ESP32-C3

ESP-IDF Programming Guide

Release v5.1-rc2
乐鑫信息科技
2023 年 06 月 15 日

Table of contents

Table of contents i

1 快速入门 **3**
- 1.1 概述 . . . 3
- 1.2 准备工作 . . . 3
  - 1.2.1 硬件: . . . 3
  - 1.2.2 软件: . . . 12
- 1.3 安装 . . . 13
  - 1.3.1 IDE . . . 13
  - 1.3.2 手动安装 . . . 13
- 1.4 编译第一个工程 . . . 43

2 API 参考 **45**
- 2.1 API Conventions . . . 45
  - 2.1.1 Error handling . . . 45
  - 2.1.2 Configuration structures . . . 45
  - 2.1.3 Private APIs . . . 47
  - 2.1.4 Components in example projects . . . 47
  - 2.1.5 API Stability . . . 47
- 2.2 应用层协议 . . . 48
  - 2.2.1 ASIO port . . . 48
  - 2.2.2 ESP-Modbus . . . 48
  - 2.2.3 ESP-MQTT . . . 49
  - 2.2.4 ESP-TLS . . . 65
  - 2.2.5 ESP HTTP 客户端 . . . 81
  - 2.2.6 ESP Local Control . . . 97
  - 2.2.7 ESP Serial Slave Link . . . 106
  - 2.2.8 ESP x509 Certificate Bundle . . . 120
  - 2.2.9 HTTP 服务器 . . . 122
  - 2.2.10 HTTPS 服务器 . . . 150
  - 2.2.11 ICMP Echo . . . 153
  - 2.2.12 mDNS 服务 . . . 158
  - 2.2.13 Mbed TLS . . . 159
  - 2.2.14 IP 网络层协议 . . . 160
- 2.3 蓝牙 API . . . 160
  - 2.3.1 BT COMMON . . . 161
  - 2.3.2 BT LE . . . 169
  - 2.3.3 Controller && VHCI . . . 293
  - 2.3.4 ESP-BLE-MESH . . . 302
  - 2.3.5 NimBLE-based host APIs . . . 584
- 2.4 错误代码参考 . . . 586
- 2.5 连网 API . . . 593
  - 2.5.1 Wi-Fi . . . 593
  - 2.5.2 以太网 . . . 713
  - 2.5.3 Thread . . . 741
  - 2.5.4 IP 网络层协议 . . . 749
  - 2.5.5 IP 网络层协议 . . . 784

2.5.6 应用层协议 . . . 786
2.6 外设 API . . . 786
2.6.1 Analog to Digital Converter (ADC) Oneshot Mode Driver . . . 786
2.6.2 Analog to Digital Converter (ADC) Continuous Mode Driver . . . 796
2.6.3 Analog to Digital Converter (ADC) Calibration Driver . . . 804
2.6.4 Clock Tree . . . 807
2.6.5 GPIO & RTC GPIO . . . 817
2.6.6 通用定时器 . . . 834
2.6.7 专用 GPIO . . . 848
2.6.8 Hash-based Message Authentication Code (HMAC) . . . 853
2.6.9 Digital Signature (DS) . . . 857
2.6.10 I2C 驱动程序 . . . 862
2.6.11 I2S . . . 880
2.6.12 LCD . . . 919
2.6.13 LED PWM 控制器 . . . 932
2.6.14 Remote Control Transceiver (RMT) . . . 950
2.6.15 SD SPI Host Driver . . . 975
2.6.16 Sigma-Delta Modulation (SDM) . . . 980
2.6.17 SPI Flash API . . . 985
2.6.18 SPI Master Driver . . . 1014
2.6.19 SPI 从机驱动程序 . . . 1036
2.6.20 SPI Slave Half Duplex . . . 1042
2.6.21 Temperature Sensor . . . 1050
2.6.22 Two-Wire Automotive Interface (TWAI) . . . 1053
2.6.23 通用异步接收器/发送器 (UART) . . . 1071
2.7 项目配置 . . . 1094
2.7.1 简介 . . . 1094
2.7.2 项目配置菜单 . . . 1094
2.7.3 使用 sdkconfig.defaults . . . 1095
2.7.4 Kconfig 格式规定 . . . 1095
2.7.5 Kconfig 选项的向后兼容性 . . . 1095
2.7.6 配置选项参考 . . . 1095
2.8 配网 API . . . 1367
2.8.1 Protocol Communication . . . 1367
2.8.2 Unified Provisioning . . . 1382
2.8.3 Wi-Fi Provisioning . . . 1386
2.9 存储 API . . . 1406
2.9.1 FAT 文件系统 . . . 1407
2.9.2 量产程序 . . . 1413
2.9.3 非易失性存储库 . . . 1417
2.9.4 NVS 分区生成程序 . . . 1439
2.9.5 NVS 分区解析程序 . . . 1444
2.9.6 SD/SDIO/MMC 驱动程序 . . . 1444
2.9.7 分区 API . . . 1457
2.9.8 SPIFFS 文件系统 . . . 1466
2.9.9 虚拟文件系统组件 . . . 1470
2.9.10 磨损均衡 API . . . 1485
2.10 System API . . . 1489
2.10.1 App Image Format . . . 1489
2.10.2 Application Level Tracing . . . 1495
2.10.3 Call function with external stack . . . 1500
2.10.4 Chip Revision . . . 1501
2.10.5 控制台终端 . . . 1504
2.10.6 eFuse Manager . . . 1513
2.10.7 Error Codes and Helper Functions . . . 1545
2.10.8 ESP HTTPS OTA . . . 1548
2.10.9 Event Loop Library . . . 1554
2.10.10 FreeRTOS (Overview) . . . 1567

2.10.11 FreeRTOS (ESP-IDF) . . . 1569
2.10.12 FreeRTOS (Supplemental Features) . . . 1690
2.10.13 Heap Memory Allocation . . . 1714
2.10.14 Memory Management for MMU Supported Memory . . . 1727
2.10.15 Heap Memory Debugging . . . 1734
2.10.16 High Resolution Timer (ESP Timer) . . . 1746
2.10.17 Internal and Unstable APIs . . . 1752
2.10.18 Interrupt allocation . . . 1754
2.10.19 Logging library . . . 1759
2.10.20 杂项系统 API . . . 1766
2.10.21 空中升级 (OTA) . . . 1782
2.10.22 电源管理 . . . 1793
2.10.23 POSIX Threads Support . . . 1800
2.10.24 Random Number Generation . . . 1804
2.10.25 睡眠模式 . . . 1807
2.10.26 SoC Capabilities . . . 1817
2.10.27 系统时间 . . . 1829
2.10.28 The Async memcpy API . . . 1835
2.10.29 Watchdogs . . . 1839

3 H/W 硬件参考 1847

4 API 指南 1849
4.1 应用层跟踪库 . . . 1849
4.1.1 概述 . . . 1849
4.1.2 运行模式 . . . 1849
4.1.3 配置选项与依赖项 . . . 1850
4.1.4 如何使用此库 . . . 1851
4.2 应用程序的启动流程 . . . 1858
4.2.1 一级引导程序 . . . 1858
4.2.2 二级引导程序 . . . 1859
4.2.3 应用程序启动阶段 . . . 1859
4.3 BluFi . . . 1860
4.3.1 概览 . . . 1861
4.3.2 BluFi 流程 . . . 1861
4.3.3 BluFi 流程图 . . . 1861
4.3.4 BluFi 中定义的帧格式 . . . 1861
4.3.5 ESP32-C3 端的安全实现 . . . 1866
4.3.6 GATT 相关说明 . . . 1867
4.4 引导加载程序 (Bootloader) . . . 1867
4.4.1 引导加载程序兼容性 . . . 1867
4.4.2 日志级别 . . . 1868
4.4.3 恢复出厂设置 . . . 1868
4.4.4 从测试固件启动 . . . 1869
4.4.5 回滚 . . . 1869
4.4.6 看门狗 . . . 1869
4.4.7 引导加载程序大小 . . . 1869
4.4.8 从深度睡眠中快速启动 . . . 1870
4.4.9 自定义引导加载程序 . . . 1870
4.5 构建系统 . . . 1870
4.5.1 概述 . . . 1870
4.5.2 使用构建系统 . . . 1871
4.5.3 示例项目 . . . 1872
4.5.4 项目 CMakeLists 文件 . . . 1873
4.5.5 组件 CMakeLists 文件 . . . 1875
4.5.6 组件配置 . . . 1876
4.5.7 预处理器定义 . . . 1877
4.5.8 组件依赖 . . . 1877

4.5.9 覆盖项目的部分设置 . . . 1881
4.5.10 仅配置组件 . . . 1882
4.5.11 CMake 调试 . . . 1882
4.5.12 组件 CMakeLists 示例 . . . 1882
4.5.13 自定义 sdkconfig 的默认值 . . . 1886
4.5.14 Flash 参数 . . . 1886
4.5.15 构建 Bootloader . . . 1887
4.5.16 编写纯 CMake 组件 . . . 1887
4.5.17 组件中使用第三方 CMake 项目 . . . 1887
4.5.18 组件中使用预建库 . . . 1888
4.5.19 在自定义 CMake 项目中使用 ESP-IDF . . . 1888
4.5.20 ESP-IDF CMake 构建系统 API . . . 1889
4.5.21 文件通配 & 增量构建 . . . 1893
4.5.22 构建系统的元数据 . . . 1893
4.5.23 构建系统内部 . . . 1894
4.5.24 从 ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统 . . . 1895
4.6 RF 共存 . . . 1896
4.6.1 概览 . . . 1896
4.6.2 ESP32-C3 支持的共存场景 . . . 1897
4.6.3 共存机制与策略 . . . 1897
4.6.4 如何使用共存功能 . . . 1898
4.7 Core Dump . . . 1899
4.7.1 Overview . . . 1899
4.7.2 Configurations . . . 1899
4.7.3 Save core dump to flash . . . 1900
4.7.4 Print core dump to UART . . . 1901
4.7.5 ROM Functions in Backtraces . . . 1901
4.7.6 Dumping variables on demand . . . 1901
4.7.7 Running `idf.py coredump-info` and `idf.py coredump-debug` . . . 1902
4.8 C++ Support . . . 1902
4.8.1 esp-idf-cxx Component . . . 1904
4.8.2 C++ language standard . . . 1904
4.8.3 Multithreading . . . 1904
4.8.4 Exception handling . . . 1905
4.8.5 Runtime Type Information (RTTI) . . . 1905
4.8.6 Developing in C++ . . . 1905
4.8.7 Limitations . . . 1907
4.8.8 What to Avoid . . . 1907
4.9 Deep Sleep Wake Stubs . . . 1907
4.9.1 Rules for Wake Stubs . . . 1907
4.9.2 Implementing A Stub . . . 1907
4.9.3 Loading Code Into RTC Memory . . . 1908
4.9.4 Loading Data Into RTC Memory . . . 1908
4.9.5 CRC Check For Wake Stubs . . . 1909
4.9.6 Example . . . 1909
4.10 错误处理 . . . 1909
4.10.1 概述 . . . 1909
4.10.2 错误码 . . . 1909
4.10.3 错误码到错误消息 . . . 1909
4.10.4 `ESP_ERROR_CHECK` 宏 . . . 1910
4.10.5 `ESP_ERROR_CHECK_WITHOUT_ABORT` 宏 . . . 1910
4.10.6 `ESP_RETURN_ON_ERROR` 宏 . . . 1910
4.10.7 `ESP_GOTO_ON_ERROR` 宏 . . . 1911
4.10.8 `ESP_RETURN_ON_FALSE` 宏 . . . 1911
4.10.9 `ESP_GOTO_ON_FALSE` 宏 . . . 1911
4.10.10 `CHECK` 宏使用示例 . . . 1911
4.10.11 错误处理模式 . . . 1911
4.10.12 C++ 异常 . . . 1912

4.11 ESP-BLE-MESH . . . 1912
4.11.1 ESP-BLE-MESH 快速入门 . . . 1913
4.11.2 ESP-BLE-MESH 示例 . . . 1920
4.11.3 ESP-BLE-MESH 演示视频 . . . 1920
4.11.4 ESP-BLE-MESH 常见问题手册 . . . 1920
4.11.5 相关文档 . . . 1920
4.12 ESP-WIFI-MESH . . . 1946
4.12.1 概述 . . . 1946
4.12.2 简介 . . . 1947
4.12.3 ESP-WIFI-MESH 概念 . . . 1948
4.12.4 建立网络 . . . 1952
4.12.5 管理网络 . . . 1957
4.12.6 数据传输 . . . 1959
4.12.7 信道切换 . . . 1962
4.12.8 性能 . . . 1964
4.12.9 更多注意事项 . . . 1965
4.13 严重错误 . . . 1965
4.13.1 概述 . . . 1965
4.13.2 紧急处理程序 . . . 1965
4.13.3 寄存器转储与回溯 . . . 1966
4.13.4 GDB Stub . . . 1969
4.13.5 RTC 看门狗超时 . . . 1969
4.13.6 Guru Meditation 错误 . . . 1969
4.13.7 其他严重错误 . . . 1971
4.14 flash 加密 . . . 1973
4.14.1 概述 . . . 1973
4.14.2 相关 eFuses . . . 1973
4.14.3 flash 的加密过程 . . . 1974
4.14.4 flash 加密设置 . . . 1975
4.14.5 可能出现的错误 . . . 1980
4.14.6 ESP32-C3 flash 加密状态 . . . 1981
4.14.7 在加密的 flash 中读写数据 . . . 1981
4.14.8 更新加密的 flash . . . 1982
4.14.9 关闭 flash 加密 . . . 1983
4.14.10 flash 加密的要点 . . . 1983
4.14.11 flash 加密的局限性 . . . 1983
4.14.12 flash 加密与安全启动 . . . 1984
4.14.13 flash 加密的高级功能 . . . 1984
4.14.14 技术细节 . . . 1985
4.15 Hardware Abstraction . . . 1985
4.15.1 Architecture . . . 1986
4.15.2 LL (Low Level) Layer . . . 1987
4.15.3 HAL (Hardware Abstraction Layer) . . . 1988
4.16 JTAG 调试 . . . 1989
4.16.1 引言 . . . 1989
4.16.2 工作原理 . . . 1989
4.16.3 选择 JTAG 适配器 . . . 1990
4.16.4 安装 OpenOCD . . . 1991
4.16.5 配置 ESP32-C3 目标板 . . . 1991
4.16.6 启动调试器 . . . 1994
4.16.7 调试范例 . . . 1994
4.16.8 从源码构建 OpenOCD . . . 1994
4.16.9 注意事项和补充内容 . . . 1999
4.16.10 相关文档 . . . 2003
4.17 链接器脚本生成机制 . . . 2028
4.17.1 概述 . . . 2028
4.17.2 快速上手 . . . 2028
4.17.3 链接器脚本生成机制内核 . . . 2031

4.18 lwIP . . . 2037
4.18.1 Supported APIs . . . 2037
4.18.2 BSD Sockets API . . . 2037
4.18.3 Netconn API . . . 2041
4.18.4 lwIP FreeRTOS Task . . . 2042
4.18.5 IPv6 Support . . . 2042
4.18.6 esp-lwip custom modifications . . . 2043
4.18.7 Performance Optimization . . . 2044
4.19 存储器类型 . . . 2045
4.19.1 DRAM（数据 RAM） . . . 2045
4.19.2 IRAM（指令 RAM） . . . 2046
4.19.3 IROM（代码从 flash 中运行） . . . 2047
4.19.4 DROM（数据存储在 flash 中） . . . 2047
4.19.5 RTC FAST memory（RTC 快速存储器） . . . 2047
4.19.6 具备 DMA 功能 . . . 2047
4.19.7 在堆栈中放置 DMA 缓冲区 . . . 2048
4.20 OpenThread . . . 2048
4.20.1 Mode of the OpenThread stack . . . 2048
4.20.2 How To Write an OpenThread Application . . . 2049
4.20.3 The OpenThread border router . . . 2050
4.21 分区表 . . . 2050
4.21.1 概述 . . . 2050
4.21.2 内置分区表 . . . 2050
4.21.3 创建自定义分区表 . . . 2051
4.21.4 生成二进制分区表 . . . 2053
4.21.5 分区大小检查 . . . 2053
4.21.6 烧写分区表 . . . 2054
4.21.7 分区工具 (parttool.py) . . . 2054
4.22 Performance . . . 2055
4.22.1 How to Optimize Performance . . . 2056
4.22.2 Guides . . . 2056
4.23 Reproducible Builds . . . 2073
4.23.1 Introduction . . . 2073
4.23.2 Reasons for non-reproducible builds . . . 2073
4.23.3 Enabling reproducible builds in ESP-IDF . . . 2073
4.23.4 How reproducible builds are achieved . . . 2073
4.23.5 Reproducible builds and debugging . . . 2074
4.23.6 Factors which still affect reproducible builds . . . 2074
4.24 RF calibration . . . 2074
4.24.1 Partial calibration . . . 2074
4.24.2 Full calibration . . . 2074
4.24.3 No calibration . . . 2075
4.24.4 PHY initialization data . . . 2075
4.24.5 API Reference . . . 2075
4.25 Security . . . 2082
4.25.1 Goals . . . 2082
4.25.2 Platform Security . . . 2082
4.25.3 Network Security . . . 2084
4.25.4 Product Security . . . 2084
4.25.5 Security Policy . . . 2085
4.26 Secure Boot V2 . . . 2086
4.26.1 Background . . . 2086
4.26.2 Advantages . . . 2086
4.26.3 Secure Boot V2 Process . . . 2087
4.26.4 Signature Block Format . . . 2087
4.26.5 Secure Padding . . . 2088
4.26.6 Verifying a Signature Block . . . 2089
4.26.7 Verifying an Image . . . 2089

4.26.8 Bootloader Size . . . 2089
4.26.9 eFuse usage . . . 2089
4.26.10 How To Enable Secure Boot V2 . . . 2089
4.26.11 Restrictions after Secure Boot is enabled . . . 2090
4.26.12 Generating Secure Boot Signing Key . . . 2091
4.26.13 Remote Signing of Images . . . 2091
4.26.14 Secure Boot Best Practices . . . 2092
4.26.15 Key Management . . . 2092
4.26.16 Multiple Keys . . . 2092
4.26.17 Key Revocation . . . 2093
4.26.18 Technical Details . . . 2093
4.26.19 Secure Boot & Flash Encryption . . . 2094
4.26.20 Signed App Verification Without Hardware Secure Boot . . . 2094
4.26.21 Advanced Features . . . 2094
4.27 Thread Local Storage . . . 2095
4.27.1 Overview . . . 2095
4.27.2 FreeRTOS Native API . . . 2095
4.27.3 Pthread API . . . 2095
4.27.4 C11 Standard . . . 2095
4.28 工具 . . . 2096
4.28.1 IDF Frontend - idf.py . . . 2096
4.28.2 IDF Docker Image . . . 2099
4.28.3 IDF Windows Installer . . . 2102
4.28.4 IDF Component Manager . . . 2103
4.28.5 IDF Clang Tidy . . . 2104
4.28.6 Downloadable Tools . . . 2105
4.29 ESP32-C3 中的单元测试 . . . 2118
4.29.1 添加常规测试用例 . . . 2118
4.29.2 添加多设备测试用例 . . . 2119
4.29.3 添加多阶段测试用例 . . . 2119
4.29.4 应用于不同芯片的单元测试 . . . 2120
4.29.5 编译单元测试程序 . . . 2121
4.29.6 运行单元测试 . . . 2121
4.29.7 带缓存补偿定时器的定时代码 . . . 2122
4.29.8 Mocks . . . 2123
4.30 Running Applications on Host . . . 2125
4.30.1 Introduction . . . 2125
4.30.2 Requirements . . . 2126
4.30.3 Build and Run . . . 2126
4.30.4 Component Linux/Mock Support Overview . . . 2126
4.31 USB Serial/JTAG Controller Console . . . 2127
4.31.1 Hardware Requirements . . . 2127
4.31.2 Software Configuration . . . 2127
4.31.3 Uploading the Application . . . 2128
4.31.4 Limitations . . . 2128
4.32 Wi-Fi 驱动程序 . . . 2128
4.32.1 ESP32-C3 Wi-Fi 功能列表 . . . 2129
4.32.2 如何编写 Wi-Fi 应用程序 . . . 2129
4.32.3 ESP32-C3 Wi-Fi API 错误代码 . . . 2130
4.32.4 初始化 ESP32-C3 Wi-Fi API 参数 . . . 2130
4.32.5 ESP32-C3 Wi-Fi 编程模型 . . . 2130
4.32.6 ESP32-C3 Wi-Fi 事件描述 . . . 2131
4.32.7 ESP32-C3 Wi-Fi station 一般情况 . . . 2133
4.32.8 ESP32-C3 Wi-Fi AP 一般情况 . . . 2136
4.32.9 ESP32-C3 Wi-Fi 扫描 . . . 2136
4.32.10 ESP32-C3 Wi-Fi station 连接场景 . . . 2143
4.32.11 找到多个 AP 时的 ESP32-C3 Wi-Fi station 连接 . . . 2149

这里是乐鑫 IoT 开发框架 (esp-idf) 的文档中心。ESP-IDF 是 ESP32、ESP32-S 和 ESP32-C 系列芯片的官方开发框架。

本文档仅包含针对 ESP32-C3 芯片的 ESP-IDF 使用。

		
快速入门	API 参考	API 指南

Chapter 1

快速入门

本文档旨在指导用户搭建 ESP32-C3 硬件开发的软件环境，通过一个简单的示例展示如何使用 ESP-IDF (Espressif IoT Development Framework) 配置菜单，并编译、下载固件至 ESP32-C3 开发板等步骤。

备注： 这是 ESP-IDF tag `v5.1-rc2` 版本的文档，还有其他版本的文档*ESP-IDF 版本简介* 供参考。

1.1 概述

ESP32-C3 SoC 芯片支持以下功能：

- 2.4 GHz Wi-Fi
- 低功耗蓝牙
- 高性能 32 位 RISC-V 单核处理器
- 多种外设
- 内置安全硬件

ESP32-C3 采用 40 nm 工艺制成，具有最佳的功耗性能、射频性能、稳定性、通用性和可靠性，适用于各种应用场景和不同功耗需求。

乐鑫为用户提供完整的软、硬件资源，进行 ESP32-C3 硬件设备的开发。其中，乐鑫的软件开发环境 ESP-IDF 旨在协助用户快速开发物联网 (IoT) 应用，可满足用户对 Wi-Fi、蓝牙、低功耗等方面的要求。

1.2 准备工作

1.2.1 硬件：

- 一款 **ESP32-C3** 开发板
- **USB 数据线** (A 转 Micro-B)
- 电脑（Windows、Linux 或 macOS）

备注： 目前一些开发板使用的是 USB Type C 接口。请确保使用合适的数据线来连接开发板!

以下是 ESP32-C3 官方开发板，点击链接可了解更多硬件信息。

ESP32-C3-DevKitM-1

本指南将帮助您快速上手 ESP32-C3-DevKitM-1，并提供该款开发板的详细信息。

ESP32-C3-DevKitM-1 是一款入门级开发板，使用以尺寸小而得名的 ESP32-C3-MINI-1 模组。该款开发板具备完整的 Wi-Fi 和低功耗蓝牙功能。

板上模组大部分管脚均已引出至两侧排针，开发人员可根据实际需求，轻松通过跳线连接多种外围设备，同时也可将开发板插在面包板上使用。

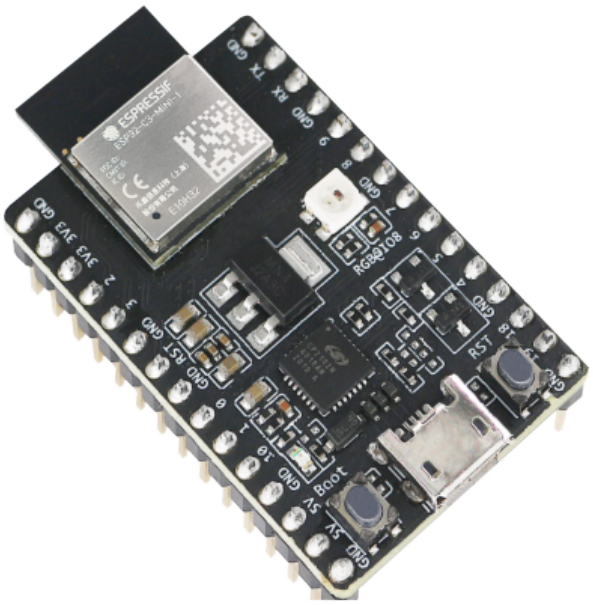

图 1: ESP32-C3-DevKitM-1

本指南包括如下内容：

- 入门指南：简要介绍了 ESP32-C3-DevKitM-1 和硬件、软件设置指南。
- 硬件参考：详细介绍了 ESP32-C3-DevKitM-1 的硬件。
- 硬件版本：介绍硬件历史版本和已知问题，并提供链接至历史版本开发板的入门指南（如有）。
- 相关文档：列出了相关文档的链接。

入门指南 本小节将简要介绍 ESP32-C3-DevKitM-1，说明如何在 ESP32-C3-DevKitM-1 上烧录固件及相关准备工作。

组件介绍 以下按照逆时针的顺序依次介绍开发板上的主要组件。

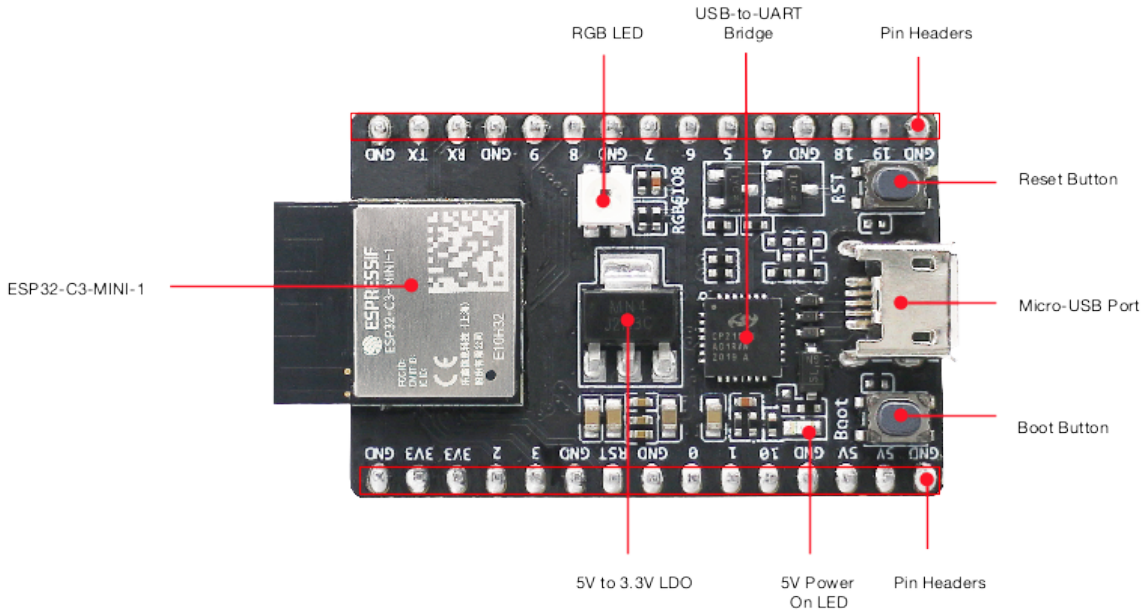

图 2: ESP32-C3-DevKitM-1 - 正面

主要组件	介绍
ESP32-C3-MINI-1	ESP32-C3-MINI-1 是一款通用型 Wi-Fi 和低功耗蓝牙双模模组，采用 PCB 板载天线。该款模组集成配置 4 MB 嵌入式 flash 的 ESP32-C3FN4 芯片。由于 flash 直接封装在芯片中，ESP32-C3-MINI-1 模组具有更小的封装尺寸。
5 V to 3.3 V LDO（5 V 转 3.3 V LDO）	电源转换器，输入 5 V，输出 3.3 V。
5 V Power On LED（5 V 电源指示灯）	开发板连接 USB 电源后，该指示灯亮起。
Pin Headers（排针）	所有可用 GPIO 管脚（除 flash 的 SPI 总线）均已引出至开发板的排针。请查看排针 获取更多信息。
Boot Button（Boot 键）	下载按键。按住 **Boot** 键的同时按一下 **Reset** 键进入“固件下载”模式，通过串口下载固件。
Micro-USB Port（Micro-USB 接口）	USB 接口。可用作开发板的供电电源或 PC 和 ESP32-C3FN4 芯片的通信接口。
Reset Button（Reset 键）	复位按键。
USB-to-UART Bridge（USB 至 UART 桥接器）	单芯片 USB 至 UART 桥接器，可提供高达 3 Mbps 的传输速率。
RGB LED	可寻址 RGB 发光二极管，由 GPIO8 驱动。

开始开发应用　通电前，请确保 ESP32-C3-DevKitM-1 完好无损。

必备硬件

- ESP32-C3-DevKitM-1
- USB 2.0 数据线（标准 A 型转 Micro-B 型）
- 电脑（Windows、Linux 或 macOS）

备注： 请确保使用适当的 USB 数据线。部分数据线仅可用于充电，无法用于数据传输和编程。

软件设置 请前往快速入门，在安装 小节查看如何快速设置开发环境，将应用程序烧录至 ESP32-C3-DevKitM-1。

内含组件和包装

零售订单 如购买样品，每个 ESP32-C3-DevKitM-1 开发板将以防静电袋或零售商选择的其他方式包装。

零售订单请前往 https://www.espressif.com/zh-hans/company/contact/buy-a-sample。

批量订单 如批量购买，ESP32-C3-DevKitM-1 开发板将以大纸板箱包装。

批量订单请前往 https://www.espressif.com/zh-hans/contact-us/sales-questions。

硬件参考

功能框图 ESP32-C3-DevKitM-1 的主要组件和连接方式如下图所示。

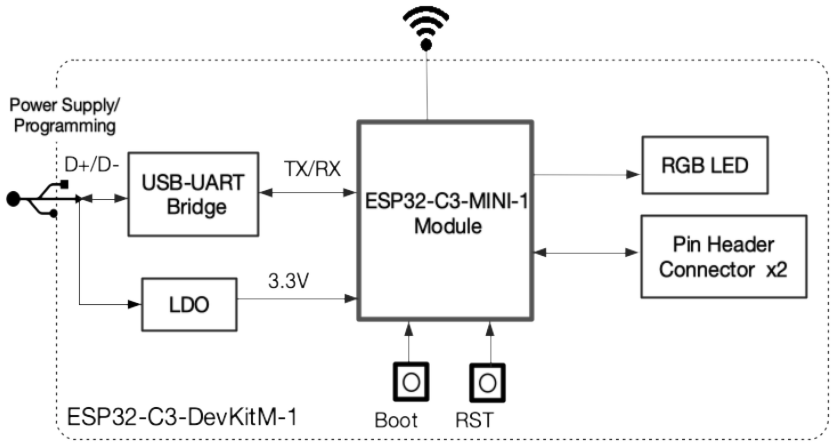

图 3: ESP32-C3-DevKitM-1 （点击放大）

电源选项 您可从以下三种供电方式中任选其一给 ESP32-C3-DevKitM-1 供电：

- Micro-USB 接口供电（默认）
- 5V 和 GND 排针供电
- 3V3 和 GND 排针供电

建议选择第一种供电方式：Micro-USB 接口供电。

排针 下表列出了开发板两侧排针（J1 和 J3）的 **名称**和 **功能**，排针的名称如图*ESP32-C3-DevKitM-1 - 正面* 所示，排针的序号与 ESP32-C3-DevKitM-1 原理图 (PDF) 一致。

J1

序号	名称	类型[Page 7, 1]	功能
1	GND	G	接地
2	3V3	P	3.3 V 电源
3	3V3	P	3.3 V 电源
4	IO2	I/O/T	GPIO2[2] , ADC1_CH2, FSPIQ
5	IO3	I/O/T	GPIO3, ADC1_CH3
6	GND	G	接地
7	RST	I	CHIP_PU
8	GND	G	接地
9	IO0	I/O/T	GPIO0, ADC1_CH0, XTAL_32K_P
10	IO1	I/O/T	GPIO1, ADC1_CH1, XTAL_32K_N
11	IO10	I/O/T	GPIO10, FSPICS0
12	GND	G	接地
13	5V	P	5 V 电源
14	5V	P	5 V 电源
15	GND	G	接地

J3

序号	名称	类型[7]	功能
1	GND	G	接地
2	TX	I/O/T	GPIO21, U0TXD
3	RX	I/O/T	GPIO20, U0RXD
4	GND	G	接地
5	IO9	I/O/T	GPIO9[2]
6	IO8	I/O/T	GPIO8[2], RGB LED
7	GND	G	接地
8	IO7	I/O/T	GPIO7, FSPID, MTDO
9	IO6	I/O/T	GPIO6, FSPICLK, MTCK
10	IO5	I/O/T	GPIO5, ADC2_CH0, FSPIWP, MTDI
11	IO4	I/O/T	GPIO4, ADC1_CH4, FSPIHD, MTMS
12	GND	G	接地
13	IO18	I/O/T	GPIO18
14	IO19	I/O/T	GPIO19
15	GND	G	接地

管脚布局

硬件版本 该开发板为最新硬件，尚未有历史版本。

[1] P：电源；I：输入；O：输出；T：可设置为高阻。

[2] GPIO2、GPIO8、GPIO9 为 ESP32-C3FN4 芯片的 Strapping 管脚。在芯片上电和系统复位过程中，Strapping 管脚根据管脚的二进制电压值控制芯片功能。Strapping 管脚的具体描述和应用，请参考 ESP32-C3 技术规格书 的 Strapping 管脚章节。

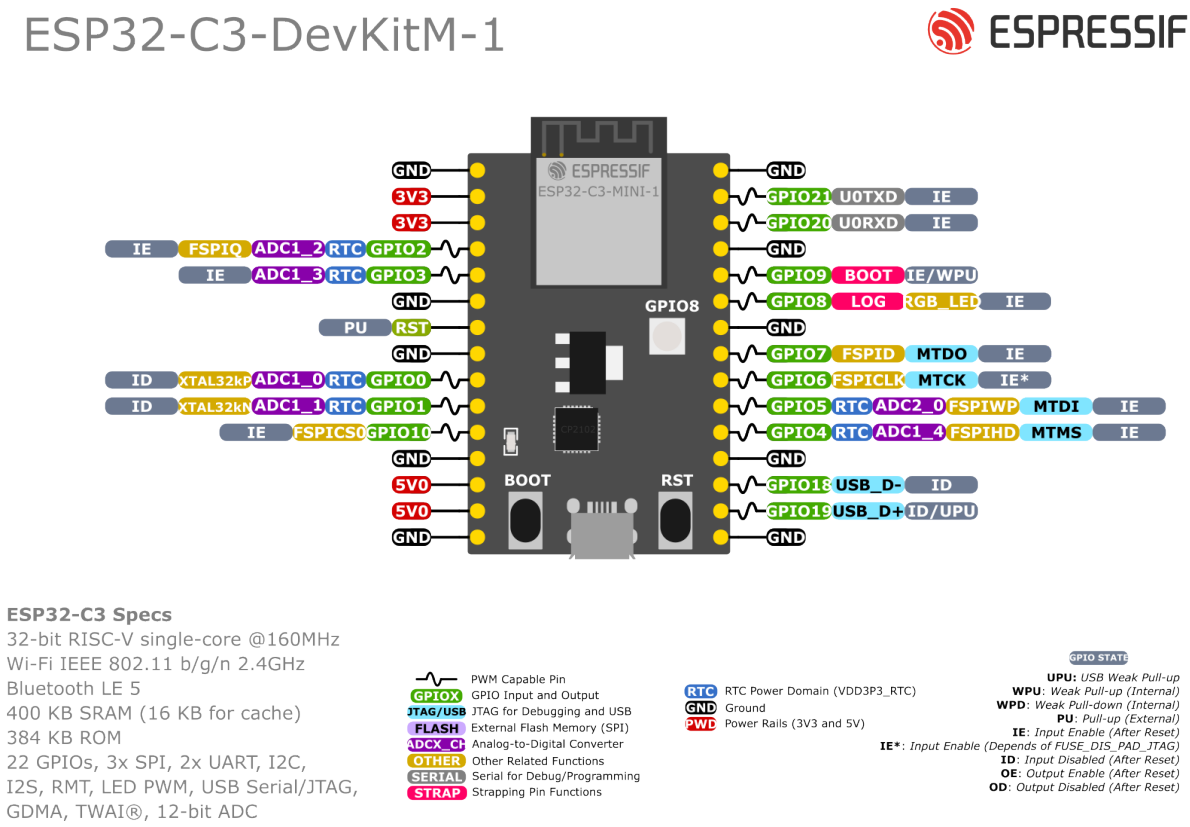

图 4: ESP32-C3-DevKitM-1 管脚布局（点击放大）

ESP32-C3-DevKitC-02

本指南将帮助您快速上手 ESP32-C3-DevKitC-02，并提供该款开发板的详细信息。

ESP32-C3-DevKitC-02 是一款入门级开发板，使用配置 4 MB SPI flash 的通用型模组 ESP32-C3-WROOM-02。该款开发板具备完整的 Wi-Fi 和低功耗蓝牙功能。

板上模组大部分管脚均已引出至两侧排针，开发人员可根据实际需求，轻松通过跳线连接多种外围设备，同时也可将开发板插在面包板上使用。

本指南包括如下内容：

- 入门指南：简要介绍了 ESP32-C3-DevKitC-02 和硬件、软件设置指南。
- 硬件参考：详细介绍了 ESP32-C3-DevKitC-02 的硬件。
- 硬件版本：介绍硬件历史版本和已知问题，并提供链接至历史版本开发板的入门指南（如有）。
- 相关文档：列出了相关文档的链接。

入门指南 本小节将简要介绍 ESP32-C3-DevKitC-02，说明如何在 ESP32-C3-DevKitC-02 上烧录固件及相关准备工作。

组件介绍 以下按照逆时针的顺序依次介绍开发板上的主要组件。

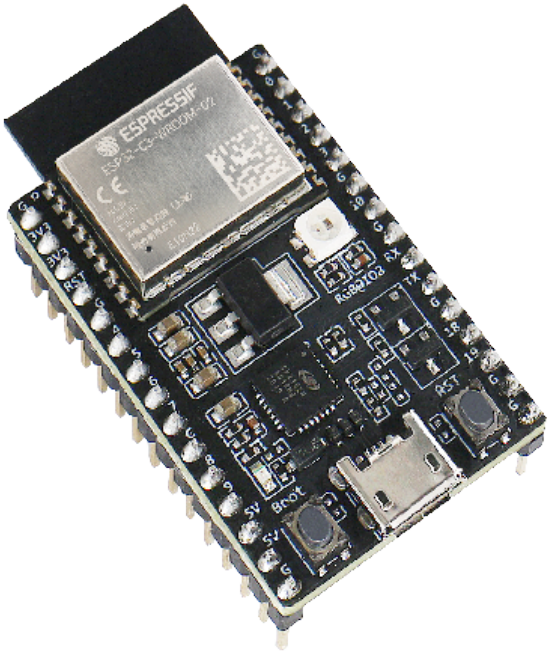

图 5: ESP32-C3-DevKitC-02

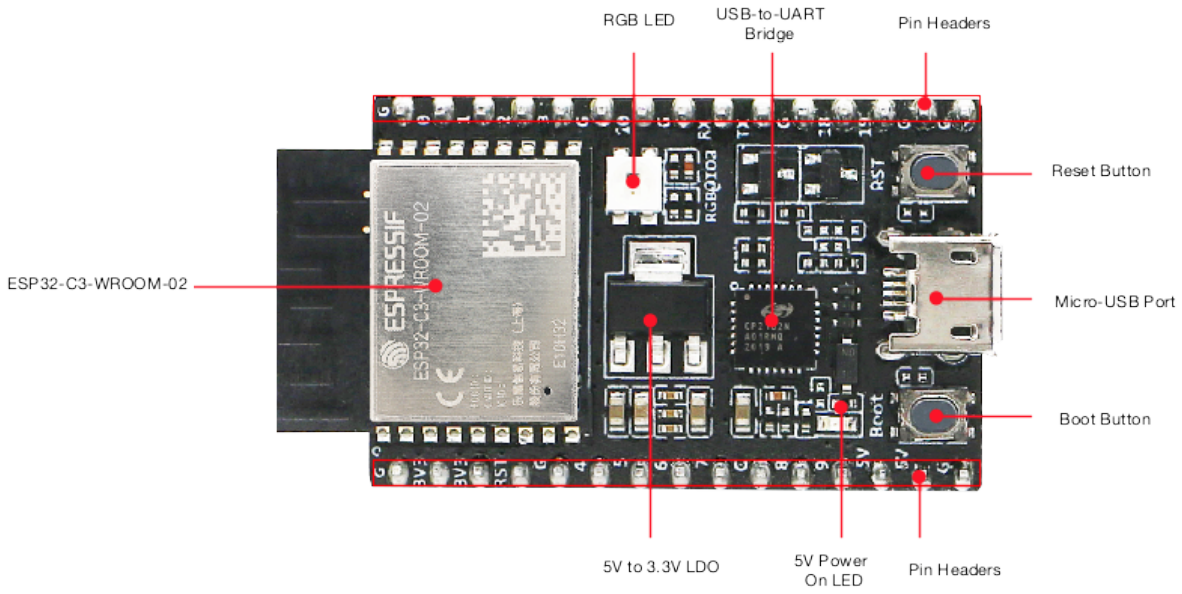

图 6: ESP32-C3-DevKitC-02 - 正面

主要组件	介绍
ESP32-C3-WROOM-02	ESP32-C3-WROOM-02 是乐鑫推出的一款通用型 Wi-Fi 和低功耗蓝牙双模模组，功能强大。该模组采用 PCB 板载天线，配置了 4 MB SPI flash。
5 V to 3.3 V LDO（5 V 转 3.3 V LDO）	电源转换器，输入 5 V，输出 3.3 V。
5 V Power On LED（5 V 电源指示灯）	开发板连接 USB 电源后，该指示灯亮起。
Pin Headers（排针）	所有可用 GPIO 管脚（除 Flash 的 SPI 总线）均已引出至开发板的排针。请查看排针 获取更多信息。
Boot Button（Boot 键）	下载按键。按住 **Boot** 键的同时按一下 **Reset** 键进入“固件下载”模式，通过串口下载固件。
Micro-USB Port（Micro-USB 接口）	USB 接口。可用作开发板的供电电源或 PC 和 ESP32-C3 芯片的通信接口。
Reset Button（Reset 键）	复位按键。
USB-to-UART Bridge（USB 至 UART 桥接器）	单芯片 USB 至 UART 桥接器，可提供高达 3 Mbps 的传输速率。
RGB LED	可寻址 RGB 发光二极管，由 GPIO8 驱动。

开始开发应用 通电前，请确保 ESP32-C3-DevKitC-02 完好无损。

必备硬件

- ESP32-C3-DevKitC-02
- USB 2.0 数据线（标准 A 型转 Micro-B 型）
- 电脑（Windows、Linux 或 macOS）

备注： 请确保使用适当的 USB 数据线。部分数据线仅可用于充电，无法用于数据传输和编程。

软件设置 请前往快速入门，在安装 小节查看如何快速设置开发环境，将应用程序烧录至 ESP32-C3-DevKitC-02。

内含组件和包装

零售订单 如购买样品，每个 ESP32-C3-DevKitC-02 开发板将以防静电袋或零售商选择的其他方式包装。

零售订单请前往 https://www.espressif.com/zh-hans/company/contact/buy-a-sample。

批量订单 如批量购买，ESP32-C3-DevKitC-02 开发板将以大纸板箱包装。

有关本开发板的更多设计文档，请联系我们的商务部门 sales@espressif.com。

1.2.2 软件：

如需在 **ESP32-C3** 上使用 ESP-IDF，请安装以下软件：

- 设置 **工具链**，用于编译 ESP32-C3 代码；

- **编译构建工具**——CMake 和 Ninja 编译构建工具，用于编译 ESP32-C3 **应用程序**；
- 获取 **ESP-IDF** 软件开发框架。该框架已经基本包含 ESP32-C3 使用的 API（软件库和源代码）和运行 **工具链**的脚本；

1.3 安装

我们提供以下方法帮助安装所有需要的软件，可根据需要选择其中之一。

1.3.1 IDE

备注： 建议您通过自己喜欢的集成开发环境 (IDE) 安装 ESP-IDF。

- Eclipse Plugin
- VSCode Extension

1.3.2 手动安装

请根据您的操作系统选择对应的手动安装流程。

Windows 平台工具链的标准设置

概述 ESP-IDF 需要安装一些必备工具，才能围绕 ESP32-C3 构建固件，包括 Python、Git、交叉编译器、CMake 和 Ninja 编译工具等。

在本入门指南中，我们通过 **命令提示符**进行有关操作。不过，您在安装 ESP-IDF 后还可以使用 Eclipse Plugin 或其他支持 CMake 的图形化工具 IDE。

备注： 限定条件：- 请注意 ESP-IDF 和 ESP-IDF 工具的安装路径不能超过 90 个字符，安装路径过长可能会导致构建失败。- Python 或 ESP-IDF 的安装路径中一定不能包含空格或括号。- 除非操作系统配置为支持 Unicode UTF-8，否则 Python 或 ESP-IDF 的安装路径中也不能包括特殊字符（非 ASCII 码字符）

系统管理员可以通过如下方式将操作系统配置为支持 Unicode UTF-8：控制面板-更改日期、时间或数字格式-管理选项卡-更改系统地域-勾选选项 “Beta：使用 Unicode UTF-8 支持全球语言” -点击确定-重启电脑。

ESP-IDF 工具安装器 安装 ESP-IDF 必备工具最简易的方式是下载一个 ESP-IDF 工具安装器。

Windows Installer Download

在线安装与离线安装的区别 在线安装程序非常小，可以安装 ESP-IDF 的所有版本。在安装过程中，安装程序只下载必要的依赖文件，包括 Git For Windows 安装器。在线安装程序会将下载的文件存储在缓存目录 `%userprofile%/espressif` 中。

离线安装程序不需要任何网络连接。安装程序中包含了所有需要的依赖文件，包括 Git For Windows 安装器。

安装内容 安装程序会安装以下组件：

- 内置的 Python
- 交叉编译器
- OpenOCD
- CMake 和 Ninja 编译工具
- ESP-IDF

安装程序允许将程序下载到现有的 ESP-IDF 目录。推荐将 ESP-IDF 下载到 `%userprofile%\Desktop\esp-idf` 目录下，其中 `%userprofile%` 代表家目录。

启动 ESP-IDF 环境 安装结束时，如果勾选了 `Run ESP-IDF PowerShell Environment` 或 `Run ESP-IDF Command Prompt (cmd.exe)`，安装程序会在选定的提示符窗口启动 ESP-IDF。

`Run ESP-IDF PowerShell Environment`:

`Run ESP-IDF Command Prompt (cmd.exe)`:

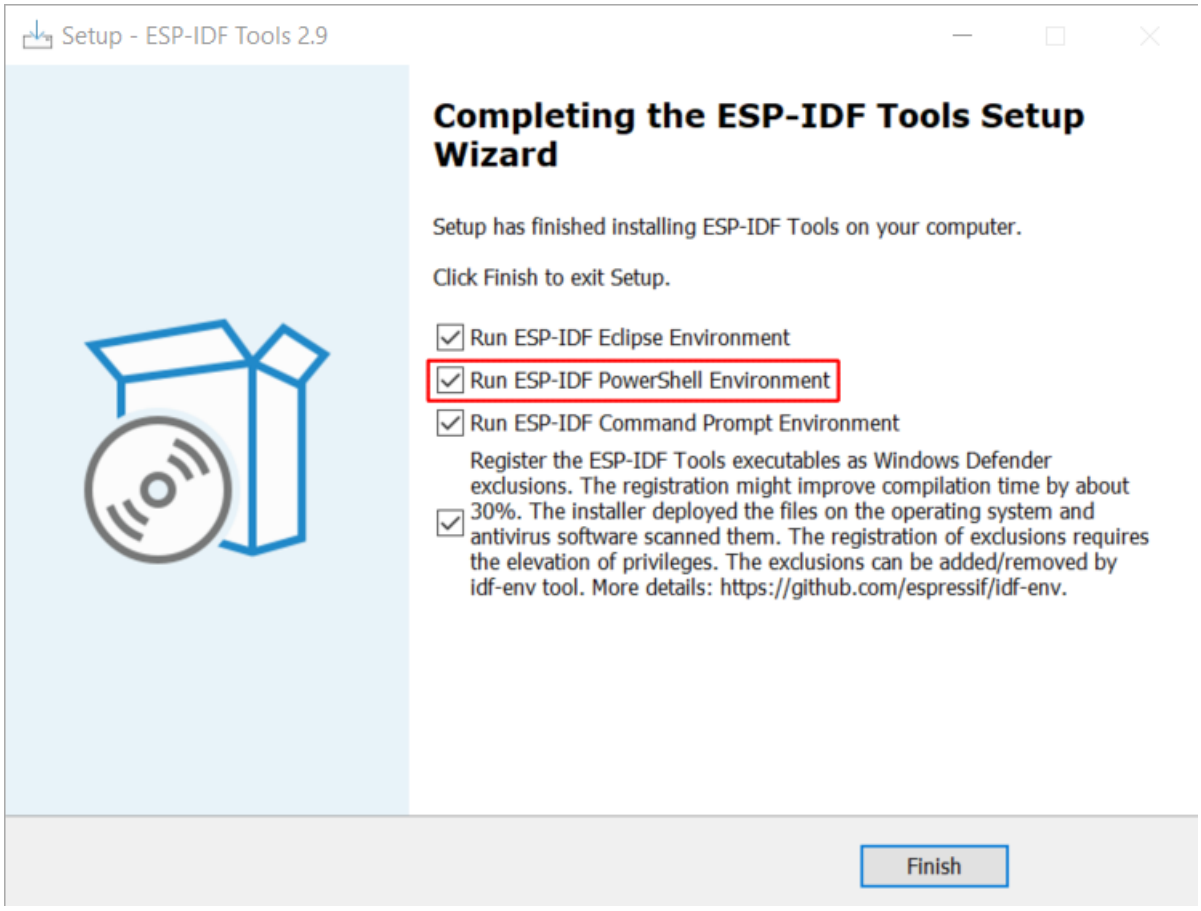

图 9: 完成 ESP-IDF 工具安装向导时运行 Run ESP-IDF PowerShell Environment

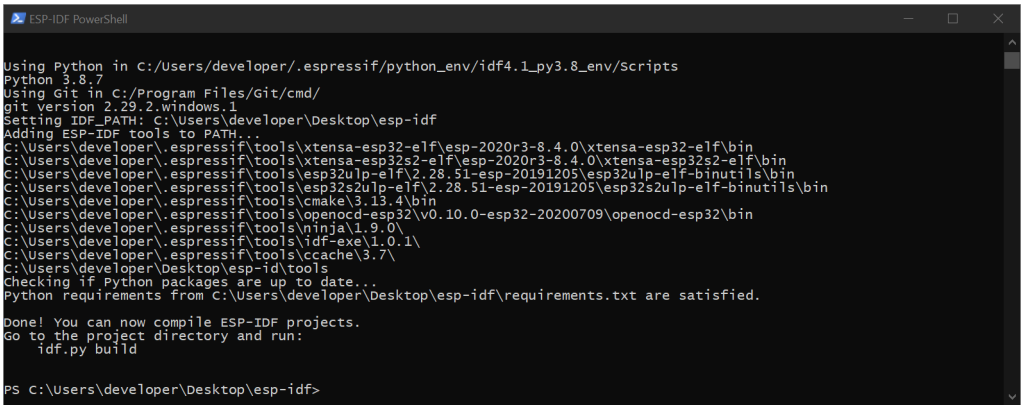

图 10: ESP-IDF PowerShell

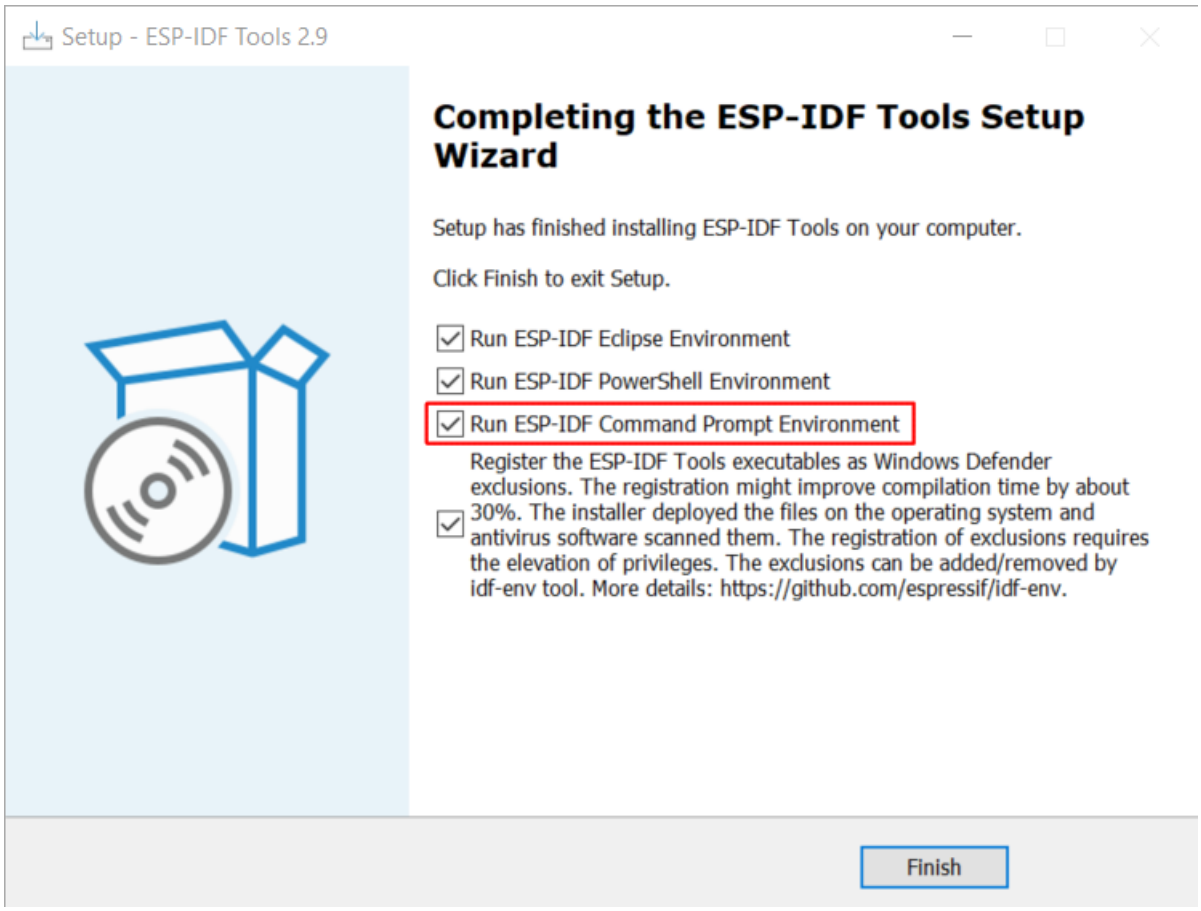

图 11: 完成 ESP-IDF 工具安装向导时运行 Run ESP-IDF Command Prompt (cmd.exe)

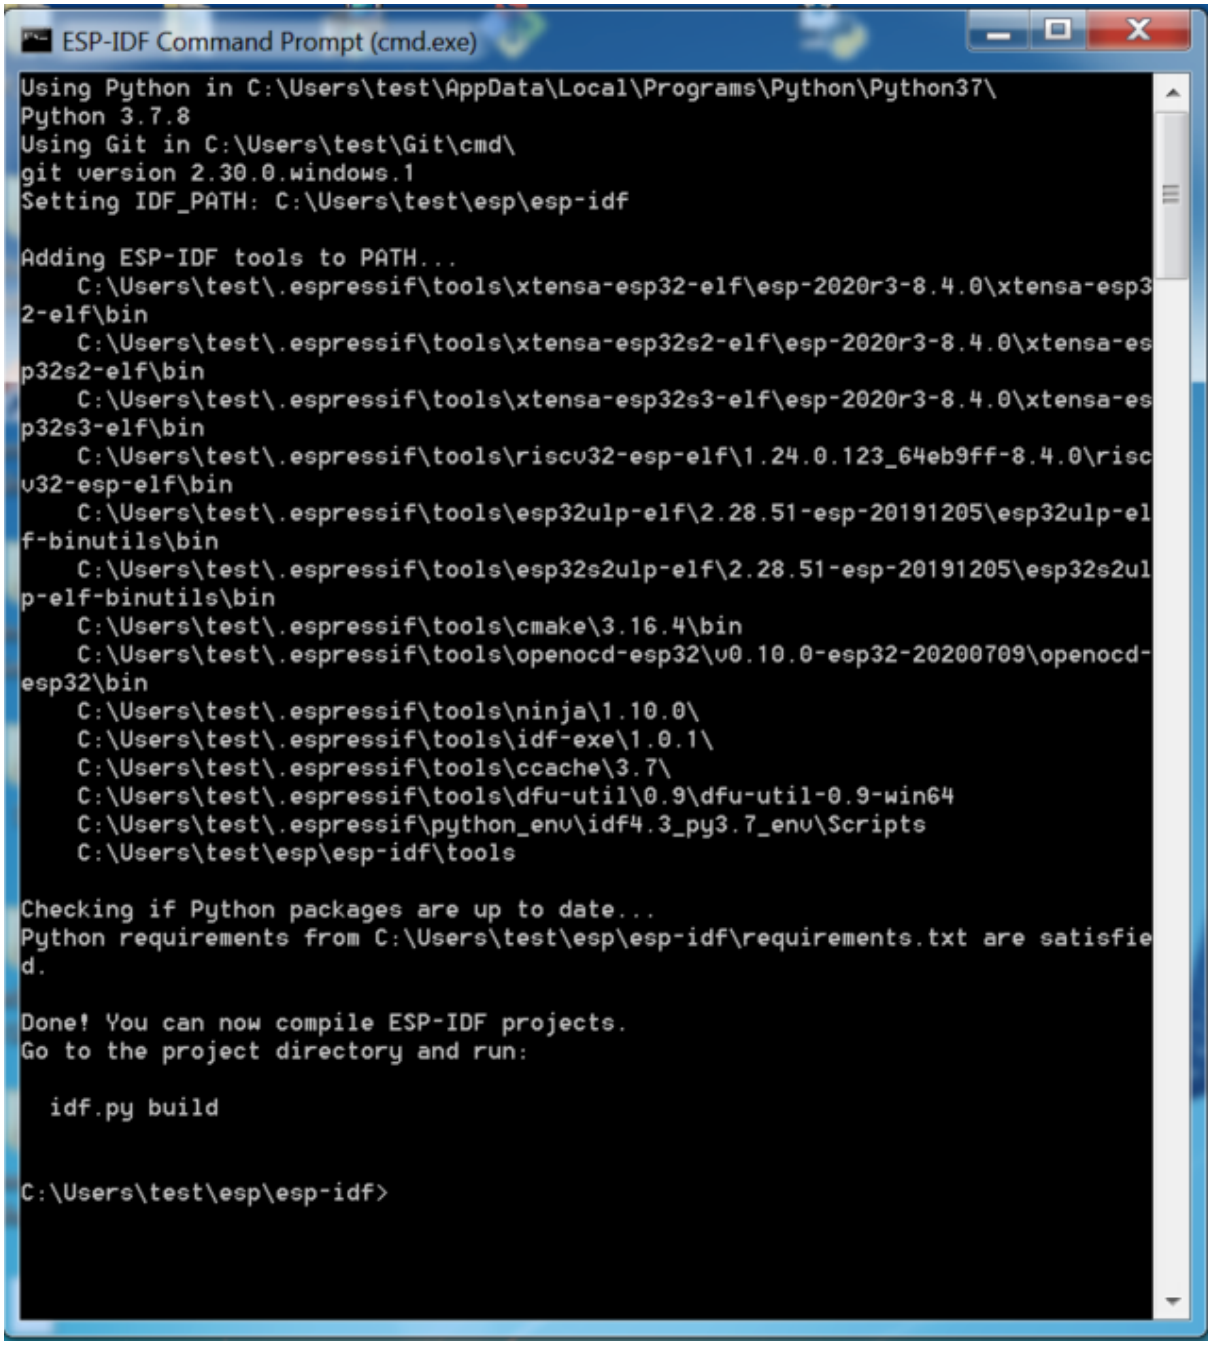

图 12: ESP-IDF 命令提示符窗口

使用命令提示符 在后续步骤中，我们将使用 Windows 的命令提示符进行操作。

ESP-IDF 工具安装器可在“开始”菜单中，创建一个打开 ESP-IDF 命令提示符窗口的快捷方式。本快捷方式可以打开 Windows 命令提示符（即 cmd.exe），并运行 `export.bat` 脚本以设置各环境变量（比如 `PATH`，`IDF_PATH` 等）。此外，您可还以通过 Windows 命令提示符使用各种已经安装的工具。

注意，本快捷方式仅适用 ESP-IDF 工具安装器中指定的 ESP-IDF 路径。如果您的电脑上存在多个 ESP-IDF 路径（比如您需要不同版本的 ESP-IDF），您有以下两种解决方法：

1. 为 ESP-IDF 工具安装器创建的快捷方式创建一个副本，并将新快捷方式的 ESP-IDF 工作路径指定为您希望使用的 ESP-IDF 路径。
2. 或者，您可以运行 `cmd.exe`，并切换至您希望使用的 ESP-IDF 目录，然后运行 `export.bat`。注意，这种方法要求 `PATH` 中存在 Python 和 Git。如果您在使用时遇到有关“找不到 Python 或 Git”的错误信息，请使用第一种方法。

开始使用 ESP-IDF 现在您已经具备了使用 ESP-IDF 的所有条件，接下来将介绍如何开始您的第一个工程。

本指南将帮助您完成使用 ESP-IDF 的第一步。按照本指南，您将使用 ESP32-C3 创建第一个工程，并构建、烧录和监控设备输出。

备注： 如果您还未安装 ESP-IDF，请参照安装 中的步骤，获取使用本指南所需的所有软件。

开始创建工程 现在，您可以准备开发 ESP32-C3 应用程序了。您可以从 ESP-IDF 中 examples 目录下的 get-started/hello_world 工程开始。

重要： ESP-IDF 编译系统不支持 ESP-IDF 路径或其工程路径中带有空格。

将 get-started/hello_world 工程复制至您本地的 `~/esp` 目录下：

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

备注： ESP-IDF 的 examples 目录下有一系列示例工程，您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

连接设备 现在，请将您的 ESP32-C3 开发板连接到 PC，并查看开发板使用的串口。

在 Windows 操作系统中，串口名称通常以 `COM` 开头。

有关如何查看串口名称的详细信息，请见*与 ESP32-C3 创建串口连接*。

备注： 请记住串口名，您会在后续步骤中使用。

配置工程 请进入 `hello_world` 目录，设置 ESP32-C3 为目标芯片，然后运行工程配置工具 `menuconfig`。

Windows

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32c3
idf.py menuconfig
```

打开一个新工程后，应首先使用 `idf.py set-target esp32c3` 设置“目标”芯片。注意，此操作将清除并初始化项目之前的编译和配置（如有）。您也可以直接将“目标”配置为环境变量（此时可跳过该步骤）。更多信息，请见*Select the Target Chip: set-target*。

正确操作上述步骤后，系统将显示以下菜单：

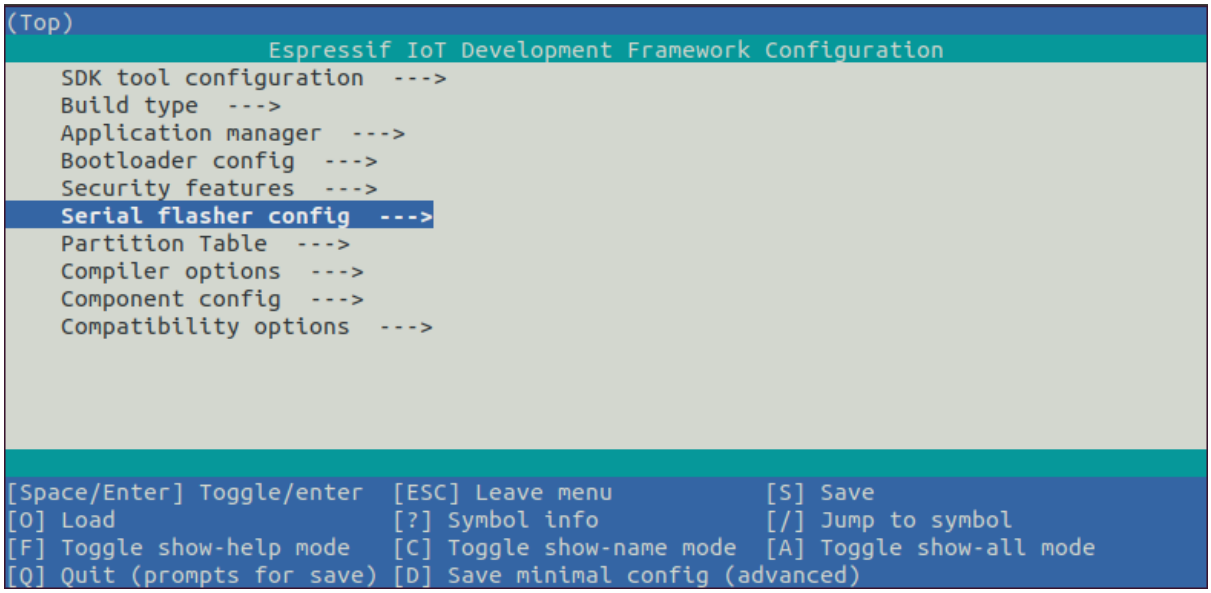

图 13: 工程配置—主窗口

您可以通过此菜单设置项目的具体变量，包括 Wi-Fi 网络名称、密码和处理器速度等。`hello_world` 示例项目会以默认配置运行，因此在这一项目中，可以跳过使用 `menuconfig` 进行项目配置这一步骤。

备注： 您终端窗口中显示出的菜单颜色可能会与上图不同。您可以通过选项 `--style` 来改变外观。请运行 `idf.py menuconfig --help` 命令，获取更多信息。

编译工程 请使用以下命令，编译烧录工程：

```
idf.py build
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成引导加载程序、分区表和应用程序二进制文件。

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin  build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
```

(下页继续)

(续上页)

```
or run 'idf.py -p PORT flash'
```

如果一切正常，编译完成后将生成.bin 文件。

烧录到设备 请运行以下命令，将刚刚生成的二进制文件烧录至您的 ESP32-C3 开发板：

```
idf.py -p PORT flash
```

请将 PORT 替换为 ESP32-C3 开发板的串口名称。如果 `PORT` 未经定义，*idf.py* 将尝试使用可用的串口自动连接。

更多有关 idf.py 参数的详情，请见*idf.py*。

备注： 勾选 `flash` 选项将自动编译并烧录工程，因此无需再运行 `idf.py build`。

若在烧录过程中遇到问题，请前往烧录故障排除 或与 *ESP32-C3* 创建串口连接 获取更多详细信息。

常规操作 在烧录过程中，您会看到类似如下的输出日志：

```
...
esptool.py --chip esp32c3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
↪after=hard_reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB␣
↪0x8000 partition_table/partition-table.bin 0x0 bootloader/bootloader.bin 0x10000␣
↪hello_world.bin
esptool.py v3.0

Leaving...
```

(下页继续)

(续上页)

```
Hard resetting via RTS pin...
Done
```

如果一切顺利，烧录完成后，开发板将会复位，应用程序“hello_world”开始运行。

如果您希望使用 Eclipse 或是 VS Code IDE，而非 `idf.py`，请参考 Eclipse Plugin，以及 VSCode Extension。

监视输出 您可以使用 `idf.py -p PORT monitor` 命令，监视“hello_world”工程的运行情况。注意，不要忘记将 PORT 替换为您的串口名称。

运行该命令后，*IDF 监视器* 应用程序将启动：：

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

此时，您就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```
    ...
    Hello world!
    Restarting in 10 seconds...
    This is esp32c3 chip with 1 CPU core(s), WiFi/BLE, silicon revision 0, 2 MB␣
↪external flash
Minimum free heap size: 337332 bytes
    Restarting in 9 seconds...
    Restarting in 8 seconds...
    Restarting in 7 seconds...
```

您可使用快捷键 `Ctrl+]`，退出 IDF 监视器。

备注： 您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
idf.py -p PORT flash monitor
```

此外，

- 请前往*IDF 监视器*，了解更多使用 IDF 监视器的快捷键和其他详情。
- 请前往*idf.py*，查看更多 `idf.py` 命令和选项。

恭喜，您已完成 ESP32-C3 的入门学习！

现在，您可以尝试一些其他 examples，或者直接开发自己的应用程序。

重要： 一些示例程序不支持 ESP32-C3，因为 ESP32-C3 中不包含所需的硬件。

在编译示例程序前请查看 README 文件中 `Supported Targets` 表格。如果表格中包含 ESP32-C3，或者不存在这个表格，那么即表示 ESP32-C3 支持这个示例程序。

其他提示

权限问题 /dev/ttyUSB0 使用某些 Linux 版本向 ESP32-C3 烧录固件时，可能会出现 `Failed to open port /dev/ttyUSB0` 错误消息。此时可以将用户添加至*Linux Dialout 组*。

兼容的 Python 版本 ESP-IDF 支持 Python 3.7 及以上版本，建议升级操作系统到最新版本从而更新 Python。也可选择从 sources 安装最新版 Python，或使用 Python 管理系统如 pyenv 对版本进行升级管理。

擦除 flash ESP-IDF 支持擦除 flash。请运行以下命令，擦除整个 flash：

```
idf.py -p PORT erase-flash
```

若存在需要擦除的 OTA 数据，请运行以下命令：

```
idf.py -p PORT erase-otadata
```

擦除 flash 需要一段时间，在擦除过程中，请勿断开设备连接。

相关文档 想要自定义安装流程的高阶用户可参照：

- *在 Windows 环境下更新 ESP-IDF 工具*
- *与 ESP32-C3 创建串口连接*
- Eclipse Plugin
- VSCode Extension
- *IDF 监视器*

在 Windows 环境下更新 ESP-IDF 工具

使用脚本安装 ESP-IDF 工具 请从 Windows “命令提示符”窗口，切换至 ESP-IDF 的安装目录。然后运行：

```
install.bat
```

对于 Powershell，请切换至 ESP-IDF 的安装目录。然后运行：

```
install.ps1
```

该命令可下载并安装 ESP-IDF 所需的工具。如您已经安装了某个版本的工具，则该命令将无效。该工具的下载安装位置由 ESP-IDF 工具安装器的设置决定，默认情况下为：`C:\Users\username\.espressif`。

使用“导出脚本”将 ESP-IDF 工具添加至 PATH 环境变量 ESP-IDF 工具安装器将在“开始菜单”为“ESP-IDF 命令提示符”创建快捷方式。点击该快捷方式可打开 Windows 命令提示符窗口，您可在该窗口使用所有已安装的工具。

有些情况下，您正在使用的命令提示符窗口并不是通过快捷方式打开的，此时如果想要在该窗口使用 ESP-IDF，您可以根据下方步骤将 ESP-IDF 工具添加至 PATH 环境变量。

首先，请打开需要使用 ESP-IDF 的命令提示符窗口，切换至安装 ESP-IDF 的目录，然后执行 `export.bat`，具体命令如下：

```
cd %userprofile%\esp\esp-idf
export.bat
```

对于 Powershell 用户，请同样切换至安装 ESP-IDF 的目录，然后执行 `export.ps1`，具体命令如下：

```
cd ~/esp/esp-idf
export.ps1
```

运行完成后，您就可以通过命令提示符使用 ESP-IDF 工具了。

与 ESP32-C3 创建串口连接

可以使用 USB 至 UART 桥或 ESP32-C3 支持的 USB 外设，与 ESP32-C3 创建串口连接。

部分开发板中已经安装有 USB 至 UART 桥。如未安装，可使用外部桥。

支持的 USB 外设 ESP32-C3 支持 USB 外设。无需 USB 至 UART 桥，便可直接烧录设备。

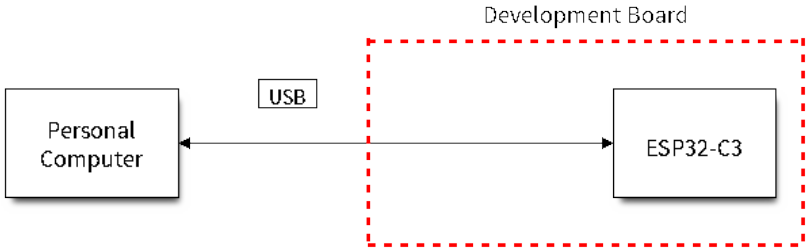

图 14: 支持 USB 的 SoC

部分支持 USB 外设的开发板同时也包含 USB 至 UART 桥。

安装有 USB 至 UART 桥的开发板 在安装有 USB 至 UART 桥的开发板中，PC 和桥之间通过 USB 连接，桥和 ESP32-C3 之间通过 UART 连接。

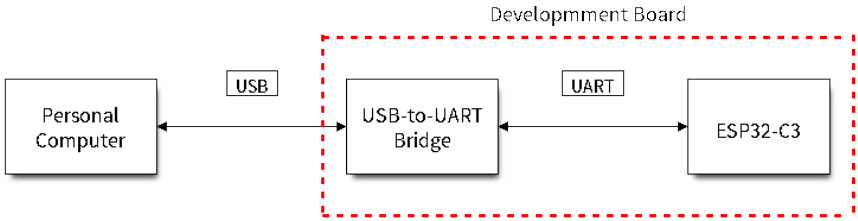

图 15: 安装有 USB 至 UART 桥的开发板

外部 USB 至 UART 桥 部分开发板使用外部 USB 至 UART 桥。这种情况通常出现在需要控制空间和成本的产品中，例如一些小型开发板或成品。

使用 USB 进行烧录 ESP32-C3 支持 USB 外设，无需外部 USB 至 UART 桥，即可烧录二进制文件。

ESP32-C3 上的 USB 使用 **GPIO19** 作为 **D+**，**GPIO18** 作为 **D-**。

备注： ESP32-C3 仅支持 *USB CDC and JTAG*。

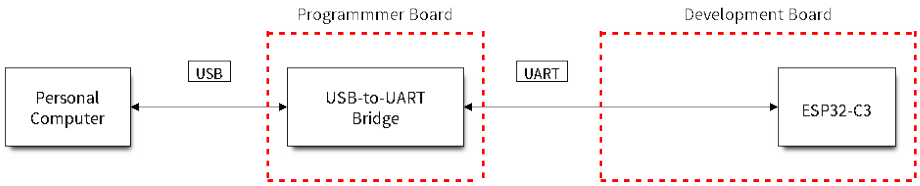

图 16: 外部 USB 至 UART 桥

首次烧录需要手动设置 ESP32-C3 进入下载模式。请按住 BOOT 按钮，同时按一下 RESET 按钮。之后，松开 BOOT 按钮。

使用 UART 进行烧录 本节描述如何使用 USB 至 UART 桥在 ESP32-C3 和 PC 之间建立串行连接。板上桥与外部桥均适用。

连接 ESP32-C3 和 PC 用 USB 线将 ESP32-C3 开发板连接到 PC。如果设备驱动程序没有自动安装，请先确认 ESP32-C3 开发板上的 USB 至 UART 桥（或外部转 UART 适配器）型号，然后在网上搜索驱动程序，并进行手动安装。

以下是乐鑫 ESP32-C3 开发板驱动程序的链接：

- CP210x: CP210x USB 至 UART 桥 VCP 驱动程序
- FTDI: FTDI 虚拟 COM 端口驱动程序

以上驱动仅供参考，请查看开发板用户指南，了解开发板具体使用的 USB 至 UART 桥芯片。一般情况下，当 ESP32-C3 开发板与 PC 连接时，对应驱动程序应该已经被打包在操作系统中，并已经自动安装。

对于使用 USB 至 UART 桥下载的设备，您可以运行以下命令，包括定义波特率的可选参数。

```
idf.py -p PORT [-b BAUD] flash
```

如需改变烧录器的波特率，请用需要的波特率代替 BAUD。默认的波特率为 460800。

备注： 如果设备不支持自动下载模式，则需要手动进入下载模式。请按住 BOOT 按钮，同时按一下 RESET 按钮。之后，松开 BOOT 按钮。

在 Windows 上查看端口 检查 Windows 设备管理器中的 COM 端口列表。断开 ESP32-C3 与 PC 的连接，然后重新连接，查看哪个端口从列表中消失后又再次出现。

以下为 ESP32 DevKitC 和 ESP32 WROVER KIT 串口：

在 Linux 和 macOS 上查看端口 查看 ESP32-C3 开发板（或外部转串口适配器）的串口设备名称，请将以下命令运行两次。首先，断开开发板或适配器，首次运行以下命令；然后，连接开发板或适配器，再次运行以下命令。其中，第二次运行命令后出现的端口即是 ESP32-C3 对应的串口：

Linux:

```
ls /dev/tty*
```

macOS:

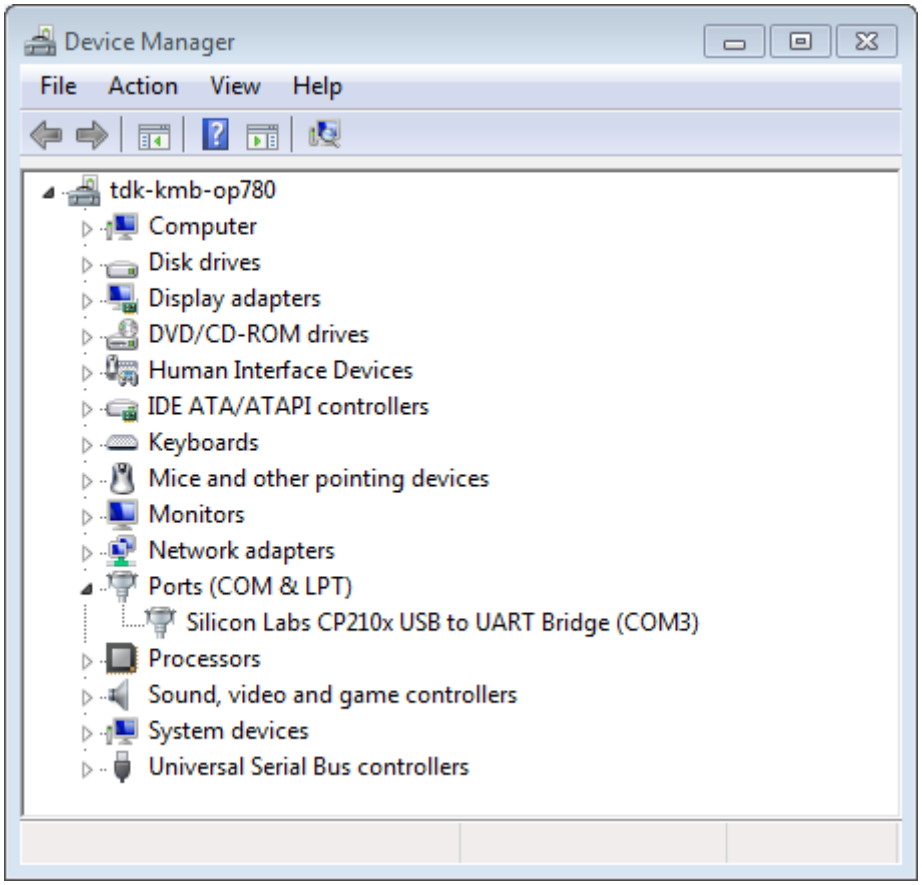

图 17: 设备管理器中 ESP32-DevKitC 的 USB 至 UART 桥

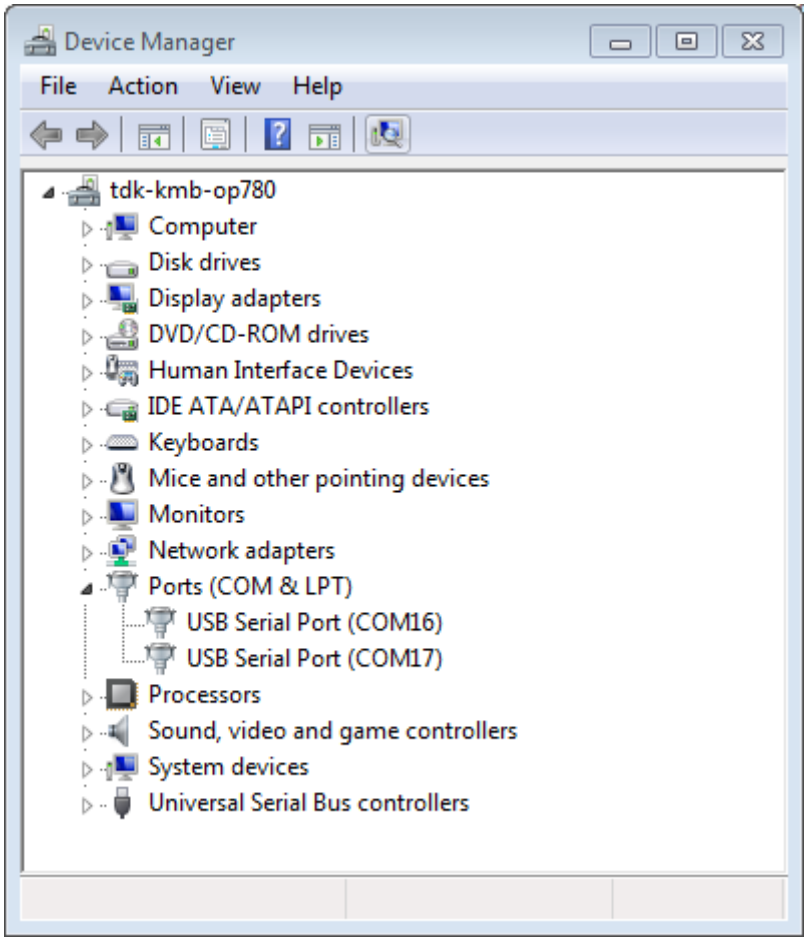

图 18: Windows 设备管理器中 ESP-WROVER-KIT 的两个 USB 串行端口

```
ls /dev/cu.*
```

备注： 对于 macOS 用户：若没有看到串口，请检查是否安装 USB/串口驱动程序。具体应使用的驱动程序，见章节*连接 ESP32-C3 和 PC*。对于 macOS High Sierra (10.13) 的用户，你可能还需要手动允许驱动程序的加载，具体可打开 *系统偏好设置* -> *安全和隐私* -> *通用*，检查是否有信息显示："来自开发人员的系统软件…"，其中开发人员的名称为 Silicon Labs 或 FTDI。

在 Linux 中添加用户到 `dialout` 当前登录用户应当可以通过 USB 对串口进行读写操作。在多数 Linux 版本中，您都可以通过以下命令，将用户添加到 `dialout` 组，从而获许读写权限:

```
sudo usermod -a -G dialout $USER
```

在 Arch Linux 中，需要通过以下命令将用户添加到 `uucp` 组中:

```
sudo usermod -a -G uucp $USER
```

请重新登录，确保串口读写权限生效。

确认串口连接 现在，请使用串口终端程序，查看重置 ESP32-C3 后终端上是否有输出，从而验证串口连接是否可用。

ESP32-C3 的控制台波特率默认为 115200。

Windows 和 Linux 操作系统 在本示例中，我们将使用 PuTTY SSH Client，PuTTY SSH Client 既可用于 Windows 也可用于 Linux。您也可以使用其他串口程序并设置如下的通信参数。

运行终端，配置在上述步骤中确认的串口：波特率 = 115200（如有需要，请更改为使用芯片的默认波特率），数据位 = 8，停止位 = 1，奇偶校验 = N。以下截屏分别展示了如何在 Windows 和 Linux 中配置串口和上述通信参数（如 115200-8-1-N）。注意，这里一定要选择在上述步骤中确认的串口进行配置。

然后，请检查 ESP32-C3 是否有打印日志。如有，请在终端打开串口进行查看。这里的日志内容取决于加载到 ESP32-C3 的应用程序，请参考输出示例。

备注： 请在验证完串口通信正常后，关闭串口终端。如果您让终端一直保持打开的状态，之后上传固件时将无法访问串口。

macOS 操作系统 macOS 提供了 **屏幕**命令，因此您不用安装串口终端程序。

- 参考*在 Linux 和 macOS 上查看端口*，运行以下命令:

  ```
  ls /dev/cu.*
  ```

- 您会看到类似如下输出:

  ```
  /dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART       /dev/cu.SLAB_
  ↪USBtoUART7
  ```

- 根据您连接到电脑上的开发板类型和数量，输出结果会有所不同。请选择开发板的设备名称，并运行以下命令（如有需要，请将 "115200" 更改为使用芯片的默认波特率）：

  ```
  screen /dev/cu.device_name 115200
  ```

将 `device_name` 替换为运行 `ls /dev/cu.*` 后出现的设备串口号。

- 您需要的正是 **屏幕**显示的日志。日志内容取决于加载到 ESP32-C3 的应用程序，请参考输出示例。请使用 Ctrl-A + \ 键退出 **屏幕**会话。

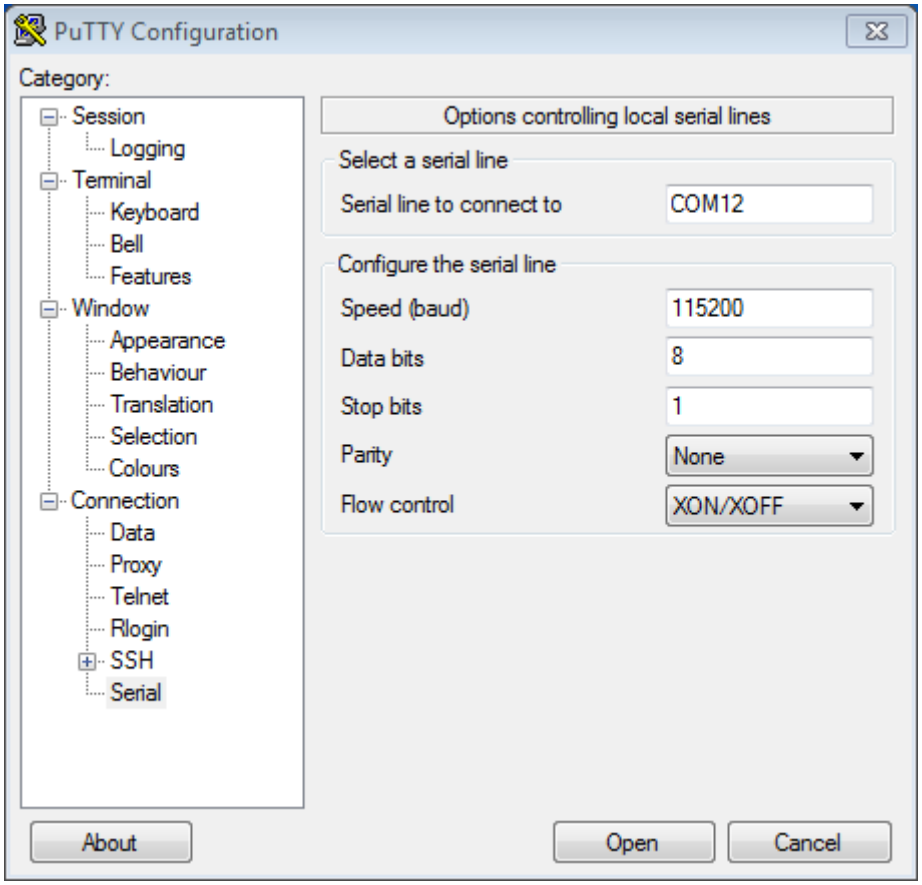

图 19: 在 Windows 操作系统中使用 PuTTY 设置串口通信参数

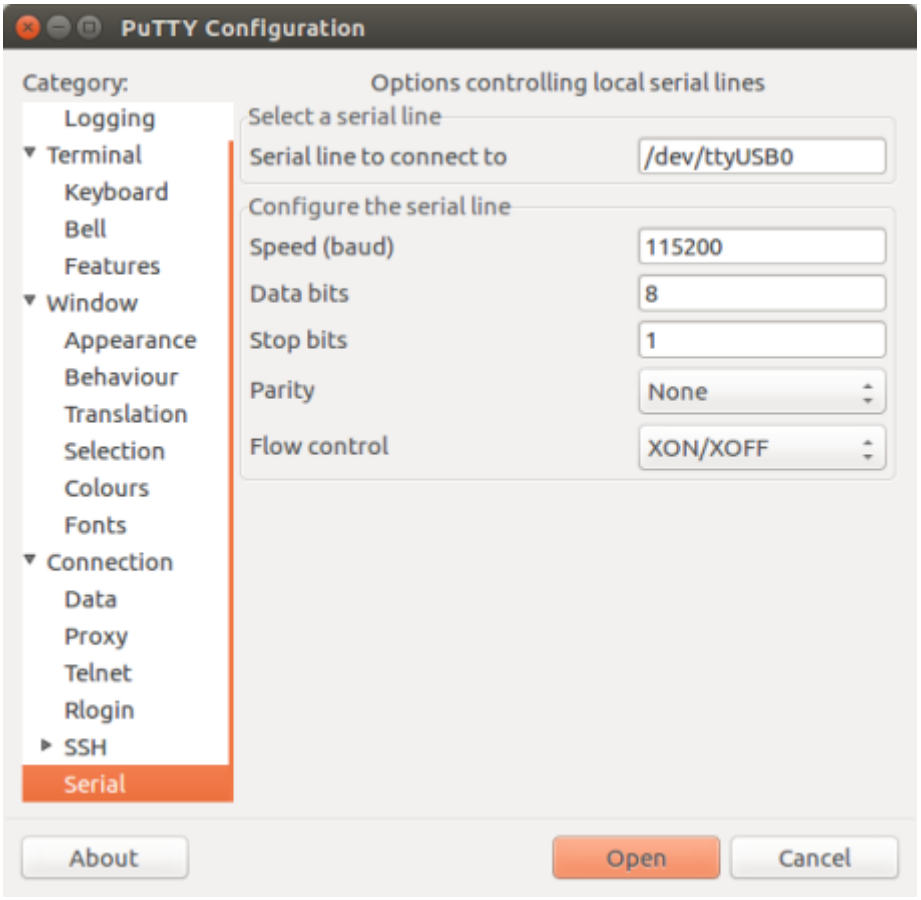

图 20: 在 Linux 操作系统中使用 PuTTY 设置串口通信参数

备注： 请在验证完串口通信正常后，关闭 **屏幕**会话。如果直接关闭终端窗口而没有关闭 **屏幕**，之后上传固件时将无法访问串口。

输出示例 以下是一个日志示例。如果没看到任何输出，请尝试重置开发板。

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

如果打印出的日志是可读的（而不是乱码），则表示串口连接正常。此时，您可以继续进行安装，并最终将应用程序上载到 ESP32-C3。

备注： 在某些串口接线方式下，在 ESP32-C3 启动并开始打印串口日志前，需要在终端程序中禁用串口 RTS & DTR 管脚。该问题仅存在于将 RTS & DTR 管脚直接连接到 EN & GPIO0 管脚上的情况，绝大多数开发板（包括乐鑫所有的开发板）都没有这个问题。更多详细信息，请参考 esptool 文档。

如您在安装 ESP32-C3 硬件开发的软件环境时，从*第五步：开始使用 ESP-IDF 吧* 跳转到了这里，请从*第五步：开始使用 ESP-IDF 吧* 继续阅读。

烧录故障排除

连接失败 如果在运行给定命令时出现如“连接失败”这样的错误，造成该错误的原因之一可能是运行 `esptool.py` 时出现错误。`esptool.py` 是构建系统调用的程序，用于重置芯片、与 ROM 引导加载器交互以及烧录固件的工具。可以按照以下步骤进行手动复位，轻松解决该问题。如果问题仍未解决，请参考 esptool 故障排除 获取更多信息。

`esptool.py` 通过使 USB 至 UART 桥（如 FTDI 或 CP210x）的 DTR 和 RTS 控制线生效来自动复位 ESP32-C3（请参考*与 ESP32-C3 创建串口连接* 获取更多详细信息）。DTR 和 RTS 控制线又连接到 ESP32-C3 的 `GPIO9` 和 `CHIP_PU` (EN) 管脚上，因此 DTR 和 RTS 的电压电平变化会使 ESP32-C3 进入固件下载模式。相关示例可查看 ESP32 DevKitC 开发板的 原理图。

一般来说，使用官方的 ESP-IDF 开发板不会出现问题。但是，`esptool.py` 在以下情况下不能自动重置硬件：

- 您的硬件没有连接到 `GPIO9` 和 `CIHP_PU` 的 DTR 和 RTS 控制线。
- DTR 和 RTS 控制线的配置方式不同。
- 不存在这样的串行控制线路。

根据硬件的种类，也可以将您的 ESP32-C3 开发板手动设置为固件下载模式（复位）。

- 对于乐鑫开发板，您可以参考对应开发板的入门指南或用户指南。例如，可以通过按住 `Boot` 按钮 (`GPIO9`) 再按住 `EN` 按钮 (`CHIP_PU`) 来手动复位 ESP-IDF 开发板。
- 对于其他类型的硬件，可以尝试将 `GPIO9` 拉低。

IDF 监视器

IDF 监视器是一个串行终端程序，使用了 esp-idf-monitor 包，用于收发目标设备串口的串行数据，IDF 监视器同时还兼具 IDF 的其他特性。

在 IDF 中调用 `idf.py monitor` 可以启用此监视器。

操作快捷键 为了方便与 IDF 监视器进行交互，请使用表中给出的快捷键。

快捷键	操作	描述
Ctrl+]	退出监视器程序	
Ctrl+T	菜单退出键	按下如下给出的任意键之一，并按指示操作。
• Ctrl+T	将菜单字符发送至远程	
• Ctrl+]	将 exit 字符发送至远程	
• Ctrl+P	重置目标设备，进入引导加载程序，通过 RTS 线暂停应用程序	重置目标设备，通过 RTS 线（如已连接）进入引导加载程序，此时开发板不运行任何程序。等待其他设备启动时可以使用此操作。
• Ctrl+R	通过 RTS 线重置目标设备	重置设备，并通过 RTS 线（如已连接）重新启动应用程序。
• Ctrl+F	编译并烧录此项目	暂停 idf_monitor，运行 `flash` 目标，然后恢复 idf_monitor。任何改动的源文件都会被重新编译，然后重新烧录。如果 idf_monitor 是以参数 `-E` 启动的，则会运行目标 `encrypted-flash`。
• Ctrl+A (或者 A)	仅编译及烧录应用程序	暂停 idf_monitor，运行 `app-flash` 目标，然后恢复 idf_monitor。这与 `flash` 类似，但只有主应用程序被编译并被重新烧录。如果 idf_monitor 是以参数 `-E` 启动的，则会运行目标 `encrypted-flash`。
• Ctrl+Y	停止/恢复在屏幕上打印日志输出	激活时，会丢弃所有传入的串行数据。允许在不退出监视器的情况下快速暂停和检查日志输出。
• Ctrl+L	停止/恢复向文件写入日志输出	在工程目录下创建一个文件，用于写入日志输出。可使用快捷键停止/恢复该功能（退出 IDF 监视器也会终止该功能）。
• Ctrl+I (或者 I)	停止/恢复打印时间标记	IDF 监视器可以在每一行的开头打印一个时间标记。时间标记的格式可以通过 `--timestamp-format` 命令行参数来改变。
• Ctrl+H (或者 H)	显示所有快捷键	
• Ctrl+X (或者 X)	退出监视器程序	
Ctrl+C	中断正在运行的应用程序	暂停 IDF 监视器并运行 GDB 项目调试器，从而在运行时调试应用程序。这需要启用:ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME 选项。

除了 `Ctrl-]` 和 `Ctrl-T`，其他快捷键信号会通过串口发送到目标设备。

兼具 IDF 特性

自动解码地址 每当芯片输出指向可执行代码的十六进制地址时，IDF 监视器将查找该地址在源代码中的位置（文件名和行号），并在下一行用黄色打印出该位置。

ESP-IDF 应用程序发生 crash 和 panic 事件时，将产生如下的寄存器转储和回溯:

```
abort() was called at PC 0x42067cd5 on core 0

```

IDF 监视器在后台运行以下命令，解码各地址:

```
riscv32-esp-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

备注: 将环境变量 `ESP_MONITOR_DECODE` 设置为 `0` 或者调用 esp_idf_monitor 的特定命令行选项 `python -m esp_idf_monitor --disable-address-decoding` 来禁止地址解码。

连接时复位目标芯片 默认情况下，IDF 监视器会在目标芯片连接时通过 DTR 和 RTS 串行线自动复位芯片。要防止 IDF 监视器在连接时自动复位，请在调用 IDF 监视器时加上选项 `--no-reset`，如 `idf.py monitor --no-reset`。

备注: `--no-reset` 选项在 IDF 监视器连接到特定端口时可以实现同样的效果，如 `idf.py monitor --no-reset -p [PORT]`。

配置 GDBStub 以启用 GDB GDBStub 支持在运行时进行调试。GDBStub 在目标上运行，并通过串口连接到主机从而接收调试命令。GDBStub 支持读取内存和变量、检查调用堆栈帧等命令。虽然没有 JTAG 调试通用，但由于 GDBStub 完全通过串行端口完成通信，故不需要使用特殊硬件（如 JTAG/USB 桥接器）。

通过将*CONFIG_ESP_SYSTEM_PANIC* 设置为 `GDBStub on runtime`，可以将目标配置为在后台运行 GDBStub。GDBStub 将保持在后台运行，直到通过串行端口发送 `Ctrl+C` 导致应用程序中断（即停止程序执行），从而让 GDBStub 处理调试命令。

此外，还可以通过设置*CONFIG_ESP_SYSTEM_PANIC* 为 `GDBStub on panic` 来配置 panic 处理程序，使其在发生 crash 事件时运行 GDBStub。当 crash 发生时，GDBStub 将通过串口输出特殊的字符串模式，表示 GDBStub 正在运行。

无论是通过发送 `Ctrl+C` 还是收到特殊字符串模式，IDF 监视器都会自动启动 GDB，从而让用户发送调试命令。GDB 退出后，通过 RTS 串口线复位目标。如果未连接 RTS 串口线，请按复位键，手动复位开发板。

备注： IDF 监视器在后台运行如下命令启用 GDB:

```
riscv32-esp-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex␣
↪interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

输出筛选 可以调用 `idf.py monitor --print-filter="xyz"` 启动 IDF 监视器，其中，`--print-filter` 是输出筛选的参数。参数默认值为空字符串，可打印任何内容。

若需对打印内容设置限制，可指定 `<tag>:<log_level>` 等选项，其中 `<tag>` 是标签字符串，`<log_level>` 是 `{N, E, W, I, D, V, *}` 集合中的一个字母，指的是日志级别。

例如，`PRINT_FILTER="tag1:W"` 只匹配并打印 `ESP_LOGW("tag1", ...)` 所写的输出，或者写在较低日志详细度级别的输出，即 `ESP_LOGE("tag1", ...)`。请勿指定 `<log_level>` 或使用详细级别默认值 `*`。

备注： 编译时，可以使用主日志在日志库 中禁用不需要的输出。也可以使用 IDF 监视器筛选输出来调整筛选设置，且无需重新编译应用程序。

应用程序标签不能包含空格、星号 `*`、冒号 `:`，以便兼容输出筛选功能。

如果应用程序输出的最后一行后面没有回车，可能会影响输出筛选功能，即，监视器开始打印该行，但后来发现该行不应该被写入。这是一个已知问题，可以通过添加回车来避免此问题（特别是在没有输出紧跟其后的情况下）。

筛选规则示例

- `*` 可用于匹配任何类型标签。但 `PRINT_FILTER="*:I tag1:E"` 打印关于 `tag1` 的输出时会报错，这是因为 `tag1` 规则比 `*` 规则的优先级高。
- 默认规则（空）等价于 `*:V`，因为在详细级别或更低级别匹配任意标签即意味匹配所有内容。
- `"*:N"` 不仅抑制了日志功能的输出，也抑制了 `printf` 的打印输出。为了避免这一问题，请使用 `*:E` 或更高的冗余级别。
- 规则 `"tag1:V"`、`"tag1:v"`、`"tag1:"`、`"tag1:*"` 和 `"tag1"` 等同。
- 规则 `"tag1:W tag1:E"` 等同于 `"tag1:E"`，这是因为后续出现的具有相同名称的标签会覆盖掉前一个标签。
- 规则 `"tag1:I tag2:W"` 仅在 Info 详细度级别或更低级别打印 `tag1`，在 Warning 详细度级别或更低级别打印 `tag2`。
- 规则 `"tag1:I tag2:W tag3:N"` 在本质上等同于上一规则，这是因为 `tag3:N` 指定 `tag3` 不打印。
- `tag3:N` 在规则 `"tag1:I tag2:W tag3:N *:V"` 中更有意义，这是因为如果没有 `tag3:N`，`tag3` 信息就可能打印出来了；`tag1` 和 `tag2` 错误信息会打印在指定的详细度级别（或更低级别），并默认打印所有内容。

高级筛选规则示例 如下日志是在没有设置任何筛选选项的情况下获得的:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID␣
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

`PRINT_FILTER="wifi esp_image:E light_driver:I"` 筛选选项捕获的输出如下所示:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

`PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` 选项的输出如下:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

IDF 监视器已知问题

Windows 环境下已知问题

- 由于 Windows 控制台限制，有些箭头键及其他一些特殊键无法在 GDB 中使用。
- 偶然情况下，`idf.py` 退出时，可能会在 IDF 监视器恢复之前暂停 30 秒。
- GDB 运行时，可能会暂停一段时间，然后才开始与 GDBStub 进行通信。

Linux 和 macOS 平台工具链的标准设置

详细安装步骤 请根据下方详细步骤，完成安装过程。

设置开发环境 以下是为 ESP32-C3 设置 ESP-IDF 的具体步骤。

- 第一步：安装准备
- 第二步：获取 *ESP-IDF*
- 第三步：设置工具
- 第四步：设置环境变量
- 第五步：开始使用 *ESP-IDF* 吧

第一步：安装准备 为了在 ESP32-C3 中使用 ESP-IDF，需要根据操作系统安装一些软件包。以下安装指南可协助您安装 Linux 和 macOS 的系统上所有需要的软件包。

Linux 用户 编译 ESP-IDF 需要以下软件包。请根据使用的 Linux 发行版本，选择合适的安装命令。

- Ubuntu 和 Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-venv python3-
↪setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.
↪0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3␣
↪python3-setuptools cmake ninja-build ccache dfu-util libusbx
```

目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja␣
↪ccache dfu-util libusb
```

备注:

- 使用 ESP-IDF 需要 CMake 3.16 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库，或开启 backports 套件库，或安装 “cmake3” 软件包（不是安装 “cmake”）。
- 如果上述列表中没有您使用的系统，请参考您所用系统的相关文档，查看安装软件包所用的命令。

---

macOS 用户 ESP-IDF 将使用 macOS 上默认安装的 Python 版本。

- 安装 CMake 和 Ninja 编译工具：
  - 若有 HomeBrew，您可以运行:

```
brew install cmake ninja dfu-util
```

  - 若有 MacPorts，您可以运行:

```
sudo port install cmake ninja dfu-util
```

  - 若以上均不适用，请访问 CMake 和 Ninja 主页，查询有关 macOS 平台的下载安装问题。
- 强烈建议同时安装 ccache 以获得更快的编译速度。如有 HomeBrew，可通过 MacPorts 上的 `brew install ccache` 或 `sudo port install ccache` 完成安装。

备注: 如您在上述任何步骤中遇到以下错误:

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools),␣
↪missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

则必须安装 XCode 命令行工具，可运行 `xcode-select --install` 命令进行安装。

Apple M1 用户 如果您使用的是 Apple M1 系列且看到如下错误提示:

```
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is␣
↪present, but tool was not found
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to␣
↪install it.
```

或者:

```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-
↪patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```

您需要运行如下命令来安装 Apple Rosetta 2：

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

安装 Python 3 Catalina 10.15 发布说明 中表示不推荐使用 Python 2.7 版本，在未来的 macOS 版本中也不会默认包含 Python 2.7。执行以下命令来检查您当前使用的 Python 版本:

```
python --version
```

如果输出结果是 `Python 2.7.17`，则代表您的默认解析器是 Python 2.7。这时需要您运行以下命令检查电脑上是否已经安装过 Python 3:

```
python3 --version
```

如果运行上述命令出现错误，则代表电脑上没有安装 Python 3。

请根据以下步骤安装 Python 3：

- 使用 HomeBrew 进行安装的方法如下:

  ```
  brew install python3
  ```

- 使用 MacPorts 进行安装的方法如下:

  ```
  sudo port install python38
  ```

第二步：获取 ESP-IDF 在围绕 ESP32-C3 构建应用程序之前，请先获取乐鑫提供的软件库文件 ESP-IDF 仓库。

获取 ESP-IDF 的本地副本：打开终端，切换到您要保存 ESP-IDF 的工作目录，使用 `git clone` 命令克隆远程仓库。针对不同操作系统的详细步骤，请见下文。

打开终端，运行以下命令：

```
mkdir -p ~/esp
cd ~/esp
git clone -b v5.1-rc2 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 `~/esp/esp-idf`。

请前往*ESP-IDF 版本简介*，查看 ESP-IDF 不同版本的具体适用场景。

第三步：设置工具 除了 ESP-IDF 本身，您还需要为支持 ESP32-C3 的项目安装 ESP-IDF 使用的各种工具，比如编译器、调试器、Python 包等。

```
cd ~/esp/esp-idf
./install.sh esp32c3
```

或使用 Fish shell：

```
cd ~/esp/esp-idf
./install.fish esp32c3
```

上述命令仅仅为 ESP32-C3 安装所需工具。如果需要为多个目标芯片开发项目，则可以一次性指定多个目标，如下所示：

```
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

或使用 Fish shell：

```
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

如果需要一次性为所有支持的目标芯片安装工具，可以运行如下命令：

```
cd ~/esp/esp-idf
./install.sh all
```

或使用 Fish shell：

```
cd ~/esp/esp-idf
./install.fish all
```

备注： 对于 macOS 用户，如您在上述任何步骤中遇到以下错误：

```
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable␣
↪to get local issuer certificate (_ssl.c:xxx)
```

可运行您电脑 Python 文件夹中的 `Install Certificates.command` 安装证书。了解更多信息，请参考 安装 ESP-IDF 工具时出现的下载错误。

下载工具备选方案 ESP-IDF 工具安装器会下载 Github 发布版本中附带的一些工具，如果访问 Github 较为缓慢，可以设置一个环境变量，从而优先选择 Espressif 的下载服务器进行 Github 资源下载。

备注： 该设置只影响从 Github 发布版本中下载的单个工具，它并不会改变访问任何 Git 仓库的 URL。

要在安装工具时优先选择 Espressif 下载服务器，请在运行 `install.sh` 时使用以下命令：

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

自定义工具安装路径 本步骤中介绍的脚本将 ESP-IDF 所需的编译工具默认安装在用户的根目录中，即 Linux 系统中的 `$HOME/.espressif` 目录。您可以选择将工具安装到其他目录中，但请在运行安装脚本前，重新设置环境变量 `IDF_TOOLS_PATH`。注意，请确保您的用户账号已经具备了读写该路径的权限。

如果修改了 `IDF_TOOLS_PATH` 变量，请确保该变量在每次执行安装脚本 (`install.bat`、`install.ps1` 或 `install.sh`) 和导出脚本 (`export.bat`、`export.ps1` 或 `export.sh`) 均保持一致。

第四步：设置环境变量 此时，您刚刚安装的工具尚未添加至 PATH 环境变量，无法通过“命令窗口”使用这些工具。因此，必须设置一些环境变量。这可以通过 ESP-IDF 提供的另一个脚本进行设置。

请在需要运行 ESP-IDF 的终端窗口运行以下命令：

```
. $HOME/esp/esp-idf/export.sh
```

对于 fish shell（仅支持 fish 3.0.0 及以上版本），请运行以下命令：

```
. $HOME/esp/esp-idf/export.fish
```

注意，命令开始的“.”与路径之间应有一个空格！

如果您需要经常运行 ESP-IDF，您可以为执行 `export.sh` 创建一个别名，具体步骤如下：

1. 复制并粘贴以下命令到 shell 配置文件中（`.profile`、`.bashrc`、`.zprofile` 等）

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. 通过重启终端窗口或运行 `source [path to profile]`，如 `source ~/.bashrc` 来刷新配置文件。

现在您可以在任何终端窗口中运行 `get_idf` 来设置或刷新 esp-idf 环境。

不建议直接将 `export.sh` 添加到 shell 的配置文件。这样做会导致在每个终端会话中都激活 IDF 虚拟环境（包括无需使用 IDF 的会话）。这违背了使用虚拟环境的目的，还可能影响其他软件的使用。

第五步：开始使用 ESP-IDF 吧 现在您已经具备了使用 ESP-IDF 的所有条件，接下来将介绍如何开始您的第一个工程。

本指南将帮助您完成使用 ESP-IDF 的第一步。按照本指南，您将使用 ESP32-C3 创建第一个工程，并构建、烧录和监控设备输出。

备注： 如果您还未安装 ESP-IDF，请参照安装 中的步骤，获取使用本指南所需的所有软件。

开始创建工程 现在，您可以准备开发 ESP32-C3 应用程序了。您可以从 ESP-IDF 中 examples 目录下的 get-started/hello_world 工程开始。

重要： ESP-IDF 编译系统不支持 ESP-IDF 路径或其工程路径中带有空格。

将 get-started/hello_world 工程复制至您本地的 `~/esp` 目录下：

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

备注： ESP-IDF 的 examples 目录下有一系列示例工程，您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

连接设备 现在，请将您的 ESP32-C3 开发板连接到 PC，并查看开发板使用的串口。

通常，串口在不同操作系统下显示的名称有所不同：

- **Linux 操作系统：** 以 `/dev/tty` 开头
- **macOS 操作系统：** 以 `/dev/cu.` 开头

有关如何查看串口名称的详细信息，请见*与 ESP32-C3 创建串口连接*。

备注： 请记住串口名，您会在后续步骤中使用。

配置工程 请进入 `hello_world` 目录，设置 ESP32-C3 为目标芯片，然后运行工程配置工具 `menuconfig`。

```
cd ~/esp/hello_world
idf.py set-target esp32c3
idf.py menuconfig
```

打开一个新工程后，应首先使用 `idf.py set-target esp32c3` 设置“目标”芯片。注意，此操作将清除并初始化项目之前的编译和配置（如有）。您也可以直接将“目标”配置为环境变量（此时可跳过该步骤）。更多信息，请见*Select the Target Chip: set-target*。

正确操作上述步骤后，系统将显示以下菜单：

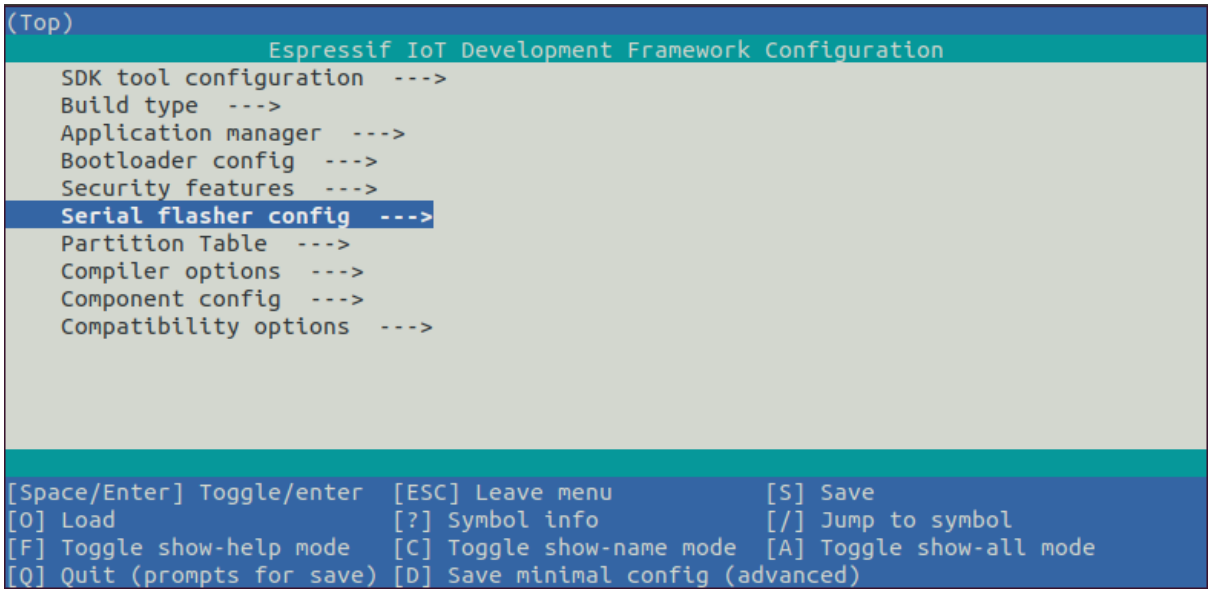

图 21: 工程配置—主窗口

您可以通过此菜单设置项目的具体变量，包括 Wi-Fi 网络名称、密码和处理器速度等。`hello_world` 示例项目会以默认配置运行，因此在这一项目中，可以跳过使用 `menuconfig` 进行项目配置这一步骤。

备注： 您终端窗口中显示出的菜单颜色可能会与上图不同。您可以通过选项 `--style` 来改变外观。请运行 `idf.py menuconfig --help` 命令，获取更多信息。

编译工程 请使用以下命令，编译烧录工程：

```
idf.py build
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成引导加载程序、分区表和应用程序二进制文件。

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin  build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'
```

如果一切正常，编译完成后将生成.bin 文件。

烧录到设备 请运行以下命令，将刚刚生成的二进制文件烧录至您的 ESP32-C3 开发板：

```
idf.py -p PORT flash
```

请将 PORT 替换为 ESP32-C3 开发板的串口名称。如果 PORT 未经定义，*idf.py* 将尝试使用可用的串口自动连接。

更多有关 idf.py 参数的详情，请见*idf.py*。

备注： 勾选 flash 选项将自动编译并烧录工程，因此无需再运行 idf.py build。

若在烧录过程中遇到问题，请前往烧录故障排除 或与 *ESP32-C3* 创建串口连接 获取更多详细信息。

常规操作 在烧录过程中，您会看到类似如下的输出日志：

```
...
esptool.py --chip esp32c3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
↪after=hard_reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB␣
↪0x8000 partition_table/partition-table.bin 0x0 bootloader/bootloader.bin 0x10000␣
↪hello_world.bin
esptool.py v3.0
Serial port /dev/ttyUSB0
Connecting....
Chip is ESP32-C3

Leaving...
Hard resetting via RTS pin...
Done
```

如果一切顺利，烧录完成后，开发板将会复位，应用程序“hello_world”开始运行。

如果您希望使用 Eclipse 或是 VS Code IDE，而非 idf.py，请参考 Eclipse Plugin，以及 VSCode Extension。

监视输出 您可以使用 `idf.py -p PORT monitor` 命令，监视“hello_world”工程的运行情况。注意，不要忘记将 PORT 替换为您的串口名称。

运行该命令后，*IDF 监视器* 应用程序将启动：：

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

此时，您就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```
    ...
    Hello world!
    Restarting in 10 seconds...
    This is esp32c3 chip with 1 CPU core(s), WiFi/BLE, silicon revision 0, 2 MB␣

```

您可使用快捷键 `Ctrl+]`，退出 IDF 监视器。

备注： 您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
idf.py -p PORT flash monitor
```

此外，

- 请前往*IDF 监视器*，了解更多使用 IDF 监视器的快捷键和其他详情。
- 请前往*idf.py*，查看更多 `idf.py` 命令和选项。

恭喜，您已完成 ESP32-C3 的入门学习！

现在，您可以尝试一些其他 examples，或者直接开发自己的应用程序。

重要： 一些示例程序不支持 ESP32-C3，因为 ESP32-C3 中不包含所需的硬件。

在编译示例程序前请查看 README 文件中 `Supported Targets` 表格。如果表格中包含 ESP32-C3，或者不存在这个表格，那么即表示 ESP32-C3 支持这个示例程序。

其他提示

权限问题 /dev/ttyUSB0 使用某些 Linux 版本向 ESP32-C3 烧录固件时，可能会出现 `Failed to open port /dev/ttyUSB0` 错误消息。此时可以将用户添加至*Linux Dialout 组*。

兼容的 Python 版本 ESP-IDF 支持 Python 3.7 及以上版本，建议升级操作系统到最新版本从而更新 Python。也可选择从 sources 安装最新版 Python，或使用 Python 管理系统如 pyenv 对版本进行升级管理。

擦除 flash ESP-IDF 支持擦除 flash。请运行以下命令，擦除整个 flash：

```
idf.py -p PORT erase-flash
```

若存在需要擦除的 OTA 数据，请运行以下命令：

```
idf.py -p PORT erase-otadata
```

擦除 flash 需要一段时间，在擦除过程中，请勿断开设备连接。

建议：更新 ESP-IDF 乐鑫会不时推出新版本的 ESP-IDF，修复 bug 或提供新的功能。请注意，EESP-IDF 的每个主要版本和次要版本都有相应的支持期限。支持期限满后，版本停止更新维护，用户可将项目升级到最新的 ESP-IDF 版本。更多关于支持期限的信息，请参考*ESP-IDF 版本*。

因此，您在使用时，也应注意更新您本地的版本。最简单的方法是：直接删除您本地的 `esp-idf` 文件夹，然后按照*第二步：获取 ESP-IDF* 中的指示，重新完成克隆。

另一种方法是仅更新变更的部分。具体方式，请前往*更新 ESP-IDF* 章节查看。具体更新步骤会根据您使用的 ESP-IDF 版本有所不同。

注意，更新完成后，请再次运行安装脚本，以防新版 ESP-IDF 所需的工具也有所更新。具体请参考*第三步：设置工具*。

一旦重新安装好工具，请使用导出脚本更新环境，具体请参考*第四步：设置环境变量*。

1.4 编译第一个工程

如果您已经安装好 ESP-IDF 且没有使用集成开发环境 (IDE)，请在命令提示行中按照*在 Windows 中开始创建工程* 或*在 Linux 和 macOS 中开始创建工程* 编译第一个工程。

Chapter 2

API 参考

2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures and types.
- Build system functions, predefined variables and options. These are documented in the *build system guide*.
- *Kconfig* options can can be used in code and in the build system (CMakeLists.txt) files.
- *Host tools* and their command line parameters are also part of ESP-IDF interface.

ESP-IDF consists of components written specifically for ESP-IDF as well as third-party libraries. In some cases, an ESP-IDF-specific wrapper is added to the third-party library, providing an interface that is either simpler or better integrated with the rest of ESP-IDF facilities. In other cases, the original API of the third-party library is presented to the application developers.

Following sections explain some of the aspects of ESP-IDF APIs and their usage.

2.1.1 Error handling

Most ESP-IDF APIs return error codes defined with `esp_err_t` type. See *Error Handling* section for more information about error handling approaches. *Error Code Reference* contains the list of error codes returned by ESP-IDF components.

2.1.2 Configuration structures

重要： Correct initialization of configuration structures is an important part in making the application compatible with future versions of ESP-IDF.

Most initialization or configuration functions in ESP-IDF take as an argument a pointer to a configuration structure. For example:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);
```

Initialization functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 designated initializers for structure initialization, since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

The C++ language supports designated initializers syntax, too, but the initializers must be in the order of declaration. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```
/* Correct, fields .dispatch_method, .name and .skip_unhandled_events are zero-
↪initialized */
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = &my_arg,
};

///* Incorrect, .arg is declared after .callback in esp_timer_create_args_t */
//const esp_timer_create_args_t my_timer_args = {
//    .arg = &my_arg,
//    .callback = &my_timer_callback,
//};
```

For more information on designated initializers, see *Designated initializers*. Note that C++ language versions older than C++20 (not the default in the current version of ESP-IDF) do not support designated initializers. If you have to compile code with an older C++ standard than C++20, you may use GCC extensions to produce the following pattern:

```
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

Default initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer.
   Now all fields are set to the default values.
   Any field can still be modified: */
config.server_port = 8081;
```

(下页继续)

(续上页)

```
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code, and not by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as *hal* only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

2.1.4 Components in example projects

ESP-IDF examples contain a variety of projects demonstrating usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples. This includes components located in common_components directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Take time to read the code and understand if it applicable to your use case.

2.1.5 API Stability

ESP-IDF uses Semantic Versioning as explained in the *versions page*.

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

Source level compatibility

ESP-IDF guarantees source level compatibility of C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Source level compatibility implies that the application can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF relese notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however this is not mandatory. Deprecated functions and files can be removed in major versions of ESP-IDF.
- Renaming components, moving source and header files between components —provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system *renaming mechanism* ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files and source code.

Lack of binary compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See *Configuration structures* for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

Other exceptions from compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issue reports about any unintended breaking changes that don't fall into the categories below.

- *Private APIs*.
- *Components in example projects*.
- Features clearly marked as "beta", "preview", or "experimental".
- Changes made to mitigate security issues or to replace insecure default behaviors with a secure ones.
- Features which were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features which depend on non-functional chip hardware features.
- Unexpected or undefined behavior (for example, due to missing validation of argument ranges) that is not documented explicitly may be fixed/changed.
- Location of *Kconfig* options in menuconfig.
- Location and names of example projects.

2.2 应用层协议

2.2.1 ASIO port

Asio is a cross-platform C++ library, see https://think-async.com/Asio/. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component *ASIO* has been moved from ESP-IDF since version v5.0 to a separate repository:

- ASIO component on GitHub

To add ASIO component in your project, please run *idf.py add-dependency espressif/asio*

Hosted Documentation

The documentation can be found on the link below:

- ASIO documentation (English)

2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (esp-modbus) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces. The ESP-IDF component *freemodbus* has been moved from ESP-IDF since version v5.0 to a separate repository:

- ESP-Modbus component on GitHub

Hosted Documentation

The documentation can be found on the link below:

- ESP-Modbus documentation (English)

Application Example

The examples below demonstrate the ESP-Modbus library of serial, TCP ports for slave and master implementations accordingly.

- protocols/modbus/serial/mb_slave
- protocols/modbus/serial/mb_master
- protocols/modbus/tcp/mb_tcp_slave
- protocols/modbus/tcp/mb_tcp_master

Please refer to the specific example README.md for details.

Protocol References

- `https://modbus.org/specs.php`: Modbus Organization with protocol specifications.

2.2.3 ESP-MQTT

概述

ESP-MQTT 是 MQTT 协议客户端的实现，MQTT 是一种基于发布/订阅模式的轻量级消息传输协议。ESP-MQTT 当前支持 MQTT v5.0。

特性

- 支持基于 TCP 的 MQTT、基于 Mbed TLS 的 SSL、基于 WebSocket 的 MQTT 以及基于 WebSocket Secure 的 MQTT
- 通过 URI 简化配置流程
- 多个实例（一个应用程序中有多个客户端）
- 支持订阅、发布、认证、遗嘱消息、保持连接心跳机制以及 3 个服务质量 (QoS) 级别（组成全功能客户端）

应用示例

- protocols/mqtt/tcp：基于 TCP 的 MQTT，默认端口 1883
- protocols/mqtt/ssl：基于 TLS 的 MQTT，默认端口 8883
- protocols/mqtt/ssl_ds：基于 TLS 的 MQTT，使用数字签名外设进行身份验证，默认端口 8883
- protocols/mqtt/ssl_mutual_auth：基于 TLS 的 MQTT，使用证书进行身份验证，默认端口 8883
- protocols/mqtt/ssl_psk：基于 TLS 的 MQTT，使用预共享密钥进行身份验证，默认端口 8883
- protocols/mqtt/ws：基于 WebSocket 的 MQTT，默认端口 80
- protocols/mqtt/wss：基于 WebSocket Secure 的 MQTT，默认端口 443
- protocols/mqtt5: 使用 ESP-MQTT 库连接 MQTT v5.0 的服务器

MQTT 消息重传

调用*esp_mqtt_client_publish* 或其非阻塞形式*esp_mqtt_client_enqueue*，可以创建新的 MQTT 消息。

QoS 0 的消息将只发送一次，QoS 1 和 2 具有不同行为，因为协议需要执行额外步骤来完成该过程。

ESP-MQTT 库将始终重新传输未确认的 QoS 1 和 2 发布消息，以避免连接错误导致信息丢失，虽然 MQTT 规范要求仅在重新连接且 Clean Session 标志设置为 0 时重新传输（针对此行为，将*disable_clean_session* 设置为 true）。

可能需要重传的 QoS 1 和 2 消息总是处于排队状态，但若使用*esp_mqtt_client_publish* 则会立即进行第一次传输尝试。未确认消息的重传将在*message_retransmit_timeout* 之后进行。在*CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS* 之后，消息会过期并被删除。如已设置*CONFIG_MQTT_REPORT_DELETED_MESSAGES*，则会发送事件来通知用户。

配置

通过设置*esp_mqtt_client_config_t* 结构体中的字段来进行配置。配置结构体包含以下子结构体，用于配置客户端的多种操作。

- *esp_mqtt_client_config_t::broker_t* - 允许设置地址和安全验证。
- *esp_mqtt_client_config_t::credentials_t* - 用于身份验证的客户端凭据。
- *esp_mqtt_client_config_t::session_t* - MQTT 会话相关配置。
- *esp_mqtt_client_config_t::network_t* - 网络相关配置。
- *esp_mqtt_client_config_t::task_t* - 允许配置 FreeRTOS 任务。
- *esp_mqtt_client_config_t::buffer_t* - 输入输出的缓冲区大小。

下文将详细介绍不同配置。

服务器

地址 通过*address* 结构体的*uri* 字段或者*hostname*、*transport* 以及*port* 的组合，可以设置服务器地址。您也可以选择设置*path*，该字段对 WebSocket 连接而言非常有用。

使用*uri* 字段的格式为 `scheme://hostname:port/path`。

- 当前支持 `mqtt`、`mqtts`、`ws` 和 `wss` 协议
- 基于 TCP 的 MQTT 示例：
  - `mqtt://mqtt.eclipseprojects.io`：基于 TCP 的 MQTT，默认端口 1883
  - `mqtt://mqtt.eclipseprojects.io:1884`：基于 TCP 的 MQTT，端口 1884
  - `mqtt://username:password@mqtt.eclipseprojects.io:1884`：基于 TCP 的 MQTT，端口 1884，带有用户名和密码
- 基于 SSL 的 MQTT 示例：
  - `mqtts://mqtt.eclipseprojects.io`：基于 SSL 的 MQTT，端口 8883
  - `mqtts://mqtt.eclipseprojects.io:8884`：基于 SSL 的 MQTT，端口 8884
- 基于 WebSocket 的 MQTT 示例：
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
- 基于 WebSocket Secure 的 MQTT 示例：
  - `wss://mqtt.eclipseprojects.io:443/mqtt`
- 最简配置：

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,␣
↪client);
esp_mqtt_client_start(client);
```

备注： 默认情况下，MQTT 客户端使用事件循环库来发布相关 MQTT 事件（已连接、已订阅、已发布等）。

验证 为验证服务器身份，对于使用 TLS 的安全链接，必须设置*verification* 结构体。服务器证书可设置为 PEM 或 DER 格式。如要选择 DER 格式，必须设置等效*certificate_len* 字段，否则应在*certificate* 字段传入以空字符结尾的 PEM 格式字符串。

- **从服务器获取证书，例如：mqtt.eclipseprojects.io**

```
openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 < /dev/
↪null \
2> /dev/null | openssl x509 -outform PEM > mqtt_eclipse_org.pem
```

- 检查示例应用程序：protocols/mqtt/ssl
- 配置：

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker = {
      .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
      .verification.certificate = (const char *)mqtt_eclipse_org_pem_start,
    },
};
```

了解其他字段的详细信息，请查看*API 参考* 以及*TLS Server verification*。

客户端凭据 *credentials* 字段下包含所有客户端相关凭据。

- *username*：指向用于连接服务器用户名的指针，也可通过 URI 设置
- *client_id*：指向客户端 ID 的指针，默认为 ESP32_%CHIPID%，其中 %CHIPID% 是十六进制 MAC 地址的最后 3 个字节

认证 可以通过*authentication* 字段设置认证参数。客户端支持以下认证方式：

- *password*：使用密码
- – *certificate* 和*key*：进行双向 TLS 身份验证，PEM 或 DER 格式均可
- *use_secure_element*：使用 ESP32-WROOM-32SE 中的安全元素
- *ds_data*：使用某些乐鑫设备的数字签名外设

会话 使用*session* 字段进行 MQTT 会话相关配置。

遗嘱消息 (LWT) 通过设置*last_will* 结构体的以下字段，MQTT 会在一个客户端意外断开连接时通过遗嘱消息通知其他客户端。

- *topic*：指向 LWT 消息主题的指针
- *msg*：指向 LWT 消息的指针
- *msg_len*：LWT 消息的长度，*msg* 不以空字符结尾时需要该字段
- *qos*：LWT 消息的服务质量
- *retain*：指定 LWT 消息的保留标志

在项目配置菜单中设置 MQTT 通过 idf.py menuconfig，可以在 Component config > ESP-MQTT Configuration 中找到 MQTT 设置。

相关设置如下：

- *CONFIG_MQTT_PROTOCOL_311*：启用 MQTT 协议 3.1.1 版本
- *CONFIG_MQTT_TRANSPORT_SSL* 和*CONFIG_MQTT_TRANSPORT_WEBSOCKET*：启用特定 MQTT 传输层，例如 SSL、WEBSOCKET 和 WEBSOCKET_SECURE

- *CONFIG_MQTT_CUSTOM_OUTBOX*：禁用 mqtt_outbox 默认实现，因此可以提供特定实现

事件

MQTT 客户端可能会发布以下事件：

- MQTT_EVENT_BEFORE_CONNECT：客户端已初始化并即将开始连接至服务器。
- MQTT_EVENT_CONNECTED：客户端已成功连接至服务器。客户端已准备好收发数据。
- MQTT_EVENT_DISCONNECTED：由于无法读取或写入数据，例如因为服务器无法使用，客户端已终止连接。
- MQTT_EVENT_SUBSCRIBED：服务器已确认客户端的订阅请求。事件数据将包含订阅消息的消息 ID。
- MQTT_EVENT_UNSUBSCRIBED：服务器已确认客户端的退订请求。事件数据将包含退订消息的消息 ID。
- MQTT_EVENT_PUBLISHED：服务器已确认客户端的发布消息。消息将仅针对 QoS 级别 1 和 2 发布，因为级别 0 不会进行确认。事件数据将包含发布消息的消息 ID。
- MQTT_EVENT_DATA：客户端已收到发布消息。事件数据包含：消息 ID、发布消息所属主题名称、收到的数据及其长度。对于超出内部缓冲区的数据，将发布多个 MQTT_EVENT_DATA，并更新事件数据的*current_data_offset* 和*total_data_len* 以跟踪碎片化消息。
- MQTT_EVENT_ERROR：客户端遇到错误。使用事件数据*error_handle* 字段中的*error_type*，可以发现错误。错误类型决定*error_handle* 结构体的哪些部分会被填充。

API 参考

Header File

- components/mqtt/esp-mqtt/include/mqtt_client.h

Functions

esp_mqtt_client_handle_t **esp_mqtt_client_init**(const *esp_mqtt_client_config_t* *config)

Creates *MQTT* client handle based on the configuration.

参数 **config** –*MQTT* configuration structure
返回 mqtt_client_handle if successfully created, NULL on error

esp_err_t **esp_mqtt_client_set_uri**(*esp_mqtt_client_handle_t* client, const char *uri)

Sets *MQTT* connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

参数
- **client** –*MQTT* client handle
- **uri** –

返回 ESP_FAIL if URI parse error, ESP_OK on success

esp_err_t **esp_mqtt_client_start**(*esp_mqtt_client_handle_t* client)

Starts *MQTT* client with already created client handle.

参数 **client** –*MQTT* client handle
返回 ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

esp_err_t **esp_mqtt_client_reconnect**(*esp_mqtt_client_handle_t* client)

This api is typically used to force reconnection upon a specific event.

参数 **client** –*MQTT* client handle
返回 ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

esp_err_t **esp_mqtt_client_disconnect**(*esp_mqtt_client_handle_t* client)

This api is typically used to force disconnection from the broker.

参数 **client** –*MQTT* client handle

返回 ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

esp_err_t **esp_mqtt_client_stop** (*esp_mqtt_client_handle_t* client)

Stops *MQTT* client tasks.

- Notes:
- Cannot be called from the *MQTT* event handler

参数 **client** –*MQTT* client handle
返回 ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

int **esp_mqtt_client_subscribe** (*esp_mqtt_client_handle_t* client, const char *topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a *MQTT* event callback i.e. internal *MQTT* task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

参数
- **client** –*MQTT* client handle
- **topic** –
- **qos** –// TODO describe parameters

返回 message_id of the subscribe message on success -1 on failure

int **esp_mqtt_client_unsubscribe** (*esp_mqtt_client_handle_t* client, const char *topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

参数
- **client** –*MQTT* client handle
- **topic** –

返回 message_id of the subscribe message on success -1 on failure

int **esp_mqtt_client_publish** (*esp_mqtt_client_handle_t* client, const char *topic, const char *data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn' t have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

参数
- **client** –*MQTT* client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –QoS of publish message
- **retain** –retain flag

返回 message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

int **esp_mqtt_client_enqueue**(*esp_mqtt_client_handle_t* client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task' s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

参数

- **client** –*MQTT* client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –QoS of publish message
- **retain** –retain flag
- **store** –if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

返回 message_id if queued successfully, -1 otherwise

esp_err_t **esp_mqtt_client_destroy**(*esp_mqtt_client_handle_t* client)

Destroys the client handle.

Notes:

- Cannot be called from the *MQTT* event handler

参数 **client** –*MQTT* client handle

返回 ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

esp_err_t **esp_mqtt_set_config**(*esp_mqtt_client_handle_t* client, const *esp_mqtt_client_config_t* *config)

Set configuration structure, typically used when updating the config (i.e. on "before_connect" event.

参数

- **client** –*MQTT* client handle
- **config** –*MQTT* configuration structure

返回 ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

esp_err_t **esp_mqtt_client_register_event**(*esp_mqtt_client_handle_t* client, *esp_mqtt_event_id_t* event, *esp_event_handler_t* event_handler, void *event_handler_arg)

Registers *MQTT* event.

参数

- **client** –*MQTT* client handle
- **event** –event type
- **event_handler** –handler callback
- **event_handler_arg** –handlers context

返回 ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

esp_err_t **esp_mqtt_client_unregister_event**(*esp_mqtt_client_handle_t* client, *esp_mqtt_event_id_t* event, *esp_event_handler_t* event_handler)

Unregisters mqtt event.

参数

- **client** –mqtt client handle
- **event** –event ID

- **event_handler** –handler to unregister

返回 ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on invalid event ID ESP_OK on success

int **esp_mqtt_client_get_outbox_size**(*esp_mqtt_client_handle_t* client)

Get outbox size.

参数 **client** –*MQTT* client handle

返回 outbox size 0 on wrong initialization

esp_err_t **esp_mqtt_dispatch_custom_event**(*esp_mqtt_client_handle_t* client, *esp_mqtt_event_t* *event)

Dispatch user event to the mqtt internal event loop.

参数

- **client** –*MQTT* client handle
- **event** –*MQTT* event handle structure

返回 ESP_OK on success ESP_ERR_TIMEOUT if the event couldn't be queued (ref also CONFIG_MQTT_EVENT_QUEUE_SIZE)

Structures

struct **esp_mqtt_error_codes**

MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

| error_type | related member variables | note | | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from tcp_transport/esp-tls | | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from *MQTT* broker on connection |

Public Members

esp_err_t **esp_tls_last_esp_err**

last esp_err code reported from esp-tls component

int **esp_tls_stack_err**

tls specific error code reported from underlying tls stack

int **esp_tls_cert_verify_flags**

tls flags reported from underlying tls stack during certificate verification

esp_mqtt_error_type_t **error_type**

error type referring to the source of the error

esp_mqtt_connect_return_code_t **connect_return_code**

connection refused error code reported from MQTT* broker on connection

int **esp_transport_sock_errno**

errno from the underlying socket

struct **esp_mqtt_event_t**

MQTT event configuration structure

Public Members

esp_mqtt_event_id_t **event_id**

MQTT event type

esp_mqtt_client_handle_t **client**

MQTT client handle for this event

char ***data**

Data associated with this event

int **data_len**

Length of the data for this event

int **total_data_len**

Total length of the data (longer data are supplied with multiple events)

int **current_data_offset**

Actual offset for the data associated with this event

char ***topic**

Topic associated with this event

int **topic_len**

Length of the topic for this event associated with this event

int **msg_id**

MQTT messaged id of message

int **session_present**

MQTT session_present flag for connection event

esp_mqtt_error_codes_t ***error_handle**

esp-mqtt error handle including esp-tls errors as well as internal *MQTT* errors

bool **retain**

Retained flag of the message associated with this event

int **qos**

QoS of the messages associated with this event

bool **dup**

dup flag of the message associated with this event

esp_mqtt_protocol_ver_t **protocol_ver**

MQTT protocol version used for connection, defaults to value from menuconfig

struct **esp_mqtt_client_config_t**

MQTT client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

Public Members

struct *esp_mqtt_client_config_t*::*broker_t* **broker**

Broker address and security verification

struct *esp_mqtt_client_config_t*::*credentials_t* **credentials**

User credentials for broker

struct *esp_mqtt_client_config_t*::*session_t* **session**

MQTT session configuration.

struct *esp_mqtt_client_config_t*::*network_t* **network**

Network configuration

struct *esp_mqtt_client_config_t*::*task_t* **task**

FreeRTOS task configuration.

struct *esp_mqtt_client_config_t*::*buffer_t* **buffer**

Buffer size configuration.

struct **broker_t**

Broker related configuration

Public Members

struct *esp_mqtt_client_config_t*::*broker_t*::*address_t* **address**

Broker address configuration

struct *esp_mqtt_client_config_t*::*broker_t*::*verification_t* **verification**

Security verification of the broker

struct **address_t**

Broker address

- uri have precedence over other fields
- If uri isn’ t set at least hostname, transport and port should.

Public Members

const char ***uri**

Complete *MQTT* broker URI

const char ***hostname**

Hostname, to set ipv4 pass it as string)

esp_mqtt_transport_t **transport**

Selects transport

const char ***path**

Path in the URI

uint32_t **port**

MQTT server port

struct **verification_t**

Broker identity verification

If fields are not set broker’s identity isn’t verified. it’s recommended to set the options in this struct for security reasons.

Public Members

bool **use_global_ca_store**

Use a global ca_store, look esp-tls documentation for details.

esp_err_t (***crt_bundle_attach**)(void *conf)

Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles.

const char ***certificate**

Certificate data, default is NULL, not required to verify the server.

size_t **certificate_len**

Length of the buffer pointed to by certificate.

const struct *psk_key_hint* ***psk_hint_key**

Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker.

bool **skip_cert_common_name_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the *MQTT* client susceptible to MITM attacks

const char ****alpn_protos**

NULL-terminated list of supported application protocols to be used for ALPN

struct **buffer_t**

Client buffer size configuration

Client have two buffers for input and output respectivelly.

Public Members

int **size**

size of *MQTT* send/receive buffer

int **out_size**

size of *MQTT* output buffer. If not defined, defaults to the size defined by `buffer_size`

struct **credentials_t**

Client related credentials for authentication.

Public Members

const char ***username**

MQTT username

const char ***client_id**

Set *MQTT* client identifier. Ignored if set_null_client_id == true If NULL set the default client id. Default client id is `ESP32_CHIPID%` where `CHIPID%` are last 3 bytes of MAC address in hex format

bool **set_null_client_id**

Selects a NULL client id

struct *esp_mqtt_client_config_t*::*credentials_t*::*authentication_t* **authentication**

Client authentication

struct **authentication_t**

Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.

Public Members

const char ***password**

MQTT password

const char ***certificate**

Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with `key`.

size_t **certificate_len**

Length of the buffer pointed to by certificate.

const char ***key**

Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also `certificate` has to be provided.

size_t **key_len**

Length of the buffer pointed to by key.

const char ***key_password**

Client key decryption password, not PEM nor DER, if provided `key_password_len` must be correctly set.

int **key_password_len**

Length of the password pointed to by `key_password`

bool **use_secure_element**

Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void ***ds_data**

Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices.

struct **network_t**

Network related configuration

Public Members

int **reconnect_timeout_ms**

Reconnect to the broker after this value in miliseconds if auto reconnect is not disabled (defaults to 10s)

int **timeout_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int **refresh_connection_after_ms**

Refresh connection after this value (in milliseconds)

bool **disable_auto_reconnect**

Client will reconnect to server (when errors/disconnect). Set `disable_auto_reconnect=true` to disable

struct **session_t**

MQTT Session related configuration

Public Members

struct *esp_mqtt_client_config_t*::*session_t*::*last_will_t* **last_will**

Last will configuration

bool **disable_clean_session**

MQTT clean session, default clean_session is true

int **keepalive**

MQTT keepalive, default is 120 seconds

bool **disable_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value `keepalive` to `0` doesn't disable keepalive feature, but uses a default keepalive period

esp_mqtt_protocol_ver_t **protocol_ver**

MQTT protocol version used for connection.

int **message_retransmit_timeout**

timeout for retransmitting of failed packet

struct **last_will_t**

Last Will and Testament message configuration.

Public Members

const char ***topic**

LWT (Last Will and Testament) message topic

const char ***msg**

LWT message, may be NULL terminated

int **msg_len**

LWT message length, if msg isn't NULL terminated must have the correct length

int **qos**

LWT message QoS

int **retain**

LWT retained message flag

struct **task_t**

Client task configuration

Public Members

int **priority**

MQTT task priority

int **stack_size**

MQTT task stack size

Macros

MQTT_ERROR_TYPE_ESP_TLS

MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

Type Definitions

typedef struct esp_mqtt_client ***esp_mqtt_client_handle_t**

typedef enum *esp_mqtt_event_id_t* **esp_mqtt_event_id_t**

MQTT event types.

User event handler receives context data in *esp_mqtt_event_t* structure with

- `client` - *MQTT* client handle
- various other data depending on event type

typedef enum *esp_mqtt_connect_return_code_t* **esp_mqtt_connect_return_code_t**

MQTT connection error codes propagated via ERROR event

typedef enum *esp_mqtt_error_type_t* **esp_mqtt_error_type_t**

MQTT connection error codes propagated via ERROR event

typedef enum *esp_mqtt_transport_t* **esp_mqtt_transport_t**

typedef enum *esp_mqtt_protocol_ver_t* **esp_mqtt_protocol_ver_t**

MQTT protocol version used for connection

typedef struct *esp_mqtt_error_codes* **esp_mqtt_error_codes_t**

MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends *esp_tls_last_error* error structure and is backward compatible with it (so might be down-casted and treated as *esp_tls_last_error* error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

| error_type | related member variables | note | | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from tcp_transport/esp-tls | | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from *MQTT* broker on connection |

typedef struct *esp_mqtt_event_t* **esp_mqtt_event_t**

MQTT event configuration structure

typedef *esp_mqtt_event_t* ***esp_mqtt_event_handle_t**

typedef *esp_err_t* (***mqtt_event_callback_t**)(*esp_mqtt_event_handle_t* event)

typedef struct *esp_mqtt_client_config_t* **esp_mqtt_client_config_t**

MQTT client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

Enumerations

enum **esp_mqtt_event_id_t**

MQTT event types.

User event handler receives context data in `esp_mqtt_event_t` structure with

- `client` - *MQTT* client handle
- various other data depending on event type

Values:

enumerator **MQTT_EVENT_ANY**

enumerator **MQTT_EVENT_ERROR**

on error event, additional context: connection return code, error handle from esp_tls (if supported)

enumerator **MQTT_EVENT_CONNECTED**

connected event, additional context: session_present flag

enumerator **MQTT_EVENT_DISCONNECTED**

disconnected event

enumerator **MQTT_EVENT_SUBSCRIBED**

subscribed event, additional context:

- msg_id message id
- error_handle `error_type` in case subscribing failed
- data pointer to broker response, check for errors.
- data_len length of the data for this event

enumerator **MQTT_EVENT_UNSUBSCRIBED**

unsubscribed event, additional context: msg_id

enumerator **MQTT_EVENT_PUBLISHED**

published event, additional context: msg_id

enumerator **MQTT_EVENT_DATA**

data event, additional context:

- msg_id message id
- topic pointer to the received topic
- topic_len length of the topic

- data pointer to the received data
- data_len length of the data for this event
- current_data_offset offset of the current data for this event
- total_data_len total length of the data received
- retain retain flag of the message
- qos QoS level of the message
- dup dup flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT_EVENT_BEFORE_CONNECT**

The event occurs before connecting

enumerator **MQTT_EVENT_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
- Additional context: msg_id (id of the deleted message).

enumerator **MQTT_USER_EVENT**

Custom event used to queue tasks into mqtt event handler All fields from the *esp_mqtt_event_t* type could be used to pass an additional context data to the handler.

enum **esp_mqtt_connect_return_code_t**

MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT_CONNECTION_ACCEPTED**

Connection accepted

enumerator **MQTT_CONNECTION_REFUSE_PROTOCOL**

MQTT connection refused reason: Wrong protocol

enumerator **MQTT_CONNECTION_REFUSE_ID_REJECTED**

MQTT connection refused reason: ID rejected

enumerator **MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE**

MQTT connection refused reason: Server unavailable

enumerator **MQTT_CONNECTION_REFUSE_BAD_USERNAME**

MQTT connection refused reason: Wrong user

enumerator **MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED**

MQTT connection refused reason: Wrong username or password

enum **esp_mqtt_error_type_t**

MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT_ERROR_TYPE_NONE**

enumerator **MQTT_ERROR_TYPE_TCP_TRANSPORT**

enumerator **MQTT_ERROR_TYPE_CONNECTION_REFUSED**

enumerator **MQTT_ERROR_TYPE_SUBSCRIBE_FAILED**

enum **esp_mqtt_transport_t**

Values:

enumerator **MQTT_TRANSPORT_UNKNOWN**

enumerator **MQTT_TRANSPORT_OVER_TCP**

MQTT over TCP, using scheme: `MQTT`

enumerator **MQTT_TRANSPORT_OVER_SSL**

MQTT over SSL, using scheme: `MQTTS`

enumerator **MQTT_TRANSPORT_OVER_WS**

MQTT over Websocket, using scheme:: `ws`

enumerator **MQTT_TRANSPORT_OVER_WSS**

MQTT over Websocket Secure, using scheme: `wss`

enum **esp_mqtt_protocol_ver_t**

MQTT protocol version used for connection

Values:

enumerator **MQTT_PROTOCOL_UNDEFINED**

enumerator **MQTT_PROTOCOL_V_3_1**

enumerator **MQTT_PROTOCOL_V_3_1_1**

enumerator **MQTT_PROTOCOL_V_5**

2.2.4 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- *`esp_tls_init()`*: for initializing the TLS connection handle.
- *`esp_tls_conn_new_sync()`*: for opening a new blocking TLS connection.
- *`esp_tls_conn_new_async()`*: for opening a new non-blocking TLS connection.
- *`esp_tls_conn_read()`*: for reading from the connection.
- *`esp_tls_conn_write()`*: for writing into the connection.

- *esp_tls_conn_destroy()*: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: protocols/https_request.

Tree structure for ESP-TLS component

```
├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h
```

The ESP-TLS component has a file esp-tls/esp_tls.h which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in esp-tls/private_include/esp_tls_mbedtls.h and API specific to wolfssl are present in esp-tls/private_include/esp_tls_wolfssl.h.

TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the *esp_tls_cfg_t* structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert_buf** and **cacert_bytes**: The CA certificate can be provided in a buffer to the *esp_tls_cfg_t* structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in *esp_tls_cfg_t* structure must be set.
  - `cacert_buf` - pointer to the buffer which contains the CA cert.
  - `cacert_bytes` - size of the CA certificate in bytes.
- **use_global_ca_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective *esp_tls_cfg_t* structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **crt_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at *ESP x509 Certificate Bundle*
- **psk_hint_key**: To use pre-shared keys for server verification, *CONFIG_ESP_TLS_PSK_VERIFICATION* should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the *esp_tls_cfg_t* structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling *CONFIG_ESP_TLS_INSECURE* and *CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY* in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the *esp_tls_cfg_t* structure. *WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.*

ESP-TLS Server cert selection hook

The ESP-TLS component provides an option to set the server cert selection hook when using the mbedTLS stack. This provides an ability to configure and use a certificate selection callback during server handshake, to select a

certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc). To enable this feature, please enable *CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK* in the ESP-TLS menuconfig. The certificate selection callback can be configured in the `esp_tls_cfg_t` structure as follows:

```
int cert_selection_callback(mbedtls_ssl_context *ssl)
{
    /* Code that the callback should execute */
    return 0;
}

esp_tls_cfg_t cfg = {
    cert_select_cb = cert_section_callback,
};
```

Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

备注: *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

1) Directly add wolfssl as a component in your project with following three commands.:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt of your project as done in wolfssl/examples. For reference see Optional Project variables in *build-system*.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example *(which has server authentication)* was run with both SSL/TLS libraries and with all respective configurations set to default. *(mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)*

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

备注： *These values are subject to change with change in configuration options and version of respective libraries.*

Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-C3. Use of the DS for TLS is supported only when ESP-TLS is used with mbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the *Digital Signature Documentation*. The technical details of Digital Signature such as how to calculate private key parameters can be found in *ESP32-C3 Technical Reference Manual* > *Digital Signature (DS)* [PDF]. The DS peripheral must be configured before it can be used to perform Digital Signature, see *Configure the DS Peripheral* in *Digital Signature*.

The DS peripheral must be initlized with the required encrypted private key parameters (obtained when the DS peripheral is configured). ESP-TLS internally initializes the DS peripheral when provided with the required DS context (DS parameters). Please see the below code snippet for passing the DS context to esp-tls context. The DS context passed to the esp-tls context should not be freed till the TLS connection is deleted.

```
#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from␣
↪the nvs or
provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client cert */,
    .clientcert_bytes = /* length of the client cert */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

备注： When using Digital Signature for the TLS connection, along with the other required params, only the client cert (*clientcert_buf*) and the DS params (*ds_data*) are required and the client key (*clientkey_buf*) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at ssl mutual auth which internally uses (ESP-TLS) for the TLS connection.

API Reference

Header File

- components/esp-tls/esp_tls.h

Functions

esp_tls_t ***esp_tls_init** (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

返回 tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

esp_tls_t ***esp_tls_conn_http_new**(const char *url, const *esp_tls_cfg_t* *cfg)

Create a new blocking TLS/SSL connection with a given "HTTP" url.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_http_new_sync` (and its asynchronous version `esp_tls_conn_http_new_async`)

参数

- **url** –**[in]** url of host.
- **cfg** –**[in]** TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to 'esp_tls_cfg_t'. At a minimum, this structure should be zero-initialized.

返回 pointer to esp_tls_t, or NULL if connection couldn't be opened.

int **esp_tls_conn_new_sync**(const char *hostname, int hostlen, int port, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

参数

- **hostname** –**[in]** Hostname of the host.
- **hostlen** –**[in]** Length of hostname.
- **port** –**[in]** Port number of the host.
- **cfg** –**[in]** TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
- **tls** –**[in]** Pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp_tls_conn_http_new_sync**(const char *url, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as esp_tls_conn_new_sync() API. However this API accepts host's url.

参数

- **url** –**[in]** url of host.
- **cfg** –**[in]** TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to 'esp_tls_cfg_t'. At a minimum, this structure should be zero-initialized.
- **tls** –**[in]** Pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp_tls_conn_new_async**(const char *hostname, int hostlen, int port, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn't wait for the connection to get established.

参数

- **hostname** –**[in]** Hostname of the host.
- **hostlen** –**[in]** Length of hostname.
- **port** –**[in]** Port number of the host.
- **cfg** –**[in]** TLS configuration as esp_tls_cfg_t. `non_block` member of this structure should be set to be true.
- **tls** –**[in]** pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

int **esp_tls_conn_http_new_async**(const char *url, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new non-blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as esp_tls_conn_new_async() API. However this API accepts host's url.

参数

- **url** –**[in]** url of host.
- **cfg** –**[in]** TLS configuration as esp_tls_cfg_t.
- **tls** –**[in]** pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

ssize_t **esp_tls_conn_write**(*esp_tls_t* *tls, const void *data, size_t datalen)

Write from buffer 'data' into specified tls connection.

参数

- **tls** –**[in]** pointer to esp-tls as esp-tls handle.
- **data** –**[in]** Buffer from which data will be written.
- **datalen** –**[in]** Length of data buffer.

返回

- >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- <0 if write operation was not successful, because either an error occured or an action must be taken by the calling process.
- ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

ssize_t **esp_tls_conn_read**(*esp_tls_t* *tls, void *data, size_t datalen)

Read from specified tls connection into the buffer 'data'.

参数

- **tls** –**[in]** pointer to esp-tls as esp-tls handle.
- **data** –**[in]** Buffer to hold read data.
- **datalen** –**[in]** Length of data buffer.

返回

- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occured or an action must be taken by the calling process.

int **esp_tls_conn_destroy**(*esp_tls_t* *tls)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new_sync() (or esp_tls_conn_http_new_sync()) and esp_tls_conn_new_async() (or esp_tls_conn_http_new_async()) APIs.

参数 **tls** –**[in]** pointer to esp-tls as esp-tls handle.

返回 - 0 on success

- -1 if socket error or an invalid argument

ssize_t **esp_tls_get_bytes_avail**(*esp_tls_t* *tls)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls's mbedtls_ssl_get_bytes_avail() API.

参数 **tls** –**[in]** pointer to esp-tls as esp-tls handle.
返回
- -1 in case of invalid arg
- bytes available in the application data record read buffer

esp_err_t **esp_tls_get_conn_sockfd**(*esp_tls_t* *tls, int *sockfd)

Returns the connection socket file descriptor from esp_tls session.

参数
- **tls** –**[in]** handle to esp_tls context
- **sockfd** –**[out]** int pointer to sockfd value.

返回 - ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

esp_err_t **esp_tls_set_conn_sockfd**(*esp_tls_t* *tls, int sockfd)

Sets the connection socket file descriptor for the esp_tls session.

参数
- **tls** –**[in]** handle to esp_tls context
- **sockfd** –**[in]** sockfd value to set.

返回 - ESP_OK on success and value of sockfd for the tls connection shall updated withthe provided value
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd < 0)

esp_err_t **esp_tls_get_conn_state**(*esp_tls_t* *tls, *esp_tls_conn_state_t* *conn_state)

Gets the connection state for the esp_tls session.

参数
- **tls** –**[in]** handle to esp_tls context
- **conn_state** –**[out]** pointer to the connection state value.

返回 - ESP_OK on success and value of sockfd for the tls connection shall updated withthe provided value
- ESP_ERR_INVALID_ARG (Invalid arguments)

esp_err_t **esp_tls_set_conn_state**(*esp_tls_t* *tls, *esp_tls_conn_state_t* conn_state)

Sets the connection state for the esp_tls session.

参数
- **tls** –**[in]** handle to esp_tls context
- **conn_state** –**[in]** connection state value to set.

返回 - ESP_OK on success and value of sockfd for the tls connection shall updated withthe provided value
- ESP_ERR_INVALID_ARG (Invalid arguments)

void ***esp_tls_get_ssl_context**(*esp_tls_t* *tls)

Returns the ssl context.

参数 **tls** –**[in]** handle to esp_tls context
返回 - ssl_ctx pointer to ssl context of underlying TLS layer on success
- NULL in case of error

esp_err_t **esp_tls_init_global_ca_store**(void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

返回
- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occured when allocating the mbedTLS resources.

esp_err_t **esp_tls_set_global_ca_store**(const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

参数

- **cacert_pem_buf** –**[in]** Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- **cacert_pem_bytes** –**[in]** Length of the buffer.

返回

- ESP_OK if adding certificates was successful.
- Other if an error occured or an action must be taken by the calling process.

void **esp_tls_free_global_ca_store**(void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

esp_err_t **esp_tls_get_and_clear_last_error**(*esp_tls_error_handle_t* h, int *esp_tls_code, int *esp_tls_flags)

Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

参数

- **h** –**[in]** esp-tls error handle.
- **esp_tls_code** –**[out]** last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
- **esp_tls_flags** –**[out]** last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

返回

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

esp_err_t **esp_tls_get_and_clear_error_type**(*esp_tls_error_handle_t* h, *esp_tls_error_type_t* err_type, int *error_code)

Returns the last error captured in esp_tls of a specific type The error information is cleared internally upon return.

参数

- **h** –**[in]** esp-tls error handle.
- **err_type** –**[in]** specific error type
- **error_code** –**[out]** last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

返回

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

esp_err_t **esp_tls_get_error_handle**(*esp_tls_t* *tls, *esp_tls_error_handle_t* *error_handle)

Returns the ESP-TLS error_handle.

参数

- **tls** –**[in]** handle to esp_tls context
- **error_handle** –**[out]** pointer to the error handle.

返回

- ESP_OK on success and error_handle will be updated with the ESP-TLS error handle.
- ESP_ERR_INVALID_ARG if (tls == NULL || error_handle == NULL)

mbedtls_x509_crt ***esp_tls_get_global_ca_store**(void)

Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than esp_tls.

备注: Modifying the pointer might cause a failure in verifying the certificates.

返回

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

esp_err_t **esp_tls_plain_tcp_connect**(const char *host, int hostlen, int port, const *esp_tls_cfg_t* *cfg, *esp_tls_error_handle_t* error_handle, int *sockfd)

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

参数

- **host** –**[in]** Hostname of the host.
- **hostlen** –**[in]** Length of hostname.
- **port** –**[in]** Port number of the host.
- **cfg** –**[in]** ESP-TLS configuration as esp_tls_cfg_t.
- **error_handle** –**[out]** ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** –**[out]** Socket descriptor if successfully connected on TCP layer

返回 ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

Structures

struct **psk_key_hint**

ESP-TLS preshared key and hint structure.

Public Members

const uint8_t ***key**

key in PSK authentication mode in binary format

const size_t **key_size**

length of the key

const char ***hint**

hint in PSK authentication mode in string format

struct **tls_keep_alive_cfg**

esp-tls client session ticket ctx

Keep alive parameters structure

Public Members

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time (second)

int **keep_alive_interval**

Keep-alive interval time (second)

int **keep_alive_count**

Keep-alive packet retry send count

struct **esp_tls_cfg**

ESP-TLS configuration parameters.

备注： Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

Public Members

const char **alpn_protos

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { “h2”, NULL };

- where ‘h2’ is the protocol name

const unsigned char *cacert_buf

Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *cacert_pem_buf

CA certificate buffer legacy name

unsigned int cacert_bytes

Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int cacert_pem_bytes

Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***clientcert_pem_buf**

Client certificate legacy name

unsigned int **clientcert_bytes**

Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert_pem_bytes**

Size of client certificate legacy name

const unsigned char ***clientkey_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***clientkey_pem_buf**

Client key legacy name

unsigned int **clientkey_bytes**

Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey_pem_bytes**

Size of client key legacy name

const unsigned char ***clientkey_password**

Client key decryption password string

unsigned int **clientkey_password_len**

String length of the password pointed to by clientkey_password

bool **non_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use_secure_element**

Enable this option to use secure element or atecc608a chip (Integrated with ESP32-WROOM-32SE)

int **timeout_ms**

Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32_MAX

bool **use_global_ca_store**

Use a global ca_store for all the connections in which this bool is set.

const char ***common_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip_common_name**

Skip any validation of server certificate CN field

tls_keep_alive_cfg_t ***keep_alive_cfg**

Enable TCP keep-alive timeout for SSL connection

const *psk_hint_key_t* ***psk_hint_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (***crt_bundle_attach**)(void *conf)

Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void ***ds_data**

Pointer for digital signature peripheral context

bool **is_plain_tcp**

Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather then TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

esp_tls_addr_family_t **addr_family**

The address family to use when connecting to a host.

Type Definitions

typedef enum *esp_tls_conn_state* **esp_tls_conn_state_t**

ESP-TLS Connection State.

typedef enum *esp_tls_role* **esp_tls_role_t**

typedef struct *psk_key_hint* **psk_hint_key_t**

ESP-TLS preshared key and hint structure.

typedef struct *tls_keep_alive_cfg* **tls_keep_alive_cfg_t**

esp-tls client session ticket ctx

Keep alive parameters structure

typedef enum *esp_tls_addr_family* **esp_tls_addr_family_t**

typedef struct *esp_tls_cfg* **esp_tls_cfg_t**

ESP-TLS configuration parameters.

备注： Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format

- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

typedef struct esp_tls **esp_tls_t**

Enumerations

enum **esp_tls_conn_state**

ESP-TLS Connection State.

Values:

enumerator **ESP_TLS_INIT**

enumerator **ESP_TLS_CONNECTING**

enumerator **ESP_TLS_HANDSHAKE**

enumerator **ESP_TLS_FAIL**

enumerator **ESP_TLS_DONE**

enum **esp_tls_role**

Values:

enumerator **ESP_TLS_CLIENT**

enumerator **ESP_TLS_SERVER**

enum **esp_tls_addr_family**

Values:

enumerator **ESP_TLS_AF_UNSPEC**

Unspecified address family.

enumerator **ESP_TLS_AF_INET**

IPv4 address family.

enumerator **ESP_TLS_AF_INET6**

IPv6 address family.

Header File

- components/esp-tls/esp_tls_errors.h

Structures

struct **esp_tls_last_error**

Error structure containing relevant errors in case tls error occurred.

Public Members

esp_err_t **last_error**

error code (based on ESP_ERR_ESP_TLS_BASE) of the last occurred error

int **esp_tls_error_code**

esp_tls error code from last esp_tls failed api

int **esp_tls_flags**

last certification verification flags

Macros

ESP_ERR_ESP_TLS_BASE

Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME

Error if hostname couldn't be resolved upon tls connection

ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET

Failed to create socket

ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY

Unsupported protocol family

ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST

Failed to connect to host

ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED

failed to set/get socket option

ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT

new connection in esp_tls_low_level_conn connection timeouted

ESP_ERR_ESP_TLS_SE_FAILED

ESP_ERR_ESP_TLS_TCP_CLOSED_FIN

ESP_ERR_MBEDTLS_CERT_PARTLY_OK

mbedtls parse certificates was partly successful

ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED

mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED

mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED

mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_X509_CRT_PARSE_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_OWN_CERT_FAILED
mbedtls api returned error

ESP_ERR_WOLFSSL_KEY_VERIFY_SETUP_FAILED
wolfSSL api returned error

ESP_ERR_WOLFSSL_SSL_HANDSHAKE_FAILED
wolfSSL api returned failed

ESP_ERR_WOLFSSL_CTX_SETUP_FAILED
wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_SETUP_FAILED
wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_WRITE_FAILED

wolfSSL api returned failed

ESP_TLS_ERR_SSL_WANT_READ

Definition of errors reported from IO API (potentially non-blocking) in case of error:

- esp_tls_conn_read()
- esp_tls_conn_write()

ESP_TLS_ERR_SSL_WANT_WRITE

ESP_TLS_ERR_SSL_TIMEOUT

Type Definitions

typedef struct *esp_tls_last_error* ***esp_tls_error_handle_t**

typedef struct *esp_tls_last_error* **esp_tls_last_error_t**

Error structure containing relevant errors in case tls error occurred.

Enumerations

enum **esp_tls_error_type_t**

Definition of different types/sources of error codes reported from different components

Values:

enumerator **ESP_TLS_ERR_TYPE_UNKNOWN**

enumerator **ESP_TLS_ERR_TYPE_SYSTEM**

System error — errno

enumerator **ESP_TLS_ERR_TYPE_MBEDTLS**

Error code from mbedTLS library

enumerator **ESP_TLS_ERR_TYPE_MBEDTLS_CERT_FLAGS**

Certificate flags defined in mbedTLS

enumerator **ESP_TLS_ERR_TYPE_ESP**

ESP-IDF error type — esp_err_t

enumerator **ESP_TLS_ERR_TYPE_WOLFSSL**

Error code from wolfSSL library

enumerator **ESP_TLS_ERR_TYPE_WOLFSSL_CERT_FLAGS**

Certificate flags defined in wolfSSL

enumerator **ESP_TLS_ERR_TYPE_MAX**

Last err type — invalid entry

2.2.5 ESP HTTP 客户端

概述

esp_http_client 提供了一组 API，用于从 ESP-IDF 应用程序中发起 HTTP/S 请求，具体的使用步骤如下：

- 首先调用*esp_http_client_init()*，创建一个*esp_http_client_handle_t* 实例，即基于给定的*esp_http_client_config_t* 配置创建 HTTP 客户端句柄。此函数必须第一个被调用。若用户未明确定义参数的配置值，则使用默认值。
- 其次调用*esp_http_client_perform()*，执行 esp_http_client 的所有操作，包括打开连接、交换数据、关闭连接（如需要），同时在当前任务完成前阻塞该任务。所有相关的事件（在*esp_http_client_config_t* 中指定）将通过事件处理程序被调用。
- 最后调用*esp_http_client_cleanup()* 来关闭连接（如有），并释放所有分配给 HTTP 客户端实例的内存。此函数必须在操作完成后最后一个被调用。

应用示例

使用 ESP HTTP 客户端发起 HTTP/S 请求的简单示例，可参考 protocols/esp_http_client。

HTTP 基本请求

如需了解实现细节，请参考应用示例中的 http_rest_with_url 和 http_rest_with_hostname_path 函数。

持久连接

持久连接是 HTTP 客户端在多次交换中重复使用同一连接的方法。如果服务器没有使用 Connection: close 头来请求关闭连接，连接就会一直保持开放，用于其他新请求。

为了使 ESP HTTP 客户端充分利用持久连接的优势，建议尽可能多地使用同一个句柄实例来发起请求，可参考应用示例中的函数 http_rest_with_url 和 http_rest_with_hostname_path。示例中，一旦创建连接，即会在连接关闭前发出多个请求（如 GET、POST、PUT 等）。

HTTPS 请求

ESP HTTP 客户端支持使用 **mbedTLS** 的 SSL 连接，需将 url 配置为以 https 开头，或将 transport_type 设置为 HTTP_TRANSPORT_OVER_SSL。可以通过*CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS* 来配置 HTTPS 支持（默认启用）。

备注： 在发起 HTTPS 请求时，如需服务器验证，首先需要向 esp_http_client_config_t 配置中的 cert_pem 成员提供额外的根证书（PEM 格式）。用户还可以通过 esp_http_client_config_t 配置中的 crt_bundle_attach 成员，使用 ESP x509 Certificate Bundle 进行服务器验证。

如需了解上文备注中的实现细节，请参考应用示例中的函数 https_with_url 和 https_with_hostname_path。

HTTP 流

有些应用程序需要主动打开连接并控制数据交换（数据流）。在这种情况下，应用流程与常规请求不同。请参考以下示例：

- *esp_http_client_init()*：创建一个 HTTP 客户端句柄。
- esp_http_client_set_* 或 esp_http_client_delete_*：修改 HTTP 连接参数（可选）。
- *esp_http_client_open()*：用 write_len（该参数为需要写入服务器的内容长度）打开 HTTP 连接，设置 write_len=0 为只读连接。
- *esp_http_client_write()*：向服务器写入数据，最大长度为*esp_http_client_open()* 函数中的 write_len 值；配置 write_len=0 无需调用此函数。
- *esp_http_client_fetch_headers()*：在发送完请求头和服务器数据（如有）后，读取 HTTP 服务器的响应头。从服务器返回 content-length，并可以由*esp_http_client_get_status_code()* 继承，以获取连接的 HTTP 状态。
- *esp_http_client_read()*：读取 HTTP 流。
- *esp_http_client_close()*：关闭连接。
- *esp_http_client_cleanup()*：释放分配的资源。

如需了解实现细节，请参考应用示例中的函数 http_perform_as_stream_reader。

HTTP 认证

ESP HTTP 客户端同时支持 基本和 摘要认证。

- 用户可以在 url 或 esp_http_client_config_t 配置中的 username 和 password 处输入用户名和密码。对于 auth_type = HTTP_AUTH_TYPE_BASIC，HTTP 客户端只需执行一项操作就可通过认证过程。
- 如果 auth_type = HTTP_AUTH_TYPE_NONE，但配置中有 username 和 password 字段，HTTP 客户端需要执行两项操作。客户端在第一次尝试连接服务器时，会收到 401 Unauthorized 头，而后再根据这些信息来选择认证方法，并在第二项操作中执行。
- 如需了解实现细节，请参考应用示例中的函数 http_auth_basic、http_auth_basic_redirect（用于基本认证）和 http_auth_digest（用于摘要认证）。

认证配置示例

- 基于 URI 的认证

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- 基于用户名和密码的认证

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

事件处理

ESP HTTP 客户端支持事件处理，发生相关事件时会触发相应的事件处理程序。*esp_http_client_event_id_t* 中包含了所有使用 ESP HTTP 客户端执行 HTTP 请求时可能发生的事件。

通过*esp_http_client_config_t::event_handler* 设置回调函数即可启用事件处理功能。

ESP HTTP 客户端诊断信息

诊断信息可以帮助用户深入了解出现的问题。在 ESP HTTP 客户端中，可以通过在事件循环库 中注册事件处理程序来获取诊断信息。此功能的增加基于 ESP Insights 框架，该框架可帮助收集诊断信息。然而，即使不

依赖 ESP Insights 框架，也可以获取诊断信息。事件处理程序可通过*esp_event_handler_register()* 函数注册到事件循环中。

事件循环中不同 HTTP 客户端事件的预期数据类型如下所示：

- HTTP_EVENT_ERROR : `esp_http_client_handle_t`
- HTTP_EVENT_ON_CONNECTED : `esp_http_client_handle_t`
- HTTP_EVENT_HEADERS_SENT : `esp_http_client_handle_t`
- HTTP_EVENT_ON_HEADER : `esp_http_client_handle_t`
- HTTP_EVENT_ON_DATA : `esp_http_client_on_data_t`
- HTTP_EVENT_ON_FINISH : `esp_http_client_handle_t`
- HTTP_EVENT_DISCONNECTED : `esp_http_client_handle_t`
- HTTP_EVENT_REDIRECT : `esp_http_client_redirect_event_data_t`

在无法接收到*HTTP_EVENT_DISCONNECTED* 之前，与事件数据一起接收到的*esp_http_client_handle_t* 将始终有效。这个句柄主要是为了区分不同的客户端连接，无法用于其他目的，因为它可能会随着客户端连接状态的变化而改变。

API 参考

Header File

- components/esp_http_client/include/esp_http_client.h

Functions

esp_http_client_handle_t **esp_http_client_init** (const *esp_http_client_config_t* *config)

Start a HTTP session This function must be the first function to call, and it returns a esp_http_client_handle_t that you must use as input to other functions in the interface. This call MUST have a corresponding call to esp_http_client_cleanup when the operation is complete.

参数 **config** –**[in]** The configurations, see `http_client_config_t`

返回

- `esp_http_client_handle_t`
- NULL if any errors

esp_err_t **esp_http_client_perform** (*esp_http_client_handle_t* client)

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same esp_http_client_handle_t as input as the esp_http_client_init call returned. esp_http_client_perform performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking esp_http_client_perform(), `is_async` member of *esp_http_client_config_t* must be set while making a call to esp_http_client_init() API. You can do any amount of calls to esp_http_client_perform while using the same esp_http_client_handle_t. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. esp_http_client will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_**` between the invokes to set options for the following esp_http_client_perform.

备注: You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several esp_http_client_handle_t. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

参数 **client** –The esp_http_client handle

返回

- ESP_OK on successful
- ESP_FAIL on error

esp_err_t **esp_http_client_cancel_request**(*esp_http_client_handle_t* client)

Cancel an ongoing HTTP request. This API closes the current socket and opens a new socket with the same esp_http_client context.

参数 **client** –The esp_http_client handle

返回

- ESP_OK on successful
- ESP_FAIL on error
- ESP_ERR_INVALID_ARG
- ESP_ERR_INVALID_STATE

esp_err_t **esp_http_client_set_url**(*esp_http_client_handle_t* client, const char *url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

参数

- **client** –**[in]** The esp_http_client handle
- **url** –**[in]** The url

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_set_post_field**(*esp_http_client_handle_t* client, const char *data, int len)

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

参数

- **client** –**[in]** The esp_http_client handle
- **data** –**[in]** post data pointer
- **len** –**[in]** post length

返回

- ESP_OK
- ESP_FAIL

int **esp_http_client_get_post_field**(*esp_http_client_handle_t* client, char **data)

Get current post field information.

参数

- **client** –**[in]** The client
- **data** –**[out]** Point to post data pointer

返回 Size of post data

esp_err_t **esp_http_client_set_header**(*esp_http_client_handle_t* client, const char *key, const char *value)

Set http request header, this function must be called after esp_http_client_init and before any perform function.

参数

- **client** –**[in]** The esp_http_client handle
- **key** –**[in]** The header key
- **value** –**[in]** The header value

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_get_header**(*esp_http_client_handle_t* client, const char *key, char **value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

参数

- **client** –**[in]** The esp_http_client handle
- **key** –**[in]** The header key
- **value** –**[out]** The header value

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_get_username**(*esp_http_client_handle_t* client, char **value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

参数

- **client** –**[in]** The esp_http_client handle
- **value** –**[out]** The username value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_username**(*esp_http_client_handle_t* client, const char *username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

参数

- **client** –**[in]** The esp_http_client handle
- **username** –**[in]** The username value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_get_password**(*esp_http_client_handle_t* client, char **value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

参数

- **client** –**[in]** The esp_http_client handle
- **value** –**[out]** The password value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_password**(*esp_http_client_handle_t* client, const char *password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

参数

- **client** –**[in]** The esp_http_client handle
- **password** –**[in]** The password value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_authtype**(*esp_http_client_handle_t* client, *esp_http_client_auth_type_t* auth_type)

Set http request auth_type.

参数

- **client** –**[in]** The esp_http_client handle
- **auth_type** –**[in]** The esp_http_client auth type

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_get_user_data**(*esp_http_client_handle_t* client, void **data)

Get http request user_data. The value stored from the *esp_http_client_config_t* will be written to the address passed into data.

参数

- **client** –**[in]** The esp_http_client handle
- **data** –**[out]** A pointer to the pointer that will be set to user_data.

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_user_data**(*esp_http_client_handle_t* client, void *data)

Set http request user_data. The value passed in +data+ will be available during event callbacks. No memory management will be performed on the user's behalf.

参数

- **client** –**[in]** The esp_http_client handle
- **data** –**[in]** The pointer to the user data

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

int **esp_http_client_get_errno**(*esp_http_client_handle_t* client)

Get HTTP client session errno.

参数 **client** –**[in]** The esp_http_client handle

返回

- (-1) if invalid argument
- errno

esp_err_t **esp_http_client_set_method**(*esp_http_client_handle_t* client, *esp_http_client_method_t* method)

Set http request method.

参数

- **client** –**[in]** The esp_http_client handle
- **method** –**[in]** The method

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_timeout_ms**(*esp_http_client_handle_t* client, int timeout_ms)

Set http request timeout.

参数

- **client** –**[in]** The esp_http_client handle
- **timeout_ms** –**[in]** The timeout value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_delete_header**(*esp_http_client_handle_t* client, const char *key)

Delete http request header.

参数

- **client** –**[in]** The esp_http_client handle
- **key** –**[in]** The key

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_open** (*esp_http_client_handle_t* client, int write_len)

This function will be open the connection, write all header strings and return.

参数

- **client** –**[in]** The esp_http_client handle
- **write_len** –**[in]** HTTP Content length need to write to the server

返回

- ESP_OK
- ESP_FAIL

int **esp_http_client_write** (*esp_http_client_handle_t* client, const char *buffer, int len)

This function will write data to the HTTP connection previously opened by esp_http_client_open()

参数

- **client** –**[in]** The esp_http_client handle
- **buffer** –The buffer
- **len** –**[in]** This value must not be larger than the write_len parameter provided to esp_http_client_open()

返回

- (-1) if any errors
- Length of data written

int64_t **esp_http_client_fetch_headers** (*esp_http_client_handle_t* client)

This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

参数 **client** –**[in]** The esp_http_client handle

返回

- (0) if stream doesn’ t contain content-length header, or chunked encoding (checked by `esp_http_client_is_chunked` response)
- (-1: ESP_FAIL) if any errors
- (-ESP_ERR_HTTP_EAGAIN = -0x7007) if call is timed-out before any data was ready
- Download data length defined by content-length header

bool **esp_http_client_is_chunked_response** (*esp_http_client_handle_t* client)

Check response data is chunked.

参数 **client** –**[in]** The esp_http_client handle

返回 true or false

int **esp_http_client_read** (*esp_http_client_handle_t* client, char *buffer, int len)

Read data from http stream.

备注: (-ESP_ERR_HTTP_EAGAIN = -0x7007) is returned when call is timed-out before any data was ready

---

参数

- **client** –**[in]** The esp_http_client handle
- **buffer** –The buffer
- **len** –**[in]** The length

返回

- (-1) if any errors
- Length of data was read

int **esp_http_client_get_status_code** (*esp_http_client_handle_t* client)

Get http response status code, the valid value if this function invoke after `esp_http_client_perform`

参数 **client** –**[in]** The esp_http_client handle

返回 Status code

int64_t **esp_http_client_get_content_length**(*esp_http_client_handle_t* client)

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

参数 **client** –**[in]** The esp_http_client handle

返回

- (-1) Chunked transfer
- Content-Length value as bytes

esp_err_t **esp_http_client_close**(*esp_http_client_handle_t* client)

Close http connection, still kept all http request resources.

参数 **client** –**[in]** The esp_http_client handle

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_cleanup**(*esp_http_client_handle_t* client)

This function must be the last function to call for an session. It is the opposite of the esp_http_client_init function and must be called with the same handle as input that a esp_http_client_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

参数 **client** –**[in]** The esp_http_client handle

返回

- ESP_OK
- ESP_FAIL

esp_http_client_transport_t **esp_http_client_get_transport_type**(*esp_http_client_handle_t* client)

Get transport type.

参数 **client** –**[in]** The esp_http_client handle

返回

- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL

esp_err_t **esp_http_client_set_redirection**(*esp_http_client_handle_t* client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request. When `disable_auto_redirect` is set, the client will not call this function but the event `HTTP_EVENT_REDIRECT` will be dispatched giving the user contol over the redirection event.

参数 **client** –**[in]** The esp_http_client handle

返回

- ESP_OK
- ESP_FAIL

void **esp_http_client_add_auth**(*esp_http_client_handle_t* client)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

备注: There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

参数 **client** –**[in]** The esp_http_client handle

bool **esp_http_client_is_complete_data_received**(*esp_http_client_handle_t* client)

Checks if entire data in the response has been read without any error.

参数 **client** –**[in]** The esp_http_client handle

返回

- true
- false

int **esp_http_client_read_response**(*esp_http_client_handle_t* client, char *buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

参数

- **client** –**[in]** The esp_http_client handle
- **buffer** –The buffer
- **len** –**[in]** The buffer length

返回

- Length of data was read

esp_err_t **esp_http_client_flush_response**(*esp_http_client_handle_t* client, int *len)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferrable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

参数

- **client** –**[in]** The esp_http_client handle
- **len** –Length of data discarded

返回

- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

esp_err_t **esp_http_client_get_url**(*esp_http_client_handle_t* client, char *url, const int len)

Get URL from client.

参数

- **client** –**[in]** The esp_http_client handle
- **url** –**[inout]** The buffer to store URL
- **len** –**[in]** The buffer length

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_get_chunk_length**(*esp_http_client_handle_t* client, int *len)

Get Chunk-Length from client.

参数

- **client** –**[in]** The esp_http_client handle
- **len** –**[out]** Variable to store length

返回

- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

Structures

struct **esp_http_client_event**

HTTP Client events data.

Public Members

esp_http_client_event_id_t **event_id**

event_id, to know the cause of the event

esp_http_client_handle_t **client**

esp_http_client_handle_t context

void ***data**

data of the event

int **data_len**

data length of data

void ***user_data**

user_data context, from *esp_http_client_config_t* user_data

char ***header_key**

For HTTP_EVENT_ON_HEADER event_id, it’ s store current http header key

char ***header_value**

For HTTP_EVENT_ON_HEADER event_id, it’ s store current http header value

struct **esp_http_client_on_data**

Argument structure for HTTP_EVENT_ON_DATA event.

Public Members

esp_http_client_handle_t **client**

Client handle

int64_t **data_process**

Total data processed

struct **esp_http_client_redirect_event_data**

Argument structure for HTTP_EVENT_REDIRECT event.

Public Members

esp_http_client_handle_t **client**

Client handle

int **status_code**

Status Code

struct **esp_http_client_config_t**

HTTP configuration.

Public Members

const char ***url**

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char ***host**

Domain or IP as string

int **port**

Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char ***username**

Using for Http authentication

const char ***password**

Using for Http authentication

esp_http_client_auth_type_t **auth_type**

Http authentication type, see `esp_http_client_auth_type_t`

const char ***path**

HTTP Path, if not set, default is `/`

const char ***query**

HTTP query

const char ***cert_pem**

SSL server certification, PEM format as string, if the client requires to verify server

size_t **cert_len**

Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char ***client_cert_pem**

SSL client certification, PEM format as string, if the server requires to verify client

size_t **client_cert_len**

Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char ***client_key_pem**

SSL client key, PEM format as string, if the server requires to verify client

size_t **client_key_len**

Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char ***client_key_password**

Client key decryption password string

size_t **client_key_password_len**

String length of the password pointed to by client_key_password

const char ***user_agent**

The User Agent string to send with HTTP requests

esp_http_client_method_t **method**

HTTP Method

int **timeout_ms**

Network timeout in milliseconds

bool **disable_auto_redirect**

Disable HTTP automatic redirects

int **max_redirection_count**

Max number of redirections on receiving HTTP redirect status code, using default value if zero

int **max_authorization_retries**

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb **event_handler**

HTTP Event Handle

esp_http_client_transport_t **transport_type**

HTTP transport type, see `esp_http_client_transport_t`

int **buffer_size**

HTTP receive buffer size

int **buffer_size_tx**

HTTP transmit buffer size

void ***user_data**

HTTP user_data context

bool **is_async**

Set asynchronous mode, only supported with HTTPS for now

bool **use_global_ca_store**

Use a global ca_store for all the connections in which this bool is set.

bool **skip_cert_common_name_check**

Skip any validation of server certificate CN field

const char ***common_name**

Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname.

esp_err_t (***crt_bundle_attach**)(void *conf)

Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time. Default is 5 (second)

int **keep_alive_interval**

Keep-alive interval time. Default is 5 (second)

int **keep_alive_count**

Keep-alive packet retry send count. Default is 3 counts

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

Macros

DEFAULT_HTTP_BUF_SIZE

ESP_ERR_HTTP_BASE

Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT

The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT

Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA

Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER

Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT

There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING

HTTP connection hasn’t been established yet

ESP_ERR_HTTP_EAGAIN

Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED

Read FIN from peer and the connection closed

Type Definitions

typedef struct esp_http_client ***esp_http_client_handle_t**

typedef struct *esp_http_client_event* ***esp_http_client_event_handle_t**

typedef struct *esp_http_client_event* **esp_http_client_event_t**

HTTP Client events data.

typedef struct *esp_http_client_on_data* **esp_http_client_on_data_t**

Argument structure for HTTP_EVENT_ON_DATA event.

typedef struct *esp_http_client_redirect_event_data* **esp_http_client_redirect_event_data_t**

Argument structure for HTTP_EVENT_REDIRECT event.

typedef *esp_err_t* (***http_event_handle_cb**)(*esp_http_client_event_t* *evt)

Enumerations

enum **esp_http_client_event_id_t**

HTTP Client events id.

Values:

enumerator **HTTP_EVENT_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP_EVENT_ON_CONNECTED**

Once the HTTP has been connected to the server, no data exchange has been performed

enumerator **HTTP_EVENT_HEADERS_SENT**

After sending all the headers to the server

enumerator **HTTP_EVENT_HEADER_SENT**

This header has been kept for backward compatability and will be deprecated in future versions esp-idf

enumerator **HTTP_EVENT_ON_HEADER**

Occurs when receiving each header sent from the server

enumerator **HTTP_EVENT_ON_DATA**

Occurs when receiving data from the server, possibly multiple portions of the packet

enumerator **HTTP_EVENT_ON_FINISH**

Occurs when finish a HTTP session

enumerator **HTTP_EVENT_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP_EVENT_REDIRECT**

Intercepting HTTP redirects to handle them manually

enum **esp_http_client_transport_t**

HTTP Client transport.

Values:

enumerator **HTTP_TRANSPORT_UNKNOWN**

Unknown

enumerator **HTTP_TRANSPORT_OVER_TCP**

Transport over tcp

enumerator **HTTP_TRANSPORT_OVER_SSL**

Transport over ssl

enum **esp_http_client_method_t**

HTTP method.

Values:

enumerator **HTTP_METHOD_GET**

HTTP GET Method

enumerator **HTTP_METHOD_POST**

HTTP POST Method

enumerator **HTTP_METHOD_PUT**

HTTP PUT Method

enumerator **HTTP_METHOD_PATCH**

HTTP PATCH Method

enumerator **HTTP_METHOD_DELETE**

HTTP DELETE Method

enumerator **HTTP_METHOD_HEAD**

HTTP HEAD Method

enumerator **HTTP_METHOD_NOTIFY**

HTTP NOTIFY Method

enumerator **HTTP_METHOD_SUBSCRIBE**

HTTP SUBSCRIBE Method

enumerator **HTTP_METHOD_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

enumerator **HTTP_METHOD_OPTIONS**

HTTP OPTIONS Method

enumerator **HTTP_METHOD_COPY**

HTTP COPY Method

enumerator **HTTP_METHOD_MOVE**

HTTP MOVE Method

enumerator **HTTP_METHOD_LOCK**
HTTP LOCK Method

enumerator **HTTP_METHOD_UNLOCK**
HTTP UNLOCK Method

enumerator **HTTP_METHOD_PROPFIND**
HTTP PROPFIND Method

enumerator **HTTP_METHOD_PROPPATCH**
HTTP PROPPATCH Method

enumerator **HTTP_METHOD_MKCOL**
HTTP MKCOL Method

enumerator **HTTP_METHOD_MAX**

enum **esp_http_client_auth_type_t**
HTTP Authentication type.

Values:

enumerator **HTTP_AUTH_TYPE_NONE**
No authention

enumerator **HTTP_AUTH_TYPE_BASIC**
HTTP Basic authentication

enumerator **HTTP_AUTH_TYPE_DIGEST**
HTTP Disgest authentication

enum **HttpStatus_Code**
Enum for the HTTP status codes.

Values:

enumerator **HttpStatus_Ok**

enumerator **HttpStatus_MultipleChoices**

enumerator **HttpStatus_MovedPermanently**

enumerator **HttpStatus_Found**

enumerator **HttpStatus_SeeOther**

enumerator **HttpStatus_TemporaryRedirect**

enumerator **HttpStatus_PermanentRedirect**

enumerator **HttpStatus_BadRequest**

enumerator **HttpStatus_Unauthorized**

enumerator **HttpStatus_Forbidden**

enumerator **HttpStatus_NotFound**

enumerator **HttpStatus_InternalError**

2.2.6 ESP Local Control

Overview

ESP Local Control (**esp_local_ctrl**) component in ESP-IDF provides capability to control an ESP device over HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the **esp_local_ctrl** service over BLE transport is performed as follows:

```
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name  = SERVICE_NAME,
            .service_uuid = {
                /* LSB <---------------------------------------
                * ---------------------------------------> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```

Similarly for HTTPS transport:

```
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();
```

(下页继续)

(续上页)

```
/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_
↪start");
extern const unsigned char servercert_end[]   asm("_binary_servercert_pem_
↪end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
↪start");
extern const unsigned char prvtkey_pem_end[]   asm("_binary_prvtkey_pem_
↪end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```

You may set security for transport in ESP local control using following options:

1. *PROTOCOM_SEC2*: specifies that SRP6a based key exchange and end to end encryption based on AES-GCM is used. This is the most preffered option as it adds a robust security with Augmented PAKE protocol i.e. SRP6a.
2. *PROTOCOM_SEC1*: specifies that Curve25519 based key exchange and end to end encryption based on AES-CTR is used.
3. *PROTOCOM_SEC0*: specifies that data will be exchanged as a plain text (no security).
4. *PROTOCOM_SEC_CUSTOM*: you can define your own security requirement. Please note that you will also have to provide *custom_handle* of type *protocomm_security_t* * in this context.

备注： The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocom security version section in *Protocol Communication* for more details.

Creating a property

Now that we know how to start the **esp_local_ctrl** service, let's add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps **esp_local_ctrl** to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines *TYPE_TIMESTAMP* and *READONLY*, which are used for setting the *type* and *flags* fields here.

