = 80,
    // Other members
};

```

旧版 SPI flash 驱动 为了使 SPI flash 驱动更为稳定，v5.0 已经删除旧版 SPI flash 驱动。旧版 SPI flash 驱动程序是指自 v3.0 以来的默认 SPI flash 驱动程序，以及自 v4.0 以来启用配置选项 `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` 的 SPI flash 驱动。从 v5.0 开始，我们将不再支持旧版 SPI flash 驱动程序。因此，旧版驱动 API 和 `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` 配置选项均被删除，请改用新 SPI flash 驱动的 API。

删除项目	替代项目
<code>spi_flash_erase_sector()</code>	<code>esp_flash_erase_region()</code>
<code>spi_flash_erase_range()</code>	<code>esp_flash_erase_region()</code>
<code>spi_flash_write()</code>	<code>esp_flash_write()</code>
<code>spi_flash_read()</code>	<code>esp_flash_read()</code>
<code>spi_flash_write_encrypted()</code>	<code>esp_flash_write_encrypted()</code>
<code>spi_flash_read_encrypted()</code>	<code>esp_flash_read_encrypted()</code>

备注: 带有前缀 `esp_flash` 的新函数接受额外的 `esp_flash_t*` 参数。您可以直接将其设置为 `NULL`，从而使函数运行主 `flash(esp_flash_default_chip)`。

由于系统函数不再是公共函数，`esp_spi_flash.h` 头文件已停止使用。若要使用 `flash` 映射 API，请使用 `spi_flash_mmap.h`。

系统

跨核执行 跨核执行 (Inter-Processor Call, IPC) 不再是一个独立组件，现已被包含至 `esp_system`。

因此，若项目的 `CMakeLists.txt` 文件中出现 `PRIV_REQUIRES esp_ipc` 或 `REQUIRES esp_ipc`，应删除这些选项，因为项目中已默认包含 `esp_system` 组件。

ESP 时钟 ESP 时钟 API（即以 `esp_clk` 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 `#include "ESP32-S3/clock.h"` 和 `#include "esp_clk.h"` 已被移除。如仍需使用 ESP 时钟 API（并不推荐），请使用 `#include "esp_private/esp_clk.h"` 来包含。

注意: 私有 API 不属于稳定的 API，不会遵循 ESP-IDF 的版本演进规则，因此不推荐用户在应用中使用。

缓存错误中断 缓存错误中断 API（即以 `esp_cache_err` 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 `#include "ESP32-S3/cache_err_int.h"` 已被移除。如仍需使用缓存错误中断 API（并不推荐），请使用 `#include "esp_private/cache_err_int.h"` 来包含。

bootloader_support

- 函数 `bootloader_common_get_reset_reason()` 已被移除。请使用 ROM 组件中的函数 `esp_rom_get_reset_reason()`。
- 函数 `esp_secure_boot_verify_sbv2_signature_block()` 和 `esp_secure_boot_verify_rsa_signature_block()` 已被移除，无新的替换函数。不推荐用户直接使用以上函数。如确需要，请在 [GitHub](#) 上对该功能提交请求，并解释您需要此函数的原因。

断电 断电 API（即以 `esp_brownout` 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 `#include "brownout.h"` 已被移除。如仍需使用断电 API（并不推荐），请使用 `#include "esp_private/brownout.h"` 来包含。

Trax Trax API（即以 `trax_` 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 `#include "trax.h"` 已被移除。如仍需使用 Trax API（并不推荐），请使用 `#include "esp_private/trax.h"` 来包含。

ROM components/esp32/rom/ 路径下存放的已弃用的 ROM 相关头文件已被移除（原包含路径为 rom/*.h）。请使用新的特定目标的路径 components/esp_rom/include/ESP32-S3/`（新的包含路径为 ``ESP32-S3/rom/*.h）。

esp_hw_support

- 头文件 soc/cpu.h 及弃用的 CPU util 函数都已被移除。请包含 esp_cpu.h 来代替相同功能的函数。
- 头文件 hal/cpu_ll.h、hal/cpu_hal.h、hal/soc_ll.h、hal/soc_hal.h 和 interrupt_controller_hal.h 的 CPU API 函数已弃用。请包含 esp_cpu.h 来代替相同功能的函数。
- 头文件 compare_set.h 已被移除。请使用 esp_cpu.h 中提供的 esp_cpu_compare_and_set() 函数来代替。
- esp_cpu_get_ccount()、esp_cpu_set_ccount() 和 esp_cpu_in_ocd_debug_mode() 已从 esp_cpu.h 中移除。请分别使用 esp_cpu_get_cycle_count()、esp_cpu_set_cycle_count() 和 esp_cpu_dbgr_is_attached() 代替。
- 头文件 esp_intr.h 已被移除。请包含 esp_intr_alloc.h 以分配和操作中断。
- Panic API（即以 esp_panic 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 #include "esp_panic.h" 已被移除。如仍需使用 Panic API（并不推荐），请使用 #include "esp_private/panic_reason.h" 来包含。此外，请包含 esp_debug_helpers.h 以使用与调试有关的任意辅助函数，如打印回溯。
- 头文件 soc_log.h 现更名为 esp_hw_log.h，并已更新为私有。建议用户使用 esp_log.h 头文件下的日志 API。
- 包含头文件 spinlock.h、clk_ctrl_os.h 和 rtc_wdt.h 时不应当使用 soc 前缀，如 #include "spinlock.h"。
- esp_chip_info() 命令返回芯片版本，格式为 = 100 * 主要 eFuse 版本 + 次要 eFuse 版本。因此，为适应新格式，esp_chip_info_t 结构体中的 revision 被扩展为 uint16_t。

PSRAM

- 针对特定目标的头文件 spiram.h 及头文件 esp_spiram.h 已被移除，创建新组件 esp_psram。对于与 PSRAM 或 SPIRAM 相关的函数，请包含 esp_psram.h，并在 CMakeLists.txt 项目文件中将 esp_psram 设置为必需组件。
- esp_spiram_get_chip_size 和 esp_spiram_get_size 已被移除，请使用 esp_psram_get_size。

eFuse

- 函数 esp_secure_boot_read_key_digests() 的参数类型从 ets_secure_boot_key_digests_t* 更新为 esp_secure_boot_key_digests_t*。新类型与旧类型相同，仅移除了 allow_key_revoke 标志。在当前代码中，后者总是被设置为 true，并未提供额外信息。
- 针对 eFuse 晶圆增加主要修订版本和次要修订版本。API esp_efuse_get_chip_ver() 与新修订不兼容，因此已被移除。请使用 API efuse_hal_get_major_chip_version()、efuse_hal_get_minor_chip_version() 或 efuse_hal_chip_revision() 来代替原有 API。

esp_common EXT_RAM_ATTR 已被弃用。请使用新的宏 EXT_RAM_BSS_ATTR 以将 .bss 放在 PSRAM 上。

esp_system

- 头文件 esp_random.h、esp_mac.h 和 esp_chip_info.h 以往都是通过头文件 esp_system.h 间接包含，更新后必须直接包含。已移除从 esp_system.h 中的间接包含功能。
- 回溯解析器 API（即以 esp_eh_frame_ 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 #include "eh_frame_parser.h" 已被移除。如仍需使用回溯解析器 API（并不推荐），请使用 #include "esp_private/eh_frame_parser.h" 来包含。

- 中断看门狗定时器 API (即以 `esp_int_wdt_` 为前缀的函数、类型或宏) 已被更新为私有 API。因此, 原先的包含路径 `#include "esp_int_wdt.h"` 已被移除。如仍需使用中断看门狗定时器 API (并不推荐), 请使用 `#include "esp_private/esp_int_wdt.h"` 来包含。

SOC 依赖性

- Doxyfiles 中列出的公共 API 头文件中不会显示不稳定和非必要的 SOC 头文件, 如 `soc/soc.h` 和 `soc/rtc.h`。这意味着, 如果用户仍然需要这些“缺失”的头文件, 就必须在代码中明确包含这些文件。
- Kconfig 选项 `LEGACY_INCLUDE_COMMON_HEADERS` 也已被移除。
- 头文件 `soc/soc_memory_types.h` 已被弃用。请使用 `esp_memory_utils.h`。包含 `soc/soc_memory_types.h` 将触发构建警告, 如 `soc_memory_types.h is deprecated, please migrate to esp_memory_utils.h`。

应用跟踪 其中一个时间戳源已从定时器组驱动改为新的 *GPTimer*。Kconfig 选项已重新命名, 例如 `APPTRACE_SV_TS_SOURCE_TIMER00` 已更改为 `APPTRACE_SV_TS_SOURCE_GPTIMER`。用户已无需选择组和定时器 ID。

esp_timer 基于 FRC2 的 `esp_timer` 过去可用于 ESP32, 现在已被移除, 更新后仅可使用更简单有效的 LAC 定时器。

ESP 镜像 ESP 镜像中关于 SPI 速度的枚举成员已重新更名:

- `ESP_IMAGE_SPI_SPEED_80M` 已被重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_1`。
- `ESP_IMAGE_SPI_SPEED_40M` 已被重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_2`。
- `ESP_IMAGE_SPI_SPEED_26M` 已被重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_3`。
- `ESP_IMAGE_SPI_SPEED_20M` 已被重新命名为 `ESP_IMAGE_SPI_SPEED_DIV_4`。

任务看门狗定时器

- API `esp_task_wdt_init()` 更新后有如下变化:
 - 以结构体的形式传递配置。
 - 可将该函数配置为订阅空闲任务。

FreeRTOS

遗留 API 及数据类型 在以往版本中, ESP-IDF 默认设置 `configENABLE_BACKWARD_COMPATIBILITY` 选项, 因此可使用 FreeRTOS v8.0.0 之前的函数名称和数据类型。该选项现在已默认禁用, 因此默认情况下不再支持以往的 FreeRTOS 名称或类型。用户可以选择以下一种解决方式:

- 更新代码, 删除以往的 FreeRTOS 名称或类型。
- 启用 `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY` 以显式调用这些名称或类型。

任务快照 头文件 `task_snapshot.h` 已从 `freertos/task.h` 中移除。如需使用任务快照 API, 请包含 `freertos/task_snapshot.h`。

函数 `vTaskGetSnapshot()` 现返回 `BaseType_t`, 成功时返回值为 `pdTRUE`, 失败则返回 `pdFALSE`。

FreeRTOS 断言 在以往版本中, FreeRTOS 断言通过 `FREERTOS_ASSERT` kconfig 选项独立配置, 不同于系统的其他部分。该选项已被移除, 现在需要通过 `COMPILER_OPTIMIZATION_ASSERTION_LEVEL` 来完成配置。

FreeRTOS 移植相关的宏 已移除以保证弃用 API 向后兼容性的 `portmacro_deprecated.h` 文件。建议使用下列函数来代替弃用 API。

- `portENTER_CRITICAL_NESTED()` 已被移除, 请使用 `portSET_INTERRUPT_MASK_FROM_ISR()` 宏。
- `portEXIT_CRITICAL_NESTED()` 已被移除, 请使用 `portCLEAR_INTERRUPT_MASK_FROM_ISR()` 宏。
- `vPortCPUInitializeMutex()` 已被移除, 请使用 `spinlock_initialize()` 函数。
- `vPortCPUAcquireMutex()` 已被移除, 请使用 `spinlock_acquire()` 函数。
- `vPortCPUAcquireMutexTimeout()` 已被移除, 请使用 `spinlock_acquire()` 函数。
- `vPortCPUReleaseMutex()` 已被移除, 请使用 `spinlock_release()` 函数。

芯片版本 在应用程序开始加载时, 引导加载程序会检查芯片版本。只有当版本为 \geq `CONFIG_ESP32S3_REV_MIN` 和 $<$ `CONFIG_ESP32S3_REV_MAX_FULL` 时, 应用程序才能成功加载。

在 OTA 升级时, 会检查应用程序头部中的版本需求和芯片版本是否符合条件。只有当版本为 \geq `CONFIG_ESP32S3_REV_MIN` 和 $<$ `CONFIG_ESP32S3_REV_MAX_FULL` 时, 应用程序才能成功更新。

工具

IDF 监视器 IDF 监视器在波特率方面的改动如下:

- 目前, IDF 监视器默认遵循自定义的控制台波特率 (`CONFIG_ESP_CONSOLE_UART_BAUDRATE`), 而非 115200。
- ESP-IDF v5.0 不再支持通过 `menuconfig` 自定义波特率。
- 支持通过设置环境变量或在命令行中使用 `idf.py monitor -b <baud>` 命令自定义波特率。
- 注意, 为了与全局波特率 `idf.py -b <baud>` 保持一致, 波特率参数已从 `-B` 改名为 `-b`。请运行 `idf.py monitor --help` 获取更多信息。

废弃指令 ESP-IDF v5.0 已将 `idf.py` 子命令和 `cmake` 目标名中的下划线 (`_`) 统一为连字符 (`-`)。使用废弃的子命令及目标名将会触发警告, 建议使用更新后的版本。具体改动如下:

表 1: 废弃子命令及目标名

废弃名	现用名
<code>efuse_common_table</code>	<code>efuse-common-table</code>
<code>efuse_custom_table</code>	<code>efuse-custom-table</code>
<code>erase_flash</code>	<code>erase-flash</code>
<code>partition_table</code>	<code>partition-table</code>
<code>partition_table-flash</code>	<code>partition-table-flash</code>
<code>post_debug</code>	<code>post-debug</code>
<code>show_efuse_table</code>	<code>show-efuse-table</code>
<code>erase_otadata</code>	<code>erase-otadata</code>
<code>read_otadata</code>	<code>read-otadata</code>

Esptool `CONFIG_ESPTOOLPY_FLASHSIZE_DETECT` 选项已重命名为 `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`, 且默认禁用。迁移到 ESP-IDF v5.0 的新项目和现有项目必须设置 `CONFIG_ESPTOOLPY_FLASHSIZE`。若因编译时 flash 大小未知而无法设置, 可启用 `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`。但需注意的是, 启用该项后, 为在烧录期间使用 flash 大小更新二进制头时不会导致摘要无效, 映像后将不再附加 SHA256 摘要。

Windows 环境 基于 MSYS/MinGW 的 Windows 环境支持已在 ESP-IDF v4.0 中弃用, v5.0 则完全移除了该项服务。请使用 **ESP-IDF 工具安装器** 设置 Windows 兼容环境。目前支持 Windows 命令行、Power Shell 和基于 Eclipse IDE 的图形用户界面等选项。此外, 还可以使用 **支持的插件**, 设置基于 VSCode 的环境。

Chapter 6

Libraries and Frameworks

6.1 Cloud Frameworks

ESP32-S3 supports multiple cloud frameworks using agents built on top of ESP-IDF. Here are the pointers to various supported cloud frameworks' agents and examples:

6.1.1 ESP RainMaker

ESP RainMaker is a complete solution for accelerated AIoT development. [ESP RainMaker on GitHub](#).

6.1.2 AWS IoT

<https://github.com/espressif/esp-aws-iot> is an open source repository for ESP32-S3 based on Amazon Web Services' `aws-iot-device-sdk-embedded-C`.

6.1.3 Azure IoT

<https://github.com/espressif/esp-azure> is an open source repository for ESP32-S3 based on Microsoft Azure' s `azure-iot-sdk-c` SDK.

6.1.4 Google IoT Core

<https://github.com/espressif/esp-google-iot> is an open source repository for ESP32-S3 based on Google' s `iot-device-sdk-embedded-c` SDK.

6.1.5 Aliyun IoT

<https://github.com/espressif/esp-aliyun> is an open source repository for ESP32-S3 based on Aliyun' s `iotkit-embedded` SDK.

6.1.6 Joylink IoT

<https://github.com/espressif/esp-joylink> is an open source repository for ESP32-S3 based on Joylink' s `joylink_dev_sdk` SDK.

6.1.7 Tencent IoT

<https://github.com/espressif/esp-welink> is an open source repository for ESP32-S3 based on Tencent's [welink SDK](#).

6.1.8 Tencentyun IoT

<https://github.com/espressif/esp-qcloud> is an open source repository for ESP32-S3 based on Tencentyun's [qcloud-iot-sdk-embedded-c SDK](#).

6.1.9 Baidu IoT

<https://github.com/espressif/esp-baidu-iot> is an open source repository for ESP32-S3 based on Baidu's [iot-sdk-c SDK](#).

6.2 其他库和开发框架

本文展示了一系列乐鑫官方发布的库和框架。

6.2.1 ESP-ADF

ESP-ADF 是一个全方位的音频应用程序框架，该框架支持：

- CODEC 的 HAL
- 音乐播放器和录音机
- 音频处理
- 蓝牙扬声器
- 互联网收音机
- 免提设备
- 语音识别

该框架对应的 GitHub 仓库为 [ESP-ADF](#)。

6.2.2 ESP-CSI

ESP-CSI 是一个具有实验性的框架，它利用 Wi-Fi 信道状态信息来检测人体存在。

该框架对应的 GitHub 仓库为 [ESP-CSI](#)。

6.2.3 ESP-DSP

ESP-DSP 提供了针对数字信号处理应用优化的算法，该库支持：

- 矩阵乘法
- 点积
- 快速傅立叶变换 (FFT)
- 无线脉冲响应 (IIR)
- 有限脉冲响应 (FIR)
- 向量数学运算

该库对应的 GitHub 仓库为 [ESP-DSP 库](#)。

6.2.4 ESP-WIFI-MESH

ESP-WIFI-MESH 基于 ESP-WIFI-MESH 协议搭建，该框架支持：

- 快速网络配置
- 稳定升级
- 高效调试
- LAN 控制
- 多种应用示例

该框架对应的 GitHub 仓库为 [ESP-MDF](#)。

6.2.5 ESP-WHO

ESP-WHO 框架利用 ESP32 及摄像头实现人脸检测及识别。

该框架对应的 GitHub 仓库为 [ESP-WHO](#)。

6.2.6 ESP RainMaker

[ESP RainMaker](#) 提供了一个快速 AIoT 开发的完整解决方案。使用 ESP RainMaker，用户可以创建多种 AIoT 设备，包括固件 AIoT 以及集成了语音助手、手机应用程序和云后端的 AIoT 等。

该解决方案对应的 GitHub 仓库为 [GitHub 上的 ESP RainMaker](#)。

6.2.7 ESP-IoT-Solution

[ESP-IoT-Solution](#) 涵盖了开发 IoT 系统时常用的设备驱动程序及代码框架。在 ESP-IoT-Solution 中，设备驱动程序和代码框架以独立组件存在，可以轻松地集成到 ESP-IDF 项目中。

ESP-IoT-Solution 支持：

- 传感器、显示器、音频、GUI、输入、执行器等设备驱动程序
- 低功耗、安全、存储等框架和文档
- 从实际应用角度指导乐鑫开源解决方案

该解决方案对应的 GitHub 仓库为 [GitHub 上的 ESP-IoT-Solution](#)。

6.2.8 ESP-Protocols

[ESP-Protocols](#) 库包含 ESP-IDF 的协议组件集。ESP-Protocols 中的代码以独立组件存在，可以轻松地集成到 ESP-IDF 项目中。此外，每个组件都可以在 [ESP-IDF 组件注册表](#) 中找到。

ESP-Protocols 组件：

- [esp_modem](#) 使用 AT 命令或 PPP 协议与 GSM/LTE 调制解调器连接，详情请参阅 [esp_modem 文档](#)。
- [mdns](#) (mDNS) 是一种组播 UDP 服务，用于提供本地网络服务与主机发现，详情请参阅 [mdns 文档](#)。
- [esp_websocket_client](#) 是 ESP-IDF 的托管组件，可在 ESP32 上实现 WebSocket 协议客户端，详情请参阅 [esp_websocket_client 文档](#)。有关 WebSocket 协议客户端，请参阅 [WebSocket_protocol_client](#)。
- [asio](#) 是一个跨平台的 C++ 库，请参阅 <https://think-async.com/Asio/>。该库基于现代 C++ 提供一致的异步模型，请参阅 [asio 文档](#)。

6.2.9 ESP-BSP

[ESP-BSP](#) 库包含了各种乐鑫和第三方开发板的板级支持包 (BSP)，可以帮助快速上手特定的开发板。它们通常包含管脚定义和辅助函数，这些函数可用于初始化特定开发板的外设。此外，BSP 还提供了一些驱动程序，可用于开发版上的外部芯片，如传感器、显示屏、音频编解码器等。

6.2.10 ESP-IDF-CXX

ESP-IDF-CXX 包含了 ESP-IDF 的部分 C++ 封装, 重点在实现易用性、安全性、自动资源管理, 以及将错误检查转移到编译过程中, 以避免运行时失败。它还提供了 ESP 定时器、I2C、SPI、GPIO 等外设或 ESP-IDF 其他功能的 C++ 类。ESP-IDF-CXX 作为组件可以从 [组件注册表](#) 中获取。详情请参阅 [README.md](#)。

Chapter 7

Contributions Guide

We welcome contributions to the esp-idf project!

7.1 How to Contribute

Contributions to esp-idf - fixing bugs, adding features, adding documentation - are welcome. We accept contributions via [Github Pull Requests](#).

7.2 Before Contributing

Before sending us a Pull Request, please consider this list of points:

- Is the contribution entirely your own work, or already licensed under an Apache License 2.0 compatible Open Source License? If not then we unfortunately cannot accept it. Please check the [Copyright Header Guide](#) for additional information.
- Does any new code conform to the esp-idf [Style Guide](#)?
- Have you installed the [pre-commit hook](#) for esp-idf project?
- Does the code documentation follow requirements in [Documenting Code](#)?
- Is the code adequately commented for people to understand how it is structured?
- Is there documentation or examples that go with code contributions? There are additional suggestions for writing good examples in [examples](#) readme.
- Are comments and documentation written in clear English, with no spelling or grammar errors?
- Example contributions are also welcome. Please check the [创建示例项目](#) guide for these.
- If the contribution contains multiple commits, are they grouped together into logical changes (one major change per pull request)? Are any commits with names like “fixed typo” [squashed into previous commits](#)?
- If you’re unsure about any of these points, please open the Pull Request anyhow and then ask us for feedback.

7.3 Pull Request Process

After you open the Pull Request, there will probably be some discussion in the comments field of the request itself.

Once the Pull Request is ready to merge, it will first be merged into our internal git system for in-house automated testing.

If this process passes, it will be merged onto the public github repository.

7.4 Legal Part

Before a contribution can be accepted, you will need to sign our *Contributor Agreement*. You will be prompted for this automatically as part of the Pull Request process.

7.5 Related Documents

7.5.1 Espressif IoT Development Framework Style Guide

About This Guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF.

Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

C Code Formatting

Naming

- Any variable or function which is only used in a single source file should be declared `static`.
- Public names (non-static variables and functions) should be namespaced with a per-component or per-unit prefix, to avoid naming collisions. ie `esp_vfs_register()` or `esp_console_run()`. Starting the prefix with `esp_` for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with `s_` for easy identification. For example, `static bool s_invert`.
- Avoid unnecessary abbreviations (ie shortening `data` to `dat`), unless the resulting name would otherwise be very long.

Indentation Use 4 spaces for each indentation level. Don't use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

Vertical Space Place one empty line between functions. Don't begin or end a function with an empty line.

```
void function1()
{
    do_one_thing();
    do_another_thing();
}
// INCORRECT, don't place empty line here
// place empty line here
void function2()
{
    // INCORRECT, don't use an empty line here
    int var = 0;
    while (var < SOME_CONSTANT) {
        do_stuff(&var);
    }
}
```

(下页继续)

```
}
}
```

The maximum line length is 120 characters as long as it doesn't seriously affect the readability.

Horizontal Space Always add single space after conditional and loop keywords:

```
if (condition) {      // correct
    // ...
}

switch (n) {          // correct
    case 0:
        // ...
}

for(int i = 0; i < CONST; ++i) {    // INCORRECT
    // ...
}
```

Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);    // correct

const int y = y0 + (x - x0)*(y1 - y0)/(x1 - x0);      // also okay

int y_cur = -y;                                       // correct
++y_cur;

const int y = y0+(x-x0)*(y1-y0)/(x1-x0);              // INCORRECT
```

No space is necessary around `.` and `->` operators.

Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```
esp_rom_gpio_connect_in_signal(PIN_CAM_D6,    I2S0I_DATA_IN14_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_D7,    I2S0I_DATA_IN15_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_HREF,  I2S0I_H_ENABLE_IDX,  false);
esp_rom_gpio_connect_in_signal(PIN_CAM_PCLK,  I2S0I_DATA_IN15_IDX, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g. `PIN_CAM_VSYNC`), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.

Never add trailing whitespace at the end of the line.

Braces

- Function definition should have a brace on a separate line:

```
// This is correct:
void function(int arg)
{
}
}
```

```
// NOT like this:
void function(int arg) {
}
```

- Within a function, place opening brace on the same line with conditional and loop statements:

```
if (condition) {
    do_one();
} else if (other_condition) {
    do_two();
}
```

Comments Use // for single line comments. For multi-line comments it is okay to use either // on each line or a /* */ block.

Although not directly related to formatting, here are a few notes about using comments effectively.