```
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name         = "timestamp",
    .type         = TYPE_TIMESTAMP,
    .size         = sizeof(int32_t),
    .flags        = READONLY,
    .ctx          = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a ctx field, which is set to point to some custom *func_get_time()*. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of *get_prop_values()* handler, which is used for retrieving the timestamp.

```
static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
↪values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value.
             * This is essential because the value has to be
             * valid even after this function returns.
             * Alternative is to use dynamic allocation
             * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of *set_prop_values()* handler. Notice how we restrict from writing to read-only properties.

```
static esp_err_t set_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     const esp_local_ctrl_prop_val_t␣
↪*prop_values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
```

(下页继续)

(续上页)

```
            ESP_LOGE(TAG, "Cannot write to read-only property %s",␣
↪props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                     prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}
```

For complete example see protocols/esp_local_ctrl

Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the **esp_local_ctrl** service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the **esp_local_ctrl** service:

1. *get_prop_count* : This should simply return the total number of properties supported by the service
2. *get_prop_values* : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. *set_prop_values* : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call *get_prop_count* and then *get_prop_values*, hence form an index to name mapping for all properties. Now when calling *set_prop_values* for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp_local_ctrl** are listed below:

表 1: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS Server + mDNS)	Description
esp_local_ctrl/version	https://<mdns-hostname>.local/esp_local_ctrl/version	Endpoint used for retrieving version string
esp_local_ctrl/control	https://<mdns-hostname>.local/esp_local_ctrl/control	Endpoint used for sending / receiving control messages

API Reference

Header File

- components/esp_local_ctrl/include/esp_local_ctrl.h

Functions

const *esp_local_ctrl_transport_t* ***esp_local_ctrl_get_transport_ble**(void)

Function for obtaining BLE transport mode.

const *esp_local_ctrl_transport_t* ***esp_local_ctrl_get_transport_httpd**(void)

Function for obtaining HTTPD transport mode.

esp_err_t **esp_local_ctrl_start**(const *esp_local_ctrl_config_t* *config)

Start local control service.

参数 **config** –**[in]** Pointer to configuration structure

返回

- ESP_OK : Success
- ESP_FAIL : Failure

esp_err_t **esp_local_ctrl_stop**(void)

Stop local control service.

esp_err_t **esp_local_ctrl_add_property**(const *esp_local_ctrl_prop_t* *prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

参数 **prop** –**[in]** Property description structure

返回

- ESP_OK : Success
- ESP_FAIL : Failure

esp_err_t **esp_local_ctrl_remove_property**(const char *name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

参数 **name** –**[in]** Name of the property to remove

返回

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Failure

const *esp_local_ctrl_prop_t* ***esp_local_ctrl_get_property**(const char *name)

Get property description structure by name.

This API may be used to get a property' s context structure `esp_local_ctrl_prop_t` when its name is known

参数 **name** –**[in]** Name of the property to find

返回

- Pointer to property
- NULL if not found

esp_err_t **esp_local_ctrl_set_handler**(const char *ep_name, *protocomm_req_handler_t* handler, void *user_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

备注: In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

参数

- **ep_name** –**[in]** Name of the endpoint

- **handler** –**[in]** Endpoint handler function
- **user_ctx** –**[in]** User data

返回

- ESP_OK : Success
- ESP_FAIL : Failure

Unions

union **esp_local_ctrl_transport_config_t**

#include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t ***ble**

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t ***httpd**

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

Structures

struct **esp_local_ctrl_prop**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

Public Members

char ***name**

Unique name of property

uint32_t **type**

Type of property. This may be set to application defined enums

size_t **size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by esp_local_ctrl when setting the value of such a property

uint32_t **flags**

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void ***ctx**

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the esp_local_ctrl service is stopped.

void (***ctx_free_fn**)(void *ctx)

Function used by esp_local_ctrl to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

struct **esp_local_ctrl_prop_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

Public Members

void ***data**

Pointer to memory holding property value

size_t **size**

Size of property value

void (***free_fn**)(void *data)

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

struct **esp_local_ctrl_handlers**

Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

esp_err_t (***get_prop_values**)(size_t props_count, const *esp_local_ctrl_prop_t* props[], *esp_local_ctrl_prop_val_t* prop_values[], void *usr_ctx)

Handler function to be implemented for retrieving current values of properties.

备注： If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

---

Param props_count **[in]** Total elements in the props array

Param props **[in]** Array of properties, the current values for which have been requested by the client

Param prop_values **[out]** Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

Param usr_ctx **[in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

Return Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument

- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

esp_err_t (***set_prop_values**)(size_t props_count, const *esp_local_ctrl_prop_t* props[], const *esp_local_ctrl_prop_val_t* prop_values[], void *usr_ctx)

Handler function to be implemented for changing values of properties.

备注: If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

Param props_count **[in]** Total elements in the props array
Param props **[in]** Array of properties, the values for which the client requests to change
Param prop_values **[in]** Array of property values, the elements of which need to be used for updating those properties specified by props argument
Param usr_ctx **[in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure
Return Returning different error codes will convey the corresponding protocol level errors to the client :
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

void ***usr_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

void (***usr_ctx_free_fn**)(void *usr_ctx)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

struct **esp_local_ctrl_proto_sec_cfg**

Protocom security configs

Public Members

esp_local_ctrl_proto_sec_t **version**

This sets protocom security version, sec0/sec1 or custom If custom, user must provide handle via `proto_sec_custom_handle` below

void ***custom_handle**

Custom security handle if security is set custom via `proto_sec` above This handle must follow `protocomm_security_t` signature

const void ***pop**

Proof of possession to be used for local control. Could be NULL.

const void ***sec_params**

Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type esp_local_ctrl_security1_params_t for protocomm security 1 and esp_local_ctrl_security2_params_t for protocomm security 2 respectively. Could be NULL.

struct **esp_local_ctrl_config**

Configuration structure to pass to `esp_local_ctrl_start()`

Public Members

const *esp_local_ctrl_transport_t* ***transport**

Transport layer over which service will be provided

esp_local_ctrl_transport_config_t **transport_config**

Transport layer over which service will be provided

esp_local_ctrl_proto_sec_cfg_t **proto_sec**

Security version and POP

esp_local_ctrl_handlers_t **handlers**

Register handlers for responding to get/set requests on properties

size_t **max_properties**

This limits the number of properties that are available at a time

Macros

ESP_LOCAL_CTRL_TRANSPORT_BLE

ESP_LOCAL_CTRL_TRANSPORT_HTTPD

Type Definitions

typedef struct *esp_local_ctrl_prop* **esp_local_ctrl_prop_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

typedef struct *esp_local_ctrl_prop_val* **esp_local_ctrl_prop_val_t**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct *esp_local_ctrl_handlers* **esp_local_ctrl_handlers_t**

Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct esp_local_ctrl_transport **esp_local_ctrl_transport_t**

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

typedef struct *protocomm_ble_config* **esp_local_ctrl_transport_config_ble_t**

Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set CONFIG_BT_BLUEDROID_ENABLED and include `protocomm_ble.h`.

typedef struct *httpd_config* **esp_local_ctrl_transport_config_httpd_t**

Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t` (for HTTPS) or `httpd_config_t` (for HTTP)

typedef enum *esp_local_ctrl_proto_sec* **esp_local_ctrl_proto_sec_t**

Security types for esp_local_control.

typedef *protocomm_security1_params_t* **esp_local_ctrl_security1_params_t**

typedef *protocomm_security2_params_t* **esp_local_ctrl_security2_params_t**

typedef struct *esp_local_ctrl_proto_sec_cfg* **esp_local_ctrl_proto_sec_cfg_t**

Protocom security configs

typedef struct *esp_local_ctrl_config* **esp_local_ctrl_config_t**

Configuration structure to pass to `esp_local_ctrl_start()`

Enumerations

enum **esp_local_ctrl_proto_sec**

Security types for esp_local_control.

Values:

enumerator **PROTOCOM_SEC0**

enumerator **PROTOCOM_SEC1**

enumerator **PROTOCOM_SEC2**

enumerator **PROTOCOM_SEC_CUSTOM**

2.2.7 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The *esp_serial_slave_link* component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an *esp_serial_slave_link* device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

ESP SPI Slave HD (Half Duplex) Mode Protocol

SPI Slave Capabilities of Espressif chips

	ESP32	ESP32-S2	ESP32-C3
SPI Slave HD	N	Y (v2)	Y (v2)
Tohost intr		N	N
Frhost intr		2 *	2 *
TX DMA		Y	Y
RX DMA		Y	Y
Shared registers		72	64

Introduction In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- Command: 8-bit, master to slave
  This phase determines the rest phases of the transactions. See *Supported Commands*.
- Address: 8-bit, master to slave, optional
  For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.
- Dummy: 8-bit, floating, optional
  This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- Data: variable length, the direction is also determined by the command.
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

Data IO Modes In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.

Mode	command WN	address WN	dummy cycles	data WN
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined by the command sent by the master (See *Supported Commands*), except the QPI mode.

QPI Mode The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it's not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

Supported Commands

备注： The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	•	•
ENQPI	Enter QPI mode	0x06	•	•
WR_DONE	Write segments done	0x07	•	•
CMD8	Interrupt	0x08	•	•
CMD9	Interrupt	0x09	•	•
CMDA	Interrupt	0x0A	•	•
EXQPI	Exit QPI mode	0xDD	•	•

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

Segment Transaction Mode Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn't have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here’s an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the *esp_serial_slave_link* component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
  The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
   The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.
   The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See *SPI Slave Capabilities of Espressif chips* for more details.

Initialization of ESP Serial Slave Link

ESP SDIO Slave The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see :doc:‘ Document of SDMMC driver </api-reference/storage/sdmmc>‘) structure.

2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The *card* member should be the `sdmmc_card_t` got in step 2, and the *recv_buffer_size* member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

ESP SPI Slave

备注： If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

Hasn't been supported yet.

APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll *tx_buffer_num* when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the *rx_data_size* for once, if the current *rx_data_size* is shorter than the buffer size the master prepared to receive. And it may poll the *rx_data_size* if the *rx_dat_size* keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

Reset counters (Optional) Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

Application Example

The example below shows how ESP32-C3 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

peripherals/sdio.

Please refer to the specific example README.md for details.

API Reference

Header File

- components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h

Functions

esp_err_t **essl_init**(*essl_handle_t* handle, uint32_t wait_ms)

Initialize the slave.

参数

- **handle** –Handle of an ESSL device.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

esp_err_t **essl_wait_for_ready**(*essl_handle_t* handle, uint32_t wait_ms)

Wait for interrupt of an ESSL slave device.

参数

- **handle** –Handle of an ESSL device.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

esp_err_t **essl_get_tx_buffer_num**(*essl_handle_t* handle, uint32_t *out_tx_num, uint32_t wait_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

参数

- **handle** –Handle of a ESSL device.
- **out_tx_num** –Output of buffer num that host can send data to ESSL slave.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

esp_err_t **essl_get_rx_data_size**(*essl_handle_t* handle, uint32_t *out_rx_size, uint32_t wait_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

参数

- **handle** –Handle of an ESSL device.
- **out_rx_size** –Output of data size to read from slave, in bytes
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

esp_err_t **essl_reset_cnt**(*essl_handle_t* handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

参数 **handle** –Handle of an ESSL device.

返回

- ESP_OK: Success

- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.

esp_err_t **essl_send_packet** (*essl_handle_t* handle, const void *start, size_t length, uint32_t wait_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

参数

- **handle** –Handle of an ESSL device.
- **start** –Start address of the packet to send
- **length** –Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error ftrom SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

esp_err_t **essl_get_packet** (*essl_handle_t* handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)

Get a packet from ESSL slave.

参数

- **handle** –Handle of an ESSL device.
- **out_data** –**[out]** Data output address
- **size** –The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- **out_length** –**[out]** Output of length the data actually received from slave.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

esp_err_t **essl_write_reg** (*essl_handle_t* handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

备注: sdio 28-31 are reserved, the lower API helps to skip.

参数

- **handle** –Handle of an ESSL device.
- **addr** –Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** –Value to write to the register.
- **value_o** –Output of the returned written value.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

esp_err_t **essl_read_reg**(*essl_handle_t* handle, uint8_t add, uint8_t *value_o, uint32_t wait_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

参数

- **handle** –Handle of a `essl` device.
- **add** –Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value_o** –Output value read from the register.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

esp_err_t **essl_wait_int**(*essl_handle_t* handle, uint32_t wait_ms)

wait for an interrupt of the slave

参数

- **handle** –Handle of an ESSL device.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

esp_err_t **essl_clear_intr**(*essl_handle_t* handle, uint32_t intr_mask, uint32_t wait_ms)

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

参数

- **handle** –Handle of an ESSL device.
- **intr_mask** –Mask of interrupt bits to clear.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

esp_err_t **essl_get_intr**(*essl_handle_t* handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)

Get interrupt bits of ESSL slave.

参数

- **handle** –Handle of an ESSL device.
- **intr_raw** –Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr_st** –Output of the masked interrupt bits. set to NULL if only raw bits are read.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_INVALID_ARG: If both `intr_raw` and `intr_st` are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

esp_err_t **essl_set_intr_ena**(*essl_handle_t* handle, uint32_t ena_mask, uint32_t wait_ms)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

参数

- **handle** –Handle of an ESSL device.
- **ena_mask** –Mask of the interrupt bits to enable.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success

- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

esp_err_t **essl_get_intr_ena**(*essl_handle_t* handle, uint32_t *ena_mask_o, uint32_t wait_ms)

Get interrupt enable bits of ESSL slave.

参数

- **handle** –Handle of an ESSL device.
- **ena_mask_o** –Output of interrupt bit enable mask.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success
- One of the error codes from SDMMC host controller

esp_err_t **essl_send_slave_intr**(*essl_handle_t* handle, uint32_t intr_mask, uint32_t wait_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

参数

- **handle** –Handle of an ESSL device.
- **intr_mask** –Mask of interrupt bits to send to slave.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

Type Definitions

typedef struct essl_dev_t ***essl_handle_t**

Handle of an ESSL device.

Header File

- components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

Functions

esp_err_t **essl_sdio_init_dev**(*essl_handle_t* *out_handle, const *essl_sdio_config_t* *config)

Initialize the ESSL SDIO device and get its handle.

参数

- **out_handle** –Output of the handle.
- **config** –Configuration for the ESSL SDIO device.

返回

- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.

esp_err_t **essl_sdio_deinit_dev**(*essl_handle_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

参数 **handle** –Handle of the ESSL SDIO device to deinit.

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: wrong handle passed

Structures

struct **essl_sdio_config_t**

Configuration for the ESSL SDIO device.

Public Members

sdmmc_card_t ***card**

The initialized sdmmc card pointer of the slave.

int **recv_buffer_size**

The pre-negotiated recv buffer size used by both the host and the slave.

Header File

- components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

Functions

esp_err_t **essl_spi_init_dev**(*essl_handle_t* *out_handle, const *essl_spi_config_t* *init_config)

Initialize the ESSL SPI device function list and get its handle.

参数

- **out_handle** –**[out]** Output of the handle
- **init_config** –Configuration for the ESSL SPI device

返回

- ESP_OK: On success
- ESP_ERR_NO_MEM: Memory exhausted
- ESP_ERR_INVALID_STATE: SPI driver is not initialized
- ESP_ERR_INVALID_ARG: Wrong register ID

esp_err_t **essl_spi_deinit_dev**(*essl_handle_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

参数 **handle** –Handle of the ESSL SPI device

返回

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI is not in use

esp_err_t **essl_spi_read_reg**(void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)

Read from the shared registers.

备注: The registers for Master/Slave synchronization are reserved. Do not use them. (see `rx_sync_reg` in *`essl_spi_config_t`*)

参数

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
- **out_value** –**[out]** Read buffer for the shared registers.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- or other return value from :cpp:func:`spi_device_transmit`.

esp_err_t **essl_spi_get_packet**(void *arg, void *out_data, size_t size, uint32_t wait_ms)

Get a packet from Slave.

参数

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **out_data** –**[out]** Output data address
- **size** –The size of the output data.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

返回

- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
- ESP_ERR_INVALID_SIZE: Master requires `size` bytes of data but Slave did not load enough bytes.

esp_err_t **essl_spi_write_reg**(void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)

Write to the shared registers.

备注: The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in *essl_spi_config_t*)

备注: Feature of checking the actual written value (`out_value`) is not supported.

参数

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1)
- **value** –Buffer for data to send, should be align to 4.
- **out_value** –**[out]** Not supported, should be set to NULL.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- ESP_ERR_NOT_SUPPORTED: Should set `out_value` to NULL. See note 2.
- or other return value from :cpp:func:`spi_device_transmit`.

esp_err_t **essl_spi_send_packet**(void *arg, const void *data, size_t size, uint32_t wait_ms)

Send a packet to Slave.

参数

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **data** –Address of the data to send
- **size** –Size of the data to send.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

返回

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The data address is not DMA capable
- ESP_ERR_INVALID_SIZE: Master will send `size` bytes of data but Slave did not load enough RX buffer

void **essl_spi_reset_cnt**(void *arg)

Reset the counter in Master context.

备注： Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

---

参数 **arg** –Context of the component. (Member `arg` from `essl_handle_t`)

esp_err_t **essl_spi_rdbuf**(*spi_device_handle_t* spi, uint8_t *out_data, int addr, int len, uint32_t flags)

Read the shared buffer from the slave in ISR way.

备注： The slave’s HW doesn’t guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

备注： `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

参数

- **spi** –SPI device handle representing the slave
- **out_data** –**[out]** Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –`SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: on success
- or other return value from :cpp:func:`spi_device_transmit`.

esp_err_t **essl_spi_rdbuf_polling**(*spi_device_handle_t* spi, uint8_t *out_data, int addr, int len, uint32_t flags)

Read the shared buffer from the slave in polling way.

备注： `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

参数

- **spi** –SPI device handle representing the slave
- **out_data** –**[out]** Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –`SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: on success
- or other return value from :cpp:func:`spi_device_transmit`.

esp_err_t **essl_spi_wrbuf**(*spi_device_handle_t* spi, const uint8_t *data, int addr, int len, uint32_t flags)

Write the shared buffer of the slave in ISR way.

备注: `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

参数

- **`spi`** –SPI device handle representing the slave
- **`data`** –Buffer for data to send, strongly suggested to be in the DRAM
- **`addr`** –Address of the slave shared buffer,
- **`len`** –Length to write
- **`flags`** –`SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

esp_err_t **`essl_spi_wrbuf_polling`**(*spi_device_handle_t* spi, const uint8_t *data, int addr, int len, uint32_t flags)

Write the shared buffer of the slave in polling way.

备注: `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

参数

- **`spi`** –SPI device handle representing the slave
- **`data`** –Buffer for data to send, strongly suggested to be in the DRAM
- **`addr`** –Address of the slave shared buffer,
- **`len`** –Length to write
- **`flags`** –`SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_polling_transmit`.

esp_err_t **`essl_spi_rddma`**(*spi_device_handle_t* spi, uint8_t *out_data, int len, int seg_len, uint32_t flags)

Receive long buffer in segments from the slave through its DMA.

备 注: This function combines several :cpp:func:`essl_spi_rddma_seg` and one :cpp:func:`essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

参数

- **`spi`** –SPI device handle representing the slave
- **`out_data`** –**[out]** Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **`len`** –Total length of data to receive.
- **`seg_len`** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `rddma_done` will still be sent.)
- **`flags`** –`SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

esp_err_t **essl_spi_rddma_seg**(*spi_device_handle_t* spi, uint8_t *out_data, int seg_len, uint32_t flags)

Read one data segment from the slave through its DMA.

备注: To read long buffer, call :cpp:func:`essl_spi_rddma` instead.

参数

- **spi** –SPI device handle representing the slave
- **out_data** –**[out]** Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- **seg_len** –Length of this segment
- **flags** –`SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

esp_err_t **essl_spi_rddma_done**(*spi_device_handle_t* spi, uint32_t flags)

Send the `rddma_done` command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

备注: This is required only when the slave is working in segment mode.

参数

- **spi** –SPI device handle representing the slave
- **flags** –`SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

esp_err_t **essl_spi_wrdma**(*spi_device_handle_t* spi, const uint8_t *data, int len, int seg_len, uint32_t flags)

Send long buffer in segments to the slave through its DMA.

备注: This function combines several :cpp:func:`essl_spi_wrdma_seg` and one :cpp:func:`essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

参数

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **len** –Total length of data to send.
- **seg_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent.)
- **flags** –`SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

esp_err_t **essl_spi_wrdma_seg**(*spi_device_handle_t* spi, const uint8_t *data, int seg_len, uint32_t flags)

Send one data segment to the slave through its DMA.

备注: To send long buffer, call :cpp:func:`essl_spi_wrdma` instead.

参数

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **seg_len** –Length of this segment
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_wrdma_done**(*spi_device_handle_t* spi, uint32_t flags)

Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

备注: This is required only when the slave is working in segment mode.

参数

- **spi** –SPI device handle representing the slave
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

Structures

struct **essl_spi_config_t**

Configuration of ESSL SPI device.

Public Members

spi_device_handle_t ***spi**

Pointer to SPI device handle.

uint32_t **tx_buf_size**

The pre-negotiated Master TX buffer size used by both the host and the slave.

uint8_t **tx_sync_reg**

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8_t **rx_sync_reg**

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

2.2.8 ESP x509 Certificate Bundle

Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

备注： The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the gen_crt_bundle.py python utility the certificates' subject name and public key are stored in a file and embedded in the ESP32-C3 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Jan 10 04:12:06 2023 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 41 while still having around 90% absolute usage coverage and 99% market share coverage according to SSL certificate authorities statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

备注： Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from *cacrt_all.pem*.

Configuration

Most configuration is done through menuconfig. CMake will generate the bundle according to the configuration and embed it.

- *CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*: automatically build and attach the bundle.
- *CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE*: decide which certificates to include from the complete root list.
- *CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH*: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {
     .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);

esp_crt_bundle_attach(&conf);
```

Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found here The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of curl. Another alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla

The common certificates bundle were made by selecting the authorities with a market share of more than 1 % from w3tech's SSL Survey. These authorities were then used to pick the names of the certificates for the filter list, *cmn_crt_authorities.csv*, from this list provided by Mozilla.

Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in *Generating the List of Root Certificates*.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: protocols/https_x509_bundle.

HTTPS example that uses ESP-TLS and the default bundle: protocols/https_request.

HTTPS example that uses mbedTLS and the default bundle: protocols/https_mbedtls.

API Reference

Header File

- components/mbedtls/esp_crt_bundle/include/esp_crt_bundle.h

Functions

esp_err_t **esp_crt_bundle_attach**(void *conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through esp_crt_bundle_set() it will default to the bundle defined in menuconfig and embedded in the binary.

参数 **conf** –**[in]** The config struct for the SSL connection.

返回

- ESP_OK if adding certificates was successful.
- Other if an error occured or an action must be taken by the calling process.

void **esp_crt_bundle_detach**(mbedtls_ssl_config *conf)

Disable and dealloc the certification bundle.

Removes the certificate verification callback and deallocates used resources

参数 **conf** –**[in]** The config struct for the SSL connection.

esp_err_t **esp_crt_bundle_set**(const uint8_t *x509_bundle, size_t bundle_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

参数

- **x509_bundle** –**[in]** A pointer to the certificate bundle.
- **bundle_size** –**[in]** Size of the certificate bundle in bytes.

返回

- ESP_OK if adding certificates was successful.
- Other if an error occured or an action must be taken by the calling process.

2.2.9 HTTP 服务器

概述

HTTP Server 组件提供了在 ESP32 上运行轻量级 Web 服务器的功能，下面介绍使用 HTTP Server 组件 API 的详细步骤：

- *httpd_start()*：创建 HTTP 服务器的实例，根据具体的配置为其分配内存和资源，并返回该服务器实例的句柄。服务器使用了两个套接字，一个用来监听 HTTP 流量（TCP 类型），另一个用来处理控制信号（UDP 类型），它们在服务器的任务循环中轮流使用。通过向 httpd_start() 传递 httpd_config_t 结构体，可以在创建服务器实例时配置任务的优先级和堆栈的大小。TCP 流量被解析为 HTTP 请求，根据请求的 URI 来调用用户注册的处理程序，在处理程序中需要发送回 HTTP 响应数据包。
- *httpd_stop()*：根据传入的句柄停止服务器，并释放相关联的内存和资源。这是一个阻塞函数，首先给服务器任务发送停止信号，然后等待其终止。期间服务器任务会关闭所有已打开的连接，删除已注册的 URI 处理程序，并将所有会话的上下文数据重置为空。
- *httpd_register_uri_handler()*：通过传入 `httpd_uri_t` 结构体类型的对象来注册 URI 处理程序。该结构体包含如下成员：`uri` 名字，`method` 类型（比如 `HTTPD_GET/HTTPD_POST/HTTPD_PUT` 等等），`esp_err_t *handler (httpd_req_t *req)` 类型的函数指针，指向用户上下文数据的 `user_ctx` 指针。

应用示例

```
/* URI 处理函数，在客户端发起 GET /uri 请求时被调用 */
esp_err_t get_handler(httpd_req_t *req)
{
    /* 发送回简单的响应数据包 */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI 处理函数，在客户端发起 POST/uri 请求时被调用 */
esp_err_t post_handler(httpd_req_t *req)
{
    /* 定义 HTTP POST 请求数据的目标缓存区
     * httpd_req_recv() 只接收 char* 数据，但也可以是
     * 任意二进制数据（需要类型转换）
     * 对于字符串数据，null 终止符会被省略，
     * content_len 会给出字符串的长度 */
    char content[100];

    /* 如果内容长度大于缓冲区则截断 */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) {  /* 返回 0 表示连接已关闭 */
        /* 检查是否超时 */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* 如果是超时，可以调用 httpd_req_recv() 重试
             * 简单起见，这里我们直接
             * 响应 HTTP 408（请求超时）错误给客户端 */
            httpd_resp_send_408(req);
        }
        /* 如果发生了错误，返回 ESP_FAIL 可以确保
         * 底层套接字被关闭 */
        return ESP_FAIL;
    }

    /* 发送简单的响应数据包 */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
```

（下页继续）

(续上页)

```
    return ESP_OK;
}

/* GET /uri 的 URI 处理结构 */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* POST/uri 的 URI 处理结构 */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* 启动 Web 服务器的函数 */
httpd_handle_t start_webserver(void)
{
    /* 生成默认的配置参数 */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* 置空 esp_http_server 的实例句柄 */
    httpd_handle_t server = NULL;

    /* 启动 httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* 注册 URI 处理程序 */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* 如果服务器启动失败，返回的句柄是 NULL */
    return server;
}

/* 停止 Web 服务器的函数 */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* 停止 httpd server */
        httpd_stop(server);
    }
}
```

简单 HTTP 服务器示例 请查看位于 protocols/http_server/simple 的 HTTP 服务器示例，该示例演示了如何处理任意内容长度的数据，读取请求头和 URL 查询参数，设置响应头。

HTTP 长连接

HTTP 服务器具有长连接的功能，允许重复使用同一个连接（会话）进行多次传输，同时保持会话的上下文数据。上下文数据可由处理程序动态分配，在这种情况下需要提前指定好自定义的回调函数，以便在连接/会话被关闭时释放这部分内存资源。

长连接示例

```
/* 自定义函数，用来释放上下文数据 */
void free_ctx_func(void *ctx)
{
    /* 也可以是 free 以外的代码逻辑 */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* 若上下文中不存在会话，则新建一个 */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE));   /*!< 指向上下文数据 */
        req->free_ctx = free_ctx_func;                   /*!< 释放上下文数据的函数
↪*/
    }

    /* 访问上下文数据 */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;

    /* 响应 */
    ..............
    ..............
    ..............

    return ESP_OK;
}
```

详情请参考位于 protocols/http_server/persistent_sockets 的示例代码。

Websocket 服务器

HTTP 服务器组件提供 websocket 支持。可以在 menuconfig 中使用*CONFIG_HTTPD_WS_SUPPORT* 选项启用 websocket 功能。有关如何使用 websocket 功能，请参阅 protocols/http_server/ws_echo_server 目录下的示例代码。

事件处理

ESP HTTP 服务器有各种事件，当特定事件发生时，事件循环库 可以触发处理程序。必须使用*esp_event_handler_register()* 注册处理程序以便 ESP HTTP 服务器进行事件处理。

esp_http_server_event_id_t 包含 ESP HTTP 服务器可能发生的所有事件。

以下为事件循环中不同 ESP HTTP 服务器事件的预期数据类型：

- HTTP_SERVER_EVENT_ERROR : `httpd_err_code_t`
- HTTP_SERVER_EVENT_START : `NULL`
- HTTP_SERVER_EVENT_ON_CONNECTED : `int`
- HTTP_SERVER_EVENT_ON_HEADER : `int`
- HTTP_SERVER_EVENT_HEADERS_SENT : `int`
- HTTP_SERVER_EVENT_ON_DATA : `esp_http_server_event_data`
- HTTP_SERVER_EVENT_SENT_DATA : `esp_http_server_event_data`
- HTTP_SERVER_EVENT_DISCONNECTED : `int`
- HTTP_SERVER_EVENT_STOP : `NULL`

Functions

esp_err_t **httpd_register_uri_handler**(*httpd_handle_t* handle, const *httpd_uri_t* *uri_handler)

Registers a URI handler.

Example usage:

```
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
   // If failed to register handler
   ....
}
```

备注: URI handlers can be registered in real time as long as the server handle is valid.

参数

- **handle** –**[in]** handle to HTTPD server instance
- **uri_handler** –**[in]** pointer to handler that needs to be registered

返回

- ESP_OK : On successfully registering the handler
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL : If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS : If handler with same URI and method is already registered

esp_err_t **httpd_unregister_uri_handler**(*httpd_handle_t* handle, const char *uri, *httpd_method_t* method)

Unregister a URI handler.

参数

- **handle** –**[in]** handle to HTTPD server instance
- **uri** –**[in]** URI string
- **method** –**[in]** HTTP method

返回

- ESP_OK : On successfully deregistering the handler
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_FOUND : Handler with specified URI and method not found

esp_err_t **httpd_unregister_uri** (*httpd_handle_t* handle, const char *uri)

Unregister all URI handlers with the specified uri string.

参数

- **handle** –**[in]** handle to HTTPD server instance
- **uri** –**[in]** uri string specifying all handlers that need to be deregisterd

返回

- ESP_OK : On successfully deregistering all such handlers
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_FOUND : No handler registered with specified uri string

esp_err_t **httpd_sess_set_recv_override** (*httpd_handle_t* hd, int sockfd, *httpd_recv_func_t* recv_func)

Override web server’ s receive function (by session FD)

This function overrides the web server’ s receive function. This same function is used to read HTTP request packets.

备注: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

参数

- **hd** –**[in]** HTTPD instance handle
- **sockfd** –**[in]** Session socket FD
- **recv_func** –**[in]** The receive function to be set for this session

返回

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_sess_set_send_override** (*httpd_handle_t* hd, int sockfd, *httpd_send_func_t* send_func)

Override web server’ s send function (by session FD)

This function overrides the web server’ s send function. This same function is used to send out any response to any HTTP request.

备注: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

参数

- **hd** –**[in]** HTTPD instance handle
- **sockfd** –**[in]** Session socket FD
- **send_func** –**[in]** The send function to be set for this session

返回

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_sess_set_pending_override** (*httpd_handle_t* hd, int sockfd, *httpd_pending_func_t* pending_func)

Override web server’ s pending function (by session FD)

This function overrides the web server’ s pending function. This function is used to test for pending bytes in a socket.

备注: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

参数

- **hd** –**[in]** HTTPD instance handle
- **sockfd** –**[in]** Session socket FD
- **pending_func** –**[in]** The receive function to be set for this session

返回

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

int **httpd_req_to_sockfd**(*httpd_req_t* *r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : httpd_sess_get_ctx(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().

备注: This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

参数 **r** –**[in]** The request whose socket descriptor should be found

返回

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int **httpd_req_recv**(*httpd_req_t* *r, char *buf, size_t buf_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching ‘buf_len’ number of bytes, while the pointer to content data is incremented internally by the same number.

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

参数

- **r** –**[in]** The request being responded to
- **buf** –**[in]** Pointer to a buffer that the data will be read into
- **buf_len** –**[in]** Length of the buffer

返回

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments

- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

size_t **httpd_req_get_hdr_value_len**(*httpd_req_t* *r, const char *field)

Search for a field in request headers and return the string length of it’ s value.

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

参数

- **r** –**[in]** The request being responded to
- **field** –**[in]** The header field to be searched in the request

返回

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

esp_err_t **httpd_req_get_hdr_value_str**(*httpd_req_t* *r, const char *field, char *val, size_t val_size)

Get the value string of a field from the request headers.

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use httpd_req_get_hdr_value_len() to know the right buffer length

---

参数

- **r** –**[in]** The request being responded to
- **field** –**[in]** The field to be searched in the header
- **val** –**[out]** Pointer to the buffer into which the value will be copied if the field is found
- **val_size** –**[in]** Size of the user buffer “val”

返回

- ESP_OK : Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

size_t **httpd_req_get_url_query_len**(*httpd_req_t* *r)

Get Query string length from the request URL.

备注: This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

---

参数 **r** –**[in]** The request being responded to

返回

- Length : Query is found in the request URL

- Zero : Query not found / Null arguments / Invalid request

esp_err_t **httpd_req_get_url_query_str** (*httpd_req_t* *r, char *buf, size_t buf_len)

Get Query string from the request URL.

备注:

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using httpd_req_get_hdr_value_str() to know the 'Content-Type' (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use httpd_req_get_url_query_len() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

---

参数

- **r** –**[in]** The request being responded to
- **buf** –**[out]** Pointer to the buffer into which the query string will be copied (if found)
- **buf_len** –**[in]** Length of output buffer

返回

- ESP_OK : Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND : Query not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Query string truncated

esp_err_t **httpd_query_key_value** (const char *qry, const char *key, char *val, size_t val_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

备注:

- The components of URL query string (keys and values) are not URLdecoded. The user must check for 'Content-Type' field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

参数

- **qry** –**[in]** Pointer to query string
- **key** –**[in]** The key to be searched in the query string
- **val** –**[out]** Pointer to the buffer into which the value will be copied if the key is found
- **val_size** –**[in]** Size of the user buffer "val"

返回

- ESP_OK : Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

esp_err_t **httpd_req_get_cookie_val** (*httpd_req_t* *req, const char *cookie_name, char *val, size_t *val_size)

Get the value string of a cookie value from the "Cookie" request headers by cookie name.

参数

- **req** –**[in]** Pointer to the HTTP request
- **cookie_name** –**[in]** The cookie name to be searched in the request
- **val** –**[out]** Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- **val_size** –**[inout]** Pointer to size of the user buffer "val". This variable will contain cookie length if ESP_OK is returned and required buffer length incase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

返回

- ESP_OK : Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated
- ESP_ERR_NO_MEM : Memory allocation failure

bool **httpd_uri_match_wildcard**(const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with "?" to make the previous character optional (typically a slash), "*" for a wildcard match, and "?*" to make the previous character optional, and if present, allow anything to follow.

Example:

- * matches everything
- /foo/? matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?* or /foo/*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters "?" and "*" anywhere else in the template will be taken literally.

参数

- **uri_template** –**[in]** URI template (pattern)
- **uri_to_match** –**[in]** URI to be matched
- **match_upto** –**[in]** how many characters of the URI buffer to test (there may be trailing query string etc.)

返回 true if a match was found

esp_err_t **httpd_resp_send**(*httpd_req_t* *r, const char *buf, ssize_t buf_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use httpd_resp_send_chunk() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

---

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

参数

- **r** –**[in]** The request being responded to

- **buf** –**[in]** Buffer from where the content is to be fetched
- **buf_len** –**[in]** Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

esp_err_t **httpd_resp_send_chunk** (*httpd_req_t* *r, const char *buf, ssize_t buf_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use httpd_resp_send() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

---

备注:

- This API is supported to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- When you are finished sending all your chunks, you must call this function with buf_len as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

参数

- **r** –**[in]** The request being responded to
- **buf** –**[in]** Pointer to a buffer that stores the data
- **buf_len** –**[in]** Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

返回

- ESP_OK : On successfully sending the response packet chunk
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline *esp_err_t* **httpd_resp_sendstr** (*httpd_req_t* *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls http_resp_send with buffer length set to string length assuming the buffer contains a null terminated string

参数

- **r** –**[in]** The request being responded to
- **str** –**[in]** String to be sent as response body

返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

static inline *esp_err_t* **httpd_resp_sendstr_chunk** (*httpd_req_t* *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string

参数

- **r** –**[in]** The request being responded to
- **str** –**[in]** String to be sent as response body (NULL to finish response packet)

返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

esp_err_t **httpd_resp_set_status**(*httpd_req_t* *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

参数

- **r** –**[in]** The request being responded to
- **status** –**[in]** The HTTP status code of this response

返回

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

esp_err_t **httpd_resp_set_type**(*httpd_req_t* *r, const char *type)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

参数

- **r** –**[in]** The request being responded to
- **type** –**[in]** The Content Type of the response

返回

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

esp_err_t **httpd_resp_set_hdr**(*httpd_req_t* *r, const char *field, const char *value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- The header isn’ t sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

参数

- **`r`** –**[in]** The request being responded to
- **`field`** –**[in]** The field name of the HTTP header
- **`value`** –**[in]** The value of this HTTP header

返回

- ESP_OK : On successfully appending new header
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_HDR : Total additional headers exceed max allowed
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

esp_err_t **`httpd_resp_send_err`** (*httpd_req_t* *req, *httpd_err_code_t* error, const char *msg)

For sending out error code in response to HTTP request.

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

参数

- **`req`** –**[in]** Pointer to the HTTP request for which the response needs to be sent
- **`error`** –**[in]** Error type to send
- **`msg`** –**[in]** Error message string (pass NULL for default message)

返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline *esp_err_t* **`httpd_resp_send_404`** (*httpd_req_t* *r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

参数 **r** –**[in]** The request being responded to
返回
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline *esp_err_t* **httpd_resp_send_408** (*httpd_req_t* *r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

参数 **r** –**[in]** The request being responded to
返回
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline *esp_err_t* **httpd_resp_send_500** (*httpd_req_t* *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

参数 **r** –**[in]** The request being responded to
返回
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

int **httpd_send** (*httpd_req_t* *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimeters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

备注:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : httpd_resp_send(), httpd_resp_send_chunk()

参数

- **r** –**[in]** The request being responded to
- **buf** –**[in]** Buffer from where the fully constructed packet is to be read
- **buf_len** –**[in]** Length of the buffer

返回

- Bytes : Number of bytes that were sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

int **httpd_socket_send**(*httpd_handle_t* hd, int sockfd, const char *buf, size_t buf_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by httpd_sess_set_send_override().

备注: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

参数

- **hd** –**[in]** server instance
- **sockfd** –**[in]** session socket file descriptor
- **buf** –**[in]** buffer with bytes to send
- **buf_len** –**[in]** data size
- **flags** –**[in]** flags for the send() function

返回

- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

int **httpd_socket_recv**(*httpd_handle_t* hd, int sockfd, char *buf, size_t buf_len, int flags)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by httpd_sess_set_recv_override().

备注: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

参数

- **hd** –**[in]** server instance
- **sockfd** –**[in]** session socket file descriptor
- **buf** –**[in]** buffer with bytes to send
- **buf_len** –**[in]** data size

- **flags** –**[in]** flags for the send() function

返回

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

esp_err_t **httpd_register_err_handler**(*httpd_handle_t* handle, *httpd_err_code_t* error, *httpd_err_handler_func_t* handler_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by `httpd_err_code_t`. See prototype `httpd_err_handler_func_t` above for details.

参数

- **handle** –**[in]** HTTP server handle
- **error** –**[in]** Error type
- **handler_fn** –**[in]** User implemented handler function (Pass NULL to unset any previously set handler)

返回

- ESP_OK : handler registered successfully
- ESP_ERR_INVALID_ARG : invalid error code or server handle

esp_err_t **httpd_start**(*httpd_handle_t* *handle, const *httpd_config_t* *config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
     // Generate default configuration
     httpd_config_t config = HTTPD_DEFAULT_CONFIG();

     // Empty handle to http_server
     httpd_handle_t server = NULL;

     // Start the httpd server
     if (httpd_start(&server, &config) == ESP_OK) {
         // Register URI handlers
         httpd_register_uri_handler(server, &uri_get);
         httpd_register_uri_handler(server, &uri_post);
     }
     // If server failed to start, handle will be NULL
     return server;
}
```

参数

- **config** –**[in]** Configuration for new instance of the server
- **handle** –**[out]** Handle to newly created instance of the server. NULL on error

返回

- ESP_OK : Instance created successfully
- ESP_ERR_INVALID_ARG : Null argument(s)
- ESP_ERR_HTTPD_ALLOC_MEM : Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK : Failed to launch server task

esp_err_t **httpd_stop**(*httpd_handle_t* handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
     // Ensure handle is non NULL
     if (server != NULL) {
         // Stop the httpd server
         httpd_stop(server);
     }
}
```

参数 **handle** –**[in]** Handle to server returned by httpd_start

返回

- ESP_OK : Server stopped successfully
- ESP_ERR_INVALID_ARG : Handle argument is Null

esp_err_t **httpd_queue_work**(*httpd_handle_t* handle, *httpd_work_fn_t* work, void *arg)

Queue execution of a function in HTTPD's context.

This API queues a work function for asynchronous execution

备注: Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

参数

- **handle** –**[in]** Handle to server returned by httpd_start
- **work** –**[in]** Pointer to the function to be executed in the HTTPD's context
- **arg** –**[in]** Pointer to the arguments that should be passed to this function

返回

- ESP_OK : On successfully queueing the work
- ESP_FAIL : Failure in ctrl socket
- ESP_ERR_INVALID_ARG : Null arguments

void ***httpd_sess_get_ctx**(*httpd_handle_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server's send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

参数

- **handle** –**[in]** Handle to server returned by httpd_start
- **sockfd** –**[in]** The socket descriptor for which the context should be extracted.

返回

- void* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd_sess_set_ctx**(*httpd_handle_t* handle, int sockfd, void *ctx, *httpd_free_ctx_fn_t* free_fn)

Set session context by socket descriptor.

参数

- **handle** –**[in]** Handle to server returned by httpd_start

- **sockfd** –**[in]** The socket descriptor for which the context should be extracted.
- **ctx** –**[in]** Context object to assign to the session
- **free_fn** –**[in]** Function that should be called to free the context

void ***httpd_sess_get_transport_ctx**(*httpd_handle_t* handle, int sockfd)

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

参见:

httpd_sess_get_ctx()

参数

- **handle** –**[in]** Handle to server returned by httpd_start
- **sockfd** –**[in]** The socket descriptor for which the context should be extracted.

返回

- void* : Pointer to the transport context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd_sess_set_transport_ctx**(*httpd_handle_t* handle, int sockfd, void *ctx, *httpd_free_ctx_fn_t* free_fn)

Set session ‘transport’ context by socket descriptor.

参见:

httpd_sess_set_ctx()

参数

- **handle** –**[in]** Handle to server returned by httpd_start
- **sockfd** –**[in]** The socket descriptor for which the context should be extracted.
- **ctx** –**[in]** Transport context object to assign to the session
- **free_fn** –**[in]** Function that should be called to free the transport context

void ***httpd_get_global_user_ctx**(*httpd_handle_t* handle)

Get HTTPD global user context (it was set in the server config struct)

参数 **handle** –**[in]** Handle to server returned by httpd_start
返回 global user context

void ***httpd_get_global_transport_ctx**(*httpd_handle_t* handle)

Get HTTPD global transport context (it was set in the server config struct)

参数 **handle** –**[in]** Handle to server returned by httpd_start
返回 global transport context

esp_err_t **httpd_sess_trigger_close**(*httpd_handle_t* handle, int sockfd)

Trigger an httpd session close externally.

备注: Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

参数

- **handle** –**[in]** Handle to server returned by httpd_start
- **sockfd** –**[in]** The socket descriptor of the session to be closed

返回

- ESP_OK : On successfully initiating closure

- ESP_FAIL : Failure to queue work
- ESP_ERR_NOT_FOUND : Socket fd not found
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_sess_update_lru_counter** (*httpd_handle_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

备注： Calling this API is only necessary if the LRU Purge Enable option is enabled.

参数

- **handle** –**[in]** Handle to server returned by httpd_start
- **sockfd** –**[in]** The socket descriptor of the session for which LRU counter is to be updated

返回

- ESP_OK : Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND : Socket not found
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_get_client_list** (*httpd_handle_t* handle, size_t *fds, int *client_fds)

Returns list of current socket descriptors of active sessions.

备注： Size of provided array has to be equal or greater then maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.

参数

- **handle** –**[in]** Handle to server returned by httpd_start
- **fds** –**[inout]** In: Size of provided client_fds array Out: Number of valid client fds returned in client_fds,
- **client_fds** –**[out]** Array of client fds

返回

- ESP_OK : Successfully retrieved session list
- ESP_ERR_INVALID_ARG : Wrong arguments or list is longer than provided array

Structures

struct **esp_http_server_event_data**

Argument structure for HTTP_SERVER_EVENT_ON_DATA and HTTP_SERVER_EVENT_SENT_DATA event

Public Members

int **fd**

Session socket file descriptor

int **data_len**

Data length

struct **httpd_config**

HTTP Server Configuration Structure.

备注： Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

unsigned **task_priority**

Priority of FreeRTOS task which runs the server

size_t **stack_size**

The maximum stack size allowed for the server task

BaseType_t **core_id**

The core the HTTP server task will run on

uint16_t **server_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16_t **ctrl_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t **max_open_sockets**

Max number of sockets/clients connected at any time (3 sockets are reserved for internal working of the HTTP server)

uint16_t **max_uri_handlers**

Maximum allowed uri handlers

uint16_t **max_resp_headers**

Maximum allowed additional headers in HTTP response

uint16_t **backlog_conn**

Number of backlog connections

bool **lru_purge_enable**

Purge "Least Recently Used" connection

uint16_t **recv_wait_timeout**

Timeout for recv function (in seconds)

uint16_t **send_wait_timeout**

Timeout for send function (in seconds)

void ***global_user_ctx**

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the httpd_req_t struct.

When shutting down, the server frees up the user context by calling free() on the global_user_ctx field. If you wish to use a custom function for freeing the global user context, please specify that here.

httpd_free_ctx_fn_t **global_user_ctx_free_fn**

Free function for global user context

void ***global_transport_ctx**

Global transport context.

Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t **global_transport_ctx_free_fn**

Free function for global transport context

bool **enable_so_linger**

bool to enable/disable linger

int **linger_timeout**

linger timeout (in seconds)

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time. Default is 5 (second)

int **keep_alive_interval**

Keep-alive interval time. Default is 5 (second)

int **keep_alive_count**

Keep-alive packet retry send count. Default is 3 counts

httpd_open_func_t **open_fn**

Custom session opening callback.

Called on a new session socket just after accept(), but before reading any data.

This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending session overrides.

If a context needs to be maintained between these functions, store it in the session using httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()

Returning a value other than ESP_OK will immediately close the new socket.

httpd_close_func_t **close_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

httpd_uri_match_func_t **uri_match_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) NULL : Internally do basic matching using `strncmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

struct **httpd_req**

HTTP Request Data Structure.

Public Members

httpd_handle_t **handle**

Handle to server instance

int **method**

The type of HTTP request, -1 if unsupported method

const char **uri**[HTTPD_MAX_URI_LEN + 1]

The URI of this request (1 byte extra for null termination)

size_t **content_len**

Length of the request body

void ***aux**

Internally used members

void ***user_ctx**

User context pointer passed during URI registration.

void ***sess_ctx**

Session Context Pointer

A session context. Contexts are maintained across 'sessions' for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

httpd_free_ctx_fn_t **free_ctx**

Pointer to free context hook

Function to free session context

If the web server ' s socket closes, it frees up the session context by calling free() on the sess_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

bool **ignore_sess_ctx_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

struct **httpd_uri**

Structure for URI handler.

Public Members

const char ***uri**

The URI to handle

httpd_method_t **method**

Method supported by the URI

esp_err_t (***handler**)(*httpd_req_t* *r)

Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

void ***user_ctx**

Pointer to user context data which will be available to handler

Macros

HTTPD_MAX_REQ_HDR_LEN

HTTPD_MAX_URI_LEN

HTTPD_SOCK_ERR_FAIL

HTTPD_SOCK_ERR_INVALID

HTTPD_SOCK_ERR_TIMEOUT

HTTPD_200

HTTPD_400

HTTP Response 400

HTTPD_404

HTTP Response 404

HTTPD_408

HTTP Response 408

HTTPD_500

HTTP Response 500

HTTPD_TYPE_JSON

HTTP Content type JSON

HTTPD_TYPE_TEXT

HTTP Content type text/HTML

HTTPD_TYPE_OCTET

HTTP Content type octext-stream

ESP_HTTPD_DEF_CTRL_PORT

HTTP Server control socket port

HTTPD_DEFAULT_CONFIG()

ESP_ERR_HTTPD_BASE

Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL

All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS

URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ

Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC

Result string truncated

ESP_ERR_HTTPD_RESP_HDR

Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND

Error occured while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM

Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK

Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN

Type Definitions

typedef struct *httpd_req* **httpd_req_t**

HTTP Request Data Structure.

typedef struct *httpd_uri* **httpd_uri_t**

Structure for URI handler.

typedef int (***httpd_send_func_t**)(*httpd_handle_t* hd, int sockfd, const char *buf, size_t buf_len, int flags)

Prototype for HTTPDs low-level send function.

备注: User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function

---

Param hd **[in]** server instance
Param sockfd **[in]** session socket file descriptor
Param buf **[in]** buffer with bytes to send
Param buf_len **[in]** data size
Param flags **[in]** flags for the send() function
Return

- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

typedef int (***httpd_recv_func_t**)(*httpd_handle_t* hd, int sockfd, char *buf, size_t buf_len, int flags)

Prototype for HTTPDs low-level recv function.

备注: User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

---

Param hd **[in]** server instance
Param sockfd **[in]** session socket file descriptor
Param buf **[in]** buffer with bytes to send
Param buf_len **[in]** data size
Param flags **[in]** flags for the send() function
Return

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

typedef int (***httpd_pending_func_t**)(*httpd_handle_t* hd, int sockfd)

Prototype for HTTPDs low-level "get pending bytes" function.

备注: User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

Param hd **[in]** server instance
Param sockfd **[in]** session socket file descriptor
Return

- Bytes : The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket pending()

typedef *esp_err_t* (***httpd_err_handler_func_t**)(*httpd_req_t* *req, *httpd_err_code_t* error)

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

备注:

- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_resp_send_err() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.

Param req **[in]** HTTP request for which the error needs to be handled
Param error **[in]** Error type
Return

- ESP_OK : error handled successful
- ESP_FAIL : failure indicates that the underlying socket needs to be closed

typedef void ***httpd_handle_t**

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

typedef enum http_method **httpd_method_t**

HTTP Method Type wrapper over "enum http_method" available in "http_parser" library.

typedef void (***httpd_free_ctx_fn_t**)(void *ctx)

Prototype for freeing context data (if any)

Param ctx [in] object to free

typedef *esp_err_t* (*__httpd_open_func_t__)(*httpd_handle_t* hd, int sockfd)

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

Param hd [in] server instance
Param sockfd [in] session socket file descriptor
Return
- ESP_OK : On success
- Any value other than ESP_OK will signal the server to close the socket immediately

typedef void (*__httpd_close_func_t__)(*httpd_handle_t* hd, int sockfd)

Function prototype for closing a session.

备注： It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

Param hd [in] server instance
Param sockfd [in] session socket file descriptor

typedef bool (*__httpd_uri_match_func_t__)(const char *reference_uri, const char *uri_to_match, size_t match_upto)

Function prototype for URI matching.

Param reference_uri [in] URI/template with respect to which the other URI is matched
Param uri_to_match [in] URI/template being matched to the reference URI/template
Param match_upto [in] For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)
Return true on match

typedef struct *httpd_config* **httpd_config_t**

HTTP Server Configuration Structure.

备注： Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

typedef void (*__httpd_work_fn_t__)(void *arg)

Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.

Param arg [in] The arguments for this work function

Enumerations

enum **httpd_err_code_t**

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

Values:

enumerator **HTTPD_500_INTERNAL_SERVER_ERROR**

enumerator **HTTPD_501_METHOD_NOT_IMPLEMENTED**

enumerator **HTTPD_505_VERSION_NOT_SUPPORTED**

enumerator **HTTPD_400_BAD_REQUEST**

enumerator **HTTPD_401_UNAUTHORIZED**

enumerator **HTTPD_403_FORBIDDEN**

enumerator **HTTPD_404_NOT_FOUND**

enumerator **HTTPD_405_METHOD_NOT_ALLOWED**

enumerator **HTTPD_408_REQ_TIMEOUT**

enumerator **HTTPD_411_LENGTH_REQUIRED**

enumerator **HTTPD_414_URI_TOO_LONG**

enumerator **HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE**

enumerator **HTTPD_ERR_CODE_MAX**

enum **esp_http_server_event_id_t**

HTTP Server events id.

Values:

enumerator **HTTP_SERVER_EVENT_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP_SERVER_EVENT_START**

This event occurs when HTTP Server is started

enumerator **HTTP_SERVER_EVENT_ON_CONNECTED**

Once the HTTP Server has been connected to the client, no data exchange has been performed

enumerator **HTTP_SERVER_EVENT_ON_HEADER**

Occurs when receiving each header sent from the client

enumerator **HTTP_SERVER_EVENT_HEADERS_SENT**

After sending all the headers to the client

enumerator **HTTP_SERVER_EVENT_ON_DATA**

Occurs when receiving data from the client

enumerator **HTTP_SERVER_EVENT_SENT_DATA**

Occurs when an ESP HTTP server session is finished

enumerator **HTTP_SERVER_EVENT_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP_SERVER_EVENT_STOP**

This event occurs when HTTP Server is stopped

2.2.10 HTTPS 服务器

概述

HTTPS 服务器组件建立在*HTTP 服务器* 组件的基础上。该服务器借助常规 HTTP 服务器中的钩子注册函数，注册 SSL 会话回调处理函数。

HTTP 服务器 组件的所有文档同样适用于用户按照本文档搭建的服务器。

API 说明

下列*HTTP 服务器* 的 API 已不适用于*HTTPS 服务器*。这些 API 仅限内部使用，用于处理安全会话和维护内部状态。

- “send”、” receive” 和 “pending” 回调注册函数——处理安全套接字
  - *httpd_sess_set_send_override()*
  - *httpd_sess_set_recv_override()*
  - *httpd_sess_set_pending_override()*
- “transport context” ——传输层上下文
  - *httpd_sess_get_transport_ctx()*：返回会话使用的 SSL
  - *httpd_sess_set_transport_ctx()*
  - *httpd_get_global_transport_ctx()*：返回共享的 SSL 上下文
  - *httpd_config::global_transport_ctx*
  - *httpd_config::global_transport_ctx_free_fn*
  - *httpd_config::open_fn*：用于设置安全套接字

其他 API 均可使用，没有其他限制。

如何使用

请参考示例 protocols/https_server 来学习如何搭建安全的服务器。

总体而言，您只需要生成证书，将其嵌入到固件中，并且在初始化结构体中配置好正确的证书地址和长度后，将其传入服务器启动函数。

通过改变初始化配置结构体中的标志*httpd_ssl_config::transport_mode*，可以选择是否需要 SSL 连接来启动服务器。在测试时或在速度比安全性更重要的可信环境中，您可以使用此功能。

性能

建立起始会话大约需要两秒，在时钟速度较慢或日志记录冗余信息较多的情况下，可能需要花费更多时间。后续通过已打开的安全套接字建立请求的速度会更快，最快只需不到 100 ms。

API 参考

Header File

- components/esp_https_server/include/esp_https_server.h

Functions

esp_err_t **httpd_ssl_start** (*httpd_handle_t* *handle, *httpd_ssl_config_t* *config)

Create a SSL capable HTTP server (secure mode may be disabled in config)

参数

- **config** –**[inout]** - server config, must not be const. Does not have to stay valid after calling this function.
- **handle** –**[out]** - storage for the server handle, must be a valid pointer

返回 success

esp_err_t **httpd_ssl_stop** (*httpd_handle_t* handle)

Stop the server. Blocks until the server is shut down.

参数 **handle** –**[in]**

返回

- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_FAIL: Failure to shut down server

Structures

struct **esp_https_server_user_cb_arg**

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

Public Members

httpd_ssl_user_cb_state_t **user_cb_state**

State of user callback

esp_tls_t ***tls**

ESP-TLS connection handle

struct **httpd_ssl_config**

HTTPS server config struct

Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

Public Members

httpd_config_t **httpd**

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8_t ***servercert**

Server certificate

size_t **servercert_len**

Server certificate byte length

const uint8_t ***cacert_pem**

CA certificate ((CA used to sign clients, or client cert itself)

size_t **cacert_len**

CA certificate byte length

const uint8_t ***prvtkey_pem**

Private key

size_t **prvtkey_len**

Private key byte length

httpd_ssl_transport_mode_t **transport_mode**

Transport Mode (default secure)

uint16_t **port_secure**

Port used when transport mode is secure (default 443)

uint16_t **port_insecure**

Port used when transport mode is insecure (default 80)

bool **session_tickets**

Enable tls session tickets

bool **use_secure_element**

Enable secure element for server session

esp_https_server_user_cb ***user_cb**

User callback for esp_https_server

void ***ssl_userdata**

user data to add to the ssl context

esp_tls_handshake_callback **cert_select_cb**

Certificate selection callback to use

const char ****alpn_protos**

Application protocols the server supports in order of prefernece. Used for negotiating during the TLS handshake, first one the client supports is selected. The data structure must live as long as the https server itself!

Macros

HTTPD_SSL_CONFIG_DEFAULT()

Default config struct init

(http_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to ‘transport_mode’
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

Type Definitions

typedef struct *esp_https_server_user_cb_arg* **esp_https_server_user_cb_arg_t**

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

typedef void **esp_https_server_user_cb**(*esp_https_server_user_cb_arg_t* *user_cb)

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

Param user_cb Callback data struct

typedef struct *httpd_ssl_config* **httpd_ssl_config_t**

Enumerations

enum **httpd_ssl_transport_mode_t**

Values:

enumerator **HTTPD_SSL_TRANSPORT_SECURE**

enumerator **HTTPD_SSL_TRANSPORT_INSECURE**

enum **httpd_ssl_user_cb_state_t**

Indicates the state at which the user callback is executed, i.e at session creation or session close.

Values:

enumerator **HTTPD_SSL_USER_CB_SESS_CREATE**

enumerator **HTTPD_SSL_USER_CB_SESS_CLOSE**

2.2.11 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called `Echo Reply`.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a new ping session To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the *esp_ping_callbacks_t*' structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4),␣
↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted,␣
↪sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted,␣
↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
```

(下页继续)

(续上页)

```
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;          // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↪ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo";  // arguments that will feed to all callback functions,␣
↪can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}
```

Start and Stop ping session You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: protocols/icmp_echo

API Reference

Header File

- components/lwip/include/apps/ping/ping_sock.h

Functions

esp_err_t **esp_ping_new_session**(const *esp_ping_config_t* *config, const *esp_ping_callbacks_t* *cbs, *esp_ping_handle_t* *hdl_out)

Create a ping session.

参数

- **config** –ping configuration
- **cbs** –a bunch of callback functions invoked by internal ping task
- **hdl_out** –handle of ping session

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)

- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

esp_err_t **esp_ping_delete_session**(*esp_ping_handle_t* hdl)

Delete a ping session.

参数 **hdl** –handle of ping session

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

esp_err_t **esp_ping_start**(*esp_ping_handle_t* hdl)

Start the ping session.

参数 **hdl** –handle of ping session

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

esp_err_t **esp_ping_stop**(*esp_ping_handle_t* hdl)

Stop the ping session.

参数 **hdl** –handle of ping session

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

esp_err_t **esp_ping_get_profile**(*esp_ping_handle_t* hdl, *esp_ping_profile_t* profile, void *data, uint32_t size)

Get runtime profile of ping session.

参数

- **hdl** –handle of ping session
- **profile** –type of profile
- **data** –profile data
- **size** –profile data size

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn’t match the “size” parameter
- ESP_OK: get profile successfully

Structures

struct **esp_ping_callbacks_t**

Type of “ping” callback functions.

Public Members

void ***cb_args**

arguments for callback functions

void (***on_ping_success**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (***on_ping_timeout**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (*`on_ping_end`)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when a ping session is finished.

struct `esp_ping_config_t`

Type of "ping" configuration.

Public Members

uint32_t `count`

A "ping" session contains count procedures

uint32_t `interval_ms`

Milliseconds between each ping procedure

uint32_t `timeout_ms`

Timeout value (in milliseconds) of each ping procedure

uint32_t `data_size`

Size of the data next to ICMP packet header

int `tos`

Type of Service, a field specified in the IP header

int `ttl`

Time to Live,a field specified in the IP header

ip_addr_t `target_addr`

Target IP address, either IPv4 or IPv6

uint32_t `task_stack_size`

Stack size of internal ping task

uint32_t `task_prio`

Priority of internal ping task

uint32_t `interface`

Netif index, interface=0 means NETIF_NO_INDEX

Macros

`ESP_PING_DEFAULT_CONFIG`()

Default ping configuration.

`ESP_PING_COUNT_INFINITE`

Set ping count to zero will ping target infinitely

Type Definitions

typedef void *`esp_ping_handle_t`

Type of "ping" session handle.

Enumerations

enum **esp_ping_profile_t**

Profile of ping session.

Values:

enumerator **ESP_PING_PROF_SEQNO**

Sequence number of a ping procedure

enumerator **ESP_PING_PROF_TOS**

Type of service of a ping procedure

enumerator **ESP_PING_PROF_TTL**

Time to live of a ping procedure

enumerator **ESP_PING_PROF_REQUEST**

Number of request packets sent out

enumerator **ESP_PING_PROF_REPLY**

Number of reply packets received

enumerator **ESP_PING_PROF_IPADDR**

IP address of replied target

enumerator **ESP_PING_PROF_SIZE**

Size of received packet

enumerator **ESP_PING_PROF_TIMEGAP**

Elapsed time between request and reply packet

enumerator **ESP_PING_PROF_DURATION**

Elapsed time of the whole ping session

2.2.12 mDNS 服务

mDNS 是一种组播 UDP 服务，用来提供本地网络服务和主机发现。

自 v5.0 版本起，ESP-IDF 组件 *mDNS* 已从 ESP-IDF 中迁出至独立的仓库：

- GitHub 上 mDNS 组件

运行 *idf.py add-dependency espressif/mdns*，在项目中添加 mDNS 组件。

托管的文档

请点击如下链接，查看 mDNS 的相关文档：

- mDNS 文档

2.2.13 Mbed TLS

Mbed TLS is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

备注： ESP-IDF uses a fork of Mbed TLS which includes a few patches (related to hardware routines of certain modules like `bignum (MPI)` and `ECC`) over vanilla Mbed TLS.

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

备注： Mbed TLS is in the process of migrating all the documentation to a single place. In the meantime, users can find the documentation at the old Mbed TLS site .

Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions present in different branches of ESP-IDF here.

备注： Please refer the *ESP-IDF Migration Guide* to migrate from Mbed TLS version 2.x to version 3.0 or greater.

Application Examples

Examples in ESP-IDF use *ESP-TLS* which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples protocols/https_server/simple (Simple HTTPS server) and protocols/https_request (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example protocols/https_mbedtls.

Alternatives

ESP-TLS acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at https://github.com/espressif/esp-wolfSSL with the upstream submodule pointer.

Please refer to *ESP-TLS: Underlying SSL/TLS Library Options* docs for more information on this and comparison of Mbed TLS and wolfSSL.

Important Config Options

Following is a brief list of important config options accessible at `Component Config -> mbedTLS`. The full list of config options can be found *here*.

- *CONFIG_MBEDTLS_SSL_PROTO_TLS1_2*: Support for TLS 1.2
- *CONFIG_MBEDTLS_SSL_PROTO_TLS1_3*: Support for TLS 1.3

- *CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*: Support for trusted root certificate bundle (more about this: *ESP x509 Certificate Bundle*)
- *CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS*: Support for TLS Session Resumption: Client session tickets
- *CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS*: Support for TLS Session Resumption: Server session tickets
- *CONFIG_MBEDTLS_HARDWARE_SHA*: Support for hardware SHA acceleration
- *CONFIG_MBEDTLS_HARDWARE_AES*: Support for hardware AES acceleration
- *CONFIG_MBEDTLS_HARDWARE_MPI*: Support for hardware MPI (bignum) acceleration

---

备注： Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1 and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out here.

Performance and Memory Tweaks

Reducing Heap Usage The following table shows typical memory usage with different configs when the protocols/https_request example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

Mbed TLS Test	Related Configs	Heap Usage (approx.)
Default	NA	42196 B
Enable SSL Variable Length	*CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH*	42120 B
Disable Keep Peer Certificate	*CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE*	38533 B
Enable Dynamic TX/RX Buffer	*CONFIG_MBEDTLS_DYNAMIC_BUFFER* *CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA* *CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT*	22013 B

备注： These values are subject to change with change in configuration options and versions of Mbed TLS.

Reducing Binary Size Under `Component Config -> mbedTLS`, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in *Minimizing Binary Size* docs.

此 API 部分的示例代码存放在 ESP-IDF 示例项目的 protocols 目录下。

2.2.14 IP 网络层协议

IP 网络层协议（应用层协议之下）的文档存放在连网 *API* 目录下。

2.3 蓝牙 API

2.3.1 BT COMMON

BT GENERIC DEFINES

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_defs.h

Structures

struct **esp_bt_uuid_t**

UUID type.

Public Members

uint16_t **len**

UUID length, 16bit, 32bit or 128bit

uint16_t **uuid16**

16bit UUID

uint32_t **uuid32**

32bit UUID

uint8_t **uuid128**[ESP_UUID_LEN_128]

128bit UUID

union *esp_bt_uuid_t*::[anonymous] **uuid**

UUID

Macros

ESP_BLUEDROID_STATUS_CHECK(status)

ESP_BT_STATUS_BASE_FOR_HCI_ERR

ESP_BT_OCTET16_LEN

ESP_BT_OCTET8_LEN

ESP_DEFAULT_GATT_IF

Default GATT interface id.

ESP_BLE_PRIM_ADV_INT_MIN

Minimum advertising interval for undirected and low duty cycle directed advertising

ESP_BLE_PRIM_ADV_INT_MAX

Maximum advertising interval for undirected and low duty cycle directed advertising

ESP_BLE_CONN_INT_MIN

relate to BTM_BLE_CONN_INT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_INT_MAX

relate to BTM_BLE_CONN_INT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_LATENCY_MAX

relate to ESP_BLE_CONN_LATENCY_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MIN

relate to BTM_BLE_CONN_SUP_TOUT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MAX

relate to ESP_BLE_CONN_SUP_TOUT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_PARAM_UNDEF

ESP_BLE_SCAN_PARAM_UNDEF

ESP_BLE_IS_VALID_PARAM(x, min, max)

Check the param is valid or not.

ESP_UUID_LEN_16

ESP_UUID_LEN_32

ESP_UUID_LEN_128

ESP_BD_ADDR_LEN

Bluetooth address length.

ESP_BLE_ENC_KEY_MASK

Used to exchange the encryption key in the init key & response key.

ESP_BLE_ID_KEY_MASK

Used to exchange the IRK key in the init key & response key.

ESP_BLE_CSR_KEY_MASK

Used to exchange the CSRK key in the init key & response key.

ESP_BLE_LINK_KEY_MASK

Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN

Minimum of the application id.

ESP_APP_ID_MAX

Maximum of the application id.

ESP_BD_ADDR_STR

ESP_BD_ADDR_HEX(addr)

Type Definitions

typedef uint8_t **esp_bt_octet16_t**[ESP_BT_OCTET16_LEN]

typedef uint8_t **esp_bt_octet8_t**[ESP_BT_OCTET8_LEN]

typedef uint8_t **esp_link_key**[ESP_BT_OCTET16_LEN]

typedef uint8_t **esp_bd_addr_t**[ESP_BD_ADDR_LEN]

Bluetooth device address.

typedef uint8_t **esp_ble_key_mask_t**

Enumerations

enum **esp_bt_status_t**

Status Return Value.

Values:

enumerator **ESP_BT_STATUS_SUCCESS**

enumerator **ESP_BT_STATUS_FAIL**

enumerator **ESP_BT_STATUS_NOT_READY**

enumerator **ESP_BT_STATUS_NOMEM**

enumerator **ESP_BT_STATUS_BUSY**

enumerator **ESP_BT_STATUS_DONE**

enumerator **ESP_BT_STATUS_UNSUPPORTED**

enumerator **ESP_BT_STATUS_PARM_INVALID**

enumerator **ESP_BT_STATUS_UNHANDLED**

enumerator **ESP_BT_STATUS_AUTH_FAILURE**

enumerator **ESP_BT_STATUS_RMT_DEV_DOWN**

enumerator **ESP_BT_STATUS_AUTH_REJECTED**

enumerator **ESP_BT_STATUS_INVALID_STATIC_RAND_ADDR**

enumerator **ESP_BT_STATUS_PENDING**

enumerator **ESP_BT_STATUS_UNACCEPT_CONN_INTERVAL**

enumerator **ESP_BT_STATUS_PARAM_OUT_OF_RANGE**

enumerator **ESP_BT_STATUS_TIMEOUT**

enumerator **ESP_BT_STATUS_PEER_LE_DATA_LEN_UNSUPPORTED**

enumerator **ESP_BT_STATUS_CONTROL_LE_DATA_LEN_UNSUPPORTED**

enumerator **ESP_BT_STATUS_ERR_ILLEGAL_PARAMETER_FMT**

enumerator **ESP_BT_STATUS_MEMORY_FULL**

enumerator **ESP_BT_STATUS_EIR_TOO_LARGE**

enumerator **ESP_BT_STATUS_HCI_SUCCESS**

enumerator **ESP_BT_STATUS_HCI_PENDING**

enumerator **ESP_BT_STATUS_HCI_ILLEGAL_COMMAND**

enumerator **ESP_BT_STATUS_HCI_NO_CONNECTION**

enumerator **ESP_BT_STATUS_HCI_HW_FAILURE**

enumerator **ESP_BT_STATUS_HCI_PAGE_TIMEOUT**

BT MAIN API

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_main.h

Functions

esp_bluedroid_status_t **esp_bluedroid_get_status**(void)

Get bluetooth stack status.

返回 Bluetooth stack status

esp_err_t **esp_bluedroid_enable**(void)

Enable bluetooth, must after esp_bluedroid_init().

返回

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_disable**(void)

Disable bluetooth, must prior to esp_bluedroid_deinit().

返回

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_init**(void)

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

返回

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_deinit**(void)

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

返回

- ESP_OK : Succeed
- Other : Failed

Enumerations

enum **esp_bluedroid_status_t**

Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

Values:

enumerator **ESP_BLUEDROID_STATUS_UNINITIALIZED**

Bluetooth not initialized

enumerator **ESP_BLUEDROID_STATUS_INITIALIZED**

Bluetooth initialized but not enabled

enumerator **ESP_BLUEDROID_STATUS_ENABLED**

Bluetooth initialized and enabled

BT DEVICE APIs

Overview Bluetooth device reference APIs.

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_device.h

Functions

const uint8_t ***esp_bt_dev_get_address**(void)

Get bluetooth device address. Must use after "esp_bluedroid_enable" .

返回 bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

esp_err_t **esp_bt_dev_set_device_name**(const char *name)

Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

参数 **name** –**[in]** : device name to be set

返回

- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- ESP_FAIL : others

2.3.2 BT LE

GAP API

Application Example Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_client
  - GATT Security Client Example Walkthrough
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_server
  - GATT Security Server Example Walkthrough

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

Functions

esp_err_t **esp_ble_gap_register_callback**(*esp_gap_ble_cb_t* callback)

This function is called to occur gap event, such as scan result.

参数 **callback** –**[in]** callback function

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_adv_data**(*esp_ble_adv_data_t* *adv_data)

This function is called to override the BTA default ADV parameters.

参数 **adv_data** –**[in]** Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_scan_params**(*esp_ble_scan_params_t* *scan_params)

This function is called to set scan parameters.

参数 **scan_params** –**[in]** Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_start_scanning**(uint32_t duration)

This procedure keep the device scanning the peer device which advertising on the air.

参数 **duration** –**[in]** Keeping the scanning time, the unit is second.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_stop_scanning**(void)

This function call to stop the device scanning the peer device which advertising on the air.

返回

- ESP_OK : success
  - other : failed

esp_err_t **esp_ble_gap_start_advertising**(*esp_ble_adv_params_t* *adv_params)

This function is called to start advertising.

参数 **adv_params** –**[in]** pointer to User defined adv_params data structure.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_stop_advertising**(void)

This function is called to stop advertising.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_update_conn_params**(*esp_ble_conn_update_params_t* *params)

Update connection parameters, can only be used when connection is up.

参数 **params** –**[in]** - connection update parameters

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_pkt_data_len**(*esp_bd_addr_t* remote_device, uint16_t tx_data_length)

This function is to set maximum LE data packet size.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_rand_addr**(*esp_bd_addr_t* rand_addr)

This function sets the static Random Address and Non-Resolvable Private Address for the application.

参数 **rand_addr** –**[in]** the random address which should be setting

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_clear_rand_addr**(void)

This function clears the random address for the application.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_local_privacy**(bool privacy_enable)

Enable/disable privacy on the local device.

参数 **privacy_enable** –**[in]** - enable/disable privacy on remote device.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_local_icon**(uint16_t icon)

set local gap appearance icon

参数 **icon** –**[in]** - External appearance value, these values are defined by the Bluetooth SIG, please refer to https://www.bluetooth.com/specifications/assigned-numbers/

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_update_whitelist**(bool add_remove, *esp_bd_addr_t* remote_bda, *esp_ble_wl_addr_type_t* wl_addr_type)

Add or remove device from white list.

参数

- **add_remove** –**[in]** the value is true if added the ble device to the white list, and false remove to the white list.
- **remote_bda** –**[in]** the remote device address add/remove from the white list.
- **wl_addr_type** –**[in]** whitelist address type

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_clear_whitelist**(void)

Clear all white list.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_whitelist_size**(uint16_t *length)

Get the whitelist size in the controller.

参数 **length** –**[out]** the white list length.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_prefer_conn_params**(*esp_bd_addr_t* bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

参数

- **bd_addr** –**[in]** BD address of the peripheral
- **min_conn_int** –**[in]** minimum preferred connection interval
- **max_conn_int** –**[in]** maximum preferred connection interval
- **slave_latency** –**[in]** preferred slave latency
- **supervision_tout** –**[in]** preferred supervision timeout

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_device_name**(const char *name)

Set device name to the local device.

参数 **name** –**[in]** - device name.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_device_name**(void)

Get device name of the local device.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_local_used_addr**(*esp_bd_addr_t* local_used_addr, uint8_t *addr_type)

This function is called to get local used address and address type. uint8_t *esp_bt_dev_get_address(void) get the public address.

参数

- **local_used_addr** –**[in]** - current local used ble address (six bytes)
- **addr_type** –**[in]** - ble address type

返回 - ESP_OK : success

- other : failed

uint8_t ***esp_ble_resolve_adv_data**(uint8_t *adv_data, uint8_t type, uint8_t *length)

This function is called to get ADV data for a specific type.

参数

- **adv_data** –**[in]** - pointer of ADV data which to be resolved
- **type** –**[in]** - finding ADV data type
- **length** –**[out]** - return the length of ADV data not including type

返回 pointer of ADV data

esp_err_t **esp_ble_gap_config_adv_data_raw**(uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw advertising data. User need to fill ADV data by self.

参数

- **raw_data** –**[in]** : raw advertising data
- **raw_data_len** –**[in]** : raw advertising data length , less than 31 bytes

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_scan_rsp_data_raw**(uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw scan response data. User need to fill scan response data by self.

参数

- **raw_data** –**[in]** : raw scan response data
- **raw_data_len** –**[in]** : raw scan response data length , less than 31 bytes

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_read_rssi**(*esp_bd_addr_t* remote_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

参数 **remote_addr** –**[in]** : The remote connection device address.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_add_duplicate_scan_exceptional_device**(*esp_ble_duplicate_exceptional_info_type_t* type, *esp_duplicate_info_t* device_info)

This function is called to add a device info into the duplicate scan exceptional list.

参数

- **type** –**[in]** device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.
- **device_info** –**[in]** the device information.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_remove_duplicate_scan_exceptional_device**(*esp_ble_duplicate_exceptional_info_type_t* type, *esp_duplicate_info_t* device_info)

This function is called to remove a device info from the duplicate scan exceptional list.

参数

- **type** –**[in]** device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.
- **device_info** –**[in]** the device information.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_clean_duplicate_scan_exceptional_list**(*esp_duplicate_scan_exceptional_list_type_t* list_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

参数 **list_type** –**[in]** duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_security_param**(*esp_ble_sm_param_t* param_type, void *value, uint8_t len)

Set a GAP security parameter value. Overrides the default value.

```
                Secure connection is highly recommended to avoid some major
                vulnerabilities like 'Impersonation in the Pin Pairing Protocol'
                (CVE-2020-26555) and 'Authentication of the LE Legacy Pairing
                Protocol'.

                To accept only `secure connection mode`, it is necessary do as␣
↪following:
```

(下页继续)

(续上页)

```
                1. Set bit `ESP_LE_AUTH_REQ_SC_ONLY` (`param_type` is
                `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit
                `ESP_LE_AUTH_REQ_MITM` is optional as required.

                2. Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` (`param_
↪type` is
                `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).
```

参数

- **param_type** –**[in]** : the type of the param which to be set
- **value** –**[in]** : the param value
- **len** –**[in]** : the length of the param value

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_security_rsp**(*esp_bd_addr_t* bd_addr, bool accept)

Grant security request access.

参数

- **bd_addr** –**[in]** : BD address of the peer
- **accept** –**[in]** : accept the security request or not

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_set_encryption**(*esp_bd_addr_t* bd_addr, *esp_ble_sec_act_t* sec_act)

Set a gap parameter value. Use this function to change the default GAP parameter values.

参数

- **bd_addr** –**[in]** : the address of the peer device need to encryption
- **sec_act** –**[in]** : This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_passkey_reply**(*esp_bd_addr_t* bd_addr, bool accept, uint32_t passkey)

Reply the key value to the peer device in the legacy connection stage.

参数

- **bd_addr** –**[in]** : BD address of the peer
- **accept** –**[in]** : passkey entry successful or declined.
- **passkey** –**[in]** : passkey value, must be a 6 digit number, can be lead by 0.

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_confirm_reply**(*esp_bd_addr_t* bd_addr, bool accept)

Reply the confirm value to the peer device in the secure connection stage.

参数

- **bd_addr** –**[in]** : BD address of the peer device
- **accept** –**[in]** : numbers to compare are the same or different.

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_remove_bond_device**(*esp_bd_addr_t* bd_addr)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

参数 **bd_addr** –**[in]** : BD address of the peer device

返回 - ESP_OK : success
- other : failed

int **esp_ble_get_bond_device_num**(void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

返回 - >= 0 : bonded devices number.
- ESP_FAIL : failed

esp_err_t **esp_ble_get_bond_device_list**(int *dev_num, *esp_ble_bond_dev_t* *dev_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

参数
- **dev_num** –**[inout]** Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- **dev_list** –**[out]** an array(buffer) of *esp_ble_bond_dev_t* type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_oob_req_reply**(*esp_bd_addr_t* bd_addr, uint8_t *TK, uint8_t len)

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

参数
- **bd_addr** –**[in]** BD address of the peer device.
- **TK** –**[in]** Temporary Key value, the TK value shall be a 128-bit random number
- **len** –**[in]** length of temporary key, should always be 128-bit

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_sc_oob_req_reply**(*esp_bd_addr_t* bd_addr, uint8_t p_c[16], uint8_t p_r[16])

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_SC_OOB_REQ_EVT.

参数
- **bd_addr** –**[in]** BD address of the peer device.
- **p_c** –**[in]** Confirmation value, it shall be a 128-bit random number
- **p_r** –**[in]** Randomizer value, it should be a 128-bit random number

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_create_sc_oob_data**(void)

This function is called to create the OOB data for SMP when secure connection.

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_disconnect**(*esp_bd_addr_t* remote_device)

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

参数 **remote_device** –**[in]** : BD address of the peer device

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_get_current_conn_params**(*esp_bd_addr_t* bd_addr, *esp_gap_conn_params_t* *conn_params)

This function is called to read the connection parameters information of the device.

参数

- **bd_addr** –**[in]** BD address of the peer device.
- **conn_params** –**[out]** the connection parameters information

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_gap_ble_set_channels**(*esp_gap_ble_channels* channels)

BLE set channels.

参数 **channels** –**[in]** : The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

返回 - ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

esp_err_t **esp_gap_ble_set_authorization**(*esp_bd_addr_t* bd_addr, bool authorize)

This function is called to authorized a link after Authentication(MITM protection)

参数
- **bd_addr** –**[in]** BD address of the peer device.
- **authorize** –**[out]** Authorized the link or not.

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_read_phy**(*esp_bd_addr_t* bd_addr)

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

参数 **bd_addr** –**[in]** : BD address of the peer device

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_preferred_default_phy**(*esp_ble_gap_phy_mask_t* tx_phy_mask, *esp_ble_gap_phy_mask_t* rx_phy_mask)

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

参数
- **tx_phy_mask** –**[in]** : indicates the transmitter PHYs that the Host prefers the Controller to use
- **rx_phy_mask** –**[in]** : indicates the receiver PHYs that the Host prefers the Controller to use

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_preferred_phy**(*esp_bd_addr_t* bd_addr, *esp_ble_gap_all_phys_t* all_phys_mask, *esp_ble_gap_phy_mask_t* tx_phy_mask, *esp_ble_gap_phy_mask_t* rx_phy_mask, *esp_ble_gap_prefer_phy_options_t* phy_options)

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

参数
- **bd_addr** –**[in]** : remote address
- **all_phys_mask** –**[in]** : a bit field that allows the Host to specify
- **tx_phy_mask** –**[in]** : a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- **rx_phy_mask** –**[in]** : a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- **phy_options** –**[in]** : a bit field that allows the Host to specify options for PHYs

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_rand_addr**(uint8_t instance, *esp_bd_addr_t* rand_addr)

This function is used by the Host to set the random device address specified by the Random_Address parameter.

参数
- **instance** –**[in]** : Used to identify an advertising set
- **rand_addr** –**[in]** : Random Device Address

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_params**(uint8_t instance, const *esp_ble_gap_ext_adv_params_t* *params)

This function is used by the Host to set the advertising parameters.

参数
- **instance** –**[in]** : identifies the advertising set whose parameters are being configured.
- **params** –**[in]** : advertising parameters

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_ext_adv_data_raw**(uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in advertising PDUs that have a data field.

参数
- **instance** –**[in]** : identifies the advertising set whose data are being configured
- **length** –**[in]** : data length
- **data** –**[in]** : data information

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_ext_scan_rsp_data_raw**(uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)

This function is used to provide scan response data used in scanning response PDUs.

参数
- **instance** –**[in]** : identifies the advertising set whose response data are being configured.
- **length** –**[in]** : responsedata length
- **scan_rsp_data** –**[in]** : response data information

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_ext_adv_start**(uint8_t num_adv, const *esp_ble_gap_ext_adv_t* *ext_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

参数
- **num_adv** –**[in]** : Number of advertising sets to enable or disable
- **ext_adv** –**[in]** : adv parameters

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_ext_adv_stop**(uint8_t num_adv, const uint8_t *ext_adv_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

参数
- **num_adv** –**[in]** : Number of advertising sets to enable or disable
- **ext_adv_inst** –**[in]** : ext adv instance

返回 - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_remove**(uint8_t instance)

This function is used to remove an advertising set from the Controller.

参数 **instance** –**[in]** : Used to identify an advertising set
返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_clear**(void)

This function is used to remove all existing advertising sets from the Controller.

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_periodic_adv_set_params**(uint8_t instance, const *esp_ble_gap_periodic_adv_params_t* *params)

This function is used by the Host to set the parameters for periodic advertising.

参数
- **instance** –**[in]** : identifies the advertising set whose periodic advertising parameters are being configured.
- **params** –**[in]** : periodic adv parameters

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_periodic_adv_data_raw**(uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in periodic advertising PDUs.

参数
- **instance** –**[in]** : identifies the advertising set whose periodic advertising parameters are being configured.
- **length** –**[in]** : the length of periodic data
- **data** –**[in]** : periodic data information

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_periodic_adv_start**(uint8_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

参数 **instance** –**[in]** : Used to identify an advertising set
返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_periodic_adv_stop**(uint8_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

参数 **instance** –**[in]** : Used to identify an advertising set
返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_ext_scan_params**(const *esp_ble_ext_scan_params_t* *params)

This function is used to set the extended scan parameters to be used on the advertising channels.

参数 **params** –**[in]** : scan parameters
返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_start_ext_scan**(uint32_t duration, uint16_t period)

This function is used to enable scanning.

参数
- **duration** –**[in]** : Scan duration

- **period** –**[in]** : Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_stop_ext_scan**(void)

This function is used to disable scanning.

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_periodic_adv_create_sync**(const *esp_ble_gap_periodic_adv_sync_params_t* *params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

参数 **params** –**[in]** : sync parameters
返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_periodic_adv_sync_cancel**(void)

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_periodic_adv_sync_terminate**(uint16_t sync_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

参数 **sync_handle** –**[in]** : identify the periodic advertiser
返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_periodic_adv_add_dev_to_list**(*esp_ble_addr_type_t* addr_type, *esp_bd_addr_t* addr, uint8_t sid)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

参数
- **addr_type** –**[in]** : address type
- **addr** –**[in]** : Device Address
- **sid** –**[in]** : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_periodic_adv_remove_dev_from_list**(*esp_ble_addr_type_t* addr_type, *esp_bd_addr_t* addr, uint8_t sid)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

参数
- **addr_type** –**[in]** : address type
- **addr** –**[in]** : Device Address
- **sid** –**[in]** : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_periodic_adv_clear_dev**(void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

返回 - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_prefer_ext_connect_params_set**(*esp_bd_addr_t* addr, *esp_ble_gap_phy_mask_t* phy_mask, const *esp_ble_gap_conn_params_t* *phy_1m_conn_params, const *esp_ble_gap_conn_params_t* *phy_2m_conn_params, const *esp_ble_gap_conn_params_t* *phy_coded_conn_params)

This function is used to set aux connection parameters.

参数

- **addr** –**[in]** : device address
- **phy_mask** –**[in]** : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- **phy_1m_conn_params** –**[in]** : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- **phy_2m_conn_params** –**[in]** : Connection parameters for the LE 2M PHY are provided.
- **phy_coded_conn_params** –**[in]** : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

返回 - ESP_OK : success

- other : failed

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate periodic advertising data set status

struct **ble_periodic_adv_report_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT.

Public Members

esp_ble_gap_periodic_adv_report_t **params**

periodic advertising report parameters

struct **ble_periodic_adv_set_params_cmpl_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate periodic advertisingparameters set status

struct **ble_periodic_adv_start_cmpl_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate periodic advertising start status

struct **ble_periodic_adv_stop_cmpl_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate periodic advertising stop status

struct **ble_periodic_adv_sync_estab_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTAB_EVT.

Public Members

uint8_t **status**

periodic advertising sync status

uint16_t **sync_handle**

periodic advertising sync handle

uint8_t **sid**

periodic advertising sid

esp_ble_addr_type_t **adv_addr_type**

periodic advertising address type

esp_bd_addr_t **adv_addr**

periodic advertising address

esp_ble_gap_phy_t **adv_phy**

periodic advertising phy type

uint16_t **period_adv_interval**

periodic advertising interval

uint8_t **adv_clk_accuracy**

periodic advertising clock accuracy

struct **ble_periodic_adv_sync_lost_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT.

Public Members

uint16_t **sync_handle**

sync handle

struct **ble_phy_update_cmpl_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

phy update status

esp_bd_addr_t **bda**

address

esp_ble_gap_phy_t **tx_phy**

tx phy type

esp_ble_gap_phy_t **rx_phy**

rx phy type

struct **ble_pkt_data_length_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the set pkt data length operation success status

esp_ble_pkt_data_length_params_t **params**

pkt data length value

struct **ble_read_phy_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_READ_PHY_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

read phy complete status

esp_bd_addr_t **bda**

read phy address

esp_ble_gap_phy_t **tx_phy**

tx phy type

esp_ble_gap_phy_t **rx_phy**

rx phy type

struct **ble_read_rssi_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the read adv tx power operation success status

int8_t **rssi**

The ble remote device rssi value, the range is from -127 to 20, the unit is dbm, if the RSSI cannot be read, the RSSI metric shall be set to 127.

esp_bd_addr_t **remote_addr**

The remote device address

struct **ble_remove_bond_dev_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the remove bond device operation success status

esp_bd_addr_t **bd_addr**

The device address which has been remove from the bond list

struct **ble_scan_param_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the set scan param operation success status

struct **ble_scan_req_received_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT.

Public Members

uint8_t **adv_instance**

extend advertising handle

esp_ble_addr_type_t **scan_addr_type**

scanner address type

esp_bd_addr_t **scan_addr**

scanner address

struct **ble_scan_result_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RESULT_EVT.

Public Members

esp_gap_search_evt_t **search_evt**

Search event type

esp_bd_addr_t **bda**

Bluetooth device address which has been searched

esp_bt_dev_type_t **dev_type**

Device type

esp_ble_addr_type_t **ble_addr_type**

Ble device address type

esp_ble_evt_type_t **ble_evt_type**

Ble scan result event type

int **rssi**

Searched device ' s RSSI

uint8_t **ble_adv**[ESP_BLE_ADV_DATA_LEN_MAX + ESP_BLE_SCAN_RSP_DATA_LEN_MAX]

Received EIR

int **flag**

Advertising data flag bit

int **num_resps**

Scan result number

uint8_t **adv_data_len**

Adv data length

uint8_t **scan_rsp_len**

Scan response length

uint32_t **num_dis**

The number of discard packets

struct **ble_scan_rsp_data_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the set scan response data operation success status

struct **ble_scan_rsp_data_raw_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the set raw advertising data operation success status

struct **ble_scan_start_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_START_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate scan start operation success status

struct **ble_scan_stop_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate scan stop operation success status

struct **ble_set_channels_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_CHANNELS_EVT.

Public Members

esp_bt_status_t **stat**

BLE set channel status

struct **ble_set_ext_scan_params_cmpl_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate extend advertising parameters set status

struct **ble_set_perf_def_phy_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate perf default phy set status

struct **ble_set_perf_phy_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate perf phy set status

struct **ble_set_rand_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.

Public Members

esp_bt_status_t **status**

Indicate set static rand address operation success status

struct **ble_update_conn_params_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT.

Public Members

esp_bt_status_t **status**

Indicate update connection parameters success status

esp_bd_addr_t **bda**

Bluetooth device address

uint16_t **min_int**

Min connection interval

uint16_t **max_int**

Max connection interval

uint16_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t **conn_int**

Current connection interval

uint16_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

struct **ble_update_duplicate_exceptional_list_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate update duplicate scan exceptional list operation success status

uint8_t **subcode**

Define in esp_bt_duplicate_exceptional_subcode_type_t

uint16_t **length**

The length of device_info

esp_duplicate_info_t **device_info**

device information, when subcode is ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN, the value is invalid

struct **ble_update_whitelist_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the add or remove whitelist operation success status

esp_ble_wl_operation_t **wl_operation**

The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

Structures

struct **esp_ble_adv_params_t**

Advertising parameters.

Public Members

uint16_t **adv_int_min**

Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t **adv_int_max**

Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval

esp_ble_adv_type_t **adv_type**

Advertising type

esp_ble_addr_type_t **own_addr_type**

Owner bluetooth device address type

esp_bd_addr_t **peer_addr**

Peer device bluetooth device address

esp_ble_addr_type_t **peer_addr_type**

Peer device bluetooth device address type, only support public address type and random address type

esp_ble_adv_channel_t **channel_map**

Advertising channel map

esp_ble_adv_filter_t **adv_filter_policy**

Advertising filter policy

struct **esp_ble_adv_data_t**

Advertising data content, according to "Supplement to the Bluetooth Core Specification".

Public Members

bool **set_scan_rsp**

Set this advertising data as scan response or not

bool **include_name**

Advertising data include device name or not

bool **include_txpower**

Advertising data include TX power

int **min_interval**

Advertising data show slave preferred connection min interval. The connection interval in the following manner: connIntervalmin = Conn_Interval_Min * 1.25 ms Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int **max_interval**

Advertising data show slave preferred connection max interval. The connection interval in the following manner: connIntervalmax = Conn_Interval_Max * 1.25 ms Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int **appearance**

External appearance of device

uint16_t **manufacturer_len**

Manufacturer data length

uint8_t ***p_manufacturer_data**

Manufacturer data point

uint16_t **service_data_len**

Service data length

uint8_t ***p_service_data**

Service data point

uint16_t **service_uuid_len**

Service uuid length

uint8_t ***p_service_uuid**

Service uuid array point

uint8_t **flag**

Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct **esp_ble_scan_params_t**

Ble scan parameters.

Public Members

esp_ble_scan_type_t **scan_type**

Scan type

esp_ble_addr_type_t **own_addr_type**

Owner address type

esp_ble_scan_filter_t **scan_filter_policy**

Scan filter policy

uint16_t **scan_interval**

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t **scan_window**

Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

esp_ble_scan_duplicate_t **scan_duplicate**

The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct **esp_gap_conn_params_t**

connection parameters information

Public Members

uint16_t **interval**

connection interval

uint16_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct **esp_ble_conn_update_params_t**

Connection update parameters.

Public Members

esp_bd_addr_t **bda**

Bluetooth device address

uint16_t **min_int**

Min connection interval

uint16_t **max_int**

Max connection interval

uint16_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct **esp_ble_pkt_data_length_params_t**

BLE pkt date length keys.

Public Members

uint16_t **rx_len**

pkt rx data length value

uint16_t **tx_len**

pkt tx data length value

struct **esp_ble_penc_keys_t**

BLE encryption keys.

Public Members

esp_bt_octet16_t **ltk**

The long term key

esp_bt_octet8_t **rand**

The random number

uint16_t **ediv**

The ediv value

uint8_t **sec_level**

The security level of the security link

uint8_t **key_size**

The key size(7~16) of the security link

struct **esp_ble_pcsrk_keys_t**

BLE CSRK keys.

Public Members

uint32_t **counter**

The counter

esp_bt_octet16_t **csrk**

The csrk key

uint8_t **sec_level**

The security level

struct **esp_ble_pid_keys_t**

BLE pid keys.

Public Members

esp_bt_octet16_t **irk**

The irk value

esp_ble_addr_type_t **addr_type**

The address type

esp_bd_addr_t **static_addr**

The static address

struct **esp_ble_lenc_keys_t**

BLE Encryption reproduction keys.

Public Members

esp_bt_octet16_t **ltk**

The long term key

uint16_t **div**

The div value

uint8_t **key_size**

The key size of the security link

uint8_t **sec_level**

The security level of the security link

struct **esp_ble_lcsrk_keys**

BLE SRK keys.

Public Members

uint32_t **counter**

The counter value

uint16_t **div**

The div value

uint8_t **sec_level**

The security level of the security link

esp_bt_octet16_t **csrk**

The csrk key value

struct **esp_ble_sec_key_notif_t**

Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

esp_bd_addr_t **bd_addr**

peer address

uint32_t **passkey**

the numeric value for comparison. If just_works, do not show this number to UI

struct **esp_ble_sec_req_t**

Structure of the security request.

Public Members

esp_bd_addr_t **bd_addr**

peer address

struct **esp_ble_bond_key_info_t**

struct type of the bond key information value

Public Members

esp_ble_key_mask_t **key_mask**

the key mask to indicate witch key is present

esp_ble_penc_keys_t **penc_key**

received peer encryption key

esp_ble_pcsrk_keys_t **pcsrk_key**

received peer device SRK

esp_ble_pid_keys_t **pid_key**

peer device ID key

struct **esp_ble_bond_dev_t**

struct type of the bond device value

Public Members

esp_bd_addr_t **bd_addr**

peer address

esp_ble_bond_key_info_t **bond_key**

the bond key information

struct **esp_ble_key_t**

union type of the security key value

Public Members

esp_bd_addr_t **bd_addr**

peer address

esp_ble_key_type_t **key_type**

key type of the security link

esp_ble_key_value_t **p_key_value**

the pointer to the key value

struct **esp_ble_local_id_keys_t**

structure type of the ble local id keys value

Public Members

esp_bt_octet16_t **ir**

the 16 bits of the ir value

esp_bt_octet16_t **irk**

the 16 bits of the ir key value

esp_bt_octet16_t **dhk**

the 16 bits of the dh key value

struct **esp_ble_local_oob_data_t**

structure type of the ble local oob data value

Public Members

esp_bt_octet16_t **oob_c**

the 128 bits of confirmation value

esp_bt_octet16_t **oob_r**

the 128 bits of randomizer value

struct **esp_ble_auth_cmpl_t**

Structure associated with ESP_AUTH_CMPL_EVT.

Public Members

esp_bd_addr_t **bd_addr**

BD address peer device.

bool **key_present**

Valid link key value in key element

esp_link_key **key**

Link key associated with peer device.

uint8_t **key_type**

The type of Link Key

bool **success**

TRUE of authentication succeeded, FALSE if failed.

uint8_t **fail_reason**

The HCI reason/error code for when success=FALSE

esp_ble_addr_type_t **addr_type**

Peer device address type

esp_bt_dev_type_t **dev_type**

Device type

esp_ble_auth_req_t **auth_mode**

authentication mode

struct **esp_ble_gap_ext_adv_params_t**

ext adv parameters

Public Members

esp_ble_ext_adv_type_mask_t **type**

ext adv type

uint32_t **interval_min**

ext adv minimum interval

uint32_t **interval_max**

ext adv maximum interval

esp_ble_adv_channel_t **channel_map**

ext adv channel map

esp_ble_addr_type_t **own_addr_type**

ext adv own address type

esp_ble_addr_type_t **peer_addr_type**

ext adv peer address type

esp_bd_addr_t **peer_addr**

ext adv peer address

esp_ble_adv_filter_t **filter_policy**

ext adv filter policy

int8_t **tx_power**

ext adv tx power

esp_ble_gap_pri_phy_t **primary_phy**

ext adv primary phy

uint8_t **max_skip**

ext adv maximum skip

esp_ble_gap_phy_t **secondary_phy**

ext adv secondary phy

uint8_t **sid**

ext adv sid

bool **scan_req_notif**

ext adv scan request event notify

struct **esp_ble_ext_scan_cfg_t**

ext scan config

Public Members

esp_ble_scan_type_t **scan_type**

ext scan type

uint16_t **scan_interval**

ext scan interval

uint16_t **scan_window**

ext scan window

struct **esp_ble_ext_scan_params_t**

ext scan parameters

Public Members

esp_ble_addr_type_t **own_addr_type**

ext scan own address type

esp_ble_scan_filter_t **filter_policy**

ext scan filter policy

esp_ble_scan_duplicate_t **scan_duplicate**

ext scan duplicate scan

esp_ble_ext_scan_cfg_mask_t **cfg_mask**

ext scan config mask

esp_ble_ext_scan_cfg_t **uncoded_cfg**

ext scan uncoded config parameters

esp_ble_ext_scan_cfg_t **coded_cfg**

ext scan coded config parameters

struct **esp_ble_gap_conn_params_t**

create extend connection parameters

Public Members

ESP_BLE_APPEARANCE_GENERIC_PHONE

relate to BTM_BLE_APPEARANCE_GENERIC_PHONE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_COMPUTER

relate to BTM_BLE_APPEARANCE_GENERIC_COMPUTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WATCH

relate to BTM_BLE_APPEARANCE_GENERIC_WATCH in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_SPORTS_WATCH

relate to BTM_BLE_APPEARANCE_SPORTS_WATCH in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CLOCK

relate to BTM_BLE_APPEARANCE_GENERIC_CLOCK in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_DISPLAY

relate to BTM_BLE_APPEARANCE_GENERIC_DISPLAY in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_REMOTE

relate to BTM_BLE_APPEARANCE_GENERIC_REMOTE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_EYEGLASSES

relate to BTM_BLE_APPEARANCE_GENERIC_EYEGLASSES in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_TAG

relate to BTM_BLE_APPEARANCE_GENERIC_TAG in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_KEYRING

relate to BTM_BLE_APPEARANCE_GENERIC_KEYRING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_MEDIA_PLAYER

relate to BTM_BLE_APPEARANCE_GENERIC_MEDIA_PLAYER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_BARCODE_SCANNER

relate to BTM_BLE_APPEARANCE_GENERIC_BARCODE_SCANNER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_THERMOMETER

relate to BTM_BLE_APPEARANCE_GENERIC_THERMOMETER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_THERMOMETER_EAR

relate to BTM_BLE_APPEARANCE_THERMOMETER_EAR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_HEART_RATE

relate to BTM_BLE_APPEARANCE_GENERIC_HEART_RATE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HEART_RATE_BELT

relate to BTM_BLE_APPEARANCE_HEART_RATE_BELT in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_BLOOD_PRESSURE

relate to BTM_BLE_APPEARANCE_GENERIC_BLOOD_PRESSURE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_BLOOD_PRESSURE_ARM

relate to BTM_BLE_APPEARANCE_BLOOD_PRESSURE_ARM in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_BLOOD_PRESSURE_WRIST

relate to BTM_BLE_APPEARANCE_BLOOD_PRESSURE_WRIST in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_HID

relate to BTM_BLE_APPEARANCE_GENERIC_HID in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_KEYBOARD

relate to BTM_BLE_APPEARANCE_HID_KEYBOARD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_MOUSE

relate to BTM_BLE_APPEARANCE_HID_MOUSE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_JOYSTICK

relate to BTM_BLE_APPEARANCE_HID_JOYSTICK in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_GAMEPAD

relate to BTM_BLE_APPEARANCE_HID_GAMEPAD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_DIGITIZER_TABLET

relate to BTM_BLE_APPEARANCE_HID_DIGITIZER_TABLET in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_CARD_READER

relate to BTM_BLE_APPEARANCE_HID_CARD_READER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_DIGITAL_PEN

relate to BTM_BLE_APPEARANCE_HID_DIGITAL_PEN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_BARCODE_SCANNER

relate to BTM_BLE_APPEARANCE_HID_BARCODE_SCANNER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_GLUCOSE

relate to BTM_BLE_APPEARANCE_GENERIC_GLUCOSE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WALKING

relate to BTM_BLE_APPEARANCE_GENERIC_WALKING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_IN_SHOE

relate to BTM_BLE_APPEARANCE_WALKING_IN_SHOE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_ON_SHOE

relate to BTM_BLE_APPEARANCE_WALKING_ON_SHOE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_ON_HIP

relate to BTM_BLE_APPEARANCE_WALKING_ON_HIP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CYCLING

relate to BTM_BLE_APPEARANCE_GENERIC_CYCLING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_COMPUTER

relate to BTM_BLE_APPEARANCE_CYCLING_COMPUTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_SPEED

relate to BTM_BLE_APPEARANCE_CYCLING_SPEED in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_CADENCE

relate to BTM_BLE_APPEARANCE_CYCLING_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_POWER

relate to BTM_BLE_APPEARANCE_CYCLING_POWER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_SPEED_CADENCE

relate to BTM_BLE_APPEARANCE_CYCLING_SPEED_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER

relate to BTM_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP

relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_PULSE_OXIMETER_WRIST

relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_WRIST in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WEIGHT

relate to BTM_BLE_APPEARANCE_GENERIC_WEIGHT in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE

relate to BTM_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_POWERED_WHEELCHAIR

relate to BTM_BLE_APPEARANCE_POWERED_WHEELCHAIR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_MOBILITY_SCOOTER

relate to BTM_BLE_APPEARANCE_MOBILITY_SCOOTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CONTINUOUS_GLUCOSE_MONITOR

relate to BTM_BLE_APPEARANCE_GENERIC_CONTINUOUS_GLUCOSE_MONITOR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_INSULIN_PUMP

relate to BTM_BLE_APPEARANCE_GENERIC_INSULIN_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP

relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP

relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PEN

relate to BTM_BLE_APPEARANCE_INSULIN_PEN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY

relate to BTM_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS

relate to BTM_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV in stack/btm_ble_api.h

ESP_GAP_BLE_CHANNELS_LEN

channel length

ESP_GAP_BLE_ADD_WHITELIST_COMPLETE_EVT

This is the old name, just for backwards compatibility.

ESP_BLE_ADV_DATA_LEN_MAX

Advertising data maximum length.

ESP_BLE_SCAN_RSP_DATA_LEN_MAX

Scan response data maximum length.

BLE_BIT(n)

ESP_BLE_GAP_SET_EXT_ADV_PROP_NONCONN_NONSCANNABLE_UNDIRECTED

Non-Connectable and Non-Scannable Undirected advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_CONNECTABLE

Connectable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_SCANNABLE

Scannable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_DIRECTED

Directed advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_HD_DIRECTED

High Duty Cycle Directed Connectable advertising (<= 3.75 ms Advertising Interval)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY

Use legacy advertising PDUs

ESP_BLE_GAP_SET_EXT_ADV_PROP_ANON_ADV

Omit advertiser’ s address from all PDUs (“anonymous advertising”)

ESP_BLE_GAP_SET_EXT_ADV_PROP_INCLUDE_TX_PWR

Include TxPower in the extended header of the advertising PDU

ESP_BLE_GAP_SET_EXT_ADV_PROP_MASK

Reserved for future use If extended advertising PDU types are being used (bit 4 = 0) then: The advertisement shall not be both connectable and scannable. High duty cycle directed connectable advertising (<= 3.75 ms advertising interval) shall not be used (bit 3 = 0) ADV_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_IND

ADV_DIRECT_IND (low duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_LD_DIR

ADV_DIRECT_IND (high duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_HD_DIR

ADV_SCAN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_SCAN

ADV_NONCONN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_NONCONN

ESP_BLE_GAP_PHY_1M

Secondery Advertisement PHY is LE1M

ESP_BLE_GAP_PHY_2M

Secondery Advertisement PHY is LE2M

ESP_BLE_GAP_PHY_CODED

Secondery Advertisement PHY is LE Coded

ESP_BLE_GAP_NO_PREFER_TRANSMIT_PHY

No Prefer TX PHY supported by controller

ESP_BLE_GAP_NO_PREFER_RECEIVE_PHY

No Prefer RX PHY supported by controller

ESP_BLE_GAP_PRI_PHY_1M

Primary phy only support 1M and LE coded phy.

Primary Phy is LE1M

ESP_BLE_GAP_PRI_PHY_CODED

Primary Phy is LE CODED

ESP_BLE_GAP_PHY_1M_PREF_MASK

The Host prefers use the LE1M transmitter or reciever PHY

ESP_BLE_GAP_PHY_2M_PREF_MASK

The Host prefers use the LE2M transmitter or reciever PHY

ESP_BLE_GAP_PHY_CODED_PREF_MASK

The Host prefers use the LE CODED transmitter or reciever PHY

ESP_BLE_GAP_PHY_OPTIONS_NO_PREF

The Host has no preferred coding when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S2_CODING

The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S8_CODING

The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_EXT_SCAN_CFG_UNCODE_MASK

Scan Advertisements on the LE1M PHY

ESP_BLE_GAP_EXT_SCAN_CFG_CODE_MASK

Scan advertisements on the LE coded PHY

ESP_BLE_GAP_EXT_ADV_DATA_COMPLETE

Advertising data.

extended advertising data compete

ESP_BLE_GAP_EXT_ADV_DATA_INCOMPLETE

extended advertising data incomplete

ESP_BLE_GAP_EXT_ADV_DATA_TRUNCATED

extended advertising data truncated mode

ESP_BLE_GAP_SYNC_POLICY_BY_ADV_INFO

Advertising SYNC policy.

sync policy by advertising info

ESP_BLE_GAP_SYNC_POLICY_BY_PERIODIC_LIST

periodic advertising sync policy

ESP_BLE_ADV_REPORT_EXT_ADV_IND

Advertising report.

advertising report with extended advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_IND

advertising report with extended scan indication type

ESP_BLE_ADV_REPORT_EXT_DIRECT_ADV

advertising report with extended direct advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_RSP
advertising report with extended scan response indication type Bluetooth 5.0, Vol 2, Part E, 7.7.65.13

ESP_BLE_LEGACY_ADV_TYPE_IND
advertising report with legacy advertising indication type

ESP_BLE_LEGACY_ADV_TYPE_DIRECT_IND
advertising report with legacy direct indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_IND
advertising report with legacy scan indication type

ESP_BLE_LEGACY_ADV_TYPE_NONCON_IND
advertising report with legacy non connectable indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_IND
advertising report with legacy scan response indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_SCAN_IND
advertising report with legacy advertising with scan response indication type

EXT_ADV_TX_PWR_NO_PREFERENCE
Extend advertising tx power, range: [-127, +126] dBm.

host has no preference for tx power

Type Definitions

typedef uint8_t **esp_ble_key_type_t**

typedef uint8_t **esp_ble_auth_req_t**
combination of the above bit pattern

typedef uint8_t **esp_ble_io_cap_t**
combination of the io capability

typedef uint8_t **esp_gap_ble_channels**[ESP_GAP_BLE_CHANNELS_LEN]

typedef uint8_t **esp_duplicate_info_t**[ESP_BD_ADDR_LEN]

typedef uint16_t **esp_ble_ext_adv_type_mask_t**

typedef uint8_t **esp_ble_gap_phy_t**

typedef uint8_t **esp_ble_gap_all_phys_t**

typedef uint8_t **esp_ble_gap_pri_phy_t**

typedef uint8_t **esp_ble_gap_phy_mask_t**

typedef uint16_t **esp_ble_gap_prefer_phy_options_t**

typedef uint8_t **esp_ble_ext_scan_cfg_mask_t**

typedef uint8_t **esp_ble_gap_ext_adv_data_status_t**

typedef uint8_t **esp_ble_gap_sync_t**

typedef uint8_t **esp_ble_gap_adv_type_t**

typedef void (***esp_gap_ble_cb_t**)(*esp_gap_ble_cb_event_t* event, *esp_ble_gap_cb_param_t* *param)

GAP callback function type.

Param event : Event type
Param param : Point to callback parameter, currently is union type

Enumerations

enum **esp_gap_ble_cb_event_t**

GAP BLE callback event type.

Values:

enumerator **ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT**

When advertising data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT**

When scan response data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT**

When scan parameters set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RESULT_EVT**

When one scan result ready, the event comes each time

enumerator **ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT**

When raw advertising data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT**

When raw advertising data set complete, the event comes

enumerator **ESP_GAP_BLE_ADV_START_COMPLETE_EVT**

When start advertising complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_START_COMPLETE_EVT**

When start scan complete, the event comes

enumerator **ESP_GAP_BLE_AUTH_CMPL_EVT**

Authentication complete indication.

enumerator **ESP_GAP_BLE_KEY_EVT**

BLE key event for peer device keys

enumerator **ESP_GAP_BLE_SEC_REQ_EVT**

BLE security request

enumerator **ESP_GAP_BLE_PASSKEY_NOTIF_EVT**

passkey notification event

enumerator **ESP_GAP_BLE_PASSKEY_REQ_EVT**

passkey request event

enumerator **ESP_GAP_BLE_OOB_REQ_EVT**

OOB request event

enumerator **ESP_GAP_BLE_LOCAL_IR_EVT**

BLE local IR (identity Root 128-bit random static value used to generate Long Term Key) event

enumerator **ESP_GAP_BLE_LOCAL_ER_EVT**

BLE local ER (Encryption Root vakue used to genrate identity resolving key) event

enumerator **ESP_GAP_BLE_NC_REQ_EVT**

Numeric Comparison request event

enumerator **ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT**

When stop adv complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT**

When stop scan complete, the event comes

enumerator **ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT**

When set the static rand address complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT**

When update connection parameters complete, the event comes

enumerator **ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT**

When set pkt length complete, the event comes

enumerator **ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT**

When Enable/disable privacy on the local device complete, the event comes

enumerator **ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT**

When remove the bond device complete, the event comes

enumerator **ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT**

When clear the bond device clear complete, the event comes

enumerator **ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT**

When get the bond device list complete, the event comes

enumerator **ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT**

When read the rssi complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT**

When add or remove whitelist complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT**

When update duplicate exceptional list complete, the event comes

enumerator **ESP_GAP_BLE_SET_CHANNELS_EVT**

When setting BLE channels complete, the event comes

enumerator **ESP_GAP_BLE_READ_PHY_COMPLETE_EVT**

when reading phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT**

when preferred default phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT**

when preferred phy complete , this event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT**

when extended set random address complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_PARAMS_COMPLETE_EVT**

when extended advertising parameter complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_DATA_SET_COMPLETE_EVT**

when extended advertising data complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_RSP_DATA_SET_COMPLETE_EVT**

when extended scan response data complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_START_COMPLETE_EVT**

when extended advertising start complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_STOP_COMPLETE_EVT**

when extended advertising stop complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_REMOVE_COMPLETE_EVT**

when extended advertising set remove complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_CLEAR_COMPLETE_EVT**

when extended advertising set clear complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT**

when periodic advertising parameter complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT**

when periodic advertising data complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT**

when periodic advertising start complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT**

when periodic advertising stop complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_CREATE_SYNC_COMPLETE_EVT**

when periodic advertising create sync complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_CANCEL_COMPLETE_EVT**

when extended advertising sync cancel complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_TERMINATE_COMPLETE_EVT**

when extended advertising sync terminate complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_ADD_DEV_COMPLETE_EVT**

when extended advertising add device complete , the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_REMOVE_DEV_COMPLETE_EVT**

when extended advertising remove device complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_CLEAR_DEV_COMPLETE_EVT**

when extended advertising clear device, the event comes

enumerator **ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT**

when extended scan parameter complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_START_COMPLETE_EVT**

when extended scan start complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_STOP_COMPLETE_EVT**

when extended scan stop complete, the event comes

enumerator **ESP_GAP_BLE_PREFER_EXT_CONN_PARAMS_SET_COMPLETE_EVT**

when extended prefer connection parameter set complete, the event comes

enumerator **ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT**

when ble phy update complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_REPORT_EVT**

when extended advertising report complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_TIMEOUT_EVT**
when scan timeout complete, the event comes

enumerator **ESP_GAP_BLE_ADV_TERMINATED_EVT**
when advertising terminate data complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT**
when scan req received complete, the event comes

enumerator **ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT**
when channel select algorithm complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT**
when periodic report advertising complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT**
when periodic advertising sync lost complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTAB_EVT**
when periodic advertising sync establish complete, the event comes

enumerator **ESP_GAP_BLE_SC_OOB_REQ_EVT**
Secure Connection OOB request event

enumerator **ESP_GAP_BLE_SC_CR_LOC_OOB_EVT**
Secure Connection create OOB data complete event

enumerator **ESP_GAP_BLE_GET_DEV_NAME_COMPLETE_EVT**
When getting BT device name complete, the event comes

enumerator **ESP_GAP_BLE_EVT_MAX**
when maximum advertising event complete, the event comes

enum **esp_ble_adv_data_type**
The type of advertising data(not adv_type)

Values:

enumerator **ESP_BLE_AD_TYPE_FLAG**

enumerator **ESP_BLE_AD_TYPE_16SRV_PART**

enumerator **ESP_BLE_AD_TYPE_16SRV_CMPL**

enumerator **ESP_BLE_AD_TYPE_32SRV_PART**

enumerator **ESP_BLE_AD_TYPE_32SRV_CMPL**

enumerator **ESP_BLE_AD_TYPE_128SRV_PART**

enumerator **ESP_BLE_AD_TYPE_128SRV_CMPL**

enumerator **ESP_BLE_AD_TYPE_NAME_SHORT**

enumerator **ESP_BLE_AD_TYPE_NAME_CMPL**

enumerator **ESP_BLE_AD_TYPE_TX_PWR**

enumerator **ESP_BLE_AD_TYPE_DEV_CLASS**

enumerator **ESP_BLE_AD_TYPE_SM_TK**

enumerator **ESP_BLE_AD_TYPE_SM_OOB_FLAG**

enumerator **ESP_BLE_AD_TYPE_INT_RANGE**

enumerator **ESP_BLE_AD_TYPE_SOL_SRV_UUID**

enumerator **ESP_BLE_AD_TYPE_128SOL_SRV_UUID**

enumerator **ESP_BLE_AD_TYPE_SERVICE_DATA**

enumerator **ESP_BLE_AD_TYPE_PUBLIC_TARGET**

enumerator **ESP_BLE_AD_TYPE_RANDOM_TARGET**

enumerator **ESP_BLE_AD_TYPE_APPEARANCE**

enumerator **ESP_BLE_AD_TYPE_ADV_INT**

enumerator **ESP_BLE_AD_TYPE_LE_DEV_ADDR**

enumerator **ESP_BLE_AD_TYPE_LE_ROLE**

enumerator **ESP_BLE_AD_TYPE_SPAIR_C256**

enumerator **ESP_BLE_AD_TYPE_SPAIR_R256**

enumerator **ESP_BLE_AD_TYPE_32SOL_SRV_UUID**

enumerator **ESP_BLE_AD_TYPE_32SERVICE_DATA**

enumerator **ESP_BLE_AD_TYPE_128SERVICE_DATA**

enumerator **ESP_BLE_AD_TYPE_LE_SECURE_CONFIRM**

enumerator **ESP_BLE_AD_TYPE_LE_SECURE_RANDOM**

enumerator **ESP_BLE_AD_TYPE_URI**

enumerator **ESP_BLE_AD_TYPE_INDOOR_POSITION**

enumerator **ESP_BLE_AD_TYPE_TRANS_DISC_DATA**

enumerator **ESP_BLE_AD_TYPE_LE_SUPPORT_FEATURE**

enumerator **ESP_BLE_AD_TYPE_CHAN_MAP_UPDATE**

enumerator **ESP_BLE_AD_MANUFACTURER_SPECIFIC_TYPE**

enum **esp_ble_adv_type_t**

Advertising mode.

Values:

enumerator **ADV_TYPE_IND**

enumerator **ADV_TYPE_DIRECT_IND_HIGH**

enumerator **ADV_TYPE_SCAN_IND**

enumerator **ADV_TYPE_NONCONN_IND**

enumerator **ADV_TYPE_DIRECT_IND_LOW**

enum **esp_ble_adv_channel_t**

Advertising channel mask.

Values:

enumerator **ADV_CHNL_37**

enumerator **ADV_CHNL_38**

enumerator **ADV_CHNL_39**

enumerator **ADV_CHNL_ALL**

enum **esp_ble_adv_filter_t**

Values:

enumerator **ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY**

Allow both scan and connection requests from anyone.

enumerator **ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY**

Allow both scan req from White List devices only and connection req from anyone.

enumerator **ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST**

Allow both scan req from anyone and connection req from White List devices only.

enumerator **ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST**

Allow scan and connection requests from White List devices only.

enum **esp_ble_sec_act_t**

Values:

enumerator **ESP_BLE_SEC_ENCRYPT**

relate to BTA_DM_BLE_SEC_ENCRYPT in bta/bta_api.h. If the device has already bonded, the stack will used Long Term Key (LTK) to encrypt with the remote device directly. Else if the device hasn't bonded, the stack will used the default authentication request used the esp_ble_gap_set_security_param function set by the user.

enumerator **ESP_BLE_SEC_ENCRYPT_NO_MITM**

relate to BTA_DM_BLE_SEC_ENCRYPT_NO_MITM in bta/bta_api.h. If the device has been already bonded, the stack will check the LTK (Long Term Key) Whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn't been bonded, the stack will use NO MITM authentication request in the current link instead of using the authreq in the esp_ble_gap_set_security_param function set by the user.

enumerator **ESP_BLE_SEC_ENCRYPT_MITM**

relate to BTA_DM_BLE_SEC_ENCRYPT_MITM in bta/bta_api.h. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn't been bonded, the stack will use MITM authentication request in the current link instead of using the authreq in the esp_ble_gap_set_security_param function set by the user.

enum **esp_ble_sm_param_t**

Values:

enumerator **ESP_BLE_SM_PASSKEY**

Authentication requirements of local device

enumerator **ESP_BLE_SM_AUTHEN_REQ_MODE**

The IO capability of local device

enumerator **ESP_BLE_SM_IOCAP_MODE**

Initiator Key Distribution/Generation

enumerator **ESP_BLE_SM_SET_INIT_KEY**

Responder Key Distribution/Generation

enumerator **ESP_BLE_SM_SET_RSP_KEY**

Maximum Encryption key size to support

enumerator **ESP_BLE_SM_MAX_KEY_SIZE**

Minimum Encryption key size requirement from Peer

enumerator **ESP_BLE_SM_MIN_KEY_SIZE**

Set static Passkey

enumerator **ESP_BLE_SM_SET_STATIC_PASSKEY**

Reset static Passkey

enumerator **ESP_BLE_SM_CLEAR_STATIC_PASSKEY**

Accept only specified SMP Authentication requirement

enumerator **ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH**

Enable/Disable OOB support

enumerator **ESP_BLE_SM_OOB_SUPPORT**

Appl encryption key size

enumerator **ESP_BLE_APP_ENC_KEY_SIZE**

authentication max param

enumerator **ESP_BLE_SM_MAX_PARAM**

enum **esp_ble_scan_type_t**

Ble scan type.

Values:

enumerator **BLE_SCAN_TYPE_PASSIVE**

Passive scan

enumerator **BLE_SCAN_TYPE_ACTIVE**

Active scan

enum **esp_ble_scan_filter_t**

Ble scan filter type.

Values:

enumerator **BLE_SCAN_FILTER_ALLOW_ALL**

Accept all :

i. advertisement packets except directed advertising packets not addressed to this device (default).

enumerator **BLE_SCAN_FILTER_ALLOW_ONLY_WLST**

Accept only :

i. advertisement packets from devices where the advertiser’ s address is in the White list.
ii. Directed advertising packets which are not addressed for this device shall be ignored.

enumerator **BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR**

Accept all :

i. undirected advertisement packets, and
ii. directed advertising packets where the initiator address is a resolvable private address, and
iii. directed advertising packets addressed to this device.

enumerator **BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR**

Accept all :

i. advertisement packets from devices where the advertiser’ s address is in the White list, and
ii. directed advertising packets where the initiator address is a resolvable private address, and
iii. directed advertising packets addressed to this device.

enum **esp_ble_scan_duplicate_t**

Ble scan duplicate type.

Values:

enumerator **BLE_SCAN_DUPLICATE_DISABLE**

the Link Layer should generate advertising reports to the host for each packet received

enumerator **BLE_SCAN_DUPLICATE_ENABLE**

the Link Layer should filter out duplicate advertising reports to the Host

enumerator **BLE_SCAN_DUPLICATE_MAX**

0x02 –0xFF, Reserved for future use

enum **esp_gap_search_evt_t**

Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

enumerator **ESP_GAP_SEARCH_INQ_RES_EVT**

Inquiry result for a peer device.

enumerator **ESP_GAP_SEARCH_INQ_CMPL_EVT**

Inquiry complete.

enumerator **ESP_GAP_SEARCH_DISC_RES_EVT**

Discovery result for a peer device.

enumerator **ESP_GAP_SEARCH_DISC_BLE_RES_EVT**

Discovery result for BLE GATT based service on a peer device.

enumerator **ESP_GAP_SEARCH_DISC_CMPL_EVT**

Discovery complete.

enumerator **ESP_GAP_SEARCH_DI_DISC_CMPL_EVT**

Discovery complete.

enumerator **ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT**

Search cancelled

enumerator **ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT**

The number of pkt discarded by flow control

enum **esp_ble_evt_type_t**

Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:

enumerator **ESP_BLE_EVT_CONN_ADV**

Connectable undirected advertising (ADV_IND)

enumerator **ESP_BLE_EVT_CONN_DIR_ADV**

Connectable directed advertising (ADV_DIRECT_IND)

enumerator **ESP_BLE_EVT_DISC_ADV**

Scannable undirected advertising (ADV_SCAN_IND)

enumerator **ESP_BLE_EVT_NON_CONN_ADV**

Non connectable undirected advertising (ADV_NONCONN_IND)

enumerator **ESP_BLE_EVT_SCAN_RSP**

Scan Response (SCAN_RSP)

enum **esp_ble_wl_operation_t**

Values:

enumerator **ESP_BLE_WHITELIST_REMOVE**

remove mac from whitelist

enumerator **ESP_BLE_WHITELIST_ADD**

add address to whitelist

enumerator **ESP_BLE_WHITELIST_CLEAR**

clear all device in whitelist

enum **esp_bt_duplicate_exceptional_subcode_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD**

Add device info into duplicate scan exceptional list

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE**

Remove device info from duplicate scan exceptional list

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN**

Clean duplicate scan exceptional list

enum **esp_ble_duplicate_exceptional_info_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR**

BLE advertising address , device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID**

BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE**

BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV**

BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ···. |‘

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV**

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ···. |‘

enum **esp_duplicate_scan_exceptional_list_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST**

duplicate scan exceptional addr list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST**

duplicate scan exceptional mesh link ID list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST**

duplicate scan exceptional mesh beacon type list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST**

duplicate scan exceptional all list

GATT DEFINES

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h

Unions

union **esp_gatt_rsp_t**

#include <esp_gatt_defs.h> GATT remote read request response type.

Public Members

esp_gatt_value_t **attr_value**

Gatt attribute structure

uint16_t **handle**

Gatt attribute handle

Structures

struct **esp_gatt_id_t**

Gatt id, include uuid and instance id.

Public Members

esp_bt_uuid_t **uuid**

UUID

uint8_t **inst_id**

Instance id

struct **esp_gatt_srvc_id_t**

Gatt service id, include id (uuid and instance id) and primary flag.

Public Members

esp_gatt_id_t **id**

Gatt id, include uuid and instance

bool **is_primary**

This service is primary or not

struct **esp_attr_desc_t**

Attribute description (used to create database)

Public Members

uint16_t **uuid_length**

UUID length

uint8_t ***uuid_p**

UUID value

uint16_t **perm**

Attribute permission

uint16_t **max_length**

Maximum length of the element

uint16_t **length**

Current length of the element

uint8_t ***value**

Element value array

struct **esp_attr_control_t**

attribute auto response flag

Public Members

uint8_t **auto_rsp**

if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will by replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

struct **esp_gatts_attr_db_t**

attribute type added to the gatt server database

Public Members

esp_attr_control_t **attr_control**

The attribute control type

esp_attr_desc_t **att_desc**

The attribute type

struct **esp_attr_value_t**

set the attribute value type

Public Members

uint16_t **attr_max_len**

attribute max value length

uint16_t **attr_len**

attribute current value length

uint8_t ***attr_value**

the pointer to attribute value

struct **esp_gatts_incl_svc_desc_t**

Gatt include service entry element.

Public Members

uint16_t **start_hdl**

Gatt start handle value of included service

uint16_t **end_hdl**

Gatt end handle value of included service

uint16_t **uuid**

Gatt attribute value UUID of included service

struct **esp_gatts_incl128_svc_desc_t**

Gatt include 128 bit service entry element.

Public Members

uint16_t **start_hdl**

Gatt start handle value of included 128 bit service

uint16_t **end_hdl**

Gatt end handle value of included 128 bit service

struct **esp_gatt_value_t**

Gatt attribute value.

Public Members

uint8_t **value**[ESP_GATT_MAX_ATTR_LEN]

Gatt attribute value

uint16_t **handle**

Gatt attribute handle

uint16_t **offset**

Gatt attribute value offset

uint16_t **len**

Gatt attribute value length

uint8_t **auth_req**

Gatt authentication request

struct **esp_gatt_conn_params_t**

Connection parameters information.

Public Members

uint16_t **interval**

connection interval

uint16_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct **esp_gattc_multi_t**

read multiple attribute

Public Members

uint8_t **num_attr**

The number of the attribute

uint16_t **handles**[ESP_GATT_MAX_READ_MULTI_HANDLES]

The handles list

struct **esp_gattc_db_elem_t**

data base attribute element

Public Members

esp_gatt_db_attr_type_t **type**

The attribute type

uint16_t **attribute_handle**

The attribute handle, it's valid for all of the type

uint16_t **start_handle**

The service start handle, it's valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

uint16_t **end_handle**

The service end handle, it's valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

esp_gatt_char_prop_t **properties**

The characteristic properties, it's valid only when the type = ESP_GATT_DB_CHARACTERISTIC

esp_bt_uuid_t **uuid**

The attribute uuid, it's valid for all of the type

struct **esp_gattc_service_elem_t**

service element

Public Members

bool **is_primary**

The service flag, true if the service is primary service, else is secondary service

uint16_t **start_handle**

The start handle of the service

uint16_t **end_handle**

The end handle of the service

esp_bt_uuid_t **uuid**

The uuid of the service

struct **esp_gattc_char_elem_t**

characteristic element

Public Members

uint16_t **char_handle**

The characteristic handle

esp_gatt_char_prop_t **properties**

The characteristic properties

esp_bt_uuid_t **uuid**

The characteristic uuid

struct **esp_gattc_descr_elem_t**

descriptor element

Public Members

uint16_t **handle**

The characteristic descriptor handle

esp_bt_uuid_t **uuid**

The characteristic descriptor uuid

struct **esp_gattc_incl_svc_elem_t**

include service element

Public Members

uint16_t **handle**

The include service current attribute handle

uint16_t **incl_srvc_s_handle**

The start handle of the service which has been included

uint16_t **incl_srvc_e_handle**

The end handle of the service which has been included

esp_bt_uuid_t **uuid**

The include service uuid

ESP_GATT_MAX_ATTR_LEN

GATT maximum attribute length.

ESP_GATT_RSP_BY_APP

ESP_GATT_AUTO_RSP

ESP_GATT_IF_NONE

If callback report gattc_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions

typedef uint16_t **esp_gatt_perm_t**

typedef uint8_t **esp_gatt_char_prop_t**

typedef uint8_t **esp_gatt_if_t**

Gatt interface type, different application on GATT client use different gatt_if

Enumerations

enum **esp_gatt_prep_write_type**

Attribute write data type from the client.

Values:

enumerator **ESP_GATT_PREP_WRITE_CANCEL**

Prepare write cancel

enumerator **ESP_GATT_PREP_WRITE_EXEC**

Prepare write execute

enum **esp_gatt_status_t**

GATT success code and error codes.

Values:

enumerator **ESP_GATT_OK**

enumerator **ESP_GATT_INVALID_HANDLE**

enumerator **ESP_GATT_READ_NOT_PERMIT**

enumerator **ESP_GATT_WRITE_NOT_PERMIT**

enumerator **ESP_GATT_INVALID_PDU**

enumerator **ESP_GATT_INSUF_AUTHENTICATION**

enumerator **ESP_GATT_REQ_NOT_SUPPORTED**

enumerator **ESP_GATT_INVALID_OFFSET**

enumerator **ESP_GATT_INSUF_AUTHORIZATION**

enumerator **ESP_GATT_PREPARE_Q_FULL**

enumerator **ESP_GATT_NOT_FOUND**

enumerator **ESP_GATT_NOT_LONG**

enumerator **ESP_GATT_INSUF_KEY_SIZE**

enumerator **ESP_GATT_INVALID_ATTR_LEN**

enumerator **ESP_GATT_ERR_UNLIKELY**

enumerator **ESP_GATT_INSUF_ENCRYPTION**

enumerator **ESP_GATT_UNSUPPORT_GRP_TYPE**

enumerator **ESP_GATT_INSUF_RESOURCE**

enumerator **ESP_GATT_NO_RESOURCES**

enumerator **ESP_GATT_INTERNAL_ERROR**

enumerator **ESP_GATT_WRONG_STATE**

enumerator **ESP_GATT_DB_FULL**

enumerator **ESP_GATT_BUSY**

enumerator **ESP_GATT_ERROR**

enumerator **ESP_GATT_CMD_STARTED**

enumerator **ESP_GATT_ILLEGAL_PARAMETER**

enumerator **ESP_GATT_PENDING**

enumerator **ESP_GATT_AUTH_FAIL**

enumerator **ESP_GATT_MORE**

enumerator **ESP_GATT_INVALID_CFG**

enumerator **ESP_GATT_SERVICE_STARTED**

enumerator **ESP_GATT_ENCRYPTED_MITM**

enumerator **ESP_GATT_ENCRYPTED_NO_MITM**

enumerator **ESP_GATT_NOT_ENCRYPTED**

enumerator **ESP_GATT_CONGESTED**

enumerator **ESP_GATT_DUP_REG**

enumerator **ESP_GATT_ALREADY_OPEN**

enumerator **ESP_GATT_CANCEL**

enumerator **ESP_GATT_STACK_RSP**

enumerator **ESP_GATT_APP_RSP**

enumerator **ESP_GATT_UNKNOWN_ERROR**

enumerator **ESP_GATT_CCC_CFG_ERR**

enumerator **ESP_GATT_PRC_IN_PROGRESS**

enumerator **ESP_GATT_OUT_OF_RANGE**

enum **esp_gatt_conn_reason_t**

Gatt Connection reason enum.

Values:

enumerator **ESP_GATT_CONN_UNKNOWN**

Gatt connection unknown

enumerator **ESP_GATT_CONN_L2C_FAILURE**

General L2cap failure

enumerator **ESP_GATT_CONN_TIMEOUT**

Connection timeout

enumerator **ESP_GATT_CONN_TERMINATE_PEER_USER**

Connection terminate by peer user

enumerator **ESP_GATT_CONN_TERMINATE_LOCAL_HOST**

Connection terminated by local host

enumerator **ESP_GATT_CONN_FAIL_ESTABLISH**

Connection fail to establish

enumerator **ESP_GATT_CONN_LMP_TIMEOUT**

Connection fail for LMP response tout

enumerator **ESP_GATT_CONN_CONN_CANCEL**

L2CAP connection cancelled

enumerator **ESP_GATT_CONN_NONE**

No connection to cancel

enum **esp_gatt_auth_req_t**

Gatt authentication request type.

Values:

enumerator **ESP_GATT_AUTH_REQ_NONE**

enumerator **ESP_GATT_AUTH_REQ_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_MITM**

enum **esp_service_source_t**

Values:

enumerator **ESP_GATT_SERVICE_FROM_REMOTE_DEVICE**

enumerator **ESP_GATT_SERVICE_FROM_NVS_FLASH**

enumerator **ESP_GATT_SERVICE_FROM_UNKNOWN**

enum **esp_gatt_write_type_t**

Gatt write type.

Values:

enumerator **ESP_GATT_WRITE_TYPE_NO_RSP**

Gatt write attribute need no response

enumerator **ESP_GATT_WRITE_TYPE_RSP**

Gatt write attribute need remote response

enum **esp_gatt_db_attr_type_t**

the type of attribute element

Values:

enumerator **ESP_GATT_DB_PRIMARY_SERVICE**

Gattc primary service attribute type in the cache

enumerator **ESP_GATT_DB_SECONDARY_SERVICE**

Gattc secondary service attribute type in the cache

enumerator **ESP_GATT_DB_CHARACTERISTIC**

Gattc characteristic attribute type in the cache

enumerator **ESP_GATT_DB_DESCRIPTOR**

Gattc characteristic descriptor attribute type in the cache

enumerator **ESP_GATT_DB_INCLUDED_SERVICE**

Gattc include service attribute type in the cache

enumerator **ESP_GATT_DB_ALL**

Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

GATT SERVER API

Application Example Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - bluetooth/bluedroid/ble/gatt_server_service_table
  - GATT Server Service Table Example Walkthrough
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - bluetooth/bluedroid/ble/gatt_server
  - GATT Server Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_server

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gatts_api.h

Functions

esp_err_t **esp_ble_gatts_register_callback**(*esp_gatts_cb_t* callback)

This function is called to register application callbacks with BTA GATTS module.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_app_register**(uint16_t app_id)

This function is called to register application identifier.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_app_unregister**(*esp_gatt_if_t* gatts_if)

unregister with GATT Server.

参数 **gatts_if** – **[in]** GATT server access interface

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_create_service**(*esp_gatt_if_t* gatts_if, *esp_gatt_srvc_id_t* *service_id, uint16_t num_handle)

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

参数

- **gatts_if** – **[in]** GATT server access interface

- **service_id** –**[in]** service ID.
- **num_handle** –**[in]** number of handle requested for this service.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_create_attr_tab**(const *esp_gatts_attr_db_t* *gatts_attr_db, *esp_gatt_if_t* gatts_if, uint16_t max_nb_attr, uint8_t srvc_inst_id)

Create a service attribute tab.

参数

- **gatts_attr_db** –**[in]** the pointer to the service attr tab
- **gatts_if** –**[in]** GATT server access interface
- **max_nb_attr** –**[in]** the number of attribute to be added to the service database.
- **srvc_inst_id** –**[in]** the instance id of the service

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_add_included_service**(uint16_t service_handle, uint16_t included_service_handle)

This function is called to add an included service. This function have to be called between ‘esp_ble_gatts_create_service’ and ‘esp_ble_gatts_add_char’. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

参数

- **service_handle** –**[in]** service handle to which this included service is to be added.
- **included_service_handle** –**[in]** the service ID to be included.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_add_char**(uint16_t service_handle, *esp_bt_uuid_t* *char_uuid, *esp_gatt_perm_t* perm, *esp_gatt_char_prop_t* property, *esp_attr_value_t* *char_val, *esp_attr_control_t* *control)

This function is called to add a characteristic into a service.

参数

- **service_handle** –**[in]** service handle to which this included service is to be added.
- **char_uuid** –**[in]** : Characteristic UUID.
- **perm** –**[in]** : Characteristic value declaration attribute permission.
- **property** –**[in]** : Characteristic Properties
- **char_val** –**[in]** : Characteristic value
- **control** –**[in]** : attribute response control byte

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_add_char_descr**(uint16_t service_handle, *esp_bt_uuid_t* *descr_uuid, *esp_gatt_perm_t* perm, *esp_attr_value_t* *char_descr_val, *esp_attr_control_t* *control)

This function is called to add characteristic descriptor. When it’s done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

参数

- **service_handle** –**[in]** service handle to which this characteristic descriptor is to be added.
- **perm** –**[in]** descriptor access permission.
- **descr_uuid** –**[in]** descriptor UUID.
- **char_descr_val** –**[in]** : Characteristic descriptor value
- **control** –**[in]** : attribute response control byte

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_delete_service**(uint16_t service_handle)

This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

参数 **service_handle** –**[in]** service_handle to be deleted.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_start_service**(uint16_t service_handle)

This function is called to start a service.

参数 **service_handle** –**[in]** the service handle to be started.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_stop_service**(uint16_t service_handle)

This function is called to stop a service.

参数 **service_handle** –**[in]** - service to be topped.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_send_indicate**(*esp_gatt_if_t* gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

参数

- **gatts_if** –**[in]** GATT server access interface
- **conn_id** –**[in]** - connection id to indicate.
- **attr_handle** –**[in]** - attribute handle to indicate.
- **value_len** –**[in]** - indicate value length.
- **value** –**[in]** value to indicate.
- **need_confirm** –**[in]** - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_send_response**(*esp_gatt_if_t* gatts_if, uint16_t conn_id, uint32_t trans_id, *esp_gatt_status_t* status, *esp_gatt_rsp_t* *rsp)

This function is called to send a response to a request.

参数

- **gatts_if** –**[in]** GATT server access interface
- **conn_id** –**[in]** - connection identifier.
- **trans_id** –**[in]** - transfer id
- **status** –**[in]** - response status
- **rsp** –**[in]** - response data.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_set_attr_value**(uint16_t attr_handle, uint16_t length, const uint8_t *value)

This function is called to set the attribute value by the application.

参数

- **attr_handle** –**[in]** the attribute handle which to be set
- **length** –**[in]** the value length
- **value** –**[in]** the pointer to the attribute value

返回

- ESP_OK : success
- other : failed

esp_gatt_status_t **esp_ble_gatts_get_attr_value**(uint16_t attr_handle, uint16_t *length, const uint8_t **value)

Retrieve attribute value.

参数

- **attr_handle** –**[in]** Attribute handle.
- **length** –**[out]** pointer to the attribute value length
- **value** –**[out]** Pointer to attribute value payload, the value cannot be modified by user

返回

- ESP_GATT_OK : success
- other : failed

esp_err_t **esp_ble_gatts_open**(*esp_gatt_if_t* gatts_if, *esp_bd_addr_t* remote_bda, bool is_direct)

Open a direct open connection or add a background auto connection.

参数

- **gatts_if** –**[in]** GATT server access interface
- **remote_bda** –**[in]** remote device bluetooth device address.
- **is_direct** –**[in]** direct connection or background auto connection

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_close**(*esp_gatt_if_t* gatts_if, uint16_t conn_id)

Close a connection a remote device.

参数

- **gatts_if** –**[in]** GATT server access interface
- **conn_id** –**[in]** connection ID to be closed.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_send_service_change_indication**(*esp_gatt_if_t* gatts_if, *esp_bd_addr_t* remote_bda)

Send service change indication.

参数

- **gatts_if** –**[in]** GATT server access interface
- **remote_bda** –**[in]** remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

返回

- ESP_OK : success
- other : failed

Unions

union **esp_ble_gatts_cb_param_t**

#include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

struct *esp_ble_gatts_cb_param_t*::*gatts_reg_evt_param* **reg**

Gatt server callback param of ESP_GATTS_REG_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_read_evt_param* **read**

Gatt server callback param of ESP_GATTS_READ_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_write_evt_param* **write**

Gatt server callback param of ESP_GATTS_WRITE_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_exec_write_evt_param* **exec_write**

Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_mtu_evt_param* **mtu**

Gatt server callback param of ESP_GATTS_MTU_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_conf_evt_param* **conf**

Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct *esp_ble_gatts_cb_param_t*::*gatts_create_evt_param* **create**

Gatt server callback param of ESP_GATTS_CREATE_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_add_incl_srvc_evt_param* **add_incl_srvc**

Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_add_char_evt_param* **add_char**

Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_add_char_descr_evt_param* **add_char_descr**

Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_delete_evt_param* **del**

Gatt server callback param of ESP_GATTS_DELETE_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_start_evt_param* **start**

Gatt server callback param of ESP_GATTS_START_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_stop_evt_param* **stop**

Gatt server callback param of ESP_GATTS_STOP_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_connect_evt_param* **connect**

Gatt server callback param of ESP_GATTS_CONNECT_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_disconnect_evt_param* **disconnect**

Gatt server callback param of ESP_GATTS_DISCONNECT_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_open_evt_param* **open**

Gatt server callback param of ESP_GATTS_OPEN_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_cancel_open_evt_param* **cancel_open**

Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_close_evt_param* **close**

Gatt server callback param of ESP_GATTS_CLOSE_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_congest_evt_param* **congest**

Gatt server callback param of ESP_GATTS_CONGEST_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_rsp_evt_param* **rsp**

Gatt server callback param of ESP_GATTS_RESPONSE_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_add_attr_tab_evt_param* **add_attr_tab**

Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_set_attr_val_evt_param* **set_attr_val**

Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT

struct *esp_ble_gatts_cb_param_t*::*gatts_send_service_change_evt_param* **service_change**

Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT

struct **gatts_add_attr_tab_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_CREAT_ATTR_TAB_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

esp_bt_uuid_t **svc_uuid**

Service uuid type

uint8_t **svc_inst_id**

Service id

uint16_t **num_handle**

The number of the attribute handle to be added to the gatts database

uint16_t ***handles**

The number to the handles

struct **gatts_add_char_descr_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_ADD_CHAR_DESCR_EVT.

Public Members

Public Members

uint16_t **conn_id**

Connection id

uint32_t **trans_id**

Transfer id

esp_bd_addr_t **bda**

The bluetooth device address which been written

uint16_t **handle**

The attribute handle

uint16_t **offset**

Offset of the value, if the value is too long

bool **need_rsp**

The write operation need to do response

bool **is_prep**

This write operation is prepare write

uint16_t **len**

The write attribute value length

uint8_t ***value**

The write attribute value

Macros

ESP_GATT_PREP_WRITE_CANCEL

Prepare write flag to indicate cancel prepare write

ESP_GATT_PREP_WRITE_EXEC

Prepare write flag to indicate execute prepare write

Type Definitions

typedef void (***esp_gatts_cb_t**)(*esp_gatts_cb_event_t* event, *esp_gatt_if_t* gatts_if, *esp_ble_gatts_cb_param_t* *param)

GATT Server callback function type.

Param event : Event type
Param gatts_if : GATT server access interface, normally different gatts_if correspond to different profile
Param param : Point to callback parameter, currently is union type

Enumerations

enum **esp_gatts_cb_event_t**

GATT Server callback function events.

Values:

enumerator **ESP_GATTS_REG_EVT**

When register application id, the event comes

enumerator **ESP_GATTS_READ_EVT**

When gatt client request read operation, the event comes

enumerator **ESP_GATTS_WRITE_EVT**

When gatt client request write operation, the event comes

enumerator **ESP_GATTS_EXEC_WRITE_EVT**

When gatt client request execute write, the event comes

enumerator **ESP_GATTS_MTU_EVT**

When set mtu complete, the event comes

enumerator **ESP_GATTS_CONF_EVT**

When receive confirm, the event comes

enumerator **ESP_GATTS_UNREG_EVT**

When unregister application id, the event comes

enumerator **ESP_GATTS_CREATE_EVT**

When create service complete, the event comes

enumerator **ESP_GATTS_ADD_INCL_SRVC_EVT**

When add included service complete, the event comes

enumerator **ESP_GATTS_ADD_CHAR_EVT**

When add characteristic complete, the event comes

enumerator **ESP_GATTS_ADD_CHAR_DESCR_EVT**

When add descriptor complete, the event comes

enumerator **ESP_GATTS_DELETE_EVT**

When delete service complete, the event comes

enumerator **ESP_GATTS_START_EVT**

When start service complete, the event comes

enumerator **ESP_GATTS_STOP_EVT**

When stop service complete, the event comes

enumerator **ESP_GATTS_CONNECT_EVT**

When gatt client connect, the event comes

enumerator **ESP_GATTS_DISCONNECT_EVT**

When gatt client disconnect, the event comes

enumerator **ESP_GATTS_OPEN_EVT**

When connect to peer, the event comes

enumerator **ESP_GATTS_CANCEL_OPEN_EVT**

When disconnect from peer, the event comes

enumerator **ESP_GATTS_CLOSE_EVT**

When gatt server close, the event comes

enumerator **ESP_GATTS_LISTEN_EVT**

When gatt listen to be connected the event comes

enumerator **ESP_GATTS_CONGEST_EVT**

When congest happen, the event comes

enumerator **ESP_GATTS_RESPONSE_EVT**

When gatt send response complete, the event comes

enumerator **ESP_GATTS_CREAT_ATTR_TAB_EVT**

When gatt create table complete, the event comes

enumerator **ESP_GATTS_SET_ATTR_VAL_EVT**

When gatt set attr value complete, the event comes

enumerator **ESP_GATTS_SEND_SERVICE_CHANGE_EVT**

When gatt send service change indication complete, the event comes

GATT CLIENT API

Application Example Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - bluetooth/bluedroid/ble/gatt_client
  - GATT Client Example Walkthrough
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - bluetooth/bluedroid/ble/gattc_multi_connect
  - GATT Client Multi-connection Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_client

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gattc_api.h

Functions

esp_err_t **esp_ble_gattc_register_callback**(*esp_gattc_cb_t* callback)

This function is called to register application callbacks with GATTC module.

参数 **callback** –**[in]** : pointer to the application callback function.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_app_register**(uint16_t app_id)

This function is called to register application callbacks with GATTC module.

参数 **app_id** –**[in]** : Application Identify (UUID), for different application

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_app_unregister**(*esp_gatt_if_t* gattc_if)

This function is called to unregister an application from GATTC module.

参数 **gattc_if** –**[in]** Gatt client access interface.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_open**(*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* remote_bda, *esp_ble_addr_type_t* remote_addr_type, bool is_direct)

Open a direct connection or add a background auto connection.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **remote_bda** –**[in]** remote device bluetooth device address.
- **remote_addr_type** –**[in]** remote device bluetooth device the address type.
- **is_direct** –**[in]** direct connection or background auto connection(by now, background auto connection is not supported).

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_aux_open**(*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* remote_bda, *esp_ble_addr_type_t* remote_addr_type, bool is_direct)

esp_err_t **esp_ble_gattc_close**(*esp_gatt_if_t* gattc_if, uint16_t conn_id)

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** connection ID to be closed.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_send_mtu_req**(*esp_gatt_if_t* gattc_if, uint16_t conn_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** connection ID.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_search_service**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_bt_uuid_t* *filter_uuid)

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** connection ID.
- **filter_uuid** –**[in]** a UUID of the service application is interested in. If Null, discover for all services.

返回

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_service**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_bt_uuid_t* *svc_uuid, *esp_gattc_service_elem_t* *result, uint16_t *count, uint16_t offset)

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** connection ID which identify the server.
- **svc_uuid** –**[in]** the pointer to the service uuid.
- **result** –**[out]** The pointer to the service which has been found in the gattc cache.
- **count** –**[inout]** input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- **offset** –**[in]** Offset of the service position to get.

返回

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_all_char**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_gattc_char_elem_t* *result, uint16_t *count, uint16_t offset)

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** connection ID which identify the server.
- **start_handle** –**[in]** the attribute start handle.
- **end_handle** –**[in]** the attribute end handle
- **result** –**[out]** The pointer to the characteristic in the service.
- **count** –**[inout]** input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- **offset** –**[in]** Offset of the characteristic position to get.

返回

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_all_descr**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t char_handle, *esp_gattc_descr_elem_t* *result, uint16_t *count, uint16_t offset)

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** connection ID which identify the server.
- **char_handle** –**[in]** the given characteristic handle
- **result** –**[out]** The pointer to the descriptor in the characteristic.
- **count** –**[inout]** input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- **offset** –**[in]** Offset of the descriptor position to get.

返回

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_char_by_uuid**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_bt_uuid_t* char_uuid, *esp_gattc_char_elem_t* *result, uint16_t *count)

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** connection ID which identify the server.
- **start_handle** –**[in]** the attribute start handle
- **end_handle** –**[in]** the attribute end handle
- **char_uuid** –**[in]** the characteristic uuid
- **result** –**[out]** The pointer to the characteristic in the service.
- **count** –**[inout]** input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

返回

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_descr_by_uuid**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_bt_uuid_t* char_uuid, *esp_bt_uuid_t* descr_uuid, *esp_gattc_descr_elem_t* *result, uint16_t *count)

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local

cache, won’t get from remote devices.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** connection ID which identify the server.
- **start_handle** –**[in]** the attribute start handle
- **end_handle** –**[in]** the attribute end handle
- **char_uuid** –**[in]** the characteristic uuid.
- **descr_uuid** –**[in]** the descriptor uuid.
- **result** –**[out]** The pointer to the descriptor in the given characteristic.
- **count** –**[inout]** input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

返回

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** connection ID which identify the server.
- **char_handle** –**[in]** the characteristic handle.
- **descr_uuid** –**[in]** the descriptor uuid.
- **result** –**[out]** The pointer to the descriptor in the given characteristic.
- **count** –**[inout]** input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

返回

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_include_service**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_bt_uuid_t* *incl_uuid, *esp_gattc_incl_svc_elem_t* *result, uint16_t *count)

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won’t get from remote devices.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** connection ID which identify the server.
- **start_handle** –**[in]** the attribute start handle
- **end_handle** –**[in]** the attribute end handle
- **incl_uuid** –**[in]** the include service uuid
- **result** –**[out]** The pointer to the include service in the given service.
- **count** –**[inout]** input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

返回

- other: failed

esp_gatt_status_t **esp_ble_gattc_get_attr_count**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_gatt_db_attr_type_t* type, uint16_t start_handle, uint16_t end_handle, uint16_t char_handle, uint16_t *count)

Find the attribute count with the given service or characteristic in the gattc cache.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** connection ID which identify the server.
- **type** –**[in]** the attribute type.
- **start_handle** –**[in]** the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- **end_handle** –**[in]** the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- **char_handle** –**[in]** the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn't ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- **count** –**[out]** output the number of attribute has been found in the gattc cache with the given attribute type.

返回

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_db**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_gattc_db_elem_t* *db, uint16_t *count)

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won't get from remote devices.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **start_handle** –**[in]** the attribute start handle
- **end_handle** –**[in]** the attribute end handle
- **conn_id** –**[in]** connection ID which identify the server.
- **db** –**[in]** output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- **count** –**[in]** number of elements in database.

返回

- other: failed

esp_err_t **esp_ble_gattc_read_char**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, *esp_gatt_auth_req_t* auth_req)

This function is called to read a service's characteristics of the given characteristic handle.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** : connection ID.
- **handle** –**[in]** : characteritic handle to read.
- **auth_req** –**[in]** : authenticate request type

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_by_type**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_bt_uuid_t* *uuid, *esp_gatt_auth_req_t* auth_req)

This function is called to read a service's characteristics of the given characteristic UUID.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** : connection ID.
- **start_handle** –**[in]** : the attribute start handle.
- **end_handle** –**[in]** : the attribute end handle
- **uuid** –**[in]** : The UUID of attribute which will be read.

- **auth_req** –**[in]** : authenticate request type

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_multiple**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_gattc_multi_t* *read_multi, *esp_gatt_auth_req_t* auth_req)

This function is called to read multiple characteristic or characteristic descriptors.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** : connection ID.
- **read_multi** –**[in]** : pointer to the read multiple parameter.
- **auth_req** –**[in]** : authenticate request type

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_char_descr**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, *esp_gatt_auth_req_t* auth_req)

This function is called to read a characteristics descriptor.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** : connection ID.
- **handle** –**[in]** : descriptor handle to read.
- **auth_req** –**[in]** : authenticate request type

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_write_char**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, *esp_gatt_write_type_t* write_type, *esp_gatt_auth_req_t* auth_req)

This function is called to write characteristic value.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** : connection ID.
- **handle** –**[in]** : characteristic handle to write.
- **value_len** –**[in]** length of the value to be written.
- **value** –**[in]** : the value to be written.
- **write_type** –**[in]** : the type of attribute write operation.
- **auth_req** –**[in]** : authentication request.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_write_char_descr**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, *esp_gatt_write_type_t* write_type, *esp_gatt_auth_req_t* auth_req)

This function is called to write characteristic descriptor value.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** : connection ID
- **handle** –**[in]** : descriptor handle to write.
- **value_len** –**[in]** length of the value to be written.
- **value** –**[in]** : the value to be written.
- **write_type** –**[in]** : the type of attribute write operation.
- **auth_req** –**[in]** : authentication request.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_prepare_write**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, *esp_gatt_auth_req_t* auth_req)

This function is called to prepare write a characteristic value.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** : connection ID.
- **handle** –**[in]** : characteristic handle to prepare write.
- **offset** –**[in]** : offset of the write value.
- **value_len** –**[in]** length of the value to be written.
- **value** –**[in]** : the value to be written.
- **auth_req** –**[in]** : authentication request.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_prepare_write_char_descr**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, *esp_gatt_auth_req_t* auth_req)

This function is called to prepare write a characteristic descriptor value.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** : connection ID.
- **handle** –**[in]** : characteristic descriptor handle to prepare write.
- **offset** –**[in]** : offset of the write value.
- **value_len** –**[in]** length of the value to be written.
- **value** –**[in]** : the value to be written.
- **auth_req** –**[in]** : authentication request.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_execute_write**(*esp_gatt_if_t* gattc_if, uint16_t conn_id, bool is_execute)

This function is called to execute write a prepare write sequence.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **conn_id** –**[in]** : connection ID.
- **is_execute** –**[in]** : execute or cancel.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_register_for_notify**(*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* server_bda, uint16_t handle)

This function is called to register for notification of a service.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **server_bda** –**[in]** : target GATT server.
- **handle** –**[in]** : GATT characteristic handle.

返回

- ESP_OK: registration succeeds
- other: failed

esp_err_t **esp_ble_gattc_unregister_for_notify**(*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* server_bda, uint16_t handle)

This function is called to de-register for notification of a service.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **server_bda** –**[in]** : target GATT server.
- **handle** –**[in]** : GATT characteristic handle.

返回

- ESP_OK: unregister succeeds
- other: failed

esp_err_t **esp_ble_gattc_cache_refresh**(*esp_bd_addr_t* remote_bda)

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

参数 **remote_bda** –**[in]** remote device BD address.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_cache_assoc**(*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* src_addr, *esp_bd_addr_t* assoc_addr, bool is_assoc)

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device ' s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

参数

- **gattc_if** –**[in]** Gatt client access interface.
- **src_addr** –**[in]** the source address which provide the attribute table.
- **assoc_addr** –**[in]** the associated device address which went to share the attribute table with the source address.
- **is_assoc** –**[in]** true add the associated device address, false remove the associated device address.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_cache_get_addr_list**(*esp_gatt_if_t* gattc_if)

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

参数 **gattc_if** –**[in]** Gatt client access interface.

返回

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_cache_clean**(*esp_bd_addr_t* remote_bda)

Clean the service cache of this device in the gattc stack,.

参数 **remote_bda** –**[in]** remote device BD address.

返回

- ESP_OK: success
- other: failed

Unions

union **esp_ble_gattc_cb_param_t**

Type Definitions

typedef void (***esp_gattc_cb_t**)(*esp_gattc_cb_event_t* event, *esp_gatt_if_t* gattc_if, *esp_ble_gattc_cb_param_t* *param)

GATT Client callback function type.

Param event : Event type
Param gattc_if : GATT client access interface, normally different gattc_if correspond to different profile
Param param : Point to callback parameter, currently is union type

Enumerations

enum **esp_gattc_cb_event_t**

GATT Client callback function events.

Values:

enumerator **ESP_GATTC_REG_EVT**

When GATT client is registered, the event comes

enumerator **ESP_GATTC_UNREG_EVT**

When GATT client is unregistered, the event comes

enumerator **ESP_GATTC_OPEN_EVT**

When GATT virtual connection is set up, the event comes

enumerator **ESP_GATTC_READ_CHAR_EVT**

When GATT characteristic is read, the event comes

enumerator **ESP_GATTC_WRITE_CHAR_EVT**

When GATT characteristic write operation completes, the event comes

enumerator **ESP_GATTC_CLOSE_EVT**

When GATT virtual connection is closed, the event comes

enumerator **ESP_GATTC_SEARCH_CMPL_EVT**

When GATT service discovery is completed, the event comes

enumerator **ESP_GATTC_SEARCH_RES_EVT**

When GATT service discovery result is got, the event comes

enumerator **ESP_GATTC_READ_DESCR_EVT**

When GATT characteristic descriptor read completes, the event comes

enumerator **ESP_GATTC_WRITE_DESCR_EVT**

When GATT characteristic descriptor write completes, the event comes

enumerator **ESP_GATTC_NOTIFY_EVT**

When GATT notification or indication arrives, the event comes

enumerator **ESP_GATTC_PREP_WRITE_EVT**

When GATT prepare-write operation completes, the event comes

enumerator **ESP_GATTC_EXEC_EVT**

When write execution completes, the event comes

enumerator **ESP_GATTC_ACL_EVT**

When ACL connection is up, the event comes

enumerator **ESP_GATTC_CANCEL_OPEN_EVT**

When GATT client ongoing connection is cancelled, the event comes

enumerator **ESP_GATTC_SRVC_CHG_EVT**

When “service changed” occurs, the event comes

enumerator **ESP_GATTC_ENC_CMPL_CB_EVT**

When encryption procedure completes, the event comes

enumerator **ESP_GATTC_CFG_MTU_EVT**

When configuration of MTU completes, the event comes

enumerator **ESP_GATTC_ADV_DATA_EVT**

When advertising of data, the event comes

enumerator **ESP_GATTC_MULT_ADV_ENB_EVT**

When multi-advertising is enabled, the event comes

enumerator **ESP_GATTC_MULT_ADV_UPD_EVT**

When multi-advertising parameters are updated, the event comes

enumerator **ESP_GATTC_MULT_ADV_DATA_EVT**

When multi-advertising data arrives, the event comes

enumerator **ESP_GATTC_MULT_ADV_DIS_EVT**

When multi-advertising is disabled, the event comes

enumerator **ESP_GATTC_CONGEST_EVT**

When GATT connection congestion comes, the event comes

enumerator **ESP_GATTC_BTH_SCAN_ENB_EVT**

When batch scan is enabled, the event comes

enumerator **ESP_GATTC_BTH_SCAN_CFG_EVT**

When batch scan storage is configured, the event comes

enumerator **ESP_GATTC_BTH_SCAN_RD_EVT**

When Batch scan read event is reported, the event comes

enumerator **ESP_GATTC_BTH_SCAN_THR_EVT**

When Batch scan threshold is set, the event comes

enumerator **ESP_GATTC_BTH_SCAN_PARAM_EVT**

When Batch scan parameters are set, the event comes

enumerator **ESP_GATTC_BTH_SCAN_DIS_EVT**

When Batch scan is disabled, the event comes

enumerator **ESP_GATTC_SCAN_FLT_CFG_EVT**

When Scan filter configuration completes, the event comes

enumerator **ESP_GATTC_SCAN_FLT_PARAM_EVT**

When Scan filter parameters are set, the event comes

enumerator **ESP_GATTC_SCAN_FLT_STATUS_EVT**

When Scan filter status is reported, the event comes

enumerator **ESP_GATTC_ADV_VSC_EVT**

When advertising vendor spec content event is reported, the event comes

enumerator **ESP_GATTC_REG_FOR_NOTIFY_EVT**

When register for notification of a service completes, the event comes

enumerator **ESP_GATTC_UNREG_FOR_NOTIFY_EVT**

When unregister for notification of a service completes, the event comes

enumerator **ESP_GATTC_CONNECT_EVT**

When the ble physical connection is set up, the event comes

enumerator **ESP_GATTC_DISCONNECT_EVT**

When the ble physical connection disconnected, the event comes

enumerator **ESP_GATTC_READ_MULTIPLE_EVT**

When the ble characteristic or descriptor multiple complete, the event comes

enumerator **ESP_GATTC_QUEUE_FULL_EVT**

When the gattc command queue full, the event comes

enumerator **ESP_GATTC_SET_ASSOC_EVT**

When the ble gattc set the associated address complete, the event comes

enumerator **ESP_GATTC_GET_ADDR_LIST_EVT**

When the ble get gattc address list in cache finish, the event comes

enumerator **ESP_GATTC_DIS_SRVC_CMPL_EVT**

When the ble discover service complete, the event comes

BLUFI API

Overview BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the "Key Exchange/Negotiation" procedure.

Application Example Check bluetooth folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32's wifi to softap/station/softap&station mode and config wifi connections - bluetooth/blufi

API Reference

Header File

- components/bt/common/api/include/api/esp_blufi_api.h

Functions

esp_err_t **esp_blufi_register_callbacks**(*esp_blufi_callbacks_t* *callbacks)

This function is called to receive blufi callback event.

参数 **callbacks** –**[in]** callback functions
返回 ESP_OK - success, other - failed

esp_err_t **esp_blufi_profile_init**(void)

This function is called to initialize blufi_profile.

返回 ESP_OK - success, other - failed

esp_err_t **esp_blufi_profile_deinit**(void)

This function is called to de-initialize blufi_profile.

返回 ESP_OK - success, other - failed

esp_err_t **esp_blufi_send_wifi_conn_report**(*wifi_mode_t* opmode, *esp_blufi_sta_conn_state_t* sta_conn_state, uint8_t softap_conn_num, *esp_blufi_extra_info_t* *extra_info)

This function is called to send wifi connection report.

参数
- **opmode** –: wifi opmode
- **sta_conn_state** –: station is already in connection or not
- **softap_conn_num** –: softap connection number
- **extra_info** –: extra information, such as sta_ssid, softap_ssid and etc.

返回 ESP_OK - success, other - failed

esp_err_t **esp_blufi_send_wifi_list**(uint16_t apCount, *esp_blufi_ap_record_t* *list)

This function is called to send wifi list.

参数
- **apCount** –: wifi list count
- **list** –: wifi list

返回 ESP_OK - success, other - failed

uint16_t **esp_blufi_get_version**(void)

Get BLUFI profile version.

返回 Most 8bit significant is Great version, Least 8bit is Sub version

esp_err_t **esp_blufi_send_error_info**(*esp_blufi_error_state_t* state)

This function is called to send blufi error information.

参数 **state** –: error state
返回 ESP_OK - success, other - failed

esp_err_t **esp_blufi_send_custom_data**(uint8_t *data, uint32_t data_len)

This function is called to custom data.

参数
- **data** –: custom data value
- **data_len** –: the length of custom data

返回 ESP_OK - success, other - failed

Unions

union **esp_blufi_cb_param_t**

#include <esp_blufi_api.h> BLUFI callback parameters union.

Public Members

struct *esp_blufi_cb_param_t*::*blufi_init_finish_evt_param* **init_finish**

Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct *esp_blufi_cb_param_t*::*blufi_deinit_finish_evt_param* **deinit_finish**

Blufi callback param of ESP_BLUFI_EVENT_DEINIT_FINISH

struct *esp_blufi_cb_param_t*::*blufi_set_wifi_mode_evt_param* **wifi_mode**

Structures

struct esp_blufi_extra_info_t

BLUFI extra information structure.

Public Members

uint8_t **sta_bssid**[6]
BSSID of station interface

bool **sta_bssid_set**
is BSSID of station interface set

uint8_t ***sta_ssid**
SSID of station interface

int **sta_ssid_len**
length of SSID of station interface

uint8_t ***sta_passwd**
password of station interface

int **sta_passwd_len**
length of password of station interface

uint8_t ***softap_ssid**
SSID of softap interface

int **softap_ssid_len**
length of SSID of softap interface

uint8_t ***softap_passwd**
password of station interface

int **softap_passwd_len**
length of password of station interface

uint8_t **softap_authmode**
authentication mode of softap interface

bool **softap_authmode_set**
is authentication mode of softap interface set

uint8_t **softap_max_conn_num**
max connection number of softap interface

bool **softap_max_conn_num_set**
is max connection number of softap interface set

uint8_t **softap_channel**
channel of softap interface

bool **softap_channel_set**
is channel of softap interface set

uint8_t **sta_max_conn_retry**
max retry of sta establish connection

bool **sta_max_conn_retry_set**
is max retry of sta establish connection set

uint8_t **sta_conn_end_reason**
reason of sta connection end

bool **sta_conn_end_reason_set**
is reason of sta connection end set

int8_t **sta_conn_rssi**
rssi of sta connection

bool **sta_conn_rssi_set**
is rssi of sta connection set

struct **esp_blufi_ap_record_t**
Description of an WiFi AP.

Public Members

uint8_t **ssid**[33]
SSID of AP

int8_t **rssi**
signal strength of AP

struct **esp_blufi_callbacks_t**
BLUFI callback functions type.

Public Members

esp_blufi_event_cb_t **event_cb**
BLUFI event callback

esp_blufi_negotiate_data_handler_t **negotiate_data_handler**
BLUFI negotiate data function for negotiate share key

esp_blufi_encrypt_func_t **encrypt_func**
BLUFI encrypt data function with share key generated by negotiate_data_handler

esp_blufi_decrypt_func_t **decrypt_func**
BLUFI decrypt data function with share key generated by negotiate_data_handler

esp_blufi_checksum_func_t **checksum_func**
BLUFI check sum function (FCS)

Macros

ESP_BLUFI_BD_ADDR_LEN

Bluetooth address length.

Type Definitions

typedef uint8_t **esp_blufi_bd_addr_t**[ESP_BLUFI_BD_ADDR_LEN]

Bluetooth device address.

typedef void (***esp_blufi_event_cb_t**)(*esp_blufi_cb_event_t* event, *esp_blufi_cb_param_t* *param)

BLUFI event callback function type.

Param event : Event type
Param param : Point to callback parameter, currently is union type

typedef void (***esp_blufi_negotiate_data_handler_t**)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)

BLUFI negotiate data handler.

Param data : data from phone
Param len : length of data from phone
Param output_data : data want to send to phone
Param output_len : length of data want to send to phone
Param need_free : output reporting if memory needs to be freed or not *

typedef int (***esp_blufi_encrypt_func_t**)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI encrypt the data after negotiate a share key.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
Param crypt_data : plain text and encrypted data, the encrypt function must support autochthonous encrypt
Param crypt_len : length of plain text
Return Nonnegative number is encrypted length, if error, return negative number;

typedef int (***esp_blufi_decrypt_func_t**)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI decrypt the data after negotiate a share key.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
Param crypt_data : encrypted data and plain text, the encrypt function must support autochthonous decrypt
Param crypt_len : length of encrypted text
Return Nonnegative number is decrypted length, if error, return negative number;

typedef uint16_t (***esp_blufi_checksum_func_t**)(uint8_t iv8, uint8_t *data, int len)

BLUFI checksum.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
Param data : data need to checksum
Param len : length of data

Enumerations

enum **esp_blufi_cb_event_t**

Values:

enumerator **ESP_BLUFI_EVENT_INIT_FINISH**

enumerator **ESP_BLUFI_EVENT_DEINIT_FINISH**

enumerator **ESP_BLUFI_EVENT_SET_WIFI_OPMODE**

enumerator **ESP_BLUFI_EVENT_BLE_CONNECT**

enumerator **ESP_BLUFI_MSG_STATE_ERROR**

2.3.3 Controller && VHCI

Application Example

Check bluetooth/hci folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE HCI command for BLE advertising - bluetooth/hci/controller_vhci_ble_adv.

API Reference

Header File

- components/bt/include/esp32/include/esp_bt.h

Functions

esp_err_t **esp_ble_tx_power_set**(*esp_ble_power_type_t* power_type, *esp_power_level_t* power_level)

Set BLE TX power Connection Tx power should only be set after connection created.

参数

- **power_type** –: The type of which tx power, could set Advertising/Connection/Default and etc
- **power_level** –Power level(index) corresponding to absolute value(dbm)

返回 ESP_OK - success, other - failed

esp_power_level_t **esp_ble_tx_power_get**(*esp_ble_power_type_t* power_type)

Get BLE TX power Connection Tx power should only be get after connection created.

参数 **power_type** –: The type of which tx power, could set Advertising/Connection/Default and etc

返回 >= 0 - Power level, < 0 - Invalid

esp_err_t **esp_bredr_tx_power_set**(*esp_power_level_t* min_power_level, *esp_power_level_t* max_power_level)

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after esp_bt_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

参数

- **min_power_level** –The minimum power level
- **max_power_level** –The maximum power level

返回 ESP_OK - success, other - failed

esp_err_t **esp_bredr_tx_power_get**(*esp_power_level_t* *min_power_level, *esp_power_level_t* *max_power_level)

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

参数

- **min_power_level** –The minimum power level
- **max_power_level** –The maximum power level

返回 ESP_OK - success, other - failed

esp_err_t **esp_bredr_sco_datapath_set**(*esp_sco_data_path_t* data_path)

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

参数 **data_path** –SCO data path

返回 ESP_OK - success, other - failed

esp_err_t **esp_bt_controller_init**(*esp_bt_controller_config_t* *cfg)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

参数 **cfg** –Initial configuration of BT controller. Different from previous version, there's a mode and some connection configuration in "cfg" to configure controller work mode and allocate the resource which is needed.

返回 ESP_OK - success, other - failed

esp_err_t **esp_bt_controller_deinit**(void)

De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

This function should be called only once, after any other BT functions are called.

返回 ESP_OK - success, other - failed

esp_err_t **esp_bt_controller_enable**(*esp_bt_mode_t* mode)

Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

参数 **mode** –: the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in "cfg" of esp_bt_controller_init().

返回 ESP_OK - success, other - failed

esp_err_t **esp_bt_controller_disable**(void)

Disable BT controller.

返回 ESP_OK - success, other - failed

esp_bt_controller_status_t **esp_bt_controller_get_status**(void)

Get BT controller is initialised/de-initialised/enabled/disabled.

返回 status value

bool **esp_vhci_host_check_send_available**(void)

esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.

返回 true for ready to send, false means cannot send packet

void **esp_vhci_host_send_packet**(uint8_t *data, uint16_t len)

esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

参数

- **data** –the packet point
- **len** –the packet length

esp_err_t **esp_vhci_host_register_callback**(const *esp_vhci_host_callback_t* *callback)

esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

参数 **callback** –*esp_vhci_host_callback* type variable
返回 ESP_OK - success, ESP_FAIL - failed

esp_err_t **esp_bt_controller_mem_release**(*esp_bt_mode_t* mode)

esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function

参数 **mode** –: the mode want to release memory
返回 ESP_OK - success, other - failed

esp_err_t **esp_bt_mem_release**(*esp_bt_mode_t* mode)

esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation" . In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

备注: In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

参数 **mode** –: the mode whose memory is to be released
返回 ESP_OK - success, other - failed

esp_err_t **esp_bt_sleep_enable**(void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and "ORIG mode" is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function "esp_bt_controller_wakeup_request" .

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_bt_sleep_disable**(void)

disable bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

返回

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_scan_dupilcate_list_flush**(void)

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

备注: This function name is incorrectly spelled, it will be fixed in release 5.x version.

返回

- ESP_OK : success
- other : failed

void **esp_wifi_bt_power_domain_on**(void)

bt Wi-Fi power domain power on

void **esp_wifi_bt_power_domain_off**(void)

bt Wi-Fi power domain power off

Structures

struct **esp_bt_controller_config_t**

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

Public Members

uint16_t **controller_task_stack_size**

Bluetooth controller task stack size

uint8_t **controller_task_prio**

Bluetooth controller task priority

uint8_t **hci_uart_no**

If use UART1/2 as HCI IO interface, indicate UART number

uint32_t **hci_uart_baudrate**

If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8_t **scan_duplicate_mode**

scan duplicate mode

uint8_t **scan_duplicate_type**

scan duplicate type

uint16_t **normal_adv_size**

Normal adv size for scan duplicate

uint16_t **mesh_adv_size**

Mesh adv size for scan duplicate

uint16_t **send_adv_reserved_size**

Controller minimum memory value

uint32_t **controller_debug_flag**

Controller debug log flag

uint8_t **mode**

Controller mode: BR/EDR, BLE or Dual Mode

uint8_t **ble_max_conn**

BLE maximum connection numbers

uint8_t **bt_max_acl_conn**

BR/EDR maximum ACL connection numbers

uint8_t **bt_sco_datapath**

SCO data path, i.e. HCI or PCM module

bool **auto_latency**

BLE auto latency, used to enhance classic BT performance

bool **bt_legacy_auth_vs_evt**

BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t **bt_max_sync_conn**

BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t **ble_sca**

BLE low power crystal accuracy index

uint8_t **pcm_role**

PCM role (master & slave)

uint8_t **pcm_polar**

PCM polar trig (falling clk edge & rising clk edge)

bool **hli**

Using high level interrupt or not

uint16_t **dup_list_refresh_period**

Duplicate scan list refresh period

uint32_t **magic**

Magic number

struct **esp_vhci_host_callback**

esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

void (***notify_host_send_available**)(void)

callback used to notify that the host can send packet to controller

int (***notify_host_recv**)(uint8_t *data, uint16_t len)

callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL

BT_CONTROLLER_INIT_CONFIG_DEFAULT()

Type Definitions

typedef struct *esp_vhci_host_callback* **esp_vhci_host_callback_t**

esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum **esp_bt_mode_t**

Bluetooth mode for controller enable/disable.

Values:

enumerator **ESP_BT_MODE_IDLE**

Bluetooth is not running

enumerator **ESP_BT_MODE_BLE**

Run BLE mode

enumerator **ESP_BT_MODE_CLASSIC_BT**

Run Classic BT mode

enumerator **ESP_BT_MODE_BTDM**

Run dual mode

enum **[anonymous]**

BLE sleep clock accuracy(SCA), values for ble_sca field in *esp_bt_controller_config_t*, currently only ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.

Values:

enumerator **ESP_BLE_SCA_500PPM**

BLE SCA at 500ppm

enumerator **ESP_BLE_SCA_250PPM**

BLE SCA at 250ppm

enumerator **ESP_BLE_SCA_150PPM**

BLE SCA at 150ppm

enumerator **ESP_BLE_SCA_100PPM**

BLE SCA at 100ppm

enumerator **ESP_BLE_SCA_75PPM**

BLE SCA at 75ppm

enumerator **ESP_BLE_SCA_50PPM**

BLE SCA at 50ppm

enumerator **ESP_BLE_SCA_30PPM**

BLE SCA at 30ppm

enumerator **ESP_BLE_SCA_20PPM**

BLE SCA at 20ppm

enum **esp_bt_controller_status_t**

Bluetooth controller enable/disable/initialised/de-initialised status.

Values:

enumerator **ESP_BT_CONTROLLER_STATUS_IDLE**

enumerator **ESP_BT_CONTROLLER_STATUS_INITED**

enumerator **ESP_BT_CONTROLLER_STATUS_ENABLED**

enumerator **ESP_BT_CONTROLLER_STATUS_NUM**

enum **esp_ble_power_type_t**

BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV : for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN : for scan. ESP_BLE_PWR_TYPE_DEFAULT : if each connection ' s TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL0**

For connection handle 0

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL1**

For connection handle 1

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL2**

For connection handle 2

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL3**

For connection handle 3

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL4**

For connection handle 4

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL5**

For connection handle 5

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL6**

For connection handle 6

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL7**

For connection handle 7

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL8**

For connection handle 8

enumerator **ESP_BLE_PWR_TYPE_ADV**

For advertising

enumerator **ESP_BLE_PWR_TYPE_SCAN**

For scan

enumerator **ESP_BLE_PWR_TYPE_DEFAULT**

For default, if not set other, it will use default value

enumerator **ESP_BLE_PWR_TYPE_NUM**

TYPE numbers

enum **esp_power_level_t**

Bluetooth TX power level(index), it’ s just a index corresponding to power(dbm).

Values:

enumerator **ESP_PWR_LVL_N12**

Corresponding to -12dbm

enumerator **ESP_PWR_LVL_N9**

Corresponding to -9dbm

enumerator **ESP_PWR_LVL_N6**

Corresponding to -6dbm

enumerator **ESP_PWR_LVL_N3**

Corresponding to -3dbm

enumerator **ESP_PWR_LVL_N0**

Corresponding to 0dbm

enumerator **ESP_PWR_LVL_P3**

Corresponding to +3dbm

enumerator **ESP_PWR_LVL_P6**

Corresponding to +6dbm

enumerator **ESP_PWR_LVL_P9**

Corresponding to +9dbm

enumerator **ESP_PWR_LVL_N14**

Backward compatibility! Setting to -14dbm will actually result to -12dbm

enumerator **ESP_PWR_LVL_N11**

Backward compatibility! Setting to -11dbm will actually result to -9dbm

enumerator **ESP_PWR_LVL_N8**

Backward compatibility! Setting to -8dbm will actually result to -6dbm

enumerator **ESP_PWR_LVL_N5**

Backward compatibility! Setting to -5dbm will actually result to -3dbm

enumerator **ESP_PWR_LVL_N2**

Backward compatibility! Setting to -2dbm will actually result to 0dbm

enumerator **ESP_PWR_LVL_P1**

Backward compatibility! Setting to +1dbm will actually result to +3dbm

enumerator **ESP_PWR_LVL_P4**

Backward compatibility! Setting to +4dbm will actually result to +6dbm

enumerator **ESP_PWR_LVL_P7**

Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum **esp_sco_data_path_t**

Bluetooth audio data transport path.

Values:

enumerator **ESP_SCO_DATA_PATH_HCI**

data over HCI transport

enumerator **ESP_SCO_DATA_PATH_PCM**

data over PCM interface

2.3.4 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section *ESP-BLE-MESH 快速入门*. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section *ESP-BLE-MESH 架构*.

Application Examples and Demos

Please refer to Sections *ESP-BLE-MESH 示例* and *ESP-BLE-MESH 演示视频*.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- *ESP-BLE-MESH Definitions*
- *ESP-BLE-MESH Core API Reference*
- *ESP-BLE-MESH Models API Reference*

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

Unions

union **esp_ble_mesh_prov_cb_param_t**

#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.

Public Members

struct *esp_ble_mesh_prov_cb_param_t*::*ble_mesh_prov_register_comp_param* **prov_register_comp**

Event parameter of ESP_BLE_MESH_PROV_REGISTER_COMP_EVT

provisioner_delete_node_with_uuid_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::*ble_mesh_provisioner_delete_node_with_addr_comp_param* **provisioner_delete_node_with_addr_comp**

Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

int **err_code**

Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner

Indicate the result of setting the heartbeat filter type by the Provisioner

Indicate the result of setting the heartbeat filter address by the Provisioner

Indicate the result of directly erasing settings by the Provisioner

Indicate the result of opening settings with index by the Provisioner

Indicate the result of opening settings with user id by the Provisioner

Indicate the result of closing settings with index by the Provisioner

Indicate the result of closing settings with user id by the Provisioner

Indicate the result of deleting settings with index by the Provisioner

Indicate the result of deleting settings with user id by the Provisioner

bool **enable**

Indicate enabling or disabling receiving heartbeat messages

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous] **provisioner_enable_heartbeat_recv_comp**

ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

uint8_t **type**

Type of the filter used for receiving heartbeat messages

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous] **provisioner_set_heartbeat_filter_type_comp**

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT

uint8_t **op**

Operation (add, remove, clean)

uint16_t **hb_src**

Heartbeat source address

uint16_t **hb_dst**

Heartbeat destination address

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous] **provisioner_set_heartbeat_filter_info_comp**

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t **init_ttl**

Heartbeat InitTTL

uint8_t **rx_ttl**

Heartbeat RxTTL

uint8_t **hops**

Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t **feature**

Bit field of currently active features of the node

int8_t **rssi**

RSSI of the heartbeat message

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous] **provisioner_recv_heartbeat**

ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]
provisioner_direct_erase_settings_comp

ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT

uint8_t **index**

Index of Provisioner settings

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]
provisioner_open_settings_with_index_comp

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT.

Event parameter of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT

char **uid**[ESP_BLE_MESH_SETTINGS_UID_SIZE + 1]

Provisioner settings user id

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]
provisioner_open_settings_with_uid_comp

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]
provisioner_close_settings_with_index_comp

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT.

Event parameter of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]
provisioner_close_settings_with_uid_comp

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous] **provisioner_delete_settings_with_index_comp**

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT.

Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous] **provisioner_delete_settings_with_uid_comp**

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT.

Event parameters of ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::*ble_mesh_model_unsub_group_addr_comp_param* **model_unsub_group_addr_comp**

Event parameters of ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::*ble_mesh_deinit_mesh_comp_param* **deinit_mesh_comp**

Event parameter of ESP_BLE_MESH_DEINIT_MESH_COMP_EVT

struct **ble_mesh_deinit_mesh_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_DEINIT_MESH_COMP_EVT.

Public Members

int **err_code**

Indicate the result of BLE Mesh deinitialization

struct **ble_mesh_friend_friendship_establish_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT.

Public Members

uint16_t **lpn_addr**

Low Power Node unicast address

struct **ble_mesh_friend_friendship_terminate_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.

Public Types

enum **[anonymous]**

This enum value is the reason of friendship termination on the friend node side

Values:

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL**

Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT**

Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ**

Receive Friend Request from existing Low Power Node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR**

Receive Friend Clear from other friend node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE**

Friend feature disabled or corresponding NetKey is deleted

Public Members

uint16_t **lpn_addr**

Low Power Node unicast address

enum *esp_ble_mesh_prov_cb_param_t*::*ble_mesh_friend_friendship_terminate_param*::*[anonymous]* **reason**

This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

struct **ble_mesh_heartbeat_msg_recv_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.

Public Members

uint8_t **hops**

Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t **feature**

Bit field of currently active features of the node

struct **ble_mesh_input_evt_param**

int **err_code**

Indicate the result of Proxy Client connect

esp_ble_mesh_bd_addr_t **addr**

Device address of the Proxy Server

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint16_t **net_idx**

Corresponding NetKey Index

struct **ble_mesh_proxy_client_connected_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT.

Public Members

esp_ble_mesh_bd_addr_t **addr**

Device address of the Proxy Server

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t **conn_handle**

Proxy connection handle

uint16_t **net_idx**

Corresponding NetKey Index

struct **ble_mesh_proxy_client_disconnect_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT.

Public Members

int **err_code**

Indicate the result of Proxy Client disconnect

uint8_t **conn_handle**

Proxy connection handle

struct **ble_mesh_proxy_client_disconnected_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT.

Public Members

esp_ble_mesh_bd_addr_t **addr**

Device address of the Proxy Server

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t **conn_handle**

Proxy connection handle

uint16_t **net_idx**

Corresponding NetKey Index

uint8_t **reason**

Proxy disconnect reason

struct **ble_mesh_proxy_client_recv_adv_pkt_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT.

Public Members

esp_ble_mesh_bd_addr_t **addr**

Device address

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint16_t **net_idx**

Network ID related NetKey Index

uint8_t **net_id**[8]

Network ID contained in the advertising packet

int8_t **rssi**

RSSI of the received advertising packet

struct **ble_mesh_proxy_client_recv_filter_status_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT.

Public Members

uint8_t **conn_handle**

Proxy connection handle

uint16_t **server_addr**

Proxy Server primary element address

uint16_t **net_idx**

Corresponding NetKey Index

uint8_t **filter_type**

Proxy Server filter type(whitelist or blacklist)

uint16_t **list_size**

Number of addresses in the Proxy Server filter list

struct **ble_mesh_proxy_client_remove_filter_addr_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT.

Public Members

int **err_code**

Indicate the result of Proxy Client remove filter address

uint8_t **conn_handle**

Proxy connection handle

uint16_t **net_idx**

Corresponding NetKey Index

struct **ble_mesh_proxy_client_set_filter_type_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT.

Public Members

int **err_code**

Indicate the result of Proxy Client set filter type

uint8_t **conn_handle**

Proxy connection handle

uint16_t **net_idx**

Corresponding NetKey Index

struct **ble_mesh_proxy_gatt_disable_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT.

Public Members

int **err_code**

Indicate the result of disabling Mesh Proxy Service

struct **ble_mesh_proxy_gatt_enable_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT.

Public Members

int **err_code**

Indicate the result of enabling Mesh Proxy Service

struct **ble_mesh_proxy_identity_enable_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT.

Public Members

int **err_code**

Indicate the result of enabling Mesh Proxy advertising

struct **ble_mesh_proxy_server_connected_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT.

Public Members

uint8_t **conn_handle**

Proxy connection handle

struct **ble_mesh_proxy_server_disconnected_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT.

Public Members

uint8_t **conn_handle**

Proxy connection handle

uint8_t **reason**

Proxy disconnect reason

struct **ble_mesh_set_fast_prov_action_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT.

Public Members

uint8_t **status_action**

Indicate the result of setting action of fast provisioning

struct **ble_mesh_set_fast_prov_info_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT.

Public Members

uint8_t **status_unicast**

Indicate the result of setting unicast address range of fast provisioning

uint8_t **status_net_idx**

Indicate the result of setting NetKey Index of fast provisioning

uint8_t **status_match**

Indicate the result of setting matching Device UUID of fast provisioning

struct **ble_mesh_set_oob_pub_key_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT.

Public Members

int **err_code**

Indicate the result of setting OOB Public Key

struct **ble_mesh_set_unprov_dev_name_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT.

Public Members

int **err_code**

Indicate the result of setting BLE Mesh device name

union **esp_ble_mesh_server_state_value_t**

#include <esp_ble_mesh_defs.h> Server model state value union.

Public Members

uint8_t **onoff**

The value of the Generic OnOff state

The value of the Light LC Light OnOff state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **gen_onoff**

The Generic OnOff state

int16_t **level**

The value of the Generic Level state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **gen_level**

The Generic Level state

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **gen_onpowerup**

The Generic OnPowerUp state

uint16_t **power**

The value of the Generic Power Actual state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **gen_power_actual**

The Generic Power Actual state

uint16_t **lightness**

The value of the Light Lightness Actual state

The value of the Light Lightness Linear state

The value of the Light CTL Lightness state

The value of the Light HSL Lightness state

The value of the Light xyL Lightness state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_lightness_actual**

The Light Lightness Actual state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_lightness_linear**

The Light Lightness Linear state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_ctl_lightness**

The Light CTL Lightness state

uint16_t **temperature**

The value of the Light CTL Temperature state

int16_t **delta_uv**

The value of the Light CTL Delta UV state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_ctl_temp_delta_uv**

The Light CTL Temperature & Delta UV states

uint16_t **hue**

The value of the Light HSL Hue state

uint16_t **saturation**

The value of the Light HSL Saturation state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_hsl**

The Light HSL composite state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_hsl_lightness**

The Light HSL Lightness state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_hsl_hue**

The Light HSL Hue state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_hsl_saturation**

The Light HSL Saturation state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_xyl_lightness**

The Light xyL Lightness state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_lc_light_onoff**

The Light LC Light OnOff state

union **esp_ble_mesh_model_cb_param_t**

#include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.

Public Members

struct *esp_ble_mesh_model_cb_param_t*::*ble_mesh_model_operation_evt_param* **model_operation**

Event parameter of ESP_BLE_MESH_MODEL_OPERATION_EVT

struct *esp_ble_mesh_model_cb_param_t*::*ble_mesh_model_send_comp_param* **model_send_comp**

Event parameter of ESP_BLE_MESH_MODEL_SEND_COMP_EVT

struct *esp_ble_mesh_model_cb_param_t*::*ble_mesh_model_publish_comp_param* **model_publish_comp**

Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT

struct *esp_ble_mesh_model_cb_param_t*::*ble_mesh_mod_recv_publish_msg_param* **client_recv_publish_msg**

Event parameter of ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT

struct *esp_ble_mesh_model_cb_param_t*::*ble_mesh_client_model_send_timeout_param* **client_send_timeout**

Event parameter of ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT

struct *esp_ble_mesh_model_cb_param_t*::*ble_mesh_model_publish_update_evt_param* **model_publish_update**

Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT

struct *esp_ble_mesh_model_cb_param_t*::*ble_mesh_server_model_update_state_comp_param* **server_model_update_state**

Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT

struct **ble_mesh_client_model_send_timeout_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.

Public Members

uint32_t **opcode**

Opcode of the previously sent message

esp_ble_mesh_model_t ***model**

Pointer to the model which sends the previous message

esp_ble_mesh_msg_ctx_t ***ctx**

Pointer to the context of the previous message

struct **ble_mesh_mod_recv_publish_msg_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.

Public Members

uint32_t **opcode**

Opcode of the unsolicited received message

esp_ble_mesh_model_t ***model**

Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t ***ctx**

Pointer to the context of the message

uint16_t **length**

Length of the received message

uint8_t ***msg**

Value of the received message

struct **ble_mesh_model_operation_evt_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.

Public Members

uint32_t **opcode**

Opcode of the received message

esp_ble_mesh_model_t ***model**

Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t ***ctx**

Pointer to the context of the received message

uint16_t **length**

Length of the received message

uint8_t ***msg**

Value of the received message

struct **ble_mesh_model_publish_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int **err_code**

Indicate the result of publishing a message

esp_ble_mesh_model_t ***model**

Pointer to the model which publishes the message

struct **ble_mesh_model_publish_update_evt_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the model which is going to update its publish message

struct **ble_mesh_model_send_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int **err_code**

Indicate the result of sending a message

uint32_t **opcode**

Opcode of the message

esp_ble_mesh_model_t ***model**

Pointer to the model which sends the message

esp_ble_mesh_msg_ctx_t ***ctx**

Context of the message

struct **ble_mesh_server_model_update_state_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.

Public Members

int **err_code**

Indicate the result of updating server model state

esp_ble_mesh_model_t ***model**

Pointer to the server model which state value is updated

esp_ble_mesh_server_state_type_t **type**

Type of the updated server state

Structures

struct **esp_ble_mesh_deinit_param_t**

BLE Mesh deinit parameters

Public Members

bool **erase_flash**

Indicate if erasing flash when deinit mesh stack

struct **esp_ble_mesh_elem_t**

Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h

Public Members

uint16_t **element_addr**

Element Address, assigned during provisioning.

const uint16_t **location**

Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t **sig_model_count**

SIG Model count

const uint8_t **vnd_model_count**

Vendor Model count

esp_ble_mesh_model_t ***sig_models**

SIG Models

esp_ble_mesh_model_t ***vnd_models**

Vendor Models

struct **esp_ble_mesh_model_pub_t**

Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the model to which the context belongs. Initialized by the stack.

uint16_t **publish_addr**

Publish Address.

uint16_t **app_idx**

Publish AppKey Index.

uint16_t **cred**

Friendship Credentials Flag.

uint16_t **send_rel**

Force reliable sending (segment acks)

uint8_t **ttl**

Publish Time to Live.

uint8_t **retransmit**

Retransmit Count & Interval Steps.

uint8_t **period**

Publish Period.

uint8_t **period_div**

Divisor for the Period.

uint8_t **fast_period**

Use FastPeriodDivisor

uint8_t **count**

Retransmissions left.

uint32_t **period_start**

Start of the current period.

struct net_buf_simple ***msg**

Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the ESP_BLE_MESH_MODEL_PUB_DEFINE macro.

ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

esp_ble_mesh_cb_t **update**

Callback used to update publish message. Initialized by the stack.

struct k_delayed_work **timer**

Publish Period Timer. Initialized by the stack.

uint8_t **dev_role**

Role of the device that is going to publish messages

struct **esp_ble_mesh_model_op_t**

Abstraction that describes a model operation context. This structure is associated with struct bt_mesh_model_op in mesh_access.h

Public Members

const uint32_t **opcode**

Message opcode

const size_t **min_len**

Message minimum length

esp_ble_mesh_cb_t **param_cb**

Callback used to handle message. Initialized by the stack.

struct **esp_ble_mesh_model_cbs_t**

Abstraction that describes a model callback structure. This structure is associated with struct bt_mesh_model_cb in mesh_access.h.

Public Members

esp_ble_mesh_cb_t **init_cb**

Callback used during model initialization. Initialized by the stack.

struct **esp_ble_mesh_model**

Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

const uint16_t **model_id**

16-bit model identifier

uint16_t **company_id**

16-bit company identifier

uint16_t **model_id**

16-bit model identifier

struct *esp_ble_mesh_model*::[anonymous]::[anonymous] **vnd**

Structure encapsulating a model ID with a company ID

union *esp_ble_mesh_model*::[anonymous] **[anonymous]**

Model ID

uint8_t **element_idx**

Internal information, mainly for persistent storage Belongs to Nth element

uint8_t **model_idx**

Is the Nth model in the element

uint16_t **flags**

Information about what has changed

esp_ble_mesh_elem_t ***element**

The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const **pub**

Model Publication

uint16_t **keys**[CONFIG_BLE_MESH_MODEL_KEY_COUNT]

AppKey List

uint16_t **groups**[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]

Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t ***op**

Model operation context

esp_ble_mesh_model_cbs_t ***cb**

Model callback structure

void ***user_data**

Model-specific user data

struct **esp_ble_mesh_msg_ctx_t**

Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

Public Members

uint16_t **net_idx**

NetKey Index of the subnet through which to send the message.

uint16_t **app_idx**

AppKey Index for message encryption.

uint16_t **addr**

Remote address.

uint16_t **recv_dst**

Destination address of a received message. Not used for sending.

int8_t **recv_rssi**

RSSI of received packet. Not used for sending.

uint8_t **recv_ttl**

Received TTL value. Not used for sending.

uint8_t **send_rel**

Force sending reliably by using segment acknowledgement

uint8_t **send_ttl**

TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t **recv_op**

Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t ***model**

Model corresponding to the message, no need to be initialized before sending message

bool **srv_send**

Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct **esp_ble_mesh_prov_t**

Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct **esp_ble_mesh_comp_t**

Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

Public Members

uint16_t **cid**

16-bit SIG-assigned company identifier

uint16_t **pid**

16-bit vendor-assigned product identifier

uint16_t **vid**

16-bit vendor-assigned product version identifier

size_t **element_count**

Element count

esp_ble_mesh_elem_t ***elements**

A sequence of elements

struct **esp_ble_mesh_unprov_dev_add_t**

Information of the device which is going to be added for provisioning.

Public Members

esp_ble_mesh_bd_addr_t **addr**

Device address

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t **uuid**[16]

Device UUID

uint16_t **oob_info**

Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

esp_ble_mesh_prov_bearer_t **bearer**

Provisioning Bearer

struct **esp_ble_mesh_device_delete_t**

Information of the device which is going to be deleted.

Public Members

esp_ble_mesh_bd_addr_t **addr**

Device address

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t **uuid**[16]

Device UUID

uint8_t **flag**

BIT0: device address; BIT1: device UUID

struct **esp_ble_mesh_prov_data_info_t**

Information of the provisioner which is going to be updated.

Public Members

uint16_t **net_idx**

NetKey Index

uint8_t **flags**

Flags

uint32_t **iv_index**

IV Index

uint8_t **flag**

BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct **esp_ble_mesh_node_t**

Information of the provisioned node

Public Members

esp_ble_mesh_bd_addr_t **addr**

Node device address

esp_ble_mesh_addr_type_t **addr_type**

Node device address type

uint8_t **dev_uuid**[16]

Device UUID

uint16_t **oob_info**

Node OOB information

uint16_t **unicast_addr**

Node unicast address

uint8_t **element_num**

Node element number

uint16_t **net_idx**

Node NetKey Index

uint8_t **flags**

Node key refresh flag and iv update flag

uint32_t **iv_index**

Node IV Index

uint8_t **dev_key**[16]

Node device key

char **name**[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]

Node name

uint16_t **comp_length**

Length of Composition Data

uint8_t ***comp_data**

Value of Composition Data

struct **esp_ble_mesh_fast_prov_info_t**

Context of fast provisioning which need to be set.

Public Members

uint16_t **unicast_min**

Minimum unicast address used for fast provisioning

uint16_t **unicast_max**

Maximum unicast address used for fast provisioning

uint16_t **net_idx**

Netkey index used for fast provisioning

uint8_t **flags**

Flags used for fast provisioning

uint32_t **iv_index**

IV Index used for fast provisioning

uint8_t **offset**

Offset of the UUID to be compared

uint8_t **match_len**

Length of the UUID to be compared

uint8_t **match_val**[16]

Value of UUID to be compared

struct **esp_ble_mesh_heartbeat_filter_info_t**

Context of Provisioner heartbeat filter information to be set

Public Members

uint16_t **hb_src**

Heartbeat source address (unicast address)

uint16_t **hb_dst**

Heartbeat destination address (unicast address or group address)

struct **esp_ble_mesh_client_op_pair_t**

BLE Mesh client models related definitions.

Client model Get/Set message opcode and corresponding Status message opcode

Public Members

uint32_t **cli_op**

The client message opcode

uint32_t **status_op**

The server status opcode corresponding to the client message opcode

struct **esp_ble_mesh_client_t**

Client Model user data context.

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the client model. Initialized by the stack.

int **op_pair_size**

Size of the op_pair

const *esp_ble_mesh_client_op_pair_t* ***op_pair**

Table containing get/set message opcode and corresponding status message opcode

uint32_t **publish_status**

Callback used to handle the received unsolicited message. Initialized by the stack.

void ***internal_data**

Pointer to the internal data of client model

uint8_t **msg_role**

Role of the device (Node/Provisioner) that is going to send messages

struct **esp_ble_mesh_client_common_param_t**

Common parameters of the messages sent by Client Model.

Public Members

esp_ble_mesh_opcode_t **opcode**

Message opcode

esp_ble_mesh_model_t ***model**

Pointer to the client model structure

esp_ble_mesh_msg_ctx_t **ctx**

The context used to send message

int32_t **msg_timeout**

Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t **msg_role**

Role of the device - Node/Provisioner

struct **esp_ble_mesh_state_transition_t**

Parameters of the server model state transition

Public Functions

BLE_MESH_ATOMIC_DEFINE(flag, *ESP_BLE_MESH_SERVER_FLAG_MAX*)

Flag used to indicate if the transition timer has been started internally.

If the model which contains *esp_ble_mesh_state_transition_t* sets "set_auto_rsp" to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

Public Members

bool **just_started**

Indicate if the state transition has just started

uint8_t **trans_time**

State transition time

uint8_t **remain_time**

Remaining time of state transition

uint8_t **delay**

Delay before starting state transition

uint32_t **quo_tt**

Duration of each divided transition step

uint32_t **counter**

Number of steps which the transition duration is divided

uint32_t **total_duration**

State transition total duration

int64_t **start_timestamp**

Time when the state transition is started

struct k_delayed_work **timer**

Timer used for state transition

struct **esp_ble_mesh_last_msg_info_t**

Parameters of the server model received last same set message.

Public Members

uint8_t **tid**

Transaction number of the last message

uint16_t **src**

Source address of the last message

uint16_t **dst**

Destination address of the last message

int64_t **timestamp**

Time when the last message is received

struct **esp_ble_mesh_server_rsp_ctrl_t**

Parameters of the Server Model response control

Public Members

uint8_t **get_auto_rsp**

BLE Mesh Server Response Option.

i. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get messages need to be replied by the application;
ii. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get messages will be replied by the server models;
iii. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set messages need to be replied by the application;
iv. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set messages will be replied by the server models;
v. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server Status messages need to be replied by the application;
vi. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server Status messages will be replied by the server models; Response control for Client Get messages

uint8_t **set_auto_rsp**

Response control for Client Set messages

uint8_t **status_auto_rsp**

Response control for Server Status messages

Macros

ESP_BLE_MESH_SDU_MAX_LEN

< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

ESP_BLE_MESH_MIC_SHORT

Length of a long Mesh MIC.

ESP_BLE_MESH_MIC_LONG

The maximum length of a BLE Mesh provisioned node name

ESP_BLE_MESH_NODE_NAME_MAX_LEN

The maximum length of a BLE Mesh unprovisioned device name

ESP_BLE_MESH_DEVICE_NAME_MAX_LEN

The maximum length of settings user id

ESP_BLE_MESH_SETTINGS_UID_SIZE

Invalid settings index

ESP_BLE_MESH_INVALID_SETTINGS_IDX

Define the BLE Mesh octet 16 bytes size

ESP_BLE_MESH_OCTET16_LEN

ESP_BLE_MESH_OCTET8_LEN

ESP_BLE_MESH_CID_NVAL

Special TTL value to request using configured default TTL

ESP_BLE_MESH_TTL_DEFAULT

Maximum allowed TTL value

ESP_BLE_MESH_TTL_MAX

ESP_BLE_MESH_ADDR_UNASSIGNED

ESP_BLE_MESH_ADDR_ALL_NODES

ESP_BLE_MESH_ADDR_PROXIES

ESP_BLE_MESH_ADDR_FRIENDS

ESP_BLE_MESH_ADDR_RELAYS

ESP_BLE_MESH_KEY_UNUSED

ESP_BLE_MESH_KEY_DEV

ESP_BLE_MESH_KEY_PRIMARY

ESP_BLE_MESH_KEY_ANY

Primary Network Key index

ESP_BLE_MESH_NET_PRIMARY

Relay state value

ESP_BLE_MESH_RELAY_DISABLED

ESP_BLE_MESH_RELAY_ENABLED

ESP_BLE_MESH_RELAY_NOT_SUPPORTED

Beacon state value

ESP_BLE_MESH_BEACON_DISABLED

ESP_BLE_MESH_BEACON_ENABLED

ESP_BLE_MESH_INVALID_NODE_INDEX

ESP_BLE_MESH_TRANSMIT(count, int_ms)

Encode transmission count & interval steps.

备注: For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

参数

- **count** –Number of retransmissions (first transmission is excluded).
- **int_ms** –Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

返回 BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

ESP_BLE_MESH_GET_TRANSMIT_COUNT(transmit)

Decode transmit count from a transmit value.

参数

- **transmit** –Encoded transmit count & interval value.

返回 Transmission count (actual transmissions equal to N + 1).

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL(transmit)

Decode transmit interval from a transmit value.

参数

- **transmit** –Encoded transmit count & interval value.

返回 Transmission interval in milliseconds.

ESP_BLE_MESH_PUBLISH_TRANSMIT(count, int_ms)

Encode Publish Retransmit count & interval steps.

参数

- **count** –Number of retransmissions (first transmission is excluded).
- **int_ms** –Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

返回 BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT(transmit)

Decode Publish Retransmit count from a given value.

参数

- **transmit** –Encoded Publish Retransmit count & interval value.

返回 Retransmission count (actual transmissions equal to N + 1).

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL(transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

参数

- **transmit** –Encoded Publish Retransmit count & interval value.

返回 Transmission interval in milliseconds.

ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN

Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN

Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN

Macros used to define message opcode

ESP_BLE_MESH_MODEL_OP_1(b0)

ESP_BLE_MESH_MODEL_OP_2(b0, b1)

ESP_BLE_MESH_MODEL_OP_3(b0, cid)

This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

ESP_BLE_MESH_SIG_MODEL(_id, _op, _pub, _user_data)

This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

ESP_BLE_MESH_VENDOR_MODEL(_company, _id, _op, _pub, _user_data)

ESP_BLE_MESH_ELEMENT(_loc, _mods, _vnd_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

备注: This macro is associated with BLE_MESH_ELEM in mesh_access.h

参数

- **_loc** –Location Descriptor.
- **_mods** –Array of SIG models.
- **_vnd_mods** –Array of vendor models.

ESP_BLE_MESH_PROV(uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

BT_OCTET32_LEN

BD_ADDR_LEN

ESP_BLE_MESH_ADDR_TYPE_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RANDOM

ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE(_name, _msg_len, _role)

Define a model publication context.

参数

- **_name** –Variable name given to the context.
- **_msg_len** –Length of the publication message.
- **_role** –Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP(_opcode, _min_len)

Define a model operation context.

参数

- **_opcode** –Message opcode.
- **_min_len** –Message minimum length.

ESP_BLE_MESH_MODEL_OP_END

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE

Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG

Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG

Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG

Device can be remove when queue is full and new device is going to added

Type Definitions

typedef uint8_t **esp_ble_mesh_octet16_t**[ESP_BLE_MESH_OCTET16_LEN]
Define the BLE Mesh octet 8 bytes size

typedef uint8_t **esp_ble_mesh_octet8_t**[ESP_BLE_MESH_OCTET8_LEN]
Invalid Company ID

typedef uint32_t **esp_ble_mesh_cb_t**

typedef uint8_t **UINT8**

typedef uint16_t **UINT16**

typedef uint32_t **UINT32**

typedef uint64_t **UINT64**

typedef *UINT8* **BT_OCTET32**[BT_OCTET32_LEN]

typedef uint8_t **BD_ADDR**[BD_ADDR_LEN]

typedef uint8_t **esp_ble_mesh_bd_addr_t**[BD_ADDR_LEN]

typedef uint8_t **esp_ble_mesh_addr_type_t**
BLE device address type.

typedef struct *esp_ble_mesh_model* **esp_ble_mesh_model_t**

typedef uint8_t **esp_ble_mesh_dev_add_flag_t**

typedef uint32_t **esp_ble_mesh_opcode_config_client_get_t**

esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_get_state function.

typedef uint32_t **esp_ble_mesh_opcode_config_client_set_t**

esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t **esp_ble_mesh_opcode_config_status_t**

esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Config Model messages The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model' s request messages.

typedef uint8_t **esp_ble_mesh_cfg_status_t**

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32_t **esp_ble_mesh_opcode_health_client_get_t**

esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_get_state function.

typedef uint32_t **esp_ble_mesh_opcode_health_client_set_t**

esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t **esp_ble_mesh_health_model_status_t**

esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model' s request messages.

typedef uint32_t **esp_ble_mesh_generic_message_opcode_t**

esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode

typedef uint32_t **esp_ble_mesh_sensor_message_opcode_t**

esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t **esp_ble_mesh_time_scene_message_opcode_t**

esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t **esp_ble_mesh_light_message_opcode_t**

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate

the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode

typedef uint32_t **esp_ble_mesh_opcode_t**

End of defines of esp_ble_mesh_opcode_t

typedef uint8_t **esp_ble_mesh_model_status_t**

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

Enumerations

enum **esp_ble_mesh_cb_type_t**

Values:

enumerator **ESP_BLE_MESH_TYPE_PROV_CB**

enumerator **ESP_BLE_MESH_TYPE_OUTPUT_NUM_CB**

enum **esp_ble_mesh_dev_role_t**

Values:

enumerator **ROLE_NODE**

enumerator **ROLE_PROVISIONER**

enumerator **ROLE_FAST_PROV**

enum **esp_ble_mesh_fast_prov_action_t**

Values:

enumerator **FAST_PROV_ACT_NONE**

enumerator **FAST_PROV_ACT_ENTER**

enumerator **FAST_PROV_ACT_SUSPEND**

enumerator **FAST_PROV_ACT_EXIT**

enumerator **FAST_PROV_ACT_MAX**

enum **esp_ble_mesh_proxy_filter_type_t**

Values:

enumerator **PROXY_FILTER_WHITELIST**

enumerator **PROXY_FILTER_BLACKLIST**

enum **esp_ble_mesh_prov_cb_event_t**

Values:

enumerator **ESP_BLE_MESH_PROV_REGISTER_COMP_EVT**

Initialize BLE Mesh provisioning capabilities and internal data information completion event

enumerator **ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT**

Set the unprovisioned device name completion event

enumerator **ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT**
Enable node provisioning functionality completion event

enumerator **ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT**
Disable node provisioning functionality completion event

enumerator **ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT**
Establish a BLE Mesh link event

enumerator **ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT**
Close a BLE Mesh link event

enumerator **ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT**
Generate Node input OOB public key event

enumerator **ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT**
Generate Node Output Number event

enumerator **ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT**
Generate Node Output String event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_EVT**
Event requiring the user to input a number or string

enumerator **ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT**
Provisioning done event

enumerator **ESP_BLE_MESH_NODE_PROV_RESET_EVT**
Provisioning reset event

enumerator **ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT**
Node set oob public key completion event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT**
Node input number completion event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT**
Node input string completion event

enumerator **ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT**
Enable BLE Mesh Proxy Identity advertising completion event

enumerator **ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT**
Enable BLE Mesh GATT Proxy Service completion event

enumerator **ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT**
Disable BLE Mesh GATT Proxy Service completion event

enumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT**

Node add NetKey locally completion event

enumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT**

Node add AppKey locally completion event

enumerator **ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT**

Node bind AppKey to model locally completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT**

Provisioner enable provisioning functionality completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT**

Provisioner disable provisioning functionality completion event

enumerator **ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT**

Provisioner receives unprovisioned device beacon event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT**

Provisioner read unprovisioned device OOB public key event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT**

Provisioner input value for provisioning procedure event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT**

Provisioner output value for provisioning procedure event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT**

Provisioner establish a BLE Mesh link event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT**

Provisioner close a BLE Mesh link event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT**

Provisioner provisioning done event

enumerator **ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT**

Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT**

Provisioner start to provision an unprovisioned device completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT**

Provisioner delete a device from the list, close provisioning link with the device completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT**

Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT**
Provisioner set net_idx/flags/iv_index used for provisioning completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT**
Provisioner set static oob value used for provisioning completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT**
Provisioner set unicast address of primary element completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT**
Provisioner read unprovisioned device OOB public key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT**
Provisioner input number completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT**
Provisioner input string completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT**
Provisioner set node name completion event

enumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT**
Provisioner add local app key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT**
Provisioner update local app key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT**
Provisioner bind local model with local app key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT**
Provisioner add local network key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT**
Provisioner update local network key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT**
Provisioner store node composition data completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT**
Provisioner delete node with uuid completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT**
Provisioner delete node with unicast address completion event

enumerator **ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT**
Provisioner start to receive heartbeat message completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT**
Provisioner set the heartbeat filter type completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT**
Provisioner set the heartbeat filter information completion event

enumerator **ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT**
Provisioner receive heartbeat message event

enumerator **ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT**
Provisioner directly erase settings completion event

enumerator **ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner open settings with index completion event

enumerator **ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT**
Provisioner open settings with user id completion event

enumerator **ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner close settings with index completion event

enumerator **ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT**
Provisioner close settings with user id completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner delete settings with index completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT**
Provisioner delete settings with user id completion event

enumerator **ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT**
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

enumerator **ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT**
Set fast provisioning action completion event

enumerator **ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT**
Receive Heartbeat message event

enumerator **ESP_BLE_MESH_LPN_ENABLE_COMP_EVT**
Enable Low Power Node completion event

enumerator **ESP_BLE_MESH_LPN_DISABLE_COMP_EVT**
Disable Low Power Node completion event

enumerator **ESP_BLE_MESH_LPN_POLL_COMP_EVT**
Low Power Node send Friend Poll completion event

enumerator **ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT**

Low Power Node establishes friendship event

enumerator **ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT**

Low Power Node terminates friendship event

enumerator **ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT**

Friend Node establishes friendship event

enumerator **ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT**

Friend Node terminates friendship event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT**

Proxy Client receives Network ID advertising packet event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT**

Proxy Client establishes connection successfully event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT**

Proxy Client terminates connection successfully event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT**

Proxy Client receives Proxy Filter Status event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT**

Proxy Client connect completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT**

Proxy Client disconnect completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT**

Proxy Client set filter type completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT**

Proxy Client add filter address completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT**

Proxy Client remove filter address completion event

enumerator **ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT**

Proxy Server establishes connection successfully event

enumerator **ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT**

Proxy Server terminates connection successfully event

enumerator **ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT**

Local model subscribes group address completion event

enumerator **ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT**

Local model unsubscribes group address completion event

enumerator **ESP_BLE_MESH_DEINIT_MESH_COMP_EVT**

De-initialize BLE Mesh stack completion event

enumerator **ESP_BLE_MESH_PROV_EVT_MAX**

enum **[anonymous]**

BLE Mesh server models related definitions.

This enum value is the flag of transition timer operation

Values:

enumerator **ESP_BLE_MESH_SERVER_TRANS_TIMER_START**

enumerator **ESP_BLE_MESH_SERVER_FLAG_MAX**

enum **esp_ble_mesh_server_state_type_t**

This enum value is the type of server model states

Values:

enumerator **ESP_BLE_MESH_GENERIC_ONOFF_STATE**

enumerator **ESP_BLE_MESH_GENERIC_LEVEL_STATE**

enumerator **ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE**

enumerator **ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE**

enumerator **ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_HUE_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE**

enumerator **ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE**

enumerator **ESP_BLE_MESH_SERVER_MODEL_STATE_MAX**

enum **esp_ble_mesh_model_cb_event_t**

Values:

enumerator **ESP_BLE_MESH_MODEL_OPERATION_EVT**

User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

enumerator **ESP_BLE_MESH_MODEL_SEND_COMP_EVT**

User-defined models send messages completion event

enumerator **ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT**

User-defined models publish messages completion event

enumerator **ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT**

User-defined client models receive publish messages event

enumerator **ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT**

Timeout event for the user-defined client models that failed to receive response from peer server models

enumerator **ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT**

When a model is configured to publish messages periodically, this event will occur during every publish period

enumerator **ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT**

Server models update state value completion event

enumerator **ESP_BLE_MESH_MODEL_EVT_MAX**

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- *ESP-BLE-MESH Stack Initialization*
- *Reading of Local Data Information*
- *Low Power Operation (Updating)*
- *Send/Publish Messages, add Local AppKey, etc.*
- *ESP-BLE-MESH Node/Provisioner Provisioning*
- *ESP-BLE-MESH GATT Proxy Server*

ESP-BLE-MESH Stack Initialization

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h

Functions

esp_err_t **esp_ble_mesh_init** (*esp_ble_mesh_prov_t* *prov, *esp_ble_mesh_comp_t* *comp)

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

备注: After calling this API, the device needs to call esp_ble_mesh_prov_enable() to enable provisioning functionality again.

参数

- **prov** –**[in]** Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- **comp** –**[in]** Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_deinit** (*esp_ble_mesh_deinit_param_t* *param)

De-initialize BLE Mesh module.

备注: This function shall be invoked after esp_ble_mesh_client_model_deinit().

参数 **param** –**[in]** Pointer to the structure of BLE Mesh deinit parameters.

返回 ESP_OK on success or error code otherwise.

Reading of Local Data Information

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h

Functions

int32_t **esp_ble_mesh_get_model_publish_period** (*esp_ble_mesh_model_t* *model)

Get the model publish period, the unit is ms.

参数 **model** –**[in]** Model instance pointer.

返回 Publish period value on success, 0 or (negative) error code from errno.h on failure.

uint16_t **esp_ble_mesh_get_primary_element_address** (void)

Get the address of the primary element.

返回 Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

uint16_t ***esp_ble_mesh_is_model_subscribed_to_group** (*esp_ble_mesh_model_t* *model, uint16_t group_addr)

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

参数

- **model** –**[in]** Pointer to the model.
- **group_addr** –**[in]** Group address.

返回 Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

esp_ble_mesh_elem_t ***esp_ble_mesh_find_element**(uint16_t element_addr)

Find the BLE Mesh element pointer via the element address.

参数 **element_addr** –**[in]** Element address.
返回 Pointer to the element on success, or NULL on failure.

uint8_t **esp_ble_mesh_get_element_count**(void)

Get the number of elements that have been registered.

返回 Number of elements.

esp_ble_mesh_model_t ***esp_ble_mesh_find_vendor_model**(const *esp_ble_mesh_elem_t* *element, uint16_t company_id, uint16_t model_id)

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

参数
- **element** –**[in]** Element to which the model belongs.
- **company_id** –**[in]** A 16-bit company identifier assigned by the Bluetooth SIG.
- **model_id** –**[in]** A 16-bit vendor-assigned model identifier.

返回 Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

esp_ble_mesh_model_t ***esp_ble_mesh_find_sig_model**(const *esp_ble_mesh_elem_t* *element, uint16_t model_id)

Find the SIG model with the given element and Model id.

参数
- **element** –**[in]** Element to which the model belongs.
- **model_id** –**[in]** SIG model identifier.

返回 Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

const *esp_ble_mesh_comp_t* ***esp_ble_mesh_get_composition_data**(void)

Get the Composition data which has been registered.

返回 Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

esp_err_t **esp_ble_mesh_model_subscribe_group_addr**(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner subscribes a group address.

备注: This function shall not be invoked before node is provisioned or Provisioner is enabled.

参数
- **element_addr** –**[in]** Unicast address of the element to which the model belongs.
- **company_id** –**[in]** A 16-bit company identifier.
- **model_id** –**[in]** A 16-bit model identifier.
- **group_addr** –**[in]** The group address to be subscribed.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_model_unsubscribe_group_addr**(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner unsubscribes a group address.

备注： This function shall not be invoked before node is provisioned or Provisioner is enabled.

参数
- **element_addr** –**[in]** Unicast address of the element to which the model belongs.
- **company_id** –**[in]** A 16-bit company identifier.
- **model_id** –**[in]** A 16-bit model identifier.
- **group_addr** –**[in]** The subscribed group address.

返回 ESP_OK on success or error code otherwise.

const uint8_t ***esp_ble_mesh_node_get_local_net_key**(uint16_t net_idx)

This function is called by Node to get the local NetKey.

参数 **net_idx** –**[in]** NetKey index.
返回 NetKey on success, or NULL on failure.

const uint8_t ***esp_ble_mesh_node_get_local_app_key**(uint16_t app_idx)

This function is called by Node to get the local AppKey.

参数 **app_idx** –**[in]** AppKey index.
返回 AppKey on success, or NULL on failure.

esp_err_t **esp_ble_mesh_node_add_local_net_key**(const uint8_t net_key[16], uint16_t net_idx)

This function is called by Node to add a local NetKey.

备注： This function can only be called after the device is provisioned.

参数
- **net_key** –**[in]** NetKey to be added.
- **net_idx** –**[in]** NetKey Index.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_add_local_app_key**(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called by Node to add a local AppKey.

备注： The net_idx must be an existing one. This function can only be called after the device is provisioned.

参数
- **app_key** –**[in]** AppKey to be added.
- **net_idx** –**[in]** NetKey Index.
- **app_idx** –**[in]** AppKey Index.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_bind_app_key_to_local_model**(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)

This function is called by Node to bind AppKey to model locally.

备注： If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

参数

- **element_addr** –**[in]** Node local element address
- **company_id** –**[in]** Node local company id
- **model_id** –**[in]** Node local model id
- **app_idx** –**[in]** Node local appkey index

返回 ESP_OK on success or error code otherwise.

Low Power Operation (Updating)

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

Functions

esp_err_t **esp_ble_mesh_lpn_enable**(void)

Enable BLE Mesh device LPN functionality.

备注: This API enables LPN functionality. Once called, the proper Friend Request will be sent.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_lpn_disable**(bool force)

Disable BLE Mesh device LPN functionality.

参数 **force** –**[in]** when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_lpn_poll**(void)

LPN tries to poll messages from the Friend Node.

备注: The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

返回 ESP_OK on success or error code otherwise.

Send/Publish Messages, add Local AppKey, etc.

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

Functions

esp_err_t **esp_ble_mesh_register_custom_model_callback**(*esp_ble_mesh_model_cb_t* callback)

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

备注： The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

参数 **callback** –**[in]** Pointer to the callback function.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_model_msg_opcode_init**(uint8_t *data, uint32_t opcode)

Add the message opcode to the beginning of the model message before sending or publishing the model message.

备注： This API is only used to set the opcode of the message.

参数

- **data** –**[in]** Pointer to the message data.
- **opcode** –**[in]** The message opcode.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_client_model_init**(*esp_ble_mesh_model_t* *model)

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variabled within the user_data(defined using esp_ble_mesh_client_t_) of the client model need to be initialized.

参数 **model** –**[in]** BLE Mesh Client model to which the message belongs.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_client_model_deinit**(*esp_ble_mesh_model_t* *model)

De-initialize the user-defined client model.

备注： This function shall be invoked before esp_ble_mesh_deinit() is called.

参数 **model** –**[in]** Pointer of the Client model.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_server_model_send_msg**(*esp_ble_mesh_model_t* *model, *esp_ble_mesh_msg_ctx_t* *ctx, uint32_t opcode, uint16_t length, uint8_t *data)

Send server model messages(such as server model status messages).

参数

- **model** –**[in]** BLE Mesh Server Model to which the message belongs.
- **ctx** –**[in]** Message context, includes keys, TTL, etc.
- **opcode** –**[in]** Message opcode.
- **length** –**[in]** Message length (exclude the message opcode).
- **data** –**[in]** Parameters of Access Payload (exclude the message opcode) to be sent.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_client_model_send_msg**(*esp_ble_mesh_model_t* *model, *esp_ble_mesh_msg_ctx_t* *ctx, uint32_t opcode, uint16_t length, uint8_t *data, int32_t msg_timeout, bool need_rsp, *esp_ble_mesh_dev_role_t* device_role)

Send client model message (such as model get, set, etc).

参数

- **model** –**[in]** BLE Mesh Client Model to which the message belongs.
- **ctx** –**[in]** Message context, includes keys, TTL, etc.
- **opcode** –**[in]** Message opcode.
- **length** –**[in]** Message length (exclude the message opcode).
- **data** –**[in]** Parameters of the Access Payload (exclude the message opcode) to be sent.
- **msg_timeout** –**[in]** Time to get response to the message (in milliseconds).
- **need_rsp** –**[in]** TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- **device_role** –**[in]** Role of the device (Node/Provisioner) that sends the message.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_model_publish**(*esp_ble_mesh_model_t* *model, uint32_t opcode, uint16_t length, uint8_t *data, *esp_ble_mesh_dev_role_t* device_role)

Send a model publication message.

备注: Before calling this function, the user needs to ensure that the model publication message (*esp_ble_mesh_model_pub_t::msg*) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

参数

- **model** –**[in]** Mesh (client) Model publishing the message.
- **opcode** –**[in]** Message opcode.
- **length** –**[in]** Message length (exclude the message opcode).
- **data** –**[in]** Parameters of the Access Payload (exclude the message opcode) to be sent.
- **device_role** –**[in]** Role of the device (node/provisioner) publishing the message of the type esp_ble_mesh_dev_role_t.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_server_model_update_state**(*esp_ble_mesh_model_t* *model, *esp_ble_mesh_server_state_type_t* type, *esp_ble_mesh_server_state_value_t* *value)

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

备注: Currently this API is used to update bound state value, not for all server model states.

参数

- **model** –**[in]** Server model which is going to update the state.
- **type** –**[in]** Server model state type.
- **value** –**[in]** Server model state value.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_local_reset**(void)

Reset the provisioning procedure of the local BLE Mesh node.

备注： All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_node_name**(uint16_t index, const char *name)

This function is called to set the node (provisioned device) name.

备注： index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

参数

- **index** –**[in]** Index of the node in the node queue.
- **name** –**[in]** Name (end by '\0') to be set for the node.

返回 ESP_OK on success or error code otherwise.

const char ***esp_ble_mesh_provisioner_get_node_name**(uint16_t index)

This function is called to get the node (provisioned device) name.

备注： index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

参数 **index** –**[in]** Index of the node in the node queue.

返回 Node name on success, or NULL on failure.

uint16_t **esp_ble_mesh_provisioner_get_node_index**(const char *name)

This function is called to get the node (provisioned device) index.

参数 **name** –**[in]** Name of the node (end by '\0').

返回 Node index on success, or an invalid value (0xFFFF) on failure.

esp_err_t **esp_ble_mesh_provisioner_store_node_comp_data**(uint16_t unicast_addr, uint8_t *data, uint16_t length)

This function is called to store the Composition Data of the node.

参数

- **unicast_addr** –**[in]** Element address of the node
- **data** –**[in]** Pointer of Composition Data
- **length** –**[in]** Length of Composition Data

返回 ESP_OK on success or error code otherwise.

esp_ble_mesh_node_t ***esp_ble_mesh_provisioner_get_node_with_uuid**(const uint8_t uuid[16])

This function is called to get the provisioned node information with the node device uuid.

参数 **uuid** –**[in]** Device UUID of the node

返回 Pointer of the node info struct or NULL on failure.

esp_ble_mesh_node_t ***esp_ble_mesh_provisioner_get_node_with_addr**(uint16_t unicast_addr)

This function is called to get the provisioned node information with the node unicast address.

参数 **unicast_addr** –**[in]** Unicast address of the node

返回 Pointer of the node info struct or NULL on failure.

esp_ble_mesh_node_t ***esp_ble_mesh_provisioner_get_node_with_name**(const char *name)

This function is called to get the provisioned node information with the node name.

参数 **name** –**[in]** Name of the node (end by '\0').

返回 Pointer of the node info struct or NULL on failure.

uint16_t **esp_ble_mesh_provisioner_get_prov_node_count**(void)

This function is called by Provisioner to get provisioned node count.

返回 Number of the provisioned nodes.

const *esp_ble_mesh_node_t* ****esp_ble_mesh_provisioner_get_node_table_entry**(void)

This function is called by Provisioner to get the entry of the node table.

备 注: After invoking the function to get the entry of nodes, users can use the "for" loop combined with the macro CONFIG_BLE_MESH_MAX_PROV_NODES to get each node's information. Before trying to read the node's information, users need to check if the node exists, i.e. if the *(*esp_ble_mesh_node_t* **node) is NULL. For example: "" const *esp_ble_mesh_node_t* **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const *esp_ble_mesh_node_t* *node = entry[i]; if (node) { ……} } ""

返回 Pointer to the start of the node table.

esp_err_t **esp_ble_mesh_provisioner_delete_node_with_uuid**(const uint8_t uuid[16])

This function is called to delete the provisioned node information with the node device uuid.

参数 **uuid** –**[in]** Device UUID of the node
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_node_with_addr**(uint16_t unicast_addr)

This function is called to delete the provisioned node information with the node unicast address.

参数 **unicast_addr** –**[in]** Unicast address of the node
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_add_local_app_key**(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called to add a local AppKey for Provisioner.

备注: app_key: If set to NULL, app_key will be generated internally. net_idx: Should be an existing one. app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

参数

- **app_key** –**[in]** The app key to be set for the local BLE Mesh stack.
- **net_idx** –**[in]** The network key index.
- **app_idx** –**[in]** The app key index.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_update_local_app_key**(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is used to update a local AppKey for Provisioner.

参数

- **app_key** –**[in]** Value of the AppKey.
- **net_idx** –**[in]** Corresponding NetKey Index.
- **app_idx** –**[in]** The AppKey Index

返回 ESP_OK on success or error code otherwise.

const uint8_t *esp_ble_mesh_provisioner_get_local_app_key(uint16_t net_idx, uint16_t app_idx)

This function is called by Provisioner to get the local app key value.

参数
- net_idx –[in] Network key index.
- app_idx –[in] Application key index.

返回 App key on success, or NULL on failure.

esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model(uint16_t element_addr, uint16_t app_idx, uint16_t model_id, uint16_t company_id)

This function is called by Provisioner to bind own model with proper app key.

备注: company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

参数
- element_addr –[in] Provisioner local element address
- app_idx –[in] Provisioner local appkey index
- model_id –[in] Provisioner local model id
- company_id –[in] Provisioner local company id

返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to add local network key.

备注: net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

参数
- net_key –[in] The network key to be added to the Provisioner local BLE Mesh stack.
- net_idx –[in] The network key index.

返回 ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_update_local_net_key(const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to update a local network key.

参数
- net_key –[in] Value of the NetKey.
- net_idx –[in] The NetKey Index.

返回 ESP_OK on success or error code otherwise.

const uint8_t *esp_ble_mesh_provisioner_get_local_net_key(uint16_t net_idx)

This function is called by Provisioner to get the local network key value.

参数 net_idx –[in] Network key index.

返回 Network key on success, or NULL on failure.

esp_err_t esp_ble_mesh_provisioner_recv_heartbeat(bool enable)

This function is called by Provisioner to enable or disable receiving heartbeat messages.

备注： If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

参数 **enable** –**[in]** Enable or disable receiving heartbeat messages.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_heartbeat_filter_type**(uint8_t type)

This function is called by Provisioner to set the heartbeat filter type.

备注： 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

a. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

参数 **type** –**[in]** Heartbeat filter type (acceptlist or rejectlist).
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_heartbeat_filter_info**(uint8_t op, *esp_ble_mesh_heartbeat_filter_info_t* *info)

This function is called by Provisioner to add or remove a heartbeat filter entry.

a. If the operation is "REMOVE", the "hb_src" can be set to the SRC (can only be a unicast address) of heartbeat messages, and the "hb_dst" can be set to the DST (unicast address or group address), at least one of them needs to be set.
   - The filter entry with the same SRC or DST will be removed.

备注： 1. If the operation is "ADD", the "hb_src" can be set to the SRC (can only be a unicast address) of heartbeat messages, and the "hb_dst" can be set to the DST (unicast address or group address), at least one of them needs to be set.

- If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
- If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
- If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

参数
- **op** –**[in]** Add or REMOVE
- **info** –**[in]** Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_direct_erase_settings**(void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

备注： This function can be invoked when the mesh stack is not initialized or has been de-initialized.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_open_settings_with_index**(uint8_t index)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

备注： Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

参数 **index** –**[in]** Settings index.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_open_settings_with_uid**(const char *uid)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

备注： Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

参数 **uid** –**[in]** Settings user id.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_close_settings_with_index**(uint8_t index, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

备注： 1. Before closing the nvs namespace, it must be open.

a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the "erase" flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the "erase" flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) …….

参数

- **index** –**[in]** Settings index.
- **erase** –**[in]** Indicate if erasing mesh information.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_close_settings_with_uid**(const char *uid, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

备注： 1. Before closing the nvs namespace, it must be open.

a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the "erase" flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the "erase" flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) …….

参数

- **uid** –**[in]** Settings user id.
- **erase** –**[in]** Indicate if erasing mesh information.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_settings_with_index**(uint8_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

备注: When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

参数 **index** –**[in]** Settings index.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_settings_with_uid**(const char *uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

备注: When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

参数 **uid** –**[in]** Settings user id.

返回 ESP_OK on success or error code otherwise.

const char ***esp_ble_mesh_provisioner_get_settings_uid**(uint8_t index)

This function is called by Provisioner to get settings user id.

参数 **index** –**[in]** Settings index.

返回 Setting user id on success or NULL on failure.

uint8_t **esp_ble_mesh_provisioner_get_settings_index**(const char *uid)

This function is called by Provisioner to get settings index.

参数 **uid** –**[in]** Settings user id.

返回 Settings index.

uint8_t **esp_ble_mesh_provisioner_get_free_settings_count**(void)

This function is called by Provisioner to get the number of free settings user id.

返回 Number of free settings user id.

const uint8_t ***esp_ble_mesh_get_fast_prov_app_key**(uint16_t net_idx, uint16_t app_idx)

This function is called to get fast provisioning application key.

参数

- **net_idx** –**[in]** Network key index.
- **app_idx** –**[in]** Application key index.

返回 Application key on success, or NULL on failure.

Type Definitions

typedef void (***esp_ble_mesh_model_cb_t**)(*esp_ble_mesh_model_cb_event_t* event, *esp_ble_mesh_model_cb_param_t* *param)

: event, event code of user-defined model events; param, parameters of user-defined model events

ESP-BLE-MESH Node/Provisioner Provisioning

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

Functions

esp_err_t **esp_ble_mesh_register_prov_callback**(*esp_ble_mesh_prov_cb_t* callback)

Register BLE Mesh provisioning callback.

参数 **callback** –**[in]** Pointer to the callback function.
返回 ESP_OK on success or error code otherwise.

bool **esp_ble_mesh_node_is_provisioned**(void)

Check if a device has been provisioned.

返回 TRUE if the device is provisioned, FALSE if the device is unprovisioned.

esp_err_t **esp_ble_mesh_node_prov_enable**(*esp_ble_mesh_prov_bearer_t* bearers)

Enable specific provisioning bearers to get the device ready for provisioning.

备注: PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

参数 **bearers** –Bit-wise OR of provisioning bearers.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_prov_disable**(*esp_ble_mesh_prov_bearer_t* bearers)

Disable specific provisioning bearers to make a device inaccessible for provisioning.

参数 **bearers** –Bit-wise OR of provisioning bearers.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_set_oob_pub_key**(uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])

Unprovisioned device set own oob public key & private key pair.

备注: In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

参数

- **pub_key_x** –**[in]** Unprovisioned device’s Public Key X
- **pub_key_y** –**[in]** Unprovisioned device’s Public Key Y
- **private_key** –**[in]** Unprovisioned device’s Private Key

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_input_number**(uint32_t number)

Provide provisioning input OOB number.

备注: This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

参数 **number** –**[in]** Number input by device.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_input_string**(const char *string)

Provide provisioning input OOB string.

备注: This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

参数 **string** –**[in]** String input by device.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_set_unprovisioned_device_name**(const char *name)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

备注: This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn't apply to PB-ADV mode.

参数 **name** –**[in]** Unprovisioned device name
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_read_oob_pub_key**(uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])

Provisioner inputs unprovisioned device's oob public key.

备注: In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

参数

- **link_idx** –**[in]** The provisioning link index
- **pub_key_x** –**[in]** Unprovisioned device's Public Key X
- **pub_key_y** –**[in]** Unprovisioned device's Public Key Y

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_input_string**(const char *string, uint8_t link_idx)

Provide provisioning input OOB string.