- Don't use single comments to disable some functionality:

```
void init_something()
{
    setup_dma();
    // load_resources();           // WHY is this thing commented, asks_
    ↪the reader?
    start_timer();
}
```

- If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

```
void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated_
    ↪yet.
    // load_resources();
    start_timer();
}
```

- Same goes for #if 0 ... #endif blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Don't use #if 0 ... #endif or comments to store code snippets which you may need in the future.
- Don't add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g. this comment adds clutter to the code without adding any useful information:

```
void init_something()
{
    setup_dma();
    // XXX add 2016-09-01
    init_dma_list();
    fill_dma_item(0);
    // end XXX add
    start_timer();
}
```

Line Endings Commits should only contain files with LF (Unix style) endings.

Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the `core.autocrlf` setting. *Github has a document about setting this option <github-line-endings>*.

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

```
git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs ↵
↳dos2unix && git commit -a --amend --no-edit --allow-empty' master
```

(Note that this line rebases on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it's possible to run `dos2unix FILENAME` and then run `git commit --amend`

Formatting Your Code You can use `astyle` program to format your code according to the above recommendations.

If you are writing a file from scratch, or doing a complete rewrite, feel free to re-format the entire file. If you are changing a small portion of file, don't re-format the code you didn't change. This will help others when they review your changes.

To re-format a file, run:

```
tools/format.sh components/my_component/file.c
```

Type Definitions Should be snake_case, ending with `_t` suffix:

```
typedef int signed_32_bit_t;
```

Enum Enums should be defined through the `typedef` and be namespaced:

```
typedef enum
{
    MODULE_FOO_ONE,
    MODULE_FOO_TWO,
    MODULE_FOO_THREE
} module_foo_t;
```

Assertions The standard C `assert()` function, defined in `assert.h` should be used to check conditions that should be true in source code. In the default configuration, an assert condition that returns `false` or `0` will call `abort()` and trigger a *Fatal Error*.

`assert()` should only be used to detect unrecoverable errors due to a serious internal logic bug or corruption, where it's not possible for the program to continue. For recoverable errors, including errors that are possible due to invalid external input, an *error value should be returned*.

备注: When asserting a value of type `esp_err_t` is equal to `ESP_OK`, use the [ESP_ERROR_CHECK](#) 宏 instead of an `assert()`.

It's possible to configure ESP-IDF projects with assertions disabled (see [CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL](#)). Therefore, functions called in an `assert()` statement should not have side-effects.

It's also necessary to use particular techniques to avoid “variable set but not used” warnings when assertions are disabled, due to code patterns such as:

```
int res = do_something();
assert(res == 0);
```

Once the `assert` is optimized out, the `res` value is unused and the compiler will warn about this. However the function `do_something()` must still be called, even if assertions are disabled.

When the variable is declared and initialized in a single statement, a good strategy is to cast it to `void` on a new line. The compiler will not produce a warning, and the variable can still be optimized out of the final binary:

```
int res = do_something();
assert(res == 0);
(void)res;
```

If the variable is declared separately, for example if it is used for multiple assertions, then it can be declared with the GCC attribute `__attribute__((unused))`. The compiler will not produce any unused variable warnings, but the variable can still be optimized out:

```
int res __attribute__((unused));

res = do_something();
assert(res == 0);

res = do_something_else();
assert(res != 0);
```

Header file guards

All public facing header files should have preprocessor guards. A `pragma` is preferred:

```
#pragma once
```

over the following pattern:

```
#ifndef FILE_NAME_H
#define FILE_NAME_H
...
#endif // FILE_NAME_H
```

In addition to guard macros, all C header files should have `extern "C"` guards to allow the header to be used from C++ code. Note that the following order should be used: `pragma once`, then any `#include` statements, then `extern "C"` guards:

```
#pragma once

#include <stdint.h>

#ifdef __cplusplus
extern "C" {
#endif

/* declarations go here */

#ifdef __cplusplus
}
#endif
```

Include statements

When writing `#include` statements, try to maintain the following order:

- C standard library headers.
- Other POSIX standard headers and common extensions to them (such as `sys/queue.h`.)
- Common IDF headers (`esp_log.h`, `esp_system.h`, `esp_timer.h`, `esp_sleep.h`, etc.)
- Headers of other components, such as FreeRTOS.
- Public headers of the current component.
- Private headers.

Use angle brackets for C standard library headers and other POSIX headers (`#include <stdio.h>`).

Use double quotes for all other headers (`#include "esp_log.h"`).

C++ Code Formatting

The same rules as for C apply. Where they are not enough, apply the following rules.

File Naming C++ Header files have the extension `.hpp`. C++ source files have the extension `.cpp`. The latter is important for the compiler to distinguish them from normal C source files.

Naming

- **Class and struct** names shall be written in CamelCase with a capital letter as beginning. Member variables and methods shall be in snake_case.
- **Namespaces** shall be in lower snake_case.
- **Templates** are specified in the line above the function declaration.
- Interfaces in terms of Object-Oriented Programming shall be named without the suffix `...Interface`. Later, this makes it easier to extract interfaces from normal classes and vice versa without making a breaking change.

Member Order in Classes In order of precedence:

- First put the public members, then the protected, then private ones. Omit public, protected or private sections without any members.
- First put constructors/destructors, then member functions, then member variables.

For example:

```
class ForExample {
public:
    // first constructors, then default constructor, then destructor
    ForExample(double example_factor_arg);
    ForExample();
    ~ForExample();

    // then remaining public methods
    set_example_factor(double example_factor_arg);

    // then public member variables
    uint32_t public_data_member;

private:
    // first private methods
    void internal_method();

    // then private member variables
    double example_factor;
};
```

Spacing

- Don't indent inside namespaces.
- Put public, protected and private labels at the same indentation level as the corresponding class label.

Simple Example

```
// file spaceship.h
#ifndef SPACESHIP_H_
#define SPACESHIP_H_
#include <cstdlib>

namespace spaceships {

class SpaceShip {
public:
    SpaceShip(size_t crew);
    size_t get_crew_size() const;

private:
    const size_t crew;
};

class SpaceShuttle : public SpaceShip {
public:
    SpaceShuttle();
};

class Sojuz : public SpaceShip {
public:
    Sojuz();
};

template <typename T>
class CargoShip {
public:
    CargoShip(const T &cargo);

private:
    T cargo;
};

} // namespace spaceships

#endif // SPACESHIP_H_

// file spaceship.cpp
#include "spaceship.h"

namespace spaceships {

// Putting the curly braces in the same line for constructors is OK if it only
↪initializes
// values in the initializer list
SpaceShip::SpaceShip(size_t crew) : crew(crew) { }

size_t SpaceShip::get_crew_size() const
{
    return crew;
}

}
```

(下页继续)

```
SpaceShuttle::SpaceShuttle() : SpaceShip(7)
{
    // doing further initialization
}

Sojuz::Sojuz() : SpaceShip(3)
{
    // doing further initialization
}

template <typename T>
CargoShip<T>::CargoShip(const T &cargo) : cargo(cargo) { }

} // namespace spaceships
```

CMake Code Style

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Don't put anything in the optional parentheses after `foreach()`, `endif()`, etc.
- Use lowercase (`with_underscores`) for command, function, and macro names.
- For locally scoped variables, use lowercase (`with_underscores`).
- For globally scoped variables, use uppercase (`WITH_UNDERSCORES`).
- Otherwise follow the defaults of the [cmake-lint](#) project.

Configuring the Code Style for a Project Using EditorConfig

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see [EditorConfig Website](#).

Documenting Code

Please see the guide here: [Documenting Code](#).

Structure

To be written.

Language Features

To be written.

7.5.2 Install pre-commit Hook for ESP-IDF Project

Required Dependency

Python 3.7.* or above. This is our recommended python version for IDF developers.

If you still have python versions not compatible, update your python versions before installing the pre-commit hook.

Install pre-commit

Run `pip install pre-commit`

Install pre-commit hook

1. Go to the IDF Project Directory
2. Run `pre-commit install --allow-missing-config`. Install hook by this approach will let you commit successfully even in branches without the `.pre-commit-config.yaml`
3. pre-commit hook will run automatically when you're running `git commit` command

Uninstall pre-commit

Run `pre-commit uninstall`

What's More?

For detailed usage, please refer to the documentation of [pre-commit](#).

Common Problems For Windows Users

`/usr/bin/env: python: Permission denied.`

If you're in Git Bash, please check the python executable location by run `which python`.

If the executable is under `~/AppData/Local/Microsoft/WindowsApps/`, then it's a link to Windows AppStore, not a real one.

Please install python manually and update this in your PATH environment variable.

Your `%USERPROFILE%` contains non-ASCII characters

`pre-commit` may fail when initializing an environment for a particular hook when the path of `pre-commit`'s cache contains non-ASCII characters. The solution is to set `PRE_COMMIT_HOME` to a path containing only standard characters before running `pre-commit`.

- CMD: `set PRE_COMMIT_HOME=C:\somepath\pre-commit`
- PowerShell: `$Env:PRE_COMMIT_HOME = "C:\somepath\pre-commit"`
- git bash: `export PRE_COMMIT_HOME="/c/somepath/pre-commit"`

7.5.3 Documenting Code

The purpose of this description is to provide quick summary on documentation style used in [espressif/esp-idf](#) repository and how to add new documentation.

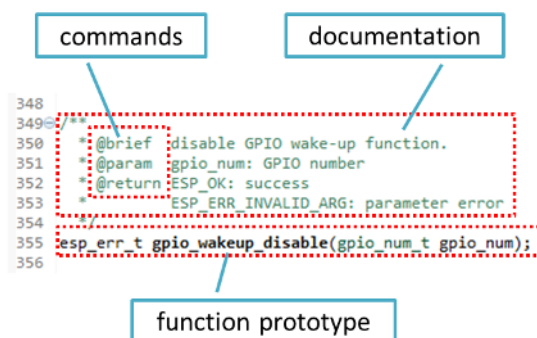

Introduction

When documenting code for this repository, please follow [Doxygen style](#). You are doing it by inserting special commands, for instance `@param`, into standard comments blocks, for example:

```
/**
 * @param ratio this is oxygen to air ratio
 */
```

Doxygen is phrasing the code, extracting the commands together with subsequent text, and building documentation out of it.

Typical comment block, that contains documentation of a function, looks like below.

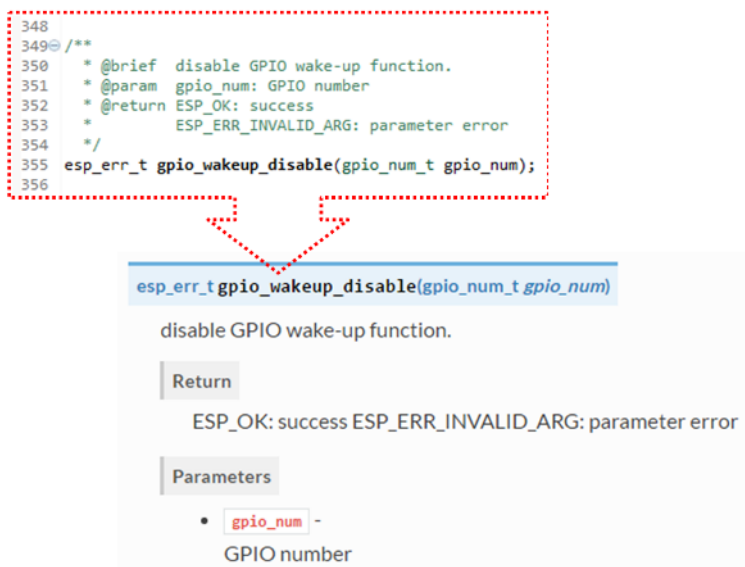

Doxygen supports couple of formatting styles. It also gives you great flexibility on level of details to include in documentation. To get familiar with available features, please check data rich and very well organized [Doxygen Manual](#).

Why we need it?

The ultimate goal is to ensure that all the code is consistently documented, so we can use tools like [Sphinx](#) and [Breathe](#) to aid preparation and automatic updates of API documentation when the code changes.

With these tools the above piece of code renders like below:

Go for it!

When writing code for this repository, please follow guidelines below.

1. Document all building blocks of code: functions, structs, typedefs, enums, macros, etc. Provide enough information about purpose, functionality and limitations of documented items, as you would like to see them documented when reading the code by others.
2. Documentation of function should describe what this function does. If it accepts input parameters and returns some value, all of them should be explained.
3. Do not add a data type before parameter or any other characters besides spaces. All spaces and line breaks are compressed into a single space. If you like to break a line, then break it twice.

```

41 @/**
42  * @brief Set log level for given tag
43  *
44  * If logging for given component has already been enabled, changes previous setting.
45  *
46  * @param tag Tag of the log entries to enable. Must be a non-NULL zero terminated string.
47  *           Value "" resets log level for all tags to the given value.
48  *
49  * @param level Selects log level to enable.
50  *             Only logs at this and lower levels will be shown.
51  */
52 void esp_log_level_set(const char* tag, esp_log_level_t level);
    
```

do not add data type

white spaces are compressed

a line break that will render

this line break will not render

```
void esp_log_level_set(const char* tag, esp_log_level_t level)
```

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

Parameters

- tag** - Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "" resets log level for all tags to the given value.
- level** - Selects log level to enable. Only logs at this and lower levels will be shown.

4. If function has void input or does not return any value, then skip @param or @return

```

26 @/**
27  * @brief Initialize BT controller
28  *
29  * This function should be called only once,
30  * before any other BT functions are called.
31  */
32 void bt_controller_init(void);
    
```

```
void bt_controller_init(void)
```

Initialize BT controller.

This function should be called only once, before any other BT functions are called.

5. When documenting a define as well as members of a struct or enum, place specific comment like below after each member.

```

45 @/**
46  * Mode of opening the non-volatile storage
47  *
48  */
49 @typedef enum {
50     NVS_READONLY, /*!< Read only */
51     NVS_READWRITE /*!< Read and write */
52 } nvs_open_mode;
    
```

enum nvs_open_mode

Mode of opening the non-volatile storage.

Values:

- NVS_READONLY**
Read only
- NVS_READWRITE**
Read and write

/*!< how to documented members */

6. To provide well formatted lists, break the line after command (like @return in example below).

```

*
* @return
*   - ESP_OK if erase operation was successful
    
```

(下页继续)

```
*   - ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
*   - ESP_ERR_NVS_READ_ONLY if handle was opened as read only
*   - ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
*   - other error codes from the underlying storage driver
*
```

7. Overview of functionality of documented header file, or group of files that make a library, should be placed in a separate README.rst file of the same directory. If this directory contains header files for different APIs, then the file name should be apiname-readme.rst.

Go one extra mile

Here are a couple of tips on how you can make your documentation even better and more useful to the reader and writer.

When writing codes, please follow the guidelines below:

1. Add code snippets to illustrate implementation. To do so, enclose snippet using @code{c} and @endcode commands.

```
*
* @code{c}
* // Example of using nvs_get_i32:
* int32_t max_buffer_size = 4096; // default value
* esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
* assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
* // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
* // have its default value.
* @endcode
*
```

The code snippet should be enclosed in a comment block of the function that it illustrates.

2. To highlight some important information use command @attention or @note.

```
*
* @attention
*   1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
*   2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to
*   ↪disconnect.
*
```

Above example also shows how to use a numbered list.

3. To provide common description to a group of similar functions, enclose them using /**@{*/ and /**@}*/ markup commands:

```
/**@{*/
/**
* @brief common description of similar functions
*
*/
void first_similar_function (void);
void second_similar_function (void);
/**@}*/
```

For practical example see [nvs_flash/include/nvs.h](#).

4. You may want to go even further and skip some code like repetitive defines or enumerations. In such case, enclose the code within /** @cond */ and /** @endcond */ commands. Example of such implementation is provided in [driver/include/driver/gpio.h](#).
5. Use markdown to make your documentation even more readable. You will add headers, links, tables and more.

```
*
* [ESP32-S3 Technical Reference Manual] (https://www.espressif.com/sites/
* ↪default/files/documentation/esp32-s3_technical_reference_manual_en.pdf)
*
```

备注: Code snippets, notes, links, etc. will not make it to the documentation, if not enclosed in a comment block associated with one of documented objects.

6. Prepare one or more complete code examples together with description. Place description to a separate file README.md in specific folder of `examples` directory.

Standardize Document Format

When it comes to text, please follow guidelines below to provide well formatted Markdown (.md) or reST (.rst) documents.

1. Please ensure that one paragraph is written in one line. Don't break lines like below. Breaking lines to enhance readability is only suitable for writing codes. To make the text easier to read, it is recommended to place an empty line to separate the paragraph.

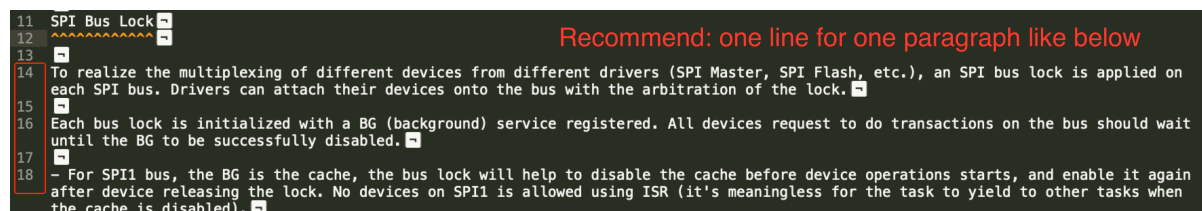

图 1: One line for one paragraph (click to enlarge)

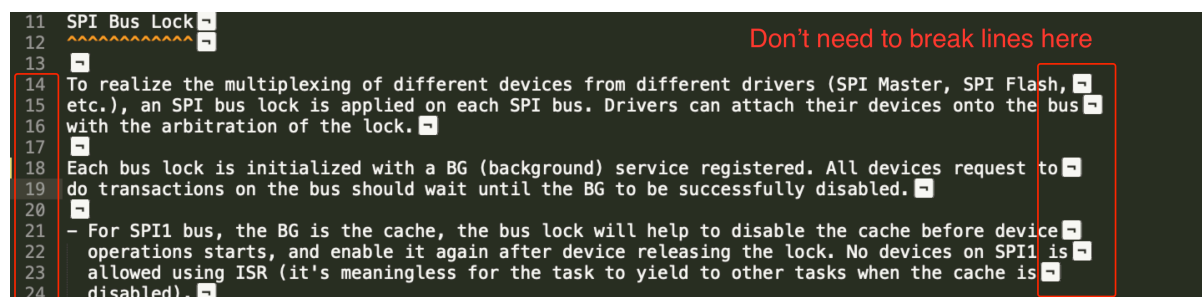

图 2: No line breaks within the same paragraph (click to enlarge)

2. Please make the line number of CN and EN documents consistent like below. The benefit of this approach is that it can save time for both writers and translators. When non-bilingual writers need to update text, they only need to update the same line in the corresponding CN or EN document. For translators, if documents are updated in English, then translators can quickly locate where to update in the corresponding CN document later. Besides, by comparing the total number of lines in EN and CN documents, you can quickly find out whether the CN version lags behind the EN version.

Building Documentation

The documentation is built with the `esp-docs` Python package, which is a wrapper around [Sphinx](#)

To install it simply do:

图 3: Keep the line number for EN and CN documents consistent (click to enlarge)

```
pip install esp-docs
```

After a successful install then the documentation can be built from the docs folder with:

```
build-docs build
```

or for specific target and language with:

```
build-docs -t esp32 -l en build
```

For more in-depth documentation about *esp-docs* features please see the documentation in the [esp-docs repository](#).

Wrap up

We love good code that is doing cool things. We love it even better, if it is well documented, so we can quickly make it run and also do the cool things.

Go ahead, contribute your code and documentation!

7.5.4 创建示例项目

每个 ESP-IDF 的示例都是一个完整的项目，其他人可以将示例复制至本地，并根据实际情况进行一定修改。请注意，示例项目主要是为了展示 ESP-IDF 的功能。

示例项目结构

- main 目录需要包含一个名为 (something)_example_main.c 的源文件，里面包含示例项目的主要功能。
- 如果该示例项目的子任务比较多，请根据逻辑将其拆分为 main 目录下的多个 C 或者 C++ 源文件，并将对应的头文件也放在同一目录下。

- 如果该示例项目具有多种功能，可以考虑在项目中增加一个 `components` 子目录，通过库功能，将示例项目的不同功能划分为不同的组件。注意，如果该组件提供的功能相对完整，且具有一定的通用性，则应该将它们添加到 ESP-IDF 的 `components` 目录中，使其成为 ESP-IDF 的一部分。
- 示例项目需要包含一个 `README.md` 文件，建议使用 [示例项目 README 模板](#)，并根据项目实际情况进行修改。
- 示例项目需要包含一个 `example_test.py` 文件，用于进行自动化测试。如果在 GitHub 上初次提交 Pull Request 时，可以先不包含这个脚本文件。具体细节，请见有关 [Pull Request](#) 的相关内容。

一般准则

示例代码需要遵循《乐鑫物联网开发框架风格指南》。

检查清单

提交一个新的示例项目之前，需要检查以下内容：

- 示例项目的名字（包括 `README.md` 中）应使用 `example`，而不要写“demo”，“test”等词汇。
- 每个示例项目只能有一个主要功能。如果某个示例项目有多个主要功能，请将其拆分为两个或更多示例项目。
- 每个示例项目应包含一个 `README.md` 文件，建议使用 [示例项目 README 模板](#)。
- 示例项目中的函数和变量的命令要遵循[命名规范](#)中的要求。对于仅在示例项目源文件中使用的非静态变量/函数，请使用 `example` 或其他类似的前缀。
- 示例项目中的所有代码结构良好，关键代码要有详细注释。
- 示例项目中所有不必要的代码（旧的调试日志，注释掉的代码等）都必须清除掉。
- 示例项目中使用的选项（比如网络名称，地址等）不得直接硬编码，应尽可能地使用配置项，或者定义为宏或常量。
- 配置项可见 `KConfig.projbuild` 文件，该文件中包含一个名为“Example Configuration”的菜单。具体情况，请查看现有示例项目。
- 所有的源代码都需要在文件开头指定许可信息（表示该代码是 in the public domain CC0）和免责声明。或者，源代码也可以应用 Apache License 2.0 许可条款。请查看现有示例项目的许可信息和免责声明，并根据实际情况进行修改。
- 任何第三方代码（无论是直接使用，还是进行了一些改进）均应保留原始代码中的许可信息，且这些代码的许可必须兼容 Apache License 2.0 协议。

7.5.5 API Documentation Template

备注: INSTRUCTIONS

1. Use this file ([docs/en/api-reference/template.rst](#)) as a template to document API.
 2. Change the file name to the name of the header file that represents documented API.
 3. Include respective files with descriptions from the API folder using `..include::`
 - `README.rst`
 - `example.rst`
 - ...
 4. Optionally provide description right in this file.
 5. Once done, remove all instructions like this one and any superfluous headers.
-

Overview

备注: INSTRUCTIONS

1. Provide overview where and how this API may be used.
2. Where applicable include code snippets to illustrate functionality of particular functions.

3. To distinguish between sections, use the following [heading levels](#):
 - # with overline, for parts
 - * with overline, for chapters
 - =, for sections
 - -, for subsections
 - ^, for subsubsections
 - ", for paragraphs
-

Application Example

备注: INSTRUCTIONS

1. Prepare one or more practical examples to demonstrate functionality of this API.
 2. Each example should follow pattern of projects located in `esp-idf/examples/` folder.
 3. Place example in this folder complete with `README.md` file.
 4. Provide overview of demonstrated functionality in `README.md`.
 5. With good overview reader should be able to understand what example does without opening the source code.
 6. Depending on complexity of example, break down description of code into parts and provide overview of functionality of each part.
 7. Include flow diagram and screenshots of application output if applicable.
 8. Finally add in this section synopsis of each example together with link to respective folder in `esp-idf/examples/`.
-

API Reference

备注: INSTRUCTIONS

1. This repository provides for automatic update of API reference documentation using *code markup retrieved by Doxygen from header files*.
1. Update is done on each documentation build by invoking Sphinx extension `:esp_extensions/run_doxygen.py` for all header files listed in the `INPUT` statement of `docs/doxygen/Doxyfile`.
1. Each line of the `INPUT` statement (other than a comment that begins with `##`) contains a path to header file `*.h` that will be used to generate corresponding `*.inc` files:

```
##  
## Wi-Fi - API Reference  
##  
../components/esp32/include/esp_wifi.h \  
../components/esp32/include/esp_smartconfig.h \  

```

1. When the headers are expanded, any macros defined by default in `sdkconfig.h` as well as any macros defined in SOC-specific `include/soc/*_caps.h` headers will be expanded. This allows the headers to include/exclude material based on the `IDF_TARGET` value.
1. The `*.inc` files contain formatted reference of API members generated automatically on each documentation build. All `*.inc` files are placed in `Sphinx_build` directory. To see directives generated for e.g. `esp_wifi.h`, run `python gen-dxd.py esp32/include/esp_wifi.h`.
1. To show contents of `*.inc` file in documentation, include it as follows:

```
.. include-build-file:: inc/esp_wifi.inc
```

For example see [docs/en/api-reference/network/esp_wifi.rst](#)

1. Optionally, rather than using *.inc files, you may want to describe API in your own way. See [docs/en/api-reference/storage/fatfs.rst](#) for example.

Below is the list of common .. doxygen...:: directives:

- Functions - .. doxygenfunction:: name_of_function
- Unions - .. doxygenunion:: name_of_union
- Structures - .. doxygenstruct:: name_of_structure together with :members:
- Macros - .. doxygendefine:: name_of_define
- Type Definitions - .. doxygentypedef:: name_of_type
- Enumerations - .. doxygenenum:: name_of_enumeration

See [Breathe documentation](#) for additional information.