```
        This is intended to be called after the esp_ble_mesh_prov_t prov_
↪input_num
        callback has been called with ESP_BLE_MESH_ENTER_STRING as the␣
↪action.
```

参数

- **string** –**[in]** String input by Provisioner.
- **link_idx** –**[in]** The provisioning link index.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_input_number**(uint32_t number, uint8_t link_idx)

Provide provisioning input OOB number.

```
        This is intended to be called after the esp_ble_mesh_prov_t prov_
↪input_num
        callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the␣
↪action.
```

参数

- **number** –**[in]** Number input by Provisioner.
- **link_idx** –**[in]** The provisioning link index.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_prov_enable**(*esp_ble_mesh_prov_bearer_t* bearers)

Enable one or more provisioning bearers.

备注: PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

参数 **bearers** –**[in]** Bit-wise OR of provisioning bearers.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_prov_disable**(*esp_ble_mesh_prov_bearer_t* bearers)

Disable one or more provisioning bearers.

备注: PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

参数 **bearers** –**[in]** Bit-wise OR of provisioning bearers.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_add_unprov_dev**(*esp_ble_mesh_unprov_dev_add_t* *add_dev, *esp_ble_mesh_dev_add_flag_t* flags)

Add unprovisioned device info to the unprov_dev queue.

备注: : 1. Currently address type only supports public address and static random address.

a. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
b. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device' s advertising packets, it will start provisioning the device internally.
   - In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.
c. Another example is when the Provisioner receives the unprovisioned device' s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.
   - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.

- If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
- Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

参数

- **add_dev** –**[in]** Pointer to a struct containing the device information
- **flags** –**[in]** Flags indicate several operations on the device information
  - Remove device information from queue after device has been provisioned (BIT0)
  - Start provisioning immediately after device is added to queue (BIT1)
  - Device can be removed if device queue is full (BIT2)

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_prov_device_with_addr**(const uint8_t uuid[16], *esp_ble_mesh_bd_addr_t* addr, *esp_ble_mesh_addr_type_t* addr_type, *esp_ble_mesh_prov_bearer_t* bearer, uint16_t oob_info, uint16_t unicast_addr)

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

备注: : 1. Currently address type only supports public address and static random address.

a. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.
b. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
c. Recommend to use only one of the functions "esp_ble_mesh_provisioner_add_unprov_dev" and "esp_ble_mesh_provisioner_prov_device_with_addr" by a Provisioner.

参数

- **uuid** –**[in]** Device UUID of the unprovisioned device
- **addr** –**[in]** Device address of the unprovisioned device
- **addr_type** –**[in]** Device address type of the unprovisioned device
- **bearer** –**[in]** Provisioning bearer going to be used by Provisioner
- **oob_info** –**[in]** OOB info of the unprovisioned device
- **unicast_addr** –**[in]** Unicast address going to be allocated for the unprovisioned device

返回 Zero on success or (negative) error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_dev**(*esp_ble_mesh_device_delete_t* *del_dev)

Delete device from queue, and reset current provisioning link with the device.

备注: If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

参数 **del_dev** –**[in]** Pointer to a struct containing the device information.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_dev_uuid_match**(const uint8_t *match_val, uint8_t match_len, uint8_t offset, bool prov_after_match)

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

参数
- **match_val** –**[in]** Value to be compared with the part of the device UUID.
- **match_len** –**[in]** Length of the compared match value.
- **offset** –**[in]** Offset of the device UUID to be compared (based on zero).
- **prov_after_match** –**[in]** Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_prov_data_info**(*esp_ble_mesh_prov_data_info_t* *prov_data_info)

This function is called by Provisioner to set provisioning data information before starting to provision.

参数 **prov_data_info** –**[in]** Pointer to a struct containing net_idx or flags or iv_index.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_static_oob_value**(const uint8_t *value, uint8_t length)

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

备注: The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

参数
- **value** –**[in]** Pointer to the static oob value.
- **length** –**[in]** Length of the static oob value.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_primary_elem_addr**(uint16_t addr)

This function is called by Provisioner to set own Primary element address.

备注: This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct *esp_ble_mesh_prov_t* will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

参数 **addr** –**[in]** Unicast address of the Primary element of Provisioner.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_set_fast_prov_info**(*esp_ble_mesh_fast_prov_info_t* *fast_prov_info)

This function is called to set provisioning data information before starting fast provisioning.

参数 **fast_prov_info** –**[in]** Pointer to a struct containing unicast address range, net_idx, etc.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_set_fast_prov_action**(*esp_ble_mesh_fast_prov_action_t* action)

This function is called to start/suspend/exit fast provisioning.

参数 **action** –**[in]** fast provisioning action (i.e. enter, suspend, exit).
返回 ESP_OK on success or error code otherwise.

Type Definitions

typedef void (***esp_ble_mesh_prov_cb_t**)(*esp_ble_mesh_prov_cb_event_t* event, *esp_ble_mesh_prov_cb_param_t* *param)

: event, event code of provisioning events; param, parameters of provisioning events

typedef void (***esp_ble_mesh_prov_adv_cb_t**)(const *esp_ble_mesh_bd_addr_t* addr, const *esp_ble_mesh_addr_type_t* addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info, *esp_ble_mesh_prov_bearer_t* bearer)

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

Param addr **[in]** Pointer to the unprovisioned device address.
Param addr_type **[in]** Unprovisioned device address type.
Param adv_type **[in]** Adv packet type(ADV_IND or ADV_NONCONN_IND).
Param dev_uuid **[in]** Unprovisioned device UUID pointer.
Param oob_info **[in]** OOB information of the unprovisioned device.
Param bearer **[in]** Adv packet received from PB-GATT or PB-ADV bearer.

ESP-BLE-MESH GATT Proxy Server

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h

Functions

esp_err_t **esp_ble_mesh_proxy_identity_enable**(void)

Enable advertising with Node Identity.

备注: This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_gatt_enable**(void)

Enable BLE Mesh GATT Proxy Service.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_gatt_disable**(void)

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_connect**(*esp_ble_mesh_bd_addr_t* addr, *esp_ble_mesh_addr_type_t* addr_type, uint16_t net_idx)

Proxy Client creates a connection with the Proxy Server.

参数

- **addr** –**[in]** Device address of the Proxy Server.
- **addr_type** –**[in]** Device address type(public or static random).
- **net_idx** –**[in]** NetKey Index related with Network ID in the Mesh Proxy advertising packet.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_disconnect**(uint8_t conn_handle)

Proxy Client terminates a connection with the Proxy Server.

参数 **conn_handle** –**[in]** Proxy connection handle.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_set_filter_type**(uint8_t conn_handle, uint16_t net_idx, *esp_ble_mesh_proxy_filter_type_t* filter_type)

Proxy Client sets the filter type of the Proxy Server.

参数

- **conn_handle** –**[in]** Proxy connection handle.
- **net_idx** –**[in]** Corresponding NetKey Index.
- **filter_type** –**[in]** whitelist or blacklist.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_add_filter_addr**(uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)

Proxy Client adds address to the Proxy Server filter list.

参数

- **conn_handle** –**[in]** Proxy connection handle.
- **net_idx** –**[in]** Corresponding NetKey Index.
- **addr** –**[in]** Pointer to the filter address.
- **addr_num** –**[in]** Number of the filter address.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_remove_filter_addr**(uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)

Proxy Client removes address from the Proxy Server filter list.

参数

- **conn_handle** –**[in]** Proxy connection handle.
- **net_idx** –**[in]** Corresponding NetKey Index.
- **addr** –**[in]** Pointer to the filter address.
- **addr_num** –**[in]** Number of the filter address.

返回 ESP_OK on success or error code otherwise.

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- *Configuration Client/Server Models*
- *Health Client/Server Models*
- *Generic Client/Server Models*
- *Sensor Client/Server Models*
- *Time and Scenes Client/Server Models*
- *Lighting Client/Server Models*

备注： Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

Functions

esp_err_t **esp_ble_mesh_register_config_client_callback**(*esp_ble_mesh_cfg_client_cb_t* callback)

Register BLE Mesh Config Client Model callback.

参数 **callback** –**[in]** Pointer to the callback function.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_config_server_callback**(*esp_ble_mesh_cfg_server_cb_t* callback)

Register BLE Mesh Config Server Model callback.

参数 **callback** –**[in]** Pointer to the callback function.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_config_client_get_state**(*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_cfg_client_get_state_t* *get_state)

Get the value of Config Server Model states using the Config Client Model get messages.

备注： If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h

参数

- **params** –**[in]** Pointer to BLE Mesh common client parameters.
- **get_state** –**[in]** Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_config_client_set_state**(*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_cfg_client_set_state_t* *set_state)

Set the value of the Configuration Server Model states using the Config Client Model set messages.

备注： If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_mesh_defs.h

参数

- **params** –**[in]** Pointer to BLE Mesh common client parameters.
- **set_state** –**[in]** Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

Unions

union **esp_ble_mesh_cfg_client_get_state_t**

esp_ble_mesh_cfg_model_sub_status_cb_t **model_sub_status**

The model subscription status value

esp_ble_mesh_cfg_net_key_status_cb_t **netkey_status**

The netkey status value

esp_ble_mesh_cfg_app_key_status_cb_t **appkey_status**

The appkey status value

esp_ble_mesh_cfg_mod_app_status_cb_t **model_app_status**

The model app status value

esp_ble_mesh_cfg_friend_status_cb_t **friend_status**

The friend status value

esp_ble_mesh_cfg_hb_pub_status_cb_t **heartbeat_pub_status**

The heartbeat publication status value

esp_ble_mesh_cfg_hb_sub_status_cb_t **heartbeat_sub_status**

The heartbeat subscription status value

esp_ble_mesh_cfg_net_trans_status_cb_t **net_transmit_status**

The network transmit status value

esp_ble_mesh_cfg_model_sub_list_cb_t **model_sub_list**

The model subscription list value

esp_ble_mesh_cfg_net_key_list_cb_t **netkey_list**

The network key index list value

esp_ble_mesh_cfg_app_key_list_cb_t **appkey_list**

The application key index list value

esp_ble_mesh_cfg_node_id_status_cb_t **node_identity_status**

The node identity status value

esp_ble_mesh_cfg_model_app_list_cb_t **model_app_list**

The model application key index list value

esp_ble_mesh_cfg_kr_phase_status_cb_t **kr_phase_status**

The key refresh phase status value

esp_ble_mesh_cfg_lpn_pollto_status_cb_t **lpn_timeout_status**

The low power node poll timeout status value

union **esp_ble_mesh_cfg_server_state_change_t**

#include <esp_ble_mesh_config_model_api.h> Configuration Server model state change value union.

Public Members

esp_ble_mesh_state_change_cfg_mod_pub_set_t **mod_pub_set**

The recv_op in ctx can be used to decide which state is changed. Config Model Publication Set

esp_ble_mesh_state_change_cfg_model_sub_add_t **mod_sub_add**

Config Model Subscription Add

esp_ble_mesh_state_change_cfg_model_sub_delete_t **mod_sub_delete**

Config Model Subscription Delete

esp_ble_mesh_state_change_cfg_netkey_add_t **netkey_add**

Config NetKey Add

esp_ble_mesh_state_change_cfg_netkey_update_t **netkey_update**

Config NetKey Update

esp_ble_mesh_state_change_cfg_netkey_delete_t **netkey_delete**

Config NetKey Delete

esp_ble_mesh_state_change_cfg_appkey_add_t **appkey_add**

Config AppKey Add

esp_ble_mesh_state_change_cfg_appkey_update_t **appkey_update**

Config AppKey Update

esp_ble_mesh_state_change_cfg_appkey_delete_t **appkey_delete**

Config AppKey Delete

esp_ble_mesh_state_change_cfg_model_app_bind_t **mod_app_bind**

Config Model App Bind

esp_ble_mesh_state_change_cfg_model_app_unbind_t **mod_app_unbind**

Config Model App Unbind

esp_ble_mesh_state_change_cfg_kr_phase_set_t **kr_phase_set**

Config Key Refresh Phase Set

union **esp_ble_mesh_cfg_server_cb_value_t**

#include <esp_ble_mesh_config_model_api.h> Configuration Server model callback value union.

Public Members

esp_ble_mesh_cfg_server_state_change_t **state_change**

ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT

Structures

struct **esp_ble_mesh_cfg_srv**

Configuration Server Model context

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Configuration Server Model

uint8_t **net_transmit**

Network Transmit state

uint8_t **relay**

Relay Mode state

uint8_t **relay_retransmit**

Relay Retransmit state

uint8_t **beacon**

Secure Network Beacon state

uint8_t **gatt_proxy**

GATT Proxy state

uint8_t **friend_state**

Friend state

uint8_t **default_ttl**

Default TTL

struct k_delayed_work **timer**

Heartbeat Publication timer

uint16_t **dst**

Destination address for Heartbeat messages

uint16_t **count**

Number of Heartbeat messages to be sent

Number of Heartbeat messages received

uint8_t **period**

Period for sending Heartbeat messages

uint8_t **ttl**

TTL to be used when sending Heartbeat messages

uint16_t **feature**

Bit field indicating features that trigger Heartbeat messages when changed

uint16_t **net_idx**

NetKey Index used by Heartbeat Publication

struct *esp_ble_mesh_cfg_srv*::[anonymous] **heartbeat_pub**

Heartbeat Publication

int64_t **expiry**

Timestamp when Heartbeat subscription period is expired

uint16_t **src**

Source address for Heartbeat messages

uint8_t **min_hops**

Minimum hops when receiving Heartbeat messages

uint8_t **max_hops**

Maximum hops when receiving Heartbeat messages

esp_ble_mesh_cb_t **heartbeat_recv_cb**

Optional heartbeat subscription tracking function

struct *esp_ble_mesh_cfg_srv*::[anonymous] **heartbeat_sub**

Heartbeat Subscription

struct **esp_ble_mesh_cfg_composition_data_get_t**

Parameters of Config Composition Data Get.

Public Members

uint8_t **page**

Page number of the Composition Data.

struct **esp_ble_mesh_cfg_model_pub_get_t**

Parameters of Config Model Publication Get.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_sig_model_sub_get_t**

Parameters of Config SIG Model Subscription Get.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

struct **esp_ble_mesh_cfg_vnd_model_sub_get_t**

Parameters of Config Vendor Model Subscription Get.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_app_key_get_t**

Parameters of Config AppKey Get.

Public Members

uint16_t **net_idx**

The network key index

struct **esp_ble_mesh_cfg_node_identity_get_t**

Parameters of Config Node Identity Get.

Public Members

uint16_t **net_idx**

The network key index

struct **esp_ble_mesh_cfg_sig_model_app_get_t**

Parameters of Config SIG Model App Get.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

struct **esp_ble_mesh_cfg_vnd_model_app_get_t**

Parameters of Config Vendor Model App Get.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_kr_phase_get_t**

Parameters of Config Key Refresh Phase Get.

Public Members

uint16_t **net_idx**

The network key index

struct **esp_ble_mesh_cfg_lpn_polltimeout_get_t**

Parameters of Config Low Power Node PollTimeout Get.

Public Members

uint16_t **lpn_addr**

The unicast address of the Low Power node

struct **esp_ble_mesh_cfg_beacon_set_t**

Parameters of Config Beacon Set.

Public Members

uint8_t **beacon**

New Secure Network Beacon state

struct **esp_ble_mesh_cfg_default_ttl_set_t**

Parameters of Config Default TTL Set.

Public Members

uint8_t **ttl**

The default TTL state value

struct **esp_ble_mesh_cfg_friend_set_t**

Parameters of Config Friend Set.

Public Members

uint8_t **friend_state**

The friend state value

struct **esp_ble_mesh_cfg_gatt_proxy_set_t**

Parameters of Config GATT Proxy Set.

Public Members

uint8_t **gatt_proxy**

The GATT Proxy state value

struct **esp_ble_mesh_cfg_relay_set_t**

Parameters of Config Relay Set.

Public Members

uint8_t **relay**

The relay value

uint8_t **relay_retransmit**

The relay retransmit value

struct **esp_ble_mesh_cfg_net_key_add_t**

Parameters of Config NetKey Add.

Public Members

uint16_t **net_idx**

The network key index

uint8_t **net_key**[16]

The network key value

struct **esp_ble_mesh_cfg_app_key_add_t**

Parameters of Config AppKey Add.

Public Members

uint16_t **net_idx**

The network key index

uint16_t **app_idx**

The app key index

uint8_t **app_key**[16]

The app key value

struct **esp_ble_mesh_cfg_model_app_bind_t**

Parameters of Config Model App Bind.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_app_idx**

Index of the app key to bind with the model

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_pub_set_t**

Parameters of Config Model Publication Set.

Public Members

uint16_t **element_addr**

The element address

uint16_t **publish_addr**

Value of the publish address

uint16_t **publish_app_idx**

Index of the application key

bool **cred_flag**

Value of the Friendship Credential Flag

uint8_t **publish_ttl**

Default TTL value for the publishing messages

uint8_t **publish_period**

Period for periodic status publishing

uint8_t **publish_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_add_t**

Parameters of Config Model Subscription Add.

Public Members

uint16_t **element_addr**

The element address

uint16_t **sub_addr**

The address to be added to the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_delete_t**

Parameters of Config Model Subscription Delete.

Public Members

uint16_t **element_addr**

The element address

uint16_t **sub_addr**

The address to be removed from the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_overwrite_t**

Parameters of Config Model Subscription Overwrite.

Public Members

uint16_t **element_addr**

The element address

uint16_t **sub_addr**

The address to be added to the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_va_add_t**

Parameters of Config Model Subscription Virtual Address Add.

Public Members

uint16_t **element_addr**

The element address

uint8_t **label_uuid**[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_va_delete_t**

Parameters of Config Model Subscription Virtual Address Delete.

Public Members

uint16_t **element_addr**

The element address

uint8_t **label_uuid**[16]

The Label UUID of the virtual address to be removed from the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_va_overwrite_t**

Parameters of Config Model Subscription Virtual Address Overwrite.

Public Members

uint16_t **element_addr**

The element address

uint8_t **label_uuid**[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_pub_va_set_t**

Parameters of Config Model Publication Virtual Address Set.

Public Members

uint16_t **element_addr**

The element address

uint8_t **label_uuid**[16]

Value of the Label UUID publish address

uint16_t **publish_app_idx**

Index of the application key

bool **cred_flag**

Value of the Friendship Credential Flag

uint8_t **publish_ttl**

Default TTL value for the publishing messages

uint8_t **publish_period**

Period for periodic status publishing

uint8_t **publish_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_delete_all_t**

Parameters of Config Model Subscription Delete All.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_net_key_update_t**

Parameters of Config NetKey Update.

Public Members

uint16_t **net_idx**

The network key index

uint8_t **net_key**[16]

The network key value

struct **esp_ble_mesh_cfg_net_key_delete_t**

Parameters of Config NetKey Delete.

Public Members

uint16_t **net_idx**

The network key index

struct **esp_ble_mesh_cfg_app_key_update_t**

Parameters of Config AppKey Update.

Public Members

uint16_t **net_idx**

The network key index

uint16_t **app_idx**

The app key index

uint8_t **app_key**[16]

The app key value

struct **esp_ble_mesh_cfg_app_key_delete_t**

Parameters of Config AppKey Delete.

Public Members

uint16_t **net_idx**

The network key index

uint16_t **app_idx**

The app key index

struct **esp_ble_mesh_cfg_node_identity_set_t**

Parameters of Config Node Identity Set.

Public Members

uint16_t **net_idx**

The network key index

uint8_t **identity**

New Node Identity state

struct **esp_ble_mesh_cfg_model_app_unbind_t**

Parameters of Config Model App Unbind.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_app_idx**

Index of the app key to bind with the model

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_kr_phase_set_t**

Parameters of Config Key Refresh Phase Set.

Public Members

uint16_t **net_idx**

The network key index

uint8_t **transition**

New Key Refresh Phase Transition

struct **esp_ble_mesh_cfg_net_transmit_set_t**

Parameters of Config Network Transmit Set.

Public Members

uint8_t **net_transmit**

Network Transmit State

struct **esp_ble_mesh_cfg_heartbeat_pub_set_t**

Parameters of Config Model Heartbeat Publication Set.

Public Members

uint16_t **dst**

Destination address for Heartbeat messages

uint8_t **count**

Number of Heartbeat messages to be sent

uint8_t **period**

Period for sending Heartbeat messages

uint8_t **ttl**

TTL to be used when sending Heartbeat messages

uint16_t **feature**

Bit field indicating features that trigger Heartbeat messages when changed

uint16_t **net_idx**

NetKey Index

struct **esp_ble_mesh_cfg_heartbeat_sub_set_t**

Parameters of Config Model Heartbeat Subscription Set.

Public Members

uint16_t **src**

Source address for Heartbeat messages

uint16_t **dst**

Destination address for Heartbeat messages

uint8_t **period**

Period for receiving Heartbeat messages

struct **esp_ble_mesh_cfg_beacon_status_cb_t**

Parameter of Config Beacon Status

Public Members

uint8_t **beacon**

Secure Network Beacon state value

struct **esp_ble_mesh_cfg_comp_data_status_cb_t**

Parameters of Config Composition Data Status

Public Members

uint8_t **page**

Page number of the Composition Data

struct net_buf_simple ***composition_data**

Pointer to Composition Data for the identified page

struct **esp_ble_mesh_cfg_default_ttl_status_cb_t**

Parameter of Config Default TTL Status

Public Members

uint8_t **default_ttl**

Default TTL state value

struct **esp_ble_mesh_cfg_gatt_proxy_status_cb_t**

Parameter of Config GATT Proxy Status

Public Members

uint8_t **gatt_proxy**

GATT Proxy state value

struct **esp_ble_mesh_cfg_relay_status_cb_t**

Parameters of Config Relay Status

Public Members

uint8_t **relay**

Relay state value

uint8_t **retransmit**

Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)

struct **esp_ble_mesh_cfg_model_pub_status_cb_t**

Parameters of Config Model Publication Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **element_addr**

Address of the element

uint16_t **publish_addr**

Value of the publish address

uint16_t **app_idx**

Index of the application key

bool **cred_flag**

Value of the Friendship Credential Flag

uint8_t **ttl**

Default TTL value for the outgoing messages

uint8_t **period**

Period for periodic status publishing

uint8_t **transmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_cfg_model_sub_status_cb_t**

Parameters of Config Model Subscription Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **element_addr**

Address of the element

uint16_t **sub_addr**

Value of the address

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_cfg_net_key_status_cb_t**

Parameters of Config NetKey Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

Index of the NetKey

struct **esp_ble_mesh_cfg_app_key_status_cb_t**

Parameters of Config AppKey Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

Index of the NetKey

uint16_t **app_idx**

Index of the application key

struct **esp_ble_mesh_cfg_mod_app_status_cb_t**

Parameters of Config Model App Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **element_addr**

Address of the element

uint16_t **app_idx**

Index of the application key

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_cfg_friend_status_cb_t**

Parameter of Config Friend Status

Public Members

uint8_t **friend_state**

Friend state value

struct **esp_ble_mesh_cfg_hb_pub_status_cb_t**

Parameters of Config Heartbeat Publication Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **dst**

Destination address for Heartbeat messages

uint8_t **count**

Number of Heartbeat messages remaining to be sent

uint8_t **period**

Period for sending Heartbeat messages

uint8_t **ttl**

TTL to be used when sending Heartbeat messages

uint16_t **features**

Features that trigger Heartbeat messages when changed

uint16_t **net_idx**

Index of the NetKey

struct **esp_ble_mesh_cfg_hb_sub_status_cb_t**

Parameters of Config Heartbeat Subscription Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **src**

Source address for Heartbeat messages

uint16_t **dst**

Destination address for Heartbeat messages

uint8_t **period**

Remaining Period for processing Heartbeat messages

uint8_t **count**

Number of Heartbeat messages received

uint8_t **min_hops**

Minimum hops when receiving Heartbeat messages

uint8_t **max_hops**

Maximum hops when receiving Heartbeat messages

struct **esp_ble_mesh_cfg_net_trans_status_cb_t**

Parameters of Config Network Transmit Status

Public Members

uint8_t **net_trans_count**

Number of transmissions for each Network PDU originating from the node

uint8_t **net_trans_step**

Maximum hops when receiving Heartbeat messages

struct **esp_ble_mesh_cfg_model_sub_list_cb_t**

Parameters of Config SIG/Vendor Subscription List

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **element_addr**

Address of the element

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct net_buf_simple ***sub_addr**

A block of all addresses from the Subscription List

struct **esp_ble_mesh_cfg_net_key_list_cb_t**

Parameter of Config NetKey List

Public Members

struct net_buf_simple ***net_idx**

A list of NetKey Indexes known to the node

struct **esp_ble_mesh_cfg_app_key_list_cb_t**

Parameters of Config AppKey List

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

NetKey Index of the NetKey that the AppKeys are bound to

struct net_buf_simple ***app_idx**

A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

struct **esp_ble_mesh_cfg_node_id_status_cb_t**

Parameters of Config Node Identity Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

Index of the NetKey

uint8_t **identity**

Node Identity state

struct **esp_ble_mesh_cfg_model_app_list_cb_t**

Parameters of Config SIG/Vendor Model App List

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **element_addr**

Address of the element

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct net_buf_simple ***app_idx**

All AppKey indexes bound to the Model

struct **esp_ble_mesh_cfg_kr_phase_status_cb_t**

Parameters of Config Key Refresh Phase Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

Index of the NetKey

uint8_t **phase**

Key Refresh Phase state

struct **esp_ble_mesh_cfg_lpn_pollto_status_cb_t**

Parameters of Config Low Power Node PollTimeout Status

Public Members

uint16_t **lpn_addr**

The unicast address of the Low Power node

int32_t **poll_timeout**

The current value of the PollTimeout timer of the Low Power node

struct **esp_ble_mesh_cfg_client_cb_param_t**

Configuration Client Model callback parameters

Public Members

int **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters

esp_ble_mesh_cfg_client_common_cb_param_t **status_cb**

The config status message callback values

struct **esp_ble_mesh_state_change_cfg_mod_pub_set_t**

Configuration Server model related context.

Public Members

uint16_t **element_addr**
Element Address

uint16_t **pub_addr**
Publish Address

uint16_t **app_idx**
AppKey Index

bool **cred_flag**
Friendship Credential Flag

uint8_t **pub_ttl**
Publish TTL

uint8_t **pub_period**
Publish Period

uint8_t **pub_retransmit**
Publish Retransmit

uint16_t **company_id**
Company ID

uint16_t **model_id**
Model ID

struct **esp_ble_mesh_state_change_cfg_model_sub_add_t**
Parameters of Config Model Subscription Add

Public Members

uint16_t **element_addr**
Element Address

uint16_t **sub_addr**
Subscription Address

uint16_t **company_id**
Company ID

uint16_t **model_id**
Model ID

struct **esp_ble_mesh_state_change_cfg_model_sub_delete_t**
Parameters of Config Model Subscription Delete

Public Members

uint16_t **element_addr**
Element Address

uint16_t **sub_addr**
Subscription Address

uint16_t **company_id**
Company ID

uint16_t **model_id**
Model ID

struct **esp_ble_mesh_state_change_cfg_netkey_add_t**
Parameters of Config NetKey Add

Public Members

uint16_t **net_idx**
NetKey Index

uint8_t **net_key**[16]
NetKey

struct **esp_ble_mesh_state_change_cfg_netkey_update_t**
Parameters of Config NetKey Update

Public Members

uint16_t **net_idx**
NetKey Index

uint8_t **net_key**[16]
NetKey

struct **esp_ble_mesh_state_change_cfg_netkey_delete_t**
Parameter of Config NetKey Delete

Public Members

uint16_t **net_idx**
NetKey Index

struct **esp_ble_mesh_state_change_cfg_appkey_add_t**
Parameters of Config AppKey Add

Public Members

uint16_t **net_idx**
NetKey Index

uint16_t **app_idx**
AppKey Index

uint8_t **app_key**[16]
AppKey

struct **esp_ble_mesh_state_change_cfg_appkey_update_t**
Parameters of Config AppKey Update

Public Members

uint16_t **net_idx**
NetKey Index

uint16_t **app_idx**
AppKey Index

uint8_t **app_key**[16]
AppKey

struct **esp_ble_mesh_state_change_cfg_appkey_delete_t**
Parameters of Config AppKey Delete

Public Members

uint16_t **net_idx**
NetKey Index

uint16_t **app_idx**
AppKey Index

struct **esp_ble_mesh_state_change_cfg_model_app_bind_t**
Parameters of Config Model App Bind

Public Members

uint16_t **element_addr**
Element Address

uint16_t **app_idx**
AppKey Index

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_state_change_cfg_model_app_unbind_t**

Parameters of Config Model App Unbind

Public Members

uint16_t **element_addr**

Element Address

uint16_t **app_idx**

AppKey Index

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_state_change_cfg_kr_phase_set_t**

Parameters of Config Key Refresh Phase Set

Public Members

uint16_t **net_idx**

NetKey Index

uint8_t **kr_phase**

New Key Refresh Phase Transition

struct **esp_ble_mesh_cfg_server_cb_param_t**

Configuration Server model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the server model structure

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received message

esp_ble_mesh_cfg_server_cb_value_t **value**

Value of the received configuration messages

Macros

ESP_BLE_MESH_MODEL_CFG_SRV(srv_data)

Define a new Config Server Model.

备注： The Config Server Model can only be included by a Primary Element.

参数

- **srv_data** –Pointer to a unique Config Server Model user_data.

返回 New Config Server Model instance.

ESP_BLE_MESH_MODEL_CFG_CLI(cli_data)

Define a new Config Client Model.

备注： The Config Client Model can only be included by a Primary Element.

参数

- **cli_data** –Pointer to a unique struct *esp_ble_mesh_client_t*.

返回 New Config Client Model instance.

Type Definitions

typedef struct *esp_ble_mesh_cfg_srv* **esp_ble_mesh_cfg_srv_t**

Configuration Server Model context

typedef void (***esp_ble_mesh_cfg_client_cb_t**)(*esp_ble_mesh_cfg_client_cb_event_t* event, *esp_ble_mesh_cfg_client_cb_param_t* *param)

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

Param event Event type
Param param Pointer to callback parameter

typedef void (***esp_ble_mesh_cfg_server_cb_t**)(*esp_ble_mesh_cfg_server_cb_event_t* event, *esp_ble_mesh_cfg_server_cb_param_t* *param)

Configuration Server Model callback function type.

Param event Event type
Param param Pointer to callback parameter

Enumerations

enum **esp_ble_mesh_cfg_client_cb_event_t**

This enum value is the event of Configuration Client Model

Values:

enumerator **ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_CFG_CLIENT_EVT_MAX**

enum **esp_ble_mesh_cfg_server_cb_event_t**

This enum value is the event of Configuration Server model

Values:

enumerator **ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT**

enumerator **ESP_BLE_MESH_CFG_SERVER_EVT_MAX**

Health Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

Functions

esp_err_t **esp_ble_mesh_register_health_client_callback**(*esp_ble_mesh_health_client_cb_t* callback)

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

参数 **callback** –**[in]** Pointer to the callback function.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_health_server_callback**(*esp_ble_mesh_health_server_cb_t* callback)

Register BLE Mesh Health Server Model callback.

参数 **callback** –**[in]** Pointer to the callback function.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_health_client_get_state**(*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_health_client_get_state_t* *get_state)

This function is called to get the Health Server states using the Health Client Model get messages.

备注: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_get_t in esp_ble_mesh_defs.h

---

参数

- **params** –**[in]** Pointer to BLE Mesh common client parameters.
- **get_state** –**[in]** Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_health_client_set_state**(*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_health_client_set_state_t* *set_state)

This function is called to set the Health Server states using the Health Client Model set messages.

备注： If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set_t in esp_ble_mesh_defs.h

参数

- **params** –**[in]** Pointer to BLE Mesh common client parameters.
- **set_state** –**[in]** Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_health_server_fault_update**(*esp_ble_mesh_elem_t* *element)

This function is called by the Health Server Model to update the context of its Health Current status.

参数 **element** –**[in]** The element to which the Health Server Model belongs.

返回 ESP_OK on success or error code otherwise.

Unions

union **esp_ble_mesh_health_client_get_state_t**

#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.

Public Members

esp_ble_mesh_health_fault_get_t **fault_get**

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

union **esp_ble_mesh_health_client_set_state_t**

#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK ESP_BLE_MESH_MODEL_OP_ATTENTION_SET ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK the set_state parameter in the esp_ble_mesh_health_client_set_state function should not be set to NULL.

Public Members

esp_ble_mesh_health_attention_set_t **attention_set**

For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNA

esp_ble_mesh_health_period_set_t **period_set**

For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.

esp_ble_mesh_health_fault_test_t **fault_test**

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.

esp_ble_mesh_health_fault_clear_t **fault_clear**

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.

union **esp_ble_mesh_health_client_common_cb_param_t**

#include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.

Public Members

esp_ble_mesh_health_current_status_cb_t **current_status**

The health current status value

esp_ble_mesh_health_fault_status_cb_t **fault_status**

The health fault status value

esp_ble_mesh_health_period_status_cb_t **period_status**

The health period status value

esp_ble_mesh_health_attention_status_cb_t **attention_status**

The health attention status value

union **esp_ble_mesh_health_server_cb_param_t**

#include <esp_ble_mesh_health_model_api.h> Health Server Model callback parameters union.

Public Members

esp_ble_mesh_health_fault_update_comp_cb_t **fault_update_comp**

ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT

esp_ble_mesh_health_fault_clear_cb_t **fault_clear**

ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT

esp_ble_mesh_health_fault_test_cb_t **fault_test**

ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT

esp_ble_mesh_health_attention_on_cb_t **attention_on**

ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT

esp_ble_mesh_health_attention_off_cb_t **attention_off**

ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT

Structures

struct **esp_ble_mesh_health_srv_cb_t**

ESP BLE Mesh Health Server callback

Public Members

esp_ble_mesh_cb_t **fault_clear**

Clear health registered faults. Initialized by the stack.

esp_ble_mesh_cb_t **fault_test**

Run a specific health test. Initialized by the stack.

esp_ble_mesh_cb_t **attention_on**

Health attention on callback. Initialized by the stack.

esp_ble_mesh_cb_t **attention_off**

Health attention off callback. Initialized by the stack.

struct **esp_ble_mesh_health_test_t**

ESP BLE Mesh Health Server test Context

Public Members

uint8_t **id_count**

Number of Health self-test ID

const uint8_t ***test_ids**

Array of Health self-test IDs

uint16_t **company_id**

Company ID used to identify the Health Fault state

uint8_t **prev_test_id**

Current test ID of the health fault test

uint8_t **current_faults**[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]

Array of current faults

uint8_t **registered_faults**[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]

Array of registered faults

struct **esp_ble_mesh_health_srv_t**

ESP BLE Mesh Health Server Model Context

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Health Server Model

esp_ble_mesh_health_srv_cb_t **health_cb**

Health callback struct

struct k_delayed_work **attention_timer**

Attention Timer state

bool **attention_timer_start**

Attention Timer start flag

esp_ble_mesh_health_test_t **health_test**

Health Server fault test

struct **esp_ble_mesh_health_fault_get_t**

Parameter of Health Fault Get

Public Members

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_attention_set_t**

Parameter of Health Attention Set

Public Members

uint8_t **attention**

Value of the Attention Timer state

struct **esp_ble_mesh_health_period_set_t**

Parameter of Health Period Set

Public Members

uint8_t **fast_period_divisor**

Divider for the Publish Period

struct **esp_ble_mesh_health_fault_test_t**

Parameter of Health Fault Test

Public Members

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

uint8_t **test_id**

ID of a specific test to be performed

struct **esp_ble_mesh_health_fault_clear_t**

Parameter of Health Fault Clear

Public Members

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_current_status_cb_t**

Parameters of Health Current Status

Public Members

uint8_t **test_id**

ID of a most recently performed test

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct net_buf_simple ***fault_array**

FaultArray field contains a sequence of 1-octet fault values

struct **esp_ble_mesh_health_fault_status_cb_t**

Parameters of Health Fault Status

Public Members

uint8_t **test_id**

ID of a most recently performed test

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct net_buf_simple ***fault_array**

FaultArray field contains a sequence of 1-octet fault values

struct **esp_ble_mesh_health_period_status_cb_t**

Parameter of Health Period Status

Public Members

uint8_t **fast_period_divisor**

Divider for the Publish Period

struct **esp_ble_mesh_health_attention_status_cb_t**

Parameter of Health Attention Status

Public Members

uint8_t **attention**

Value of the Attention Timer state

struct **esp_ble_mesh_health_client_cb_param_t**

Health Client Model callback parameters

Public Members

int **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_health_client_common_cb_param_t **status_cb**

The health message status callback values

struct **esp_ble_mesh_health_fault_update_comp_cb_t**

Parameter of publishing Health Current Status completion event

Public Members

int **error_code**

The result of publishing Health Current Status

esp_ble_mesh_elem_t ***element**

Pointer to the element which contains the Health Server Model

struct **esp_ble_mesh_health_fault_clear_cb_t**

Parameters of Health Fault Clear event

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Health Server Model

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_fault_test_cb_t**

Parameters of Health Fault Test event

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Health Server Model

uint8_t **test_id**

ID of a specific test to be performed

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_attention_on_cb_t**

Parameter of Health Attention On event

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Health Server Model

uint8_t **time**

Duration of attention timer on (in seconds)

struct **esp_ble_mesh_health_attention_off_cb_t**

Parameter of Health Attention Off event

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Health Server Model

Macros

ESP_BLE_MESH_MODEL_HEALTH_SRV(srv, pub)

Define a new Health Server Model.

备注: The Health Server Model can only be included by a Primary Element.

参数

- **srv** –Pointer to the unique struct *esp_ble_mesh_health_srv_t*.
- **pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.

返回 New Health Server Model instance.

ESP_BLE_MESH_MODEL_HEALTH_CLI(cli_data)

Define a new Health Client Model.

备注: This API needs to be called for each element on which the application needs to have a Health Client Model.

参数

- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Health Client Model instance.

ESP_BLE_MESH_HEALTH_PUB_DEFINE(_name, _max, _role)

A helper to define a health publication context

参数

- **_name** –Name given to the publication context variable.
- **_max** –Maximum number of faults the element can have.
- **_role** –Role of the device which contains the model.

ESP_BLE_MESH_HEALTH_STANDARD_TEST

SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

ESP_BLE_MESH_NO_FAULT

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

ESP_BLE_MESH_BATTERY_LOW_WARNING

Type Definitions

typedef void (***esp_ble_mesh_health_client_cb_t**)(*esp_ble_mesh_health_client_cb_event_t* event, *esp_ble_mesh_health_client_cb_param_t* *param)

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

Param event Event type
Param param Pointer to callback parameter

typedef void (***esp_ble_mesh_health_server_cb_t**)(*esp_ble_mesh_health_server_cb_event_t* event, *esp_ble_mesh_health_server_cb_param_t* *param)

Health Server Model callback function type.

Param event Event type
Param param Pointer to callback parameter

Enumerations

enum **esp_ble_mesh_health_client_cb_event_t**

This enum value is the event of Health Client Model

Values:

enumerator **ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX**

enum **esp_ble_mesh_health_server_cb_event_t**

This enum value is the event of Health Server Model

Values:

enumerator **ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT**

enumerator **ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT**

enumerator **ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT**

enumerator **ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT**

enumerator **ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT**

enumerator **ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX**

Generic Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

Functions

esp_err_t **esp_ble_mesh_register_generic_client_callback**(*esp_ble_mesh_generic_client_cb_t* callback)

Register BLE Mesh Generic Client Model callback.

参数 **callback** –**[in]** Pointer to the callback function.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_generic_client_get_state**(*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_generic_client_get_state_t* *get_state)

Get the value of Generic Server Model states using the Generic Client Model get messages.

备注: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

---

参数

- **params** –**[in]** Pointer to BLE Mesh common client parameters.
- **get_state** –**[in]** Pointer to generic get message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_generic_client_set_state**(*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_generic_client_set_state_t* *set_state)

Set the value of Generic Server Model states using the Generic Client Model set messages.

备注： If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

参数

- **params** –**[in]** Pointer to BLE Mesh common client parameters.
- **set_state** –**[in]** Pointer to generic set message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_generic_server_callback**(*esp_ble_mesh_generic_server_cb_t* callback)

Register BLE Mesh Generic Server Model callback.

参数 **callback** –**[in]** Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

esp_ble_mesh_state_change_gen_onoff_set_t **onoff_set**

The recv_op in ctx can be used to decide which state is changed. Generic OnOff Set

esp_ble_mesh_state_change_gen_level_set_t **level_set**

Generic Level Set

esp_ble_mesh_state_change_gen_delta_set_t **delta_set**

Generic Delta Set

esp_ble_mesh_state_change_gen_move_set_t **move_set**

Generic Move Set

esp_ble_mesh_state_change_gen_def_trans_time_set_t **def_trans_time_set**

Generic Default Transition Time Set

esp_ble_mesh_state_change_gen_onpowerup_set_t **onpowerup_set**

Generic OnPowerUp Set

esp_ble_mesh_state_change_gen_power_level_set_t **power_level_set**

Generic Power Level Set

esp_ble_mesh_state_change_gen_power_default_set_t **power_default_set**

Generic Power Default Set

esp_ble_mesh_state_change_gen_power_range_set_t **power_range_set**

Generic Power Range Set

esp_ble_mesh_state_change_gen_loc_global_set_t **loc_global_set**

Generic Location Global Set

esp_ble_mesh_state_change_gen_loc_local_set_t **loc_local_set**

Generic Location Local Set

esp_ble_mesh_state_change_gen_user_property_set_t **user_property_set**

Generic User Property Set

esp_ble_mesh_state_change_gen_admin_property_set_t **admin_property_set**

Generic Admin Property Set

esp_ble_mesh_state_change_gen_manu_property_set_t **manu_property_set**

Generic Manufacturer Property Set

union **esp_ble_mesh_generic_server_recv_get_msg_t**

#include <esp_ble_mesh_generic_model_api.h> Generic Server Model received get message union.

Public Members

esp_ble_mesh_server_recv_gen_user_property_get_t **user_property**

Generic User Property Get

esp_ble_mesh_server_recv_gen_admin_property_get_t **admin_property**

Generic Admin Property Get

esp_ble_mesh_server_recv_gen_manufacturer_property_get_t **manu_property**

Generic Manufacturer Property Get

esp_ble_mesh_server_recv_gen_client_properties_get_t **client_properties**

Generic Client Properties Get

union **esp_ble_mesh_generic_server_recv_set_msg_t**

#include <esp_ble_mesh_generic_model_api.h> Generic Server Model received set message union.

Public Members

Structures

struct **esp_ble_mesh_gen_onoff_set_t**

Bluetooth Mesh Generic Client Model Get and Set parameters structure.

Parameters of Generic OnOff Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint8_t **onoff**

Target value of Generic OnOff state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_level_set_t**

Parameters of Generic Level Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **level**

Target value of Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_delta_set_t**

Parameters of Generic Delta Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

int32_t **level**

Delta change of Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_move_set_t**

Parameters of Generic Move Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **delta_level**

Delta Level step to calculate Move speed for Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_def_trans_time_set_t**

Parameter of Generic Default Transition Time Set.

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_onpowerup_set_t**

Parameter of Generic OnPowerUp Set.

Public Members

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_level_set_t**

Parameters of Generic Power Level Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **power**

Target value of Generic Power Actual state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_power_default_set_t**

Parameter of Generic Power Default Set.

Public Members

uint16_t **power**

The value of the Generic Power Default state

struct **esp_ble_mesh_gen_power_range_set_t**

Parameters of Generic Power Range Set.

Public Members

uint16_t **range_min**

Value of Range Min field of Generic Power Range state

uint16_t **range_max**

Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_gen_loc_global_set_t**

Parameters of Generic Location Global Set.

Public Members

int32_t **global_latitude**

Global Coordinates (Latitude)

int32_t **global_longitude**

Global Coordinates (Longitude)

int16_t **global_altitude**

Global Altitude

struct **esp_ble_mesh_gen_loc_local_set_t**

Parameters of Generic Location Local Set.

Public Members

int16_t **local_north**

Local Coordinates (North)

int16_t **local_east**

Local Coordinates (East)

int16_t **local_altitude**

Local Altitude

uint8_t **floor_number**

Floor Number

uint16_t **uncertainty**

Uncertainty

struct **esp_ble_mesh_gen_user_property_get_t**

Parameter of Generic User Property Get.

Public Members

uint16_t **property_id**

Property ID identifying a Generic User Property

struct **esp_ble_mesh_gen_user_property_set_t**

Parameters of Generic User Property Set.

Public Members

uint16_t **property_id**

Property ID identifying a Generic User Property

struct net_buf_simple ***property_value**

Raw value for the User Property

struct **esp_ble_mesh_gen_admin_property_get_t**

Parameter of Generic Admin Property Get.

Public Members

uint16_t **property_id**

Property ID identifying a Generic Admin Property

struct **esp_ble_mesh_gen_admin_property_set_t**

Parameters of Generic Admin Property Set.

Public Members

uint16_t **property_id**

Property ID identifying a Generic Admin Property

uint8_t **user_access**

Enumeration indicating user access

struct net_buf_simple ***property_value**

Raw value for the Admin Property

struct **esp_ble_mesh_gen_manufacturer_property_get_t**

Parameter of Generic Manufacturer Property Get.

Public Members

uint16_t **property_id**

Property ID identifying a Generic Manufacturer Property

struct **esp_ble_mesh_gen_manufacturer_property_set_t**

Parameters of Generic Manufacturer Property Set.

Public Members

uint16_t **property_id**

Property ID identifying a Generic Manufacturer Property

uint8_t **user_access**

Enumeration indicating user access

struct **esp_ble_mesh_gen_client_properties_get_t**

Parameter of Generic Client Properties Get.

Public Members

uint16_t **property_id**

A starting Client Property ID present within an element

struct **esp_ble_mesh_gen_onoff_status_cb_t**

Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.

Parameters of Generic OnOff Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint8_t **present_onoff**

Current value of Generic OnOff state

uint8_t **target_onoff**

Target value of Generic OnOff state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_level_status_cb_t**

Parameters of Generic Level Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **present_level**

Current value of Generic Level state

int16_t **target_level**

Target value of the Generic Level state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_def_trans_time_status_cb_t**

Parameter of Generic Default Transition Time Status.

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_onpowerup_status_cb_t**

Parameter of Generic OnPowerUp Status.

Public Members

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_level_status_cb_t**

Parameters of Generic Power Level Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_power**

Current value of Generic Power Actual state

uint16_t **target_power**

Target value of Generic Power Actual state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_power_last_status_cb_t**

Parameter of Generic Power Last Status.

Public Members

uint16_t **power**

The value of the Generic Power Last state

struct **esp_ble_mesh_gen_power_default_status_cb_t**

Parameter of Generic Power Default Status.

Public Members

uint16_t **power**

The value of the Generic Default Last state

struct **esp_ble_mesh_gen_power_range_status_cb_t**

Parameters of Generic Power Range Status.

Public Members

uint8_t **status_code**

Status Code for the request message

uint16_t **range_min**

Value of Range Min field of Generic Power Range state

uint16_t **range_max**

Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_gen_battery_status_cb_t**

Parameters of Generic Battery Status.

Public Members

uint32_t **battery_level**

Value of Generic Battery Level state

uint32_t **time_to_discharge**

Value of Generic Battery Time to Discharge state

uint32_t **time_to_charge**

Value of Generic Battery Time to Charge state

uint32_t **flags**

Value of Generic Battery Flags state

struct **esp_ble_mesh_gen_loc_global_status_cb_t**

Parameters of Generic Location Global Status.

Public Members

int32_t **global_latitude**

Global Coordinates (Latitude)

int32_t **global_longitude**

Global Coordinates (Longitude)

int16_t **global_altitude**

Global Altitude

struct **esp_ble_mesh_gen_loc_local_status_cb_t**

Parameters of Generic Location Local Status.

Public Members

int16_t **local_north**

Local Coordinates (North)

int16_t **local_east**

Local Coordinates (East)

int16_t **local_altitude**

Local Altitude

uint8_t **floor_number**

Floor Number

uint16_t **uncertainty**

Uncertainty

struct **esp_ble_mesh_gen_user_properties_status_cb_t**

Parameter of Generic User Properties Status.

Public Members

struct net_buf_simple ***property_ids**

Buffer contains a sequence of N User Property IDs

struct **esp_ble_mesh_gen_user_property_status_cb_t**

Parameters of Generic User Property Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID identifying a Generic User Property

uint8_t **user_access**

Enumeration indicating user access (optional)

struct net_buf_simple ***property_value**

Raw value for the User Property (C.1)

struct **esp_ble_mesh_gen_admin_properties_status_cb_t**

Parameter of Generic Admin Properties Status.

Public Members

struct net_buf_simple ***property_ids**

Buffer contains a sequence of N Admin Property IDs

struct **esp_ble_mesh_gen_admin_property_status_cb_t**

Parameters of Generic Admin Property Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID identifying a Generic Admin Property

uint8_t **user_access**

Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Manufacturer Property (C.1)

struct esp_ble_mesh_gen_client_properties_status_cb_t
Parameter of Generic Client Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_cb_param_t
Generic Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_gen_client_status_cb_t **status_cb**

The generic status message callback values

struct **esp_ble_mesh_gen_onoff_state_t**

Parameters of Generic OnOff state

Public Members

uint8_t **onoff**

The present value of the Generic OnOff state

uint8_t **target_onoff**

The target value of the Generic OnOff state

struct **esp_ble_mesh_gen_onoff_srv_t**

User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t **state**

Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct **esp_ble_mesh_gen_level_state_t**

Parameters of Generic Level state

Public Members

int16_t **level**

The present value of the Generic Level state

int16_t **target_level**

The target value of the Generic Level state

int16_t **last_level**

When a new transaction starts, level should be set to last_last, and use "level + incoming delta" to calculate the target level. In another word, "last_level" is used to record "level" of the last transaction, and "last_delta" is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t **last_delta**

The last delta change of the Generic Level state

bool **move_start**

Indicate if the transition of the Generic Level state has been started

bool **positive**

Indicate if the transition is positive or negative

struct **esp_ble_mesh_gen_level_srv_t**

User data of Generic Level Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_level_state_t **state**

Parameters of the Generic Level state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_level**

Delta change value of level state transition

struct **esp_ble_mesh_gen_def_trans_time_state_t**

Parameter of Generic Default Transition Time state

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_def_trans_time_srv_t**

User data of Generic Default Transition Time Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_def_trans_time_state_t **state**

Parameters of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_onpowerup_state_t**

Parameter of Generic OnPowerUp state

Public Members

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_onoff_srv_t**

User data of Generic Power OnOff Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t ***state**

Parameters of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_onoff_setup_srv_t**

User data of Generic Power OnOff Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t ***state**

Parameters of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_level_state_t**

Parameters of Generic Power Level state

Public Members

uint16_t **power_actual**

The present value of the Generic Power Actual state

uint16_t **target_power_actual**

The target value of the Generic Power Actual state

uint16_t **power_last**

The value of the Generic Power Last state

uint16_t **power_default**

The value of the Generic Power Default state

uint8_t **status_code**

The status code of setting Generic Power Range state

uint16_t **power_range_min**

The minimum value of the Generic Power Range state

uint16_t **power_range_max**

The maximum value of the Generic Power Range state

struct **esp_ble_mesh_gen_power_level_srv_t**

User data of Generic Power Level Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t ***state**

Parameters of the Generic Power Level state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_level**

Delta change value of level state transition

struct **esp_ble_mesh_gen_power_level_setup_srv_t**

User data of Generic Power Level Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power Level Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t ***state**

Parameters of the Generic Power Level state

struct **esp_ble_mesh_gen_battery_state_t**

Parameters of Generic Battery state

Public Members

uint32_t **battery_level**

The value of the Generic Battery Level state

uint32_t **time_to_discharge**

The value of the Generic Battery Time to Discharge state

uint32_t **time_to_charge**

The value of the Generic Battery Time to Charge state

uint32_t **battery_flags**

The value of the Generic Battery Flags state

struct **esp_ble_mesh_gen_battery_srv_t**

User data of Generic Battery Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Battery Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_battery_state_t **state**

Parameters of the Generic Battery state

struct **esp_ble_mesh_gen_location_state_t**

Parameters of Generic Location state

Public Members

int32_t **global_latitude**

The value of the Global Latitude field

int32_t **global_longitude**

The value of the Global Longitude field

int16_t **global_altitude**

The value of the Global Altitude field

int16_t **local_north**

The value of the Local North field

int16_t **local_east**

The value of the Local East field

int16_t **local_altitude**

The value of the Local Altitude field

uint8_t **floor_number**

The value of the Floor Number field

uint16_t **uncertainty**

The value of the Uncertainty field

struct **esp_ble_mesh_gen_location_srv_t**

User data of Generic Location Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Location Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_location_state_t ***state**

Parameters of the Generic Location state

struct **esp_ble_mesh_gen_location_setup_srv_t**

User data of Generic Location Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Location Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_location_state_t ***state**

Parameters of the Generic Location state

struct **esp_ble_mesh_generic_property_t**

Parameters of Generic Property states

Public Members

uint16_t **id**

The value of User/Admin/Manufacturer Property ID

uint8_t **user_access**

The value of User Access field

uint8_t **admin_access**

The value of Admin Access field

uint8_t **manu_access**

The value of Manufacturer Access field

struct net_buf_simple ***val**

The value of User/Admin/Manufacturer Property

struct **esp_ble_mesh_gen_user_prop_srv_t**

User data of Generic User Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic User Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic User Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic User Property state

struct **esp_ble_mesh_gen_admin_prop_srv_t**

User data of Generic Admin Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Admin Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic Admin Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic Admin Property state

struct **esp_ble_mesh_gen_manu_prop_srv_t**

User data of Generic Manufacturer Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic Manufacturer Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic Manufacturer Property state

struct **esp_ble_mesh_gen_client_prop_srv_t**

User data of Generic Client Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Client Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **id_count**

Generic Client Property ID count

uint16_t ***property_ids**

Parameters of the Generic Client Property state

struct **esp_ble_mesh_state_change_gen_onoff_set_t**

Parameter of Generic OnOff Set state change event

Public Members

uint8_t **onoff**

The value of Generic OnOff state

struct **esp_ble_mesh_state_change_gen_level_set_t**

Parameter of Generic Level Set state change event

Public Members

int16_t **level**

The value of Generic Level state

struct **esp_ble_mesh_state_change_gen_delta_set_t**

Parameter of Generic Delta Set state change event

Public Members

int16_t **level**

The value of Generic Level state

struct **esp_ble_mesh_state_change_gen_move_set_t**

Parameter of Generic Move Set state change event

Public Members

int16_t **level**

The value of Generic Level state

struct **esp_ble_mesh_state_change_gen_def_trans_time_set_t**

Parameter of Generic Default Transition Time Set state change event

Public Members

uint8_t **trans_time**

The value of Generic Default Transition Time state

struct **esp_ble_mesh_state_change_gen_onpowerup_set_t**

Parameter of Generic OnPowerUp Set state change event

Public Members

uint8_t **onpowerup**

The value of Generic OnPowerUp state

struct **esp_ble_mesh_state_change_gen_power_level_set_t**

Parameter of Generic Power Level Set state change event

Public Members

uint16_t **power**

The value of Generic Power Actual state

struct **esp_ble_mesh_state_change_gen_power_default_set_t**

Parameter of Generic Power Default Set state change event

Public Members

uint16_t **power**

The value of Generic Power Default state

struct **esp_ble_mesh_state_change_gen_power_range_set_t**

Parameters of Generic Power Range Set state change event

Public Members

uint16_t **range_min**

The minimum value of Generic Power Range state

uint16_t **range_max**

The maximum value of Generic Power Range state

struct **esp_ble_mesh_state_change_gen_loc_global_set_t**

Parameters of Generic Location Global Set state change event

Public Members

int32_t **latitude**

The Global Latitude value of Generic Location state

int32_t **longitude**

The Global Longitude value of Generic Location state

int16_t **altitude**

The Global Altitude value of Generic Location state

struct **esp_ble_mesh_state_change_gen_loc_local_set_t**

Parameters of Generic Location Local Set state change event

Public Members

int16_t **north**

The Local North value of Generic Location state

int16_t **east**

The Local East value of Generic Location state

int16_t **altitude**

The Local Altitude value of Generic Location state

uint8_t **floor_number**

The Floor Number value of Generic Location state

uint16_t **uncertainty**

The Uncertainty value of Generic Location state

struct **esp_ble_mesh_state_change_gen_user_property_set_t**

Parameters of Generic User Property Set state change event

Public Members

uint16_t **id**

The property id of Generic User Property state

struct net_buf_simple ***value**

The property value of Generic User Property state

struct **esp_ble_mesh_state_change_gen_admin_property_set_t**

Parameters of Generic Admin Property Set state change event

Public Members

uint16_t **id**

The property id of Generic Admin Property state

uint8_t **access**

The property access of Generic Admin Property state

struct net_buf_simple ***value**

The property value of Generic Admin Property state

struct **esp_ble_mesh_state_change_gen_manu_property_set_t**

Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t **id**

The property id of Generic Manufacturer Property state

uint8_t **access**

The property value of Generic Manufacturer Property state

struct **esp_ble_mesh_server_recv_gen_user_property_get_t**

Context of the received Generic User Property Get message

Public Members

uint16_t **property_id**

Property ID identifying a Generic User Property

struct **esp_ble_mesh_server_recv_gen_admin_property_get_t**

Context of the received Generic Admin Property Get message

Public Members

uint16_t **property_id**

Property ID identifying a Generic Admin Property

struct **esp_ble_mesh_server_recv_gen_manufacturer_property_get_t**

Context of the received Generic Manufacturer Property message

Public Members

uint16_t **property_id**

Property ID identifying a Generic Manufacturer Property

struct **esp_ble_mesh_server_recv_gen_client_properties_get_t**

Context of the received Generic Client Properties Get message

Public Members

uint16_t **property_id**

A starting Client Property ID present within an element

struct **esp_ble_mesh_server_recv_gen_onoff_set_t**

Context of the received Generic OnOff Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint8_t **onoff**

Target value of Generic OnOff state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_gen_level_set_t**

Context of the received Generic Level Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **level**

Target value of Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_gen_delta_set_t**

Context of the received Generic Delta Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

int32_t **delta_level**

Delta change of Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_gen_move_set_t**

Context of the received Generic Move Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **delta_level**

Delta Level step to calculate Move speed for Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_gen_def_trans_time_set_t**

Context of the received Generic Default Transition Time Set message

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_server_recv_gen_onpowerup_set_t**

Context of the received Generic OnPowerUp Set message

Public Members

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_server_recv_gen_power_level_set_t**

Context of the received Generic Power Level Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **power**

Target value of Generic Power Actual state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_gen_power_default_set_t**

Context of the received Generic Power Default Set message

Public Members

uint16_t **power**

The value of the Generic Power Default state

struct **esp_ble_mesh_server_recv_gen_power_range_set_t**

Context of the received Generic Power Range Set message

Public Members

uint16_t **range_min**

Value of Range Min field of Generic Power Range state

uint16_t **range_max**

Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_server_recv_gen_loc_global_set_t**

Context of the received Generic Location Global Set message

Public Members

int32_t **global_latitude**
Global Coordinates (Latitude)

int32_t **global_longitude**
Global Coordinates (Longitude)

int16_t **global_altitude**
Global Altitude

struct **esp_ble_mesh_server_recv_gen_loc_local_set_t**
Context of the received Generic Location Local Set message

Public Members

int16_t **local_north**
Local Coordinates (North)

int16_t **local_east**
Local Coordinates (East)

int16_t **local_altitude**
Local Altitude

uint8_t **floor_number**
Floor Number

uint16_t **uncertainty**
Uncertainty

struct **esp_ble_mesh_server_recv_gen_user_property_set_t**
Context of the received Generic User Property Set message

Public Members

uint16_t **property_id**
Property ID identifying a Generic User Property

struct net_buf_simple ***property_value**
Raw value for the User Property

struct **esp_ble_mesh_server_recv_gen_admin_property_set_t**
Context of the received Generic Admin Property Set message

Public Members

uint16_t **property_id**

Property ID identifying a Generic Admin Property

uint8_t **user_access**

Enumeration indicating user access

struct net_buf_simple ***property_value**

Raw value for the Admin Property

struct **esp_ble_mesh_server_recv_gen_manufacturer_property_set_t**

Context of the received Generic Manufacturer Property Set message

Public Members

uint16_t **property_id**

Property ID identifying a Generic Manufacturer Property

uint8_t **user_access**

Enumeration indicating user access

struct **esp_ble_mesh_generic_server_cb_param_t**

Generic Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Generic Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_generic_server_cb_value_t **value**

Value of the received Generic Messages

Macros

ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI(cli_pub, cli_data)

Define a new Generic OnOff Client Model.

备注： This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Generic OnOff Client Model instance.

ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI(cli_pub, cli_data)

Define a new Generic Level Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Generic Level Client Model instance.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI(cli_pub, cli_data)

Define a new Generic Default Transition Time Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Generic Default Transition Time Client Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI(cli_pub, cli_data)

Define a new Generic Power OnOff Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Generic Power OnOff Client Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI(cli_pub, cli_data)

Define a new Generic Power Level Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Generic Power Level Client Model instance.

ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI(cli_pub, cli_data)

Define a new Generic Battery Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Generic Battery Client Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI(cli_pub, cli_data)

Define a new Generic Location Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Generic Location Client Model instance.

ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI(cli_pub, cli_data)

Define a new Generic Property Client Model.

备注: This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Generic Location Client Model instance.

ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV(srv_pub, srv_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

备注: 1. The Generic OnOff Server Model is a root model.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_onoff_srv_t*.

返回 New Generic OnOff Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV(srv_pub, srv_data)

Define a new Generic Level Server Model.

备注: 1. The Generic Level Server Model is a root model.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_level_srv_t*.

返回 New Generic Level Server Model instance.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV(srv_pub, srv_data)

Define a new Generic Default Transition Time Server Model.

备注： 1. The Generic Default Transition Time Server Model is a root model.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_def_trans_time_srv_t*.

返回 New Generic Default Transition Time Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV(srv_pub, srv_data)

Define a new Generic Power OnOff Server Model.

备注： 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.

a. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
b. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_onoff_srv_t*.

返回 New Generic Power OnOff Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV(srv_pub, srv_data)

Define a new Generic Power OnOff Setup Server Model.

备注： 1. The Generic Power OnOff Setup Server model extends the Generic Power OnOff Server model and the Generic Default Transition Time Server model.

a. This model shall support model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_onoff_setup_srv_t*.

返回 New Generic Power OnOff Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV(srv_pub, srv_data)

Define a new Generic Power Level Server Model.

备注： 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_level_srv_t*.

返回 New Generic Power Level Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV(srv_pub, srv_data)

Define a new Generic Power Level Setup Server Model.

备注： 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.

a. This model shall support model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_level_setup_srv_t*.

返回 New Generic Power Level Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV(srv_pub, srv_data)

Define a new Generic Battery Server Model.

备注： 1. The Generic Battery Server Model is a root model.

a. This model shall support model publication and model subscription.
b. The model may be used to represent an element that is powered by a battery.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_battery_srv_t*.

返回 New Generic Battery Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV(srv_pub, srv_data)

Define a new Generic Location Server Model.

备注： 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

a. This model shall support model publication and model subscription.
b. The model may be used to represent an element that knows its location (global or local).

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_location_srv_t*.

返回 New Generic Location Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV(srv_pub, srv_data)

Define a new Generic Location Setup Server Model.

备注： 1. The Generic Location Setup Server model extends the Generic Location Server model.

a. This model shall support model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_location_setup_srv_t*.

返回 New Generic Location Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV(srv_pub, srv_data)

Define a new Generic User Property Server Model.

备注： 1. The Generic User Property Server model is a root model.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_user_prop_srv_t*.

返回 New Generic User Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV(srv_pub, srv_data)

Define a new Generic Admin Property Server Model.

备注： 1. The Generic Admin Property Server model extends the Generic User Property Server model.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_admin_prop_srv_t*.

返回 New Generic Admin Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV(srv_pub, srv_data)

Define a new Generic Manufacturer Property Server Model.

备注： 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_manu_prop_srv_t*.

返回 New Generic Manufacturer Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV(srv_pub, srv_data)

Define a new Generic User Property Server Model.

备注： 1. The Generic Client Property Server model is a root model.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_client_prop_srv_t*.

返回 New Generic Client Property Server Model instance.

Type Definitions

typedef void (*`esp_ble_mesh_generic_client_cb_t`)(*esp_ble_mesh_generic_client_cb_event_t* event, *esp_ble_mesh_generic_client_cb_param_t* *param)

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

Param event Event type
Param param Pointer to callback parameter

typedef void (*`esp_ble_mesh_generic_server_cb_t`)(*esp_ble_mesh_generic_server_cb_event_t* event, *esp_ble_mesh_generic_server_cb_param_t* *param)

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

Param event Event type
Param param Pointer to callback parameter

Enumerations

enum `esp_ble_mesh_generic_client_cb_event_t`

This enum value is the event of Generic Client Model

Values:

enumerator `ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT`

enumerator `ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT`

enumerator `ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT`

enumerator `ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT`

enumerator `ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX`

enum `esp_ble_mesh_gen_user_prop_access_t`

This enum value is the access value of Generic User Property

Values:

enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT`

enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_READ`

enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_WRITE`

enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE`

enum `esp_ble_mesh_gen_admin_prop_access_t`

This enum value is the access value of Generic Admin Property

Values:

enumerator `ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP`

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE**

enum **esp_ble_mesh_gen_manu_prop_access_t**

This enum value is the access value of Generic Manufacturer Property

Values:

enumerator **ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP**

enumerator **ESP_BLE_MESH_GEN_MANU_ACCESS_READ**

enum **esp_ble_mesh_generic_server_cb_event_t**

This enum value is the event of Generic Server Model

Values:

enumerator **ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT**

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Generic Get messages are received.
ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT**

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Get messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT**

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX**

Sensor Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h

Functions

esp_err_t **esp_ble_mesh_register_sensor_client_callback**(*esp_ble_mesh_sensor_client_cb_t* callback)

Register BLE Mesh Sensor Client Model callback.

参数 **callback** – **[in]** Pointer to the callback function.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_sensor_client_get_state**(*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_sensor_client_get_state_t* *get_state)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

---

参数

- **params** –**[in]** Pointer to BLE Mesh common client parameters.
- **get_state** –**[in]** Pointer to sensor get message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_sensor_client_set_state**(*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_sensor_client_set_state_t* *set_state)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

---

参数

- **params** –**[in]** Pointer to BLE Mesh common client parameters.
- **set_state** –**[in]** Pointer to sensor set message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_sensor_server_callback**(*esp_ble_mesh_sensor_server_cb_t* callback)

Register BLE Mesh Sensor Server Model callback.

参数 **callback** –**[in]** Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

esp_ble_mesh_server_recv_sensor_series_get_t **sensor_series**

Sensor Series Get

union **esp_ble_mesh_sensor_server_recv_set_msg_t**

#include <esp_ble_mesh_sensor_model_api.h> Sensor Server Model received set message union.

Public Members

esp_ble_mesh_server_recv_sensor_cadence_set_t **sensor_cadence**

Sensor Cadence Set

esp_ble_mesh_server_recv_sensor_setting_set_t **sensor_setting**

Sensor Setting Set

union **esp_ble_mesh_sensor_server_cb_value_t**

#include <esp_ble_mesh_sensor_model_api.h> Sensor Server Model callback value union.

Public Members

esp_ble_mesh_sensor_server_state_change_t **state_change**

ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT

esp_ble_mesh_sensor_server_recv_get_msg_t **get**

ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT

esp_ble_mesh_sensor_server_recv_set_msg_t **set**

ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT

Structures

struct **esp_ble_mesh_sensor_descriptor_get_t**

Bluetooth Mesh Sensor Client Model Get and Set parameters structure.

Parameters of Sensor Descriptor Get

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID of a sensor (optional)

struct **esp_ble_mesh_sensor_cadence_get_t**

Parameter of Sensor Cadence Get

Public Members

uint16_t **property_id**

Property ID of a sensor

struct **esp_ble_mesh_sensor_cadence_set_t**

Parameters of Sensor Cadence Set

Public Members

uint16_t **property_id**

Property ID for the sensor

uint8_t **fast_cadence_period_divisor**

Divisor for the publish period

uint8_t **status_trigger_type**

The unit and format of the Status Trigger Delta fields

struct net_buf_simple ***status_trigger_delta_down**

Delta down value that triggers a status message

struct net_buf_simple ***status_trigger_delta_up**

Delta up value that triggers a status message

uint8_t **status_min_interval**

Minimum interval between two consecutive Status messages

struct net_buf_simple ***fast_cadence_low**

Low value for the fast cadence range

struct net_buf_simple ***fast_cadence_high**

Fast value for the fast cadence range

struct **esp_ble_mesh_sensor_settings_get_t**

Parameter of Sensor Settings Get

Public Members

uint16_t **sensor_property_id**

Property ID of a sensor

struct **esp_ble_mesh_sensor_setting_get_t**

Parameters of Sensor Setting Get

Public Members

uint16_t **sensor_property_id**

Property ID of a sensor

uint16_t **sensor_setting_property_id**

Setting ID identifying a setting within a sensor

struct **esp_ble_mesh_sensor_setting_set_t**

Parameters of Sensor Setting Set

Public Members

uint16_t **sensor_property_id**

Property ID identifying a sensor

uint16_t **sensor_setting_property_id**

Setting ID identifying a setting within a sensor

struct net_buf_simple ***sensor_setting_raw**

Raw value for the setting

struct **esp_ble_mesh_sensor_get_t**

Parameters of Sensor Get

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID for the sensor (optional)

struct **esp_ble_mesh_sensor_column_get_t**

Parameters of Sensor Column Get

Public Members

uint16_t **property_id**

Property identifying a sensor

struct net_buf_simple ***raw_value_x**

Raw value identifying a column

struct **esp_ble_mesh_sensor_series_get_t**

Parameters of Sensor Series Get

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property identifying a sensor

struct net_buf_simple ***raw_value_x1**

Raw value identifying a starting column (optional)

struct net_buf_simple ***raw_value_x2**

Raw value identifying an ending column (C.1)

struct **esp_ble_mesh_sensor_descriptor_status_cb_t**

Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.

Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple ***descriptor**

Sequence of 8-octet sensor descriptors (optional)

struct **esp_ble_mesh_sensor_cadence_status_cb_t**

Parameters of Sensor Cadence Status

Public Members

uint16_t **property_id**

Property for the sensor

struct net_buf_simple ***sensor_cadence_value**

Value of sensor cadence state

struct **esp_ble_mesh_sensor_settings_status_cb_t**

Parameters of Sensor Settings Status

Public Members

uint16_t **sensor_property_id**

Property ID identifying a sensor

struct net_buf_simple ***sensor_setting_property_ids**

A sequence of N sensor setting property IDs (optional)

struct **esp_ble_mesh_sensor_setting_status_cb_t**

Parameters of Sensor Setting Status

Public Members

bool **op_en**

Indicate id optional parameters are included

uint16_t **sensor_property_id**

Property ID identifying a sensor

uint16_t **sensor_setting_property_id**

Setting ID identifying a setting within a sensor

uint8_t **sensor_setting_access**

Read/Write access rights for the setting (optional)

struct net_buf_simple ***sensor_setting_raw**

Raw value for the setting

struct **esp_ble_mesh_sensor_status_cb_t**

Parameter of Sensor Status

Public Members

struct net_buf_simple ***marshalled_sensor_data**

Value of sensor data state (optional)

struct **esp_ble_mesh_sensor_column_status_cb_t**

Parameters of Sensor Column Status

Public Members

uint16_t **property_id**

Property identifying a sensor and the Y axis

struct net_buf_simple ***sensor_column_value**

Left values of sensor column status

struct **esp_ble_mesh_sensor_series_status_cb_t**

Parameters of Sensor Series Status

Public Members

uint16_t **property_id**

Property identifying a sensor and the Y axis

struct net_buf_simple ***sensor_series_value**

Left values of sensor series status

struct **esp_ble_mesh_sensor_client_cb_param_t**

Sensor Client Model callback parameters

Public Members

int **error_code**

0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_sensor_client_status_cb_t **status_cb**

The sensor status message callback values

struct **esp_ble_mesh_sensor_descriptor_t**

Parameters of Sensor Descriptor state

Public Members

uint32_t **positive_tolerance**

The value of Sensor Positive Tolerance field

uint32_t **negative_tolerance**

The value of Sensor Negative Tolerance field

uint32_t **sampling_function**

The value of Sensor Sampling Function field

uint8_t **measure_period**

The value of Sensor Measurement Period field

uint8_t **update_interval**

The value of Sensor Update Interval field

struct **esp_ble_mesh_sensor_setting_t**

Parameters of Sensor Setting state

Public Members

uint16_t **property_id**

The value of Sensor Setting Property ID field

uint8_t **access**

The value of Sensor Setting Access field

struct net_buf_simple ***raw**

The value of Sensor Setting Raw field

struct **esp_ble_mesh_sensor_cadence_t**

Parameters of Sensor Cadence state

Public Members

uint8_t **period_divisor**

The value of Fast Cadence Period Divisor field

uint8_t **trigger_type**

The value of Status Trigger Type field

struct net_buf_simple ***trigger_delta_down**

Note: The parameter "size" in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the "size" precisely. The value of Status Trigger Delta Down field

struct net_buf_simple ***trigger_delta_up**

The value of Status Trigger Delta Up field

uint8_t **min_interval**

The value of Status Min Interval field

struct net_buf_simple ***fast_cadence_low**

The value of Fast Cadence Low field

struct net_buf_simple ***fast_cadence_high**

The value of Fast Cadence High field

struct **esp_ble_mesh_sensor_data_t**

Parameters of Sensor Data state

Public Members

uint8_t **format**

Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1 –16). Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 – 127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t **length**

The value of the Sensor Data length

struct net_buf_simple ***raw_value**

The value of Sensor Data raw value

struct **esp_ble_mesh_sensor_series_column_t**

Parameters of Sensor Series Column state

Public Members

struct net_buf_simple ***raw_value_x**

The value of Sensor Raw Value X field

struct net_buf_simple ***column_width**

The value of Sensor Column Width field

struct net_buf_simple ***raw_value_y**

The value of Sensor Raw Value Y field

struct **esp_ble_mesh_sensor_state_t**

Parameters of Sensor states

Public Members

uint16_t **sensor_property_id**

The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t **descriptor**

Parameters of the Sensor Descriptor state

const uint8_t **setting_count**

Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t ***settings**

Parameters of the Sensor Setting state

esp_ble_mesh_sensor_cadence_t ***cadence**

The Sensor Cadence state may be not supported by sensors based on device properties referencing "non-scalar characteristics" such as "histograms" or "composite characteristics". Parameters of the Sensor Cadence state

esp_ble_mesh_sensor_data_t **sensor_data**

Parameters of the Sensor Data state

esp_ble_mesh_sensor_series_column_t **series_column**

Parameters of the Sensor Series Column state

struct **esp_ble_mesh_sensor_srv_t**

User data of Sensor Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Sensor Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

const uint8_t **state_count**

Sensor state count

esp_ble_mesh_sensor_state_t ***states**

Parameters of the Sensor states

struct **esp_ble_mesh_sensor_setup_srv_t**

User data of Sensor Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Sensor Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

const uint8_t **state_count**

Sensor state count

esp_ble_mesh_sensor_state_t ***states**

Parameters of the Sensor states

struct **esp_ble_mesh_state_change_sensor_cadence_set_t**

Parameters of Sensor Cadence Set state change event

Public Members

uint16_t **property_id**

The value of Sensor Property ID state

uint8_t **period_divisor**

The value of Fast Cadence Period Divisor state

uint8_t **trigger_type**

The value of Status Trigger Type state

struct net_buf_simple ***trigger_delta_down**

The value of Status Trigger Delta Down state

struct net_buf_simple ***trigger_delta_up**

The value of Status Trigger Delta Up state

uint8_t **min_interval**

The value of Status Min Interval state

struct net_buf_simple ***fast_cadence_low**

The value of Fast Cadence Low state

struct net_buf_simple ***fast_cadence_high**

The value of Fast Cadence High state

struct **esp_ble_mesh_state_change_sensor_setting_set_t**

Parameters of Sensor Setting Set state change event

Public Members

uint16_t **property_id**

The value of Sensor Property ID state

uint16_t **setting_property_id**

The value of Sensor Setting Property ID state

struct net_buf_simple ***setting_value**

The value of Sensor Property Value state

struct **esp_ble_mesh_server_recv_sensor_descriptor_get_t**

Context of the received Sensor Descriptor Get message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID of a sensor (optional)

struct **esp_ble_mesh_server_recv_sensor_cadence_get_t**

Context of the received Sensor Cadence Get message

Public Members

uint16_t **property_id**

Property ID of a sensor

struct **esp_ble_mesh_server_recv_sensor_settings_get_t**

Context of the received Sensor Settings Get message

Public Members

uint16_t **property_id**

Property ID of a sensor

struct **esp_ble_mesh_server_recv_sensor_setting_get_t**

Context of the received Sensor Setting Get message

Public Members

uint16_t **property_id**

Property ID of a sensor

uint16_t **setting_property_id**

Setting ID identifying a setting within a sensor

struct **esp_ble_mesh_server_recv_sensor_get_t**

Context of the received Sensor Get message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID for the sensor (optional)

struct **esp_ble_mesh_server_recv_sensor_column_get_t**

Context of the received Sensor Column Get message

Public Members

uint16_t **property_id**

Property identifying a sensor

struct net_buf_simple ***raw_value_x**

Raw value identifying a column

struct **esp_ble_mesh_server_recv_sensor_series_get_t**

Context of the received Sensor Series Get message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property identifying a sensor

struct net_buf_simple ***raw_value**

Raw value containing X1 and X2 (optional)

struct **esp_ble_mesh_server_recv_sensor_cadence_set_t**

Context of the received Sensor Cadence Set message

Public Members

uint16_t **property_id**

Property ID for the sensor

struct net_buf_simple ***cadence**

Value of Sensor Cadence state

struct **esp_ble_mesh_server_recv_sensor_setting_set_t**

Context of the received Sensor Setting Set message

Public Members

uint16_t **property_id**

Property ID identifying a sensor

uint16_t **setting_property_id**

Setting ID identifying a setting within a sensor

struct net_buf_simple ***setting_raw**

Raw value for the setting

struct **esp_ble_mesh_sensor_server_cb_param_t**

Sensor Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Sensor Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_sensor_server_cb_value_t **value**

Value of the received Sensor Messages

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI(cli_pub, cli_data)

Define a new Sensor Client Model.

备注: This API needs to be called for each element on which the application needs to have a Sensor Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Sensor Client Model instance.

ESP_BLE_MESH_MODEL_SENSOR_SRV(srv_pub, srv_data)

Sensor Server Models related context.

Define a new Sensor Server Model.

备注: 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_sensor_srv_t*.

返回 New Sensor Server Model instance.

ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV(srv_pub, srv_data)

Define a new Sensor Setup Server Model.

备注: 1. The Sensor Setup Server model extends the Sensor Server model.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_sensor_setup_srv_t*.

返回 New Sensor Setup Server Model instance.

ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID

Invalid Sensor Property ID

ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN

Length of Sensor Property ID

ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN

Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE

Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE

Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD

Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL

Not applicable Sensor Update Interval

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID

Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN

Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN

Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ

Sensor Setting Access - Read

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE

Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN

Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN

Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE

Maximum value of Sensor Period Divisor

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX

Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR

Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16

Sensor Status Trigger Type - Format Type “uint16”

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A

Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B

Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN

MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN

MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN

Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT(_data)

Get format of the sensor data.

备注: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

参数

- **_data** –Pointer to the start of the sensor data.

返回 Format of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH(_data, _fmt)

Get length of the sensor data.

备注: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

参数

- **_data** –Pointer to the start of the sensor data.
- **_fmt** –Format of the sensor data.

返回 Length (zero-based) of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID(_data, _fmt)

Get Sensor Property ID of the sensor data.

备注: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

参数

- **_data** –Pointer to the start of the sensor data.
- **_fmt** –Format of the sensor data.

返回 Sensor Property ID of the sensor data.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID(_len, _id)

Generate a MPID value for sensor data with Format A.

备注: 1. The Format field is 0b0 and indicates that Format A is used.

a. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
b. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
c. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

参数

- **_len** –Length of Sensor Raw value.
- **_id** –Sensor Property ID.

返回 2-octet MPID value for sensor data with Format A.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID(_len, _id)

Generate a MPID value for sensor data with Format B.

备注: 1. The Format field is 0b1 and indicates Format B is used.

a. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
b. The Property ID is a 16-bit bit field representing a Property ID.
c. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
d. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

参数

- **_len** –Length of Sensor Raw value.
- **_id** –Sensor Property ID.

返回 3-octet MPID value for sensor data with Format B.

Type Definitions

typedef void (***esp_ble_mesh_sensor_client_cb_t**)(*esp_ble_mesh_sensor_client_cb_event_t* event, *esp_ble_mesh_sensor_client_cb_param_t* *param)

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

Param event Event type
Param param Pointer to callback parameter

typedef void (***esp_ble_mesh_sensor_server_cb_t**)(*esp_ble_mesh_sensor_server_cb_event_t* event, *esp_ble_mesh_sensor_server_cb_param_t* *param)

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

Param event Event type
Param param Pointer to callback parameter

Enumerations

enum **esp_ble_mesh_sensor_client_cb_event_t**

This enum value is the event of Sensor Client Model

Values:

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX**

enum **esp_ble_mesh_sensor_sample_func**

This enum value is value of Sensor Sampling Function

Values:

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_RMS**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_COUNT**

enum **esp_ble_mesh_sensor_server_cb_event_t**

This enum value is the event of Sensor Server Model

Values:

enumerator **ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT**

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.
ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT**

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT**

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX**

Time and Scenes Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

esp_err_t **esp_ble_mesh_register_time_scene_client_callback**(*esp_ble_mesh_time_scene_client_cb_t* callback)

Register BLE Mesh Time Scene Client Model callback.

参数 **callback** – **[in]** Pointer to the callback function.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_time_scene_client_get_state**(*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_time_scene_client_get_state_t* *get_state)

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

---

参数

- **params** –**[in]** Pointer to BLE Mesh common client parameters.
- **get_state** –**[in]** Pointer to time scene get message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_time_scene_client_set_state**(*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_time_scene_client_set_state_t* *set_state)

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

---

参数

- **params** –**[in]** Pointer to BLE Mesh common client parameters.
- **set_state** –**[in]** Pointer to time scene set message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_time_scene_server_callback**(*esp_ble_mesh_time_scene_server_cb_t* callback)

Register BLE Mesh Time and Scenes Server Model callback.

参数 **callback** –**[in]** Pointer to the callback function.

返回 ESP_OK on success or error code otherwise.

Structures

struct **esp_ble_mesh_time_set_t**

Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **sub_second**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_time_zone_set_t**

Parameters of Time Zone Set

Public Members

uint8_t **time_zone_offset_new**

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_tai_utc_delta_set_t**

Parameters of TAI-UTC Delta Set

Public Members

uint16_t **tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint16_t **padding**

Always 0b0. Other values are Prohibited.

uint8_t **tai_delta_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_time_role_set_t**

Parameter of Time Role Set

Public Members

uint8_t **time_role**

The Time Role for the element

struct **esp_ble_mesh_scene_store_t**

Parameter of Scene Store

Public Members

uint16_t **scene_number**

The number of scenes to be stored

struct **esp_ble_mesh_scene_recall_t**

Parameters of Scene Recall

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **scene_number**

The number of scenes to be recalled

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_scene_delete_t**

Parameter of Scene Delete

Public Members

uint16_t **scene_number**

The number of scenes to be deleted

struct **esp_ble_mesh_scheduler_act_get_t**

Parameter of Scheduler Action Get

Public Members

uint8_t **index**

Index of the Schedule Register entry to get

struct **esp_ble_mesh_scheduler_act_set_t**

Parameters of Scheduler Action Set

Public Members

uint64_t **index**

Index of the Schedule Register entry to set

uint64_t **year**

Scheduled year for the action

uint64_t **month**

Scheduled month for the action

uint64_t **day**

Scheduled day of the month for the action

uint64_t **hour**

Scheduled hour for the action

uint64_t **minute**

Scheduled minute for the action

uint64_t **second**

Scheduled second for the action

uint64_t **day_of_week**

Schedule days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action

uint16_t **scene_number**

Transition time for this action

struct **esp_ble_mesh_time_status_cb_t**

Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **sub_second**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_time_zone_status_cb_t**

Parameters of Time Zone Status

Public Members

uint8_t **time_zone_offset_curr**

Current local time zone offset

uint8_t **time_zone_offset_new**

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_tai_utc_delta_status_cb_t**

Parameters of TAI-UTC Delta Status

Public Members

uint16_t **tai_utc_delta_curr**

Current difference between TAI and UTC in seconds

uint16_t **padding_1**

Always 0b0. Other values are Prohibited.

uint16_t **tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint16_t **padding_2**

Always 0b0. Other values are Prohibited.

uint8_t **tai_delta_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_time_role_status_cb_t**

Parameter of Time Role Status

Public Members

uint8_t **time_role**

The Time Role for the element

struct **esp_ble_mesh_scene_status_cb_t**

Parameters of Scene Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint8_t **status_code**

Status code of the last operation

uint16_t **current_scene**

Scene Number of the current scene

uint16_t **target_scene**

Scene Number of the target scene (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_scene_register_status_cb_t**

Parameters of Scene Register Status

Public Members

uint8_t **status_code**

Status code for the previous operation

uint16_t **current_scene**

Scene Number of the current scene

struct net_buf_simple ***scenes**

A list of scenes stored within an element

struct **esp_ble_mesh_scheduler_status_cb_t**

Parameter of Scheduler Status

Public Members

uint16_t **schedules**

Bit field indicating defined Actions in the Schedule Register

struct **esp_ble_mesh_scheduler_act_status_cb_t**

Parameters of Scheduler Action Status

Public Members

uint64_t **index**

Enumerates (selects) a Schedule Register entry

uint64_t **year**

Scheduled year for the action

uint64_t **month**

Scheduled month for the action

uint64_t **day**

Scheduled day of the month for the action

uint64_t **hour**

Scheduled hour for the action

uint64_t **minute**

Scheduled minute for the action

uint64_t **second**

Scheduled second for the action

uint64_t **day_of_week**

Schedule days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action

uint16_t **scene_number**

Transition time for this action

struct **esp_ble_mesh_time_scene_client_cb_param_t**

Time Scene Client Model callback parameters

Public Members

int **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_time_scene_client_status_cb_t **status_cb**

The scene status message callback values

struct **esp_ble_mesh_time_state_t**

Parameters of Time state

Public Members

uint8_t **tai_seconds**[5]

The value of the TAI Seconds state

uint8_t **subsecond**

The value of the Subsecond field

uint8_t **uncertainty**

The value of the Uncertainty field

uint8_t **time_zone_offset_curr**

The value of the Time Zone Offset Current field

uint8_t **time_zone_offset_new**

The value of the Time Zone Offset New state

uint8_t **tai_zone_change**[5]

The value of the TAI of Zone Chaneg field

uint16_t **time_authority**

The value of the Time Authority bit

uint16_t **tai_utc_delta_curr**

The value of the TAI-UTC Delta Current state

uint16_t **tai_utc_delta_new**

The value of the TAI-UTC Delta New state

uint8_t **tai_delta_change**[5]

The value of the TAI of Delta Change field

struct *esp_ble_mesh_time_state_t*::[anonymous] **time**

Parameters of the Time state

uint8_t **time_role**

The value of the Time Role state

struct **esp_ble_mesh_time_srv_t**

User data of Time Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_time_state_t ***state**

Parameters of the Time state

struct **esp_ble_mesh_time_setup_srv_t**

User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_time_state_t ***state**

Parameters of the Time state

struct **esp_ble_mesh_scene_register_t**

a. Scene Store is an operation of storing values of a present state of an element.
b. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
c. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
d. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

Public Members

uint16_t **scene_number**

The value of the Scene Number

uint8_t **scene_type**

The value of the Scene Type

struct net_buf_simple ***scene_value**

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

struct **esp_ble_mesh_scenes_state_t**

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

Public Members

const uint16_t **scene_count**

The Scenes state’ s scene count

esp_ble_mesh_scene_register_t ***scenes**

Parameters of the Scenes state

uint16_t **current_scene**

The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element's state that is marked as "Stored with Scene" has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t **target_scene**

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

uint8_t **status_code**

The status code of the last scene operation

bool **in_progress**

Indicate if the scene transition is in progress

struct **esp_ble_mesh_scene_srv_t**

User data of Scene Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scene Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scenes_state_t ***state**

Parameters of the Scenes state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct **esp_ble_mesh_scene_setup_srv_t**

User data of Scene Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scene Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scenes_state_t ***state**

Parameters of the Scenes state

struct **esp_ble_mesh_schedule_register_t**

Parameters of Scheduler Register state

Public Members

bool **in_use**

Indicate if the registered schedule is in use

uint64_t **year**

The value of Scheduled year for the action

uint64_t **month**

The value of Scheduled month for the action

uint64_t **day**

The value of Scheduled day of the month for the action

uint64_t **hour**

The value of Scheduled hour for the action

uint64_t **minute**

The value of Scheduled minute for the action

uint64_t **second**

The value of Scheduled second for the action

uint64_t **day_of_week**

The value of Schedule days of the week for the action

uint64_t **action**

The value of Action to be performed at the scheduled time

uint64_t **trans_time**

The value of Transition time for this action

uint16_t **scene_number**

The value of Scene Number to be used for some actions

struct **esp_ble_mesh_scheduler_state_t**

Parameters of Scheduler state

Public Members

const uint8_t **schedule_count**

Scheduler count

esp_ble_mesh_schedule_register_t ***schedules**

Up to 16 scheduled entries

struct **esp_ble_mesh_scheduler_srv_t**

User data of Scheduler Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scheduler Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scheduler_state_t ***state**

Parameters of the Scheduler state

struct **esp_ble_mesh_scheduler_setup_srv_t**

User data of Scheduler Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scheduler Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scheduler_state_t ***state**

Parameters of the Scheduler state

struct **esp_ble_mesh_state_change_time_set_t**

Parameters of Time Set state change event

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **subsecond**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta_curr**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset_curr**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_state_change_time_status_t**

Parameters of Time Status state change event

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **subsecond**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta_curr**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset_curr**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_state_change_time_zone_set_t**

Parameters of Time Zone Set state change event

Public Members

uint8_t **time_zone_offset_new**

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_state_change_tai_utc_delta_set_t**

Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t **tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint8_t **tai_delta_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_state_change_time_role_set_t**

Parameter of Time Role Set state change event

Public Members

uint8_t **time_role**

The Time Role for the element

struct **esp_ble_mesh_state_change_scene_store_t**

Parameter of Scene Store state change event

Public Members

uint16_t **scene_number**

The number of scenes to be stored

struct **esp_ble_mesh_state_change_scene_recall_t**

Parameter of Scene Recall state change event

Public Members

uint16_t **scene_number**

The number of scenes to be recalled

struct **esp_ble_mesh_state_change_scene_delete_t**

Parameter of Scene Delete state change event

Public Members

uint16_t **scene_number**

The number of scenes to be deleted

struct **esp_ble_mesh_state_change_scheduler_act_set_t**

Parameter of Scheduler Action Set state change event

Public Members

uint64_t **index**

Index of the Schedule Register entry to set

uint64_t **year**

Scheduled year for the action

uint64_t **month**

Scheduled month for the action

uint64_t **day**

Scheduled day of the month for the action

uint64_t **hour**

Scheduled hour for the action

uint64_t **minute**

Scheduled minute for the action

uint64_t **second**

Scheduled second for the action

uint64_t **day_of_week**

Schedule days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action

uint16_t **scene_number**

Scene number to be used for some actions

struct **esp_ble_mesh_server_recv_scheduler_act_get_t**

Context of the received Scheduler Action Get message

Public Members

uint8_t **index**

Index of the Schedule Register entry to get

struct **esp_ble_mesh_server_recv_time_set_t**

Context of the received Time Set message

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **subsecond**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_server_recv_time_zone_set_t**

Context of the received Time Zone Set message

Public Members

uint8_t **time_zone_offset_new**

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_server_recv_tai_utc_delta_set_t**

Context of the received TAI UTC Delta Set message

Public Members

uint16_t **tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint16_t **padding**

Always 0b0. Other values are Prohibited.

uint8_t **tai_delta_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_server_recv_time_role_set_t**

Context of the received Time Role Set message

Public Members

uint8_t **time_role**

The Time Role for the element

struct **esp_ble_mesh_server_recv_scene_store_t**

Context of the received Scene Store message

Public Members

uint16_t **scene_number**

The number of scenes to be stored

struct **esp_ble_mesh_server_recv_scene_recall_t**

Context of the received Scene Recall message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **scene_number**

The number of scenes to be recalled

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_scene_delete_t**

Context of the received Scene Delete message

Public Members

uint16_t **scene_number**

The number of scenes to be deleted

struct **esp_ble_mesh_server_recv_scheduler_act_set_t**

Context of the received Scheduler Action Set message

Public Members

uint64_t **index**

Index of the Schedule Register entry to set

uint64_t **year**

Scheduled year for the action

uint64_t **month**

Scheduled month for the action

uint64_t **day**

Scheduled day of the month for the action

uint64_t **hour**

Scheduled hour for the action

uint64_t **minute**

Scheduled minute for the action

uint64_t **second**

Scheduled second for the action

uint64_t **day_of_week**

Schedule days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action

uint16_t **scene_number**

Scene number to be used for some actions

struct **esp_ble_mesh_server_recv_time_status_t**

Context of the received Time Status message

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **subsecond**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_time_scene_server_cb_param_t**

Time Scene Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Time and Scenes Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_time_scene_server_cb_value_t **value**

Value of the received Time and Scenes Messages

Macros

ESP_BLE_MESH_MODEL_TIME_CLI(cli_pub, cli_data)

Define a new Time Client Model.

备注: This API needs to be called for each element on which the application needs to have a Time Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Time Client Model instance.

ESP_BLE_MESH_MODEL_SCENE_CLI(cli_pub, cli_data)

Define a new Scene Client Model.

备注: This API needs to be called for each element on which the application needs to have a Scene Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Scene Client Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_CLI(cli_pub, cli_data)

Define a new Scheduler Client Model.

备注： This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Scheduler Client Model instance.

ESP_BLE_MESH_MODEL_TIME_SRV(srv_pub, srv_data)

Time Scene Server Models related context.

Define a new Time Server Model.

备注： 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_time_srv_t*.

返回 New Time Server Model instance.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV(srv_data)

Define a new Time Setup Server Model.

备注： 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

a. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
b. This model does not support subscribing nor publishing.

参数

- **srv_data** –Pointer to the unique struct *esp_ble_mesh_time_setup_srv_t*.

返回 New Time Setup Server Model instance.

ESP_BLE_MESH_MODEL_SCENE_SRV(srv_pub, srv_data)

Define a new Scene Server Model.

备注： 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

a. This model shall support model publication and model subscription.
b. The model may be present only on the Primary element of a node.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scene_srv_t*.

返回 New Scene Server Model instance.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV(srv_pub, srv_data)

Define a new Scene Setup Server Model.

备注： 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

a. This model shall support model subscription.
b. The model may be present only on the Primary element of a node.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scene_setup_srv_t*.

返回 New Scene Setup Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SRV(srv_pub, srv_data)

Define a new Scheduler Server Model.

备注： 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.

a. This model shall support model publication and model subscription.
b. The model may be present only on the Primary element of a node.
c. The model requires the Time Server model shall be present on the element.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scheduler_srv_t*.

返回 New Scheduler Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV(srv_pub, srv_data)

Define a new Scheduler Setup Server Model.

备注： 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.

a. This model shall support model subscription.
b. The model may be present only on the Primary element of a node.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scheduler_setup_srv_t*.

返回 New Scheduler Setup Server Model instance.

ESP_BLE_MESH_UNKNOWN_TAI_SECONDS

Unknown TAI Seconds

ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE

Unknown TAI of Zone Change

ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE

Unknown TAI of Delta Change

ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE

Maximum TAI-UTC Delta value

ESP_BLE_MESH_TAI_SECONDS_LEN

Length of TAI Seconds

ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN

Length of TAI of Zone Change

ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN

Length of TAI of Delta Change

ESP_BLE_MESH_INVALID_SCENE_NUMBER

Invalid Scene Number

ESP_BLE_MESH_SCENE_NUMBER_LEN

Length of the Scene Number

ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR

Any year of the Scheduled year

ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY

Any day of the Scheduled day

ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR

Any hour of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY

Any hour of the Scheduled Day

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR

Any minute of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN

Every 15 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN

Every 20 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR

Once of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN

Any second of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC

Every 15 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC

Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN

Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF

Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON

Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL

Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION

Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE

Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX

Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE

Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY

Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY

Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLINET

Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS

Scene operation - Success

ESP_BLE_MESH_SCENE_REG_FULL

Scene operation - Scene Register Full

ESP_BLE_MESH_SCENE_NOT_FOUND

Scene operation - Scene Not Found

Type Definitions

typedef void (***esp_ble_mesh_time_scene_client_cb_t**)(*esp_ble_mesh_time_scene_client_cb_event_t* event, *esp_ble_mesh_time_scene_client_cb_param_t* *param)

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

Param event Event type
Param param Pointer to callback parameter

typedef void (***esp_ble_mesh_time_scene_server_cb_t**)(*esp_ble_mesh_time_scene_server_cb_event_t* event, *esp_ble_mesh_time_scene_server_cb_param_t* *param)

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

Param event Event type
Param param Pointer to callback parameter

Enumerations

enum **esp_ble_mesh_time_scene_client_cb_event_t**

This enum value is the event of Time Scene Client Model

Values:

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX**

enum **esp_ble_mesh_time_scene_server_cb_event_t**

This enum value is the event of Time Scene Server Model

Values:

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT**

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Time Scene Get messages are received.
ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT**

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Get messages are received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT**

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT**

When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when TIme Status message is received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX**

Lighting Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

Functions

esp_err_t **esp_ble_mesh_register_light_client_callback**(*esp_ble_mesh_light_client_cb_t* callback)

Register BLE Mesh Light Client Model callback.

参数 **callback** –**[in]** pointer to the callback function.
返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_light_client_get_state**(*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_light_client_get_state_t* *get_state)

Get the value of Light Server Model states using the Light Client Model get messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

---

参数
- **params** –**[in]** Pointer to BLE Mesh common client parameters.
- **get_state** –**[in]** Pointer of light get message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_light_client_set_state**(*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_light_client_set_state_t* *set_state)

Set the value of Light Server Model states using the Light Client Model set messages.

备注: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

---

参数
- **params** –**[in]** Pointer to BLE Mesh common client parameters.
- **set_state** –**[in]** Pointer of light set message value. Shall not be set to NULL.

返回 ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_lighting_server_callback**(*esp_ble_mesh_lighting_server_cb_t* callback)

Register BLE Mesh Lighting Server Model callback.

参数 **callback** –**[in]** Pointer to the callback function.
返回 ESP_OK on success or error code otherwise.

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_lightness_default_set_t**

Parameter of Light Lightness Default Set

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

struct **esp_ble_mesh_light_lightness_range_set_t**

Parameters of Light Lightness Range Set

Public Members

uint16_t **range_min**

Value of range min field of light lightness range state

uint16_t **range_max**

Value of range max field of light lightness range state

struct **esp_ble_mesh_light_ctl_set_t**

Parameters of Light CTL Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **ctl_lightness**

Target value of light ctl lightness state

uint16_t **ctl_temperatrue**

Target value of light ctl temperature state

int16_t **ctl_delta_uv**

Target value of light ctl delta UV state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_ctl_temperature_set_t**

Parameters of Light CTL Temperature Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **ctl_temperatrue**

Target value of light ctl temperature state

int16_t **ctl_delta_uv**

Target value of light ctl delta UV state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_ctl_temperature_range_set_t**

Parameters of Light CTL Temperature Range Set

Public Members

uint16_t **range_min**

Value of temperature range min field of light ctl temperature range state

uint16_t **range_max**

Value of temperature range max field of light ctl temperature range state

struct **esp_ble_mesh_light_ctl_default_set_t**

Parameters of Light CTL Default Set

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **temperature**

Value of light temperature default state

int16_t **delta_uv**

Value of light delta UV default state

struct **esp_ble_mesh_light_hsl_set_t**

Parameters of Light HSL Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hsl_lightness**

Target value of light hsl lightness state

uint16_t **hsl_hue**

Target value of light hsl hue state

uint16_t **hsl_saturation**

Target value of light hsl saturation state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_hsl_hue_set_t**

Parameters of Light HSL Hue Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hue**

Target value of light hsl hue state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_hsl_saturation_set_t**

Parameters of Light HSL Saturation Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **saturation**

Target value of light hsl hue state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_hsl_default_set_t**

Parameters of Light HSL Default Set

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **hue**

Value of light hue default state

uint16_t **saturation**

Value of light saturation default state

struct **esp_ble_mesh_light_hsl_range_set_t**

Parameters of Light HSL Range Set

Public Members

uint16_t **hue_range_min**

Value of hue range min field of light hsl hue range state

uint16_t **hue_range_max**

Value of hue range max field of light hsl hue range state

uint16_t **saturation_range_min**

Value of saturation range min field of light hsl saturation range state

uint16_t **saturation_range_max**

Value of saturation range max field of light hsl saturation range state

struct **esp_ble_mesh_light_xyl_set_t**

Parameters of Light xyL Set

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **xyl_lightness**

The target value of the Light xyL Lightness state

uint16_t **xyl_x**

The target value of the Light xyL x state

uint16_t **xyl_y**

The target value of the Light xyL y state

uint8_t **tid**

Transaction Identifier

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_xyl_default_set_t**

Parameters of Light xyL Default Set

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

uint16_t **xyl_x**

The value of the Light xyL x Default state

uint16_t **xyl_y**

The value of the Light xyL y Default state

struct **esp_ble_mesh_light_xyl_range_set_t**

Parameters of Light xyL Range Set

Public Members

uint16_t **xyl_x_range_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t **xyl_x_range_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t **xyl_y_range_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t **xyl_y_range_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp_ble_mesh_light_lc_mode_set_t**

Parameter of Light LC Mode Set

Public Members

uint8_t **mode**

The target value of the Light LC Mode state

struct **esp_ble_mesh_light_lc_om_set_t**

Parameter of Light LC OM Set

Public Members

uint8_t **mode**

The target value of the Light LC Occupancy Mode state

struct **esp_ble_mesh_light_lc_light_onoff_set_t**

Parameters of Light LC Light OnOff Set

Public Members

bool **op_en**

Indicate whether optional parameters included

uint8_t **light_onoff**

The target value of the Light LC Light OnOff state

uint8_t **tid**

Transaction Identifier

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_lc_property_get_t**

Parameter of Light LC Property Get

Public Members

uint16_t **property_id**

Property ID identifying a Light LC Property

struct **esp_ble_mesh_light_lc_property_set_t**

Parameters of Light LC Property Set

Public Members

uint16_t **property_id**

Property ID identifying a Light LC Property

struct net_buf_simple ***property_value**

Raw value for the Light LC Property

struct **esp_ble_mesh_light_lightness_status_cb_t**

Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_lightness**

Current value of light lightness actual state

uint16_t **target_lightness**

Target value of light lightness actual state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_lightness_linear_status_cb_t**

Parameters of Light Lightness Linear Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_lightness**

Current value of light lightness linear state

uint16_t **target_lightness**

Target value of light lightness linear state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_lightness_last_status_cb_t**

Parameter of Light Lightness Last Status

Public Members

uint16_t **lightness**

The value of the Light Lightness Last state

struct **esp_ble_mesh_light_lightness_default_status_cb_t**

Parameter of Light Lightness Default Status

Public Members

uint16_t **lightness**

The value of the Light Lightness default State

struct **esp_ble_mesh_light_lightness_range_status_cb_t**

Parameters of Light Lightness Range Status

Public Members

uint8_t **status_code**

Status Code for the request message

uint16_t **range_min**

Value of range min field of light lightness range state

uint16_t **range_max**

Value of range max field of light lightness range state

struct **esp_ble_mesh_light_ctl_status_cb_t**

Parameters of Light CTL Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_ctl_lightness**

Current value of light ctl lightness state

uint16_t **present_ctl_temperature**

Current value of light ctl temperature state

uint16_t **target_ctl_lightness**

Target value of light ctl lightness state (optional)

uint16_t **target_ctl_temperature**

Target value of light ctl temperature state (C.1)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_ctl_temperature_status_cb_t**

Parameters of Light CTL Temperature Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_ctl_temperature**

Current value of light ctl temperature state

uint16_t **present_ctl_delta_uv**

Current value of light ctl delta UV state

uint16_t **target_ctl_temperature**

Target value of light ctl temperature state (optional)

uint16_t **target_ctl_delta_uv**

Target value of light ctl delta UV state (C.1)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_ctl_temperature_range_status_cb_t**

Parameters of Light CTL Temperature Range Status

Public Members

uint8_t **status_code**

Status code for the request message

uint16_t **range_min**

Value of temperature range min field of light ctl temperature range state

uint16_t **range_max**

Value of temperature range max field of light ctl temperature range state

struct **esp_ble_mesh_light_ctl_default_status_cb_t**

Parameters of Light CTL Default Status

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **temperature**

Value of light temperature default state

int16_t **delta_uv**

Value of light delta UV default state

struct **esp_ble_mesh_light_hsl_status_cb_t**

Parameters of Light HSL Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hsl_lightness**

Current value of light hsl lightness state

uint16_t **hsl_hue**

Current value of light hsl hue state

uint16_t **hsl_saturation**

Current value of light hsl saturation state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_hsl_target_status_cb_t**

Parameters of Light HSL Target Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hsl_lightness_target**

Target value of light hsl lightness state

uint16_t **hsl_hue_target**

Target value of light hsl hue state

uint16_t **hsl_saturation_target**

Target value of light hsl saturation state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_hsl_hue_status_cb_t**

Parameters of Light HSL Hue Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_hue**

Current value of light hsl hue state

uint16_t **target_hue**

Target value of light hsl hue state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_hsl_saturation_status_cb_t**

Parameters of Light HSL Saturation Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_saturation**

Current value of light hsl saturation state

uint16_t **target_saturation**

Target value of light hsl saturation state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_hsl_default_status_cb_t**

Parameters of Light HSL Default Status

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **hue**

Value of light hue default state

uint16_t **saturation**

Value of light saturation default state

struct **esp_ble_mesh_light_hsl_range_status_cb_t**

Parameters of Light HSL Range Status

Public Members

uint8_t **status_code**

Status code for the request message

uint16_t **hue_range_min**

Value of hue range min field of light hsl hue range state

uint16_t **hue_range_max**

Value of hue range max field of light hsl hue range state

uint16_t **saturation_range_min**

Value of saturation range min field of light hsl saturation range state

uint16_t **saturation_range_max**

Value of saturation range max field of light hsl saturation range state

struct **esp_ble_mesh_light_xyl_status_cb_t**

Parameters of Light xyL Status

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **xyl_lightness**

The present value of the Light xyL Lightness state

uint16_t **xyl_x**

The present value of the Light xyL x state

uint16_t **xyl_y**

The present value of the Light xyL y state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_xyl_target_status_cb_t**

Parameters of Light xyL Target Status

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **target_xyl_lightness**

The target value of the Light xyL Lightness state

uint16_t **target_xyl_x**

The target value of the Light xyL x state

uint16_t **target_xyl_y**

The target value of the Light xyL y state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_xyl_default_status_cb_t**

Parameters of Light xyL Default Status

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

uint16_t **xyl_x**

The value of the Light xyL x Default state

uint16_t **xyl_y**

The value of the Light xyL y Default state

struct **esp_ble_mesh_light_xyl_range_status_cb_t**

Parameters of Light xyL Range Status

Public Members

uint8_t **status_code**

Status Code for the requesting message

uint16_t **xyl_x_range_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t **xyl_x_range_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t **xyl_y_range_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t **xyl_y_range_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp_ble_mesh_light_lc_mode_status_cb_t**

Parameter of Light LC Mode Status

Public Members

uint8_t **mode**

The present value of the Light LC Mode state

struct **esp_ble_mesh_light_lc_om_status_cb_t**

Parameter of Light LC OM Status

Public Members

uint8_t **mode**

The present value of the Light LC Occupancy Mode state

struct **esp_ble_mesh_light_lc_light_onoff_status_cb_t**

Parameters of Light LC Light OnOff Status

Public Members

bool **op_en**

Indicate whether optional parameters included

uint8_t **present_light_onoff**

The present value of the Light LC Light OnOff state

uint8_t **target_light_onoff**

The target value of the Light LC Light OnOff state (Optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_lc_property_status_cb_t**

Parameters of Light LC Property Status

Public Members

uint16_t **property_id**

Property ID identifying a Light LC Property

struct net_buf_simple ***property_value**

Raw value for the Light LC Property

struct **esp_ble_mesh_light_client_cb_param_t**

Lighting Client Model callback parameters

Public Members

int **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_light_client_status_cb_t **status_cb**

The light status message callback values

struct **esp_ble_mesh_light_lightness_state_t**

Parameters of Light Lightness state

Public Members

uint16_t **lightness_linear**

The present value of Light Lightness Linear state

uint16_t **target_lightness_linear**

The target value of Light Lightness Linear state

uint16_t **lightness_actual**

The present value of Light Lightness Actual state

uint16_t **target_lightness_actual**

The target value of Light Lightness Actual state

uint16_t **lightness_last**

The value of Light Lightness Last state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint8_t **status_code**

The status code of setting Light Lightness Range state

uint16_t **lightness_range_min**

The minimum value of Light Lightness Range state

uint16_t **lightness_range_max**

The maximum value of Light Lightness Range state

struct **esp_ble_mesh_light_lightness_srv_t**

User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t ***state**

Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **actual_transition**

Parameters of state transition

esp_ble_mesh_state_transition_t **linear_transition**

Parameters of state transition

int32_t **tt_delta_lightness_actual**

Delta change value of lightness actual state transition

int32_t **tt_delta_lightness_linear**

Delta change value of lightness linear state transition

struct **esp_ble_mesh_light_lightness_setup_srv_t**

User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t ***state**

Parameters of the Light Lightness state

struct **esp_ble_mesh_light_ctl_state_t**

Parameters of Light CTL state

Public Members

uint16_t **lightness**

The present value of Light CTL Lightness state

uint16_t **target_lightness**

The target value of Light CTL Lightness state

uint16_t **temperature**

The present value of Light CTL Temperature state

uint16_t **target_temperature**

The target value of Light CTL Temperature state

int16_t **delta_uv**

The present value of Light CTL Delta UV state

int16_t **target_delta_uv**

The target value of Light CTL Delta UV state

uint8_t **status_code**

The statue code of setting Light CTL Temperature Range state

uint16_t **temperature_range_min**

The minimum value of Light CTL Temperature Range state

uint16_t **temperature_range_max**

The maximum value of Light CTL Temperature Range state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint16_t **temperature_default**

The value of Light CTL Temperature Default state

int16_t **delta_uv_default**

The value of Light CTL Delta UV Default state

struct **esp_ble_mesh_light_ctl_srv_t**

User data of Light CTL Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_lightness**

Delta change value of lightness state transition

int32_t **tt_delta_temperature**

Delta change value of temperature state transition

int32_t **tt_delta_delta_uv**

Delta change value of delta uv state transition

struct **esp_ble_mesh_light_ctl_setup_srv_t**

User data of Light CTL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

struct **esp_ble_mesh_light_ctl_temp_srv_t**

User data of Light CTL Temperature Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_temperature**

Delta change value of temperature state transition

int32_t **tt_delta_delta_uv**

Delta change value of delta uv state transition

struct **esp_ble_mesh_light_hsl_state_t**

Parameters of Light HSL state

Public Members

uint16_t **lightness**

The present value of Light HSL Lightness state

uint16_t **target_lightness**

The target value of Light HSL Lightness state

uint16_t **hue**

The present value of Light HSL Hue state

uint16_t **target_hue**

The target value of Light HSL Hue state

uint16_t **saturation**

The present value of Light HSL Saturation state

uint16_t **target_saturation**

The target value of Light HSL Saturation state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint16_t **hue_default**

The value of Light HSL Hue Default state

uint16_t **saturation_default**
The value of Light HSL Saturation Default state

uint8_t **status_code**
The status code of setting Light HSL Hue & Saturation Range state

uint16_t **hue_range_min**
The minimum value of Light HSL Hue Range state

uint16_t **hue_range_max**
The maximum value of Light HSL Hue Range state

uint16_t **saturation_range_min**
The minimum value of Light HSL Saturation state

uint16_t **saturation_range_max**
The maximum value of Light HSL Saturation state

struct **esp_ble_mesh_light_hsl_srv_t**
User data of Light HSL Server Model

Public Members

esp_ble_mesh_model_t ***model**
Pointer to the Lighting HSL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t ***state**
Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t **last**
Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**
Parameters of state transition

int32_t **tt_delta_lightness**
Delta change value of lightness state transition

int32_t **tt_delta_hue**
Delta change value of hue state transition

int32_t **tt_delta_saturation**
Delta change value of saturation state transition

struct **esp_ble_mesh_light_hsl_setup_srv_t**
User data of Light HSL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting HSL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t ***state**

Parameters of the Light HSL state

struct **esp_ble_mesh_light_hsl_hue_srv_t**

User data of Light HSL Hue Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting HSL Hue Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t ***state**

Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_hue**

Delta change value of hue state transition

struct **esp_ble_mesh_light_hsl_sat_srv_t**

User data of Light HSL Saturation Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t ***state**

Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_saturation**

Delta change value of saturation state transition

struct **esp_ble_mesh_light_xyl_state_t**

Parameters of Light xyL state

Public Members

uint16_t **lightness**

The present value of Light xyL Lightness state

uint16_t **target_lightness**

The target value of Light xyL Lightness state

uint16_t **x**

The present value of Light xyL x state

uint16_t **target_x**

The target value of Light xyL x state

uint16_t **y**

The present value of Light xyL y state

uint16_t **target_y**

The target value of Light xyL y state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint16_t **x_default**

The value of Light xyL x Default state

uint16_t **y_default**

The value of Light xyL y Default state

uint8_t **status_code**

The status code of setting Light xyL x & y Range state

uint16_t **x_range_min**

The minimum value of Light xyL x Range state

uint16_t **x_range_max**

The maximum value of Light xyL x Range state

uint16_t **y_range_min**

The minimum value of Light xyL y Range state

uint16_t **y_range_max**

The maximum value of Light xyL y Range state

struct **esp_ble_mesh_light_xyl_srv_t**

User data of Light xyL Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting xyL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t ***state**

Parameters of the Light xyL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_lightness**

Delta change value of lightness state transition

int32_t **tt_delta_x**

Delta change value of x state transition

int32_t **tt_delta_y**

Delta change value of y state transition

struct **esp_ble_mesh_light_xyl_setup_srv_t**

User data of Light xyL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting xyL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t ***state**

Parameters of the Light xyL state

struct **esp_ble_mesh_light_lc_state_t**

Parameters of Light LC states

Public Members

uint32_t **mode**

0b0 The controller is turned off.

- The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32_t **occupancy_mode**

The value of Light LC Occupancy Mode state

uint32_t **light_onoff**

The present value of Light LC Light OnOff state

uint32_t **target_light_onoff**

The target value of Light LC Light OnOff state

uint32_t **occupancy**

The value of Light LC Occupancy state

uint32_t **ambient_luxlevel**

The value of Light LC Ambient LuxLevel state

uint16_t **linear_output**

i. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
ii. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
iii. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

struct **esp_ble_mesh_light_lc_property_state_t**

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

Public Members

uint32_t **time_occupancy_delay**

A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t **time_fade_on**

A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t **time_run_on**

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t **time_fade**

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t **time_prolong**

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t **time_fade_standby_auto**

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t **time_fade_standby_manual**

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

uint16_t **lightness_on**

A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t **lightness_prolong**

A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t **lightness_standby**

A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t **ambient_luxlevel_on**

A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t **ambient_luxlevel_prolong**

A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t **ambient_luxlevel_standby**

A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float **regulator_kiu**

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float **regulator_kid**

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float **regulator_kpu**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float **regulator_kpd**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t **regulator_accuracy**

A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t **set_occupancy_to_1_delay**

If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct **esp_ble_mesh_light_lc_state_machine_t**

Parameters of Light LC state machine

Public Members

uint8_t **fade_on**

The value of transition time of Light LC Time Fade On

uint8_t **fade**

The value of transition time of Light LC Time Fade

uint8_t **fade_standby_auto**

The value of transition time of Light LC Time Fade Standby Auto

uint8_t **fade_standby_manual**

The value of transition time of Light LC Time Fade Standby Manual

struct *esp_ble_mesh_light_lc_state_machine_t*::[anonymous] **trans_time**

The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

esp_ble_mesh_lc_state_t **state**

The value of Light LC state machine state

struct k_delayed_work **timer**

Timer of Light LC state machine

struct **esp_ble_mesh_light_control_t**

Parameters of Light Lightness controller

Public Members

esp_ble_mesh_light_lc_state_t **state**

Parameters of Light LC state

esp_ble_mesh_light_lc_property_state_t **prop_state**

Parameters of Light LC Property state

esp_ble_mesh_light_lc_state_machine_t **state_machine**

Parameters of Light LC state machine

struct **esp_ble_mesh_light_lc_srv_t**

User data of Light LC Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting LC Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_control_t ***lc**

Parameters of the Light controller

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct **esp_ble_mesh_light_lc_setup_srv_t**

User data of Light LC Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting LC Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_control_t ***lc**

Parameters of the Light controller

struct **esp_ble_mesh_state_change_light_lightness_set_t**

Parameter of Light Lightness Actual state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Actual state

struct **esp_ble_mesh_state_change_light_lightness_linear_set_t**

Parameter of Light Lightness Linear state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Linear state

struct **esp_ble_mesh_state_change_light_lightness_default_set_t**

Parameter of Light Lightness Default state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Default state

struct **esp_ble_mesh_state_change_light_lightness_range_set_t**

Parameters of Light Lightness Range state change event

Public Members

uint16_t **range_min**

The minimum value of Light Lightness Range state

uint16_t **range_max**

The maximum value of Light Lightness Range state

struct **esp_ble_mesh_state_change_light_ctl_set_t**

Parameters of Light CTL state change event

Public Members

uint16_t **lightness**

The value of Light CTL Lightness state

uint16_t **temperature**

The value of Light CTL Temperature state

int16_t **delta_uv**

The value of Light CTL Delta UV state

struct **esp_ble_mesh_state_change_light_ctl_temperature_set_t**

Parameters of Light CTL Temperature state change event

Public Members

uint16_t **temperature**

The value of Light CTL Temperature state

int16_t **delta_uv**

The value of Light CTL Delta UV state

struct **esp_ble_mesh_state_change_light_ctl_temperature_range_set_t**

Parameters of Light CTL Temperature Range state change event

Public Members

uint16_t **range_min**

The minimum value of Light CTL Temperature Range state

uint16_t **range_max**

The maximum value of Light CTL Temperature Range state

struct **esp_ble_mesh_state_change_light_ctl_default_set_t**

Parameters of Light CTL Default state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Default state

uint16_t **temperature**

The value of Light CTL Temperature Default state

int16_t **delta_uv**

The value of Light CTL Delta UV Default state

struct **esp_ble_mesh_state_change_light_hsl_set_t**

Parameters of Light HSL state change event

Public Members

uint16_t **lightness**

The value of Light HSL Lightness state

uint16_t **hue**

The value of Light HSL Hue state

uint16_t **saturation**

The value of Light HSL Saturation state

struct **esp_ble_mesh_state_change_light_hsl_hue_set_t**

Parameter of Light HSL Hue state change event

Public Members

uint16_t **hue**

The value of Light HSL Hue state

struct **esp_ble_mesh_state_change_light_hsl_saturation_set_t**

Parameter of Light HSL Saturation state change event

Public Members

uint16_t **saturation**

The value of Light HSL Saturation state

struct **esp_ble_mesh_state_change_light_hsl_default_set_t**

Parameters of Light HSL Default state change event

Public Members

uint16_t **lightness**

The value of Light HSL Lightness Default state

uint16_t **hue**

The value of Light HSL Hue Default state

uint16_t **saturation**

The value of Light HSL Saturation Default state

struct **esp_ble_mesh_state_change_light_hsl_range_set_t**

Parameters of Light HSL Range state change event

Public Members

uint16_t **hue_range_min**

The minimum hue value of Light HSL Range state

uint16_t **hue_range_max**

The maximum hue value of Light HSL Range state

uint16_t **saturation_range_min**

The minimum saturation value of Light HSL Range state

uint16_t **saturation_range_max**

The maximum saturation value of Light HSL Range state

struct **esp_ble_mesh_state_change_light_xyl_set_t**

Parameters of Light xyL state change event

Public Members

uint16_t **lightness**

The value of Light xyL Lightness state

uint16_t **x**

The value of Light xyL x state

uint16_t **y**

The value of Light xyL y state

struct **esp_ble_mesh_state_change_light_xyl_default_set_t**

Parameters of Light xyL Default state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Default state

uint16_t **x**

The value of Light xyL x Default state

uint16_t **y**

The value of Light xyL y Default state

struct **esp_ble_mesh_state_change_light_xyl_range_set_t**

Parameters of Light xyL Range state change event

Public Members

uint16_t **x_range_min**

The minimum value of Light xyL x Range state

uint16_t **x_range_max**

The maximum value of Light xyL x Range state

uint16_t **y_range_min**

The minimum value of Light xyL y Range state

uint16_t **y_range_max**

The maximum value of Light xyL y Range state

struct **esp_ble_mesh_state_change_light_lc_mode_set_t**

Parameter of Light LC Mode state change event

Public Members

uint8_t **mode**

The value of Light LC Mode state

struct **esp_ble_mesh_state_change_light_lc_om_set_t**

Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t **mode**

The value of Light LC Occupancy Mode state

struct **esp_ble_mesh_state_change_light_lc_light_onoff_set_t**

Parameter of Light LC Light OnOff state change event

Public Members

uint8_t **onoff**

The value of Light LC Light OnOff state

struct **esp_ble_mesh_state_change_light_lc_property_set_t**

Parameters of Light LC Property state change event

Public Members

uint16_t **property_id**

The property id of Light LC Property state

struct net_buf_simple ***property_value**

The property value of Light LC Property state

struct **esp_ble_mesh_state_change_sensor_status_t**

Parameters of Sensor Status state change event

Public Members

uint16_t **property_id**

The value of Sensor Property ID

uint8_t **occupancy**

The value of Light LC Occupancy state

uint32_t **set_occupancy_to_1_delay**

The value of Light LC Set Occupancy to 1 Delay state

uint32_t **ambient_luxlevel**

The value of Light LC Ambient Luxlevel state

union *esp_ble_mesh_state_change_sensor_status_t*::[anonymous] **state**

Parameters of Sensor Status related state

struct **esp_ble_mesh_server_recv_light_lc_property_get_t**

Context of the received Light LC Property Get message

Public Members

uint16_t **property_id**

Property ID identifying a Light LC Property

struct **esp_ble_mesh_server_recv_light_lightness_set_t**

Context of the received Light Lightness Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **lightness**

Target value of light lightness actual state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_light_lightness_linear_set_t**

Context of the received Light Lightness Linear Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **lightness**

Target value of light lightness linear state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_light_lightness_default_set_t**

Context of the received Light Lightness Default Set message

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

struct **esp_ble_mesh_server_recv_light_lightness_range_set_t**

Context of the received Light Lightness Range Set message

Public Members

uint16_t **range_min**

Value of range min field of light lightness range state

uint16_t **range_max**

Value of range max field of light lightness range state

struct **esp_ble_mesh_server_recv_light_ctl_set_t**

Context of the received Light CTL Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **lightness**

Target value of light ctl lightness state

uint16_t **temperature**

Target value of light ctl temperature state

int16_t **delta_uv**

Target value of light ctl delta UV state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_light_ctl_temperature_set_t**

Context of the received Light CTL Temperature Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **temperature**

Target value of light ctl temperature state

int16_t **delta_uv**

Target value of light ctl delta UV state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t**

Context of the received Light CTL Temperature Range Set message

Public Members

uint16_t **range_min**

Value of temperature range min field of light ctl temperature range state

uint16_t **range_max**

Value of temperature range max field of light ctl temperature range state

struct **esp_ble_mesh_server_recv_light_ctl_default_set_t**

Context of the received Light CTL Default Set message

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **temperature**

Value of light temperature default state

int16_t **delta_uv**

Value of light delta UV default state

struct **esp_ble_mesh_server_recv_light_hsl_set_t**

Context of the received Light HSL Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **lightness**

Target value of light hsl lightness state

uint16_t **hue**

Target value of light hsl hue state

uint16_t **saturation**

Target value of light hsl saturation state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_light_hsl_hue_set_t**

Context of the received Light HSL Hue Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hue**

Target value of light hsl hue state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_light_hsl_saturation_set_t**

Context of the received Light HSL Saturation Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **saturation**

Target value of light hsl hue state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_light_hsl_default_set_t**

Context of the received Light HSL Default Set message

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **hue**

Value of light hue default state

uint16_t **saturation**

Value of light saturation default state

struct **esp_ble_mesh_server_recv_light_hsl_range_set_t**

Context of the received Light HSL Range Set message

Public Members

uint16_t **hue_range_min**

Value of hue range min field of light hsl hue range state

uint16_t **hue_range_max**

Value of hue range max field of light hsl hue range state

uint16_t **saturation_range_min**

Value of saturation range min field of light hsl saturation range state

uint16_t **saturation_range_max**

Value of saturation range max field of light hsl saturation range state

struct **esp_ble_mesh_server_recv_light_xyl_set_t**

Context of the received Light xyL Set message

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **lightness**

The target value of the Light xyL Lightness state

uint16_t **x**

The target value of the Light xyL x state

uint16_t **y**

The target value of the Light xyL y state

uint8_t **tid**

Transaction Identifier

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_light_xyl_default_set_t**

Context of the received Light xyL Default Set message

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

uint16_t **x**

The value of the Light xyL x Default state

uint16_t **y**

The value of the Light xyL y Default state

struct **esp_ble_mesh_server_recv_light_xyl_range_set_t**

Context of the received Light xyl Range Set message

Public Members

uint16_t **x_range_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t **x_range_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t **y_range_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t **y_range_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp_ble_mesh_server_recv_light_lc_mode_set_t**

Context of the received Light LC Mode Set message

Public Members

uint8_t **mode**

The target value of the Light LC Mode state

struct **esp_ble_mesh_server_recv_light_lc_om_set_t**

Context of the received Light OM Set message

Public Members

uint8_t **mode**

The target value of the Light LC Occupancy Mode state

struct **esp_ble_mesh_server_recv_light_lc_light_onoff_set_t**

Context of the received Light LC Light OnOff Set message

Public Members

bool **op_en**

Indicate whether optional parameters included

uint8_t **light_onoff**

The target value of the Light LC Light OnOff state

uint8_t **tid**

Transaction Identifier

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_light_lc_property_set_t**

Context of the received Light LC Property Set message

Public Members

uint16_t **property_id**

Property ID identifying a Light LC Property

struct net_buf_simple ***property_value**

Raw value for the Light LC Property

struct **esp_ble_mesh_server_recv_sensor_status_t**

Context of the received Sensor Status message

Public Members

struct net_buf_simple ***data**

Value of sensor data state (optional)

struct **esp_ble_mesh_lighting_server_cb_param_t**

Lighting Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Lighting Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_lighting_server_cb_value_t **value**

Value of the received Lighting Messages

Macros

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI(cli_pub, cli_data)

Define a new Light Lightness Client Model.

备注: This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Light Lightness Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI(cli_pub, cli_data)

Define a new Light CTL Client Model.

备注: This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Light CTL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI(cli_pub, cli_data)

Define a new Light HSL Client Model.

备注: This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Light HSL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI(cli_pub, cli_data)

Define a new Light xyL Client Model.

备注: This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Light xyL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_CLI(cli_pub, cli_data)

Define a new Light LC Client Model.

备注: This API needs to be called for each element on which the application needs to have a Light LC Client Model.

参数

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

返回 New Light LC Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV(srv_pub, srv_data)

Lighting Server Models related context.

Define a new Light Lightness Server Model.

备注: 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lightness_srv_t*.

返回 New Light Lightness Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV(srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

备注： 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

a. This model shall support model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lightness_setup_srv_t*.

返回 New Light Lightness Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV(srv_pub, srv_data)

Define a new Light CTL Server Model.

备注： 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

a. This model shall support model publication and model subscription.
b. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_ctl_srv_t*.

返回 New Light CTL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV(srv_pub, srv_data)

Define a new Light CTL Setup Server Model.

备注： 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

a. This model shall support model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_ctl_setup_srv_t*.

返回 New Light CTL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV(srv_pub, srv_data)

Define a new Light CTL Temperature Server Model.

备注： 1. The Light CTL Temperature Server model extends the Generic Level Server model.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_ctl_temp_srv_t*.

返回 New Light CTL Temperature Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV(srv_pub, srv_data)

Define a new Light HSL Server Model.

备注: 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

a. This model shall support model publication and model subscription.
b. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_srv_t*.

返回 New Light HSL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV(srv_pub, srv_data)

Define a new Light HSL Setup Server Model.

备注: 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

a. This model shall support model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_setup_srv_t*.

返回 New Light HSL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV(srv_pub, srv_data)

Define a new Light HSL Hue Server Model.

备注: 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_hue_srv_t*.

返回 New Light HSL Hue Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV(srv_pub, srv_data)

Define a new Light HSL Saturation Server Model.

备注： 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_sat_srv_t*.

返回 New Light HSL Saturation Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV(srv_pub, srv_data)

Define a new Light xyL Server Model.

备注： 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

a. This model shall support model publication and model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_xyl_srv_t*.

返回 New Light xyL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV(srv_pub, srv_data)

Define a new Light xyL Setup Server Model.

备注： 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.

a. This model shall support model subscription.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_xyl_setup_srv_t*.

返回 New Light xyL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_SRV(srv_pub, srv_data)

Define a new Light LC Server Model.

备注： 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

a. This model shall support model publication and model subscription.
b. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lc_srv_t*.

返回 New Light LC Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV(srv_pub, srv_data)

Define a new Light LC Setup Server Model.

备注： 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.

a. This model shall support model publication and model subscription.
b. This model may be used to configure setup parameters for the Light LC Server model.

参数

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lc_setup_srv_t*.

返回 New Light LC Setup Server Model instance.

Type Definitions

typedef void (***esp_ble_mesh_light_client_cb_t**)(*esp_ble_mesh_light_client_cb_event_t* event, *esp_ble_mesh_light_client_cb_param_t* *param)

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

Param event Event type
Param param Pointer to callback parameter

typedef void (***esp_ble_mesh_lighting_server_cb_t**)(*esp_ble_mesh_lighting_server_cb_event_t* event, *esp_ble_mesh_lighting_server_cb_param_t* *param)

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

Param event Event type
Param param Pointer to callback parameter

Enumerations

enum **esp_ble_mesh_light_client_cb_event_t**

This enum value is the event of Lighting Client Model

Values:

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX**

enum **esp_ble_mesh_lc_state_t**

This enum value is the Light LC State Machine states

Values:

enumerator **ESP_BLE_MESH_LC_OFF**

enumerator **ESP_BLE_MESH_LC_STANDBY**

enumerator **ESP_BLE_MESH_LC_FADE_ON**

enumerator **ESP_BLE_MESH_LC_RUN**

enumerator **ESP_BLE_MESH_LC_FADE**

enumerator **ESP_BLE_MESH_LC_PROLONG**

enumerator **ESP_BLE_MESH_LC_FADE_STANDBY_AUTO**

enumerator **ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL**

enum **esp_ble_mesh_lighting_server_cb_event_t**

This enum value is the event of Lighting Server Model

Values:

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT**

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Lighting Get messages are received.
ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT**

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Get messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT**

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT**

When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Status message is received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX**

2.3.5 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features

of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

图 1: ESP NimBLE Stack

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using *`nvs_flash_init()`* API. This is because ESP controller uses NVS during initialization.
- Initialize the host and controller stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h

Functions

esp_err_t **esp_nimble_hci_init**(void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

返回

- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

esp_err_t **esp_nimble_hci_deinit**(void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

备注: This function should be called after the NimBLE host is deinitialized.

返回

- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

Macros

BLE_HCI_UART_H4_NONE

BLE_HCI_UART_H4_CMD

BLE_HCI_UART_H4_ACL

BLE_HCI_UART_H4_SCO

BLE_HCI_UART_H4_EVT

ESP-IDF 目前支持两个主机堆栈。基于 Bluedroid 的堆栈（默认）支持传统蓝牙和 BLE，而基于 Apache NimBLE 的堆栈仅支持 BLE。用户可参考如下信息进行选择：

- 对于同时涉及传统蓝牙和 BLE 的用例，应该选用 Bluedroid。
- 对于仅涉及 BLE 的用例，建议选用 NimBLE。在代码占用和运行时，NimBLE 对内存的要求较低，因此适用于此类场景。

蓝牙 API 的示例代码存放于 ESP-IDF 示例项目的 bluetooth/bluedroid 目录下。

下面的示例给出了详细介绍：

- GATT 客户端示例
- GATT 服务端服务表格示例
- GATT 服务端示例
- GATT 客户端安全性示例
- GATT 服务端安全性示例
- GATT 客户端多连接示例

2.4 错误代码参考

本节列出了 ESP-IDF 中定义的各种错误代码常量。

有关 ESP-IDF 中出错处理的通用信息，请参见*错误处理*。

ESP_FAIL (-1): Generic esp_err_t code indicating failure

ESP_OK (0): esp_err_t value indicating success (no error)

ESP_ERR_NO_MEM **(0x101)**: Out of memory

ESP_ERR_INVALID_ARG **(0x102)**: Invalid argument

ESP_ERR_INVALID_STATE **(0x103)**: Invalid state

ESP_ERR_INVALID_SIZE **(0x104)**: Invalid size

ESP_ERR_NOT_FOUND **(0x105)**: Requested resource not found

ESP_ERR_NOT_SUPPORTED **(0x106)**: Operation or feature not supported

ESP_ERR_TIMEOUT **(0x107)**: Operation timed out

ESP_ERR_INVALID_RESPONSE **(0x108)**: Received response was invalid

ESP_ERR_INVALID_CRC **(0x109)**: CRC or checksum was invalid

ESP_ERR_INVALID_VERSION **(0x10a)**: Version was invalid

ESP_ERR_INVALID_MAC **(0x10b)**: MAC address was invalid

ESP_ERR_NOT_FINISHED **(0x10c)**: There are items remained to retrieve

ESP_ERR_NVS_BASE **(0x1100)**: Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED **(0x1101)**: The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND **(0x1102)**: A requested entry couldn't be found or namespace doesn't exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH **(0x1103)**: The type of set or get operation doesn't match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY **(0x1104)**: Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE **(0x1105)**: There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME **(0x1106)**: Namespace name doesn't satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE **(0x1107)**: Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED **(0x1108)**: The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

ESP_ERR_NVS_KEY_TOO_LONG **(0x1109)**: Key name is too long

ESP_ERR_NVS_PAGE_FULL **(0x110a)**: Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE **(0x110b)**: NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

ESP_ERR_NVS_INVALID_LENGTH **(0x110c)**: String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES **(0x110d)**: NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

ESP_ERR_NVS_VALUE_TOO_LONG **(0x110e)**: Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND **(0x110f)**: Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND **(0x1110)**: NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED **(0x1111)**: XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED **(0x1112)**: XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED **(0x1113)**: XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND **(0x1114)**: XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED **(0x1115)**: NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED **(0x1116)**: NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART **(0x1117)**: NVS key partition is corrupt

ESP_ERR_NVS_CONTENT_DIFFERS **(0x1118)**: Internal error; never returned by nvs API functions. NVS key is different in comparison

ESP_ERR_NVS_WRONG_ENCRYPTION **(0x1119)**: NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_ULP_BASE **(0x1200)**: Offset for ULP-related error codes

ESP_ERR_ULP_SIZE_TOO_BIG **(0x1201)**: Program doesn't fit into RTC memory reserved for the ULP

ESP_ERR_ULP_INVALID_LOAD_ADDR **(0x1202)**: Load address is outside of RTC memory reserved for the ULP

ESP_ERR_ULP_DUPLICATE_LABEL **(0x1203)**: More than one label with the same number was defined

ESP_ERR_ULP_UNDEFINED_LABEL **(0x1204)**: Branch instructions references an undefined label

ESP_ERR_ULP_BRANCH_OUT_OF_RANGE **(0x1205)**: Branch target is out of range of B instruction (try replacing with BX)

ESP_ERR_OTA_BASE **(0x1500)**: Base error code for ota_ops api

ESP_ERR_OTA_PARTITION_CONFLICT **(0x1501)**: Error if request was to write or erase the current running partition

ESP_ERR_OTA_SELECT_INFO_INVALID **(0x1502)**: Error if OTA data partition contains invalid content

ESP_ERR_OTA_VALIDATE_FAILED **(0x1503)**: Error if OTA app image is invalid

ESP_ERR_OTA_SMALL_SEC_VER **(0x1504)**: Error if the firmware has a secure version less than the running firmware.

ESP_ERR_OTA_ROLLBACK_FAILED **(0x1505)**: Error if flash does not have valid firmware in passive partition and hence rollback is not possible

ESP_ERR_OTA_ROLLBACK_INVALID_STATE **(0x1506)**: Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

ESP_ERR_EFUSE **(0x1600)**: Base error code for efuse api.

ESP_OK_EFUSE_CNT **(0x1601)**: OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL **(0x1602)**: Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG **(0x1603)**: Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING **(0x1604)**: Error while a encoding operation.

ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS **(0x1605)**: Error not enough unused key blocks available

ESP_ERR_DAMAGED_READING **(0x1606)**: Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

ESP_ERR_IMAGE_BASE **(0x2000)**

ESP_ERR_IMAGE_FLASH_FAIL **(0x2001)**

ESP_ERR_IMAGE_INVALID **(0x2002)**

ESP_ERR_WIFI_BASE **(0x3000)**: Starting number of WiFi error codes

ESP_ERR_WIFI_NOT_INIT **(0x3001)**: WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED **(0x3002)**: WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED **(0x3003)**: WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF **(0x3004)**: WiFi interface error

ESP_ERR_WIFI_MODE **(0x3005)**: WiFi mode error

ESP_ERR_WIFI_STATE **(0x3006)**: WiFi internal state error

ESP_ERR_WIFI_CONN **(0x3007)**: WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS **(0x3008)**: WiFi internal NVS module error

ESP_ERR_WIFI_MAC **(0x3009)**: MAC address is invalid

ESP_ERR_WIFI_SSID **(0x300a)**: SSID is invalid

ESP_ERR_WIFI_PASSWORD **(0x300b)**: Password is invalid

ESP_ERR_WIFI_TIMEOUT **(0x300c)**: Timeout error

ESP_ERR_WIFI_WAKE_FAIL **(0x300d)**: WiFi is in sleep state(RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK **(0x300e)**: The caller would block

ESP_ERR_WIFI_NOT_CONNECT **(0x300f)**: Station still in disconnect status

ESP_ERR_WIFI_POST **(0x3012)**: Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE **(0x3013)**: Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE **(0x3014)**: Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC **(0x3015)**: The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW **(0x3016)**: The WiFi TX is disallowed

ESP_ERR_WIFI_TWT_FULL **(0x3017)**: no available flow id

ESP_ERR_WIFI_TWT_SETUP_TIMEOUT **(0x3018)**: Timeout of receiving twt setup response frame, timeout times can be set during twt setup

ESP_ERR_WIFI_REGISTRAR **(0x3033)**: WPS registrar is not supported

ESP_ERR_WIFI_WPS_TYPE **(0x3034)**: WPS type error

ESP_ERR_WIFI_WPS_SM **(0x3035)**: WPS state machine is not initialized

ESP_ERR_ESPNOW_BASE **(0x3064)**: ESPNOW error number base.

ESP_ERR_ESPNOW_NOT_INIT **(0x3065)**: ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG **(0x3066)**: Invalid argument

ESP_ERR_ESPNOW_NO_MEM **(0x3067)**: Out of memory

ESP_ERR_ESPNOW_FULL **(0x3068)**: ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND **(0x3069)**: ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL **(0x306a)**: Internal error

ESP_ERR_ESPNOW_EXIST **(0x306b)**: ESPNOW peer has existed

ESP_ERR_ESPNOW_IF **(0x306c)**: Interface error

ESP_ERR_DPP_FAILURE **(0x3097)**: Generic failure during DPP Operation

ESP_ERR_DPP_TX_FAILURE **(0x3098)**: DPP Frame Tx failed OR not Acked

ESP_ERR_DPP_INVALID_ATTR **(0x3099)**: Encountered invalid DPP Attribute

ESP_ERR_MESH_BASE **(0x4000)**: Starting number of MESH error codes

ESP_ERR_MESH_WIFI_NOT_START **(0x4001)**

ESP_ERR_MESH_NOT_INIT **(0x4002)**

ESP_ERR_MESH_NOT_CONFIG **(0x4003)**

ESP_ERR_MESH_NOT_START **(0x4004)**

ESP_ERR_MESH_NOT_SUPPORT **(0x4005)**

ESP_ERR_MESH_NOT_ALLOWED **(0x4006)**

ESP_ERR_MESH_NO_MEMORY **(0x4007)**

ESP_ERR_MESH_ARGUMENT **(0x4008)**

ESP_ERR_MESH_EXCEED_MTU **(0x4009)**

ESP_ERR_MESH_TIMEOUT **(0x400a)**

ESP_ERR_MESH_DISCONNECTED **(0x400b)**

ESP_ERR_MESH_QUEUE_FAIL **(0x400c)**

ESP_ERR_MESH_QUEUE_FULL **(0x400d)**

ESP_ERR_MESH_NO_PARENT_FOUND **(0x400e)**

ESP_ERR_MESH_NO_ROUTE_FOUND **(0x400f)**

ESP_ERR_MESH_OPTION_NULL **(0x4010)**

ESP_ERR_MESH_OPTION_UNKNOWN **(0x4011)**

ESP_ERR_MESH_XON_NO_WINDOW **(0x4012)**

ESP_ERR_MESH_INTERFACE **(0x4013)**

ESP_ERR_MESH_DISCARD_DUPLICATE **(0x4014)**

ESP_ERR_MESH_DISCARD **(0x4015)**

ESP_ERR_MESH_VOTING **(0x4016)**

ESP_ERR_MESH_XMIT **(0x4017)**

ESP_ERR_MESH_QUEUE_READ **(0x4018)**

ESP_ERR_MESH_PS **(0x4019)**

ESP_ERR_MESH_RECV_RELEASE **(0x401a)**

ESP_ERR_ESP_NETIF_BASE **(0x5000)**

ESP_ERR_ESP_NETIF_INVALID_PARAMS **(0x5001)**

ESP_ERR_ESP_NETIF_IF_NOT_READY **(0x5002)**

ESP_ERR_ESP_NETIF_DHCPC_START_FAILED **(0x5003)**

ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED **(0x5004)**

ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED **(0x5005)**

ESP_ERR_ESP_NETIF_NO_MEM **(0x5006)**

ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED **(0x5007)**

ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED **(0x5008)**

ESP_ERR_ESP_NETIF_INIT_FAILED **(0x5009)**

ESP_ERR_ESP_NETIF_DNS_NOT_CONFIGURED **(0x500a)**

ESP_ERR_ESP_NETIF_MLD6_FAILED **(0x500b)**

ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED **(0x500c)**

ESP_ERR_ESP_NETIF_DHCPS_START_FAILED **(0x500d)**

ESP_ERR_FLASH_BASE **(0x6000)**: Starting number of flash error codes

ESP_ERR_FLASH_OP_FAIL **(0x6001)**

ESP_ERR_FLASH_OP_TIMEOUT **(0x6002)**

ESP_ERR_FLASH_NOT_INITIALISED **(0x6003)**

ESP_ERR_FLASH_UNSUPPORTED_HOST **(0x6004)**

ESP_ERR_FLASH_UNSUPPORTED_CHIP **(0x6005)**

ESP_ERR_FLASH_PROTECTED **(0x6006)**

ESP_ERR_HTTP_BASE **(0x7000)**: Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT **(0x7001)**: The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT **(0x7002)**: Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA **(0x7003)**: Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER **(0x7004)**: Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT **(0x7005)**: There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING **(0x7006)**: HTTP connection hasn't been established yet

ESP_ERR_HTTP_EAGAIN **(0x7007)**: Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED **(0x7008)**: Read FIN from peer and the connection closed

ESP_ERR_ESP_TLS_BASE **(0x8000)**: Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME **(0x8001)**: Error if hostname couldn't be resolved upon tls connection

ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET **(0x8002)**: Failed to create socket

ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY **(0x8003)**: Unsupported protocol family

ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST **(0x8004)**: Failed to connect to host

ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED **(0x8005)**: failed to set/get socket option

ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT **(0x8006)**: new connection in esp_tls_low_level_conn connection timeouted

ESP_ERR_ESP_TLS_SE_FAILED **(0x8007)**

ESP_ERR_ESP_TLS_TCP_CLOSED_FIN **(0x8008)**

ESP_ERR_MBEDTLS_CERT_PARTLY_OK **(0x8010)**: mbedtls parse certificates was partly successful

ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED **(0x8011)**: mbedtls api returned error

ESP_ERR_TCP_TRANSPORT_NO_MEM **(0xe004)**: Memory allocation failed

2.5 连网 API

2.5.1 Wi-Fi

ESP-NOW

概述 ESP-NOW 是一种由乐鑫公司定义的无连接 Wi-Fi 通信协议。在 ESP-NOW 中，应用程序数据被封装在各个供应商的动作帧中，然后在无连接的情况下，从一个 Wi-Fi 设备传输到另一个 Wi-Fi 设备。CTR 与 CBC-MAC 协议 (CCMP) 可用来保护动作帧的安全。ESP-NOW 广泛应用于智能照明、远程控制、传感器等领域。

帧格式 ESP-NOW 使用各个供应商的动作帧传输数据，默认比特率为 1 Mbps。各个供应商的动作帧格式为：

MAC 报头	分类代码	组织标识符	随机值	供应商特定内容	FCS
24 字节	1 字节	3 字节	4 字节	7~257 字节	4 字节

- 分类代码：分类代码字段可用于指示各个供应商的类别（比如 127）。
- 组织标识符：组织标识符包含一个唯一标识符 (比如 0x18fe34)，为乐鑫指定的 MAC 地址的前三个字节。
- 随机值：防止重放攻击。
- 供应商特定内容：供应商特定内容包含供应商特定字段，如下所示：

元素 ID	长度	组织标识符	类型	版本	正文
1 字节	1 字节	3 字节	1 字节	1 字节	0 ~ 250 字节

- 元素 ID：元素 ID 字段可用于指示特定于供应商的元素。
- 长度：长度是组织标识符、类型、版本和正文的总长度。
- 组织标识符：组织标识符包含一个唯一标识符 (比如 0x18fe34)，为乐鑫指定的 MAC 地址的前三个字节。
- 类型：类型字段设置为 4，代表 ESP-NOW。
- 版本：版本字段设置为 ESP-NOW 的版本。
- 正文：正文包含 ESP-NOW 数据。

由于 ESP-NOW 是无连接的，因此 MAC 报头与标准帧略有不同。FrameControl 字段的 FromDS 和 ToDS 位均为 0。第一个地址字段用于配置目标地址。第二个地址字段用于配置源地址。第三个地址字段用于配置广播地址 (0xff:0xff:0xff:0xff:0xff:0xff)。

安全

ESP-NOW 采用 CCMP 方法保护供应商特定动作帧的安全，具体可参考 IEEE Std. 802.11-2012。Wi-Fi 设备维护一个初始

- PMK 可使用 AES-128 算法加密 LMK。请调用*esp_now_set_pmk()* 设置 PMK。如果未设置 PMK，将使用默认 PMK。
- LMK 可通过 CCMP 方法对供应商特定的动作帧进行加密，最多拥有 6 个不同的 LMK。如果未设置配对设备的 LMK，则动作帧不进行加密。

目前，不支持加密组播供应商特定的动作帧。

初始化和反初始化 调用*esp_now_init()* 初始化 ESP-NOW，调用*esp_now_deinit()* 反初始化 ESP-NOW。ESP-NOW 数据必须在 Wi-Fi 启动后传输，因此建议在初始化 ESP-NOW 之前启动 Wi-Fi，并在反初始化 ESP-NOW 之后停止 Wi-Fi。当调用*esp_now_deinit()* 时，配对设备的所有信息都将被删除。

添加配对设备 在将数据发送到其他设备之前，请先调用*esp_now_add_peer()* 将其添加到配对设备列表中。如果启用了加密，则必须设置 LMK。ESP-NOW 数据可以从 Station 或 Softap 接口发送。确保在发送 ESP-NOW 数据之前已启用该接口。

配对设备的最大数量是 20，其中加密设备的数量不超过 17，默认值是 7。如果想要修改加密设备的数量，在 Wi-Fi menuconfig 设置*CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM*。

在发送广播数据之前必须添加具有广播 MAC 地址的设备。配对设备的信道范围是从 0 ~ 14。如果信道设置为 0，数据将在当前信道上发送。否则，必须使用本地设备所在的通道。

发送 ESP-NOW 数据 调用*esp_now_send()* 发送 ESP-NOW 数据，调用*esp_now_register_send_cb()* 注册发送回调函数。如果 MAC 层成功接收到数据，则该函数将返回 *ESP_NOW_SEND_SUCCESS* 事件。否则，它将返回 *ESP_NOW_SEND_FAIL*。ESP-NOW 数据发送失败可能有几种原因，比如目标设备不存在、设备的信道不相同、动作帧在传输过程中丢失等。应用层并不一定可以总能接收到数据。如果需要，应用层可在接收 ESP-NOW 数据时发回一个应答 (ACK) 数据。如果接收 ACK 数据超时，则将重新传输 ESP-NOW 数据。可以为 ESP-NOW 数据设置序列号，从而删除重复的数据。

如果有大量 ESP-NOW 数据要发送，调用 `esp_now_send()` 时需注意单次发送的数据不能超过 250 字节。请注意，两个 ESP-NOW 数据包的发送间隔太短可能导致回调函数返回混乱。因此，建议在等到上一次回调函数返回 ACK 后再发送下一个 ESP-NOW 数据。发送回调函数从高优先级的 Wi-Fi 任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数据发布到队列，并交给优先级较低的任务处理。

接收 ESP-NOW 数据 调用*esp_now_register_recv_cb()* 注册接收回调函数。当接收 ESP-NOW 数据时，需要调用接收回调函数。接收回调函数也在 Wi-Fi 任务任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数据发布到队列，并交给优先级较低的任务处理。

配置 ESP-NOW 速率 调用*esp_wifi_config_espnow_rate()* 配置指定接口的 ESPNOW 速率。确保在配置速率之前使能接口。这个 API 应该在*esp_wifi_start()* 之后调用。

配置 ESP-NOW 功耗参数 当且仅当 ESP32-C3 配置为 STA 模式时，允许其进行休眠。

进行休眠时，调用*esp_now_set_wake_window()* 为 ESP-NOW 收包配置 Window。默认情况下 Window 为最大值，将允许一直收包。

如果对 ESP-NOW 进功耗管理，也需要调用*esp_wifi_connectionless_module_set_wake_interval()*。

请参考非连接模块功耗管理 获取更多信息。

应用示例

- 如何在设备间传输 ESP-NOW 数据：wifi/espnow。
- 了解更多 ESP-NOW 的应用示例，请参考 README.md 文件。

API 参考

Header File

- components/esp_wifi/include/esp_now.h

Functions

esp_err_t **esp_now_init**(void)

Initialize ESPNOW function.

返回
- ESP_OK : succeed
- ESP_ERR_ESPNOW_INTERNAL : Internal error

esp_err_t **esp_now_deinit**(void)

De-initialize ESPNOW function.

返回
- ESP_OK : succeed

esp_err_t **esp_now_get_version**(uint32_t *version)

Get the version of ESPNOW.

参数 **version** –ESPNOW version
返回
- ESP_OK : succeed
- ESP_ERR_ESPNOW_ARG : invalid argument

esp_err_t **esp_now_register_recv_cb**(*esp_now_recv_cb_t* cb)

Register callback function of receiving ESPNOW data.

参数 **cb** –callback function of receiving ESPNOW data
返回
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

esp_err_t **esp_now_unregister_recv_cb**(void)

Unregister callback function of receiving ESPNOW data.

返回
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

esp_err_t **esp_now_register_send_cb**(*esp_now_send_cb_t* cb)

Register callback function of sending ESPNOW data.

参数 **cb** –callback function of sending ESPNOW data
返回
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

esp_err_t **esp_now_unregister_send_cb**(void)

Unregister callback function of sending ESPNOW data.

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

esp_err_t **esp_now_send**(const uint8_t *peer_addr, const uint8_t *data, size_t len)

Send ESPNOW data.

Attention 1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
Attention 2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
Attention 3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
Attention 4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

参数

- **peer_addr** –peer MAC address
- **data** –data to send
- **len** –length of data

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_INTERNAL : internal error
- ESP_ERR_ESPNOW_NO_MEM : out of memory, when this happens, you can delay a while before sending the next data
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found
- ESP_ERR_ESPNOW_IF : current WiFi interface doesn’ t match that of peer

esp_err_t **esp_now_add_peer**(const *esp_now_peer_info_t* *peer)

Add a peer to peer list.

参数 **peer** –peer information

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_FULL : peer list is full
- ESP_ERR_ESPNOW_NO_MEM : out of memory
- ESP_ERR_ESPNOW_EXIST : peer has existed

esp_err_t **esp_now_del_peer**(const uint8_t *peer_addr)

Delete a peer from peer list.

参数 **peer_addr** –peer MAC address

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

esp_err_t **esp_now_mod_peer**(const *esp_now_peer_info_t* *peer)

Modify a peer.

参数 **peer** –peer information

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_FULL : peer list is full

esp_err_t **esp_wifi_config_espnow_rate**(*wifi_interface_t* ifx, *wifi_phy_rate_t* rate)

Config ESPNOW rate of specified interface.

Deprecated:

please use *esp_now_set_peer_rate_config()* instead.

Attention 1. This API should be called after esp_wifi_start().
Attention 2. This API only work when not use Wi-Fi 6 and *esp_now_set_peer_rate_config()* not called.

参数

- **ifx** –Interface to be configured.
- **rate** –Phy rate to be configured.

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_now_set_peer_rate_config**(const uint8_t *peer_addr, *esp_now_rate_config_t* *config)

Set ESPNOW rate config for each peer.

Attention 1. This API should be called after esp_wifi_start() and *esp_now_init()*.

参数

- **peer_addr** –peer MAC address
- **config** –rate config to be configured.

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_INTERNAL : internal error

esp_err_t **esp_now_get_peer**(const uint8_t *peer_addr, *esp_now_peer_info_t* *peer)

Get a peer whose MAC address matches peer_addr from peer list.

参数

- **peer_addr** –peer MAC address
- **peer** –peer information

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

esp_err_t **esp_now_fetch_peer**(bool from_head, *esp_now_peer_info_t* *peer)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

参数

- **from_head** –fetch from head of list or not
- **peer** –peer information

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

bool **esp_now_is_peer_exist**(const uint8_t *peer_addr)

Peer exists or not.

参数 **peer_addr** –peer MAC address

返回

- true : peer exists
- false : peer not exists

esp_err_t **esp_now_get_peer_num**(*esp_now_peer_num_t* *num)

Get the number of peers.

参数 **num** –number of peers

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument

esp_err_t **esp_now_set_pmk**(const uint8_t *pmk)

Set the primary master key.

Attention 1. primary master key is used to encrypt local master key

参数 **pmk** –primary master key

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument

esp_err_t **esp_now_set_wake_window**(uint16_t window)

Set wake window for esp_now to wake up in interval unit.

Attention 1. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.

Attention 2. Default value is the maximum.

参数 **window** –Milliseconds would the chip keep waked each interval, from 0 to 65535.

返回

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

Structures

struct **esp_now_peer_info**

ESPNOW peer information parameters.

Public Members

uint8_t **peer_addr**[ESP_NOW_ETH_ALEN]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8_t **lmk**[ESP_NOW_KEY_LEN]

ESPNOW peer local master key that is used to encrypt data

uint8_t **channel**

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

wifi_interface_t **ifidx**

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool **encrypt**

ESPNOW data that this peer sends/receives is encrypted or not

void ***priv**

ESPNOW peer private data

struct **esp_now_peer_num**

Number of ESPNOW peers which exist currently.

Public Members

int **total_num**

Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

int **encrypt_num**

Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM

struct **esp_now_recv_info**

ESPNOW packet information.

Public Members

uint8_t ***src_addr**

Source address of ESPNOW packet

uint8_t ***des_addr**

Destination address of ESPNOW packet

wifi_pkt_rx_ctrl_t ***rx_ctrl**

Rx control info of ESPNOW packet

struct **esp_now_rate_config**

ESPNOW rate config.

Public Members

wifi_phy_mode_t **phymode**

ESPNOW phymode of specified interface

wifi_phy_rate_t **rate**

ESPNOW rate of specified interface

bool **ersu**

ESPNOW using ersu send frame

Macros

ESP_ERR_ESPNOW_BASE

ESPNOW error number base.

ESP_ERR_ESPNOW_NOT_INIT

ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG

Invalid argument

ESP_ERR_ESPNOW_NO_MEM

Out of memory

ESP_ERR_ESPNOW_FULL

ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND

ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL

Internal error

ESP_ERR_ESPNOW_EXIST

ESPNOW peer has existed

ESP_ERR_ESPNOW_IF

Interface error

ESP_NOW_ETH_ALEN

Length of ESPNOW peer MAC address

ESP_NOW_KEY_LEN

Length of ESPNOW peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM

Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM

Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN

Maximum length of ESPNOW data which is sent very time

Type Definitions

typedef struct *esp_now_peer_info* **esp_now_peer_info_t**

ESPNOW peer information parameters.

typedef struct *esp_now_peer_num* **esp_now_peer_num_t**

Number of ESPNOW peers which exist currently.

typedef struct *esp_now_recv_info* **esp_now_recv_info_t**

ESPNOW packet information.

typedef struct *esp_now_rate_config* **esp_now_rate_config_t**

ESPNOW rate config.

typedef void (***esp_now_recv_cb_t**)(const *esp_now_recv_info_t* *esp_now_info, const uint8_t *data, int data_len)

Callback function of receiving ESPNOW data.

Attention esp_now_info is a local variable，it can only be used in the callback.

Param esp_now_info received ESPNOW packet information
Param data received data
Param data_len length of received data

typedef void (***esp_now_send_cb_t**)(const uint8_t *mac_addr, *esp_now_send_status_t* status)

Callback function of sending ESPNOW data.

Param mac_addr peer MAC address
Param status status of sending ESPNOW data (succeed or fail)

Enumerations

enum **esp_now_send_status_t**

Status of sending ESPNOW data .

Values:

enumerator **ESP_NOW_SEND_SUCCESS**

Send ESPNOW data successfully

enumerator **ESP_NOW_SEND_FAIL**

Send ESPNOW data fail

ESP-WIFI-MESH 编程指南

这是 ESP-WIFI-MESH 的编程指南，包括 API 参考和编码示例。本指南分为以下部分：

1. *ESP-WIFI-MESH 编程模型*
2. *编写 ESP-WIFI-MESH 应用程序*
3. *自组网*
4. *应用实例*
5. *API 参考*

有关 ESP-WIFI-MESH 协议的文档，请见*ESP-WIFI-MESH API 指南*。有关 ESP-WIFI-MESH 开发框架的更多内容，请见 ESP-WIFI-MESH 开发框架。

ESP-WIFI-MESH 编程模型

软件栈 ESP-WIFI-MESH 软件栈基于 Wi-Fi 驱动程序和 FreeRTOS 构建，某些情况下（如根节点）也会使用 LwIP 软件栈。下图展示了 ESP-WIFI-MESH 软件栈。

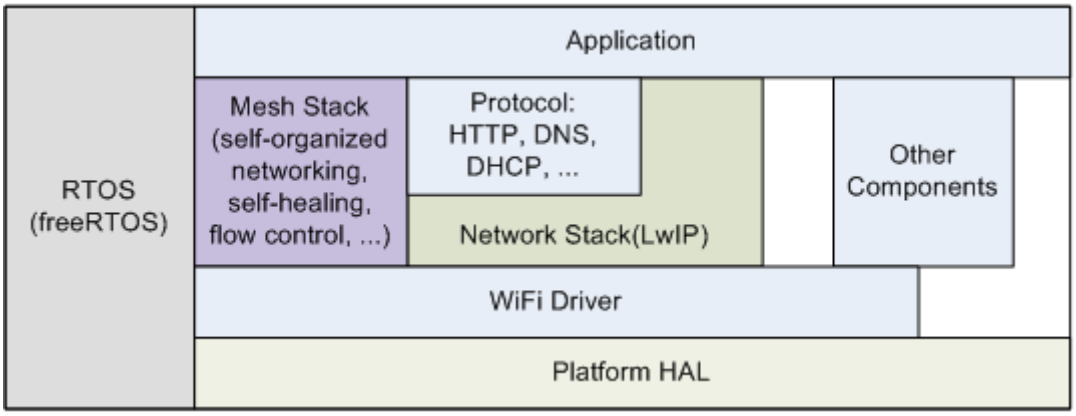

图 2: ESP-WIFI-MESH 软件栈

系统事件 应用程序可通过 **ESP-WIFI-MESH 事件**与 ESP-WIFI-MESH 交互。由于 ESP-WIFI-MESH 构建在 Wi-Fi 软件栈之上，因此也可以通过 **Wi-Fi 事件任务**与 Wi-Fi 驱动程序进行交互。下图展示了 ESP-WIFI-MESH 应用程序中各种系统事件的接口。

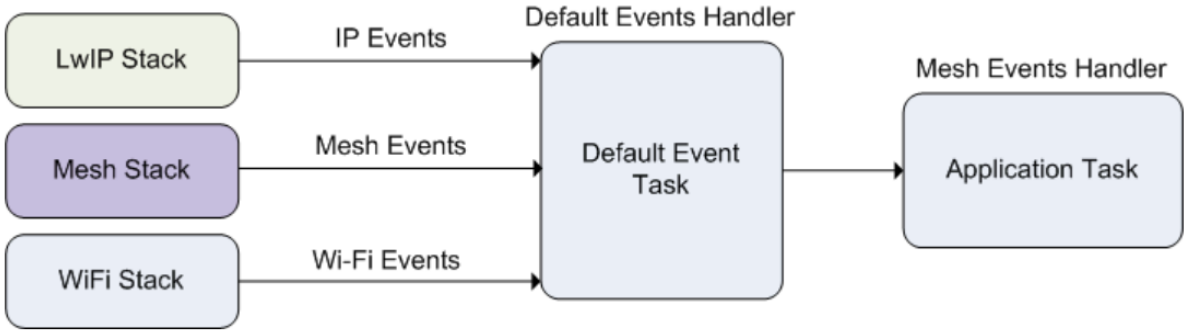

图 3: ESP-WIFI-MESH 系统事件交付

mesh_event_id_t 定义了所有可能的 ESP-WIFI-MESH 事件，并且可以指示父节点和子节点的连接或断开等事件。应用程序如需使用 ESP-WIFI-MESH 事件，则必须通过*esp_event_handler_register()* 将 **Mesh 事件处理程序**注册在默认事件任务中。注册完成后，ESP-WIFI-MESH 事件将包含与应用程序所有相关事件相关的处理程序。

Mesh 事件的典型应用场景包括：使用*MESH_EVENT_PARENT_CONNECTED* 和*MESH_EVENT_CHILD_CONNECTED* 事件来指示节点何时可以分别开始传输上行和下行的数据。同样，也可以使用*IP_EVENT_STA_GOT_IP* 和*IP_EVENT_STA_LOST_IP* 事件来指示根节点何时可以向外部 IP 网络传输数据。

警告： 在自组网模式下使用 ESP-WIFI-MESH 时，用户必须确保不得调用 Wi-Fi API。原因在于：自组网模式将在内部调用 Wi-Fi API 实现连接/断开/扫描等操作。**此时，如果外部应用程序调用 Wi-Fi API（包括来自回调函数和 Wi-Fi 事件处理程序的调用）都可能会干扰 ESP-WIFI-MESH 的自组网行为**。因此，用户不应该在*esp_mesh_start()* 和*esp_mesh_stop()* 之间调用 Wi-Fi API。

LwIP & ESP-WIFI-MESH 应用程序无需通过 LwIP 层便可直接访问 ESP-WIFI-MESH 软件栈，LwIP 层仅在根节点和外部 IP 网络的数据发送与接收时会用到。但是，由于每个节点都有可能成为根节点（由于自动根节点选择机制的存在），每个节点仍必须初始化 LwIP 软件栈。

可成为根节点的每个节点都需要通过调用*esp_netif_init()* 来初始化 LwIP 软件栈。为了防止非根节点访问 LwIP，应用程序不应使用 esp_netif API 创建或注册任何网络接口。

> ESP-WIFI-MESH 的根节点必须与路由器连接。因此，当一个节点成为根节点时，**该节点对应的处理程序必须启动 DHCP 客户端服务并立即获取 IP 地址**。这样做将允许其他节点开始向/从外部 IP 网络发送/接收数据包。但是，如果使用静态 IP 设置，则不需要执行此步骤。

编写 ESP-WIFI-MESH 应用程序 ESP-WIFI-MESH 在正常启动前必须先初始化 LwIP 和 Wi-Fi 软件栈。下方代码展示了 ESP-WIFI-MESH 在开始自身初始化前必须完成的步骤。