To provide a link to header file, use the *link custom role* directive as follows:

```
* :component_file:`path_to/header_file.h`
```

1. In any case, to generate API reference, the file [docs/doxygen/Doxyfile](#) should be updated with paths to *.h headers that are being documented.
 1. When changes are committed and documentation is build, check how this section has been rendered. *Correct annotations* in respective header files, if required.
-

7.5.6 Contributor Agreement

Individual Contributor Non-Exclusive License Agreement including the Traditional Patent License OPTION

Thank you for your interest in contributing to this Espressif project hosted on GitHub (“We” or “Us”).

The purpose of this contributor agreement (“Agreement”) is to clarify and document the rights granted by contributors to Us. To make this document effective, please follow the instructions in the [Contributions Guide](#).

1. DEFINITIONS “You” means the Individual Copyright owner who submits a Contribution to Us. If You are an employee and submit the Contribution as part of your employment, You have had Your employer approve this Agreement or sign the Entity version of this document.

“**Contribution**” means any original work of authorship (software and/or documentation) including any modifications or additions to an existing work, Submitted by You to Us, in which You own the Copyright. If You do not own the Copyright in the entire work of authorship, please contact Us by submitting a comment on GitHub.

“**Copyright**” means all rights protecting works of authorship owned or controlled by You, including copyright, moral and neighboring rights, as appropriate, for the full term of their existence including any extensions by You.

“**Material**” means the software or documentation made available by Us to third parties. When this Agreement covers more than one software project, the Material means the software or documentation to which the Contribution was Submitted. After You Submit the Contribution, it may be included in the Material.

“**Submit**” means any form of physical, electronic, or written communication sent to Us, including but not limited to electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, Us, but excluding communication that is conspicuously marked or otherwise designated in writing by You as “Not a Contribution.”

“**Submission Date**” means the date You Submit a Contribution to Us.

“**Documentation**” means any non-software portion of a Contribution.

2. LICENSE GRANT 2.1 Copyright License to Us

Subject to the terms and conditions of this Agreement, You hereby grant to Us a worldwide, royalty-free, NON-exclusive, perpetual and irrevocable license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, under the Copyright covering the Contribution to use the Contribution by all means, including, but not limited to:

- to publish the Contribution,
- to modify the Contribution, to prepare derivative works based upon or containing the Contribution and to combine the Contribution with other software code,
- to reproduce the Contribution in original or modified form,
- to distribute, to make the Contribution available to the public, display and publicly perform the Contribution in original or modified form.

2.2 Moral Rights remain unaffected to the extent they are recognized and not waivable by applicable law. Notwithstanding, You may add your name in the header of the source code files of Your Contribution and We will respect this attribution when using Your Contribution.

3. PATENTS 3.1 Patent License

Subject to the terms and conditions of this Agreement You hereby grant to us a worldwide, royalty-free, non-exclusive, perpetual and irrevocable (except as stated in Section 3.2) patent license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, to make, have made, use, sell, offer for sale, import and otherwise transfer the Contribution and the Contribution in combination with the Material (and portions of such combination). This license applies to all patents owned or controlled by You, whether already acquired or hereafter acquired, that would be infringed by making, having made, using, selling, offering for sale, importing or otherwise transferring of Your Contribution(s) alone or by combination of Your Contribution(s) with the Material.

3.2 Revocation of Patent License

You reserve the right to revoke the patent license stated in section 3.1 if we make any infringement claim that is targeted at your Contribution and not asserted for a Defensive Purpose. An assertion of claims of the Patents shall be considered for a “Defensive Purpose” if the claims are asserted against an entity that has filed, maintained, threatened, or voluntarily participated in a patent infringement lawsuit against Us or any of Our licensees.

4. DISCLAIMER THE CONTRIBUTION IS PROVIDED “AS IS” . MORE PARTICULARLY, ALL EXPRESS OR IMPLIED WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT ARE EXPRESSLY DISCLAIMED BY YOU TO US AND BY US TO YOU. TO THE EXTENT THAT ANY SUCH WARRANTIES CANNOT BE DISCLAIMED, SUCH WARRANTY IS LIMITED IN DURATION TO THE MINIMUM PERIOD PERMITTED BY LAW.

5. Consequential Damage Waiver TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT WILL YOU OR US BE LIABLE FOR ANY LOSS OF PROFITS, LOSS OF ANTICIPATED SAVINGS, LOSS OF DATA, INDIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL AND EXEMPLARY DAMAGES ARISING OUT OF THIS AGREEMENT REGARDLESS OF THE LEGAL OR EQUITABLE THEORY (CONTRACT, TORT OR OTHERWISE) UPON WHICH THE CLAIM IS BASED.

6. Approximation of Disclaimer and Damage Waiver IF THE DISCLAIMER AND DAMAGE WAIVER MENTIONED IN SECTION 4 AND SECTION 5 CANNOT BE GIVEN LEGAL EFFECT UNDER APPLICABLE LOCAL LAW, REVIEWING COURTS SHALL APPLY LOCAL LAW THAT MOST CLOSELY APPROXIMATES AN ABSOLUTE WAIVER OF ALL CIVIL LIABILITY IN CONNECTION WITH THE CONTRIBUTION.

7. Term 7.1 This Agreement shall come into effect upon Your acceptance of the terms and conditions.

7.2 In the event of a termination of this Agreement Sections 4, 5, 6, 7 and 8 shall survive such termination and shall remain in full force thereafter. For the avoidance of doubt, Contributions that are already licensed under a free and open source license at the date of the termination shall remain in full force after the termination of this Agreement.

8. Miscellaneous 8.1 This Agreement and all disputes, claims, actions, suits or other proceedings arising out of this agreement or relating in any way to it shall be governed by the laws of People’s Republic of China excluding its private international law provisions.

8.2 This Agreement sets out the entire agreement between You and Us for Your Contributions to Us and overrides all other agreements or understandings.

8.3 If any provision of this Agreement is found void and unenforceable, such provision will be replaced to the extent possible with a provision that comes closest to the meaning of the original provision and that is enforceable. The terms and conditions set forth in this Agreement shall apply notwithstanding any failure of essential purpose of this Agreement or any limited remedy to the maximum extent possible under law.

8.4 You agree to notify Us of any facts or circumstances of which you become aware that would make this Agreement inaccurate in any respect.

7.5.7 Copyright Header Guide

ESP-IDF is released under [the Apache License 2.0](#) with some additional third-party copyrighted code released under various licenses. For further information please refer to [the list of copyrights and licenses](#).

This page explains how the source code should be properly marked with a copyright header. ESP-IDF uses [The Software Package Data Exchange \(SPDX\)](#) format which is short and can be easily read by humans or processed by automated tools for copyright checks.

How to Check the Copyright Headers

Please make sure you have installed [the pre-commit hooks](#) which contain a copyright header checker as well. The checker can suggest a header if it is not able to detect a properly formatted SPDX header.

What if the Checker's Suggestion is Incorrect?

No automated checker (no matter how good is) can replace humans. So the developer's responsibility is to modify the offered header to be in line with the law and the license restrictions of the original code on which the work is based on. Certain licenses are not compatible between each other. Such corner cases will be covered by the following examples.

The checker can be configured with the `tools/ci/check_copyright_config.yaml` configuration file. Please check the options it offers and consider updating it in order to match the headers correctly.

Common Examples of Copyright Headers

The simplest case is when the code is not based on any licensed previous work, e.g. it was written completely from scratch. Such code can be decorated with the following copyright header and put under the license of ESP-IDF:

```
/*
 * SPDX-FileCopyrightText: 2015-2022 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: Apache-2.0
 */
```

Less restrictive parts of ESP-IDF Some parts of ESP-IDF are deliberately under less restrictive licenses in order to ease their re-use in commercial closed source projects. This is the case for [ESP-IDF examples](#) which are in Public domain or under the Creative Commons Zero Universal (CC0) license. The following header can be used in such source files:

```
/*
 * SPDX-FileCopyrightText: 2015-2022 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: Unlicense OR CC0-1.0
 */
```

The option allowing multiple licenses joined with the OR keyword from the above example can be achieved with the definition of multiple allowed licenses in the `tools/ci/check_copyright_config.yaml` configuration file. Please use this option with care and only selectively for a limited part of ESP-IDF.

Third party licenses Code licensed under different licenses, modified by Espressif Systems and included in ESP-IDF cannot be licensed under Apache License 2.0 not even if the checker suggests it. It is advised to keep the original copyright header and add an SPDX before it.

The following example is a suitable header for a code licensed under the “GNU General Public License v2.0 or later” held by John Doe with some additional modifications done by Espressif Systems:

```
/*
 * SPDX-FileCopyrightText: 1991 John Doe
 *
 * SPDX-License-Identifier: GPL-2.0-or-later
 *
 * SPDX-FileContributor: 2019-2022 Espressif Systems (Shanghai) CO LTD
 */
```

The licenses can be identified and the short SPDX identifiers can be found in the official [SPDX license list](#). Other very common licenses are the GPL-2.0-only, the BSD-3-Clause, and the BSD-2-Clause.

The configuration stored in `tools/ci/check_copyright_config.yaml` offers features useful for third party licenses:

- A different license can be defined for the files part of a third party library.
- The check for a selected set of files can be permanently disabled. Please use this option with care and only in cases when none of the other options are suitable.

7.5.8 ESP-IDF Tests with Pytest Guide

This documentation is a guide that introduces the following aspects:

1. The basic idea of different test types in ESP-IDF
2. How to apply the pytest framework to the test python scripts to make sure the apps are working as expected.
3. ESP-IDF CI target test process
4. Run ESP-IDF tests with pytest locally

5. Tips and tricks on pytest

Disclaimer

In ESP-IDF, we use the following plugins by default:

- [pytest-embedded](#) with default services `esp`, `idf`
- [pytest-rerunfailures](#)

All the introduced concepts and usages are based on the default behavior in ESP-IDF. Not all of them are available in vanilla pytest.

Installation

All dependencies could be installed by running the install script with the `--enable-pytest` argument, e.g. `$ install.sh --enable-pytest`.

Common Issues During Installation

No Package 'dbus-1' found If you're facing an error message like:

```
configure: error: Package requirements (dbus-1 >= 1.8) were not met:
No package 'dbus-1' found
Consider adjusting the PKG_CONFIG_PATH environment variable if you
installed software in a non-standard prefix.
```

If you're running a ubuntu system, you may need to run:

```
sudo apt-get install libdbus-glib-1-dev
```

or

```
sudo apt-get install libdbus-1-dev
```

For other linux distros, you may Google the error message and find the solution. This issue could be solved by installing the related header files.

Invalid command 'bdist_wheel' If you're facing an error message like:

```
error: invalid command 'bdist_wheel'
```

You may need to run:

```
python -m pip install -U pip
```

Or

```
python -m pip install wheel
```

Before running the pip commands, please make sure you're using the IDF python virtual environment.

Basic Concepts

Component-based Unit Tests Component-based unit tests are our recommended way to test your component. All the test apps should be located under `$(IDF_PATH)/components/<COMPONENT_NAME>/test_apps`.

For example:

```

components/
├── my_component/
│   ├── include/
│   │   └── ...
│   ├── test_apps/
│   │   ├── test_app_1
│   │   │   ├── main/
│   │   │   │   └── ...
│   │   │   ├── CMakeLists.txt
│   │   │   └── pytest_my_component_app_1.py
│   │   ├── test_app_2
│   │   │   ├── ...
│   │   │   └── pytest_my_component_app_2.py
│   │   └── parent_folder
│   │       ├── test_app_3
│   │       │   ├── ...
│   │       │   └── pytest_my_component_app_3.py
│   │       └── ...
│   ├── my_component.c
│   └── CMakeLists.txt

```

Example Tests Example Tests are tests for examples that are intended to demonstrate parts of the ESP-IDF functionality to our customers.

All the test apps should be located under `$(IDF_PATH)/examples`. For more information please refer to the [Examples Readme](#).

For example:

```

examples/
├── parent_folder/
│   └── example_1/
│       ├── main/
│       │   └── ...
│       ├── CMakeLists.txt
│       └── pytest_example_1.py

```

Custom Tests Custom Tests are tests that aim to run some arbitrary test internally. They are not intended to demonstrate the ESP-IDF functionality to our customers in any way.

All the test apps should be located under `$(IDF_PATH)/tools/test_apps`. For more information please refer to the [Custom Test Readme](#).