```
ESP_ERROR_CHECK(esp_netif_init());

/*事件初始化*/
ESP_ERROR_CHECK(esp_event_loop_create_default());

/*Wi-Fi 初始化 */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/*注册 IP 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↪event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

在完成 LwIP 和 Wi-Fi 的初始化后，需完成以下三个步骤以启动并运行 ESP-WIFI-MESH。

1. *初始化 Mesh*
2. *配置 ESP-WIFI-MESH 网络*
3. *启动 Mesh*

初始化 Mesh 下方代码片段展示如何初始化 ESP-WIFI-MESH。

```
/*Mesh 初始化 */
ESP_ERROR_CHECK(esp_mesh_init());
/*注册 mesh 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↪event_handler, NULL));
```

配置 ESP-WIFI-MESH 网络 ESP-WIFI-MESH 可通过*esp_mesh_set_config()* 进行配置，并使用*mesh_cfg_t* 结构体传递参数。该结构体包含以下 ESP-WIFI-MESH 的配置参数：

参数	描述
Channel（信道）	1 到 14 信道
Mesh ID	ESP-WIFI-MESH 网络的 ID，见*mesh_addr_t*。
Router（路由器）	路由器配置，见*mesh_router_t*。
Mesh AP	Mesh AP 配置，见*mesh_ap_cfg_t*
Crypto Functions（加密函数）	Mesh IE 的加密函数，见 mesh_crypto_funcs_t。

下方代码片段展示如何配置 ESP-WIFI-MESH。

```
/* 默认启用 MESH IE 加密 */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* Mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* 信道（需与路由器信道匹配）*/
cfg.channel = CONFIG_MESH_CHANNEL;
/* 路由器 */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
```

(下页继续)

(续上页)

```
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
    strlen(CONFIG_MESH_ROUTER_PASSWD));
/* Mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
    strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```

启动 Mesh 下方代码片段展示如何启动 ESP-WIFI-MESH。

```
/* 启动 Mesh */
ESP_ERROR_CHECK(esp_mesh_start());
```

启动 ESP-WIFI-MESH 后，应用程序应检查 ESP-WIFI-MESH 事件，以确定它是何时连接到网络的。连接后，应用程序可使用*esp_mesh_send()* 和*esp_mesh_recv()* 在 ESP-WIFI-MESH 网络中发送、接收数据包。

自组网 自组网是 ESP-WIFI-MESH 的功能之一，允许节点自动扫描/选择/连接/重新连接到其他节点和路由器。此功能允许 ESP-WIFI-MESH 网络具有很高的自主性，可适应变化的动态网络拓扑结构和环境。启用自组网功能后，ESP-WIFI-MESH 网络中的节点能够自主完成以下操作：

- 选择或选举根节点（见建立网络 中的 **自动根节点选择**）
- 选择首选的父节点（见建立网络 中的 **父节点选择**）
- 网络断开时自动重新连接（见管理网络 中的 **中间父节点失败**）

启用自组网功能后，ESP-WIFI-MESH 软件栈将内部调用 Wi-Fi API。因此，**在启用自组网功能时，应用层不得调用 Wi-Fi API，否则会干扰 ESP-WIFI-MESH 的工作**。

开关自组网 应用程序可以在运行时通过调用*esp_mesh_set_self_organized()* 函数，启用或禁用自组网功能。该函数具有以下两个参数：

- `bool enable` 指定启用或禁用自组网功能。
- `bool select_parent` 指定在启用自组网功能时是否应选择新的父节点。根据节点类型和节点当前状态，选择新的父节点具有不同的作用。在禁用自组网功能时，此参数不使用。

禁用自组网 下方代码片段展示了如何禁用自组网功能。

```
//禁用自组网
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH 将在禁用自组网时尝试维护节点的当前 Wi-Fi 状态。

- 如果节点先前已连接到其他节点，则将保持连接。
- 如果节点先前已断开连接并且正在扫描父节点或路由器，则将停止扫描。
- 如果节点以前尝试重新连接到父节点或路由器，则将停止重新连接。

启用自组网 ESP-WIFI-MESH 将尝试在启用自组网时保持节点的当前 Wi-Fi 状态。但是，根据节点类型以及是否选择了新的父节点，节点的 Wi-Fi 状态可能会发生变化。下表显示了启用自组网的效果。

是否选择父节点	是否为根结点	作用
N	N	已连接到父节点的节点将保持连接。
		之前扫描父节点的节点将停止扫描。调用*esp_mesh_connect()* 重新启动。
	Y	已连接到路由器的根节点将保持连接。
		从路由器断开的根结点需调用*esp_mesh_connect()* 进行重连。
Y	N	没有父节点的节点将自动选择首选父节点并连接。
		已连接到父节点的节点将断开连接，重新选择首选父节点并进行重连。
	Y	根结点在连接至父节点前必须放弃“根结点”的角色。因此，根节点将断开与路由器和所有子节点的连接，选择首选父节点并进行连接。

下方代码片段展示了如何启用自组网功能。

```
//启用自组网，并选择一个新的父节点
esp_mesh_set_self_organized(true, true);

...

//启用自组网并手动重新连接
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

调用 Wi-Fi API 在有些情况下，应用程序可能希望在使用 ESP-WIFI-MESH 期间调用 Wi-Fi API。例如，应用程序可能需要手动扫描邻近的接入点 (AP)。**但在应用程序调用任何 Wi-Fi API 之前，必须先禁用自组网**。否则，ESP-WIFI-MESH 软件栈可能会同时调用 Wi-Fi API，进而影响应用程序的正常调用。

应用程序不应在*esp_mesh_set_self_organized()* 之间调用 Wi-Fi API。下方代码片段展示了应用程序如何在 ESP-WIFI-MESH 运行期间安全地调用*esp_wifi_scan_start()*。

```
//禁用自组网
esp_mesh_set_self_organized(0, 0);

//停止任何正在进行的扫描
esp_wifi_scan_stop();
//手动启动扫描运行完成时自动停止
esp_wifi_scan_start();

//进程扫描结果

...

//如果仍为连接状态，则重新启用自组网
esp_mesh_set_self_organized(1, 0);

...

//如果不为根节点且未连接，则重新启用自组网
esp_mesh_set_self_organized(1, 1);

...

//如果为根节点且未连接，则重新启用
esp_mesh_set_self_organized(1, 0);   //不选择新的父节点
esp_mesh_connect();                  //手动重新连接到路由器
```

应用实例 ESP-IDF 包含以下 ESP-WIFI-MESH 示例项目：

内部通信示例 展示了如何搭建 ESP-WIFI-MESH 网络，并让根节点向网络中的每个节点发送数据包。

手动连网示例 展示了如何在禁用自组网功能的情况下使用 ESP-WIFI-MESH。此示例展示了如何对节点进行编程，以手动扫描潜在父节点的列表，并根据自定义标准选择父节点。

API 参考

Header File

- components/esp_wifi/include/esp_mesh.h

Functions

esp_err_t **esp_mesh_init**(void)

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

Attention This API shall be called after Wi-Fi is started.

返回
- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_deinit**(void)

Mesh de-initialization.

```
        - Release resources and stop the mesh
```

返回
- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_start**(void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

Attention This API shall be called after mesh initialization and configuration.

返回
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

esp_err_t **esp_mesh_stop**(void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_send**(const *mesh_addr_t* *to, const *mesh_data_t* *data, int flag, const *mesh_opt_t* opt[], int opt_count)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

Attention This API is not reentrant.

参数

- **to** –**[in]** the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **data** –**[in]** pointer to a sending mesh packet
  - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- **flag** –**[in]** bitmap for data sent
  - Speed up the route search
    - If the packet is to the root and "to" parameter is NULL, set this parameter to 0.
    - If the packet is to an internal device, MESH_DATA_P2P should be set.
    - If the packet is to the root ("to" parameter isn't NULL) or to external IP network, MESH_DATA_TODS should be set.
    - If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    - If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
  - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn't read out in time by esp_mesh_recv_toDS().

Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.

- **opt** –**[in]** options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- **opt_count** –**[in]** option count
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

返回

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

esp_err_t **esp_mesh_send_block_time**(uint32_t time_ms)

Set blocking time of esp_mesh_send()

Attention This API shall be called before mesh is started.

参数 **time_ms** –**[in]** blocking time of esp_mesh_send(), unit:ms

返回

- ESP_OK

esp_err_t **esp_mesh_recv**(*mesh_addr_t* *from, *mesh_data_t* *data, int timeout_ms, int *flag, *mesh_opt_t* opt[], int opt_count)

Receive a packet targeted to self over the mesh network.

flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

Attention Mesh RX queue should be checked regularly to avoid running out of memory.

- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

参数

- **from** –**[out]** the address of the original source of the packet
- **data** –**[out]** pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- **timeout_ms** –**[in]** wait time if a packet isn't immediately available (0:no wait, portMAX_DELAY:wait forever)
- **flag** –**[out]** bitmap for data received
  - MESH_DATA_FROMDS represents data from external IP network
  - MESH_DATA_TODS represents data directed upward within the mesh network
- **opt** –**[out]** options desired to receive

  - MESH_OPT_RECV_DS_ADDR attaches the DS address
- **opt_count** –**[in]** option count desired to receive
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

esp_err_t **esp_mesh_recv_toDS**(*mesh_addr_t* *from, *mesh_addr_t* *to, *mesh_data_t* *data, int timeout_ms, int *flag, *mesh_opt_t* opt[], int opt_count)

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn't been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default:32. If this size is too large, and esp_mesh_recv_toDS() isn't called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

Attention This API is only called by the root.

参数

- **from** –**[out]** the address of the original source of the packet
- **to** –**[out]** the address contains remote IP address and port (IPv4:PORT)
- **data** –**[out]** pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- **timeout_ms** –**[in]** wait time if a packet isn't immediately available (0:no wait, portMAX_DELAY:wait forever)
- **flag** –**[out]** bitmap for data received
  - MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** –**[out]** options desired to receive
- **opt_count** –**[in]** option count desired to receive

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD
- ESP_ERR_MESH_RECV_RELEASE

esp_err_t **esp_mesh_set_config**(const *mesh_cfg_t* *config)

Set mesh stack configuration.

- Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.

- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

Attention This API shall be called before mesh is started after mesh is initialized.

参数 **config** –**[in]** pointer to mesh stack configuration
返回
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t **esp_mesh_get_config**(*mesh_cfg_t* *config)

Get mesh stack configuration.

参数 **config** –**[out]** pointer to mesh stack configuration
返回
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_set_router**(const *mesh_router_t* *router)

Get router configuration.

Attention This API is used to dynamically modify the router configuration after mesh is configured.

参数 **router** –**[in]** pointer to router configuration
返回
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_get_router**(*mesh_router_t* *router)

Get router configuration.

参数 **router** –**[out]** pointer to router configuration
返回
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_set_id**(const *mesh_addr_t* *id)

Set mesh network ID.

Attention This API is used to dynamically modify the mesh network ID.

参数 **id** –**[in]** pointer to mesh network ID
返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

esp_err_t **esp_mesh_get_id**(*mesh_addr_t* *id)

Get mesh network ID.

参数 **id** –**[out]** pointer to mesh network ID

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_set_type**(*mesh_type_t* type)

Designate device type over the mesh network.

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

参数 **type** –**[in]** device type

返回

- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

mesh_type_t **esp_mesh_get_type**(void)

Get device type over mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

返回 mesh type

esp_err_t **esp_mesh_set_max_layer**(int max_layer)

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

Attention This API shall be called before mesh is started.

参数 **max_layer** –**[in]** max layer value

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

int **esp_mesh_get_max_layer**(void)

Get max layer value.

返回 max layer value

esp_err_t **esp_mesh_set_ap_password**(const uint8_t *pwd, int len)

Set mesh softAP password.

Attention This API shall be called before mesh is started.

参数

- **pwd** –**[in]** pointer to the password
- **len** –**[in]** password length

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t **esp_mesh_set_ap_authmode**(*wifi_auth_mode_t* authmode)

Set mesh softAP authentication mode.

Attention This API shall be called before mesh is started.

参数 **authmode** –**[in]** authentication mode

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

wifi_auth_mode_t **esp_mesh_get_ap_authmode**(void)

Get mesh softAP authentication mode.

返回 authentication mode

esp_err_t **esp_mesh_set_ap_connections**(int connections)

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

Attention This API shall be called before mesh is started.

参数 **connections** –**[in]** the number of max connections

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

int **esp_mesh_get_ap_connections**(void)

Get mesh max connection configuration.

返回 the number of mesh max connections

int **esp_mesh_get_non_mesh_connections**(void)

Get non-mesh max connection configuration.

返回 the number of non-mesh max connections

int **esp_mesh_get_layer**(void)

Get current layer value over the mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

返回 layer value

esp_err_t **esp_mesh_get_parent_bssid**(*mesh_addr_t* *bssid)

Get the parent BSSID.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

参数 **bssid** –**[out]** pointer to parent BSSID

返回

- ESP_OK
- ESP_FAIL

bool **esp_mesh_is_root**(void)

Return whether the device is the root node of the network.

返回 true/false

esp_err_t **esp_mesh_set_self_organized**(bool enable, bool select_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

Attention This API is used to dynamically modify whether to enable the self organizing.

参数

- **enable** –**[in]** enable or disable self-organized networking
- **select_parent** –**[in]** Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

返回

- ESP_OK
- ESP_FAIL

bool **esp_mesh_get_self_organized**(void)

Return whether enable self-organized networking or not.

返回 true/false

esp_err_t **esp_mesh_waive_root**(const *mesh_vote_t* *vote, int reason)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.

- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

参数

- **`vote`** –**[in]** vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field is_rc_specified shall be false.
  - Field attempts shall be at least 15 times.
- **`reason`** –**[in]** only accept MESH_VOTE_REASON_ROOT_INITIATED for now

返回

- ESP_OK
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD
- ESP_FAIL

esp_err_t **`esp_mesh_set_vote_percentage`**(float percentage)

Set vote percentage threshold for approval of being a root (default:0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

Attention This API shall be called before mesh is started.

参数 **`percentage`** –**[in]** vote percentage threshold

返回

- ESP_OK
- ESP_FAIL

float **`esp_mesh_get_vote_percentage`**(void)

Get vote percentage threshold for approval of being a root.

返回 percentage threshold

esp_err_t **`esp_mesh_set_ap_assoc_expire`**(int seconds)

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn’ t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

参数 **`seconds`** –**[in]** the expired time

返回

- ESP_OK
- ESP_FAIL

int **esp_mesh_get_ap_assoc_expire**(void)

Get mesh softAP associate expired time.

返回 seconds

int **esp_mesh_get_total_node_num**(void)

Get total number of devices in current network (including the root)

Attention The returned value might be incorrect when the network is changing.

返回 total number of devices (including the root)

int **esp_mesh_get_routing_table_size**(void)

Get the number of devices in this device's sub-network (including self)

返回 the number of devices over this device's sub-network (including self)

esp_err_t **esp_mesh_get_routing_table**(*mesh_addr_t* *mac, int len, int *size)

Get routing table of this device's sub-network (including itself)

参数

- **mac** –**[out]** pointer to routing table
- **len** –**[in]** routing table size(in bytes)
- **size** –**[out]** pointer to the number of devices in routing table (including itself)

返回

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_post_toDS_state**(bool reachable)

Post the toDS state to the mesh stack.

Attention This API is only for the root.

参数 **reachable** –**[in]** this state represents whether the root is able to access external IP network

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_tx_pending**(*mesh_tx_pending_t* *pending)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

参数 **pending** –**[out]** pointer to the TX pending

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_rx_pending**(*mesh_rx_pending_t* *pending)

Return the number of packets available in the queue waiting to be received by applications.

参数 **pending** –**[out]** pointer to the RX pending

返回

- ESP_OK
- ESP_FAIL

int **esp_mesh_available_txupQ_num**(const *mesh_addr_t* *addr, uint32_t *xseqno_in)

Return the number of packets could be accepted from the specified address.

参数

- **addr** –**[in]** self address or an associate children address

- **xseqno_in** –**[out]** sequence number of the last received packet from the specified address

返回 the number of upQ for a certain address

esp_err_t **esp_mesh_set_xon_qsize**(int qsize)

Set the number of RX queue for the node, the average number of window allocated to one of its child node is: wnd = xon_qsize / (2 * max_connection + 1). However, the window of each child node is not strictly equal to the average value, it is affected by the traffic also.

Attention This API shall be called before mesh is started.

参数 **qsize** –**[in]** default:32 (min:16)

返回

- ESP_OK
- ESP_FAIL

int **esp_mesh_get_xon_qsize**(void)

Get queue size.

返回 the number of queue

esp_err_t **esp_mesh_allow_root_conflicts**(bool allowed)

Set whether allow more than one root existing in one network.

参数 **allowed** –**[in]** allow or not

返回

- ESP_OK
- ESP_WIFI_ERR_NOT_INIT
- ESP_WIFI_ERR_NOT_START

bool **esp_mesh_is_root_conflicts_allowed**(void)

Check whether allow more than one root to exist in one network.

返回 true/false

esp_err_t **esp_mesh_set_group_id**(const *mesh_addr_t* *addr, int num)

Set group ID addresses.

参数

- **addr** –**[in]** pointer to new group ID addresses
- **num** –**[in]** the number of group ID addresses

返回

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t **esp_mesh_delete_group_id**(const *mesh_addr_t* *addr, int num)

Delete group ID addresses.

参数

- **addr** –**[in]** pointer to deleted group ID address
- **num** –**[in]** the number of group ID addresses

返回

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

int **esp_mesh_get_group_num**(void)

Get the number of group ID addresses.

返回 the number of group ID addresses

esp_err_t **esp_mesh_get_group_list**(*mesh_addr_t* *addr, int num)

Get group ID addresses.

参数

- **addr** –**[out]** pointer to group ID addresses
- **num** –**[in]** the number of group ID addresses

返回

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

bool **esp_mesh_is_my_group**(const *mesh_addr_t* *addr)

Check whether the specified group address is my group.

返回 true/false

esp_err_t **esp_mesh_set_capacity_num**(int num)

Set mesh network capacity (max:1000, default:300)

Attention This API shall be called before mesh is started.

参数 **num** –**[in]** mesh network capacity

返回

- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

int **esp_mesh_get_capacity_num**(void)

Get mesh network capacity.

返回 mesh network capacity

esp_err_t **esp_mesh_set_ie_crypto_funcs**(const mesh_crypto_funcs_t *crypto_funcs)

Set mesh IE crypto functions.

Attention This API can be called at any time after mesh is initialized.

参数 **crypto_funcs** –**[in]** crypto functions for mesh IE

- If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

返回

- ESP_OK

esp_err_t **esp_mesh_set_ie_crypto_key**(const char *key, int len)

Set mesh IE crypto key.

Attention This API can be called at any time after mesh is initialized.

参数

- **key** –**[in]** ASCII crypto key
- **len** –**[in]** length in bytes, range:8~64

返回

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t **esp_mesh_get_ie_crypto_key**(char *key, int len)

Get mesh IE crypto key.

参数

- **key** –**[out]** ASCII crypto key
- **len** –**[in]** length in bytes, range:8~64

返回

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t **esp_mesh_set_root_healing_delay**(int delay_ms)

Set delay time before starting root healing.

参数 **delay_ms** –**[in]** delay time in milliseconds

返回

- ESP_OK

int **esp_mesh_get_root_healing_delay**(void)

Get delay time before network starts root healing.

返回 delay time in milliseconds

esp_err_t **esp_mesh_fix_root**(bool enable)

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

参数 **enable** –**[in]** enable or not

返回

- ESP_OK

bool **esp_mesh_is_root_fixed**(void)

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
- Network Fixed Root Setting also changes with the "flag" value in parent networking IE.

返回 true/false

esp_err_t **esp_mesh_set_parent**(const *wifi_config_t* *parent, const *mesh_addr_t* *parent_mesh_id, *mesh_type_t* my_type, int my_layer)

Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

参数

- **parent** –**[in]** parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- **parent_mesh_id** –**[in]** parent mesh ID,
  - If this value is not set, the original mesh ID is used.
- **my_type** –**[in]** mesh type
  - MESH_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
- **my_layer** –**[in]** mesh layer
  - my_layer of the device may change after joining the network.

- If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
- If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

返回

- ESP_OK
- ESP_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_CONFIG

esp_err_t **esp_mesh_scan_get_ap_ie_len**(int *len)

Get mesh networking IE length of one AP.

参数 **len** –**[out]** mesh networking IE length

返回

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

esp_err_t **esp_mesh_scan_get_ap_record**(*wifi_ap_record_t* *ap_record, void *buffer)

Get AP record.

Attention Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time. See "manual_networking" example.

参数

- **ap_record** –**[out]** pointer to one AP record
- **buffer** –**[out]** pointer to the mesh networking IE of this AP

返回

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

esp_err_t **esp_mesh_flush_upstream_packets**(void)

Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

返回

- ESP_OK

esp_err_t **esp_mesh_get_subnet_nodes_num**(const *mesh_addr_t* *child_mac, int *nodes_num)

Get the number of nodes in the subnet of a specific child.

参数

- **child_mac** –**[in]** an associated child address of this device
- **nodes_num** –**[out]** pointer to the number of nodes in the subnet of a specific child

返回

- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_get_subnet_nodes_list**(const *mesh_addr_t* *child_mac, *mesh_addr_t* *nodes, int nodes_num)

Get nodes in the subnet of a specific child.

参数

- **child_mac** –**[in]** an associated child address of this device
- **nodes** –**[out]** pointer to nodes in the subnet of a specific child
- **nodes_num** –**[in]** the number of nodes in the subnet of a specific child

返回

- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_disconnect**(void)

Disconnect from current parent.

返回

- ESP_OK

esp_err_t **esp_mesh_connect**(void)

Connect to current parent.

返回

- ESP_OK

esp_err_t **esp_mesh_flush_scan_result**(void)

Flush scan result.

返回

- ESP_OK

esp_err_t **esp_mesh_switch_channel**(const uint8_t *new_bssid, int csa_newchan, int csa_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

Attention This API is only called by the root.

参数

- **new_bssid** –**[in]** the new router BSSID if the router changes
- **csa_newchan** –**[in]** the new channel number to which the whole network is moving
- **csa_count** –**[in]** channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

返回

- ESP_OK

esp_err_t **esp_mesh_get_router_bssid**(uint8_t *router_bssid)

Get the router BSSID.

参数 **router_bssid** –**[out]** pointer to the router BSSID

返回

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG

int64_t **esp_mesh_get_tsf_time**(void)

Get the TSF time.

返回 the TSF time

esp_err_t **esp_mesh_set_topology**(*esp_mesh_topology_t* topo)

Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

Attention This API shall be called before mesh is started.

参数 **topo** –**[in]** MESH_TOPO_TREE or MESH_TOPO_CHAIN

返回

- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_mesh_topology_t **esp_mesh_get_topology**(void)

Get mesh topology.

返回 MESH_TOPO_TREE or MESH_TOPO_CHAIN

esp_err_t **esp_mesh_enable_ps**(void)

Enable mesh Power Save function.

Attention This API shall be called before mesh is started.

返回

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t **esp_mesh_disable_ps**(void)

Disable mesh Power Save function.

Attention This API shall be called before mesh is started.

返回

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

bool **esp_mesh_is_ps_enabled**(void)

Check whether the mesh Power Save function is enabled.

返回 true/false

bool **esp_mesh_is_device_active**(void)

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

返回 true/false

esp_err_t **esp_mesh_set_active_duty_cycle**(int dev_duty, int dev_duty_type)

Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.

- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

参数

- **dev_duty** –**[in]** device duty cycle
- **dev_duty_type** –**[in]** device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_active_duty_cycle**(int *dev_duty, int *dev_duty_type)

Get device duty cycle and type.

参数

- **dev_duty** –**[out]** device duty cycle
- **dev_duty_type** –**[out]** device PS duty cycle type

返回

- ESP_OK

esp_err_t **esp_mesh_set_network_duty_cycle**(int nwk_duty, int duration_mins, int applied_rule)

Set the network duty cycle, duration and rule.

- The range of nwk_duty values is 1 to 100. The default value is 10.
- nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
- duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
- Only the root can set duration_mins to (-1).
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
- The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
- A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

Attention This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)nwk_duty shall be set to the same value for all devices; (2)duration_mins shall be set to (-1); (3)applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
- After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

参数

- **nwk_duty** –**[in]** network duty cycle
- **duration_mins** –**[in]** duration (unit: minutes)
- **applied_rule** –**[in]** only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_network_duty_cycle**(int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)

Get the network duty cycle, duration, type and rule.

参数

- **nwk_duty** –**[out]** current network duty cycle
- **duration_mins** –**[out]** the duration of current nwk_duty
- **dev_duty_type** –**[out]** if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- **applied_rule** –**[out]** MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

返回

- ESP_OK

int **esp_mesh_get_running_active_duty_cycle**(void)

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
- If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

返回 the running active duty cycle

esp_err_t **esp_mesh_ps_duty_signaling**(int fwd_times)

Duty signaling.

参数 **fwd_times** –**[in]** the times of forwarding duty signaling packets

返回

- ESP_OK

Unions

union **mesh_addr_t**

#include <esp_mesh.h> Mesh address.

Public Members

uint8_t **addr**[6]

mac address

mip_t **mip**

mip address

union **mesh_event_info_t**

#include <esp_mesh.h> Mesh event information.

Public Members

mesh_event_channel_switch_t **channel_switch**

channel switch

mesh_event_child_connected_t **child_connected**

child connected

mesh_event_child_disconnected_t **child_disconnected**

child disconnected

mesh_event_routing_table_change_t **routing_table**

routing table change

mesh_event_connected_t **connected**

parent connected

mesh_event_disconnected_t **disconnected**

parent disconnected

mesh_event_no_parent_found_t **no_parent**

no parent found

mesh_event_layer_change_t **layer_change**

layer change

mesh_event_toDS_state_t **toDS_state**

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t **vote_started**

vote started

mesh_event_root_address_t **root_addr**

root address

mesh_event_root_switch_req_t **switch_req**

root switch request

mesh_event_root_conflict_t **root_conflict**

other powerful root

mesh_event_root_fixed_t **root_fixed**

fixed root

mesh_event_scan_done_t **scan_done**

scan done

mesh_event_network_state_t **network_state**

network state, such as whether current mesh network has a root.

mesh_event_find_network_t **find_network**

network found that can join

mesh_event_router_switch_t **router_switch**

new router information

mesh_event_ps_duty_t **ps_duty**

PS duty information

union **mesh_rc_config_t**

#include <esp_mesh.h> Vote address configuration.

Public Members

int **attempts**

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t **rc_addr**

a new root address specified by users for API esp_mesh_waive_root()

Structures

struct **mip_t**

IP address and port.

Public Members

esp_ip4_addr_t **ip4**

IP address

uint16_t **port**

port

struct **mesh_event_channel_switch_t**

Channel switch information.

Public Members

uint8_t **channel**

new channel

struct **mesh_event_connected_t**

Parent connected information.

Public Members

wifi_event_sta_connected_t **connected**

parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint16_t **self_layer**

layer

uint8_t **duty**

parent duty

struct **mesh_event_no_parent_found_t**

No parent found information.

Public Members

int **scan_times**

scan times being through

struct **mesh_event_layer_change_t**

Layer change information.

Public Members

uint16_t **new_layer**

new layer

struct **mesh_event_vote_started_t**

vote started information

Public Members

int **reason**

vote reason, vote could be initiated by children or by the root itself

int **attempts**

max vote attempts before stopped

mesh_addr_t **rc_addr**

root address specified by users via API esp_mesh_waive_root()

struct **mesh_event_find_network_t**

find a mesh network that this device can join

Public Members

uint8_t **channel**

channel number of the new found network

uint8_t **router_bssid**[6]

router BSSID

struct **mesh_event_root_switch_req_t**

Root switch request information.

Public Members

int **reason**

root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()

mesh_addr_t **rc_addr**

the address of root switch requester

struct **mesh_event_root_conflict_t**

Other powerful root address.

Public Members

int8_t **rssi**

rssi with router

uint16_t **capacity**

the number of devices in current network

uint8_t **addr**[6]

other powerful root address

struct **mesh_event_routing_table_change_t**

Routing table change.

Public Members

uint16_t **rt_size_new**

the new value

uint16_t **rt_size_change**

the changed value

struct **mesh_event_root_fixed_t**

Root fixed.

Public Members

bool **is_fixed**

status

struct **mesh_event_scan_done_t**

Scan done event information.

Public Members

uint8_t **number**

the number of APs scanned

struct **mesh_event_network_state_t**

Network state information.

Public Members

bool **is_rootless**

whether current mesh network has a root

struct **mesh_event_ps_duty_t**

PS duty information.

Public Members

uint8_t **duty**

parent or child duty

mesh_event_child_connected_t **child_connected**

child info

struct **mesh_opt_t**

Mesh option.

Public Members

uint8_t **type**

option type

uint16_t **len**
: option length

uint8_t ***val**
: option value

struct **mesh_data_t**
: Mesh data for esp_mesh_send() and esp_mesh_recv()

Public Members

uint8_t ***data**
: data

uint16_t **size**
: data size

mesh_proto_t **proto**
: data protocol

mesh_tos_t **tos**
: data type of service

struct **mesh_router_t**
: Router configuration.

Public Members

uint8_t **ssid**[32]
: SSID

uint8_t **ssid_len**
: length of SSID

uint8_t **bssid**[6]
: BSSID, if this value is specified, users should also specify "allow_router_switch".

uint8_t **password**[64]
: password

bool **allow_router_switch**
: if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after "fail" (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct **mesh_ap_cfg_t**
: Mesh softAP configuration.

Public Members

uint8_t **password**[64]

mesh softAP password

uint8_t **max_connection**

max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections

uint8_t **nonmesh_max_connection**

max non-mesh connections

struct **mesh_cfg_t**

Mesh initialization configuration.

Public Members

uint8_t **channel**

channel, the mesh network on

bool **allow_channel_switch**

if this value is set, when "fail" (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

mesh_addr_t **mesh_id**

mesh network identification

mesh_router_t **router**

router configuration

mesh_ap_cfg_t **mesh_ap**

mesh softAP configuration

const mesh_crypto_funcs_t ***crypto_funcs**

crypto functions

struct **mesh_vote_t**

Vote.

Public Members

float **percentage**

vote percentage threshold for approval of being a root

bool **is_rc_specified**

if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

mesh_rc_config_t **config**

vote address configuration

struct **mesh_tx_pending_t**

The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int **to_parent**

to parent queue

int **to_parent_p2p**

to parent (P2P) queue

int **to_child**

to child queue

int **to_child_p2p**

to child (P2P) queue

int **mgmt**

management queue

int **broadcast**

broadcast and multicast queue

struct **mesh_rx_pending_t**

The number of packets available in the queue waiting to be received by applications.

Public Members

int **toDS**

to external DS

int **toSelf**

to self

Macros

MESH_ROOT_LAYER

root layer value

MESH_MTU

max transmit unit(in bytes)

MESH_MPS

max payload size(in bytes)

ESP_ERR_MESH_WIFI_NOT_START

Mesh error code definition.

Wi-Fi isn’t started

ESP_ERR_MESH_NOT_INIT

mesh isn’t initialized

ESP_ERR_MESH_NOT_CONFIG

mesh isn’t configured

ESP_ERR_MESH_NOT_START

mesh isn’t started

ESP_ERR_MESH_NOT_SUPPORT

not supported yet

ESP_ERR_MESH_NOT_ALLOWED

operation is not allowed

ESP_ERR_MESH_NO_MEMORY

out of memory

ESP_ERR_MESH_ARGUMENT

illegal argument

ESP_ERR_MESH_EXCEED_MTU

packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT

timeout

ESP_ERR_MESH_DISCONNECTED

disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL

queue fail

ESP_ERR_MESH_QUEUE_FULL

queue full

ESP_ERR_MESH_NO_PARENT_FOUND

no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND

no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL

no option found

ESP_ERR_MESH_OPTION_UNKNOWN

unknown option

ESP_ERR_MESH_XON_NO_WINDOW

no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE

low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE

discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD

discard the packet

ESP_ERR_MESH_VOTING

vote in progress

ESP_ERR_MESH_XMIT

XMIT

ESP_ERR_MESH_QUEUE_READ

error in reading queue

ESP_ERR_MESH_PS

mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE

release esp_mesh_recv_toDS

MESH_DATA_ENC

Flags bitmap for esp_mesh_send() and esp_mesh_recv()

data encrypted (Unimplemented)

MESH_DATA_P2P

point-to-point delivery over the mesh network

MESH_DATA_FROMDS

receive from external IP network

MESH_DATA_TODS

identify this packet is target to external IP network

MESH_DATA_NONBLOCK

esp_mesh_send() non-block

MESH_DATA_DROP

in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP

identify this packet is target to a group address

MESH_OPT_SEND_GROUP

Option definitions for esp_mesh_send() and esp_mesh_recv()

data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR

return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS

Flag of mesh networking IE.

vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE

no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND

root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED

fixed root

MESH_PS_DEVICE_DUTY_REQUEST

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

MESH_PS_DEVICE_DUTY_DEMAND

requests to join a network PS and specifies a demanded device duty cycle

MESH_PS_NETWORK_DUTY_MASTER

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Mesh PS (Power Save) duty cycle applied rule.

MESH_PS_NETWORK_DUTY_APPLIED_UPLINK

MESH_INIT_CONFIG_DEFAULT()

Type Definitions

typedef *mesh_addr_t* **mesh_event_root_address_t**

Root address.

typedef *wifi_event_sta_disconnected_t* **mesh_event_disconnected_t**

Parent disconnected information.

typedef *wifi_event_ap_staconnected_t* **mesh_event_child_connected_t**

Child connected information.

typedef *wifi_event_ap_stadisconnected_t* **mesh_event_child_disconnected_t**

Child disconnected information.

typedef *wifi_event_sta_connected_t* **mesh_event_router_switch_t**

New router information.

Enumerations

enum **mesh_event_id_t**

Enumerated list of mesh event id.

Values:

enumerator **MESH_EVENT_STARTED**

mesh is started

enumerator **MESH_EVENT_STOPPED**

mesh is stopped

enumerator **MESH_EVENT_CHANNEL_SWITCH**

channel switch

enumerator **MESH_EVENT_CHILD_CONNECTED**

a child is connected on softAP interface

enumerator **MESH_EVENT_CHILD_DISCONNECTED**

a child is disconnected on softAP interface

enumerator **MESH_EVENT_ROUTING_TABLE_ADD**

routing table is changed by adding newly joined children

enumerator **MESH_EVENT_ROUTING_TABLE_REMOVE**

routing table is changed by removing leave children

enumerator **MESH_EVENT_PARENT_CONNECTED**

parent is connected on station interface

enumerator **MESH_EVENT_PARENT_DISCONNECTED**

parent is disconnected on station interface

enumerator **MESH_EVENT_NO_PARENT_FOUND**

no parent found

enumerator **MESH_EVENT_LAYER_CHANGE**

layer changes over the mesh network

enumerator **MESH_EVENT_TODS_STATE**

state represents whether the root is able to access external IP network. This state is a manual event that needs to be triggered with esp_mesh_post_toDS_state().

enumerator **MESH_EVENT_VOTE_STARTED**

the process of voting a new root is started either by children or by the root

enumerator **MESH_EVENT_VOTE_STOPPED**

the process of voting a new root is stopped

enumerator **MESH_EVENT_ROOT_ADDRESS**

the root address is obtained. It is posted by mesh stack automatically.

enumerator **MESH_EVENT_ROOT_SWITCH_REQ**

root switch request sent from a new voted root candidate

enumerator **MESH_EVENT_ROOT_SWITCH_ACK**

root switch acknowledgment responds the above request sent from current root

enumerator **MESH_EVENT_ROOT_ASKED_YIELD**

the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

enumerator **MESH_EVENT_ROOT_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent' s. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator **MESH_EVENT_SCAN_DONE**

if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

enumerator **MESH_EVENT_NETWORK_STATE**

network state, such as whether current mesh network has a root.

enumerator **MESH_EVENT_STOP_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator **MESH_EVENT_FIND_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator **MESH_EVENT_ROUTER_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

enumerator **MESH_EVENT_PS_PARENT_DUTY**

parent duty

enumerator **MESH_EVENT_PS_CHILD_DUTY**

child duty

enumerator **MESH_EVENT_PS_DEVICE_DUTY**

device duty

enumerator **MESH_EVENT_MAX**

enum **mesh_type_t**

Device type.

Values:

enumerator **MESH_IDLE**

hasn't joined the mesh network yet

enumerator **MESH_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

enumerator **MESH_NODE**

intermediate device. Has the ability to forward packets over the mesh network

enumerator **MESH_LEAF**

has no forwarding ability

enumerator **MESH_STA**

connect to router with a standlone Wi-Fi station mode, no network expansion capability

enum **mesh_proto_t**

Protocol of transmitted application data.

Values:

enumerator **MESH_PROTO_BIN**

binary

enumerator **MESH_PROTO_HTTP**

HTTP protocol

enumerator **MESH_PROTO_JSON**

JSON format

enumerator **MESH_PROTO_MQTT**

MQTT protocol

enumerator **MESH_PROTO_AP**

IP network mesh communication of node's AP interface

enumerator **MESH_PROTO_STA**

IP network mesh communication of node's STA interface

enum **mesh_tos_t**

For reliable transmission, mesh stack provides three type of services.

Values:

enumerator **MESH_TOS_P2P**

provide P2P (point-to-point) retransmission on mesh stack by default

enumerator **MESH_TOS_E2E**

provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

enumerator **MESH_TOS_DEF**

no retransmission on mesh stack

enum **mesh_vote_reason_t**

Vote reason.

Values:

enumerator **MESH_VOTE_REASON_ROOT_INITIATED**

vote is initiated by the root

enumerator **MESH_VOTE_REASON_CHILD_INITIATED**

vote is initiated by children

enum **mesh_disconnect_reason_t**

Mesh disconnect reason code.

Values:

enumerator **MESH_REASON_CYCLIC**

cyclic is detected

enumerator **MESH_REASON_PARENT_IDLE**

parent is idle

enumerator **MESH_REASON_LEAF**

the connected device is changed to a leaf

enumerator **MESH_REASON_DIFF_ID**

in different mesh ID

enumerator **MESH_REASON_ROOTS**

root conflict is detected

enumerator **MESH_REASON_PARENT_STOPPED**

parent has stopped the mesh

enumerator **MESH_REASON_SCAN_FAIL**

scan fail

enumerator **MESH_REASON_IE_UNKNOWN**

unknown IE

enumerator **MESH_REASON_WAIVE_ROOT**

waive root

enumerator **MESH_REASON_PARENT_WORSE**

parent with very poor RSSI

enumerator **MESH_REASON_EMPTY_PASSWORD**

use an empty password to connect to an encrypted parent

enumerator **MESH_REASON_PARENT_UNENCRYPTED**

connect to an unencrypted parent/router

enum **esp_mesh_topology_t**

Mesh topology.

Values:

enumerator **MESH_TOPO_TREE**

tree topology

enumerator **MESH_TOPO_CHAIN**

chain topology

enum **mesh_event_toDS_state_t**

The reachability of the root to a DS (distribute system)

Values:

enumerator **MESH_TODS_UNREACHABLE**

the root isn't able to access external IP network

enumerator **MESH_TODS_REACHABLE**

the root is able to access external IP network

SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-C3 devices, check 配网 *API*.

Application Example Connect ESP32-C3 to target AP using SmartConfig: wifi/smart_config.

API Reference

Header File

- components/esp_wifi/include/esp_smartconfig.h

Functions

const char ***esp_smartconfig_get_version**(void)

Get the version of SmartConfig.

返回

- SmartConfig version const char.

esp_err_t **esp_smartconfig_start**(const *smartconfig_start_config_t* *config)

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.
Attention 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

参数 **config** –pointer to smartconfig start configure structure
返回

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_stop**(void)

Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

Attention Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

返回

- ESP_OK: succeed
- others: fail

esp_err_t **esp_esptouch_set_timeout**(uint8_t time_s)

Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

参数 **time_s** –range 15s~255s, offset:45s.
返回

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_set_type**(*smartconfig_type_t* type)

Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

参数 **type** –Choose from the smartconfig_type_t.
返回

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_fast_mode**(bool enable)

Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API esp_smartconfig_start.
Attention 2. Fast mode have corresponding APP(phone).
Attention 3. Two mode is compatible.

参数 **enable** –false-disable(default); true-enable;
返回
- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_get_rvd_data**(uint8_t *rvd_data, uint8_t len)

Get reserved data of ESPTouch v2.

参数
- **rvd_data** –reserved data
- **len** –length of reserved data

返回
- ESP_OK: succeed
- others: fail

Structures

struct **smartconfig_event_got_ssid_pswd_t**

Argument structure for SC_EVENT_GOT_SSID_PSWD event

Public Members

uint8_t **ssid**[32]

SSID of the AP. Null terminated string.

uint8_t **password**[64]

Password of the AP. Null terminated string.

bool **bssid_set**

whether set MAC address of target AP or not.

uint8_t **bssid**[6]

MAC address of target AP.

smartconfig_type_t **type**

Type of smartconfig(ESPTouch or AirKiss).

uint8_t **token**

Token from cellphone which is used to send ACK to cellphone.

uint8_t **cellphone_ip**[4]

IP address of cellphone.

struct **smartconfig_start_config_t**

Configure structure for esp_smartconfig_start

Public Members

bool **enable_log**
Enable smartconfig logs.

bool **esp_touch_v2_enable_crypt**
Enable ESPTouch v2 crypt.

char ***esp_touch_v2_key**
ESPTouch v2 crypt key, len should be 16.

Macros

SMARTCONFIG_START_CONFIG_DEFAULT()

Enumerations

enum **smartconfig_type_t**
Values:

enumerator **SC_TYPE_ESPTOUCH**
protocol: ESPTouch

enumerator **SC_TYPE_AIRKISS**
protocol: AirKiss

enumerator **SC_TYPE_ESPTOUCH_AIRKISS**
protocol: ESPTouch and AirKiss

enumerator **SC_TYPE_ESPTOUCH_V2**
protocol: ESPTouch v2

enum **smartconfig_event_t**
Smartconfig event declarations
Values:

enumerator **SC_EVENT_SCAN_DONE**
Station smartconfig has finished to scan for APs

enumerator **SC_EVENT_FOUND_CHANNEL**
Station smartconfig has found the channel of the target AP

enumerator **SC_EVENT_GOT_SSID_PSWD**
Station smartconfig got the SSID and password

enumerator **SC_EVENT_SEND_ACK_DONE**
Station smartconfig has sent ACK to cellphone

Wi-Fi 库

概述 Wi-Fi 库支持配置及监控 ESP32-C3 Wi-Fi 连网功能。支持配置：

- station 模式（即 STA 模式或 Wi-Fi 客户端模式），此时 ESP32-C3 连接到接入点 (AP)。
- AP 模式（即 Soft-AP 模式或接入点模式），此时基站连接到 ESP32-C3。
- station/AP 共存模式（ESP32-C3 既是接入点，同时又作为基站连接到另外一个接入点）。
- 上述模式的各种安全模式（WPA、WPA2 及 WEP 等）。
- 扫描接入点（包括主动扫描及被动扫描）。
- 使用混杂模式监控 IEEE802.11 Wi-Fi 数据包。

应用示例 ESP-IDF 仓库的 wifi 目录下提供了演示 Wi-Fi 库功能的几个应用示例，请查看 README 了解更多详细信息。

API 参考

Header File

- components/esp_wifi/include/esp_wifi.h

Functions

esp_err_t **esp_wifi_init** (const *wifi_init_config_t* *config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

Attention 1. This API must be called before all other WiFi API can be called

Attention 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into *wifi_init_config_t* in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field 'magic' of *wifi_init_config_t* should always be WIFI_INIT_CONFIG_MAGIC!

参数 **config** –pointer to WiFi initialized configuration structure; can point to a temporary variable.

返回

- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

esp_err_t **esp_wifi_deinit** (void)

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

Attention 1. This API should be called if you want to remove WiFi driver from the system

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_mode** (*wifi_mode_t* mode)

Set the WiFi operating mode.

```
Set the WiFi operating mode as station, soft-AP, station+soft-AP or NAN.
The default mode is station mode.
```

参数 **mode** –WiFi operating mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

esp_err_t **esp_wifi_get_mode**(*wifi_mode_t* *mode)

Get current operating mode of WiFi.

参数 **mode** – **[out]** store current WiFi mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_start**(void)

Start WiFi according to current configuration If mode is WIFI_MODE_STA, it creates station control block and starts station If mode is WIFI_MODE_AP, it creates soft-AP control block and starts soft-AP If mode is WIFI_MODE_APSTA, it creates soft-AP and station control block and starts soft-AP and station If mode is WIFI_MODE_NAN, it creates NAN control block and starts NAN.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors

esp_err_t **esp_wifi_stop**(void)

Stop WiFi If mode is WIFI_MODE_STA, it stops station and frees station control block If mode is WIFI_MODE_AP, it stops soft-AP and frees soft-AP control block If mode is WIFI_MODE_APSTA, it stops station/soft-AP and frees station/soft-AP control block If mode is WIFI_MODE_NAN, it stops NAN and frees NAN control block.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_restore**(void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp_wifi_set_bandwidth,
- esp_wifi_set_protocol,
- esp_wifi_set_config related
- esp_wifi_set_mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_connect**(void)

Connect WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode

Attention 2. If station interface is connected to an AP, call esp_wifi_disconnect to disconnect.

Attention 3. The scanning triggered by esp_wifi_scan_start() will not be effective until connection between device and the AP is established. If device is scanning and connecting at the same time, it will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do reconnection after device received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn ' t exist, and you still try reconnection after device received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

esp_err_t **esp_wifi_disconnect**(void)

Disconnect WiFi station from the AP.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

esp_err_t **esp_wifi_clear_fast_connect**(void)

Currently this API is just an stub API.

返回

- ESP_OK: succeed
- others: fail

esp_err_t **esp_wifi_deauth_sta**(uint16_t aid)

deauthenticate all stations or associated id equals to aid

参数 **aid** –when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

esp_err_t **esp_wifi_scan_start**(const *wifi_scan_config_t* *config, bool block)

Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

参数

- **config** –configuration of scanning
- **block** –if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start

- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

esp_err_t **esp_wifi_scan_stop**(void)

Stop the scan in process.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

esp_err_t **esp_wifi_scan_get_ap_num**(uint16_t *number)

Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.

参数 **number** –**[out]** store number of APIs found in last scan

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_scan_get_ap_records**(uint16_t *number, *wifi_ap_record_t* *ap_records)

Get AP list found in last scan.

参数

- **number** –**[inout]** As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- **ap_records** –*wifi_ap_record_t* array to hold the found APs

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

esp_err_t **esp_wifi_clear_ap_list**(void)

Clear AP list found in last scan.

Attention When the obtained ap list fails,bss info must be cleared,otherwise it may cause memory leakage.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_sta_get_ap_info**(*wifi_ap_record_t* *ap_info)

Get information of AP to which the device is associated with.

Attention When the obtained country information is empty, it means that the AP does not carry country information

参数 **ap_info** –the *wifi_ap_record_t* to hold AP information sta can get the connected ap's phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the *wifi_ap_record_t* struct. For example, phy_11b = 1 imply that ap support 802.11b mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don't initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

esp_err_t **esp_wifi_set_ps**(*wifi_ps_type_t* type)

Set current WiFi power save type.

Attention Default power save type is WIFI_PS_MIN_MODEM.

参数 **type** –power save type

返回 ESP_OK: succeed

esp_err_t **esp_wifi_get_ps**(*wifi_ps_type_t* *type)

Get current WiFi power save type.

Attention Default power save type is WIFI_PS_MIN_MODEM.

参数 **type** –**[out]** store current power save type

返回 ESP_OK: succeed

esp_err_t **esp_wifi_set_protocol**(*wifi_interface_t* ifx, uint8_t protocol_bitmap)

Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROT
if CONFIG_SOC_WIFI_HE_SUPPORT, the default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PR

Attention Support 802.11b or 802.11bg or 802.11bgn or 802.11bgnax or LR mode

参数

- **ifx** –interfaces
- **protocol_bitmap** –WiFi protocol bitmap

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_get_protocol**(*wifi_interface_t* ifx, uint8_t *protocol_bitmap)

Get the current protocol bitmap of the specified interface.

参数

- **ifx** –interface
- **protocol_bitmap** –**[out]** store current WiFi protocol bitmap of interface ifx

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_set_bandwidth**(*wifi_interface_t* ifx, *wifi_bandwidth_t* bw)

Set the bandwidth of specified interface.

Attention 1. API return false if try to configure an interface that is not enabled

Attention 2. WIFI_BW_HT40 is supported only when the interface support 11N

参数

- **ifx** –interface to be configured
- **bw** –bandwidth

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_get_bandwidth**(*wifi_interface_t* ifx, *wifi_bandwidth_t* *bw)

Get the bandwidth of specified interface.

Attention 1. API return false if try to get a interface that is not enable

参数

- **ifx** –interface to be configured
- **bw** –**[out]** store bandwidth of interface ifx

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_channel**(uint8_t primary, *wifi_second_chan_t* second)

Set primary/secondary channel of device.

Attention 1. This API should be called after esp_wifi_start()

Attention 2. When device is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

Attention 3. When device is in softAP mode, this API should not be called when softAP has connected to external STAs

Attention 4. When device is in STA+softAP mode, this API should not be called when in the scenarios described above

Attention 5. The channel info set by this API will not be stored in NVS. So If you want to remeber the channel used before wifi stop, you need to call this API again after wifi start, or you can call `esp_wifi_set_config()` to store the channel info in NVS.

参数

- **primary** –for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second** –for HT20, second is ignored, for HT40, second is the second channel

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_get_channel**(uint8_t *primary, *wifi_second_chan_t* *second)

Get the primary/secondary channel of device.

Attention 1. API return false if try to get a interface that is not enable

参数

- **primary** –store current primary channel
- **second** –**[out]** store current second channel

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_country**(const *wifi_country_t* *country)

configure country info

Attention 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.

Attention 2. The default country is "01" (world safe mode) {.cc="01", .schan=1, .nchan=11, .policy=WIFI_COUNTRY_POLICY_AUTO}.

Attention 3. The third octect of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as ' '.

Attention 4. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc="US", .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc="JP", .schan=1, .nchan=14} then the country info that will be used is {.cc="JP", .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc="US", .schan=1, .nchan=11} in the example.

Attention 5. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

Attention 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 7. The country configuration is stored into flash.

Attention 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

参数 **country** –the configured country info

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_get_country**(*wifi_country_t* *country)

get the current country info

参数 **country** –country info

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_mac**(*wifi_interface_t* ifx, const uint8_t mac[6])

Set MAC address of WiFi station, soft-AP or NAN interface.

Attention 1. This API can only be called when the interface is disabled

Attention 2. Above mentioned interfaces have different MAC addresses, do not set them to be the same.

Attention 3. The bit 0 of the first byte of MAC address can not be 1. For example, the MAC address can set to be "1a:XX:XX:XX:XX:XX", but can not be "15:XX:XX:XX:XX:XX".

参数

- **ifx** –interface
- **mac** –the MAC address

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_get_mac**(*wifi_interface_t* ifx, uint8_t mac[6])

Get mac of specified interface.

参数

- **ifx** –interface
- **mac** –**[out]** store mac of the interface ifx

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

esp_err_t **esp_wifi_set_promiscuous_rx_cb**(*wifi_promiscuous_cb_t* cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

参数 **cb** –callback

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_promiscuous**(bool en)

Enable the promiscuous mode.

参数 **en** –false - disable, true - enable

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_get_promiscuous**(bool *en)

Get the promiscuous mode.

参数 **en** –**[out]** store the current status of promiscuous mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_promiscuous_filter**(const *wifi_promiscuous_filter_t* *filter)

Enable the promiscuous mode packet type filter.

备注: The default filter is to filter all packets except WIFI_PKT_MISC

参数 **filter** –the packet type filtered in promiscuous mode.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_get_promiscuous_filter**(*wifi_promiscuous_filter_t* *filter)

Get the promiscuous filter.

参数 **filter** –**[out]** store the current status of promiscuous filter

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_promiscuous_ctrl_filter**(const *wifi_promiscuous_filter_t* *filter)

Enable subtype filter of the control packet in promiscuous mode.

备注: The default filter is to filter none control packet.

参数 **filter** –the subtype of the control packet filtered in promiscuous mode.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_get_promiscuous_ctrl_filter**(*wifi_promiscuous_filter_t* *filter)

Get the subtype filter of the control packet in promiscuous mode.

参数 **filter** –**[out]** store the current status of subtype filter of the control packet in promiscuous mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

esp_err_t **esp_wifi_set_config**(*wifi_interface_t* interface, *wifi_config_t* *conf)

Set the configuration of the STA, AP or NAN.

Attention 1. This API can be called only when specified interface is enabled, otherwise, API fail

Attention 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

Attention 3. ESP devices are limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the station.

Attention 4. The configuration will be stored in NVS for station and soft-AP

参数

- **interface** –interface
- **conf** –station, soft-AP or NAN configuration

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the erro code in esp_err.h

esp_err_t **esp_wifi_get_config**(*wifi_interface_t* interface, *wifi_config_t* *conf)

Get configuration of specified interface.

参数

- **interface** –interface
- **conf** –**[out]** station or soft-AP configuration

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

esp_err_t **esp_wifi_ap_get_sta_list**(*wifi_sta_list_t* *sta)

Get STAs associated with soft-AP.

Attention SSC only API

参数 **sta** –**[out]** station list ap can get the connected sta' s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the *wifi_sta_info_t* struct. For example, phy_11b = 1 imply that sta support 802.11b mode

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

esp_err_t **esp_wifi_ap_get_sta_aid**(const uint8_t mac[6], uint16_t *aid)

Get AID of STA connected with soft-AP.

参数

- **mac** –STA' s mac address
- **aid** –**[out]** Store the AID corresponding to STA mac

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

esp_err_t **esp_wifi_set_storage**(*wifi_storage_t* storage)

Set the WiFi API configuration storage type.

Attention 1. The default value is WIFI_STORAGE_FLASH

参数 **storage** –: storage type

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_vendor_ie**(bool enable, *wifi_vendor_ie_type_t* type, *wifi_vendor_ie_id_t* idx, const void *vnd_ie)

Set 802.11 Vendor-Specific Information Element.

参数

- **enable** –If true, specified IE is enabled. If false, specified IE is removed.
- **type** –Information Element type. Determines the frame type to associate with the IE.
- **idx** –Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- **vnd_ie** –Pointer to vendor specific element data. First 6 bytes should be a header with fields matching *vendor_ie_data_t*. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

esp_err_t **esp_wifi_set_vendor_ie_cb**(*esp_vendor_ie_cb_t* cb, void *ctx)

Register Vendor-Specific Information Element monitoring callback.

参数

- **cb** –Callback function
- **ctx** –Context argument, passed to callback function.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_max_tx_power**(int8_t power)

Set maximum transmitting power after WiFi start.

Attention 1. Maximum power before wifi startup is limited by PHY init data bin.

Attention 2. The value set by this API will be mapped to the max_tx_power of the structure *wifi_country_t* variable.

Attention 3. Mapping Table {Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

Attention 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

Attention 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

参数 **power** –Maximum WiFi transmitting power.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

esp_err_t **esp_wifi_get_max_tx_power**(int8_t *power)

Get maximum transmiting power after WiFi start.

参数 **power** –Maximum WiFi transmitting power, unit is 0.25dBm.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument

esp_err_t **esp_wifi_set_event_mask**(uint32_t mask)

Set mask to enable or disable some WiFi events.

Attention 1. Mask can be created by logical OR of various WIFI_EVENT_MASK_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

Attention 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.

Attention 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

参数 **mask** –WiFi event mask.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_get_event_mask**(uint32_t *mask)

Get mask of WiFi events.

参数 **mask** –WiFi event mask.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

esp_err_t **esp_wifi_80211_tx**(*wifi_interface_t* ifx, const void *buffer, int len, bool en_sys_seq)

Send raw ieee80211 data.

Attention Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

参数

- **ifx** –interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- **buffer** –raw ieee80211 buffer
- **len** –the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- **en_sys_seq** –indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

返回

- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

esp_err_t **esp_wifi_set_csi_rx_cb**(*wifi_csi_cb_t* cb, void *ctx)

Register the RX callback function of CSI data.

```
Each time a CSI data is received, the callback function will be called.
```

参数

- **cb** –callback
- **ctx** –context argument, passed to callback function

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_csi_config**(const *wifi_csi_config_t* *config)

Set CSI data configuration.

return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

参数 **config** –configuration

esp_err_t **esp_wifi_set_csi**(bool en)

Enable or disable CSI.

return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

参数 **en** –true - enable, false - disable

esp_err_t **esp_wifi_set_ant_gpio**(const *wifi_ant_gpio_config_t* *config)

Set antenna GPIO configuration.

参数 **config** –Antenna GPIO configuration.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

esp_err_t **esp_wifi_get_ant_gpio**(*wifi_ant_gpio_config_t* *config)

Get current antenna GPIO configuration.

参数 **config** –Antenna GPIO configuration.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

esp_err_t **esp_wifi_set_ant**(const *wifi_ant_config_t* *config)

Set antenna configuration.

参数 **config** –Antenna configuration.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

esp_err_t **esp_wifi_get_ant**(*wifi_ant_config_t* *config)

Get current antenna configuration.

参数 **config** –Antenna configuration.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

int64_t **esp_wifi_get_tsf_time**(*wifi_interface_t* interface)

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn't receive at least one beacon after connected, will return 0.

Attention Enabling power save may cause the return value inaccurate, except WiFi modem sleep

参数 **interface** –The interface whose tsf_time is to be retrieved.
返回 0 or the TSF time

esp_err_t **esp_wifi_set_inactive_time**(*wifi_interface_t* ifx, uint16_t sec)

Set the inactive time of the STA or AP.

Attention 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.
Attention 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.
Attention 3. The inactive time configuration is not stored into flash

参数

- **ifx** –interface to be configured.
- **sec** –Inactive time. Unit seconds.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

esp_err_t **esp_wifi_get_inactive_time**(*wifi_interface_t* ifx, uint16_t *sec)

Get inactive time of specified interface.

参数

- **ifx** –Interface to be configured.
- **sec** –Inactive time. Unit seconds.

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument

esp_err_t **esp_wifi_statis_dump**(uint32_t modules)

Dump WiFi statistics.

参数 **modules** –statistic modules to be dumped
返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_set_rssi_threshold**(int32_t rssi)

Set RSSI threshold below which APP will get an event.

Attention This API needs to be called every time after WIFI_EVENT_STA_BSS_RSSI_LOW event is received.

参数 **rssi** –threshold value in dbm between -100 to 0

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

esp_err_t **esp_wifi_ftm_initiate_session**(*wifi_ftm_initiator_cfg_t* *cfg)

Start an FTM Initiator session by sending FTM request If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

Attention 1. Use this API only in Station mode.

Attention 2. If FTM is initiated on a different channel than Station is connected in or internal SoftAP is started in, FTM defaults to a single burst in ASAP mode.

参数 **cfg** –FTM Initiator session configuration

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_ftm_end_session**(void)

End the ongoing FTM Initiator session.

Attention This API works only on FTM Initiator

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_ftm_resp_set_offset**(int16_t offset_cm)

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

Attention Use this API only in AP mode before performing FTM as responder

参数 **offset_cm** –T1 Offset to be added in centimeters

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_config_11b_rate**(*wifi_interface_t* ifx, bool disable)

Enable or disable 11b rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

Attention 2. Only when really need to disable 11b rate call this API otherwise don’ t call this.

参数

- **ifx** –Interface to be configured.
- **disable** –true means disable 11b rate while false means enable 11b rate.

返回

- ESP_OK: succeed

- others: failed

esp_err_t **esp_wifi_connectionless_module_set_wake_interval**(uint16_t wake_interval)

Set wake interval for connectionless modules to wake up periodically.

Attention 1. Only one wake interval for all connectionless modules.

Attention 2. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.

Attention 3. Event WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START would be posted each time wake interval starts.

Attention 4. Recommend to configure interval in multiples of hundred. (e.g. 100ms)

Attention 5. Recommend to configure interval to ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE to get stable performance at coexistence mode.

参数 **wake_interval** –Milliseconds after would the chip wake up, from 1 to 65535.

esp_err_t **esp_wifi_set_country_code**(const char *country, bool ieee80211d_enabled)

configure country

Attention 1. When ieee80211d_enabled, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

Attention 2. When ieee80211d_enabled is disabled, then the configured country info is used always.

Attention 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 4. The country configuration is stored into flash.

Attention 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Attention 6. Supported country codes are "01" (world safe mode) "AT" ," AU" ," BE" ," BG" ," BR" , "CA" ," CH" ," CN" ," CY" ," CZ" ," DE" ," DK" ," EE" ," ES" ," FI" ," FR" ," GB" ," GR" ," HK" ," HR" ," HU" , "IE" ," IN" ," IS" ," IT" ," JP" ," KR" ," LI" ," LT" ," LU" ," LV" ," MT" ," MX" ," NL" ," NO" ," NZ" ," PL" ," PT" , "RO" ," SE" ," SI" ," SK" ," TW" ," US"

Attention 7. When country code "01" (world safe mode) is set, SoftAP mode won't contain country IE.

Attention 8. The default country is "01" (world safe mode) and ieee80211d_enabled is TRUE.

Attention 9. The third octect of country code string is one of the following: ' ', 'O' , 'I' , 'X' , otherwise it is considered as ' '.

参数

- **country** –the configured country ISO code
- **ieee80211d_enabled** –802.11d is enabled or not

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_get_country_code**(char *country)

get the current country code

参数 **country** –country code

返回

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_config_80211_tx_rate**(*wifi_interface_t* ifx, *wifi_phy_rate_t* rate)

Config 80211 tx rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

参数

- **ifx** –Interface to be configured.
- **rate** –Phy rate to be configured.

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_disable_pmf_config**(*wifi_interface_t* ifx)

Disable PMF configuration for specified interface.

Attention This API should be called after esp_wifi_set_config() and before esp_wifi_start().

参数 **ifx** –Interface to be configured.

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_sta_get_aid**(uint16_t *aid)

Get the Association id assigned to STA by AP.

Attention aid = 0 if station is not connected to AP.

参数 **aid** –**[out]** store the aid

返回

- ESP_OK: succeed

esp_err_t **esp_wifi_sta_get_negotiated_phymode**(*wifi_phy_mode_t* *phymode)

Get the negotiated phymode after connection.

Attention Operation phy mode, BIT[5]: indicate whether LR enabled, BIT[0-4]: wifi_phy_mode_t

参数 **phymode** –**[out]** store the negotiated phymode.

返回

- ESP_OK: succeed

esp_err_t **esp_wifi_set_dynamic_cs**(bool enabled)

Config dynamic carrier sense.

Attention This API should be called after esp_wifi_start().

参数 **enabled** –Dynamic carrier sense is enabled or not.

返回

- ESP_OK: succeed
- others: failed

Structures

struct **wifi_init_config_t**

WiFi stack configuration parameters passed to esp_wifi_init call.

Public Members

wifi_osi_funcs_t ***osi_funcs**

WiFi OS functions

wpa_crypto_funcs_t **wpa_crypto_funcs**

WiFi station crypto functions when connect

int **static_rx_buf_num**

WiFi static RX buffer number

int **dynamic_rx_buf_num**

WiFi dynamic RX buffer number

int **tx_buf_type**

WiFi TX buffer type

int **static_tx_buf_num**

WiFi static TX buffer number

int **dynamic_tx_buf_num**

WiFi dynamic TX buffer number

int **cache_tx_buf_num**

WiFi TX cache buffer number

int **csi_enable**

WiFi channel state information enable flag

int **ampdu_rx_enable**

WiFi AMPDU RX feature enable flag

int **ampdu_tx_enable**

WiFi AMPDU TX feature enable flag

int **amsdu_tx_enable**

WiFi AMSDU TX feature enable flag

int **nvs_enable**

WiFi NVS flash enable flag

int **nano_enable**

Nano option for printf/scan family enable flag

int **rx_ba_win**

WiFi Block Ack RX window size

int **wifi_task_core_id**

WiFi Task Core ID

int **beacon_max_len**

WiFi softAP maximum length of the beacon

int **mgmt_sbuf_num**

WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t **feature_caps**

Enables additional WiFi features and capabilities

bool **sta_disconnected_pm**

WiFi Power Management for station at disconnected status

int **espnow_max_encrypt_num**

Maximum encrypt number of peers supported by espnow

int **magic**

WiFi init magic number, it should be the last field

Macros

ESP_ERR_WIFI_NOT_INIT

WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED

WiFi driver was not started by esp_wifi_start

Type Definitions

typedef void (***wifi_promiscuous_cb_t**)(void *buf, *wifi_promiscuous_pkt_type_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Param buf Data received. Type of data in buffer (*wifi_promiscuous_pkt_t* or *wifi_pkt_rx_ctrl_t*) indicated by 'type' parameter.

Param type promiscuous packet type.

typedef void (***esp_vendor_ie_cb_t**)(void *ctx, *wifi_vendor_ie_type_t* type, const uint8_t sa[6], const *vendor_ie_data_t* *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

Param ctx Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.
Param type Information element type, based on frame type received.
Param sa Source 802.11 address.
Param vnd_ie Pointer to the vendor specific element data received.
Param rssi Received signal strength indication.

typedef void (***wifi_csi_cb_t**)(void *ctx, *wifi_csi_info_t* *data)

The RX callback function of Channel State Information(CSI) data.

```
Each time a CSI data is received, the callback function will be called.
```

Param ctx context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
Param data CSI data received. The memory that it points to will be deallocated after callback function returns.

- components/esp_wifi/include/esp_wifi_types.h

Unions

union **wifi_config_t**

#include <esp_wifi_types.h> Configuration data for device’ s AP or STA or NAN.

The usage of this union (for ap, sta or nan configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config()

Public Members

wifi_ap_config_t **ap**

configuration of AP

wifi_sta_config_t **sta**

configuration of STA

wifi_nan_config_t **nan**

configuration of NAN

Structures

struct **wifi_country_t**

Structure describing WiFi country-based regional restrictions.

Public Members

char **cc**[3]

country code string

uint8_t **schan**

start channel

uint8_t **nchan**

total channel number

int8_t **max_tx_power**

This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.

wifi_country_policy_t **policy**

country policy

struct **wifi_active_scan_time_t**

Range of active scan times per channel.

Public Members

uint32_t **min**

minimum active scan time per channel, units: millisecond

uint32_t **max**

maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct **wifi_scan_time_t**

Aggregate of active & passive scan time per channel.

Public Members

wifi_active_scan_time_t **active**

active scan time per channel, units: millisecond.

uint32_t **passive**

passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct **wifi_scan_config_t**

Parameters for an SSID scan.

Public Members

uint8_t ***ssid**

SSID of AP

uint8_t ***bssid**

MAC address of AP

uint8_t **channel**

channel, scan the specific channel

bool **show_hidden**

enable to scan AP whose SSID is hidden

wifi_scan_type_t **scan_type**

scan type, active or passive

wifi_scan_time_t **scan_time**

scan time per channel

struct **wifi_he_ap_info_t**

Description of a WiFi AP HE Info.

Public Members

uint8_t **bss_color**

an unsigned integer whose value is the BSS Color of the BSS corresponding to the AP

uint8_t **partial_bss_color**

indicate if an AID assignment rule based on the BSS color

uint8_t **bss_color_disabled**

indicate if the use of BSS color is disabled

uint8_t **bssid_index**

in M-BSSID set, identifies the nontransmitted BSSID

struct **wifi_ap_record_t**

Description of a WiFi AP.

Public Members

uint8_t **bssid**[6]

MAC address of AP

uint8_t **ssid**[33]

SSID of AP

uint8_t **primary**
: channel of AP

wifi_second_chan_t **second**
: secondary channel of AP

int8_t **rssi**
: signal strength of AP

wifi_auth_mode_t **authmode**
: authmode of AP

wifi_cipher_type_t **pairwise_cipher**
: pairwise cipher of AP

wifi_cipher_type_t **group_cipher**
: group cipher of AP

wifi_ant_t **ant**
: antenna used to receive beacon from AP

uint32_t **phy_11b**
: bit: 0 flag to identify if 11b mode is enabled or not

uint32_t **phy_11g**
: bit: 1 flag to identify if 11g mode is enabled or not

uint32_t **phy_11n**
: bit: 2 flag to identify if 11n mode is enabled or not

uint32_t **phy_lr**
: bit: 3 flag to identify if low rate is enabled or not

uint32_t **phy_11ax**
: bit: 4 flag to identify if 11ax mode is enabled or not

uint32_t **wps**
: bit: 5 flag to identify if WPS is supported or not

uint32_t **ftm_responder**
: bit: 6 flag to identify if FTM is supported in responder mode

uint32_t **ftm_initiator**
: bit: 7 flag to identify if FTM is supported in initiator mode

uint32_t **reserved**
: bit: 8..31 reserved

wifi_country_t **country**

country information of AP

wifi_he_ap_info_t **he_ap**

HE AP info

struct **wifi_scan_threshold_t**

Structure describing parameters for a WiFi fast scan.

Public Members

int8_t **rssi**

The minimum rssi to accept in the fast scan mode

wifi_auth_mode_t **authmode**

The weakest authmode to accept in the fast scan mode Note: Incase this value is not set and password is set as per WPA2 standards(password len >= 8), it will be defaulted to WPA2 and device won't connect to deprecated WEP/WPA networks. Please set authmode threshold as WIFI_AUTH_WEP/WIFI_AUTH_WPA_PSK to connect to WEP/WPA networks

struct **wifi_pmf_config_t**

Configuration structure for Protected Management Frame

Public Members

bool **capable**

Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool **required**

Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct **wifi_ap_config_t**

Soft-AP configuration settings for the device.

Public Members

uint8_t **ssid**[32]

SSID of soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.

uint8_t **password**[64]

Password of soft-AP.

uint8_t **ssid_len**

Optional length of SSID field.

uint8_t **channel**

Channel of soft-AP

wifi_auth_mode_t **authmode**

Auth mode of soft-AP. Do not support AUTH_WEP, AUTH_WAPI_PSK and AUTH_OWE in soft-AP mode. When the auth mode is set to WPA2_PSK, WPA2_WPA3_PSK or WPA3_PSK, the pairwise cipher will be overwritten with WIFI_CIPHER_TYPE_CCMP.

uint8_t **ssid_hidden**

Broadcast SSID or not, default 0, broadcast the SSID

uint8_t **max_connection**

Max number of stations allowed to connect in

uint16_t **beacon_interval**

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

wifi_cipher_type_t **pairwise_cipher**

Pairwise cipher of SoftAP, group cipher will be derived using this. Cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

bool **ftm_responder**

Enable FTM Responder mode

wifi_pmf_config_t **pmf_cfg**

Configuration for Protected Management Frame

wifi_sae_pwe_method_t **sae_pwe_h2e**

Configuration for SAE PWE derivation method

struct **wifi_sta_config_t**

STA configuration settings for the device.

Public Members

uint8_t **ssid**[32]

SSID of target AP.

uint8_t **password**[64]

Password of target AP.

wifi_scan_method_t **scan_method**

do all channel scan or fast scan

bool **bssid_set**

whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

uint8_t **bssid**[6]

MAC address of target AP

uint8_t **channel**

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

uint16_t **listen_interval**

Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

wifi_sort_method_t **sort_method**

sort the connect AP in the list by rssi or security mode

wifi_scan_threshold_t **threshold**

When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

wifi_pmf_config_t **pmf_cfg**

Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

uint32_t **rm_enabled**

Whether Radio Measurements are enabled for the connection

uint32_t **btm_enabled**

Whether BSS Transition Management is enabled for the connection

uint32_t **mbo_enabled**

Whether MBO is enabled for the connection

uint32_t **ft_enabled**

Whether FT is enabled for the connection

uint32_t **owe_enabled**

Whether OWE is enabled for the connection

uint32_t **transition_disable**

Whether to enable transition disable feature

uint32_t **reserved**

Reserved for future feature set

wifi_sae_pwe_method_t **sae_pwe_h2e**

Configuration for SAE PWE derivation method

wifi_sae_pk_mode_t **sae_pk_mode**

Configuration for SAE-PK (Public Key) Authentication method

uint8_t **failure_retry_cnt**

Number of connection retries station will do before moving to next AP. scan_method should be set as WIFI_ALL_CHANNEL_SCAN to use this config. Note: Enabling this may cause connection time to increase incase best AP doesn't behave properly.

uint32_t **he_dcm_set**

Whether DCM max.constellation for transmission and reception is set.

uint32_t **he_dcm_max_constellation_tx**

Indicate the max.constellation for DCM in TB PPDU the STA supported. 0: not supported. 1: BPSK, 2: QPSK, 3: 16-QAM. The default value is 3.

uint32_t **he_dcm_max_constellation_rx**

Indicate the max.constellation for DCM in both Data field and HE-SIG-B field the STA supported. 0: not supported. 1: BPSK, 2: QPSK, 3: 16-QAM. The default value is 3.

uint32_t **he_mcs9_enabled**

Whether to support HE-MCS 0 to 9. The default value is 0.

uint32_t **he_su_beamformee_disabled**

Whether to disable support for operation as an SU beamformee.

uint32_t **he_trig_su_bmforming_feedback_disabled**

Whether to disable support the transmission of SU feedback in an HE TB sounding sequence.

uint32_t **he_trig_mu_bmforming_partial_feedback_disabled**

Whether to disable support the transmission of partial-bandwidth MU feedback in an HE TB sounding sequence.

uint32_t **he_trig_cqi_feedback_disabled**

Whether to disable support the transmission of CQI feedback in an HE TB sounding sequence.

uint32_t **he_reserved**

Reserved for future feature set

uint8_t **sae_h2e_identifier**[SAE_H2E_IDENTIFIER_LEN]

Password identifier for H2E. this needs to be null terminated string

struct **wifi_nan_config_t**

NAN Discovery start configuration.

Public Members

uint8_t **op_channel**

NAN Discovery operating channel

uint8_t **master_pref**

Device’ s preference value to serve as NAN Master

uint8_t **scan_time**

Scan time in seconds while searching for a NAN cluster

uint16_t **warm_up_sec**

Warm up time before assuming NAN Anchor Master role

struct **wifi_sta_info_t**

Description of STA associated with AP.

Public Members

uint8_t **mac**[6]

mac address

int8_t **rssi**

current average rssi of sta connected

uint32_t **phy_11b**

bit: 0 flag to identify if 11b mode is enabled or not

uint32_t **phy_11g**

bit: 1 flag to identify if 11g mode is enabled or not

uint32_t **phy_11n**

bit: 2 flag to identify if 11n mode is enabled or not

uint32_t **phy_lr**

bit: 3 flag to identify if low rate is enabled or not

uint32_t **phy_11ax**

bit: 4 flag to identify if 11ax mode is enabled or not

uint32_t **is_mesh_child**

bit: 5 flag to identify mesh child

uint32_t **reserved**

bit: 6..31 reserved

struct **wifi_sta_list_t**

List of stations associated with the Soft-AP.

Public Members

wifi_sta_info_t **sta**[ESP_WIFI_MAX_CONN_NUM]

station list

int **num**

number of stations in the list (other entries are invalid)

struct **vendor_ie_data_t**

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t **element_id**

Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t **length**

Length of all bytes in the element data following this field. Minimum 4.

uint8_t **vendor_oui**[3]

Vendor identifier (OUI).

uint8_t **vendor_oui_type**

Vendor-specific OUI type.

uint8_t **payload**[0]

Payload. Length is equal to value in ‘length’ field, minus 4.

struct **wifi_pkt_rx_ctrl_t**

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

Public Members

signed **rssi**

Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned **rate**

PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned **__pad0__**

reserved

unsigned **sig_mode**

0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned **__pad1__**

reserved

unsigned **mcs**

Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned **cwb**

Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned **__pad2__**

reserved

unsigned **smoothing**

reserved

unsigned **not_sounding**

reserved

unsigned **__pad3__**

reserved

unsigned **aggregation**

Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned **stbc**

Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned **fec_coding**

Flag is set for 11n packets which are LDPC

unsigned **sgi**

Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned **__pad4__**

reserved

unsigned **ampdu_cnt**

ampdu cnt

unsigned **channel**

primary channel on which this packet is received

unsigned **secondary_channel**

secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **__pad5__**

reserved

unsigned **timestamp**

timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **__pad6__**

reserved

signed **noise_floor**

noise floor of Radio Frequency Module(RF). unit: dBm

unsigned **__pad7__**

reserved

unsigned **__pad8__**

reserved

unsigned **__pad9__**

reserved

unsigned **ant**

antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **__pad10__**

reserved

unsigned **__pad11__**

reserved

unsigned **__pad12__**

reserved

unsigned **sig_len**

length of packet including Frame Check Sequence(FCS)

unsigned **__pad13__**

reserved

unsigned **rx_state**

state of the packet. 0: no error; others: error numbers which are not public

struct **wifi_promiscuous_pkt_t**

Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

Public Members

wifi_pkt_rx_ctrl_t **rx_ctrl**

metadata header

uint8_t **payload**[0]

Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

struct **wifi_promiscuous_filter_t**

Mask for filtering different packet types in promiscuous mode.

Public Members

uint32_t **filter_mask**

OR of one or more filter values WIFI_PROMIS_FILTER_*

struct **wifi_csi_config_t**

Channel state information(CSI) configuration type.

Public Members

bool **lltf_en**

enable to receive legacy long training field(lltf) data. Default enabled

bool **htltf_en**

enable to receive HT long training field(htltf) data. Default enabled

bool **stbc_htltf2_en**

enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

bool **ltf_merge_en**

enable to generate htlft data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

bool **channel_filter_en**

enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool **manu_scale**

manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8_t **shift**

manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct **wifi_csi_info_t**

CSI data type.

Public Members

wifi_pkt_rx_ctrl_t **rx_ctrl**

received packet radio metadata header of the CSI data

uint8_t **mac**[6]

source MAC address of the CSI data

uint8_t **dmac**[6]

destination MAC address of the CSI data

bool **first_word_invalid**

first four bytes of the CSI data is invalid or not

int8_t ***buf**

buffer of CSI data

uint16_t **len**

length of CSI data

struct **wifi_ant_gpio_t**

WiFi GPIO configuration for antenna selection.

Public Members

uint8_t **gpio_select**

Whether this GPIO is connected to external antenna switch

uint8_t **gpio_num**

The GPIO number that connects to external antenna switch

struct **wifi_ant_gpio_config_t**

WiFi GPIOs configuration for antenna selection.

Public Members

wifi_ant_gpio_t **gpio_cfg**[4]

The configurations of GPIOs that connect to external antenna switch

struct **wifi_ant_config_t**

WiFi antenna configuration.

Public Members

wifi_ant_mode_t **rx_ant_mode**

WiFi antenna mode for receiving

wifi_ant_t **rx_ant_default**

Default antenna mode for receiving, it’ s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

wifi_ant_mode_t **tx_ant_mode**

WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

uint8_t **enabled_ant0**

Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t **enabled_ant1**

Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct **wifi_action_tx_req_t**

Action Frame Tx Request.

Public Members

wifi_interface_t **ifx**

WiFi interface to send request to

uint8_t **dest_mac**[6]

Destination MAC address

bool **no_ack**

Indicates no ack required

wifi_action_rx_cb_t **rx_cb**

Rx Callback to receive any response

uint32_t **data_len**

Length of the appended Data

uint8_t **data**[0]

Appended Data payload

struct **wifi_ftm_initiator_cfg_t**

FTM Initiator configuration.

Public Members

uint8_t **resp_mac**[6]

MAC address of the FTM Responder

uint8_t **channel**

Primary channel of the FTM Responder

uint8_t **frm_count**

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16_t **burst_period**

Requested time period between consecutive FTM bursts in 100’s of milliseconds (0 - No pref)

struct **wifi_beacon_monitor_config_t**

WiFi beacon monitor parameter configuration.

Public Members

bool **enable**

Enable or disable beacon monitor

uint8_t **loss_timeout**

Beacon lost timeout

uint8_t **loss_threshold**

Maximum number of consecutive lost beacons allowed

uint8_t **delta_intr_early**

Delta early time for RF PHY on

uint8_t **delta_loss_timeout**

Delta timeout time for RF PHY off

struct **wifi_nan_publish_cfg_t**

NAN Publish service configuration parameters.

Public Members

char **service_name**[ESP_WIFI_MAX_SVC_NAME_LEN]

Service name identifier

wifi_nan_service_type_t **type**

Service type

char **matching_filter**[ESP_WIFI_MAX_FILTER_LEN]

Comma separated filters for filtering services

char **svc_info**[ESP_WIFI_MAX_SVC_INFO_LEN]

Service info shared in Publish frame

uint8_t **single_replied_event**

Give single Replied event or every time

uint8_t **datapath_reqd**

NAN Datapath required for the service

uint8_t **reserved**

Reserved

struct **wifi_nan_subscribe_cfg_t**

NAN Subscribe service configuration parameters.

Public Members

char **service_name**[ESP_WIFI_MAX_SVC_NAME_LEN]
Service name identifier

wifi_nan_service_type_t **type**
Service type

char **matching_filter**[ESP_WIFI_MAX_FILTER_LEN]
Comma separated filters for filtering services

char **svc_info**[ESP_WIFI_MAX_SVC_INFO_LEN]
Service info shared in Subscribe frame

uint8_t **single_match_event**
Give single Match event or every time

uint8_t **reserved**
Reserved

struct **wifi_nan_followup_params_t**
NAN Follow-up parameters.

Public Members

uint8_t **inst_id**
Own service instance id

uint8_t **peer_inst_id**
Peer’ s service instance id

uint8_t **peer_mac**[6]
Peer’ s MAC address

char **svc_info**[ESP_WIFI_MAX_SVC_INFO_LEN]
Service info(or message) to be shared

struct **wifi_nan_datapath_req_t**
NAN Datapath Request parameters.

Public Members

uint8_t **pub_id**
Publisher’ s service instance id

uint8_t **peer_mac**[6]
Peer’ s MAC address

bool **confirm_required**

NDP Confirm frame required

struct **wifi_nan_datapath_resp_t**

NAN Datapath Response parameters.

Public Members

bool **accept**

True - Accept incoming NDP, False - Reject it

uint8_t **ndp_id**

NAN Datapath Identifier

uint8_t **peer_mac**[6]

Peer’ s MAC address

struct **wifi_nan_datapath_end_req_t**

NAN Datapath End parameters.

Public Members

uint8_t **ndp_id**

NAN Datapath Identifier

uint8_t **peer_mac**[6]

Peer’ s MAC address

struct **wifi_event_sta_scan_done_t**

Argument structure for WIFI_EVENT_SCAN_DONE event

Public Members

uint32_t **status**

status of scanning APs: 0 —success, 1 - failure

uint8_t **number**

number of scan results

uint8_t **scan_id**

scan sequence number, used for block scan

struct **wifi_event_sta_connected_t**

Argument structure for WIFI_EVENT_STA_CONNECTED event

Public Members

uint8_t **ssid**[32]
SSID of connected AP

uint8_t **ssid_len**
SSID length of connected AP

uint8_t **bssid**[6]
BSSID of connected AP

uint8_t **channel**
channel of connected AP

wifi_auth_mode_t **authmode**
authentication mode used by AP

uint16_t **aid**
authentication id assigned by the connected AP

struct **wifi_event_sta_disconnected_t**
Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members

uint8_t **ssid**[32]
SSID of disconnected AP

uint8_t **ssid_len**
SSID length of disconnected AP

uint8_t **bssid**[6]
BSSID of disconnected AP

uint8_t **reason**
reason of disconnection

int8_t **rssi**
rssi of disconnection

struct **wifi_event_sta_authmode_change_t**
Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

wifi_auth_mode_t **old_mode**
the old auth mode of AP

wifi_auth_mode_t **new_mode**

the new auth mode of AP

struct **wifi_event_sta_wps_er_pin_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

uint8_t **pin_code**[8]

PIN code of station in enrollee mode

struct **wifi_event_sta_wps_er_success_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

uint8_t **ap_cred_cnt**

Number of AP credentials received

uint8_t **ssid**[MAX_SSID_LEN]

SSID of AP

uint8_t **passphrase**[MAX_PASSPHRASE_LEN]

Passphrase for the AP

struct *wifi_event_sta_wps_er_success_t*::[anonymous] **ap_cred**[MAX_WPS_AP_CRED]

All AP credentials received from WPS handshake

struct **wifi_event_ap_staconnected_t**

Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

uint8_t **mac**[6]

MAC address of the station connected to Soft-AP

uint8_t **aid**

the aid that soft-AP gives to the station connected to

bool **is_mesh_child**

flag to identify mesh child

struct **wifi_event_ap_stadisconnected_t**

Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t **mac**[6]

MAC address of the station disconnects to soft-AP

uint8_t **aid**

the aid that soft-AP gave to the station disconnects to

bool **is_mesh_child**

flag to identify mesh child

struct **wifi_event_ap_probe_req_rx_t**

Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int **rssi**

Received probe request signal strength

uint8_t **mac**[6]

MAC address of the station which send probe request

struct **wifi_event_bss_rssi_low_t**

Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t **rssi**

RSSI value of bss

struct **wifi_ftm_report_entry_t**

Argument structure for

Public Members

uint8_t **dlog_token**

Dialog Token of the FTM frame

int8_t **rssi**

RSSI of the FTM frame received

uint32_t **rtt**

Round Trip Time in pSec with a peer

uint64_t **t1**

Time of departure of FTM frame from FTM Responder in pSec

uint64_t **t2**

Time of arrival of FTM frame at FTM Initiator in pSec

uint64_t **t3**

Time of departure of ACK from FTM Initiator in pSec

uint64_t **t4**

Time of arrival of ACK at FTM Responder in pSec

struct **wifi_event_ftm_report_t**

Argument structure for WIFI_EVENT_FTM_REPORT event

Public Members

uint8_t **peer_mac**[6]

MAC address of the FTM Peer

wifi_ftm_status_t **status**

Status of the FTM operation

uint32_t **rtt_raw**

Raw average Round-Trip-Time with peer in Nano-Seconds

uint32_t **rtt_est**

Estimated Round-Trip-Time with peer in Nano-Seconds

uint32_t **dist_est**

Estimated one-way distance in Centi-Meters

wifi_ftm_report_entry_t ***ftm_report_data**

Pointer to FTM Report with multiple entries, should be freed after use

uint8_t **ftm_report_num_entries**

Number of entries in the FTM Report data

struct **wifi_event_action_tx_status_t**

Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

Public Members

wifi_interface_t **ifx**

WiFi interface to send request to

uint32_t **context**

Context to identify the request

uint8_t **da**[6]

Destination MAC address

uint8_t **status**

Status of the operation

struct **wifi_event_roc_done_t**

Argument structure for WIFI_EVENT_ROC_DONE event

Public Members

uint32_t **context**

Context to identify the request

struct **wifi_event_ap_wps_rg_pin_t**

Argument structure for WIFI_EVENT_AP_WPS_RG_PIN event

Public Members

uint8_t **pin_code**[8]

PIN code of station in enrollee mode

struct **wifi_event_ap_wps_rg_fail_reason_t**

Argument structure for WIFI_EVENT_AP_WPS_RG_FAILED event

Public Members

wps_fail_reason_t **reason**

WPS failure reason wps_fail_reason_t

uint8_t **peer_macaddr**[6]

Enrollee mac address

struct **wifi_event_ap_wps_rg_success_t**

Argument structure for WIFI_EVENT_AP_WPS_RG_SUCCESS event

Public Members

uint8_t **peer_macaddr**[6]

Enrollee mac address

struct **wifi_event_nan_svc_match_t**

Argument structure for WIFI_EVENT_NAN_SVC_MATCH event

Public Members

uint8_t **subscribe_id**

Subscribe Service Identifier

uint8_t **publish_id**

Publish Service Identifier

uint8_t **pub_if_mac**[6]

NAN Interface MAC of the Publisher

struct **wifi_event_nan_replied_t**

Argument structure for WIFI_EVENT_NAN_REPLIED event

Public Members

uint8_t **publish_id**

Publish Service Identifier

uint8_t **subscribe_id**

Subscribe Service Identifier

uint8_t **sub_if_mac**[6]

NAN Interface MAC of the Subscriber

struct **wifi_event_nan_receive_t**

Argument structure for WIFI_EVENT_NAN_RECEIVE event

Public Members

uint8_t **inst_id**

Our Service Identifier

uint8_t **peer_inst_id**

Peer’ s Service Identifier

uint8_t **peer_if_mac**[6]

Peer’ s NAN Interface MAC

uint8_t **peer_svc_info**[ESP_WIFI_MAX_SVC_INFO_LEN]

Peer Service Info

struct **wifi_event_ndp_indication_t**

Argument structure for WIFI_EVENT_NDP_INDICATION event

Public Members

uint8_t **publish_id**

Publish Id for NAN Service

uint8_t **ndp_id**

NDP instance id

uint8_t **peer_nmi**[6]

Peer’s NAN Management Interface MAC

uint8_t **peer_ndi**[6]

Peer’s NAN Data Interface MAC

uint8_t **svc_info**[ESP_WIFI_MAX_SVC_INFO_LEN]

Service Specific Info

struct **wifi_event_ndp_confirm_t**

Argument structure for WIFI_EVENT_NDP_CONFIRM event

Public Members

uint8_t **status**

NDP status code

uint8_t **ndp_id**

NDP instance id

uint8_t **peer_nmi**[6]

Peer’s NAN Management Interface MAC

uint8_t **peer_ndi**[6]

Peer’s NAN Data Interface MAC

uint8_t **own_ndi**[6]

Own NAN Data Interface MAC

uint8_t **svc_info**[ESP_WIFI_MAX_SVC_INFO_LEN]

Service Specific Info

struct **wifi_event_ndp_terminated_t**

Argument structure for WIFI_EVENT_NDP_TERMINATED event

Public Members

uint8_t **reason**

Termination reason code

uint8_t **ndp_id**

NDP instance id

uint8_t **init_ndi**[6]

Initiator’s NAN Data Interface MAC

Macros

Type Definitions

typedef int (*`wifi_action_rx_cb_t`)(uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)

The Rx callback function of Action Tx operations.

Param hdr pointer to the IEEE 802.11 Header structure
Param payload pointer to the Payload following 802.11 Header
Param len length of the Payload
Param channel channel number the frame is received on

Enumerations

enum `wifi_mode_t`

Values:

enumerator **WIFI_MODE_NULL**
null mode

enumerator **WIFI_MODE_STA**
WiFi station mode

enumerator **WIFI_MODE_AP**
WiFi soft-AP mode

enumerator **WIFI_MODE_APSTA**
WiFi station + soft-AP mode

enumerator **WIFI_MODE_NAN**
WiFi NAN mode

enumerator **WIFI_MODE_MAX**

enum **wifi_interface_t**
Values:

enumerator **WIFI_IF_STA**

enumerator **WIFI_IF_AP**

enumerator **WIFI_IF_MAX**

enum **wifi_country_policy_t**
Values:

enumerator **WIFI_COUNTRY_POLICY_AUTO**
Country policy is auto, use the country info of AP to which the station is connected

enumerator **WIFI_COUNTRY_POLICY_MANUAL**
Country policy is manual, always use the configured country info

enum **wifi_auth_mode_t**
Values:

enumerator **WIFI_AUTH_OPEN**
authenticate mode : open

enumerator **WIFI_AUTH_WEP**
authenticate mode : WEP

enumerator **WIFI_AUTH_WPA_PSK**
authenticate mode : WPA_PSK

enumerator **WIFI_AUTH_WPA2_PSK**
authenticate mode : WPA2_PSK

enumerator **WIFI_AUTH_WPA_WPA2_PSK**
authenticate mode : WPA_WPA2_PSK

enumerator **WIFI_AUTH_WPA2_ENTERPRISE**
authenticate mode : WPA2_ENTERPRISE

enumerator **WIFI_AUTH_WPA3_PSK**
authenticate mode : WPA3_PSK

enumerator **WIFI_AUTH_WPA2_WPA3_PSK**
authenticate mode : WPA2_WPA3_PSK

enumerator **WIFI_AUTH_WAPI_PSK**
authenticate mode : WAPI_PSK

enumerator **WIFI_AUTH_OWE**
authenticate mode : OWE

enumerator **WIFI_AUTH_MAX**

enum **wifi_err_reason_t**
Values:

enumerator **WIFI_REASON_UNSPECIFIED**

enumerator **WIFI_REASON_AUTH_EXPIRE**

enumerator **WIFI_REASON_AUTH_LEAVE**

enumerator **WIFI_REASON_ASSOC_EXPIRE**

enumerator **WIFI_REASON_ASSOC_TOOMANY**

enumerator **WIFI_REASON_BEACON_TIMEOUT**

enumerator **WIFI_REASON_NO_AP_FOUND**

enumerator **WIFI_REASON_AUTH_FAIL**

enumerator **WIFI_REASON_ASSOC_FAIL**

enumerator **WIFI_REASON_HANDSHAKE_TIMEOUT**

enumerator **WIFI_REASON_CONNECTION_FAIL**

enumerator **WIFI_REASON_AP_TSF_RESET**

enumerator **WIFI_REASON_ROAMING**

enumerator **WIFI_REASON_ASSOC_COMEBACK_TIME_TOO_LONG**

enumerator **WIFI_REASON_SA_QUERY_TIMEOUT**

enum **wifi_second_chan_t**

Values:

enumerator **WIFI_SECOND_CHAN_NONE**

the channel width is HT20

enumerator **WIFI_SECOND_CHAN_ABOVE**

the channel width is HT40 and the secondary channel is above the primary channel

enumerator **WIFI_SECOND_CHAN_BELOW**

the channel width is HT40 and the secondary channel is below the primary channel

enum **wifi_scan_type_t**

Values:

enumerator **WIFI_SCAN_TYPE_ACTIVE**

active scan

enumerator **WIFI_SCAN_TYPE_PASSIVE**

passive scan

enum **wifi_cipher_type_t**

Values:

enumerator **WIFI_CIPHER_TYPE_NONE**

the cipher type is none

enumerator **WIFI_CIPHER_TYPE_WEP40**

the cipher type is WEP40

enumerator **WIFI_CIPHER_TYPE_WEP104**

the cipher type is WEP104

enumerator **WIFI_CIPHER_TYPE_TKIP**

the cipher type is TKIP

enumerator **WIFI_CIPHER_TYPE_CCMP**

the cipher type is CCMP

enumerator **WIFI_CIPHER_TYPE_TKIP_CCMP**

the cipher type is TKIP and CCMP

enumerator **WIFI_CIPHER_TYPE_AES_CMAC128**

the cipher type is AES-CMAC-128

enumerator **WIFI_CIPHER_TYPE_SMS4**

the cipher type is SMS4

enumerator **WIFI_CIPHER_TYPE_GCMP**

the cipher type is GCMP

enumerator **WIFI_CIPHER_TYPE_GCMP256**

the cipher type is GCMP-256

enumerator **WIFI_CIPHER_TYPE_AES_GMAC128**

the cipher type is AES-GMAC-128

enumerator **WIFI_CIPHER_TYPE_AES_GMAC256**

the cipher type is AES-GMAC-256

enumerator **WIFI_CIPHER_TYPE_UNKNOWN**

the cipher type is unknown

enum **wifi_ant_t**

WiFi antenna.

Values:

enumerator **WIFI_ANT_ANT0**

WiFi antenna 0

enumerator **WIFI_ANT_ANT1**

WiFi antenna 1

enumerator **WIFI_ANT_MAX**

Invalid WiFi antenna

enum **wifi_scan_method_t**

Values:

enumerator **WIFI_FAST_SCAN**

Do fast scan, scan will end after find SSID match AP

enumerator **WIFI_ALL_CHANNEL_SCAN**

All channel scan, scan will end after scan all the channel

enum **wifi_sort_method_t**

Values:

enumerator **WIFI_CONNECT_AP_BY_SIGNAL**

Sort match AP in scan list by RSSI

enumerator **WIFI_CONNECT_AP_BY_SECURITY**

Sort match AP in scan list by security mode

enum **wifi_ps_type_t**

Values:

enumerator **WIFI_PS_NONE**

No power save

enumerator **WIFI_PS_MIN_MODEM**

Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

enumerator **WIFI_PS_MAX_MODEM**

Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in *wifi_sta_config_t*

enum **wifi_bandwidth_t**

Values:

enumerator **WIFI_BW_HT20**

enumerator **WIFI_BW_HT40**

enum **wifi_sae_pwe_method_t**

Configuration for SAE PWE derivation

Values:

enumerator **WPA3_SAE_PWE_UNSPECIFIED**

enumerator **WPA3_SAE_PWE_HUNT_AND_PECK**

enumerator **WPA3_SAE_PWE_HASH_TO_ELEMENT**

enumerator **WPA3_SAE_PWE_BOTH**

enum **wifi_sae_pk_mode_t**

Configuration for SAE-PK

Values:

enumerator **WPA3_SAE_PK_MODE_AUTOMATIC**

enumerator **WPA3_SAE_PK_MODE_ONLY**

enumerator **WPA3_SAE_PK_MODE_DISABLED**

enum **wifi_storage_t**

Values:

enumerator **WIFI_STORAGE_FLASH**

all configuration will store in both memory and flash

enumerator **WIFI_STORAGE_RAM**

all configuration will only store in the memory

enum **wifi_vendor_ie_type_t**

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

Values:

enumerator **WIFI_VND_IE_TYPE_BEACON**

enumerator **WIFI_VND_IE_TYPE_PROBE_REQ**

enumerator **WIFI_VND_IE_TYPE_PROBE_RESP**

enumerator **WIFI_VND_IE_TYPE_ASSOC_REQ**

enumerator **WIFI_VND_IE_TYPE_ASSOC_RESP**

enum **wifi_vendor_ie_id_t**

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

Values:

enumerator **WIFI_VND_IE_ID_0**

enumerator **WIFI_VND_IE_ID_1**

enum **wifi_phy_mode_t**

Operation Phymode.

Values:

enumerator **WIFI_PHY_MODE_LR**

PHY mode for Low Rate

enumerator **WIFI_PHY_MODE_11B**

PHY mode for 11b

enumerator **WIFI_PHY_MODE_11G**

PHY mode for 11g

enumerator **WIFI_PHY_MODE_HT20**

PHY mode for Bandwidth HT20

enumerator **WIFI_PHY_MODE_HT40**

PHY mode for Bandwidth HT40

enumerator **WIFI_PHY_MODE_HE20**

PHY mode for Bandwidth HE20

enum **wifi_promiscuous_pkt_type_t**

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

Values:

enumerator **WIFI_PKT_MGMT**

Management frame, indicates ‘buf’ argument is *wifi_promiscuous_pkt_t*

enumerator **WIFI_PKT_CTRL**

Control frame, indicates ‘buf’ argument is *wifi_promiscuous_pkt_t*

enumerator **WIFI_PKT_DATA**

Data frame, indiciates ‘buf’ argument is *wifi_promiscuous_pkt_t*

enumerator **WIFI_PKT_MISC**

Other type, such as MIMO etc. ‘buf’ argument is *wifi_promiscuous_pkt_t* but the payload is zero length.

enum **wifi_ant_mode_t**

WiFi antenna mode.

Values:

enumerator **WIFI_ANT_MODE_ANT0**

Enable WiFi antenna 0 only

enumerator **WIFI_ANT_MODE_ANT1**

Enable WiFi antenna 1 only

enumerator **WIFI_ANT_MODE_AUTO**

Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator **WIFI_ANT_MODE_MAX**

Invalid WiFi enabled antenna

enum **wifi_nan_service_type_t**

NAN Services types.

Values:

enumerator **NAN_PUBLISH_SOLICITED**

Send unicast Publish frame to Subscribers that match the requirement

enumerator **NAN_PUBLISH_UNSOLICITED**

Send broadcast Publish frames in every Discovery Window(DW)

enumerator **NAN_SUBSCRIBE_ACTIVE**

Send broadcast Subscribe frames in every DW

enumerator **NAN_SUBSCRIBE_PASSIVE**

Passively listens to Publish frames

enum **wifi_phy_rate_t**

WiFi PHY rate encodings.

Values:

enumerator **WIFI_PHY_RATE_1M_L**

1 Mbps with long preamble

enumerator **WIFI_PHY_RATE_2M_L**

2 Mbps with long preamble

enumerator **WIFI_PHY_RATE_5M_L**

5.5 Mbps with long preamble

enumerator **WIFI_PHY_RATE_11M_L**

11 Mbps with long preamble

enumerator **WIFI_PHY_RATE_2M_S**

2 Mbps with short preamble

enumerator **WIFI_PHY_RATE_5M_S**

5.5 Mbps with short preamble

enumerator **WIFI_PHY_RATE_11M_S**

11 Mbps with short preamble

enumerator **WIFI_PHY_RATE_48M**

48 Mbps

enumerator **WIFI_PHY_RATE_24M**

24 Mbps

enumerator **WIFI_PHY_RATE_12M**

12 Mbps

enumerator **WIFI_PHY_RATE_6M**

6 Mbps

enumerator **WIFI_PHY_RATE_54M**

54 Mbps

enumerator **WIFI_PHY_RATE_36M**

36 Mbps

enumerator **WIFI_PHY_RATE_18M**

18 Mbps

enumerator **WIFI_PHY_RATE_9M**

9 Mbps rate table and guard interval information for each MCS rate

enumerator **WIFI_PHY_RATE_MCS0_LGI**
MCS0 with long GI

enumerator **WIFI_PHY_RATE_MCS1_LGI**
MCS1 with long GI

enumerator **WIFI_PHY_RATE_MCS2_LGI**
MCS2 with long GI

enumerator **WIFI_PHY_RATE_MCS3_LGI**
MCS3 with long GI

enumerator **WIFI_PHY_RATE_MCS4_LGI**
MCS4 with long GI

enumerator **WIFI_PHY_RATE_MCS5_LGI**
MCS5 with long GI

enumerator **WIFI_PHY_RATE_MCS6_LGI**
MCS6 with long GI

enumerator **WIFI_PHY_RATE_MCS7_LGI**
MCS7 with long GI

enumerator **WIFI_PHY_RATE_MCS0_SGI**
MCS0 with short GI

enumerator **WIFI_PHY_RATE_MCS1_SGI**
MCS1 with short GI

enumerator **WIFI_PHY_RATE_MCS2_SGI**
MCS2 with short GI

enumerator **WIFI_PHY_RATE_MCS3_SGI**
MCS3 with short GI

enumerator **WIFI_PHY_RATE_MCS4_SGI**
MCS4 with short GI

enumerator **WIFI_PHY_RATE_MCS5_SGI**
MCS5 with short GI

enumerator **WIFI_PHY_RATE_MCS6_SGI**
MCS6 with short GI

enumerator **WIFI_PHY_RATE_MCS7_SGI**
MCS7 with short GI

enumerator **WIFI_PHY_RATE_LORA_250K**

250 Kbps

enumerator **WIFI_PHY_RATE_LORA_500K**

500 Kbps

enumerator **WIFI_PHY_RATE_MAX**

enum **wifi_event_t**

WiFi event declarations

Values:

enumerator **WIFI_EVENT_WIFI_READY**

WiFi ready

enumerator **WIFI_EVENT_SCAN_DONE**

Finished scanning AP

enumerator **WIFI_EVENT_STA_START**

Station start

enumerator **WIFI_EVENT_STA_STOP**

Station stop

enumerator **WIFI_EVENT_STA_CONNECTED**

Station connected to AP

enumerator **WIFI_EVENT_STA_DISCONNECTED**

Station disconnected from AP

enumerator **WIFI_EVENT_STA_AUTHMODE_CHANGE**

the auth mode of AP connected by device’ s station changed

enumerator **WIFI_EVENT_STA_WPS_ER_SUCCESS**

Station wps succeeds in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_FAILED**

Station wps fails in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_TIMEOUT**

Station wps timeout in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_PIN**

Station wps pin code in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP**

Station wps overlap in enrollee mode

enumerator **WIFI_EVENT_AP_START**

Soft-AP start

enumerator **WIFI_EVENT_AP_STOP**

Soft-AP stop

enumerator **WIFI_EVENT_AP_STACONNECTED**

a station connected to Soft-AP

enumerator **WIFI_EVENT_AP_STADISCONNECTED**

a station disconnected from Soft-AP

enumerator **WIFI_EVENT_AP_PROBEREQRECVED**

Receive probe request packet in soft-AP interface

enumerator **WIFI_EVENT_FTM_REPORT**

Receive report of FTM procedure

enumerator **WIFI_EVENT_STA_BSS_RSSI_LOW**

AP’ s RSSI crossed configured threshold

enumerator **WIFI_EVENT_ACTION_TX_STATUS**

Status indication of Action Tx operation

enumerator **WIFI_EVENT_ROC_DONE**

Remain-on-Channel operation complete

enumerator **WIFI_EVENT_STA_BEACON_TIMEOUT**

Station beacon timeout

enumerator **WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START**

Connectionless module wake interval start

enumerator **WIFI_EVENT_AP_WPS_RG_SUCCESS**

Soft-AP wps succeeds in registrar mode

enumerator **WIFI_EVENT_AP_WPS_RG_FAILED**

Soft-AP wps fails in registrar mode

enumerator **WIFI_EVENT_AP_WPS_RG_TIMEOUT**

Soft-AP wps timeout in registrar mode

enumerator **WIFI_EVENT_AP_WPS_RG_PIN**

Soft-AP wps pin code in registrar mode

enumerator **WIFI_EVENT_AP_WPS_RG_PBC_OVERLAP**

Soft-AP wps overlap in registrar mode

enumerator **WIFI_EVENT_ITWT_SETUP**

iTWT setup

enumerator **WIFI_EVENT_ITWT_TEARDOWN**

iTWT teardown

enumerator **WIFI_EVENT_ITWT_PROBE**

iTWT probe

enumerator **WIFI_EVENT_ITWT_SUSPEND**

iTWT suspend

enumerator **WIFI_EVENT_NAN_STARTED**

NAN Discovery has started

enumerator **WIFI_EVENT_NAN_STOPPED**

NAN Discovery has stopped

enumerator **WIFI_EVENT_NAN_SVC_MATCH**

NAN Service Discovery match found

enumerator **WIFI_EVENT_NAN_REPLIED**

Replied to a NAN peer with Service Discovery match

enumerator **WIFI_EVENT_NAN_RECEIVE**

Received a Follow-up message

enumerator **WIFI_EVENT_NDP_INDICATION**

Received NDP Request from a NAN Peer

enumerator **WIFI_EVENT_NDP_CONFIRM**

NDP Confirm Indication

enumerator **WIFI_EVENT_NDP_TERMINATED**

NAN Datapath terminated indication

enumerator **WIFI_EVENT_MAX**

Invalid WiFi event ID

enum **wifi_event_sta_wps_fail_reason_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

Values:

enumerator **WPS_FAIL_REASON_NORMAL**

WPS normal fail reason

enumerator **WPS_FAIL_REASON_RECV_M2D**

WPS receive M2D frame

enumerator **WPS_FAIL_REASON_MAX**

enum **wifi_ftm_status_t**

FTM operation status types.

Values:

enumerator **FTM_STATUS_SUCCESS**

FTM exchange is successful

enumerator **FTM_STATUS_UNSUPPORTED**

Peer does not support FTM

enumerator **FTM_STATUS_CONF_REJECTED**

Peer rejected FTM configuration in FTM Request

enumerator **FTM_STATUS_NO_RESPONSE**

Peer did not respond to FTM Requests

enumerator **FTM_STATUS_FAIL**

Unknown error during FTM exchange

enum **wps_fail_reason_t**

Values:

enumerator **WPS_AP_FAIL_REASON_NORMAL**

WPS normal fail reason

enumerator **WPS_AP_FAIL_REASON_CONFIG**

WPS failed due to incorrect config

enumerator **WPS_AP_FAIL_REASON_AUTH**

WPS failed during auth

enumerator **WPS_AP_FAIL_REASON_MAX**

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance’ s official page on Easy Connect for more information.

ESP32-C3 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-C3 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

Application Example Example on how to provision ESP32-C3 using a supported smartphone: wifi/wifi_easy_connect/dpp-enrollee.

API Reference

Header File

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h

Functions

esp_err_t **esp_supp_dpp_init** (*esp_supp_dpp_event_cb_t* evt_cb)

Initialize DPP Supplicant.