Pytest in ESP-IDF

Pytest Execution Process

1. Bootstrapping Phase
 - Create session-scoped caches:
 - port-target cache
 - port-app cache
2. Collection Phase
 1. Get all the python files with the prefix `pytest_`

2. Get all the test functions with the prefix `test_`
 3. Apply the [params](#), and duplicate the test functions.
 4. Filter the test cases with CLI options. Introduced detailed usages [here](#)
3. Test Running Phase
 1. Construct the [fixtures](#). In ESP-IDF, the common fixtures are initialized in this order:
 1. `pexpect_proc`: [pexpect](#) instance
 2. `app`: [IdfApp](#) instance
The information of the app, like `sdkconfig`, `flash_files`, `partition_table`, etc., would be parsed at this phase.
 3. `serial`: [IdfSerial](#) instance
The port of the host which connected to the target type parsed from the app would be auto-detected.
The flash files would be auto flashed.
 4. `dut`: [IdfDut](#) instance
 2. Run the real test function
 3. Deconstruct the fixtures in this order:
 1. `dut`
 1. close the `serial` port
 2. (Only for apps with [unity test framework](#)) generate junit report of the unity test cases
 2. `serial`
 3. `app`
 4. `pexpect_proc`: Close the file descriptor
 4. (Only for apps with [unity test framework](#))
Raise `AssertionError` when detected unity test failed if you call `dut.expect_from_unity_output()` in the test function.
 4. Reporting Phase
 1. Generate junit report of the test functions
 2. Modify the junit report test case name into ESP-IDF test case ID format: `<target>.<config>.<test function name>`
 5. Finalizing Phase (Only for apps with [unity test framework](#))
Combine the junit reports if the junit reports of the unity test cases are generated.

Example Code This code example is taken from `pytest_console_basic.py`.

```
@pytest.mark.esp32
@pytest.mark.esp32c3
@pytest.mark.generic
@pytest.mark.parametrize('config', [
    'history',
    'nohistory',
], indirect=True)
def test_console_advanced(config: str, dut: Dut) -> None:
    if config == 'history':
        dut.expect('Command history enabled')
    elif config == 'nohistory':
        dut.expect('Command history disabled')
```

备注: Using `expect_exact` is better here. For further reading about the different types of `expect` functions, please refer to the [pytest-embedded Expecting documentation](#).

Use Markers to Specify the Supported Targets You can use markers to specify the supported targets and the test env in CI. You can run `pytest --markers` to get more details about different markers.

```
@pytest.mark.esp32      # <-- support esp32
@pytest.mark.esp32c3   # <-- support esp32c3
@pytest.mark.generic    # <-- test env `generic, would assign to runner with tag_
↳ `generic`
```

Besides, if the test case supports all officially ESP-IDF-supported targets, like esp32, esp32s2, esp32s3, esp32c3 for now (2022.2), you can use a special marker `supported_targets` to apply them all in one line.

This code example is taken from `pytest_gptimer_example.py`.

```
@pytest.mark.supported_targets
@pytest.mark.generic
def test_gptimer_example(dut: Dut) -> None:
    ...
```

Use Params to Specify the sdkconfig Files You can use `pytest.mark.parametrize` with “config” to apply the same test to different apps with different sdkconfig files. For more information about `sdkconfig.ci.xxx` files, please refer to the Configuration Files section under [this readme](#).

```
@pytest.mark.parametrize('config', [
    'history',      # <-- run with app built by sdkconfig.ci.history
    'nohistory',   # <-- run with app built by sdkconfig.ci.nohistory
], indirect=True) # <-- `indirect=True` is required
```

Overall, this test function would be replicated to 4 test cases:

- esp32.history.test_console_advanced
- esp32.nohistory.test_console_advanced
- esp32c3.history.test_console_advanced
- esp32c3.nohistory.test_console_advanced

Advanced Examples

Multi Dut Tests with the Same App

```
@pytest.mark.esp32s2
@pytest.mark.esp32s3
@pytest.mark.usb_host
@pytest.mark.parametrize('count', [
    2,
], indirect=True)
def test_usb_host(dut: Tuple[IdfDut, IdfDut]) -> None:
    device = dut[0] # <-- assume the first dut is the device
    host = dut[1]  # <-- and the second dut is the host
    ...
```

After setting the param `count` to 2, all these fixtures are changed into tuples.

Multi Dut Tests with Different Apps This code example is taken from `pytest_wifi_getting_started.py`.

```
@pytest.mark.esp32
@pytest.mark.multi_dut_generic
@pytest.mark.parametrize(
    'count, app_path', [
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
→path.dirname(__file__), "station")}'),
    ], indirect=True
)
def test_wifi_getting_started(dut: Tuple[IdfDut, IdfDut]) -> None:
    softap = dut[0]
    station = dut[1]
    ...
```

Here the first dut was flashed with the app [softap](#) , and the second dut was flashed with the app [station](#) .

备注: Here the `app_path` should be set with absolute path. the `__file__` macro in python would return the absolute path of the test script itself.

Multi Dut Tests with Different Apps, and Targets This code example is taken from [pytest_wifi_getting_started.py](#) . As the comment says, for now it' s not running in the ESP-IDF CI.

```
@pytest.mark.parametrize(
    'count, app_path, target', [
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↪path.dirname(__file__), "station")}|',
         'esp32|esp32s2'),
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↪path.dirname(__file__), "station")}|',
         'esp32s2|esp32'),
    ],
    indirect=True,
)
def test_wifi_getting_started(dut: Tuple[IdfDut, IdfDut]) -> None:
    softap = dut[0]
    station = dut[1]
    ...
```

Overall, this test function would be replicated to 2 test cases:

- softap with esp32 target, and station with esp32s2 target
- softap with esp32s2 target, and station with esp32 target

Support different targets with different sdkconfig files This code example is taken from [pytest_panic.py](#) as an advanced example.

```
CONFIGS = [
    pytest.param('coredump_flash_bin_crc', marks=[pytest.mark.esp32, pytest.mark.
↪esp32s2]),
    pytest.param('coredump_flash_elf_sha', marks=[pytest.mark.esp32]), # sha256_
↪only supported on esp32
    pytest.param('coredump_uart_bin_crc', marks=[pytest.mark.esp32, pytest.mark.
↪esp32s2]),
    pytest.param('coredump_uart_elf_crc', marks=[pytest.mark.esp32, pytest.mark.
↪esp32s2]),
    pytest.param('gdbstub', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
    pytest.param('panic', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
]

@pytest.mark.parametrize('config', CONFIGS, indirect=True)
...

```

Use Custom Class Usually, you can write a custom class in these conditions:

1. Add more reusable functions for a certain number of DUTs
2. Add custom setup and teardown functions in different phases described [here](#)

This code example is taken from [panic/confest.py](#)

```

class PanicTestDut (IdfDut) :
    ...

@pytest.fixture(scope='module')
def monkeypatch_module(request: FixtureRequest) -> MonkeyPatch:
    mp = MonkeyPatch()
    request.addfinalizer(mp.undo)
    return mp

@pytest.fixture(scope='module', autouse=True)
def replace_dut_class(monkeypatch_module: MonkeyPatch) -> None:
    monkeypatch_module setattr('pytest_embedded_idf.dut.IdfDut', PanicTestDut)

```

`monkeypatch_module` provide a [module-scoped monkeypatch](#) fixture.

`replace_dut_class` is a [module-scoped autouse](#) fixture. This function replaces the `IdfDut` class with your custom class.

Mark Flaky Tests Sometimes, our test is based on ethernet or wifi. The network may cause the test flaky. We could mark the single test case within the code repo.

This code example is taken from [pytest_esp_eth.py](#)

```

@pytest.mark.flaky(reruns=3, reruns_delay=5)
def test_esp_eth_ip101(dut: Dut) -> None:
    ...

```

This flaky marker means that if the test function failed, the test case would rerun for a maximum of 3 times with 5 seconds delay.

Mark Known Failure Cases Sometimes a test couldn't pass for the following reasons:

- Has a bug
- The success ratio is too low because of environment issue, such as network issue. Retry couldn't help

Now you may mark this test case with marker `xfail` with a user-friendly readable reason.

This code example is taken from [pytest_panic.py](#)

```

@pytest.mark.xfail('config.getvalue("target") == "esp32s2"', reason='raised_
↳IllegalInstruction instead')
def test_cache_error(dut: PanicTestDut, config: str, test_func_name: str) -> None:

```

This marker means that if the test would be a known failure one on esp32s2.

Mark Nightly Run Test Cases Some tests cases are only triggered in nightly run pipelines due to a lack of runners.

```

@pytest.mark.nightly_run

```

This marker means that the test case would only be run with env var `NIGHTLY_RUN` or `INCLUDE_NIGHTLY_RUN`.

Run the Tests in CI

The workflow in CI is simple, build jobs -> target test jobs.

Build Jobs

Build Job Names

- Component-based Unit Tests: `build_pytest_components_<target>`
- Example Tests: `build_pytest_examples_<target>`
- Custom Tests: `build_pytest_test_apps_<target>`

Build Job Command The command used by CI to build all the relevant tests is: `python $IDF_PATH/tools/ci/ci_build_apps.py <parent_dir> --target <target> -vv --pytest-apps`

All apps which supported the specified target would be built with all supported `sdkconfig` files under `build_<target>_<config>`.

For example, If you run `python $IDF_PATH/tools/ci/ci_build_apps.py $IDF_PATH/examples/system/console/basic --target esp32 --pytest-apps`, the folder structure would be like this:

```
basic
├── build_esp32_history/
│   └── ...
├── build_esp32_nohistory/
│   └── ...
├── main/
├── CMakeLists.txt
├── pytest_console_basic.py
└── ...
```

All the binaries folders would be uploaded as artifacts under the same directories.

Target Test Jobs

Target Test Job Names

- Component-based Unit Tests: `component_ut_pytest_<target>_<test_env>`
- Example Tests: `example_test_pytest_<target>_<test_env>`
- Custom Tests: `test_app_test_pytest_<target>_<test_env>`

Target Test Job Command The command used by CI to run all the relevant tests is: `pytest <parent_dir> --target <target> -m <test_env_marker>`

All test cases with the specified target marker and the test env marker under the parent folder would be executed.

The binaries in the target test jobs are downloaded from build jobs, the artifacts would be placed under the same directories.

Run the Tests Locally

The local executing process is the same as the CI process.

For example, if you want to run all the esp32 tests under the `$IDF_PATH/examples/system/console/basic` folder, you may:

```
$ pip install pytest-embedded-serial-esp pytest-embedded-idf
$ cd $IDF_PATH
$ ./export.sh
$ cd examples/system/console/basic
$ python $IDF_PATH/tools/ci/ci_build_apps.py . --target esp32 -vv --pytest-apps
$ pytest --target esp32
```

Tips and Tricks

Filter the Test Cases

- filter by target with `pytest --target <target>`
pytest would run all the test cases that support specified target.
- filter by sdkconfig file with `pytest --sdkconfig <sdkconfig>`
if `<sdkconfig>` is default, pytest would run all the test cases with the sdkconfig file `sdkconfig.defaults`.
In other cases, pytest would run all the test cases with sdkconfig file `sdkconfig.ci.<sdkconfig>`.

Add New Markers We're using two types of custom markers, target markers which indicate that the test cases should support this target, and env markers which indicate that the test case should be assigned to runners with these tags in CI.

You can add new markers by adding one line under the `#{IDF_PATH}/pytest.ini` `markers =` section. The grammar should be: `<marker_name>: <marker_description>`

Generate JUnit Report You can call pytest with `--junitxml <filepath>` to generate the JUnit report. In ESP-IDF, the test case name would be unified as “`<target>.<config>.<function_name>`” .

Skip Auto Flash Binary Skipping auto-flash binary every time would be useful when you're debugging your test script.

You can call pytest with `--skip-autoload y` to achieve it.

Record Statistics Sometimes you may need to record some statistics while running the tests, like the performance test statistics.

You can use `record_xml_attribute` fixture in your test script, and the statistics would be recorded as attributes in the JUnit report.

Logging System Sometimes you may need to add some extra logging lines while running the test cases.

You can use `python logging module` to achieve this.

Known Limitations and Workarounds

Avoid Using Thread for Performance Test `pytest-embedded` is using some threads internally to help gather all stdout to the pexpect process. Due to the limitation of `Global Interpreter Lock`, if you're using threads to do performance tests, these threads would block each other and there would be great performance loss.

workaround

Use `Process` instead, the APIs should be almost the same as `Thread`.