```
Starts DPP Supplicant and initializes related Data Structures.
```

return

- ESP_OK: Success
- ESP_FAIL: Failure

参数 **evt_cb** –Callback function to receive DPP related events

void **esp_supp_dpp_deinit** (void)

De-initalize DPP Supplicant.

```
Frees memory from DPP Supplicant Data Structures.
```

esp_err_t **esp_supp_dpp_bootstrap_gen** (const char *chan_list, *esp_supp_dpp_bootstrap_t* type, const char *key, const char *info)

Generates Bootstrap Information as an Enrollee.

```
Generates Out Of Band Bootstrap information as an Enrollee which can be
used by a DPP Configurator to provision the Enrollee.
```

参数

- **chan_list** –List of channels device will be available on for listening
- **type** –Bootstrap method type, only QR Code method is supported for now.
- **key** –(Optional) 32 byte Raw Private Key for generating a Bootstrapping Public Key
- **info** –(Optional) Ancilliary Device Information like Serial Number

返回

- ESP_OK: Success
- ESP_FAIL: Failure

esp_err_t **esp_supp_dpp_start_listen** (void)

Start listening on Channels provided during esp_supp_dpp_bootstrap_gen.

```
Listens on every Channel from Channel List for a pre-defined wait time.
```

返回

- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

void **esp_supp_dpp_stop_listen** (void)

Stop listening on Channels.

```
Stops listening on Channels and cancels ongoing listen operation.
```

Macros

ESP_ERR_DPP_FAILURE

Generic failure during DPP Operation

ESP_ERR_DPP_TX_FAILURE

DPP Frame Tx failed OR not Acked

ESP_ERR_DPP_INVALID_ATTR

Encountered invalid DPP Attribute

Type Definitions

typedef enum *dpp_bootstrap_type* **esp_supp_dpp_bootstrap_t**

Types of Bootstrap Methods for DPP.

typedef void (***esp_supp_dpp_event_cb_t**)(*esp_supp_dpp_event_t* evt, void *data)

Callback function for receiving DPP Events from Supplicant.

```
Callback function will be called with DPP related information.
```

Param evt DPP event ID
Param data Event data payload

Enumerations

enum **dpp_bootstrap_type**

Types of Bootstrap Methods for DPP.

Values:

enumerator **DPP_BOOTSTRAP_QR_CODE**

QR Code Method

enumerator **DPP_BOOTSTRAP_PKEX**

Proof of Knowledge Method

enumerator **DPP_BOOTSTRAP_NFC_URI**

NFC URI record Method

enum **esp_supp_dpp_event_t**

Types of Callback Events received from DPP Supplicant.

Values:

enumerator **ESP_SUPP_DPP_URI_READY**

URI is ready through Bootstrapping

enumerator **ESP_SUPP_DPP_CFG_RECVD**

Config received via DPP Authentication

enumerator **ESP_SUPP_DPP_FAIL**

DPP Authentication failure

Wi-Fi Aware™ (NAN)

Wi-Fi Aware™ or NAN (Neighbor Awareness Networking) is a protocol that allows Wi-Fi devices to discover services in their proximity. Typically, location-based services are based on querying servers for information about the environment and the location knowledge is based on GPS or other location reckoning techniques. However NAN does not require real-time connection to servers, GPS or other geo-location, but instead uses direct device-to-device Wi-Fi to discover and exchange information. NAN scales effectively in dense Wi-Fi environments and complements the connectivity of Wi-Fi by providing information about people and services in the proximity.

Multiple NAN devices which are in the vicinity will form a NAN cluster which allows them to communicate with each other. Devices within a NAN cluster can advertise (Publish method) or look for (Subscribe method) services using NAN Service Discovery protocols. Matching of services is done by service name, once a match is found a device can either send a message or establish an IPv6 datapath with the peer.

ESP32-C3 supports Wi-Fi Aware in standalone mode with support for both Service Discovery and Datapath. Wi-Fi Aware is still an evolving protocol. Please refer to Wi-Fi Alliance's official page on Wi-Fi Aware for more information. Many Android smartphones with Android 8 or higher support Wi-Fi Aware. Refer to Android's developer guide on Wi-Fi Aware Wi-Fi Aware for more information.

Application Example A pair of examples for a Publisher-Subscriber use case: wifi/wifi_aware/nan_publisher and wifi/wifi_aware/nan_subscriber. A user interactive console example to explore full functionality of Wi-Fi Aware: wifi/wifi_aware/nan_console. Please check the *README* for more details in respective example directories.

API Reference

Header File

- components/esp_wifi/wifi_apps/include/esp_nan.h

Functions

esp_err_t **esp_wifi_nan_start**(const *wifi_nan_config_t* *nan_cfg)

Start NAN Discovery with provided configuration.

Attention This API should be called after esp_wifi_init().

参数 **nan_cfg** –NAN related parameters to be configured.

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_nan_stop**(void)

Stop NAN Discovery, end NAN Services and Datapaths.

返回

- ESP_OK: succeed
- others: failed

uint8_t **esp_wifi_nan_publish_service**(const *wifi_nan_publish_cfg_t* *publish_cfg, bool ndp_resp_needed)

Start Publishing a service to the NAN Peers in vicinity.

Attention This API should be called after esp_wifi_nan_start().

参数

- **publish_cfg** –Configuration parameters for publishing a service.
- **ndp_resp_needed** –Setting this true will require user response for every NDP Req using esp_wifi_nan_datapath_resp API.

返回

- non-zero: Publish service identifier
- zero: failed

uint8_t **esp_wifi_nan_subscribe_service**(const *wifi_nan_subscribe_cfg_t* *subscribe_cfg)

Subscribe for a service within the NAN cluster.

Attention This API should be called after esp_wifi_nan_start().

参数 **subscribe_cfg** –Configuration parameters for subscribing for a service.

返回

- non-zero: Subscribe service identifier
- zero: failed

esp_err_t **esp_wifi_nan_send_message**(*wifi_nan_followup_params_t* *fup_params)

Send a follow-up message to the NAN Peer with matched service.

Attention This API should be called after a NAN service is discovered due to a match.

参数 **fup_params** –Configuration parameters for sending a Follow-up message.

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_nan_cancel_service**(uint8_t service_id)

Cancel a NAN service.

参数 **service_id** –Publish/Subscribe service id to be cancelled.

返回

- ESP_OK: succeed
- others: failed

uint8_t **esp_wifi_nan_datapath_req**(*wifi_nan_datapath_req_t* *req)

Send NAN Datapath Request to a NAN Publisher with matched service.

Attention This API should be called by the Subscriber after a match occurs with a Publisher.

参数 **req** –NAN Datapath Request parameters.

返回

- non-zero NAN Datapath identifier: If NAN datapath req was accepted by publisher
- zero: If NAN datapath req was rejected by publisher or a timeout occurs

esp_err_t **esp_wifi_nan_datapath_resp**(*wifi_nan_datapath_resp_t* *resp)

Respond to a NAN Datapath request with Accept or Reject.

Attention This API should be called if ndp_auto_accept is not set True by the Publisher and a WIFI_EVENT_NDP_INDICATION event is received due to an incoming NDP request.

参数 **resp** –NAN Datapath Response parameters.

返回

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_nan_datapath_end**(*wifi_nan_datapath_end_req_t* *req)

Terminate a NAN Datapath.

参数 **req** –NAN Datapath end request parameters.

返回

- ESP_OK: succeed
- others: failed

void **esp_wifi_nan_get_ipv6_linklocal_from_mac**(ip6_addr_t *ip6, uint8_t *mac_addr)

Get IPv6 Link Local address using MAC address.

参数

- **ip6** –**[out]** Derived IPv6 Link Local address.
- **mac_addr** –**[in]** Input MAC Address.

esp_err_t **esp_wifi_nan_get_own_svc_info**(uint8_t *own_svc_id, char *svc_name, int *num_peer_records)

brief Get own Service information from Service ID OR Name.

参数

- **own_svc_id** –**[inout]** As input, it indicates Service ID to search for. As output, it indicates Service ID of the service found using Service Name.
- **svc_name** –**[inout]** As input, it indicates Service Name to search for. As output, it indicates Service Name of the service found using Service ID.
- **num_peer_records** –**[out]** Number of peers discovered by corresponding service.

返回

- ESP_OK: succeed
- ESP_FAIL: failed

esp_err_t **esp_wifi_nan_get_peer_records**(int *num_peer_records, uint8_t own_svc_id, struct *nan_peer_record* *peer_record)

brief Get a list of Peers discovered by the given Service.

参数

- **num_peer_records** –**[inout]** As input param, it stores max peers peer_record can hold. As output param, it specifies the actual number of peers this API returns.
- **own_svc_id** –Service ID of own service.
- **peer_record** –**[out]** Pointer to first peer record.

返回

- ESP_OK: succeed
- ESP_FAIL: failed

esp_err_t **esp_wifi_nan_get_peer_info**(char *svc_name, uint8_t *peer_mac, struct *nan_peer_record* *peer_info)

brief Find Peer’s Service information using Peer MAC and optionally Service Name.

参数

- **svc_name** –Service Name of the published/subscribed service.
- **peer_mac** –Peer’s NAN Management Interface MAC address.
- **peer_info** –**[out]** Peer’s service information structure.

返回

- ESP_OK: succeed
- ESP_FAIL: failed

Structures

struct **nan_peer_record**

Parameters of a peer service record

Public Members

uint8_t **peer_svc_id**

Identifier of Peer’s service

uint8_t **own_svc_id**

Identifier of own service associated with Peer

uint8_t **peer_nmi**[6]

Peer’s NAN Management Interface address

uint8_t **peer_svc_type**

Peer’s service type (Publish/Subscribe)

uint8_t **ndp_id**

Specifies if the peer has any active datapath

uint8_t **peer_ndi**[6]

Peer’s NAN Data Interface address, only valid when ndp_id is non-zero

Macros

WIFI_NAN_CONFIG_DEFAULT()

NDP_STATUS_ACCEPTED

NDP_STATUS_REJECTED

NAN_MAX_PEERS_RECORD

ESP_NAN_PUBLISH

ESP_NAN_SUBSCRIBE

本部分的 Wi-Fi API 示例代码存放在 ESP-IDF 示例项目的 wifi 目录下。

ESP-WIFI-MESH 的示例代码存放在 ESP-IDF 示例项目的 mesh 目录下。

2.5.2 以太网

以太网

概述 ESP-IDF 提供一系列功能强大且兼具一致性的 API，为内部以太网 MAC (EMAC) 控制器和外部 SPI-Ethernet 模块提供支持。

本编程指南分为以下几个部分：

1. 以太网基本概念
2. 配置 *MAC* 和 *PHY*
3. 连接驱动程序至 *TCP/IP* 协议栈
4. 以太网驱动程序的杂项控制

以太网基本概念 以太网是一种异步的带冲突检测的载波侦听多路访问 (CSMA/CD) 协议/接口。通常来说，以太网不太适用于低功率应用。然而，得益于其广泛的部署、高效的网络连接、高数据率以及范围不限的可扩展性，几乎所有的有线通信都可以通过以太网进行。

符合 IEEE 802.3 标准的正常以太网帧的长度在 64 至 1518 字节之间，由五个或六个不同的字段组成：目的地 MAC 地址 (DA)、源 MAC 地址 (SA)、类型/长度字段、数据有效载荷字段、可选的填充字段和帧校验序列字段 (CRC)。此外，在以太网上传输时，以太网数据包的开头需附加 7 字节的前导码和 1 字节的帧起始符 (SOF)。

因此，双绞线上的通信如图所示：

前导码和帧起始符 前导码包含 7 字节的 `55H`，作用是使接收器在实际帧到达之前锁定数据流。

帧前界定符 (SFD) 为二进制序列 `10101011` （物理介质层可见）。有时它也被视作前导码的一部分。

在传输和接收数据时，协议将自动从数据包中生成/移除前导码和帧起始符。

目的地址 (DA) 目的地址字段包含一个 6 字节长的设备 MAC 地址，数据包将发送到该地址。如果 MAC 地址第一个字节中的最低有效位是 1，则该地址为组播地址。例如，01-00-00-F0-00 和 33-45-67-89-AB-CD 是组播地址，而 00-00-00-F0-00 和 32-45-67-89-AB-CD 不是。

带有组播地址的数据包将到达选定的一组以太网节点，并发挥重要作用。如果目的地址字段是保留的多播地址，即 FF-FF-FF-FF-FF-FF，则该数据包是一个广播数据包，指向共享网络中的每个对象。如果 MAC 地址的第一个字节中的最低有效位为 0，则该地址为单播地址，仅供寻址节点使用。

通常，EMAC 控制器会集成接收过滤器，用于丢弃或接收带有组播、广播和/或单播目的地址的数据包。传输数据包时，由主机控制器将所需的目标地址写入传输缓冲区。

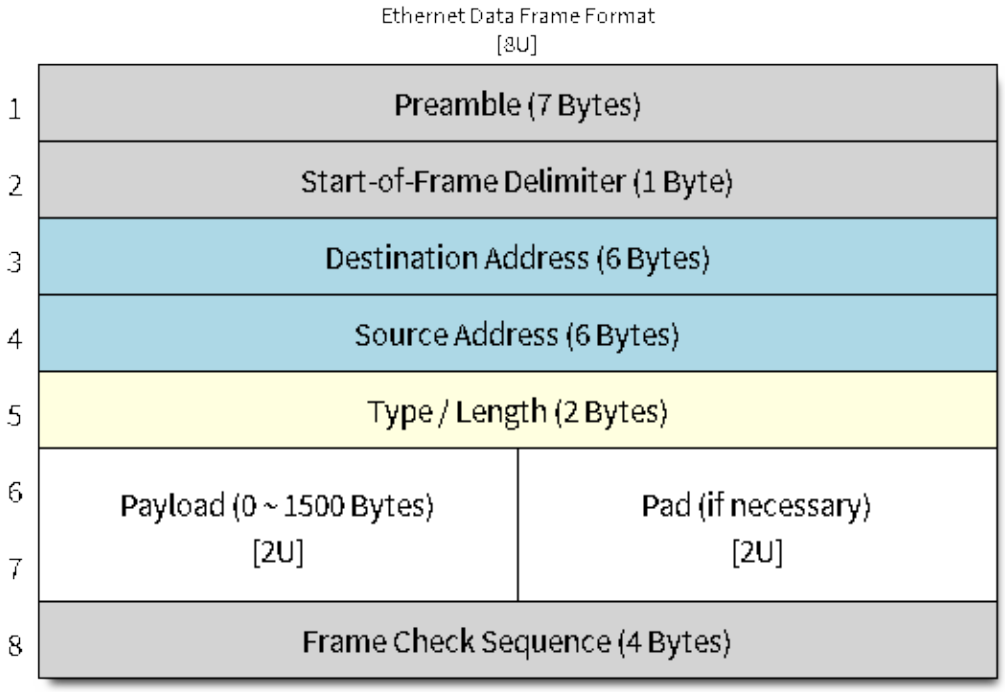

图 4: 以太网数据帧格式

源地址 (SA) 源地址字段包含一个 6 字节长的节点 MAC 地址，以太网数据包通过该节点创建。以太网的用户需为所使用的任意控制器生成唯一的 MAC 地址。MAC 地址由两部分组成：前三个字节称为组织唯一标识符 (OUI)，由 IEEE 分配；后三个字节是地址字节，由购买 OUI 的公司配置。有关 ESP-IDF 中使用的 MAC 地址的详细信息，请参见*MAC 地址分配*。

传输数据包时，由主机控制器将分配的源 MAC 地址写入传输缓冲区。

类型/长度 类型/长度字段长度为 2 字节。如果其值 <= 1500（十进制），则该字段为长度字段，指定在数据字段后的非填充数据量；如果其值 >= 1536，则该字段值表示后续数据包所属的协议。以下为该字段的常见值：

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

使用专有网络的用户可以将此字段配置为长度字段。然而，对于使用互联网协议 (IP) 或地址解析协议 (ARP) 等协议的应用程序，在传输数据包时，应将此字段配置为协议规范定义的适当类型。

数据有效载荷 数据有效载荷字段是一个可变长度的字段，长度从 0 到 1500 字节不等。更大的数据包会因违反以太网标准而被大多数以太网节点丢弃。

数据有效载荷字段包含客户端数据，如 IP 数据报。

填充及帧校验序列 (FCS) 填充字段是一个可变长度的字段。数据有效载荷较小时，将添加填充字段以满足 IEEE 802.3 规范的要求。

以太网数据包的 DA、SA、类型、数据有效载荷和填充字段共计必须不小于 60 字节。加上所需的 4 字节 FCS 字段，数据包的长度必须不小于 64 字节。如果数据有效载荷字段小于 46 字节，则需要加上一个填充字段。

帧校验序列字段 (FCS) 长度为 4 字节，其中包含一个行业标准的 32 位 CRC，该 CRC 是根据 DA、SA、类型、数据有效载荷和填充字段的数据计算的。鉴于计算 CRC 的复杂性，硬件通常会自动生成一个有效的 CRC 进行传输。否则，需由主机控制器生成 CRC 并将其写入传输缓冲区。

通常情况下，主机控制器无需关注填充字段和 CRC 字段，因为这两部分可以在传输或接收时由硬件 EMAC 自动生成或验证。然而，当数据包到达时，填充字段和 CRC 字段将被写入接收缓冲区。因此，如果需要的话，主机控制器也可以对它们进行评估。

备注： 除了上述的基本数据帧，在 10/100 Mbps 以太网中还有两种常见的帧类型：控制帧和 VLAN 标记帧。ESP-IDF 不支持这两种帧类型。

配置 MAC 和 PHY 以太网驱动器由两部分组成：MAC 和 PHY。

根据您的以太网板设计，需要分别为 MAC 和 PHY 配置必要的参数，通过两者完成驱动程序的安装。

MAC 的相关配置可以在*eth_mac_config_t* 中找到，具体包括：

- *eth_mac_config_t::sw_reset_timeout_ms*：软件复位超时值，单位为毫秒。通常，MAC 复位应在 100 ms 内完成。
- *eth_mac_config_t::rx_task_stack_size* 和*eth_mac_config_t::rx_task_prio*：MAC 驱动会创建一个专门的任务来处理传入的数据包，这两个参数用于设置该任务的堆栈大小和优先级。
- *eth_mac_config_t::flags*：指定 MAC 驱动应支持的额外功能，尤其适用于某些特殊情况。这个字段的值支持与以 ETH_MAC_FLAG_ 为前缀的宏进行 OR 运算。例如，如果 MAC 驱动应在禁用缓存后开始工作，那么则需要用*ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE* 配置这个字段。

MAC 的相关配置可以在*eth_phy_config_t* 中找到，具体包括：

- *eth_phy_config_t::phy_addr*：同一条 SMI 总线上可以存在多个 PHY 设备，所以有必要为各个 PHY 设备分配唯一地址。通常，这个地址是在硬件设计期间，通过拉高/拉低一些 PHY strapping 管脚来配置的。根据不同的以太网开发板，可配置值为 0 到 15。需注意，如果 SMI 总线上仅有一个 PHY 设备，将该值配置为 -1，即可使驱动程序自动检测 PHY 地址。
- *eth_phy_config_t::reset_timeout_ms*：复位超时值，单位为毫秒。通常，PHY 复位应在 100 ms 内完成。
- *eth_phy_config_t::autonego_timeout_ms*：自动协商超时值，单位为毫秒。以太网驱动程序会自动与对等的以太网节点进行协商，以确定双工和速度模式。此值通常取决于您电路板上 PHY 设备的性能。
- *eth_phy_config_t::reset_gpio_num*：如果您的开发板同时将 PHY 复位管脚连接至了任意 GPIO 管脚，请使用该字段进行配置。否则，配置为 -1。

ESP-IDF 在宏*ETH_MAC_DEFAULT_CONFIG* 和*ETH_PHY_DEFAULT_CONFIG* 中为 MAC 和 PHY 提供了默认配置。

创建 MAC 和 PHY 实例 以太网驱动是以面向对象的方式实现的。对 MAC 和 PHY 的任何操作都应基于实例。

SPI-Ethernet 模块

```
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG();         // 应用默认的通用 MAC␣
↪配置
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG();         // 应用默认的 PHY 配置
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR;              // 根据开发板设计更改␣
↪PHY 地址
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // 更改用于 PHY␣
↪复位的 GPIO
```

(下页继续)

(续上页)

```
// 安装 GPIO 中断服务（因为 SPI-Ethernet 模块为中断驱动）
gpio_install_isr_service(0);
// 配置 SPI 总线
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// 配置 SPI 从机设备
spi_device_interface_config_t spi_devcfg = {
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_
↪SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);
```

备注:

- 当为 SPI-Ethernet 模块（例如 DM9051）创建 MAC 和 PHY 实例时，由于 PHY 是集成在模块中的，因此调用的实例创建函数的后缀须保持一致（例如 *esp_eth_mac_new_dm9051* 和 *esp_eth_phy_new_dm9051* 搭配使用）。
- 针对不同的以太网模块，或是为了满足特定 PCB 上的 SPI 时序，SPI 从机设备配置（即 *spi_device_interface_config_t*）可能略有不同。具体配置请查看模块规格以及 ESP-IDF 中的示例。

安装驱动程序 安装以太网驱动程序需要结合 MAC 和 PHY 实例，并在*esp_eth_config_t* 中配置一些额外的高级选项（即不仅限于 MAC 或 PHY 的选项）：

- *esp_eth_config_t::mac*：由 MAC 生成器创建的实例（例如 esp_eth_mac_new_esp32()）。
- *esp_eth_config_t::phy*：由 PHY 生成器创建的实例（例如*esp_eth_phy_new_ip101()*）。
- *esp_eth_config_t::check_link_period_ms*：以太网驱动程序会启用操作系统定时器来定期检查链接状态。该字段用于设置间隔时间，单位为毫秒。
- *esp_eth_config_t::stack_input*：在大多数的以太网物联网应用中，驱动器接收的以太网帧会被传递到上层（如 TCP/IP 栈）。经配置，该字段为负责处理传入帧的函数。您可以在安装驱动程序后，通过函数*esp_eth_update_input_path()* 更新该字段。该字段支持在运行过程中进行更新。
- *esp_eth_config_t::on_lowlevel_init_done* 和*esp_eth_config_t::on_lowlevel_deinit_done*：这两个字段用于指定钩子函数，当去初始化或初始化低级别硬件时，会调用钩子函数。

ESP-IDF 在宏*ETH_DEFAULT_CONFIG* 中为安装驱动程序提供了一个默认配置。

```
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // 应用默认驱动程序配置
esp_eth_handle_t eth_handle = NULL; // 驱动程序安装完毕后，将得到驱动程序的句柄
esp_eth_driver_install(&config, &eth_handle); // 安装驱动程序
```

以太网驱动程序包含事件驱动模型，该模型会向用户空间发送有用及重要的事件。安装以太网驱动程序之前，需要首先初始化事件循环。有关事件驱动编程的更多信息，请参考*ESP Event*.

```
/** 以太网事件的事件处理程序 */
static void eth_event_handler(void *arg, esp_event_base_t event_base,
                              int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* 可从事件数据中获得以太网驱动句柄 */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
    case ETHERNET_EVENT_CONNECTED:
        esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
        ESP_LOGI(TAG, "Ethernet Link Up");
        ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                 mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
↪addr[4], mac_addr[5]);
        break;
    case ETHERNET_EVENT_DISCONNECTED:
        ESP_LOGI(TAG, "Ethernet Link Down");
        break;
    case ETHERNET_EVENT_START:
        ESP_LOGI(TAG, "Ethernet Started");
        break;
    case ETHERNET_EVENT_STOP:
        ESP_LOGI(TAG, "Ethernet Stopped");
        break;
    default:
        break;
    }
}

esp_event_loop_create_default(); // 创建一个在后台运行的默认事件循环
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);␣
↪// 注册以太网事件处理程序（用于在发生 link up/down␣
↪等事件时，处理特定的用户相关内容）
```

启动以太网驱动程序 安装驱动程序后，可以立即启动以太网。

```
esp_eth_start(eth_handle); // 启动以太网驱动程序状态机
```

连接驱动程序至 TCP/IP 协议栈 现在，以太网驱动程序已经完成安装。但对应 OSI（开放式系统互连模型）来看，目前阶段仍然属于第二层（即数据链路层）。这意味着可以检测到 link up/down 事件，获得用户空间的 MAC 地址，但无法获得 IP 地址，当然也无法发送 HTTP 请求。ESP-IDF 中使用的 TCP/IP 协议栈是 LwIP，关于 LwIP 的更多信息，请参考*LwIP*。

要将以太网驱动程序连接至 TCP/IP 协议栈，需要以下三步：

1. 为以太网驱动程序创建网络接口
2. 将网络接口连接到以太网驱动程序
3. 注册 IP 事件处理程序

有关网络接口的更多信息，请参考*Network Interface*。

```
/** IP_EVENT_ETH_GOT_IP 的事件处理程序 */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
                                 int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
```

（下页继续）

(续上页)

```
    ESP_LOGI(TAG, "~~~~~~~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~~~~~~~");
}

esp_netif_init()); // 初始化 TCP/IP 网络接口（在应用程序中应仅调用一次）
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // 应用以太网的默认网络接口配置
esp_netif_t *eth_netif = esp_netif_new(&cfg); // 为以太网驱动程序创建网络接口

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); //␣
↪将以太网驱动程序连接至 TCP/IP 协议栈
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler,␣
↪NULL); // 注册用户定义的 IP 事件处理程序
esp_eth_start(eth_handle); // 启动以太网驱动程序状态机
```

警告： 推荐在完成整个以太网驱动和网络接口的初始化后，再注册用户定义的以太网/IP 事件处理程序，也就是把注册事件处理程序作为启动以太网驱动程序的最后一步。这样可以确保以太网驱动程序或网络接口将首先执行以太网/IP 事件，从而保证在执行用户定义的处理程序时，系统处于预期状态。

以太网驱动程序的杂项控制 以下功能只支持在安装以太网驱动程序后调用。

- 关闭以太网驱动程序：*esp_eth_stop()*
- 更新以太网数据输入路径：*esp_eth_update_input_path()*
- 获取/设置以太网驱动程序杂项内容：*esp_eth_ioctl()*

```
/* 获取 MAC 地址 */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
         mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_
↪addr[5]);

/* 获取 PHY 地址 */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

数据流量控制 受 RAM 大小限制，在网络拥堵时，MCU 上的以太网通常仅能处理有限数量的帧。发送站的数据传输速度可能快于对等端的接收能力。以太网数据流量控制机制允许接收节点向发送方发出信号，要求暂停传输，直到接收方跟上。这项功能是通过暂停帧实现的，该帧定义在 IEEE 802.3x 中。

暂停帧是一种特殊的以太网帧，用于携带暂停命令，其 EtherType 字段为 0x8808，控制操作码为 0x0001。只有配置为全双工操作的节点组可以发送暂停帧。当节点组希望暂停链路的另一端时，它会发送一个暂停帧到 48 位的保留组播地址 01-80-C2-00-00-01。暂停帧中也包括请求暂停的时间段，以两字节的整数形式发送，值的范围从 0 到 65535。

安装以太网驱动程序后，数据流量控制功能默认禁用，可以通过以下方式启用此功能：

```
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

需注意，暂停帧是在自动协商期间由 PHY 向对等端公布的。只有当链路的两边都支持暂停帧时，以太网驱动程序才会发送暂停帧。

应用示例

- 以太网基本示例：ethernet/basic
- 以太网 iperf 示例：ethernet/iperf
- 以太网到 Wi-Fi AP “路由器”：ethernet/eth2ap
- 大多数协议示例也适用于以太网：protocols

进阶操作

自定义 PHY 驱动程序 目前市面上已有多家 PHY 制造商提供了大量的芯片组合。ESP-IDF 现已支持数种 PHY 芯片，但是由于价格、功能、库存等原因，有时用户还是无法找到一款能满足其实际需求的芯片。

好在 IEEE 802.3 在其 22.2.4 管理功能部分对 EMAC 和 PHY 之间的管理接口进行了标准化。该部分定义了所谓的” MII 管理接口” 规范，用于控制 PHY 和收集 PHY 的状态，还定义了一组管理寄存器来控制芯片行为、链接属性、自动协商配置等。在 ESP-IDF 中，这项基本的管理功能是由 esp_eth/src/esp_eth_phy_802_3.c 实现的，这也大大降低了创建新的自定义 PHY 芯片驱动的难度。

备注： 由于一些 PHY 芯片可能不符合 IEEE 802.3 第 22.2.4 节的规定，所以请首先查看 PHY 数据手册。不过，就算芯片不符合规定，您依旧可以创建自定义 PHY 驱动程序，只是由于需要自行定义所有的 PHY 管理功能，这个过程将变得较为复杂。

ESP-IDF 以太网驱动程序所需的大部分 PHY 管理功能都已涵盖在 esp_eth/src/esp_eth_phy_802_3.c 中。不过对于以下几项，可能仍需针对不同芯片开发具体的管理功能：

- 链接状态。此项总是由使用的具体芯片决定
- 芯片初始化。即使不存在严格的限制，也应进行自定义，以确保使用的是符合预期的芯片
- 芯片的具体功能配置

创建自定义 PHY 驱动程序的步骤：

1. 请根据 PHY 数据手册，定义针对供应商的特定注册表布局。示例请参见 esp_eth/src/esp_eth_phy_ip101.c。
2. 准备衍生的 PHY 管理对象信息结构，该结构：
   - 必须至少包含 IEEE 802.3 *phy_802_3_t* 父对象
   - 可选包含支持非 IEEE 802.3 或自定义功能所需的额外变量。示例请参见 esp_eth/src/esp_eth_phy_ksz80xx.c。
3. 定义针对芯片的特定管理回调功能。
4. 初始化 IEEE 802.3 父对象并重新分配针对芯片的特定管理回调功能。

实现新的自定义 PHY 驱动程序后，你可以通过 IDF 组件管理中心 将驱动分享给其他用户。

API 参考

Header File

- components/esp_eth/include/esp_eth.h

Header File

- components/esp_eth/include/esp_eth_driver.h

Functions

esp_err_t **esp_eth_driver_install** (const *esp_eth_config_t* *config, *esp_eth_handle_t* *out_hdl)

Install Ethernet driver.

参数

- **config** –**[in]** configuration of the Ethernet driver

- **out_hdl** –**[out]** handle of Ethernet driver

返回

- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there's no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_driver_uninstall**(*esp_eth_handle_t* hdl)

Uninstall Ethernet driver.

备注: It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

参数 **hdl** –**[in]** handle of Ethernet driver

返回

- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_start**(*esp_eth_handle_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

备注: This API will start driver state machine and internal software timer (for checking link status).

参数 **hdl** –**[in]** handle of Ethernet driver

返回

- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_stop**(*esp_eth_handle_t* hdl)

Stop Ethernet driver.

备注: This function does the oppsite operation of `esp_eth_start`.

参数 **hdl** –**[in]** handle of Ethernet driver

返回

- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_update_input_path**(*esp_eth_handle_t* hdl, *esp_err_t* (*stack_input)(*esp_eth_handle_t* hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)

Update Ethernet data input path (i.e. specify where to pass the input buffer)

备注： After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

参数

- **hdl** –**[in]** handle of Ethernet driver
- **stack_input** –**[in]** function pointer, which does the actual process on incoming packets
- **priv** –**[in]** private resource, which gets passed to `stack_input` callback without any modification

返回

- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

esp_err_t **esp_eth_transmit**(*esp_eth_handle_t* hdl, void *buf, size_t length)

General Transmit.

参数

- **hdl** –**[in]** handle of Ethernet driver
- **buf** –**[in]** buffer of the packet to transfer
- **length** –**[in]** length of the buffer to transfer

返回

- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_STATE: invalid driver state (e.i. driver is not started)
- ESP_ERR_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP_FAIL: transmit frame buffer failed because some other error occurred

esp_err_t **esp_eth_transmit_vargs**(*esp_eth_handle_t* hdl, uint32_t argc, ...)

Special Transmit with variable number of arguments.

参数

- **hdl** –**[in]** handle of Ethernet driver
- **argc** –**[in]** number variable arguments
- **...** –variable arguments

返回

- ESP_OK: transmit successfull
- ESP_ERR_INVALID_STATE: invalid driver state (e.i. driver is not started)
- ESP_ERR_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP_FAIL: transmit frame buffer failed because some other error occurred

esp_err_t **esp_eth_ioctl**(*esp_eth_handle_t* hdl, *esp_eth_io_cmd_t* cmd, void *data)

Misc IO function of Etherent driver.

The following common IO control commands are supported:

- `ETH_CMD_S_MAC_ADDR` sets Ethernet interface MAC address. `data` argument is pointer to MAC address buffer with expected size of 6 bytes.
- `ETH_CMD_G_MAC_ADDR` gets Ethernet interface MAC address. `data` argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- `ETH_CMD_S_PHY_ADDR` sets PHY address in range of <0-31>. `data` argument is pointer to memory of uint32_t datatype from where the configuration option is read.
- `ETH_CMD_G_PHY_ADDR` gets PHY address. `data` argument is pointer to memory of uint32_t datatype to which the PHY address is to be stored.

- ETH_CMD_S_AUTONEGO enables or disables Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- ETH_CMD_G_AUTONEGO gets current configuration of the Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype to which the current configuration is to be stored.
- ETH_CMD_S_SPEED sets the Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- ETH_CMD_G_SPEED gets current Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.
- ETH_CMD_S_PROMISCUOUS sets/resets Ethernet interface promiscuous mode. data argument is pointer to memory of bool datatype from which the configuration option is read.
- ETH_CMD_S_FLOW_CTRL sets/resets Ethernet interface flow control. data argument is pointer to memory of bool datatype from which the configuration option is read.
- ETH_CMD_S_DUPLEX_MODE sets the Ethernet duplex mode. data argument is pointer to memory of eth_duplex_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- ETH_CMD_G_DUPLEX_MODE gets current Ethernet link duplex mode. data argument is pointer to memory of eth_duplex_t datatype to which the duplex mode is to be stored.
- ETH_CMD_S_PHY_LOOPBACK sets/resets PHY to/from loopback mode. data argument is pointer to memory of bool datatype from which the configuration option is read.
- Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

参数

- **hdl** –**[in]** handle of Ethernet driver
- **cmd** –**[in]** IO control command
- **data** –**[inout]** address of data for set command or address where to store the data when used with get command

返回

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

esp_err_t **esp_eth_increase_reference**(*esp_eth_handle_t* hdl)

Increase Ethernet driver reference.

备注： Ethernet driver handle can be obtained by os timer, netif, etc. It's dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

参数 **hdl** –**[in]** handle of Ethernet driver

返回

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

esp_err_t **esp_eth_decrease_reference**(*esp_eth_handle_t* hdl)

Decrease Ethernet driver reference.

参数 **hdl** –**[in]** handle of Ethernet driver

返回

- ESP_OK: increase reference successfully

- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Structures

struct **esp_eth_config_t**

Configuration of Ethernet driver.

Public Members

esp_eth_mac_t ***mac**

Ethernet MAC object.

esp_eth_phy_t ***phy**

Ethernet PHY object.

uint32_t **check_link_period_ms**

Period time of checking Ethernet link status.

esp_err_t (***stack_input**)(*esp_eth_handle_t* eth_handle, uint8_t *buffer, uint32_t length, void *priv)

Input frame buffer to user’ s stack.

Param eth_handle [in] handle of Ethernet driver
Param buffer [in] frame buffer that will get input to upper stack
Param length [in] length of the frame buffer
Return
- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack

esp_err_t (***on_lowlevel_init_done**)(*esp_eth_handle_t* eth_handle)

Callback function invoked when lowlevel initialization is finished.

Param eth_handle [in] handle of Ethernet driver
Return
- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

esp_err_t (***on_lowlevel_deinit_done**)(*esp_eth_handle_t* eth_handle)

Callback function invoked when lowlevel deinitialization is finished.

Param eth_handle [in] handle of Ethernet driver
Return
- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

esp_err_t (***read_phy_reg**)(*esp_eth_handle_t* eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

备注: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’ s SMI interface.

Param eth_handle [in] handle of Ethernet driver

Param phy_addr **[in]** PHY chip address (0~31)
Param phy_reg **[in]** PHY register index code
Param reg_value **[out]** PHY register value
Return
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

esp_err_t (***write_phy_reg**)(*esp_eth_handle_t* eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

备注: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC' s SMI interface.

Param eth_handle **[in]** handle of Ethernet driver
Param phy_addr **[in]** PHY chip address (0~31)
Param phy_reg **[in]** PHY register index code
Param reg_value **[in]** PHY register value
Return
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

Macros

ETH_DEFAULT_CONFIG(emac, ephy)

Default configuration for Ethernet driver.

Type Definitions

typedef void ***esp_eth_handle_t**

Handle of Ethernet driver.

Enumerations

enum **esp_eth_io_cmd_t**

Command list for ioctl API.

Values:

enumerator **ETH_CMD_G_MAC_ADDR**

Get MAC address

enumerator **ETH_CMD_S_MAC_ADDR**

Set MAC address

enumerator **ETH_CMD_G_PHY_ADDR**

Get PHY address

enumerator **ETH_CMD_S_PHY_ADDR**

Set PHY address

enumerator **ETH_CMD_G_AUTONEGO**

Get PHY Auto Negotiation

enumerator **ETH_CMD_S_AUTONEGO**

Set PHY Auto Negotiation

enumerator **ETH_CMD_G_SPEED**

Get Speed

enumerator **ETH_CMD_S_SPEED**

Set Speed

enumerator **ETH_CMD_S_PROMISCUOUS**

Set promiscuous mode

enumerator **ETH_CMD_S_FLOW_CTRL**

Set flow control

enumerator **ETH_CMD_G_DUPLEX_MODE**

Get Duplex mode

enumerator **ETH_CMD_S_DUPLEX_MODE**

Set Duplex mode

enumerator **ETH_CMD_S_PHY_LOOPBACK**

Set PHY loopback

enumerator **ETH_CMD_CUSTOM_MAC_CMDS**

enumerator **ETH_CMD_CUSTOM_PHY_CMDS**

Header File

- components/esp_eth/include/esp_eth_com.h

Structures

struct **esp_eth_mediator_s**

Ethernet mediator.

Public Members

esp_err_t (***phy_reg_read**)(*esp_eth_mediator_t* *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Param eth **[in]** mediator of Ethernet driver
Param phy_addr **[in]** PHY Chip address (0~31)
Param phy_reg **[in]** PHY register index code
Param reg_value **[out]** PHY register value
Return
- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

esp_err_t (***phy_reg_write**)(*esp_eth_mediator_t* *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Param eth **[in]** mediator of Ethernet driver
Param phy_addr **[in]** PHY Chip address (0~31)
Param phy_reg **[in]** PHY register index code
Param reg_value **[in]** PHY register value
Return
- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

esp_err_t (***stack_input**)(*esp_eth_mediator_t* *eth, uint8_t *buffer, uint32_t length)

Deliver packet to upper stack.

Param eth **[in]** mediator of Ethernet driver
Param buffer **[in]** packet buffer
Param length **[in]** length of the packet
Return
- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

esp_err_t (***on_state_changed**)(*esp_eth_mediator_t* *eth, *esp_eth_state_t* state, void *args)

Callback on Ethernet state changed.

Param eth **[in]** mediator of Ethernet driver
Param state **[in]** new state
Param args **[in]** optional argument for the new state
Return
- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

Type Definitions

typedef struct *esp_eth_mediator_s* **esp_eth_mediator_t**

Ethernet mediator.

Enumerations

enum **esp_eth_state_t**

Ethernet driver state.

Values:

enumerator **ETH_STATE_LLINIT**

Lowlevel init done

enumerator **ETH_STATE_DEINIT**

Deinit done

enumerator **ETH_STATE_LINK**

Link status changed

enumerator **ETH_STATE_SPEED**

Speed updated

enumerator **ETH_STATE_DUPLEX**

Duplex updated

enumerator **ETH_STATE_PAUSE**

Pause ability updated

enum **eth_event_t**

Ethernet event declarations.

Values:

enumerator **ETHERNET_EVENT_START**

Ethernet driver start

enumerator **ETHERNET_EVENT_STOP**

Ethernet driver stop

enumerator **ETHERNET_EVENT_CONNECTED**

Ethernet got a valid link

enumerator **ETHERNET_EVENT_DISCONNECTED**

Ethernet lost a valid link

Header File

- components/esp_eth/include/esp_eth_mac.h

Unions

union **eth_mac_clock_config_t**

#include <esp_eth_mac.h> Ethernet MAC Clock Configuration.

Public Members

struct *eth_mac_clock_config_t*::[anonymous] **mii**

EMAC MII Clock Configuration

emac_rmii_clock_mode_t **clock_mode**

RMII Clock Mode Configuration

emac_rmii_clock_gpio_t **clock_gpio**

RMII Clock GPIO Configuration

struct *eth_mac_clock_config_t*::[anonymous] **rmii**

EMAC RMII Clock Configuration

Structures

struct **esp_eth_mac_s**

Ethernet MAC.

Public Members

esp_err_t (***set_mediator**)(*esp_eth_mac_t* *mac, *esp_eth_mediator_t* *eth)

Set mediator for Ethernet MAC.

Param mac **[in]** Ethernet MAC instance
Param eth **[in]** Ethernet mediator
Return

- ESP_OK: set mediator for Ethernet MAC successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

esp_err_t (***init**)(*esp_eth_mac_t* *mac)

Initialize Ethernet MAC.

Param mac **[in]** Ethernet MAC instance
Return

- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

esp_err_t (***deinit**)(*esp_eth_mac_t* *mac)

Deinitialize Ethernet MAC.

Param mac **[in]** Ethernet MAC instance
Return

- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

esp_err_t (***start**)(*esp_eth_mac_t* *mac)

Start Ethernet MAC.

Param mac **[in]** Ethernet MAC instance
Return

- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

esp_err_t (***stop**)(*esp_eth_mac_t* *mac)

Stop Ethernet MAC.

Param mac **[in]** Ethernet MAC instance
Return

- ESP_OK: stop Ethernet MAC successfully

- ESP_FAIL: stop Ethernet MAC failed because some error occurred

esp_err_t (*`transmit`)(*esp_eth_mac_t* *mac, uint8_t *buf, uint32_t length)

Transmit packet from Ethernet MAC.

备注： Returned error codes may differ for each specific MAC chip.

Param mac [in] Ethernet MAC instance
Param buf [in] packet buffer to transmit
Param length [in] length of packet
Return

- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
- ESP_FAIL: transmit packet failed because some other error occurred

esp_err_t (*`transmit_vargs`)(*esp_eth_mac_t* *mac, uint32_t argc, va_list args)

Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

备注： Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

备注： Returned error codes may differ for each specific MAC chip.

Param mac [in] Ethernet MAC instance
Param argc [in] number variable arguments
Param args [in] variable arguments
Return

- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
- ESP_FAIL: transmit packet failed because some other error occurred

esp_err_t (*`receive`)(*esp_eth_mac_t* *mac, uint8_t *buf, uint32_t *length)

Receive packet from Ethernet MAC.

备注： Memory of buf is allocated in the Layer2, make sure it get free after process.

备注： Before this function got invoked, the value of "length" should set by user, equals the size of buffer. After the function returned, the value of "length" means the real length of received data.

Param mac [in] Ethernet MAC instance
Param buf [out] packet buffer which will preserve the received frame
Param length [out] length of the received packet
Return

- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned "length" indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred

esp_err_t (*`read_phy_reg`)(*esp_eth_mac_t* *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Param mac **[in]** Ethernet MAC instance
Param phy_addr **[in]** PHY chip address (0~31)
Param phy_reg **[in]** PHY register index code
Param reg_value **[out]** PHY register value
Return

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

esp_err_t (*`write_phy_reg`)(*esp_eth_mac_t* *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Param mac **[in]** Ethernet MAC instance
Param phy_addr **[in]** PHY chip address (0~31)
Param phy_reg **[in]** PHY register index code
Param reg_value **[in]** PHY register value
Return

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

esp_err_t (*`set_addr`)(*esp_eth_mac_t* *mac, uint8_t *addr)

Set MAC address.

Param mac **[in]** Ethernet MAC instance
Param addr **[in]** MAC address
Return

- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

esp_err_t (*`get_addr`)(*esp_eth_mac_t* *mac, uint8_t *addr)

Get MAC address.

Param mac **[in]** Ethernet MAC instance
Param addr **[out]** MAC address
Return

- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

esp_err_t (*`set_speed`)(*esp_eth_mac_t* *mac, eth_speed_t speed)

Set speed of MAC.

Param ma:c **[in]** Ethernet MAC instance
Param speed **[in]** MAC speed
Return

- ESP_OK: set MAC speed successfully

- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

esp_err_t (*`set_duplex`)(*esp_eth_mac_t* *mac, eth_duplex_t duplex)

Set duplex mode of MAC.

Param mac [in] Ethernet MAC instance
Param duplex [in] MAC duplex
Return
- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

esp_err_t (*`set_link`)(*esp_eth_mac_t* *mac, eth_link_t link)

Set link status of MAC.

Param mac [in] Ethernet MAC instance
Param link [in] Link status
Return
- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

esp_err_t (*`set_promiscuous`)(*esp_eth_mac_t* *mac, bool enable)

Set promiscuous of MAC.

Param mac [in] Ethernet MAC instance
Param enable [in] set true to enable promiscuous mode; set false to disable promiscuous mode
Return
- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

esp_err_t (*`enable_flow_ctrl`)(*esp_eth_mac_t* *mac, bool enable)

Enable flow control on MAC layer or not.

Param mac [in] Ethernet MAC instance
Param enable [in] set true to enable flow control; set false to disable flow control
Return
- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

esp_err_t (*`set_peer_pause_ability`)(*esp_eth_mac_t* *mac, uint32_t ability)

Set the PAUSE ability of peer node.

Param mac [in] Ethernet MAC instance
Param ability [in] zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner
Return
- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

esp_err_t (*`custom_ioctl`)(*esp_eth_mac_t* *mac, uint32_t cmd, void *data)

Custom IO function of MAC driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of MAC chip.

备注: This function may not be assigned when the MAC chip supports only most common set of

configuration options.

Param mac **[in]** Ethernet MAC instance
Param cmd **[in]** IO control command
Param data **[inout]** address of data for `set` command or address where to store the data when used with `get` command
Return
- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

esp_err_t (*`del`)(*esp_eth_mac_t* *mac)

Free memory of Ethernet MAC.

Param mac **[in]** Ethernet MAC instance
Return
- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

struct **`eth_mac_config_t`**

Configuration of Ethernet MAC object.

Public Members

uint32_t **`sw_reset_timeout_ms`**

Software reset timeout value (Unit: ms)

uint32_t **`rx_task_stack_size`**

Stack size of the receive task

uint32_t **`rx_task_prio`**

Priority of the receive task

uint32_t **`flags`**

Flags that specify extra capability for mac driver

Macros

`ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`

MAC driver can work when cache is disabled

`ETH_MAC_FLAG_PIN_TO_CORE`

Pin MAC task to the CPU core where driver installation happened

`ETH_MAC_DEFAULT_CONFIG`()

Default configuration for Ethernet MAC object.

Type Definitions

typedef struct *esp_eth_mac_s* **`esp_eth_mac_t`**

Ethernet MAC.

Enumerations

enum **emac_rmii_clock_mode_t**

RMII Clock Mode Options.

Values:

enumerator **EMAC_CLK_DEFAULT**

Default values configured using Kconfig are going to be used when "Default" selected.

enumerator **EMAC_CLK_EXT_IN**

Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

备注: MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

---

enumerator **EMAC_CLK_OUT**

Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum **emac_rmii_clock_gpio_t**

RMII Clock GPIO number Options.

Values:

enumerator **EMAC_CLK_IN_GPIO**

MAC will get RMII clock from outside at this GPIO.

备注: ESP32 only supports GPIO0 to input the RMII clock.

---

enumerator **EMAC_APPL_CLK_OUT_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO0.

备注: GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn't have directly relationship with EMAC peripheral. Sometimes this clock won't work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don't select GPIO0 output mode for stability.

---

enumerator **EMAC_CLK_OUT_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC_CLK_OUT_180_GPIO**

Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

Header File

- components/esp_eth/include/esp_eth_phy.h

Functions

esp_eth_phy_t ***esp_eth_phy_new_ip101** (const *eth_phy_config_t* *config)

Create a PHY instance of IP101.

参数 **config** –**[in]** configuration of PHY
返回
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_rtl8201** (const *eth_phy_config_t* *config)

Create a PHY instance of RTL8201.

参数 **config** –**[in]** configuration of PHY
返回
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_lan87xx** (const *eth_phy_config_t* *config)

Create a PHY instance of LAN87xx.

参数 **config** –**[in]** configuration of PHY
返回
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_dp83848** (const *eth_phy_config_t* *config)

Create a PHY instance of DP83848.

参数 **config** –**[in]** configuration of PHY
返回
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_ksz80xx** (const *eth_phy_config_t* *config)

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, `NULL` is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

参数 **config** –**[in]** configuration of PHY
返回
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Structures

struct **esp_eth_phy_s**

Ethernet PHY.

Public Members

esp_err_t (***set_mediator**)(*esp_eth_phy_t* *phy, *esp_eth_mediator_t* *mediator)

Set mediator for PHY.

Param phy **[in]** Ethernet PHY instance
Param mediator **[in]** mediator of Ethernet driver
Return
- ESP_OK: set mediator for Ethernet PHY instance successfully

- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

esp_err_t (*`reset`)(*esp_eth_phy_t* *phy)

Software Reset Ethernet PHY.

Param phy **[in]** Ethernet PHY instance
Return
- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

esp_err_t (*`reset_hw`)(*esp_eth_phy_t* *phy)

Hardware Reset Ethernet PHY.

备注： Hardware reset is mostly done by pull down and up PHY’s nRST pin

Param phy **[in]** Ethernet PHY instance
Return
- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

esp_err_t (*`init`)(*esp_eth_phy_t* *phy)

Initialize Ethernet PHY.

Param phy **[in]** Ethernet PHY instance
Return
- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

esp_err_t (*`deinit`)(*esp_eth_phy_t* *phy)

Deinitialize Ethernet PHY.

Param phy **[in]** Ethernet PHY instance
Return
- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

esp_err_t (*`autonego_ctrl`)(*esp_eth_phy_t* *phy, *eth_phy_autoneg_cmd_t* cmd, bool *autonego_en_stat)

Configure auto negotiation.

Param phy **[in]** Ethernet PHY instance
Param cmd **[in]** Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation
Param autonego_en_stat **[out]** Address where to store current status of auto negotiation configuration
Return
- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid command

esp_err_t (*`get_link`)(*esp_eth_phy_t* *phy)

Get Ethernet PHY link status.

Param phy **[in]** Ethernet PHY instance
Return

- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

esp_err_t (*`pwrctl`)(*esp_eth_phy_t* *phy, bool enable)

Power control of Ethernet PHY.

Param phy **[in]** Ethernet PHY instance
Param enable **[in]** set true to power on Ethernet PHY; ser false to power off Ethernet PHY
Return
- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

esp_err_t (*`set_addr`)(*esp_eth_phy_t* *phy, uint32_t addr)

Set PHY chip address.

Param phy **[in]** Ethernet PHY instance
Param addr **[in]** PHY chip address
Return
- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

esp_err_t (*`get_addr`)(*esp_eth_phy_t* *phy, uint32_t *addr)

Get PHY chip address.

Param phy **[in]** Ethernet PHY instance
Param addr **[out]** PHY chip address
Return
- ESP_OK: get Ethernet PHY address successfully
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

esp_err_t (*`advertise_pause_ability`)(*esp_eth_phy_t* *phy, uint32_t ability)

Advertise pause function supported by MAC layer.

Param phy **[in]** Ethernet PHY instance
Param addr **[out]** Pause ability
Return
- ESP_OK: Advertise pause ability successfully
- ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

esp_err_t (*`loopback`)(*esp_eth_phy_t* *phy, bool enable)

Sets the PHY to loopback mode.

Param phy **[in]** Ethernet PHY instance
Param enable **[in]** enables or disables PHY loopback
Return
- ESP_OK: PHY instance loopback mode has been configured successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

esp_err_t (*`set_speed`)(*esp_eth_phy_t* *phy, eth_speed_t speed)

Sets PHY speed mode.

备注: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

---

Param phy **[in]** Ethernet PHY instance

Param speed [in] Speed mode to be set
Return
- ESP_OK: PHY instance speed mode has been configured successfully
- ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

esp_err_t (*`set_duplex`)(*esp_eth_phy_t* *phy, eth_duplex_t duplex)

Sets PHY duplex mode.

备注: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

---

Param phy [in] Ethernet PHY instance
Param duplex [in] Duplex mode to be set
Return
- ESP_OK: PHY instance duplex mode has been configured successfully
- ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

esp_err_t (*`custom_ioctl`)(*esp_eth_phy_t* *phy, uint32_t cmd, void *data)

Custom IO function of PHY driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of PHY chip.

备注: This function may not be assigned when the PHY chip supports only most common set of configuration options.

Param phy [in] Ethernet PHY instance
Param cmd [in] IO control command
Param data [inout] address of data for `set` command or address where to store the data when used with `get` command
Return
- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

esp_err_t (*`del`)(*esp_eth_phy_t* *phy)

Free memory of Ethernet PHY instance.

Param phy [in] Ethernet PHY instance
Return
- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

struct **`eth_phy_config_t`**

Ethernet PHY configuration.

Public Members

int32_t **`phy_addr`**

PHY address, set -1 to enable PHY address detection at initialization stage

uint32_t **reset_timeout_ms**

Reset timeout value (Unit: ms)

uint32_t **autonego_timeout_ms**

Auto-negotiation timeout value (Unit: ms)

int **reset_gpio_num**

Reset GPIO number, -1 means no hardware reset

Macros

ESP_ETH_PHY_ADDR_AUTO

ETH_PHY_DEFAULT_CONFIG()

Default configuration for Ethernet PHY object.

Type Definitions

typedef struct *esp_eth_phy_s* **esp_eth_phy_t**

Ethernet PHY.

Enumerations

enum **eth_phy_autoneg_cmd_t**

Auto-negotiation controll commands.

Values:

enumerator **ESP_ETH_PHY_AUTONEGO_RESTART**

enumerator **ESP_ETH_PHY_AUTONEGO_EN**

enumerator **ESP_ETH_PHY_AUTONEGO_DIS**

enumerator **ESP_ETH_PHY_AUTONEGO_G_STAT**

Header File

- components/esp_eth/include/esp_eth_phy_802_3.h

Functions

esp_err_t **esp_eth_phy_802_3_reset_hw**(*phy_802_3_t* *phy_802_3, uint32_t reset_assert_us)

Performs hardware reset with specific reset pin assertion time.

参数

- **phy_802_3** –IEEE 802.3 PHY object infostructure
- **reset_assert_us** –Hardware reset pin assertion time

返回

- ESP_OK: reset Ethernet PHY successfully

esp_err_t **esp_eth_phy_802_3_detect_phy_addr**(*esp_eth_mediator_t* *eth, int *detected_addr)

Detect PHY address.

参数

- **eth** –Mediator of Ethernet driver
- **detected_addr** –**[out]** a valid address after detection

返回

- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can't detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

esp_err_t **esp_eth_phy_802_3_basic_phy_init**(*phy_802_3_t* *phy_802_3)

Performs basic PHY chip initialization.

备注: It should be called as the first function in PHY specific driver instance

参数 **phy_802_3** –IEEE 802.3 PHY object infostructure

返回

- ESP_OK: initialized Ethernet PHY successfully
- ESP_FAIL: initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: PHY device not detected
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

esp_err_t **esp_eth_phy_802_3_basic_phy_deinit**(*phy_802_3_t* *phy_802_3)

Performs basic PHY chip de-initialization.

备注: It should be called as the last function in PHY specific driver instance

参数 **phy_802_3** –IEEE 802.3 PHY object infostructure

返回

- ESP_OK: de-initialized Ethernet PHY successfully
- ESP_FAIL: de-initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

esp_err_t **esp_eth_phy_802_3_read_oui**(*phy_802_3_t* *phy_802_3, uint32_t *oui)

Reads raw content of OUI field.

参数

- **phy_802_3** –IEEE 802.3 PHY object infostructure
- **oui** –**[out]** OUI value

返回

- ESP_OK: OUI field read successfully
- ESP_FAIL: OUI field read failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid `oui` argument
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

esp_err_t **esp_eth_phy_802_3_read_manufac_info**(*phy_802_3_t* *phy_802_3, uint8_t *model, uint8_t *rev)

Reads manufacturer's model and revision number.

参数

- **phy_802_3** –IEEE 802.3 PHY object infostructure
- **model** –**[out]** Manufacturer’s model number (can be NULL when not required)
- **rev** –**[out]** Manufacturer’s revision number (can be NULL when not required)

返回

- ESP_OK: Manufacturer’s info read successfully
- ESP_FAIL: Manufacturer’s info read failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

phy_802_3_t ***esp_eth_phy_into_phy_802_3**(*esp_eth_phy_t* *phy)

Returns address to parent IEEE 802.3 PHY object infostructure.

参数 **phy** –Ethernet PHY instance

返回 phy_802_3_t*

- address to parent IEEE 802.3 PHY object infostructure

esp_err_t **esp_eth_phy_802_3_obj_config_init**(*phy_802_3_t* *phy_802_3, const *eth_phy_config_t* *config)

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

参数

- **phy_802_3** –Address to IEEE 802.3 PHY object infostructure
- **config** –Configuration of the IEEE 802.3 PHY object

返回

- ESP_OK: configuration initialized successfully
- ESP_ERR_INVALID_ARG: invalid `config` argument

Structures

struct **phy_802_3_t**

IEEE 802.3 PHY object infostructure.

Public Members

esp_eth_phy_t **parent**

Parent Ethernet PHY instance

esp_eth_mediator_t ***eth**

Mediator of Ethernet driver

int **addr**

PHY address

uint32_t **reset_timeout_ms**

Reset timeout value (Unit: ms)

uint32_t **autonego_timeout_ms**

Auto-negotiation timeout value (Unit: ms)

eth_link_t **link_status**

Current Link status

int **reset_gpio_num**

Reset GPIO number, -1 means no hardware reset

Header File

- components/esp_eth/include/esp_eth_netif_glue.h

Functions

esp_eth_netif_glue_handle_t **esp_eth_new_netif_glue**(*esp_eth_handle_t* eth_hdl)

Create a netif glue for Ethernet driver.

备注: netif glue is used to attach io driver to TCP/IP netif

参数 **eth_hdl** –Ethernet driver handle
返回 glue object, which inherits esp_netif_driver_base_t

esp_err_t **esp_eth_del_netif_glue**(*esp_eth_netif_glue_handle_t* eth_netif_glue)

Delete netif glue of Ethernet driver.

参数 **eth_netif_glue** –netif glue
返回 -ESP_OK: delete netif glue successfully

Type Definitions

typedef struct esp_eth_netif_glue_t ***esp_eth_netif_glue_handle_t**

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

本部分的以太网 API 示例代码存放在 ESP-IDF 示例项目的 ethernet 目录下。

2.5.3 Thread

Thread

Introduction Thread is a IP-based mesh networking protocol. It's based on the 802.15.4 physical and MAC layer.

Application Examples The openthread directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell openthread/ot_cli.
- The Thread border router openthread/ot_br.
- The Thread radio co-processor openthread/ot_rcp.

API Reference For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the OpenThread official website.

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

Header File

- components/openthread/include/esp_openthread.h

Functions

esp_err_t **esp_openthread_init**(const *esp_openthread_platform_config_t* *init_config)

Initializes the full OpenThread stack.

备注: The OpenThread instance will also be initialized in this function.

参数 **init_config** –**[in]** The initialization configuration.

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

esp_err_t **esp_openthread_launch_mainloop**(void)

Launches the OpenThread main loop.

备注: Thie function will not return unless error happens when running the OpenThread stack.

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

esp_err_t **esp_openthread_deinit**(void)

This function performs OpenThread stack and platform driver deinitialization.

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

otInstance ***esp_openthread_get_instance**(void)

This function acquires the underlying OpenThread instance.

备注: This function can be called on other tasks without lock.

返回 The OpenThread instance pointer

Header File

- components/openthread/include/esp_openthread_types.h

Structures

struct **esp_openthread_mainloop_context_t**

This structure represents a context for a select() based mainloop.

Public Members

fd_set **read_fds**

The read file descriptors

fd_set **write_fds**
: The write file descriptors

fd_set **error_fds**
: The error file descriptors

int **max_fd**
: The max file descriptor

struct timeval **timeout**
: The timeout

struct **esp_openthread_uart_config_t**
: The uart port config for OpenThread.

Public Members

uart_port_t **port**
: UART port number

uart_config_t **uart_config**
: UART configuration, see *uart_config_t* docs

gpio_num_t **rx_pin**
: UART RX pin

gpio_num_t **tx_pin**
: UART TX pin

struct **esp_openthread_spi_host_config_t**
: The spi port config for OpenThread.

Public Members

spi_host_device_t **host_device**
: SPI host device

spi_dma_chan_t **dma_channel**
: DMA channel

spi_bus_config_t **spi_interface**
: SPI bus

spi_device_interface_config_t **spi_device**
: SPI peripheral device

gpio_num_t **intr_pin**
: SPI interrupt pin

struct **esp_openthread_spi_slave_config_t**

The spi slave config for OpenThread.

Public Members

spi_host_device_t **host_device**

SPI host device

spi_bus_config_t **bus_config**

SPI bus config

spi_slave_interface_config_t **slave_config**

SPI slave config

gpio_num_t **intr_pin**

SPI interrupt pin

struct **esp_openthread_radio_config_t**

The OpenThread radio configuration.

Public Members

esp_openthread_radio_mode_t **radio_mode**

The radio mode

esp_openthread_uart_config_t **radio_uart_config**

The uart configuration to RCP

esp_openthread_spi_host_config_t **radio_spi_config**

The spi configuration to RCP

struct **esp_openthread_host_connection_config_t**

The OpenThread host connection configuration.

Public Members

esp_openthread_host_connection_mode_t **host_connection_mode**

The host connection mode

esp_openthread_uart_config_t **host_uart_config**

The uart configuration to host

esp_openthread_spi_slave_config_t **spi_slave_config**

The spi configuration to host

struct **esp_openthread_port_config_t**

The OpenThread port specific configuration.

Public Members

const char *`storage_partition_name`

The partition for storing OpenThread dataset

uint8_t `netif_queue_size`

The packet queue size for the network interface

uint8_t `task_queue_size`

The task queue size

struct `esp_openthread_platform_config_t`

The OpenThread platform configuration.

Public Members

esp_openthread_radio_config_t `radio_config`

The radio configuration

esp_openthread_host_connection_config_t `host_config`

The host connection configuration

esp_openthread_port_config_t `port_config`

The port configuration

Type Definitions

typedef void (*`esp_openthread_rcp_failure_handler`)(void)

Enumerations

enum `esp_openthread_event_t`

OpenThread event declarations.

Values:

enumerator `OPENTHREAD_EVENT_START`

OpenThread stack start

enumerator `OPENTHREAD_EVENT_STOP`

OpenThread stack stop

enumerator `OPENTHREAD_EVENT_IF_UP`

OpenThread network interface up

enumerator `OPENTHREAD_EVENT_IF_DOWN`

OpenThread network interface down

enumerator **OPENTHREAD_EVENT_GOT_IP6**

OpenThread stack added IPv6 address

enumerator **OPENTHREAD_EVENT_LOST_IP6**

OpenThread stack removed IPv6 address

enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN**

OpenThread stack joined IPv6 multicast group

enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE**

OpenThread stack left IPv6 multicast group

enumerator **OPENTHREAD_EVENT_TREL_ADD_IP6**

OpenThread stack added TREL IPv6 address

enumerator **OPENTHREAD_EVENT_TREL_REMOVE_IP6**

OpenThread stack removed TREL IPv6 address

enumerator **OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN**

OpenThread stack joined TREL IPv6 multicast group

enumerator **OPENTHREAD_EVENT_SET_DNS_SERVER**

OpenThread stack set DNS server >

enum **esp_openthread_radio_mode_t**

The radio mode of OpenThread.

Values:

enumerator **RADIO_MODE_NATIVE**

Use the native 15.4 radio

enumerator **RADIO_MODE_UART_RCP**

UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_SPI_RCP**

SPI connection to a 15.4 capable radio co-processor (RCP)

enum **esp_openthread_host_connection_mode_t**

How OpenThread connects to the host.

Values:

enumerator **HOST_CONNECTION_MODE_NONE**

Disable host connection

enumerator **HOST_CONNECTION_MODE_CLI_UART**

CLI UART connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_UART**

RCP UART connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_SPI**

RCP SPI connection to the host

Header File

- components/openthread/include/esp_openthread_lock.h

Functions

esp_err_t **esp_openthread_lock_init**(void)

This function initializes the OpenThread API lock.

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

void **esp_openthread_lock_deinit**(void)

This function deinitializes the OpenThread API lock.

bool **esp_openthread_lock_acquire**(TickType_t block_ticks)

This function acquires the OpenThread API lock.

备注: Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

参数 **block_ticks** – **[in]** The maxinum number of RTOS ticks to wait for the lock.

返回

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp_openthread_lock_release**(void)

This function releases the OpenThread API lock.

bool **esp_openthread_task_switching_lock_acquire**(TickType_t block_ticks)

This function acquires the OpenThread API task switching lock.

备注: In OpenThread API context, it waits for some actions to be done in other tasks (like lwip), after task switching, it needs to call OpenThread API again. Normally it's not allowed, since the previous OpenThread API lock is not released yet. This task_switching lock allows the OpenThread API can be called in this case.

备注: Please use esp_openthread_lock_acquire() for normal cases.

参数 **block_ticks** – **[in]** The maxinum number of RTOS ticks to wait for the lock.

返回

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp_openthread_task_switching_lock_release**(void)

This function releases the OpenThread API task switching lock.

Header File

- components/openthread/include/esp_openthread_netif_glue.h

Functions

void ***esp_openthread_netif_glue_init**(const *esp_openthread_platform_config_t* *config)

This function initializes the OpenThread network interface glue.

参数 **config** –**[in]** The platform configuration.

返回

- glue pointer on success
- NULL on failure

void **esp_openthread_netif_glue_deinit**(void)

This function deinitializes the OpenThread network interface glue.

esp_netif_t ***esp_openthread_get_netif**(void)

This function acquires the OpenThread netif.

返回 The OpenThread netif or NULL if not initialzied.

Macros

ESP_NETIF_INHERENT_DEFAULT_OPENTHREAD()

Default configuration reference of OT esp-netif.

ESP_NETIF_DEFAULT_OPENTHREAD()

Header File

- components/openthread/include/esp_openthread_border_router.h

Functions

void **esp_openthread_set_backbone_netif**(*esp_netif_t* *backbone_netif)

Sets the backbone interface used for border routing.

备注: This function must be called before esp_openthread_init

参数 **backbone_netif** –**[in]** The backbone network interface (WiFi or ethernet)

esp_err_t **esp_openthread_border_router_init**(void)

Initializes the border router features of OpenThread.

备注: Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD_BORDER_ROUTER is required.

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if feature not supported
- ESP_ERR_INVALID_STATE if already initialized
- ESP_FIAL on other failures

esp_err_t **esp_openthread_border_router_deinit**(void)

Deinitializes the border router features of OpenThread.

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
- ESP_FIAL on other failures

esp_netif_t ***esp_openthread_get_backbone_netif**(void)

Gets the backbone interface of OpenThread border router.

返回 The backbone interface or NULL if border router not initialized.

void **esp_openthread_register_rcp_failure_handler**(*esp_openthread_rcp_failure_handler* handler)

Registers the callback for RCP failure.

void **esp_openthread_rcp_deinit**(void)

Deinitializes the conneciton to RCP.

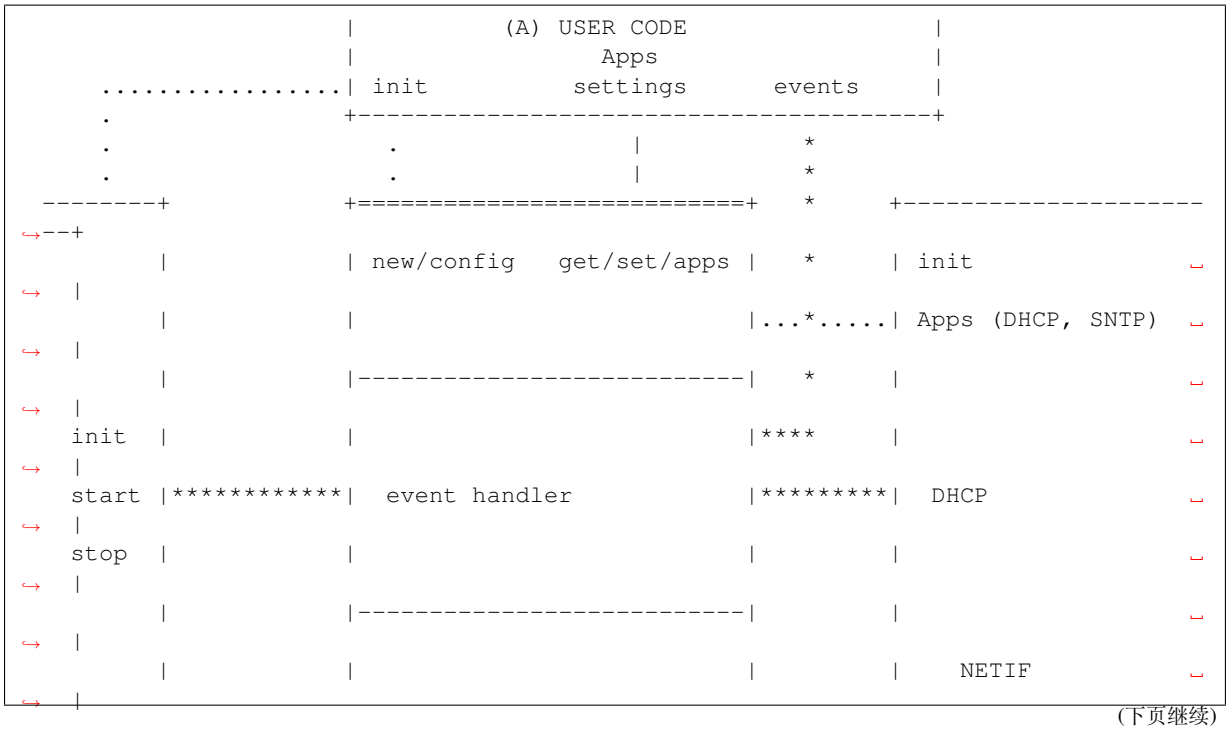
Thread 是一种基于 IPv6 的物联网网状网络技术。本部分的 Thread API 示例代码存放在 ESP-IDF 示例项目的 openthread 目录下。

2.5.4 IP 网络层协议

ESP-NETIF

The purpose of ESP-NETIF library is twofold:

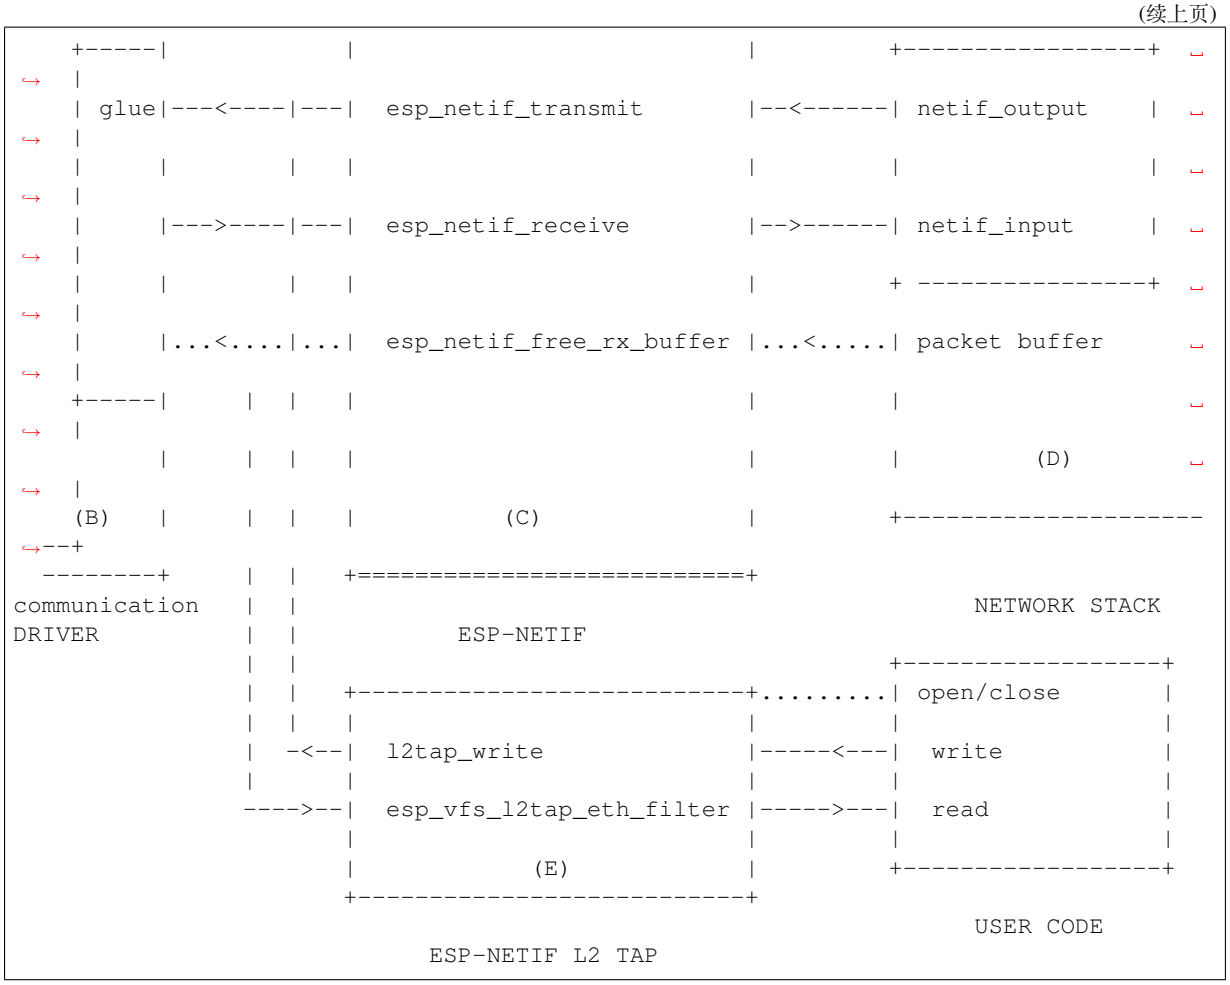
- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.



ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

It is also possible to use a custom TCP/IP stack with ESP-IDF, provided it implements BSD API. For more information on building ESP-IDF without lwIP, please refer to components/esp_netif_stack/README.md.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.



In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF architecture

(下页继续)

(续上页)

Data and event flow in the diagram

- `.....` Initialization line from user code to ESP-NETIF and communication driver
- `--<--->--` Data packets going from communication media to TCP/IP stack and back
- `********` Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- `|` User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure with

- ESP-NETIF specific options (flags, behaviour, name)
- Network stack options (netif init and input functions, not publicly available)
- IO driver specific options (transmit, free rx buffer functions, IO driver handle)

3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers

- use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
- register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver Communication driver plays these two important roles in relation with ESP-NETIF:

1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer

- Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
- Calls `esp_netif_receive()` to pass incoming data to network stack

C) ESP-NETIF ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input/Output API (for passing data between IO driver and network stack)
3) Event or Action API

- Used for network interface lifecycle management
- ESP-NETIF provides building blocks for designing event handlers

4) Setters and Getters for basic network interface properties
5) Network stack abstraction: enabling user interaction with TCP/IP stack

- Set interface up or down
- DHCP server and client API
- DNS API
- *SNTP API*

6) Driver conversion utilities

D) Network stack Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). Refer to 虚拟文件系统组件 to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to Layer 2 infrastructure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by `if_key` (e.g. *ETH_DEF*) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in

standard use cases. Filtering is also advantageous from a perspective the user's application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

ESP-NETIF L2 TAP Interface Usage Manual

Initialization To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by *CONFIG_ESP_NETIF_L2_TAP* first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

open() Once the ESP-NETIF L2 TAP is registered, it can be opened at path name "/dev/net/tap". The same path name can be opened multiple times up to *CONFIG_ESP_NETIF_L2_TAP_MAX_FDS* and multiple file descriptors with with different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with `O_NONBLOCK` file status flag to the `read()` does not block. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned and `errno` is set to indicate the error.

ioctl() The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- `L2TAP_S_INTF_DEVICE` - bounds the file descriptor to specific Network Interface which is identified by its `if_key`. ESP-NETIF Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`'s used in ESP-IDF can be found in esp_netif/include/esp_netif_defaults.h.
- `L2TAP_S_DEVICE_DRV_HNDL` - is other way how to bound the file descriptor to specific Network Interface. In this case the Network interface is identified directly by IO Driver handle (e.g. `esp_eth_handle_t` in case of Ethernet). The IO Driver handle is passed to `ioctl()` as the third parameter.
- `L2TAP_S_RCV_FILTER` - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval <0, 0x05DC> at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user's application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All above set configuration options have getter counterpart option to read the current settings.

警告: The file descriptor needs to be firstly bounded to specific Network Interface by `L2TAP_S_INTF_DEVICE` or `L2TAP_S_DEVICE_DRV_HNDL` to be `L2TAP_S_RCV_FILTER` option available.

备注: VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.

备注: `L2TAP_S_DEVICE_DRV_HNDL` is particularly useful when user's application does not require usage of IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.
EBADF - not a valid file descriptor.
EACCES - option change is denied in this state (e.g. file descriptor has not be bounded to Network interface yet).
EINVAL - invalid configuration argument. Ethernet type filter is already used by other file descriptor on that same Network interface.
ENODEV - no such Network Interface which is tried to be assigned to the file descriptor exists.
ENOSYS - unsupported operation, passed configuration option does not exists.

fcntl() `fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with file descriptor:

- `F_GETFD` - the function returns the file descriptor flags, the third argument is ignored.
- `F_SETFD` - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On error, -1 is returned, and `errno` is set to indicate the error.
EBADF - not a valid file descriptor.
ENOSYS - unsupported command.

read() Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by *CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE* Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.
EBADF - not a valid file descriptor.
EAGAIN - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

write() A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User's application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user's application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

```
+-------------------+-------------------+-------------+-----------------------------
↪---      --+
|  Destination MAC  |     Source MAC    | Type/Length | Payload (protocol header/
↪data) ...    |
+-------------------+-------------------+-------------+-----------------------------
↪---      --+
        6B                  6B                2B                 0-1486B
```

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

EBADF - not a valid file descriptor.

EBADMSG - Ethernet type of the frame is different then file descriptor configured filter.

EIO - Network interface not available or busy.

close() Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first' s task read operation then ends with error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

EBADF - not a valid file descriptor.

select() Select is used in a standard way, just *CONFIG_VFS_SUPPORT_SELECT* needs to be enabled to be the `select()` function available.

SNTP API You can find a brief introduction to SNTP in general, its initialization code and basic modes in *SNTP 时间同步* section in the *System Time Document*.

This section provides more details about specific use cases of SNTP service, with statically configured servers, or using DHCP provided servers, or both. The workflow is usually very simple:

1) Initialize and configure the service using *esp_netif_sntp_init()*.
2) Start the service via *esp_netif_sntp_start()*. This step is not needed if we auto-started the service in the previous step (default). It' s useful to start the service explicitly after connecting, if we want to use DHCP obtained NTP servers. (This option needs to be enabled before connecting, but SNTP service should be started after)
3) Wait for the system time to synchronize using *esp_netif_sntp_sync_wait()* (only if needed).
4) Stop and destroy the service using *esp_netif_sntp_deinit()*.

Basic mode with statically defined server(s) Initialize the module with the default configuration after connecting to network. Note that it' s possible to provide multiple NTP servers in the configuration struct:

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(2,
                           ESP_SNTP_SERVER_LIST("time.windows.com", "pool.ntp.org"␣
↪) );
esp_netif_sntp_init(&config);
```

备 注: If we want to configure multiple SNTP servers, we have to update lwIP configuration *CONFIG_LWIP_SNTP_MAX_SERVERS*.

Use DHCP obtained SNTP server(s) First of all, we have to enable lwIP configuration option *CONFIG_LWIP_DHCP_GET_NTP_SRV*. Then we have to initialize the SNTP module with the DHCP option and no NTP server:

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(0, {} );
config.start = false;                       // start SNTP service explicitly
config.server_from_dhcp = true;             // accept NTP offer from DHCP server
esp_netif_sntp_init(&config);
```

Then, once we’re connected, we could start the service using:

```
esp_netif_sntp_start();
```

备注： It’s also possible to start the service during initialization (default `config.start=true`). This would likely cause the initial SNTP request to fail (since we are not connected yet) and thus some backoff time for subsequent requests.

Use both static and dynamic servers Very similar to the scenario above (DHCP provided SNTP server), but in this configuration we need to make sure that the static server configuration is refreshed when obtaining NTP servers by DHCP. The underlying lwIP code cleans up the rest of the list of NTP servers when DHCP provided information gets accepted. Thus the ESP-NETIF SNTP module saves the statically configured server(s) and reconfigures them after obtaining DHCP lease.

The typical configuration now looks as per below, providing the specific `IP_EVENT` to update the config and index of the first server to reconfigure (for example setting `config.index_of_first_server=1` would keep DHCP provided server at index 0, and the statically configured server at index 1).

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG("pool.ntp.org");
config.start = false;                       // start SNTP service explicitly␣
↪(after connecting)
config.server_from_dhcp = true;             // accept NTP offers from DHCP server
config.renew_servers_after_new_IP = true;   // let esp-netif update configured␣
↪SNTP server(s) after receiving DHCP lease
config.index_of_first_server = 1;           // updates from server num 1, leaving␣
↪server 0 (from DHCP) intact
config.ip_event_to_renew = IP_EVENT_STA_GOT_IP;  // IP event on which we refresh␣
↪the configuration
```

Then we start the service normally with *esp_netif_sntp_start()*.

ESP-NETIF programmer’s manual Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: wifi/getting_started/station/main/station_example_main.c
- Ethernet: ethernet/basic/main/ethernet_example_main.c
- L2 TAP: protocols/l2tap/main/l2tap_main.c
- WiFi Access Point: wifi/getting_started/softAP/main/softap_example_main.c

For more specific cases please consult this guide: *ESP-NETIF Custom I/O Driver*.

WiFi default initialization The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- *esp_netif_create_default_wifi_sta()*
- *esp_netif_create_default_wifi_ap()*

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using *esp_netif_destroy_default_wifi()*.
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using *esp_netif_destroy()*.
- When using Wifi in `AP+STA` mode, both these interfaces has to be created.

API Reference

Header File

- components/esp_netif/include/esp_netif.h

Functions

esp_err_t **esp_netif_init**(void)

Initialize the underlying TCP/IP stack.

备注: This function should be called exactly once from application code, when the application starts up.

返回

- ESP_OK on success
- ESP_FAIL if initializing failed

esp_err_t **esp_netif_deinit**(void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

```
Note: Deinitialization is not supported yet
```

返回

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

esp_netif_t ***esp_netif_new**(const *esp_netif_config_t* *esp_netif_config)

Creates an instance of new esp-netif object based on provided config.

参数 **esp_netif_config** –pointer esp-netif configuration

返回

- pointer to esp-netif object on success
- NULL otherwise

void **esp_netif_destroy**(*esp_netif_t* *esp_netif)

Destroys the esp_netif object.

参数 **esp_netif** –**[in]** pointer to the object to be deleted

esp_err_t **esp_netif_set_driver_config**(*esp_netif_t* *esp_netif, const *esp_netif_driver_ifconfig_t* *driver_config)

Configures driver related options of esp_netif object.

参数

- **esp_netif** –**[inout]** pointer to the object to be configured
- **driver_config** –**[in]** pointer esp-netif io driver related configuration

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

esp_err_t **esp_netif_attach**(*esp_netif_t* *esp_netif, *esp_netif_iodriver_handle* driver_handle)

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

参数

- **esp_netif** –**[inout]** pointer to esp_netif object to be attached
- **driver_handle** –**[in]** pointer to the driver handle

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s pot_attach callback failed

esp_err_t **esp_netif_receive**(*esp_netif_t* *esp_netif, void *buffer, size_t len, void *eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **buffer** –**[in]** Received data
- **len** –**[in]** Length of the data frame
- **eb** –**[in]** Pointer to internal buffer (used in Wi-Fi driver)

返回

- ESP_OK

void **esp_netif_action_start**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

备注: This API can be directly used as event handler

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_stop**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver stop event.

备注: This API can be directly used as event handler

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_connected**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver connected event.

备注: This API can be directly used as event handler

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_disconnected**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver disconnected event.

备注: This API can be directly used as event handler

参数

- **esp_netif** – **[in]** Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_got_ip**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon network got IP event.

备注: This API can be directly used as event handler

参数

- **esp_netif** – **[in]** Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_join_ip6_multicast_group**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group join.

备注: This API can be directly used as event handler

参数

- **esp_netif** – **[in]** Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_leave_ip6_multicast_group**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

备注: This API can be directly used as event handler

参数

- **esp_netif** – **[in]** Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_add_ip6_address**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

备注： This API can be directly used as event handler

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_remove_ip6_address**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

备注： This API can be directly used as event handler

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

esp_err_t **esp_netif_set_default_netif**(*esp_netif_t* *esp_netif)

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route_prio If the selected netif is set default using this API, no other interface could be set-default disregarding its route_prio number (unless the selected netif gets destroyed)

参数 **esp_netif** –**[in]** Handle to esp-netif instance
返回 ESP_OK on success

esp_netif_t ***esp_netif_get_default_netif**(void)

Getter function of the default netif.

This API returns the selected default netif.

返回 Handle to esp-netif instance of the default netif.

esp_err_t **esp_netif_join_ip6_multicast_group**(*esp_netif_t* *esp_netif, const *esp_ip6_addr_t* *addr)

Cause the TCP/IP stack to join a IPv6 multicast group.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **addr** –**[in]** The multicast group to join

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_MLD6_FAILED
- ESP_ERR_NO_MEM

esp_err_t **esp_netif_leave_ip6_multicast_group**(*esp_netif_t* *esp_netif, const *esp_ip6_addr_t* *addr)

Cause the TCP/IP stack to leave a IPv6 multicast group.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **addr** –**[in]** The multicast group to leave

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_MLD6_FAILED
- ESP_ERR_NO_MEM

esp_err_t **esp_netif_set_mac**(*esp_netif_t* *esp_netif, uint8_t mac[])

Set the mac address for the interface instance.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **mac** –**[in]** Desired mac address for the related network interface

返回

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

esp_err_t **esp_netif_get_mac**(*esp_netif_t* *esp_netif, uint8_t mac[])

Get the mac address for the interface instance.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **mac** –**[out]** Resultant mac address for the related network interface

返回

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

esp_err_t **esp_netif_set_hostname**(*esp_netif_t* *esp_netif, const char *hostname)

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **hostname** –**[in]** New hostname for the interface. Maximum length 32 bytes.

返回

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

esp_err_t **esp_netif_get_hostname**(*esp_netif_t* *esp_netif, const char **hostname)

Get interface hostname.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **hostname** –**[out]** Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

返回

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

bool **esp_netif_is_netif_up**(*esp_netif_t* *esp_netif)

Test if supplied interface is up or down.

参数 **esp_netif** –**[in]** Handle to esp-netif instance

返回

- true - Interface is up
- false - Interface is down

esp_err_t **esp_netif_get_ip_info**(*esp_netif_t* *esp_netif, *esp_netif_ip_info_t* *ip_info)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **ip_info** –**[out]** If successful, IP information will be returned in this argument.

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_get_old_ip_info**(*esp_netif_t* *esp_netif, *esp_netif_ip_info_t* *ip_info)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **ip_info** –**[out]** If successful, IP information will be returned in this argument.

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_set_ip_info**(*esp_netif_t* *esp_netif, const *esp_netif_ip_info_t* *ip_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

备注: DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

备注: Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **ip_info** –**[in]** IP information to set on the specified interface

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

esp_err_t **esp_netif_set_old_ip_info**(*esp_netif_t* *esp_netif, const *esp_netif_ip_info_t* *ip_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the "IP lost timer" will expire (after the configured interval) and set the old IP information to zero.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **ip_info** –**[in]** Store the old IP information for the specified interface

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

int **esp_netif_get_netif_impl_index**(*esp_netif_t* *esp_netif)

Get net interface index from network stack implementation.

备注: This index could be used in `setsockopt()` to bind socket with multicast interface

---

参数 **esp_netif** –**[in]** Handle to esp-netif instance
返回 implementation specific index of interface represented with supplied esp_netif

esp_err_t **esp_netif_get_netif_impl_name**(*esp_netif_t* *esp_netif, char *name)

Get net interface name from network stack implementation.

备注: This name could be used in `setsockopt()` to bind socket with appropriate interface

---

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **name** –**[out]** Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_napt_enable**(*esp_netif_t* *esp_netif)

Enable NAPT on an interface.

备注: Enable operation can be performed only on one interface at a time. NAPT cannot be enabled on multiple interfaces according to this implementation.

参数 **esp_netif** –**[in]** Handle to esp-netif instance
返回

- ESP_OK
- ESP_FAIL
- ESP_ERR_NOT_SUPPORTED

esp_err_t **esp_netif_napt_disable**(*esp_netif_t* *esp_netif)

Disable NAPT on an interface.

参数 **esp_netif** –**[in]** Handle to esp-netif instance
返回

- ESP_OK
- ESP_FAIL
- ESP_ERR_NOT_SUPPORTED

esp_err_t **esp_netif_dhcps_option**(*esp_netif_t* *esp_netif, *esp_netif_dhcp_option_mode_t* opt_op, *esp_netif_dhcp_option_id_t* opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP server option.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **opt_op** –**[in]** ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** –**[in]** Option index to get or set, must be one of the supported enum values.
- **opt_val** –**[inout]** Pointer to the option parameter.
- **opt_len** –**[in]** Length of the option parameter.

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t **esp_netif_dhcpc_option**(*esp_netif_t* *esp_netif, *esp_netif_dhcp_option_mode_t* opt_op, *esp_netif_dhcp_option_id_t* opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP client option.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **opt_op** –**[in]** ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** –**[in]** Option index to get or set, must be one of the supported enum values.
- **opt_val** –**[inout]** Pointer to the option parameter.
- **opt_len** –**[in]** Length of the option parameter.

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t **esp_netif_dhcpc_start**(*esp_netif_t* *esp_netif)

Start DHCP client (only if enabled in interface object)

备 注: The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

参数 **esp_netif** –**[in]** Handle to esp-netif instance

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

esp_err_t **esp_netif_dhcpc_stop**(*esp_netif_t* *esp_netif)

Stop DHCP client (only if enabled in interface object)

备注: Calling action_netif_stop() will also stop the DHCP Client if it is running.

参数 **esp_netif** –**[in]** Handle to esp-netif instance

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

esp_err_t **esp_netif_dhcpc_get_status**(*esp_netif_t* *esp_netif, *esp_netif_dhcp_status_t* *status)

Get DHCP client status.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **status** –**[out]** If successful, the status of DHCP client will be returned in this argument.

返回

- ESP_OK

esp_err_t **esp_netif_dhcps_get_status**(*esp_netif_t* *esp_netif, *esp_netif_dhcp_status_t* *status)

Get DHCP Server status.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **status** –**[out]** If successful, the status of the DHCP server will be returned in this argument.

返回

- ESP_OK

esp_err_t **esp_netif_dhcps_start**(*esp_netif_t* *esp_netif)

Start DHCP server (only if enabled in interface object)

参数 **esp_netif** –**[in]** Handle to esp-netif instance

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t **esp_netif_dhcps_stop**(*esp_netif_t* *esp_netif)

Stop DHCP server (only if enabled in interface object)

参数 **esp_netif** –**[in]** Handle to esp-netif instance

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

esp_err_t **esp_netif_dhcps_get_clients_by_mac**(*esp_netif_t* *esp_netif, int num, *esp_netif_pair_mac_ip_t* *mac_ip_pair)

Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **num** –**[in]** Number of clients with specified MAC addresses in the array of pairs
- **mac_ip_pair** –**[inout]** Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS on invalid params
- ESP_ERR_NOT_SUPPORTED if DHCP server not enabled

esp_err_t **esp_netif_set_dns_info**(*esp_netif_t* *esp_netif, *esp_netif_dns_type_t* type, *esp_netif_dns_info_t* *dns)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP_NETIF_DNS_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **type** –**[in]** Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- **dns** –**[in]** DNS Server address to set

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

esp_err_t **esp_netif_get_dns_info**(*esp_netif_t* *esp_netif, *esp_netif_dns_type_t* type, *esp_netif_dns_info_t* *dns)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to *esp_netif_set_dns_info()*. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **type** –**[in]** Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- **dns** –**[out]** DNS Server result is written here on success

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

esp_err_t **esp_netif_create_ip6_linklocal**(*esp_netif_t* *esp_netif)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

参数 **esp_netif** –**[in]** Handle to esp-netif instance

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_get_ip6_linklocal**(*esp_netif_t* *esp_netif, *esp_ip6_addr_t* *if_ip6)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **if_ip6** –**[out]** IPv6 information will be returned in this argument if successful.

返回

- ESP_OK

- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

esp_err_t **esp_netif_get_ip6_global** (*esp_netif_t* *esp_netif, *esp_ip6_addr_t* *if_ip6)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **if_ip6** –**[out]** IPv6 information will be returned in this argument if successful.

返回

- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

int **esp_netif_get_all_ip6** (*esp_netif_t* *esp_netif, *esp_ip6_addr_t* if_ip6[])

Get all IPv6 addresses of the specified interface.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **if_ip6** –**[out]** Array of IPv6 addresses will be copied to the argument

返回 number of returned IPv6 addresses

void **esp_netif_set_ip4_addr** (*esp_ip4_addr_t* *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)

Sets IPv4 address to the specified octets.

参数

- **addr** –**[out]** IP address to be set
- **a** –the first octet (127 for IP 127.0.0.1)
- **b** –
- **c** –
- **d** –

char ***esp_ip4addr_ntoa** (const *esp_ip4_addr_t* *addr, char *buf, int buflen)

Converts numeric IP address into decimal dotted ASCII representation.

参数

- **addr** –ip address in network order to convert
- **buf** –target buffer where the string is stored
- **buflen** –length of buf

返回 either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

uint32_t **esp_ip4addr_aton** (const char *addr)

Ascii internet address interpretation routine The value returned is in network order.

参数 **addr** –IP address in ascii representation (e.g. “127.0.0.1”)

返回 ip address in network order

esp_err_t **esp_netif_str_to_ip4** (const char *src, *esp_ip4_addr_t* *dst)

Converts Ascii internet IPv4 address into esp_ip4_addr_t.

参数

- **src** –**[in]** IPv4 address in ascii representation (e.g. “127.0.0.1”)
- **dst** –**[out]** Address of the target esp_ip4_addr_t structure to receive converted address

返回

- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

esp_err_t **esp_netif_str_to_ip6**(const char *src, *esp_ip6_addr_t* *dst)

Converts Ascii internet IPv6 address into esp_ip4_addr_t Zeros in the IP address can be stripped or completely ommited: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1”)

参数

- **src** –**[in]** IPv6 address in ascii representation (e.g. “2001:0db8:85a3:0000:0000:0000:0002:0001”)
- **dst** –**[out]** Address of the target esp_ip6_addr_t structure to receive converted address

返回

- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

esp_netif_iodriver_handle **esp_netif_get_io_driver**(*esp_netif_t* *esp_netif)

Gets media driver handle for this esp-netif instance.

参数 **esp_netif** –**[in]** Handle to esp-netif instance
返回 opaque pointer of related IO driver

esp_netif_t ***esp_netif_get_handle_from_ifkey**(const char *if_key)

Searches over a list of created objects to find an instance with supplied if key.

参数 **if_key** –Textual description of network interface
返回 Handle to esp-netif instance

esp_netif_flags_t **esp_netif_get_flags**(*esp_netif_t* *esp_netif)

Returns configured flags for this interface.

参数 **esp_netif** –**[in]** Handle to esp-netif instance
返回 Configuration flags

const char ***esp_netif_get_ifkey**(*esp_netif_t* *esp_netif)

Returns configured interface key for this esp-netif instance.

参数 **esp_netif** –**[in]** Handle to esp-netif instance
返回 Textual description of related interface

const char ***esp_netif_get_desc**(*esp_netif_t* *esp_netif)

Returns configured interface type for this esp-netif instance.

参数 **esp_netif** –**[in]** Handle to esp-netif instance
返回 Enumerated type of this interface, such as station, AP, ethernet

int **esp_netif_get_route_prio**(*esp_netif_t* *esp_netif)

Returns configured routing priority number.

参数 **esp_netif** –**[in]** Handle to esp-netif instance
返回 Integer representing the instance’s route-prio, or -1 if invalid paramters

int32_t **esp_netif_get_event_id**(*esp_netif_t* *esp_netif, *esp_netif_ip_event_type_t* event_type)

Returns configured event for this esp-netif instance and supplied event type.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **event_type** –(either get or lost IP)

返回 specific event id which is configured to be raised if the interface lost or acquired IP address
-1 if supplied event_type is not known

esp_netif_t ***esp_netif_next**(*esp_netif_t* *esp_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

参数 **esp_netif** –**[in]** Handle to esp-netif instance
返回 First netif from the list if supplied parameter is NULL, next one otherwise

size_t **esp_netif_get_nr_of_ifs**(void)

Returns number of registered esp_netif objects.

返回 Number of esp_netifs

void **esp_netif_netstack_buf_ref**(void *netstack_buf)

increase the reference counter of net stack buffer

参数 **netstack_buf** –**[in]** the net stack buffer

void **esp_netif_netstack_buf_free**(void *netstack_buf)

free the netstack buffer

参数 **netstack_buf** –**[in]** the net stack buffer

esp_err_t **esp_netif_tcpip_exec**(*esp_netif_callback_fn* fn, void *ctx)

Utility to execute the supplied callback in TCP/IP context.

参数

- **fn** –Pointer to the callback
- **ctx** –Parameter to the callback

返回 The error code (esp_err_t) returned by the callback

Type Definitions

typedef *esp_err_t* (***esp_netif_callback_fn**)(void *ctx)

TCPIP thread safe callback used with *esp_netif_tcpip_exec()*

Header File

- components/esp_netif/include/esp_netif_sntp.h

Functions

esp_err_t **esp_netif_sntp_init**(const *esp_sntp_config_t* *config)

Initialize SNTP with supplied config struct.

参数 **config** –Config struct

返回 ESP_OK on success

esp_err_t **esp_netif_sntp_start**(void)

Start SNTP service if it wasn’t started during init (config.start = false) or restart it if already started.

返回 ESP_OK on success

void **esp_netif_sntp_deinit**(void)

Deinitialize esp_netif SNTP module.

esp_err_t **esp_netif_sntp_sync_wait**(TickType_t tout)

Wait for time sync event.

参数 **tout** –Specified timeout in RTOS ticks

返回 ESP_TIMEOUT if sync event didn’t came withing the timeout ESP_ERR_NOT_FINISHED if the sync event came, but we’re in smooth update mode and still in progress (SNTP_SYNC_STATUS_IN_PROGRESS) ESP_OK if time sync’ed

Structures

struct **esp_sntp_config**

SNTP configuration struct.

Public Members

bool **smooth_sync**
: set to true if smooth sync required

bool **server_from_dhcp**
: set to true to request NTP server config from DHCP

bool **wait_for_sync**
: if true, we create a semaphore to signal time sync event

bool **start**
: set to true to automatically start the SNTP service

esp_sntp_time_cb_t **sync_cb**
: optionally sets callback function on time sync event

bool **renew_servers_after_new_IP**
: this is used to refresh server list if NTP provided by DHCP (which cleans other pre-configured servers)

ip_event_t **ip_event_to_renew**
: set the IP event id on which we refresh server list (if renew_servers_after_new_IP=true)

size_t **index_of_first_server**
: refresh server list after this server (if renew_servers_after_new_IP=true)

size_t **num_of_servers**
: number of preconfigured NTP servers

const char ***servers**[1]
: list of servers

Macros

ESP_SNTP_SERVER_LIST(...)
: Utility macro for providing multiple servers in parentheses.

ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(servers_in_list, list_of_servers)
: Default configuration to init SNTP with multiple servers.

  参数
  - **servers_in_list** –Number of servers in the list
  - **list_of_servers** –List of servers (use *ESP_SNTP_SERVER_LIST(⋯)*)

ESP_NETIF_SNTP_DEFAULT_CONFIG(server)
: Default configuration with a single server.

Type Definitions

typedef void (***esp_sntp_time_cb_t**)(struct timeval *tv)
: Time sync notification function.

typedef struct *esp_sntp_config* **esp_sntp_config_t**
: SNTP configuration struct.

Header File

- components/esp_netif/include/esp_netif_types.h

Structures

struct **esp_netif_dns_info_t**

DNS server info.

Public Members

esp_ip_addr_t **ip**

IPV4 address of DNS server

struct **esp_netif_ip_info_t**

Event structure for IP_EVENT_STA_GOT_IP, IP_EVENT_ETH_GOT_IP events

Public Members

esp_ip4_addr_t **ip**

Interface IPV4 address

esp_ip4_addr_t **netmask**

Interface IPV4 netmask

esp_ip4_addr_t **gw**

Interface IPV4 gateway address

struct **esp_netif_ip6_info_t**

IPV6 IP address information.

Public Members

esp_ip6_addr_t **ip**

Interface IPV6 address

struct **ip_event_got_ip_t**

Event structure for IP_EVENT_GOT_IP event.

Public Members

esp_netif_t ***esp_netif**

Pointer to corresponding esp-netif object

esp_netif_ip_info_t **ip_info**

IP address, netmask, gatway IP address

bool **ip_changed**

Whether the assigned IP has changed or not

struct **ip_event_got_ip6_t**

Event structure for IP_EVENT_GOT_IP6 event

Public Members

esp_netif_t ***esp_netif**

Pointer to corresponding esp-netif object

esp_netif_ip6_info_t **ip6_info**

IPv6 address of the interface

int **ip_index**

IPv6 address index

struct **ip_event_add_ip6_t**

Event structure for ADD_IP6 event

Public Members

esp_ip6_addr_t **addr**

The address to be added to the interface

bool **preferred**

The default preference of the address

struct **ip_event_ap_staipassigned_t**

Event structure for IP_EVENT_AP_STAIPASSIGNED event

Public Members

esp_netif_t ***esp_netif**

Pointer to the associated netif handle

esp_ip4_addr_t **ip**

IP address which was assigned to the station

uint8_t **mac**[6]

MAC address of the connected client

struct **bridgeif_config**

LwIP bridge configuration

Public Members

uint16_t **max_fdb_dyn_entries**

maximum number of entries in dynamic forwarding database

uint16_t **max_fdb_sta_entries**

maximum number of entries in static forwarding database

uint8_t **max_ports**

maximum number of ports the bridge can consist of

struct **esp_netif_inherent_config**

ESP-netif inherent config parameters.

Public Members

esp_netif_flags_t **flags**

flags that define esp-netif behavior

uint8_t **mac**[6]

initial mac address for this interface

const *esp_netif_ip_info_t* ***ip_info**

initial ip address for this interface

uint32_t **get_ip_event**

event id to be raised when interface gets an IP

uint32_t **lost_ip_event**

event id to be raised when interface losts its IP

const char ***if_key**

string identifier of the interface

const char ***if_desc**

textual description of the interface

int **route_prio**

numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route_prio indicates a higher priority

bridgeif_config_t ***bridge_info**

LwIP bridge configuration

struct **esp_netif_driver_base_s**

ESP-netif driver base handle.

Public Members

esp_err_t (***post_attach**)(*esp_netif_t* *netif, *esp_netif_iodriver_handle* h)
post attach function pointer

esp_netif_t ***netif**
netif handle

struct **esp_netif_driver_ifconfig**
Specific IO driver configuration.

Public Members

esp_netif_iodriver_handle **handle**
io-driver handle

esp_err_t (***transmit**)(void *h, void *buffer, size_t len)
transmit function pointer

esp_err_t (***transmit_wrap**)(void *h, void *buffer, size_t len, void *netstack_buffer)
transmit wrap function pointer

void (***driver_free_rx_buffer**)(void *h, void *buffer)
free rx buffer function pointer

struct **esp_netif_config**
Generic esp_netif configuration.

Public Members

const *esp_netif_inherent_config_t* ***base**
base config

const *esp_netif_driver_ifconfig_t* ***driver**
driver config

const *esp_netif_netstack_config_t* ***stack**
stack config

struct **esp_netif_pair_mac_ip_t**
DHCP client’ s addr info (pair of MAC and IP address)

Public Members

uint8_t **mac**[6]
Clients MAC address

esp_ip4_addr_t **ip**

Clients IP address

Macros

ESP_ERR_ESP_NETIF_BASE

Definition of ESP-NETIF based errors.

ESP_ERR_ESP_NETIF_INVALID_PARAMS

ESP_ERR_ESP_NETIF_IF_NOT_READY

ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED

ESP_ERR_ESP_NETIF_NO_MEM

ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED

ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED

ESP_ERR_ESP_NETIF_DNS_NOT_CONFIGURED

ESP_ERR_ESP_NETIF_MLD6_FAILED

ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED

ESP_ERR_ESP_NETIF_DHCPS_START_FAILED

ESP_NETIF_BR_FLOOD

Definition of ESP-NETIF bridge controll.

ESP_NETIF_BR_DROP

ESP_NETIF_BR_FDW_CPU

Type Definitions

typedef struct esp_netif_obj **esp_netif_t**

typedef enum *esp_netif_flags* **esp_netif_flags_t**

typedef enum *esp_netif_ip_event_type* **esp_netif_ip_event_type_t**

typedef struct *bridgeif_config* **bridgeif_config_t**

LwIP bridge configuration

typedef struct *esp_netif_inherent_config* **esp_netif_inherent_config_t**

ESP-netif inherent config parameters.

typedef struct *esp_netif_config* **esp_netif_config_t**

typedef void ***esp_netif_iodriver_handle**

IO driver handle type.

typedef struct *esp_netif_driver_base_s* **esp_netif_driver_base_t**

ESP-netif driver base handle.

typedef struct *esp_netif_driver_ifconfig* **esp_netif_driver_ifconfig_t**

typedef struct esp_netif_netstack_config **esp_netif_netstack_config_t**

Specific L3 network stack configuration.

typedef *esp_err_t* (***esp_netif_receive_t**)(*esp_netif_t* *esp_netif, void *buffer, size_t len, void *eb)

ESP-NETIF Receive function type.

Enumerations

enum **esp_netif_dns_type_t**

Type of DNS server.

Values:

enumerator **ESP_NETIF_DNS_MAIN**

DNS main server address

enumerator **ESP_NETIF_DNS_BACKUP**

DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator **ESP_NETIF_DNS_FALLBACK**

DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator **ESP_NETIF_DNS_MAX**

enum **esp_netif_dhcp_status_t**

Status of DHCP client or DHCP server.

Values:

enumerator **ESP_NETIF_DHCP_INIT**

DHCP client/server is in initial state (not yet started)

enumerator **ESP_NETIF_DHCP_STARTED**

DHCP client/server has been started

enumerator **ESP_NETIF_DHCP_STOPPED**

DHCP client/server has been stopped

enumerator **ESP_NETIF_DHCP_STATUS_MAX**

enum **esp_netif_dhcp_option_mode_t**

Mode for DHCP client or DHCP server option functions.

Values:

enumerator **ESP_NETIF_OP_START**

enumerator **ESP_NETIF_OP_SET**

Set option

enumerator **ESP_NETIF_OP_GET**

Get option

enumerator **ESP_NETIF_OP_MAX**

enum **esp_netif_dhcp_option_id_t**

Supported options for DHCP client or DHCP server.

Values:

enumerator **ESP_NETIF_SUBNET_MASK**

Network mask

enumerator **ESP_NETIF_DOMAIN_NAME_SERVER**

Domain name server

enumerator **ESP_NETIF_ROUTER_SOLICITATION_ADDRESS**

Solicitation router address

enumerator **ESP_NETIF_REQUESTED_IP_ADDRESS**

Request specific IP address

enumerator **ESP_NETIF_IP_ADDRESS_LEASE_TIME**

Request IP address lease time

enumerator **ESP_NETIF_IP_REQUEST_RETRY_TIME**

Request IP address retry counter

enumerator **ESP_NETIF_VENDOR_CLASS_IDENTIFIER**

Vendor Class Identifier of a DHCP client

enumerator **ESP_NETIF_VENDOR_SPECIFIC_INFO**

Vendor Specific Information of a DHCP server

enum **ip_event_t**

IP event declarations

Values:

enumerator **IP_EVENT_STA_GOT_IP**

station got IP from connected AP

enumerator **IP_EVENT_STA_LOST_IP**

station lost IP and the IP is reset to 0

enumerator **IP_EVENT_AP_STAIPASSIGNED**

soft-AP assign an IP to a connected station

enumerator **IP_EVENT_GOT_IP6**

station or ap or ethernet interface v6IP addr is preferred

enumerator **IP_EVENT_ETH_GOT_IP**

ethernet got IP from connected AP

enumerator **IP_EVENT_ETH_LOST_IP**

ethernet lost IP and the IP is reset to 0

enumerator **IP_EVENT_PPP_GOT_IP**

PPP interface got IP

enumerator **IP_EVENT_PPP_LOST_IP**

PPP interface lost IP

enum **esp_netif_flags**

Values:

enumerator **ESP_NETIF_DHCP_CLIENT**

enumerator **ESP_NETIF_DHCP_SERVER**

enumerator **ESP_NETIF_FLAG_AUTOUP**

Functions

esp_err_t **esp_vfs_l2tap_intf_register**(*l2tap_vfs_config_t* *config)

Add L2 TAP virtual filesystem driver.

This function must be called prior usage of ESP-NETIF L2 TAP Interface

参数 **config** –L2 TAP virtual filesystem driver configuration. Default base path /dev/net/tap is used when this paramenter is NULL.

返回 esp_err_t

- ESP_OK on success

esp_err_t **esp_vfs_l2tap_intf_unregister**(const char *base_path)

Removes L2 TAP virtual filesystem driver.

参数 **base_path** –Base path to the L2 TAP virtual filesystem driver. Default path /dev/net/tap is used when this paramenter is NULL.

返回 esp_err_t

- ESP_OK on success

esp_err_t **esp_vfs_l2tap_eth_filter**(*l2tap_iodriver_handle* driver_handle, void *buff, size_t *size)

Filters received Ethernet L2 frames into L2 TAP infrastructure.

参数

- **driver_handle** –handle of driver at which the frame was received
- **buff** –received L2 frame
- **size** –input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP

返回 esp_err_t

- ESP_OK is always returned

Structures

struct **l2tap_vfs_config_t**

L2Tap VFS config parameters.

WiFi default API reference

Header File

- components/esp_wifi/include/esp_wifi_default.h

Functions

esp_err_t **esp_netif_attach_wifi_station**(*esp_netif_t* *esp_netif)

Attaches wifi station interface to supplied netif.

参数 **esp_netif** – instance to attach the wifi station to

返回

- ESP_OK on success
- ESP_FAIL if attach failed

esp_err_t **esp_netif_attach_wifi_ap**(*esp_netif_t* *esp_netif)

Attaches wifi soft AP interface to supplied netif.

参数 **esp_netif** – instance to attach the wifi AP to

返回

- ESP_OK on success
- ESP_FAIL if attach failed

esp_err_t **esp_wifi_set_default_wifi_sta_handlers**(void)

Sets default wifi event handlers for STA interface.

返回

- ESP_OK on success, error returned from esp_event_handler_register if failed

esp_err_t **esp_wifi_set_default_wifi_ap_handlers**(void)

Sets default wifi event handlers for AP interface.

返回

- ESP_OK on success, error returned from esp_event_handler_register if failed

esp_err_t **esp_wifi_set_default_wifi_nan_handlers**(void)

Sets default wifi event handlers for NAN interface.

返回

- ESP_OK on success, error returned from esp_event_handler_register if failed

esp_err_t **esp_wifi_clear_default_wifi_driver_and_handlers**(void *esp_netif)

Clears default wifi event handlers for supplied network interface.

参数 **esp_netif** – instance of corresponding if object

返回

- ESP_OK on success, error returned from esp_event_handler_register if failed

esp_netif_t ***esp_netif_create_default_wifi_ap**(void)

Creates default WIFI AP. In case of any init error this API aborts.

备注: The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

返回 pointer to esp-netif instance

esp_netif_t ***esp_netif_create_default_wifi_sta**(void)

Creates default WIFI STA. In case of any init error this API aborts.

备注: The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

返回 pointer to esp-netif instance

esp_netif_t ***esp_netif_create_default_wifi_nan**(void)

Creates default WIFI NAN. In case of any init error this API aborts.

备注: The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

返回 pointer to esp-netif instance

void **esp_netif_destroy_default_wifi**(void *esp_netif)

Destroys default WIFI netif created with esp_netif_create_default_wifi_…() API.

备注: This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

参数 **esp_netif** –**[in]** object to detach from WiFi and destroy

esp_netif_t ***esp_netif_create_wifi**(*wifi_interface_t* wifi_if, const *esp_netif_inherent_config_t* *esp_netif_config)

Creates esp_netif WiFi object based on the custom configuration.

Attention This API DOES NOT register default handlers!

参数

- **wifi_if** –**[in]** type of wifi interface
- **esp_netif_config** –inherent esp-netif configuration pointer

返回 pointer to esp-netif instance

esp_err_t **esp_netif_create_default_wifi_mesh_netifs**(*esp_netif_t* **p_netif_sta, *esp_netif_t* **p_netif_ap)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

参数

- **p_netif_sta** –**[out]** pointer where the resultant STA interface is saved (if non NULL)
- **p_netif_ap** –**[out]** pointer where the resultant AP interface is saved (if non NULL)

返回 ESP_OK on success

2.5.5 IP 网络层协议

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver's lifecycle transitions.

Packet input/output As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- *esp_netif_transmit()*
- *esp_netif_free_rx_buffer()*
- *esp_netif_receive()*

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls *esp_netif_receive()* on a new data received event.

Post attach callback A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle␣
↪driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
        esp_netif_driver_base_t base;           /*!< base structure reserved as␣
↪esp-netif driver */
        driver_impl             *h;             /*!< handle of driver␣
↪implementation */
    } my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the *esp_netif_attach()* gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
            .driver_free_rx_buffer = my_free_rx_buf,
            .transmit = my_transmit,
            .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

Default handlers I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example *driver start -> network start*, etc. An example of such a default handler is provided below:

```
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↪netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↪EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↪EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

Network stack connection The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer.

Note, that IDF provides several network stack configurations for the most common network interfaces, such as for the WiFi station or Ethernet. These configurations are defined in esp_netif/include/esp_netif_defaults.h and should be sufficient for most network drivers. (In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set)

The following API reference outlines these network stack interaction with the esp-netif:

Header File

- components/esp_netif/include/esp_netif_net_stack.h

Functions

esp_netif_t ***esp_netif_get_handle_from_netif_impl**(void *dev)

Returns esp-netif handle.

参数 **dev** –**[in]** opaque ptr to network interface of specific TCP/IP stack
返回 handle to related esp-netif instance

void ***esp_netif_get_netif_impl**(*esp_netif_t* *esp_netif)

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

参数 **esp_netif** –**[in]** Handle to esp-netif instance
返回 handle to related network stack netif handle

esp_err_t **esp_netif_set_link_speed**(*esp_netif_t* *esp_netif, uint32_t speed)

Set link-speed for the specified network interface.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **speed** –**[in]** Link speed in bit/s

返回 ESP_OK on success

esp_err_t **esp_netif_transmit**(*esp_netif_t* *esp_netif, void *data, size_t len)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **data** –**[in]** Data to be transmitted
- **len** –**[in]** Length of the data frame

返回 ESP_OK on success, an error passed from the I/O driver otherwise

esp_err_t **esp_netif_transmit_wrap**(*esp_netif_t* *esp_netif, void *data, size_t len, void *netstack_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **data** –**[in]** Data to be transmitted
- **len** –**[in]** Length of the data frame
- **netstack_buf** –**[in]** net stack buffer

返回 ESP_OK on success, an error passed from the I/O driver otherwise

void **esp_netif_free_rx_buffer**(void *esp_netif, void *buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

参数

- **esp_netif** –**[in]** Handle to esp-netif instance
- **buffer** –**[in]** Rx buffer pointer

TCP/IP 套接字 API 的示例代码存放在 ESP-IDF 示例项目的 protocols/sockets 目录下。

应用层网络协议（IP 网络层协议之上）的相关文档存放在应用层协议 目录下。

2.6 外设 API

2.6.1 Analog to Digital Converter (ADC) Oneshot Mode Driver

Introduction

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from dedicated analog IO pads.

ESP32-C3 has two ADC unit(s), which can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC oneshot mode conversion.

Functional Overview

The following sections of this document cover the typical steps to install and operate an ADC:

- *Resource Allocation* - covers which parameters should be set up to get an ADC handle and how to recycle the resources when ADC finishes working.
- *Unit Configuration* - covers the parameters that should be set up to configure the ADC unit, so as to get ADC conversion raw result.
- *Read Conversion Result* - covers how to get ADC conversion raw result.
- *Hardware Limitations* - describes the ADC related hardware limitations.
- *Power Management* - covers power management related.
- *IRAM Safe* - describes tips on how to read ADC conversion raw result when cache is disabled.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation The ADC oneshot mode driver is implemented based on ESP32-C3 SAR ADC module. Different ESP chips might have different number of independent ADCs. From oneshot mode driver's point of view, an ADC instance is represented by `adc_oneshot_unit_handle_t`.

To install an ADC instance, set up the required initial configuration structure `adc_oneshot_unit_init_cfg_t`:

- `adc_oneshot_unit_init_cfg_t::unit_id` selects the ADC. Please refer to the datasheet to know dedicated analog IOs for this ADC.
- `adc_oneshot_unit_init_cfg_t::clk_src` selects the source clock of the ADC. If it's set to 0, driver will fallback to use a default clock source, see `adc_oneshot_clk_src_t` to know the details.
- `adc_oneshot_unit_init_cfg_t::ulp_mode` sets if the ADC will be working under ULP mode.

After setting up the initial configurations for the ADC, call `adc_oneshot_new_unit()` with the prepared `adc_oneshot_unit_init_cfg_t`. This function will return an ADC unit handle, if the allocation is successful.

This function may fail due to various errors such as invalid argumemts, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return `ESP_ERR_NOT_FOUND` error. Number of available ADC(s) is recorded by `SOC_ADC_PERIPH_NUM`.

If a previously created ADC instance is no loger required, you should recycle the ADC instance by calling `adc_oneshot_del_unit()`, related hardware and software resources will be recycled as well.

Create an ADC Unit Handle under Normal Oneshot Mode

```
adc_oneshot_unit_handle_t adc1_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adc1_handle));
```

Recycle the ADC Unit

```
ESP_ERROR_CHECK(adc_oneshot_del_unit(adc1_handle));
```

Unit Configuration After an ADC instance is created, set up the *adc_oneshot_chan_cfg_t* to configure ADC IOs to measure analog signal:

- *adc_oneshot_chan_cfg_t::atten*, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- *adc_oneshot_chan_cfg_t::bitwidth*, the bitwidth of the raw conversion result.

备注: For the IO corresponding ADC channel number. Check datasheet to know the ADC IOs. On the other hand, *adc_continuous_io_to_channel()* and *adc_continuous_channel_to_io()* can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call *adc_oneshot_config_channel()* with above configuration structure. You should specify an ADC channel to be configured as well. This function (*adc_oneshot_config_channel()*) can be called multiple times to configure different ADC channels. The Driver will save each of these channel configurations internally.

Configure Two ADC Channels

```
adc_oneshot_chan_cfg_t config = {
    .bitwidth = ADC_BITWIDTH_DEFAULT,
    .atten = ADC_ATTEN_DB_11,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN0, &
↪config));
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN1, &
↪config));
```

Read Conversion Result After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call *adc_oneshot_read()* to get the conversion raw result of an ADC channel.

- *adc_oneshot_read()* is safe to use. ADC(s) are shared by some other drivers / peripherals, see *Hardware Limitations*. This function uses mutexes to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers / peripherals, and return *ESP_ERR_TIMEOUT*. Under this condition, the ADC raw result is invalid.

These two functions will both fail due to invalid arguments.

The ADC conversion results read from these two functions are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

```
Vout = Dout * Vmax / Dmax        (1)
```

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM.
Dmax	Maximum of the output ADC raw digital reading result, which is 2^bitwidth, where bitwidth is the :cpp:member::*adc_oneshot_chan_cfg_t:bitwidth* configured before.

To do further calbration to convert the ADC raw result to voltage in mV, please refer to calibration doc *Analog to Digital Converter (ADC) Calibration Driver*.

Read Raw Result

```
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0,
↪ adc_raw[0][0]);
```

(下页继续)

(续上页)

```
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1,
↪ adc_raw[0][1]);
```

Hardware Limitations

- Random Number Generator uses ADC as a input source. When ADC *adc_oneshot_read()* works, the random number generated from RNG will be less random.
- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. *adc_oneshot_read()* has provided the protection.
- ADC2 oneshot mode is no longer supported, due to hardware limitation. The results are not stable. This issue can be found in ESP32C3 Errata. For compatibility, you can enable *CONFIG_ADC_ONESHOT_FORCE_USE_ADC2_ON_C3* to force use ADC2.

Power Management When power management is enabled (i.e. *CONFIG_PM_ENABLE* is on), the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the *adc_oneshot_read()* will poll the CPU until the function returns. During this period of time, the task in which ADC oneshot mode driver resides won't be blocked. Therefore the clock frequency is stable when reading.

IRAM Safe By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled (Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc.). If these APIs executes when the Cache is disabled, you will probably see errors like Illegal Instruction or Load/Store Prohibited.

Thread Safety

- *adc_oneshot_new_unit()*
- *adc_oneshot_config_channel()*
- *adc_oneshot_read()*

Above functions are guaranteed to be thread safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- *adc_oneshot_del_unit()* is not thread safe. Besides, concurrently calling this function may result in failures of above thread-safe APIs.

Kconfig Options

- *CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM* controls where to place the ADC fast read function (IRAM or Flash), see *IRAM Safe* for more details.

Application Examples

- ADC oneshot mode example: peripherals/adc/oneshot_read.

API Reference

Structures

struct **adc_digi_pattern_config_t**

ADC digital controller pattern configuration.

Public Members

uint8_t **atten**

Attenuation of this ADC channel.

uint8_t **channel**

ADC channel.

uint8_t **unit**

ADC unit.

uint8_t **bit_width**

ADC output bit width.

struct **adc_digi_output_data_t**

ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

Public Members

uint32_t **data**

ADC real output data info. Resolution: 12 bit.

uint32_t **reserved12**

Reserved12.

uint32_t **channel**

ADC channel index info. If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.

uint32_t **unit**

ADC unit index info. 0: ADC1; 1: ADC2.

uint32_t **reserved17_31**

Reserved17.

struct *adc_digi_output_data_t*::[anonymous]::[anonymous] **type2**

When the configured output format is 12bit.

uint32_t **val**

Raw data value

Type Definitions

typedef *soc_periph_adc_digi_clk_src_t* **adc_oneshot_clk_src_t**

Clock source type of oneshot mode which uses digital controller.

typedef *soc_periph_adc_digi_clk_src_t* **adc_continuous_clk_src_t**

Clock source type of continuous mode which uses digital controller.

Enumerations

enum **adc_unit_t**

ADC unit.

Values:

enumerator **ADC_UNIT_1**

SAR ADC 1.

enumerator **ADC_UNIT_2**

SAR ADC 2.

enum **adc_channel_t**

ADC channels.

Values:

enumerator **ADC_CHANNEL_0**

ADC channel.

enumerator **ADC_CHANNEL_1**

ADC channel.

enumerator **ADC_CHANNEL_2**

ADC channel.

enumerator **ADC_CHANNEL_3**

ADC channel.

enumerator **ADC_CHANNEL_4**

ADC channel.

enumerator **ADC_CHANNEL_5**

ADC channel.

enumerator **ADC_CHANNEL_6**

ADC channel.

enumerator **ADC_CHANNEL_7**

ADC channel.

enumerator **ADC_CHANNEL_8**

ADC channel.

enumerator **ADC_CHANNEL_9**

ADC channel.

enum **adc_atten_t**

ADC attenuation parameter. Different parameters determine the range of the ADC.

Values:

enumerator **ADC_ATTEN_DB_0**

No input attenuation, ADC can measure up to approx.

enumerator **ADC_ATTEN_DB_2_5**

The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

enumerator **ADC_ATTEN_DB_6**

The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

enumerator **ADC_ATTEN_DB_11**

The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

enum **adc_bitwidth_t**

Values:

enumerator **ADC_BITWIDTH_DEFAULT**

Default ADC output bits, max supported width will be selected.

enumerator **ADC_BITWIDTH_9**

ADC output width is 9Bit.

enumerator **ADC_BITWIDTH_10**

ADC output width is 10Bit.

enumerator **ADC_BITWIDTH_11**

ADC output width is 11Bit.

enumerator **ADC_BITWIDTH_12**

ADC output width is 12Bit.

enumerator **ADC_BITWIDTH_13**

ADC output width is 13Bit.

enum **adc_ulp_mode_t**

Values:

enumerator **ADC_ULP_MODE_DISABLE**

ADC ULP mode is disabled.

enumerator **ADC_ULP_MODE_FSM**

ADC is controlled by ULP FSM.

enumerator **ADC_ULP_MODE_RISCV**

ADC is controlled by ULP RISCV.

enum **adc_digi_convert_mode_t**

ADC digital controller (DMA mode) work mode.

Values:

enumerator **ADC_CONV_SINGLE_UNIT_1**

Only use ADC1 for conversion.

enumerator **ADC_CONV_SINGLE_UNIT_2**

Only use ADC2 for conversion.

enumerator **ADC_CONV_BOTH_UNIT**

Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC_CONV_ALTER_UNIT**

Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ⋯..

enum **adc_digi_output_format_t**

ADC digital controller (DMA mode) output data format option.

Values:

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE1**

See `adc_digi_output_data_t.type1`

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE2**

See *adc_digi_output_data_t.type2*

enum **adc_digi_iir_filter_t**

ADC IIR Filter ID.

Values:

enumerator **ADC_DIGI_IIR_FILTER_0**

Filter 0.

enumerator **ADC_DIGI_IIR_FILTER_1**

Filter 1.

enum **adc_digi_iir_filter_coeff_t**

IIR Filter Coefficient.

Values:

enumerator **ADC_DIGI_IIR_FILTER_COEFF_2**

The filter coefficient is 2.

enumerator **ADC_DIGI_IIR_FILTER_COEFF_4**

The filter coefficient is 4.

enumerator **ADC_DIGI_IIR_FILTER_COEFF_8**

The filter coefficient is 8.

enumerator **ADC_DIGI_IIR_FILTER_COEFF_16**

The filter coefficient is 16.

enumerator **ADC_DIGI_IIR_FILTER_COEFF_64**

The filter coefficient is 64.

Header File

- components/esp_adc/include/esp_adc/adc_oneshot.h

Functions

esp_err_t **adc_oneshot_new_unit**(const *adc_oneshot_unit_init_cfg_t* *init_config, *adc_oneshot_unit_handle_t* *ret_unit)

Create a handle to a specific ADC unit.

备注: This API is thread-safe. For more details, see ADC programming guide

---

参数

- **init_config** –**[in]** Driver initial configurations
- **ret_unit** –**[out]** ADC unit handle

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NO_MEM: No memory
- ESP_ERR_NOT_FOUND: The ADC peripheral to be claimed is already in use
- ESP_FAIL: Clock source isn’ t initialised correctly

esp_err_t **adc_oneshot_config_channel**(*adc_oneshot_unit_handle_t* handle, *adc_channel_t* channel, const *adc_oneshot_chan_cfg_t* *config)

Set ADC oneshot mode required configurations.

备注: This API is thread-safe. For more details, see ADC programming guide

---

参数

- **handle** –**[in]** ADC handle
- **channel** –**[in]** ADC channel to be configured
- **config** –**[in]** ADC configurations

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments

esp_err_t **adc_oneshot_read**(*adc_oneshot_unit_handle_t* handle, *adc_channel_t* chan, int *out_raw)

Get one ADC conversion raw result.

备注： This API is thread-safe. For more details, see ADC programming guide

备注： This API should NOT be called in an ISR context

参数
- **handle** –**[in]** ADC handle
- **chan** –**[in]** ADC channel
- **out_raw** –**[out]** ADC conversion raw result

返回
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_TIMEOUT: Timeout, the ADC result is invalid

esp_err_t **adc_oneshot_del_unit**(*adc_oneshot_unit_handle_t* handle)

Delete the ADC unit handle.

备注： This API is thread-safe. For more details, see ADC programming guide

参数 **handle** –**[in]** ADC handle

返回
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NOT_FOUND: The ADC peripheral to be disclaimed isn’t in use

esp_err_t **adc_oneshot_io_to_channel**(int io_num, *adc_unit_t* *unit_id, *adc_channel_t* *channel)

Get ADC channel from the given GPIO number.

参数
- **io_num** –**[in]** GPIO number
- **unit_id** –**[out]** ADC unit
- **channel** –**[out]** ADC channel

返回
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

esp_err_t **adc_oneshot_channel_to_io**(*adc_unit_t* unit_id, *adc_channel_t* channel, int *io_num)

Get GPIO number from the given ADC channel.

参数
- **unit_id** –**[in]** ADC unit
- **channel** –**[in]** ADC channel
- **io_num** –**[out]** GPIO number
- **–** –ESP_OK: On success
  - ESP_ERR_INVALID_ARG: Invalid argument

esp_err_t **adc_oneshot_get_calibrated_result**(*adc_oneshot_unit_handle_t* handle, *adc_cali_handle_t* cali_handle, *adc_channel_t* chan, int *cali_result)

Convenience function to get ADC calibrated result.

This is an all-in-one function which does:

- oneshot read ADC raw result
- calibrate the raw result and convert it into calibrated result (in mV)

参数

- **handle** –**[in]** ADC oneshot handle, you should call adc_oneshot_new_unit() to get this handle
- **cali_handle** –**[in]** ADC calibration handle, you should call adc_cali_create_scheme_x() in adc_cali_scheme.h to create a handle
- **chan** –**[in]** ADC channel
- **cali_result** –**[out]** Calibrated ADC result (in mV)

返回

- ESP_OK Other return errors from adc_oneshot_read() and adc_cali_raw_to_voltage()

Structures

struct **adc_oneshot_unit_init_cfg_t**

ADC oneshot driver initial configurations.

Public Members

adc_unit_t **unit_id**

ADC unit.

adc_oneshot_clk_src_t **clk_src**

Clock source.

adc_ulp_mode_t **ulp_mode**

ADC controlled by ULP, see `adc_ulp_mode_t`

struct **adc_oneshot_chan_cfg_t**

ADC channel configurations.

Public Members

adc_atten_t **atten**

ADC attenuation.

adc_bitwidth_t **bitwidth**

ADC conversion result bits.

Type Definitions

typedef struct adc_oneshot_unit_ctx_t ***adc_oneshot_unit_handle_t**

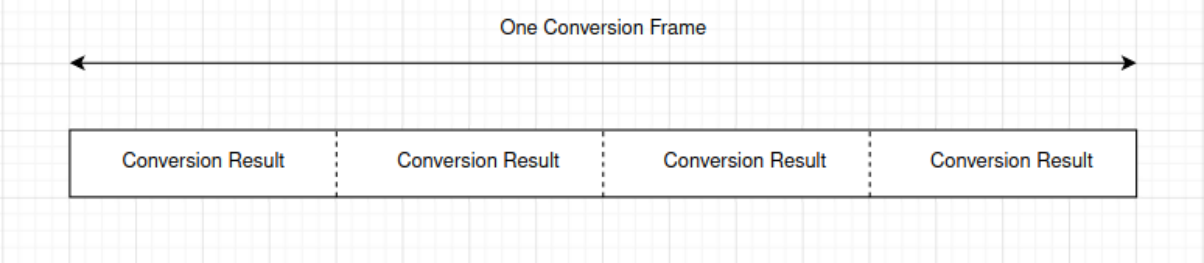
Type of ADC unit handle for oneshot mode.

2.6.2 Analog to Digital Converter (ADC) Continuous Mode Driver

Introduction

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from specific analog IO pads.

ESP32-C3 has two ADC unit(s), which can be used in scenario(s) like:



- Generate one-shot ADC conversion result

- Generate continuous ADC conversion results

This guide will introduce ADC continuous mode conversion.

Driver Concepts ADC continuous mode conversion is made up with multiple Conversion Frames.

- Conversion Frame: One Conversion Frame contains multiple Conversion Results. Conversion Frame size is configured in `adc_continuous_new_handle()`, in bytes.
- Conversion Result: One Conversion Result contains multiple bytes (see `SOC_ADC_DIGI_RESULT_BYTES`). Its structure is `adc_digi_output_data_t`, including ADC unit, ADC channel and raw data.

Functional Overview

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from group of ADC channels continuously:

- *Resource Allocation* - covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- *ADC Configurations* - describes how to configure the ADC(s) to make it work under continuous mode.
- *ADC Control* - describes ADC control functions.
- *Register Event Callbacks* - describes how to hook user specific code to an ADC continuous mode event callback function.
- *Read Conversion Result* - covers how to get ADC conversion result.
- *Hardware Limitations* - describes the ADC related hardware limitations.
- *Power Management* - covers power management related.
- *IRAM Safe* - covers the IRAM safe functions.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.

Resource Allocation The ADC continuous mode driver is implemented based on ESP32-C3 SAR ADC module. Different ESP targets might have different number of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure `adc_continuous_handle_cfg_t`:

- `adc_continuous_handle_cfg_t::max_store_buf_size` set the maximum size (in bytes) of the pool that the driver saves ADC conversion result into. If this pool is full, new conversion results will be lost.
- `adc_continuous_handle_cfg_t::conv_frame_size` set the size of the ADC conversion frame, in bytes.

After setting up above configurations for the ADC, call `adc_continuous_new_handle()` with the prepared `adc_continuous_handle_cfg_t`. This function may fail due to various errors such as invalid argumemts, insufficient memory, etc.

Especially, when this function returns `ESP_ERR_NOT_FOUND`, this means there is no free GDMA channel.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling `adc_continuous_deinit()`.

Two IIR filters are available when ADC is working under continuous mode. To create an ADC IIR filter, you should set up the `adc_continuous_iir_filter_config_t`, and call `adc_new_continuous_iir_filter()`.

- `adc_digi_filter_config_t::unit`, ADC unit.
- `adc_digi_filter_config_t::channel`, ADC channel to be filtered.
- `adc_digi_filter_config_t::coeff`, filter coefficient.

To recycle a filter, you should call `adc_del_continuous_iir_filter()`.

备注： If you use both the filters on a same ADC channel, then only the first one will take effect.

Initialize the ADC Continuous Mode Driver

```
adc_continuous_handle_cfg_t adc_config = {
    .max_store_buf_size = 1024,
    .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));
```

Recycle the ADC Unit

```
ESP_ERROR_CHECK(adc_continuous_deinit());
```

ADC Configurations After the ADC continuous mode driver is initialized, set up the *adc_continuous_config_t* to configure ADC IOs to measure analog signal:

- *adc_continuous_config_t::pattern_num*, number of ADC channels that will be used.
- *adc_continuous_config_t::adc_pattern*, list of configs for each ADC channel that will be used, see below description.
- *adc_continuous_config_t::sample_freq_hz*, expected ADC sampling frequency in Hz.
- *adc_continuous_config_t::conv_mode*, continuous conversion mode.
- *adc_continuous_config_t::format*, conversion output format.

For *adc_digi_pattern_config_t*:

- *adc_digi_pattern_config_t::atten*, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- *adc_digi_pattern_config_t::channel*, the IO corresponding ADC channel number. See below note.
- *adc_digi_pattern_config_t::unit*, the ADC that the IO is subordinate to.
- *adc_digi_pattern_config_t::bit_width*, the bitwidth of the raw conversion result.

备注： For the IO corresponding ADC channel number. Check datasheet to acquire the ADC IOs. On the other hand, *adc_continuous_io_to_channel()* and *adc_continuous_channel_to_io()* can be used to acquire the ADC channels and ADC IOs.

To make these settings take effect, call *adc_continuous_config()* with the configuration structure above. This API may fail due to reasons like *ESP_ERR_INVALID_ARG*. When it returns *ESP_ERR_INVALID_STATE*, this means the ADC continuous mode driver is started, you shouldn't call this API at this moment.

See ADC continuous mode example peripherals/adc/continuous_read to see configuration codes.

To enable / disable the ADC IIR filter, you should call `adc_continuous_iir_filter_enable()` / `adc_continuous_iir_filter_disable()`.

ADC Control

Start and Stop Calling *adc_continuous_start()* will make the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results. On the contrary, calling *adc_continuous_stop()* will stop the ADC conversion.

```
ESP_ERROR_CHECK(adc_continuous_stop());
```

Register Event Callbacks By calling *adc_continuous_register_event_callbacks()*, you can hook your own function to the driver ISR. Supported event callbacks are listed in *adc_continuous_evt_cbs_t* - *adc_continuous_evt_cbs_t::on_conv_done*, this is invoked when one conversion frame finishes. - *adc_continuous_evt_cbs_t::on_pool_ovf*, this is invoked when internal pool is full. Newer conversion results will be discarded.

As above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logics should not appear in these callbacks. Callback function prototype is declared in *adc_continuous_callback_t*.

You can also register your own context when calling *adc_continuous_register_event_callbacks()*, by the parameter `user_data`. This user data will be passed to the callback functions directly.

This function may fail due to reasons like *ESP_ERR_INVALID_ARG*. Specially, when *CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE* is enabled, this error may indicate that the callback functions aren't in internal RAM. Check error log to know this. Besides, when it fails due to *ESP_ERR_INVALID_STATE*, this means the ADC continuous mode driver is started, you shouldn't add callback at this moment.

Conversion Done Event The driver will fill in the event data of a *adc_continuous_evt_cbs_t::on_conv_done* event. Event data contains a buffer pointer to a conversion frame buffer, together with the size. Refer to *adc_continuous_evt_data_t* to know the event data structure.

备注: It is worth noting that, the data buffer *adc_continuous_evt_data_t::conv_frame_buffer* is maintained by the driver itself. Therefore, never free this piece of memory.

备注: When the Kconfig option *CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE* is enabled, the registered callbacks and the functions called by the callbacks should be placed in IRAM. The involved variables should be placed in internal RAM as well.

Pool Overflow Event The ADC continuous mode driver has an internal pool to save the conversion results. When the pool is full, a pool overflow event will emerge. Under this condition, the driver won't fill in the event data. This usually happens the speed to read data from the pool (by calling *adc_continuous_read()*) is much slower than the ADC conversion speed.

Read Conversion Result After calling *adc_continuous_start()*, the ADC continuous conversion starts. Call *adc_continuous_read()* to get the conversion results of the ADC channels. You need to provide a buffer to get the raw results.

This function will try to read the expected length of conversion results each time.

- If the requested length isn't reached, the function will still move the data from the internal pool to the buffer you prepared. Therefore, check the *out_length* to know the actual size of conversion results.
- If there is no conversion result generated in the internal pool, the function will block for *timeout_ms* until the conversion results are generated. If there is still no generated results, the function will return *ESP_ERR_TIMEOUT*.
- If the generated results fill up the internal pool, new generated results will be lost. Next time when the *adc_continuous_read()* is called, this function will return *ESP_ERR_INVALID_STATE* indicating this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from above function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

```
Vout = Dout * Vmax / Dmax        (1)
```

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM.
Dmax	Maximum of the output ADC raw digital reading result, which is 2^bitwidth, where bitwidth is the :cpp:member::*adc_digi_pattern_config_t:bit_width* configured before.

To do further calbration to convert the ADC raw result to voltage in mV, please refer to calibration doc *Analog to Digital Converter (ADC) Calibration Driver*.

Hardware Limitations

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. `adc_continuous_start()` has provided the protection.
- Random Number Generator uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.
- ADC2 continuous mode is no longer supported, due to hardware limitation. The results are not stable. This issue can be found in ESP32C3 Errata. For compatibility, you can enable *CONFIG_ADC_CONTINUOUS_FORCE_USE_ADC2_ON_C3_S3* to force use ADC2.

Power Management When power management is enabled (i.e. *CONFIG_PM_ENABLE* is on), the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. The lock is acquired after the continuous conversion is started by `adc_continuous_start()`. Similarly, the lock will be released after `adc_continuous_stop()`. Therefore, `adc_continuous_start()` and `adc_continuous_stop()` should appear in pairs, otherwise the power management will be out of action.

IRAM Safe All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option *CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE*, driver internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

Thread Safety ADC continuous mode driver APIs are not guaranteed to be thread safe. However, the share hardware mutual exclusion is provided by the driver. See *Hardware Limitations* for more details.

Application Examples

- ADC continuous mode example: peripherals/adc/continuous_read.

API Reference

Header File

- components/esp_adc/include/esp_adc/adc_continuous.h

Functions

esp_err_t **adc_continuous_new_handle**(const *adc_continuous_handle_cfg_t* *hdl_config, *adc_continuous_handle_t* *ret_handle)

Initialize ADC continuous driver and get a handle to it.

参数

- **hdl_config** –**[in]** Pointer to ADC initilization config. Refer to *adc_continuous_handle_cfg_t*.
- **ret_handle** –**[out]** ADC continuous mode driver handle

返回

- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_NO_MEM If out of memory
- ESP_OK On success

esp_err_t **adc_continuous_config**(*adc_continuous_handle_t* handle, const *adc_continuous_config_t* *config)

Set ADC continuous mode required configurations.

参数

- **handle** –**[in]** ADC continuous mode driver handle
- **config** –**[in]** Refer to `adc_digi_config_t`.

返回

- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn't call this API at this moment
- ESP_ERR_INVALID_ARG: If the combination of arguments is invalid.
- ESP_OK: On success

esp_err_t **adc_continuous_register_event_callbacks**(*adc_continuous_handle_t* handle, const *adc_continuous_evt_cbs_t* *cbs, void *user_data)

Register callbacks.

备注: User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member in the `cbs` structure to NULL.

备注: When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including `user_data`) should be in internal RAM as well.

备注: You should only call this API when the ADC continuous mode driver isn't started. Check return value to know this.

参数

- **handle** –**[in]** ADC continuous mode driver handle
- **cbs** –**[in]** Group of callback functions
- **user_data** –**[in]** User data, which will be delivered to the callback functions directly

返回

- ESP_OK: On success

- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn't call this API at this moment

esp_err_t **adc_continuous_start**(*adc_continuous_handle_t* handle)

Start the ADC under continuous mode. After this, the hardware starts working.

参数 **handle** –**[in]** ADC continuous mode driver handle

返回

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

esp_err_t **adc_continuous_read**(*adc_continuous_handle_t* handle, uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)

Read bytes from ADC under continuous mode.

参数

- **handle** –**[in]** ADC continuous mode driver handle
- **buf** –**[out]** Conversion result buffer to read from ADC. Suggest convert to *adc_digi_output_data_t* for `ADC Conversion Results`. See `@brief Driver Backgrounds` to know this concept.
- **length_max** –**[in]** Expected length of the Conversion Results read from the ADC, in bytes.
- **out_length** –**[out]** Real length of the Conversion Results read from the ADC via this API, in bytes.
- **timeout_ms** –**[in]** Time to wait for data via this API, in millisecond.

返回

- ESP_ERR_INVALID_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT Operation timed out
- ESP_OK On success

esp_err_t **adc_continuous_stop**(*adc_continuous_handle_t* handle)

Stop the ADC. After this, the hardware stops working.

参数 **handle** –**[in]** ADC continuous mode driver handle

返回

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

esp_err_t **adc_continuous_deinit**(*adc_continuous_handle_t* handle)

Deinitialize the ADC continuous driver.

参数 **handle** –**[in]** ADC continuous mode driver handle

返回

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

esp_err_t **adc_continuous_io_to_channel**(int io_num, *adc_unit_t* *unit_id, *adc_channel_t* *channel)

Get ADC channel from the given GPIO number.

参数

- **io_num** –**[in]** GPIO number
- **unit_id** –**[out]** ADC unit
- **channel** –**[out]** ADC channel

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

esp_err_t **adc_continuous_channel_to_io**(*adc_unit_t* unit_id, *adc_channel_t* channel, int *io_num)

Get GPIO number from the given ADC channel.

参数

- **unit_id** –**[in]** ADC unit
- **channel** –**[in]** ADC channel
- **io_num** –**[out]** GPIO number
- **–** –ESP_OK: On success
  - ESP_ERR_INVALID_ARG: Invalid argument

Structures

struct **adc_continuous_handle_cfg_t**

ADC continuous mode driver initial configurations.

Public Members

uint32_t **max_store_buf_size**

Max length of the conversion Results that driver can store, in bytes.

uint32_t **conv_frame_size**

Conversion frame size, in bytes. This should be in multiples of `SOC_ADC_DIGI_DATA_BYTES_PER_CONV`.

struct **adc_continuous_config_t**

ADC continuous mode driver configurations.

Public Members

uint32_t **pattern_num**

Number of ADC channels that will be used.

adc_digi_pattern_config_t ***adc_pattern**

List of configs for each ADC channel that will be used.

uint32_t **sample_freq_hz**

The expected ADC sampling frequency in Hz. Please refer to `soc/soc_caps.h` to know available sampling frequency range

adc_digi_convert_mode_t **conv_mode**

ADC DMA conversion mode, see `adc_digi_convert_mode_t`.

adc_digi_output_format_t **format**

ADC DMA conversion output format, see `adc_digi_output_format_t`.

struct **adc_continuous_evt_data_t**

Event data structure.

备注: The `conv_frame_buffer` is maintained by the driver itself, so never free this piece of memory.

Public Members

uint8_t ***conv_frame_buffer***

Pointer to conversion result buffer for one conversion frame.

uint32_t **size**

Conversion frame size.

struct **adc_continuous_evt_cbs_t**

Group of ADC continuous mode callbacks.

备注： These callbacks are all running in an ISR environment.

备注： When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

Public Members

adc_continuous_callback_t **on_conv_done**

Event callback, invoked when one conversion frame is done. See `@brief Driver Backgrounds` to konw `conversion frame` concept.

adc_continuous_callback_t **on_pool_ovf**

Event callback, invoked when the internal pool is full.

Macros

ADC_MAX_DELAY

Driver Backgrounds.

Type Definitions

typedef struct adc_continuous_ctx_t ***adc_continuous_handle_t**

Type of adc continuous mode driver handle.

typedef bool (***adc_continuous_callback_t**)(*adc_continuous_handle_t* handle, const *adc_continuous_evt_data_t* *edata, void *user_data)

Prototype of ADC continuous mode event callback.

Param handle **[in]** ADC continuous mode driver handle
Param edata **[in]** Pointer to ADC contunuous mode event data
Param user_data **[in]** User registered context, registered when in `adc_continuous_register_event_callbacks()`
Return Whether a high priority task is woken up by this function

2.6.3 Analog to Digital Converter (ADC) Calibration Driver

Introduction

Based on series of comparisons with the reference voltage, ESP32-C3 ADC determines each bit of the output digital result. Per design the ESP32-C3 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide will introduce an ADC calibration driver to minimize this difference.

Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

- *Calibration Scheme Creation* - covers how to create a calibration scheme handle and delete the calibration scheme handle.
- *Result Conversion* - convers how to convert ADC raw result to calibrated result.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Minimize Noise* - describes a general way to minimize the noise.

Calibration Scheme Creation The ADC calibration driver provides ADC calibration scheme(s). From calibration driver's point of view, an ADC calibration scheme is created to an ADC calibration handle *adc_cali_handle_t*.

adc_cali_check_scheme() can be used to know which calibration scheme is supported on the chip. For those users who are already aware of the supported scheme, this step can be skipped. Just call the corresponding function to create the scheme handle.

For those users who use their custom ADC calibration schemes, you could either modify this function *adc_cali_check_scheme()*, or just skip this step and call your custom creation function.

ADC Calibration Curve Fitting Scheme ESP32-C3 supports `ADC_CALI_SCHEME_VER_CURVE_FITTING` scheme. To create this scheme, set up `adc_cali_curve_fitting_config_t` first.

- `adc_cali_curve_fitting_config_t::unit_id`, the ADC that your ADC raw results are from.
- `adc_cali_curve_fitting_config_t::atten`, ADC attenuation that your ADC raw results use.
- `adc_cali_curve_fitting_config_t::bitwidth`, the ADC raw result bitwidth.

After setting up the configuration structure, call `adc_cali_create_scheme_curve_fitting()` to create a Curve Fitting calibration scheme handle. This function may fail due to reasons such as *ESP_ERR_INVALID_ARG* or *ESP_ERR_NO_MEM*. Especially, when the function return *ESP_ERR_NOT_SUPPORTED*, this means the calibration scheme required eFuse bits are not burnt on your board.

Create Curve Fitting Scheme

```
ESP_LOGI(TAG, "calibration scheme version is %s", "Curve Fitting");
adc_cali_curve_fitting_config_t cali_config = {
    .unit_id = unit,
    .atten = atten,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_curve_fitting(&cali_config, &handle));
```

When the ADC calibration is no longer used, please delete the calibration scheme driver from the calibration handle by calling `adc_cali_delete_scheme_curve_fitting()`.

Delete Curve Fitting Scheme

```
ESP_LOGI(TAG, "delete %s calibration scheme", "Curve Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_curve_fitting(handle));
```

备注: For users who want to use their custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table *adc_cali_scheme_t* in *components/esp_adc/interface/adc_cali_interface.h* to know the ESP ADC calibration interface.

Result Conversion After setting up the calibration characteristics, you can call *adc_cali_raw_to_voltage()* to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to invalid argument. Especailly, if this function returns *ESP_ERR_INVALID_STATE*, this means the calibration scheme isn't created. You need to create a calibration scheme handle, use *adc_cali_check_scheme()* to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

Get Voltage

```
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &
↪voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_
↪ADC1_CHAN0, voltage[0][0]);
```

Thread Safety The factory function `esp_adc_cali_new_scheme()` is guaranteed to be thread safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks.

Other functions that take the *adc_cali_handle_t* as the first positional parameter are not thread safe, you should avoid calling them from multiple tasks.

Minimize Noise The ESP32-C3 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

API Reference

Header File

- components/esp_adc/include/esp_adc/adc_cali.h

Functions

esp_err_t **adc_cali_check_scheme**(*adc_cali_scheme_ver_t* *scheme_mask)

Check the supported ADC calibration scheme.

参数 **scheme_mask** –**[out]** Supported ADC calibration scheme(s)

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_SUPPORTED: No supported calibration scheme

esp_err_t **adc_cali_raw_to_voltage**(*adc_cali_handle_t* handle, int raw, int *voltage)

Convert ADC raw data to calibrated voltage.

参数

- **handle** –**[in]** ADC calibration handle
- **raw** –**[in]** ADC raw data
- **voltage** –**[out]** Calibrated ADC voltage (in mV)

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument

- ESP_ERR_INVALID_STATE: Invalid state, scheme didn't registered

Type Definitions

typedef struct adc_cali_scheme_t ***adc_cali_handle_t**

ADC calibration handle.

Enumerations

enum **adc_cali_scheme_ver_t**

ADC calibration scheme.

Values:

enumerator **ADC_CALI_SCHEME_VER_LINE_FITTING**

Line fitting scheme.

enumerator **ADC_CALI_SCHEME_VER_CURVE_FITTING**

Curve fitting scheme.

Header File

- components/esp_adc/include/esp_adc/adc_cali_scheme.h

2.6.4 Clock Tree

The clock subsystem of ESP32-C3 is used to source and distribute system/module clocks from a range of root clocks. The clock tree driver maintains the basic functionality of the system clock and the intricate relationship among module clocks.

This document starts with the introduction to root and module clocks. Then it covers the clock tree APIs that users can call to monitor the status of the module clocks at runtime.

Introduction

This section lists definitions of the ESP32-C3's supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help user select a proper source clock for the peripheral.

Root Clocks Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), WIFI, BT, the RTC, and the peripherals.

ESP32-C3's root clocks are listed in *soc_root_clk_t*:

- Internal 17.5MHz RC Oscillator (RC_FAST)
  This RC oscillator generates a ~17.5MHz clock signal output as the RC_FAST_CLK.
  The ~17.5MHz signal output is also passed into a configurable divider, which by default divides the input clock frequency by 256, to generate a RC_FAST_D256_CLK.
  The exact frequency of RC_FAST_CLK can be computed in runtime through calibration on the RC_FAST_D256_CLK.
- External 40MHz Crystal (XTAL)
- Internal 136kHz RC Oscillator (RC_SLOW)
  This RC oscillator generates a ~136kHz clock signal output as the RC_SLOW_CLK.
  The exact frequency of this clock can be computed in runtime through calibration.

- External 32kHz Crystal - optional (XTAL32K)
  The clock source for this XTAL32K_CLK can be either a 32kHz crystal connecting to the XTAL_32K_P and XTAL_32K_N pins or a 32kHz clock signal generated by an external circuit. The external signal must be connected to the XTAL_32K_P pin. XTAL32K_CLK can also be calibrated to get its exact frequency.

Typically, the frequency of the signal generated from a RC oscillator circuit is less accurate and more sensitive to environment comparing to the signal generated from a crystal. ESP32-C3 provides several clock source options for the RTC_SLOW_CLK, and users can make the choice based on the requirements for system time accuracy and power consumption (refer to *RTC 定时器时钟源* for more details).

Module Clocks ESP32-C3's available module clocks are listed in *soc_module_clk_t*. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.

API Usage

The clock tree driver provides an all-in-one API to get the frequency of the module clocks, *esp_clk_tree_src_get_freq_hz()*. Users can call this function at any moment, with specifying the clock name (*soc_module_clk_t*) and the desired degree of precision of the returned frequency value (*esp_clk_tree_src_freq_precision_t*).

API Reference

Header File

- components/soc/esp32c3/include/soc/clk_tree_defs.h

Macros

SOC_CLK_RC_FAST_FREQ_APPROX

Approximate RC_FAST_CLK frequency in Hz

SOC_CLK_RC_SLOW_FREQ_APPROX

Approximate RC_SLOW_CLK frequency in Hz

SOC_CLK_RC_FAST_D256_FREQ_APPROX

Approximate RC_FAST_D256_CLK frequency in Hz

SOC_CLK_XTAL32K_FREQ_APPROX

Approximate XTAL32K_CLK frequency in Hz

SOC_GPTIMER_CLKS

Array initializer for all supported clock sources of GPTimer.

The following code can be used to iterate all possible clocks:

```
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_
↪t)SOC_GPTIMER_CLKS;
for (size_t i = 0; i< sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock `clk`
}
```

SOC_RMT_CLKS

Array initializer for all supported clock sources of RMT.

SOC_TEMP_SENSOR_CLKS

Array initializer for all supported clock sources of Temperature Sensor.

SOC_I2S_CLKS

Array initializer for all supported clock sources of I2S.

SOC_I2C_CLKS

Array initializer for all supported clock sources of I2C.

SOC_SPI_CLKS

Array initializer for all supported clock sources of SPI.

SOC_SDM_CLKS

Array initializer for all supported clock sources of SDM.

SOC_GLITCH_FILTER_CLKS

Array initializer for all supported clock sources of Glitch Filter.

SOC_TWAI_CLKS

Array initializer for all supported clock sources of TWAI.

SOC_ADC_DIGI_CLKS

Array initializer for all supported clock sources of ADC digital controller.

SOC_MWDT_CLKS

Array initializer for all supported clock sources of MWDT.

SOC_LEDC_CLKS

Array initializer for all supported clock sources of LEDC.

Enumerations

enum **soc_root_clk_t**

Root clock.

Values:

enumerator **SOC_ROOT_CLK_INT_RC_FAST**

Internal 17.5MHz RC oscillator

enumerator **SOC_ROOT_CLK_INT_RC_SLOW**

Internal 136kHz RC oscillator

enumerator **SOC_ROOT_CLK_EXT_XTAL**

External 40MHz crystal

enumerator **SOC_ROOT_CLK_EXT_XTAL32K**

External 32kHz crystal/clock signal

enum **soc_cpu_clk_src_t**

CPU_CLK mux inputs, which are the supported clock sources for the CPU_CLK.

备注： Enum values are matched with the register field values on purpose

Values:

enumerator **SOC_CPU_CLK_SRC_XTAL**

Select XTAL_CLK as CPU_CLK source

enumerator **SOC_CPU_CLK_SRC_PLL**

Select PLL_CLK as CPU_CLK source (PLL_CLK is the output of 40MHz crystal oscillator frequency multiplier, can be 480MHz or 320MHz)

enumerator **SOC_CPU_CLK_SRC_RC_FAST**

Select RC_FAST_CLK as CPU_CLK source

enumerator **SOC_CPU_CLK_SRC_INVALID**

Invalid CPU_CLK source

enum **soc_rtc_slow_clk_src_t**

RTC_SLOW_CLK mux inputs, which are the supported clock sources for the RTC_SLOW_CLK.

备注： Enum values are matched with the register field values on purpose

Values:

enumerator **SOC_RTC_SLOW_CLK_SRC_RC_SLOW**

Select RC_SLOW_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_XTAL32K**

Select XTAL32K_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_RC_FAST_D256**

Select RC_FAST_D256_CLK (referred as FOSC_DIV or 8m_d256/8md256 in TRM and reg. description) as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_INVALID**

Invalid RTC_SLOW_CLK source

enum **soc_rtc_fast_clk_src_t**

RTC_FAST_CLK mux inputs, which are the supported clock sources for the RTC_FAST_CLK.

备注： Enum values are matched with the register field values on purpose

Values:

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_D2**

Select XTAL_D2_CLK (may referred as XTAL_CLK_DIV_2) as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_DIV**

Alias name for `SOC_RTC_FAST_CLK_SRC_XTAL_D2`

enumerator **SOC_RTC_FAST_CLK_SRC_RC_FAST**

Select RC_FAST_CLK as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_INVALID**

Invalid RTC_FAST_CLK source

enum **soc_module_clk_t**

Supported clock sources for modules (CPU, peripherals, RTC, etc.)

备注： enum starts from 1, to save 0 for special purpose

Values:

enumerator **SOC_MOD_CLK_CPU**

CPU_CLK can be sourced from XTAL, PLL, or RC_FAST by configuring soc_cpu_clk_src_t

enumerator **SOC_MOD_CLK_RTC_FAST**

RTC_FAST_CLK can be sourced from XTAL_D2 or RC_FAST by configuring soc_rtc_fast_clk_src_t

enumerator **SOC_MOD_CLK_RTC_SLOW**

RTC_SLOW_CLK can be sourced from RC_SLOW, XTAL32K, or RC_FAST_D256 by configuring soc_rtc_slow_clk_src_t

enumerator **SOC_MOD_CLK_APB**

APB_CLK is highly dependent on the CPU_CLK source

enumerator **SOC_MOD_CLK_PLL_F80M**

PLL_F80M_CLK is derived from PLL, and has a fixed frequency of 80MHz

enumerator **SOC_MOD_CLK_PLL_F160M**

PLL_F160M_CLK is derived from PLL, and has a fixed frequency of 160MHz

enumerator **SOC_MOD_CLK_XTAL32K**

XTAL32K_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_RC_FAST**

RC_FAST_CLK comes from the internal 20MHz rc oscillator, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_RC_FAST_D256**

RC_FAST_D256_CLK comes from the internal 20MHz rc oscillator, divided by 256, and passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_XTAL**

XTAL_CLK comes from the external 40MHz crystal

enumerator **SOC_MOD_CLK_INVALID**

Indication of the end of the available module clock sources

enum **soc_periph_systimer_clk_src_t**

Type of SYSTIMER clock source.

Values:

enumerator **SYSTIMER_CLK_SRC_XTAL**

SYSTIMER source clock is XTAL

enumerator **SYSTIMER_CLK_SRC_DEFAULT**

SYSTIMER source clock default choice is XTAL

enum **soc_periph_gptimer_clk_src_t**

Type of GPTimer clock source.

Values:

enumerator **GPTIMER_CLK_SRC_APB**

Select APB as the source clock

enumerator **GPTIMER_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **GPTIMER_CLK_SRC_DEFAULT**

Select APB as the default choice

enum **soc_periph_tg_clk_src_legacy_t**

Type of Timer Group clock source, reserved for the legacy timer group driver.

Values:

enumerator **TIMER_SRC_CLK_APB**

Timer group clock source is APB

enumerator **TIMER_SRC_CLK_XTAL**

Timer group clock source is XTAL

enumerator **TIMER_SRC_CLK_DEFAULT**

Timer group clock source default choice is APB

enum **soc_periph_rmt_clk_src_t**

Type of RMT clock source.

Values:

enumerator **RMT_CLK_SRC_APB**

Select APB as the source clock

enumerator **RMT_CLK_SRC_RC_FAST**

Select RC_FAST as the source clock

enumerator **RMT_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **RMT_CLK_SRC_DEFAULT**

Select APB as the default choice

enum **soc_periph_rmt_clk_src_legacy_t**

Type of RMT clock source, reserved for the legacy RMT driver.

Values:

enumerator **RMT_BASECLK_APB**

RMT source clock is APB

enumerator **RMT_BASECLK_XTAL**

RMT source clock is XTAL

enumerator **RMT_BASECLK_DEFAULT**

RMT source clock default choice is APB

enum **soc_periph_temperature_sensor_clk_src_t**

Type of Temp Sensor clock source.

Values:

enumerator **TEMPERATURE_SENSOR_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **TEMPERATURE_SENSOR_CLK_SRC_RC_FAST**

Select RC_FAST as the source clock

enumerator **TEMPERATURE_SENSOR_CLK_SRC_DEFAULT**

Select XTAL as the default choice

enum **soc_periph_uart_clk_src_legacy_t**

Type of UART clock source, reserved for the legacy UART driver.

Values:

enumerator **UART_SCLK_APB**

UART source clock is APB CLK

enumerator **UART_SCLK_RTC**

UART source clock is RC_FAST

enumerator **UART_SCLK_XTAL**

UART source clock is XTAL

enumerator **UART_SCLK_DEFAULT**

UART source clock default choice is APB

enum **soc_periph_i2s_clk_src_t**

I2S clock source enum.

Values:

enumerator **I2S_CLK_SRC_DEFAULT**

Select PLL_F160M as the default source clock

enumerator **I2S_CLK_SRC_PLL_160M**

Select PLL_F160M as the source clock

enumerator **I2S_CLK_SRC_XTAL**

Select XTAL as the source clock

enum **soc_periph_i2c_clk_src_t**

Type of I2C clock source.

Values:

enumerator **I2C_CLK_SRC_XTAL**

enumerator **I2C_CLK_SRC_RC_FAST**

enumerator **I2C_CLK_SRC_DEFAULT**

enum **soc_periph_spi_clk_src_t**

Type of SPI clock source.

Values:

enumerator **SPI_CLK_SRC_DEFAULT**

Select APB as SPI source clock

enumerator **SPI_CLK_SRC_APB**

Select APB as SPI source clock

enumerator **SPI_CLK_SRC_XTAL**

Select XTAL as SPI source clock

enum **soc_periph_sdm_clk_src_t**

Sigma Delta Modulator clock source.

Values:

enumerator **SDM_CLK_SRC_APB**

Select APB as the source clock

enumerator **SDM_CLK_SRC_DEFAULT**

Select APB as the default clock choice

enum **soc_periph_glitch_filter_clk_src_t**

Glitch filter clock source.

Values:

enumerator **GLITCH_FILTER_CLK_SRC_APB**

Select APB clock as the source clock

enumerator **GLITCH_FILTER_CLK_SRC_DEFAULT**

Select APB clock as the default clock choice

enum **soc_periph_twai_clk_src_t**

TWAI clock source.

Values:

enumerator **TWAI_CLK_SRC_APB**

Select APB as the source clock

enumerator **TWAI_CLK_SRC_DEFAULT**

Select APB as the default clock choice

enum **soc_periph_adc_digi_clk_src_t**

ADC digital controller clock source.

Values:

enumerator **ADC_DIGI_CLK_SRC_APB**

Select APB as the source clock

enumerator **ADC_DIGI_CLK_SRC_DEFAULT**

Select APB as the default clock choice

enum **soc_periph_mwdt_clk_src_t**

MWDT clock source.

Values:

enumerator **MWDT_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **MWDT_CLK_SRC_APB**

Select APB as the source clock

enumerator **MWDT_CLK_SRC_DEFAULT**

Select APB as the default clock choice

enum **soc_periph_ledc_clk_src_legacy_t**

Type of LEDC clock source, reserved for the legacy LEDC driver.

Values:

enumerator **LEDC_AUTO_CLK**

LEDC source clock will be automatically selected based on the giving resolution and duty parameter when init the timer

enumerator **LEDC_USE_APB_CLK**

Select APB as the source clock

enumerator **LEDC_USE_RC_FAST_CLK**

Select RC_FAST as the source clock

enumerator **LEDC_USE_XTAL_CLK**

Select XTAL as the source clock

enumerator **LEDC_USE_RTC8M_CLK**

Alias of ‘LEDC_USE_RC_FAST_CLK’

Header File

- components/esp_hw_support/include/esp_clk_tree.h

Functions

esp_err_t **esp_clk_tree_src_get_freq_hz**(*soc_module_clk_t* clk_src, *esp_clk_tree_src_freq_precision_t* precision, uint32_t *freq_value)

Get frequency of module clock source.

参数

- **clk_src** –**[in]** Clock source available to modules, in soc_module_clk_t
- **precision** –**[in]** Degree of precision, one of esp_clk_tree_src_freq_precision_t values This arg only applies to the clock sources that their frequencies can vary: SOC_MOD_CLK_RTC_FAST, SOC_MOD_CLK_RTC_SLOW, SOC_MOD_CLK_RC_FAST, SOC_MOD_CLK_RC_FAST_D256, SOC_MOD_CLK_XTAL32K For other clock sources, this field is ignored.
- **freq_value** –**[out]** Frequency of the clock source, in Hz

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Calibration failed

Enumerations

enum **esp_clk_tree_src_freq_precision_t**

Degree of precision of frequency value to be returned by esp_clk_tree_src_get_freq_hz()

Values:

enumerator **ESP_CLK_TREE_SRC_FREQ_PRECISION_CACHED**

enumerator **ESP_CLK_TREE_SRC_FREQ_PRECISION_APPROX**

enumerator **ESP_CLK_TREE_SRC_FREQ_PRECISION_EXACT**

enumerator **ESP_CLK_TREE_SRC_FREQ_PRECISION_INVALID**

2.6.5 GPIO & RTC GPIO

GPIO 汇总

ESP32-C3 芯片具有 22 个物理 GPIO 管脚（GPIO0 ~ GPIO21）。每个管脚都可用作一个通用 IO，或连接一个内部的外设信号。通过 GPIO 交换矩阵和 IO MUX，可配置外设模块的输入信号来源于任何的 IO 管脚，并且外设模块的输出信号也可连接到任意 IO 管脚。这些模块共同组成了芯片的 IO 控制。更多详细信息，请参阅 *ESP32-C3 技术参考手册* > *IO MUX 和 GPIO 矩阵*（*GPIO*、*IO_MUX*） [PDF]。

下表提供了各管脚的详细信息，部分 GPIO 具有特殊的使用限制，具体可参考表中的注释列。

GPIO	模拟功能	注释
GPIO0	ADC1_CH0	RTC
GPIO1	ADC1_CH1	RTC
GPIO2	ADC1_CH2	Strapping 管脚；RTC
GPIO3	ADC1_CH3	RTC
GPIO4	ADC1_CH4	RTC
GPIO5	ADC2_CH0	RTC
GPIO6		
GPIO7		
GPIO8		Strapping 管脚
GPIO9		Strapping 管脚
GPIO10		
GPIO11		
GPIO12		SPI0/1
GPIO13		SPI0/1
GPIO14		SPI0/1
GPIO15		SPI0/1
GPIO16		SPI0/1
GPIO17		SPI0/1
GPIO18		USB-JTAG
GPIO19		USB-JTAG
GPIO20		
GPIO21		

备注:

- Strapping 管脚：GPIO2、GPIO8、和 GPIO9 是 Strapping 管脚。更多信息请参考 ESP32-C3 技术规格书。
- SPI0/1：GPIO12-17 通常用于 SPI flash 和 PSRAM，不推荐用于其他用途。
- USB-JTAG：GPIO18 和 GPIO19 默认用于 USB-JTAG。用做 GPIO 时驱动程序将禁用 USB-JTAG。
- RTC：GPIO0-5 可以在 Deep-sleep 模式时使用。

GPIO 毛刺过滤器

ESP32-C3 内置硬件的过滤器可以过滤掉 GPIO 输入端口上的毛刺信号，在一定程度上避免错误触发中断或者是错把噪声当成有效的外设信号。

每个 GPIO 都可以使用独立的毛刺过滤器，该过滤器可以将那些脉冲宽度窄于 **2** 个采样时钟的信号剔除掉，该宽度无法配置。GPIO 对输入信号的采样时钟通常是 IO_MUX 的时钟源。在驱动中，此类过滤器称为 管脚毛刺过滤器。可以调用 *gpio_new_pin_glitch_filter()* 函数创建一个过滤器句柄。过滤器的相关配置保存在 *gpio_pin_glitch_filter_config_t* 结构体中。

- *gpio_pin_glitch_filter_config_t::gpio_num* 设置启用毛刺过滤器的 GPIO 编号。

毛刺过滤器默认关闭，可调用 *gpio_glitch_filter_enable()* 使能过滤器。如需回收这个过滤器，可以调用 *gpio_del_glitch_filter()* 函数。在回收句柄前，请确保过滤器处于关闭状态，否则需调用 *gpio_glitch_filter_disable()*。

应用示例

- GPIO 输出和输入中断示例：peripherals/gpio/generic_gpio。

API 参考 - 普通 GPIO

Header File

- components/driver/gpio/include/driver/gpio.h

Functions

esp_err_t **gpio_config**(const *gpio_config_t* *pGPIOConfig)

GPIO common configuration.