- pytest-embedded documentation: <https://docs.espressif.com/projects/pytest-embedded/en/latest/>

Chapter 8

ESP-IDF 版本简介

ESP-IDF 的 GitHub 仓库时常更新，特别是用于开发新特性的 `master` 分支。
如有量产需求，请使用稳定版本。

8.1 发布版本

您可以通过以下链接访问各个版本的配套文档：

- 最新稳定版 ESP-IDF：https://docs.espressif.com/projects/esp-idf/zh_CN/stable/
- 最新版 ESP-IDF（即 `master` 分支）：https://docs.espressif.com/projects/esp-idf/zh_CN/latest/

ESP-IDF 在 GitHub 平台上的完整发布历史请见 [发布说明页面](#)。您可以在该页面查看各个版本的发布说明、配套文档及相应获取方式。

8.2 我该选择哪个版本？

- 如有量产需求，请使用 [最新稳定版本](#)。稳定版本已通过人工测试，后续更新仅修复 `bug`，主要特性不受影响（更多详情，请见 [版本管理](#)）。请访问 [发布说明页面](#) 界面查看每一个稳定发布版本。
- 如需尝试/测试 ESP-IDF 的最新特性，请使用 [最新版本（在 `master` 分支上）](#)。最新版本包含 ESP-IDF 的所有最新特性，已通过自动化测试，但尚未全部完成人工测试（因此存在一定风险）。
- 如需使用稳定版本中没有的新特性，但同时又不希望受到 `master` 分支更新的影响，您可以将一个最适合您的稳定版本 [更新至一个预发布版本](#) 或 [更新至一个发布分支](#)。
- 如需使用其他基于 ESP-IDF 的项目，请先查看该项目的文档，以确定其兼容的 ESP-IDF 版本。

有关如何更新 ESP-IDF 本地副本的内容，请参考 [更新 ESP-IDF](#) 章节。

8.3 版本管理

ESP-IDF 采用了 [语义版本管理方法](#)，即您可以从字面含义理解每个版本的差异。其中

- 主要版本（例 `v3.0`）代表有重大更新，包括增加新特性、改变现有特性及移除已弃用的特性。
升级至一个新的主要版本（例 `v2.1` 升级至 `v3.0`）意味着您可能需要更新工程代码，并重新测试工程，具体可参考 [发布说明页面](#) 的重大变更 (`Breaking Change`) 部分。
- 次要版本（例 `v3.1`）代表有新增特性和 `bug` 修复，但现有特性不受影响，公开 API 的使用也不受影响。
升级至一个新的次要版本（例 `v3.0` 升级至 `v3.1`）意味着您可能不需要更新您的工程代码，但需重新测试您的工程，特别是 [发布说明页面](#) 中专门提到的部分。
- `Bugfix` 版本（例 `v3.0.1`）仅修复 `bug`，并不增加任何新特性。

升级至一个新的 **Bugfix** 版本（例 v3.0 升级至 v3.0.1）意味着您不需要更新您的工程代码，仅需测试与本次发布修复 **bug**（列表见 [发布说明页面](#)）直接相关的特性。

8.4 支持期限

ESP-IDF 的每个主要版本和次要版本都有相应的支持期限。支持期限满后，版本停止更新维护，将不再提供支持。

[支持期限政策](#) 对此有具体描述，并介绍了每个版本的支持期限是如何界定的。

[发布说明页面](#) 界面上的每一个发布版本都提供了该版本的支持期限信息。

一般而言：

- 如您刚开始一个新项目，建议使用最新稳定版本。
- 如您有 [GitHub](#) 账号，请点击 [发布说明页面](#) 界面右上角的“Watch”按钮，并选中“Releases only”选项。[GitHub](#) 将会在新版本发布的时候通知您。当您所使用的版本有 **Bugfix** 版本发布时，请做好升级至该 **Bugfix** 版本的规划。
- 如可能，请定期（如每年一次）将项目的 **IDF** 版本升级至一个新的主要版本或次要版本。对于次要版本更新，更新过程应该比较简单，但对于主要版本更新，可能需要细致查看发布说明并做对应的更新规划。
- 请确保您所使用的版本停止更新维护前，已做好升级至新版本的规划。

ESP-IDF 的每个主要版本和次要版本（V4.1、V4.2 等）的支持期限为 30 个月，从最初的稳定版发布日期算起。

在支持期限内意味着 ESP-IDF 团队将继续在 [GitHub](#) 的发布分支上进行 **bug** 修复、安全修复等，并根据需要定期发布新的 **Bugfix** 版本。

支持期限分为“服务期”和“维护期”：

周期	时长	是否推荐新工程使用
服务期	12 个月	是
维护期	18 个月	否

在服务期内，**Bugfix** 版本的发布更为频繁。某些情况下，在服务期内会增加新特性，这些特性主要是为了满足新产品特定监管要求或标准，并且回归风险非常低。

在维护期内，该版本仍受支持，但只会对严重性较高的问题或安全问题进行 **bug** 修复。

当开始一个新项目时，建议使用在服务期内的版本。

鼓励用户在您所用的版本支持期限结束之前，将所有的工程升级到最新的 ESP-IDF 版本。在版本支持期限满后，我们将不再继续进行 **bug** 修复。

支持期限不包括预发布版本（betas、预览版、*-rc* 和 *-dev* 版等），有时会将某个特性在发布版中标记为“预览版”，这意味着该特性也不在支持期限内。

关于 [不同版本的 ESP-IDF](#)（主要版本、次要版本、**Bugfix** 版本等）的更多信息，请参考 [ESP-IDF 编程指南](#)。

8.5 查看当前版本

查看 ESP-IDF 本地副本的版本，请使用 `idf.py` 命令：

```
idf.py --version
```

此外，由于 ESP-IDF 的版本也已编译至固件中，因此您也可以使用宏 `IDF_VER` 查看 ESP-IDF 的版本（以字符串的格式）。ESP-IDF 默认引导程序会在设备启动时打印 ESP-IDF 的版本。请注意，在 GitHub 仓库中的代码更新时，代码中的版本信息仅会在源代码重新编译或在清除编译时才会更新，因此打印出来的版本可能并不是最新的。

如果编写的代码需要支持多个 ESP-IDF 版本，可以在编译时使用 *compile-time macros* 检查版本。

几个 ESP-IDF 版本的例子：

版本字符串	含义
v3.2-dev-306-gbeb3611ca	<p>master 分支上的预发布版本。</p> <ul style="list-style-type: none"> - v3.2-dev: 为 v3.2 进行的开发。 - 306: v3.2 开发启动后的 commit 数量。 - beb3611ca: commit 标识符。
v3.0.2	稳定版本，标签为 v3.0.2。
v3.1-beta1-75-g346d6b0ea	<p>v3.1 的 beta 测试版本（可参考更新至一个发布分支）。</p> <ul style="list-style-type: none"> - v3.1-beta1 - 预发布标签。 - 75: 添加预发布 beta 标签后的 commit 数量。 - 346d6b0ea: commit 标识符。
v3.0.1-dirty	<p>稳定版本，标签为 v3.0.1。</p> <ul style="list-style-type: none"> - dirty 代表 ESP-IDF 的本地副本有修改。

8.6 Git 工作流

乐鑫 ESP-IDF 团队的 (Git) 开发工作流程如下：

- 新的改动总是在 `master` 分支（最新版本）上进行。`master` 分支上的 ESP-IDF 版本总带有 `-dev` 标签，表示“正在开发中”，例 `v3.1-dev`。
- 这些改动将首先在乐鑫的内部 Git 仓库进行代码审阅与测试，而后在自动化测试完成后推至 GitHub。
- 新版本一旦完成特性开发（在 `master` 分支上进行）并达到进入 `beta` 测试的标准，则将该版本切换至一个新分支（例 `release/v3.1`）。此外，该分支还打上预发布标签（例 `v3.1-beta1`）。您可以在 GitHub 平台上查看 ESP-IDF 的完整 [分支列表](#) 和 [标签列表](#)。`Beta` 预发布版本可能仍存在大量“已知问题”（Known Issue）。
- 随着对 `beta` 版本的不断测试，`bug` 修复将同时增加至该发布分支和 `master` 分支。而且，`master` 分支可能也已经开始为下个版本开发新特性了。
- 当测试快结束时，该发布分支上将增加一个 `rc` 标签，代表候选发布（Release Candidate），例 `v3.1-rc1`。此时，该分支仍属于预发布版本。
- 如果一直未发现或报告重大 `bug`，则该预发布版本将最终增加“主要版本”（例 `v4.0`）或“次要版本”标记（例 `v3.1`），成为正式发布版本，并体现在 [发布说明页面](#)。
- 后续，发布版本中发现的 `bug` 都将在该发布分支上进行修复。
- 发布分支上会定期进行 `bug` 修复，人工测试完成后，该分支将增加一个 `Bugfix` 版本标签（例 `v3.1.1`），并体现在 [发布说明页面](#)。

8.7 更新 ESP-IDF

请根据您的实际情况，对 ESP-IDF 进行更新。

- 如有量产用途，建议参考[更新至一个稳定发布版本](#)。
- 如需测试/研发/尝试最新特性，建议参考[更新至 `master` 分支](#)。
- 两者折衷建议参考[更新至一个发布分支](#)。

备注： 在参考本指南时，请首先获得 ESP-IDF 的本地副本，具体步骤请参考[入门指南](#) 中的介绍。

8.7.1 更新至一个稳定发布版本

对于量产用户，推荐更新至一个新的 ESP-IDF 发布版本，请参考以下步骤：

- 请定期查看 [发布说明页面](#)，了解最新发布情况。
- 如有新发布的 `Bugfix` 版本（例 `v3.0.1` 或 `v3.0.2`）时，请将新的 `Bugfix` 版本更新至您的 ESP-IDF 目录：

```
cd $IDF_PATH
git fetch
git checkout vX.Y.Z
git submodule update --init --recursive
```

- 在主要版本或次要版本新发布时，请查看发布说明中的具体描述，并决定是否升级您的版本。具体命令与上方描述一致。

备注： 如果您之前在安装 ESP-IDF 时使用了 `zip` 文件包，而非通过 `Git` 命令，则您将无法使用 `Git` 命令进行版本升级，此属正常情况。这种情况下，请重新下载最新 `zip` 文件包，并替换掉之前 `IDF_PATH` 下的全部内容。

8.7.2 更新至一个预发布版本

您也可以将您的本地副本切换（命令 `git checkout`）至一个预发布版本或 rc 版本，具体方法请参考[更新至一个稳定发布版本](#) 中的描述。

预发布版本通常不体现在 [发布说明页面](#)。更多详情，请查看完整 [标签列表](#)。使用预发布版本的注意事项，请参考[更新至一个发布分支](#) 中的描述。

8.7.3 更新至 master 分支

备注：ESP-IDF 中 master 分支上的代码会时时更新，因此使用 master 分支相当在“流血的边缘试探”，存在一定风险。

如需使用 ESP-IDF 的 master 分支，请参考以下步骤：

- 本地切换至 master 分支：

```
cd $IDF_PATH
git checkout master
git pull
git submodule update --init --recursive
```

- 此外，您还应在后续工作中不时使用 `git pull` 命令，将远端 master 上的更新同步到本地。注意，在更新 master 分支后，您可能需要更改工程代码，也可能遇到新的 bug。
- 如需从 master 分支切换至一个发布分支或稳定版本，请使用 `git checkout` 命令。

重要：强烈建议您定期使用 `git pull` 和 `git submodule update --init --recursive` 命令，确保本地副本得到及时更新。旧的 master 分支相当于一个“快照”，可能存在未记录的问题，且无法获得支持。对于半稳定版本，请参考[更新至一个发布分支](#)。

8.7.4 更新至一个发布分支

从稳定性来说，使用“发布分支”相当于在使用 master 分支和稳定版本之间进行折衷，包含一些 master 分支上的新特性，但也同时保证可通过 beta 测试且基本完成了 bug 修复。

更多详情，请前往 [GitHub](#) 查看完整 [标签列表](#)。

举例，您可以关注 ESP-IDF v3.1 分支，随时关注该分支上的 Bugfix 版本发布（例 v3.1.1 等）：

```
cd $IDF_PATH
git fetch
git checkout release/v3.1
git pull
git submodule update --init --recursive
```

您每次在该分支上使用 `git pull` 时都相当于把最新的 Bugfix 版本发布更新至您的本地副本中。

备注：发布分支并不会会有专门的配套文档，建议您使用与本分支最接近版本的文档。

Chapter 9

资源

9.1 PlatformIO

- [What is PlatformIO?](#)
- [Installation](#)
- [Configuration](#)
- [Tutorials](#)
- [Project Examples](#)
- [Next Steps](#)

9.1.1 What is PlatformIO?

PlatformIO is a cross-platform embedded development environment with out-of-the-box support for ESP-IDF.

Since ESP-IDF support within PlatformIO is not maintained by the Espressif team, please report any issues with PlatformIO directly to its developers in [the official PlatformIO repositories](#).

A detailed overview of the PlatformIO ecosystem and its philosophy can be found in [the official PlatformIO documentation](#).

9.1.2 Installation

- [PlatformIO IDE](#) is a toolset for embedded C/C++ development available on Windows, macOS and Linux platforms
- [PlatformIO Core \(CLI\)](#) is a command-line tool that consists of multi-platform build system, platform and library managers and other integration components. It can be used with a variety of code development environments and allows integration with cloud platforms and web services

9.1.3 Configuration

Please go through [the official PlatformIO configuration guide](#) for ESP-IDF.

9.1.4 Tutorials

- [ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis](#)

9.1.5 Project Examples

Please check ESP-IDF page in [the official PlatformIO documentation](#)

9.1.6 Next Steps

Here are some useful links for exploring the PlatformIO ecosystem:

- Learn more about [integrations with other IDEs/Text Editors](#)
- Get help from [PlatformIO community](#)

9.2 有用的链接

- 您可以在 [ESP32 论坛](#) 中提出您的问题，访问社区资源。
- 您可以通过 [GitHub](#) 的 [Issues](#) 版块提交 bug 或功能请求。在提交新 Issue 之前，请先查看现有的 [Issues](#)。
- 您可以在 [ESP IoT Solution](#) 库中找到基于 ESP-IDF 的 [解决方案](#)、[应用实例](#)、[组件和驱动](#) 等内容。多数文档均提供中英文版本。
- 通过 [Arduino](#) 平台开发应用，请参考 [ESP32](#)、[ESP32-S2](#) 和 [ESP32-C3](#) 芯片的 [Arduino 内核](#)。
- 关于 ESP32 的书籍列表，请查看 [乐鑫](#) 网站。
- 如果您有兴趣参与到 ESP-IDF 的开发，请查阅 [Contributions Guide](#)。
- 关于 ESP32-S3 的其它信息，请查看官网 [文档](#) 版块。
- 关于本文档的 PDF 和 HTML 格式下载（最新版本和早期版本），请点击 [下载](#)。

Copyrights and Licenses

10.1 Software Copyrights

All original source code in this repository is Copyright (C) 2015-2022 Espressif Systems. This source code is licensed under the Apache License 2.0 as described in the file LICENSE.

Additional third party copyrighted code is included under the following licenses.

Where source code headers specify Copyright & License information, this information takes precedence over the summaries made here.

Some examples use external components which are not Apache licensed, please check the copyright description in each example source code.

10.1.1 Firmware Components

These third party libraries can be included into the application (firmware) produced by ESP-IDF.

- [Newlib](#) is licensed under the BSD License and is Copyright of various parties, as described in [COPYING.NEWLIB](#).
- [Xtensa header files](#) are Copyright (C) 2013 Tensilica Inc and are licensed under the MIT License as reproduced in the individual header files.
- Original parts of [FreeRTOS](#) (components/freertos) are Copyright (C) 2017 Amazon.com, Inc. or its affiliates are licensed under the MIT License, as described in [license.txt](#).
- Original parts of [LWIP](#) (components/lwip) are Copyright (C) 2001, 2002 Swedish Institute of Computer Science and are licensed under the BSD License as described in [COPYING file](#).
- [wpa_supplicant](#) Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- [FreeBSD net80211](#) Copyright (c) 2004-2008 Sam Leffler, Errno Consulting and licensed under the BSD license.
- [argtable3](#) argument parsing library Copyright (C) 1998-2001,2003-2011,2013 Stewart Heitmann and licensed under 3-clause BSD license. [argtable3](#) also includes the following software components. For details, please see [argtable3 LICENSE file](#).
 - C Hash Table library, Copyright (c) 2002, Christopher Clark and licensed under 3-clause BSD license.
 - The Better String library, Copyright (c) 2014, Paul Hsieh and licensed under 3-clause BSD license.
 - TCL library, Copyright the Regents of the University of California, Sun Microsystems, Inc., Scriptics Corporation, ActiveState Corporation and other parties, and licensed under TCL/TK License.
- [linenoise](#) line editing library Copyright (c) 2010-2014 Salvatore Sanfilippo, Copyright (c) 2010-2013 Pieter Noordhuis, licensed under 2-clause BSD license.
- [FatFS](#) library, Copyright (C) 2017 ChaN, is licensed under [a BSD-style license](#) .
- [cJSON](#) library, Copyright (c) 2009-2017 Dave Gamble and cJSON contributors, is licensed under MIT license as described in [LICENSE file](#) .
- [micro-eccl](#) library, Copyright (c) 2014 Kenneth MacKay, is licensed under 2-clause BSD license.

- [Mbed TLS](#) library, Copyright (C) 2006-2018 ARM Limited, is licensed under Apache License 2.0 as described in [LICENSE file](#) .
- [SPIFFS](#) library, Copyright (c) 2013-2017 Peter Andersson, is licensed under MIT license as described in [LICENSE file](#) .
- [SD/MMC driver](#) is derived from [OpenBSD SD/MMC driver](#), Copyright (c) 2006 Uwe Stuehler, and is licensed under BSD license.
- [ESP-MQTT](#) MQTT Package (contiki-mqtt) - Copyright (c) 2014, Stephen Robinson, MQTT-ESP - Tuan PM <tuanpm at live dot com> is licensed under Apache License 2.0 as described in [LICENSE file](#) .
- [BLE Mesh](#) is adapted from Zephyr Project, Copyright (c) 2017-2018 Intel Corporation and licensed under Apache License 2.0

- [TLSF allocator](#) Two Level Segregated Fit memory allocator, Copyright (c) 2006-2016, Matthew Conte, and licensed under the BSD 3-clause license.
- [openthread](#), Copyright (c) The OpenThread Authors, is licensed under BSD License as described in [LICENSE file](#).
- [UBSAN runtime](#) —Copyright (c) 2016, Linaro Limited and Jiří Závěručky, licensed under the BSD 2-clause license.
- [HTTP Parser](#) Based on src/http/nginx_http_parse.c from NGINX copyright Igor Sysoev. Additional changes are licensed under the same terms as NGINX and Joyent, Inc. and other Node contributors. For details please check [LICENSE file](#).
- [SEGGER SystemView](#) target-side library, Copyright (c) 2015-2017 SEGGER Microcontroller GmbH & Co. KG, is licensed under BSD 3-clause license.

10.1.2 Documentation

- HTML version of the [ESP-IDF Programming Guide](#) uses the Sphinx theme [sphinx_idf_theme](#), which is Copyright (c) 2013-2020 Dave Snider, Read the Docs, Inc. & contributors, and Espressif Systems (Shanghai) CO., LTD. It is based on [sphinx_rtd_theme](#). Both are licensed under MIT license.

10.2 ROM Source Code Copyrights

ESP32, ESP32-S and ESP32-C Series SoCs mask ROM hardware includes binaries compiled from portions of the following third party software:

- [Newlib](#) , licensed under the BSD License and is Copyright of various parties, as described in [COPYING.NEWLIB](#).
- Xtensa libhal, Copyright (c) Tensilica Inc and licensed under the MIT license (see below).
- [TinyBasic](#) Plus, Copyright Mike Field & Scott Lawrence and licensed under the MIT license (see below).
- [miniz](#), by Rich Geldreich - placed into the public domain.
- [wpa_supplicant](#) Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- [TJpgDec](#) Copyright (C) 2011, ChaN, all right reserved. See below for license.

10.3 Xtensa libhal MIT License

Copyright (c) 2003, 2006, 2010 Tensilica Inc.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software”), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

10.4 TinyBasic Plus MIT License

Copyright (c) 2012-2013

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software”), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

10.5 TjpgDec License

TjpgDec - Tiny JPEG Decompressor R0.01 (C)ChaN, 2011 The TjpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

- The TjpgDec module is a free software and there is NO WARRANTY.
- No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.
- Redistributions of source code must retain the above copyright notice.

Chapter 11

关于本指南

本指南为 ESP32-S3 官方应用开发框架 **ESP-IDF** 的配套文档。

ESP32-S3 是一款支持 2.4 GHz Wi-Fi 和低功耗蓝牙的芯片，搭载 Xtensa® 32 位 LX7 处理器。

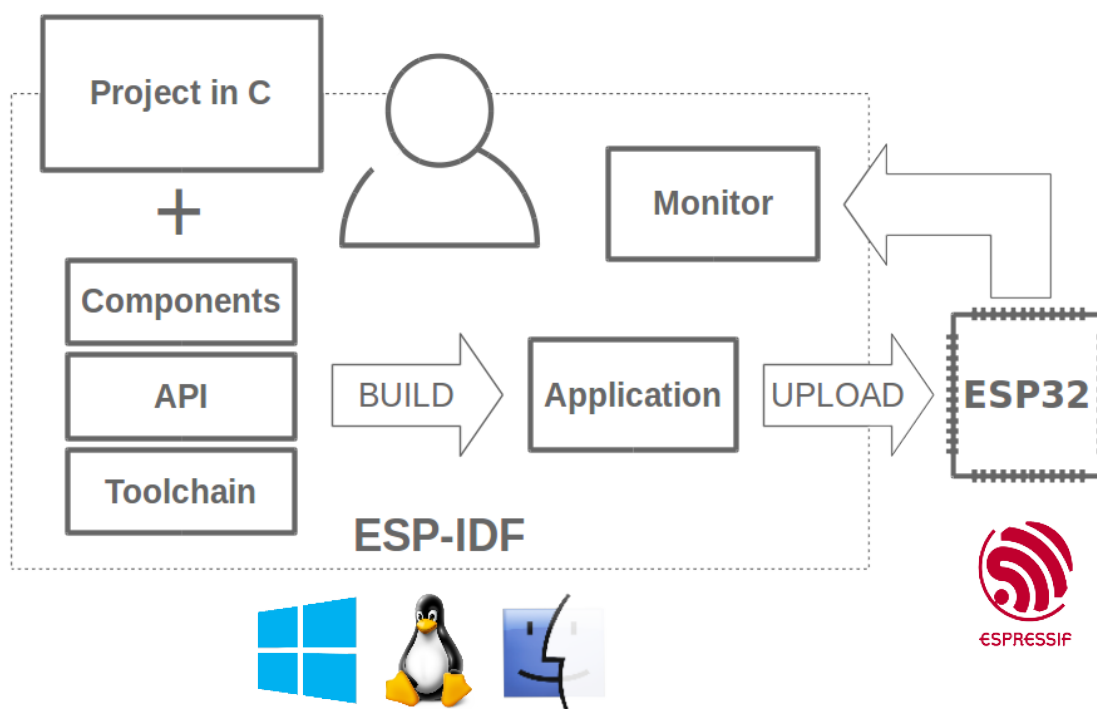

图 1: 乐鑫物联网综合开发框架

ESP-IDF 即乐鑫物联网开发框架，可为在 Windows、Linux 和 macOS 系统平台上开发 ESP32-S3 应用程序提供工具链、API、组件和工作流程的支持。

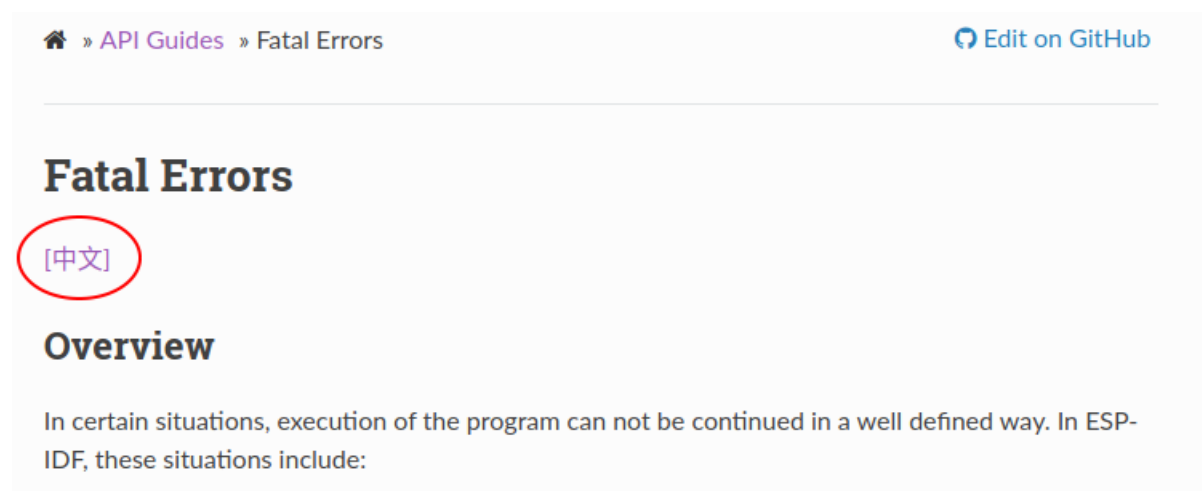

Chapter 12

切换语言

《ESP-IDF 编程指南》部分文档现在有两种语言的版本。如有出入请以英文版本为准。

- 英文
- 中文

如下图所示，如果该文档两种语言版本均具备，您可以通过点击文档上方的语言链接轻松进行语言切换。