```
Configure GPIO's Mode,pull-up,PullDown,IntrType
```

参数 **pGPIOConfig** –Pointer to GPIO configure struct

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_reset_pin**(*gpio_num_t* gpio_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

备注: This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

参数 **gpio_num** –GPIO number.

返回 Always return ESP_OK.

esp_err_t **gpio_set_intr_type**(*gpio_num_t* gpio_num, *gpio_int_type_t* intr_type)

GPIO set interrupt trigger type.

参数

- **gpio_num** –GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **intr_type** –Interrupt type, select from gpio_int_type_t

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_intr_enable**(*gpio_num_t* gpio_num)

Enable GPIO module interrupt signal.

备注: ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of ESP32 ECO and Workarounds for Bugs for the description of this issue.

参数 **gpio_num** –GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_intr_disable**(*gpio_num_t* gpio_num)

Disable GPIO module interrupt signal.

备注: This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

参数 **gpio_num** –GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_set_level**(*gpio_num_t* gpio_num, uint32_t level)

GPIO set output level.

备注: This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

参数

- **gpio_num** –GPIO number. If you want to set the output level of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **level** –Output level. 0: low ; 1: high

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

int **gpio_get_level**(*gpio_num_t* gpio_num)

GPIO get input level.

警告: If the pad is not configured for input (or input and output) the returned value is always 0.

参数 **gpio_num** –GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio_num should be GPIO_NUM_16 (16);

返回

- 0 the GPIO input level is 0

- 1 the GPIO input level is 1

esp_err_t **gpio_set_direction**(*gpio_num_t* gpio_num, *gpio_mode_t* mode)

GPIO set direction.

Configure GPIO direction,such as output_only,input_only,output_and_input

参数

- **gpio_num** –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **mode** –GPIO direction

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

esp_err_t **gpio_set_pull_mode**(*gpio_num_t* gpio_num, *gpio_pull_mode_t* pull)

Configure GPIO pull-up/pull-down resistors.

备注: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

参数

- **gpio_num** –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **pull** –GPIO pull up/down mode.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

esp_err_t **gpio_wakeup_enable**(*gpio_num_t* gpio_num, *gpio_int_type_t* intr_type)

Enable GPIO wake-up function.

参数

- **gpio_num** –GPIO number.
- **intr_type** –GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_wakeup_disable**(*gpio_num_t* gpio_num)

Disable GPIO wake-up function.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_isr_register**(void (*fn)(void*), void *arg, int intr_alloc_flags, *gpio_isr_handle_t* *handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

参数

- **fn** –Interrupt handler function.
- **arg** –Parameter for handler function

- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

返回

- ESP_OK Success ;
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

esp_err_t **gpio_pullup_en**(*gpio_num_t* gpio_num)

Enable pull-up on GPIO.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_pullup_dis**(*gpio_num_t* gpio_num)

Disable pull-up on GPIO.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_pulldown_en**(*gpio_num_t* gpio_num)

Enable pull-down on GPIO.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_pulldown_dis**(*gpio_num_t* gpio_num)

Disable pull-down on GPIO.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_install_isr_service**(int intr_alloc_flags)

Install the GPIO driver’ s ETS_GPIO_INTR_SOURCE ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with gpio_isr_register() - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the gpio_isr_handler_add() function.

参数 **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

返回

- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

void **gpio_uninstall_isr_service**(void)

Uninstall the driver’ s GPIO ISR service, freeing related resources.

esp_err_t **gpio_isr_handler_add**(*gpio_num_t* gpio_num, *gpio_isr_t* isr_handler, void *args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using gpio_install_isr_service() to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in gpio_install_isr_service().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

参数

- **gpio_num** –GPIO number
- **isr_handler** –ISR handler function for the corresponding GPIO number.
- **args** –parameter for ISR handler.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_isr_handler_remove**(*gpio_num_t* gpio_num)

Remove ISR handler for the corresponding GPIO pin.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_set_drive_capability**(*gpio_num_t* gpio_num, *gpio_drive_cap_t* strength)

Set GPIO pad drive capability.

参数

- **gpio_num** –GPIO number, only support output GPIOs
- **strength** –Drive capability of the pad

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_get_drive_capability**(*gpio_num_t* gpio_num, *gpio_drive_cap_t* *strength)

Get GPIO pad drive capability.

参数

- **gpio_num** –GPIO number, only support output GPIOs
- **strength** –Pointer to accept drive capability of the pad

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_hold_en**(*gpio_num_t* gpio_num)

Enable gpio pad hold function.

When a GPIO is set to hold, its state is latched at that moment and will not change when the internal signal or the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). This function can be used to retain the state of GPIOs when the chip or system is reset, for example, when watchdog time-out or Deep-sleep events are triggered.

This function works in both input and output modes, and only applicable to output-capable GPIOs. If this function is enabled: in output mode: the output level of the GPIO will be locked and can not be changed. in input mode: the input read value can still reflect the changes of the input signal.

However, on ESP32/S2/C3/S3/C2, this function cannot be used to hold the state of a digital GPIO during Deep-sleep. Even if this function is enabled, the digital GPIO will be reset to its default state when the chip

wakes up from Deep-sleep. If you want to hold the state of a digital GPIO during Deep-sleep, please call `gpio_deep_sleep_hold_en`.

Power down or call `gpio_hold_dis` will disable this function.

参数 **gpio_num** –GPIO number, only support output-capable GPIOs

返回

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

esp_err_t **gpio_hold_dis**(*gpio_num_t* gpio_num)

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to hight level before calling `gpio_hold_dis`.

参数 **gpio_num** –GPIO number, only support output-capable GPIOs

返回

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

void **gpio_deep_sleep_hold_en**(void)

Enable all digital gpio pads hold function during Deep-sleep.

Enabling this feature makes all digital gpio pads be at the holding state during Deep-sleep. The state of each pad holds is its active configuration (not pad's sleep configuration!).

Note that this pad hold feature only works when the chip is in Deep-sleep mode. When the chip is in active mode, the digital gpio state can be changed freely even you have called this function.

After this API is being called, the digital gpio Deep-sleep hold feature will work during every sleep process. You should call `gpio_deep_sleep_hold_dis` to disable this feature.

void **gpio_deep_sleep_hold_dis**(void)

Disable all digital gpio pads hold function during Deep-sleep.

void **gpio_iomux_in**(uint32_t gpio_num, uint32_t signal_idx)

SOC_GPIO_SUPPORT_HOLD_SINGLE_IO_IN_DSLP.

Set pad input to a peripheral signal through the IOMUX.

参数

- **gpio_num** –GPIO number of the pad.
- **signal_idx** –Peripheral signal id to input. One of the `*_IN_IDX` signals in `soc/gpio_sig_map.h`.

void **gpio_iomux_out**(uint8_t gpio_num, int func, bool oen_inv)

Set peripheral output to an GPIO pad through the IOMUX.

参数

- **gpio_num** –gpio_num GPIO number of the pad.
- **func** –The function number of the peripheral pin to output pin. One of the `FUNC_X_*` of specified pin (X) in `soc/io_mux_reg.h`.
- **oen_inv** –True if the output enable needs to be inverted, otherwise False.

esp_err_t **gpio_force_hold_all**(void)

Force hold all digital and rtc gpio pads.

GPIO force hold, no matter the chip in active mode or sleep modes.

This function will immediately cause all pads to latch the current values of input enable, output enable, output value, function, and drive strength values.

> **警告：** This function will hold flash and UART pins as well. Therefore, this function, and all code run afterwards (till calling `gpio_force_unhold_all` to disable this feature), MUST be placed in internal RAM as holding the flash pins will halt SPI flash operation, and holding the UART pins will halt any UART logging.

esp_err_t **gpio_force_unhold_all**(void)

Force unhold all digital and rtc gpio pads.

esp_err_t **gpio_sleep_sel_en**(*gpio_num_t* gpio_num)

Enable SLP_SEL to change GPIO status automantically in lightsleep.

参数 **gpio_num** –GPIO number of the pad.

返回

- ESP_OK Success

esp_err_t **gpio_sleep_sel_dis**(*gpio_num_t* gpio_num)

Disable SLP_SEL to change GPIO status automantically in lightsleep.

参数 **gpio_num** –GPIO number of the pad.

返回

- ESP_OK Success

esp_err_t **gpio_sleep_set_direction**(*gpio_num_t* gpio_num, *gpio_mode_t* mode)

GPIO set direction at sleep.

Configure GPIO direction,such as output_only,input_only,output_and_input

参数

- **gpio_num** –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **mode** –GPIO direction

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

esp_err_t **gpio_sleep_set_pull_mode**(*gpio_num_t* gpio_num, *gpio_pull_mode_t* pull)

Configure GPIO pull-up/pull-down resistors at sleep.

> **备注：** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

参数

- **gpio_num** –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **pull** –GPIO pull up/down mode.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

esp_err_t **gpio_deep_sleep_wakeup_enable**(*gpio_num_t* gpio_num, *gpio_int_type_t* intr_type)

Enable GPIO deep-sleep wake-up function.

> **备注：** Called by the SDK. User shouldn’t call this directly in the APP.

参数

- **gpio_num** –GPIO number.

- **intr_type** –GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_deep_sleep_wakeup_disable**(*gpio_num_t* gpio_num)

Disable GPIO deep-sleep wake-up function.

参数 **gpio_num** –GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Structures

struct **gpio_config_t**

Configuration parameters of GPIO pad for gpio_config function.

Public Members

uint64_t **pin_bit_mask**

GPIO pin: set with bit mask, each bit maps to a GPIO

enum **gpio_hys_ctrl_mode_t**

Available option for configuring hysteresis feature of GPIOs.

Values:

enumerator **GPIO_HYS_CTRL_EFUSE**

Pad input hysteresis ctrl by efuse

enumerator **GPIO_HYS_SOFT_ENABLE**

Pad input hysteresis enable by software

enumerator **GPIO_HYS_SOFT_DISABLE**

Pad input hysteresis disable by software

API 参考 - GPIO 毛刺过滤器

Header File

- components/driver/gpio/include/driver/gpio_filter.h

Functions

esp_err_t **gpio_new_pin_glitch_filter**(const *gpio_pin_glitch_filter_config_t* *config, *gpio_glitch_filter_handle_t* *ret_filter)

Create a pin glitch filter.

备注: Pin glitch filter parameters are fixed, pulses shorter than two sample clocks (IO-MUX's source clock) will be filtered out. It's independent with "flex" glitch filter. See also `gpio_new_flex_glitch_filter`.

备注: The created filter handle can later be deleted by `gpio_del_glitch_filter`.

参数

- **config** –**[in]** Glitch filter configuration
- **ret_filter** –**[out]** Returned glitch filter handle

返回

- ESP_OK: Create a pin glitch filter successfully
- ESP_ERR_INVALID_ARG: Create a pin glitch filter failed because of invalid arguments (e.g. wrong GPIO number)
- ESP_ERR_NO_MEM: Create a pin glitch filter failed because of out of memory
- ESP_FAIL: Create a pin glitch filter failed because of other error

esp_err_t **gpio_new_flex_glitch_filter**(const *gpio_flex_glitch_filter_config_t* *config, *gpio_glitch_filter_handle_t* *ret_filter)

Allocate a flex glitch filter.

备注： “flex” means the filter parameters (window, threshold) are adjustable. It’s independent with pin glitch filter. See also `gpio_new_pin_glitch_filter`.

备注： The created filter handle can later be deleted by `gpio_del_glitch_filter`.

参数

- **`config`** –**[in]** Glitch filter configuration
- **`ret_filter`** –**[out]** Returned glitch filter handle

返回

- ESP_OK: Allocate a flex glitch filter successfully
- ESP_ERR_INVALID_ARG: Allocate a flex glitch filter failed because of invalid arguments (e.g. wrong GPIO number, filter parameters out of range)
- ESP_ERR_NO_MEM: Allocate a flex glitch filter failed because of out of memory
- ESP_ERR_NOT_FOUND: Allocate a flex glitch filter failed because the underlying hardware resources are used up
- ESP_FAIL: Allocate a flex glitch filter failed because of other error

esp_err_t **`gpio_del_glitch_filter`**(*gpio_glitch_filter_handle_t* filter)

Delete a glitch filter.

参数 **`filter`** –**[in]** Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

返回

- ESP_OK: Delete glitch filter successfully
- ESP_ERR_INVALID_ARG: Delete glitch filter failed because of invalid arguments
- ESP_ERR_INVALID_STATE: Delete glitch filter failed because the glitch filter is still in working
- ESP_FAIL: Delete glitch filter failed because of other error

esp_err_t **`gpio_glitch_filter_enable`**(*gpio_glitch_filter_handle_t* filter)

Enable a glitch filter.

参数 **`filter`** –**[in]** Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

返回

- ESP_OK: Enable glitch filter successfully
- ESP_ERR_INVALID_ARG: Enable glitch filter failed because of invalid arguments
- ESP_ERR_INVALID_STATE: Enable glitch filter failed because the glitch filter is already enabled
- ESP_FAIL: Enable glitch filter failed because of other error

esp_err_t **`gpio_glitch_filter_disable`**(*gpio_glitch_filter_handle_t* filter)

Disable a glitch filter.

参数 **`filter`** –**[in]** Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

返回

- ESP_OK: Disable glitch filter successfully
- ESP_ERR_INVALID_ARG: Disable glitch filter failed because of invalid arguments
- ESP_ERR_INVALID_STATE: Disable glitch filter failed because the glitch filter is not enabled yet
- ESP_FAIL: Disable glitch filter failed because of other error

Structures

struct **`gpio_pin_glitch_filter_config_t`**

Configuration of GPIO pin glitch filter.

Public Members

glitch_filter_clock_source_t **clk_src**

Clock source for the glitch filter

gpio_num_t **gpio_num**

GPIO number

struct **gpio_flex_glitch_filter_config_t**

Configuration of GPIO flex glitch filter.

Public Members

glitch_filter_clock_source_t **clk_src**

Clock source for the glitch filter

gpio_num_t **gpio_num**

GPIO number

uint32_t **window_width_ns**

Sample window width (in ns)

uint32_t **window_thres_ns**

Sample window threshold (in ns), during the `window_width_ns` sample window, any pulse whose width < window_thres_ns will be discarded.

Type Definitions

typedef struct gpio_glitch_filter_t ***gpio_glitch_filter_handle_t**

Typedef of GPIO glitch filter handle.

2.6.6 通用定时器

简介

通用定时器是 ESP32-C3 定时器组外设的驱动程序。ESP32-C3 硬件定时器分辨率高，具有灵活的报警功能。定时器内部计数器达到特定目标数值的行为被称为定时器报警。定时器报警时将调用用户注册的不同定时器回调函数。

通用定时器通常在以下场景中使用：

- 如同挂钟一般自由运行，随时随地获取高分辨率时间戳；
- 生成周期性警报，定期触发事件；
- 生成一次性警报，在目标时间内响应。

功能概述

下文介绍了配置和操作定时器的常规步骤：

- 资源分配 - 获取定时器句柄应设置的参数，以及如何在通用定时器完成工作时回收资源。
- 设置和获取计数值 - 如何强制定时器从起点开始计数，以及如何随时获取计数值。
- 设置警报动作 - 启动警报事件应设置的参数。
- 注册事件回调函数 - 如何将用户的特定代码挂载到警报事件回调函数。
- 使能和禁用定时器 - 如何使能和禁用定时器。
- 启动和停止定时器 - 通过不同报警行为启动定时器的典型使用场景。
- 电源管理 - 选择不同的时钟源将会如何影响功耗。
- *IRAM* 安全 - 在 cache 禁用的情况下，如何更好地让定时器处理中断事务以及实现 IO 控制功能。
- 线程安全 - 驱动程序保证哪些 API 线程安全。
- *Kconfig* 选项 - 支持的 Kconfig 选项，这些选项会对驱动程序行为产生不同影响。

资源分配 不同的 ESP 芯片可能有不同数量的独立定时器组，每组内也可能有若干个独立定时器。[1]

通用定时器实例由 *gptimer_handle_t* 表示。后台驱动会在资源池中管理所有可用的硬件资源，这样您便无需考虑硬件所属的定时器以及定时器组。

要安装一个定时器实例，需要提前提供配置结构体 *gptimer_config_t*：

- *gptimer_config_t::clk_src* 选择定时器的时钟源。*gptimer_clock_source_t* 中列出多个可用时钟，仅可选择其中一个时钟。了解不同时钟源对功耗的影响，请查看章节电源管理。
- *gptimer_config_t::direction* 设置定时器的计数方向，*gptimer_count_direction_t* 中列出多个支持的方向，仅可选择其中一个方向。
- *gptimer_config_t::resolution_hz* 设置内部计数器的分辨率。计数器每滴答一次相当于 **1 / resolution_hz** 秒。
- 选用 *gptimer_config_t::intr_shared* 设置是否将定时器中断源标记为共享源。了解共享中断的优缺点，请参考 *Interrupt Handling*。

完成上述结构配置之后，可以将结构传递给 *gptimer_new_timer()*，用以实例化定时器实例并返回定时器句柄。

该函数可能由于内存不足、参数无效等错误而失败。具体来说，当没有更多的空闲定时器（即所有硬件资源已用完）时，将返回 *ESP_ERR_NOT_FOUND*。可用定时器总数由 *SOC_TIMER_GROUP_TOTAL_TIMERS* 表示，不同的 ESP 芯片该数值不同。

如已不再需要之前创建的通用定时器实例，应通过调用 *gptimer_del_timer()* 回收定时器，以便底层硬件定时器用于其他目的。在删除通用定时器句柄之前，请通过 *gptimer_disable()* 禁用定时器，或者通过 *gptimer_enable()* 确认定时器尚未使能。

创建分辨率为 1 MHz 的通用定时器句柄

```
gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

设置和获取计数值 创建通用定时器时，内部计数器将默认重置为零。计数值可以通过 *gptimer_set_raw_count()* 异步更新。最大计数值取决于硬件定时器的位宽，这也会在 SOC 宏 *SOC_TIMER_GROUP_COUNTER_BIT_WIDTH* 中有所反映。当更新活动定时器的原始计数值时，定时器将立即从新值开始计数。

[1] 不同 ESP 芯片系列的通用定时器实例数量可能不同。了解详细信息，请参考《ESP32-C3 技术参考手册》> 章节定时器组 (TIMG) [PDF]。驱动程序不会禁止您申请更多的定时器，但是当所有可用的硬件资源用完时将会返回错误。在分配资源时，请务必检查返回值（例如 *gptimer_new_timer()*）。

计数值可以随时通过*gptimer_get_raw_count()* 获取。

设置警报动作 对于大多数通用定时器使用场景而言，应在启动定时器之前设置警报动作，但不包括简单的挂钟场景，该场景仅需自由运行的定时器。设置警报动作，需要根据如何使用警报事件来配置*gptimer_alarm_config_t* 的不同参数：

- *gptimer_alarm_config_t::alarm_count* 设置触发警报事件的目标计数值。设置警报值时还需考虑计数方向。尤其是当*gptimer_alarm_config_t::auto_reload_on_alarm* 为 true 时，*gptimer_alarm_config_t::alarm_count* 和*gptimer_alarm_config_t::reload_count* 不能设置为相同的值，因为警报值和重载值相同时没有意义。
- *gptimer_alarm_config_t::reload_count* 代表警报事件发生时要重载的计数值。此配置仅在*gptimer_alarm_config_t::auto_reload_on_alarm* 设置为 true 时生效。
- *gptimer_alarm_config_t::auto_reload_on_alarm* 标志设置是否使能自动重载功能。如果使能，硬件定时器将在警报事件发生时立即将*gptimer_alarm_config_t::reload_count* 的值重载到计数器中。

要使警报配置生效，需要调用*gptimer_set_alarm_action()*。特别是当*gptimer_alarm_config_t* 设置为 NULL 时，报警功能将被禁用。

备注： 如果警报值已设置且定时器超过该值，则会立即触发警报。

注册事件回调函数 定时器启动后，可动态产生特定事件（如“警报事件”）。如需在事件发生时调用某些函数，请通过*gptimer_register_event_callbacks()* 将函数挂载到中断服务例程 (ISR)。*gptimer_event_callbacks_t* 中列出了所有支持的事件回调函数：

- *gptimer_event_callbacks_t::on_alarm* 设置警报事件的回调函数。由于此函数在 ISR 上下文中调用，必须确保该函数不会试图阻塞（例如，确保仅从函数内调用具有 ISR 后缀的 FreeRTOS API）。函数原型在*gptimer_alarm_cb_t* 中有所声明。

您也可以通过参数 user_data 将自己的上下文保存到*gptimer_register_event_callbacks()* 中。用户数据将直接传递给回调函数。

此功能将为定时器延迟安装中断服务，但不使能中断服务。所以，请在*gptimer_enable()* 之前调用这一函数，否则将返回*ESP_ERR_INVALID_STATE* 错误。了解详细信息，请查看章节使能和禁用定时器。

使能和禁用定时器 在对定时器进行 IO 控制之前，需要先调用*gptimer_enable()* 使能定时器。此函数功能如下：

- 此函数将把定时器驱动程序的状态从 **init** 切换为 **enable**。
- 如果*gptimer_register_event_callbacks()* 已经延迟安装中断服务，此函数将使能中断服务。
- 如果选择了特定的时钟源（例如 APB 时钟），此函数将获取适当的电源管理锁。了解更多信息，请查看章节电源管理。

调用*gptimer_disable()* 会进行相反的操作，即将定时器驱动程序恢复到 **init** 状态，禁用中断服务并释放电源管理锁。

启动和停止定时器 启动和停止是定时器的基本 IO 操作。调用*gptimer_start()* 可以使内部计数器开始工作，而*gptimer_stop()* 可以使计数器停止工作。下文说明了如何在存在或不存在警报事件的情况下启动定时器。调用*gptimer_start()* 将使驱动程序状态从 enable 转换为 run, 反之亦然。您需要确保 start 和 stop 函数成对使用，否则，函数可能返回*ESP_ERR_INVALID_STATE*。

将定时器作为挂钟启动

```
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at anytime
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

触发周期性事件

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Don't introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this␣
↪callback
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

触发一次性事件

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
```

(下页继续)

(续上页)

```
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

警报值动态更新 通过更改*gptimer_alarm_event_data_t::alarm_value*，可以在 ISR 程序回调中动态更新警报值。警报值将在回调函数返回后更新。

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer, &alarm_config));
```

电源管理 有些电源管理的策略会在某些时刻关闭时钟源，或者改变时钟源的频率，以求降低功耗。比如在启用 DFS 后，APB 时钟源会降低频率。如果浅睡眠（light sleep）模式也被开启，PLL 和 XTAL 时钟都会被默认关闭，从而导致 GPTimer 的计时不准确。

驱动程序会根据具体的时钟源选择，通过创建不同的电源锁来避免上述情况的发生。驱动会在 *gptimer_enable()* 函数中增加电源锁的引用计数，并在 *gptimer_disable()* 函数中减少电源锁的引用计数，从而保证了在 *gptimer_enable()* 和 *gptimer_disable()* 之间，GPTimer 的时钟源始处于稳定工作的状态。

IRAM 安全 默认情况下，当 cache 因写入或擦除 flash 等原因而被禁用时，通用定时器的中断服务将会延迟，造成警报中断无法及时执行。在实时应用程序中通常需要避免这一情况发生。

调用 Kconfig 选项 *CONFIG_GPTIMER_ISR_IRAM_SAFE* 可实现如下功能：

- 即使禁用 cache 也可使能正在运行的中断
- 将 ISR 使用的所有函数放入 IRAM[2]
- 将驱动程序对象放入 DRAM（以防意外映射到 PSRAM）

这将允许中断在 cache 禁用时运行，但会增加 IRAM 使用量。

调用另一 Kconfig 选项 *CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM* 也可将常用的 IO 控制功能放入 IRAM，以便这些函数在 cache 禁用时也能执行。常用的 IO 控制功能如下：

- *gptimer_start()*
- *gptimer_stop()*
- *gptimer_get_raw_count()*
- *gptimer_set_raw_count()*
- *gptimer_set_alarm_action()*

线程安全 驱动提供的所有 API 都是线程安全的，这意味着您可以从不同的 RTOS 任务中调用这些函数，而无需额外的互斥锁去保护。以下这些函数还被允许在中断上下文中运行。

- *gptimer_start()*
- *gptimer_stop()*
- *gptimer_get_raw_count()*
- *gptimer_set_raw_count()*
- *gptimer_get_captured_count()*
- *gptimer_set_alarm_action()*

Kconfig 选项

- *CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM* 控制放置通用定时器控制函数（IRAM 或 flash）的位置。了解更多信息，请参考章节 *IRAM 安全*。
- *CONFIG_GPTIMER_ISR_IRAM_SAFE* 控制默认 ISR 程序在 cache 禁用时是否可以运行。了解更多信息，请参考章节 *IRAM 安全*。
- *CONFIG_GPTIMER_ENABLE_DEBUG_LOG* 用于启用调试日志输出。启用这一选项将增加固件二进制文件大小。

应用示例

- 示例 peripherals/timer_group/gptimer 中列出了通用定时器的典型用例。

[2] *gptimer_event_callbacks_t::on_alarm* 回调函数和这一函数调用的函数也需放在 IRAM 中，请自行处理。

API 参考

Header File

- components/driver/gptimer/include/driver/gptimer.h

Functions

esp_err_t **gptimer_new_timer**(const *gptimer_config_t* *config, *gptimer_handle_t* *ret_timer)

Create a new General Purpose Timer, and return the handle.

备注: The newly created timer is put in the "init" state.

参数

- **config** –**[in]** GPTimer configuration
- **ret_timer** –**[out]** Returned timer handle

返回

- ESP_OK: Create GPTimer successfully
- ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
- ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create GPTimer failed because of other error

esp_err_t **gptimer_del_timer**(*gptimer_handle_t* timer)

Delete the GPTimer handle.

备注: A timer must be in the "init" state before it can be deleted.

参数 **timer** –**[in]** Timer handle created by `gptimer_new_timer`

返回

- ESP_OK: Delete GPTimer successfully
- ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete GPTimer failed because the timer is not in init state
- ESP_FAIL: Delete GPTimer failed because of other error

esp_err_t **gptimer_set_raw_count**(*gptimer_handle_t* timer, uint64_t value)

Set GPTimer raw count value.

备注: When updating the raw count of an active timer, the timer will immediately start counting from the new value.

备注: This function is allowed to run within ISR context

备注: If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

参数

- **timer** –**[in]** Timer handle created by `gptimer_new_timer`
- **value** –**[in]** Count value to be set

返回

- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Set GPTimer raw count value failed because of other error

esp_err_t **gptimer_get_raw_count** (*gptimer_handle_t* timer, uint64_t *value)

Get GPTimer raw count value.

备注: This function will trigger a software capture event and then return the captured count value.

备注: With the raw count value and the resolution returned from `gptimer_get_resolution`, you can convert the count value into seconds.

备注: This function is allowed to run within ISR context

备注: If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

参数

- **timer** –**[in]** Timer handle created by `gptimer_new_timer`
- **value** –**[out]** Returned GPTimer count value

返回

- ESP_OK: Get GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Get GPTimer raw count value failed because of other error

esp_err_t **gptimer_get_resolution** (*gptimer_handle_t* timer, uint32_t *out_resolution)

Return the real resolution of the timer.

备 注: usually the timer resolution is same as what you configured in the *`gptimer_config_t::resolution_hz`*, but some unstable clock source (e.g. RC_FAST) will do a calibration, the real resolution can be different from the configured one.

参数

- **timer** –**[in]** Timer handle created by `gptimer_new_timer`
- **out_resolution** –**[out]** Returned timer resolution, in Hz

返回

- ESP_OK: Get GPTimer resolution successfully
- ESP_ERR_INVALID_ARG: Get GPTimer resolution failed because of invalid argument
- ESP_FAIL: Get GPTimer resolution failed because of other error

esp_err_t **gptimer_get_captured_count** (*gptimer_handle_t* timer, uint64_t *value)

Get GPTimer captured count value.

备 注: The capture action can be issued either by ETM event or by software (see also `gptimer_get_raw_count`).

备注： This function is allowed to run within ISR context

备注： If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

参数

- **`timer`** –**[in]** Timer handle created by `gptimer_new_timer`
- **`value`** –**[out]** Returned captured count value

返回

- ESP_OK: Get GPTimer captured count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer captured count value failed because of invalid argument
- ESP_FAIL: Get GPTimer captured count value failed because of other error

esp_err_t **`gptimer_register_event_callbacks`**(*gptimer_handle_t* timer, const *gptimer_event_callbacks_t* *cbs, void *user_data)

Set callbacks for GPTimer.

备注： User registered callbacks are expected to be runnable within ISR context

备注： The first call to this function needs to be before the call to `gptimer_enable`

备注： User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

参数

- **`timer`** –**[in]** Timer handle created by `gptimer_new_timer`
- **`cbs`** –**[in]** Group of callback functions
- **`user_data`** –**[in]** User data, which will be passed to callback functions directly

返回

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because the timer is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

esp_err_t **`gptimer_set_alarm_action`**(*gptimer_handle_t* timer, const *gptimer_alarm_config_t* *config)

Set alarm event actions for GPTimer.

备注： This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

备注： If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

参数

- **`timer`** –**[in]** Timer handle created by `gptimer_new_timer`

- **config** –**[in]** Alarm configuration, especially, set config to NULL means disabling the alarm function

返回

- ESP_OK: Set alarm action for GPTimer successfully
- ESP_ERR_INVALID_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP_FAIL: Set alarm action for GPTimer failed because of other error

esp_err_t **gptimer_enable**(*gptimer_handle_t* timer)

Enable GPTimer.

备注: This function will transit the timer state from "init" to "enable".

备注: This function will enable the interrupt service, if it's lazy installed in `gptimer_register_event_callbacks`.

备注: This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the *`gptimer_config_t`*, while `CONFIG_PM_ENABLE` is enabled.

备注: Enable a timer doesn't mean to start it. See also `gptimer_start` for how to make the timer start counting.

参数 **timer** –**[in]** Timer handle created by `gptimer_new_timer`

返回

- ESP_OK: Enable GPTimer successfully
- ESP_ERR_INVALID_ARG: Enable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable GPTimer failed because the timer is already enabled
- ESP_FAIL: Enable GPTimer failed because of other error

esp_err_t **gptimer_disable**(*gptimer_handle_t* timer)

Disable GPTimer.

备注: This function will transit the timer state from "enable" to "init".

备注: This function will disable the interrupt service if it's installed.

备注: This function will release the PM lock if it's acquired in the `gptimer_enable`.

备注: Disable a timer doesn't mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

参数 **timer** –**[in]** Timer handle created by `gptimer_new_timer`

返回

- ESP_OK: Disable GPTimer successfully
- ESP_ERR_INVALID_ARG: Disable GPTimer failed because of invalid argument

- ESP_ERR_INVALID_STATE: Disable GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Disable GPTimer failed because of other error

esp_err_t **gptimer_start**(*gptimer_handle_t* timer)

Start GPTimer (internal counter starts counting)

备注: This function will transit the timer state from "enable" to "run".

备注: This function is allowed to run within ISR context

备注: If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

参数 **timer** –**[in]** Timer handle created by gptimer_new_timer

返回

- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not enabled or is already in running
- ESP_FAIL: Start GPTimer failed because of other error

esp_err_t **gptimer_stop**(*gptimer_handle_t* timer)

Stop GPTimer (internal counter stops counting)

备注: This function will transit the timer state from "run" to "enable".

备注: This function is allowed to run within ISR context

备注: If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

参数 **timer** –**[in]** Timer handle created by gptimer_new_timer

返回

- ESP_OK: Stop GPTimer successfully
- ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not in running.
- ESP_FAIL: Stop GPTimer failed because of other error

Structures

struct **gptimer_config_t**

General Purpose Timer configuration.

Public Members

gptimer_clock_source_t **clk_src**

GPTimer clock source

gptimer_count_direction_t **direction**

Count direction

uint32_t **resolution_hz**

Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution_hz) seconds

uint32_t **intr_shared**

Set true, the timer interrupt number can be shared with other peripherals

struct *gptimer_config_t*::[anonymous] **flags**

GPTimer config flags

struct **gptimer_event_callbacks_t**

Group of supported GPTimer callbacks.

备注： The callbacks are all running under ISR environment

备注： When CONFIG_GPTIMER_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

Public Members

gptimer_alarm_cb_t **on_alarm**

Timer alarm callback

struct **gptimer_alarm_config_t**

General Purpose Timer alarm configuration.

Public Members

uint64_t **alarm_count**

Alarm target count value

uint64_t **reload_count**

Alarm reload count value, effect only when `auto_reload_on_alarm` is set to true

uint32_t **auto_reload_on_alarm**

Reload the count value by hardware, immediately at the alarm event

struct *gptimer_alarm_config_t*::[anonymous] **flags**

Alarm config flags

Header File

- components/driver/gptimer/include/driver/gptimer_etm.h

Functions

esp_err_t **gptimer_new_etm_event**(*gptimer_handle_t* timer, const *gptimer_etm_event_config_t* *config, esp_etm_event_handle_t *out_event)

Get the ETM event for GPTimer.

备注: The created ETM event object can be deleted later by calling `esp_etm_del_event`

参数

- **timer** –**[in]** Timer handle created by `gptimer_new_timer`
- **config** –**[in]** GPTimer ETM event configuration
- **out_event** –**[out]** Returned ETM event handle

返回

- ESP_OK: Get ETM event successfully
- ESP_ERR_INVALID_ARG: Get ETM event failed because of invalid argument
- ESP_FAIL: Get ETM event failed because of other error

esp_err_t **gptimer_new_etm_task**(*gptimer_handle_t* timer, const *gptimer_etm_task_config_t* *config, esp_etm_task_handle_t *out_task)

Get the ETM task for GPTimer.

备注: The created ETM task object can be deleted later by calling `esp_etm_del_task`

参数

- **timer** –**[in]** Timer handle created by `gptimer_new_timer`
- **config** –**[in]** GPTimer ETM task configuration
- **out_task** –**[out]** Returned ETM task handle

返回

- ESP_OK: Get ETM task successfully
- ESP_ERR_INVALID_ARG: Get ETM task failed because of invalid argument
- ESP_FAIL: Get ETM task failed because of other error

Structures

struct **gptimer_etm_event_config_t**

GPTimer ETM event configuration.

Public Members

gptimer_etm_event_type_t **event_type**

GPTimer ETM event type

struct **gptimer_etm_task_config_t**

GPTimer ETM task configuration.

Public Members

gptimer_etm_task_type_t **task_type**

GPTimer ETM task type

Header File

- components/driver/gptimer/include/driver/gptimer_types.h

Structures

struct **gptimer_alarm_event_data_t**

GPTimer alarm event data.

Public Members

uint64_t **count_value**

Current count value

uint64_t **alarm_value**

Current alarm value

Type Definitions

typedef struct gptimer_t ***gptimer_handle_t**

Type of General Purpose Timer handle.

typedef bool (***gptimer_alarm_cb_t**)(*gptimer_handle_t* timer, const *gptimer_alarm_event_data_t* *edata, void *user_ctx)

Timer alarm callback prototype.

Param timer **[in]** Timer handle created by `gptimer_new_timer`
Param edata **[in]** Alarm event data, fed by driver
Param user_ctx **[in]** User data, passed from `gptimer_register_event_callbacks`
Return Whether a high priority task has been waken up by this function

Header File

- components/hal/include/hal/timer_types.h

Type Definitions

typedef *soc_periph_gptimer_clk_src_t* **gptimer_clock_source_t**

GPTimer clock source.

备注: User should select the clock source based on the power and resolution requirement

Enumerations

enum **gptimer_count_direction_t**

GPTimer count direction.

Values:

enumerator **GPTIMER_COUNT_DOWN**

Decrease count value

enumerator **GPTIMER_COUNT_UP**

Increase count value

enum **gptimer_etm_task_type_t**

GPTimer specific tasks that supported by the ETM module.

Values:

enumerator **GPTIMER_ETM_TASK_START_COUNT**

Start the counter

enumerator **GPTIMER_ETM_TASK_STOP_COUNT**

Stop the counter

enumerator **GPTIMER_ETM_TASK_EN_ALARM**

Enable the alarm

enumerator **GPTIMER_ETM_TASK_RELOAD**

Reload preset value into counter

enumerator **GPTIMER_ETM_TASK_CAPTURE**

Capture current count value into specific register

enumerator **GPTIMER_ETM_TASK_MAX**

Maximum number of tasks

enum **gptimer_etm_event_type_t**

GPTimer specific events that supported by the ETM module.

Values:

enumerator **GPTIMER_ETM_EVENT_ALARM_MATCH**

Count value matches the alarm target value

enumerator **GPTIMER_ETM_EVENT_MAX**

Maximum number of events

2.6.7 专用 GPIO

概述

专用 GPIO 专为 CPU 与 GPIO 矩阵和 IO MUX 交互而设计。任何配置为“专用”的 GPIO 都可以通过 CPU 指令直接访问，从而轻松提高 GPIO 翻转速度，方便用户以 bit-banging 的方式模拟串行/并行接口。通过 CPU 指令的方式控制 GPIO 的软件开销非常小，因此能够胜任一些特殊场合，比如通过示波器观测“GPIO 翻转信号”来间接测量某些性能指标。

创建/销毁 GPIO 捆绑包

GPIO 捆绑包是一组 GPIO，该组 GPIO 可以在一个 CPU 周期内同时操作。一个包能够包含 GPIO 的最大数量受每个 CPU 的限制。另外，GPIO 捆绑包与派生它的 CPU 有很强的相关性。**注意，任何对 GPIO 捆绑包操作的任务都必须运行在 GPIO 捆绑包所属的 CPU 内核**。同理，只有那些安装在同一个 CPU 内核上的 ISR 才允许对该 GPIO 捆绑包进行操作。

备注： 专用 GPIO 更像是 CPU 外设，因此与 CPU 内核关系密切。强烈建议在 pin-to-core 任务中安装和操作 GPIO 捆绑包。例如，如果 GPIOA 连接到了 CPU0，而专用的 GPIO 指令却是从 CPU1 发出的，那么就无法控制 GPIOA。

安装 GPIO 捆绑包需要调用*dedic_gpio_new_bundle()* 来分配软件资源并将专用通道连接到用户选择的 GPIO。GPIO 捆绑包的配置在*dedic_gpio_bundle_config_t* 结构体中：

- gpio_array：包含 GPIO 编号的数组。
- array_size：gpio_array 的元素个数。
- flags：用于控制 GPIO 捆绑包行为的标志。
  - in_en 和 out_en 用于选择是否开启输入输出功能（这两个功能可以同时开启）。
  - in_invert 和 out_invert 用于选择是否反转 GPIO 信号。

以下代码展示了如何安装只有输出功能的 GPIO 捆绑包：

```
// 配置 GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
    gpio_config(&io_conf);
}
// 创建 bundleA，仅输出
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
    .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
    .flags = {
        .out_en = 1,
    },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));
```

如需卸载 GPIO 捆绑包，可调用*dedic_gpio_del_bundle()*。

备注： *dedic_gpio_new_bundle()* 不包含任何 GPIO pad 配置（例如上拉/下拉、驱动能力、输出/输入使能）。因此，在安装专用 GPIO 捆绑包之前，您必须使用 GPIO 驱动程序 API（如*gpio_config()*）单独配置 GPIO。更多关于 GPIO 驱动的信息，请参考*GPIO API 参考*。

GPIO 捆绑包操作

操作	函数
以掩码的方式指定 GPIO 捆绑包的输出	*dedic_gpio_bundle_write()*
读取 GPIO 捆绑包实际输出的电平值	*dedic_gpio_bundle_read_out()*
读取 GPIO 捆绑包中输入的电平值	*dedic_gpio_bundle_read_in()*

备注： 由于函数调用的开销和内部涉及的位操作，使用上述函数可能无法获得较高的 GPIO 翻转速度。

用户可以尝试通过编写汇编代码操作 *GPIO* 来减少开销，但应自行注意线程安全。

通过编写汇编代码操作 GPIO

高阶用户可以通过编写汇编代码或调用 CPU 低层 API 来操作 GPIO。常见步骤为：

1. 分配一个 GPIO 捆绑包：`dedic_gpio_new_bundle()`
2. 查询该包占用的掩码：`dedic_gpio_get_out_mask()` 和/或`dedic_gpio_get_in_mask()`
3. 调用 CPU LL apis (如 *cpu_ll_write_dedic_gpio_mask*) 或使用该掩码编写汇编代码
4. 切换 IO 的最快捷方式是使用专用的“设置/清除”指令：
   - 设置 GPIO 位：`csrrsi rd, csr, imm[4:0]`
   - 清除 GPIO 位：`csrrci rd, csr, imm[4:0]`
   - 注意：只能控制最低位的 4 个 GPIO 通道

通过汇编操作专用 GPIO 的示例代码存放在 ESP-IDF 示例项目的 peripherals/dedicated_gpio 目录下。示例演示了如何通过汇编操作专用 GPIO 来模拟 UART、I2C 和 SPI 总线。

有关支持的专用 GPIO 指令的详细信息，请参考 *ESP32-C3 技术参考手册* > *ESP-RISC-V CPU* [PDF]。

一些专用的 CPU 指令也包含在 *hal/dedic_gpio_cpu_ll.h* 中，作为辅助内联函数。

备注： 由于自定义指令在不同目标上可能会有不同的格式，在应用程序中编写汇编代码可能会让代码难以在不同的芯片架构之间移植。

API 参考

Header File

- components/driver/gpio/include/driver/dedic_gpio.h

Functions

esp_err_t **dedic_gpio_get_out_mask**(*dedic_gpio_bundle_handle_t* bundle, uint32_t *mask)

Get allocated channel mask.

备注： Each bundle should have at least one mask (in or/and out), based on bundle configuration.

备注： With the returned mask, user can directly invoke LL function like “dedic_gpio_cpu_ll_write_mask” or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

参数

- **bundle** –**[in]** Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- **mask** –**[out]** Returned mask value for on specific direction (in or out)

返回

- ESP_OK: Get channel mask successfully
- ESP_ERR_INVALID_ARG: Get channel mask failed because of invalid argument
- ESP_FAIL: Get channel mask failed because of other error

esp_err_t **dedic_gpio_get_in_mask**(*dedic_gpio_bundle_handle_t* bundle, uint32_t *mask)

esp_err_t **dedic_gpio_get_out_offset**(*dedic_gpio_bundle_handle_t* bundle, uint32_t *offset)

Get the channel offset of the GPIO bundle.

A GPIO bundle maps the GPIOS of a particular direction to a consecutive set of channels within a particular GPIO bank of a particular CPU. This function returns the offset to the bundle's first channel of a particular direction within the bank.

参数

- **bundle** –**[in]** Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"
- **offset** –**[out]** Offset value to the first channel of a specific direction (in or out)

返回

- ESP_OK: Get channel offset successfully
- ESP_ERR_INVALID_ARG: Get channel offset failed because of invalid argument
- ESP_FAIL: Get channel offset failed because of other error

esp_err_t **dedic_gpio_get_in_offset**(*dedic_gpio_bundle_handle_t* bundle, uint32_t *offset)

esp_err_t **dedic_gpio_new_bundle**(const *dedic_gpio_bundle_config_t* *config, *dedic_gpio_bundle_handle_t* *ret_bundle)

Create GPIO bundle and return the handle.

备注: One has to enable at least input or output mode in "config" parameter.

参数

- **config** –**[in]** Configuration of GPIO bundle
- **ret_bundle** –**[out]** Returned handle of the new created GPIO bundle

返回

- ESP_OK: Create GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Create GPIO bundle failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPIO bundle failed because of no capable memory
- ESP_ERR_NOT_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP_FAIL: Create GPIO bundle failed because of other error

esp_err_t **dedic_gpio_del_bundle**(*dedic_gpio_bundle_handle_t* bundle)

Destroy GPIO bundle.

参数 **bundle** –**[in]** Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"

返回

- ESP_OK: Destroy GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Destroy GPIO bundle failed because of invalid argument
- ESP_FAIL: Destroy GPIO bundle failed because of other error

void **dedic_gpio_bundle_write**(*dedic_gpio_bundle_handle_t* bundle, uint32_t mask, uint32_t value)

Write value to GPIO bundle.

备注: The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

备注: For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

参数

- **bundle** –**[in]** Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"
- **mask** –**[in]** Mask of the GPIOs to be written in the given bundle

- **value** –**[in]** Value to write to given GPIO bundle, low bit represents low member in the bundle

uint32_t **dedic_gpio_bundle_read_out**(*dedic_gpio_bundle_handle_t* bundle)

Read the value that output from the given GPIO bundle.

备注: For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

参数 **bundle** –**[in]** Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"
返回 Value that output from the GPIO bundle, low bit represents low member in the bundle

uint32_t **dedic_gpio_bundle_read_in**(*dedic_gpio_bundle_handle_t* bundle)

Read the value that input to the given GPIO bundle.

备注: For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

参数 **bundle** –**[in]** Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"
返回 Value that input to the GPIO bundle, low bit represents low member in the bundle

Structures

struct **dedic_gpio_bundle_config_t**

Type of Dedicated GPIO bundle configuration.

Public Members

const int ***gpio_array**

Array of GPIO numbers, gpio_array[0] ~ gpio_array[size-1] <=> low_dedic_channel_num ~ high_dedic_channel_num

size_t **array_size**

Number of GPIOs in gpio_array

unsigned int **in_en**

Enable input

unsigned int **in_invert**

Invert input signal

unsigned int **out_en**

Enable output

unsigned int **out_invert**

Invert output signal

struct *dedic_gpio_bundle_config_t*::[anonymous] **flags**

Flags to control specific behaviour of GPIO bundle

Type Definitions

typedef struct dedic_gpio_bundle_t ***dedic_gpio_bundle_handle_t**

Type of Dedicated GPIO bundle.

2.6.8 Hash-based Message Authentication Code (HMAC)

The HMAC (Hash-based Message Authentication Code) module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block. HMACs work with pre-shared secret keys and provide authenticity and integrity to a message.

For more detailed information on the application workflow and the HMAC calculation process, see *ESP32-C3 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

Generalized Application Scheme

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel. To verify A's messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates HMAC of the received message itself.
- B checks wether the received and calculated HMACs match. If they do match, the message is authentic.

However, the HMAC itself isn't bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

HMAC on the ESP32-C3

On the ESP32-C3, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, the ESP32-C3 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is called *Upstream* mode, while the last two modes are called *Downstream* modes.

eFuse Keys for HMAC Six physical eFuse blocks can be used as keys for the HMAC module: block 4 up to block 9. The enum `hmac_key_id_t` in the API maps them to *HMAC_KEY0* ⋯*HMAC_KEY5*. Each key has a corresponding eFuse parameter *key purpose* determining for which of the three HMAC application scenarios (see below) the key may be used:

Key Purpose	Application Scenario
8	HMAC generated for software use
7	HMAC used as a key for the Digital Signature (DS) module
6	HMAC used for enabling the soft-disabled JTAG interface
5	HMAC both as a key for the DS module and for enabling JTAG

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the *key purpose* (see *ESP32-C3 Technical Reference Manual > eFuse Controller (eFuse)* [PDF]). Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the purpose of the provided key block matches the purpose stored in the eFuses of the key block provided by the ID.

HMAC Generation for Software Key Purpose value: 8

In this case, the HMAC is given out to the software (e.g. to authenticate a message).

The API to calculate the HMAC is `esp_hmac_calculate()`. The input arguments for the function are the message, message length and the eFuse key block ID which contains the secret and has efuse key purpose set to Upstream mode.

HMAC for Digital Signature Key Purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. The user only needs to provide the eFuse key block and purpose on the HMAC side (additional parameters are required for the Digital Signature component in that case). Neither the key nor the actual HMAC are ever exposed to outside the HMAC module and DS component. The calculation of the HMAC and its hand-over to the DS component happen internally.

For more details, see *ESP32-C3 Technical Reference Manual* > *Digital Signature (DS)* [PDF].

HMAC for Enabling JTAG Key Purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before. Following is the procedure to re-enable the JTAG

Setup

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose HMAC_DOWN_ALL (5) or HMAC_DOWN_JTAG (6). This can be done using the ets_efuse_write_key() function in the firmware or using espefuse.py from the host.
3. Configure the eFuse key block to be read protected using the esp_efuse_set_read_protect(), so that software cannot read back the value.
4. Burn the "soft JTAG disable" bit/bits on ESP32-C3. This will permanently disable JTAG unless the correct key value is provided by software.

备注: The API *esp_efuse_write_field_cnt(ESP_EFUSE_SOFT_DIS_JTAG, ESP_EFUSE_SOFT_DIS_JTAG[0]->bit_count)* can be used to burn "soft JTAG disable" bits on ESP32-C3.

备注: If `DIS_PAD_JTAG` eFuse is set, then `SOFT_DIS_JTAG` functionality does not work because JTAG is permanently disabled.

JTAG enable

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the `esp_hmac_jtag_enable()` function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call `esp_hmac_jtag_disable()`.

For more details, see *ESP32-C3 Technical Reference Manual* > *HMAC Accelerator (HMAC)* [PDF].

Application Outline

Following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage. We use *ets_efuse_write_key* to set physical key block 4 in the eFuse for the HMAC module together with its purpose. *ETS_EFUSE_KEY_PURPOSE_HMAC_UP* (8) means that this key can only be used for HMAC generation for software usage:

```
#include "esp32c3/rom/efuse.h"

const uint8_t key_data[32] = { ... };

int ets_status = ets_efuse_write_key(ETS_EFUSE_BLOCK_KEY4,
                    ETS_EFUSE_KEY_PURPOSE_HMAC_UP,
                    key_data, sizeof(key_data));

if (ets_status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

API Reference

Header File

- components/esp_hw_support/include/esp_hmac.h

Functions

esp_err_t **esp_hmac_calculate**(*hmac_key_id_t* key_id, const void *message, size_t message_len, uint8_t *hmac)

Calculate the HMAC of a given message.

Calculate the HMAC `hmac` of a given message `message` with length `message_len`. SHA256 is used for the calculation.

备注： Uses the HMAC peripheral in “upstream” mode.

参数

- **key_id** –Determines which of the 6 key blocks in the efuses should be used for the HMAC calcuation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- **message** –the message for which to calculate the HMAC
- **message_len** –message length return ESP_ERR_INVALID_STATE if unsuccessful
- **hmac** –**[out]** the hmac result; the buffer behind the provided pointer must be a writeable buffer of 32 bytes

返回

- ESP_OK, if the calculation was successful,

- ESP_ERR_INVALID_ARG if message or hmac is a nullptr or if key_id out of range
- ESP_FAIL, if the hmac calculation failed

esp_err_t **esp_hmac_jtag_enable**(*hmac_key_id_t* key_id, const uint8_t *token)

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

备注： Return value of the API does not indicate the JTAG status.

参数

- **key_id** –Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- **token** –Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

返回

- ESP_OK, if the key_purpose of the key_id matches to HMAC downstread mode, The API returns success even if calculated HMAC does not match with the provided token. However, The JTAG will be re-enabled only if the calculated HMAC value matches with provided token, otherwise JTAG will remain disabled.
- ESP_FAIL, if the key_purpose of the key_id is not set to HMAC downstream purpose or JTAG is permanently disabled by EFUSE_HARD_DIS_JTAG eFuse parameter.
- ESP_ERR_INVALID_ARG, invalid input arguments

esp_err_t **esp_hmac_jtag_disable**(void)

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling esp_hmac_jtag_enable() API.

返回

- ESP_OK return ESP_OK after writing the HMAC_SET_INVALIDATE_JTAG_REG with value 1.

Enumerations

enum **hmac_key_id_t**

The possible efuse keys for the HMAC peripheral

Values:

enumerator **HMAC_KEY0**

enumerator **HMAC_KEY1**

enumerator **HMAC_KEY2**

enumerator **HMAC_KEY3**

enumerator **HMAC_KEY4**

enumerator **HMAC_KEY5**

enumerator **HMAC_KEY_MAX**

2.6.9 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see *ESP32-C3 Technical Reference Manual* > *Digital Signature (DS)* [PDF].

Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-C3 or alternatively on a host. For this context, the IDF provides `esp_efuse_write_block()` to set the HMAC key and `esp_hmac_calculate()` to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in *ESP32-C3 Technical Reference Manual* > *Digital Signature (DS)* [PDF].

Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see *ESP32-C3 Technical Reference Manual* > *Digital Signature (DS)* [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,
2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is `esp_ds_sign()` and simply blocks until the calculation is finished. If software needs to do something else during the calculation, `esp_ds_start_sign()` can be called, followed by periodic calls to `esp_ds_is_busy()` to check when the calculation has finished. Once the calculation has finished, `esp_ds_finish_sign()` can be called to get the resulting signature.

The APIs `esp_ds_sign()` and `esp_ds_start_sign()` calculate a plain RSA signature with help of the DS peripheral. This signature needs to be converted to appropriate format for further use. For example, MbedTLS SSL stack supports PKCS#1 format. The API `esp_ds_rsa_sign()` can be used to obtain the signature directly in the PKCS#1 v1.5 format. It internally uses `esp_ds_start_sign()` and converts the signature into PKCS#1 v1.5 format.

备注： Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-C3 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

1) Randomly generate a 256 bit value called the *Initialization Vector* (IV).
2) Randomly generate a 256 bit value called the *HMAC_KEY*.
3) Calculate the encrypted private key paramters from the client private key (RSA) and the parameters generated in the above steps.
4) Then burn the 256 bit *HMAC_KEY* on the efuse, which can only be read by the DS peripheral.

For more details, see *ESP32-C3 Technical Reference Manual* > *Digital Signature (DS)* [PDF].

To configure the DS peripheral for development purposes, you can use the esp-secure-cert-tool.

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. The application then needs to read the ds data from the flash which has been done through the API's provided by the esp_secure_cert_mgr component. Please refer the component/README. for more details.

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of *ESP-TLS*. Please refer to *Digital Signature with ESP-TLS* in *ESP-TLS* for more details. As mentioned in the *ESP-TLS* documentation, the application only needs to provide the encrypted private key parameters to the esp_tls context (as *ds_data*), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

Example for SSL Mutual Authentication using DS

The example ssl_ds shows how to use the DS peripheral for mutual authentication. The example uses *mqtt_client* (Implemented through *ESP-MQTT*) to connect to broker test.mosquitto.org using ssl transport with mutual authentication. The ssl part is internally performed with *ESP-TLS*. See example README for more details.

API Reference

Header File

- components/esp_hw_support/include/esp_ds.h

Functions

esp_err_t **esp_ds_sign**(const void *message, const *esp_ds_data_t* *data, *hmac_key_id_t* key_id, void *signature)

Sign the message with a hardware key from specific key slot. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: Z = XY mod M where, Z is the signature, X is the input message, Y and M are the RSA private key parameters.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

备注: Please see note section of `esp_ds_start_sign()` for more details about the input parameters.

参数

- **message** –the message to be signed; its length should be (data->rsa_length + 1)*4 bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. message = padding(hash(inputMsg)))
- **data** –the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id** –the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data

- **signature** –the destination of the signature, should be (data->rsa_length + 1)*4 bytes long

返回

- ESP_OK if successful, the signature was written to the parameter `signature`.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or data->rsa_length is too long or 0
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn't been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTO_DS_INVALID_KEY if there's a problem with passing the HMAC key to the DS component
- ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn't match; the signature is invalid.
- ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

esp_err_t **esp_ds_start_sign**(const void *message, const *esp_ds_data_t* *data, *hmac_key_id_t* key_id, *esp_ds_context_t* **esp_ds_ctx)

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: Z = XY mod M where, Z is the signature, X is the input message, Y and M are the RSA private key parameters.

备注: This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner. The numbers Y, M, Rb which are a part of esp_ds_data_t should be provided in little endian format and should be of length equal to the RSA private key bit length The message length in bits should also be equal to the RSA private key bit length. No padding is applied to the message automatically, Please ensure the message is appropriate padded before calling the API.

参数

- **message** –the message to be signed; its length should be (data->rsa_length + 1)*4 bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. message = padding(hash(inputMsg)))
- **data** –the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id** –the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **esp_ds_ctx** –the context object which is needed for finishing the signing process later

返回

- ESP_OK if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or data->rsa_length is too long or 0
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn't been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTO_DS_INVALID_KEY if there's a problem with passing the HMAC key to the DS component

bool **esp_ds_is_busy**(void)

Return true if the DS peripheral is busy, otherwise false.

备注: Only valid if `esp_ds_start_sign()` was called before.

---

esp_err_t **esp_ds_finish_sign**(void *signature, *esp_ds_context_t* *esp_ds_ctx)

Finish the signing process.

参数

- **signature** –the destination of the signature, should be (data->rsa_length + 1)*4 bytes long, the resultant signature bytes shall be written in little endian format.
- **esp_ds_ctx** –the context object retreived by `esp_ds_start_sign()`

返回

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL
- ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn't match; the signature is invalid. This means that the encrypted RSA key parameters are invalid, indicating that they may have been tampered with or indicating a flash error, etc.
- ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches (see TRM for more details).

esp_err_t **esp_ds_encrypt_params**(*esp_ds_data_t* *data, const void *iv, const *esp_ds_p_data_t* *p_data, const void *key)

Encrypt the private key parameters.

The encryption is a prerequisite step before any signature operation can be done. It is not strictly necessary to use this encryption function, the encryption could also happen on an external device.

备注: The numbers Y, M, Rb which are a part of esp_ds_data_t should be provided in little endian format and should be of length equal to the RSA private key bit length The message length in bits should also be equal to the RSA private key bit length. No padding is applied to the message automatically, Please ensure the message is appropriate padded before calling the API.

参数

- **data** –Output buffer to store encrypted data, suitable for later use generating signatures.
- **iv** –Pointer to 16 byte IV buffer, will be copied into 'data'. Should be randomly generated bytes each time.
- **p_data** –Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and 'data' is stored.
- **key** –Pointer to 32 bytes of key data. Type determined by key_type parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

返回

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or p_data->rsa_length is too long

Structures

struct **esp_digital_signature_data**

Encrypted private key data. Recommended to store in flash in this format.

备注: This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Public Members

esp_digital_signature_length_t **rsa_length**

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

This value must match the length field encrypted and stored in 'c', or invalid results will be returned. (The DS peripheral will always use the value in 'c', not this value, so an attacker can't alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

备注： In IDF, the enum type length is the same as of type unsigned, so they can be used interchangably. See the ROM code for the original declaration of struct `ets_ds_data_t`.

---

uint32_t **iv**[ESP_DS_IV_BIT_LEN / 32]

IV value used to encrypt 'c'

uint8_t **c**[ESP_DS_C_LEN]

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

struct **esp_ds_p_data_t**

Plaintext parameters used by Digital Signature.

This is only used for encrypting the RSA parameters by calling esp_ds_encrypt_params(). Afterwards, the result can be stored in flash or in other persistent memory. The encryption is a prerequisite step before any signature operation can be done.

备注： Y, M, Rb, & M_Prime must all be in little endian format.

Public Members

uint32_t **Y**[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]

RSA exponent.

uint32_t **M**[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]

RSA modulus.

uint32_t **Rb**[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]

RSA r inverse operand.

uint32_t **M_prime**

RSA M prime operand.

uint32_t **length**

RSA length in words (32 bit)

Macros

ESP_DS_IV_BIT_LEN

ESP_DS_IV_LEN

ESP_DS_SIGNATURE_MAX_BIT_LEN

ESP_DS_SIGNATURE_MD_BIT_LEN

ESP_DS_SIGNATURE_M_PRIME_BIT_LEN

ESP_DS_SIGNATURE_L_BIT_LEN

ESP_DS_SIGNATURE_PADDING_BIT_LEN

ESP_DS_C_LEN

Type Definitions

typedef struct esp_ds_context **esp_ds_context_t**

typedef struct *esp_digital_signature_data* **esp_ds_data_t**

Encrypted private key data. Recommended to store in flash in this format.

备注： This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Enumerations

enum **esp_digital_signature_length_t**

Values:

enumerator **ESP_DS_RSA_1024**

enumerator **ESP_DS_RSA_2048**

enumerator **ESP_DS_RSA_3072**

enumerator **ESP_DS_RSA_4096**

2.6.10 I2C 驱动程序

概述

I2C 是一种串行同步半双工通信协议，总线上可以同时挂载多个主机和从机。I2C 总线由串行数据线 (SDA) 和串行时钟线 (SCL) 线构成。这些线都需要上拉电阻。

I2C 具有简单且制造成本低廉等优点，主要用于低速外围设备的短距离通信（一英尺以内）。

ESP32-C3 有 1 个 I2C 控制器（也称为端口），负责处理在 I2C 总线上的通信。每个控制器都可以设置为主机或从机。

驱动程序的功能

I2C 驱动程序管理在 I2C 总线上设备的通信，该驱动程序具备以下功能：

- 在主机模式下读写字节
- 支持从机模式
- 读取并写入寄存器，然后由主机读取/写入

使用驱动程序

以下部分将指导您完成 I2C 驱动程序配置和工作的基本步骤：

1. 配置驱动程序 - 设置初始化参数（如主机模式或从机模式，SDA 和 SCL 使用的 GPIO 管脚，时钟速度等）
2. 安装驱动程序- 激活一个 I2C 控制器的驱动，该控制器可为主机也可为从机
3. 根据是为主机还是从机配置驱动程序，选择合适的项目
   a) 主机模式下通信 - 发起通信（主机模式）
   b) 从机模式下通信 - 响应主机消息（从机模式）
4. 中断处理 - 配置 I2C 中断服务
5. 用户自定义配置 - 调整默认的 I2C 通信参数（如时序、位序等）
6. 错误处理 - 如何识别和处理驱动程序配置和通信错误
7. 删除驱动程序- 在通信结束时释放 I2C 驱动程序所使用的资源

配置驱动程序 建立 I2C 通信第一步是配置驱动程序，这需要设置*i2c_config_t* 结构中的几个参数：

- 设置 I2C **工作模式** - 从*i2c_mode_t* 中选择主机模式或从机模式
- 设置 **通信管脚**
  - 指定 SDA 和 SCL 信号使用的 GPIO 管脚
  - 是否启用 ESP32-C3 的内部上拉电阻
- （仅限主机模式）设置 I2C **时钟速度**
- （仅限从机模式）设置以下内容：
  - 是否应启用 **10 位寻址模式**
  - 定义 **从机地址**

然后，初始化给定 I2C 端口的配置，请使用端口号和*i2c_config_t* 作为函数调用参数来调用*i2c_param_config()* 函数。

配置示例（主机）：

```
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,          // 配置 SDA 的 GPIO
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,          // 配置 SCL 的 GPIO
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ,  // 为项目选择频率
    .clk_flags = 0,          // 可选项，可以使用 I2C_SCLK_SRC_FLAG_* 标志来选择␣
↪I2C 源时钟
};
```

配置示例（从机）：

```
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,             // 配置 SDA 的 GPIO
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO,             // 配置 SCL 的 GPIO
```

(下页继续)

(续上页)

```
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR,          // 项目从机地址
    .slave.maximum_speed = I2C_SLAVE_MAX_SPEED // 预期的最大时钟速度
    .clk_flags = 0,                              // 可选项，可以使用 I2C_SCLK_SRC_
↪FLAG_* 标志来选择 I2C 源时钟
};
```

在此阶段，*i2c_param_config()* 还将其他 I2C 配置参数设置为 I2C 总线协议规范中定义的默认值。有关默认值及修改默认值的详细信息，请参考用户自定义配置。

源时钟配置 增加了 **时钟源分配器**，用于支持不同的时钟源。时钟分配器将选择一个满足所有频率和能力要求的时钟源（如*i2c_config_t::clk_flags* 中的要求）。

当*i2c_config_t::clk_flags* 为 0 时，时钟分配器将仅根据所需频率进行选择。如果不需要诸如 APB 之类的特殊功能，则可以将时钟分配器配置为仅根据所需频率选择源时钟。为此，请将*i2c_config_t::clk_flags* 设置为 0。有关时钟特性，请参见下表。

备注： 如果时钟不满足请求的功能，则该时钟不是有效的选项，即，请求的功能中的任何位（clk_flags）在时钟的功能中均为 0。

表 2: ESP32-C3 时钟源特性

时钟名称	时钟频率	SCL 的最大频率	时钟功能
XTAL 时钟	40 MHz	2 MHz	/
RTC 时钟	20 MHz	1 MHz	*I2C_SCLK_SRC_FLAG_AWARE_DFS*, *I2C_SCLK_SRC_FLAG_LIGHT_SLEEP*

对*i2c_config_t::clk_flags* 的解释如下：

1. *I2C_SCLK_SRC_FLAG_AWARE_DFS*：当 APB 时钟改变时，时钟的波特率不会改变。
2. *I2C_SCLK_SRC_FLAG_LIGHT_SLEEP*：支持轻度睡眠模式，APB 时钟则不支持。
3. ESP32-C3 可能不支持某些标志，请在使用前阅读技术参考手册。

备注： 在主机模式下，SCL 的时钟频率不应大于上表中提到的 SCL 的最大频率。

备注： SCL 的时钟频率会被上拉电阻和线上电容（或是从机电容）一起影响。因此，用户需要自己选择合适的上拉电阻去保证 SCL 时钟频率是准确的。尽管 I2C 协议推荐上拉电阻值为 1 K 欧姆到 10 K 欧姆，但是需要根据不同的频率需要选择不同的上拉电阻。

通常来说，所选择的频率越高，需要的上拉电阻越小（但是不要小于 1 K 欧姆）。这是因为高电阻会减小电流，这会延长上升时间从而使频率变慢。通常我们推荐的上拉阻值范围为 2 K 欧姆到 5 K 欧姆，但是用户可能也需要根据他们的实际情况做出一些调整。

安装驱动程序 配置好 I2C 驱动程序后，使用以下参数调用函数*i2c_driver_install()* 安装驱动程序：

- 端口号，从 *i2c_port_t* 中二选一
- 主机或从机模式，从 *i2c_mode_t* 中选择
- （仅限从机模式）分配用于在从机模式下发送和接收数据的缓存区大小。I2C 是一个以主机为中心的总线，数据只能根据主机的请求从从机传输到主机。因此，从机通常有一个发送缓存区，供从应用程序写入数据使用。数据保留在发送缓存区中，由主机自行读取。
- 用于分配中断的标志（请参考 esp_hw_support/include/esp_intr_alloc.h 中 ESP_INTR_FLAG_* 值）

主机模式下通信 安装 I2C 驱动程序后，ESP32-C3 即可与其他 I2C 设备通信。

ESP32-C3 的 I2C 控制器在主机模式下负责与 I2C 从机设备建立通信，并发送命令让从机响应，如进行测量并将结果发给主机。

为优化通信流程，驱动程序提供一个名为“命令链接”的容器，该容器应填充一系列命令，然后传递给 I2C 控制器执行。

主机写入数据 下面的示例展示如何为 I2C 主机构建命令链接，从而向从机发送 *n* 个字节。

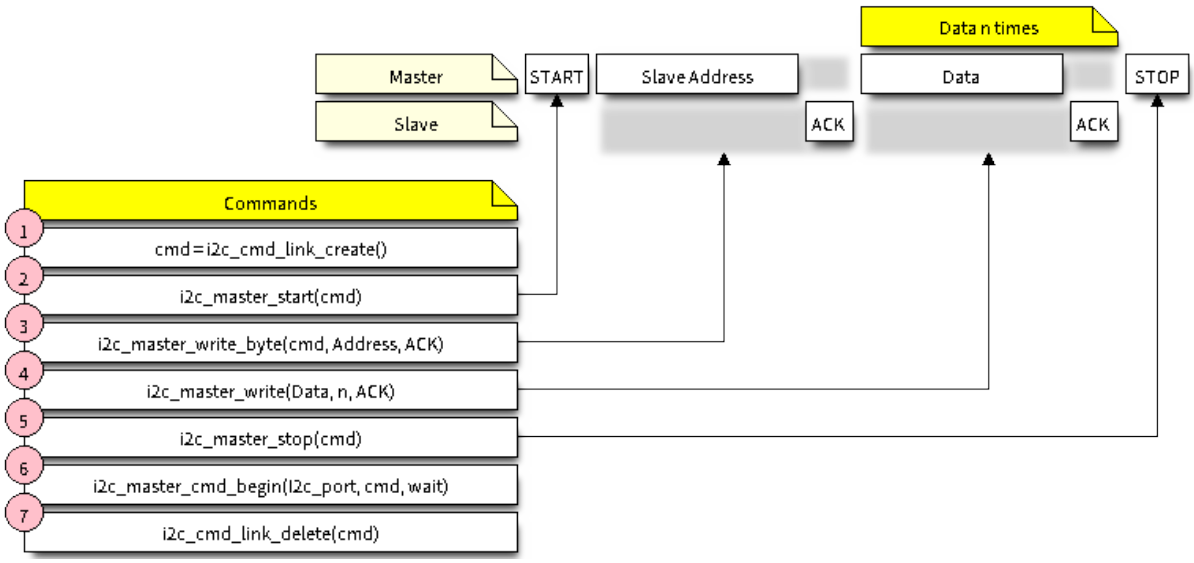

图 5: I2C command link - master write example

下面介绍如何为“主机写入数据”设置命令链接及其内部内容：

1. 使用 *i2c_cmd_link_create()* 创建一个命令链接。
   然后，将一系列待发送给从机的数据填充命令链接：
   a) **启动位** - *i2c_master_start()*
   b) **从机地址** - *i2c_master_write_byte()*。提供单字节地址作为调用此函数的实参。
   c) **数据** - 一个或多个字节的数据作为 *i2c_master_write()* 的实参。
   d) **停止位** - *i2c_master_stop()*
   函数 *i2c_master_write_byte()* 和 *i2c_master_write()* 都有额外的实参，规定主机是否应确认其有无接受到 ACK 位。
2. 通过调用 *i2c_master_cmd_begin()* 来触发 I2C 控制器执行命令链接。一旦开始执行，就不能再修改命令链接。
3. 命令发送后，通过调用 *i2c_cmd_link_delete()* 释放命令链接使用的资源。

主机读取数据 下面的示例展示如何为 I2C 主机构建命令链接，以便从从机读取 *n* 个字节。

在读取数据时，在上图的步骤 4 中，不是用 `i2c_master_write...`，而是用 *i2c_master_read_byte()* 和/或 *i2c_master_read()* 填充命令链接。同样，在步骤 5 中配置最后一次的读取，以便主机不提供 ACK 位。

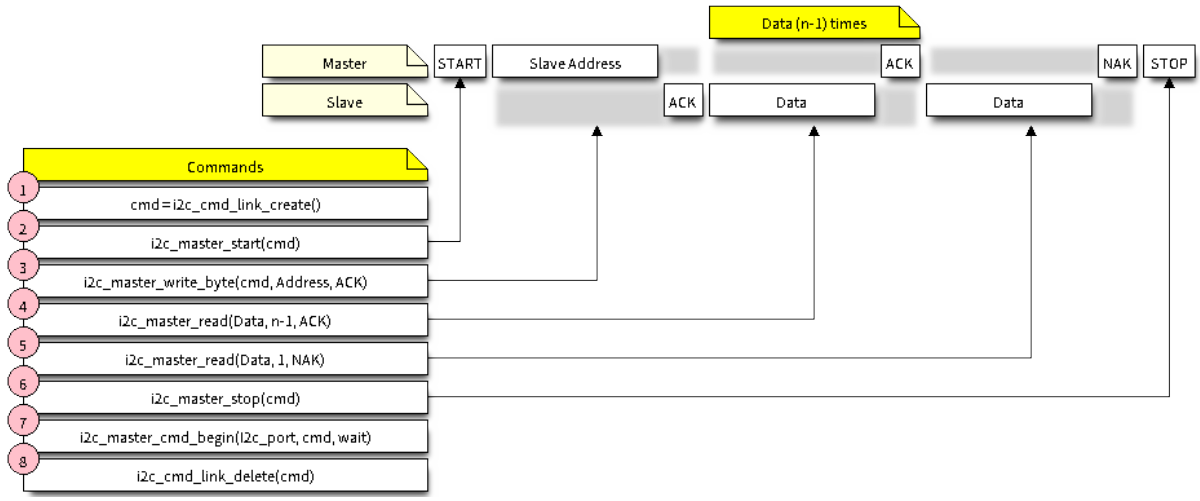

图 6: I2C command link - master read example

指示写入或读取数据 发送从机地址后（请参考上图中第 3 步），主机可以写入或从从机读取数据。

主机实际执行的操作信息存储在从机地址的最低有效位中。

因此，为了将数据写入从机，主机发送的命令链接应包含地址 `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE`，如下所示：

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

同理，指示从从机读取数据的命令链接如下所示：

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

从机模式下通信 安装 I2C 驱动程序后，ESP32-C3 即可与其他 I2C 设备通信。

API 为从机提供以下功能：

- *i2c_slave_read_buffer()*
  当主机将数据写入从机时，从机将自动将其存储在接收缓存区中。从机应用程序可自行调用函数*i2c_slave_read_buffer()*。如果接收缓存区中没有数据，此函数还具有一个参数用于指定阻塞时间。这将允许从机应用程序在指定的超时设定内等待数据到达缓存区。
- *i2c_slave_write_buffer()*
  发送缓存区是用于存储从机要以 FIFO 顺序发送给主机的所有数据。在主机请求接收前，这些数据一直存储在发送缓存区。函数*i2c_slave_write_buffer()*有一个参数，用于指定发送缓存区已满时的块时间。这将允许从机应用程序在指定的超时设定内等待发送缓存区中足够的可用空间。

在 peripherals/i2c 中可找到介绍如何使用这些功能的代码示例。

中断处理 安装驱动程序时，默认情况下会安装中断处理程序。

用户自定义配置 如本节末尾所述*配置驱动程序*，函数*i2c_param_config()*在初始化 I2C 端口的驱动程序配置时，也会将几个 I2C 通信参数设置为 I2C 总线协议规范规定的默认值。其他一些相关参数已在 I2C 控制器的寄存器中预先配置。

通过调用下表中提供的专用函数，可以将所有这些参数更改为用户自定义值。请注意，时序值是在 APB 时钟周期中定义。

表 3: 其他可配置的 I2C 通信参数

要更改的参数	函数
SCL 脉冲周期的高电平和低电平	*i2c_set_period()*
在产生 **启动**信号期间使用的 SCL 和 SDA 信号时序	*i2c_set_start_timing()*
在产生 **停止**信号期间使用的 SCL 和 SDA 信号时序	*i2c_set_stop_timing()*
从机采样以及主机切换时，SCL 和 SDA 信号之间的时序关系	*i2c_set_data_timing()*
I2C 超时	*i2c_set_timeout()*
优先发送/接收最高有效位 (LSB) 或最低有效位 (MSB），可在*i2c_trans_mode_t* 定义的模式中选择	*i2c_set_data_mode()*

上述每个函数都有一个 *_get_* 对应项来检查当前设置的值。例如，调用*i2c_get_timeout()* 来检查 I2C 超时值。

要检查在驱动程序配置过程中设置的参数默认值，请参考文件 driver/i2c/i2c.c 并查找带有后缀 _DEFAULT 的定义。

通过函数*i2c_set_pin()* 可以为 SDA 和 SCL 信号选择不同的管脚并改变上拉配置。如果要修改已经输入的值，请使用函数*i2c_param_config()*。

备注： ESP32-C3 的内部上拉电阻范围为几万欧姆，因此在大多数情况下，它们本身不足以用作 I2C 上拉电阻。建议用户使用阻值在 I2C 总线协议规范规定范围内的上拉电阻。计算阻值的具体方法，可参考 TI 应用说明

错误处理 大多数 I2C 驱动程序的函数在成功完成时会返回 ESP_OK，或在失败时会返回特定的错误代码。实时检查返回的值并进行错误处理是一种好习惯。驱动程序也会打印日志消息，其中包含错误说明，例如检查输入配置的正确性。有关详细信息，请参考文件 driver/i2c/i2c.c 并用后缀 _ERR_STR 查找定义。

使用专用中断来捕获通信故障。例如，如果从机将数据发送回主机耗费太长时间，会触发 I2C_TIME_OUT_INT 中断。详细信息请参考中断处理。

如果出现通信失败，可以分别为发送和接收缓存区调用*i2c_reset_tx_fifo()* 和*i2c_reset_rx_fifo()* 来重置内部硬件缓存区。

删除驱动程序 当使用*i2c_driver_install()* 建立 I2C 通信，一段时间后不再需要 I2C 通信时，可以通过调用*i2c_driver_delete()* 来移除驱动程序以释放分配的资源。

由于函数*i2c_driver_delete()* 无法保证线程安全性，请在调用该函数移除驱动程序前务必确保所有的线程都已停止使用驱动程序。

应用示例

I2C 主机和从机示例：peripherals/i2c。

API 参考

Header File

- components/driver/i2c/include/driver/i2c.h

Functions

esp_err_t **i2c_driver_install**(*i2c_port_t* i2c_num, *i2c_mode_t* mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)

Install an I2C driver.

备注： Not all Espressif chips can support slave mode (e.g. ESP32C2)

备注： In master mode, if the cache is likely to be disabled(such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram(if psram is enabled) in interrupt handle function when cache is disabled.

参数

- **`i2c_num`** –I2C port number
- **`mode`** –I2C mode (either master or slave).
- **`slv_rx_buf_len`** –Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- **`slv_tx_buf_len`** –Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- **`intr_alloc_flags`** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver installation error

esp_err_t **`i2c_driver_delete`**(*i2c_port_t* i2c_num)

Delete I2C driver.

备注： This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

参数 **`i2c_num`** –I2C port to delete

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **`i2c_param_config`**(*i2c_port_t* i2c_num, const *i2c_config_t* *i2c_conf)

Configure an I2C bus with the given configuration.

参数

- **`i2c_num`** –I2C port to configure
- **`i2c_conf`** –Pointer to the I2C configuration

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **`i2c_reset_tx_fifo`**(*i2c_port_t* i2c_num)

reset I2C tx hardware fifo

参数 **`i2c_num`** –I2C port number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **`i2c_reset_rx_fifo`**(*i2c_port_t* i2c_num)

reset I2C rx fifo

参数 **i2c_num** –I2C port number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_pin**(*i2c_port_t* i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, *i2c_mode_t* mode)

Configure GPIO pins for I2C SCK and SDA signals.

参数

- **i2c_num** –I2C port number
- **sda_io_num** –GPIO number for I2C SDA signal
- **scl_io_num** –GPIO number for I2C SCL signal
- **sda_pullup_en** –Enable the internal pullup for SDA pin
- **scl_pullup_en** –Enable the internal pullup for SCL pin
- **mode** –I2C mode

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_master_write_to_device**(*i2c_port_t* i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc…It shall only be called in I2C master mode.

参数

- **i2c_num** –I2C port number to perform the transfer on
- **device_address** –I2C device’s 7-bit address
- **write_buffer** –Bytes to send on the bus
- **write_size** –Size, in bytes, of the write buffer
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

esp_err_t **i2c_master_read_from_device**(*i2c_port_t* i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc…It shall only be called in I2C master mode.

参数

- **i2c_num** –I2C port number to perform the transfer on
- **device_address** –I2C device’s 7-bit address
- **read_buffer** –Buffer to store the bytes received on the bus
- **read_size** –Size, in bytes, of the read buffer
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

esp_err_t **i2c_master_write_read_device**(*i2c_port_t* i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the `write` and `read`, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc···It shall only be called in I2C master mode.

参数

- **i2c_num** –I2C port number to perform the transfer on
- **device_address** –I2C device’ s 7-bit address
- **write_buffer** –Bytes to send on the bus
- **write_size** –Size, in bytes, of the write buffer
- **read_buffer** –Buffer to store the bytes received on the bus
- **read_size** –Size, in bytes, of the read buffer
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’ t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

i2c_cmd_handle_t **i2c_cmd_link_create_static**(uint8_t *buffer, uint32_t size)

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ···) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

备注: It is **highly** advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with `malloc`).

参数

- **buffer** –Buffer to use for commands allocations
- **size** –Size in bytes of the buffer

返回 Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

i2c_cmd_handle_t **i2c_cmd_link_create**(void)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

返回 Handle to the I2C command link or NULL in case of insufficient dynamic memory.

void **i2c_cmd_link_delete_static**(*i2c_cmd_handle_t* cmd_handle)

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static`.

参数 **cmd_handle** –I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function

void **i2c_cmd_link_delete**(*i2c_cmd_handle_t* cmd_handle)

Free the I2C commands list.

参数 **cmd_handle** –I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function

esp_err_t **i2c_master_start**(*i2c_cmd_handle_t* cmd_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

参数 **cmd_handle** –I2C commands list

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_write_byte**(*i2c_cmd_handle_t* cmd_handle, uint8_t data, bool ack_en)

Queue a "write byte" command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

参数

- **cmd_handle** –I2C commands list
- **data** –Byte to send on the port
- **ack_en** –Enable ACK signal

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_write**(*i2c_cmd_handle_t* cmd_handle, const uint8_t *data, size_t data_len, bool ack_en)

Queue a "write (multiple) bytes" command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

参数

- **cmd_handle** –I2C commands list
- **data** –Bytes to send. This buffer shall remain **valid** until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to `ESP_INTR_FLAG_IRAM`, `data` should be allocated from internal RAM.
- **data_len** –Length, in bytes, of the data buffer
- **ack_en** –Enable ACK signal

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_read_byte**(*i2c_cmd_handle_t* cmd_handle, uint8_t *data, *i2c_ack_type_t* ack)

Queue a "read byte" command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

参数

- **cmd_handle** –I2C commands list
- **data** –Pointer where the received byte will the stored. This buffer shall remain **valid** until the transaction is finished.
- **ack** –ACK signal

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_read**(*i2c_cmd_handle_t* cmd_handle, uint8_t *data, size_t data_len, *i2c_ack_type_t* ack)

Queue a "read (multiple) bytes" command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

参数

- **cmd_handle** –I2C commands list
- **data** –Pointer where the received bytes will the stored. This buffer shall remain **valid** until the transaction is finished.
- **data_len** –Size, in bytes, of the `data` buffer
- **ack** –ACK signal

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_stop**(*i2c_cmd_handle_t* cmd_handle)

Queue a "STOP signal" to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

参数 **cmd_handle** –I2C commands list

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_cmd_begin**(*i2c_port_t* i2c_num, *i2c_cmd_handle_t* cmd_handle, TickType_t ticks_to_wait)

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C port is protected by mutex, so this function is thread-safe. This function shall only be called in I2C master mode.

参数

- **i2c_num** –I2C port number
- **cmd_handle** –I2C commands list
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

int **i2c_slave_write_buffer**(*i2c_port_t* i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

备注: This function shall only be called in I2C slave mode.

参数

- **i2c_num** –I2C port number
- **data** –Bytes to write into internal buffer
- **size** –Size, in bytes, of `data` buffer
- **ticks_to_wait** –Maximum ticks to wait.

返回

- ESP_FAIL (-1) Parameter error
- Other (>=0) The number of data bytes pushed to the I2C slave buffer.

int **i2c_slave_read_buffer**(*i2c_port_t* i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware

RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the `data` user buffer.

备注： This function shall only be called in I2C slave mode.

参数

- **i2c_num** –I2C port number
- **data** –Buffer to fill with ringbuffer’ s bytes
- **max_size** –Maximum bytes to read
- **ticks_to_wait** –Maximum waiting ticks

返回

- ESP_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes read from I2C slave buffer.

esp_err_t **i2c_set_period**(*i2c_port_t* i2c_num, int high_period, int low_period)

Set I2C master clock period.

参数

- **i2c_num** –I2C port number
- **high_period** –Clock cycle number during SCL is high level, high_period is a 14 bit value
- **low_period** –Clock cycle number during SCL is low level, low_period is a 14 bit value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_period**(*i2c_port_t* i2c_num, int *high_period, int *low_period)

Get I2C master clock period.

参数

- **i2c_num** –I2C port number
- **high_period** –pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- **low_period** –pointer to get clock cycle number during SCL is low level, will get a 14 bit value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_filter_enable**(*i2c_port_t* i2c_num, uint8_t cyc_num)

Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

备注： Enable filter will slow down the SCL clock.

参数

- **i2c_num** –I2C port number to filter
- **cyc_num** –the APB cycles need to be filtered (0<= cyc_num <=7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_filter_disable**(*i2c_port_t* i2c_num)

Disable filter on I2C bus.

参数 **i2c_num** –I2C port number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_start_timing**(*i2c_port_t* i2c_num, int setup_time, int hold_time)

set I2C master start signal timing

参数

- **i2c_num** –I2C port number
- **setup_time** –clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’ s a 10-bit value.
- **hold_time** –clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it’ s a 10-bit value.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_start_timing**(*i2c_port_t* i2c_num, int *setup_time, int *hold_time)

get I2C master start signal timing

参数

- **i2c_num** –I2C port number
- **setup_time** –pointer to get setup time
- **hold_time** –pointer to get hold time

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_stop_timing**(*i2c_port_t* i2c_num, int setup_time, int hold_time)

set I2C master stop signal timing

参数

- **i2c_num** –I2C port number
- **setup_time** –clock num between the rising-edge of SCL and the rising-edge of SDA, it’ s a 10-bit value.
- **hold_time** –clock number after the STOP bit’ s rising-edge, it’ s a 14-bit value.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_stop_timing**(*i2c_port_t* i2c_num, int *setup_time, int *hold_time)

get I2C master stop signal timing

参数

- **i2c_num** –I2C port number
- **setup_time** –pointer to get setup time.
- **hold_time** –pointer to get hold time.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_data_timing**(*i2c_port_t* i2c_num, int sample_time, int hold_time)

set I2C data signal timing

参数

- **i2c_num** –I2C port number
- **sample_time** –clock number I2C used to sample data on SDA after the rising-edge of SCL, it’ s a 10-bit value
- **hold_time** –clock number I2C used to hold the data after the falling-edge of SCL, it’ s a 10-bit value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_data_timing**(*i2c_port_t* i2c_num, int *sample_time, int *hold_time)

get I2C data signal timing

参数

- **i2c_num** –I2C port number
- **sample_time** –pointer to get sample time
- **hold_time** –pointer to get hold time

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_timeout**(*i2c_port_t* i2c_num, int timeout)

set I2C timeout value

参数

- **i2c_num** –I2C port number
- **timeout** –timeout value for I2C bus (unit: APB 80Mhz clock cycle)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_timeout**(*i2c_port_t* i2c_num, int *timeout)

get I2C timeout value

参数

- **i2c_num** –I2C port number
- **timeout** –pointer to get timeout value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_data_mode**(*i2c_port_t* i2c_num, *i2c_trans_mode_t* tx_trans_mode, *i2c_trans_mode_t* rx_trans_mode)

set I2C data transfer mode

参数

- **i2c_num** –I2C port number
- **tx_trans_mode** –I2C sending data mode
- **rx_trans_mode** –I2C receving data mode

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_data_mode**(*i2c_port_t* i2c_num, *i2c_trans_mode_t* *tx_trans_mode, *i2c_trans_mode_t* *rx_trans_mode)

get I2C data transfer mode

参数

- **i2c_num** –I2C port number
- **tx_trans_mode** –pointer to get I2C sending data mode
- **rx_trans_mode** –pointer to get I2C receiving data mode

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Structures

struct **i2c_config_t**

I2C initialization parameters.

Public Members

i2c_mode_t **mode**

I2C mode

int **sda_io_num**

GPIO number for I2C sda signal

int **scl_io_num**

GPIO number for I2C scl signal

bool **sda_pullup_en**

Internal GPIO pull mode for I2C sda signal

bool **scl_pullup_en**

Internal GPIO pull mode for I2C scl signal

uint32_t **clk_speed**

I2C clock frequency for master mode, (no higher than 1MHz for now)

struct *i2c_config_t*::[anonymous]::[anonymous] **master**

I2C master config

uint8_t **addr_10bit_en**

I2C 10bit address mode enable for slave mode

uint16_t **slave_addr**

I2C address for slave mode

uint32_t **maximum_speed**

I2C expected clock speed from SCL.

struct *i2c_config_t*::[anonymous]::[anonymous] **slave**

I2C slave config

uint32_t **clk_flags**

Bitwise of `I2C_SCLK_SRC_FLAG_**FOR_DFS**` for clk source choice

Macros

I2C_SCLK_SRC_FLAG_FOR_NOMAL

Any one clock source that is available for the specified frequency may be choosen

I2C_SCLK_SRC_FLAG_AWARE_DFS

For REF tick clock, it won't change with APB.

I2C_SCLK_SRC_FLAG_LIGHT_SLEEP

For light sleep mode.

I2C_INTERNAL_STRUCT_SIZE

Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

I2C_LINK_RECOMMENDED_SIZE(TRANSACTIONS)

The following macro is used to determine the recommended size of the buffer to pass to `i2c_cmd_link_create_static()` function. It requires one parameter, `TRANSACTIONS`, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, `TRANSACTIONS` must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as "(repeated) start", "stop", "nack", "ack" shall not be counted.

Type Definitions

typedef void ***i2c_cmd_handle_t**

I2C command handle

Header File

- components/hal/include/hal/i2c_types.h

Structures

struct **i2c_hal_clk_config_t**

Data structure for calculating I2C bus timing.

Public Members

uint16_t **clkm_div**

I2C core clock devider

uint16_t **scl_low**

I2C scl low period

uint16_t **scl_high**

I2C scl hight period

uint16_t **scl_wait_high**

I2C scl wait_high period

uint16_t **sda_hold**

I2C scl low period

uint16_t **sda_sample**

I2C sda sample time

uint16_t **setup**

I2C start and stop condition setup period

uint16_t **hold**

I2C start and stop condition hold period

uint16_t **tout**

I2C bus timeout period

struct **i2c_hal_timing_config_t**

Timing configuration structure. Used for I2C reset internally.

Public Members

int **high_period**

high_period time

int **low_period**

low_period time

int **wait_high_period**

wait_high_period time

int **rstart_setup**

restart setup

int **start_hold**

start hold time

int **stop_setup**

stop setup

int **stop_hold**

stop hold time

int **sda_sample**

high_period time

int **sda_hold**

sda hold time

int **timeout**

timeout value

Type Definitions

typedef *soc_periph_i2c_clk_src_t* **i2c_clock_source_t**

I2C group clock source.

Enumerations

enum **i2c_port_t**

I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).

Values:

enumerator **I2C_NUM_0**

I2C port 0

enumerator **I2C_NUM_MAX**

I2C port max

enum **i2c_mode_t**

Values:

enumerator **I2C_MODE_SLAVE**

I2C slave mode

enumerator **I2C_MODE_MASTER**

I2C master mode

enumerator **I2C_MODE_MAX**

enum **i2c_rw_t**

Values:

enumerator **I2C_MASTER_WRITE**

I2C write data

enumerator **I2C_MASTER_READ**

I2C read data

enum **i2c_trans_mode_t**

Values:

enumerator **I2C_DATA_MODE_MSB_FIRST**

I2C data msb first

enumerator **I2C_DATA_MODE_LSB_FIRST**

I2C data lsb first

enumerator **I2C_DATA_MODE_MAX**

enum **i2c_addr_mode_t**

Values:

enumerator **I2C_ADDR_BIT_7**

I2C 7bit address for slave mode

enumerator **I2C_ADDR_BIT_10**

I2C 10bit address for slave mode

enumerator **I2C_ADDR_BIT_MAX**

enum **i2c_ack_type_t**

Values:

enumerator **I2C_MASTER_ACK**

I2C ack for each byte read

enumerator **I2C_MASTER_NACK**

I2C nack for each byte read

enumerator **I2C_MASTER_LAST_NACK**

I2C nack for the last byte

enumerator **I2C_MASTER_ACK_MAX**

2.6.11 I2S

简介

I2S（Inter-IC Sound，集成电路内置音频总线）是一种同步串行通信协议，通常用于在两个数字音频设备之间传输音频数据。

ESP32-C3 包含 1 个 I2S 外设。通过配置这些外设，可以借助 I2S 驱动来输入和输出采样数据。

标准或 TDM 通信模式下的 I2S 总线包含以下几条线路：

- **MCLK**：主时钟线。该信号线可选，具体取决于从机，主要用于向 I2S 从机提供参考时钟。
- **BCLK**：位时钟线。用于数据线的位时钟。
- **WS**：字（声道）选择线。通常用于识别声道（除 PDM 模式外）。
- **DIN/DOUT**：串行数据输入/输出线。如果 DIN 和 DOUT 被配置到相同的 GPIO，数据将在内部回环。

PDM 通信模式下的 I2S 总线包含以下几条线路：

- **CLK**：PDM 时钟线。
- **DIN/DOUT**：串行数据输入/输出线。

每个 I2S 控制器都具备以下功能，可由 I2S 驱动进行配置：

- 可用作系统主机或从机
- 可用作发射器或接收器
- DMA 控制器支持流数据采样，CPU 无需单独复制每个采样数据

每个控制器都有独立的 RX 和 TX 通道，连接到不同 GPIO 管脚，能够在不同的时钟和声道配置下工作。注意，尽管在一个控制器上 TX 通道和 RX 通道的内部 MCLK 相互独立，但输出的 MCLK 信号只能连接到一个通道。如果需要两个互相独立的 MCLK 输出，必须将其分配到不同的 I2S 控制器上。

I2S 文件结构

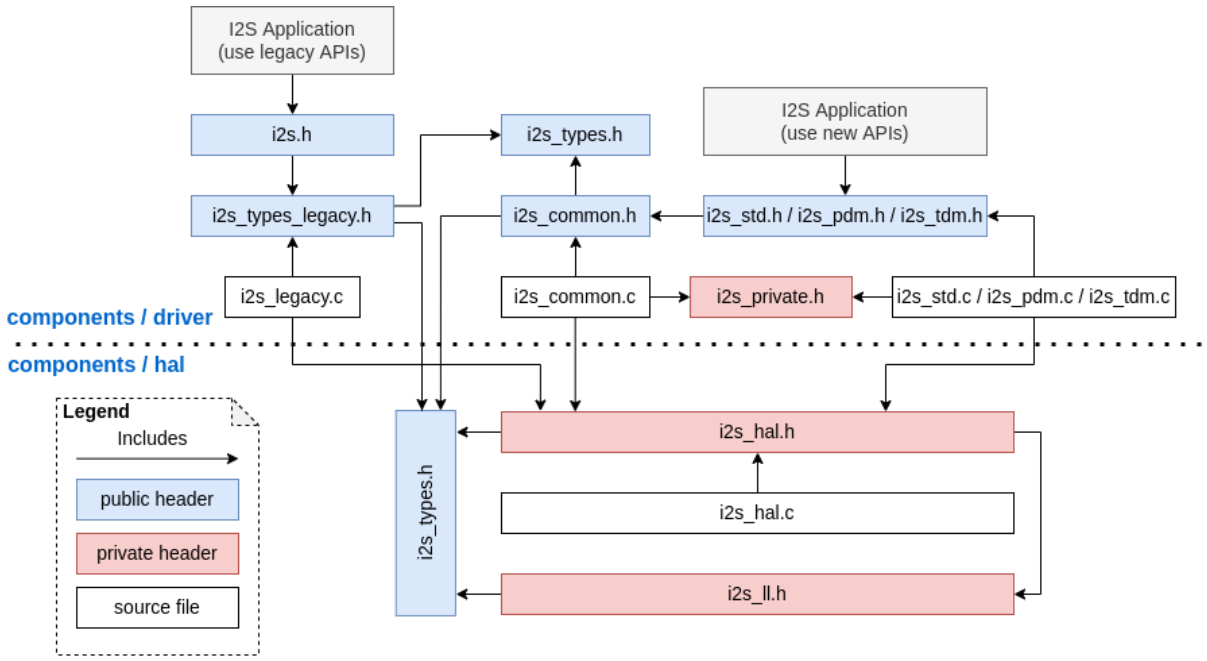

图 7: I2S 文件结构

需要包含在 I2S 应用中的公共头文件如下所示：

- `i2s.h`：提供原有 I2S API（用于使用原有驱动的应用）。
- `i2s_std.h`：提供标准通信模式的 API（用于使用标准模式的新驱动程序的应用）。
- `i2s_pdm.h`：提供 PDM 通信模式的 API（用于使用 PDM 模式的新驱动程序的应用）。
- `i2s_tdm.h`：提供 TDM 通信模式的 API（用于使用 TDM 模式的新驱动的应用）。

备注： 原有驱动与新驱动无法共存。包含 `i2s.h` 以使用原有驱动，或包含其他三个头文件以使用新驱动。原有驱动未来可能会被删除。

已包含在上述头文件中的公共头文件如下所示：

- `i2s_types_legacy.h`：提供只在原有驱动中使用的原有公共类型。
- `i2s_types.h`：提供公共类型。
- `i2s_common.h`：提供所有通信模式通用的 API。

I2S 时钟

时钟源

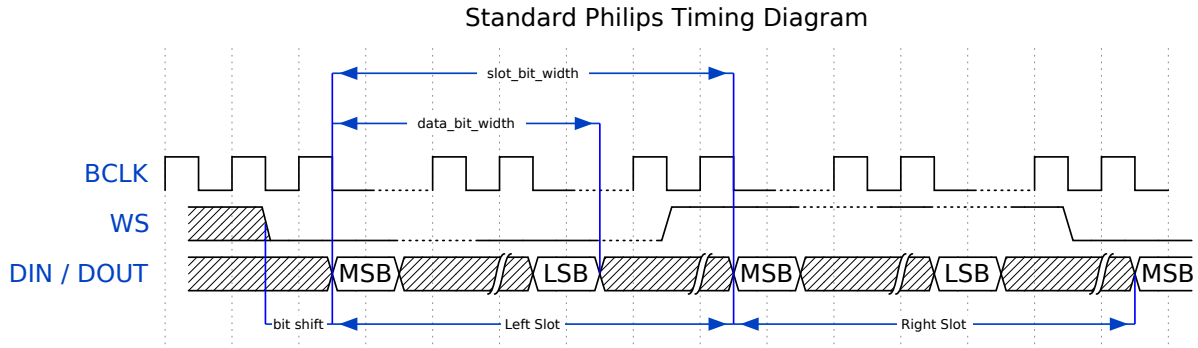
- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`：默认 PLL 时钟。
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`：160 MHz PLL 时钟。

时钟术语

- **采样率**：单声道每秒采样数据数量。
- **SCLK**：源时钟频率，即时钟源的频率。
- **MCLK**：主时钟频率，BCLK 由其产生。MCLK 信号通常作为参考时钟，用于同步 I2S 主机和从机之间的 BCLK 和 WS。
- **BCLK**：位时钟频率，一个 BCLK 时钟周期代表数据管脚上的一个数据位。通过*i2s_std_slot_config_t::slot_bit_width* 配置的通道位宽即为一个声道中的 BCLK 时钟周期数量，因此一个声道中可以有 8/16/24/32 个 BCLK 时钟周期。

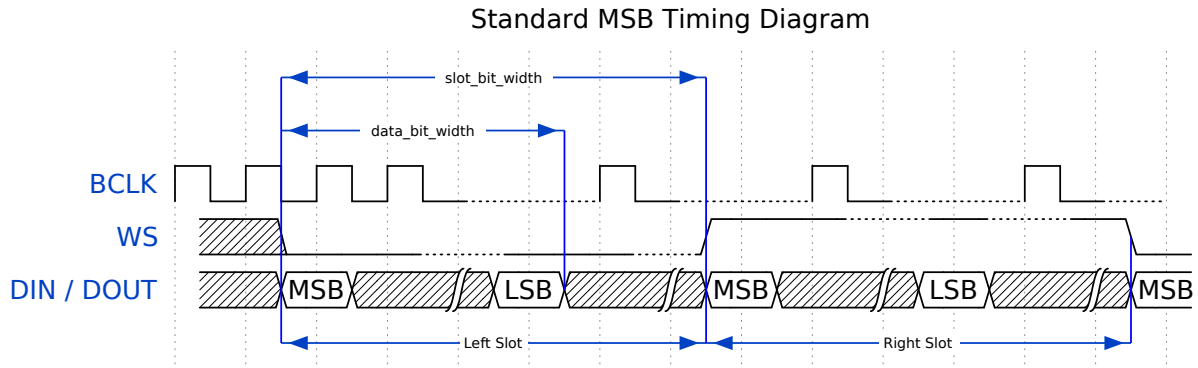
- **LRCK / WS**：左/右时钟或字选择时钟。在非 PDM 模式下，其频率等于采样率。

备 注: 通常，MCLK 应该同时是采样率和 BCLK 的倍数。字段*i2s_std_clk_config_t::mclk_multiple* 表示 MCLK 相对于采样率的倍数。在大多数情况下，将其设置为 `I2S_MCLK_MULTIPLE_256` 即可。但如果 `slot_bit_width` 被设置为 `I2S_SLOT_BIT_WIDTH_24BIT`，为了保证 MCLK 是 BCLK 的整数倍，应该将*i2s_std_clk_config_t::mclk_multiple* 设置为能被 3 整除的倍数，如 `I2S_MCLK_MULTIPLE_384`，否则 WS 会不精准。



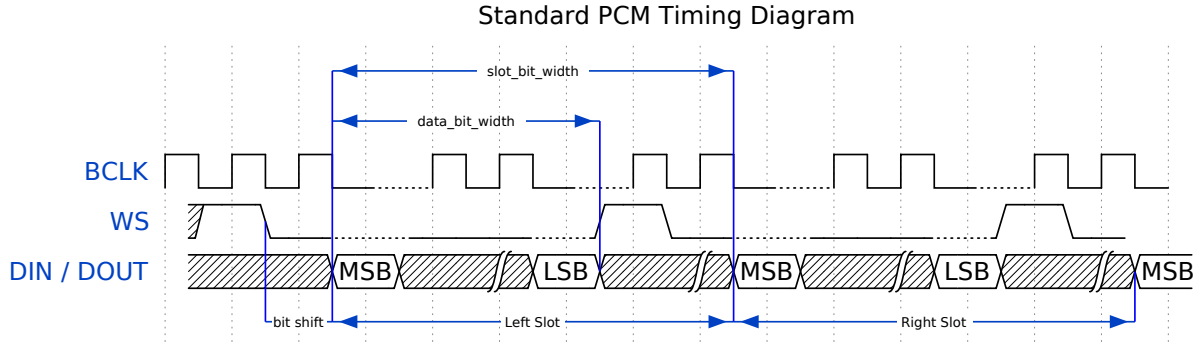
I2S 通信模式

模式概览



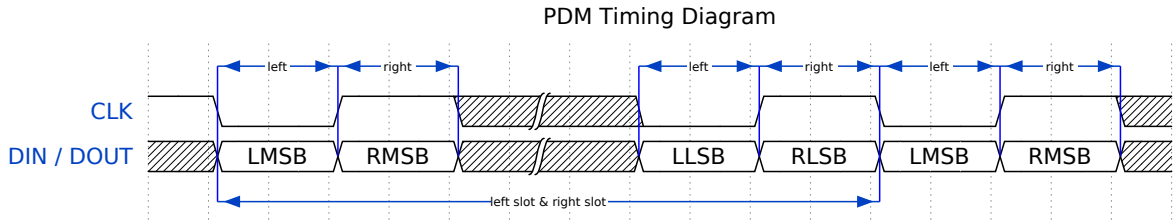
芯片	I2S 标准	PDM TX	PDM RX	TDM	ADC/DAC	LCD/摄像头
ESP32	I2S 0/1	I2S 0	I2S 0	无	I2S 0	I2S 0
ESP32-S2	I2S 0	无	无	无	无	I2S 0
ESP32-C3	I2S 0	I2S 0	无	I2S 0	无	无
ESP32-C6	I2S 0	I2S 0	无	I2S 0	无	无
ESP32-S3	I2S 0/1	I2S 0	I2S 0	I2S 0/1	无	无
ESP32-H2	I2S 0	I2S 0	无	I2S 0	无	无

标准模式 标准模式中有且仅有左右两个声道，驱动中将声道称为 slot。这些声道可以支持 8/16/24/32 位宽的采样数据，声道的通信格式主要包括以下几种：



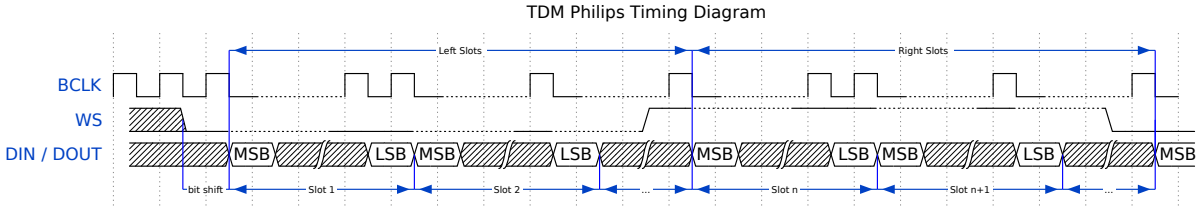
- **Philips 格式**：数据信号与 WS 信号相比有一个位的位移。WS 信号的占空比为 50%。

- **MSB 格式**：与 Philips 格式基本相同，但其数据没有位移。

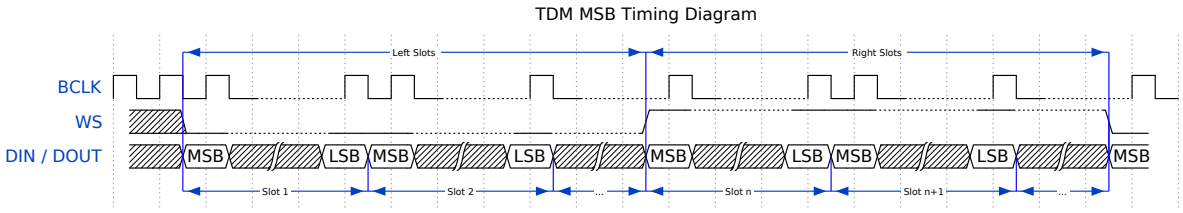


- **PCM 帧同步**：数据有一个位的位移，同时 WS 信号变成脉冲，持续一个 BCLK 周期。

PDM 模式 (TX) 在 PDM（Pulse-density Modulation，脉冲密度调制）模式下，TX 通道可以将 PCM 数据转换为 PDM 格式，该格式始终有左右两个声道。PDM TX 只在 I2S0 中受支持，且只支持 16 位宽的采样数据。PDM TX 至少需要一个 CLK 管脚用于时钟信号，一个 DOUT 管脚用于数据信号（即下图中的 WS 和 SD 信号。BCK 信号为内部位采样时钟，在 PDM 设备之间不需要）。PDM 模式允许用户配置上采样参数*i2s_pdm_tx_clk_config_t::up_sample_fp*和*i2s_pdm_tx_clk_config_t::up_sample_fs*，上采样率可以通过公式 `up_sample_rate = i2s_pdm_tx_clk_config_t::up_sample_fp / i2s_pdm_tx_clk_config_t::up_sample_fs` 来计算。在 PDM TX 中有以下两种上采样模式：

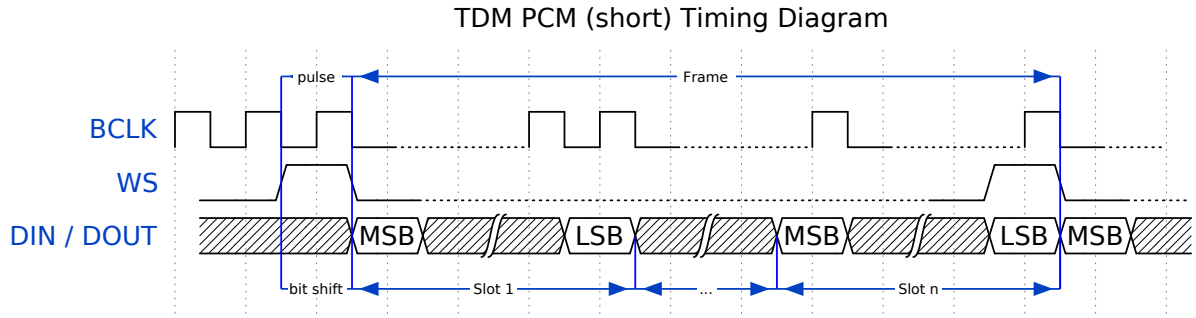


- **固定时钟频率模式**：在这种模式下，上采样率将根据采样率的变化而变化。设置 `fp = 960`、`fs = sample_rate / 100`，则 CLK 管脚上的时钟频率 (Fpdm) 将固定为 `128 * 48 KHz = 6.144 MHz`。注意此频率不等于采样率 (Fpcm)。
- **固定上采样率模式**：在这种模式下，上采样率固定为 2。设置 `fp = 960`、`fs = 480`，则 CLK 管脚上的时钟频率 (Fpdm) 将为 `128 * sample_rate`。

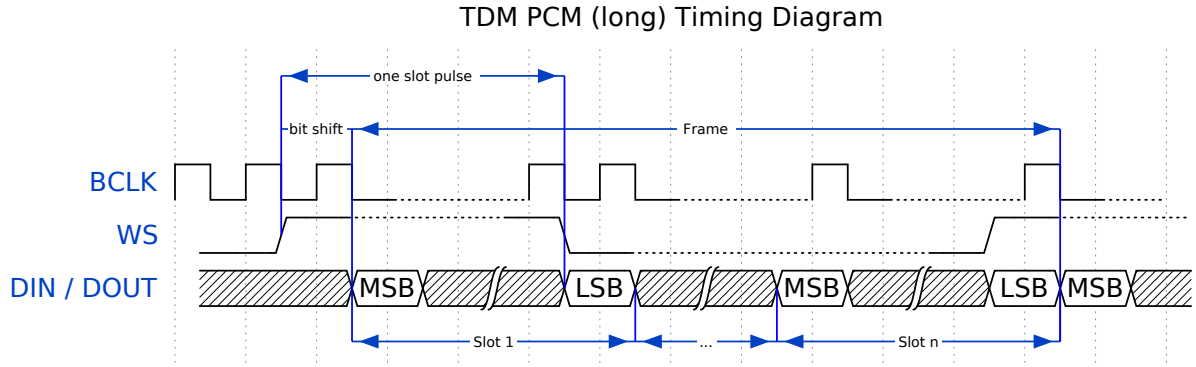


TDM 模式 TDM（Time Division Multiplexing，时分多路复用）模式最多支持 16 个声道，可通过*i2s_tdm_slot_config_t::slot_mask*启用通道。

但由于硬件限制，声道设置为 32 位宽时最多只能支持 4 个声道，16 位宽时最多只能支持 8 个声道，8 位宽时最多只能支持 16 个声道。TDM 的声道通信格式与标准模式基本相同，但有一些细微差别。



- **Philips 格式**：数据信号与 WS 信号相比有一个位的位移。无论一帧中包含多少个声道，WS 信号的占空比将始终保持为 50%。



- **MSB 格式**：与 Philips 格式基本相同，但数据没有位移。

- **PCM 短帧同步**：数据有一个位的位移，同时 WS 信号变为脉冲，每帧持续一个 BCLK 周期。

- **PCM 长帧同步**：数据有一个位的位移，同时 WS 信号将在每一帧持续一个声道的宽度。例如，如果启用了四个声道，那么 WS 的占空比将是 25%，如果启用了五个声道，则为 20%。

功能概览

I2S 驱动提供以下服务：

资源管理 I2S 驱动中的资源可分为三个级别：

- 平台级资源：当前芯片中所有 I2S 控制器的资源。
- 控制器级资源：一个 I2S 控制器的资源。
- 通道级资源：一个 I2S 控制器 TX 或 RX 通道的资源。

公开的 API 都是通道级别的 API，通道句柄`i2s_chan_handle_t` 可以帮助用户管理特定通道下的资源，而无需考虑其他两个级别的资源。高级别资源为私有资源，由驱动自动管理。用户可以调用`i2s_new_channel()` 来分配通道句柄，或调用`i2s_del_channel()` 来删除该句柄。

电源管理 电源管理启用（即开启*CONFIG_PM_ENABLE*）时，系统将在进入 Light-sleep 前调整或停止 I2S 时钟源，这可能会影响 I2S 信号，从而导致传输或接收的数据无效。

I2S 驱动可以获取电源管理锁，从而防止系统设置更改或时钟源被禁用。时钟源为 APB 时，锁的类型将被设置为`esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX`。时钟源为 APLL（若支持）时，锁的类型将被设置为`esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`。用户通过 I2S 读写时（即调

用*i2s_channel_read()* 或*i2s_channel_write()*），驱动程序将获取电源管理锁，并在读写完成后释放锁。

有限状态机 I2S 通道有三种状态，分别为 `registered`（已注册）、`ready`（准备就绪）和 `running`（运行中），它们的关系如下图所示：

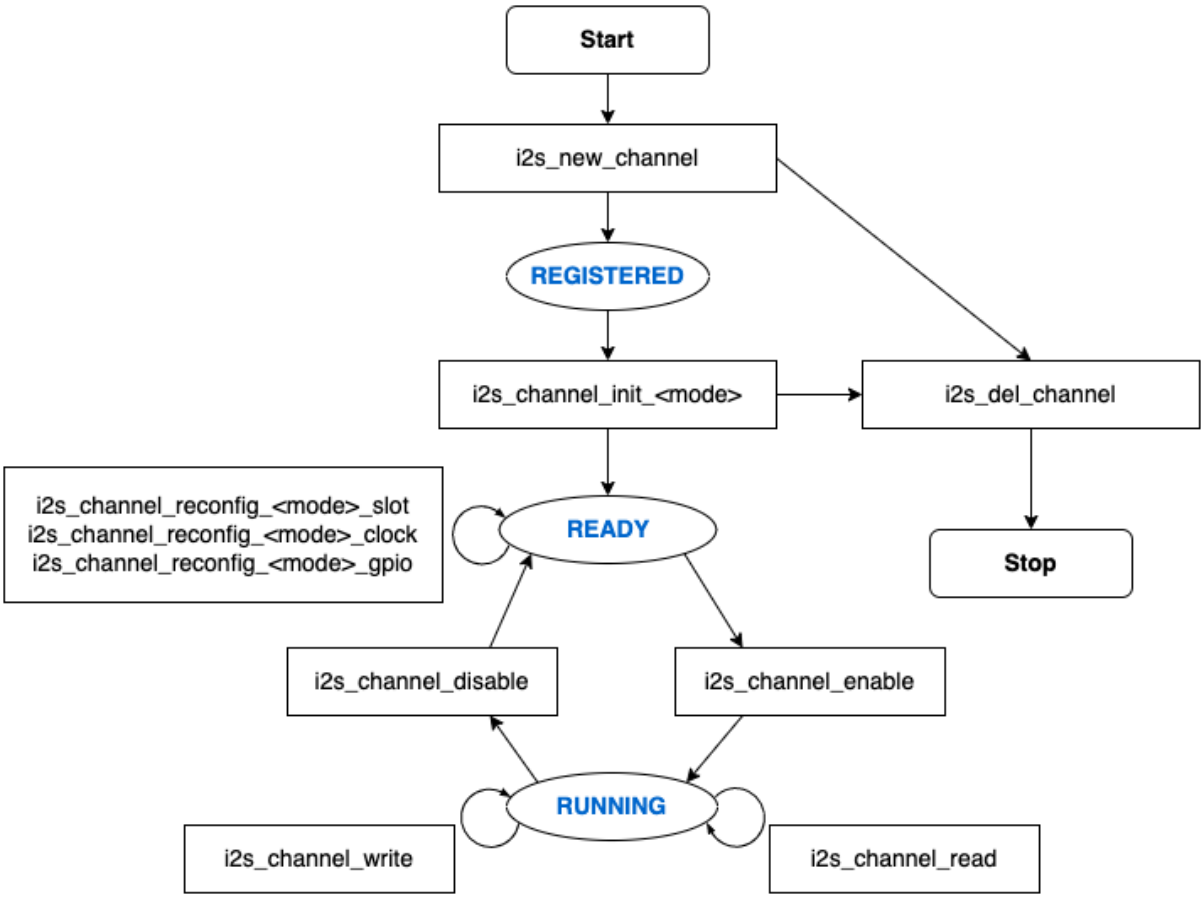


图 8: I2S 有限状态机

图中的 `<mode>` 可用相应的 I2S 通信模式来代替，如 `std` 代表标准的双声道模式。更多关于通信模式的信息，请参考*I2S 通信模式* 小节。

数据传输 I2S 的数据传输（包括数据发送和接收）由 DMA 实现。在传输数据之前，请调用*i2s_channel_enable()* 来启用特定的通道。发送或接收的数据达到 DMA 缓冲区的大小时，将触发 `I2S_OUT_EOF` 或 `I2S_IN_SUC_EOF` 中断。注意，DMA 缓冲区的大小不等于*i2s_chan_config_t::dma_frame_num*，这里的一帧是指一个 WS 周期内的所有采样数据。因此，`dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`。传输数据时，可以调用*i2s_channel_write()* 来输入数据，并把数据从源缓冲区复制到 DMA TX 缓冲区等待传输完成。此过程将重复进行，直到发送的字节数达到配置的大小。接收数据时，用户可以调用函数*i2s_channel_read()* 来等待接收包含 DMA 缓冲区地址的消息队列，从而将数据从 DMA RX 缓冲区复制到目标缓冲区。

i2s_channel_write() 和*i2s_channel_read()* 都是阻塞函数，在源缓冲区的数据发送完毕前，或是整个目标缓冲区都被加载数据占用时，它们会一直保持等待状态。在等待时间达到最大阻塞时间时，返回 *ESP_ERR_TIMEOUT* 错误。要实现异步发送或接收数据，可以通过*i2s_channel_register_event_callback()* 注册回调，随即便可在回调函数中直接访问 DMA 缓冲区，无需通过这两个阻塞函数来发送或接收数据。但请注意，该回调是一个中断回调，不要在该回调中添加复杂的逻辑、进行浮点运算或调用不可重入函数。

配置 用户可以通过调用相应函数（即 `i2s_channel_init_std_mode()`、`i2s_channel_init_pdm_rx_mode()`、`i2s_channel_init_pdm_tx_mode()` 或 `i2s_channel_init_tdm_mode()`）将通道初始化为特定模式。如果初始化后需要更新配置，必须先调用*i2s_channel_disable()* 以确保通道已经停止运行，然后再调用相应的‘reconfig’函数，例如*i2s_channel_reconfig_std_slot()*、*i2s_channel_reconfig_std_clock()* 和*i2s_channel_reconfig_std_gpio()*。

IRAM 安全 默认情况下，由于写入或擦除 flash 等原因导致 cache 被禁用时，I2S 中断将产生延迟，无法及时执行 EOF 中断。

在实时应用中，可通过启用 Kconfig 选项*CONFIG_I2S_ISR_IRAM_SAFE* 来避免此种情况发生，启用后：

1. 即使在 cache 被禁用的情况下，中断仍可继续运行。
2. 驱动程序将存放进 DRAM 中（以防其意外映射到 PSRAM 中）。

启用该选项可以保证 cache 禁用时的中断运行，但会相应增加 IRAM 占用。

线程安全 驱动程序可保证所有公开的 I2S API 的线程安全，使用时，可以直接从不同的 RTOS 任务中调用此类 API，无需额外锁保护。注意，I2S 驱动使用 mutex 锁来保证线程安全，因此不允许在 ISR 中使用这些 API。

Kconfig 选项

- *CONFIG_I2S_ISR_IRAM_SAFE* 控制默认 ISR 处理程序能否在禁用 cache 的情况下工作。更多信息可参考 *IRAM 安全*。
- *CONFIG_I2S_SUPPRESS_DEPRECATE_WARN* 控制是否在使用原有 I2S 驱动时关闭警告信息。
- *CONFIG_I2S_ENABLE_DEBUG_LOG* 用于启用调试日志输出。启用该选项将增加固件的二进制文件大小。

应用实例

I2S 驱动例程请参考 peripherals/i2s 目录。以下为每种模式的简单用法：

标准 TX/RX 模式的应用 不同声道的通信格式可通过以下标准模式的辅助宏来生成。如上所述，在标准模式下有三种格式，辅助宏分别为：

- *I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG*
- *I2S_STD_PCM_SLOT_DEFAULT_CONFIG*
- *I2S_STD_MSB_SLOT_DEFAULT_CONFIG*

时钟配置的辅助宏为：

- *I2S_STD_CLK_DEFAULT_CONFIG*。

请参考标准模式 了解 STD API 的相关信息。更多细节请参考 driver/i2s/include/driver/i2s_std.h。

STD TX 模式 以 16 位数据位宽为例，如果 `uint16_t` 写缓冲区中的数据如下所示：

数据 0	数据 1	数据 2	数据 3	数据 4	数据 5	数据 6	数据 7	···
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	···

下表展示了在不同*i2s_std_slot_config_t::slot_mode* 和*i2s_std_slot_config_t::slot_mask* 设置下线路上的真实数据。

数据位宽	声道模式	声道掩码	WS 低电平	WS 高电平	WS 低电平	WS 高电平	WS 低电平	WS 高电平	WS 低电平	WS 高电平
16 位	单声道	左	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
		右	0x0000	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004
		左右	0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
	立体声	左	0x0001	0x0000	0x0003	0x0000	0x0005	0x0000	0x0007	0x0000
		右	0x0000	0x0002	0x0000	0x0004	0x0000	0x0006	0x0000	0x0008
		左右	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

备注: 数据位宽为 8 位和 32 位时，缓冲区的类型最好为 `uint8_t` 和 `uint32_t`。但需注意，数据位宽为 24 位时，数据缓冲区应该以 3 字节对齐，即每 3 个字节代表一个 24 位数据，另外，*i2s_chan_config_t::dma_frame_num*、*i2s_std_clk_config_t::mclk_multiple* 和写缓冲区的大小应该为 3 的倍数，否则线路上的数据或采样率可能会不准确。

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* 通过辅助宏获取默认的通道配置
 * 这个辅助宏在 'i2s_common.h' 中定义，由所有 I2S 通信模式共享
 * 它可以帮助指定 I2S 角色和端口 ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
/* 分配新的 TX 通道并获取该通道的句柄 */
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* 进行配置，可以通过宏生成声道配置和时钟配置
 * 这两个辅助宏在 'i2s_std.h' 中定义，只能用于 STD 模式
 * 它们可以帮助初始化或更新声道和时钟配置 */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↪MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* 初始化通道 */
i2s_channel_init_std_mode(tx_handle, &std_cfg);

/* 在写入数据之前，先启用 TX 通道 */
i2s_channel_enable(tx_handle);
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_
↪wait);

/* 如果需要更新声道或时钟配置
 * 需要在更新前先禁用通道 */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // 默认为立体声
```

(下页继续)

(续上页)

```
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* 删除通道之前必须先禁用通道 */
i2s_channel_disable(tx_handle);
/* 如果不再需要句柄，删除该句柄以释放通道资源 */
i2s_del_channel(tx_handle);
```

STD RX 模式 例如，当数据位宽为 16 时，如线路上的数据如下所示：

WS 低电平	WS 高电平	WS 低电平	WS 高电平	WS 低电平	WS 高电平	WS 低电平	WS 高电平	···
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	···

不同*i2s_std_slot_config_t::slot_mode* 和*i2s_std_slot_config_t::slot_mask* 配置下缓冲区中收到的数据如下所示。

数据位宽	声道模式	声道掩码	数据 0	数据 1	数据 2	数据 3	数据 4	数据 5	数据 6	数据 7
16 位	单声道	左	0x0001	0x0003	0x0005	0x0007	0x0009	0x000b	0x000d	0x000f
		右	0x0002	0x0004	0x0006	0x0008	0x000a	0x000c	0x000e	0x0010
	立体声	任意	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

备注: 8 位、24 位和 32 位与 16 位的情况类似，接收缓冲区的数据位宽与线路上的数据位宽相等。此外需注意，数据位宽为 24 位时，*i2s_chan_config_t::dma_frame_num*、*i2s_std_clk_config_t::mclk_multiple* 和接收缓冲区的大小应该为 3 的倍数，否则线路上的数据或采样率可能会不准确。

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↪MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
```

(下页继续)

(续上页)

```
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* 初始化通道 */
i2s_channel_init_std_mode(rx_handle, &std_cfg);

/* 在读取数据之前，先启动 RX 通道 */
i2s_channel_enable(rx_handle);
i2s_channel_read(rx_handle, desc_buf, bytes_to_read, bytes_read, ticks_to_wait);

/* 删除通道之前必须先禁用通道 */
i2s_channel_disable(rx_handle);
/* 如果不再需要句柄，删除该句柄以释放通道资源 */
i2s_del_channel(rx_handle);
```

PDM TX 模式的应用 针对 TX 通道的 PDM 模式，声道配置的辅助宏为：

- *I2S_PDM_TX_SLOT_DEFAULT_CONFIG*

时钟配置的辅助宏为：

- *I2S_PDM_TX_CLK_DEFAULT_CONFIG*

PDM TX API 的相关信息，可参考*PDM 模式*。更多细节请参阅 driver/i2s/include/driver/i2s_pdm.h。

PDM 数据位宽固定为 16 位。如果 `int16_t` 写缓冲区中的数据如下：

数据 0	数据 1	数据 2	数据 3	数据 4	数据 5	数据 6	数据 7	…
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	…

下表展示了不同*i2s_pdm_tx_slot_config_t::slot_mode*和 `i2s_pdm_tx_slot_config_t::slot_mask` 设置下线路上的真实数据。为方便理解，已将线路上的数据格式由 PDM 转为 PCM。

线路模式	声道模式	线路	左	右	左	右	左	右	左	右
单线 Codec	单声道	dout	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
	立体声	dout	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008
单线 DAC	单声道	dout	0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
双线 DAC	单声道	dout	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		dout2	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000
	立体声	dout	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		dout2	0x0001	0x0001	0x0003	0x0003	0x0005	0x0005	0x0007	0x0007

备注： PDM TX 模式有三种线路模式，分别为 `I2S_PDM_TX_ONE_LINE_CODEC`、`I2S_PDM_TX_ONE_LINE_DAC` 和 `I2S_PDM_TX_TWO_LINE_DAC`。单线 Codec 用于需要时钟信号的 PDM 编解码器，PDM 编解码器可以通过时钟电平来区分左右声道。另外两种模式可通过低通滤波器直接驱动功率放大器，而无需时钟信号，所以有两条线路来区分左右声道。此外，对于单线 Codec 的单声道模式，可以通过在 GPIO 配置中设置时钟反转标志，强制将声道改变为右声道。

```
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"
```

(下页继续)

(续上页)

```
/* 分配 I2S TX 通道 */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* 初始化通道为 PDM TX 模式 */
i2s_pdm_tx_config_t pdm_tx_cfg = {
    .clk_cfg = I2S_PDM_TX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_TX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_tx_mode(tx_handle, &pdm_tx_cfg);

...
```

TDM TX/RX 模式的应用 可以通过以下 TDM 模式的辅助宏生成不同的声道通信格式。如上所述，TDM 模式有四种格式，它们的辅助宏分别为：

- *I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG*
- *I2S_TDM_MSB_SLOT_DEFAULT_CONFIG*
- *I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG*
- *I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG*

时钟配置的辅助宏为：

- *I2S_TDM_CLK_DEFAULT_CONFIG*

有关 TDM API 的信息，请参阅*TDM 模式*。更多细节请参阅 driver/i2s/include/driver/i2s_tdm.h。

备注： 在为从机配置时钟时，由于硬件限制，请注意*i2s_tdm_clk_config_t::bclk_div* 不应小于 8，增加此字段的值可以减少从机发送数据的延迟。使用高采样率时，数据可能会延迟一个 BCLK 周期以上，这将导致数据错位。可以通过缓慢增加*i2s_tdm_clk_config_t::bclk_div* 的值来进行校正。

由于*i2s_tdm_clk_config_t::bclk_div* 是 MCLK 基于 BCLK 的除数，增加该值也可以提高 MCLK 频率。因此，如果 MCLK 频率太高，将会无法从源时钟分频，此时时钟计算可能会失败，也就是说*i2s_tdm_clk_config_t::bclk_div* 不是越大越好。

TDM TX 模式

```
#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* 分配 I2S TX 通道 */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* 初始化通道为 TDM 模式 */
i2s_tdm_config_t tdm_cfg = {
    .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
    .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_STEREO,
```

(下页继续)

(续上页)

```
                I2S_TDM_SLOT0 | I2S_TDM_SLOT1 | I2S_TDM_SLOT2 | I2S_TDM_SLOT3),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_tdm_mode(tx_handle, &tdm_cfg);

...
```

TDM RX 模式

```
#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* 将通道模式设置为 TDM */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_CONFIG(I2S_ROLE_MASTER, I2S_COMM_MODE_TDM,
↪ &i2s_pin);
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* 初始化通道为 TDM 模式 */
i2s_tdm_config_t tdm_cfg = {
    .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
    .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_STEREO,
                I2S_TDM_SLOT0 | I2S_TDM_SLOT1 | I2S_TDM_SLOT2 | I2S_TDM_SLOT3),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_18,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_tdm_mode(rx_handle, &tdm_cfg);
...
```

全双工 全双工模式可以在 I2S 端口中同时注册 TX 和 RX 通道，同时通道共享 BCLK 和 WS 信号。目前，STD 和 TDM 通信模式支持以下方式的全双工通信，但不支持 PDM 全双工模式，因为 PDM 模式下 TX 和 RX 通道的时钟不同。

请注意，一个句柄只能代表一个通道，因此仍然需要对 TX 和 RX 通道逐个进行声道和时钟配置。

以下示例展示了如何分配两个全双工通道：

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"
```

(下页继续)

(续上页)

```
i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* 分配两个 I2S 通道 */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
/* 同时分配给 TX 和 RX 通道，使其进入全双工模式。 */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);

/* 配置两个通道，因为在全双工模式下，TX 和 RX 通道必须相同。 */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↪SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(tx_handle, &std_cfg);
i2s_channel_init_std_mode(rx_handle, &std_cfg);

i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);

...
```

单工模式 在单工模式下分配通道，应该为每个通道调用*i2s_new_channel()*。ESP32-C3 上，TX/RX 通道的时钟和 GPIO 管脚相互独立，因此可以配置为不同的模式和时钟，并且能够在单工模式下共存于同一个 I2S 端口中。对于 PDM 模式，用户可以通过在同一个 I2S 端口上注册 PDM TX 单工和 PDM RX 单工来实现 PDM 双工。但在这种情况下，PDM TX/RX 可能会使用不同的时钟，因此在配置 GPIO 管脚和时钟时需多加注意。

以下为单工模式的示例。请注意，如果 TX 和 RX 通道来自同一个控制器，则 TX 和 RX 通道的内部 MCLK 信号虽然是分开的，但输出的 MCLK 信号只能绑定到其中一个通道。如果两个通道都初始化了 MCLK，则该信号会绑定到后初始化的通道。

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↪SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
```

(下页继续)

(续上页)

```
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* 初始化通道 */
i2s_channel_init_std_mode(tx_handle, &std_tx_cfg);
i2s_channel_enable(tx_handle);

/* 如果没有找到其他可用的 I2S 设备，RX 通道将被注册在另一个 I2S 上
 * 并返回 ESP_ERR_NOT_FOUND */
i2s_new_channel(&chan_cfg, NULL, &rx_handle); // RX 和 TX 通道都将注册在 I2S0␣
↪上，但配置可以不同
i2s_std_config_t std_rx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(16000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↪MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_6,
        .ws = GPIO_NUM_7,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);
i2s_channel_enable(rx_handle);
```

应用注意事项

防止数据丢失 对于需要高频采样率的应用，数据的巨大吞吐量可能会导致数据丢失。用户可以通过注册 ISR 回调函数来接收事件队列中的数据丢失事件：

```
static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t␣
↪handle, i2s_event_data_t *event, void *user_ctx)
{
    // 处理 RX 队列溢出事件 ...
    return false;
}

i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};
TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));
```

请按照以下步骤操作，以防止数据丢失：

1. 确定中断间隔。通常来说，当发生数据丢失时，为减少中断次数，中断间隔应该越久越好。因此，在保证 DMA 缓冲区大小不超过最大值 4092 的前提下，应使 dma_frame_num 尽可能大。具体转换关系如下:

```
interrupt_interval(unit: sec) = dma_frame_num / sample_rate
dma_buffer_size = dma_frame_num * slot_num * data_bit_width / 8 <= 4092
```

2. 确定 dma_desc_num 的值。dma_desc_num 由 i2s_channel_read 轮询周期的最大时间决定，所有接收到的数据都应该存储在两个 i2s_channel_read 之间。这个周期可以通过计时器或输出 GPIO 信号来计算。具体转换关系如下:

```
dma_desc_num > polling_cycle / interrupt_interval
```

3. 确定接收缓冲区大小。在 i2s_channel_read 中提供的接收缓冲区应当能够容纳所有 DMA 缓冲区中的数据，这意味着它应该大于所有 DMA 缓冲区的总大小:

```
recv_buffer_size > dma_desc_num * dma_buffer_size
```

例如，如果某个 I2S 应用的已知值包括:

```
sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10 ms
```

那么可以按照以下公式计算出参数 dma_frame_num、dma_desc_num 和 recv_buf_size:

```
dma_frame_num * slot_num * data_bit_width / 8 = dma_buffer_size <= 4092
dma_frame_num <= 511
interrupt_interval = dma_frame_num / sample_rate = 511 / 144000 = 0.003549 s = 3.
↪549 ms
dma_desc_num > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818)␣
↪= 3
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes
```

Functions

esp_err_t **i2s_channel_init_std_mode**(*i2s_chan_handle_t* handle, const *i2s_std_config_t* *std_cfg)

Initialize i2s channel to standard mode.

备注: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

参数

- **handle** –**[in]** I2S channel handler
- **std_cfg** –**[in]** Configurations for standard mode, including clock, slot and gpio The clock configuration can be generated by the helper macro I2S_STD_CLK_DEFAULT_CONFIG The slot configuration can be generated by the helper macro I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG, I2S_STD_PCM_SLOT_DEFAULT_CONFIG or I2S_STD_MSB_SLOT_DEFAULT_CONFIG

返回

- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

esp_err_t **i2s_channel_reconfig_std_clock**(*i2s_chan_handle_t* handle, const *i2s_std_clk_config_t* *clk_cfg)

Reconfigure the I2S clock for standard mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

备注: The input channel handle has to be initialized to standard mode, i.e., 'i2s_channel_init_std_mode' has been called before reconfiguring

参数

- **handle** –**[in]** I2S channel handler
- **clk_cfg** –**[in]** Standard mode clock configuration, can be generated by `I2S_STD_CLK_DEFAULT_CONFIG`

返回

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_std_slot**(*i2s_chan_handle_t* handle, const *i2s_std_slot_config_t* *slot_cfg)

Reconfigure the I2S slot for standard mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

备注: The input channel handle has to be initialized to standard mode, i.e., 'i2s_channel_init_std_mode' has been called before reconfiguring

参数

- **handle** –**[in]** I2S channel handler
- **slot_cfg** –**[in]** Standard mode slot configuration, can be generated by `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` and `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`.

返回

- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_std_gpio**(*i2s_chan_handle_t* handle, const *i2s_std_gpio_config_t* *gpio_cfg)

Reconfigure the I2S gpio for standard mode.

备注： Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

备注： The input channel handle has to be initialized to standard mode, i.e., 'i2s_channel_init_std_mode' has been called before reconfiguring

参数

- **handle** –**[in]** I2S channel handler
- **gpio_cfg** –**[in]** Standard mode gpio configuration, specified by user

返回

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

Structures

struct **i2s_std_slot_config_t**

I2S slot configuration for standard mode.

Public Members

i2s_data_bit_width_t **data_bit_width**

I2S sample data bit width (valid data bits per sample)

i2s_slot_bit_width_t **slot_bit_width**

I2S slot bit width (total bits per slot)

i2s_slot_mode_t **slot_mode**

Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data

i2s_std_slot_mask_t **slot_mask**

Select the left, right or both slot

uint32_t **ws_width**

WS signal width (i.e. the number of bclk ticks that ws signal is high)

bool **ws_pol**

WS signal polarity, set true to enable high lever first

bool **bit_shift**

Set to enable bit shift in Philips mode

bool **left_align**

Set to enable left alignment

bool **big_endian**

Set to enable big endian

bool **bit_order_lsb**

Set to enable lsb first

struct **i2s_std_clk_config_t**

I2S clock configuration for standard mode.

Public Members

uint32_t **sample_rate_hz**

I2S sample rate

i2s_clock_src_t **clk_src**

Choose clock source

i2s_mclk_multiple_t **mclk_multiple**

The multiple of mclk to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of '3' (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

struct **i2s_std_gpio_config_t**

I2S standard mode GPIO pins configuration.

Public Members

gpio_num_t **mclk**

MCK pin, output

gpio_num_t **bclk**

BCK pin, input in slave role, output in master role

gpio_num_t **ws**

WS pin, input in slave role, output in master role

gpio_num_t **dout**

DATA pin, output

gpio_num_t **din**

DATA pin, input

uint32_t **mclk_inv**

Set 1 to invert the mclk output

uint32_t **bclk_inv**

Set 1 to invert the bclk input/output

uint32_t **ws_inv**

Set 1 to invert the ws input/output

struct *i2s_std_gpio_config_t*::[anonymous] **invert_flags**

GPIO pin invert flags

struct **i2s_std_config_t**

I2S standard mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_std_clk_config_t **clk_cfg**

Standard mode clock configuration, can be generated by macro I2S_STD_CLK_DEFAULT_CONFIG

i2s_std_slot_config_t **slot_cfg**

Standard mode slot configuration, can be generated by macros I2S_STD_[mode]_SLOT_DEFAULT_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM

i2s_std_gpio_config_t **gpio_cfg**

Standard mode gpio configuration, specified by user

Macros

I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(bits_per_sample, mono_or_stereo)

Philips format in 2 slots.

This file is specified for I2S standard communication mode Features:

- Philips/MSB/PCM are supported in standard mode
- Fixed to 2 slots

参数

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_PCM_SLOT_DEFAULT_CONFIG(bits_per_sample, mono_or_stereo)

PCM(short) format in 2 slots.

备注： PCM(long) is same as philips in 2 slots

参数

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_MSB_SLOT_DEFAULT_CONFIG(bits_per_sample, mono_or_stereo)

MSB format in 2 slots.

参数

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_CLK_DEFAULT_CONFIG(rate)

i2s default standard clock configuration

备注: Please set the mclk_multiple to I2S_MCLK_MULTIPLE_384 while using 24 bits data width Otherwise the sample rate might be imprecise since the bclk division is not a integer

---

参数

- **rate** –sample rate

PDM 模式

Header File

- components/driver/i2s/include/driver/i2s_pdm.h

Functions

esp_err_t **i2s_channel_init_pdm_tx_mode**(*i2s_chan_handle_t* handle, const *i2s_pdm_tx_config_t* *pdm_tx_cfg)

Initialize i2s channel to PDM TX mode.

备注: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

参数

- **handle** –**[in]** I2S tx channel handler
- **pdm_tx_cfg** –**[in]** Configurations for PDM TX mode, including clock, slot and gpio The clock configuration can be generated by the helper macro `I2S_PDM_TX_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

返回

- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

esp_err_t **i2s_channel_reconfig_pdm_tx_clock**(*i2s_chan_handle_t* handle, const *i2s_pdm_tx_clk_config_t* *clk_cfg)

Reconfigure the I2S clock for PDM TX mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

备注: The input channel handle has to be initialized to PDM TX mode, i.e., 'i2s_channel_init_pdm_tx_mode' has been called before reconfiguring

---

参数

- **handle** –**[in]** I2S tx channel handler

- **clk_cfg** –**[in]** PDM TX mode clock configuration, can be generated by `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

返回

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_pdm_tx_slot**(*i2s_chan_handle_t* handle, const *i2s_pdm_tx_slot_config_t* *slot_cfg)

Reconfigure the I2S slot for PDM TX mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

备 注: The input channel handle has to be initialized to PDM TX mode, i.e., 'i2s_channel_init_pdm_tx_mode' has been called before reconfiguring

参数

- **handle** –**[in]** I2S tx channel handler
- **slot_cfg** –**[in]** PDM TX mode slot configuration, can be generated by `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

返回

- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_pdm_tx_gpio**(*i2s_chan_handle_t* handle, const *i2s_pdm_tx_gpio_config_t* *gpio_cfg)

Reconfigure the I2S gpio for PDM TX mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

备 注: The input channel handle has to be initialized to PDM TX mode, i.e., 'i2s_channel_init_pdm_tx_mode' has been called before reconfiguring

参数

- **handle** –**[in]** I2S tx channel handler
- **gpio_cfg** –**[in]** PDM TX mode gpio configuration, specified by user

返回

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

Structures

struct **i2s_pdm_tx_slot_config_t**

I2S slot configuration for pdm tx mode.

Public Members

i2s_data_bit_width_t **data_bit_width**

I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

i2s_slot_bit_width_t **slot_bit_width**

I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

i2s_slot_mode_t **slot_mode**

Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO For PDM TX mode, mono means the data buffer only contains one slot data, Stereo means the data buffer contains two slots data

uint32_t **sd_prescale**

Sigma-delta filter prescale

i2s_pdm_sig_scale_t **sd_scale**

Sigma-delta filter scaling value

i2s_pdm_sig_scale_t **hp_scale**

High pass filter scaling value

i2s_pdm_sig_scale_t **lp_scale**

Low pass filter scaling value

i2s_pdm_sig_scale_t **sinc_scale**

Sinc filter scaling value

i2s_pdm_tx_line_mode_t **line_mode**

PDM TX line mode, one-line codec, one-line dac, two-line dac mode can be selected

bool **hp_en**

High pass filter enable

float **hp_cut_off_freq_hz**

High pass filter cut-off frequency, range 23.3Hz ~ 185Hz, see cut-off frequency sheet above

uint32_t **sd_dither**

Sigma-delta filter dither

uint32_t **sd_dither2**

Sigma-delta filter dither2

struct **i2s_pdm_tx_clk_config_t**

I2S clock configuration for pdm tx mode.

Public Members

uint32_t **sample_rate_hz**

I2S sample rate, not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear

i2s_clock_src_t **clk_src**

Choose clock source

i2s_mclk_multiple_t **mclk_multiple**

The multiple of mclk to the sample rate

uint32_t **up_sample_fp**

Up-sampling param fp

uint32_t **up_sample_fs**

Up-sampling param fs, not allowed to be greater than 480

struct **i2s_pdm_tx_gpio_config_t**

I2S PDM tx mode GPIO pins configuration.

Public Members

gpio_num_t **clk**

PDM clk pin, output

gpio_num_t **dout**

DATA pin, output

gpio_num_t **dout2**

The second data pin for the DAC dual-line mode, only take effect when the line mode is `I2S_PDM_TX_TWO_LINE_DAC`

uint32_t **clk_inv**

Set 1 to invert the clk output

struct *i2s_pdm_tx_gpio_config_t*::[anonymous] **invert_flags**

GPIO pin invert flags

struct **i2s_pdm_tx_config_t**

I2S PDM TX mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_pdm_tx_clk_config_t **clk_cfg**

PDM TX clock configurations, can be generated by macro I2S_PDM_TX_CLK_DEFAULT_CONFIG

i2s_pdm_tx_slot_config_t **slot_cfg**

PDM TX slot configurations, can be generated by macro I2S_PDM_TX_SLOT_DEFAULT_CONFIG

i2s_pdm_tx_gpio_config_t **gpio_cfg**

PDM TX gpio configurations, specified by user

Macros

I2S_PDM_TX_SLOT_DEFAULT_CONFIG(bits_per_sample, mono_or_stereo)

PDM style in 2 slots(TX)

This file is specified for I2S PDM communication mode Features:

- Only support PDM tx/rx mode
- Fixed to 2 slots
- Data bit width only support 16 bits

参数

- **bits_per_sample** –i2s data bit width, only support 16 bits for PDM mode
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_PDM_TX_CLK_DEFAULT_CONFIG(rate)

i2s default pdm tx clock configuration

备注: TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample_rate_hz / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate_hz If the pdm receiver do not care the pdm serial clock, it' s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be adopted.

参数

- **rate** –sample rate (not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear)

TDM 模式

Header File

- components/driver/i2s/include/driver/i2s_tdm.h

Functions

esp_err_t **i2s_channel_init_tdm_mode**(*i2s_chan_handle_t* handle, const *i2s_tdm_config_t* *tdm_cfg)

Initialize i2s channel to TDM mode.

备注: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

参数

- **handle** –**[in]** I2S channel handler
- **tdm_cfg** –**[in]** Configurations for TDM mode, including clock, slot and gpio The clock configuration can be generated by the helper macro `I2S_TDM_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG` or `I2S_TDM_MSB_SLOT_DEFAULT_CONFIG`

返回

- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

esp_err_t **i2s_channel_reconfig_tdm_clock**(*i2s_chan_handle_t* handle, const *i2s_tdm_clk_config_t* *clk_cfg)

Reconfigure the I2S clock for TDM mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

备注: The input channel handle has to be initialized to TDM mode, i.e., 'i2s_channel_init_tdm_mode' has been called before reconfiguring

---

参数

- **handle** –**[in]** I2S channel handler
- **clk_cfg** –**[in]** Standard mode clock configuration, can be generated by `I2S_TDM_CLK_DEFAULT_CONFIG`

返回

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not TDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_tdm_slot**(*i2s_chan_handle_t* handle, const *i2s_tdm_slot_config_t* *slot_cfg)

Reconfigure the I2S slot for TDM mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

备注: The input channel handle has to be initialized to TDM mode, i.e., 'i2s_channel_init_tdm_mode' has been called before reconfiguring

---

参数

- **handle** –**[in]** I2S channel handler
- **slot_cfg** –**[in]** Standard mode slot configuration, can be generated by `I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG` or `I2S_TDM_MSB_SLOT_DEFAULT_CONFIG`.

返回

- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not TDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_tdm_gpio**(*i2s_chan_handle_t* handle, const *i2s_tdm_gpio_config_t* *gpio_cfg)

Reconfigure the I2S gpio for TDM mode.

备注： Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

备注： The input channel handle has to be initialized to TDM mode, i.e., 'i2s_channel_init_tdm_mode' has been called before reconfiguring

参数

- **handle** –**[in]** I2S channel handler
- **gpio_cfg** –**[in]** Standard mode gpio configuration, specified by user

返回

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not TDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

Structures

struct **i2s_tdm_slot_config_t**

I2S slot configuration for tdm mode.

Public Members

i2s_data_bit_width_t **data_bit_width**

I2S sample data bit width (valid data bits per sample)

i2s_slot_bit_width_t **slot_bit_width**

I2S slot bit width (total bits per slot)

i2s_slot_mode_t **slot_mode**

Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

i2s_tdm_slot_mask_t **slot_mask**

Slot mask. Activating slots by setting 1 to corresponding bits. When the activated slots is not consecutive, those data in inactivated slots will be ignored

uint32_t **ws_width**

WS signal width (i.e. the number of bclk ticks that ws signal is high)

bool **ws_pol**

WS signal polarity, set true to enable high lever first

bool **bit_shift**

Set true to enable bit shift in Philips mode

bool **left_align**

Set true to enable left alignment

bool **big_endian**

Set true to enable big endian

bool **bit_order_lsb**

Set true to enable lsb first

bool **skip_mask**

Set true to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent

uint32_t **total_slot**

I2S total number of slots. If it is smaller than the biggest activated channel number, it will be set to this number automatically.

struct **i2s_tdm_clk_config_t**

I2S clock configuration for tdm mode.

Public Members

uint32_t **sample_rate_hz**

I2S sample rate

i2s_clock_src_t **clk_src**

Choose clock source

i2s_mclk_multiple_t **mclk_multiple**

The multiple of mclk to the sample rate, only take effect for master role

uint32_t **bclk_div**

The division from mclk to bclk, only take effect for slave role, it shouldn't be smaller than 8. Increase this field when data sent by slave lag behind

struct **i2s_tdm_gpio_config_t**

I2S TDM mode GPIO pins configuration.

Public Members

gpio_num_t **mclk**

MCK pin, output

gpio_num_t **bclk**

BCK pin, input in slave role, output in master role

gpio_num_t **ws**

WS pin, input in slave role, output in master role

gpio_num_t **dout**

DATA pin, output

gpio_num_t **din**

DATA pin, input

uint32_t **mclk_inv**

Set 1 to invert the mclk output

uint32_t **bclk_inv**

Set 1 to invert the bclk input/output

uint32_t **ws_inv**

Set 1 to invert the ws input/output

struct *i2s_tdm_gpio_config_t*::[anonymous] **invert_flags**

GPIO pin invert flags

struct **i2s_tdm_config_t**

I2S TDM mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_tdm_clk_config_t **clk_cfg**

TDM mode clock configuration, can be generated by macro I2S_TDM_CLK_DEFAULT_CONFIG

i2s_tdm_slot_config_t **slot_cfg**

TDM mode slot configuration, can be generated by macros I2S_TDM_[mode]_SLOT_DEFAULT_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM_SHORT/PCM_LONG

i2s_tdm_gpio_config_t **gpio_cfg**

TDM mode gpio configuration, specified by user

Macros

I2S_TDM_AUTO_SLOT_NUM

This file is specified for I2S TDM communication mode Features:

- More than 2 slots

I2S_TDM_AUTO_WS_WIDTH

I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG(bits_per_sample, mono_or_stereo, mask)

Philips format in active slot that enabled by mask.

参数

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- **mask** –active slot mask

I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(bits_per_sample, mono_or_stereo, mask)

MSB format in active slot enabled that by mask.

参数

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

- **mask** –active slot mask

I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG(bits_per_sample, mono_or_stereo, mask)

PCM(short) format in active slot that enabled by mask.

参数

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- **mask** –active slot mask

I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG(bits_per_sample, mono_or_stereo, mask)

PCM(long) format in active slot that enabled by mask.

参数

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- **mask** –active slot mask

I2S_TDM_CLK_DEFAULT_CONFIG(rate)

i2s default tdm clock configuration

备注: Please set the mclk_multiple to I2S_MCLK_MULTIPLE_384 while the data width in slot configuration is set to 24 bits Otherwise the sample rate might be imprecise since the bclk division is not a integer

---

参数

- **rate** –sample rate

I2S 驱动

Header File

- components/driver/i2s/include/driver/i2s_common.h

Functions

esp_err_t **i2s_new_channel**(const *i2s_chan_config_t* *chan_cfg, *i2s_chan_handle_t* *ret_tx_handle, *i2s_chan_handle_t* *ret_rx_handle)

Allocate new I2S channel(s)

备注: The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

备注: When the port id in channel configuration is I2S_NUM_AUTO, driver will allocate I2S port automatically on one of the i2s controller, otherwise driver will try to allocate the new channel on the selected port.

备注: If both tx_handle and rx_handle are not NULL, it means this I2S controller will work at full-duplex mode, the rx and tx channels will be allocated on a same I2S port in this case. Note that some configurations of tx/rx channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can't guarantee tx/rx channels write/read synchronously, they can only share the clock signals for now.

备注： If tx_handle OR rx_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both rx and tx channel) will be occupied, even if only one of rx or tx channel is registered. For the other targets, another channel on this controller will still available.

参数

- **chan_cfg** –**[in]** I2S controller channel configurations
- **ret_tx_handle** –**[out]** I2S channel handler used for managing the sending channel(optional)
- **ret_rx_handle** –**[out]** I2S channel handler used for managing the receiving channel(optional)

返回

- ESP_OK Allocate new channel(s) success
- ESP_ERR_NOT_SUPPORTED The communication mode is not supported on the current chip
- ESP_ERR_INVALID_ARG NULL pointer or illegal parameter in *i2s_chan_config_t*
- ESP_ERR_NOT_FOUND No available I2S channel found

esp_err_t **i2s_del_channel**(*i2s_chan_handle_t* handle)

Delete the i2s channel.

备注： Only allowed to be called when the i2s channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

备注： Resource will be free automatically if all channels in one port are deleted

参数 **handle** –**[in]** I2S channel handler

- ESP_OK Delete successfully
- ESP_ERR_INVALID_ARG NULL pointer

esp_err_t **i2s_channel_get_info**(*i2s_chan_handle_t* handle, *i2s_chan_info_t* *chan_info)

Get I2S channel information.

参数

- **handle** –**[in]** I2S channel handler
- **chan_info** –**[out]** I2S channel basic information

返回

- ESP_OK Get i2s channel information success
- ESP_ERR_NOT_FOUND The input handle doesn't match any registered I2S channels, it may not an i2s channel handle or not available any more
- ESP_ERR_INVALID_ARG The input handle or chan_info pointer is NULL

esp_err_t **i2s_channel_enable**(*i2s_chan_handle_t* handle)

Enable the i2s channel.

备注： Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

备注： Enable the channel can start the I2S communication on hardware. It will start outputting bclk and ws signal. For mclk signal, it will start to output when initialization is finished

参数 **handle** –**[in]** I2S channel handler

- ESP_OK Start successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE This channel has not initialized or already started

esp_err_t **i2s_channel_disable**(*i2s_chan_handle_t* handle)

Disable the i2s channel.

备注: Only allowed to be called when the channel state is RUNNING, (i.e., channel has been started) the channel will enter READY state once it is disabled successfully.

备注: Disable the channel can stop the I2S communication on hardware. It will stop bclk and ws signal but not mclk signal

---

参数 **handle** –**[in]** I2S channel handler

返回

- ESP_OK Stop successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE This channel has not stated

esp_err_t **i2s_channel_preload_data**(*i2s_chan_handle_t* tx_handle, const void *src, size_t size, size_t *bytes_loaded)

Preload the data into TX DMA buffer.

备注: Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started)

备注: As the initial DMA buffer has no data inside, it will transmit the empty buffer after enabled the channel, this function is used to preload the data into the DMA buffer, so that the valid data can be transmitted immediately after the channel is enabled.

备注: This function can be called multiple times before enabling the channel, the buffer that loaded later will be concatenated behind the former loaded buffer. But when all the DMA buffers have been loaded, no more data can be preload then, please check the `bytes_loaded` parameter to see how many bytes are loaded successfully, when the `bytes_loaded` is smaller than the `size`, it means the DMA buffers are full.

参数

- **tx_handle** –**[in]** I2S TX channel handler
- **src** –**[in]** The pointer of the source buffer to be loaded
- **size** –**[in]** The source buffer size
- **bytes_loaded** –**[out]** The bytes that successfully been loaded into the TX DMA buffer

返回

- ESP_OK Load data successful
- ESP_ERR_INVALID_ARG NULL pointer or not TX direction
- ESP_ERR_INVALID_STATE This channel has not stated

esp_err_t **i2s_channel_write**(*i2s_chan_handle_t* handle, const void *src, size_t size, size_t *bytes_written, uint32_t timeout_ms)

I2S write data.

备注： Only allowed to be called when the channel state is RUNNING, (i.e., tx channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

参数

- **handle** –**[in]** I2S channel handler
- **src** –**[in]** The pointer of sent data buffer
- **size** –**[in]** Max data buffer length
- **bytes_written** –**[out]** Byte number that actually be sent, can be NULL if not needed
- **timeout_ms** –**[in]** Max block time

返回

- ESP_OK Write successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not tx handle
- ESP_ERR_TIMEOUT Writing timeout, no writing event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to write

esp_err_t **i2s_channel_read**(*i2s_chan_handle_t* handle, void *dest, size_t size, size_t *bytes_read, uint32_t timeout_ms)

I2S read data.

备注： Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

参数

- **handle** –**[in]** I2S channel handler
- **dest** –**[in]** The pointer of receiving data buffer
- **size** –**[in]** Max data buffer length
- **bytes_read** –**[out]** Byte number that actually be read, can be NULL if not needed
- **timeout_ms** –**[in]** Max block time

返回

- ESP_OK Read successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not rx handle
- ESP_ERR_TIMEOUT Reading timeout, no reading event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to read

esp_err_t **i2s_channel_register_event_callback**(*i2s_chan_handle_t* handle, const *i2s_event_callbacks_t* *callbacks, void *user_data)

Set event callbacks for I2S channel.

备注： Only allowed to be called when the channel state is REGISTERED / READY, (i.e., before channel starts)

备注： User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to NULL.

备注： When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data`

should also reside in SRAM or internal RAM as well.

参数

- **handle** –**[in]** I2S channel handler
- **callbacks** –**[in]** Group of callback functions
- **user_data** –**[in]** User data, which will be passed to callback functions directly

返回

- ESP_OK Set event callbacks successfully
- ESP_ERR_INVALID_ARG Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE Set event callbacks failed because the current channel state is not REGISTERED or READY

Structures

struct **i2s_event_callbacks_t**

Group of I2S callbacks.

备注： The callbacks are all running under ISR environment

备注： When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

i2s_isr_callback_t **on_recv**

Callback of data received event, only for rx channel The event data includes DMA buffer address and size that just finished receiving data

i2s_isr_callback_t **on_recv_q_ovf**

Callback of receiving queue overflowed event, only for rx channel The event data includes buffer size that has been overwritten

i2s_isr_callback_t **on_sent**

Callback of data sent event, only for tx channel The event data includes DMA buffer address and size that just finished sending data

i2s_isr_callback_t **on_send_q_ovf**

Callback of sending queue overflowed event, only for tx channel The event data includes buffer size that has been overwritten

struct **i2s_chan_config_t**

I2S controller channel configuration.

Public Members

i2s_port_t **id**

I2S port id

i2s_role_t **role**

I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

uint32_t **dma_desc_num**

I2S DMA buffer number, it is also the number of DMA descriptor

uint32_t **dma_frame_num**

I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of '3' when the data bit width is 24.

bool **auto_clear**

Set to auto clear DMA TX buffer, i2s will always send zero automatically if no data to send

struct **i2s_chan_info_t**

I2S channel information.

Public Members

i2s_port_t **id**

I2S port id

i2s_role_t **role**

I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

i2s_dir_t **dir**

I2S channel direction

i2s_comm_mode_t **mode**

I2S channel communication mode

i2s_chan_handle_t **pair_chan**

I2S pair channel handle in duplex mode, always NULL in simplex mode

Macros

I2S_CHANNEL_DEFAULT_CONFIG(i2s_num, i2s_role)

get default I2S property

I2S_GPIO_UNUSED

Used in i2s_gpio_config_t for signals which are not used

I2S 类型

Header File

- components/driver/i2s/include/driver/i2s_types.h

Structures

struct **i2s_event_data_t**

Event structure used in I2S event queue.

Public Members

void ***data**

The pointer of DMA buffer that just finished sending or receiving for `on_recv` and `on_sent` callback NULL for `on_recv_q_ovf` and `on_send_q_ovf` callback

size_t **size**

The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the dma_frame_num and data_bit_width, typically it is fixed when data_bit_width is not changed.

Type Definitions

typedef struct i2s_channel_obj_t ***i2s_chan_handle_t**

i2s channel object handle, the control unit of the i2s driver

typedef bool (***i2s_isr_callback_t**)(*i2s_chan_handle_t* handle, *i2s_event_data_t* *event, void *user_ctx)

I2S event callback.

Param handle **[in]** I2S channel handle, created from `i2s_new_channel()`
Param event **[in]** I2S event data
Param user_ctx **[in]** User registered context, passed from `i2s_channel_register_event_callback()`
Return Whether a high priority task has been waken up by this callback function

Enumerations

enum **i2s_port_t**

I2S controller port number, the max port number is (SOC_I2S_NUM -1).

Values:

enumerator **I2S_NUM_0**

I2S controller port 0

enumerator **I2S_NUM_AUTO**

Select whichever port is available

enum **i2s_comm_mode_t**

I2S controller communication mode.

Values:

enumerator **I2S_COMM_MODE_STD**

I2S controller using standard communication mode, support philips/MSB/PCM format

enumerator **I2S_COMM_MODE_PDM**

I2S controller using PDM communication mode, support PDM output or input

enumerator **I2S_COMM_MODE_TDM**

I2S controller using TDM communication mode, support up to 16 slots per frame

enumerator **I2S_COMM_MODE_NONE**

Unspecified I2S controller mode

enum **i2s_mclk_multiple_t**

The multiple of mclk to sample rate.

Values:

enumerator **I2S_MCLK_MULTIPLE_128**

mclk = sample_rate * 128

enumerator **I2S_MCLK_MULTIPLE_256**

mclk = sample_rate * 256

enumerator **I2S_MCLK_MULTIPLE_384**

mclk = sample_rate * 384

enumerator **I2S_MCLK_MULTIPLE_512**

mclk = sample_rate * 512

Header File

- components/hal/include/hal/i2s_types.h

Type Definitions

typedef *soc_periph_i2s_clk_src_t* **i2s_clock_src_t**

I2S clock source

Enumerations

enum **i2s_slot_mode_t**

I2S channel slot mode.

Values:

enumerator **I2S_SLOT_MODE_MONO**

I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

enumerator **I2S_SLOT_MODE_STEREO**

I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enum **i2s_dir_t**

I2S channel direction.

Values:

enumerator **I2S_DIR_RX**

I2S channel direction RX

enumerator **I2S_DIR_TX**

I2S channel direction TX

enum **i2s_role_t**

I2S controller role.

Values:

enumerator **I2S_ROLE_MASTER**

I2S controller master role, bclk and ws signal will be set to output

enumerator **I2S_ROLE_SLAVE**

I2S controller slave role, bclk and ws signal will be set to input

enum **i2s_data_bit_width_t**

Available data bit width in one slot.

Values:

enumerator **I2S_DATA_BIT_WIDTH_8BIT**

I2S channel data bit-width: 8

enumerator **I2S_DATA_BIT_WIDTH_16BIT**

I2S channel data bit-width: 16

enumerator **I2S_DATA_BIT_WIDTH_24BIT**

I2S channel data bit-width: 24

enumerator **I2S_DATA_BIT_WIDTH_32BIT**

I2S channel data bit-width: 32

enum **i2s_slot_bit_width_t**

Total slot bit width in one slot.

Values:

enumerator **I2S_SLOT_BIT_WIDTH_AUTO**

I2S channel slot bit-width equals to data bit-width

enumerator **I2S_SLOT_BIT_WIDTH_8BIT**

I2S channel slot bit-width: 8

enumerator **I2S_SLOT_BIT_WIDTH_16BIT**

I2S channel slot bit-width: 16

enumerator **I2S_SLOT_BIT_WIDTH_24BIT**

I2S channel slot bit-width: 24

enumerator **I2S_SLOT_BIT_WIDTH_32BIT**

I2S channel slot bit-width: 32

enum **i2s_pcm_compress_t**

A/U-law decompress or compress configuration.

Values:

enumerator **I2S_PCM_DISABLE**

Disable A/U law decompress or compress

enumerator **I2S_PCM_A_DECOMPRESS**

A-law decompress

enumerator **I2S_PCM_A_COMPRESS**

A-law compress

enumerator **I2S_PCM_U_DECOMPRESS**

U-law decompress

enumerator **I2S_PCM_U_COMPRESS**

U-law compress

enum **i2s_pdm_sig_scale_t**

pdm tx singnal scaling mode

Values:

enumerator **I2S_PDM_SIG_SCALING_DIV_2**

I2S TX PDM signal scaling: /2

enumerator **I2S_PDM_SIG_SCALING_MUL_1**

I2S TX PDM signal scaling: x1

enumerator **I2S_PDM_SIG_SCALING_MUL_2**

I2S TX PDM signal scaling: x2

enumerator **I2S_PDM_SIG_SCALING_MUL_4**

I2S TX PDM signal scaling: x4

enum **i2s_pdm_tx_line_mode_t**

PDM TX line mode.

备注: For the standard codec mode, PDM pins are connect to a codec which requires both clock signal and data signal For the DAC output mode, PDM data signal can be connected to a power amplifier directly with a low-pass filter, normally, DAC output mode doesn't need the clock signal.

Values:

enumerator **I2S_PDM_TX_ONE_LINE_CODEC**

Standard PDM format output, left and right slot data on a single line

enumerator **I2S_PDM_TX_ONE_LINE_DAC**

PDM DAC format output, left or right slot data on a single line

enumerator **I2S_PDM_TX_TWO_LINE_DAC**

PDM DAC format output, left and right slot data on separated lines

enum **i2s_std_slot_mask_t**

I2S slot select in standard mode.

备注： It has different meanings in tx/rx/mono/stereo mode, and it may have differen behaviors on different targets For the details, please refer to the I2S API reference

---

Values:

enumerator **I2S_STD_SLOT_LEFT**

I2S transmits or receives left slot

enumerator **I2S_STD_SLOT_RIGHT**

I2S transmits or receives right slot

enumerator **I2S_STD_SLOT_BOTH**

I2S transmits or receives both left and right slot

enum **i2s_pdm_slot_mask_t**

I2S slot select in PDM mode.

Values:

enumerator **I2S_PDM_SLOT_RIGHT**

I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled up

enumerator **I2S_PDM_SLOT_LEFT**

I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled down

enumerator **I2S_PDM_SLOT_BOTH**

I2S PDM transmits or receives both two slots

enum **i2s_tdm_slot_mask_t**

tdm slot number

备注： Multiple slots in TDM mode. For TX module, only the active slot send the audio data, the inactive slot send a constant or will be skipped if ‘skip_msk’ is set. For RX module, only receive the audio data in active slots, the data in inactive slots will be ignored. the bit map of active slot can not exceed (0x1«total_slot_num). e.g: slot_mask = (I2S_TDM_SLOT0 | I2S_TDM_SLOT3), here the active slot number is 2 and total_slot is not supposed to be smaller than 4.

Values:

enumerator **I2S_TDM_SLOT0**

I2S slot 0 enabled

enumerator **I2S_TDM_SLOT1**
I2S slot 1 enabled

enumerator **I2S_TDM_SLOT2**
I2S slot 2 enabled

enumerator **I2S_TDM_SLOT3**
I2S slot 3 enabled

enumerator **I2S_TDM_SLOT4**
I2S slot 4 enabled

enumerator **I2S_TDM_SLOT5**
I2S slot 5 enabled

enumerator **I2S_TDM_SLOT6**
I2S slot 6 enabled

enumerator **I2S_TDM_SLOT7**
I2S slot 7 enabled

enumerator **I2S_TDM_SLOT8**
I2S slot 8 enabled

enumerator **I2S_TDM_SLOT9**
I2S slot 9 enabled

enumerator **I2S_TDM_SLOT10**
I2S slot 10 enabled

enumerator **I2S_TDM_SLOT11**
I2S slot 11 enabled

enumerator **I2S_TDM_SLOT12**
I2S slot 12 enabled

enumerator **I2S_TDM_SLOT13**
I2S slot 13 enabled

enumerator **I2S_TDM_SLOT14**
I2S slot 14 enabled

enumerator **I2S_TDM_SLOT15**
I2S slot 15 enabled

2.6.12 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/SRGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In `esp_lcd`, an LCD panel is represented by *`esp_lcd_panel_handle_t`*, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer and the hardware connection interface, the LCD panel drivers are mainly grouped into the following categories:

- Controller based LCD driver involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install. The frame buffer is located in the controller' s internal GRAM (Graphical RAM). ESP-IDF provides only a limited number of LCD controller drivers out of the box (e.g. ST7789, SSD1306), *More Controller Based LCD Drivers* are maintained in the *Espressif Component Registry <https://components.espressif.com/>_*.
- *SPI Interfaced LCD* describes the steps to install the SPI LCD IO driver and then get the panel handle.
- *I2C Interfaced LCD* describes the steps to install the I2C LCD IO driver and then get the panel handle.
- *LCD Panel IO Operations* - provides a set of APIs to operate the LCD panel, like turning on/off the display, setting the orientation, etc. These operations are common for either controller-based LCD panel driver or RGB LCD panel driver.

SPI Interfaced LCD

1. Create an SPI bus. Please refer to *SPI Master API doc* for more details.

```
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1, // Quad SPI LCD driver is not yet supported
    .quadhd_io_num = -1, // Quad SPI LCD driver is not yet supported
    .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), //␣
↪transfer 80 lines of pixels (assume pixel is RGB565) at most in one␣
↪SPI transaction
};
ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_
↪AUTO)); // Enable the DMA feature
```

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:
   - *`esp_lcd_panel_io_spi_config_t::dc_gpio_num`*: Sets the gpio number for the DC signal line (some LCD calls this `RS` line). The LCD driver will use this GPIO to switch between sending command and sending data.
   - *`esp_lcd_panel_io_spi_config_t::cs_gpio_num`*: Sets the gpio number for the CS signal line. The LCD driver will use this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e. this LCD), you can set the gpio number to `-1` to occupy the bus exclusively.
   - *`esp_lcd_panel_io_spi_config_t::pclk_hz`* sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.
   - *`esp_lcd_panel_io_spi_config_t::spi_mode`* sets the SPI mode. The LCD driver will use this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the *SPI Master API doc*.
   - *`esp_lcd_panel_io_spi_config_t::lcd_cmd_bits`* and *`esp_lcd_panel_io_spi_config_t::lcd_param_bits`* set the bit width of

the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

- *esp_lcd_panel_io_spi_config_t::trans_queue_depth* sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
    .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
    .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
    .spi_mode = 0,
    .trans_queue_depth = 10,
};
// Attach the LCD to the SPI bus
ESP_ERROR_CHECK(esp_lcd_new_panel_io_spi((esp_lcd_spi_bus_handle_t)LCD_
↪HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the SPI IO device handle that allocated in the last step, and some panel specific configurations:
   - *esp_lcd_panel_dev_config_t::reset_gpio_num* sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to `-1`.
   - *esp_lcd_panel_dev_config_t::rgb_endian* sets the endian of the RGB color data.
   - *esp_lcd_panel_dev_config_t::bits_per_pixel* sets the bit width of the pixel color data. The LCD driver will use this value to calculate the number of bytes to send to the LCD controller chip.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_endian = LCD_RGB_ENDIAN_BGR,
    .bits_per_pixel = 16,
};
// Create LCD panel handle for ST7789, with the SPI IO device handle
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
↪panel_handle));
```

I2C Interfaced LCD

1. Create I2C bus. Please refer to *I2C API doc* for more details.

```
i2c_config_t i2c_conf = {
    .mode = I2C_MODE_MASTER, // I2C LCD is a master node
    .sda_io_num = EXAMPLE_PIN_NUM_SDA,
    .scl_io_num = EXAMPLE_PIN_NUM_SCL,
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
};
ESP_ERROR_CHECK(i2c_param_config(I2C_HOST, &i2c_conf));
ESP_ERROR_CHECK(i2c_driver_install(I2C_HOST, I2C_MODE_MASTER, 0, 0,␣
↪0));
```

2. Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:
   - *esp_lcd_panel_io_i2c_config_t::dev_addr* sets the I2C device address of the LCD controller chip. The LCD driver will use this address to communicate with the LCD controller chip.

- *esp_lcd_panel_io_i2c_config_t::lcd_cmd_bits* and *esp_lcd_panel_io_i2c_config_t::lcd_param_bits* set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i2c_config_t io_config = {
    .dev_addr = EXAMPLE_I2C_HW_ADDR,
    .control_phase_bytes = 1, // refer to LCD spec
    .dc_bit_offset = 6,       // refer to LCD spec
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_CMD_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i2c((esp_lcd_i2c_bus_handle_t)I2C_
↪HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:
    - *esp_lcd_panel_dev_config_t::reset_gpio_num* sets the LCD ' s hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to `-1`.
    - *esp_lcd_panel_dev_config_t::bits_per_pixel* sets the bit width of the pixel color data. The LCD driver will use this value to calculate the number of bytes to send to the LCD controller chip.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .bits_per_pixel = 1,
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_ssd1306(io_handle, &panel_config, &
↪panel_handle));
```

More Controller Based LCD Drivers

More LCD panel drivers and touch drivers are available in IDF Component Registry. The list of available and planned drivers with links is in this table.

LCD Panel IO Operations

- *esp_lcd_panel_reset()* can reset the LCD panel.
- Use *esp_lcd_panel_swap_xy()* and *esp_lcd_panel_mirror()*, you can rotate the LCD screen.
- *esp_lcd_panel_disp_on_off()* can turn on or off the LCD screen (different from LCD backlight).
- *esp_lcd_panel_draw_bitmap()* is the most significant function, that will do the magic to draw the user provided color buffer to the LCD screen, where the draw window is also configurable.

Application Example

LCD examples are located under: peripherals/lcd:

- Universal SPI LCD example with SPI touch - peripherals/lcd/spi_lcd_touch
- Jpeg decoding and LCD display - peripherals/lcd/tjpgd
- I2C interfaced OLED display scrolling text - peripherals/lcd/i2c_oled

API Reference

Enumerations

enum **lcd_color_rgb_endian_t**

RGB color endian.

Values:

enumerator **LCD_RGB_ENDIAN_RGB**

RGB data endian: RGB

enumerator **LCD_RGB_ENDIAN_BGR**

RGB data endian: BGR

enum **lcd_color_space_t**

LCD color space.

Values:

enumerator **LCD_COLOR_SPACE_RGB**

Color space: RGB

enumerator **LCD_COLOR_SPACE_YUV**

Color space: YUV

enum **lcd_color_range_t**

LCD color range.

Values:

enumerator **LCD_COLOR_RANGE_LIMIT**

Limited color range

enumerator **LCD_COLOR_RANGE_FULL**

Full color range

enum **lcd_yuv_sample_t**

YUV sampling method.

Values:

enumerator **LCD_YUV_SAMPLE_422**

YUV 4:2:2 sampling

enumerator **LCD_YUV_SAMPLE_420**

YUV 4:2:0 sampling

enumerator **LCD_YUV_SAMPLE_411**

YUV 4:1:1 sampling

enum **lcd_yuv_conv_std_t**

The standard used for conversion between RGB and YUV.

Values:

enumerator **LCD_YUV_CONV_STD_BT601**

YUV<->RGB conversion standard: BT.601

enumerator **LCD_YUV_CONV_STD_BT709**

YUV<->RGB conversion standard: BT.709

Functions

esp_err_t **esp_lcd_panel_io_rx_param**(*esp_lcd_panel_io_handle_t* io, int lcd_cmd, void *param, size_t param_size)

Transmit LCD command and receive corresponding parameters.

备注: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

参数

- **io** –**[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** –**[in]** The specific LCD command, set to -1 if no command needed
- **param** –**[out]** Buffer for the command data
- **param_size** –**[in]** Size of `param` buffer

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if read is not supported by transport
- ESP_OK on success

esp_err_t **esp_lcd_panel_io_tx_param**(*esp_lcd_panel_io_handle_t* io, int lcd_cmd, const void *param, size_t param_size)

Transmit LCD command and corresponding parameters.

备注: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

参数

- **`io`** –**[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **`lcd_cmd`** –**[in]** The specific LCD command, set to -1 if no command needed
- **`param`** –**[in]** Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **`param_size`** –**[in]** Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **`esp_lcd_panel_io_tx_color`**(*esp_lcd_panel_io_handle_t* io, int lcd_cmd, const void *color, size_t color_size)

Transmit LCD RGB data.

备注: This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

参数

- **`io`** –**[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **`lcd_cmd`** –**[in]** The specific LCD command, set to -1 if no command needed
- **`color`** –**[in]** Buffer that holds the RGB color data
- **`color_size`** –**[in]** Size of `color` in memory, in bytes

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **`esp_lcd_panel_io_del`**(*esp_lcd_panel_io_handle_t* io)

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

参数 **`io`** –**[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **`esp_lcd_panel_io_register_event_callbacks`**(*esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_io_callbacks_t* *cbs, void *user_ctx)

Register LCD panel IO callbacks.

参数

- **`io`** –**[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **`cbs`** –**[in]** structure with all LCD panel IO callbacks
- **`user_ctx`** –**[in]** User private data, passed directly to callback’ s user_ctx

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_io_spi**(*esp_lcd_spi_bus_handle_t* bus, const *esp_lcd_panel_io_spi_config_t* *io_config, *esp_lcd_panel_io_handle_t* *ret_io)

Create LCD panel IO handle, for SPI interface.

参数

- **bus** –**[in]** SPI bus handle
- **io_config** –**[in]** IO configuration, for SPI interface
- **ret_io** –**[out]** Returned IO handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_io_i2c**(*esp_lcd_i2c_bus_handle_t* bus, const *esp_lcd_panel_io_i2c_config_t* *io_config, *esp_lcd_panel_io_handle_t* *ret_io)

Create LCD panel IO handle, for I2C interface.

参数

- **bus** –**[in]** I2C bus handle
- **io_config** –**[in]** IO configuration, for I2C interface
- **ret_io** –**[out]** Returned IO handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Structures

struct **esp_lcd_panel_io_event_data_t**

Type of LCD panel IO event data.

struct **esp_lcd_panel_io_callbacks_t**

Type of LCD panel IO callbacks.

Public Members

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

struct **esp_lcd_panel_io_spi_config_t**

Panel IO configuration structure, for SPI interface.

Public Members

int **cs_gpio_num**

GPIO used for CS line

int **dc_gpio_num**

GPIO used to select the D/C line, set this to -1 if the D/C line is not used

int **spi_mode**

Traditional SPI mode (0~3)

unsigned int **pclk_hz**

Frequency of pixel clock

size_t **trans_queue_depth**

Size of internal transaction queue

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

void ***user_ctx**

User private data, passed directly to on_color_trans_done’ s user_ctx

int **lcd_cmd_bits**

Bit-width of LCD command

int **lcd_param_bits**

Bit-width of LCD parameter

unsigned int **dc_low_on_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **octal_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **sio_mode**

Read and write through a single data line (MOSI)

unsigned int **lsb_first**

transmit LSB bit first

unsigned int **cs_high_active**

CS line is high active

struct *esp_lcd_panel_io_spi_config_t*::[anonymous] **flags**

Extra flags to fine-tune the SPI device

struct **esp_lcd_panel_io_i2c_config_t**

Panel IO configuration structure, for I2C interface.

Public Members

uint32_t **dev_addr**

I2C device address

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

void ***user_ctx**

User private data, passed directly to on_color_trans_done’ s user_ctx

size_t **control_phase_bytes**

I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc_bit_offset**

Offset of the D/C selection bit in control phase

int **lcd_cmd_bits**

Bit-width of LCD command

int **lcd_param_bits**

Bit-width of LCD parameter

unsigned int **dc_low_on_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable_control_phase**

If this flag is enabled, the control phase isn’ t used

struct *esp_lcd_panel_io_i2c_config_t*::[anonymous] **flags**

Extra flags to fine-tune the I2C device

Type Definitions

typedef void ***esp_lcd_spi_bus_handle_t**

Type of LCD SPI bus handle

typedef void ***esp_lcd_i2c_bus_handle_t**

Type of LCD I2C bus handle

typedef struct esp_lcd_i80_bus_t ***esp_lcd_i80_bus_handle_t**

Type of LCD intel 8080 bus handle

typedef bool (***esp_lcd_panel_io_color_trans_done_cb_t**)(*esp_lcd_panel_io_handle_t* panel_io, *esp_lcd_panel_io_event_data_t* *edata, void *user_ctx)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

Param panel_io [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
Param edata [in] Panel IO event data, fed by driver
Param user_ctx [in] User data, passed from `esp_lcd_panel_io_xxx_config_t`
Return Whether a high priority task has been waken up by this function

Header File

- components/esp_lcd/include/esp_lcd_panel_ops.h

Functions

esp_err_t **esp_lcd_panel_reset**(*esp_lcd_panel_handle_t* panel)

Reset LCD panel.

备注: Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

参数 **panel** –**[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_init**(*esp_lcd_panel_handle_t* panel)

Initialize LCD panel.

备注: Before calling this function, make sure the LCD panel has finished the `reset` stage by `esp_lcd_panel_reset()`.

参数 **panel** –**[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_del**(*esp_lcd_panel_handle_t* panel)

Deinitialize the LCD panel.

参数 **panel** –**[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_draw_bitmap**(*esp_lcd_panel_handle_t* panel, int x_start, int y_start, int x_end, int y_end, const void *color_data)

Draw bitmap on LCD panel.

参数

- **panel** –**[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_start** –**[in]** Start index on x-axis (x_start included)
- **y_start** –**[in]** Start index on y-axis (y_start included)
- **x_end** –**[in]** End index on x-axis (x_end not included)
- **y_end** –**[in]** End index on y-axis (y_end not included)
- **color_data** –**[in]** RGB color data that will be dumped to the specific window range

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_mirror**(*esp_lcd_panel_handle_t* panel, bool mirror_x, bool mirror_y)

Mirror the LCD panel on specific axis.

备注: Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

参数

- **panel** –**[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror_x** –**[in]** Whether the panel will be mirrored about the x axis
- **mirror_y** –**[in]** Whether the panel will be mirrored about the y axis

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_swap_xy**(*esp_lcd_panel_handle_t* panel, bool swap_axes)

Swap/Exchange x and y axis.

备注: Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

参数

- **panel** –**[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap_axes** –**[in]** Whether to swap the x and y axis

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_set_gap**(*esp_lcd_panel_handle_t* panel, int x_gap, int y_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

备注: Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

参数

- **panel** –**[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_gap** –**[in]** Extra gap on x axis, in pixels
- **y_gap** –**[in]** Extra gap on y axis, in pixels

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_invert_color**(*esp_lcd_panel_handle_t* panel, bool invert_color_data)

Invert the color (bit-wise invert the color data line)

参数

- **panel** –**[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert_color_data** –**[in]** Whether to invert the color data

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_disp_on_off**(*esp_lcd_panel_handle_t* panel, bool on_off)

Turn on or off the display.

参数

- **panel** –**[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on_off** –**[in]** True to turns on display, False to turns off display

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_disp_off**(*esp_lcd_panel_handle_t* panel, bool off)

Turn off the display.

参数

- **panel** –**[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** –**[in]** Whether to turn off the screen

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Header File

- components/esp_lcd/include/esp_lcd_panel_rgb.h

Header File

- components/esp_lcd/include/esp_lcd_panel_vendor.h

Functions

esp_err_t **esp_lcd_new_panel_st7789**(const *esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_dev_config_t* *panel_dev_config, *esp_lcd_panel_handle_t* *ret_panel)

Create LCD panel for model ST7789.

参数

- **io** –**[in]** LCD panel IO handle
- **panel_dev_config** –**[in]** general panel device configuration
- **ret_panel** –**[out]** Returned LCD panel handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_nt35510**(const *esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_dev_config_t* *panel_dev_config, *esp_lcd_panel_handle_t* *ret_panel)

Create LCD panel for model NT35510.

参数

- **io** –**[in]** LCD panel IO handle
- **panel_dev_config** –**[in]** general panel device configuration
- **ret_panel** –**[out]** Returned LCD panel handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_ssd1306**(const *esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_dev_config_t* *panel_dev_config, *esp_lcd_panel_handle_t* *ret_panel)

Create LCD panel for model SSD1306.

参数

- **io** –**[in]** LCD panel IO handle
- **panel_dev_config** –**[in]** general panel device configuration
- **ret_panel** –**[out]** Returned LCD panel handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Structures

struct **esp_lcd_panel_dev_config_t**

Configuration structure for panel device.

Public Members

int **reset_gpio_num**

GPIO used to reset the LCD panel, set to -1 if it’ s not used

lcd_color_rgb_endian_t **color_space**

Deprecated:

Set RGB color space, please use rgb_endian instead

lcd_color_rgb_endian_t **rgb_endian**

Set RGB data endian: RGB or BGR

unsigned int **bits_per_pixel**

Color depth, in bpp

unsigned int **reset_active_high**

Setting this if the panel reset is high level active

struct *esp_lcd_panel_dev_config_t*::[anonymous] **flags**

LCD panel config flags

void ***vendor_config**

vendor specific configuration, optional, left as NULL if not used

2.6.13 LED PWM 控制器

概述

LED 控制器 (LEDC) 主要用于控制 LED，也可产生 PWM 信号用于其他设备的控制。该控制器有 6 路通道，可以产生独立的波形来驱动 RGB LED 等设备。

LED PWM 控制器可在无需 CPU 干预的情况下自动改变占空比，实现亮度和颜色渐变。

功能概览

设置 LEDC 通道分三步完成。注意，与 ESP32 不同，ESP32-C3 仅支持设置通道为低速模式。

1. 定时器配置 指定 PWM 信号的频率和占空比分辨率。
2. 通道配置 绑定定时器和输出 PWM 信号的 GPIO。
3. 改变 *PWM* 信号 输出 PWM 信号来驱动 LED。可通过软件控制或使用硬件渐变功能来改变 LED 的亮度。

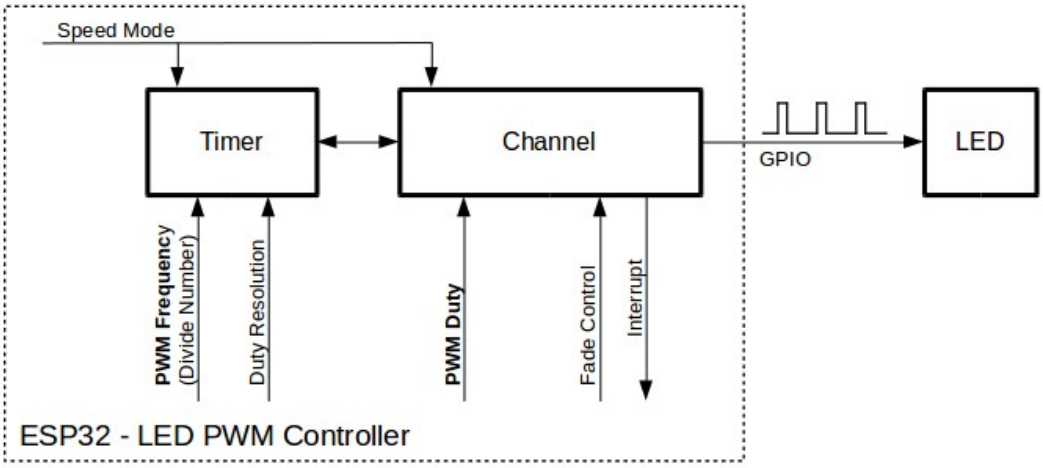

图 9: LED PWM 控制器 API 的关键配置

另一个可选步骤是可以在渐变终端设置一个中断。

备注： 首次 LEDC 配置时，建议先配置定时器（调用函数*ledc_timer_config()*），再配置通道（调用函数*ledc_channel_config()*）。这样可以确保 IO 脚上的 PWM 信号自有输出开始其频率就是正确的。

定时器配置 要设置定时器，可调用函数*ledc_timer_config()*，并将包括如下配置参数的数据结构*ledc_timer_config_t* 传递给该函数：

- 速度模式（值必须为 LEDC_LOW_SPEED_MODE）
- 定时器索引*ledc_timer_t*
- PWM 信号频率
- PWM 占空比分辨率
- 时钟源*ledc_clk_cfg_t*

频率和占空比分辨率相互关联。PWM 频率越高，占空比分辨率越低，反之亦然。如果 API 不是用来改变 LED 亮度，而是用于其它目的，这种相互关系可能会很重要。更多信息详见*频率和占空比分辨率支持范围* 一节。

时钟源同样可以限制 PWM 频率。选择的时钟源频率越高，可以配置的 PWM 频率上限就越高。

表 4: ESP32-C3 LEDC 时钟源特性

时钟名称	时钟频率	时钟功能
APB_CLK	80 MHz	/
RC_FAST_CLK	~20 MHz	支持动态调频（DFS）功能，支持 Light-sleep 模式
XTAL_CLK	40 MHz	支持动态调频（DFS）功能

备注：

1. 如果 ESP32-C3 的定时器选用了 RC_FAST_CLK 作为其时钟源，驱动会通过内部校准来得知这个时钟源的实际频率。这样确保了输出 PWM 信号频率的精准性。

2. ESP32-C3 的所有定时器共用一个时钟源。因此 ESP32-C3 不支持给不同的定时器配置不同的时钟源。

通道配置 定时器设置好后，请配置所需的通道（*ledc_channel_t* 之一）。配置通道需调用函数*ledc_channel_config()*。

通道的配置与定时器设置类似，需向通道配置函数传递包括通道配置参数的结构体*ledc_channel_config_t*。

此时，通道会按照*ledc_channel_config_t* 的配置开始运作，并在选定的 GPIO 上生成由定时器设置指定的频率和占空比的 PWM 信号。在通道运作过程中，可以随时通过调用函数*ledc_stop()* 将其暂停。

改变 PWM 信号 通道开始运行、生成具有恒定占空比和频率的 PWM 信号之后，有几种方式可以改变该信号。驱动 LED 时，主要通过改变占空比来变化光线亮度。

以下两节介绍了如何使用软件和硬件改变占空比。如有需要，PWM 信号的频率也可更改，详见*改变 PWM 频率* 一节。

备注： 在 ESP32-C3 的 LED PWM 控制器中，所有的定时器和通道都只支持低速模式。对 PWM 设置的任何改变，都需要由软件显式地触发（见下文）。

使用软件改变 PWM 占空比 调用函数*ledc_set_duty()* 可以设置新的占空比。之后，调用函数*ledc_update_duty()* 使新配置生效。要查看当前设置的占空比，可使用 _get_ 函数*ledc_get_duty()*。

另外一种设置占空比和其他通道参数的方式是调用*通道配置* 一节提到的函数*ledc_channel_config()*。

传递给函数的占空比数值范围取决于选定的 `duty_resolution`，应为 `0` 至 `(2 ** duty_resolution) - 1`。例如，如选定的占空比分辨率为 10，则占空比的数值范围为 0 至 1023。此时分辨率为 ~0.1%。

使用硬件改变 PWM 占空比 LED PWM 控制器硬件可逐渐改变占空比的数值。要使用此功能，需用函数*ledc_fade_func_install()* 使能渐变，之后用下列可用渐变函数之一配置：

- *ledc_set_fade_with_time()*
- *ledc_set_fade_with_step()*
- *ledc_set_fade()*

最后需要调用*ledc_fade_start()* 开启渐变。渐变可以在阻塞或非阻塞模式下运行，具体区别请查看*ledc_fade_mode_t*。需要特别注意的是，不管在哪种模式下，下一次渐变或是单次占空比配置的指令生效都必须等到前一次渐变完成或被中止。中止一个正在运行中的渐变需要调用函数*ledc_fade_stop()*。

此外，在使能渐变后，每个通道都可以额外通过调用*ledc_cb_register()* 注册一个回调函数用以获得渐变完成的事件通知。回调函数的原型被定义在*ledc_cb_t*。每个回调函数都应当返回一个布尔值给驱动的中断处理函数，用以表示是否有高优先级任务被其唤醒。此外，值得注意的是，由于驱动的中断处理函数被放在了 IRAM 中，回调函数和其调用的函数也需要被放在 IRAM 中。*ledc_cb_register()* 会检查回调函数及函数上下文的指针地址是否在正确的存储区域。

如不需要渐变和渐变中断，可用函数*ledc_fade_func_uninstall()* 关闭。

改变 PWM 频率 LED PWM 控制器 API 有多种方式即时改变 PWM 频率：

- 通过调用函数*ledc_set_freq()* 设置频率。可用函数*ledc_get_freq()* 查看当前频率。

- 通过调用函数*ledc_bind_channel_timer()* 将其他定时器绑定到该通道来改变频率和占空比分辨率。
- 通过调用函数*ledc_channel_config()* 改变通道的定时器。

控制 PWM 的更多方式 有一些较底层的定时器特定函数可用于更改 PWM 设置：

- *ledc_timer_set()*
- *ledc_timer_rst()*
- *ledc_timer_pause()*
- *ledc_timer_resume()*

前两个功能可通过函数*ledc_channel_config()* 在后台运行，在定时器配置后启动。

使用中断 配置 LED PWM 控制器通道时，可在*ledc_channel_config_t* 中选取参数*ledc_intr_type_t*，在渐变完成时触发中断。

要注册处理程序来处理中断，可调用函数*ledc_isr_register()*。

频率和占空比分辨率支持范围

LED PWM 控制器主要用于驱动 LED。该控制器 PWM 占空比设置的分辨率范围较广。比如，PWM 频率为 5 kHz 时，占空比分辨率最大可为 13 位。这意味着占空比可为 0 至 100% 之间的任意值，分辨率为 ~0.012%（2 ** 13 = 8192 LED 亮度的离散电平）。然而，这些参数取决于为 LED PWM 控制器定时器计时的时钟信号，LED PWM 控制器为通道提供时钟（具体可参考定时器配置 和 *ESP32-C3 技术参考手册 > LED PWM 计时器 (LEDC)* [PDF]）。

LED PWM 控制器可用于生成频率较高的信号，足以为数码相机模组等其他设备提供时钟。此时，最大频率可为 40 MHz，占空比分辨率为 1 位。也就是说，占空比固定为 50%，无法调整。

LED PWM 控制器 API 会在设定的频率和占空比分辨率超过 LED PWM 控制器硬件范围时报错。例如，试图将频率设置为 20 MHz、占空比分辨率设置为 3 位时，串行端口监视器上会报告如下错误：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try␣
↪reducing freq_hz or duty_resolution. div_param=128
```

此时，占空比分辨率或频率必须降低。比如，将占空比分辨率设置为 2 会解决这一问题，让占空比设置为 25% 的倍数，即 25%、50% 或 75%。

如设置的频率和占空比分辨率低于所支持的最低值，LED PWM 驱动器也会反映并报告，如：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try␣
↪increasing freq_hz or duty_resolution. div_param=128000000
```

占空比分辨率通常用*ledc_timer_bit_t* 设置，范围是 10 至 15 位。如需较低的占空比分辨率（上至 10，下至 1），可直接输入相应数值。

应用实例

使用 LEDC 基本实例请参照 peripherals/ledc/ledc_basic。

使用 LEDC 改变占空比和渐变控制的实例请参照 peripherals/ledc/ledc_fade。

API 参考

Header File

- components/driver/ledc/include/driver/ledc.h

Functions

esp_err_t **ledc_channel_config**(const *ledc_channel_config_t* *ledc_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

参数 **ledc_conf** –Pointer of LEDC channel configure struct

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_timer_config**(const *ledc_timer_config_t* *timer_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

参数 **timer_conf** –Pointer of LEDC timer configure struct

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

esp_err_t **ledc_update_duty**(*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC update channel parameters.

备注: Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

备注: ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

---

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_set_pin**(int gpio_num, *ledc_mode_t* speed_mode, *ledc_channel_t* ledc_channel)

Set LEDC output gpio.

备注: This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use `ledc_channel_config()` instead to fully configure a LEDC channel.

参数

- **gpio_num** –The LEDC output gpio
- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc_channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_stop**(*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t idle_level)

LEDC stop. Disable LEDC output, and set idle level.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **idle_level** –Set output idle level after LEDC stops.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_set_freq**(*ledc_mode_t* speed_mode, *ledc_timer_t* timer_num, uint32_t freq_hz)

LEDC set channel frequency (Hz)

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** –LEDC timer index (0-3), select from ledc_timer_t
- **freq_hz** –Set the LEDC frequency

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

uint32_t **ledc_get_freq**(*ledc_mode_t* speed_mode, *ledc_timer_t* timer_num)

LEDC get channel frequency (Hz)

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** –LEDC timer index (0-3), select from ledc_timer_t

返回

- 0 error
- Others Current LEDC frequency

esp_err_t **ledc_set_duty_with_hpoint**(*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, uint32_t hpoint)

LEDC set duty and hpoint value Only after calling ledc_update_duty will the duty update.

备注: ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

---

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- **hpoint** –Set the LEDC hpoint value(max: 0xfffff)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

int **ledc_get_hpoint**(*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC get hpoint value, the counter value when the output is set high level.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

返回

- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

esp_err_t **ledc_set_duty**(*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

备注: ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

uint32_t **ledc_get_duty**(*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling ledc_update_duty, because duty update doesn't take effect until the next cycle.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

返回

- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

esp_err_t **ledc_set_fade**(*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, *ledc_duty_direction_t* fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)

LEDC set gradient Set LEDC gradient, After the function calls the ledc_update_duty function, the function can take effect.

备注： For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** –Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- **fade_direction** –Set the direction of the gradient
- **step_num** –Set the number of the gradient
- **duty_cycle_num** –Set how many LEDC tick each time the gradient lasts
- **duty_scale** –Set gradient change amplitude

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_isr_register**(void (*fn)(void*), void *arg, int intr_alloc_flags, *ledc_isr_handle_t* *handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

参数

- **fn** –Interrupt handler function.
- **arg** –User-supplied argument passed to the handler function.
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

esp_err_t **ledc_timer_set**(*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel, uint32_t clock_divider, uint32_t duty_resolution, *ledc_clk_src_t* clk_src)

Configure LEDC settings.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –Timer index (0-3), there are 4 timers in LEDC module
- **clock_divider** –Timer clock divide value, the timer clock is divided from the selected clock source
- **duty_resolution** –Resolution of duty setting in number of bits. The range of duty values is [0, (2**duty_resolution)]
- **clk_src** –Select LEDC source clock.

返回

- (-1) Parameter error
- Other Current LEDC duty

esp_err_t **ledc_timer_rst**(*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Reset LEDC timer.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –LEDC timer index (0-3), select from ledc_timer_t

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_timer_pause**(*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Pause LEDC timer counter.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –LEDC timer index (0-3), select from ledc_timer_t

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_timer_resume**(*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Resume LEDC timer.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –LEDC timer index (0-3), select from ledc_timer_t

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_bind_channel_timer**(*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_timer_t* timer_sel)

Bind LEDC channel with the selected timer.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **timer_sel** –LEDC timer index (0-3), select from ledc_timer_t

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_set_fade_with_step**(*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)

Set LEDC fade function.

备注: Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

备注: ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

---

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode. ,

- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** –Target duty of fading [0, (2**duty_resolution) - 1]
- **scale** –Controls the increase or decrease step scale.
- **cycle_num** –increase or decrease the duty every cycle_num cycles

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_with_time** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, int max_fade_time_ms)

Set LEDC fade function, with a limited time.

备注: Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

备注: ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

---

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode. ,
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** –Target duty of fading [0, (2**duty_resolution) - 1]
- **max_fade_time_ms** –The maximum time of the fading (ms).

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

esp_err_t **ledc_fade_func_install** (int intr_alloc_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

参数 **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function already installed.

void **ledc_fade_func_uninstall** (void)

Uninstall LEDC fade function.

esp_err_t **ledc_fade_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_fade_mode_t* fade_mode)

Start LEDC fading.

备注: Call ledc_fade_func_install() once before calling this function. Call this API right after ledc_set_fade_with_time or ledc_set_fade_with_step before to start fading.

备注: Starting fade operation with this API is not thread-safe, use with care.

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel number
- **fade_mode** –Whether to block until fading done. See ledc_types.h ledc_fade_mode_t for more info. Note that this function will not return until fading to the target duty if LEDC_FADE_WAIT_DONE mode is selected.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

esp_err_t **ledc_fade_stop**(*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

Stop LEDC fading. The duty of the channel is garanteed to be fixed at most one PWM cycle after the function returns.

备注: This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

备注: Call this API will abort the fading operation only if it was started by calling ledc_fade_start with LEDC_FADE_NO_WAIT mode.

备注: If a fade was started with LEDC_FADE_WAIT_DONE mode, calling this API afterwards HAS no use in stopping the fade. Fade will continue until it reachs the target duty.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel number

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

esp_err_t **ledc_set_duty_and_update**(*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, uint32_t hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress

on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- **hpoint** –Set the LEDC hpoint value(max: 0xfffff)

esp_err_t **ledc_set_fade_time_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t max_fade_time_ms, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

备注: Call ledc_fade_func_install() once, before calling this function.

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** –Target duty of fading [0, (2**duty_resolution) - 1]
- **max_fade_time_ms** –The maximum time of the fading (ms).
- **fade_mode** –choose blocking or non-blocking mode

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_step_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function.

备注: Call ledc_fade_func_install() once before calling this function.

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** –Target duty of fading [0, (2**duty_resolution) - 1]

- **scale** –Controls the increase or decrease step scale.
- **cycle_num** –increase or decrease the duty every cycle_num cycles
- **fade_mode** –choose blocking or non-blocking mode

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

esp_err_t **ledc_cb_register**(*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_cbs_t* *cbs, void *user_arg)

LEDC callback registration function.

备注: The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

参数

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **cbs** –Group of LEDC callback functions
- **user_arg** –user registered data for the callback function

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Structures

struct **ledc_channel_config_t**

Configuration parameters of LEDC channel for ledc_channel_config function.

Public Members

int **gpio_num**

the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

ledc_mode_t **speed_mode**

LEDC speed speed_mode, high-speed mode or low-speed mode

ledc_channel_t **channel**

LEDC channel (0 - LEDC_CHANNEL_MAX-1)

ledc_intr_type_t **intr_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

ledc_timer_t **timer_sel**

Select the timer source of channel (0 - LEDC_TIMER_MAX-1)

uint32_t **duty**

LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

int **hpoint**

LEDC channel hpoint value, the max value is 0xfffff

unsigned int **output_invert**

Enable (1) or disable (0) gpio output invert

struct *ledc_channel_config_t*::[anonymous] **flags**

LEDC flags

struct **ledc_timer_config_t**

Configuration parameters of LEDC Timer timer for ledc_timer_config function.

Public Members

ledc_mode_t **speed_mode**

LEDC speed speed_mode, high-speed mode or low-speed mode

ledc_timer_bit_t **duty_resolution**

LEDC channel duty resolution

ledc_timer_t **timer_num**

The timer source of channel (0 - LEDC_TIMER_MAX-1)

uint32_t **freq_hz**

LEDC timer frequency (Hz)

ledc_clk_cfg_t **clk_cfg**

Configure LEDC source clock from ledc_clk_cfg_t. Note that LEDC_USE_RC_FAST_CLK and LEDC_USE_XTAL_CLK are non-timer-specific clock sources. You can not have one LEDC timer uses RC_FAST_CLK as the clock source and have another LEDC timer uses XTAL_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

struct **ledc_cb_param_t**

LEDC callback parameter.

Public Members

ledc_cb_event_t **event**

Event name

uint32_t **speed_mode**

Speed mode of the LEDC channel group

uint32_t **channel**

LEDC channel (0 - LEDC_CHANNEL_MAX-1)

uint32_t **duty**

LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution) - 1]

struct **ledc_cbs_t**

Group of supported LEDC callbacks.

备注： The callbacks are all running under ISR environment

Public Members

ledc_cb_t **fade_cb**

LEDC fade_end callback function

Macros

LEDC_APB_CLK_HZ

Frequency of one of the LEDC peripheral clock sources, APB_CLK.

备注： This macro should have no use in your application, we keep it here only for backward compatible

LEDC_ERR_DUTY

LEDC_ERR_VAL

Type Definitions

typedef *intr_handle_t* **ledc_isr_handle_t**

typedef bool (***ledc_cb_t**)(const *ledc_cb_param_t* *param, void *user_arg)

Type of LEDC event callback.

Param param LEDC callback parameter
Param user_arg User registered data
Return Whether a high priority task has been waken up by this function

Enumerations

enum **ledc_cb_event_t**

LEDC callback event type.

Values:

enumerator **LEDC_FADE_END_EVT**

LEDC fade end event

Header File

- components/hal/include/hal/ledc_types.h

Type Definitions

typedef *soc_periph_ledc_clk_src_legacy_t* **ledc_clk_cfg_t**

LEDC clock source configuration struct.

In theory, the following enumeration shall be placed in LEDC driver's header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

Enumerations

enum **ledc_mode_t**

Values:

enumerator **LEDC_LOW_SPEED_MODE**

LEDC low speed speed_mode

enumerator **LEDC_SPEED_MODE_MAX**

LEDC speed limit

enum **ledc_intr_type_t**

Values:

enumerator **LEDC_INTR_DISABLE**

Disable LEDC interrupt

enumerator **LEDC_INTR_FADE_END**

Enable LEDC interrupt

enumerator **LEDC_INTR_MAX**

enum **ledc_duty_direction_t**

Values:

enumerator **LEDC_DUTY_DIR_DECREASE**

LEDC duty decrease direction

enumerator **LEDC_DUTY_DIR_INCREASE**

LEDC duty increase direction

enumerator **LEDC_DUTY_DIR_MAX**

enum **ledc_slow_clk_sel_t**

LEDC global clock sources.

Values:

enumerator **LEDC_SLOW_CLK_RC_FAST**

LEDC low speed timer clock source is RC_FAST clock

enumerator **LEDC_SLOW_CLK_APB**

LEDC low speed timer clock source is 80MHz APB clock

enumerator **LEDC_SLOW_CLK_XTAL**

LEDC low speed timer clock source XTAL clock

enumerator **LEDC_SLOW_CLK_RTC8M**

Alias of ‘LEDC_SLOW_CLK_RC_FAST’

enum **ledc_clk_src_t**

LEDC timer-specific clock sources.

Note: Setting numeric values to match ledc_clk_cfg_t values are a hack to avoid collision with LEDC_AUTO_CLK in the driver, as these enums have very similar names and user may pass one of these by mistake.

Values:

enumerator **LEDC_APB_CLK**

LEDC timer clock divided from APB clock (80Mhz)

enumerator **LEDC_SCLK**

Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL

enum **ledc_timer_t**

Values:

enumerator **LEDC_TIMER_0**

LEDC timer 0

enumerator **LEDC_TIMER_1**

LEDC timer 1

enumerator **LEDC_TIMER_2**

LEDC timer 2

enumerator **LEDC_TIMER_3**

LEDC timer 3

enumerator **LEDC_TIMER_MAX**

enum **ledc_channel_t**

Values:

enumerator **LEDC_CHANNEL_0**

LEDC channel 0

enumerator **LEDC_CHANNEL_1**
LEDC channel 1

enumerator **LEDC_CHANNEL_2**
LEDC channel 2

enumerator **LEDC_CHANNEL_3**
LEDC channel 3

enumerator **LEDC_CHANNEL_4**
LEDC channel 4

enumerator **LEDC_CHANNEL_5**
LEDC channel 5

enumerator **LEDC_CHANNEL_MAX**

enum **ledc_timer_bit_t**
Values:

enumerator **LEDC_TIMER_1_BIT**
LEDC PWM duty resolution of 1 bits

enumerator **LEDC_TIMER_2_BIT**
LEDC PWM duty resolution of 2 bits

enumerator **LEDC_TIMER_3_BIT**
LEDC PWM duty resolution of 3 bits

enumerator **LEDC_TIMER_4_BIT**
LEDC PWM duty resolution of 4 bits

enumerator **LEDC_TIMER_5_BIT**
LEDC PWM duty resolution of 5 bits

enumerator **LEDC_TIMER_6_BIT**
LEDC PWM duty resolution of 6 bits

enumerator **LEDC_TIMER_7_BIT**
LEDC PWM duty resolution of 7 bits

enumerator **LEDC_TIMER_8_BIT**
LEDC PWM duty resolution of 8 bits

enumerator **LEDC_TIMER_9_BIT**
LEDC PWM duty resolution of 9 bits

enumerator **LEDC_TIMER_10_BIT**
LEDC PWM duty resolution of 10 bits

enumerator **LEDC_TIMER_11_BIT**

LEDC PWM duty resolution of 11 bits

enumerator **LEDC_TIMER_12_BIT**

LEDC PWM duty resolution of 12 bits

enumerator **LEDC_TIMER_13_BIT**

LEDC PWM duty resolution of 13 bits

enumerator **LEDC_TIMER_14_BIT**

LEDC PWM duty resolution of 14 bits

enumerator **LEDC_TIMER_BIT_MAX**

enum **ledc_fade_mode_t**

Values:

enumerator **LEDC_FADE_NO_WAIT**

LEDC fade function will return immediately

enumerator **LEDC_FADE_WAIT_DONE**

LEDC fade function will block until fading to the target duty

enumerator **LEDC_FADE_MAX**

2.6.14 Remote Control Transceiver (RMT)

Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, the functionality of RMT can be extended to a versatile and general purpose transceiver. From the perspective of network layering, the RMT hardware contains both physical and data link layer. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called **RMT symbol**, which is represented by *rmt_symbol_word_t* in the driver.

ESP32-C3 contains multiple channels in the RMT peripheral.[1] Each channel can be configured as either transmitter or receiver, independently.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g. NEC
- General purpose sequence generator
- Transmit signals in a hardware controlled loop, with finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

Layout of RMT Symbols The RMT hardware defines data in its own pattern –the **RMT symbol**. Each symbol consists of two pairs of two values. The first value in a pair describes the signal duration in RMT ticks and is 15 bits long. The second provides the signal level (high or low) and is contained in a single bit, as shown below:

[1] Different ESP chip series might have different number of RMT channels. Please refer to the [TRM] for details. The driver won't forbid you from applying for more RMT channels, but it will return error when there's no hardware resources available. Please always check the return value when doing *Resource Allocation*.

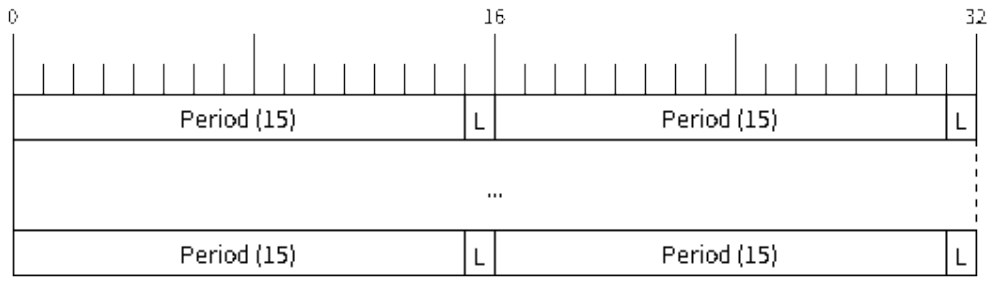

图 10: Structure of RMT symbols (L - signal level)

RMT Transmitter Overview The data path and control path of an RMT TX channel is illustrated in the figure below:

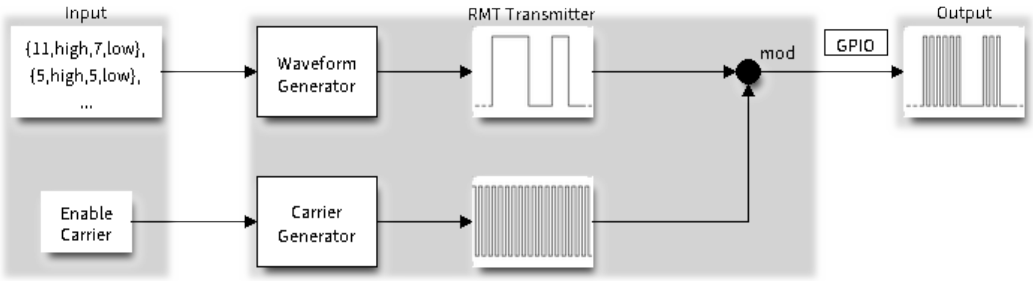

图 11: RMT Transmitter Overview

The driver will encode user's data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high frequency carrier signal before being routed to a GPIO pad.

RMT Receiver Overview The data path and control path of an RMT RX channel is illustrated in the figure below:

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It's feasible to tell the receiver the basic characteristics of the incoming signal, so that the signal's stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high frequency carrier from the base signal.

Functional Overview

Description of the RMT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate RMT channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- *Carrier Modulation and Demodulation* - describes how to modulate carrier for TX channel and demodulate carrier for RX channel.
- *Register Event Callbacks* - covers how to hook user specific code to RMT channel specific events.
- *Enable and Disable channel* - shows how to enable and disable the RMT channel.
- *Initiate TX Transaction* - describes the steps to initiate a transaction for TX channel.
- *Initiate RX Transaction* - describes the steps to initiate a transaction for RX channel.

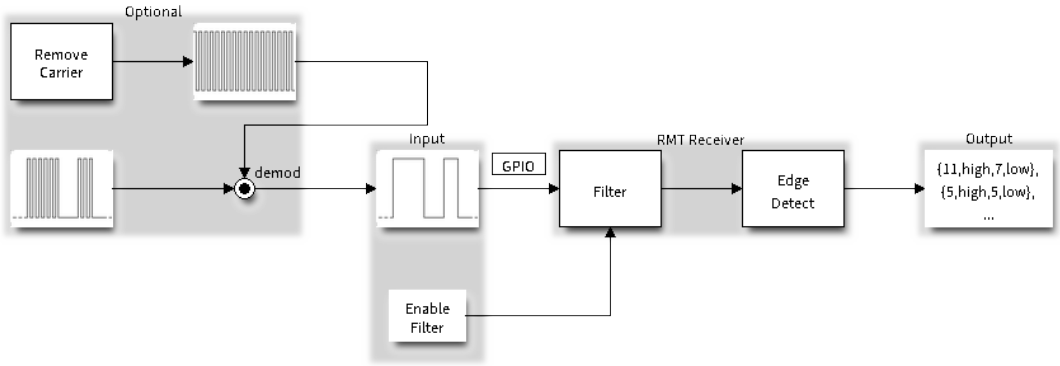

图 12: RMT Receiver Overview

- *Multiple Channels Simultaneous Transmission* - describes how to collect multiple channels into a sync group and start transaction at the same time.
- *RMT Encoder* - focuses on how to write a customized encoder in a combination way, with the help of the primitive encoders provided by the driver.
- *Power Management* - describes how different source clock will affect power consumption.
- *IRAM Safe* - describes tips on how to make the RMT interrupt work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can bring different effects to the driver.

Resource Allocation Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The available channels are managed in a resource pool, which will hand out a free channel on request.

Install RMT TX Channel To install an RMT TX channel, there's a configuration structure that needs to be given in advance: `rmt_tx_channel_config_t`:

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock will also be used by other channels, which means user should ensure this configuration is same when allocating other channels, regardless of TX or RX. For the effect on power consumption of different clock source, please refer to *Power Management* section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of RMT signal is calculated based on this **tick**.
- `rmt_tx_channel_config_t::mem_block_symbols` this field have a slightly different meaning based on if the DMA backend is enabled or not. If the DMA is enabled via `rmt_tx_channel_config_t::with_dma`, then this field controls the size of the internal DMA buffer. To achieve a better throughput and smaller CPU overhead, we recommend you to set a large value, e.g. `1024`. If DMA is not used, this field controls the size of the dedicated memory block that owned by the channel, which should be at least 48.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` is used to indicate if the channel needs a DMA backend. A channel with DMA attached can offload the CPU by a lot. However, DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_tx_channel_config_t::io_loop_back` enables both the GPIO's input and output ability through the GPIO matrix peripheral. Meanwhile, if both TX and RX channels are bound to the same GPIO, then monitoring of the data transmission line can be realized.

- *rmt_tx_channel_config_t::io_od_mode* configures the GPIO as open-drain mode. It is useful for simulating bi-directional buses, sucn as 1-wire bus, combined with *rmt_tx_channel_config_t::io_loop_back*.

Once the *rmt_tx_channel_config_t* structure is populated with mandatory parameters, users can call *rmt_new_tx_channel()* to allocate and initialize a TX channel. This function will return an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function will return *ESP_ERR_NOT_FOUND* error. If some feature (e.g. DMA backend) is not supported by hardware, it will return *ESP_ERR_NOT_SUPPORTED* error.

```
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,   // select source clock
    .gpio_num = 0,                    // GPIO number
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1MHz tick resolution, i.e. 1 tick = 1us
    .trans_queue_depth = 4,           // set the number of transactions that can␣
↪pend in the background
    .flags.invert_out = false,        // don't invert output signal
    .flags.with_dma = false,          // don't need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));
```

Install RMT RX Channel To install an RMT RX channel, there's a configuration structure that needs to be given in advance: *rmt_rx_channel_config_t*:

- *rmt_rx_channel_config_t::gpio_num* sets the GPIO number used by the receiver.
- *rmt_rx_channel_config_t::clk_src* selects the source clock for the RMT channel. The available clocks are listed in *rmt_clock_source_t*. Note that, the selected clock will also be used by other channels, which means user should ensure this configuration is same when allocating other channels, regardless of TX or RX. For the effect on power consumption of different clock source, please refer to *Power Management* section.
- *rmt_rx_channel_config_t::resolution_hz* sets the resolution of the internal tick counter. The timing parameter of RMT signal is calculated based on this **tick**.
- *rmt_rx_channel_config_t::mem_block_symbols* this field have a slightly different meaning based on if the DMA backend is enabled or not. If the DMA is enabled via *rmt_rx_channel_config_t::with_dma*, then this field controls the maximum size of the DMA buffer. If DMA is not used, this field controls the size of the dedicated memory block that owned by the channel, which should be at least 48.
- *rmt_rx_channel_config_t::invert_in* is used to decide whether to invert the input signals before they going into RMT receiver. The inversion is done by GPIO matrix instead of by the RMT peripheral.
- *rmt_rx_channel_config_t::with_dma* is used to indicate if the channel needs a DMA backend. A channel with DMA attached can offload the CPU by a lot. However, DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter *ESP_ERR_NOT_SUPPORTED* error.
- *rmt_rx_channel_config_t::io_loop_back* is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral. Meanwhile, if both TX and RX channels are bound to the same GPIO, then monitoring of the data transmission line can be realized.

Once the *rmt_rx_channel_config_t* structure is populated with mandatory parameters, users can call *rmt_new_rx_channel()* to allocate and initialize a RX channel. This function will return an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function will return *ESP_ERR_NOT_FOUND* error. If some feature (e.g. DMA backend) is not supported by hardware, it will return *ESP_ERR_NOT_SUPPORTED* error.

```
rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,   // select source clock
    .resolution_hz = 1 * 1000 * 1000, // 1MHz tick resolution, i.e. 1 tick = 1us
```

(下页继续)

(续上页)

```
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256Bytes
    .gpio_num = 2,                    // GPIO number
    .flags.invert_in = false,         // don't invert input signal
    .flags.with_dma = false,          // don't need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));
```

Uninstall RMT Channel If a previously installed RMT channel is no longer needed, it's recommended to recycle the resources by calling *rmt_del_channel()*, which in return allows the underlying hardware to be usable for other purposes.

Carrier Modulation and Demodulation The RMT transmitter can generate a carrier wave and modulate it onto the base signal. Compared to the base signal, the carrier frequency is usually high. In addition, user can only set the frequency and duty cycle for the carrier. The RMT receiver can demodulate the carrier from the incoming signal. Note that, carrier modulation and demodulation is not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a *ESP_ERR_NOT_SUPPORTED* error.

Carrier related configurations lie in *rmt_carrier_config_t*:

- *rmt_carrier_config_t::frequency_hz* sets the carrier frequency, in Hz.
- *rmt_carrier_config_t::duty_cycle* sets the carrier duty cycle.
- *rmt_carrier_config_t::polarity_active_low* sets the carrier polarity, i.e. on which level the carrier is applied.
- *rmt_carrier_config_t::always_on* sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for TX channel.

备注： For RX channel, we shouldn't set the carrier frequency exactly to the theoretical value. It's recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25KHz, instead of the 38KHz that configured on the TX side. The reason is that reflection and refraction will occur when a signal travels through the air, leading to the a distortion on the receiver side.

```
rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33,                 // duty cycle 33%
    .frequency_hz = 38000,              // 38KHz
    .flags.polarity_active_low = false, // carrier should modulated to high level
};
// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));

rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33,                 // duty cycle 33%
    .frequency_hz = 25000,              // 25KHz carrier, should be smaller than␣
↪transmitter's carrier frequency
    .flags.polarity_active_low = false, // the carrier is modulated to high level
};
// demodulate carrier from RX channel
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));
```

Register Event Callbacks When an RMT channel finishes transmitting or receiving, a specific event will be generated and notify the CPU by interrupt. If you have some function that needs to be called when those events occurred, you can hook your function to the ISR (Interrupt Service Routine) by calling *rmt_tx_register_event_callbacks()* and *rmt_rx_register_event_callbacks()* for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn't attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR`

suffix are called from within the function). The callback function has a boolean return value, to tell the caller whether a high priority task is woke up by it.

TX channel supported event callbacks are listed in the *rmt_tx_event_callbacks_t*:

- *rmt_tx_event_callbacks_t::on_trans_done* sets a callback function for trans done event. The function prototype is declared in *rmt_tx_done_callback_t*.

RX channel supported event callbacks are listed in the *rmt_rx_event_callbacks_t*:

- *rmt_rx_event_callbacks_t::on_recv_done* sets a callback function for receive complete event. The function prototype is declared in *rmt_rx_done_callback_t*.

User can save own context in *rmt_tx_register_event_callbacks()* and *rmt_rx_register_event_callbacks()* as well, via the parameter `user_data`. The user data will be directly passed to each callback function.

In the callback function, users can fetch the event specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is only valid for the duration of the callback.

The TX done event data is defined in *rmt_tx_done_event_data_t*:

- *rmt_tx_done_event_data_t::num_symbols* tells the number of transmitted RMT symbols. This also reflects the size of encoding artifacts. Please note, this value will count in the EOF symbol as well, which is appended by the driver, to mark the end of one transaction.

The RX complete event data is defined in *rmt_rx_done_event_data_t*:

- *rmt_rx_done_event_data_t::received_symbols* points to the received RMT symbols. These symbols are saved in the `buffer` parameter of *rmt_receive()* function. User shouldn't free this receive buffer before the callback returns.
- *rmt_rx_done_event_data_t::num_symbols* tells the number of received RMT symbols. This value won't be bigger than `buffer_size` parameter of *rmt_receive()* function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver will truncate it.

Enable and Disable channel *rmt_enable()* must be called in advanced before transmitting or receiving RMT symbols. For transmitters, enabling a channel will enable a specific interrupt and prepare the hardware to dispatch transactions. For RX channels, enabling a channel will enable an interrupt, but the receiver is not started during this time, as it has no idea about the characteristics of the incoming signals. The receiver will be started in *rmt_receive()*.

rmt_disable() does the opposite work by disabling the interrupt and clearing pending status. The transmitter and receiver will be disabled as well.

```
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

Initiate TX Transaction RMT is a special communication peripheral as it's unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format *rmt_symbol_word_t*. However, the hardware doesn't help to convert the user data into RMT symbols, this can only be done in software —by the so-called **RMT Encoder**. The encoder is responsible for encoding user data into RMT symbols and then write to RMT memory block or DMA buffer. For how to create an RMT encoder, please refer to *RMT Encoder*.

Once we got an encoder, we can initiate a TX transaction by calling *rmt_transmit()*. This function takes several positional parameters like channel handle, encoder handle, payload buffer. Besides that, we also need to provide a transmission specific configuration in *rmt_transmit_config_t*:

- *rmt_transmit_config_t::loop_count* sets the number of transmission loop. After the transmitter finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences at the cost of a very little CPU intervention. Specially, setting

rmt_transmit_config_t::loop_count to *-1* means an infinite loop transmission. In this situation, the channel won't stop until manually call of *rmt_disable()*. And the trans done event won't be generated as well. If *rmt_transmit_config_t::loop_count* is set to a positive number, the trans done event won't be generated until target number of loop transmission have finished. Note that, the **loop transmit** feature is not supported on all ESP chips, please refer to [TRM] before you configure this option. Or you might encounter *ESP_ERR_NOT_SUPPORTED* error.

- *rmt_transmit_config_t::eot_level* sets the output level when the transmitter finishes working or stops working by calling *rmt_disable()*.

备注: There's a limitation in the transmission size if the *rmt_transmit_config_t::loop_count* is set to non-zero (i.e. to enable the loop feature). The encoded RMT symbols should not exceed the capacity of RMT hardware memory block size. Or you might see error message like `encoding artifacts can't exceed hw memory block for loop transmission`. If you have to start a large transaction by loop, you can try either:

- Increase the *rmt_tx_channel_config_t::mem_block_symbols*. This approach doesn't work if the DMA backend is also enabled.
- Customize an encoder and construct a forever loop in the encoding function. See also *RMT Encoder*.

Internally, *rmt_transmit()* will construct a transaction descriptor and send to a job queue, which will be dispatched in the ISR. So it is possible that the transaction is not started yet when *rmt_transmit()* returns. To ensure all pending transaction to complete, user can use *rmt_tx_wait_all_done()*.

Multiple Channels Simultaneous Transmission In some real-time control applications, we don't want any time drift in between when startup multiple TX channels. For example, to make two robotic arms move simultaneously. The RMT driver can help to manage this by creating a so-called **Sync Manager**. The sync manager is represented by *rmt_sync_manager_handle_t* in the driver. The procedure of RMT sync transmission is shown as follows:

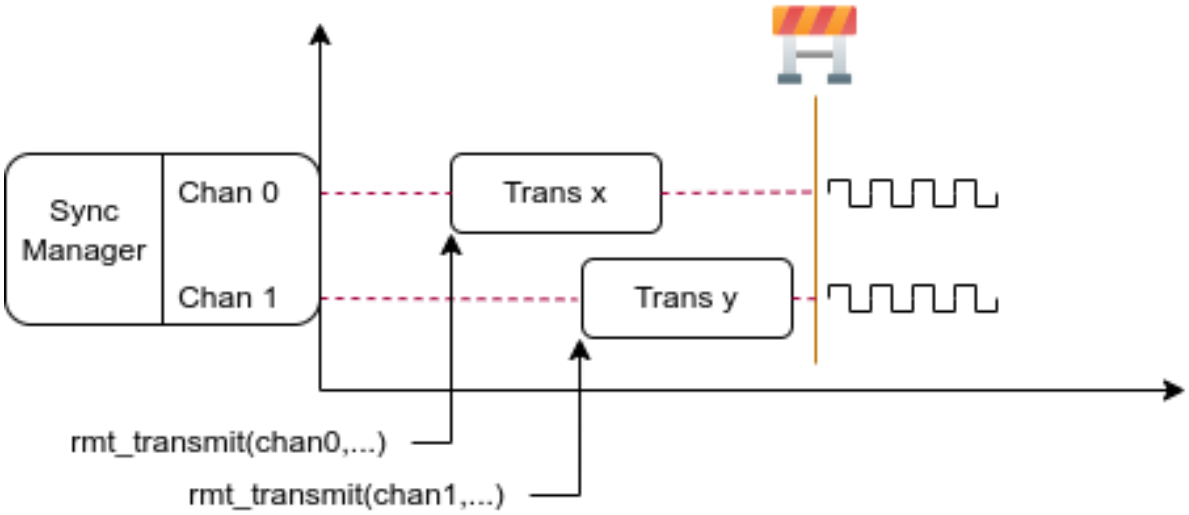

图 13: RMT TX Sync

Install RMT Sync Manager To create a sync manager, user needs to tell which channels are going to be managed in the *rmt_sync_manager_config_t*:

- *rmt_sync_manager_config_t::tx_channel_array* points to the array of TX channels to be managed.
- *rmt_sync_manager_config_t::array_size* sets the number of channels to be managed.

rmt_new_sync_manager() can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Specially, when the sync manager has been installed before, and there're no

hardware resources to create another manager, this function will report *ESP_ERR_NOT_FOUND* error. In addition, if the sync manager is not supported by the hardware, it will report *ESP_ERR_NOT_SUPPORTED* error. Please refer to [TRM] before using the sync manager feature.

Start Transmission Simultaneously For any managed TX channel, it won't start the machine until all the channels in the *rmt_sync_manager_config_t::tx_channel_array* are called with *rmt_transmit()*. Before that, the channel is just put in a waiting state. Different channel usually take different time to finish the job if the transaction is different, which results in a loss of sync. So user needs to call *rmt_sync_reset()* to pull the channels back to the starting line again before restarting a simultaneous transmission.

Calling *rmt_del_sync_manager()* can recycle the sync manager and enable the channels to initiate transactions independently afterwards.

```
rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2};
// install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT,        // select source clock
        .gpio_num = tx_gpio_number[i],     // GPIO number
        .mem_block_symbols = 64,           // memory block size, 64 * 4 = 256Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1MHz resolution
        .trans_queue_depth = 1,            // set the number of transactions that␣
↪can pend in the background
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));

ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_
↪num * 3, &transmit_config));
// tx_channels[0] won't start transmission until call of `rmt_transmit()` for tx_
↪channels[1] returns
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_
↪num * 3, &transmit_config));
```

Initiate RX Transaction As also discussed in the *Enable and Disable channel*, the RX channel still doesn't get ready to receive RMT symbols even user calls *rmt_enable()*. User needs to specify the basic characteristics of the incoming signals in *rmt_receive_config_t*:

- *rmt_receive_config_t::signal_range_min_ns* specifies the minimal valid pulse duration (either high or low level). A pulse whose width is smaller than this value will be treated as glitch and ignored by the hardware.
- *rmt_receive_config_t::signal_range_max_ns* specifies the maximum valid pulse duration (either high or low level). A pulse whose width is bigger than this value will be treated as **Stop Signal**, and the receiver will generate receive complete event immediately.

The RMT receiver will start the RX machine after user calls *rmt_receive()* with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, user needs to sets the *rmt_receive_config_t* again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of *rmt_symbol_word_t*.

Due to the limited size of memory block, the RMT receiver will notify the driver to copy away the accumulated symbols in a ping-pong way.

The copy destination should be provided in the `buffer` parameter of *`rmt_receive()`* function. If this buffer size is not sufficient, the receiver can continue to work but later incoming symbols will be dropped and report an error message: `user buffer too small, received symbols truncated`. Please take care of the lifecycle of the `buffer` parameter, user shouldn't recycle the buffer before the receiver finished or stopped working.

The receiver will be stopped by the driver when it finishes working (i.e. received a signal whose duration is bigger than *`rmt_receive_config_t::signal_range_max_ns`*). User needs to call *`rmt_receive()`* again to restart the receiver, is necessary. User can get the received data in the *`rmt_rx_event_callbacks_t::on_recv_done`* callback. See also *Register Event Callbacks* for more information.

```
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt_
↪rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    // send the received RMT symbols to the parser task
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    // return whether any task is woken up
    return high_task_wakeup == pdTRUE;
}

QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
rmt_rx_event_callbacks_t cbs = {
    .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, receive_queue));

// the following timing requirement is based on NEC protocol
rmt_receive_config_t receive_config = {
    .signal_range_min_ns = 1250,     // the shortest duration for NEC signal is␣
↪560us, 1250ns < 560us, valid signal won't be treated as noise
    .signal_range_max_ns = 12000000, // the longest duration for NEC signal is␣
↪9000us, 12000000ns > 9000us, the receive won't stop early
};

rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a␣
↪standard NEC frame
// ready to receive
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_
↪config));
// wait for RX done signal
rmt_rx_done_event_data_t rx_data;
xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
// parse the receive symbols
example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);
```

RMT Encoder An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory (or DMA buffer) at specific time. There're some special restrictions for an encoding function:

- An encoding function might be called for several times within a single transaction. This is because the target RMT memory block can't accommodate all the artifacts at once. We have to use the memory in a **ping-pong** way, thus the encoding session is divided into multiple parts. This requires the encoder to be **stateful**.
- The encoding function is running in the ISR context. To speed up the encoding session, it's high recommend to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with RMT driver faster, some commonly used encoders are provided out-of-the box. They can either work alone or chained together into a new encoder. See also Composite Pattern for the principle behind. The driver has defined the encoder interface in *`rmt_encoder_t`*, it contains the following functions:

- *`rmt_encoder_t::encode`* is the fundamental function of an encoder. This is where the encoding session

happens. Please note, the *rmt_encoder_t::encode* function might be called for multiple times within a single transaction. The encode function should return the state of current encoding session. The supported states are listed in the *rmt_encode_state_t*. If the result contains *RMT_ENCODING_COMPLETE*, it means the current encoder has finished work. If the result contains *RMT_ENCODING_MEM_FULL*, we need to yield from current session, as there's no space to save more encoding artifacts.

- *rmt_encoder_t::reset* should reset the encoder state back to initial. The RMT encoder is stateful, if RMT transmitter stopped manually without its corresponding encoder being reset, then the following encoding session can be wrong. This function is also called implicitly in *rmt_disable()*.
- *rmt_encoder_t::del* function should free the resources allocated by the encoder.

Copy Encoder A copy encoder is created by calling *rmt_new_copy_encoder()*. Copy encoder's main functionality is to copy the RMT symbols from user space into the driver layer. It's usually used to encode const data (i.e. data won't change at runtime after initialization), for example, the leading code in the IR protocol.

A configuration structure *rmt_copy_encoder_config_t* should be provided in advance before calling *rmt_new_copy_encoder()*. Currently, this configuration is reserved for future expansion.

Bytes Encoder A bytes encoder is created by calling *rmt_new_bytes_encoder()*. Bytes encoder's main functionality is to convert the user space byte stream into RMT symbols dynamically. It's usually used to encode dynamic data, for example, the address and command fields in the IR protocol.

A configuration structure *rmt_bytes_encoder_config_t* should be provided in advance before calling *rmt_new_bytes_encoder()*:

- *rmt_bytes_encoder_config_t::bit0* and *rmt_bytes_encoder_config_t::bit1* are necessary to tell to the encoder how to represent bit zero and bit one in the format of *rmt_symbol_word_t*.
- *rmt_bytes_encoder_config_t::msb_first* sets the encoding order for of byte. If it is set to true, the encoder will encode the **Most Significant Bit** first. Otherwise, it will encode the **Least Significant Bit** first.

Besides the primitive encoders provided by the driver, user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

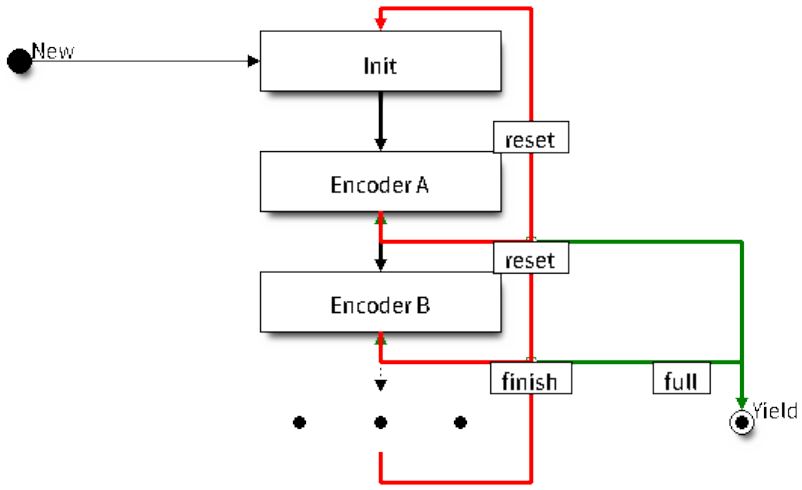

图 14: RMT Encoder Chain

Customize RMT Encoder for NEC Protocol In this section, we will demonstrate on how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is *562.5µs* in length, logical bits are transmitted as follows. It is worth mentioning, the bytes of data bits are sent least significant bit first.

- Logical `0`: a *562.5µs* pulse burst followed by a *562.5µs* space, with a total transmit time of *1.125ms*

- Logical `1`: a *562.5µs* pulse burst followed by a *1.6875ms* space, with a total transmit time of *2.25ms*

When a key is pressed on the remote controller, the message transmitted consists of the following, in order:

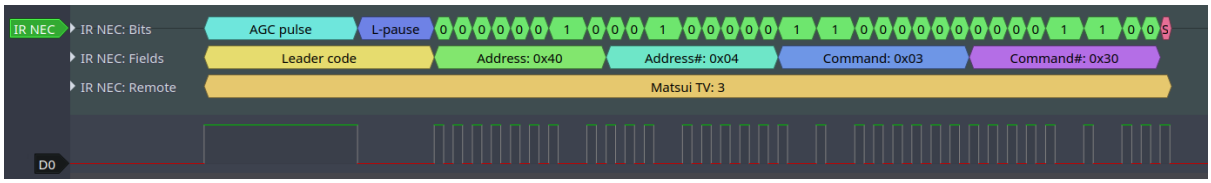

图 15: IR NEC Frame

- *9ms* leading pulse burst (also called the "AGC pulse")
- *4.5ms* space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command
- 8-bit logical inverse of the command
- a final *562.5µs* pulse burst to signify the end of message transmission

Then we can construct the NEC *rmt_encoder_t::encode* function in the same order, for example:

```
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct a encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base;           // the base "class", declares the standard␣
↪encoder interface
    rmt_encoder_t *copy_encoder;  // use the copy_encoder to encode the leading␣
↪and ending pulse
    rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address␣
↪and command data
    rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT␣
↪representation
    rmt_symbol_word_t nec_ending_symbol;  // NEC ending code with RMT␣
↪representation
    int state; // record the current encoding state (i.e. we're in which encoding␣
↪phase)
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t␣
↪channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_
↪state)
{
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_
↪t, base);
    rmt_encode_state_t session_state = RMT_ENCODING_RESET;
    rmt_encode_state_t state = RMT_ENCODING_RESET;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
    case 0: // send leading code
        encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
↪encoder->nec_leading_symbol,
                                                sizeof(rmt_symbol_word_t), &
↪session_state);
```

(下页继续)

(续上页)

```
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 1; // we can only switch to next state when␣
↪current encoder finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there's no free space to put other encoding␣
↪artifacts
        }
    // fall-through
    case 1: // send address
        encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
↪code->address, sizeof(uint16_t), &session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 2; // we can only switch to next state when␣
↪current encoder finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there's no free space to put other encoding␣
↪artifacts
        }
    // fall-through
    case 2: // send command
        encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
↪code->command, sizeof(uint16_t), &session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 3; // we can only switch to next state when␣
↪current encoder finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there's no free space to put other encoding␣
↪artifacts
        }
    // fall-through
    case 3: // send ending code
        encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
↪encoder->nec_ending_symbol,
                                                sizeof(rmt_symbol_word_t), &
↪session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = RMT_ENCODING_RESET; // back to the initial␣
↪encoding session
            state |= RMT_ENCODING_COMPLETE; // telling the caller the NEC encoding␣
↪has finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there's no free space to put other encoding␣
↪artifacts
        }
    }
out:
    *ret_state = state;
    return encoded_symbols;
}
```

A full sample code can be found in peripherals/rmt/ir_nec_transceiver. In the above snippet, we use a `switch-case` plus several `goto` statements to implement a state machine . With this pattern, user can construct a lot more complex IR protocols.

Power Management When power management is enabled (i.e. *CONFIG_PM_ENABLE* is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the resolution of RMT internal counter.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type *ESP_PM_APB_FREQ_MAX*. Whenever user creates an RMT channel that has selected *RMT_CLK_SRC_APB* as the clock source, the driver will guarantee that the power management lock is acquired after the channel enabled by *rmt_enable()*. Likewise, the driver releases the lock after *rmt_disable()* is called for the same channel. This also reveals that the *rmt_enable()* and *rmt_disable()* should appear in pairs.

If the channel clock source is selected to others like *RMT_CLK_SRC_XTAL*, then the driver won't install power management lock for it, which is more suitable for a low power application as long as the source clock can still provide sufficient resolution.

IRAM Safe By default, the RMT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing the main Flash. Thus the transaction done interrupt will not get executed in time, which is not expected in a real-time application. What's worse, when the RMT transaction relies on **ping-pong** interrupt to successively encode or copy RMT symbols, such delayed response can lead to an unpredictable result.

There's a Kconfig option *CONFIG_RMT_ISR_IRAM_SAFE* that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM[2]
3. Place driver object into DRAM (in case it's mapped to PSRAM by accident)

This Kconfig option will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

Thread Safety The factory function *rmt_new_tx_channel()*, *rmt_new_rx_channel()* and *rmt_new_sync_manager()* are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the *rmt_channel_handle_t* and *rmt_sync_manager_handle_t* as the first positional parameter, are not thread safe. which means the user should avoid calling them from multiple tasks.

Kconfig Options

- *CONFIG_RMT_ISR_IRAM_SAFE* controls whether the default ISR handler can work when cache is disabled, see also *IRAM Safe* for more information.
- *CONFIG_RMT_ENABLE_DEBUG_LOG* is used to enabled the debug log at the cost of increased firmware binary size.

Application Examples

- RMT based RGB LED strip customized encoder: peripherals/rmt/led_strip
- RMT IR NEC protocol encoding and decoding: peripherals/rmt/ir_nec_transceiver
- RMT transactions in queue: peripherals/rmt/musical_buzzer
- RMT based stepper motor with S-curve algorithm: : peripherals/rmt/stepper_motor
- RMT infinite loop for driving DShot ESC: peripherals/rmt/dshot_esc
- RMT simulate 1-wire protocol (take DS18B20 as example): peripherals/rmt/onewire

API Reference

Header File

- components/driver/rmt/include/driver/rmt_tx.h

[2] Callback function (e.g. *rmt_tx_event_callbacks_t::on_trans_done*) and the functions invoked by itself should also reside in IRAM, users need to take care of this by themselves.

Functions

esp_err_t **rmt_new_tx_channel**(const *rmt_tx_channel_config_t* *config, *rmt_channel_handle_t* *ret_chan)

Create a RMT TX channel.

参数

- **config** –**[in]** TX channel configurations
- **ret_chan** –**[out]** Returned generic RMT channel handle

返回

- ESP_OK: Create RMT TX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT TX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT TX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT TX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT TX channel failed because of other error

esp_err_t **rmt_transmit**(*rmt_channel_handle_t* tx_channel, *rmt_encoder_handle_t* encoder, const void *payload, size_t payload_bytes, const *rmt_transmit_config_t* *config)

Transmit data by RMT TX channel.

备注: This function will construct a transaction descriptor and push to a queue. The transaction will not start immediately until it’s dispatched in the ISR. If there’re too many transactions pending in the queue, this function will block until the queue has free space.

备注: The data to be transmitted will be encoded into RMT symbols by the specific `encoder`.

参数

- **tx_channel** –**[in]** RMT TX channel that created by `rmt_new_tx_channel()`
- **encoder** –**[in]** RMT encoder that created by various factory APIs like `rmt_new_bytes_encoder()`
- **payload** –**[in]** The raw data to be encoded into RMT symbols
- **payload_bytes** –**[in]** Size of the `payload` in bytes
- **config** –**[in]** Transmission specific configuration

返回

- ESP_OK: Transmit data successfully
- ESP_ERR_INVALID_ARG: Transmit data failed because of invalid argument
- ESP_ERR_INVALID_STATE: Transmit data failed because channel is not enabled
- ESP_ERR_NOT_SUPPORTED: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- ESP_FAIL: Transmit data failed because of other error

esp_err_t **rmt_tx_wait_all_done**(*rmt_channel_handle_t* tx_channel, int timeout_ms)

Wait for all pending TX transactions done.

备注: This function will block forever if the pending transaction can’t be finished within a limited time (e.g. an infinite loop transaction). See also `rmt_disable()` for how to terminate a working channel.

参数

- **tx_channel** –**[in]** RMT TX channel that created by `rmt_new_tx_channel()`
- **timeout_ms** –**[in]** Wait timeout, in ms. Specially, -1 means to wait forever.

返回

- ESP_OK: Flush transactions successfully
- ESP_ERR_INVALID_ARG: Flush transactions failed because of invalid argument

- ESP_ERR_TIMEOUT: Flush transactions failed because of timeout
- ESP_FAIL: Flush transactions failed because of other error

esp_err_t **rmt_tx_register_event_callbacks**(*rmt_channel_handle_t* tx_channel, const *rmt_tx_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for RMT TX channel.

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

备注: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

参数

- **tx_channel** –**[in]** RMT generic channel that created by `rmt_new_tx_channel()`
- **cbs** –**[in]** Group of callback functions
- **user_data** –**[in]** User data, which will be passed to callback functions directly

返回

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

esp_err_t **rmt_new_sync_manager**(const *rmt_sync_manager_config_t* *config, *rmt_sync_manager_handle_t* *ret_synchro)

Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

备注: All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

参数

- **config** –**[in]** Synchronization manager configuration
- **ret_synchro** –**[out]** Returned synchronization manager handle

返回

- ESP_OK: Create sync manager successfully
- ESP_ERR_INVALID_ARG: Create sync manager failed because of invalid argument
- ESP_ERR_NOT_SUPPORTED: Create sync manager failed because it is not supported by hardware
- ESP_ERR_INVALID_STATE: Create sync manager failed because not all channels are enabled
- ESP_ERR_NO_MEM: Create sync manager failed because out of memory
- ESP_ERR_NOT_FOUND: Create sync manager failed because all sync controllers are used up and no more free one
- ESP_FAIL: Create sync manager failed because of other error

esp_err_t **rmt_del_sync_manager**(*rmt_sync_manager_handle_t* synchro)

Delete synchronization manager.

参数 **synchro** –**[in]** Synchronization manager handle returned from `rmt_new_sync_manager()`

返回

- ESP_OK: Delete the synchronization manager successfully

- ESP_ERR_INVALID_ARG: Delete the synchronization manager failed because of invalid argument
- ESP_FAIL: Delete the synchronization manager failed because of other error

esp_err_t **rmt_sync_reset**(*rmt_sync_manager_handle_t* synchro)

Reset synchronization manager.

参数 **synchro** –**[in]** Synchronization manager handle returned from `rmt_new_sync_manager()`

返回

- ESP_OK: Reset the synchronization manager successfully
- ESP_ERR_INVALID_ARG: Reset the synchronization manager failed because of invalid argument
- ESP_FAIL: Reset the synchronization manager failed because of other error

Structures

struct **rmt_tx_event_callbacks_t**

Group of RMT TX callbacks.

备注: The callbacks are all running under ISR environment

备注: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

rmt_tx_done_callback_t **on_trans_done**

Event callback, invoked when transmission is finished

struct **rmt_tx_channel_config_t**

RMT TX channel specific configuration.

Public Members

gpio_num_t **gpio_num**

GPIO number used by RMT TX channel. Set to -1 if unused

rmt_clock_source_t **clk_src**

Clock source of RMT TX channel, channels in the same group must use the same clock source

uint32_t **resolution_hz**

Channel clock resolution, in Hz

size_t **mem_block_symbols**

Size of memory block, in number of *rmt_symbol_word_t*, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value; In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

size_t **trans_queue_depth**

Depth of internal transfer queue, increase this value can support more transfers pending in the background

uint32_t **invert_out**

Whether to invert the RMT channel signal before output to GPIO pad

uint32_t **with_dma**

If set, the driver will allocate an RMT channel with DMA capability

uint32_t **io_loop_back**

The signal output from the GPIO will be fed to the input path as well

uint32_t **io_od_mode**

Configure the GPIO as open-drain mode

struct *rmt_tx_channel_config_t*::[anonymous] **flags**

TX channel config flags

struct **rmt_transmit_config_t**

RMT transmit specific configuration.

Public Members

int **loop_count**

Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

uint32_t **eot_level**

Set the output level for the "End Of Transmission"

struct *rmt_transmit_config_t*::[anonymous] **flags**

Transmit config flags

struct **rmt_sync_manager_config_t**

Synchronous manager configuration.

Public Members

const *rmt_channel_handle_t* ***tx_channel_array**

Array of TX channels that are about to be managed by a synchronous controller

size_t **array_size**

Size of the `tx_channel_array`

Header File

- components/driver/rmt/include/driver/rmt_rx.h

Functions

esp_err_t **rmt_new_rx_channel**(const *rmt_rx_channel_config_t* *config, *rmt_channel_handle_t* *ret_chan)

Create a RMT RX channel.

参数

- **config** –**[in]** RX channel configurations
- **ret_chan** –**[out]** Returned generic RMT channel handle

返回

- ESP_OK: Create RMT RX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT RX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT RX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT RX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT RX channel failed because of other error

esp_err_t **rmt_receive**(*rmt_channel_handle_t* rx_channel, void *buffer, size_t buffer_size, const *rmt_receive_config_t* *config)

Initiate a receive job for RMT RX channel.

备 注: This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `rmt_rx_register_event_callbacks()`.

参数

- **rx_channel** –**[in]** RMT RX channel that created by `rmt_new_rx_channel()`
- **buffer** –**[in]** The buffer to store the received RMT symbols
- **buffer_size** –**[in]** size of the `buffer`, in bytes
- **config** –**[in]** Receive specific configurations

返回

- ESP_OK: Initiate receive job successfully
- ESP_ERR_INVALID_ARG: Initiate receive job failed because of invalid argument
- ESP_ERR_INVALID_STATE: Initiate receive job failed because channel is not enabled
- ESP_FAIL: Initiate receive job failed because of other error

esp_err_t **rmt_rx_register_event_callbacks**(*rmt_channel_handle_t* rx_channel, const *rmt_rx_event_callbacks_t* *cbs, void *user_data)

Set callbacks for RMT RX channel.

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

备注: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

参数

- **rx_channel** –**[in]** RMT generic channel that created by `rmt_new_rx_channel()`
- **cbs** –**[in]** Group of callback functions
- **user_data** –**[in]** User data, which will be passed to callback functions directly

返回

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument

- ESP_FAIL: Set event callbacks failed because of other error

Structures

struct **rmt_rx_event_callbacks_t**

Group of RMT RX callbacks.

备注: The callbacks are all running under ISR environment

备注: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

rmt_rx_done_callback_t **on_recv_done**

Event callback, invoked when one RMT channel receiving transaction completes

struct **rmt_rx_channel_config_t**

RMT RX channel specific configuration.

Public Members

gpio_num_t **gpio_num**

GPIO number used by RMT RX channel. Set to -1 if unused

rmt_clock_source_t **clk_src**

Clock source of RMT RX channel, channels in the same group must use the same clock source

uint32_t **resolution_hz**

Channel clock resolution, in Hz

size_t **mem_block_symbols**

Size of memory block, in number of *rmt_symbol_word_t*, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value (e.g. 1024); In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

uint32_t **invert_in**

Whether to invert the incoming RMT channel signal

uint32_t **with_dma**

If set, the driver will allocate an RMT channel with DMA capability

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *rmt_rx_channel_config_t*::[anonymous] **flags**

RX channel config flags

struct **rmt_receive_config_t**

RMT receive specific configuration.

Public Members

uint32_t **signal_range_min_ns**

A pulse whose width is smaller than this threshold will be treated as glitch and ignored

uint32_t **signal_range_max_ns**

RMT will stop receiving if one symbol level has kept more than `signal_range_max_ns`

Header File

- components/driver/rmt/include/driver/rmt_common.h

Functions

esp_err_t **rmt_del_channel**(*rmt_channel_handle_t* channel)

Delete an RMT channel.

参数 **channel** –**[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

返回

- ESP_OK: Delete RMT channel successfully
- ESP_ERR_INVALID_ARG: Delete RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete RMT channel failed because it is still in working
- ESP_FAIL: Delete RMT channel failed because of other error

esp_err_t **rmt_apply_carrier**(*rmt_channel_handle_t* channel, const *rmt_carrier_config_t* *config)

Apply modulation feature for TX channel or demodulation feature for RX channel.

参数

- **channel** –**[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
- **config** –**[in]** Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

返回

- ESP_OK: Apply carrier configuration successfully
- ESP_ERR_INVALID_ARG: Apply carrier configuration failed because of invalid argument
- ESP_FAIL: Apply carrier configuration failed because of other error

esp_err_t **rmt_enable**(*rmt_channel_handle_t* channel)

Enable the RMT channel.

备注: This function will acquire a PM lock that might be installed during channel allocation

参数 **channel** –**[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

返回

- ESP_OK: Enable RMT channel successfully
- ESP_ERR_INVALID_ARG: Enable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable RMT channel failed because it's enabled already
- ESP_FAIL: Enable RMT channel failed because of other error

esp_err_t **rmt_disable**(*rmt_channel_handle_t* channel)

Disable the RMT channel.

备注: This function will release a PM lock that might be installed during channel allocation

参数 **channel** –**[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

返回

- ESP_OK: Disable RMT channel successfully
- ESP_ERR_INVALID_ARG: Disable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable RMT channel failed because it's not enabled yet
- ESP_FAIL: Disable RMT channel failed because of other error

Structures

struct **rmt_carrier_config_t**

RMT carrier wave configuration (for either modulation or demodulation)

Public Members

uint32_t **frequency_hz**

Carrier wave frequency, in Hz, 0 means disabling the carrier

float **duty_cycle**

Carrier wave duty cycle (0~100%)

uint32_t **polarity_active_low**

Specify the polarity of carrier, by default it's modulated to base signal's high level

uint32_t **always_on**

If set, the carrier can always exist even there's not transfer undergoing

struct *rmt_carrier_config_t*::[anonymous] **flags**

Carrier config flags

Header File

- components/driver/rmt/include/driver/rmt_encoder.h

Functions

esp_err_t **rmt_new_bytes_encoder**(const *rmt_bytes_encoder_config_t* *config, *rmt_encoder_handle_t* *ret_encoder)

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

参数

- **config** –**[in]** Bytes encoder configuration
- **ret_encoder** –**[out]** Returned encoder handle

返回

- ESP_OK: Create RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT bytes encoder failed because of invalid argument

- ESP_ERR_NO_MEM: Create RMT bytes encoder failed because out of memory
- ESP_FAIL: Create RMT bytes encoder failed because of other error

esp_err_t **rmt_new_copy_encoder**(const *rmt_copy_encoder_config_t* *config, *rmt_encoder_handle_t* *ret_encoder)

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

参数

- **config** –**[in]** Copy encoder configuration
- **ret_encoder** –**[out]** Returned encoder handle

返回

- ESP_OK: Create RMT copy encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT copy encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT copy encoder failed because out of memory
- ESP_FAIL: Create RMT copy encoder failed because of other error

esp_err_t **rmt_del_encoder**(*rmt_encoder_handle_t* encoder)

Delete RMT encoder.

参数 **encoder** –**[in]** RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

返回

- ESP_OK: Delete RMT encoder successfully
- ESP_ERR_INVALID_ARG: Delete RMT encoder failed because of invalid argument
- ESP_FAIL: Delete RMT encoder failed because of other error

esp_err_t **rmt_encoder_reset**(*rmt_encoder_handle_t* encoder)

Reset RMT encoder.

参数 **encoder** –**[in]** RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

返回

- ESP_OK: Reset RMT encoder successfully
- ESP_ERR_INVALID_ARG: Reset RMT encoder failed because of invalid argument
- ESP_FAIL: Reset RMT encoder failed because of other error

Structures

struct **rmt_encoder_t**

Interface of RMT encoder.

Public Members

size_t (***encode**)(*rmt_encoder_t* *encoder, *rmt_channel_handle_t* tx_channel, const void *primary_data, size_t data_size, *rmt_encode_state_t* *ret_state)

Encode the user data into RMT symbols and write into RMT memory.

备注: The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

备注: It's recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

Param encoder **[in]** Encoder handle

Param tx_channel **[in]** RMT TX channel handle, returned from `rmt_new_tx_channel()`

Param primary_data **[in]** App data to be encoded into RMT symbols
Param data_size **[in]** Size of primary_data, in bytes
Param ret_state **[out]** Returned current encoder’ s state
Return Number of RMT symbols that the primary data has been encoded into

esp_err_t (*`reset`)(*rmt_encoder_t* *encoder)

Reset encoding state.

Param encoder **[in]** Encoder handle
Return
- ESP_OK: reset encoder successfully
- ESP_FAIL: reset encoder failed

esp_err_t (*`del`)(*rmt_encoder_t* *encoder)

Delete encoder object.

Param encoder **[in]** Encoder handle
Return
- ESP_OK: delete encoder successfully
- ESP_FAIL: delete encoder failed

struct **`rmt_bytes_encoder_config_t`**

Bytes encoder configuration.

Public Members

rmt_symbol_word_t **`bit0`**

How to represent BIT0 in RMT symbol

rmt_symbol_word_t **`bit1`**

How to represent BIT1 in RMT symbol

uint32_t **`msb_first`**

Whether to encode MSB bit first

struct *rmt_bytes_encoder_config_t*::[anonymous] **`flags`**

Encoder config flag

struct **`rmt_copy_encoder_config_t`**

Copy encoder configuration.

Enumerations

enum **`rmt_encode_state_t`**

RMT encoding state.

Values:

enumerator **`RMT_ENCODING_RESET`**

The encoding session is in reset state

enumerator **RMT_ENCODING_COMPLETE**

The encoding session is finished, the caller can continue with subsequent encoding

enumerator **RMT_ENCODING_MEM_FULL**

The encoding artifact memory is full, the caller should return from current encoding session

Header File

- components/driver/rmt/include/driver/rmt_types.h

Structures

struct **rmt_tx_done_event_data_t**

Type of RMT TX done event data.

Public Members

size_t **num_symbols**

The number of transmitted RMT symbols, including one EOF symbol, which is appended by the driver to mark the end of a transmission. For a loop transmission, this value only counts for one round.

struct **rmt_rx_done_event_data_t**

Type of RMT RX done event data.

Public Members

rmt_symbol_word_t ***received_symbols**

Point to the received RMT symbols

size_t **num_symbols**

The number of received RMT symbols

Type Definitions

typedef struct rmt_channel_t ***rmt_channel_handle_t**

Type of RMT channel handle.

typedef struct rmt_sync_manager_t ***rmt_sync_manager_handle_t**

Type of RMT synchronization manager handle.

typedef struct *rmt_encoder_t* ***rmt_encoder_handle_t**

Type of RMT encoder handle.

typedef bool (***rmt_tx_done_callback_t**)(*rmt_channel_handle_t* tx_chan, const *rmt_tx_done_event_data_t* *edata, void *user_ctx)

Prototype of RMT event callback.

Param tx_chan **[in]** RMT channel handle, created from `rmt_new_tx_channel()`

Param edata **[in]** Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

Param user_ctx [in] User registered context, passed from `rmt_tx_register_event_callbacks()`
Return Whether a high priority task has been waken up by this callback function

typedef bool (***rmt_rx_done_callback_t**)(*rmt_channel_handle_t* rx_chan, const *rmt_rx_done_event_data_t* *edata, void *user_ctx)

Prototype of RMT event callback.

Param rx_chan [in] RMT channel handle, created from `rmt_new_rx_channel()`
Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.
Param user_ctx [in] User registered context, passed from `rmt_rx_register_event_callbacks()`
Return Whether a high priority task has been waken up by this function

Header File

- components/hal/include/hal/rmt_types.h

Unions

union **rmt_symbol_word_t**

#include <rmt_types.h> The layout of RMT symbol stored in memory, which is decided by the hardware design.

Public Members

uint16_t **duration0**

Duration of level0

uint16_t **level0**

Level of the first part

uint16_t **duration1**

Duration of level1

uint16_t **level1**

Level of the second part

struct *rmt_symbol_word_t*::[anonymous] **[anonymous]**

uint32_t **val**

Equivalent unsigned value for the RMT symbol

Type Definitions

typedef *soc_periph_rmt_clk_src_t* **rmt_clock_source_t**

RMT group clock source.

备注: User should select the clock source based on the power and resolution requirement

2.6.15 SD SPI Host Driver

Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an *sdspi_dev_handle_t* spi_handle returned when attaching the device to an SPI bus by calling *sdspi_host_init_device*. The bus should be already initialized before (by *spi_bus_initialize*).

With the help of *SPI Master driver* based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize a structure `sdspi_device_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call *sdspi_host_init_device* to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the *slot* parameter of the structure to the SD SPI device spi_handle just returned from *sdspi_host_init_device*. Call *sdmmc_card_init* with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver's API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see *the SD/SDIO/MMC Driver*.

备注: SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

警告: If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see *Sharing the SPI bus among SD card and other SPI devices*.

Related Docs

Sharing the SPI bus among SD card and other SPI devices The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

Pin loading of other devices When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

AC loading SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin’ s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing requirements of an SD card may be violoated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

(Terminology: **launch edge**: at which clock edge the data start to toggle; **latch edge**: at which clock edge the data is supposed to be sampled by the receiver, for SD cad, it’ s the rising edge.)

1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.
   You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it’ s not as obvious as with an oscilloscope.
2. Try to use slower clock frequency.
   If the lower frequency can work while the higher frequency can’ t, it’ s an indication of the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.

DC loading The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current , it should be larger than 700uA, otherwise the device output may not be read correctly.

Initialization sequence

备注: If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (SDMMC_FREQ_PROBING = 400 KHz for SD card) to avoid the influence of pin AC loading (see above section).

When using ab SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also storage/sd_card)

1. Initialize the SPI bus properly by *spi_bus_initialize*.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step.
   You can do this by either:
   1. Attach devices to the SPI bus by calling *spi_bus_add_device*. This function will initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
   3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefull the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).
3. Mount the card to the filesystem by calling *esp_vfs_fat_sdspi_mount*.
   This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.
   If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.
4. Now you can talk to other SPI devices freely!

API Reference

Header File

- components/driver/spi/include/driver/sdspi_host.h

Functions

esp_err_t **sdspi_host_init**(void)

Initialize SD SPI driver.

备注: This function is not thread safe

返回

- ESP_OK on success
- other error codes may be returned in future versions

esp_err_t **sdspi_host_init_device**(const *sdspi_device_config_t* *dev_config, *sdspi_dev_handle_t* *out_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

备注: This function is not thread safe

备注: Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

备注: The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

参数

- **dev_config** –pointer to device configuration structure
- **out_handle** –Output of the handle to the sdspi device.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_host_init_device has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying spi_master and gpio drivers

esp_err_t **sdspi_host_remove_device**(*sdspi_dev_handle_t* handle)

Remove an SD SPI device.

参数 **handle** –Handle of the SD SPI device
返回 Always ESP_OK

esp_err_t **sdspi_host_do_transaction**(*sdspi_dev_handle_t* handle, *sdmmc_command_t* *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

备注: This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_* functions are not called.

参数

- **handle** –Handle of the sdspi device
- **cmdinfo** –pointer to structure describing command and data to transfer

返回

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

esp_err_t **sdspi_host_set_card_clk**(*sdspi_dev_handle_t* host, uint32_t freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

备注: This function is not thread safe

参数

- **host** –Handle of the sdspi device
- **freq_khz** –card clock frequency, in kHz

返回

- ESP_OK on success
- other error codes may be returned in the future

esp_err_t **sdspi_host_get_real_freq**(*sdspi_dev_handle_t* handle, int *real_freq_khz)

Calculate working frequency for specific device.

参数

- **handle** –SDSPI device handle
- **real_freq_khz** –**[out]** output parameter to hold the calculated frequency (in kHz)

返回

- ESP_ERR_INVALID_ARG : `handle` is NULL or invalid or `real_freq_khz` parameter is NULL
- ESP_OK : Success

esp_err_t **sdspi_host_deinit**(void)

Release resources allocated using sdspi_host_init.

备注: This function is not thread safe

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

esp_err_t **sdspi_host_io_int_enable**(*sdspi_dev_handle_t* handle)

Enable SDIO interrupt.

参数 **handle** –Handle of the sdspi device

返回

- ESP_OK on success

esp_err_t **sdspi_host_io_int_wait**(*sdspi_dev_handle_t* handle, TickType_t timeout_ticks)

Wait for SDIO interrupt until timeout.

参数

- **handle** –Handle of the sdspi device
- **timeout_ticks** –Ticks to wait before timeout.

返回

- ESP_OK on success

Structures

struct **sdspi_device_config_t**

Extra configuration for SD SPI device.

Public Members

spi_host_device_t **host_id**

SPI host to use, SPIx_HOST (see spi_types.h).

gpio_num_t **gpio_cs**

GPIO number of CS signal.

gpio_num_t **gpio_cd**

GPIO number of card detect signal.

gpio_num_t **gpio_wp**

GPIO number of write protect signal.

gpio_num_t **gpio_int**

GPIO number of interrupt line (input) for SDIO card.

Macros

SDSPI_DEFAULT_HOST

SDSPI_DEFAULT_DMA

SDSPI_HOST_DEFAULT()

Default *sdmmc_host_t* structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

'slot' should be set to an sdspi device initialized by `sdspi_host_init_device()`.

SDSPI_SLOT_NO_CS

indicates that card select line is not used

SDSPI_SLOT_NO_CD

indicates that card detect line is not used

SDSPI_SLOT_NO_WP

indicates that write protect line is not used

SDSPI_SLOT_NO_INT

indicates that interrupt line is not used

SDSPI_DEVICE_CONFIG_DEFAULT()

Macro defining default configuration of SD SPI device.

Type Definitions

typedef int **sdspi_dev_handle_t**

Handle representing an SD SPI device.

2.6.16 Sigma-Delta Modulation (SDM)

Introduction

ESP32-C3 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available.[1]

Delta-sigma modulation converts an analog voltage signal into a pulse frequency, or pulse density, which can be understood as pulse-density modulation (PDM) (refer to Delta-sigma modulation on Wikipedia).

The main differences comparing to the PDM in I2S peripheral and DAC are:

1. SDM has no clock signal, it just like the DAC mode of PDM;
2. SDM has no DMA, and it can't change its output density continuously. If you have to, you can update the density in a timer's callback;
3. Base on the former two points, an external active or passive filter is required to restore the analog wave (See *Convert to analog signal (Optional)*);

Typically, a Sigma-Delta modulated channel can be used in scenarios like:

- LED dimming
- Simple DAC (8-bit), with the help of an active RC low-pass filter
- Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

Functional Overview

The following sections of this document cover the typical steps to install and operate a SDM channel:

- *Resource Allocation* - covers which parameters should be set up to get a channel handle and how to recycle the resources when it finishes working.
- *Enable and Disable Channel* - covers how to enable and disable the channel.
- *Set Equivalent Duty Cycle* - describes how to set the equivalent duty cycle of the PDM pulses.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - lists which functions are supposed to work even when the cache is disabled.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation A SDM channel is represented by `sdm_channel_handle_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation. The driver manages all available channels in a pool, so that users don't need to manually assign a fixed channel to a GPIO.

To install a SDM channel, you should call `sdm_new_channel()` to get a channel handle. Channel specific configurations are passed in the `sdm_config_t` structure:

- `sdm_config_t::gpio_num` sets the GPIO that the PDM pulses will output from
- `sdm_config_t::clk_src` selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- `sdm_config_t::sample_rate_hz` sets the sample rate of the SDM module.
- `sdm_config_t::invert_out` sets whether to invert the output signal.
- `sdm_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

[1] Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter GPIO and IOMUX in ESP32-C3 Technical Reference Manual for more details. The driver won't forbid you from applying for more channels, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `sdm_new_channel()`).

The function *sdm_new_channel()* can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e. all hardware SDM channels have been used up), then *ESP_ERR_NOT_FOUND* will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling *sdm_del_channel()*. It allows the underlying HW channel to be used for other purposes. Before deleting a SDM channel handle, you should disable it by *sdm_channel_disable()* in advance or make sure it has not enabled yet by *sdm_channel_enable()*.

Creating a SDM Channel with Sample Rate of 1MHz

```
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

Enable and Disable Channel Before doing further IO control to the SDM channel, you should enable it first, by calling *sdm_channel_enable()*. Internally, this function will:

- switch the channel state from **init** to **enable**
- acquire a proper power management lock is a specific clock source (e.g. APB clock) is selected. See also *Power management* for more information.

On the contrary, calling *sdm_channel_disable()* will do the opposite, that is, put the channel back to the **init** state and release the power management lock.

Set Pulse Density For the output PDM signals, the pulse density decides the output analog voltage that restored by a low-pass filter. The restored analog voltage from the channel is calculated by `Vout = VDD_IO / 256 * duty + VDD_IO / 2`. The range of the quantized `density` input parameter of *sdm_channel_set_pulse_density()* is from -128 to 127 (eight-bit signed integer). For example, if a zero value is set, then the output signal's duty will be around 50%.

Power Management When power management is enabled (i.e. *CONFIG_PM_ENABLE* is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the sample rate of the sigma-delta modulator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type *ESP_PM_APB_FREQ_MAX*. Whenever the driver creates a SDM channel instance that has selected *SDM_CLK_SRC_APB* as its clock source, the driver will guarantee that the power management lock is acquired when enable the channel by *sdm_channel_enable()*. Likewise, the driver releases the lock when *sdm_channel_disable()* is called for that channel.

IRAM Safe There's a Kconfig option *CONFIG_SDM_CTRL_FUNC_IN_IRAM* that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- *sdm_channel_set_pulse_density()*

Thread Safety The factory function *sdm_new_channel()* is guaranteed to be thread safe by the driver, which means, user can call it from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- *sdm_channel_set_pulse_density()*

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread safe. Which means the user should avoid calling them from multiple tasks.

Kconfig Options

- *CONFIG_SDM_CTRL_FUNC_IN_IRAM* controls where to place the SDM channel control functions (IRAM or Flash), see *IRAM Safe* for more information.
- *CONFIG_SDM_ENABLE_DEBUG_LOG* is used to enabled the debug log output. Enable this option will increase the firmware binary size.

Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don't have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

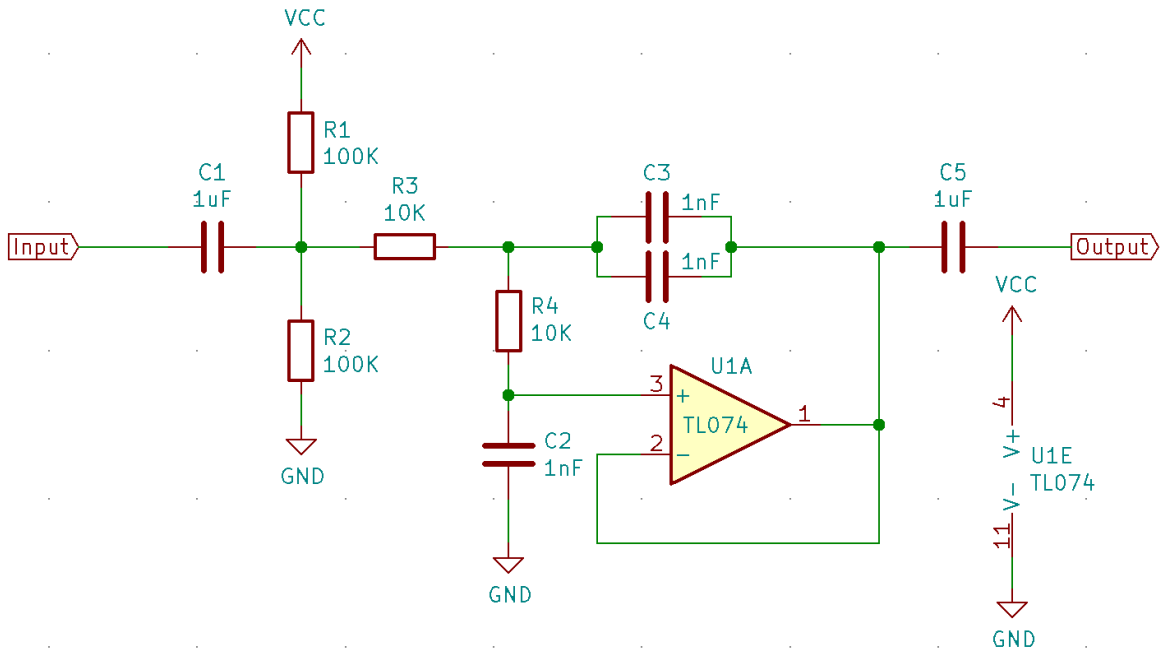

图 16: Sallen-Key Low Pass Filter

Application Example

- 100 Hz sine wave that is modulated with Sigma-Delta: peripherals/sigma_delta/sdm_dac.
- LED driven by a GPIO that is modulated with Sigma-Delta: peripherals/sigma_delta/sdm_led.

API Reference

Header File

- components/driver/sigma_delta/include/driver/sdm.h

Functions

esp_err_t **sdm_new_channel**(const *sdm_config_t* *config, *sdm_channel_handle_t* *ret_chan)

Create a new Sigma Delta channel.

参数

- **config** –**[in]** SDM configuration
- **ret_chan** –**[out]** Returned SDM channel handle

返回

- ESP_OK: Create SDM channel successfully
- ESP_ERR_INVALID_ARG: Create SDM channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create SDM channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create SDM channel failed because all channels are used up and no more free one
- ESP_FAIL: Create SDM channel failed because of other error

esp_err_t **sdm_del_channel**(*sdm_channel_handle_t* chan)

Delete the Sigma Delta channel.

参数 **chan** –**[in]** SDM channel created by `sdm_new_channel`

返回

- ESP_OK: Delete the SDM channel successfully
- ESP_ERR_INVALID_ARG: Delete the SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the SDM channel failed because the channel is not in init state
- ESP_FAIL: Delete the SDM channel failed because of other error

esp_err_t **sdm_channel_enable**(*sdm_channel_handle_t* chan)

Enable the Sigma Delta channel.

备注: This function will transit the channel state from init to enable.

备注: This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the *sdm_config_t*, while `CONFIG_PM_ENABLE` is enabled.

参数 **chan** –**[in]** SDM channel created by `sdm_new_channel`

返回

- ESP_OK: Enable SDM channel successfully
- ESP_ERR_INVALID_ARG: Enable SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable SDM channel failed because the channel is already enabled
- ESP_FAIL: Enable SDM channel failed because of other error

esp_err_t **sdm_channel_disable**(*sdm_channel_handle_t* chan)

Disable the Sigma Delta channel.

备注: This function will do the opposite work to the `sdm_channel_enable()`

参数 **chan** –**[in]** SDM channel created by `sdm_new_channel`

返回

- ESP_OK: Disable SDM channel successfully
- ESP_ERR_INVALID_ARG: Disable SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable SDM channel failed because the channel is not enabled yet
- ESP_FAIL: Disable SDM channel failed because of other error

esp_err_t **sdm_channel_set_pulse_density**(*sdm_channel_handle_t* chan, int8_t density)

Set the pulse density of the PDM output signal.

备注: The raw output signal requires a low-pass filter to restore it into analog voltage, the restored analog output voltage could be Vout = VDD_IO / 256 * density + VDD_IO / 2

备注: This function is allowed to run within ISR context

备注: This function will be placed into IRAM if `CONFIG_SDM_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

参数

- **chan** –**[in]** SDM channel created by `sdm_new_channel`
- **density** –**[in]** Quantized pulse density of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

返回

- ESP_OK: Set pulse density successfully
- ESP_ERR_INVALID_ARG: Set pulse density failed because of invalid argument
- ESP_FAIL: Set pulse density failed because of other error

esp_err_t **sdm_channel_set_duty**(*sdm_channel_handle_t* chan, int8_t duty)

The alias function of `sdm_channel_set_pulse_density`, it decides the pulse density of the output signal.

备注: `sdm_channel_set_pulse_density` has a more appropriate name compare this alias function, suggest to turn to `sdm_channel_set_pulse_density` instead

参数

- **chan** –**[in]** SDM channel created by `sdm_new_channel`
- **duty** –**[in]** Actually it's the quantized pulse density of the PDM output signal

返回

- ESP_OK: Set duty cycle successfully
- ESP_ERR_INVALID_ARG: Set duty cycle failed because of invalid argument
- ESP_FAIL: Set duty cycle failed because of other error

Structures

struct **sdm_config_t**

Sigma Delta channel configuration.

Public Members

int **gpio_num**

GPIO number

sdm_clock_source_t **clk_src**

Clock source

uint32_t **sample_rate_hz**

Over sample rate in Hz, it determines the frequency of the carrier pulses

uint32_t **invert_out**

Whether to invert the output signal

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *sdm_config_t*::[anonymous] **flags**

Extra flags

Type Definitions

typedef struct sdm_channel_t ***sdm_channel_handle_t**

Type of Sigma Delta channel handle.

Header File

- components/hal/include/hal/sdm_types.h

Type Definitions

typedef *soc_periph_sdm_clk_src_t* **sdm_clock_source_t**

2.6.17 SPI Flash API

概述

spi_flash 组件提供外部 flash 数据读取、写入、擦除和内存映射相关的 API 函数。

关于更多高层次的用于访问分区（分区表定义于分区表）的 API 函数，参见分区 *API* 。

备注： 访问主 flash 芯片时，建议使用上述 `esp_partition_*` API 函数，而非低层级的 `esp_flash_*` API 函数。分区表 API 函数根据存储在分区表中的数据，进行边界检查并计算在 flash 中的正确偏移量。不过，您仍可以使用 `esp_flash_*` 函数直接访问外部（额外）的 SPI flash 芯片。

与 ESP-IDF v4.0 之前的 API 不同，这一版 `esp_flash_*` API 功能并不局限于主 SPI flash 芯片（即运行程序的 SPI flash 芯片）。使用不同的芯片指针，您可以访问连接到 SPI0/1 或 SPI2 总线的外部 flash 芯片。

备注： 大多数 `esp_flash_*` API 使用 SPI1，SPI2 等外设而非通过 SPI0 上的 cache。这使得它们不仅能访问主 flash，也能访问外部 flash 。

而由于 cache 的限制，所有经过 cache 的操作都只能对主 flash 进行。这些操作的地址同样受到 cache 能力的限制。Cache 无法访问外部 flash 或者高于它能力的地址段。这些 cache 操作包括：mmap ，加密读写，执行代码或者访问在 flash 中的变量。

备注： ESP-IDF v4.0 之后的 flash API 不再是 原子的。因此，如果读操作执行过程中发生写操作，且读操作和写操作的 flash 地址出现重叠，读操作返回的数据可能会包含旧数据和新数据（新数据为写操作更新产生的数据）。

备注： 仅有主 flash 芯片支持加密操作，外接（经 SPI1 使用其他不同片选访问，或经其它 SPI 总线访问）的 flash 芯片则不支持加密操作。硬件的限制也决定了仅有主 flash 支持从 cache 当中读取。

Flash 功能支持情况

支持的 Flash 列表 不同厂家的 flash 特性有不同的操作方式，因此需要特殊的驱动支持。当前驱动支持大多数厂家 flash 24 位地址范围内的快速/慢速读，以及二线模式 (DIO/DOUT)，因为他们不需要任何厂家的自定义命令。

当前驱动支持以下厂家/型号的 flash 的四线模式 (QIO/QOUT)：

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

备注： 只有 ESP32-C3 支持上述某个 flash 时，芯片的驱动才默认支持这款 flash。可使用 menuconfig 中的 `Component config` > `SPI Flash driver` > `Auto-detect flash chips` 选项来使能/禁用某个 flash。

Flash 可选的功能

Optional features for flash Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- *Auto Suspend & Resume*
- *Flash unique ID*
- *High performance mode*
- *OPI flash support*
- *32-bit Address Flash Chips*

备注：

- The features listed above needs to be supported by both esp chips and flash chips.
- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact Espressif's business team to know if we can supply such products for you.
- If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.

注意： This document only shows that IDF code has supported the features of those flash chips. It’s not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own brought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

Auto Suspend & Resume You can refer to *当使能 flash 擦除的自动暂停* for more information about this feature. The support list is as follows.

ESP Chips List:

1. ESP32C3

Flash Chips List:

1. XM25QxxC series.

Flash unique ID Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

ESP Chips Lists:

ALL

Flash Chips List:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

High performance mode

备注： This section is provided for Dual mode (DOUT/DIO) and Quad mode (QIO/QOUT) flash chips. Octal flash used on ESP-chips support High performance mode by default so far, you can refer to the octal flash support list below.

High performance mode (HPM) means that the SPI1 and flash chip works under high frequency. Usually, when the operating frequency of the flash is greater than 80MHz, it is considered that the flash works under HPM. As far as we acknowledged, flash chips have more than two different coping strategies when flash work under HPM. For some flash chips, HPM is controlled by high performance flag (HPF) in status register and for some flash chips, HPM is controlled by dummy cycle bit.

For following conditions， IDF start code deals with HPM internally.

ESP Chips List:

1. ESP32S3

Flash Chips (name & ID) List:

1. GD25Q64C (ID: 0xC84017)
2. GD25Q32C (ID: 0xC84016)

注意： It is hard to create several strategies to cover all situations, so all flash chips using HPM need to be supported explicitly. Therefore, if you try to use a flash not listed as supported under high performance mode, it might cause some error. So, when you try to use the flash chip beyond supported list, please test properly.

OPI flash support OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

ESP Chips List:

1. ESP32S3

Flash Chips List:

1. MX25UM25645G

32-bit Address Flash Chips Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regretfully, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

ESP Chips List:

ALL ESP Chips support this.

Flash Chips List:

1. W25Q256
2. GD25Q256

有一些功能可能不是所有的 flash 芯片都支持，或不是所有的 ESP 芯片都支持。这些功能包括：

- 32 比特地址的 flash 支持 - 通常意味着拥有大于 16 MB 内存空间的大容量 flash 需要更长的地址去访问。
- flash 的私有 ID (unique ID) - 表示 flash 支持它自己的 64-bit 独有 ID 。
- 暂停与恢复 - 表示 flash 可以在读/写的过程中接受暂停/恢复的命令。ESP32-C3 可以在 flash 正在写/擦除的过程中保持 cache 开启，并能随机读取 flash 中的内容。

如果您想使用这些功能，则需保证 ESP32-C3 支持这些功能，且产品里所使用的 flash 芯片也要支持这些功能。请参阅*Optional features for flash*，查看更多信息。

您也可以自定义 flash 芯片驱动。请参阅*Overriding Default Chip Drivers*，查看详细信息。

警告： Customizing SPI Flash Chip Drivers is considered an "expert" feature. Users should only do so at their own risk. (See the notes below)

Overriding Default Chip Drivers During the SPI Flash driver's initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated in together with each IDF version. However IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List

1. Enable the *CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST* config option. This will prevent compilation and linking of the Default Chip Driver List (*default_registered_chips*) provided by IDF. Instead, the linker will search for the structure of the same name (*default_registered_chips*) that must be provided by the user.
2. Add a new component in your project, e.g. *custom_chip_driver*.
3. Copy the necessary chip driver files from the *spi_flash* component in IDF. This may include:
   - *spi_flash_chip_drivers.c* (to provide the *default_registered_chips* structure)
   - Any of the *spi_flash_chip_*.c* files that matches your own flash model best
   - *CMakeLists.txt* and *linker.lf* files

   Modify the files above properly. Including:
   - Change the `default_registered_chips` variable to non-static and remove the #ifdef logic around it.
   - Update *linker.lf* file to rename the fragment header and the library name to match the new component.
   - If reusing other drivers, some header names need prefixing with `spi_flash/` when included from outside spi_flash component.

备注:

- When writing your own flash chip driver, you can set your flash chip capabilities through *spi_flash_chip_***(vendor)_get_caps* and points the function pointer *get_chip_caps* for protection to the *spi_flash_chip_***_get_caps* function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in *spi_flash_caps_t* by checking the flash datasheet.
  2. Write a function named *spi_flash_chip_***(vendor)_get_caps*. Take the example below as a reference. (if the flash support *suspend* and *read unique id*).
  3. Points the pointer *get_chip_caps* (in *spi_flash_chip_t*) to the function mentioned above.

```
spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip)
{
   spi_flash_caps_t caps_flags = 0;
   // 32-bit-address flash is not supported
   flash-suspend is supported
   caps_flags |= SPI_FLAHS_CHIP_CAP_SUSPEND;
   // flash read unique id.
   caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
   return caps_flags;
}
```

```
const spi_flash_chip_t esp_flash_chip_eon = {
   // Other function pointers
   .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example storage/custom_flash_driver.

---

4. Write a new *CMakeLists.txt* file for the *custom_chip_driver* component, including an additional line to add a linker dependency from *spi_flash* to *custom_chip_driver*:

```
idf_component_register(SRCS "spi_flash_chip_drivers.c"
                       "spi_flash_chip_mychip.c"  # modify as needed
                       REQUIRES hal
                       PRIV_REQUIRES spi_flash
                       LDFRAGMENTS linker.lf)
idf_component_add_link_dependency(FROM spi_flash)
```

   - An example of this component CMakeLists.txt can be found in storage/custom_flash_driver/components/custom_chip_driver/CMakeLists.txt
5. The *linker.lf* is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See 链接器脚本生成机制 for more details. Make sure this file covers all the source files that you add.
6. Build your project, and you will see the new flash driver is used.

Example See also storage/custom_flash_driver.

初始化 Flash 设备

在使用 esp_flash_* API 之前，您需要在 SPI 总线上初始化芯片，步骤如下：

1. 调用 *spi_bus_initialize()* 初始化 SPI 总线。此函数将初始化总线上设备间共享的资源，如 I/O、DMA、中断等。
2. 调用 *spi_bus_add_flash_device()* 将 flash 设备连接到总线上。然后分配内存，填充 esp_flash_t 结构体，同时初始化 CS I/O。
3. 调用 *esp_flash_init()* 与芯片进行通信。后续操作会依据芯片类型不同而有差异。

备注： 当前，已支持多个 flash 芯片连接到同一总线。

SPI Flash 访问 API

如下所示为处理 flash 中数据的函数集：

- *esp_flash_read()*：将数据从 flash 读取到 RAM；
- *esp_flash_write()*：将数据从 RAM 写入到 flash；
- *esp_flash_erase_region()*：擦除 flash 中指定区域的数据；
- *esp_flash_erase_chip()*：擦除整个 flash；
- esp_flash_get_chip_size()：返回 menuconfig 中设置的 flash 芯片容量（以字节为单位）。

一般来说，请尽量避免对主 SPI flash 芯片直接使用原始 SPI flash 函数。如需对主 SPI flash 芯片进行操作，请使用分区专用函数。

SPI Flash 容量

SPI flash 容量由引导加载程序镜像头部（烧录偏移量为 0x1000）的一个字段进行配置。

默认情况下，引导程序被写入 flash 时，esptool.py 会自动检测 SPI flash 容量，同时使用正确容量更新引导程序的头部。您也可以在工程配置中设置 CONFIG_ESPTOOLPY_FLASHSIZE，生成固定的 flash 容量。

如需在运行时覆盖已配置的 flash 容量，请配置 g_rom_flashchip 结构中的 chip_size。esp_flash_* 函数使用此容量（于软件和 ROM 中）进行边界检查。

SPI1 Flash 并发约束

SPI1 flash 并发约束 指令/数据 cache（用以执行固件）与 SPI1 外设（由像 SPI flash 驱动一样的驱动程序控制）共享 SPI0/1 总线。因此，SPI1 外设上的操作会对整个系统造成显著的影响。这类操作包括调用 SPI flash API 或者 SPI1 总线上的其他驱动、任何 flash 操作（如读取、写入、擦除）或是由其他用户定义的 SPI 操作（对主 flash 或是其他 SPI 从机）。

在 ESP32-C3 上，默认启用的配置选项 *CONFIG_SPI_FLASH_AUTO_SUSPEND* 允许 flash/PSRAM 的 cache 访问和 SPI1 的操作并发执行。请参阅 *当使能 flash 擦除的自动暂停*，查看详细信息。

在该选项被禁用的情况下，读取/写入/擦除 flash 时，cache 必须被禁用。使用驱动访问 SPI1 的相关约束参见 *当 cache 被禁用时*。这些约束会带来更多的 IRAM/DRAM 消耗。

当 cache 被禁用时 此时，在 flash 擦写操作中，所有的 CPU 都只能执行 IRAM 中的代码，而且必须从 DRAM 中读取数据。如果您使用本文档中 API 函数，上述限制将自动生效且透明（无需您额外关注），但这些限制可能会影响系统中的其他任务的性能。

备注： 启用*CONFIG_SPI_FLASH_AUTO_SUSPEND* 时，cache 不会被禁用，其中的操作将通过硬件仲裁器来协调。

为避免意外读取 flash cache，在 flash 操作完成前，所有 CPU 上，所有的非 IRAM 安全的中断都会被禁用。

另请参阅*OS 函数* 和*SPI 总线锁*。

除 SPI0/1 以外，SPI 总线上的其他 flash 芯片则不受这种限制。

请参阅*应用程序内存分布*，查看内部 RAM（如 IRAM、DRAM）和 flash cache 的区别。

IRAM 安全中断处理程序 如果您需要在 flash 操作期间运行中断处理程序（比如低延迟操作），请在*注册中断处理程序* 时设置 `ESP_INTR_FLAG_IRAM`。

请确保中断处理程序访问的所有数据和函数（包括其调用的数据和函数）都存储在 IRAM 或 DRAM 中。参见*如何将代码放入 IRAM*。

在函数或符号未被正确放入 IRAM/DRAM 的情况下，中断处理程序在 flash 操作期间从 flash cache 中读取数据时，会导致程序崩溃。这可能是因为代码未被正确放入 IRAM 而产生非法指令异常，也可能是因为常数未被正确放入 DRAM 而读取到垃圾数据。

备注： 在 ISRs 中处理字符串时，不建议使用 *printf* 和其他输出函数。为了方便调试，在从 ISRs 中获取数据时，请使用 `ESP_DRAM_LOGE()` 和类似的宏。请确保 `TAG` 和格式字符串都放置于 `DRAM` 中。

非 IRAM 安全中断处理程序 如果在注册时没有设置 *ESP_INTR_FLAG_IRAM* 标志，当 cache 被禁用时，将不会执行中断处理程序。一旦 cache 恢复，非 IRAM 安全的中断将重新启用，中断处理程序随即再次正常运行。这意味着，只要 cache 被禁用，将不会发生相应的硬件事件。

当使能 flash 擦除的自动暂停 当使能 flash 擦除的自动暂停，访问 SPI1 时（如擦除、写入、读取主 flash）cache 便无需被禁用。硬件会负责仲裁二者的访问。

当 SPI1 操作较短时（如读取操作），CPU 和 cache 会等待直到 SPI1 的操作结束。然而对于一个擦除操作，自动暂停会发生并打断擦除操作，允许 CPU 能够在有限时间内从 cache 读取数据。

因此，部分的代码及变量便可以放入 flash / PSRAM 而非 IRAM / DRAM，同时仍然能够在 flash 擦除期间被执行。这样就减少了 IRAM / DRAM 的消耗。

请注意这个功能会带来 flash 暂停及恢复时的额外开销。如果被频繁打断，flash 的擦除时间可能异常的长。为了确保 flash 擦除操作在一个合理的时间内完成，请调整 FreeRTOS 任务优先级，这样仅有那些高于擦除任务优先级的任务，会在擦除进行过程中会被执行。

换句话说，代码可以分为以下三类：

1. 关键代码：放置在 IRAM / DRAM 中。这类代码通常有较高的性能要求，与 cache / flash / PSRAM 相关，或者被频繁调用。
2. cache 访问的代码：放置在 flash / PSRAM 中。这类代码的性能要求较低，或者较少被调用。他们会在 flash 擦除的时候被执行，带来一定的开销。
3. 低优先级代码：放置在 flash / PSRAM 中，并且在 flash 擦除的期间被禁止运行。这类代码的任务优先级应被设置的低于擦除任务，从而避免影响 flash 擦除的速度。

注意： 指令/数据 cache（用以执行固件）与 SPI1 外设（由像 SPI flash 驱动一样的驱动程序控制）共享 SPI0/1 总线。因此，在 SPI1 总线上调用 SPI flash API（包括访问主 flash）会对整个系统造成显著的影响。请参阅*SPI1 flash 并发约束*，查看详细信息。

SPI Flash 加密

您可以对 SPI flash 内容进行加密，并在硬件层对其进行透明解密。

请参阅*flash 加密*，查看详细信息。

内存映射 API

ESP32-C3 的内存硬件可以将 flash 部分区域映射到指令地址空间和数据地址空间。此映射仅用于读操作，不能通过写入 flash 映射的存储区域来改变 flash 中的内容。

Flash 在 64 KB 页进行映射。内存映射硬件既可将 flash 映射到数据地址空间，也能映射到指令地址空间。请查看技术参考手册，了解内存映射硬件的详细信息及有关限制。

请注意，有些页被用于将应用程序映射到内存中，因此实际可用的页会少于硬件提供的总数。

启用*Flash 加密* 时，使用内存映射区域从 flash 读取数据是解密 flash 的唯一方法，解密需在硬件层进行。

内存映射 API 在 `spi_flash_mmap.h` 和 `esp_partition.h` 中声明：

- *`spi_flash_mmap()`*：将 flash 物理地址区域映射到 CPU 指令空间或数据空间；
- *`spi_flash_munmap()`*：取消上述区域的映射；
- *`esp_partition_mmap()`*：将分区的一部分映射至 CPU 指令空间或数据空间；

`spi_flash_mmap()` 和*`esp_partition_mmap()`* 的区别如下：

- *`spi_flash_mmap()`*：需要给定一个 64 KB 对齐的物理地址；
- *`esp_partition_mmap()`*：给定分区内任意偏移量即可，此函数根据需要将返回的指针调整至指向映射内存。

内存映射以页为单位，即使传递给 `esp_partition_mmap` 的是一个分区，分区外的数据也是也是可以被读取到的，不会受到分区边界的影响。

备注： 由于 mmap 是由 cache 支持的，因此，mmap 也仅能用在主 flash 上。

SPI Flash 实现

`esp_flash_t` 结构体包含芯片数据和该 API 的三个重要部分：

1. 主机驱动，为访问芯片提供硬件支持；
2. 芯片驱动，为不同芯片提供兼容性服务；
3. OS 函数，在不同阶段（一级或二级 Boot 或者应用程序阶段）为部分 OS 函数（如锁、延迟）提供支持。

主机驱动 主机驱动依赖 `hal/include/hal` 文件夹下 `spi_flash_types.h` 定义的 `spi_flash_host_driver_t` 接口。该接口提供了一些常用的函数，用于与芯片通信。

在 SPI HAL 文件中，有些函数是基于现有的 ESP32-C3 memory-spi 来实现的。但是，由于 ESP32-C3 的速度限制，HAL 层无法提供某些读命令的高速实现（所以这些命令根本没有在 HAL 的文件中被实现）。`memspi_host_driver.h` 和 `.c` 文件使用 HAL 提供的 `common_command` 函数实现上述读命令的高速版本，并将所有它实现的以及 HAL 函数封装为 `spi_flash_host_driver_t` 供更上层调用。

您甚至可以仅通过 GPIO 来实现自己的主机驱动。只要实现了 `spi_flash_host_driver_t` 中所有函数，不管底层硬件是什么，esp_flash API 都可以访问 flash。

芯片驱动 芯片驱动在 `spi_flash_chip_driver.h` 中进行定义，并将主机驱动提供的基本函数进行封装以供 API 层使用。

有些操作需在执行前先发送命令，或在执行后读取状态，因此有些芯片需要不同的命令或值以及通信方式。

`generic chip` 芯片代表了常见的 flash 芯片，其他芯片驱动可以在这种通用芯片的基础上进行开发。

芯片驱动依赖主机驱动。

OS 函数 OS 函数层目前支持访问锁和延迟的方法。

锁（见*SPI 总线锁*）用于解决同一 SPI 总线上的设备访问和 SPI flash 芯片访问之间的冲突。例如：

1. 经 SPI1 总线访问 flash 芯片时，应当禁用 cache（平时用于获取代码和 PSRAM 数据）。
2. 经其他总线访问 flash 芯片时，应当禁用 flash 上 SPI 主驱动器注册的 ISR 以避免冲突。
3. SPI 主驱动器上某些没有 CS 线或者 CS 线受软件（如 SDSPI）控制的设备需要在一段时间内独占总线。

延时则用于某些长时操作，需要主机处于等待状态或执行轮询。

顶层 API 将芯片驱动和 OS 函数封装成一个完整的组件，并提供参数检查。

使用 OS 函数还可以在一定程度上避免在擦除大块 flash 区域时出现看门狗超时的情况。在这段时间内，CPU 将被 flash 擦除任务占用，从而阻止其他任务的执行，包括为看门狗定时器 (WDT) 供电的空闲任务。若已选中配置选项*CONFIG_ESP_TASK_WDT_PANIC*，并且 flash 操作时间长于看门狗的超时时间，系统将重新启动。

不过，由于不同的 flash 芯片擦除时间不同，flash 驱动几乎无法兼容，很难完全规避超时的风险。因此，您需要格外注意这一点。请遵照以下指南：

1. 建议启用*CONFIG_SPI_FLASH_YIELD_DURING_ERASE* 选项，允许调度器在擦除 flash 时进行重新调度。此外，还可以使用下列参数。
   - 在 menuconfig 中增加*CONFIG_SPI_FLASH_ERASE_YIELD_TICKS* 或减少*CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS* 的时间。
   - 您也可以在 menuconfig 中增加*CONFIG_ESP_TASK_WDT_TIMEOUT_S* 的时间以设置更长的看门狗超时周期。然而，看门狗超时周期拉长后，可能无法再检测到以前可检测到的超时。
2. 请注意，在进行长时间的 SPI flash 操作时，启用*CONFIG_ESP_TASK_WDT_PANIC* 选项将会在超时时触发恐慌处理程序。不过，启用该选项也可以帮助处理应用程序中的意外异常，您可以根据实际情况决定是否需要启用这个选项。
3. 在开发过程中，请根据项目对擦除 flash 的具体要求和时间限制，谨慎进行 flash 操作。在配置 flash 擦除超时周期时，请在实际产品要求的基础上留出合理的冗余时间，从而提高产品的可靠性。

实现细节

必须确保操作期间，两个 CPU 均未从 flash 运行代码，实现细节如下：- 单核模式下，SDK 在执行 flash 操作前将禁用中断或调度算法。- 双核模式下，SDK 需确保两个 CPU 均未运行 flash 代码。

如果有 SPI flash API 在 CPU A（PRO 或 APP）上调用，它使用 `esp_ipc_call` API 在 CPU B 上运行 `spi_flash_op_block_func` 函数。`esp_ipc_call` API 会在 CPU B 上唤醒一个高优先级任务，即运行 `spi_flash_op_block_func` 函数。运行该函数将禁用 CPU B 上的 cache，并使用 `s_flash_op_can_start` 旗帜来标志 cache 已禁用。然后，CPU A 上的任务也会禁用 cache 并继续执行 flash 操作。

执行 flash 操作时，CPU A 和 CPU B 仍然可以执行中断操作。默认中断代码均存储于 RAM 中，如果新添加了中断分配 API，则应添加一个标志位以请求在 flash 操作期间禁用该新分配的中断。

Flash 操作完成后，CPU A 上的函数将设置另一标志位，即 `s_flash_op_complete`，用以通知 CPU B 上的任务可以重新启用 cache 并释放 CPU。接着，CPU A 上的函数也重新启用 cache，并将控制权返还给调用者。

另外，所有 API 函数均受互斥量 `s_flash_op_mutex` 保护。

在单核环境中（启用*CONFIG_FREERTOS_UNICORE*），您需要禁用上述两个 cache 以防发生 CPU 间通信。

SPI Flash API ESP-IDF version vs Chip-ROM version There is a set of SPI Flash drivers in Chip-ROM which you can use by enabling *CONFIG_SPI_FLASH_ROM_IMPL*. Most of the ESP-IDF SPI Flash driver code are in internal RAM, therefore enabling this option will free some internal RAM usage. Note if you enable this option, this means some SPI Flash driver features and bugfixes that are done in ESP-IDF might not be included in the Chip-ROM version.

Feature Supported by ESP-IDF but not in Chip-ROM

- Octal Flash chip support. See *OPI flash support* for details.
- 32-bit-address support for GD25Q256. See *32-bit Address Flash Chips* for details.
- TH Flash chip support.
- Kconfig option *CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED*.
- *CONFIG_SPI_FLASH_VERIFY_WRITE*, enabling this option helps you detect bad writing.
- *CONFIG_SPI_FLASH_LOG_FAILED_WRITE*, enabling this option will print the bad writing.
- *CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE*, enabling this option will check if you’ re writing zero to one.
- *CONFIG_SPI_FLASH_DANGEROUS_WRITE*, enabling this option will check for flash programming to certain protected regions like bootloader, partition table or application itself.
- *CONFIG_SPI_FLASH_ENABLE_COUNTERS*, enabling this option to collect performance data for ESP-IDF SPI Flash driver APIs.

Bugfixes Introduced in ESP-IDF but not in Chip-ROM

- Detected Flash physical size correctly, for larger than 256MBit Flash chips. (Commit ID: b4964279d44f73cce7cfd5cf684567fbdfd6fd9e)
- Improved SPI1 cs setup timing, otherwise issue may happen on ZB32Q128. (Commit ID: 08f1bbe0c75382f1702e40c941e93314285105d4)
- Fixed issue that only 128KB virtual address ranges can be mapped to instructions on Flash.

ESP-IDF 和 Chip-ROM 版本 SPI Flash 驱动对比

请参考*SPI Flash API ESP-IDF version vs Chip-ROM version*.

SPI Flash API 参考

Header File

- components/spi_flash/include/esp_flash_spi_init.h

Functions

esp_err_t **spi_bus_add_flash_device**(*esp_flash_t* **out_chip, const *esp_flash_spi_device_config_t* *config)

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

参数

- **out_chip** –Pointer to hold the initialized chip.
- **config** –Configuration of the chips to initialize.

返回

- ESP_ERR_INVALID_ARG: out_chip is NULL, or some field in the config is invalid.
- ESP_ERR_NO_MEM: failed to allocate memory for the chip structures.
- ESP_OK: success.

esp_err_t **spi_bus_remove_flash_device**(*esp_flash_t* *chip)

Remove a SPI Flash device from the SPI bus.

参数 **chip** –The flash device to remove.

返回

- ESP_ERR_INVALID_ARG: The chip is invalid.
- ESP_OK: success.

Structures

struct **esp_flash_spi_device_config_t**

Configurations for the SPI Flash to init.

Public Members

spi_host_device_t **host_id**

Bus to use.

int **cs_io_num**

GPIO pin to output the CS signal.

esp_flash_io_mode_t **io_mode**

IO mode to read from the Flash.

enum *esp_flash_speed_s* **speed**

Speed of the Flash clock. Replaced by freq_mhz.

int **input_delay_ns**

Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs_id**

CS line ID, ignored when not `host_id` is not SPI1_HOST, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

int **freq_mhz**

The frequency of flash chip(MHZ)

Header File

- components/spi_flash/include/esp_flash.h

Functions

esp_err_t **esp_flash_init**(*esp_flash_t* *chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

备注： Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

备注： If the chip->drv pointer is NULL, chip chip_drv will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

参数 **chip** –Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.
返回 ESP_OK on success, or a flash error code if initialisation fails.

bool **esp_flash_chip_driver_initialized**(const *esp_flash_t* *chip)

Check if appropriate chip driver is set.

参数 **chip** –Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.
返回 true if set, otherwise false.

esp_err_t **esp_flash_read_id**(*esp_flash_t* *chip, uint32_t *out_id)

Read flash ID via the common "RDID" SPI flash command.

ID is a 24-bit value. Lower 16 bits of 'id' are the chip ID, upper 8 bits are the manufacturer ID.

参数

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_id** –**[out]** Pointer to receive ID value.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_size**(*esp_flash_t* *chip, uint32_t *out_size)

Detect flash size based on flash ID.

备注: 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

a. The out_size returned only stands for The out_size stands for the size in the binary image header. If you want to get the real size of the chip, please call `esp_flash_get_physical_size` instead.

参数

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_size** –**[out]** Detected size in bytes, standing for the size in the binary image header.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_physical_size**(*esp_flash_t* *chip, uint32_t *flash_size)

Detect flash size based on flash ID.

备注: Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

参数

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **flash_size** –**[out]** Detected size in bytes.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_read_unique_chip_id**(*esp_flash_t* *chip, uint64_t *out_id)

Read flash unique ID via the common "RDUID" SPI flash command.

ID is a 64-bit value.

参数

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().

- **out_id** –**[out]** Pointer to receive unique ID value.

返回

- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn’ t support read id.

esp_err_t **esp_flash_erase_chip**(*esp_flash_t* *chip)

Erase flash chip contents.

参数 **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()

返回

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_erase_region**(*esp_flash_t* *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.

Sector size is specifyed in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

参数

- **chip** –Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **start** –Address to start erasing flash. Must be sector aligned.
- **len** –Length of region to erase. Must also be sector aligned.

返回

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_get_chip_write_protect**(*esp_flash_t* *chip, bool *write_protected)

Read if the entire chip is write protected.

备注: A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

参数

- **chip** –Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **write_protected** –**[out]** Pointer to boolean, set to the value of the write protect flag.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_set_chip_write_protect**(*esp_flash_t* *chip, bool write_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

备注： Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

参数

- **chip** –Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **write_protect** –Boolean value for the write protect flag

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protectable_regions**(const *esp_flash_t* *chip, const *esp_flash_region_t* **out_regions, uint32_t *out_num_regions)

Read the list of individually protectable regions of this SPI flash chip.

备注： Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

参数

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_regions** –**[out]** Pointer to receive a pointer to the array of protectable regions of the chip.
- **out_num_regions** –**[out]** Pointer to an integer receiving the count of protectable regions in the array returned in 'regions'.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protected_region**(*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool *out_protected)

Detect if a region of the SPI flash chip is protected.

备注： It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

备注： Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

参数

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **region** –Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- **out_protected** –**[out]** Pointer to a flag which is set based on the protected status for this region.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_set_protected_region**(*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool protect)

Update the protected status for a region of the SPI flash chip.

备注： It is possible for the region protection flag to be cleared and write operations to still fail, if protection

is enabled for the entire chip.

备注： Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

参数

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **region** –Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- **protect** –Write protection flag to set.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_read**(*esp_flash_t* *chip, void *buffer, uint32_t address, uint32_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

备注： If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

参数

- **chip** –Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **buffer** –Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** –Address on flash to read from. Must be less than chip->size field.
- **length** –Length (in bytes) of data to read.

返回

- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

esp_err_t **esp_flash_write**(*esp_flash_t* *chip, const void *buffer, uint32_t address, uint32_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

参数

- **chip** –Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **address** –Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** –Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** –Length (in bytes) of data to write.

返回

- ESP_OK on success,
- ESP_FAIL, bad write, this will be detected only when CONFIG_SPI_FLASH_VERIFY_WRITE is enabled

- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_write_encrypted**(*esp_flash_t* *chip, uint32_t address, const void *buffer, uint32_t length)

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

备注: Both address & length must be 16 byte aligned, as this is the encryption block size

参数

- **chip** –Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** –Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** –Pointer to a buffer with the data to write.
- **length** –Length (in bytes) of data to write. 16 byte aligned.

返回

- ESP_OK: on success
- ESP_FAIL: bad write, this will be detected only when CONFIG_SPI_FLASH_VERIFY_WRITE is enabled
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.

esp_err_t **esp_flash_read_encrypted**(*esp_flash_t* *chip, uint32_t address, void *out_buffer, uint32_t length)

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

参数

- **chip** –Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** –Address on flash to read from.
- **out_buffer** –Pointer to a buffer for the data to read to.
- **length** –Length (in bytes) of data to read.

返回

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.

static inline bool **esp_flash_is_quad_mode**(const *esp_flash_t* *chip)

Returns true if chip is configured for Quad I/O or Quad Fast Read.

参数 **chip** –Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.
返回 true if flash works in quad mode, otherwise false

Structures

struct **esp_flash_region_t**

Structure for describing a region of flash.

Public Members

uint32_t **offset**

Start address of this region.

uint32_t **size**

Size of the region.

struct **esp_flash_os_functions_t**

OS-level integration hooks for accessing flash chips inside a running OS.

It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

esp_err_t (***start**)(void *arg)

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).

esp_err_t (***end**)(void *arg)

Called after completing any flash operation.

esp_err_t (***region_protected**)(void *arg, size_t start_addr, size_t size)

Called before any erase/write operations to check whether the region is limited by the OS

esp_err_t (***delay_us**)(void *arg, uint32_t us)

Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’.

void *(***get_temp_buffer**)(void *arg, size_t reqest_size, size_t *out_size)

Called for get temp buffer when buffer from application cannot be directly read into/write from.

void (***release_temp_buffer**)(void *arg, void *temp_buf)

Called for release temp buffer.

esp_err_t (***check_yield**)(void *arg, uint32_t chip_status, uint32_t *out_request)

Yield to other tasks. Called during erase operations.

Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

esp_err_t (***yield**)(void *arg, uint32_t *out_status)

Yield to other tasks. Called during erase operations.

int64_t (***get_system_time**)(void *arg)

Called for get system time.

void (***set_flash_op_status**)(uint32_t op_status)

Call to set flash operation status

struct **esp_flash_t**

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to esp_flash_init()). It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

spi_flash_host_inst_t ***host**

Pointer to hardware-specific "host_driver" structure. Must be initialized before used.

const *spi_flash_chip_t* ***chip_drv**

Pointer to chip-model-specific "adapter" structure. If NULL, will be detected during initialisation.

const *esp_flash_os_functions_t* ***os_func**

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void ***os_func_data**

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

esp_flash_io_mode_t **read_mode**

Configured SPI flash read mode. Set before `esp_flash_init` is called.

uint32_t **size**

Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call `esp_flash_get_physical_size`.

uint32_t **chip_id**

Detected chip id.

uint32_t **busy**

This flag is used to verify chip's status.

uint32_t **hpm_dummy_ena**

This flag is used to verify whether flash works under HPM status.

uint32_t **reserved_flags**

reserved.

Macros

SPI_FLASH_YIELD_REQ_YIELD

SPI_FLASH_YIELD_REQ_SUSPEND

SPI_FLASH_YIELD_STA_RESUME

SPI_FLASH_OS_IS_ERASING_STATUS_FLAG

Type Definitions

typedef struct *spi_flash_chip_t* **spi_flash_chip_t**

Header File

- components/spi_flash/include/spi_flash_mmap.h

Functions

esp_err_t **spi_flash_mmap**(size_t src_addr, size_t size, *spi_flash_mmap_memory_t* memory, const void **out_ptr, *spi_flash_mmap_handle_t* *out_handle)

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if mmap/munmap are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use spi_flash_mmap_dump() function.

参数

- **src_addr** –Physical address in flash where requested region starts. This address *must* be aligned to 64kB boundary (SPI_FLASH_MMU_PAGE_SIZE)
- **size** –Size of region to be mapped. This size will be rounded up to a 64kB boundary
- **memory** –Address space where the region should be mapped (data or instruction)
- **out_ptr** –**[out]** Output, pointer to the mapped memory region
- **out_handle** –**[out]** Output, handle which should be used for spi_flash_munmap call

返回 ESP_OK on success, ESP_ERR_NO_MEM if pages can not be allocated

esp_err_t **spi_flash_mmap_pages**(const int *pages, size_t page_count, *spi_flash_mmap_memory_t* memory, const void **out_ptr, *spi_flash_mmap_handle_t* *out_handle)

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as spi_flash_mmap() but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

参数

- **pages** –An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- **page_count** –Number of entries in the pages array
- **memory** –Address space where the region should be mapped (instruction or data)
- **out_ptr** –**[out]** Output, pointer to the mapped memory region
- **out_handle** –**[out]** Output, handle which should be used for spi_flash_munmap call

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if pages can not be allocated
- ESP_ERR_INVALID_ARG if pagecount is zero or pages array is not in internal memory

void **spi_flash_munmap**(*spi_flash_mmap_handle_t* handle)

Release region previously obtained using spi_flash_mmap.

备注: Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

参数 **handle** –Handle obtained from spi_flash_mmap

void **spi_flash_mmap_dump**(void)

Display information about mapped regions.

This function lists handles obtained using spi_flash_mmap, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

uint32_t **spi_flash_mmap_get_free_pages**(*spi_flash_mmap_memory_t* memory)

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual spi_flash_mmap (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

参数 **memory** –memory type of MMU table free page
返回 number of free pages which can be mmaped

size_t **spi_flash_cache2phys**(const void *cached)

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have have been assigned via spi_flash_mmap(), any address in memory mapped flash space can be looked up.

参数 **cached** –Pointer to flashed cached memory.
返回

- SPI_FLASH_CACHE2PHYS_FAIL If cache address is outside flash cache region, or the address is not mapped.
- Otherwise, returns physical offset in flash

const void ***spi_flash_phys2cache**(size_t phys_offs, *spi_flash_mmap_memory_t* memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via spi_flash_mmap(), any address in flash can be looked up.

备注: Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

备 注: This function doesn’ t impose any alignment constraints, but if memory argument is SPI_FLASH_MMAP_INST and phys_offs is not 4-byte aligned, then reading from the returned pointer will result in a crash.

参数

- **phys_offs** –Physical offset in flash memory to look up.
- **memory** –Address space type to look up a flash cache address mapping for (instruction or data)

返回

- NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
- Cached memory address (in IROM or DROM space) corresponding to phys_offs.

Macros

ESP_ERR_FLASH_OP_FAIL

This file contains `spi_flash_mmap_xx` APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

ESP_ERR_FLASH_OP_TIMEOUT

SPI_FLASH_SEC_SIZE

SPI Flash sector size

SPI_FLASH_MMU_PAGE_SIZE

Flash cache MMU mapping page size

SPI_FLASH_CACHE2PHYS_FAIL

Type Definitions

typedef uint32_t **spi_flash_mmap_handle_t**

Opaque handle for memory region obtained from spi_flash_mmap.

Enumerations

enum **spi_flash_mmap_memory_t**

Enumeration which specifies memory space requested in an mmap call.

Values:

enumerator **SPI_FLASH_MMAP_DATA**

map to data memory, allows byte-aligned access

enumerator **SPI_FLASH_MMAP_INST**

map to instruction memory, allows only 4-byte-aligned access

Header File

- components/hal/include/hal/spi_flash_types.h

Structures

struct **spi_flash_trans_t**

Definition of a common transaction. Also holds the return value.

Public Members

uint8_t **reserved**

Reserved, must be 0.

uint8_t **mosi_len**

Output data length, in bytes.

uint8_t **miso_len**

Input data length, in bytes.

uint8_t **address_bitlen**

Length of address in bits, set to 0 if command does not need an address.

uint32_t **address**

Address to perform operation on.

const uint8_t ***mosi_data**

Output data to salve.

uint8_t ***miso_data**

[out] Input data from slave, little endian

uint32_t **flags**

Flags for this transaction. Set to 0 for now.

uint16_t **command**

Command to send.

uint8_t **dummy_bitlen**

Basic dummy bits to use.

uint32_t **io_mode**

Flash working mode when `SPI_FLASH_IGNORE_BASEIO` is specified.

struct **spi_flash_sus_cmd_conf**

Configuration structure for the flash chip suspend feature.

Public Members

uint32_t **sus_mask**

SUS/SUS1/SUS2 bit in flash register.

uint32_t **cmd_rdsr**

Read flash status register(2) command.

uint32_t **sus_cmd**

Flash suspend command.

uint32_t **res_cmd**

Flash resume command.

uint32_t **reserved**

Reserved, set to 0.

struct **spi_flash_encryption_t**

Structure for flash encryption operations.

Public Members

void (*`flash_encryption_enable`)(void)

Enable the flash encryption.

void (*`flash_encryption_disable`)(void)

Disable the flash encryption.

void (*`flash_encryption_data_prepare`)(uint32_t address, const uint32_t *buffer, uint32_t size)

Prepare flash encryption before operation.

备注： address and buffer must be 8-word aligned.

Param address The destination address in flash for the write operation.
Param buffer Data for programming
Param size Size to program.

void (*`flash_encryption_done`)(void)

flash data encryption operation is done.

void (*`flash_encryption_destroy`)(void)

Destroy encrypted result

bool (*`flash_encryption_check`)(uint32_t address, uint32_t length)

Check if is qualified to encrypt the buffer

Param address the address of written flash partition.
Param length Buffer size.

struct `spi_flash_host_inst_t`

SPI Flash Host driver instance

Public Members

const struct *spi_flash_host_driver_s* *`driver`

Pointer to the implementation function table.

struct `spi_flash_host_driver_s`

Host driver configuration and context structure.

Public Members

esp_err_t (*`dev_config`)(*spi_flash_host_inst_t* *host)

Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

esp_err_t (*`common_command`)(*spi_flash_host_inst_t* *host, *spi_flash_trans_t* *t)

Send an user-defined spi transaction to the device.

esp_err_t (***read_id***)(*spi_flash_host_inst_t* *host, uint32_t *id)

Read flash ID.

void (***erase_chip***)(*spi_flash_host_inst_t* *host)

Erase whole flash chip.

void (***erase_sector***)(*spi_flash_host_inst_t* *host, uint32_t start_address)

Erase a specific sector by its start address.

void (***erase_block***)(*spi_flash_host_inst_t* *host, uint32_t start_address)

Erase a specific block by its start address.

esp_err_t (***read_status***)(*spi_flash_host_inst_t* *host, uint8_t *out_sr)

Read the status of the flash chip.

esp_err_t (***set_write_protect***)(*spi_flash_host_inst_t* *host, bool wp)

Disable write protection.

void (***program_page***)(*spi_flash_host_inst_t* *host, const void *buffer, uint32_t address, uint32_t length)

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

bool (***supports_direct_write***)(*spi_flash_host_inst_t* *host, const void *p)

Check whether the SPI host supports direct write.

When cache is disabled, SPI1 doesn't support directly write when buffer isn't internal.

int (***write_data_slicer***)(*spi_flash_host_inst_t* *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

Param address Beginning flash address to write
Param len Length request to write
Param align_addr Output of the aligned address to write to
Param page_size Physical page size of the flash chip
Return Length that can be actually written in one `program_page` call

esp_err_t (***read***)(*spi_flash_host_inst_t* *host, void *buffer, uint32_t address, uint32_t read_len)

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

bool (***supports_direct_read***)(*spi_flash_host_inst_t* *host, const void *p)

Check whether the SPI host supports direct read.

When cache is disabled, SPI1 doesn't support directly read when the given buffer isn't internal.

int (***read_data_slicer***)(*spi_flash_host_inst_t* *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for read data. The `read` should be called iteratively with the return value of this function.

Param address Beginning flash address to read
Param len Length request to read
Param align_addr Output of the aligned address to read
Param page_size Physical page size of the flash chip
Return Length that can be actually read in one `read` call

uint32_t (*`host_status`)(*spi_flash_host_inst_t* *host)

Check the host status, 0:busy, 1:idle, 2:suspended.

esp_err_t (*`configure_host_io_mode`)(*spi_flash_host_inst_t* *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, *esp_flash_io_mode_t* io_mode)

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (*`poll_cmd_done`)(*spi_flash_host_inst_t* *host)

Internal use, poll the HW until the last operation is done.

esp_err_t (*`flush_cache`)(*spi_flash_host_inst_t* *host, uint32_t addr, uint32_t size)

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

void (*`check_suspend`)(*spi_flash_host_inst_t* *host)

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (*`resume`)(*spi_flash_host_inst_t* *host)

Resume flash from suspend manually

void (*`suspend`)(*spi_flash_host_inst_t* *host)

Set flash in suspend status manually

esp_err_t (*`sus_setup`)(*spi_flash_host_inst_t* *host, const *spi_flash_sus_cmd_conf* *sus_conf)

Suspend feature setup for setting cmd and status register mask.

Macros

`SPI_FLASH_TRANS_FLAG_CMD16`

Send command of 16 bits.

`SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO`

Not applying the basic io mode configuration for this transaction.

`SPI_FLASH_TRANS_FLAG_BYTE_SWAP`

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

`SPI_FLASH_CONFIG_CONF_BITS`

OR the io_mode with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

`SPI_FLASH_OPI_FLAG`

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

`SPI_FLASH_READ_MODE_MIN`

Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions

typedef enum *esp_flash_speed_s* **esp_flash_speed_t**

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLSH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

typedef struct *spi_flash_host_driver_s* **spi_flash_host_driver_t**

Enumerations

enum **esp_flash_speed_s**

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLSH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

enumerator **ESP_FLASH_5MHZ**

The flash runs under 5MHz.

enumerator **ESP_FLASH_10MHZ**

The flash runs under 10MHz.

enumerator **ESP_FLASH_20MHZ**

The flash runs under 20MHz.

enumerator **ESP_FLASH_26MHZ**

The flash runs under 26MHz.

enumerator **ESP_FLASH_40MHZ**

The flash runs under 40MHz.

enumerator **ESP_FLASH_80MHZ**

The flash runs under 80MHz.

enumerator **ESP_FLASH_120MHZ**

The flash runs under 120MHz, 120MHZ can only be used by main flash after timing tuning in system. Do not use this directely in any API.

enumerator **ESP_FLASH_SPEED_MAX**

The maximum frequency supported by the host is `ESP_FLASH_SPEED_MAX-1`.

enum **esp_flash_io_mode_t**

Mode used for reading from SPI flash.

Values:

enumerator **SPI_FLASH_SLOWRD**

Data read using single I/O, some limits on speed.

enumerator **SPI_FLASH_FASTRD**

Data read using single I/O, no limit on speed.

enumerator **SPI_FLASH_DOUT**

Data read using dual I/O.

enumerator **SPI_FLASH_DIO**

Both address & data transferred using dual I/O.

enumerator **SPI_FLASH_QOUT**

Data read using quad I/O.

enumerator **SPI_FLASH_QIO**

Both address & data transferred using quad I/O.

enumerator **SPI_FLASH_OPI_STR**

Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI_FLASH_OPI_DTR**

Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI_FLASH_READ_MODE_MAX**

The fastest io mode supported by the host is `ESP_FLASH_READ_MODE_MAX-1`.

Header File

- components/hal/include/hal/esp_flash_err.h

Macros

ESP_ERR_FLASH_NOT_INITIALISED

esp_flash_chip_t structure not correctly initialised by esp_flash_init().

ESP_ERR_FLASH_UNSUPPORTED_HOST

Requested operation isn't supported via this host SPI bus (chip->spi field).

ESP_ERR_FLASH_UNSUPPORTED_CHIP

Requested operation isn't supported by this model of SPI flash chip.

ESP_ERR_FLASH_PROTECTED

Write operation failed due to chip's write protection being enabled.

Enumerations

enum **[anonymous]**

Values:

enumerator **ESP_ERR_FLASH_SIZE_NOT_MATCH**

The chip doesn't have enough space for the current partition table.

enumerator **ESP_ERR_FLASH_NO_RESPONSE**

Chip did not respond to the command, or timed out.

Flash 加密 API 参考

Header File

- components/bootloader_support/include/esp_flash_encrypt.h

Functions

bool **esp_flash_encryption_enabled**(void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

返回 true if flash encryption is enabled.

esp_err_t **esp_flash_encrypt_check_and_update**(void)

bool **esp_flash_encrypt_state**(void)

Returns the Flash Encryption state and prints it.

返回 True - Flash Encryption is enabled False - Flash Encryption is not enabled

bool **esp_flash_encrypt_initialized_once**(void)

Checks if the first initialization was done.

If the first initialization was done then FLASH_CRYPT_CNT != 0

返回 true - the first initialization was done false - the first initialization was NOT done

esp_err_t **esp_flash_encrypt_init**(void)

The first initialization of Flash Encryption key and related eFuses.

返回 ESP_OK if all operations succeeded

esp_err_t **esp_flash_encrypt_contents**(void)

Encrypts flash content.

返回 ESP_OK if all operations succeeded

esp_err_t **esp_flash_encrypt_enable**(void)

Activates Flash encryption on the chip.

It burns FLASH_CRYPT_CNT eFuse based on the CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE option.

返回 ESP_OK if all operations succeeded

bool **esp_flash_encrypt_is_write_protected**(bool print_error)

Returns True if the write protection of FLASH_CRYPT_CNT is set.

参数 **print_error** –Print error if it is write protected
返回 true - if FLASH_CRYPT_CNT is write protected

esp_err_t **esp_flash_encrypt_region**(uint32_t src_addr, size_t data_length)

Encrypt-in-place a block of flash sectors.

备注: This function resets RTC_WDT between operations with sectors.

参数

- **src_addr** –Source offset in flash. Should be multiple of 4096 bytes.

- **data_length** –Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

返回 ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

void **esp_flash_write_protect_crypt_cnt**(void)

Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

备注: On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

---

esp_flash_enc_mode_t **esp_get_flash_encryption_mode**(void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

返回

void **esp_flash_encryption_init_checks**(void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

---

备注: This function is called automatically during app startup, it doesn't need to be called from the app.

---

esp_err_t **esp_flash_encryption_enable_secure_features**(void)

Set all secure eFuse features related to flash encryption.

返回

- ESP_OK - Successfully

bool **esp_flash_encryption_cfg_verify_release_mode**(void)

Returns the verification status for all physical security features of flash encryption in release mode.

If the device has flash encryption feature configured in the release mode, then it is highly recommended to call this API in the application startup code. This API verifies the sanity of the eFuse configuration against the release (production) mode of the flash encryption feature.

返回

- True - all eFuses are configured correctly
- False - not all eFuses are configured correctly.

void **esp_flash_encryption_set_release_mode**(void)

Switches Flash Encryption from "Development" to "Release".

If already in "Release" mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- " disable encrypt in dl mode"
- set FLASH_CRYPT_CNT efuse to max

Enumerations

enum **esp_flash_enc_mode_t**

Values:

enumerator **ESP_FLASH_ENC_MODE_DISABLED**

enumerator **ESP_FLASH_ENC_MODE_DEVELOPMENT**

enumerator **ESP_FLASH_ENC_MODE_RELEASE**

2.6.18 SPI Master Driver

SPI Master driver is a program that controls ESP32-C3 ' s SPI peripherals while they function as masters.

Overview of ESP32-C3 ' s SPI peripherals

ESP32-C3 integrates 2 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32-C3 ' s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus.
  Currently, SPI Master driver does not support SPI1 bus.
- SPI2 is a general purpose SPI controller. It has an independent signal bus with the same name. The bus has 6 CS lines to drive up to 6 SPI slaves.

Terminology

The terms used in relation to the SPI master driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral inside ESP32-C3 that initiates SPI transmissions over the bus, and acts as an SPI Master.
Device	SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.
SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.
QUADHD	Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.
DATA4	Data4 signal in Octal/OPI mode.
DATA5	Data5 signal in Octal/OPI mode.
DATA6	Data6 signal in Octal/OPI mode.
DATA7	Data7 signal in Octal/OPI mode.
Assertion	The action of activating a line.
Deassertion	The action of returning the line back to inactive (back to idle) status.
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch edge	Edge of the clock at which the source register *launches* the signal onto the line.
Latch edge	Edge of the clock at which the destination register *latches in* the signal.

Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see *SPI 总线锁*.

警告： The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32-C3 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time. You can use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral related tasks to ensure thread safety.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

SPI 特性

SPI 主机

SPI 总线锁 为了多路复用来自 SPI 主机、SPI flash 等不同驱动的设备，每个 SPI 总线上都配有 SPI 总线锁。驱动程序可以通过对锁实施仲裁，将设备连接到总线上。

每个总线锁都已初始化并注册了后台服务 (BG)。设备应在 BG 禁用后，再在总线上进行传输。

- SPI1 总线的后台服务为高速缓存。在设备操作开始前，总线锁可以禁用高速缓存，并在设备释放锁后将其再次启用。高速缓存处于禁用状态时，让出当前任务的执行权毫无意义，因此，该情况下 SPI1 总线上的任何设备都无法使用 ISR。
  SPI 主机驱动程序暂不支持 SPI1 总线。只有 SPI flash 驱动程序可以连接到该总线。
- 对于其他总线，驱动程序可以将 ISR 注册为后台服务。若设备任务要求独占总线，则总线锁将阻塞该任务，同时禁用 ISR，随即解除对该任务的阻塞。任务释放锁后，如果 ISR 中还有待处理的事务，则锁将尝试重新启用 ISR。

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
Command	In this phase, a command (0-16 bit) is written to the bus by the Host.
Address	In this phase, an address (0-32 bit) is transmitted over the bus by the Host.
Dummy	This phase is configurable and is used to meet the timing requirements.
Write	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
Read	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure *spi_bus_config_t*, device configuration structure *spi_device_interface_config_t*, and transaction configuration structure *spi_transaction_t*.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- *spi_device_interface_config_t::command_bits*
- *spi_device_interface_config_t::address_bits*
- *spi_transaction_t::length*

While the member *spi_transaction_t::rxlength* only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by *spi_transaction_t::length* and *spi_transaction_t::rxlength* respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device's configuration: if *spi_device_interface_config_t::command_bits* and/or *spi_device_interface_config_t::address_bits* are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If *spi_transaction_t::rx_buffer* is NULL and *SPI_TRANS_USE_RXDATA* is not set, the read phase is skipped. If *spi_transaction_t::tx_buffer* is NULL and *SPI_TRANS_USE_TXDATA* is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see *Notes on Sending Mixed Transactions to the Same Device*.

Interrupt Transactions Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

Polling Transactions Polling transactions do not use interrupts. The routine keeps polling the SPI Host' s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see *Bus Acquiring*.

Transaction Line Mode Supported line modes for ESP32-C3 are listed as follows, to make use of these modes, set the member *flags* in the struct `spi_transaction_t` as shown in the *Transaction Flag* column. If you want to check if corresponding IO pins are set or not, set the member *flags* in the `spi_bus_config_t` as shown in the *Bus IO setting Flag* column.

Mode name	Command Line Width	Address Line Width	Data Line Width	Transaction Flag	Bus IO setting Flag
Normal SPI	1	1	1	0	0
Dual Output	1	1	2	SPI_TRANS_MODE_DIO	SPICOMMON_BUSFLAG_DUAL
Dual I/O	1	2	2	SPI_TRANS_MODE_DIO | SPI_TRANS_MULTILINE_ADDR	
Quad Output	1	1	4	SPI_TRANS_MODE_QIO	SPICOMMON_BUSFLAG_QUAD
Quad I/O	1	4	4	SPI_TRANS_MODE_QIO | SPI_TRANS_MULTILINE_ADDR	

Command and Address Phases During the command and address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

If the command and address phase need to be as the same number of lines as data phase, you need to set *SPI_TRANS_MULTILINE_CMD* and/or *SPI_TRANS_MULTILINE_ADDR* to the *flags* member in the struct `spi_transaction_t`. Also see *Transaction Line Mode*.

Write and Read Phases Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (staring from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set *SPI_DEVICE_HALFDUPLEX* flag for the member *flags* in the struct `spi_device_interface_config_t`. And the member *flags* in the struct `spi_transaction_t` should be set as described in *Transaction Line Mode*.

备注： Half-duplex transactions with both read and write phases are not supported. Please use full duplex mode.

Bus Acquiring Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - ***Interrupt*** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - ***Polling*** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the peripherals/spi_master directory of ESP-IDF examples.

Transactions with Data Not Exceeding 32 Bits When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the

spi_transaction_t::tx_data member and setting the *SPI_TRANS_USE_TXDATA* flag on the transmission. For received data, use *spi_transaction_t::rx_data* and set *SPI_TRANS_USE_RXDATA*. In both cases, do not touch the *spi_transaction_t::tx_buffer* or *spi_transaction_t::rx_buffer* members, because they use the same memory locations as *spi_transaction_t::tx_data* and *spi_transaction_t::rx_data*.

Transactions with Integers Other Than `uint8_t` An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional "random" bits, so the reading must be performed correctly.

On top of that, ESP32-C3 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- *SPI_SWAP_DATA_TX* for data to be transmitted
- *SPI_SWAP_DATA_RX* for data received

Notes on Sending Mixed Transactions to the Same Device To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function *spi_device_polling_end()* after *spi_device_polling_start()* to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with *spi_device_polling_transmit()* so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call *spi_device_polling_start()*. To do that, you can keep calling *spi_device_get_trans_result()* until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

GPIO Matrix and IO_MUX Most of chip's peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80MHz or lower frequencies, routing SPI pins via GPIO matrix will behave the same comparing to routing them via IOMUX.

The IO_MUX pins for SPI buses are given below.

Pin Name	GPIO Number (SPI2)
CS0[1]	10
SCLK	6
MISO	2
MOSI	7
QUADWP	5
QUADHD	4

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See *Interrupt Transactions*. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 µs.
- Interrupt Transaction via CPU: 27 µs.
- Polling Transaction via DMA: 10 µs.
- Polling Transaction via CPU: 9 µs.

Note that these data are tested with *CONFIG_SPI_MASTER_ISR_IN_IRAM* enabled. SPI transaction related code are placed in the internal memory. If this option is turned off (for example, for internal memory optimization), the transaction duration may be affected.

SPI Clock Frequency Clock source of the GPSPI peripherals can be selected by setting `spi_device_handle_t::cfg::clock_source`. You can refer to *`spi_clock_source_t`* to know the supported clock sources. By default driver will set `spi_device_handle_t::cfg::clock_source` to *SPI_CLK_SRC_DEFAULT*. This usually stands for the highest frequency among GPSPI clock sources. Its value will be different among chips.

Actual clock frequency of a device may not be exactly equal to the number you set, it will be re-calculated by the driver to the nearest hardware compatible number, and not larger than the clock frequency of the clock source. You can call *`spi_device_get_actual_freq()`* to know the actual frequency computed by the driver.

Theoretical maximum transfer speed of Write or Read phase can be calculated according to the table below:

Line Width of Write/Read phase	Speed (Bps)
1-Line	*SPI Frequency / 8*
2-Line	*SPI Frequency / 4*
4-Line	*SPI Frequency / 2*

The transfer speed calculation of other phases(command, address, dummy) are similar.

[1] Only the first Device attached to the bus can use the CS0 pin.

Cache Miss The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select *CONFIG_SPI_MASTER_IN_IRAM* to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

备注： SPI driver implementation is based on FreeRTOS APIs, to use *CONFIG_SPI_MASTER_IN_IRAM*, you should not enable *CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH*.

For an interrupt transaction, the overall cost is *20+8n/Fspi[MHz]* [us] for n bytes transferred in one transaction. Hence, the transferring speed is: *n/(20+8n/Fspi)*. An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval (us)	Transaction Length (bytes)	Total Time (us)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable *CONFIG_SPI_MASTER_ISR_IN_IRAM* and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see *IRAM 安全中断处理程序*.

Application Example

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the peripherals/spi_master/hd_eeprom directory of ESP-IDF examples.

API Reference - SPI Common

Header File

- components/hal/include/hal/spi_types.h

Structures

struct **spi_line_mode_t**

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

Public Members

uint8_t **cmd_lines**

The line width of command phase, e.g. 2-line-cmd-phase.

uint8_t **addr_lines**

The line width of address phase, e.g. 1-line-addr-phase.

uint8_t **data_lines**

The line width of data phase, e.g. 4-line-data-phase.

Type Definitions

typedef *soc_periph_spi_clk_src_t* **spi_clock_source_t**

Type of SPI clock source.

Enumerations

enum **spi_host_device_t**

Enum with the three SPI peripherals that are software-accessible in it.

Values:

enumerator **SPI1_HOST**

SPI1.

enumerator **SPI2_HOST**

SPI2.

enumerator **SPI_HOST_MAX**

invalid host value

enum **spi_event_t**

SPI Events.

Values:

enumerator **SPI_EV_BUF_TX**

The buffer has sent data to master.

enumerator **SPI_EV_BUF_RX**

The buffer has received data from master.

enumerator **SPI_EV_SEND_DMA_READY**

Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI_EV_SEND**

Master has received certain number of the data, the number is determined by Master.

enumerator **SPI_EV_RECV_DMA_READY**

Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI_EV_RECV**

Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI_EV_CMD9**

Received CMD9 from master.

enumerator **SPI_EV_CMDA**

Received CMDA from master.

enumerator **SPI_EV_TRANS**

A transaction has done.

enum **spi_command_t**

SPI command.

Values:

enumerator **SPI_CMD_HD_WRBUF**

enumerator **SPI_CMD_HD_RDBUF**

enumerator **SPI_CMD_HD_WRDMA**

enumerator **SPI_CMD_HD_RDDMA**

enumerator **SPI_CMD_HD_SEG_END**

enumerator **SPI_CMD_HD_EN_QPI**

enumerator **SPI_CMD_HD_WR_END**

enumerator **SPI_CMD_HD_INT0**

enumerator **SPI_CMD_HD_INT1**

enumerator **SPI_CMD_HD_INT2**

Header File

- components/driver/spi/include/driver/spi_common.h

Functions

esp_err_t **spi_bus_initialize**(*spi_host_device_t* host_id, const *spi_bus_config_t* *bus_config, *spi_dma_chan_t* dma_chan)

Initialize a SPI bus.

警告： SPI0/1 is not supported

警告： If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

> **警告：** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

参数

- **host_id** –SPI peripheral that controls this bus
- **bus_config** –Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- **dma_chan** –- Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

返回

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **spi_bus_free**(*spi_host_device_t* host_id)

Free a SPI bus.

> **警告：** In order for this to succeed, all devices have to be removed first.

参数 **host_id** –SPI peripheral to free

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if bus hasn't been initialized before, or not all devices on the bus are freed
- ESP_OK on success

Structures

struct **spi_bus_config_t**

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

备注： Be advised that the slave driver does not use the quadwp/quadhd lines and fields in *spi_bus_config_t* refering to these lines will be ignored and can thus safely be left uninitialized.

Public Members

int **mosi_io_num**

GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

int **data0_io_num**

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int **miso_io_num**

GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

int **data1_io_num**

GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int **sclk_io_num**

GPIO pin for SPI Clock signal, or -1 if not used.

int **quadwp_io_num**

GPIO pin for WP (Write Protect) signal, or -1 if not used.

int **data2_io_num**

GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int **quadhd_io_num**

GPIO pin for HD (Hold) signal, or -1 if not used.

int **data3_io_num**

GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int **data4_io_num**

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int **data5_io_num**

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int **data6_io_num**

GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int **data7_io_num**

GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int **max_transfer_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

uint32_t **flags**

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

intr_cpu_id_t **isr_cpu_id**

Select cpu core to register SPI ISR.

int **intr_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros

SPI_MAX_DMA_LEN

SPI_SWAP_DATA_TX(DATA, LEN)

Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to `&data`.

参数

- **DATA** –Data to be sent, can be uint8_t, uint16_t or uint32_t.
- **LEN** –Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

SPI_SWAP_DATA_RX(DATA, LEN)

Transform received data of length <= 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

参数

- **DATA** –Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
- **LEN** –Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE

Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER

Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_GPIO_PINS

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

SPICOMMON_BUSFLAG_SCLK

Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO

Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI

Check existing of MOSI pin. Or indicates MOSI line initialized.

SPICOMMON_BUSFLAG_DUAL

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_IO4_IO7

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

SPICOMMON_BUSFLAG_OCTAL

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

SPICOMMON_BUSFLAG_NATIVE_PINS

Type Definitions

typedef *spi_common_dma_t* **spi_dma_chan_t**

Enumerations

enum **spi_common_dma_t**

SPI DMA channels.

Values:

enumerator **SPI_DMA_DISABLED**

Do not enable DMA for SPI.

enumerator **SPI_DMA_CH_AUTO**

Enable DMA, channel is automatically selected by driver.

API Reference - SPI Master

Header File

- components/driver/spi/include/driver/spi_master.h

Functions

esp_err_t **spi_bus_add_device**(*spi_host_device_t* host_id, const *spi_device_interface_config_t* *dev_config, *spi_device_handle_t* *handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

备注： While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

参数

- **host_id** –SPI peripheral to allocate device on
- **dev_config** –SPI interface protocol config for the device
- **handle** –Pointer to variable to hold the device handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid or configuration combination is not supported (e.g. `dev_config->post_cb` isn't set while flag `SPI_DEVICE_NO_RETURN_RESULT` is enabled)
- ESP_ERR_INVALID_STATE if selected clock source is unavailable or spi bus not initialized
- ESP_ERR_NOT_FOUND if host doesn't have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **spi_bus_remove_device**(*spi_device_handle_t* handle)

Remove a device from the SPI bus.

参数 **handle** –Device handle to free

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

esp_err_t **spi_device_queue_trans**(*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

备注: Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

参数

- **handle** –Device handle obtained using spi_host_add_dev
- **trans_desc** –Description of transaction to execute
- **ticks_to_wait** –Ticks to wait until there's room in the queue; use portMAX_DELAY to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- ESP_ERR_TIMEOUT if there was no room in the queue before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

esp_err_t **spi_device_get_trans_result**(*spi_device_handle_t* handle, *spi_transaction_t* **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device succesfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

参数

- **handle** –Device handle obtained using spi_host_add_dev
- **trans_desc** –Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by spi_device_get_trans_result.
- **ticks_to_wait** –Ticks to wait until there's a returned item; use portMAX_DELAY to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if flag `SPI_DEVICE_NO_RETURN_RESULT` is set
- ESP_ERR_TIMEOUT if there was no completed transaction before ticks_to_wait expired
- ESP_OK on success

esp_err_t **spi_device_transmit**(*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_queue_trans() followed by spi_device_get_trans_result(). Do not use this when there is still a transaction separately queued (started) from spi_device_queue_trans() or polling_start/transmit that hasn't been finalized.

备注： This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simutanuously.

参数

- **handle** –Device handle obtained using spi_host_add_dev
- **trans_desc** –Description of transaction to execute

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **spi_device_polling_start**(*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Immediately start a polling transaction.

备注： Normally a device cannot start (queue) polling and interrupt transactions simutanuously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

参数

- **handle** –Device handle obtained using spi_host_add_dev
- **trans_desc** –Description of transaction to execute
- **ticks_to_wait** –Ticks to wait until there's room in the queue; currently only portMAX_DELAY is supported.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

esp_err_t **spi_device_polling_end**(*spi_device_handle_t* handle, TickType_t ticks_to_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has succesfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

参数

- **handle** –Device handle obtained using spi_host_add_dev
- **ticks_to_wait** –Ticks to wait until there's a returned item; use portMAX_DELAY to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
- ESP_OK on success

esp_err_t **spi_device_polling_transmit**(*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_polling_start() followed by spi_device_polling_end(). Do not use this when there is still a transaction that hasn't been finalized.

备注: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simutanuously.

参数

- **handle** –Device handle obtained using spi_host_add_dev
- **trans_desc** –Description of transaction to execute

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **spi_device_acquire_bus**(*spi_device_handle_t* device, TickType_t wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

备注: The function will wait until all the existing transactions have been sent.

参数

- **device** –The device to occupy the bus.
- **wait** –Time to wait before the the bus is occupied by the device. Currently MUST set to portMAX_DELAY.

返回

- ESP_ERR_INVALID_ARG : `wait` is not set to portMAX_DELAY.
- ESP_OK : Success.

void **spi_device_release_bus**(*spi_device_handle_t* dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

参数 **dev** –The device to release the bus.

esp_err_t **spi_device_get_actual_freq**(*spi_device_handle_t* handle, int *freq_khz)

Calculate working frequency for specific device.

参数

- **handle** –SPI device handle
- **freq_khz** –**[out]** output parameter to hold calculated frequency in kHz

返回

- ESP_ERR_INVALID_ARG : `handle` or `freq_khz` parameter is NULL
- ESP_OK : Success

int **spi_get_actual_clock**(int fapb, int hz, int duty_cycle)

Calculate the working frequency that is most close to desired frequency.

参数

- **fapb** –The frequency of apb clock, should be `APB_CLK_FREQ`.
- **hz** –Desired working frequency
- **duty_cycle** –Duty cycle of the spi clock

返回 Actual working frequency that most fit.

void **spi_get_timing**(bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)

Calculate the timing settings of specified frequency and settings.

备注: If **dummy_o* is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

参数

- **gpio_is_used** –True if using GPIO matrix, or False if iomux pins are used.
- **input_delay_ns** –Input delay from SCLK launch edge to MISO data valid.
- **eff_clk** –Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
- **dummy_o** –Address of dummy bits used output. Set to NULL if not needed.
- **cycles_remain_o** –Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int **spi_get_freq_limit**(bool gpio_is_used, int input_delay_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be aplied in the half duplex mode.

参数

- **gpio_is_used** –True if using GPIO matrix, or False if native pins are used.
- **input_delay_ns** –Input delay from SCLK launch edge to MISO data valid.

返回 Frequency limit of current configurations.

esp_err_t **spi_bus_get_max_transaction_len**(*spi_host_device_t* host_id, size_t *max_bytes)

Get max length (in bytes) of one transaction.

参数

- **host_id** –SPI peripheral
- **max_bytes** –**[out]** Max length of one transaction, in bytes

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument

Structures

struct **spi_device_interface_config_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

Public Members

uint8_t **command_bits**

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

uint8_t **address_bits**

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

uint8_t **dummy_bits**

Amount of dummy bits to insert between address and data phase.

uint8_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

spi_clock_source_t **clock_source**

Select SPI clock source, `SPI_CLK_SRC_DEFAULT` by default.

uint16_t **duty_cycle_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t **cs_ena_pretrans**

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t **cs_ena_posttrans**

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int **clock_speed_hz**

Clock speed, divisors of the SPI `clock_source`, in Hz.

int **input_delay_ns**

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it' s suggest to have the right value.

int **spics_io_num**

CS GPIO pin for this device, or -1 if not used.

uint32_t **flags**

Bitwise OR of SPI_DEVICE_* flags.

int **queue_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

transaction_cb_t **pre_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

transaction_cb_t **post_cb**

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct **spi_transaction_t**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members

uint32_t **flags**

Bitwise OR of SPI_TRANS_* flags.

uint16_t **cmd**

Command data, of which the length is set in the `command_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be "command" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

uint64_t **addr**

Address data, of which the length is set in the `address_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be "address" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.

Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t **length**

Total data length, in bits.

size_t **rxlength**

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

void ***user**

User-defined variable. Can be used to store eg transaction ID.

const void ***tx_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t **tx_data**[4]

If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void ***rx_buffer**

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t **rx_data**[4]

If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct **spi_transaction_ext_t**

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to `SPI_TRANS_VARIABLE_CMD_ADR` to use the bit length here.

Public Members

struct *spi_transaction_t* **base**

Transaction data, so that pointer to *spi_transaction_t* can be converted into *spi_transaction_ext_t*.

uint8_t **command_bits**

The command length in this transaction, in bits.

uint8_t **address_bits**

The address length in this transaction, in bits.

uint8_t **dummy_bits**

The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M

SPI common used frequency (in Hz)

备注： SPI peripheral only has an integer divider, and the default clock source can be different on other targets, so the actual frequency may be slightly different from the desired frequency. 8MHz

---

SPI_MASTER_FREQ_9M

8.89MHz

SPI_MASTER_FREQ_10M

10MHz

SPI_MASTER_FREQ_11M

11.43MHz

SPI_MASTER_FREQ_13M

13.33MHz

SPI_MASTER_FREQ_16M

16MHz

SPI_MASTER_FREQ_20M

20MHz

SPI_MASTER_FREQ_26M

26.67MHz

SPI_MASTER_FREQ_40M

40MHz

SPI_MASTER_FREQ_80M

80MHz

SPI_DEVICE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_DEVICE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_DEVICE_3WIRE

Use MOSI (=spid) for both sending and receiving data.

SPI_DEVICE_POSITIVE_CS

Make CS positive during a transaction instead of negative.

SPI_DEVICE_HALFDUPLEX

Transmit data before receiving it, instead of simultaneously.

SPI_DEVICE_CLK_AS_CS

Output clock on CS line if CS is active.

SPI_DEVICE_NO_DUMMY

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’ re going to work with output only, or read without dummy bits at your own risk.

SPI_DEVICE_DDRCLK

SPI_DEVICE_NO_RETURN_RESULT

Don’ t return the descriptor to the host on completion (use post_cb to notify instead)

SPI_TRANS_MODE_DIO

Transmit/receive data in 2-bit mode.

SPI_TRANS_MODE_QIO

Transmit/receive data in 4-bit mode.

SPI_TRANS_USE_RXDATA

Receive into rx_data member of *spi_transaction_t* instead into memory at rx_buffer.

SPI_TRANS_USE_TXDATA

Transmit tx_data member of *spi_transaction_t* instead of data at tx_buffer. Do not set tx_buffer when using this.

SPI_TRANS_MODE_DIOQIO_ADDR

Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

SPI_TRANS_VARIABLE_CMD

Use the `command_bits` in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

SPI_TRANS_VARIABLE_ADDR

Use the `address_bits` in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

SPI_TRANS_VARIABLE_DUMMY

Use the `dummy_bits` in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

SPI_TRANS_CS_KEEP_ACTIVE

Keep CS active after data transfer.

SPI_TRANS_MULTILINE_CMD

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

SPI_TRANS_MODE_OCT

Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

Type Definitions

typedef void (***transaction_cb_t**)(*spi_transaction_t* *trans)

typedef struct spi_device_t ***spi_device_handle_t**

Handle for a device on a SPI bus.

2.6.19 SPI 从机驱动程序

SPI 从机驱动程序控制在 ESP32-C3 中作为从机的 SPI 外设。

ESP32-C3 中 SPI 外设概述

ESP32-C3 集成了 1 个通用的 SPI 控制器。该控制器具有与之同名的独立总线信号。

术语

下表为 SPI 主机驱动的相关术语。

术语	定义
主机 (Host)	ESP32-C3 外部的 SPI 控制器外设。用作 SPI 主机，在总线上发起 SPI 传输。
从机设备 (Device)	SPI 从机设备（通用 SPI 控制器）。每个从机设备共享 MOSI、MISO 和 SCLK 信号，但只有当主机向从机设备的专属 CS 线发出信号时，从机设备才会在总线上处于激活状态。
总线 (Bus)	信号总线，由连接到同一主机的所有从机设备共用。一般来说，一条总线包括以下线路：MISO、MOSI、SCLK、一条或多条 CS 线，以及可选的 QUADWP 和 QUADHD。每个从机设备都有单独的 CS 线，除此之外，所有从机设备都连接在相同的线路下。如果以菊花链的方式连接，几个从机设备也可以共享一条 CS 线。
MISO	主机输入，从机输出，也写作 Q。数据从从机设备发送至主机。
MOSI	主机输出，从机输入，也写作 D。数据从主机发送至从机设备。
SCLK	串行时钟。由主机产生的振荡信号，使数据位的传输保持同步。
CS	片选。允许主机选择连接到总线上的单个从机设备，以便发送或接收数据。
QUADWP	写保护信号。只用于 4 位 (qio/qout) 传输。
QUADHD	保持信号。只用于 4 位 (qio/qout) 传输。
断言 (Assertion)	指激活一条线的操作。反之，将线路恢复到非活动状态（回到空闲状态）的操作则称为 *去断言*。
传输事务 (Transaction)	即主机断言从机设备的 CS 线，向从机设备传输数据，接着去断言 CS 线的过程。传输事务为原子操作，不可打断。
发射沿 (Launch Edge)	源寄存器将信号 *发射* 到线路上的时钟边沿。
锁存沿 (Latch Edge)	目的寄存器 *锁存* 信号的时钟边沿。

驱动程序的功能

SPI 从机驱动程序允许将 SPI 外设作为全双工设备使用。驱动程序可以发送/接收长度不超过 64 字节的传输事务，或者利用 DMA 来发送/接收更长的传输事务。然而，存在一些与 DMA 有关的已知问题。

SPI 从机驱动程序支持将 SPI ISR 注册至指定 CPU 内核。如果多个任务同时尝试访问一个 SPI 设备，建议您重构应用程序，以使每个 SPI 外设一次只由一个任务访问。此外，请使用 `spi_bus_config_t::isr_cpu_id` 将 SPI ISR 注册至与 SPI 外设相关任务相同的内核，确保线程安全。

SPI 传输事务

主机断言 CS 线并在 SCLK 线上发出时钟脉冲时，一次全双工 SPI 传输事务就此开始。每个时钟脉冲都意味着通过 MOSI 线从主机转移一个数据位到从机设备上，并同时通过 MISO 线返回一个数据位。传输事务结束后，主机去断言 CS 线。

传输事务的属性由作为从机设备的 SPI 外设的配置结构体 `spi_slave_interface_config_t` 和传输事务配置结构体 `spi_slave_transaction_t` 决定。

由于并非每次传输事务都需要写入和读取数据，您可以选择配置 `spi_transaction_t` 为仅 TX、仅 RX 或同时 TX 和 RX 传输事务。如果将 `spi_slave_transaction_t::rx_buffer` 设置为 NULL，读取阶段将被跳过。与之类似，如果将 `spi_slave_transaction_t::tx_buffer` 设置为 NULL，则写入阶段将被跳过。

备注： 主机应在从机设备准备好接收数据之后再进行传输事务。建议使用另外一个 GPIO 管脚作为握手信号来同步设备。更多细节，请参阅传输事务间隔。

使用驱动程序

- 调用函数 cpp:func:*spi_slave_initialize*，将 SPI 外设初始化为从机设备。请确保在 *bus_config* 中设置正确的 I/O 管脚，并将未使用的信号设置为 `-1`。
- 传输事务开始前，需用要求的事务参数填充一个或多个*spi_slave_transaction_t* 结构体。可以通过调用函数*spi_slave_queue_trans()* 来将所有传输事务排进队列，并在稍后使用函数*spi_slave_get_trans_result()* 查询结果；也可以将所有请求输入*spi_slave_transmit()* 中单独处理。主机上的传输事务完成前，后两个函数将被阻塞，以便发送并接收队列中的数据。

-（可选）如需卸载 SPI 从机驱动程序，请调用*spi_slave_free()*。

传输事务数据和主/从机长度不匹配

通常，通过从机设备进行传输的数据会被读取或写入到由*spi_slave_transaction_t::rx_buffer* 和*spi_slave_transaction_t::tx_buffer* 指示的大块内存中。可以配置 SPI 驱动程序，使用 DMA 进行传输。在这种情况下，则必须使用 `pvPortMallocCaps(size, MALLOC_CAP_DMA)` 将缓存区分配到具备 DMA 功能的内存中。

驱动程序可以读取或写入缓存区的数据量取决于*spi_slave_transaction_t::length*，但其并不会定义一次 SPI 传输的实际长度。传输事务的长度由主机的时钟线和 CS 线决定，且只有在传输事务完成后，才能从*spi_slave_transaction_t::trans_len* 中读取实际长度。

如果传输长度超过缓存区长度，则只有在*spi_slave_transaction_t::length* 中指定的初始比特数会被发送和接收。此时，*spi_slave_transaction_t::trans_len* 被设置为*spi_slave_transaction_t::length* 而非实际传输事务长度。若需满足实际传输事务长度的要求，请将*spi_slave_transaction_t::length* 设置为大于*spi_slave_transaction_t::trans_len* 预期最大值的值。如果传输长度短于缓存区长度，则只传输与缓存区长度相等的数据。

GPIO 交换矩阵和 IO_MUX

ESP32-C3 的大多数外设信号都直接连接到其专用的 IO_MUX 管脚。不过，也可以使用 GPIO 交换矩阵，将信号路由到任何可用的其他管脚。如果通过 GPIO 交换矩阵路由了至少一个信号，则所有信号都将通过 GPIO 交换矩阵路由。

当 SPI 主机频率配置为 80 MHz 或更低时，则通过 GPIO 交换矩阵或 IO_MUX 路由 SPI 管脚效果相同。

下表列出了 SPI 总线的 IO_MUX 管脚。

管脚名称	GPIO 编号 (SPI2)
CS0	10
SCLK	6
MISO	2
MOSI	7
QUADWP	5
QUADHD	4

速度与时钟

传输事务间隔 ESP32-C3 的 SPI 从机外设是由 CPU 控制的通用从机设备。与专用的从机相比，在内嵌 CPU 的 SPI 从机设备中，预定义寄存器的数量有限，所有的传输事务都必须由 CPU 处理。也就是说，传输和响应并不是实时的，且可能存在明显的延迟。

解决方案为，首先使用函数*spi_slave_queue_trans()*，然后使用*spi_slave_get_trans_result()*，来代替*spi_slave_transmit()*。由此一来，可使从机设备的响应速度提高一倍。

您也可以配置一个 GPIO 管脚，当从机设备开始新一次传输事务前，它将通过该管脚向主机发出信号。示例代码存放在 peripherals/spi_slave 目录下。

时钟频率要求 SPI 从机的工作频率最高可达 60 MHz。如果时钟频率过快或占空比不足 50%，数据就无法被正确识别或接收。

限制条件和已知问题

1. 若启用了 DMA，则 RX 缓冲区应该以字对齐（从 32 位边界开始，字节长度为 4 的倍数）。否则，DMA 可能无法正确写入或无法实现边界对齐。若此项条件不满足，驱动程序将会报错。
   此外，主机写入字节长度应为 4 的倍数。长度不符合的数据将被丢弃。

应用示例

从机设备/主机通信的示例代码存放在 ESP-IDF 示例项目的 peripherals/spi_slave 目录下。

Functions

esp_err_t **spi_slave_initialize**(*spi_host_device_t* host, const *spi_bus_config_t* *bus_config, const *spi_slave_interface_config_t* *slave_config, *spi_dma_chan_t* dma_chan)

Initialize a SPI bus as a slave interface.

警告： SPI0/1 is not supported

警告： If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

警告： The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

参数

- **host** –SPI peripheral to use as a SPI slave interface
- **bus_config** –Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- **slave_config** –Pointer to a *spi_slave_interface_config_t* struct specifying the details for the slave interface
- **dma_chan** –- Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

返回

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use

- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **spi_slave_free** (*spi_host_device_t* host)

Free a SPI bus claimed as a SPI slave interface.

参数 **host** –SPI peripheral to free

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

esp_err_t **spi_slave_queue_trans** (*spi_host_device_t* host, const *spi_slave_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via spi_slave_initialize.) This function may block if the queue is full (depending on the ticks_to_wait parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

参数

- **host** –SPI peripheral that is acting as a slave
- **trans_desc** –Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** –Ticks to wait until there's room in the queue; use portMAX_DELAY to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **spi_slave_get_trans_result** (*spi_host_device_t* host, *spi_slave_transaction_t* **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with spi_slave_queue_trans) has succesfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

参数

- **host** –SPI peripheral to that is acting as a slave
- **trans_desc** –**[out]** Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait** –Ticks to wait until there's a returned item; use portMAX_DELAY to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if flag `SPI_SLAVE_NO_RETURN_RESULT` is set
- ESP_OK on success

esp_err_t **spi_slave_transmit** (*spi_host_device_t* host, *spi_slave_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Do a SPI transaction.

Essentially does the same as spi_slave_queue_trans followed by spi_slave_get_trans_result. Do not use this when there is still a transaction queued that hasn't been finalized using spi_slave_get_trans_result.

参数

- **host** –SPI peripheral to that is acting as a slave
- **trans_desc** –Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** –Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Structures

struct **spi_slave_interface_config_t**

This is a configuration for a SPI host acting as a slave device.

Public Members

int **spics_io_num**

CS GPIO pin for this device.

uint32_t **flags**

Bitwise OR of SPI_SLAVE_* flags.

int **queue_size**

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

uint8_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

slave_transaction_cb_t **post_setup_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

slave_transaction_cb_t **post_trans_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct **spi_slave_transaction_t**

This structure describes one SPI transaction

Public Members

size_t **length**

Total data length, in bits.

size_t **trans_len**

Transaction data length, in bits.

const void ***tx_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

void ***rx_buffer**

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is anabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

void ***user**

User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_SLAVE_NO_RETURN_RESULT

Don't return the descriptor to the host on completion (use `post_trans_cb` to notify instead)

Type Definitions

typedef void (***slave_transaction_cb_t**)(*spi_slave_transaction_t* *trans)

2.6.20 SPI Slave Half Duplex

Introduction

The half duplex (HD) mode is a special mode provided by ESP SPI Slave peripheral. Under this mode, the hardware provides more services than the full duplex (FD) mode (the mode for general purpose SPI transactions, see *SPI 从机驱动程序*). These services reduce the CPU load and the response time of SPI Slave, but the communication format is determined by the hardware. The communication format is always half duplex, so comes the name of Half Duplex Mode.

There are several different types of transactions, determined by the *command* phase of the transaction. Each transaction may consist of the following phases: command, address, dummy, data. The command phase is mandatory, while the other fields may be determined by the command field. During the command, address, dummy phases, the bus is always controlled by the master, while the direction of the data phase depends on the command. The data phase can be either an in phase, for the master to write data to the slave; or an out phase, for the master to read data from the slave.

About the details of how master should communicate with the SPI Slave, see *ESP SPI Slave HD (Half Duplex) Mode Protocol*.

By these different transactions, the slave provide these services to the master:

- A DMA channel for the master to write a great amount of data to the slave.
- A DMA channel for the master to read a great amount of data from the slave.
- Several general purpose registers, shard between the master and the slave.
- Several general purpose interrupts, for the master to interrupt the SW of slave.

Terminology

- Transaction
- Channel
- Sending
- Receiving
- Data Descriptor

Driver Feature

- Transaction read/write by master in segments
- Queues for data to send and received

Driver usage

Slave initialization Call `spi_slave_hd_init()` to initialize the SPI bus as well as the peripheral and the driver. The SPI slave will exclusively use the SPI peripheral, pins of the bus before it's deinitialized. Most configurations of the slave should be done as soon as the slave is being initialized.

The `spi_bus_config_t` specifies how the bus should be initialized, while `spi_slave_hd_slot_config_t` specifies how the SPI Slave driver should work.

Deinitialization (optional) Call `spi_slave_hd_deinit()` to uninstall the driver. The resources, including the pins, SPI peripheral, internal memory used by the driver, interrupt sources, will be released by the deinit function.

Send/Receive Data by DMA Channels To send data to the master through the sending DMA channel, the application should properly wrap the data to send by a `spi_slave_hd_data_t` descriptor structure before calling `spi_slave_hd_queue_trans()` with the data descriptor, and the channel argument of `SPI_SLAVE_CHAN_TX`. The pointers to descriptors are stored in the queue, and the data will be send to the master upon master's RDDMA command in the same order they are put into the queue by `spi_slave_hd_queue_trans()`.

The application should check the result of data sending by calling `spi_slave_hd_get_trans_res()` with the channel set as `SPI_SLAVE_CHAN_TX`. This function will block until the transaction with command RDDMA from master successfully completes (or timeout). The `out_trans` argument of the function will output the pointer of the data descriptor which is just finished.

Receiving data from the master through the receiving DMA channel is quite similar. The application calls `spi_slave_hd_queue_trans()` with proper data descriptor and the channel argument of `SPI_SLAVE_CHAN_RX`. And the application calls the `spi_slave_hd_get_trans_res()` later to get the descriptor to the receiving buffer, before it handles the data in the receiving buffer.

备注： This driver itself doesn't have internal buffer for the data to send, or just received. The application should provide data descriptors for the data buffer to send to master, or to receive data from the master.

The application will have to properly keep the data descriptor as well as the buffer it points to, after the descriptor is successfully sent into the driver internal queue by `spi_slave_hd_queue_trans()`, and before returned by

spi_slave_hd_get_trans_res(). During this period, the hardware as well as the driver may read or write to the buffer and the descriptor when required at any time.

Please note that the buffer doesn't have to be fully sent or filled before it's terminated. For example, in the segment transaction mode, the master has to send CMD7 to terminate a WRDMA transaction, or send CMD8 to terminate a RDDMA transaction (in segments), no matter the send (receive) buffer is used up (full) or not.

Using Data Arguments Sometimes you may have initiator (sending data descriptor) and closure (handling returned descriptors) functions in different places. When you get the returned data descriptor in the closure, you may need some extra information when handle the finished data descriptor. For example, you may want to know which round it is for the returned descriptor, when you send the same piece of data for several times.

Set the `arg` member in the data descriptor to an variable indicating the transaction (by force casting), or point it to a a structure which wraps all the information you may need when handling the sending/receiving data. Then you can get what you need in your closure.

Using callbacks

备注： These callbacks are called in the ISR, so that they are fast enough. However, you may need to be very careful to write the code in the ISR. The callback should return as soon as possible. No delay or blocking operations are allowed.

The `spi_slave_hd_intr_config_t` member in the *spi_slave_hd_slot_config_t* configuration structure passed when initialize the SPI Slave HD driver, allows you having callbacks for each events you may concern.

The corresponding interrupt for each callbacks that is not *NULL* will enabled, so that the callbacks can be called immediately when the events happen. You don't need to provide callbacks for the unconcerned events.

The `arg` member in the configuration structure can help you pass some context to the callback, or indicate which SPI Slave instance when you are using the same callbacks for several SPI Slave peripherals. Set the `arg` member to an variable indicating the SPI Slave instance (by force casting), or point it to a context structure. All the callbacks will be called with this `arg` argument you set when the callbacks are initialized.

There are two other arguments: the `event` and the `awoken`. The `event` passes the information of the current event to the callback. The *spi_slave_hd_event_t* type contains the information of the event, for example, event type, the data descriptor just finished (The *data argument* will be very useful in this case!). The `awoken` argument is an output one, telling the ISR there are tasks are awoken after this callback, and the ISR should call *portYIELD_FROM_ISR()* to do task scheduling. Just pass the `awoken` argument to all FreeRTOS APIs which may unblock tasks, and the awoken will be returned to the ISR.

Writing/Reading Shared Registers Call *spi_slave_hd_write_buffer()* to write the shared buffer, and *spi_slave_hd_read_buffer()* to read the shared buffer.

备注： On ESP32-C3, the shared registers are read/written in words by the application, but read/written in bytes by the master. There's no guarantee four continuous bytes read from the master are from the same word written by the slave's application. It's also possible that if the slave reads a word while the master is writing bytes of the word, the slave may get one word with half of them just written by the master, and the other half hasn't been written into.

The master can confirm that the word is not in transition by reading the word twice and comparing the values.

For the slave, it will be more difficult to ensure the word is not in transition because the process of master writing four bytes can be very long (32 SPI clocks). You can put some CRC in the last (largest address) byte of a word so that when the byte is written, the word is sure to be all written.

Due to the conflicts there may be among read/write from SW (worse if there are multi cores) and master, it is suggested that a word is only used in one direction (only written by master or only written by the slave).

Receiving General Purpose Interrupts From the Master When the master sends CMD 0x08, 0x09 or 0x0A, the slave corresponding will be triggered. Currently the CMD8 is permanently used to indicate the termination of RDDMA segments. To receiving general purpose interrupts, register callbacks for CMD 0x09 and 0x0A when the slave is initialized, see *Using callbacks*.

Application Example

The code example for Device/Host communication can be found in the peripherals/spi_slave_hd directory of ESP-IDF examples.

API reference

Header File

- components/driver/spi/include/driver/spi_slave_hd.h

Functions

esp_err_t **spi_slave_hd_init** (*spi_host_device_t* host_id, const *spi_bus_config_t* *bus_config, const *spi_slave_hd_slot_config_t* *config)

Initialize the SPI Slave HD driver.

参数

- **host_id** –The host to use
- **bus_config** –Bus configuration for the bus used
- **config** –Configuration for the SPI Slave HD driver

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: invalid argument given
- ESP_ERR_INVALID_STATE: function called in invalid state, may be some resources are already in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM: memory allocation failed
- or other return value from `esp_intr_alloc`

esp_err_t **spi_slave_hd_deinit** (*spi_host_device_t* host_id)

Deinitialize the SPI Slave HD driver.

参数 **host_id** –The host to deinitialize the driver

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: if the host_id is not correct

esp_err_t **spi_slave_hd_queue_trans** (*spi_host_device_t* host_id, *spi_slave_chan_t* chan, *spi_slave_hd_data_t* *trans, TickType_t timeout)

Queue transactions (segment mode)

参数

- **host_id** –Host to queue the transaction
- **chan** –SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **trans** –Transaction descriptors
- **timeout** –Timeout before the data is queued

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: The input argument is invalid. Can be the following reason:
  - The buffer given is not DMA capable
  - The length of data is invalid (not larger than 0, or exceed the max transfer length)
  - The transaction direction is invalid
- ESP_ERR_TIMEOUT: Cannot queue the data before timeout. Master is still processing previous transaction.

- ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under segment mode.

esp_err_t **spi_slave_hd_get_trans_res** (*spi_host_device_t* host_id, *spi_slave_chan_t* chan, *spi_slave_hd_data_t* **out_trans, TickType_t timeout)

Get the result of a data transaction (segment mode)

备注: This API should be called successfully the same times as the `spi_slave_hd_queue_trans`.

参数

- **host_id** –Host to queue the transaction
- **chan** –Channel to get the result, SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **out_trans** –**[out]** Pointer to the transaction descriptor (*spi_slave_hd_data_t*) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it's meaningless for TX.
- **timeout** –Timeout before the result is got

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: Function is not valid
- ESP_ERR_TIMEOUT: There's no transaction done before timeout
- ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under segment mode.

void **spi_slave_hd_read_buffer** (*spi_host_device_t* host_id, int addr, uint8_t *out_data, size_t len)

Read the shared registers.

参数

- **host_id** –Host to read the shared registers
- **addr** –Address of register to read, 0 to `SOC_SPI_MAXIMUM_BUFFER_SIZE-1`
- **out_data** –**[out]** Output buffer to store the read data
- **len** –Length to read, not larger than `SOC_SPI_MAXIMUM_BUFFER_SIZE-addr`

void **spi_slave_hd_write_buffer** (*spi_host_device_t* host_id, int addr, uint8_t *data, size_t len)

Write the shared registers.

参数

- **host_id** –Host to write the shared registers
- **addr** –Address of register to write, 0 to `SOC_SPI_MAXIMUM_BUFFER_SIZE-1`
- **data** –Buffer holding the data to write
- **len** –Length to write, `SOC_SPI_MAXIMUM_BUFFER_SIZE-addr`

esp_err_t **spi_slave_hd_append_trans** (*spi_host_device_t* host_id, *spi_slave_chan_t* chan, *spi_slave_hd_data_t* *trans, TickType_t timeout)

Load transactions (append mode)

备注: In this mode, user transaction descriptors will be appended to the DMA and the DMA will keep processing the data without stopping

---

参数

- **host_id** –Host to load transactions
- **chan** –SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **trans** –Transaction descriptor
- **timeout** –Timeout before the transaction is loaded

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: The input argument is invalid. Can be the following reason:

  - The buffer given is not DMA capable
  - The length of data is invalid (not larger than 0, or exceed the max transfer length)
  - The transaction direction is invalid
- ESP_ERR_TIMEOUT: Master is still processing previous transaction. There is no available transaction for slave to load
- ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under append mode.

esp_err_t **spi_slave_hd_get_append_trans_res**(*spi_host_device_t* host_id, *spi_slave_chan_t* chan, *spi_slave_hd_data_t* **out_trans, TickType_t timeout)

Get the result of a data transaction (append mode)

备注: This API should be called the same times as the `spi_slave_hd_append_trans`

参数

- **host_id** –Host to load the transaction
- **chan** –SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **out_trans** –**[out]** Pointer to the transaction descriptor (*spi_slave_hd_data_t*) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it's meaningless for TX.
- **timeout** –Timeout before the result is got

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: Function is not valid
- ESP_ERR_TIMEOUT: There's no transaction done before timeout
- ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under append mode.

Structures

struct **spi_slave_hd_data_t**

Descriptor of data to send/receive.

Public Members

uint8_t ***data**

Buffer to send, must be DMA capable.

size_t **len**

Len of data to send/receive. For receiving the buffer length should be multiples of 4 bytes, otherwise the extra part will be truncated.

size_t **trans_len**

For RX direction, it indicates the data actually received. For TX direction, it is meaningless.

void ***arg**

Extra argument indiciating this data.

struct **spi_slave_hd_event_t**

Information of SPI Slave HD event.

Public Members

spi_event_t **event**

Event type.

spi_slave_hd_data_t ***trans**

Corresponding transaction for SPI_EV_SEND and SPI_EV_RECV events.

struct **spi_slave_hd_callback_config_t**

Callback configuration structure for SPI Slave HD.

Public Members

slave_cb_t **cb_buffer_tx**

Callback when master reads from shared buffer.

slave_cb_t **cb_buffer_rx**

Callback when master writes to shared buffer.

slave_cb_t **cb_send_dma_ready**

Callback when TX data buffer is loaded to the hardware (DMA)

slave_cb_t **cb_sent**

Callback when data are sent.

slave_cb_t **cb_recv_dma_ready**

Callback when RX data buffer is loaded to the hardware (DMA)

slave_cb_t **cb_recv**

Callback when data are received.

slave_cb_t **cb_cmd9**

Callback when CMD9 received.

slave_cb_t **cb_cmdA**

Callback when CMDA received.

void ***arg**

Argument indicating this SPI Slave HD peripheral instance.

struct **spi_slave_hd_slot_config_t**

Configuration structure for the SPI Slave HD driver.

Public Members

uint8_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint32_t **spics_io_num**

CS GPIO pin for this device.

uint32_t **flags**

Bitwise OR of SPI_SLAVE_HD_* flags.

uint32_t **command_bits**

command field bits, multiples of 8 and at least 8.

uint32_t **address_bits**

address field bits, multiples of 8 and at least 8.

uint32_t **dummy_bits**

dummy field bits, multiples of 8 and at least 8.

uint32_t **queue_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using spi_slave_hd_queue_trans but not yet finished using spi_slave_hd_get_trans_result) at the same time.

spi_dma_chan_t **dma_chan**

DMA channel to used.

spi_slave_hd_callback_config_t **cb_config**

Callback configuration.

Macros

SPI_SLAVE_HD_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_HD_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_SLAVE_HD_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_SLAVE_HD_APPEND_MODE

Adopt DMA append mode for transactions. In this mode, users can load(append) DMA descriptors without stopping the DMA.

Type Definitions

typedef bool (***slave_cb_t**)(void *arg, *spi_slave_hd_event_t* *event, BaseType_t *awoken)

Callback for SPI Slave HD.

Enumerations

enum **spi_slave_chan_t**

Channel of SPI Slave HD to do data transaction.

Values:

enumerator **SPI_SLAVE_CHAN_TX**

The output channel (RDDMA)

enumerator **SPI_SLAVE_CHAN_RX**

The input channel (WRDMA)

2.6.21 Temperature Sensor

Introduction

The ESP32-C3 has a built-in sensor used to measure the chip' s internal temperature. The temperature sensor module contains an 8-bit Sigma-Delta ADC and a DAC to compensate for the temperature offset.

Due to restrictions of hardware, the sensor has predefined measurement ranges with specific measurement errors. See the table below for details.

predefined range (°C)	error (°C)
50 ~ 125	< 3
20 ~ 100	< 2
-10 ~ 80	< 1
-30 ~ 50	< 2
-40 ~ 20	< 3

备注: The temperature sensor is designed primarily to measure the temperature changes inside the chip. The temperature value depends on factors like microcontroller clock frequency or I/O load. Generally, the chip' s internal temperature might be higher than the ambient temperature.

Functional Overview

- *Resource Allocation* - covers which parameters should be set up to get a temperature sensor handle and how to recycle the resources when temperature sensor finishes working.
- *Enable and Disable Temperature Sensor* - covers how to enable and disable the temperature sensor.
- *Get Temperature Value* - covers how to get the real-time temperature value.
- *Power Management* - covers how temperature sensor is affected when changing power mode (i.e. light sleep).
- *Thread Safety* - covers how to make the driver to be thread safe.

Resource Allocation The ESP32-C3 has just one built-in temperature sensor hardware. The temperature sensor instance is represented by `temperature_sensor_handle_t`, which is also the bond of the context. It would always be the parameter of the temperature APIs with the information of hardware and configurations, so user can just create a pointer of type `temperature_sensor_handle_t` and passing to APIs as needed.

In order to install a built-in temperature sensor instance, the first thing is to evaluate the temperature range in your detection environment (For example: if the testing environment is in a room, the range you evaluate might be 10 °C ~ 30 °C; if the testing in a lamp bulb, the range you evaluate might be 60 °C ~ 110 °C). Based on that, the following configuration structure should be defined in advance: `temperature_sensor_config_t`:

- `range_min`. The minimum value of testing range you have evaluated.
- `range_max`. The maximum value of testing range you have evaluated.

After the ranges are set, the structure could be passed to *temperature_sensor_install()*, which will instantiate the temperature sensor instance and return a handle.

As mentioned above, different measure ranges have different measurement errors. The user doesn't need to care about the measurement error because we have an internal mechanism to choose the minimum error according to the given range.

If the temperature sensor is no longer needed, you need to call *temperature_sensor_uninstall()* to free the temperature sensor resource.

Creating a Temperature Sensor Handle

- Step1: Evaluate the testing range. In this example, the range is 20 °C ~ 50 °C.
- Step2: Configure the range and obtain a handle

```
temperature_sensor_handle_t temp_handle = NULL;
temperature_sensor_config_t temp_sensor = {
    .range_min = 20,
    .range_max = 50,
};
ESP_ERROR_CHECK(temperature_sensor_install(&temp_sensor, &temp_handle));
```

Enable and Disable Temperature Sensor

1. Enable the temperature sensor by calling *temperature_sensor_enable()*. The internal temperature sensor circuit will start to work. The driver state will transit from init to enable.
2. To Disable the temperature sensor, please call *temperature_sensor_disable()*.

Get Temperature Value After the temperature sensor is enabled by *temperature_sensor_enable()*, user can get the current temperature by calling *temperature_sensor_get_celsius()*.

```
// Enable temperature sensor
ESP_ERROR_CHECK(temperature_sensor_enable(temp_handle));
// Get converted sensor data
float tsens_out;
ESP_ERROR_CHECK(temperature_sensor_get_celsius(temp_handle, &tsens_out));
printf("Temperature in %f °C\n", tsens_out);
// Disable the temperature sensor if it's not needed and save the power
ESP_ERROR_CHECK(temperature_sensor_disable(temp_handle));
```

Power Management When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), temperature sensor will still keep working because it uses XTAL clock (on ESP32-C3) or RTC clock (on ESP32-S2/S3).

Thread Safety In temperature sensor we don't add any protection to keep the thread safe. Because from the common usage, temperature sensor should only be called in one task. If you must use this driver in different tasks, please add extra locks to protect it.

Unexpected Behaviors

1. The value user gets from the chip is usually different from the ambient temperature. It is because the temperature sensor is built inside the chip. To some extent, it measures the temperature of the chip.
2. When installing the temperature sensor, the driver gives a 'the boundary you gave cannot meet the range of internal temperature sensor' error feedback. It is because the built-in temperature sensor has testing limit. The error due to setting *temperature_sensor_config_t*:

(1) Totally out of range, like 200 °C ~ 300 °C.
(2) Cross the boundary of each predefined measurement. like 40 °C ~ 110 °C.

Application Example

- Temperature sensor reading example: peripherals/temperature_sensor/temp_sensor.

API Reference

Header File

- components/driver/temperature_sensor/include/driver/temperature_sensor.h

Functions

esp_err_t **temperature_sensor_install** (const *temperature_sensor_config_t* *tsens_config, *temperature_sensor_handle_t* *ret_tsens)

Install temperature sensor driver.

参数
- **tsens_config** –Pointer to config structure.
- **ret_tsens** –Return the pointer of temperature sensor handle.

返回
- ESP_OK if succeed

esp_err_t **temperature_sensor_uninstall** (*temperature_sensor_handle_t* tsens)

Uninstall the temperature sensor driver.

参数 **tsens** –The handle created by `temperature_sensor_install()`.

返回
- ESP_OK if succeed.

esp_err_t **temperature_sensor_enable** (*temperature_sensor_handle_t* tsens)

Enable the temperature sensor.

参数 **tsens** –The handle created by `temperature_sensor_install()`.

返回
- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is enabled already.

esp_err_t **temperature_sensor_disable** (*temperature_sensor_handle_t* tsens)

Disable temperature sensor.

参数 **tsens** –The handle created by `temperature_sensor_install()`.

返回
- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is not enabled yet.

esp_err_t **temperature_sensor_get_celsius** (*temperature_sensor_handle_t* tsens, float *out_celsius)

Read temperature sensor data that is converted to degrees Celsius.

备注: Should not be called from interrupt.

参数
- **tsens** –The handle created by `temperature_sensor_install()`.
- **out_celsius** –The measure output value.

返回
- ESP_OK Success

- ESP_ERR_INVALID_ARG invalid arguments
- ESP_ERR_INVALID_STATE Temperature sensor is not enabled yet.
- ESP_FAIL Parse the sensor data into ambient temperature failed (e.g. out of the range).

Structures

struct **temperature_sensor_config_t**

Configuration of measurement range for the temperature sensor.

备注: If you see the log `the boundary you gave cannot meet the range of internal temperature sensor`. You may need to refer to predefined range listed doc `api-reference/peripherals/Temperature sensor`.

Public Members

int **range_min**

the minimum value of the temperature you want to test

int **range_max**

the maximum value of the temperature you want to test

temperature_sensor_clk_src_t **clk_src**

the clock source of the temperature sensor.

Macros

TEMPERATURE_SENSOR_CONFIG_DEFAULT(min, max)

temperature_sensor_config_t default constructure

Type Definitions

typedef struct temperature_sensor_obj_t ***temperature_sensor_handle_t**

Type of temperature sensor driver handle.

2.6.22 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-C3 contains 1 TWAI controller(s) that can be configured to communicate on a TWAI bus via an external transceiver.

警告: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

Sections

- *Two-Wire Automotive Interface (TWAI)*
  - *Overview*
  - *TWAI Protocol Summary*
  - *Signals Lines and Transceiver*
  - *Driver Configuration*
  - *Driver Operation*
  - *Examples*
  - *API Reference*

TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

Asynchronous: The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

Error Detection and Signalling: Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

Message Priorities: Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

TWAI Messages TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

Error States and Counters The TWAI protocol implements a feature known as "fault confinement" where a persistently erroneous node will eventually eliminate itself form the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node's **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

Error Active: A node is Error Active when **both TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

Error Passive: A node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

Bus-Off: A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

Signals Lines and Transceiver

The TWAI controller does not contain a integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required**. The type of external transceiver used should depend on the application's physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller's interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32-C3's GPIO pads.

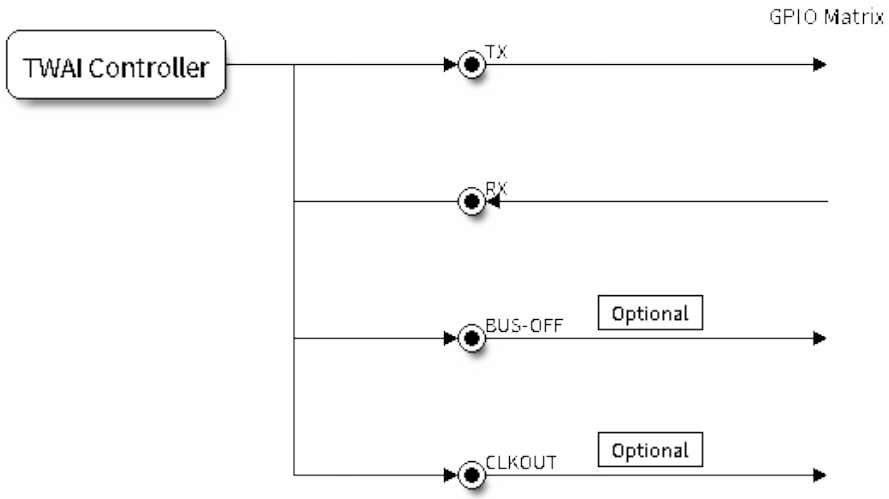

图 17: Signal lines of the TWAI controller

TX and RX: The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

BUS-OFF: The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

CLKOUT: The CLKOUT signal line is **optional** and outputs a prescaled version of the controller's source clock.

备注: An external transceiver **must internally loopback the TX to RX** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

Driver Configuration

This section covers how to configure the TWAI driver.

Operating Modes The TWAI driver supports the following modes of operations:

Normal Mode: The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

No Ack Mode: The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

Listen Only Mode: This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

Alerts The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling *twai_reconfigure_alerts()*. The application can then wait for any enabled alerts to occur by calling *twai_read_alerts()*. The TWAI driver supports the following alerts:

表 5: TWAI Driver Alerts

Alert Flag	Description
TWAI_ALERT_TX_IDLE	No more messages queued for transmission
TWAI_ALERT_TX_SUCCESS	The previous transmission was successful
TWAI_ALERT_RX_DATA	A frame has been received and added to the RX queue
TWAI_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
TWAI_ALERT_ERR_ACTIVE	TWAI controller has become error active
TWAI_ALERT_RECOVERY_IN_PROGRESS	TWAI controller is undergoing bus recovery
TWAI_ALERT_BUS_RECOVERED	TWAI controller has successfully completed bus recovery
TWAI_ALERT_ARB_LOST	The previous transmission lost arbitration
TWAI_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
TWAI_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
TWAI_ALERT_TX_FAILED	The previous transmission has failed
TWAI_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
TWAI_ALERT_ERR_PASS	TWAI controller has become error passive
TWAI_ALERT_BUS_OFF	Bus-off condition occurred. TWAI controller can no longer influence bus

备注: The TWAI controller's **error warning limit** is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the **error warning limit** to **96**. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below **96**.

备注: When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the *CONFIG_TWAI_ISR_IN_IRAM* option is enabled (see *Placing ISR into IRAM*).

备注: The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

Bit Timing The operating bit rate of the TWAI driver is configured using the *twai_timing_config_t* structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quantum** is determined by a prescaled version of the TWAI controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller's source clock. On the ESP32-C3, the `brp` can be **any even number from 2 to 16384**. Alternatively, you can decide the resolution of each quantum, by setting *`twai_timing_config_t::quanta_resolution_hz`* to a non-zero value. In this way, the driver can calculate the underlying `brp` value for you. It's useful when you set different clock sources but want the bitrate to keep the same.

Supported clock source for a TWAI controller is listed in the *`twai_clock_source_t`* and can be specified in *`twai_timing_config_t::clk_src`*.

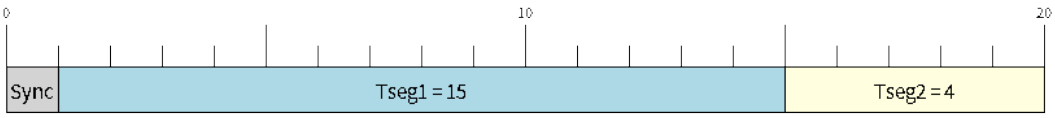

图 18: Bit timing configuration for 500kbit/s given BRP = 8, clock source frequency is 80MHz

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

备注: Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS`
- `TWAI_TIMING_CONFIG_800KBITS`
- `TWAI_TIMING_CONFIG_500KBITS`
- `TWAI_TIMING_CONFIG_250KBITS`
- `TWAI_TIMING_CONFIG_125KBITS`
- `TWAI_TIMING_CONFIG_100KBITS`
- `TWAI_TIMING_CONFIG_50KBITS`
- `TWAI_TIMING_CONFIG_25KBITS`
- `TWAI_TIMING_CONFIG_20KBITS`
- `TWAI_TIMING_CONFIG_16KBITS`
- `TWAI_TIMING_CONFIG_12_5KBITS`
- `TWAI_TIMING_CONFIG_10KBITS`
- `TWAI_TIMING_CONFIG_5KBITS`
- `TWAI_TIMING_CONFIG_1KBITS`

Acceptance Filter The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within *`twai_filter_config_t`* known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

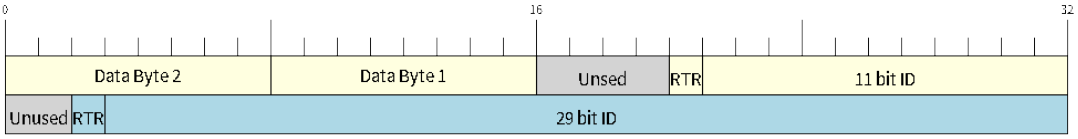

图 19: Bit layout of single filter mode (Right side MSBit)

Dual Filter Mode will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

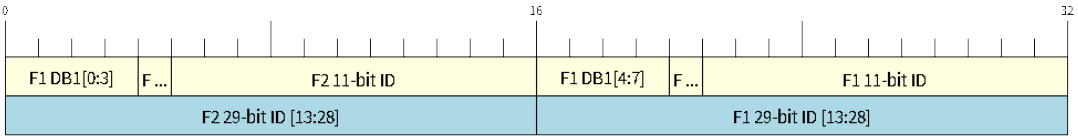

图 20: Bit layout of dual filter mode (Right side MSBit)

Disabling TX Queue The TX queue can be disabled during configuration by setting the `tx_queue_len` member of *`twai_general_config_t`* to `0`. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

Placing ISR into IRAM The TWAI driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver's RX queue.
- Load messages pending transmission from the driver's TX queue and write them into the TX buffer.

To place the TWAI driver's ISR, users must do the following:

- Enable the *CONFIG_TWAI_ISR_IN_IRAM* option using `idf.py menuconfig`.
- When calling *`twai_driver_install()`*, the *intr_flags* member of *`twai_general_config_t`* should set the *`ESP_INTR_FLAG_IRAM`* set.

备注: When the *CONFIG_TWAI_ISR_IN_IRAM* option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

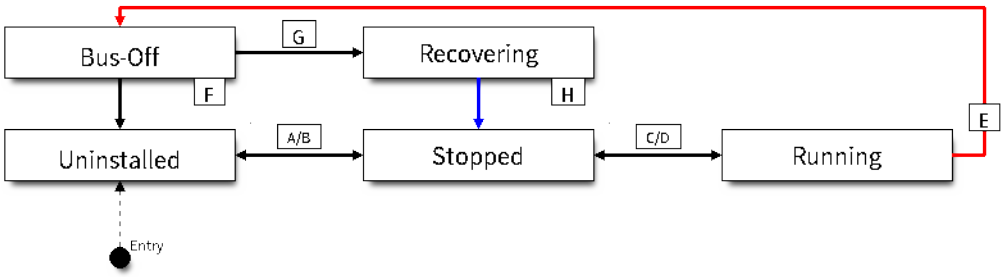

图 21: State transition diagram of the TWAI driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled -> Stopped	`twai_driver_install()`
B	Stopped -> Uninstalled	`twai_driver_uninstall()`
C	Stopped -> Running	`twai_start()`
D	Running -> Stopped	`twai_stop()`
E	Running -> Bus-Off	Transmit Error Counter >= 256
F	Bus-Off -> Uninstalled	`twai_driver_uninstall()`
G	Bus-Off -> Recovering	`twai_initiate_recovery()`
H	Recovering -> Stopped	128 occurrences of 11 consecutive recessive bits.

Driver States **Uninstalled**: In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

Stopped: In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

Running: In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

Bus-Off: The bus-off state is automatically entered when the TWAI controller' s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

Recovering: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

Message Fields and Flags The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the *flags* member of `twai_message_t` and the following message flags:

Message Flag	Description
TWAI_MSG_FLAG_EXTD	Message is in Extended Frame Format (29bit ID)
TWAI_MSG_FLAG_RTR	Message is a Remote Frame (Remote Transmission Request)
TWAI_MSG_FLAG_SS	Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.
TWAI_MSG_FLAG_SELF	Transmit message using Self Reception Request (Transmitted message will also received by the same node). Unused for received message.
TWAI_MSG_FLAG_DLC_NON_COMP	Message's Data length code is larger than 8. This will break compliance with TWAI
TWAI_MSG_FLAG_NONE	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

Examples

Configuration & Installation The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the *twai_driver_install()* function, and the *twai_start()* function.

```
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
↪NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...

}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

Message Transmission The following code snippet demonstrates how to transmit a message via the usage of the *twai_message_t* type and *twai_transmit()* function.

```
#include "driver/twai.h"

...
```

(下页继续)

(续上页)

```
//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

Message Reception The following code snippet demonstrates how to receive a message via the usage of the *twai_message_t* type and *twai_receive()* function.

```
#include "driver/twai.h"

...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}
```

Reconfiguring and Reading Alerts The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the *twai_reconfigure_alerts()* and *twai_read_alerts()* functions.

```
#include "driver/twai.h"

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
```

(下页继续)

(续上页)

```
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);
```

Stop and Uninstall The following code demonstrates how to stop and uninstall the TWAI driver via the use of the *twai_stop()* and *twai_driver_uninstall()* functions.

```
#include "driver/twai.h"

...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration The acceptance mask in *twai_filter_config_t* can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

```
ID1 =  11'b101 1010 0000
ID2 =  11'b101 1010 0001
ID3 =  11'b101 1010 0100
ID4 =  11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101
```

Application Examples **Network Example:** The TWAI Network example demonstrates communication between two ESP32-C3s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via peripherals/twai/twai_network.

Alert and Recovery Example: This example demonstrates how to use the TWAI driver's alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via peripherals/twai/twai_alert_and_recovery.

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via peripherals/twai/twai_self_test.

API Reference

Header File

- components/hal/include/hal/twai_types.h

Structures

struct **twai_message_t**

Structure to store a TWAI message.

备注： The flags member is deprecated

Public Members

uint32_t **extd**

Extended Frame Format (29bit ID)

uint32_t **rtr**

Message is a Remote Frame

uint32_t **ss**

Transmit as a Single Shot Transmission. Unused for received.

uint32_t **self**

Transmit as a Self Reception Request. Unused for received.

uint32_t **dlc_non_comp**

Message's Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32_t **reserved**

Reserved bits

uint32_t **flags**

Deprecated: Alternate way to set bits using message flags

uint32_t **identifier**

11 or 29 bit identifier

uint8_t **data_length_code**

Data length code

uint8_t **data**[TWAI_FRAME_MAX_DLC]

Data bytes (not relevant in RTR frame)

struct **twai_timing_config_t**

Structure for bit timing configuration of the TWAI driver.

备注： Macro initializers are available for this structure

Public Members

twai_clock_source_t **clk_src**

Clock source, set to 0 or TWAI_CLK_SRC_DEFAULT if you want a default clock source

uint32_t **quanta_resolution_hz**

The resolution of one timing quanta, in Hz. Note: the value of `brp` will reflected by this field if it's non-zero, otherwise, `brp` needs to be set manually

uint32_t **brp**

Baudrate prescale (i.e., clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for non-ESP32 chip. Note: For ESP32 ECO 2 or later, multiples of 4 from 132 to 256 are also supported

uint8_t **tseg_1**

Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t **tseg_2**

Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t **sjw**

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool **triple_sampling**

Enables triple sampling when the TWAI controller samples a bit

struct **twai_filter_config_t**

Structure for acceptance filter configuration of the TWAI driver (see documentation)

备注： Macro initializers are available for this structure

Public Members

uint32_t **acceptance_code**

32-bit acceptance code

uint32_t **acceptance_mask**

32-bit acceptance mask

bool **single_filter**

Use Single Filter Mode (see documentation)

Macros

TWAI_EXTD_ID_MASK

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

TWAI_STD_ID_MASK

Bit mask for 11 bit Standard Frame Format ID

TWAI_FRAME_MAX_DLC

Max data bytes allowed in TWAI

TWAI_FRAME_EXTD_ID_LEN_BYTES

EFF ID requires 4 bytes (29bit)

TWAI_FRAME_STD_ID_LEN_BYTES

SFF ID requires 2 bytes (11bit)

TWAI_ERR_PASS_THRESH

Error counter threshold for error passive

Type Definitions

typedef *soc_periph_twai_clk_src_t* **twai_clock_source_t**

RMT group clock source.

备注: User should select the clock source based on the power and resolution requirement

---

Enumerations

enum **twai_mode_t**

TWAI Controller operating modes.

Values:

enumerator **TWAI_MODE_NORMAL**

Normal operating mode where TWAI controller can send/receive/acknowledge messages

enumerator **TWAI_MODE_NO_ACK**

Transmission does not require acknowledgment. Use this mode for self testing

enumerator **TWAI_MODE_LISTEN_ONLY**

The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File

- components/driver/twai/include/driver/twai.h

Functions

esp_err_t **twai_driver_install**(const *twai_general_config_t* *g_config, const *twai_timing_config_t* *t_config, const *twai_filter_config_t* *f_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

备注： Macro initializers are available for the configuration structures (see documentation)

备注： To reinstall the TWAI driver, call twai_driver_uninstall() first

参数

- **g_config** –**[in]** General configuration structure
- **t_config** –**[in]** Timing configuration structure
- **f_config** –**[in]** Filter configuration structure

返回

- ESP_OK: Successfully installed TWAI driver
- ESP_ERR_INVALID_ARG: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed

esp_err_t **twai_driver_uninstall**(void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

警告： The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

返回

- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

esp_err_t **twai_start**(void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

返回

- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

esp_err_t **twai_stop**(void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until twai_start() is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

警告： A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

返回

- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

esp_err_t **twai_transmit**(const *twai_message_t* *message, TickType_t ticks_to_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

备注： This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

备注： The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

参数

- **message** –**[in]** Message to transmit
- **ticks_to_wait** –**[in]** Number of FreeRTOS ticks to block on the TX queue

返回

- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

esp_err_t **twai_receive**(*twai_message_t* *message, TickType_t ticks_to_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

警告： The flags field of the received message should be checked to determine if the received message contains any data bytes.

参数

- **message** –**[out]** Received message
- **ticks_to_wait** –**[in]** Number of FreeRTOS ticks to block on RX queue

返回

- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_read_alerts**(uint32_t *alerts, TickType_t ticks_to_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

备注： Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

参数

- **alerts** –**[out]** Bit field of raised alerts (see documentation for alert flags)
- **ticks_to_wait** –**[in]** Number of FreeRTOS ticks to block for alert

返回

- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_reconfigure_alerts**(uint32_t alerts_enabled, uint32_t *current_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

参数

- **alerts_enabled** –**[in]** Bit field of alerts to enable (see documentation for alert flags)
- **current_alerts** –**[out]** Bit field of currently raised alerts. Set to NULL if unused

返回

- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_initiate_recovery**(void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

备注: The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

返回

- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

esp_err_t **twai_get_status_info**(*twai_status_info_t* *status_info)

Get current status information of the TWAI driver.

参数 **status_info** –**[out]** Status information

返回

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_clear_transmit_queue**(void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

备注: The transmit queue is automatically cleared when twai_stop() or twai_initiate_recovery() is called.

返回

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

esp_err_t **twai_clear_receive_queue**(void)

Clear the receive queue.

This function will clear the receive queue of all messages.

备注： The receive queue is automatically cleared when twai_start() is called.

返回

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

Structures

struct **twai_general_config_t**

Structure for general configuration of the TWAI driver.

备注： Macro initializers are available for this structure

Public Members

twai_mode_t **mode**

Mode of TWAI controller

gpio_num_t **tx_io**

Transmit GPIO number

gpio_num_t **rx_io**

Receive GPIO number

gpio_num_t **clkout_io**

CLKOUT GPIO number (optional, set to -1 if unused)

gpio_num_t **bus_off_io**

Bus off indicator GPIO number (optional, set to -1 if unused)

uint32_t **tx_queue_len**

Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32_t **rx_queue_len**

Number of messages RX queue can hold

uint32_t **alerts_enabled**

Bit field of alerts to enable (see documentation)

uint32_t **clkout_divider**

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int **intr_flags**

Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

struct **twai_status_info_t**

Structure to store status information of TWAI driver.

Public Members

twai_state_t **state**

Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32_t **msgs_to_tx**

Number of messages queued for transmission or awaiting transmission completion

uint32_t **msgs_to_rx**

Number of messages in RX queue waiting to be read

uint32_t **tx_error_counter**

Current value of Transmit Error Counter

uint32_t **rx_error_counter**

Current value of Receive Error Counter

uint32_t **tx_failed_count**

Number of messages that failed transmissions

uint32_t **rx_missed_count**

Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t **rx_overrun_count**

Number of messages that were lost due to a RX FIFO overrun

uint32_t **arb_lost_count**

Number of instances arbitration was lost

uint32_t **bus_error_count**

Number of instances a bus error has occurred

Macros

TWAI_IO_UNUSED

Marks GPIO as unused in TWAI configuration

Enumerations

enum **twai_state_t**

TWAI driver states.

Values:

enumerator **TWAI_STATE_STOPPED**

Stopped state. The TWAI controller will not participate in any TWAI bus activities

enumerator **TWAI_STATE_RUNNING**

Running state. The TWAI controller can transmit and receive messages

enumerator **TWAI_STATE_BUS_OFF**

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

enumerator **TWAI_STATE_RECOVERING**

Recovering state. The TWAI controller is undergoing bus recovery

2.6.23 通用异步接收器/发送器 (UART)

简介

通用异步接收器/发送器 (UART) 属于一种硬件功能，通过使用 RS232、RS422、RS485 等常见异步串行通信接口来处理通信时序要求和数据帧。UART 是实现不同设备之间全双工或半双工数据交换的一种常用且经济的方式。

ESP32-C3 芯片有 2 个 UART 控制器（也称为端口），每个控制器都有一组相同的寄存器以简化编程并提高灵活性。

每个 UART 控制器可以独立配置波特率、数据位长度、位顺序、停止位位数、奇偶校验位等参数。所有控制器都与不同制造商的 UART 设备兼容，并且支持红外数据协会 (IrDA) 定义的标准协议。

功能概述

下文介绍了如何使用 UART 驱动程序的函数和数据类型在 ESP32-C3 和其他 UART 设备之间建立通信。基本编程流程分为以下几个步骤：

1. 设置通信参数 - 设置波特率、数据位、停止位等
2. 设置通信管脚 - 分配连接设备的管脚
3. 安装驱动程序 - 为 UART 驱动程序分配 ESP32-C3 资源
4. 运行 *UART* 通信 - 发送/接收数据
5. 使用中断 - 触发特定通信事件的中断
6. 删除驱动程序 - 如无需 UART 通信，则释放已分配的资源

步骤 1 到 3 为配置阶段，步骤 4 为 UART 运行阶段，步骤 5 和 6 为可选步骤。

UART 驱动程序函数通过*uart_port_t* 识别不同的 UART 控制器。调用以下所有函数均需此标识。

设置通信参数 UART 通信参数可以在一个步骤中完成全部配置，也可以在多个步骤中单独配置。

一次性配置所有参数 调用函数*uart_param_config()* 并向其传递*uart_config_t* 结构体，*uart_config_t* 结构体应包含所有必要的参数。请参考以下示例。

```
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
```

(下页继续)

(续上页)

```
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

了解配置硬件流控模式的更多信息，请参考 peripherals/uart/uart_echo。

分步依次配置每个参数 调用下表中的专用函数，能够单独配置特定参数。如需重新配置某个参数，也可使用这些函数。

表 6: 单独配置特定参数的函数

配置参数	函数
波特率	*uart_set_baudrate()*
传输位	调用*uart_set_word_length()* 设置*uart_word_length_t*
奇偶控制	调用*uart_parity_t* 设置*uart_set_parity()*
停止位	调用*uart_set_stop_bits()* 设置*uart_stop_bits_t*
硬件流控模式	调用*uart_set_hw_flow_ctrl()* 设置*uart_hw_flowcontrol_t*
通信模式	调用*uart_set_mode()* 设置*uart_mode_t*

表中每个函数都可使用 _get_ 对应项来查看当前设置值。例如，查看当前波特率值，请调用*uart_get_baudrate()*。

设置通信管脚 通信参数设置完成后，可以配置其他 UART 设备连接的 GPIO 管脚。调用函数*uart_set_pin()*，指定配置 Tx、Rx、RTS 和 CTS 信号的 GPIO 管脚编号。如要为特定信号保留当前分配的管脚编号，可传递宏*UART_PIN_NO_CHANGE*。

请为不使用的管脚都指定为宏*UART_PIN_NO_CHANGE*。

```
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 18, 19));
```

安装驱动程序 通信管脚设置完成后，请调用*uart_driver_install()* 安装驱动程序并指定以下参数：

- Tx 环形缓冲区的大小
- Rx 环形缓冲区的大小
- 事件队列句柄和大小
- 分配中断的标志

该函数将为 UART 驱动程序分配所需的内部资源。

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, \
                                    uart_buffer_size, 10, &uart_queue, 0));
```

此步骤完成后，您可连接外部 UART 设备检查通信。

运行 UART 通信 串行通信由每个 UART 控制器的有限状态机 (FSM) 控制。

发送数据的过程分为以下步骤：

1. 将数据写入 Tx FIFO 缓冲区
2. FSM 序列化数据

3. FSM 发送数据

接收数据的过程类似，只是步骤相反：

1. FSM 处理且并行化传入的串行流
2. FSM 将数据写入 Rx FIFO 缓冲区
3. 从 Rx FIFO 缓冲区读取数据

因此，应用程序仅会通过*uart_write_bytes()* 和*uart_read_bytes()* 从特定缓冲区写入或读取数据，其余工作由 FSM 完成。

发送数据 发送数据准备好后，调用函数*uart_write_bytes()*，并向其传递数据缓冲区的地址和数据长度。该函数会立即或在有足够可用空间时将数据复制到 Tx 环形缓冲区，随后退出。当 Tx FIFO 缓冲区中有可用空间时，中断服务例程 (ISR) 会在后台将数据从 Tx 环形缓冲区移动到 Tx FIFO 缓冲区。调用函数请参考以下代码。

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

函数*uart_write_bytes_with_break()* 与*uart_write_bytes()* 类似，但在传输结束时会添加串行中断信号。“串行中断信号”意味着 Tx 线保持低电平的时间长于一个数据帧。

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n",strlen("test break\n"), 100);
```

能够将数据写入 Tx FIFO 缓冲区的另一函数是*uart_tx_chars()*。与*uart_write_bytes()* 不同，此函数在没有可用空间之前不会阻塞。相反，它将写入所有可以立即放入硬件 Tx FIFO 的数据，然后返回写入的字节数。

“配套”函数*uart_wait_tx_done()* 用于监听 Tx FIFO 缓冲区的状态，并在缓冲区为空时返回。

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS␣
↪ticks (TickType_t)
```

接收数据 一旦数据被 UART 接收并保存在 Rx FIFO 缓冲区中，就需要使用函数*uart_read_bytes()* 检索数据。读取数据之前，调用*uart_get_buffered_data_len()* 能够查看 Rx FIFO 缓冲区中可用的字节数。请参考以下示例。

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

如果不再需要 Rx FIFO 缓冲区中的数据，可以调用*uart_flush()* 清空缓冲区。

软件流控 如果硬件流控被禁用，您可使用函数*uart_set_rts()* 和*uart_set_dtr()* 分别手动设置 RTS 和 DTR 信号电平。

通信方式选择 UART 控制器支持多种通信模式，使用函数*uart_set_mode()* 可以选择模式。选择特定模式后，UART 驱动程序将处理已连接 UART 设备的相应行为。例如，使用 RTS 线控制 RS485 驱动芯片，能够实现半双工 RS485 通信。

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

使用中断 根据特定的 UART 状态或检测到的错误，可以生成许多不同的中断。*ESP32-C3 技术参考手册* > UART 控制器 (UART) > UART 中断和 UHCI 中断 [PDF] 中提供了可用中断的完整列表。调用 `uart_enable_intr_mask()` 或 `uart_disable_intr_mask()` 能够分别启用或禁用特定中断。

调用 `uart_driver_install()` 函数可以安装驱动程序的内部中断处理程序，用以管理 Tx 和 Rx 环形缓冲区，并提供事件等高级 API 函数（见下文）。

API 提供了一种便利的方法来处理本文所讨论的特定中断，即用专用函数包装中断：

- **事件检测**：`uart_event_type_t` 定义了多个事件，使用 FreeRTOS 队列功能能够将其报告给用户应用程序。您可调用*安装驱动程序* 中的 `uart_driver_install()` 函数启用此功能，请参考 peripherals/uart/uart_events 中使用事件检测的示例。
- **达到 FIFO 空间阈值或传输超时**：Tx 和 Rx FIFO 缓冲区在填充特定数量的字符和在发送或接收数据超时的情况下将会触发中断。如要使用此类中断，请执行以下操作：
  - 配置缓冲区长度和超时阈值：在结构体 `uart_intr_config_t` 中输入相应阈值并调用 `uart_intr_config()`
  - 启用中断：调用函数 `uart_enable_tx_intr()` 和 `uart_enable_rx_intr()`
  - 禁用中断：调用函数 `uart_disable_tx_intr()` 或 `uart_disable_rx_intr()`
- **模式检测**：在检测到重复接收/发送同一字符的“模式”时触发中断，请参考示例 peripherals/uart/uart_events。例如，模式检测可用于检测命令字符串末尾是否存在特定数量的相同字符（“模式”）。可以调用以下函数：
  - 配置并启用此中断：调用 `uart_enable_pattern_det_baud_intr()`
  - 禁用中断：调用 `uart_disable_pattern_det_intr()`

宏指令 API 还定义了一些宏指令。例如，`UART_FIFO_LEN` 定义了硬件 FIFO 缓冲区的长度，`UART_BITRATE_MAX` 定义了 UART 控制器支持的最大波特率。

删除驱动程序 如不再需要与 `uart_driver_install()` 建立通信，则可调用 `uart_driver_delete()` 删除驱动程序，释放已分配的资源。

RS485 特定通信模式简介

备注： 下文将使用 `[UART_REGISTER_NAME].[UART_FIELD_BIT]` 指代 UART 寄存器字段/位。了解特定模式位的更多信息，请参考 *ESP32-C3 技术参考手册* > UART 控制器 (UART) > 寄存器摘要 [PDF]。您可搜索寄存器名称导航至寄存器描述，找到相应字段/位。

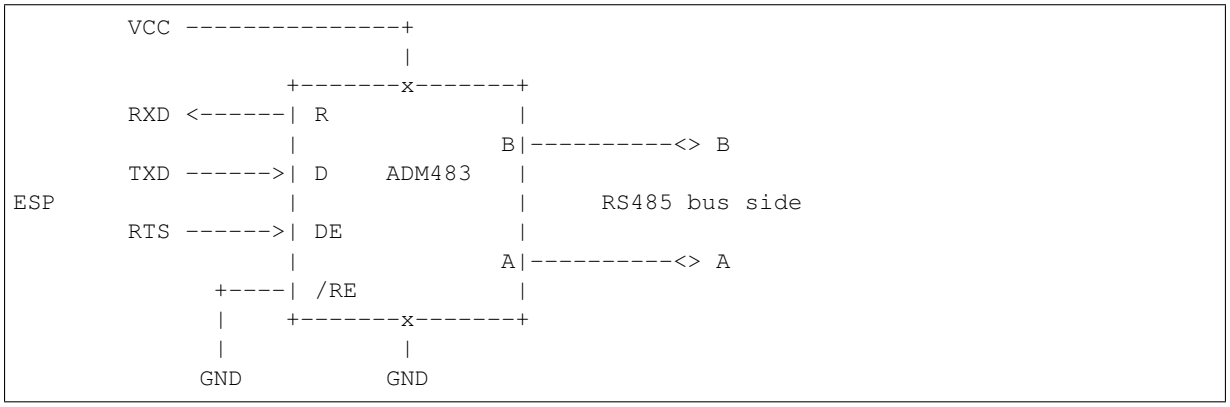
- `UART_RS485_CONF_REG.UART_RS485_EN`：设置此位将启用 RS485 通信模式支持。
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`：设置此位，发送器的输出信号将环回到接收器的输入信号。
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`：设置此位，如果接收器繁忙，发送器仍将发送数据（由硬件自动解决冲突）。

ESP32-C3 的 RS485 UART 硬件能够检测数据报传输期间的信号冲突，并在启用此中断时生成中断 `UART_RS485_CLASH_INT`。术语冲突表示发送的数据报与另一端接收到的数据报不同。数据冲突通常与总线上其他活跃设备的存在有关，或者是由于总线错误而出现。

冲突检测功能允许在激活和触发中断时处理冲突。中断 `UART_RS485_FRM_ERR_INT` 和 `UART_RS485_PARITY_ERR_INT` 可与冲突检测功能一起使用，在 RS485 模式下分别控制帧错误和奇偶校验位错误。UART 驱动程序支持此功能，通过选择 `UART_MODE_RS485_APP_CTRL` 模式可以使用（参考函数 `uart_set_mode()`）。

冲突检测功能可与电路 A 和电路 C 一起使用（参考章节*接口连接选项*）。在使用电路 A 或 B 时，连接到总线驱动 DE 管脚的 RTS 管脚应由用户应用程序控制。调用函数 `uart_get_collision_flag()` 能够查看是否触发冲突检测标志。

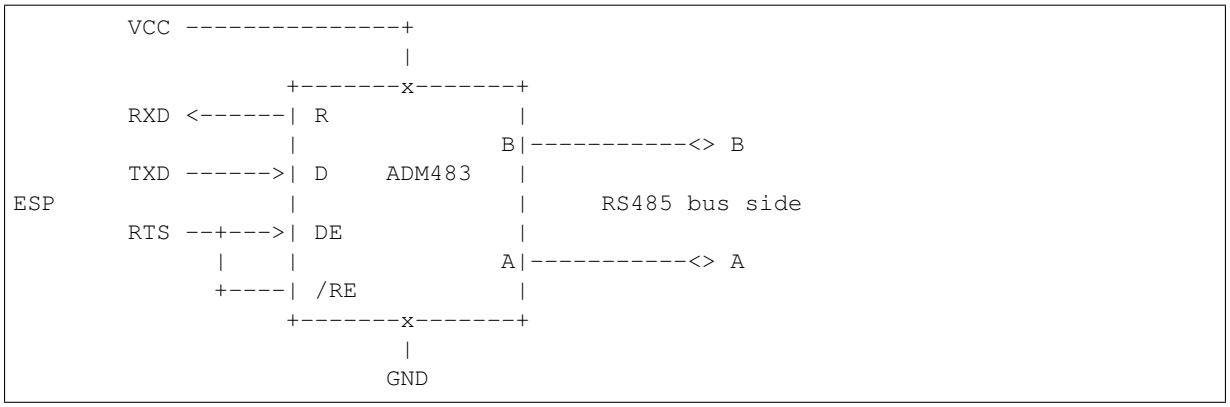
ESP32-C3 UART 控制器本身不支持半双工通信，因其无法自动控制连接到 RS485 总线驱动 RE/DE 输入的 RTS 管脚。然而，半双工通信能够通过 UART 驱动程序对 RTS 管脚的软件控制来实现，调用 `uart_set_mode()` 并选择 `UART_MODE_RS485_HALF_DUPLEX` 模式能够启用这一功能。



主机开始向 Tx FIFO 缓冲区写入数据时，UART 驱动程序会自动置位 RTS 管脚（逻辑 1）；最后一位数据传输完成后，驱动程序就会取消置位 RTS 管脚（逻辑 0）。要使用此模式，软件必须禁用硬件流控功能。此模式适用于下文所有已用电路。

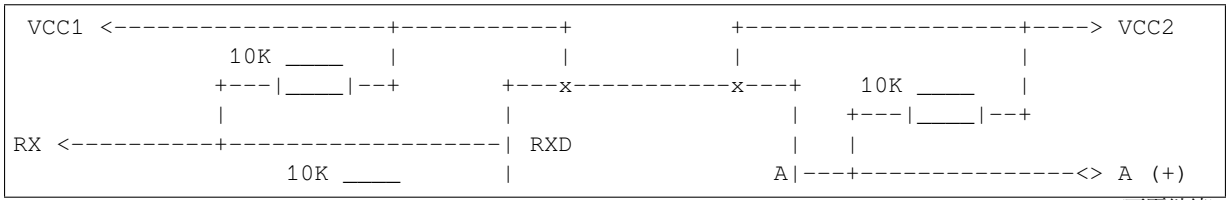
接口连接选项 本节提供了示例原理图来介绍 ESP32-C3 RS485 接口连接的基本内容。

备注:



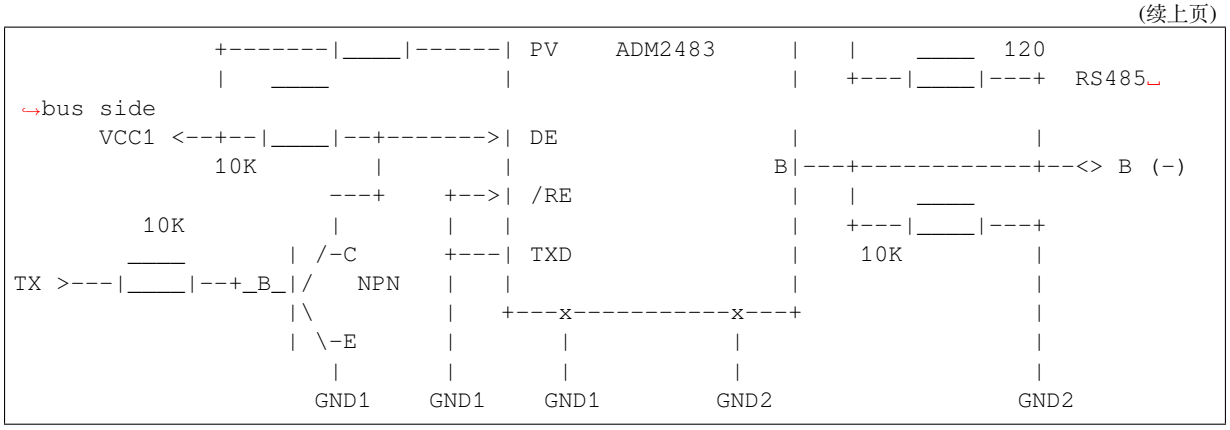
- **下列原理图不一定包含所有必要元素。**
- **模拟设备** ADM483 和 ADM2483 是 RS485 收发器的常见示例，**也可使用其他类似的收发器。**

电路 A：冲突检测电路



推荐这一电路，因为该电路较为简单，同时能够检测冲突。持续启用线路驱动中的接收器时，UART 将会监控 RS485 总线。启用 UART_RS485_CONF_REG.UART_RS485TX_RX_EN 位时，UART 外设会执行回波抑制。

电路 B：无冲突检测的手动切换发射器/接收器



该电路无法检测冲突。置位 UART_RS485_CONF_REG.UART_RS485TX_RX_EN 位时，电路将抑制硬件收到的空字节。这种情况下 UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN 位不适用。

电路 C：自动切换发射器/接收器

(下页继续)

(续上页)

这种电气隔离电路不需要用软件应用程序或驱动程序控制 RTS 管脚，因为电路能够自动控制收发器方向。但是在传输过程中，需要将 `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` 设置为 1 并将 `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` 设置为 0 来抑制空字节。此设置可以在任何 RS485 UART 模式下工作，包括*UART_MODE_UART*。

应用示例

下表列出了目录 peripherals/uart/ 下可用的代码示例。

代码示例	描述
peripherals/uart/uart_echo	配置 UART 设置、安装 UART 驱动程序以及通过 UART1 接口读取/写入。
peripherals/uart/uart_events	报告各种通信事件，使用模式检测中断。
peripherals/uart/uart_async_rxtxtasks	通过同一 UART 在两个独立的 FreeRTOS 任务中发送和接收数据。
peripherals/uart/uart_select	针对 UART 文件描述符使用同步 I/O 多路复用。
peripherals/uart/uart_echo_rs485	设置 UART 驱动程序以半双工模式通过 RS485 接口进行通信。此示例与 peripherals/uart/uart_echo 类似，但允许通过连接到 ESP32-C3 管脚的 RS485 接口芯片进行通信。
peripherals/uart/nmea0183_parser	解析通过 UART 外设从 GPS 收到的 NMEA0183 语句来获取 GPS 信息。

API 参考

Header File

- components/driver/uart/include/driver/uart.h

Functions

esp_err_t **uart_driver_install**(*uart_port_t* uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, *QueueHandle_t* *uart_queue, int intr_alloc_flags)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

备注： Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

- **rx_buffer_size** –UART RX ring buffer size.
- **tx_buffer_size** –UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue_size** –UART event queue size/depth.
- **uart_queue** –UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver's ISR handler is not located in IRAM)

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_driver_delete**(*uart_port_t* uart_num)

Uninstall UART driver.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

bool **uart_is_driver_installed**(*uart_port_t* uart_num)

Checks whether the driver is installed or not.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- true driver is installed
- false driver is not installed

esp_err_t **uart_set_word_length**(*uart_port_t* uart_num, *uart_word_length_t* data_bit)

Set UART data bits.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **data_bit** –UART data bits

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_word_length**(*uart_port_t* uart_num, *uart_word_length_t* *data_bit)

Get the UART data bit configuration.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **data_bit** –Pointer to accept value of UART data bits.

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

esp_err_t **uart_set_stop_bits**(*uart_port_t* uart_num, *uart_stop_bits_t* stop_bits)

Set UART stop bits.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits** –UART stop bits

返回

- ESP_OK Success
- ESP_FAIL Fail

esp_err_t **uart_get_stop_bits**(*uart_port_t* uart_num, *uart_stop_bits_t* *stop_bits)

Get the UART stop bit configuration.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits** –Pointer to accept value of UART stop bits.

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

esp_err_t **uart_set_parity**(*uart_port_t* uart_num, *uart_parity_t* parity_mode)

Set UART parity mode.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **parity_mode** –the enum of uart parity configuration

返回

- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t **uart_get_parity**(*uart_port_t* uart_num, *uart_parity_t* *parity_mode)

Get the UART parity mode configuration.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **parity_mode** –Pointer to accept value of UART parity mode.

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

esp_err_t **uart_get_sclk_freq**(*uart_sclk_t* sclk, uint32_t *out_freq_hz)

Get the frequency of a clock source for the UART.

参数

- **sclk** –Clock source
- **out_freq_hz** –**[out]** Output of frequency, in Hz

返回

- ESP_ERR_INVALID_ARG: if the clock source is not supported
- otherwise ESP_OK

esp_err_t **uart_set_baudrate**(*uart_port_t* uart_num, uint32_t baudrate)

Set UART baud rate.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** –UART baud rate.

返回

- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t **uart_get_baudrate**(*uart_port_t* uart_num, uint32_t *baudrate)

Get the UART baud rate configuration.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** –Pointer to accept value of UART baud rate

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

esp_err_t **uart_set_line_inverse**(*uart_port_t* uart_num, uint32_t inverse_mask)

Set UART line inverse mode.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

- **inverse_mask** –Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_hw_flow_ctrl**(*uart_port_t* uart_num, *uart_hw_flowcontrol_t* flow_ctrl, uint8_t rx_thresh)

Set hardware flow control.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** –Hardware flow control mode
- **rx_thresh** –Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_sw_flow_ctrl**(*uart_port_t* uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)

Set software flow control.

参数

- **uart_num** –UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **enable** –switch on or off
- **rx_thresh_xon** –low water mark
- **rx_thresh_xoff** –high water mark

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_hw_flow_ctrl**(*uart_port_t* uart_num, *uart_hw_flowcontrol_t* *flow_ctrl)

Get the UART hardware flow control configuration.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** –Option for different flow control mode.

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

esp_err_t **uart_clear_intr_status**(*uart_port_t* uart_num, uint32_t clr_mask)

Clear UART interrupt status.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **clr_mask** –Bit mask of the interrupt status to be cleared.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_intr_mask**(*uart_port_t* uart_num, uint32_t enable_mask)

Set UART interrupt enable.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **enable_mask** –Bit mask of the enable bits.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_intr_mask**(*uart_port_t* uart_num, uint32_t disable_mask)

Clear UART interrupt enable bits.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **disable_mask** –Bit mask of the disable bits.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_rx_intr**(*uart_port_t* uart_num)

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_rx_intr**(*uart_port_t* uart_num)

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_tx_intr**(*uart_port_t* uart_num)

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

参数 **uart_num** –UART port number

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_tx_intr**(*uart_port_t* uart_num, int enable, int thresh)

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **enable** –1: enable; 0: disable
- **thresh** –Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_pin**(*uart_port_t* uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)

Assign signals of a UART peripheral to GPIO pins.

备注: If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0's default TX pin and GPIO3 is UART0's default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

备注: Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **tx_io_num** –UART TX pin GPIO number.
- **rx_io_num** –UART RX pin GPIO number.
- **rts_io_num** –UART RTS pin GPIO number.
- **cts_io_num** –UART CTS pin GPIO number.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_rts**(*uart_port_t* uart_num, int level)

Manually set the UART RTS pin level.

备注: UART must be configured with hardware flow control disabled.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **level** –1: RTS output low (active); 0: RTS output high (block)

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_dtr**(*uart_port_t* uart_num, int level)

Manually set the UART DTR pin level.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **level** –1: DTR output low; 0: DTR output high

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_tx_idle_num**(*uart_port_t* uart_num, uint16_t idle_num)

Set UART idle interval after tx FIFO is empty.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **idle_num** –idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_param_config**(*uart_port_t* uart_num, const *uart_config_t* *uart_config)

Set UART configuration parameters.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **uart_config** –UART parameter settings

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_intr_config**(*uart_port_t* uart_num, const *uart_intr_config_t* *intr_conf)

Configure UART interrupts.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **intr_conf** –UART interrupt settings

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_wait_tx_done**(*uart_port_t* uart_num, TickType_t ticks_to_wait)

Wait until UART TX FIFO is empty.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **ticks_to_wait** –Timeout, count in RTOS ticks

返回

- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

int **uart_tx_chars**(*uart_port_t* uart_num, const char *buffer, uint32_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

备注: This function should only be used when UART TX buffer is not enabled.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **buffer** –data buffer address
- **len** –data length to send

返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_write_bytes**(*uart_port_t* uart_num, const void *src, size_t size)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx_buffer_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **src** –data buffer address
- **size** –data length to send

返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_write_bytes_with_break**(*uart_port_t* uart_num, const void *src, size_t size, int brk_len)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx_buffer_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **src** –data buffer address

- **size** –data length to send
- **brk_len** –break signal duration(unit: the time it takes to send one bit at current baudrate)

返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_read_bytes**(*uart_port_t* uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)

UART read bytes from UART buffer.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **buf** –pointer to the buffer.
- **length** –data length
- **ticks_to_wait** –sTimeout, count in RTOS ticks

返回

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART buffer

esp_err_t **uart_flush**(*uart_port_t* uart_num)

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

备注: Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_flush_input**(*uart_port_t* uart_num)

Clear input buffer, discard all the data is in the ring-buffer.

备注: In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_buffered_data_len**(*uart_port_t* uart_num, size_t *size)

UART get RX ring buffer cached data length.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **size** –Pointer of size_t to accept cached data length

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_tx_buffer_free_size**(*uart_port_t* uart_num, size_t *size)

UART get TX ring buffer free space size.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **size** –Pointer of size_t to accept the free space size

返回

- ESP_OK Success

- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_disable_pattern_det_intr**(*uart_port_t* uart_num)

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_pattern_det_baud_intr**(*uart_port_t* uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

参数

- **uart_num** –UART port number.
- **pattern_chr** –character of the pattern.
- **chr_num** –number of the character, 8bit value.
- **chr_tout** –timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- **post_idle** –idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char
- **pre_idle** –idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

int **uart_pattern_pop_pos**(*uart_port_t* uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

备注: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

int **uart_pattern_get_pos**(*uart_port_t* uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

备注： If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

参数 **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

返回

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

esp_err_t **uart_pattern_queue_reset** (*uart_port_t* uart_num, int queue_length)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

参数

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **queue_length** –Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

返回

- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t **uart_set_mode** (*uart_port_t* uart_num, *uart_mode_t* mode)

UART set communication mode.

备注： This function must be executed after uart_driver_install(), when the driver object is initialized.

参数

- **uart_num** –Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **mode** –UART UART mode to set

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_set_rx_full_threshold** (*uart_port_t* uart_num, int threshold)

Set uart threshold value for RX fifo full.

备注： If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

参数

- **uart_num** –UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **threshold** –Threshold value above which RX fifo full interrupt is generated

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_set_tx_empty_threshold** (*uart_port_t* uart_num, int threshold)

Set uart threshold values for TX fifo empty.

参数

- **uart_num** –UART_NUM_0, UART_NUM_1 or UART_NUM_2

- **threshold** –Threshold value below which TX fifo empty interrupt is generated

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_set_rx_timeout**(*uart_port_t* uart_num, const uint8_t tout_thresh)

UART set threshold timeout for TOUT feature.

参数

- **uart_num** –Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **tout_thresh** –This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_get_collision_flag**(*uart_port_t* uart_num, bool *collision_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

参数

- **uart_num** –Uart number to configure the max port number is (UART_NUM_MAX -1).
- **collision_flag** –Pointer to variable of type bool to return collision flag.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_set_wakeup_threshold**(*uart_port_t* uart_num, int wakeup_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To ensure that UART has correct Baud rate all the time, it is necessary to select a source clock which has a fixed frequency and remains active during sleep. For the supported clock sources of the chips, please refer to `uart_sclk_t` or `soc_periph_uart_clk_src_legacy_t`

备注: in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

参数

- **uart_num** –UART number, the max port number is (UART_NUM_MAX -1).
- **wakeup_threshold** –number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

esp_err_t **uart_get_wakeup_threshold** (*uart_port_t* uart_num, int *out_wakeup_threshold)

Get the number of RX pin signal edges for light sleep wakeup.

See description of uart_set_wakeup_threshold for the explanation of UART wakeup feature.

参数

- **uart_num** –UART number, the max port number is (UART_NUM_MAX -1).
- **out_wakeup_threshold** –**[out]** output, set to the current value of wakeup threshold for the given UART.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

esp_err_t **uart_wait_tx_idle_polling** (*uart_port_t* uart_num)

Wait until UART tx memory empty and the last char send ok (polling mode).

-

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

参数 **uart_num** –UART number

esp_err_t **uart_set_loop_back** (*uart_port_t* uart_num, bool loop_back_en)

Configure TX signal loop back to RX module, just for the test usage.

-

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

参数

- **uart_num** –UART number
- **loop_back_en** –Set ture to enable the loop back function, else set it false.

void **uart_set_always_rx_timeout** (*uart_port_t* uart_num, bool always_rx_timeout_en)

Configure behavior of UART RX timeout interrupt.

When always_rx_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

参数

- **uart_num** –UART number
- **always_rx_timeout_en** –Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures

struct **uart_intr_config_t**

UART interrupt configuration parameters for uart_intr_config function.

Public Members

uint32_t **intr_enable_mask**

UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under UART_INT_ENA_REG(i), connect with bit-or operator

uint8_t **rx_timeout_thresh**

UART timeout interrupt threshold (unit: time of sending one byte)

uint8_t **txfifo_empty_intr_thresh**

UART TX empty interrupt threshold.

uint8_t **rxfifo_full_thresh**

UART RX full interrupt threshold.

struct **uart_event_t**

Event structure used in UART event queue.

Public Members

uart_event_type_t **type**

UART event type

size_t **size**

UART data size for UART_DATA event

bool **timeout_flag**

UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

Macros

UART_NUM_0

UART port 0

UART_NUM_1

UART port 1

UART_NUM_MAX

UART port max

UART_PIN_NO_CHANGE

UART_FIFO_LEN

Length of the UART HW FIFO.

UART_BITRATE_MAX

Maximum configurable bitrate.

Type Definitions

typedef *intr_handle_t* **uart_isr_handle_t**

Enumerations

enum **uart_event_type_t**

UART event types used in the ring buffer.

Values:

enumerator **UART_DATA**

UART data event

enumerator **UART_BREAK**

UART break event

enumerator **UART_BUFFER_FULL**

UART RX buffer full event

enumerator **UART_FIFO_OVF**

UART FIFO overflow event

enumerator **UART_FRAME_ERR**

UART RX frame error event

enumerator **UART_PARITY_ERR**

UART RX parity event

enumerator **UART_DATA_BREAK**

UART TX data and break event

enumerator **UART_PATTERN_DET**

UART pattern detected

enumerator **UART_WAKEUP**

UART wakeup event

enumerator **UART_EVENT_MAX**

UART event max index

Header File

- components/hal/include/hal/uart_types.h

Structures

struct **uart_at_cmd_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at confirguration.

Public Members

uint8_t **cmd_char**

UART AT cmd char

uint8_t **char_num**

AT cmd char repeat number

uint32_t **gap_tout**

gap time(in baud-rate) between AT cmd char

uint32_t **pre_idle**

the idle time(in baud-rate) between the non AT char and first AT char

uint32_t **post_idle**

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart_sw_flowctrl_t**

UART software flow control configuration parameters.

Public Members

uint8_t **xon_char**

Xon flow control char

uint8_t **xoff_char**

Xoff flow control char

uint8_t **xon_thrd**

If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t **xoff_thrd**

If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

struct **uart_config_t**

UART configuration parameters for uart_param_config function.

Public Members

int **baud_rate**

UART baud rate

uart_word_length_t **data_bits**
UART byte size

uart_parity_t **parity**
UART parity mode

uart_stop_bits_t **stop_bits**
UART stop bits

uart_hw_flowcontrol_t **flow_ctrl**
UART HW flow control mode (cts/rts)

uint8_t **rx_flow_ctrl_thresh**
UART HW RTS threshold

uart_sclk_t **source_clk**
UART source clock selection

Type Definitions

typedef int **uart_port_t**
UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).

typedef *soc_periph_uart_clk_src_legacy_t* **uart_sclk_t**
UART source clock.

Enumerations

enum **uart_mode_t**
UART mode selection.

Values:

enumerator **UART_MODE_UART**
mode: regular UART mode

enumerator **UART_MODE_RS485_HALF_DUPLEX**
mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART_MODE_IRDA**
mode: IRDA UART mode

enumerator **UART_MODE_RS485_COLLISION_DETECT**
mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART_MODE_RS485_APP_CTRL**
mode: application control RS485 UART mode (used for test purposes)

enum **uart_word_length_t**
UART word length constants.

Values:

enumerator **UART_DATA_5_BITS**
word length: 5bits

enumerator **UART_DATA_6_BITS**
word length: 6bits

enumerator **UART_DATA_7_BITS**
word length: 7bits

enumerator **UART_DATA_8_BITS**
word length: 8bits

enumerator **UART_DATA_BITS_MAX**

enum **uart_stop_bits_t**
UART stop bits number.

Values:

enumerator **UART_STOP_BITS_1**
stop bit: 1bit

enumerator **UART_STOP_BITS_1_5**
stop bit: 1.5bits

enumerator **UART_STOP_BITS_2**
stop bit: 2bits

enumerator **UART_STOP_BITS_MAX**

enum **uart_parity_t**
UART parity constants.

Values:

enumerator **UART_PARITY_DISABLE**
Disable UART parity

enumerator **UART_PARITY_EVEN**
Enable UART even parity

enumerator **UART_PARITY_ODD**
Enable UART odd parity

enum **uart_hw_flowcontrol_t**
UART hardware flow control modes.

Values:

enumerator **UART_HW_FLOWCTRL_DISABLE**
disable hardware flow control

enumerator **UART_HW_FLOWCTRL_RTS**
enable RX hardware flow control (rts)

enumerator **UART_HW_FLOWCTRL_CTS**
enable TX hardware flow control (cts)

enumerator **UART_HW_FLOWCTRL_CTS_RTS**
enable hardware flow control

enumerator **UART_HW_FLOWCTRL_MAX**

enum **uart_signal_inv_t**
UART signal bit map.

Values:

enumerator **UART_SIGNAL_INV_DISABLE**
Disable UART signal inverse

enumerator **UART_SIGNAL_IRDA_TX_INV**
inverse the UART irda_tx signal

enumerator **UART_SIGNAL_IRDA_RX_INV**
inverse the UART irda_rx signal

enumerator **UART_SIGNAL_RXD_INV**
inverse the UART rxd signal

enumerator **UART_SIGNAL_CTS_INV**
inverse the UART cts signal

enumerator **UART_SIGNAL_DSR_INV**
inverse the UART dsr signal

enumerator **UART_SIGNAL_TXD_INV**
inverse the UART txd signal

enumerator **UART_SIGNAL_RTS_INV**
inverse the UART rts signal

enumerator **UART_SIGNAL_DTR_INV**
inverse the UART dtr signal

GPIO 查找宏指令 UART 外设有供直接连接的专用 IO_MUX 管脚，但也可用非直接的 GPIO 矩阵将信号配置到其他管脚。如要直接连接，需要知道哪一管脚为 UART 通道的专用 IO_MUX 管脚。GPIO 查找宏简化了查找和分配 IO_MUX 管脚的过程，您可根据 IO_MUX 管脚编号或所需 UART 通道名称选择一个宏，该宏将返回匹配的对应项。请查看下列示例。

备注： 如需较高的 UART 波特率（超过 40 MHz），即仅使用 IO_MUX 管脚时，可以使用此类宏。在其他情况下可以忽略这些宏，并使用 GPIO 矩阵为 UART 功能配置任一 GPIO 管脚。

---

1. UART_NUM_2_TXD_DIRECT_GPIO_NUM 返回 UART 通道 2 TXD 管脚的 IO_MUX 管脚编号（管脚 17）
2. UART_GPIO19_DIRECT_CHANNEL 在通过 IO_MUX 连接到 UART 外设时返回 GPIO 19 的 UART 编号（即 UART_NUM_0）
3. GPIO 19 在通过 IO_MUX 用作 UART CTS 管脚时，UART_CTS_GPIO19_DIRECT_CHANNEL 将返回 GPIO 19 的 UART 编号（即 UART_NUM_0）。该宏类似于上述宏，但指定了管脚功能，这也是 IO_MUX 分配的一部分。

Header File

- components/soc/esp32c3/include/soc/uart_channel.h

Macros

UART_GPIO21_DIRECT_CHANNEL

UART_NUM_0_TXD_DIRECT_GPIO_NUM

UART_GPIO20_DIRECT_CHANNEL

UART_NUM_0_RXD_DIRECT_GPIO_NUM

UART_TXD_GPIO21_DIRECT_CHANNEL

UART_RXD_GPIO20_DIRECT_CHANNEL

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 peripherals 目录下。

2.7 项目配置

2.7.1 简介

ESP-IDF 使用基于 kconfiglib 的 esp-idf-kconfig 包，而 kconfiglib 是 Kconfig 系统的 Python 扩展。Kconfig 提供了编译时的项目配置机制，以及多种类型的配置选项（如整数、字符串和布尔值等）。Kconfig 文件指定了选项之间的依赖关系、默认值、组合方式等。

了解所有可用功能，请查看 Kconfig 和 kconfiglib 扩展。

2.7.2 项目配置菜单

应用程序开发人员可以通过 `idf.py menuconfig` 构建目标，在终端中打开项目配置菜单。

更新后，此配置将保存在项目根目录的 `sdkconfig` 文件中。借助 `sdkconfig`，应用程序构建目标将在构建目录中生成 `sdkconfig.h` 文件，并使得 `sdkconfig` 选项可用于项目构建系统和源文件。

2.7.3 使用 sdkconfig.defaults

在某些情况下，例如 sdkconfig 文件处于版本控制状态时，构建系统可能会不便于更改 sdkconfig 文件。在构建系统中创建 sdkconfig.defaults 文件可以避免上述情况发生。该文件可以手动或自动创建，且永远不会被构建系统更改。该文件包含所有不同于默认选项的重要选项，其格式与 sdkconfig 文件格式相同。如果用户记得所有已更改的配置则可以手动创建 sdkconfig.defaults，或者运行 idf.py save-defconfig 命令来自动生成此文件。

sdkconfig.defaults 创建后，用户可以删除 sdkconfig 或将其添加到版本控制系统的忽略列表中（例如 git 的 .gitignore 文件）。项目构建目标将自动创建 sdkconfig 文件，填充 sdkconfig.defaults 文件中的设置，并将其他设置配置为默认值。请注意，构建时 sdkconfig.defaults 中的设置不会覆盖 sdkconfig 的已有设置。了解更多信息，请查看*自定义 sdkconfig 的默认值*。

2.7.4 Kconfig 格式规定

Kconfig 文件的格式规定如下：

- 在所有菜单中，选项名称的前缀需保持一致。目前，前缀长度应为至少 3 个字符。
- 每级采用 4 个空格的缩进方式，子项需比父项多缩进一级。例如，menu 缩进 0 个空格，menu 中的 config 则缩进 4 个空格，config 中的 help 缩进 8 个空格，help 下的文本缩进 12 个空格。
- 行末不得出现尾随空格。
- 选项最长为 40 个字符。
- 每行最长为 120 个字符。

备注： 菜单中不同配置的 help 小节将被视为 reStructuredText 格式，以便生成相应选项的参考文档。

格式检查器

tools/ci/check_kconfigs.py 可以检查 Kconfig 文件是否符合上述格式规定。检查器会检查 ESP-IDF 目录下的所有 Kconfig 和 Kconfig.projbuild 文件，如有格式错误，会生成后缀为 .new 的新文件以提供修改建议。请注意，检查器不能解决所有格式问题，开发人员仍需终审和修改文件使其通过测试。例如，在没有其他误导性格式的情况下，检查器能够更正缩进，但无法提供菜单内选项的常用前缀。

2.7.5 Kconfig 选项的向后兼容性

标准 Kconfig 工具会忽略 sdkconfig 中的未知选项。因此，如果开发人员对某些选项进行了自定义设置，但这些选项在 ESP-IDF 新版本中被重命名，原有设置将被忽略。以下功能可以避免上述情况发生：

1. 工具链使用 kconfgen 预处理 sdkconfig 文件。例如，menuconfig 会读取这些文件，从而保留旧选项设置。
2. kconfgen 递归查找 ESP-IDF 目录中所有包含新旧 Kconfig 选项名称的 sdkconfig.rename 文件。在 sdkconfig 文件中，新选项将替换旧选项。针对单个目标的重命名可以放在特定目标的重命名文件 sdkconfig.rename.TARGET 中，其中 TARGET 是目标名称，例如 sdkconfig.rename.esp32s2。
3. kconfgen 通过添加兼容性语句列表（即经过修改后，将旧选项的值设置为新选项的值），后处理 sdkconfig 文件，并生成所有构建结果（sdkconfig.h、sdkconfig.cmake 以及 auto.conf）。如果用户在其代码中仍然使用旧选项，此举可以防止用户代码出现问题。
4. kconfgen 会自动生成*Deprecated options and their replacements*。

2.7.6 配置选项参考

以下小节包含由 Kconfig 文件自动生成的 ESP-IDF 可用选项列表。请注意，由于所选选项不同，下列某些选项可能在 menuconfig 界面中默认不可见。

按照惯例，所有选项名称均为大写字母加下划线。当 Kconfig 生成 `sdkconfig` 和 `sdkconfig.h` 文件时，选项名称会以 `CONFIG_` 为前缀。因此，如果 Kconfig 文件定义了 `ENABLE_FOO` 选项且 `menuconfig` 中选择了该选项，则 `sdkconfig` 和 `sdkconfig.h` 文件也将定义 `CONFIG_ENABLE_FOO`。在以下小节中，选项名称也以 `CONFIG_` 为前缀，与源代码相同。

Build type

Contains:

- *CONFIG_APP_BUILD_TYPE*
- *CONFIG_APP_BUILD_TYPE_PURE_RAM_APP*
- *CONFIG_APP_REPRODUCIBLE_BUILD*
- *CONFIG_APP_NO_BLOBS*

CONFIG_APP_BUILD_TYPE

Application build type

Found in: Build type

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG or UART. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for some kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash.

Note: when APP_BUILD_TYPE_RAM is selected and loaded with JTAG, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

> # Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target mon reset halt # Run to a specific point in ROM code, # where most of initialization is complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb app_main c

Execute this gdbinit file as follows:

> xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit

Example gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/

When loading the BIN with UART, the ROM will jump to ram and run the app after finishing the ROM startup code, so there’s no additional startup initialization required. You can use the *load_ram* in esptool.py to load the generated .bin file into ram and execute.

Example: esptool.py –chip {chip} -p {port} -b {baud} –no-stub load_ram {app.bin}

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG_APP_BUILD_TYPE_RAM is required, other options help reduce application memory footprint.

> CONFIG_APP_BUILD_TYPE_RAM=y CONFIG_VFS_SUPPORT_TERMIOS= CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=

Available options:

- Default (binary application + 2nd stage bootloader) (APP_BUILD_TYPE_APP_2NDBOOT)
- Build app runs entirely in RAM (EXPERIMENTAL) (APP_BUILD_TYPE_RAM)

CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

Build app without SPI_FLASH/PSRAM support (saves ram)

Found in: Build type

If this option is enabled, external memory and related peripherals, such as Cache, MMU, Flash and PSRAM, won't be initialized. Corresponding drivers won't be introduced either. Components that depend on the spi_flash component will also be unavailable, such as app_update, etc. When this option is enabled, about 26KB of RAM space can be saved.

CONFIG_APP_REPRODUCIBLE_BUILD

Enable reproducible build

Found in: Build type

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create automatically. (or will be append if you have one already)

Default value:

- No (disabled)

CONFIG_APP_NO_BLOBS

No Binary Blobs

Found in: Build type

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

Default value:

- No (disabled)

Bootloader config

Contains:

- *CONFIG_BOOTLOADER_LOG_LEVEL*
- *CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION*
- *CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*
- *CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE*
- *CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT*
- *CONFIG_BOOTLOADER_APP_TEST*
- *CONFIG_BOOTLOADER_FACTORY_RESET*
- *CONFIG_BOOTLOADER_HOLD_TIME_GPIO*
- *CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC*
- *CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS*
- *CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON*
- *CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP*
- *CONFIG_BOOTLOADER_WDT_ENABLE*
- *CONFIG_BOOTLOADER_VDDSDIO_BOOST*

CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION

Bootloader optimization Level

Found in: Bootloader config

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default "Size" setting will add the -0s flag to CFLAGS.

- The "Debug" setting will add the -Og flag to CFLAGS.
- The "Performance" setting will add the -O2 flag to CFLAGS.
- The "None" setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

Available options:
- Size (-Os) (BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

CONFIG_BOOTLOADER_LOG_LEVEL

Bootloader log verbosity

Found in: Bootloader config

Specify how much output to see in bootloader logs.

Available options:
- No output (BOOTLOADER_LOG_LEVEL_NONE)
- Error (BOOTLOADER_LOG_LEVEL_ERROR)
- Warning (BOOTLOADER_LOG_LEVEL_WARN)
- Info (BOOTLOADER_LOG_LEVEL_INFO)
- Debug (BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (BOOTLOADER_LOG_LEVEL_VERBOSE)

CONFIG_BOOTLOADER_VDDSDIO_BOOST

VDDSDIO LDO voltage

Found in: Bootloader config

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

Available options:
- 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)

CONFIG_BOOTLOADER_FACTORY_RESET

GPIO triggers factory reset

Found in: Bootloader config

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from "factory" partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

Default value:
- No (disabled)

CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET

Number of the GPIO input for factory reset

Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs. not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

Default value:

- 4 if *CONFIG_BOOTLOADER_FACTORY_RESET*

CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL

Factory reset GPIO level

Found in: Bootloader config > *CONFIG_BOOTLOADER_FACTORY_RESET*

Pin level for factory reset, can be triggered on low or high.

Available options:

- Reset on GPIO low (BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (BOOTLOADER_FACTORY_RESET_PIN_HIGH)

CONFIG_BOOTLOADER_OTA_DATA_ERASE

Clear OTA data on factory reset (select factory partition)

Found in: Bootloader config > *CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from "factory" partition (or OTA slot 0 if no factory partition is present) after a factory reset.

CONFIG_BOOTLOADER_DATA_FACTORY_RESET

Comma-separated names of partitions to clear on factory reset

Found in: Bootloader config > *CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: "nvs, phy_init, …") Make sure that the name specified in the partition table and here are the same. Partitions of type "app" cannot be specified here.

Default value:

- "nvs" if *CONFIG_BOOTLOADER_FACTORY_RESET*

CONFIG_BOOTLOADER_APP_TEST

GPIO triggers boot from test app partition

Found in: Bootloader config

Allows to run the test app from "TEST" partition. A boot from "test" partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

Default value:

- No (disabled) if *CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST

Number of the GPIO input to boot TEST partition

Found in: Bootloader config > *CONFIG_BOOTLOADER_APP_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

Range:
- from 0 to 39 if *CONFIG_BOOTLOADER_APP_TEST*

Default value:
- 18 if *CONFIG_BOOTLOADER_APP_TEST*

CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL

App test GPIO level

Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST

Pin level for app test, can be triggered on low or high.

Available options:
- Enter test app on GPIO low (BOOTLOADER_APP_TEST_PIN_LOW)
- Enter test app on GPIO high (BOOTLOADER_APP_TEST_PIN_HIGH)

CONFIG_BOOTLOADER_HOLD_TIME_GPIO

Hold time of GPIO for reset/test mode (seconds)

Found in: Bootloader config

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

Default value:
- 5 if *CONFIG_BOOTLOADER_FACTORY_RESET* || *CONFIG_BOOTLOADER_APP_TEST*

CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE

Enable protection for unmapped memory regions

Found in: Bootloader config

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

Default value:
- Yes (enabled)

CONFIG_BOOTLOADER_WDT_ENABLE

Use RTC watchdog in start code

Found in: Bootloader config

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on RTC_CLK_SRC (INTERNAL_RC or EXTERNAL_CRYSTAL).

Default value:
- Yes (enabled)

CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE

Allows RTC watchdog disable in user code

Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app's own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_WDT_TIME_MS

Timeout for RTC watchdog (ms)

Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

Range:

- from 0 to 120000

Default value:

- 9000

CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

Enable app rollback support

Found in: Bootloader config

After updating the app, the bootloader runs a new app with the "ESP_OTA_IMG_PENDING_VERIFY" state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

Enable app anti-rollback support

Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

This option prevents rollback to previous firmware/application image with lower security version.

Default value:

- No (disabled) if *CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*

CONFIG_BOOTLOADER_APP_SECURE_VERSION

eFuse secure version of app

Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

Default value:

- 0 if *CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD

Size of the efuse secure version field

Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

Range:

- from 1 to 16 if *CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

Default value:

- 16 if *CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE

Emulate operations with efuse secure version(only test)

Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implemention without permanent write eFuse bits. There should be an entry in partition table with following details: *emul_efuse, data, efuse, , 0x2000*.

This option enables: EFUSE_VIRTUAL and EFUSE_VIRTUAL_KEEP_IN_FLASH.

Default value:

- No (disabled) if *CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP

Skip image validation when exiting deep sleep

Found in: Bootloader config

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using deep_sleep() entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if "allow insecure options" is enabled, however it's strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

Default value:

- No (disabled) if (*CONFIG_SECURE_BOOT* && *CONFIG_SECURE_BOOT_INSECURE*) || *CONFIG_SECURE_BOOT*

CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON

Skip image validation from power on reset (READ HELP FIRST)

Found in: Bootloader config

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it's not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it's not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option BOOTLOADER_WDT_ENABLE enabled and consider also enabling BOOTLOADER_WDT_DISABLE_IN_USER_CODE - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS

Skip image validation always (READ HELP FIRST)

Found in: Bootloader config

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting "Skip image validation from power on reset" instead. However, if boot time is the only important factor then it can be enabled.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

Reserve RTC FAST memory for custom purposes

Found in: Bootloader config

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootoloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE

Size in bytes for custom purposes

Found in: Bootloader config > CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

Default value:

- 0 if *CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC*

CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT

Enable the support for flash chips of XMC (READ HELP FIRST)

Found in: Bootloader config

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON’T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

Default value:

- Yes (enabled)

Security features

Contains:

- *CONFIG_SECURE_BOOT_INSECURE*
- *CONFIG_SECURE_SIGNED_APPS_SCHEME*
- *CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT*
- *CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP*
- *CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE*
- *CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE*
- *CONFIG_SECURE_FLASH_ENC_ENABLED*
- *CONFIG_SECURE_BOOT*
- *CONFIG_SECURE_BOOTLOADER_KEY_ENCODING*
- *Potentially insecure options*
- *CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT*
- *CONFIG_SECURE_BOOT_VERIFICATION_KEY*
- *CONFIG_SECURE_BOOTLOADER_MODE*
- *CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*
- *CONFIG_SECURE_UART_ROM_DL_MODE*
- *CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT*

CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

Require signed app images

Found in: Security features

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

CONFIG_SECURE_SIGNED_APPS_SCHEME

App Signing Scheme

Found in: Security features

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
   - Legacy custom secure boot scheme. Supported in ESP32 SoC.
2. **Secure boot V2**
   - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
   - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

Available options:

- ECDSA (SECURE_SIGNED_APPS_ECDSA_SCHEME)
  Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.
- RSA (SECURE_SIGNED_APPS_RSA_SCHEME)
  Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.
- ECDSA (V2) (SECURE_SIGNED_APPS_ECDSA_V2_SCHEME)
  For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE

ECDSA key size

Found in: Security features

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

Available options:

- Using ECC curve NISTP192 (SECURE_BOOT_ECDSA_KEY_LEN_192_BITS)
- Using ECC curve NISTP256 (Recommended) (SECURE_BOOT_ECDSA_KEY_LEN_256_BITS)

CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT

Bootloader verifies app signatures

Found in: Security features

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn't add significant security by itself so most users will want to leave it disabled.

Default value:

- No (disabled) if *CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT* && SECURE_SIGNED_APPS_ECDSA_SCHEME

CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

Verify app signature on update

Found in: Security features

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

Default value:

- Yes (enabled) if *CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT*

CONFIG_SECURE_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

Found in: Security features

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

Default value:

- No (disabled)

CONFIG_SECURE_BOOT_VERSION

Select secure boot version

Found in: Security features > CONFIG_SECURE_BOOT

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

Available options:

- Enable Secure Boot version 1 (SECURE_BOOT_V1_ENABLED)
  Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.
- Enable Secure Boot version 2 (SECURE_BOOT_V2_ENABLED)
  Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer's Guide for this version before enabling.

CONFIG_SECURE_BOOTLOADER_MODE

Secure bootloader mode

Found in: Security features

Available options:

- One-time flash (SECURE_BOOTLOADER_ONE_TIME_FLASH)
  On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot.
  Enabling this option means that the bootloader cannot be changed after the first time it is booted.
- Reflashable (SECURE_BOOTLOADER_REFLASHABLE)
  Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.
  This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.
  This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Sign binaries during build

Found in: Security features

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in "Secure boot private signing key" will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

CONFIG_SECURE_BOOT_SIGNING_KEY

Secure boot private signing key

Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See the Secure Boot section of the ESP-IDF Programmer's Guide for this version for details.

Default value:

- "secure_boot_signing_key.pem" if *CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*

CONFIG_SECURE_BOOT_VERIFICATION_KEY

Secure boot public signature verification key

Found in: Security features

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the espsecure.py extract_public_key command.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE

Enable Aggressive key revoke strategy

Found in: Security features

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

Default value:

- No (disabled) if *CONFIG_SECURE_BOOT*

CONFIG_SECURE_BOOTLOADER_KEY_ENCODING

Hardware Key Encoding

Found in: Security features

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with espefuse.py.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn't change any firmware code, it only changes the size of key binary which is generated at build time.

Available options:

- No encoding (256 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
- 3/4 encoding (192 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

CONFIG_SECURE_BOOT_INSECURE

Allow potentially insecure options

Found in: Security features

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

Default value:

- No (disabled) if *CONFIG_SECURE_BOOT*

CONFIG_SECURE_FLASH_ENC_ENABLED

Enable flash encryption on boot (READ DOCS FIRST)

Found in: Security features

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *flash 加密* before enabling.

Default value:

- No (disabled)

CONFIG_SECURE_FLASH_ENCRYPTION_KEYSIZE

Size of generated AES-XTS key

Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED

Size of generated AES-XTS key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

Available options:

- AES-128 key derived from 128 bits (SHA256(128 bits)) (SECURE_FLASH_ENCRYPTION_AES128_DERIVED)
- AES-128 (256-bit key) (SECURE_FLASH_ENCRYPTION_AES128)
- AES-256 (512-bit key) (SECURE_FLASH_ENCRYPTION_AES256)

CONFIG_SECURE_FLASH_ENCRYPTION_MODE

Enable usage mode

Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it's possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it's no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

When EFUSE_VIRTUAL is enabled, SECURE_FLASH_ENCRYPTION_MODE_RELEASE is not available. For CI tests we use IDF_CI_BUILD to bypass it ("export IDF_CI_BUILD=1"). We do not recommend bypassing it for other purposes.

Refer to the Flash Encryption section of the ESP-IDF Programmer's Guide for details.

Available options:

- Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
- Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

Potentially insecure options Contains:

- *CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS*
- *CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION*
- *CONFIG_SECURE_BOOT_ALLOW_JTAG*
- *CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC*
- *CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE*
- *CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS*
- *CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED*
- *CONFIG_SECURE_FLASH_SKIP_WRITE_PROTECTION_CACHE*

CONFIG_SECURE_BOOT_ALLOW_JTAG

Allow JTAG Debugging

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

Default value:

- No (disabled) if *CONFIG_SECURE_BOOT_INSECURE* || SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION

Allow app partition length not 64KB aligned

Found in: Security features > Potentially insecure options

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn't support 64KB aligned partition lengths.

CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS

Allow additional read protecting of efuses

Found in: Security features > Potentially insecure options

If not set (default, recommended), on first boot the bootloader will burn the WR_DIS_RD_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK_KEY0-BLOCK_KEY5)(for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a BLOCK is read-protected, the application will read all zeros from that block

NOTE: If "UART ROM download mode (Permanently disabled (recommended))" or "UART ROM download mode (Permanently switch to Secure mode (recommended))" is set, then it is __NOT__ possible to read/write efuses using espefuse.py utility. However, efuse can be read/written from the application

CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS

Leave unused digest slots available (not revoke)

Found in: Security features > Potentially insecure options

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called esp_efuse_set_digest_revoke(num_digest) for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

Default value:

- No (disabled) if *CONFIG_SECURE_BOOT_INSECURE*

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC

Leave UART bootloader encryption enabled

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

Default value:

- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE

Leave UART bootloader flash cache enabled

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

Default value:

- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED

Require flash encryption to be already enabled

Found in: Security features > Potentially insecure options

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espefuse.py.

Default value:

- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_SKIP_WRITE_PROTECTION_CACHE

Skip write-protection of DIS_CACHE (DIS_ICACHE, DIS_DCACHE)

Found in: Security features > Potentially insecure options

If not set (default, recommended), on the first boot the bootloader will burn the write-protection of DIS_CACHE(for ESP32) or DIS_ICACHE/DIS_DCACHE(for other chips) eFuse when Flash Encryption is enabled. Write protection for cache disable efuse prevents the chip from being blocked if it is set by accident. App and bootloader use cache so disabling it makes the chip useless for IDF. Due to other eFuses are linked with the same write protection bit (see the list below) then write-protection will not be done if these SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC, SECURE_BOOT_ALLOW_JTAG or SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE options are selected to give a chance to turn on the chip into the release mode later.

List of eFuses with the same write protection bit: ESP32: MAC, MAC_CRC, DISABLE_APP_CPU, DISABLE_BT, DIS_CACHE, VOL_LEVEL_HP_INV.

ESP32-C3: DIS_ICACHE, DIS_USB_JTAG, DIS_DOWNLOAD_ICACHE, DIS_USB_SERIAL_JTAG, DIS_FORCE_DOWNLOAD, DIS_TWAI, JTAG_SEL_ENABLE, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-C6: SWAP_UART_SDIO_EN, DIS_ICACHE, DIS_USB_JTAG, DIS_DOWNLOAD_ICACHE, DIS_USB_SERIAL_JTAG, DIS_FORCE_DOWNLOAD, DIS_TWAI, JTAG_SEL_ENABLE, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-H2: DIS_ICACHE, DIS_USB_JTAG, POWERGLITCH_EN, DIS_FORCE_DOWNLOAD, SPI_DOWNLOAD_MSPI_DIS, DIS_TWAI, JTAG_SEL_ENABLE, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-S2: DIS_ICACHE, DIS_DCACHE, DIS_DOWNLOAD_ICACHE, DIS_DOWNLOAD_DCACHE, DIS_FORCE_DOWNLOAD, DIS_USB, DIS_TWAI, DIS_BOOT_REMAP, SOFT_DIS_JTAG, HARD_DIS_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-S3: DIS_ICACHE, DIS_DCACHE, DIS_DOWNLOAD_ICACHE, DIS_DOWNLOAD_DCACHE, DIS_FORCE_DOWNLOAD, DIS_USB_OTG, DIS_TWAI, DIS_APP_CPU, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT, DIS_USB_JTAG, DIS_USB_SERIAL_JTAG, STRAP_JTAG_SEL, USB_PHY_SEL.

CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP

Check Flash Encryption enabled on app startup

Found in: Security features

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

Default value:

- Yes (enabled) if *CONFIG_SECURE_FLASH_ENC_ENABLED*

CONFIG_SECURE_UART_ROM_DL_MODE

UART ROM download mode

Found in: Security features

Available options:

- UART ROM download mode (Permanently disabled (recommended)) (SECURE_DISABLE_ROM_DL_MODE)
  If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espefuse.py and similar tools.
  Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.
  It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.
  It is also possible to permanently disable Download Mode by calling esp_efuse_disable_rom_download_mode() at runtime.
- UART ROM download mode (Permanently switch to Secure mode (recommended)) (SECURE_ENABLE_SECURE_ROM_DL_MODE)
  If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.
  Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (*get_security_info*).

Secure Download mode is not compatible with the esptool.py flasher stub feature, espefuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.
Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential "attack surface" for an attacker to try and bypass them with a successful physical attack.
It is also possible to enable secure download mode at runtime by calling esp_efuse_enable_rom_secure_download_mode()
Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

- UART ROM download mode (Enabled (not recommended)) (SECURE_INSECURE_ALLOW_DL_MODE)
  This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

Application manager

Contains:

- *CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR*
- *CONFIG_APP_EXCLUDE_PROJECT_VER_VAR*
- *CONFIG_APP_PROJECT_VER_FROM_CONFIG*
- *CONFIG_APP_RETRIEVE_LEN_ELF_SHA*
- *CONFIG_APP_COMPILE_TIME_DATE*

CONFIG_APP_COMPILE_TIME_DATE

Use time/date stamp for app

Found in: Application manager

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

Default value:

- Yes (enabled)

CONFIG_APP_EXCLUDE_PROJECT_VER_VAR

Exclude PROJECT_VER from firmware image

Found in: Application manager

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

Default value:

- No (disabled)

CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR

Exclude PROJECT_NAME from firmware image

Found in: Application manager

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

Default value:

- No (disabled)

CONFIG_APP_PROJECT_VER_FROM_CONFIG

Get the project version from Kconfig

Found in: Application manager

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

Default value:

- No (disabled)

CONFIG_APP_PROJECT_VER

Project version

Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG

Project version

Default value:

- 1 if *CONFIG_APP_PROJECT_VER_FROM_CONFIG*

CONFIG_APP_RETRIEVE_LEN_ELF_SHA

The length of APP ELF SHA is stored in RAM(chars)

Found in: Application manager

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

Range:

- from 8 to 64

Default value:

- 16

Boot ROM Behavior

Contains:

- *CONFIG_BOOT_ROM_LOG_SCHEME*

CONFIG_BOOT_ROM_LOG_SCHEME

Permanently change Boot ROM output

Found in: Boot ROM Behavior

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

Available options:

- Always Log (BOOT_ROM_LOG_ALWAYS_ON)
  Always print ROM logs, this is the default behavior.
- Permanently disable logging (BOOT_ROM_LOG_ALWAYS_OFF)
  Don’t print ROM logs.
- Log on GPIO High (BOOT_ROM_LOG_ON_GPIO_HIGH)
  Print ROM logs when GPIO level is high during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

- Log on GPIO Low (BOOT_ROM_LOG_ON_GPIO_LOW)
  Print ROM logs when GPIO level is low during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

Serial flasher config

Contains:

- *CONFIG_ESPTOOLPY_AFTER*
- *CONFIG_ESPTOOLPY_BEFORE*
- *CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE*
- *CONFIG_ESPTOOLPY_NO_STUB*
- *CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE*
- *CONFIG_ESPTOOLPY_FLASHSIZE*
- *CONFIG_ESPTOOLPY_FLASHMODE*
- *CONFIG_ESPTOOLPY_FLASHFREQ*

CONFIG_ESPTOOLPY_NO_STUB

Disable download stub

Found in: Serial flasher config

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

Default value:

- No (disabled) if *CONFIG_APP_BUILD_TYPE_PURE_RAM_APP*

CONFIG_ESPTOOLPY_FLASHMODE

Flash SPI mode

Found in: Serial flasher config

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:

- QIO (ESPTOOLPY_FLASHMODE_QIO)
- QOUT (ESPTOOLPY_FLASHMODE_QOUT)
- DIO (ESPTOOLPY_FLASHMODE_DIO)
- DOUT (ESPTOOLPY_FLASHMODE_DOUT)
- OPI (ESPTOOLPY_FLASHMODE_OPI)

CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE

Flash Sampling Mode

Found in: Serial flasher config

Available options:

- STR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
- DTR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

CONFIG_ESPTOOLPY_FLASHFREQ

Flash SPI speed

Found in: Serial flasher config

Available options:

- 120 MHz (ESPTOOLPY_FLASHFREQ_120M)

  - Flash 120 MHz SDR mode is stable.
  - Flash 120 MHz DDR mode is an experimental feature, it works when the temperature is stable.

    Risks: If your chip powers on at a certain temperature, then after the temperature increases or decreases by approximately 20 Celsius degrees (depending on the chip), the program will crash randomly.
- 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
- 64 MHz (ESPTOOLPY_FLASHFREQ_64M)
- 60 MHz (ESPTOOLPY_FLASHFREQ_60M)
- 48 MHz (ESPTOOLPY_FLASHFREQ_48M)
- 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
- 32 MHz (ESPTOOLPY_FLASHFREQ_32M)
- 30 MHz (ESPTOOLPY_FLASHFREQ_30M)
- 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
- 24 MHz (ESPTOOLPY_FLASHFREQ_24M)
- 20 MHz (ESPTOOLPY_FLASHFREQ_20M)
- 16 MHz (ESPTOOLPY_FLASHFREQ_16M)
- 15 MHz (ESPTOOLPY_FLASHFREQ_15M)

CONFIG_ESPTOOLPY_FLASHSIZE

Flash size

Found in: Serial flasher config

SPI flash size, in megabytes

Available options:

- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)
- 32 MB (ESPTOOLPY_FLASHSIZE_32MB)
- 64 MB (ESPTOOLPY_FLASHSIZE_64MB)
- 128 MB (ESPTOOLPY_FLASHSIZE_128MB)

CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE

Detect flash size when flashing bootloader

Found in: Serial flasher config

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

Default value:

- No (disabled) if *CONFIG_APP_BUILD_TYPE_PURE_RAM_APP*

CONFIG_ESPTOOLPY_BEFORE

Before flashing

Found in: Serial flasher config

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
- No reset (ESPTOOLPY_BEFORE_NORESET)

CONFIG_ESPTOOLPY_AFTER

After flashing

Found in: Serial flasher config

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)

Partition Table

Contains:

- *CONFIG_PARTITION_TABLE_CUSTOM_FILENAME*
- *CONFIG_PARTITION_TABLE_MD5*
- *CONFIG_PARTITION_TABLE_OFFSET*
- *CONFIG_PARTITION_TABLE_TYPE*

CONFIG_PARTITION_TABLE_TYPE

Partition Table

Found in: Partition Table

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it's expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:

- Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)
  This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Single factory app (large), no OTA (PARTITION_TABLE_SINGLE_APP_LARGE)
  This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)
  This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv

- Custom partition table CSV (PARTITION_TABLE_CUSTOM)
  Specify the path to the partition table CSV to use for your project.
  Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- Single factory app, no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
  This is a variation of the default "Single factory app, no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_encr_nvs.csv
- Single factory app (large), no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)
  This is a variation of the "Single factory app (large), no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large_encr_nvs.csv
- Factory app, two OTA definitions, encrypted NVS (PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
  This is a variation of the "Factory app, two OTA definitions" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota_encr_nvs.csv

CONFIG_PARTITION_TABLE_CUSTOM_FILENAME

Custom partition CSV file

Found in: Partition Table

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

Default value:

- "partitions.csv"

CONFIG_PARTITION_TABLE_OFFSET

Offset of partition table

Found in: Partition Table

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

Default value:

- "0x8000"

CONFIG_PARTITION_TABLE_MD5

Generate an MD5 checksum for the partition table

Found in: Partition Table

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

Default value:

- Yes (enabled)

Compiler options

Contains:

- *CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL*
- *CONFIG_COMPILER_FLOAT_LIB_FROM*
- *CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT*
- *CONFIG_COMPILER_DISABLE_GCC12_WARNINGS*
- *CONFIG_COMPILER_DUMP_RTL_FILES*
- *CONFIG_COMPILER_SAVE_RESTORE_LIBCALLS*
- *CONFIG_COMPILER_WARN_WRITE_STRINGS*
- *CONFIG_COMPILER_CXX_EXCEPTIONS*
- *CONFIG_COMPILER_CXX_RTTI*
- *CONFIG_COMPILER_OPTIMIZATION*
- *CONFIG_COMPILER_HIDE_PATHS_MACROS*
- *CONFIG_COMPILER_STACK_CHECK_MODE*

CONFIG_COMPILER_OPTIMIZATION

Optimization Level

Found in: Compiler options

This option sets compiler optimization level (gcc -O argument) for the app.

- The "Default" setting will add the -0g flag to CFLAGS.
- The "Size" setting will add the -0s flag to CFLAGS.
- The "Performance" setting will add the -O2 flag to CFLAGS.
- The "None" setting will add the -O0 flag to CFLAGS.

The "Size" setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The "Performance" setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

"None" with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOTLOADER_COMPILER_OPTIMIZATION setting.

Available options:

- Debug (-Og) (COMPILER_OPTIMIZATION_DEFAULT)
- Optimize for size (-Os) (COMPILER_OPTIMIZATION_SIZE)
- Optimize for performance (-O2) (COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (COMPILER_OPTIMIZATION_NONE)

CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

Assertion level

Found in: Compiler options

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to "silent" to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:

- Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
  If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

CONFIG_COMPILER_FLOAT_LIB_FROM

Compiler float lib source

Found in: Compiler options

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is "fast", but it has a few exceptions from IEEE 754 compliance.

Available options:

- libgcc (COMPILER_FLOAT_LIB_FROM_GCCLIB)
- librvfp (COMPILER_FLOAT_LIB_FROM_RVFPLIB)

CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT

Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

Found in: Compiler options

If enabled, the error messages will be discarded in following check macros: - ESP_RETURN_ON_ERROR - ESP_EXIT_ON_ERROR - ESP_RETURN_ON_FALSE - ESP_EXIT_ON_FALSE

Default value:

- No (disabled)

CONFIG_COMPILER_HIDE_PATHS_MACROS

Replace ESP-IDF and project paths in binaries

Found in: Compiler options

When expanding the __FILE__ and __BASE_FILE__ macros, replace paths inside ESP-IDF with paths relative to the placeholder string "IDF", and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes -fmacro-prefix-map options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom -fmacro-prefix-map or -ffile-prefix-map arguments.

Default value:

- Yes (enabled)

CONFIG_COMPILER_CXX_EXCEPTIONS

Enable C++ exceptions

Found in: Compiler options

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

Default value:

- No (disabled)

Contains:

- *CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE*

CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

Emergency Pool Size

Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

Default value:

- 0 if *CONFIG_COMPILER_CXX_EXCEPTIONS*

CONFIG_COMPILER_CXX_RTTI

Enable C++ run-time type info (RTTI)

Found in: Compiler options

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using dynamic_cast conversion and typeid operator.

Default value:

- No (disabled)

CONFIG_COMPILER_STACK_CHECK_MODE

Stack smashing protection mode

Found in: Compiler options

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: -fstack-protector) only functions that call alloca, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: -fstack-protector-strong) is like NORMAL, but includes additional functions to be protected –those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: -fstack-protector-all) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

Available options:

- None (COMPILER_STACK_CHECK_MODE_NONE)
- Normal (COMPILER_STACK_CHECK_MODE_NORM)
- Strong (COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (COMPILER_STACK_CHECK_MODE_ALL)

CONFIG_COMPILER_WARN_WRITE_STRINGS

Enable -Wwrite-strings warning flag

Found in: Compiler options

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char \*` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char \*`.

Default value:

- No (disabled)

CONFIG_COMPILER_SAVE_RESTORE_LIBCALLS

Enable -msave-restore flag to reduce code size

Found in: Compiler options

Adds -msave-restore to C/C++ compilation flags.

When this flag is enabled, compiler will call library functions to save/restore registers in function prologues/epilogues. This results in lower overall code size, at the expense of slightly reduced performance.

This option can be enabled for RISC-V targets only.

CONFIG_COMPILER_DISABLE_GCC12_WARNINGS

Disable new warnings introduced in GCC 12

Found in: Compiler options

Enable this option if use GCC 12 or newer, and want to disable warnings which don't appear with GCC 11.

Default value:

- No (disabled)

CONFIG_COMPILER_DUMP_RTL_FILES

Dump RTL files during compilation

Found in: Compiler options

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

Component config

Contains:

- *CONFIG_APPTRACE_UART_TX_MSG_SIZE*
- *CONFIG_APPTRACE_UART_TX_GPIO*
- *CONFIG_APPTRACE_UART_TX_BUFF_SIZE*

CONFIG_APPTRACE_DESTINATION1

Data Destination 1

Found in: Component config > Application Level Tracing

Select destination for application trace: JTAG or none (to disable).

Available options:

- JTAG (APPTRACE_DEST_JTAG)
- None (APPTRACE_DEST_NONE)

CONFIG_APPTRACE_DESTINATION2

Data Destination 2

Found in: Component config > Application Level Tracing

Select destination for application trace: UART(XX) or none (to disable).

Available options:

- UART0 (APPTRACE_DEST_UART0)
- UART1 (APPTRACE_DEST_UART1)
- UART2 (APPTRACE_DEST_UART2)
- USB_CDC (APPTRACE_DEST_USB_CDC)
- None (APPTRACE_DEST_UART_NONE)

CONFIG_APPTRACE_UART_TX_GPIO

UART TX on GPIO#

Found in: Component config > Application Level Tracing

This GPIO is used for UART TX pin.

CONFIG_APPTRACE_UART_RX_GPIO

UART RX on GPIO#

Found in: Component config > Application Level Tracing

This GPIO is used for UART RX pin.

CONFIG_APPTRACE_UART_BAUDRATE

UART baud rate

Found in: Component config > Application Level Tracing

This baud rate is used for UART.

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

CONFIG_APPTRACE_UART_RX_BUFF_SIZE

UART RX ring buffer size

Found in: Component config > Application Level Tracing

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

CONFIG_APPTRACE_UART_TX_BUFF_SIZE

UART TX ring buffer size

Found in: Component config > Application Level Tracing

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

CONFIG_APPTRACE_UART_TX_MSG_SIZE

UART TX message size

Found in: Component config > Application Level Tracing

Maximum size of the single message to transfer.

CONFIG_APPTRACE_UART_TASK_PRIO

UART Task Priority

Found in: Component config > Application Level Tracing

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX_PRIORITIES-1).

Range:

- from 1 to 32

Default value:

- 1

CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO

Timeout for flushing last trace data to host on panic

Found in: Component config > Application Level Tracing

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH

Threshold for flushing last trace data to host on panic

Found in: Component config > Application Level Tracing

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

CONFIG_APPTRACE_BUF_SIZE

Size of the apptrace buffer

Found in: Component config > Application Level Tracing

Size of the memory buffer for trace data in bytes.

CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX

Size of the pending data buffer

Found in: Component config > Application Level Tracing

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

FreeRTOS SystemView Tracing Contains:

- *CONFIG_APPTRACE_SV_CPU*
- *CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE*
- *CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE*
- *CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE*
- *CONFIG_APPTRACE_SV_MAX_TASKS*
- *CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE*
- *CONFIG_APPTRACE_SV_ENABLE*
- *CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE*
- *CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE*
- *CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE*
- *CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE*
- *CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE*
- *CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE*
- *CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE*
- *CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE*
- *CONFIG_APPTRACE_SV_TS_SOURCE*
- *CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE*
- *CONFIG_APPTRACE_SV_BUF_WAIT_TMO*

CONFIG_APPTRACE_SV_ENABLE

SystemView Tracing Enable

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables supporrt for SEGGER SystemView tracing functionality.

CONFIG_APPTRACE_SV_DEST

SystemView destination

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

SystemView witt transfer data trough defined interface.

Available options:

- Data destination JTAG (APPTRACE_SV_DEST_JTAG)
  Send SEGGER SystemView events through JTAG interface.
- Data destination UART (APPTRACE_SV_DEST_UART)
  Send SEGGER SystemView events through UART interface.

CONFIG_APPTRACE_SV_CPU

CPU to trace

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Define the CPU to trace by SystemView.

Available options:

- CPU0 (APPTRACE_SV_DEST_CPU_0)
  Send SEGGER SystemView events for Pro CPU.
- CPU1 (APPTRACE_SV_DEST_CPU_1)
  Send SEGGER SystemView events for App CPU.

CONFIG_APPTRACE_SV_TS_SOURCE

Timer to use as timestamp source

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:

- CPU cycle counter (CCOUNT) (APPTRACE_SV_TS_SOURCE_CCOUNT)
- General Purpose Timer (Timer Group) (APPTRACE_SV_TS_SOURCE_GPTIMER)
- esp_timer high resolution timer (APPTRACE_SV_TS_SOURCE_ESP_TIMER)

CONFIG_APPTRACE_SV_MAX_TASKS

Maximum supported tasks

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Configures maximum supported tasks in sysview debug

CONFIG_APPTRACE_SV_BUF_WAIT_TMO

Trace buffer wait timeout

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE

Trace Buffer Overflow Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "Trace Buffer Overflow" event.

CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE

ISR Enter Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "ISR Enter" event.

CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE

ISR Exit Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "ISR Exit" event.

CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE

ISR Exit to Scheduler Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "ISR to Scheduler" event.

CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE

Task Start Execution Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "Task Start Execution" event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE

Task Stop Execution Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "Task Stop Execution" event.

CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE

Task Start Ready State Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "Task Start Ready State" event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE

Task Stop Ready State Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "Task Stop Ready State" event.

CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE

Task Create Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "Task Create" event.

CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "Task Terminate" event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE

System Idle Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "System Idle" event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "Timer Enter" event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE

Timer Exit Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables "Timer Exit" event.

CONFIG_APPTRACE_GCOV_ENABLE

GCOV to Host Enable

Found in: Component config > Application Level Tracing

Enables support for GCOV data transfer to host.

Bluetooth Contains:

- *Bluedroid Options*
- *CONFIG_BT_ENABLED*
- *Controller Options*
- *NimBLE Options*

CONFIG_BT_ENABLED

Bluetooth

Found in: Component config > Bluetooth

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

CONFIG_BT_HOST

Host

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED

This helps to choose Bluetooth host stack

Available options:

- Bluedroid - Dual-mode (BT_BLUEDROID_ENABLED)
  This option is recommended for classic Bluetooth or for dual-mode usecases
- NimBLE - BLE only (BT_NIMBLE_ENABLED)
  This option is recommended for BLE only usecases to save on memory
- Disabled (BT_CONTROLLER_ONLY)
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

CONFIG_BT_CONTROLLER

Controller

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED

This helps to choose Bluetooth controller stack

Available options:

- Enabled (BT_CONTROLLER_ENABLED)
  This option is recommended for Bluetooth controller usecases
- Disabled (BT_CONTROLLER_DISABLED)
  This option is recommended for Bluetooth Host only usecases

Bluedroid Options

Contains:

- *CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK*
- *CONFIG_BT_BLUEDROID_MEM_DEBUG*
- *CONFIG_BT_BTU_TASK_STACK_SIZE*
- *CONFIG_BT_BTC_TASK_STACK_SIZE*
- *CONFIG_BT_BLE_ENABLED*
- *BT DEBUG LOG LEVEL*
- *CONFIG_BT_ACL_CONNECTIONS*
- *CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST*
- *CONFIG_BT_STACK_NO_LOG*
- *CONFIG_BT_BLE_42_FEATURES_SUPPORTED*
- *CONFIG_BT_BLE_50_FEATURES_SUPPORTED*
- *CONFIG_BT_MULTI_CONNECTION_ENBALE*
- *CONFIG_BT_MAX_DEVICE_NAME_LEN*
- *CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN*
- *CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE*
- *CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT*
- *CONFIG_BT_BLE_RPA_TIMEOUT*
- *CONFIG_BT_BLE_RPA_SUPPORTED*
- *CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY*

CONFIG_BT_BTC_TASK_STACK_SIZE

Bluetooth event (callback to application) task stack size

Found in: Component config > Bluetooth > Bluedroid Options

This select btc task stack size

Default value:

- 3072 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE

The cpu core which Bluedroid run

Found in: Component config > Bluetooth > Bluedroid Options

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (BT_BLUEDROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_BLUEDROID_PINNED_TO_CORE_1)

CONFIG_BT_BTU_TASK_STACK_SIZE

Bluetooth Bluedroid Host Stack task stack size

Found in: Component config > Bluetooth > Bluedroid Options

This select btu task stack size

Default value:

- 4096 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLUEDROID_MEM_DEBUG

Bluedroid memory debug

Found in: Component config > Bluetooth > Bluedroid Options

Bluedroid memory debug

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ENABLED

Bluetooth Low Energy

Found in: Component config > Bluetooth > Bluedroid Options

This enables Bluetooth Low Energy

Default value:

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_ENABLE

Include GATT server module(GATTS)

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be disabled when the app work only on gatt client mode

Default value:

- Yes (enabled) if *CONFIG_BT_BLE_ENABLED* && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_PPCP_CHAR_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This enables "Peripheral Preferred Connection Parameters" characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

Default value:

- No (disabled) if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_BLUFI_ENABLE

Include blufi function

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This option can be close when the app does not require blufi function.

Default value:

- No (disabled) if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED

CONFIG_BT_GATT_MAX_SR_PROFILES

Max GATT Server Profiles

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Maximum GATT Server Profiles Count

Range:

- from 1 to 32 if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 8 if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATT_MAX_SR_ATTRIBUTES

Max GATT Service Attributes

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Maximum GATT Service Attributes Count

Range:

- from 1 to 500 if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 100 if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE

GATTS Service Change Mode

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Service change indication mode for GATT Server.

Available options:

- GATTS manually send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_MANUAL)
  Manually send service change indication through API esp_ble_gatts_send_service_change_indication()
- GATTS automatically send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_AUTO)
  Let Bluedroid handle the service change indication internally

CONFIG_BT_GATTS_ROBUST_CACHING_ENABLED

Enable Robust Caching on Server Side

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This option enable gatt robust caching feature on server

Default value:

- No (disabled) if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_DEVICE_NAME_WRITABLE

Allow to write device name by GATT clients

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Enabling this option allows remote GATT clients to write device name

Default value:

- No (disabled) if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_APPEARANCE_WRITABLE

Allow to write appearance by GATT clients

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Enabling this option allows remote GATT clients to write appearance

Default value:

- No (disabled) if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_ENABLE

Include GATT client module(GATTC)

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app work only on gatt server mode

Default value:

- Yes (enabled) if *CONFIG_BT_BLE_ENABLED* && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_MAX_CACHE_CHAR

Max gattc cache characteristic for discover

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

Maximum GATTC cache characteristic count

Range:

- from 1 to 500 if *CONFIG_BT_GATTC_ENABLE* && BT_BLUEDROID_ENABLED

Default value:

- 40 if *CONFIG_BT_GATTC_ENABLE* && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_CACHE_NVS_FLASH

Save gattc cache data to nvs flash

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

This select can save gattc cache data to nvs flash

Default value:

- No (disabled) if *CONFIG_BT_GATTC_ENABLE* && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_CONNECT_RETRY_COUNT

The number of attempts to reconnect if the connection establishment failed

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

The number of attempts to reconnect if the connection establishment failed

Range:

- from 0 to 7 if *CONFIG_BT_GATTC_ENABLE* && BT_BLUEDROID_ENABLED

Default value:

- 3 if *CONFIG_BT_GATTC_ENABLE* && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_SMP_ENABLE

Include BLE security module(SMP)

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app not used the ble security connect.

Default value:

- Yes (enabled) if *CONFIG_BT_BLE_ENABLED* && BT_BLUEDROID_ENABLED

CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE

Slave enable connection parameters update during pairing

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

Default value:

- No (disabled) if *CONFIG_BT_BLE_SMP_ENABLE* && BT_BLUEDROID_ENABLED

CONFIG_BT_STACK_NO_LOG

Disable BT debug logs (minimize bin size)

Found in: Component config > Bluetooth > Bluedroid Options

This select can save the rodata code size

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

BT DEBUG LOG LEVEL Contains:

- *CONFIG_BT_LOG_A2D_TRACE_LEVEL*
- *CONFIG_BT_LOG_APPL_TRACE_LEVEL*
- *CONFIG_BT_LOG_AVCT_TRACE_LEVEL*
- *CONFIG_BT_LOG_AVDT_TRACE_LEVEL*
- *CONFIG_BT_LOG_AVRC_TRACE_LEVEL*
- *CONFIG_BT_LOG_BLUFI_TRACE_LEVEL*
- *CONFIG_BT_LOG_BNEP_TRACE_LEVEL*
- *CONFIG_BT_LOG_BTC_TRACE_LEVEL*
- *CONFIG_BT_LOG_BTIF_TRACE_LEVEL*
- *CONFIG_BT_LOG_BTM_TRACE_LEVEL*
- *CONFIG_BT_LOG_GAP_TRACE_LEVEL*
- *CONFIG_BT_LOG_GATT_TRACE_LEVEL*
- *CONFIG_BT_LOG_HCI_TRACE_LEVEL*
- *CONFIG_BT_LOG_HID_TRACE_LEVEL*
- *CONFIG_BT_LOG_L2CAP_TRACE_LEVEL*
- *CONFIG_BT_LOG_MCA_TRACE_LEVEL*
- *CONFIG_BT_LOG_OSI_TRACE_LEVEL*
- *CONFIG_BT_LOG_PAN_TRACE_LEVEL*
- *CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL*
- *CONFIG_BT_LOG_SDP_TRACE_LEVEL*
- *CONFIG_BT_LOG_SMP_TRACE_LEVEL*

CONFIG_BT_LOG_HCI_TRACE_LEVEL

HCI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HCI layer

Available options:

- NONE (BT_LOG_HCI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HCI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HCI_TRACE_LEVEL_WARNING)
- API (BT_LOG_HCI_TRACE_LEVEL_API)
- EVENT (BT_LOG_HCI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HCI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTM_TRACE_LEVEL

BTM layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTM layer

Available options:

- NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_L2CAP_TRACE_LEVEL

L2CAP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for L2CAP layer

Available options:

- NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_L2CAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL

RFCOMM layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for RFCOMM layer

Available options:

- NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SDP_TRACE_LEVEL

SDP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for SDP layer

Available options:

- NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SDP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GAP_TRACE_LEVEL

GAP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for GAP layer

Available options:

- NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_GAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)

- DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL

BNEP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BNEP layer

Available options:

- NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
- API (BT_LOG_BNEP_TRACE_LEVEL_API)
- EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_PAN_TRACE_LEVEL

PAN layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for PAN layer

Available options:

- NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
- API (BT_LOG_PAN_TRACE_LEVEL_API)
- EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_A2D_TRACE_LEVEL

A2D layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for A2D layer

Available options:

- NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
- API (BT_LOG_A2D_TRACE_LEVEL_API)
- EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVDT_TRACE_LEVEL

AVDT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVDT layer

Available options:

- NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVDT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVCT_TRACE_LEVEL

AVCT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVCT layer

Available options:

- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVRC_TRACE_LEVEL

AVRC layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVRC layer

Available options:

- NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL

MCA layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for MCA layer

Available options:

- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HID layer

Available options:

- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for APPL layer

Available options:

- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for GATT layer

Available options:

- NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
- API (BT_LOG_GATT_TRACE_LEVEL_API)
- EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for SMP layer

Available options:

- NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SMP_TRACE_LEVEL_API)

- EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTIF layer

Available options:

- NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTIF_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL

BTC layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTC layer

Available options:

- NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTC_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for OSI layer

Available options:

- NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
- API (BT_LOG_OSI_TRACE_LEVEL_API)
- EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

BLUFI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BLUFI layer

Available options:

- NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
- API (BT_LOG_BLUFI_TRACE_LEVEL_API)
- EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_ACL_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~9)

Found in: Component config > Bluetooth > Bluedroid Options

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

Range:

- from 1 to 9 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 4 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_MULTI_CONNECTION_ENBALE

Enable BLE multi-conections

Found in: Component config > Bluetooth > Bluedroid Options

Enable this option if there are multiple connections

Default value:

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST

BT/BLE will first malloc the memory from the PSRAM

Found in: Component config > Bluetooth > Bluedroid Options

This select can save the internal RAM if there have the PSRAM

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY

Use dynamic memory allocation in BT/BLE stack

Found in: Component config > Bluetooth > Bluedroid Options

This select can make the allocation of memory will become more flexible

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK

BLE queue congestion check

Found in: Component config > Bluetooth > Bluedroid Options

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN

Report adv data and scan response individually when BLE active scan

Found in: Component config > Bluetooth > Bluedroid Options

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

Memory reserved at start of DRAM for Bluetooth stack

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && *CONFIG_BT_BLE_ENABLED* && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

Timeout of BLE connection establishment

Found in: Component config > Bluetooth > Bluedroid Options

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.

Range:

- from 1 to 60 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 30 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_MAX_DEVICE_NAME_LEN

length of bluetooth device name

Found in: Component config > Bluetooth > Bluedroid Options

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can't fit in will be truncated.

Range:

- from 32 to 248 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 32 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_RPA_SUPPORTED

Update RPA to Controller

Found in: Component config > Bluetooth > Bluedroid Options

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_RPA_TIMEOUT

Timeout of resolvable private address

Found in: Component config > Bluetooth > Bluedroid Options

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

Range:

- from 1 to 3600 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 900 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_50_FEATURES_SUPPORTED

Enable BLE 5.0 features

Found in: Component config > Bluetooth > Bluedroid Options

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

Default value:

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_42_FEATURES_SUPPORTED

Enable BLE 4.2 features

Found in: Component config > Bluetooth > Bluedroid Options

This enables BLE 4.2 features.

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

NimBLE Options

Contains:

- *CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME*
- *CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS*
- *CONFIG_BT_NIMBLE_WHITELIST_SIZE*
- *CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER*
- *CONFIG_BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM*
- *CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT*
- *CONFIG_BT_NIMBLE_ROLE_BROADCASTER*
- *CONFIG_BT_NIMBLE_ROLE_CENTRAL*
- *CONFIG_BT_NIMBLE_MESH*
- *CONFIG_BT_NIMBLE_ROLE_OBSERVER*
- *CONFIG_BT_NIMBLE_ROLE_PERIPHERAL*
- *CONFIG_BT_NIMBLE_SECURITY_ENABLE*

- *CONFIG_BT_NIMBLE_BLUFI_ENABLE*
- *CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT*
- *CONFIG_BT_NIMBLE_USE_ESP_TIMER*
- *CONFIG_BT_NIMBLE_DEBUG*
- *CONFIG_BT_NIMBLE_HOST_BASED_PRIVACY*
- *CONFIG_BT_NIMBLE_HS_FLOW_CTRL*
- *CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE*
- *CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN*
- *CONFIG_BT_NIMBLE_MAX_BONDS*
- *CONFIG_BT_NIMBLE_MAX_CCCDS*
- *CONFIG_BT_NIMBLE_MAX_CONNECTIONS*
- *CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM*
- *CONFIG_BT_NIMBLE_GATT_MAX_PROCS*
- *CONFIG_BT_NIMBLE_MEM_ALLOC_MODE*
- *Memory Settings*
- *CONFIG_BT_NIMBLE_LOG_LEVEL*
- *CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE*
- *CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS*
- *CONFIG_BT_NIMBLE_NVS_PERSIST*
- *CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU*
- *CONFIG_BT_NIMBLE_RPA_TIMEOUT*
- *CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE*
- *CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST*

CONFIG_BT_NIMBLE_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > Bluetooth > NimBLE Options

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:

- Internal memory (BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
- Internal IRAM (BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT)
  Allows to use IRAM memory region as 8bit accessible region.
  Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BT_NIMBLE_LOG_LEVEL

NimBLE Host log verbosity

Found in: Component config > Bluetooth > NimBLE Options

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config –> Log output –> Default log verbosity”.

Available options:

- No logs (BT_NIMBLE_LOG_LEVEL_NONE)
- Error logs (BT_NIMBLE_LOG_LEVEL_ERROR)
- Warning logs (BT_NIMBLE_LOG_LEVEL_WARNING)
- Info logs (BT_NIMBLE_LOG_LEVEL_INFO)

- Debug logs (BT_NIMBLE_LOG_LEVEL_DEBUG)

CONFIG_BT_NIMBLE_MAX_CONNECTIONS

Maximum number of concurrent connections

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu. For ESP32C2, ESP32C6 and ESP32H2, each connection will take about 1k DRAM.

Range:
- from 1 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:
- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_BONDS

Maximum number of bonds to save across reboots

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of bonds to save for peer security and our security

Default value:
- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CCCDS

Maximum number of CCC descriptors to save across reboots

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of CCC descriptors to save

Default value:
- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM

Maximum number of connection oriented channels

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

Range:
- from 0 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:
- 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE

The CPU core on which NimBLE host will run

Found in: Component config > Bluetooth > NimBLE Options

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

Available options:
- Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)

- Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE

NimBLE Host task stack size

Found in: Component config > Bluetooth > NimBLE Options

This configures stack size of NimBLE host task

Default value:

- 5120 if *CONFIG_BLE_MESH* && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- 4096 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_CENTRAL

Enable BLE Central role

Found in: Component config > Bluetooth > NimBLE Options

Enables central role

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_PERIPHERAL

Enable BLE Peripheral role

Found in: Component config > Bluetooth > NimBLE Options

Enable peripheral role

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_BROADCASTER

Enable BLE Broadcaster role

Found in: Component config > Bluetooth > NimBLE Options

Enables broadcaster role

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_OBSERVER

Enable BLE Observer role

Found in: Component config > Bluetooth > NimBLE Options

Enables observer role

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_NVS_PERSIST

Persist the BLE Bonding keys in NVS

Found in: Component config > Bluetooth > NimBLE Options

Enable this flag to make bonding persistent across device reboots

Default value:

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable BLE SM feature

Found in: Component config > Bluetooth > NimBLE Options

Enable BLE sm feature

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:

- *CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION*
- *CONFIG_BT_NIMBLE_SM_LEGACY*
- *CONFIG_BT_NIMBLE_SM_SC*

CONFIG_BT_NIMBLE_SM_LEGACY

Security manager legacy pairing

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager legacy pairing

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_SECURITY_ENABLE* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC

Security manager secure connections (4.2)

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager secure connections

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_SECURITY_ENABLE* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS

Use predefined public-private key pair

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE > CONFIG_BT_NIMBLE_SM_SC

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

Default value:

- No (disabled) if *CONFIG_BT_NIMBLE_SECURITY_ENABLE* && *CONFIG_BT_NIMBLE_SM_SC* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION

Enable LE encryption

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable encryption connection

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_SECURITY_ENABLE* && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_DEBUG

Enable extra runtime asserts and host debugging

Found in: Component config > Bluetooth > NimBLE Options

This enables extra runtime asserts and host debugging

Default value:

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME

BLE GAP default device name

Found in: Component config > Bluetooth > NimBLE Options

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API ble_svc_gap_device_name_set()

Default value:

- “nimble” if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN

Maximum length of BLE device name in octets

Found in: Component config > Bluetooth > NimBLE Options

Device Name characteristic value shall be 0 to 248 octets in length

Default value:

- 31 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU

Preferred MTU size in octets

Found in: Component config > Bluetooth > NimBLE Options

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API ble_att_set_preferred_mtu()

Default value:

- 256 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE

External appearance of the device

Found in: Component config > Bluetooth > NimBLE Options

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

Default value:

- 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Memory Settings Contains:

- *CONFIG_BT_NIMBLE_ACL_BUF_COUNT*
- *CONFIG_BT_NIMBLE_ACL_BUF_SIZE*
- *CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE*
- *CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT*
- *CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT*
- *CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT*
- *CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE*
- *CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT*
- *CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE*

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT

MSYS_1 Block Count

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

Default value:

- 24 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED
- 12 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE

MSYS_1 Block Size

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

Dynamic memory size of block 1

Default value:

- 128 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED
- 256 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT

MSYS_2 Block Count

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

Dynamic memory count

Default value:

- 24 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE

MSYS_2 Block Size

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

Dynamic memory size of block 2

Default value:

- 320 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ACL_BUF_COUNT

ACL Buffer count

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

The number of ACL data buffers.

Default value:

- 24 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ACL_BUF_SIZE

ACL Buffer size

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

Default value:

- 255 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE

HCI Event Buffer size

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

Default value:

- 257 if *CONFIG_BT_NIMBLE_EXT_ADV* && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- 70 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT

High Priority HCI Event Buffer count

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

Default value:

- 30 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT

Low Priority HCI Event Buffer count

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

This is the low priority HCI events' buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

Default value:

- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_GATT_MAX_PROCS

Maximum number of GATT client procedures

Found in: Component config > Bluetooth > NimBLE Options

Maximum number of GATT client procedures that can be executed.

Default value:

- 4 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Enable Host Flow control

Found in: Component config > Bluetooth > NimBLE Options

Enable Host Flow control

Default value:

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL

Host Flow control interval

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Host flow control interval in msecs

Default value:

- 1000 if *CONFIG_BT_NIMBLE_HS_FLOW_CTRL* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH

Host Flow control threshold

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

Default value:

- 2 if *CONFIG_BT_NIMBLE_HS_FLOW_CTRL* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT

Host Flow control on disconnect

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Enable this option to send number-of-completed-packets event to controller after disconnection

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_HS_FLOW_CTRL* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_RPA_TIMEOUT

RPA timeout in seconds

Found in: Component config > Bluetooth > NimBLE Options

Time interval between RPA address change. This is applicable in case of Host based RPA

Range:
- from 1 to 41400 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:
- 900 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH

Enable BLE mesh functionality

Found in: Component config > Bluetooth > NimBLE Options

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: *:doc:../esp32/api-guides/esp-ble-mesh/ble-mesh-index*“

Default value:
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:

- *CONFIG_BT_NIMBLE_MESH_PROVISIONER*
- *CONFIG_BT_NIMBLE_MESH_PROV*
- *CONFIG_BT_NIMBLE_MESH_GATT_PROXY*
- *CONFIG_BT_NIMBLE_MESH_FRIEND*
- *CONFIG_BT_NIMBLE_MESH_LOW_POWER*
- *CONFIG_BT_NIMBLE_MESH_PROXY*
- *CONFIG_BT_NIMBLE_MESH_RELAY*
- *CONFIG_BT_NIMBLE_MESH_DEVICE_NAME*
- *CONFIG_BT_NIMBLE_MESH_NODE_COUNT*

CONFIG_BT_NIMBLE_MESH_PROXY

Enable mesh proxy functionality

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

Default value:
- No (disabled) if *CONFIG_BT_NIMBLE_MESH* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROV

Enable BLE mesh provisioning

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable mesh provisioning

Default value:
- Yes (enabled) if *CONFIG_BT_NIMBLE_MESH* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PB_ADV

Enable mesh provisioning over advertising bearer

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV

Enable this option to allow the device to be provisioned over the advertising bearer

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_MESH_PROV* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PB_GATT

Enable mesh provisioning over GATT bearer

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV

Enable this option to allow the device to be provisioned over the GATT bearer

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_MESH_PROV* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_GATT_PROXY

Enable GATT Proxy functionality

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_MESH* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_RELAY

Enable mesh relay functionality

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Support for acting as a Mesh Relay Node

Default value:

- No (disabled) if *CONFIG_BT_NIMBLE_MESH* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_LOW_POWER

Enable mesh low power mode

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable this option to be able to act as a Low Power Node

Default value:

- No (disabled) if *CONFIG_BT_NIMBLE_MESH* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_FRIEND

Enable mesh friend functionality

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable this option to be able to act as a Friend Node

Default value:

- No (disabled) if *CONFIG_BT_NIMBLE_MESH* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_DEVICE_NAME

Set mesh device name

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

This value defines Bluetooth Mesh device/node name

Default value:

- “nimble-mesh-node” if *CONFIG_BT_NIMBLE_MESH* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_NODE_COUNT

Set mesh node count

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Defines mesh node count.

Default value:

- 1 if *CONFIG_BT_NIMBLE_MESH* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROVISIONER

Enable BLE mesh provisioner

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable mesh provisioner.

Default value:

- 0 if *CONFIG_BT_NIMBLE_MESH* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS

Override TinyCrypt with mbedTLS for crypto computations

Found in: Component config > Bluetooth > NimBLE Options

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS

BLE host stop timeout in msec

Found in: Component config > Bluetooth > NimBLE Options

BLE Host stop procedure timeout in milliseconds.

Default value:

- 2000 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HOST_BASED_PRIVACY

Enable host based privacy for random address.

Found in: Component config > Bluetooth > NimBLE Options

Use this option to do host based Random Private Address resolution. If this option is disabled then controller based privacy is used.

Default value:

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

Enable connection reattempts on connection establishment error

Found in: Component config > Bluetooth > NimBLE Options

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT

Maximum number connection reattempts

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

Defines maximum number of connection reattempts.

Range:

- from 1 to 7 if BT_NIMBLE_ENABLED && *CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT* && BT_NIMBLE_ENABLED

Default value:

- 3 if BT_NIMBLE_ENABLED && *CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable BLE 5 feature

Found in: Component config > Bluetooth > NimBLE Options

Enable BLE 5 feature

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:

- *CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY*
- *CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY*
- *CONFIG_BT_NIMBLE_EXT_ADV*
- *CONFIG_BT_NIMBLE_BLE_POWER_CONTROL*
- *CONFIG_BT_NIMBLE_MAX_PERIODIC_ADVERTISER_LIST*
- *CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS*

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY

Enable 2M Phy

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable 2M-PHY

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY

Enable coded Phy

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable coded-PHY

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_EXT_ADV

Enable extended advertising

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

Default value:

- No (disabled) if *CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_EXT_ADV_INSTANCES

Maximum number of extended advertising instances.

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. For ESP32C2, ESP32C6 and ESP32H2, each extended advertising instance will take about 0.5k DRAM.

Range:

- from 0 to 4 if *CONFIG_BT_NIMBLE_EXT_ADV* && *CONFIG_BT_NIMBLE_EXT_ADV* && BT_NIMBLE_ENABLED

Default value:

- 1 if *CONFIG_BT_NIMBLE_EXT_ADV* && *CONFIG_BT_NIMBLE_EXT_ADV* && *CONFIG_BT_NIMBLE_EXT_ADV* && BT_NIMBLE_ENABLED
- 0 if *CONFIG_BT_NIMBLE_EXT_ADV* && *CONFIG_BT_NIMBLE_EXT_ADV* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_EXT_ADV_MAX_SIZE

Maximum length of the advertising data.

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Defines the length of the extended adv data. The value should not exceed 1650.

Range:

- from 0 to 1650 if *CONFIG_BT_NIMBLE_EXT_ADV* && *CONFIG_BT_NIMBLE_EXT_ADV* && BT_NIMBLE_ENABLED

Default value:

- 1650 if *CONFIG_BT_NIMBLE_EXT_ADV* && *CONFIG_BT_NIMBLE_EXT_ADV* && *CONFIG_BT_NIMBLE_EXT_ADV* && BT_NIMBLE_ENABLED
- 0 if *CONFIG_BT_NIMBLE_EXT_ADV* && *CONFIG_BT_NIMBLE_EXT_ADV* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV

Enable periodic advertisement.

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Enable this option to start periodic advertisement.

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_EXT_ADV* && *CONFIG_BT_NIMBLE_EXT_ADV* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_PERIODIC_ADV_SYNC_TRANSFER

Enable Transer Sync Events

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV > CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV

This enables controller transfer periodic sync events to host

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV* && *CONFIG_BT_NIMBLE_EXT_ADV* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS

Maximum number of periodic advertising syncs

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

Range:

- from 0 to 8 if *CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT* && BT_NIMBLE_ENABLED

Default value:

- 1 if *CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV* && *CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT* && BT_NIMBLE_ENABLED
- 0 if *CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_PERIODIC_ADVERTISER_LIST

Maximum number of periodic advertiser list

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to set the upper limit for number of periodic advertiser list.

Range:

- from 1 to 5 if *CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT* && SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

Default value:

- 5 if *CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT* && *CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT* && SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLE_POWER_CONTROL

Enable support for BLE Power Control

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to enable the Power Control feature

Default value:

- No (disabled) if *CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT* && SOC_BLE_POWER_CONTROL_SUPPORTED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

Found in: Component config > Bluetooth > NimBLE Options

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

Available options:

- Force Enable (BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM_EN)
  Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM_DIS)
  Disable the limitation on max tx/rx time for Coded-PHY connection

CONFIG_BT_NIMBLE_WHITELIST_SIZE

BLE white list size

Found in: Component config > Bluetooth > NimBLE Options

BLE list size

Range:

- from 1 to 15 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:

- 12 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST

Throughput Test Mode enable

Found in: Component config > Bluetooth > NimBLE Options

Enable the throughput test mode

Default value:

- No (disabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLUFI_ENABLE

Enable blufi functionality

Found in: Component config > Bluetooth > NimBLE Options

Set this option to enable blufi functionality.

Default value:

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_USE_ESP_TIMER

Enable Esp Timer for Nimble

Found in: Component config > Bluetooth > NimBLE Options

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER

Blob transfer

Found in: Component config > Bluetooth > NimBLE Options

This option is used when data to be sent is more than 512 bytes. For peripheral role, BT_NIMBLE_MSYS_1_BLOCK_COUNT needs to be increased according to the need.

Controller Options

Contains:

- *CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP*
- *CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL*
- *CONFIG_BT_CTRL_BLE_MAX_ACT*
- *CONFIG_BT_CTRL_BLE_SCAN_DUPL*
- *CONFIG_BT_CTRL_BLE_STATIC_ACL_TX_BUF_NB*
- *CONFIG_BT_CTRL_HW_CCA_VAL*
- *CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM*
- *CONFIG_BT_CTRL_CE_LENGTH_TYPE*
- *CONFIG_BT_CTRL_RX_ANTENNA_INDEX*
- *CONFIG_BT_CTRL_TX_ANTENNA_INDEX*
- *CONFIG_BT_CTRL_SCAN_BACKOFF_UPPERLIMITMAX*
- *CONFIG_BT_CTRL_AGC_RECORRECT_EN*
- *CONFIG_BT_CTRL_HCI_MODE_CHOICE*
- *CONFIG_BT_CTRL_HW_CCA*
- *MODEM SLEEP Options*
- *CONFIG_BT_CTRL_PINNED_TO_CORE_CHOICE*
- *CONFIG_BT_CTRL_ADV_DUP_FILT_MAX*

CONFIG_BT_CTRL_BLE_MAX_ACT

BLE Max Instances

Found in: Component config > Bluetooth > Controller Options

BLE maximum activities of bluetooth controller , both of connections, scan , sync and adv(periodic adv, multi-adv). Each instance needs to consume 828 bytes, you can save RAM by modifying the instance value according to actual needs.

Range:

- from 1 to 10 if BT_CONTROLLER_ENABLED

Default value:

- 6 if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_STATIC_ACL_TX_BUF_NB

BLE static ACL TX buffer numbers

Found in: Component config > Bluetooth > Controller Options

BLE ACL buffer have two methods to be allocated. One is persistent allocating (alloate when controller initialise, never free until controller de-initialise) another is dynamically allocating (allocate before TX and free after TX).

Range:
- from 0 to 12 if BT_CONTROLLER_ENABLED

Default value:
- 0 if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_PINNED_TO_CORE_CHOICE

The cpu core which bluetooth controller run

Found in: Component config > Bluetooth > Controller Options

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

Available options:
- Core 0 (PRO CPU) (BT_CTRL_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_CTRL_PINNED_TO_CORE_1)

CONFIG_BT_CTRL_HCI_MODE_CHOICE

HCI mode

Found in: Component config > Bluetooth > Controller Options

Specify HCI mode as VHCI or UART(H4)

Available options:
- VHCI (BT_CTRL_HCI_MODE_VHCI)
  Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32S3 or ESP32C3.
- UART(H4) (BT_CTRL_HCI_MODE_UART_H4)
  If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

CONFIG_BT_CTRL_ADV_DUP_FILT_MAX

The maxinum number of 5.0 extend duplicate scan filter

Found in: Component config > Bluetooth > Controller Options

The maxinum number of suplicate scan filter

Range:
- from 1 to 500 if BT_CONTROLLER_ENABLED

Default value:
- 30 if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_HW_CCA

HW CCA check enable

Found in: Component config > Bluetooth > Controller Options

It enables HW CCA feature in controller

Default value:
- No (disabled) if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_HW_CCA_VAL

CCA threshold value

Found in: Component config > Bluetooth > Controller Options

It is the threshold value of HW CCA, if the value is 30, it means CCA threshold is -30 dBm.

Range:
- from 20 to 60 if BT_CONTROLLER_ENABLED

Default value:
- 20 if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_CE_LENGTH_TYPE

Connection event length determination method

Found in: Component config > Bluetooth > Controller Options

Specify connection event length determination

Available options:
- ORIGINAL (BT_CTRL_CE_LENGTH_TYPE_ORIG)
- Use CE parameter for HCI command (BT_CTRL_CE_LENGTH_TYPE_CE)
- Use Espressif self-defined method (BT_CTRL_CE_LENGTH_TYPE_SD)

CONFIG_BT_CTRL_TX_ANTENNA_INDEX

default Tx anntena used

Found in: Component config > Bluetooth > Controller Options

Specify default Tx antenna used for bluetooth

Available options:
- Antenna 0 (BT_CTRL_TX_ANTENNA_INDEX_0)
- Antenna 1 (BT_CTRL_TX_ANTENNA_INDEX_1)

CONFIG_BT_CTRL_RX_ANTENNA_INDEX

default Rx anntena used

Found in: Component config > Bluetooth > Controller Options

Specify default Rx antenna used for bluetooth

Available options:
- Antenna 0 (BT_CTRL_RX_ANTENNA_INDEX_0)
- Antenna 1 (BT_CTRL_RX_ANTENNA_INDEX_1)

CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL

BLE default Tx power level

Found in: Component config > Bluetooth > Controller Options

Specify default Tx power level

Available options:
- -24dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N24)
- -21dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N21)
- -18dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N18)
- -15dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N15)
- -12dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N12)
- **-9dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_N9)

- **-6dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_N6)
- **-3dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_N3)
- 0dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N0)
- **+3dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_P3)
- **+6dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_P6)
- **+9dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_P9)
- +12dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P12)
- +15dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P15)
- +18dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P18)
- +21dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P21)

CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP

BLE adv report flow control supported

Found in: Component config > Bluetooth > Controller Options

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

Default value:

- Yes (enabled) if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM

BLE adv report flow control number

Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP

The number of unprocessed advertising report that bluetooth host can save.If you set *BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM* to a small value, this may cause adv packets lost. If you set *BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM* to a large value, bluetooth host may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set *BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM* according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

Range:

- from 50 to 1000 if *CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP* && BT_CONTROLLER_ENABLED

Default value:

- 100 if *CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP* && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_ADV_REPORT_DISCARD_THRSHOLD

BLE adv lost event threshold value

Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set *BT_CTRL_BLE_ADV_REPORT_DISCARD_THRSHOLD* to a small value or printf every adv lost event, it may cause adv packets lost more.

Range:

- from 1 to 1000 if *CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP* && BT_CONTROLLER_ENABLED

Default value:

- 20 if *CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP* && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_SCAN_DUPL

BLE Scan Duplicate Options

Found in: Component config > Bluetooth > Controller Options

This select enables parameters setting of BLE scan duplicate.

Default value:

- Yes (enabled) if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_SCAN_DUPL_TYPE

Scan Duplicate Type

Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL

Scan duplicate have three ways. one is "Scan Duplicate By Device Address", This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is "Scan Duplicate By Device Address And Advertising Data". This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is "Scan Duplicate By Advertising Data". This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

Available options:

- Scan Duplicate By Device Address (BT_CTRL_SCAN_DUPL_TYPE_DEVICE)
  This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once
- Scan Duplicate By Advertising Data (BT_CTRL_SCAN_DUPL_TYPE_DATA)
  This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
- Scan Duplicate By Device Address And Advertising Data (BT_CTRL_SCAN_DUPL_TYPE_DATA_DEVICE)
  This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

CONFIG_BT_CTRL_SCAN_DUPL_CACHE_SIZE

Maximum number of devices in scan duplicate filter

Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

Range:

- from 10 to 1000 if *CONFIG_BT_CTRL_BLE_SCAN_DUPL* && BT_CONTROLLER_ENABLED

Default value:

- 100 if *CONFIG_BT_CTRL_BLE_SCAN_DUPL* && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_DUPL_SCAN_CACHE_REFRESH_PERIOD

Duplicate scan list refresh period (seconds)

Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL

If the period value is non-zero, the controller will periodically clear the device information stored in the scan duuplicate filter. If it is 0, the scan duuplicate filter will not be cleared until the scanning is disabled. Duplicate advertisements for this period should not be sent to the Host in advertising report events. There

are two scenarios where the ADV packet will be repeatedly reported: 1. The duplicate scan cache is full, the controller will delete the oldest device information and add new device information. 2. When the refresh period is up, the controller will clear all device information and start filtering again.

Range:

- from 0 to 1000 if *CONFIG_BT_CTRL_BLE_SCAN_DUPL* && BT_CONTROLLER_ENABLED

Default value:

- 0 if *CONFIG_BT_CTRL_BLE_SCAN_DUPL* && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN

Special duplicate scan mechanism for BLE Mesh scan

Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL

This enables the BLE scan duplicate for special BLE Mesh scan.

Default value:

- No (disabled) if *CONFIG_BT_CTRL_BLE_SCAN_DUPL* && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_MESH_DUPL_SCAN_CACHE_SIZE

Maximum number of Mesh adv packets in scan duplicate filter

Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL > CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

Range:

- from 10 to 1000 if *CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN* && BT_CONTROLLER_ENABLED

Default value:

- 100 if *CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN* && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

Found in: Component config > Bluetooth > Controller Options

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

Available options:

- Force Enable (BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_EN)
  Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_DIS)
  Disable the limitation on max tx/rx time for Coded-PHY connection

MODEM SLEEP Options

Contains:

- *CONFIG_BT_CTRL_MODEM_SLEEP*
- *CONFIG_BT_CTRL_MAIN_XTAL_PU_DURING_LIGHT_SLEEP*

CONFIG_BT_CTRL_MODEM_SLEEP

Bluetooth modem sleep

Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options

Enable/disable bluetooth controller low power mode. Modem sleep is not supported to be used with UART HCI.

Default value:

- No (disabled) if BT_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_MODEM_SLEEP_MODE_1

Bluetooth Modem sleep Mode 1

Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options > CONFIG_BT_CTRL_MODEM_SLEEP

Mode 1 is the currently supported sleep mode. In this mode, bluetooth controller sleeps between and BLE events. A low power clock is used to maintain bluetooth reference clock.

Default value:

- Yes (enabled) if *CONFIG_BT_CTRL_MODEM_SLEEP* && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_LOW_POWER_CLOCK

Bluetooth low power clock

Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options > CONFIG_BT_CTRL_MODEM_SLEEP > CONFIG_BT_CTRL_MODEM_SLEEP_MODE_1

Select the low power clock source for bluetooth controller

Available options:

- Main crystal (BT_CTRL_LPCLK_SEL_MAIN_XTAL)
  Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling(DFS) enabled, and bluetooth can work under light sleep enabled. Main crystal has a relatively better performance than other bluetooth low power clock sources.
- External 32kHz crystal (BT_CTRL_LPCLK_SEL_EXT_32K_XTAL)
  External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.
- Internal 150kHz RC oscillator (BT_CTRL_LPCLK_SEL_RTC_SLOW)
  Internal 150kHz RC oscillator. The accuracy of this clock is a lot larger than 500ppm which is required in Bluetooth communication, so don't select this option in scenarios such as BLE connection state.

CONFIG_BT_CTRL_MAIN_XTAL_PU_DURING_LIGHT_SLEEP

power up main XTAL during light sleep

Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options

If this option is selected, the main crystal will power up during light sleep when the low power clock selects an external 32kHz crystal but the external 32kHz crystal does not exist or the low power clock selects the main crystal.

Default value:

- No (disabled) if (BT_CTRL_LPCLK_SEL_MAIN_XTAL || BT_CTRL_LPCLK_SEL_EXT_32K_XTAL) && *CONFIG_FREERTOS_USE_TICKLESS_IDLE* && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_AGC_RECORRECT_EN

Enable HW AGC recorrect

Found in: Component config > Bluetooth > Controller Options

Enable uncoded phy AGC recorrect

Default value:

- No (disabled) if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_CODED_AGC_RECORRECT_EN

Enable coded phy AGC recorrect

Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_AGC_RECORRECT_EN

Enable coded phy AGC recorrect

Default value:

- No (disabled) if *CONFIG_BT_CTRL_AGC_RECORRECT_EN* && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_SCAN_BACKOFF_UPPERLIMITMAX

Disable active scan backoff

Found in: Component config > Bluetooth > Controller Options

Disable active scan backoff. The bluetooth spec requires that scanners should run a backoff procedure to minimize collision of scan request PDUs from nultiple scanners. If scan backoff is disabled, in active scanning, scan request PDU will be sent every time when HW receives scannable ADV PDU.

Default value:

- No (disabled) if BT_CONTROLLER_ENABLED

CONFIG_BLE_MESH

ESP BLE Mesh Support

Found in: Component config

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- *BLE Mesh and BLE coexistence support*
- *CONFIG_BLE_MESH_GATT_PROXY_CLIENT*

CONFIG_BLE_MESH_HCI_5_0

Support sending 20ms non-connectable adv packets

Found in: Component config > *CONFIG_BLE_MESH*

It is a temporary solution and needs further modifications.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_USE_DUPLICATE_SCAN

Support Duplicate Scan in BLE Mesh

Found in: Component config > *CONFIG_BLE_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

Default value:

- Yes (enabled) if BT_BLUEDROID_ENABLED && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > *CONFIG_BLE_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM (BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BLE_MESH_MEM_ALLOC_MODE_DEFAULT)
  Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)
  Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Enable FreeRTOS static allocation

Found in: Component config > CONFIG_BLE_MESH

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

Default value:

- No (disabled) if ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE

Memory allocation for FreeRTOS objects

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)
  If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT)
  If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

CONFIG_BLE_MESH_DEINIT

Support de-initialize BLE Mesh stack

Found in: Component config > CONFIG_BLE_MESH

If enabled, users can use the function esp_ble_mesh_deinit() to de-initialize the whole BLE Mesh stack.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

BLE Mesh and BLE coexistence support Contains:

- *CONFIG_BLE_MESH_SUPPORT_BLE_SCAN*
- *CONFIG_BLE_MESH_SUPPORT_BLE_ADV*

CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Support sending normal BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can send normal BLE advertising packets with specific API.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT

Number of advertising buffers for BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Number of advertising buffers for BLE packets available.

Range:

- from 1 to 255 if *CONFIG_BLE_MESH_SUPPORT_BLE_ADV* && *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH_SUPPORT_BLE_ADV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SUPPORT_BLE_SCAN

Support scanning normal BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_FAST_PROV

Enable BLE Mesh Fast Provisioning

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_NODE

Support for BLE Mesh Node

Found in: Component config > CONFIG_BLE_MESH

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

CONFIG_BLE_MESH_PROVISIONER

Support for BLE Mesh Provisioner

Found in: Component config > CONFIG_BLE_MESH

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM

Maximum number of unprovisioned devices that can be added to device queue

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

Range:

- from 1 to 100 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 10 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MAX_PROV_NODES

Maximum number of devices that can be provisioned by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

Range:

- from 1 to 1000 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 10 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PBA_SAME_TIME

Maximum number of PB-ADV running at the same time by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many devices can be provisioned at the same time using PB-ADV. For examples, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

Range:

- from 1 to 10 if *CONFIG_BLE_MESH_PB_ADV* && *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 2 if *CONFIG_BLE_MESH_PB_ADV* && *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PBG_SAME_TIME

Maximum number of PB-GATT running at the same time by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

Range:

- from 1 to 5 if *CONFIG_BLE_MESH_PB_GATT* && *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 1 if *CONFIG_BLE_MESH_PB_GATT* && *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT

Maximum number of mesh subnets that can be created by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

Range:

- from 1 to 4096 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT

Maximum number of application keys that can be owned by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

Range:

- from 1 to 4096 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROVISIONER_RECV_HB

Support receiving Heartbeat messages

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE

Maximum number of filter entries for receiving Heartbeat messages

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

Range:

- from 1 to 1000 if *CONFIG_BLE_MESH_PROVISIONER_RECV_HB* && *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH_PROVISIONER_RECV_HB* && *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROV

BLE Mesh Provisioning support

Found in: Component config > CONFIG_BLE_MESH

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PB_ADV

Provisioning support using the advertising bearer (PB-ADV)

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE_MESH_FAST_PROV is selected, the value is better to be 3 seconds, or less.

Range:

- from 1 to 100 if *CONFIG_BLE_MESH_NODE* && *CONFIG_BLE_MESH_PB_ADV* && *CONFIG_BLE_MESH*

Default value:

- 5 if *CONFIG_BLE_MESH_NODE* && *CONFIG_BLE_MESH_PB_ADV* && *CONFIG_BLE_MESH*
- 3 if *CONFIG_BLE_MESH_FAST_PROV* && *CONFIG_BLE_MESH_NODE* && *CONFIG_BLE_MESH_PB_ADV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PB_GATT

Provisioning support using GATT (PB-GATT)

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

Virtual option enabled whenever any Proxy protocol is needed

CONFIG_BLE_MESH_PROXY

BLE Mesh Proxy protocol support

Found in: Component config > CONFIG_BLE_MESH

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_GATT_PROXY_SERVER

BLE Mesh GATT Proxy Server

Found in: Component config > CONFIG_BLE_MESH

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH_NODE* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_NODE_ID_TIMEOUT

Node Identity advertising timeout

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

Range:

- from 1 to 60 if *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

Default value:

- 60 if *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROXY_FILTER_SIZE

Maximum number of filter entries per Proxy Client

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

Range:

- from 1 to 32767 if *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

Default value:

- 4 if *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_GATT_PROXY_CLIENT

BLE Mesh GATT Proxy Client

Found in: Component config > CONFIG_BLE_MESH

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SETTINGS

Store BLE Mesh configuration persistently

Found in: Component config > CONFIG_BLE_MESH

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_STORE_TIMEOUT

Delay (in seconds) before storing anything persistently

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

Range:

- from 0 to 1000000 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

Default value:

- 0 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SEQ_STORE_RATE

How often the sequence number gets updated in storage

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that's guaranteed to be larger than the last one used before power off.

Range:

- from 0 to 1000000 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

Default value:

- 0 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RPL_STORE_TIMEOUT

Minimum frequency that the RPL gets updated in storage

Found in: Component config > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

Range:

- from 0 to 1000000 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

Default value:

- 0 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY

A specific option for settings backward compatibility

Found in: Component config > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_SETTINGS*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of "mesh/role" in nvs. In the new version mesh stack, key of "mesh/role" is added in nvs, recovering node information needs to check "mesh/role" key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of "mesh/role" because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_NODE* && *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SPECIFIC_PARTITION

Use a specific NVS partition for BLE Mesh

Found in: Component config > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_SETTINGS*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes' information in the flash (e.g. more than 20), this option is recommended to be enabled.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PARTITION_NAME

Name of the NVS partition for BLE Mesh

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION

This value defines the name of the specified NVS partition used by the mesh stack.

Default value:

- "ble_mesh" if *CONFIG_BLE_MESH_SPECIFIC_PARTITION* && *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE

Support using multiple NVS namespaces by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MAX_NVS_NAMESPACE

Maximum number of NVS namespaces

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE

This option specifies the maximum NVS namespaces supported by Provisioner.

Range:

- from 1 to 255 if *CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE* && *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

Default value:

- 2 if *CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE* && *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SUBNET_COUNT

Maximum number of mesh subnets per network

Found in: Component config > CONFIG_BLE_MESH

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

Range:

- from 1 to 4096 if *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_APP_KEY_COUNT

Maximum number of application keys per network

Found in: Component config > CONFIG_BLE_MESH

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

Range:
- from 1 to 4096 if *CONFIG_BLE_MESH*

Default value:
- 3 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MODEL_KEY_COUNT

Maximum number of application keys per model

Found in: Component config > CONFIG_BLE_MESH

This option specifies the maximum number of application keys to which each model can be bound.

Range:
- from 1 to 4096 if *CONFIG_BLE_MESH*

Default value:
- 3 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MODEL_GROUP_COUNT

Maximum number of group address subscriptions per model

Found in: Component config > CONFIG_BLE_MESH

This option specifies the maximum number of addresses to which each model can be subscribed.

Range:
- from 1 to 4096 if *CONFIG_BLE_MESH*

Default value:
- 3 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LABEL_COUNT

Maximum number of Label UUIDs used for Virtual Addresses

Found in: Component config > CONFIG_BLE_MESH

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

Range:
- from 0 to 4096 if *CONFIG_BLE_MESH*

Default value:
- 3 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_CRPL

Maximum capacity of the replay protection list

Found in: Component config > CONFIG_BLE_MESH

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into

consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

Range:
- from 2 to 65535 if *CONFIG_BLE_MESH*

Default value:
- 10 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MSG_CACHE_SIZE

Network message cache size

Found in: Component config > CONFIG_BLE_MESH

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

Range:
- from 2 to 65535 if *CONFIG_BLE_MESH*

Default value:
- 10 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_ADV_BUF_COUNT

Number of advertising buffers

Found in: Component config > CONFIG_BLE_MESH

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

Range:
- from 6 to 256 if *CONFIG_BLE_MESH*

Default value:
- 60 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_IVU_DIVIDER

Divider for IV Update state refresh timer

Found in: Component config > CONFIG_BLE_MESH

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn't necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

Range:
- from 2 to 96 if *CONFIG_BLE_MESH*

Default value:

- 4 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_IVU_RECOVERY_IVI

Recovery the IV index when the latest whole IV update procedure is missed

Found in: Component config > CONFIG_BLE_MESH

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_TX_SEG_MSG_COUNT

Maximum number of simultaneous outgoing segmented messages

Found in: Component config > CONFIG_BLE_MESH

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

Range:

- from 1 to if *CONFIG_BLE_MESH*

Default value:

- 1 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RX_SEG_MSG_COUNT

Maximum number of simultaneous incoming segmented messages

Found in: Component config > CONFIG_BLE_MESH

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

Range:

- from 1 to 255 if *CONFIG_BLE_MESH*

Default value:

- 1 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RX_SDU_MAX

Maximum incoming Upper Transport Access PDU length

Found in: Component config > CONFIG_BLE_MESH

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

Range:

- from 36 to 384 if *CONFIG_BLE_MESH*

Default value:

- 384 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_TX_SEG_MAX

Maximum number of segments in outgoing messages

Found in: Component config > CONFIG_BLE_MESH

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what's the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

Range:

- from 2 to 32 if *CONFIG_BLE_MESH*

Default value:

- 32 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RELAY

Relay support

Found in: Component config > CONFIG_BLE_MESH

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH_NODE* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RELAY_ADV_BUF

Use separate advertising buffers for relay packets

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_RELAY* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT

Number of advertising buffers for relay packets

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF

Number of advertising buffers for relay packets available.

Range:

- from 6 to 256 if *CONFIG_BLE_MESH_RELAY_ADV_BUF* && *CONFIG_BLE_MESH_RELAY* && *CONFIG_BLE_MESH*

Default value:

- 60 if *CONFIG_BLE_MESH_RELAY_ADV_BUF* && *CONFIG_BLE_MESH_RELAY* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LOW_POWER

Support for Low Power features

Found in: Component config > CONFIG_BLE_MESH

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

CONFIG_BLE_MESH_LPN_ESTABLISHMENT

Perform Friendship establishment using low power

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_AUTO

Automatically start looking for Friend nodes once provisioned

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling bt_mesh_lpn_set(true). When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT

Time from last received message before going to LPN mode

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

Range:

- from 0 to 3600 if *CONFIG_BLE_MESH_LPN_AUTO* && *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- 15 if *CONFIG_BLE_MESH_LPN_AUTO* && *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT

Retry timeout for Friend requests

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

Range:
- from 1 to 3600 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:
- 6 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_RSSI_FACTOR

RSSIFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

Range:
- from 0 to 3 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:
- 0 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR

ReceiveWindowFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

Range:
- from 0 to 3 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:
- 0 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE

Minimum size of the acceptable friend queue (MinQueueSizeLog)

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER
