**备注：**温度传感器主要用于测量芯片内部的温度变化。芯片内部温度通常高于环境温度，并且受到微控制器的时钟频率或 I/O 负载、外部散热环境等因素影响。

## 功能概述

下文将分节概述温度传感器的功能：

- [资源分配](#) - 介绍了部分参数，设置这些参数可以获取温度传感器句柄；还介绍了在温度传感器完成工作后如何回收资源。
- [启用及禁用温度传感器](#) - 介绍如何启用及禁用温度传感器。
- [获取测量的温度值](#) - 介绍如何获取实时温度值。
- [电源管理](#) - 介绍更改功耗模式（如 Light-sleep 模式）对温度传感器造成的影响。
- [线程安全](#) - 介绍如何使驱动程序具备线程安全性。

**资源分配** ESP32-C3 只有一个内置温度传感器硬件。`temperature_sensor_handle_t` 表示温度传感器模块，该变量也是不同函数之间的纽带。通过使用相同的`temperature_sensor_handle_t` 变量，可以在不同的函数调用中访问和修改温度传感器属性，以控制和管理温度传感器。该变量会作为温度 API 的参数，携带有关硬件和配置的信息，你只需创建类型为`temperature_sensor_handle_t` 的指针，并将其传递给所需 API。

请在安装内置温度传感器模块前评估测量环境的温度范围。例如，如果在室内测量，环境温度可能在 10 °C ~ 30 °C；如果在灯泡中测量，环境温度则可能在 60 °C ~ 110 °C。在环境温度范围的基础上，请先根据以下值定义配置结构体`temperature_sensor_config_t`，再安装内置温度传感器：

- `range_min`：所测量温度范围的最小值。
- `range_max`：所测量温度范围的最大值。

设置好温度范围后，将配置结构体传递给`temperature_sensor_install()`，该函数将创建温度传感器模块并返回句柄。

如前文所述，不同测量范围对应不同测量误差。然而你无需自行比对测量误差，乐鑫提供了一个内部机制，可以根据所给温度范围选择最小误差。

温度传感器使用完毕后，请调用`temperature_sensor_uninstall()` 释放相应资源。

## 创建温度传感器句柄

- 第 1 步：评估测量范围。本示例的温度范围为 20 °C ~ 50 °C。
- 第 2 步：配置测量范围，获取温度传感器句柄。

```
temperature_sensor_handle_t temp_handle = NULL;
temperature_sensor_config_t temp_sensor = {
    .range_min = 20,
    .range_max = 50,
};
ESP_ERROR_CHECK(temperature_sensor_install(&temp_sensor, &temp_handle));
```

## 启用及禁用温度传感器

1. 调用`temperature_sensor_enable()` 启用温度传感器。此时，内部温度传感器回路开始工作，驱动程序从初始化状态转为启用状态。
2. 调用`temperature_sensor_disable()` 禁用温度传感器。

**获取测量的温度值** 通过 `temperature_sensor_enable()` 启用温度传感器后，可以调用 `temperature_sensor_get_celsius()` 获取当前测量的温度值。

```
// 启用温度传感器
ESP_ERROR_CHECK(temperature_sensor_enable(temp_handle));
// 获取传输的传感器数据
float tsens_out;
ESP_ERROR_CHECK(temperature_sensor_get_celsius(temp_handle, &tsens_out));
printf("Temperature in %f °C\n", tsens_out);
// 温度传感器使用完毕后，禁用温度传感器，节约功耗
ESP_ERROR_CHECK(temperature_sensor_disable(temp_handle));
```

**电源管理** 由于温度传感器不使用 APB 时钟，无论是否激活 `CONFIG_PM_ENABLE` 启用电源管理，温度传感器仍可以继续工作。

**线程安全** 温度传感器中并未添加任何确保线程安全的额外保护，因为温度传感器通常只在一个任务中调用。如果要在不同任务中使用该驱动程序，请设置额外的锁进行保护。

### 意外情况

1. 从芯片获取的温度值通常与环境温度不同，因为温度传感器内置于芯片，从某种程度来说，温度传感器测量的是芯片内的温度。
2. 安装温度传感器失败时，如果驱动程序打印的错误信息为 `the boundary you gave cannot meet the range of internal temperature sensor`，说明内置温度传感器温度测量范围的限制影响了安装过程，该错误通常由以下几种不正确的 `temperature_sensor_config_t` 配置造成：
  - (1) 超出温度测量范围，如 `200 °C ~ 300 °C`。
  - (2) 超过了预定义测量范围的界限，如 `40 °C ~ 110 °C`。

### 应用示例

- 读取温度传感器测量值：[peripherals/temperature\\_sensor/temp\\_sensor](#)。

### API 参考

#### Header File

- `components/driver/temperature_sensor/include/driver/temperature_sensor.h`
- This header file can be included with:

```
#include "driver/temperature_sensor.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **temperature\_sensor\_install** (const *temperature\_sensor\_config\_t* \*tsens\_config,  
*temperature\_sensor\_handle\_t* \*ret\_tsens)

Install temperature sensor driver.

**参数**

- **tsens\_config** -- Pointer to config structure.
- **ret\_tsens** -- Return the pointer of temperature sensor handle.

**返回**

- ESP\_OK if succeed

*esp\_err\_t* **temperature\_sensor\_uninstall** (*temperature\_sensor\_handle\_t* tsens)

Uninstall the temperature sensor driver.

**参数** **tsens** -- The handle created by `temperature_sensor_install()`.

**返回**

- ESP\_OK if succeed.

*esp\_err\_t* **temperature\_sensor\_enable** (*temperature\_sensor\_handle\_t* tsens)

Enable the temperature sensor.

**参数** **tsens** -- The handle created by `temperature_sensor_install()`.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE if temperature sensor is enabled already.

*esp\_err\_t* **temperature\_sensor\_disable** (*temperature\_sensor\_handle\_t* tsens)

Disable temperature sensor.

**参数** **tsens** -- The handle created by `temperature_sensor_install()`.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE if temperature sensor is not enabled yet.

*esp\_err\_t* **temperature\_sensor\_get\_celsius** (*temperature\_sensor\_handle\_t* tsens, float \*out\_celsius)

Read temperature sensor data that is converted to degrees Celsius.

---

**备注:** Should not be called from interrupt.

---

**参数**

- **tsens** -- The handle created by `temperature_sensor_install()`.
- **out\_celsius** -- The measure output value.

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG invalid arguments
- ESP\_ERR\_INVALID\_STATE Temperature sensor is not enabled yet.
- ESP\_FAIL Parse the sensor data into ambient temperature failed (e.g. out of the range).

## Structures

struct **temperature\_sensor\_config\_t**

Configuration of measurement range for the temperature sensor.

---

**备注:** If you see the log the boundary you gave cannot meet the range of internal temperature sensor. You may need to refer to predefined range listed `doc api-reference/peripherals/Temperature sensor`.

---

## Public Members

int **range\_min**

the minimum value of the temperature you want to test

int **range\_max**

the maximum value of the temperature you want to test

temperature\_sensor\_clk\_src\_t **clk\_src**

the clock source of the temperature sensor.

## Macros

**TEMPERATURE\_SENSOR\_CONFIG\_DEFAULT** (min, max)

*temperature\_sensor\_config\_t* default constructure

## Type Definitions

typedef struct temperature\_sensor\_obj\_t \***temperature\_sensor\_handle\_t**

Type of temperature sensor driver handle.

## 2.6.22 Two-Wire Automotive Interface (TWAI)

### Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-C3 contains 1 TWAI controller(s) that can be configured to communicate on a TWAI bus via an external transceiver.

**警告:** The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

### Sections

- *Two-Wire Automotive Interface (TWAI)*
  - *Overview*
  - *TWAI Protocol Summary*
  - *Signals Lines and Transceiver*
  - *API Naming Conventions*
  - *Driver Configuration*
  - *Driver Operation*
  - *Examples*
  - *API Reference*

### TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signaling:** Every node constantly monitors the bus. When any node detects an error, it signals the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This results in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages** TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters** The TWAI protocol implements a feature known as "fault confinement" where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node's **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

**Error Active:** A node is Error Active when **both TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

**Error Passive:** A node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

**Bus-Off:** A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

### Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required**. The type of external transceiver used should depend on the application's physical layer specification (e.g., using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller's interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32-C3's GPIO pads.

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0 V), and a recessive bit as a high logic level (3.3 V).

**BUS-OFF:** The BUS-OFF signal line is **optional** and is set to a low logic level (0 V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3 V) otherwise.

图 23: Signal lines of the TWAI controller

**CLKOUT:** The CLKOUT signal line is **optional** and outputs a prescaled version of the controller's source clock.

**备注:** An external transceiver **must internally loopback the TX to RX** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

### API Naming Conventions

**备注:** The TWAI driver provides two sets of API. One is handle-free and is widely used in IDF versions earlier than v5.2, but it can only support one TWAI hardware controller. The other set is with handles, and the function name is usually suffixed with "v2", which can support any number of TWAI controllers. These two sets of API can be used at the same time, but it is recommended to use the "v2" version in your new projects.

### Driver Configuration

This section covers how to configure the TWAI driver.

**Operating Modes** The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

**Listen Only Mode:** This mode prevents the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller is still able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts** The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

表 3: TWAI Driver Alerts

Alert Flag	Description
TWAI_ALERT_TX_IDLE	No more messages queued for transmission
TWAI_ALERT_TX_SUCCESS	The previous transmission was successful
TWAI_ALERT_RX_DATA	A frame has been received and added to the RX queue
TWAI_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
TWAI_ALERT_ERR_ACTIVE	TWAI controller has become error active
TWAI_ALERT_RECOVERY_IN_PROGRESS	TWAI controller is undergoing bus recovery
TWAI_ALERT_BUS_RECOVERED	TWAI controller has successfully completed bus recovery
TWAI_ALERT_ARB_LOST	The previous transmission lost arbitration
TWAI_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
TWAI_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
TWAI_ALERT_TX_FAILED	The previous transmission has failed
TWAI_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
TWAI_ALERT_ERR_PASS	TWAI controller has become error passive
TWAI_ALERT_BUS_OFF	Bus-off condition occurred. TWAI controller can no longer influence bus

**备注:** The TWAI controller's **error warning limit** is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the **error warning limit** to **96**. The `TWAI_ALERT_ABOVE_ERR_WARN` is raised when the TEC or REC becomes larger than or equal to the error warning limit. The `TWAI_ALERT_BELOW_ERR_WARN` is raised when both TEC and REC return back to values below **96**.

**备注:** When enabling alerts, the `TWAI_ALERT_AND_LOG` flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and `TWAI_ALERT_AND_LOG` if the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled (see *Placing ISR into IRAM*).

**备注:** The `TWAI_ALERT_ALL` and `TWAI_ALERT_NONE` macros can also be used to enable/disable all alerts during configuration/reconfiguration.

**Bit Timing** The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quantum** is determined by a pre-scaled version of the TWAI controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller's source clock. On the ESP32-C3, the `brp` can be **any even number from 2 to 16384**. Alternatively, you can decide the resolution of each quantum, by setting `twai_timing_config_t::quanta_resolution_hz` to a non-zero value. In this way, the driver can calculate the underlying `brp` value for you. It is useful when you set different clock sources but want the bitrate to keep the same.

Supported clock source for a TWAI controller is listed in the `twai_clock_source_t` and can be specified in `twai_timing_config_t::clk_src`.

图 24: Bit timing configuration for 500kbit/s given BRP = 8, clock source frequency is 80MHz

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** causes 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

---

**备注:** Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

---

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS`
- `TWAI_TIMING_CONFIG_800KBITS`
- `TWAI_TIMING_CONFIG_500KBITS`
- `TWAI_TIMING_CONFIG_250KBITS`
- `TWAI_TIMING_CONFIG_125KBITS`
- `TWAI_TIMING_CONFIG_100KBITS`
- `TWAI_TIMING_CONFIG_50KBITS`
- `TWAI_TIMING_CONFIG_25KBITS`
- `TWAI_TIMING_CONFIG_20KBITS`
- `TWAI_TIMING_CONFIG_16KBITS`
- `TWAI_TIMING_CONFIG_12_5KBITS`
- `TWAI_TIMING_CONFIG_10KBITS`
- `TWAI_TIMING_CONFIG_5KBITS`
- `TWAI_TIMING_CONFIG_1KBITS`

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **does not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode uses the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

**Dual Filter Mode** uses the acceptance code and mask to define two separate filters allowing for increased flexibility

图 25: Bit layout of single filter mode (Right side MSBit)

of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

图 26: Bit layout of dual filter mode (Right side MSBit)

**Disabling TX Queue** The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This allows applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

**Placing ISR into IRAM** The TWAI driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR continues to:

- Read received messages from the RX buffer and place them into the driver's RX queue.
- Load messages pending transmission from the driver's TX queue and write them into the TX buffer.

To place the TWAI driver's ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

---

**备注:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

---

## Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

图 27: State transition diagram of the TWAI driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled > Stopped	<code>twai_driver_install()</code>
B	Stopped > Uninstalled	<code>twai_driver_uninstall()</code>
C	Stopped > Running	<code>twai_start()</code>
D	Running > Stopped	<code>twai_stop()</code>
E	Running > Bus-Off	Transmit Error Counter $\geq$ 256
F	Bus-Off > Uninstalled	<code>twai_driver_uninstall()</code>
G	Bus-Off > Recovering	<code>twai_initiate_recovery()</code>
H	Recovering > Stopped	128 occurrences of 11 consecutive recessive bits.

**Driver States Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller is unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore, the TWAI controller is able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller's Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller is unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver remains in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags** The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the `flags` member of `twai_message_t` and the following message flags:

Message Flag	Description
TWAI_MSG_FLAG_EXTD	Message is in Extended Frame Format (29bit ID)
TWAI_MSG_FLAG_RTR	Message is a Remote Frame (Remote Transmission Request)
TWAI_MSG_FLAG_SS	Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.
TWAI_MSG_FLAG_SELF	Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.
TWAI_MSG_FLAG_DLC_NON	Message's Data length code is larger than 8. This will break compliance with TWAI
TWAI_MSG_FLAG_NONE	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

## Examples

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
    ↪NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Install Multiple TWAI Instances** The following code snippet demonstrates how to install multiple TWAI instances via the use of the `twai_driver_install_v2()` function.

```
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
```

(下页继续)

```

{
    twai_handle_t twai_bus_0;
    twai_handle_t twai_bus_1;
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_0, GPIO_
↪NUM_1, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install driver for TWAI bus 0
    g_config.controller_id = 0;
    if (twai_driver_install_v2(&g_config, &t_config, &f_config, &twai_bus_0) ==_
↪ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }
    //Start TWAI driver
    if (twai_start_v2(twai_bus_0) == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    //Install driver for TWAI bus 1
    g_config.controller_id = 1;
    g_config.tx_io = GPIO_NUM_2;
    g_config.rx_io = GPIO_NUM_3;
    if (twai_driver_install_v2(&g_config, &t_config, &f_config, &twai_bus_1) ==_
↪ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }
    //Start TWAI driver
    if (twai_start_v2(twai_bus_1) == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    //Other Driver operations must use version 2 API as well
    ...
}

```

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```

#include "driver/twai.h"

...

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;

```

(下页继续)

(续上页)

```

message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```

#include "driver/twai.h"

...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

```

**Reconfiguring and Reading Alerts** The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```

#include "driver/twai.h"

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs

```

(下页继续)

```
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);
```

**Stop and Uninstall** The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```
#include "driver/twai.h"

...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

**Multiple ID Filter Configuration** The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs are accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101
```

**Application Examples** **Network Example:** The TWAI Network example demonstrates communication between two ESP32-C3s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via [peripherals/twai/twai\\_network](#).

**Alert and Recovery Example:** This example demonstrates how to use the TWAI driver's alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/twai/twai\\_alert\\_and\\_recovery](#).

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via [peripherals/twai/twai\\_self\\_test](#).

## API Reference

### Header File

- [components/hal/include/hal/twai\\_types.h](#)
- This header file can be included with:

```
#include "hal/twai_types.h"
```

## Structures

struct **twai\_message\_t**

Structure to store a TWAI message.

---

**备注:** The flags member is deprecated

---

## Public Members

uint32\_t **extd**

Extended Frame Format (29bit ID)

uint32\_t **rtr**

Message is a Remote Frame

uint32\_t **ss**

Transmit as a Single Shot Transmission. Unused for received.

uint32\_t **self**

Transmit as a Self Reception Request. Unused for received.

uint32\_t **dlc\_non\_comp**

Message's Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32\_t **reserved**

Reserved bits

uint32\_t **flags**

Deprecated: Alternate way to set bits using message flags

uint32\_t **identifier**

11 or 29 bit identifier

uint8\_t **data\_length\_code**

Data length code

uint8\_t **data**[TWAI\_FRAME\_MAX\_DLC]

Data bytes (not relevant in RTR frame)

struct **twai\_timing\_config\_t**

Structure for bit timing configuration of the TWAI driver.

---

**备注:** Macro initializers are available for this structure

---

## Public Members

### `twai_clock_source_t clk_src`

Clock source, set to 0 or `TWAI_CLK_SRC_DEFAULT` if you want a default clock source

### `uint32_t quanta_resolution_hz`

The resolution of one timing quanta, in Hz. Note: the value of `brp` will be reflected by this field if it's non-zero, otherwise, `brp` needs to be set manually

### `uint32_t brp`

Baudrate prescale (i.e., clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for non-ESP32 chip. Note: For ESP32 ECO 2 or later, multiples of 4 from 132 to 256 are also supported

### `uint8_t tseg_1`

Timing segment 1 (Number of time quanta, between 1 to 16)

### `uint8_t tseg_2`

Timing segment 2 (Number of time quanta, 1 to 8)

### `uint8_t sjw`

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

### `bool triple_sampling`

Enables triple sampling when the TWAI controller samples a bit

### `struct twai_filter_config_t`

Structure for acceptance filter configuration of the TWAI driver (see documentation)

---

备注: Macro initializers are available for this structure

---

## Public Members

### `uint32_t acceptance_code`

32-bit acceptance code

### `uint32_t acceptance_mask`

32-bit acceptance mask

### `bool single_filter`

Use Single Filter Mode (see documentation)

## Macros

### `TWAI_EXTD_ID_MASK`

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

**TWAI\_STD\_ID\_MASK**

Bit mask for 11 bit Standard Frame Format ID

**TWAI\_FRAME\_MAX\_DLC**

Max data bytes allowed in TWAI

**TWAI\_FRAME\_EXTD\_ID\_LEN\_BYTES**

EFF ID requires 4 bytes (29bit)

**TWAI\_FRAME\_STD\_ID\_LEN\_BYTES**

SFF ID requires 2 bytes (11bit)

**TWAI\_ERR\_PASS\_THRESH**

Error counter threshold for error passive

**Type Definitions**

typedef *soc\_periph\_twai\_clk\_src\_t* **twai\_clock\_source\_t**

RMT group clock source.

---

**备注:** User should select the clock source based on the power and resolution requirement

---

**Enumerations**

enum **twai\_mode\_t**

TWAI Controller operating modes.

*Values:*

enumerator **TWAI\_MODE\_NORMAL**

Normal operating mode where TWAI controller can send/receive/acknowledge messages

enumerator **TWAI\_MODE\_NO\_ACK**

Transmission does not require acknowledgment. Use this mode for self testing

enumerator **TWAI\_MODE\_LISTEN\_ONLY**

The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

**Header File**

- [components/driver/twai/include/driver/twai.h](#)
- This header file can be included with:

```
#include "driver/twai.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

PRIV\_REQUIRES driver

## Functions

*esp\_err\_t twai\_driver\_install* (const *twai\_general\_config\_t* \*g\_config, const *twai\_timing\_config\_t* \*t\_config, const *twai\_filter\_config\_t* \*f\_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

---

**备注:** Macro initializers are available for the configuration structures (see documentation)

---

---

**备注:** To reinstall the TWAI driver, call *twai\_driver\_uninstall*() first

---

### 参数

- **g\_config** -- **[in]** General configuration structure
- **t\_config** -- **[in]** Timing configuration structure
- **f\_config** -- **[in]** Filter configuration structure

### 返回

- ESP\_OK: Successfully installed TWAI driver
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution
- ESP\_ERR\_NO\_MEM: Insufficient memory
- ESP\_ERR\_INVALID\_STATE: Driver is already installed

*esp\_err\_t twai\_driver\_install\_v2* (const *twai\_general\_config\_t* \*g\_config, const *twai\_timing\_config\_t* \*t\_config, const *twai\_filter\_config\_t* \*f\_config, *twai\_handle\_t* \*ret\_twai)

Install TWAI driver and return a handle.

---

**备注:** This is an advanced version of *twai\_driver\_install* that can return a driver handle, so that it allows you to install multiple TWAI drivers. Don't forget to set the proper *controller\_id* in the *twai\_general\_config\_t*. Please refer to the documentation of *twai\_driver\_install* for more details.

---

### 参数

- **g\_config** -- **[in]** General configuration structure
- **t\_config** -- **[in]** Timing configuration structure
- **f\_config** -- **[in]** Filter configuration structure
- **ret\_twai** -- **[out]** Pointer to a new created TWAI handle

### 返回

- ESP\_OK: Successfully installed TWAI driver
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution, invalid controller ID
- ESP\_ERR\_NO\_MEM: Insufficient memory
- ESP\_ERR\_INVALID\_STATE: Driver is already installed

*esp\_err\_t twai\_driver\_uninstall* (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**警告:** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

#### 返回

- ESP\_OK: Successfully uninstalled TWAI driver
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped/bus-off state, or is not installed

*esp\_err\_t twai\_driver\_uninstall\_v2* (*twai\_handle\_t* handle)

Uninstall the TWAI driver with a given handle.

**备注:** This is an advanced version of `twai_driver_uninstall` that can uninstall a TWAI driver with a given handle. Please refer to the documentation of `twai_driver_uninstall` for more details.

**参数** `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

#### 返回

- ESP\_OK: Successfully uninstalled TWAI driver
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped/bus-off state, or is not installed

*esp\_err\_t twai\_start* (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

#### 返回

- ESP\_OK: TWAI driver is now running
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped state, or is not installed

*esp\_err\_t twai\_start\_v2* (*twai\_handle\_t* handle)

Start the TWAI driver with a given handle.

**备注:** This is an advanced version of `twai_start` that can start a TWAI driver with a given handle. Please refer to the documentation of `twai_start` for more details.

**参数** `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

#### 返回

- ESP\_OK: TWAI driver is now running
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped state, or is not installed

*esp\_err\_t twai\_stop* (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**警告:** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

#### 返回

- ESP\_OK: TWAI driver is now Stopped
- ESP\_ERR\_INVALID\_STATE: Driver is not in running state, or is not installed

*esp\_err\_t twai\_stop\_v2* (*twai\_handle\_t* handle)

Stop the TWAI driver with a given handle.

---

**备注:** This is an advanced version of `twai_stop` that can stop a TWAI driver with a given handle. Please refer to the documentation of `twai_stop` for more details.

---

**参数** **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`

- 返回**
- ESP\_OK: TWAI driver is now Stopped
  - ESP\_ERR\_INVALID\_STATE: Driver is not in running state, or is not installed

*esp\_err\_t twai\_transmit* (const *twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

---

**备注:** This function does not guarantee that the transmission is successful. The TX\_SUCCESS/TX\_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

---

---

**备注:** The TX\_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

---

**参数**

- **message** -- [in] Message to transmit
- **ticks\_to\_wait** -- [in] Number of FreeRTOS ticks to block on the TX queue

**返回**

- ESP\_OK: Transmission successfully queued/initiated
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_TIMEOUT: Timed out waiting for space on TX queue
- ESP\_FAIL: TX queue is disabled and another message is currently transmitting
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in running state, or is not installed
- ESP\_ERR\_NOT\_SUPPORTED: Listen Only Mode does not support transmissions

*esp\_err\_t twai\_transmit\_v2* (*twai\_handle\_t* handle, const *twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Transmit a TWAI message via a given handle.

---

**备注:** This is an advanced version of `twai_transmit` that can transmit a TWAI message with a given handle. Please refer to the documentation of `twai_transmit` for more details.

---

**参数**

- **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`
- **message** -- [in] Message to transmit
- **ticks\_to\_wait** -- [in] Number of FreeRTOS ticks to block on the TX queue

**返回**

- ESP\_OK: Transmission successfully queued/initiated
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_TIMEOUT: Timed out waiting for space on TX queue
- ESP\_FAIL: TX queue is disabled and another message is currently transmitting
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in running state, or is not installed
- ESP\_ERR\_NOT\_SUPPORTED: Listen Only Mode does not support transmissions

*esp\_err\_t twai\_receive* (*twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

**警告:** The flags field of the received message should be checked to determine if the received message contains any data bytes.

#### 参数

- **message** -- [out] Received message
- **ticks\_to\_wait** -- [in] Number of FreeRTOS ticks to block on RX queue

#### 返回

- ESP\_OK: Message successfully received from RX queue
- ESP\_ERR\_TIMEOUT: Timed out waiting for message
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_receive\_v2* (*twai\_handle\_t* handle, *twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Receive a TWAI message via a given handle.

---

**备注:** This is an advanced version of `twai_receive` that can receive a TWAI message with a given handle. Please refer to the documentation of `twai_receive` for more details.

---

#### 参数

- **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`
- **message** -- [out] Received message
- **ticks\_to\_wait** -- [in] Number of FreeRTOS ticks to block on RX queue

#### 返回

- ESP\_OK: Message successfully received from RX queue
- ESP\_ERR\_TIMEOUT: Timed out waiting for message
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_read\_alerts* (uint32\_t \*alerts, TickType\_t ticks\_to\_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

---

**备注:** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

---

#### 参数

- **alerts** -- [out] Bit field of raised alerts (see documentation for alert flags)
- **ticks\_to\_wait** -- [in] Number of FreeRTOS ticks to block for alert

#### 返回

- ESP\_OK: Alerts read
- ESP\_ERR\_TIMEOUT: Timed out waiting for alerts
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_read\_alerts\_v2* (*twai\_handle\_t* handle, uint32\_t \*alerts, TickType\_t ticks\_to\_wait)

Read TWAI driver alerts with a given handle.

---

**备注:** This is an advanced version of `twai_read_alerts` that can read TWAI driver alerts with a given handle. Please refer to the documentation of `twai_read_alerts` for more details.

---

#### 参数

- **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`
- **alerts** -- [out] Bit field of raised alerts (see documentation for alert flags)
- **ticks\_to\_wait** -- [in] Number of FreeRTOS ticks to block for alert

#### 返回

- ESP\_OK: Alerts read
- ESP\_ERR\_TIMEOUT: Timed out waiting for alerts
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_reconfigure\_alerts* (uint32\_t alerts\_enabled, uint32\_t \*current\_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

#### 参数

- **alerts\_enabled** -- [in] Bit field of alerts to enable (see documentation for alert flags)
- **current\_alerts** -- [out] Bit field of currently raised alerts. Set to NULL if unused

#### 返回

- ESP\_OK: Alerts reconfigured
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_reconfigure\_alerts\_v2* (*twai\_handle\_t* handle, uint32\_t alerts\_enabled, uint32\_t \*current\_alerts)

Reconfigure which alerts are enabled, with a given handle.

---

**备注:** This is an advanced version of `twai_reconfigure_alerts` that can reconfigure which alerts are enabled with a given handle. Please refer to the documentation of `twai_reconfigure_alerts` for more details.

---

#### 参数

- **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`
- **alerts\_enabled** -- [in] Bit field of alerts to enable (see documentation for alert flags)
- **current\_alerts** -- [out] Bit field of currently raised alerts. Set to NULL if unused

#### 返回

- ESP\_OK: Alerts reconfigured
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_initiate\_recovery* (void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the

TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

---

**备注:** The `BUS_RECOVERED` alert can be enabled to alert the application when the bus recovery process completes.

---

**返回**

- `ESP_OK`: Bus recovery started
- `ESP_ERR_INVALID_STATE`: TWAI driver is not in the bus-off state, or is not installed

*esp\_err\_t* **twai\_initiate\_recovery\_v2** (*twai\_handle\_t* handle)

Start the bus recovery process with a given handle.

---

**备注:** This is an advanced version of `twai_initiate_recovery` that can start the bus recovery process with a given handle. Please refer to the documentation of `twai_initiate_recovery` for more details.

---

**参数** `handle` -- **[in]** TWAI driver handle returned by `twai_driver_install_v2`

**返回**

- `ESP_OK`: Bus recovery started
- `ESP_ERR_INVALID_STATE`: TWAI driver is not in the bus-off state, or is not installed

*esp\_err\_t* **twai\_get\_status\_info** (*twai\_status\_info\_t* \*status\_info)

Get current status information of the TWAI driver.

**参数** `status_info` -- **[out]** Status information

**返回**

- `ESP_OK`: Status information retrieved
- `ESP_ERR_INVALID_ARG`: Arguments are invalid
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

*esp\_err\_t* **twai\_get\_status\_info\_v2** (*twai\_handle\_t* handle, *twai\_status\_info\_t* \*status\_info)

Get current status information of a given TWAI driver handle.

---

**备注:** This is an advanced version of `twai_get_status_info` that can get current status information of a given TWAI driver handle. Please refer to the documentation of `twai_get_status_info` for more details.

---

**参数**

- `handle` -- **[in]** TWAI driver handle returned by `twai_driver_install_v2`
- `status_info` -- **[out]** Status information

**返回**

- `ESP_OK`: Status information retrieved
- `ESP_ERR_INVALID_ARG`: Arguments are invalid
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

*esp\_err\_t* **twai\_clear\_transmit\_queue** (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

---

**备注:** The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

---

**返回**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed or TX queue is disabled

*esp\_err\_t twai\_clear\_transmit\_queue\_v2* (*twai\_handle\_t* handle)

Clear the transmit queue of a given TWAI driver handle.

---

**备注:** This is an advanced version of `twai_clear_transmit_queue` that can clear the transmit queue of a given TWAI driver handle. Please refer to the documentation of `twai_clear_transmit_queue` for more details.

---

**参数** `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

**返回**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed or TX queue is disabled

*esp\_err\_t twai\_clear\_receive\_queue* (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

---

**备注:** The receive queue is automatically cleared when `twai_start()` is called.

---

**返回**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_clear\_receive\_queue\_v2* (*twai\_handle\_t* handle)

Clear the receive queue of a given TWAI driver handle.

---

**备注:** This is an advanced version of `twai_clear_receive_queue` that can clear the receive queue of a given TWAI driver handle. Please refer to the documentation of `twai_clear_receive_queue` for more details.

---

**参数** `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

**返回**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

## Structures

struct `twai_general_config_t`

Structure for general configuration of the TWAI driver.

---

**备注:** Macro initializers are available for this structure

---

## Public Members

int **controller\_id**

TWAI controller ID, index from 0. If you want to install TWAI driver with a non-zero controller\_id, please use `twai_driver_install_v2`

*twai\_mode\_t* **mode**

Mode of TWAI controller

gpio\_num\_t **tx\_io**

Transmit GPIO number

gpio\_num\_t **rx\_io**

Receive GPIO number

gpio\_num\_t **clkout\_io**

CLKOUT GPIO number (optional, set to -1 if unused)

gpio\_num\_t **bus\_off\_io**

Bus off indicator GPIO number (optional, set to -1 if unused)

uint32\_t **tx\_queue\_len**

Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32\_t **rx\_queue\_len**

Number of messages RX queue can hold

uint32\_t **alerts\_enabled**

Bit field of alerts to enable (see documentation)

uint32\_t **clkout\_divider**

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int **intr\_flags**

Interrupt flags to set the priority of the driver's ISR. Note that to use the `ESP_INTR_FLAG_IRAM`, the `CONFIG_TWAI_ISR_IN_IRAM` option should be enabled first.

struct **twai\_status\_info\_t**

Structure to store status information of TWAI driver.

## Public Members

*twai\_state\_t* **state**

Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32\_t **msgs\_to\_tx**

Number of messages queued for transmission or awaiting transmission completion

uint32\_t **msgs\_to\_rx**

Number of messages in RX queue waiting to be read

uint32\_t **tx\_error\_counter**

Current value of Transmit Error Counter

uint32\_t **rx\_error\_counter**

Current value of Receive Error Counter

uint32\_t **tx\_failed\_count**

Number of messages that failed transmissions

uint32\_t **rx\_missed\_count**

Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32\_t **rx\_overrun\_count**

Number of messages that were lost due to a RX FIFO overrun

uint32\_t **arb\_lost\_count**

Number of instances arbitration was lost

uint32\_t **bus\_error\_count**

Number of instances a bus error has occurred

## Macros

**TWAI\_IO\_UNUSED**

Marks GPIO as unused in TWAI configuration

## Type Definitions

typedef struct twai\_obj\_t \***twai\_handle\_t**

TWAI controller handle.

## Enumerations

enum **twai\_state\_t**

TWAI driver states.

*Values:*

enumerator **TWAI\_STATE\_STOPPED**

Stopped state. The TWAI controller will not participate in any TWAI bus activities

enumerator **TWAI\_STATE\_RUNNING**

Running state. The TWAI controller can transmit and receive messages

enumerator **TWAI\_STATE\_BUS\_OFF**

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

enumerator **TWAI\_STATE\_RECOVERING**

Recovering state. The TWAI controller is undergoing bus recovery

## 2.6.23 通用异步接收器/发送器 (UART)

### 简介

通用异步接收器/发送器 (UART) 属于一种硬件功能，通过使用 RS232、RS422、RS485 等常见异步串行通信接口来处理通信时序要求和数据帧。UART 是实现不同设备之间全双工或半双工数据交换的一种常用且经济的方式。

ESP32-C3 芯片有 2 个 UART 控制器（也称为端口），每个控制器都有一组相同的寄存器以简化编程并提高灵活性。

每个 UART 控制器可以独立配置波特率、数据位长度、位顺序、停止位位数、奇偶校验位等参数。所有具备完整功能的 UART 控制器都能与不同制造商的 UART 设备兼容，并且支持红外数据协会 (IrDA) 定义的标准协议。

### 功能概述

下文介绍了如何使用 UART 驱动程序的函数和数据类型在 ESP32-C3 和其他 UART 设备之间建立通信。基本编程流程分为以下几个步骤：

1. **设置通信参数** - 设置波特率、数据位、停止位等
2. **设置通信管脚** - 分配连接设备的管脚
3. **安装驱动程序** - 为 UART 驱动程序分配 ESP32-C3 资源
4. **运行 UART 通信** - 发送/接收数据
5. **使用中断** - 触发特定通信事件的中断
6. **删除驱动程序** - 如无需 UART 通信，则释放已分配的资源

步骤 1 到 3 为配置阶段，步骤 4 为 UART 运行阶段，步骤 5 和 6 为可选步骤。

UART 驱动程序函数通过 `uart_port_t` 识别不同的 UART 控制器。调用以下所有函数均需此标识。

**设置通信参数** UART 通信参数可以在一个步骤中完成全部配置，也可以在多个步骤中单独配置。

**一次性配置所有参数** 调用函数 `uart_param_config()` 并向其传递 `uart_config_t` 结构体，`uart_config_t` 结构体应包含所有必要的参数。请参考以下示例。

```
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

了解配置硬件流控模式的更多信息，请参考 [peripherals/uart/uart\\_echo](#)。

**分步依次配置每个参数** 调用下表中的专用函数，能够单独配置特定参数。如需重新配置某个参数，也可使用这些函数。

表 4: 单独配置特定参数的函数

配置参数	函数
波特率	<code>uart_set_baudrate()</code>
传输位	调用 <code>uart_set_word_length()</code> 设置 <code>uart_word_length_t</code>
奇偶控制	调用 <code>uart_parity_t</code> 设置 <code>uart_set_parity()</code>
停止位	调用 <code>uart_set_stop_bits()</code> 设置 <code>uart_stop_bits_t</code>
硬件流控模式	调用 <code>uart_set_hw_flow_ctrl()</code> 设置 <code>uart_hw_flowcontrol_t</code>
通信模式	调用 <code>uart_set_mode()</code> 设置 <code>uart_mode_t</code>

表中每个函数都可使用 `_get_` 对应项来查看当前设置值。例如，查看当前波特率值，请调用 `uart_get_baudrate()`。

**设置通信管脚** 通信参数设置完成后，可以配置其他 UART 设备连接的 GPIO 管脚。调用函数 `uart_set_pin()`，指定配置 Tx、Rx、RTS 和 CTS 信号的 GPIO 管脚编号。如要为特定信号保留当前分配的管脚编号，可传递宏 `UART_PIN_NO_CHANGE`。

请为不使用的管脚都指定为宏 `UART_PIN_NO_CHANGE`。

```
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 18, 19));
```

**安装驱动程序** 通信管脚设置完成后，请调用 `uart_driver_install()` 安装驱动程序并指定以下参数：

- Tx 环形缓冲区的大小
- Rx 环形缓冲区的大小
- 事件队列句柄和大小
- 分配中断的标志

该函数将为 UART 驱动程序分配所需的内部资源。

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

此步骤完成后，可连接外部 UART 设备检查通信。

**运行 UART 通信** 串行通信由每个 UART 控制器的有限状态机 (FSM) 控制。

发送数据的过程分为以下步骤：

1. 将数据写入 Tx FIFO 缓冲区
2. FSM 序列化数据
3. FSM 发送数据

接收数据的过程类似，只是步骤相反：

1. FSM 处理且并行化传入的串行流
2. FSM 将数据写入 Rx FIFO 缓冲区
3. 从 Rx FIFO 缓冲区读取数据

因此，应用程序仅会通过 `uart_write_bytes()` 和 `uart_read_bytes()` 从特定缓冲区写入或读取数据，其余工作由 FSM 完成。

**发送数据** 发送数据准备好后，调用函数 `uart_write_bytes()`，并向其传递数据缓冲区的地址和数据长度。该函数会立即或在有足够可用空间时将数据复制到 Tx 环形缓冲区，随后退出。当 Tx FIFO 缓冲区中有可用空间时，中断服务例程 (ISR) 会在后台将数据从 Tx 环形缓冲区移动到 Tx FIFO 缓冲区。调用函数请参考以下代码。

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

函数 `uart_write_bytes_with_break()` 与 `uart_write_bytes()` 类似，但在传输结束时会添加串行中断信号。“串行中断信号”意味着 Tx 线保持低电平的时间长于一个数据帧。

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

能够将数据写入 Tx FIFO 缓冲区的另一函数是 `uart_tx_chars()`。与 `uart_write_bytes()` 不同，此函数在没有可用空间之前不会阻塞。相反，它将写入所有可以立即放入硬件 Tx FIFO 的数据，然后返回写入的字节数。

“配套”函数 `uart_wait_tx_done()` 用于监听 Tx FIFO 缓冲区的状态，并在缓冲区为空时返回。

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

**接收数据** 一旦 UART 接收了数据，并将其保存在 Rx FIFO 缓冲区中，就需要使用函数 `uart_read_bytes()` 检索数据。读取数据之前，调用 `uart_get_buffered_data_len()` 能够查看 Rx FIFO 缓冲区中可用的字节数。请参考以下示例。

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

如果不再需要 Rx FIFO 缓冲区中的数据，可以调用 `uart_flush()` 清空缓冲区。

**软件流控** 如果硬件流控处于禁用状态，可使用函数 `uart_set_rts()` 和 `uart_set_dtr()` 分别手动设置 RTS 和 DTR 信号电平。

**通信方式选择** UART 控制器支持多种通信模式，使用函数 `uart_set_mode()` 可以选择模式。选择特定模式后，UART 驱动程序将处理已连接 UART 设备的相应行为。例如，使用 RTS 线控制 RS485 驱动芯片，能够实现半双工 RS485 通信。

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**使用中断** 根据特定的 UART 状态或检测到的错误，可以生成许多不同的中断。**ESP32-C3 技术参考手册 > UART 控制器 (UART) > UART 中断和 UHCI 中断 [PDF]** 中提供了可用中断的完整列表。调用 `uart_enable_intr_mask()` 或 `uart_disable_intr_mask()` 能够分别启用或禁用特定中断。

调用 `uart_driver_install()` 函数可以安装驱动程序的内部中断处理程序，用以管理 Tx 和 Rx 环形缓冲区，并提供事件等高级 API 函数（见下文）。

API 提供了一种便利的方法来处理本文所讨论的特定中断，即用专用函数包装中断：

- **事件检测**: `uart_event_type_t` 定义了多个事件, 使用 FreeRTOS 队列功能能够将其报告给用户应用程序。调用 `安装驱动程序` 中的 `uart_driver_install()` 函数, 可以启用此功能, 请参考 `peripherals/uart/uart_events` 中使用事件检测的示例。
- **达到 FIFO 空间阈值或传输超时**: Tx 和 Rx FIFO 缓冲区在填充特定数量的字符和在发送或接收数据超时的情况下将会触发中断。如要使用此类中断, 请执行以下操作:
  - 配置缓冲区长度和超时阈值: 在结构体 `uart_intr_config_t` 中输入相应阈值并调用 `uart_intr_config()`
  - 启用中断: 调用函数 `uart_enable_tx_intr()` 和 `uart_enable_rx_intr()`
  - 禁用中断: 调用函数 `uart_disable_tx_intr()` 或 `uart_disable_rx_intr()`
- **模式检测**: 在检测到重复接收/发送同一字符的“模式”时触发中断, 请参考示例 `peripherals/uart/uart_events`。例如, 模式检测可用于检测命令字符串末尾是否存在特定数量的相同字符 (“模式”)。可以调用以下函数:
  - 配置并启用此中断: 调用 `uart_enable_pattern_det_baud_intr()`
  - 禁用中断: 调用 `uart_disable_pattern_det_intr()`

**宏指令** API 还定义了一些宏指令。例如, `UART_HW_FIFO_LEN` 定义了硬件 FIFO 缓冲区的长度, `UART_BITRATE_MAX` 定义了 UART 控制器支持的最大波特率。

**删除驱动程序** 如不再需要与 `uart_driver_install()` 建立通信, 则可调用 `uart_driver_delete()` 删除驱动程序, 释放已分配的资源。

## RS485 特定通信模式简介

**备注:** 下文将使用 `[UART_REGISTER_NAME].[UART_FIELD_BIT]` 指代 UART 寄存器字段/位。了解特定模式位的更多信息, 请参考 **ESP32-C3 技术参考手册 > UART 控制器 (UART) > 寄存器摘要 [PDF]**。请搜索寄存器名称导航至寄存器描述, 找到相应字段/位。

- `UART_RS485_CONF_REG.UART_RS485_EN`: 设置此位将启用 RS485 通信模式支持。
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: 设置此位, 发送器的输出信号将环回到接收器的输入信号。
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: 设置此位, 如果接收器繁忙, 发送器仍将发送数据 (由硬件自动解决冲突)。

ESP32-C3 的 RS485 UART 硬件能够检测数据报传输期间的信号冲突, 并在启用此中断时生成中断 `UART_RS485_CLASH_INT`。术语冲突表示发送的数据报与另一端接收到的数据报不同。数据冲突通常与总线上其他活跃设备的存在有关, 或者是由于总线错误而出现。

冲突检测功能允许在激活和触发中断时处理冲突。中断 `UART_RS485_FRM_ERR_INT` 和 `UART_RS485_PARITY_ERR_INT` 可与冲突检测功能一起使用, 在 RS485 模式下分别控制帧错误和奇偶校验位错误。UART 驱动程序支持此功能, 通过选择 `UART_MODE_RS485_APP_CTRL` 模式可以使用 (参考函数 `uart_set_mode()`)。

冲突检测功能可与电路 A 和电路 C 一起使用 (参考章节 [接口连接选项](#))。在使用电路 A 或 B 时, 连接到总线驱动 DE 管脚的 RTS 管脚应由用户应用程序控制。调用函数 `uart_get_collision_flag()` 能够查看是否触发冲突检测标志。

ESP32-C3 UART 控制器本身不支持半双工通信, 因其无法自动控制连接到 RS485 总线驱动 RE/DE 输入的 RTS 管脚。然而, 半双工通信能够通过 UART 驱动程序对 RTS 管脚的软件控制来实现, 调用 `uart_set_mode()` 并选择 `UART_MODE_RS485_HALF_DUPLEX` 模式能够启用这一功能。

主机开始向 Tx FIFO 缓冲区写入数据时, UART 驱动程序会自动置位 RTS 管脚 (逻辑 1); 最后一位数据传输完成后, 驱动程序就会取消置位 RTS 管脚 (逻辑 0)。要使用此模式, 软件必须禁用硬件流控功能。此模式适用于下文所有已用电路。

**接口连接选项** 本节提供了示例原理图来介绍 ESP32-C3 RS485 接口连接的基本内容。

备注:

- 下列原理图不一定包含所有必要元素。
- 模拟设备 ADM483 和 ADM2483 是 RS485 收发器的常见示例，也可使用其他类似的收发器。

电路 A: 冲突检测电路

推荐这一电路，因为该电路较为简单，同时能够检测冲突。持续启用线路驱动中的接收器时，UART 将会监控 RS485 总线。启用 UART\_RS485\_CONF\_REG.UART\_RS485TX\_RX\_EN 位时，UART 外设会执行回波抑制。

电路 B: 无冲突检测的手动切换发射器/接收器

该电路无法检测冲突。置位 UART\_RS485\_CONF\_REG.UART\_RS485TX\_RX\_EN 位时，电路将抑制硬件收到的空字节。这种情况下 UART\_RS485\_CONF\_REG.UART\_RS485RXBY\_TX\_EN 位不适用。

电路 C: 自动切换发射器/接收器

(下页继续)

这种电气隔离电路不需要用软件应用程序或驱动程序控制 RTS 管脚，因为电路能够自动控制收发器方向。但是在传输过程中，需要将 `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` 设置为 1 并将 `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` 设置为 0 来抑制空字节。此设置可以在任何 RS485 UART 模式下工作，包括 `UART_MODE_UART`。

## 应用示例

下表列出了目录 `peripherals/uart/` 下可用的代码示例。

代码示例	描述
<code>peripherals/uart/uart_echo</code>	配置 UART 设置、安装 UART 驱动程序以及通过 UART1 接口读取/写入。
<code>peripherals/uart/uart_events</code>	报告各种通信事件，使用模式检测中断。
<code>peripherals/uart/uart_async_rxtxtasks</code>	通过同一 UART 在两个独立的 FreeRTOS 任务中发送和接收数据。
<code>peripherals/uart/uart_select</code>	针对 UART 文件描述符使用同步 I/O 多路复用。
<code>peripherals/uart/uart_echo_rs485</code>	设置 UART 驱动程序以半双工模式通过 RS485 接口进行通信。此示例与 <code>peripherals/uart/uart_echo</code> 类似，但允许通过连接到 ESP32-C3 管脚的 RS485 接口芯片进行通信。
<code>peripherals/uart/nmea0183_parser</code>	解析通过 UART 外设从 GPS 收到的 NMEA0183 语句来获取 GPS 信息。

## API 参考

### Header File

- `components/driver/uart/include/driver/uart.h`
- This header file can be included with:

```
#include "driver/uart.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)`

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

---

**备注:** Rx\_buffer\_size should be greater than UART\_HW\_FIFO\_LEN(uart\_num). Tx\_buffer\_size should be either zero or greater than UART\_HW\_FIFO\_LEN(uart\_num).

---

**参数**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **rx\_buffer\_size** -- UART RX ring buffer size.
- **tx\_buffer\_size** -- UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue\_size** -- UART event queue size/depth.
- **uart\_queue** -- UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info. Do not set ESP\_INTR\_FLAG\_IRAM here (the driver's ISR handler is not located in IRAM)

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_driver\_delete** (*uart\_port\_t* uart\_num)

Uninstall UART driver.

**参数** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

bool **uart\_is\_driver\_installed** (*uart\_port\_t* uart\_num)

Checks whether the driver is installed or not.

**参数** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- true driver is installed
- false driver is not installed

*esp\_err\_t* **uart\_set\_word\_length** (*uart\_port\_t* uart\_num, *uart\_word\_length\_t* data\_bit)

Set UART data bits.

**参数**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **data\_bit** -- UART data bits

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_word\_length** (*uart\_port\_t* uart\_num, *uart\_word\_length\_t* \*data\_bit)

Get the UART data bit configuration.

**参数**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **data\_bit** -- Pointer to accept value of UART data bits.

**返回**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*data\_bit)

*esp\_err\_t* **uart\_set\_stop\_bits** (*uart\_port\_t* uart\_num, *uart\_stop\_bits\_t* stop\_bits)

Set UART stop bits.

**参数**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

- **stop\_bits** -- UART stop bits
- 返回

- ESP\_OK Success
- ESP\_FAIL Fail

*esp\_err\_t* **uart\_get\_stop\_bits** (*uart\_port\_t* uart\_num, *uart\_stop\_bits\_t* \*stop\_bits)

Get the UART stop bit configuration.

参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **stop\_bits** -- Pointer to accept value of UART stop bits.

返回

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*stop\_bit)

*esp\_err\_t* **uart\_set\_parity** (*uart\_port\_t* uart\_num, *uart\_parity\_t* parity\_mode)

Set UART parity mode.

参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **parity\_mode** -- the enum of uart parity configuration

返回

- ESP\_FAIL Parameter error
- ESP\_OK Success

*esp\_err\_t* **uart\_get\_parity** (*uart\_port\_t* uart\_num, *uart\_parity\_t* \*parity\_mode)

Get the UART parity mode configuration.

参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **parity\_mode** -- Pointer to accept value of UART parity mode.

返回

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*parity\_mode)

*esp\_err\_t* **uart\_get\_sclk\_freq** (*uart\_sclk\_t* sclk, uint32\_t \*out\_freq\_hz)

Get the frequency of a clock source for the HP UART port.

参数

- **sclk** -- Clock source
- **out\_freq\_hz** -- [out] Output of frequency, in Hz

返回

- ESP\_ERR\_INVALID\_ARG: if the clock source is not supported
- otherwise ESP\_OK

*esp\_err\_t* **uart\_set\_baudrate** (*uart\_port\_t* uart\_num, uint32\_t baudrate)

Set UART baud rate.

参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **baudrate** -- UART baud rate.

返回

- ESP\_FAIL Parameter error
- ESP\_OK Success

*esp\_err\_t* **uart\_get\_baudrate** (*uart\_port\_t* uart\_num, uint32\_t \*baudrate)

Get the UART baud rate configuration.

参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **baudrate** -- Pointer to accept value of UART baud rate

返回

- ESP\_FAIL Parameter error

- ESP\_OK Success, result will be put in (\*baudrate)

*esp\_err\_t* **uart\_set\_line\_inverse** (*uart\_port\_t* uart\_num, uint32\_t inverse\_mask)

Set UART line inverse mode.

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **inverse\_mask** -- Choose the wires that need to be inverted. Using the ORred mask of *uart\_signal\_inv\_t*

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* flow\_ctrl, uint8\_t rx\_thresh)

Set hardware flow control.

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** -- Hardware flow control mode
- **rx\_thresh** -- Threshold of Hardware RX flow control (0 ~ UART\_HW\_FIFO\_LEN(uart\_num)). Only when UART\_HW\_FLOWCTRL\_RTS is set, will the rx\_thresh value be set.

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_sw\_flow\_ctrl** (*uart\_port\_t* uart\_num, bool enable, uint8\_t rx\_thresh\_xon, uint8\_t rx\_thresh\_xoff)

Set software flow control.

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1)
- **enable** -- switch on or off
- **rx\_thresh\_xon** -- low water mark
- **rx\_thresh\_xoff** -- high water mark

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* \*flow\_ctrl)

Get the UART hardware flow control configuration.

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** -- Option for different flow control mode.

#### 返回

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*flow\_ctrl)

*esp\_err\_t* **uart\_clear\_intr\_status** (*uart\_port\_t* uart\_num, uint32\_t clr\_mask)

Clear UART interrupt status.

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **clr\_mask** -- Bit mask of the interrupt status to be cleared.

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t enable\_mask)

Set UART interrupt enable.

**参数**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable\_mask** -- Bit mask of the enable bits.

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t disable\_mask)

Clear UART interrupt enable bits.

**参数**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **disable\_mask** -- Bit mask of the disable bits.

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_rx\_intr** (*uart\_port\_t* uart\_num)

Enable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**参数** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_rx\_intr** (*uart\_port\_t* uart\_num)

Disable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**参数** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_tx\_intr** (*uart\_port\_t* uart\_num)

Disable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**参数** **uart\_num** -- UART port number

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_tx\_intr** (*uart\_port\_t* uart\_num, int enable, int thresh)

Enable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**参数**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable** -- 1: enable; 0: disable
- **thresh** -- Threshold of TX interrupt, 0 ~ UART\_HW\_FIFO\_LEN(uart\_num)

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_pin** (*uart\_port\_t* uart\_num, int tx\_io\_num, int rx\_io\_num, int rts\_io\_num, int cts\_io\_num)

Assign signals of a UART peripheral to GPIO pins.

---

**备注:** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0's default TX pin and GPIO3 is UART0's default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is

performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

---

**备注:** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

---

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **tx\_io\_num** -- UART TX pin GPIO number.
- **rx\_io\_num** -- UART RX pin GPIO number.
- **rts\_io\_num** -- UART RTS pin GPIO number.
- **cts\_io\_num** -- UART CTS pin GPIO number.

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_rts** (*uart\_port\_t* uart\_num, int level)

Manually set the UART RTS pin level.

---

**备注:** UART must be configured with hardware flow control disabled.

---

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** -- 1: RTS output low (active); 0: RTS output high (block)

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_dtr** (*uart\_port\_t* uart\_num, int level)

Manually set the UART DTR pin level.

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** -- 1: DTR output low; 0: DTR output high

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_tx\_idle\_num** (*uart\_port\_t* uart\_num, uint16\_t idle\_num)

Set UART idle interval after tx FIFO is empty.

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **idle\_num** -- idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_param\_config** (*uart\_port\_t* uart\_num, const *uart\_config\_t* \*uart\_config)

Set UART configuration parameters.

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **uart\_config** -- UART parameter settings

#### 返回

- ESP\_OK Success

- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_intr\_config** (*uart\_port\_t* uart\_num, const *uart\_intr\_config\_t* \*intr\_conf)

Configure UART interrupts.

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **intr\_conf** -- UART interrupt settings

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_wait\_tx\_done** (*uart\_port\_t* uart\_num, TickType\_t ticks\_to\_wait)

Wait until UART TX FIFO is empty.

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **ticks\_to\_wait** -- Timeout, count in RTOS ticks

#### 返回

- ESP\_OK Success
- ESP\_FAIL Parameter error
- ESP\_ERR\_TIMEOUT Timeout

int **uart\_tx\_chars** (*uart\_port\_t* uart\_num, const char \*buffer, uint32\_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

---

备注: This function should only be used when UART TX buffer is not enabled.

---

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buffer** -- data buffer address
- **len** -- data length to send

#### 返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_write\_bytes** (*uart\_port\_t* uart\_num, const void \*src, size\_t size)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send

#### 返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_write\_bytes\_with\_break** (*uart\_port\_t* uart\_num, const void \*src, size\_t size, int brk\_len)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**参数**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send
- **brk\_len** -- break signal duration(unit: the time it takes to send one bit at current baudrate)

**返回**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_read\_bytes** (*uart\_port\_t* uart\_num, void \*buf, uint32\_t length, TickType\_t ticks\_to\_wait)

UART read bytes from UART buffer.

**参数**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buf** -- pointer to the buffer.
- **length** -- data length
- **ticks\_to\_wait** -- sTimeout, count in RTOS ticks

**返回**

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART buffer

*esp\_err\_t* **uart\_flush** (*uart\_port\_t* uart\_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

---

**备注:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**参数** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_flush\_input** (*uart\_port\_t* uart\_num)

Clear input buffer, discard all the data is in the ring-buffer.

---

**备注:** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**参数** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_buffered\_data\_len** (*uart\_port\_t* uart\_num, size\_t \*size)

UART get RX ring buffer cached data length.

**参数**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **size** -- Pointer of size\_t to accept cached data length

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_tx\_buffer\_free\_size** (*uart\_port\_t* uart\_num, size\_t \*size)

UART get TX ring buffer free space size.

**参数**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **size** -- Pointer of size\_t to accept the free space size

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_disable\_pattern\_det\_intr** (*uart\_port\_t* uart\_num)

UART disable pattern detect function. Designed for applications like 'AT commands'. When the hardware detects a series of one same character, the interrupt will be triggered.

**参数** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_pattern\_det\_baud\_intr** (*uart\_port\_t* uart\_num, char pattern\_chr, uint8\_t chr\_num, int chr\_tout, int post\_idle, int pre\_idle)

UART enable pattern detect function. Designed for applications like 'AT commands'. When the hardware detect a series of one same character, the interrupt will be triggered.

**参数**

- **uart\_num** -- UART port number.
- **pattern\_chr** -- character of the pattern.
- **chr\_num** -- number of the character, 8bit value.
- **chr\_tout** -- timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at\_cmd char.
- **post\_idle** -- idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at\_cmd char
- **pre\_idle** -- idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at\_cmd char.

**返回**

- ESP\_OK Success
- ESP\_FAIL Parameter error

int **uart\_pattern\_pop\_pos** (*uart\_port\_t* uart\_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**备注:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**参数** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

`int uart_pattern_get_pos (uart_port_t uart_num)`

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**备注:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**参数** `uart_num` -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**返回**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

`esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)`

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

**参数**

- `uart_num` -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- `queue_length` -- Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

**返回**

- ESP\_ERR\_NO\_MEM No enough memory
- ESP\_ERR\_INVALID\_STATE Driver not installed
- ESP\_FAIL Parameter error
- ESP\_OK Success

`esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)`

UART set communication mode.

---

**备注:** This function must be executed after `uart_driver_install()`, when the driver object is initialized.

---

**参数**

- `uart_num` -- Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- `mode` -- UART UART mode to set

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)`

Set uart threshold value for RX fifo full.

---

**备注:** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

---

**参数**

- `uart_num` -- UART port number, the max port number is (UART\_NUM\_MAX -1)
- `threshold` -- Threshold value above which RX fifo full interrupt is generated

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

`esp_err_t uart_set_tx_empty_threshold(uart_port_t uart_num, int threshold)`

Set uart threshold values for TX fifo empty.

#### 参数

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1)
- **threshold** -- Threshold value below which TX fifo empty interrupt is generated

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

`esp_err_t uart_set_rx_timeout(uart_port_t uart_num, const uint8_t tout_thresh)`

UART set threshold timeout for TOUT feature.

#### 参数

- **uart\_num** -- Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- **tout\_thresh** -- This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. `tout_thresh = 1`, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART\_RXFIFO\_TOUT\_INT interrupt is triggered. If `tout_thresh == 0`, the TOUT feature is disabled.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

`esp_err_t uart_get_collision_flag(uart_port_t uart_num, bool *collision_flag)`

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by `collision_flag`. `*collision_flag = true`, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after `uart_write_bytes()`).

#### 参数

- **uart\_num** -- Uart number to configure the max port number is (UART\_NUM\_MAX -1).
- **collision\_flag** -- Pointer to variable of type bool to return collision flag.

#### 返回

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)`

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter 'a' with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when 'a' is sent, set `wakeup_threshold=3`.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To ensure that UART has correct Baud rate all the time, it is necessary to select a source clock which has a fixed frequency and remains active during sleep. For the supported clock sources of the chips, please refer to `uart_sclk_t` or `soc_periph_uart_clk_src_legacy_t`

---

**备注:** in ESP32, the wakeup signal can only be input via IO\_MUX (i.e. GPIO3 should be configured as function\_1 to wake up UART0, GPIO9 should be configured as function\_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

---

**参数**

- **uart\_num** -- UART number, the max port number is (UART\_NUM\_MAX -1).
- **wakeup\_threshold** -- number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if uart\_num is incorrect or wakeup\_threshold is outside of [3, 0x3ff] range.

*esp\_err\_t* **uart\_get\_wakeup\_threshold** (*uart\_port\_t* uart\_num, int \*out\_wakeup\_threshold)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

**参数**

- **uart\_num** -- UART number, the max port number is (UART\_NUM\_MAX -1).
- **out\_wakeup\_threshold** -- **[out]** output, set to the current value of wakeup threshold for the given UART.

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if out\_wakeup\_threshold is NULL

*esp\_err\_t* **uart\_wait\_tx\_idle\_polling** (*uart\_port\_t* uart\_num)

Wait until UART tx memory empty and the last char send ok (polling mode).

•

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**参数** **uart\_num** -- UART number

*esp\_err\_t* **uart\_set\_loop\_back** (*uart\_port\_t* uart\_num, bool loop\_back\_en)

Configure TX signal loop back to RX module, just for the test usage.

•

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**参数**

- **uart\_num** -- UART number
- **loop\_back\_en** -- Set ture to enable the loop back function, else set it false.

void **uart\_set\_always\_rx\_timeout** (*uart\_port\_t* uart\_num, bool always\_rx\_timeout\_en)

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

### 参数

- **uart\_num** -- UART number
- **always\_rx\_timeout\_en** -- Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

### Structures

struct **uart\_config\_t**

UART configuration parameters for `uart_param_config` function.

#### Public Members

int **baud\_rate**

UART baud rate

*uart\_word\_length\_t* **data\_bits**

UART byte size

*uart\_parity\_t* **parity**

UART parity mode

*uart\_stop\_bits\_t* **stop\_bits**

UART stop bits

*uart\_hw\_flowcontrol\_t* **flow\_ctrl**

UART HW flow control mode (cts/rts)

uint8\_t **rx\_flow\_ctrl\_thresh**

UART HW RTS threshold

*uart\_sclk\_t* **source\_clk**

UART source clock selection

struct **uart\_intr\_config\_t**

UART interrupt configuration parameters for `uart_intr_config` function.

#### Public Members

uint32\_t **intr\_enable\_mask**

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

uint8\_t **rx\_timeout\_thresh**

UART timeout interrupt threshold (unit: time of sending one byte)

uint8\_t **txfifo\_empty\_intr\_thresh**

UART TX empty interrupt threshold.

uint8\_t **rxfifo\_full\_thresh**

UART RX full interrupt threshold.

struct **uart\_event\_t**

Event structure used in UART event queue.

### Public Members

*uart\_event\_type\_t* **type**

UART event type

size\_t **size**

UART data size for UART\_DATA event

bool **timeout\_flag**

UART data read timeout flag for UART\_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

### Macros

**UART\_PIN\_NO\_CHANGE**

**UART\_FIFO\_LEN**

Length of the HP UART HW FIFO.

**UART\_HW\_FIFO\_LEN** (uart\_num)

Length of the UART HW FIFO.

**UART\_BITRATE\_MAX**

Maximum configurable bitrate.

### Type Definitions

typedef *intr\_handle\_t* **uart\_isr\_handle\_t**

### Enumerations

enum **uart\_event\_type\_t**

UART event types used in the ring buffer.

*Values:*

enumerator **UART\_DATA**

UART data event

enumerator **UART\_BREAK**

UART break event

enumerator **UART\_BUFFER\_FULL**

UART RX buffer full event

enumerator **UART\_FIFO\_OVF**

UART FIFO overflow event

enumerator **UART\_FRAME\_ERR**

UART RX frame error event

enumerator **UART\_PARITY\_ERR**

UART RX parity event

enumerator **UART\_DATA\_BREAK**

UART TX data and break event

enumerator **UART\_PATTERN\_DET**

UART pattern detected

enumerator **UART\_WAKEUP**

UART wakeup event

enumerator **UART\_EVENT\_MAX**

UART event max index

### Header File

- [components/hal/include/hal/uart\\_types.h](#)
- This header file can be included with:

```
#include "hal/uart_types.h"
```

### Structures

struct **uart\_at\_cmd\_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

### Public Members

uint8\_t **cmd\_char**

UART AT cmd char

uint8\_t **char\_num**

AT cmd char repeat number

uint32\_t **gap\_tout**

gap time(in baud-rate) between AT cmd char

uint32\_t **pre\_idle**

the idle time(in baud-rate) between the non AT char and first AT char

uint32\_t **post\_idle**

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart\_sw\_flowctrl\_t**

UART software flow control configuration parameters.

### Public Members

uint8\_t **xon\_char**

Xon flow control char

uint8\_t **xoff\_char**

Xoff flow control char

uint8\_t **xon\_thrd**

If the software flow control is enabled and the data amount in rxfifo is less than xon\_thrd, an xon\_char will be sent

uint8\_t **xoff\_thrd**

If the software flow control is enabled and the data amount in rxfifo is more than xoff\_thrd, an xoff\_char will be sent

### Type Definitions

typedef *soc\_periph\_uart\_clk\_src\_legacy\_t* **uart\_sclk\_t**

UART source clock.

### Enumerations

enum **uart\_port\_t**

UART port number, can be UART\_NUM\_0 ~ (UART\_NUM\_MAX -1).

*Values:*

enumerator **UART\_NUM\_0**

UART port 0

enumerator **UART\_NUM\_1**

UART port 1

enumerator **UART\_NUM\_MAX**

UART port max

enum **uart\_mode\_t**

UART mode selection.

*Values:*

enumerator **UART\_MODE\_UART**

mode: regular UART mode

enumerator **UART\_MODE\_RS485\_HALF\_DUPLEX**

mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART\_MODE\_IRDA**

mode: IRDA UART mode

enumerator **UART\_MODE\_RS485\_COLLISION\_DETECT**

mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART\_MODE\_RS485\_APP\_CTRL**

mode: application control RS485 UART mode (used for test purposes)

enum **uart\_word\_length\_t**

UART word length constants.

*Values:*

enumerator **UART\_DATA\_5\_BITS**

word length: 5bits

enumerator **UART\_DATA\_6\_BITS**

word length: 6bits

enumerator **UART\_DATA\_7\_BITS**

word length: 7bits

enumerator **UART\_DATA\_8\_BITS**

word length: 8bits

enumerator **UART\_DATA\_BITS\_MAX**

enum **uart\_stop\_bits\_t**

UART stop bits number.

*Values:*

enumerator **UART\_STOP\_BITS\_1**

stop bit: 1bit

enumerator **UART\_STOP\_BITS\_1\_5**

stop bit: 1.5bits

enumerator **UART\_STOP\_BITS\_2**

stop bit: 2bits

enumerator **UART\_STOP\_BITS\_MAX**

enum **uart\_parity\_t**

UART parity constants.

*Values:*

enumerator **UART\_PARITY\_DISABLE**

Disable UART parity

enumerator **UART\_PARITY\_EVEN**

Enable UART even parity

enumerator **UART\_PARITY\_ODD**

Enable UART odd parity

enum **uart\_hw\_flowcontrol\_t**

UART hardware flow control modes.

*Values:*

enumerator **UART\_HW\_FLOWCTRL\_DISABLE**

disable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_RTS**

enable RX hardware flow control (rts)

enumerator **UART\_HW\_FLOWCTRL\_CTS**

enable TX hardware flow control (cts)

enumerator **UART\_HW\_FLOWCTRL\_CTS\_RTS**

enable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_MAX**

enum **uart\_signal\_inv\_t**

UART signal bit map.

*Values:*

enumerator **UART\_SIGNAL\_INV\_DISABLE**

Disable UART signal inverse

enumerator **UART\_SIGNAL\_IRDA\_TX\_INV**

inverse the UART irda\_tx signal

enumerator **UART\_SIGNAL\_IRDA\_RX\_INV**

inverse the UART irda\_rx signal

enumerator **UART\_SIGNAL\_RXD\_INV**

inverse the UART rxd signal

enumerator **UART\_SIGNAL\_CTS\_INV**

inverse the UART cts signal

enumerator **UART\_SIGNAL\_DSR\_INV**

inverse the UART dsr signal

enumerator **UART\_SIGNAL\_TXD\_INV**

inverse the UART txd signal

enumerator **UART\_SIGNAL\_RTS\_INV**

inverse the UART rts signal

enumerator **UART\_SIGNAL\_DTR\_INV**

inverse the UART dtr signal

**GPIO 查找宏指令** UART 外设设有供直接连接的专用 IO\_MUX 管脚，但也可用非直接的 GPIO 矩阵将信号配置到其他管脚。如要直接连接，需要知道哪一管脚为 UART 通道的专用 IO\_MUX 管脚。GPIO 查找宏简化了查找和分配 IO\_MUX 管脚的过程，可根据 IO\_MUX 管脚编号或所需 UART 通道名称选择一个宏，该宏将返回匹配的对应项。请查看下列示例。

**备注：**如需较高的 UART 波特率（超过 40 MHz），即仅使用 IO\_MUX 管脚时，可以使用此类宏。在其他情况下可以忽略这些宏，并使用 GPIO 矩阵为 UART 功能配置任一 GPIO 管脚。

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` 返回 UART 通道 2 TXD 管脚的 IO\_MUX 管脚编号（管脚 17）
2. `UART_GPIO19_DIRECT_CHANNEL` 在通过 IO\_MUX 连接到 UART 外设时返回 GPIO 19 的 UART 编号（即 `UART_NUM_0`）
3. GPIO 19 在通过 IO\_MUX 用作 UART CTS 管脚时，`UART_CTS_GPIO19_DIRECT_CHANNEL` 将返回 GPIO 19 的 UART 编号（即 `UART_NUM_0`）。该宏类似于上述宏，但指定了管脚功能，这也是 IO\_MUX 分配的一部分。

### Header File

- [components/soc/esp32c3/include/soc/uart\\_channel.h](#)
- This header file can be included with:

```
#include "soc/uart_channel.h"
```

### Macros

`UART_GPIO21_DIRECT_CHANNEL`

`UART_NUM_0_TXD_DIRECT_GPIO_NUM`

`UART_GPIO20_DIRECT_CHANNEL`

`UART_NUM_0_RXD_DIRECT_GPIO_NUM`

`UART_TXD_GPIO21_DIRECT_CHANNEL`

## UART\_RXD\_GPIO20\_DIRECT\_CHANNEL

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 [peripherals](#) 目录下。

## 2.7 项目配置

### 2.7.1 简介

ESP-IDF 使用基于 [kconfiglib](#) 的 [esp-idf-kconfig](#) 包，而 [kconfiglib](#) 是 [Kconfig](#) 系统的 Python 扩展。[Kconfig](#) 提供了编译时的项目配置机制，以及多种类型的配置选项（如整数、字符串和布尔值等）。[Kconfig](#) 文件指定了选项之间的依赖关系、默认值、组合方式等。

了解所有可用功能，请查看 [Kconfig](#) 和 [kconfiglib](#) 扩展。

### 2.7.2 项目配置菜单

应用程序开发人员可以通过 `idf.py menuconfig` 构建目标，在终端中打开项目配置菜单。

更新后，此配置将保存在项目根目录的 `sdkconfig` 文件中。借助 `sdkconfig`，应用程序构建目标将在构建目录中生成 `sdkconfig.h` 文件，并使得 `sdkconfig` 选项可用于项目构建系统和源文件。

### 2.7.3 使用 `sdkconfig.defaults`

在某些情况下，例如 `sdkconfig` 文件处于版本控制状态时，构建系统可能会不便于更改 `sdkconfig` 文件。要避免上述情况，可以在构建系统中创建 `sdkconfig.defaults` 文件。该文件可以手动或自动创建，且构建系统永远不会对其进行更改。该文件包含所有不同于默认选项的重要选项，其格式与 `sdkconfig` 文件格式相同。如果用户记得所有已更改的配置，则可以手动创建 `sdkconfig.defaults`，或运行 `idf.py save-defconfig` 命令来自动生成此文件。

`sdkconfig.defaults` 创建后，用户可以删除 `sdkconfig` 或将其添加到版本控制系统的忽略列表中（例如 `git` 的 `.gitignore` 文件）。项目构建目标将自动创建 `sdkconfig` 文件，填充 `sdkconfig.defaults` 文件中的设置，并将其他设置配置为默认值。请注意，构建时 `sdkconfig.defaults` 中的设置不会覆盖 `sdkconfig` 的已有设置。了解更多信息，请查看 [自定义 `sdkconfig` 的默认值](#)。

### 2.7.4 [Kconfig](#) 格式规定

[Kconfig](#) 文件的格式规定如下：

- 在所有菜单中，选项名称的前缀需保持一致。目前，前缀长度应为至少 3 个字符。
- 每级采用 4 个空格的缩进方式，子项需比父项多缩进一级。例如，`menu` 缩进 0 个空格，`menu` 中的 `config` 则缩进 4 个空格，`config` 中的 `help` 缩进 8 个空格，`help` 下的文本缩进 12 个空格。
- 行末不得出现尾随空格。
- 选项最长为 50 个字符。
- 每行最长为 120 个字符。

---

**备注：** 菜单中不同配置的 `help` 小节默认视为 `reStructuredText` 格式，以便生成相应选项的参考文档。

---

## 格式检查器

`esp-idf-kconfig` 软件包中的 `kconfcheck` 工具可以检查 `Kconfig` 文件是否符合上述格式规定。检查器会检查作为参数给出的所有 `Kconfig` 和 `Kconfig.projbuild` 文件，并生成一个后缀为 `.new` 的新文件，如有格式错误，便会在此文件中提供修改建议。注意，检查器不能解决所有格式问题，开发人员仍需终审并修改文件，使其通过测试。例如，在没有其他误导性格式的情况下，检查器能够更正缩进，但无法为菜单内选项提供常用的前缀。

`esp-idf-kconfig` 软件包可以在 `ESP-IDF` 环境中使用。运行命令 `python -m kconfcheck <path_to_kconfig_file>` 即可调用检查工具。

如需了解更多内容，请参考 [esp-idf-kconfig 相关文档](#)。

## 2.7.5 Kconfig 选项的向后兼容性

标准 `Kconfig` 工具会忽略 `sdkconfig` 中的未知选项。因此，如果开发人员对某些选项进行了自定义设置，但这些选项在 `ESP-IDF` 新版本中重新命名，标准 `Kconfig` 工具将忽略原有设置。以下功能可以避免上述情况：

1. 工具链使用 `kconfgen` 预处理 `sdkconfig` 文件。例如，`menuconfig` 会读取这些文件，从而保留旧选项设置。
2. `kconfgen` 递归查找 `ESP-IDF` 目录中所有包含新旧 `Kconfig` 选项名称的 `sdkconfig.rename` 文件。在 `sdkconfig` 文件中，新选项将替换旧选项。针对单个目标的重命名可以放在特定目标的重命名文件 `sdkconfig.rename.TARGET` 中，其中 `TARGET` 是目标名称，例如 `sdkconfig.rename.esp32s2`。
3. `kconfgen` 通过添加兼容性语句列表（即经过修改后，将旧选项的值设置为新选项的值），后处理 `sdkconfig` 文件，并生成所有构建结果（`sdkconfig.h`、`sdkconfig.cmake` 以及 `auto.conf`）。如果用户在其代码中仍然使用旧选项，此举可以防止用户代码出现问题。
4. `kconfgen` 会自动生成 [Deprecated options and their replacements](#)。

## 2.7.6 配置选项参考

以下小节包含由 `Kconfig` 文件自动生成的 `ESP-IDF` 可用选项列表。请注意，由于所选选项不同，下列某些选项可能在 `menuconfig` 界面中默认不可见。

按照惯例，所有选项名称均为大写字母加下划线。当 `Kconfig` 生成 `sdkconfig` 和 `sdkconfig.h` 文件时，选项名称会以 `CONFIG_` 为前缀。因此，如果 `Kconfig` 文件定义了 `ENABLE_FOO` 选项且 `menuconfig` 中选择了该选项，则 `sdkconfig` 和 `sdkconfig.h` 文件也将定义 `CONFIG_ENABLE_FOO`。在以下小节中，选项名称也以 `CONFIG_` 为前缀，与源代码相同。

### Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

### CONFIG\_APP\_BUILD\_TYPE

Application build type

Found in: *Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG or UART. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for some kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash.

Note: when APP\_BUILD\_TYPE\_RAM is selected and loaded with JTAG, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in tools/test\_apps/system/gdb\_loadable\_elf/

When loading the BIN with UART, the ROM will jump to ram and run the app after finishing the ROM startup code, so there's no additional startup initialization required. You can use the *load\_ram* in esptool.py to load the generated .bin file into ram and execute.

**Example:** esptool.py --chip {chip} -p {port} -b {baud} --no-stub load\_ram {app.bin}

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG\_APP\_BUILD\_TYPE\_RAM is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_RAM=y CONFIG_VFS_SUPPORT_TERMIOS= CON-
FIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

Available options:

- Default (binary application + 2nd stage bootloader) (CONFIG\_APP\_BUILD\_TYPE\_APP\_2NDBOOT)
- Build app runs entirely in RAM (EXPERIMENTAL) (CONFIG\_APP\_BUILD\_TYPE\_RAM)

## CONFIG\_APP\_BUILD\_TYPE\_PURE\_RAM\_APP

Build app without SPI\_FLASH/PSRAM support (saves ram)

Found in: *Build type*

If this option is enabled, external memory and related peripherals, such as Cache, MMU, Flash and PSRAM, won't be initialized. Corresponding drivers won't be introduced either. Components that depend on the spi\_flash component will also be unavailable, such as app\_update, etc. When this option is enabled, about 26KB of RAM space can be saved.

## CONFIG\_APP\_REPRODUCIBLE\_BUILD

Enable reproducible build

Found in: *Build type*

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create automatically. (or will be append if you have one already)

**Default value:**

- No (disabled)

**CONFIG\_APP\_NO\_BLOBS**

No Binary Blobs

*Found in: Build type*

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

**Default value:**

- No (disabled)

**Bootloader config**

Contains:

- *CONFIG\_BOOTLOADER\_LOG\_LEVEL*
- *Bootloader manager*
- *CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION*
- *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE*
- *CONFIG\_BOOTLOADER\_REGION\_PROTECTION\_ENABLE*
- *CONFIG\_BOOTLOADER\_APP\_TEST*
- *CONFIG\_BOOTLOADER\_FACTORY\_RESET*
- *CONFIG\_BOOTLOADER\_HOLD\_TIME\_GPIO*
- *CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC*
- *Serial Flash Configurations*
- *CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS*
- *CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON*
- *CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_IN\_DEEP\_SLEEP*
- *CONFIG\_BOOTLOADER\_WDT\_ENABLE*
- *CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST*

**Bootloader manager** Contains:

- *CONFIG\_BOOTLOADER\_PROJECT\_VER*
- *CONFIG\_BOOTLOADER\_COMPILE\_TIME\_DATE*

**CONFIG\_BOOTLOADER\_COMPILE\_TIME\_DATE**

Use time/date stamp for bootloader

*Found in: Bootloader config > Bootloader manager*

If set, then the bootloader will be built with the current time/date stamp. It is stored in the bootloader description structure. If not set, time/date stamp will be excluded from bootloader image. This can be useful for getting the same binary image files made from the same source, but at different times.

**CONFIG\_BOOTLOADER\_PROJECT\_VER**

Project version

*Found in: Bootloader config > Bootloader manager*

Project version. It is placed in "version" field of the esp\_bootloader\_desc structure. The type of this field is "uint32\_t".

**Range:**

- from 0 to 4294967295

**Default value:**

- 1

## CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION

Bootloader optimization Level

*Found in: [Bootloader config](#)*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default "Size" setting will add the -Os flag to CFLAGS.
- The "Debug" setting will add the -Og flag to CFLAGS.
- The "Performance" setting will add the -O2 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

Available options:

- Size (-Os) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_SIZE)
- Debug (-Og) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_DEBUG)
- Optimize for performance (-O2) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_PERF)
- Debug without optimization (-O0) (Deprecated, will be removed in IDF v6.0) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_NONE)

## CONFIG\_BOOTLOADER\_LOG\_LEVEL

Bootloader log verbosity

*Found in: [Bootloader config](#)*

Specify how much output to see in bootloader logs.

Available options:

- No output (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_NONE)
- Error (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_ERROR)
- Warning (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_WARN)
- Info (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_INFO)
- Debug (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_DEBUG)
- Verbose (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_VERBOSE)

## Serial Flash Configurations

 Contains:

- [CONFIG\\_BOOTLOADER\\_FLASH\\_DC\\_AWARE](#)
- [CONFIG\\_BOOTLOADER\\_FLASH\\_XMC\\_SUPPORT](#)

## CONFIG\_BOOTLOADER\_FLASH\_DC\_AWARE

Allow app adjust Dummy Cycle bits in SPI Flash for higher frequency (READ HELP FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

This will force 2nd bootloader to be loaded by DOUT mode, and will restore Dummy Cycle setting by resetting the Flash

### CONFIG\_BOOTLOADER\_FLASH\_XMC\_SUPPORT

Enable the support for flash chips of XMC (READ DOCS FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON'T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

comment "Features below require specific hardware (READ DOCS FIRST!)"

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST

VDDSDIO LDO voltage

*Found in: [Bootloader config](#)*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

Available options:

- 1.8V (CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST\_1\_8V)
- 1.9V (CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST\_1\_9V)

### CONFIG\_BOOTLOADER\_FACTORY\_RESET

GPIO triggers factory reset

*Found in: [Bootloader config](#)*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from "factory" partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_NUM\_PIN\_FACTORY\_RESET

Number of the GPIO input for factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Default value:**

- 4 if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

### CONFIG\_BOOTLOADER\_FACTORY\_RESET\_PIN\_LEVEL

Factory reset GPIO level

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_FACTORY\_RESET*

Pin level for factory reset, can be triggered on low or high.

Available options:

- Reset on GPIO low (*CONFIG\_BOOTLOADER\_FACTORY\_RESET\_PIN\_LOW*)
- Reset on GPIO high (*CONFIG\_BOOTLOADER\_FACTORY\_RESET\_PIN\_HIGH*)

### CONFIG\_BOOTLOADER\_OTA\_DATA\_ERASE

Clear OTA data on factory reset (select factory partition)

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_FACTORY\_RESET*

The device will boot from "factory" partition (or OTA slot 0 if no factory partition is present) after a factory reset.

### CONFIG\_BOOTLOADER\_DATA\_FACTORY\_RESET

Comma-separated names of partitions to clear on factory reset

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_FACTORY\_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: "nvs, phy\_init, ...") Make sure that the name specified in the partition table and here are the same. Partitions of type "app" cannot be specified here.

**Default value:**

- "nvs" if *CONFIG\_BOOTLOADER\_FACTORY\_RESET*

### CONFIG\_BOOTLOADER\_APP\_TEST

GPIO triggers boot from test app partition

Found in: *Bootloader config*

Allows to run the test app from "TEST" partition. A boot from "test" partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

### CONFIG\_BOOTLOADER\_NUM\_PIN\_APP\_TEST

Number of the GPIO input to boot TEST partition

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**

- from 0 to 39 if *CONFIG\_BOOTLOADER\_APP\_TEST*

**Default value:**

- 18 if *CONFIG\_BOOTLOADER\_APP\_TEST*

### CONFIG\_BOOTLOADER\_APP\_TEST\_PIN\_LEVEL

App test GPIO level

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_TEST*

Pin level for app test, can be triggered on low or high.

Available options:

- Enter test app on GPIO low (*CONFIG\_BOOTLOADER\_APP\_TEST\_PIN\_LOW*)
- Enter test app on GPIO high (*CONFIG\_BOOTLOADER\_APP\_TEST\_PIN\_HIGH*)

### CONFIG\_BOOTLOADER\_HOLD\_TIME\_GPIO

Hold time of GPIO for reset/test mode (seconds)

Found in: *Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**

- 5 if *CONFIG\_BOOTLOADER\_FACTORY\_RESET* || *CONFIG\_BOOTLOADER\_APP\_TEST*

### CONFIG\_BOOTLOADER\_REGION\_PROTECTION\_ENABLE

Enable protection for unmapped memory regions

Found in: *Bootloader config*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_WDT\_ENABLE

Use RTC watchdog in start code

Found in: *Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC\_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for *slow\_clk* - and ends calling *app\_main*. Re-set timeout is needed due to WDT uses a *SLOW\_CLK* clock source. After changing a frequency *slow\_clk* a time of WDT needs to re-set for new frequency. *slow\_clk* depends on *RTC\_CLK\_SRC* (*INTERNAL\_RC* or *EXTERNAL\_CRYSTAL*).

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_WDT\_DISABLE\_IN\_USER\_CODE

Allows RTC watchdog disable in user code

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_WDT\_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the *rtc\_wdt* in the app's own code. If this option is not set (default), then *rtc\_wdt* will be disabled by ESP-IDF before calling the *app\_main()* function.

Use function `rtc_wdt_feed()` for resetting counter of `rtc_wdt`. Use function `rtc_wdt_disable()` for disabling `rtc_wdt`.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_WDT\_TIME\_MS

Timeout for RTC watchdog (ms)

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_WDT\\_ENABLE](#)*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC\_WDT will reset while encryption operations will be performed.

**Range:**

- from 0 to 120000

**Default value:**

- 9000

### CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE

Enable app rollback support

*Found in: [Bootloader config](#)*

After updating the app, the bootloader runs a new app with the "ESP\_OTA\_IMG\_PENDING\_VERIFY" state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK

Enable app anti-rollback support

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#)*

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#)

### CONFIG\_BOOTLOADER\_APP\_SECURE\_VERSION

eFuse secure version of app

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see `BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota\_0 + ota\_1 (without factory).

**Default value:**

- 0 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### **CONFIG\_BOOTLOADER\_APP\_SEC\_VER\_SIZE\_EFUSE\_FIELD**

Size of the efuse secure version field

*Found in:* `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**

- from 1 to 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**Default value:**

- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### **CONFIG\_BOOTLOADER\_EFUSE\_SECURE\_VERSION\_EMULATE**

Emulate operations with efuse secure version(only test)

*Found in:* `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: `EFUSE_VIRTUAL` and `EFUSE_VIRTUAL_KEEP_IN_FLASH`.

**Default value:**

- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### **CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_IN\_DEEP\_SLEEP**

Skip image validation when exiting deep sleep

*Found in:* `Bootloader config`

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if "allow insecure options" is enabled, however it's strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT && CONFIG_SECURE_BOOT_INSECURE`

### **CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON**

Skip image validation from power on reset (READ HELP FIRST)

*Found in:* `Bootloader config`

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it's not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it's not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS**

Skip image validation always (READ HELP FIRST)

*Found in: [Bootloader config](#)*

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting "Skip image validation from power on reset" instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC**

Reserve RTC FAST memory for custom purposes

*Found in: [Bootloader config](#)*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through `PRO_CPU`.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_IN\_CRC**

Include custom memory in the CRC calculation

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)*

This option allows the customer to use the legacy bootloader behavior when the RTC FAST memory CRC calculation takes place. When this option is enabled, the allocated user custom data will be taken into account in the CRC calculation. This means that any change to the custom data would need a CRC update to prevent the bootloader from marking this data as corrupted. If this option is disabled, the custom data will not be taken into account when calculating the RTC FAST memory CRC. The user custom data can be changed freely, without the need to update the CRC. **THIS OPTION MUST BE THE SAME FOR BOTH THE BOOTLOADER AND THE APPLICATION BUILDS.**

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

## CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_SIZE

Size in bytes for custom purposes

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (*rtc\_retain\_mem\_t*) is reserved and has access from the bootloader and an application.

**Default value:**

- 0 if *CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC*

## Security features

Contains:

- *CONFIG\_SECURE\_BOOT\_INSECURE*
- *CONFIG\_SECURE\_SIGNED\_APPS\_SCHEME*
- *CONFIG\_SECURE\_SIGNED\_ON\_BOOT\_NO\_SECURE\_BOOT*
- *CONFIG\_SECURE\_FLASH\_CHECK\_ENC\_EN\_IN\_APP*
- *CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_SIZE*
- *CONFIG\_SECURE\_BOOT\_ENABLE\_AGGRESSIVE\_KEY\_REVOKE*
- *CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*
- *CONFIG\_SECURE\_BOOT*
- *CONFIG\_SECURE\_FLASH\_ENCRYPT\_ONLY\_IMAGE\_LEN\_IN\_APP\_PART*
- *CONFIG\_SECURE\_BOOT\_FLASH\_BOOTLOADER\_DEFAULT*
- *CONFIG\_SECURE\_BOOTLOADER\_KEY\_ENCODING*
- *Potentially insecure options*
- *CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT*
- *CONFIG\_SECURE\_BOOT\_VERIFICATION\_KEY*
- *CONFIG\_SECURE\_BOOTLOADER\_MODE*
- *CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES*
- *CONFIG\_SECURE\_UART\_ROM\_DL\_MODE*
- *CONFIG\_SECURE\_SIGNED\_ON\_UPDATE\_NO\_SECURE\_BOOT*

## CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT

Require signed app images

Found in: *Security features*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

## CONFIG\_SECURE\_SIGNED\_APPS\_SCHEME

App Signing Scheme

Found in: *Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
  - Legacy custom secure boot scheme. Supported in ESP32 SoC.
2. **Secure boot V2**

- RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
- ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

Available options:

- ECDSA (CONFIG\_SECURE\_SIGNED\_APPS\_ECDSA\_SCHEME)  
Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.
- RSA (CONFIG\_SECURE\_SIGNED\_APPS\_RSA\_SCHEME)  
Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.
- ECDSA (V2) (CONFIG\_SECURE\_SIGNED\_APPS\_ECDSA\_V2\_SCHEME)  
For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

### CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_SIZE

ECDSA key size

*Found in: Security features*

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

Available options:

- Using ECC curve NISTP192 (CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_192\_BITS)
- Using ECC curve NISTP256 (Recommended) (CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_256\_BITS)

### CONFIG\_SECURE\_SIGNED\_ON\_BOOT\_NO\_SECURE\_BOOT

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn't add significant security by itself so most users will want to leave it disabled.

**Default value:**

- No (disabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` && `CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME`

### CONFIG\_SECURE\_SIGNED\_ON\_UPDATE\_NO\_SECURE\_BOOT

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the `esp_ota_ops.h` APIs are used for OTA updates, or `esp_image_format.h` APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**Default value:**

- Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

## CONFIG\_SECURE\_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: [Security features](#)*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**

- No (disabled)

## CONFIG\_SECURE\_BOOT\_VERSION

Select secure boot version

*Found in: [Security features](#) > `CONFIG_SECURE_BOOT`*

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

Available options:

- Enable Secure Boot version 1 (`CONFIG_SECURE_BOOT_V1_ENABLED`)  
Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.
- Enable Secure Boot version 2 (`CONFIG_SECURE_BOOT_V2_ENABLED`)  
Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer's Guide for this version before enabling.

## CONFIG\_SECURE\_BOOTLOADER\_MODE

Secure bootloader mode

*Found in: [Security features](#)*

Available options:

- One-time flash (`CONFIG_SECURE_BOOTLOADER_ONE_TIME_FLASH`)  
On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot.  
Enabling this option means that the bootloader cannot be changed after the first time it is booted.
- Reflashable (`CONFIG_SECURE_BOOTLOADER_REFLASHABLE`)  
Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.  
This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.  
This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

### **CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES**

Sign binaries during build

*Found in: [Security features](#)*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in "Secure boot private signing key" will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using `espsecure.py`. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

### **CONFIG\_SECURE\_BOOT\_SIGNING\_KEY**

Secure boot private signing key

*Found in: [Security features](#) > [CONFIG\\_SECURE\\_BOOT\\_BUILD\\_SIGNED\\_BINARIES](#)*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: `espsecure.py generate_signing_key secure_boot_signing_key.pem`

See the Secure Boot section of the ESP-IDF Programmer's Guide for this version for details.

#### **Default value:**

- "secure\_boot\_signing\_key.pem" if [CONFIG\\_SECURE\\_BOOT\\_BUILD\\_SIGNED\\_BINARIES](#)

### **CONFIG\_SECURE\_BOOT\_VERIFICATION\_KEY**

Secure boot public signature verification key

*Found in: [Security features](#)*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

## CONFIG\_SECURE\_BOOT\_ENABLE\_AGGRESSIVE\_KEY\_REVOKE

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

### Default value:

- No (disabled) if `CONFIG_SECURE_BOOT`

## CONFIG\_SECURE\_BOOT\_FLASH\_BOOTLOADER\_DEFAULT

Flash bootloader along with other artifacts when using the default flash command

*Found in: Security features*

When Secure Boot V2 is enabled, by default the bootloader is not flashed along with other artifacts like the application and the partition table images, i.e. bootloader has to be separately flashed using the command `idf.py bootloader flash`, whereas, the application and partition table can be flashed using the command `idf.py flash` itself. Enabling this option allows flashing the bootloader along with the other artifacts by invocation of the command `idf.py flash`.

If this option is enabled make sure that even the bootloader is signed using the correct secure boot key, otherwise the bootloader signature verification would fail, as hash of the public key which is present in the bootloader signature would not match with the digest stored into the efuses and thus the device will not be able to boot up.

### Default value:

- No (disabled) if `CONFIG_SECURE_BOOT_V2_ENABLED` && `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

## CONFIG\_SECURE\_BOOTLOADER\_KEY\_ENCODING

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with `espefuse.py`.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn't change any firmware code, it only changes the size of key binary which is generated at build time.

Available options:

- No encoding (256 bit key) (`CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_256BIT`)
- 3/4 encoding (192 bit key) (`CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_192BIT`)

### CONFIG\_SECURE\_BOOT\_INSECURE

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

**Default value:**

- No (disabled) if *CONFIG\_SECURE\_BOOT*

### CONFIG\_SECURE\_FLASH\_ENC\_ENABLED

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *flash 加密* before enabling.

**Default value:**

- No (disabled)

### CONFIG\_SECURE\_FLASH\_ENCRYPTION\_KEYSIZE

Size of generated XTS-AES key

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

Size of generated XTS-AES key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

Available options:

- AES-128 key derived from 128 bits (SHA256(128 bits)) (*CONFIG\_SECURE\_FLASH\_ENCRYPTION\_AES128\_DERIVED*)
- AES-128 (256-bit key) (*CONFIG\_SECURE\_FLASH\_ENCRYPTION\_AES128*)
- AES-256 (512-bit key) (*CONFIG\_SECURE\_FLASH\_ENCRYPTION\_AES256*)

### CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE

Enable usage mode

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it's possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it's no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

When EFUSE\_VIRTUAL is enabled, SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE is not available. For CI tests we use IDF\_CI\_BUILD to bypass it ("export IDF\_CI\_BUILD=1"). We do not recommend bypassing it for other purposes.

Refer to the Flash Encryption section of the ESP-IDF Programmer's Guide for details.

Available options:

- Development (NOT SECURE) (CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE\_DEVELOPMENT)
- Release (CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE)

#### Potentially insecure options Contains:

- [CONFIG\\_SECURE\\_BOOT\\_V2\\_ALLOW\\_EFUSE\\_RD\\_DIS](#)
- [CONFIG\\_SECURE\\_BOOT\\_ALLOW\\_SHORT\\_APP\\_PARTITION](#)
- [CONFIG\\_SECURE\\_BOOT\\_ALLOW\\_JTAG](#)
- [CONFIG\\_SECURE\\_FLASH\\_UART\\_BOOTLOADER\\_ALLOW\\_ENC](#)
- [CONFIG\\_SECURE\\_FLASH\\_UART\\_BOOTLOADER\\_ALLOW\\_CACHE](#)
- [CONFIG\\_SECURE\\_BOOT\\_ALLOW\\_UNUSED\\_DIGEST\\_SLOTS](#)
- [CONFIG\\_SECURE\\_FLASH\\_REQUIRE\\_ALREADY\\_ENABLED](#)
- [CONFIG\\_SECURE\\_FLASH\\_SKIP\\_WRITE\\_PROTECTION\\_CACHE](#)

#### CONFIG\_SECURE\_BOOT\_ALLOW\_JTAG

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

##### Default value:

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

#### CONFIG\_SECURE\_BOOT\_ALLOW\_SHORT\_APP\_PARTITION

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn't support 64KB aligned partition lengths.

### CONFIG\_SECURE\_BOOT\_V2\_ALLOW\_EFUSE\_RD\_DIS

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the WR\_DIS\_RD\_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE\_RD\_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK\_KEY0-BLOCK\_KEY5)(for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a BLOCK is read-protected, the application will read all zeros from that block

NOTE: If "UART ROM download mode (Permanently disabled (recommended))" or "UART ROM download mode (Permanently switch to Secure mode (recommended))" is set, then it is NOT possible to read/write efuses using espfuse.py utility. However, efuse can be read/written from the application

### CONFIG\_SECURE\_BOOT\_ALLOW\_UNUSED\_DIGEST\_SLOTS

Leave unused digest slots available (not revoke)

*Found in: Security features > Potentially insecure options*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called esp\_efuse\_set\_digest\_revoke(num\_digest) for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

**Default value:**

- No (disabled) if [CONFIG\\_SECURE\\_BOOT\\_INSECURE](#)

### CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_ENC

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**

- No (disabled) if [CONFIG\\_SECURE\\_FLASH\\_ENCRYPTION\\_MODE\\_DEVELOPMENT](#)

### CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_CACHE

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**

- No (disabled) if [CONFIG\\_SECURE\\_FLASH\\_ENCRYPTION\\_MODE\\_DEVELOPMENT](#)

**CONFIG\_SECURE\_FLASH\_REQUIRE\_ALREADY\_ENABLED**

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using `esepfuse.py`.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG\_SECURE\_FLASH\_SKIP\_WRITE\_PROTECTION\_CACHE**

Skip write-protection of DIS\_CACHE (DIS\_ICACHE, DIS\_DCACHE)

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on the first boot the bootloader will burn the write-protection of DIS\_CACHE(for ESP32) or DIS\_ICACHE/DIS\_DCACHE(for other chips) eFuse when Flash Encryption is enabled. Write protection for cache disable efuse prevents the chip from being blocked if it is set by accident. App and bootloader use cache so disabling it makes the chip useless for IDF. Due to other eFuses are linked with the same write protection bit (see the list below) then write-protection will not be done if these `SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`, `SECURE_BOOT_ALLOW_JTAG` or `SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE` options are selected to give a chance to turn on the chip into the release mode later.

List of eFuses with the same write protection bit: ESP32: `MAC`, `MAC_CRC`, `DISABLE_APP_CPU`, `DISABLE_BT`, `DIS_CACHE`, `VOL_LEVEL_HP_INV`.

ESP32-C3: `DIS_ICACHE`, `DIS_USB_JTAG`, `DIS_DOWNLOAD_ICACHE`, `DIS_USB_SERIAL_JTAG`, `DIS_FORCE_DOWNLOAD`, `DIS_TWAI`, `JTAG_SEL_ENABLE`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-C6: `SWAP_UART_SDIO_EN`, `DIS_ICACHE`, `DIS_USB_JTAG`, `DIS_DOWNLOAD_ICACHE`, `DIS_USB_SERIAL_JTAG`, `DIS_FORCE_DOWNLOAD`, `DIS_TWAI`, `JTAG_SEL_ENABLE`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-H2: `DIS_ICACHE`, `DIS_USB_JTAG`, `POWERGLITCH_EN`, `DIS_FORCE_DOWNLOAD`, `SPI_DOWNLOAD_MSPI_DIS`, `DIS_TWAI`, `JTAG_SEL_ENABLE`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-S2: `DIS_ICACHE`, `DIS_DCACHE`, `DIS_DOWNLOAD_ICACHE`, `DIS_DOWNLOAD_DCACHE`, `DIS_FORCE_DOWNLOAD`, `DIS_USB`, `DIS_TWAI`, `DIS_BOOT_REMAP`, `SOFT_DIS_JTAG`, `HARD_DIS_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-S3: `DIS_ICACHE`, `DIS_DCACHE`, `DIS_DOWNLOAD_ICACHE`, `DIS_DOWNLOAD_DCACHE`, `DIS_FORCE_DOWNLOAD`, `DIS_USB_OTG`, `DIS_TWAI`, `DIS_APP_CPU`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`, `DIS_USB_JTAG`, `DIS_USB_SERIAL_JTAG`, `STRAP_JTAG_SEL`, `USB_PHY_SEL`.

**CONFIG\_SECURE\_FLASH\_ENCRYPT\_ONLY\_IMAGE\_LEN\_IN\_APP\_PART**

Encrypt only the app image that is present in the partition of type app

*Found in: Security features*

If set, optimise encryption time for the partition of type APP, by only encrypting the app image that is present in the partition, instead of the whole partition. The image length used for encryption is derived

from the image metadata, which includes the size of the app image, checksum, hash and also the signature sector when secure boot is enabled.

If not set (default), the whole partition of type APP would be encrypted, which increases the encryption time but might be useful if there is any custom data appended to the firmware image.

### CONFIG\_SECURE\_FLASH\_CHECK\_ENC\_EN\_IN\_APP

Check Flash Encryption enabled on app startup

*Found in: Security features*

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

#### Default value:

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

### CONFIG\_SECURE\_UART\_ROM\_DL\_MODE

UART ROM download mode

*Found in: Security features*

Available options:

- UART ROM download mode (Permanently disabled (recommended)) (`CONFIG_SECURE_DISABLE_ROM_DL_MODE`)  
If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of `esptool.py`, `espefuse.py` and similar tools.  
Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.  
It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.  
It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.
- UART ROM download mode (Permanently switch to Secure mode (recommended)) (`CONFIG_SECURE_ENABLE_SECURE_ROM_DL_MODE`)  
If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.  
Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (`get_security_info`).  
Secure Download mode is not compatible with the `esptool.py` flasher stub feature, `espefuse.py`, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.  
Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential "attack surface" for an attacker to try and bypass them with a successful physical attack.  
It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`  
Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).
- UART ROM download mode (Enabled (not recommended)) (`CONFIG_SECURE_INSECURE_ALLOW_DL_MODE`)

This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

### Application manager

Contains:

- `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`
- `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`
- `CONFIG_APP_PROJECT_VER_FROM_CONFIG`
- `CONFIG_APP_RETRIEVE_LEN_ELF_SHA`
- `CONFIG_APP_COMPILE_TIME_DATE`

#### **CONFIG\_APP\_COMPILE\_TIME\_DATE**

Use time/date stamp for app

*Found in:* [Application manager](#)

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

#### **CONFIG\_APP\_EXCLUDE\_PROJECT\_VER\_VAR**

Exclude PROJECT\_VER from firmware image

*Found in:* [Application manager](#)

The PROJECT\_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp\_app\_desc structure.

**Default value:**

- No (disabled)

#### **CONFIG\_APP\_EXCLUDE\_PROJECT\_NAME\_VAR**

Exclude PROJECT\_NAME from firmware image

*Found in:* [Application manager](#)

The PROJECT\_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp\_app\_desc structure.

**Default value:**

- No (disabled)

#### **CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG**

Get the project version from Kconfig

*Found in:* [Application manager](#)

If this is enabled, then config item APP\_PROJECT\_VER will be used for the variable PROJECT\_VER. Other ways to set PROJECT\_VER will be ignored.

**Default value:**

- No (disabled)

## CONFIG\_APP\_PROJECT\_VER

Project version

Found in: *Application manager* > *CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

Project version

**Default value:**

- 1 if *CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

## CONFIG\_APP\_RETRIEVE\_LEN\_ELF\_SHA

The length of APP ELF SHA is stored in RAM(chars)

Found in: *Application manager*

At startup, the app will read the embedded APP ELF SHA-256 hash value from flash and convert it into a string and store it in a RAM buffer. This ensures the panic handler and core dump will be able to print this string even when cache is disabled. The size of the buffer is APP\_RETRIEVE\_LEN\_ELF\_SHA plus the null terminator. Changing this value will change the size of this buffer, in bytes.

**Range:**

- from 8 to 64

**Default value:**

- 9

## Boot ROM Behavior

Contains:

- *CONFIG\_BOOT\_ROM\_LOG\_SCHEME*

## CONFIG\_BOOT\_ROM\_LOG\_SCHEME

Permanently change Boot ROM output

Found in: *Boot ROM Behavior*

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

Available options:

- Always Log (*CONFIG\_BOOT\_ROM\_LOG\_ALWAYS\_ON*)  
Always print ROM logs, this is the default behavior.
- Permanently disable logging (*CONFIG\_BOOT\_ROM\_LOG\_ALWAYS\_OFF*)  
Don't print ROM logs.
- Log on GPIO High (*CONFIG\_BOOT\_ROM\_LOG\_ON\_GPIO\_HIGH*)  
Print ROM logs when GPIO level is high during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.
- Log on GPIO Low (*CONFIG\_BOOT\_ROM\_LOG\_ON\_GPIO\_LOW*)  
Print ROM logs when GPIO level is low during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

## Serial flasher config

Contains:

- *CONFIG\_ESPTOOLPY\_AFTER*
- *CONFIG\_ESPTOOLPY\_BEFORE*

- `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`
- `CONFIG_ESPTOOLPY_NO_STUB`
- `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE`
- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`

### **CONFIG\_ESPTOOLPY\_NO\_STUB**

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

### **CONFIG\_ESPTOOLPY\_FLASHMODE**

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:

- QIO (`CONFIG_ESPTOOLPY_FLASHMODE_QIO`)
- QOUT (`CONFIG_ESPTOOLPY_FLASHMODE_QOUT`)
- DIO (`CONFIG_ESPTOOLPY_FLASHMODE_DIO`)
- DOUT (`CONFIG_ESPTOOLPY_FLASHMODE_DOUT`)
- OPI (`CONFIG_ESPTOOLPY_FLASHMODE_OPI`)

### **CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE**

Flash Sampling Mode

*Found in: Serial flasher config*

Available options:

- STR Mode (`CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_STR`)
- DTR Mode (`CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_DTR`)

### **CONFIG\_ESPTOOLPY\_FLASHFREQ**

Flash SPI speed

*Found in: Serial flasher config*

Available options:

- 120 MHz (READ DOCS FIRST) (`CONFIG_ESPTOOLPY_FLASHFREQ_120M`)
  - Optional feature for QSPI Flash. Read docs and enable `CONFIG_SPI_FLASH_HPM_ENA` first!
  - Flash 120 MHz SDR mode is stable.
  - Flash 120 MHz DDR mode is an experimental feature, it works when the temperature is stable.

**Risks:** If your chip powers on at a certain temperature, then after the temperature increases or decreases by approximately 20 Celsius degrees (depending on the chip), the program will crash randomly.

- 80 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_80M)
- 64 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_64M)
- 60 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_60M)
- 48 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_48M)
- 40 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_40M)
- 32 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_32M)
- 30 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_30M)
- 26 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_26M)
- 24 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_24M)
- 20 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_20M)
- 16 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_16M)
- 15 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_15M)

### CONFIG\_ESPTOOLPY\_FLASHSIZE

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

Available options:

- 1 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_1MB)
- 2 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_2MB)
- 4 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_4MB)
- 8 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_8MB)
- 16 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_16MB)
- 32 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_32MB)
- 64 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_64MB)
- 128 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_128MB)

### CONFIG\_ESPTOOLPY\_HEADER\_FLASHSIZE\_UPDATE

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

### CONFIG\_ESPTOOLPY\_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset to bootloader (CONFIG\_ESPTOOLPY\_BEFORE\_RESET)
- No reset (CONFIG\_ESPTOOLPY\_BEFORE\_NORESET)

### CONFIG\_ESPTOOLPY\_AFTER

After flashing

Found in: *Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset after flashing (CONFIG\_ESPTOOLPY\_AFTER\_RESET)
- Stay in bootloader (CONFIG\_ESPTOOLPY\_AFTER\_NORESET)

### Partition Table

Contains:

- *CONFIG\_PARTITION\_TABLE\_CUSTOM\_FILENAME*
- *CONFIG\_PARTITION\_TABLE\_MD5*
- *CONFIG\_PARTITION\_TABLE\_OFFSET*
- *CONFIG\_PARTITION\_TABLE\_TYPE*

### CONFIG\_PARTITION\_TABLE\_TYPE

Partition Table

Found in: *Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition\_table directory. These are mostly intended for example and development use, it's expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:

- Single factory app, no OTA (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP)  
This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Single factory app (large), no OTA (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_LARGE)  
This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_large.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.

- Factory app, two OTA definitions (CONFIG\_PARTITION\_TABLE\_TWO\_OTA)  
This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size. The corresponding CSV file in the IDF directory is `components/partition_table/partitions_two_ota.csv`
- Custom partition table CSV (CONFIG\_PARTITION\_TABLE\_CUSTOM)  
Specify the path to the partition table CSV to use for your project. Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- Single factory app, no OTA, encrypted NVS (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_ENCRYPTED\_NVS)  
This is a variation of the default "Single factory app, no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information. The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_encr_nvs.csv`
- Single factory app (large), no OTA, encrypted NVS (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_LARGE\_ENC\_NVS)  
This is a variation of the "Single factory app (large), no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information. The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_large_encr_nvs.csv`
- Factory app, two OTA definitions, encrypted NVS (CONFIG\_PARTITION\_TABLE\_TWO\_OTA\_ENCRYPTED\_NVS)  
This is a variation of the "Factory app, two OTA definitions" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information. The corresponding CSV file in the IDF directory is `components/partition_table/partitions_two_ota_encr_nvs.csv`

### CONFIG\_PARTITION\_TABLE\_CUSTOM\_FILENAME

Custom partition CSV file

Found in: [Partition Table](#)

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- "partitions.csv"

### CONFIG\_PARTITION\_TABLE\_OFFSET

Offset of partition table

Found in: [Partition Table](#)

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION\_TABLE\_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**

- "0x8000"

## CONFIG\_PARTITION\_TABLE\_MD5

Generate an MD5 checksum for the partition table

Found in: *Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**

- Yes (enabled)

## Compiler options

Contains:

- *CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTION\_LEVEL*
- *CONFIG\_COMPILER\_FLOAT\_LIB\_FROM*
- *CONFIG\_COMPILER\_RT\_LIB*
- *CONFIG\_COMPILER\_OPTIMIZATION\_CHECKS\_SILENT*
- *CONFIG\_COMPILER\_DISABLE\_GCC12\_WARNINGS*
- *CONFIG\_COMPILER\_DISABLE\_GCC13\_WARNINGS*
- *CONFIG\_COMPILER\_DUMP\_RTL\_FILES*
- *CONFIG\_COMPILER\_SAVE\_RESTORE\_LIBCALLS*
- *CONFIG\_COMPILER\_WARN\_WRITE\_STRINGS*
- *CONFIG\_COMPILER\_CXX\_EXCEPTIONS*
- *CONFIG\_COMPILER\_CXX\_RTTI*
- *CONFIG\_COMPILER\_OPTIMIZATION*
- *CONFIG\_COMPILER\_HIDE\_PATHS\_MACROS*
- *CONFIG\_COMPILER\_STACK\_CHECK\_MODE*

## CONFIG\_COMPILER\_OPTIMIZATION

Optimization Level

Found in: *Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The "Debug" setting will add the -Og flag to CFLAGS.
- The "Size" setting will add the -Os flag to CFLAGS.
- The "Performance" setting will add the -O2 flag to CFLAGS.
- The "None" setting will add the -O0 flag to CFLAGS.

The "Size" setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The "Performance" setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

"None" with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the `BOOTLOADER_COMPILER_OPTIMIZATION` setting.

Available options:

- Debug (-Og) (`CONFIG_COMPILER_OPTIMIZATION_DEBUG`)
- Optimize for size (-Os) (`CONFIG_COMPILER_OPTIMIZATION_SIZE`)
- Optimize for performance (-O2) (`CONFIG_COMPILER_OPTIMIZATION_PERF`)

- Debug without optimization (-O0) (CONFIG\_COMPILER\_OPTIMIZATION\_NONE)

### CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTION\_LEVEL

Assertion level

*Found in: [Compiler options](#)*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to "silent" to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:

- Enabled (CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTIONS\_ENABLE)  
Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTIONS\_SILENT)  
Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTIONS\_DISABLE)  
If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

### CONFIG\_COMPILER\_FLOAT\_LIB\_FROM

Compiler float lib source

*Found in: [Compiler options](#)*

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is "fast", but it has a few exceptions from IEEE 754 compliance.

Available options:

- libgcc (CONFIG\_COMPILER\_FLOAT\_LIB\_FROM\_GCCLIB)
- librvfp (CONFIG\_COMPILER\_FLOAT\_LIB\_FROM\_RVFPLIB)

### CONFIG\_COMPILER\_OPTIMIZATION\_CHECKS\_SILENT

Disable messages in ESP\_RETURN\_ON\_\* and ESP\_EXIT\_ON\_\* macros

*Found in: [Compiler options](#)*

If enabled, the error messages will be discarded in following check macros: -  
ESP\_RETURN\_ON\_ERROR - ESP\_EXIT\_ON\_ERROR - ESP\_RETURN\_ON\_FALSE -  
ESP\_EXIT\_ON\_FALSE

**Default value:**

- No (disabled)

## CONFIG\_COMPILER\_HIDE\_PATHS\_MACROS

Replace ESP-IDF and project paths in binaries

*Found in: [Compiler options](#)*

When expanding the `__FILE__` and `__BASE_FILE__` macros, replace paths inside ESP-IDF with paths relative to the placeholder string "IDF", and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes `-macro-prefix-map` options to the GCC command line. To replace additional paths in your binaries, modify the project `CMakeLists.txt` file to pass custom `-macro-prefix-map` or `-file-prefix-map` arguments.

**Default value:**

- Yes (enabled)

## CONFIG\_COMPILER\_CXX\_EXCEPTIONS

Enable C++ exceptions

*Found in: [Compiler options](#)*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any `libstdc++` code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS\\_EMG\\_POOL\\_SIZE](#)

## CONFIG\_COMPILER\_CXX\_EXCEPTIONS\_EMG\_POOL\_SIZE

Emergency Pool Size

*Found in: [Compiler options](#) > [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**

- 0 if [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)

## CONFIG\_COMPILER\_CXX\_RTTI

Enable C++ run-time type info (RTTI)

*Found in: [Compiler options](#)*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

**Default value:**

- No (disabled)

## CONFIG\_COMPILER\_STACK\_CHECK\_MODE

Stack smashing protection mode

*Found in: [Compiler options](#)*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected -- those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

Available options:

- None (CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_NONE)
- Normal (CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_NORM)
- Strong (CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_STRONG)
- Overall (CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_ALL)

## CONFIG\_COMPILER\_WARN\_WRITE\_STRINGS

Enable `-Wwrite-strings` warning flag

*Found in: [Compiler options](#)*

Adds `-Wwrite-strings` flag for the C/C++ compilers.

For C, this gives string constants the type `const char []` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

**Default value:**

- No (disabled)

## CONFIG\_COMPILER\_SAVE\_RESTORE\_LIBCALLS

Enable `-msave-restore` flag to reduce code size

*Found in: [Compiler options](#)*

Adds `-msave-restore` to C/C++ compilation flags.

When this flag is enabled, compiler will call library functions to save/restore registers in function prologues/epilogues. This results in lower overall code size, at the expense of slightly reduced performance.

This option can be enabled for RISC-V targets only.

### CONFIG\_COMPILER\_DISABLE\_GCC12\_WARNINGS

Disable new warnings introduced in GCC 12

*Found in:* [Compiler options](#)

Enable this option if use GCC 12 or newer, and want to disable warnings which don't appear with GCC 11.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DISABLE\_GCC13\_WARNINGS

Disable new warnings introduced in GCC 13

*Found in:* [Compiler options](#)

Enable this option if use GCC 13 or newer, and want to disable warnings which don't appear with GCC 12.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DUMP\_RTL\_FILES

Dump RTL files during compilation

*Found in:* [Compiler options](#)

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

### CONFIG\_COMPILER\_RT\_LIB

Compiler runtime library

*Found in:* [Compiler options](#)

Select runtime library to be used by compiler. - GCC toolchain supports libgcc only. - Clang allows to choose between libgcc or libclang\_rt. - For host builds ("linux" target), uses the default library.

Available options:

- libgcc (CONFIG\_COMPILER\_RT\_LIB\_GCCLIB)
- libclang\_rt (CONFIG\_COMPILER\_RT\_LIB\_CLANGRT)
- Host (CONFIG\_COMPILER\_RT\_LIB\_HOST)

### Component config

**Application Level Tracing** Contains:

- *CONFIG\_APPTRACE\_DESTINATION1*
- *CONFIG\_APPTRACE\_DESTINATION2*
- *FreeRTOS System View Tracing*
- *CONFIG\_APPTRACE\_GCOV\_ENABLE*
- *CONFIG\_APPTRACE\_BUF\_SIZE*
- *CONFIG\_APPTRACE\_PENDING\_DATA\_SIZE\_MAX*
- *CONFIG\_APPTRACE\_POSTMORTEM\_FLUSH\_THRESH*
- *CONFIG\_APPTRACE\_ONPANIC\_HOST\_FLUSH\_TMO*
- *CONFIG\_APPTRACE\_UART\_BAUDRATE*
- *CONFIG\_APPTRACE\_UART\_RX\_GPIO*

- `CONFIG_APPTRACE_UART_RX_BUFF_SIZE`
- `CONFIG_APPTRACE_UART_TASK_PRIO`
- `CONFIG_APPTRACE_UART_TX_MSG_SIZE`
- `CONFIG_APPTRACE_UART_TX_GPIO`
- `CONFIG_APPTRACE_UART_TX_BUFF_SIZE`

### **CONFIG\_APPTRACE\_DESTINATION1**

Data Destination 1

*Found in: Component config > Application Level Tracing*

Select destination for application trace: JTAG or none (to disable).

Available options:

- JTAG (`CONFIG_APPTRACE_DEST_JTAG`)
- None (`CONFIG_APPTRACE_DEST_NONE`)

### **CONFIG\_APPTRACE\_DESTINATION2**

Data Destination 2

*Found in: Component config > Application Level Tracing*

Select destination for application trace: UART(XX) or none (to disable).

Available options:

- UART0 (`CONFIG_APPTRACE_DEST_UART0`)
- UART1 (`CONFIG_APPTRACE_DEST_UART1`)
- UART2 (`CONFIG_APPTRACE_DEST_UART2`)
- USB\_CDC (`CONFIG_APPTRACE_DEST_USB_CDC`)
- None (`CONFIG_APPTRACE_DEST_UART_NONE`)

### **CONFIG\_APPTRACE\_UART\_TX\_GPIO**

UART TX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART TX pin.

### **CONFIG\_APPTRACE\_UART\_RX\_GPIO**

UART RX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART RX pin.

### **CONFIG\_APPTRACE\_UART\_BAUDRATE**

UART baud rate

*Found in: Component config > Application Level Tracing*

This baud rate is used for UART.

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided

from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

### **CONFIG\_APPTRACE\_UART\_RX\_BUFF\_SIZE**

UART RX ring buffer size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

### **CONFIG\_APPTRACE\_UART\_TX\_BUFF\_SIZE**

UART TX ring buffer size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

### **CONFIG\_APPTRACE\_UART\_TX\_MSG\_SIZE**

UART TX message size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Maximum size of the single message to transfer.

### **CONFIG\_APPTRACE\_UART\_TASK\_PPIO**

UART Task Priority

*Found in: [Component config](#) > [Application Level Tracing](#)*

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX\_PRIORITIES-1).

**Range:**

- from 1 to 32

**Default value:**

- 1

### **CONFIG\_APPTRACE\_ONPANIC\_HOST\_FLUSH\_TMO**

Timeout for flushing last trace data to host on panic

*Found in: [Component config](#) > [Application Level Tracing](#)*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

### **CONFIG\_APPTRACE\_POSTMORTEM\_FLUSH\_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: [Component config](#) > [Application Level Tracing](#)*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG\_APPTRACE\_BUF\_SIZE**

Size of the apptrace buffer

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the memory buffer for trace data in bytes.

**CONFIG\_APPTRACE\_PENDING\_DATA\_SIZE\_MAX**

Size of the pending data buffer

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing** Contains:

- [CONFIG\\_APPTRACE\\_SV\\_CPU](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_ISR\\_ENTER\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_ISR\\_EXIT\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_ISR\\_TO\\_SCHED\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_MAX\\_TASKS](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_IDLE\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_CREATE\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_START\\_EXEC\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_START\\_READY\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_STOP\\_EXEC\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_STOP\\_READY\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_TERMINATE\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TIMER\\_ENTER\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TIMER\\_EXIT\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_TS\\_SOURCE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_OVERFLOW\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_BUF\\_WAIT\\_TMO](#)

**CONFIG\_APPTRACE\_SV\_ENABLE**

SystemView Tracing Enable

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables support for SEGGER SystemView tracing functionality.

**CONFIG\_APPTRACE\_SV\_DEST**

SystemView destination

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

SystemView will transfer data through defined interface.

Available options:

- Data destination JTAG ([CONFIG\\_APPTRACE\\_SV\\_DEST\\_JTAG](#))  
Send SEGGER SystemView events through JTAG interface.
- Data destination UART ([CONFIG\\_APPTRACE\\_SV\\_DEST\\_UART](#))  
Send SEGGER SystemView events through UART interface.

### CONFIG\_APPTRACE\_SV\_CPU

CPU to trace

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Define the CPU to trace by SystemView.

Available options:

- CPU0 (CONFIG\_APPTRACE\_SV\_DEST\_CPU\_0)  
Send SEGGER SystemView events for Pro CPU.
- CPU1 (CONFIG\_APPTRACE\_SV\_DEST\_CPU\_1)  
Send SEGGER SystemView events for App CPU.

### CONFIG\_APPTRACE\_SV\_TS\_SOURCE

Timer to use as timestamp source

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:

- CPU cycle counter (CCOUNT) (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_CCOUNT)
- General Purpose Timer (Timer Group) (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_GPTIMER)
- esp\_timer high resolution timer (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_ESP\_TIMER)

### CONFIG\_APPTRACE\_SV\_MAX\_TASKS

Maximum supported tasks

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Configures maximum supported tasks in sysview debug

### CONFIG\_APPTRACE\_SV\_BUF\_WAIT\_TMO

Trace buffer wait timeout

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

### CONFIG\_APPTRACE\_SV\_EVT\_OVERFLOW\_ENABLE

Trace Buffer Overflow Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "Trace Buffer Overflow" event.

### CONFIG\_APPTRACE\_SV\_EVT\_ISR\_ENTER\_ENABLE

ISR Enter Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "ISR Enter" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_EXIT\_ENABLE**

ISR Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "ISR Exit" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_TO\_SCHED\_ENABLE**

ISR Exit to Scheduler Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "ISR to Scheduler" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_EXEC\_ENABLE**

Task Start Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "Task Start Execution" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_EXEC\_ENABLE**

Task Stop Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "Task Stop Execution" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_READY\_ENABLE**

Task Start Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "Task Start Ready State" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_READY\_ENABLE**

Task Stop Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "Task Stop Ready State" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_CREATE\_ENABLE**

Task Create Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "Task Create" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_TERMINATE\_ENABLE**

Task Terminate Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "Task Terminate" event.

### CONFIG\_APPTRACE\_SV\_EVT\_IDLE\_ENABLE

System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "System Idle" event.

### CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_ENTER\_ENABLE

Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "Timer Enter" event.

### CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_EXIT\_ENABLE

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "Timer Exit" event.

### CONFIG\_APPTRACE\_GCOV\_ENABLE

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

### CONFIG\_APPTRACE\_GCOV\_DUMP\_TASK\_STACK\_SIZE

Gcov dump task stack size

*Found in: Component config > Application Level Tracing > CONFIG\_APPTRACE\_GCOV\_ENABLE*

Configures stack size of Gcov dump task

#### Default value:

- 2048 if *CONFIG\_APPTRACE\_GCOV\_ENABLE*

### Bluetooth

Contains:

- *Bluedroid Options*
- *CONFIG\_BT\_ENABLED*
- *Controller Options*
- *NimBLE Options*
- *CONFIG\_BT\_RELEASE\_IRAM*

### CONFIG\_BT\_ENABLED

Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

## CONFIG\_BT\_HOST

Host

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED*

This helps to choose Bluetooth host stack

Available options:

- **Bluedroid - Dual-mode (CONFIG\_BT\_BLUEDROID\_ENABLED)**  
This option is recommended for classic Bluetooth or for dual-mode usecases
- **NimBLE - BLE only (CONFIG\_BT\_NIMBLE\_ENABLED)**  
This option is recommended for BLE only usecases to save on memory
- **Disabled (CONFIG\_BT\_CONTROLLER\_ONLY)**  
This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

## CONFIG\_BT\_CONTROLLER

Controller

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED*

This helps to choose Bluetooth controller stack

Available options:

- **Enabled (CONFIG\_BT\_CONTROLLER\_ENABLED)**  
This option is recommended for Bluetooth controller usecases
- **Disabled (CONFIG\_BT\_CONTROLLER\_DISABLED)**  
This option is recommended for Bluetooth Host only usecases

### Bluedroid Options

 Contains:

- *CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK*
- *CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG*
- *CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE*

- *CONFIG\_BT\_BLE\_FEAT\_CREATE\_SYNC\_ENH*
- *CONFIG\_BT\_BLUEDROID\_ESP\_COEX\_VSC*
- *CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_ENH*
- *CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN*
- *CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN*
- *CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE*

- `CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT`
- `CONFIG_BT_BLE_RPA_TIMEOUT`
- `CONFIG_BT_BLE_RPA_SUPPORTED`
- `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY`
- `CONFIG_BT_HFP_WBS_ENABLE`

### **CONFIG\_BT\_BTC\_TASK\_STACK\_SIZE**

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Bluebird Options*

This select btc task stack size

**Default value:**

- 3072 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE**

The cpu core which Bluebird run

*Found in: Component config > Bluetooth > Bluebird Options*

Which the cpu core to run Bluebird. Can choose core0 and core1. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (`CONFIG_BT_BLUEDROID_PINNED_TO_CORE_0`)
- Core 1 (APP CPU) (`CONFIG_BT_BLUEDROID_PINNED_TO_CORE_1`)

### **CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE**

Bluetooth Bluebird Host Stack task stack size

*Found in: Component config > Bluetooth > Bluebird Options*

This select btu task stack size

**Default value:**

- 4352 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG**

Bluebird memory debug

*Found in: Component config > Bluetooth > Bluebird Options*

Bluebird memory debug

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLUEDROID\_ESP\_COEX\_VSC**

Enable Espressif Vendor-specific HCI commands for coexist status configuration

*Found in: Component config > Bluetooth > Bluebird Options*

Enable Espressif Vendor-specific HCI commands for coexist status configuration

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_CLASSIC\_ENABLED**

Classic Bluetooth

*Found in:* [Component config > Bluetooth > Bluebird Options](#)

For now this option needs "SMP\_ENABLE" to be set to yes

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEBIRD_ENABLED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_BT_CLASSIC_SUPPORTED) || CONFIG_BT_CONTROLLER_DISABLED) && CONFIG_BT_BLUEBIRD_ENABLED`

**CONFIG\_BT\_CLASSIC\_BQB\_ENABLED**

Host Qualification support for Classic Bluetooth

*Found in:* [Component config > Bluetooth > Bluebird Options > CONFIG\\_BT\\_CLASSIC\\_ENABLED](#)

This enables functionalities of Host qualification for Classic Bluetooth.

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

**CONFIG\_BT\_A2DP\_ENABLE**

A2DP

*Found in:* [Component config > Bluetooth > Bluebird Options > CONFIG\\_BT\\_CLASSIC\\_ENABLED](#)

Advanced Audio Distribution Profile

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

**CONFIG\_BT\_SPP\_ENABLED**

SPP

*Found in:* [Component config > Bluetooth > Bluebird Options > CONFIG\\_BT\\_CLASSIC\\_ENABLED](#)

This enables the Serial Port Profile

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

**CONFIG\_BT\_L2CAP\_ENABLED**

BT L2CAP

*Found in:* [Component config > Bluetooth > Bluebird Options > CONFIG\\_BT\\_CLASSIC\\_ENABLED](#)

This enables the Logical Link Control and Adaptation Layer Protocol. Only supported classic bluetooth.

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

## CONFIG\_BT\_HFP\_ENABLE

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED*

Hands Free Unit and Audio Gateway can be included simultaneously but they cannot run simultaneously due to internal limitations.

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

Contains:

- `CONFIG_BT_HFP_AG_ENABLE`
- `CONFIG_BT_HFP_AUDIO_DATA_PATH`
- `CONFIG_BT_HFP_CLIENT_ENABLE`

## CONFIG\_BT\_HFP\_CLIENT\_ENABLE

Hands Free Unit

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED > CONFIG\_BT\_HFP\_ENABLE*

**Default value:**

- Yes (enabled) if `CONFIG_BT_HFP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

## CONFIG\_BT\_HFP\_AG\_ENABLE

Audio Gateway

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED > CONFIG\_BT\_HFP\_ENABLE*

**Default value:**

- Yes (enabled) if `CONFIG_BT_HFP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

## CONFIG\_BT\_HFP\_AUDIO\_DATA\_PATH

audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED > CONFIG\_BT\_HFP\_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API "esp\_bredr\_sco\_datapath\_set" in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

Available options:

- PCM (`CONFIG_BT_HFP_AUDIO_DATA_PATH_PCM`)
- HCI (`CONFIG_BT_HFP_AUDIO_DATA_PATH_HCI`)

## CONFIG\_BT\_HFP\_WBS\_ENABLE

Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

**Default value:**

- Yes (enabled) if `CONFIG_BT_HFP_AUDIO_DATA_PATH_HCI` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_HID\_ENABLED**

Classic BT HID

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

Contains:

- `CONFIG_BT_HID_DEVICE_ENABLED`
- `CONFIG_BT_HID_HOST_ENABLED`

### **CONFIG\_BT\_HID\_HOST\_ENABLED**

Classic BT HID Host

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_HID\_ENABLED*

This enables the BT HID Host

**Default value:**

- No (disabled) if `CONFIG_BT_HID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_HID\_DEVICE\_ENABLED**

Classic BT HID Device

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_HID\_ENABLED*

This enables the BT HID Device

### **CONFIG\_BT\_BLE\_ENABLED**

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_GATTS\_ENABLE**

Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_GATTS\_PPCP\_CHAR\_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This enables "Peripheral Preferred Connection Parameters" characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_BLE\_BLUFI\_ENABLE

Include blufi function

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option can be close when the app does not require blufi function.

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATT\_MAX\_SR\_PROFILES

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Server Profiles Count

**Range:**

- from 1 to 32 if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 8 if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATT\_MAX\_SR\_ATTRIBUTES

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Service Attributes Count

**Range:**

- from 1 to 500 if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 100 if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MODE

GATTS Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Service change indication mode for GATT Server.

Available options:

- GATTS manually send service change indication (CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MANUAL)  
Manually send service change indication through API `esp_ble_gatts_send_service_change_indication()`
- GATTS automatically send service change indication (CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_AUTO)  
Let Bluetooth handle the service change indication internally

### CONFIG\_BT\_GATTS\_ROBUST\_CACHING\_ENABLED

Enable Robust Caching on Server Side

*Found in: Component config > Bluetooth > Bluetooth Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option enables the GATT robust caching feature on the server. If turned on, the Client Supported Features characteristic, Database Hash characteristic, and Server Supported Features characteristic will be included in the GAP SERVICE.

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTS\_DEVICE\_NAME\_WRITABLE

Allow to write device name by GATT clients

*Found in: Component config > Bluetooth > Bluetooth Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Enabling this option allows remote GATT clients to write device name

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTS\_APPEARANCE\_WRITABLE

Allow to write appearance by GATT clients

*Found in: Component config > Bluetooth > Bluetooth Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Enabling this option allows remote GATT clients to write appearance

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTC\_ENABLE

Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Bluetooth Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app work only on gatt server mode

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTC\_MAX\_CACHE\_CHAR

Max gattc cache characteristic for discover

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

Maximum GATTC cache characteristic count

**Range:**

- from 1 to 500 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 40 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTC\_NOTIF\_REG\_MAX

Max gattc notify(indication) register number

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

Maximum GATTC notify(indication) register number

**Range:**

- from 1 to 64 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 5 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTC\_CACHE\_NVS\_FLASH

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTC\_CONNECT\_RETRY\_COUNT

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**

- from 0 to 7 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 3 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_BLE\_SMP\_ENABLE

Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**CONFIG\_BT\_SMP\_SLAVE\_CON\_PARAMS\_UPD\_ENABLE**

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_BLE\_SMP\_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_STACK\_NO\_LOG**

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**BT DEBUG LOG LEVEL** Contains:

- `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
- `CONFIG_BT_LOG_APPL_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BLUFI_TRACE_LEVEL`
- `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTM_TRACE_LEVEL`
- `CONFIG_BT_LOG_GAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_GATT_TRACE_LEVEL`
- `CONFIG_BT_LOG_HCI_TRACE_LEVEL`
- `CONFIG_BT_LOG_HID_TRACE_LEVEL`
- `CONFIG_BT_LOG_L2CAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_MCA_TRACE_LEVEL`
- `CONFIG_BT_LOG_OSI_TRACE_LEVEL`
- `CONFIG_BT_LOG_PAN_TRACE_LEVEL`
- `CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL`
- `CONFIG_BT_LOG_SDP_TRACE_LEVEL`
- `CONFIG_BT_LOG_SMP_TRACE_LEVEL`

**CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL**

HCI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HCI layer

Available options:

- NONE (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_NONE`)
- ERROR (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_ERROR`)

- WARNING (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL

BTM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTM layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL

L2CAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for L2CAP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL

RFCOMM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for RFCOMM layer

Available options:

- NONE (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL

SDP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SDP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL

GAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GAP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL

BNEP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BNEP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL

PAN layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for PAN layer

Available options:

- NONE (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL**

A2D layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for A2D layer

Available options:

- NONE (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL**

AVDT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVDT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL**

AVCT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVCT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL**

AVRC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVRC layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL**

MCA layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for MCA layer

Available options:

- NONE (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL**

HID layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for HID layer

Available options:

- NONE (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_EVENT)

- DEBUG (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL

APPL layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for APPL layer

Available options:

- NONE (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL

GATT layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for GATT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL

SMP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for SMP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL

BTIF layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTIF layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL

BTC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTC layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL

OSI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for OSI layer

Available options:

- NONE (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL

BLUFI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BLUFI layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_ACL\_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~9)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

**Range:**

- from 1 to 9 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 4 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE

Enable BLE multi-connections

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable this option if there are multiple connections

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST

BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the internal RAM if there have the PSRAM

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_DYNAMIC\_ENV\_MEMORY

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can make the allocation of memory will become more flexible

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > Bluebird Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

**CONFIG\_BT\_SMP\_MAX BONDS**

BT/BLE maximum bond device count

*Found in: Component config > Bluetooth > Bluebird Options*

The number of security records for peer devices.

**CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN**

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluebird Options*

Originally, when doing BLE active scan, Bluebird will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluebird will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEBIRD_ENABLED` && `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

**CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT**

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluebird Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, `ESP_GATTC_OPEN_EVT` or `ESP_GATTS_OPEN_EVT` is triggered.

**Range:**

- from 1 to 60 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

**Default value:**

- 30 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

**CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN**

length of bluetooth device name

*Found in: Component config > Bluetooth > Bluebird Options*

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can't fit in will be truncated.

**Range:**

- from 32 to 248 if `CONFIG_BT_BLUEBIRD_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

**Default value:**

- 32 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_RPA\_SUPPORTED

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

**Default value:**

- Yes (enabled) if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_RPA\_TIMEOUT

Timeout of resolvable private address

*Found in: Component config > Bluetooth > Bluedroid Options*

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

**Range:**

- from 1 to 3600 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 900 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED

Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Bluedroid Options*

Enabling this option activates BLE 5.0 features. This option is universally supported in chips that support BLE, except for ESP32.

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && (`CONFIG_BT_CONTROLLER_ENABLED` || `CONFIG_BT_CONTROLLER_DISABLED`) && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED

Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && (`CONFIG_BT_CONTROLLER_ENABLED` || `CONFIG_BT_CONTROLLER_DISABLED`) && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_SYNC\_TRANSFER**

Enable BLE periodic advertising sync transfer feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE periodic advertising sync transfer feature

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_ENH**

Enable periodic adv enhancements(adi support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the periodic advertising enhancements

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_FEAT\_CREATE\_SYNC\_ENH**

Enable create sync enhancements(reporting disable and duplicate filtering enable support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the create sync enhancements

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_HIGH\_DUTY\_ADV\_INTERVAL**

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enable BLE high duty advertising interval feature

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**NimBLE Options** Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK`
- `BLE Services`
- `CONFIG_BT_NIMBLE_WHITELIST_SIZE`
- `CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_ROLE_BROADCASTER`
- `CONFIG_BT_NIMBLE_ROLE_CENTRAL`
- `CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL`
- `CONFIG_BT_NIMBLE_MESH`
- `CONFIG_BT_NIMBLE_ROLE_OBSERVER`

- `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL`
- `CONFIG_BT_NIMBLE_SECURITY_ENABLE`
- `CONFIG_BT_NIMBLE_BLUFI_ENABLE`
- `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`
- `CONFIG_BT_NIMBLE_DYNAMIC_SERVICE`
- `CONFIG_BT_NIMBLE_USE_ESP_TIMER`
- `CONFIG_BT_NIMBLE_DEBUG`
- `CONFIG_BT_NIMBLE_HS_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_VS_SUPPORT`
- `CONFIG_BT_NIMBLE_OPTIMIZE_MULTI_CONN`
- `CONFIG_BT_NIMBLE_ENC_ADV_DATA`
- `CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE`
- *GAP Service*
- *Host-controller Transport*
- `CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN`
- `CONFIG_BT_NIMBLE_MAX_BONDS`
- `CONFIG_BT_NIMBLE_MAX_CCCDS`
- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS`
- `CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM`
- `CONFIG_BT_NIMBLE_GATT_MAX_PROCS`
- `CONFIG_BT_NIMBLE_MEM_ALLOC_MODE`
- *Memory Settings*
- `CONFIG_BT_NIMBLE_LOG_LEVEL`
- `CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE`
- `CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS`
- `CONFIG_BT_NIMBLE_NVS_PERSIST`
- `CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU`
- `CONFIG_BT_NIMBLE_RPA_TIMEOUT`
- `CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST`

### **CONFIG\_BT\_NIMBLE\_MEM\_ALLOC\_MODE**

Memory allocation strategy

*Found in: Component config > Bluetooth > NimBLE Options*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:

- Internal memory (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL`)
- External SPIRAM (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL`)
- Default alloc mode (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT`)
- Internal IRAM (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT`)  
Allows to use IRAM memory region as 8bit accessible region.  
Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### **CONFIG\_BT\_NIMBLE\_LOG\_LEVEL**

NimBLE Host log verbosity

Found in: *Component config > Bluetooth > NimBLE Options*

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in "Component config --> Log output --> Default log verbosity".

Available options:

- No logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_NONE)
- Error logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_ERROR)
- Warning logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_WARNING)
- Info logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_INFO)
- Debug logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_DEBUG)

### CONFIG\_BT\_NIMBLE\_MAX\_CONNECTIONS

Maximum number of concurrent connections

Found in: *Component config > Bluetooth > NimBLE Options*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM\_CTRL\_BLE\_MAX\_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT\_CTRL\_BLE\_MAX\_ACT from controller menu. For ESP32C2, ESP32C6 and ESP32H2, each connection will take about 1k DRAM.

**Range:**

- from 1 to 9 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**Default value:**

- 3 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MAX BONDS

Maximum number of bonds to save across reboots

Found in: *Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

**Default value:**

- 3 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MAX\_CCCDS

Maximum number of CCC descriptors to save across reboots

Found in: *Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

**Default value:**

- 8 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_L2CAP\_COC\_MAX\_NUM

Maximum number of connection oriented channels

Found in: *Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

**Range:**

- from 0 to 9 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_PINNED\_TO\_CORE\_CHOICE**

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

Available options:

- Core 0 (PRO CPU) (`CONFIG_BT_NIMBLE_PINNED_TO_CORE_0`)
- Core 1 (APP CPU) (`CONFIG_BT_NIMBLE_PINNED_TO_CORE_1`)

### **CONFIG\_BT\_NIMBLE\_HOST\_TASK\_STACK\_SIZE**

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**

- 5120 if `CONFIG_BLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
- 4096 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_ROLE\_CENTRAL**

Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables central role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_ROLE\_PERIPHERAL**

Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*

Enable peripheral role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_ROLE\_BROADCASTER**

Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables broadcaster role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_OBSERVER

Enable BLE Observer role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables observer role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_NVS\_PERSIST

Persist the BLE Bonding keys in NVS

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this flag to make bonding persistent across device reboots

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SECURITY\_ENABLE

Enable BLE SM feature

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE sm feature

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION`
- `CONFIG_BT_NIMBLE_SM_SC_LVL`
- `CONFIG_BT_NIMBLE_SM_LEGACY`
- `CONFIG_BT_NIMBLE_SM_SC`

### CONFIG\_BT\_NIMBLE\_SM\_LEGACY

Security manager legacy pairing

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_SECURITY\_ENABLE*

Enable security manager legacy pairing

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SM\_SC

Security manager secure connections (4.2)

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_SECURITY\_ENABLE*

Enable security manager secure connections

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_ENABLED`

## CONFIG\_BT\_NIMBLE\_SM\_SC\_DEBUG\_KEYS

Use predefined public-private key pair

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) > [CONFIG\\_BT\\_NIMBLE\\_SM\\_SC](#)

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) && [CONFIG\\_BT\\_NIMBLE\\_SM\\_SC](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

## CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_ENCRYPTION

Enable LE encryption

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#)

Enable encryption connection

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

## CONFIG\_BT\_NIMBLE\_SM\_SC\_LVL

Security level

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#)

LE Security Mode 1 Levels: 1. No Security 2. Unauthenticated pairing with encryption 3. Authenticated pairing with encryption 4. Authenticated LE Secure Connections pairing with encryption using a 128-bit strength encryption key.

**Default value:**

- 0 if [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

## CONFIG\_BT\_NIMBLE\_DEBUG

Enable extra runtime asserts and host debugging

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This enables extra runtime asserts and host debugging

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

## CONFIG\_BT\_NIMBLE\_DYNAMIC\_SERVICE

Enable dynamic services

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This enables user to add/remove Gatt services at runtime

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_DEVICE\_NAME**

BLE GAP default device name

*Found in: Component config > Bluetooth > NimBLE Options*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

**Default value:**

- "nimble" if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_GAP\_DEVICE\_NAME\_MAX\_LEN**

Maximum length of BLE device name in octets

*Found in: Component config > Bluetooth > NimBLE Options*

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**

- 31 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_ATT\_PREFERRED\_MTU**

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

**Default value:**

- 256 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEARANCE**

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Memory Settings** Contains:

- `CONFIG_BT_NIMBLE_TRANSPORT_ACL_FROM_LL_COUNT`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_DISCARD_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_BUF_FROM_HEAP`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_TRANSPORT_ACL_SIZE`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_COUNT`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_SIZE`

### CONFIG\_BT\_NIMBLE\_MSYS\_1\_BLOCK\_COUNT

MSYS\_1 Block Count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

MSYS is a system level mbuf registry. For prepare write & prepare responses Mbufs are allocated out of msys\_1 pool. For NIMBLE\_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**

- 24 if SOC\_ESP\_NIMBLE\_CONTROLLER && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_1\_BLOCK\_SIZE

MSYS\_1 Block Size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

Dynamic memory size of block 1

**Default value:**

- 128 if SOC\_ESP\_NIMBLE\_CONTROLLER && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_2\_BLOCK\_COUNT

MSYS\_2 Block Count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

Dynamic memory count

**Default value:**

- 24 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_2\_BLOCK\_SIZE

MSYS\_2 Block Size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

Dynamic memory size of block 2

**Default value:**

- 320 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_BUF\_FROM\_HEAP

Get Msys Mbuf from heap

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This option sets the source of the shared msys mbuf memory between the Host and the Controller. Allocate the memory from the heap if this option is sets, from the mempool otherwise.

**Default value:**

- Yes (enabled) if BT\_LE\_MSYS\_INIT\_IN\_CONTROLLER && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_ACL\_FROM\_LL\_COUNT

ACL Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

The number of ACL data buffers allocated for host.

**Default value:**

- 24 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_ACL\_SIZE**

Transport ACL Buffer size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**

- 255 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_EVT\_SIZE**

Transport Event Buffer size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**

- 257 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
- 70 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_EVT\_COUNT**

Transport Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

**Default value:**

- 30 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_EVT\_DISCARD\_COUNT**

Discardable Transport Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the low priority HCI events' buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

**Default value:**

- 8 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_GATT\_MAX\_PROCS**

Maximum number of GATT client procedures

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Maximum number of GATT client procedures that can be executed.

**Default value:**

- 4 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL**

Enable Host Flow control

*Found in: Component config > Bluetooth > NimBLE Options*

Enable Host Flow control

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_ITVL**

Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL*

Host flow control interval in msec

**Default value:**

- 1000 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_THRESH**

Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**

- 2 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_TX\_ON\_DISCONNECT**

Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_RPA\_TIMEOUT**

RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change. This is applicable in case of Host based RPA

**Range:**

- from 1 to 41400 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**

- 900 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

## CONFIG\_BT\_NIMBLE\_MESH

Enable BLE mesh functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: `./doc/./esp32/api-guides/esp-ble-mesh/ble-mesh-index`

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_MESH_PROVISIONER`
- `CONFIG_BT_NIMBLE_MESH_PROV`
- `CONFIG_BT_NIMBLE_MESH_GATT_PROXY`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
- `CONFIG_BT_NIMBLE_MESH_RELAY`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_MESH_NODE_COUNT`

## CONFIG\_BT\_NIMBLE\_MESH\_PROXY

Enable mesh proxy functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > `CONFIG_BT_NIMBLE_MESH`*

Enable proxy. This is automatically set whenever `NIMBLE_MESH_PB_GATT` or `NIMBLE_MESH_GATT_PROXY` is set

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

## CONFIG\_BT\_NIMBLE\_MESH\_PROV

Enable BLE mesh provisioning

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > `CONFIG_BT_NIMBLE_MESH`*

Enable mesh provisioning

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

## CONFIG\_BT\_NIMBLE\_MESH\_PB\_ADV

Enable mesh provisioning over advertising bearer

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > `CONFIG_BT_NIMBLE_MESH` > `CONFIG_BT_NIMBLE_MESH_PROV`*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_PB\_GATT

Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH > CONFIG\_BT\_NIMBLE\_MESH\_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_GATT\_PROXY

Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_RELAY

Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Support for acting as a Mesh Relay Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_LOW\_POWER

Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Low Power Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_FRIEND

Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_DEVICE\_NAME

Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**

- "nimble-mesh-node" if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_NODE\_COUNT**

Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Defines mesh node count.

**Default value:**

- 1 if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_PROVISIONER**

Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable mesh provisioner.

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_CRYPTOSTACK\_MBEDTLS**

Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_HS\_STOP\_TIMEOUT\_MS**

BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*

BLE Host stop procedure timeout in milliseconds.

**Default value:**

- 2000 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_ENABLE\_CONN\_REATTEMPT**

Enable connection reattempts on connection establishment error

*Found in: Component config > Bluetooth > NimBLE Options*

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MAX\_CONN\_REATTEMPT**

Maximum number connection reattempts

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#)

Defines maximum number of connection reattempts.

**Range:**

- from 1 to 7 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 3 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT**

Enable BLE 5 feature

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable BLE 5 feature

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

Contains:

- [CONFIG\\_BT\\_NIMBLE\\_LL\\_CFG\\_FEAT\\_LE\\_2M\\_PHY](#)
- [CONFIG\\_BT\\_NIMBLE\\_LL\\_CFG\\_FEAT\\_LE\\_CODED\\_PHY](#)
- [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)
- [CONFIG\\_BT\\_NIMBLE\\_BLE\\_POWER\\_CONTROL](#)
- [CONFIG\\_BT\\_NIMBLE\\_MAX\\_PERIODIC\\_ADVERTISER\\_LIST](#)
- [CONFIG\\_BT\\_NIMBLE\\_MAX\\_PERIODIC\\_SYNC](#)
- [CONFIG\\_BT\\_NIMBLE\\_PERIODIC\\_ADV\\_ENH](#)

**CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_2M\_PHY**

Enable 2M Phy

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable 2M-PHY

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_CODED\_PHY**

Enable coded Phy

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable coded-PHY

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_EXT\_ADV**

Enable extended advertising

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_MAX\_EXT\_ADV\_INSTANCES**

Maximum number of extended advertising instances.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. For ESP32C2, ESP32C6 and ESP32H2, each extended advertising instance will take about 0.5k DRAM.

**Range:**

- from 0 to 4 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)
- 0 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_EXT\_ADV\_MAX\_SIZE**

Maximum length of the advertising data.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Defines the length of the extended adv data. The value should not exceed 1650.

**Range:**

- from 0 to 1650 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1650 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)
- 0 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_ENABLE\_PERIODIC\_ADV**

Enable periodic advertisement.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Enable this option to start periodic advertisement.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_PERIODIC\_ADV\_SYNC\_TRANSFER**

Enable Transer Sync Events

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV > CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV`

This enables controller transfer periodic sync events to host

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MAX\_PERIODIC\_SYNCS**

Maximum number of periodic advertising syncs

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

**Range:**

- from 0 to 8 if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED`

**Default value:**

- 1 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MAX\_PERIODIC\_ADVERTISER\_LIST**

Maximum number of periodic advertiser list

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`

Set this option to set the upper limit for number of periodic advertiser list.

**Range:**

- from 1 to 5 if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && SOC_ESP_NIMBLE_CONTROLLER && CONFIG_BT_NIMBLE_ENABLED`

**Default value:**

- 5 if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && SOC_ESP_NIMBLE_CONTROLLER && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_BLE\_POWER\_CONTROL**

Enable support for BLE Power Control

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`

Set this option to enable the Power Control feature

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && SOC_BLE_POWER_CONTROL_SUPPORTED && CONFIG_BT_NIMBLE_ENABLED`

## CONFIG\_BT\_NIMBLE\_PERIODIC\_ADV\_ENH

Periodic adv enhancements(adi support)

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable the periodic advertising enhancements

## CONFIG\_BT\_NIMBLE\_GATT\_CACHING

Enable GATT caching

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable GATT caching

Contains:

- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING\\_MAX\\_CONNS](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING\\_MAX\\_CHRS](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING\\_MAX\\_DSCLS](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING\\_MAX\\_SVCS](#)

## CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_CONNS

Maximum connections to be cached

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of connections to be cached.

**Default value:**

- 1 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

## CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_SVCS

Maximum number of services per connection

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of services per connection to be cached.

**Default value:**

- 64 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

## CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_CHRS

Maximum number of characteristics per connection

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of characteristics per connection to be cached.

**Default value:**

- 64 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_DSCS

Maximum number of descriptors per connection

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of descriptors per connection to be cached.

**Default value:**

- 64 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_WHITELIST\_SIZE

BLE white list size

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

BLE list size

**Range:**

- from 1 to 15 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 12 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_TEST\_THROUGHPUT\_TEST

Throughput Test Mode enable

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable the throughput test mode

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_BLUFI\_ENABLE

Enable blufi functionality

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Set this option to enable blufi functionality.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_USE\_ESP\_TIMER

Enable Esp Timer for Nimble

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_BLE\_GATT\_BLOB\_TRANSFER

Blob transfer

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This option is used when data to be sent is more than 512 bytes. For peripheral role, BT\_NIMBLE\_MSYS\_1\_BLOCK\_COUNT needs to be increased according to the need.

**GAP Service** Contains:

- *GAP Appearance write permissions*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CENT\_ADDR\_RESOLUTION*
- *GAP device name write permissions*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MAX\_CONN\_INTERVAL*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MIN\_CONN\_INTERVAL*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SLAVE\_LATENCY*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SUPERVISION\_TMO*

**GAP Appearance write permissions** Contains:

- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE**

Write

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions*

Enable write permission (BLE\_GATT\_CHR\_F\_WRITE)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE\_ENC**

Write with encryption

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

Enable write with encryption permission (BLE\_GATT\_CHR\_F\_WRITE\_ENC)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE\_AUTHEN**

Write with authentication

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

Enable write with authentication permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHEN)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE\_AUTHOR**

Write with authorisation

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

Enable write with authorisation permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHOR)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CENT\_ADDR\_RESOLUTION**

GAP Characteristic - Central Address Resolution

Found in: *Component config > Bluetooth > NimBLE Options > GAP Service*

Whether or not Central Address Resolution characteristic is supported on the device, and if supported, whether or not Central Address Resolution is supported.

- Central Address Resolution characteristic not supported
- Central Address Resolution not supported
- Central Address Resolution supported

Available options:

- Characteristic not supported (CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CAR\_CHAR\_NOT\_SUPP)
- Central Address Resolution not supported (CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CAR\_NOT\_SUPP)
- Central Address Resolution supported (CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CAR\_SUPP)

**GAP device name write permissions** Contains:

- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE**

Write

Found in: *Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions*

Enable write permission (BLE\_GATT\_CHR\_F\_WRITE)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE\_ENC**

Write with encryption

Found in: *Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

Enable write with encryption permission (BLE\_GATT\_CHR\_F\_WRITE\_ENC)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE\_AUTHEN**

Write with authentication

Found in: *Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

Enable write with authentication permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHEN)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE\_AUTHOR**

Write with authorisation

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

Enable write with authorisation permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHOR)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MAX\_CONN\_INTERVAL**

PPCP Connection Interval Max (Unit: 1.25 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Connection Interval maximum value Interval Max = value \* 1.25 ms

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MIN\_CONN\_INTERVAL**

PPCP Connection Interval Min (Unit: 1.25 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Connection Interval minimum value Interval Min = value \* 1.25 ms

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SLAVE\_LATENCY**

PPCP Slave Latency

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Slave Latency

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SUPERVISION\_TMO**

PPCP Supervision Timeout (Unit: 10 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Supervision Timeout Timeout = Value \* 10 ms

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED`

**BLE Services** Contains:

- `CONFIG_BT_NIMBLE_HID_SERVICE`

### CONFIG\_BT\_NIMBLE\_HID\_SERVICE

HID service

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services*

Enable HID service support

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_SVC_HID_MAX_RPTS`
- `CONFIG_BT_NIMBLE_SVC_HID_MAX_INSTANCES`

### CONFIG\_BT\_NIMBLE\_SVC\_HID\_MAX\_INSTANCES

Maximum HID service instances

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > CONFIG\_BT\_NIMBLE\_HID\_SERVICE*

Defines maximum number of HID service instances

**Default value:**

- 2 if `CONFIG_BT_NIMBLE_HID_SERVICE` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_HID\_MAX\_RPTS

Maximum HID Report characteristics per service instance

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > CONFIG\_BT\_NIMBLE\_HID\_SERVICE*

Defines maximum number of report characteristics per service instance

**Default value:**

- 3 if `CONFIG_BT_NIMBLE_HID_SERVICE` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_VS\_SUPPORT

Enable support for VSC and VSE

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used to enable support for sending Vendor Specific HCI commands and handling Vendor Specific HCI Events.

### CONFIG\_BT\_NIMBLE\_OPTIMIZE\_MULTI\_CONN

Enable the optimization of multi-connection

*Found in: Component config > Bluetooth > NimBLE Options*

This option enables the use of vendor-specific APIs for multi-connections, which can greatly enhance the stability of coexistence between numerous central and peripheral devices. It will prohibit the usage of standard APIs.

**Default value:**

- No (disabled) if `SOC_BLE_MULTI_CONN_OPTIMIZATION` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ENC\_ADV\_DATA

Encrypted Advertising Data

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used to enable encrypted advertising data.

### CONFIG\_BT\_NIMBLE\_MAX\_EADS

Maximum number of EAD devices to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_ENC\_ADV\_DATA*

Defines maximum number of encrypted advertising data key material to save

**Default value:**

- 10 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENC\_ADV\_DATA* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_HIGH\_DUTY\_ADV\_ITVL

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > NimBLE Options*

This enable BLE high duty advertising interval feature

### CONFIG\_BT\_NIMBLE\_HOST\_QUEUE\_CONG\_CHECK

BLE queue congestion check

*Found in: Component config > Bluetooth > NimBLE Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**Host-controller Transport** Contains:

- *CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*
- *CONFIG\_BT\_NIMBLE\_HCI\_UART\_CTS\_PIN*
- *CONFIG\_BT\_NIMBLE\_USE\_HCI\_UART\_FLOW\_CTRL*
- *CONFIG\_BT\_NIMBLE\_USE\_HCI\_UART\_PARITY*
- *CONFIG\_BT\_NIMBLE\_HCI\_UART\_RTS\_PIN*
- *CONFIG\_BT\_NIMBLE\_UART\_RX\_PIN*
- *CONFIG\_BT\_NIMBLE\_UART\_TX\_PIN*

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART

Enable Uart Transport

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

Use UART transport

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_CONTROLLER\_DISABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART\_PORT**

Uart port

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Uart port

**Default value:**

- 1 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_USE\_HCI\_UART\_PARITY**

Uart PARITY

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

Uart Parity

Available options:

- None (`CONFIG_UART_PARITY_NONE`)
- Odd (`CONFIG_UART_PARITY_ODD`)
- Even (`CONFIG_UART_PARITY_EVEN`)

**CONFIG\_BT\_NIMBLE\_UART\_RX\_PIN**

UART Rx pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

Rx pin for Nimble Transport

**Default value:**

- 5 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_UART\_TX\_PIN**

UART Tx pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

Tx pin for Nimble Transport

**Default value:**

- 4 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_USE\_HCI\_UART\_FLOW\_CTRL**

Uart Flow Control

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

Uart Flow Control

Available options:

- Disable (`CONFIG_UART_HW_FLOWCTRL_DISABLE`)
- Enable hardware flow control (`CONFIG_UART_HW_FLOWCTRL_CTS_RTS`)

### CONFIG\_BT\_NIMBLE\_HCI\_UART\_RTS\_PIN

UART Rts Pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

UART HCI RTS pin

**Default value:**

- 19 if *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_HCI\_UART\_CTS\_PIN

UART Cts Pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

UART HCI CTS pin

**Default value:**

- 23 if *CONFIG\_BT\_NIMBLE\_ENABLED*

**Controller Options** Contains:

- *CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP*
- *CONFIG\_BT\_BLE\_CCA\_MODE*
- *CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL*
- *CONFIG\_BT\_CTRL\_BLE\_MAX\_ACT*
- *CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL*
- *CONFIG\_BT\_CTRL\_BLE\_STATIC\_ACL\_TX\_BUF\_NB*
- *CONFIG\_BT\_CTRL\_HW\_CCA\_VAL*
- *CONFIG\_BT\_CTRL\_COEX\_PHY\_CODED\_TX\_RX\_TLIM*
- *CONFIG\_BT\_CTRL\_CE\_LENGTH\_TYPE*
- *CONFIG\_BT\_CTRL\_RX\_ANTENNA\_INDEX*
- *CONFIG\_BT\_CTRL\_TX\_ANTENNA\_INDEX*
- *CONFIG\_BT\_CTRL\_SCAN\_BACKOFF\_UPPERLIMITMAX*
- *CONFIG\_BT\_BLE\_ADV\_DATA\_LENGTH\_ZERO\_AUX*
- *CONFIG\_BT\_CTRL\_AGC\_RECORRECT\_EN*
- *CONFIG\_BT\_CTRL\_HCI\_MODE\_CHOICE*
- *MODEM\_SLEEP Options*
- *CONFIG\_BT\_CTRL\_PINNED\_TO\_CORE\_CHOICE*
- *CONFIG\_BT\_CTRL\_ADV\_DUP\_FILT\_MAX*

### CONFIG\_BT\_CTRL\_BLE\_MAX\_ACT

BLE Max Instances

*Found in: Component config > Bluetooth > Controller Options*

BLE maximum activities of bluetooth controller , both of connections, scan , sync and adv(periodic adv, multi-adv). Each instance needs to consume 828 bytes, you can save RAM by modifying the instance value according to actual needs.

**Range:**

- from 1 to 10 if *CONFIG\_BT\_CONTROLLER\_ENABLED*

**Default value:**

- 6 if *CONFIG\_BT\_CONTROLLER\_ENABLED*

### CONFIG\_BT\_CTRL\_BLE\_STATIC\_ACL\_TX\_BUF\_NB

BLE static ACL TX buffer numbers

*Found in: Component config > Bluetooth > Controller Options*

BLE ACL buffer have two methods to be allocated. One is persistent allocating (allocate when controller initialise, never free until controller de-initialise) another is dynamically allocating (allocate before TX and free after TX).

**Range:**

- from 0 to 12 if `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 0 if `CONFIG_BT_CONTROLLER_ENABLED`

### **CONFIG\_BT\_CTRL\_PINNED\_TO\_CORE\_CHOICE**

The cpu core which bluetooth controller run

*Found in: Component config > Bluetooth > Controller Options*

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (`CONFIG_BT_CTRL_PINNED_TO_CORE_0`)
- Core 1 (APP CPU) (`CONFIG_BT_CTRL_PINNED_TO_CORE_1`)

### **CONFIG\_BT\_CTRL\_HCI\_MODE\_CHOICE**

HCI mode

*Found in: Component config > Bluetooth > Controller Options*

Specify HCI mode as VHCI or UART(H4)

Available options:

- VHCI (`CONFIG_BT_CTRL_HCI_MODE_VHCI`)  
Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32S3 or ESP32C3.
- UART(H4) (`CONFIG_BT_CTRL_HCI_MODE_UART_H4`)  
If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

### **CONFIG\_BT\_CTRL\_ADV\_DUP\_FILTER\_MAX**

The maximum number of 5.0 extend duplicate scan filter

*Found in: Component config > Bluetooth > Controller Options*

The maximum number of suplicate scan filter

**Range:**

- from 1 to 500 if `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 30 if `CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BT\_BLE\_CCA\_MODE

BLE CCA mode

*Found in: Component config > Bluetooth > Controller Options*

Define BT BLE CCA mode

Available options:

- NONE (CONFIG\_BT\_BLE\_CCA\_MODE\_NONE)
- Hardware (CONFIG\_BT\_BLE\_CCA\_MODE\_HW)
- Software (CONFIG\_BT\_BLE\_CCA\_MODE\_SW)

### CONFIG\_BT\_CTRL\_HW\_CCA\_VAL

CCA threshold value

*Found in: Component config > Bluetooth > Controller Options*

It is the threshold value of HW CCA, if the value is 30, it means CCA threshold is -30 dBm.

**Range:**

- from 20 to 100 if *CONFIG\_BT\_CONTROLLER\_ENABLED*

**Default value:**

- 20 if *CONFIG\_BT\_CONTROLLER\_ENABLED*

### CONFIG\_BT\_CTRL\_CE\_LENGTH\_TYPE

Connection event length determination method

*Found in: Component config > Bluetooth > Controller Options*

Specify connection event length determination

Available options:

- ORIGINAL (CONFIG\_BT\_CTRL\_CE\_LENGTH\_TYPE\_ORIG)
- Use CE parameter for HCI command (CONFIG\_BT\_CTRL\_CE\_LENGTH\_TYPE\_CE)
- Use Espressif self-defined method (CONFIG\_BT\_CTRL\_CE\_LENGTH\_TYPE\_SD)

### CONFIG\_BT\_CTRL\_TX\_ANTENNA\_INDEX

default Tx antenna used

*Found in: Component config > Bluetooth > Controller Options*

Specify default Tx antenna used for bluetooth

Available options:

- Antenna 0 (CONFIG\_BT\_CTRL\_TX\_ANTENNA\_INDEX\_0)
- Antenna 1 (CONFIG\_BT\_CTRL\_TX\_ANTENNA\_INDEX\_1)

**CONFIG\_BT\_CTRL\_RX\_ANTENNA\_INDEX**

default Rx antenna used

*Found in: Component config > Bluetooth > Controller Options*

Specify default Rx antenna used for bluetooth

Available options:

- Antenna 0 (CONFIG\_BT\_CTRL\_RX\_ANTENNA\_INDEX\_0)
- Antenna 1 (CONFIG\_BT\_CTRL\_RX\_ANTENNA\_INDEX\_1)

**CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL**

BLE default Tx power level

*Found in: Component config > Bluetooth > Controller Options*

Specify default Tx power level

Available options:

- -24dBm (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N24)
- -21dBm (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N21)
- -18dBm (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N18)
- -15dBm (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N15)
- -12dBm (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N12)
- **-9dBm** (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N9)
- **-6dBm** (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N6)
- **-3dBm** (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N3)
- 0dBm (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N0)
- **+3dBm** (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P3)
- **+6dBm** (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P6)
- **+9dBm** (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P9)
- +12dBm (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P12)
- +15dBm (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P15)
- +18dBm (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P18)
- +21dBm (CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P21)

**CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP**

BLE adv report flow control supported

*Found in: Component config > Bluetooth > Controller Options*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_CONTROLLER\_ENABLED*

**CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_NUM**

BLE adv report flow control number

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP*

The number of unprocessed advertising report that bluetooth host can save. If you set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a small value, this may cause adv packets lost. If you set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a large value, bluetooth host may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 \* 50 bytes. Please set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**Range:**

- from 50 to 1000 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 100 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_DISCARD\_THRSHOLD**

BLE adv lost event threshold value

*Found in:* `Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP`

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set `BT_CTRL_BLE_ADV_REPORT_DISCARD_THRSHOLD` to a small value or printf every adv lost event, it may cause adv packets lost more.

**Range:**

- from 1 to 1000 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 20 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL**

BLE Scan Duplicate Options

*Found in:* `Component config > Bluetooth > Controller Options`

This select enables parameters setting of BLE scan duplicate.

**Default value:**

- Yes (enabled) if `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_CTRL\_SCAN\_DUPL\_TYPE**

Scan Duplicate Type

*Found in:* `Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL`

Scan duplicate have three ways. one is "Scan Duplicate By Device Address", This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is "Scan Duplicate By Device Address And Advertising Data". This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is "Scan Duplicate By Advertising Data". This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

Available options:

- Scan Duplicate By Device Address (`CONFIG_BT_CTRL_SCAN_DUPL_TYPE_DEVICE`)  
Advertising packets with the same address, address type, and advertising type are reported once.
- Scan Duplicate By Advertising Data (`CONFIG_BT_CTRL_SCAN_DUPL_TYPE_DATA`)  
Advertising packets with identical advertising data, address type, and advertising type are reported only once, even if they originate from different devices.
- Scan Duplicate By Device Address And Advertising Data (`CONFIG_BT_CTRL_SCAN_DUPL_TYPE_DATA_DEVICE`)  
Advertising packets with the same address, advertising data, address type, and advertising type are reported only once.

### **CONFIG\_BT\_CTRL\_SCAN\_DUPL\_CACHE\_SIZE**

Maximum number of devices in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL*

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**

- from 10 to 1000 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 100 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

### **CONFIG\_BT\_CTRL\_DUPL\_SCAN\_CACHE\_REFRESH\_PERIOD**

Duplicate scan list refresh period (seconds)

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL*

If the period value is non-zero, the controller will periodically clear the device information stored in the scan duplicate filter. If it is 0, the scan duplicate filter will not be cleared until the scanning is disabled. Duplicate advertisements for this period should not be sent to the Host in advertising report events. There are two scenarios where the ADV packet will be repeatedly reported: 1. The duplicate scan cache is full, the controller will delete the oldest device information and add new device information. 2. When the refresh period is up, the controller will clear all device information and start filtering again.

**Range:**

- from 0 to 1000 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 0 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

### **CONFIG\_BT\_CTRL\_BLE\_MESH\_SCAN\_DUPL\_EN**

Special duplicate scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL*

This enables the BLE scan duplicate for special BLE Mesh scan.

**Default value:**

- No (disabled) if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

### **CONFIG\_BT\_CTRL\_MESH\_DUPL\_SCAN\_CACHE\_SIZE**

Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL > CONFIG\_BT\_CTRL\_BLE\_MESH\_SCAN\_DUPL\_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**

- from 10 to 1000 if `CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 100 if `CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_CONTROLLER_ENABLED`

## CONFIG\_BT\_CTRL\_COEX\_PHY\_CODED\_TX\_RX\_TLIM

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

*Found in: Component config > Bluetooth > Controller Options*

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

Available options:

- Force Enable (`CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_EN`)  
Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (`CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_DIS`)  
Disable the limitation on max tx/rx time for Coded-PHY connection

## MODEM SLEEP Options

 Contains:

- `CONFIG_BT_CTRL_MODEM_SLEEP`
- `CONFIG_BT_CTRL_MAIN_XTAL_PU_DURING_LIGHT_SLEEP`

## CONFIG\_BT\_CTRL\_MODEM\_SLEEP

Bluetooth modem sleep

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options*

Enable/disable bluetooth controller low power mode. Modem sleep is not supported to be used with UART HCI.

## CONFIG\_BT\_CTRL\_MODEM\_SLEEP\_MODE\_1

Bluetooth Modem sleep Mode 1

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options > CONFIG\_BT\_CTRL\_MODEM\_SLEEP*

Mode 1 is the currently supported sleep mode. In this mode, bluetooth controller sleeps between and BLE events. A low power clock is used to maintain bluetooth reference clock.

**Default value:**

- Yes (enabled) if `CONFIG_BT_CTRL_MODEM_SLEEP` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_CTRL\_LOW\_POWER\_CLOCK**

Bluetooth low power clock

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [MODEM SLEEP Options](#) > [CONFIG\\_BT\\_CTRL\\_MODEM\\_SLEEP](#) > [CONFIG\\_BT\\_CTRL\\_MODEM\\_SLEEP\\_MODE\\_1](#)

Select the low power clock source for bluetooth controller

Available options:

- Main crystal (CONFIG\_BT\_CTRL\_LPCLK\_SEL\_MAIN\_XTAL)  
Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling(DFS) enabled, and bluetooth can work under light sleep enabled. Main crystal has a relatively better performance than other bluetooth low power clock sources.
- External 32kHz crystal (CONFIG\_BT\_CTRL\_LPCLK\_SEL\_EXT\_32K\_XTAL)  
External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.
- Internal 150kHz RC oscillator (CONFIG\_BT\_CTRL\_LPCLK\_SEL\_RTC\_SLOW)  
Internal 150kHz RC oscillator. The accuracy of this clock is a lot larger than 500ppm which is required in Bluetooth communication, so don't select this option in scenarios such as BLE connection state.

**CONFIG\_BT\_CTRL\_MAIN\_XTAL\_PU\_DURING\_LIGHT\_SLEEP**

power up main XTAL during light sleep

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [MODEM SLEEP Options](#)

If this option is selected, the main crystal will power up during light sleep when the low power clock selects an external 32kHz crystal but the external 32kHz crystal does not exist or the low power clock selects the main crystal.

**Default value:**

- No (disabled) if `(CONFIG_BT_CTRL_LPCLK_SEL_MAIN_XTAL || CONFIG_BT_CTRL_LPCLK_SEL_EXT_32K_XTAL) && CONFIG_FREERTOS_USE_TICKLESS_IDLE && CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_CTRL\_AGC\_RECORRECT\_EN**

Enable HW AGC recorrect

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#)

Enable uncoded phy AGC recorrect

**Default value:**

- No (disabled) if `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_CTRL\_CODED\_AGC\_RECORRECT\_EN**

Enable coded phy AGC recorrect

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG\\_BT\\_CTRL\\_AGC\\_RECORRECT\\_EN](#)

Enable coded phy AGC recorrect

**Default value:**

- No (disabled) if `CONFIG_BT_CTRL_AGC_RECORRECT_EN && CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BT\_CTRL\_SCAN\_BACKOFF\_UPPERLIMITMAX

Disable active scan backoff

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)*

Disable active scan backoff. The bluetooth spec requires that scanners should run a backoff procedure to minimize collision of scan request PDUs from multiple scanners. If scan backoff is disabled, in active scanning, scan request PDU will be sent every time when HW receives scannable ADV PDU.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

### CONFIG\_BT\_BLE\_ADV\_DATA\_LENGTH\_ZERO\_AUX

Enable aux packet when ext adv data length is zero

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)*

When this option is enabled, auxiliary packets will be present in the events of 'Non-Connectable and Non-Scannable' regardless of whether the advertising length is 0. If this option is not enabled, auxiliary packets will only be present when the advertising length is not 0.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

### CONFIG\_BT\_RELEASE\_IRAM

Release Bluetooth text (READ DOCS FIRST)

*Found in: [Component config](#) > [Bluetooth](#)*

This option release Bluetooth text section and merge Bluetooth data, bss & text into a large free heap region when esp\_bt\_mem\_release is called, total saving ~21kB or more of IRAM. ESP32-C2 only 3 configurable PMP entries available, rest of them are hard-coded. We cannot split the memory into 3 different regions (IRAM, BLE-IRAM, DRAM). So this option will disable the PMP (ESP\_SYSTEM\_PMP\_IDRAM\_SPLIT)

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_ENABLED](#) && BT\_LE\_RELEASE\_IRAM\_SUPPORTED

### CONFIG\_BLE\_MESH

ESP BLE Mesh Support

*Found in: [Component config](#)*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- [BLE Mesh and BLE coexistence support](#)
- [CONFIG\\_BLE\\_MESH\\_GATT\\_PROXY\\_CLIENT](#)
- [CONFIG\\_BLE\\_MESH\\_GATT\\_PROXY\\_SERVER](#)
- [BLE Mesh NET BUF DEBUG LOG LEVEL](#)

- `CONFIG_BLE_MESH_PROVISIONER`
- `CONFIG_BLE_MESH_FRIEND`
- `CONFIG_BLE_MESH_LOW_POWER`
- `CONFIG_BLE_MESH_HCI_5_0`
- `CONFIG_BLE_MESH_RANDOM_ADV_INTERVAL`
- `CONFIG_BLE_MESH_IV_UPDATE_TEST`
- `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT`

### **CONFIG\_BLE\_MESH\_HCI\_5\_0**

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG\_BLE\_MESH*

It is a temporary solution and needs further modifications.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_RANDOM\_ADV\_INTERVAL**

Support using random adv interval for mesh packets

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to allow using random advertising interval for mesh packets. And this could help avoid collision of advertising packets.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_USE\_DUPLICATE\_SCAN

Support Duplicate Scan in BLE Mesh

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is "Scan Duplicate By Device Address and Advertising Data".

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_ACTIVE\_SCAN

Support Active Scan in BLE Mesh

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to allow using BLE Active Scan for BLE Mesh.

### CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE

Memory allocation strategy

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM (CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE\_INTERNAL)
- External SPIRAM (CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE\_EXTERNAL)
- Default alloc mode (CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE\_DEFAULT)  
Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM (CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE\_IRAM\_8BIT)  
Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC

Enable FreeRTOS static allocation

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is

disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**Default value:**

- No (disabled) if `ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_MODE

Memory allocation for FreeRTOS objects

Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC`

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (`CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL`)  
If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when `SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY` is enabled. See the SPIRAM options for more details.
- Internal IRAM (`CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT`)  
If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

### CONFIG\_BLE\_MESH\_DEINIT

Support de-initialize BLE Mesh stack

Found in: `Component config` > `CONFIG_BLE_MESH`

If enabled, users can use the function `esp_ble_mesh_deinit()` to de-initialize the whole BLE Mesh stack.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

### BLE Mesh and BLE coexistence support

 Contains:

- `CONFIG_BLE_MESH_SUPPORT_BLE_SCAN`
- `CONFIG_BLE_MESH_SUPPORT_BLE_ADV`

### CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV

Support sending normal BLE advertising packets

Found in: `Component config` > `CONFIG_BLE_MESH` > `BLE Mesh and BLE coexistence support`

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_BLE\_ADV\_BUF\_COUNT

Number of advertising buffers for BLE advertising packets

Found in: `Component config` > `CONFIG_BLE_MESH` > `BLE Mesh and BLE coexistence support` > `CONFIG_BLE_MESH_SUPPORT_BLE_ADV`

Number of advertising buffers for BLE packets available.

**Range:**

- from 1 to 255 if `CONFIG_BLE_MESH_SUPPORT_BLE_ADV` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_SUPPORT_BLE_ADV` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_SCAN**

Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_FAST\_PROV**

Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_NODE**

Support for BLE Mesh Node

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

### **CONFIG\_BLE\_MESH\_PROVISIONER**

Support for BLE Mesh Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

### **CONFIG\_BLE\_MESH\_WAIT\_FOR\_PROV\_MAX\_DEV\_NUM**

Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**

- from 1 to 100 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 10 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_MAX\_PROV\_NODES

Maximum number of devices that can be provisioned by Provisioner

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PBA\_SAME\_TIME

Maximum number of PB-ADV running at the same time by Provisioner

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

**Range:**

- from 1 to 10 if *CONFIG\_BLE\_MESH\_PB\_ADV* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_PB\_ADV* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PBG\_SAME\_TIME

Maximum number of PB-GATT running at the same time by Provisioner

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

**Range:**

- from 1 to 5 if *CONFIG\_BLE\_MESH\_PB\_GATT* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if *CONFIG\_BLE\_MESH\_PB\_GATT* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROVISIONER\_SUBNET\_COUNT

Maximum number of mesh subnets that can be created by Provisioner

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_APP\_KEY\_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_PROVISIONER`

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB**

Support receiving Heartbeat messages

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_PROVISIONER`

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB\_FILTER\_SIZE**

Maximum number of filter entries for receiving Heartbeat messages

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_PROVISIONER` > `CONFIG_BLE_MESH_PROVISIONER_RECV_HB`

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**Range:**

- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROV**

BLE Mesh Provisioning support

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PROV\_EPA

BLE Mesh enhanced provisioning authentication

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROV*

Enable this option to support BLE Mesh enhanced provisioning authentication functionality. This option can increase the security level of provisioning. It is recommended to enable this option.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH\_PROV* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_CERT\_BASED\_PROV

Support Certificate-based provisioning

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROV*

Enable this option to support BLE Mesh Certificate-Based Provisioning.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_PROV* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_RECORD\_FRAG\_MAX\_SIZE

Maximum size of the provisioning record fragment that Provisioner can receive

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROV* > *CONFIG\_BLE\_MESH\_CERT\_BASED\_PROV*

This option sets the maximum size of the provisioning record fragment that the Provisioner can receive. The range depends on provisioning bearer.

**Range:**

- from 1 to 57 if *CONFIG\_BLE\_MESH\_CERT\_BASED\_PROV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 56 if *CONFIG\_BLE\_MESH\_CERT\_BASED\_PROV* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PB\_ADV

Provisioning support using the advertising bearer (PB-ADV)

*Found in:* *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_UNPROVISIONED\_BEACON\_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PB\_ADV*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE\_MESH\_FAST\_PROV is selected, the value is better to be 3 seconds, or less.

**Range:**

- from 1 to 100 if *CONFIG\_BLE\_MESH\_NODE* && *CONFIG\_BLE\_MESH\_PB\_ADV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 5 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`
- 3 if `CONFIG_BLE_MESH_FAST_PROV` && `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PB\_GATT

Provisioning support using GATT (PB-GATT)

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

### CONFIG\_BLE\_MESH\_PROXY

BLE Mesh Proxy protocol support

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER

BLE Mesh GATT Proxy Server

*Found in:* `Component config` > `CONFIG_BLE_MESH`

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_NODE\_ID\_TIMEOUT

Node Identity advertising timeout

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_GATT_PROXY_SERVER`

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**

- from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**Default value:**

- 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PROXY\_FILTER\_SIZE**

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**Range:**

- from 1 to 32767 if *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 4 if *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER* && *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_PROXY\_PRIVACY**

Support Proxy Privacy

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*

The Proxy Privacy parameter controls the privacy of the Proxy Server over the connection. The value of the Proxy Privacy parameter is controlled by the type of proxy connection, which is dependent on the bearer used by the proxy connection.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH\_PRB\_SRV* && *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER* && *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_RX**

Support receiving Proxy Solicitation PDU

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*

Enable this option to support receiving Proxy Solicitation PDU.

**CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_RX\_CRPL**

Maximum capacity of solicitation replay protection list

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER > CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_RX*

This option specifies the maximum capacity of the solicitation replay protection list. The solicitation replay protection list is used to reject Solicitation PDUs that were already processed by a node, which will store the solicitation src and solicitation sequence number of the received Solicitation PDU message.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_RX* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_RX* && *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT**

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG\_BLE\_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_TX

Support sending Proxy Solicitation PDU

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT*

Enable this option to support sending Proxy Solicitation PDU.

### CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_TX\_SRC\_COUNT

Maximum number of SSRC that can be used by Proxy Client

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT > CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_TX*

This option specifies the maximum number of Solicitation Source (SSRC) that can be used by Proxy Client for sending a Solicitation PDU. A Proxy Client may use the primary address or any of the secondary addresses as the SSRC for a Solicitation PDU. So for a Proxy Client, it's better to choose the value based on its own element count.

**Range:**

- from 1 to 16 if *CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_TX* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_TX* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SETTINGS

Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG\_BLE\_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_STORE\_TIMEOUT

Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**

- from 0 to 1000000 if *CONFIG\_BLE\_MESH\_SETTINGS* && *CONFIG\_BLE\_MESH*

**Default value:**

- 0 if *CONFIG\_BLE\_MESH\_SETTINGS* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SEQ\_STORE\_RATE

How often the sequence number gets updated in storage

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment.

If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that's guaranteed to be larger than the last one used before power off.

**Range:**

- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_RPL\_STORE\_TIMEOUT

Minimum frequency that the RPL gets updated in storage

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_SETTINGS*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

**Range:**

- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_SETTINGS\_BACKWARD\_COMPATIBILITY

A specific option for settings backward compatibility

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_SETTINGS*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of "mesh/role" in nvs. In the new version mesh stack, key of "mesh/role" is added in nvs, recovering node information needs to check "mesh/role" key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of "mesh/role" because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_SPECIFIC\_PARTITION

Use a specific NVS partition for BLE Mesh

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_SETTINGS*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exist in the csv file. When Provisioner needs to store a large amount of nodes' information in the flash (e.g. more than 20), this option is recommended to be enabled.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PARTITION\_NAME**

Name of the NVS partition for BLE Mesh

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_SETTINGS > CONFIG\_BLE\_MESH\_SPECIFIC\_PARTITION*

This value defines the name of the specified NVS partition used by the mesh stack.

**Default value:**

- "ble\_mesh" if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_USE\_MULTIPLE\_NAMESPACE**

Support using multiple NVS namespaces by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_SETTINGS*

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_MAX\_NVS\_NAMESPACE**

Maximum number of NVS namespaces

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_SETTINGS > CONFIG\_BLE\_MESH\_USE\_MULTIPLE\_NAMESPACE*

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**

- from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_SUBNET\_COUNT**

Maximum number of mesh subnets per network

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_APP\_KEY\_COUNT**

Maximum number of application keys per network

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT**

Maximum number of application keys per model

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT**

Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LABEL\_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**Range:**

- from 0 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_CRPL**

Maximum capacity of the replay protection list

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay

attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

**Range:**

- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**

- 10 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_NOT\_RELAY\_REPLAY\_MSG**

Not relay replayed messages in a mesh network

*Found in:* `Component config` > `CONFIG_BLE_MESH`

There may be many expired messages in a complex mesh network that would be considered replayed messages. Enable this option will refuse to relay such messages, which could help to reduce invalid packets in the mesh network. However, it should be noted that enabling this option may result in packet loss in certain environments. Therefore, users need to decide whether to enable this option according to the actual usage situation.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_EXPERIMENTAL` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_MSG\_CACHE\_SIZE**

Network message cache size

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

**Range:**

- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**

- 10 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_ADV\_BUF\_COUNT**

Number of advertising buffers

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Number of advertising buffers available. The transport layer reserves `ADV_BUF_COUNT` - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**

- from 6 to 256 if `CONFIG_BLE_MESH`

**Default value:**

- 60 if `CONFIG_BLE_MESH`

## CONFIG\_BLE\_MESH\_IVU\_DIVIDER

Divider for IV Update state refresh timer

Found in: *Component config* > *CONFIG\_BLE\_MESH*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn't necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**

- from 2 to 96 if *CONFIG\_BLE\_MESH*

**Default value:**

- 4 if *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_IVU\_RECOVERY\_IVI

Recovery the IV index when the latest whole IV update procedure is missed

Found in: *Component config* > *CONFIG\_BLE\_MESH*

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_SAR\_ENHANCEMENT

Segmentation and reassembly enhancement

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to use the enhanced segmentation and reassembly mechanism introduced in Bluetooth Mesh Protocol 1.1.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_TX\_SEG\_MSG\_COUNT

Maximum number of simultaneous outgoing segmented messages

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to if `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_RX\_SEG\_MSG\_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in: `Component config` > `CONFIG_BLE_MESH`*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to 255 if `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_RX\_SDU\_MAX**

Maximum incoming Upper Transport Access PDU length

*Found in: `Component config` > `CONFIG_BLE_MESH`*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

**Range:**

- from 36 to 384 if `CONFIG_BLE_MESH`

**Default value:**

- 384 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_TX\_SEG\_MAX**

Maximum number of segments in outgoing messages

*Found in: `Component config` > `CONFIG_BLE_MESH`*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what's the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (`BLE_MESH_ADV_BUF_COUNT`) as there are outgoing segments.

**Range:**

- from 2 to 32 if `CONFIG_BLE_MESH`

**Default value:**

- 32 if `CONFIG_BLE_MESH`

## CONFIG\_BLE\_MESH\_RELAY

Relay support

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF

Use separate advertising buffers for relay packets

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_RELAY](#)

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_RELAY](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF\_COUNT

Number of advertising buffers for relay packets

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_RELAY](#) > [CONFIG\\_BLE\\_MESH\\_RELAY\\_ADV\\_BUF](#)

Number of advertising buffers for relay packets available.

**Range:**

- from 6 to 256 if [CONFIG\\_BLE\\_MESH\\_RELAY\\_ADV\\_BUF](#) && [CONFIG\\_BLE\\_MESH\\_RELAY](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 60 if [CONFIG\\_BLE\\_MESH\\_RELAY\\_ADV\\_BUF](#) && [CONFIG\\_BLE\\_MESH\\_RELAY](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LOW\_POWER

Support for Low Power features

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

## CONFIG\_BLE\_MESH\_LPN\_ESTABLISHMENT

Perform Friendship establishment using low power

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#)

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LPN\_AUTO

Automatically start looking for Friend nodes once provisioned

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_LOW\_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_LPN\_AUTO\_TIMEOUT

Time from last received message before going to LPN mode

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_LOW\_POWER* > *CONFIG\_BLE\_MESH\_LPN\_AUTO*

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**

- from 0 to 3600 if *CONFIG\_BLE\_MESH\_LPN\_AUTO* && *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 15 if *CONFIG\_BLE\_MESH\_LPN\_AUTO* && *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_LPN\_RETRY\_TIMEOUT

Retry timeout for Friend requests

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_LOW\_POWER*

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**

- from 1 to 3600 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 6 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_LPN\_RSSI\_FACTOR

RSSIFactor, used in Friend Offer Delay calculation

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_LOW\_POWER*

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 0 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_LPN\_RECV\_WIN\_FACTOR

ReceiveWindowFactor, used in Friend Offer Delay calculation

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_LOW\_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 0 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_LPN\_MIN\_QUEUE\_SIZE

Minimum size of the acceptable friend queue (MinQueueSizeLog)

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_LOW\_POWER*

The MinQueueSizeLog field is defined as  $\log_2(N)$ , where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.

**Range:**

- from 1 to 7 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_LPN\_RECV\_DELAY

Receive delay requested by the local node

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_LOW\_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**

- from 10 to 255 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 100 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_LPN\_POLL\_TIMEOUT

The value of the PollTimeout timer

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_LOW\_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**

- from 10 to 244735 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 300 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_INIT\_POLL\_TIMEOUT

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**

- from 10 to if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_SCAN\_LATENCY

Latency for enabling scanning

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**

- from 0 to 50 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_GROUPS

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**

- from 0 to 16384 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 8 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_SUB\_ALL\_NODES\_ADDR

Automatically subscribe all nodes address

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Automatically subscribe all nodes address when friendship established.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND

Support for Friend feature

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to be able to act as a Friend Node.

### CONFIG\_BLE\_MESH\_FRIEND\_RECV\_WIN

Friend Receive Window

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_QUEUE\_SIZE

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**

- from 2 to 65536 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 16 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_SUB\_LIST\_SIZE

Friend Subscription List Size

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**

- from 0 to 1023 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_LPN\_COUNT

Number of supported LPN nodes

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_SEG\_RX

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of incomplete segment lists tracked for each Friends' LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**Range:**

- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_NO\_LOG**

Disable BLE Mesh debug logs (minimize bin size)

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH` && `CONFIG_BLE_MESH`

**BLE Mesh STACK DEBUG LOG LEVEL** Contains:

- `CONFIG_BLE_MESH_STACK_TRACE_LEVEL`

**CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL**

BLE\_MESH\_STACK

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `BLE Mesh STACK DEBUG LOG LEVEL`

Define BLE Mesh trace level for BLE Mesh stack.

Available options:

- NONE (`CONFIG_BLE_MESH_TRACE_LEVEL_NONE`)
- ERROR (`CONFIG_BLE_MESH_TRACE_LEVEL_ERROR`)
- WARNING (`CONFIG_BLE_MESH_TRACE_LEVEL_WARNING`)
- INFO (`CONFIG_BLE_MESH_TRACE_LEVEL_INFO`)
- DEBUG (`CONFIG_BLE_MESH_TRACE_LEVEL_DEBUG`)
- VERBOSE (`CONFIG_BLE_MESH_TRACE_LEVEL_VERBOSE`)

**BLE Mesh NET BUF DEBUG LOG LEVEL** Contains:

- `CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL`

**CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL**

BLE\_MESH\_NET\_BUF

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `BLE Mesh NET BUF DEBUG LOG LEVEL`

Define BLE Mesh trace level for BLE Mesh net buffer.

Available options:

- NONE (`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_NONE`)
- ERROR (`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR`)
- WARNING (`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING`)
- INFO (`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_INFO`)
- DEBUG (`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG`)
- VERBOSE (`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE`)

## CONFIG\_BLE\_MESH\_CLIENT\_MSG\_TIMEOUT

Timeout(ms) for client message response

*Found in: Component config > CONFIG\_BLE\_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

### Range:

- from 100 to 1200000 if *CONFIG\_BLE\_MESH*

### Default value:

- 4000 if *CONFIG\_BLE\_MESH*

## Support for BLE Mesh Foundation models Contains:

- *CONFIG\_BLE\_MESH\_BRC\_CLI*
- *CONFIG\_BLE\_MESH\_BRC\_SRV*
- *CONFIG\_BLE\_MESH\_CFG\_CLI*
- *CONFIG\_BLE\_MESH\_DF\_CLI*
- *CONFIG\_BLE\_MESH\_DF\_SRV*
- *CONFIG\_BLE\_MESH\_HEALTH\_CLI*
- *CONFIG\_BLE\_MESH\_HEALTH\_SRV*
- *CONFIG\_BLE\_MESH\_LCD\_CLI*
- *CONFIG\_BLE\_MESH\_LCD\_SRV*
- *CONFIG\_BLE\_MESH\_PRB\_CLI*
- *CONFIG\_BLE\_MESH\_PRB\_SRV*
- *CONFIG\_BLE\_MESH\_ODP\_CLI*
- *CONFIG\_BLE\_MESH\_ODP\_SRV*
- *CONFIG\_BLE\_MESH\_AGG\_CLI*
- *CONFIG\_BLE\_MESH\_AGG\_SRV*
- *CONFIG\_BLE\_MESH\_RPR\_CLI*
- *CONFIG\_BLE\_MESH\_RPR\_SRV*
- *CONFIG\_BLE\_MESH\_SAR\_CLI*
- *CONFIG\_BLE\_MESH\_SAR\_SRV*
- *CONFIG\_BLE\_MESH\_SRPL\_CLI*
- *CONFIG\_BLE\_MESH\_SRPL\_SRV*
- *CONFIG\_BLE\_MESH\_COMP\_DATA\_1*
- *CONFIG\_BLE\_MESH\_COMP\_DATA\_128*
- *CONFIG\_BLE\_MESH\_MODELS\_METADATA\_0*

## CONFIG\_BLE\_MESH\_CFG\_CLI

Configuration Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

## CONFIG\_BLE\_MESH\_HEALTH\_CLI

Health Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.

**CONFIG\_BLE\_MESH\_HEALTH\_SRV**

Health Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_BRC\_CLI**

Bridge Configuration Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Bridge Configuration Client model.

**CONFIG\_BLE\_MESH\_BRC\_SRV**

Bridge Configuration Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Bridge Configuration Server model.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_MAX\_BRIDGING\_TABLE\_ENTRY\_COUNT**

Maximum number of Bridging Table entries

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_BRC\_SRV*

Maximum number of Bridging Table entries that the Bridge Configuration Server can support.

**Range:**

- from 16 to 65535 if *CONFIG\_BLE\_MESH\_BRC\_SRV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 16 if *CONFIG\_BLE\_MESH\_BRC\_SRV* && *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_BRIDGE\_CRPL**

Maximum capacity of bridge replay protection list

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_BRC\_SRV*

This option specifies the maximum capacity of the bridge replay protection list. The bridge replay protection list is used to prevent a bridged subnet from replay attack, which will store the source address and sequence number of the received bridge messages.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_BRC\_SRV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 5 if *CONFIG\_BLE\_MESH\_BRC\_SRV* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_PRB\_CLI**

Mesh Private Beacon Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Mesh Private Beacon Client model.

### **CONFIG\_BLE\_MESH\_PRB\_SRV**

Mesh Private Beacon Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Mesh Private Beacon Server model.

### **CONFIG\_BLE\_MESH\_ODP\_CLI**

On-Demand Private Proxy Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for On-Demand Private Proxy Client model.

### **CONFIG\_BLE\_MESH\_ODP\_SRV**

On-Demand Private Proxy Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for On-Demand Private Proxy Server model.

### **CONFIG\_BLE\_MESH\_SRPL\_CLI**

Solicitation PDU RPL Configuration Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Solicitation PDU RPL Configuration Client model.

### **CONFIG\_BLE\_MESH\_SRPL\_SRV**

Solicitation PDU RPL Configuration Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Solicitation PDU RPL Configuration Server model. Note: This option depends on the functionality of receiving Solicitation PDU. If the device doesn't support receiving Solicitation PDU, then there is no need to enable this server model.

### **CONFIG\_BLE\_MESH\_AGG\_CLI**

Opcodes Aggregator Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Opcodes Aggregator Client model.

### **CONFIG\_BLE\_MESH\_AGG\_SRV**

Opcodes Aggregator Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Opcodes Aggregator Server model.

### **CONFIG\_BLE\_MESH\_SAR\_CLI**

SAR Configuration Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for SAR Configuration Client model.

### **CONFIG\_BLE\_MESH\_SAR\_SRV**

SAR Configuration Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for SAR Configuration Server model.

### **CONFIG\_BLE\_MESH\_COMP\_DATA\_1**

Support Composition Data Page 1

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Composition Data Page 1 contains information about the relationships among models. Each model either can be a root model or can extend other models.

### **CONFIG\_BLE\_MESH\_COMP\_DATA\_128**

Support Composition Data Page 128

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Composition Data Page 128 is used to indicate the structure of elements, features, and models of a node after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Composition Data Page 128 shall be present if the node supports the Remote Provisioning Server model; otherwise it is optional.

### **CONFIG\_BLE\_MESH\_MODELS\_METADATA\_0**

Support Models Metadata Page 0

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

The Models Metadata state contains metadata of a node' s models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 0 shall be present if the node supports the Large Composition Data Server model.

### **CONFIG\_BLE\_MESH\_MODELS\_METADATA\_128**

Support Models Metadata Page 128

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#) > [CONFIG\\_BLE\\_MESH\\_MODELS\\_METADATA\\_0](#)*

The Models Metadata state contains metadata of a node' s models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 128 contains metadata for the node' s models after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Models Metadata Page 128 shall be present if the node supports the Remote Provisioning Server model and the node supports the Large Composition Data Server model.

**CONFIG\_BLE\_MESH\_LCD\_CLI**

Large Composition Data Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Large Composition Data Client model.

**CONFIG\_BLE\_MESH\_LCD\_SRV**

Large Composition Data Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Large Composition Data Server model.

**CONFIG\_BLE\_MESH\_RPR\_CLI**

Remote Provisioning Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Remote Provisioning Client model

**CONFIG\_BLE\_MESH\_RPR\_CLI\_PROV\_SAME\_TIME**

Maximum number of PB-Remote running at the same time by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_RPR\_CLI*

This option specifies how many devices can be provisioned at the same time using PB-REMOTE. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-REMOTE at the same time.

**Range:**

- from 1 to 5 if *CONFIG\_BLE\_MESH\_RPR\_CLI* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_RPR\_CLI* && *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_RPR\_SRV**

Remote Provisioning Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Remote Provisioning Server model

**CONFIG\_BLE\_MESH\_RPR\_SRV\_MAX\_SCANNED\_ITEMS**

Maximum number of device information can be scanned

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_RPR\_SRV*

This option specifies how many device information can a Remote Provisioning Server store each time while scanning.

**Range:**

- from 4 to 255 if *CONFIG\_BLE\_MESH\_RPR\_SRV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_RPR\_SRV* && *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_RPR\_SRV\_ACTIVE\_SCAN**

Support Active Scan for remote provisioning

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_RPR\_SRV*

Enable this option to support Active Scan for remote provisioning.

**CONFIG\_BLE\_MESH\_RPR\_SRV\_MAX\_EXT\_SCAN**

Maximum number of extended scan procedures

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_RPR\_SRV*

This option specifies how many extended scan procedures can be started by the Remote Provisioning Server.

**Range:**

- from 1 to 10 if *CONFIG\_BLE\_MESH\_RPR\_SRV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if *CONFIG\_BLE\_MESH\_RPR\_SRV* && *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_DF\_CLI**

Directed Forwarding Configuration Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Directed Forwarding Configuration Client model.

**CONFIG\_BLE\_MESH\_DF\_SRV**

Directed Forwarding Configuration Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Directed Forwarding Configuration Server model.

**CONFIG\_BLE\_MESH\_MAX\_DISC\_TABLE\_ENTRY\_COUNT**

Maximum number of discovery table entries in a given subnet

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

Maximum number of Discovery Table entries supported by the node in a given subnet.

**Range:**

- from 2 to 255 if *CONFIG\_BLE\_MESH\_DF\_SRV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_DF\_SRV* && *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_MAX\_FORWARD\_TABLE\_ENTRY\_COUNT**

Maximum number of forward table entries in a given subnet

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

Maximum number of Forward Table entries supported by the node in a given subnet.

**Range:**

- from 2 to 64 if *CONFIG\_BLE\_MESH\_DF\_SRV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_MAX\_DEPS\_NODES\_PER\_PATH**

Maximum number of dependent nodes per path

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

Maximum size of dependent nodes list supported by each forward table entry.

**Range:**

- from 2 to 64 if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**Default value:**

- 2 if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PATH\_MONITOR\_TEST**

Enable Path Monitoring test mode

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

The option only removes the Path Use timer; all other behavior of the device is not changed. If Path Monitoring test mode is going to be used, this option should be enabled.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_SUPPORT\_DIRECTED\_PROXY**

Enable Directed Proxy functionality

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

Support Directed Proxy functionality.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**Support for BLE Mesh Client/Server models** Contains:

- `CONFIG_BLE_MESH_MBT_CLI`
- `CONFIG_BLE_MESH_MBT_SRV`
- `CONFIG_BLE_MESH_GENERIC_BATTERY_CLI`
- `CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI`
- `CONFIG_BLE_MESH_GENERIC_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_LOCATION_CLI`
- `CONFIG_BLE_MESH_GENERIC_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI`
- `CONFIG_BLE_MESH_GENERIC_SERVER`
- `CONFIG_BLE_MESH_LIGHT_CTL_CLI`
- `CONFIG_BLE_MESH_LIGHT_HSL_CLI`
- `CONFIG_BLE_MESH_LIGHT_LC_CLI`
- `CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI`
- `CONFIG_BLE_MESH_LIGHT_XYL_CLI`
- `CONFIG_BLE_MESH_LIGHTING_SERVER`

- *CONFIG\_BLE\_MESH\_SCENE\_CLI*
- *CONFIG\_BLE\_MESH\_SCHEDULER\_CLI*
- *CONFIG\_BLE\_MESH\_SENSOR\_CLI*
- *CONFIG\_BLE\_MESH\_SENSOR\_SERVER*
- *CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER*
- *CONFIG\_BLE\_MESH\_TIME\_CLI*

#### **CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI**

Generic OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI**

Generic Level Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Level Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI**

Generic Default Transition Time Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Default Transition Time Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI**

Generic Power OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power OnOff Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI**

Generic Power Level Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power Level Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI**

Generic Battery Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Battery Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI**

Generic Location Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Location Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_CLI**

Generic Property Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Property Client model.

### **CONFIG\_BLE\_MESH\_SENSOR\_CLI**

Sensor Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor Client model.

### **CONFIG\_BLE\_MESH\_TIME\_CLI**

Time Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time Client model.

### **CONFIG\_BLE\_MESH\_SCENE\_CLI**

Scene Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scene Client model.

### **CONFIG\_BLE\_MESH\_SCHEDULER\_CLI**

Scheduler Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scheduler Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI**

Light Lightness Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light Lightness Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI**

Light CTL Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light CTL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI**

Light HSL Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light HSL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI**

Light XYL Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light XYL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI**

Light LC Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light LC Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_SERVER**

Generic server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_SENSOR\_SERVER**

Sensor server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER**

Time and Scenes server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time and Scenes server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_LIGHTING\_SERVER**

Lighting server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MBT\_CLI

BLOB Transfer Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for BLOB Transfer Client model.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MAX\_BLOB\_RECEIVERS

Maximum number of simultaneous blob receivers

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models > CONFIG\_BLE\_MESH\_MBT\_CLI*

Maximum number of BLOB Transfer Server models that can participating in the BLOB transfer with a BLOB Transfer Client model.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_MBT\_CLI* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_MBT\_CLI* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MBT\_SRV

BLOB Transfer Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for BLOB Transfer Server model.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_IV\_UPDATE\_TEST

Test the IV Update Procedure

*Found in: Component config > CONFIG\_BLE\_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### BLE Mesh specific test option

 Contains:

- *CONFIG\_BLE\_MESH\_DEBUG*
- *CONFIG\_BLE\_MESH\_SHELL*
- *CONFIG\_BLE\_MESH\_BQB\_TEST*
- *CONFIG\_BLE\_MESH\_SELF\_TEST*
- *CONFIG\_BLE\_MESH\_TEST\_AUTO\_ENTER\_NETWORK*
- *CONFIG\_BLE\_MESH\_TEST\_USE\_WHITE\_LIST*

### CONFIG\_BLE\_MESH\_SELF\_TEST

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_BQB\_TEST**

Enable BLE Mesh specific internal test

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option is used to enable some internal functions for auto-pts test.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_TEST\_AUTO\_ENTER\_NETWORK**

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_TEST\_USE\_WHITE\_LIST**

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_SHELL**

Enable BLE Mesh shell

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_DEBUG**

Enable BLE Mesh debug logs

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_DEBUG\_NET**

Network layer debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Network layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_TRANS**

Transport layer debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Transport layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_BEACON**

Beacon debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Beacon-related debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_CRYPTO**

Crypto debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable cryptographic debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_PROV**

Provisioning debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Provisioning debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_ACCESS**

Access layer debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Access layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_MODEL**

Foundation model debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Foundation Models debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_ADV

Advertising debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable advertising debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_LOW\_POWER

Low Power debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable Low Power debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_FRIEND

Friend debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable Friend debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_PROXY

Proxy debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable Proxy protocol debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_EXPERIMENTAL

Make BLE Mesh experimental features visible

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Make BLE Mesh Experimental features visible. Experimental features list: - [CONFIG\\_BLE\\_MESH\\_NOT\\_RELAY\\_REPLAY\\_MSG](#)

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

**Driver Configurations** Contains:

- [Analog Comparator Configuration](#)
- [DAC Configuration](#)
- [GPIO Configuration](#)
- [GPTimer Configuration](#)
- [I2C Configuration](#)
- [I2S Configuration](#)
- [LEDC Configuration](#)
- [Legacy ADC Configuration](#)
- [MCPWM Configuration](#)
- [Parallel IO Configuration](#)
- [PCNT Configuration](#)
- [RMT Configuration](#)
- [Sigma Delta Modulator Configuration](#)

- [SPI Configuration](#)
- [Temperature sensor Configuration](#)
- [TWAI Configuration](#)
- [UART Configuration](#)
- [USB Serial/JTAG Configuration](#)

**Legacy ADC Configuration** Contains:

- [CONFIG\\_ADC\\_DISABLE\\_DAC](#)
- [Legacy ADC Calibration Configuration](#)
- [CONFIG\\_ADC\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### **CONFIG\_ADC\_DISABLE\_DAC**

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#)*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**

- Yes (enabled) if SOC\_DAC\_SUPPORTED

### **CONFIG\_ADC\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#)*

Whether to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**Legacy ADC Calibration Configuration** Contains:

- [CONFIG\\_ADC\\_CALI\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### **CONFIG\_ADC\_CALI\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#) > [Legacy ADC Calibration Configuration](#)*

Whether to suppress the deprecation warnings when using legacy adc calibration driver (esp\_adc\_cal.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**SPI Configuration** Contains:

- [CONFIG\\_SPI\\_MASTER\\_ISR\\_IN\\_IRAM](#)
- [CONFIG\\_SPI\\_SLAVE\\_ISR\\_IN\\_IRAM](#)
- [CONFIG\\_SPI\\_MASTER\\_IN\\_IRAM](#)
- [CONFIG\\_SPI\\_SLAVE\\_IN\\_IRAM](#)

**CONFIG\_SPI\_MASTER\_IN\_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

This configuration won't be available if `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH` is enabled.

During unit test, this is enabled to measure the ideal case of api.

**CONFIG\_SPI\_MASTER\_ISR\_IN\_IRAM**

Place SPI master ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Enabling this configuration is possible only when `HEAP_PLACE_FUNCTION_INTO_FLASH` is disabled since the spi master uses can allocate transactions buffers into DMA memory section using the heap component API that ipso facto has to be placed in IRAM.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**CONFIG\_SPI\_SLAVE\_IN\_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**Default value:**

- No (disabled)

**CONFIG\_SPI\_SLAVE\_ISR\_IN\_IRAM**

Place SPI slave ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**

- Yes (enabled)

**TWAI Configuration** Contains:

- [CONFIG\\_TWAI\\_ERRATA\\_FIX\\_LISTEN\\_ONLY\\_DOM](#)
- [CONFIG\\_TWAI\\_ISR\\_IN\\_IRAM](#)

**CONFIG\_TWAI\_ISR\_IN\_IRAM**

Place TWAI ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [TWAI Configuration](#)*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the ESP\_INTR\_FLAG\_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI\_ALERT\_AND\_LOG flag) will have no effect.

**Default value:**

- No (disabled)

**CONFIG\_TWAI\_ERRATA\_FIX\_LISTEN\_ONLY\_DOM**

Add SW workaround for listen only transmits dominant bit errata

*Found in: [Component config](#) > [Driver Configurations](#) > [TWAI Configuration](#)*

When in the listen only mode, the TWAI controller must not influence the TWAI bus (i.e., must not send any dominant bits). However, while in listen only mode on the ESP32/ESP32-S2/ESP32-S3/ESP32-C3, the TWAI controller will still transmit dominant bits when it detects an error (i.e., as part of an active error frame). Enabling this option will add a workaround that forces the TWAI controller into an error passive state on initialization, thus preventing any dominant bits from being sent.

**Default value:**

- Yes (enabled)

**Temperature sensor Configuration** Contains:

- [CONFIG\\_TEMP\\_SENSOR\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_TEMP\\_SENSOR\\_SUPPRESS\\_DEPRECATED\\_WARN](#)
- [CONFIG\\_TEMP\\_SENSOR\\_ISR\\_IRAM\\_SAFE](#)

**CONFIG\_TEMP\_SENSOR\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Whether to suppress the deprecation warnings when using legacy temperature sensor driver (driver/temp\_sensor.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### CONFIG\_TEMP\_SENSOR\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Whether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### CONFIG\_TEMP\_SENSOR\_ISR\_IRAM\_SAFE

Temperature sensor ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Ensure the Temperature Sensor interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_TEMPERATURE\_SENSOR\_INTR\_SUPPORT

**UART Configuration** Contains:

- [CONFIG\\_UART\\_ISR\\_IN\\_IRAM](#)

### CONFIG\_UART\_ISR\_IN\_IRAM

Place UART ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [UART Configuration](#)*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**GPIO Configuration** Contains:

- [CONFIG\\_GPIO\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### CONFIG\_GPIO\_CTRL\_FUNC\_IN\_IRAM

Place GPIO control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPIO Configuration](#)*

Place GPIO control functions (like intr\_disable/set\_level) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**

- No (disabled)

**Sigma Delta Modulator Configuration** Contains:

- [CONFIG\\_SDM\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_SDM\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_SDM\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_SDM\_CTRL\_FUNC\_IN\_IRAM

Place SDM control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Place SDM control functions (like `set_duty`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### CONFIG\_SDM\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Whether to suppress the deprecation warnings when using legacy sigma delta driver. If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### CONFIG\_SDM\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Whether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### Analog Comparator Configuration

 Contains:

- [CONFIG\\_ANA\\_CMPR\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_ANA\\_CMPR\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_ANA\\_CMPR\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### CONFIG\_ANA\_CMPR\_ISR\_IRAM\_SAFE

Analog comparator ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [Analog Comparator Configuration](#)*

Ensure the Analog Comparator interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if `SOC_ANA_CMPR_SUPPORTED`

### CONFIG\_ANA\_CMPR\_CTRL\_FUNC\_IN\_IRAM

Place Analog Comparator control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [Analog Comparator Configuration](#)*

Place Analog Comparator control functions (like `ana_cmpr_set_internal_reference`) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_ANA\_CMPR\_SUPPORTED

**CONFIG\_ANA\_CMPR\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Analog Comparator Configuration](#)*

Whether to enable the debug log message for Analog Comparator driver. Note that, this option only controls the Analog Comparator driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_ANA\_CMPR\_SUPPORTED

**GPTimer Configuration** Contains:

- [CONFIG\\_GPTIMER\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_GPTIMER\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_GPTIMER\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_GPTIMER\\_ISR\\_HANDLER\\_IN\\_IRAM](#)
- [CONFIG\\_GPTIMER\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

**CONFIG\_GPTIMER\_ISR\_HANDLER\_IN\_IRAM**

Place GPTimer ISR handler into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Place GPTimer ISR handler into IRAM for better performance and fewer cache misses.

**Default value:**

- Yes (enabled)

**CONFIG\_GPTIMER\_CTRL\_FUNC\_IN\_IRAM**

Place GPTimer control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

**CONFIG\_GPTIMER\_ISR\_IRAM\_SAFE**

GPTimer ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### CONFIG\_GPTIMER\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Whether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### CONFIG\_GPTIMER\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Whether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**PCNT Configuration** Contains:

- [CONFIG\\_PCNT\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_PCNT\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_PCNT\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_PCNT\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_PCNT\_CTRL\_FUNC\_IN\_IRAM

Place PCNT control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_PCNT\_SUPPORTED

### CONFIG\_PCNT\_ISR\_IRAM\_SAFE

PCNT ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_PCNT\_SUPPORTED

### CONFIG\_PCNT\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Whether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if SOC\_PCNT\_SUPPORTED

**CONFIG\_PCNT\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > PCNT Configuration*

Whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_PCNT\_SUPPORTED

**RMT Configuration** Contains:

- [CONFIG\\_RMT\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_RMT\\_RECV\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_RMT\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_RMT\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

**CONFIG\_RMT\_ISR\_IRAM\_SAFE**

RMT ISR IRAM-Safe

*Found in: Component config > Driver Configurations > RMT Configuration*

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

**CONFIG\_RMT\_RECV\_FUNC\_IN\_IRAM**

Place RMT receive function into IRAM

*Found in: Component config > Driver Configurations > RMT Configuration*

Place RMT receive function into IRAM, so that the receive function can be IRAM-safe and able to be called when the flash cache is disabled. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

**CONFIG\_RMT\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > RMT Configuration*

Whether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### CONFIG\_RMT\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Whether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### MCPWM Configuration

 Contains:

- [CONFIG\\_MCPWM\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_MCPWM\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_MCPWM\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_MCPWM\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_MCPWM\_ISR\_IRAM\_SAFE

Place MCPWM ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

**Default value:**

- No (disabled) if SOC\_MCPWM\_SUPPORTED

### CONFIG\_MCPWM\_CTRL\_FUNC\_IN\_IRAM

Place MCPWM control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Place MCPWM control functions (like `set_compare_value`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_MCPWM\_SUPPORTED

### CONFIG\_MCPWM\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Whether to suppress the deprecation warnings when using legacy MCPWM driver (`driver/mcpwm.h`). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if SOC\_MCPWM\_SUPPORTED

### CONFIG\_MCPWM\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Whether to enable the debug log message for MCPWM driver. Note that, this option only controls the MCPWM driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_MCPWM\_SUPPORTED

**I2S Configuration** Contains:

- [CONFIG\\_I2S\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_I2S\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_I2S\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

**CONFIG\_I2S\_ISR\_IRAM\_SAFE**

I2S ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

**CONFIG\_I2S\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Enable this option will suppress the deprecation warnings of using APIs in legacy I2S driver.

**Default value:**

- No (disabled)

**CONFIG\_I2S\_ENABLE\_DEBUG\_LOG**

Enable I2S debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Whether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

**Default value:**

- No (disabled)

**DAC Configuration** Contains:

- [CONFIG\\_DAC\\_DMA\\_AUTO\\_16BIT\\_ALIGN](#)
- [CONFIG\\_DAC\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_DAC\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_DAC\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_DAC\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

**CONFIG\_DAC\_CTRL\_FUNC\_IN\_IRAM**

Place DAC control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Place DAC control functions (e.g. 'dac\_oneshot\_output\_voltage') into IRAM, so that this function can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_DAC\_SUPPORTED

### CONFIG\_DAC\_ISR\_IRAM\_SAFE

DAC ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Ensure the DAC interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_DAC\_SUPPORTED

### CONFIG\_DAC\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Whether to suppress the deprecation warnings when using legacy DAC driver (driver/dac.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if SOC\_DAC\_SUPPORTED

### CONFIG\_DAC\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Whether to enable the debug log message for DAC driver. Note that, this option only controls the DAC driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_DAC\_SUPPORTED

### CONFIG\_DAC\_DMA\_AUTO\_16BIT\_ALIGN

Align the continuous data to 16 bit automatically

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Whether to left shift the continuous data to align every bytes to 16 bits in the driver. On ESP32, although the DAC resolution is only 8 bits, the hardware requires 16 bits data in continuous mode. By enabling this option, the driver will left shift 8 bits for the input data automatically. Only disable this option when you decide to do this step by yourself. Note that the driver will allocate a new piece of memory to save the converted data.

**Default value:**

- Yes (enabled) if SOC\_DAC\_DMA\_16BIT\_ALIGN && SOC\_DAC\_SUPPORTED

### USB Serial/JTAG Configuration

 Contains:

- [CONFIG\\_USJ\\_NO\\_AUTO\\_LS\\_ON\\_CONNECTION](#)

## CONFIG\_USJ\_NO\_AUTO\_LS\_ON\_CONNECTION

Don't enter the automatic light sleep when USB Serial/JTAG port is connected

*Found in: [Component config](#) > [Driver Configurations](#) > [USB Serial/JTAG Configuration](#)*

If enabled, the chip will constantly monitor the connection status of the USB Serial/JTAG port. As long as the USB Serial/JTAG is connected, a ESP\_PM\_NO\_LIGHT\_SLEEP power management lock will be acquired to prevent the system from entering light sleep. This option can be useful if serial monitoring is needed via USB Serial/JTAG while power management is enabled, as the USB Serial/JTAG cannot work under light sleep and after waking up from light sleep. Note. This option can only control the automatic Light-Sleep behavior. If `esp_light_sleep_start()` is called manually from the program, enabling this option will not prevent light sleep entry even if the USB Serial/JTAG is in use.

**Parallel IO Configuration** Contains:

- [CONFIG\\_PARLIO\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_PARLIO\\_ISR\\_IRAM\\_SAFE](#)

## CONFIG\_PARLIO\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Parallel IO Configuration](#)*

Whether to enable the debug log message for parallel IO driver. Note that, this option only controls the parallel IO driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_PARLIO\_SUPPORTED

## CONFIG\_PARLIO\_ISR\_IRAM\_SAFE

Parallel IO ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [Parallel IO Configuration](#)*

Ensure the Parallel IO interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_PARLIO\_SUPPORTED

**LEDC Configuration** Contains:

- [CONFIG\\_LEDC\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

## CONFIG\_LEDC\_CTRL\_FUNC\_IN\_IRAM

Place LEDC control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [LEDC Configuration](#)*

Place LEDC control functions (`ledc_update_duty` and `ledc_stop`) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

**I2C Configuration** Contains:

- [CONFIG\\_I2C\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_I2C\\_ISR\\_IRAM\\_SAFE](#)

### **CONFIG\_I2C\_ISR\_IRAM\_SAFE**

I2C ISR IRAM-Safe

*Found in: Component config > Driver Configurations > I2C Configuration*

Ensure the I2C interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). note: This cannot be used in the I2C legacy driver.

**Default value:**

- No (disabled)

### **CONFIG\_I2C\_ENABLE\_DEBUG\_LOG**

Enable I2C debug log

*Found in: Component config > Driver Configurations > I2C Configuration*

Whether to enable the debug log message for I2C driver. Note that this option only controls the I2C driver log, will not affect other drivers.

note: This cannot be used in the I2C legacy driver.

**Default value:**

- No (disabled)

**eFuse Bit Manager** Contains:

- [CONFIG\\_EFUSE\\_VIRTUAL](#)
- [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)

### **CONFIG\_EFUSE\_CUSTOM\_TABLE**

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**

- No (disabled)

### **CONFIG\_EFUSE\_CUSTOM\_TABLE\_FILENAME**

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG\_EFUSE\_CUSTOM\_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- "main/esp\_efuse\_custom\_table.csv" if [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)

## CONFIG\_EFUSE\_VIRTUAL

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If "n" - No virtual mode. All eFuse operations are real and use eFuse registers. If "y" - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

If it is "y", then SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE cannot be used. Because the EFUSE VIRT mode is for testing only.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

### Default value:

- No (disabled)

## CONFIG\_EFUSE\_VIRTUAL\_KEEP\_IN\_FLASH

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG\_EFUSE\_VIRTUAL*

In addition to the "Simulate eFuse operations in RAM" option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition\_table should have the efuse partition. partition.csv: "efuse\_em, data, efuse, , 0x2000,"

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure\_boot and flash\_encryption).

## CONFIG\_EFUSE\_VIRTUAL\_LOG\_ALL\_WRITES

Log all virtual writes

*Found in: Component config > eFuse Bit Manager > CONFIG\_EFUSE\_VIRTUAL*

If enabled, log efuse burns. This shows changes that would be made.

## ESP-TLS Contains:

- *CONFIG\_ESP\_TLS\_INSECURE*
- *CONFIG\_ESP\_TLS\_LIBRARY\_CHOOSE*
- *CONFIG\_ESP\_TLS\_CLIENT\_SESSION\_TICKETS*
- *CONFIG\_ESP\_DEBUG\_WOLFSSL*
- *CONFIG\_ESP\_TLS\_SERVER*
- *CONFIG\_ESP\_TLS\_PSK\_VERIFICATION*
- *CONFIG\_ESP\_WOLFSSL\_SMALL\_CERT\_VERIFY*
- *CONFIG\_ESP\_TLS\_USE\_DS\_PERIPHERAL*

## CONFIG\_ESP\_TLS\_LIBRARY\_CHOOSE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

Available options:

- mbedTLS (CONFIG\_ESP\_TLS\_USING\_MBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (CONFIG\_ESP\_TLS\_USING\_WOLFSSL)

### CONFIG\_ESP\_TLS\_USE\_DS\_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TLS\_CLIENT\_SESSION\_TICKETS

Enable client session tickets

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable session ticket support as specified in RFC5077.

### CONFIG\_ESP\_TLS\_SERVER

Enable ESP-TLS Server

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

### CONFIG\_ESP\_TLS\_SERVER\_SESSION\_TICKETS

Enable server session tickets

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)*

Enable session ticket support as specified in RFC5077

### CONFIG\_ESP\_TLS\_SERVER\_SESSION\_TICKET\_TIMEOUT

Server session ticket timeout in seconds

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#) > [CONFIG\\_ESP\\_TLS\\_SERVER\\_SESSION\\_TICKETS](#)*

Sets the session ticket timeout used in the tls server.

**Default value:**

- 86400 if [CONFIG\\_ESP\\_TLS\\_SERVER\\_SESSION\\_TICKETS](#)

### CONFIG\_ESP\_TLS\_SERVER\_CERT\_SELECT\_HOOK

Certificate selection hook

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)*

Ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc).

### CONFIG\_ESP\_TLS\_SERVER\_MIN\_AUTH\_MODE\_OPTIONAL

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)*

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

`mbdtdtls_ssl_get_verify_result()` can be called after the handshake is complete to retrieve status of verification.

### CONFIG\_ESP\_TLS\_PSK\_VERIFICATION

Enable PSK verification

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

### CONFIG\_ESP\_TLS\_INSECURE

Allow potentially insecure options

*Found in: [Component config](#) > [ESP-TLS](#)*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

### CONFIG\_ESP\_TLS\_SKIP\_SERVER\_CERT\_VERIFY

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_INSECURE](#)*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. `cert_bundle_attach`, `use_global_ca_store` etc.). WARNING : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like `ca_store` etc.

### CONFIG\_ESP\_WOLFSSL\_SMALL\_CERT\_VERIFY

Enable SMALL\_CERT\_VERIFY

*Found in: [Component config](#) > [ESP-TLS](#)*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_TLS\\_USING\\_WOLFSSL](#)

### CONFIG\_ESP\_DEBUG\_WOLFSSL

Enable debug logs for wolfSSL

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable detailed debug prints for wolfSSL SSL library.

**ADC and ADC Calibration** Contains:

- *ADC Calibration Configurations*
- *CONFIG\_ADC\_CONTINUOUS\_ISR\_IRAM\_SAFE*
- *CONFIG\_ADC\_DISABLE\_DAC\_OUTPUT*
- *CONFIG\_ADC\_CONTINUOUS\_FORCE\_USE\_ADC2\_ON\_C3\_S3*
- *CONFIG\_ADC\_ONESHOT\_FORCE\_USE\_ADC2\_ON\_C3*
- *CONFIG\_ADC\_ONESHOT\_CTRL\_FUNC\_IN\_IRAM*

**CONFIG\_ADC\_ONESHOT\_CTRL\_FUNC\_IN\_IRAM**

Place ISR version ADC oneshot mode read function into IRAM

*Found in: Component config > ADC and ADC Calibration*

Place ISR version ADC oneshot mode read function into IRAM.

**Default value:**

- No (disabled)

**CONFIG\_ADC\_CONTINUOUS\_ISR\_IRAM\_SAFE**

ADC continuous mode driver ISR IRAM-Safe

*Found in: Component config > ADC and ADC Calibration*

Ensure the ADC continuous mode ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

**Default value:**

- No (disabled)

**ADC Calibration Configurations****CONFIG\_ADC\_DISABLE\_DAC\_OUTPUT**

Disable DAC when ADC2 is in use

*Found in: Component config > ADC and ADC Calibration*

By default, this is set. The ADC oneshot driver will disable the output of the corresponding DAC channels: ESP32: IO25 and IO26 ESP32S2: IO17 and IO18

Disable this option so as to measure the output of DAC by internal ADC, for test usage.

**Default value:**

- Yes (enabled) if SOC\_DAC\_SUPPORTED

**CONFIG\_ADC\_CONTINUOUS\_FORCE\_USE\_ADC2\_ON\_C3\_S3**

Force use ADC2 continuous mode on ESP32S3 or ESP32C3

*Found in: Component config > ADC and ADC Calibration*

On ESP32C3 and ESP32S3, ADC2 Digital Controller is not stable. Therefore, ADC2 continuous mode is not suggested on ESP32S3 and ESP32C3

If you stick to this, you can enable this option to force use ADC2 under above conditions. For more details, you can search for errata on espressif website.

**Default value:**

- No (disabled)

### CONFIG\_ADC\_ONESHOT\_FORCE\_USE\_ADC2\_ON\_C3

Force use ADC2 oneshot mode on ESP32C3

*Found in: [Component config > ADC and ADC Calibration](#)*

On ESP32C3, ADC2 Digital Controller is not stable. Therefore, ADC2 oneshot mode is not suggested on ESP32C3

If you stick to this, you can enable this option to force use ADC2 under above conditions. For more details, you can search for errata on espressif website.

**Default value:**

- No (disabled)

### Wireless Coexistence

 Contains:

- [CONFIG\\_ESP\\_COEX\\_EXTERNAL\\_COEXIST\\_ENABLE](#)
- [CONFIG\\_ESP\\_COEX\\_SW\\_COEXIST\\_ENABLE](#)

### CONFIG\_ESP\_COEX\_SW\_COEXIST\_ENABLE

Software controls WiFi/Bluetooth coexistence

*Found in: [Component config > Wireless Coexistence](#)*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_ENABLED](#) || [CONFIG\\_IEEE802154\\_ENABLED](#) || ([CONFIG\\_IEEE802154\\_ENABLED](#) && [CONFIG\\_BT\\_ENABLED](#))

### CONFIG\_ESP\_COEX\_EXTERNAL\_COEXIST\_ENABLE

External Coexistence

*Found in: [Component config > Wireless Coexistence](#)*

If enabled, HW External coexistence arbitration is managed by GPIO pins. It can support three types of wired combinations so far which are 1-wired/2-wired/3-wired. User can select GPIO pins in application code with configure interfaces.

This function depends on BT-off because currently we do not support external coex and internal coex simultaneously.

### Common ESP-related

 Contains:

- [CONFIG\\_ESP\\_ERR\\_TO\\_NAME\\_LOOKUP](#)

### CONFIG\_ESP\_ERR\_TO\_NAME\_LOOKUP

Enable lookup of error code strings

*Found in: [Component config > Common ESP-related](#)*

Functions `esp_err_to_name()` and `esp_err_to_name_r()` return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**

- Yes (enabled)

**Ethernet** Contains:

- [CONFIG\\_ETH\\_TRANSMIT\\_MUTEX](#)
- [CONFIG\\_ETH\\_USE\\_OPENETH](#)
- [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)

### **CONFIG\_ETH\_USE\_SPI\_ETHERNET**

Support SPI to Ethernet Module

*Found in: [Component config](#) > [Ethernet](#)*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**

- Yes (enabled)

Contains:

- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_DM9051](#)
- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_KSZ8851SNL](#)
- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_W5500](#)

### **CONFIG\_ETH\_SPI\_ETHERNET\_DM9051**

Use DM9051

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)*

DM9051 is a fast Ethernet controller with an SPI interface. It's also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

### **CONFIG\_ETH\_SPI\_ETHERNET\_W5500**

Use W5500 (MAC RAW)

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

### **CONFIG\_ETH\_SPI\_ETHERNET\_KSZ8851SNL**

Use KSZ8851SNL

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

### **CONFIG\_ETH\_USE\_OPENETH**

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: [Component config](#) > [Ethernet](#)*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_ETH\\_OPENETH\\_DMA\\_RX\\_BUFFER\\_NUM](#)
- [CONFIG\\_ETH\\_OPENETH\\_DMA\\_TX\\_BUFFER\\_NUM](#)

### **CONFIG\_ETH\_OPENETH\_DMA\_RX\_BUFFER\_NUM**

Number of Ethernet DMA Rx buffers

*Found in:* [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_OPENETH](#)

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

**Default value:**

- 4 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

### **CONFIG\_ETH\_OPENETH\_DMA\_TX\_BUFFER\_NUM**

Number of Ethernet DMA Tx buffers

*Found in:* [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_OPENETH](#)

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

**Default value:**

- 1 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

### **CONFIG\_ETH\_TRANSMIT\_MUTEX**

Enable Transmit Mutex

*Found in:* [Component config](#) > [Ethernet](#)

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

**Default value:**

- No (disabled)

**Event Loop Library** Contains:

- [CONFIG\\_ESP\\_EVENT\\_LOOP\\_PROFILING](#)
- [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)

### **CONFIG\_ESP\_EVENT\_LOOP\_PROFILING**

Enable event loop profiling

*Found in:* [Component config](#) > [Event Loop Library](#)

Enables collections of statistics in the event loop library such as the number of events posted to/received by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_EVENT\_POST\_FROM\_ISR

Support posting events from ISRs

*Found in: [Component config](#) > [Event Loop Library](#)*

Enable posting events from interrupt handlers.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_EVENT\_POST\_FROM\_IRAM\_ISR

Support posting events from ISRs placed in IRAM

*Found in: [Component config](#) > [Event Loop Library](#) > [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

**Default value:**

- Yes (enabled)

**GDB Stub** Contains:

- [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)
- [CONFIG\\_ESP\\_SYSTEM\\_GDBSTUB\\_RUNTIME](#)

### CONFIG\_ESP\_SYSTEM\_GDBSTUB\_RUNTIME

GDBStub at runtime

*Found in: [Component config](#) > [GDB Stub](#)*

Enable builtin GDBStub. This allows to debug the target device using serial port: - Run 'idf.py monitor'. - Wait for the device to initialize. - Press Ctrl+C to interrupt the execution and enter GDB attached to your device for debugging. NOTE: all UART input will be handled by GDBStub.

### CONFIG\_ESP\_GDBSTUB\_SUPPORT\_TASKS

Enable listing FreeRTOS tasks through GDB Stub

*Found in: [Component config](#) > [GDB Stub](#)*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using 'info threads' command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

### CONFIG\_ESP\_GDBSTUB\_MAX\_TASKS

Maximum number of tasks supported by GDB Stub

*Found in: [Component config](#) > [GDB Stub](#) > [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)*

Set the number of tasks which GDB Stub will support.

**Default value:**

- 32 if [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)

**ESP HTTP client** Contains:

- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_BASIC\\_AUTH](#)
- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_DIGEST\\_AUTH](#)
- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_HTTPS](#)

### CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_HTTPS

Enable https

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_BASIC\_AUTH

Enable HTTP Basic Authentication

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

### CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_DIGEST\_AUTH

Enable HTTP Digest Authentication

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

### HTTP Server

 Contains:

- [CONFIG\\_HTTPD\\_QUEUE\\_WORK\\_BLOCKING](#)
- [CONFIG\\_HTTPD\\_PURGE\\_BUF\\_LEN](#)
- [CONFIG\\_HTTPD\\_LOG\\_PURGE\\_DATA](#)
- [CONFIG\\_HTTPD\\_MAX\\_REQ\\_HDR\\_LEN](#)
- [CONFIG\\_HTTPD\\_MAX\\_URI\\_LEN](#)
- [CONFIG\\_HTTPD\\_ERR\\_RESP\\_NO\\_DELAY](#)
- [CONFIG\\_HTTPD\\_WS\\_SUPPORT](#)

### CONFIG\_HTTPD\_MAX\_REQ\_HDR\_LEN

Max HTTP Request Header Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**

- 512

### CONFIG\_HTTPD\_MAX\_URI\_LEN

Max HTTP URI Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of HTTP request URI to be processed by the server

**Default value:**

- 512

**CONFIG\_HTTPD\_ERR\_RESP\_NO\_DELAY**

Use TCP\_NODELAY socket option when sending HTTP error responses

*Found in: [Component config](#) > [HTTP Server](#)*

Using TCP\_NODELAY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

**Default value:**

- Yes (enabled)

**CONFIG\_HTTPD\_PURGE\_BUF\_LEN**

Length of temporary buffer for purging data

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

**Default value:**

- 32

**CONFIG\_HTTPD\_LOG\_PURGE\_DATA**

Log purged content data at Debug level

*Found in: [Component config](#) > [HTTP Server](#)*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**

- No (disabled)

**CONFIG\_HTTPD\_WS\_SUPPORT**

WebSocket server support

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the WebSocket server support.

**Default value:**

- No (disabled)

**CONFIG\_HTTPD\_QUEUE\_WORK\_BLOCKING**

httpd\_queue\_work as blocking API

*Found in: [Component config](#) > [HTTP Server](#)*

This makes httpd\_queue\_work() API to wait until a message space is available on UDP control socket. It internally uses a counting semaphore with count set to `LWIP_UDP_RECVMBOX_SIZE` to achieve this. This config will slightly change API behavior to block until message gets delivered on control socket.

**ESP HTTPS OTA** Contains:

- [CONFIG\\_ESP\\_HTTPS\\_OTA\\_ALLOW\\_HTTP](#)
- [CONFIG\\_ESP\\_HTTPS\\_OTA\\_DECRYPT\\_CB](#)

**CONFIG\_ESP\_HTTPS\_OTA\_DECRYPT\_CB**

Provide decryption callback

*Found in:* [Component config](#) > [ESP HTTPS OTA](#)

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_HTTPS\_OTA\_ALLOW\_HTTP**

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in:* [Component config](#) > [ESP HTTPS OTA](#)

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

**Default value:**

- No (disabled)

**ESP HTTPS server** Contains:

- [CONFIG\\_ESP\\_HTTPS\\_SERVER\\_ENABLE](#)

**CONFIG\_ESP\_HTTPS\_SERVER\_ENABLE**

Enable ESP\_HTTPS\_SERVER component

*Found in:* [Component config](#) > [ESP HTTPS server](#)

Enable ESP HTTPS server component

**Hardware Settings** Contains:

- [Chip revision](#)
- [Crypto DPA Protection](#)
- [ESP\\_SLEEP\\_WORKAROUND](#)
- [ETM Configuration](#)
- [GDMA Configuration](#)
- [MAC Config](#)
- [Main XTAL Config](#)
- [Peripheral Control](#)
- [RTC Clock Config](#)
- [Sleep Config](#)

**Chip revision** Contains:

- [CONFIG\\_ESP\\_REV\\_NEW\\_CHIP\\_TEST](#)
- [CONFIG\\_ESP32C3\\_REV\\_MIN](#)

## CONFIG\_ESP32C3\_REV\_MIN

Minimum Supported ESP32-C3 Revision

*Found in: [Component config](#) > [Hardware Settings](#) > [Chip revision](#)*

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

Available options:

- Rev v0.0 (ECO0) (CONFIG\_ESP32C3\_REV\_MIN\_0)
- Rev v0.1 (ECO1) (CONFIG\_ESP32C3\_REV\_MIN\_1)
- Rev v0.2 (ECO2) (CONFIG\_ESP32C3\_REV\_MIN\_2)
- Rev v0.3 (ECO3) (CONFIG\_ESP32C3\_REV\_MIN\_3)
- Rev v0.4 (ECO4) (CONFIG\_ESP32C3\_REV\_MIN\_4)
- Rev v1.1 (CONFIG\_ESP32C3\_REV\_MIN\_101)

## CONFIG\_ESP\_REV\_NEW\_CHIP\_TEST

Internal test mode

*Found in: [Component config](#) > [Hardware Settings](#) > [Chip revision](#)*

For internal chip testing, a small number of new versions chips didn't update the version field in eFuse, you can enable this option to force the software recognize the chip version based on the rev selected in menuconfig.

**Default value:**

- No (disabled)

**MAC Config** Contains:

- [CONFIG\\_ESP\\_MAC\\_USE\\_CUSTOM\\_MAC\\_AS\\_BASE\\_MAC](#)
- [CONFIG\\_ESP32C3\\_UNIVERSAL\\_MAC\\_ADDRESSES](#)

## CONFIG\_ESP32C3\_UNIVERSAL\_MAC\_ADDRESSES

Number of universally administered (by IEEE) MAC address

*Found in: [Component config](#) > [Hardware Settings](#) > [MAC Config](#)*

Configure the number of universally administered (by IEEE) MAC addresses.

During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address.

If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address.

If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively.

When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

Note that ESP32-C3 has no integrated Ethernet MAC. Although it's possible to use the `esp_read_mac()` API to return a MAC for Ethernet, this can only be used with an external MAC peripheral.

Available options:

- Two (`CONFIG_ESP32C3_UNIVERSAL_MAC_ADDRESSES_TWO`)
- Four (`CONFIG_ESP32C3_UNIVERSAL_MAC_ADDRESSES_FOUR`)

### **CONFIG\_ESP\_MAC\_USE\_CUSTOM\_MAC\_AS\_BASE\_MAC**

Enable using custom mac as base mac

*Found in: [Component config](#) > [Hardware Settings](#) > [MAC Config](#)*

When this configuration is enabled, the user can invoke `esp_read_mac` to obtain the desired type of MAC using a custom MAC as the base MAC.

**Default value:**

- No (disabled)

**Sleep Config** Contains:

- `CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS`
- `CONFIG_ESP_SLEEP_CACHE_SAFE_ASSERTION`
- `CONFIG_ESP_SLEEP_EVENT_CALLBACKS`
- `CONFIG_ESP_SLEEP_DEBUG`
- `CONFIG_ESP_SLEEP_WAIT_FLASH_READY_EXTRA_DELAY`
- `CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND`
- `CONFIG_ESP_SLEEP_POWER_DOWN_FLASH`
- `CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU`
- `CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND`
- `CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND`

### **CONFIG\_ESP\_SLEEP\_POWER\_DOWN\_FLASH**

Power down flash in light sleep when there is no SPIRAM

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

If enabled, chip will try to power down flash as part of `esp_light_sleep_start()`, which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using `esp_sleep_pd_config()` to set `ESP_PD_DOMAIN_VDDSDIO` to `ESP_PD_OPTION_OFF`. It should be noted that there is a risk in powering down flash, you can refer *ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash* for more details.

### **CONFIG\_ESP\_SLEEP\_FLASH\_LEAKAGE\_WORKAROUND**

Pull-up Flash CS pin in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of SPI Flash is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in Flash may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of Flash to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of SPI Flash in the

external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don't deselect this option if you don't have external SPI Flash CS pin pullups.)

### CONFIG\_ESP\_SLEEP\_PSRAM\_LEAKAGE\_WORKAROUND

Pull-up PSRAM CS pin in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of PSRAM is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in PSRAM may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of PSRAM to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of PSRAM in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don't deselect this option if you don't have external PSRAM CS pin pullups.)

**Default value:**

- Yes (enabled) if SPIRAM

### CONFIG\_ESP\_SLEEP\_MSPI\_NEED\_ALL\_IO\_PU

Pull-up all SPI pins in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

### CONFIG\_ESP\_SLEEP\_GPIO\_RESET\_WORKAROUND

light sleep GPIO reset workaround

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

esp32c2, esp32c3, esp32s3, esp32c6 and esp32h2 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating, The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_SLEEP\_WAIT\_FLASH\_READY\_EXTRA\_DELAY

Extra delay (in us) after flash powerdown sleep wakeup to wait flash ready

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

When the chip exits sleep, the CPU and the flash chip are powered on at the same time. CPU will run rom code (deepsleep) or ram code (lightsleep) first, and then load or execute code from flash.

Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

(!!! Please adjust this value according to the Data Sheet of SPI Flash used in your project.) In Flash Data Sheet, the parameters that define the Flash ready timing after power-up (minimum time from Vcc(min) to CS active) usually named tVSL in ELECTRICAL CHARACTERISTICS chapter, and the configuration value here should be: `ESP_SLEEP_WAIT_FLASH_READY_EXTRA_DELAY = tVSL - 900`

For esp32 and esp32s3, the default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing "flash read err, 1000" message printed to the console after deep sleep reset on esp32, or triggered RTC\_WDT/LP\_WDT after lightsleep wakeup, try increasing this value. (For esp32, the delay will be executed in both deep sleep and light sleep wake up flow. For chips after esp32, the delay will be executed only in light sleep flow, the delay controlled by the EFUSE\_FLASH\_TPUW in ROM will be executed in deepsleep wake up flow.)

**Range:**

- from 0 to 5000

**Default value:**

- 0

### **CONFIG\_ESP\_SLEEP\_CACHE\_SAFE\_ASSERTION**

Check the cache safety of the sleep wakeup code in sleep process

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

Enabling it will check the cache safety of the code before the flash power is ready after light sleep wakeup, and check PM\_SLP\_IRAM\_OPT related code cache safety. This option is only for code quality inspection. Enabling it will increase the time overhead of entering and exiting sleep. It is not recommended to enable it in the release version.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_SLEEP\_DEBUG**

esp sleep debug

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

Enable esp sleep debug.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_SLEEP\_GPIO\_ENABLE\_INTERNAL\_RESISTORS**

Allow to enable internal pull-up/downs for the Deep-Sleep wakeup IOs

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

When using rtc gpio wakeup source during deepsleep without external pull-up/downs, you may want to make use of the internal ones.

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_SLEEP\_EVENT\_CALLBACKS

Enable registration of sleep event callbacks

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

If enabled, it allows user to register sleep event callbacks. It is primarily designed for internal developers and customers can use PM\_LIGHT\_SLEEP\_CALLBACKS as an alternative.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible.

### Default value:

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

## ESP\_SLEEP\_WORKAROUND Contains:

- [CONFIG\\_ESP\\_SLEEP\\_SYSTIMER\\_STALL\\_WORKAROUND](#)

## CONFIG\_ESP\_SLEEP\_SYSTIMER\_STALL\_WORKAROUND

ESP32C3 SYSTIMER Stall Issue Workaround

*Found in: [Component config](#) > [Hardware Settings](#) > [ESP\\_SLEEP\\_WORKAROUND](#)*

Its not able to stall ESP32C3 systimer in sleep. To fix related RTOS TICK issue, select it to disable related systimer during sleep. TODO: IDF-7036

## RTC Clock Config Contains:

- [CONFIG\\_RTC\\_CLK\\_CAL\\_CYCLES](#)
- [CONFIG\\_RTC\\_CLK\\_SRC](#)

## CONFIG\_RTC\_CLK\_SRC

RTC clock source

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

Choose which clock is used as RTC clock source.

Available options:

- Internal 136kHz RC oscillator ([CONFIG\\_RTC\\_CLK\\_SRC\\_INT\\_RC](#))
- External 32kHz crystal ([CONFIG\\_RTC\\_CLK\\_SRC\\_EXT\\_CRYS](#))
- External 32kHz oscillator at 32K\_XP pin ([CONFIG\\_RTC\\_CLK\\_SRC\\_EXT\\_OSC](#))
- Internal 17.5MHz oscillator, divided by 256 ([CONFIG\\_RTC\\_CLK\\_SRC\\_INT\\_8MD256](#))

## CONFIG\_RTC\_CLK\_CAL\_CYCLES

Number of cycles for RTC\_SLOW\_CLK calibration

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

When the startup code initializes RTC\_SLOW\_CLK, it can perform calibration by comparing the RTC\_SLOW\_CLK frequency with main XTAL frequency. This option sets the number of RTC\_SLOW\_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- **32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more.** In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

**Range:**

- from 0 to 27000 if `CONFIG_RTC_CLK_SRC_EXT_CRYST` || `CONFIG_RTC_CLK_SRC_EXT_OSC` || `CONFIG_RTC_CLK_SRC_INT_8MD256`
- from 0 to 32766

**Default value:**

- 3000 if `CONFIG_RTC_CLK_SRC_EXT_CRYST` || `CONFIG_RTC_CLK_SRC_EXT_OSC` || `CONFIG_RTC_CLK_SRC_INT_8MD256`
- 1024

**Peripheral Control** Contains:

- `CONFIG_PERIPH_CTRL_FUNC_IN_IRAM`

### **CONFIG\_PERIPH\_CTRL\_FUNC\_IN\_IRAM**

Place peripheral control functions into IRAM

*Found in: Component config > Hardware Settings > Peripheral Control*

Place peripheral control functions (e.g. `periph_module_reset`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**

- No (disabled)

**ETM Configuration** Contains:

- `CONFIG_ETM_ENABLE_DEBUG_LOG`

### **CONFIG\_ETM\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: Component config > Hardware Settings > ETM Configuration*

Whether to enable the debug log message for ETM core driver. Note that, this option only controls the ETM related driver log, won't affect other drivers.

**Default value:**

- No (disabled) if `SOC_ETM_SUPPORTED`

**GDMA Configuration** Contains:

- `CONFIG_GDMA_ENABLE_DEBUG_LOG`
- `CONFIG_GDMA_ISR_IRAM_SAFE`
- `CONFIG_GDMA_CTRL_FUNC_IN_IRAM`

### **CONFIG\_GDMA\_CTRL\_FUNC\_IN\_IRAM**

Place GDMA control functions into IRAM

*Found in: Component config > Hardware Settings > GDMA Configuration*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

**CONFIG\_GDMA\_ISR\_IRAM\_SAFE**

GDMA ISR IRAM-Safe

*Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configuration](#)*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

**Default value:**

- No (disabled)

**CONFIG\_GDMA\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configuration](#)*

Whether to enable the debug log message for GDMA driver. Note that, this option only controls the GDMA driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**Main XTAL Config** Contains:

- [CONFIG\\_XTAL\\_FREQ\\_SEL](#)

**CONFIG\_XTAL\_FREQ\_SEL**

Main XTAL frequency

*Found in: [Component config](#) > [Hardware Settings](#) > [Main XTAL Config](#)*

This option selects the operating frequency of the XTAL (crystal) clock used to drive the ESP target. The selected value MUST reflect the frequency of the given hardware.

Note: The XTAL\_FREQ\_AUTO option allows the ESP target to automatically estimating XTAL clock's operating frequency. However, this feature is only supported on the ESP32. The ESP32 uses the internal 8MHZ as a reference when estimating. Due to the internal oscillator's frequency being temperature dependent, usage of the XTAL\_FREQ\_AUTO is not recommended in applications that operate in high ambient temperatures or use high-temperature qualified chips and modules.

Available options:

- 24 MHz (CONFIG\_XTAL\_FREQ\_24)
- 26 MHz (CONFIG\_XTAL\_FREQ\_26)
- 32 MHz (CONFIG\_XTAL\_FREQ\_32)
- 40 MHz (CONFIG\_XTAL\_FREQ\_40)
- Autodetect (CONFIG\_XTAL\_FREQ\_AUTO)

**Crypto DPA Protection** Contains:

- [CONFIG\\_ESP\\_CRYPTODPA\\_PROTECTION\\_AT\\_STARTUP](#)

## CONFIG\_ESP\_CRYPTDPA\_PROTECTION\_AT\_STARTUP

Enable crypto DPA protection at startup

*Found in: [Component config](#) > [Hardware Settings](#) > [Crypto DPA Protection](#)*

This config controls the DPA (Differential Power Analysis) protection knob for the crypto peripherals. DPA protection dynamically adjusts the clock frequency of the crypto peripheral. DPA protection helps to make it difficult to perform SCA attacks on the crypto peripherals. However, there is also associated performance impact based on the security level set. Please refer to the TRM for more details.

**Default value:**

- Yes (enabled) if SOC\_CRYPTDPA\_PROTECTION\_SUPPORTED

## CONFIG\_ESP\_CRYPTDPA\_PROTECTION\_LEVEL

DPA protection level

*Found in: [Component config](#) > [Hardware Settings](#) > [Crypto DPA Protection](#) > [CONFIG\\_ESP\\_CRYPTDPA\\_PROTECTION\\_AT\\_STARTUP](#)*

Configure the DPA protection security level

Available options:

- Security level low (CONFIG\_ESP\_CRYPTDPA\_PROTECTION\_LEVEL\_LOW)
- Security level medium (CONFIG\_ESP\_CRYPTDPA\_PROTECTION\_LEVEL\_MEDIUM)
- Security level high (CONFIG\_ESP\_CRYPTDPA\_PROTECTION\_LEVEL\_HIGH)

**LCD and Touch Panel** Contains:

- [LCD Peripheral Configuration](#)

**LCD Peripheral Configuration** Contains:

- [CONFIG\\_LCD\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_LCD\\_PANEL\\_IO\\_FORMAT\\_BUF\\_SIZE](#)
- [CONFIG\\_LCD\\_RGB\\_RESTART\\_IN\\_VSYNC](#)
- [CONFIG\\_LCD\\_RGB\\_ISR\\_IRAM\\_SAFE](#)

## CONFIG\_LCD\_PANEL\_IO\_FORMAT\_BUF\_SIZE

LCD panel io format buffer size

*Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)*

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

**Default value:**

- 32

## CONFIG\_LCD\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)*

Whether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### CONFIG\_LCD\_RGB\_ISR\_IRAM\_SAFE

RGB LCD ISR IRAM-Safe

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

**Default value:**

- No (disabled) if SOC\_LCD\_RGB\_SUPPORTED

### CONFIG\_LCD\_RGB\_RESTART\_IN\_VSYNC

Restart transmission in VSYNC

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Reset the GDMA channel every VBlank to stop permanent desyncs from happening. Only need to enable it when in your application, the DMA can't deliver data as fast as the LCD consumes it.

**Default value:**

- No (disabled) if SOC\_LCD\_RGB\_SUPPORTED

**ESP NETIF Adapter** Contains:

- [CONFIG\\_ESP\\_NETIF\\_BRIDGE\\_EN](#)
- [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)
- [CONFIG\\_ESP\\_NETIF\\_IP\\_LOST\\_TIMER\\_INTERVAL](#)
- [CONFIG\\_ESP\\_NETIF\\_USE\\_TCPIP\\_STACK\\_LIB](#)
- [CONFIG\\_ESP\\_NETIF\\_RECEIVE\\_REPORT\\_ERRORS](#)

### CONFIG\_ESP\_NETIF\_IP\_LOST\_TIMER\_INTERVAL

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM\_EVENT\_STA\_LOST\_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**

- from 0 to 65535

**Default value:**

- 120

### CONFIG\_ESP\_NETIF\_USE\_TCPIP\_STACK\_LIB

TCP/IP Stack Library

*Found in: Component config > ESP NETIF Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

Available options:

- LwIP (CONFIG\_ESP\_NETIF\_TCPIP\_LWIP)  
lwIP is a small independent implementation of the TCP/IP protocol suite.

- Loopback (CONFIG\_ESP\_NETIF\_LOOPBACK)  
Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

### CONFIG\_ESP\_NETIF\_RECEIVE\_REPORT\_ERRORS

Use esp\_err\_t to report errors from esp\_netif\_receive

*Found in: Component config > ESP NETIF Adapter*

Enable if esp\_netif\_receive() should return error code. This is useful to inform upper layers that packet input to TCP/IP stack failed, so the upper layers could implement flow control. This option is disabled by default due to backward compatibility and will be enabled in v6.0 (IDF-7194)

**Default value:**

- No (disabled)

### CONFIG\_ESP\_NETIF\_L2\_TAP

Enable netif L2 TAP support

*Found in: Component config > ESP NETIF Adapter*

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

### CONFIG\_ESP\_NETIF\_L2\_TAP\_MAX\_FDS

Maximum number of opened L2 TAP File descriptors

*Found in: Component config > ESP NETIF Adapter > CONFIG\_ESP\_NETIF\_L2\_TAP*

Maximum number of opened File descriptors (FD's) associated with ESP TAP device. ESP TAP FD's take up a certain amount of memory, and allowing fewer FD's to be opened at the same time conserves memory.

**Range:**

- from 1 to 10 if *CONFIG\_ESP\_NETIF\_L2\_TAP*

**Default value:**

- 5 if *CONFIG\_ESP\_NETIF\_L2\_TAP*

### CONFIG\_ESP\_NETIF\_L2\_TAP\_RX\_QUEUE\_SIZE

Size of L2 TAP Rx queue

*Found in: Component config > ESP NETIF Adapter > CONFIG\_ESP\_NETIF\_L2\_TAP*

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

**Range:**

- from 1 to 100 if *CONFIG\_ESP\_NETIF\_L2\_TAP*

**Default value:**

- 20 if *CONFIG\_ESP\_NETIF\_L2\_TAP*

### CONFIG\_ESP\_NETIF\_BRIDGE\_EN

Enable LwIP IEEE 802.1D bridge

*Found in: Component config > ESP NETIF Adapter*

Enable LwIP IEEE 802.1D bridge support in ESP-NETIF. Note that "Number of clients store data in netif" (LWIP\_NUM\_NETIF\_CLIENT\_DATA) option needs to be properly configured to be LwIP bridge available!

**Default value:**

- No (disabled)

## Partition API Configuration

**PHY** Contains:

- [CONFIG\\_ESP\\_PHY\\_CALIBRATION\\_MODE](#)
- [CONFIG\\_ESP\\_PHY\\_ENABLE\\_CERT\\_TEST](#)
- [CONFIG\\_ESP\\_PHY\\_ENABLE\\_USB](#)
- [CONFIG\\_ESP\\_PHY\\_IMPROVE\\_RX\\_11B](#)
- [CONFIG\\_ESP\\_PHY\\_MAX\\_WIFI\\_TX\\_POWER](#)
- [CONFIG\\_ESP\\_PHY\\_MAC\\_BB\\_PD](#)
- [CONFIG\\_ESP\\_PHY\\_REDUCE\\_TX\\_POWER](#)
- [CONFIG\\_ESP\\_PHY\\_CALIBRATION\\_AND\\_DATA\\_STORAGE](#)
- [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

## CONFIG\_ESP\_PHY\_CALIBRATION\_AND\_DATA\_STORAGE

Store phy calibration data in NVS

*Found in: [Component config](#) > [PHY](#)*

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it's easy that your board calibrate bad data, choose 'n'. Two cases for example, you should choose 'n': 1.If your board is easy to be booted up with antenna disconnected. 2.Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose 'y'.

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION

Use a partition to store PHY init data

*Found in: [Component config](#) > [PHY](#)*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: 'data', subtype: 'phy'). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose 'n'.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_ESP\\_PHY\\_DEFAULT\\_INIT\\_IF\\_INVALID](#)
- [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)

## CONFIG\_ESP\_PHY\_DEFAULT\_INIT\_IF\_INVALID

Reset default PHY init data if invalid

*Found in:* *Component config > PHY > CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION*

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose 'n'.

**Default value:**

- No (disabled) if *CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION*

## CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN

Support multiple PHY init data bin

*Found in:* *Component config > PHY > CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION*

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China's PHY init data bin is used by default. Can be modified by country information in API `esp_wifi_set_country()`. The priority of switching the PHY init data type is: 1. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_MANUAL`. 2. Country notified by the connected AP. 3. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_AUTO`.

**Default value:**

- No (disabled) if *CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION* && *CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION*

## CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN\_EMBED

Support embedded multiple phy init data bin to app bin

*Found in:* *Component config > PHY > CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION > CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN*

If enabled, multiple phy init data bin will embedded into app bin. If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

**Default value:**

- No (disabled) if *CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN* && *CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION*

## CONFIG\_ESP\_PHY\_INIT\_DATA\_ERROR

Terminate operation when PHY init data error

*Found in:* *Component config > PHY > CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION > CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN*

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**Default value:**

- No (disabled) if *CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN* && *CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION*

## CONFIG\_ESP\_PHY\_MAX\_WIFI\_TX\_POWER

Max WiFi TX power (dBm)

*Found in:* *Component config > PHY*

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**

- from 10 to 20

**Default value:**

- 20

### CONFIG\_ESP\_PHY\_MAC\_BB\_PD

Power down MAC and baseband of Wi-Fi and Bluetooth when PHY is disabled

*Found in: [Component config](#) > [PHY](#)*

If enabled, the MAC and baseband of Wi-Fi and Bluetooth will be powered down when PHY is disabled. Enabling this setting reduces power consumption by a small amount but increases RAM use by approximately 4 KB(Wi-Fi only), 2 KB(Bluetooth only) or 5.3 KB(Wi-Fi + Bluetooth).

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

### CONFIG\_ESP\_PHY\_REDUCE\_TX\_POWER

Reduce PHY TX power when brownout reset

*Found in: [Component config](#) > [PHY](#)*

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_PHY\_ENABLE\_USB

Enable USB when phy init

*Found in: [Component config](#) > [PHY](#)*

When using USB Serial/JTAG/OTG/CDC, PHY should enable USB, otherwise USB module can not work properly. Notice: Enabling this configuration option will slightly impact wifi performance.

**Default value:**

- Yes (enabled)
- No (disabled)

### CONFIG\_ESP\_PHY\_ENABLE\_CERT\_TEST

Enable RF certification test functions

*Found in: [Component config](#) > [PHY](#)*

If enabled, you can use RF certification test APIs.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_PHY\_CALIBRATION\_MODE

Calibration mode

*Found in: [Component config](#) > [PHY](#)*

Select PHY calibration mode. During RF initialization, the partial calibration method is used by default for RF calibration. Full calibration takes about 100ms more than partial calibration. If boot duration is

not critical, it is suggested to use the full calibration method. No calibration method is only used when the device wakes up from deep sleep.

Available options:

- Calibration partial (CONFIG\_ESP\_PHY\_RF\_CAL\_PARTIAL)
- Calibration none (CONFIG\_ESP\_PHY\_RF\_CAL\_NONE)
- Calibration full (CONFIG\_ESP\_PHY\_RF\_CAL\_FULL)

### CONFIG\_ESP\_PHY\_IMPROVE\_RX\_11B

Improve Wi-Fi receive 11b pkts

*Found in: [Component config](#) > [PHY](#)*

This is a workaround to improve Wi-Fi receive 11b pkts for some modules using AC-DC power supply with high interference, enable this option will sacrifice Wi-Fi OFDM receive performance. But to guarantee 11b receive performance serves as a bottom line in this case.

**Default value:**

- No (disabled) if SOC\_PHY\_IMPROVE\_RX\_11B

**Power Management** Contains:

- [CONFIG\\_PM\\_LIGHTSLEEP\\_RTC\\_OSC\\_CAL\\_INTERVAL](#)
- [CONFIG\\_PM\\_SLP\\_DISABLE\\_GPIO](#)
- [CONFIG\\_PM\\_LIGHT\\_SLEEP\\_CALLBACKS](#)
- [CONFIG\\_PM\\_POWER\\_DOWN\\_CPU\\_IN\\_LIGHT\\_SLEEP](#)
- [CONFIG\\_PM\\_POWER\\_DOWN\\_PERIPHERAL\\_IN\\_LIGHT\\_SLEEP](#)
- [CONFIG\\_PM\\_SLP\\_IRAM\\_OPT](#)
- [CONFIG\\_PM\\_RTOS\\_IDLE\\_OPT](#)
- [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_ENABLE

Support for power management

*Found in: [Component config](#) > [Power Management](#)*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**

- No (disabled) if `__DOXYGEN__`

### CONFIG\_PM\_DFS\_INIT\_AUTO

Enable dynamic frequency scaling (DFS) at startup

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT\_CPU\_FREQ\_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp\_pm\_configure function.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

## CONFIG\_PM\_PROFILING

Enable profiling counters for PM locks

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, esp\_pm\_\* functions will keep track of the amount of time each of the power management locks has been held, and esp\_pm\_dump\_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

## CONFIG\_PM\_TRACE

Enable debug tracing of PM using GPIOs

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm\_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

## CONFIG\_PM\_SLP\_IRAM\_OPT

Put lightsleep related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 2.1KB of lightsleep related source code would be in IRAM and chip would sleep longer for 310us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

## CONFIG\_PM\_RTOS\_IDLE\_OPT

Put RTOS IDLE related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 180Bytes of RTOS\_IDLE related source code would be in IRAM and chip would sleep longer for 20us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

## CONFIG\_PM\_SLP\_DISABLE\_GPIO

Disable all GPIO when chip at sleep

*Found in: [Component config](#) > [Power Management](#)*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call 'gpio\_sleep\_sel\_dis' to disable this feature on those pins. You can also keep this feature on and call 'gpio\_sleep\_set\_direction' and 'gpio\_sleep\_set\_pull\_mode' to have a different GPIO configuration at sleep. Waring: If you want to enable this option on ESP32, you should enable [GPIO\\_ESP32\\_SUPPORT\\_SWITCH\\_SLP\\_PULL](#) at first, otherwise you will not be able to switch pullup/pulldown mode.

## CONFIG\_PM\_LIGHTSLEEP\_RTC\_OSC\_CAL\_INTERVAL

Calibrate the RTC\_FAST/SLOW clock every N times of light sleep

*Found in: [Component config](#) > [Power Management](#)*

The value of this option determines the calibration interval of the RTC\_FAST/SLOW clock during sleep when power management is enabled. When it is configured as N, the RTC\_FAST/SLOW clock will be calibrated every N times of lightsleep. Decreasing this value will increase the time the chip is in the active state, thereby increasing the average power consumption of the chip. Increasing this value can reduce the average power consumption, but when the external environment changes drastically and the chip RTC\_FAST/SLOW oscillator frequency drifts, it may cause system instability.

**Range:**

- from 1 to 128 if [CONFIG\\_PM\\_ENABLE](#)

**Default value:**

- 1 if [CONFIG\\_PM\\_ENABLE](#)

## CONFIG\_PM\_POWER\_DOWN\_CPU\_IN\_LIGHT\_SLEEP

Power down CPU in light sleep

*Found in: [Component config](#) > [Power Management](#)*

If enabled, the CPU will be powered down in light sleep, ESP chips supports saving and restoring CPU's running context before and after light sleep, the feature provides applications with seamless CPU powered-down lightsleep without user awareness. But this will takes up some internal memory. On esp32c3 soc, enabling this option will consume 1.68 KB of internal RAM and will reduce sleep current consumption by about 100 uA. On esp32s3 soc, enabling this option will consume 8.58 KB of internal RAM and will reduce sleep current consumption by about 650 uA.

**Default value:**

- Yes (enabled)

## CONFIG\_PM\_POWER\_DOWN\_PERIPHERAL\_IN\_LIGHT\_SLEEP

Power down Digital Peripheral in light sleep (EXPERIMENTAL)

*Found in: [Component config](#) > [Power Management](#)*

If enabled, digital peripherals will be powered down in light sleep, it will reduce sleep current consumption by about 100 uA. Chip will save/restore register context at sleep/wake time to keep the system running. Enabling this option will increase static RAM and heap usage, the actual cost depends on the peripherals you have initialized. In order to save/restore the context of the necessary hardware for FreeRTOS to run, it will need at least 4.55 KB free heap at sleep time. Otherwise sleep will not power down the peripherals.

Note1: Please use this option with caution, the current IDF does not support the retention of all peripherals. When the digital peripherals are powered off and a sleep and wake-up is completed, the peripherals that have not saved the running context are equivalent to performing a reset. !!! Please confirm the peripherals used in your application and their sleep retention support status before enabling this option, peripherals sleep retention driver support status is tracked in `power_management.rst`

Note2: When this option is enabled simultaneously with `FREERTOS_USE_TICKLESS_IDLE`, since the UART will be powered down, the uart FIFO will be flushed before sleep to avoid data loss, however, this has the potential to block the sleep process and cause the wakeup time to be skipped, which will cause the tick of freertos to not be compensated correctly when returning from sleep and cause the system to crash. To avoid this, you can increase `FREERTOS_IDLE_TIME_BEFORE_SLEEP` threshold in `menuconfig`.

**Default value:**

- No (disabled) if `SOC_PAU_SUPPORTED`

## CONFIG\_PM\_LIGHT\_SLEEP\_CALLBACKS

Enable registration of pm light sleep callbacks

*Found in: [Component config](#) > [Power Management](#)*

If enabled, it allows user to register entry and exit callbacks which are called before and after entering auto light sleep.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

## ESP PSRAM

**ESP Ringbuf** Contains:

- [CONFIG\\_RINGBUF\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH](#)

## CONFIG\_RINGBUF\_PLACE\_FUNCTIONS\_INTO\_FLASH

Place non-ISR ringbuf functions into flash

*Found in: [Component config](#) > [ESP Ringbuf](#)*

Place non-ISR ringbuf functions (like xRingbufferCreate/xRingbufferSend) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

**Default value:**

- No (disabled)

## CONFIG\_RINGBUF\_PLACE\_ISR\_FUNCTIONS\_INTO\_FLASH

Place ISR ringbuf functions into flash

*Found in: [Component config](#) > [ESP Ringbuf](#) > [CONFIG\\_RINGBUF\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH](#)*

Place ISR ringbuf functions (like xRingbufferSendFromISR/xRingbufferReceiveFromISR) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which are configured to run the ISR from an IRAM context, e.g. [CONFIG\\_UART\\_ISR\\_IN\\_IRAM](#).

**Default value:**

- No (disabled) if [CONFIG\\_RINGBUF\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH](#)

**ESP System Settings** Contains:

- [CONFIG\\_ESP\\_SYSTEM\\_RTC\\_EXT\\_XTAL\\_BOOTSTRAP\\_CYCLES](#)
- [Brownout Detector](#)
- [CONFIG\\_ESP\\_CONSOLE\\_UART](#)
- [CONFIG\\_ESP\\_CONSOLE\\_SECONDARY](#)
- [CONFIG\\_ESP\\_DEFAULT\\_CPU\\_FREQ\\_MHZ](#)
- [CONFIG\\_ESP\\_SYSTEM\\_ALLOW\\_RTC\\_FAST\\_MEM\\_AS\\_HEAP](#)
- [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#)
- [CONFIG\\_ESP\\_SYSTEM\\_EVENT\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_ESP\\_SYSTEM\\_USE\\_EH\\_FRAME](#)

- `CONFIG_ESP_SYSTEM_HW_STACK_GUARD`
- `CONFIG_ESP_XT_WDT`
- `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`
- `CONFIG_ESP_INT_WDT`
- `CONFIG_ESP_MAIN_TASK_AFFINITY`
- `CONFIG_ESP_MAIN_TASK_STACK_SIZE`
- `CONFIG_ESP_DEBUG_OCDAWARE`
- *Memory protection*
- `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
- `CONFIG_ESP_DEBUG_STUBS_ENABLE`
- `CONFIG_ESP_SYSTEM_PANIC`
- `CONFIG_ESP_SYSTEM_PANIC_REBOOT_DELAY_SECONDS`
- `CONFIG_ESP_PANIC_HANDLER_IRAM`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
- `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
- `CONFIG_ESP_CONSOLE_UART_NUM`
- `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_TX_GPIO`

### **CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ**

CPU frequency

*Found in: [Component config](#) > [ESP System Settings](#)*

CPU frequency to be set on application startup.

Available options:

- 40 MHz (`CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_40`)
- 80 MHz (`CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_80`)
- 160 MHz (`CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_160`)

### **CONFIG\_ESP\_SYSTEM\_PANIC**

Panic handler behaviour

*Found in: [Component config](#) > [ESP System Settings](#)*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler's action here.

Available options:

- Print registers and halt (`CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT`)  
Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (`CONFIG_ESP_SYSTEM_PANIC_PRINT_REBOOT`)  
Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (`CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT`)  
Just resets the processor without outputting anything
- GDBStub on panic (`CONFIG_ESP_SYSTEM_PANIC_GDBSTUB`)  
Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.

### **CONFIG\_ESP\_SYSTEM\_PANIC\_REBOOT\_DELAY\_SECONDS**

Panic reboot delay (Seconds)

*Found in: [Component config](#) > [ESP System Settings](#)*

After the panic handler executes, you can specify a number of seconds to wait before the device reboots.

**Range:**

- from 0 to 99

**Default value:**

- 0

### CONFIG\_ESP\_SYSTEM\_RTC\_EXT\_XTAL\_BOOTSTRAP\_CYCLES

Bootstrap cycles for external 32kHz crystal

*Found in: [Component config](#) > [ESP System Settings](#)*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger "Number of cycles for RTC\_SLOW\_CLK calibration" (about 3000).

### CONFIG\_ESP\_SYSTEM\_ALLOW\_RTC\_FAST\_MEM\_AS\_HEAP

Enable RTC fast memory for dynamic allocations

*Found in: [Component config](#) > [ESP System Settings](#)*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_SYSTEM\_USE\_EH\_FRAME

Generate and use eh\_frame for backtracing

*Found in: [Component config](#) > [ESP System Settings](#)*

Generate DWARF information for each function of the project. These information will be parsed and used to perform backtracing when panics occur. Activating this option will activate asynchronous frame unwinding and generation of both .eh\_frame and .eh\_frame\_hdr sections, resulting in a bigger binary size (20% to 100% larger). The main purpose of this option is to be able to have a backtrace parsed and printed by the program itself, regardless of the serial monitor used. This option shall NOT be used for production.

**Default value:**

- No (disabled)

**Memory protection** Contains:

- [CONFIG\\_ESP\\_SYSTEM\\_PMP\\_IDRAM\\_SPLIT](#)
- [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)

### CONFIG\_ESP\_SYSTEM\_PMP\_IDRAM\_SPLIT

Enable IRAM/DRAM split protection

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#)*

If enabled, the CPU watches all the memory access and raises an exception in case of any memory violation. This feature automatically splits the SRAM memory, using PMP, into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled) if SOC\_CPU\_IDRAM\_SPLIT\_USING\_PMP

### CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE

Enable memory protection

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#)*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE\_LOCK

Lock memory protection settings

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#) > [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_SYSTEM\_EVENT\_QUEUE\_SIZE

System event queue size

*Found in: [Component config](#) > [ESP System Settings](#)*

Config system event queue size in different application.

**Default value:**

- 32

### CONFIG\_ESP\_SYSTEM\_EVENT\_TASK\_STACK\_SIZE

Event loop task stack size

*Found in: [Component config](#) > [ESP System Settings](#)*

Config system event task stack size in different application.

**Default value:**

- 2304

## CONFIG\_ESP\_MAIN\_TASK\_STACK\_SIZE

Main task stack size

*Found in: [Component config](#) > [ESP System Settings](#)*

Configure the "main task" stack size. This is the stack of the task which calls `app_main()`. If `app_main()` returns then this task is deleted and its stack memory is freed.

**Default value:**

- 3584

## CONFIG\_ESP\_MAIN\_TASK\_AFFINITY

Main task core affinity

*Found in: [Component config](#) > [ESP System Settings](#)*

Configure the "main task" core affinity. This is the used core of the task which calls `app_main()`. If `app_main()` returns then this task is deleted.

Available options:

- CPU0 (CONFIG\_ESP\_MAIN\_TASK\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_ESP\_MAIN\_TASK\_AFFINITY\_CPU1)
- No affinity (CONFIG\_ESP\_MAIN\_TASK\_AFFINITY\_NO\_AFFINITY)

## CONFIG\_ESP\_MINIMAL\_SHARED\_STACK\_SIZE

Minimal allowed size for shared stack

*Found in: [Component config](#) > [ESP System Settings](#)*

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

**Default value:**

- 2048

## CONFIG\_ESP\_CONSOLE\_UART

Channel for console output

*Found in: [Component config](#) > [ESP System Settings](#)*

Select where to send console output (through `stdout` and `stderr`).

- Default is to use UART0 on pre-defined GPIOs.
- If "Custom" is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If "None" is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, "USB CDC" option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

Available options:

- Default: UART0 (CONFIG\_ESP\_CONSOLE\_UART\_DEFAULT)
- USB CDC (CONFIG\_ESP\_CONSOLE\_USB\_CDC)
- USB Serial/JTAG Controller (CONFIG\_ESP\_CONSOLE\_USB\_SERIAL\_JTAG)
- Custom UART (CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM)

- None (CONFIG\_ESP\_CONSOLE\_NONE)

### CONFIG\_ESP\_CONSOLE\_SECONDARY

Channel for console secondary output

*Found in: Component config > ESP System Settings*

This secondary option supports output through other specific port like USB\_SERIAL\_JTAG when UART0 port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or input through this secondary port, please change the primary config to this port in *Channel for console output* menu.

Available options:

- No secondary console (CONFIG\_ESP\_CONSOLE\_SECONDARY\_NONE)
- USB\_SERIAL\_JTAG PORT (CONFIG\_ESP\_CONSOLE\_SECONDARY\_USB\_SERIAL\_JTAG)  
This option supports output through USB\_SERIAL\_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB\_SERIAL\_JTAG port, please change the primary config to ESP\_CONSOLE\_USB\_SERIAL\_JTAG above.

### CONFIG\_ESP\_CONSOLE\_UART\_NUM

UART peripheral to use for console output (0-1)

*Found in: Component config > ESP System Settings*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via esp\_rom\_printf.

Available options:

- UART0 (CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_0)
- UART1 (CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_1)

### CONFIG\_ESP\_CONSOLE\_UART\_TX\_GPIO

UART TX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 21 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*

**Default value:**

- 21 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*
- 43 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*

## CONFIG\_ESP\_CONSOLE\_UART\_RX\_GPIO

UART RX on GPIO#

*Found in: [Component config](#) > [ESP System Settings](#)*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn't read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 21 if [CONFIG\\_ESP\\_CONSOLE\\_UART\\_CUSTOM](#)

**Default value:**

- 20 if [CONFIG\\_ESP\\_CONSOLE\\_UART\\_CUSTOM](#)
- 44 if [CONFIG\\_ESP\\_CONSOLE\\_UART\\_CUSTOM](#)

## CONFIG\_ESP\_CONSOLE\_UART\_BAUDRATE

UART console baud rate

*Found in: [Component config](#) > [ESP System Settings](#)*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 1200 to 1000000 if [CONFIG\\_PM\\_ENABLE](#)

**Default value:**

- 115200

## CONFIG\_ESP\_INT\_WDT

Interrupt watchdog

*Found in: [Component config](#) > [ESP System Settings](#)*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_INT\_WDT\_TIMEOUT\_MS

Interrupt watchdog timeout (ms)

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**

- from 10 to 10000

**Default value:**

- 300

**CONFIG\_ESP\_INT\_WDT\_CHECK\_CPU1**

Also watch CPU1 tick interrupt

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

Also detect if interrupts on CPU 1 are disabled for too long.

**CONFIG\_ESP\_TASK\_WDT\_EN**

Enable Task Watchdog Timer

*Found in: [Component config](#) > [ESP System Settings](#)*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will enable the Task Watchdog Timer. It can be either initialized automatically at startup or initialized after startup (see Task Watchdog Timer API Reference)

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_TASK\_WDT\_INIT**

Initialize Task Watchdog Timer on startup

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#)*

Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_TASK\_WDT\_PANIC**

Invoke panic handler on Task Watchdog timeout

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**

- No (disabled)

**CONFIG\_ESP\_TASK\_WDT\_TIMEOUT\_S**

Task Watchdog timeout period (seconds)

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**

- from 1 to 60

**Default value:**

- 5

### CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU0

Watch CPU0 Idle Task

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU1

Watch CPU1 Idle Task

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

### CONFIG\_ESP\_XT\_WDT

Initialize XTAL32K watchdog timer on startup

*Found in:* [Component config](#) > [ESP System Settings](#)

This watchdog timer can detect oscillation failure of the XTAL32K\_CLK. When such a failure is detected the hardware can be set up to automatically switch to BACKUP32K\_CLK and generate an interrupt.

### CONFIG\_ESP\_XT\_WDT\_TIMEOUT

XTAL32K watchdog timeout period

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_XT\\_WDT](#)

Timeout period configuration for the XTAL32K watchdog timer based on RTC\_CLK.

**Range:**

- from 1 to 255 if [CONFIG\\_ESP\\_XT\\_WDT](#)

**Default value:**

- 200 if [CONFIG\\_ESP\\_XT\\_WDT](#)

### CONFIG\_ESP\_XT\_WDT\_BACKUP\_CLK\_ENABLE

Automatically switch to BACKUP32K\_CLK when timer expires

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_XT\\_WDT](#)

Enable this to automatically switch to BACKUP32K\_CLK as the source of RTC\_SLOW\_CLK when the watchdog timer expires.

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_XT\\_WDT](#)

### CONFIG\_ESP\_PANIC\_HANDLER\_IRAM

Place panic handler code in IRAM

*Found in: [Component config](#) > [ESP System Settings](#)*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_DEBUG\_STUBS\_ENABLE

OpenOCD debug stubs

*Found in: [Component config](#) > [ESP System Settings](#)*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

### CONFIG\_ESP\_DEBUG\_OCDAWARE

Make exception and panic handlers JTAG/OCD aware

*Found in: [Component config](#) > [ESP System Settings](#)*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_SYSTEM\_CHECK\_INT\_LEVEL

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: [Component config](#) > [ESP System Settings](#)*

Interrupt level to use for Interrupt Watchdog, IPC\_ISR and other system checks.

Available options:

- Level 5 interrupt (CONFIG\_ESP\_SYSTEM\_CHECK\_INT\_LEVEL\_5)  
Using level 5 interrupt for Interrupt Watchdog, IPC\_ISR and other system checks.
- Level 4 interrupt (CONFIG\_ESP\_SYSTEM\_CHECK\_INT\_LEVEL\_4)  
Using level 4 interrupt for Interrupt Watchdog, IPC\_ISR and other system checks.

**Brownout Detector** Contains:

- [CONFIG\\_ESP\\_BROWNOUT\\_DET](#)

## CONFIG\_ESP\_BROWNOUT\_DET

Hardware brownout detect & reset

*Found in: Component config > ESP System Settings > Brownout Detector*

The ESP32-C3 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL

Brownout voltage level

*Found in: Component config > ESP System Settings > Brownout Detector > CONFIG\_ESP\_BROWNOUT\_DET*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

Available options:

- 2.51V (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_7)
- 2.64V (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_6)
- 2.76V (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_5)
- 2.92V (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_4)
- 3.10V (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_3)
- 3.27V (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_2)

## CONFIG\_ESP\_SYSTEM\_HW\_STACK\_GUARD

Hardware stack guard

*Found in: Component config > ESP System Settings*

This config allows to trigger a panic interrupt when Stack Pointer register goes out of allocated stack memory bounds.

**Default value:**

- Yes (enabled)

**IPC (Inter-Processor Call)** Contains:

- *CONFIG\_ESP\_IPC\_TASK\_STACK\_SIZE*
- *CONFIG\_ESP\_IPC\_USES\_CALLERS\_PRIORITY*

## CONFIG\_ESP\_IPC\_TASK\_STACK\_SIZE

Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**

- from 512 to 65536

**Default value:**

- 1024

### CONFIG\_ESP\_IPC\_USES\_CALLERS\_PRIORITY

IPC runs at caller's priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX\_PRIORITIES - 1) priority.

### High resolution timer (esp\_timer) Contains:

- *CONFIG\_ESP\_TIMER\_PROFILING*
- *CONFIG\_ESP\_TIMER\_TASK\_AFFINITY*
- *CONFIG\_ESP\_TIMER\_TASK\_STACK\_SIZE*
- *CONFIG\_ESP\_TIMER\_INTERRUPT\_LEVEL*
- *CONFIG\_ESP\_TIMER\_SHOW\_EXPERIMENTAL*
- *CONFIG\_ESP\_TIMER\_SUPPORTS\_ISR\_DISPATCH\_METHOD*
- *CONFIG\_ESP\_TIMER\_ISR\_AFFINITY*

### CONFIG\_ESP\_TIMER\_PROFILING

Enable esp\_timer profiling features

*Found in: Component config > High resolution timer (esp\_timer)*

If enabled, esp\_timer\_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_TIMER\_TASK\_STACK\_SIZE

High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp\_timer)*

Configure the stack size of "timer\_task" task. This task is used to dispatch callbacks of timers created using ets\_timer and esp\_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see "FreeRTOS timer task stack size" option in "FreeRTOS".

**Range:**

- from 2048 to 65536

**Default value:**

- 3584

### CONFIG\_ESP\_TIMER\_INTERRUPT\_LEVEL

Interrupt level

*Found in: Component config > High resolution timer (esp\_timer)*

It sets the interrupt level for esp\_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp\_timer latency.

**Range:**

- from 1 to 1

**Default value:**

- 1

**CONFIG\_ESP\_TIMER\_SHOW\_EXPERIMENTAL**

show esp\_timer's experimental features

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

This shows some hidden features of esp\_timer. Note that they may break other features, use them with care.

**CONFIG\_ESP\_TIMER\_TASK\_AFFINITY**

esp\_timer task core affinity

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - "CPU0": (default) esp\_timer task is processed by CPU0. - "CPU1": esp\_timer task is processed by CPU1. - "No affinity": esp\_timer task can be processed by any CPU.

Available options:

- CPU0 (CONFIG\_ESP\_TIMER\_TASK\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_ESP\_TIMER\_TASK\_AFFINITY\_CPU1)
- No affinity (CONFIG\_ESP\_TIMER\_TASK\_AFFINITY\_NO\_AFFINITY)

**CONFIG\_ESP\_TIMER\_ISR\_AFFINITY**

timer interrupt core affinity

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - "CPU0": (default) timer interrupt is processed by CPU0. - "CPU1": timer interrupt is processed by CPU1. - "No affinity": timer interrupt can be processed by any CPU. It helps to reduce latency but there is a disadvantage it leads to the timer ISR running on every core. It increases the CPU time usage for timer ISRs by N on an N-core system.

Available options:

- CPU0 (CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_CPU1)
- No affinity (CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_NO\_AFFINITY)

**CONFIG\_ESP\_TIMER\_SUPPORTS\_ISR\_DISPATCH\_METHOD**

Support ISR dispatch method

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

Allows using ESP\_TIMER\_ISR dispatch method (ESP\_TIMER\_TASK dispatch method is also available). - ESP\_TIMER\_TASK - Timer callbacks are dispatched from a high-priority esp\_timer task. - ESP\_TIMER\_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**

- No (disabled)

**Wi-Fi** Contains:

- *CONFIG\_ESP\_WIFI\_TESTING\_OPTIONS*
- *CONFIG\_ESP\_WIFI\_WPS\_SOFTAP\_REGISTRAR*
- *CONFIG\_ESP\_WIFI\_11KV\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_11R\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_DPP\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_ENTERPRISE\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_MBO\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_SUITE\_B\_192*
- *CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_OWE\_STA*
- *CONFIG\_ESP\_WIFI\_WAPI\_PSK*
- *CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_RX\_STATS*
- *CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_TX\_STATS*
- *CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_SAE*
- *CONFIG\_ESP\_WIFI\_SOFTAP\_BEACON\_MAX\_LEN*
- *CONFIG\_ESP\_WIFI\_CACHE\_TX\_BUFFER\_NUM*
- *CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM*
- *CONFIG\_ESP\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM*
- *CONFIG\_ESP\_WIFI\_RX\_MGMT\_BUF\_NUM\_DEF*
- *CONFIG\_ESP\_WIFI\_STATIC\_RX\_BUFFER\_NUM*
- *CONFIG\_ESP\_WIFI\_STATIC\_TX\_BUFFER\_NUM*
- *CONFIG\_ESP\_WIFI\_ESPNOW\_MAX\_ENCRYPT\_NUM*
- *CONFIG\_ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE*
- *CONFIG\_ESP\_WIFI\_DEBUG\_PRINT*
- *CONFIG\_ESP\_WIFI\_MGMT\_RX\_BUFFER*
- *CONFIG\_ESP\_WIFI\_TX\_BUFFER*
- *CONFIG\_ESP\_WIFI\_MBEDTLS\_CRYPT*
- *CONFIG\_ESP\_WIFI\_AMPDU\_RX\_ENABLED*
- *CONFIG\_ESP\_WIFI\_AMPDU\_TX\_ENABLED*
- *CONFIG\_ESP\_WIFI\_AMSDU\_TX\_ENABLED*
- *CONFIG\_ESP\_WIFI\_NAN\_ENABLE*
- *CONFIG\_ESP\_WIFI\_CSI\_ENABLED*
- *CONFIG\_ESP\_WIFI\_EXTRA\_IRAM\_OPT*
- *CONFIG\_ESP\_WIFI\_FTM\_ENABLE*
- *CONFIG\_ESP\_WIFI\_GCMP\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_GMAC\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_IRAM\_OPT*
- *CONFIG\_ESP\_WIFI\_MGMT\_SBUF\_NUM*
- *CONFIG\_ESP\_WIFI\_ENHANCED\_LIGHT\_SLEEP*
- *CONFIG\_ESP\_WIFI\_NVS\_ENABLED*
- *CONFIG\_ESP\_WIFI\_RX\_IRAM\_OPT*
- *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*
- *CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT*
- *CONFIG\_ESP\_WIFI\_SOFTAP\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_TASK\_CORE\_ID*
- *WPS Configuration Options*

**CONFIG\_ESP\_WIFI\_STATIC\_RX\_BUFFER\_NUM**

Max number of WiFi static RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when esp\_wifi\_init is called, they are not freed until esp\_wifi\_deinit is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If `ESP_WIFI_AMPDU_RX_ENABLED` is enabled, this value is recommended to set equal or bigger than `ESP_WIFI_RX_BA_WIN` in order to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 128 if `SOC_WIFI_HE_SUPPORT`

**Default value:**

- 16 if `SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

### CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM

Max number of WiFi dynamic RX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**

- from 0 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**

- 32

### CONFIG\_ESP\_WIFI\_TX\_BUFFER

Type of WiFi TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Select type of WiFi TX buffers:

If "Static" is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If "Dynamic" is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the Wifi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, "Static" should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, "Dynamic" should be selected to improve the utilization of RAM.

Available options:

- Static (`CONFIG_ESP_WIFI_STATIC_TX_BUFFER`)
- Dynamic (`CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER`)

### CONFIG\_ESP\_WIFI\_STATIC\_TX\_BUFFER\_NUM

Max number of WiFi static TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when `esp_wifi_init()` is called, they are not released until `esp_wifi_deinit()` is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 64 if `CONFIG_ESP_WIFI_STATIC_TX_BUFFER`

**Default value:**

- 16 if `CONFIG_ESP_WIFI_STATIC_TX_BUFFER`

### CONFIG\_ESP\_WIFI\_CACHE\_TX\_BUFFER\_NUM

Max number of WiFi cache TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

**Range:**

- from 16 to 128 if SPIRAM

**Default value:**

- 32 if SPIRAM

### CONFIG\_ESP\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM

Max number of WiFi dynamic TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 128

**Default value:**

- 32

### CONFIG\_ESP\_WIFI\_MGMT\_RX\_BUFFER

Type of WiFi RX MGMT buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Select type of WiFi RX MGMT buffers:

If "Static" is selected, WiFi RX MGMT buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static RX MGMT buffer is fixed to about 500 Bytes.

If "Dynamic" is selected, each WiFi RX MGMT buffer is allocated as needed when a MGMT data frame is received. The MGMT buffer is freed after the MGMT data frame has been processed by the WiFi driver.

Available options:

- Static (CONFIG\_ESP\_WIFI\_STATIC\_RX\_MGMT\_BUFFER)
- Dynamic (CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_MGMT\_BUFFER)

### CONFIG\_ESP\_WIFI\_RX\_MGMT\_BUF\_NUM\_DEF

Max number of WiFi RX MGMT buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi RX\_MGMT buffers.

For Management buffers, the number of dynamic and static management buffers is the same. In order to prevent memory fragmentation, the management buffer type should be set to static first.

**Range:**

- from 1 to 10

**Default value:**

- 5

### CONFIG\_ESP\_WIFI\_CSI\_ENABLED

WiFi CSI(Channel State Information)

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable CSI(Channel State Information) feature. CSI takes about CONFIG\_ESP\_WIFI\_STATIC\_RX\_BUFFER\_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_AMPDU\_TX\_ENABLED

WiFi AMPDU TX

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable AMPDU TX feature

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_TX\_BA\_WIN

WiFi AMPDU TX BA window size

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_AMPDU\\_TX\\_ENABLED](#)*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

**Range:**

- from 2 to 64 if SOC\_WIFI\_HE\_SUPPORT && [CONFIG\\_ESP\\_WIFI\\_AMPDU\\_TX\\_ENABLED](#)

**Default value:**

- 6

### CONFIG\_ESP\_WIFI\_AMPDU\_RX\_ENABLED

WiFi AMPDU RX

Found in: [Component config > Wi-Fi](#)

Select this option to enable AMPDU RX feature

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_RX\_BA\_WIN

WiFi AMPDU RX BA window size

Found in: [Component config > Wi-Fi > CONFIG\\_ESP\\_WIFI\\_AMPDU\\_RX\\_ENABLED](#)

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is preferred to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 64 if SOC\_WIFI\_HE\_SUPPORT && CONFIG\_ESP\_WIFI\_AMPDU\_RX\_ENABLED

**Default value:**

- 16 if SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP && CONFIG\_ESP\_WIFI\_AMPDU\_RX\_ENABLED

### CONFIG\_ESP\_WIFI\_AMSDU\_TX\_ENABLED

WiFi AMSDU TX

Found in: [Component config > Wi-Fi](#)

Select this option to enable AMSDU TX feature

**Default value:**

- No (disabled) if SPIRAM

### CONFIG\_ESP\_WIFI\_NVS\_ENABLED

WiFi NVS flash

Found in: [Component config > Wi-Fi](#)

Select this option to enable WiFi NVS flash

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_TASK\_CORE\_ID

WiFi Task Core ID

Found in: [Component config > Wi-Fi](#)

Pinned WiFi task to core 0 or core 1.

Available options:

- Core 0 (CONFIG\_ESP\_WIFI\_TASK\_PINNED\_TO\_CORE\_0)

- Core 1 (CONFIG\_ESP\_WIFI\_TASK\_PINNED\_TO\_CORE\_1)

### CONFIG\_ESP\_WIFI\_SOFTAP\_BEACON\_MAX\_LEN

Max length of WiFi SoftAP Beacon

*Found in: [Component config](#) > [Wi-Fi](#)*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36\*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**

- from 752 to 1256

**Default value:**

- 752

### CONFIG\_ESP\_WIFI\_MGMT\_SBUF\_NUM

WiFi mgmt short buffer number

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi management short buffer.

**Range:**

- from 6 to 32

**Default value:**

- 32

### CONFIG\_ESP\_WIFI\_IRAM\_OPT

WiFi IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_EXTRA\_IRAM\_OPT

WiFi EXTRA IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place additional frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 5Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_RX\_IRAM\_OPT

WiFi RX IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_SAE

Enable WPA3-Personal

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP's. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENABLE\_SAE\_PK

Enable SAE-PK

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WPA3\\_SAE](#)*

Select this option to enable SAE-PK

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_SOFTAP\_SAE\_SUPPORT

Enable WPA3 Personal(SAE) SoftAP

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WPA3\\_SAE](#)*

Select this option to enable SAE support in softAP mode.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_OWE\_STA

Enable OWE STA

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to allow the device to establish OWE connection with eligible AP's. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT

WiFi SLP IRAM speed optimization

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP\_WIFI\_IRAM\_OPT and ESP\_WIFI\_RX\_IRAM\_OPT, or this one. If already enabled ESP\_WIFI\_IRAM\_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP\_WIFI\_RX\_IRAM\_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

### CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MIN\_ACTIVE\_TIME

Minimum active time

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**

- from 8 to 60 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**Default value:**

- 50 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

### CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MAX\_ACTIVE\_TIME

Maximum keep alive time

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

The maximum time that wifi keep alive, unit: seconds.

**Range:**

- from 10 to 60 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**Default value:**

- 10 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

### CONFIG\_ESP\_WIFI\_FTM\_ENABLE

WiFi FTM

Found in: [Component config](#) > [Wi-Fi](#)

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_FTM\_INITIATOR\_SUPPORT

FTM Initiator support

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)

### CONFIG\_ESP\_WIFI\_FTM\_RESPONDER\_SUPPORT

FTM Responder support

Found in: *Component config* > *Wi-Fi* > *CONFIG\_ESP\_WIFI\_FTM\_ENABLE*

**Default value:**

- Yes (enabled) if *CONFIG\_ESP\_WIFI\_FTM\_ENABLE*

### CONFIG\_ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE

Power Management for station at disconnected

Found in: *Component config* > *Wi-Fi*

Select this option to enable power\_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_GCMP\_SUPPORT

WiFi GCMP Support(GCMP128 and GCMP256)

Found in: *Component config* > *Wi-Fi*

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_GMAC\_SUPPORT

WiFi GMAC Support(GMAC128 and GMAC256)

Found in: *Component config* > *Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_SOFTAP\_SUPPORT

WiFi SoftAP Support

Found in: *Component config* > *Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENHANCED\_LIGHT\_SLEEP

WiFi modem automatically receives the beacon

Found in: *Component config* > *Wi-Fi*

The wifi modem automatically receives the beacon frame during light sleep.

**Default value:**

- No (disabled) if *CONFIG\_ESP\_PHY\_MAC\_BB\_PD* &&  
SOC\_PM\_SUPPORT\_BEACON\_WAKEUP

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT

Wifi sleep optimize when beacon lost

Found in: *Component config > Wi-Fi*

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_TIMEOUT

Beacon loss timeout

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

**Range:**

- from 5 to 100 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 10 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_THRESHOLD

Maximum number of consecutive lost beacons allowed

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

**Range:**

- from 0 to 8 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 3 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_PHY\_ON\_DELTA\_EARLY\_TIME

Delta early time for RF PHY on

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

**Range:**

- from 0 to 100 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 2 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_PHY\_OFF\_DELTA\_TIMEOUT\_TIME

Delta timeout time for RF PHY off

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

**Range:**

- from 0 to 8 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 2 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_ESPNOW\_MAX\_ENCRYPT\_NUM

Maximum espnow encrypt peers number

Found in: [Component config](#) > [Wi-Fi](#)

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum number of connections of SoftAP = Max hardware keys number. When using ESP mesh, this value should be set to a maximum of 6.

**Range:**

- from 0 to 17

**Default value:**

- 7

### CONFIG\_ESP\_WIFI\_NAN\_ENABLE

WiFi Aware

Found in: [Component config](#) > [Wi-Fi](#)

Enable WiFi Aware (NAN) feature.

**Default value:**

- No (disabled) if SOC\_WIFI\_NAN\_SUPPORT

### CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_TX\_STATS

Enable Wi-Fi transmission statistics

Found in: [Component config](#) > [Wi-Fi](#)

Enable Wi-Fi transmission statistics. Total support 4 access category. Each access category will use 346 bytes memory.

**Default value:**

- Yes (enabled) if SOC\_WIFI\_HE\_SUPPORT

### CONFIG\_ESP\_WIFI\_MBEDTLS\_CRYPTO

Use MbedTLS crypto APIs

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable the use of MbedTLS crypto APIs. The internal crypto support within the supplicant is limited and may not suffice for all new security features, including WPA3.

It is recommended to always keep this option enabled. Additionally, note that MbedTLS can leverage hardware acceleration if available, resulting in significantly faster cryptographic operations.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_MBEDTLS\_TLS\_CLIENT

Use MbedTLS TLS client for WiFi Enterprise connection

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_MBEDTLS\\_CRYPTO](#)

Select this option to use MbedTLS TLS client for WPA2 enterprise connection. Please note that from MbedTLS-3.0 onwards, MbedTLS does not support SSL-3.0 TLS-v1.0, TLS-v1.1 versions. In case your server is using one of these version, it is advisable to update your server. Please disable this option for compatibility with older TLS versions.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_WAPI\_PSK**

Enable WAPI PSK support

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**

- No (disabled)

**CONFIG\_ESP\_WIFI\_SUITE\_B\_192**

Enable NSA suite B support with 192 bit key

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_WIFI\_11KV\_SUPPORT**

Enable 802.11k, 802.11v APIs Support

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_WIFI\_SCAN\_CACHE**

Keep scan results in cache

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_11KV\\_SUPPORT](#)*

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_WIFI\\_11KV\\_SUPPORT](#)

**CONFIG\_ESP\_WIFI\_MBO\_SUPPORT**

Enable Multi Band Operation Certification Support

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WiFi Multiband operation certification support.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_DPP\_SUPPORT

Enable DPP support

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable WiFi Easy Connect Support.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_11R\_SUPPORT

Enable 802.11R (Fast Transition) Support

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable WiFi Fast Transition Support.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_WPS\_SOFTAP\_REGISTRAR

Add WPS Registrar support in SoftAP mode

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable WPS registrar support in softAP mode.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_RX\_STATS

Enable Wi-Fi reception statistics

Found in: [Component config](#) > [Wi-Fi](#)

Enable Wi-Fi reception statistics. Total support 2 access category. Each access category will use 190 bytes memory.

**Default value:**

- Yes (enabled) if SOC\_WIFI\_HE\_SUPPORT

### CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_RX\_MU\_STATS

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WIFI\\_RX\\_STATS](#)

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics. Will use 10932 bytes memory.

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WIFI\\_RX\\_STATS](#)

### WPS Configuration Options

 Contains:

- [CONFIG\\_ESP\\_WIFI\\_WPS\\_PASSPHRASE](#)
- [CONFIG\\_ESP\\_WIFI\\_WPS\\_STRICT](#)

### CONFIG\_ESP\_WIFI\_WPS\_STRICT

Strictly validate all WPS attributes

*Found in: [Component config](#) > [Wi-Fi](#) > [WPS Configuration Options](#)*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_WPS\_PASSPHRASE

Get WPA2 passphrase in WPS config

*Found in: [Component config](#) > [Wi-Fi](#) > [WPS Configuration Options](#)*

Select this option to get passphrase during WPS configuration. This option fakes the virtual display capabilities to get the configuration in passphrase mode. Not recommended to be used since WPS credentials should not be shared to other devices, making it in readable format increases that risk, also passphrase requires pbkdf2 to convert in psk.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_DEBUG\_PRINT

Print debug messages from WPA Supplicant

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_TESTING\_OPTIONS

Add DPP testing code

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this to enable unity test for DPP.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_ENTERPRISE\_SUPPORT

Enable enterprise option

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this to enable/disable enterprise connection support.

disabling this will reduce binary size. disabling this will disable the use of any esp\_wifi\_sta\_wpa2\_ent\_\* (as APIs will be meaningless)

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_WIFI\_ENT\_FREE\_DYNAMIC\_BUFFER

Free dynamic buffers during WiFi enterprise connection

Found in: *Component config* > *Wi-Fi* > *CONFIG\_ESP\_WIFI\_ENTERPRISE\_SUPPORT*

Select this configuration to free dynamic buffers during WiFi enterprise connection. This will enable chip to reduce heap consumption during WiFi enterprise connection.

**Default value:**

- No (disabled)

**Core dump** Contains:

- *CONFIG\_ESP\_COREDUMP\_CHECK\_BOOT*
- *CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT*
- *CONFIG\_ESP\_COREDUMP\_CHECKSUM*
- *CONFIG\_ESP\_COREDUMP\_TO\_FLASH\_OR\_UART*
- *CONFIG\_ESP\_COREDUMP\_UART\_DELAY*
- *CONFIG\_ESP\_COREDUMP\_LOGS*
- *CONFIG\_ESP\_COREDUMP\_DECODE*
- *CONFIG\_ESP\_COREDUMP\_MAX\_TASKS\_NUM*
- *CONFIG\_ESP\_COREDUMP\_STACK\_SIZE*
- *CONFIG\_ESP\_COREDUMP\_SUMMARY\_STACKDUMP\_SIZE*

## CONFIG\_ESP\_COREDUMP\_TO\_FLASH\_OR\_UART

Data destination

Found in: *Component config* > *Core dump*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition\_table directory.

Available options:

- Flash (*CONFIG\_ESP\_COREDUMP\_ENABLE\_TO\_FLASH*)
- UART (*CONFIG\_ESP\_COREDUMP\_ENABLE\_TO\_UART*)
- None (*CONFIG\_ESP\_COREDUMP\_ENABLE\_TO\_NONE*)

## CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT

Core dump data format

Found in: *Component config* > *Core dump*

Select the data format for core dump.

Available options:

- Binary format (*CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT\_BIN*)
- ELF format (*CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT\_ELF*)

### CONFIG\_ESP\_COREDUMP\_CHECKSUM

Core dump data integrity check

*Found in:* [Component config](#) > [Core dump](#)

Select the integrity check for the core dump.

Available options:

- Use CRC32 for integrity verification (CONFIG\_ESP\_COREDUMP\_CHECKSUM\_CRC32)
- Use SHA256 for integrity verification (CONFIG\_ESP\_COREDUMP\_CHECKSUM\_SHA256)

### CONFIG\_ESP\_COREDUMP\_CHECK\_BOOT

Check core dump data integrity on boot

*Found in:* [Component config](#) > [Core dump](#)

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_COREDUMP\\_ENABLE\\_TO\\_FLASH](#)

### CONFIG\_ESP\_COREDUMP\_LOGS

Enable coredump logs for debugging

*Found in:* [Component config](#) > [Core dump](#)

Enable/disable coredump logs. Logs strings from espcoredump component are placed in DRAM. Disabling these helps to save ~5KB of internal memory.

### CONFIG\_ESP\_COREDUMP\_MAX\_TASKS\_NUM

Maximum number of tasks

*Found in:* [Component config](#) > [Core dump](#)

Maximum number of tasks snapshots in core dump.

### CONFIG\_ESP\_COREDUMP\_UART\_DELAY

Delay before print to UART

*Found in:* [Component config](#) > [Core dump](#)

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

**Default value:**

- 0 if [CONFIG\\_ESP\\_COREDUMP\\_ENABLE\\_TO\\_UART](#)

### CONFIG\_ESP\_COREDUMP\_STACK\_SIZE

Reserved stack size

*Found in:* [Component config](#) > [Core dump](#)

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

## CONFIG\_ESP\_COREDUMP\_SUMMARY\_STACKDUMP\_SIZE

Size of the stack dump buffer

*Found in: Component config > Core dump*

Size of the buffer that would be reserved for extracting backtrace info summary. This buffer will contain the stack dump of the crashed task. This dump is useful in generating backtrace

**Range:**

- from 512 to 4096 if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF` && `CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH`

**Default value:**

- 1024 if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF` && `CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH`

## CONFIG\_ESP\_COREDUMP\_DECODE

Handling of UART core dumps in IDF Monitor

*Found in: Component config > Core dump*

Available options:

- Decode and show summary (info\_corefile) (CONFIG\_ESP\_COREDUMP\_DECODE\_INFO)
- Don't decode (CONFIG\_ESP\_COREDUMP\_DECODE\_DISABLE)

## FAT Filesystem support

 Contains:

- `CONFIG_FATFS_API_ENCODING`
- `CONFIG_FATFS_VFS_FSTAT_BLKSIZE`
- `CONFIG_FATFS_IMMEDIATE_FSYNC`
- `CONFIG_FATFS_USE_FASTSEEK`
- `CONFIG_FATFS_LONG_FILENAMES`
- `CONFIG_FATFS_MAX_LFN`
- `CONFIG_FATFS_FS_LOCK`
- `CONFIG_FATFS_VOLUME_COUNT`
- `CONFIG_FATFS_CHOOSE_CODEPAGE`
- `CONFIG_FATFS_ALLOC_PREFER_EXTRAM`
- `CONFIG_FATFS_SECTOR_SIZE`
- `CONFIG_FATFS_TIMEOUT_MS`
- `CONFIG_FATFS_PER_FILE_CACHE`

## CONFIG\_FATFS\_VOLUME\_COUNT

Number of volumes

*Found in: Component config > FAT Filesystem support*

Number of volumes (logical drives) to use.

**Range:**

- from 1 to 10

**Default value:**

- 2

## CONFIG\_FATFS\_LONG\_FILENAMES

Long filename support

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

Available options:

- No long filenames (CONFIG\_FATFS\_LFN\_NONE)
- Long filename buffer in heap (CONFIG\_FATFS\_LFN\_HEAP)
- Long filename buffer on stack (CONFIG\_FATFS\_LFN\_STACK)

## CONFIG\_FATFS\_SECTOR\_SIZE

Sector size

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Specify the size of the sector in bytes for FATFS partition generator.

Available options:

- 512 (CONFIG\_FATFS\_SECTOR\_512)
- 4096 (CONFIG\_FATFS\_SECTOR\_4096)

## CONFIG\_FATFS\_CHOOSE\_CODEPAGE

OEM Code Page

*Found in: [Component config](#) > [FAT Filesystem support](#)*

OEM code page used for file name encodings.

If "Dynamic" is selected, code page can be chosen at runtime using `f_setcp` function. Note that choosing this option will increase application size by ~480kB.

Available options:

- Dynamic (all code pages supported) (CONFIG\_FATFS\_CODEPAGE\_DYNAMIC)
- US (CP437) (CONFIG\_FATFS\_CODEPAGE\_437)
- Arabic (CP720) (CONFIG\_FATFS\_CODEPAGE\_720)
- Greek (CP737) (CONFIG\_FATFS\_CODEPAGE\_737)
- KBL (CP771) (CONFIG\_FATFS\_CODEPAGE\_771)
- Baltic (CP775) (CONFIG\_FATFS\_CODEPAGE\_775)
- Latin 1 (CP850) (CONFIG\_FATFS\_CODEPAGE\_850)
- Latin 2 (CP852) (CONFIG\_FATFS\_CODEPAGE\_852)
- Cyrillic (CP855) (CONFIG\_FATFS\_CODEPAGE\_855)
- Turkish (CP857) (CONFIG\_FATFS\_CODEPAGE\_857)
- Portugese (CP860) (CONFIG\_FATFS\_CODEPAGE\_860)
- Icelandic (CP861) (CONFIG\_FATFS\_CODEPAGE\_861)
- Hebrew (CP862) (CONFIG\_FATFS\_CODEPAGE\_862)
- Canadian French (CP863) (CONFIG\_FATFS\_CODEPAGE\_863)
- Arabic (CP864) (CONFIG\_FATFS\_CODEPAGE\_864)
- Nordic (CP865) (CONFIG\_FATFS\_CODEPAGE\_865)
- Russian (CP866) (CONFIG\_FATFS\_CODEPAGE\_866)
- Greek 2 (CP869) (CONFIG\_FATFS\_CODEPAGE\_869)
- Japanese (DBCS) (CP932) (CONFIG\_FATFS\_CODEPAGE\_932)

- Simplified Chinese (DBCS) (CP936) (CONFIG\_FATFS\_CODEPAGE\_936)
- Korean (DBCS) (CP949) (CONFIG\_FATFS\_CODEPAGE\_949)
- Traditional Chinese (DBCS) (CP950) (CONFIG\_FATFS\_CODEPAGE\_950)

### CONFIG\_FATFS\_MAX\_LFN

Max long filename length

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Maximum long filename length. Can be reduced to save RAM.

### CONFIG\_FATFS\_API\_ENCODING

API character encoding

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

Available options:

- API uses ANSI/OEM encoding (CONFIG\_FATFS\_API\_ENCODING\_ANSI\_OEM)
- API uses UTF-8 encoding (CONFIG\_FATFS\_API\_ENCODING\_UTF\_8)

### CONFIG\_FATFS\_FS\_LOCK

Number of simultaneously open files protected by lock function

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets the FATFS configuration value `_FS_LOCK`. The option `_FS_LOCK` switches file lock function to control duplicated file open and illegal operation to open objects.

\* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

\* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

**Range:**

- from 0 to 65535

**Default value:**

- 0

### CONFIG\_FATFS\_TIMEOUT\_MS

Timeout for acquiring a file lock, ms

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets FATFS configuration value `_FS_TIMEOUT`, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

**Default value:**

- 10000

### CONFIG\_FATFS\_PER\_FILE\_CACHE

Use separate cache for each file

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option affects FATFS configuration value `_FS_TINY`.

If this option is set, `_FS_TINY` is 0, and each open file has its own cache, size of the cache is equal to the `_MAX_SS` variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, `_FS_TINY` is 1, and single cache is used for all open files, size is also equal to `_MAX_SS` variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**

- Yes (enabled)

### CONFIG\_FATFS\_ALLOC\_PREFER\_EXTRAM

Prefer external RAM when allocating FATFS buffers

*Found in: [Component config](#) > [FAT Filesystem support](#)*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**

- Yes (enabled) if `SPIRAM_USE_CAPS_ALLOC` || `SPIRAM_USE_MALLOC`

### CONFIG\_FATFS\_USE\_FASTSEEK

Enable fast seek algorithm when using `lseek` function through VFS FAT

*Found in: [Component config](#) > [FAT Filesystem support](#)*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**

- No (disabled)

### CONFIG\_FATFS\_FAST\_SEEK\_BUFFER\_SIZE

Fast seek CLMT buffer size

*Found in: [Component config](#) > [FAT Filesystem support](#) > [CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**

- 64 if `CONFIG_FATFS_USE_FASTSEEK`

### CONFIG\_FATFS\_VFS\_FSTAT\_BLKSIZE

Default block size

*Found in: [Component config](#) > [FAT Filesystem support](#)*

If set to 0, the 'newlib' library's default size (BLKSIZ) is used (128 B). If set to a non-zero value, the value is used as the block size. Default file buffer size is set to this value and the buffer is allocated when first attempt of reading/writing to a file is made. Increasing this value improves fread() speed, however the heap usage is increased as well.

NOTE: The block size value is shared by all the filesystem functions accessing target media for given file descriptor! See 'Improving I/O performance' section of 'Maximizing Execution Speed' documentation page for more details.

**Default value:**

- 0

### CONFIG\_FATFS\_IMMEDIATE\_FSYNC

Enable automatic f\_sync

*Found in: Component config > FAT Filesystem support*

Enables automatic calling of f\_sync() to flush recent file changes after each call of vfs\_fat\_write(), vfs\_fat\_pwrite(), vfs\_fat\_link(), vfs\_fat\_truncate() and vfs\_fat\_ftruncate() functions. This feature improves file-consistency and size reporting accuracy for the FatFS, at a price on decreased performance due to frequent disk operations

**Default value:**

- No (disabled)

### FreeRTOS Contains:

- *Kernel*
- *Port*

### Kernel Contains:

- *CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW*
- *CONFIG\_FREERTOS\_ENABLE\_BACKWARD\_COMPATIBILITY*
- *CONFIG\_FREERTOS\_GENERATE\_RUN\_TIME\_STATS*
- *CONFIG\_FREERTOS\_MAX\_TASK\_NAME\_LEN*
- *CONFIG\_FREERTOS\_IDLE\_TASK\_STACKSIZE*
- *CONFIG\_FREERTOS\_THREAD\_LOCAL\_STORAGE\_POINTERS*
- *CONFIG\_FREERTOS\_QUEUE\_REGISTRY\_SIZE*
- *CONFIG\_FREERTOS\_TASK\_NOTIFICATION\_ARRAY\_ENTRIES*
- *CONFIG\_FREERTOS\_HZ*
- *CONFIG\_FREERTOS\_TIMER\_QUEUE\_LENGTH*
- *CONFIG\_FREERTOS\_TIMER\_SERVICE\_TASK\_NAME*
- *CONFIG\_FREERTOS\_TIMER\_TASK\_PRIORITY*
- *CONFIG\_FREERTOS\_TIMER\_TASK\_STACK\_DEPTH*
- *CONFIG\_FREERTOS\_USE\_IDLE\_HOOK*
- *CONFIG\_FREERTOS\_OPTIMIZED\_SCHEDULER*
- *CONFIG\_FREERTOS\_USE\_TICK\_HOOK*
- *CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE*

- *CONFIG\_FREERTOS\_USE\_MINIMAL\_IDLE\_HOOK*

### CONFIG\_FREERTOS\_SMP

Run the Amazon SMP FreeRTOS kernel instead (FEATURE UNDER DEVELOPMENT)

*Found in: Component config > FreeRTOS > Kernel*

Amazon has released an SMP version of the FreeRTOS Kernel which can be found via the following link: <https://github.com/FreeRTOS/FreeRTOS-Kernel/tree/smp>

IDF has added an experimental port of this SMP kernel located in `components/freertos/FreeRTOS-Kernel-SMP`. Enabling this option will cause IDF to use the Amazon SMP kernel. Note that THIS FEATURE IS UNDER ACTIVE DEVELOPMENT, users use this at their own risk.

Leaving this option disabled will mean the IDF FreeRTOS kernel is used instead, which is located in: `components/freertos/FreeRTOS-Kernel`. Both kernel versions are SMP capable, but differ in their implementation and features.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_UNICORE

Run FreeRTOS only on first core

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

### CONFIG\_FREERTOS\_HZ

`configTICK_RATE_HZ`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the FreeRTOS tick interrupt frequency in Hz (see `configTICK_RATE_HZ` documentation for more details).

**Range:**

- from 1 to 1000

**Default value:**

- 100

### CONFIG\_FREERTOS\_OPTIMIZED\_SCHEDULER

`configUSE_PORT_OPTIMISED_TASK_SELECTION`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables port specific task selection method. This option can speed up the search of ready tasks when scheduling (see `configUSE_PORT_OPTIMISED_TASK_SELECTION` documentation for more details).

### CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW

`configCHECK_FOR_STACK_OVERFLOW`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables FreeRTOS to check for stack overflows (see `configCHECK_FOR_STACK_OVERFLOW` documentation for more details).

Note: If users do not provide their own `vApplicationStackOverflowHook()` function, a default function will be provided by ESP-IDF.

Available options:

- No checking (CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW\_NONE)  
Do not check for stack overflows (configCHECK\_FOR\_STACK\_OVERFLOW = 0)
- Check by stack pointer value (Method 1) (CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW\_PTRVAL)  
Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK\_FOR\_STACK\_OVERFLOW = 1)
- Check using canary bytes (Method 2) (CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW\_CANARY)  
Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK\_FOR\_STACK\_OVERFLOW = 2)

## CONFIG\_FREERTOS\_THREAD\_LOCAL\_STORAGE\_POINTERS

configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the number of thread local storage pointers in each task (see configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS documentation for more details).

Note: In ESP-IDF, this value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

### Range:

- from 1 to 256

### Default value:

- 1

## CONFIG\_FREERTOS\_IDLE\_TASK\_STACKSIZE

configMINIMAL\_STACK\_SIZE (Idle task stack size)

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the idle task stack size in bytes (see configMINIMAL\_STACK\_SIZE documentation for more details).

Note:

- ESP-IDF specifies stack sizes in bytes instead of words.
- The default size is enough for most use cases.
- The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.
- Conversely, the stack size can be reduced to the minimum if non of the idle features are used.

### Range:

- from 768 to 32768

### Default value:

- 1536

## CONFIG\_FREERTOS\_USE\_IDLE\_HOOK

configUSE\_IDLE\_HOOK

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the idle task application hook (see configUSE\_IDLE\_HOOK documentation for more details).

Note:

- The application must provide the hook function `void vApplicationIdleHook( void ) ;`

- `vApplicationIdleHook()` is called from FreeRTOS idle task(s)
- The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled simultaneously.

**Default value:**

- No (disabled)

**CONFIG\_FREERTOS\_USE\_MINIMAL\_IDLE\_HOOK**

Use FreeRTOS minimal idle hook

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the minimal idle task application hook (see `configUSE_IDLE_HOOK` documentation for more details).

Note:

- The application must provide the hook function `void vApplicationMinimalIdleHook( void );`
- `vApplicationMinimalIdleHook()` is called from FreeRTOS minimal idle task(s)

**Default value:**

- No (disabled) if `CONFIG_FREERTOS_SMP`

**CONFIG\_FREERTOS\_USE\_TICK\_HOOK**

`configUSE_TICK_HOOK`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the tick hook (see `configUSE_TICK_HOOK` documentation for more details).

Note:

- The application must provide the hook function `void vApplicationTickHook( void );`
- `vApplicationTickHook()` is called from FreeRTOS's tick handling function `xTaskIncrementTick()`
- The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

**Default value:**

- No (disabled)

**CONFIG\_FREERTOS\_MAX\_TASK\_NAME\_LEN**

`configMAX_TASK_NAME_LEN`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the maximum number of characters for task names (see `configMAX_TASK_NAME_LEN` documentation for more details).

Note: For most uses, the default of 16 characters is sufficient.

**Range:**

- from 1 to 256

**Default value:**

- 16

### CONFIG\_FREERTOS\_ENABLE\_BACKWARD\_COMPATIBILITY

configENABLE\_BACKWARD\_COMPATIBILITY

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enable backward compatibility with APIs prior to FreeRTOS v8.0.0. (see configENABLE\_BACKWARD\_COMPATIBILITY documentation for more details).

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_TIMER\_SERVICE\_TASK\_NAME

configTIMER\_SERVICE\_TASK\_NAME

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the timer task's name (see configTIMER\_SERVICE\_TASK\_NAME documentation for more details).

**Default value:**

- "Tmr Svc"

### CONFIG\_FREERTOS\_TIMER\_TASK\_PRIORITY

configTIMER\_TASK\_PRIORITY

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the timer task's priority (see configTIMER\_TASK\_PRIORITY documentation for more details).

**Range:**

- from 1 to 25

**Default value:**

- 1

### CONFIG\_FREERTOS\_TIMER\_TASK\_STACK\_DEPTH

configTIMER\_TASK\_STACK\_DEPTH

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the timer task's stack size (see configTIMER\_TASK\_STACK\_DEPTH documentation for more details).

**Range:**

- from 1536 to 32768

**Default value:**

- 2048

### CONFIG\_FREERTOS\_TIMER\_QUEUE\_LENGTH

configTIMER\_QUEUE\_LENGTH

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the timer task's command queue length (see configTIMER\_QUEUE\_LENGTH documentation for more details).

**Range:**

- from 5 to 20

**Default value:**

- 10

### CONFIG\_FREERTOS\_QUEUE\_REGISTRY\_SIZE

configQUEUE\_REGISTRY\_SIZE

*Found in: Component config > FreeRTOS > Kernel*

Set the size of the queue registry (see configQUEUE\_REGISTRY\_SIZE documentation for more details).

Note: A value of 0 will disable queue registry functionality

**Range:**

- from 0 to 20

**Default value:**

- 0

### CONFIG\_FREERTOS\_TASK\_NOTIFICATION\_ARRAY\_ENTRIES

configTASK\_NOTIFICATION\_ARRAY\_ENTRIES

*Found in: Component config > FreeRTOS > Kernel*

Set the size of the task notification array of each task. When increasing this value, keep in mind that this means additional memory for each and every task on the system. However, task notifications in general are more light weight compared to alternatives such as semaphores.

**Range:**

- from 1 to 32

**Default value:**

- 1

### CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY

configUSE\_TRACE\_FACILITY

*Found in: Component config > FreeRTOS > Kernel*

Enables additional structure members and functions to assist with execution visualization and tracing (see configUSE\_TRACE\_FACILITY documentation for more details).

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_USE\_STATS\_FORMATTING\_FUNCTIONS

configUSE\_STATS\_FORMATTING\_FUNCTIONS

*Found in: Component config > FreeRTOS > Kernel > CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY*

Set configUSE\_TRACE\_FACILITY and configUSE\_STATS\_FORMATTING\_FUNCTIONS to 1 to include the `vTaskList()` and `vTaskGetRunTimeStats()` functions in the build (see configUSE\_STATS\_FORMATTING\_FUNCTIONS documentation for more details).

**Default value:**

- No (disabled) if *CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY*

### CONFIG\_FREERTOS\_VTASKLIST\_INCLUDE\_COREID

Enable display of xCoreID in vTaskList

*Found in: Component config > FreeRTOS > Kernel > CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY > CONFIG\_FREERTOS\_USE\_STATS\_FORMATTING\_FUNCTIONS*

If enabled, this will include an extra column when `vTaskList` is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

## CONFIG\_FREERTOS\_GENERATE\_RUN\_TIME\_STATS

configGENERATE\_RUN\_TIME\_STATS

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Enables collection of run time statistics for each task (see configGENERATE\_RUN\_TIME\_STATS documentation for more details).

Note: The clock used for run time statistics can be configured in FREERTOS\_RUN\_TIME\_STATS\_CLK.

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_RUN\_TIME\_COUNTER\_TYPE

configRUN\_TIME\_COUNTER\_TYPE

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_GENERATE\\_RUN\\_TIME\\_STATS](#)

Sets the data type used for the FreeRTOS run time stats. A larger data type can be used to reduce the frequency of the counter overflowing.

Available options:

- uint32\_t (CONFIG\_FREERTOS\_RUN\_TIME\_COUNTER\_TYPE\_U32)  
configRUN\_TIME\_COUNTER\_TYPE is set to uint32\_t
- uint64\_t (CONFIG\_FREERTOS\_RUN\_TIME\_COUNTER\_TYPE\_U64)  
configRUN\_TIME\_COUNTER\_TYPE is set to uint64\_t

## CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE

configUSE\_TICKLESS\_IDLE

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP option. This feature is also known as "automatic light sleep".

Note that timers created using esp\_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the "skip\_unhandled\_events" option as true.

If disabled, automatic light sleep support will be disabled.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

## CONFIG\_FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP

configEXPECTED\_IDLE\_TIME\_BEFORE\_SLEEP

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks. You can enable PM\_PROFILING feature in esp\_pm components and dump the sleep status with esp\_pm\_dump\_locks, if the proportion of rejected sleeps is too high, please increase this value to improve scheduling efficiency

**Range:**

- from 2 to 4294967295 if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

**Default value:**

- 3 if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

**Port** Contains:

- `CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER`
- `CONFIG_FREERTOS_RUN_TIME_STATS_CLK`
- `CONFIG_FREERTOS_INTERRUPT_BACKTRACE`
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK`
- `CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP`
- `CONFIG_FREERTOS_TASK_PRE_DELETION_HOOK`
- `CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS`
- `CONFIG_FREERTOS_ISR_STACKSIZE`
- `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`
- `CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE`
- `CONFIG_FREERTOS_CORETIMER`
- `CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER`

### **CONFIG\_FREERTOS\_TASK\_FUNCTION\_WRAPPER**

Wrap task functions

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

**Default value:**

- Yes (enabled)

### **CONFIG\_FREERTOS\_WATCHPOINT\_END\_OF\_STACK**

Enable stack overflow debug watchpoint

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See `FREERTOS_CHECK_STACKOVERFLOW` for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panicking) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**Default value:**

- No (disabled)

### **CONFIG\_FREERTOS\_TLSP\_DELETION\_CALLBACKS**

Enable thread local storage pointers deletion callbacks

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

ESP-IDF provides users with the ability to free TLSP memory by registering TLSP deletion callbacks. These callbacks are automatically called by FreeRTOS when a task is deleted. When this option is turned on, the memory reserved for TLSPs in the TCB is doubled to make space for storing the deletion callbacks. If the user does not wish to use TLSP deletion callbacks then this option could be turned off to save space in the TCB memory.

**Default value:**

- Yes (enabled)

**CONFIG\_FREERTOS\_TASK\_PRE\_DELETION\_HOOK**

Enable task pre-deletion hook

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

Enable this option to make FreeRTOS call a user provided hook function right before it deletes a task (i.e., frees/releases a dynamically/statically allocated task's memory). This is useful if users want to know when a task is actually deleted (in case the task's deletion is delegated to the IDLE task).

If this config option is enabled, users must define a `void vTaskPreDeletionHook( void \* pxTCB )` hook function in their application.

**CONFIG\_FREERTOS\_ENABLE\_STATIC\_TASK\_CLEAN\_UP**

Enable static task clean up hook (DEPRECATED)

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

THIS OPTION IS DEPRECATED. Use `CONFIG_FREERTOS_TASK_PRE_DELETION_HOOK` instead.

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Note: Users will need to provide a `void vPortCleanUpTCB ( void \*pxTCB )` callback

**Default value:**

- No (disabled)

**CONFIG\_FREERTOS\_CHECK\_MUTEX\_GIVEN\_BY\_OWNER**

Check that mutex semaphore is given by owner task

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

**CONFIG\_FREERTOS\_ISR\_STACKSIZE**

ISR stack size

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**Range:**

- from 2096 to 32768 if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF`
- from 1536 to 32768

**Default value:**

- 2096 if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF`
- 1536

## CONFIG\_FREERTOS\_INTERRUPT\_BACKTRACE

Enable backtrace from interrupt to task context

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

### Default value:

- Yes (enabled)

## CONFIG\_FREERTOS\_CORETIMER

Tick timer source (Xtensa Only)

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities.

Available options:

- Timer 0 (int 6, level 1) (CONFIG\_FREERTOS\_CORETIMER\_0)  
Select this to use timer 0
- Timer 1 (int 15, level 3) (CONFIG\_FREERTOS\_CORETIMER\_1)  
Select this to use timer 1
- SYSTIMER 0 (level 1) (CONFIG\_FREERTOS\_CORETIMER\_SYSTIMER\_LVL1)  
Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (CONFIG\_FREERTOS\_CORETIMER\_SYSTIMER\_LVL3)  
Select this to use systimer with the 3 interrupt priority.

## CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_CLK

Choose the clock source for run time stats

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

Choose the clock source for FreeRTOS run time stats. Options are CPU0's CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

Available options:

- Use ESP TIMER for run time stats (CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_USING\_ESP\_TIMER)  
ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_USING\_CPU\_CLK)  
CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP\_DEFAULT\_CPU\_FREQ\_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of

time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

### CONFIG\_FREERTOS\_PLACE\_FUNCTIONS\_INTO\_FLASH

Place FreeRTOS functions into Flash

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_CHECK\_PORT\_CRITICAL\_COMPLIANCE

Tests compliance with Vanilla FreeRTOS port\*\_CRITICAL calls

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, context of port\*\_CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port\*\_CRITICAL from ISR context would cause assert failure

**Default value:**

- No (disabled)

### Hardware Abstraction Layer (HAL) and Low Level (LL) Contains:

- [CONFIG\\_HAL\\_DEFAULT\\_ASSERTION\\_LEVEL](#)
- [CONFIG\\_HAL\\_LOG\\_LEVEL](#)
- [CONFIG\\_HAL\\_SYSTIMER\\_USE\\_ROM\\_IMPL](#)
- [CONFIG\\_HAL\\_WDT\\_USE\\_ROM\\_IMPL](#)

### CONFIG\_HAL\_DEFAULT\_ASSERTION\_LEVEL

Default HAL assertion level

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can't exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can't be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

Available options:

- Same as system assertion level (CONFIG\_HAL\_ASSERTION\_EQUALS\_SYSTEM)
- Disabled (CONFIG\_HAL\_ASSERTION\_DISABLE)
- Silent (CONFIG\_HAL\_ASSERTION\_SILENT)
- Enabled (CONFIG\_HAL\_ASSERTION\_ENABLE)

### CONFIG\_HAL\_LOG\_LEVEL

HAL layer log verbosity

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Specify how much output to see in HAL logs.

Available options:

- No output (CONFIG\_HAL\_LOG\_LEVEL\_NONE)
- Error (CONFIG\_HAL\_LOG\_LEVEL\_ERROR)
- Warning (CONFIG\_HAL\_LOG\_LEVEL\_WARN)
- Info (CONFIG\_HAL\_LOG\_LEVEL\_INFO)
- Debug (CONFIG\_HAL\_LOG\_LEVEL\_DEBUG)
- Verbose (CONFIG\_HAL\_LOG\_LEVEL\_VERBOSE)

### CONFIG\_HAL\_SYSTIMER\_USE\_ROM\_IMPL

Use ROM implementation of SysTimer HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. If making this as "y" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if ESP\_ROM\_HAS\_HAL\_SYSTIMER

### CONFIG\_HAL\_WDT\_USE\_ROM\_IMPL

Use ROM implementation of WDT HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. If making this as "y" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if ESP\_ROM\_HAS\_HAL\_WDT

### Heap memory debugging Contains:

- *CONFIG\_HEAP\_ABORT\_WHEN\_ALLOCATION\_FAILS*
- *CONFIG\_HEAP\_TASK\_TRACKING*
- *CONFIG\_HEAP\_PLACE\_FUNCTION\_INTO\_FLASH*
- *CONFIG\_HEAP\_CORRUPTION\_DETECTION*
- *CONFIG\_HEAP\_TRACING\_DEST*
- *CONFIG\_HEAP\_TRACING\_STACK\_DEPTH*
- *CONFIG\_HEAP\_USE\_HOOKS*
- *CONFIG\_HEAP\_TRACE\_HASH\_MAP*
- *CONFIG\_HEAP\_TLSF\_USE\_ROM\_IMPL*

### CONFIG\_HEAP\_CORRUPTION\_DETECTION

Heap corruption detection

*Found in: Component config > Heap memory debugging*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the "Heap Memory Debugging" page of the IDF documentation for a description of each level of heap corruption detection.

Available options:

- Basic (no poisoning) (CONFIG\_HEAP\_POISONING\_DISABLED)
- Light impact (CONFIG\_HEAP\_POISONING\_LIGHT)
- Comprehensive (CONFIG\_HEAP\_POISONING\_COMPREHENSIVE)

### CONFIG\_HEAP\_TRACING\_DEST

Heap tracing

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enables the heap tracing API defined in esp\_heap\_trace.h.

This function causes a moderate increase in IRAM code size and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it's best to keep it disabled unless tracing is being used.

Available options:

- Disabled (CONFIG\_HEAP\_TRACING\_OFF)
- Standalone (CONFIG\_HEAP\_TRACING\_STANDALONE)
- Host-based (CONFIG\_HEAP\_TRACING\_TOHOST)

### CONFIG\_HEAP\_TRACING\_STACK\_DEPTH

Heap tracing stack depth

*Found in: [Component config](#) > [Heap memory debugging](#)*

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

### CONFIG\_HEAP\_USE\_HOOKS

Use allocation and free hooks

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable the user to implement function hooks triggered for each successful allocation and free.

### CONFIG\_HEAP\_TASK\_TRACKING

Enable heap task tracking

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

### CONFIG\_HEAP\_TRACE\_HASH\_MAP

Use hash map mechanism to access heap trace records

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to use a hash map to increase performance in handling heap trace records.

Heap trace standalone supports storing records as a list, or a list + hash map.

Using only a list takes less memory, but calls to 'free' will get slower as the list grows. This is particularly affected when using `HEAP_TRACE_ALL` mode.

By using a list + hash map, calls to 'free' remain fast, at the cost of additional memory to store the hash map.

**Default value:**

- No (disabled) if `CONFIG_HEAP_TRACING_STANDALONE`

### **CONFIG\_HEAP\_TRACE\_HASH\_MAP\_IN\_EXT\_RAM**

Place hash map in external RAM

*Found in: [Component config](#) > [Heap memory debugging](#) > `CONFIG_HEAP_TRACE_HASH_MAP`*

When enabled this configuration forces the hash map to be placed in external RAM.

**Default value:**

- No (disabled) if `CONFIG_HEAP_TRACE_HASH_MAP`

### **CONFIG\_HEAP\_TRACE\_HASH\_MAP\_SIZE**

The number of entries in the hash map

*Found in: [Component config](#) > [Heap memory debugging](#) > `CONFIG_HEAP_TRACE_HASH_MAP`*

Defines the number of entries in the heap trace hashmap. Each entry takes 8 bytes. The bigger this number is, the better the performance. Recommended range: 200 - 2000.

**Default value:**

- 512 if `CONFIG_HEAP_TRACE_HASH_MAP`

### **CONFIG\_HEAP\_ABORT\_WHEN\_ALLOCATION\_FAILS**

Abort if memory allocation fails

*Found in: [Component config](#) > [Heap memory debugging](#)*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**

- No (disabled)

### **CONFIG\_HEAP\_TLSF\_USE\_ROM\_IMPL**

Use ROM implementation of heap tlsf library

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to use heap functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. If making this as "y" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if `ESP_ROM_HAS_HEAP_TLSF`

### **CONFIG\_HEAP\_PLACE\_FUNCTION\_INTO\_FLASH**

Force the entire heap component to be placed in flash memory

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to save up RAM space by placing the heap component in the flash memory

Note that it is only safe to enable this configuration if no functions from `esp_heap_caps.h` or `esp_heap_trace.h` are called from ISR.

**IEEE 802.15.4** Contains:

- `CONFIG_IEEE802154_ENABLED`

### **CONFIG\_IEEE802154\_ENABLED**

IEEE802154 Enable

Found in: *Component config* > *IEEE 802.15.4*

**Default value:**

- Yes (enabled) if `SOC_IEEE802154_SUPPORTED`

### **CONFIG\_IEEE802154\_RX\_BUFFER\_SIZE**

The number of 802.15.4 receive buffers

Found in: *Component config* > *IEEE 802.15.4* > *CONFIG\_IEEE802154\_ENABLED*

The number of 802.15.4 receive buffers

**Range:**

- from 2 to 100 if `CONFIG_IEEE802154_ENABLED`

**Default value:**

- 20 if `CONFIG_IEEE802154_ENABLED`

### **CONFIG\_IEEE802154\_CCA\_MODE**

Clear Channel Assessment (CCA) mode

Found in: *Component config* > *IEEE 802.15.4* > *CONFIG\_IEEE802154\_ENABLED*

configure the CCA mode

Available options:

- Carrier sense only (`CONFIG_IEEE802154_CCA_CARRIER`)  
configure the CCA mode to Energy above threshold
- Energy above threshold (`CONFIG_IEEE802154_CCA_ED`)  
configure the CCA mode to Energy above threshold
- Carrier sense OR energy above threshold (`CONFIG_IEEE802154_CCA_CARRIER_OR_ED`)  
configure the CCA mode to Carrier sense OR energy above threshold
- Carrier sense AND energy above threshold (`CONFIG_IEEE802154_CCA_CARRIER_AND_ED`)  
configure the CCA mode to Carrier sense AND energy above threshold

### **CONFIG\_IEEE802154\_CCA\_THRESHOLD**

CCA detection threshold

Found in: *Component config* > *IEEE 802.15.4* > *CONFIG\_IEEE802154\_ENABLED*

set the CCA threshold, in dB

**Range:**

- from -120 to 0 if `CONFIG_IEEE802154_ENABLED`

**Default value:**

- "-60" if `CONFIG_IEEE802154_ENABLED`

**CONFIG\_IEEE802154\_PENDING\_TABLE\_SIZE**

Pending table size

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

set the pending table size

**Range:**

- from 1 to 100 if *CONFIG\_IEEE802154\_ENABLED*

**Default value:**

- 20 if *CONFIG\_IEEE802154\_ENABLED*

**CONFIG\_IEEE802154\_MULTI\_PAN\_ENABLE**

Enable multi-pan feature for frame filter

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enable IEEE802154 multi-pan

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_ENABLED*

**CONFIG\_IEEE802154\_TIMING\_OPTIMIZATION**

Enable throughput optimization

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enabling this option increases throughput by ~5% at the expense of ~2.1k IRAM code size increase.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_ENABLED*

**CONFIG\_IEEE802154\_SLEEP\_ENABLE**

Enable IEEE802154 light sleep

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enabling this option allows the IEEE802.15.4 module to be powered down during automatic light sleep, which reduces current consumption.

**Default value:**

- No (disabled) if *CONFIG\_PM\_ENABLE* && *CONFIG\_IEEE802154\_ENABLED*

**CONFIG\_IEEE802154\_DEBUG**

Enable IEEE802154 Debug

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enabling this option allows different kinds of IEEE802154 debug output. All IEEE802154 debug features increase the size of the final binary.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_ENABLED*

Contains:

- *CONFIG\_IEEE802154\_RECORD\_ABORT*
- *CONFIG\_IEEE802154\_RECORD\_CMD*
- *CONFIG\_IEEE802154\_RECORD\_EVENT*
- *CONFIG\_IEEE802154\_RECORD\_STATE*
- *CONFIG\_IEEE802154\_TXRX\_STATISTIC*

- `CONFIG_IEEE802154_ASSERT`

### **CONFIG\_IEEE802154\_ASSERT**

Enrich the assert information with IEEE802154 state and event

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to add some probe codes in the driver, and these informations will be printed when assert.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

### **CONFIG\_IEEE802154\_RECORD\_EVENT**

Enable record event information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record event, when assert, the recorded event will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

### **CONFIG\_IEEE802154\_RECORD\_EVENT\_SIZE**

Record event table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_EVENT`

set the record event table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_EVENT`

**Default value:**

- 30 if `CONFIG_IEEE802154_RECORD_EVENT`

### **CONFIG\_IEEE802154\_RECORD\_STATE**

Enable record state information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record state, when assert, the recorded state will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

### **CONFIG\_IEEE802154\_RECORD\_STATE\_SIZE**

Record state table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_STATE`

set the record state table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_STATE`

**Default value:**

- 10 if `CONFIG_IEEE802154_RECORD_STATE`

### **CONFIG\_IEEE802154\_RECORD\_CMD**

Enable record command information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record the command, when assert, the recorded command will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

### **CONFIG\_IEEE802154\_RECORD\_CMD\_SIZE**

Record command table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_CMD`

set the record command table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_CMD`

**Default value:**

- 10 if `CONFIG_IEEE802154_RECORD_CMD`

### **CONFIG\_IEEE802154\_RECORD\_ABORT**

Enable record abort information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record the abort, when assert, the recorded abort will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

### **CONFIG\_IEEE802154\_RECORD\_ABORT\_SIZE**

Record abort table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_ABORT`

set the record abort table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_ABORT`

**Default value:**

- 10 if `CONFIG_IEEE802154_RECORD_ABORT`

### **CONFIG\_IEEE802154\_TXRX\_STATISTIC**

Enable record tx/rx packets information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record the tx and rx

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

**Log output** Contains:

- [CONFIG\\_LOG\\_DEFAULT\\_LEVEL](#)
- [CONFIG\\_LOG\\_MASTER\\_LEVEL](#)
- [CONFIG\\_LOG\\_TIMESTAMP\\_SOURCE](#)
- [CONFIG\\_LOG\\_MAXIMUM\\_LEVEL](#)
- [CONFIG\\_LOG\\_COLORS](#)

### **CONFIG\_LOG\_DEFAULT\_LEVEL**

Default log verbosity

*Found in:* [Component config](#) > [Log output](#)

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set` function.

By default, this setting limits which log statements are compiled into the program. For example, selecting "Warning" would mean that changing log level to "Debug" at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

Available options:

- No output (`CONFIG_LOG_DEFAULT_LEVEL_NONE`)
- Error (`CONFIG_LOG_DEFAULT_LEVEL_ERROR`)
- Warning (`CONFIG_LOG_DEFAULT_LEVEL_WARN`)
- Info (`CONFIG_LOG_DEFAULT_LEVEL_INFO`)
- Debug (`CONFIG_LOG_DEFAULT_LEVEL_DEBUG`)
- Verbose (`CONFIG_LOG_DEFAULT_LEVEL_VERBOSE`)

### **CONFIG\_LOG\_MAXIMUM\_LEVEL**

Maximum log verbosity

*Found in:* [Component config](#) > [Log output](#)

This config option sets the highest log verbosity that it's possible to select at runtime by calling `esp_log_level_set()`. This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate "Bootloader log verbosity" setting.

Available options:

- Same as default (`CONFIG_LOG_MAXIMUM_EQUALS_DEFAULT`)
- Error (`CONFIG_LOG_MAXIMUM_LEVEL_ERROR`)
- Warning (`CONFIG_LOG_MAXIMUM_LEVEL_WARN`)
- Info (`CONFIG_LOG_MAXIMUM_LEVEL_INFO`)
- Debug (`CONFIG_LOG_MAXIMUM_LEVEL_DEBUG`)
- Verbose (`CONFIG_LOG_MAXIMUM_LEVEL_VERBOSE`)

### CONFIG\_LOG\_MASTER\_LEVEL

Enable global master log level

*Found in: [Component config](#) > [Log output](#)*

Enables an additional global "master" log level check that occurs before a log tag cache lookup. This is useful if you want to compile in a lot of logs that are selectable at runtime, but avoid the performance hit during periods where you don't want log output. Examples include remote log forwarding, or disabling logs during a time-critical or CPU-intensive section and re-enabling them later. Results in larger program size depending on number of logs compiled in.

If enabled, defaults to LOG\_DEFAULT\_LEVEL and can be set using esp\_log\_set\_level\_master(). This check takes precedence over ESP\_LOG\_LEVEL\_LOCAL.

**Default value:**

- No (disabled)

### CONFIG\_LOG\_COLORS

Use ANSI terminal colors in log output

*Found in: [Component config](#) > [Log output](#)*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**

- Yes (enabled)

### CONFIG\_LOG\_TIMESTAMP\_SOURCE

Log Timestamps

*Found in: [Component config](#) > [Log output](#)*

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the chip's RTC and high resolution timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

Available options:

- Milliseconds Since Boot (CONFIG\_LOG\_TIMESTAMP\_SOURCE\_RTOS)
- System Time (CONFIG\_LOG\_TIMESTAMP\_SOURCE\_SYSTEM)

**LWIP** Contains:

- *CONFIG\_LWIP\_IP\_DEFAULT\_TTL*

- [UDP](#)
- [CONFIG\\_LWIP\\_IPV6\\_RDNSS\\_MAX\\_DNS\\_SERVERS](#)

### CONFIG\_LWIP\_ENABLE

Enable LwIP stack

*Found in: [Component config](#) > [LWIP](#)*

Builds normally if selected. Excludes LwIP from build if unselected, even if it is a dependency of a component or application. Some applications can switch their IP stacks, e.g., when switching between chip and Linux targets (LwIP stack vs. Linux IP stack). Since the LwIP dependency cannot easily be excluded based on a Kconfig option, it has to be a dependency in all cases. This switch allows the LwIP stack to be built selectively, even if it is a dependency.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_LOCAL\_HOSTNAME

Local netif hostname

*Found in: [Component config](#) > [LWIP](#)*

The default name this device will report to other devices on the network. Could be updated at runtime with `esp_netif_set_hostname()`

**Default value:**

- "espressif"

### CONFIG\_LWIP\_NETIF\_API

Enable usage of standard POSIX APIs in LWIP

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, standard POSIX APIs: `if_indextoname()`, `if_nametoindex()` could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as `esp_netif_get_netif_impl_name()`)

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCPIP\_TASK\_PRIO

LWIP TCP/IP Task Priority

*Found in: [Component config](#) > [LWIP](#)*

LWIP tcpip task priority. In case of high throughput, this parameter could be changed up to (`config-MAX_PRIORITIES-1`).

**Range:**

- from 1 to 24

**Default value:**

- 18

### CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING

Enable tcpip core locking

*Found in: [Component config](#) > [LWIP](#)*

If Enable tcpip core locking,Creates a global mutex that is held during TCPIP thread operations.Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See LOCK\_TCPIP\_CORE() and UNLOCK\_TCPIP\_CORE().

If disable tcpip core locking,TCP IP will perform tasks through context switching

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING\_INPUT

Enable tcpip core locking input

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_TCPIP\\_CORE\\_LOCKING](#)*

when LWIP\_TCPIP\_CORE\_LOCKING is enabled, this lets tcpip\_input() grab the mutex for input packets as well, instead of allocating a message and passing it to tcpip\_thread.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_TCPIP\\_CORE\\_LOCKING](#)

### CONFIG\_LWIP\_CHECK\_THREAD\_SAFETY

Checks that lwip API runs in expected context

*Found in: [Component config](#) > [LWIP](#)*

Enable to check that the project does not violate lwip thread safety. If enabled, all lwip functions that require thread awareness run an assertion to verify that the TCP/IP core functionality is either locked or accessed from the correct thread.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DNS\_SUPPORT\_MDNS\_QUERIES

Enable mDNS queries in resolving host name

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_L2\_TO\_L3\_COPY

Enable copy between Layer2 and Layer3 packets

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IRAM\_OPTIMIZATION

Enable LWIP IRAM optimization

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn't help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_EXTRA\_IRAM\_OPTIMIZATION

Enable LWIP IRAM optimization for TCP part

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, some tcp part functions relating to RX/TX in LWIP will be put into IRAM, it can improve TCP throughput. On the other hand, it needs about 17KB IRAM for these optimizations.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TIMERS\_ONDEMAND

Enable LWIP Timers on demand

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_ND6

LWIP NDP6 Enable/Disable

*Found in: [Component config](#) > [LWIP](#)*

This option is used to disable the Network Discovery Protocol (NDP) if it is not required. Please use this option with caution, as the NDP is essential for IPv6 functionality within a local network.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_FORCE\_ROUTER\_FORWARDING

LWIP Force Router Forwarding Enable/Disable

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ND6](#)*

This option is used to set the the router flag for the NA packets. When enabled, the router flag in NA packet will always set to 1, otherwise, never set router flag for NA packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_MAX\_SOCKETS

Max number of open sockets

Found in: *Component config* > *LWIP*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**Range:**

- from 1 to 16

**Default value:**

- 10

### CONFIG\_LWIP\_USE\_ONLY\_LWIP\_SELECT

Support LWIP socket select() only (DEPRECATED)

Found in: *Component config* > *LWIP*

This option is deprecated. Do not use this option, use VFS\_SUPPORT\_SELECT instead.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_LINGER

Enable SO\_LINGER processing

Found in: *Component config* > *LWIP*

Enabling this option allows SO\_LINGER processing. l\_onoff = 1,l\_linger can set the timeout.

If l\_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If l\_linger!=0,Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_REUSE

Enable SO\_REUSEADDR option

Found in: *Component config* > *LWIP*

Enabling this option allows binding to a port which remains in TIME\_WAIT.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_SO\_REUSE\_RXTOALL

SO\_REUSEADDR copies broadcast/multicast to all matches

Found in: *Component config* > *LWIP* > *CONFIG\_LWIP\_SO\_REUSE*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO\_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don't plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_SO\_RCVBUF

Enable SO\_RCVBUF option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for available data on a netconn.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_NETBUF\_RECVINFO

Enable IP\_PKTINFO option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP\_DEFAULT\_TTL

The value for Time-To-Live used by transport layers

*Found in: [Component config](#) > [LWIP](#)*

Set value for Time-To-Live used by transport layers.

**Range:**

- from 1 to 255

**Default value:**

- 64

### CONFIG\_LWIP\_IP4\_FRAG

Enable fragment outgoing IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IP6\_FRAG

Enable fragment outgoing IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IP4\_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP4 packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP6\_REASSEMBLY

Enable reassembly incoming fragmented IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP6 packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP\_REASS\_MAX\_PBUFS

The maximum amount of pbufs waiting to be reassembled

*Found in: Component config > LWIP*

Set the maximum amount of pbufs waiting to be reassembled.

**Range:**

- from 10 to 100

**Default value:**

- 10

### CONFIG\_LWIP\_IP\_FORWARD

Enable IP forwarding

*Found in: Component config > LWIP*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV4\_NAPT

Enable NAT (new/experimental)

*Found in: Component config > LWIP > CONFIG\_LWIP\_IP\_FORWARD*

Enabling this option allows Network Address and Port Translation.

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_IP\_FORWARD*

### CONFIG\_LWIP\_IPV4\_NAPT\_PORTMAP

Enable NAT Port Mapping (new/experimental)

*Found in: Component config > LWIP > CONFIG\_LWIP\_IP\_FORWARD > CONFIG\_LWIP\_IPV4\_NAPT*

Enabling this option allows Port Forwarding or Port mapping.

**Default value:**

- Yes (enabled) if *CONFIG\_LWIP\_IPV4\_NAPT*

### CONFIG\_LWIP\_STATS

Enable LWIP statistics

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows LWIP statistics

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_ESP\_GRATUITOUS\_ARP

Send gratuitous ARP periodically

*Found in: [Component config](#) > [LWIP](#)*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues.If the ARP table of the AP is old, and the AP doesn't send ARP request to update it's ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it's ARP table.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_GARP\_TMR\_INTERVAL

GARP timer interval(seconds)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ESP\\_GRATUITOUS\\_ARP](#)*

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**

- 60

### CONFIG\_LWIP\_ESP\_MLDV6\_REPORT

Send mldv6 report periodically

*Found in: [Component config](#) > [LWIP](#)*

Enable this option allows to send mldv6 report periodically.

This option solve the issue that failed to receive multicast data. Some routers fail to forward multicast packets. To solve this problem, send multicast mldv6 report to routers regularly.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_MLDV6\_TMR\_INTERVAL

mldv6 report timer interval(seconds)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ESP\\_MLDV6\\_REPORT](#)*

Set the timer interval for mldv6 report. The default value is 30s

**Default value:**

- 40

### CONFIG\_LWIP\_TCPIP\_RECVMBOX\_SIZE

TCPIP task receive mail box size

Found in: [Component config > LWIP](#)

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**

- from 6 to 1024 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 32

### CONFIG\_LWIP\_DHCP\_DOES\_ARP\_CHECK

DHCP: Perform ARP check on any offered address

Found in: [Component config > LWIP](#)

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCP\_DISABLE\_CLIENT\_ID

DHCP: Disable Use of HW address as client identification

Found in: [Component config > LWIP](#)

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to "y" in order to exclude option 61 from DHCP packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DHCP\_DISABLE\_VENDOR\_CLASS\_ID

DHCP: Disable Use of vendor class identification

Found in: [Component config > LWIP](#)

This option could be used to disable DHCP client vendor class identification. Set this option to "y" in order to exclude option 60 from DHCP packets.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCP\_RESTORE\_LAST\_IP

DHCP: Restore last IP obtained from DHCP server

Found in: [Component config > LWIP](#)

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DHCP\_OPTIONS\_LEN

DHCP total option length

Found in: [Component config](#) > [LWIP](#)

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP\_ASSERT due to option value is too long. Please increase the LWIP\_DHCP\_OPTIONS\_LEN value.

**Range:**

- from 68 to 255

**Default value:**

- 68

### CONFIG\_LWIP\_NUM\_NETIF\_CLIENT\_DATA

Number of clients store data in netif

Found in: [Component config](#) > [LWIP](#)

Number of clients that may store data in client\_data member array of struct netif.

**Range:**

- from 0 to 256

**Default value:**

- 0

### CONFIG\_LWIP\_DHCP\_COARSE\_TIMER\_SECS

DHCP coarse timer interval(s)

Found in: [Component config](#) > [LWIP](#)

Set DHCP coarse interval in seconds. A higher value will be less precise but cost less power consumption.

**Range:**

- from 1 to 10

**Default value:**

- 1

**DHCP server** Contains:

- [CONFIG\\_LWIP\\_DHCPS](#)

### CONFIG\_LWIP\_DHCPS

DHCPS: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPS)

Found in: [Component config](#) > [LWIP](#) > [DHCP server](#)

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCPS\_LEASE\_UNIT

Multiplier for lease time, in seconds

Found in: [Component config](#) > [LWIP](#) > [DHCP server](#) > [CONFIG\\_LWIP\\_DHCPS](#)

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**Range:**

- from 1 to 3600

**Default value:**

- 60

**CONFIG\_LWIP\_DHCPS\_MAX\_STATION\_NUM**

Maximum number of stations

*Found in: Component config > LWIP > DHCP server > CONFIG\_LWIP\_DHCPS*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it's address pool, without notification.

**Range:**

- from 1 to 64

**Default value:**

- 8

**CONFIG\_LWIP\_DHCPS\_STATIC\_ENTRIES**

Enable ARP static entries

*Found in: Component config > LWIP > DHCP server > CONFIG\_LWIP\_DHCPS*

Enabling this option allows DHCP server to support temporary static ARP entries for DHCP Client. This will help the DHCP server to send the DHCP OFFER and DHCP ACK using IP unicast.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_AUTOIP**

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

**Default value:**

- No (disabled)

Contains:

- *CONFIG\_LWIP\_AUTOIP\_TRIES*
- *CONFIG\_LWIP\_AUTOIP\_MAX\_CONFLICTS*
- *CONFIG\_LWIP\_AUTOIP\_RATE\_LIMIT\_INTERVAL*

**CONFIG\_LWIP\_AUTOIP\_TRIES**

DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG\_LWIP\_AUTOIP*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: "This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP." (In the case of ESP-IDF, this means multiple SYSTEM\_EVENT\_STA\_GOT\_IP events.)

**Range:**

- from 1 to 100 if *CONFIG\_LWIP\_AUTOIP*

**Default value:**

- 2 if `CONFIG_LWIP_AUTOIP`

**CONFIG\_LWIP\_AUTOIP\_MAX\_CONFLICTS**

Max IP conflicts before rate limiting

*Found in: Component config > LWIP > CONFIG\_LWIP\_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**

- from 1 to 100 if `CONFIG_LWIP_AUTOIP`

**Default value:**

- 9 if `CONFIG_LWIP_AUTOIP`

**CONFIG\_LWIP\_AUTOIP\_RATE\_LIMIT\_INTERVAL**

Rate limited interval (seconds)

*Found in: Component config > LWIP > CONFIG\_LWIP\_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

**Range:**

- from 5 to 120 if `CONFIG_LWIP_AUTOIP`

**Default value:**

- 20 if `CONFIG_LWIP_AUTOIP`

**CONFIG\_LWIP\_IPV4**

Enable IPv4

*Found in: Component config > LWIP*

Enable IPv4 stack. If you want to use IPv6 only TCP/IP stack, disable this.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_IPV6**

Enable IPv6

*Found in: Component config > LWIP*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP\_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_IPV6\_AUTOCONFIG**

Enable IPV6 stateless address autoconfiguration (SLAAC)

*Found in: Component config > LWIP > CONFIG\_LWIP\_IPV6*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV6\_NUM\_ADDRESSES

Number of IPv6 addresses on each network interface

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IPV6](#)*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**

- 3

### CONFIG\_LWIP\_IPV6\_FORWARD

Enable IPv6 forwarding between interfaces

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IPV6](#)*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV6\_RDNSS\_MAX\_DNS\_SERVERS

Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in: [Component config](#) > [LWIP](#)*

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

**Default value:**

- 0 if [CONFIG\\_LWIP\\_IPV6\\_AUTOCONFIG](#)

### CONFIG\_LWIP\_IPV6\_DHCP6

Enable DHCPv6 stateless address autoconfiguration

*Found in: [Component config](#) > [LWIP](#)*

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using `dhcp6_enable_stateless(netif)`; Note that the stateful address autoconfiguration is not supported.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_IPV6\\_AUTOCONFIG](#)

### CONFIG\_LWIP\_NETIF\_STATUS\_CALLBACK

Enable status callback for network interfaces

*Found in: [Component config](#) > [LWIP](#)*

Enable callbacks when the network interface is up/down and addresses are changed.

**Default value:**

- No (disabled)

## CONFIG\_LWIP\_NETIF\_LOOPBACK

Support per-interface loopback

*Found in:* [Component config > LWIP](#)

Enabling this option means that if a packet is sent with a destination address equal to the interface's own IP address, it will "loop back" and be received by this interface. Disabling this option disables support of loopback interface in lwIP

**Default value:**

- Yes (enabled)

Contains:

- [CONFIG\\_LWIP\\_LOOPBACK\\_MAX\\_PBUFS](#)

## CONFIG\_LWIP\_LOOPBACK\_MAX\_PBUFS

Max queued loopback packets per interface

*Found in:* [Component config > LWIP > CONFIG\\_LWIP\\_NETIF\\_LOOPBACK](#)

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**Range:**

- from 0 to 16

**Default value:**

- 8

**TCP** Contains:

- [CONFIG\\_LWIP\\_TCP\\_WND\\_DEFAULT](#)
- [CONFIG\\_LWIP\\_TCP\\_SND\\_BUF\\_DEFAULT](#)
- [CONFIG\\_LWIP\\_TCP\\_RECVMBOX\\_SIZE](#)
- [CONFIG\\_LWIP\\_TCP\\_RTO\\_TIME](#)
- [CONFIG\\_LWIP\\_MAX\\_ACTIVE\\_TCP](#)
- [CONFIG\\_LWIP\\_TCP\\_FIN\\_WAIT\\_TIMEOUT](#)
- [CONFIG\\_LWIP\\_MAX\\_LISTENING\\_TCP](#)
- [CONFIG\\_LWIP\\_TCP\\_MAXRTX](#)
- [CONFIG\\_LWIP\\_TCP\\_SYNMAXRTX](#)
- [CONFIG\\_LWIP\\_TCP\\_MSL](#)
- [CONFIG\\_LWIP\\_TCP\\_MSS](#)
- [CONFIG\\_LWIP\\_TCP\\_OVERSIZE](#)
- [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)
- [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- [CONFIG\\_LWIP\\_TCP\\_HIGH\\_SPEED\\_RETRANSMISSION](#)
- [CONFIG\\_LWIP\\_TCP\\_TMR\\_INTERVAL](#)

## CONFIG\_LWIP\_MAX\_ACTIVE\_TCP

Maximum active TCP Connections

*Found in:* [Component config > LWIP > TCP](#)

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**CONFIG\_LWIP\_MAX\_LISTENING\_TCP**

Maximum listening TCP Connections

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**CONFIG\_LWIP\_TCP\_HIGH\_SPEED\_RETRANSMISSION**

TCP high speed retransmissions

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_TCP\_MAXRTX**

Maximum number of retransmissions of data segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of data segments.

**Range:**

- from 3 to 12

**Default value:**

- 12

**CONFIG\_LWIP\_TCP\_SYNMAXRTX**

Maximum number of retransmissions of SYN segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of SYN segments.

**Range:**

- from 3 to 12

**Default value:**

- 12

### CONFIG\_LWIP\_TCP\_MSS

Maximum Segment Size (MSS)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP\_MSS Range: 576 <= TCP\_MSS <= 1460 IPv6 TCP\_MSS Range: 1220<= TCP\_MSS <= 1440

**Range:**

- from 536 to 1460

**Default value:**

- 1440

### CONFIG\_LWIP\_TCP\_TMR\_INTERVAL

TCP timer interval(ms)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**

- 250

### CONFIG\_LWIP\_TCP\_MSL

Maximum segment lifetime (MSL)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 60000

### CONFIG\_LWIP\_TCP\_FIN\_WAIT\_TIMEOUT

Maximum FIN segment lifetime

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 20000

### CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT

Default send buffer size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with `lwip_setsockopt(s, TCP_SNDBUF, ...)`.

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**

- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5760

### CONFIG\_LWIP\_TCP\_WND\_DEFAULT

Default receive window size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with `lwip_setsockopt(s, TCP_WINDOW, ...)`.

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**

- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5760

### CONFIG\_LWIP\_TCP\_RECVMBOX\_SIZE

Default TCP receive mail box size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is:  $LWIP\_TCP\_WND\_DEFAULT/TCP\_MSS + 2$ , e.g. if  $LWIP\_TCP\_WND\_DEFAULT=14360$ ,  $TCP\_MSS=1436$ , then the recommended receive mail box size is  $(14360/1436 + 2) = 12$ .

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can cache maximum `LWIP_TCP_RECVMBOX_SIZE` packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is `LWIP_TCP_RECVMBOX_SIZE` multiplies the maximum TCP socket number. In other words, the bigger `LWIP_TCP_RECVMBOX_SIZE` means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 1024 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 6

### CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ

Queue incoming out-of-order segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCP\_OOSEQ\_TIMEOUT

Timeout for each pbuf queued in TCP OOSEQ, in RTOs.

*Found in: [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)*

The timeout value is TCP\_OOSEQ\_TIMEOUT \* RTO.

**Range:**

- from 1 to 30

**Default value:**

- 6

### CONFIG\_LWIP\_TCP\_OOSEQ\_MAX\_PBUFS

The maximum number of pbufs queued on OOSEQ per pcb

*Found in: [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)*

If LWIP\_TCP\_OOSEQ\_MAX\_PBUFS = 0, TCP will not control the number of OOSEQ pbufs.

In a poor network environment, many out-of-order tcp pbufs will be received. These out-of-order pbufs will be cached in the TCP out-of-order queue which will cause Wi-Fi/Ethernet fail to release RX buffer in time. It is possible that all RX buffers for MAC layer are used by OOSEQ.

Control the number of out-of-order pbufs to ensure that the MAC layer has enough RX buffer to receive packets.

In the Wi-Fi scenario, recommended OOSEQ PBUFS Range:  $0 \leq \text{TCP\_OOSEQ\_MAX\_PBUFS} \leq \text{CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM}/(\text{MAX\_TCP\_NUMBER} + 1)$

In the Ethernet scenario, recommended Ethernet OOSEQ PBUFS Range:  $0 \leq \text{TCP\_OOSEQ\_MAX\_PBUFS} \leq \text{CONFIG\_ETH\_DMA\_RX\_BUFFER\_NUM}/(\text{MAX\_TCP\_NUMBER} + 1)$

Within the recommended value range, the larger the value, the better the performance.

MAX\_TCP\_NUMBER represent Maximum number of TCP connections in Wi-Fi(STA+SoftAP) and Ethernet scenario.

**Range:**

- from 0 to 12

**Default value:**

- 0 if SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP && [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)

### CONFIG\_LWIP\_TCP\_SACK\_OUT

Support sending selective acknowledgements

*Found in: [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCP\_OVERSIZE

Pre-allocate transmit PBUF size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Allows enabling "oversize" allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle's algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

Available options:

- MSS (CONFIG\_LWIP\_TCP\_OVERSIZE\_MSS)
- 25% MSS (CONFIG\_LWIP\_TCP\_OVERSIZE\_QUARTER\_MSS)
- Disabled (CONFIG\_LWIP\_TCP\_OVERSIZE\_DISABLE)

### CONFIG\_LWIP\_WND\_SCALE

Support TCP window scale

*Found in: Component config > LWIP > TCP*

Enable this feature to support TCP window scaling.

**Default value:**

- No (disabled) if SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP

### CONFIG\_LWIP\_TCP\_RCV\_SCALE

Set TCP receiving window scaling factor

*Found in: Component config > LWIP > TCP > CONFIG\_LWIP\_WND\_SCALE*

Enable this feature to support TCP window scaling.

**Range:**

- from 0 to 14 if *CONFIG\_LWIP\_WND\_SCALE*

**Default value:**

- 0 if *CONFIG\_LWIP\_WND\_SCALE*

### CONFIG\_LWIP\_TCP\_RTO\_TIME

Default TCP rto time

*Found in: Component config > LWIP > TCP*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**

- 1500

**UDP** Contains:

- *CONFIG\_LWIP\_UDP\_RECVMBOX\_SIZE*
- *CONFIG\_LWIP\_MAX\_UDP\_PCBS*

### CONFIG\_LWIP\_MAX\_UDP\_PCBS

Maximum active UDP control blocks

*Found in: Component config > LWIP > UDP*

The maximum number of active UDP "connections" (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

### CONFIG\_LWIP\_UDP\_RECVMBOX\_SIZE

Default UDP receive mail box size

*Found in: [Component config](#) > [LWIP](#) > [UDP](#)*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum UDP\_RECVMBOX\_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP\_RECVMBOX\_SIZE multiplies the maximum UDP socket number. In other words, the bigger UDP\_RECVMBOX\_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 64

**Default value:**

- 6

**Checksums** Contains:

- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_ICMP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_IP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_UDP](#)

### CONFIG\_LWIP\_CHECKSUM\_CHECK\_IP

Enable LWIP IP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received IP messages

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_CHECKSUM\_CHECK\_UDP

Enable LWIP UDP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received UDP messages

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_CHECKSUM\_CHECK\_ICMP

Enable LWIP ICMP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received ICMP messages

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCPIP\_TASK\_STACK\_SIZE

TCP/IP Task Stack Size

Found in: *Component config* > *LWIP*

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**

- from 2048 to 65536

**Default value:**

- 3072

### CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY

TCP/IP task affinity

Found in: *Component config* > *LWIP*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to "TCP/IP" task and "Ping" task.

Available options:

- No affinity (`CONFIG_LWIP_TCPIP_TASK_AFFINITY_NO_AFFINITY`)
- CPU0 (`CONFIG_LWIP_TCPIP_TASK_AFFINITY_CPU0`)
- CPU1 (`CONFIG_LWIP_TCPIP_TASK_AFFINITY_CPU1`)

### CONFIG\_LWIP\_PPP\_SUPPORT

Enable PPP support

Found in: *Component config* > *LWIP*

Enable PPP stack. Now only PPP over serial is possible.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_PPP\\_ENABLE\\_IPV6](#)

### CONFIG\_LWIP\_PPP\_ENABLE\_IPV6

Enable IPV6 support for PPP connections (IPV6CP)

Found in: *Component config* > *LWIP* > *CONFIG\_LWIP\_PPP\_SUPPORT*

Enable IPV6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPV6 addressing in the local link. If they are requested for IPV6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPV6 support.

**Default value:**

- Yes (enabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#) && [CONFIG\\_LWIP\\_IPV6](#)

### CONFIG\_LWIP\_IPV6\_MEMP\_NUM\_ND6\_QUEUE

Max number of IPv6 packets to queue during MAC resolution

Found in: *Component config* > *LWIP*

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**

- from 3 to 20

**Default value:**

- 3

### **CONFIG\_LWIP\_IPV6\_ND6\_NUM\_NEIGHBORS**

Max number of entries in IPv6 neighbor cache

*Found in: [Component config > LWIP](#)*

Config max number of entries in IPv6 neighbor cache

**Range:**

- from 3 to 10

**Default value:**

- 5

### **CONFIG\_LWIP\_PPP\_NOTIFY\_PHASE\_SUPPORT**

Enable Notify Phase Callback

*Found in: [Component config > LWIP](#)*

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_PAP\_SUPPORT**

Enable PAP support

*Found in: [Component config > LWIP](#)*

Enable Password Authentication Protocol (PAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_CHAP\_SUPPORT**

Enable CHAP support

*Found in: [Component config > LWIP](#)*

Enable Challenge Handshake Authentication Protocol (CHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_MSCHAP\_SUPPORT**

Enable MSCHAP support

*Found in: [Component config > LWIP](#)*

Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_PPP\_MPPE\_SUPPORT

Enable MPPE support

*Found in: Component config > LWIP*

Enable Microsoft Point-to-Point Encryption (MPPE) support

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_PPP\_SUPPORT*

### CONFIG\_LWIP\_ENABLE\_LCP\_ECHO

Enable LCP ECHO

*Found in: Component config > LWIP*

Enable LCP echo keepalive requests

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_PPP\_SUPPORT*

### CONFIG\_LWIP\_LCP\_ECHOINTERVAL

Echo interval (s)

*Found in: Component config > LWIP > CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

Interval in seconds between keepalive LCP echo requests, 0 to disable.

**Range:**

- from 0 to 1000000 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

**Default value:**

- 3 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

### CONFIG\_LWIP\_LCP\_MAXECHOFAILS

Maximum echo failures

*Found in: Component config > LWIP > CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

Number of consecutive unanswered echo requests before failure is indicated.

**Range:**

- from 0 to 100000 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

**Default value:**

- 3 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

### CONFIG\_LWIP\_PPP\_DEBUG\_ON

Enable PPP debug log output

*Found in: Component config > LWIP*

Enable PPP debug log output

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_PPP\_SUPPORT*

### CONFIG\_LWIP\_SLIP\_SUPPORT

Enable SLIP support (new/experimental)

*Found in: [Component config](#) > [LWIP](#)*

Enable SLIP stack. Now only SLIP over serial is possible.

SLIP over serial support is experimental and unsupported.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_SLIP\\_DEBUG\\_ON](#)

### CONFIG\_LWIP\_SLIP\_DEBUG\_ON

Enable SLIP debug log output

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_SLIP\\_SUPPORT](#)*

Enable SLIP debug log output

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_SLIP\\_SUPPORT](#)

**ICMP** Contains:

- [CONFIG\\_LWIP\\_ICMP](#)
- [CONFIG\\_LWIP\\_BROADCAST\\_PING](#)
- [CONFIG\\_LWIP\\_MULTICAST\\_PING](#)

### CONFIG\_LWIP\_ICMP

ICMP: Enable ICMP

*Found in: [Component config](#) > [LWIP](#) > [ICMP](#)*

Enable ICMP module for check network stability

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_MULTICAST\_PING

Respond to multicast pings

*Found in: [Component config](#) > [LWIP](#) > [ICMP](#)*

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_BROADCAST\_PING

Respond to broadcast pings

*Found in: [Component config](#) > [LWIP](#) > [ICMP](#)*

**Default value:**

- No (disabled)

**LWIP RAW API** Contains:

- [CONFIG\\_LWIP\\_MAX\\_RAW\\_PCBS](#)

### **CONFIG\_LWIP\_MAX\_RAW\_PCBS**

Maximum LWIP RAW PCBs

*Found in:* [Component config](#) > [LWIP](#) > [LWIP RAW API](#)

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**SNTP** Contains:

- [CONFIG\\_LWIP\\_SNTP\\_MAX\\_SERVERS](#)
- [CONFIG\\_LWIP\\_SNTP\\_UPDATE\\_DELAY](#)
- [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

### **CONFIG\_LWIP\_SNTP\_MAX\_SERVERS**

Maximum number of NTP servers

*Found in:* [Component config](#) > [LWIP](#) > [SNTP](#)

Set maximum number of NTP servers used by LwIP SNTP module. First argument of `sntp_setserver/sntp_setservername` functions is limited to this value.

**Range:**

- from 1 to 16

**Default value:**

- 1

### **CONFIG\_LWIP\_DHCP\_GET\_NTP\_SRV**

Request NTP servers from DHCP

*Found in:* [Component config](#) > [LWIP](#) > [SNTP](#)

If enabled, LWIP will add 'NTP' to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see `sntp_servermode_dhcp()` func.)

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_DHCP\_MAX\_NTP\_SERVERS**

Maximum number of NTP servers acquired via DHCP

*Found in:* [Component config](#) > [LWIP](#) > [SNTP](#) > [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

Set maximum number of NTP servers acquired via DHCP-offer. Should be less or equal to "Maximum number of NTP servers", any extra servers would be just ignored.

**Range:**

- from 1 to 16 if [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

**Default value:**

- 1 if [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

### CONFIG\_LWIP\_SNTP\_UPDATE\_DELAY

Request interval to update time (ms)

Found in: *Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**Range:**

- from 15000 to 4294967295

**Default value:**

- 3600000

**DNS** Contains:

- *CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_SUPPORT*
- *CONFIG\_LWIP\_DNS\_MAX\_SERVERS*

### CONFIG\_LWIP\_DNS\_MAX\_SERVERS

Maximum number of DNS servers

Found in: *Component config > LWIP > DNS*

Set maximum number of DNS servers. If fallback DNS servers are supported, the number of DNS servers needs to be greater than or equal to 3.

**Range:**

- from 1 to 4

**Default value:**

- 3

### CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_SUPPORT

Enable DNS fallback server support

Found in: *Component config > LWIP > DNS*

Enable this feature to support DNS fallback server.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_ADDRESS

DNS fallback server address

Found in: *Component config > LWIP > DNS > CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_SUPPORT*

This option allows you to config dns fallback server address.

**Default value:**

- "114.114.114.114" if *CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_SUPPORT*

### CONFIG\_LWIP\_BRIDGEIF\_MAX\_PORTS

Maximum number of bridge ports

Found in: *Component config > LWIP*

Set maximum number of ports a bridge can consists of.

**Range:**

- from 1 to 63

**Default value:**

- 7

**CONFIG\_LWIP\_ESP\_LWIP\_ASSERT**

Enable LWIP ASSERT checks

*Found in:* [Component config](#) > [LWIP](#)

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled.

If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

**Hooks** Contains:

- [CONFIG\\_LWIP\\_HOOK\\_ND6\\_GET\\_GW](#)
- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_INPUT](#)
- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_ROUTE](#)
- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_SELECT\\_SRC\\_ADDR](#)
- [CONFIG\\_LWIP\\_HOOK\\_NETCONN\\_EXTERNAL\\_RESOLVE](#)
- [CONFIG\\_LWIP\\_HOOK\\_TCP\\_ISN](#)

**CONFIG\_LWIP\_HOOK\_TCP\_ISN**

TCP ISN Hook

*Found in:* [Component config](#) > [LWIP](#) > [Hooks](#)

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (*tcp\_next\_isn*) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to `LWIP_HOOK_TCP_ISN_CUSTOM` to provide custom implementation. Set to `LWIP_HOOK_TCP_ISN_NONE` to use lwIP implementation.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_TCP_ISN_NONE`)
- Default implementation (`CONFIG_LWIP_HOOK_TCP_ISN_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_TCP_ISN_CUSTOM`)

**CONFIG\_LWIP\_HOOK\_IP6\_ROUTE**

IPv6 route Hook

*Found in:* [Component config](#) > [LWIP](#) > [Hooks](#)

Enables custom IPv6 route hook. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_IP6_ROUTE_NONE`)
- Default (weak) implementation (`CONFIG_LWIP_HOOK_IP6_ROUTE_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_IP6_ROUTE_CUSTOM`)

### CONFIG\_LWIP\_HOOK\_ND6\_GET\_GW

IPv6 get gateway Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 route hook. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_ND6\_GET\_GW\_NONE)
- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_ND6\_GET\_GW\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_ND6\_GET\_GW\_CUSTOM)

### CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR

IPv6 source address selection Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 source address selection. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR\_NONE)
- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR\_CUSTOM)

### CONFIG\_LWIP\_HOOK\_NETCONN\_EXTERNAL\_RESOLVE

Netconn external resolve Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom DNS resolve hook. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_NONE)
- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_CUSTOM)

### CONFIG\_LWIP\_HOOK\_IP6\_INPUT

IPv6 packet input

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 packet input. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_IP6\_INPUT\_NONE)
- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_IP6\_INPUT\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_IP6\_INPUT\_CUSTOM)

## CONFIG\_LWIP\_DEBUG

Enable LWIP Debug

*Found in: Component config > LWIP*

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

### Default value:

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_API\\_LIB\\_DEBUG](#)
- [CONFIG\\_LWIP\\_BRIDGEIF\\_FDB\\_DEBUG](#)
- [CONFIG\\_LWIP\\_BRIDGEIF\\_FW\\_DEBUG](#)
- [CONFIG\\_LWIP\\_BRIDGEIF\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DHCP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DHCP\\_STATE\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DNS\\_DEBUG](#)
- [CONFIG\\_LWIP\\_ETHARP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_ICMP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_ICMP6\\_DEBUG](#)
- [CONFIG\\_LWIP\\_IP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_IP6\\_DEBUG](#)
- [CONFIG\\_LWIP\\_NAPT\\_DEBUG](#)
- [CONFIG\\_LWIP\\_NETIF\\_DEBUG](#)
- [CONFIG\\_LWIP\\_PBUF\\_DEBUG](#)
- [CONFIG\\_LWIP\\_SNTP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_SOCKETS\\_DEBUG](#)
- [CONFIG\\_LWIP\\_TCP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_UDP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DEBUG\\_ESP\\_LOG](#)

## CONFIG\_LWIP\_DEBUG\_ESP\_LOG

Route LWIP debugs through ESP\_LOG interface

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

Enabling this option routes all enabled LWIP debugs through ESP\_LOGD.

### Default value:

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

## CONFIG\_LWIP\_NETIF\_DEBUG

Enable netif debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

### Default value:

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_PBUF\_DEBUG**

Enable pbuf debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_ETHARP\_DEBUG**

Enable etharp debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_API\_LIB\_DEBUG**

Enable api lib debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_SOCKETS\_DEBUG**

Enable socket debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_IP\_DEBUG**

Enable IP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_ICMP\_DEBUG**

Enable ICMP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG* && *CONFIG\_LWIP\_ICMP*

### **CONFIG\_LWIP\_DHCP\_STATE\_DEBUG**

Enable DHCP state tracking

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_DHCP\_DEBUG**

Enable DHCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_IP6\_DEBUG**

Enable IP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_ICMP6\_DEBUG**

Enable ICMP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_TCP\_DEBUG**

Enable TCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_UDP\_DEBUG**

Enable UDP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_SNTP\_DEBUG**

Enable SNTP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_DNS\_DEBUG**

Enable DNS debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_NAPT\_DEBUG**

Enable NAPT debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG* && *CONFIG\_LWIP\_IPV4\_NAPT*

**CONFIG\_LWIP\_BRIDGEIF\_DEBUG**

Enable bridge generic debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_BRIDGEIF\_FDB\_DEBUG**

Enable bridge FDB debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_BRIDGEIF\_FW\_DEBUG**

Enable bridge forwarding debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**MBEDTLS** Contains:

- *CONFIG\_MBEDTLS\_ASYMMETRIC\_CONTENT\_LEN*
- *Certificate Bundle*
- *Certificates*
- *CONFIG\_MBEDTLS\_CHACHA20\_C*
- *CONFIG\_MBEDTLS\_DHM\_C*
- *CONFIG\_MBEDTLS\_ECP\_C*
- *CONFIG\_MBEDTLS\_ECDH\_C*

- `CONFIG_MBEDTLS_ROM_MD5`
- `CONFIG_MBEDTLS_USE_CRYPTO_ROM_IMPL`
- `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

## **CONFIG\_MBEDTLS\_MEM\_ALLOC\_MODE**

Memory allocation strategy

*Found in: Component config > mbedtls*

Allocation strategy for mbedtls, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls\_platform\_set\_calloc\_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal memory (CONFIG\_MBEDTLS\_INTERNAL\_MEM\_ALLOC)
- External SPIRAM (CONFIG\_MBEDTLS\_EXTERNAL\_MEM\_ALLOC)
- Default alloc mode (CONFIG\_MBEDTLS\_DEFAULT\_MEM\_ALLOC)
- Custom alloc mode (CONFIG\_MBEDTLS\_CUSTOM\_MEM\_ALLOC)
- Internal IRAM (CONFIG\_MBEDTLS\_IRAM\_8BIT\_MEM\_ALLOC)  
Allows to use IRAM memory region as 8bit accessible region.  
TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### CONFIG\_MBEDTLS\_SSL\_MAX\_CONTENT\_LEN

TLS maximum message content length

*Found in: [Component config](#) > [mbedtls](#)*

Maximum TLS message length (in bytes) supported by mbedtls.

16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max\_fragment\_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS\_ERR\_SSL\_INVALID\_RECORD (-0x7200).

### CONFIG\_MBEDTLS\_ASYMMETRIC\_CONTENT\_LEN

Asymmetric in/out fragment length

*Found in: [Component config](#) > [mbedtls](#)*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_IN\_CONTENT\_LEN

TLS maximum incoming fragment length

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)*

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS\_SSL\_MAX\_CONTENT\_LEN).

**Range:**

- from 512 to 16384

**Default value:**

- 16384

### CONFIG\_MBEDTLS\_SSL\_OUT\_CONTENT\_LEN

TLS maximum outgoing fragment length

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)*

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS\_SSL\_MAX\_CONTENT\_LEN).

**Range:**

- from 512 to 16384

**Default value:**

- 4096

**CONFIG\_MBEDTLS\_DYNAMIC\_BUFFER**

Using dynamic TX/RX buffer

*Found in: [Component config](#) > [mbedtls](#)*

Using dynamic TX/RX buffer. After enabling this option, mbedtls will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedtls also allocate TX and RX buffer with the default value of "MBEDTLS\_SSL\_OUT\_CONTENT\_LEN" or "MBEDTLS\_SSL\_IN\_CONTENT\_LEN", so to save more heap, users can set the options to be an appropriate value.

**CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CONFIG\_DATA**

Free private key and DHM data after its usage

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)*

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)

**CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CA\_CERT**

Free SSL CA certificate after its usage

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_FREE\\_CONFIG\\_DATA](#)*

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_FREE\\_CONFIG\\_DATA](#)

**CONFIG\_MBEDTLS\_DEBUG**

Enable mbedtls debugging

*Found in: [Component config](#) > [mbedtls](#)*

Enable mbedtls debugging functions at compile time.

If this option is enabled, you can include "mbedtls/esp\_debug.h" and call `mbedtls_esp_enable_debug_log()` at runtime in order to enable mbedtls debug output via the ESP log mechanism.

**Default value:**

- No (disabled)

## CONFIG\_MBEDTLS\_DEBUG\_LEVEL

Set mbedTLS debugging level

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_DEBUG*

Set mbedTLS debugging level

Available options:

- Warning (CONFIG\_MBEDTLS\_DEBUG\_LEVEL\_WARN)
- Info (CONFIG\_MBEDTLS\_DEBUG\_LEVEL\_INFO)
- Debug (CONFIG\_MBEDTLS\_DEBUG\_LEVEL\_DEBUG)
- Verbose (CONFIG\_MBEDTLS\_DEBUG\_LEVEL\_VERBOSE)

### **mbedTLS v3.x related** Contains:

- *DTLS-based configurations*
- *CONFIG\_MBEDTLS\_PKCS7\_C*
- *CONFIG\_MBEDTLS\_SSL\_CONTEXT\_SERIALIZATION*
- *CONFIG\_MBEDTLS\_X509\_TRUSTED\_CERT\_CALLBACK*
- *CONFIG\_MBEDTLS\_SSL\_KEEP\_PEER\_CERTIFICATE*
- *CONFIG\_MBEDTLS\_SSL\_CID\_PADDING\_GRANULARITY*
- *CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3*
- *CONFIG\_MBEDTLS\_ECDH\_LEGACY\_CONTEXT*
- *CONFIG\_MBEDTLS\_SSL\_VARIABLE\_BUFFER\_LENGTH*

## CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3

Support TLS 1.3 protocol

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

### **TLS 1.3 related configurations** Contains:

- *CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_EPHEMERAL*
- *CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_COMPATIBILITY\_MODE*
- *CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK\_EPHEMERAL*
- *CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK*

## CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_COMPATIBILITY\_MODE

TLS 1.3 middlebox compatibility mode

*Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3 > TLS 1.3 related configurations*

**Default value:**

- Yes (enabled) if *CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3*

## CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK

TLS 1.3 PSK key exchange mode

*Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3 > TLS 1.3 related configurations*

**Default value:**

- Yes (enabled) if *CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3*

### CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_EPHEMERAL

TLS 1.3 ephemeral key exchange mode

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#) > [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#) > [TLS 1.3 related configurations](#)

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#)

### CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK\_EPHEMERAL

TLS 1.3 PSK ephemeral key exchange mode

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#) > [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#) > [TLS 1.3 related configurations](#)

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#)

### CONFIG\_MBEDTLS\_SSL\_VARIABLE\_BUFFER\_LENGTH

Variable SSL buffer length

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_ECDH\_LEGACY\_CONTEXT

Use a backward compatible ECDH context (Experimental)

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)

Use the legacy ECDH context format. Define this option only if you enable MBEDTLS\_ECP\_RESTARTABLE or if you want to access ECDH context fields directly.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_ECDH\\_C](#) && [CONFIG\\_MBEDTLS\\_ECP\\_RESTARTABLE](#)

### CONFIG\_MBEDTLS\_X509\_TRUSTED\_CERT\_CALLBACK

Enable trusted certificate callbacks

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedtls documentation for required API and more details.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_CONTEXT\_SERIALIZATION

Enable serialization of the TLS context structures

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)

Enable serialization of the TLS context structures This is a local optimization in handling a single, potentially long-lived connection.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_SSL\_KEEP\_PEER\_CERTIFICATE**

Keep peer certificate after handshake completion

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Keep the peer's certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedTLS documentation for required API and more details.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_PKCS7\_C**

Enable PKCS #7

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Enable PKCS #7 core for using PKCS #7-formatted signatures.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_SSL\_CID\_PADDING\_GRANULARITY**

Record plaintext padding

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Controls the use of record plaintext padding in TLS 1.3 and when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3` || `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**Default value:**

- 16 if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3` || `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**DTLS-based configurations** Contains:

- `CONFIG_MBEDTLS_SSL_DTLS_SRTP`
- `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID**

Support for the DTLS Connection ID extension

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

### **CONFIG\_MBEDTLS\_SSL\_CID\_IN\_LEN\_MAX**

Maximum length of CIDs used for incoming DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID*

Maximum length of CIDs used for incoming DTLS messages

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**

- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

### **CONFIG\_MBEDTLS\_SSL\_CID\_OUT\_LEN\_MAX**

Maximum length of CIDs used for outgoing DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID*

Maximum length of CIDs used for outgoing DTLS messages

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**

- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

### **CONFIG\_MBEDTLS\_SSL\_DTLS\_SRTP**

Enable support for negotiation of DTLS-SRTP (RFC 5764)

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the `use_srtp` extension.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Certificate Bundle** Contains:

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`

### **CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE**

Enable trusted root certificate bundle

*Found in: Component config > mbedTLS > Certificate Bundle*

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_DEFAULT\_CERTIFICATE\_BUNDLE**

Default certificate bundle options

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

Available options:

- Use the full default certificate bundle (CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_FULL)
- Use only the most common certificates from the default bundles (CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_CMN)  
Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_NONE)

**CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE**

Add custom certificates to the default bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE\_PATH**

Custom certificate bundle path

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#) > [CONFIG\\_MBEDTLS\\_CUSTOM\\_CERTIFICATE\\_BUNDLE](#)

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

**CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE\_MAX\_CERTS**

Maximum no of certificates allowed in certificate bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Default value:**

- 200

**CONFIG\_MBEDTLS\_ECP\_RESTARTABLE**

Enable mbedtls ecp restartable

*Found in:* [Component config](#) > [mbedtls](#)

Enable "non-blocking" ECC operations that can return early and be resumed.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CMAC\_C**

Enable CMAC mode for block ciphers

*Found in: [Component config](#) > [mbedtls](#)*

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_HARDWARE\_AES**

Enable hardware AES acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

**CONFIG\_MBEDTLS\_AES\_USE\_INTERRUPT**

Use interrupt for long AES operations

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)*

Use an interrupt to coordinate long AES operations.

This allows other code to run on the CPU while an AES operation is pending. Otherwise the CPU busy-waits.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_AES\_INTERRUPT\_LEVEL**

AES hardware interrupt level

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#) > [CONFIG\\_MBEDTLS\\_AES\\_USE\\_INTERRUPT](#)*

This config helps to set the interrupt priority level for the AES peripheral. Value 0 (default) means that there is no preference regarding the interrupt priority level and any level from 1 to 3 can be selected (based on the availability). Note: Higher value indicates high interrupt priority.

**Range:**

- from 0 to 3

**Default value:**

- 0

**CONFIG\_MBEDTLS\_HARDWARE\_GCM**

Enable partially hardware accelerated GCM

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)*

Enable partially hardware accelerated GCM. GHASH calculation is still done in software.

If MBEDTLS\_HARDWARE\_GCM is disabled and MBEDTLS\_HARDWARE\_AES is enabled then mbedtls will still use the hardware accelerated AES block operation, but on a single block at a time.

**Default value:**

- Yes (enabled) if SOC\_AES\_SUPPORT\_GCM && [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)

**CONFIG\_MBEDTLS\_HARDWARE\_MPI**

Enable hardware MPI (bignum) acceleration

*Found in:* [Component config](#) > [mbedtls](#)

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC\_RSA\_MAX\_BIT\_LEN bit results.

These operations are used by RSA.

**CONFIG\_MBEDTLS\_MPI\_USE\_INTERRUPT**

Use interrupt for MPI exp-mod operations

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#)

Use an interrupt to coordinate long MPI operations.

This allows other code to run on the CPU while an MPI operation is pending. Otherwise the CPU busy-waits.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_MPI\_INTERRUPT\_LEVEL**

MPI hardware interrupt level

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#) > [CONFIG\\_MBEDTLS\\_MPI\\_USE\\_INTERRUPT](#)

This config helps to set the interrupt priority level for the MPI peripheral. Value 0 (default) means that there is no preference regarding the interrupt priority level and any level from 1 to 3 can be selected (based on the availability). Note: Higher value indicates high interrupt priority.

**Range:**

- from 0 to 3

**Default value:**

- 0

**CONFIG\_MBEDTLS\_HARDWARE\_SHA**

Enable hardware SHA acceleration

*Found in:* [Component config](#) > [mbedtls](#)

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedtls.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**CONFIG\_MBEDTLS\_HARDWARE\_ECC**

Enable hardware ECC acceleration

*Found in:* [Component config > mbedTLS](#)

Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedTLS

**Default value:**

- Yes (enabled) if SOC\_ECC\_SUPPORTED

**CONFIG\_MBEDTLS\_ECC\_OTHER\_CURVES\_SOFT\_FALLBACK**

Fallback to software implementation for curves not supported in hardware

*Found in:* [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_HARDWARE\\_ECC](#)

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_HARDWARE\\_ECC](#)

**CONFIG\_MBEDTLS\_ROM\_MD5**

Use MD5 implementation in ROM

*Found in:* [Component config > mbedTLS](#)

Use ROM MD5 in mbedTLS.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_HARDWARE\_ECDSA\_SIGN**

Enable ECDSA signing using on-chip ECDSA peripheral

*Found in:* [Component config > mbedTLS](#)

Enable hardware accelerated ECDSA peripheral to sign data on curve SECP192R1 and SECP256R1 in mbedTLS.

Note that for signing, the private key has to be burnt in an efuse key block with key purpose set to ECDSA\_KEY. If no key is burnt, it will report an error

The key should be burnt in little endian format. `espefuse.py` utility handles it internally but care needs to be taken while burning using `esp_efuse` APIs

**Default value:**

- No (disabled) if SOC\_ECDSA\_SUPPORTED

**CONFIG\_MBEDTLS\_HARDWARE\_ECDSA\_VERIFY**

Enable ECDSA signature verification using on-chip ECDSA peripheral

*Found in:* [Component config > mbedTLS](#)

Enable hardware accelerated ECDSA peripheral to verify signature on curve SECP192R1 and SECP256R1 in mbedTLS.

**Default value:**

- Yes (enabled) if SOC\_ECDSA\_SUPPORTED

### CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY

Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HAVE\_TIME

Enable mbedtls time support

*Found in: [Component config](#) > [mbedtls](#)*

Enable use of time.h functions (time() and gmtime()) by mbedtls.

This option doesn't require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn't call any standard timekeeping functions.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_PLATFORM\_TIME\_ALT

Enable mbedtls time support: platform-specific

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)*

Enabling this config will provide users with a function "mbedtls\_platform\_set\_time()" that allows to set an alternative time function pointer.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HAVE\_TIME\_DATE

Enable mbedtls certificate expiry check

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)*

Enables X.509 certificate expiry checks in mbedtls.

If this option is disabled (default) then X.509 certificate "valid from" and "valid to" timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the

current system time then verification will fail with code `MBEDTLS_X509_BADCERT_FUTURE` or `MBEDTLS_X509_BADCERT_EXPIRED`.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF's SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_ECDSA\_DETERMINISTIC**

Enable deterministic ECDSA

*Found in: [Component config > mbedTLS](#)*

Standard ECDSA is "fragile" in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_SHA512\_C**

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: [Component config > mbedTLS](#)*

Enable `MBEDTLS_SHA512_C` adds support for SHA-384 and SHA-512.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_TLS\_MODE**

TLS Protocol Role

*Found in: [Component config > mbedTLS](#)*

`mbedTLS` can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

Available options:

- Server & Client (`CONFIG_MBEDTLS_TLS_SERVER_AND_CLIENT`)
- Server (`CONFIG_MBEDTLS_TLS_SERVER_ONLY`)
- Client (`CONFIG_MBEDTLS_TLS_CLIENT_ONLY`)
- None (`CONFIG_MBEDTLS_TLS_DISABLED`)

### **TLS Key Exchange Methods** Contains:

- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_DHE\\_RSA](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ECJPAKE](#)
- [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_RSA](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

### CONFIG\_MBEDTLS\_PSK\_MODES

Enable pre-shared-key ciphersuites

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_PSK

Enable PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_PSK

Enable DHE-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#) && [CONFIG\\_MBEDTLS\\_DHM\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_PSK

Enable ECDHE-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#) && [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA\_PSK

Enable RSA-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA

Enable RSA-only based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to support ciphersuites with prefix TLS-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_RSA

Enable DHE-RSA based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_DHM\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE

Support Elliptic Curve based ciphersuites

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_RSA

Enable ECDHE-RSA based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_ECDSA

Enable ECDHE-ECDSA based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_ECDSA

Enable ECDH-ECDSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_RSA

Enable ECDH-RSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECJPAKE

Enable ECJPAKE based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_ECJPAKE\\_C](#) && [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_SECP256R1\\_ENABLED](#)

### CONFIG\_MBEDTLS\_SSL\_RENEGOTIATION

Support TLS renegotiation

*Found in:* [Component config](#) > [mbedtls](#)

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don't need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_2

Support TLS 1.2 protocol

*Found in:* [Component config](#) > [mbedtls](#)

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_GMTSSL1\_1

Support GM/T SSL 1.1 protocol

*Found in:* [Component config](#) > [mbedtls](#)

Provisions for GM/T SSL 1.1 support

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_SSL\_PROTO\_DTLS**

Support DTLS protocol (all versions)

*Found in: [Component config](#) > [mbedtls](#)*

Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_SSL\_ALPN**

Support ALPN (Application Layer Protocol Negotiation)

*Found in: [Component config](#) > [mbedtls](#)*

Disabling this option will save some code size if it is not needed.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_CLIENT\_SSL\_SESSION\_TICKETS**

TLS: Client Support for RFC 5077 SSL session tickets

*Found in: [Component config](#) > [mbedtls](#)*

Client support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_SERVER\_SSL\_SESSION\_TICKETS**

TLS: Server Support for RFC 5077 SSL session tickets

*Found in: [Component config](#) > [mbedtls](#)*

Server support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### **Symmetric Ciphers** Contains:

- [CONFIG\\_MBEDTLS\\_AES\\_C](#)
- [CONFIG\\_MBEDTLS\\_BLOWFISH\\_C](#)
- [CONFIG\\_MBEDTLS\\_CAMELLIA\\_C](#)
- [CONFIG\\_MBEDTLS\\_CCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_DES\\_C](#)
- [CONFIG\\_MBEDTLS\\_GCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_NIST\\_KW\\_C](#)
- [CONFIG\\_MBEDTLS\\_XTEA\\_C](#)

### CONFIG\_MBEDTLS\_AES\_C

AES block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_CAMELLIA\_C

Camellia block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_DES\_C

DES block cipher (legacy, insecure)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_BLOWFISH\_C

Blowfish block cipher (read help)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedtls TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_XTEA\_C

XTEA block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the XTEA block cipher.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CCM\_C

CCM (Counter with CBC-MAC) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_GCM\_C

GCM (Galois/Counter) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_NIST\_KW\_C

NIST key wrapping (KW) and KW padding (KWP)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable NIST key wrapping and key wrapping padding.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_RIPEMD160\_C

Enable RIPEMD-160 hash algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable the RIPEMD-160 hash algorithm.

**Default value:**

- No (disabled)

**Certificates** Contains:

- [CONFIG\\_MBEDTLS\\_PEM\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_PEM\\_WRITE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CRL\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CSR\\_PARSE\\_C](#)

### CONFIG\_MBEDTLS\_PEM\_PARSE\_C

Read & Parse PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_PEM\_WRITE\_C

Write PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_X509\_CRL\_PARSE\_C**

X.509 CRL parsing

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Support for parsing X.509 Certificate Revocation Lists.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_X509\_CSR\_PARSE\_C**

X.509 CSR parsing

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Support for parsing X.509 Certificate Signing Requests

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECP\_C**

Elliptic Curve Ciphers

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_DHM\_C**

Diffie-Hellman-Merkle key exchange (DHM)

*Found in: [Component config](#) > [mbedtls](#)*

Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file *mbedtls/dhm.h* file.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_ECDH\_C**

Elliptic Curve Diffie-Hellman (ECDH)

*Found in: [Component config](#) > [mbedtls](#)*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_ECDSA\_C

Elliptic Curve DSA

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_ECJPAKE\_C

Elliptic curve J-PAKE

*Found in: [Component config](#) > [mbedtls](#)*

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_ECP\_DP\_SECP192R1\_ENABLED

Enable SECP192R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP192R1 Elliptic Curve.

### CONFIG\_MBEDTLS\_ECP\_DP\_SECP224R1\_ENABLED

Enable SECP224R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP224R1 Elliptic Curve.

### CONFIG\_MBEDTLS\_ECP\_DP\_SECP256R1\_ENABLED

Enable SECP256R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP256R1 Elliptic Curve.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_ECP\_DP\_SECP384R1\_ENABLED

Enable SECP384R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP384R1 Elliptic Curve.

### CONFIG\_MBEDTLS\_ECP\_DP\_SECP521R1\_ENABLED

Enable SECP521R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP521R1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP192K1\_ENABLED**

Enable SECP192K1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP192K1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP224K1\_ENABLED**

Enable SECP224K1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP224K1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP256K1\_ENABLED**

Enable SECP256K1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP256K1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_BP256R1\_ENABLED**

Enable BP256R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

support for DP Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_BP384R1\_ENABLED**

Enable BP384R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

support for DP Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_BP512R1\_ENABLED**

Enable BP512R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

support for DP Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_CURVE25519\_ENABLED**

Enable CURVE25519 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for CURVE25519 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_NIST\_OPTIM**

NIST 'modulo p' optimisations

*Found in: [Component config](#) > [mbedtls](#)*

NIST 'modulo p' optimisations increase Elliptic Curve operation performance.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECP\_FIXED\_POINT\_OPTIM**

Enable fixed-point multiplication optimisations

*Found in: [Component config](#) > [mbedtls](#)*

This configuration option enables optimizations to speedup (about 3 ~ 4 times) the ECP fixed point multiplication using pre-computed tables in the flash memory. Disabling this configuration option saves flash footprint (about 29KB if all Elliptic Curve selected) in the application binary.

# end of Elliptic Curve options

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_POLY1305\_C**

Poly1305 MAC algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for Poly1305 MAC algorithm.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CHACHA20\_C**

Chacha20 stream cipher

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for Chacha20 stream cipher.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CHACHAPOLY\_C**

ChaCha20-Poly1305 AEAD algorithm

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_CHACHA20\\_C](#)*

Enable support for ChaCha20-Poly1305 AEAD algorithm.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_CHACHA20\\_C](#) && [CONFIG\\_MBEDTLS\\_POLY1305\\_C](#)

**CONFIG\_MBEDTLS\_HKDF\_C**

HKDF algorithm (RFC 5869)

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_THREADING\_C

Enable the threading abstraction layer

Found in: *Component config > mbedTLS*

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_THREADING\_ALT

Enable threading alternate implementation

Found in: *Component config > mbedTLS > CONFIG\_MBEDTLS\_THREADING\_C*

Enable threading alt to allow your own alternate threading implementation.

**Default value:**

- Yes (enabled) if *CONFIG\_MBEDTLS\_THREADING\_C*

### CONFIG\_MBEDTLS\_THREADING\_PTHREAD

Enable threading pthread implementation

Found in: *Component config > mbedTLS > CONFIG\_MBEDTLS\_THREADING\_C*

Enable the pthread wrapper layer for the threading layer.

**Default value:**

- No (disabled) if *CONFIG\_MBEDTLS\_THREADING\_C*

### CONFIG\_MBEDTLS\_LARGE\_KEY\_SOFTWARE\_MPI

Fallback to software implementation for larger MPI values

Found in: *Component config > mbedTLS*

Fallback to software implementation for RSA key lengths larger than SOC\_RSA\_MAX\_BIT\_LEN. If this is not active then the ESP will be unable to process keys greater than SOC\_RSA\_MAX\_BIT\_LEN.

**Default value:**

- Yes (enabled)
- No (disabled)

### CONFIG\_MBEDTLS\_USE\_CRYPTRO\_ROM\_IMPL

Use ROM implementation of the crypto algorithm

Found in: *Component config > mbedTLS*

Enable this flag to use mbedtls crypto algorithm from ROM instead of ESP-IDF.

This configuration option saves flash footprint in the application binary. Note that the version of mbedtls crypto algorithm library in ROM is v2.16.12. We have done the security analysis of the mbedtls revision in ROM (v2.16.12) and ensured that affected symbols have been patched (removed). If in the future mbedtls revisions there are security issues that also affects the version in ROM (v2.16.12) then we shall patch the relevant symbols. This would increase the flash footprint and hence care must be taken to keep some reserved space for the application binary in flash layout.

**Default value:**

- No (disabled) if *ESP\_ROM\_HAS\_MBEDTLS\_CRYPTRO\_LIB* && *CONFIG\_IDF\_EXPERIMENTAL\_FEATURES*

### ESP-MQTT Configurations Contains:

- `CONFIG_MQTT_CUSTOM_OUTBOX`
- `CONFIG_MQTT_TRANSPORT_SSL`
- `CONFIG_MQTT_TRANSPORT_WEBSOCKET`
- `CONFIG_MQTT_PROTOCOL_311`
- `CONFIG_MQTT_PROTOCOL_5`
- `CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED`
- `CONFIG_MQTT_USE_CUSTOM_CONFIG`
- `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS`
- `CONFIG_MQTT_REPORT_DELETED_MESSAGES`
- `CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED`
- `CONFIG_MQTT_OUTBOX_DATA_ON_EXTERNAL_MEMORY`
- `CONFIG_MQTT_MSG_ID_INCREMENTAL`

### CONFIG\_MQTT\_PROTOCOL\_311

Enable MQTT protocol 3.1.1

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will use MQTT protocol 3.1

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_PROTOCOL\_5

Enable MQTT protocol 5.0

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will not support MQTT 5.0

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_TRANSPORT\_SSL

Enable MQTT over SSL

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over SSL with mbedtls

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET

Enable MQTT over Websocket

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over Websocket.

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET\_SECURE

Enable MQTT over Websocket Secure

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)

Enable MQTT transport over Websocket Secure.

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_MSG\_ID\_INCREMENTAL

Use Incremental Message Id

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED

Skip publish if disconnected

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_REPORT\_DELETED\_MESSAGES

Report deleted messages

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG

MQTT Using custom configurations

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Custom MQTT configurations.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_TCP\_DEFAULT\_PORT

Default MQTT over TCP port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over TCP port

**Default value:**

- 1883 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_SSL\_DEFAULT\_PORT

Default MQTT over SSL port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over SSL port

**Default value:**

- 8883 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_SSL](#)

### CONFIG\_MQTT\_WS\_DEFAULT\_PORT

Default MQTT over Websocket port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over Websocket port

**Default value:**

- 80 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)

### CONFIG\_MQTT\_WSS\_DEFAULT\_PORT

Default MQTT over Websocket Secure port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over Websocket Secure port

**Default value:**

- 443 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET\\_SECURE](#)

### CONFIG\_MQTT\_BUFFER\_SIZE

Default MQTT Buffer Size

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

This buffer size using for both transmit and receive

**Default value:**

- 1024 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_TASK\_STACK\_SIZE

MQTT task stack size

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

MQTT task stack size

**Default value:**

- 6144 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_DISABLE\_API\_LOCKS

Disable API locks

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn't access MQTT API from multiple concurrent tasks

**Default value:**

- No (disabled) if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

### CONFIG\_MQTT\_TASK\_PRIORITY

MQTT task priority

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

MQTT task priority. Higher number denotes higher priority.

**Default value:**

- 5 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

### CONFIG\_MQTT\_POLL\_READ\_TIMEOUT\_MS

MQTT transport poll read timeout

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Timeout when polling underlying transport for read.

**Default value:**

- 1000 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

### CONFIG\_MQTT\_EVENT\_QUEUE\_SIZE

Number of queued events.

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

A value higher than 1 enables multiple queued events.

**Default value:**

- 1 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

### CONFIG\_MQTT\_TASK\_CORE\_SELECTION\_ENABLED

Enable MQTT task core selection

*Found in: Component config > ESP-MQTT Configurations*

This will enable core selection

### CONFIG\_MQTT\_TASK\_CORE\_SELECTION

Core to use ?

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_TASK\_CORE\_SELECTION\_ENABLED*

Available options:

- Core 0 (CONFIG\_MQTT\_USE\_CORE\_0)
- Core 1 (CONFIG\_MQTT\_USE\_CORE\_1)

## CONFIG\_MQTT\_OUTBOX\_DATA\_ON\_EXTERNAL\_MEMORY

Use external memory for outbox data

*Found in: [Component config > ESP-MQTT Configurations](#)*

Set to true to use external memory for outbox data.

**Default value:**

- No (disabled) if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

## CONFIG\_MQTT\_CUSTOM\_OUTBOX

Enable custom outbox implementation

*Found in: [Component config > ESP-MQTT Configurations](#)*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources: `idf_component_get_property(mqtt mqtt COMPONENT_LIB) set_property(TARGET ${mqtt} PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)`

**Default value:**

- No (disabled)

## CONFIG\_MQTT\_OUTBOX\_EXPIRED\_TIMEOUT\_MS

Outbox message expired timeout[ms]

*Found in: [Component config > ESP-MQTT Configurations](#)*

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**

- 30000 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

**Newlib** Contains:

- [CONFIG\\_NEWLIB\\_NANO\\_FORMAT](#)
- [CONFIG\\_NEWLIB\\_STDIN\\_LINE\\_ENDING](#)
- [CONFIG\\_NEWLIB\\_STDOUT\\_LINE\\_ENDING](#)
- [CONFIG\\_NEWLIB\\_TIME\\_SYSCALL](#)

## CONFIG\_NEWLIB\_STDOUT\_LINE\_ENDING

Line ending for UART output

*Found in: [Component config > Newlib](#)*

This option allows configuring the desired line endings sent to UART when a newline ('n', LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR

LF: no modification is applied, stdout is sent as is

CR: each occurrence of LF is replaced with CR

This option doesn't affect behavior of the UART driver (`drivers/uart.h`).

Available options:

- CRLF ([CONFIG\\_NEWLIB\\_STDOUT\\_LINE\\_ENDING\\_CRLF](#))
- LF ([CONFIG\\_NEWLIB\\_STDOUT\\_LINE\\_ENDING\\_LF](#))

- CR (CONFIG\_NEWLIB\_STDOUT\_LINE\_ENDING\_CR)

### CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING

Line ending for UART input

*Found in: [Component config](#) > [Newlib](#)*

This option allows configuring which input sequence on UART produces a newline ('n', LF) on stdin. Three options are possible:

CRLF: CRLF is converted to LF

LF: no modification is applied, input is sent to stdin as is

CR: each occurrence of CR is replaced with LF

This option doesn't affect behavior of the UART driver (drivers/uart.h).

Available options:

- CRLF (CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING\_CRLF)
- LF (CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING\_LF)
- CR (CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING\_CR)

### CONFIG\_NEWLIB\_NANO\_FORMAT

Enable 'nano' formatting options for printf/scanf family

*Found in: [Component config](#) > [Newlib](#)*

In most chips the ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called "nano" formatting option. This option doesn't support 64-bit integer formats and C99 features, such as positional arguments.

For more details about "nano" formatting option, please see newlib readme file, search for '--enable-newlib-nano-formatted-io': <https://sourceware.org/newlib/README>

If this option is enabled and the ROM contains functions from newlib-nano, the build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

Some chips (e.g. ESP32-C6) has the full formatting versions of printf/scanf in ROM instead of the nano versions and in this building with newlib nano might actually increase the size of the binary. Which functions are present in ROM can be seen from ROM caps: ESP\_ROM\_HAS\_NEWLIB\_NANO\_FORMAT and ESP\_ROM\_HAS\_NEWLIB\_NORMAL\_FORMAT.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

### CONFIG\_NEWLIB\_TIME\_SYSCALL

Timers used for gettimeofday function

*Found in: [Component config](#) > [Newlib](#)*

This setting defines which hardware timers are used to implement 'gettimeofday' and 'time' functions in C library.

- **If both high-resolution (systimer for all targets except ESP32) and RTC timers are used**, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.

- **If only high-resolution timer (systimer) is used, gettimeofday will** provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- **If only RTC timer is used, timekeeping will continue in** deep sleep, but time will be measured at 6.(6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- **If no timers are used, gettimeofday and time functions** return -1 and set errno to ENOSYS.
- **When RTC is used for timekeeping, two RTC\_STORE registers are** used to keep time in deep sleep mode.

Available options:

- RTC and high-resolution timer (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_RTC\_HRT)
- RTC (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_RTC)
- High-resolution timer (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_HRT)
- None (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_NONE)

**NVS** Contains:

- [CONFIG\\_NVS\\_LEGACY\\_DUP\\_KEYS\\_COMPATIBILITY](#)
- [CONFIG\\_NVS\\_ENCRYPTION](#)
- [CONFIG\\_NVS\\_COMPATIBLE\\_PRE\\_V4\\_3\\_ENCRYPTION\\_FLAG](#)
- [CONFIG\\_NVS\\_ASSERT\\_ERROR\\_CHECK](#)

### CONFIG\_NVS\_ENCRYPTION

Enable NVS encryption

*Found in: [Component config](#) > [NVS](#)*

This option enables encryption for NVS. When enabled, XTS-AES is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition (enabling flash encryption is mandatory here) or to be derived from an HMAC key burnt in eFuse.

**Default value:**

- Yes (enabled) if [CONFIG\\_SECURE\\_FLASH\\_ENC\\_ENABLED](#)

### CONFIG\_NVS\_COMPATIBLE\_PRE\_V4\_3\_ENCRYPTION\_FLAG

NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in: [Component config](#) > [NVS](#)*

Enabling this will ignore "encrypted" flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have "encrypted" flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

### CONFIG\_NVS\_ASSERT\_ERROR\_CHECK

Use assertions for error checking

*Found in: [Component config](#) > [NVS](#)*

This option switches error checking type between assertions (y) or return codes (n).

**Default value:**

- No (disabled)

## CONFIG\_NVS\_LEGACY\_DUP\_KEYS\_COMPATIBILITY

Enable legacy `nvs_set` function behavior when same key is reused with different data types

Found in: *Component config > NVS*

Enabling this option will switch the `nvs_set()` family of functions to the legacy mode: when called repeatedly with the same key but different data type, the existing value in the NVS remains active and the new value is just stored, actually not accessible through corresponding `nvs_get()` call for the key given. Use this option only when your application relies on such NVS API behaviour.

**Default value:**

- No (disabled)

## NVS Security Provider Contains:

- [CONFIG\\_NVS\\_SEC\\_HMAC\\_EFUSE\\_KEY\\_ID](#)
- [CONFIG\\_NVS\\_SEC\\_KEY\\_PROTECTION\\_SCHEME](#)

## CONFIG\_NVS\_SEC\_KEY\_PROTECTION\_SCHEME

NVS Encryption: Key Protection Scheme

Found in: *Component config > NVS Security Provider*

This choice defines the default NVS encryption keys protection scheme; which will be used for the default NVS partition. Users can use the corresponding scheme registration APIs to register other schemes for the default as well as other NVS partitions.

Available options:

- Using Flash Encryption ([CONFIG\\_NVS\\_SEC\\_KEY\\_PROTECT\\_USING\\_FLASH\\_ENC](#))  
Protect the NVS Encryption Keys using Flash Encryption Requires a separate 'nvs\_keys' partition (which will be encrypted by flash encryption) for storing the NVS encryption keys
- Using HMAC peripheral ([CONFIG\\_NVS\\_SEC\\_KEY\\_PROTECT\\_USING\\_HMAC](#))  
Derive and protect the NVS Encryption Keys using the HMAC peripheral Requires the specified eFuse block ([NVS\\_SEC\\_HMAC\\_EFUSE\\_KEY\\_ID](#) or the v2 API argument) to be empty or pre-written with a key with the purpose [ESP\\_EFUSE\\_KEY\\_PURPOSE\\_HMAC\\_UP](#)

## CONFIG\_NVS\_SEC\_HMAC\_EFUSE\_KEY\_ID

eFuse key ID storing the HMAC key

Found in: *Component config > NVS Security Provider*

eFuse block key ID storing the HMAC key for deriving the NVS encryption keys

Note: The eFuse block key ID required by the HMAC scheme ([CONFIG\\_NVS\\_SEC\\_KEY\\_PROTECT\\_USING\\_HMAC](#)) is set using this config when the default NVS partition is initialized with `nvs_flash_init()`. The eFuse block key ID can also be set at runtime by passing the appropriate value to the NVS security scheme registration APIs.

**Range:**

- from 0 to 6 if [CONFIG\\_NVS\\_SEC\\_KEY\\_PROTECT\\_USING\\_HMAC](#)

**Default value:**

- 6 if [CONFIG\\_NVS\\_SEC\\_KEY\\_PROTECT\\_USING\\_HMAC](#)

**OpenThread** Contains:

- `CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT`
- `CONFIG_OPENTHREAD_DEVICE_TYPE`
- `CONFIG_OPENTHREAD_RADIO_TYPE`
- `CONFIG_OPENTHREAD_BORDER_ROUTER`
- `CONFIG_OPENTHREAD_COMMISSIONER`
- `CONFIG_OPENTHREAD_CSL_DEBUG_ENABLE`
- `CONFIG_OPENTHREAD_CSL_ENABLE`
- `CONFIG_OPENTHREAD_DIAG`
- `CONFIG_OPENTHREAD_DNS_CLIENT`
- `CONFIG_OPENTHREAD_DUA_ENABLE`
- `CONFIG_OPENTHREAD_JOINER`
- `CONFIG_OPENTHREAD_LINK_METRICS`
- `CONFIG_OPENTHREAD_MACFILTER_ENABLE`
- `CONFIG_OPENTHREAD_CLI`
- `CONFIG_OPENTHREAD_SPINEL_ONLY`
- `CONFIG_OPENTHREAD_RX_ON_WHEN_IDLE`
- `CONFIG_OPENTHREAD_RADIO_STATS_ENABLE`
- `CONFIG_OPENTHREAD_SRP_CLIENT`
- `CONFIG_OPENTHREAD_TIME_SYNC`
- `CONFIG_OPENTHREAD_NCP_VENDOR_HOOK`
- `CONFIG_OPENTHREAD_ENABLED`
- `CONFIG_OPENTHREAD_XTAL_ACCURACY`
- `CONFIG_OPENTHREAD_CSL_UNCERTAIN`
- `CONFIG_OPENTHREAD_CSL_ACCURACY`
- `CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS`
- `CONFIG_OPENTHREAD_RCP_TRANSPORT`
- `CONFIG_OPENTHREAD_MLE_MAX_CHILDREN`
- `CONFIG_OPENTHREAD_TMF_ADDR_CACHE_ENTRIES`
- `CONFIG_OPENTHREAD_SPINEL_RX_FRAME_BUFFER_SIZE`
- `CONFIG_OPENTHREAD_UART_BUFFER_SIZE`
- *Thread Address Query Config*
- *Thread Operational Dataset*
- `CONFIG_OPENTHREAD_DNS64_CLIENT`

**CONFIG\_OPENTHREAD\_ENABLED**

OpenThread

*Found in: Component config > OpenThread*

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**

- No (disabled)

**CONFIG\_OPENTHREAD\_LOG\_LEVEL\_DYNAMIC**

Enable dynamic log level control

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED*

Select this option to enable dynamic log level control for OpenThread

**Default value:**

- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG\_OPENTHREAD\_CONSOLE\_TYPE**

OpenThread console type

Found in: *Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED*

Select OpenThread console type

Available options:

- OpenThread console type UART (CONFIG\_OPENTHREAD\_CONSOLE\_TYPE\_UART)
- OpenThread console type USB Serial/JTAG Controller (CONFIG\_OPENTHREAD\_CONSOLE\_TYPE\_USB\_SERIAL\_JTAG)

### CONFIG\_OPENTHREAD\_LOG\_LEVEL

OpenThread log verbosity

Found in: *Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED*

Select OpenThread log level.

Available options:

- No logs (CONFIG\_OPENTHREAD\_LOG\_LEVEL\_NONE)
- Error logs (CONFIG\_OPENTHREAD\_LOG\_LEVEL\_CRIT)
- Warning logs (CONFIG\_OPENTHREAD\_LOG\_LEVEL\_WARN)
- Notice logs (CONFIG\_OPENTHREAD\_LOG\_LEVEL\_NOTE)
- Info logs (CONFIG\_OPENTHREAD\_LOG\_LEVEL\_INFO)
- Debug logs (CONFIG\_OPENTHREAD\_LOG\_LEVEL\_DEBG)

**Thread Operational Dataset** Contains:

- *CONFIG\_OPENTHREAD\_NETWORK\_EXTPANID*
- *CONFIG\_OPENTHREAD\_MESH\_LOCAL\_PREFIX*
- *CONFIG\_OPENTHREAD\_NETWORK\_CHANNEL*
- *CONFIG\_OPENTHREAD\_NETWORK\_MASTERKEY*
- *CONFIG\_OPENTHREAD\_NETWORK\_NAME*
- *CONFIG\_OPENTHREAD\_NETWORK\_PANID*
- *CONFIG\_OPENTHREAD\_NETWORK\_PSKC*

### CONFIG\_OPENTHREAD\_NETWORK\_NAME

OpenThread network name

Found in: *Component config > OpenThread > Thread Operational Dataset*

**Default value:**

- "OpenThread-ESP"

### CONFIG\_OPENTHREAD\_MESH\_LOCAL\_PREFIX

OpenThread mesh local prefix, format <address>/<plen>

Found in: *Component config > OpenThread > Thread Operational Dataset*

A string in the format "<address>/<plen>", where <address> is an IPv6 address and <plen> is a prefix length. For example "fd00:db8:a0:0::/64"

**Default value:**

- "fd00:db8:a0:0::/64"

### CONFIG\_OPENTHREAD\_NETWORK\_CHANNEL

OpenThread network channel

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

**Range:**

- from 11 to 26

**Default value:**

- 15

### CONFIG\_OPENTHREAD\_NETWORK\_PANID

OpenThread network pan id

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

**Range:**

- from 0 to 0xFFFFE

**Default value:**

- "0x1234"

### CONFIG\_OPENTHREAD\_NETWORK\_EXTPANID

OpenThread extended pan id

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

The OpenThread network extended pan id in hex string format

**Default value:**

- dead00beef00cafe

### CONFIG\_OPENTHREAD\_NETWORK\_MASTERKEY

OpenThread network key

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

The OpenThread network network key in hex string format

**Default value:**

- 00112233445566778899aabbccddeeff

### CONFIG\_OPENTHREAD\_NETWORK\_PSKC

OpenThread pre-shared commissioner key

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

The OpenThread pre-shared commissioner key in hex string format

**Default value:**

- 104810e2315100afd6bc9215a6bfac53

### CONFIG\_OPENTHREAD\_RADIO\_TYPE

Config the Thread radio type

*Found in: [Component config](#) > [OpenThread](#)*

Configure how OpenThread connects to the 15.4 radio

Available options:

- Native 15.4 radio (CONFIG\_OPENTHREAD\_RADIO\_NATIVE)  
Select this to use the native 15.4 radio.
- Connect via UART (CONFIG\_OPENTHREAD\_RADIO\_SPINEL\_UART)  
Select this to connect to a Radio Co-Processor via UART.
- Connect via SPI (CONFIG\_OPENTHREAD\_RADIO\_SPINEL\_SPI)  
Select this to connect to a Radio Co-Processor via SPI.

### CONFIG\_OPENTHREAD\_DEVICE\_TYPE

Config the Thread device type

*Found in: [Component config](#) > [OpenThread](#)*

OpenThread can be configured to different device types (FTD, MTD, Radio)

Available options:

- Full Thread Device (CONFIG\_OPENTHREAD\_FTD)  
Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (CONFIG\_OPENTHREAD\_MTD)  
Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (CONFIG\_OPENTHREAD\_RADIO)  
Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

### CONFIG\_OPENTHREAD\_RCP\_TRANSPORT

The RCP transport type

*Found in: [Component config](#) > [OpenThread](#)*

Available options:

- UART RCP (CONFIG\_OPENTHREAD\_RCP\_UART)  
Select this to enable UART connection to host.
- SPI RCP (CONFIG\_OPENTHREAD\_RCP\_SPI)  
Select this to enable SPI connection to host.

### CONFIG\_OPENTHREAD\_NCP\_VENDOR\_HOOK

Enable vendor command for RCP

*Found in: [Component config](#) > [OpenThread](#)*

Select this to enable OpenThread NCP vendor commands.

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_RADIO](#)

### CONFIG\_OPENTHREAD\_CLI

Enable Openthread Command-Line Interface

*Found in: [Component config](#) > [OpenThread](#)*

Select this option to enable Command-Line Interface in OpenThread.

**Default value:**

- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

### CONFIG\_OPENTHREAD\_DIAG

Enable diag

*Found in: Component config > OpenThread*

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

**Default value:**

- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

### CONFIG\_OPENTHREAD\_COMMISSIONER

Enable Commissioner

*Found in: Component config > OpenThread*

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

### CONFIG\_OPENTHREAD\_COMM\_MAX\_JOINER\_ENTRIES

The size of max commissioning joiner entries

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_COMMISSIONER*

**Range:**

- from 2 to 50 if `CONFIG_OPENTHREAD_COMMISSIONER`

**Default value:**

- 2 if `CONFIG_OPENTHREAD_COMMISSIONER`

### CONFIG\_OPENTHREAD\_JOINER

Enable Joiner

*Found in: Component config > OpenThread*

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

### CONFIG\_OPENTHREAD\_SRP\_CLIENT

Enable SRP Client

*Found in: Component config > OpenThread*

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

**Default value:**

- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG\_OPENTHREAD\_SRP\_CLIENT\_MAX\_SERVICES**

Specifies number of service entries in the SRP client service pool

*Found in:* *Component config > OpenThread > CONFIG\_OPENTHREAD\_SRP\_CLIENT*

Set the max buffer size of service entries in the SRP client service pool.

**Range:**

- from 2 to 20 if *CONFIG\_OPENTHREAD\_SRP\_CLIENT*

**Default value:**

- 5 if *CONFIG\_OPENTHREAD\_SRP\_CLIENT*

**CONFIG\_OPENTHREAD\_DNS\_CLIENT**

Enable DNS Client

*Found in:* *Component config > OpenThread*

Select this option to enable DNS Client in OpenThread.

**Default value:**

- Yes (enabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_BORDER\_ROUTER**

Enable Border Router

*Found in:* *Component config > OpenThread*

Select this option to enable border router features in OpenThread.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_PLATFORM\_MSGPOOL\_MANAGEMENT**

Allocate message pool buffer from PSRAM

*Found in:* *Component config > OpenThread*

If enabled, the message pool is managed by platform defined logic.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED* && (SPIRAM\_USE\_CAPS\_ALLOC || SPIRAM\_USE\_MALLOC)

**CONFIG\_OPENTHREAD\_NUM\_MESSAGE\_BUFFERS**

The number of openthread message buffers

*Found in:* *Component config > OpenThread*

**Range:**

- from 10 to 8191 if *CONFIG\_OPENTHREAD\_PLATFORM\_MSGPOOL\_MANAGEMENT* && *CONFIG\_OPENTHREAD\_ENABLED*

**Default value:**

- 65 if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_SPINEL\_RX\_FRAME\_BUFFER\_SIZE**

The size of openthread spinel rx frame buffer

Found in: *Component config > OpenThread*

**Range:**

- from 512 to 8192 if `CONFIG_OPENTHREAD_ENABLED` || `CONFIG_OPENTHREAD_SPINEL_ONLY`

**Default value:**

- 1024 if `CONFIG_OPENTHREAD_ENABLED` || `CONFIG_OPENTHREAD_SPINEL_ONLY`

**CONFIG\_OPENTHREAD\_MLE\_MAX\_CHILDREN**

The size of max MLE children entries

Found in: *Component config > OpenThread*

**Range:**

- from 5 to 50 if `CONFIG_OPENTHREAD_ENABLED`

**Default value:**

- 10 if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG\_OPENTHREAD\_TMF\_ADDR\_CACHE\_ENTRIES**

The size of max TMF address cache entries

Found in: *Component config > OpenThread*

**Range:**

- from 5 to 50 if `CONFIG_OPENTHREAD_ENABLED`

**Default value:**

- 20 if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG\_OPENTHREAD\_DNS64\_CLIENT**

Use dns64 client

Found in: *Component config > OpenThread*

Select this option to acquire NAT64 address from dns servers.

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED` && `CONFIG_LWIP_IPV4`

**CONFIG\_OPENTHREAD\_DNS\_SERVER\_ADDR**

DNS server address (IPv4)

Found in: *Component config > OpenThread > CONFIG\_OPENTHREAD\_DNS64\_CLIENT*

Set the DNS server IPv4 address.

**Default value:**

- "8.8.8.8" if `CONFIG_OPENTHREAD_DNS64_CLIENT`

**CONFIG\_OPENTHREAD\_UART\_BUFFER\_SIZE**

The uart received buffer size of openthread

Found in: *Component config > OpenThread*

Set the OpenThread UART buffer size.

**Range:**

- from 128 to 1024 if *CONFIG\_OPENTHREAD\_ENABLED*

**Default value:**

- 768 if *CONFIG\_OPENTHREAD\_ENABLED*

### **CONFIG\_OPENTHREAD\_LINK\_METRICS**

Enable link metrics feature

*Found in: Component config > OpenThread*

Select this option to enable link metrics feature

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### **CONFIG\_OPENTHREAD\_MACFILTER\_ENABLE**

Enable mac filter feature

*Found in: Component config > OpenThread*

Select this option to enable mac filter feature

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### **CONFIG\_OPENTHREAD\_CSL\_ENABLE**

Enable CSL feature

*Found in: Component config > OpenThread*

Select this option to enable CSL feature

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### **CONFIG\_OPENTHREAD\_XTAL\_ACCURACY**

The accuracy of the XTAL

*Found in: Component config > OpenThread*

The device's XTAL accuracy, in ppm.

**Default value:**

- 130

### **CONFIG\_OPENTHREAD\_CSL\_ACCURACY**

The current CSL rx/tx scheduling drift, in units of  $\pm$  ppm

*Found in: Component config > OpenThread*

The current accuracy of the clock used for scheduling CSL operations

**Default value:**

- 1 if *CONFIG\_OPENTHREAD\_CSL\_ENABLE*

**CONFIG\_OPENTHREAD\_CSL\_UNCERTAIN**

The CSL Uncertainty in units of 10 us.

*Found in:* [Component config > OpenThread](#)

The fixed uncertainty of the Device for scheduling CSL Transmissions in units of 10 microseconds.

**Default value:**

- 1 if [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#)

**CONFIG\_OPENTHREAD\_CSL\_DEBUG\_ENABLE**

Enable CSL debug

*Found in:* [Component config > OpenThread](#)

Select this option to set rx on when sleep in CSL feature, only for debug

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#)

**CONFIG\_OPENTHREAD\_DUA\_ENABLE**

Enable Domain Unicast Address feature

*Found in:* [Component config > OpenThread](#)

Only used for Thread1.2 certification

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

**CONFIG\_OPENTHREAD\_TIME\_SYNC**

Enable the time synchronization service feature

*Found in:* [Component config > OpenThread](#)

Select this option to enable time synchronization feature, the devices in the same Thread network could sync to the same network time.

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

**CONFIG\_OPENTHREAD\_RADIO\_STATS\_ENABLE**

Enable Radio Statistics feature

*Found in:* [Component config > OpenThread](#)

Select this option to enable the radio statistics feature, you can use radio command to print some radio Statistics informations.

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_FTD](#) || [CONFIG\\_OPENTHREAD\\_MTD](#)

**CONFIG\_OPENTHREAD\_SPINEL\_ONLY**

Enable OpenThread External Radio Spinel feature

*Found in:* [Component config > OpenThread](#)

Select this option to enable the OpenThread Radio Spinel for external protocol stack, such as Zigbee.

**Default value:**

- No (disabled)

### CONFIG\_OPENTHREAD\_RX\_ON\_WHEN\_IDLE

Enable OpenThread radio capability rx on when idle

Found in: *Component config > OpenThread*

Select this option to enable OpenThread radio capability rx on when idle. Do not support this feature when SW coexistence is enabled.

**Default value:**

- No (disabled) if *CONFIG\_ESP\_COEX\_SW\_COEXIST\_ENABLE*

### Thread Address Query Config Contains:

- *CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_RETRY\_DELAY*
- *CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_MAX\_RETRY\_DELAY*
- *CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_TIMEOUT*

### CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_TIMEOUT

Timeout value (in seconds) for a address notification response after sending an address query.

Found in: *Component config > OpenThread > Thread Address Query Config*

**Range:**

- from 1 to 10 if *CONFIG\_OPENTHREAD\_FTD* || *CONFIG\_OPENTHREAD\_MTD*

**Default value:**

- 3 if *CONFIG\_OPENTHREAD\_FTD* || *CONFIG\_OPENTHREAD\_MTD*

### CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_RETRY\_DELAY

Initial retry delay for address query (in seconds).

Found in: *Component config > OpenThread > Thread Address Query Config*

**Range:**

- from 1 to 120 if *CONFIG\_OPENTHREAD\_FTD* || *CONFIG\_OPENTHREAD\_MTD*

**Default value:**

- 15 if *CONFIG\_OPENTHREAD\_FTD* || *CONFIG\_OPENTHREAD\_MTD*

### CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_MAX\_RETRY\_DELAY

Maximum retry delay for address query (in seconds).

Found in: *Component config > OpenThread > Thread Address Query Config*

**Range:**

- from 96 to 960 if *CONFIG\_OPENTHREAD\_FTD* || *CONFIG\_OPENTHREAD\_MTD*

**Default value:**

- 120 if *CONFIG\_OPENTHREAD\_FTD* || *CONFIG\_OPENTHREAD\_MTD*

### Protocomm Contains:

- *CONFIG\_ESP\_PROTOCOMM\_SUPPORT\_SECURITY\_VERSION\_0*
- *CONFIG\_ESP\_PROTOCOMM\_SUPPORT\_SECURITY\_VERSION\_1*
- *CONFIG\_ESP\_PROTOCOMM\_SUPPORT\_SECURITY\_VERSION\_2*

### CONFIG\_ESP\_PROTCOMM\_SUPPORT\_SECURITY\_VERSION\_0

Support protocomm security version 0 (no security)

*Found in: [Component config](#) > [Protocomm](#)*

Enable support of security version 0. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_PROTCOMM\_SUPPORT\_SECURITY\_VERSION\_1

Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption)

*Found in: [Component config](#) > [Protocomm](#)*

Enable support of security version 1. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_PROTCOMM\_SUPPORT\_SECURITY\_VERSION\_2

Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption)

*Found in: [Component config](#) > [Protocomm](#)*

Enable support of security version 2. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**

- Yes (enabled)

### **PThreads** Contains:

- [CONFIG\\_PTHREAD\\_TASK\\_NAME\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_CORE\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_PRIO\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_STACK\\_SIZE\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_STACK\\_MIN](#)

### CONFIG\_PTHREAD\_TASK\_PRIO\_DEFAULT

Default task priority

*Found in: [Component config](#) > [PThreads](#)*

Priority used to create new tasks with default pthread parameters.

**Range:**

- from 0 to 255

**Default value:**

- 5

### CONFIG\_PTHREAD\_TASK\_STACK\_SIZE\_DEFAULT

Default task stack size

Found in: [Component config > PThreads](#)

Stack size used to create new tasks with default pthread parameters.

**Default value:**

- 3072

### CONFIG\_PTHREAD\_STACK\_MIN

Minimum allowed pthread stack size

Found in: [Component config > PThreads](#)

Minimum allowed pthread stack size set in attributes passed to pthread\_create

**Default value:**

- 768

### CONFIG\_PTHREAD\_TASK\_CORE\_DEFAULT

Default pthread core affinity

Found in: [Component config > PThreads](#)

The default core to which pthreads are pinned.

Available options:

- No affinity (CONFIG\_PTHREAD\_DEFAULT\_CORE\_NO\_AFFINITY)
- Core 0 (CONFIG\_PTHREAD\_DEFAULT\_CORE\_0)
- Core 1 (CONFIG\_PTHREAD\_DEFAULT\_CORE\_1)

### CONFIG\_PTHREAD\_TASK\_NAME\_DEFAULT

Default name of pthreads

Found in: [Component config > PThreads](#)

The default name of pthreads.

**Default value:**

- "pthread"

**SoC Settings** Contains:

- [MMU Config](#)

### MMU Config

**Main Flash configuration** Contains:

- [Optional and Experimental Features \(READ DOCS FIRST\)](#)
- [SPI Flash behavior when brownout](#)

**SPI Flash behavior when brownout** Contains:

- [CONFIG\\_SPI\\_FLASH\\_BROWNOUT\\_RESET\\_XMC](#)

## CONFIG\_SPI\_FLASH\_BROWNOUT\_RESET\_XMC

Enable sending reset when brownout for XMC flash chips

*Found in: [Component config](#) > [Main Flash configuration](#) > [SPI Flash behavior when brownout](#)*

When this option is selected, the patch will be enabled for XMC. Follow the recommended flow by XMC for better stability.

DO NOT DISABLE UNLESS YOU KNOW WHAT YOU ARE DOING.

### Optional and Experimental Features (READ DOCS FIRST) Contains:

- [CONFIG\\_SPI\\_FLASH\\_AUTO\\_SUSPEND](#)
- [CONFIG\\_SPI\\_FLASH\\_HPM\\_DC](#)

## CONFIG\_SPI\_FLASH\_HPM\_DC

Support HPM using DC (READ DOCS FIRST)

*Found in: [Component config](#) > [Main Flash configuration](#) > [Optional and Experimental Features \(READ DOCS FIRST\)](#)*

This feature needs your bootloader to be compiled DC-aware (BOOT-LOADER\_FLASH\_DC\_AWARE=y). Otherwise the chip will not be able to boot after a reset.

Available options:

- Auto (Enable when bootloader support enabled (BOOT-LOADER\_FLASH\_DC\_AWARE)) (CONFIG\_SPI\_FLASH\_HPM\_DC\_AUTO)
- Disable (READ DOCS FIRST) (CONFIG\_SPI\_FLASH\_HPM\_DC\_DISABLE)

## CONFIG\_SPI\_FLASH\_AUTO\_SUSPEND

Auto suspend long erase/write operations (READ DOCS FIRST)

*Found in: [Component config](#) > [Main Flash configuration](#) > [Optional and Experimental Features \(READ DOCS FIRST\)](#)*

This option is disabled by default because it is supported only for specific flash chips and for specific Espressif chips. To evaluate if you can use this feature refer to *Optional Features for Flash > Auto Suspend & Resume* of the *ESP-IDF Programming Guide*.

CAUTION: If you want to OTA to an app with this feature turned on, please make sure the bootloader has the support for it. (later than IDF v4.3)

If you are using an official Espressif module, please contact Espressif Business support to check if the module has the flash that support this feature installed. Also refer to *Concurrency Constraints for Flash on SPI1 > Flash Auto Suspend Feature* before enabling this option.

### SPI Flash driver Contains:

- *Auto-detect flash chips*
- [CONFIG\\_SPI\\_FLASH\\_BYPASS\\_BLOCK\\_ERASE](#)
- [CONFIG\\_SPI\\_FLASH\\_ENABLE\\_ENCRYPTED\\_READ\\_WRITE](#)
- [CONFIG\\_SPI\\_FLASH\\_ENABLE\\_COUNTERS](#)
- [CONFIG\\_SPI\\_FLASH\\_ROM\\_DRIVER\\_PATCH](#)
- [CONFIG\\_SPI\\_FLASH\\_YIELD\\_DURING\\_ERASE](#)
- [CONFIG\\_SPI\\_FLASH\\_CHECK\\_ERASE\\_TIMEOUT\\_DISABLED](#)
- [CONFIG\\_SPI\\_FLASH\\_WRITE\\_CHUNK\\_SIZE](#)
- [CONFIG\\_SPI\\_FLASH\\_OVERRIDE\\_CHIP\\_DRIVER\\_LIST](#)
- [CONFIG\\_SPI\\_FLASH\\_SIZE\\_OVERRIDE](#)

- [CONFIG\\_SPI\\_FLASH\\_ROM\\_IMPL](#)
- [CONFIG\\_SPI\\_FLASH\\_VERIFY\\_WRITE](#)
- [CONFIG\\_SPI\\_FLASH\\_DANGEROUS\\_WRITE](#)

### **CONFIG\_SPI\_FLASH\_VERIFY\_WRITE**

Verify SPI flash writes

*Found in: [Component config](#) > [SPI Flash driver](#)*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

### **CONFIG\_SPI\_FLASH\_LOG\_FAILED\_WRITE**

Log errors if verification fails

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_VERIFY\\_WRITE](#)*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

### **CONFIG\_SPI\_FLASH\_WARN\_SETTING\_ZERO\_TO\_ONE**

Log warning if writing zero bits to ones

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_VERIFY\\_WRITE](#)*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

### **CONFIG\_SPI\_FLASH\_ENABLE\_COUNTERS**

Enable operation counters

*Found in: [Component config](#) > [SPI Flash driver](#)*

This option enables the following APIs:

- `esp_flash_reset_counters`
- `esp_flash_dump_counters`
- `esp_flash_get_counters`

These APIs may be used to collect performance data for `spi_flash` APIs and to help understand behaviour of libraries which use SPI flash.

### **CONFIG\_SPI\_FLASH\_ROM\_DRIVER\_PATCH**

Enable SPI flash ROM driver patched functions

*Found in: [Component config](#) > [SPI Flash driver](#)*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

### CONFIG\_SPI\_FLASH\_ROM\_IMPL

Use esp\_flash implementation in ROM

*Found in: Component config > SPI Flash driver*

Enable this flag to use new SPI flash driver functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. But you can use all of our flash features.

If making this as "y" in your project, you will increase free IRAM. But you may miss out on some flash features and support for new flash chips.

Currently the ROM cannot support the following features:

- SPI\_FLASH\_AUTO\_SUSPEND (C3, S3)

### CONFIG\_SPI\_FLASH\_DANGEROUS\_WRITE

Writing to dangerous flash regions

*Found in: Component config > SPI Flash driver*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the esp\_rom\_xxx SPI flash ROM functions. These functions should not be called directly from IDF applications.

Available options:

- Aborts (CONFIG\_SPI\_FLASH\_DANGEROUS\_WRITE\_ABORTS)
- Fails (CONFIG\_SPI\_FLASH\_DANGEROUS\_WRITE\_FAILS)
- Allowed (CONFIG\_SPI\_FLASH\_DANGEROUS\_WRITE\_ALLOWED)

### CONFIG\_SPI\_FLASH\_BYPASS\_BLOCK\_ERASE

Bypass a block erase and always do sector erase

*Found in: Component config > SPI Flash driver*

Some flash chips can have very high "max" erase times, especially for block erase (32KB or 64KB). This option allows to bypass "block erase" and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

### CONFIG\_SPI\_FLASH\_YIELD\_DURING\_ERASE

Enables yield operation during flash erase

*Found in: Component config > SPI Flash driver*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks. Please use this configuration together with SPI\\_FLASH\\_ERASE\\_YIELD\\_DURATION\\_MS and SPI\\_FLASH\\_ERASE\\_YIELD\\_TICKS after carefully checking flash datasheet to avoid a watchdog timeout. For more information, please check *SPI Flash API* reference documentation under section *OS Function*.

**CONFIG\_SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS**

Duration of erasing to yield CPUs (ms)

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_YIELD\\_DURING\\_ERASE](#)*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

**CONFIG\_SPI\_FLASH\_ERASE\_YIELD\_TICKS**

CPU release time (tick) for an erase operation

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_YIELD\\_DURING\\_ERASE](#)*

Defines how many ticks will be before returning to continue a erasing.

**CONFIG\_SPI\_FLASH\_WRITE\_CHUNK\_SIZE**

Flash write chunk size

*Found in: [Component config](#) > [SPI Flash driver](#)*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

**CONFIG\_SPI\_FLASH\_SIZE\_OVERRIDE**

Override flash size in bootloader header by ESPTOOLPY\_FLASHSIZE

*Found in: [Component config](#) > [SPI Flash driver](#)*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY\_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

**CONFIG\_SPI\_FLASH\_CHECK\_ERASE\_TIMEOUT\_DISABLED**

Flash timeout checkout disabled

*Found in: [Component config](#) > [SPI Flash driver](#)*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

**CONFIG\_SPI\_FLASH\_OVERRIDE\_CHIP\_DRIVER\_LIST**

Override default chip driver list

*Found in: [Component config](#) > [SPI Flash driver](#)*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the *default\_registered\_chips* structure must be provided by the user.

See example: `custom_chip_driver` under `examples/storage` for more details.

**Auto-detect flash chips** Contains:

- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_BOYA\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_GD\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_ISSI\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_MXIC\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_TH\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_WINBOND\\_CHIP](#)

**CONFIG\_SPI\_FLASH\_SUPPORT\_ISSI\_CHIP**

ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**CONFIG\_SPI\_FLASH\_SUPPORT\_MXIC\_CHIP**

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**CONFIG\_SPI\_FLASH\_SUPPORT\_GD\_CHIP**

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip\_drv` member of the chip struct. If you are using Wrover modules, please don't disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

**CONFIG\_SPI\_FLASH\_SUPPORT\_WINBOND\_CHIP**

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**CONFIG\_SPI\_FLASH\_SUPPORT\_BOYA\_CHIP**

BOYA

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

## CONFIG\_SPI\_FLASH\_SUPPORT\_TH\_CHIP

TH

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of TH chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

## CONFIG\_SPI\_FLASH\_ENABLE\_ENCRYPTED\_READ\_WRITE

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

## SPIFFS Configuration Contains:

- *Debug Configuration*
- *CONFIG\_SPIFFS\_USE\_MAGIC*
- *CONFIG\_SPIFFS\_GC\_STATS*
- *CONFIG\_SPIFFS\_PAGE\_CHECK*
- *CONFIG\_SPIFFS\_FOLLOW\_SYMLINKS*
- *CONFIG\_SPIFFS\_MAX\_PARTITIONS*
- *CONFIG\_SPIFFS\_USE\_MTIME*
- *CONFIG\_SPIFFS\_GC\_MAX\_RUNS*
- *CONFIG\_SPIFFS\_OBJ\_NAME\_LEN*
- *CONFIG\_SPIFFS\_META\_LENGTH*
- *SPIFFS Cache Configuration*
- *CONFIG\_SPIFFS\_PAGE\_SIZE*
- *CONFIG\_SPIFFS\_MTIME\_WIDE\_64\_BITS*

## CONFIG\_SPIFFS\_MAX\_PARTITIONS

Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.

**Range:**

- from 1 to 10

**Default value:**

- 3

## SPIFFS Cache Configuration Contains:

- *CONFIG\_SPIFFS\_CACHE*

## CONFIG\_SPIFFS\_CACHE

Enable SPIFFS Cache

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration*

Enables/disable memory read caching of nucleus file system operations.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_CACHE\_WR

Enable SPIFFS Write Caching

*Found in:* [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#) > [CONFIG\\_SPIFFS\\_CACHE](#)

Enables memory write caching for file descriptors in hydrogen.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_CACHE\_STATS

Enable SPIFFS Cache Statistics

*Found in:* [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#) > [CONFIG\\_SPIFFS\\_CACHE](#)

Enable/disable statistics on caching. Debug/test purpose only.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_PAGE\_CHECK

Enable SPIFFS Page Check

*Found in:* [Component config](#) > [SPIFFS Configuration](#)

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_GC\_MAX\_RUNS

Set Maximum GC Runs

*Found in:* [Component config](#) > [SPIFFS Configuration](#)

Define maximum number of GC runs to perform to reach desired free pages.

**Range:**

- from 1 to 10000

**Default value:**

- 10

### CONFIG\_SPIFFS\_GC\_STATS

Enable SPIFFS GC Statistics

*Found in:* [Component config](#) > [SPIFFS Configuration](#)

Enable/disable statistics on gc. Debug/test purpose only.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_PAGE\_SIZE

SPIFFS logical page size

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**Range:**

- from 256 to 1024

**Default value:**

- 256

### CONFIG\_SPIFFS\_OBJ\_NAME\_LEN

Set SPIFFS Maximum Name Length

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS\_OBJ\_NAME\_LEN - 1.

SPIFFS\_OBJ\_NAME\_LEN + SPIFFS\_META\_LENGTH should not exceed SPIFFS\_PAGE\_SIZE - 64.

**Range:**

- from 1 to 256

**Default value:**

- 32

### CONFIG\_SPIFFS\_FOLLOW\_SYMLINKS

Enable symbolic links for image creation

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_USE\_MAGIC

Enable SPIFFS Filesystem Magic

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_USE\_MAGIC\_LENGTH

Enable SPIFFS Filesystem Length Magic

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [CONFIG\\_SPIFFS\\_USE\\_MAGIC](#)*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_META\_LENGTH

Size of per-file metadata field

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS\_OBJ\_NAME\_LEN + SPIFFS\_META\_LENGTH should not exceed SPIFFS\_PAGE\_SIZE - 64.

**Default value:**

- 4

### CONFIG\_SPIFFS\_USE\_MTIME

Save file modification time

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_MTIME\_WIDE\_64\_BITS

The time field occupies 64 bits in the image instead of 32 bits

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS\_META\_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with 64-bit time\_t support.

**Default value:**

- No (disabled) if `CONFIG_SPIFFS_META_LENGTH >= 8`

**Debug Configuration** Contains:

- [CONFIG\\_SPIFFS\\_DBG](#)
- [CONFIG\\_SPIFFS\\_API\\_DBG](#)
- [CONFIG\\_SPIFFS\\_CACHE\\_DBG](#)
- [CONFIG\\_SPIFFS\\_CHECK\\_DBG](#)
- [CONFIG\\_SPIFFS\\_TEST\\_VISUALISATION](#)
- [CONFIG\\_SPIFFS\\_GC\\_DBG](#)

### CONFIG\_SPIFFS\_DBG

Enable general SPIFFS debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print general debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_API\_DBG**

Enable SPIFFS API debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print API debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_GC\_DBG**

Enable SPIFFS Garbage Cleaner debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print GC debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_CACHE\_DBG**

Enable SPIFFS Cache debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print cache debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_CHECK\_DBG**

Enable SPIFFS Filesystem Check debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print Filesystem Check debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_TEST\_VISUALISATION**

Enable SPIFFS Filesystem Visualization

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enable this option to enable SPIFFS\_vis function in the API.

**Default value:**

- No (disabled)

**TCP Transport** Contains:

- [Websocket](#)

**Websocket** Contains:

- [CONFIG\\_WS\\_TRANSPORT](#)

### CONFIG\_WS\_TRANSPORT

Enable Websocket Transport

*Found in: [Component config](#) > [TCP Transport](#) > [Websocket](#)*

Enable support for creating websocket transport.

**Default value:**

- Yes (enabled)

### CONFIG\_WS\_BUFFER\_SIZE

Websocket transport buffer size

*Found in: [Component config](#) > [TCP Transport](#) > [Websocket](#) > [CONFIG\\_WS\\_TRANSPORT](#)*

Size of the buffer used for constructing the HTTP Upgrade request during connect

**Default value:**

- 1024

### CONFIG\_WS\_DYNAMIC\_BUFFER

Using dynamic websocket transport buffer

*Found in: [Component config](#) > [TCP Transport](#) > [Websocket](#) > [CONFIG\\_WS\\_TRANSPORT](#)*

If enable this option, websocket transport buffer will be freed after connection succeed to save more heap.

**Default value:**

- No (disabled)

**Ultra Low Power (ULP) Co-processor** Contains:

- [CONFIG\\_ULP\\_COPROC\\_ENABLED](#)
- [ULP RISC-V Settings](#)

### CONFIG\_ULP\_COPROC\_ENABLED

Enable Ultra Low Power (ULP) Co-processor

*Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#)*

Enable this feature if you plan to use the ULP Co-processor. Once this option is enabled, further ULP co-processor configuration will appear in the menu.

**Default value:**

- No (disabled) if `SOC_ULP_SUPPORTED || SOC_RISCV_COPROC_SUPPORTED || SOC_LP_CORE_SUPPORTED`

### CONFIG\_ULP\_COPROC\_TYPE

ULP Co-processor type

*Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [CONFIG\\_ULP\\_COPROC\\_ENABLED](#)*

Choose the ULP Coprocessor type: ULP FSM (Finite State Machine) or ULP RISC-V.

Available options:

- ULP FSM (Finite State Machine) (`CONFIG_ULP_COPROC_TYPE_FSM`)

- ULP RISC-V (CONFIG\_ULP\_COPROC\_TYPE\_RISCV)
- LP core RISC-V (CONFIG\_ULP\_COPROC\_TYPE\_LP\_CORE)

### CONFIG\_ULP\_COPROC\_RESERVE\_MEM

RTC slow memory reserved for coprocessor

*Found in:* [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [CONFIG\\_ULP\\_COPROC\\_ENABLED](#)

Bytes of memory to reserve for ULP Co-processor firmware & data. Data is reserved at the beginning of RTC slow memory.

**Range:**

- from 32 to 8176 if [CONFIG\\_ULP\\_COPROC\\_ENABLED](#) && (SOC\_ULP\_SUPPORTED || SOC\_RISCV\_COPROC\_SUPPORTED || SOC\_LP\_CORE\_SUPPORTED)

**Default value:**

- 4096 if [CONFIG\\_ULP\\_COPROC\\_ENABLED](#) && (SOC\_ULP\_SUPPORTED || SOC\_RISCV\_COPROC\_SUPPORTED || SOC\_LP\_CORE\_SUPPORTED)

### ULP RISC-V Settings

 Contains:

- [CONFIG\\_ULP\\_RISCV\\_UART\\_BAUDRATE](#)
- [CONFIG\\_ULP\\_RISCV\\_I2C\\_RW\\_TIMEOUT](#)

### CONFIG\_ULP\_RISCV\_UART\_BAUDRATE

Baudrate used by the bitbanged ULP RISC-V UART driver

*Found in:* [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [ULP RISC-V Settings](#)

The accuracy of the bitbanged UART driver is limited, it is not recommend to increase the value above 19200.

**Default value:**

- 9600 if [CONFIG\\_ULP\\_COPROC\\_TYPE\\_RISCV](#) && (SOC\_ULP\_SUPPORTED || SOC\_RISCV\_COPROC\_SUPPORTED || SOC\_LP\_CORE\_SUPPORTED)

### CONFIG\_ULP\_RISCV\_I2C\_RW\_TIMEOUT

Set timeout for ULP RISC-V I2C transaction timeout in ticks.

*Found in:* [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [ULP RISC-V Settings](#)

Set the ULP RISC-V I2C read/write timeout. Set this value to -1 if the ULP RISC-V I2C read and write APIs should wait forever. Please note that the tick rate of the ULP co-processor would be different than the OS tick rate of the main core and therefore can have different timeout value depending on which core the API is invoked on.

**Range:**

- from -1 to 4294967295 if [CONFIG\\_ULP\\_COPROC\\_TYPE\\_RISCV](#) && (SOC\_ULP\_SUPPORTED || SOC\_RISCV\_COPROC\_SUPPORTED || SOC\_LP\_CORE\_SUPPORTED)

**Default value:**

- 500 if [CONFIG\\_ULP\\_COPROC\\_TYPE\\_RISCV](#) && (SOC\_ULP\_SUPPORTED || SOC\_RISCV\_COPROC\_SUPPORTED || SOC\_LP\_CORE\_SUPPORTED)

### Unity unit testing library

 Contains:

- [CONFIG\\_UNITY\\_ENABLE\\_COLOR](#)
- [CONFIG\\_UNITY\\_ENABLE\\_IDF\\_TEST\\_RUNNER](#)
- [CONFIG\\_UNITY\\_ENABLE\\_FIXTURE](#)

- `CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL`
- `CONFIG_UNITY_ENABLE_64BIT`
- `CONFIG_UNITY_ENABLE_DOUBLE`
- `CONFIG_UNITY_ENABLE_FLOAT`

### **CONFIG\_UNITY\_ENABLE\_FLOAT**

Support for float type

*Found in: [Component config](#) > [Unity unit testing library](#)*

If not set, assertions on float arguments will not be available.

**Default value:**

- Yes (enabled)

### **CONFIG\_UNITY\_ENABLE\_DOUBLE**

Support for double type

*Found in: [Component config](#) > [Unity unit testing library](#)*

If not set, assertions on double arguments will not be available.

**Default value:**

- Yes (enabled)

### **CONFIG\_UNITY\_ENABLE\_64BIT**

Support for 64-bit integer types

*Found in: [Component config](#) > [Unity unit testing library](#)*

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to `UNITY_ASSERT_EQUAL`, as that will cause pointer-to-int-cast warnings.

**Default value:**

- No (disabled)

### **CONFIG\_UNITY\_ENABLE\_COLOR**

Colorize test output

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, Unity will colorize test results using console escape sequences.

**Default value:**

- No (disabled)

### **CONFIG\_UNITY\_ENABLE\_IDF\_TEST\_RUNNER**

Include ESP-IDF test registration/running helpers

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, then the following features will be available:

- `TEST_CASE` macro which performs automatic registration of test functions
- Functions to run registered test functions: `unity_run_all_tests`, `unity_run_tests_with_filter`, `unity_run_single_test_by_name`.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via `unity_run_menu` function.

Disable if a different test registration mechanism is used.

**Default value:**

- Yes (enabled)

**CONFIG\_UNITY\_ENABLE\_FIXTURE**

Include Unity test fixture

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, unity\_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**

- No (disabled)

**CONFIG\_UNITY\_ENABLE\_BACKTRACE\_ON\_FAIL**

Print a backtrace when a unit test fails

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST\_ASSERT, TEST\_FAIL etc.

**Default value:**

- No (disabled)

**USB-OTG** Contains:

- [CONFIG\\_USB\\_HOST\\_ENABLE\\_ENUM\\_FILTER\\_CALLBACK](#)
- [CONFIG\\_USB\\_HOST\\_HW\\_BUFFER\\_BIAS](#)
- [CONFIG\\_USB\\_HOST\\_CONTROL\\_TRANSFER\\_MAX\\_SIZE](#)
- [Root Hub configuration](#)

**CONFIG\_USB\_HOST\_CONTROL\_TRANSFER\_MAX\_SIZE**

Largest size (in bytes) of transfers to/from default endpoints

*Found in: [Component config](#) > [USB-OTG](#)*

Each USB device attached is allocated a dedicated buffer for its OUT/IN transfers to/from the device's control endpoint. The maximum size of that buffer is determined by this option. The limited size of the transfer buffer have the following implications: - The maximum length of control transfers is limited - Device's with configuration descriptors larger than this limit cannot be supported

**Default value:**

- 256 if SOC\_USB\_OTG\_SUPPORTED

**CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS**

Hardware FIFO size biasing

*Found in: [Component config](#) > [USB-OTG](#)*

The underlying hardware has size adjustable FIFOs to cache USB packets on reception (IN) or for transmission (OUT). The size of these FIFOs will affect the largest MPS (maximum packet size) and the maximum number of packets that can be cached at any one time. The hardware contains the following FIFOs: RX (for all IN packets), Non-periodic TX (for Bulk and Control OUT packets), and Periodic TX (for Interrupt and Isochronous OUT packets). This configuration option allows biasing the FIFO sizes towards a particular use case, which may be necessary for devices that have endpoints with large MPS. The MPS limits for each biasing are listed below:

Balanced: - IN (all transfer types), 408 bytes - OUT non-periodic (Bulk/Control), 192 bytes (i.e., 3 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 192 bytes

Bias IN: - IN (all transfer types), 600 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 128 bytes

Bias Periodic OUT: - IN (all transfer types), 128 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 600 bytes

Available options:

- Balanced (CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS\_BALANCED)
- Bias IN (CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS\_IN)
- Periodic OUT (CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS\_PERIODIC\_OUT)

**Root Hub configuration** Contains:

- [CONFIG\\_USB\\_HOST\\_DEBOUNCE\\_DELAY\\_MS](#)
- [CONFIG\\_USB\\_HOST\\_RESET\\_HOLD\\_MS](#)
- [CONFIG\\_USB\\_HOST\\_RESET\\_RECOVERY\\_MS](#)
- [CONFIG\\_USB\\_HOST\\_SET\\_ADDR\\_RECOVERY\\_MS](#)

### CONFIG\_USB\_HOST\_DEBOUNCE\_DELAY\_MS

Debounce delay in ms

*Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)*

On connection of a USB device, the USB 2.0 specification requires a "debounce interval with a minimum duration of 100ms" to allow the connection to stabilize (see USB 2.0 chapter 7.1.7.3 for more details). During the debounce interval, no new connection/disconnection events are registered.

The default value is set to 250 ms to be safe.

**Default value:**

- 250 if SOC\_USB\_OTG\_SUPPORTED

### CONFIG\_USB\_HOST\_RESET\_HOLD\_MS

Reset hold in ms

*Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)*

The reset signaling can be generated on any Hub or Host Controller port by request from the USB System Software. The USB 2.0 specification requires that "the reset signaling must be driven for a minimum of 10ms" (see USB 2.0 chapter 7.1.7.5 for more details). After the reset, the hub port will transition to the Enabled state (refer to Section 11.5).

The default value is set to 30 ms to be safe.

**Default value:**

- 30 if SOC\_USB\_OTG\_SUPPORTED

### CONFIG\_USB\_HOST\_RESET\_RECOVERY\_MS

Reset recovery delay in ms

*Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)*

After a port stops driving the reset signal, the USB 2.0 specification requires that the "USB System Software guarantees a minimum of 10 ms for reset recovery" before the attached device is expected to respond to data transfers (see USB 2.0 chapter 7.1.7.3 for more details). The device may ignore any data transfers during the recovery interval.

The default value is set to 30 ms to be safe.

**Default value:**

- 30 if SOC\_USB\_OTG\_SUPPORTED

### CONFIG\_USB\_HOST\_SET\_ADDR\_RECOVERY\_MS

SetAddress() recovery time in ms

*Found in: Component config > USB-OTG > Root Hub configuration*

”After successful completion of the Status stage, the device is allowed a SetAddress() recovery interval of 2 ms. At the end of this interval, the device must be able to accept Setup packets addressed to the new address. Also, at the end of the recovery interval, the device must not respond to tokens sent to the old address (unless, of course, the old and new address is the same).” See USB 2.0 chapter 9.2.6.3 for more details.

The default value is set to 10 ms to be safe.

**Default value:**

- 10 if SOC\_USB\_OTG\_SUPPORTED

### CONFIG\_USB\_HOST\_ENABLE\_ENUM\_FILTER\_CALLBACK

Enable enumeration filter callback

*Found in: Component config > USB-OTG*

The enumeration filter callback is called before enumeration of each newly attached device. This callback allows users to control whether a device should be enumerated, and what configuration number to use when enumerating a device.

If enabled, the enumeration filter callback can be set via ‘usb\_host\_config\_t’ when calling ‘usb\_host\_install()’.

**Default value:**

- No (disabled) if SOC\_USB\_OTG\_SUPPORTED

**Virtual file system** Contains:

- [CONFIG\\_VFS\\_SUPPORT\\_IO](#)

### CONFIG\_VFS\_SUPPORT\_IO

Provide basic I/O functions

*Found in: Component config > Virtual file system*

If enabled, the following functions are provided by the VFS component.

open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:

close, read, write, ioctl, fcntl.

**Default value:**

- Yes (enabled)

### CONFIG\_VFS\_SUPPORT\_DIR

Provide directory related functions

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)*

If enabled, the following functions are provided by the VFS component.

stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir\_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

**Default value:**

- Yes (enabled)

### CONFIG\_VFS\_SUPPORT\_SELECT

Provide select function

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)*

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for "select" on UART file descriptors is not required.

### CONFIG\_VFS\_SUPPRESS\_SELECT\_DEBUG\_OUTPUT

Suppress select() related debug outputs

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#) > [CONFIG\\_VFS\\_SUPPORT\\_SELECT](#)*

Select() related functions might produce an inconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

**Default value:**

- Yes (enabled)

### CONFIG\_VFS\_SELECT\_IN\_RAM

Make VFS driver select() callbacks IRAM-safe

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#) > [CONFIG\\_VFS\\_SUPPORT\\_SELECT](#)*

If enabled, VFS driver select() callback function will be placed in IRAM.

**Default value:**

- No (disabled)

### CONFIG\_VFS\_SUPPORT\_TERMIOS

Provide termios.h functions

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)*

Disabling this option can save memory when the support for termios.h is not required.

**Default value:**

- Yes (enabled)

## CONFIG\_VFS\_MAX\_COUNT

Maximum Number of Virtual Filesystems

*Found in: Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO*

Define maximum number of virtual filesystems that can be registered.

**Range:**

- from 1 to 20

**Default value:**

- 8

## Host File System I/O (Semihosting) Contains:

- *CONFIG\_VFS\_SEMIHOSTFS\_MAX\_MOUNT\_POINTS*

## CONFIG\_VFS\_SEMIHOSTFS\_MAX\_MOUNT\_POINTS

Host FS: Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.

**Default value:**

- 1

## Wear Levelling Contains:

- *CONFIG\_WL\_SECTOR\_MODE*
- *CONFIG\_WL\_SECTOR\_SIZE*

## CONFIG\_WL\_SECTOR\_SIZE

Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

Available options:

- 512 (CONFIG\_WL\_SECTOR\_SIZE\_512)
- 4096 (CONFIG\_WL\_SECTOR\_SIZE\_4096)

## CONFIG\_WL\_SECTOR\_MODE

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

Available options:

- Performance (CONFIG\_WL\_SECTOR\_MODE\_PERF)
- Safety (CONFIG\_WL\_SECTOR\_MODE\_SAFE)

**Wi-Fi Provisioning Manager** Contains:

- [CONFIG\\_WIFI\\_PROV\\_BLE\\_BONDING](#)
- [CONFIG\\_WIFI\\_PROV\\_BLE\\_SEC\\_CONN](#)
- [CONFIG\\_WIFI\\_PROV\\_BLE\\_FORCE\\_ENCRYPTION](#)
- [CONFIG\\_WIFI\\_PROV\\_KEEP\\_BLE\\_ON\\_AFTER\\_PROV](#)
- [CONFIG\\_WIFI\\_PROV\\_SCAN\\_MAX\\_ENTRIES](#)
- [CONFIG\\_WIFI\\_PROV\\_AUTOSTOP\\_TIMEOUT](#)
- [CONFIG\\_WIFI\\_PROV\\_STA\\_SCAN\\_METHOD](#)

### **CONFIG\_WIFI\_PROV\_SCAN\_MAX\_ENTRIES**

Max Wi-Fi Scan Result Entries

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

**Range:**

- from 1 to 255

**Default value:**

- 16

### **CONFIG\_WIFI\_PROV\_AUTOSTOP\_TIMEOUT**

Provisioning auto-stop timeout

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

**Range:**

- from 5 to 600

**Default value:**

- 30

### **CONFIG\_WIFI\_PROV\_BLE\_BONDING**

Enable BLE bonding

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

This option is applicable only when provisioning transport is BLE.

### CONFIG\_WIFI\_PROV\_BLE\_SEC\_CONN

Enable BLE Secure connection flag

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enable Secure connection support when provisioning transport is BLE.

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_WIFI\_PROV\_BLE\_FORCE\_ENCRYPTION

Force Link Encryption during characteristic Read / Write

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enforce link encryption when attempting to read / write characteristic

### CONFIG\_WIFI\_PROV\_KEEP\_BLE\_ON\_AFTER\_PROV

Keep BT on after provisioning is done

*Found in: Component config > Wi-Fi Provisioning Manager*

### CONFIG\_WIFI\_PROV\_DISCONNECT\_AFTER\_PROV

Terminate connection after provisioning is done

*Found in: Component config > Wi-Fi Provisioning Manager > CONFIG\_WIFI\_PROV\_KEEP\_BLE\_ON\_AFTER\_PROV*

**Default value:**

- Yes (enabled) if `CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV`

### CONFIG\_WIFI\_PROV\_STA\_SCAN\_METHOD

Wifi Provisioning Scan Method

*Found in: Component config > Wi-Fi Provisioning Manager*

Available options:

- All Channel Scan (`CONFIG_WIFI_PROV_STA_ALL_CHANNEL_SCAN`)  
Scan will end after scanning the entire channel. This option is useful in Mesh WiFi Systems.
- Fast Scan (`CONFIG_WIFI_PROV_STA_FAST_SCAN`)  
Scan will end after an AP matching with the SSID has been detected.

### CONFIG\_IDF\_EXPERIMENTAL\_FEATURES

Make experimental features visible

*Found in:*

By enabling this option, ESP-IDF experimental feature options will be visible.

Note you should still enable a certain experimental feature option to use it, and you should read the corresponding risk warning and known issue list carefully.

Current experimental feature list:

- `CONFIG_ESPTOOLPY_FLASHFREQ_120M` && `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_DTR`

- CONFIG\_SPIRAM\_SPEED\_120M && CONFIG\_SPIRAM\_MODE\_OCT
- CONFIG\_BOOTLOADER\_CACHE\_32BIT\_ADDR\_QUAD\_FLASH
- CONFIG\_MBEDTLS\_USE\_CRYPTOROM\_IMPL

**Default value:**

- No (disabled)

**Deprecated options and their replacements**

- CONFIG\_A2DP\_ENABLE ([CONFIG\\_BT\\_A2DP\\_ENABLE](#))
- CONFIG\_A2D\_INITIAL\_TRACE\_LEVEL ([CONFIG\\_BT\\_LOG\\_A2D\\_TRACE\\_LEVEL](#))

## 2.8 配网 API

### 2.8.1 协议通信

#### 概述

协议通信 (protocomm) 组件用于管理安全会话并为多种传输提供框架。应用程序还可以直接使用 protocomm 层来增加特定扩展，用于配网或非配网使用场景。

以下功能可用于配网：

- 应用程序层面的通信安全
  - protocomm\_security0 (无安全功能)
  - protocomm\_security1 (Curve25519 密钥交换 + AES-CTR 加密/解密)
  - protocomm\_security2 (基于 SRP6a 的密钥交换 + AES-GCM 加密/解密)
- 所有权验证 (Proof-of-possession) (仅 protocomm\_security1 支持该功能)
- 盐值和验证器 (Salt and Verifier) (仅 protocomm\_security2 支持该功能)

在 protocomm 内部，protobuf (协议缓冲区) 用于建立安全会话。用户可以自行选择 (即使在不使用 Protobuf 的情况下) 实现安全性，也可以在没有任何安全层的情况下使用协议。

Protocomm 为以下各种传输提供框架：

- 低功耗蓝牙
- Wi-Fi (SoftAP + HTTPD)
- 控制台：使用该传输方案时，设备端会自动调用处理程序。相关代码片段，请参见下文传输示例。

请注意，对于 protocomm\_security1 和 protocomm\_security2，客户端仍需要执行双向握手来建立会话。关于安全握手逻辑的详情，请参阅[统一配网](#)。

#### 启用 protocomm 安全版本

关于启用/禁用相应的安全版本，请参阅 protocomm 组件的项目配置菜单。相应配置选项如下：

- 支持 protocomm\_security0，该版本无安全功能：[CONFIG\\_ESP\\_PROTOCOMM\\_SUPPORT\\_SECURITY\\_VERSION\\_0](#)，该选项默认启用。
- 支持 protocomm\_security1，使用 Curve25519 密钥交换和 AES-CTR 加密/解密：[CONFIG\\_ESP\\_PROTOCOMM\\_SUPPORT\\_SECURITY\\_VERSION\\_1](#)，该选项默认启用。
- 支持 protocomm\_security2，使用基于 SRP6a 的密钥交换和 AES-GCM 加密/解密：[CONFIG\\_ESP\\_PROTOCOMM\\_SUPPORT\\_SECURITY\\_VERSION\\_2](#)。

---

**备注：** 启用多个安全版本后可以动态控制安全版本，但也会增加固件大小。

---

#### 使用 Security 2 的 SoftAP + HTTP 传输方案示例

示例用法请参阅 [wifi\\_provisioning/src/scheme\\_softap.c](#)。

```

/* 此为将通过 protocomm 注册的端点处理程序，会直接回显接收到的数据 */
esp_err_t echo_req_handler (uint32_t session_id,
                            const uint8_t *inbuf, ssize_t inlen,
                            uint8_t **outbuf, ssize_t *outlen,
                            void *priv_data)
{
    /* Session ID 可以用于持久化 */
    printf("Session ID : %d", session_id);

    /* 回显接收到的数据 */
    *outlen = inlen;          /* 输出更新后的数据长度 */
    *outbuf = malloc(inlen); /* 将在外部释放 */
    memcpy(*outbuf, inbuf, inlen);

    /* 端点创建时传递的私有数据 */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

void stop_pc(protocomm_t *pc)
{
    /* 移除由其唯一名称标识的端点 */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* 移除由其名称标识的安全端点 */
    protocomm_unset_security(pc, "security_endpoint");

    /* 停止 HTTP 服务器 */
    protocomm_httpd_stop(pc);

    /* 删除（即释放）protocomm 实例 */

```

```

    protocomm_delete(pc);
}

```

## 使用 Security 1 的 SoftAP + HTTP 传输方案示例

示例用法请参阅 `wifi_provisioning/src/scheme_softap.c`。

```

/* 此为将通过 protocomm 注册的端点处理程序，会直接回显接收到的数据 */
esp_err_t echo_req_handler (uint32_t session_id,
                            const uint8_t *inbuf, ssize_t inlen,
                            uint8_t **outbuf, ssize_t *outlen,
                            void *priv_data)
{
    /* Session ID 可以用于持久化 */
    printf("Session ID : %d", session_id);

    /* 回显接收到的数据 */
    *outlen = inlen;          /* 输出更新后的数据长度 */
    *outbuf = malloc(inlen); /* 将在外部释放 */
    memcpy(*outbuf, inbuf, inlen);

    /* 端点创建时传递的私有数据 */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

/* 通过 HTTP 启动 protocomm 实例的示例函数 */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* 配置 protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
        .data = {
            .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
        }
    };

    /* 启动基于 HTTP 的 protocomm 服务器 */
    protocomm_httpd_start(pc, &pc_config);

    /* 从 pop_string 创建 security1 参数对象。该对象必须在 protocomm_
    ↪端点作用域内有效，且无需为静态对象，即可以在删除端点时动态分配和释放。*/
    const static protocomm_security1_params_t sec1_params = {
        .data = (const uint8_t *) strdup(pop_string),
        .len = strlen(pop_string)
    };

    /*_
    ↪在应用程序层面为通信设置安全方案。与请求处理程序类似，设置安全方案会创建一个端点，并注册_
    ↪protocomm_security1 提供的处理程序。也可以使用 protocomm_security0_
    ↪进行类似操作。单个 protocomm 实例中一次只能设置一种类型的安全方案*/
    protocomm_set_security(pc, "security_endpoint", &protocomm_security1, &sec1_
    ↪params);
}

```

(下页继续)

(续上页)

```

    /* 传递给端点的私有数据必须在 protocomm_
    ↪端点作用域内有效。该数据无需为静态数据，即可以在删除端点时动态分配和释放。*/
    static uint32_t priv_data = 1234;

    /* 为 protocomm_
    ↪实例添加一个新端点，该端点由唯一名称标识，再注册一个处理函数，在执行函数时传递私有数据。只要端点
    ↪
    protocomm_add_endpoint(pc, "echo_req_endpoint",
                           echo_req_handler, (void *) &priv_data);

    return pc;
}

/* 停止 protocomm 实例的示例函数 */
void stop_pc(protocomm_t *pc)
{
    /* 移除由其唯一名称标识的端点 */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* 移除由其名称标识的安全端点 */
    protocomm_unset_security(pc, "security_endpoint");

    /* 停止 HTTP 服务器 */
    protocomm_httpd_stop(pc);

    /* 删除（即释放）protocomm 实例 */
    protocomm_delete(pc);
}

```

## 使用 Security 0 的低功耗蓝牙传输方案示例

示例用法请参阅 `wifi_provisioning/src/scheme_ble.c`。

```

/* 通过低功耗蓝牙启动安全 protocomm 实例的示例函数 */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* 端点 UUID */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };

    /* 配置 protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* 最低有效位 <-----> 最高有效位 */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x00, 0x80,
            0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_table[0]),
        .nu_lookup = nu_lookup_table
    };

    /* 启动基于低功耗蓝牙的 protocomm 层 */
    protocomm_ble_start(pc, &config);

    /* protocomm_security0 方案不使用所有权证明，因此可以将其保持为 NULL */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security0, NULL);
}

```

(下页继续)

```

    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler, NULL);
    return pc;
}

/* 停止 protocomm 实例的示例函数 */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* 停止低功耗蓝牙 protocomm 服务 */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}

```

## API 参考

### Header File

- [components/protocomm/include/common/protocomm.h](#)
- This header file can be included with:

```
#include "protocomm.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

### Functions

`protocomm_t*` **protocomm\_new** (void)

Create a new `protocomm` instance.

This API will return a new dynamically allocated `protocomm` instance with all elements of the `protocomm_t` structure initialized to `NULL`.

#### 返回

- `protocomm_t*` : On success
- `NULL` : No memory for allocating new instance

void **protocomm\_delete** (`protocomm_t*` pc)

Delete a `protocomm` instance.

This API will deallocate a `protocomm` instance that was created using `protocomm_new()`.

**参数** `pc` -- [in] Pointer to the `protocomm` instance to be deleted

`esp_err_t` **protocomm\_add\_endpoint** (`protocomm_t*` pc, const char \*ep\_name, `protocomm_req_handler_t` h, void \*priv\_data)

Add endpoint request handler for a `protocomm` instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

---

**备注:**

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
  - This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the `protocomm_t` instance structure.
- 

**参数**

- **pc** -- **[in]** Pointer to the `protocomm` instance
- **ep\_name** -- **[in]** Endpoint identifier(name) string
- **h** -- **[in]** Endpoint handler function
- **priv\_data** -- **[in]** Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

**返回**

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

*esp\_err\_t* **protocomm\_remove\_endpoint** (*protocomm\_t* \*pc, const char \*ep\_name)

Remove endpoint request handler for a `protocomm` instance.

This API will remove a registered endpoint handler identified by an endpoint name.

---

**备注:**

- This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.
- 

**参数**

- **pc** -- **[in]** Pointer to the `protocomm` instance
- **ep\_name** -- **[in]** Endpoint identifier(name) string

**返回**

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

*esp\_err\_t* **protocomm\_open\_session** (*protocomm\_t* \*pc, uint32\_t session\_id)

Allocates internal resources for new transport session.

---

**备注:**

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
- 

**参数**

- **pc** -- **[in]** Pointer to the `protocomm` instance
- **session\_id** -- **[in]** Unique ID for a communication session

**返回**

- `ESP_OK` : Request handled successfully
- `ESP_ERR_NO_MEM` : Error allocating internal resource
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

*esp\_err\_t* **protocomm\_close\_session** (*protocomm\_t* \*pc, uint32\_t session\_id)

Frees internal resources used by a transport session.

---

**备注:**

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
-

**参数**

- **pc** -- **[in]** Pointer to the protocomm instance
- **session\_id** -- **[in]** Unique ID for a communication session

**返回**

- ESP\_OK : Request handled successfully
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_req\_handle** (*protocomm\_t* \*pc, const char \*ep\_name, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

---

**备注:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
  - Resulting output buffer must be deallocated by the caller.
- 

**参数**

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep\_name** -- **[in]** Endpoint identifier(name) string
- **session\_id** -- **[in]** Unique ID for a communication session
- **inbuf** -- **[in]** Input buffer contains input request data which is to be processed by the registered handler
- **inlen** -- **[in]** Length of the input buffer
- **outbuf** -- **[out]** Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **outlen** -- **[out]** Buffer length of the allocated output buffer

**返回**

- ESP\_OK : Request handled successfully
- ESP\_FAIL : Internal error in execution of registered handler
- ESP\_ERR\_NO\_MEM : Error allocating internal resource
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_set\_security** (*protocomm\_t* \*pc, const char \*ep\_name, const *protocomm\_security\_t* \*sec, const void \*sec\_params)

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

---

**备注:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
  - The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` and `protocomm_security2` are readily available.
- 

**参数**

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep\_name** -- **[in]** Endpoint identifier(name) string
- **sec** -- **[in]** Pointer to endpoint security instance
- **sec\_params** -- **[in]** Pointer to security params (NULL if not needed) The pointer should contain the security params struct of appropriate security version. For protocomm security version 1 and 2 `sec_params` should contain pointer to struct of type pro-

tocomm\_security1\_params\_t and protocmm\_security2\_params\_t respectively. The contents of this pointer must be valid till the security session has been running and is not closed.

#### 返回

- ESP\_OK : Success
- ESP\_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP\_ERR\_INVALID\_STATE : Security endpoint already set
- ESP\_ERR\_NO\_MEM : Error allocating endpoint resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name/handler arguments

*esp\_err\_t* **protocmm\_unset\_security** (*protocmm\_t* \*pc, const char \*ep\_name)

Remove endpoint security for a protocmm instance.

This API will remove a registered security endpoint identified by an endpoint name.

#### 参数

- **pc** -- **[in]** Pointer to the protocmm instance
- **ep\_name** -- **[in]** Endpoint identifier(name) string

#### 返回

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocmm\_set\_version** (*protocmm\_t* \*pc, const char \*ep\_name, const char \*version)

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

---

#### 备注:

- An endpoint must be bound to a valid protocmm instance, created using `protocmm_new()`.
- 

#### 参数

- **pc** -- **[in]** Pointer to the protocmm instance
- **ep\_name** -- **[in]** Endpoint identifier(name) string
- **version** -- **[in]** Version identifier(name) string

#### 返回

- ESP\_OK : Success
- ESP\_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP\_ERR\_INVALID\_STATE : Version endpoint already set
- ESP\_ERR\_NO\_MEM : Error allocating endpoint resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name/handler arguments

*esp\_err\_t* **protocmm\_unset\_version** (*protocmm\_t* \*pc, const char \*ep\_name)

Remove version verification endpoint from a protocmm instance.

This API will remove a registered version endpoint identified by an endpoint name.

#### 参数

- **pc** -- **[in]** Pointer to the protocmm instance
- **ep\_name** -- **[in]** Endpoint identifier(name) string

#### 返回

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

## Type Definitions

```
typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
```

Function prototype for protocomm endpoint handler.

```
typedef struct protocomm protocomm_t
```

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

---

**备注:** Structure of the protocomm object is kept private

---

## Header File

- [components/protocomm/include/security/protocomm\\_security.h](#)
- This header file can be included with:

```
#include "protocomm_security.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

## Structures

```
struct protocomm_security1_params
```

Protocomm Security 1 parameters: Proof Of Possession.

### Public Members

```
const uint8_t *data
```

Pointer to buffer containing the proof of possession data

```
uint16_t len
```

Length (in bytes) of the proof of possession data

```
struct protocomm_security2_params
```

Protocomm Security 2 parameters: Salt and Verifier.

### Public Members

```
const char *salt
```

Pointer to the buffer containing the salt

```
uint16_t salt_len
```

Length (in bytes) of the salt

const char \***verifier**

Pointer to the buffer containing the verifier

uint16\_t **verifier\_len**

Length (in bytes) of the verifier

struct **protocomm\_security**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

---

**备注:** This structure should not have any dynamic members to allow re-entrancy

---

### Public Members

int **ver**

Unique version number of security implementation

*esp\_err\_t* (\***init**)(*protocomm\_security\_handle\_t* \*handle)

Function for initializing/allocating security infrastructure

*esp\_err\_t* (\***cleanup**)(*protocomm\_security\_handle\_t* handle)

Function for deallocating security infrastructure

*esp\_err\_t* (\***new\_transport\_session**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id)

Starts new secure transport session with specified ID

*esp\_err\_t* (\***close\_transport\_session**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id)

Closes a secure transport session with specified ID

*esp\_err\_t* (\***security\_req\_handler**)(*protocomm\_security\_handle\_t* handle, const void \*sec\_params, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen, void \*priv\_data)

Handler function for authenticating connection request and establishing secure session

*esp\_err\_t* (\***encrypt**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen)

Function which implements the encryption algorithm

*esp\_err\_t* (\***decrypt**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen)

Function which implements the decryption algorithm

### Type Definitions

typedef struct *protocomm\_security1\_params* **protocomm\_security1\_params\_t**

Protocomm Security 1 parameters: Proof Of Possession.

typedef *protocomm\_security1\_params\_t* **protocomm\_security\_pop\_t**

typedef struct *protocomm\_security2\_params* **protocomm\_security2\_params\_t**

Protocomm Security 2 parameters: Salt and Verifier.

typedef void \***protocomm\_security\_handle\_t**

typedef struct *protocomm\_security* **protocomm\_security\_t**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

---

**备注:** This structure should not have any dynamic members to allow re-entrancy

---

## Enumerations

enum **protocomm\_security\_session\_event\_t**

Events generated by the protocomm security layer.

These events are generated while establishing secured session.

*Values:*

enumerator **PROTOCOLM\_SECURITY\_SESSION\_SETUP\_OK**

Secured session established successfully

enumerator **PROTOCOLM\_SECURITY\_SESSION\_INVALID\_SECURITY\_PARAMS**

Received invalid (NULL) security parameters (username / client public-key)

enumerator **PROTOCOLM\_SECURITY\_SESSION\_CREDENTIALS\_MISMATCH**

Received incorrect credentials (username / PoP)

## Header File

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

### Functions

*esp\_srp\_handle\_t* \***esp\_srp\_init** (*esp\_ng\_type\_t* ng)

Initialize srp context for given NG type.

---

**备注:** the handle gets freed with `esp_srp_free`

---

**参数 ng** -- NG type given by `esp_ng_type_t`

**返回** `esp_srp_handle_t`\* srp handle

void **esp\_srp\_free** (*esp\_srp\_handle\_t* \*hd)

free `esp_srp_context`

**参数 hd** -- handle to be free

*esp\_err\_t* **esp\_srp\_srv\_pubkey** (*esp\_srp\_handle\_t* \*hd, const char \*username, int username\_len, const char \*pass, int pass\_len, int salt\_len, char \*\*bytes\_B, int \*len\_B, char \*\*bytes\_salt)

Returns B (pub key) and salt. [Step2.b].

---

**备注:** \*bytes\_B MUST NOT BE FREED BY THE CALLER

---

---

备注: \*bytes\_salt MUST NOT BE FREE BY THE CALLER

---

### 参数

- **hd** -- esp\_srp handle
- **username** -- Username not expected NULL terminated
- **username\_len** -- Username length
- **pass** -- Password not expected to be NULL terminated
- **pass\_len** -- Password length
- **salt\_len** -- Salt length
- **bytes\_B** -- Public Key returned
- **len\_B** -- Length of the public key
- **bytes\_salt** -- Salt bytes generated

返回 esp\_err\_t ESP\_OK on success, appropriate error otherwise

*esp\_err\_t* **esp\_srp\_gen\_salt\_verifier** (const char \*username, int username\_len, const char \*pass, int pass\_len, char \*\*bytes\_salt, int salt\_len, char \*\*verifier, int \*verifier\_len)

Generate salt-verifier pair, given username, password and salt length.

---

备注: if API has returned ESP\_OK, salt and verifier generated need to be freed by caller

---

备注: Usually, username and password are not saved on the device. Rather salt and verifier are generated outside the device and are embedded. this convenience API can be used to generate salt and verifier on the fly for development use case. OR for devices which intentionally want to generate different password each time and can send it to the client securely. e.g., a device has a display and it shows the pin

---

### 参数

- **username** -- [in] username
- **username\_len** -- [in] length of the username
- **pass** -- [in] password
- **pass\_len** -- [in] length of the password
- **bytes\_salt** -- [out] generated salt on successful generation, or NULL
- **salt\_len** -- [in] salt length
- **verifier** -- [out] generated verifier on successful generation, or NULL
- **verifier\_len** -- [out] length of the generated verifier

返回 esp\_err\_t ESP\_OK on success, appropriate error otherwise

*esp\_err\_t* **esp\_srp\_set\_salt\_verifier** (*esp\_srp\_handle\_t* \*hd, const char \*salt, int salt\_len, const char \*verifier, int verifier\_len)

Set the Salt and Verifier pre-generated for a given password. This should be used only if the actual password is not available. The public key can then be generated using *esp\_srp\_srv\_pubkey\_from\_salt\_verifier()* and not *esp\_srp\_srv\_pubkey()*

### 参数

- **hd** -- esp\_srp\_handle
- **salt** -- pre-generated salt bytes
- **salt\_len** -- length of the salt bytes
- **verifier** -- pre-generated verifier
- **verifier\_len** -- length of the verifier bytes

返回 esp\_err\_t ESP\_OK on success, appropriate error otherwise

*esp\_err\_t* **esp\_srp\_srv\_pubkey\_from\_salt\_verifier** (*esp\_srp\_handle\_t* \*hd, char \*\*bytes\_B, int \*len\_B)

Returns B (pub key)[Step2.b] when the salt and verifier are set using `esp_srp_set_salt_verifier()`

---

备注: \*bytes\_B MUST NOT BE FREED BY THE CALLER

---

#### 参数

- **hd** -- esp\_srp handle
- **bytes\_B** -- Key returned to the called
- **len\_B** -- Length of the key returned

返回 esp\_err\_t ESP\_OK on success, appropriate error otherwise

`esp_err_t esp_srp_get_session_key(esp_srp_handle_t *hd, char *bytes_A, int len_A, char **bytes_key, uint16_t *len_key)`

Get session key in \*bytes\_key given by len in \*len\_key. [Step2.c].

This calculated session key is used for further communication given the proofs are exchanged/authenticated with `esp_srp_exchange_proofs`

---

备注: \*bytes\_key MUST NOT BE FREED BY THE CALLER

---

#### 参数

- **hd** -- esp\_srp handle
- **bytes\_A** -- Private Key
- **len\_A** -- Private Key length
- **bytes\_key** -- Key returned to the caller
- **len\_key** -- length of the key in \*bytes\_key

返回 esp\_err\_t ESP\_OK on success, appropriate error otherwise

`esp_err_t esp_srp_exchange_proofs(esp_srp_handle_t *hd, char *username, uint16_t username_len, char *bytes_user_proof, char *bytes_host_proof)`

Complete the authentication. If this step fails, the session\_key exchanged should not be used.

This is the final authentication step in SRP algorithm [Step4.1, Step4.b, Step4.c]

#### 参数

- **hd** -- esp\_srp handle
- **username** -- Username not expected NULL terminated
- **username\_len** -- Username length
- **bytes\_user\_proof** -- param in
- **bytes\_host\_proof** -- parameter out (should be SHA512\_DIGEST\_LENGTH) bytes in size

返回 esp\_err\_t ESP\_OK if user's proof is ok and subsequently bytes\_host\_proof is populated with our own proof.

## Type Definitions

```
typedef struct esp_srp_handle esp_srp_handle_t
```

esp\_srp handle as the result of `esp_srp_init`

The handle is returned by `esp_srp_init` on successful init. It is then passed for subsequent API calls as an argument. `esp_srp_free` can be used to clean up the handle. After `esp_srp_free` the handle becomes invalid.

## Enumerations

enum **esp\_ng\_type\_t**

Large prime+generator to be used for the algorithm.

Values:

enumerator **ESP\_NG\_3072**

### Header File

- [components/protocomm/include/transport/protocomm\\_httpd.h](#)
- This header file can be included with:

```
#include "protocomm_httpd.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

### Functions

*esp\_err\_t* **protocomm\_httpd\_start** (*protocomm\_t* \*pc, const *protocomm\_httpd\_config\_t* \*config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

---

**备注:** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

---

#### 参数

- **pc** -- **[in]** Protocomm instance pointer obtained from `protocomm_new()`
- **config** -- **[in]** Pointer to config structure for initializing HTTP server

#### 返回

- **ESP\_OK** : Success
- **ESP\_ERR\_INVALID\_ARG** : Null arguments
- **ESP\_ERR\_NOT\_SUPPORTED** : Transport layer bound to another protocomm instance
- **ESP\_ERR\_INVALID\_STATE** : Transport layer already bound to this protocomm instance
- **ESP\_ERR\_NO\_MEM** : Memory allocation for server resource failed
- **ESP\_ERR\_HTTPD\_\*** : HTTP server error on start

*esp\_err\_t* **protocomm\_httpd\_stop** (*protocomm\_t* \*pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**参数** **pc** -- **[in]** Same protocomm instance that was passed to `protocomm_httpd_start()`

#### 返回

- **ESP\_OK** : Success
- **ESP\_ERR\_INVALID\_ARG** : Null / incorrect protocomm instance pointer

## Unions

union **protocomm\_httpd\_config\_data\_t**

*#include <protocomm\_httpd.h>* Protocomm HTTPD Configuration Data

### Public Members

void \***handle**

HTTP Server Handle, if `ext_handle_provided` is set to true

*protocomm\_http\_server\_config\_t* **config**

HTTP Server Configuration, if a server is not already active

## Structures

struct **protocomm\_http\_server\_config\_t**

Config parameters for protocomm HTTP server.

### Public Members

uint16\_t **port**

Port on which the HTTP server will listen

size\_t **stack\_size**

Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned **task\_priority**

Priority of server task

struct **protocomm\_httpd\_config\_t**

Config parameters for protocomm HTTP server.

### Public Members

bool **ext\_handle\_provided**

Flag to indicate if an external HTTP Server Handle has been provided. In such a case, protocomm will use the same HTTP Server and not start a new one internally.

*protocomm\_httpd\_config\_data\_t* **data**

Protocomm HTTPD Configuration Data

## Macros

**PROTOCOLM\_HTTPD\_DEFAULT\_CONFIG** ()

## Header File

- `components/protocomm/include/transport/protocomm_ble.h`
- This header file can be included with:

```
#include "protocomm_ble.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

## Functions

`esp_err_t protocomm_ble_start(protocomm_t *pc, const protocomm_ble_config_t *config)`

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

### 参数

- **pc** -- [in] Protocomm instance pointer obtained from `protocomm_new()`
- **config** -- [in] Pointer to config structure for initializing BLE

### 返回

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE start error
- `ESP_ERR_NO_MEM` : Error allocating memory for internal resources
- `ESP_ERR_INVALID_STATE` : Error in ble config
- `ESP_ERR_INVALID_ARG` : Null arguments

`esp_err_t protocomm_ble_stop(protocomm_t *pc)`

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

---

**备注:** You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

---

**参数 pc** -- [in] Same protocomm instance that was passed to `protocomm_ble_start()`

### 返回

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE stop error
- `ESP_ERR_INVALID_ARG` : Null / incorrect protocomm instance

## Structures

struct **name\_uuid**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

### Public Members

const char \***name**

Name of the handler, which is passed to protocomm layer

uint16\_t **uuid**

UUID to be assigned to the BLE characteristic which is mapped to the handler

struct **protocomm\_ble\_event\_t**

Structure for BLE events in Protocomm.

### Public Members

uint16\_t **evt\_type**

This field indicates the type of BLE event that occurred.

uint16\_t **conn\_handle**

The handle of the relevant connection.

uint16\_t **conn\_status**

The status of the connection attempt; 0: the connection was successfully established. 0 BLE host error code: the connection attempt failed for the specified reason.

uint16\_t **disconnect\_reason**

Return code indicating the reason for the disconnect.

struct **protocomm\_ble\_config**

Config parameters for protocomm BLE service.

### Public Members

char **device\_name**[MAX\_BLE\_DEVNAME\_LEN + 1]

BLE device name being broadcast at the time of provisioning

uint8\_t **service\_uuid**[BLE\_UUID128\_VAL\_LENGTH]

128 bit UUID of the provisioning service

uint8\_t \***manufacturer\_data**

BLE device manufacturer data pointer in advertisement

ssize\_t **manufacturer\_data\_len**

BLE device manufacturer data length in advertisement

ssize\_t **nu\_lookup\_count**

Number of entries in the Name-UUID lookup table

*protocomm\_ble\_name\_uuid\_t* \***nu\_lookup**

Pointer to the Name-UUID lookup table

unsigned **ble\_bonding**

BLE bonding

unsigned **ble\_sm\_sc**

BLE security flag

unsigned **ble\_link\_encryption**

BLE security flag

## Macros

### **MAX\_BLE\_DEVNAME\_LEN**

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

### **BLE\_UUID128\_VAL\_LENGTH**

### **MAX\_BLE\_MANUFACTURER\_DATA\_LEN**

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

## Type Definitions

typedef struct *name\_uuid* **protocomm\_ble\_name\_uuid\_t**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct *protocomm\_ble\_config* **protocomm\_ble\_config\_t**

Config parameters for protocomm BLE service.

## Enumerations

enum **protocomm\_transport\_ble\_event\_t**

Events generated by BLE transport.

These events are generated when the BLE transport is paired and disconnected.

*Values:*

enumerator **PROTOCOLM\_TRANSPORT\_BLE\_CONNECTED**

enumerator **PROTOCOLM\_TRANSPORT\_BLE\_DISCONNECTED**

## 2.8.2 统一配网

### 概述

ESP-IDF 支持统一配网，提供可扩展的机制，支持开发者使用不同传输方式和安全方案配置设备的 Wi-Fi 凭证和其他自定义配置。ESP-IDF 为不同的使用场景提供完整可用的 Wi-Fi 配网解决方案，并附带 iOS 和 Android 示例应用程序。开发者可以扩展设备端和手机应用端实现，来满足发送额外自定义配置数据的需求。以下为该实现的重要功能：

### 1. 可扩展协议

该协议高度灵活，支持开发者在配网过程中发送自定义配置，以及在应用程序中自定义数据格式。

### 2. 传输方式灵活

该协议可以作为 Wi-Fi (SoftAP + HTTP 服务器) 或低功耗蓝牙上的传输方式，并且可轻松应用于任何支持请求—响应行为的传输方式。

### 3. 安全方案灵活

配网过程中，各使用场景可能需要不同安全方案来保护传输的数据。部分应用程序可能使用 WPA2 保护的 SoftAP 或具有“即插即用 (just-works)”安全方案的低功耗蓝牙。亦或者，应用程序可能认为传输不安全，需要应用层的安全方案。统一配网框架支持应用程序根据需要选择合适的安全方案。

### 4. 数据格式紧凑

该协议使用 [Google Protobufs](#) 作为会话设置和 Wi-Fi 配网的数据格式。该方案提供紧凑的数据格式，并可以使用不同编程语言进行数据解析。请注意，该配网的应用数据格式并不只局限于 Protobufs，开发者可以自行选择自己想用的数据格式。

## 配网过程示例

### 选择传输方式

统一配网支持 Wi-Fi (SoftAP + HTTP 服务器) 和低功耗蓝牙 (基于 GATT) 传输方式。要选择最佳传输方式，需要考虑以下几点：

1. 基于低功耗蓝牙的传输方式的优势在于，在配网过程中，设备和客户端之间的低功耗蓝牙通信通道稳定，可以提供可靠的配网反馈信息。
2. 基于低功耗蓝牙的配网实现可以提升手机应用的用户体验，因为在 Android 和 iOS 系统中，用户可以直接在手机应用内发现并连接设备。
3. 然而，低功耗蓝牙传输在运行时会占用约 110 KB 内存。如果产品在配网完成后不再使用低功耗蓝牙或经典蓝牙功能，几乎所有内存都可以回收并添加到堆中。
4. 基于 SoftAP 的传输方式兼容性很强，但以下两点需要关注：
  - 设备使用同一频段来托管 SoftAP 以及连接到配置的 AP。由于 AP 可能位于不同信道，可能导致手机无法可靠地接收到连接状态更新。
  - 手机 (即客户端) 必须先断开与当前 AP 的连接才能连接到 SoftAP。配网过程完成并且 SoftAP 关闭后，原始网络才会恢复。
5. 使用 SoftAP 传输方式时，不需要为 Wi-Fi 使用场景分配太多额外内存。
6. 在 iOS 系统中，如果使用基于 SoftAP 的配网，用户需要将手机切换到 系统设置页面，手动连接 Wi-Fi 热点。由于 iOS 系统限制，iOS 应用程序中无法使用发现 (即扫描) 和连接 API。

### 选择安全方案

应用程序开发者需要根据传输方式和其他限制选择相应安全方案。从配网安全角度，需要考虑以下因素：

1. 必须保护客户端发送的配置数据安全以及设备响应数据安全。
2. 客户端应该对连接的设备进行身份验证。
3. 设备制造商可以使用所有权证明 (proof-of-possession, PoP) 这一安全措施，即为每个设备配置一个独特的设备密钥。设备配网时需要输入该密钥，以确保只有设备的合法持有者可以对其进行配网。

有两种安全方案层级可供选择，开发者可以根据需求选择其中一种或结合使用。

#### 1. 传输层安全

对于 SoftAP 配网，可以使用 WPA2 保护的安全方案，则每个设备都会有唯一密码，且该密码也可以用作 PoP。对于低功耗蓝牙配网，在考量其支持的安全层级后，可以使用“即插即用”方案保护传输层的安全。

#### 2. 应用程序层安全

统一配网子系统支持应用层的安全方案 ([Security 1 方案](#))，即通过 PoP 提供数据保护和身份验证。如果应用程序不使用传输层的安全方案，或者传输层的安全方案不满足使用场景的需求，可以使用该方案。

图 28: 配网过程示例

## 设备发现

广播和设备发现由应用程序自行处理。根据所选协议，手机应用程序和设备固件应用程序可以选择适当的广播和发现方法。

对于 SoftAP + HTTP 传输方式，通常可以通过设备托管 AP 的 SSID（网络名称）发现。

对于低功耗蓝牙传输方式，可以使用设备名称或包含在广播中的主要服务 (Primary service) 进行发现，也可以将两者结合。

## 架构

以下图表展示了统一配网的架构：

图 29: 统一配网架构

统一配网依赖名为**协议通信** (protocomm) 的基础层，该层提供了安全方案和传输机制的框架。Wi-Fi 配网层使用 protocomm 提供简单的回调函数，供应用程序设置配置和获取 Wi-Fi 状态。应用程序可以控制这些回调的实现方式。此外，应用程序还可以直接使用 protocomm 来注册自定义处理程序。

应用程序会创建一个 protocomm 实例，该实例会映射到特定传输方式和安全方案。protocomm 中的每个传输方式都有“端点”概念，对应特定类型信息通信的逻辑通道。例如，进行安全握手的端点与 Wi-Fi 配置端点不同。每个端点都用字符串标识，具体取决于传输内部对端点变化的表示方式。对于 SoftAP + HTTP 传输方式，端点对应 URI；而对于低功耗蓝牙，端点对应具有特定 UUID 的 GATT 特征。开发者可以创建自定义端点，为同一端点接收或发送的数据实现处理程序。

## 安全方案

目前，统一配网支持以下安全方案：

1. Security 0

无安全功能（即无加密）。

## 2. Security 1

基于 Curve25519 的密钥交换、共享密钥派生和 AES256-CTR 模式的数据加密。该方案支持两种模式：

- a. 授权模式 - 使用 PoP 字符串授权会话以及派生共享密钥。
- b. 无授权模式（不启用 PoP） - 仅通过密钥交换派生共享密钥。

## 3. Security 2

基于 SRP6a 的共享密钥派生和 AES256-GCM 模式的数据加密。

---

**备注：**要启用相应安全方案，需要设置项目配置菜单，更多详情请参考[启用 \*protocomm\* 安全版本](#)。

---

### Security 1 方案

以下时序图展示了 Security 1 方案的详情：

### Security 2 方案

Security 2 方案基于 Secure Remote Password (SRP6a) 协议，详情请参阅 [RFC 5054](#)。

该协议要求预先使用标识用户名  $I$  和明文密码  $p$  生成盐值 (salt) 和验证器 (verifier)，然后将盐值和验证器存储在 ESP32-C3。

- 应通过适当方式（例如二维码贴纸）将密码  $p$  和用户名  $I$  提供给手机应用程序（即配网实体）。

以下时序图展示了 Security 2 方案的详情：

### 示例代码

关于 API 指南和示例用法的代码片段，请参阅[协议通信](#)和[Wi-Fi 配网](#)。

关于应用程序的实现示例，请参阅[provisioning](#)。

### 配网工具

以下为各平台的配网应用程序，包括源代码：

- **Android:**
  - [Play Store 上的低功耗蓝牙配网应用程序](#)。
  - [Play Store 上的 SoftAP 配网应用程序](#)。
  - [GitHub 上的源代码](#)：[esp-idf-provisioning-android](#)。
- **iOS:**
  - [App Store 上的低功耗蓝牙配网应用程序](#)。
  - [App Store 上的 SoftAP 配网应用程序](#)。
  - [GitHub 上的源代码](#)：[esp-idf-provisioning-ios](#)。
- **Linux/macOS/Windows:** 基于 Python 的命令行工具 [tools/esp\\_prov](#)，可用于设备配网。

手机应用程序界面简洁，便于用户使用，而开发者可以使用命令行应用程序，便于调试。

### 2.8.3 Wi-Fi 配网

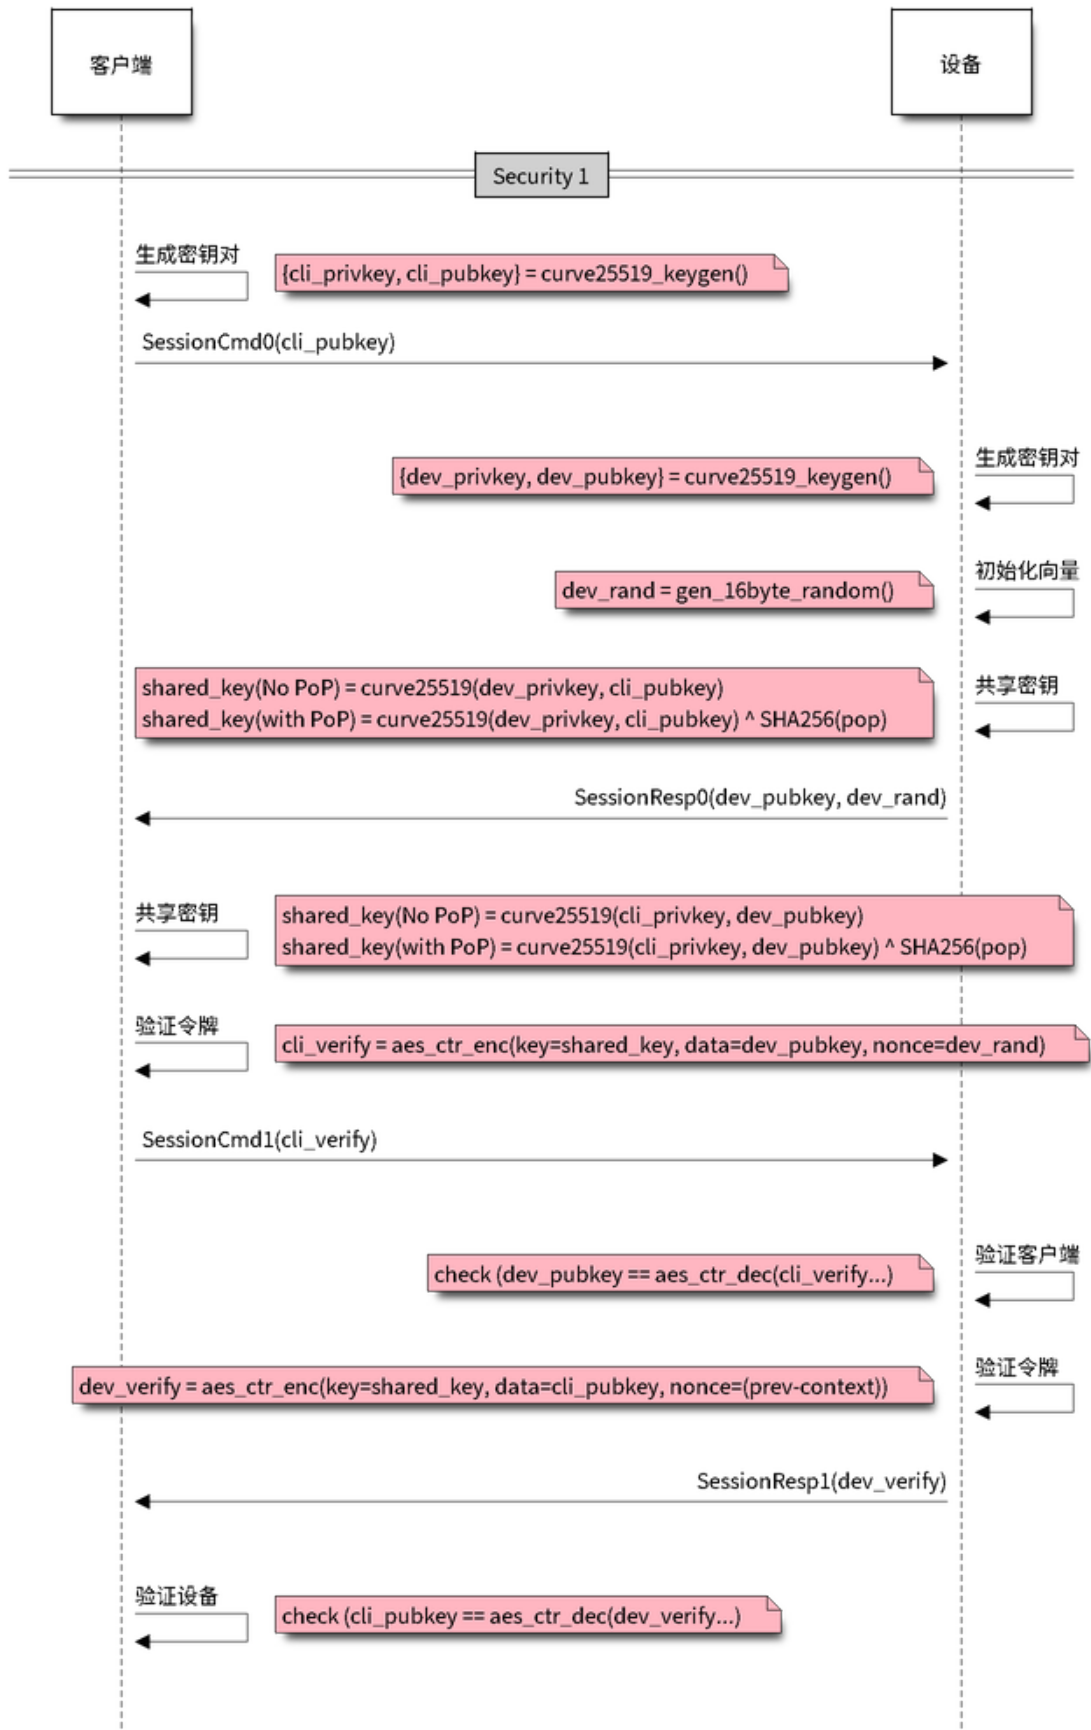

图 30: Security 1

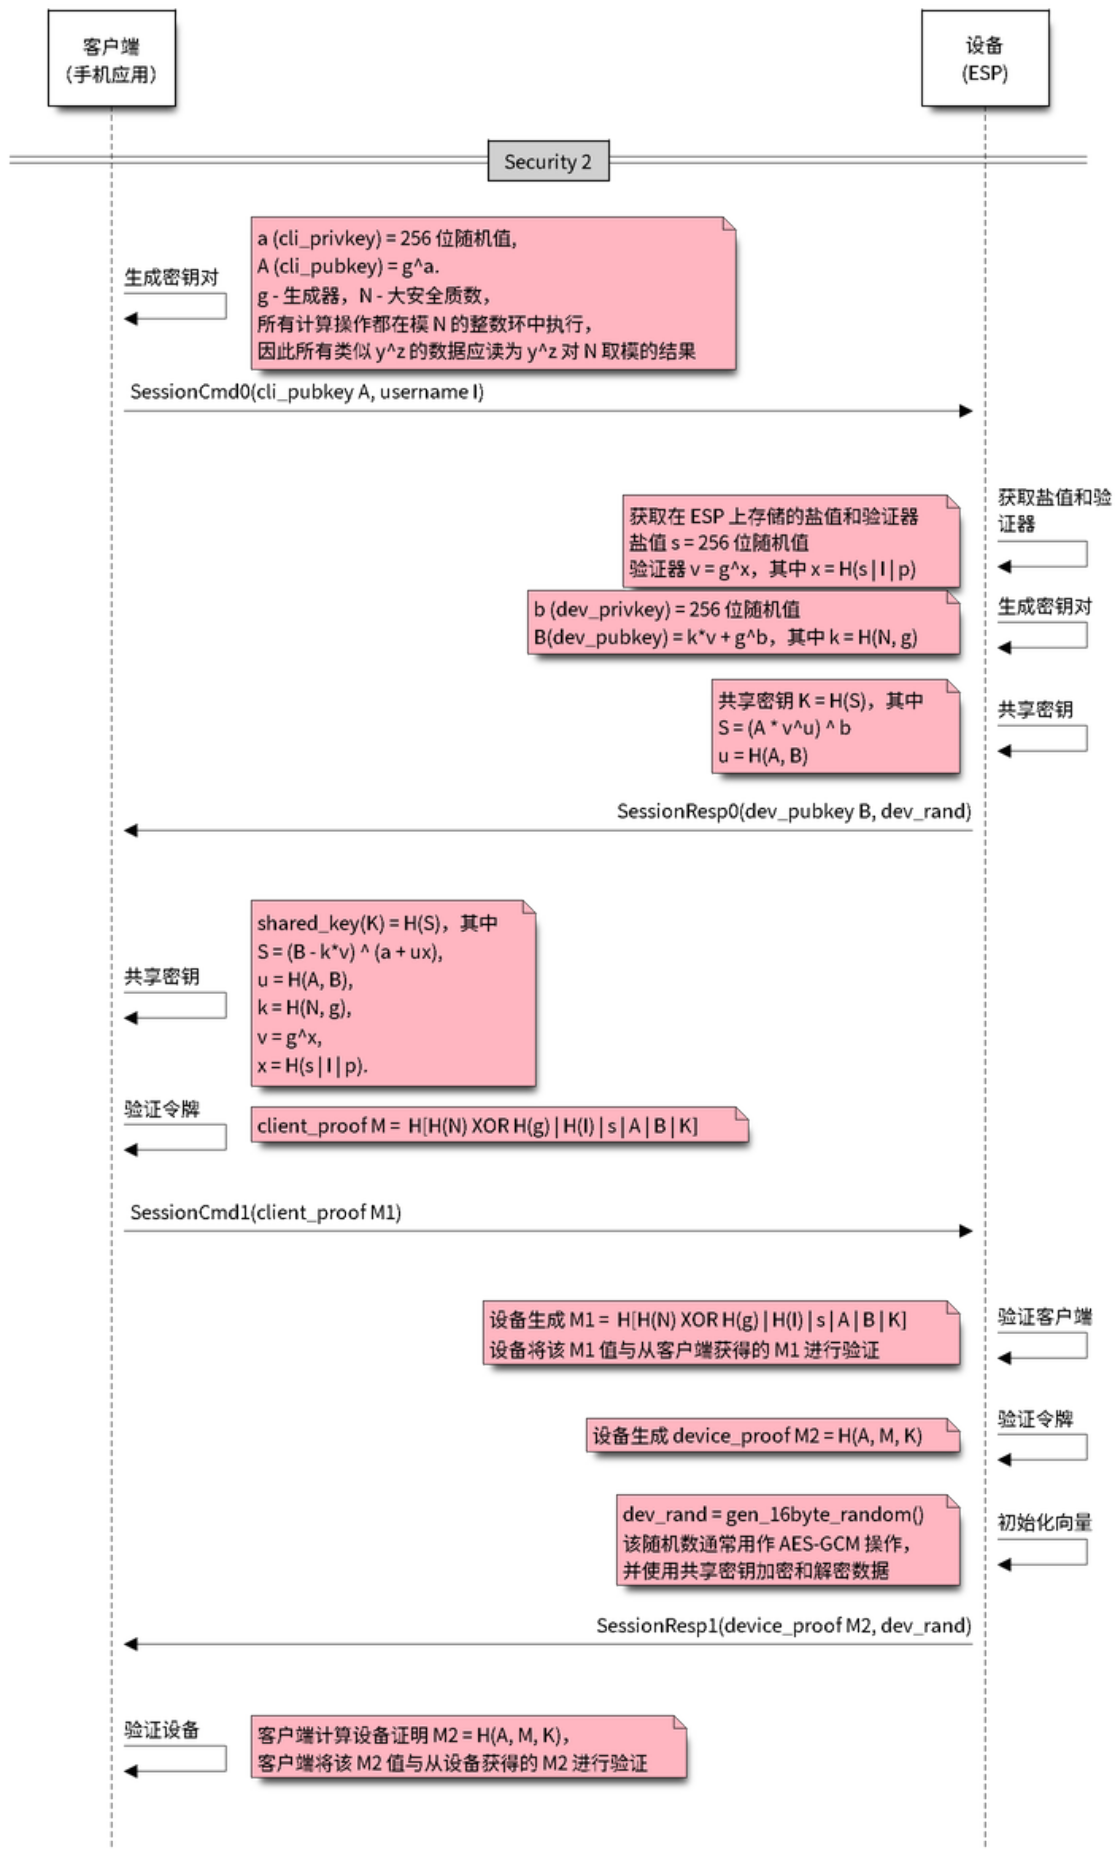

图 31: Security 2

## 概述

该组件提供控制 Wi-Fi 配网服务的 API，可以通过 SoftAP 或低功耗蓝牙建立协议通信安全会话，接收和配置 Wi-Fi 凭证。通过一组 `wifi_prov_mgr_API`，可以快速实现配网服务，该服务具备必要功能、代码量少且足够灵活。

**初始化** 调用 `wifi_prov_mgr_init()` 可以配置和初始化配网管理器，因此在调用任何其他 `wifi_prov_mgr_API` 之前必须先调用此函数。请注意，该管理器依赖于 ESP-IDF 的其他组件，包括 NVS、TCP/IP、Event Loop 和 Wi-Fi，以及可选的 mDNS，因此在调用之前必须先初始化这些组件。调用 `wifi_prov_mgr_deinit()` 可以随时反初始化管理器。

```
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};

ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

以下配置结构体 `wifi_prov_mgr_config_t` 里包含的部分字段可用于指定特定管理器行为：

- `wifi_prov_mgr_config_t::scheme` - 用于指定配网方案。每个方案对应一种 `protocomm` 支持的传输模式，因此支持三个选项：
  - `wifi_prov_scheme_ble` - 使用低功耗蓝牙传输和 GATT 服务器来处理配网命令。
  - `wifi_prov_scheme_softap` - 使用 Wi-Fi SoftAP 传输和 HTTP 服务器来处理配网命令。
  - `wifi_prov_scheme_console` - 使用串口传输和控制台来处理配网命令。
- `wifi_prov_mgr_config_t::scheme_event_handler` - 为方案定义的专属事件处理程序。选择适当方案后，其专属事件处理程序支持管理器自动处理特定事项。目前，该选项不适用于 SoftAP 或基于控制台的配网方案，但对于低功耗蓝牙配网方案来说非常方便。因为蓝牙需要相当多内存才能正常工作，所以配网完成后，主应用程序需要使用低功耗蓝牙或经典蓝牙时，可能需要回收配网所占的全部或部分内存。此外，未来每当配网设备重启时，都需要再次回收内存。为了便于使用 `wifi_prov_scheme_ble` 选项，各方案定义了专属处理程序。设备会根据所选处理程序，在反初始化配网管理器时自动释放低功耗蓝牙、经典蓝牙或蓝牙双模的内存。可用选项包括：
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - 同时释放经典蓝牙和低功耗蓝牙或蓝牙双模的内存，可以在主应用程序不需要蓝牙时使用该选项。
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - 只释放低功耗蓝牙的内存，可以在主应用程序需要经典蓝牙时使用该选项。
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - 仅释放经典蓝牙的内存，可以在主应用程序需要低功耗蓝牙时使用该选项，内存会在初始化管理器时立即释放。
  - `WIFI_PROV_EVENT_HANDLER_NONE` - 不使用任何特定方案的专属处理程序。以下情况可使用该选项：不使用低功耗蓝牙配网方案，即使用 SoftAP 或控制台方案；主应用程序需要自行回收内存；主应用程序需要同时使用低功耗蓝牙和经典蓝牙。
- `wifi_prov_mgr_config_t::app_event_handler` (不推荐) - 目前建议使用默认的事件循环处理程序捕获生成的 `WIFI_PROV_EVENT`。关于配网服务生成事件的列表，请参阅 `wifi_prov_cb_event_t` 的定义。以下是配网事件示例摘录：

```
static void event_handler(void* arg, esp_event_base_t event_base,
                        int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV: {
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t_
↳*)event_data;
```

(下页继续)

(续上页)

```

        ESP_LOGI(TAG, "Received Wi-Fi credentials"
                  "\n\tSSID      : %s\n\tPassword : %s",
                  (const char *) wifi_sta_cfg->ssid,
                  (const char *) wifi_sta_cfg->password);
        break;
    }
    case WIFI_PROV_CRED_FAIL: {
        wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
        ↪reason_t *)event_data;
        ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
        ↪"\n\tPlease reset to factory and retry_
        ↪provisioning",
                  (*reason == WIFI_PROV_STA_AUTH_ERROR) ?
        ↪"Wi-Fi station authentication failed" : "Wi-Fi_
        ↪access-point not found");
        break;
    }
    case WIFI_PROV_CRED_SUCCESS:
        ESP_LOGI(TAG, "Provisioning successful");
        break;
    case WIFI_PROV_END:
        /*配网完成后, 反初始化管理器。*/
        wifi_prov_mgr_deinit();
        break;
    default:
        break;
    }
}
}
}

```

调用 `wifi_prov_mgr_deinit()` 可以随时反初始化管理器。

**检查配网状态** 在运行时, 可以调用 `wifi_prov_mgr_is_provisioned()` 检查设备是否配网完成, 该函数会在内部检查 Wi-Fi 凭据是否存储在 NVS 中。

请注意, 目前管理器并没有自己的 NVS 命名空间来存储 Wi-Fi 凭据, 而是依赖 `esp_wifi_ API` 来设置和获取存储在默认位置的 NVS 中的凭据。

可以采用以下任一方法重置配网状态:

- 手动擦除 NVS 分区的配网相关部分。
- 主应用程序必须实现某种逻辑, 以在运行时调用 `esp_wifi_ API` 来擦除凭据。
- 主应用程序必须实现某种逻辑, 以在不考虑配网状态的情况下, 强制启动配网。

```

bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );

```

**启动配网服务** 在启动配网服务时, 需要指定服务名称和相应密钥, 即:

- 使用 `wifi_prov_scheme_softap` 方案时, 服务名称对应 Wi-Fi SoftAP 的 SSID, 密钥对应密码。
- 使用 `wifi_prov_scheme_ble` 方案时, 服务名称对应低功耗蓝牙设备名称, 无需指定密钥。

此外, 由于管理器内部使用了 `protocomm`, 可以选择其提供的任一安全功能:

- **Security 1** 是安全通信, 该安全通信需要先握手, 其中涉及 X25519 密钥交换和使用所有权证明 pop 完成身份验证, 随后使用 AES-CTR 加密或解密后续消息。
- **Security 0** 是纯文本通信, 会直接忽略 pop。

关于安全功能的更多详情, 请参阅[统一配网](#)。

```

const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );

```

如果收到有效的 Wi-Fi AP 凭据，且设备成功连接到该 AP 并获取了 IP，配网服务会自动结束。此外，调用 `wifi_prov_mgr_stop_provisioning()` 可以随时停止配网服务。

**备注：**如果设备使用提供的凭据无法连接，则它不再接受新的凭据，但在设备重新启动前，配网服务仍然会继续运行，并向客户端传递连接失败的信息。设备重新启动后配网状态将变为已配网，因为在 NVS 中找到了凭据，但除非出现与凭据匹配的可用 AP，否则设备仍然无法使用原凭据进行连接。可以通过重置 NVS 中的凭据或强制启动配网服务来解决这个问题，详情请参阅上文[检查配网状态](#)。

**等待配网完成** 主应用程序通常会等待配网服务完成，然后反初始化管理器以释放资源，最后开始执行自己的逻辑。

有两种方法可以实现这一点，其中调用阻塞 `wifi_prov_mgr_wait()` 更为简单。

```

// 启动配网服务
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );

// 等待服务完成
wifi_prov_mgr_wait();

// 最后反初始化管理器
wifi_prov_mgr_deinit();

```

另一种方法是使用默认的事件循环处理程序捕获 `WIFI_PROV_EVENT` 并在事件 ID 为 `WIFI_PROV_END` 时调用 `wifi_prov_mgr_deinit()`：

```

static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* 配网完成后反初始化管理器 */
        wifi_prov_mgr_deinit();
    }
}

```

**用户端实现** 启动服务时，通过广播服务名称识别即将配网的设备。根据选择的传输方式，该服务名称为低功耗蓝牙设备的名称或 SoftAP SSID。

使用 SoftAP 传输方式时，为便于服务发现，必须在启动配网之前初始化 mDNS。在这种情况下，应使用主应用程序设置的主机名，并且在内部将服务类型设置为 `_esp_wifi_prov`。

使用低功耗蓝牙传输方式时，应使用 `wifi_prov_scheme_ble_set_service_uuid()` 设置一个自定义的 128 位 UUID。该 UUID 将包含在低功耗蓝牙广播中，并对应于提供配网端点作为 GATT 特征的主要服务。每个 GATT 特征都基于主要服务 UUID 形成，其中从第 0 个字节开始计数，第 12 和第 13 个字节为自动分配的不同字节。由于端点特征 UUID 自动分配，因此不应将其用于识别端点。客户端应用程序应通过读取每个特征的用户特征描述符 (0x2901) 来识别端点，该描述符包含特征的端点名称。例如，如果将服务 UUID 设置为 55cc035e-fb27-4f80-be02-3c60828b7451，每个端点特征将分配到一个类似于 55cc\_\_\_\_-fb27-4f80-be02-3c60828b7451 的 UUID，其中第 12 和第 13 个字节具有唯一值。

连接设备后，可以通过以下方式识别与配网相关的 `protocomm` 端点：

表 5: 配网服务提供的端点

端点名称即低功耗蓝牙 + GATT 服务器	URI 即 SoftAP + HTTP 服务器 + mDNS	描述
<code>prov-session</code>	<code>http://&lt;mDNS-hostname&gt;.local/prov-session</code>	用于建立会话的安全端点
<code>prov-scan</code>	<code>http://wifi-prov.local/prov-scan</code>	用于启动 Wi-Fi 扫描和接收扫描结果的端点
<code>prov-ctrl</code>	<code>http://wifi-prov.local/prov-ctrl</code>	用于控制 Wi-Fi 配网状态的端点
<code>prov-config</code>	<code>http://&lt;mDNS-hostname&gt;.local/prov-config</code>	用于在设备上配置 Wi-Fi 凭据的端点
<code>proto-ver</code>	<code>http://&lt;mDNS-hostname&gt;.local/proto-ver</code>	用于获取版本信息的端点

连接后，客户端应用程序可以立即从 `proto-ver` 端点获取版本或属性信息。所有与此端点的通信均未加密，因此在建立安全会话前，可以检索相关必要信息，确保会话兼容。响应结果以 JSON 格式返回，格式类似于 `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, ...`。其中 `prov` 标签提供了配网服务的版本 `ver` 和属性 `cap`。目前仅支持 `no_pop` 属性，表示该服务不需要验证所有权证明。任何与应用程序相关的版本或属性将由其他标签给出，如本示例中的 `my_app`。使用 `wifi_prov_mgr_set_app_info()` 可以设置这些附加字段。

用户端应用程序需要根据所配置的安全方案实现签名握手，以建立和认证 `protocomm` 安全会话。当管理器配置为使用 `protocomm security 0` 时，则不需要实现签名握手。

关于安全握手和加密的详情，请参阅[统一配网](#)。应用程序必须使用 `protocomm/proto` 中的 `.proto` 文件。`.proto` 文件定义了 `prov-session` 端点支持的 `protobuf` 消息结构。

建立会话后，以下 `wifi_config` 命令集可用于配置 Wi-Fi 凭据，这些命令会被序列化为 `protobuf` 消息，对应的 `.proto` 文件存放在 `wifi_provisioning/proto` 中。

- `get_status` - 用于查询 Wi-Fi 连接状态。设备响应状态为连接中、已连接或已断开。如果状态为已断开，则还会包含断开原因。
- `set_config` - 用于设置 Wi-Fi 连接凭据。
- `apply_config` - 用于应用先前保存的凭据，即由 `set_config` 设置的凭据，并启动 Wi-Fi 站点。

建立会话后，客户端还可以从设备请求 Wi-Fi 扫描结果。返回结果为 AP SSID 的列表，按信号强度降序排序。由此，客户端应用程序可以在设备配网时显示附近的 AP，并且用户可以选择其中一个 SSID 并提供密码，然后使用上述 `wifi_config` 命令发送密码。`wifi_scan` 端点支持以下 `protobuf` 命令：

- `scan_start` - 启动 Wi-Fi 扫描有多个选项，具体如下：
  - `blocking` (输入) - 如果参数为 `true`，则命令只会在扫描完成后返回。
  - `passive` (输入) - 如果参数为 `true`，则以被动模式启动扫描，扫描速度可能更慢。
  - `group_channels` (输入) - 该参数用于指定是否分组扫描。如果参数为 0，表示一次性扫描所有信道；如果参数为非零值，则表示分组扫描信道且参数值为每组中的信道数，每个连续组之间有 120 毫秒的延迟。分组扫描非常适用于使用 SoftAP 的传输模式，因为一次性扫描所有信道可能会导致 Wi-Fi 驱动没有足够时间发送信标，进而导致与部分站点断连。分组扫描时，管理器每扫描完一组信道，至少会等待 120 毫秒，确保驱动程序有足够时间发送信标。例如，假设共有 14 个 Wi-Fi 信道，将 `group_channels` 设置为 3 则将创建 5 个分组，每个分组包含 3 个信道，最后一个分组则为 14 除以 3 余下的 2 个信道。因此，扫描开始时，首先会扫描前 3 个信道，然后等待 120 毫秒，再继续扫描后 3 个信道，以此类推，直到扫描完 14 个信道。可以根据实际情况调整此参数，因为分组中信道数量过少可能会增加整体扫描时间，而信道数量过多则可能会导致连接再次断开。大多数情况下，将参数值设置为 4 即可。请注意，对于低功耗蓝牙等其他传输模式，可以放心将该参数设置为 0，从而在最短时间内完成扫描。
  - `period_ms` (输入) - 该扫描参数用于设置在每个信道上的等待时间。
- `scan_status` - 可以返回扫描过程的状态：
  - `scan_finished` (输出) - 扫描完成时，该参数返回为 `true`。
  - `result_count` (输出) - 该参数返回到目前为止获取的结果总数。如果扫描仍在进行，该数字会不断更新。

- `scan_result` - 用于获取扫描结果。即使扫描仍在进行，也可以调用此函数。
  - `start_index` (输入) - 从结果列表中获取条目的起始索引位置。
  - `count` (输入) - 从起始索引位置获取的条目数目。
  - `entries` (输出) - 返回条目的列表。每个条目包含 `ssid`、`channel` 和 `rsssi` 信息。

客户端还可以使用 `wifi_ctrl` 端点来控制设备的配网状态。`wifi_ctrl` 端点支持的 `protobuf` 命令如下：

- `ctrl_reset` - 仅在配网失败时，重置设备的内部状态机并清除已配置的凭据。
- `ctrl_reprov` - 仅在设备已成功配网的前提下，设备需要重新配网获取新的凭据时，重置设备的内部状态机并清除已配置的凭据。

**附加端点** 如果用户想要根据自己的需求定制一些附加 `protocomm` 端点，可以通过两步完成。第一步是创建一个具有特定名称的端点，第二步是为该端点注册一个处理程序。关于端点处理程序的函数签名，请参阅[协议通信](#)。自定义端点必须在初始化后、配网服务启动之前创建，但只能在配网服务启动后为该端点注册 `protocomm` 处理程序。

```
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_
↪key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, ↪
↪custom_ep_data);
```

配网服务停止时，端点会自动取消注册。

在运行时，可以调用 `wifi_prov_mgr_endpoint_unregister()` 来手动停用某个端点。该函数也可以用于停用配网服务使用的内部端点。

**何时以及如何停止配网服务？** 当设备使用 `apply_config` 命令设置的 Wi-Fi 凭据成功连接，配网服务将默认停止，并在响应下一个 `get_status` 命令后自动关闭低功耗蓝牙或 softAP。如果设备没有收到 `get_status` 命令，配网服务将在超时 30 秒后停止。

如果设备因 SSID 或密码不正确等原因无法使用 Wi-Fi 凭据成功连接，配网服务将继续运行，并通过 `get_status` 命令持续响应为断连状态，并提供断连原因。此时设备不会再接受任何新的 Wi-Fi 凭据。除非强制启动配网服务或擦除 NVS 存储，这些凭据将保留。

可以调用 `wifi_prov_mgr_disable_auto_stop()` 来禁用默认设置。禁用后，只有在显式调用 `wifi_prov_mgr_stop_provisioning()` 之后，配网服务才会停止，且该函数会安排一个任务来停止配网服务，之后立即返回。配网服务将在一定延迟后停止，并触发 `WIFI_PROV_END` 事件。该延迟时间可以由 `wifi_prov_mgr_disable_auto_stop()` 的参数指定。

如果需要在成功建立 Wi-Fi 连接后的某个时间再停止配网服务，应用程序可以采取定制行为。例如，如果应用程序需要设备连接到某个云服务并获取另一组凭证，继而通过自定义 `protocomm` 端点交换凭证，那么成功完成此操作后，可以在 `protocomm` 处理程序中调用 `wifi_prov_mgr_stop_provisioning()` 来停止配网服务。设定适当的延迟时间可以确保 `protocomm` 处理程序的响应到达客户端应用程序后，才释放传输资源。

## 应用程序示例

关于完整实现示例，请参阅 [provisioning/wifi\\_prov\\_mgr](#)。

## 配网工具

以下为各平台相应的配网应用程序，并附带源代码：

- **Android:**
  - [Play Store 上的低功耗蓝牙配网应用程序](#)。
  - [Play Store 上的 SoftAP 配网应用程序](#)。

- GitHub 上的源代码: [esp-idf-provisioning-android](#)。
- **iOS:**
  - App Store 上的低功耗蓝牙配网应用程序。
  - App Store 上的 SoftAP 配网应用程序。
  - GitHub 上的源代码: [esp-idf-provisioning-ios](#)。
- Linux/MacOS/Windows: 基于 Python 的命令行工具 [tools/esp\\_prov](#), 可用于设备配网。

手机应用程序界面简洁, 便于用户使用, 而开发者可以使用命令行应用程序, 便于调试。

## API 参考

### Header File

- [components/wifi\\_provisioning/include/wifi\\_provisioning/manager.h](#)
- This header file can be included with:

```
#include "wifi_provisioning/manager.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

### Functions

*esp\_err\_t* **wifi\_prov\_mgr\_init** (*wifi\_prov\_mgr\_config\_t* config)

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event `WIFI_PROV_INIT` is emitted right after initialization is complete

**参数 config** -- [in] Configuration structure

**返回**

- `ESP_OK` : Success
- `ESP_FAIL` : Fail

void **wifi\_prov\_mgr\_deinit** (void)

Stop provisioning (if running) and release resource used by the manager.

Event `WIFI_PROV_DEINIT` is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting `WIFI_PROV_END`, and then performs the de-initialization

*esp\_err\_t* **wifi\_prov\_mgr\_is\_provisioned** (bool \*provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by `esp_wifi` component

If one were to call `esp_wifi_set_config()` directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

---

**备注:** Calling `wifi_prov_mgr_start_provisioning()` automatically resets the provision state, irrespective of what the state was prior to making the call.

---

**参数** `provisioned` -- **[out]** True if provisioned, else false  
**返回**

- `ESP_OK` : Retrieved provision state successfully
- `ESP_FAIL` : Wi-Fi not initialized
- `ESP_ERR_INVALID_ARG` : Null argument supplied

`esp_err_t wifi_prov_mgr_start_provisioning` (`wifi_prov_security_t` security, const void \*wifi\_prov\_sec\_params, const char \*service\_name, const char \*service\_key)

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- `wifi_prov_scheme_ble` : This starts `protocomm_ble`, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- `wifi_prov_scheme_softap` : This activates SoftAP mode of Wi-Fi and starts `protocomm_httpd`, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type `_esp_wifi_prov._tcp`)

Event `WIFI_PROV_START` is emitted right after provisioning starts without failure

---

**备注:** This API will start provisioning service even if device is found to be already provisioned, i.e. `wifi_prov_mgr_is_provisioned()` yields true

---

**参数**

- **security** -- **[in]** Specify which `protocomm` security scheme to use :
  - `WIFI_PROV_SECURITY_0` : For no security
  - `WIFI_PROV_SECURITY_1` : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
  - `WIFI_PROV_SECURITY_2`: SRP6a based authentication and key exchange followed by AES-GCM encryption/decryption of provisioning messages
- **wifi\_prov\_sec\_params** -- **[in]** Pointer to security params (NULL if not needed). This is not needed for `protocomm` security 0 This pointer should hold the struct of type `wifi_prov_security1_params_t` for `protocomm` security 1 and `wifi_prov_security2_params_t` for `protocomm` security 2 respectively. This pointer and its contents should be valid till the provisioning service is running and has not been stopped or de-inited.
- **service\_name** -- **[in]** Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- **service\_key** -- **[in]** Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

**返回**

- `ESP_OK` : Provisioning started successfully
- `ESP_FAIL` : Failed to start provisioning service
- `ESP_ERR_INVALID_STATE` : Provisioning manager not initialized or already started

void `wifi_prov_mgr_stop_provisioning` (void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event `WIFI_PROV_END` will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the `WIFI_PROV_END`, followed by `WIFI_PROV_DEINIT`, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient `cleanup_delay`, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

`Cleanup_delay` is set when calling `wifi_prov_mgr_disable_auto_stop()`. If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once `WIFI_PROV_CRED_SUCCESS` is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

void **wifi\_prov\_mgr\_wait** (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event `WIFI_PROV_END` is emitted.

This will not block if provisioning is not started or not initialized.

*esp\_err\_t* **wifi\_prov\_mgr\_disable\_auto\_stop** (uint32\_t `cleanup_delay`)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call `wifi_prov_mgr_stop_provisioning()` later when the device is fully configured and the provisioning service is no longer required.

---

**备注:** This must be called before executing `wifi_prov_mgr_start_provisioning()`

---

**参数** `cleanup_delay` -- **[in]** Sets the delay after which the actual cleanup of transport related resources is done after a call to `wifi_prov_mgr_stop_provisioning()` returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

**返回**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started

*esp\_err\_t* **wifi\_prov\_mgr\_set\_app\_info** (const char \*`label`, const char \*`version`, const char \*\*`capabilities`, size\_t `total_capabilities`)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label "prov", containing only provisioning service version and capabilities. Application services should use a label other than "prov" so as not to overwrite this.

---

**备注:** This must be called before executing `wifi_prov_mgr_start_provisioning()`

---

**参数**

- `label` -- **[in]** String indicating the application name.
- `version` -- **[in]** String indicating the application version. There is no constraint on format.

- **capabilities** -- **[in]** Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- **total\_capabilities** -- **[in]** Size of capabilities array

**返回**

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_STATE : Manager not initialized or provisioning service already started
- ESP\_ERR\_NO\_MEM : Failed to allocate memory for version string
- ESP\_ERR\_INVALID\_ARG : Null argument

*esp\_err\_t* **wifi\_prov\_mgr\_endpoint\_create** (const char \*ep\_name)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

---

**备注:** This API can only be called BEFORE provisioning is started

---

---

**备注:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

---

---

**备注:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

---

**参数** **ep\_name** -- **[in]** unique name of the endpoint

**返回**

- ESP\_OK : Success
- ESP\_FAIL : Failure

*esp\_err\_t* **wifi\_prov\_mgr\_endpoint\_register** (const char \*ep\_name, *protocomm\_req\_handler\_t* handler, void \*user\_ctx)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

---

**备注:** This API can only be called AFTER provisioning has started

---

---

**备注:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

---

---

**备注:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

---

**参数**

- **ep\_name** -- [in] Name of the endpoint
- **handler** -- [in] Endpoint handler function
- **user\_ctx** -- [in] User data

**返回**

- ESP\_OK : Success
- ESP\_FAIL : Failure

void **wifi\_prov\_mgr\_endpoint\_unregister** (const char \*ep\_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

**参数 ep\_name** -- [in] Name of the endpoint

*esp\_err\_t* **wifi\_prov\_mgr\_get\_wifi\_state** (*wifi\_prov\_sta\_state\_t* \*state)

Get state of Wi-Fi Station during provisioning.

**参数 state** -- [out] Pointer to wifi\_prov\_sta\_state\_t variable to be filled

**返回**

- ESP\_OK : Successfully retrieved Wi-Fi state
- ESP\_FAIL : Provisioning app not running

*esp\_err\_t* **wifi\_prov\_mgr\_get\_wifi\_disconnect\_reason** (*wifi\_prov\_sta\_fail\_reason\_t* \*reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

**参数 reason** -- [out] Pointer to wifi\_prov\_sta\_fail\_reason\_t variable to be filled

**返回**

- ESP\_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP\_FAIL : Provisioning app not running

*esp\_err\_t* **wifi\_prov\_mgr\_configure\_sta** (*wifi\_config\_t* \*wifi\_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI\_PROV\_CRED\_RECV is emitted after credentials have been applied and Wi-Fi station started

**参数 wifi\_cfg** -- [in] Pointer to Wi-Fi configuration structure

**返回**

- ESP\_OK : Wi-Fi configured and started successfully
- ESP\_FAIL : Failed to set configuration

*esp\_err\_t* **wifi\_prov\_mgr\_reset\_provisioning** (void)

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

**返回**

- ESP\_OK : Reset provisioning config successfully
- ESP\_FAIL : Failed to reset provisioning config

*esp\_err\_t* **wifi\_prov\_mgr\_reset\_sm\_state\_on\_failure** (void)

Reset internal state machine and clear provisioned credentials.

This API should be used to restart provisioning ONLY in the case of provisioning failures without rebooting the device.

**返回**

- ESP\_OK : Reset provisioning state machine successfully
- ESP\_FAIL : Failed to reset provisioning state machine
- ESP\_ERR\_INVALID\_STATE : Manager not initialized

*esp\_err\_t* **wifi\_prov\_mgr\_reset\_sm\_state\_for\_reprovision** (void)

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning ONLY in case the device is to be provisioned again for new credentials after a previous successful provisioning without rebooting the device.

---

**备注:** This API can be used only if provisioning auto-stop has been disabled using `wifi_prov_mgr_disable_auto_stop()`

---

**返回**

- ESP\_OK : Reset provisioning state machine successfully
- ESP\_FAIL : Failed to reset provisioning state machine
- ESP\_ERR\_INVALID\_STATE : Manager not initialized

**Structures**

struct **wifi\_prov\_event\_handler\_t**

Event handler that is used by the manager while provisioning service is active.

**Public Members**

*wifi\_prov\_cb\_func\_t* **event\_cb**

Callback function to be executed on provisioning events

void **\*user\_data**

User context data to pass as parameter to callback function

struct **wifi\_prov\_scheme**

Structure for specifying the provisioning scheme to be followed by the manager.

---

**备注:** Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
  - `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
  - `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)
- 

**Public Members**

*esp\_err\_t* (**\*prov\_start**)(*protocomm\_t* \*pc, void \*config)

Function which is to be called by the manager when it is to start the provisioning service associated with a `protocomm` instance and a scheme specific configuration

*esp\_err\_t* (**\*prov\_stop**)(*protocomm\_t* \*pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a `protocomm` instance

void **(\*new\_config)**(void)

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to *prov\_start()*

void **(\*delete\_config)**(void \*config)

Function which is to be called by the manager to delete a configuration generated using *new\_config()*

*esp\_err\_t* **(\*set\_config\_service)**(void \*config, const char \*service\_name, const char \*service\_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure

*esp\_err\_t* **(\*set\_config\_endpoint)**(void \*config, const char \*endpoint\_name, uint16\_t uuid)

Function which is to be called by the manager to set a protocol endpoint with an identifying name and UUID in the configuration structure

*wifi\_mode\_t* **wifi\_mode**

Sets mode of operation of Wi-Fi during provisioning This is set to :

- **WIFI\_MODE\_APSTA** for SoftAP transport
- **WIFI\_MODE\_STA** for BLE transport

struct **wifi\_prov\_mgr\_config\_t**

Structure for specifying the manager configuration.

## Public Members

*wifi\_prov\_scheme\_t* **scheme**

Provisioning scheme to use. Following schemes are already available:

- **wifi\_prov\_scheme\_ble** : for provisioning over BLE transport + GATT server
- **wifi\_prov\_scheme\_softap** : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- **wifi\_prov\_scheme\_console** : for provisioning over Serial UART transport + Console (for debugging)

*wifi\_prov\_event\_handler\_t* **scheme\_event\_handler**

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use **WIFI\_PROV\_EVENT\_HANDLER\_NONE** when not used. When using scheme **wifi\_prov\_scheme\_ble**, the following options are available:

- **WIFI\_PROV\_SCHEME\_BLE\_EVENT\_HANDLER\_FREE\_BTDM**
- **WIFI\_PROV\_SCHEME\_BLE\_EVENT\_HANDLER\_FREE\_BLE**
- **WIFI\_PROV\_SCHEME\_BLE\_EVENT\_HANDLER\_FREE\_BT**

*wifi\_prov\_event\_handler\_t* **app\_event\_handler**

Event handler that can be set for the purpose of incorporating application specific behavior. Use **WIFI\_PROV\_EVENT\_HANDLER\_NONE** when not used.

## Macros

**WIFI\_PROV\_EVENT\_HANDLER\_NONE**

Event handler can be set to none if not used.

## Type Definitions

typedef void (\***wifi\_prov\_cb\_func\_t**)(void \*user\_data, *wifi\_prov\_cb\_event\_t* event, void \*event\_data)

typedef struct *wifi\_prov\_scheme* **wifi\_prov\_scheme\_t**

Structure for specifying the provisioning scheme to be followed by the manager.

---

**备注:** Ready to use schemes are available:

- **wifi\_prov\_scheme\_ble** : for provisioning over BLE transport + GATT server
  - **wifi\_prov\_scheme\_softap** : for provisioning over SoftAP transport + HTTP server
  - **wifi\_prov\_scheme\_console** : for provisioning over Serial UART transport + Console (for debugging)
- 

typedef enum *wifi\_prov\_security* **wifi\_prov\_security\_t**

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

typedef *protocomm\_security2\_params\_t* **wifi\_prov\_security2\_params\_t**

Security 2 params structure This needs to be passed when using **WIFI\_PROV\_SECURITY\_2**.

## Enumerations

enum **wifi\_prov\_cb\_event\_t**

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

*Values:*

enumerator **WIFI\_PROV\_INIT**

Emitted when the manager is initialized

enumerator **WIFI\_PROV\_START**

Indicates that provisioning has started

enumerator **WIFI\_PROV\_CRED\_RECV**

Emitted when Wi-Fi AP credentials are received via protocomm endpoint *wifi\_config*. The event data in this case is a pointer to the corresponding *wifi\_sta\_config\_t* structure

enumerator **WIFI\_PROV\_CRED\_FAIL**

Emitted when device fails to connect to the AP of which the credentials were received earlier on event **WIFI\_PROV\_CRED\_RECV**. The event data in this case is a pointer to the disconnection reason code with type *wifi\_prov\_sta\_fail\_reason\_t*

enumerator **WIFI\_PROV\_CRED\_SUCCESS**

Emitted when device successfully connects to the AP of which the credentials were received earlier on event **WIFI\_PROV\_CRED\_RECV**

enumerator **WIFI\_PROV\_END**

Signals that provisioning service has stopped

enumerator **WIFI\_PROV\_DEINIT**

Signals that manager has been de-initialized

enum **wifi\_prov\_security**

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

*Values:*

enumerator **WIFI\_PROV\_SECURITY\_0**

No security (plain-text communication)

enumerator **WIFI\_PROV\_SECURITY\_1**

This secure communication mode consists of X25519 key exchange

- proof of possession (pop) based authentication
- AES-CTR encryption

enumerator **WIFI\_PROV\_SECURITY\_2**

This secure communication mode consists of SRP6a based authentication and key exchange

- AES-GCM encryption/decryption

### Header File

- [components/wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_ble.h](#)
- This header file can be included with:

```
#include "wifi_provisioning/scheme_ble.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your CMakeLists.txt:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

### Functions

void **wifi\_prov\_scheme\_ble\_event\_cb\_free\_bt***dm* (void \*user\_data, [wifi\\_prov\\_cb\\_event\\_t](#) event, void \*event\_data)

void **wifi\_prov\_scheme\_ble\_event\_cb\_free\_ble** (void \*user\_data, [wifi\\_prov\\_cb\\_event\\_t](#) event, void \*event\_data)

void **wifi\_prov\_scheme\_ble\_event\_cb\_free\_bt** (void \*user\_data, [wifi\\_prov\\_cb\\_event\\_t](#) event, void \*event\_data)

[esp\\_err\\_t](#) **wifi\_prov\_scheme\_ble\_set\_service\_uuid** (uint8\_t \*uuid128)

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`, otherwise the default UUID will be used.

---

**备注:** The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

---

**参数** `uuid128` -- [in] A custom 128 bit UUID

**返回**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

`esp_err_t wifi_prov_scheme_ble_set_mfg_data` (uint8\_t \*mfg\_data, ssize\_t mfg\_data\_len)

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`.

---

**备注:** It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e.  $(mfg\_data\_len + 2) < 31 - (device\_name\_length + 2)$ . If the `mfg_data` length exceeds this limit, the length will be truncated.

---

**参数**

- `mfg_data` -- [in] Custom manufacturer data
- `mfg_data_len` -- [in] Manufacturer data length

**返回**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

## Macros

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

## Header File

- `components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h`
- This header file can be included with:

```
#include "wifi_provisioning/scheme_softap.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

## Functions

void **wifi\_prov\_scheme\_softap\_set\_httpd\_handle** (void \*handle)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

---

**备注:** This API should be called before `wifi_prov_mgr_start_provisioning()`

---

**参数** **handle** -- [in] Handle to HTTPD server instance

### Header File

- [components/wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_console.h](#)
- This header file can be included with:

```
#include "wifi_provisioning/scheme_console.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

### Header File

### Functions

*esp\_err\_t* **wifi\_prov\_config\_data\_handler** (uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen, void \*priv\_data)

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (`protocomm_protocomm_req_handler_t`) using `protocomm_add_endpoint()`

### Structures

struct **wifi\_prov\_sta\_conn\_info\_t**

WiFi STA connected status information.

**Public Members**

char **ip\_addr**[IP4ADDR\_STRLEN\_MAX]

IP Address received by station

char **bssid**[6]

BSSID of the AP to which connection was established

char **ssid**[33]

SSID of the to which connection was established

uint8\_t **channel**

Channel of the AP

uint8\_t **auth\_mode**

Authorization mode of the AP

struct **wifi\_prov\_config\_get\_data\_t**

WiFi status data to be sent in response to `get_status` request from master.

**Public Members**

*wifi\_prov\_sta\_state\_t* **wifi\_state**

WiFi state of the station

*wifi\_prov\_sta\_fail\_reason\_t* **fail\_reason**

Reason for disconnection (valid only when `wifi_state` is `WIFI_STATION_DISCONNECTED`)

*wifi\_prov\_sta\_conn\_info\_t* **conn\_info**

Connection information (valid only when `wifi_state` is `WIFI_STATION_CONNECTED`)

struct **wifi\_prov\_config\_set\_data\_t**

WiFi config data received by slave during `set_config` request from master.

**Public Members**

char **ssid**[33]

SSID of the AP to which the slave is to be connected

char **password**[64]

Password of the AP

char **bssid**[6]

BSSID of the AP

uint8\_t **channel**

Channel of the AP

struct **wifi\_prov\_config\_handlers**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

### Public Members

*esp\_err\_t* (\***get\_status\_handler**)(*wifi\_prov\_config\_get\_data\_t* \*resp\_data, *wifi\_prov\_ctx\_t* \*\*ctx)

Handler function called when connection status of the slave (in WiFi station mode) is requested

*esp\_err\_t* (\***set\_config\_handler**)(const *wifi\_prov\_config\_set\_data\_t* \*req\_data, *wifi\_prov\_ctx\_t* \*\*ctx)

Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

*esp\_err\_t* (\***apply\_config\_handler**)(*wifi\_prov\_ctx\_t* \*\*ctx)

Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.

*wifi\_prov\_ctx\_t* \***ctx**

Context pointer to be passed to above handler functions upon invocation

### Type Definitions

typedef struct *wifi\_prov\_ctx* **wifi\_prov\_ctx\_t**

Type of context data passed to each get/set/apply handler function set in `wifi_prov_config_handlers` structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

typedef struct *wifi\_prov\_config\_handlers* **wifi\_prov\_config\_handlers\_t**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

### Enumerations

enum **wifi\_prov\_sta\_state\_t**

WiFi STA status for conveying back to the provisioning master.

*Values:*

enumerator **WIFI\_PROV\_STA\_CONNECTING**

enumerator **WIFI\_PROV\_STA\_CONNECTED**

enumerator **WIFI\_PROV\_STA\_DISCONNECTED**

```
enum wifi_prov_sta_fail_reason_t
```

WiFi STA connection fail reason.

Values:

```
enumerator WIFI_PROV_STA_AUTH_ERROR
```

```
enumerator WIFI_PROV_STA_AP_NOT_FOUND
```

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 `provisioning` 目录下。

本部分的 API 示例代码存放在 `wifi/smart_config` 目录下。

本部分的 API 示例代码存放在 `wifi/wifi_easy_connect/dpp-enrollee` 目录下。

## 2.9 存储 API

本节提供高层次的存储 API 的参考文档。这些 API 基于如 SPI flash、SD/MMC 等低层次驱动。

- **分区表 API** 基于分区表，允许以块为单位访问 SPI flash。
- **非易失性存储库 (NVS)** 在 SPI NOR flash 上实现了一个有容错性，和磨损均衡功能的键值对存储。
- **虚拟文件系统 (VFS)** 库提供了一个用于注册文件系统驱动接口。SPIFFS、FAT 以及多种其他的文件系统库都基于 VFS。
- **SPIFFS** 是一个专为 SPI NOR flash 优化的磨损均衡的文件系统，非常适用于小分区和低吞吐率的应用。
- **FAT** 是一个可用于 SPI flash 或者 SD/MMC 存储卡的标准文件系统。
- **磨损均衡** 库实现了一个适用于 SPI NOR flash 的 flash 翻译层 (FTL)，用于 flash 中 FAT 分区的容器。

---

**备注：** 建议使用高层次的 API (`esp_partition` 或者文件系统) 而非低层次驱动 API 去访问 SPI NOR flash。

由于 NOR flash 和乐鑫硬件的一些限制，访问主 flash 会影响各个系统的性能。关于这些限制的更多信息，参见 *SPI flash API*。

---

### 2.9.1 FAT 文件系统

ESP-IDF 使用 **FatFs** 库来实现 FAT 文件系统。FatFs 库位于 `fatfs` 组件中，支持直接使用，也可以借助 C 标准库和 POSIX API 通过 VFS (虚拟文件系统) 使用 FatFs 库的大多数功能。

此外，我们对 FatFs 库进行了扩展，新增了支持可插拔磁盘 I/O 调度层，从而允许在运行时将 FatFs 驱动映射到物理磁盘。

#### FatFs 与 VFS 配合使用

头文件 `fatfs/vfs/esp_vfs_fat.h` 定义了连接 FatFs 和 VFS 的函数。

函数 `esp_vfs_fat_register()` 分配一个 FATFS 结构，并在 VFS 中注册特定路径前缀。如果文件路径以此前缀开头，则对此文件的后续操作将转至 FatFs API。

函数 `esp_vfs_fat_unregister_path()` 删除在 VFS 中的注册，并释放 FATFS 结构。

多数应用程序在使用 `esp_vfs_fat_` 函数时，采用如下步骤：

1. 调用 `esp_vfs_fat_register()`，指定：

- 挂载文件系统的路径前缀（例如，"/sdcard" 或 "/spiflash"）
  - FatFs 驱动编号
  - 一个用于接收指向 FATFS 结构指针的变量
2. 调用 `ff_diskio_register()`，为步骤 1 中的驱动编号注册磁盘 I/O 驱动；
  3. 调用 FatFs 函数 `f_mount()`，随后调用 `f_fdisk()` 或 `f_mkfs()`，并使用与传递到 `esp_vfs_fat_register()` 相同的驱动编号挂载文件系统。请参考 [FatFs 文档](#)，查看更多信息；
  4. 调用 C 标准库和 POSIX API 对路径中带有步骤 1 中所述前缀的文件（例如，"/sdcard/hello.txt"）执行打开、读取、写入、擦除、复制等操作。文件系统默认使用 [8.3 文件名格式 \(SFN\)](#)。如需使用长文件名 (LFN)，启用 `CONFIG_FATFS_LONG_FILENAMES` 选项。请参考 [here](#)，查看更多信息；
  5. 可以启用 `CONFIG_FATFS_USE_FASTSEEK` 选项，可以使用 POSIX `lseek` 实现快速执行。快速查找不适用于编辑模式下的文件，所以，使用快速查找时，应在只读模式下打开（或者关闭后重新打开）文件；
  6. 可以启用 `CONFIG_FATFS_IMMEDIATE_FSYNC` 选项，在每次调用 `vfs_fat_write()`、`vfs_fat_pwrite()`、`vfs_fat_link()`、`vfs_fat_truncate()` 和 `vfs_fat_ftruncate()` 函数之后，自动调用 `f_sync()` 以同步最近的文件改动。该功能可提高文件系统中文件的一致性和文件大小报告的准确性，但是由于需要频繁进行磁盘操作，性能将会受到影响；
  7. 可以直接调用 FatFs 库函数，但需要使用没有 VFS 前缀的路径，如 `"/hello.txt"`；
  8. 关闭所有打开的文件；
  9. 调用 FatFs 函数 `f_mount()` 并使用 `NULL FATFS*` 参数，为与上述编号相同的驱动卸载文件系统；
  10. 调用 FatFs 函数 `ff_diskio_register()` 并使用 `NULL ff_diskio_impl_t*` 参数和相同的驱动编号，来释放注册的磁盘 I/O 驱动；
  11. 调用 `esp_vfs_fat_unregister_path()` 并使用文件系统挂载的路径将 FatFs 从 VFS 中移除，并释放步骤 1 中分配的 FATFS 结构。

便捷函数 `esp_vfs_fat_sdmmc_mount()`、`esp_vfs_fat_sdspi_mount()` 和 `esp_vfs_fat_sdcard_unmount()` 对上述步骤进行了封装，并加入了对 SD 卡初始化的处理。我们将在下一章节详细介绍以上函数。

### FatFs 与 VFS 和 SD 卡配合使用

头文件 `fatfs/vfs/esp_vfs_fat.h` 定义了便捷函数 `esp_vfs_fat_sdmmc_mount()`、`esp_vfs_fat_sdspi_mount()` 和 `esp_vfs_fat_sdcard_unmount()`。这些函数分别执行上一章节的步骤 1-3 和步骤 7-9，并初始化 SD 卡，但仅提供有限的错误处理功能。我们鼓励开发人员查看源代码，将更多高级功能集成到产品应用中。

便捷函数 `esp_vfs_fat_sdmmc_unmount()` 用于卸载文件系统并释放从 `esp_vfs_fat_sdmmc_mount()` 函数获取的资源。

### FatFs 与 VFS 配合使用（只读模式下）

头文件 `fatfs/vfs/esp_vfs_fat.h` 也定义了两个便捷函数 `esp_vfs_fat_spiflash_mount_ro()` 和 `esp_vfs_fat_spiflash_unmount_ro()`。上述两个函数分别对 FAT 只读分区执行步骤 1-3 和步骤 7-9。有些数据分区仅在工厂配置时写入一次，之后在整个硬件生命周期内都不会再有任何改动。利用上述两个函数处理这种数据分区非常方便。

### FatFs 磁盘 I/O 层

我们对 FatFs API 函数进行了扩展，实现了运行期间注册磁盘 I/O 驱动。

上述 API 为 SD/MMC 卡提供了磁盘 I/O 函数实现方式，可使用 `ff_diskio_register_sdmmc()` 函数注册指定的 FatFs 驱动编号。

```
void ff_diskio_register (BYTE pdrv, const ff_diskio_impl_t *discio_impl)
```

Register or unregister diskio driver for given drive number.

When FATFS library calls one of `disk_XXX` functions for driver number `pdrv`, corresponding function in `discio_impl` for given `pdrv` will be called.

**参数**

- **pdrv** -- drive number
- **discio\_impl** -- pointer to *ff\_diskio\_impl\_t* structure with diskio functions or NULL to unregister and free previously registered drive

struct **ff\_diskio\_impl\_t**

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

**Public Members**

DSTATUS (**\*init**)(unsigned char pdrv)

disk initialization function

DSTATUS (**\*status**)(unsigned char pdrv)

disk status check function

DRESULT (**\*read**)(unsigned char pdrv, unsigned char \*buff, uint32\_t sector, unsigned count)

sector read function

DRESULT (**\*write**)(unsigned char pdrv, const unsigned char \*buff, uint32\_t sector, unsigned count)

sector write function

DRESULT (**\*ioctl**)(unsigned char pdrv, unsigned char cmd, void \*buff)

function to get info about disk and do some misc operations

void **ff\_diskio\_register\_sdmmc** (unsigned char pdrv, *sdmmc\_card\_t* \*card)

Register SD/MMC diskio driver

**参数**

- **pdrv** -- drive number
- **card** -- pointer to *sdmmc\_card\_t* structure describing a card; card should be initialized before calling *f\_mount*.

*esp\_err\_t* **ff\_diskio\_register\_wl\_partition** (unsigned char pdrv, *wl\_handle\_t* flash\_handle)

Register spi flash partition

**参数**

- **pdrv** -- drive number
- **flash\_handle** -- handle of the wear levelling partition.

*esp\_err\_t* **ff\_diskio\_register\_raw\_partition** (unsigned char pdrv, const *esp\_partition\_t* \*part\_handle)

Register spi flash partition

**参数**

- **pdrv** -- drive number
- **part\_handle** -- pointer to raw flash partition.

**FatFs 分区生成器**

我们为 FatFs (*wl\_fatfsngen.py*) 提供了分区生成器, 该生成器集成在构建系统中, 方便用户在自己的项目中使用。

该生成器可以在主机上创建文件系统镜像, 并用指定的主机文件夹内容对其进行填充。

该脚本是建立在分区生成器的基础上 ([fatfsgen.py](#))，目前除了可以生成分区外，也可以初始化磨损均衡。

目前的最新版本支持短文件名、长文件名、FAT12 和 FAT16。长文件名的上限是 255 个字符，文件名中可以包含多个 . 字符以及其他字符，如 +、,、;、=、[ and ] 等。

如需进一步了解 FatFs 分区生成器或分区分析器，请查看 [Generating and parsing FAT partition on host](#)。

**构建系统中使用 FatFs 分区生成器** 通过调用 `fatfs_create_partition_image` 可以直接从 CMake 构建系统中调用 FatFs 分区生成器：

```
fatfs_create_spiflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

如果不希望在生成分区时使用磨损均衡，可以使用 `fatfs_create_rawflash_image`：

```
fatfs_create_rawflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

`fatfs_create_spiflash_image` 以及 `fatfs_create_rawflash_image` 必须从项目的 `CMakeLists.txt` 中调用。

如果决定使用 `fatfs_create_rawflash_image`（不支持磨损均衡），请注意它仅支持在设备中以只读模式安装。

该函数的参数如下：

1. `partition` - 分区的名称，需要在分区表中定义（如 [storage/fatfsgen/partitions\\_example.csv](#)）。
2. `base_dir` - 目录名称，该目录会被编码为 FatFs 分区，也可以选择将其被烧录进设备。但注意必须在分区表中指定合适的分区大小。
3. `FLASH_IN_PROJECT` 标志 - 可选参数，用户可以通过指定 `FLASH_IN_PROJECT`，选择在执行 `idf.py flash -p <PORT>` 时让分区镜像自动与应用程序二进制文件、分区表等一同烧录进设备。
4. `PRESERVE_TIME` 标志 - 可选参数，用户可强制让目标镜像保留源文件夹的时间戳。如果不保留，每个目标镜像的时间戳都将设置为 FATFS 默认初始时间（1980 年 1 月 1 日）。

例如：

```
fatfs_create_partition_image(my_fatfs_partition my_folder FLASH_IN_PROJECT)
```

没有指定 `FLASH_IN_PROJECT` 时也可以生成分区镜像，但是用户需要使用 `esptool.py` 或自定义的构建系统目标对其手动烧录。

相关示例请查看 [storage/fatfsgen](#)。

## FatFs 分区分析器

我们为 FatFs 提供分区分析器 ([fatfsparse.py](#))。

该分析器为 FatFs 分区生成器 ([fatfsgen.py](#)) 的逆向工具，可以根据 FatFs 镜像在主机上生成文件夹结构。

可以使用：

```
./fatfsparse.py [-h] [--wl-layer {detect,enabled,disabled}] fatfs_image.img
```

## 高级 API 参考

### Header File

- `components/fatfs/vfs/esp_vfs_fat.h`
- This header file can be included with:

```
#include "esp_vfs_fat.h"
```

- This header file is a part of the API provided by the `fatfs` component. To declare that your component depends on `fatfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES fatfs
```

or

```
PRIV_REQUIRES fatfs
```

## Functions

`esp_err_t esp_vfs_fat_register` (const char \*base\_path, const char \*fat\_drive, size\_t max\_files, FATFS \*\*out\_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, `fat_drive` argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for `f_mount` call.

---

**备注:** This function doesn't mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

---

### 参数

- **base\_path** -- path prefix where FATFS should be registered
- **fat\_drive** -- FATFS drive specification; if only one drive is used, can be an empty string
- **max\_files** -- maximum number of files which can be open at the same time
- **out\_fs** -- [out] pointer to FATFS structure which can be used for FATFS `f_mount` call is returned via this argument.

### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_register` was already called
- ESP\_ERR\_NO\_MEM if not enough memory or too many VFSes already registered

`esp_err_t esp_vfs_fat_unregister_path` (const char \*base\_path)

Un-register FATFS from VFS.

---

**备注:** FATFS structure returned by `esp_vfs_fat_register` is destroyed after this call. Make sure to call `f_mount` function to unmount it before calling `esp_vfs_fat_unregister_path`. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

---

**参数** **base\_path** -- path prefix where FATFS is registered. This is the same used when `esp_vfs_fat_register` was called

### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if FATFS is not registered in VFS

`esp_err_t esp_vfs_fat_sdmmc_mount` (const char \*base\_path, const `sdmmc_host_t` \*host\_config, const void \*slot\_config, const `esp_vfs_fat_mount_config_t` \*mount\_config, `sdmmc_card_t` \*\*out\_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in `host_config`
- initializes SD card with configuration in `slot_config`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`

- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

---

**备注:** Use this API to mount a card through SDSPI is deprecated. Please call `esp_vfs_fat_sdspi_mount()` instead for that case.

---

#### 参数

- **base\_path** -- path where partition should be registered (e.g. `"/sdcard"`)
- **host\_config** -- Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using `SDMMC_HOST_DEFAULT()` macro. When using SPI peripheral, this structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- **slot\_config** -- Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to `sdmmc_slot_config_t` structure initialized using `SDMMC_SLOT_CONFIG_DEFAULT`.
- **mount\_config** -- pointer to structure with extra parameters for mounting FATFS
- **out\_card** -- [out] if not NULL, pointer to the card information structure will be returned via this argument

#### 返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_sdmmc_mount` was already called
- `ESP_ERR_NO_MEM` if memory can not be allocated
- `ESP_FAIL` if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

`esp_err_t esp_vfs_fat_sdspi_mount` (const char \*base\_path, const *sdmmc\_host\_t* \*host\_config\_input, const *sdspi\_device\_config\_t* \*slot\_config, const *esp\_vfs\_fat\_mount\_config\_t* \*mount\_config, *sdmmc\_card\_t* \*\*out\_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in `slot_config`, and attach it to an initialized SPI bus.
- initializes SD card with configuration in `host_config_input`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

---

**备注:** This function try to attach the new SD SPI device to the bus specified in `host_config`. Make sure the SPI bus specified in `host_config->slot` have been initialized by `spi_bus_initialize()` before.

---

#### 参数

- **base\_path** -- path where partition should be registered (e.g. `"/sdcard"`)
- **host\_config\_input** -- Pointer to structure describing SDMMC host. This structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- **slot\_config** -- Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to *sdspi\_device\_config\_t* structure initialized using `SDSPI_DEVICE_CONFIG_DEFAULT()`.
- **mount\_config** -- pointer to structure with extra parameters for mounting FATFS

- **out\_card** -- [out] If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it's not suggested to use more than one card at the same time and unmount one of them in your application.

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_sdmmc\_mount was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

*esp\_err\_t* **esp\_vfs\_fat\_sdmmc\_unmount** (void)

Unmount FAT filesystem and release resources acquired using esp\_vfs\_fat\_sdmmc\_mount.

*Deprecated:*

Use esp\_vfs\_fat\_sdcard\_unmount () instead.

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_sdmmc\_mount hasn't been called

*esp\_err\_t* **esp\_vfs\_fat\_sdcard\_unmount** (const char \*base\_path, *sdmmc\_card\_t* \*card)

Unmount an SD card from the FAT filesystem and release resources acquired using esp\_vfs\_fat\_sdmmc\_mount () or esp\_vfs\_fat\_sdspi\_mount ()

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the card argument is unregistered
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_sdmmc\_mount hasn't been called

*esp\_err\_t* **esp\_vfs\_fat\_sdcard\_format** (const char \*base\_path, *sdmmc\_card\_t* \*card)

Format FAT filesystem.

---

**备注:** This API should be only called when the FAT is already mounted.

---

**参数**

- **base\_path** -- Path where partition should be registered (e.g. "/sdcard")
- **card** -- Pointer to the card handle, which should be initialised by calling esp\_vfs\_fat\_sdspi\_mount first

**返回**

- ESP\_OK
- ESP\_ERR\_INVALID\_STATE: FAT partition isn't mounted, call esp\_vfs\_fat\_sdmmc\_mount or esp\_vfs\_fat\_sdspi\_mount first
- ESP\_ERR\_NO\_MEM: if memory can not be allocated
- ESP\_FAIL: fail to format it, or fail to mount back

*esp\_err\_t* **esp\_vfs\_fat\_spiflash\_mount\_rw\_wl** (const char \*base\_path, const char \*partition\_label, const *esp\_vfs\_fat\_mount\_config\_t* \*mount\_config, *wl\_handle\_t* \*wl\_handle)

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition\_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition

- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact.

#### 参数

- **base\_path** -- path where FATFS partition should be mounted (e.g. `"/spiflash"`)
- **partition\_label** -- label of the partition which should be used
- **mount\_config** -- pointer to structure with extra parameters for mounting FATFS
- **wl\_handle** -- [out] wear levelling driver handle

#### 返回

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition table does not contain FATFS partition with given label
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_spiflash_mount_rw_wl` was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

*esp\_err\_t* `esp_vfs_fat_spiflash_unmount_rw_wl` (const char \*base\_path, *wl\_handle\_t* wl\_handle)

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_spiflash_mount_rw_wl`.

#### 参数

- **base\_path** -- path where partition should be registered (e.g. `"/spiflash"`)
- **wl\_handle** -- wear levelling driver handle returned by `esp_vfs_fat_spiflash_mount_rw_wl`

#### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_spiflash_mount_rw_wl` hasn't been called

*esp\_err\_t* `esp_vfs_fat_spiflash_format_rw_wl` (const char \*base\_path, const char \*partition\_label)

Format FAT filesystem.

---

**备注:** This API can be called when the FAT is mounted / not mounted. If this API is called when the FAT isn't mounted (by calling `esp_vfs_fat_spiflash_mount_rw_wl`), this API will first mount the FAT then format it, then restore back to the original state.

---

#### 参数

- **base\_path** -- Path where partition should be registered (e.g. `"/spiflash"`)
- **partition\_label** -- Label of the partition which should be used

#### 返回

- ESP\_OK
- ESP\_ERR\_NO\_MEM: if memory can not be allocated
- Other errors from `esp_vfs_fat_spiflash_mount_rw_wl`

*esp\_err\_t* `esp_vfs_fat_spiflash_mount_ro` (const char \*base\_path, const char \*partition\_label, const *esp\_vfs\_fat\_mount\_config\_t* \*mount\_config)

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined `partition_label`. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

---

**备注:** Wear levelling is not used when FAT is mounted in read-only mode using this function.

---

**参数**

- **base\_path** -- path where FATFS partition should be mounted (e.g. `"/spiflash"`)
- **partition\_label** -- label of the partition which should be used
- **mount\_config** -- pointer to structure with extra parameters for mounting FATFS

**返回**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition table does not contain FATFS partition with given label
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_spiflash_mount_ro` was already called for the same partition
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

*esp\_err\_t* **esp\_vfs\_fat\_spiflash\_unmount\_ro** (const char \*base\_path, const char \*partition\_label)

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_spiflash_mount_ro`.

**参数**

- **base\_path** -- path where partition should be registered (e.g. `"/spiflash"`)
- **partition\_label** -- label of partition to be unmounted

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_spiflash_mount_ro` hasn't been called

*esp\_err\_t* **esp\_vfs\_fat\_info** (const char \*base\_path, uint64\_t \*out\_total\_bytes, uint64\_t \*out\_free\_bytes)

Get information for FATFS partition.

**参数**

- **base\_path** -- Base path of the partition examined (e.g. `"/spiflash"`)
- **out\_total\_bytes** -- [out] Size of the file system
- **out\_free\_bytes** -- [out] Free bytes available in the file system

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if partition not found
- ESP\_FAIL if another FRESULT error (saved in `errno`)

**Structures**

struct **esp\_vfs\_fat\_mount\_config\_t**

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount_rw_wl` functions.

**Public Members**

bool **format\_if\_mount\_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int **max\_files**

Max number of open files.

size\_t **allocation\_unit\_size**

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and `128 * sector size`. For SD cards, sector size is always 512 bytes. For wear\_leveling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

#### bool `disk_status_check_enable`

Enables real `ff_disk_status` function implementation for SD cards (`ff_sdmmc_status`). Possibly slows down IO performance.

Try to enable if you need to handle situations when SD cards are not unmounted properly before physical removal or you are experiencing issues with SD cards.

Doesn't do anything for other memory storage media.

### Type Definitions

```
typedef esp_vfs_fat_mount_config_t esp_vfs_fat_sdmmc_mount_config_t
```

## 2.9.2 量产程序

### 介绍

这一程序主要用于量产时为每一设备创建工厂 NVS（非易失性存储器）分区镜像。NVS 分区镜像由 CSV（逗号分隔值）文件生成，文件中包含了用户提供的配置项及配置值。

注意，该程序仅创建用于量产的二进制镜像，您需要使用以下工具将镜像烧录到设备上：

- [esptool.py](#)
- [Flash 下载工具](#)（仅适用于 Windows）。下载后解压，然后按照 doc 文件夹中的说明操作。
- 使用定制的生产工具直接烧录程序

### 准备工作

该程序依赖于 `esp-idf` 的 NVS 分区程序

- 操作系统要求：
  - Linux、MacOS 或 Windows（标准版）
- 安装依赖包：
  - [Python](#)

---

### 备注：

使用该程序之前，请确保：

- Python 路径已添加到 PATH 环境变量中；
  - 已经安装 `requirement.txt` 中的软件包，`requirement.txt` 在 `esp-idf` 根目录下。
-

## 具体流程

### CSV 配置文件

CSV 配置文件中包含设备待烧录的配置信息，定义了待烧录的配置项。

配置文件中数据格式如下（*REPEAT* 标签可选）：

```

name1,namespace,    <-- 第一个条目应该为 "namespace" 类型
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
  
```

**备注：** 文件第一行应始终为 namespace 条目。

每行应包含三个参数：key、type 和 encoding，并以逗号分隔。如果有 REPEAT 标签，则主 CSV 文件中所有设备此键值均相同。

有关各个参数的详细说明，请参阅 NVS 分区生成程序的 *README* 文件。

CSV 配置文件示例如下：

```

app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
  
```

**备注：**

**请确保：**

- 逗号',' 前后无空格；
- CSV 文件每行末尾无空格。

### 主 CSV 文件

主 CSV 文件中包含设备待烧录的详细信息，文件中每行均对应一个设备实体。

主 CSV 文件的数据格式如下：

```

key1,key2,key3,....
value1,value2,value3,....
  
```

**备注：** 文件中键 (key) 名应始终置于文件首行。从配置文件中获取的键，在此文件中的排列顺序应与其在配置文件中的排列顺序相同。主 CSV 文件同时可以包含其它列 (键)，这些列将被视为元数据，而不会编译进最终二进制文件。

每行应包含相应键的键值 (value)，并用逗号隔开。如果某键带有 REPEAT 标签，则仅需在第二行（即第一个条目）输入对应的值，后面其他行为空。

参数描述如下：

**value** Data value

value 是与键对应的键值。

主 CSV 文件示例如下：

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6feeff,,103
```

**备注：**如果出现 REPEAT 标签，则会在相同目录下生成一个新的主 CSV 文件用作主输入文件，并在每行为带有 REPEAT 标签的键插入键值。

量产程序还会创建中间 CSV 文件，NVS 分区程序将使用此 CSV 文件作为输入，然后生成二进制文件。

中间 CSV 文件的格式如下：

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

此步骤将为每一设备生成一个中间 CSV 文件。

## 运行量产程序

使用方法：

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

可选参数：

序号	参数	描述
1	-h, --help	显示帮助信息并退出

命令：

运行 `mfg_gen.py {command} -h` 查看更多帮助信息

序号	参数	描述
1	generate	生成 NVS 分区
2	generate-key	生成加密密钥

## 为每个设备生成工厂镜像（默认）

使用方法：

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
                             [--keyfile KEYFILE] [--inputkey INPUTKEY]
                             [--outdir OUTDIR]
                             conf values prefix size
```

## 位置参数:

参数	描述
conf	待解析的 CSV 配置文件路径
values	待解析的主 CSV 文件路径
prefix	每个输出文件名前缀的唯一名称
size	NVS 分区大小 (以字节为单位, 且为 4096 的整数倍)

## 可选参数:

参数	描述
-h, --help	显示帮助信息并退出
--fileid FILEID	每个文件名后缀的唯一文件标识符 (主 CSV 文件中的任意键), 默认为数值 1、2、3...
--version {1,2}	<ul style="list-style-type: none"> <li>• 设置多页 Blob 版本。</li> <li>• 版本 1 - 禁用多页 Blob;</li> <li>• 版本 2 - 启用多页 Blob;</li> <li>• 默认版本: 版本 2</li> </ul>
--keygen	生成 NVS 分区加密密钥
--inputkey INPUTKEY	内含 NVS 分区加密密钥的文件
--outdir OUTDIR	输出目录, 用于存储创建的文件 (默认当前目录)

请运行以下命令为每个设备生成工厂镜像, 量产程序同时提供了一个 CSV 示例文件:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000
```

主 CSV 文件应在 file 类型下设置一个相对路径, 相对于运行该程序的当前目录。

## 为每个设备生成工厂加密镜像

运行以下命令为每一设备生成工厂加密镜像, 量产程序同时提供了一个 CSV 示例文件。

- 通过量产程序生成加密密钥来进行加密:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --keygen
```

**备注:** 创建的加密密钥格式为 <outdir>/keys/keys-<prefix>-<fileid>.bin。加密密钥存储于新建文件的 keys/ 目录下, 与 NVS 密钥分区结构兼容。更多信息请参考 [NVS 密钥分区](#)。

- 提供加密密钥用作二进制输入文件来进行加密:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

## 仅生成加密密钥

## 使用方法:

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

可选参数: +-----+-----+ | 参数 | 描述 | +-----+-----+  
+-----+ | -h, --help | 显示帮助信息并退出 | +-----+-----+  
+-----+ | --keyfile KEYFILE | 加密密钥文件的输出路径 | +-----+-----+  
+-----+ | --outdir OUTDIR | 输出目录, 用于存储创建的文件 (默认当前目录) | +-----+-----+  
+-----+

运行以下命令仅生成加密密钥:

```
python mfg_gen.py generate-key
```

---

**备注:** 创建的加密密钥格式为 `<outdir>/keys/keys-<timestamp>.bin`。时间戳格式为: `%m-%d_%H-%M`。如需自定义目标文件名, 请使用 `--keyfile` 参数。

---

生成的加密密钥二进制文件还可以用于为每个设备的工厂镜像加密。

`fileid` 参数的默认值为 1、2、3..., 与主 CSV 文件中的行一一对应, 内含设备配置值。

运行量产程序时, 将在指定的 `outdir` 目录下创建以下文件夹:

- `bin/` 存储生成的二进制文件
- `csv/` 存储生成的中间 CSV 文件
- `keys/` 存储加密密钥 (创建工厂加密镜像时会用到)

### 2.9.3 非易失性存储库

#### 简介

非易失性存储 (NVS) 库主要用于在 flash 中存储键值格式的数据。本文档将详细介绍 NVS 常用的一些概念。

**底层存储** NVS 库通过调用 `esp_partition` API 使用主 flash 的部分空间, 即类型为 `data` 且子类型为 `nvs` 的所有分区。应用程序可调用 `nvs_open()` API 选择使用带有 `nvs` 标签的分区, 也可以通过调用 `nvs_open_from_partition()` API 选择使用指定名称的任意分区。

NVS 库后续版本可能会增加其他存储器后端, 来将数据保存至其他 flash 芯片 (SPI 或 I2C 接口)、RTC 或 FRAM 中。

---

**备注:** 如果 NVS 分区被截断 (例如, 更改分区表布局时), 则应擦除分区内容。可以使用 ESP-IDF 构建系统中的 `idf.py erase-flash` 命令擦除 flash 上的所有内容。

---

---

**备注:** NVS 最适合存储一些较小的数据, 而非字符串或二进制大对象 (BLOB) 等较大的数据。如需存储较大的 BLOB 或者字符串, 请考虑使用基于磨损均衡库的 FAT 文件系统。

---

**键值对** NVS 的操作对象为键值对, 其中键是 ASCII 字符串, 当前支持的最大键长为 15 个字符。值可以为以下几种类型:

- 整数型: `uint8_t`、`int8_t`、`uint16_t`、`int16_t`、`uint32_t`、`int32_t`、`uint64_t` 和 `int64_t`;
- 以 0 结尾的字符串;
- 可变长度的二进制数据 (BLOB)

---

**备注:** 字符串值当前上限为 4000 字节, 其中包括空终止符。BLOB 值上限为 508,000 字节或分区大小的 97.6% 减去 4000 字节, 以较低值为准。

---

后续可能会增加对 `float` 和 `double` 等其他类型数据的支持。

键必须唯一。为现有的键写入新值时, 会将旧的值及数据类型更新为写入操作指定的值和数据类型。

读取值时会执行数据类型检查。如果读取操作预期的数据类型与对应键的数据类型不匹配，则返回错误。

**命名空间** 为了减少不同组件之间键名的潜在冲突，NVS 将每个键值对分配给一个命名空间。命名空间的命名规则遵循键名的命名规则，例如，最多可占 15 个字符。此外，单个 NVS 分区最多只能容纳 254 个不同的命名空间。命名空间的名称在调用 `nvs_open()` 或 `nvs_open_from_partition` 中指定，调用后将返回一个不透明句柄，用于后续调用 `nvs_get_*`、`nvs_set_*` 和 `nvs_commit` 函数。这样，一个句柄关联一个命名空间，键名便不会与其他命名空间中相同键名冲突。请注意，不同 NVS 分区中具有相同名称的命名空间将被视为不同的命名空间。

**NVS 迭代器** 迭代器允许根据指定的分区名称、命名空间和数据类型轮询 NVS 中存储的键值对。

使用以下函数，可执行相关操作：

- `nvs_entry_find`: 创建一个不透明句柄，用于后续调用 `nvs_entry_next` 和 `nvs_entry_info` 函数；
- `nvs_entry_next`: 让迭代器指向下一个键值对；
- `nvs_entry_info`: 返回每个键值对的信息。

总的来说，所有通过 `nvs_entry_find()` 获得的迭代器（包括 NULL 迭代器）都必须使用 `nvs_release_iterator()` 释放。

一般情况下，`nvs_entry_find()` 和 `nvs_entry_next()` 会将给定的迭代器设置为 NULL 或为一个有效的迭代器。但如果出现参数错误（如返回 `ESP_ERR_NVS_NOT_FOUND`），给定的迭代器不会被修改。因此，在调用 `nvs_entry_find()` 之前最好将迭代器初始化为 NULL，这样可以避免在释放迭代器之前进行复杂的错误检查。

**安全性、篡改性及鲁棒性** NVS 与 ESP32-C3 flash 加密系统不直接兼容。然而，如果 NVS 加密与 ESP32-C3 flash 加密或 HMAC 外设一起使用，数据仍可以加密形式存储。详情请参考 [NVS 加密](#)。

如果未启用 NVS 加密，任何对 flash 芯片有物理访问权限的用户都可以修改、擦除或添加键值对。NVS 加密启用后，如果不知道相应的 NVS 加密密钥，则无法修改或添加键值对并将其识别为有效键值对。但是，针对擦除操作没有相应的防篡改功能。

当 flash 处于不一致状态时，NVS 库会尝试恢复。在任何时间点关闭设备电源，然后重新打开电源，不会导致数据丢失；但如果关闭设备电源时正在写入新的键值对，这一键值对可能会丢失。该库还应该能够在 flash 中存在任何随机数据的情况下正常初始化。

## NVS 加密

详情请参考 [NVS 加密](#)。

## NVS 分区生成程序

NVS 分区生成程序帮助生成 NVS 分区二进制文件，可使用烧录程序将二进制文件单独烧录至特定分区。烧录至分区上的键值对由 CSV 文件提供，详情请参考 [NVS 分区生成程序](#)。

可以直接使用函数 `nvs_create_partition_image` 通过 CMake 创建分区二进制文件，无需手动调用 `nvs_partition_gen.py` 工具：

```
nvs_create_partition_image(<partition> <csv> [FLASH_IN_PROJECT] [DEPENDS dep dep_
↪dep ...])
```

位置参数：

参数	描述
<code>partition</code>	NVS 分区名
<code>csv</code>	解析的 CSV 文件路径

**可选参数:**

参数	描述
FLASH_IN_PROJECT	NVS 分区名
DEPENDS	指定命令依赖的文件

在没有指定 `FLASH_IN_PROJECT` 的情况下，也支持生成分区镜像，不过此时需要使用 `idf.py <partition>-flash` 手动进行烧录。举个例子，如果分区名为 `nvs`，则需使用的命令为 `idf.py nvs-flash`。

目前，仅支持从组件中的 `CMakeLists.txt` 文件调用 `nvs_create_partition_image`，且此选项仅适用于非加密分区。

**应用示例**

ESP-IDF `storage` 目录下提供了数个代码示例：

**[storage/nvs\\_rw\\_value](#)**

演示如何读取及写入 NVS 单个整数值。

此示例中的值表示 ESP32-C3 模组重启次数。NVS 中数据不会因为模组重启而丢失，因此只有将这一值存储于 NVS 中，才能起到重启次数计数器的作用。

该示例也演示了如何检测读取/写入操作是否成功，以及某个特定值是否在 NVS 中尚未初始化。诊断程序以纯文本形式提供，有助于追踪程序流程，及时发现问题。

**[storage/nvs\\_rw\\_blob](#)**

演示如何读取及写入 NVS 单个整数值和 BLOB（二进制大对象），并在 NVS 中存储这一数值，即便 ESP32-C3 模组重启也不会消失。

- `value` - 记录 ESP32-C3 模组软重启次数和硬重启次数。
- `blob` - 内含记录模组运行次数的表格。此表格将被从 NVS 读取至动态分配的 RAM 上。每次手动软重启后，表格内运行次数即增加一次，新加的运行次数被写入 NVS。下拉 GPIO0 即可手动软重启。

该示例也演示了如何执行诊断程序以检测读取/写入操作是否成功。

**[storage/nvs\\_rw\\_value\\_cxx](#)**

这个例子与 `storage/nvs_rw_value` 完全一样，只是使用了 C++ 的 NVS 句柄类。

**内部实现**

**键值对日志** NVS 按顺序存储键值对，新的键值对添加在最后。因此，如需更新某一键值对，实际是在日志最后增加一对新的键值对，同时将旧的键值对标记为已擦除。

**页面和条目** NVS 库在其操作中主要使用两个实体：页面和条目。页面是一个逻辑结构，用于存储部分的整体日志。逻辑页面对应 flash 的一个物理扇区，正在使用中的页面具有与之相关联的序列号。序列号赋予了页面顺序，较高的序列号对应较晚创建的页面。页面有以下几种状态：

**空或未初始化** 页面对应的 flash 扇区为空白状态（所有字节均为 `0xff`）。此时，页面未存储任何数据且没有关联的序列号。

**活跃状态** 此时 flash 已完成初始化，页头部写入 flash，页面已具备有效序列号。页面中存在一些空条目，可写入数据。任意时刻，至多有一个页面处于活跃状态。

**写满状态** flash 已写满键值对，状态不再改变。用户无法向写满状态下的页面写入新键值对，但仍可将一些键值对标记为已擦除。

**擦除状态** 未擦除的键值对将移至其他页面，以便擦除当前页面。这一状态仅为暂时性状态，即 API 调用返回时，页面应脱离这一状态。如果设备突然断电，下次开机时，设备将继续把未擦除的键值对移至其他页面，并继续擦除当前页面。

**损坏状态** 页头部包含无效数据，无法进一步解析该页面中的数据，因此之前写入该页面的所有条目均无法访问。相应的 flash 扇区并不会被立即擦除，而是与其他处于未初始化状态的扇区一起等待后续使用。这一状态可能对调试有用。

flash 扇区映射至逻辑页面并没有特定的顺序，NVS 库会检查存储在 flash 扇区的页面序列号，并根据序列号组织页面。

**页面结构** 当前，我们假设 flash 扇区大小为 4096 字节，并且 ESP32-C3 flash 加密硬件在 32 字节块上运行。未来有可能引入一些编译时可配置项（可通过 menuconfig 进行配置），以适配具有不同扇区大小的 flash 芯片。但目前尚不清楚 SPI flash 驱动和 SPI flash cache 之类的系统组件是否支持其他扇区大小。

页面由头部、条目状态位图和条目三部分组成。为了实现与 ESP32-C3 flash 加密功能兼容，条目大小设置为 32 字节。如果键值为整数型，条目则保存一个键值对；如果键值为字符串或 BLOB 类型，则条目仅保存一个键值对的部分内容（更多信息详见条目结构描述）。

页面结构如下图所示，括号内数字表示该部分的大小（以字节为单位）。

头部和条目状态位图写入 flash 时不加密。如果启用了 ESP32-C3 flash 加密功能，则条目写入 flash 时将会加密。

通过将 0 写入某些位可以定义页面状态值，表示状态改变。因此，如果需要变更页面状态，并不一定要擦除页面，除非要将其变更为擦除状态。

头部中的 version 字段反映了所用的 NVS 格式版本。为实现向后兼容，版本升级从 0xff 开始依次递减（例如，version-1 为 0xff，version-2 为 0xfe，以此类推）。

头部中 CRC32 值是由不包含状态值的条目计算所得（4 到 28 字节）。当前未使用的条目用 0xff 字节填充。

条目结构和条目状态位图的详细信息见下文描述。

**条目和条目状态位图** 每个条目可处于以下三种状态之一，每个状态在条目状态位图中用两位表示。位图中的最后四位 (256 - 2 \* 126) 未使用。

**空 (2'b11)** 条目还未写入任何内容，处于未初始化状态（全部字节为 0xff）。

**写入 (2'b10)** 一个键值对（或跨多个条目的键值对的部分内容）已写入条目中。

**擦除 (2'b00)** 条目中的键值对已丢弃，条目内容不再解析。

**条目结构** 如果键值类型为基础类型，即 1 - 8 个字节长度的整数型，条目将保存一个键值对；如果键值类型为字符串或 BLOB 类型，条目将保存整个键值对的部分内容。另外，如果键值为字符串类型且跨多个条目，则键值所跨的所有条目均保存在同一页面。BLOB 则可以切分为多个块，实现跨多个页面。BLOB 索引是一个附加的固定长度元数据条目，用于追踪 BLOB 块。目前条目仍支持早期 BLOB 格式（可读取可修改），但这些 BLOB 一经修改，即以新格式储存至条目。

条目结构中各个字段含义如下：

**命名空间 (NS, NameSpace)** 该条目的命名空间索引，详细信息参见命名空间实现章节。

**类型 (Type)** 一个字节表示的值的数据类型，[nvs\\_flash/include/nvs\\_handle.hpp](#) 下的 `ItemType` 枚举了可能的类型。

**跨度 (Span)** 该键值对所用的条目数量。如果键值为整数型，条目数量即为 1。如果键值为字符串或 BLOB，则条目数量取决于值的长度。

**块索引 (ChunkIndex)** 用于存储 BLOB 类型数据块的索引。如果键值为其他数据类型，则此处索引应写入 `0xff`。

**CRC32** 对条目下所有字节进行校验后，所得的校验和（CRC32 字段不计算在内）。

**键 (Key)** 即以零结尾的 ASCII 字符串，字符串最长为 15 字节，不包含最后一个字节的零终止符。

**数据 (Data)** 如果键值类型为整数型，则数据字段仅包含键值。如果键值小于八个字节，使用 `0xff` 填充未使用的部分（右侧）。

如果键值类型为 BLOB 索引条目，则该字段的八个字节将保存以下数据块信息：

- **块大小** 整个 BLOB 数据的大小（以字节为单位）。该字段仅用于 BLOB 索引类型条目。
- **ChunkCount** 存储过程中 BLOB 分成的数据块总量。该字段仅用于 BLOB 索引类型条目。
- **ChunkStart** BLOB 第一个数据块的块索引，后续数据块索引依次递增，步长为 1。该字段仅用于 BLOB 索引类型条目。

如果键值类型为字符串或 BLOB 数据块，数据字段的这八个字节将保存该键值的一些附加信息，如下所示：

- **数据大小** 实际数据的大小（以字节为单位）。如果键值类型为字符串，此字段也应将零终止符包含在内。此字段仅用于字符串和 BLOB 类型条目。
- **CRC32** 数据所有字节的校验和，该字段仅用于字符串和 BLOB 类型条目。

可变长度值（字符串和 BLOB）写入后续条目，每个条目 32 字节。第一个条目的 `Span` 字段将指明使用了多少条目。

**命名空间** 如上所述，每个键值对属于一个命名空间。命名空间标识符（字符串）也作为键值对的键，存储在索引为 0 的命名空间中。与这些键对应的值就是这些命名空间的索引。

NS=0 Type=uint8_t Key="wifi" Value=1	Entry describing namespace "wifi"
NS=1 Type=uint32_t Key="channel" Value=6	Key "channel" in namespace "wifi"
NS=0 Type=uint8_t Key="pwm" Value=2	Entry describing namespace "pwm"
NS=2 Type=uint16_t Key="channel" Value=20	Key "channel" in namespace "pwm"

**条目哈希列表** 为了减少对 flash 执行的读操作次数，Page 类对象均设有一个列表，包含一对数据：条目索引和条目哈希值。该列表可大大提高检索速度，而无需迭代所有条目并逐个从 flash 中读取。Page::findItem 首先从哈希列表中检索条目哈希值，如果条目存在，则在页面内给出条目索引。由于哈希冲突，在哈希列表中检索条目哈希值可能会得到不同的条目，对 flash 中条目再次迭代可解决这一冲突。

哈希列表中每个节点均包含一个 24 位哈希值和 8 位条目索引。哈希值根据条目命名空间、键名和块索引由 CRC32 计算所得，计算结果保留 24 位。为减少将 32 位条目存储在链表中的开销，链表采用了数组的双向链表。每个数组占用 128 个字节，包含 29 个条目、两个链表指针和一个 32 位计数字段。因此，每页额外需要的 RAM 最少为 128 字节，最多为 640 字节。

## API 参考

### Header File

- [components/nvs\\_flash/include/nvs\\_flash.h](#)
- This header file can be included with:

```
#include "nvs_flash.h"
```

- This header file is a part of the API provided by the nvs\_flash component. To declare that your component depends on nvs\_flash, add the following to your CMakeLists.txt:

```
REQUIRES nvs_flash
```

or

```
PRIV_REQUIRES nvs_flash
```

### Functions

*esp\_err\_t* **nvs\_flash\_init** (void)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled "nvs" in the partition table.

When "NVS\_ENCRYPTION" is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

- Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any "data" type partition which has the subtype value set to "nvs\_keys")
- If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
- Internally call "nvs\_flash\_secure\_init()" with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

**返回**

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if no partition with label "nvs" is found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs\_flash\_read\_security\_cfg API (when "NVS\_ENCRYPTION" is enabled).
- error codes from nvs\_flash\_generate\_keys API (when "NVS\_ENCRYPTION" is enabled).
- error codes from nvs\_flash\_secure\_init\_partition API (when "NVS\_ENCRYPTION" is enabled) .

*esp\_err\_t* **nvs\_flash\_init\_partition** (const char \*partition\_label)

Initialize NVS flash storage for the specified partition.

**参数** **partition\_label** -- [in] Label of the partition. Must be no longer than 16 characters.

**返回**

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if specified partition is not found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_init\_partition\_ptr** (const *esp\_partition\_t* \*partition)

Initialize NVS flash storage for the partition specified by partition pointer.

**参数** **partition** -- [in] pointer to a partition obtained by the ESP partition API.

**返回**

- ESP\_OK if storage was successfully initialized
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_INVALID\_ARG in case partition is NULL
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_deinit** (void)

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with "nvs" label in the partition table.

**返回**

- ESP\_OK on success (storage was deinitialized)
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage was not initialized prior to this call

*esp\_err\_t* **nvs\_flash\_deinit\_partition** (const char \*partition\_label)

Deinitialize NVS storage for the given NVS partition.

**参数** **partition\_label** -- [in] Label of the partition

**返回**

- ESP\_OK on success
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage for given partition was not initialized prior to this call

*esp\_err\_t* **nvs\_flash\_erase** (void)

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label "nvs").

---

**备注:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be

initialized again to be used.

---

**返回**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no NVS partition labeled "nvs" in the partition table
- different error in case de-initialization fails (shouldn't happen)

*esp\_err\_t* **nvs\_flash\_erase\_partition** (const char \*part\_name)

Erase specified NVS partition.

Erase all content of a specified NVS partition

---

**备注:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

---

**参数** **part\_name** -- [in] Name (label) of the partition which should be erased

**返回**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn't happen)

*esp\_err\_t* **nvs\_flash\_erase\_partition\_ptr** (const *esp\_partition\_t* \*partition)

Erase custom partition.

Erase all content of specified custom partition.

---

**备注:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

---

**参数** **partition** -- [in] pointer to a partition obtained by the ESP partition API.

**返回**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no partition with the specified parameters in the partition table
- ESP\_ERR\_INVALID\_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_secure\_init** (*nvs\_sec\_cfg\_t* \*cfg)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled "nvs" in the partition table.

**参数** **cfg** -- [in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption is used.

**返回**

- ESP\_OK if storage has been initialized successfully.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if no partition with label "nvs" is found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

***esp\_err\_t* nvs\_flash\_secure\_init\_partition** (const char \*partition\_label, *nvs\_sec\_cfg\_t* \*cfg)

Initialize NVS flash storage for the specified partition.

#### 参数

- **partition\_label** -- **[in]** Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- **cfg** -- **[in]** Security configuration (keys) to be used for NVS encryption/decryption. If **cfg** is null, no encryption/decryption is used.

#### 返回

- ESP\_OK if storage has been initialized successfully.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if specified partition is not found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

***esp\_err\_t* nvs\_flash\_generate\_keys** (const *esp\_partition\_t* \*partition, *nvs\_sec\_cfg\_t* \*cfg)

Generate and store NVS keys in the provided esp partition.

#### 参数

- **partition** -- **[in]** Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** -- **[out]** Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

#### 返回

- ESP\_OK, if **cfg** was read successfully;
- ESP\_ERR\_INVALID\_ARG, if partition or **cfg** is NULL;
- or error codes from `esp_partition_write/erase` APIs.

***esp\_err\_t* nvs\_flash\_read\_security\_cfg** (const *esp\_partition\_t* \*partition, *nvs\_sec\_cfg\_t* \*cfg)

Read NVS security configuration from a partition.

---

备注: Provided partition is assumed to be marked 'encrypted'.

---

#### 参数

- **partition** -- **[in]** Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** -- **[out]** Pointer to nvs security configuration structure. Pointer must be non-NULL.

#### 返回

- ESP\_OK, if **cfg** was read successfully;
- ESP\_ERR\_INVALID\_ARG, if partition or **cfg** is NULL
- ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED, if the partition is not yet written with keys.
- ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART, if the partition containing keys is found to be corrupt
- or error codes from `esp_partition_read` API.

***esp\_err\_t* nvs\_flash\_register\_security\_scheme** (*nvs\_sec\_scheme\_t* \*scheme\_cfg)

Registers the given security scheme for NVS encryption The scheme registered with `sec_scheme_id` by this API be used as the default security scheme for the "nvs" partition. Users will have to call this API explicitly in their application.

**参数** **scheme\_cfg** -- **[in]** Pointer to the security scheme configuration structure that the user (or the `nvs_key_provider`) wants to register.

#### 返回

- ESP\_OK, if security scheme registration succeeds;
- ESP\_ERR\_INVALID\_ARG, if **scheme\_cfg** is NULL;
- ESP\_FAIL, if security scheme registration fails

*nvs\_sec\_scheme\_t* \***nvs\_flash\_get\_default\_security\_scheme** (void)

Fetch the configuration structure for the default active security scheme for NVS encryption.

**返回** Pointer to the default active security scheme configuration (NULL if no scheme is registered yet i.e. active)

*esp\_err\_t* **nvs\_flash\_generate\_keys\_v2** (*nvs\_sec\_scheme\_t* \*scheme\_cfg, *nvs\_sec\_cfg\_t* \*cfg)

Generate (and store) the NVS keys using the specified key-protection scheme.

**参数**

- **scheme\_cfg** -- **[in]** Security scheme specific configuration
- **cfg** -- **[out]** Security configuration (encryption keys)

**返回**

- ESP\_OK, if cfg was populated successfully with generated encryption keys;
- ESP\_ERR\_INVALID\_ARG, if scheme\_cfg or cfg is NULL;
- ESP\_FAIL, if the key generation process fails

*esp\_err\_t* **nvs\_flash\_read\_security\_cfg\_v2** (*nvs\_sec\_scheme\_t* \*scheme\_cfg, *nvs\_sec\_cfg\_t* \*cfg)

Read NVS security configuration set by the specified security scheme.

**参数**

- **scheme\_cfg** -- **[in]** Security scheme specific configuration
- **cfg** -- **[out]** Security configuration (encryption keys)

**返回**

- ESP\_OK, if cfg was read successfully;
- ESP\_ERR\_INVALID\_ARG, if scheme\_cfg or cfg is NULL;
- ESP\_FAIL, if the key reading process fails

## Structures

struct **nvs\_sec\_cfg\_t**

Key for encryption and decryption.

### Public Members

uint8\_t **eky**[NVS\_KEY\_SIZE]

XTS encryption and decryption key

uint8\_t **tky**[NVS\_KEY\_SIZE]

XTS tweak key

struct **nvs\_sec\_scheme\_t**

NVS encryption: Security scheme configuration structure.

### Public Members

int **scheme\_id**

Security Scheme ID (E.g. HMAC)

void \***scheme\_data**

Scheme-specific data (E.g. eFuse block for HMAC-based key generation)

*nvs\_flash\_generate\_keys\_t* **nvs\_flash\_key\_gen**

Callback for the nvs\_flash\_key\_gen implementation

*nvs\_flash\_read\_cfg\_t* **nvs\_flash\_read\_cfg**

Callback for the `nvs_flash_read_keys` implementation

## Macros

**NVS\_KEY\_SIZE**

## Type Definitions

typedef *esp\_err\_t* (\***nvs\_flash\_generate\_keys\_t**)(const void \*scheme\_data, *nvs\_sec\_cfg\_t* \*cfg)

Callback function prototype for generating the NVS encryption keys.

typedef *esp\_err\_t* (\***nvs\_flash\_read\_cfg\_t**)(const void \*scheme\_data, *nvs\_sec\_cfg\_t* \*cfg)

Callback function prototype for reading the NVS encryption keys.

## Header File

- `components/nvs_flash/include/nvs.h`
- This header file can be included with:

```
#include "nvs.h"
```

- This header file is a part of the API provided by the `nvs_flash` component. To declare that your component depends on `nvs_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES nvs_flash
```

or

```
PRIV_REQUIRES nvs_flash
```

## Functions

*esp\_err\_t* **nvs\_set\_i8** (*nvs\_handle\_t* handle, const char \*key, *int8\_t* value)

set *int8\_t* value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called. Regardless whether key-value pair is created or updated, function always requires at least one `nvs` available entry. See `nvs_get_stats`. After create type of operation, the number of available entries is decreased by one. After update type of operation, the number of available entries remains the same.

### 参数

- **handle** -- [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** -- [in] Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** -- [in] The value to set.

### 返回

- `ESP_OK` if value was set successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value

- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

`esp_err_t nvs_set_u8` (*nvs\_handle\_t* handle, const char \*key, uint8\_t value)

set uint8\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i16` (*nvs\_handle\_t* handle, const char \*key, int16\_t value)

set int16\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u16` (*nvs\_handle\_t* handle, const char \*key, uint16\_t value)

set uint16\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i32` (*nvs\_handle\_t* handle, const char \*key, int32\_t value)

set int32\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u32` (*nvs\_handle\_t* handle, const char \*key, uint32\_t value)

set uint32\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i64` (*nvs\_handle\_t* handle, const char \*key, int64\_t value)

set int64\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u64` (*nvs\_handle\_t* handle, const char \*key, uint64\_t value)

set uint64\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_str` (*nvs\_handle\_t* handle, const char \*key, const char \*value)

set string for given key

Sets string value for the key. Function requires whole space for new data to be available as contiguous entries in same nvs page. Operation consumes 1 overhead entry and 1 entry per each 32 characters of new string including zero character to be set. In case of value update for existing key, entries occupied by the previous value and overhead entry are returned to the pool of available entries. Note that storage of long string values can fail due to fragmentation of nvs pages even if `available_entries` returned by `nvs_get_stats` suggests enough overall space available. Note that the underlying storage will not be updated until `nvs_commit` is called.

### 参数

- **handle** -- **[in]** Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** -- **[in]** The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

### 返回

- `ESP_OK` if value was set successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value

- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the string value is too long

`esp_err_t nvs_get_i8(nvs_handle_t handle, const char *key, int8_t *out_value)`

get int8\_t value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, out\_value is not modified.

out\_value has to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

### 参数

- **handle** -- **[in]** Handle obtained from `nvs_open` function.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **out\_value** -- Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.

### 返回

- `ESP_OK` if the value was retrieved successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is NULL
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if length is not sufficient to store data

`esp_err_t nvs_get_u8(nvs_handle_t handle, const char *key, uint8_t *out_value)`

get uint8\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i16(nvs_handle_t handle, const char *key, int16_t *out_value)`

get int16\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u16(nvs_handle_t handle, const char *key, uint16_t *out_value)`

get uint16\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i32(nvs_handle_t handle, const char *key, int32_t *out_value)`

get int32\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u32(nvs_handle_t handle, const char *key, uint32_t *out_value)`

get uint32\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i64` (*nvs\_handle\_t* handle, const char \*key, int64\_t \*out\_value)

get int64\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u64` (*nvs\_handle\_t* handle, const char \*key, uint64\_t \*out\_value)

get uint64\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_str` (*nvs\_handle\_t* handle, const char \*key, char \*out\_value, size\_t \*length)

get string value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

`nvs_get_str` and `nvs_get_blob` functions support WinAPI-style length queries. To get the size necessary to store the value, call `nvs_get_str` or `nvs_get_blob` with zero `out_value` and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For `nvs_get_str`, this length includes the zero terminator. When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, length has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get/set_str` is used for zero-terminated C strings, and `nvs_get/set_blob` used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into
↳dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

### 参数

- **handle** -- [in] Handle obtained from `nvs_open` function.
- **key** -- [in] Key name. Maximum length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- **out\_value** -- [out] Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.
- **length** -- [inout] A non-zero pointer to the variable holding the length of `out_value`. In case `out_value` a zero, will be set to the length required to hold the value. In case `out_value` is not zero, will be set to the actual length of the value written. For `nvs_get_str` this includes zero terminator.

### 返回

- ESP\_OK if the value was retrieved successfully
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP\_ERR\_NVS\_NOT\_FOUND if the requested key doesn't exist
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_ERR\_NVS\_INVALID\_NAME if key name doesn't satisfy constraints
- ESP\_ERR\_NVS\_INVALID\_LENGTH if length is not sufficient to store data

`esp_err_t nvs_get_blob` (*nvs\_handle\_t* handle, const char \*key, void \*out\_value, size\_t \*length)

get blob value for given key

This function behaves the same as `nvs_get_str`, except for the data type.

*esp\_err\_t* **nvs\_open** (const char \*namespace\_name, *nvs\_open\_mode\_t* open\_mode, *nvs\_handle\_t* \*out\_handle)

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled "nvs" in the partition table.

#### 参数

- **namespace\_name** -- **[in]** Namespace name. Maximum length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- **open\_mode** -- **[in]** NVS\_READWRITE or NVS\_READONLY. If NVS\_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out\_handle** -- **[out]** If successful (return code is zero), handle will be returned in this argument.

#### 返回

- ESP\_OK if storage handle was opened successfully
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with label "nvs" is not found
- ESP\_ERR\_NVS\_NOT\_FOUND id namespace doesn't exist yet and mode is NVS\_READONLY
- ESP\_ERR\_NVS\_INVALID\_NAME if namespace name doesn't satisfy constraints
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- ESP\_ERR\_NOT\_ALLOWED if the NVS partition is read-only and mode is NVS\_READWRITE
- ESP\_ERR\_INVALID\_ARG if out\_handle is equal to NULL
- other error codes from the underlying storage driver

*esp\_err\_t* **nvs\_open\_from\_partition** (const char \*part\_name, const char \*namespace\_name, *nvs\_open\_mode\_t* open\_mode, *nvs\_handle\_t* \*out\_handle)

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs\_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs\_flash\_init\_partition() API.

#### 参数

- **part\_name** -- **[in]** Label (name) of the partition of interest for object read/write/erase
- **namespace\_name** -- **[in]** Namespace name. Maximum length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- **open\_mode** -- **[in]** NVS\_READWRITE or NVS\_READONLY. If NVS\_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out\_handle** -- **[out]** If successful (return code is zero), handle will be returned in this argument.

#### 返回

- ESP\_OK if storage handle was opened successfully
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with specified name is not found
- ESP\_ERR\_NVS\_NOT\_FOUND id namespace doesn't exist yet and mode is NVS\_READONLY
- ESP\_ERR\_NVS\_INVALID\_NAME if namespace name doesn't satisfy constraints
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)

- `ESP_ERR_NOT_ALLOWED` if the NVS partition is read-only and mode is `NVS_READWRITE`
- `ESP_ERR_INVALID_ARG` if `out_handle` is equal to `NULL`
- other error codes from the underlying storage driver

`esp_err_t nvs_set_blob` (*nvs\_handle\_t* handle, const char \*key, const void \*value, size\_t length)

set variable length binary value for given key

Sets variable length binary value for the key. Function uses 2 overhead and 1 entry per each 32 bytes of new data from the pool of available entries. See `nvs_get_stats`. In case of value update for existing key, space occupied by the existing value and 2 overhead entries are returned to the pool of available entries. Note that the underlying storage will not be updated until `nvs_commit` is called.

#### 参数

- **handle** -- **[in]** Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** -- **[in]** The value to set.
- **length** -- **[in]** length of binary value to set, in bytes; Maximum length is 508000 bytes or  $(97.6\%$  of the partition size - 4000) bytes whichever is lower.

#### 返回

- `ESP_OK` if value was set successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the value is too long

`esp_err_t nvs_find_key` (*nvs\_handle\_t* handle, const char \*key, *nvs\_type\_t* \*out\_type)

Lookup key-value pair with given key name.

Note that function may indicate both existence of the key as well as the data type of NVS entry if it is found.

#### 参数

- **handle** -- **[in]** Storage handle obtained with `nvs_open`.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **out\_type** -- **[out]** Pointer to the output variable populated with data type of NVS entry in case key was found. May be `NULL`, respective data type is then not provided.

#### 返回

- `ESP_OK` if NVS entry for key provided was found
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- other error codes from the underlying storage driver

`esp_err_t nvs_erase_key` (*nvs\_handle\_t* handle, const char \*key)

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

#### 参数

- **handle** -- **[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

- **key** -- **[in]** Key name. Maximum length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.

**返回**

- ESP\_OK if erase operation was successful
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_ERR\_NVS\_READ\_ONLY if handle was opened as read only
- ESP\_ERR\_NVS\_NOT\_FOUND if the requested key doesn't exist
- other error codes from the underlying storage driver

*esp\_err\_t* **nvs\_erase\_all** (*nvs\_handle\_t* handle)

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

**参数 handle** -- **[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

**返回**

- ESP\_OK if erase operation was successful
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_ERR\_NVS\_READ\_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

*esp\_err\_t* **nvs\_commit** (*nvs\_handle\_t* handle)

Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

**参数 handle** -- **[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

**返回**

- ESP\_OK if the changes have been written successfully
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

void **nvs\_close** (*nvs\_handle\_t* handle)

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with `nvs_open` once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using `nvs_commit` function. Once this function is called on a handle, the handle should no longer be used.

**参数 handle** -- **[in]** Storage handle to close

*esp\_err\_t* **nvs\_get\_stats** (const char \*part\_name, *nvs\_stats\_t* \*nvs\_stats)

Fill structure *nvs\_stats\_t*. It provides info about memory used by NVS.

This function calculates the number of used entries, free entries, available entries, total entries and number of namespaces in partition.

```
// Example of nvs_get_stats() to get overview of actual statistics of data_
→entries :
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%lu), FreeEntries = (%lu), AvailableEntries = (
→%lu), AllEntries = (%lu)\n",
      nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.available_
→entries, nvs_stats.total_entries);
```

**参数**

- **part\_name** -- **[in]** Partition name NVS in the partition table. If pass a NULL than will use NVS\_DEFAULT\_PART\_NAME ("nvs").
- **nvs\_stats** -- **[out]** Returns filled structure nvs\_stats\_t. It provides info about used memory the partition.

**返回**

- ESP\_OK if the changes have been written successfully. Return param nvs\_stats will be filled.
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with label "name" is not found. Return param nvs\_stats will be filled 0.
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized. Return param nvs\_stats will be filled 0.
- ESP\_ERR\_INVALID\_ARG if nvs\_stats is equal to NULL.
- ESP\_ERR\_INVALID\_STATE if there is page with the status of INVALID. Return param nvs\_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

*esp\_err\_t* **nvs\_get\_used\_entry\_count** (*nvs\_handle\_t* handle, *size\_t* \*used\_entries)

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value used\_entries (if err is equal to ESP\_OK). Because the name space entry takes one entry.

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs.
↳in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
// the total number of entries occupied by the namespace
total_entries_namespace = used_entries + 1;
}
```

**参数**

- **handle** -- **[in]** Handle obtained from nvs\_open function.
- **used\_entries** -- **[out]** Returns amount of used entries from a namespace.

**返回**

- ESP\_OK if the changes have been written successfully. Return param used\_entries will be filled valid value.
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized. Return param used\_entries will be filled 0.
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL. Return param used\_entries will be filled 0.
- ESP\_ERR\_INVALID\_ARG if used\_entries is equal to NULL.
- Other error codes from the underlying storage driver. Return param used\_entries will be filled 0.

*esp\_err\_t* **nvs\_entry\_find** (const char \*part\_name, const char \*namespace\_name, *nvs\_type\_t* type, *nvs\_iterator\_t* \*output\_iterator)

Create an iterator to enumerate NVS entries based on one or more parameters.

```
// Example of listing all the key-value pairs of any type under specified
↳partition and namespace
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_
↳ANY, &it);
```

(下页继续)

```

while(res == ESP_OK) {
nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are
↳guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);

```

### 参数

- **part\_name** -- [in] Partition name
- **namespace\_name** -- [in] Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **type** -- [in] One of `nvs_type_t` values.
- **output\_iterator** -- [out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is NULL, too. If `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is not changed. If a valid iterator is obtained through this function, it has to be released using `nvs_release_iterator` when not used any more, unless `ESP_ERR_INVALID_ARG` is returned.

### 返回

- `ESP_OK` if no internal error or programming error occurred.
- `ESP_ERR_NVS_NOT_FOUND` if no element of specified criteria has been found.
- `ESP_ERR_NO_MEM` if memory has been exhausted during allocation of internal structures.
- `ESP_ERR_INVALID_ARG` if any of the parameters is NULL. Note: don't release `output_iterator` in case `ESP_ERR_INVALID_ARG` has been returned

`esp_err_t nvs_entry_find_in_handle` (`nvs_handle_t` handle, `nvs_type_t` type, `nvs_iterator_t` \*output\_iterator)

Create an iterator to enumerate NVS entries based on a handle and type.

```

// Example of listing all the key-value pairs of any type under specified
↳handle (which defines a partition and namespace)
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find_in_handle(<nvs_handle>, NVS_TYPE_ANY, &it);
while(res == ESP_OK) {
nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are
↳guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);

```

### 参数

- **handle** -- [in] Handle obtained from `nvs_open` function.
- **type** -- [in] One of `nvs_type_t` values.
- **output\_iterator** -- [out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is NULL, too. If `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is not changed. If a valid iterator is obtained through this function, it has to be released using `nvs_release_iterator` when not used any more, unless `ESP_ERR_INVALID_ARG` is returned.

### 返回

- ESP\_OK if no internal error or programming error occurred.
- ESP\_ERR\_NVS\_NOT\_FOUND if no element of specified criteria has been found.
- ESP\_ERR\_NO\_MEM if memory has been exhausted during allocation of internal structures.
- ESP\_ERR\_NVS\_INVALID\_HANDLE if unknown handle was specified.
- ESP\_ERR\_INVALID\_ARG if output\_iterator parameter is NULL. Note: don't release output\_iterator in case ESP\_ERR\_INVALID\_ARG has been returned

*esp\_err\_t* **nvs\_entry\_next** (*nvs\_iterator\_t* \*iterator)

Advances the iterator to next item matching the iterator criteria.

Note that any copies of the iterator will be invalid after this call.

**参数** **iterator** -- **[inout]** Iterator obtained from nvs\_entry\_find or nvs\_entry\_find\_in\_handle function. Must be non-NULL. If any error except ESP\_ERR\_INVALID\_ARG occurs, iterator is set to NULL. If ESP\_ERR\_INVALID\_ARG occurs, iterator is not changed.

**返回**

- ESP\_OK if no internal error or programming error occurred.
- ESP\_ERR\_NVS\_NOT\_FOUND if no next element matching the iterator criteria.
- ESP\_ERR\_INVALID\_ARG if iterator is NULL.
- Possibly other errors in the future for internal programming or flash errors.

*esp\_err\_t* **nvs\_entry\_info** (const *nvs\_iterator\_t* iterator, *nvs\_entry\_info\_t* \*out\_info)

Fills *nvs\_entry\_info\_t* structure with information about entry pointed to by the iterator.

**参数**

- **iterator** -- **[in]** Iterator obtained from nvs\_entry\_find or nvs\_entry\_find\_in\_handle function. Must be non-NULL.
- **out\_info** -- **[out]** Structure to which entry information is copied.

**返回**

- ESP\_OK if all parameters are valid; current iterator data has been written to out\_info
- ESP\_ERR\_INVALID\_ARG if one of the parameters is NULL.

void **nvs\_release\_iterator** (*nvs\_iterator\_t* iterator)

Release iterator.

**参数** **iterator** -- **[in]** Release iterator obtained from nvs\_entry\_find or nvs\_entry\_find\_in\_handle or nvs\_entry\_next function. NULL argument is allowed.

## Structures

struct **nvs\_entry\_info\_t**

information about entry obtained from nvs\_entry\_info function

## Public Members

char **namespace\_name**[NVS\_NS\_NAME\_MAX\_SIZE]

Namespace to which key-value belong

char **key**[NVS\_KEY\_NAME\_MAX\_SIZE]

Key of stored key-value pair

*nvs\_type\_t* **type**

Type of stored key-value pair

struct **nvs\_stats\_t**

---

**备注:** Info about storage space NVS.

---

### Public Members

size\_t **used\_entries**

Number of used entries.

size\_t **free\_entries**

Number of free entries. It includes also reserved entries.

size\_t **available\_entries**

Number of entries available for data storage.

size\_t **total\_entries**

Number of all entries.

size\_t **namespace\_count**

Number of namespaces.

### Macros

**ESP\_ERR\_NVS\_BASE**

Starting number of error codes

**ESP\_ERR\_NVS\_NOT\_INITIALIZED**

The storage driver is not initialized

**ESP\_ERR\_NVS\_NOT\_FOUND**

A requested entry couldn't be found or namespace doesn't exist yet and mode is NVS\_READONLY

**ESP\_ERR\_NVS\_TYPE\_MISMATCH**

The type of set or get operation doesn't match the type of value stored in NVS

**ESP\_ERR\_NVS\_READ\_ONLY**

Storage handle was opened as read only

**ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE**

There is not enough space in the underlying storage to save the value

**ESP\_ERR\_NVS\_INVALID\_NAME**

Namespace name doesn't satisfy constraints

**ESP\_ERR\_NVS\_INVALID\_HANDLE**

Handle has been closed or is NULL

**ESP\_ERR\_NVS\_REMOVE\_FAILED**

The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

**ESP\_ERR\_NVS\_KEY\_TOO\_LONG**

Key name is too long

**ESP\_ERR\_NVS\_PAGE\_FULL**

Internal error; never returned by nvs API functions

**ESP\_ERR\_NVS\_INVALID\_STATE**

NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

**ESP\_ERR\_NVS\_INVALID\_LENGTH**

String or blob length is not sufficient to store data

**ESP\_ERR\_NVS\_NO\_FREE\_PAGES**

NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

**ESP\_ERR\_NVS\_VALUE\_TOO\_LONG**

Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

**ESP\_ERR\_NVS\_PART\_NOT\_FOUND**

Partition with specified name is not found in the partition table

**ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND**

NVS partition contains data in new format and cannot be recognized by this version of code

**ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED**

XTS encryption failed while writing NVS entry

**ESP\_ERR\_NVS\_XTS\_DECR\_FAILED**

XTS decryption failed while reading NVS entry

**ESP\_ERR\_NVS\_XTS\_CFG\_FAILED**

XTS configuration setting failed

**ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND**

XTS configuration not found

**ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED**

NVS encryption is not supported in this version

**ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED**

NVS key partition is uninitialized

**ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART**

NVS key partition is corrupt

**ESP\_ERR\_NVS\_WRONG\_ENCRYPTION**

NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP\_ERR\_NVS\_CONTENT\_DIFFERS**

Internal error; never returned by nvs API functions. NVS key is different in comparison

**NVS\_DEFAULT\_PART\_NAME**

Default partition name of the NVS partition in the partition table

**NVS\_PART\_NAME\_MAX\_SIZE**

maximum length of partition name (excluding null terminator)

**NVS\_KEY\_NAME\_MAX\_SIZE**

Maximum length of NVS key name (including null terminator)

**NVS\_NS\_NAME\_MAX\_SIZE**

Maximum length of NVS namespace name (including null terminator)

**Type Definitions**

```
typedef uint32_t nvs_handle_t
```

Opaque pointer type representing non-volatile storage handle

```
typedef nvs_handle_t nvs_handle
```

```
typedef nvs_open_mode_t nvs_open_mode
```

```
typedef struct nvs_opaque_iterator_t *nvs_iterator_t
```

Opaque pointer type representing iterator to nvs entries

**Enumerations**

```
enum nvs_open_mode_t
```

Mode of opening the non-volatile storage.

*Values:*

```
enumerator NVS_READONLY
```

Read only

```
enumerator NVS_READWRITE
```

Read and write

```
enum nvs_type_t
```

Types of variables.

*Values:*

```
enumerator NVS_TYPE_U8
```

Type uint8\_t

enumerator **NVS\_TYPE\_I8**

Type int8\_t

enumerator **NVS\_TYPE\_U16**

Type uint16\_t

enumerator **NVS\_TYPE\_I16**

Type int16\_t

enumerator **NVS\_TYPE\_U32**

Type uint32\_t

enumerator **NVS\_TYPE\_I32**

Type int32\_t

enumerator **NVS\_TYPE\_U64**

Type uint64\_t

enumerator **NVS\_TYPE\_I64**

Type int64\_t

enumerator **NVS\_TYPE\_STR**

Type string

enumerator **NVS\_TYPE\_BLOB**

Type blob

enumerator **NVS\_TYPE\_ANY**

Must be last

## 2.9.4 NVS 加密

### 概述

本文档主要介绍 NVS 加密功能，这一功能有助于实现设备在 flash 中的安全存储。

存储在 NVS 分区中的数据可以用 XTS-AES 进行加密，与磁盘加密标准 IEEE P1619 中提到的加密方式类似。加密时，每个条目都被视作一个 sector，而条目的相对地址（相对于分区起始位置）作为 sector-number 输入加密算法。

根据要使用的具体方案，可以选择启用 `CONFIG_NVS_ENCRYPTION` 和 `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` > `CONFIG_NVS_SEC_KEY_PROTECT_USING_FLASH_ENC` 或 `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC` 实现 NVS 加密。

### NVS 加密：基于 flash 加密的方案

在这个方案中，NVS 加密所需的密钥存储在另一个分区中，该分区用 *flash 加密* 进行保护。因此，使用该方案时，必须先启用 *flash 加密*。

启用 *flash* 加密时需同时启用 NVS 加密，因为 Wi-Fi 驱动程序会将凭据（如 SSID 和密码）储存在默认 NVS 分区中。如已启用平台级加密，那么则需要同时启用 NVS 加密。

要用这一方案进行 NVS 加密，分区表中必须包含 *NVS 密钥分区*。在分区表选项（`menuconfig > Partition Table`）中，有两个包含 *NVS 密钥分区* 的分区表，可通过项目配置菜单（`idf.py menuconfig`）进行选择。要了解如何配置和使用 NVS 加密功能，请参考示例 [security/flash\\_encryption](#)。

**NVS 密钥分区** 应用如果要使用 NVS 加密（使用基于 flash 加密的方案）编译时，须使用类型为 `data` 和子类型为 `key` 的密钥分区。该分区应被标记为 `encrypted` 且最小为 4 KB（最小分区大小）。参考 [分区表](#) 了解详情。在分区表选项（`menuconfig > Partition Table`）中，有两个包含 *NVS 密钥分区* 的额外分区表，可以直接用于 NVS 加密。分区的结构如下所示：

-----+-----+-----+-----+-----
XTS encryption key (32)
-----+-----+-----+-----+-----
XTS tweak key (32)
-----+-----+-----+-----+-----
CRC32 (4)
-----+-----+-----+-----+-----

可以通过以下两种方式之一生成 *NVS 密钥分区* 中的 XTS 加密密钥：

### 在 ESP32-C3 芯片上生成密钥

- 启用 NVS 加密时，可使用 API 函数 `nvs_flash_init()` 来初始化加密的默认 NVS 分区。该 API 函数会内部生成 ESP 芯片的 XTS 加密密钥，并找到第一个 *NVS 密钥分区*。
- 然后，该 API 函数使用 `nvs_flash/include/nvs_flash.h` 提供的 `nvs_flash_generate_keys()` API 函数，自动生成 NVS 密钥并存储到该分区。只有当相应的密钥分区为空时，才会生成和存储新密钥。然后，就可以利用 `nvs_flash_secure_init_partition()` 用此密钥分区来读取安全配置，以初始化自定义的加密 NVS 分区。
- API 函数 `nvs_flash_secure_init()` 和 `nvs_flash_secure_init_partition()` 不会内部生成密钥。如果要使用这两个 API 函数初始化加密的 NVS 分区，可以在启动后使用 `nvs_flash.h` 提供的 `nvs_flash_generate_keys()` API 函数生成密钥，然后由该 API 函数将生成的密钥以加密形式写入密钥分区中。

**备注：** 请注意，在使用此方法启动应用程序前，必须完全擦除 `nvs_keys` 分区。否则，应用程序可能会生成 `ESP_ERR_NVS_CORRUPT_KEY_PART` 错误代码，该代码假设 `nvs_keys` 分区不为空并且包含格式错误的数。可以使用以下命令来实现：

```
parttool.py --port PORT --partition-table-file=PARTITION_TABLE_FILE --
↪partition-table-offset PARTITION_TABLE_OFFSET erase_partition --
↪partition-type=data --partition-subtype=nvs_keys
```

### 使用预生成的 NVS 密钥分区

如果 *NVS 密钥分区* 中的密钥不是由应用程序生成，则需要使用预先生成的密钥分区。可以使用 *NVS 分区生成程序* 生成包含 XTS 加密密钥的 *NVS 密钥分区*。然后使用以下两个命令将预生成的密钥分区存储到 flash 上：

#### 1. 构建并烧写分区表

```
idf.py partition-table partition-table-flash
```

#### 2. 使用 `parttool.py`（参见 [分区表](#) 中分区工具相关章节）将密钥存储在 flash 上的 *NVS 密钥分区* 中

```
parttool.py --port PORT --partition-table-offset PARTITION_TABLE_OFFSET ↪
↪write_partition --partition-name="name of nvs_key partition" --input ↪
↪NVS_KEY_PARTITION_FILE
```

**备注：** 如果设备是在 flash 加密开发模式下加密的，那么要更新 NVS 密钥分区就需要使用 `parttool.py` 来加密 NVS 密钥分区，并提供一个指向你构建目录中未加密分区表的指针 (`build/partition_table`)，因为设备上的分区表也是加密的。命令如下：

```
parttool.py --esptool-write-args encrypt --port PORT --partition-table-
→file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE_
→OFFSET write_partition --partition-name="nvs_key 分区名称" --input NVS_
→KEY_PARTITION_FILE
```

由于密钥分区被标记为 `encrypted`，且 `flash 加密` 已启用，引导程序会在首次启动时使用 flash 加密密钥对此分区进行加密。

一个应用程序可以使用不同的密钥对不同的 NVS 分区进行加密，从而拥有多个密钥分区。应用程序应为加密或解密操作提供正确的密钥分区和密钥信息。

### NVS 加密：基于 HMAC 外设的方案

此方案中，用于 NVS 加密的 XTS 密钥来自 eFuse 中编程的 HMAC 密钥，其目的是 `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP`。由于加密密钥在运行时生成，不存储在 flash 中，因此这个功能不需要单独的 NVS 密钥分区。

**备注：** 通过这个方案，无需启用 flash 加密就能在 ESP32-C3 上实现安全存储。

**重要：** 注意，此方案使用一个 eFuse 块来存储获取加密密钥所需的 HMAC 密钥。

- NVS 加密启用后，可用 API 函数 `nvs_flash_init()` 来初始化加密的默认 NVS 分区。该 API 函数首先检查 `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` 处是否存在一个 HMAC 密钥。

**备注：** `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` 配置的有效范围为 0 (`hmac_key_id_t::HMAC_KEY0`) 到 5 (`hmac_key_id_t::HMAC_KEY5`)。默认情况下该配置为 6 (`hmac_key_id_t::HMAC_KEY_MAX`)，须在构建用户应用程序之前进行修改。

- 如果找不到密钥，会内部生成一个密钥，并储存在 `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` 指定的 eFuse 块中。
- 如果找到用于 `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP` 的密钥，该密钥也会用于 XTS 加密密钥的生成。
- 如果指定的 eFuse 块被 `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP` 以外目的的密钥占用，则会引发错误。
- 然后，API `nvs_flash_init()` 使用 `nvs_flash/include/nvs_flash.h` 提供的 `nvs_flash_generate_keys_v2()` API 函数，自动生成所需的 NVS 密钥。该密钥还可用于读取安全配置（参见 `nvs_flash_read_security_cfg_v2()`）并通过 `nvs_flash_secure_init_partition()` 初始化自定义的加密 NVS 分区。
- API 函数 `nvs_flash_secure_init()` 和 `nvs_flash_secure_init_partition()` 不会内部生成密钥。使用这些 API 函数初始化加密的 NVS 分区时，可在启动后用 API 函数 `nvs_flash_generate_keys_v2()` 生成密钥，或使用 `nvs_flash_read_security_cfg_v2()` 获取并填充 NVS 安全配置结构 `nvs_sec_cfg_t`，将其输入到上述 API 中。

**备注：** 可以使用以下命令预先在 eFuse 中设置自己的 HMAC 密钥：

```
espefuse.py -p PORT burn_key <BLOCK_KEYN> <hmac_key_file.bin> HMAC_UP
```

## 加密读/写

NVS API 函数 `nvs_get_*` 或 `nvs_set_*` 也可用于读取和写入加密的 NVS 分区。

### 加密默认的 NVS 分区

- 要为默认 NVS 分区启用加密，无需额外的步骤。在启用 `CONFIG_NVS_ENCRYPTION` 时，API 函数 `nvs_flash_init()` 会根据使用的方案（由 `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` 设置）在内部执行一些额外步骤，为默认的 NVS 分区启用加密。
- 在基于 flash 加密的方案中，加密密钥由找到的第一个 NVS 密钥分区生成。在 HMAC 方案中，密钥由 `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` 中烧录的 HMAC 密钥生成（参考 API 文档以了解更多信息）。

另外，还可使用 API 函数 `nvs_flash_secure_init()` 为默认 NVS 分区启用加密。

### 加密自定义 NVS 分区

- 要为一个自定义的 NVS 分区启用加密，使用 API 函数 `nvs_flash_secure_init_partition()` 代替 `nvs_flash_init_partition()`。
- 使用 API 函数 `nvs_flash_secure_init()` 和 `nvs_flash_secure_init_partition()` 时，为了在启用加密的情况下执行 NVS 读/写操作，应用程序应遵守以下步骤：

#### 1. 填充 NVS 安全配置结构 `nvs_sec_cfg_t`

- 对基于 flash 加密的方案
  - \* 使用 API 函数 `esp_partition_find*` 查找密钥分区和 NVS 数据分区。
  - \* 使用 API 函数 `nvs_flash_read_security_cfg()` 或 `nvs_flash_generate_keys()` 填充 `nvs_sec_cfg_t` 结构体。
- 对基于 HMAC 的方案
  - \* 用 `nvs_sec_config_hmac_t` 为设置特定方案配置数据，并使用 API `nvs_sec_provider_register_hmac()` 注册此基于 HMAC 的方案。该 API 也将用于填充特定方案的句柄（参见 `nvs_sec_scheme_t`）。
  - \* 使用 API 函数 `nvs_flash_read_security_cfg_v2()` 或 `nvs_flash_generate_keys_v2()` 填充 `nvs_sec_cfg_t` 结构体。

```
nvs_sec_cfg_t cfg = {};
nvs_sec_scheme_t *sec_scheme_handle = NULL;

nvs_sec_config_hmac_t sec_scheme_cfg = {};
hmac_key_id_t hmac_key = HMAC_KEY0;
sec_scheme_cfg.hmac_key_id = hmac_key;

ret = nvs_sec_provider_register_hmac(&sec_scheme_cfg, &sec_scheme_
↪handle);
if (ret != ESP_OK) {
return ret;
}

ret = nvs_flash_read_security_cfg_v2(sec_scheme_handle, &cfg);
if (ret != ESP_OK) {
if (ret == ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND) {
ret = nvs_flash_generate_keys_v2(&sec_scheme_handle, &cfg);
if (ret != ESP_OK) {
ESP_LOGE(TAG, "Failed to generate NVS encr-keys!");
return ret;
}
}
ESP_LOGE(TAG, "Failed to read NVS security cfg!");
return ret;
}
}
```

2. 使用 API 函数 `nvs_flash_secure_init()` 或 `nvs_flash_secure_init_partition()` 初始化 NVS flash 分区。
3. 使用 API 函数 `nvs_open()` 或 `nvs_open_from_partition()` 打开一个命名空间。
4. 使用 `nvs_get_*` 或 `nvs_set_*` 执行 NVS 读/写操作。

5. 使用 `nvs_flash_deinit()` 取消初始化 NVS 分区。

**备注:** 在采用基于 HMAC 的方案时, 可以在不启用任何 NVS 加密的配置选项的情况下开始上述工作流: `CONFIG_NVS_ENCRYPTION`, `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` -> `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC` 和 `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID`, 以使用 `nvs_flash_secure_init()` API 加密默认分区及自定义的 NVS 分区。

## NVS Security Provider

组件 `nvs_sec_provider` 存储了 NVS 加密方案的所有特定实现代码, 并且适用于未来的方案。此组件充当 `nvs_flash` 组件处理加密密钥的接口。组件 `nvs_sec_provider` 有自己的配置菜单, 选定的安全方案和相应设置基于这一菜单注册到 `nvs_flash` 组件。

该组件通过工厂函数注册了特殊的安全框架, 可以实现出厂即用的安全方案。在该方案中, 无需使用 API 来生成、读取加密密钥 (如 `nvs_sec_provider_register_hmac()`)。要了解 API 的使用, 参考示例 `security/nvs_encryption_hmac`。

## API 参考

### Header File

- `components/nvs_sec_provider/include/nvs_sec_provider.h`
- This header file can be included with:

```
#include "nvs_sec_provider.h"
```

- This header file is a part of the API provided by the `nvs_sec_provider` component. To declare that your component depends on `nvs_sec_provider`, add the following to your CMakeLists.txt:

```
REQUIRES nvs_sec_provider
```

or

```
PRIV_REQUIRES nvs_sec_provider
```

### Functions

`esp_err_t nvs_sec_provider_register_flash_enc` (const `nvs_sec_config_flash_enc_t` \*`sec_scheme_cfg`, `nvs_sec_scheme_t` \*\*`sec_scheme_handle_out`)

Register the Flash-Encryption based scheme for NVS Encryption.

#### 参数

- `sec_scheme_cfg` -- [in] Security scheme specific configuration data
- `sec_scheme_handle_out` -- [out] Security scheme specific configuration handle

#### 返回

- `ESP_OK`, if `sec_scheme_handle_out` was populated successfully with the scheme configuration;
- `ESP_ERR_INVALID_ARG`, if `sec_scheme_cfg` is NULL;
- `ESP_ERR_NO_MEM`, No memory for the scheme-specific handle `sec_scheme_handle_out`
- `ESP_ERR_NOT_FOUND`, if no `nvs_keys` partition is found

`esp_err_t nvs_sec_provider_register_hmac` (const `nvs_sec_config_hmac_t` \*`sec_scheme_cfg`, `nvs_sec_scheme_t` \*\*`sec_scheme_handle_out`)

Register the HMAC-based scheme for NVS Encryption.

#### 参数

- `sec_scheme_cfg` -- [in] Security scheme specific configuration data

- **sec\_scheme\_handle\_out** -- [out] Security scheme specific configuration handle
- 返回
- ESP\_OK, if `sec_scheme_handle_out` was populated successfully with the scheme configuration;
  - ESP\_ERR\_INVALID\_ARG, if `scheme_cfg_hmac` is NULL;
  - ESP\_ERR\_NO\_MEM, No memory for the scheme-specific handle `sec_scheme_handle_out`

*esp\_err\_t* **nvs\_sec\_provider\_deregister** (*nvs\_sec\_scheme\_t* \*sec\_scheme\_handle)

Deregister the NVS encryption scheme registered with the given handle.

参数 **sec\_scheme\_handle** -- [in] Security scheme specific configuration handle

返回

- ESP\_OK, if the scheme registered with `sec_scheme_handle` was deregistered successfully
- ESP\_ERR\_INVALID\_ARG, if `sec_scheme_handle` is NULL;

## Structures

struct **nvs\_sec\_config\_flash\_enc\_t**

Flash encryption-based scheme specific configuration data.

## Public Members

const *esp\_partition\_t* \***nvs\_keys\_part**

Partition of subtype `nvs_keys` holding the NVS encryption keys

struct **nvs\_sec\_config\_hmac\_t**

HMAC-based scheme specific configuration data.

## Public Members

*hmac\_key\_id\_t* **hmac\_key\_id**

HMAC Key ID used for generating the NVS encryption keys

## Macros

**ESP\_ERR\_NVS\_SEC\_BASE**

Starting number of error codes

**ESP\_ERR\_NVS\_SEC\_HMAC\_KEY\_NOT\_FOUND**

HMAC Key required to generate the NVS encryption keys not found

**ESP\_ERR\_NVS\_SEC\_HMAC\_KEY\_BLK\_ALREADY\_USED**

Provided eFuse block for HMAC key generation is already in use

**ESP\_ERR\_NVS\_SEC\_HMAC\_KEY\_GENERATION\_FAILED**

Failed to generate/write the HMAC key to eFuse

**ESP\_ERR\_NVS\_SEC\_HMAC\_XTS\_KEYS\_DERIV\_FAILED**

Failed to derive the NVS encryption keys based on the HMAC-based scheme

**NVS\_SEC\_PROVIDER\_CFG\_FLASH\_ENC\_DEFAULT ()**

Helper for populating the Flash encryption-based scheme specific configuration data.

**NVS\_SEC\_PROVIDER\_CFG\_HMAC\_DEFAULT ()**

Helper for populating the HMAC-based scheme specific configuration data.

**Enumerations**enum **nvs\_sec\_scheme\_id\_t**

NVS Encryption Keys Protection Scheme.

*Values:*

enumerator **NVS\_SEC\_SCHEME\_FLASH\_ENC**

Protect NVS encryption keys using Flash Encryption

enumerator **NVS\_SEC\_SCHEME\_HMAC**

Protect NVS encryption keys using HMAC peripheral

enumerator **NVS\_SEC\_SCHEME\_MAX**

## 2.9.5 NVS 分区生成程序

### 介绍

NVS 分区生成程序 ([nvs\\_flash/nvs\\_partition\\_generator/nvs\\_partition\\_gen.py](#)) 根据 CSV 文件中的键值对生成二进制文件。该二进制文件与[非易失性存储库](#)中定义的 NVS 结构兼容。

NVS 分区生成程序适合用于生成二进制数据 (blob)，其中包括设备生产时可从外部烧录的 ODM/OEM 数据。这也使得生产制造商在使用同一个应用固件的基础上，通过自定义参数，如序列号，为每个设备生成不同配置的二进制 NVS 分区。

### 准备工作

在加密模式下使用该程序，需安装下列软件包：

- cryptography

根目录下的 *requirements.txt* 包含必需 python 包，请预先安装。

**CSV 文件格式** CSV 文件每行需包含四个参数，以逗号隔开。具体参数描述见下表：

序号	参数	描述	说明
1	Key	主键，应用程序可通过查询此键来获取数据。	
2	Type	支持 file、data 和 namespace。	
3	Encoding	支持 u8、i8、u16、i16、u32、i32、u64、i64、string、hex2bin、base64 和 binary。决定二进制 bin 文件中 value 被编码成的类型。string 和 binary 编码的区别在于，string 数据以 NULL 字符结尾，binary 数据则不是。	file 类型当前仅支持 hex2bin、base64、string 和 binary 编码。
4	Value	Data value	namespace 字段的 encoding 和 value 应为空。namespace 的 encoding 和 value 为固定值，不可设置。这些单元格中的所有值都会被忽视。

**备注：** CSV 文件的第一行应始终为列标题，不可设置。

此类 CSV 文件的 Dump 示例如下：

```
key,type,encoding,value <-- 列标题
namespace_name,namespace,, <-- 第一个条目为 "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

**备注：**

**请确保：**

- 逗号','前后无空格；
- CSV 文件每行末尾无空格。

### NVS 条目和命名空间 (namespace) 的关联

如 CSV 文件中出现命名空间条目，后续条目均会被视为该命名空间的一部分，直至找到下一个命名空间条目。找到新命名空间条目后，后续所有条目都会被视为新命名空间的一部分。

**备注：** CSV 文件中第一个条目应始终为 namespace。

### 支持多页 blob

默认情况下，二进制 blob 可跨多页，格式参考 [条目结构](#) 章节。如需使用旧版格式，可在程序中禁用该功能。

### 支持加解密

NVS 分区生成程序还可使用 XTS-AES 加密生成二进制加密文件或对此类文件进行解密。更多信息详见 [NVS 加密](#)。

## 运行程序

### 使用方法:

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

### 可选参数:

序号	参数	描述
1	-h/--help	显示帮助信息并退出

### 命令:

运行 `nvs_partition_gen.py {command} -h` 查看更多帮助信息

序号	参数	描述
1	generate	生成 NVS 分区
2	generate-key	生成加密密钥
3	encrypt	加密 NVS 分区
4	decrypt	解密 NVS 分区

### 生成 NVS 分区 (默认模式) 使用方法:

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR]_
↳input output size
```

### 位置参数:

参数	描述
input	待解析的 CSV 文件路径
output	NVS 二进制文件的输出路径
size	NVS 分区大小 (以字节为单位, 且为 4096 的整数倍)

### 可选参数:

参数	描述
-h/--help	显示帮助信息并退出
--version {1,2}	<ul style="list-style-type: none"> <li>设置多页 blob 版本, 默认为版本 2。</li> <li>版本 1: 禁用多页 blob;</li> <li>版本 2: 启用多页 blob。</li> </ul>
--outdir OUTDIR	输出目录, 用于存储创建的文件。(默认当前目录)

运行如下命令创建 NVS 分区, 该程序同时会提供 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

### 生成加密密钥分区 使用方法:

```
python nvs_partition_gen.py generate-key [-h] [--key_protect_hmac] [--kp_hmac_
↳keygen]
                                [--kp_hmac_keyfile KP_HMAC_KEYFILE]_
↳[--kp_hmac_inputkey KP_HMAC_INPUTKEY]
                                [--keyfile KEYFILE] [--outdir OUTDIR]
```

## 可选参数:

参数	描述
-h / --help	显示帮助信息并退出
--keyfile KEYFILE	加密密钥分区文件的输出路径
--outdir OUTDIR	输出目录, 用于存储创建的文件 (默认当前目录)

## 可选参数 (仅适用于 HMAC 方案):

参数	描述
--key_protect_hmac	设置后使用基于 HMAC 的 NVS 加密密钥保护方案, 否则使用基于 flash 加密的默认方案
--kp_hmac_keygen	为基于 HMAC 的加密方案生成 HMAC 密钥
--kp_hmac_keyfile KP_HMAC_KEYFILE	HMAC 密钥文件的输出路径
--kp_hmac_inputkey KP_HMAC_INPUTKEY	包含 HMAC 密钥的文件, 用于生成 NVS 加密密钥

运行以下命令仅生成加密密钥分区:

```
python nvs_partition_gen.py generate-key
```

运行以下命令, 为基于 HMAC 的方案生成加密密钥:

- 生成 HMAC 密钥和 NVS 加密密钥:

```
python nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_keygen
```

**备注:** 上述命令生成 <outdir>/keys/keys-<timestamp>.bin 格式的加密密钥和 <outdir>/keys/hmac-keys-<timestamp>.bin 格式的 HMAC 密钥。

- 基于 HMAC 密钥生成 NVS 加密密钥:

```
python nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_inputkey_
↳testdata/sample_hmac_key.bin
```

**备注:** 可将自定义文件名作为参数提供给 HMAC 密钥和加密密钥。

## 生成 NVS 加密分区 使用方法:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
                                  [--keyfile KEYFILE] [--inputkey INPUTKEY] [--
↳outdir OUTDIR]
                                  [--key_protect_hmac] [--kp_hmac_keygen]
                                  [--kp_hmac_keyfile KP_HMAC_KEYFILE] [--kp_hmac_
↳inputkey KP_HMAC_INPUTKEY]
                                  input output size
```

## 位置参数:

参数	描述
input	待解析的 CSV 文件路径
output	NVS 二进制文件的输出路径
size	NVS 分区大小 (以字节为单位, 且为 4096 的整数倍)

## 可选参数:

参数	描述
-h/--help	显示帮助信息并退出
--version {1,2}	<ul style="list-style-type: none"> <li>• 设置多页 blob 版本，默认为版本 2。</li> <li>• 版本 1: 禁用多页 blob;</li> <li>• 版本 2: 启用多页 blob。</li> </ul>
--keygen	生成 NVS 分区加密密钥
--keyfile KEYFILE	密钥文件的输出路径
--inputkey INPUTKEY	内含 NVS 分区加密密钥的文件
--outdir OUTDIR	输出目录，用于存储创建的文件。(默认当前目录)

## 可选参数 (仅适用于 HMAC 方案) :

参数	描述
--key_protect_hmac	设置后使用基于 HMAC 的 NVS 加密密钥保护方案，否则使用基于 flash 加密的默认方案
--kp_hmac_keygen	为基于 HMAC 的加密方案生成 HMAC 密钥
--kp_hmac_keyfile KP_HMAC_KEYFILE	HMAC 密钥文件的输出路径
--kp_hmac_inputkey KP_HMAC_INPUTKEY	包含 HMAC 密钥的文件，用于生成 NVS 加密密钥

运行以下命令加密 NVS 分区，该程序同时会提供一个 CSV 示例文件。

- 通过 NVS 分区生成程序生成加密密钥来加密:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --keygen
```

**备注:** 创建的加密密钥格式为 <outdir>/keys/keys-<timestamp>.bin。

- 要使用基于 HMAC 的方案生成加密分区，可将上述命令与附加参数搭配使用。
  - 通过 NVS 分区生成程序生成加密密钥和 HMAC 密钥，从而进行加密:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.
↪bin 0x3000 --keygen --key_protect_hmac --kp_hmac_keygen
```

**备注:** 上述命令生成 <outdir>/keys/keys-<timestamp>.bin 格式的加密密钥和 <outdir>/keys/hmac-keys-<timestamp>.bin 格式的 HMAC 密钥。

- 通过 NVS 分区生成程序使用用户提供的 HMAC 密钥生成加密密钥，从而进行加密:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.
↪bin 0x3000 --keygen --key_protect_hmac --kp_hmac_inputkey testdata/
↪sample_hmac_key.bin
```

**备注:** 可将自定义文件名作为参数提供给 HMAC 密钥和加密密钥。

- 通过 NVS 分区生成程序生成加密密钥，并将密钥存储于自定义的文件中:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --keygen --keyfile sample_keys.bin
```

**备注:**

- 创建的加密密钥格式为 <outdir>/keys/sample\_keys.bin。
- 加密密钥存储于新建文件的 keys/ 目录下，与 NVS 密钥分区结构兼容。更多信息请参考 [NVS 密钥分区](#)。

- 将加密密钥用作二进制输入文件来进行加密:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
↳0x3000 --inputkey sample_keys.bin
```

**解密 NVS 分区 使用方法:**

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

**位置参数:**

参数	描述
input	待解析的 NVS 加密分区文件路径
key	含有解密密钥的文件路径
output	已解密的二进制文件输出路径

**可选参数:**

参数	描述
-h / --help	显示帮助信息并退出
--outdir OUTDIR	输出目录，用于存储创建的文件（默认当前目录）

运行以下命令解密已加密的 NVS 分区:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

可以在命令中提供版本参数，选择格式版本号:

- 版本 1: 禁用多页 blob
- 版本 2: 启用多页 blob

**版本 1: 禁用多页 blob** 如需禁用多页 blob，请按照如下命令将版本参数设置为 1，以此格式运行分区生成程序。该程序同时会提供一个 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 -
↳-version 1
```

**版本 2: 启用多页 blob** 如需启用多页 blob，请按照如下命令将版本参数设置为 2，以此格式运行分区生成程序。该程序同时会提供一个 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --
↳version 2
```

**备注:**

- NVS 分区最小为 0x3000 字节。
- 将二进制文件烧录至设备时，请确保与应用的 sdkconfig 设置一致。

## 说明

- 分区生成程序不会对重复键进行检查，而将数据同时写入这两个重复键中。请注意不要使用同名的键；
- 新页面创建后，前一页的空白处不会再写入数据。CSV 文件中的字段须按次序排列以优化内存；
- 暂不支持 64 位数据类型。

## 2.9.6 NVS 分区解析程序

### 介绍

NVS 分区解析程序 `nvs_flash/nvs_partition_tool/nvs_tool.py` 加载并解析 NVS 存储分区，以便于调试和数据提取。该程序还支持完整性检查功能，可扫描分区中可能存在的错误。Blob 数据以 `base64` 格式进行编码。

### 加密分区

此程序不支持解密。如需解密 NVS 分区，请使用 [NVS 分区生成程序](#)。该工具支持 NVS 分区加解密。

### 使用方法

该程序提供了 `-f` 或 `-format` 选项，对应两种不同的输出格式：

- `json` - 所有输出均以 JSON 格式打印。
- `text` - 输出以可读文本的格式打印，有以下输出格式可选。

针对 `text` 输出格式，该程序提供了 `-d` 或 `-dump` 选项，包含六种不同的输出方式：

- `all` (默认) - 打印所有带有元数据的条目。
- `written` - 只打印带有元数据的写入条目。
- `minimal` - 打印写入的 `namespace:key = value` 对。
- `namespaces` - 打印所有写入的命名空间。
- `blobs` - 打印所有 blob 和字符串（若 blob 和字符串是以分块的形式，则对其进行重组）。
- `storage_info` - 打印每一页面的条目状态计数。

**注意：**该程序还提供 `none` 选项，该选项不会打印任何内容。如果 NVS 分区的内容并不相关，可以将该选项和完整性检查选项一起使用。

该程序支持完整性检查功能，选择选项 `-i` 或 `--integrity-check` 即可运行（该选项会导致 `json` 输出格式无效，因此只适用于 `text` 格式）。此功能可扫描整个分区，并打印出可能存在的错误。当此功能和 `-d none` 一起使用时，可只打印可能存在的错误。

## 2.9.7 SD/SDIO/MMC 驱动程序

### 概述

SD/SDIO/MMC 驱动是一种基于 SDMMC 和 SD SPI 主机驱动的协议级驱动程序，目前已支持 SD 存储器、SDIO 卡和 eMMC 芯片。

SDMMC 主机驱动和 SD SPI 主机驱动 (`driver/sdmmc/include/driver/sdmmc_host.h` 和 `driver/spi/include/driver/sdsp_host.h`) 为以下功能提供 API：

- 发送命令至从设备

- 接收和发送数据
- 处理总线错误

初始化函数及配置函数：

- 如需初始化和配置 SD SPI 主机，请参阅 [SD SPI 主机 API](#)

## 应用示例

ESP-IDF [storage/sd\\_card](#) 目录下提供了 SDMMC 驱动与 FatFs 库组合使用的示例，演示了先初始化卡，然后使用 POSIX 和 C 库 API 向卡读写数据。请参考示例目录下 README.md 文件，查看更多详细信息。

**复合卡（存储 + IO）** 该驱动程序不支持 SD 复合卡，复合卡会被视为 IO 卡。

**线程安全** 多数应用程序仅需在一个任务中使用协议层。因此，协议层在 `sdmcc_card_t` 结构体或在访问 SDMMC 或 SD SPI 主机驱动程序时不使用任何类型的锁。这种锁通常在较高级实现，例如文件系统驱动程序。

## API 参考

### Header File

- [components/sdmmc/include/sdmmc\\_cmd.h](#)
- This header file can be included with:

```
#include "sdmmc_cmd.h"
```

- This header file is a part of the API provided by the `sdmmc` component. To declare that your component depends on `sdmmc`, add the following to your CMakeLists.txt:

```
REQUIRES sdmmc
```

or

```
PRIV_REQUIRES sdmmc
```

### Functions

`esp_err_t sdmmc_card_init` (const `sdmmc_host_t` \*host, `sdmmc_card_t` \*out\_card)

Probe and initialize SD/MMC card using given host

---

**备注：** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

---

#### 参数

- **host** -- pointer to structure defining host controller
- **out\_card** -- pointer to structure which will receive information about the card when the function completes

#### 返回

- ESP\_OK on success
- One of the error codes from SDMMC host controller

void `sdmmc_card_print_info` (FILE \*stream, const `sdmmc_card_t` \*card)

Print information about the card to a stream.

#### 参数

- **stream** -- stream obtained using fopen or fdopen
- **card** -- card information structure initialized using sdmmc\_card\_init

*esp\_err\_t* **sdmmc\_get\_status** (*sdmmc\_card\_t* \*card)

Get status of SD/MMC card

**参数** **card** -- pointer to card information structure previously initialized using sdmmc\_card\_init

**返回**

- ESP\_OK on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_write\_sectors** (*sdmmc\_card\_t* \*card, const void \*src, size\_t start\_sector, size\_t sector\_count)

Write given number of sectors to SD/MMC card

**参数**

- **card** -- pointer to card information structure previously initialized using sdmmc\_card\_init
- **src** -- pointer to data buffer to read data from; data size must be equal to sector\_count \* card->csd.sector\_size
- **start\_sector** -- sector where to start writing
- **sector\_count** -- number of sectors to write

**返回**

- ESP\_OK on success or sector\_count equal to 0
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_read\_sectors** (*sdmmc\_card\_t* \*card, void \*dst, size\_t start\_sector, size\_t sector\_count)

Read given number of sectors from the SD/MMC card

**参数**

- **card** -- pointer to card information structure previously initialized using sdmmc\_card\_init
- **dst** -- pointer to data buffer to write into; buffer size must be at least sector\_count \* card->csd.sector\_size
- **start\_sector** -- sector where to start reading
- **sector\_count** -- number of sectors to read

**返回**

- ESP\_OK on success or sector\_count equal to 0
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_erase\_sectors** (*sdmmc\_card\_t* \*card, size\_t start\_sector, size\_t sector\_count, *sdmmc\_erase\_arg\_t* arg)

Erase given number of sectors from the SD/MMC card

---

**备注:** When sdmmc\_erase\_sectors used with cards in SDSPI mode, it was observed that card requires re-init after erase operation.

---

**参数**

- **card** -- pointer to card information structure previously initialized using sdmmc\_card\_init
- **start\_sector** -- sector where to start erase
- **sector\_count** -- number of sectors to erase
- **arg** -- erase command (CMD38) argument

**返回**

- ESP\_OK on success or sector\_count equal to 0
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_can\_discard** (*sdmmc\_card\_t* \*card)

Check if SD/MMC card supports discard

参数 **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`  
 返回

- ESP\_OK if supported by the card/device
- ESP\_FAIL if not supported by the card/device

*esp\_err\_t* `sdmmc_can_trim` (*sdmmc\_card\_t* \*card)

Check if SD/MMC card supports trim

参数 **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`  
 返回

- ESP\_OK if supported by the card/device
- ESP\_FAIL if not supported by the card/device

*esp\_err\_t* `sdmmc_mmc_can_sanitize` (*sdmmc\_card\_t* \*card)

Check if SD/MMC card supports sanitize

参数 **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`  
 返回

- ESP\_OK if supported by the card/device
- ESP\_FAIL if not supported by the card/device

*esp\_err\_t* `sdmmc_mmc_sanitize` (*sdmmc\_card\_t* \*card, *uint32\_t* timeout\_ms)

Sanitize the data that was unmapped by a Discard command

---

备注: Discard command has to precede sanitize operation. To discard, use `MMC_DICARD_ARG` with `sdmmc_erase_sectors` argument

---

参数

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **timeout\_ms** -- timeout value in milliseconds required to sanitize the selected range of sectors.

返回

- ESP\_OK on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* `sdmmc_full_erase` (*sdmmc\_card\_t* \*card)

Erase complete SD/MMC card

参数 **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`  
 返回

- ESP\_OK on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* `sdmmc_io_read_byte` (*sdmmc\_card\_t* \*card, *uint32\_t* function, *uint32\_t* reg, *uint8\_t* \*out\_byte)

Read one byte from an SDIO card using `IO_RW_DIRECT` (CMD52)

参数

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **reg** -- byte address within IO function
- **out\_byte** -- [out] output, receives the value read from the card

返回

- ESP\_OK on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* `sdmmc_io_write_byte` (*sdmmc\_card\_t* \*card, *uint32\_t* function, *uint32\_t* reg, *uint8\_t* in\_byte, *uint8\_t* \*out\_byte)

Write one byte to an SDIO card using `IO_RW_DIRECT` (CMD52)

**参数**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **reg** -- byte address within IO function
- **in\_byte** -- value to be written
- **out\_byte** -- [out] if not NULL, receives new byte value read from the card (read-after-write).

**返回**

- ESP\_OK on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_read\_bytes** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, void \*dst, size\_t size)

Read multiple bytes from an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see `sdmmc_io_read_blocks`.

**参数**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where reading starts
- **dst** -- buffer which receives the data read from card
- **size** -- number of bytes to read

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_write\_bytes** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, const void \*src, size\_t size)

Write multiple bytes to an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

**参数**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where writing starts
- **src** -- data to be written
- **size** -- number of bytes to write

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_read\_blocks** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, void \*dst, size\_t size)

Read blocks of data from an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

**参数**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where writing starts

- **dst** -- buffer which receives the data read from card
- **size** -- number of bytes to read, must be divisible by the card block size.

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_write\_blocks** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, const void \*src, size\_t size)

Write blocks of data to an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see `sdmmc_io_write_bytes`.

**参数**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where writing starts
- **src** -- data to be written
- **size** -- number of bytes to read, must be divisible by the card block size.

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_enable\_int** (*sdmmc\_card\_t* \*card)

Enable SDIO interrupt in the SDMMC host

**参数** **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

**返回**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if the host controller does not support IO interrupts

*esp\_err\_t* **sdmmc\_io\_wait\_int** (*sdmmc\_card\_t* \*card, TickType\_t timeout\_ticks)

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

**参数**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **timeout\_ticks** -- time to wait for the interrupt, in RTOS ticks

**返回**

- ESP\_OK if the interrupt is received
- ESP\_ERR\_NOT\_SUPPORTED if the host controller does not support IO interrupts
- ESP\_ERR\_TIMEOUT if the interrupt does not happen in `timeout_ticks`

*esp\_err\_t* **sdmmc\_io\_get\_cis\_data** (*sdmmc\_card\_t* \*card, uint8\_t \*out\_buffer, size\_t buffer\_size, size\_t \*inout\_cis\_size)

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

**参数**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **out\_buffer** -- Output buffer of the CIS data
- **buffer\_size** -- Size of the buffer.
- **inout\_cis\_size** -- Mandatory, pointer to a size, input and output.

- input: Limitation of maximum searching range, should be 0 or larger than `buffer_size`. The function searches for `CIS_CODE_END` until this range. Set to 0 to search infinitely.
- output: The size required to store all the CIS data, if `CIS_CODE_END` is found.

**返回**

- `ESP_OK`: on success
- `ESP_ERR_INVALID_RESPONSE`: if the card does not (correctly) support CIS.
- `ESP_ERR_INVALID_SIZE`: `CIS_CODE_END` found, but `buffer_size` is less than required size, which is stored in the `inout_cis_size` then.
- `ESP_ERR_NOT_FOUND`: if the `CIS_CODE_END` not found. Increase input value of `inout_cis_size` or set it to 0, if you still want to search for the end; output value of `inout_cis_size` is invalid in this case.
- and other error code return from `sdmmc_io_read_bytes`

`esp_err_t sdmmc_io_print_cis_info` (uint8\_t \*buffer, size\_t buffer\_size, FILE \*fp)

Parse and print the CIS information of an SDIO card.

**备注:** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in `sdmmc_io.c` and contribute to the IDF through the Github repository.

```
using sdmmc_card_init
```

**参数**

- **buffer** -- Buffer to parse
- **buffer\_size** -- Size of the buffer.
- **fp** -- File pointer to print to, set to NULL to print to stdout.

**返回**

- `ESP_OK`: on success
- `ESP_ERR_NOT_SUPPORTED`: if the value from the card is not supported to be parsed.
- `ESP_ERR_INVALID_SIZE`: if the CIS size fields are not correct.

**Header File**

- [components/driver/sdmmc/include/driver/sdmmc\\_types.h](#)
- This header file can be included with:

```
#include "driver/sdmmc_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

**Structures**

struct `sdmmc_csd_t`

Decoded values from SD card Card Specific Data register

**Public Members**

int **csd\_ver**  
CSD structure format

int **mmc\_ver**  
MMC version (for CID format)

int **capacity**  
total number of sectors

int **sector\_size**  
sector size in bytes

int **read\_block\_len**  
block length for reads

int **card\_command\_class**  
Card Command Class for SD

int **tr\_speed**  
Max transfer speed

struct **sdmmc\_cid\_t**  
Decoded values from SD card Card IDentification register

### Public Members

int **mfg\_id**  
manufacturer identification number

int **oem\_id**  
OEM/product identification number

char **name**[8]  
product name (MMC v1 has the longest)

int **revision**  
product revision

int **serial**  
product serial number

int **date**  
manufacturing date

struct **sdmmc\_scr\_t**  
Decoded values from SD Configuration Register Note: When new member is added, update reserved bits accordingly

**Public Members****uint32\_t sd\_spec**

SD Physical layer specification version, reported by card

**uint32\_t erase\_mem\_state**

data state on card after erase whether 0 or 1 (card vendor dependent)

**uint32\_t bus\_width**

bus widths supported by card: BIT(0) —1-bit bus, BIT(2) —4-bit bus

**uint32\_t reserved**

reserved for future expansion

**uint32\_t rsvd\_mnf**

reserved for manufacturer usage

**struct sdmmc\_ssr\_t**

Decoded values from SD Status Register Note: When new member is added, update reserved bits accordingly

**Public Members****uint32\_t alloc\_unit\_kb**

Allocation unit of the card, in multiples of kB (1024 bytes)

**uint32\_t erase\_size\_au**

Erase size for the purpose of timeout calculation, in multiples of allocation unit

**uint32\_t cur\_bus\_width**

SD current bus width

**uint32\_t discard\_support**

SD discard feature support

**uint32\_t fule\_support**

SD FULE (Full User Area Logical Erase) feature support

**uint32\_t erase\_timeout**

Timeout (in seconds) for erase of a single allocation unit

**uint32\_t erase\_offset**

Constant timeout offset (in seconds) for any erase operation

**uint32\_t reserved**

reserved for future expansion

**struct sdmmc\_ext\_csd\_t**

Decoded values of Extended Card Specific Data

**Public Members**uint8\_t **rev**

Extended CSD Revision

uint8\_t **power\_class**

Power class used by the card

uint8\_t **erase\_mem\_state**

data state on card after erase whether 0 or 1 (card vendor dependent)

uint8\_t **sec\_feature**

secure data management features supported by the card

struct **sdmmc\_switch\_func\_rsp\_t**

SD SWITCH\_FUNC response buffer

**Public Members**uint32\_t **data**[512 / 8 / sizeof(uint32\_t)]

response data

struct **sdmmc\_command\_t**

SD/MMC command information

**Public Members**uint32\_t **opcode**

SD or MMC command index

uint32\_t **arg**

SD/MMC command argument

*sdmmc\_response\_t* **response**

response buffer

void \***data**

buffer to send or read into

size\_t **datalen**

length of data in the buffer

size\_t **buflen**

length of the buffer

size\_t **blklen**

block length

int **flags**

see below

*esp\_err\_t* **error**

error returned from transfer

uint32\_t **timeout\_ms**

response timeout, in milliseconds

struct **sdmmc\_host\_t**

SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

### Public Members

uint32\_t **flags**

flags defining host properties

int **slot**

slot number, to be passed to host functions

int **max\_freq\_khz**

max frequency supported by the host

float **io\_voltage**

I/O voltage used by the controller (voltage switching is not supported)

*esp\_err\_t* (\***init**)(void)

Host function to initialize the driver

*esp\_err\_t* (\***set\_bus\_width**)(int slot, size\_t width)

host function to set bus width

size\_t (\***get\_bus\_width**)(int slot)

host function to get bus width

*esp\_err\_t* (\***set\_bus\_ddr\_mode**)(int slot, bool ddr\_enable)

host function to set DDR mode

*esp\_err\_t* (\***set\_card\_clk**)(int slot, uint32\_t freq\_khz)

host function to set card clock frequency

*esp\_err\_t* (\***set\_cclk\_always\_on**)(int slot, bool cclk\_always\_on)

host function to set whether the clock is always enabled

*esp\_err\_t* (\***do\_transaction**)(int slot, *sdmmc\_command\_t* \*cmdinfo)

host function to do a transaction

*esp\_err\_t* (\***deinit**)(void)

host function to deinitialize the driver

*esp\_err\_t* (\***deinit\_p**)(int slot)

host function to deinitialize the driver, called with the `slot`

*esp\_err\_t* (\***io\_int\_enable**)(int slot)

Host function to enable SDIO interrupt line

*esp\_err\_t* (\***io\_int\_wait**)(int slot, TickType\_t timeout\_ticks)

Host function to wait for SDIO interrupt line to be active

int **command\_timeout\_ms**

timeout, in milliseconds, of a single command. Set to 0 to use the default value.

*esp\_err\_t* (\***get\_real\_freq**)(int slot, int \*real\_freq)

Host function to provide real working freq, based on SDMMC controller setup

*sdmmc\_delay\_phase\_t* **input\_delay\_phase**

input delay phase, this will only take into effect when the host works in SDMMC\_FREQ\_HIGHSPEED or SDMMC\_FREQ\_52M. Driver will print out how long the delay is

*esp\_err\_t* (\***set\_input\_delay**)(int slot, *sdmmc\_delay\_phase\_t* delay\_phase)

set input delay phase

struct **sdmmc\_card\_t**

SD/MMC card information structure

## Public Members

*sdmmc\_host\_t* **host**

Host with which the card is associated

uint32\_t **ocr**

OCR (Operation Conditions Register) value

*sdmmc\_cid\_t* **cid**

decoded CID (Card IDentification) register value

*sdmmc\_response\_t* **raw\_cid**

raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

*sdmmc\_csd\_t* **csd**

decoded CSD (Card-Specific Data) register value

*sdmmc\_scr\_t* **scr**

decoded SCR (SD card Configuration Register) value

*sdmmc\_ssr\_t* **ssr**

decoded SSR (SD Status Register) value

*sdmmc\_ext\_csd\_t* **ext\_csd**

decoded EXT\_CSD (Extended Card Specific Data) register value

uint16\_t **rca**

RCA (Relative Card Address)

uint16\_t **max\_freq\_khz**

Maximum frequency, in kHz, supported by the card

int **real\_freq\_khz**

Real working frequency, in kHz, configured on the host controller

uint32\_t **is\_mem**

Bit indicates if the card is a memory card

uint32\_t **is\_sdio**

Bit indicates if the card is an IO card

uint32\_t **is\_mmc**

Bit indicates if the card is MMC

uint32\_t **num\_io\_functions**

If **is\_sdio** is 1, contains the number of IO functions on the card

uint32\_t **log\_bus\_width**

log<sub>2</sub>(bus width supported by card)

uint32\_t **is\_ddr**

Card supports DDR mode

uint32\_t **reserved**

Reserved for future expansion

## Macros

**SDMMC\_HOST\_FLAG\_1BIT**

host supports 1-line SD and MMC protocol

**SDMMC\_HOST\_FLAG\_4BIT**

host supports 4-line SD and MMC protocol

**SDMMC\_HOST\_FLAG\_8BIT**

host supports 8-line MMC protocol

**SDMMC\_HOST\_FLAG\_SPI**

host supports SPI protocol

**SDMMC\_HOST\_FLAG\_DDR**

host supports DDR mode for SD/MMC

**SDMMC\_HOST\_FLAG\_DEINIT\_ARG**

host `deinit` function called with the slot argument

**SDMMC\_FREQ\_DEFAULT**

SD/MMC Default speed (limited by clock divider)

**SDMMC\_FREQ\_HIGHSPEED**

SD High speed (limited by clock divider)

**SDMMC\_FREQ\_PROBING**

SD/MMC probing speed

**SDMMC\_FREQ\_52M**

MMC 52MHz speed

**SDMMC\_FREQ\_26M**

MMC 26MHz speed

**Type Definitions**

```
typedef uint32_t sdmmc_response_t[4]
```

SD/MMC command response buffer

**Enumerations**

```
enum sdmmc_delay_phase_t
```

SD/MMC Host clock timing delay phases

This will only take effect when the host works in `SDMMC_FREQ_HIGHSPEED` or `SDMMC_FREQ_52M`. Driver will print out how long the delay is, in picosecond (ps).

*Values:*

```
enumerator SDMMC_DELAY_PHASE_0
```

Delay phase 0

```
enumerator SDMMC_DELAY_PHASE_1
```

Delay phase 1

```
enumerator SDMMC_DELAY_PHASE_2
```

Delay phase 2

```
enumerator SDMMC_DELAY_PHASE_3
```

Delay phase 3

```
enum sdmmc_erase_arg_t
```

SD/MMC erase command(38) arguments SD: ERASE: Erase the write blocks, physical/hard erase.

DISCARD: Card may deallocate the discarded blocks partially or completely. After discard operation the previously written data may be partially or fully read by the host depending on card implementation.

MMC: ERASE: Does TRIM, applies erase operation to write blocks instead of Erase Group.

DISCARD: The Discard function allows the host to identify data that is no longer required so that the device can erase the data if necessary during background erase events. Applies to write blocks instead of Erase Group. After discard operation, the original data may be remained partially or fully accessible to the host dependent on device.

Values:

enumerator **SDMMC\_ERASE\_ARG**

Erase operation on SD, Trim operation on MMC

enumerator **SDMMC\_DISCARD\_ARG**

Discard operation for SD/MMC

## 2.9.8 分区 API

### 概述

`esp_partition` 组件提供了高层次的 API 函数，用于访问定义在分区表中的分区。这些 API 基于 *SPI flash API* 提供的低层次 API。

### 分区表 API

ESP-IDF 工程使用分区表保存 SPI flash 各区信息，包括引导程序、各种应用程序二进制文件、数据及文件系统等。请参阅分区表，查看详细信息。

该组件在 `esp_partition.h` 中声明了一些 API 函数，用以枚举在分区表中找到的分区，并对这些分区执行操作：

- `esp_partition_find()`：在分区表中查找特定类型的条目，返回一个不透明迭代器；
- `esp_partition_get()`：返回一个结构体，描述给定迭代器的分区；
- `esp_partition_next()`：将迭代器移至下一个找到的分区；
- `esp_partition_iterator_release()`：释放 `esp_partition_find()` 中返回的迭代器；
- `esp_partition_find_first()`：返回描述 `esp_partition_find()` 中找到的第一个分区的结构；
- `esp_partition_read()`、`esp_partition_write()` 和 `esp_partition_erase_range()` 等同于 `esp_flash_read()`、`esp_flash_write()` 和 `esp_flash_erase_region()`，但在分区边界内执行。

### 另请参考

- 分区表
- 空中升级 (OTA) 提供了高层 API 用于更新存储在 flash 中的 app 固件。
- 非易失性存储库 提供了结构化 API 用于存储 SPI flash 中的碎片数据。

### 分区表 API 参考

#### Header File

- `components/esp_partition/include/esp_partition.h`

- This header file can be included with:

```
#include "esp_partition.h"
```

- This header file is a part of the API provided by the `esp_partition` component. To declare that your component depends on `esp_partition`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_partition
```

or

```
PRIV_REQUIRES esp_partition
```

## Functions

*esp\_partition\_iterator\_t* **esp\_partition\_find** (*esp\_partition\_type\_t* type, *esp\_partition\_subtype\_t* subtype, const char \*label)

Find partition based on one or more parameters.

### 参数

- **type** -- Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** -- Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** -- (optional) Partition label. Set this value if looking for partition with a specific name. Pass `NULL` otherwise.

**返回** iterator which can be used to enumerate all the partitions found, or `NULL` if no partitions were found. Iterator obtained through this function has to be released using `esp_partition_iterator_release` when not used any more.

const *esp\_partition\_t* \***esp\_partition\_find\_first** (*esp\_partition\_type\_t* type, *esp\_partition\_subtype\_t* subtype, const char \*label)

Find first partition based on one or more parameters.

### 参数

- **type** -- Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** -- Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** -- (optional) Partition label. Set this value if looking for partition with a specific name. Pass `NULL` otherwise.

**返回** pointer to *esp\_partition\_t* structure, or `NULL` if no partition is found. This pointer is valid for the lifetime of the application.

const *esp\_partition\_t* \***esp\_partition\_get** (*esp\_partition\_iterator\_t* iterator)

Get *esp\_partition\_t* structure for given partition.

**参数** **iterator** -- Iterator obtained using `esp_partition_find`. Must be non-`NULL`.

**返回** pointer to *esp\_partition\_t* structure. This pointer is valid for the lifetime of the application.

*esp\_partition\_iterator\_t* **esp\_partition\_next** (*esp\_partition\_iterator\_t* iterator)

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

**参数** **iterator** -- Iterator obtained using `esp_partition_find`. Must be non-`NULL`.

**返回** `NULL` if no partition was found, valid *esp\_partition\_iterator\_t* otherwise.

void **esp\_partition\_iterator\_release** (*esp\_partition\_iterator\_t* iterator)

Release partition iterator.

**参数 iterator** -- Iterator obtained using `esp_partition_find`. The iterator is allowed to be NULL, so it is not necessary to check its value before calling this function.

`const esp_partition_t *esp_partition_verify (const esp_partition_t *partition)`

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from `esp_partition_get()`, as a test for equality.

**参数 partition** -- Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

**返回**

- If partition not found, returns NULL.
- If found, returns a pointer to the `esp_partition_t` structure in flash. This pointer is always valid for the lifetime of the application.

`esp_err_t esp_partition_read (const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)`

Read data from the partition.

Partitions marked with an encryption flag will automatically be read and decrypted via a cache mapping.

**参数**

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst** -- Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **src\_offset** -- Address of the data to be read, relative to the beginning of the partition.
- **size** -- Size of data to be read, in bytes.

**返回** ESP\_OK, if data was read successfully; ESP\_ERR\_INVALID\_ARG, if `src_offset` exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

`esp_err_t esp_partition_write (const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)`

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

Partitions marked with an encryption flag will automatically be written via the `esp_flash_write_encrypted()` function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the `esp_flash_write_encrypted()` function for more details. Unencrypted partitions do not have this restriction.

---

**备注:** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

---

**参数**

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst\_offset** -- Address where the data should be written, relative to the beginning of the partition.
- **src** -- Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **size** -- Size of data to be written, in bytes.

**返回** ESP\_OK, if data was written successfully; ESP\_ERR\_INVALID\_ARG, if `dst_offset` exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if write would go out of bounds of the partition;

ESP\_ERR\_NOT\_ALLOWED, if partition is read-only; or one of error codes from lower-level flash driver.

*esp\_err\_t* **esp\_partition\_read\_raw** (const *esp\_partition\_t* \*partition, size\_t src\_offset, void \*dst, size\_t size)

Read data from the partition without any transformation/decryption.

---

**备注:** This function is essentially the same as *esp\_partition\_read()* above. It just never decrypts data but returns it as is.

---

#### 参数

- **partition** -- Pointer to partition structure obtained using *esp\_partition\_find\_first* or *esp\_partition\_get*. Must be non-NULL.
- **dst** -- Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **src\_offset** -- Address of the data to be read, relative to the beginning of the partition.
- **size** -- Size of data to be read, in bytes.

**返回** ESP\_OK, if data was read successfully; ESP\_ERR\_INVALID\_ARG, if *src\_offset* exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

*esp\_err\_t* **esp\_partition\_write\_raw** (const *esp\_partition\_t* \*partition, size\_t dst\_offset, const void \*src, size\_t size)

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using *esp\_partition\_erase\_range* function.

---

**备注:** This function is essentially the same as *esp\_partition\_write()* above. It just never encrypts data but writes it as is.

---

---

**备注:** Prior to writing to flash memory, make sure it has been erased with *esp\_partition\_erase\_range* call.

---

#### 参数

- **partition** -- Pointer to partition structure obtained using *esp\_partition\_find\_first* or *esp\_partition\_get*. Must be non-NULL.
- **dst\_offset** -- Address where the data should be written, relative to the beginning of the partition.
- **src** -- Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **size** -- Size of data to be written, in bytes.

**返回** ESP\_OK, if data was written successfully; ESP\_ERR\_INVALID\_ARG, if *dst\_offset* exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if write would go out of bounds of the partition; ESP\_ERR\_NOT\_ALLOWED, if partition is read-only; or one of the error codes from lower-level flash driver.

*esp\_err\_t* **esp\_partition\_erase\_range** (const *esp\_partition\_t* \*partition, size\_t offset, size\_t size)

Erase part of the partition.

#### 参数

- **partition** -- Pointer to partition structure obtained using *esp\_partition\_find\_first* or *esp\_partition\_get*. Must be non-NULL.

- **offset** -- Offset from the beginning of partition where erase operation should start. Must be aligned to partition->erase\_size.
- **size** -- Size of the range which should be erased, in bytes. Must be divisible by partition->erase\_size.

**返回** ESP\_OK, if the range was erased successfully; ESP\_ERR\_INVALID\_ARG, if iterator or dst are NULL; ESP\_ERR\_INVALID\_SIZE, if erase would go out of bounds of the partition; ESP\_ERR\_NOT\_ALLOWED, if partition is read-only; or one of error codes from lower-level flash driver.

*esp\_err\_t* **esp\_partition\_mmap** (const *esp\_partition\_t* \*partition, size\_t offset, size\_t size, *esp\_partition\_mmap\_memory\_t* memory, const void \*\*out\_ptr, *esp\_partition\_mmap\_handle\_t* \*out\_handle)

Configure MMU to map partition into data memory.

Unlike spi\_flash\_mmap function, which requires a 64kB aligned base address, this function doesn't impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via out\_ptr argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via out\_handle argument to esp\_partition\_munmap function.

#### 参数

- **partition** -- Pointer to partition structure obtained using esp\_partition\_find\_first or esp\_partition\_get. Must be non-NULL.
- **offset** -- Offset from the beginning of partition where mapping should start.
- **size** -- Size of the area to be mapped.
- **memory** -- Memory space where the region should be mapped
- **out\_ptr** -- Output, pointer to the mapped memory region
- **out\_handle** -- Output, handle which should be used for esp\_partition\_munmap call

**返回** ESP\_OK, if successful

void **esp\_partition\_munmap** (*esp\_partition\_mmap\_handle\_t* handle)

Release region previously obtained using esp\_partition\_mmap.

---

**备注:** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

---

参数 **handle** -- Handle obtained from spi\_flash\_mmap

*esp\_err\_t* **esp\_partition\_get\_sha256** (const *esp\_partition\_t* \*partition, uint8\_t \*sha\_256)

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP\_ERR\_IMAGE\_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

#### 参数

- **partition** -- **[in]** Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- **sha\_256** -- **[out]** Returned SHA-256 digest for a given partition.

#### 返回

- ESP\_OK: In case of successful operation.
- ESP\_ERR\_INVALID\_ARG: The size was 0 or the sha\_256 was NULL.
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for sha256 operation.
- ESP\_ERR\_IMAGE\_INVALID: App partition doesn't contain a valid app image.
- ESP\_FAIL: An allocation error occurred.

bool **esp\_partition\_check\_identity** (const *esp\_partition\_t* \*partition\_1, const *esp\_partition\_t* \*partition\_2)

Check for the identity of two partitions by SHA-256 digest.

#### 参数

- **partition\_1** -- [in] Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- **partition\_2** -- [in] Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

#### 返回

- True: In case of the two firmware is equal.
- False: Otherwise

*esp\_err\_t* **esp\_partition\_register\_external** (*esp\_flash\_t* \*flash\_chip, size\_t offset, size\_t size, const char \*label, *esp\_partition\_type\_t* type, *esp\_partition\_subtype\_t* subtype, const *esp\_partition\_t* \*\*out\_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the *esp\_flash\_t* structure) as partitions. This allows using them with components which access SPI flash through the *esp\_partition* API.

#### 参数

- **flash\_chip** -- Pointer to the structure identifying the flash chip
- **offset** -- Address in bytes, where the partition starts
- **size** -- Size of the partition in bytes
- **label** -- Partition name
- **type** -- One of the partition types (ESP\_PARTITION\_TYPE\_\*), or an integer. Note that applications can not be booted from external flash chips, so using ESP\_PARTITION\_TYPE\_APP is not supported.
- **subtype** -- One of the partition subtypes (ESP\_PARTITION\_SUBTYPE\_\*), or an integer.
- **out\_partition** -- [out] Output, if non-NULL, receives the pointer to the resulting *esp\_partition\_t* structure

#### 返回

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if memory allocation has failed
- ESP\_ERR\_INVALID\_ARG if the new partition overlaps another partition on the same flash chip
- ESP\_ERR\_INVALID\_SIZE if the partition doesn't fit into the flash chip size

*esp\_err\_t* **esp\_partition\_deregister\_external** (const *esp\_partition\_t* \*partition)

Deregister the partition previously registered using *esp\_partition\_register\_external*.

参数 **partition** -- pointer to the partition structure obtained from *esp\_partition\_register\_external*,

#### 返回

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition pointer is not found
- ESP\_ERR\_INVALID\_ARG if the partition comes from the partition table
- ESP\_ERR\_INVALID\_ARG if the partition was not registered using *esp\_partition\_register\_external* function.

void **esp\_partition\_unload\_all** (void)

Unload partitions and free space allocated by them.

## Structures

struct **esp\_partition\_t**

partition information structure

This is not the format in flash, that format is `esp_partition_info_t`.

However, this is the format used by this API.

### Public Members

`esp_flash_t *flash_chip`

SPI flash chip on which the partition resides

`esp_partition_type_t type`

partition type (app/data)

`esp_partition_subtype_t subtype`

partition subtype

`uint32_t address`

starting address of the partition in flash

`uint32_t size`

size of the partition, in bytes

`uint32_t erase_size`

size the erase operation should be aligned to

`char label[17]`

partition label, zero-terminated ASCII string

`bool encrypted`

flag is set to true if partition is encrypted

`bool readonly`

flag is set to true if partition is read-only

### Macros

`ESP_PARTITION_SUBTYPE_OTA(i)`

Convenience macro to get `esp_partition_subtype_t` value for the *i*-th OTA partition.

### Type Definitions

`typedef uint32_t esp_partition_mmap_handle_t`

Opaque handle for memory region obtained from `esp_partition_mmap`.

`typedef struct esp_partition_iterator_opaque_ *esp_partition_iterator_t`

Opaque partition iterator type.

### Enumerations

`enum esp_partition_mmap_memory_t`

Enumeration which specifies memory space requested in an `mmap` call.

*Values:*

enumerator **ESP\_PARTITION\_MMAP\_DATA**

map to data memory (Vaddr0), allows byte-aligned access, 4 MB total

enumerator **ESP\_PARTITION\_MMAP\_INST**

map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total

enum **esp\_partition\_type\_t**

Partition type.

---

**备注:** Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

---

*Values:*

enumerator **ESP\_PARTITION\_TYPE\_APP**

Application partition type.

enumerator **ESP\_PARTITION\_TYPE\_DATA**

Data partition type.

enumerator **ESP\_PARTITION\_TYPE\_ANY**

Used to search for partitions with any type.

enum **esp\_partition\_subtype\_t**

Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

---

**备注:** These ESP-IDF-defined partition subtypes apply to partitions of type **ESP\_PARTITION\_TYPE\_APP** and **ESP\_PARTITION\_TYPE\_DATA**.

---

*Values:*

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_FACTORY**

Factory application partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN**

Base for OTA partition subtypes.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_0**

OTA partition 0.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_1**

OTA partition 1.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_2**

OTA partition 2.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_3**

OTA partition 3.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_4**

OTA partition 4.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_5**

OTA partition 5.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_6**

OTA partition 6.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_7**

OTA partition 7.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_8**

OTA partition 8.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_9**

OTA partition 9.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_10**

OTA partition 10.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_11**

OTA partition 11.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_12**

OTA partition 12.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_13**

OTA partition 13.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_14**

OTA partition 14.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_15**

OTA partition 15.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MAX**

Max subtype of OTA partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_TEST**

Test application partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_OTA**

OTA selection partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_PHY**

PHY init data partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_NVS**

NVS partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_COREDUMP**

COREDUMP partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_NVS\_KEYS**

Partition for NVS keys.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_EFUSE\_EM**

Partition for emulate eFuse bits.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_UNDEFINED**

Undefined (or unspecified) data partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_ESPHTTPD**

ESPHTTPD partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_FAT**

FAT partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_SPIFFS**

SPIFFS partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_LITTLEFS**

LITTLEFS partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_ANY**

Used to search for partitions with any subtype.

## 2.9.9 SPIFFS 文件系统

### 概述

SPIFFS 是一个用于 SPI NOR flash 设备的嵌入式文件系统，支持磨损均衡、文件系统一致性检查等功能。

### 说明

- 目前，SPIFFS 尚不支持目录，但可以生成扁平结构。如果 SPIFFS 挂载在 /spiffs 下，在 /spiffs/tmp/myfile.txt 路径下创建一个文件则会在 SPIFFS 中生成一个名为 /tmp/myfile.txt 的文件，而不是在 /spiffs/tmp 下生成名为 myfile.txt 的文件；
- SPIFFS 并非实时栈，每次写操作耗时不等；
- 目前，SPIFFS 尚不支持检测或处理已损坏的块。
- SPIFFS 只能稳定地使用约 75% 的指定分区容量。

- 当文件系统空间不足时，垃圾收集器会尝试多次扫描文件系统来寻找可用空间。根据所需空间的不同，写操作会被调用多次，每次函数调用将花费几秒。同一操作可能会花费不同时长的问题缘于 SPIFFS 的设计，且已在官方的 [SPIFFS github 仓库](https://github.com/espressif/esp-idf/issues/1737) 或是 <https://github.com/espressif/esp-idf/issues/1737> 中被多次报告。这个问题可以通过 [SPIFFS 配置](#) 部分缓解。
- 被删除文件通常不会被完全清除，会在文件系统中遗留下无法使用的部分。
- 如果 ESP32-C3 在文件系统操作期间断电，可能会导致 SPIFFS 损坏。但是仍可通过 `esp_spiffs_check` 函数恢复文件系统。详情请参阅官方 [SPIFFS FAQ](#)。

## 工具

### `spiffsgen.py` `spiffsgen.py`:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

参数（必选）说明如下：

- **image\_size**: 分区大小，用于烧录生成的 SPIFFS 镜像；
- **base\_dir**: 创建 SPIFFS 镜像的目录；
- **output\_file**: SPIFFS 镜像输出文件。

其他参数（可选）也参与控制镜像的生成，用户可以运行以下帮助命令，查看这些参数的具体信息：

```
python spiffsgen.py --help
```

上述可选参数对应 SPIFFS 构建配置选项。若想顺利生成可用的镜像，请确保使用的参数或配置与构建 SPIFFS 时所用的参数或配置相同。运行帮助命令将显示参数所对应的 SPIFFS 构建配置。如未指定参数，将使用帮助信息中的默认值。

镜像生成后，用户可以使用 `esptool.py` 或 `parttool.py` 烧录镜像。

用户可以在命令行或脚本中手动单独调用 `spiffsgen.py`，也可以直接从构建系统调用 `spiffs_create_partition_image` 来使用 `spiffsgen.py`：

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS_  
→dep dep dep...])
```

在构建系统中使用 `spiffsgen.py` 更为方便，构建配置会自动传递给 `spiffsgen.py` 工具，确保生成的镜像可用于构建。比如，单独调用 `spiffsgen.py` 时需要用到 **image\_size** 参数，但在构建系统中调用 `spiffs_create_partition_image` 时，仅需要 **partition** 参数，镜像大小将直接从工程分区表中获取。

使用 `spiffs_create_partition_image`，必须从组件 `CMakeLists.txt` 文件调用。

用户也可以指定 `FLASH_IN_PROJECT`，然后使用 `idf.py flash` 将镜像与应用程序二进制文件、分区表等一起自动烧录至设备，例如：

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

不指定 `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` 也可以生成镜像，但须使用 `esptool.py`、`parttool.py` 或自定义构建系统目标手动烧录。

有时基本目录中的内容是在构建时生成的，用户可以使用 `DEPENDS/SPIFFS_IMAGE_DEPENDS` 指定目标，因此可以在生成镜像之前执行此目标：

```
add_custom_target(dep COMMAND ...)  
  
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

请参考 [storage/spiffsgen](#)，查看示例。

**mkspiffs** 用户也可以使用 **mkspiffs** 工具创建 SPIFFS 分区镜像。与 `spiffsgen.py` 相似，**mkspiffs** 也可以用于从指定文件夹中生成镜像，然后使用 `esptool.py` 烧录镜像。

该工具需要获取以下参数：

- **Block Size**: 4096 (SPI flash 标准)
- **Page Size**: 256 (SPI flash 标准)
- **Image Size**: 分区大小 (以字节为单位, 可从分区表中获取)
- **Partition Offset**: 分区起始地址 (可从分区表中获取)

运行以下命令，将文件夹打包成 1 MB 大小的镜像：

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

运行以下命令，将镜像烧录到 ESP32-C3 (偏移量: 0x110000)：

```
python esptool.py --chip esp32c3 --port [port] --baud [baud] write_flash -z_
↳0x110000 spiffs.bin
```

**选择合适的 SPIFFS 工具** 上面介绍的两款 SPIFFS 工具功能相似，需根据实际情况，选择合适的一款。

以下情况优先选用 `spiffsgen.py` 工具：

1. 仅需在构建时简单生成 SPIFFS 镜像，请选择使用 `spiffsgen.py`，因为 `spiffsgen.py` 可以直接在构建系统中使用函数或命令生成 SPIFFS 镜像。
2. 主机没有可用的 C/C++ 编译器时，可以选择使用 `spiffsgen.py` 工具，因为 `spiffsgen.py` 不需要编译。

以下情况优先选用 `mkspiffs` 工具：

1. 如果用户除了需要生成镜像外，还需要拆包 SPIFFS 镜像，请选择使用 `mkspiffs` 工具，因为 `spiffsgen.py` 目前尚不支持此功能。
2. 如果用户当前环境中 Python 解释器不可用，但主机编译器可用，或者有预编译的 `mkspiffs` 二进制文件，此时请选择使用 `mkspiffs` 工具。但是，`mkspiffs` 没有集成到构建系统，用户必须自己完成以下工作：在构建期间编译 `mkspiffs` (如果未使用预编译的二进制文件)，为输出文件创建构建规则或目标，将适当的参数传递给工具等。

## 另请参阅

- [分区表](#)

## 应用示例

`storage/spiffs` 目录下提供了 SPIFFS 应用示例。该示例初始化并挂载了一个 SPIFFS 分区，然后使用 POSIX 和 C 库 API 写入和读取数据。请参考 `example` 目录下的 `README.md` 文件，获取详细信息。

## 高级 API 参考

### Header File

- `components/spiffs/include/esp_spiffs.h`
- This header file can be included with:

```
#include "esp_spiffs.h"
```

- This header file is a part of the API provided by the `spiffs` component. To declare that your component depends on `spiffs`, add the following to your `CMakeLists.txt`:

```
REQUIRES spiffs
```

or

```
PRIV_REQUIRES spiiffs
```

## Functions

*esp\_err\_t* **esp\_vfs\_spiiffs\_register** (const *esp\_vfs\_spiiffs\_conf\_t* \*conf)

Register and mount SPIFFS to VFS with given path prefix.

**参数** *conf* -- Pointer to *esp\_vfs\_spiiffs\_conf\_t* configuration structure

**返回**

- ESP\_OK if success
- ESP\_ERR\_NO\_MEM if objects could not be allocated
- ESP\_ERR\_INVALID\_STATE if already mounted or partition is encrypted
- ESP\_ERR\_NOT\_FOUND if partition for SPIFFS was not found
- ESP\_FAIL if mount or format fails

*esp\_err\_t* **esp\_vfs\_spiiffs\_unregister** (const char \*partition\_label)

Unregister and unmount SPIFFS from VFS

**参数** *partition\_label* -- Same label as passed to *esp\_vfs\_spiiffs\_register*.

**返回**

- ESP\_OK if successful
- ESP\_ERR\_INVALID\_STATE already unregistered

bool **esp\_spiiffs\_mounted** (const char \*partition\_label)

Check if SPIFFS is mounted

**参数** *partition\_label* -- Optional, label of the partition to check. If not specified, first partition with subtype=spiiffs is used.

**返回**

- true if mounted
- false if not mounted

*esp\_err\_t* **esp\_spiiffs\_format** (const char \*partition\_label)

Format the SPIFFS partition

**参数** *partition\_label* -- Same label as passed to *esp\_vfs\_spiiffs\_register*.

**返回**

- ESP\_OK if successful
- ESP\_FAIL on error

*esp\_err\_t* **esp\_spiiffs\_info** (const char \*partition\_label, size\_t \*total\_bytes, size\_t \*used\_bytes)

Get information for SPIFFS

**参数**

- *partition\_label* -- Same label as passed to *esp\_vfs\_spiiffs\_register*
- *total\_bytes* -- [out] Size of the file system
- *used\_bytes* -- [out] Current used bytes in the file system

**返回**

- ESP\_OK if success
- ESP\_ERR\_INVALID\_STATE if not mounted

*esp\_err\_t* **esp\_spiiffs\_check** (const char \*partition\_label)

Check integrity of SPIFFS

**参数** *partition\_label* -- Same label as passed to *esp\_vfs\_spiiffs\_register*

**返回**

- ESP\_OK if successful
- ESP\_ERR\_INVALID\_STATE if not mounted
- ESP\_FAIL on error

`esp_err_t esp_spiffs_gc` (const char \*partition\_label, size\_t size\_to\_gc)

Perform garbage collection in SPIFFS partition.

Call this function to run GC and ensure that at least the given amount of space is available in the partition. This function will fail with `ESP_ERR_NOT_FINISHED` if it is not possible to reclaim the requested space (that is, not enough free or deleted pages in the filesystem). This function will also fail if it fails to reclaim the requested space after `CONFIG_SPIFFS_GC_MAX_RUNS` number of GC iterations. On one GC iteration, SPIFFS will erase one logical block (4kB). Therefore the value of `CONFIG_SPIFFS_GC_MAX_RUNS` should be set at least to the maximum expected `size_to_gc`, divided by 4096. For example, if the application expects to make room for a 1MB file and calls `esp_spiffs_gc(label, 1024 * 1024)`, `CONFIG_SPIFFS_GC_MAX_RUNS` should be set to at least 256. On the other hand, increasing `CONFIG_SPIFFS_GC_MAX_RUNS` value increases the maximum amount of time for which any SPIFFS GC or write operation may potentially block.

#### 参数

- **partition\_label** -- Label of the partition to be garbage-collected. The partition must be already mounted.
- **size\_to\_gc** -- The number of bytes that the GC process should attempt to make available.

#### 返回

- `ESP_OK` on success
- `ESP_ERR_NOT_FINISHED` if GC fails to reclaim the size given by `size_to_gc`
- `ESP_ERR_INVALID_STATE` if the partition is not mounted
- `ESP_FAIL` on all other errors

## Structures

struct **esp\_vfs\_spiffs\_conf\_t**

Configuration structure for `esp_vfs_spiffs_register`.

### Public Members

const char \***base\_path**

File path prefix associated with the filesystem.

const char \***partition\_label**

Optional, label of SPIFFS partition to use. If set to `NULL`, first partition with subtype=`spiffs` will be used.

size\_t **max\_files**

Maximum files that could be open at the same time.

bool **format\_if\_mount\_failed**

If true, it will format the file system if it fails to mount.

## 2.9.10 虚拟文件系统组件

### 概述

虚拟文件系统 (VFS) 组件为驱动程序提供一个统一接口，可以操作类文件对象。这类驱动程序可以是 FAT、SPIFFS 等真实文件系统，也可以是提供文件类接口的设备驱动程序。

VFS 组件支持 C 库函数（如 `fopen` 和 `fprintf` 等）与文件系统 (FS) 驱动程序协同工作。在高层级，每个 FS 驱动程序均与某些路径前缀相关联。当一个 C 库函数需要打开文件时，VFS 组件将搜索与该文件所在文件路径相关联的 FS 驱动程序，并将调用传递给该驱动程序。针对该文件的读取、写入等其他操作的调用也将传递给这个驱动程序。

例如，使用 `/fat` 前缀注册 FAT 文件系统驱动，之后即可调用 `fopen("/fat/file.txt", "w")`。之后，VFS 将调用 FAT 驱动的 `open` 函数，并将参数 `/file.txt` 和合适的打开模式传递给 `open` 函数；后续对返回的 `FILE*` 数据流调用 C 库函数也同样会传递给 FAT 驱动。

## 注册 FS 驱动程序

如需注册 FS 驱动程序，应用程序首先要定义一个 `esp_vfs_t` 结构体实例，并用指向 FS API 的函数指针填充它。

```
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};

ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

在上述代码中需要用到 `read`、`write` 或 `read_p`、`write_p`，具体使用哪组函数由 FS 驱动程序 API 的声明方式决定。

示例 1：声明 API 函数时不带额外的上下文指针参数，即 FS 驱动程序为单例模式，此时使用 `write`

```
ssize_t myfs_write(int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

示例 2：声明 API 函数时需要一个额外的上下文指针作为参数，即可支持多个 FS 驱动程序实例，此时使用 `write_p`

```
ssize_t myfs_write(myfs_t* fs, int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

**同步输入/输出多路复用** VFS 组件支持通过 `select()` 进行同步输入/输出多路复用，其实现方式如下：

1. 调用 `select()`，使用时提供的文件描述符可以属于不同的 VFS 驱动。
2. 文件描述符被分为几组，每组属于一个 VFS 驱动。
3. 非套接字 VFS 驱动的文件描述符由 `start_select()` 移交给指定的 VFS 驱动，后文会对此进行详述。该函数代表指定驱动 `select()` 的实现。这是一个非阻塞的调用，意味着在设置好检查与指定文件描述符相关事件的环境后，该函数应该立即返回。
4. 套接字 VFS 驱动的文件描述符由 `socket_select()` 移交给套接字 VFS 驱动，后文会对此进行详述。这是一个阻塞调用，意味着只有当有一个与套接字文件描述符相关的事件或非套接字驱动发出信号让 `socket_select()` 退出时，它才会返回。
5. 从各个 VFS 驱动程序收集结果，并通过对环境检查取消初始化来终止所有驱动程序。
6. `select()` 调用结束并返回适当的结果。

**非套接字 VFS 驱动** 如果要使用非套接字 VFS 驱动的文件描述符调用 `select()`，那么需要用函数 `start_select()` 和 `end_select()` 注册该驱动，具体如下：

```
// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
// ... other members initialized
```

调用 `start_select()` 函数可以设置环境，检测指定 VFS 驱动的文件描述符读取/写入/错误条件。

调用 `end_select()` 函数可以终止/取消初始化/释放由 `start_select()` 设置的环境。

**备注：** 在少数情况下，在调用 `end_select()` 之前可能并没有调用过 `start_select()`。因此 `end_select()` 的实现必须在该情况下返回错误而不能崩溃。

如需获取更多信息，请参考 [vfs/vfs\\_uart.c](#) 中 UART 外设的 VFS 驱动，尤其是函数 `esp_vfs_dev_uart_register()`、`uart_start_select()` 和 `uart_end_select()`。

请参考以下示例，查看如何使用 VFS 文件描述符调用 `select()`：

- [peripherals/uart/uart\\_select](#)
- [system/select](#)

**套接字 VFS 驱动** 套接字 VFS 驱动会使用自实现的 `socket_select()` 函数，在读取/写入/错误条件时，非套接字 VFS 驱动会通知该函数。

可通过定义以下函数注册套接字 VFS 驱动：

```
// In definition of esp_vfs_t:
    .socket_select = &lwip_select,
    .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
    .stop_socket_select = &lwip_stop_socket_select,
    .stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

函数 `socket_select()` 是套接字驱动对 `select()` 的内部实现。该函数只对套接字 VFS 驱动的文件描述符起作用。

`get_socket_select_semaphore()` 返回信号对象 (semaphore)，用于非套接字驱动程序中，以终止 `socket_select()` 的等待。

`stop_socket_select()` 通过传递 `get_socket_select_semaphore()` 函数返回的对象来终止 `socket_select()` 函数的等待。

`stop_socket_select_isr()` 与 `stop_socket_select()` 的作用相似，但是前者可在 ISR 中使用。

请参考 [lwip/port/esp32xx/vfs\\_lwip.c](#) 以了解使用 LWIP 的套接字驱动参考实现。

**备注：**如果 `select()` 用于套接字文件描述符，可以禁用 `CONFIG_VFS_SUPPORT_SELECT` 选项来减少代码量，提高性能。不要在 `select()` 调用过程中更改套接字驱动，否则会出现一些未定义行为。

## 路径

已注册的 FS 驱动程序均有一个路径前缀与之关联，此路径前缀即为分区的挂载点。

如果挂载点中嵌套了其他挂载点，则在打开文件时使用具有最长匹配路径前缀的挂载点。例如，假设以下文件系统已在 VFS 中注册：

- 在 `/data` 下注册 FS 驱动程序 1
- 在 `/data/static` 下注册 FS 驱动程序 2

那么：

- 打开 `/data/log.txt` 会调用驱动程序 FS 1；
- 打开 `/data/static/index.html` 需调用 FS 驱动程序 2；
- 即便 FS 驱动程序 2 中没有 `/index.html`，也不会 FS 驱动程序 1 中查找 `/static/index.html`。

挂载点名称必须以路径分隔符 (`/`) 开头，且分隔符后至少包含一个字符。但在以下情况中，VFS 同样支持空的挂载点名称：1. 应用程序需要提供一个“最后方案”下使用的文件系统；2. 应用程序需要同时覆盖 VFS 功能。如果没有与路径匹配的前缀，就会使用到这种文件系统。

VFS 不会对路径中的点 (`.`) 进行特殊处理，也不会将 `..` 视为对父目录的引用。在上述示例中，使用 `/data/static/./log.txt` 路径不会调用 FS 驱动程序 1 打开 `/log.txt`。特定的 FS 驱动程序（如 FATFS）可能以不同的方式处理文件名中的点。

执行打开文件操作时，FS 驱动程序仅得到文件的相对路径（挂载点前缀已经被去除）：

1. 以 `/data` 为路径前缀注册 `myfs` 驱动；
2. 应用程序调用 `fopen("/data/config.json", ...)`；
3. VFS 调用 `myfs_open("/config.json", ...)`；
4. `myfs` 驱动打开 `/config.json` 文件。

VFS 对文件路径长度没有限制，但文件系统路径前缀受 `ESP_VFS_PATH_MAX` 限制，即路径前缀上限为 `ESP_VFS_PATH_MAX`。各个文件系统驱动则可能会对自己的文件名长度设置一些限制。

## 文件描述符

文件描述符是一组很小的正整数，从 0 到 `FD_SETSIZE - 1`，`FD_SETSIZE` 定义在 `sys/select.h`。最大文件描述符由 `CONFIG_LWIP_MAX_SOCKETS` 定义，且为套接字保留。VFS 中包含一个名为 `s_fd_table` 的查找表，用于将全局文件描述符映射至 `s_vfs` 数组中注册的 VFS 驱动索引。

## 标准 IO 流 (`stdin`, `stdout`, `stderr`)

如果 `menuconfig` 中 `UART for console output` 选项没有设置为 `None`，则 `stdin`、`stdout` 和 `stderr` 将默认从 UART 读取或写入。UART0 或 UART1 可用作标准 IO。默认情况下，UART0 使用 115200 波特率，TX 管脚为 GPIO1，RX 管脚为 GPIO3。上述参数可以在 `menuconfig` 中更改。

对 `stdout` 或 `stderr` 执行写入操作将会向 UART 发送 FIFO 发送字符，对 `stdin` 执行读取操作则会从 UART 接收 FIFO 中取出字符。

默认情况下，VFS 使用简单的函数对 UART 进行读写操作。在所有数据放进 UART FIFO 之前，写操作将处于 `busy-wait` 状态，读操作处于非阻塞状态，仅返回 FIFO 中已有数据。由于读操作为非阻塞，高层次 C 库函数调用（如 `fscanf("%d\n", &var);`）可能获取不到所需结果。

如果应用程序使用 UART 驱动，则可以调用 `esp_vfs_dev_uart_use_driver` 函数来指导 VFS 使用驱动中断、读写阻塞功能等，也可以调用 `esp_vfs_dev_uart_use_nonblocking` 来恢复非阻塞函数。

VFS 还为输入和输出提供换行符转换功能（可选）。多数应用程序在程序内部发送或接收以 LF (“\n”) 结尾的行，但不同的终端程序可能需要不同的换行符，比如 CR 或 CRLF。应用程序可以通过 `menuconfig` 或者调用 `esp_vfs_dev_uart_port_set_rx_line_endings` 和 `esp_vfs_dev_uart_port_set_tx_line_endings` 为输入输出配置换行符。

**标准流和 FreeRTOS 任务** `stdin`、`stdout` 和 `stderr` 的 FILE 对象在所有 FreeRTOS 任务之间共享，指向这些对象的指针分别存储在每个任务的 `struct _reent` 中。

预处理器把如下代码解释为 `fprintf(__getreent()->_stderr, "42\n");`:

```
fprintf(stderr, "42\n");
```

其中 `__getreent()` 函数将为每个任务返回一个指向 `newlib libc` 中 `struct _reent` 的指针。每个任务的 TCB 均拥有一个 `struct _reent` 结构体，任务初始化后，`struct _reent` 结构体中的 `_stdin`、`_stdout` 和 `_stderr` 将会被赋予 `_GLOBAL_REENT` 中 `_stdin`、`_stdout` 和 `_stderr` 的值，`_GLOBAL_REENT` 即为 FreeRTOS 启动之前所用结构体。

这样设计带来的结果是：

- 允许设置给定任务的 `stdin`、`stdout` 和 `stderr`，而不影响其他任务，例如通过 `stdin = fopen("/dev/uart/1", "r");`
- 但使用 `fclose` 关闭默认 `stdin`、`stdout` 或 `stderr` 将同时关闭相应的 FILE 流对象，因此会影响其他任务；
- 如需更改新任务的默认 `stdin`、`stdout` 和 `stderr` 流，请在创建新任务之前修改 `_GLOBAL_REENT->_stdin(_stdout, _stderr)`。

## eventfd()

`eventfd()` 是一个很强大的工具，可以循环通知基于 `select()` 的自定义事件。在 ESP-IDF 中，`eventfd()` 的实现大体上与 `man(2) eventfd` 中的描述相同，主要区别如下：

- 在调用 `eventfd()` 之前必须先调用 `esp_vfs_eventfd_register()`；
- 标志中没有 `EFD_CLOEXEC`、`EFD_NONBLOCK` 和 `EFD_SEMAPHORE` 选项；
- `EFD_SUPPORT_ISR` 选项已经被添加到标志中。在中断处理程序中读取和写入 `eventfd` 需要这个标志。

注意，用 `EFD_SUPPORT_ISR` 创建 `eventfd` 将导致在读取、写入文件时，以及在设置这个文件的 `select()` 开始和结束时，暂时禁用中断。

## API 参考

### Header File

- `components/vfs/include/esp_vfs.h`
- This header file can be included with:

```
#include "esp_vfs.h"
```

- This header file is a part of the API provided by the `vfs` component. To declare that your component depends on `vfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES vfs
```

or

```
PRIV_REQUIRES vfs
```

## Functions

`ssize_t esp_vfs_write` (struct \_reent \*r, int fd, const void \*data, size\_t size)

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

`off_t esp_vfs_lseek` (struct \_reent \*r, int fd, off\_t size, int mode)

`ssize_t esp_vfs_read` (struct \_reent \*r, int fd, void \*dst, size\_t size)

`int esp_vfs_open` (struct \_reent \*r, const char \*path, int flags, int mode)

`int esp_vfs_close` (struct \_reent \*r, int fd)

`int esp_vfs_fstat` (struct \_reent \*r, int fd, struct stat \*st)

`int esp_vfs_stat` (struct \_reent \*r, const char \*path, struct stat \*st)

`int esp_vfs_link` (struct \_reent \*r, const char \*n1, const char \*n2)

`int esp_vfs_unlink` (struct \_reent \*r, const char \*path)

`int esp_vfs_rename` (struct \_reent \*r, const char \*src, const char \*dst)

`int esp_vfs_utime` (const char \*path, const struct utimbuf \*times)

`esp_err_t esp_vfs_register` (const char \*base\_path, const *esp\_vfs\_t* \*vfs, void \*ctx)

Register a virtual filesystem for given path prefix.

#### 参数

- **base\_path** -- file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to `ESP_VFS_PATH_MAX` characters long, and at least 2 characters long. Name must start with a "/" and must not end with "/". For example, "/data" or "/dev/spi" are valid. These VFSes would then be called to handle file paths such as "/data/myfile.txt" or "/dev/spi/0". In the special case of an empty `base_path`, a "fallback" VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
- **vfs** -- Pointer to *esp\_vfs\_t*, a structure which maps syscalls to the filesystem driver functions. VFS component doesn't assume ownership of this pointer.
- **ctx** -- If `vfs->flags` has `ESP_VFS_FLAG_CONTEXT_PTR` set, a pointer which should be passed to VFS functions. Otherwise, NULL.

**返回** `ESP_OK` if successful, `ESP_ERR_NO_MEM` if too many VFSes are registered.

`esp_err_t esp_vfs_register_fd_range` (const *esp\_vfs\_t* \*vfs, void \*ctx, int min\_fd, int max\_fd)

Special case function for registering a VFS that uses a method other than `open()` to open new file descriptors from the interval `<min_fd; max_fd)`.

This is a special-purpose function intended for registering LWIP sockets to VFS.

#### 参数

- **vfs** -- Pointer to *esp\_vfs\_t*. Meaning is the same as for `esp_vfs_register()`.
- **ctx** -- Pointer to context structure. Meaning is the same as for `esp_vfs_register()`.
- **min\_fd** -- The smallest file descriptor this VFS will use.
- **max\_fd** -- Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

**返回** `ESP_OK` if successful, `ESP_ERR_NO_MEM` if too many VFSes are registered, `ESP_ERR_INVALID_ARG` if the file descriptor boundaries are incorrect.

`esp_err_t esp_vfs_register_with_id` (const *esp\_vfs\_t* \*vfs, void \*ctx, *esp\_vfs\_id\_t* \*vfs\_id)

Special case function for registering a VFS that uses a method other than `open()` to open new file descriptors. In comparison with `esp_vfs_register_fd_range`, this function doesn't pre-registers an interval of file descriptors. File descriptors can be registered later, by using `esp_vfs_register_fd`.

#### 参数

- **vfs** -- Pointer to *esp\_vfs\_t*. Meaning is the same as for `esp_vfs_register()`.
- **ctx** -- Pointer to context structure. Meaning is the same as for `esp_vfs_register()`.

- **vfs\_id** -- Here will be written the VFS ID which can be passed to `esp_vfs_register_fd` for registering file descriptors.
- 返回 ESP\_OK if successful, ESP\_ERR\_NO\_MEM if too many VFSes are registered, ESP\_ERR\_INVALID\_ARG if the file descriptor boundaries are incorrect.

*esp\_err\_t* **esp\_vfs\_unregister** (const char \*base\_path)

Unregister a virtual filesystem for given path prefix

参数 **base\_path** -- file prefix previously used in `esp_vfs_register` call

返回 ESP\_OK if successful, ESP\_ERR\_INVALID\_STATE if VFS for given prefix hasn't been registered

*esp\_err\_t* **esp\_vfs\_unregister\_with\_id** (*esp\_vfs\_id\_t* vfs\_id)

Unregister a virtual filesystem with the given index

参数 **vfs\_id** -- The VFS ID returned by `esp_vfs_register_with_id`

返回 ESP\_OK if successful, ESP\_ERR\_INVALID\_STATE if VFS for the given index hasn't been registered

*esp\_err\_t* **esp\_vfs\_register\_fd** (*esp\_vfs\_id\_t* vfs\_id, int \*fd)

Special function for registering another file descriptor for a VFS registered by `esp_vfs_register_with_id`.

参数

- **vfs\_id** -- VFS identifier returned by `esp_vfs_register_with_id`.
- **fd** -- The registered file descriptor will be written to this address.

返回 ESP\_OK if the registration is successful, ESP\_ERR\_NO\_MEM if too many file descriptors are registered, ESP\_ERR\_INVALID\_ARG if the arguments are incorrect.

*esp\_err\_t* **esp\_vfs\_register\_fd\_with\_local\_fd** (*esp\_vfs\_id\_t* vfs\_id, int local\_fd, bool permanent, int \*fd)

Special function for registering another file descriptor with given `local_fd` for a VFS registered by `esp_vfs_register_with_id`.

参数

- **vfs\_id** -- VFS identifier returned by `esp_vfs_register_with_id`.
- **local\_fd** -- The fd in the local vfs. Passing -1 will set the local fd as the (\*fd) value.
- **permanent** -- Whether the fd should be treated as permanent (not removed after close())
- **fd** -- The registered file descriptor will be written to this address.

返回 ESP\_OK if the registration is successful, ESP\_ERR\_NO\_MEM if too many file descriptors are registered, ESP\_ERR\_INVALID\_ARG if the arguments are incorrect.

*esp\_err\_t* **esp\_vfs\_unregister\_fd** (*esp\_vfs\_id\_t* vfs\_id, int fd)

Special function for unregistering a file descriptor belonging to a VFS registered by `esp_vfs_register_with_id`.

参数

- **vfs\_id** -- VFS identifier returned by `esp_vfs_register_with_id`.
- **fd** -- File descriptor which should be unregistered.

返回 ESP\_OK if the registration is successful, ESP\_ERR\_INVALID\_ARG if the arguments are incorrect.

int **esp\_vfs\_select** (int nfd, fd\_set \*readfds, fd\_set \*writefds, fd\_set \*errorfds, struct timeval \*timeout)

Synchronous I/O multiplexing which implements the functionality of POSIX `select()` for VFS.

参数

- **nfd** -- Specifies the range of descriptors which should be checked. The first `nfd`s descriptors will be checked in each set.
- **readfds** -- If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- **writefds** -- If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.

- **errorfds** -- If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- **timeout** -- If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

**返回** The number of descriptors set in the descriptor sets, or -1 when an error (specified by errno) have occurred.

void **esp\_vfs\_select\_triggered** (*esp\_vfs\_select\_sem\_t* sem)

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start\_select.

**参数** **sem** -- semaphore structure which was passed to the driver by the start\_select call

void **esp\_vfs\_select\_triggered\_isr** (*esp\_vfs\_select\_sem\_t* sem, BaseType\_t \*woken)

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start\_select.

**参数**

- **sem** -- semaphore structure which was passed to the driver by the start\_select call
- **woken** -- is set to pdTRUE if the function wakes up a task with higher priority

ssize\_t **esp\_vfs\_pread** (int fd, void \*dst, size\_t size, off\_t offset)

Implements the VFS layer of POSIX pread()

**参数**

- **fd** -- File descriptor used for read
- **dst** -- Pointer to the buffer where the output will be written
- **size** -- Number of bytes to be read
- **offset** -- Starting offset of the read

**返回** A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

ssize\_t **esp\_vfs\_pwrite** (int fd, const void \*src, size\_t size, off\_t offset)

Implements the VFS layer of POSIX pwrite()

**参数**

- **fd** -- File descriptor used for write
- **src** -- Pointer to the buffer from where the output will be read
- **size** -- Number of bytes to write
- **offset** -- Starting offset of the write

**返回** A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

## Structures

struct **esp\_vfs\_select\_sem\_t**

VFS semaphore type for select()

## Public Members

bool **is\_sem\_local**

type of "sem" is SemaphoreHandle\_t when true, defined by socket driver otherwise

void **\*sem**  
semaphore instance

struct **esp\_vfs\_t**

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have `_p` suffix, set flags member to `ESP_VFS_FLAG_CONTEXT_PTR` and provide the context pointer to `esp_vfs_register` function. If the implementation doesn't use this extra argument, populate the members without `_p` suffix and set flags member to `ESP_VFS_FLAG_DEFAULT`.

If the FS driver doesn't provide some of the functions, set corresponding members to `NULL`.

### Public Members

int **flags**

`ESP_VFS_FLAG_CONTEXT_PTR`      and/or      `ESP_VFS_FLAG_READONLY_FS`      or  
`ESP_VFS_FLAG_DEFAULT`

`ssize_t (*write_p)(void *p, int fd, const void *data, size_t size)`  
Write with context pointer

`ssize_t (*write)(int fd, const void *data, size_t size)`  
Write without context pointer

`off_t (*lseek_p)(void *p, int fd, off_t size, int mode)`  
Seek with context pointer

`off_t (*lseek)(int fd, off_t size, int mode)`  
Seek without context pointer

`ssize_t (*read_p)(void *ctx, int fd, void *dst, size_t size)`  
Read with context pointer

`ssize_t (*read)(int fd, void *dst, size_t size)`  
Read without context pointer

`ssize_t (*pread_p)(void *ctx, int fd, void *dst, size_t size, off_t offset)`  
pread with context pointer

`ssize_t (*pread)(int fd, void *dst, size_t size, off_t offset)`  
pread without context pointer

`ssize_t (*pwrite_p)(void *ctx, int fd, const void *src, size_t size, off_t offset)`  
pwrite with context pointer

ssize\_t (\***pwrite**)(int fd, const void \*src, size\_t size, off\_t offset)

pwrite without context pointer

int (\***open\_p**)(void \*ctx, const char \*path, int flags, int mode)

open with context pointer

int (\***open**)(const char \*path, int flags, int mode)

open without context pointer

int (\***close\_p**)(void \*ctx, int fd)

close with context pointer

int (\***close**)(int fd)

close without context pointer

int (\***fstat\_p**)(void \*ctx, int fd, struct *stat* \*st)

fstat with context pointer

int (\***fstat**)(int fd, struct *stat* \*st)

fstat without context pointer

int (\***stat\_p**)(void \*ctx, const char \*path, struct *stat* \*st)

stat with context pointer

int (\***stat**)(const char \*path, struct *stat* \*st)

stat without context pointer

int (\***link\_p**)(void \*ctx, const char \*n1, const char \*n2)

link with context pointer

int (\***link**)(const char \*n1, const char \*n2)

link without context pointer

int (\***unlink\_p**)(void \*ctx, const char \*path)

unlink with context pointer

int (\***unlink**)(const char \*path)

unlink without context pointer

int (\***rename\_p**)(void \*ctx, const char \*src, const char \*dst)

rename with context pointer

int (\***rename**)(const char \*src, const char \*dst)

rename without context pointer

DIR (\***opendir\_p**)(void \*ctx, const char \*name)

opendir with context pointer

`DIR *(*opendir)(const char *name)`  
opendir without context pointer

`struct dirent *(*readdir_p)(void *ctx, DIR *pdir)`  
readdir with context pointer

`struct dirent *(*readdir)(DIR *pdir)`  
readdir without context pointer

`int (*readdir_r_p)(void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)`  
readdir\_r with context pointer

`int (*readdir_r)(DIR *pdir, struct dirent *entry, struct dirent **out_dirent)`  
readdir\_r without context pointer

`long (*telldir_p)(void *ctx, DIR *pdir)`  
telldir with context pointer

`long (*telldir)(DIR *pdir)`  
telldir without context pointer

`void (*seekdir_p)(void *ctx, DIR *pdir, long offset)`  
seekdir with context pointer

`void (*seekdir)(DIR *pdir, long offset)`  
seekdir without context pointer

`int (*closedir_p)(void *ctx, DIR *pdir)`  
closedir with context pointer

`int (*closedir)(DIR *pdir)`  
closedir without context pointer

`int (*mkdir_p)(void *ctx, const char *name, mode_t mode)`  
mkdir with context pointer

`int (*mkdir)(const char *name, mode_t mode)`  
mkdir without context pointer

`int (*rmdir_p)(void *ctx, const char *name)`  
rmdir with context pointer

`int (*rmdir)(const char *name)`  
rmdir without context pointer

`int (*fcntl_p)(void *ctx, int fd, int cmd, int arg)`  
fcntl with context pointer

int (**\*fcntl**)(int fd, int cmd, int arg)

fcntl without context pointer

int (**\*ioctl\_p**)(void \*ctx, int fd, int cmd, va\_list args)

ioctl with context pointer

int (**\*ioctl**)(int fd, int cmd, va\_list args)

ioctl without context pointer

int (**\*fsync\_p**)(void \*ctx, int fd)

fsync with context pointer

int (**\*fsync**)(int fd)

fsync without context pointer

int (**\*access\_p**)(void \*ctx, const char \*path, int amode)

access with context pointer

int (**\*access**)(const char \*path, int amode)

access without context pointer

int (**\*truncate\_p**)(void \*ctx, const char \*path, off\_t length)

truncate with context pointer

int (**\*truncate**)(const char \*path, off\_t length)

truncate without context pointer

int (**\*ftruncate\_p**)(void \*ctx, int fd, off\_t length)

ftruncate with context pointer

int (**\*ftruncate**)(int fd, off\_t length)

ftruncate without context pointer

int (**\*utime\_p**)(void \*ctx, const char \*path, const struct utimbuf \*times)

utime with context pointer

int (**\*utime**)(const char \*path, const struct utimbuf \*times)

utime without context pointer

int (**\*tcsetattr\_p**)(void \*ctx, int fd, int optional\_actions, const struct termios \*p)

tcsetattr with context pointer

int (**\*tcsetattr**)(int fd, int optional\_actions, const struct termios \*p)

tcsetattr without context pointer

int (**\*tcgetattr\_p**)(void \*ctx, int fd, struct termios \*p)

tcgetattr with context pointer

int (**\*tcgetattr**)(int fd, struct termios \*p)  
tcgetattr without context pointer

int (**\*tcdrain\_p**)(void \*ctx, int fd)  
tcdrain with context pointer

int (**\*tcdrain**)(int fd)  
tcdrain without context pointer

int (**\*tcflush\_p**)(void \*ctx, int fd, int select)  
tcflush with context pointer

int (**\*tcflush**)(int fd, int select)  
tcflush without context pointer

int (**\*tcflow\_p**)(void \*ctx, int fd, int action)  
tcflow with context pointer

int (**\*tcflow**)(int fd, int action)  
tcflow without context pointer

pid\_t (**\*tcgetsid\_p**)(void \*ctx, int fd)  
tcgetsid with context pointer

pid\_t (**\*tcgetsid**)(int fd)  
tcgetsid without context pointer

int (**\*tcsendbreak\_p**)(void \*ctx, int fd, int duration)  
tcsendbreak with context pointer

int (**\*tcsendbreak**)(int fd, int duration)  
tcsendbreak without context pointer

*esp\_err\_t* (**\*start\_select**)(int nfds, fd\_set \*readfds, fd\_set \*writefds, fd\_set \*exceptfds,  
*esp\_vfs\_select\_sem\_t* sem, void \*\*end\_select\_args)

start\_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (**\*socket\_select**)(int nfds, fd\_set \*readfds, fd\_set \*writefds, fd\_set \*errorfds, struct timeval \*timeout)

socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (**\*stop\_socket\_select**)(void \*sem)

called by VFS to interrupt the socket\_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (**\*stop\_socket\_select\_isr**)(void \*sem, BaseType\_t \*woken)

stop\_socket\_select which can be called from ISR; set only for the socket driver

```
void>(*get_socket_select_semaphore)(void)
```

end\_select is called to stop the I/O multiplexing and deinitialize the environment created by start\_select for the given VFS

```
esp_err_t(*end_select)(void *end_select_args)
```

get\_socket\_select\_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

## Macros

### MAX\_FDS

Maximum number of (global) file descriptors.

### ESP\_VFS\_PATH\_MAX

Maximum length of path prefix (not including zero terminator)

### ESP\_VFS\_FLAG\_DEFAULT

Default value of flags member in *esp\_vfs\_t* structure.

### ESP\_VFS\_FLAG\_CONTEXT\_PTR

Flag which indicates that FS needs extra context pointer in syscalls.

### ESP\_VFS\_FLAG\_READONLY\_FS

Flag which indicates that FS is located on read-only partition.

## Type Definitions

```
typedef int esp_vfs_id_t
```

## Header File

- [components/vfs/include/esp\\_vfs\\_dev.h](#)
- This header file can be included with:

```
#include "esp_vfs_dev.h"
```

- This header file is a part of the API provided by the *vfs* component. To declare that your component depends on *vfs*, add the following to your CMakeLists.txt:

```
REQUIRES vfs
```

or

```
PRIV_REQUIRES vfs
```

## Functions

```
void esp_vfs_dev_uart_register (void)
```

add /dev/uart virtual filesystem driver

This function is called from startup code to enable serial output

```
void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)
```

Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines ('  
, LF) passed into stdin:

- `ESP_LINE_ENDINGS_CRLF`: convert CRLF to LF
- `ESP_LINE_ENDINGS_CR`: convert CR to LF
- `ESP_LINE_ENDINGS_LF`: no modification

---

**备注:** this function is not thread safe w.r.t. reading from UART

---

**参数** `mode` -- line endings expected on UART

void `esp_vfs_dev_uart_set_tx_line_endings` (`esp_line_endings_t mode`)  
Set the line endings to sent to UART.

This specifies the conversion between newlines ('  
, LF) on stdout and line endings sent over UART:

- `ESP_LINE_ENDINGS_CRLF`: convert LF to CRLF
- `ESP_LINE_ENDINGS_CR`: convert LF to CR
- `ESP_LINE_ENDINGS_LF`: no modification

---

**备注:** this function is not thread safe w.r.t. writing to UART

---

**参数** `mode` -- line endings to send to UART

int `esp_vfs_dev_uart_port_set_rx_line_endings` (int `uart_num`, `esp_line_endings_t mode`)  
Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines ('  
, LF) passed into stdin:

- `ESP_LINE_ENDINGS_CRLF`: convert CRLF to LF
- `ESP_LINE_ENDINGS_CR`: convert CR to LF
- `ESP_LINE_ENDINGS_LF`: no modification

---

**备注:** this function is not thread safe w.r.t. reading from UART

---

**参数**

- `uart_num` -- the UART number
- `mode` -- line endings to send to UART

**返回** 0 if succeeded, or -1 when an error (specified by `errno`) have occurred.

int **esp\_vfs\_dev\_uart\_port\_set\_tx\_line\_endings** (int uart\_num, esp\_line\_endings\_t mode)

Set the line endings to sent to specified UART.

This specifies the conversion between newlines ('  
, LF) on stdout and line endings sent over UART:

- **ESP\_LINE\_ENDINGS\_CRLF**: convert LF to CRLF
- **ESP\_LINE\_ENDINGS\_CR**: convert LF to CR
- **ESP\_LINE\_ENDINGS\_LF**: no modification

---

**备注:** this function is not thread safe w.r.t. writing to UART

---

#### 参数

- **uart\_num** -- the UART number
- **mode** -- line endings to send to UART

返回 0 if succeeded, or -1 when an error (specified by errno) have occurred.

void **esp\_vfs\_dev\_uart\_use\_nonblocking** (int uart\_num)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

参数 **uart\_num** -- UART peripheral number

void **esp\_vfs\_dev\_uart\_use\_driver** (int uart\_num)

set VFS to use UART driver for reading and writing

---

**备注:** application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

---

参数 **uart\_num** -- UART peripheral number

void **esp\_vfs\_usb\_serial\_jtag\_use\_driver** (void)

set VFS to use USB-SERIAL-JTAG driver for reading and writing

---

**备注:** application must configure USB-SERIAL-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

---

void **esp\_vfs\_usb\_serial\_jtag\_use\_nonblocking** (void)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

#### Header File

- [components/vfs/include/esp\\_vfs\\_eventfd.h](#)
- This header file can be included with:

```
#include "esp_vfs_eventfd.h"
```

- This header file is a part of the API provided by the `vfs` component. To declare that your component depends on `vfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES vfs
```

or

```
PRIV_REQUIRES vfs
```

## Functions

*esp\_err\_t* **esp\_vfs\_eventfd\_register** (const *esp\_vfs\_eventfd\_config\_t* \*config)

Registers the event vfs.

返回 ESP\_OK if successful, ESP\_ERR\_NO\_MEM if too many VFses are registered.

*esp\_err\_t* **esp\_vfs\_eventfd\_unregister** (void)

Unregisters the event vfs.

返回 ESP\_OK if successful, ESP\_ERR\_INVALID\_STATE if VFS for given prefix hasn't been registered

int **eventfd** (unsigned int initval, int flags)

## Structures

struct **esp\_vfs\_eventfd\_config\_t**

Eventfd vfs initialization settings.

## Public Members

size\_t **max\_fds**

The maximum number of eventfds supported

## Macros

**EFD\_SUPPORT\_ISR**

**ESP\_VFS\_EVENTD\_CONFIG\_DEFAULT** ()

## 2.9.11 磨损均衡 API

### 概述

ESP32-C3 所使用的 flash，特别是 SPI flash，多数具备扇区结构，且每个扇区仅允许有限次数的擦除/修改操作。为了避免过度使用某一扇区，乐鑫提供了磨损均衡组件，无需用户介入即可帮助用户均衡各个扇区之间的磨损。

磨损均衡组件包含了通过分区组件对外部 SPI flash 进行数据读取、写入、擦除和存储器映射相关的 API 函数。磨损均衡组件还具有软件上更高级别的 API 函数，与 [FAT 文件系统](#) 协同工作。

磨损均衡组件与 FAT 文件系统组件共用 FAT 文件系统的扇区，扇区大小为 4096 字节，是标准 flash 扇区的大小。在这种模式下，磨损均衡组件性能达到最佳，但需要在 RAM 中占用更多内存。

为了节省内存，磨损均衡组件还提供了另外两种模式，均使用 512 字节大小的扇区：

- **性能模式**：先将数据保存在 RAM 中，擦除扇区，然后将数据存储回 flash。如果设备在扇区擦写过程中突然断电，则整个扇区（4096 字节）数据将全部丢失。

- **安全模式**: 数据先保存在 flash 中空余扇区, 擦除扇区后, 数据即存储回去。如果设备断电, 上电后可立即恢复数据。

设备默认设置如下:

- 定义扇区大小为 512 字节
- 默认使用性能模式

您可以使用配置菜单更改设置。

磨损均衡组件不会将数据缓存在 RAM 中。写入和擦除函数直接修改 flash, 函数返回后, flash 即完成修改。

## 磨损均衡访问 API

处理 flash 数据常用的 API 如下所示:

- `wl_mount` - 为指定分区挂载并初始化磨损均衡模块
- `wl_unmount` - 卸载分区并释放磨损均衡模块
- `wl_erase_range` - 擦除 flash 中指定的地址范围
- `wl_write` - 将数据写入分区
- `wl_read` - 从分区读取数据
- `wl_size` - 返回可用内存的大小 (以字节为单位)
- `wl_sector_size` - 返回一个扇区的大小

请尽量避免直接使用原始磨损均衡函数, 建议您使用文件系统特定的函数。

## 内存大小

内存大小是根据分区参数在磨损均衡模块中计算所得, 由于模块使用 flash 部分扇区存储内部数据, 因此计算所得内存大小有少许偏差。

## 另请参阅

- [FAT 文件系统](#)
- [分区表](#)

## 应用示例

[storage/wear\\_levelling](#) 中提供了一款磨损均衡驱动与 FatFs 库结合使用的示例。该示例初始化磨损均衡驱动, 挂载 FAT 文件系统分区, 并使用 POSIX (可移植操作系统接口) 和 C 库 API 从中写入和读取数据。如需了解更多信息, 请参考 [storage/wear\\_levelling/README.md](#)。

## 高级 API 参考

### 头文件

- [fatfs/vfs/esp\\_vfs\\_fat.h](#)

有关高级磨损均衡函数 `esp_vfs_fat_spiflash_mount_rw_wl()`、`esp_vfs_fat_spiflash_unmount_rw_wl()` 和结构体 `esp_vfs_fat_mount_config_t` 的详细内容, 请参见 [FAT 文件系统](#)。

## 中层 API 参考

### Header File

- [components/wear\\_levelling/include/wear\\_levelling.h](#)
- This header file can be included with:

```
#include "wear_levelling.h"
```

- This header file is a part of the API provided by the `wear_levelling` component. To declare that your component depends on `wear_levelling`, add the following to your `CMakeLists.txt`:

```
REQUIRES wear_levelling
```

or

```
PRIV_REQUIRES wear_levelling
```

### Functions

**`esp_err_t wl_mount`** (const `esp_partition_t` \*partition, `wl_handle_t` \*out\_handle)

Mount WL for defined partition.

#### 参数

- **partition** -- that will be used for access
- **out\_handle** -- handle of the WL instance

#### 返回

- `ESP_OK`, if the WL allocation is successful;
- `ESP_ERR_INVALID_ARG`, if the arguments for WL configuration are not valid;
- `ESP_ERR_NO_MEM`, if the WL allocation fails because of insufficient memory;

**`esp_err_t wl_unmount`** (`wl_handle_t` handle)

Unmount WL for defined partition.

**参数** **handle** -- WL partition handle

#### 返回

- `ESP_OK`, if the operation is successful;
- or one of error codes from lower-level flash driver.

**`esp_err_t wl_erase_range`** (`wl_handle_t` handle, `size_t` start\_addr, `size_t` size)

Erase part of the WL storage.

#### 参数

- **handle** -- WL handle that are related to the partition
- **start\_addr** -- Address from where erase operation should start. Must be aligned to the result of function `wl_sector_size(...)`.
- **size** -- Size of the range which should be erased, in bytes. Must be divisible by the result of function `wl_sector_size(...)`.

#### 返回

- `ESP_OK`, if the given range was erased successfully;
- `ESP_ERR_INVALID_ARG`, if iterator or dst are NULL;
- `ESP_ERR_INVALID_SIZE`, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**`esp_err_t wl_write`** (`wl_handle_t` handle, `size_t` dest\_addr, const void \*src, `size_t` size)

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `wl_erase_range` function.

---

**备注:** Prior to writing to WL storage, make sure it has been erased with `wl_erase_range` call.

---

**参数**

- **handle** -- WL handle corresponding to the WL partition
- **dest\_addr** -- Address where the data should be written, relative to the beginning of the partition.
- **src** -- Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **size** -- Size of data to be written, in bytes.

**返回**

- ESP\_OK, if data was written successfully;
- ESP\_ERR\_INVALID\_ARG, if dst\_offset exceeds partition size;
- ESP\_ERR\_INVALID\_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

`esp_err_t wl_read (wl_handle_t handle, size_t src_addr, void *dest, size_t size)`

Read data from the WL storage.

**参数**

- **handle** -- WL module instance that was initialized before
- **dest** -- Pointer to the buffer where data should be stored. The Pointer must be non-NULL and the buffer must be at least 'size' bytes long.
- **src\_addr** -- Address of the data to be read, relative to the beginning of the partition.
- **size** -- Size of data to be read, in bytes.

**返回**

- ESP\_OK, if data was read successfully;
- ESP\_ERR\_INVALID\_ARG, if src\_offset exceeds partition size;
- ESP\_ERR\_INVALID\_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

`size_t wl_size (wl_handle_t handle)`

Get the actual flash size in use for the WL storage partition.

**参数** **handle** -- WL module handle that was initialized before

**返回** usable size, in bytes

`size_t wl_sector_size (wl_handle_t handle)`

Get sector size of the WL instance.

**参数** **handle** -- WL module handle that was initialized before

**返回** sector size, in bytes

**Macros**

**WL\_INVALID\_HANDLE**

**Type Definitions**

```
typedef int32_t wl_handle_t
```

wear levelling handle

此部分 API 代码示例存放在 ESP-IDF 示例项目的 [storage](#) 目录下。

**2.10 系统 API**

## 2.10.1 应用程序镜像格式

### 应用程序镜像结构

应用程序镜像包含以下内容：

1. `esp_image_header_t` 结构体描述了 SPI flash 的模式和内存段的数量。
2. `esp_image_segment_header_t` 结构体描述了每个段、每个段的长度及其在 ESP32-C3 内存中的位置，此描述后接长度为 `data_len` 的数据。镜像中每个段的数据偏移量的计算方式如下：
  - 0 段的偏移量 = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`
  - 1 段的偏移量 = 0 段的偏移量 + 0 段长度 + `sizeof(esp_image_segment_header_t)`
  - 2 段的偏移量 = 1 段的偏移量 + 1 段长度 + `sizeof(esp_image_segment_header_t)`
  - ...

`segment_count` 字段定义了每个段的数量，存储在 `esp_image_header_t` 中。各段段数量不能超过 `ESP_IMAGE_MAX_SEGMENTS`。

运行以下命令，获取镜像段列表：

```
esptool.py --chip esp32c3 image_info build/app.bin
```

```
esptool.py v2.3.1

↳0) load

```

有关内存段类型和地址范围的详细信息，请参阅 [ESP32-C3 技术参考手册 > 系统和存储器 > 内部存储器 \[PDF\]](#)。

3. 镜像有一个校验和字节，位于最后一个段之后。此字节写在一个十六字节填充边界上，因此应用程序镜像可能需要填充。
4. 如果在 `esp_image_header_t` 中设置了 `hash_appended` 字段，则会附加 SHA256 校验和字段。SHA256 哈希值的计算范围是从第一个字节开始，到这个字段为止。该字段长度为 32 字节。
5. 如果选项 `CONFIG_SECURE_SIGNED_APPS_SCHEME` 设置为 ECDSA，那么应用程序镜像将有额外的 68 字节用于 ECDSA 签名，其中包括：
  - 版本号 (4 字节)
  - 签名数据 (64 字节)
6. 如果选项 `CONFIG_SECURE_SIGNED_APPS_SCHEME` 设置为 RSA 或 ECDSA (V2)，则应用程序镜像将有一个额外的签名扇区，大小为 4K 字节。关于此签名扇区格式的更多内容，请参考 [Signature Block Format](#)。

## 应用程序描述

应用程序二进制文件的 DROM 段从 `esp_app_desc_t` 结构体开始，该结构体中包含了用于描述应用程序的特定字段，如下所示：

- `magic_word`: `esp_app_desc_t` 结构体的魔术词
- `secure_version`: 参见 [防回滚](#)
- `version`: 参见 [应用程序版本](#)<sup>1</sup>
- `project_name`: 通过 `PROJECT_NAME` 填充<sup>1</sup>
- `time` 和 `date`: 编译时间和日期
- `idf_ver`: ESP-IDF 的版本<sup>1</sup>
- `app_elf_sha256`: 包含应用程序 ELF 文件的 sha256 哈希

这个结构体有助于识别通过空中升级 (OTA) 上传的镜像，因为其中包含一个固定的偏移量，大小为 `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`。一旦设备接收到包含此结构体的第一个段，就能根据其中的充分信息来确定是否应继续更新。

要获取当前运行的应用程序的 `esp_app_desc_t` 结构体，请调用 `esp_app_get_description()`。

要获取另一个 OTA 分区的 `esp_app_desc_t` 结构体，请调用 `esp_ota_get_partition_description()`。

## 向应用程序添加自定义结构体

也可以自定义类似的结构体，并使其相对于镜像起始位置有一个固定的偏移量。

采用以下方式向镜像添加自定义结构体：

```

const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_
↳app_desc = { ... }

```

<sup>1</sup> 最大长度为 32 个字符，其中包括 null 终止符。也就是说，如果 `PROJECT_NAME` 的长度超过 31 个字符，超出的字符将被忽略。

自定义结构体的偏移量为 `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)`。

需在 `CMakeLists.txt` 中添加 `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")`，确保自定义结构体在未使用时也位于镜像中。

## API 参考

### Header File

- [components/bootloader\\_support/include/esp\\_app\\_format.h](#)
- This header file can be included with:

```
#include "esp_app_format.h"
```

- This header file is a part of the API provided by the `bootloader_support` component. To declare that your component depends on `bootloader_support`, add the following to your `CMakeLists.txt`:

```
REQUIRES bootloader_support
```

or

```
PRIV_REQUIRES bootloader_support
```

### Structures

struct **esp\_image\_header\_t**

Main header of binary image.

#### Public Members

uint8\_t **magic**

Magic word `ESP_IMAGE_HEADER_MAGIC`

uint8\_t **segment\_count**

Count of memory segments

uint8\_t **spi\_mode**

flash read mode (`esp_image_spi_mode_t` as `uint8_t`)

uint8\_t **spi\_speed**

flash frequency (`esp_image_spi_freq_t` as `uint8_t`)

uint8\_t **spi\_size**

flash chip size (`esp_image_flash_size_t` as `uint8_t`)

uint32\_t **entry\_addr**

Entry address

uint8\_t **wp\_pin**

WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to `0xEE=disabled`)

uint8\_t **spi\_pin\_drv**[3]

Drive settings for the SPI flash pins (read by ROM bootloader)

*esp\_chip\_id\_t* **chip\_id**

Chip identification number

uint8\_t **min\_chip\_rev**

Minimal chip revision supported by image After the Major and Minor revision eFuses were introduced into the chips, this field is no longer used. But for compatibility reasons, we keep this field and the data in it. Use `min_chip_rev_full` instead. The software interprets this as a Major version for most of the chips and as a Minor version for the ESP32-C3.

uint16\_t **min\_chip\_rev\_full**

Minimal chip revision supported by image, in format: major \* 100 + minor

uint16\_t **max\_chip\_rev\_full**

Maximal chip revision supported by image, in format: major \* 100 + minor

uint8\_t **reserved**[4]

Reserved bytes in additional header space, currently unused

uint8\_t **hash\_appended**

If 1, a SHA256 digest "simple hash" (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

struct **esp\_image\_segment\_header\_t**

Header of binary image segment.

### Public Members

uint32\_t **load\_addr**

Address of segment

uint32\_t **data\_len**

Length of data

### Macros

**ESP\_IMAGE\_HEADER\_MAGIC**

The magic word for the *esp\_image\_header\_t* structure.

**ESP\_IMAGE\_MAX\_SEGMENTS**

Max count of segments in the image.

### Enumerations

enum **esp\_chip\_id\_t**

ESP chip ID.

*Values:*

enumerator **ESP\_CHIP\_ID\_ESP32**

chip ID: ESP32

enumerator **ESP\_CHIP\_ID\_ESP32S2**

chip ID: ESP32-S2

enumerator **ESP\_CHIP\_ID\_ESP32C3**

chip ID: ESP32-C3

enumerator **ESP\_CHIP\_ID\_ESP32S3**

chip ID: ESP32-S3

enumerator **ESP\_CHIP\_ID\_ESP32C2**

chip ID: ESP32-C2

enumerator **ESP\_CHIP\_ID\_ESP32C6**

chip ID: ESP32-C6

enumerator **ESP\_CHIP\_ID\_ESP32H2**

chip ID: ESP32-H2

enumerator **ESP\_CHIP\_ID\_ESP32P4**

chip ID: ESP32-P4

enumerator **ESP\_CHIP\_ID\_INVALID**

Invalid chip ID (we defined it to make sure the `esp_chip_id_t` is 2 bytes size)

enum **esp\_image\_spi\_mode\_t**

SPI flash mode, used in [esp\\_image\\_header\\_t](#).

*Values:*

enumerator **ESP\_IMAGE\_SPI\_MODE\_QIO**

SPI mode QIO

enumerator **ESP\_IMAGE\_SPI\_MODE\_QOUT**

SPI mode QOUT

enumerator **ESP\_IMAGE\_SPI\_MODE\_DIO**

SPI mode DIO

enumerator **ESP\_IMAGE\_SPI\_MODE\_DOUT**

SPI mode DOUT

enumerator **ESP\_IMAGE\_SPI\_MODE\_FAST\_READ**

SPI mode FAST\_READ

enumerator **ESP\_IMAGE\_SPI\_MODE\_SLOW\_READ**

SPI mode SLOW\_READ

enum **esp\_image\_spi\_freq\_t**

SPI flash clock division factor.

*Values:*

enumerator **ESP\_IMAGE\_SPI\_SPEED\_DIV\_2**

The SPI flash clock frequency is divided by 2 of the clock source

enumerator **ESP\_IMAGE\_SPI\_SPEED\_DIV\_3**

The SPI flash clock frequency is divided by 3 of the clock source

enumerator **ESP\_IMAGE\_SPI\_SPEED\_DIV\_4**

The SPI flash clock frequency is divided by 4 of the clock source

enumerator **ESP\_IMAGE\_SPI\_SPEED\_DIV\_1**

The SPI flash clock frequency equals to the clock source

enum **esp\_image\_flash\_size\_t**

Supported SPI flash sizes.

*Values:*

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_1MB**

SPI flash size 1 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_2MB**

SPI flash size 2 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_4MB**

SPI flash size 4 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_8MB**

SPI flash size 8 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_16MB**

SPI flash size 16 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_32MB**

SPI flash size 32 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_64MB**

SPI flash size 64 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_128MB**

SPI flash size 128 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_MAX**

SPI flash size MAX

## 2.10.2 Bootloader Image Format

The bootloader image consists of the same structures as the application image, see [Application Image Structures](#). The only difference is in the [Bootloader Description](#) structure.

To get information about the bootloader image, please run the following command:

```
esptool.py --chip esp32c3 image_info build/bootloader/bootloader.bin --version 2
```

```

### Bootloader Description

The DRAM0 segment of the bootloader binary starts with the `esp_bootloader_desc_t` structure which carries specific fields describing the bootloader. This structure is located at a fixed offset = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`.

- `magic_byte` - the magic byte for the `esp_bootloader_desc` structure.
- `reserved` - reserved for the future IDF use.
- `version` - bootloader version, see [CONFIG\\_BOOTLOADER\\_PROJECT\\_VER](#)
- `idf_ver` - ESP-IDF version. \*
- `date and time` - compile date and time.

- reserved2 - reserved for the future IDF use.

\* - The maximum length is 32 characters, including null-termination character.

To get the `esp_bootloader_desc_t` structure from the running bootloader, use `esp_bootloader_get_description()`.

To get the `esp_bootloader_desc_t` structure from a running application, use `esp_ota_get_bootloader_description()`.

## API Reference

### Header File

- `components/esp_bootloader_format/include/esp_bootloader_desc.h`
- This header file can be included with:

```
#include "esp_bootloader_desc.h"
```

- This header file is a part of the API provided by the `esp_bootloader_format` component. To declare that your component depends on `esp_bootloader_format`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_bootloader_format
```

or

```
PRIV_REQUIRES esp_bootloader_format
```

### Functions

const `esp_bootloader_desc_t`\***esp\_bootloader\_get\_description** (void)

Return `esp_bootloader_desc` structure.

Intended for use by the bootloader.

返回 Pointer to `esp_bootloader_desc` structure.

### Structures

struct **esp\_bootloader\_desc\_t**

Bootloader description structure.

#### Public Members

uint8\_t **magic\_byte**

Magic byte `ESP_BOOTLOADER_DESC_MAGIC_BYTE`

uint8\_t **reserved**[3]

reserved for IDF

uint32\_t **version**

Bootloader version

char **idf\_ver**[32]

Version IDF

```
char date_time[24]
    Compile date and time
```

```
uint8_t reserved2[16]
    reserved for IDF
```

## Macros

### ESP\_BOOTLOADER\_DESC\_MAGIC\_BYTE

The magic byte for the `esp_bootloader_desc` structure that is in DRAM.

## 2.10.3 应用级追踪

### 概述

ESP-IDF 支持用于程序行为分析的 **应用级追踪**功能。在 `menuconfig` 中启用该功能后，即可通过 JTAG 接口在主机和 ESP32-C3 之间传输任意数据，最小化程序的执行开销。

在程序运行时，开发人员可使用该库向主机发送应用程序的特定执行状态，并接收来自应用程序的命令或其他信息。该库的主要用例包括：

1. 收集特定应用程序的数据，参见[特定应用程序的跟踪](#)。
2. 向主机发送轻量级日志，参见[记录日志到主机](#)。
3. 系统行为分析，参见[基于 SEGGER System View 的系统行为分析](#)。

## API 参考

### Header File

- `components/app_trace/include/esp_app_trace.h`
- This header file can be included with:

```
#include "esp_app_trace.h"
```

- This header file is a part of the API provided by the `app_trace` component. To declare that your component depends on `app_trace`, add the following to your `CMakeLists.txt`:

```
REQUIRES app_trace
```

or

```
PRIV_REQUIRES app_trace
```

### Functions

`esp_err_t esp_apprtrace_init` (void)

Initializes application tracing module.

---

**备注：** Should be called before any `esp_apprtrace_xxx` call.

---

返回 ESP\_OK on success, otherwise see `esp_err_t`

void **esp\_apptrace\_down\_buffer\_config** (uint8\_t \*buf, uint32\_t size)

Configures down buffer.

---

**备注:** Needs to be called before attempting to receive any data using `esp_apptrace_down_buffer_get` and `esp_apptrace_read`. This function does not protect internal data by lock.

---

**参数**

- **buf** -- Address of buffer to use for down channel (host to target) data.
- **size** -- Size of the buffer.

uint8\_t \***esp\_apptrace\_buffer\_get** (*esp\_apptrace\_dest\_t* dest, uint32\_t size, uint32\_t tmo)

Allocates buffer for trace data. Once the data in the buffer is ready to be sent, `esp_apptrace_buffer_put` must be called to indicate it.

**参数**

- **dest** -- Indicates HW interface to send data.
- **size** -- Size of data to write to trace buffer.
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

**返回** non-NULL on success, otherwise NULL.

*esp\_err\_t* **esp\_apptrace\_buffer\_put** (*esp\_apptrace\_dest\_t* dest, uint8\_t \*ptr, uint32\_t tmo)

Indicates that the data in the buffer is ready to be sent. This function is a counterpart of and must be preceded by `esp_apptrace_buffer_get`.

**参数**

- **dest** -- Indicates HW interface to send data. Should be identical to the same parameter in call to `esp_apptrace_buffer_get`.
- **ptr** -- Address of trace buffer to release. Should be the value returned by call to `esp_apptrace_buffer_get`.
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

**返回** `ESP_OK` on success, otherwise see `esp_err_t`

*esp\_err\_t* **esp\_apptrace\_write** (*esp\_apptrace\_dest\_t* dest, const void \*data, uint32\_t size, uint32\_t tmo)

Writes data to trace buffer.

**参数**

- **dest** -- Indicates HW interface to send data.
- **data** -- Address of data to write to trace buffer.
- **size** -- Size of data to write to trace buffer.
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

**返回** `ESP_OK` on success, otherwise see `esp_err_t`

int **esp\_apptrace\_vprintf\_to** (*esp\_apptrace\_dest\_t* dest, uint32\_t tmo, const char \*fmt, va\_list ap)

vprintf-like function to send log messages to host via specified HW interface.

**参数**

- **dest** -- Indicates HW interface to send data.
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.
- **fmt** -- Address of format string.
- **ap** -- List of arguments.

**返回** Number of bytes written.

int **esp\_apptrace\_vprintf** (const char \*fmt, va\_list ap)

vprintf-like function to send log messages to host.

**参数**

- **fmt** -- Address of format string.
  - **ap** -- List of arguments.
- 返回 Number of bytes written.

*esp\_err\_t* **esp\_appttrace\_flush** (*esp\_appttrace\_dest\_t* dest, uint32\_t tmo)

Flushes remaining data in trace buffer to host.

#### 参数

- **dest** -- Indicates HW interface to flush data on.
- **tmo** -- Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

返回 ESP\_OK on success, otherwise see esp\_err\_t

*esp\_err\_t* **esp\_appttrace\_flush\_nolock** (*esp\_appttrace\_dest\_t* dest, uint32\_t min\_sz, uint32\_t tmo)

Flushes remaining data in trace buffer to host without locking internal data. This is a special version of esp\_appttrace\_flush which should be called from panic handler.

#### 参数

- **dest** -- Indicates HW interface to flush data on.
- **min\_sz** -- Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- **tmo** -- Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

返回 ESP\_OK on success, otherwise see esp\_err\_t

*esp\_err\_t* **esp\_appttrace\_read** (*esp\_appttrace\_dest\_t* dest, void \*data, uint32\_t \*size, uint32\_t tmo)

Reads host data from trace buffer.

#### 参数

- **dest** -- Indicates HW interface to read the data on.
- **data** -- Address of buffer to put data from trace buffer.
- **size** -- Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- **tmo** -- Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

返回 ESP\_OK on success, otherwise see esp\_err\_t

uint8\_t \***esp\_appttrace\_down\_buffer\_get** (*esp\_appttrace\_dest\_t* dest, uint32\_t \*size, uint32\_t tmo)

Retrieves incoming data buffer if any. Once data in the buffer is processed, esp\_appttrace\_down\_buffer\_put must be called to indicate it.

#### 参数

- **dest** -- Indicates HW interface to receive data.
- **size** -- Address to store size of available data in down buffer. Must be initialized with requested value.
- **tmo** -- Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

返回 non-NULL on success, otherwise NULL.

*esp\_err\_t* **esp\_appttrace\_down\_buffer\_put** (*esp\_appttrace\_dest\_t* dest, uint8\_t \*ptr, uint32\_t tmo)

Indicates that the data in the down buffer is processed. This function is a counterpart of and must be preceded by esp\_appttrace\_down\_buffer\_get.

#### 参数

- **dest** -- Indicates HW interface to receive data. Should be identical to the same parameter in call to esp\_appttrace\_down\_buffer\_get.
- **ptr** -- Address of trace buffer to release. Should be the value returned by call to esp\_appttrace\_down\_buffer\_get.
- **tmo** -- Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

返回 ESP\_OK on success, otherwise see esp\_err\_t

bool **esp\_appttrace\_host\_is\_connected** (*esp\_appttrace\_dest\_t* dest)

Checks whether host is connected.

**参数 dest** -- Indicates HW interface to use.

**返回** true if host is connected, otherwise false

void \***esp\_appttrace\_fopen** (*esp\_appttrace\_dest\_t* dest, const char \*path, const char \*mode)

Opens file on host. This function has the same semantic as 'fopen' except for the first argument.

**参数**

- **dest** -- Indicates HW interface to use.
- **path** -- Path to file.
- **mode** -- Mode string. See fopen for details.

**返回** non zero file handle on success, otherwise 0

int **esp\_appttrace\_fclose** (*esp\_appttrace\_dest\_t* dest, void \*stream)

Closes file on host. This function has the same semantic as 'fclose' except for the first argument.

**参数**

- **dest** -- Indicates HW interface to use.
- **stream** -- File handle returned by esp\_appttrace\_fopen.

**返回** Zero on success, otherwise non-zero. See fclose for details.

size\_t **esp\_appttrace\_fwrite** (*esp\_appttrace\_dest\_t* dest, const void \*ptr, size\_t size, size\_t nmemb, void \*stream)

Writes to file on host. This function has the same semantic as 'fwrite' except for the first argument.

**参数**

- **dest** -- Indicates HW interface to use.
- **ptr** -- Address of data to write.
- **size** -- Size of an item.
- **nmemb** -- Number of items to write.
- **stream** -- File handle returned by esp\_appttrace\_fopen.

**返回** Number of written items. See fwrite for details.

size\_t **esp\_appttrace\_fread** (*esp\_appttrace\_dest\_t* dest, void \*ptr, size\_t size, size\_t nmemb, void \*stream)

Read file on host. This function has the same semantic as 'fread' except for the first argument.

**参数**

- **dest** -- Indicates HW interface to use.
- **ptr** -- Address to store read data.
- **size** -- Size of an item.
- **nmemb** -- Number of items to read.
- **stream** -- File handle returned by esp\_appttrace\_fopen.

**返回** Number of read items. See fread for details.

int **esp\_appttrace\_fseek** (*esp\_appttrace\_dest\_t* dest, void \*stream, long offset, int whence)

Set position indicator in file on host. This function has the same semantic as 'fseek' except for the first argument.

**参数**

- **dest** -- Indicates HW interface to use.
- **stream** -- File handle returned by esp\_appttrace\_fopen.
- **offset** -- Offset. See fseek for details.
- **whence** -- Position in file. See fseek for details.

**返回** Zero on success, otherwise non-zero. See fseek for details.

int **esp\_appttrace\_ftell** (*esp\_appttrace\_dest\_t* dest, void \*stream)

Get current position indicator for file on host. This function has the same semantic as 'ftell' except for the first argument.

**参数**

- **dest** -- Indicates HW interface to use.
- **stream** -- File handle returned by esp\_appttrace\_fopen.

**返回** Current position in file. See `ftell` for details.

int `esp_apptrace_fstop` (`esp_apptrace_dest_t` dest)

Indicates to the host that all file operations are complete. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

**参数** `dest` -- Indicates HW interface to use.

**返回** `ESP_OK` on success, otherwise see `esp_err_t`

int `esp_apptrace_feof` (`esp_apptrace_dest_t` dest, void \*stream)

Test end-of-file indicator on a stream. This function has the same semantic as 'feof' except for the first argument.

**参数**

- `dest` -- Indicates HW interface to use.

- `stream` -- File handle returned by `esp_apptrace_fopen`.

**返回** Non-Zero if end-of-file indicator is set for stream. See `feof` for details.

void `esp_gcov_dump` (void)

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

## Enumerations

enum `esp_apptrace_dest_t`

Application trace data destinations bits.

*Values:*

enumerator `ESP_APPTRACE_DEST_JTAG`

JTAG destination.

enumerator `ESP_APPTRACE_DEST_TRAX`

xxx\_TRAX name is obsolete, use more common xxx\_JTAG

enumerator `ESP_APPTRACE_DEST_UART`

UART destination.

enumerator `ESP_APPTRACE_DEST_MAX`

enumerator `ESP_APPTRACE_DEST_NUM`

## Header File

- `components/app_trace/include/esp_sysview_trace.h`
- This header file can be included with:

```
#include "esp_sysview_trace.h"
```

- This header file is a part of the API provided by the `app_trace` component. To declare that your component depends on `app_trace`, add the following to your `CMakeLists.txt`:

```
REQUIRES app_trace
```

or

```
PRIV_REQUIRES app_trace
```

**Functions**

static inline *esp\_err\_t* **esp\_sysview\_flush** (uint32\_t tmo)

Flushes remaining data in SystemView trace buffer to host.

**参数** **tmo** -- Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

**返回** ESP\_OK.

int **esp\_sysview\_vprintf** (const char \*format, va\_list args)

vprintf-like function to sent log messages to the host.

**参数**

- **format** -- Address of format string.
- **args** -- List of arguments.

**返回** Number of bytes written.

*esp\_err\_t* **esp\_sysview\_heap\_trace\_start** (uint32\_t tmo)

Starts SystemView heap tracing.

**参数** **tmo** -- Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

**返回** ESP\_OK on success, ESP\_ERR\_TIMEOUT if operation has been timed out.

*esp\_err\_t* **esp\_sysview\_heap\_trace\_stop** (void)

Stops SystemView heap tracing.

**返回** ESP\_OK.

void **esp\_sysview\_heap\_trace\_alloc** (void \*addr, uint32\_t size, const void \*callers)

Sends heap allocation event to the host.

**参数**

- **addr** -- Address of allocated block.
- **size** -- Size of allocated block.
- **callers** -- Pointer to array with callstack addresses. Array size must be CONFIG\_HEAP\_TRACING\_STACK\_DEPTH.

void **esp\_sysview\_heap\_trace\_free** (void \*addr, const void \*callers)

Sends heap de-allocation event to the host.

**参数**

- **addr** -- Address of de-allocated block.
- **callers** -- Pointer to array with callstack addresses. Array size must be CONFIG\_HEAP\_TRACING\_STACK\_DEPTH.

**2.10.4 使用外部堆栈调用函数****概述**

执行某个给定函数时，可以使用用户分配的堆栈空间，且该堆栈空间独立于当前任务的堆栈。这一机制能够节省在调用常用函数时浪费大量堆栈空间，例如 `printf` 函数。具体而言，将给定函数作为参数传入 `esp_execute_shared_stack_function()` 中，给定函数便会在共享堆栈空间内作为回调函数延迟执行。

**使用方法**

`esp_execute_shared_stack_function()` 需要四个参数：

- 由调用者分配的互斥锁，防止同一函数共享分配的堆栈
- 指向分配的堆栈顶部的指针

- 以字节为单位的堆栈的大小
- 指向需要共享堆栈的函数的指针

通过这一功能，用户指定的函数被作为回调函数延迟执行，并在用户分配的空间中调用，无需从当前任务堆栈中获取空间。

该函数的使用方式如下所示：

```
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//假设要使用一个单独的堆栈空间来调用 printf 函数
//允许应用程序减小其堆栈大小
void app_main()
{
    //从堆中或以静态方式分配一个堆栈 buffer:
    StackType_t *shared_stack = malloc(8192 * sizeof(StackType_t));
    assert(shared_stack != NULL);

    //分配一个互斥锁:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //使用宏助手调用所需函数:
    esp_execute_shared_stack_function(printf_lock,
                                     shared_stack,
                                     8192,
                                     external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}
```

## API 参考

### Header File

- [components/esp\\_system/include/esp\\_expression\\_with\\_stack.h](#)
- This header file can be included with:

```
#include "esp_expression_with_stack.h"
```

### Functions

void **esp\_execute\_shared\_stack\_function** (*SemaphoreHandle\_t* lock, void \*stack, size\_t stack\_size, *shared\_stack\_function* function)

Calls user defined shared stack space function.

---

**备注:** if either lock, stack or stack size is invalid, the expression will be called using the current stack.

---

### 参数

- **lock** -- Mutex object to protect in case of shared stack
- **stack** -- Pointer to user allocated stack
- **stack\_size** -- Size of current stack in bytes
- **function** -- pointer to the shared stack function to be executed

## Macros

**ESP\_EXECUTE\_EXPRESSION\_WITH\_STACK** (lock, stack, stack\_size, expression)

## Type Definitions

```
typedef void (*shared_stack_function)(void)
```

## 2.10.5 芯片版本

### 概述

ESP32-C3 可能包含多个芯片版本。引入不同的版本主要用于修复问题，有时也用于添加新功能。[版本控制方案](#) 描述了这些芯片修订的版本以及运行时读取版本信息所用的 API。

须考虑应用程序、ESP-IDF 版本和芯片版本之间的兼容性：

- 应用程序可能依赖于某个芯片版本的修复内容或功能。
- 较新版本的硬件可能与较早版本的 ESP-IDF 不兼容。

本文档的[ESP-IDF 兼容性检查](#) 部分描述了应用程序如何明确芯片版本需求，以及 ESP-IDF 如何对兼容性进行检查。文档最后提供了此方案的故障排除相关信息。

### 版本控制方案

芯片版本号通常以 vX.Y 的形式表示，其中：

- X 表示主版本号。该号码变更表示在旧版芯片上使用的软件与新版芯片不兼容，必须升级软件方可使用。
- Y 表示次版本号。该号码变更表示在旧版芯片上使用的软件与新版芯片兼容，无需升级软件。

如果新版芯片不包含重大变更，则可以兼容旧版芯片上运行的软件。此时，新版芯片的主版本号不变，次版本号加 1。例如，版本号从 v1.1 变为 v1.2。

相反，如果新版芯片包含重大变更，则 **无法兼容** 旧版芯片的软件。此时，新版芯片的主版本号增加，次版本号设置为 0。例如，版本号从 v1.1 变为 v2.0。

此版本控制方式能够表示芯片版本之间的衍生关系，并清晰表明芯片变更是否为重大变更。

在芯片发生非重大变更时，ESP-IDF 的执行逻辑应与此前最近版本的逻辑相同，从而达到无缝衔接。在这样便可直接将编译后的二进制文件迁移到更新了次版本的芯片上，无需升级 ESP-IDF 版本并重新编译整个项目。

当二进制文件在更新了主版本的芯片上意外执行时，软件也能够根据主版本报告问题。此主次版本方案还允许硬件变更分支化。

---

**备注：** 目前的主次版本号芯片版本方案是从 ESP-IDF v5.0 开始引入的。因此，早期 ESP-IDF 创建的引导加载程序将继续使用晶圆版本表示的芯片版本方案。

---

**用于芯片版本的 eFuse 位** 芯片使用以下几个 eFuse 字段来进行版本控制：

- 主版本号 (WAFER\_VERSION\_MAJOR eFuse)
- 次版本号 (WAFER\_VERSION\_MINOR eFuse)
- 忽略最大版本限制位 (DISABLE\_WAFER\_VERSION\_MAJOR eFuse)。请参考[ESP-IDF 兼容性检查](#) 了解此 eFuse 字段。

**备注：**此前的版本控制逻辑基于单一的 eFuse 版本字段，即 `WAFER_VERSION`。这种方式无法表明芯片的更新是否为重大更新，是一种线性的版本控制逻辑。

**芯片版本 API** 使用下列 API 从 eFuse 中读取芯片版本：

- `efuse_hal_chip_revision()`，返回的版本格式为 `major * 100 + minor`。
- `efuse_hal_get_major_chip_version()` 返回主版本号。
- `efuse_hal_get_minor_chip_version()` 返回次版本号。

下列 Kconfig 选项（格式为 `major * 100 + minor`）可以将芯片版本依赖添加到代码中：

- `CONFIG_ESP32C3_REV_MIN_FULL`
- `CONFIG_ESP_REV_MIN_FULL`
- `CONFIG_ESP32C3_REV_MAX_FULL`
- `CONFIG_ESP_REV_MAX_FULL`

### ESP-IDF 兼容性检查

如果构建的应用程序需要支持特定芯片的多个版本，可通过 Kconfig 指定支持的最小和最大芯片版本号。

最小芯片版本号可以通过 Kconfig 选项 `CONFIG_ESP32C3_REV_MIN` 来选择。设置最小芯片版本后，软件只能在较新的芯片版本上运行，以便支持某些功能或修复某些错误。

最大芯片版本号无法指定，只能由当前使用的 ESP-IDF 版本自动决定。ESP-IDF 会拒绝启动任何超过最大芯片版本号的芯片版本。由于特定版本的 ESP-IDF 无法预知未来的芯片版本更新，因此最大芯片版本号通常设置为 `maximum supported MAJOR version + 99`。可以设置“忽略最大版本” eFuse 来绕过最大版本限制，但这不能确保软件正常工作。

下文介绍了芯片版本未通过兼容性检查时显示的故障排除信息及解决方法，并描述了在早期 ESP-IDF 版本中与软件行为和兼容性检查相关的技术细节。

### 故障排除

1. 如果第二阶段引导加载程序所运行的芯片版本低于镜像（如软件镜像）中指定的最小版本，会发生重启并显示以下消息：

```
Image requires chip rev >= v3.0, but chip is v1.0
```

要解决此问题，

- 确保使用的芯片达到了要求的最低版本及以上。
- 减小 `CONFIG_ESP32C3_REV_MIN` 的值并重建镜像，使镜像的版本与当前芯片版本兼容。

1. 如果应用程序所需的芯片版本不处于最小和最大芯片版本的区间范围内，会发生重启并显示以下消息：

```
Image requires chip rev <= v2.99, but chip is v3.0
```

为解决此问题，需更新 ESP-IDF 到较新版本，以支持该芯片版本 (`CONFIG_ESP32C3_REV_MAX_FULL`)。也可以在 eFuse 中设置 `Ignore maximal revision` 位，或使用与当前 ESP-IDF 版本兼容的其他芯片版本。

**二进制镜像的常见版本需求** 二级引导程序和应用程序二进制镜像中包含 `esp_image_header_t` 头文件，其中记录了可以运行该软件的芯片版本号。这一头文件有 3 个与版本相关的字段：

- `min_chip_rev` - 镜像所需芯片的最小主版本号（但对于 ESP32-C3，该字段指次版本号）。其值由 `CONFIG_ESP32C3_REV_MIN` 确定。
- `min_chip_rev_full` - 镜像所需芯片的最小次版本号，格式为 `major * 100 + minor`。其值由 `CONFIG_ESP32C3_REV_MIN` 确定。

- `max_chip_rev_full` - 镜像所需芯片的最大版本，格式为 `major * 100 + minor`。其值由 `CONFIG_ESP32C3_REV_MAX_FULL` 确定。用户无法对其进行修改，仅当 ESP-IDF 支持新版本时由乐鑫官方进行更改。

**最大和最小版本限制** 应用启动过程中，检查最小和最大版本的顺序如下：

1. 在运行第 2 阶段引导启动程序前，第 1 阶段引导启动程序（ROM 引导启动程序）不会在 `esp_image_header_t` 中检查最小和最大版本字段。
2. 在第 2 阶段引导启动程序的初始化阶段，会检查引导程序自身是否可以在此版本的芯片上启动。它从引导启动程序镜像的头文件中读取最小版本，并与 eFuse 中的芯片版本进行比较。如果芯片版本低于最小版本，引导启动程序会拒绝启动并中止运行。此阶段不检查最大版本。
3. 然后，第 2 阶段引导启动程序会检查应用程序的版本要求。它从应用程序镜像的头文件中读取最小和最大版本，并与 eFuse 中的芯片版本进行比较。如果该芯片版本低于最小版本或高于最大版本，引导程序会拒绝启动并中止。然而，如果设置了忽略最大版本位，则可以忽略最大版本限制。软件确定可以使用此芯片版本时，用户可以自行设置忽略位。
4. 在空中升级 (OTA) 阶段，运行中的应用程序会检查新软件是否与芯片版本相匹配。它会从新应用程序镜像的标头中提取最小和最大版本，并与 eFuse 中的芯片版本进行比较。应用程序检查版本匹配的方式与引导启动程序相同，即芯片版本须处在最小和最大版本之间（忽略最大版本的逻辑也相同）。

**向后兼容旧版 ESP-IDF 构建的引导启动程序** 主要版本号 and 次版本号的 eFuse 位对于旧版引导启动程序（由早于 v5.0 版本的 ESP-IDF 进行构建）而言是未知的。旧版启动引导程序只使用一个 eFuse 位来表示芯片版本。

在 ESP-IDF v4.3 中添加了对 ESP32-C3 芯片的支持。旧版引导启动程序无法读取晶圆版本 eFuse 的所有位，只能读取前 3 个最低有效位。因此，旧版引导启动程序无法正确检测芯片版本。具体而言，只能正确检测 v0.0 至 v0.8 范围内的芯片版本，其他芯片版本则会被错误识别为该范围内的某个版本。

请使用 `esptool chip_id` 命令查看芯片版本。

## API 参考

### Header File

- `components/hal/include/hal/efuse_hal.h`
- This header file can be included with:

```
#include "hal/efuse_hal.h"
```

### Functions

void `efuse_hal_get_mac` (uint8\_t \*mac)

get factory mac address

uint32\_t `efuse_hal_chip_revision` (void)

Returns chip version.

**返回** Chip version in format: Major \* 100 + Minor

uint32\_t **efuse\_hal\_blk\_version** (void)

Return block version.

**返回** Block version in format: Major \* 100 + Minor

bool **efuse\_hal\_flash\_encryption\_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH\_CRYPT\_CNT efuse has an odd number of bits set.

**返回** true if flash encryption is enabled.

bool **efuse\_hal\_get\_disable\_wafer\_version\_major** (void)

Returns the status of whether the bootloader (and OTA) will check the maximum chip version or not.

**返回** true - Skip the maximum chip version check.

uint32\_t **efuse\_hal\_get\_major\_chip\_version** (void)

Returns major chip version.

uint32\_t **efuse\_hal\_get\_minor\_chip\_version** (void)

Returns minor chip version.

## 2.10.6 控制台终端

ESP-IDF 提供了 `console` 组件，它包含了开发基于串口的交互式控制终端所需要的所有模块，主要支持以下功能：

- 行编辑，由 `linenoise` 库具体实现，它支持处理退格键和方向键，支持回看命令的历史记录，支持命令的自动补全和参数提示。
- 将命令行拆分为参数列表。
- 参数解析，由 `argtable3` 库具体实现，该库提供解析 GNU 样式的命令行参数的 API。
- 用于注册和调度命令的函数。
- 帮助创建 REPL (Read-Evaluate-Print-Loop) 环境的函数。

---

**备注：** 这些功能模块可以一起使用，也可以独立使用，例如仅使用行编辑和命令注册的功能，然后使用 `getopt` 函数或者自定义的函数来实现参数解析，而不是直接使用 `argtable3` 库。同样地，还可以使用更简单的命令输入方法（比如 `fgets` 函数）和其他用于命令分割和参数解析的方法。

---

---

**备注：** 当在支持硬件 USB 串行接口的芯片上使用控制台应用程序时，建议禁用次级串口控制台输出。次级输出仅用于显示，对于交互式应用程序没有任何作用。

---

### 行编辑

行编辑功能允许用户通过按键输入来编辑命令，使用退格键删除符号，使用左/右键在命令中移动光标，使用上/下键导航到之前输入的命令，使用制表键（“Tab”）来自动补全命令。

---

**备注：** 此功能依赖于终端应用程序对 ANSI 转义符的支持。因此，显示原始 UART 数据的串口监视器不能与行编辑库一同使用。如果运行 `system/console` 示例程序的时候看到的输出结果是 `[6n` 或者类似的转义字符而不是命令行提示符 `esp>` 时，就表明当前的串口监视器不支持 ANSI 转义字符。已知可用的串口监视程序有 GNU `screen`、`minicom` 和 `esp-idf-monitor`（可以通过在项目目录下执行 `idf.py monitor` 来调用）。

---

前往这里可以查看 `linenoise` 库提供的所有函数的描述。

**配置** Linenose 库不需要显式地初始化，但是在调用行编辑函数之前，可能需要对某些配置的默认值稍作修改。

- `linenoseClearScreen()`  
使用转义字符清除终端屏幕，并将光标定位在左上角。
- `linenoseSetMultiLine()`  
在单行和多行编辑模式之间进行切换。单行模式下，如果命令的长度超过终端的宽度，会在行内滚动命令文本以显示文本的结尾，在这种情况下，文本的开头部分会被隐藏。单行模式在每次按下按键时发送给屏幕刷新的数据比较少，与多行模式相比更不容易发生故障。另一方面，在单行模式下编辑命令和复制命令将变得更加困难。默认情况下开启的是单行模式。
- `linenoseAllowEmpty()`  
设置 `linenose` 库收到空行的解析行为，设置为 `true` 时返回长度为零的字符串 ("")，设置为 `false` 时返回 `NULL`。默认情况下，将返回长度为零的字符串。
- `linenoseSetMaxLineLen()`  
设置 `linenose` 库中每行的最大长度，默认长度为 4096 字节，可以通过更新该默认值来优化 RAM 内存的使用。

### 主循环

- `linenose()`  
在大多数情况下，控制台应用程序都会具有相同的工作形式——在某个循环中不断读取输入的内容，然后解析再处理。`linenose()` 是专门用来获取用户按键输入的函数，当回车键被按下后会返回完整的一行内容。因此可以用它来完成前面循环中的“读取”任务。
- `linenoseFree()`  
必须调用此函数才能释放从 `linenose()` 函数获取的命令行缓冲区。

### 提示和补全

- `linenoseSetCompletionCallback()`  
当用户按下制表键时，`linenose` 会调用 **补全回调函数**，该回调函数会检查当前已经输入的内容，然后调用 `linenoseAddCompletion()` 函数来提供所有可能的补全后的命令列表。启用补全功能，需要事先调用 `linenoseSetCompletionCallback()` 函数来注册补全回调函数。`console` 组件提供了一个现成的函数来为注册的命令提供补全功能 `esp_console_get_completion()`（见下文）。
- `linenoseAddCompletion()`  
补全回调函数会通过调用此函数来通知 `linenose` 库当前键入命令所有可能的补全结果。
- `linenoseSetHintsCallback()`  
每当用户的输入改变时，`linenose` 就会调用此回调函数，检查到目前为止输入的命令行内容，然后提供带有提示信息的字符串（例如命令参数列表），然后会在同一行上用不同的颜色显示出该文本。
- `linenoseSetFreeHintsCallback()`  
如果 **提示回调函数** 返回的提示字符串是动态分配的或者需要以其它方式回收，就需要使用 `linenoseSetFreeHintsCallback()` 注册具体的清理函数。

### 历史记录

- `linenoseHistorySetMaxLen()`  
该函数设置要保留在内存中的最近输入的命令的数量。用户通过使用向上/向下箭头来导航历史记录。
- `linenoseHistoryAdd()`  
`linenose` 不会自动向历史记录中添加命令，应用程序需要调用此函数来将命令字符串添加到历史记录中。
- `linenoseHistorySave()`  
该函数将命令的历史记录从 RAM 中保存为文本文件，例如保存到 SD 卡或者 flash 的文件系统中。
- `linenoseHistoryLoad()`  
与 `linenoseHistorySave` 相对应，从文件中加载历史记录。
- `linenoseHistoryFree()`  
释放用于存储命令历史记录内存。当使用完 `linenose` 库后需要调用此函数。

## 将命令行拆分成参数列表

console 组件提供 `esp_console_split_argv()` 函数来将命令行字符串拆分为参数列表。该函数会返回参数的数量 (`argc`) 和一个指针数组, 该指针数组可以作为 `argv` 参数传递给任何接受 `argc`, `argv` 格式参数的函数。

根据以下规则来将命令行拆分成参数列表:

- 参数由空格分隔
- 如果参数本身需要使用空格, 可以使用 `\` (反斜杠) 对它们进行转义
- 其它能被识别的转义字符有 `\\` (显示反斜杠本身) 和 `\"` (显示双引号)
- 可以使用双引号来引用参数, 引号只可能出现在参数的开头和结尾。参数中的引号必须如上所述进行转义。参数周围的引号会被 `esp_console_split_argv()` 函数删除

示例:

- `abc def 1 20 .3 > [ abc, def, 1, 20, .3 ]`
- `abc "123 456" def > [ abc, 123 456, def ]`
- ``a\ b\\c\" > [ a b\c" ]`

## 参数解析

对于参数解析, console 组件使用 `argtable3` 库。有关 `argtable3` 的介绍请查看 [教程](#) 或者 Github 仓库中的 [示例代码](#)。

## 命令的注册与调度

console 组件包含了一些工具函数, 用来注册命令, 将用户输入的命令和已经注册的命令进行匹配, 使用命令行输入的参数调用命令。

应用程序首先调用 `esp_console_init()` 来初始化命令注册模块, 然后调用 `esp_console_cmd_register()` 函数注册命令处理程序。

对于每个命令, 应用程序需要提供以下信息 (需要以 `esp_console_cmd_t` 结构体的形式给出):

- 命令名字 (不含空格的字符串)
- 帮助文档, 解释该命令的用途
- 可选的提示文本, 列出命令的参数。如果应用程序使用 `Argtable3` 库来解析参数, 则可以通过提供指向 `argtable` 参数定义结构体的指针来自动生成提示文本
- 命令处理函数

命令注册模块还提供了其它函数:

- `esp_console_run()`  
该函数接受命令行字符串, 使用 `esp_console_split_argv()` 函数将其拆分为 `argc/argv` 形式的参数列表, 在已经注册的组件列表中查找命令, 如果找到, 则执行其对应的处理程序。
- `esp_console_register_help_command()`  
将 `help` 命令添加到已注册命令列表中, 此命令将会以列表的方式打印所有注册的命令及其参数和帮助文本。
- `esp_console_get_completion()`  
与 `linenoise` 库中的 `linenoiseSetCompletionCallback()` 一同使用的回调函数, 根据已经注册的命令列表为 `linenoise` 提供补全功能。
- `esp_console_get_hint()`  
与 `linenoise` 库中 `linenoiseSetHintsCallback()` 一同使用的回调函数, 为 `linenoise` 提供已经注册的命令的参数提示功能。

## 初始化 REPL 环境

除了上述的各种函数, console 组件还提供了一些 API 来帮助创建一个基本的 REPL 环境。

在一个典型的 console 应用中，你只需要调用 `esp_console_new_repl_uart()`，它会为你初始化好构建在 UART 基础上的 REPL 环境，其中包括安装 UART 驱动，基本的 console 配置，创建一个新的线程来执行 REPL 任务，注册一些基本的命令（比如 `help` 命令）。

之后你可以使用 `esp_console_cmd_register()` 来注册其它命令。REPL 环境在初始化后需要再调用 `esp_console_start_repl()` 函数才能开始运行。

同样，如果 REPL 环境是构建在 USB\_SERIAL\_JTAG 设备基础上，你只需要先调用 `esp_console_new_repl_usb_serial_jtag()` 函数进行初始化，然后再照常调用其它函数。

## 应用程序示例

`system/console` 目录下提供了 console 组件的示例应用程序，展示了具体的使用方法。该示例介绍了如何初始化 UART 和 VFS 的功能，设置 `linenoise` 库，从 UART 中读取命令并加以处理，然后将历史命令存储到 flash 中。更多信息，请参阅示例代码目录中的 `README.md` 文件。

此外，ESP-IDF 还提供了众多基于 console 组件的示例程序，它们可以辅助应用程序的开发。例如，`peripherals/i2c/i2c_tools`，`wifi/ipperf` 等等。

## API 参考

### Header File

- `components/console/esp_console.h`
- This header file can be included with:

```
#include "esp_console.h"
```

- This header file is a part of the API provided by the `console` component. To declare that your component depends on `console`, add the following to your `CMakeLists.txt`:

```
REQUIRES console
```

or

```
PRIV_REQUIRES console
```

### Functions

`esp_err_t esp_console_init` (const `esp_console_config_t` \*config)

initialize console module

---

**备注:** Call this once before using other console module features

---

**参数** `config` -- console configuration

**返回**

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_ERR_INVALID_STATE` if already initialized
- `ESP_ERR_INVALID_ARG` if the configuration is invalid

`esp_err_t esp_console_deinit` (void)

de-initialize console module

---

**备注:** Call this once when done using console module functions

---

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not initialized yet

*esp\_err\_t* **esp\_console\_cmd\_register** (const *esp\_console\_cmd\_t* \*cmd)

Register console command.

**参数** **cmd** -- pointer to the command description; can point to a temporary value

**返回**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_ERR\_INVALID\_ARG if command description includes invalid arguments

*esp\_err\_t* **esp\_console\_run** (const char \*cmdline, int \*cmd\_ret)

Run command line.

**参数**

- **cmdline** -- command line (command name followed by a number of arguments)
- **cmd\_ret** -- [out] return code from the command (set if command was run)

**返回**

- ESP\_OK, if command was run
- ESP\_ERR\_INVALID\_ARG, if the command line is empty, or only contained whitespace
- ESP\_ERR\_NOT\_FOUND, if command with given name wasn't registered
- ESP\_ERR\_INVALID\_STATE, if esp\_console\_init wasn't called

size\_t **esp\_console\_split\_argv** (char \*line, char \*\*argv, size\_t argv\_size)

Split command line into arguments in place.

```
* - This function finds whitespace-separated arguments in the given input line.
*
*   'abc def 1 20 .3' -> [ 'abc', 'def', '1', '20', '.3' ]
*
* - Argument which include spaces may be surrounded with quotes. In this case
*   spaces are preserved and quotes are stripped.
*
*   'abc "123 456" def' -> [ 'abc', '123 456', 'def' ]
*
* - Escape sequences may be used to produce backslash, double quote, and space:
*
*   'a\ b\\c\"' -> [ 'a b\c"' ]
*
```

**备注:** Pointers to at most argv\_size - 1 arguments are returned in argv array. The pointer after the last one (i.e. argv[argc]) is set to NULL.

**参数**

- **line** -- pointer to buffer to parse; it is modified in place
- **argv** -- array where the pointers to arguments are written
- **argv\_size** -- number of elements in argv\_array (max. number of arguments)

**返回** number of arguments found (argc)

void **esp\_console\_get\_completion** (const char \*buf, *linenoiseCompletions* \*lc)

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

```
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

**参数**

- **buf** -- the string typed by the user
- **lc** -- linenoiseCompletions to be filled in

const char \***esp\_console\_get\_hint** (const char \*buf, int \*color, int \*bold)

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:

```
linenoiseSetHintsCallback((linenoiseHintsCallback*) &esp_console_get_hint);
```

The extra cast is needed because linenoiseHintsCallback is defined as returning a char\* instead of const char\*.

#### 参数

- **buf** -- line typed by the user
- **color** -- [out] ANSI color code to be used when displaying the hint
- **bold** -- [out] set to 1 if hint has to be displayed in bold

**返回** string containing the hint text. This string is persistent and should not be freed (i.e. linenoiseSetFreeHintsCallback should not be used).

*esp\_err\_t* **esp\_console\_register\_help\_command** (void)

Register a 'help' command.

Default 'help' command prints the list of registered commands along with hints and help strings if no additional argument is given. If an additional argument is given, the help command will look for a command with the same name and only print the hints and help strings of that command.

#### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE, if esp\_console\_init wasn't called

*esp\_err\_t* **esp\_console\_new\_repl\_uart** (const *esp\_console\_dev\_uart\_config\_t* \*dev\_config, const *esp\_console\_repl\_config\_t* \*repl\_config, *esp\_console\_repl\_t* \*\*ret\_repl)

Establish a console REPL environment over UART driver.

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp\_console functions.

---

**备注:** This is an all-in-one function to establish the environment needed for REPL, includes:

- Install the UART driver on the console UART (8n1, 115200, REF\_TICK clock source)
  - Configures the stdin/stdout to go through the UART driver
  - Initializes linenoise
  - Spawn new thread to run REPL in the background
- 

#### 参数

- **dev\_config** -- [in] UART device configuration
- **repl\_config** -- [in] REPL configuration
- **ret\_repl** -- [out] return REPL handle after initialization succeed, return NULL otherwise

#### 返回

- ESP\_OK on success
- ESP\_FAIL Parameter error

*esp\_err\_t* **esp\_console\_new\_repl\_usb\_serial\_jtag** (const *esp\_console\_dev\_usb\_serial\_jtag\_config\_t* \*dev\_config, const *esp\_console\_repl\_config\_t* \*repl\_config, *esp\_console\_repl\_t* \*\*ret\_repl)

Establish a console REPL (Read-eval-print loop) environment over USB-SERIAL-JTAG.

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying `linenoise` and `esp_console` functions.

---

**备注:** This is an all-in-one function to establish the environment needed for REPL, includes:

- Initializes `linenoise`
  - Spawn new thread to run REPL in the background
- 

#### 参数

- **dev\_config** -- [in] USB-SERIAL-JTAG configuration
- **repl\_config** -- [in] REPL configuration
- **ret\_repl** -- [out] return REPL handle after initialization succeed, return NULL otherwise

#### 返回

- `ESP_OK` on success
- `ESP_FAIL` Parameter error

`esp_err_t esp_console_start_repl(esp_console_repl_t *repl)`

Start REPL environment.

---

**备注:** Once the REPL gets started, it won't be stopped until the user calls `repl->del(repl)` to destroy the REPL environment.

---

**参数** **repl** -- [in] REPL handle returned from `esp_console_new_repl_XXX`

#### 返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE`, if `repl` has started already

## Structures

struct **esp\_console\_config\_t**

Parameters for console initialization.

### Public Members

size\_t **max\_cmdline\_length**

length of command line buffer, in bytes

size\_t **max\_cmdline\_args**

maximum number of command line arguments to parse

uint32\_t **heap\_alloc\_caps**

where to (e.g. `MALLOC_CAP_SPIRAM`) allocate heap objects such as `cmds` used by `esp_console`

int **hint\_color**

ASCII color code of hint text.

int **hint\_bold**

Set to 1 to print hint text in bold.

struct **esp\_console\_repl\_config\_t**  
Parameters for console REPL (Read Eval Print Loop)

### Public Members

uint32\_t **max\_history\_len**  
maximum length for the history

const char \***history\_save\_path**  
file path used to save history commands, set to NULL won't save to file system

uint32\_t **task\_stack\_size**  
repl task stack size

uint32\_t **task\_priority**  
repl task priority

const char \***prompt**  
prompt (NULL represents default: "esp> ")

size\_t **max\_cmdline\_length**  
maximum length of a command line. If 0, default value will be used

struct **esp\_console\_dev\_uart\_config\_t**  
Parameters for console device: UART.

### Public Members

int **channel**  
UART channel number (count from zero)

int **baud\_rate**  
Communication baud rate.

int **tx\_gpio\_num**  
GPIO number for TX path, -1 means using default one.

int **rx\_gpio\_num**  
GPIO number for RX path, -1 means using default one.

struct **esp\_console\_dev\_usb\_serial\_jtag\_config\_t**  
Parameters for console device: USB-SERIAL-JTAG.

---

**备注:** It's an empty structure for now, reserved for future

---

struct **esp\_console\_cmd\_t**  
Console command description.

## Public Members

const char \***command**

Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to `esp_console_deinit`.

const char \***help**

Help text for the command, shown by help command. If set, the pointer must be valid until the call to `esp_console_deinit`. If not set, the command will not be listed in 'help' output.

const char \***hint**

Hint text, usually lists possible arguments. If set to NULL, and 'argtable' field is non-NULL, hint will be generated automatically

*esp\_console\_cmd\_func\_t* **func**

Pointer to a function which implements the command.

void \***argtable**

Array or structure of pointers to `arg_xxx` structures, may be NULL. Used to generate hint text if 'hint' is set to NULL. Array/structure which this field points to must end with an `arg_end`. Only used for the duration of `esp_console_cmd_register` call.

struct **esp\_console\_repl\_s**

Console REPL base structure.

## Public Members

*esp\_err\_t* (\***del**)(*esp\_console\_repl\_t* \*repl)

Delete console REPL environment.

**Param repl [in]** REPL handle returned from `esp_console_new_repl_xxx`

**Return**

- ESP\_OK on success
- ESP\_FAIL on errors

## Macros

**ESP\_CONSOLE\_CONFIG\_DEFAULT** ()

Default console configuration value.

**ESP\_CONSOLE\_REPL\_CONFIG\_DEFAULT** ()

Default console repl configuration value.

**ESP\_CONSOLE\_DEV\_UART\_CONFIG\_DEFAULT** ()

**ESP\_CONSOLE\_DEV\_USB\_SERIAL\_JTAG\_CONFIG\_DEFAULT** ()

## Type Definitions

typedef struct *linenoiseCompletions* **linenoiseCompletions**

typedef int (\***esp\_console\_cmd\_func\_t**)(int argc, char \*\*argv)

Console command main function.

**Param argc** number of arguments

**Param argv** array with argc entries, each pointing to a zero-terminated string argument

**Return** console command return code, 0 indicates "success"

typedef struct *esp\_console\_repl\_s* **esp\_console\_repl\_t**

Type defined for console REPL.

## 2.10.7 eFuse Manager

### Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

### Hardware Description

The ESP32-C3 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE\_BLK0).

For more details, see **ESP32-C3 Technical Reference Manual > eFuse Controller (eFuse)** [PDF]. Some eFuse bits are available for user applications.

ESP32-C3 has 11 eFuse blocks each of the size of 256 bits (not all bits are available):

- EFUSE\_BLK0 is used entirely for system purposes;
- EFUSE\_BLK1 is used entirely for system purposes;
- EFUSE\_BLK2 is used entirely for system purposes;
- EFUSE\_BLK3 (also named EFUSE\_BLK\_USER\_DATA) can be used for user purposes;
- EFUSE\_BLK4 (also named EFUSE\_BLK\_KEY0) can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK5 (also named EFUSE\_BLK\_KEY1) can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK6 (also named EFUSE\_BLK\_KEY2) can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK7 (also named EFUSE\_BLK\_KEY3) can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK8 (also named EFUSE\_BLK\_KEY4) can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK9 (also named EFUSE\_BLK\_KEY5) can be used for any purpose except for flash encryption (due to a HW bug);
- EFUSE\_BLK10 (also named EFUSE\_BLK\_SYS\_DATA\_PART2) is reserved for system purposes.

Each block is divided into 8 32-bits registers.

### eFuse Manager Component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool `efuse_table_gen.py`. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a *custom* file from the user's project directory, the utility checks with the *common* CSV file.

CSV files:

- common (*esp\_efuse\_table.csv*) - contains eFuse fields which are used inside the ESP-IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse-common-table`). Note that changes in this file can lead to incorrect operation.
- custom - (optional and can be enabled by `CONFIG_EFUSE_CUSTOM_TABLE`) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse-custom-table`.

### Description CSV File

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK10), bit_start(0..255), bit_
↪count(1..256), comment
```

Individual params in CSV file the following meanings:

#### field\_name

Name of field. The prefix `ESP_EFUSE_` is added to the name, and this field name is available in the code. This name is used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see `MAC_FACTORY` field in the common table). The field\_name supports structured format using `.` to show that the field belongs to another field (see `WR_DIS` and `RD_DIS` in the common table).

#### efuse\_block

Block number. It determines where the eFuse bits are placed for this field. Available `EFUSE_BLK0..EFUSE_BLK10`.

#### bit\_start

Start bit number (0..255). The `bit_start` field can be omitted. In this case, it is set to `bit_start + bit_count` from the previous record, if it has the same `efuse_block`. Otherwise (if `efuse_block` is different, or this is the first entry), an error will be generated.

#### bit\_count

The number of bits to use in this field (1..-). This parameter cannot be omitted. This field also may be `MAX_BLK_LEN` in this case, the field length has the maximum block length.

#### comment

This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, indicating that it belongs to one field. For example two fields `MAC_FACTORY` and `MAC_FACTORY_CRC`:

```
# Factory MAC address #
#####
MAC_FACTORY,          EFUSE_BLK0,    72,    8,    Factory MAC addr [0]
,                    EFUSE_BLK0,    64,    8,    Factory MAC addr [1]
,                    EFUSE_BLK0,    56,    8,    Factory MAC addr [2]
,                    EFUSE_BLK0,    48,    8,    Factory MAC addr [3]
,                    EFUSE_BLK0,    40,    8,    Factory MAC addr [4]
,                    EFUSE_BLK0,    32,    8,    Factory MAC addr [5]
MAC_FACTORY_CRC,     EFUSE_BLK0,    80,    8,    CRC8 for factory MAC address
```

This field is available in code as `ESP_EFUSE_MAC_FACTORY` and `ESP_EFUSE_MAC_FACTORY_CRC`.

## Structured eFuse Fields

WR_DIS,	EFUSE_BLK0,	0,	32,	Write protection
WR_DIS.RD_DIS, ↪RD_DIS	EFUSE_BLK0,	0,	1,	Write protection for
WR_DIS.FIELD_1, ↪FIELD_1	EFUSE_BLK0,	1,	1,	Write protection for
WR_DIS.FIELD_2, ↪FIELD_2 (includes B1 and B2)	EFUSE_BLK0,	2,	4,	Write protection for
WR_DIS.FIELD_2.B1, ↪FIELD_2.B1	EFUSE_BLK0,	2,	2,	Write protection for
WR_DIS.FIELD_2.B2, ↪FIELD_2.B2	EFUSE_BLK0,	4,	2,	Write protection for
WR_DIS.FIELD_3, ↪FIELD_3	EFUSE_BLK0,	5,	1,	Write protection for
WR_DIS.FIELD_3.ALIAS, ↪FIELD_3 (just a alias for WR_DIS.FIELD_3)	EFUSE_BLK0,	5,	1,	Write protection for
WR_DIS.FIELD_4, ↪FIELD_4	EFUSE_BLK0,	7,	1,	Write protection for

The structured eFuse field looks like `WR_DIS.RD_DIS` where the dot points that this field belongs to the parent field - `WR_DIS` and cannot be out of the parent's range.

It is possible to use some levels of structured fields as `WR_DIS.FIELD_2.B1` and `B2`. These fields should not be crossed each other and should be in the range of two fields: `WR_DIS` and `WR_DIS.FIELD_2`.

It is possible to create aliases for fields with the same range, see `WR_DIS.FIELD_3` and `WR_DIS.FIELD_3.ALIAS`.

The ESP-IDF names for structured eFuse fields should be unique. The `efuse_table_gen` tool generates the final names where the dot is replaced by `_`. The names for using in ESP-IDF are `ESP_EFUSE_WR_DIS`, `ESP_EFUSE_WR_DIS_RD_DIS`, `ESP_EFUSE_WR_DIS_FIELD_2_B1`, etc.

The `efuse_table_gen` tool checks that the fields do not overlap each other and must be within the range of a field if there is a violation, then throws the following error:

```
Field at USER_DATA, EFUSE_BLK3, 0, 256 intersected with SERIAL_NUMBER, EFUSE_
↪BLK3, 0, 32
```

**Solution:** Describe `SERIAL_NUMBER` to be included in `USER_DATA`. (`USER_DATA.SERIAL_NUMBER`).

```
Field at FEILD, EFUSE_BLK3, 0, 50 out of range FEILD.MAJOR_NUMBER, EFUSE_BLK3,
↪60, 32
```

**Solution:** Change `bit_start` for `FIELD.MAJOR_NUMBER` from 60 to 0, so `MAJOR_NUMBER` is in the `FEILD` range.

### efuse\_table\_gen.py Tool

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional `custom` file is used, it will be checked with the existing `common` file (`esp_efuse_table.csv`). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type `esp_efuse_desc_t`.

To generate a `common` files, use the following command `idf.py efuse-common-table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py --idf_target esp32c3 esp32c3/esp_efuse_table.csv
```

After generation in the folder `$IDF_PATH/components/efuse/esp32c3` create:

- `esp_efuse_table.c` file.

- In *include* folder *esp\_efuse\_table.c* file.

To generate a *custom* files, use the following command `idf.py efuse-custom-table` or:

```
cd $IDF_PATH/components/efuse/  
./efuse_table_gen.py --idf_target esp32c3 esp32c3/esp_efuse_table.csv PROJECT_PATH/  
↪main/esp_efuse_custom_table.csv
```

After generation in the folder `PROJECT_PATH/main` create:

- *esp\_efuse\_custom\_table.c* file.
- In *include* folder *esp\_efuse\_custom\_table.c* file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"  
#include "esp_efuse_table.h" // or "esp_efuse_custom_table.h"
```

## Supported Coding Scheme

Coding schemes are used to protect against data corruption. ESP32-C3 supports two coding schemes:

- None. EFUSE\_BLK0 is stored with four backups, meaning each bit is stored four times. This backup scheme is automatically applied by the hardware and is not visible to software. EFUSE\_BLK0 can be written many times.
- RS. EFUSE\_BLK1 - EFUSE\_BLK10 use Reed-Solomon coding scheme that supports up to 5 bytes of automatic error correction. Software encodes the 32-byte EFUSE\_BLKx using RS (44, 32) to generate a 12-byte check code, and then burn the EFUSE\_BLKx and the check code into eFuse at the same time. The eFuse Controller automatically decodes the RS encoding and applies error correction when reading back the eFuse block. Because the RS check codes are generated across the entire 256-bit eFuse block, each block can only be written to one time.

To write some fields into one block, or different blocks in one time, you need to use the batch writing mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual using the `esp_efuse_write_...` functions. At the end to burn them, call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

---

**备注:** If there is already pre-written data in the eFuse block using the Reed-Solomon encoding scheme, then it is not possible to write anything extra (even if the required bits are empty) without breaking the previous encoding data. This encoding data will be overwritten with new encoding data and completely destroyed (however, the payload eFuses are not damaged). It can be related to: CUSTOM\_MAC, SPI\_PAD\_CONFIG\_HD, SPI\_PAD\_CONFIG\_CS, etc. Please contact Espressif to order the required pre-burnt eFuses.

FOR TESTING ONLY (NOT RECOMMENDED): You can ignore or suppress errors that violate encoding scheme data in order to burn the necessary bits in the eFuse block.

---

## eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as "1".
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as "1".
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
- `esp_efuse_write_reg()` - writes value to eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.

- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.
- `esp_efuse_get_key_dis_read()` - Returns a read protection for the key block.
- `esp_efuse_set_key_dis_read()` - Sets a read protection for the key block.
- `esp_efuse_get_key_dis_write()` - Returns a write protection for the key block.
- `esp_efuse_set_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_get_key_purpose()` - Returns the current purpose set for an eFuse key block.
- `esp_efuse_write_key()` - Programs a block of key data to an eFuse block
- `esp_efuse_write_keys()` - Programs keys to unused eFuse blocks
- `esp_efuse_find_purpose()` - Finds a key block with the particular purpose set.
- `esp_efuse_get_keypurpose_dis_write()` - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- `esp_efuse_key_block_unused()` - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this `esp_efuse_get_pkg_ver()`.

### eFuse API for Keys

EFUSE\_BLK\_KEY0 - EFUSE\_BLK\_KEY5 are intended to keep up to 6 keys with a length of 256-bits. Each key has an ESP\_EFUSE\_KEY\_PURPOSE\_x field which defines the purpose of these keys. The purpose field is described in `esp_efuse_purpose_t`.

The purposes like ESP\_EFUSE\_KEY\_PURPOSE\_XTS\_AES... are used for flash encryption.

The purposes like ESP\_EFUSE\_KEY\_PURPOSE\_SECURE\_BOOT\_DIGEST... are used for secure boot.

There are some eFuse APIs useful to work with states of keys.

- `esp_efuse_get_purpose_field()` - Returns a pointer to a key purpose for an eFuse key block.
- `esp_efuse_get_key()` - Returns a pointer to a key block.
- `esp_efuse_set_key_purpose()` - Sets a key purpose for an eFuse key block.
- `esp_efuse_set_keypurpose_dis_write()` - Sets a write protection of the key purpose field for an eFuse key block.
- `esp_efuse_find_unused_key_block()` - Search for an unused key block and return the first one found.
- `esp_efuse_count_unused_key_blocks()` - Returns the number of unused eFuse key blocks in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX
- `esp_efuse_get_digest_revoke()` - Returns the status of the Secure Boot public key digest revocation bit.
- `esp_efuse_set_digest_revoke()` - Sets the Secure Boot public key digest revocation bit.
- `esp_efuse_get_write_protect_of_digest_revoke()` - Returns a write protection of the Secure Boot public key digest revocation bit.
- `esp_efuse_set_write_protect_of_digest_revoke()` - Sets a write protection of the Secure Boot public key digest revocation bit.

### How to Add a New Field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show-efuse-table` or the next command:

```
$ ./efuse_table_gen.py esp32c3/esp_efuse_table.csv --info
Max number of bits in BLK 256
Sorted efuse table:
```

Used bits in efuse table:

```

EFUSE_BLK0
[0 31] [0 0] [2 2] ... [40 44] [46 52] [57 58] [80 111] [116 117] [124 130] [132↪
↪135] [141 157] [159 161]
EFUSE_BLK1
[0 122] [135 179] [183 185]
EFUSE_BLK10
[0 255]
EFUSE_BLK2
[0 129] [131 227]

```

(下页继续)

```

EFUSE_BLK3
[0 255] [200 247]
EFUSE_BLK4
[0 255]
EFUSE_BLK5
[0 255]
EFUSE_BLK6
[0 255]
EFUSE_BLK7
[0 255]
EFUSE_BLK8
[0 255]
EFUSE_BLK9
[0 255]
Note: Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for
↳Espressif)

```

The number of bits not included in square brackets is free (some bits are reserved for Espressif). All fields are checked for overlapping.

To add fields to an existing field, use the *Structured efuse fields* technique. For example, adding the fields: SERIAL\_NUMBER, MODEL\_NUMBER and HARDWARE REV to an existing USER\_DATA field. Use . (dot) to show an attachment in a field.

USER_DATA.SERIAL_NUMBER,	EFUSE_BLK3,	0,	32,
USER_DATA.MODEL_NUMBER,	EFUSE_BLK3,	32,	10,
USER_DATA.HARDWARE_REV,	EFUSE_BLK3,	42,	10,

2. Fill a line for field: field\_name, efuse\_block, bit\_start, bit\_count, comment.
3. Run a show\_efuse\_table command to check eFuse table. To generate source files run efuse\_common\_table or efuse\_custom\_table command.

You may get errors such as intersects with or out of range. Please see how to solve them in the *Structured efuse fields* article.

## Bit Order

The eFuses bit order is little endian (see the example below), it means that eFuse bits are read and written from LSB to MSB:

```

$ espefuse.py dump

USER_DATA      (BLOCK3      ) [3 ] read_regs: 03020100 07060504 0B0A0908
↳0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C
BLOCK4        (BLOCK4      ) [4 ] read_regs: 03020100 07060504 0B0A0908
↳0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C

where is the register representation:

EFUSE_RD_USR_DATA0_REG = 0x03020100
EFUSE_RD_USR_DATA1_REG = 0x07060504
EFUSE_RD_USR_DATA2_REG = 0x0B0A0908
EFUSE_RD_USR_DATA3_REG = 0x0F0E0D0C
EFUSE_RD_USR_DATA4_REG = 0x13121111
EFUSE_RD_USR_DATA5_REG = 0x17161514
EFUSE_RD_USR_DATA6_REG = 0x1B1A1918
EFUSE_RD_USR_DATA7_REG = 0x1F1E1D1C

where is the byte representation:

```

(续上页)

```
byte[0] = 0x00, byte[1] = 0x01, ... byte[3] = 0x03, byte[4] = 0x04, ..., byte[31] ↵
↵= 0x1F
```

For example, csv file describes the USER\_DATA field, which occupies all 256 bits (a whole block).

USER_DATA,	EFUSE_BLK3,	0,	256,	User data
USER_DATA.FIELD1,	EFUSE_BLK3,	16,	16,	Field1
ID,	EFUSE_BLK4,	8,	3,	ID bit[0..2]
,	EFUSE_BLK4,	16,	2,	ID bit[3..4]
,	EFUSE_BLK4,	32,	3,	ID bit[5..7]

Thus, reading the eFuse USER\_DATA block written as above gives the following results:

```
uint8_t buf[32] = { 0 };
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &buf, sizeof(buf) * 8);
// buf[0] = 0x00, buf[1] = 0x01, ... buf[31] = 0x1F

// id = 0x01
// b'001
```

### Get eFuses During Build

There is a way to get the state of eFuses at the build stage of the project. There are two cmake functions for this:

- `espefuse_get_json_summary()` - It calls the `espefuse.py summary --format json` command and returns a json string (it is not stored in a file).
- `espefuse_get_efuse()` - It finds a given eFuse name in the json string and returns its property.

The json string has the following properties:

```
{
  "MAC": {
    "bit_len": 48,
    "block": 0,
    "category": "identity",
    "description": "Factory MAC Address",
```

(下页继续)

(续上页)

```

    "efuse_type": "bytes:6",
    "name": "MAC",
    "pos": 0,
    "readable": true,
    "value": "94:b9:7e:5a:6e:58 (CRC 0xe2 OK)",
    "word": 1,
    "writeable": true
  },
}

```

These functions can be used from a top-level project `CMakeLists.txt` ([get-started/hello\\_world/CMakeLists.txt](#)):

```

# ...
project(hello_world)

espefuse_get_json_summary(efuse_json)
espefuse_get_efuse(ret_data ${efuse_json} "MAC" "value")
message("MAC:" ${ret_data})

```

The format of the value property is the same as shown in `espefuse.py summary`.

```
MAC:94:b9:7e:5a:6e:58 (CRC 0xe2 OK)
```

There is an example test [system/efuse/CMakeLists.txt](#) which adds a custom target `efuse-summary`. This allows you to run the `idf.py efuse-summary` command to read the required eFuses (specified in the `efuse_names` list) at any time, not just at project build time.

## Debug eFuse & Unit Tests

**Virtual eFuses** The Kconfig option `CONFIG_EFUSE_VIRTUAL` virtualizes eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the `CONFIG_EFUSE_VIRTUAL` option there is `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option that adds a feature to keep eFuses in flash memory. To use this mode the `partition_table` should have the `efuse` partition. `partition.csv`: `"efuse_em, data, efuse, , 0x2000, "`. During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test `secure_boot` and `flash_encryption` features with this option).

**Flash Encryption Testing** Flash Encryption (FE) is a hardware feature that requires the physical burning of eFuses: `key` and `FLASH_CRYPT_CNT`. If FE is not actually enabled then enabling the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option just gives testing possibilities and does not encrypt anything in the flash, even though the logs say encryption happens. The `bootloader_flash_write()` is adapted for this purpose. But if FE is already enabled on the chip and you run an application or bootloader created with the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option then the flash encryption/decryption operations will work properly (data are encrypted as it is written into an encrypted flash partition and decrypted when they are read from an encrypted partition).

**espefuse.py** `esptool` includes a useful tool for reading/writing ESP32-C3 eFuse bits - [espefuse.py](#).

```

espefuse.py -p PORT summary

espefuse.py v4.6-dev
Connecting....
Detecting chip type... ESP32-C3

## Header File

- [components/efuse/esp32c3/include/esp\\_efuse\\_chip.h](#)
- This header file can be included with:

```
#include "esp_efuse_chip.h"
```

- This header file is a part of the API provided by the `efuse` component. To declare that your component depends on `efuse`, add the following to your `CMakeLists.txt`:

```
REQUIRES efuse
```

or

```
PRIV_REQUIRES efuse
```

## Enumerations

enum `esp_efuse_block_t`

Type of eFuse blocks ESP32C3.

*Values:*

enumerator `EFUSE_BLK0`

Number of eFuse BLOCK0. REPEAT\_DATA

enumerator `EFUSE_BLK1`

Number of eFuse BLOCK1. MAC\_SPI\_8M\_SYS

enumerator `EFUSE_BLK2`

Number of eFuse BLOCK2. SYS\_DATA\_PART1

enumerator **EFUSE\_BLK\_SYS\_DATA\_PART1**

Number of eFuse BLOCK2. SYS\_DATA\_PART1

enumerator **EFUSE\_BLK3**

Number of eFuse BLOCK3. USER\_DATA

enumerator **EFUSE\_BLK\_USER\_DATA**

Number of eFuse BLOCK3. USER\_DATA

enumerator **EFUSE\_BLK4**

Number of eFuse BLOCK4. KEY0

enumerator **EFUSE\_BLK\_KEY0**

Number of eFuse BLOCK4. KEY0

enumerator **EFUSE\_BLK5**

Number of eFuse BLOCK5. KEY1

enumerator **EFUSE\_BLK\_KEY1**

Number of eFuse BLOCK5. KEY1

enumerator **EFUSE\_BLK6**

Number of eFuse BLOCK6. KEY2

enumerator **EFUSE\_BLK\_KEY2**

Number of eFuse BLOCK6. KEY2

enumerator **EFUSE\_BLK7**

Number of eFuse BLOCK7. KEY3

enumerator **EFUSE\_BLK\_KEY3**

Number of eFuse BLOCK7. KEY3

enumerator **EFUSE\_BLK8**

Number of eFuse BLOCK8. KEY4

enumerator **EFUSE\_BLK\_KEY4**

Number of eFuse BLOCK8. KEY4

enumerator **EFUSE\_BLK9**

Number of eFuse BLOCK9. KEY5

enumerator **EFUSE\_BLK\_KEY5**

Number of eFuse BLOCK9. KEY5

enumerator **EFUSE\_BLK\_KEY\_MAX**

enumerator **EFUSE\_BLK10**

Number of eFuse BLOCK10. SYS\_DATA\_PART2

enumerator **EFUSE\_BLK\_SYS\_DATA\_PART2**

Number of eFuse BLOCK10. SYS\_DATA\_PART2

enumerator **EFUSE\_BLK\_MAX**

enum **esp\_efuse\_coding\_scheme\_t**

Type of coding scheme.

*Values:*

enumerator **EFUSE\_CODING\_SCHEME\_NONE**

None

enumerator **EFUSE\_CODING\_SCHEME\_RS**

Reed-Solomon coding

enum **esp\_efuse\_purpose\_t**

Type of key purpose.

*Values:*

enumerator **ESP\_EFUSE\_KEY\_PURPOSE\_USER**

User purposes (software-only use)

enumerator **ESP\_EFUSE\_KEY\_PURPOSE\_RESERVED**

Reserved

enumerator **ESP\_EFUSE\_KEY\_PURPOSE\_XTS\_AES\_128\_KEY**

XTS\_AES\_128\_KEY (flash/PSRAM encryption)

enumerator **ESP\_EFUSE\_KEY\_PURPOSE\_HMAC\_DOWN\_ALL**

HMAC Downstream mode

enumerator **ESP\_EFUSE\_KEY\_PURPOSE\_HMAC\_DOWN\_JTAG**

JTAG soft enable key (uses HMAC Downstream mode)

enumerator **ESP\_EFUSE\_KEY\_PURPOSE\_HMAC\_DOWN\_DIGITAL\_SIGNATURE**

Digital Signature peripheral key (uses HMAC Downstream mode)

enumerator **ESP\_EFUSE\_KEY\_PURPOSE\_HMAC\_UP**

HMAC Upstream mode

enumerator **ESP\_EFUSE\_KEY\_PURPOSE\_SECURE\_BOOT\_DIGEST0**

SECURE\_BOOT\_DIGEST0 (Secure Boot key digest)

enumerator **ESP\_EFUSE\_KEY\_PURPOSE\_SECURE\_BOOT\_DIGEST1**

SECURE\_BOOT\_DIGEST1 (Secure Boot key digest)

enumerator **ESP\_EFUSE\_KEY\_PURPOSE\_SECURE\_BOOT\_DIGEST2**

SECURE\_BOOT\_DIGEST2 (Secure Boot key digest)

enumerator **ESP\_EFUSE\_KEY\_PURPOSE\_MAX**

MAX PURPOSE

### Header File

- `components/efuse/include/esp_efuse.h`
- This header file can be included with:

```
#include "esp_efuse.h"
```

- This header file is a part of the API provided by the `efuse` component. To declare that your component depends on `efuse`, add the following to your `CMakeLists.txt`:

```
REQUIRES efuse
```

or

```
PRIV_REQUIRES efuse
```

### Functions

`esp_err_t esp_efuse_read_field_blob` (const `esp_efuse_desc_t` \*field[], void \*dst, size\_t dst\_size\_bits)

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in "field" structure or "dst\_size\_bits" required size. Use "esp\_efuse\_get\_field\_size()" function to determine the length of the field.

---

备注: Please note that reading in the batch mode does not show uncommitted changes.

---

#### 参数

- **field** -- [in] A pointer to the structure describing the fields of efuse.
- **dst** -- [out] A pointer to array that will contain the result of reading.
- **dst\_size\_bits** -- [in] The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

#### 返回

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.

bool `esp_efuse_read_field_bit` (const `esp_efuse_desc_t` \*field[])

Read a single bit eFuse field as a boolean value.

---

备注: The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call `esp_efuse_read_field_blob()` and check the returned value instead.

---

---

备注: If assertions are enabled and the parameter is invalid, execution will abort

---

---

备注: Please note that reading in the batch mode does not show uncommitted changes.

---

参数 **field** -- [in] A pointer to the structure describing the fields of efuse.

#### 返回

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

*esp\_err\_t* **esp\_efuse\_read\_field\_cnt** (const *esp\_efuse\_desc\_t* \*field[], size\_t \*out\_cnt)

Reads bits from EFUSE field and returns number of bits programmed as "1".

If the bits are set not sequentially, they will still be counted.

---

**备注:** Please note that reading in the batch mode does not show uncommitted changes.

---

#### 参数

- **field** -- [in] A pointer to the structure describing the fields of efuse.
- **out\_cnt** -- [out] A pointer that will contain the number of programmed as "1" bits.

#### 返回

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.

*esp\_err\_t* **esp\_efuse\_write\_field\_blob** (const *esp\_efuse\_desc\_t* \*field[], const void \*src, size\_t src\_size\_bits)

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in "field" structure or "src\_size\_bits" required size. Use "esp\_efuse\_get\_field\_size()" function to determine the length of the field. After the function is completed, the writing registers are cleared.

#### 参数

- **field** -- [in] A pointer to the structure describing the fields of efuse.
- **src** -- [in] A pointer to array that contains the data for writing.
- **src\_size\_bits** -- [in] The number of bits required to write.

#### 返回

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

*esp\_err\_t* **esp\_efuse\_write\_field\_cnt** (const *esp\_efuse\_desc\_t* \*field[], size\_t cnt)

Writes a required count of bits as "1" to EFUSE field.

If there are no free bits in the field to set the required number of bits to "1", ESP\_ERR\_EFUSE\_CNT\_IS\_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

#### 参数

- **field** -- [in] A pointer to the structure describing the fields of efuse.
- **cnt** -- [in] Required number of programmed as "1" bits.

#### 返回

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_CNT\_IS\_FULL: Not all requested cnt bits is set.

*esp\_err\_t* **esp\_efuse\_write\_field\_bit** (const *esp\_efuse\_desc\_t* \*field[])

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp\_efuse\_write\_field\_cnt() with the cnt parameter equal to 1, except that it will return ESP\_OK if the field is already set to 1.

**参数** **field** -- [in] Pointer to the structure describing the efuse field.

**返回**

- ESP\_OK: The operation was successfully completed, or the bit was already set to value 1.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments, including if the efuse field is not 1 bit wide.

*esp\_err\_t* **esp\_efuse\_set\_write\_protect** (*esp\_efuse\_block\_t* blk)

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

**参数 blk** -- **[in]** Block number of eFuse. (EFUSE\_BLK1, EFUSE\_BLK2 and EFUSE\_BLK3)

**返回**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_CNT\_IS\_FULL: Not all requested cnt bits is set.
- ESP\_ERR\_NOT\_SUPPORTED: The block does not support this command.

*esp\_err\_t* **esp\_efuse\_set\_read\_protect** (*esp\_efuse\_block\_t* blk)

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

**参数 blk** -- **[in]** Block number of eFuse. (EFUSE\_BLK1, EFUSE\_BLK2 and EFUSE\_BLK3)

**返回**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_CNT\_IS\_FULL: Not all requested cnt bits is set.
- ESP\_ERR\_NOT\_SUPPORTED: The block does not support this command.

int **esp\_efuse\_get\_field\_size** (const *esp\_efuse\_desc\_t* \*field[])

Returns the number of bits used by field.

**参数 field** -- **[in]** A pointer to the structure describing the fields of efuse.

**返回** Returns the number of bits used by field.

uint32\_t **esp\_efuse\_read\_reg** (*esp\_efuse\_block\_t* blk, unsigned int num\_reg)

Returns value of efuse register.

This is a thread-safe implementation. Example: EFUSE\_BLK2\_RDATA3\_REG where (blk=2, num\_reg=3)

---

**备注:** Please note that reading in the batch mode does not show uncommitted changes.

---

**参数**

- **blk** -- **[in]** Block number of eFuse.
- **num\_reg** -- **[in]** The register number in the block.

**返回** Value of register

*esp\_err\_t* **esp\_efuse\_write\_reg** (*esp\_efuse\_block\_t* blk, unsigned int num\_reg, uint32\_t val)

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE\_BLK3\_WDATA0\_REG where (blk=3, num\_reg=0)

**参数**

- **blk** -- **[in]** Block number of eFuse.
- **num\_reg** -- **[in]** The register number in the block.
- **val** -- **[in]** Value to write.

**返回**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.

*esp\_efuse\_coding\_scheme\_t* **esp\_efuse\_get\_coding\_scheme** (*esp\_efuse\_block\_t* blk)

Return efuse coding scheme for blocks.

---

**备注:** The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

---

**参数** **blk** -- **[in]** Block number of eFuse.  
**返回** Return efuse coding scheme for blocks

*esp\_err\_t* **esp\_efuse\_read\_block** (*esp\_efuse\_block\_t* blk, void \*dst\_key, size\_t offset\_in\_bits, size\_t size\_bits)

Read key to efuse block starting at the offset and the required size.

---

**备注:** Please note that reading in the batch mode does not show uncommitted changes.

---

**参数**

- **blk** -- **[in]** Block number of eFuse.
- **dst\_key** -- **[in]** A pointer to array that will contain the result of reading.
- **offset\_in\_bits** -- **[in]** Start bit in block.
- **size\_bits** -- **[in]** The number of bits required to read.

**返回**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

*esp\_err\_t* **esp\_efuse\_write\_block** (*esp\_efuse\_block\_t* blk, const void \*src\_key, size\_t offset\_in\_bits, size\_t size\_bits)

Write key to efuse block starting at the offset and the required size.

**参数**

- **blk** -- **[in]** Block number of eFuse.
- **src\_key** -- **[in]** A pointer to array that contains the key for writing.
- **offset\_in\_bits** -- **[in]** Start bit in block.
- **size\_bits** -- **[in]** The number of bits required to write.

**返回**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits

uint32\_t **esp\_efuse\_get\_pkg\_ver** (void)

Returns chip package from efuse.

**返回** chip package

void **esp\_efuse\_reset** (void)

Reset efuse write registers.

Efuse write registers are written to zero, to negate any changes that have been staged here.

---

**备注:** This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller's responsibility to serialise.

---

*esp\_err\_t* **esp\_efuse\_disable\_rom\_download\_mode** (void)

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

---

**备注:** Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

---

---

**备注:** If ROM Download Mode is already disabled, this function does nothing and returns success.

---

#### 返回

- ESP\_OK If the eFuse was successfully burned, or had already been burned.
- ESP\_ERR\_NOT\_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode
- ESP\_ERR\_INVALID\_STATE (ESP32 only) This eFuse is write protected and cannot be written

*esp\_err\_t* **esp\_efuse\_set\_rom\_log\_scheme** (*esp\_efuse\_rom\_log\_scheme\_t* log\_scheme)

Set boot ROM log scheme via eFuse.

---

**备注:** By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can't be changed again.

---

**参数** *log\_scheme* -- Supported ROM log scheme

#### 返回

- ESP\_OK If the eFuse was successfully burned, or had already been burned.
- ESP\_ERR\_NOT\_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme
- ESP\_ERR\_INVALID\_STATE This eFuse is write protected or has been burned already

*esp\_err\_t* **esp\_efuse\_enable\_rom\_secure\_download\_mode** (void)

Switch ROM Download Mode to Secure Download mode via eFuse.

Permanently enables Secure Download mode. This mode limits the use of ROM Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.

---

**备注:** If Secure Download mode is already enabled, this function does nothing and returns success.

---

---

**备注:** Disabling the ROM Download Mode also disables Secure Download Mode.

---

#### 返回

- ESP\_OK If the eFuse was successfully burned, or had already been burned.
- ESP\_ERR\_INVALID\_STATE ROM Download Mode has been disabled via eFuse, so Secure Download mode is unavailable.

uint32\_t **esp\_efuse\_read\_secure\_version** (void)

Return secure\_version from efuse field.

**返回** Secure version from efuse field

bool **esp\_efuse\_check\_secure\_version** (uint32\_t secure\_version)

Check secure\_version from app and secure\_version and from efuse field.

**参数** **secure\_version** -- Secure version from app.

**返回**

- True: If version of app is equal or more then secure\_version from efuse.

*esp\_err\_t* **esp\_efuse\_update\_secure\_version** (uint32\_t secure\_version)

Write efuse field by secure\_version value.

Update the secure\_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

**参数** **secure\_version** -- [in] Secure version from app.

**返回**

- ESP\_OK: Successful.
- ESP\_FAIL: secure version of app cannot be set to efuse field.
- ESP\_ERR\_NOT\_SUPPORTED: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

*esp\_err\_t* **esp\_efuse\_batch\_write\_begin** (void)

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call begin() then perform as usually the necessary operations read and write and at the end call commit() to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

```
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE...);
esp_efuse_write_field_cnt(ESP_EFUSE...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3); // ESP_EFUSE_1 == 1, here we write a new
↳value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1
↳because uncommitted changes are not readable, it will be available only
↳after commit.
...

// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be
↳done in the last commit().

...

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 3.
```

---

备注: Please note that reading in the batch mode does not show uncommitted changes.

---

#### 返回

- ESP\_OK: Successful.

*esp\_err\_t* **esp\_efuse\_batch\_write\_cancel** (void)

Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

#### 返回

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_STATE: The batch mode was not set.

*esp\_err\_t* **esp\_efuse\_batch\_write\_commit** (void)

Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

#### 返回

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_STATE: The deferred writing mode was not set.

bool **esp\_efuse\_block\_is\_empty** (*esp\_efuse\_block\_t* block)

Checks that the given block is empty.

#### 返回

- True: The block is empty.
- False: The block is not empty or was an error.

bool **esp\_efuse\_get\_key\_dis\_read** (*esp\_efuse\_block\_t* block)

Returns a read protection for the key block.

参数 **block** -- [in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

返回 True: The key block is read protected False: The key block is readable.

*esp\_err\_t* **esp\_efuse\_set\_key\_dis\_read** (*esp\_efuse\_block\_t* block)

Sets a read protection for the key block.

参数 **block** -- [in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

#### 返回

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

bool **esp\_efuse\_get\_key\_dis\_write** (*esp\_efuse\_block\_t* block)

Returns a write protection for the key block.

参数 **block** -- [in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

返回 True: The key block is write protected False: The key block is writeable.

*esp\_err\_t* **esp\_efuse\_set\_key\_dis\_write** (*esp\_efuse\_block\_t* block)

Sets a write protection for the key block.

参数 **block** -- [in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

#### 返回

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.

- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

bool `esp_efuse_key_block_unused` (*esp\_efuse\_block\_t* block)

Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0 (`ESP_EFUSE_KEY_PURPOSE_USER`)

参数 **block** -- key block to check.

返回

- True if key block is unused,
- False if key block is used or the specified block index is not a key block.

bool `esp_efuse_find_purpose` (*esp\_efuse\_purpose\_t* purpose, *esp\_efuse\_block\_t* \*block)

Find a key block with the particular purpose set.

参数

- **purpose** -- [in] Purpose to search for.
- **block** -- [out] Pointer in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX` which will be set to the key block if found. Can be NULL, if only need to test the key block exists.

返回

- True: If found,
- False: If not found (value at block pointer is unchanged).

bool `esp_efuse_get_keypurpose_dis_write` (*esp\_efuse\_block\_t* block)

Returns a write protection of the key purpose field for an efuse key block.

---

备注: For ESP32: no keypurpose, it returns always True.

---

参数 **block** -- [in] A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

返回 True: The key purpose is write protected. False: The key purpose is writeable.

*esp\_efuse\_purpose\_t* `esp_efuse_get_key_purpose` (*esp\_efuse\_block\_t* block)

Returns the current purpose set for an efuse key block.

参数 **block** -- [in] A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

返回

- Value: If Successful, it returns the value of the purpose related to the given key block.
- `ESP_EFUSE_KEY_PURPOSE_MAX`: Otherwise.

const *esp\_efuse\_desc\_t* \*\*`esp_efuse_get_purpose_field` (*esp\_efuse\_block\_t* block)

Returns a pointer to a key purpose for an efuse key block.

To get the value of this field use `esp_efuse_read_field_blob()` or `esp_efuse_get_key_purpose()`.

参数 **block** -- [in] A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

返回 Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

const *esp\_efuse\_desc\_t* \*\*`esp_efuse_get_key` (*esp\_efuse\_block\_t* block)

Returns a pointer to a key block.

参数 **block** -- [in] A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

返回 Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

*esp\_err\_t* `esp_efuse_set_key_purpose` (*esp\_efuse\_block\_t* block, *esp\_efuse\_purpose\_t* purpose)

Sets a key purpose for an efuse key block.

参数

- **block** -- [in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX
- **purpose** -- [in] Key purpose.

**返回**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

*esp\_err\_t* **esp\_efuse\_set\_keypurpose\_dis\_write** (*esp\_efuse\_block\_t* block)

Sets a write protection of the key purpose field for an efuse key block.

**参数** **block** -- [in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

**返回**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

*esp\_efuse\_block\_t* **esp\_efuse\_find\_unused\_key\_block** (void)

Search for an unused key block and return the first one found.

See `esp_efuse_key_block_unused` for a description of an unused key block.

**返回** First unused key block, or EFUSE\_BLK\_KEY\_MAX if no unused key block is found.

unsigned **esp\_efuse\_count\_unused\_key\_blocks** (void)

Return the number of unused efuse key blocks in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX.

bool **esp\_efuse\_get\_digest\_revoke** (unsigned num\_digest)

Returns the status of the Secure Boot public key digest revocation bit.

**参数** **num\_digest** -- [in] The number of digest in range 0..2

**返回**

- True: If key digest is revoked,
- False; If key digest is not revoked.

*esp\_err\_t* **esp\_efuse\_set\_digest\_revoke** (unsigned num\_digest)

Sets the Secure Boot public key digest revocation bit.

**参数** **num\_digest** -- [in] The number of digest in range 0..2

**返回**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

bool **esp\_efuse\_get\_write\_protect\_of\_digest\_revoke** (unsigned num\_digest)

Returns a write protection of the Secure Boot public key digest revocation bit.

**参数** **num\_digest** -- [in] The number of digest in range 0..2

**返回** True: The revocation bit is write protected. False: The revocation bit is writeable.

*esp\_err\_t* **esp\_efuse\_set\_write\_protect\_of\_digest\_revoke** (unsigned num\_digest)

Sets a write protection of the Secure Boot public key digest revocation bit.

**参数** **num\_digest** -- [in] The number of digest in range 0..2

**返回**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.

- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_write_key` (`esp_efuse_block_t` block, `esp_efuse_purpose_t` purpose, const void \*key, size\_t key\_size\_bytes)

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

---

**备注:** This API also enables the read protection efuse bit for certain key blocks like XTS-AES, HMAC, ECDSA etc. This ensures that the key is only accessible to hardware peripheral.

---

---

**备注:** For SoC's with capability `SOC_EFUSE_ECDSA_USE_HARDWARE_K` (e.g., ESP32-H2), this API writes an additional efuse bit for ECDSA key purpose to enforce hardware TRNG generated k mode in the peripheral.

---

#### 参数

- **block** -- **[in]** Block to read purpose for. Must be in range `EFUSE_BLK_KEY0` to `EFUSE_BLK_KEY_MAX`. Key block must be unused (`esp_efuse_key_block_unused`).
- **purpose** -- **[in]** Purpose to set for this key. Purpose must be already unset.
- **key** -- **[in]** Pointer to data to write.
- **key\_size\_bytes** -- **[in]** Bytes length of data to write.

#### 返回

- `ESP_OK`: Successful.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_INVALID_STATE`: Error in efuses state, unused block not found.
- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_write_keys` (const `esp_efuse_purpose_t` purposes[], uint8\_t keys[][32], unsigned number\_of\_keys)

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

---

**备注:** This API also enables the read protection efuse bit for certain key blocks like XTS-AES, HMAC, ECDSA etc. This ensures that the key is only accessible to hardware peripheral.

---

---

**备注:** For SoC's with capability `SOC_EFUSE_ECDSA_USE_HARDWARE_K` (e.g., ESP32-H2), this API writes an additional efuse bit for ECDSA key purpose to enforce hardware TRNG generated k mode in the peripheral.

---

#### 参数

- **purposes** -- **[in]** Array of purposes (`purpose[number_of_keys]`).
- **keys** -- **[in]** Array of keys (`uint8_t keys[number_of_keys][32]`). Each key is 32 bytes long.
- **number\_of\_keys** -- **[in]** The number of keys to write (up to 6 keys).

#### 返回

- `ESP_OK`: Successful.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_INVALID_STATE`: Error in efuses state, unused block not found.
- `ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS`: Error not enough unused key blocks available

- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

*esp\_err\_t* **esp\_secure\_boot\_read\_key\_digests** (*esp\_secure\_boot\_key\_digests\_t* \*trusted\_key\_digests)

Read key digests from efuse. Any revoked/missing digests will be marked as NULL.

**参数** `trusted_key_digests` -- **[out]** Trusted keys digests, stored in this parameter after successfully completing this function. The number of digests depends on the SOC's capabilities.

**返回**

- `ESP_OK`: Successful.
- `ESP_FAIL`: If `trusted_keys` is NULL or there is no valid digest.

*esp\_err\_t* **esp\_efuse\_check\_errors** (void)

Checks eFuse errors in BLOCK0.

It does a BLOCK0 check if eFuse `EFUSE_ERR_RST_ENABLE` is set. If BLOCK0 has an error, it prints the error and returns `ESP_FAIL`, which should be treated as `esp_restart`.

---

**备注:** Refers to ESP32-C3 only.

---

**返回**

- `ESP_OK`: No errors in BLOCK0.
- `ESP_FAIL`: Error in BLOCK0 requiring reboot.

## Structures

struct **esp\_efuse\_desc\_t**

Type definition for an eFuse field.

## Public Members

*esp\_efuse\_block\_t* **efuse\_block**

Block of eFuse

uint8\_t **bit\_start**

Start bit [0..255]

uint16\_t **bit\_count**

Length of bit field [1..-]

struct **esp\_secure\_boot\_key\_digests\_t**

Pointers to the trusted key digests.

The number of digests depends on the SOC's capabilities.

## Public Members

const void \***key\_digests**[3]

Pointers to the key digests

## Macros

### ESP\_ERR\_EFUSE

Base error code for efuse api.

### ESP\_OK\_EFUSE\_CNT

OK the required number of bits is set.

### ESP\_ERR\_EFUSE\_CNT\_IS\_FULL

Error field is full.

### ESP\_ERR\_EFUSE\_REPEATED\_PROG

Error repeated programming of programmed bits is strictly forbidden.

### ESP\_ERR\_CODING

Error while a encoding operation.

### ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS

Error not enough unused key blocks available

### ESP\_ERR\_DAMAGED\_READING

Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

## Enumerations

### enum `esp_efuse_rom_log_scheme_t`

Type definition for ROM log scheme.

*Values:*

enumerator `ESP_EFUSE_ROM_LOG_ALWAYS_ON`

Always enable ROM logging

enumerator `ESP_EFUSE_ROM_LOG_ON_GPIO_LOW`

ROM logging is enabled when specific GPIO level is low during start up

enumerator `ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH`

ROM logging is enabled when specific GPIO level is high during start up

enumerator `ESP_EFUSE_ROM_LOG_ALWAYS_OFF`

Disable ROM logging permanently

## 2.10.8 错误代码和辅助函数

本节列出了 ESP-IDF 中常见错误代码的定义，以及部分与错误处理相关的辅助函数。

有关 ESP-IDF 中错误代码的基本信息，请参阅[错误处理](#)。

有关 ESP-IDF 定义的错误代码的完整列表，请参阅[错误代码参考](#)。

## API 参考

### Header File

- [components/esp\\_common/include/esp\\_check.h](#)
- This header file can be included with:

```
#include "esp_check.h"
```

### Macros

**ESP\_RETURN\_ON\_ERROR** (x, log\_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP\_OK, it prints the message and returns. In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros. The first one is using the GNU extension `##_VA_ARGS__`. The second one is using the C++20 feature `VA_OPT(,)`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven't found any good alternative to using `##_VA_ARGS__`. Macro which can be used to check the error code. If the code is not ESP\_OK, it prints the message and returns.

**ESP\_RETURN\_ON\_ERROR\_ISR** (x, log\_tag, format, ...)

A version of ESP\_RETURN\_ON\_ERROR() macro that can be called from ISR.

**ESP\_GOTO\_ON\_ERROR** (x, goto\_tag, log\_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP\_OK, it prints the message, sets the local variable 'ret' to the code, and then exits by jumping to 'goto\_tag'.

**ESP\_GOTO\_ON\_ERROR\_ISR** (x, goto\_tag, log\_tag, format, ...)

A version of ESP\_GOTO\_ON\_ERROR() macro that can be called from ISR.

**ESP\_RETURN\_ON\_FALSE** (a, err\_code, log\_tag, format, ...)

Macro which can be used to check the condition. If the condition is not 'true', it prints the message and returns with the supplied 'err\_code'.

**ESP\_RETURN\_ON\_FALSE\_ISR** (a, err\_code, log\_tag, format, ...)

A version of ESP\_RETURN\_ON\_FALSE() macro that can be called from ISR.

**ESP\_GOTO\_ON\_FALSE** (a, err\_code, goto\_tag, log\_tag, format, ...)

Macro which can be used to check the condition. If the condition is not 'true', it prints the message, sets the local variable 'ret' to the supplied 'err\_code', and then exits by jumping to 'goto\_tag'.

**ESP\_GOTO\_ON\_FALSE\_ISR** (a, err\_code, goto\_tag, log\_tag, format, ...)

A version of ESP\_GOTO\_ON\_FALSE() macro that can be called from ISR.

### Header File

- [components/esp\\_common/include/esp\\_err.h](#)
- This header file can be included with:

```
#include "esp_err.h"
```

### Functions

const char \***esp\_err\_to\_name** (esp\_err\_t code)

Returns string for esp\_err\_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script `tools/gen_esp_err_to_name.py` which should be run each time an esp\_err\_t error is modified, created or removed from the IDF project.

参数 code -- esp\_err\_t error code

**返回** string error message

const char \***esp\_err\_to\_name\_r** (*esp\_err\_t* code, char \*buf, size\_t buflen)

Returns string for esp\_err\_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp\_err\_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen\_esp\_err\_to\_name.py which should be run each time an esp\_err\_t error is modified, created or removed from the IDF project.

**参数**

- **code** -- esp\_err\_t error code
- **buf** -- [**out**] buffer where the error message should be written
- **buflen** -- Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

**返回** buf containing the string error message

## Macros

### ESP\_OK

esp\_err\_t value indicating success (no error)

### ESP\_FAIL

Generic esp\_err\_t code indicating failure

### ESP\_ERR\_NO\_MEM

Out of memory

### ESP\_ERR\_INVALID\_ARG

Invalid argument

### ESP\_ERR\_INVALID\_STATE

Invalid state

### ESP\_ERR\_INVALID\_SIZE

Invalid size

### ESP\_ERR\_NOT\_FOUND

Requested resource not found

### ESP\_ERR\_NOT\_SUPPORTED

Operation or feature not supported

### ESP\_ERR\_TIMEOUT

Operation timed out

### ESP\_ERR\_INVALID\_RESPONSE

Received response was invalid

### ESP\_ERR\_INVALID\_CRC

CRC or checksum was invalid

### ESP\_ERR\_INVALID\_VERSION

Version was invalid

**ESP\_ERR\_INVALID\_MAC**

MAC address was invalid

**ESP\_ERR\_NOT\_FINISHED**

Operation has not fully completed

**ESP\_ERR\_NOT\_ALLOWED**

Operation is not allowed

**ESP\_ERR\_WIFI\_BASE**

Starting number of WiFi error codes

**ESP\_ERR\_MESH\_BASE**

Starting number of MESH error codes

**ESP\_ERR\_FLASH\_BASE**

Starting number of flash error codes

**ESP\_ERR\_HW\_CRYPTO\_BASE**

Starting number of HW cryptography module error codes

**ESP\_ERR\_MEMPROT\_BASE**

Starting number of Memory Protection API error codes

**ESP\_ERROR\_CHECK** (x)

Macro which can be used to check the error code, and terminate the program in case the code is not ESP\_OK. Prints the error code, error location, and the failed statement to serial output.

Disabled if assertions are disabled.

**ESP\_ERROR\_CHECK\_WITHOUT\_ABORT** (x)

Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP\_ERROR\_CHECK(), this prints the same error message but isn't terminating the program.

**Type Definitions**

```
typedef int esp_err_t
```

## 2.10.9 ESP HTTPS OTA 升级

### 概述

`esp_https_ota` 是现有 OTA（空中升级）API 的抽象层，其中提供了简化的 API，能够通过 HTTPS 升级固件。

### 应用示例

```

esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_https_ota_config_t ota_config = {
        .http_config = &config,
    };
    esp_err_t ret = esp_https_ota(&ota_config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}

```

### 服务器验证

验证服务器时，应将 PEM 格式的根证书提供给 `esp_http_client_config_t::cert_pem` 成员。如需了解有关服务器验证的更多信息，请参阅 [TLS 服务器验证](#)。

**备注：** 应使用服务器端点的 **根证书** 应用于验证，而不能使用证书链中的任何中间证书，因为根证书有效期最长，且通常长时间维持不变。用户还可以通过 `esp_http_client_config_t::cert_bundle_attach` 成员使用 ESP x509 证书包功能进行验证，其中涵盖了大多数受信任的根证书。

### 通过 HTTPS 下载部分镜像

要使用部分镜像下载功能，请启用 `esp_https_ota_config_t` 中的 `partial_http_download` 配置。启用此配置后，固件镜像将通过多个指定大小的 HTTP 请求进行下载。将 `max_http_request_size` 设置为所需值，即可指定每个请求的最大内容长度。

在从 AWS S3 等服务获取镜像时，这一选项非常有用。在启用该选项时，可以将 mbedTLS Rx 的 buffer 大小（即 `CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN`）设置为较小的值。不启用此配置时，无法将其设置为较小值。

mbedTLS Rx buffer 的默认大小为 16 KB，但如果将 `partial_http_download` 的 `max_http_request_size` 设置为 4 KB，便能将 mbedTLS Rx 的 buffer 减小到 4 KB。使用这一配置方式预计可以节省约 12 KB 内存。

### 签名验证

要进一步提升安全性，还可以验证 OTA 固件镜像的签名。更多内容请参考 [没有安全启动的安全 OTA 升级](#)。

### 高级 API

`esp_https_ota` 还提供一些高级 API，用于查看 OTA 过程的更多信息并满足其他控制需求。

如需查看使用高级 ESP\_HTTPS\_OTA API 的示例，请前往 [system/ota/advanced\\_https\\_ota](#)。

## 使用预加密固件进行 OTA 升级

如需使用预加密的固件进行 OTA 升级，请在组件的菜单配置中启用 `CONFIG_ESP_HTTPS_OTA_DECRYPT_CB` 选项。

如需查看使用预加密固件进行 OTA 升级的示例，请前往 [system/ota/pre\\_encrypted\\_ota](#)。

## OTA 系统事件

ESP HTTPS OTA 过程中可能发生各种系统事件。当特定事件发生时，会由 [事件循环库](#) 触发处理程序。此处理程序必须使用 `esp_event_handler_register()` 注册。这有助于 ESP HTTPS OTA 进行事件处理。

`esp_https_ota_event_t` 中包含了使用 ESP HTTPS OTA 升级时可能发生的所有事件。

## 事件处理程序示例

```

/* 用于捕获系统事件的事件处理程序 */
static void event_handler(void* arg, esp_event_base_t event_base,
                          int32_t event_id, void* event_data)
{
    if (event_base == ESP_HTTPS_OTA_EVENT) {
        switch (event_id) {
            case ESP_HTTPS_OTA_START:
                ESP_LOGI(TAG, "OTA started");
                break;
            case ESP_HTTPS_OTA_CONNECTED:
                ESP_LOGI(TAG, "Connected to server");
                break;
            case ESP_HTTPS_OTA_GET_IMG_DESC:
                ESP_LOGI(TAG, "Reading Image Description");
                break;
            case ESP_HTTPS_OTA_VERIFY_CHIP_ID:
                ESP_LOGI(TAG, "Verifying chip id of new image: %d", *(esp_
↪chip_id_t *)event_data);
                break;
            case ESP_HTTPS_OTA_DECRYPT_CB:
                ESP_LOGI(TAG, "Callback to decrypt function");
                break;
            case ESP_HTTPS_OTA_WRITE_FLASH:
                ESP_LOGD(TAG, "Writing to flash: %d written", *(int_
↪*)event_data);
                break;
            case ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION:
                ESP_LOGI(TAG, "Boot partition updated. Next Partition: %d
↪", *(esp_partition_subtype_t *)event_data);
                break;
            case ESP_HTTPS_OTA_FINISH:
                ESP_LOGI(TAG, "OTA finish");
                break;
            case ESP_HTTPS_OTA_ABORT:
                ESP_LOGI(TAG, "OTA abort");
                break;
        }
    }
}

```

系统事件循环中，不同 ESP HTTPS OTA 事件的预期数据类型如下所示：

- `ESP_HTTPS_OTA_START` : NULL
- `ESP_HTTPS_OTA_CONNECTED` : NULL
- `ESP_HTTPS_OTA_GET_IMG_DESC` : NULL

- `ESP_HTTPS_OTA_VERIFY_CHIP_ID`: `esp_chip_id_t`
- `ESP_HTTPS_OTA_DECRYPT_CB`: `NULL`
- `ESP_HTTPS_OTA_WRITE_FLASH`: `int`
- `ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION`: `esp_partition_subtype_t`
- `ESP_HTTPS_OTA_FINISH`: `NULL`
- `ESP_HTTPS_OTA_ABORT`: `NULL`

## API 参考

### Header File

- `components/esp_https_ota/include/esp_https_ota.h`
- This header file can be included with:

```
#include "esp_https_ota.h"
```

- This header file is a part of the API provided by the `esp_https_ota` component. To declare that your component depends on `esp_https_ota`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_https_ota
```

or

```
PRIV_REQUIRES esp_https_ota
```

### Functions

**`esp_err_t esp_https_ota`** (const `esp_https_ota_config_t` \*ota\_config)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `ota_config->http_config`.

---

**备注:** This API handles the entire OTA operation, so if this API is being used then no other APIs from `esp_https_ota` component should be called. If more information and control is needed during the HTTPS OTA process, then one can use `esp_https_ota_begin` and subsequent APIs. If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image.

---

**参数** `ota_config` -- [in] pointer to `esp_https_ota_config_t` structure.

**返回**

- `ESP_OK`: OTA data updated, next reboot will use specified partition.
- `ESP_FAIL`: For generic failure.
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's app\_update component.

**`esp_err_t esp_https_ota_begin`** (const `esp_https_ota_config_t` \*ota\_config, `esp_https_ota_handle_t` \*handle)

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then `esp_https_ota_perform` should be called to continue with the OTA process and there should be a call to `esp_https_ota_finish` on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert

of URLs differ then it should be appended to `cert_pem` member of `http_config`, which is a part of `ota_config`. In case of error, this API explicitly sets `handle` to `NULL`.

---

**备注:** This API is blocking, so setting `is_async` member of `http_config` structure will result in an error.

---

#### 参数

- **ota\_config** -- **[in]** pointer to `esp_https_ota_config_t` structure
- **handle** -- **[out]** pointer to an allocated data of type `esp_https_ota_handle_t` which will be initialised in this function

#### 返回

- `ESP_OK`: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- `ESP_FAIL`: For generic failure.
- `ESP_ERR_INVALID_ARG`: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in `app_update` component and `esp_http_client` component in `esp-idf`.

*esp\_err\_t* **esp\_https\_ota\_perform** (*esp\_https\_ota\_handle\_t* https\_ota\_handle)

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if `esp_https_ota_begin()` returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

**参数** **https\_ota\_handle** -- **[in]** pointer to `esp_https_ota_handle_t` structure

#### 返回

- `ESP_ERR_HTTPS_OTA_IN_PROGRESS`: OTA update is in progress, call this API again to continue.
- `ESP_OK`: OTA update was successful
- `ESP_FAIL`: OTA update failed
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_INVALID_VERSION`: Invalid chip revision in image header
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- For other return codes, refer OTA documentation in `esp-idf`'s `app_update` component.

bool **esp\_https\_ota\_is\_complete\_data\_received** (*esp\_https\_ota\_handle\_t* https\_ota\_handle)

Checks if complete data was received or not.

---

**备注:** This API can be called just before `esp_https_ota_finish()` to validate if the complete image was indeed received.

---

**参数** **https\_ota\_handle** -- **[in]** pointer to `esp_https_ota_handle_t` structure

#### 返回

- false
- true

*esp\_err\_t* **esp\_https\_ota\_finish** (*esp\_https\_ota\_handle\_t* https\_ota\_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

---

**备注:** If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image. `esp_https_ota_finish` should not be called after calling `esp_https_ota_abort`.

---

**参数** `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure  
**返回**

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image

*esp\_err\_t* `esp_https_ota_abort` (*esp\_https\_ota\_handle\_t* https\_ota\_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

---

**备注:** `esp_https_ota_abort` should not be called after calling `esp_https_ota_finish`.

---

**参数** `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure  
**返回**

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`: Invalid ESP HTTPS OTA state
- `ESP_FAIL`: OTA not started
- `ESP_ERR_NOT_FOUND`: OTA handle not found
- `ESP_ERR_INVALID_ARG`: Invalid argument

*esp\_err\_t* `esp_https_ota_get_img_desc` (*esp\_https\_ota\_handle\_t* https\_ota\_handle, *esp\_app\_desc\_t* \*new\_app\_info)

Reads app description from image header. The app description provides information like the "Firmware version" of the image.

---

**备注:** This API can be called only after `esp_https_ota_begin()` and before `esp_https_ota_perform()`. Calling this API is not mandatory.

---

**参数**

- `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure
- `new_app_info` -- [out] pointer to an allocated *esp\_app\_desc\_t* structure

**返回**

- `ESP_ERR_INVALID_ARG`: Invalid arguments
- `ESP_ERR_INVALID_STATE`: Invalid state to call this API. `esp_https_ota_begin()` not called yet.
- `ESP_FAIL`: Failed to read image descriptor
- `ESP_OK`: Successfully read image descriptor

`int` `esp_https_ota_get_image_len_read` (*esp\_https\_ota\_handle\_t* https\_ota\_handle)

This function returns OTA image data read so far.

---

**备注:** This API should be called only if `esp_https_ota_perform()` has been called atleast once or if `esp_https_ota_get_img_desc` has been called before.

---

**参数** `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure  
**返回**

- -1 On failure
- total bytes read so far

int **esp\_https\_ota\_get\_image\_size** (*esp\_https\_ota\_handle\_t* https\_ota\_handle)

This function returns OTA image total size.

---

**备注:** This API should be called after `esp_https_ota_begin()` has been already called. This can be used to create some sort of progress indication (in combination with `esp_https_ota_get_image_len_read()`)

---

**参数** **https\_ota\_handle** -- [in] pointer to `esp_https_ota_handle_t` structure

**返回**

- -1 On failure or chunked encoding
- total bytes of image

## Structures

struct **esp\_https\_ota\_config\_t**

ESP HTTPS OTA configuration.

## Public Members

const *esp\_http\_client\_config\_t* \***http\_config**

ESP HTTP client configuration

*http\_client\_init\_cb\_t* **http\_client\_init\_cb**

Callback after ESP HTTP client is initialised

bool **bulk\_flash\_erase**

Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

bool **partial\_http\_download**

Enable Firmware image to be downloaded over multiple HTTP requests

int **max\_http\_request\_size**

Maximum request size for partial HTTP download

## Macros

**ESP\_ERR\_HTTPS\_OTA\_BASE**

**ESP\_ERR\_HTTPS\_OTA\_IN\_PROGRESS**

## Type Definitions

typedef void \***esp\_https\_ota\_handle\_t**

typedef *esp\_err\_t* (\***http\_client\_init\_cb\_t**)(*esp\_http\_client\_handle\_t*)

## Enumerations

enum **esp\_https\_ota\_event\_t**

Events generated by OTA process.

*Values:*

enumerator **ESP\_HTTPS\_OTA\_START**

OTA started

enumerator **ESP\_HTTPS\_OTA\_CONNECTED**

Connected to server

enumerator **ESP\_HTTPS\_OTA\_GET\_IMG\_DESC**

Read app description from image header

enumerator **ESP\_HTTPS\_OTA\_VERIFY\_CHIP\_ID**

Verify chip id of new image

enumerator **ESP\_HTTPS\_OTA\_DECRYPT\_CB**

Callback to decrypt function

enumerator **ESP\_HTTPS\_OTA\_WRITE\_FLASH**

Flash write operation

enumerator **ESP\_HTTPS\_OTA\_UPDATE\_BOOT\_PARTITION**

Boot partition update after successful ota update

enumerator **ESP\_HTTPS\_OTA\_FINISH**

OTA finished

enumerator **ESP\_HTTPS\_OTA\_ABORT**

OTA aborted

### 2.10.10 事件循环库

#### 概述

事件循环库使组件能够声明事件，允许其他组件注册处理程序（即在事件发生时执行的代码片段）。此时，无需直接涉及应用程序，松散耦合组件也能够其他组件状态变化时附加所需的行为。此外，通过将代码执行序列化，在指定的任务中运行事件循环库，可以简化事件处理程序，实现更高效的事件处理。例如，当某个高级库要使用 Wi-Fi 库时，它可以直接订阅[ESP32 Wi-Fi 编程模型](#)，对有关事件做出相应。

---

**备注：** 蓝牙栈各模块通过调用专用回调函数向应用程序传递事件，而非通过事件循环库传递。

---

## 调用 esp\_event API

使用事件循环库时应注意区分“事件”与“事件循环”。

事件表示重要的发生事件，如 Wi-Fi 成功连接到接入点。引用事件时应使用由两部分组成的标识符，详情请参阅[事件定义与事件声明](#)。事件循环是连接事件和事件处理程序之间的桥梁，事件源通过使用事件循环库提供的 API 将事件发布到事件循环中，注册到事件循环中的事件处理程序会响应特定类型的事件。

以下为事件循环库的使用流程：

1. 定义一个函数，并在事件发布到事件循环中时运行该函数。此函数被称为事件处理程序，应具有与 `esp_event_handler_t` 同类型的签名。
2. 调用 `esp_event_loop_create()` 创建事件循环，该函数输出类型为 `esp_event_loop_handle_t` 的循环句柄，使用此 API 创建的事件循环称为用户事件循环。另有一种特殊事件循环，请参阅[默认事件循环](#)。
3. 调用 `esp_event_handler_register_with()` 将事件处理程序注册到循环中。处理程序可以注册到多个循环中，请参阅[注册处理程序注意事项](#)。
4. 事件源调用 `esp_event_post_to()` 将事件发布到事件循环中。
5. 调用 `esp_event_handler_unregister_with()`，组件可以在事件循环中取消注册事件处理程序。
6. 调用 `esp_event_loop_delete()` 删除不再需要的事件循环。

上述流程代码如下：

```
// 1. 定义事件处理程序
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void*_
↳event_data)
{
    // 事件处理程序逻辑
}

void app_main()
{
    // 2. 用一个类型为 esp_event_loop_args_t_
↳的配置结构体，指定所创建循环的属性。获取一个类型为 esp_event_loop_handle_t_
↳的句柄，用于其他 API 引用循环、执行操作。
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...
        .task_priority = ...,
        .task_stack_size = ...,
        .task_core_id = ...
    };

    esp_event_loop_handle_t loop_handle;

    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. 注册在 (1) 中定义的事件处理程序。MY_EVENT_BASE 和 MY_EVENT_ID_
↳指定了一个假设事件：将处理程序 run_on_event 发布到循环中时，执行该处理程序。
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳on_event, ...);

    ...

    // 4._
↳将事件发布到循环中。此时，事件排入事件循环队列，在某个时刻，事件循环会执行已注册到发布事件的事件
↳run_on_event。为简化过程，此示例从 app_main 调用 esp_event_post_
↳to，实际应用中可从任何其他任务中发布事件。
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

    ...
}
```

(下页继续)

```

// 5. 注销无用的处理程序。
esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳on_event);

...

// 6. 删除无用的事件循环。
esp_event_loop_delete(loop_handle);
}

```

## 事件定义与事件声明

如前所述，事件标识符由两部分组成：事件根基和事件 ID。事件根基标识独立的事件组；事件 ID 标识组中的特定事件。可以将事件根基和事件 ID 类比为人的姓和名，姓表示一个家族，名表示家族中的某个人。

事件循环库提供了宏以便声明和定义事件根基。

声明事件根基：

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE);
```

定义事件根基：

```
ESP_EVENT_DEFINE_BASE(EVENT_BASE);
```

**备注：**在 ESP-IDF 中，系统事件的根基标识符为大写字母，并以 `_EVENT` 结尾。例如，Wi-Fi 事件的根基声明为 `WIFI_EVENT`，以太网的事件根基声明为 `ETHERNET_EVENT` 等。这样一来，事件根基与常量类似（尽管根据宏 `ESP_EVENT_DECLARE_BASE` 和 `ESP_EVENT_DEFINE_BASE` 的定义，它们属于全局变量）。

建议以枚举类型声明事件 ID，它们通常放在公共头文件中。

事件 ID：

```

enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}

```

## 默认事件循环

默认事件循环是一种特殊循环，用于处理系统事件（如 Wi-Fi 事件）。用户无法使用该循环的句柄，创建、删除、注册/注销处理程序以及事件发布均通过用户事件循环 API 的变体完成，下表列出了这些变体及其对用户事件循环。

用户事件循环	默认事件循环
<a href="#"><code>esp_event_loop_create()</code></a>	<a href="#"><code>esp_event_loop_create_default()</code></a>
<a href="#"><code>esp_event_loop_delete()</code></a>	<a href="#"><code>esp_event_loop_delete_default()</code></a>
<a href="#"><code>esp_event_handler_register_with()</code></a>	<a href="#"><code>esp_event_handler_register()</code></a>
<a href="#"><code>esp_event_handler_unregister_with()</code></a>	<a href="#"><code>esp_event_handler_unregister()</code></a>
<a href="#"><code>esp_event_post_to()</code></a>	<a href="#"><code>esp_event_post()</code></a>

比较二者签名可知，它们大部分是相似的，唯一区别在于默认事件循环的 API 不需要指定循环句柄。

除了 API 的差异和用于系统事件的特殊分类外，默认事件循环和用户事件循环的行为并无差异。实际上，用户甚至可以将自己的事件发布到默认事件循环中，以节省内存而无需创建自己的循环。

### 注册处理程序注意事项

通过重复调用 `esp_event_handler_register_with()`，可以将单个处理程序独立注册到多个事件中，且每次调用均可指定处理程序应执行的具体事件根基和事件 ID。

然而，在某些情况下，你可能希望处理程序在以下情况时执行：

- (1) 所有发布到循环的事件
- (2) 特定基本标识符的所有事件

为此，可调用特殊的事件根基标识符 `ESP_EVENT_ANY_BASE` 和特殊的事件 `ESP_EVENT_ANY_ID` 实现，这些特殊标识符可以作为 `esp_event_handler_register_with()` 的事件根基和事件 ID 参数传递。

因此 `esp_event_handler_register_with()` 的有效参数为：

1. `<event base>`, `<event ID>` - 根基为 `<event base>` 且 ID 为 `<event ID>` 的事件发布到循环中时，执行处理程序。
2. `<event base>`, `ESP_EVENT_ANY_ID` - 任何根基为 `<event base>` 的事件发布到循环中时，执行处理程序。
3. `ESP_EVENT_ANY_BASE`, `ESP_EVENT_ANY_ID` - 任何事件发布到循环中时，执行处理程序。

例如，如果注册了以下处理程序：

```
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_
↳event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_
↳on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID,
↳run_on_event_3, ...);
```

如果假设事件由 `MY_EVENT_BASE` 和 `MY_EVENT_ID` 组成，则三个处理程序 `run_on_event_1`、`run_on_event_2` 和 `run_on_event_3` 都会执行。

如果假设事件由 `MY_EVENT_BASE` 和 `MY_OTHER_EVENT_ID` 组成，则仅执行处理程序 `run_on_event_2` 和 `run_on_event_3`。

如果假设事件由 `MY_OTHER_EVENT_BASE` 和 `MY_OTHER_EVENT_ID` 组成，则仅执行处理程序 `run_on_event_3`。

**处理程序自行注销** 通常情况下，由事件循环运行的事件处理程序 **不允许在该事件循环上执行任何注册/注销活动**，但允许处理程序自行注销。例如，可以执行以下操作：

```
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void*
↳event_data)
{
    esp_event_loop_handle_t *loop_handle = (esp_event_loop_handle_t*) handler_arg;
    esp_event_handler_unregister_with(*loop_handle, MY_EVENT_BASE, MY_EVENT_ID,
↳run_on_event);
}

void app_main(void)
{
    esp_event_loop_handle_t loop_handle;
    esp_event_loop_create(&loop_args, &loop_handle);
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳on_event, &loop_handle);
    // ... 发布事件 MY_EVENT_BASE 和 MY_EVENT_ID，并在某些时候运行循环
}
```

**注册处理程序及处理程序调度顺序** 一般而言，对于在调度期间与某个已发布事件匹配的处理程序，先注册的也会先执行。在所有注册均使用单个任务执行的情况下，可以通过在其他处理程序注册前注册目标处理程序，控制处理程序的执行顺序。如果计划利用这一规则，在有多个任务注册处理程序的情况下要多加小心。此时，虽然“先注册，先执行”的规则仍然成立，但率先执行的任务也会率先注册其处理程序，而由单个任务连续注册的处理函数仍然按相对顺序调度。但如果该任务在注册期间被另一个任务抢占，而该任务还注册了处理程序，则在调度期间，那些处理程序也将在处理其他任务时执行。

### 事件循环性能分析

要启动数据收集，统计所有已创建事件循环的数据，请激活配置选项 `CONFIG_ESP_EVENT_LOOP_PROFILING`，函数 `esp_event_dump()` 可将收集的统计数据输出到文件流中。有关转储信息的更多详情，请参阅 `esp_event_dump()` API 参考。

### 应用示例

使用 `esp_event` 库的示例存放在 `system/esp_event` 中，涵盖事件声明、循环创建、处理程序注册和注销以及事件发布。

其他使用 `esp_event` 库的示例：

- [NMEA Parser](#)，该示例将解码从 GPS 接收到的语句。

### API 参考

#### Header File

- `components/esp_event/include/esp_event.h`
- This header file can be included with:

```
#include "esp_event.h"
```

- This header file is a part of the API provided by the `esp_event` component. To declare that your component depends on `esp_event`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_event
```

or

```
PRIV_REQUIRES esp_event
```

#### Functions

`esp_err_t esp_event_loop_create` (const `esp_event_loop_args_t` \*event\_loop\_args, `esp_event_loop_handle_t` \*event\_loop)

Create a new event loop.

##### 参数

- `event_loop_args` -- [in] configuration structure for the event loop to create
- `event_loop` -- [out] handle to the created event loop

##### 返回

- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: `event_loop_args` or `event_loop` was NULL
- `ESP_ERR_NO_MEM`: Cannot allocate memory for event loops list
- `ESP_FAIL`: Failed to create task loop
- Others: Fail

`esp_err_t esp_event_loop_delete` (`esp_event_loop_handle_t` event\_loop)

Delete an existing event loop.

参数 `event_loop` -- [in] event loop to delete, must not be NULL

**返回**

- ESP\_OK: Success
- Others: Fail

*esp\_err\_t* **esp\_event\_loop\_create\_default** (void)

Create default event loop.

**返回**

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for event loops list
- ESP\_ERR\_INVALID\_STATE: Default event loop has already been created
- ESP\_FAIL: Failed to create task loop
- Others: Fail

*esp\_err\_t* **esp\_event\_loop\_delete\_default** (void)

Delete the default event loop.

**返回**

- ESP\_OK: Success
- Others: Fail

*esp\_err\_t* **esp\_event\_loop\_run** (*esp\_event\_loop\_handle\_t* event\_loop, TickType\_t ticks\_to\_run)

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in event\_loop\_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all the allotted time waiting on the event queue. Once an event has been dequeued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the dequeued event, and (2) during dispatch of the dequeued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last dequeued event.

In cases where waiting on the queue times out, ESP\_OK is returned and not ESP\_ERR\_TIMEOUT, since it is normal behavior.

---

**备注:** encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

---

**参数**

- **event\_loop** -- **[in]** event loop to dispatch posted events from, must not be NULL
- **ticks\_to\_run** -- **[in]** number of ticks to run the loop

**返回**

- ESP\_OK: Success
- Others: Fail

*esp\_err\_t* **esp\_event\_handler\_register** (*esp\_event\_base\_t* event\_base, int32\_t event\_id, *esp\_event\_handler\_t* event\_handler, void \*event\_handler\_arg)

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event\_base and event\_id
- all events of a certain base: specify exact event\_base and use ESP\_EVENT\_ANY\_ID as the event\_id
- all events known by the loop: use ESP\_EVENT\_ANY\_BASE for event\_base and ESP\_EVENT\_ANY\_ID as the event\_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

---

**备注:** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

---

#### 参数

- **event\_base** -- **[in]** the base ID of the event to register the handler for
- **event\_id** -- **[in]** the ID of the event to register the handler for
- **event\_handler** -- **[in]** the handler function which gets called when the event is dispatched
- **event\_handler\_arg** -- **[in]** data, aside from event data, that is passed to the handler when it is called

#### 返回

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for the handler
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event ID
- Others: Fail

```
esp_err_t esp_event_handler_register_with(esp_event_loop_handle_t event_loop, esp_event_base_t
                                         event_base, int32_t event_id, esp_event_handler_t
                                         event_handler, void *event_handler_arg)
```

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as `esp_event_handler_register`, except the additional specification of the event loop to register the handler to.

---

**备注:** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

---

#### 参数

- **event\_loop** -- **[in]** the event loop to register this handler function to, must not be NULL
- **event\_base** -- **[in]** the base ID of the event to register the handler for
- **event\_id** -- **[in]** the ID of the event to register the handler for
- **event\_handler** -- **[in]** the handler function which gets called when the event is dispatched
- **event\_handler\_arg** -- **[in]** data, aside from event data, that is passed to the handler when it is called

#### 返回

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for the handler
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event ID
- Others: Fail

```
esp_err_t esp_event_handler_instance_register_with(esp_event_loop_handle_t event_loop,
                                                  esp_event_base_t event_base, int32_t
                                                  event_id, esp_event_handler_t
                                                  event_handler, void *event_handler_arg,
                                                  esp_event_handler_instance_t *instance)
```

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact `event_base` and `event_id`
- all events of a certain base: specify exact `event_base` and use `ESP_EVENT_ANY_ID` as the `event_id`
- all events known by the loop: use `ESP_EVENT_ANY_BASE` for `event_base` and `ESP_EVENT_ANY_ID` as the `event_id`

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

---

**备注:** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

---

### 参数

- **event\_loop** -- **[in]** the event loop to register this handler function to, must not be NULL
- **event\_base** -- **[in]** the base ID of the event to register the handler for
- **event\_id** -- **[in]** the ID of the event to register the handler for
- **event\_handler** -- **[in]** the handler function which gets called when the event is dispatched
- **event\_handler\_arg** -- **[in]** data, aside from event data, that is passed to the handler when it is called
- **instance** -- **[out]** An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

### 返回

- `ESP_OK`: Success
- `ESP_ERR_NO_MEM`: Cannot allocate memory for the handler
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

```
esp_err_t esp_event_handler_instance_register(esp_event_base_t event_base, int32_t event_id,
                                             esp_event_handler_t event_handler, void
                                             *event_handler_arg,
                                             esp_event_handler_instance_t *instance)
```

Register an instance of event handler to the default loop.

This function does the same as `esp_event_handler_instance_register_with`, except that it registers the handler to the default event loop.

---

**备注:** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

---

### 参数

- **event\_base** -- **[in]** the base ID of the event to register the handler for
- **event\_id** -- **[in]** the ID of the event to register the handler for
- **event\_handler** -- **[in]** the handler function which gets called when the event is dispatched
- **event\_handler\_arg** -- **[in]** data, aside from event data, that is passed to the handler when it is called

- **instance** -- **[out]** An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

#### 返回

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for the handler
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

*esp\_err\_t* **esp\_event\_handler\_unregister** (*esp\_event\_base\_t* event\_base, *int32\_t* event\_id, *esp\_event\_handler\_t* event\_handler)

Unregister a handler with the system event loop (legacy).

Unregisters a handler, so it will no longer be called during dispatch. Handlers can be unregistered for any combination of event\_base and event\_id which were previously registered. To unregister a handler, the event\_base and event\_id arguments must match exactly the arguments passed to esp\_event\_handler\_register() when that handler was registered. Passing ESP\_EVENT\_ANY\_BASE and/or ESP\_EVENT\_ANY\_ID will only unregister handlers that were registered with the same wildcard arguments.

---

**备注:** When using ESP\_EVENT\_ANY\_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP\_EVENT\_ANY\_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

---

#### 参数

- **event\_base** -- **[in]** the base of the event with which to unregister the handler
- **event\_id** -- **[in]** the ID of the event with which to unregister the handler
- **event\_handler** -- **[in]** the handler to unregister

返回 ESP\_OK success

返回 ESP\_ERR\_INVALID\_ARG invalid combination of event base and event ID

返回 others fail

*esp\_err\_t* **esp\_event\_handler\_unregister\_with** (*esp\_event\_loop\_handle\_t* event\_loop, *esp\_event\_base\_t* event\_base, *int32\_t* event\_id, *esp\_event\_handler\_t* event\_handler)

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as esp\_event\_handler\_unregister, except the additional specification of the event loop to unregister the handler with.

#### 参数

- **event\_loop** -- **[in]** the event loop with which to unregister this handler function, must not be NULL
- **event\_base** -- **[in]** the base of the event with which to unregister the handler
- **event\_id** -- **[in]** the ID of the event with which to unregister the handler
- **event\_handler** -- **[in]** the handler to unregister

#### 返回

- ESP\_OK: Success
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event ID
- Others: Fail

*esp\_err\_t* **esp\_event\_handler\_instance\_unregister\_with** (*esp\_event\_loop\_handle\_t* event\_loop, *esp\_event\_base\_t* event\_base, *int32\_t* event\_id, *esp\_event\_handler\_instance\_t* instance)

Unregister a handler instance from a specific event loop.

Unregisters a handler instance, so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of `event_base` and `event_id` which were previously registered. To unregister a handler instance, the `event_base` and `event_id` arguments must match exactly the arguments passed to `esp_event_handler_instance_register()` when that handler instance was registered. Passing `ESP_EVENT_ANY_BASE` and/or `ESP_EVENT_ANY_ID` will only unregister handler instances that were registered with the same wildcard arguments.

---

**备注:** When using `ESP_EVENT_ANY_ID`, handlers registered to specific event IDs using the same base will not be unregistered. When using `ESP_EVENT_ANY_BASE`, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

---

#### 参数

- **event\_loop** -- **[in]** the event loop with which to unregister this handler function, must not be NULL
- **event\_base** -- **[in]** the base of the event with which to unregister the handler
- **event\_id** -- **[in]** the ID of the event with which to unregister the handler
- **instance** -- **[in]** the instance object of the registration to be unregistered

#### 返回

- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event ID
- Others: Fail

*esp\_err\_t* **esp\_event\_handler\_instance\_unregister** (*esp\_event\_base\_t* event\_base, *int32\_t* event\_id, *esp\_event\_handler\_instance\_t* instance)

Unregister a handler from the system event loop.

This function does the same as `esp_event_handler_instance_unregister_with`, except that it unregisters the handler instance from the default event loop.

#### 参数

- **event\_base** -- **[in]** the base of the event with which to unregister the handler
- **event\_id** -- **[in]** the ID of the event with which to unregister the handler
- **instance** -- **[in]** the instance object of the registration to be unregistered

#### 返回

- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event ID
- Others: Fail

*esp\_err\_t* **esp\_event\_post** (*esp\_event\_base\_t* event\_base, *int32\_t* event\_id, *const void \**event\_data, *size\_t* event\_data\_size, *TickType\_t* ticks\_to\_wait)

Posts an event to the system default event loop. The event loop library keeps a copy of `event_data` and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

#### 参数

- **event\_base** -- **[in]** the event base that identifies the event
- **event\_id** -- **[in]** the event ID that identifies the event
- **event\_data** -- **[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event\_data\_size** -- **[in]** the size of the event data
- **ticks\_to\_wait** -- **[in]** number of ticks to block on a full event queue

#### 返回

- `ESP_OK`: Success
- `ESP_ERR_TIMEOUT`: Time to wait for event queue to unblock expired, queue full when posting from ISR

- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event ID
- Others: Fail

*esp\_err\_t* **esp\_event\_post\_to** (*esp\_event\_loop\_handle\_t* event\_loop, *esp\_event\_base\_t* event\_base, *int32\_t* event\_id, const void \*event\_data, *size\_t* event\_data\_size, *TickType\_t* ticks\_to\_wait)

Posts an event to the specified event loop. The event loop library keeps a copy of event\_data and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp\_event\_post\_to, except the additional specification of the event loop to post the event to.

#### 参数

- **event\_loop** -- **[in]** the event loop to post to, must not be NULL
- **event\_base** -- **[in]** the event base that identifies the event
- **event\_id** -- **[in]** the event ID that identifies the event
- **event\_data** -- **[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event\_data\_size** -- **[in]** the size of the event data
- **ticks\_to\_wait** -- **[in]** number of ticks to block on a full event queue

#### 返回

- ESP\_OK: Success
- ESP\_ERR\_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event ID
- Others: Fail

*esp\_err\_t* **esp\_event\_isr\_post** (*esp\_event\_base\_t* event\_base, *int32\_t* event\_id, const void \*event\_data, *size\_t* event\_data\_size, *BaseType\_t* \*task\_unblocked)

Special variant of esp\_event\_post for posting events from interrupt handlers.

---

**备注:** this function is only available when CONFIG\_ESP\_EVENT\_POST\_FROM\_ISR is enabled

---

---

**备注:** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG\_ESP\_EVENT\_POST\_FROM\_IRAM\_ISR

---

#### 参数

- **event\_base** -- **[in]** the event base that identifies the event
- **event\_id** -- **[in]** the event ID that identifies the event
- **event\_data** -- **[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event\_data\_size** -- **[in]** the size of the event data; max is 4 bytes
- **task\_unblocked** -- **[out]** an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

#### 返回

- ESP\_OK: Success
- ESP\_FAIL: Event queue for the default event loop full
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

*esp\_err\_t* **esp\_event\_isr\_post\_to** (*esp\_event\_loop\_handle\_t* event\_loop, *esp\_event\_base\_t* event\_base, *int32\_t* event\_id, const void \*event\_data, *size\_t* event\_data\_size, *BaseType\_t* \*task\_unblocked)

Special variant of `esp_event_post_to` for posting events from interrupt handlers.

**备注:** this function is only available when `CONFIG_ESP_EVENT_POST_FROM_ISR` is enabled

**备注:** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR`

### 参数

- **event\_loop** -- **[in]** the event loop to post to, must not be NULL
- **event\_base** -- **[in]** the event base that identifies the event
- **event\_id** -- **[in]** the event ID that identifies the event
- **event\_data** -- **[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event\_data\_size** -- **[in]** the size of the event data
- **task\_unblocked** -- **[out]** an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

### 返回

- ESP\_OK: Success
- ESP\_FAIL: Event queue for the loop full
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

`esp_err_t esp_event_dump` (FILE \*file)

Dumps statistics of all event loops.

Dumps event loop info in the format:

```

event loop
  handler
  handler
  ...
event loop
  handler
  handler
  ...

where:

event loop
  format: address,name rx:total_received dr:total_dropped
  where:
    address - memory address of the event loop
    name - name of the event loop, 'none' if no dedicated task
    total_received - number of successfully posted events
    total_dropped - number of events unsuccessfully posted due to queue.
↳being full

handler
  format: address ev:base,id inv:total_invoked run:total_runtime
  where:
    address - address of the handler function
    base,id - the event specified by event base and ID this handler.
↳executes
    total_invoked - number of times this handler has been invoked

```

(下页继续)

```
total_runtime - total amount of time used for invoking this handler
```

**备注:** this function is a noop when CONFIG\_ESP\_EVENT\_LOOP\_PROFILING is disabled

**参数** **file** -- [in] the file stream to output to  
**返回**

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for event loops list
- Others: Fail

## Structures

struct **esp\_event\_loop\_args\_t**

Configuration for creating event loops.

### Public Members

int32\_t **queue\_size**

size of the event loop queue

const char \***task\_name**

name of the event loop task; if NULL, a dedicated task is not created for event loop

UBaseType\_t **task\_priority**

priority of the event loop task, ignored if task name is NULL

uint32\_t **task\_stack\_size**

stack size of the event loop task, ignored if task name is NULL

BaseType\_t **task\_core\_id**

core to which the event loop task is pinned to, ignored if task name is NULL

## Header File

- [components/esp\\_event/include/esp\\_event\\_base.h](#)
- This header file can be included with:

```
#include "esp_event_base.h"
```

- This header file is a part of the API provided by the `esp_event` component. To declare that your component depends on `esp_event`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_event
```

or

```
PRIV_REQUIRES esp_event
```

## Macros

**ESP\_EVENT\_DECLARE\_BASE** (id)

**ESP\_EVENT\_DEFINE\_BASE** (id)

**ESP\_EVENT\_ANY\_BASE**

register handler for any event base

**ESP\_EVENT\_ANY\_ID**

register handler for any event id

## Type Definitions

typedef void **\*esp\_event\_loop\_handle\_t**

a number that identifies an event with respect to a base

typedef void (**\*esp\_event\_handler\_t**)(void \*event\_handler\_arg, esp\_event\_base\_t event\_base, int32\_t event\_id, void \*event\_data)

function called when an event is posted to the queue

typedef void **\*esp\_event\_handler\_instance\_t**

context identifying an instance of a registered event handler

### 2.10.11 FreeRTOS 概述

#### 概述

FreeRTOS 是一个开源的 RTOS（实时操作系统）内核，它以组件的形式集成到 ESP-IDF 中。因此，所有的 ESP-IDF 应用程序及多种 ESP-IDF 组件都基于 FreeRTOS 编写。FreeRTOS 内核已移植到 ESP 芯片的所有 CPU 架构（即 Xtensa 和 RISC-V）中。

此外，ESP-IDF 还提供了不同的 FreeRTOS 实现，支持在多核 ESP 目标芯片上的 SMP（对称多处理）。本文档主要介绍了 FreeRTOS 组件、ESP-IDF 提供的 FreeRTOS 实现，并简要介绍了这些实现的共同之处。

#### 实现

官方 FreeRTOS（下文称为原生 FreeRTOS）是一个单核 RTOS。为了支持各种多核 ESP 目标芯片，ESP-IDF 支持下述不同的 FreeRTOS 实现。

#### ESP-IDF FreeRTOS

ESP-IDF FreeRTOS 是基于原生 FreeRTOS v10.5.1 的 FreeRTOS 实现，其中包含支持 SMP 的大量更新。ESP-IDF FreeRTOS 最多支持两个核（即双核 SMP），但在设计上对这种场景进行了优化。关于 ESP-IDF FreeRTOS 及具体更新内容，请参考 [FreeRTOS \(IDF\)](#) 文档。

---

**备注：**ESP-IDF FreeRTOS 是目前 ESP-IDF 默认的 FreeRTOS 实现。

---

## Amazon SMP FreeRTOS

Amazon SMP FreeRTOS 是由 Amazon 官方支持的 FreeRTOS SMP 实现。Amazon SMP FreeRTOS 能够支持 N 核，即双核以上。通过 `CONFIG_FREERTOS_SMP` 选项能够启用 Amazon SMP FreeRTOS。关于 Amazon SMP FreeRTOS 的更多细节，请参考 [官方 Amazon SMP FreeRTOS 文档](#)。

**警告：** Amazon SMP FreeRTOS 实现（及其在 ESP-IDF 中的移植）目前处于试验/测试状态，因此，可能会发生重大的行为变化及 API 变更。

### 配置

**内核配置** 原生 FreeRTOS 要求移植工具和应用程序通过在 `FreeRTOSConfig.h` 头文件中添加各种 `#define config...` 宏定义来配置内核。原生 FreeRTOS 支持一系列内核配置选项，允许启用或禁用各种内核行为和功能。

然而，对于 ESP-IDF 中的所有 FreeRTOS 移植，`FreeRTOSConfig.h` 头文件被视为私有文件，用户不得修改。由于该选项在 ESP-IDF 中是必选项或不被支持，`FreeRTOSConfig.h` 中的大量内核配置选项均为硬编码。所有用户可配置的内核配置选项都在 `Component Config/FreeRTOS/Kernel` 下的 `menuconfig` 中。

关于用户可配置内核选项的完整列表，参见 [项目配置](#)。下列为常用的内核配置选项：

- `CONFIG_FREERTOS_UNICORE`：仅在核 0 上运行 FreeRTOS。注意，这 **不等同于运行原生 FreeRTOS**。另外，此选项还可能影响除 `freertos` 外其他组件的行为。关于在单核上运行 FreeRTOS 的更多内容，请参考 [单核模式](#)（使用 ESP-IDF FreeRTOS 时）或参考 Amazon SMP FreeRTOS 的官方文档，还可以在 ESP-IDF 组件中搜索 `CONFIG_FREERTOS_UNICORE`。

---

**备注：** 由于 ESP32-C3 是一个单核 SoC，所以总是会启用 `CONFIG_FREERTOS_UNICORE` 配置。

---

- `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY` 可以向后兼容某些 FreeRTOS 宏、类型或函数，这些宏、类型或函数已在 v8.0 及以上版本中弃用。

**端口配置** 其他不属于内核配置的 FreeRTOS 相关配置选项都在 `Component Config/FreeRTOS/Port` 下的 `menuconfig` 中。这些选项可以配置以下内容：

- FreeRTOS 端口本身（如 tick 定时器选择，ISR 堆栈大小）
- 其他添加到 FreeRTOS 实现或端口的功能

### 使用 FreeRTOS

**应用程序入口点** 与原生 FreeRTOS 不同，在 ESP-IDF 中使用 FreeRTOS 的用户 **永远不应调用** `vTaskStartScheduler()` 和 `vTaskEndScheduler()`。相反，ESP-IDF 会自动启动 FreeRTOS。用户必须定义一个 `void app_main(void)` 函数作为用户应用程序的入口点，并在 ESP-IDF 启动时被自动调用。

- 通常，用户会从 `app_main` 中启动应用程序的其他任务。
- `app_main` 函数可以在任何时候返回（应用终止前）。
- `app_main` 函数由 `main` 任务调用。

**后台任务** 在启动过程中，ESP-IDF 和 FreeRTOS 内核会自动创建多个在后台运行的任务，如下表所示。

表 6: 启动过程创建任务列表

任务名称	描述	堆栈大小	亲和性	优先级
空闲任务 (IDLE <sub>x</sub> )	为每个 CPU 核创建并分配一个空闲任务 (IDLE <sub>x</sub> ), 其中 <i>x</i> 是 CPU 核的编号。当启用单核配置时, <i>x</i> 将被删除。	<a href="#">CONFIG_FREERTOS_IDLE_TASK_STACK_SIZE</a>	CON-核	0
FreeRTOS 定时器任务 (Tmr Svc)	如果应用程序调用了任何 FreeRTOS 定时器 API, FreeRTOS 会创建定时器服务或守护任务	<a href="#">CONFIG_FREERTOS_TIMER_TASK_STACK_SIZE</a>	CON-核	CON-
主任务 (main)	简单调用 app_main 的任务在 app_main 返回时会自我删除	<a href="#">CONFIG_ESP_MAIN_TASK_STACK_SIZE</a>	CON-CON-	1
IPC 任务 (ipcx)	当 <a href="#">CONFIG_FREERTOS_UNICORE</a> 为假时, 为每个 CPU 核创建并分配一个 IPC 任务 (ipcx)。IPC 任务用于实现处理器间调用 (IPC) 功能	<a href="#">CONFIG_ESP_IPC_TASK_STACK_SIZE</a>	CON-核	24
ESP 定时器任务 (esp_timer)	ESP-IDF 创建 ESP 定时器任务用于处理 ESP 定时器回调	<a href="#">CONFIG_ESP_TIMER_TASK_STACK_SIZE</a>	CON-核	22

**备注:** 注意, 如果应用程序使用了其他 ESP-IDF 功能 (如 Wi-Fi 或蓝牙), 那么这些功能可能会在上表的任务之外创建自己的后台任务。

### FreeRTOS 附加功能

ESP-IDF 还为 FreeRTOS 提供了一些补充功能, 如环形 buffer、ESP-IDF 风格的 tick 钩子和 idle 钩子、以及 TLSP 删除回调。要了解更多信息, 请参见 [FreeRTOS \(附加功能\)](#)。

### FreeRTOS 堆

原生 FreeRTOS 自带 [堆实现选择](#), 然而 ESP-IDF 已经实现了自己的堆 (参见 [堆内存分配](#)), 因此不使用原生 FreeRTOS 的堆实现。ESP-IDF 中的所有 FreeRTOS 端口都将 FreeRTOS 内存分配或释放调用 (例如 `pvPortMalloc()` 和 `pvPortFree()`) 映射到 ESP-IDF 堆 API (即 `heap_caps_malloc()` 和 `heap_caps_free()`)。然而 FreeRTOS 端口可以确保 FreeRTOS 分配的所有动态内存都放在内部内存中。

**备注:** 如果希望将 FreeRTOS 任务或对象放在外部内存中, 可以使用以下方法:

- 使用一个 `...CreateWithCaps()` API, 如 `xTaskCreateWithCaps()` 和 `xQueueCreateWithCaps()` 来分配任务或对象 (参见 [IDF 附加 API](#) 获取更多详细信息)。
- 使用 `heap_caps_malloc()` 为这些对象手动分配外部内存, 然后使用 FreeRTOS 的一个 `...CreateStatic()` 函数从分配的内存中创建对象。

### 2.10.12 FreeRTOS (IDF)

本文档介绍了 ESP-IDF 框架内的 FreeRTOS 双核 SMP 实现，包含以下小节：

## 目录

- *FreeRTOS (IDF)*
  - 概述
  - 对称多处理
  - 任务
  - *SMP* 调度器
  - 临界区
  - 其他事项
  - *API* 参考

## 概述

原始 FreeRTOS（下文称 Vanilla FreeRTOS）是一款小巧高效的实时操作系统，适用于许多单核 MCU 和 SoC。但为了支持双核 ESP 芯片，如 ESP32、ESP32-S3、ESP32-P4，ESP-IDF 特别提供了支持双核对称多处理 (SMP) 的 FreeRTOS 实现（下文称 IDF FreeRTOS）。

IDF FreeRTOS 源代码基于 Vanilla FreeRTOS v10.5.1，但内核行为和 API 都有重大修改，以支持双核 SMP。不过用户也可以启用 `CONFIG_FREERTOS_UNICORE` 选项，将 IDF FreeRTOS 配置为支持单核，详情请参阅 [单核模式](#)。

---

**备注：** 本文档假定读者已具备 Vanilla FreeRTOS 的必要背景知识，即了解其特性、行为和 API 用法。如需了解背景知识，请参阅 [Vanilla FreeRTOS 文档](#)。

---

## 对称多处理

**基本概念** 对称多处理是一种计算架构，其中，两个及以上相同的 CPU 核连接到单个共享的主内存，并由单个操作系统控制。SMP 系统通常具有以下特点：

- 多个核独立运行。每个核都有自己的寄存器文件、中断和中断处理。
- 对每个核呈现相同的内存视图。因此，无论在哪个核上运行，访问特定内存地址的代码都会产生相同的效果。

与单核或非对称多处理系统相比，SMP 系统的主要优势在于：

- 存在多个核，支持多个硬件线程，从而提高整体处理吞吐量。
- 对称内存支持线程在执行期间切换核，从而提高 CPU 利用率。

尽管 SMP 系统支持线程切换核，但在某些情况下，线程必须或应该仅在特定核上运行。因此，在 SMP 系统中，线程也具备核亲和性，指定线程在哪个特定核上运行。

- 分配给特定核的线程只能在该核上运行。
- 未分配给特定核的线程支持在执行期间切换核。

**ESP 芯片上的 SMP** ESP32、ESP32-S3、ESP32-P4 等 ESP 芯片是双核 SMP SoC，具有以下硬件特性以支持 SMP：

- 具有两个完全相同的核，分别称为核 0 和核 1。代码段无论在哪个核上运行，都有相同的执行效果。
- 具有对称内存（除了少数例外情况）。
  - 如果多个核同时访问相同的内存地址，它们的访问会被内存总线串行化。
  - 通过 ISA 提供的原子比较和交换指令，可以实现对同一内存地址的真正原子访问。
- 跨核中断支持由一个核触发另一个核上的中断，这使得核间可以互相发送信号，如请求在另一个核上进行上下文切换。

---

**备注：**在 ESP-IDF 中，核 0 和核 1 有时分别又被称为 PRO\_CPU 和 APP\_CPU。别名 PRO\_CPU 和 APP\_CPU 反映了典型 ESP-IDF 应用程序使用这两个 CPU 的方式。负责处理 Wi-Fi 或蓝牙等协议相关处理程序的任务通常会分配给核 0，因此称核 0 为 PRO\_CPU；而处理应用程序其余部分的任务会分配给核 1，因此称核 1 为 APP\_CPU。

---

## 任务

**创建任务** Vanilla FreeRTOS 提供以下用于创建任务的函数：

- 使用 `xTaskCreate()` 创建任务时，任务内存动态分配。
- 使用 `xTaskCreateStatic()` 创建任务时，任务内存静态分配，即由用户提供。

然而，在 SMP 系统中，任务需要分配到特定核。因此，ESP-IDF 提供了 Vanilla FreeRTOS 任务创建函数的 `...PinnedToCore()` 版本：

- 使用 `xTaskCreatePinnedToCore()` 可以创建具有特定核亲和性的任务，任务内存动态分配。
- 使用 `xTaskCreateStaticPinnedToCore()` 可以创建具有特定核亲和性的任务，任务内存静态分配，即由用户提供。

不同于普通的任务创建函数 API，`...PinnedToCore()` 版本的任务创建函数 API 有额外的 `xCoreID` 参数，用于指定所创建任务的核亲和性。核亲和性的有效值包括：

- 0：将创建的任务分配给核 0
- 1：将创建的任务分配给核 1
- `tskNO_AFFINITY`：支持任务在两个核上运行

注意，IDF FreeRTOS 仍支持普通的任务创建函数，但这些标准函数已经过调整，会内部调用其 `...PinnedToCore()` 版本，同时将核亲和性设置为 `tskNO_AFFINITY`。

---

**备注：**IDF FreeRTOS 还更改了任务创建函数中的 `ulStackDepth` 参数。在 Vanilla FreeRTOS 中，任务堆栈的大小以字为单位指定，而在 IDF FreeRTOS 中，任务堆栈的大小以字节为单位指定。

---

**执行任务** IDF FreeRTOS 中任务的结构与 Vanilla FreeRTOS 相同。具体而言，IDF FreeRTOS 任务：

- 只能处于以下任一状态：运行中、就绪、阻塞或挂起。
- 任务函数通常为无限循环。
- 任务函数不应返回。

**删除任务** 调用 `vTaskDelete()` 可以在 Vanilla FreeRTOS 中删除任务。该函数可用于删除其他任务，若任务句柄为 NULL 则删除当前运行任务。如果删除的任务是当前正在运行的任务时，任务的内存释放有时会委托给空闲任务执行。

IDF FreeRTOS 提供了同样的 `vTaskDelete()` 函数。然而，IDF FreeRTOS 是一个双核系统，因此调用 `vTaskDelete()` 时，行为上会与 Vanilla FreeRTOS 有以下差异：

- 删除另一个核上运行的任务时，会在另一个核上触发一次让步，任务内存由其中一个空闲任务释放。
- 如果删除的任务没有在任一核上运行，则会立即释放其内存。

请避免删除正在另一个核上运行的任务，否则由于无法确定该任务正在执行的操作，可能会导致难以预料的行为，例如：

- 删除持有互斥锁的任务。
- 删除尚未释放其先前分配的内存的任务。

请尽可能自己设计应用程序，确保在调用 `vTaskDelete()` 时，删除的任务处于已知状态。例如：

- 当任务完成执行操作并清理了任务内使用的所有资源时，任务调用 `vTaskDelete(NULL)` 自行删除。

- 在被另一个任务删除前，任务调用 `vTaskSuspend()` 将自己置于挂起状态。

## SMP 调度器

对 Vanilla FreeRTOS 调度器最确切的描述是 **具有时间分片和固定优先级的抢占式调度器**，这意味着：

- 每个任务在创建时都赋予了固定优先级，调度器会执行具有最高优先级且处于就绪状态的任务。
- 调度器可以在不需要当前运行任务的协作下切换执行到另一个任务。
- 调度器会采用轮转方式，定期在具有相同优先级的就绪状态任务间切换执行，时间分片由时钟中断控制。

IDF FreeRTOS 调度器支持相同的调度特性，即固定优先级、抢占和时间分片，但也存在细微的行为差异。

**固定优先级** 在 Vanilla FreeRTOS 中，当调度器选择要运行的新任务时，往往会选择当前优先级最高的就绪任务。而在 IDF FreeRTOS 中，每个核都独立地调度要运行的任务。当特定核选择一个任务时，该核会选择优先级最高且可以在该核上运行的就绪状态任务。满足以下条件时，任务可以在核上运行：

- 任务亲和性兼容，即已分配或未分配给当前核。
- 该任务当前没有在其他核上运行。

但是，两个具有最高优先级的就绪任务不一定始终由调度器运行，因为还需考虑到任务的核亲和性。例如，给定以下任务：

- 优先级为 10 的任务 A，分配给核 0
- 优先级为 9 的任务 B，分配给核 0
- 优先级为 8 的任务 C，分配给核 1

经过调度后，任务 A 将在核 0 上运行，任务 C 将在核 1 上运行。即使任务 B 是第二优先级任务，也不会被执行。

**抢占** 在 Vanilla FreeRTOS 中，如果优先级更高的任务已准备好执行，调度器可以抢占当前正在运行的任务。同样，在 IDF FreeRTOS 任务中，如果调度器确定一个优先级更高的任务可以在某个核上运行，那么调度器可以单独抢占各个核。

但在某些情况下，一个优先级更高的就绪任务可以在多个核上运行。此时，调度器只会抢占一个核。即便当前有多个核可以抢占，调度器总是优先选择当前核。换句话说，如果优先级更高的就绪任务未分配，并且其优先级高于两个核的当前优先级，调度器将始终选择抢占当前核。例如，给定以下任务：

- 优先级为 8 的任务 A 当前在核 0 上运行
- 优先级为 9 的任务 B 当前在核 1 上运行
- 优先级为 10 的任务 C 未分配，并由任务 B 解除了阻塞

经过调度后，任务 A 将在核 0 上运行，任务 C 将抢占任务 B，因为调度器总是优先选择当前核。

**时间分片** Vanilla FreeRTOS 实现了时间分片，这意味着如果当前优先级最高的就绪任务包含多个就绪任务，调度器会在这些任务间轮转定期切换。

然而，在 IDF FreeRTOS 中，由于以下原因，特定任务可能无法在特定核上运行，因此无法实现完美的轮转时间分片：

- 任务分配给了另一个核。
- 任务未分配，但已经由其他核运行。

因此，当核在所有就绪状态任务中搜索寻找要运行的任务时，可能需要跳过同一优先级列表中的一些任务，或者降低优先级，以找到可以运行的就绪状态任务。

IDF FreeRTOS 调度器会确保已选择运行的任务置于列表末尾，为同一优先级的就绪状态任务实现最佳轮转时间分片。这样，在下一次调度迭代（即，下一个滴答中断或让步）中，未经选择的任务优先级会更高。

以下示例展示了最佳轮转时间分片的实操。假设：

- 有四个相同优先级的就绪状态任务 AX、B0、C1 和 D1，其中：
  - 优先级是当前具有就绪状态任务的最高优先级。

- 第一个字符代表任务名称，即 A、B、C、D。
  - 第二个字符表示任务核的分配情况，X 表示未分配。
- 任务列表始终从头开始搜索

1. 起始状态，尚未选择要运行的就绪状态任务。

```
Head [ AX , B0 , C1 , D0 ] Tail
```

2. 核 0 有一个滴答中断，搜索要运行的任务。选择任务 A，并将其移至列表末尾。

```
Core 0 ┌
      │
      ▼
Head [ AX , B0 , C1 , D0 ] Tail
                                [0]
Head [ B0 , C1 , D0 , AX ] Tail
```

3. 核 1 有一个滴答中断，搜索要运行的任务。由于亲和性不兼容，任务 B 无法运行，因此核 1 跳到任务 C。选择任务 C，并将其移至列表末尾。

```
Core 1 ┌
      │
      ▼
Head [ B0 , C1 , D0 , AX ] Tail
                                [0]
                                [1]
Head [ B0 , D0 , AX , C1 ] Tail
```

4. 核 0 有另一个滴答中断，搜索要运行的任务。选择任务 B，并将其移至列表末尾。

```
Core 0 ┌
      │
      ▼
Head [ B0 , D0 , AX , C1 ] Tail
                                [1]
                                [0]
Head [ D0 , AX , C1 , B0 ] Tail
```

5. 核 1 有另一个滴答中断，搜索要运行的任务。由于亲和性不兼容，任务 D 无法运行，因此核 1 跳到任务 A。选择任务 A，并将其移至列表末尾。

```
Core 1 ┌
      │
      ▼
Head [ D0 , AX , C1 , B0 ] Tail
                                [0]
                                [1]
Head [ D0 , C1 , B0 , AX ] Tail
```

在使用最佳轮转时间分片时需注意：

- 相同优先级的多个就绪状态任务不一定可以像在 Vanilla FreeRTOS 中一样按顺序运行。如以上示例所示，核可能会跳过任务。
- 然而，经过足够的滴答次数，任务最终将获得一些处理时间。
- 如果核找不到优先级最高的可运行就绪任务，它将降低优先级来搜索任务。
- 为了实现理想的轮转时间分片，应确保特定优先级的所有任务都分配给同一个核。

**时钟中断** Vanilla FreeRTOS 要求定期发生滴答中断，滴答中断有以下作用：

- 增加调度器的滴答计数
- 为超时的阻塞任务解除阻塞
- 检查是否需要进行时间分片，即触发上下文切换
- 执行应用程序滴答函数

在 IDF FreeRTOS 中，每个核都会接收到定期中断，并独立运行滴答中断。每个核上的滴答中断周期相同，但可能不同步。然而，上述滴答中断任务不会由所有核同时执行，具体而言：

- 核 0 执行上述所有滴答中断任务

- 核 1 仅检查是否需要时间分片并执行应用程序滴答函数

**备注:** 在 IDF FreeRTOS 中, 核 0 是负责时间计数的唯一核。因此, 任何阻止核 0 增加滴答计数的情况, 例如暂停核 0 上的调度器, 都会导致整个调度器的时间计数滞后。

**空闲任务** 启动调度器时, Vanilla FreeRTOS 会隐式创建一个优先级为 0 的空闲任务。当没有其他任务准备运行时, 空闲任务运行并有以下作用:

- 释放已删除任务的内存
- 执行应用程序的空闲函数

而 IDF FreeRTOS 为每个核单独创建了一个固定的空闲任务。每个核上的空闲任务起到与其 Vanilla FreeRTOS 对应任务相同的作用。

**调度器挂起** Vanilla FreeRTOS 支持调用 `vTaskSuspendAll()` 挂起调度器, 调用 `xTaskResumeAll()` 恢复调度器。调度器挂起时:

- 禁用任务切换, 但仍启用中断。
- 禁止调用任何阻塞或让出函数, 禁用时间分片。
- 时钟计数冻结, 但仍会发生时钟中断以执行应用程序时钟函数。

调度器恢复时, `xTaskResumeAll()` 会补上所有丢失的时钟计数, 并解除超时任务的阻塞。

在 IDF FreeRTOS 中, 无法在多个核上同时挂起调度器。因此, 在特定核上 (如核 A) 调用 `vTaskSuspendAll()` 时:

- 只在核 A 上禁用任务切换, 但仍启用核 A 的中断。
- 禁止在核 A 上调用任何阻塞或让出函数, 在核 A 上禁用时间分片。
- 核 A 上的中断解除任务阻塞时, 对核 A 亲和的任务会进入核 A 的待执行任务列表。未分配的任务或对其他核亲和的任务可以在运行调度器的核上调度。
- 所有核上的调度器均挂起时, 由中断解除阻塞的任务将进入它们分配的核的待执行任务列表。如果任务未分配, 则进入调用中断的核的待执行任务列表。
- 如果核 A 是核 0, 则时钟计数将被冻结, 挂起的时钟计数将递增, 但仍会发生时钟中断以执行应用程序时钟函数。

在特定核 (如核 A) 上调用 `xTaskResumeAll()` 时:

- 任何添加到核 A 的待执行任务列表中的任务将恢复执行。
- 如果核 A 是核 0, 则挂起的时钟计数将回退, 补上丢失的时钟计数。

**警告:** IDF FreeRTOS 上的调度器挂起仅暂停特定核上的调度, 因此调度器挂起 **不能** 确保访问共享数据时任务互斥。如果需要互斥, 请使用适当的锁定机制, 如互斥锁或自旋锁。

## 临界区

**禁用中断** Vanilla FreeRTOS 支持通过调用 `taskDISABLE_INTERRUPTS` 和 `taskENABLE_INTERRUPTS` 分别禁用和启用中断。IDF FreeRTOS 提供了相同的 API, 但中断只能在当前核上禁用或启用。

在 Vanilla FreeRTOS 以及其他普通单核系统中, 禁用中断可以有效实现互斥, **但在 SMP 系统中, 禁用中断并不能确保实现互斥**, 而应使用有自旋锁的临界区以实现互斥。

**API 变更** Vanilla FreeRTOS 通过禁用中断实现临界区 (Critical Section), 以防止在临界区内发生抢占式上下文切换和中断服务, 确保进入临界区的任务或 ISR 是访问共享资源的唯一实体。Vanilla FreeRTOS 中的临界区提供以下 API:

- `taskENTER_CRITICAL()` 通过禁用中断进入临界区

- `taskEXIT_CRITICAL()` 通过重新启用中断退出临界区
- `taskENTER_CRITICAL_FROM_ISR()` 通过禁用中断嵌套从 `ISR` 进入临界区
- `taskEXIT_CRITICAL_FROM_ISR()` 通过重新启用中断嵌套从 `ISR` 退出临界区

然而，在 `SMP` 系统中，仅禁用中断并不能构成临界区，因为存在其他核意味着共享资源仍可以同时访问。因此，`IDF FreeRTOS` 中的临界区是使用自旋锁实现的。为适应自旋锁，`IDF FreeRTOS` 中的临界区 API 包含一个额外的自旋锁参数，具体如下：

- 自旋锁为 `portMUX_TYPE` (**请勿与 `FreeRTOS` 互斥混淆**)
- `taskENTER_CRITICAL(&spinlock)` 从任务上下文进入临界区
- `taskEXIT_CRITICAL(&spinlock)` 从任务上下文退出临界区
- `taskENTER_CRITICAL_ISR(&spinlock)` 从中断上下文进入临界区
- `taskEXIT_CRITICAL_ISR(&spinlock)` 从中断上下文退出临界区

**备注：**临界区 API 可以递归调用，即可以嵌套使用临界区。只要退出临界区的次数与进入的次数相同，多次递归进入临界区就是有效的。但是，由于临界区可以针对不同的自旋锁，因此在递归进入临界区时，应注意避免死锁。

自旋锁可以静态或动态分配。因此，提供了静态和动态初始化自旋锁的宏，如下代码片段所示。

- 静态分配自旋锁并使用 `portMUX_INITIALIZER_UNLOCKED` 初始化：

```
// 静态分配并初始化自旋锁
static portMUX_TYPE my_spinlock = portMUX_INITIALIZER_UNLOCKED;

void some_function(void)
{
    taskENTER_CRITICAL(&my_spinlock);
    // 此时已处于临界区
    taskEXIT_CRITICAL(&my_spinlock);
}
```

- 静态分配自旋锁并使用 `portMUX_INITIALIZE()` 初始化：

```
// 动态分配自旋锁
portMUX_TYPE *my_spinlock = malloc(sizeof(portMUX_TYPE));
// 动态初始化自旋锁
portMUX_INITIALIZE(my_spinlock);

...

taskENTER_CRITICAL(my_spinlock);
// 访问资源
taskEXIT_CRITICAL(my_spinlock);
```

**实现** `IDF FreeRTOS` 中，特定核进入和退出临界区的过程如下：

- 对于 `taskENTER_CRITICAL(&spinlock)` 或 `taskENTER_CRITICAL_ISR(&spinlock)`
  1. 核禁用其中断或中断嵌套，直到达到 `configMAX_SYSCALL_INTERRUPT_PRIORITY`。
  2. 接着，核使用原子比较和设置指令在自旋锁上自旋，直到获取锁。当核能够将锁的所有者值设置为核的 ID 时，就获得了锁。
  3. 一旦获取了自旋锁，函数返回。剩余的临界区部分将在禁用中断或中断嵌套的情况下运行。
- 对于 `taskEXIT_CRITICAL(&spinlock)` 或 `taskEXIT_CRITICAL_ISR(&spinlock)`
  1. 核通过清除自旋锁的所有者值释放自旋锁。
  2. 核重新启用中断或中断嵌套。

**限制与注意事项** 由于在临界区内禁用了中断或中断嵌套，产生了多个关于在临界区内可执行操作的限制，请牢记以下操作限制和注意事项：

- 临界区应尽可能短

- 临界区持续时间越长，越可能延迟挂起中断的执行。
- 临界区通常应仅涉及少量数据结构和/或硬件寄存器。
- 如果可以，尽可能将执行操作和/或事件处理程序推迟到临界区之外。
- 不应在临界区内调用 FreeRTOS API
- 不应在临界区内调用任何阻塞或让出函数

## 其他事项

**单核模式** 尽管 IDF FreeRTOS 是为双核 SMP 专门设计的，但也可通过启用 `CONFIG_FREERTOS_UNICORE` 选项，将 IDF FreeRTOS 配置为支持单核。

对于 ESP32-S2 和 ESP32-C3 等单核芯片，`CONFIG_FREERTOS_UNICORE` 选项始终启用。对于 ESP32 和 ESP32-S3 等多核芯片也可以设置 `CONFIG_FREERTOS_UNICORE`，对于多核目标（如 ESP32 和 ESP32-S3），也可以设置 `CONFIG_FREERTOS_UNICORE`，但启用该选项后应用仅在核 0 上运行。

在单核模式下，IDF FreeRTOS 与 Vanilla FreeRTOS 完全相同，因此无需考虑前文提到的对内核行为的 SMP 更改。因此，在单核模式下构建 IDF FreeRTOS 具有以下特点：

- 内核在临界区内执行的所有操作都是确定的（即在临界区内不走链表）。
- 恢复了 Vanilla FreeRTOS 调度算法（包括完美的轮转时间分片）。
- 移除了所有单核构建中的 SMP 专用数据。

在单核模式下仍可调用 SMP API，这些 API 仍然保持公开，以便为单核和多核构建源代码，而无需调用不同的 API 集。不过，SMP API 在单核模式下不会展示任何 SMP 行为，因此实际上等同于其对应的单核模式 API。例如：

- 任何 `...ForCore(..., BaseType_t xCoreID)` SMP API 将只接受 0 为 `xCoreID` 的有效值。
- `...PinnedToCore()` 任务创建 API 将直接忽略 `xCoreID` 核亲和参数。
- 临界区 API 仍需要自旋锁参数，但不会使用自旋锁，临界区将恢复为仅用于禁用/启用中断。

## API 参考

本节介绍了 FreeRTOS 类型、函数和宏，均从 FreeRTOS 头文件自动生成。

## 任务 API

### Header File

- [components/freertos/FreeRTOS-Kernel/include/freertos/task.h](#)
- This header file can be included with:

```
#include "freertos/task.h"
```

### Functions

```
static inline BaseType_t xTaskCreate (TaskFunction_t pxTaskCode, const char *const pcName, const
                                     configSTACK_DEPTH_TYPE usStackDepth, void *const
                                     pvParameters, UBaseType_t uxPriority, TaskHandle_t *const
                                     pxCreatedTask)
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

See `xTaskCreateStatic()` for a version that does not use any dynamic memory allocation.

xTaskCreate() can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using xTaskCreateRestricted().

Example usage:

```
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter_
    ↪ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared static.
    ↪ If it was just an
    // an automatic stack variable it might no longer exist, or at least have been_
    ↪corrupted, by the time
    // the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
    ↪PRIORITY, &xHandle );
    configASSERT( xHandle );

    // Use the handle to delete the task.
    if( xHandle != NULL )
    {
        vTaskDelete( xHandle );
    }
}
```

---

**备注:** If configNUMBER\_OF\_CORES > 1, this function will create an unpinned task (see tskNO\_AFFINITY for more details).

---

**备注:** If program uses thread local variables (ones specified with " \_\_thread" keyword) then storage for them will be allocated on the task's stack.

---

### 参数

- **pxTaskCode** -- Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- **pcName** -- A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX\_TASK\_NAME\_LEN - default is 16.
- **usStackDepth** -- The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE\_BIT of the priority parameter. For example, to create a privileged task at priority

2 the uxPriority parameter should be set to ( 2 | portPRIVILEGE\_BIT ).

- **pxCreatedTask** -- Used to pass back a handle by which the created task can be referenced.

**返回** pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

```
static inline TaskHandle_t xTaskCreateStatic (TaskFunction_t pxTaskCode, const char *const pcName,
                                             const uint32_t ulStackDepth, void *const pvParameters,
                                             UBaseType_t uxPriority, StackType_t *const
                                             puxStackBuffer, StaticTask_t *const pxTaskBuffer)
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```
// Dimensions of the buffer that the task being created will use as its stack.
// NOTE: This is the number of words the stack will hold, not the number of
// bytes. For example, if each stack item is 32-bits, and this is set to 100,
// then 400 bytes (100 * 32-bits) will be allocated.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic(
        vTaskCode,          // Function that implements the task.
        "NAME",            // Text name for the task.
        STACK_SIZE,       // Stack size in words, not bytes.
        ( void * ) 1,     // Parameter passed into the task.
        tskIDLE_PRIORITY, // Priority at which the task is created.
```

(下页继续)

```

        xStack,          // Array to use as the task's stack.
        &xTaskBuffer ); // Variable to hold the task's data.
→structure.

// puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
// been created, and xHandle will be the task's handle. Use the handle
// to suspend the task.
    vTaskSuspend( xHandle );
}

```

**备注:** If configNUMBER\_OF\_CORES > 1, this function will create an unpinning task (see tskNO\_AFFINITY for more details).

**备注:** If program uses thread local variables (ones specified with “\_\_thread” keyword) then storage for them will be allocated on the task’s stack.

### 参数

- **pxTaskCode** -- Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- **pcName** -- A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX\_TASK\_NAME\_LEN in FreeRTOSConfig.h.
- **ulStackDepth** -- The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task will run.
- **puxStackBuffer** -- Must point to a StackType\_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** -- Must point to a variable of type StaticTask\_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

**返回** If neither puxStackBuffer nor pxTaskBuffer are NULL, then the task will be created and a handle to the created task is returned. If either puxStackBuffer or pxTaskBuffer are NULL then the task will not be created and NULL is returned.

void **vTaskAllocateMPURegions** (*TaskHandle\_t* xTask, const *MemoryRegion\_t* \*const pxRegions)

Memory regions are assigned to a restricted task when the task is created by a call to xTaskCreateRestricted(). These regions can be redefined using vTaskAllocateMPURegions().

Example usage:

```

// Define an array of MemoryRegion_t structures that configures an MPU region
// allowing read/write access for 1024 bytes starting at the beginning of the
// ucOneKByte array. The other two of the maximum 3 definable regions are
// unused so set to zero.
static const MemoryRegion_t xAltRegions[ portNUM_CONFIGURABLE_REGIONS ] =
{
    // Base address      Length      Parameters
    { ucOneKByte,      1024,      portMPU_REGION_READ_WRITE },
    { 0,                0,         0 },
    { 0,                0,         0 }
};

```

(下页继续)

```

void vATask( void *pvParameters )
{
    // This task was created such that it has access to certain regions of
    // memory as defined by the MPU configuration. At some point it is
    // desired that these MPU regions are replaced with that defined in the
    // xAltRegions const struct above. Use a call to vTaskAllocateMPURegions()
    // for this purpose. NULL is used as the task handle to indicate that this
    // function should modify the MPU regions of the calling task.
    vTaskAllocateMPURegions( NULL, xAltRegions );

    // Now the task can continue its function, but from this point on can only
    // access its stack and the ucOneKByte array (unless any other statically
    // defined or shared regions have been declared elsewhere).
}

```

**参数**

- **xTask** -- The handle of the task being updated.
- **pxRegions** -- A pointer to a MemoryRegion\_t structure that contains the new memory region definitions.

void **vTaskDelete** (*TaskHandle\_t* xTaskToDelete)

INCLUDE\_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

Remove a task from the RTOS real time kernel's management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete (). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file death.c for sample code that utilises vTaskDelete ().

Example usage:

```

void vOtherFunction( void )
{
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}

```

**参数 xTaskToDelete** -- The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

void **vTaskDelay** (const TickType\_t xTicksToDelay)

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant portTICK\_PERIOD\_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDE\_vTaskDelay must be defined as 1 for this function to be available. See the configuration section for more information.

`vTaskDelay()` specifies a time at which the task wishes to unblock relative to the time at which `vTaskDelay()` is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after `vTaskDelay()` is called. `vTaskDelay()` does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will affect the frequency at which `vTaskDelay()` gets called and therefore the time at which the task next executes. See `xTaskDelayUntil()` for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```
void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}
```

**参数 `xTicksToDelay`** -- The amount of time, in tick periods, that the calling task should block.

`BaseType_t xTaskDelayUntil` (`TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement`)

`INCLUDE_xTaskDelayUntil` must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from `vTaskDelay()` in one important aspect: `vTaskDelay()` will cause a task to block for the specified number of ticks from the time `vTaskDelay()` is called. It is therefore difficult to use `vTaskDelay()` by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling `vTaskDelay()` may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas `vTaskDelay()` specifies a wake time relative to the time at which the function is called, `xTaskDelayUntil()` specifies the absolute (exact) time at which it wishes to unblock.

The macro `pdMS_TO_TICKS()` can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;
    BaseType_t xWasDelayed;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount();
    for( ;; )
    {
        // Wait for the next cycle.
    }
}
```

(下页继续)

```

xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

// Perform action here. xWasDelayed value can be used to determine
// whether a deadline was missed if the code here took too long.
}
}

```

**参数**

- **pxPreviousWakeTime** -- Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within xTaskDelayUntil ().
- **xTimeIncrement** -- The cycle time period. The task will be unblocked at time \*pxPreviousWakeTime + xTimeIncrement. Calling xTaskDelayUntil with the same xTimeIncrement parameter value will cause the task to execute with a fixed interface period.

**返回** Value which can be used to check whether the task was actually delayed. Will be pdTRUE if the task was delayed and pdFALSE otherwise. A task will not be delayed if the next expected wake time is in the past.

BaseType\_t **xTaskAbortDelay** (*TaskHandle\_t* xTask)

INCLUDE\_xTaskAbortDelay must be defined as 1 in FreeRTOSConfig.h for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when vTaskDelay() is called, or an event on an object, such as when xQueueReceive() or ulTaskNotifyTake() is called. If the handle of a task that is in the Blocked state is used in a call to xTaskAbortDelay() then the task will leave the Blocked state, and return from whichever function call placed the task into the Blocked state.

There is no 'FromISR' version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.

**参数 xTask** -- The handle of the task to remove from the Blocked state.

**返回** If the task referenced by xTask was not in the Blocked state then pdFAIL is returned. Otherwise pdPASS is returned.

UBaseType\_t **uxTaskPriorityGet** (const *TaskHandle\_t* xTask)

INCLUDE\_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the priority of any task.

Example usage:

```

void vAFunction( void )
{
TaskHandle_t xHandle;

// Create a task, storing the handle.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
→);

// ...

// Use the handle to obtain the priority of the created task.
// It was created with tskIDLE_PRIORITY, but may have changed
// it itself.
if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )

```

(下页继续)

```

    {
    // The task has changed it's priority.
    }

    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
    // Our priority (obtained using NULL handle) is higher.
    }
    }
}

```

**参数 xTask** -- Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

**返回** The priority of xTask.

UBaseType\_t **uxTaskPriorityGetFromISR**(const *TaskHandle\_t* xTask)

A version of uxTaskPriorityGet() that can be used from an ISR.

*eTaskState* **eTaskGetState**(*TaskHandle\_t* xTask)

INCLUDE\_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the state of any task. States are encoded by the eTaskState enumerated type.

**参数 xTask** -- Handle of the task to be queried.

**返回** The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

void **vTaskGetInfo**(*TaskHandle\_t* xTask, *TaskStatus\_t* \*pxTaskStatus, BaseType\_t xGetFreeStackSpace, *eTaskState* eState)

configUSE\_TRACE\_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus\_t structure with information about a task.

Example usage:

```

void vAFunction( void )
{
TaskHandle_t xHandle;
TaskStatus_t xTaskDetails;

// Obtain the handle of a task from its name.
xHandle = xTaskGetHandle( "Task_Name" );

// Check the handle is not NULL.
configASSERT( xHandle );

// Use the handle to obtain further information about the task.
vTaskGetInfo( xHandle,
              &xTaskDetails,
              pdTRUE, // Include the high water mark in xTaskDetails.
              eInvalid ); // Include the task state in xTaskDetails.
}

```

**参数**

- **xTask** -- Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus** -- A pointer to the TaskStatus\_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSpace** -- The TaskStatus\_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus\_t structure if xGetFreeStackSpace is not set to pdFALSE;
- **eState** -- The TaskStatus\_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus\_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus\_t structure.

void **vTaskPrioritySet** (*TaskHandle\_t* xTask, UBaseType\_t uxNewPriority)

INCLUDE\_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // ...

    // Use the handle to raise the priority of the created task.
    vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

    // ...

    // Use a NULL handle to raise our priority to the same value.
    vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}
```

#### 参数

- **xTask** -- Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- **uxNewPriority** -- The priority to which the task will be set.

void **vTaskSuspend** (*TaskHandle\_t* xTaskToSuspend)

INCLUDE\_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to vTaskSuspend are not accumulative - i.e. calling vTaskSuspend () twice on the same task still only requires one call to vTaskResume () to ready the suspended task.

Example usage:

```

void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    //...

    // Suspend ourselves.
    vTaskSuspend( NULL );

    // We cannot get here unless another task calls vTaskResume
    // with our handle as the parameter.
}

```

**参数 xTaskToSuspend** -- Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

**void vTaskResume** (*TaskHandle\_t* xTaskToResume)

INCLUDE\_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Resumes a suspended task.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to vTaskResume ().

Example usage:

```

void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...
}

```

(下页继续)

(续上页)

```

// The created task will not run during this period, unless
// another task calls vTaskResume( xHandle ).

//...

// Resume the suspended task ourselves.
vTaskResume( xHandle );

// The created task will once again get microcontroller processing
// time in accordance with its priority within the system.
}

```

**参数 xTaskToResume** -- Handle to the task being readied.

BaseType\_t **xTaskResumeFromISR** (*TaskHandle\_t* xTaskToResume)

INCLUDE\_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of vTaskResume() that can be called from within an ISR.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to xTaskResumeFromISR ().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

**参数 xTaskToResume** -- Handle to the task being readied.

**返回** pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

void **vTaskSuspendAll** (void)

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is suspended.

After calling vTaskSuspendAll () the calling task will continue to execute without risk of being swapped out until a call to xTaskResumeAll () has been made.

API functions that have the potential to cause a context switch (for example, xTaskDelayUntil(), xQueueSend(), etc.) must not be called while the scheduler is suspended.

Example usage:

```

void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.

        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical

```

(下页继续)

```

// sections as we have all the microcontroller processing time.
// During this time interrupts will still operate and the kernel
// tick count will be maintained.

// ...

// The operation is complete. Restart the kernel.
    xTaskResumeAll ();
}
}

```

BaseType\_t **xTaskResumeAll** (void)

Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().

xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to vTaskSuspend().

Example usage:

```

void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.

        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the real
        // time kernel tick count will be maintained.

        // ...

        // The operation is complete. Restart the kernel. We want to force
        // a context switch - but there is no point if resuming the scheduler
        // caused a context switch already.
        if( !xTaskResumeAll () )
        {
            taskYIELD ();
        }
    }
}

```

**返回** If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise pdFALSE is returned.

TickType\_t **xTaskGetTickCount** (void)

**返回** The count of ticks since vTaskStartScheduler was called.

TickType\_t **xTaskGetTickCountFromISR** (void)

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType\_t is the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being used.

**返回** The count of ticks since vTaskStartScheduler was called.

UBaseType\_t **uxTaskGetNumberOfTasks** (void)

**返回** The number of tasks that the real time kernel is currently managing. This includes all ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle task will also be included in the count.

char \***pcTaskGetName** (*TaskHandle\_t* xTaskToQuery)

**返回** The text (human readable) name of the task referenced by the handle xTaskToQuery. A task can query its own name by either passing in its own handle, or by setting xTaskToQuery to NULL.

*TaskHandle\_t* **xTaskGetHandle** (const char \*pcNameToQuery)

NOTE: This function takes a relatively long time to complete and should be used sparingly.

**返回** The handle of the task that has the human readable name pcNameToQuery. NULL is returned if no matching name is found. INCLUDE\_xTaskGetHandle must be set to 1 in FreeRTOSConfig.h for pcTaskGetHandle() to be available.

BaseType\_t **xTaskGetStaticBuffers** (*TaskHandle\_t* xTask, StackType\_t \*\*ppuxStackBuffer, StaticTask\_t \*\*ppxTaskBuffer)

Retrieve pointers to a statically created task's data structure buffer and stack buffer. These are the same buffers that are supplied at the time of creation.

**参数**

- **xTask** -- The task for which to retrieve the buffers.
- **ppuxStackBuffer** -- Used to return a pointer to the task's stack buffer.
- **ppxTaskBuffer** -- Used to return a pointer to the task's data structure buffer.

**返回** pdTRUE if buffers were retrieved, pdFALSE otherwise.

UBaseType\_t **uxTaskGetStackHighWaterMark** (*TaskHandle\_t* xTask)

INCLUDE\_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK\_DEPTH\_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

**参数** **xTask** -- Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

**返回** The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

configSTACK\_DEPTH\_TYPE **uxTaskGetStackHighWaterMark2** (*TaskHandle\_t* xTask)

INCLUDE\_uxTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

`uxTaskGetStackHighWaterMark()` and `uxTaskGetStackHighWaterMark2()` are the same except for their return type. Using `configSTACK_DEPTH_TYPE` allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

**参数** `xTask` -- Handle of the task associated with the stack to be checked. Set `xTask` to `NULL` to check the stack of the calling task.

**返回** The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by `xTask` was created.

void **vTaskSetApplicationTaskTag** (*TaskHandle\_t* xTask, *TaskHookFunction\_t* pxHookFunction)

Sets `pxHookFunction` to be the task hook function used by the task `xTask`. Passing `xTask` as `NULL` has the effect of setting the calling tasks hook function.

*TaskHookFunction\_t* **xTaskGetApplicationTaskTag** (*TaskHandle\_t* xTask)

Returns the `pxHookFunction` value assigned to the task `xTask`. Do not call from an interrupt service routine - call `xTaskGetApplicationTaskTagFromISR()` instead.

*TaskHookFunction\_t* **xTaskGetApplicationTaskTagFromISR** (*TaskHandle\_t* xTask)

Returns the `pxHookFunction` value assigned to the task `xTask`. Can be called from an interrupt service routine.

void **vTaskSetThreadLocalStoragePointer** (*TaskHandle\_t* xTaskToSet, BaseType\_t xIndex, void \*pvValue)

Each task contains an array of pointers that is dimensioned by the `configNUM_THREAD_LOCAL_STORAGE_POINTERS` setting in `FreeRTOSConfig.h`. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish. The following two functions are used to set and query a pointer respectively.

void **\*pvTaskGetThreadLocalStoragePointer** (*TaskHandle\_t* xTaskToQuery, BaseType\_t xIndex)

void **vApplicationGetIdleTaskMemory** (*StaticTask\_t* \*\*ppxIdleTaskTCBBuffer, *StackType\_t* \*\*ppxIdleTaskStackBuffer, *uint32\_t* \*pulIdleTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when `configSUPPORT_STATIC_ALLOCATION` is set. For more information see this URI: [https://www.FreeRTOS.org/a00110.html#configSUPPORT\\_STATIC\\_ALLOCATION](https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION)

**参数**

- **ppxIdleTaskTCBBuffer** -- A handle to a statically allocated TCB buffer
- **ppxIdleTaskStackBuffer** -- A handle to a statically allocated Stack buffer for the idle task
- **pulIdleTaskStackSize** -- A pointer to the number of elements that will fit in the allocated stack buffer

BaseType\_t **xTaskCallApplicationTaskHook** (*TaskHandle\_t* xTask, void \*pvParameter)

Calls the hook function associated with `xTask`. Passing `xTask` as `NULL` has the effect of calling the Running tasks (the calling task) hook function.

`pvParameter` is passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

*TaskHandle\_t* **xTaskGetIdleTaskHandle** (void)

`xTaskGetIdleTaskHandle()` is only available if `INCLUDE_xTaskGetIdleTaskHandle` is set to 1 in `FreeRTOSConfig.h`.

Simply returns the handle of the idle task of the current core. It is not valid to call `xTaskGetIdleTaskHandle()` before the scheduler has been started.

UBaseType\_t **uxTaskGetSystemState** (*TaskStatus\_t* \*const pxTaskStatusArray, const UBaseType\_t uxArraySize, *configRUN\_TIME\_COUNTER\_TYPE* \*const pulTotalRunTime)

`configUSE_TRACE_FACILITY` must be defined as 1 in `FreeRTOSConfig.h` for `uxTaskGetSystemState()` to be available.

uxTaskGetSystemState() populates an TaskStatus\_t structure for each task in the system. TaskStatus\_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the TaskStatus\_t structure definition in this file for the full member list.

NOTE: This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

Example usage:

```

// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    configRUN_TIME_COUNTER_TYPE ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
    pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
    // function is executing.
    uxArraySize = uxTaskGetNumberOfTasks();

    // Allocate a TaskStatus_t structure for each task. An array could be
    // allocated statically at compile time.
    pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

    if( pxTaskStatusArray != NULL )
    {
        // Generate raw status information about each task.
        uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &
        ↪ulTotalRunTime );

        // For percentage calculations.
        ulTotalRunTime /= 100UL;

        // Avoid divide by zero errors.
        if( ulTotalRunTime > 0 )
        {
            // For each populated position in the pxTaskStatusArray array,
            // format the raw data as human readable ASCII data
            for( x = 0; x < uxArraySize; x++ )
            {
                // What percentage of the total run time has the task used?
                // This will always be rounded down to the nearest integer.
                // ulTotalRunTimeDiv100 has already been divided by 100.
                ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter
                ↪/ ulTotalRunTime;

                if( ulStatsAsPercentage > 0UL )
                {
                    sprintf( pcWriteBuffer, "%s\t\t%lu\t\t%lu%%\r\n",
                    ↪pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,
                    ↪ulStatsAsPercentage );
                }
                else
                {
                    // If the percentage is zero here then the task has

```

(下页继续)

```

// consumed less than 1% of the total run time.
        sprintf( pcWriteBuffer, "%s\t\t%lu\t\t<1%%\r\n",
→pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
    }

    pcWriteBuffer += strlen( ( char * ) pcWriteBuffer );
}

}

// The array is no longer needed, free the memory it consumes.
vPortFree( pxTaskStatusArray );
}
}

```

**参数**

- **pxTaskStatusArray** -- A pointer to an array of TaskStatus\_t structures. The array must contain at least one TaskStatus\_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.
- **uxArraySize** -- The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus\_t structures contained in the array, not by the number of bytes in the array.
- **pulTotalRunTime** -- If configGENERATE\_RUN\_TIME\_STATS is set to 1 in FreeRTOSConfig.h then \*pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see <https://www.FreeRTOS.org/rtos-run-time-stats.html>) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

**返回** The number of TaskStatus\_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberOfTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.

void **vTaskList** (char \*pcWriteBuffer)

configUSE\_TRACE\_FACILITY and configUSE\_STATS\_FORMATTING\_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark.

Tasks are reported as blocked ('B'), ready ('R'), deleted ('D') or suspended ('S').

PLEASE NOTE:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task: names, states, priority, stack usage and task number. Stack usage specified as the number of unused StackType\_t words stack can hold on top of stack - not the number of bytes.

vTaskList() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

**参数 pcWriteBuffer** -- A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

void **vTaskGetRunTimeStats** (char \*pcWriteBuffer)

configGENERATE\_RUN\_TIME\_STATS and configUSE\_STATS\_FORMATTING\_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE\_TIMER\_FOR\_RUN\_TIME\_STATS() and portGET\_RUN\_TIME\_COUNTER\_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Setting configGENERATE\_RUN\_TIME\_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE\_TIMER\_FOR\_RUN\_TIME\_STATS() macro. Calling vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

NOTE 2:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskGetRunTimeStats() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

vTaskGetRunTimeStats() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskGetRunTimeStats().

**参数 pcWriteBuffer** -- A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

configRUN\_TIME\_COUNTER\_TYPE **ulTaskGetIdleRunTimeCounter** (void)

configGENERATE\_RUN\_TIME\_STATS, configUSE\_STATS\_FORMATTING\_FUNCTIONS and INCLUDE\_xTaskGetIdleTaskHandle must all be defined as 1 for these functions to be available. The application must also then provide definitions for portCONFIGURE\_TIMER\_FOR\_RUN\_TIME\_STATS() and portGET\_RUN\_TIME\_COUNTER\_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting configGENERATE\_RUN\_TIME\_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE\_TIMER\_FOR\_RUN\_TIME\_STATS() macro. While uxTaskGetSystemState() and vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, ulTaskGetIdleRunTimeCounter() returns the total execution time of just the idle task and ulTaskGetIdleRunTimePercent() returns the percentage of the CPU time used by just the idle task.

Note the amount of idle time is only a good measure of the slack time in a system if there are no other tasks executing at the idle priority, tickless idle is not used, and configIDLE\_SHOULD\_YIELD is set to 0.

---

**备注:** If configNUMBER\_OF\_CORES > 1, calling this function will query the idle task of the current core.

---

**返回** The total run time of the idle task or the percentage of the total run time consumed by the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` macros.

`configRUN_TIME_COUNTER_TYPE` **ulTaskGetIdleRunTimePercent** (void)

`BaseType_t` **xTaskGenericNotifyWait** (`UBaseType_t` uxIndexToWaitOn, `uint32_t` ulBitsToClearOnEntry, `uint32_t` ulBitsToClearOnExit, `uint32_t` \*pulNotificationValue, `TickType_t` xTicksToWait)

Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWaitIndexed()` or `ulTaskNotifyTakeIndexed()` (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use `xTaskNotifyWaitIndexed()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyWait()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotifyWait()` is equivalent to calling `xTaskNotifyWaitIndexed()` with the `uxIndexToWaitOn` parameter set to 0.

#### 参数

- **uxIndexToWaitOn** -- The index within the calling task's array of notification values on which the calling task will wait for a notification to be received. `uxIndexToWaitOn` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyWait()` does not have this parameter and always waits for notifications on index 0.
- **ulBitsToClearOnEntry** -- Bits that are set in `ulBitsToClearOnEntry` value will be cleared in the calling task's notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting `ulBitsToClearOnEntry` to `ULONG_MAX` (if `limits.h` is included) or `0xffffffffUL` (if `limits.h` is not included) will have the effect of resetting the task's notification value to 0. Setting `ulBitsToClearOnEntry` to 0 will leave the task's notification value unchanged.
- **ulBitsToClearOnExit** -- If a notification is pending or received before the calling task exits the `xTaskNotifyWait()` function then the task's notification value (see the `xTaskNotify()` API function) is passed out using the `pulNotificationValue` parameter. Then any

bits that are set in `ulBitsToClearOnExit` will be cleared in the task's notification value (note `*pulNotificationValue` is set before any bits are cleared). Setting `ulBitsToClearOnExit` to `ULONG_MAX` (if `limits.h` is included) or `0xffffffffUL` (if `limits.h` is not included) will have the effect of resetting the task's notification value to 0 before the function exits. Setting `ulBitsToClearOnExit` to 0 will leave the task's notification value unchanged when the function exits (in which case the value passed out in `pulNotificationValue` will match the task's notification value).

- **`pulNotificationValue`** -- Used to pass the task's notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by `ulBitsToClearOnExit` being non-zero.
- **`xTicksToWait`** -- The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when `xTaskNotifyWait()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS( value_in_ms )` can be used to convert a time specified in milliseconds to a time specified in ticks.

**返回** If a notification was received (including notifications that were already pending when `xTaskNotifyWait` was called) then `pdPASS` is returned. Otherwise `pdFAIL` is returned.

void **`vTaskGenericNotifyGiveFromISR`** (*TaskHandle\_t* xTaskToNotify, *UBaseType\_t* uxIndexToNotify, *BaseType\_t* \*pxHigherPriorityTaskWoken)

A version of `xTaskNotifyGiveIndexed()` that can be called from an interrupt service routine (ISR).

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for more details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this macro to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`vTaskNotifyGiveIndexedFromISR()` is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the `xSemaphoreGiveFromISR()` API function, the equivalent action that instead uses a task notification is `vTaskNotifyGiveIndexedFromISR()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotifyTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyFromISR()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyGiveFromISR()` is equivalent to calling `xTaskNotifyGiveIndexedFromISR()` with the `uxIndexToNotify` parameter set to 0.

#### 参数

- **`xTaskToNotify`** -- The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.

- **uxIndexToNotify** -- The index within the target task's array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyGiveFromISR()` does not have this parameter and always sends notifications to index 0.
- **pxHigherPriorityTaskWoken** -- `vTaskNotifyGiveFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If `vTaskNotifyGiveFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

BaseType\_t **xTaskGenericNotifyStateClear** (*TaskHandle\_t* xTask, UBaseType\_t uxIndexToClear)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be 'pending' until it is read or explicitly cleared by the receiving task. `xTaskNotifyStateClearIndexed()` is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set `xTask` to `NULL` to clear the notification state of the calling task.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyStateClear()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyStateClear()` is equivalent to calling `xTaskNotifyStateClearIndexed()` with the `uxIndexToNotify` parameter set to 0.

#### 参数

- **xTask** -- The handle of the RTOS task that will have a notification state cleared. Set `xTask` to `NULL` to clear a notification state in the calling task. To obtain a task's handle create the task using `xTaskCreate()` and make use of the `pxCreatedTask` parameter, or create the task using `xTaskCreateStatic()` and store the returned value, or use the task's name in a call to `xTaskGetHandle()`.
- **uxIndexToClear** -- The index within the target task's array of notification values to act upon. For example, setting `uxIndexToClear` to 1 will clear the state of the notification at index 1 within the array. `uxIndexToClear` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `ulTaskNotifyStateClear()` does not have this parameter and always acts on the notification at index 0.

**返回** `pdTRUE` if the task's notification state was set to `eNotWaitingNotification`, otherwise `pdFALSE`.

uint32\_t **ulTaskGenericNotifyValueClear** (*TaskHandle\_t* xTask, UBaseType\_t uxIndexToClear, uint32\_t ulBitsToClear)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

`ulTaskNotifyValueClearIndexed()` clears the bits specified by the `ulBitsToClear` bit mask in the notification value at array index `uxIndexToClear` of the task referenced by `xTask`.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `ulTaskNotifyValueClear()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `ulTaskNotifyValueClear()` is equivalent to calling `ulTaskNotifyValueClearIndexed()` with the `uxIndexToClear` parameter set to 0.

#### 参数

- **xTask** -- The handle of the RTOS task that will have bits in one of its notification values cleared. Set `xTask` to `NULL` to clear bits in a notification value of the calling task. To obtain a task's handle create the task using `xTaskCreate()` and make use of the `pxCreatedTask` parameter, or create the task using `xTaskCreateStatic()` and store the returned value, or use the task's name in a call to `xTaskGetHandle()`.
- **uxIndexToClear** -- The index within the target task's array of notification values in which to clear the bits. `uxIndexToClear` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `ulTaskNotifyValueClear()` does not have this parameter and always clears bits in the notification value at index 0.
- **ulBitsToClear** -- Bit mask of the bits to clear in the notification value of `xTask`. Set a bit to 1 to clear the corresponding bits in the task's notification value. Set `ulBitsToClear` to `0xffffffff` (`UINT_MAX` on 32-bit architectures) to clear the notification value to 0. Set `ulBitsToClear` to 0 to query the task's notification value without clearing any bits.

**返回** The value of the target task's notification value before the bits specified by `ulBitsToClear` were cleared.

void **vTaskSetTimeoutState** (Timeout\_t \*const pxTimeout)

Capture the current time for future use with `xTaskCheckForTimeout()`.

**参数 pxTimeout** -- Pointer to a timeout object into which the current time is to be captured. The captured time includes the tick count and the number of times the tick count has overflowed since the system first booted.

BaseType\_t **xTaskCheckForTimeout** (Timeout\_t \*const pxTimeout, TickType\_t \*const pxTicksToWait)

Determines if `pxTicksToWait` ticks has passed since a time was captured using a call to `vTaskSetTimeoutState()`. The captured time includes the tick count and the number of times the tick count has overflowed.

#### Example Usage:

```
// Driver library function used to receive uxWantedBytes from an Rx buffer
// that is filled by a UART interrupt. If there are not enough bytes in the
// Rx buffer then the task enters the Blocked state until it is notified that
// more data has been placed into the buffer. If there is still not enough
// data then the task re-enters the Blocked state, and xTaskCheckForTimeout()
// is used to re-calculate the Block time to ensure the total amount of time
// spent in the Blocked state does not exceed MAX_TIME_TO_WAIT. This
// continues until either the buffer contains at least uxWantedBytes bytes,
// or the total amount of time spent in the Blocked state reaches
// MAX_TIME_TO_WAIT - at which point the task reads however many bytes are
// available up to a maximum of uxWantedBytes.

size_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    Timeout_t xTimeout;

    // Initialize xTimeout. This records the time at which this function
    // was entered.
    vTaskSetTimeoutState( &xTimeout );

    // Loop until the buffer contains the wanted number of bytes, or a
```

(下页继续)

```

// timeout occurs.
while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
{
// The buffer didn't contain enough data so this task is going to
// enter the Blocked state. Adjusting xTicksToWait to account for
// any time that has been spent in the Blocked state within this
// function so far to ensure the total amount of time spent in the
// Blocked state does not exceed MAX_TIME_TO_WAIT.
if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
{
//Timed out before the wanted number of bytes were available,
// exit the loop.
break;
}

// Wait for a maximum of xTicksToWait ticks to be notified that the
// receive interrupt has placed more data into the buffer.
ulTaskNotifyTake( pdTRUE, xTicksToWait );
}

// Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
// The actual number of bytes read (which might be less than
// uxWantedBytes) is returned.
uxReceived = UART_read_from_receive_buffer( pxUARTInstance,
                                             pucBuffer,
                                             uxWantedBytes );

return uxReceived;
}

```

**参见:**

<https://www.FreeRTOS.org/xTaskCheckForTimeOut.html>

**参数**

- **pxTimeOut** -- The time status as captured previously using `vTaskSetTimeOutState`. If the timeout has not yet occurred, it is updated to reflect the current time status.
- **pxTicksToWait** -- The number of ticks to check for timeout i.e. if `pxTicksToWait` ticks have passed since `pxTimeOut` was last updated (either by `vTaskSetTimeOutState()` or `xTaskCheckForTimeOut()`), the timeout has occurred. If the timeout has not occurred, `pxTicksToWait` is updated to reflect the number of remaining ticks.

**返回** If timeout has occurred, `pdTRUE` is returned. Otherwise `pdFALSE` is returned and `pxTicksToWait` is updated to reflect the number of remaining ticks.

**BaseType\_t xTaskCatchUpTicks** (TickType\_t xTicksToCatchUp)

This function corrects the tick count value after the application code has held interrupts disabled for an extended period resulting in tick interrupts having been missed.

This function is similar to `vTaskStepTick()`, however, unlike `vTaskStepTick()`, `xTaskCatchUpTicks()` may move the tick count forward past a time at which a task should be removed from the blocked state. That means tasks may have to be removed from the blocked state as the tick count is moved.

**参数** **xTicksToCatchUp** -- The number of tick interrupts that have been missed due to interrupts being disabled. Its value is not computed automatically, so must be computed by the application writer.

**返回** `pdTRUE` if moving the tick count forward resulted in a task leaving the blocked state and a context switch being performed. Otherwise `pdFALSE`.

**Structures**

struct **xTASK\_STATUS**

Used with the uxTaskGetSystemState() function to return the state of each task in the system.

### Public Members

*TaskHandle\_t* **xHandle**

The handle of the task to which the rest of the information in the structure relates.

const char \***pcTaskName**

A pointer to the task's name. This value will be invalid if the task was deleted since the structure was populated!

UBaseType\_t **xTaskNumber**

A number unique to the task.

*eTaskState* **eCurrentState**

The state in which the task existed when the structure was populated.

UBaseType\_t **uxCurrentPriority**

The priority at which the task was running (may be inherited) when the structure was populated.

UBaseType\_t **uxBasePriority**

The priority to which the task will return if the task's current priority has been inherited to avoid unbounded priority inversion when obtaining a mutex. Only valid if configUSE\_MUTEXES is defined as 1 in FreeRTOSConfig.h.

configRUN\_TIME\_COUNTER\_TYPE **ulRunTimeCounter**

The total run time allocated to the task so far, as defined by the run time stats clock. See <https://www.FreeRTOS.org/rtos-run-time-stats.html>. Only valid when configGENERATE\_RUN\_TIME\_STATS is defined as 1 in FreeRTOSConfig.h.

StackType\_t \***pxStackBase**

Points to the lowest address of the task's stack area.

configSTACK\_DEPTH\_TYPE **usStackHighWaterMark**

The minimum amount of stack space that has remained for the task since the task was created. The closer this value is to zero the closer the task has come to overflowing its stack.

BaseType\_t **xCoreID**

Core this task is pinned to (0, 1, or tskNO\_AFFINITY). If configNUMBER\_OF\_CORES == 1, this will always be 0.

### Macros

**tskIDLE\_PRIORITY**

Defines the priority used by the idle task. This must not be modified.

**tskNO\_AFFINITY**

Macro representing and unpinned (i.e., "no affinity") task in xCoreID parameters

**taskVALID\_CORE\_ID** (xCoreID)

Macro to check if an xCoreID value is valid

返回 pdTRUE if valid, pdFALSE otherwise.

**taskYIELD** ()

Macro for forcing a context switch.

**taskENTER\_CRITICAL** (x)

Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

NOTE: This may alter the stack (depending on the portable implementation) so must be used with care!

**taskENTER\_CRITICAL\_FROM\_ISR** ()**taskENTER\_CRITICAL\_ISR** (x)**taskEXIT\_CRITICAL** (x)

Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

NOTE: This may alter the stack (depending on the portable implementation) so must be used with care!

**taskEXIT\_CRITICAL\_FROM\_ISR** (x)**taskEXIT\_CRITICAL\_ISR** (x)**taskDISABLE\_INTERRUPTS** ()

Macro to disable all maskable interrupts.

**taskENABLE\_INTERRUPTS** ()

Macro to enable microcontroller interrupts.

**taskSCHEDULER\_SUSPENDED**

Definitions returned by xTaskGetSchedulerState(). taskSCHEDULER\_SUSPENDED is 0 to generate more optimal code when configASSERT() is defined as the constant is used in assert() statements.

**taskSCHEDULER\_NOT\_STARTED****taskSCHEDULER\_RUNNING****xTaskNotifyIndexed** (xTaskToNotify, uxIndexToNotify, ulValue, eAction)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

configUSE\_TASK\_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32\_t). The constant configTASK\_NOTIFICATION\_ARRAY\_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification to be pending. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWaitIndexed()` or `ulTaskNotifyTakeIndexed()` (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotify()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotify()` is equivalent to calling `xTaskNotifyIndexed()` with the `uxIndexToNotify` parameter set to 0.

`eSetBits` - The target notification value is bitwise ORed with `ulValue`. `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

`eIncrement` - The target notification value is incremented. `ulValue` is not used and `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

`eSetValueWithOverwrite` - The target notification value is set to the value of `ulValue`, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

`eSetValueWithoutOverwrite` - If the task being notified did not already have a notification pending at the same array index then the target notification value is set to `ulValue` and `xTaskNotifyIndexed()` will return `pdPASS`. If the task being notified already had a notification pending at the same array index then no action is performed and `pdFAIL` is returned.

`eNoAction` - The task receives a notification at the specified array index without the notification value at that index being updated. `ulValue` is not used and `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

`pulPreviousNotificationValue` - Can be used to pass out the subject task's notification value before any bits are modified by the notify function.

#### 参数

- **`xTaskToNotify`** -- The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **`uxIndexToNotify`** -- The index within the target task's array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotify()` does not have this parameter and always sends notifications to index 0.
- **`ulValue`** -- Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.
- **`eAction`** -- Specifies how the notification updates the task's notification value, if at all. Valid values for `eAction` are as follows:

**返回** Dependent on the value of `eAction`. See the description of the `eAction` parameter.

**`xTaskNotifyAndQueryIndexed`** (`xTaskToNotify`, `uxIndexToNotify`, `ulValue`, `eAction`, `pulPreviousNotifyValue`)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`xTaskNotifyAndQueryIndexed()` performs the same operation as `xTaskNotifyIndexed()` with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than when the function returns) in the additional `pulPreviousNotifyValue` parameter.

`xTaskNotifyAndQuery()` performs the same operation as `xTaskNotify()` with the addition that it also returns the subject task's prior notification value (the notification value as it was at the time the function is called, rather than when the function returns) in the additional `pulPreviousNotifyValue` parameter.

**xTaskNotifyIndexedFromISR** (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

configUSE\_TASK\_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

A version of xTaskNotifyIndexed() that can be used from an interrupt service routine (ISR).

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32\_t). The constant configTASK\_NOTIFICATION\_ARRAY\_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyFromISR() is equivalent to calling xTaskNotifyIndexedFromISR() with the uxIndexToNotify parameter set to 0.

eSetBits - The task's notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.

eIncrement - The task's notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

eSetValueWithOverwrite - The task's notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). xTaskNotify() always returns pdPASS in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending then the task's notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

#### 参数

- **uxIndexToNotify** -- The index within the target task's array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK\_NOTIFICATION\_ARRAY\_ENTRIES. xTaskNotifyFromISR() does not have this parameter and always sends notifications to index 0.

- **xTaskToNotify** -- The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **ulValue** -- Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.
- **eAction** -- Specifies how the notification updates the task's notification value, if at all. Valid values for `eAction` are as follows:
- **pxHigherPriorityTaskWoken** -- `xTaskNotifyFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If `xTaskNotifyFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

**返回** Dependent on the value of `eAction`. See the description of the `eAction` parameter.

**xTaskNotifyAndQueryIndexedFromISR** (`xTaskToNotify`, `uxIndexToNotify`, `ulValue`, `eAction`, `pulPreviousNotificationValue`, `pxHigherPriorityTaskWoken`)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`xTaskNotifyAndQueryIndexedFromISR()` performs the same operation as `xTaskNotifyIndexedFromISR()` with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional `pulPreviousNotificationValue` parameter.

`xTaskNotifyAndQueryFromISR()` performs the same operation as `xTaskNotifyFromISR()` with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional `pulPreviousNotificationValue` parameter.

**xTaskNotifyWait** (`ulBitsToClearOnEntry`, `ulBitsToClearOnExit`, `pulNotificationValue`, `xTicksToWait`)

**xTaskNotifyWaitIndexed** (`uxIndexToWaitOn`, `ulBitsToClearOnEntry`, `ulBitsToClearOnExit`, `pulNotificationValue`, `xTicksToWait`)

**xTaskNotifyGiveIndexed** (`xTaskToNotify`, `uxIndexToNotify`)

Sends a direct to task notification to a particular index in the target task's notification array in a manner similar to giving a counting semaphore.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for more details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these macros to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`xTaskNotifyGiveIndexed()` is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the `xSemaphoreGive()` API function, the equivalent action that instead uses a task notification is `xTaskNotifyGiveIndexed()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotifyTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyGive()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotifyGive()` is equivalent to calling `xTaskNotifyGiveIndexed()` with the `uxIndexToNotify` parameter set to 0.

#### 参数

- **xTaskToNotify** -- The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **uxIndexToNotify** -- The index within the target task's array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyGive()` does not have this parameter and always sends notifications to index 0.

**返回** `xTaskNotifyGive()` is a macro that calls `xTaskNotify()` with the `eAction` parameter set to `eIncrement` - so `pdPASS` is always returned.

**vTaskNotifyGiveFromISR** (`xTaskToNotify`, `pxHigherPriorityTaskWoken`)

**vTaskNotifyGiveIndexedFromISR** (`xTaskToNotify`, `uxIndexToNotify`, `pxHigherPriorityTaskWoken`)

**ulTaskNotifyTakeIndexed** (`uxIndexToWaitOn`, `xClearCountOnExit`, `xTicksToWait`)

Waits for a direct to task notification on a particular index in the calling task's notification array in a manner similar to taking a counting semaphore.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`ulTaskNotifyTakeIndexed()` is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the `xSemaphoreTake()` API function, the equivalent action that instead uses a task notification is `ulTaskNotifyTakeIndexed()`.

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the `xTaskNotifyGiveIndexed()` macro, or `xTaskNotifyIndex()` function with the `eAction` parameter set to `eIncrement`.

`ulTaskNotifyTakeIndexed()` can either clear the task's notification value at the array index specified by the `uxIndexToWaitOn` parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification. The task does not consume any CPU time while it is in the Blocked state.

Where as `xTaskNotifyWaitIndexed()` will return when a notification is pending, `ulTaskNotifyTakeIndexed()` will return when the task's notification value is not zero.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `ulTaskNotifyTake()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `ulTaskNotifyTake()` is equivalent to calling `ulTaskNotifyTakeIndexed()` with the `uxIndexToWaitOn` parameter set to 0.

#### 参数

- **uxIndexToWaitOn** -- The index within the calling task's array of notification values on which the calling task will wait for a notification to be non-zero. `uxIndexToWaitOn` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyTake()` does not have this parameter and always waits for notifications on index 0.
- **xClearCountOnExit** -- if `xClearCountOnExit` is `pdFALSE` then the task's notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If `xClearCountOnExit` is not `pdFALSE` then the task's notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.
- **xTicksToWait** -- The maximum amount of time that the task should wait in the Blocked state for the task's notification value to be greater than zero, should the count not already be greater than zero when `ulTaskNotifyTake()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS( value_in_ms )` can be used to convert a time specified in milliseconds to a time specified in ticks.

**返回** The task's notification count before it is either cleared to zero or decremented (see the `xClearCountOnExit` parameter).

**xTaskNotifyStateClear** (xTask)

**xTaskNotifyStateClearIndexed** (xTask, uxIndexToClear)

**ulTaskNotifyValueClear** (xTask, ulBitsToClear)

**ulTaskNotifyValueClearIndexed** (xTask, uxIndexToClear, ulBitsToClear)

### Type Definitions

```
typedef struct tskTaskControlBlock *TaskHandle_t
```

```
typedef BaseType_t (*TaskHookFunction_t)(void*)
```

Defines the prototype to which the application task hook function must conform.

```
typedef struct xTASK_STATUS TaskStatus_t
```

Used with the `uxTaskGetSystemState()` function to return the state of each task in the system.

### Enumerations

```
enum eTaskState
```

Task states returned by `eTaskGetState`.

*Values:*

```
enumerator eRunning
```

A task is querying the state of itself, so must be running.

```
enumerator eReady
```

The task being queried is in a ready or pending ready list.

enumerator **eBlocked**

The task being queried is in the Blocked state.

enumerator **eSuspended**

The task being queried is in the Suspended state, or is in the Blocked state with an infinite time out.

enumerator **eDeleted**

The task being queried has been deleted, but its TCB has not yet been freed.

enumerator **eInvalid**

Used as an 'invalid state' value.

enum **eNotifyAction**

Actions that can be performed when vTaskNotify() is called.

*Values:*

enumerator **eNoAction**

Notify the task without updating its notify value.

enumerator **eSetBits**

Set bits in the task's notification value.

enumerator **eIncrement**

Increment the task's notification value.

enumerator **eSetValueWithOverwrite**

Set the task's notification value to a specific value even if the previous value has not yet been read by the task.

enumerator **eSetValueWithoutOverwrite**

Set the task's notification value if the previous value has been read by the task.

enum **eSleepModeStatus**

Possible return values for eTaskConfirmSleepModeStatus().

*Values:*

enumerator **eAbortSleep**

A task has been made ready or a context switch pended since portSUPPRESS\_TICKS\_AND\_SLEEP() was called - abort entering a sleep mode.

enumerator **eStandardSleep**

Enter a sleep mode that will not last any longer than the expected idle time.

## 队列 API

### Header File

- [components/freertos/FreeRTOS-Kernel/include/freertos/queue.h](#)
- This header file can be included with:

```
#include "freertos/queue.h"
```

## Functions

BaseType\_t **xQueueGenericSend** (*QueueHandle\_t* xQueue, const void \*const pvItemToQueue, TickType\_t xTicksToWait, const BaseType\_t xCopyPosition)

It is preferred that the macros `xQueueSend()`, `xQueueSendToFront()` and `xQueueSendToBack()` are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR()` for an alternative which may be used in an ISR.

Example usage:

```
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10,
            ←queueSEND_TO_BACK ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueGenericSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0,
            ←queueSEND_TO_BACK );
    }

    // ... Rest of task code.
}
```

## 参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required.
- **xCopyPosition** -- Can take the value queueSEND\_TO\_BACK to place the item at the back of the queue, or queueSEND\_TO\_FRONT to place the item at the front of the queue (for high priority messages).

返回 pdTRUE if the item was successfully posted, otherwise errQUEUE\_FULL.

BaseType\_t **xQueuePeek** (*QueueHandle\_t* xQueue, void \*const pvBuffer, TickType\_t xTicksToWait)

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

This macro must not be used in an interrupt service routine. See xQueuePeekFromISR() for an alternative that can be called from an interrupt service routine.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{

```

(下页继续)

```

struct AMessage *pxRxdMessage;

if( xQueue != 0 )
{
// Peek a message on the created queue. Block for 10 ticks if a
// message is not immediately available.
if( xQueuePeek( xQueue, &( pxRxdMessage ), ( TickType_t ) 10 ) )
{
// pxRxdMessage now points to the struct AMessage variable posted
// by vATask, but the item still remains on the queue.
}
}

// ... Rest of task code.
}

```

**参数**

- **xQueue** -- The handle to the queue from which the item is to be received.
- **pvBuffer** -- Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

**返回** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType\_t **xQueuePeekFromISR** (*QueueHandle\_t* xQueue, void \*const pvBuffer)

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

**参数**

- **xQueue** -- The handle to the queue from which the item is to be received.
- **pvBuffer** -- Pointer to the buffer into which the received item will be copied.

**返回** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType\_t **xQueueReceive** (*QueueHandle\_t* xQueue, void \*const pvBuffer, TickType\_t xTicksToWait)

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```

struct AMessage
{
char ucMessageID;
char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

```

```

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pRxedMessage;

    if( xQueue != 0 )
    {
        // Receive a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if( xQueueReceive( xQueue, &( pRxedMessage ), ( TickType_t ) 10 ) )
        {
            // pRxedMessage now points to the struct AMessage variable posted
            // by vATask.
        }
    }

    // ... Rest of task code.
}

```

**参数**

- **xQueue** -- The handle to the queue from which the item is to be received.
- **pvBuffer** -- Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. `xQueueReceive()` will return immediately if `xTicksToWait` is zero and the queue is empty. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

**返回** `pdTRUE` if an item was successfully received from the queue, otherwise `pdFALSE`.

`UBaseType_t uxQueueMessagesWaiting` (const [QueueHandle\\_t](#) xQueue)

Return the number of messages stored in a queue.

**参数** **xQueue** -- A handle to the queue being queried.

**返回** The number of messages available in the queue.

`UBaseType_t uxQueueSpacesAvailable` (const [QueueHandle\\_t](#) xQueue)

Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

**参数** **xQueue** -- A handle to the queue being queried.

**返回** The number of spaces available in the queue.

void **vQueueDelete** (*QueueHandle\_t* xQueue)

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

**参数** **xQueue** -- A handle to the queue to be deleted.

BaseType\_t **xQueueGenericSendFromISR** (*QueueHandle\_t* xQueue, const void \*const pvItemToQueue, BaseType\_t \*const pxHigherPriorityTaskWoken, const BaseType\_t xCopyPosition)

It is preferred that the macros `xQueueSendFromISR()`, `xQueueSendToFrontFromISR()` and `xQueueSendToBackFromISR()` be used in place of calling this function directly. `xQueueGiveFromISR()` is an equivalent for use by semaphores that don't actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWokenByPost;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWokenByPost = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post each byte.
        xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost,
        ↪ queueSEND_TO_BACK );

    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary. Note that the
    // name of the yield function required is port specific.
    if( xHigherPriorityTaskWokenByPost )
    {
        portYIELD_FROM_ISR();
    }
}
```

#### 参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- **pxHigherPriorityTaskWoken** -- `xQueueGenericSendFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending to the queue caused a task to unblock,

and the unblocked task has a priority higher than the currently running task. If `xQueueGenericSendFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.

- **xCopyPosition** -- Can take the value `queueSEND_TO_BACK` to place the item at the back of the queue, or `queueSEND_TO_FRONT` to place the item at the front of the queue (for high priority messages).

返回 `pdTRUE` if the data was successfully sent to the queue, otherwise `errQUEUE_FULL`.

`BaseType_t xQueueGiveFromISR ( QueueHandle_t xQueue, BaseType_t *const pxHigherPriorityTaskWoken )`

`BaseType_t xQueueReceiveFromISR ( QueueHandle_t xQueue, void *const pvBuffer, BaseType_t *const pxHigherPriorityTaskWoken )`

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

```
QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction( void *pvParameters )
{
    char cValueToPost;
    const TickType_t xTicksToWait = ( TickType_t )0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate( 10, sizeof( char ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Post some characters that will be used within an ISR. If the queue
    // is full then this task will block for xTicksToWait ticks.
    cValueToPost = 'a';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
    cValueToPost = 'b';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

    // ... keep posting characters ... this task may block when the queue
    // becomes full.

    cValueToPost = 'c';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
    BaseType_t xTaskWokenByReceive = pdFALSE;
    char cRxdChar;

    while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxdChar, &
    ↪xTaskWokenByReceive) )
    {
        // A character was received. Output the character now.
        vOutputCharacter( cRxdChar );

        // If removing the character from the queue woke the task that was
```

(下页继续)

```

// posting onto the queue xTaskWokenByReceive will have been set to
// pdTRUE. No matter how many times this loop iterates only one
// task will be woken.
}

if( xTaskWokenByReceive != ( char ) pdFALSE;
{
    taskYIELD ();
}
}

```

**参数**

- **xQueue** -- The handle to the queue from which the item is to be received.
- **pvBuffer** -- Pointer to the buffer into which the received item will be copied.
- **pxHigherPriorityTaskWoken** -- A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock \*pxTaskWoken will get set to pdTRUE, otherwise \*pxTaskWoken will remain unchanged.

**返回** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType\_t **xQueueIsQueueEmptyFromISR** (const [QueueHandle\\_t](#) xQueue)

Queries a queue to determine if the queue is empty. This function should only be used in an ISR.

**参数** **xQueue** -- The handle of the queue being queried

**返回** pdFALSE if the queue is not empty, or pdTRUE if the queue is empty.

BaseType\_t **xQueueIsQueueFullFromISR** (const [QueueHandle\\_t](#) xQueue)

Queries a queue to determine if the queue is full. This function should only be used in an ISR.

**参数** **xQueue** -- The handle of the queue being queried

**返回** pdFALSE if the queue is not full, or pdTRUE if the queue is full.

UBaseType\_t **uxQueueMessagesWaitingFromISR** (const [QueueHandle\\_t](#) xQueue)

A version of uxQueueMessagesWaiting() that can be called from an ISR. Return the number of messages stored in a queue.

**参数** **xQueue** -- A handle to the queue being queried.

**返回** The number of messages available in the queue.

void **vQueueAddToRegistry** ([QueueHandle\\_t](#) xQueue, const char \*pcQueueName)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

configQUEUE\_REGISTRY\_SIZE defines the maximum number of handles the registry can hold. configQUEUE\_REGISTRY\_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not affect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

If vQueueAddToRegistry is called more than once with the same xQueue parameter, the registry will store the pcQueueName parameter from the most recent call to vQueueAddToRegistry.

**参数**

- **xQueue** -- The handle of the queue being added to the registry. This is the handle returned by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.
- **pcQueueName** -- The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

void **vQueueUnregisterQueue** (*QueueHandle\_t* xQueue)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `vQueueAddToRegistry()` add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and `vQueueUnregisterQueue()` to remove the queue, semaphore or mutex from the register. If you are not using a kernel aware debugger then this function can be ignored.

**参数 xQueue** -- The handle of the queue being removed from the registry.

const char \***pcQueueGetName** (*QueueHandle\_t* xQueue)

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `pcQueueGetName()` to look up and return the name of a queue in the queue registry from the queue's handle.

**参数 xQueue** -- The handle of the queue the name of which will be returned.

**返回** If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

*QueueSetHandle\_t* **xQueueCreateSet** (const UBaseType\_t uxEventQueueLength)

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See `FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c` for an example using this function.

A queue set must be explicitly created using a call to `xQueueCreateSet()` before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to `xQueueAddToSet()`. `xQueueSelectFromSet()` is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on <https://www.FreeRTOS.org/RTOS-queue-sets.html> for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

**参数 uxEventQueueLength** -- Queue sets store events that occur on the queues and semaphores contained in the set. `uxEventQueueLength` specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost `uxEventQueueLength` should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:

- If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then `uxEventQueueLength` should be set to  $(5 + 12 + 1)$ , or 18.
- If a queue set is to hold three binary semaphores then `uxEventQueueLength` should be set to  $(1 + 1 + 1)$ , or 3.
- If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then `uxEventQueueLength` should be set to  $(5 + 3)$ , or 8.

**返回** If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

BaseType\_t **xQueueAddToSet** (*QueueSetMemberHandle\_t* xQueueOrSemaphore, *QueueSetHandle\_t* xQueueSet)

Adds a queue or semaphore to a queue set that was previously created by a call to `xQueueCreateSet()`.

See `FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c` for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

#### 参数

- **xQueueOrSemaphore** -- The handle of the queue or semaphore being added to the queue set (cast to an `QueueSetMemberHandle_t` type).
- **xQueueSet** -- The handle of the queue set to which the queue or semaphore is being added.

**返回** If the queue or semaphore was successfully added to the queue set then `pdPASS` is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then `pdFAIL` is returned.

BaseType\_t **xQueueRemoveFromSet** (*QueueSetMemberHandle\_t* xQueueOrSemaphore, *QueueSetHandle\_t* xQueueSet)

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See `FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c` for an example using this function.

#### 参数

- **xQueueOrSemaphore** -- The handle of the queue or semaphore being removed from the queue set (cast to an `QueueSetMemberHandle_t` type).
- **xQueueSet** -- The handle of the queue set in which the queue or semaphore is included.

**返回** If the queue or semaphore was successfully removed from the queue set then `pdPASS` is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then `pdFAIL` is returned.

*QueueSetMemberHandle\_t* **xQueueSelectFromSet** (*QueueSetHandle\_t* xQueueSet, const TickType\_t xTicksToWait)

`xQueueSelectFromSet()` selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). `xQueueSelectFromSet()` effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See `FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c` for an example using this function.

Note 1: See the documentation on <https://www.FreeRTOS.org/RTOS-queue-sets.html> for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

#### 参数

- **xQueueSet** -- The queue set on which the task will (potentially) block.
- **xTicksToWait** -- The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

**返回** `xQueueSelectFromSet()` will return the handle of a queue (cast to a `QueueSetMemberHandle_t` type) contained in the queue set that contains data, or the handle of a semaphore (cast to a `QueueSetMemberHandle_t` type) contained in the queue set that is available, or `NULL` if no such queue or semaphore exists before before the specified block time expires.

*QueueSetMemberHandle\_t* **xQueueSelectFromSetFromISR** (*QueueSetHandle\_t* xQueueSet)

A version of `xQueueSelectFromSet()` that can be used from an ISR.

## Macros

**xQueueCreate** (uxQueueLength, uxItemSize)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using `xQueueCreate()` then both blocks of memory are automatically dynamically allocated inside the `xQueueCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a queue is created using `xQueueCreateStatic()` then the application writer must provide the memory that will get used by the queue. `xQueueCreateStatic()` therefore allows a queue to be created without using any dynamic memory allocation.

<https://www.FreeRTOS.org/Embedded-RTOS-Queues.html>

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue2 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // ... Rest of task code.
}

```

**参数**

- **uxQueueLength** -- The maximum number of items that the queue can contain.
- **uxItemSize** -- The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

**返回** If the queue is successfully create then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

**xQueueCreateStatic** (uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using `xQueueCreate()` then both blocks of memory are automatically dynamically allocated inside the `xQueueCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a queue is created using `xQueueCreateStatic()` then the application writer must provide the memory that will get used by the queue. `xQueueCreateStatic()` therefore allows a queue to be created without using any dynamic memory allocation.

<https://www.FreeRTOS.org/Embedded-RTOS-Queues.html>

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [(queue length) * (queue item size)] bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can
    →hold.
                                ITEM_SIZE // The size of each item in the queue
    →hold the items in the queue.
                                &( ucQueueStorage[ 0 ] ), // The buffer that will
    →queue structure.
                                &xQueueBuffer ); // The buffer that will hold the

    // The queue is guaranteed to be created successfully as no dynamic memory
    // allocation is used. Therefore xQueue1 is now a handle to a valid queue.

    // ... Rest of task code.
}

```

### 参数

- **uxQueueLength** -- The maximum number of items that the queue can contain.
- **uxItemSize** -- The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
- **pucQueueStorage** -- If **uxItemSize** is not zero then **pucQueueStorage** must point to a **uint8\_t** array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is ( **uxQueueLength** \* **uxItemsSize** ) bytes. If **uxItemSize** is zero then **pucQueueStorage** can be **NULL**.
- **pxQueueBuffer** -- Must point to a variable of type **StaticQueue\_t**, which will be used to hold the queue's data structure.

**返回** If the queue is created then a handle to the created queue is returned. If **pxQueueBuffer** is **NULL** then **NULL** is returned.

**xQueueGetStaticBuffers** (xQueue, pucQueueStorage, ppxStaticQueue)

Retrieve pointers to a statically created queue's data structure buffer and storage area buffer. These are the same buffers that are supplied at the time of creation.

### 参数

- **xQueue** -- The queue for which to retrieve the buffers.
- **ppucQueueStorage** -- Used to return a pointer to the queue's storage area buffer.
- **ppxStaticQueue** -- Used to return a pointer to the queue's data structure buffer.

返回 pdTRUE if buffers were retrieved, pdFALSE otherwise.

**xQueueSendToFront** (xQueue, pvItemToQueue, xTicksToWait)

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.
}

```

### 参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods

so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

返回 `pdTRUE` if the item was successfully posted, otherwise `errQUEUE_FULL`.

#### **xQueueSendToBack** (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls `xQueueGenericSend()`.

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR()` for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.
}

```

#### 参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes

will be copied from pvItemToQueue into the queue storage area.

- **xTicksToWait** -- The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required.

返回 pdTRUE if the item was successfully posted, otherwise errQUEUE\_FULL.

#### **xQueueSend** (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equivalent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.
}

```

**参数**

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required.

**返回** pdTRUE if the item was successfully posted, otherwise errQUEUE\_FULL.

**xQueueOverwrite** (xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See xQueueOverwriteFromISR () for an alternative which may be used in an ISR.

Example usage:

```
void vFunction( void *pvParameters )
{
QueueHandle_t xQueue;
uint32_t ulVarToSend, ulValReceived;

// Create a queue to hold one uint32_t value. It is strongly
// recommended *not* to use xQueueOverwrite() on queues that can
// contain more than one value, and doing so will trigger an assertion
// if configASSERT() is defined.
xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

// Write the value 10 to the queue using xQueueOverwrite().
ulVarToSend = 10;
xQueueOverwrite( xQueue, &ulVarToSend );

// Peeking the queue should now return 10, but leave the value 10 in
// the queue. A block time of zero is used as it is known that the
// queue holds a value.
ulValReceived = 0;
xQueuePeek( xQueue, &ulValReceived, 0 );

if( ulValReceived != 10 )
{
// Error unless the item was removed by a different task.
}

// The queue is still full. Use xQueueOverwrite() to overwrite the
// value held in the queue with 100.
ulVarToSend = 100;
xQueueOverwrite( xQueue, &ulVarToSend );

// This time read from the queue, leaving the queue empty once more.
// A block time of 0 is used again.
xQueueReceive( xQueue, &ulValReceived, 0 );

// The value read should be the last value written, even though the
// queue was already full when the value was written.
```

(下页继续)

```

if( ulValReceived != 100 )
{
// Error!
}

// ...
}

```

**参数**

- **xQueue** -- The handle of the queue to which the data is being sent.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.

**返回** xQueueOverwrite() is a macro that calls xQueueGenericSend(), and therefore has the same return values as xQueueSendToFront(). However, pdPASS is the only value that can be returned because xQueueOverwrite() will write to the queue even when the queue is already full.

**xQueueSendToFrontFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```

void vBufferISR( void )
{
char cIn;
BaseType_t xHigherPriorityTaskWoken;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWoken = pdFALSE;

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post the byte.
xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
taskYIELD ();
}
}

```

**参数**

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.

- **pxHigherPriorityTaskWoken** -- `xQueueSendToFrontFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueSendToFrontFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.

返回 `pdTRUE` if the data was successfully sent to the queue, otherwise `errQUEUE_FULL`.

**xQueueSendToBackFromISR** (`xQueue`, `pvItemToQueue`, `pxHigherPriorityTaskWoken`)

This is a macro that calls `xQueueGenericSendFromISR()`.

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        taskYIELD ();
    }
}
```

#### 参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- **pxHigherPriorityTaskWoken** -- `xQueueSendToBackFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueSendToBackFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.

返回 `pdTRUE` if the data was successfully sent to the queue, otherwise `errQUEUE_FULL`.

**xQueueOverwriteFromISR** (`xQueue`, `pvItemToQueue`, `pxHigherPriorityTaskWoken`)

A version of `xQueueOverwrite()` that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```
QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwriteFromISR() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler( void )
{
    // xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    uint32_t ulVarToSend, ulValReceived;

    // Write the value 10 to the queue using xQueueOverwriteFromISR().
    ulVarToSend = 10;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // The queue is full, but calling xQueueOverwriteFromISR() again will still
    // pass because the value held in the queue will be overwritten with the
    // new value.
    ulVarToSend = 100;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // Reading from the queue will now return 100.

    // ...

    if( xHigherPriorityTaskWoken == pdTRUE )
    {
        // Writing to the queue caused a task to unblock and the unblocked task
        // has a priority higher than or equal to the priority of the currently
        // executing task (the task this interrupt interrupted). Perform a context
        // switch so this interrupt returns directly to the unblocked task.
        portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
    }
}
```

### 参数

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** -- xQueueOverwriteFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**返回** xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

**xQueueSendFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls `xQueueGenericSendFromISR()`. It is included for backward compatibility with versions of FreeRTOS.org that did not include the `xQueueSendToBackFromISR()` and `xQueueSendToFrontFromISR()` macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        // Actual macro used here is port specific.
        portYIELD_FROM_ISR ();
    }
}
```

**参数**

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- **pxHigherPriorityTaskWoken** -- `xQueueSendFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueSendFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.

**返回** `pdTRUE` if the data was successfully sent to the queue, otherwise `errQUEUE_FULL`.

**xQueueReset** (xQueue)

Reset a queue back to its original empty state. The return value is now obsolete and is always set to `pdPASS`.

**Type Definitions**

```
typedef struct QueueDefinition *QueueHandle_t
```

typedef struct QueueDefinition \***QueueSetHandle\_t**

Type by which queue sets are referenced. For example, a call to `xQueueCreateSet()` returns an `xQueueSet` variable that can then be used as a parameter to `xQueueSelectFromSet()`, `xQueueAddToSet()`, etc.

typedef struct QueueDefinition \***QueueSetMemberHandle\_t**

Queue sets can contain both queues and semaphores, so the `QueueSetMemberHandle_t` is defined as a type to be used where a parameter or return value can be either an `QueueHandle_t` or an `SemaphoreHandle_t`.

- This header file can be included with:

```
#include "freertos/semphr.h"
```

### Macros

**semBINARY\_SEMAPHORE\_QUEUE\_LENGTH**

**semSEMAPHORE\_QUEUE\_ITEM\_LENGTH**

**semGIVE\_BLOCK\_TIME**

**vSemaphoreCreateBinary** (`xSemaphore`)

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

This old `vSemaphoreCreateBinary()` macro is now deprecated in favour of the `xSemaphoreCreateBinary()` function. Note that binary semaphores created using the `vSemaphoreCreateBinary()` macro are created in a state such that the first call to 'take' the semaphore would pass, whereas binary semaphores created using `xSemaphoreCreateBinary()` are created in a state such that the the semaphore must first be 'given' before it can be 'taken'.

*Macro* that implements a semaphore by using the existing queue mechanism. The queue length is 1 as this is a binary semaphore. The data size is 0 as we don't want to actually store any data - we just want to know if the queue is empty or full.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously 'give' the semaphore while another continuously 'takes' the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary ().
    // This is a macro so pass the variable in directly.
    vSemaphoreCreateBinary( xSemaphore );
```

(下页继续)

```

if( xSemaphore != NULL )
{
// The semaphore was created successfully.
// The semaphore can now be used.
}
}

```

**参数**

- **xSemaphore** -- Handle to the created semaphore. Should be of type SemaphoreHandle\_t.

**xSemaphoreCreateBinary()**

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see <https://www.FreeRTOS.org/a00111.html>). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old vSemaphoreCreateBinary() macro is now deprecated in favour of this xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to 'take' the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the the semaphore must first be 'given' before it can be 'taken'.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously 'give' the semaphore while another continuously 'takes' the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```

SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
// Semaphore cannot be used before a call to xSemaphoreCreateBinary().
// This is a macro so pass the variable in directly.
xSemaphore = xSemaphoreCreateBinary();

if( xSemaphore != NULL )
{
// The semaphore was created successfully.
// The semaphore can now be used.
}
}

```

**返回** Handle to the created semaphore, or NULL if the memory required to hold the semaphore's data structures could not be allocated.

**xSemaphoreCreateBinaryStatic** (pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using `xSemaphoreCreateBinary()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateBinary()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a binary semaphore is created using `xSemaphoreCreateBinaryStatic()` then the application writer must provide the memory. `xSemaphoreCreateBinaryStatic()` therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously 'give' the semaphore while another continuously 'takes' the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary().
    // The semaphore's data structures will be placed in the xSemaphoreBuffer
    // variable, the address of which is passed into the function. The
    // function's parameter is not NULL, so the function will not attempt any
    // dynamic memory allocation, and therefore the function will not return
    // return NULL.
    xSemaphore = xSemaphoreCreateBinary( &xSemaphoreBuffer );

    // Rest of task code goes here.
}
```

#### 参数

- **pxStaticSemaphore** -- Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the semaphore's data structure, removing the need for the memory to be allocated dynamically.

**返回** If the semaphore is created then a handle to the created semaphore is returned. If `pxSemaphoreBuffer` is `NULL` then `NULL` is returned.

#### **xSemaphoreTake** (xSemaphore, xBlockTime)

*Macro* to obtain a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()`, `xSemaphoreCreateMutex()` or `xSemaphoreCreateCounting()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    xSemaphore = xSemaphoreCreateBinary();
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
```

(下页继续)

```

{
    // ... Do other things.

    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.

            // ...

            // We have finished accessing the shared resource. Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
        else
        {
            // We could not obtain the semaphore and can therefore not access
            // the shared resource safely.
        }
    }
}

```

**参数**

- **xSemaphore** -- A handle to the semaphore being taken - obtained when the semaphore was created.
- **xBlockTime** -- The time in ticks to wait for the semaphore to become available. The macro portTICK\_PERIOD\_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX\_DELAY can be used to block indefinitely (provided INCLUDE\_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

**返回** pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

**xSemaphoreTakeRecursive** (xMutex, xBlockTime)

Macro to recursively obtain, or 'take', a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE\_RECURSIVE\_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be 'taken' repeatedly by the owner. The mutex doesn't become available again until the owner has called xSemaphoreGiveRecursive() for each successful 'take' request. For example, if a task successfully 'takes' the same mutex 5 times then the mutex will not be available to any other task until it has also 'given' the mutex back exactly five times.

Example usage:

```

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

```

(下页继续)

```

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, but instead buried in a more complex
            // call structure. This is just for illustrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}

```

**参数**

- **xMutex** -- A handle to the mutex being obtained. This is the handle returned by `xSemaphoreCreateRecursiveMutex()`;
- **xBlockTime** -- The time in ticks to wait for the semaphore to become available. The macro `portTICK_PERIOD_MS` can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. If the task already owns the semaphore then `xSemaphoreTakeRecursive()` will return immediately no matter what the value of `xBlockTime`.

**返回** `pdTRUE` if the semaphore was obtained. `pdFALSE` if `xBlockTime` expired without the semaphore becoming available.

**xSemaphoreGive** (xSemaphore)

Macro to release a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()`, `xSemaphoreCreateMutex()` or `xSemaphoreCreateCounting()`. and obtained using `xSemaphoreTake()`.

This macro must not be used from an ISR. See `xSemaphoreGiveFromISR()` for an alternative which can be

used from an ISR.

This macro must also not be used on semaphores created using `xSemaphoreCreateRecursiveMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    xSemaphore = vSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        if( xSemaphoreGive( xSemaphore ) != pdTRUE )
        {
            // We would expect this call to fail because we cannot give
            // a semaphore without first "taking" it!
        }

        // Obtain the semaphore - don't block if the semaphore is not
        // immediately available.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
        {
            // We now have the semaphore and can access the shared resource.

            // ...

            // We have finished accessing the shared resource so can free the
            // semaphore.
            if( xSemaphoreGive( xSemaphore ) != pdTRUE )
            {
                // We would not expect this call to fail because we must have
                // obtained the semaphore to get here.
            }
        }
    }
}
```

#### 参数

- **xSemaphore** -- A handle to the semaphore being released. This is the handle returned when the semaphore was created.

**返回** `pdTRUE` if the semaphore was released. `pdFALSE` if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

#### **xSemaphoreGiveRecursive** (xMutex)

*Macro* to recursively release, or 'give', a mutex type semaphore. The mutex must have previously been created using a call to `xSemaphoreCreateRecursiveMutex()`;

`configUSE_RECURSIVE_MUTEXES` must be set to 1 in `FreeRTOSConfig.h` for this macro to be available.

This macro must not be used on mutexes created using `xSemaphoreCreateMutex()`.

A mutex used recursively can be 'taken' repeatedly by the owner. The mutex doesn't become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful 'take' request. For example, if a task successfully 'takes' the same mutex 5 times then the mutex will not be available to any other task until it has also 'given' the mutex back exactly five times.

Example usage:

```

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, it would be more likely that the calls
            // to xSemaphoreGiveRecursive() would be called as a call stack
            // unwound. This is just for demonstrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
    }
    else
    {
        // We could not obtain the mutex and can therefore not access
        // the shared resource safely.
    }
}
}

```

#### 参数

- **xMutex** -- A handle to the mutex being released, or 'given'. This is the handle returned by `xSemaphoreCreateMutex()`;

返回 `pdTRUE` if the semaphore was given.

**xSemaphoreGiveFromISR** (xSemaphore, pxHigherPriorityTaskWoken)

Macro to release a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()` or `xSemaphoreCreateCounting()`.

Mutex type semaphores (those created using a call to `xSemaphoreCreateMutex()`) must not be used with this macro.

This macro can be used from an ISR.

Example usage:

```
#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
void vATask( void * pvParameters )
{
    for( ;; )
    {
        // We want this task to run every 10 ticks of a timer. The semaphore
        // was created before this task was started.

        // Block waiting for the semaphore to become available.
        if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
        {
            // It is time to execute.

            // ...

            // We have finished our task. Return to the top of the loop where
            // we will block on the semaphore until it is time to execute
            // again. Note when using the semaphore for synchronisation with an
            // ISR in this manner there is no need to 'give' the semaphore back.
        }
    }

// Timer ISR
void vTimerISR( void * pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;

    // A timer tick has occurred.

    // ... Do other time functions.

    // Is it time for vATask () to run?
    xHigherPriorityTaskWoken = pdFALSE;
    ucLocalTickCount++;
    if( ucLocalTickCount >= TICKS_TO_WAIT )
    {
        // Unblock the task by releasing the semaphore.
        xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

        // Reset the count so we release the semaphore again in 10 ticks time.
        ucLocalTickCount = 0;
    }

    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // We can force a context switch here. Context switching from an
        // ISR uses port specific syntax. Check the demo task for your port
        // to find the syntax required.
    }
}
```

(下页继续)

```
}

```

**参数**

- **xSemaphore** -- A handle to the semaphore being released. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** -- xSemaphoreGiveFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**返回** pdTRUE if the semaphore was successfully given, otherwise errQUEUE\_FULL.

**xSemaphoreTakeFromISR** (xSemaphore, pxHigherPriorityTaskWoken)

*Macro* to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

**参数**

- **xSemaphore** -- A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** -- xSemaphoreTakeFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**返回** pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

**xSemaphoreCreateMutex** ()

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see <https://www.FreeRTOS.org/a00111.html>). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore MUST ALWAYS 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;
```

(下页继续)

```

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}

```

**返回** If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.

#### **xSemaphoreCreateMutexStatic** (pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using `xSemaphoreCreateMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateMutex()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a mutex is created using `xSemaphoreCreateMutexStatic()` then the application writer must provide the memory. `xSemaphoreCreateMutexStatic()` therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the `xSemaphoreTake()` and `xSemaphoreGive()` macros. The `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore MUST ALWAYS 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```

SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}

```

#### **参数**

- **pxMutexBuffer** -- Must point to a variable of type `StaticSemaphore_t`, which will be used to hold the mutex's data structure, removing the need for the memory to be allocated dynamically.

**返回** If the mutex was successfully created then a handle to the created mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

#### **xSemaphoreCreateRecursiveMutex()**

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see <https://www.FreeRTOS.org/a00111.html>). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be 'taken' repeatedly by the owner. The mutex doesn't become available again until the owner has called xSemaphoreGiveRecursive() for each successful 'take' request. For example, if a task successfully 'takes' the same mutex 5 times then the mutex will not be available to any other task until it has also 'given' the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore MUST ALWAYS 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**返回** xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle\_t.

#### **xSemaphoreCreateRecursiveMutexStatic()** (pxStaticSemaphore)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see <https://www.FreeRTOS.org/a00111.html>). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex.

`xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be 'taken' repeatedly by the owner. The mutex doesn't become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful 'take' request. For example, if a task successfully 'takes' the same mutex 5 times then the mutex will not be available to any other task until it has also 'given' the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore **MUST ALWAYS** 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a
    // recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold
    // the mutexes data structures - so no dynamic memory allocation will be
    // attempted.
    xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

#### 参数

- **pxStaticSemaphore** -- Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the recursive mutex's data structure, removing the need for the memory to be allocated dynamically.

**返回** If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If `pxStaticSemaphore` was `NULL` then `NULL` is returned.

#### **xSemaphoreCreateCounting** (uxMaxCount, uxInitialCount)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer can instead optionally provide the memory that will get used by the counting semaphore. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

## 1) Counting events.

In this usage scenario an event handler will 'give' a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will 'take' a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

## 2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it 'gives' the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
    // The max value to which the semaphore can count should be 10, and the
    // initial value assigned to the count should be 0.
    xSemaphore = xSemaphoreCreateCounting( 10, 0 );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**参数**

- **uxMaxCount** -- The maximum count value that can be reached. When the semaphore reaches this value it can no longer be 'given'.
- **uxInitialCount** -- The count value assigned to the semaphore when it is created.

**返回** Handle to the created semaphore. Null if the semaphore could not be created.

**xSemaphoreCreateCountingStatic** (uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer must provide the memory. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

## 1) Counting events.

In this usage scenario an event handler will 'give' a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will 'take' a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

## 2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it 'gives' the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Counting semaphore cannot be used before they have been created. Create
    // a counting semaphore using xSemaphoreCreateCountingStatic(). The max
    // value to which the semaphore can count is 10, and the initial value
    // assigned to the count will be 0. The address of xSemaphoreBuffer is
    // passed in and will be used to hold the semaphore structure, so no dynamic
    // memory allocation will be used.
    xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

    // No memory allocation was attempted so xSemaphore cannot be NULL, so there
    // is no need to check its value.
}
```

### 参数

- **uxMaxCount** -- The maximum count value that can be reached. When the semaphore reaches this value it can no longer be 'given'.
- **uxInitialCount** -- The count value assigned to the semaphore when it is created.
- **pxSemaphoreBuffer** -- Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the semaphore's data structure, removing the need for the memory to be allocated dynamically.

**返回** If the counting semaphore was successfully created then a handle to the created counting semaphore is returned. If `pxSemaphoreBuffer` was `NULL` then `NULL` is returned.

### **vSemaphoreDelete** (xSemaphore)

Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore if the mutex is held by a task.

### 参数

- **xSemaphore** -- A handle to the semaphore to be deleted.

### **xSemaphoreGetMutexHolder** (xSemaphore)

If `xMutex` is indeed a mutex type semaphore, return the current mutex holder. If `xMutex` is not a mutex type semaphore, or the mutex is available (not held by a task), return `NULL`.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of determining the identity of the mutex holder as the holder may change between the function exiting and the returned value being tested.

**xSemaphoreGetMutexHolderFromISR** (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

**uxSemaphoreGetCount** (xSemaphore)

If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

**uxSemaphoreGetCountFromISR** (xSemaphore)

semphr.h

```
UBaseType_t uxSemaphoreGetCountFromISR( SemaphoreHandle_t xSemaphore );
```

If the semaphore is a counting semaphore then uxSemaphoreGetCountFromISR() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCountFromISR() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

**xSemaphoreGetStaticBuffer** (xSemaphore, ppxSemaphoreBuffer)

Retrieve pointer to a statically created binary semaphore, counting semaphore, or mutex semaphore's data structure buffer. This is the same buffer that is supplied at the time of creation.

**参数**

- **xSemaphore** -- The semaphore for which to retrieve the buffer.
- **ppxSemaphoreBuffer** -- Used to return a pointer to the semaphore's data structure buffer.

**返回** pdTRUE if buffer was retrieved, pdFALSE otherwise.

**Type Definitions**

```
typedef QueueHandle_t SemaphoreHandle_t
```

**定时器 API****Header File**

- [components/freertos/FreeRTOS-Kernel/include/freertos/timers.h](#)
- This header file can be included with:

```
#include "freertos/timers.h"
```

**Functions**

**TimerHandle\_t xTimerCreate** (const char \*const pcTimerName, const TickType\_t xTimerPeriodInTicks, const BaseType\_t xAutoReload, void \*const pvTimerID, *TimerCallbackFunction\_t* pxCallbackFunction)

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

## Example usage:

```

* #define NUM_TIMERS 5
*
* // An array to hold handles to the created timers.
* TimerHandle_t xTimers[ NUM_TIMERS ];
*
* // An array to hold a count of the number of times each timer expires.
* int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };
*
* // Define a callback function that will be used by multiple timer instances.
* // The callback function does nothing but count the number of times the
* // associated timer expires, and stop the timer once the timer has expired
* // 10 times.
* void vTimerCallback( TimerHandle_t pxTimer )
* {
*   int32_t lArrayIndex;
*   const int32_t xMaxExpiryCountBeforeStopping = 10;
*
*   // Optionally do something if the pxTimer parameter is NULL.
*   configASSERT( pxTimer );
*
*   // Which timer expired?
*   lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );
*
*   // Increment the number of times that pxTimer has expired.
*   lExpireCounters[ lArrayIndex ] += 1;
*
*   // If the timer has expired 10 times then stop it from running.
*   if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
*   {
*     // Do not use a block time if calling a timer API function from a
*     // timer callback function, as doing so could cause a deadlock!
*     xTimerStop( pxTimer, 0 );
*   }
* }
*
* void main( void )
* {
*   int32_t x;
*
*   // Create then start some timers. Starting the timers before the
*   ↪ scheduler
*   // has been started means the timers will start running immediately that
*   // the scheduler starts.
*   for( x = 0; x < NUM_TIMERS; x++ )
*   {
*     xTimers[ x ] = xTimerCreate( "Timer", // Just a text
*     ↪ name, not used by the kernel.
*                               ( 100 * ( x + 1 ) ), // The timer
*     ↪ period in ticks.
*                               pdTRUE, // The timers
*     ↪ will auto-reload themselves when they expire.
*                               ( void * ) x, // Assign each
*     ↪ timer a unique id equal to its array index.
*                               vTimerCallback // Each timer
*     ↪ calls the same callback when it expires.
*                               );
*
*     if( xTimers[ x ] == NULL )
*     {

```

(下页继续)

```

*           // The timer was not created.
*       }
*       else
*       {
*           // Start the timer. No block time is specified, and even if one_
→was
*           // it would be ignored because the scheduler has not yet been
*           // started.
*           if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
*           {
*               // The timer could not be set into the Active state.
*           }
*       }
*   }
*   // ...
*   // Create tasks here.
*   // ...
*
*   // Starting the scheduler will start the timers running as they have_
→already
*   // been set into the active state.
*   vTaskStartScheduler();
*
*   // Should not reach here.
*   for( ;; );
* }
*

```

### 参数

- **pcTimerName** -- A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks** -- The timer period. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to ( 500 / portTICK\_PERIOD\_MS ) provided configTICK\_RATE\_HZ is less than or equal to 1000. Time timer period must be greater than 0.
- **xAutoReload** -- If xAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If xAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** -- An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** -- The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction\_t, which is "void vCallbackFunction( TimerHandle\_t xTimer );".

**返回** If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created because there is insufficient FreeRTOS heap remaining to allocate the timer structures then NULL is returned.

**TimerHandle\_t xTimerCreateStatic** (const char \*const pcTimerName, const TickType\_t xTimerPeriodInTicks, const BaseType\_t xAutoReload, void \*const pvTimerID, *TimerCallbackFunction\_t* pxCallbackFunction, StaticTimer\_t \*pxTimerBuffer)

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using `xTimerCreate()` then the required memory is automatically dynamically allocated inside the `xTimerCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a software timer is created using `xTimerCreateStatic()` then the application writer must provide the memory that will get used by the software timer. `xTimerCreateStatic()` therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.

Example usage:

```
*
* // The buffer used to hold the software timer's data structure.
* static StaticTimer_t xTimerBuffer;
*
* // A variable that will be incremented by the software timer's callback
* // function.
* UBaseType_t uxVariableToIncrement = 0;
*
* // A software timer callback function that increments a variable passed to
* // it when the software timer was created. After the 5th increment the
* // callback function stops the software timer.
* static void prvTimerCallback( TimerHandle_t xExpiredTimer )
* {
*     UBaseType_t *puxVariableToIncrement;
*     BaseType_t xReturned;
*
*     // Obtain the address of the variable to increment from the timer ID.
*     puxVariableToIncrement = ( UBaseType_t * ) pvTimerGetTimerID(
* ↪xExpiredTimer );
*
*     // Increment the variable to show the timer callback has executed.
*     ( *puxVariableToIncrement )++;
*
*     // If this callback has executed the required number of times, stop the
*     // timer.
*     if( *puxVariableToIncrement == 5 )
*     {
*         // This is called from a timer callback so must not block.
*         xTimerStop( xExpiredTimer, staticDONT_BLOCK );
*     }
* }
*
* void main( void )
* {
*     // Create the software time. xTimerCreateStatic() has an extra parameter
*     // than the normal xTimerCreate() API function. The parameter is a
* ↪pointer
*     // to the StaticTimer_t structure that will hold the software timer
*     // structure. If the parameter is passed as NULL then the structure
* ↪will be
*     // allocated dynamically, just as if xTimerCreate() had been called.
*     xTimer = xTimerCreateStatic( "T1", // Text name for the task.
* ↪ Helps debugging only. Not used by FreeRTOS.
*     // The period of the
* ↪timer in ticks.
*     // This is an auto-reload
* ↪timer.
```

(下页继续)

```

*          ( void * ) &uxVariableToIncrement, // A
↪variable incremented by the software timer's callback function
*          prvTimerCallback, // The function to
↪execute when the timer expires.
*          &xTimerBuffer ); // The buffer that will
↪hold the software timer structure.
*
* // The scheduler has not started yet so a block time is not used.
* xReturned = xTimerStart( xTimer, 0 );
*
* // ...
* // Create tasks here.
* // ...
*
* // Starting the scheduler will start the timers running as they have
↪already
* // been set into the active state.
* vTaskStartScheduler();
*
* // Should not reach here.
* for( ;; );
* }
*

```

### 参数

- **pcTimerName** -- A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks** -- The timer period. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to ( 500 / portTICK\_PERIOD\_MS ) provided configTICK\_RATE\_HZ is less than or equal to 1000. The timer period must be greater than 0.
- **xAutoReload** -- If xAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If xAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** -- An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** -- The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction\_t, which is "void vCallbackFunction( TimerHandle\_t xTimer );".
- **pxTimerBuffer** -- Must point to a variable of type StaticTimer\_t, which will be then be used to hold the software timer's data structures, removing the need for the memory to be allocated dynamically.

**返回** If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

void \***pvTimerGetTimerID**( const *TimerHandle\_t* xTimer)

Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer, and by calling the vTimerSetTimerID() API function.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

**参数 xTimer** -- The timer being queried.

**返回** The ID assigned to the timer being queried.

void **vTimerSetTimerID** (*TimerHandle\_t* xTimer, void \*pvNewID)

Sets the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

**参数**

- **xTimer** -- The timer being updated.
- **pvNewID** -- The ID to assign to the timer.

BaseType\_t **xTimerIsTimerActive** (*TimerHandle\_t* xTimer)

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```
* // This function assumes xTimer has already been created.
* void vAFunction( TimerHandle_t xTimer )
* {
*     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
*     →equivalently "if( xTimerIsTimerActive( xTimer ) )"
*     {
*         // xTimer is active, do something.
*     }
*     else
*     {
*         // xTimer is not active, do something else.
*     }
* }
*
```

**参数 xTimer** -- The timer being queried.

**返回** pdFALSE will be returned if the timer is dormant. A value other than pdFALSE will be returned if the timer is active.

*TaskHandle\_t* **xTimerGetTimerDaemonTaskHandle** (void)

Simply returns the handle of the timer service/daemon task. It is not valid to call xTimerGetTimerDaemonTaskHandle() before the scheduler has been started.

BaseType\_t **xTimerPendFunctionCallFromISR** (*PendedFunction\_t* xFunctionToPend, void \*pvParameter1, uint32\_t ulParameter2, BaseType\_t \*pxHigherPriorityTaskWoken)

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in `timers.c` and is prefixed with 'Timer').

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases `xTimerPendFunctionCallFromISR()` can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

```
*
* // The callback function that will execute in the context of the daemon_
* →task.
* // Note callback functions must all use this same prototype.
* void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
* {
*     BaseType_t xInterfaceToService;
*
*     // The interface that requires servicing is passed in the second
*     // parameter. The first parameter is not used in this case.
*     xInterfaceToService = ( BaseType_t ) ulParameter2;
*
*     // ...Perform the processing here...
* }
*
* // An ISR that receives data packets from multiple interfaces
* void vAnISR( void )
* {
*     BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;
*
*     // Query the hardware to determine which interface needs processing.
*     xInterfaceToService = prvCheckInterfaces();
*
*     // The actual processing is to be deferred to a task. Request the
*     // vProcessInterface() callback function is executed, passing in the
*     // number of the interface that needs processing. The interface to
*     // service is passed in the second parameter. The first parameter is
*     // not used in this case.
*     xHigherPriorityTaskWoken = pdFALSE;
*     xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )_
* →xInterfaceToService, &xHigherPriorityTaskWoken );
*
*     // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
*     // switch should be requested. The macro used is port specific and will
*     // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
*     // the documentation page for the port being used.
*     portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
*
* }
*
```

### 参数

- **xFunctionToPend** -- The function to execute from the timer service/ daemon task. The function must conform to the `PendedFunction_t` prototype.
- **pvParameter1** -- The value of the callback function's first parameter. The parameter has a `void *` type to allow it to be used to pass any type. For example, unsigned longs can be cast to a `void *`, or the `void *` can be used to point to a structure.

- **ulParameter2** -- The value of the callback function's second parameter.
- **pxHigherPriorityTaskWoken** -- As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using `configTIMER_TASK_PRIORITY` in `FreeRTOSConfig.h`) is higher than the priority of the currently running task (the task the interrupt interrupted) then `*pxHigherPriorityTaskWoken` will be set to `pdTRUE` within `xTimerPendFunctionCallFromISR()`, indicating that a context switch should be requested before the interrupt exits. For that reason `*pxHigherPriorityTaskWoken` must be initialised to `pdFALSE`. See the example code below.

**返回** `pdPASS` is returned if the message was successfully sent to the timer daemon task, otherwise `pdFALSE` is returned.

`BaseType_t xTimerPendFunctionCall` (*PendedFunction\_t* xFunctionToPend, void \*pvParameter1, uint32\_t ulParameter2, TickType\_t xTicksToWait)

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in `timers.c` and is prefixed with "Timer").

#### 参数

- **xFunctionToPend** -- The function to execute from the timer service/ daemon task. The function must conform to the `PendedFunction_t` prototype.
- **pvParameter1** -- The value of the callback function's first parameter. The parameter has a void \* type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void \*, or the void \* can be used to point to a structure.
- **ulParameter2** -- The value of the callback function's second parameter.
- **xTicksToWait** -- Calling this function will result in a message being sent to the timer daemon task on a queue. `xTicksToWait` is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

**返回** `pdPASS` is returned if the message was successfully sent to the timer daemon task, otherwise `pdFALSE` is returned.

`const char *pcTimerGetName` (*TimerHandle\_t* xTimer)

Returns the name that was assigned to a timer when the timer was created.

**参数** **xTimer** -- The handle of the timer being queried.

**返回** The name assigned to the timer specified by the `xTimer` parameter.

`void vTimerSetReloadMode` (*TimerHandle\_t* xTimer, const BaseType\_t xAutoReload)

Updates a timer to be either an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

#### 参数

- **xTimer** -- The handle of the timer being updated.
- **xAutoReload** -- If `xAutoReload` is set to `pdTRUE` then the timer will expire repeatedly with a frequency set by the timer's period (see the `xTimerPeriodInTicks` parameter of the `xTimerCreate()` API function). If `xAutoReload` is set to `pdFALSE` then the timer will be a one-shot timer and enter the dormant state after it expires.

`BaseType_t xTimerGetReloadMode` (*TimerHandle\_t* xTimer)

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

**参数** **xTimer** -- The handle of the timer being queried.

**返回** If the timer is an auto-reload timer then `pdTRUE` is returned, otherwise `pdFALSE` is returned.

`UBaseType_t uxTimerGetReloadMode` (*TimerHandle\_t* xTimer)

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

**参数 xTimer** -- The handle of the timer being queried.

**返回** If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

TickType\_t **xTimerGetPeriod** (*TimerHandle\_t* xTimer)

Returns the period of a timer.

**参数 xTimer** -- The handle of the timer being queried.

**返回** The period of the timer in ticks.

TickType\_t **xTimerGetExpiryTime** (*TimerHandle\_t* xTimer)

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

**参数 xTimer** -- The handle of the timer being queried.

**返回** If the timer is running then the time in ticks at which the timer will next expire is returned. If the timer is not running then the return value is undefined.

BaseType\_t **xTimerGetStaticBuffer** (*TimerHandle\_t* xTimer, StaticTimer\_t \*\*ppxTimerBuffer)

Retrieve pointer to a statically created timer's data structure buffer. This is the same buffer that is supplied at the time of creation.

**参数**

- **xTimer** -- The timer for which to retrieve the buffer.
- **ppxTimerBuffer** -- Used to return a pointer to the timers's data structure buffer.

**返回** pdTRUE if the buffer was retrieved, pdFALSE otherwise.

void **vApplicationGetTimerTaskMemory** (StaticTask\_t \*\*ppxTimerTaskTCBBuffer, StackType\_t \*\*ppxTimerTaskStackBuffer, uint32\_t \*pulTimerTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Timer Task TCB. This function is required when configSUPPORT\_STATIC\_ALLOCATION is set. For more information see this URI: [https://www.FreeRTOS.org/a00110.html#configSUPPORT\\_STATIC\\_ALLOCATION](https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION)

**参数**

- **ppxTimerTaskTCBBuffer** -- A handle to a statically allocated TCB buffer
- **ppxTimerTaskStackBuffer** -- A handle to a statically allocated Stack buffer for the idle task
- **pulTimerTaskStackSize** -- A pointer to the number of elements that will fit in the allocated stack buffer

## Macros

**xTimerStart** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER\_QUEUE\_LENGTH configuration constant.

xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called 'n' ticks after xTimerStart() was called, where 'n' is the timers defined period.

It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerStart() was called.

The configUSE\_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.

Example usage:

See the `xTimerCreate()` API function example usage scenario.

#### 参数

- **xTimer** -- The handle of the timer being started/restarted.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when `xTimerStart()` was called. `xTicksToWait` is ignored if `xTimerStart()` is called before the scheduler is started.

**返回** `pdFAIL` will be returned if the start command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerStart()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

#### **xTimerStop** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerStop()` stops a timer that was previously started using either of the `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` or `xTimerChangePeriodFromISR()` API functions.

Stopping a timer ensures the timer is not in the active state.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerStop()` to be available.

Example usage:

See the `xTimerCreate()` API function example usage scenario.

#### 参数

- **xTimer** -- The handle of the timer being stopped.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when `xTimerStop()` was called. `xTicksToWait` is ignored if `xTimerStop()` is called before the scheduler is started.

**返回** `pdFAIL` will be returned if the stop command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

#### **xTimerChangePeriod** (xTimer, xNewPeriod, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerChangePeriod()` changes the period of a timer that was previously created using the `xTimerCreate()` API function.

`xTimerChangePeriod()` can be called to change the period of an active or dormant state timer.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerChangePeriod()` to be available.

Example usage:

```
* // This function assumes xTimer has already been created.  If the timer
* // referenced by xTimer is already active when it is called, then the timer
* // is deleted.  If the timer referenced by xTimer is not active when it is
* // called, then the period of the timer is set to 500ms and the timer is
* // started.
* void vAFunction( TimerHandle_t xTimer )
* {
*     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
*     ↪equivalently "if( xTimerIsTimerActive( xTimer ) )"
*     {
*         // xTimer is already active - delete it.
*         xTimerDelete( xTimer );
*     }
*     else
*     {
*         // xTimer is not active, change its period to 500ms.  This will also
*         // cause the timer to start.  Block for a maximum of 100 ticks if the
*         // change period command cannot immediately be sent to the timer
*         // command queue.
*         if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) ==
*     ↪pdPASS )
*         {
*             // The command was successfully sent.
*         }
*         else
*         {
*             // The command could not be sent, even after waiting for 100
*     ↪ticks
*             // to pass.  Take appropriate action here.
*         }
*     }
* }
*
```

### 参数

- **xTimer** -- The handle of the timer that is having its period changed.
- **xNewPeriod** -- The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK\_PERIOD\_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to ( 500 / portTICK\_PERIOD\_MS ) provided configTICK\_RATE\_HZ is less than or equal to 1000.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when xTimerChangePeriod() was called. xTicksToWait is ignored if xTimerChangePeriod() is called before the scheduler is started.

**返回** pdFAIL will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

### **xTimerDelete** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The

length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerDelete()` deletes a timer that was previously created using the `xTimerCreate()` API function.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerDelete()` to be available.

Example usage:

See the `xTimerChangePeriod()` API function example usage scenario.

#### 参数

- **xTimer** -- The handle of the timer being deleted.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when `xTimerDelete()` was called. `xTicksToWait` is ignored if `xTimerDelete()` is called before the scheduler is started.

**返回** `pdFAIL` will be returned if the delete command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

#### **xTimerReset** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerReset()` re-starts a timer that was previously created using the `xTimerCreate()` API function. If the timer had already been started and was already in the active state, then `xTimerReset()` will cause the timer to re-evaluate its expiry time so that it is relative to when `xTimerReset()` was called. If the timer was in the dormant state then `xTimerReset()` has equivalent functionality to the `xTimerStart()` API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called 'n' ticks after `xTimerReset()` was called, where 'n' is the timers defined period.

It is valid to call `xTimerReset()` before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when `xTimerReset()` was called.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerReset()` to be available.

Example usage:

```
* // When a key is pressed, an LCD back-light is switched on. If 5 seconds_
↪pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer.
*
* TimerHandle_t xBacklightTimer = NULL;
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
```

(下页继续)

```

*
* // The key press event handler.
* void vKeyPressEventHandler( char cKey )
* {
*     // Ensure the LCD back-light is on, then reset the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. Wait 10 ticks for the command to be successfully sent
*     // if it cannot be sent immediately.
*     vSetBacklightState( BACKLIGHT_ON );
*     if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
*     {
*         // The reset command was not executed successfully. Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
* }
*
* void main( void )
* {
*     int32_t x;
*
*     // Create then start the one-shot timer that is responsible for turning
*     // the back-light off if no keys are pressed within a 5 second period.
*     xBacklightTimer = xTimerCreate( "BacklightTimer",           // Just a
* ↪text name, not used by the kernel.
*                                     ( 5000 / portTICK_PERIOD_MS), // The
* ↪timer period in ticks.
*                                     pdFALSE,                       // The timer
* ↪is a one-shot timer.
*                                     0,                             // The id is
* ↪not used by the callback so can take any value.
*                                     vBacklightTimerCallback       // The
* ↪callback function that switches the LCD back-light off.
*                                     );
*
*     if( xBacklightTimer == NULL )
*     {
*         // The timer was not created.
*     }
*     else
*     {
*         // Start the timer. No block time is specified, and even if one was
*         // it would be ignored because the scheduler has not yet been
*         // started.
*         if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
*         {
*             // The timer could not be set into the Active state.
*         }
*     }
*
*     // ...
*     // Create tasks here.
*     // ...
*
*     // Starting the scheduler will start the timer running as it has already
*     // been set into the active state.
*     vTaskStartScheduler();
*
*     // Should not reach here.
*     for( ;; );

```

```
* }
*
```

**参数**

- **xTimer** -- The handle of the timer being reset/started/restarted.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

**返回** pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

**xTimerStartFromISR** (xTimer, pxHigherPriorityTaskWoken)

A version of xTimerStart() that can be called from an interrupt service routine.

**Example usage:**

```
* // This scenario assumes xBacklightTimer has already been created. When a
* // key is pressed, an LCD back-light is switched on. If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
* {
*     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // Ensure the LCD back-light is on, then restart the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. This is an interrupt service routine so can only
*     // call FreeRTOS API functions that end in "FromISR".
*     vSetBacklightState( BACKLIGHT_ON );
*
*     // xTimerStartFromISR() or xTimerResetFromISR() could be called here
*     // as both cause the timer to re-calculate its expiry time.
*     // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
*     // declared (in this function).
*     if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=_
↪pdPASS )
*     {
*         // The start command was not executed successfully. Take appropriate
*         // action here.
```

(下页继续)

```

*     }
*
*     // Perform the rest of the key processing here.
*
*     // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*     // should be performed. The syntax required to perform a context switch
*     // from inside an ISR varies from port to port, and from compiler to
*     // compiler. Inspect the demos for the port you are using to find the
*     // actual syntax required.
*     if( xHigherPriorityTaskWoken != pdFALSE )
*     {
*         // Call the interrupt safe yield function here (actual function
*         // depends on the FreeRTOS port being used).
*     }
* }
*

```

### 参数

- **xTimer** -- The handle of the timer being started/restarted.
- **pxHigherPriorityTaskWoken** -- The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStartFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then \*pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStartFromISR() function. If xTimerStartFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

**返回** pdFAIL will be returned if the start command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStartFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

### xTimerStopFromISR (xTimer, pxHigherPriorityTaskWoken)

A version of xTimerStop() that can be called from an interrupt service routine.

#### Example usage:

```

* // This scenario assumes xTimer has already been created and started. When
* // an interrupt occurs, the timer should be simply stopped.
*
* // The interrupt service routine that stops the timer.
* void vAnExampleInterruptServiceRoutine( void )
* {
*     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // The interrupt has occurred - simply stop the timer.
*     // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
*     // (within this function). As this is an interrupt service routine, only
*     // FreeRTOS API functions that end in "FromISR" can be used.
*     if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
*     {
*         // The stop command was not executed successfully. Take appropriate
*         // action here.
*     }
*

```

(下页继续)

```

*     }
*
*     // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*     // should be performed. The syntax required to perform a context switch
*     // from inside an ISR varies from port to port, and from compiler to
*     // compiler. Inspect the demos for the port you are using to find the
*     // actual syntax required.
*     if( xHigherPriorityTaskWoken != pdFALSE )
*     {
*         // Call the interrupt safe yield function here (actual function
*         // depends on the FreeRTOS port being used).
*     }
* }
*

```

### 参数

- **xTimer** -- The handle of the timer being stopped.
- **pxHigherPriorityTaskWoken** -- The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStopFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStopFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then \*pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStopFromISR() function. If xTimerStopFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

**返回** pdFAIL will be returned if the stop command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

**xTimerChangePeriodFromISR** (xTimer, xNewPeriod, pxHigherPriorityTaskWoken)

A version of xTimerChangePeriod() that can be called from an interrupt service routine.

Example usage:

```

* // This scenario assumes xTimer has already been created and started. When
* // an interrupt occurs, the period of xTimer should be changed to 500ms.
*
* // The interrupt service routine that changes the period of xTimer.
* void vAnExampleInterruptServiceRoutine( void )
* {
*     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // The interrupt has occurred - change the period of xTimer to 500ms.
*     // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
*     // (within this function). As this is an interrupt service routine, only
*     // FreeRTOS API functions that end in "FromISR" can be used.
*     if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) !=
*     ↪pdPASS )
*     {
*         // The command to change the timers period was not executed
*         // successfully. Take appropriate action here.
*     }
* }
*

```

(下页继续)

```

* // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
* // should be performed. The syntax required to perform a context switch
* // from inside an ISR varies from port to port, and from compiler to
* // compiler. Inspect the demos for the port you are using to find the
* // actual syntax required.
* if( xHigherPriorityTaskWoken != pdFALSE )
* {
*     // Call the interrupt safe yield function here (actual function
*     // depends on the FreeRTOS port being used).
* }
* }
*

```

**参数**

- **xTimer** -- The handle of the timer that is having its period changed.
- **xNewPeriod** -- The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK\_PERIOD\_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to ( 500 / portTICK\_PERIOD\_MS ) provided configTICK\_RATE\_HZ is less than or equal to 1000.
- **pxHigherPriorityTaskWoken** -- The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerChangePeriodFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/ daemon task out of the Blocked state. If calling xTimerChangePeriodFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then \*pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerChangePeriodFromISR() function. If xTimerChangePeriodFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

**返回** pdFAIL will be returned if the command to change the timers period could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

**xTimerResetFromISR** (xTimer, pxHigherPriorityTaskWoken)

A version of xTimerReset() that can be called from an interrupt service routine.

**Example usage:**

```

* // This scenario assumes xBacklightTimer has already been created. When a
* // key is pressed, an LCD back-light is switched on. If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }

```

```

*
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
* {
* BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
* // Ensure the LCD back-light is on, then reset the timer that is
* // responsible for turning the back-light off after 5 seconds of
* // key inactivity. This is an interrupt service routine so can only
* // call FreeRTOS API functions that end in "FromISR".
* vSetBacklightState( BACKLIGHT_ON );
*
* // xTimerStartFromISR() or xTimerResetFromISR() could be called here
* // as both cause the timer to re-calculate its expiry time.
* // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
* // declared (in this function).
* if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
* {
* // The reset command was not executed successfully. Take appropriate
* // action here.
* }
*
* // Perform the rest of the key processing here.
*
* // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
* // should be performed. The syntax required to perform a context switch
* // from inside an ISR varies from port to port, and from compiler to
* // compiler. Inspect the demos for the port you are using to find the
* // actual syntax required.
* if( xHigherPriorityTaskWoken != pdFALSE )
* {
* // Call the interrupt safe yield function here (actual function
* // depends on the FreeRTOS port being used).
* }
* }
*

```

### 参数

- **xTimer** -- The handle of the timer that is to be started, reset, or restarted.
- **pxHigherPriorityTaskWoken** -- The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerResetFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerResetFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then \*pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerResetFromISR() function. If xTimerResetFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

**返回** pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerResetFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

### Type Definitions

```
typedef struct tmrTimerControl *TimerHandle_t
```

```
typedef void (*TimerCallbackFunction_t)(TimerHandle_t xTimer)
```

Defines the prototype to which timer callback functions must conform.

```
typedef void (*PendedFunction_t)(void*, uint32_t)
```

Defines the prototype to which functions used with the xTimerPendFunctionCallFromISR() function must conform.

## 事件组 API

### Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/event\_groups.h
- This header file can be included with:

```
#include "freertos/event_groups.h"
```

### Functions

*EventGroupHandle\_t* **xEventGroupCreate** (void)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event group is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE\_16\_BIT\_TICKS setting in FreeRTOSConfig.h. If configUSE\_16\_BIT\_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE\_16\_BIT\_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits\_t type is used to store event bits within an event group.

Example usage:

```
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

**返回** If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See <https://www.FreeRTOS.org/a00111.html>

**EventGroupHandle\_t xEventGroupCreateStatic** (StaticEventGroup\_t \*pxEventGroupBuffer)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE\_16\_BIT\_TICKS setting in FreeRTOSConfig.h. If configUSE\_16\_BIT\_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE\_16\_BIT\_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits\_t type is used to store event bits within an event group.

Example usage:

```
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group's data structures
StaticEventGroup_t xEventGroupBuffer;

// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );
```

**参数 pxEventGroupBuffer** -- pxEventGroupBuffer must point to a variable of type StaticEventGroup\_t, which will be then be used to hold the event group's data structures, removing the need for the memory to be allocated dynamically.

**返回** If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

**EventBits\_t xEventGroupWaitBits** (EventGroupHandle\_t xEventGroup, const EventBits\_t uxBitsToWaitFor, const BaseType\_t xClearOnExit, const BaseType\_t xWaitForAllBits, TickType\_t xTicksToWait)

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
    // the event group. Clear the bits before exiting.
    uxBits = xEventGroupWaitBits(
        xEventGroup,    // The event group being tested.
```

(下页继续)

```

        BIT_0 | BIT_4, // The bits within the event group to wait
    ↪for.
        pdTRUE,       // BIT_0 and BIT_4 should be cleared before
    ↪returning.
        pdFALSE,     // Don't wait for both bits, either bit will
    ↪do.
        xTicksToWait ); // Wait a maximum of 100ms for either bit to
    ↪be set.

if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
    // xEventGroupWaitBits() returned because both bits were set.
    }
else if( ( uxBits & BIT_0 ) != 0 )
    {
    // xEventGroupWaitBits() returned because just BIT_0 was set.
    }
else if( ( uxBits & BIT_4 ) != 0 )
    {
    // xEventGroupWaitBits() returned because just BIT_4 was set.
    }
else
    {
    // xEventGroupWaitBits() returned because xTicksToWait ticks passed
    // without either BIT_0 or BIT_4 becoming set.
    }
}

```

### 参数

- **xEventGroup** -- The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- **uxBitsToWaitFor** -- A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set `uxBitsToWaitFor` to `0x05`. To wait for bits 0 and/or bit 1 and/or bit 2 set `uxBitsToWaitFor` to `0x07`. Etc.
- **xClearOnExit** -- If `xClearOnExit` is set to `pdTRUE` then any bits within `uxBitsToWaitFor` that are set within the event group will be cleared before `xEventGroupWaitBits()` returns if the wait condition was met (if the function returns for a reason other than a timeout). If `xClearOnExit` is set to `pdFALSE` then the bits set in the event group are not altered when the call to `xEventGroupWaitBits()` returns.
- **xWaitForAllBits** -- If `xWaitForAllBits` is set to `pdTRUE` then `xEventGroupWaitBits()` will return when either all the bits in `uxBitsToWaitFor` are set or the specified block time expires. If `xWaitForAllBits` is set to `pdFALSE` then `xEventGroupWaitBits()` will return when any one of the bits set in `uxBitsToWaitFor` is set or the specified block time expires. The block time is specified by the `xTicksToWait` parameter.
- **xTicksToWait** -- The maximum amount of time (specified in 'ticks') to wait for one/all (depending on the `xWaitForAllBits` value) of the bits specified by `uxBitsToWaitFor` to become set. A value of `portMAX_DELAY` can be used to block indefinitely (provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`).

**返回** The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupWaitBits()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupWaitBits()` returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that `xClearOnExit` parameter was set to `pdTRUE`.

**EventBits\_t xEventGroupClearBits** (*EventGroupHandle\_t* xEventGroup, const *EventBits\_t* uxBitsToClear)

Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits(
        xEventGroup,    // The event group being updated.
        BIT_0 | BIT_4 ); // The bits being cleared.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 were set before xEventGroupClearBits() was
        // called. Both will now be clear (not set).
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 was set before xEventGroupClearBits() was called. It will
        // now be clear.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 was set before xEventGroupClearBits() was called. It will
        // now be clear.
    }
    else
    {
        // Neither bit 0 nor bit 4 were set in the first place.
    }
}
```

#### 参数

- **xEventGroup** -- The event group in which the bits are to be cleared.
- **uxBitsToClear** -- A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

**返回** The value of the event group before the specified bits were cleared.

**EventBits\_t xEventGroupSetBits** (EventGroupHandle\_t xEventGroup, const EventBits\_t uxBitsToSet)

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBitsFromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Set bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupSetBits(
        xEventGroup,    // The event group being updated.
```

(下页继续)

```

        BIT_0 | BIT_4 ); // The bits being set.

if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
    // Both bit 0 and bit 4 remained set when the function returned.
    }
else if( ( uxBits & BIT_0 ) != 0 )
    {
    // Bit 0 remained set when the function returned, but bit 4 was
    // cleared. It might be that bit 4 was cleared automatically as a
    // task that was waiting for bit 4 was removed from the Blocked
    // state.
    }
else if( ( uxBits & BIT_4 ) != 0 )
    {
    // Bit 4 remained set when the function returned, but bit 0 was
    // cleared. It might be that bit 0 was cleared automatically as a
    // task that was waiting for bit 0 was removed from the Blocked
    // state.
    }
else
    {
    // Neither bit 0 nor bit 4 remained set. It might be that a task
    // was waiting for both of the bits to be set, and the bits were
    // cleared as the task left the Blocked state.
    }
}

```

**参数**

- **xEventGroup** -- The event group in which the bits are to be set.
- **uxBitsToSet** -- A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

**返回** The value of the event group at the time the call to xEventGroupSetBits() returns. There are two reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called xEventGroupSetBits() will execute and may change the event group value before the call to xEventGroupSetBits() returns.

*EventBits\_t* **xEventGroupSync** (*EventGroupHandle\_t* xEventGroup, const *EventBits\_t* uxBitsToSet, const *EventBits\_t* uxBitsToWaitFor, TickType\_t xTicksToWait)

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the uxBitsToWait parameter are set, or become set within that time. In this case all the bits specified by uxBitsToWait will be automatically cleared before the function returns.

Example usage:

```

// Bits used by the three tasks.
#define TASK_0_BIT    ( 1 << 0 )
#define TASK_1_BIT    ( 1 << 1 )
#define TASK_2_BIT    ( 1 << 2 )

```

```

#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event
// group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
EventBits_t uxReturn;
TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

for( ;; )
{
// Perform task functionality here.

// Set bit 0 in the event flag to note this task has reached the
// sync point. The other two tasks will set the other two bits defined
// by ALL_SYNC_BITS. All three tasks have reached the synchronisation
// point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms
// for this to happen.
uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS,
↳xTicksToWait );

if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
{
// All three tasks reached the synchronisation point before the call
// to xEventGroupSync() timed out.
}
}
}

void vTask1( void *pvParameters )
{
for( ;; )
{
// Perform task functionality here.

// Set bit 1 in the event flag to note this task has reached the
// synchronisation point. The other two tasks will set the other two
// bits defined by ALL_SYNC_BITS. All three tasks have reached the
// synchronisation point when all the ALL_SYNC_BITS are set. Wait
// indefinitely for this to happen.
xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );

// xEventGroupSync() was called with an indefinite block time, so
// this task will only reach here if the synchronisation was made by all
// three tasks, so there is no need to test the return value.
}
}

void vTask2( void *pvParameters )
{
for( ;; )
{
// Perform task functionality here.

// Set bit 2 in the event flag to note this task has reached the
// synchronisation point. The other two tasks will set the other two
// bits defined by ALL_SYNC_BITS. All three tasks have reached the
// synchronisation point when all the ALL_SYNC_BITS are set. Wait

```

```

// indefinitely for this to happen.
    xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );

// xEventGroupSync() was called with an indefinite block time, so
// this task will only reach here if the synchronisation was made by all
// three tasks, so there is no need to test the return value.
}
}

```

**参数**

- **xEventGroup** -- The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- **uxBitsToSet** -- The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the uxBitsToWait parameter are set.
- **uxBitsToWaitFor** -- A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and bit 1 and bit 2 set uxBitsToWaitFor to 0x07. Etc.
- **xTicksToWait** -- The maximum amount of time (specified in 'ticks') to wait for all of the bits specified by uxBitsToWaitFor to become set.

**返回** The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupSync() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupSync() returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

*EventBits\_t* **xEventGroupGetBitsFromISR** (*EventGroupHandle\_t* xEventGroup)

A version of xEventGroupGetBits() that can be called from an ISR.

**参数** **xEventGroup** -- The event group being queried.

**返回** The event group bits at the time xEventGroupGetBitsFromISR() was called.

void **vEventGroupDelete** (*EventGroupHandle\_t* xEventGroup)

Delete an event group that was previously created by a call to xEventGroupCreate(). Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group's value.

**参数** **xEventGroup** -- The event group being deleted.

BaseType\_t **xEventGroupGetStaticBuffer** (*EventGroupHandle\_t* xEventGroup, StaticEventGroup\_t \*\*ppxEventGroupBuffer)

Retrieve a pointer to a statically created event groups's data structure buffer. It is the same buffer that is supplied at the time of creation.

**参数**

- **xEventGroup** -- The event group for which to retrieve the buffer.
- **ppxEventGroupBuffer** -- Used to return a pointer to the event groups's data structure buffer.

**返回** pdTRUE if the buffer was retrieved, pdFALSE otherwise.

**Macros**

**xEventGroupClearBitsFromISR** (xEventGroup, uxBitsToClear)

A version of xEventGroupClearBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore xEventGroupClearBitsFromISR() sends a message to the timer task to have the clear operation performed in the context of the timer task.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(
        xEventGroup, // The event group being updated.
        BIT_0 | BIT_4 ); // The bits being set.

    if( xResult == pdPASS )
    {
        // The message was posted successfully.
        portYIELD_FROM_ISR( pdTRUE );
    }
}
```

**备注:** If this function returns `pdPASS` then the timer task is ready to run and a `portYIELD_FROM_ISR(pdTRUE)` should be executed to perform the needed clear on the event group. This behavior is different from `xEventGroupSetBitsFromISR` because the parameter `xHigherPriorityTaskWoken` is not present.

#### 参数

- **xEventGroup** -- The event group in which the bits are to be cleared.
- **uxBitsToClear** -- A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set `uxBitsToClear` to `0x08`. To clear bit 3 and bit 0 set `uxBitsToClear` to `0x09`.

**返回** If the request to execute the function was posted successfully then `pdPASS` is returned, otherwise `pdFALSE` is returned. `pdFALSE` will be returned if the timer service queue was full.

**xEventGroupSetBitsFromISR** (xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)

A version of `xEventGroupSetBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore `xEventGroupSetBitsFromISR()` sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
```

(下页继续)

```

BaseType_t xHigherPriorityTaskWoken, xResult;

// xHigherPriorityTaskWoken must be initialised to pdFALSE.
xHigherPriorityTaskWoken = pdFALSE;

// Set bit 0 and bit 4 in xEventGroup.
xResult = xEventGroupSetBitsFromISR(
    xEventGroup,    // The event group being updated.
    BIT_0 | BIT_4  // The bits being set.
    &xHigherPriorityTaskWoken );

// Was the message posted successfully?
if( xResult == pdPASS )
{
    // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
    // switch should be requested. The macro used is port specific and
    // will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
    // refer to the documentation page for the port being used.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
}

```

### 参数

- **xEventGroup** -- The event group in which the bits are to be set.
- **uxBitsToSet** -- A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.
- **pxHigherPriorityTaskWoken** -- As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then \*pxHigherPriorityTaskWoken will be set to pdTRUE by xEventGroupSetBitsFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason \*pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

**返回** If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

### **xEventGroupGetBits** (xEventGroup)

Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

### 参数

- **xEventGroup** -- The event group being queried.

**返回** The event group bits at the time xEventGroupGetBits() was called.

## Type Definitions

```
typedef struct EventGroupDef_t *EventGroupHandle_t
```

```
typedef TickType_t EventBits_t
```

## 流缓冲区 API

### Header File

- `components/freertos/FreeRTOS-Kernel/include/freertos/stream_buffer.h`
- This header file can be included with:

```
#include "freertos/stream_buffer.h"
```

## Functions

BaseType\_t **xStreamBufferGetStaticBuffers** (*StreamBufferHandle\_t* xStreamBuffer, uint8\_t  
\*\*ppucStreamBufferStorageArea, StaticStreamBuffer\_t  
\*\*ppxStaticStreamBuffer)

Retrieve pointers to a statically created stream buffer's data structure buffer and storage area buffer. These are the same buffers that are supplied at the time of creation.

### 参数

- **xStreamBuffer** -- The stream buffer for which to retrieve the buffers.
- **ppucStreamBufferStorageArea** -- Used to return a pointer to the stream buffer's storage area buffer.
- **ppxStaticStreamBuffer** -- Used to return a pointer to the stream buffer's data structure buffer.

**返回** pdTRUE if buffers were retrieved, pdFALSE otherwise.

size\_t **xStreamBufferSend** (*StreamBufferHandle\_t* xStreamBuffer, const void \*pvTxData, size\_t  
xDataLengthBytes, TickType\_t xTicksToWait)

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

**NOTE:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( StreamBufferHandle_t xStreamBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the stream buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the stream buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend,
    ↪ sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xStreamBufferSend() times out before there was enough
        // space in the buffer for the data to be written, but it did
        // successfully write xBytesSent bytes.
    }

    // Send the string to the stream buffer. Return immediately if there is not
    // enough space in the buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend,
    ↪ strlen( pcStringToSend ), 0 );
```

(下页继续)

```

if( xBytesSent != strlen( pcStringToSend ) )
{
// The entire string could not be added to the stream buffer because
// there was not enough free space in the buffer, but xBytesSent bytes
// were sent. Could try again to send the remaining bytes.
}
}

```

**参数**

- **xStreamBuffer** -- The handle of the stream buffer to which a stream is being sent.
- **pvTxData** -- A pointer to the buffer that holds the bytes to be copied into the stream buffer.
- **xDataLengthBytes** -- The maximum number of bytes to copy from pvTxData into the stream buffer.
- **xTicksToWait** -- The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold the another xDataLengthBytes bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS\_TO\_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX\_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE\_vTaskSuspend is set to 1 in FreeRTOSConfig.h. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.

**返回** The number of bytes written to the stream buffer. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible.

size\_t **xStreamBufferSendFromISR** (*StreamBufferHandle\_t* xStreamBuffer, const void \*pvTxData, size\_t xDataLengthBytes, BaseType\_t \*const pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

**NOTE:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```

// A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
size_t xBytesSent;
char *pcStringToSend = "String to send";
BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

// Attempt to send the string to the stream buffer.

```

(下页继续)

```

xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
                                       ( void * ) pcStringToSend,
                                       strlen( pcStringToSend ),
                                       &xHigherPriorityTaskWoken );

if( xBytesSent != strlen( pcStringToSend ) )
{
// There was not enough free space in the stream buffer for the entire
// string to be written, ut xBytesSent bytes were written.
}

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xStreamBufferSendFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

**参数**

- **xStreamBuffer** -- The handle of the stream buffer to which a stream is being sent.
- **pvTxData** -- A pointer to the data that is to be copied into the stream buffer.
- **xDataLengthBytes** -- The maximum number of bytes to copy from pvTxData into the stream buffer.
- **pxHigherPriorityTaskWoken** -- It is possible that a stream buffer will have a task blocked on it waiting for data. Calling xStreamBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xStreamBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferSendFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. \*pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the example code below for an example.

**返回** The number of bytes actually written to the stream buffer, which will be less than xDataLengthBytes if the stream buffer didn't have enough free space for all the bytes to be written.

size\_t **xStreamBufferReceive** (*StreamBufferHandle\_t* xStreamBuffer, void \*pvRxData, size\_t xBufferLengthBytes, TickType\_t xTicksToWait)

Receives bytes from a stream buffer.

**NOTE:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferReceive() to read from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read from a stream buffer from an interrupt service routine (ISR).

Example use:

```

void vAFunction( StreamBuffer_t xStreamBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
    // Wait in the Blocked state (so not using any CPU processing time) for a
    // maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
    // available.
    xReceivedBytes = xStreamBufferReceive( xStreamBuffer,
                                          ( void * ) ucRxData,
                                          sizeof( ucRxData ),
                                          xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains another xReceivedBytes bytes of data, which can
        // be processed here....
    }
}

```

### 参数

- **xStreamBuffer** -- The handle of the stream buffer from which bytes are to be received.
- **pvRxData** -- A pointer to the buffer into which the received bytes will be copied.
- **xBufferLengthBytes** -- The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **xTicksToWait** -- The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. xStreamBufferReceive() will return immediately if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS\_TO\_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX\_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE\_vTaskSuspend is set to 1 in FreeRTOSConfig.h. A task does not use any CPU time when it is in the Blocked state.

**返回** The number of bytes actually read from the stream buffer, which will be less than xBufferLengthBytes if the call to xStreamBufferReceive() timed out before xBufferLengthBytes were available.

size\_t **xStreamBufferReceiveFromISR** (*StreamBufferHandle\_t* xStreamBuffer, void \*pvRxData, size\_t xBufferLengthBytes, BaseType\_t \*const pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives bytes from a stream buffer.

Use xStreamBufferReceive() to read bytes from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```

// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;

```

(下页继续)

```

BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

// Receive the next stream from the stream buffer.
xReceivedBytes = xStreamBufferReceiveFromISR( xStreamBuffer,
                                              ( void * ) ucRxData,
                                              sizeof( ucRxData ),
                                              &xHigherPriorityTaskWoken );

if( xReceivedBytes > 0 )
{
// ucRxData contains xReceivedBytes read from the stream buffer.
// Process the stream here....
}

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xStreamBufferReceiveFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

**参数**

- **xStreamBuffer** -- The handle of the stream buffer from which a stream is being received.
- **pvRxData** -- A pointer to the buffer into which the received bytes are copied.
- **xBufferLengthBytes** -- The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **pxHigherPriorityTaskWoken** -- It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling xStreamBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xStreamBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferReceiveFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. \*pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

**返回** The number of bytes read from the stream buffer, if any.

void **vStreamBufferDelete** (*StreamBufferHandle\_t* xStreamBuffer)

Deletes a stream buffer that was previously created using a call to xStreamBufferCreate() or xStreamBufferCreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

**参数** **xStreamBuffer** -- The handle of the stream buffer to be deleted.

BaseType\_t **xStreamBufferIsFull** (*StreamBufferHandle\_t* xStreamBuffer)

Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

**参数** **xStreamBuffer** -- The handle of the stream buffer being queried.

**返回** If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType\_t **xStreamBufferIsEmpty** (*StreamBufferHandle\_t* xStreamBuffer)

Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

**参数 xStreamBuffer** -- The handle of the stream buffer being queried.

**返回** If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType\_t **xStreamBufferReset** (*StreamBufferHandle\_t* xStreamBuffer)

Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

**参数 xStreamBuffer** -- The handle of the stream buffer being reset.

**返回** If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

size\_t **xStreamBufferSpacesAvailable** (*StreamBufferHandle\_t* xStreamBuffer)

Queries a stream buffer to see how much free space it contains, which is equal to the amount of data that can be sent to the stream buffer before it is full.

**参数 xStreamBuffer** -- The handle of the stream buffer being queried.

**返回** The number of bytes that can be written to the stream buffer before the stream buffer would be full.

size\_t **xStreamBufferBytesAvailable** (*StreamBufferHandle\_t* xStreamBuffer)

Queries a stream buffer to see how much data it contains, which is equal to the number of bytes that can be read from the stream buffer before the stream buffer would be empty.

**参数 xStreamBuffer** -- The handle of the stream buffer being queried.

**返回** The number of bytes that can be read from the stream buffer before the stream buffer would be empty.

BaseType\_t **xStreamBufferSetTriggerLevel** (*StreamBufferHandle\_t* xStreamBuffer, size\_t xTriggerLevel)

A stream buffer's trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

**参数**

- **xStreamBuffer** -- The handle of the stream buffer being updated.
- **xTriggerLevel** -- The new trigger level for the stream buffer.

**返回** If xTriggerLevel was less than or equal to the stream buffer's length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType\_t **xStreamBufferSendCompletedFromISR** (*StreamBufferHandle\_t* xStreamBuffer, BaseType\_t \*pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND\_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND\_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND\_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

#### 参数

- **xStreamBuffer** -- The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** -- \*pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferSendCompletedFromISR(). If calling xStreamBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then \*pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**返回** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType\_t **xStreamBufferReceiveCompletedFromISR** (*StreamBufferHandle\_t* xStreamBuffer, BaseType\_t \*pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE\_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE\_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE\_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

#### 参数

- **xStreamBuffer** -- The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken** -- \*pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferReceiveCompletedFromISR(). If calling xStreamBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then \*pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**返回** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

## Macros

**xStreamBufferCreateWithCallback** (xBufferSizeBytes, xTriggerLevelBytes, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new stream buffer using dynamically allocated memory. See xStreamBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT\_DYNAMIC\_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xStreamBufferCreate() to be available.

Example use:

```
void vAFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

// Create a stream buffer that can hold 100 bytes. The memory used to hold
// both the stream buffer structure and the data in the stream buffer is
// allocated dynamically.
xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes, xTriggerLevel );

if( xStreamBuffer == NULL )
```

(下页继续)

```

{
// There was not enough heap memory space available to create the
// stream buffer.
}
else
{
// The stream buffer was created successfully and can now be used.
}
}

```

**参数**

- **xBufferSizeBytes** -- The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes** -- The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pxSendCompletedCallback** -- Callback invoked when number of bytes at least equal to trigger level is sent to the stream buffer. If the parameter is NULL, it will use the default implementation provided by sbSEND\_COMPLETED macro. To enable the callback, configUSE\_SB\_COMPLETED\_CALLBACK must be set to 1 in FreeRTOSConfig.h.
- **pxReceiveCompletedCallback** -- Callback invoked when more than zero bytes are read from a stream buffer. If the parameter is NULL, it will use the default implementation provided by sbRECEIVE\_COMPLETED macro. To enable the callback, configUSE\_SB\_COMPLETED\_CALLBACK must be set to 1 in FreeRTOSConfig.h.

**返回** If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

**xStreamBufferCreateStaticWithCallback** (xBufferSizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea, pxStaticStreamBuffer, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new stream buffer using statically allocated memory. See xStreamBufferCreate() for a version that uses dynamically allocated memory.

configSUPPORT\_STATIC\_ALLOCATION must be set to 1 in FreeRTOSConfig.h for xStreamBufferCreateStatic() to be available.

Example use:

```

// Used to dimension the array used to hold the streams. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

```

```

// The variable used to hold the stream buffer structure.
StaticStreamBuffer_t xStreamBufferStruct;

void MyFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xTriggerLevel = 1;

    xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucStorageBuffer ),
                                              xTriggerLevel,
                                              ucStorageBuffer,
                                              &xStreamBufferStruct );

// As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
// parameters were NULL, xStreamBuffer will not be NULL, and can be used to
// reference the created stream buffer in other stream buffer API calls.

// Other code that uses the stream buffer can go here.
}

```

### 参数

- **xBufferSizeBytes** -- The size, in bytes, of the buffer pointed to by the pucStreamBufferStorageArea parameter.
- **xTriggerLevelBytes** -- The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pucStreamBufferStorageArea** -- Must point to a uint8\_t array that is at least xBufferSizeBytes big. This is the array to which streams are copied when they are written to the stream buffer.
- **pxStaticStreamBuffer** -- Must point to a variable of type StaticStreamBuffer\_t, which will be used to hold the stream buffer's data structure.
- **pxSendCompletedCallback** -- Callback invoked when number of bytes at least equal to trigger level is sent to the stream buffer. If the parameter is NULL, it will use the default implementation provided by sbSEND\_COMPLETED macro. To enable the callback, configUSE\_SB\_COMPLETED\_CALLBACK must be set to 1 in FreeRTOSConfig.h.
- **pxReceiveCompletedCallback** -- Callback invoked when more than zero bytes are read from a stream buffer. If the parameter is NULL, it will use the default implementation provided by sbRECEIVE\_COMPLETED macro. To enable the callback, configUSE\_SB\_COMPLETED\_CALLBACK must be set to 1 in FreeRTOSConfig.h.

**返回** If the stream buffer is created successfully then a handle to the created stream buffer is returned. If either pucStreamBufferStorageArea or pxStaticstreamBuffer are NULL then NULL is returned.

### Type Definitions

```
typedef struct StreamBufferDef_t *StreamBufferHandle_t
```

```
typedef void (*StreamBufferCallbackFunction_t)(StreamBufferHandle_t xStreamBuffer, BaseType_t xIsInsideISR, BaseType_t *const pxHigherPriorityTaskWoken)
```

Type used as a stream buffer's optional callback.

## 消息缓冲区 API

### Header File

- `components/freertos/FreeRTOS-Kernel/include/freertos/message_buffer.h`
- This header file can be included with:

```
#include "freertos/message_buffer.h"
```

### Macros

**xMessageBufferCreateWithCallback** (xBufferSizeBytes, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new message buffer using dynamically allocated memory. See `xMessageBufferCreateStatic()` for a version that uses statically allocated memory (memory that is allocated at compile time).

`configSUPPORT_DYNAMIC_ALLOCATION` must be set to 1 or left undefined in `FreeRTOSConfig.h` for `xMessageBufferCreate()` to be available.

Example use:

```
void vAFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;

    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

    if( xMessageBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // message buffer.
    }
    else
    {
        // The message buffer was created successfully and can now be used.
    }
}
```

### 参数

- **xBufferSizeBytes** -- The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the message buffer an additional `sizeof( size_t )` bytes are also written to store the message's length. `sizeof( size_t )` is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.
- **pxSendCompletedCallback** -- Callback invoked when a send operation to the message buffer is complete. If the parameter is `NULL` or `xMessageBufferCreate()` is called without the parameter, then it will use the default implementation provided by `sbSEND_COMPLETED` macro. To enable the callback, `configUSE_SB_COMPLETED_CALLBACK` must be set to 1 in `FreeRTOSConfig.h`.

- **pxReceiveCompletedCallback** -- Callback invoked when a receive operation from the message buffer is complete. If the parameter is NULL or xMessageBufferCreate() is called without the parameter, it will use the default implementation provided by sbRECEIVE\_COMPLETED macro. To enable the callback, configUSE\_SB\_COMPLETED\_CALLBACK must be set to 1 in FreeRTOSConfig.h.

**返回** If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.

**xMessageBufferCreateStaticWithCallback** (xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMessageBuffer, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new message buffer using statically allocated memory. See xMessageBufferCreate() for a version that uses dynamically allocated memory.

Example use:

```
// Used to dimension the array used to hold the messages. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;

    xMessageBuffer = xMessageBufferCreateStatic( sizeof( ucStorageBuffer ),
                                                ucStorageBuffer,
                                                &xMessageBufferStruct );

    // As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer
    // parameters were NULL, xMessageBuffer will not be NULL, and can be used to
    // reference the created message buffer in other message buffer API calls.

    // Other code that uses the message buffer can go here.
}
```

### 参数

- **xBufferSizeBytes** -- The size, in bytes, of the buffer pointed to by the pucMessageBufferStorageArea parameter. When a message is written to the message buffer an additional sizeof( size\_t ) bytes are also written to store the message's length. sizeof( size\_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually (xBufferSizeBytes - 1).
- **pucMessageBufferStorageArea** -- Must point to a uint8\_t array that is at least xBufferSizeBytes big. This is the array to which messages are copied when they are written to the message buffer.
- **pxStaticMessageBuffer** -- Must point to a variable of type StaticMessageBuffer\_t, which will be used to hold the message buffer's data structure.
- **pxSendCompletedCallback** -- Callback invoked when a new message is sent to the message buffer. If the parameter is NULL or xMessageBufferCreate() is called without the parameter, then it will use the default implementa-

tion provided by `sbSEND_COMPLETED` macro. To enable the callback, `configUSE_SB_COMPLETED_CALLBACK` must be set to 1 in `FreeRTOSConfig.h`.

- **pxReceiveCompletedCallback** -- Callback invoked when a message is read from a message buffer. If the parameter is `NULL` or `xMessageBufferCreate()` is called without the parameter, it will use the default implementation provided by `sbRECEIVE_COMPLETED` macro. To enable the callback, `configUSE_SB_COMPLETED_CALLBACK` must be set to 1 in `FreeRTOSConfig.h`.

**返回** If the message buffer is created successfully then a handle to the created message buffer is returned. If either `pucMessageBufferStorageArea` or `pxStaticmessageBuffer` are `NULL` then `NULL` is returned.

**xMessageBufferGetStaticBuffers** (`xMessageBuffer`, `ppucMessageBufferStorageArea`, `ppxStaticMessageBuffer`)

Retrieve pointers to a statically created message buffer's data structure buffer and storage area buffer. These are the same buffers that are supplied at the time of creation.

**参数**

- **xMessageBuffer** -- The message buffer for which to retrieve the buffers.
- **ppucMessageBufferStorageArea** -- Used to return a pointer to the message buffer's storage area buffer.
- **ppxStaticMessageBuffer** -- Used to return a pointer to the message buffer's data structure buffer.

**返回** `pdTRUE` if buffers were retrieved, `pdFALSE` otherwise.

**xMessageBufferSend** (`xMessageBuffer`, `pvTxData`, `xDataLengthBytes`, `xTicksToWait`)

Sends a discrete message to the message buffer. The message can be any length that fits within the buffer's free space, and is copied into the buffer.

**NOTE:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xMessageBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xMessageBufferRead()`) inside a critical section and set the receive block time to 0.

Use `xMessageBufferSend()` to write to a message buffer from a task. Use `xMessageBufferSendFromISR()` to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( MessageBufferHandle_t xMessageBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the message buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the message buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend,
    →sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xMessageBufferSend() times out before there was enough
        // space in the buffer for the data to be written.
    }
}
```

(下页继续)

```

}

// Send the string to the message buffer. Return immediately if there is
// not enough space in the buffer.
xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend,
↳strlen( pcStringToSend ), 0 );

if( xBytesSent != strlen( pcStringToSend ) )
{
// The string could not be added to the message buffer because there was
// not enough free space in the buffer.
}
}

```

**参数**

- **xMessageBuffer** -- The handle of the message buffer to which a message is being sent.
- **pvTxData** -- A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** -- The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof( size\_t ) bytes are also written to store the message's length. sizeof( size\_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **xTicksToWait** -- The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when xMessageBufferSend() is called. The calling task will never block if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS\_TO\_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX\_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE\_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

**返回** The number of bytes written to the message buffer. If the call to xMessageBufferSend() times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then xDataLengthBytes is returned.

**xMessageBufferSendFromISR** (xMessageBuffer, pvTxData, xDataLengthBytes,  
pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer's free space, and is copied into the buffer.

**NOTE:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```

// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the message buffer.
    xBytesSent = xMessageBufferSendFromISR( xMessageBuffer,
                                            ( void * ) pcStringToSend,
                                            strlen( pcStringToSend ),
                                            &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

### 参数

- **xMessageBuffer** -- The handle of the message buffer to which a message is being sent.
- **pvTxData** -- A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** -- The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof( size\_t ) bytes are also written to store the message's length. sizeof( size\_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **pxHigherPriorityTaskWoken** -- It is possible that a message buffer will have a task blocked on it waiting for data. Calling xMessageBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xMessageBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferSendFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. \*pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

**返回** The number of bytes actually written to the message buffer. If the message buffer didn't have enough free space for the message to be stored then 0 is returned, otherwise xDataLengthBytes is returned.

**xMessageBufferReceive** (xMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)

Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of

the buffer.

**NOTE:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xMessageBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xMessageBufferRead()`) inside a critical section and set the receive block time to 0.

Use `xMessageBufferReceive()` to read from a message buffer from a task. Use `xMessageBufferReceiveFromISR()` to read from a message buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( MessageBuffer_t xMessageBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive the next message from the message buffer. Wait in the Blocked
    // state (so not using any CPU processing time) for a maximum of 100ms for
    // a message to become available.
    xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
                                           ( void * ) ucRxData,
                                           sizeof( ucRxData ),
                                           xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }
}
```

### 参数

- **xMessageBuffer** -- The handle of the message buffer from which a message is being received.
- **pvRxData** -- A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** -- The length of the buffer pointed to by the `pvRxData` parameter. This sets the maximum length of the message that can be received. If `xBufferLengthBytes` is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **xTicksToWait** -- The maximum amount of time the task should remain in the Blocked state to wait for a message, should the message buffer be empty. `xMessageBufferReceive()` will return immediately if `xTicksToWait` is zero and the message buffer is empty. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro `pdMS_TO_TICKS()` can be used to convert a time specified in milliseconds into a time specified in ticks. Setting `xTicksToWait` to `portMAX_DELAY` will cause the task to wait indefinitely (without timing out), provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`. Tasks do not use any CPU time when they are in the Blocked state.

**返回** The length, in bytes, of the message read from the message buffer, if any. If `xMessageBufferReceive()` times out before a message became available then zero is returned. If the length of the message is greater than `xBufferLengthBytes` then the message will be left in the message buffer and zero is returned.

**xMessageBufferReceiveFromISR** (xMessageBuffer, pvRxData, xBufferLengthBytes, pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

**NOTE:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```
// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next message from the message buffer.
    xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
                                                    ( void * ) ucRxData,
                                                    sizeof( ucRxData ),
                                                    &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

**参数**

- **xMessageBuffer** -- The handle of the message buffer from which a message is being received.
- **pvRxData** -- A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** -- The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.

- **pxHigherPriorityTaskWoken** -- It is possible that a message buffer will have a task blocked on it waiting for space to become available. Calling `xMessageBufferReceiveFromISR()` can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling `xMessageBufferReceiveFromISR()` causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, `xMessageBufferReceiveFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE`. If `xMessageBufferReceiveFromISR()` sets this value to `pdTRUE`, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. `*pxHigherPriorityTaskWoken` should be set to `pdFALSE` before it is passed into the function. See the code example below for an example.

**返回** The length, in bytes, of the message read from the message buffer, if any.

#### **vMessageBufferDelete** (xMessageBuffer)

Deletes a message buffer that was previously created using a call to `xMessageBufferCreate()` or `xMessageBufferCreateStatic()`. If the message buffer was created using dynamic memory (that is, by `xMessageBufferCreate()`), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

##### 参数

- **xMessageBuffer** -- The handle of the message buffer to be deleted.

#### **xMessageBufferIsFull** (xMessageBuffer)

Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any size, until space is made available by a message being removed from the message buffer.

##### 参数

- **xMessageBuffer** -- The handle of the message buffer being queried.

**返回** If the message buffer referenced by `xMessageBuffer` is full then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

#### **xMessageBufferIsEmpty** (xMessageBuffer)

Tests to see if a message buffer is empty (does not contain any messages).

##### 参数

- **xMessageBuffer** -- The handle of the message buffer being queried.

**返回** If the message buffer referenced by `xMessageBuffer` is empty then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

#### **xMessageBufferReset** (xMessageBuffer)

Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

##### 参数

- **xMessageBuffer** -- The handle of the message buffer being reset.

**返回** If the message buffer was reset then `pdPASS` is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a message to be available, then `pdFAIL` is returned.

#### **xMessageBufferSpaceAvailable** (xMessageBuffer)

message\_buffer.h

```
size_t xMessageBufferSpaceAvailable( MessageBufferHandle_t xMessageBuffer );
```

Returns the number of bytes of free space in the message buffer.

##### 参数

- **xMessageBuffer** -- The handle of the message buffer being queried.

**返回** The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional `sizeof( size_t )` bytes are also written to store the message's length. `sizeof( size_t )` is typically 4 bytes on

a 32-bit architecture, so if `xMessageBufferSpacesAvailable()` returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

**xMessageBufferSpacesAvailable** (xMessageBuffer)

**xMessageBufferNextLengthBytes** (xMessageBuffer)

Returns the length (in bytes) of the next message in a message buffer. Useful if `xMessageBufferReceive()` returned 0 because the size of the buffer passed into `xMessageBufferReceive()` was too small to hold the next message.

#### 参数

- **xMessageBuffer** -- The handle of the message buffer being queried.

**返回** The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.

**xMessageBufferSendCompletedFromISR** (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The `sbSEND_COMPLETED()` macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the `sbSEND_COMPLETED()` macro sends a notification to the task to remove it from the Blocked state. `xMessageBufferSendCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of `sbSEND_COMPLETED()`, and **MUST NOT BE USED AT ANY OTHER TIME**.

See the example implemented in `FreeRTOS/Demo/Minimal/MessageBufferAMP.c` for additional information.

#### 参数

- **xMessageBuffer** -- The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** -- \*pxHigherPriorityTaskWoken should be initialised to `pdFALSE` before it is passed into `xMessageBufferSendCompletedFromISR()`. If calling `xMessageBufferSendCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then \*pxHigherPriorityTaskWoken will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

**返回** If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

**xMessageBufferReceiveCompletedFromISR** (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The `sbRECEIVE_COMPLETED()` macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the `sbRECEIVE_COMPLETED()` macro sends a notification to the task to remove it from the Blocked state. `xMessageBufferReceiveCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of `sbRECEIVE_COMPLETED()`, and **MUST NOT BE USED AT ANY OTHER TIME**.

See the example implemented in `FreeRTOS/Demo/Minimal/MessageBufferAMP.c` for additional information.

#### 参数

- **xMessageBuffer** -- The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken** -- \*pxHigherPriorityTaskWoken should be initialised to `pdFALSE` before it is passed into `xMessageBufferReceiveCompletedFromISR()`. If calling `xMessageBufferReceiveCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then \*pxHigherPriorityTaskWoken will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

**返回** If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

## Type Definitions

typedef *StreamBufferHandle\_t* **MessageBufferHandle\_t**

Type by which message buffers are referenced. For example, a call to `xMessageBufferCreate()` returns an `MessageBufferHandle_t` variable that can then be used as a parameter to `xMessageBufferSend()`, `xMessageBufferReceive()`, etc. Message buffer is essentially built as a stream buffer hence its handle is also set to same type as a stream buffer handle.

### 2.10.13 FreeRTOS (附加功能)

ESP-IDF 为 FreeRTOS 提供了多种附加功能。这些附加功能适用于 ESP-IDF 支持的所有 FreeRTOS 实现，即 ESP-IDF FreeRTOS 和 Amazon SMP FreeRTOS。本文档介绍了这些附加功能，内容包括以下几个部分：

#### 目录

- *FreeRTOS* (附加功能)
  - 概述
  - 环形 *buffer*
  - *ESP-IDF tick* 钩子和 *idle* 钩子
  - *TLSP* 删除回调
  - *IDF* 附加 *API*
  - 组件专用功能
  - *API* 参考

#### 概述

ESP-IDF 为 FreeRTOS 提供了以下附加功能：

- **环形 buffer**：FIFO 缓冲区，支持任意长度的数据项。
- **ESP-IDF tick 钩子和 idle 钩子**：ESP-IDF 提供了多个自定义的 tick 钩子和 idle 钩子，相较于 FreeRTOS，支持的钩子数量更多且更灵活。
- **线程本地存储指针 (TLSP) 删除回调**：当一个任务被删除时，TLSP 删除回调会自动运行，从而自动清理 TLSP。
- **IDF 附加 API**：专用于 ESP-IDF 的附加函数，用于增强 FreeRTOS 的功能。
- **组件专用功能**：目前只添加了一个专用于组件的功能，即 `ORIG_INCLUDE_PATH`。

#### 环形 buffer

FreeRTOS 提供了流 buffer 和消息 buffer，作为在任务和 ISR 之间发送任意大小数据的主要机制。然而，FreeRTOS 流 buffer 和消息 buffer 具有以下限制：

- 仅支持单一的发送者和单一的接收者
- 数据通过复制的方式进行传递
- 无法为延迟发送（即发送获取）预留 buffer 空间

为此，ESP-IDF 提供了一个单独的环形 buffer 来解决上述问题。

ESP-IDF 环形 buffer 是一个典型的 FIFO buffer，支持任意大小的数据项。在数据项大小可变的情况下，环形 buffer 比 FreeRTOS 队列更节约内存，可以替代 FreeRTOS 队列使用。环形 buffer 的容量不是由可以存储的数据项数量衡量的，而是由用于存储数据项的内存量来衡量的。

环形 buffer 提供了 API 来发送数据项，或为环形 buffer 中的数据项分配空间，以便进行手动填充。为提高效率，**数据项都通过引用的方式从环形 buffer 中检索出来**。因此，所有检索出的数据项也 **必须**通过 `vRingbufferReturnItem()` 或 `vRingbufferReturnItemFromISR()` 返回到环形 buffer，以便将其从环形 buffer 中完全移除。

环形 buffer 分为以下三种类型：

**不可分割 buffer:** 确保将一个数据项存储在连续的内存中，并且在任何情况下都不会尝试分割数据项。当数据项必须占用连续的内存时，请使用不可分割 buffer。仅不可分割 buffer 允许为延迟发送保留缓冲空间。更多信息请参考函数 `xRingbufferSendAcquire()` 和 `xRingbufferSendComplete()` 的文档。

**可分割 buffer:** 当数据项在 buffer 末尾绕回时，如果 buffer 头部和尾部的总空间足够，则支持将一个数据项分成两部分进行存储。可分割 buffer 比不可分割 buffer 更节省内存，但在检索时可能会返回数据项的两个部分。

**字节 buffer:** 不将数据存储在单独的数据项。所有数据都存储为字节序列，每次可以发送或检索任意大小的字节。当不需要单独维护数据项时，推荐使用字节 buffer，例如字节流。

**备注:** 不可分割 buffer 和可分割 buffer 在 32 位对齐地址上存储数据项。因此，在检索一个数据项时，数据项指针一定也是 32 位对齐的。这在向 DMA 发送数据时非常有用。

**备注:** 存储在不可分割或可分割 buffer 中的每个数据项需要额外的 8 字节用于标头。数据项大小会向上取整为 32 位对齐大小，即 4 字节的倍数，实际的数据项大小则记录在标头中。不可分割和可分割 buffer 的大小在创建时也会向上取整。

**使用方法** 以下示例演示了如何使用 `xRingbufferCreate()` 和 `xRingbufferSend()` 来创建环形 buffer，并向其发送数据项：

```
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";

...

//创建环形 buffer
RingbufHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer\n");
}

//发送一个数据项
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_
↳TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to send item\n");
}
```

以下示例演示了如何使用 `xRingbufferSendAcquire()` 和 `xRingbufferSendComplete()` 代替 `xRingbufferSend()` 来获取环形 buffer (`RINGBUF_TYPE_NOSPLIT` 类型) 上的内存，然后向其发送一个数据项。虽然增加了一个步骤，但可以实现获取要写入内存的地址，并自行写入内存。

```
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+((N)+3)&(~3))

...

//为 DMA 描述符和相应的数据 buffer 检索空间
//此步骤必须通过 SendAcquire 完成，否则，复制时地址可能会不同
```

(下页继续)

```

dma_item_t item;
UBaseType_t res = xRingbufferSendAcquire(buf_handle,
                                         &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to acquire memory for item\n");
}
item->dma_desc = (lldesc_t) {
    .size = buffer_size,
    .length = buffer_size,
    .eof = 0,
    .owner = 1,
    .buf = &item->buf,
};
//实际发送到环形 buffer 以供使用
res = xRingbufferSendComplete(buf_handle, &item);
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

```

以下示例演示了使用 `xRingbufferReceive()` 和 `vRingbufferReturnItem()` 从不可分割环形 **buffer** 中检索和返回数据项:

```

...

//从不可分割环形 buffer 中接收一个数据项
size_t item_size;
char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_
↪TICKS(1000));

//Check received item
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //返回数据项
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //数据项检索失败
    printf("Failed to receive item\n");
}

```

以下示例演示了使用 `xRingbufferReceiveSplit()` 和 `vRingbufferReturnItem()` 从可分割环形 **buffer** 中检索和返回数据项:

```

...

//从可分割环形 buffer 中接收一个数据项
size_t item_size1, item_size2;
char *item1, *item2;
BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)&item1, (void_
↪**)&item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

//检查收到的数据项
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
    //Check if item was split

```

(下页继续)

```

    if (item2 != NULL) {
        for (int i = 0; i < item_size2; i++) {
            printf("%c", item2[i]);
        }
        vRingbufferReturnItem(buf_handle, (void *)item2);
    }
    printf("\n");
} else {
    //接收数据项失败
    printf("Failed to receive item\n");
}

```

以下示例演示了使用 `xRingbufferReceiveUpTo()` 和 `vRingbufferReturnItem()` 从字节 buffer 中检索和返回数据项:

```

...
//从字节 buffer 中接收数据
size_t item_size;
char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_
↳TICKS(1000), sizeof(tx_item));

//检查接收到的数据
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //返回数据项
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //接收数据项失败
    printf("Failed to receive item\n");
}

```

对于以上函数的 ISR 安全版本, 请调用 `xRingbufferSendFromISR()`、`xRingbufferReceiveFromISR()`、`xRingbufferReceiveSplitFromISR()`、`xRingbufferReceiveUpToFromISR()` 和 `vRingbufferReturnItemFromISR()`。

**备注:** 当字节在环形 buffer 的末端绕回时, 需调用 `RingbufferReceive[UpTo][FromISR]()` 两次。

**发送到环形 buffer** 以下图表将不可分割和可分割 buffer 与字节 buffer 进行对比, 说明了三者在发送数据或数据项方面的差异。图表中, 假设分别向 128 字节的 buffer 发送大小为 18、3 和 27 字节的三个数据项:

图 32: 向不可分割或可分割的环形 buffer 发送数据项

对于不可分割和可分割 buffer, 每个数据项前都有 8 字节标头信息。此外, 为了保持整体的 32 位对齐, 每

个数据项占用的空间都会 **向上取整到最接近的 32 位对齐大小**。数据项的实际大小会记录在标头中，并在检索数据项时返回。

参考上图，18、3 和 27 字节的数据项分别 **向上取整为 20、4 和 28 字节**，然后在每个数据项前面添加一个 8 字节的标头。

图 33: 向字节 buffer 发送数据项

字节 buffer 将数据视为一个字节序列，不会产引入任何额外开销，不添加标头信息。因此，发送到字节 buffer 的所有数据都会合并成一个数据项。

参考上图，18、3 和 27 字节的数据项被顺序写入字节 buffer，并 **合并成一个 48 字节的数据项**。

**使用 SendAcquire 和 SendComplete** 不可分割 buffer 中的数据项严格按照 FIFO 顺序通过 SendAcquire 获取，并且必须通过 SendComplete 发送到 buffer 以便访问。也可以发送或获取多个数据项，且无需严格遵照获取顺序，但接收数据项却必须遵循 FIFO。所以，如果不为最早获取的数据项调用 SendComplete，就无法接收后续数据项。

以下图表说明了当 SendAcquire 和 SendComplete 顺序不同时的情形。一开始，已经有一个 16 字节的数据项发送到环形 buffer。然后调用 SendAcquire 在环形 buffer 上获取 20、8、24 字节的空间。

图 34: 在不可分割环形 buffer 中 SendAcquire/SendComplete 数据项

然后填充 buffer，按照 8、24、20 字节的顺序通过 SendComplete 将数据项发送到环形 buffer。当 8 字节和 24 字节的数据发送后，仍只能获取 16 字节的数据项。因此，如果不为 20 字节数据项调用 SendComplete，就无法获取该数据项，也无法获取 20 字节后的数据项。

当 20 字节数据项最终发送完成后，就可以在 buffer 中最初的 16 字节数据项之后，按照 20、8、24 字节的顺序接收所有的三个数据项。

由于 SendAcquire 及 SendComplete 要求所获取的 buffer 必须是完整的（未包装的），故可分割 buffer 和字节 buffer 不支持上述调用操作。

**绕回** 以下图表说明了发送数据项需要绕回时，不可分割、可分割和字节 buffer 之间的差异。图表假设有一个 128 字节的 buffer，其中有 56 字节的空闲空间可以绕回使用，并发送了一个 28 字节的数据项。

不可分割 buffer 只在连续的空闲空间中存储数据项，在任何情况下都不分割数据项。当 buffer 尾部的空闲空间不足以完全存储数据项及其标头时，尾部的空闲空间将被 **标记为虚拟数据**。然后，数据项将绕回并存储在 buffer 头部的空闲空间中。

图 35: 在不可分割 buffer 中绕回

参考上图，buffer 尾部的 16 字节空闲空间不足以存储 28 字节的数据项，因此，这 16 字节被标记为虚拟数据，然后将数据项写入了 buffer 头部的空闲空间中。

图 36: 在可分割 buffer 中绕回

当 buffer 尾部的空闲空间不足以存储数据项及其标头时，可分割 buffer 会尝试将数据项分割成两部分。分割的两部分数据项都将有自己的标头，因此会产生额外的 8 字节开销。

参考上图，buffer 尾部的 16 字节空闲空间不足以存储 28 字节的数据项。因此将数据项分割成两部分（8 字节和 20 字节），并将两部分写入 buffer。

**备注：** 可分割 buffer 将其分割好的两部分数据视为两个独立的数据项，因此不应调用 `xRingbufferReceive()`。需调用 `xRingbufferReceiveSplit()` 以线程安全的方式接收分割的两部分数据项。

图 37: 在字节 buffer 中绕回

字节 buffer 将尽可能多的数据存储到 buffer 尾部的空闲空间中。剩余的数据会存储在 buffer 头部的空闲空间。在字节 buffer 中绕回不会产生任何额外开销。

参考上图，buffer 尾部的 16 字节空闲空间不足以完全存储 28 字节的数据，因此，将数据填入这 16 字节空闲空间后，剩余的 12 字节会被写入 buffer 头部的空闲空间。此时，buffer 包含两个独立的连续数据，并且每个连续数据都被字节 buffer 视为一个独立数据项。

**检索/返回** 以下图表说明了在检索和返回数据时，不可分割、可分割 buffer 和字节 buffer 之间的差异：

不可分割 buffer 和可分割 buffer 中的数据项按严格的 FIFO 顺序检索并必须返回，以释放占用的空间。在返回之前可以检索多个数据项，且不必按照检索的顺序返回数据项。但是，释放空间必须按 FIFO 顺

图 38: 在不可分割和可分割环形 buffer 中检索/返回数据项

序进行，因此如果不返回最早检索的数据项，就无法释放后续数据项占用的空间。

参考上图，16、20 和 8 字节的数据项按 FIFO 顺序被检索出来。但是，这些数据项并不是按照被检索的顺序返回的。最先返回的是 20 字节的数据项，然后分别返回 8 字节和 16 字节的数据项。直到第一个数据项（即 16 字节的数据项）返回后，空间才会被释放。

图 39: 在字节 buffer 中检索/返回数据

字节 buffer 不允许在返回之前进行多次检索（每次检索必须在下一次检索之前返回结果）。使用 `xRingbufferReceive()` 或 `xRingbufferReceiveFromISR()` 时，会检索所有连续存储的数据。使用 `xRingbufferReceiveUpTo()` 或 `xRingbufferReceiveUpToFromISR()` 可限制检索的最大字节数。由于每次检索后都必须返回，因此数据一返回就会释放空间。

参考上图，buffer 尾部 38 字节连续存储的数据被检索、返回和释放。然后，下一次调用 `xRingbufferReceive()` 或 `xRingbufferReceiveFromISR()` 时，buffer 将绕回并对头部的 30 字节连续存储数据进行同样的处理。

**使用队列集的环形 buffer** 使用 `xRingbufferAddToQueueSetRead()` 可以将环形 buffer 添加到 FreeRTOS 队列集中，这样每次环形 buffer 接收一个数据项或数据时，队列集都会收到通知。添加到队列集后，每次从环形 buffer 检索数据项时都应该先调用 `xQueueSelectFromSet()`。要检查选定的队列集成员是否为环形 buffer，调用 `xRingbufferCanRead()`。

以下示例演示了如何使用包含环形 buffer 的队列集：

```
#include "freertos/queue.h"
#include "freertos/ringbuf.h"

...

//创建环形 buffer 和队列集
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
```

(下一页继续)

```

QueueSetHandle_t queue_set = xQueueCreateSet(3);

//向队列集中添加环形 buffer
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}

...

//阻塞队列集
QueueSetMemberHandle_t member = xQueueSelectFromSet(queue_set, pdMS_TO_
↪TICKS(1000));

//检查成员是否为环形 buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);

    //处理数据项
    ...
} else {
    ...
}

```

**使用静态分配的环形 buffer** `xRingbufferCreateStatic()` 可用于创建具有特定内存需求的环形 buffer（如在外部 RAM 中分配的环形 buffer）。环形 buffer 使用的所有内存块都必须在创建之前手动分配，然后传递给 `xRingbufferCreateStatic()` 以初始化为环形 buffer。这些内存块中包括：

- 环形 buffer 的数据结构类型 `StaticRingbuffer_t`。
- 环形 buffer 的存储区域，大小为 `xBufferSize`。注意，对于不可分割和可分割 buffer，`xBufferSize` 必须为 32 位对齐大小。

这些块的分配方式取决于具体的需求。例如，静态声明所有块，或动态分配为具有特定功能的块，如外部 RAM。

**备注：** 当删除通过 `xRingbufferCreateStatic()` 创建的环形 buffer 时，`vRingbufferDelete()` 函数不会释放任何内存块。释放内存必须在调用 `vRingbufferDelete()` 后手动完成。

下面的代码片段演示了一个完全在外部 RAM 中分配的环形 buffer：

```

#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"

#define BUFFER_SIZE    400    //32 位对齐大小
#define BUFFER_TYPE    RINGBUF_TYPE_NOSPLIT
...

//将 环形 buffer 数据结构体和存储区分配到外部 RAM 中
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_
↪malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t)*BUFFER_SIZE, ↪
↪MALLOC_CAP_SPIRAM);

//使用手动分配的内存创建环形 buffer
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_
↪storage, buffer_struct);

```

(下页继续)

```

...
//使用后删除环形 buffer
vRingbufferDelete(handle);

//手动释放所有内存块
free(buffer_struct);
free(buffer_storage);

```

### ESP-IDF tick 钩子和 idle 钩子

FreeRTOS 允许应用程序在编译时提供一个 tick 钩子和一个 idle 钩子：

- FreeRTOS tick 钩子可以通过 `CONFIG_FREERTOS_USE_TICK_HOOK` 选项启用。应用程序必须提供 `void vApplicationTickHook( void )` 回调。
- FreeRTOS idle 钩子可以通过 `CONFIG_FREERTOS_USE_IDLE_HOOK` 选项启用。应用程序必须提供 `void vApplicationIdleHook( void )` 回调。

然而，FreeRTOS tick 钩子和 idle 钩子有以下不足：

- FreeRTOS 钩子是在编译时注册的
- 每种钩子只能注册一个
- 在多核目标芯片上，FreeRTOS 钩子是对称的，即每个内核的 tick 中断和 idle 任务最终都会调用同一个钩子

因此，ESP-IDF 提供了 tick 钩子和 idle 钩子来补充 FreeRTOS tick 和 idle 钩子的功能。ESP-IDF 钩子具有以下功能：

- 钩子可以在运行时注册和注销
- 可以注册多个钩子。每个内核中，同一类型的钩子最多可以注册 8 个
- 在多核目标芯片上，钩子可以是不对称的，即可以为每个内核注册不同的钩子

使用以下 API 注册和注销 ESP-IDF 钩子：

- 对于 tick 钩子：
  - 用 `esp_register_freertos_tick_hook()` 或 `esp_register_freertos_tick_hook_for_cpu()` 注册
  - 用 `esp_deregister_freertos_tick_hook()` 或 `esp_deregister_freertos_tick_hook_for_cpu()` 注销
- 对于 idle 钩子：
  - 使用 `esp_register_freertos_idle_hook()` 或 `esp_register_freertos_idle_hook_for_cpu()` 注册
  - 使用 `esp_deregister_freertos_idle_hook()` 或 `esp_deregister_freertos_idle_hook_for_cpu()` 注销

---

**备注：**在 cache 被禁用时，tick 中断仍保持活动，因此任何 tick 钩子（FreeRTOS 或 ESP-IDF）函数都必须放在内部 RAM 中。请参考 [SPI flash API documentation](#) 了解详情。

---

### TLSP 删除回调

原生 FreeRTOS 提供了线程本地存储指针 (TLSP) 功能，这些指针直接存储在特定任务的任务控制块 (TCB) 中。TLSP 允许每个任务拥有自己的数据结构指针集合。在原生 FreeRTOS 中：

- 在任务创建后，需调用 `vTaskSetThreadLocalStoragePointer()` 设置任务的 TLSP。
- 在任务的生命周期中，需调用 `pvTaskGetThreadLocalStoragePointer()` 获取任务的 TLSP。
- 在删除任务前，需释放 TLSP 指向的内存。

然而，为了能够自动释放 TLSP 内存，ESP-IDF 额外提供了 TLSP 删除回调功能。当删除任务时，这些删除回调函数会被自动调用，从而清除 TLSP 内存，无需在每个任务的代码中显式添加内存清除逻辑。

设置 TLSP 删除回调的方式与设置 TLSP 类似。

- `vTaskSetThreadLocalStoragePointerAndDelCallback()` 设置了特定的 TLSP 及其关联的回调。
- 调用原生 FreeRTOS 函数 `vTaskSetThreadLocalStoragePointer()` 只会将 TLSP 的关联删除回调设置为 `NULL`，也就是说，在任务删除期间不会调用该 TLSP 的回调。

在实现 TLSP 回调时，应注意以下几点：

- 回调 **绝对不能尝试阻塞或让出**，并且应尽可能缩短临界区的时间。
- 回调是在删除任务的内存即将被释放前调用的。因此，回调可以通过 `vTaskDelete()` 本身调用，也可以从空闲任务中调用。

## IDF 附加 API

`freertos/esp_additions/include/freertos/idf_additions.h` 头文件包含了 ESP-IDF 添加的与 FreeRTOS 相关的辅助函数。通过 `#include "freertos/idf_additions.h"` 可添加此头文件。

## 组件专用功能

除了基本 CMake 构建属性中提供的标准组件变量外，FreeRTOS 组件还提供了参数（目前只有一个参数）以简化与其他模块的集成：

- `ORIG_INCLUDE_PATH` - 包含指向 freeRTOS 根包含文件夹的绝对路径。因此可以直接用 `#include "FreeRTOS.h"` 引用头文件，而无需使用 `#include "freertos/FreeRTOS.h"`。

## API 参考

### 环形 buffer API

#### Header File

- `components/esp_ringbuf/include/freertos/ringbuf.h`
- This header file can be included with:

```
#include "freertos/ringbuf.h"
```

- This header file is a part of the API provided by the `esp_ringbuf` component. To declare that your component depends on `esp_ringbuf`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_ringbuf
```

or

```
PRIV_REQUIRES esp_ringbuf
```

## Functions

`RingbufHandle_t` `xRingbufferCreate` (`size_t` `xBufferSize`, `RingbufferType_t` `xBufferType`)

Create a ring buffer.

---

**备注：** `xBufferSize` of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

---

### 参数

- **xBufferSize** -- [in] Size of the buffer in bytes. Note that items require space for a header in no-split/allow-split buffers
- **xBufferType** -- [in] Type of ring buffer, see documentation.

返回 A handle to the created ring buffer, or NULL in case of error.

*RingbufHandle\_t* **xRingbufferCreateNoSplit** (size\_t xItemSize, size\_t xItemNum)

Create a ring buffer of type RINGBUF\_TYPE\_NOSPLIT for a fixed item\_size.

This API is similar to xRingbufferCreate(), but it will internally allocate additional space for the headers.

参数

- **xItemSize** -- [in] Size of each item to be put into the ring buffer
- **xItemNum** -- [in] Maximum number of items the buffer needs to hold simultaneously

返回 A RingbufHandle\_t handle to the created ring buffer, or NULL in case of error.

*RingbufHandle\_t* **xRingbufferCreateStatic** (size\_t xBufferSize, *RingbufferType\_t* xBufferType, uint8\_t \*pucRingbufferStorage, *StaticRingbuffer\_t* \*pxStaticRingbuffer)

Create a ring buffer but manually provide the required memory.

---

备注: xBufferSize of no-split/allow-split buffers MUST be 32-bit aligned.

---

参数

- **xBufferSize** -- [in] Size of the buffer in bytes.
- **xBufferType** -- [in] Type of ring buffer, see documentation
- **pucRingbufferStorage** -- [in] Pointer to the ring buffer's storage area. Storage area must have the same size as specified by xBufferSize
- **pxStaticRingbuffer** -- [in] Pointed to a struct of type StaticRingbuffer\_t which will be used to hold the ring buffer's data structure

返回 A handle to the created ring buffer

BaseType\_t **xRingbufferSend** (*RingbufHandle\_t* xRingbuffer, const void \*pvItem, size\_t xItemSize, TickType\_t xTicksToWait)

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.

---

备注: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

---

---

备注: For no-split/allow-split buffers, an xItemSize of 0 will result in an item with no data being set (i.e., item only contains the header). For byte buffers, an xItemSize of 0 will simply return pdTRUE without copying any data.

---

参数

- **xRingbuffer** -- [in] Ring buffer to insert the item into
- **pvItem** -- [in] Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **xItemSize** -- [in] Size of data to insert.
- **xTicksToWait** -- [in] Ticks to wait for room in the ring buffer.

返回

- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType\_t **xRingbufferSendFromISR** (*RingbufHandle\_t* xRingbuffer, const void \*pvItem, size\_t xItemSize, BaseType\_t \*pxHigherPriorityTaskWoken)

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

---

**备注:** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

---

---

**备注:** For no-split/allow-split buffers, an xItemSize of 0 will result in an item with no data being set (i.e., item only contains the header). For byte buffers, an xItemSize of 0 will simply return pdTRUE without copying any data.

---

#### 参数

- **xRingbuffer** -- [in] Ring buffer to insert the item into
- **pvItem** -- [in] Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **xItemSize** -- [in] Size of data to insert.
- **pxHigherPriorityTaskWoken** -- [out] Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

#### 返回

- pdTRUE if succeeded
- pdFALSE when the ring buffer does not have space.

BaseType\_t **xRingbufferSendAcquire** (*RingbufHandle\_t* xRingbuffer, void \*\*ppvItem, size\_t xItemSize, TickType\_t xTicksToWait)

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items `SendAcquire` or `Send` after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

---

**备注:** Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

---

---

**备注:** An xItemSize of 0 will result in a buffer being acquired, but the buffer will have a size of 0.

---

#### 参数

- **xRingbuffer** -- [in] Ring buffer to allocate the memory
- **ppvItem** -- [out] Double pointer to memory acquired (set to NULL if no memory were retrieved)
- **xItemSize** -- [in] Size of item to acquire.
- **xTicksToWait** -- [in] Ticks to wait for room in the ring buffer.

#### 返回

- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType\_t **xRingbufferSendComplete** (*RingbufHandle\_t* xRingbuffer, void \*pvItem)

Actually send an item into the ring buffer allocated before by xRingbufferSendAcquire.

---

**备注:** Only applicable for no-split ring buffers. Only call for items allocated by xRingbufferSendAcquire.

---

**参数**

- **xRingbuffer** -- [in] Ring buffer to insert the item into
- **pvItem** -- [in] Pointer to item in allocated memory to insert.

**返回**

- pdTRUE if succeeded
- pdFALSE if fail for some reason.

void \***xRingbufferReceive** (*RingbufHandle\_t* xRingbuffer, size\_t \*pxItemSize, TickType\_t xTicksToWait)

Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

---

**备注:** A call to vRingbufferReturnItem() is required after this to free the item retrieved.

---

---

**备注:** It is possible to receive items with a pxItemSize of 0 on no-split/allow split buffers.

---

**参数**

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **pxItemSize** -- [out] Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** -- [in] Ticks to wait for items in the ring buffer.

**返回**

- Pointer to the retrieved item on success; \*pxItemSize filled with the length of the item.
- NULL on timeout, \*pxItemSize is untouched in that case.

void \***xRingbufferReceiveFromISR** (*RingbufHandle\_t* xRingbuffer, size\_t \*pxItemSize)

Retrieve an item from the ring buffer in an ISR.

Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval

---

**备注:** A call to vRingbufferReturnItemFromISR() is required after this to free the item retrieved.

---

---

**备注:** Byte buffers do not allow multiple retrievals before returning an item

---

---

**备注:** Two calls to RingbufferReceiveFromISR() are required if the bytes wrap around the end of the ring buffer.

---

---

**备注:** It is possible to receive items with a pxItemSize of 0 on no-split/allow split buffers.

---

**参数**

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **pxItemSize** -- [out] Pointer to a variable to which the size of the retrieved item will be written.

**返回**

- Pointer to the retrieved item on success; \*pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, \*pxItemSize is untouched in that case.

BaseType\_t **xRingbufferReceiveSplit** (*RingbufHandle\_t* xRingbuffer, void \*\*ppvHeadItem, void \*\*ppvTailItem, size\_t \*pxHeadItemSize, size\_t \*pxTailItemSize, TickType\_t xTicksToWait)

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

---

**备注:** Call(s) to vRingbufferReturnItem() is required after this to free up the item(s) retrieved.

---

---

**备注:** This function should only be called on allow-split buffers

---

---

**备注:** It is possible to receive items with a pxItemSize of 0 on allow split buffers.

---

**参数**

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **ppvHeadItem** -- [out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** -- [out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** -- [out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** -- [out] Pointer to size of second part (unmodified if item is not split)
- **xTicksToWait** -- [in] Ticks to wait for items in the ring buffer.

**返回**

- pdTRUE if an item (split or unsplit) was retrieved
- pdFALSE when no item was retrieved

BaseType\_t **xRingbufferReceiveSplitFromISR** (*RingbufHandle\_t* xRingbuffer, void \*\*ppvHeadItem, void \*\*ppvTailItem, size\_t \*pxHeadItemSize, size\_t \*pxTailItemSize)

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval

---

**备注:** Calls to vRingbufferReturnItemFromISR() is required after this to free up the item(s) retrieved.

---

---

**备注:** This function should only be called on allow-split buffers

---

---

**备注:** It is possible to receive items with a pxItemSize of 0 on allow split buffers.

---

**参数**

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **ppvHeadItem** -- [out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** -- [out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** -- [out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** -- [out] Pointer to size of second part (unmodified if item is not split)

**返回**

- pdTRUE if an item (split or unsplit) was retrieved
- pdFALSE when no item was retrieved

void **\*xRingbufferReceiveUpTo** (*RingbufHandle\_t* xRingbuffer, size\_t \*pxItemSize, TickType\_t xTicksToWait, size\_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

---

**备注:** A call to `vRingbufferReturnItem()` is required after this to free up the data retrieved.

---

---

**备注:** This function should only be called on byte buffers

---

---

**备注:** Byte buffers do not allow multiple retrievals before returning an item

---

---

**备注:** Two calls to `RingbufferReceiveUpTo()` are required if the bytes wrap around the end of the ring buffer.

---

**参数**

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **pxItemSize** -- [out] Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** -- [in] Ticks to wait for items in the ring buffer.
- **xMaxSize** -- [in] Maximum number of bytes to return.

**返回**

- Pointer to the retrieved item on success; \*pxItemSize filled with the length of the item.
- NULL on timeout, \*pxItemSize is untouched in that case.

void **\*xRingbufferReceiveUpToFromISR** (*RingbufHandle\_t* xRingbuffer, size\_t \*pxItemSize, size\_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

---

**备注:** A call to `vRingbufferReturnItemFromISR()` is required after this to free up the data received.

---

---

**备注:** This function should only be called on byte buffers

---

---

**备注:** Byte buffers do not allow multiple retrievals before returning an item

---

**参数**

- **xRingbuffer** -- **[in]** Ring buffer to retrieve the item from
- **pxItemSize** -- **[out]** Pointer to a variable to which the size of the retrieved item will be written.
- **xMaxSize** -- **[in]** Maximum number of bytes to return. Size of 0 simply returns NULL.

**返回**

- Pointer to the retrieved item on success; \*pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, \*pxItemSize is untouched in that case.

void **vRingbufferReturnItem** (*RingbufHandle\_t* xRingbuffer, void \*pvItem)

Return a previously-retrieved item to the ring buffer.

---

**备注:** If a split item is retrieved, both parts should be returned by calling this function twice

---

**参数**

- **xRingbuffer** -- **[in]** Ring buffer the item was retrieved from
- **pvItem** -- **[in]** Item that was received earlier

void **vRingbufferReturnItemFromISR** (*RingbufHandle\_t* xRingbuffer, void \*pvItem, BaseType\_t \*pxHigherPriorityTaskWoken)

Return a previously-retrieved item to the ring buffer from an ISR.

---

**备注:** If a split item is retrieved, both parts should be returned by calling this function twice

---

**参数**

- **xRingbuffer** -- **[in]** Ring buffer the item was retrieved from
- **pvItem** -- **[in]** Item that was received earlier
- **pxHigherPriorityTaskWoken** -- **[out]** Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

void **vRingbufferDelete** (*RingbufHandle\_t* xRingbuffer)

Delete a ring buffer.

---

**备注:** This function will not deallocate any memory if the ring buffer was created using xRingbufferCreateStatic(). Deallocation must be done manually by the user.

---

**参数** **xRingbuffer** -- **[in]** Ring buffer to delete

size\_t **xRingbufferGetMaxItemSize** (*RingbufHandle\_t* xRingbuffer)

Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

---

**备注:** The max item size for a no-split buffer is limited to ((buffer\_size/2)-header\_size). This limit is imposed so that an item of max item size can always be sent to an empty no-split buffer regardless of the internal positions of the buffer's read/write/free pointers.

---

**参数** **xRingbuffer** -- **[in]** Ring buffer to query

**返回** Maximum size, in bytes, of an item that can be placed in a ring buffer.

size\_t **xRingbufferGetCurFreeSize** (*RingbufHandle\_t* xRingbuffer)

Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

---

**备注:** An empty no-split buffer has a max current free size for an item that is limited to ((buffer\_size/2)-header\_size). See API reference for xRingbufferGetMaxItemSize().

---

**警告:** This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application's responsibility to ensure atomic access to this API and the subsequent Send

**参数** **xRingbuffer** -- [in] Ring buffer to query

**返回** Current free size, in bytes, available for an entry

BaseType\_t **xRingbufferAddToQueueSetRead** (*RingbufHandle\_t* xRingbuffer, *QueueSetHandle\_t* xQueueSet)

Add the ring buffer to a queue set. Notified when data has been written to the ring buffer.

This function adds the ring buffer to a queue set, thus allowing a task to block on multiple queues/ring buffers. The queue set is notified when the new data becomes available to read on the ring buffer.

**参数**

- **xRingbuffer** -- [in] Ring buffer to add to the queue set
- **xQueueSet** -- [in] Queue set to add the ring buffer to

**返回**

- pdTRUE on success, pdFALSE otherwise

static inline BaseType\_t **xRingbufferCanRead** (*RingbufHandle\_t* xRingbuffer, *QueueSetMemberHandle\_t* xMember)

Check if the selected queue set member is a particular ring buffer.

This API checks if queue set member returned from xQueueSelectFromSet() is a particular ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

**参数**

- **xRingbuffer** -- [in] Ring buffer to check
- **xMember** -- [in] Member returned from xQueueSelectFromSet

**返回**

- pdTRUE when selected queue set member is the ring buffer
- pdFALSE otherwise.

BaseType\_t **xRingbufferRemoveFromQueueSetRead** (*RingbufHandle\_t* xRingbuffer, *QueueSetHandle\_t* xQueueSet)

Remove the ring buffer from a queue set.

This function removes a ring buffer from a queue set. The ring buffer must have been previously added to the queue set using xRingbufferAddToQueueSetRead().

**参数**

- **xRingbuffer** -- [in] Ring buffer to remove from the queue set
- **xQueueSet** -- [in] Queue set to remove the ring buffer from

**返回**

- pdTRUE on success
- pdFALSE otherwise

void **vRingbufferGetInfo** (*RingbufHandle\_t* xRingbuffer, UBaseType\_t \*uxFree, UBaseType\_t \*uxRead, UBaseType\_t \*uxWrite, UBaseType\_t \*uxAcquire, UBaseType\_t \*uxItemsWaiting)

Get information about ring buffer status.

Get information of a ring buffer's current status such as free/read/write/acquire pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

#### 参数

- **xRingbuffer** -- [in] Ring buffer to remove from the queue set
- **uxFree** -- [out] Pointer use to store free pointer position
- **uxRead** -- [out] Pointer use to store read pointer position
- **uxWrite** -- [out] Pointer use to store write pointer position
- **uxAcquire** -- [out] Pointer use to store acquire pointer position
- **uxItemsWaiting** -- [out] Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

void **xRingbufferPrintInfo** (*RingbufHandle\_t* xRingbuffer)

Debugging function to print the internal pointers in the ring buffer.

参数 **xRingbuffer** -- Ring buffer to show

UBaseType\_t **xRingbufferGetStaticBuffer** (*RingbufHandle\_t* xRingbuffer, uint8\_t \*\*ppucRingbufferStorage, *StaticRingbuffer\_t* \*\*ppxStaticRingbuffer)

Retrieve the pointers to a statically created ring buffer.

#### 参数

- **xRingbuffer** -- [in] Ring buffer
- **ppucRingbufferStorage** -- [out] Used to return a pointer to the queue's storage area buffer
- **ppxStaticRingbuffer** -- [out] Used to return a pointer to the queue's data structure buffer

返回 pdTRUE if buffers were retrieved, pdFALSE otherwise.

*RingbufHandle\_t* **xRingbufferCreateWithCaps** (size\_t xBufferSize, *RingbufferType\_t* xBufferType, UBaseType\_t uxMemoryCaps)

Creates a ring buffer with specific memory capabilities.

This function is similar to xRingbufferCreate(), except that it allows the memory allocated for the ring buffer to have specific capabilities (e.g., MALLOC\_CAP\_INTERNAL).

---

**备注:** A queue created using this function must only be deleted using vRingbufferDeleteWithCaps()

---

#### 参数

- **xBufferSize** -- [in] Size of the buffer in bytes
- **xBufferType** -- [in] Type of ring buffer, see documentation.
- **uxMemoryCaps** -- [in] Memory capabilities of the queue's memory (see esp\_heap\_caps.h)

返回 Handle to the created ring buffer or NULL on failure.

void **vRingbufferDeleteWithCaps** (*RingbufHandle\_t* xRingbuffer)

Deletes a ring buffer previously created using xRingbufferCreateWithCaps()

参数 **xRingbuffer** -- Ring buffer

## Structures

struct **xSTATIC\_RINGBUFFER**

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

### Type Definitions

typedef void \***RingbufHandle\_t**

Type by which ring buffers are referenced. For example, a call to `xRingbufferCreate()` returns a `RingbufHandle_t` variable that can then be used as a parameter to `xRingbufferSend()`, `xRingbufferReceive()`, etc.

typedef struct *xSTATIC\_RINGBUFFER* **StaticRingbuffer\_t**

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

### Enumerations

enum **RingbufferType\_t**

*Values:*

enumerator **RINGBUF\_TYPE\_NOSPLIT**

No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

enumerator **RINGBUF\_TYPE\_ALLOWSPLIT**

Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

enumerator **RINGBUF\_TYPE\_BYTEBUF**

Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

enumerator **RINGBUF\_TYPE\_MAX**

### 钩子 API

#### Header File

- [components/esp\\_system/include/esp\\_freertos\\_hooks.h](#)
- This header file can be included with:

```
#include "esp_freertos_hooks.h"
```

**Functions**

*esp\_err\_t* **esp\_register\_freertos\_idle\_hook\_for\_cpu** (*esp\_freertos\_idle\_cb\_t* new\_idle\_cb, UBaseType\_t cpuid)

Register a callback to be called from the specified core's idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**警告:** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**参数**

- **new\_idle\_cb** -- [in] Callback to be called
- **cpuid** -- [in] id of the core

**返回**

- ESP\_OK: Callback registered to the specified core's idle hook
- ESP\_ERR\_NO\_MEM: No more space on the specified core's idle hook to register callback
- ESP\_ERR\_INVALID\_ARG: cpuid is invalid

*esp\_err\_t* **esp\_register\_freertos\_idle\_hook** (*esp\_freertos\_idle\_cb\_t* new\_idle\_cb)

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**警告:** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**参数** **new\_idle\_cb** -- [in] Callback to be called

**返回**

- ESP\_OK: Callback registered to the calling core's idle hook
- ESP\_ERR\_NO\_MEM: No more space on the calling core's idle hook to register callback

*esp\_err\_t* **esp\_register\_freertos\_tick\_hook\_for\_cpu** (*esp\_freertos\_tick\_cb\_t* new\_tick\_cb, UBaseType\_t cpuid)

Register a callback to be called from the specified core's tick hook.

**参数**

- **new\_tick\_cb** -- [in] Callback to be called
- **cpuid** -- [in] id of the core

**返回**

- ESP\_OK: Callback registered to specified core's tick hook
- ESP\_ERR\_NO\_MEM: No more space on the specified core's tick hook to register the callback
- ESP\_ERR\_INVALID\_ARG: cpuid is invalid

*esp\_err\_t* **esp\_register\_freertos\_tick\_hook** (*esp\_freertos\_tick\_cb\_t* new\_tick\_cb)

Register a callback to be called from the calling core's tick hook.

**参数** **new\_tick\_cb** -- [in] Callback to be called

**返回**

- ESP\_OK: Callback registered to the calling core's tick hook
- ESP\_ERR\_NO\_MEM: No more space on the calling core's tick hook to register the callback

void **esp\_deregister\_freertos\_idle\_hook\_for\_cpu** (*esp\_freertos\_idle\_cb\_t* old\_idle\_cb, UBaseType\_t cpuid)

Unregister an idle callback from the idle hook of the specified core.

**参数**

- **old\_idle\_cb** -- [in] Callback to be unregistered
- **cpuid** -- [in] id of the core

void **esp\_deregister\_freertos\_idle\_hook** (*esp\_freertos\_idle\_cb\_t* old\_idle\_cb)

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

**参数** **old\_idle\_cb** -- [in] Callback to be unregistered

void **esp\_deregister\_freertos\_tick\_hook\_for\_cpu** (*esp\_freertos\_tick\_cb\_t* old\_tick\_cb,  
UBaseType\_t cpuid)

Unregister a tick callback from the tick hook of the specified core.

**参数**

- **old\_tick\_cb** -- [in] Callback to be unregistered
- **cpuid** -- [in] id of the core

void **esp\_deregister\_freertos\_tick\_hook** (*esp\_freertos\_tick\_cb\_t* old\_tick\_cb)

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

**参数** **old\_tick\_cb** -- [in] Callback to be unregistered

**Type Definitions**

```
typedef bool (*esp_freertos_idle_cb_t)(void)
```

```
typedef void (*esp_freertos_tick_cb_t)(void)
```

**附加 API****Header File**

- This header file can be included with:

```
#include "freertos/idf_additions.h"
```

**Functions**

BaseType\_t **xTaskCreatePinnedToCore** (TaskFunction\_t pxTaskCode, const char \*const pcName, const uint32\_t ulStackDepth, void \*const pvParameters, UBaseType\_t uxPriority, *TaskHandle\_t* \*const pxCreatedTask, const BaseType\_t xCoreID)

Create a new task that is pinned to a particular core.

This function is similar to xTaskCreate(), but allows the creation of a pinned task. The task's pinned core is specified by the xCoreID argument. If xCoreID is set to tskNO\_AFFINITY, then the task is unpinned and can run on any core.

---

**备注:** If ( configNUMBER\_OF\_CORES == 1 ), setting xCoreID to tskNO\_AFFINITY will be treated as 0.

---

**参数**

- **pxTaskCode** -- Pointer to the task entry function.
- **pcName** -- A descriptive name for the task.

- **ulStackDepth** -- The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run.
- **pxCreatedTask** -- Used to pass back a handle by which the created task can be referenced.
- **xCoreID** -- The core to which the task is pinned to, or tskNO\_AFFINITY if the task has no core affinity.

**返回** pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

*TaskHandle\_t* **xTaskCreateStaticPinnedToCore** (TaskFunction\_t pxTaskCode, const char \*const pcName, const uint32\_t ulStackDepth, void \*const pvParameters, UBaseType\_t uxPriority, StackType\_t \*const puxStackBuffer, StaticTask\_t \*const pxTaskBuffer, const BaseType\_t xCoreID)

Create a new static task that is pinned to a particular core.

This function is similar to xTaskCreateStatic(), but allows the creation of a pinned task. The task's pinned core is specified by the xCoreID argument. If xCoreID is set to tskNO\_AFFINITY, then the task is unpinned and can run on any core.

---

**备注:** If ( configNUMBER\_OF\_CORES == 1 ), setting xCoreID to tskNO\_AFFINITY will be treated as 0.

---

#### 参数

- **pxTaskCode** -- Pointer to the task entry function.
- **pcName** -- A descriptive name for the task.
- **ulStackDepth** -- The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run.
- **puxStackBuffer** -- Must point to a StackType\_t array that has at least ulStackDepth indexes
- **pxTaskBuffer** -- Must point to a variable of type StaticTask\_t, which will then be used to hold the task's data structures,
- **xCoreID** -- The core to which the task is pinned to, or tskNO\_AFFINITY if the task has no core affinity.

**返回** The task handle if the task was created, NULL otherwise.

Basetype\_t **xTaskGetCoreID** (*TaskHandle\_t* xTask)

Get the current core ID of a particular task.

Helper function to get the core ID of a particular task. If the task is pinned to a particular core, the core ID is returned. If the task is not pinned to a particular core, tskNO\_AFFINITY is returned.

If CONFIG\_FREERTOS\_UNICORE is enabled, this function simply returns 0.

[refactor-todo] See if this needs to be deprecated (IDF-8145)(IDF-8164)

---

**备注:** If CONFIG\_FREERTOS\_SMP is enabled, please call vTaskCoreAffinityGet() instead.

---

---

**备注:** In IDF FreeRTOS when configNUMBER\_OF\_CORES == 1, this function will always return 0,

---

**参数** **xTask** -- The task to query

**返回** The task's core ID or tskNO\_AFFINITY

**TaskHandle\_t xTaskGetIdleTaskHandleForCore** ( BaseType\_t xCoreID )

Get the handle of idle task for the given core.

[refactor-todo] See if this needs to be deprecated (IDF-8145)

---

**备注:** If CONFIG\_FREERTOS\_SMP is enabled, please call xTaskGetIdleTaskHandle() instead.

---

**参数** **xCoreID** -- The core to query

**返回** Handle of the idle task for the queried core

**TaskHandle\_t xTaskGetCurrentTaskHandleForCore** ( BaseType\_t xCoreID )

Get the handle of the task currently running on a certain core.

Because of the nature of SMP processing, there is no guarantee that this value will still be valid on return and should only be used for debugging purposes.

[refactor-todo] See if this needs to be deprecated (IDF-8145)

---

**备注:** If CONFIG\_FREERTOS\_SMP is enabled, please call xTaskGetCurrentTaskHandleCPU() instead.

---

**参数** **xCoreID** -- The core to query

**返回** Handle of the current task running on the queried core

**uint8\_t \*pxTaskGetStackStart** ( TaskHandle\_t xTask )

Returns the start of the stack associated with xTask.

Returns the lowest stack memory address, regardless of whether the stack grows up or down.

[refactor-todo] Change return type to StackType\_t (IDF-8158)

**参数** **xTask** -- Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.

**返回** A pointer to the start of the stack.

**void vTaskSetThreadLocalStoragePointerAndDelCallback** ( TaskHandle\_t xTaskToSet, BaseType\_t xIndex, void \*pvValue, TlsDeleteCallbackFunction\_t pvDelCallback )

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

**参数**

- **xTaskToSet** -- Task to set thread local storage pointer for
- **xIndex** -- The index of the pointer to set, from 0 to configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS - 1.
- **pvValue** -- Pointer value to set.
- **pvDelCallback** -- Function to call to dispose of the local storage pointer when the task is deleted.

BaseType\_t **xTaskCreatePinnedToCoreWithCaps** (TaskFunction\_t pvTaskCode, const char \*const pcName, const configSTACK\_DEPTH\_TYPE usStackSize, void \*const pvParameters, UBaseType\_t uxPriority, *TaskHandle\_t* \*const pvCreatedTask, const BaseType\_t xCoreID, UBaseType\_t uxMemoryCaps)

Creates a pinned task where its stack has specific memory capabilities.

This function is similar to xTaskCreatePinnedToCore(), except that it allows the memory allocated for the task's stack to have specific capabilities (e.g., MALLOC\_CAP\_SPIRAM).

However, the specified capabilities will NOT apply to the task's TCB as a TCB must always be in internal RAM.

#### 参数

- **pvTaskCode** -- Pointer to the task entry function
- **pcName** -- A descriptive name for the task
- **usStackSize** -- The size of the task stack specified as the number of bytes
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run.
- **pvCreatedTask** -- Used to pass back a handle by which the created task can be referenced.
- **xCoreID** -- Core to which the task is pinned to, or tskNO\_AFFINITY if unpinned.
- **uxMemoryCaps** -- Memory capabilities of the task stack's memory (see esp\_heap\_caps.h)

**返回** pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

static inline BaseType\_t **xTaskCreateWithCaps** (TaskFunction\_t pvTaskCode, const char \*const pcName, configSTACK\_DEPTH\_TYPE usStackSize, void \*const pvParameters, UBaseType\_t uxPriority, *TaskHandle\_t* \*pvCreatedTask, UBaseType\_t uxMemoryCaps)

Creates a task where its stack has specific memory capabilities.

This function is similar to xTaskCreate(), except that it allows the memory allocated for the task's stack to have specific capabilities (e.g., MALLOC\_CAP\_SPIRAM).

However, the specified capabilities will NOT apply to the task's TCB as a TCB must always be in internal RAM.

---

**备注:** A task created using this function must only be deleted using vTaskDeleteWithCaps()

---

#### 参数

- **pvTaskCode** -- Pointer to the task entry function
- **pcName** -- A descriptive name for the task
- **usStackSize** -- The size of the task stack specified as the number of bytes
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run.
- **pvCreatedTask** -- Used to pass back a handle by which the created task can be referenced.
- **uxMemoryCaps** -- Memory capabilities of the task stack's memory (see esp\_heap\_caps.h)

**返回** pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

void **vTaskDeleteWithCaps** (*TaskHandle\_t* xTaskToDelete)

Deletes a task previously created using xTaskCreateWithCaps() or xTaskCreatePinnedToCoreWithCaps()

**参数** **xTaskToDelete** -- A handle to the task to be deleted

*QueueHandle\_t* **xQueueCreateWithCaps** (UBaseType\_t uxQueueLength, UBaseType\_t uxItemSize, UBaseType\_t uxMemoryCaps)

Creates a queue with specific memory capabilities.

This function is similar to `xQueueCreate()`, except that it allows the memory allocated for the queue to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

---

**备注:** A queue created using this function must only be deleted using `vQueueDeleteWithCaps()`

---

**参数**

- **uxQueueLength** -- The maximum number of items that the queue can contain.
- **uxItemSize** -- The number of bytes each item in the queue will require.
- **uxMemoryCaps** -- Memory capabilities of the queue's memory (see `esp_heap_caps.h`)

**返回** Handle to the created queue or NULL on failure.

void **vQueueDeleteWithCaps** (*QueueHandle\_t* xQueue)

Deletes a queue previously created using `xQueueCreateWithCaps()`

**参数** **xQueue** -- A handle to the queue to be deleted.

static inline *SemaphoreHandle\_t* **xSemaphoreCreateBinaryWithCaps** (UBaseType\_t uxMemoryCaps)

Creates a binary semaphore with specific memory capabilities.

This function is similar to `vSemaphoreCreateBinary()`, except that it allows the memory allocated for the binary semaphore to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

---

**备注:** A binary semaphore created using this function must only be deleted using `vSemaphoreDeleteWithCaps()`

---

**参数** **uxMemoryCaps** -- Memory capabilities of the binary semaphore's memory (see `esp_heap_caps.h`)

**返回** Handle to the created binary semaphore or NULL on failure.

static inline *SemaphoreHandle\_t* **xSemaphoreCreateCountingWithCaps** (UBaseType\_t uxMaxCount, UBaseType\_t uxInitialCount, UBaseType\_t uxMemoryCaps)

Creates a counting semaphore with specific memory capabilities.

This function is similar to `xSemaphoreCreateCounting()`, except that it allows the memory allocated for the counting semaphore to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

---

**备注:** A counting semaphore created using this function must only be deleted using `vSemaphoreDeleteWithCaps()`

---

**参数**

- **uxMaxCount** -- The maximum count value that can be reached.
- **uxInitialCount** -- The count value assigned to the semaphore when it is created.
- **uxMemoryCaps** -- Memory capabilities of the counting semaphore's memory (see `esp_heap_caps.h`)

**返回** Handle to the created counting semaphore or NULL on failure.

static inline *SemaphoreHandle\_t* **xSemaphoreCreateMutexWithCaps** (UBaseType\_t uxMemoryCaps)

Creates a mutex semaphore with specific memory capabilities.

This function is similar to `xSemaphoreCreateMutex()`, except that it allows the memory allocated for the mutex semaphore to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

---

**备注:** A mutex semaphore created using this function must only be deleted using `vSemaphoreDeleteWithCaps()`

---

**参数** `uxMemoryCaps` -- Memory capabilities of the mutex semaphore's memory (see `esp_heap_caps.h`)

**返回** Handle to the created mutex semaphore or NULL on failure.

static inline *SemaphoreHandle\_t* **xSemaphoreCreateRecursiveMutexWithCaps** (UBaseType\_t uxMemoryCaps)

Creates a recursive mutex with specific memory capabilities.

This function is similar to `xSemaphoreCreateRecursiveMutex()`, except that it allows the memory allocated for the recursive mutex to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

---

**备注:** A recursive mutex created using this function must only be deleted using `vSemaphoreDeleteWithCaps()`

---

**参数** `uxMemoryCaps` -- Memory capabilities of the recursive mutex's memory (see `esp_heap_caps.h`)

**返回** Handle to the created recursive mutex or NULL on failure.

void **vSemaphoreDeleteWithCaps** (*SemaphoreHandle\_t* xSemaphore)

Deletes a semaphore previously created using one of the `xSemaphoreCreate...WithCaps()` functions.

**参数** `xSemaphore` -- A handle to the semaphore to be deleted.

static inline *StreamBufferHandle\_t* **xStreamBufferCreateWithCaps** (size\_t xBufferSizeBytes, size\_t xTriggerLevelBytes, UBaseType\_t uxMemoryCaps)

Creates a stream buffer with specific memory capabilities.

This function is similar to `xStreamBufferCreate()`, except that it allows the memory allocated for the stream buffer to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

---

**备注:** A stream buffer created using this function must only be deleted using `vStreamBufferDeleteWithCaps()`

---

#### 参数

- **xBufferSizeBytes** -- The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes** -- The number of bytes that must be in the stream buffer before unblocking
- **uxMemoryCaps** -- Memory capabilities of the stream buffer's memory (see `esp_heap_caps.h`)

**返回** Handle to the created stream buffer or NULL on failure.

static inline void **vStreamBufferDeleteWithCaps** (*StreamBufferHandle\_t* xStreamBuffer)

Deletes a stream buffer previously created using `xStreamBufferCreateWithCaps()`

**参数** `xStreamBuffer` -- A handle to the stream buffer to be deleted.

static inline *MessageBufferHandle\_t* **xMessageBufferCreateWithCaps** (size\_t xBufferSizeBytes, UBaseType\_t uxMemoryCaps)

Creates a message buffer with specific memory capabilities.

This function is similar to `xMessageBufferCreate()`, except that it allows the memory allocated for the message buffer to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

---

**备注:** A message buffer created using this function must only be deleted using `vMessageBufferDeleteWithCaps()`

---

#### 参数

- **xBufferSizeBytes** -- The total number of bytes (not messages) the message buffer will be able to hold at any one time.
- **uxMemoryCaps** -- Memory capabilities of the message buffer's memory (see `esp_heap_caps.h`)

**返回** Handle to the created message buffer or NULL on failure.

static inline void **vMessageBufferDeleteWithCaps** (*MessageBufferHandle\_t* xMessageBuffer)

Deletes a stream buffer previously created using `xMessageBufferCreateWithCaps()`

**参数** **xMessageBuffer** -- A handle to the message buffer to be deleted.

*EventGroupHandle\_t* **xEventGroupCreateWithCaps** (U BaseType\_t uxMemoryCaps)

Creates an event group with specific memory capabilities.

This function is similar to `xEventGroupCreate()`, except that it allows the memory allocated for the event group to have specific capabilities (e.g., `MALLOC_CAP_INTERNAL`).

---

**备注:** An event group created using this function must only be deleted using `vEventGroupDeleteWithCaps()`

---

**参数** **uxMemoryCaps** -- Memory capabilities of the event group's memory (see `esp_heap_caps.h`)

**返回** Handle to the created event group or NULL on failure.

void **vEventGroupDeleteWithCaps** (*EventGroupHandle\_t* xEventGroup)

Deletes an event group previously created using `xEventGroupCreateWithCaps()`

**参数** **xEventGroup** -- A handle to the event group to be deleted.

## Type Definitions

typedef void (\***TlsDeleteCallbackFunction\_t**)(int, void\*)

Prototype of local storage pointer deletion callback.

### 2.10.14 堆内存分配

#### 栈 (stack) 和堆 (heap) 的区别

ESP-IDF 应用程序使用常见的计算机架构模式：由程序控制流动态分配的内存（即 **栈**）、由函数调用动态分配的内存（即 **堆**）以及在编译时分配的 **静态内存**。

由于 ESP-IDF 是一个多线程 RTOS 环境，因此每个 RTOS 任务都有自己的栈，这些栈默认在创建任务时从堆中分配。有关栈静态分配的方法，请参阅 `xTaskCreateStatic()`。

ESP32-C3 使用多种类型的 RAM，因此具备不同属性的堆，即基于属性的内存分配器允许应用程序按不同目的进行堆分配。

多数情况下，可直接使用 C 标准函数库中的 `malloc()` 和 `free()` 函数实现堆分配。为充分利用各种内存类型及其特性，ESP-IDF 还具有基于内存属性的堆内存分配器。要配备具有特定属性的内存，如 **DMA 存储器** 或可执行内存，可以创建具备所需属性的 OR 掩码，将其传递给 `heap_caps_malloc()`。

## 内存属性

ESP32-C3 包含多种类型的 RAM：

- **DRAM** (数据 RAM) 是连接到 CPU 数据总线上的内存，用于存储数据。这是作为堆访问最常见的一种内存。
- **IRAM** (指令 RAM) 是连接到 CPU 指令总线上的内存，通常仅用于存储可执行数据（即指令）。如果作为通用内存访问，则所有访问必须为 **32 位可访问内存**。
- **D/IRAM** 是连接到 CPU 数据总线和指令总线的 RAM，因此可用作指令 RAM 或数据 RAM。

有关内存类型的详细信息，请参阅 [存储器类型](#)。

所有的 DRAM 内存都可以单字节访问，因此所有的 DRAM 堆都具有 `MALLOC_CAP_8BIT` 属性。要获取所有 DRAM 堆的剩余空间大小，请调用 `heap_caps_get_free_size(MALLOC_CAP_8BIT)`。

调用 `malloc()` 时，ESP-IDF `malloc()` 内部调用 `heap_caps_malloc_default(size)`，使用属性 `MALLOC_CAP_DEFAULT` 分配内存。该属性可实现字节寻址功能，即存储空间的最小编址单位为字节。

`malloc()` 使用基于属性的分配系统，所以使用 `heap_caps_malloc()` 分配的内存可以通过调用标准的 `free()` 函数释放。

## 可用堆空间

**DRAM** 启动时，DRAM 堆包含应用程序未静态分配的所有数据内存，减少静态分配的缓冲区将增加可用的空闲堆空间。

调用命令 `idf.py size` 可查找静态分配内存大小。

---

**备注：**运行时可用的 DRAM 堆空间可能少于编译时计算的大小，因为启动时会在运行 FreeRTOS 调度程序之前从堆中分配部分内存，包括初始 FreeRTOS 任务的栈内存。

---

**IRAM** 启动时，IRAM 堆包含所有应用程序可执行代码未使用的指令内存。

调用命令 `idf.py size` 查找应用程序使用的 IRAM 量。

**D/IRAM** 一些内存存在 ESP32-C3 中可用作 DRAM 或 IRAM。如果从 D/IRAM 区域分配内存，则两种类型的内存的可用堆空间都会减少。

**堆空间大小** 启动时，所有 ESP-IDF 应用程序都会记录全部堆地址（和空间大小）的摘要，级别为 **Info**：

```
I (252) heap_init: Initializing. RAM available for dynamic allocation:
I (259) heap_init: At 3FFAE6E0 len 00001920 (6 KiB): DRAM
I (265) heap_init: At 3FFB2EC8 len 0002D138 (180 KiB): DRAM
I (272) heap_init: At 3FFE0440 len 00003AE0 (14 KiB): D/IRAM
I (278) heap_init: At 3FFE4350 len 0001BCB0 (111 KiB): D/IRAM
I (284) heap_init: At 4008944C len 00016BB4 (90 KiB): IRAM
```

**查找可用堆** 请参阅 [堆内存信息](#)。

## 特殊用途

**DMA 存储器** 使用 `MALLOC_CAP_DMA` 标志分配适合与硬件 DMA 引擎（如 SPI 和 I2S）配合使用的内存，此属性标志不包括外部 PSRAM。

**32 位可访问内存** 如果某个内存结构体仅以 32 位为单位寻址，例如一个整数或指针数组，则可以使用 `MALLOC_CAP_32BIT` 标志分配。通过这一方式，分配器能够在无法调用 `malloc()` 的情况下提供 IRAM 内存，从而充分利用 ESP32-C3 中的所有可用内存。

请注意，使用 `MALLOC_CAP_32BIT` 分配的内存只能通过 32 位读写访问，其他类型的访问将导致 `LoadStoreError` 异常。

## 线程安全性

堆函数是线程安全的，因此可不受限制，在不同任务中同时调用多个堆函数。

从中断处理程序 (ISR) 上下文中调用 `malloc`、`free` 和相关函数虽然在技术层面可行（请参阅[从 ISR 调用堆相关函数](#)），但不建议使用此种方法，因为调用堆函数可能会延迟其他中断。建议重构应用程序，将 ISR 使用的任何缓冲区预先分配到 ISR 之外。之后可能会删除从 ISR 调用堆函数的功能。

## 从 ISR 调用堆相关函数

堆组件中的以下函数可以在中断处理程序 (ISR) 中调用：

- `heap_caps_malloc()`
- `heap_caps_malloc_default()`
- `heap_caps_realloc_default()`
- `heap_caps_malloc_prefer()`
- `heap_caps_realloc_prefer()`
- `heap_caps_calloc_prefer()`
- `heap_caps_free()`
- `heap_caps_realloc()`
- `heap_caps_calloc()`
- `heap_caps_aligned_alloc()`
- `heap_caps_aligned_free()`

---

**备注：** 不建议使用此种方法。

---

## 堆跟踪及调试

以下功能介绍详见[堆内存调试](#)：

- 堆信息（释放内存空间等）
- 堆分配与释放函数挂钩
- 堆损坏检测
- 堆跟踪（检测、监控内存泄漏等）

## 实现说明

堆属性分配器对芯片内存区域的了解源于 SoC 组件，该组件包含芯片的内存布局信息以及每个区域的不同属性。各区域的功能为首要考虑因素，如会优先使用 DRAM 和 IRAM 特定区域而非用途更广的 D/IRAM 区域来分配内存。

每个连续的内存区域都包含其自己的内存堆，由 `multi_heap` 函数创建。`multi_heap` 允许将任何连续的内存区域作为堆使用。

堆属性分配器通过对内存区域的了解初始化每个单独的堆，堆属性 API 中的分配函数将基于所需的属性、可用空间和每个区域使用的首选项为分配函数找到最合适的堆，随后为位于特定内存区域的堆调用 `multi_heap_malloc()`。

调用 `free()` 查找对应释放地址的特定堆，随后在特定的 `multi_heap` 实例上调用 `multi_heap_free()`。

## API 参考 - 堆分配

### Header File

- `components/heap/include/esp_heap_caps.h`
- This header file can be included with:

```
#include "esp_heap_caps.h"
```

### Functions

`esp_err_t heap_caps_register_failed_alloc_callback(esp_alloc_failed_hook_t callback)`

registers a callback function to be invoked if a memory allocation operation fails

**参数** `callback` -- caller defined callback to be invoked

**返回** ESP\_OK if callback was registered.

void `*heap_caps_malloc(size_t size, uint32_t caps)`

Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to `libc malloc()`, for capability-aware memory.

**参数**

- **size** -- Size, in bytes, of the amount of memory to allocate
- **caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

**返回** A pointer to the memory allocated on success, NULL on failure

void `heap_caps_free(void *ptr)`

Free memory previously allocated via `heap_caps_malloc()` or `heap_caps_realloc()`.

Equivalent semantics to `libc free()`, for capability-aware memory.

In IDF, `free(p)` is equivalent to `heap_caps_free(p)`.

**参数** `ptr` -- Pointer to memory previously returned from `heap_caps_malloc()` or `heap_caps_realloc()`. Can be NULL.

void `*heap_caps_realloc(void *ptr, size_t size, uint32_t caps)`

Reallocate memory previously allocated via `heap_caps_malloc()` or `heap_caps_realloc()`.

Equivalent semantics to `libc realloc()`, for capability-aware memory.

In IDF, `realloc(p, s)` is equivalent to `heap_caps_realloc(p, s, MALLOC_CAP_8BIT)`.

'caps' parameter can be different to the capabilities that any original 'ptr' was allocated with. In this way, `realloc` can be used to "move" a buffer if necessary to ensure it meets a new set of capabilities.

**参数**

- **ptr** -- Pointer to previously allocated memory, or NULL for a new allocation.
- **size** -- Size of the new buffer requested, or 0 to free the buffer.
- **caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory desired for the new allocation.

**返回** Pointer to a new buffer of size 'size' with capabilities 'caps', or NULL if allocation failed.

void \***heap\_caps\_aligned\_alloc** (size\_t alignment, size\_t size, uint32\_t caps)

Allocate an aligned chunk of memory which has the given capabilities.

Equivalent semantics to libc aligned\_alloc(), for capability-aware memory.

**参数**

- **alignment** -- How the pointer received needs to be aligned must be a power of two
- **size** -- Size, in bytes, of the amount of memory to allocate
- **caps** -- Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory to be returned

**返回** A pointer to the memory allocated on success, NULL on failure

void **heap\_caps\_aligned\_free** (void \*ptr)

Used to deallocate memory previously allocated with heap\_caps\_aligned\_alloc.

---

**备注:** This function is deprecated, please consider using heap\_caps\_free() instead

---

**参数 ptr** -- Pointer to the memory allocated

void \***heap\_caps\_aligned\_calloc** (size\_t alignment, size\_t n, size\_t size, uint32\_t caps)

Allocate an aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

**参数**

- **alignment** -- How the pointer received needs to be aligned must be a power of two
- **n** -- Number of continuing chunks of memory to allocate
- **size** -- Size, in bytes, of a chunk of memory to allocate
- **caps** -- Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory to be returned

**返回** A pointer to the memory allocated on success, NULL on failure

void \***heap\_caps\_calloc** (size\_t n, size\_t size, uint32\_t caps)

Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to libc calloc(), for capability-aware memory.

In IDF, calloc(p) is equivalent to heap\_caps\_calloc(p, MALLOC\_CAP\_8BIT).

**参数**

- **n** -- Number of continuing chunks of memory to allocate
- **size** -- Size, in bytes, of a chunk of memory to allocate
- **caps** -- Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory to be returned

**返回** A pointer to the memory allocated on success, NULL on failure

size\_t **heap\_caps\_get\_total\_size** (uint32\_t caps)

Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

**参数 caps** -- Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory

**返回** total size in bytes

size\_t **heap\_caps\_get\_free\_size** (uint32\_t caps)

Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

---

**备注:** Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use `heap_caps_get_largest_free_block()` for this purpose.

---

**参数 caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory  
**返回** Amount of free bytes in the regions

`size_t heap_caps_get_minimum_free_size` (`uint32_t caps`)

Get the total minimum free memory of all regions with the given capabilities.

This adds all the low watermarks of the regions capable of delivering the memory with the given capabilities.

---

**备注:** Note the result may be less than the global all-time minimum available heap of this kind, as "low watermarks" are tracked per-region. Individual regions' heaps may have reached their "low watermarks" at different points in time. However, this result still gives a "worst case" indication for all-time minimum free heap.

---

**参数 caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory  
**返回** Amount of free bytes in the regions

`size_t heap_caps_get_largest_free_block` (`uint32_t caps`)

Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of `s` for which `heap_caps_malloc(s, caps)` will succeed.

**参数 caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory  
**返回** Size of the largest free block in bytes.

`void heap_caps_get_info` (`multi_heap_info_t *info`, `uint32_t caps`)

Get heap info for all regions with the given capabilities.

Calls `multi_heap_info()` on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for `multi_heap_info_t`, except that `minimum_free_bytes` has the same caveats described in `heap_caps_get_minimum_free_size()`.

**参数**

- **info** -- Pointer to a structure which will be filled with relevant heap metadata.
- **caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

`void heap_caps_print_heap_info` (`uint32_t caps`)

Print a summary of all memory with the given capabilities.

Calls `multi_heap_info` on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

**参数 caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

`bool heap_caps_check_integrity_all` (`bool print_errors`)

Check integrity of all heap memory in the system.

Calls `multi_heap_check` on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling `heap_caps_check_integrity` with the `caps` argument set to `MALLOC_CAP_INVALID`.

---

**备注:** Please increase the value of `CONFIG_ESP_INT_WDT_TIMEOUT_MS` when using this API with PSRAM enabled.

---

**参数 print\_errors** -- Print specific errors if heap corruption is found.

**返回** True if all heaps are valid, False if at least one heap is corrupt.

bool **heap\_caps\_check\_integrity** (uint32\_t caps, bool print\_errors)

Check integrity of all heaps with the given capabilities.

Calls multi\_heap\_check on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also heap\_caps\_check\_integrity\_all to check all heap memory in the system and heap\_caps\_check\_integrity\_addr to check memory around a single address.

---

**备注:** Please increase the value of CONFIG\_ESP\_INT\_WDT\_TIMEOUT\_MS when using this API with PSRAM capability flag.

---

**参数**

- **caps** -- Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory
- **print\_errors** -- Print specific errors if heap corruption is found.

**返回** True if all heaps are valid, False if at least one heap is corrupt.

bool **heap\_caps\_check\_integrity\_addr** (intptr\_t addr, bool print\_errors)

Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won't work, and you should call heap\_caps\_check\_integrity or heap\_caps\_check\_integrity\_all instead.

---

**备注:** The entire heap region around the address is checked, not only the adjacent heap blocks.

---

**参数**

- **addr** -- Address in memory. Check for corruption in region containing this address.
- **print\_errors** -- Print specific errors if heap corruption is found.

**返回** True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn't belong to a heap region.

void **heap\_caps\_malloc\_extmem\_enable** (size\_t limit)

Enable malloc() in external memory and set limit below which malloc() attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

**参数 limit** -- Limit, in bytes.

void \***heap\_caps\_malloc\_prefer** (size\_t size, size\_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

**Attention** The variable parameters are bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory. This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

**参数**

- **size** -- Size, in bytes, of the amount of memory to allocate

- **num** -- Number of variable parameters
- 返回 A pointer to the memory allocated on success, NULL on failure

void **\*heap\_caps\_realloc\_prefer** (void \*ptr, size\_t size, size\_t num, ...)

Reallocate a chunk of memory as preference in decreasing order.

**参数**

- **ptr** -- Pointer to previously allocated memory, or NULL for a new allocation.
- **size** -- Size of the new buffer requested, or 0 to free the buffer.
- **num** -- Number of variable parameters

返回 Pointer to a new buffer of size 'size', or NULL if allocation failed.

void **\*heap\_caps\_calloc\_prefer** (size\_t n, size\_t size, size\_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

**参数**

- **n** -- Number of continuing chunks of memory to allocate
- **size** -- Size, in bytes, of a chunk of memory to allocate
- **num** -- Number of variable parameters

返回 A pointer to the memory allocated on success, NULL on failure

void **heap\_caps\_dump** (uint32\_t caps)

Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr). For each (variable sized) block in each matching heap, the following output is printed on a single line:

- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).
- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

**参数 caps** -- Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory

void **heap\_caps\_dump\_all** (void)

Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for heap\_caps\_dump.

size\_t **heap\_caps\_get\_allocated\_size** (void \*ptr)

Return the size that a particular pointer was allocated with.

---

**备注:** The app will crash with an assertion failure if the pointer is not valid.

---

**参数 ptr** -- Pointer to currently allocated heap memory. Must be a pointer value previously returned by heap\_caps\_malloc, malloc, calloc, etc. and not yet freed.

返回 Size of the memory allocated at this block.

## Macros

**HEAP\_IRAM\_ATTR**

**MALLOC\_CAP\_EXEC**

Flags to indicate the capabilities of the various memory systems.

Memory must be able to run executable code

**MALLOC\_CAP\_32BIT**

Memory must allow for aligned 32-bit data accesses.

**MALLOC\_CAP\_8BIT**

Memory must allow for 8/16/...-bit data accesses.

**MALLOC\_CAP\_DMA**

Memory must be able to accessed by DMA.

**MALLOC\_CAP\_PID2**

Memory must be mapped to PID2 memory space (PIDs are not currently used)

**MALLOC\_CAP\_PID3**

Memory must be mapped to PID3 memory space (PIDs are not currently used)

**MALLOC\_CAP\_PID4**

Memory must be mapped to PID4 memory space (PIDs are not currently used)

**MALLOC\_CAP\_PID5**

Memory must be mapped to PID5 memory space (PIDs are not currently used)

**MALLOC\_CAP\_PID6**

Memory must be mapped to PID6 memory space (PIDs are not currently used)

**MALLOC\_CAP\_PID7**

Memory must be mapped to PID7 memory space (PIDs are not currently used)

**MALLOC\_CAP\_SPIRAM**

Memory must be in SPI RAM.

**MALLOC\_CAP\_INTERNAL**

Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

**MALLOC\_CAP\_DEFAULT**

Memory can be returned in a non-capability-specific memory allocation (e.g. malloc(), calloc()) call.

**MALLOC\_CAP\_IRAM\_8BIT**

Memory must be in IRAM and allow unaligned access.

**MALLOC\_CAP\_RETENTION**

Memory must be able to accessed by retention DMA.

**MALLOC\_CAP\_RTCRAM**

Memory must be in RTC fast memory.

**MALLOC\_CAP\_TCM**

Memory must be in TCM memory.

**MALLOC\_CAP\_INVALID**

Memory can't be used / list end marker.

**Type Definitions**

typedef void (\***esp\_alloc\_failed\_hook\_t**)(size\_t size, uint32\_t caps, const char \*function\_name)

callback called when an allocation operation fails, if registered

**Param size** in bytes of failed allocation

**Param caps** capabilities requested of failed allocation

**Param function\_name** function which generated the failure

**API 参考 - 初始化****Header File**

- [components/heap/include/esp\\_heap\\_caps\\_init.h](#)
- This header file can be included with:

```
#include "esp_heap_caps_init.h"
```

**Functions**

void **heap\_caps\_init** (void)

Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

void **heap\_caps\_enable\_nonos\_stack\_heaps** (void)

Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

*esp\_err\_t* **heap\_caps\_add\_region** (intptr\_t start, intptr\_t end)

Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in `soc_memory_layout.c` for the SoC, and are registered via `heap_caps_init()`. Some regions can't be used immediately and are later enabled via `heap_caps_enable_nonos_stack_heaps()`.

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the "reserved" regions or other data in `soc_memory_layout`, caller needs to consider this themselves.

All memory within the region specified by `start` & `end` parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in `soc_memory_layout.c`.

Use `heap_caps_add_region_with_caps()` to register a region with custom capabilities.

---

**备注:** Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

```
Existing region: 0x1000 <-> 0x3000
New region:     0x1000 <-> 0x3000 (Allowed)
New region:     0x1000 <-> 0x2000 (Allowed)
New region:     0x0000 <-> 0x1000 (Allowed)
New region:     0x3000 <-> 0x4000 (Allowed)
New region:     0x0000 <-> 0x2000 (NOT Allowed)
New region:     0x0000 <-> 0x4000 (NOT Allowed)
New region:     0x1000 <-> 0x4000 (NOT Allowed)
New region:     0x2000 <-> 0x4000 (NOT Allowed)
```

**参数**

- **start** -- Start address of new region.
- **end** -- End address of new region.

**返回** ESP\_OK on success, ESP\_ERR\_INVALID\_ARG if a parameter is invalid, ESP\_ERR\_NOT\_FOUND if the specified start address doesn't reside in a known region, or any error returned by heap\_caps\_add\_region\_with\_caps().

*esp\_err\_t* **heap\_caps\_add\_region\_with\_caps** (const uint32\_t caps[], intptr\_t start, intptr\_t end)

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to heap\_caps\_add\_region(), only custom memory capabilities are specified by the caller.

**备注:** Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

```
Existing region: 0x1000 <-> 0x3000
New region:     0x1000 <-> 0x3000 (Allowed)
New region:     0x1000 <-> 0x2000 (Allowed)
New region:     0x0000 <-> 0x1000 (Allowed)
New region:     0x3000 <-> 0x4000 (Allowed)
New region:     0x0000 <-> 0x2000 (NOT Allowed)
New region:     0x0000 <-> 0x4000 (NOT Allowed)
New region:     0x1000 <-> 0x4000 (NOT Allowed)
New region:     0x2000 <-> 0x4000 (NOT Allowed)
```

**参数**

- **caps** -- Ordered array of capability masks for the new region, in order of priority. Must have length SOC\_MEMORY\_TYPE\_NO\_PRIOS. Does not need to remain valid after the call returns.
- **start** -- Start address of new region.
- **end** -- End address of new region.

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if a parameter is invalid
- ESP\_ERR\_NO\_MEM if no memory to register new heap.
- ESP\_ERR\_INVALID\_SIZE if the memory region is too small to fit a heap
- ESP\_FAIL if region overlaps the start and/or end of an existing region

**API 参考 - 多堆 API**

(注意: 堆属性分配器在内部使用多堆 API, 而多数 IDF 程序不需要直接调用此 API。)

**Header File**

- [components/heap/include/multi\\_heap.h](#)

- This header file can be included with:

```
#include "multi_heap.h"
```

### Functions

void **\*multi\_heap\_aligned\_alloc** (*multi\_heap\_handle\_t* heap, size\_t size, size\_t alignment)

allocate a chunk of memory with specific alignment

#### 参数

- **heap** -- Handle to a registered heap.
- **size** -- size in bytes of memory chunk
- **alignment** -- how the memory must be aligned

返回 pointer to the memory allocated, NULL on failure

void **\*multi\_heap\_malloc** (*multi\_heap\_handle\_t* heap, size\_t size)

malloc() a buffer in a given heap

Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

#### 参数

- **heap** -- Handle to a registered heap.
- **size** -- Size of desired buffer.

返回 Pointer to new memory, or NULL if allocation fails.

void **multi\_heap\_aligned\_free** (*multi\_heap\_handle\_t* heap, void \*p)

free() a buffer aligned in a given heap.

---

备注: This function is deprecated, consider using multi\_heap\_free() instead

---

#### 参数

- **heap** -- Handle to a registered heap.
- **p** -- NULL, or a pointer previously returned from multi\_heap\_aligned\_alloc() for the same heap.

void **multi\_heap\_free** (*multi\_heap\_handle\_t* heap, void \*p)

free() a buffer in a given heap.

Semantics are the same as standard free(), only the argument 'p' must be NULL or have been allocated in the specified heap.

#### 参数

- **heap** -- Handle to a registered heap.
- **p** -- NULL, or a pointer previously returned from multi\_heap\_malloc() or multi\_heap\_realloc() for the same heap.

void **\*multi\_heap\_realloc** (*multi\_heap\_handle\_t* heap, void \*p, size\_t size)

realloc() a buffer in a given heap.

Semantics are the same as standard realloc(), only the argument 'p' must be NULL or have been allocated in the specified heap.

#### 参数

- **heap** -- Handle to a registered heap.
- **p** -- NULL, or a pointer previously returned from multi\_heap\_malloc() or multi\_heap\_realloc() for the same heap.
- **size** -- Desired new size for buffer.

返回 New buffer of 'size' containing contents of 'p', or NULL if reallocation failed.

size\_t **multi\_heap\_get\_allocated\_size** (*multi\_heap\_handle\_t* heap, void \*p)

Return the size that a particular pointer was allocated with.

**参数**

- **heap** -- Handle to a registered heap.
- **p** -- Pointer, must have been previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.

**返回** Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

*multi\_heap\_handle\_t* **multi\_heap\_register** (void \*start, size\_t size)

Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

**参数**

- **start** -- Start address of the memory to use for a new heap.
- **size** -- Size (in bytes) of the new heap.

**返回** Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

void **multi\_heap\_set\_lock** (*multi\_heap\_handle\_t* heap, void \*lock)

Associate a private lock pointer with a heap.

The lock argument is supplied to the `MULTI_HEAP_LOCK()` and `MULTI_HEAP_UNLOCK()` macros, defined in `multi_heap_platform.h`.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

**参数**

- **heap** -- Handle to a registered heap.
- **lock** -- Optional pointer to a locking structure to associate with this heap.

void **multi\_heap\_dump** (*multi\_heap\_handle\_t* heap)

Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

**参数** **heap** -- Handle to a registered heap.

bool **multi\_heap\_check** (*multi\_heap\_handle\_t* heap, bool print\_errors)

Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining `MULTI_CHECK_FAIL_PRINTF` in `multi_heap_platform.h`.

---

**备注:** This function is not thread-safe as it sets a global variable with the value of `print_errors`.

---

**参数**

- **heap** -- Handle to a registered heap.
- **print\_errors** -- If true, errors will be printed to stderr.

**返回** true if heap is valid, false otherwise.

size\_t **multi\_heap\_free\_size** (*multi\_heap\_handle\_t* heap)

Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the `total_free_bytes` member returned by `multi_heap_get_heap_info()`.

Note that the heap may be fragmented, so the actual maximum size for a single `malloc()` may be lower. To know this size, see the `largest_free_block` member returned by `multi_heap_get_heap_info()`.

**参数** `heap` -- Handle to a registered heap.

**返回** Number of free bytes.

`size_t multi_heap_minimum_free_size` (*multi\_heap\_handle\_t* heap)

Return the lifetime minimum free heap size.

Equivalent to the `minimum_free_bytes` member returned by `multi_heap_get_info()`.

Returns the lifetime "low watermark" of possible values returned from `multi_free_heap_size()`, for the specified heap.

**参数** `heap` -- Handle to a registered heap.

**返回** Number of free bytes.

`void multi_heap_get_info` (*multi\_heap\_handle\_t* heap, *multi\_heap\_info\_t* \*info)

Return metadata about a given heap.

Fills a *multi\_heap\_info\_t* structure with information about the specified heap.

**参数**

- `heap` -- Handle to a registered heap.
- `info` -- Pointer to a structure to fill with heap metadata.

`void *multi_heap_aligned_alloc_offs` (*multi\_heap\_handle\_t* heap, `size_t` size, `size_t` alignment, `size_t` offset)

Perform an aligned allocation from the provided offset.

**参数**

- `heap` -- The heap in which to perform the allocation
- `size` -- The size of the allocation
- `alignment` -- How the memory must be aligned
- `offset` -- The offset at which the alignment should start

**返回** `void*` The ptr to the allocated memory

## Structures

`struct multi_heap_info_t`

Structure to access heap metadata via `multi_heap_get_info`.

## Public Members

`size_t total_free_bytes`

Total free bytes in the heap. Equivalent to `multi_free_heap_size()`.

`size_t total_allocated_bytes`

Total bytes allocated to data in the heap.

`size_t largest_free_block`

Size of the largest free block in the heap. This is the largest `malloc`-able size.

`size_t minimum_free_bytes`

Lifetime minimum free heap size. Equivalent to `multi_minimum_free_heap_size()`.

**size\_t allocated\_blocks**

Number of (variable size) blocks allocated in the heap.

**size\_t free\_blocks**

Number of (variable size) free blocks in the heap.

**size\_t total\_blocks**

Total number of (variable size) blocks in the heap.

**Type Definitions**

```
typedef struct multi_heap_info *multi_heap_handle_t
```

Opaque handle to a registered heap.

**2.10.15 基于 MMU 的存储管理****简介**

ESP32-C3 的存储管理单元 (MMU) 相对简单。它可以在物理存储地址和虚拟存储地址之间进行存储地址转换，因此，CPU 可以通过虚拟存储地址来访问物理存储。虚拟存储地址有多种类型，分别具有不同的功能。

ESP-IDF 提供了一个存储器映射驱动程序，用于管理这些物理存储地址和虚拟存储地址之间的关系，实现一些功能。例如，可以通过指针从 SPI flash 中读取内容。

存储映射驱动程序实际上是一个基于属性的虚拟存储地址分配器，允许应用程序为不同的目的分配虚拟存储地址。下文将此驱动程序称为 `esp_mmap` 驱动程序。

ESP-IDF 还提供了一个存储器同步驱动程序来处理潜在的不同步的情况。

**物理存储类型**

存储映射驱动程序目前支持映射到以下物理存储类型：

- SPI flash

**虚拟存储的功能**

- `MMU_MEM_CAP_EXEC`：此功能表示虚拟存储地址具有执行权限。注意，此权限的范围仅限 MMU 硬件内部。
- `MMU_MEM_CAP_READ`：此功能表示虚拟存储地址具有读取权限。注意，此权限的范围仅限 MMU 硬件内部。
- `MMU_MEM_CAP_WRITE`：此功能表示虚拟存储地址具有写入权限。注意，此权限的范围仅限 MMU 硬件内部。
- `MMU_MEM_CAP_32BIT`：此功能表示允许访问 32 位或 32 位倍数的虚拟存储。
- `MMU_MEM_CAP_8BIT`：此功能表示允许访问 8 位或 8 位倍数的虚拟存储。

如需了解具有特定功能的最大连续可映射块大小，请调用 `esp_mmu_map_get_max_consecutive_free_block_size()`。

## 存储管理驱动程序

### 驱动程序

**术语解释** 虚拟存储池由一个或多个虚拟存储区域组成，如下图所示：

- 一个虚拟存储池是指可以映射到物理存储的整个虚拟地址范围。
- 一个虚拟存储区域是指具有相同属性的虚拟地址范围。
- 一个虚拟存储块是指一块动态映射的虚拟地址范围。
- 一个间隙是指两个虚拟存储块之间的虚拟地址范围。
- 一个物理存储块是指一块待映射或已映射到虚拟存储块的物理地址范围。
- 动态映射是指调用 `esp_mmap` 驱动程序 API `esp_mmu_map()` 进行的映射，此 API 会将给定的物理存储块映射到 `esp_mmap` 驱动程序分配的虚拟存储块中。

**存储块的关系** 在映射物理存储块 A 时，存储块 A 与此前已映射的另一个物理存储块 B 之间可能存在以下关系之一：

- 包含：块 A 被完全包含在块 B 内，如下图所示：

- 相同：块 A 与块 B 完全相同，如下图所示：

注意，`esp_mmap` 驱动程序将相同 **视为包含**。

- 重叠：块 A 与块 B 重叠，如下图所示：

特殊情况下，当块 A 完全包围块 B 时，如下图所示：

注意，esp\_mmap 驱动程序将这种情况 **视为重叠**。

## 驱动程序行为

**存储映射** 可以调用 `esp_mmu_map()` 进行动态映射。该 API 会根据你所选择的虚拟存储的属性分配一定大小的虚拟存储块，然后按照要求将此虚拟存储块映射到物理存储块中。esp\_mmap 驱动程序支持映射到一种或多种物理存储，因此，应在映射时指定物理存储目标。

默认情况下，物理存储块和虚拟存储块是一对一映射。因此，当调用 `esp_mmu_map()` 时，如果存储关系不同，API 的行为也有所不同：

- 如果是“包含”的情形，此 API 将返回 `ESP_ERR_INVALID_STATE`。此时，由于之前已映射的虚拟存储包含待映射的虚拟存储，因此返回的 `out_ptr` 会指向之前映射的虚拟存储的起始地址。
- 如果是“相同”的情形，此 API 的行为与“包含”的情况完全相同。
- 如果是“重叠”的情形，此 API 默认返回 `ESP_ERR_INVALID_ARG`。这表明，esp\_mmap 驱动程序在默认情况下，不允许将一个物理存储地址映射到多个虚拟存储地址。

但是，可以使用 `ESP_MMU_MMAP_FLAG_PADDR_SHARED` flag，代表在物理地址和虚拟地址之间的一对多映射：

- 如果是“重叠”的情形，此 API 将按照要求分配一个新的虚拟存储块，并将其映射到给定的物理存储块中。

**取消存储映射** 可以调用 `esp_mmu_unmap()` 来取消先前存储块的映射。如果尝试取消映射的虚拟存储块实际尚未映射到任何物理存储块，此 API 将返回 `ESP_ERR_NOT_FOUND`。

**存储地址转换** esp\_mmap 驱动程序提供了两个辅助 API，用于虚拟存储地址和物理存储地址之间的转换：

- `esp_mmu_vaddr_to_paddr()` 可将虚拟存储地址转换为物理存储地址。
- `esp_mmu_paddr_to_vaddr()` 可将物理存储地址转换为虚拟存储地址。

**存储同步** 可以通过一种或多种方法来访问支持 MMU 的物理存储。

SPI flash 可以通过 SPI1 (ESP-IDF `spi_flash` 驱动 API) 或指针进行访问。ESP-IDF `spi_flash` 驱动 API 中已经考虑了存储同步, 因此在使用时无需额外考虑存储同步。

## 线程安全

`esp_mmu_map.h` 中的 API 不能确保线程的安全性。

`esp_cache.h` 中的 API 能够确保线程的安全性。

## API 参考

### API 参考 - ESP MMAP 驱动

#### Header File

- `components/esp_mm/include/esp_mmu_map.h`
- This header file can be included with:

```
#include "esp_mmu_map.h"
```

- This header file is a part of the API provided by the `esp_mm` component. To declare that your component depends on `esp_mm`, add the following to your CMakeLists.txt:

```
REQUIRES esp_mm
```

or

```
PRIV_REQUIRES esp_mm
```

#### Functions

`esp_err_t esp_mmu_map` (`esp_paddr_t paddr_start`, `size_t size`, `mmu_target_t target`, `mmu_mem_caps_t caps`, `int flags`, `void **out_ptr`)

Map a physical memory block to external virtual address block, with given capabilities.

---

**备注:** This API does not guarantee thread safety

---

#### 参数

- **paddr\_start** -- [in] Start address of the physical memory block
- **size** -- [in] Size to be mapped. Size will be rounded up by to the nearest multiple of MMU page size
- **target** -- [in] Physical memory target you're going to map to, see `mmu_target_t`
- **caps** -- [in] Memory capabilities, see `mmu_mem_caps_t`
- **flags** -- [in] Mmap flags
- **out\_ptr** -- [out] Start address of the mapped virtual memory

#### 返回

- `ESP_OK`
- `ESP_ERR_INVALID_ARG`: Invalid argument, see printed logs
- `ESP_ERR_NOT_SUPPORTED`: Only on ESP32, PSRAM is not a supported physical memory target
- `ESP_ERR_NOT_FOUND`: No enough size free block to use
- `ESP_ERR_NO_MEM`: Out of memory, this API will allocate some heap memory for internal usage

- **ESP\_ERR\_INVALID\_STATE**: Paddr is mapped already, this API will return corresponding vaddr\_start of the previously mapped block. Only to-be-mapped paddr block is totally enclosed by a previously mapped block will lead to this error. (Identical scenario will behave similarly) new\_block\_start new\_block\_end |-----New Block -----| |-----Block -----| block\_start block\_end

*esp\_err\_t* **esp\_mmu\_unmap** (void \*ptr)

Unmap a previously mapped virtual memory block.

---

**备注:** This API does not guarantee thread safety

---

**参数 ptr** -- [in] Start address of the virtual memory

**返回**

- **ESP\_OK**
- **ESP\_ERR\_INVALID\_ARG**: Null pointer
- **ESP\_ERR\_NOT\_FOUND**: Vaddr is not in external memory, or it's not mapped yet

*esp\_err\_t* **esp\_mmu\_map\_get\_max\_consecutive\_free\_block\_size** (mmu\_mem\_caps\_t caps, mmu\_target\_t target, size\_t \*out\_len)

Get largest consecutive free external virtual memory block size, with given capabilities and given physical target.

**参数**

- **caps** -- [in] Bitwise OR of MMU\_MEM\_CAP\_\* flags indicating the memory block
- **target** -- [in] Physical memory target you're going to map to, see mmu\_target\_t.
- **out\_len** -- [out] Largest free block length, in bytes.

**返回**

- **ESP\_OK**
- **ESP\_ERR\_INVALID\_ARG**: Invalid arguments, could be null pointer

*esp\_err\_t* **esp\_mmu\_map\_dump\_mapped\_blocks** (FILE \*stream)

Dump all the previously mapped blocks

---

**备注:** This API shall not be called from an ISR.

---

---

**备注:** This API does not guarantee thread safety

---

**参数 stream** -- stream to print information to; use stdout or stderr to print to the console; use fmemopen/open\_memstream to print to a string buffer.

**返回**

- **ESP\_OK**

*esp\_err\_t* **esp\_mmu\_vaddr\_to\_paddr** (void \*vaddr, *esp\_paddr\_t* \*out\_paddr, mmu\_target\_t \*out\_target)

Convert virtual address to physical address.

**参数**

- **vaddr** -- [in] Virtual address
- **out\_paddr** -- [out] Physical address
- **out\_target** -- [out] Physical memory target, see mmu\_target\_t

**返回**

- **ESP\_OK**
- **ESP\_ERR\_INVALID\_ARG**: Null pointer, or vaddr is not within external memory
- **ESP\_ERR\_NOT\_FOUND**: Vaddr is not mapped yet

`esp_err_t esp_mmu_paddr_to_vaddr` (`esp_paddr_t` paddr, `mmu_target_t` target, `mmu_vaddr_t` type, void `**out_vaddr`)

Convert physical address to virtual address.

#### 参数

- **paddr** -- [in] Physical address
- **target** -- [in] Physical memory target, see `mmu_target_t`
- **type** -- [in] Virtual address type, could be either instruction or data
- **out\_vaddr** -- [out] Virtual address

#### 返回

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG: Null pointer
- ESP\_ERR\_NOT\_FOUND: Paddr is not mapped yet

`esp_err_t esp_mmu_paddr_find_caps` (const `esp_paddr_t` paddr, `mmu_mem_caps_t` \*out\_caps)

If the physical address is mapped, this API will provide the capabilities of the virtual address where the physical address is mapped to.

---

**备注:** : Only return value is ESP\_OK(which means physically address is successfully mapped), then caps you get make sense.

---

---

**备注:** This API only check one page (see CONFIG\_MMU\_PAGE\_SIZE), starting from the paddr

---

#### 参数

- **paddr** -- [in] Physical address
- **out\_caps** -- [out] Bitwise OR of MMU\_MEM\_CAP\_\* flags indicating the capabilities of a virtual address where the physical address is mapped to.

#### 返回

- ESP\_OK: Physical address successfully mapped.
- ESP\_ERR\_INVALID\_ARG: Null pointer
- ESP\_ERR\_NOT\_FOUND: Physical address is not mapped successfully.

## Macros

**ESP\_MMU\_MMAP\_FLAG\_PADDR\_SHARED**

Share this mapping.

MMU Memory Mapping Driver APIs for MMU supported memory

Driver Backgrounds:

## Type Definitions

typedef uint32\_t **esp\_paddr\_t**

Physical memory type.

## 2.10.16 堆内存调试

### 概述

ESP-IDF 集成了用于请求堆内存信息、堆内存损坏检测和堆内存跟踪的工具，有助于跟踪内存相关错误。

有关堆内存分配器的基本信息，请参阅[堆内存分配](#)。

## 堆内存信息

要获取堆内存状态的相关信息，请调用以下函数：

- `heap_caps_get_free_size()` 返回不同属性内存的当前空闲内存。
- `heap_caps_get_largest_free_block()` 返回堆中最大的空闲块，也是当前可分配的最大内存块。跟踪此值并将其与总空闲堆对比，可以检测堆碎片化情况。
- `heap_caps_get_minimum_free_size()` 可以跟踪堆启动以来的“低水位”。
- `heap_caps_get_info()` 返回一个 `multi_heap_info_t` 结构体，包含上述函数的信息，以及一些额外的特定堆内存数据（分配数量等）。
- `heap_caps_print_heap_info()` 将 `heap_caps_get_info()` 返回的信息摘要打印到标准输出。
- `heap_caps_dump()` 和 `heap_caps_dump_all()` 输出堆中每个内存块结构的详细信息。注意，这可能会产生大量输出。

## 堆内存分配与释放钩子函数

通过堆内存分配及释放检测钩子，可获取每次堆内存分配及释放操作成功的提示：

- 定义 `esp_heap_trace_alloc_hook()` 获取堆内存分配操作成功的提示
- 定义 `esp_heap_trace_free_hook()` 获取堆内存释放操作成功的提示

要启用此功能，请设置 `CONFIG_HEAP_USE_HOOKS` 选项。`esp_heap_trace_alloc_hook()` 和 `esp_heap_trace_free_hook()` 具有弱声明（即 `__attribute__((weak))`），因此无需为这两个钩子提供声明。鉴于从 `ISR` 中分配和释放堆内存存在技术上是可行的（**但强烈不建议**），`esp_heap_trace_alloc_hook()` 和 `esp_heap_trace_free_hook()` 可能会从 `ISR` 中调用。

不建议在钩子函数中执行（或调用 API 函数执行）阻塞操作或堆内存分配与释放。一般而言，最好保持代码简洁，避免在钩子函数中进行复杂计算。

要定义堆内存分配及释放钩子，请参阅如下示例：

```
#include "esp_heap_caps.h"

void esp_heap_trace_alloc_hook(void* ptr, size_t size, uint32_t caps)
{
    ...
}

void esp_heap_trace_free_hook(void* ptr)
{
    ...
}

void app_main()
{
    ...
}
```

## 堆内存损坏检测

堆内存损坏检测可检测到各类堆内存错误，包括：

- 越界写入和缓冲区溢出
- 写入已释放的内存
- 从已释放或未初始化的内存读取

**断言** 如 `heap/multi_heap.c` 等堆的实现方式包含许多断言，堆内存损坏则断言失败。为高效检测堆内存损坏，请确保在项目配置中通过 `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` 选项启用断言。

如果堆完整性断言失败，将打印一行类似 `CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c` 的内容，打印的内存地址即内容损坏的堆结构地址。

调用 `heap_caps_check_integrity_all()` 或相关函数可手动检测堆内存完整性，该函数可以检测所有请求的堆内存完整性，在禁用断言时仍可生效。若此完整性检测检测到错误，将打印相应错误及内容损坏的堆内存结构地址。

**内存分配失败钩子** 用户可以使用 `heap_caps_register_failed_alloc_callback()` 注册回调函数，每次内存分配操作失败时都会调用该函数。

此外，若启用 `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS` 选项，可以在任何分配操作失败时，自动中止系统。

要注册内存分配失败的回调函数，请参阅如下示例：

```
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char_
↪*function_name)
{
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n
↪", function_name, requested_size, caps);
}

void app_main()
{
    ...
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_
↪failed_hook);
    ...
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
    ...
}
```

**定位堆内存损坏** 内存损坏可能是最难定位和修复的错误类型之一，因为导致内存损坏的原因可能与问题的表现毫不相干。以下是有关定位堆内存损坏的一些提示：

- 如果系统崩溃并提示 `CORRUPT HEAP:`，打印信息中通常包含栈跟踪，但此栈跟踪往往无效，因为系统会在检测到堆内存损坏后崩溃，但实际的损坏通常发生在其他位置，且损坏时间早于系统发现的时间。
- 将堆内存调试配置项级别增加到“轻度影响”或“全面”可以得到更准确的信息，定位首个内存损坏的地址。
- 在代码中定期调用 `heap_caps_check_integrity_all()` 或 `heap_caps_check_integrity_addr()` 可以定位内存损坏发生的确切时间。可以反复调整检测函数位置，以定位导致堆内存损坏的代码块。
- 根据损坏的内存地址，按照 [JTAG 调试](#) 在此地址上设置监视点，并在写入时使 CPU 暂停。
- 如果没有 JTAG，但大致了解损坏发生的时间，则可以通过 `esp_cpu_set_watchpoint()` 在软件中提前设置监视点，触发监视点将导致致命错误。函数使用示例为 `esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE)`。注意，监视点在各个 CPU 独立存在，并且仅设置在当前运行的 CPU 上，因此，若无法确定哪个 CPU 破坏了内存，则需要两个 CPU 上分别调用此函数。
- 对于缓冲区溢出，以 `HEAP_TRACE_ALL` 模式进行 [堆内存跟踪](#) 可以看到哪些调用函数正在从堆中分配哪些地址，详情请参阅 [堆内存跟踪定位堆内存损坏](#)。如果可以找到在已损坏地址的前一地址分配内存的函数，这些函数很可能就是使缓冲区溢出的函数。
- 调用 `heap_caps_dump()` 或 `heap_caps_dump_all()` 提示损坏区域周围堆块的情况，并了解哪些堆块可能已经溢出或下溢等。

**配置项** 暂时提高堆内存损坏检测级别，可以进一步获取有关堆内存损坏错误的详细信息。

在项目配置菜单中，可以在 Component config 下找到 Heap memory debugging 菜单，其中的 `CONFIG_HEAP_CORRUPTION_DETECTION` 选项可以设置为以下三种级别：

**基本模式（无污染）** 此为默认级别，默认情况下，不会启用任何特殊的堆内存损坏检测功能。但会启用提供的断言。如果堆的任何内部数据结构出现覆盖或损坏，就会打印出一个堆内存损坏错误。这通常表示缓冲区溢出或越界写入。

启用断言时，如果出现重复释放相同内存的情况（即双重释放），则会触发断言。

在基本模式调用 `heap_caps_check_integrity()`，可以检查所有堆结构的完整性，并在出错时打印错误信息。

**轻微影响模式** 在此级别下，每个分配的内存块都会在头尾加入“canary 字节”进行“污染”。如果应用程序在已分配缓冲区的边界外写入数据，则会破坏这些 canary 字节，导致完整性检查失败。

头 canary 字的值为 0xABBA1234（按字节顺序为 3412BAAB），尾 canary 字的值为 0xBAAD5678（按字节顺序为 7856ADBA）。

基本模式下的堆内存损坏检测可以检测到大多数越界写入，在检测到错误前的越界字节数取决于堆属性。但轻微影响模式更精确，可以检测到单个字节的越界写入。

启用轻微影响模式检测会增加内存使用量，每次内存分配需要 9 至 12 个额外的字节，具体取决于对齐方式。

在轻微影响模式下，每次调用 `heap_caps_free()` 时，都会检查要释放的缓冲区头尾 canary 字节是否匹配预期值。

调用 `heap_caps_check_integrity()` 时，会检查所有已分配的堆内存块的 canary 字节是否匹配预期值。

以上两种情况检查的是，在缓冲区返回给用户之前，已分配块的前 4 个字节是否为 0xABBA1234，以及在缓冲区返回给用户之后，最后 4 个字节是否为 0xBAAD5678。

如果检查到字节与上述值不同，通常表示缓冲区越界或下溢。其中越界表示在写入内存时，写入的数据超过了所分配内存的大小，导致写入到了未分配的内存区域；下溢表示在读取内存时，读取的数据超出了所分配内存的范围，读取了未分配的内存区域的数据。

**全面检测模式** 此级别包含了轻微影响模式的检测功能，此外还会检查未初始化访问和使用已释放内存产生的错误。此模式会将所有新分配的内存填充为 0xCE，将所有已释放的内存填充为 0xFE。

启用全面检测模式会对运行性能产生实质影响，因为每次 `heap_caps_malloc()` 或 `heap_caps_free()` 操作完成时，都需要将所有内存设置为分配模式，并检查内存。但是，此模式更容易检测到其他方式难以发现的内存损坏错误。建议只在调试时启用此模式，请勿在生产环境中启用。

**全面检测模式下程序崩溃** 全面检测模式下，如果应用程序在读取或写入与 0xCECECECE 相关地址时崩溃，表示它读取了未初始化内存。此时，应修改应用程序，使用 `heap_caps calloc()` 将内存清零，或在使用前初始化内存。在栈分配的自动变量中也可能存在 0xCECECECE 的值，因为 ESP-IDF 中的大多数任务栈最初由堆分配，而在 C 中，栈内存默认未初始化。

如果应用程序崩溃，且异常寄存器转储指示某些地址或值为 0xFEFEFEFE，表示它读取了已释放的堆内存。此时，应修改应用程序，避免访问已释放的堆内存。

调用 `heap_caps_malloc()` 或 `heap_caps_realloc()` 时，如果在已释放的内存中找到了不同于 0xFEFEFEFE 的值，将导致应用程序崩溃。这表示应用程序写入了已经释放的内存，从而产生错误。

**全面检测模式下手动堆内存检测** 调用 `heap_caps_check_integrity()` 会打印与 `0xFEFEFEFE`、`0xABBA1234`、或 `0xBAAD5678` 相关的错误。在不同情况下，检测器均会检测给定模式，若未找到，则输出相应错误：

- 对于已释放的堆内存块，检测器会检查是否所有字节都设置为 `0xFE`，检测到任何其他值都表示错误写入了已释放内存。
- 对于已分配的堆内存块，检测器的检查模式与轻微影响模式相同，即在每个分配的缓冲区头部和尾部检查 `canary` 字节 `0xABBA1234` 和 `0xBAAD5678`，检测到任何其他字节都表示缓冲区越界或下溢。

## 堆任务跟踪

堆任务跟踪可获取堆内存分配的各任务信息，应用程序须指定计划跟踪堆分配的堆属性。

示例代码可参考 [system/heap\\_task\\_tracking](#)。

## 堆内存跟踪

堆内存跟踪支持跟踪用于分配或释放内存的代码，且支持以下两种跟踪模式：

- 独立模式。此模式下，跟踪数据保存在设备上（因此收集的信息大小受指定缓冲区限制），并由设备上的代码完成分析。部分 API 可访问和转储收集的信息。
- 主机模式。此模式不受独立模式所限制，其跟踪数据使用 `app_trace` 库通过 JTAG 连接发送到主机，随后使用特殊工具完成分析。

堆内存跟踪具有以下两种功能：

- 泄漏检测：检测已分配但未释放的内存。
- 堆内存使用分析：显示在跟踪运行期间所有分配或释放内存的函数。

**如何判断内存泄漏** 如果怀疑存在内存泄漏，首先要找出程序中存在泄漏的部分。调用 `heap_caps_get_free_size()` 或 [堆内存信息](#) 中的其他相关函数，跟踪应用程序的内存使用情况，尝试将泄漏范围缩小到某个或一系列空闲内存始终减少而没有恢复的函数。

**独立模式** 确定存在泄漏的代码后，请执行以下步骤：

- 启用 `CONFIG_HEAP_TRACING_DEST` 选项。
- 在程序早期调用函数 `heap_trace_init_standalone()` 注册一个可用于记录内存跟踪的缓冲区。
- 在有内存泄漏之嫌的代码块前，调用函数 `heap_trace_start()` 记录系统中的所有内存分配和释放操作。
- 在有内存泄露之嫌的代码块后，调用函数 `heap_trace_stop()` 停止跟踪。
- 调用函数 `heap_trace_dump()` 导出内存跟踪结果。

应用程序代码初始化、启动和停止堆内存跟踪的一般过程，见以下代码片段示例：

```
#include "esp_heap_trace.h"

#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // 该缓冲区必须在内部 RAM 中

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}
```

(下页继续)

```

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );

    do_something_you_suspect_is_leaking();

    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}

```

堆内存跟踪堆输出将类似以下格式的内容：

```

2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccount 0x2e9b7384 caller
8 bytes (@ 0x3ffaf804) allocated CPU 0 ccount 0x2e9b79c0 caller
40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0

```

**备注：**以上示例输出使用 *IDF 监视器*，自动将 PC 地址解码为其源文件和行号。

第一行表示与缓冲区的总大小相比，缓冲区内的分配条目数量。

在 HEAP\_TRACE\_LEAKS 模式下，对跟踪的每个未释放的已分配内存，打印的信息中都会包含以下内容：

- XX bytes：分配的字节数。
- @ 0x...：从 `heap_caps_malloc()` 或 `heap_caps_calloc()` 返回的堆地址。
- Internal 或 PSRAM：分配内存的一般位置。
- CPU x：分配过程中运行的 CPU（CPU 0 或 CPU 1）。
- ccount 0x...：分配时的 COUNTER（CPU 循环计数器）寄存器值，CPU 0 与 CPU 1 中的这一值不同。

最后，将打印“泄漏”的总字节数（即在跟踪期间分配但未释放的总字节数），以及它所代表的总分配次数。

如果跟踪缓冲区不足以容纳所有分配，则会打印警告。如果看到此警告，请考虑缩短跟踪时间，或增加跟踪缓冲区中记录的数量。

**主机模式** 确定存在泄漏的代码后，请执行以下步骤：

- 在项目配置菜单中，导航至 Component settings > Heap Memory Debugging > *CONFIG\_HEAP\_TRACING\_DEST* 并选择 Host-Based。
- 在项目配置菜单中，导航至 Component settings > Application Level Tracing > *CONFIG\_APPTRACE\_DESTINATION1* 并选择 Trace memory。
- 在项目配置菜单中，导航至 Component settings > Application Level Tracing > FreeRTOS SystemView Tracing 并启用 *CONFIG\_APPTRACE\_SV\_ENABLE*。
- 在程序早期，调用函数 `heap_trace_init_tohost()`，初始化 JTAG 堆内存跟踪模块。
- 在有内存泄漏之嫌的代码块前，调用函数 `heap_trace_start()` 开始记录系统中的内存分配和释放操作。  
主机模式忽略该函数参数，堆内存跟踪模块以 HEAP\_TRACE\_ALL 传递后的方式运行，即所有的内存分配和释放都发送到主机。
- 在有内存泄露之嫌的代码块后，调用函数 `heap_trace_stop()` 停止跟踪。

应用程序代码初始化、启动和停止基于主机模式堆内存跟踪的一般过程，请参阅以下代码片段示例：

```
#include "esp_heap_trace.h"

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );

    do_something_you_suspect_is_leaking();

    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```

要收集并分析堆内存跟踪结果，请在主机上完成以下操作：

1. 构建程序并将其下载到目标设备，详情请参阅[第五步：开始使用 ESP-IDF](#)吧。
2. 运行 OpenOCD（请参阅[JTAG 调试](#)）。

---

**备注：** 使用此功能需要 v0.10.0-esp32-20181105 或更高版本的 OpenOCD。

---

3. 使用 GDB 可以自动启动和/或停止跟踪，为此应准备特殊的 gdbinit 文件：

```
target remote :3333

mon reset halt
maintenance flush register-cache

tb heap_trace_start
commands
mon esp sysview start file:///tmp/heap.svdat
c
end

tb heap_trace_stop
commands
mon esp sysview stop
end

c
```

使用此文件，GDB 将连接到目标设备、重置该设备，在程序触发 `heap_trace_start()` 断点时开始跟踪，在程序触发 `heap_trace_stop()` 断点时停止跟踪。跟踪数据将保存至 `/tmp/heap_log.svdat`。

4. 使用命令 `riscv32-esp-elf-gdb -x gdbinit </path/to/program/elf>` 运行 GDB
5. 调用 `heap_trace_stop()` 函数使程序停止运行时，退出 GDB，跟踪数据将保存至 `/tmp/heap.svdat`
6. 运行处理脚本 `$IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b </path/to/program/elf> /tmp/heap_log.svdat`

堆内存跟踪堆输出将类似以下格式的内容：

```
Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 byte!)
```

(下页继续)

(续上页)

```
Process events from '['/tmp/heap.svdat']'...

```

**堆内存跟踪定位堆内存损坏** 堆内存跟踪也是一种定位堆内存损坏位置的方法。当堆中的某个区域损坏时，可能是因为程序中的其他部分在相邻地址分配内存。

如果大致了解堆内存损坏发生的时间范围，启用 `HEAP_TRACE_ALL` 模式的堆内存跟踪，可以记录分配内存的所有函数及其相应地址。

以此方法使用堆内存跟踪与上文描述的内存泄漏检测类似，对已分配但未释放的内存输出结果相同，但还会显示已释放内存的记录。

**性能影响** 在 `menuconfig` 中启用堆内存跟踪，会增加程序代码的大小，即便未运行堆内存跟踪，也会对堆内存分配或释放操作的性能产生较小的负面影响。

运行堆内存跟踪时，堆内存分配或释放操作的速度明显变慢。增加为各内存分配的栈帧深度（见上文）

也会造成这种性能影响。

为减轻堆内存跟踪运行时的性能损失，请启用 `CONFIG_HEAP_TRACE_HASH_MAP`。此时，将使用哈希映射机制处理堆内存跟踪记录，减少堆内存分配或释放操作的执行时长。设置 `CONFIG_HEAP_TRACE_HASH_MAP_SIZE` 的值可以调整哈希映射的大小。

**内存泄漏误报** 并非所有由 `heap_trace_dump()` 打印的信息都是内存泄漏，以下情况也可能打印信息：

- 在调用 `heap_trace_start()` 后分配且在调用 `heap_trace_stop()` 后才释放的内存都会出现在泄漏信息中。
- 系统中的其他任务也可能进行内存分配。根据这些任务的时间安排，报错的这部分内存很可能在调用 `heap_trace_stop()` 后释放。
- 当任务第一次使用 `stdio`，如调用 `heap_caps_printf()` 时，`libc` 会分配一个锁，即 RTOS 互斥信号量，该分配将持续至任务删除。
- 进行打印浮点数等调用 `heap_caps_printf()` 的操作时，会根据需要，从堆中分配一些内存，这些分配将持续至任务删除。
- 蓝牙、Wi-Fi 和 TCP/IP 库会分配堆内存缓冲区，处理传入或传出的数据，这些内存缓冲区通常持续时间较短。但如果在运行堆内存泄漏跟踪期间，网络底层接收或发送了数据，一些缓冲区可能会出现在堆内存泄漏跟踪输出中。
- 由于存在 `TIME_WAIT` 状态，TCP 连接在关闭后仍会使用一些内存，`TIME_WAIT` 状态结束后将释放这些内存。

要区分“真实”和“误报”的内存泄漏，可以在堆内存跟踪运行时多次调用可疑代码，并在堆内存跟踪输出中查找重复出现的内存分配情况。

## API 参考 - 堆内存跟踪

### Header File

- [components/heap/include/esp\\_heap\\_trace.h](#)
- This header file can be included with:

```
#include "esp_heap_trace.h"
```

### Functions

`esp_err_t heap_trace_init_standalone(heap_trace_record_t *record_buffer, size_t num_records)`

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0)`;

#### 参数

- **record\_buffer** -- Provide a buffer to use for heap trace data. Note: External RAM is allowed, but it prevents recording allocations made from ISR's.
- **num\_records** -- Size of the heap trace buffer, as number of record structures.

#### 返回

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

`esp_err_t heap_trace_init_tohost(void)`

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

#### 返回

- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.

- ESP\_OK Heap tracing initialised successfully.

*esp\_err\_t* **heap\_trace\_start** (*heap\_trace\_mode\_t* mode)

Start heap tracing. All heap allocations & frees will be traced, until `heap_trace_stop()` is called.

---

**备注:** `heap_trace_init_standalone()` must be called to provide a valid buffer, before this function is called.

---

---

**备注:** Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

---

**参数** **mode** -- Mode for tracing.

- `HEAP_TRACE_ALL` means all heap allocations and frees are traced.
- `HEAP_TRACE_LEAKS` means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

**返回**

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` A non-zero-length buffer has not been set via `heap_trace_init_standalone()`.
- `ESP_OK` Tracing is started.

*esp\_err\_t* **heap\_trace\_stop** (void)

Stop heap tracing.

**返回**

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` Heap tracing was not in progress.
- `ESP_OK` Heap tracing stopped..

*esp\_err\_t* **heap\_trace\_resume** (void)

Resume heap tracing which was previously stopped.

Unlike `heap_trace_start()`, this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when `heap_trace_start()` was last called (or `HEAP_TRACE_ALL` if `heap_trace_start()` was never called).

**返回**

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` Heap tracing was already started.
- `ESP_OK` Heap tracing resumed.

*size\_t* **heap\_trace\_get\_count** (void)

Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.

*esp\_err\_t* **heap\_trace\_get** (*size\_t* index, *heap\_trace\_record\_t* \*record)

Return a raw record from the heap trace buffer.

---

**备注:** It is safe to call this function while heap tracing is running, however in `HEAP_TRACE_LEAK` mode record indexing may skip entries unless heap tracing is stopped first.

---

**参数**

- **index** -- Index (zero-based) of the record to return.
- **record** -- **[out]** Record where the heap trace record will be copied.

**返回**

- ESP\_ERR\_NOT\_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP\_ERR\_INVALID\_STATE Heap tracing was not initialised.
- ESP\_ERR\_INVALID\_ARG Index is out of bounds for current heap trace record count.
- ESP\_OK Record returned successfully.

void **heap\_trace\_dump** (void)

Dump heap trace record data to stdout.

---

**备注:** It is safe to call this function while heap tracing is running, however in HEAP\_TRACE\_LEAK mode the dump may skip entries unless heap tracing is stopped first.

---

void **heap\_trace\_dump\_caps** (const uint32\_t caps)

Dump heap trace from the memory of the capabilities passed as parameter.

**参数 caps** -- Capability(ies) of the memory from which to dump the trace. Set MAL-LOC\_CAP\_INTERNAL to dump heap trace data from internal memory. Set MAL-LOC\_CAP\_SPIRAM to dump heap trace data from PSRAM. Set both to dump both heap trace data.

*esp\_err\_t* **heap\_trace\_summary** (*heap\_trace\_summary\_t* \*summary)

Get summary information about the result of a heap trace.

---

**备注:** It is safe to call this function while heap tracing is running.

---

## Structures

struct **heap\_trace\_record\_t**

Trace record data type. Stores information about an allocated region of memory.

### Public Members

uint32\_t **ccount**

CCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

void \***address**

Address which was allocated. If NULL, then this record is empty.

size\_t **size**

Size of the allocation.

void \***allocated\_by**[CONFIG\_HEAP\_TRACING\_STACK\_DEPTH]

Call stack of the caller which allocated the memory.

void \***freed\_by**[CONFIG\_HEAP\_TRACING\_STACK\_DEPTH]

Call stack of the caller which freed the memory (all zero if not freed.)

struct **heap\_trace\_summary\_t**

Stores information about the result of a heap trace.

## Public Members

### `heap_trace_mode_t` mode

The heap trace mode we just completed / are running.

### `size_t` total\_allocations

The total number of allocations made during tracing.

### `size_t` total\_frees

The total number of frees made during tracing.

### `size_t` count

The number of records in the internal buffer.

### `size_t` capacity

The capacity of the internal buffer.

### `size_t` high\_water\_mark

The maximum value that 'count' got to.

### `size_t` has\_overflowed

True if the internal buffer overflowed at some point.

## Macros

`CONFIG_HEAP_TRACING_STACK_DEPTH`

## Type Definitions

typedef struct `heap_trace_record_t` `heap_trace_record_t`

Trace record data type. Stores information about an allocated region of memory.

## Enumerations

enum `heap_trace_mode_t`

*Values:*

enumerator `HEAP_TRACE_ALL`

enumerator `HEAP_TRACE_LEAKS`

## 2.10.17 高分辨率定时器 (ESP 定时器)

## 概述

尽管 FreeRTOS 提供软件定时器，但 FreeRTOS 软件定时器存在一定局限性：

- 最大分辨率等于 RTOS 滴答周期
- 定时器回调函数从低优先级的定时器服务（即守护进程）任务中分发。该任务可能会被其他任务抢占，导致精度和准确性下降。

硬件定时器虽不受上述限制，但使用不便。例如，应用组件可能需要在特定的未来时间触发定时器事件，但硬件定时器通常只有一个“compare（比较）”值用于中断生成。为提升使用的便利性，应在硬件定时器的基础上构建某种机制来管理待处理事件列表，确保在相应的硬件中断发生时调度回调。

esp\_timer API 集支持单次定时器和周期定时器、微秒级的时间分辨率、以及 52 位范围。

esp\_timer 内部使用 52 位硬件定时器，具体硬件实现取决于芯片型号，如 ESP32-C3 使用的是 SYS-TIMER。

定时器回调可通过以下两种方式调度：

- ESP\_TIMER\_TASK。
- ESP\_TIMER\_ISR。仅当 `CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD` 被启用时可用（默认为禁用）。

使用 ESP\_TIMER\_TASK 这一途径时，定时器回调函数是从高优先级的 esp\_timer 任务中调度的。由于所有回调函数都是从同一个任务中调度，因此建议在回调函数本身中仅执行最小化的工作，如使用队列向低优先级任务发布事件。

如果有优先级高于 esp\_timer 的其他任务正在运行，则回调调度将延迟，直至 esp\_timer 能够运行。例如，执行 SPI flash 操作时便会发生此类情况。

使用 ESP\_TIMER\_ISR 这一途径时，定时器回调由定时器中断处理程序直接调度。对旨在降低延迟的简单回调，建议使用此途径。

创建、启动定时器并调度回调需要一些时间。因此，单次 esp\_timer 的超时值存在最小限制。若调用 `esp_timer_start_once()` 时设置的超时值小于 20 us，回调函数仍会在大约 20 微秒后被调度。

周期 esp\_timer 将最小周期限制为 50 us。周期小于 50 us 的软件定时器会占用大部分 CPU 时间，因此它们并不实用。如需使用小周期定时器，请考虑使用专用硬件外设或 DMA 功能。

## 使用 esp\_timer API

单个定时器由 `esp_timer_handle_t` 类型表示。每个定时器都有与之关联的回调函数，定时器超时时会从 esp\_timer 任务中调用此函数。

- 要创建定时器，请调用函数 `esp_timer_create()`。
- 要删除定时器，请调用函数 `esp_timer_delete()`。

定时器可以以单次模式和周期模式启动。

- 要以单次模式启动定时器，请调用函数 `esp_timer_start_once()`，传递应在多久后调用回调的时间间隔。调用回调时，定时器被视为停止工作。
- 要以周期模式启动定时器，请调用函数 `esp_timer_start_periodic()`，传递应调用回调的周期。计时器持续运行，直到调用函数 `esp_timer_stop()`。

注意，当调用函数 `esp_timer_start_once()` 或 `esp_timer_start_periodic()` 时，应确保定时器处于非运行状态。因此，要重启运行中的定时器，需首先调用函数 `esp_timer_stop()` 停止定时器，然后调用 `esp_timer_start_once()` 或 `esp_timer_start_periodic()` 来启动定时器。

## 回调函数

---

**备注：** 回调函数应尽可能简略，避免影响所有定时器。

---

若定时器回调由 `ESP_TIMER_ISR` 方式处理，则该回调不应调用切换上下文的 `portYIELD_FROM_ISR()`，而应调用函数 `esp_timer_isr_dispatch_need_yield()`。如果系统有此需求，上下文切换将在所有 ISR 调度定时器处理完毕后进行。

### Light-sleep 模式下的 esp\_timer

在 `Light-sleep` 期间，`esp_timer` 计数器停止工作，并且不调用回调函数，而是由 RTC 计数器负责计算时间。唤醒后，系统得到两个计数器间的差值，并调用函数推进 `esp_timer` 计数器计数。计数器计数被推进后，系统开始调用 `Light-sleep` 期间未被调用的回调。回调数量取决于 `Light-sleep` 模式持续时长和定时器周期，这可能会导致某些队列溢出。以上情况仅适用于周期性定时器，单次定时器只会被调用一次。

通过在 `Light-sleep` 模式前调用函数 `esp_timer_stop()` 可以改变上述行为。但在某些情况下这可能并不方便。比起使用停止函数，在 `esp_timer_create()` 中使用 `skip_unhandled_events` 选项将更加便利。当 `skip_unhandled_events` 为真时，如果一个周期性定时器在 `Light-sleep` 期间超时一次或多次，那么在唤醒时只有一个回调会被调用。

使用带有自动 `Light-sleep` 的 `skip_unhandled_events` 选项（请参阅[电源管理](#)），有助于在系统处于 `Light-sleep` 状态时降低功耗。`Light-sleep` 的持续时间也在一定程度上由下一个事件发生的时间确定。具有 `skip_unhandled_events`` 选项的定时器不会唤醒系统。

### 处理回调

设计 `esp_timer` 是为了使定时器实现高分辨率和低延迟，并具备处理延迟事件的能力。如果定时器延迟，回调将被尽快调用，不会丢失。在最糟的情况下，周期性定时器可能超过一个周期还没有被处理，此时回调将被陆续调用，而不会等待设定的周期。这会给某些应用带来负面影响，为避免此类情况发生，特引入 `skip_unhandled_events` 选项。设置该选项后，即使一个周期性定时器多次超时且无法调用回调，该定时器在恢复处理能力后，仍将只产生一个回调事件。

### 获取当前时间

`esp_timer` 还提供了一个便捷函数 `esp_timer_get_time()` 以获取自启动以来经过的时间，可精确到微秒。这个函数通常会在 `app_main` 函数即将被调用前，返回自 `esp_timer` 启动以来的微秒数。

不同于 `gettimeofday` 函数，`esp_timer_get_time()` 返回的值：

- 芯片从 `Deep-sleep` 中唤醒后，从零开始
- 没有应用时区或 DST 调整

### 应用示例

`esp_timer` API 的详细用法可参阅 [system/esp\\_timer](#)。

### API 参考

#### Header File

- `components/esp_timer/include/esp_timer.h`
- This header file can be included with:

```
#include "esp_timer.h"
```

- This header file is a part of the API provided by the `esp_timer` component. To declare that your component depends on `esp_timer`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_timer
```

or

`PRIV_REQUIRES esp_timer`

## Functions

*esp\_err\_t* **esp\_timer\_early\_init** (void)

Minimal initialization of esp\_timer.

This function can be called very early in startup process, after this call only esp\_timer\_get\_time function can be used.

---

**备注:** This function is called from startup code. Applications do not need to call this function before using other esp\_timer APIs.

---

### 返回

- ESP\_OK on success

*esp\_err\_t* **esp\_timer\_init** (void)

Initialize esp\_timer library.

This function will be called from startup code on every core if CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_NO\_AFFINITY is enabled, It allocates the timer ISR on MULTIPLE cores and creates the timer task which can be run on any core.

---

**备注:** This function is called from startup code. Applications do not need to call this function before using other esp\_timer APIs. Before calling this function, esp\_timer\_early\_init must be called by the startup code.

---

### 返回

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_ERR\_INVALID\_STATE if already initialized
- other errors from interrupt allocator

*esp\_err\_t* **esp\_timer\_deinit** (void)

De-initialize esp\_timer library.

---

**备注:** Normally this function should not be called from applications

---

### 返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not yet initialized

*esp\_err\_t* **esp\_timer\_create** (const *esp\_timer\_create\_args\_t* \*create\_args, *esp\_timer\_handle\_t* \*out\_handle)

Create an esp\_timer instance.

---

**备注:** When done using the timer, delete it with esp\_timer\_delete function.

---

### 参数

- **create\_args** -- Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.

- **out\_handle** -- [out] Output, pointer to `esp_timer_handle_t` variable which will hold the created timer handle.

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if some of the create\_args are not valid
- ESP\_ERR\_INVALID\_STATE if esp\_timer library is not initialized yet
- ESP\_ERR\_NO\_MEM if memory allocation fails

*esp\_err\_t* **esp\_timer\_start\_once** (*esp\_timer\_handle\_t* timer, uint64\_t timeout\_us)

Start one-shot timer.

Timer should not be running when this function is called.

**参数**

- **timer** -- timer handle created using `esp_timer_create`
- **timeout\_us** -- timer timeout, in microseconds relative to the current moment

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle is invalid
- ESP\_ERR\_INVALID\_STATE if the timer is already running

*esp\_err\_t* **esp\_timer\_start\_periodic** (*esp\_timer\_handle\_t* timer, uint64\_t period)

Start a periodic timer.

Timer should not be running when this function is called. This function will start the timer which will trigger every 'period' microseconds.

**参数**

- **timer** -- timer handle created using `esp_timer_create`
- **period** -- timer period, in microseconds

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle is invalid
- ESP\_ERR\_INVALID\_STATE if the timer is already running

*esp\_err\_t* **esp\_timer\_restart** (*esp\_timer\_handle\_t* timer, uint64\_t timeout\_us)

Restart a currently running timer.

If the given timer is a one-shot timer, the timer is restarted immediately and will timeout once in `timeout_us` microseconds. If the given timer is a periodic timer, the timer is restarted immediately with a new period of `timeout_us` microseconds.

**参数**

- **timer** -- timer Handle created using `esp_timer_create`
- **timeout\_us** -- Timeout, in microseconds relative to the current time. In case of a periodic timer, also represents the new period.

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle is invalid
- ESP\_ERR\_INVALID\_STATE if the timer is not running

*esp\_err\_t* **esp\_timer\_stop** (*esp\_timer\_handle\_t* timer)

Stop the timer.

This function stops the timer previously started using `esp_timer_start_once` or `esp_timer_start_periodic`.

**参数** **timer** -- timer handle created using `esp_timer_create`

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if the timer is not running

*esp\_err\_t* **esp\_timer\_delete** (*esp\_timer\_handle\_t* timer)

Delete an `esp_timer` instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

**参数** **timer** -- timer handle allocated using `esp_timer_create`  
**返回**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if the timer is running

*int64\_t* **esp\_timer\_get\_time** (void)

Get time in microseconds since boot.

**返回** number of microseconds since underlying timer has been started

*int64\_t* **esp\_timer\_get\_next\_alarm** (void)

Get the timestamp when the next timeout is expected to occur.

**返回** Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by `esp_timer_get_time`.

*int64\_t* **esp\_timer\_get\_next\_alarm\_for\_wake\_up** (void)

Get the timestamp when the next timeout is expected to occur skipping those which have `skip_unhandled_events` flag.

**返回** Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by `esp_timer_get_time`.

*esp\_err\_t* **esp\_timer\_get\_period** (*esp\_timer\_handle\_t* timer, *uint64\_t* \*period)

Get the period of a timer.

This function fetches the timeout period of a timer.

---

**备注:** The timeout period is the time interval with which a timer restarts after expiry. For one-shot timers, the period is 0 as there is no periodicity associated with such timers.

---

**参数**

- **timer** -- timer handle allocated using `esp_timer_create`
- **period** -- memory to store the timer period value in microseconds

**返回**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if the arguments are invalid

*esp\_err\_t* **esp\_timer\_get\_expiry\_time** (*esp\_timer\_handle\_t* timer, *uint64\_t* \*expiry)

Get the expiry time of a one-shot timer.

This function fetches the expiry time of a one-shot timer.

---

**备注:** This API returns a valid expiry time only for a one-shot timer. It returns an error if the timer handle passed to the function is for a periodic timer.

---

**参数**

- **timer** -- timer handle allocated using `esp_timer_create`
- **expiry** -- memory to store the timeout value in microseconds

**返回**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if the arguments are invalid
- `ESP_ERR_NOT_SUPPORTED` if the timer type is periodic

*esp\_err\_t* **esp\_timer\_dump** (FILE \*stream)

Dump the list of timers to a stream.

If CONFIG\_ESP\_TIMER\_PROFILING option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.

The format is:

name period alarm times\_armed times\_triggered total\_callback\_run\_time

where:

name —timer name (if CONFIG\_ESP\_TIMER\_PROFILING is defined), or timer pointer period —period of timer, in microseconds, or 0 for one-shot timer alarm - time of the next alarm, in microseconds since boot, or 0 if the timer is not started

The following fields are printed if CONFIG\_ESP\_TIMER\_PROFILING is defined:

times\_armed —number of times the timer was armed via esp\_timer\_start\_X times\_triggered - number of times the callback was called total\_callback\_run\_time - total time taken by callback to execute, across all calls

**参数 stream** -- stream (such as stdout) to dump the information to

**返回**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if can not allocate temporary buffer for the output

void **esp\_timer\_isr\_dispatch\_need\_yield** (void)

Requests a context switch from a timer callback function.

This only works for a timer that has an ISR dispatch method. The context switch will be called after all ISR dispatch timers have been processed.

bool **esp\_timer\_is\_active** (*esp\_timer\_handle\_t* timer)

Returns status of a timer, active or not.

This function is used to identify if the timer is still active or not.

**参数 timer** -- timer handle created using esp\_timer\_create

**返回**

- 1 if timer is still active
- 0 if timer is not active.

*esp\_err\_t* **esp\_timer\_new\_etm\_alarm\_event** (esp\_etm\_event\_handle\_t \*out\_event)

Get the ETM event handle of esp\_timer underlying alarm event.

---

**备注:** The created ETM event object can be deleted later by calling esp\_etm\_del\_event

---

---

**备注:** The ETM event is generated by the underlying hardware –systemer, therefore, if the esp\_timer is not clocked by systemer, then no ETM event will be generated.

---

**参数 out\_event** -- [out] Returned ETM event handle

**返回**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

## Structures

struct **esp\_timer\_create\_args\_t**

Timer configuration passed to esp\_timer\_create.

## Public Members

### *esp\_timer\_cb\_t* callback

Function to call when timer expires.

void \***arg**

Argument to pass to the callback.

### *esp\_timer\_dispatch\_t* dispatch\_method

Call the callback from task or from ISR.

const char \***name**

Timer name, used in `esp_timer_dump` function.

bool **skip\_unhandled\_events**

Skip unhandled events for periodic timers.

## Type Definitions

```
typedef struct esp_timer *esp_timer_handle_t
```

Opaque type representing a single `esp_timer`.

```
typedef void (*esp_timer_cb_t)(void *arg)
```

Timer callback function type.

**Param arg** pointer to opaque user-specific data

## Enumerations

```
enum esp_timer_dispatch_t
```

Method for dispatching timer callback.

*Values:*

```
enumerator ESP_TIMER_TASK
```

Callback is called from timer task.

```
enumerator ESP_TIMER_MAX
```

Count of the methods for dispatching timer callback.

## 2.10.18 Internal and Unstable APIs

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.

### API Reference

#### Header File

- `components/esp_rom/include/esp_rom_sys.h`
- This header file can be included with:

```
#include "esp_rom_sys.h"
```

## Functions

void **esp\_rom\_software\_reset\_system** (void)

Software Reset digital core include RTC.

It is not recommended to use this function in esp-idf, use esp\_restart() instead.

void **esp\_rom\_software\_reset\_cpu** (int cpu\_no)

Software Reset cpu core.

It is not recommended to use this function in esp-idf, use esp\_restart() instead.

**参数** `cpu_no` -- : The CPU to reset, 0 for PRO CPU, 1 for APP CPU.

int **esp\_rom\_printf** (const char \*fmt, ...)

Print formatted string to console device.

---

**备注:** float and long long data are not supported!

---

### 参数

- **fmt** -- Format string
- **...** -- Additional arguments, depending on the format string

**返回** int: Total number of characters written on success; A negative number on failure.

void **esp\_rom\_delay\_us** (uint32\_t us)

Pauses execution for us microseconds.

**参数** `us` -- Number of microseconds to pause

void **esp\_rom\_install\_channel\_putc** (int channel, void (\*putc)(char c))

esp\_rom\_printf can print message to different channels simultaneously. This function can help install the low level putc function for esp\_rom\_printf.

### 参数

- **channel** -- Channel number (starting from 1)
- **putc** -- Function pointer to the putc implementation. Set NULL can disconnect esp\_rom\_printf with putc.

void **esp\_rom\_install\_uart\_printf** (void)

Install UART1 as the default console channel, equivalent to esp\_rom\_install\_channel\_putc(1, esp\_rom\_uart\_putc)

soc\_reset\_reason\_t **esp\_rom\_get\_reset\_reason** (int cpu\_no)

Get reset reason of CPU.

**参数** `cpu_no` -- CPU number

**返回** Reset reason code (see in soc/reset\_reasons.h)

void **esp\_rom\_route\_intr\_matrix** (int cpu\_core, uint32\_t periph\_intr\_id, uint32\_t cpu\_intr\_num)

Route peripheral interrupt sources to CPU's interrupt port by matrix.

Usually there're 4 steps to use an interrupt:

- Route peripheral interrupt source to CPU. e.g. `esp_rom_route_intr_matrix(0, ETS_WIFI_MAC_INTR_SOURCE, ETS_WMAC_INUM)`
- Set interrupt handler for CPU
- Enable CPU interrupt
- Enable peripheral interrupt

### 参数

- **cpu\_core** -- The CPU number, which the peripheral interrupt will inform to
- **periph\_intr\_id** -- The peripheral interrupt source number
- **cpu\_intr\_num** -- The CPU (external) interrupt number. On targets that use CLIC as their interrupt controller, this number represents the external interrupt number. For example, passing `cpu_intr_num = i` to this function would in fact bind peripheral source to CPU interrupt `CLIC_EXT_INTR_NUM_OFFSET + i`.

`uint32_t esp_rom_get_cpu_ticks_per_us` (void)

Get the real CPU ticks per us.

返回 CPU ticks per us

void `esp_rom_set_cpu_ticks_per_us` (uint32\_t ticks\_per\_us)

Set the real CPU tick rate.

---

**备注:** Call this function when CPU frequency is changed, otherwise the `esp_rom_delay_us` can be inaccurate.

---

参数 `ticks_per_us` -- CPU ticks per us

## 2.10.19 中断分配

### 概述

ESP32-C3 有一个核，31 个中断。每个中断的优先级别都可独立地通过编程设置。

由于中断源数量多于中断，有时多个驱动程序可以共用一个中断。`esp_intr_alloc()` 抽象隐藏了这些实现细节。

驱动程序可以通过调用 `esp_intr_alloc()`，或 `esp_intr_alloc_intrstatus()` 为某个外设分配中断。通过向此函数传递 `flag`，可以指定中断类型、优先级和触发方式。然后，中断分配代码会找到适用的中断，使用中断矩阵将其连接到外设，并为其安装给定的中断处理程序和 ISR。

中断分配器提供两种不同的中断类型：共享中断和非共享中断，这两种中断需要不同处理方式。非共享中断在每次调用 `esp_intr_alloc()` 时，都会分配一个单独的中断，该中断仅用于与其相连的外设，只调用一个 ISR。共享中断则可以由多个外设触发，当其中一个外设发出中断信号时，会调用多个 ISR。因此，针对共享中断的 ISR 应检查对应外设的中断状态，以确定是否需要采取任何操作。

非共享中断可由电平或边缘触发。共享中断只能由电平触发，因为使用边缘触发可能会错过中断。

要解释为什么共享中断只能由电平触发，以外设 A 和外设 B 共用一个边缘触发中断为例进行说明：当外设 B 触发中断时，会将其中断信号设置为高电平，产生一个从低到高的边缘，进而锁存 CPU 中断位，并触发 ISR。接着，ISR 开始执行，检查到此时外设 A 没有触发中断，于是继续处理外设 B 的中断信号，最后将外设 B 的中断状态清除。最后，CPU 会在 ISR 返回之前清除中断位锁存器。因此在整个中断处理过程中，如果外设 A 触发了中断，该中断会因 CPU 清除中断位锁存器而丢失。

### IRAM-safe 中断处理程序

`ESP_INTR_FLAG_IRAM` flag 注册的中断处理程序始终在 IRAM（并从 DRAM 读取其所有数据）中运行，因此在擦除和写入 flash 时无需禁用。

这对于需要保证最小执行延迟的中断来说非常有用，因为 flash 写入和擦除操作可能很慢（擦除可能需要数十毫秒或数百毫秒才能完成）。

如果中断被频繁调用，可以将中断处理程序保留在 IRAM 中，避免 flash cache 丢失。

有关更多详细信息，请参阅 [SPI flash API 相关文档](#)。

## 多个处理程序共用一个中断源

如果用 `ESP_INTR_FLAG_SHARED` flag 分配所有处理程序，可能将多个处理程序分配给同一个源。这些程序会被分配给与源关联的中断，并在源可用时按顺序调用。处理程序可以单独禁用和释放。如果启用了的一个或多个处理程序，则会将源关联到中断（启用），否则会取消关联。禁用的处理程序永远不会被调用，但是只要启用了源的任何一个处理程序，这个源仍然能被触发。

关联到非共享中断的源不支持此功能。

尽管支持此功能，使用时也必须 **非常小心**。通常存在两种办法可以阻止中断触发：**禁用源**或**屏蔽外设中断状态**。ESP-IDF 仅处理源本身的启用和禁用，中断源的状态位和屏蔽位须由用户操作。

**状态位须在负责该位的处理程序禁用前屏蔽，也可以在另一个启用的中断中屏蔽和处理该状态位。**

**备注：**如果不屏蔽状态位而让其处于未处理状态，同时禁用这些状态位的处理程序，就会导致无限次触发中断，引起系统崩溃。

## 排除中断分配故障

CPU 中断在大多数 Espressif SoC 上都是有限的资源。因此，一个运行的程序有可能耗尽 CPU 中断，例如初始化多个外设驱动程序的情况。这通常导致驱动程序的初始化函数返回 `ESP_ERR_NOT_FOUND` 错误。

这种情况下，可使用 `esp_intr_dump()` 函数打印中断列表及其状态。此函数输出通常如下：

```
CPU 0 interrupt status:
Int  Level  Type   Status
0    1      Level  Reserved
1    1      Level  Reserved
2    1      Level  Used: RTC_CORE
3    1      Level  Used: TGO_LACT_LEVEL
...
```

输出列含义如下：

- **Int:** CPU 中断输入编号。通常不直接在软件中使用，仅作为参考。
- **Level:** 已分配中断的优先级级别。空闲的中断具有标记 \*。
- **Type:** 已分配中断的类型（电平或边缘中断）。空闲的中断具有标记 \*。
- **Status: 中断的可能状态：**
  - **Reserved:** 中断在硬件层面保留，或由 ESP-IDF 的某些部分保留。不能使用 `esp_intr_alloc()` 分配。
  - **Used:** <source>: 中断已分配并连接到单个外设。
  - **Shared:** <source1> <source2> ...: 中断已分配并连接到多个外设。参见本文档 [多个处理程序共用一个中断源](#) 章节。
  - **Free:** 中断未分配，可以由 `esp_intr_alloc()` 使用。

如果已确认应用程序的确用完了中断，可组合采用下列建议解决问题：

- 找到可接受更高延迟的中断，并用 `ESP_INTR_FLAG_SHARED` flag（或与 `ESP_INTR_FLAG_LOWMED` 进行 OR 运算）分配这些中断。对两个或更多外设使用此 flag 能让它们使用单个中断输入，从而为其他外设节约中断输入。参见 [多个处理程序共用一个中断源](#)。
- 检查是否有些外设驱动程序不需要一直启用，并按需将其初始化或取消初始化。这样可以减少同时分配的中断数量。

## API 参考

### Header File

- [components/esp\\_hw\\_support/include/esp\\_intr\\_types.h](#)
- This header file can be included with:

```
#include "esp_intr_types.h"
```

### Macros

**ESP\_INTR\_CPU\_AFFINITY\_TO\_CORE\_ID** (cpu\_affinity)

Convert esp\_intr\_cpu\_affinity\_t to CPU core ID.

### Type Definitions

typedef void (\***intr\_handler\_t**)(void \*arg)

Function prototype for interrupt handler function

typedef struct intr\_handle\_data\_t \***intr\_handle\_t**

Handle to an interrupt handler

### Enumerations

enum **esp\_intr\_cpu\_affinity\_t**

Interrupt CPU core affinity.

This type specify the CPU core that the peripheral interrupt is connected to.

*Values:*

enumerator **ESP\_INTR\_CPU\_AFFINITY\_AUTO**

Install the peripheral interrupt to ANY CPU core, decided by on which CPU the interrupt allocator is running.

enumerator **ESP\_INTR\_CPU\_AFFINITY\_0**

Install the peripheral interrupt to CPU core 0.

enumerator **ESP\_INTR\_CPU\_AFFINITY\_1**

Install the peripheral interrupt to CPU core 1.

### Header File

- [components/esp\\_hw\\_support/include/esp\\_intr\\_alloc.h](#)
- This header file can be included with:

```
#include "esp_intr_alloc.h"
```

### Functions

**esp\_err\_t esp\_intr\_mark\_shared** (int intno, int cpu, bool is\_in\_iram)

Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

#### 参数

- **intno** -- The number of the interrupt (0-31)
- **cpu** -- CPU on which the interrupt should be marked as shared (0 or 1)
- **is\_in\_iram** -- Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

返回 ESP\_ERR\_INVALID\_ARG if cpu or intno is invalid ESP\_OK otherwise  
*esp\_err\_t* **esp\_intr\_reserve** (int intno, int cpu)

Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

#### 参数

- **intno** -- The number of the interrupt (0-31)
- **cpu** -- CPU on which the interrupt should be marked as shared (0 or 1)

返回 ESP\_ERR\_INVALID\_ARG if cpu or intno is invalid ESP\_OK otherwise

*esp\_err\_t* **esp\_intr\_alloc** (int source, int flags, *intr\_handler\_t* handler, void \*arg, *intr\_handle\_t* \*ret\_handle)

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP\_INTR\_FLAG\_IRAM flag is used, and handler address is not in IRAM or RTC\_FAST\_MEM, then ESP\_ERR\_INVALID\_ARG is returned.

#### 参数

- **source** -- The interrupt source. One of the ETS\*\_INTR\_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS\_INTERNAL\*\_INTR\_SOURCE sources as defined in this header.
- **flags** -- An ORred mask of the ESP\_INTR\_FLAG\_\* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP\_INTR\_FLAG\_SHARED, it will allocate a shared interrupt of level 1. Setting ESP\_INTR\_FLAG\_INTRDISABLED will return from this function with the interrupt disabled.
- **handler** -- The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- **arg** -- Optional argument for passed to the interrupt handler
- **ret\_handle** -- Pointer to an intr\_handle\_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

返回 ESP\_ERR\_INVALID\_ARG if the combination of arguments is invalid.  
 ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags ESP\_OK otherwise

*esp\_err\_t* **esp\_intr\_alloc\_intrstatus** (int source, int flags, uint32\_t intrstatusreg, uint32\_t intrstatusmask, *intr\_handler\_t* handler, void \*arg, *intr\_handle\_t* \*ret\_handle)

Allocate an interrupt with the given parameters.

This essentially does the same as esp\_intr\_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped

#### 参数

- **source** -- The interrupt source. One of the ETS\*\_INTR\_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS\_INTERNAL\*\_INTR\_SOURCE sources as defined in this header.
- **flags** -- An ORred mask of the ESP\_INTR\_FLAG\_\* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP\_INTR\_FLAG\_SHARED, it will allocate a shared interrupt of level 1. Setting ESP\_INTR\_FLAG\_INTRDISABLED will return from this function with the interrupt disabled.
- **intrstatusreg** -- The address of an interrupt status register

- **intrstatusmask** -- A mask. If a read of address intrstatusreg has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- **handler** -- The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- **arg** -- Optional argument for passed to the interrupt handler
- **ret\_handle** -- Pointer to an intr\_handle\_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

返回 ESP\_ERR\_INVALID\_ARG if the combination of arguments is invalid.  
ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags ESP\_OK otherwise

*esp\_err\_t* **esp\_intr\_free** (*intr\_handle\_t* handle)

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

---

**备注:** When the handler shares its source with other handlers, the interrupt status bits it's responsible for should be managed properly before freeing it. see `esp_intr_disable` for more details. Please do not call this function in `esp_ipc_call_blocking`.

---

**参数 handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

返回 ESP\_ERR\_INVALID\_ARG the handle is NULL ESP\_FAIL failed to release this handle  
ESP\_OK otherwise

int **esp\_intr\_get\_cpu** (*intr\_handle\_t* handle)

Get CPU number an interrupt is tied to.

**参数 handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

返回 The core number where the interrupt is allocated

int **esp\_intr\_get\_intno** (*intr\_handle\_t* handle)

Get the allocated interrupt for a certain handle.

**参数 handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

返回 The interrupt number

*esp\_err\_t* **esp\_intr\_disable** (*intr\_handle\_t* handle)

Disable the interrupt associated with the handle.

---

**备注:**

- For local interrupts (ESP\_INTERNAL\_\* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
  - When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.
- 

**参数 handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

返回 ESP\_ERR\_INVALID\_ARG if the combination of arguments is invalid. ESP\_OK otherwise

*esp\_err\_t* **esp\_intr\_enable** (*intr\_handle\_t* handle)

Enable the interrupt associated with the handle.

**备注:** For local interrupts (ESP\_INTERNAL\_\* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

---

**参数 handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`  
**返回** ESP\_ERR\_INVALID\_ARG if the combination of arguments is invalid. ESP\_OK otherwise

*esp\_err\_t* `esp_intr_set_in_iram` (*intr\_handle\_t* handle, bool is\_in\_iram)

Set the "in IRAM" status of the handler.

---

**备注:** Does not work on shared interrupts.

---

#### 参数

- **handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
- **is\_in\_iram** -- Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

**返回** ESP\_ERR\_INVALID\_ARG if the combination of arguments is invalid. ESP\_OK otherwise

void `esp_intr_noniram_disable` (void)

Disable interrupts that aren't specifically marked as running from IRAM.

void `esp_intr_noniram_enable` (void)

Re-enable interrupts disabled by `esp_intr_noniram_disable`.

void `esp_intr_enable_source` (int inum)

enable the interrupt source based on its number

**参数 inum** -- interrupt number from 0 to 31

void `esp_intr_disable_source` (int inum)

disable the interrupt source based on its number

**参数 inum** -- interrupt number from 0 to 31

static inline int `esp_intr_flags_to_level` (int flags)

Get the lowest interrupt level from the flags.

**参数 flags** -- The same flags that pass to `esp_intr_alloc_intrstatus` API

static inline int `esp_intr_level_to_flags` (int level)

Get the interrupt flags from the supplied level (priority)

**参数 level** -- The interrupt priority level

*esp\_err\_t* `esp_intr_dump` (FILE \*stream)

Dump the status of allocated interrupts.

**参数 stream** -- The stream to dump to, if NULL then stdout is used

**返回** ESP\_OK on success

## Macros

**ESP\_INTR\_FLAG\_LEVEL1**

Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling `esp_intr_alloc*` needs. Accept a Level 1 interrupt vector (lowest priority)

**ESP\_INTR\_FLAG\_LEVEL2**

Accept a Level 2 interrupt vector.

**ESP\_INTR\_FLAG\_LEVEL3**

Accept a Level 3 interrupt vector.

**ESP\_INTR\_FLAG\_LEVEL4**

Accept a Level 4 interrupt vector.

**ESP\_INTR\_FLAG\_LEVEL5**

Accept a Level 5 interrupt vector.

**ESP\_INTR\_FLAG\_LEVEL6**

Accept a Level 6 interrupt vector.

**ESP\_INTR\_FLAG\_NMI**

Accept a Level 7 interrupt vector (highest priority)

**ESP\_INTR\_FLAG\_SHARED**

Interrupt can be shared between ISRs.

**ESP\_INTR\_FLAG\_EDGE**

Edge-triggered interrupt.

**ESP\_INTR\_FLAG\_IRAM**

ISR can be called if cache is disabled.

**ESP\_INTR\_FLAG\_INTRDISABLED**

Return with this interrupt disabled.

**ESP\_INTR\_FLAG\_LOWMED**

Low and medium prio interrupts. These can be handled in C.

**ESP\_INTR\_FLAG\_HIGH**

High level interrupts. Need to be handled in assembly.

**ESP\_INTR\_FLAG\_LEVELMASK**

Mask for all level flags.

**ETS\_INTERNAL\_TIMER0\_INTR\_SOURCE**

Platform timer 0 interrupt source.

The `esp_intr_alloc*` functions can allocate an int for all `ETS_*_INTR_SOURCE` interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.

**ETS\_INTERNAL\_TIMER1\_INTR\_SOURCE**

Platform timer 1 interrupt source.

**ETS\_INTERNAL\_TIMER2\_INTR\_SOURCE**

Platform timer 2 interrupt source.

**ETS\_INTERNAL\_SW0\_INTR\_SOURCE**

Software int source 1.

**ETS\_INTERNAL\_SW1\_INTR\_SOURCE**

Software int source 2.

**ETS\_INTERNAL\_PROFILING\_INTR\_SOURCE**

Int source for profiling.

**ETS\_INTERNAL\_UNUSED\_INTR\_SOURCE**

Interrupt is not assigned to any source.

**ETS\_INTERNAL\_INTR\_SOURCE\_OFF**

Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly

**ESP\_INTR\_ENABLE** (inum)

Enable interrupt by interrupt number

**ESP\_INTR\_DISABLE** (inum)

Disable interrupt by interrupt number

## 2.10.20 Logging library

### Overview

The logging library provides three ways for setting log verbosity:

- **At compile time:** in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`.
- Optionally, also in menuconfig, set the maximum verbosity level using the option `CONFIG_LOG_MAXIMUM_LEVEL`. By default, this is the same as the default level, but it can be set higher in order to compile more optional logs into the firmware.
- **At runtime:** all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per-module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.
- **At runtime:** if `CONFIG_LOG_MASTER_LEVEL` is enabled then a Master logging level can be set using `esp_log_set_level_master()`. This option adds an additional logging level check for all compiled logs. Note that this will increase application size. This feature is useful if you want to compile in a lot of logs that are selectable at runtime, but also want to avoid the performance hit from looking up the tags and their log level when you don't want log output.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

---

**备注:** The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_MAXIMUM_LEVEL`. To increase log level for a specific file above this maximum at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).

---

## How to use this library

In each C file that uses logging functionality, define the TAG variable as shown below:

```
static const char* TAG = "MyModule";
```

Then use one of logging macros to produce output, e.g:

```
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error_
↳ * 100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- ESP\_LOGE - error (lowest)
- ESP\_LOGW - warning
- ESP\_LOGI - info
- ESP\_LOGD - debug
- ESP\_LOGV - verbose (highest)

Additionally, there are ESP\_EARLY\_LOGx versions for each of these macros, e.g. *ESP\_EARLY\_LOGE*. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal ESP\_LOGx macros can also be used while compiling the bootloader, but they will fall back to the same implementation as ESP\_EARLY\_LOGx macros.

There are also ESP\_DRAM\_LOGx versions for each of these macros, e.g. *ESP\_DRAM\_LOGE*. These versions are used in some places where logging may occur with interrupts disabled or with flash cache inaccessible. Use of this macros should be as sparing as possible, as logging in these types of code should be avoided for performance reasons.

---

**备注:** Inside critical sections interrupts are disabled so it's only possible to use ESP\_DRAM\_LOGx (preferred) or ESP\_EARLY\_LOGx. Even though it's possible to log in these situations, it's better if your program can be structured not to require it.

---

To override default verbosity level at file or component scope, define the LOG\_LOCAL\_LEVEL macro.

At file scope, define it before including `esp_log.h`, e.g.:

```
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component CMakeLists:

```
target_compile_definitions(${COMPONENT_LIB} PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG_
↳ VERBOSE")
```

To configure logging output per module at runtime, add calls to the function `esp_log_level_set()` as follows:

```
esp_log_level_set("*", ESP_LOG_ERROR);           // set all components to ERROR level
esp_log_level_set("wifi", ESP_LOG_WARN);        // enable WARN logs from WiFi stack
esp_log_level_set("dhcpc", ESP_LOG_INFO);       // enable INFO logs from DHCP client
```

---

**备注:** The "DRAM" and "EARLY" log macro variants documented above do not support per module setting of log verbosity. These macros will always log at the "default" verbosity level, which can only be changed at runtime by calling `esp_log_level_set("*", level)`.

---

Even when logs are disabled by using a tag name they will still require a processing time of around 10.9 microseconds per entry.

**Master Logging Level** To enable the Master logging level feature, the `CONFIG_LOG_MASTER_LEVEL` option must be enabled. It adds an additional level check for `ESP_LOGx` macros before calling `esp_log_write()`. This allows to set a higher `CONFIG_LOG_MAXIMUM_LEVEL`, but not inflict a performance hit during normal operation (only when directed). An application may set the master logging level (`esp_log_set_level_master()`) globally to enforce a maximum log level. `ESP_LOGx` macros above this level will be skipped immediately, rather than calling `esp_log_write()` and doing a tag lookup. It is recommended to only use this in a top-level application and not in shared components as this would override the global log level for any user using the component. By default, at startup, the Master logging level is `CONFIG_LOG_DEFAULT_LEVEL`.

Note that this feature increases application size because the additional check is added into all `ESP_LOGx` macros.

The snippet below shows how it works. Setting the Master logging level to `ESP_LOG_NONE` disables all logging globally. `esp_log_level_set()` does not currently affect logging. But after the Master logging level is released, the logs will be printed as set by `esp_log_level_set()`.

```
// Master logging level is CONFIG_LOG_DEFAULT_LEVEL at start up and = ESP_LOG_INFO
ESP_LOGI("lib_name", "Message for print"); // prints a INFO message
esp_log_level_set("lib_name", ESP_LOG_WARN); // enables WARN logs from lib_
↳name

esp_log_set_level_master(ESP_LOG_NONE); // disables all logs globally.↳
↳esp_log_level_set has no effect at the moment.

ESP_LOGW("lib_name", "Message for print"); // no print, Master logging↳
↳level blocks it
esp_log_level_set("lib_name", ESP_LOG_INFO); // enable INFO logs from lib_
↳name
ESP_LOGI("lib_name", "Message for print"); // no print, Master logging↳
↳level blocks it

esp_log_set_level_master(ESP_LOG_INFO); // enables all INFO logs↳
↳globally.

ESP_LOGI("lib_name", "Message for print"); // prints a INFO message
```

**Logging to Host via JTAG** By default, the logging library uses the `vprintf`-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section [记录日志到主机](#).

**Thread Safety** The log string is first written into a memory buffer and then sent to the UART for printing. Log calls are thread-safe, i.e., logs of different threads do not conflict with each other.

### Application Example

The logging library is commonly used by most ESP-IDF components and examples. For demonstration of log functionality, check ESP-IDF's [examples](#) directory. The most relevant examples that deal with logging are the following:

- [system/ota](#)
- [storage/sd\\_card](#)
- [protocols/https\\_request](#)

### API Reference

#### Header File

- [components/log/include/esp\\_log.h](#)
- This header file can be included with:

```
#include "esp_log.h"
```

## Functions

void **esp\_log\_set\_level\_master** (*esp\_log\_level\_t* level)

Master log level.

Optional master log level to check against for ESP\_LOGx macros before calling esp\_log\_write. Allows one to set a higher CONFIG\_LOG\_MAXIMUM\_LEVEL but not impose a performance hit during normal operation (only when instructed). An application may set esp\_log\_set\_level\_master(level) to globally enforce a maximum log level. ESP\_LOGx macros above this level will be skipped immediately, rather than calling esp\_log\_write and doing a cache hit.

The tradeoff is increased application size.

**参数 level** -- Master log level

*esp\_log\_level\_t* **esp\_log\_get\_level\_master** (void)

Returns master log level.

**返回** Master log level

void **esp\_log\_level\_set** (const char \*tag, *esp\_log\_level\_t* level)

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

---

**备注:** Note that this function can not raise log level above the level set using CONFIG\_LOG\_MAXIMUM\_LEVEL setting in menuconfig. To raise log level above the default one for a given file, define LOG\_LOCAL\_LEVEL to one of the ESP\_LOG\_\* values, before including esp\_log.h in this file.

---

### 参数

- **tag** -- Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "\*" resets log level for all tags to the given value.
- **level** -- Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

*esp\_log\_level\_t* **esp\_log\_level\_get** (const char \*tag)

Get log level for a given tag, can be used to avoid expensive log statements.

**参数 tag** -- Tag of the log to query current level. Must be a non-NULL zero terminated string.

**返回** The current log level for the given tag

*vprintf\_like\_t* **esp\_log\_set\_vprintf** (*vprintf\_like\_t* func)

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

---

**备注:** Please note that function callback here must be re-entrant as it can be invoked in parallel from multiple thread context.

---

**参数 func** -- new Function used for output. Must have same signature as vprintf.

**返回** func old Function used for output.

uint32\_t **esp\_log\_timestamp** (void)

Function which returns timestamp to be used in log output.

This function is used in expansion of ESP\_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

返回 timestamp, in milliseconds

char \***esp\_log\_system\_timestamp** (void)

Function which returns system timestamp to be used in log output.

This function is used in expansion of ESP\_LOGx macros to print the system time as "HH:MM:SS.sss". The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently, this will not get used in logging from binary blobs (i.e. Wi-Fi & Bluetooth libraries), these will still print the RTOS tick time.

返回 timestamp, in "HH:MM:SS.sss"

uint32\_t **esp\_log\_early\_timestamp** (void)

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

返回 timestamp, in milliseconds

void **esp\_log\_write** (*esp\_log\_level\_t* level, const char \*tag, const char \*format, ...)

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP\_LOGE, ESP\_LOGW, ESP\_LOGI, ESP\_LOGD, ESP\_LOGV macros.

This function or these macros should not be used from an interrupt.

void **esp\_log\_writev** (*esp\_log\_level\_t* level, const char \*tag, const char \*format, va\_list args)

Write message into the log, va\_list variant.

This function is provided to ease integration toward other logging framework, so that esp\_log can be used as a log sink.

参见:

esp\_log\_write()

## Macros

**ESP\_LOG\_BUFFER\_HEX\_LEVEL** (tag, buffer, buff\_len, level)

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

参数

- **tag** -- description tag
- **buffer** -- Pointer to the buffer array
- **buff\_len** -- length of buffer in bytes
- **level** -- level of the log

**ESP\_LOG\_BUFFER\_CHAR\_LEVEL** (tag, buffer, buff\_len, level)

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

参数

- **tag** -- description tag

- **buffer** -- Pointer to the buffer array
- **buff\_len** -- length of buffer in bytes
- **level** -- level of the log

**ESP\_LOG\_BUFFER\_HEXDUMP** (tag, buffer, buff\_len, level)

Dump a buffer to the log at specified level.

The dump log shows just like the one below:

```

W (195) log_example: 0x3ffb4280 45 53 50 33 32 20 69 73 20 67 72 65 61 74
↪2c 20 |ESP32 is great, |
W (195) log_example: 0x3ffb4290 77 6f 72 6b 69 6e 67 20 61 6c 6f 6e 67 20
↪77 69 |working along wi|
W (205) log_example: 0x3ffb42a0 74 68 20 74 68 65 20 49 44 46 2e 00
↪ |th the IDF..|

```

It is highly recommended to use terminals with over 102 text width.

#### 参数

- **tag** -- description tag
- **buffer** -- Pointer to the buffer array
- **buff\_len** -- length of buffer in bytes
- **level** -- level of the log

**ESP\_LOG\_BUFFER\_HEX** (tag, buffer, buff\_len)

Log a buffer of hex bytes at Info level.

#### 参见:

esp\_log\_buffer\_hex\_level

#### 参数

- **tag** -- description tag
- **buffer** -- Pointer to the buffer array
- **buff\_len** -- length of buffer in bytes

**ESP\_LOG\_BUFFER\_CHAR** (tag, buffer, buff\_len)

Log a buffer of characters at Info level. Buffer should contain only printable characters.

#### 参见:

esp\_log\_buffer\_char\_level

#### 参数

- **tag** -- description tag
- **buffer** -- Pointer to the buffer array
- **buff\_len** -- length of buffer in bytes

**ESP\_EARLY\_LOGE** (tag, format, ...)

macro to output logs in startup code, before heap allocator and syscalls have been initialized. Log at ESP\_LOG\_ERROR level.

#### 参见:

printf,ESP\_LOGE,ESP\_DRAM\_LOGE In the future, we want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension `##__VA_ARGS__`. The second one is using the C++20 feature `VA_OPT(,)`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven't found any good alternative to using `##__VA_ARGS__`.

**ESP\_EARLY\_LOGW** (tag, format, ...)

macro to output logs in startup code at ESP\_LOG\_WARN level.

参见:

ESP\_EARLY\_LOGE,ESP\_LOGE,printf

**ESP\_EARLY\_LOGI** (tag, format, ...)

macro to output logs in startup code at ESP\_LOG\_INFO level.

参见:

ESP\_EARLY\_LOGE,ESP\_LOGE,printf

**ESP\_EARLY\_LOGD** (tag, format, ...)

macro to output logs in startup code at ESP\_LOG\_DEBUG level.

参见:

ESP\_EARLY\_LOGE,ESP\_LOGE,printf

**ESP\_EARLY\_LOGV** (tag, format, ...)

macro to output logs in startup code at ESP\_LOG\_VERBOSE level.

参见:

ESP\_EARLY\_LOGE,ESP\_LOGE,printf

**\_ESP\_LOG\_EARLY\_ENABLED** (log\_level)

**ESP\_LOG\_EARLY\_IMPL** (tag, format, log\_level, log\_tag\_letter, ...)

**ESP\_LOGE** (tag, format, ...)

**ESP\_LOGW** (tag, format, ...)

**ESP\_LOGI** (tag, format, ...)

**ESP\_LOGD** (tag, format, ...)

**ESP\_LOGV** (tag, format, ...)

**ESP\_LOG\_LEVEL** (level, tag, format, ...)

runtime macro to output logs at a specified level.

参见:

printf

参数

- **tag** -- tag of the log, which can be used to change the log level by `esp_log_level_set` at runtime.
- **level** -- level of the output log.
- **format** -- format of the output log. See `printf`
- ... -- variables to be replaced into the log. See `printf`

**ESP\_LOG\_LEVEL\_LOCAL** (level, tag, format, ...)

runtime macro to output logs at a specified level. Also check the level with LOG\_LOCAL\_LEVEL. If CONFIG\_LOG\_MASTER\_LEVEL set, also check first against esp\_log\_get\_level\_master().

**参见:**

printf, ESP\_LOG\_LEVEL

**ESP\_DRAM\_LOGE** (tag, format, ...)

Macro to output logs when the cache is disabled. Log at ESP\_LOG\_ERROR level.

Similar to

Usage: `ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", or ESP_DRAM_LOGE(TAG, "format", ...)`; where TAG is a char\* that points to a str in the DRAM.

**参见:**

ESP\_EARLY\_LOGE, the log level cannot be changed per-tag, however esp\_log\_level\_set("\*", level) will set the default level which controls these log lines also.

**参见:**

esp\_rom\_printf, ESP\_LOGE

---

**备注:** Unlike normal logging macros, it's possible to use this macro when interrupts are disabled or inside an ISR.

---

---

**备注:** Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

---

**ESP\_DRAM\_LOGW** (tag, format, ...)

macro to output logs when the cache is disabled at ESP\_LOG\_WARN level.

**参见:**

ESP\_DRAM\_LOGW, ESP\_LOGW, esp\_rom\_printf

**ESP\_DRAM\_LOGI** (tag, format, ...)

macro to output logs when the cache is disabled at ESP\_LOG\_INFO level.

**参见:**

ESP\_DRAM\_LOGI, ESP\_LOGI, esp\_rom\_printf

**ESP\_DRAM\_LOGD** (tag, format, ...)

macro to output logs when the cache is disabled at ESP\_LOG\_DEBUG level.

**参见:**

ESP\_DRAM\_LOGD, ESP\_LOGD, esp\_rom\_printf

**ESP\_DRAM\_LOGV** (tag, format, ...)

macro to output logs when the cache is disabled at ESP\_LOG\_VERBOSE level.

**参见:**

ESP\_DRAM\_LOGV, ESP\_LOGV, esp\_rom\_printf

### Type Definitions

typedef int (**\*vprintf\_like\_t**)(const char\*, va\_list)

### Enumerations

enum **esp\_log\_level\_t**

Log level.

*Values:*

enumerator **ESP\_LOG\_NONE**

No log output

enumerator **ESP\_LOG\_ERROR**

Critical errors, software module can not recover on its own

enumerator **ESP\_LOG\_WARN**

Error conditions from which recovery measures have been taken

enumerator **ESP\_LOG\_INFO**

Information messages which describe normal flow of events

enumerator **ESP\_LOG\_DEBUG**

Extra information which is not necessary for normal use (values, pointers, sizes, etc).

enumerator **ESP\_LOG\_VERBOSE**

Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

## 2.10.21 杂项系统 API

### 软件复位

函数 `esp_restart()` 用于执行芯片的软件复位。调用此函数时，程序停止执行，CPU 复位，应用程序由 bootloader 加载并重启。

函数 `esp_register_shutdown_handler()` 用于注册复位前会自动调用的例程（复位过程由 `esp_restart()` 函数触发），这与 `atexit` POSIX 函数的功能类似。

### 复位原因

ESP-IDF 应用程序启动或复位的原因有多种。调用 `esp_reset_reason()` 函数可获取最近一次复位的原因。复位的所有可能原因，请查看 `esp_reset_reason_t` 中的描述。

## 堆内存

ESP-IDF 中有两个与堆内存相关的函数：

- 函数 `esp_get_free_heap_size()` 用于查询当前可用的堆内存大小。
- 函数 `esp_get_minimum_free_heap_size()` 用于查询整个过程中可用的最小堆内存大小（例如应用程序生命周期内可用的最小堆内存大小）。

请注意，ESP-IDF 支持功能不同的多个堆。上文中函数返回的堆内存大小可使用 `malloc` 函数族来进行分配。有关堆内存的更多信息，请参阅[堆内存分配](#)。

## MAC 地址

以下 API 用于查询和自定义支持的网络接口（如 Wi-Fi、蓝牙、以太网）的 MAC 地址。

要获取特定接口（如 Wi-Fi、蓝牙、以太网）的 MAC 地址，请调用函数 `esp_read_mac()`。

在 ESP-IDF 中，各个网络接口的 MAC 地址是根据单个 **基准 MAC 地址 (Base MAC address)** 计算出来的。默认情况下使用乐鑫指定的基准 MAC 地址，该基准地址在产品生产过程中已预烧录至 ESP32-C3 eFuse。

接口	MAC 地址（默认 4 个全局地址）	MAC 地址（2 个全局地址）
Wi-Fi Station	base_mac	base_mac
Wi-Fi SoftAP	base_mac 最后一组字节后加 1	本地 MAC（由 Wi-Fi Station MAC 生成）
蓝牙	base_mac 最后一组字节后加 2	base_mac 最后一组字节后加 1
以太网	base_mac 最后一组字节后加 3	本地 MAC（由蓝牙 MAC 生成）

**备注：** [配置选项](#) 配置了乐鑫提供的全局 MAC 地址的数量。

**备注：** ESP32-C3 内部未集成以太网 MAC 地址，但仍可以计算得出该地址。不过，以太网 MAC 地址只能与外部以太网接口（如 SPI 以太网设备）一起使用，具体请参阅[以太网](#)。

**自定义接口 MAC** 有时用户可能需要自定义 MAC 地址，这些地址并不由基准 MAC 地址生成。如需设置自定义接口 MAC 地址，请使用 `esp_iface_mac_addr_set()` 函数。该函数用于覆盖由基准 MAC 地址设置（或尚未设置）的接口 MAC 地址。一旦设置某个接口 MAC 地址，即使更改基准 MAC 地址，也不会对其产生影响。

**自定义基准 MAC** 乐鑫已将默认的基准 MAC 地址预烧录至 eFuse BLK1 中。如需设置自定义基准 MAC 地址，请在初始化任一网络接口或调用 `esp_read_mac()` 函数前调用 `esp_base_mac_addr_set()` 函数。自定义基准 MAC 地址可以存储在任何支持的存储设备中（例如 flash、NVS）。

分配自定义基准 MAC 地址时，应避免 MAC 地址重叠。请根据上面的表格配置选项 `CONFIG_ESP32C3_UNIVERSAL_MAC_ADDRESSES`，设置可从自定义基准 MAC 地址生成的有效全局 MAC 地址。

**备注：** 也可以调用函数 `esp_netif_set_mac()`，在网络初始化后设置网络接口使用的特定 MAC。但建议使用此处介绍的自定义基准 MAC 地址的方法，以避免原始 MAC 地址在更改前短暂出现在网络上。

**eFuse 中的自定义 MAC 地址** ESP-IDF 提供了 `esp_efuse_mac_get_custom()` 函数，从 eFuse 读取自定义 MAC 地址时，调用该函数将从 eFuse BLK3 加载 MAC 地址。用户也可以调用 `esp_read_mac()` 函数，此时需使用 `ESP_MAC_EFUSE_CUSTOM` 参数。 `esp_efuse_mac_get_custom()` 函数假定自定义基准 MAC 地址的存储格式如下：

字段	比特数	比特范围
MAC address	48	200:248

**备注：** eFuse BLK3 在烧写时使用 RS 编码，这意味着必须同时烧写该块中的所有 eFuse 字段。

调用 `esp_efuse_mac_get_custom()` 或 `esp_read_mac()` 函数获得自定义 eFuse MAC 地址后，请将此 MAC 地址设置为基准 MAC 地址。有以下两种方法：

1. 使用原有 API：调用 `esp_base_mac_addr_set()`。
2. 使用新 API：调用 `esp_iface_mac_addr_set()`，此时需使用 `ESP_MAC_BASE` 参数。

**本地 MAC 地址和全局 MAC 地址** 在 ESP32-C3 中，乐鑫已预烧录足够数量的有效乐鑫全局 MAC 地址，供所有内部接口使用。上文中的表格已经介绍了如何根据基准 MAC 地址计算出具体接口的 MAC 地址。

当使用自定义 MAC 地址时，可能并非所有接口都能被分配到一个全局 MAC 地址。此时，接口会被分配一个本地 MAC 地址。请注意，这些地址仅用于单个本地网络。

本地 MAC 地址和全局 MAC 地址的定义，请参见 [此处](#)。

内部调用函数 `esp_derive_local_mac()`，可从全局 MAC 地址生成本地 MAC 地址。具体流程如下：

1. 在全局 MAC 地址的第一个字节组中设置 U/L 位（位值为 0x2），创建本地 MAC 地址。
2. 如果该位已存在于全局 MAC 地址中（即现有的“全局”MAC 地址实际上已经是本地 MAC 地址），则本地 MAC 地址的第一个字节组与 0x4 异或。

## 芯片版本

`esp_chip_info()` 函数用于填充 `esp_chip_info_t` 结构体中的芯片信息，包括芯片版本、CPU 数量和芯片中已启用功能的位掩码。

## SDK 版本

调用函数 `esp_get_idf_version()` 可返回一个字符串，该字符串包含了用于编译应用程序的 ESP-IDF 版本，与构建系统中通过 `IDF_VER` 变量所获得的值相同。该版本字符串的格式即 `git describe` 命令的运行结果。

也有其它的版本宏可用于在构建过程中获取 ESP-IDF 版本，它们可根据 ESP-IDF 版本启用或禁用部分程序。

- `ESP_IDF_VERSION_MAJOR`、`ESP_IDF_VERSION_MINOR` 和 `ESP_IDF_VERSION_PATCH` 分别被定义为代表主要版本、次要版本和补丁版本的整数。
- `ESP_IDF_VERSION_VAL` 和 `ESP_IDF_VERSION` 可在确认版本时使用：

```
#include "esp_idf_version.h"

#if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
    // 启用 ESP-IDF v4.0 中的功能
#endif
```

## 应用程序版本

应用程序版本存储在 `esp_app_desc_t` 结构体中。该结构体位于 DROM 扇区，有一个从二进制文件头部计算的固定偏移值。该结构体位于 `esp_image_header_t` 和 `esp_image_segment_header_t` 结构体之后。字段 `Version` 类型为字符串，最大长度为 32 字节。

若需手动设置版本，需要在项目的 `CMakeLists.txt` 文件中设置 `PROJECT_VER` 变量，即在 `CMakeLists.txt` 文件中，在包含 `project.cmake` 之前添加 `set(PROJECT_VER "0.1.0.1")`。

如果设置了 `CONFIG_APP_PROJECT_VER_FROM_CONFIG` 选项，则将使用 `CONFIG_APP_PROJECT_VER` 的值。否则，如果在项目中未设置 `PROJECT_VER` 变量，则该变量将从 `$(PROJECT_PATH)/version.txt` 文件（若有）中检索，或使用 `git` 命令 `git describe` 检索。如果两者都不可用，则 `PROJECT_VER` 将被设置为“1”。应用程序可通过调用 `esp_app_get_description()` 或 `esp_ota_get_partition_description()` 函数来获取应用程序的版本信息。

## API 参考

### Header File

- `components/esp_system/include/esp_system.h`
- This header file can be included with:

```
#include "esp_system.h"
```

### Functions

`esp_err_t esp_register_shutdown_handler(shutdown_handler_t handle)`

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using `esp_restart` function.

**参数** `handle` -- function to execute on restart

**返回**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if the handler has already been registered
- `ESP_ERR_NO_MEM` if no more shutdown handler slots are available

`esp_err_t esp_unregister_shutdown_handler(shutdown_handler_t handle)`

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using `esp_register_shutdown_handler` function.

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if the given handler hasn't been registered before

`void esp_restart (void)`

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be `SW_CPU_RESET`. Peripherals (except for Wi-Fi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

`esp_reset_reason_t esp_reset_reason (void)`

Get reason of last reset.

**返回** See description of `esp_reset_reason_t` for explanation of each value.

`uint32_t esp_get_free_heap_size (void)`

Get the size of available heap.

---

**备注:** Note that the returned value may be larger than the maximum contiguous block which can be allocated.

---

**返回** Available heap size, in bytes.

uint32\_t **esp\_get\_free\_internal\_heap\_size** (void)

Get the size of available internal heap.

---

**备注:** Note that the returned value may be larger than the maximum contiguous block which can be allocated.

---

**返回** Available internal heap size, in bytes.

uint32\_t **esp\_get\_minimum\_free\_heap\_size** (void)

Get the minimum heap that has ever been available.

**返回** Minimum free heap ever available

void **esp\_system\_abort** (const char \*details)

Trigger a software abort.

**参数 details** -- Details that will be displayed during panic handling.

### Type Definitions

typedef void (\***shutdown\_handler\_t**)(void)

Shutdown handler type

### Enumerations

enum **esp\_reset\_reason\_t**

Reset reasons.

*Values:*

enumerator **ESP\_RST\_UNKNOWN**

Reset reason can not be determined.

enumerator **ESP\_RST\_POWERON**

Reset due to power-on event.

enumerator **ESP\_RST\_EXT**

Reset by external pin (not applicable for ESP32)

enumerator **ESP\_RST\_SW**

Software reset via esp\_restart.

enumerator **ESP\_RST\_PANIC**

Software reset due to exception/panic.

enumerator **ESP\_RST\_INT\_WDT**

Reset (software or hardware) due to interrupt watchdog.

enumerator **ESP\_RST\_TASK\_WDT**

Reset due to task watchdog.

enumerator **ESP\_RST\_WDT**

Reset due to other watchdogs.

enumerator **ESP\_RST\_DEEPSLEEP**

Reset after exiting deep sleep mode.

enumerator **ESP\_RST\_BROWNOUT**

Brownout reset (software or hardware)

enumerator **ESP\_RST\_SDIO**

Reset over SDIO.

enumerator **ESP\_RST\_USB**

Reset by USB peripheral.

enumerator **ESP\_RST\_JTAG**

Reset by JTAG.

### Header File

- [components/esp\\_common/include/esp\\_idf\\_version.h](#)
- This header file can be included with:

```
#include "esp_idf_version.h"
```

### Functions

const char \***esp\_get\_idf\_version** (void)

Return full IDF version string, same as 'git describe' output.

---

**备注:** If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don't differentiate between development, pre-release and release versions, but the output of this function does.

---

返回 constant string from IDF\_VER

### Macros

**ESP\_IDF\_VERSION\_MAJOR**

Major version number (X.x.x)

**ESP\_IDF\_VERSION\_MINOR**

Minor version number (x.X.x)

**ESP\_IDF\_VERSION\_PATCH**

Patch version number (x.x.X)

**ESP\_IDF\_VERSION\_VAL** (major, minor, patch)

Macro to convert IDF version number into an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

**ESP\_IDF\_VERSION**

Current IDF version, as an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

## Header File

- `components/esp_hw_support/include/esp_mac.h`
- This header file can be included with:

```
#include "esp_mac.h"
```

## Functions

**`esp_err_t esp_base_mac_addr_set`** (const uint8\_t \*mac)

Set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage e.g. flash and EEPROM.

Base MAC address is used to generate the MAC addresses used by network interfaces.

If using a custom base MAC address, call this API before initializing any network interfaces. Refer to the ESP-IDF Programming Guide for details about how the Base MAC is used.

---

**备注:** Base MAC must be a unicast MAC (least significant bit of first byte must be zero).

---

---

**备注:** If not using a valid OUI, set the "locally administered" bit (bit value 0x02 in the first byte) to avoid collisions.

---

**参数** `mac` -- base MAC address, length: 6 bytes. length: 6 bytes for MAC-48

**返回** ESP\_OK on success ESP\_ERR\_INVALID\_ARG If mac is NULL or is not a unicast MAC

**`esp_err_t esp_base_mac_addr_get`** (uint8\_t \*mac)

Return base MAC address which is set using `esp_base_mac_addr_set`.

---

**备注:** If no custom Base MAC has been set, this returns the pre-programmed Espressif base MAC address.

---

**参数** `mac` -- base MAC address, length: 6 bytes. length: 6 bytes for MAC-48

**返回** ESP\_OK on success ESP\_ERR\_INVALID\_ARG `mac` is NULL  
ESP\_ERR\_INVALID\_MAC base MAC address has not been set

**`esp_err_t esp_efuse_mac_get_custom`** (uint8\_t \*mac)

Return base MAC address which was previously written to BLK3 of EFUSE.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. This API returns the custom base MAC address which was previously written to EFUSE BLK3 in a specified format.

Writing this EFUSE allows setting of a different (non-Espressif) base MAC address. It is also possible to store a custom base MAC address elsewhere, see `esp_base_mac_addr_set()` for details.

---

**备注:** This function is currently only supported on ESP32.

---

**参数** `mac` -- base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4, if CONFIG\_SOC\_IEEE802154\_SUPPORTED=y)

**返回** ESP\_OK on success ESP\_ERR\_INVALID\_ARG `mac` is NULL  
ESP\_ERR\_INVALID\_MAC CUSTOM\_MAC address has not been set, all zeros (for esp32-xx) ESP\_ERR\_INVALID\_VERSION An invalid MAC version field was read from BLK3 of EFUSE (for esp32) ESP\_ERR\_INVALID\_CRC An invalid MAC CRC was read from BLK3 of EFUSE (for esp32)

`esp_err_t esp_efuse_mac_get_default` (uint8\_t \*mac)

Return base MAC address which is factory-programmed by Espressif in EFUSE.

- 参数** **mac** -- base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4, if CONFIG\_SOC\_IEEE802154\_SUPPORTED=y)  
**返回** ESP\_OK on success ESP\_ERR\_INVALID\_ARG mac is NULL

`esp_err_t esp_read_mac` (uint8\_t \*mac, `esp_mac_type_t` type)

Read base MAC address and set MAC address of the interface.

This function first get base MAC address using `esp_base_mac_addr_get()`. Then calculates the MAC address of the specific interface requested, refer to ESP-IDF Programming Guide for the algorithm.

The MAC address set by the `esp_iface_mac_addr_set()` function will not depend on the base MAC address.

**参数**

- **mac** -- base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4, if CONFIG\_SOC\_IEEE802154\_SUPPORTED=y)
- **type** -- Type of MAC address to return

**返回** ESP\_OK on success

`esp_err_t esp_derive_local_mac` (uint8\_t \*local\_mac, const uint8\_t \*universal\_mac)

Derive local MAC address from universal MAC address.

This function copies a universal MAC address and then sets the "locally

administered" bit (bit 0x2) in the first octet, creating a locally administered MAC address.

If the universal MAC address argument is already a locally administered MAC address, then the first octet is XORed with 0x4 in order to create a different locally administered MAC address.

**参数**

- **local\_mac** -- base MAC address, length: 6 bytes. length: 6 bytes for MAC-48
- **universal\_mac** -- Source universal MAC address, length: 6 bytes.

**返回** ESP\_OK on success

`esp_err_t esp_iface_mac_addr_set` (const uint8\_t \*mac, `esp_mac_type_t` type)

Set custom MAC address of the interface. This function allows you to overwrite the MAC addresses of the interfaces set by the base MAC address.

**参数**

- **mac** -- MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for ESP\_MAC\_IEEE802154 type, if CONFIG\_SOC\_IEEE802154\_SUPPORTED=y)
- **type** -- Type of MAC address

**返回** ESP\_OK on success

`size_t esp_mac_addr_len_get` (`esp_mac_type_t` type)

Return the size of the MAC type in bytes.

If CONFIG\_SOC\_IEEE802154\_SUPPORTED is set then for these types:

- ESP\_MAC\_IEEE802154 is 8 bytes.
- ESP\_MAC\_BASE, ESP\_MAC\_EFUSE\_FACTORY and ESP\_MAC\_EFUSE\_CUSTOM the MAC size is 6 bytes.
- ESP\_MAC\_EFUSE\_EXT is 2 bytes. If CONFIG\_SOC\_IEEE802154\_SUPPORTED is not set then for all types it returns 6 bytes.

**参数** **type** -- Type of MAC address

**返回** 0 MAC type not found (not supported) 6 bytes for MAC-48. 8 bytes for EUI-64.

## Macros

**MAC2STR** (a)

**MACSTR**

## Enumerations

enum **esp\_mac\_type\_t**

*Values:*

enumerator **ESP\_MAC\_WIFI\_STA**

MAC for WiFi Station (6 bytes)

enumerator **ESP\_MAC\_WIFI\_SOFTAP**

MAC for WiFi Soft-AP (6 bytes)

enumerator **ESP\_MAC\_BT**

MAC for Bluetooth (6 bytes)

enumerator **ESP\_MAC\_ETH**

MAC for Ethernet (6 bytes)

enumerator **ESP\_MAC\_IEEE802154**

if CONFIG\_SOC\_IEEE802154\_SUPPORTED=y, MAC for IEEE802154 (8 bytes)

enumerator **ESP\_MAC\_BASE**

Base MAC for that used for other MAC types (6 bytes)

enumerator **ESP\_MAC\_EFUSE\_FACTORY**

MAC\_FACTORY eFuse which was burned by Espressif in production (6 bytes)

enumerator **ESP\_MAC\_EFUSE\_CUSTOM**

MAC\_CUSTOM eFuse which can be burned by customer (6 bytes)

enumerator **ESP\_MAC\_EFUSE\_EXT**

if CONFIG\_SOC\_IEEE802154\_SUPPORTED=y, MAC\_EXT eFuse which is used as an extender for IEEE802154 MAC (2 bytes)

## Header File

- [components/esp\\_hw\\_support/include/esp\\_chip\\_info.h](#)
- This header file can be included with:

```
#include "esp_chip_info.h"
```

## Functions

void **esp\_chip\_info** (*esp\_chip\_info\_t* \*out\_info)

Fill an *esp\_chip\_info\_t* structure with information about the chip.

参数 **out\_info** -- [out] structure to be filled

## Structures

struct **esp\_chip\_info\_t**

The structure represents information about the chip.

### Public Members

*esp\_chip\_model\_t* **model**

chip model, one of esp\_chip\_model\_t

uint32\_t **features**

bit mask of CHIP\_FEATURE\_x feature flags

uint16\_t **revision**

chip revision number (in format MXX; where M - wafer major version, XX - wafer minor version)

uint8\_t **cores**

number of CPU cores

## Macros

**CHIP\_FEATURE\_EMB\_FLASH**

Chip has embedded flash memory.

**CHIP\_FEATURE\_WIFI\_BGN**

Chip has 2.4GHz WiFi.

**CHIP\_FEATURE\_BLE**

Chip has Bluetooth LE.

**CHIP\_FEATURE\_BT**

Chip has Bluetooth Classic.

**CHIP\_FEATURE\_IEEE802154**

Chip has IEEE 802.15.4.

**CHIP\_FEATURE\_EMB\_PSRAM**

Chip has embedded psram.

## Enumerations

enum **esp\_chip\_model\_t**

Chip models.

*Values:*

enumerator **CHIP\_ESP32**

ESP32.

enumerator **CHIP\_ESP32S2**

ESP32-S2.

enumerator **CHIP\_ESP32S3**

ESP32-S3.

enumerator **CHIP\_ESP32C3**

ESP32-C3.

enumerator **CHIP\_ESP32C2**

ESP32-C2.

enumerator **CHIP\_ESP32C6**

ESP32-C6.

enumerator **CHIP\_ESP32H2**

ESP32-H2.

enumerator **CHIP\_ESP32P4**

ESP32-P4.

enumerator **CHIP\_POSIX\_LINUX**

The code is running on POSIX/Linux simulator.

### Header File

- [components/esp\\_hw\\_support/include/esp\\_cpu.h](#)
- This header file can be included with:

```
#include "esp_cpu.h"
```

### Functions

void **esp\_cpu\_stall** (int core\_id)

Stall a CPU core.

**参数** **core\_id** -- The core's ID

void **esp\_cpu\_unstall** (int core\_id)

Resume a previously stalled CPU core.

**参数** **core\_id** -- The core's ID

void **esp\_cpu\_reset** (int core\_id)

Reset a CPU core.

**参数** **core\_id** -- The core's ID

void **esp\_cpu\_wait\_for\_intr** (void)

Wait for Interrupt.

This function causes the current CPU core to execute its Wait For Interrupt (WFI or equivalent) instruction. After executing this function, the CPU core will stop execution until an interrupt occurs.

int **esp\_cpu\_get\_core\_id** (void)

Get the current core's ID.

This function will return the ID of the current CPU (i.e., the CPU that calls this function).

**返回** The current core's ID [0..SOC\_CPU\_CORES\_NUM - 1]

void \***esp\_cpu\_get\_sp** (void)

Read the current stack pointer address.

**返回** Stack pointer address

*esp\_cpu\_cycle\_count\_t* **esp\_cpu\_get\_cycle\_count** (void)

Get the current CPU core's cycle count.

Each CPU core maintains an internal counter (i.e., cycle count) that increments every CPU clock cycle.

**返回** Current CPU's cycle count, 0 if not supported.

void **esp\_cpu\_set\_cycle\_count** (*esp\_cpu\_cycle\_count\_t* cycle\_count)

Set the current CPU core's cycle count.

Set the given value into the internal counter that increments every CPU clock cycle.

**参数** **cycle\_count** -- CPU cycle count

void \***esp\_cpu\_pc\_to\_addr** (uint32\_t pc)

Convert a program counter (PC) value to address.

If the architecture does not store the true virtual address in the CPU's PC or return addresses, this function will convert the PC value to a virtual address. Otherwise, the PC is just returned

**参数** **pc** -- PC value

**返回** Virtual address

void **esp\_cpu\_intr\_get\_desc** (int core\_id, int intr\_num, *esp\_cpu\_intr\_desc\_t* \*intr\_desc\_ret)

Get a CPU interrupt's descriptor.

Each CPU interrupt has a descriptor describing the interrupt's capabilities and restrictions. This function gets the descriptor of a particular interrupt on a particular CPU.

**参数**

- **core\_id** -- [in] The core's ID
- **intr\_num** -- [in] Interrupt number
- **intr\_desc\_ret** -- [out] The interrupt's descriptor

void **esp\_cpu\_intr\_set\_ivt\_addr** (const void \*ivt\_addr)

Set the base address of the current CPU's Interrupt Vector Table (IVT)

**参数** **ivt\_addr** -- Interrupt Vector Table's base address

void **esp\_cpu\_intr\_set\_type** (int intr\_num, *esp\_cpu\_intr\_type\_t* intr\_type)

Set the interrupt type of a particular interrupt.

Set the interrupt type (Level or Edge) of a particular interrupt on the current CPU.

**参数**

- **intr\_num** -- Interrupt number (from 0 to 31)
- **intr\_type** -- The interrupt's type

*esp\_cpu\_intr\_type\_t* **esp\_cpu\_intr\_get\_type** (int intr\_num)

Get the current configured type of a particular interrupt.

Get the currently configured type (i.e., level or edge) of a particular interrupt on the current CPU.

**参数** **intr\_num** -- Interrupt number (from 0 to 31)

**返回** Interrupt type

void **esp\_cpu\_intr\_set\_priority** (int intr\_num, int intr\_priority)

Set the priority of a particular interrupt.

Set the priority of a particular interrupt on the current CPU.

**参数**

- **intr\_num** -- Interrupt number (from 0 to 31)

- **intr\_priority** -- The interrupt's priority

int **esp\_cpu\_intr\_get\_priority** (int intr\_num)

Get the current configured priority of a particular interrupt.

Get the currently configured priority of a particular interrupt on the current CPU.

参数 **intr\_num** -- Interrupt number (from 0 to 31)

返回 Interrupt's priority

bool **esp\_cpu\_intr\_has\_handler** (int intr\_num)

Check if a particular interrupt already has a handler function.

Check if a particular interrupt on the current CPU already has a handler function assigned.

---

备注: This function simply checks if the IVT of the current CPU already has a handler assigned.

---

参数 **intr\_num** -- Interrupt number (from 0 to 31)

返回 True if the interrupt has a handler function, false otherwise.

void **esp\_cpu\_intr\_set\_handler** (int intr\_num, *esp\_cpu\_intr\_handler\_t* handler, void \*handler\_arg)

Set the handler function of a particular interrupt.

Assign a handler function (i.e., ISR) to a particular interrupt on the current CPU.

---

备注: This function simply sets the handler function (in the IVT) and does not actually enable the interrupt.

---

参数

- **intr\_num** -- Interrupt number (from 0 to 31)
- **handler** -- Handler function
- **handler\_arg** -- Argument passed to the handler function

void \***esp\_cpu\_intr\_get\_handler\_arg** (int intr\_num)

Get a handler function's argument of.

Get the argument of a previously assigned handler function on the current CPU.

参数 **intr\_num** -- Interrupt number (from 0 to 31)

返回 The the argument passed to the handler function

void **esp\_cpu\_intr\_enable** (uint32\_t intr\_mask)

Enable particular interrupts on the current CPU.

参数 **intr\_mask** -- Bit mask of the interrupts to enable

void **esp\_cpu\_intr\_disable** (uint32\_t intr\_mask)

Disable particular interrupts on the current CPU.

参数 **intr\_mask** -- Bit mask of the interrupts to disable

uint32\_t **esp\_cpu\_intr\_get\_enabled\_mask** (void)

Get the enabled interrupts on the current CPU.

返回 Bit mask of the enabled interrupts

void **esp\_cpu\_intr\_edge\_ack** (int intr\_num)

Acknowledge an edge interrupt.

参数 **intr\_num** -- Interrupt number (from 0 to 31)

void **esp\_cpu\_configure\_region\_protection** (void)

Configure the CPU to disable access to invalid memory regions.

*esp\_err\_t* **esp\_cpu\_set\_breakpoint** (int bp\_num, const void \*bp\_addr)

Set and enable a hardware breakpoint on the current CPU.

---

**备注:** This function is meant to be called by the panic handler to set a breakpoint for an attached debugger during a panic.

---

---

**备注:** Overwrites previously set breakpoint with same breakpoint number.

---

#### 参数

- **bp\_num** -- Hardware breakpoint number [0..SOC\_CPU\_BREAKPOINTS\_NUM - 1]
- **bp\_addr** -- Address to set a breakpoint on

**返回** ESP\_OK if breakpoint is set. Failure otherwise

*esp\_err\_t* **esp\_cpu\_clear\_breakpoint** (int bp\_num)

Clear a hardware breakpoint on the current CPU.

---

**备注:** Clears a breakpoint regardless of whether it was previously set

---

**参数** **bp\_num** -- Hardware breakpoint number [0..SOC\_CPU\_BREAKPOINTS\_NUM - 1]

**返回** ESP\_OK if breakpoint is cleared. Failure otherwise

*esp\_err\_t* **esp\_cpu\_set\_watchpoint** (int wp\_num, const void \*wp\_addr, size\_t size, *esp\_cpu\_watchpoint\_trigger\_t* trigger)

Set and enable a hardware watchpoint on the current CPU.

Set and enable a hardware watchpoint on the current CPU, specifying the memory range and trigger operation. Watchpoints will break/panic the CPU when the CPU accesses (according to the trigger type) on a certain memory range.

---

**备注:** Overwrites previously set watchpoint with same watchpoint number. On RISC-V chips, this API uses method0(Exact matching) and method1(NAPOT matching) according to the riscv-debug-spec-0.13 specification for address matching. If the watch region size is 1byte, it uses exact matching (method 0). If the watch region size is larger than 1byte, it uses NAPOT matching (method 1). This mode requires the watching region start address to be aligned to the watching region size.

---

#### 参数

- **wp\_num** -- Hardware watchpoint number [0..SOC\_CPU\_WATCHPOINTS\_NUM - 1]
- **wp\_addr** -- Watchpoint's base address, must be naturally aligned to the size of the region
- **size** -- Size of the region to watch. Must be one of  $2^n$  and in the range of [1 ... SOC\_CPU\_WATCHPOINT\_MAX\_REGION\_SIZE]
- **trigger** -- Trigger type

**返回** ESP\_ERR\_INVALID\_ARG on invalid arg, ESP\_OK otherwise

*esp\_err\_t* **esp\_cpu\_clear\_watchpoint** (int wp\_num)

Clear a hardware watchpoint on the current CPU.

---

**备注:** Clears a watchpoint regardless of whether it was previously set

---

**参数** `wp_num` -- Hardware watchpoint number [0..SOC\_CPU\_WATCHPOINTS\_NUM - 1]  
**返回** ESP\_OK if watchpoint was cleared. Failure otherwise.

bool `esp_cpu_dbggr_is_attached` (void)

Check if the current CPU has a debugger attached.

**返回** True if debugger is attached, false otherwise

void `esp_cpu_dbggr_break` (void)

Trigger a call to the current CPU's attached debugger.

intptr\_t `esp_cpu_get_call_addr` (intptr\_t return\_address)

Given the return address, calculate the address of the preceding call instruction This is typically used to answer the question "where was the function called from?".

**参数** `return_address` -- The value of the return address register. Typically set to the value of `__builtin_return_address(0)`.

**返回** Address of the call instruction preceding the return address.

bool `esp_cpu_compare_and_set` (volatile uint32\_t \*addr, uint32\_t compare\_value, uint32\_t new\_value)

Atomic compare-and-set operation.

**参数**

- **addr** -- Address of atomic variable
- **compare\_value** -- Value to compare the atomic variable to
- **new\_value** -- New value to set the atomic variable to

**返回** Whether the atomic variable was set or not

## Structures

struct `esp_cpu_intr_desc_t`

CPU interrupt descriptor.

Each particular CPU interrupt has an associated descriptor describing that particular interrupt's characteristics. Call `esp_cpu_intr_get_desc()` to get the descriptors of a particular interrupt.

## Public Members

int `priority`

Priority of the interrupt if it has a fixed priority, (-1) if the priority is configurable.

*esp\_cpu\_intr\_type\_t* type

Whether the interrupt is an edge or level type interrupt, ESP\_CPU\_INTR\_TYPE\_NA if the type is configurable.

uint32\_t `flags`

Flags indicating extra details.

## Macros

`ESP_CPU_INTR_DESC_FLAG_SPECIAL`

Interrupt descriptor flags of *esp\_cpu\_intr\_desc\_t*.

The interrupt is a special interrupt (e.g., a CPU timer interrupt)

`ESP_CPU_INTR_DESC_FLAG_RESVD`

The interrupt is reserved for internal use

## Type Definitions

typedef uint32\_t **esp\_cpu\_cycle\_count\_t**

CPU cycle count type.

This data type represents the CPU's clock cycle count

typedef void (\***esp\_cpu\_intr\_handler\_t**)(void \*arg)

CPU interrupt handler type.

## Enumerations

enum **esp\_cpu\_intr\_type\_t**

CPU interrupt type.

*Values:*

enumerator **ESP\_CPU\_INTR\_TYPE\_LEVEL**

enumerator **ESP\_CPU\_INTR\_TYPE\_EDGE**

enumerator **ESP\_CPU\_INTR\_TYPE\_NA**

enum **esp\_cpu\_watchpoint\_trigger\_t**

CPU watchpoint trigger type.

*Values:*

enumerator **ESP\_CPU\_WATCHPOINT\_LOAD**

enumerator **ESP\_CPU\_WATCHPOINT\_STORE**

enumerator **ESP\_CPU\_WATCHPOINT\_ACCESS**

## Header File

- [components/esp\\_app\\_format/include/esp\\_app\\_desc.h](#)
- This header file can be included with:

```
#include "esp_app_desc.h"
```

- This header file is a part of the API provided by the `esp_app_format` component. To declare that your component depends on `esp_app_format`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_app_format
```

## Functions

const [esp\\_app\\_desc\\_t](#) \***esp\_app\_get\_description**(void)

Return `esp_app_desc` structure. This structure includes app version.

Return description for running app.

**返回** Pointer to `esp_app_desc` structure.

int **esp\_app\_get\_elf\_sha256** (char \*dst, size\_t size)

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

**参数**

- **dst** -- Destination buffer
- **size** -- Size of the buffer

**返回** Number of bytes written to dst (including null terminator)

char \***esp\_app\_get\_elf\_sha256\_str** (void)

Return SHA256 of the ELF file which is already formatted as hexadecimal, null-terminated included. Can be used in panic handler or core dump during when cache is disabled. The length is defined by CONFIG\_APP\_RETRIEVE\_LEN\_ELF\_SHA option.

**返回** Hexadecimal SHA256 string

## Structures

struct **esp\_app\_desc\_t**

Description about application.

### Public Members

uint32\_t **magic\_word**

Magic word ESP\_APP\_DESC\_MAGIC\_WORD

uint32\_t **secure\_version**

Secure version

uint32\_t **reserv1**[2]

reserv1

char **version**[32]

Application version

char **project\_name**[32]

Project name

char **time**[16]

Compile time

char **date**[16]

Compile date

char **idf\_ver**[32]

Version IDF

uint8\_t **app\_elf\_sha256**[32]

sha256 of elf file

uint32\_t **reserv2**[20]

reserv2

## Macros

### ESP\_APP\_DESC\_MAGIC\_WORD

The magic word for the `esp_app_desc` structure that is in DRAM.

## 2.10.22 空中升级 (OTA)

### OTA 流程概览

OTA 升级机制可以让设备在固件正常运行时根据接收数据（如通过 Wi-Fi 或蓝牙）进行自我更新。

要运行 OTA 机制，需配置设备的分区表，该分区表至少包括两个 OTA 应用程序分区（即 `ota_0` 和 `ota_1`）和一个 OTA 数据分区。

OTA 功能启动后，向当前未用于启动的 OTA 应用分区写入新的应用固件镜像。镜像验证后，OTA 数据分区更新，指定在下次启动时使用该镜像。

### OTA 数据分区

所有使用 OTA 功能项目，其分区表必须包含一个 OTA 数据分区（类型为 `data`，子类型为 `ota`）。

工厂启动设置下，OTA 数据分区中应没有数据（所有字节擦写成 `0xFF`）。如果分区表中有工厂应用程序，ESP-IDF 软件引导加载程序会启动工厂应用程序。如果分区表中没有工厂应用程序，则启动第一个可用的 OTA 分区（通常是 `ota_0`）。

第一次 OTA 升级后，OTA 数据分区更新，指定下次启动哪个 OTA 应用程序分区。

OTA 数据分区的容量是 2 个 flash 扇区的大小（`0x2000` 字节），防止写入时电源故障引发问题。两个扇区单独擦除、写入匹配数据，若存在不一致，则用计数器字段判定哪个扇区为最新数据。

### 应用程序回滚

应用程序回滚的主要目的是确保设备在更新后正常工作。如果新版应用程序出现严重错误，该功能可使设备回滚到之前正常运行的应用版本。在使能回滚并且 OTA 升级应用程序至新版本后，可能出现的结果如下：

- 应用程序运行正常，`esp_ota_mark_app_valid_cancel_rollback()` 将正在运行的应用程序状态标记为 `ESP_OTA_IMG_VALID`，启动此应用程序无限制。
- 应用程序出现严重错误，无法继续工作，必须回滚到此前的版本，`esp_ota_mark_app_invalid_rollback_and_reboot()` 将正在运行的版本标记为 `ESP_OTA_IMG_INVALID` 然后复位。引导加载程序不会选取此版本，而是启动此前正常运行的版本。
- 如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能，则无需调用函数便可复位，回滚至之前的应用版本。

---

**备注：**应用程序的状态不是写到程序的二进制镜像，而是写到 `otadata` 分区。该分区有一个 `ota_seq` 计数器，该计数器是 OTA 应用分区的指针，指向下次启动时选取应用所在的分区（`ota_0`, `ota_1`, ...）。

---

**应用程序 OTA 状态** 状态控制了选取启动应用程序的过程：

状态	引导加载程序选取启动应用程序的限制
ESP_OTA_IMG_VALID	没有限制，可以选取。
ESP_OTA_IMG_UNDELETED	没有限制，可以选取。
ESP_OTA_IMG_INVALID	不会选取。
ESP_OTA_IMG_ABORTED	不会选取。
ESP_OTA_IMG_NEW	如使能 <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> ，则仅会选取一次。在引导加载程序中，状态立即变为 <code>ESP_OTA_IMG_PENDING_VERIFY</code> 。
ESP_OTA_IMG_PENDING_VERIFY	如使能 <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> ，则不会选取，状态变为“ESP_OTA_IMG_ABORTED”。

如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 没有使能（默认情况），则 `esp_ota_mark_app_valid_cancel_rollback()` 和 `esp_ota_mark_app_invalid_rollback_and_reboot()` 为可选功能，`ESP_OTA_IMG_NEW` 和 `ESP_OTA_IMG_PENDING_VERIFY` 不会使用。

Kconfig 中的 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 可以帮助用户追踪新版应用程序的第一次启动。应用程序需调用 `esp_ota_mark_app_valid_cancel_rollback()` 函数确认可以运行，否则将会在重启时回滚至旧版本。该功能可让用户在启动阶段控制应用程序的可操作性。新版应用程序仅有一次机会尝试是否能成功启动。

**回滚过程** `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能时，回滚过程如下：

- 新版应用程序下载成功，`esp_ota_set_boot_partition()` 函数将分区设为可启动，状态设为 `ESP_OTA_IMG_NEW`。该状态表示应用程序为新版本，第一次启动需要监测。
- 重新启动 `esp_restart()`。
- 引导加载程序检查 `ESP_OTA_IMG_PENDING_VERIFY` 状态，如有设置，则将其写入 `ESP_OTA_IMG_ABORTED`。
- 引导加载程序选取一个新版应用程序来引导，这样应用程序状态就不会设置为 `ESP_OTA_IMG_INVALID` 或 `ESP_OTA_IMG_ABORTED`。
- 引导加载程序检查所选取的新版应用程序，若状态设置为 `ESP_OTA_IMG_NEW`，则写入 `ESP_OTA_IMG_PENDING_VERIFY`。该状态表示，需确认应用程序的可操作性，如不确认，发生重启，则状态会重写为 `ESP_OTA_IMG_ABORTED`（见上文），该应用程序不可再启动，将回滚至上一版本。
- 新版应用程序启动，应进行自测。
- 若通过自测，则必须调用函数 `esp_ota_mark_app_valid_cancel_rollback()`，因为新版应用程序在等待确认其可操作性（`ESP_OTA_IMG_PENDING_VERIFY` 状态）。
- 若未通过自测，则调用函数 `esp_ota_mark_app_invalid_rollback_and_reboot()`，回滚至之前能正常工作的应用程序版本，同时将无效的新版本应用程序设置为 `ESP_OTA_IMG_INVALID`。
- 如果新版应用程序可操作性没有确认，则状态一直为 `ESP_OTA_IMG_PENDING_VERIFY`。下一次启动时，状态变更为 `ESP_OTA_IMG_ABORTED`，阻止其再次启动，之后回滚到之前的版本。

**意外复位** 如果在新版应用第一次启动时发生断电或意外崩溃，则会回滚至之前正常运行的版本。

建议：尽快完成自测，防止因断电回滚。

只有 OTA 分区可以回滚。工厂分区不会回滚。

**启动无效/中止的应用程序** 用户可以启动此前设置为 `ESP_OTA_IMG_INVALID` 或 `ESP_OTA_IMG_ABORTED` 的应用程序：

- 获取最后一个无效应用分区 `esp_ota_get_last_invalid_partition()`。
- 将获取的分区传递给 `esp_ota_set_boot_partition()`，更新 otadata。
- 重启 `esp_restart()`。引导加载程序会启动指定应用程序。

要确定是否在应用程序启动时进行自测，可以调用 `esp_ota_get_state_partition()` 函数。如果结果为 `ESP_OTA_IMG_PENDING_VERIFY`，则需要自测，后续确认应用程序的可操作性。

**如何设置状态** 下文简单描述了如何设置应用程序状态：

- ESP\_OTA\_IMG\_VALID 由函数 `esp_ota_mark_app_valid_cancel_rollback()` 设置。
- 如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 没有使能，ESP\_OTA\_IMG\_UNDEFINED 由函数 `esp_ota_set_boot_partition()` 设置。
- 如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能，ESP\_OTA\_IMG\_NEW 由函数 `esp_ota_set_boot_partition()` 设置。
- ESP\_OTA\_IMG\_INVALID 由函数 `esp_ota_mark_app_invalid_rollback_and_reboot()` 设置。
- 如果应用程序的可操作性无法确认，发生重启（`CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能），则设置 ESP\_OTA\_IMG\_ABORTED。
- 如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能，选取的应用程序状态为 ESP\_OTA\_IMG\_NEW，则在引导加载程序中设置 ESP\_OTA\_IMG\_PENDING\_VERIFY。

## 防回滚

防回滚机制可以防止回滚到安全版本号低于芯片 eFuse 中烧录程序的应用程序版本。

设置 `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`，启动防回滚机制。在引导加载程序中选取可启动的应用程序，会额外检查芯片和应用程序镜像的安全版本号。可启动固件中的应用安全版本号必须等于或高于芯片中的应用安全版本号。

`CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` 和 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 一起使用。此时，只有安全版本号等于或高于芯片中的应用安全版本号时才会回滚。

## 典型的防回滚机制

- 新发布的固件解决了此前版本的安全问题。
- 开发者在确保固件可以运行之后，增加安全版本号，发布固件。
- 下载新版应用程序。
- 运行函数 `esp_ota_set_boot_partition()`，将新版应用程序设为可启动。如果新版应用程序的安全版本号低于芯片中的应用安全版本号，新版应用程序会被擦除，无法更新到新固件。
- 重新启动。
- 在引导加载程序中选取安全版本号等于或高于芯片中应用安全版本号的应用程序。如果 otadata 处于初始阶段，通过串行通道加载了安全版本号高于芯片中应用安全版本的固件，则引导加载程序中 eFuse 的安全版本号会立即更新。
- 新版应用程序启动，之后进行可操作性检测，如果通过检测，则调用函数 `esp_ota_mark_app_valid_cancel_rollback()`，将应用程序标记为 ESP\_OTA\_IMG\_VALID，更新芯片中应用程序的安全版本号。注意，如果调用函数 `esp_ota_mark_app_invalid_rollback_and_reboot()`，可能会因为设备中没有可启动的应用程序而回滚失败，返回 ESP\_ERR\_OTA\_ROLLBACK\_FAILED 错误，应用程序状态一直为 ESP\_OTA\_IMG\_PENDING\_VERIFY。
- 如果运行的应用程序处于 ESP\_OTA\_IMG\_VALID 状态，则可再次更新。

建议：

如果想避免因服务器应用程序的安全版本号低于运行的应用程序，造成不必要的下载和擦除，必须从镜像的第一个包中获取 `new_app_info.secure_version`，和 eFuse 的安全版本号比较。如果 `esp_efuse_check_secure_version(new_app_info.secure_version)` 函数为真，则下载继续，反之则中断。

```

....
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_
↪header_t) + sizeof(esp_app_desc_t)) {

```

(下页继续)

(续上页)

```

        // check current version with downloading
        if (esp_efuse_check_secure_version(new_app_info.secure_version) ==_
↪false) {
            ESP_LOGE(TAG, "This a new app can not be downloaded due to a_
↪secure version is lower than stored in efuse.");
            http_cleanup(client);
            task_fatal_error();
        }

        image_header_was_checked = true;

        esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
    }
}
esp_ota_write( update_handle, (const void *)ota_write_data, data_read);
}
...

```

限制:

- `secure_version` 字段最多有 16 位。也就是说，防回滚最多可以做 16 次。用户可以使用 `CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` 减少该 eFuse 字段的长度。
- 防回滚不支持工厂和测试分区，因此分区表中不应有设置为 工厂或 测试的分区。

`security_version`:

- 存储在应用程序镜像中的 `esp_app_desc` 里。版本号用 `CONFIG_BOOTLOADER_APP_SECURE_VERSION` 设置。

### 没有安全启动的安全 OTA 升级

即便硬件安全启动没有使能，也可验证已签名的 OTA 升级。可通过设置 `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` 和 `CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT` 实现。

### OTA 工具 `otatool.py`

`app_update` 组件中有 `app_update/otatool.py` 工具，用于在目标设备上完成下列 OTA 分区相关操作：

- 读取 `otadata` 分区 (`read_otadata`)
- 擦除 `otadata` 分区，将设备复位至工厂应用程序 (`erase_otadata`)
- 切换 OTA 分区 (`switch_ota_partition`)
- 擦除 OTA 分区 (`erase_ota_partition`)
- 写入 OTA 分区 (`write_ota_partition`)
- 读取 OTA 分区 (`read_ota_partition`)

用户若想通过编程方式完成相关操作，可从另一个 Python 脚本导入并使用该 OTA 工具，或者从 Shell 脚本调用该 OTA 工具。前者可使用工具的 Python API，后者可使用命令行界面。

**Python API** 首先，确保已导入 `otatool` 模块。

```

import sys
import os

idf_path = os.environ["IDF_PATH"] # 从环境中获取 IDF_PATH 的值
otatool_dir = os.path.join(idf_path, "components", "app_update") # otatool.py_
↪位于 $IDF_PATH/components/app_update 下

```

(下页继续)

(续上页)

```
sys.path.append(otatool_dir) # 使能 Python 寻找 otatool 模块
from otatool import * # 导入 otatool 模块内的所有名称
```

要使用 OTA 工具的 Python API，第一步是创建 *OtatoolTarget* 对象：

```
# 创建 partool.py 的目标设备，并将目标设备连接到串行端口 /dev/ttyUSB1
target = OtatoolTarget("/dev/ttyUSB1")
```

现在，可使用创建的 *OtatoolTarget* 在目标设备上完成操作：

```
# 擦除 otadata，将设备复位至工厂应用程序
target.erase_otadata()

# 擦除 OTA 应用程序分区 0
target.erase_ota_partition(0)

# 将启动分区切换至 OTA 应用程序分区 1
target.switch_ota_partition(1)

# 读取 OTA 分区 'ota_3'，将内容保存至文件 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

要操作的 OTA 分区通过应用程序分区序号或分区名称指定。

更多关于 Python API 的信息，请查看 OTA 工具的代码注释。

**命令行界面** otatool.py 的命令行界面具有如下结构：

```
otatool.py [command-args] [subcommand] [subcommand-args]
```

- command-args - 执行主命令 (otatool.py) 所需的实际参数，多与目标设备有关
- subcommand - 要执行的操作
- subcommand-args - 所选操作的实际参数

```
# 擦除 otadata，将设备复位至工厂应用程序
otatool.py --port "/dev/ttyUSB1" erase_otadata

# 擦除 OTA 应用程序分区 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0

# 将启动分区切换至 OTA 应用程序分区 1
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1

# 读取 OTA 分区 'ota_3'，将内容保存至文件 'ota_3.bin'
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin
```

更多信息可用 `--help` 指令查看：

```
# 显示可用的子命令和主命令描述
otatool.py --help

# 显示子命令的描述
otatool.py [subcommand] --help
```

## 应用程序示例

端对端的 OTA 固件升级示例请参考 [system/ota](#)。

## API 参考

### Header File

- [components/app\\_update/include/esp\\_ota\\_ops.h](#)
- This header file can be included with:

```
#include "esp_ota_ops.h"
```

- This header file is a part of the API provided by the `app_update` component. To declare that your component depends on `app_update`, add the following to your `CMakeLists.txt`:

```
REQUIRES app_update
```

or

```
PRIV_REQUIRES app_update
```

### Functions

const [esp\\_app\\_desc\\_t](#) \***esp\_ota\_get\_app\_description** (void)

Return `esp_app_desc` structure. This structure includes app version.

Return description for running app.

---

**备注:** This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_app_get_description`

---

**返回** Pointer to `esp_app_desc` structure.

int **esp\_ota\_get\_app\_elf\_sha256** (char \*dst, size\_t size)

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

---

**备注:** This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_app_get_elf_sha256`

---

### 参数

- **dst** -- Destination buffer
- **size** -- Size of the buffer

**返回** Number of bytes written to `dst` (including null terminator)

[esp\\_err\\_t](#) **esp\_ota\_begin** (const [esp\\_partition\\_t](#) \*partition, size\_t image\_size, [esp\\_ota\\_handle\\_t](#) \*out\_handle)

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass `OTA_SIZE_UNKNOWN` which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until `esp_ota_end()` is called with the returned handle.

Note: If the rollback option is enabled and the running application has the `ESP_OTA_IMG_PENDING_VERIFY` state then it will lead to the `ESP_ERR_OTA_ROLLBACK_INVALID_STATE` error. Confirm the running app before to run download a new app, use `esp_ota_mark_app_valid_cancel_rollback()` function for it (this should be done as early as possible when you first download a new application).

#### 参数

- **partition** -- Pointer to info for partition which will receive the OTA update. Required.
- **image\_size** -- Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or `OTA_SIZE_UNKNOWN`, the entire partition is erased.
- **out\_handle** -- On success, returns a handle which should be used for subsequent `esp_ota_write()` and `esp_ota_end()` calls.

#### 返回

- `ESP_OK`: OTA operation commenced successfully.
- `ESP_ERR_INVALID_ARG`: partition or out\_handle arguments were NULL, or partition doesn't point to an OTA app partition.
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_OTA_PARTITION_CONFLICT`: Partition holds the currently running firmware, cannot update in place.
- `ESP_ERR_NOT_FOUND`: Partition argument not found in partition table.
- `ESP_ERR_OTA_SELECT_INFO_INVALID`: The OTA data partition contains invalid data.
- `ESP_ERR_INVALID_SIZE`: Partition doesn't fit in configured flash size.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- `ESP_ERR_OTA_ROLLBACK_INVALID_STATE`: If the running app has not confirmed state. Before performing an update, the application must be valid.

*esp\_err\_t* **esp\_ota\_write** (*esp\_ota\_handle\_t* handle, const void \*data, size\_t size)

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

#### 参数

- **handle** -- Handle obtained from `esp_ota_begin`
- **data** -- Data buffer to write
- **size** -- Size of data buffer in bytes.

#### 返回

- `ESP_OK`: Data was written to flash successfully, or size = 0
- `ESP_ERR_INVALID_ARG`: handle is invalid.
- `ESP_ERR_OTA_VALIDATE_FAILED`: First byte of image contains invalid app image magic byte.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- `ESP_ERR_OTA_SELECT_INFO_INVALID`: OTA data partition has invalid contents

*esp\_err\_t* **esp\_ota\_write\_with\_offset** (*esp\_ota\_handle\_t* handle, const void \*data, size\_t size, uint32\_t offset)

Write OTA update data to partition at an offset.

This function can write data in non-contiguous manner. If flash encryption is enabled, data should be 16 bytes aligned.

---

**备注:** While performing OTA, if the packets arrive out of order, `esp_ota_write_with_offset()` can be used to write data in non-contiguous manner. Use of `esp_ota_write_with_offset()` in combination with `esp_ota_write()` is not recommended.

---

**参数**

- **handle** -- Handle obtained from `esp_ota_begin`
- **data** -- Data buffer to write
- **size** -- Size of data buffer in bytes
- **offset** -- Offset in flash partition

**返回**

- `ESP_OK`: Data was written to flash successfully.
- `ESP_ERR_INVALID_ARG`: handle is invalid.
- `ESP_ERR_OTA_VALIDATE_FAILED`: First byte of image contains invalid app image magic byte.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- `ESP_ERR_OTA_SELECT_INFO_INVALID`: OTA data partition has invalid contents

*esp\_err\_t* **esp\_ota\_end** (*esp\_ota\_handle\_t* handle)

Finish OTA update and validate newly written app image.

---

**备注:** After calling `esp_ota_end()`, the handle is no longer valid and any memory associated with it is freed (regardless of result).

---

**参数** **handle** -- Handle obtained from `esp_ota_begin()`.

**返回**

- `ESP_OK`: Newly written OTA app image is valid.
- `ESP_ERR_NOT_FOUND`: OTA handle was not found.
- `ESP_ERR_INVALID_ARG`: Handle was never written to.
- `ESP_ERR_OTA_VALIDATE_FAILED`: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- `ESP_ERR_INVALID_STATE`: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

*esp\_err\_t* **esp\_ota\_abort** (*esp\_ota\_handle\_t* handle)

Abort OTA update, free the handle and memory associated with it.

**参数** **handle** -- obtained from `esp_ota_begin()`.

**返回**

- `ESP_OK`: Handle and its associated memory is freed successfully.
- `ESP_ERR_NOT_FOUND`: OTA handle was not found.

*esp\_err\_t* **esp\_ota\_set\_boot\_partition** (const *esp\_partition\_t* \*partition)

Configure OTA data for a new boot partition.

---

**备注:** If this function returns `ESP_OK`, calling `esp_restart()` will boot the newly configured app partition.

---

**参数** **partition** -- Pointer to info for partition containing app image to boot.

**返回**

- `ESP_OK`: OTA data updated, next reboot will use specified partition.
- `ESP_ERR_INVALID_ARG`: partition argument was NULL or didn't point to a valid OTA partition of type "app".
- `ESP_ERR_OTA_VALIDATE_FAILED`: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- `ESP_ERR_NOT_FOUND`: OTA data partition not found.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash erase or write failed.

```
const esp_partition_t *esp_ota_get_boot_partition (void)
```

Get partition info of currently configured boot app.

If `esp_ota_set_boot_partition()` has been called, the partition which was set by that function will be returned.

If `esp_ota_set_boot_partition()` has not been called, the result is usually the same as `esp_ota_get_running_partition()`. The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use `esp_image_verify(ESP_IMAGE_VERIFY, ...)` to verify if the returned partition contains a bootable image.

**返回** Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

```
const esp_partition_t *esp_ota_get_running_partition (void)
```

Get partition info of currently running app.

This function is different to `esp_ota_get_boot_partition()` in that it ignores any change of selected boot partition caused by `esp_ota_set_boot_partition()`. Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from `esp_ota_get_boot_partition()` if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

**返回** Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

```
const esp_partition_t *esp_ota_get_next_update_partition (const esp_partition_t *start_from)
```

Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to `esp_ota_begin()`.

Finds next partition round-robin, starting from the current running partition.

**参数** `start_from` -- If set, treat this partition info as describing the current running partition. Can be NULL, in which case `esp_ota_get_running_partition()` is used to find the currently running partition. The result of this function is never the same as this argument.

**返回** Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

```
esp_err_t esp_ota_get_partition_description (const esp_partition_t *partition, esp_app_desc_t *app_desc)
```

Returns `esp_app_desc` structure for app partition. This structure includes app version.

Returns a description for the requested app partition.

**参数**

- **partition** -- [in] Pointer to app partition. (only app partition)
- **app\_desc** -- [out] Structure of info about app.

**返回**

- ESP\_OK Successful.
- ESP\_ERR\_NOT\_FOUND `app_desc` structure is not found. Magic word is incorrect.
- ESP\_ERR\_NOT\_SUPPORTED Partition is not application.
- ESP\_ERR\_INVALID\_ARG Arguments is NULL or if partition's offset exceeds partition size.
- ESP\_ERR\_INVALID\_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

*esp\_err\_t* **esp\_ota\_get\_bootloader\_description** (const *esp\_partition\_t* \*bootloader\_partition, *esp\_bootloader\_desc\_t* \*desc)

Returns the description structure of the bootloader.

#### 参数

- **bootloader\_partition** -- **[in]** Pointer to bootloader partition. If NULL, then the current bootloader is used (the default location).  
offset = CONFIG\_BOOTLOADER\_OFFSET\_IN\_FLASH,  
size = CONFIG\_PARTITION\_TABLE\_OFFSET - CONFIG\_BOOTLOADER\_OFFSET\_IN\_FLASH,
- **desc** -- **[out]** Structure of info about bootloader.

#### 返回

- ESP\_OK Successful.
- ESP\_ERR\_NOT\_FOUND Description structure is not found in the bootloader image. Magic byte is incorrect.
- ESP\_ERR\_INVALID\_ARG Arguments is NULL.
- ESP\_ERR\_INVALID\_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

uint8\_t **esp\_ota\_get\_app\_partition\_count** (void)

Returns number of ota partitions provided in partition table.

#### 返回

- Number of OTA partitions

*esp\_err\_t* **esp\_ota\_mark\_app\_valid\_cancel\_rollback** (void)

This function is called to indicate that the running app is working well.

#### 返回

- ESP\_OK: if successful.

*esp\_err\_t* **esp\_ota\_mark\_app\_invalid\_rollback\_and\_reboot** (void)

This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

#### 返回

- ESP\_FAIL: if not successful.
- ESP\_ERR\_OTA\_ROLLBACK\_FAILED: The rollback is not possible due to flash does not have any apps.

const *esp\_partition\_t* \***esp\_ota\_get\_last\_invalid\_partition** (void)

Returns last partition with invalid state (ESP\_OTA\_IMG\_INVALID or ESP\_OTA\_IMG\_ABORTED).

#### 返回

partition.

*esp\_err\_t* **esp\_ota\_get\_state\_partition** (const *esp\_partition\_t* \*partition, *esp\_ota\_img\_states\_t* \*ota\_state)

Returns state for given partition.

#### 参数

- **partition** -- **[in]** Pointer to partition.
- **ota\_state** -- **[out]** state of partition (if this partition has a record in otadata).

#### 返回

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: partition or ota\_state arguments were NULL.
- ESP\_ERR\_NOT\_SUPPORTED: partition is not ota.
- ESP\_ERR\_NOT\_FOUND: Partition table does not have otadata or state was not found for given partition.

*esp\_err\_t* **esp\_ota\_erase\_last\_boot\_app\_partition** (void)

Erase previous boot app partition and corresponding otadata select for this partition.

When current app is marked to as valid then you can erase previous app partition.

返回

- ESP\_OK: Successful, otherwise ESP\_ERR.

bool **esp\_ota\_check\_rollback\_is\_possible** (void)

Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in otadata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure\_version of app >= secure\_version of efuse (if anti-rollback is enabled).

返回

- True: Returns true if the slots have at least one app (except the running app).
- False: The rollback is not possible.

*esp\_err\_t* **esp\_ota\_revoke\_secure\_boot\_public\_key** (*esp\_ota\_secure\_boot\_public\_key\_index\_t* index)

Revokes the signature digest denoted by the given index. This should be called in the application only after the rollback logic otherwise the device may end up in unrecoverable state.

Relevant for Secure boot v2 on ESP32-S2, ESP32-S3, ESP32-C3, ESP32-C6, ESP32-H2 where up to 3 key digests can be stored (Key #N-1, Key #N, Key #N+1). When a key used to sign an app is invalidated, an OTA update is to be sent with an app signed with at least one of the other two keys which has not been revoked already. After successfully booting the OTA app should call this function to revoke Key #N-1.

参数 **index** -- - The index of the signature block to be revoked

返回

- ESP\_OK: If revocation is successful.
- ESP\_ERR\_INVALID\_ARG: If the index of the public key to be revoked is incorrect.
- ESP\_FAIL: If secure boot v2 has not been enabled.

## Macros

**OTA\_SIZE\_UNKNOWN**

Used for esp\_ota\_begin() if new image size is unknown

**OTA\_WITH\_SEQUENTIAL\_WRITES**

Used for esp\_ota\_begin() if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)

**ESP\_ERR\_OTA\_BASE**

Base error code for ota\_ops api

**ESP\_ERR\_OTA\_PARTITION\_CONFLICT**

Error if request was to write or erase the current running partition

**ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID**

Error if OTA data partition contains invalid content

**ESP\_ERR\_OTA\_VALIDATE\_FAILED**

Error if OTA app image is invalid

**ESP\_ERR\_OTA\_SMALL\_SEC\_VER**

Error if the firmware has a secure version less than the running firmware.

**ESP\_ERR\_OTA\_ROLLBACK\_FAILED**

Error if flash does not have valid firmware in passive partition and hence rollback is not possible

**ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE**

Error if current active firmware is still marked in pending validation state (ESP\_OTA\_IMG\_PENDING\_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

**Type Definitions**

```
typedef uint32_t esp_ota_handle_t
```

Opaque handle for an application OTA update.

esp\_ota\_begin() returns a handle which is then used for subsequent calls to esp\_ota\_write() and esp\_ota\_end().

**Enumerations**

```
enum esp_ota_secure_boot_public_key_index_t
```

Secure Boot V2 public key indexes.

*Values:*

```
enumerator SECURE_BOOT_PUBLIC_KEY_INDEX_0
```

Points to the 0th index of the Secure Boot v2 public key

```
enumerator SECURE_BOOT_PUBLIC_KEY_INDEX_1
```

Points to the 1st index of the Secure Boot v2 public key

```
enumerator SECURE_BOOT_PUBLIC_KEY_INDEX_2
```

Points to the 2nd index of the Secure Boot v2 public key

**OTA 升级失败排查****2.10.23 电源管理****概述**

ESP-IDF 中集成的电源管理算法可以根据应用程序组件的需求，调整外围总线 (APB) 频率和 CPU 频率，并使芯片进入 Light-sleep 模式，尽可能减少运行应用程序的功耗。

应用程序组件可以通过创建和获取电源管理锁来控制功耗。

例如：

- 对于从 APB 获得时钟频率的外设，其驱动可以要求在使用该外设时，将 APB 频率设置为 80 MHz。
- RTOS 可以要求 CPU 在有任务准备开始运行时以最高配置频率工作。
- 一些外设可能需要中断才能启用，因此其驱动也会要求禁用 Light-sleep 模式。

请求较高的 APB 频率或 CPU 频率以及禁用 Light-sleep 模式会增加功耗，因此请将组件使用的电源管理锁降到最少。

图 40: OTA 升级失败时如何排查 (点击放大)

## 电源管理配置

编译时可使用 `CONFIG_PM_ENABLE` 选项启用电源管理功能。

启用电源管理功能将会增加中断延迟。额外延迟与多个因素有关，例如：CPU 频率、单/双核模式、是否需要进行频率切换等。CPU 频率为 240 MHz 且未启用频率调节时，最小额外延迟为 0.2 us；如果启用频率调节，且在中断入口将频率由 40 MHz 调节至 80 MHz，则最大额外延迟为 40 us。

通过调用 `esp_pm_configure()` 函数可以在应用程序中启用动态调频 (DFS) 功能和自动 Light-sleep 模式。此函数的参数 `esp_pm_config_t` 定义了频率调节的相关设置。在此参数结构中，需要初始化以下三个字段：

- `max_freq_mhz`：最大 CPU 频率 (MHz)，即获取 `ESP_PM_CPU_FREQ_MAX` 锁后所使用的频率。该字段通常设置为 `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`。
- `min_freq_mhz`：最小 CPU 频率 (MHz)，即仅获取 `ESP_PM_APB_FREQ_MAX` 锁后所使用的频率。该字段可设置为晶振 (XTAL) 频率值，或者 XTAL 频率值除以整数。注意，10 MHz 是生成 1 MHz 的 `REF_TICK` 默认时钟所需的最小频率。
- `light_sleep_enable`：没有获取任何管理锁时，决定系统是否需要自动进入 Light-sleep 状态 (true/false)。  
如果在 `menuconfig` 中启用了 `CONFIG_PM_DFS_INIT_AUTO` 选项，最大 CPU 频率将由 `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ` 设置决定，最小 CPU 频率将锁定为 XTAL 频率。

---

**备注：** 自动 Light-sleep 模式基于 FreeRTOS Tickless Idle 功能，因此如果在 `menuconfig` 中没有启用 `CONFIG_FREERTOS_USE_TICKLESS_IDLE` 选项，在请求自动 Light-sleep 时，`esp_pm_configure()` 将会返回 `ESP_ERR_NOT_SUPPORTED` 错误。

---

---

**备注：** Light-sleep 状态下，外设设有时钟门控，不会产生来自 GPIO 和内部外设的中断。[睡眠模式](#) 文档中所提到的唤醒源可用于从 Light-sleep 状态触发唤醒。

---

## 电源管理锁

应用程序可以通过获取或释放管理锁来控制电源管理算法。应用程序获取电源管理锁后，电源管理算法的操作将受到下面的限制。释放电源管理锁后，限制解除。

电源管理锁设有获取/释放计数器，如果已多次获取电源管理锁，则需要将电源管理锁释放相同次数以解除限制。

ESP32-C3 支持下表中三种电源管理锁。

电源管理锁	描述
<code>ESP_PM_CPU_FREQ_MAX</code>	请求使用 <code>esp_pm_configure()</code> 将 CPU 频率设置为最大值。ESP32-C3 可以将该值设置为 80 MHz 或 160 MHz。
<code>ESP_PM_APB_FREQ_MAX</code>	请求将 APB 频率设置为最大值，ESP32-C3 支持的最大频率为 80 MHz。
<code>ESP_PM_NO_LIGHT_SLEEP</code>	禁止自动切换至 Light-sleep 模式。

## ESP32-C3 电源管理算法

下表列出了启用动态调频时如何切换 CPU 频率和 APB 频率。可以使用 `esp_pm_configure()` 或 `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ` 指定 CPU 最大频率。

CPU 最高频率	电源管理锁获取情况	APB 频率和 CPU 频率
160	获取 ESP_PM_CPU_FREQ_MAX	CPU: 160 MHz APB: 80 Mhz
	获取 ESP_PM_APB_FREQ_MAX, 未获得 ESP_PM_CPU_FREQ_MAX	CPU: 80 MHz APB: 80 Mhz
	无	使用 <code>esp_pm_configure()</code> 为二者设置最小值
80	获取 ESP_PM_CPU_FREQ_MAX 或 ESP_PM_APB_FREQ_MAX	CPU: 80 MHz APB: 80 Mhz
	无	使用 <code>esp_pm_configure()</code> 为二者设置最小值

如果没有获取任何管理锁，调用 `esp_pm_configure()` 将启动 Light-sleep 模式。Light-sleep 模式持续时间由以下因素决定：

- 处于阻塞状态的 FreeRTOS 任务数（有限超时）
- 高分辨率定时器 API 注册的计数器数量

也可以设置 Light-sleep 模式在最近事件（任务解除阻塞，或计时器超时）之前的持续时间，在持续时间结束后再唤醒芯片。

为了跳过不必要的唤醒，可以将 `skip_unhandled_events` 选项设置为 `true` 来初始化 `esp_timer`。带有此标志的定时器不会唤醒系统，有助于减少功耗。

### 动态调频和外设驱动

启用动态调频后，APB 频率可在一个 RTOS 滴答周期内多次更改。有些外设不受 APB 频率变更的影响，但有些外设可能会出现。例如，Timer Group 外设定时器会继续计数，但定时器计数的速度将随 APB 频率的变更而变更。

时钟频率不受 APB 频率影响的外设时钟源通常有 REF\_TICK, XTAL, RC\_FAST (i.e., RTC\_8M)。因此，为了保证外设在 DFS 期间的行为一致，建议在上述时钟中选择其一作为外设的时钟源。如果想要了解更多详情可以浏览每个外设” API 参考 > 外设 API “页面的“电源管理”章节。

目前以下外设驱动程序可感知动态调频，并在调频期间使用 ESP\_PM\_APB\_FREQ\_MAX 锁：

- SPI master
- I2C
- I2S（如果 APLL 锁在使用中，I2S 则会启用 ESP\_PM\_NO\_LIGHT\_SLEEP 锁）
- SDMMC

启用以下驱动程序时，将占用 ESP\_PM\_APB\_FREQ\_MAX 锁：

- **SPI slave**：从调用 `spi_slave_initialize()` 至 `spi_slave_free()` 期间。
- **GPTimer**：从调用 `gptimer_enable()` 至 `gptimer_disable()` 期间。
- **Ethernet**：从调用 `esp_eth_driver_install()` 至 `esp_eth_driver_uninstall()` 期间。
- **WiFi**：从调用 `esp_wifi_start()` 至 `esp_wifi_stop()` 期间。如果启用了调制解调器睡眠模式，广播关闭时将释放此管理锁。

- **TWAI**: 从调用 `twai_driver_install()` 至 `twai_driver_uninstall()` 期间 (只有在 TWAI 时钟源选择为 `TWAI_CLK_SRC_APB` 的时候生效)。
- **Bluetooth**: 从调用 `esp_bt_controller_enable()` 至 `esp_bt_controller_disable()` 期间。如果启用了蓝牙调制解调器, 广播关闭时将释放此管理锁。但依然占用 `ESP_PM_NO_LIGHT_SLEEP` 锁。

以下外设驱动程序无法感知动态调频, 应用程序需自己获取/释放管理锁:

- PCNT
- Sigma-delta
- 旧版定时器驱动 (Timer Group)

## Light-sleep 外设下电

### API 参考

#### Header File

- `components/esp_pm/include/esp_pm.h`
- This header file can be included with:

```
#include "esp_pm.h"
```

- This header file is a part of the API provided by the `esp_pm` component. To declare that your component depends on `esp_pm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_pm
```

or

```
PRIV_REQUIRES esp_pm
```

#### Functions

`esp_err_t esp_pm_configure` (const void \*config)

Set implementation-specific power management configuration.

**参数 config** -- pointer to implementation-specific configuration structure (e.g. `esp_pm_config_esp32`)

**返回**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if the configuration values are not correct
- `ESP_ERR_NOT_SUPPORTED` if certain combination of values is not supported, or if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

`esp_err_t esp_pm_get_configuration` (void \*config)

Get implementation-specific power management configuration.

**参数 config** -- pointer to implementation-specific configuration structure (e.g. `esp_pm_config_esp32`)

**返回**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if the pointer is null

`esp_err_t esp_pm_lock_create` (`esp_pm_lock_type_t` lock\_type, int arg, const char \*name, `esp_pm_lock_handle_t` \*out\_handle)

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call `esp_pm_lock_acquire` to take the lock.

This function must not be called from an ISR.

**参数**

- **lock\_type** -- Power management constraint which the lock should control
- **arg** -- argument, value depends on lock\_type, see esp\_pm\_lock\_type\_t
- **name** -- arbitrary string identifying the lock (e.g. "wifi" or "spi"). Used by the esp\_pm\_dump\_locks function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
- **out\_handle** -- [out] handle returned from this function. Use this handle when calling esp\_pm\_lock\_delete, esp\_pm\_lock\_acquire, esp\_pm\_lock\_release. Must not be NULL.

**返回**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if the lock structure can not be allocated
- ESP\_ERR\_INVALID\_ARG if out\_handle is NULL or type argument is not valid
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

*esp\_err\_t* **esp\_pm\_lock\_acquire** (*esp\_pm\_lock\_handle\_t* handle)

Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to esp\_pm\_lock\_create, or any of the lower power modes (higher numeric values of 'mode').

The lock is recursive, in the sense that if esp\_pm\_lock\_acquire is called a number of times, esp\_pm\_lock\_release has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp\_pm\_lock\_\* functions for the same handle.

**参数 handle** -- handle obtained from esp\_pm\_lock\_create function

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle is invalid
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

*esp\_err\_t* **esp\_pm\_lock\_release** (*esp\_pm\_lock\_handle\_t* handle)

Release the lock taken using esp\_pm\_lock\_acquire.

Call to this functions removes power management restrictions placed when taking the lock.

Locks are recursive, so if esp\_pm\_lock\_acquire is called a number of times, esp\_pm\_lock\_release has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp\_pm\_lock\_\* functions for the same handle.

**参数 handle** -- handle obtained from esp\_pm\_lock\_create function

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle is invalid
- ESP\_ERR\_INVALID\_STATE if lock is not acquired
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

*esp\_err\_t* **esp\_pm\_lock\_delete** (*esp\_pm\_lock\_handle\_t* handle)

Delete a lock created using esp\_pm\_lock.

The lock must be released before calling this function.

This function must not be called from an ISR.

**参数 handle** -- handle obtained from esp\_pm\_lock\_create function

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle argument is NULL
- ESP\_ERR\_INVALID\_STATE if the lock is still acquired
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

*esp\_err\_t* **esp\_pm\_dump\_locks** (FILE \*stream)

Dump the list of all locks to stderr

This function dumps debugging information about locks created using `esp_pm_lock_create` to an output stream.

This function must not be called from an ISR. If `esp_pm_lock_acquire/release` are called while this function is running, inconsistent results may be reported.

**参数** **stream** -- stream to print information to; use `stdout` or `stderr` to print to the console; use `fmemopen/open_memstream` to print to a string buffer.

**返回**

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

## Structures

struct **esp\_pm\_config\_t**

Power management config.

Pass a pointer to this structure as an argument to `esp_pm_configure` function.

## Public Members

int **max\_freq\_mhz**

Maximum CPU frequency, in MHz

int **min\_freq\_mhz**

Minimum CPU frequency to use when no locks are taken, in MHz

bool **light\_sleep\_enable**

Enter light sleep when no locks are taken

## Type Definitions

typedef *esp\_pm\_config\_t* **esp\_pm\_config\_esp32\_t**

backward compatibility newer chips no longer require this typedef

typedef *esp\_pm\_config\_t* **esp\_pm\_config\_esp32s2\_t**

typedef *esp\_pm\_config\_t* **esp\_pm\_config\_esp32s3\_t**

typedef *esp\_pm\_config\_t* **esp\_pm\_config\_esp32c3\_t**

typedef *esp\_pm\_config\_t* **esp\_pm\_config\_esp32c2\_t**

typedef *esp\_pm\_config\_t* **esp\_pm\_config\_esp32c6\_t**

typedef struct esp\_pm\_lock \***esp\_pm\_lock\_handle\_t**

Opaque handle to the power management lock.

## Enumerations

enum `esp_pm_lock_type_t`

Power management constraints.

*Values:*

enumerator `ESP_PM_CPU_FREQ_MAX`

Require CPU frequency to be at the maximum value set via `esp_pm_configure`. Argument is unused and should be set to 0.

enumerator `ESP_PM_APB_FREQ_MAX`

Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

enumerator `ESP_PM_NO_LIGHT_SLEEP`

Prevent the system from going into light sleep. Argument is unused and should be set to 0.

## 2.10.24 POSIX Thread

### 概述

ESP-IDF 基于 FreeRTOS，但提供了一系列与 POSIX 兼容的 API，以便轻松移植第三方代码，例如支持 pthread 常用的 pthread API。

在 ESP-IDF 中，pthread 对 FreeRTOS 中的等效功能进行了包装。pthread API 所需的运行内存或性能开销很低，但 pthread 或 FreeRTOS 的可用功能并非都可以通过 ESP-IDF 的 pthread 支持来实现。

添加标准 pthread.h 头文件后可以在 ESP-IDF 中使用 pthread，该头文件已包含在工具链 libc 中。还有另一个专用于 ESP-IDF 的头文件 esp\_pthread.h，其中提供了一些额外的非 POSIX API，以便通过 pthread 使用一些 ESP-IDF 功能。

C++ 标准库中的 `std::thread`、`std::mutex`、`std::condition_variable` 等功能也是通过 pthread (利用 GCC libstdc++) 实现的。因此，本文档提到的限制条件也同样适用于 C++ 标准库中等效功能。

### RTOS 集成

与许多使用 pthread 的操作系统不同，ESP-IDF 是一个实时操作系统，具有实时调度程序。这意味着只有当一个更高优先级的任务准备就绪、线程在 OS 同步结构（如 mutex）上发生阻塞、或者线程调用 `sleep`、`vTaskDelay()`、`usleep` 等函数时，线程才会停止运行。

---

**备注：**如果调用 C 标准库或 C++ `sleep` 函数，例如在 `unistd.h` 中定义的 `usleep`，那么只有当睡眠时间超过一个 *FreeRTOS 滴答周期* 时，任务才会阻塞并让出内核。如果时间较短，线程将处于忙等待状态，不会让步给另一个 RTOS 任务。

---

默认情况下，所有 pthread 具有相同的 RTOS 优先级，但可以通过调用 *ESP-IDF 提供的扩展 API* 对此优先级进行更改。

### 标准功能

ESP-IDF 中实现了以下标准 API。

请参考 [标准 pthread 文档](#) 或 `pthread.h`，了解每个函数标准参数和行为的详细信息。下文还列出了 pthread API 与标准 API 相比的差异或局限性。

### 线程 API

- **pthread\_create()**
  - attr 参数仅支持设置堆栈大小和分离状态，其他属性字段将被忽略。
  - 与 FreeRTOS 任务函数不同，start\_routine 函数允许返回。如果函数返回，分离类型的线程会被自动删除。而默认的可连接类型线程将被挂起，直到调用 pthread\_join()。
- pthread\_join()
- pthread\_detach()
- pthread\_exit()
- sched\_yield()
- **pthread\_self()**
  - 如果从不是 pthread 的 FreeRTOS 任务中调用此函数，断言会失败。
- pthread\_equal()

### 线程属性

- pthread\_attr\_init()
- **pthread\_attr\_destroy()**
  - 此函数不需要释放任何资源，而是将 attr 结构体重置为默认值。其实现与 pthread\_attr\_init() 相同。
- pthread\_attr\_getstacksize() / pthread\_attr\_setstacksize()
- pthread\_attr\_getdetachstate() / pthread\_attr\_setdetachstate()

### Once

- pthread\_once()

支持静态初始化常量 PTHREAD\_ONCE\_INIT。

---

**备注：** 在使用 pthread 或 FreeRTOS API 创建的任务中都可以调用此函数。

---

**互斥锁** POSIX 互斥锁被实现为 FreeRTOS 互斥信号量（普通类型用于“快速”或“错误检查”互斥锁，递归类型用于“递归”互斥锁），因此与使用 xSemaphoreCreateMutex() 创建的互斥锁具有相同的优先级继承行为。

- pthread\_mutex\_init()
- pthread\_mutex\_destroy()
- pthread\_mutex\_lock()
- pthread\_mutex\_timedlock()
- pthread\_mutex\_trylock()
- pthread\_mutex\_unlock()
- pthread\_mutexattr\_init()
- pthread\_mutexattr\_destroy()
- pthread\_mutexattr\_gettype() / pthread\_mutexattr\_settype()

支持静态初始化常量 PTHREAD\_MUTEX\_INITIALIZER，但不支持其他互斥锁类型的非标准静态初始化常量。

---

**备注：** 在使用 pthread 或 FreeRTOS API 创建的任务中都可以调用这些函数。

---

## 条件变量

- `pthread_cond_init()`
  - `attr` 参数未实现，将被忽略。
- `pthread_cond_destroy()`
- `pthread_cond_signal()`
- `pthread_cond_broadcast()`
- `pthread_cond_wait()`
- `pthread_cond_timedwait()`

支持静态初始化常量 `PTHREAD_COND_INITIALIZER`。

- `pthread_cond_timedwait()` 超时的分辨率为 RTOS 滴答周期（参见 `CONFIG_FREERTOS_HZ`）。在请求超时后，超时最多会延迟一个滴答周期。

---

**备注：** 在使用 `pthread` 或 FreeRTOS API 创建的任务中都可以调用这些函数。

---

**信号量** ESP-IDF 中实现了 POSIX 未命名信号量，下文介绍了可访问的 API。除非另有说明，否则 ESP-IDF 中未命名信号量的实现遵循 [POSIX 标准规定的信号量](#)。

- `sem_init()`
- `sem_destroy()`
  - `pshared` 被忽略。信号量始终可以在 FreeRTOS 任务之间共享。
- `sem_post()`
  - 如果信号量的值已经是 `SEM_VALUE_MAX`，则返回 `-1`，并将 `errno` 设置为 `EAGAIN`。
- `sem_wait()`
- `sem_trywait()`
- `sem_timedwait()`
  - 通过 `abstime` 传递的时间值将被向上舍入到下一个 FreeRTOS 时钟滴答。
  - 超时实际发生在被舍入到的滴答之后，下一个滴答之前。
  - 在计算超时后，任务有可能被立即抢占（可能性较小），从而延迟下一个阻塞操作系统调用的超时，延迟的时间等于抢占的持续时间。
- `sem_getvalue()`

**读/写锁** ESP-IDF 中实现了 POSIX 读写锁规范的以下 API 函数：

- `pthread_rwlock_init()`
  - `attr` 参数未实现，将被忽略。
- `pthread_rwlock_destroy()`
- `pthread_rwlock_rdlock()`
- `pthread_rwlock_tryrdlock()`
- `pthread_rwlock_wrlock()`
- `pthread_rwlock_trywrlock()`
- `pthread_rwlock_unlock()`

支持静态初始化器常量 `PTHREAD_RWLOCK_INITIALIZER`。

---

**备注：** 在 `pthread` 或 FreeRTOS API 创建的任务中都可以调用此函数。

---

## 线程特定数据

- `pthread_key_create()`
  - 支持 `destr_function` 参数。如果线程函数正常退出并调用 `pthread_exit()`，此参数数就会被调用，或者在使用 FreeRTOS 函数 `vTaskDelete()` 直接删除了底层任务时被调用。
- `pthread_key_delete()`

- `pthread_setspecific()` / `pthread_getspecific()`

**备注：**在 `pthread` 或 FreeRTOS API 创建的任务中都可以调用此函数。当从 FreeRTOS API 创建的任务中调用这些函数时，必须先启用 `CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS` 配置选项，以确保在删除任务之前清理线程数据。

**备注：**ESP-IDF 中还有其他的线程本地存储选项，包括性能更高的选项。参见 [线程局部存储](#)。

## 未实现 API

`pthread.h` 头文件是一个标准头文件，包含了在 ESP-IDF 中未实现的额外 API 和功能，包括：

- 如果调用 `pthread_cancel()`，返回 `ENOSYS`。
- `pthread_condattr_init()` 如果被调用，返回 `ENOSYS`。

其他未列出的 `pthread` 函数未在 ESP-IDF 中实现，如果从 ESP-IDF 应用程序中直接引用，将产生编译器错误或链接器错误。如果希望 ESP-IDF 支持某个尚未实现的 API，请在 [GitHub 上发起功能请求](#) 并提供详细信息。

## ESP-IDF 扩展

在 `esp_pthreads.h` 头文件中定义的 API `esp_pthread_set_cfg()` 提供了自定义扩展，能够对后续 `pthread_create()` 的调用行为进行控制。目前提供以下配置：

- 如果调用 `pthread_create()` 时未指定默认堆栈大小，可设置新线程的默认堆栈大小（覆盖 `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`）。
- 新线程的 RTOS 优先级（覆盖 `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`）。
- 新线程的 FreeRTOS 任务名称（覆盖 `CONFIG_PTHREAD_TASK_NAME_DEFAULT`）

此配置的作用范围是调用线程或 FreeRTOS 任务，这意味着 `esp_pthread_set_cfg()` 可以在不同的线程或任务中独立调用。如果在当前配置中设置了 `inherit_cfg` 标志，那么当一个线程递归调用 `pthread_create()` 时，任何新创建的线程都会继承该线程的配置，否则新线程将采用默认配置。

## 示例

- [system/pthread](#) 演示了如何使用 `pthread` API 创建线程。
- [cxx/pthread](#) 演示了如何通过线程使用 C++ 标准库函数。

## API 参考

### Header File

- [components/pthread/include/esp\\_pthread.h](#)
- This header file can be included with:

```
#include "esp_pthread.h"
```

- This header file is a part of the API provided by the `pthread` component. To declare that your component depends on `pthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES pthread
```

or

PRIV\_REQUIRES pthread

## Functions

*esp\_thread\_cfg\_t* **esp\_thread\_get\_default\_config** (void)

Creates a default pthread configuration based on the values set via menuconfig.

**返回** A default configuration structure.

*esp\_err\_t* **esp\_thread\_set\_cfg** (const *esp\_thread\_cfg\_t* \*cfg)

Configure parameters for creating pthread.

This API allows you to configure how the subsequent pthread\_create() call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the 'inherit' flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

---

**备注:** Passing non-NULL attributes to pthread\_create() will override the stack\_size parameter set using this API

---

**参数** *cfg* -- The pthread config parameters

**返回**

- ESP\_OK if configuration was successfully set
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_ERR\_INVALID\_ARG if stack\_size is less than PTHREAD\_STACK\_MIN

*esp\_err\_t* **esp\_thread\_get\_cfg** (*esp\_thread\_cfg\_t* \*p)

Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

**参数** *p* -- Pointer to the pthread config structure that will be updated with the currently configured parameters

**返回**

- ESP\_OK if the configuration was available
- ESP\_ERR\_NOT\_FOUND if a configuration wasn't previously set

*esp\_err\_t* **esp\_thread\_init** (void)

Initialize pthread library.

## Structures

struct **esp\_thread\_cfg\_t**

pthread configuration structure that influences pthread creation

### Public Members

size\_t **stack\_size**

The stack size of the pthread.

size\_t **prio**

The thread's priority.

bool **inherit\_cfg**

Inherit this configuration further.

const char \***thread\_name**

The thread name.

int **pin\_to\_core**

The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

## Macros

**PTHREAD\_STACK\_MIN**

### 2.10.25 Random Number Generation

ESP32-C3 contains a hardware random number generator, values from it can be obtained using the APIs *esp\_random()* and *esp\_fill\_random()*.

The hardware RNG produces true random numbers under any of the following conditions:

- RF subsystem is enabled (i.e., Wi-Fi or Bluetooth are enabled).
- An internal entropy source has been enabled by calling *bootloader\_random\_enable()* and not yet disabled by calling *bootloader\_random\_disable()*.
- While the ESP-IDF 二级引导程序 is running. This is because the default ESP-IDF bootloader implementation calls *bootloader\_random\_enable()* when the bootloader starts, and *bootloader\_random\_disable()* before executing the app.

When any of these conditions are true, samples of physical noise are continuously mixed into the internal hardware RNG state to provide entropy. Consult the **ESP32-C3 Technical Reference Manual > Random Number Generator (RNG)** [PDF] chapter for more details.

If none of the above conditions are true, the output of the RNG should be considered pseudo-random only.

## Startup

During startup, ESP-IDF bootloader temporarily enables a non-RF entropy source (internal reference voltage noise) that provides entropy for any first boot key generation. However, after the app starts executing then normally only pseudo-random numbers are available until Wi-Fi or Bluetooth are initialized.

To re-enable the entropy source temporarily during app startup, or for an application that does not use Wi-Fi or Bluetooth, call the function *bootloader\_random\_enable()* to re-enable the internal entropy source. The function *bootloader\_random\_disable()* must be called to disable the entropy source again before using ADC, Wi-Fi or Bluetooth.

---

**备注:** The entropy source enabled during the boot process by the ESP-IDF Second Stage Bootloader seeds the internal RNG state with some entropy. However, the internal hardware RNG state is not large enough to provide a continuous stream of true random numbers. This is why a continuous entropy source must be enabled whenever true random numbers are required.

---

---

**备注:** If an application requires a source of true random numbers but it is not possible to permanently enable a hardware entropy source, consider using a strong software DRBG implementation such as the mbedTLS CTR-DRBG or HMAC-DRBG, with an initial seed of entropy from hardware RNG true random numbers.

---

## Secondary Entropy

ESP32-C3 RNG contains a secondary entropy source, based on sampling an asynchronous 8 MHz internal oscillator (see the Technical Reference Manual for details). This entropy source is always enabled in ESP-IDF and continuously mixed into the RNG state by hardware. In testing, this secondary entropy source was sufficient to pass the [Dieharder](#) random number test suite without the main entropy source enabled (test input was created by concatenating short samples from a continuously resetting ESP32-C3). However, it is currently only guaranteed that true random numbers are produced when the main entropy source is also enabled as described above.

## API Reference

### Header File

- [components/esp\\_hw\\_support/include/esp\\_random.h](#)
- This header file can be included with:

```
#include "esp_random.h"
```

### Functions

uint32\_t **esp\_random** (void)

Get one random 32-bit word from hardware RNG.

If Wi-Fi or Bluetooth are enabled, this function returns true random numbers. In other situations, if true random numbers are required then consult the ESP-IDF Programming Guide "Random Number Generation" section for necessary prerequisites.

This function automatically busy-waits to ensure enough external entropy has been introduced into the hardware RNG state, before returning a new random number. This delay is very short (always less than 100 CPU cycles).

返回 Random value between 0 and U\_INT32\_MAX

void **esp\_fill\_random** (void \*buf, size\_t len)

Fill a buffer with random bytes from hardware RNG.

---

备注: This function is implemented via calls to `esp_random()`, so the same constraints apply.

---

### 参数

- **buf** -- Pointer to buffer to fill with random numbers.
- **len** -- Length of buffer in bytes

### Header File

- [components/bootloader\\_support/include/bootloader\\_random.h](#)
- This header file can be included with:

```
#include "bootloader_random.h"
```

- This header file is a part of the API provided by the `bootloader_support` component. To declare that your component depends on `bootloader_support`, add the following to your `CMakeLists.txt`:

```
REQUIRES bootloader_support
```

or

```
PRIV_REQUIRES bootloader_support
```

**Functions**

void **bootloader\_random\_enable** (void)

Enable an entropy source for RNG if RF subsystem is disabled.

The exact internal entropy source mechanism depends on the chip in use but all SoCs use the SAR ADC to continuously mix random bits (an internal noise reading) into the HWRNG. Consult the SoC Technical Reference Manual for more information.

Can also be called from app code, if true random numbers are required without initialized RF subsystem. This might be the case in early startup code of the application when the RF subsystem has not started yet or if the RF subsystem should not be enabled for power saving.

Consult ESP-IDF Programming Guide "Random Number Generation" section for details.

**警告:** This function is not safe to use if any other subsystem is accessing the RF subsystem or the ADC at the same time!

void **bootloader\_random\_disable** (void)

Disable entropy source for RNG.

Disables internal entropy source. Must be called after `bootloader_random_enable()` and before RF subsystem features, ADC, or I2S (ESP32 only) are initialized.

Consult the ESP-IDF Programming Guide "Random Number Generation" section for details.

void **bootloader\_fill\_random** (void \*buffer, size\_t length)

Fill buffer with 'length' random bytes.

---

**备注:** If this function is being called from app code only, and never from the bootloader, then it's better to call `esp_fill_random()`.

---

**参数**

- **buffer** -- Pointer to buffer
- **length** -- This many bytes of random data will be copied to buffer

**getrandom()**

A compatible version of the Linux `getrandom()` function is also provided for ease of porting:

```
#include <sys/random.h>

ssize_t getrandom(void *buf, size_t buflen, unsigned int flags);
```

This function is implemented by calling `esp_fill_random()` internally.

The `flags` argument is ignored, this function is always non-blocking but the strength of any random numbers is dependent on the same conditions described above.

Return value is -1 (with `errno` set to `EFAULT`) if the `buf` argument is NULL, and equal to `buflen` otherwise.

**getentropy()**

A compatible version of the Linux `getentropy()` function is also provided for ease of porting:

```
#include <unistd.h>

int getentropy(void *buffer, size_t length);
```

This function is implemented by calling `getrandom()` internally.

Strength of any random numbers is dependent on the same conditions described above.

**Return value is 0 on success and -1 otherwise with `errno` set to:**

- `EFAULT` if the `buffer` argument is `NULL`.
- `EIO` if the `length` is more than 256.

## 2.10.26 睡眠模式

### 概述

ESP32-C3 具有 `Light-sleep` 和 `Deep-sleep` 两种睡眠节能模式。根据应用所使用的功能，还有一些细分的子睡眠模式。关于这些睡眠模式和其子模式，参见[睡眠节能模式](#)。另外，还可以配置一些断电选项来进一步减少功耗，请参见[断电选项](#)。

睡眠模式有多种唤醒源。这些唤醒源也可以组合在一起，此时任何一个唤醒源都可以触发唤醒。[唤醒源](#)详细描述了这些唤醒源，以及配置 API。

断电选项和唤醒源的配置不是必要的，并且可以在进入睡眠模式前的任意时候进行。

最后，应用通过调用开始睡眠的 API 来使芯片进入其中一种睡眠模式，更多详情请参见[进入睡眠模式](#)。当唤醒条件满足，芯片就会从睡眠中被唤醒。关于如何获取唤醒原因，请参见[检查睡眠唤醒原因](#)。关于醒来后如何处理唤醒源，请参见[禁用睡眠模式唤醒源](#)。

### 睡眠节能模式

在 `Light-sleep` 模式下，数字外设、CPU、以及大部分 RAM 都使用时钟门控，同时其供电电压降低。退出该模式后，数字外设、CPU 和 RAM 恢复运行，并且内部状态将被保留。

在 `Deep-sleep` 模式下，CPU、大部分 RAM、以及所有由时钟 `APB_CLK` 驱动的数字外设都会被断电。芯片上继续处于供电状态的部分仅包括：

- RTC 控制器
- RTC 高速内存

**睡眠模式下的 Wi-Fi 和 Bluetooth 功能** 在 `Light-sleep` 和 `Deep-sleep` 模式下，无线外设会被断电。因此，在进入这两种睡眠模式前，应用程序必须调用恰当的函数 (`esp_bluedroid_disable()`、`esp_bt_controller_disable()` 或 `esp_wifi_stop()`) 来禁用 Wi-Fi 和 Bluetooth。在 `Light-sleep` 或 `Deep-sleep` 模式下，即使不调用这些函数也无法连接 Wi-Fi 和 Bluetooth。

如需保持 Wi-Fi 和 Bluetooth 连接，请启用 Wi-Fi 和 Bluetooth Modem-sleep 模式和自动 `Light-sleep` 模式（请参阅[电源管理 API](#)）。在这两种模式下，Wi-Fi 和 Bluetooth 驱动程序发出请求时，系统将自动从睡眠中被唤醒，从而保持连接。

**子睡眠模式** 下表首行表示子睡眠模式，首列表示不同模式支持的功能。在睡眠模式下，支持更多功能的模式功耗可能更大。睡眠系统会自动选择满足用户功能需求且功耗最小的模式。

Deep-sleep:

	DSLSP_ULTRA_LOW	DSLSP_DEFAULT	DSLSP_8MD256/ DSLSP_ADC_TSENS
ULP/触摸传感器 (仅限 ESP32-S2、ESP32-S3)	Y	Y	Y
RTC IO 输入/高温下 RTC 内存		Y	Y
ADC_TSEN_MONITOR			Y
8MD256 作为 RTC_SLOW_CLK 时钟源			Y

功能:

1. RTC IO 输入/高温下 RTC 内存 (试验功能): 将 RTC IO 用作输入管脚, 或在高温下使用 RTC 内存。禁用上述功能, 芯片可进入超低功耗模式。由 API `rtc_sleep_enable_ultra_low()` 控制。
2. ADC\_TSEN\_MONITOR: 在 monitor 模式下使用 ADC/温度传感器 (由 ULP 控制), 通过 `ulp_adc_init()` 或其更高级别的 API 启用。仅适用于支持 monitor 模式的 ESP32-S2 和 ESP32-S3 芯片。
3. 8MD256 作为 RTC\_SLOW\_CLK 时钟源: 通过 `CONFIG_RTC_CLK_SRC_INT_8MD256` 选择 8MD256 作为 RTC\_SLOW\_CLK 时钟源时, 芯片在 Deep-sleep 模式下将自动进入该子睡眠模式。

Light-sleep:

	LSLP_DEFAULT	LSLP_ADC_TSENS	LSLP_8MD256/ LSLP_LEDC8M/ LSLP_XTAL_FPU
ULP/触摸传感器 (仅限 ESP32-S2、ESP32-S3)	Y	Y	Y
RTC IO 输入/高温下 RTC 内存	Y	Y	Y
ADC_TSEN_MONITOR		Y	Y
8MD256 作为 RTC_SLOW_CLK 时钟源			Y
数字外设使用 8 MHz RC 时钟源			Y
保持 XTAL 时钟开启			Y

功能: (了解 Deep-sleep 模式, 请参考前文 8MD256 和 ADC\_TSEN\_MONITOR 功能描述)

1. 数字外设使用 8 MHz RC 时钟源: 目前, 只有 LEDC 在 Light-sleep 模式下使用该时钟源。当 LEDC 选用该时钟源时, 此功能将自动启用。
2. 保持 XTAL 时钟开启: 在 Light-sleep 模式下保持 XTAL 时钟开启, 由 `ESP_PD_DOMAIN_XTAL` 电源域控制。

ESP32-C3 不支持 ADC\_TSEN\_MONITOR 和 LSLP\_ADC\_TSENS 功能。

## 唤醒源

通过 API `esp_sleep_enable_x_wakeup` 可启用唤醒源。唤醒源在芯片被唤醒后并不会被禁用, 若你不再需要某些唤醒源, 可通过 API `esp_sleep_disable_wakeup_source()` 将其禁用, 详见[禁用睡眠模式唤醒源](#)。

以下是 ESP32-C3 所支持的唤醒源。

**定时器** RTC 控制器中内嵌定时器, 可用于在预定义的时间到达后唤醒芯片。时间精度为微秒, 但其实际分辨率依赖于为 `RTC_SLOW_CLK` 所选择的时钟源。

在这种唤醒模式下, 无需为睡眠模式中的 RTC 外设或内存供电。

调用 `esp_sleep_enable_timer_wakeup()` 函数可启用使用定时器唤醒睡眠模式。

**GPIO 唤醒** 任何一个 IO 都可以用作外部输入管脚，将芯片从 Light-sleep 状态唤醒。调用 `gpio_wakeup_enable()` 函数可以将任意管脚单独配置为在高电平或低电平触发唤醒。此后，应调用 `esp_sleep_enable_gpio_wakeup()` 函数来启用此唤醒源。

此外，可将由 VDD3P3\_RTC 电源域供电的 IO 用于芯片的 Deep-sleep 唤醒。调用 `esp_deep_sleep_enable_gpio_wakeup()` 函数可以配置相应的唤醒管脚和唤醒触发电平，该函数用于启用相应管脚的 Deep-sleep 唤醒功能。

**UART 唤醒（仅适用于 Light-sleep 模式）** 当 ESP32-C3 从外部设备接收 UART 输入时，通常需要在输入数据可用时唤醒芯片。UART 外设支持在 RX 管脚上观测到一定数量的上升沿时，将芯片从 Light-sleep 模式中唤醒。调用 `uart_set_wakeup_threshold()` 函数可设置被观测上升沿的数量。请注意，触发唤醒的字符（及该字符前的所有字符）在唤醒后不会被 UART 接收，因此在发送数据之前，外部设备通常需要首先向 ESP32-C3 额外发送一个字符以触发唤醒。

可调用 `esp_sleep_enable_uart_wakeup()` 函数来启用此唤醒源。

**禁用睡眠模式唤醒源** 调用 API `esp_sleep_disable_wakeup_source()` 可以禁用给定唤醒源的触发器，从而禁用该唤醒源。此外，如果将参数设置为 `ESP_SLEEP_WAKEUP_ALL`，该函数可用于禁用所有触发器。

## 断电选项

应用程序可以使用 API `esp_sleep_pd_config()` 强制 RTC 外设和 RTC 内存进入特定断电模式。在 Deep-sleep 模式下，你还可以通过隔离一些 IO 来进一步降低功耗。

**RTC 外设和内存断电** 默认情况下，调用函数 `esp_deep_sleep_start()` 和 `esp_light_sleep_start()` 后，所有唤醒源不需要的 RTC 电源域都会被断电。可调用函数 `esp_sleep_pd_config()` 来修改这一设置。

ESP32-C3 中只有 RTC 高速内存，因此，如果程序中的某些值被标记为 `RTC_DATA_ATTR`、`RTC_SLOW_ATTR` 或 `RTC_FAST_ATTR` 属性，那么所有这些值都将被存入 RTC 高速内存，默认情况下保持供电。如有需要，也可以使用函数 `esp_sleep_pd_config()` 对其进行修改。

**flash 断电** 默认情况下，调用函数 `esp_light_sleep_start()` 后，flash 不会断电，因为在 sleep 过程中断电 flash 存在风险。具体而言，flash 断电需要时间，但是在此期间，系统有可能被唤醒，导致 flash 重新被上电。此时，断电尚未完成又重新上电的硬件行为有可能导致 flash 无法正常工作。

理论上讲，在 flash 完全断电后可以仅唤醒系统，然而现实情况是 flash 断电所需的时间很难预测。如果用户为 flash 供电电路添加了滤波电容，断电所需时间可能会更长。此外，即使可以预知 flash 彻底断电所需的时间，有时也不能通过设置足够长的睡眠时间来确保 flash 断电的安全（比如，突发的异步唤醒源会使得实际的睡眠时间不可控）。

**警告：** 如果在 flash 的供电电路上添加了滤波电容，那么应当尽一切可能避免 flash 断电。

因为这些不可控的因素，ESP-IDF 很难保证 flash 断电的绝对安全。因此 ESP-IDF 不推荐用户断电 flash。对于一些功耗敏感型应用，可以通过设置 Kconfig 配置项 `CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND` 来减少 Light-sleep 期间 flash 的功耗。这种方式在几乎所有场景下都要比断电 flash 更好，兼顾了安全性和功耗。

考虑到有些用户能够充分评估断电 flash 的风险，并希望通过断电 flash 来获得更低的功耗，因此 ESP-IDF 提供了两种断电 flash 的机制：

- 设置 Kconfig 配置项 `CONFIG_ESP_SLEEP_POWER_DOWN_FLASH` 将使 ESP-IDF 以一个严格的条件来断电 flash。严格的条件具体指的是，RTC timer 是唯一的唤醒源且睡眠时间比 flash 彻底断电所需时间更长。

- 调用函数 `esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_OFF)` 将使 ESP-IDF 以一个宽松的条件来断电 flash。宽松的条件具体指的是 RTC timer 唤醒源未被使能 或睡眠时间比 flash 彻底断电所需时间更长。

---

**备注:**

- Light-sleep 模式下, ESP-IDF 没有提供保证 flash 一定会被断电的机制。
  - 不管用户的配置如何, 函数 `esp_deep_sleep_start()` 都会强制断电 flash。
- 

**配置 IO (仅适用于 Deep-sleep)** 一些 ESP32-C3 IO 在默认情况下启用内部上拉或下拉电阻。如果这些管脚在 Deep-sleep 模式下中受外部电路驱动, 电流流经这些上下拉电阻时, 可能会增加电流消耗。

**在 Deep-sleep 模式中:**

- 数字 GPIO (GPIO6 ~ 21) 处于高阻态。
- **RTC GPIO (GPIO0 ~ 5) 可能处于以下状态:**
  - 如果未启用保持 (hold) 功能, RTC GPIO 将处于高阻态。
  - 如果启用保持功能, RTC GPIO 管脚将会在保持功能开启时处于锁存状态。

**进入睡眠模式**

应用程序通过 API `esp_light_sleep_start()` 或 `esp_deep_sleep_start()` 进入 Light-sleep 或 Deep-sleep 模式。此时, 系统将按照被请求的唤醒源和断电选项配置有关的 RTC 控制器参数。

允许在未配置唤醒源的情况下进入睡眠模式。在此情况下, 芯片将一直处于睡眠模式, 直到从外部被复位。

**UART 输出处理** 在进入睡眠模式之前, 调用函数 `esp_deep_sleep_start()` 会冲刷掉 UART FIFO 缓存。

当使用函数 `esp_light_sleep_start()` 进入 Light-sleep 模式时, UART FIFO 将不会被冲刷。与之相反, UART 输出将被暂停, FIFO 中的剩余字符将在 Light-sleep 唤醒后被发送。

**检查睡眠唤醒原因**

`esp_sleep_get_wakeup_cause()` 函数可用于检测是何种唤醒源在睡眠期间被触发。

**应用程序示例**

- [protocols/sntp](#): 如何实现 Deep-sleep 模式的基本功能, 周期性唤醒 ESP 模块, 以从 NTP 服务器获取时间。
- [wifi/power\\_save](#): 如何通过 Wi-Fi Modem-sleep 模式和自动 Light-sleep 模式保持 Wi-Fi 连接。
- [bluetooth/nimble/power\\_save](#): 如何通过 Bluetooth Modem-sleep 模式和自动 Light-sleep 模式保持 Bluetooth 连接。
- [system/deep\\_sleep](#): 如何通过定时器触发 Deep-sleep 唤醒。

**API 参考****Header File**

- [components/esp\\_hw\\_support/include/esp\\_sleep.h](#)
- This header file can be included with:

```
#include "esp_sleep.h"
```

## Functions

*esp\_err\_t* **esp\_sleep\_disable\_wakeup\_source** (*esp\_sleep\_source\_t* source)

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

---

**备注:** This function does not modify wake up configuration in RTC. It will be performed in `esp_deep_sleep_start/esp_light_sleep_start` function.

---

**参数** `source` -- - number of source to disable of type `esp_sleep_source_t`

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if trigger was not active

*esp\_err\_t* **esp\_sleep\_enable\_timer\_wakeup** (`uint64_t` time\_in\_us)

Enable wakeup by timer.

**参数** `time_in_us` -- time before wakeup, in microseconds

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if value is out of range (TBD)

bool **esp\_sleep\_is\_valid\_wakeup\_gpio** (`gpio_num_t` gpio\_num)

Returns true if a GPIO number is valid for use as wakeup source.

---

**备注:** For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

---

**参数** `gpio_num` -- Number of the GPIO to test for wakeup source capability

**返回** True if this GPIO number will be accepted as a sleep wakeup source.

*esp\_err\_t* **esp\_deep\_sleep\_enable\_gpio\_wakeup** (`uint64_t` gpio\_pin\_mask,  
*esp\_deepsleep\_gpio\_wake\_up\_mode\_t* mode)

Enable wakeup using specific gpio pins.

This function enables an IO pin to wake up the chip from deep sleep.

---

**备注:** This function does not modify pin configuration. The pins are configured inside `esp_deep_sleep_start`, immediately before entering sleep mode.

---

---

**备注:** You don't need to worry about pull-up or pull-down resistors before using this function because the `ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS` option is enabled by default. It will automatically set pull-up or pull-down resistors internally in `esp_deep_sleep_start` based on the wakeup mode. However, when using external pull-up or pull-down resistors, please be sure to disable the `ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS` option, as the combination of internal and external resistors may cause interference. BTW, when you use low level to wake up the chip, we strongly recommend you to add external resistors (pull-up).

---

**参数**

- **gpio\_pin\_mask** -- Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality (pads that powered by VDD3P3\_RTC) can be used in this bit map.
- **mode** -- Select logic function used to determine wakeup condition:
  - ESP\_GPIO\_WAKEUP\_GPIO\_LOW: wake up when the gpio turn to low.
  - ESP\_GPIO\_WAKEUP\_GPIO\_HIGH: wake up when the gpio turn to high.

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the mask contains any invalid deep sleep wakeup pin or wakeup mode is invalid

**esp\_err\_t esp\_sleep\_enable\_gpio\_wakeup** (void)

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wakeup from light sleep though.

To enable wakeup, first call gpio\_wakeup\_enable, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

---

**备注:** On ESP32, GPIO wakeup source can not be used together with touch or ULP wakeup sources.

---

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if wakeup triggers conflict

**esp\_err\_t esp\_sleep\_enable\_uart\_wakeup** (int uart\_num)

Enable wakeup from light sleep using UART.

Use uart\_set\_wakeup\_threshold function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

---

**备注:** ESP32 does not support wakeup from UART2.

---

**参数** **uart\_num** -- UART port to wake up from

**返回**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if wakeup from given UART is not supported

**esp\_err\_t esp\_sleep\_enable\_bt\_wakeup** (void)

Enable wakeup by bluetooth.

**返回**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if wakeup from bluetooth is not supported

**esp\_err\_t esp\_sleep\_disable\_bt\_wakeup** (void)

Disable wakeup by bluetooth.

**返回**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if wakeup from bluetooth is not supported

*esp\_err\_t* **esp\_sleep\_enable\_wifi\_wakeup** (void)

Enable wakeup by WiFi MAC.

返回

- ESP\_OK on success

*esp\_err\_t* **esp\_sleep\_disable\_wifi\_wakeup** (void)

Disable wakeup by WiFi MAC.

返回

- ESP\_OK on success

*esp\_err\_t* **esp\_sleep\_enable\_wifi\_beacon\_wakeup** (void)

Enable beacon wakeup by WiFi MAC, it will wake up the system into modem state.

返回

- ESP\_OK on success

*esp\_err\_t* **esp\_sleep\_disable\_wifi\_beacon\_wakeup** (void)

Disable beacon wakeup by WiFi MAC.

返回

- ESP\_OK on success

uint64\_t **esp\_sleep\_get\_ext1\_wakeup\_status** (void)

Get the bit mask of GPIOs which caused wakeup (ext1)

If wakeup was caused by another source, this function will return 0.

返回 bit mask, if GPIO on caused wakeup, BIT(n) will be set

uint64\_t **esp\_sleep\_get\_gpio\_wakeup\_status** (void)

Get the bit mask of GPIOs which caused wakeup (gpio)

If wakeup was caused by another source, this function will return 0.

返回 bit mask, if GPIO on caused wakeup, BIT(n) will be set

*esp\_err\_t* **esp\_sleep\_pd\_config** (*esp\_sleep\_pd\_domain\_t* domain, *esp\_sleep\_pd\_option\_t* option)

Set power down mode for an RTC power domain in sleep mode.

If not set using this API, all power domains default to ESP\_PD\_OPTION\_AUTO.

参数

- **domain** -- power domain to configure
- **option** -- power down option (ESP\_PD\_OPTION\_OFF, ESP\_PD\_OPTION\_ON, or ESP\_PD\_OPTION\_AUTO)

返回

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if either of the arguments is out of range

*esp\_err\_t* **esp\_deep\_sleep\_try\_to\_start** (void)

Enter deep sleep with the configured wakeup options.

The reason for the rejection can be such as a short sleep time.

---

**备注:** In general, the function does not return, but if the sleep is rejected, then it returns from it.

---

返回

- No return - If the sleep is not rejected.
- ESP\_ERR\_SLEEP\_REJECT sleep request is rejected(wakeup source set before the sleep request)

void **esp\_deep\_sleep\_start** (void)

Enter deep sleep with the configured wakeup options.

---

**备注:** The function does not do a return (no rejection). Even if wakeup source set before the sleep request it goes to deep sleep anyway.

---

*esp\_err\_t* **esp\_light\_sleep\_start** (void)

Enter light sleep with the configured wakeup options.

返回

- ESP\_OK on success (returned after wakeup)
- ESP\_ERR\_SLEEP\_REJECT sleep request is rejected(wakeup source set before the sleep request)
- ESP\_ERR\_SLEEP\_TOO\_SHORT\_SLEEP\_DURATION after deducting the sleep flow overhead, the final sleep duration is too short to cover the minimum sleep duration of the chip, when rtc timer wakeup source enabled

*esp\_err\_t* **esp\_deep\_sleep\_try** (uint64\_t time\_in\_us)

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to `esp_deep_sleep_enable_timer_wakeup` followed by a call to `esp_deep_sleep_start`.

The reason for the rejection can be such as a short sleep time.

---

**备注:** In general, the function does not return, but if the sleep is rejected, then it returns from it.

---

参数 **time\_in\_us** -- deep-sleep time, unit: microsecond

返回

- No return - If the sleep is not rejected.
- ESP\_ERR\_SLEEP\_REJECT sleep request is rejected(wakeup source set before the sleep request)

void **esp\_deep\_sleep** (uint64\_t time\_in\_us)

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to `esp_deep_sleep_enable_timer_wakeup` followed by a call to `esp_deep_sleep_start`.

---

**备注:** The function does not do a return (no rejection).. Even if wakeup source set before the sleep request it goes to deep sleep anyway.

---

参数 **time\_in\_us** -- deep-sleep time, unit: microsecond

*esp\_err\_t* **esp\_deep\_sleep\_register\_hook** (*esp\_deep\_sleep\_cb\_t* new\_dslp\_cb)

Register a callback to be called from the deep sleep prepare.

**警告:** deepsleep callbacks should without parameters, and MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**参数** `new_dslp_cb` -- Callback to be called

**返回**

- ESP\_OK: Callback registered to the deepsleep `misc_modules_sleep_prepare`
- ESP\_ERR\_NO\_MEM: No more hook space for register the callback

void `esp_deep_sleep_deregister_hook` (*esp\_deep\_sleep\_cb\_t* old\_dslp\_cb)

Unregister an deepsleep callback.

**参数** `old_dslp_cb` -- Callback to be unregistered

*esp\_sleep\_wakeup\_cause\_t* `esp_sleep_get_wakeup_cause` (void)

Get the wakeup source which caused wakeup from sleep.

**返回** cause of wake up from last sleep (deep sleep or light sleep)

void `esp_wake_deep_sleep` (void)

Default stub to run on wake from deep sleep.

Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.

This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.

See docs/deep-sleep-stub.rst for details.

void `esp_set_deep_sleep_wake_stub` (*esp\_deep\_sleep\_wake\_stub\_fn\_t* new\_stub)

Install a new stub at runtime to run on wake from deep sleep.

If implementing `esp_wake_deep_sleep()` then it is not necessary to call this function.

However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked `RTC_IRAM_ATTR`, and must obey the same rules given for `esp_wake_deep_sleep()`.

void `esp_set_deep_sleep_wake_stub_default_entry` (void)

Set wake stub entry to default `esp_wake_stub_entry`

*esp\_deep\_sleep\_wake\_stub\_fn\_t* `esp_get_deep_sleep_wake_stub` (void)

Get current wake from deep sleep stub.

**返回** Return current wake from deep sleep stub, or NULL if no stub is installed.

void `esp_default_wake_deep_sleep` (void)

The default esp-idf-provided `esp_wake_deep_sleep()` stub.

See docs/deep-sleep-stub.rst for details.

void `esp_deep_sleep_disable_rom_logging` (void)

Disable logging from the ROM code after deep sleep.

Using LSB of `RTC_STORE4`.

*esp\_err\_t* `esp_sleep_cpu_pd_low_init` (void)

CPU Power down low-level initialize, enable CPU power down during light sleep.

**返回**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM not enough retention memory

*esp\_err\_t* **esp\_sleep\_cpu\_pd\_low\_deinit** (void)

CPU Power down low-level deinitialize, disable CPU power down during light sleep.

返回

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM not enough retention memory

*esp\_err\_t* **esp\_sleep\_cpu\_retention\_init** (void)

CPU Power down initialize.

返回

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM not enough retention memory

*esp\_err\_t* **esp\_sleep\_cpu\_retention\_deinit** (void)

CPU Power down de-initialize.

Release system retention memory.

返回

- ESP\_OK on success

void **esp\_sleep\_config\_gpio\_isolate** (void)

Configure to isolate all GPIO pins in sleep state.

void **esp\_sleep\_enable\_gpio\_switch** (bool enable)

Enable or disable GPIO pins status switching between slept status and waked status.

参数 **enable** -- decide whether to switch status or not

## Macros

**ESP\_PD\_DOMAIN\_RTC8M**

## Type Definitions

typedef void (\***esp\_deep\_sleep\_cb\_t**)(void)

typedef *esp\_sleep\_source\_t* **esp\_sleep\_wakeup\_cause\_t**

typedef void (\***esp\_deep\_sleep\_wake\_stub\_fn\_t**)(void)

Function type for stub to run on wake from sleep.

## Enumerations

enum **esp\_deepsleep\_gpio\_wake\_up\_mode\_t**

Logic function used for EXT1 wakeup mode.

*Values:*

enumerator **ESP\_GPIO\_WAKEUP\_GPIO\_LOW**

enumerator **ESP\_GPIO\_WAKEUP\_GPIO\_HIGH**

enum **esp\_sleep\_pd\_domain\_t**

Power domains which can be powered down in sleep mode.

*Values:*

enumerator **ESP\_PD\_DOMAIN\_XTAL**

XTAL oscillator.

enumerator **ESP\_PD\_DOMAIN\_RC\_FAST**

Internal Fast oscillator.

enumerator **ESP\_PD\_DOMAIN\_CPU**

CPU core.

enumerator **ESP\_PD\_DOMAIN\_VDDSDIO**

VDD\_SDIO.

enumerator **ESP\_PD\_DOMAIN\_MAX**

Number of domains.

enum **esp\_sleep\_pd\_option\_t**

Power down options.

*Values:*

enumerator **ESP\_PD\_OPTION\_OFF**

Power down the power domain in sleep mode.

enumerator **ESP\_PD\_OPTION\_ON**

Keep power domain enabled during sleep mode.

enumerator **ESP\_PD\_OPTION\_AUTO**

Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

enum **esp\_sleep\_source\_t**

Sleep wakeup cause.

*Values:*

enumerator **ESP\_SLEEP\_WAKEUP\_UNDEFINED**

In case of deep sleep, reset was not caused by exit from deep sleep.

enumerator **ESP\_SLEEP\_WAKEUP\_ALL**

Not a wakeup cause, used to disable all wakeup sources with `esp_sleep_disable_wakeup_source`.

enumerator **ESP\_SLEEP\_WAKEUP\_EXT0**

Wakeup caused by external signal using `RTC_IO`.

enumerator **ESP\_SLEEP\_WAKEUP\_EXT1**

Wakeup caused by external signal using `RTC_CNTL`.

enumerator **ESP\_SLEEP\_WAKEUP\_TIMER**

Wakeup caused by timer.

enumerator **ESP\_SLEEP\_WAKEUP\_TOUCHPAD**

Wakeup caused by touchpad.

enumerator **ESP\_SLEEP\_WAKEUP\_ULP**

Wakeup caused by ULP program.

enumerator **ESP\_SLEEP\_WAKEUP\_GPIO**

Wakeup caused by GPIO (light sleep only on ESP32, S2 and S3)

enumerator **ESP\_SLEEP\_WAKEUP\_UART**

Wakeup caused by UART (light sleep only)

enumerator **ESP\_SLEEP\_WAKEUP\_WIFI**

Wakeup caused by WIFI (light sleep only)

enumerator **ESP\_SLEEP\_WAKEUP\_COCPU**

Wakeup caused by COCPU int.

enumerator **ESP\_SLEEP\_WAKEUP\_COCPU\_TRAP\_TRIG**

Wakeup caused by COCPU crash.

enumerator **ESP\_SLEEP\_WAKEUP\_BT**

Wakeup caused by BT (light sleep only)

enum **esp\_sleep\_mode\_t**

Sleep mode.

*Values:*

enumerator **ESP\_SLEEP\_MODE\_LIGHT\_SLEEP**

light sleep mode

enumerator **ESP\_SLEEP\_MODE\_DEEP\_SLEEP**

deep sleep mode

enum **[anonymous]**

*Values:*

enumerator **ESP\_ERR\_SLEEP\_REJECT**

enumerator **ESP\_ERR\_SLEEP\_TOO\_SHORT\_SLEEP\_DURATION**

## 2.10.27 SoC 功能

此文档介绍了 ESP32-C3 SoC 硬件功能的宏定义。ESP-IDF 中的条件编译指令通常使用这些宏来确定哪些依赖于硬件的功能受到支持，从而控制需编译的代码内容。

**备注：**目前，这些宏定义不属于公共 API，未来可能发生重大更改。如需了解详情，请前往[ESP-IDF 版本简介](#)。

---

**SOC\_RMT\_GROUPS**

One RMT group

**SOC\_RMT\_TX\_CANDIDATES\_PER\_GROUP**

Number of channels that capable of Transmit

**SOC\_RMT\_RX\_CANDIDATES\_PER\_GROUP**

Number of channels that capable of Receive

**SOC\_RMT\_CHANNELS\_PER\_GROUP**

Total 4 channels

**SOC\_RMT\_MEM\_WORDS\_PER\_CHANNEL**

Each channel owns 48 words memory (1 word = 4 Bytes)

**SOC\_RMT\_SUPPORT\_RX\_PINGPONG**

Support Ping-Pong mode on RX path

**SOC\_RMT\_SUPPORT\_RX\_DEMODULATION**

Support signal demodulation on RX path (i.e. remove carrier)

**SOC\_RMT\_SUPPORT\_TX\_ASYNC\_STOP**

Support stop transmission asynchronously

**SOC\_RMT\_SUPPORT\_TX\_LOOP\_COUNT**

Support transmit specified number of cycles in loop mode

**SOC\_RMT\_SUPPORT\_TX\_SYNCHRO**

Support coordinate a group of TX channels to start simultaneously

**SOC\_RMT\_SUPPORT\_TX\_CARRIER\_DATA\_ONLY**

TX carrier can be modulated to data phase only

**SOC\_RMT\_SUPPORT\_XTAL**

Support set XTAL clock as the RMT clock source

**SOC\_RMT\_SUPPORT\_APB**

Support set APB as the RMT clock source

**SOC\_RMT\_SUPPORT\_RC\_FAST**

Support set RC\_FAST clock as the RMT clock source

**SOC\_RTC\_SLOW\_CLK\_SUPPORT\_RC\_FAST\_D256**

**SOC\_CLK\_RC\_FAST\_SUPPORT\_CALIBRATION**

**SOC\_CLK\_XTAL32K\_SUPPORTED**

Support to connect an external low frequency crystal

**SOC\_TEMPERATURE\_SENSOR\_SUPPORT\_FAST\_RC**

**SOC\_TEMPERATURE\_SENSOR\_SUPPORT\_XTAL**

**SOC\_WIFI\_HW\_TSF**

Support hardware TSF

**SOC\_WIFI\_FTM\_SUPPORT**

Support FTM

**SOC\_WIFI\_GCMP\_SUPPORT**

Support GCMP(GCMP128 and GCMP256)

**SOC\_WIFI\_WAPI\_SUPPORT**

Support WAPI

**SOC\_WIFI\_CSI\_SUPPORT**

Support CSI

**SOC\_WIFI\_MESH\_SUPPORT**

Support WIFI MESH

**SOC\_WIFI\_SUPPORT\_VARIABLE\_BEACON\_WINDOW**

Support delta early time for rf phy on/off

**SOC\_BLE\_SUPPORTED**

Support Bluetooth Low Energy hardware

**SOC\_BLE\_MESH\_SUPPORTED**

Support BLE MESH

**SOC\_BLE\_50\_SUPPORTED**

Support Bluetooth 5.0

**SOC\_BLE\_DEVICE\_PRIVACY\_SUPPORTED**

Support BLE device privacy mode

**SOC\_BLUFI\_SUPPORTED**

Support BLUFI

**SOC\_PHY\_COMBO\_MODULE**

Support Wi-Fi and BLE

**2.10.28 系统时间****概述**

ESP32-C3 使用两种硬件时钟源建立和保持系统时间。根据应用目的及对系统时间的精度要求，既可以仅使用其中一种时钟源，也可以同时使用两种时钟源。这两种硬件时钟源为：

- **RTC 定时器**：RTC 定时器在任何睡眠模式下及在任何复位后均可保持系统时间（上电复位除外，因为上电复位会重置 RTC 定时器）。时钟频率偏差取决于 **RTC 定时器时钟源**，该偏差只会在睡眠模式下影响时间精度。睡眠模式下，时间分辨率为 6.667  $\mu\text{s}$ 。
- **高分辨率定时器**：高分辨率定时器在睡眠模式下及在复位后不可用，但其时间精度更高。该定时器使用 APB\_CLK 时钟源（通常为 80 MHz），时钟频率偏差小于  $\pm 10$  ppm，时间分辨率为 1  $\mu\text{s}$ 。

可供选择的硬件时钟源组合如下所示：

- RTC 和高分辨率定时器（默认）
- RTC
- 高分辨率定时器
- 无

默认时钟源的时间精度最高，建议使用该配置。此外，用户也可以通过配置选项 **CONFIG\_NEWLIB\_TIME\_SYSCALL** 来选择其他时钟源。

**RTC 定时器时钟源**

RTC 定时器有以下时钟源：

- 内置 136 kHz RC 振荡器（默认）：Deep-sleep 模式下电流消耗最低，不依赖任何外部元件。但由于温度波动会影响该时钟源的频率稳定性，在 Deep-sleep 和 Light-sleep 模式下都有可能发生时间偏移。
- 外置 32 kHz 晶振：需要将一个 32 kHz 晶振连接到 XTAL\_32K\_P 和 XTAL\_32K\_N 管脚。频率稳定性更高，但在 Deep-sleep 模式下电流消耗略高（比默认模式高 1  $\mu\text{A}$ ）。
- 管脚 XTAL\_32K\_P 外置 32 kHz 振荡器：允许使用由外部电路产生的 32 kHz 时钟。外部时钟信号必须连接到管脚 XTAL\_32K\_P。正弦波信号的振幅应小于 1.2 V，方波信号的振幅应小于 1 V。正常模式下，电压范围应为  $0.1 < V_{\text{cm}} < 0.5 \times V_{\text{amp}}$ ，其中  $V_{\text{amp}}$  代表信号振幅。使用此时钟源时，管脚 XTAL\_32K\_P 无法用作 GPIO 管脚。
- 内置 17.5 MHz 振荡器的 256 分频时钟（约 68 kHz）：频率稳定性优于内置 136 kHz RC 振荡器，同样无需外部元件，但 Deep-sleep 模式下电流消耗更高（比默认模式高 5  $\mu\text{A}$ ）。

时钟源的选择取决于系统时间精度要求和睡眠模式下的功耗要求。要修改 RTC 时钟源，请在项目配置中设置 **CONFIG\_RTC\_CLK\_SRC**。

想要了解外置晶振或外置振荡器的更多布线要求，请参考 **ESP32-C3 硬件设计指南**。

## 获取当前时间

要获取当前时间，请使用 POSIX 函数 `gettimeofday()`。此外，也可以使用以下标准 C 库函数来获取时间并对其进行操作：

```
gettimeofday
time
asctime
clock
ctime
difftime
gmtime
localtime
mktime
strftime
adjtime*
```

如需立即更新当前时间，并暂停平滑时间校正，请使用 POSIX 函数 `settimeofday()`。

若要求时间的分辨率为 1 s，请使用以下代码片段：

```
time_t now;
char strftime_buf[64];
struct tm timeinfo;

time(&now);
// 将时区设置为中国标准时间
setenv("TZ", "CST-8", 1);
tzset();

localtime_r(&now, &timeinfo);
strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
```

若要求时间的分辨率为 1  $\mu$ s，请使用以下代码片段：

```
struct timeval tv_now;
gettimeofday(&tv_now, NULL);
int64_t time_us = (int64_t)tv_now.tv_sec * 1000000L + (int64_t)tv_now.tv_usec;
```

## SNTP 时间同步

要设置当前时间，可以使用 POSIX 函数 `settimeofday()` 和 `adjtime()`。lwIP 中的 SNTP 库会在收到 NTP 服务器的响应报文后，调用这两个函数以更新当前的系统时间。当然，用户可以在 lwIP SNTP 库之外独立地使用这两个函数。

包括 SNTP 函数在内的一些 lwIP API 并非线程安全，因此建议在与 SNTP 模块交互时使用 *esp\_netif component*。

要初始化特定的 SNTP 服务器并启动 SNTP 服务，只需创建有特定服务器名称的默认 SNTP 服务器配置，然后调用 `esp_netif_sntp_init()` 注册该服务器并启动 SNTP 服务。

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG("pool.ntp.org");
esp_netif_sntp_init(&config);
```

一旦收到 SNTP 服务器的响应，此代码会自动执行时间同步。有时等待时间同步很有意义，调用 `esp_netif_sntp_sync_wait()` 可实现此目的：

```
if (esp_netif_sntp_sync_wait(pdMS_TO_TICKS(10000)) != ESP_OK) {
    printf("Failed to update system time within 10s timeout");
}
```

要配置多个 NTP 服务器（或使用更高级的设置，例如 DHCP 提供的 NTP 服务器），请参考 *esp\_netif* 文档 *SNTP API* 中的详细说明。

lwIP SNTP 库可在下列任一同步模式下工作：

- *SNTP\_SYNC\_MODE\_IMMED*（默认）：使用 `settimeofday()`，收到 SNTP 服务器响应后立即更新系统时间。
- *SNTP\_SYNC\_MODE\_SMOOTH*：使用函数 `adjtime()` 逐渐减少时间误差以平滑更新时间。如果 SNTP 响应时间和系统时间之差超过 35 分钟，请立即使用 `settimeofday()` 更新系统时间。

如要选择 *SNTP\_SYNC\_MODE\_SMOOTH* 模式，请将 SNTP 配置结构体中的 `esp_sntp_config::smooth` 设置为 `true`，否则将默认使用 *SNTP\_SYNC\_MODE\_IMMED* 模式。

设置时间同步时的回调函数，请使用配置结构体中的 `esp_sntp_config::sync_cb` 字段。

添加此初始化代码后，应用程序将定期同步时间。时间同步周期由 *CONFIG\_LWIP\_SNTP\_UPDATE\_DELAY* 设置（默认为一小时）。如需修改，请在项目配置中设置 *CONFIG\_LWIP\_SNTP\_UPDATE\_DELAY*。

如需查看示例代码，请前往 `protocols/sntp` 目录。该目录下的示例展示了如何基于 lwIP SNTP 库实现时间同步。

也可以直接使用 lwIP API，但请务必注意线程安全。线程安全的 API 如下：

- `sntp_set_time_sync_notification_cb()` 用于设置通知时间同步过程的回调函数。
- `sntp_get_sync_status()` 和 `sntp_set_sync_status()` 用于获取/设置时间同步状态。
- `sntp_set_sync_mode()` 用于设置同步模式。
- `esp_sntp_setoperatingmode()` 用于设置首选操作模式。*ESP\_SNTP\_OPMODE\_POLL* 和 `esp_sntp_init()` 可初始化 SNTP 模块。
- `esp_sntp_setservername()` 用于配置特定 SNTP 服务器。

## 时区

要设置本地时区，请使用以下 POSIX 函数：

1. 调用 `setenv()`，将 `TZ` 环境变量根据设备位置设置为正确的值。时间字符串的格式与 *GNU libc* 文档中描述的不同（但实现方式不同）。
2. 调用 `tzset()`，为新的时区更新 C 库的运行数据。

完成上述步骤后，请调用标准 C 库函数 `localtime()`。该函数将返回排除时区偏差和夏令时干扰后的准确本地时间。

## 2036 年和 2038 年溢出问题

**SNTP/NTP 2036 年溢出问题** SNTP/NTP 时间戳为 64 位无符号定点数，其中前 32 位表示整数部分，后 32 位表示小数部分。该 64 位无符号定点数代表从 1900 年 1 月 1 日 00:00 起经过的秒数，因此 SNTP/NTP 时间将在 2036 年溢出。

为了解决这一问题，可以使用整数部分的 MSB（惯例为位 0）来表示 1968 年到 2104 年之间的时间范围（查看 *RFC2030* 了解更多信息），这一惯例将使得 SNTP/NTP 时间戳的生命周期延长。该惯例会在 lwIP 库的 SNTP 模块中实现，因此 ESP-IDF 中 SNTP 相关功能在 2104 年之前能够经受住时间的考验。

**Unix 时间 2038 年溢出问题** Unix 时间（类型 `time_t`）此前为有符号的 32 位整数，因此将于 2038 年溢出（即 *Y2K38* 问题）。为了解决 Y2K38 问题，ESP-IDF 从 v5.0 版本起开始使用有符号的 64 位整数来表示 `time_t`，从而将 `time_t` 溢出推迟 2920 亿年。

## API 参考

### Header File

- `components/lwip/include/apps/esp_sntp.h`
- This header file can be included with:

```
#include "esp_sntp.h"
```

- This header file is a part of the API provided by the `lwip` component. To declare that your component depends on `lwip`, add the following to your `CMakeLists.txt`:

```
REQUIRES lwip
```

or

```
PRIV_REQUIRES lwip
```

## Functions

void **sntp\_sync\_time** (struct timeval \*tv)

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a `sntp_sync_time()` function in the app firmware source. If the default implementation is used, calling `sntp_set_sync_mode()` allows the time synchronization mode to be changed to instant or smooth. If a callback function is registered via `sntp_set_time_sync_notification_cb()`, it will be called following time synchronization.

**参数 tv** -- Time received from SNTP server.

void **sntp\_set\_sync\_mode** (*sntp\_sync\_mode\_t* sync\_mode)

Set the sync mode.

Modes allowed: `SNTP_SYNC_MODE_IMMED` and `SNTP_SYNC_MODE_SMOOTH`.

**参数 sync\_mode** -- Sync mode.

*sntp\_sync\_mode\_t* **sntp\_get\_sync\_mode** (void)

Get set sync mode.

**返回** `SNTP_SYNC_MODE_IMMED`: Update time immediately.  
`SNTP_SYNC_MODE_SMOOTH`: Smooth time updating.

*sntp\_sync\_status\_t* **sntp\_get\_sync\_status** (void)

Get status of time sync.

After the update is completed, the status will be returned as `SNTP_SYNC_STATUS_COMPLETED`. After that, the status will be reset to `SNTP_SYNC_STATUS_RESET`. If the update operation is not completed yet, the status will be `SNTP_SYNC_STATUS_RESET`. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be `SNTP_SYNC_STATUS_IN_PROGRESS`.

**返回** `SNTP_SYNC_STATUS_RESET`: Reset status. `SNTP_SYNC_STATUS_COMPLETED`: Time is synchronized. `SNTP_SYNC_STATUS_IN_PROGRESS`: Smooth time sync in progress.

void **sntp\_set\_sync\_status** (*sntp\_sync\_status\_t* sync\_status)

Set status of time sync.

**参数 sync\_status** -- status of time sync (see `sntp_sync_status_t`)

void **sntp\_set\_time\_sync\_notification\_cb** (*sntp\_sync\_time\_cb\_t* callback)

Set a callback function for time synchronization notification.

**参数 callback** -- a callback function

void **sntp\_set\_sync\_interval** (uint32\_t interval\_ms)

Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in the next attempt update time through SNTP. To apply the new sync interval call the `sntp_restart()` function, otherwise, it will be applied after the last interval expired.

参数 **interval\_ms** -- The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds will be set.

uint32\_t **sntp\_get\_sync\_interval** (void)

Get the sync interval of SNTP operation.

返回 the sync interval

bool **sntp\_restart** (void)

Restart SNTP.

返回 True - Restart False - SNTP was not initialized yet

void **esp\_sntp\_setoperatingmode** (*esp\_sntp\_operatingmode\_t* operating\_mode)

Sets SNTP operating mode. The mode has to be set before init.

参数 **operating\_mode** -- Desired operating mode

void **esp\_sntp\_init** (void)

Init and start SNTP service.

void **esp\_sntp\_stop** (void)

Stops SNTP service.

void **esp\_sntp\_setserver** (u8\_t idx, const ip\_addr\_t \*addr)

Sets SNTP server address.

参数

- **idx** -- Index of the server
- **addr** -- IP address of the server

void **esp\_sntp\_setservername** (u8\_t idx, const char \*server)

Sets SNTP hostname.

参数

- **idx** -- Index of the server
- **server** -- Name of the server

const char \***esp\_sntp\_getservername** (u8\_t idx)

Gets SNTP server name.

参数 **idx** -- Index of the server

返回 Name of the server

const ip\_addr\_t \***esp\_sntp\_getserver** (u8\_t idx)

Get SNTP server IP.

参数 **idx** -- Index of the server

返回 IP address of the server

bool **esp\_sntp\_enabled** (void)

Checks if sntp is enabled.

返回 true if sntp module is enabled

static inline void **sntp\_setoperatingmode** (u8\_t operating\_mode)

if not build within lwip, provide translating inlines, that will warn about thread safety

static inline void **sntp\_servermode\_dhcp** (int set\_servers\_from\_dhcp)

static inline void **sntp\_setservername** (u8\_t idx, const char \*server)

static inline void **sntp\_init** (void)

static inline const char \***sntp\_getservername** (u8\_t idx)

static inline const ip\_addr\_t \***sntp\_getserver** (u8\_t idx)

## Macros

**esp\_sntp\_sync\_time**

Aliases for esp\_sntp prefixed API (inherently thread safe)

**esp\_sntp\_set\_sync\_mode**

**esp\_sntp\_get\_sync\_mode**

**esp\_sntp\_get\_sync\_status**

**esp\_sntp\_set\_sync\_status**

**esp\_sntp\_set\_time\_sync\_notification\_cb**

**esp\_sntp\_set\_sync\_interval**

**esp\_sntp\_get\_sync\_interval**

**esp\_sntp\_restart**

**SNTP\_OPMODE\_POLL**

## Type Definitions

typedef void (\***sntp\_sync\_time\_cb\_t**)(struct timeval \*tv)

SNTP callback function for notifying about time sync event.

**Param tv** Time received from SNTP server.

## Enumerations

enum **sntp\_sync\_mode\_t**

SNTP time update mode.

*Values:*

enumerator **SNTP\_SYNC\_MODE\_IMMED**

Update system time immediately when receiving a response from the SNTP server.

enumerator **SNTP\_SYNC\_MODE\_SMOOTH**

Smooth time updating. Time error is gradually reduced using adjtime function. If the difference between SNTP response time and system time is large (more than 35 minutes) then update immediately.

enum **sntp\_sync\_status\_t**

SNTP sync status.

*Values:*

enumerator **SNTP\_SYNC\_STATUS\_RESET**

enumerator **SNTP\_SYNC\_STATUS\_COMPLETED**

enumerator **SNTP\_SYNC\_STATUS\_IN\_PROGRESS**

enum **esp\_sntp\_operatingmode\_t**

SNTP operating modes per lwip SNTP module.

*Values:*

enumerator **ESP\_SNTP\_OPMODE\_POLL**

enumerator **ESP\_SNTP\_OPMODE\_LISTENONLY**

## 2.10.29 异步内存复制

### 概述

ESP32-C3 有一个 DMA 引擎，能够以异步方式帮助 CPU 完成内部内存复制操作。

异步 memcopy API 中封装了所有 DMA 配置和操作，`esp_async_memcopy()` 的签名与标准 C 库的 memcopy 函数基本相同。

DMA 允许多个内存复制请求在首个请求完成之前排队，即允许计算和内存复制的重叠。此外，通过注册事件回调函数，还可以知道内存复制请求完成的准确时间。

### 配置并安装驱动

安装异步 memcopy 驱动的方法取决于底层 DMA 引擎：

- `esp_async_memcopy_install_gdma_ahb()` 用于安装基于 AHB GDMA 引擎的异步 memcopy 驱动。
- `esp_async_memcopy_install()` 是一个通用 API，用于安装带有默认 DMA 引擎的异步 memcopy 驱动。如果 SoC 具有 CP DMA 引擎，则默认 DMA 引擎为 CP DMA，否则，默认 DMA 引擎为 AHB GDMA。

在 `async_memcopy_config_t` 中设置驱动配置：

- `backlog`：此项用于配置首个请求完成前可以排队的最大内存复制事务数量。如果将此字段设置为零，会应用默认值 4。
- `sram_trans_align`：声明 SRAM 中数据地址和复制大小的对齐方式，如果数据没有对齐限制，则设置为零。如果设置为四的倍数（即 4X），驱动程序将内部启用突发模式，这有利于某些和性能相关的应用程序。
- `psram_trans_align`：声明 PSRAM 中数据地址和复制大小的对齐方式。如果 memcopy 的目标地址位于 PSRAM 中，用户必须给出一个有效值（只支持 16、32、64）。如果设置为零，会默认采用 16 位对齐。在内部，驱动程序会根据对齐方式来配置 DMA 访问 PSRAM 时所用的块大小。
- `flags`：此项可以启用一些特殊的驱动功能。

```

async_memcopy_config_t config = ASYNC_MEMCOPY_DEFAULT_CONFIG();
// 更新底层 DMA 引擎支持的最大数据流
config.backlog = 8;
async_memcopy_handle_t driver = NULL;
ESP_ERROR_CHECK(esp_async_memcopy_install(&config, &driver)); // 使用默认 DMA_
↳引擎安装驱动

```

## 发送内存复制请求

使用 `esp_async_memcpy()` API 将内存复制请求发送到 DMA 引擎。在驱动程序成功安装后才能调用该 API。此 API 是线程安全的，因此可以从不同的任务中调用。

与 `libc` 版本的 `memcpy` 不同，你可以选择给 `esp_async_memcpy()` 设置一个回调函数，以便在内存复制完成时收到通知。注意，回调是在 `ISR` 上下文中执行的，请不要在回调中调用任何阻塞函数。

回调函数的原型是 `async_memcpy_isr_cb_t`。回调函数只有在借助 `RTOS` API（如 `xSemaphoreGiveFromISR()`）唤醒了高优先级任务后才能返回 `true`。

```
// 回调实现，在 ISR 上下文中运行
static bool my_async_memcpy_cb(async_memcpy_handle_t mcp_hdl, async_memcpy_event_t
↳*event, void *cb_args)
{
    SemaphoreHandle_t sem = (SemaphoreHandle_t)cb_args;
    BaseType_t high_task_wakeup = pdFALSE;
    xSemaphoreGiveFromISR(sem, &high_task_wakeup); //↳
↳如果解锁了一些高优先级任务，则将 high_task_wakeup 设置为 pdTRUE
    return high_task_wakeup == pdTRUE;
}

// 创建一个信号量，在异步 memcpy 完成时进行报告
SemaphoreHandle_t semphr = xSemaphoreCreateBinary();

// 从用户的上下文中调用
ESP_ERROR_CHECK(esp_async_memcpy(driver_handle, to, from, copy_len, my_async_
↳memcpy_cb, my_semaphore));
// 其他事项
xSemaphoreTake(my_semaphore, portMAX_DELAY); // 等待 buffer 复制完成
```

## 卸载驱动

使用 `esp_async_memcpy_uninstall()` 卸载异步 `memcpy` 驱动。无需在每次 `memcpy` 操作后手动卸载。如果你的应用程序不再需要此驱动，此 API 可以帮助回收内存和其他硬件资源。

## API 参考

### Header File

- `components/esp_hw_support/include/esp_async_memcpy.h`
- This header file can be included with:

```
#include "esp_async_memcpy.h"
```

### Functions

`esp_err_t esp_async_memcpy_install_gdma_ahb` (const `async_memcpy_config_t` \*config, `async_memcpy_handle_t` \*mcp)

Install async memcpy driver, with AHB-GDMA as the backend.

#### 参数

- **config** -- [in] Configuration of async memcpy
- **mcp** -- [out] Returned driver handle

#### 返回

- `ESP_OK`: Install async memcpy driver successfully
- `ESP_ERR_INVALID_ARG`: Install async memcpy driver failed because of invalid argument
- `ESP_ERR_NO_MEM`: Install async memcpy driver failed because out of memory
- `ESP_FAIL`: Install async memcpy driver failed because of other error

*esp\_err\_t* **esp\_async\_memcpy\_install** (const *async\_memcpy\_config\_t* \*config, *async\_memcpy\_handle\_t* \*mcp)

Install async memcpy driver with the default DMA backend.

---

**备注:** On chip with CPDMA support, CPDMA is the default choice. On chip with AHB-GDMA support, AHB-GDMA is the default choice.

---

#### 参数

- **config** -- **[in]** Configuration of async memcpy
- **mcp** -- **[out]** Returned driver handle

#### 返回

- **ESP\_OK**: Install async memcpy driver successfully
- **ESP\_ERR\_INVALID\_ARG**: Install async memcpy driver failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Install async memcpy driver failed because out of memory
- **ESP\_FAIL**: Install async memcpy driver failed because of other error

*esp\_err\_t* **esp\_async\_memcpy\_uninstall** (*async\_memcpy\_handle\_t* mcp)

Uninstall async memcpy driver.

**参数** **mcp** -- **[in]** Handle of async memcpy driver that returned from `esp_async_memcpy_install`

#### 返回

- **ESP\_OK**: Uninstall async memcpy driver successfully
- **ESP\_ERR\_INVALID\_ARG**: Uninstall async memcpy driver failed because of invalid argument
- **ESP\_FAIL**: Uninstall async memcpy driver failed because of other error

*esp\_err\_t* **esp\_async\_memcpy** (*async\_memcpy\_handle\_t* mcp, void \*dst, void \*src, size\_t n, *async\_memcpy\_isr\_cb\_t* cb\_isr, void \*cb\_args)

Send an asynchronous memory copy request.

---

**备注:** The callback function is invoked in interrupt context, never do blocking jobs in the callback.

---

#### 参数

- **mcp** -- **[in]** Handle of async memcpy driver that returned from `esp_async_memcpy_install`
- **dst** -- **[in]** Destination address (copy to)
- **src** -- **[in]** Source address (copy from)
- **n** -- **[in]** Number of bytes to copy
- **cb\_isr** -- **[in]** Callback function, which got invoked in interrupt context. Set to NULL can bypass the callback.
- **cb\_args** -- **[in]** User defined argument to be passed to the callback function

#### 返回

- **ESP\_OK**: Send memory copy request successfully
- **ESP\_ERR\_INVALID\_ARG**: Send memory copy request failed because of invalid argument
- **ESP\_FAIL**: Send memory copy request failed because of other error

## Structures

struct **async\_memcpy\_event\_t**

Async memory copy event data.

### Public Members

void **\*data**

Event data

struct **async\_memcpy\_config\_t**

Type of async memcpy configuration.

### Public Members

uint32\_t **backlog**

Maximum number of transactions that can be prepared in the background

size\_t **sram\_trans\_align**

DMA transfer alignment (both in size and address) for SRAM memory

size\_t **psram\_trans\_align**

DMA transfer alignment (both in size and address) for PSRAM memory

uint32\_t **flags**

Extra flags to control async memcpy feature

### Macros

**ASYNC\_MEMCPY\_DEFAULT\_CONFIG()**

Default configuration for async memcpy.

### Type Definitions

typedef struct async\_memcpy\_context\_t **\*async\_memcpy\_handle\_t**

Async memory copy driver handle.

typedef bool (**\*async\_memcpy\_isr\_cb\_t**)(*async\_memcpy\_handle\_t* mcp\_hdl, *async\_memcpy\_event\_t* \*event, void \*cb\_args)

Type of async memcpy interrupt callback function.

---

**备注:** User can call OS primitives (semaphore, mutex, etc) in the callback function. Keep in mind, if any OS primitive wakes high priority task up, the callback should return true.

---

**Param mcp\_hdl** Handle of async memcpy

**Param event** Event object, which contains related data, reserved for future

**Param cb\_args** User defined arguments, passed from esp\_async\_memcpy function

**Return** Whether a high priority task is woken up by the callback function

## 2.10.30 看门狗

## 概述

ESP-IDF 支持以下类型的看门狗定时器：

- 中断看门狗定时器 (IWDT)
- 任务看门狗定时器 (TWDT)
- XTAL32K 看门狗定时器 (Crystal 32K 看门狗定时器，即 XTWDT)

中断看门狗负责确保 ISR（中断服务程序）不被长时间阻塞，TWDT 负责检测任务长时间运行而不让步的情况。

通过 [项目配置菜单](#) 可启用各种看门狗定时器。其中，TWDT 也可以在程序运行时启用。

## 中断看门狗定时器 (IWDT)

IWDT 的目的是，确保中断服务例程 (ISR) 运行不会受到长时间阻塞（即 IWDT 超时）。阻塞 ISR 及时运行会增加 ISR 延迟，也会阻止任务切换（因为任务切换是从 ISR 执行的）。阻止 ISR 运行的事项包括：

- 禁用中断
- 临界区（也会禁用中断）
- 其他相同或更高优先级的 ISR，在完成前会阻止相同或较低优先级的 ISR

IWDT 利用定时器组 1 中的看门狗定时器作为其底层硬件定时器，并在每个 CPU 上使用 FreeRTOS 时钟滴答中断，即 tick 中断。如果某个 CPU 上的 tick 中断没有在 IWDT 超时前运行，就表明该 CPU 上的 ISR 运行受阻（参见上文原因列表）。

当 IWDT 超时后，默认操作是调用紧急处理程序 (Panic Handler)，并显示出错原因 (Interrupt wdt timeout on CPU0 或 Interrupt wdt timeout on CPU1，视情况而定)。根据紧急处理程序的配置行为（参见 [CONFIG\\_ESP\\_SYSTEM\\_PANIC](#)），用户可通过回溯、OpenOCD、gdbstub 等来调试 IWDT 超时问题，也可以重置芯片（这在生产环境中可能是首选）。

如果出于某种原因，IWDT 超时后紧急处理程序无法运行，IWDT 还可以通过其二阶段超时来硬重置芯片（即系统重置）。

## 配置

- IWDT 默认通过 [CONFIG\\_ESP\\_INT\\_WDT](#) 选项启用。
- 通过 [CONFIG\\_ESP\\_INT\\_WDT\\_TIMEOUT\\_MS](#) 选项设置 IWDT 超时。
  - 注意，如果启用了 PSRAM 支持，那么默认的超时时间会更长，因为在某些情况下，临界区或中断例程访问大量 PSRAM 需要更长时间。
  - 超时时间至少应是 FreeRTOS tick 周期的两倍时长（参见 [CONFIG\\_FREERTOS\\_HZ](#)）。

**调优** 如果 IWDT 超时是中断或临界区运行超时导致的，可以考虑重写代码：

- 临界区应尽可能短。任何非关键的代码或计算都应放在临界区外。
- 中断处理程序也应尽可能减少计算量。考虑让 ISR 使用队列向任务推送数据，从而将计算推迟到任务中进行。

临界区或中断处理程序都不应阻塞其他事件。如果不能或不希望通过更改代码减少处理时间，可以通过设置 [CONFIG\\_ESP\\_INT\\_WDT\\_TIMEOUT\\_MS](#) 延长超时时间。

## 任务看门狗定时器 (TWDT)

任务看门狗定时器 (TWDT) 用于监视特定任务，确保任务在配置的超时时间内执行。TWDT 主要监视每个 CPU 的空闲任务，但其他任务也可以订阅 TWDT 监视。通过监视每个 CPU 的空闲任务，TWDT 可以检测到任务长时间运行没有让出的情况。这可能表明代码编写不当，在外设上自旋循环，或者任务陷入了无限循环。

TWDT 是基于定时器组 0 中的硬件看门狗定时器构建的。超时发生时触发中断。

可以在用户代码中定义函数 `esp_task_wdt_isr_user_handler` 来接收超时事件，并扩展默认行为。

**使用** 调用以下函数，用 TWDT 监视任务：

- `esp_task_wdt_init()` 初始化 TWDT 并订阅空闲任务。
- `esp_task_wdt_add()` 为其他任务订阅 TWDT。
- 订阅后，应从任务中调用 `esp_task_wdt_reset()` 来喂 TWDT。
- `esp_task_wdt_delete()` 可以取消之前订阅的任务。
- `esp_task_wdt_deinit()` 取消订阅空闲任务并反初始化 TWDT。

在需要更细粒度级别监视的情况下（即确保调用特定的函数、存根、代码路径），TWDT 允许订阅 users。

- `esp_task_wdt_add_user()` 订阅 TWDT 的任意用户。此函数返回添加用户的用户句柄。
- 必须使用用户句柄调用 `esp_task_wdt_reset_user()`，防止 TWDT 超时。
- `esp_task_wdt_delete_user()` 取消订阅 TWDT 的任意用户。

**配置** TWDT 的默认超时时间可以通过 `CONFIG_ESP_TASK_WDT_TIMEOUT_S` 配置项进行设置，并应至少设置为任何单个任务预计需要独占 CPU 的时长，例如某应用程序将进行长时间的密集计算且不让位给其他任务时的预计时长。也可以调用 `esp_task_wdt_init()`，在运行时更改此时间。

**备注：** 擦除较大的 flash 区域可能会非常耗时，并可能导致任务连续运行，触发 TWDT 超时。以下两种方法可以避免这种情况：

- 在 `menuconfig` 中增加 `CONFIG_ESP_TASK_WDT_TIMEOUT_S`，延长看门狗超时时间。
- 在擦除 flash 区域前，调用 `esp_task_wdt_init()` 增加看门狗超时时间。

如需了解更多信息，请参考 [SPI flash API](#)。

以下配置选项控制 TWDT 配置，默认情况下全部启用：

- `CONFIG_ESP_TASK_WDT_EN` - 启用 TWDT 功能。如果禁用此选项，TWDT 即使运行时已初始化也无法使用。
- `CONFIG_ESP_TASK_WDT_INIT` - TWDT 在启动期间自动初始化。禁用此选项时，仍可以调用 `esp_task_wdt_init()` 在运行时初始化 TWDT。
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0` - 空闲任务在启动时订阅了 TWDT。如果此选项被禁用，仍可以调用 `esp_task_wdt_init()` 再次订阅。

**备注：** 如果 TWDT 超时，会默认在继续运行应用程序前打印警告和回溯。如希望超时触发系统严重错误和系统重置，可以通过 `CONFIG_ESP_TASK_WDT_PANIC` 进行配置。

## XTAL32K 看门狗定时器 (XTWDT)

ESP32-C3 的一个可选时钟输入是外部 32 kHz 无源晶振 (XTAL32K)，它常用作各种子系统（如 RTC）的时钟源 (XTAL32K\_CLK)。

XTWDT 是一个专用看门狗定时器，用于确保 XTAL32K 正常工作。如果 XTAL32K\_CLK 是 RTC\_SLOW\_CLK 的时钟源，当它停止振荡时，XTWDT 会检测到并生成中断。XTWDT 还具有切换振荡器功能，可以自动切换到内部振荡器（准确度较低）作为 RTC\_SLOW\_CLK 的时钟源。

由于切换到备用时钟是在硬件中完成的，因此切换也可以在 Deep-sleep 期间发生。这也说明，即使在芯片处于 Deep-sleep 并等待定时器超时时，XTAL32K\_CLK 停止工作，芯片还是能按计划唤醒。

如果 XTAL32K\_CLK 重新开始正常工作，则可以调用 `esp_xt_wdt_restore_clk` 切换回时钟源，重新启用看门狗定时器。

## 配置

- 选择外部 32 KHz 晶体或振荡器时 (*CONFIG\_RTC\_CLK\_SRC*)，通过 *CONFIG\_ESP\_XT\_WDT* 配置选项启用 XTWDT。
- 设置 *CONFIG\_ESP\_XT\_WDT\_TIMEOUT* 选项来配置超时时间。
- 通过 *CONFIG\_ESP\_XT\_WDT\_BACKUP\_CLK\_ENABLE* 配置选项启用自动切换备用时钟功能。

## JTAG & 看门狗

在使用 OpenOCD 进行调试时，CPU 会在每次达到断点时停止运行。然而，如果遇到断点后看门狗定时器继续运行，就会最终触发复位，为调试代码带来巨大的困难。因此，OpenOCD 会在每个断点处禁用中断和任务的看门狗的硬件定时器。此外，在离开断点时，OpenOCD 也不会重新启用定时器，也就是说，中断看门狗和任务看门狗实际上被禁用。当 ESP32-C3 通过 JTAG 连接到 OpenOCD 时，看门狗不会打印任何警告或出现严重错误。

## API 参考

**任务看门狗** 在 ESP-IDF 中使用任务看门狗的完整示例：[system/task\\_watchdog](#)

### Header File

- `components/esp_system/include/esp_task_wdt.h`
- This header file can be included with:

```
#include "esp_task_wdt.h"
```

### Functions

*esp\_err\_t* **esp\_task\_wdt\_init** (const *esp\_task\_wdt\_config\_t* \*config)

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. This function will subscribe the idle tasks if configured to do so. For other tasks, users can subscribe them using `esp_task_wdt_add()` or `esp_task_wdt_add_user()`. This function won't start the timer if no task have been registered yet.

---

**备注：** `esp_task_wdt_init()` must only be called after the scheduler is started. Moreover, it must not be called by multiple tasks simultaneously.

---

**参数** `config` -- [in] Configuration structure

**返回**

- ESP\_OK: Initialization was successful
- ESP\_ERR\_INVALID\_STATE: Already initialized
- Other: Failed to initialize TWDT

*esp\_err\_t* **esp\_task\_wdt\_reconfigure** (const *esp\_task\_wdt\_config\_t* \*config)

Reconfigure the Task Watchdog Timer (TWDT)

The function reconfigures the running TWDT. It must already be initialized when this function is called.

---

**备注：** `esp_task_wdt_reconfigure()` must not be called by multiple tasks simultaneously.

---

**参数** `config` -- [in] Configuration structure

**返回**

- ESP\_OK: Reconfiguring was successful
- ESP\_ERR\_INVALID\_STATE: TWDT not initialized yet

- Other: Failed to initialize TWDT

*esp\_err\_t* **esp\_task\_wdt\_deinit** (void)

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT, and unsubscribe any idle tasks. Calling this function whilst other tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

---

**备注:** `esp_task_wdt_deinit()` must not be called by multiple tasks simultaneously.

---

#### 返回

- ESP\_OK: TWDT successfully deinitialized
- Other: Failed to deinitialize TWDT

*esp\_err\_t* **esp\_task\_wdt\_add** (*TaskHandle\_t* task\_handle)

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call `esp_task_wdt_reset()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

**参数** `task_handle` -- Handle of the task. Input NULL to subscribe the current running task to the TWDT

#### 返回

- ESP\_OK: Successfully subscribed the task to the TWDT
- Other: Failed to subscribe task

*esp\_err\_t* **esp\_task\_wdt\_add\_user** (const char \*user\_name, *esp\_task\_wdt\_user\_handle\_t* \*user\_handle\_ret)

Subscribe a user to the Task Watchdog Timer (TWDT)

This function subscribes a user to the TWDT. A user of the TWDT is usually a function that needs to run periodically. Each subscribed user must periodically call `esp_task_wdt_reset_user()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

#### 参数

- **user\_name** -- [in] String to identify the user
- **user\_handle\_ret** -- [out] Handle of the user

#### 返回

- ESP\_OK: Successfully subscribed the user to the TWDT
- Other: Failed to subscribe user

*esp\_err\_t* **esp\_task\_wdt\_reset** (void)

Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

#### 返回

- ESP\_OK: Successfully reset the TWDT on behalf of the currently running task
- Other: Failed to reset

*esp\_err\_t* **esp\_task\_wdt\_reset\_user** (*esp\_task\_wdt\_user\_handle\_t* user\_handle)

Reset the Task Watchdog Timer (TWDT) on behalf of a user.

This function will reset the TWDT on behalf of a user. Each subscribed user must periodically call this function to prevent the TWDT from timing out. If one or more subscribed users fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

**参数** `user_handle` -- [in] User handle

- ESP\_OK: Successfully reset the TWDT on behalf of the user
- Other: Failed to reset

*esp\_err\_t* **esp\_task\_wdt\_delete** (*TaskHandle\_t* task\_handle)

Unsubscribes a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call `esp_task_wdt_reset()`.

**参数** **task\_handle** -- [in] Handle of the task. Input NULL to unsubscribe the current running task.

**返回**

- ESP\_OK: Successfully unsubscribed the task from the TWDT
- Other: Failed to unsubscribe task

*esp\_err\_t* **esp\_task\_wdt\_delete\_user** (*esp\_task\_wdt\_user\_handle\_t* user\_handle)

Unsubscribes a user from the Task Watchdog Timer (TWDT)

This function will unsubscribe a user from the TWDT. After being unsubscribed, the user should no longer call `esp_task_wdt_reset_user()`.

**参数** **user\_handle** -- [in] User handle

**返回**

- ESP\_OK: Successfully unsubscribed the user from the TWDT
- Other: Failed to unsubscribe user

*esp\_err\_t* **esp\_task\_wdt\_status** (*TaskHandle\_t* task\_handle)

Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

**参数** **task\_handle** -- [in] Handle of the task. Input NULL to query the current running task.

**返回** :

- ESP\_OK: The task is currently subscribed to the TWDT
- ESP\_ERR\_NOT\_FOUND: The task is not subscribed
- ESP\_ERR\_INVALID\_STATE: TWDT was never initialized

void **esp\_task\_wdt\_isr\_user\_handler** (void)

User ISR callback placeholder.

This function is called by `task_wdt_isr` function (ISR for when TWDT times out). It can be defined in user code to handle TWDT events.

---

**备注:** It has the same limitations as the interrupt function. Do not use ESP\_LOGx functions inside.

---

*esp\_err\_t* **esp\_task\_wdt\_print\_triggered\_tasks** (*task\_wdt\_msg\_handler* msg\_handler, void \*opaque, int \*cpus\_fail)

Prints or retrieves information about tasks/users that triggered the Task Watchdog Timeout.

This function provides various operations to handle tasks/users that did not reset the Task Watchdog in time. It can print detailed information about these tasks/users, such as their names, associated CPUs, and whether they have been reset. Additionally, it can retrieve the total length of the printed information or the CPU affinity of the failing tasks.

---

**备注:**

- If `msg_handler` is not provided, the information will be printed to console using `ESP_EARLY_LOGE`.
- If `msg_handler` is provided, the function will send the printed information to the provided message handler function.

- If `cpus_fail` is provided, the function will store the CPU affinity of the failing tasks in the provided integer.
  - During the execution of this function, logging is allowed in critical sections, as TWDT timeouts are considered fatal errors.
- 

### 参数

- **msg\_handler** -- [in] Optional message handler function that will be called for each printed line.
- **opaque** -- [in] Optional pointer to opaque data that will be passed to the message handler function.
- **cpus\_fail** -- [out] Optional pointer to an integer where the CPU affinity of the failing tasks will be stored.

### 返回

- **ESP\_OK**: The function executed successfully.
- **ESP\_FAIL**: No triggered tasks were found, and thus no information was printed or retrieved.

## Structures

struct **esp\_task\_wdt\_config\_t**

Task Watchdog Timer (TWDT) configuration structure.

### Public Members

uint32\_t **timeout\_ms**

TWDT timeout duration in milliseconds

uint32\_t **idle\_core\_mask**

Bitmask of the core whose idle task should be subscribed on initialization where  $1 \ll i$  means that core  $i$ 's idle task will be monitored by the TWDT

bool **trigger\_panic**

Trigger panic when timeout occurs

## Type Definitions

typedef struct esp\_task\_wdt\_user\_handle\_s \***esp\_task\_wdt\_user\_handle\_t**

Task Watchdog Timer (TWDT) user handle.

typedef void (\***task\_wdt\_msg\_handler**)(void \*opaque, const char \*msg)

此部分 API 代码示例存放在 ESP-IDF 示例项目的 [system](#) 目录下。

## Chapter 4

# API 指南

### 4.1 应用层跟踪库

#### 4.1.1 概述

ESP-IDF 中提供了应用层跟踪功能，用于分析应用程序的行为。这一功能在相应的库中实现，可以通过 `menuconfig` 开启。此功能允许用户在程序运行开销很小的前提下，通过 JTAG、UART 或 USB 接口在主机和 ESP32-C3 之间传输任意数据。用户也可同时使用 JTAG 和 UART 接口。UART 接口主要用于连接 SEGGER SystemView 工具（参见 [SystemView](#)）。

开发人员可以使用这一功能库将应用程序的运行状态发送给主机，在运行时接收来自主机的命令或者其他类型的信息。该库的主要使用场景有：

1. 收集来自特定应用程序的数据。具体请参阅[特定应用程序的跟踪](#)。
2. 记录到主机的轻量级日志。具体请参阅[记录日志到主机](#)。
3. 系统行为分析。具体请参阅[基于 SEGGER SystemView 的系统行为分析](#)。
4. 获取源代码覆盖率。具体请参阅[Gcov（源代码覆盖）](#)。

使用 JTAG 接口的跟踪组件工作示意图如下所示：

#### 4.1.2 运行模式

该库支持两种运行模式：

**后验模式：**后验模式为默认模式，该模式不需要和主机进行交互。在这种模式下，跟踪模块不会检查主机是否已经从 `HW UP BUFFER` 缓冲区读走所有数据，而是直接使用新数据覆盖旧数据。如果用户仅对最新的跟踪数据感兴趣，例如想要分析程序在崩溃之前的行为，则推荐使用该模式。主机可以稍后根据用户的请求来读取数据，例如在使用 JTAG 接口的情况下，通过特殊的 `OpenOCD` 命令进行读取。

**流模式：**当主机连接到 ESP32-C3 时，跟踪模块会进入此模式。在这种模式下，跟踪模块在新数据写入 `HW UP BUFFER` 之前会检查其中是否有足够的空间，并在必要的时候等待主机读取数据并释放足够的内存。最大等待时间是由用户传递给相应 API 函数的超时时间参数决定的。因此当应用程序尝试使用有限的最大等待时间值来将数据写入跟踪缓冲区时，这些数据可能会被丢弃。尤其需要注意的是，如果在对时效要求严格的代码中（如中断处理函数、操作系统调度等）指定了无限的超时时间，将会导致系统故障。为了避免丢失此类关键数据，开发人员可以在 `menuconfig` 中开启 `CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX` 选项，以启用额外的数据缓冲区。此宏还指定了在上述条件下可以缓冲的数据大小，它有助于缓解由于 USB 总线拥塞等原因导致的向主机传输数据间歇性减缓的状况。但是，当跟踪数据流的平均比特率超出硬件接口的能力时，该选项无法发挥作用。

图 1: 使用 JTAG 接口的跟踪组件

### 4.1.3 配置选项与依赖项

使用此功能需要在主机端和目标端进行以下配置：

1. **主机端：**应用程序跟踪通过 JTAG 来完成，因此需要在主机上安装并运行 OpenOCD。详细信息请参阅 [JTAG 调试](#)。
2. **目标端：**在 `menuconfig` 中开启应用程序跟踪功能。前往 `Component config > Application Level Tracing` 菜单，选择跟踪数据的传输目标（具体用于传输的硬件接口：JTAG 和/或 UART），选择任一非 `None` 的目标都会自动开启 `CONFIG_APPTRACE_ENABLE` 这个选项。对于 UART 接口，用户必须定义波特率、TX 和 RX 管脚及其他相关参数。

**备注：**为了实现更高的数据速率并降低丢包率，建议优化 JTAG 的时钟频率，使其达到能够稳定运行的最大值。详细信息请参阅 [优化 JTAG 的速度](#)。

以下为前述未提及的另外两个 `menuconfig` 选项：

1. *Threshold for flushing last trace data to host on panic* (`CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`)。使用 JTAG 接口时，此选项是必选项。在该模式下，跟踪数据以 16 KB 数据块的形式暴露给主机。在后验模式中，一个块被填充后会被暴露给主机，同时之前的块不再可用。也就是说，跟踪数据以 16 KB 的粒度进行覆盖。发生 Panic 时，当前输入块的最新数据将会被暴露给主机，主机可以读取数据以进行后续分析。如果系统发生 Panic 时，仍有少量数据还没来得及暴露给主机，那么之前收集的 16 KB 数据将丢失，主机只能获取少部分的最新跟踪数据，从而可能无法诊断问题。此 `menuconfig` 选项有助于避免此类情况，它可以控制发生 Panic 时刷新数据的阈值。例如，用户可以设置需要不少于 512 字节的最新跟踪数据，如果在发生 Panic 时待处理的数据少于 512 字节，则数据不会被刷新，也不会覆盖之前的 16 KB 数据。该选项仅在后验模式和使用 JTAG 工作时可发挥作用。
2. *Timeout for flushing last trace data to host on panic* (`CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`)。该选项仅在流模式下才可发挥作用，它可用于控制跟踪模块在发生 Panic 时等待主机读取最新数据的最长时间。
3. *UART RX/TX ring buffer size* (`CONFIG_APPTRACE_UART_TX_BUFF_SIZE`)。缓冲区的大小取决于通过 UART 传输的数据量。

4. *UART TX message size* (: `ref:CONFIG_APPTRACE_UART_TX_MSG_size`)。要传输的单条消息的最大尺寸。

#### 4.1.4 如何使用此库

该库提供了用于在主机和 ESP32-C3 之间传输任意数据的 API。在 `menuconfig` 中启用该库后，目标应用程序的跟踪模块会在系统启动时自动初始化。因此，用户需要做的就是调用相应的 API 来发送、接收或者刷新数据。

##### 特定应用程序的跟踪

通常，用户需要决定在每个方向上待传输数据的类型以及如何解析（处理）这些数据。要想在目标和主机之间传输数据，则需执行以下几个步骤：

1. 在目标端，用户需要实现将跟踪数据写入主机的算法。下面的代码片段展示了如何执行此操作。

```
#include "esp_app_trace.h"
...
char buf[] = "Hello World!";
esp_err_t res = esp_apptrace_write(ESP_APPTRACE_DEST_TRAX, buf, strlen(buf),
↳ESP_APPTRACE_TMO_INFINITE);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to write data to host!");
    return res;
}
```

`esp_apptrace_write()` 函数使用 `memcpy` 把用户数据复制到内部缓存中。在某些情况下，使用 `esp_apptrace_buffer_get()` 和 `esp_apptrace_buffer_put()` 函数会更加理想，它们允许开发人员自行分配缓冲区并填充。下面的代码片段展示了如何执行此操作。

```
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)esp_apptrace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32, 100/
↳*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
sprintf(ptr, "Here is the number %d", number);
esp_err_t res = esp_apptrace_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/*tmo.
↳in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report
↳incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

另外，根据实际项目的需要，用户可能希望从主机接收数据。下面的代码片段展示了如何执行此操作。

```
#include "esp_app_trace.h"
...
char buf[32];
char down_buf[32];
size_t sz = sizeof(buf);

/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
```

(下页继续)

```

esp_err_t res = esp_appttrace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/*do not
↳wait*/);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
    ...
}

```

esp\_appttrace\_read() 函数使用 memcopy 把主机端的数据复制到用户缓存区。在某些情况下, 使用 esp\_appttrace\_down\_buffer\_get() 和 esp\_appttrace\_down\_buffer\_put() 函数可能更为理想。它们允许开发人员占用一块读缓冲区并就地地进行有关处理操作。下面的代码片段展示了如何执行此操作。

```

#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
size_t sz = 32;

/* config down buffer */
esp_appttrace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_appttrace_down_buffer_get(ESP_APPTRACE_DEST_TRAX, &sz,
↳100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 4) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}
esp_err_t res = esp_appttrace_down_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/
↳*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report
↳incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}

```

2. 下一步是编译应用程序的镜像, 并将其下载到目标板上。这一步可以参考文档[构建并烧写](#)。
3. 运行 OpenOCD (参见[JTAG 调试](#))。
4. 连接到 OpenOCD 的 telnet 服务器。用户可在终端执行命令 telnet <oocd\_host> 4444。如果用户是在运行 OpenOCD 的同一台机器上打开 telnet 会话, 可以使用 localhost 替换上面命令中的 <oocd\_host>。
5. 使用特殊的 OpenOCD 命令开始收集待跟踪的命令。此命令将传输跟踪数据并将其重定向到指定的文件或套接字 (当前仅支持文件作为跟踪数据目标)。相关命令的说明, 请参阅[启动调试器](#)。
6. 最后, 处理接收到的数据。由于数据格式由用户自己定义, 本文档中省略数据处理的具体流程。数据处理的范例可以参考位于 \$IDF\_PATH/tools/esp\_app\_trace 下的 Python 脚本 apptrace\_proc.py (用于功能测试) 和 logtrace\_proc.py (请参阅[记录日志到主机](#)章节中的详细信息)。

**OpenOCD 应用程序跟踪命令** HW UP BUFFER 在用户数据块之间共享, 并且会代替 API 调用者 (在任务或者中断上下文中) 填充分配到的内存。在多线程环境中, 正在填充缓冲区的任务/中断可能会被另一个高优先级的任务/中断抢占, 因此主机可能会读取到还未准备好的用户数据。对此, 跟踪模块在所有用户数据块之前添加一个数据头, 其中包含有分配的用户缓冲区的大小 (2 字节) 和实际写入的数据长度

(2 字节)，也就是说数据头总共长 4 字节。负责读取跟踪数据的 OpenOCD 命令在读取到不完整的用户数据块时会报错，但是无论如何，它都会将整个用户数据块（包括还未填充的区域）的内容放到输出文件中。

下文介绍了如何使用 OpenOCD 应用程序跟踪命令。

---

**备注：**目前，OpenOCD 还不支持将任意用户数据发送到目标的命令。

---

命令用法：

```
esp apptrace [start <options>] | [stop] | [status] | [dump <cores_num>
<outfile>]
```

子命令：

**start** 开始跟踪（连续流模式）。

**stop** 停止跟踪。

**status** 获取跟踪状态。

**dump** 转储所有后验模式的数据。

Start 子命令的语法：

```
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt
[skip_size]]]]]
```

**outfile** 用于保存来自两个 CPU 的数据文件的路径，该参数需要具有以下格式：file://path/to/file。

**poll\_period** 轮询跟踪数据的周期（单位：毫秒），如果大于 0 则以非阻塞模式运行。默认为 1 毫秒。

**trace\_size** 最多要收集的数据量（单位：字节），接收到指定数量的数据后将会停止跟踪。默认为 -1（禁用跟踪大小停止触发器）。

**stop\_tmo** 空闲超时（单位：秒），如果指定的时间段内都没有数据就会停止跟踪。默认为 -1（禁用跟踪超时停止触发器）。还可以将其设置为比目标跟踪命令之间的最长暂停值更长的值（可选）。

**wait4halt** 如果设置为 0 则立即开始跟踪，否则命令会先等待目标停止（复位、打断点等），然后对其进行自动恢复并开始跟踪。默认值为 0。

**skip\_size** 开始时要跳过的字节数，默认为 0。

---

**备注：**如果 poll\_period 为 0，则在跟踪停止之前，OpenOCD 的 telnet 命令将不可用。必须通过复位电路板或者在 OpenOCD 的窗口中（非 telnet 会话窗口）使用快捷键 Ctrl+C。另一种选择是设置 trace\_size 并等待，当收集到指定数据量时，跟踪会自动停止。

---

命令使用示例：

1. 将 2048 个字节的跟踪数据收集到 trace.log 文件中，该文件将保存在 openocd-esp32 目录中。

```
esp apptrace start file://trace.log 1 2048 5 0 0
```

跟踪数据会被检索并以非阻塞的模式保存到文件中，如果收集满 2048 字节的数据或者在 5 秒内都没有新的数据，那么该过程就会停止。

---

**备注：**在将数据提供给 OpenOCD 之前，会对其进行缓冲。如果看到“Data timeout!”的消息，则表示目标可能在超时之前没有向 OpenOCD 发送足够的数以清空缓冲区。要解决这个问题，可以增加超时时间或者使用函数 esp\_apptrace\_flush() 以特定间隔刷新数据。

---

2. 在非阻塞模式下无限地检索跟踪数据。

```
esp apptrace start file://trace.log 1 -1 -1 0 0
```

对收集数据的大小没有限制，也不设置超时时间。要停止此过程，可以在 OpenOCD 的 telnet 会话窗口中发送 esp apptrace stop 命令，或者在 OpenOCD 窗口中使用快捷键 Ctrl+C。

3. 检索跟踪数据并无限期保存。

```
esp appttrace start file://trace.log 0 -1 -1 0 0
```

在跟踪停止之前，OpenOCD 的 telnet 会话窗口将不可用。要停止跟踪，请在 OpenOCD 的窗口中使用快捷键 Ctrl+C。

4. 等待目标停止，然后恢复目标的操作并开始检索数据。当收集满 2048 字节的数据后就停止：

```
esp appttrace start file://trace.log 0 2048 -1 1 0
```

想要复位后立即开始跟踪，请使用 OpenOCD 的 `reset halt` 命令。

## 记录日志到主机

记录日志到主机是 ESP-IDF 中一个非常实用的功能：通过应用层跟踪库将日志保存到主机端。某种程度上，这也算是一种半主机 (semihosting) 机制，相较于调用 `ESP_LOGx` 将待打印的字符串发送到 UART 的日志记录方式，此功能将大部分工作转移到了主机端，从而减少了本地工作量。

ESP-IDF 的日志库会默认使用类 `vprintf` 的函数将格式化的字符串输出到专用的 UART，一般来说涉及以下几个步骤：

1. 解析格式字符串以获取每个参数的类型。
2. 根据其类型，将每个参数都转换为字符串。
3. 格式字符串与转换后的参数一起发送到 UART。

虽然可以对类 `vprintf` 函数进行一定程度的优化，但由于在任何情况下都必须执行上述步骤，并且每个步骤都会消耗一定的时间（尤其是步骤 3），所以经常会发生以下这种情况：向程序中添加额外的打印信息以诊断问题，却改变了应用程序的行为，使得问题无法复现。在最严重的情况下，程序无法正常工作，最终导致报错甚至挂起。

想要解决此类问题，可以使用更高的波特率或者其他更快的接口，并将字符串格式化的工作转移到主机端。

通过应用层跟踪库的 `esp_appttrace_vprintf` 函数，可以将日志信息发送到主机，该函数不执行格式字符串和参数的完全解析，而仅仅计算传递参数的数量，并将它们与格式字符串地址一起发送给主机。主机端会通过一个特殊的 Python 脚本来处理并打印接收到的日志数据。

**局限** 目前通过 JTAG 实现记录日志还存在以下几点局限：

1. 不支持使用 `ESP_EARLY_LOGx` 宏进行跟踪。
2. 不支持大小超过 4 字节的 `printf` 参数（例如 `double` 和 `uint64_t`）。
3. 仅支持 `.rodata` 段中的格式字符串和参数。
4. 最多支持 256 个 `printf` 参数。

**如何使用** 为了使用跟踪模块来记录日志，用户需要执行以下步骤：

1. 在目标端，需要安装特殊的类 `vprintf` 函数 `esp_appttrace_vprintf()`，该函数负责将日志数据发送给主机，使用方法为 `esp_log_set_vprintf(esp_appttrace_vprintf);`。如需将日志数据再次重定向给 UART，请使用 `esp_log_set_vprintf(vprintf);`。
2. 按照 [特定应用程序的跟踪](#) 章节中的第 2-5 步进行操作。
3. 打印接收到的日志记录，请在终端运行以下命令：`$IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file`。

**Log Trace Processor 命令选项** 命令用法：

```
logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>
```

位置参数 (必要)：

**trace\_file** 日志跟踪文件的路径。

**elf\_file** 程序 ELF 文件的路径。

可选参数：

**-h, --help** 显示此帮助信息并退出。  
**--no-errors, -n** 不打印错误信息。

### 基于 SEGGER SystemView 的系统行为分析

ESP-IDF 中另一个基于应用层跟踪库的实用功能是系统级跟踪，它会生成与 SEGGER SystemView 工具相兼容的跟踪信息。SEGGER SystemView 是一款实时记录和可视化工具，用来分析应用程序运行时的行为，可通过 UART 接口实时查看事件。

**如何使用** 若需使用这个功能，需要在 menuconfig 中开启 `CONFIG_APPTRACE_SV_ENABLE` 选项，具体路径为 Component config > Application Level Tracing > FreeRTOS SystemView Tracing。同一菜单栏下还开启了其它几个选项：

1. *SystemView destination*。选择需要使用的接口：JTAG 或 UART。使用 UART 接口时，可以将 SystemView 应用程序直接连接到 ESP32-C3 并实时接收数据。
2. *ESP32-C3 timer to use as SystemView timestamp source* (`CONFIG_APPTRACE_SV_TS_SOURCE`)。选择 SystemView 事件使用的时间戳来源。在单核模式下，使用 ESP32-C3 内部的循环计数器生成时间戳，其最大的工作频率是 240 MHz（时间戳粒度大约为 4 ns）。在双核模式下，使用工作在 40 MHz 的外部定时器，因此时间戳粒度为 25 ns。
3. 可以单独启用或禁用的 SystemView 事件集合 (`CONFIG_APPTRACE_SV_EVT_XXX`):
  - Trace Buffer Overflow Event
  - ISR Enter Event
  - ISR Exit Event
  - ISR Exit to Scheduler Event
  - Task Start Execution Event
  - Task Stop Execution Event
  - Task Start Ready State Event
  - Task Stop Ready State Event
  - Task Create Event
  - Task Terminate Event
  - System Idle Event
  - Timer Enter Event
  - Timer Exit Event

ESP-IDF 中已经包含了所有用于生成兼容 SystemView 跟踪信息的代码，用户只需配置必要的项目选项（如上所示），然后构建、烧写映像到目标板，接着参照前面的介绍，使用 OpenOCD 收集数据。

4. 想要通过 UART 接口进行实时跟踪，请在菜单配置选项 Component config > Application Level Tracing > FreeRTOS SystemView Tracing 中选择 Pro 或 App CPU。

### OpenOCD SystemView 跟踪命令选项 命令用法：

```
esp sysview [start <options>] | [stop] | [status]
```

子命令：

**start** 开启跟踪（连续流模式）。

**stop** 停止跟踪。

**status** 获取跟踪状态。

Start 子命令语法：

```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

**outfile1** 保存 PRO CPU 数据的文件路径。此参数需要具有如下格式：file://path/to/file。

**outfile2** 保存 APP CPU 数据的文件路径。此参数需要具有如下格式：file://path/to/file。

**poll\_period** 跟踪数据的轮询周期（单位：毫秒）。如果该值大于 0，则命令以非阻塞的模式运行。默认为 1 毫秒。

**trace\_size** 最多要收集的数据量（单位：字节）。当收到指定数量的数据后，将停止跟踪。默认值是 -1（禁用跟踪大小停止触发器）。

**stop\_tmo** 空闲超时（单位：秒）。如果指定的时间内没有数据，将停止跟踪。默认值是 -1（禁用跟踪超时停止触发器）。

**备注：**如果 `poll_period` 为 0，则在跟踪停止之前，OpenOCD 的 `telnet` 命令行将不可用。你需要复位板卡，或者在 OpenOCD 的窗口（非 `telnet` 会话窗口）输入 `Ctrl+C` 命令，手动停止跟踪。另一个办法是设置 `trace_size`，等到收集满指定数量的数据后自动停止跟踪。

命令使用示例：

1. 将 SystemView 跟踪数据收集到文件 `pro-cpu.SVdat` 和 `app-cpu.SVdat` 中。这些文件会被保存在 `openocd-esp32` 目录中。

```
esp sysview start file://pro-cpu.SVdat file://app-cpu.SVdat
```

跟踪数据被检索并以非阻塞的方式保存。要停止此过程，需要在 OpenOCD 的 `telnet` 会话窗口输入 `esp sysview stop` 命令，也可以在 OpenOCD 窗口中按下快捷键 `Ctrl+C`。

2. 检索跟踪数据并无限保存。

```
esp32 sysview start file://pro-cpu.SVdat file://app-cpu.SVdat 0 -1 -1
```

OpenOCD 的 `telnet` 命令行在跟踪停止前会无法使用，要停止跟踪，请在 OpenOCD 窗口使用 `Ctrl+C` 快捷键。

**数据可视化** 收集到跟踪数据后，用户可以使用特殊的工具对结果进行可视化并分析程序行为。

在工具中单独分析每个核的跟踪数据是比较棘手的，但是 Eclipse 提供了 *Impulse* 插件，该插件可以加载多个跟踪文件，并且可以在同一视图中检查来自两个内核的事件。此外，与免费版的 SystemView 相比，此插件没有 1,000,000 个事件的限制。

关于如何安装、配置 *Impulse* 并使用它来可视化来自单个核心的跟踪数据，请参阅 [官方教程](#)。

**备注：**ESP-IDF 使用自己的 SystemView FreeRTOS 事件 ID 映射，因此用户需要将 `$(SYSVIEW_INSTALL_DIR)/Description/SYSVIEW_FreeRTOS.txt` 替换成 `$(IDF_PATH)/tools/esp_app_trace/SYSVIEW_FreeRTOS.txt`。在使用上述链接配置 SystemView 序列化程序时，也应该使用该特定文件的内容。

## Gcov（源代码覆盖）

**Gcov 和 Gcovr 简介** 源代码覆盖率显示程序运行时间内执行的每一条程序执行路径的数量和频率。**Gcov** 是一款 GCC 工具，与编译器协同使用时，可生成日志文件，显示源文件每行的执行次数。**Gcovr** 是管理 **Gcov** 和生成代码覆盖率总结的工具。

一般来说，使用 **Gcov** 在主机上编译和运行程序会经过以下步骤：

1. 使用 GCC 以及 `--coverage` 选项编译源代码。编译器会在编译过程中生成一个 `.gcno` 注释文件，该文件包含重建执行路径块图以及将每个块映射到源代码行号等信息。每个用 `--coverage` 选项编译的源文件都会生成自己的同名 `.gcno` 文件（如 `main.c` 在编译时会生成 `main.gcno`）。
2. 执行程序。在执行过程中，程序会生成 `.gcda` 数据文件。这些数据文件包含了执行路径的统计。程序将为每个用 `--coverage` 选项编译的源文件生成一个 `.gcda` 文件（如 `main.c` 将生成 `main.gcda`）。
3. **Gcov** 或 **Gcovr** 可用于生成基于 `.gcno`、`.gcda` 和源文件的代码覆盖。**Gcov** 将以 `.gcov` 文件的形式为每个源文件生成基于文本的覆盖报告，而 **Gcovr** 将以 HTML 格式生成覆盖报告。

**ESP-IDF 中的 Gcov 和 Gcovr 应用** 在 ESP-IDF 中使用 **Gcov** 的过程比较复杂，因为程序不在主机上运行，而在目标机上运行。代码覆盖率数据（即 `.gcda` 文件）最初存储在目标机上，OpenOCD 在运行时通过 JTAG 将代码覆盖数据从目标机转储到主机上。在 ESP-IDF 中使用 **Gcov** 可以分为以下几个步骤：

1. [为 Gcov 设置项目](#)

2. 转储代码覆盖数据
3. 生成代码覆盖报告

## 为 Gcov 设置项目

**编译器选项** 为了获取项目中的代码覆盖率数据，必须用 `--coverage` 选项编译项目中的一个或多个源文件。在 ESP-IDF 中，这可以在组件级或单个源文件级实现：

- 在组件的 `CMakeLists.txt` 文件中添加 `target_compile_options(${COMPONENT_LIB} PRIVATE --coverage)` 可确保使用 `--coverage` 选项编译组件中的所有源文件。
- 在组件的 `CMakeLists.txt` 文件中添加 `set_source_files_properties(source1.c source2.c PROPERTIES COMPILE_FLAGS --coverage)` 可确保使用 `--coverage` 选项编译同一组件中选定的某些源文件（如 `source1.c` 和 `source2.c`）。

当一个源文件用 `--coverage` 选项编译时（例如 `gcov_example.c`），编译器会在项目的构建目录下生成 `gcov_example.gcno` 文件。

**项目配置** 在构建有源代码覆盖的项目之前，请运行 `idf.py menuconfig` 以启用以下项目配置选项。

- 通过 `CONFIG_APPTRACE_DESTINATION1` 选项选择 Trace Memory 来启用应用程序跟踪模块。
- 通过 `CONFIG_APPTRACE_GCOV_ENABLE` 选项启用 Gcov 主机。

**转储代码覆盖数据** 一旦项目使用 `--coverage` 选项编译并烧录到目标机上，在应用程序运行时，代码覆盖数据将存储在目标机内部（即在跟踪存储器中）。将代码覆盖率数据从目标机转移到主机上的过程称为转储。

覆盖率数据的转储通过 OpenOCD 进行（关于如何设置和运行 OpenOCD，请参考 [JTAG 调试](#)）。由于该过程需要通过向 OpenOCD 发出命令来触发转储，因此必须打开 telnet 会话，以向 OpenOCD 发出这些命令（运行 `telnet localhost 4444`）。GDB 也可以代替 telnet 来向 OpenOCD 发出命令，但是所有从 GDB 发出的命令都需要以 `mon <ocd_command>` 为前缀。

当目标机转储代码覆盖数据时，`.gcda` 文件存储在项目的构建目录中。例如，如果 `main` 组件的 `gcov_example_main.c` 在编译时使用了 `--coverage` 选项，那么转储代码覆盖数据将在 `build/esp-idf/main/CMakeFiles/_idf_main.dir/gcov_example_main.c.gcda` 中生成 `gcov_example_main.gcda` 文件。注意，编译过程中产生的 `.gcno` 文件也放在同一目录下。

代码覆盖数据的转储可以在应用程序的整个生命周期内多次进行。每次转储都会用最新的代码覆盖信息更新 `.gcda` 文件。代码覆盖数据是累积的，因此最新的数据将包含应用程序整个生命周期中每个代码路径的总执行次数。

ESP-IDF 支持两种将代码覆盖数据从目标机转储到主机的方法：

- 运行中实时转储
- 硬编码转储

**运行中实时转储** 通过 telnet 会话调用 OpenOCD 命令 `ESP32-C3 gcov` 来触发运行时的实时转储。一旦被调用，OpenOCD 将立即抢占 ESP32-C3 的当前状态，并执行内置的 ESP-IDF Gcov 调试存根函数。调试存根函数将数据转储到主机。完成后，ESP32-C3 将恢复当前状态。

**硬编码转储** 硬编码转储是由应用程序本身从程序内部调用 `esp_gcov_dump()` 函数触发的。在调用时，应用程序将停止并等待 OpenOCD 连接，同时检索代码覆盖数据。一旦 `esp_gcov_dump()` 函数被调用，主机将通过 telnet 会话执行 `esp gcov dump OpenOCD` 命令，该命令会将 OpenOCD 连接到 ESP32-C3，检索代码覆盖数据，然后断开与 ESP32-C3 的连接，从而恢复应用程序。在应用程序的生命周期中可多次触发硬编码转储。

在必要时（如应用程序初始化后或是应用程序主循环的每次迭代期间）放置 `esp_gcov_dump()`，当应用程序在生命周期的某刻需要代码覆盖率数据时，硬编码转储会非常有用。

GDB 可以用来在 `esp_gcov_dump()` 上设置断点，然后使用 `gdbinit` 脚本自动调用 `mon esp gcov dump`（关于 GDB 的使用可参考[使用命令行调试](#)）。

以下 GDB 脚本将在 `esp_gcov_dump()` 处添加一个断点，然后调用 `mon esp gcov dump OpenOCD` 命令。

```
b esp_gcov_dump
commands
mon esp gcov dump
end
```

**备注：** 注意，所有的 OpenOCD 命令都应该在 GDB 中以 `mon <occd_command>` 方式调用。

**生成代码覆盖报告** 一旦代码覆盖数据被转储，`.gcno`、`.gcda` 和源文件可以用来生成代码覆盖报告。该报告会显示源文件中每行被执行的次数。

`Gcov` 和 `Gcovr` 都可以用来生成代码覆盖报告。安装 Xtensa 工具链时会一起安装 `Gcov`，但 `Gcovr` 可能需要单独安装。关于如何使用 `Gcov` 或 `Gcovr`，请参考[Gcov 文档](#)和[Gcovr 文档](#)。

**在工程中添加 Gcovr 构建目标** 用户可以在自己的工程中定义额外的构建目标，从而通过一个简单的构建命令即可更方便地生成报告。

请在工程的 `CMakeLists.txt` 文件中添加以下内容：

```
include($ENV{IDF_PATH}/tools/cmake/gcov.cmake)
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

可使用以下命令：

- `cmake --build build/ --target gcovr-report:` 在 `$(BUILD_DIR_BASE)/coverage_report/html` 目录下生成 HTML 格式代码覆盖报告。
- `cmake --build build/ --target cov-data-clean:` 删除所有代码覆盖数据文件。

## 4.2 应用程序的启动流程

本文将介绍 ESP32-C3 从上电到运行 `app_main` 函数中间所经历的步骤（即启动流程）。

宏观上，该启动流程可以分为如下 3 个步骤：

1. **一级引导程序** 被固化在了 ESP32-C3 内部的 ROM 中，它会从 flash 的 0x0 偏移地址处加载二级引导程序至 RAM (IRAM & DRAM) 中。
2. **二级引导程序** 从 flash 中加载分区表和主程序镜像至内存中，主程序中包含了 RAM 段和通过 flash 高速缓存映射的只读段。
3. **应用程序启动阶段** 运行，这时第二个 CPU 和 RTOS 的调度器启动。

下面会对上述过程进行更为详细的阐述。

### 4.2.1 一级引导程序

SoC 复位后，CPU 会立即开始运行，执行所有的初始化操作。复位向量代码位于 ESP32-C3 芯片掩膜 ROM 处，且不能被修改。

复位向量调用的启动代码会根据 `GPIO_STRAP_REG` 寄存器的值来确定 ESP32-C3 的启动模式，该寄存器保存着复位后 `bootstrap` 引脚的电平状态。根据不同的复位原因，程序会执行如下操作：

1. 从深度睡眠模式复位：如果 `RTC_CNTL_STORE6_REG` 寄存器的值非零，且 `RTC_CNTL_STORE7_REG` 寄存器中的 `RTC` 内存的 `CRC` 校验值有效，那么程序会使用 `RTC_CNTL_STORE6_REG` 寄存器的值作为入口地址，并立即跳转到该地址运行。如果 `RTC_CNTL_STORE6_REG` 的值为零，或 `RTC_CNTL_STORE7_REG` 中的 `CRC` 校验值无效，又或通过 `RTC_CNTL_STORE6_REG` 调用的代码返回，那么则像上电复位一样继续启动。**注意：**如果想在`RTC_CNTL_STORE6_REG` 调用代码中运行自定义的代码，可以参考[深度睡眠](#)文档里面介绍的深度睡眠存根机制方法。
2. 上电复位、软件 SoC 复位、看门狗 SoC 复位：检查 `GPIO_STRAP_REG` 寄存器，判断是否请求自定义启动模式，如 `UART` 下载模式。如果是，ROM 会执行此自定义加载模式，否则会像软件 CPU 复位一样继续启动。请参考 `ESP32-C3` 技术规格书了解 SoC 启动模式以及具体执行过程。
3. 软件 CPU 复位、看门狗 CPU 复位：根据 `EFUSE` 中的值配置 `SPI flash`，然后尝试从 `flash` 中加载代码，这部分将会在后面一小节详细介绍。

---

**备注：**正常启动模式下会使能 `RTC` 看门狗，因此，如果进程中断或停止，看门狗将自动重置 `SOC` 并重新启动过程。如果 `strapping GPIOs` 已更改，则可能导致 `SoC` 陷入新的启动模式。

---

## 4.2.2 二级引导程序

在 `ESP-IDF` 中，存放在 `flash` 的 `0x0` 偏移地址处的二进制镜像就是二级引导程序。二级引导程序的源码可以在 `ESP-IDF` 的 `components/bootloader` 目录下找到。`ESP-IDF` 使用二级引导程序可以增加 `flash` 分区的灵活性（使用分区表），并且方便实现 `flash` 加密，安全引导和空中升级（`OTA`）等功能。

当一级引导程序校验并加载完二级引导程序后，它会从二进制镜像的头部找到二级引导程序的入口点，并跳转过去运行。

二级引导程序默认从 `flash` 的 `0x8000` 偏移地址处（可配置的值）读取分区表。请参考[分区表](#)获取详细信息。引导程序会寻找工厂分区和 `OTA` 应用程序分区。如果在分区表中找到了 `OTA` 应用程序分区，引导程序将查询 `otadata` 分区以确定应引导哪个分区。更多信息请参考[空中升级 \(OTA\)](#)。

关于 `ESP-IDF` 引导程序可用的配置选项，请参考[引导加载程序 \(Bootloader\)](#)。

对于选定的分区，二级引导程序将从 `flash` 逐段读取二进制镜像：

- 对于在内部 `IRAM`（指令 `RAM`）或 `DRAM`（数据 `RAM`）中具有加载地址的段，将把数据从 `flash` 复制到它们的加载地址处。
- 对于一些加载地址位于 `DROM`（数据存储在 `flash` 中）或 `IROM`（代码从 `flash` 中运行）区域的段，通过配置 `flash MMU`，可为从 `flash` 到加载地址提供正确的映射。

一旦处理完所有段（即加载了代码并设置了 `flash MMU`），二级引导程序将验证应用程序的完整性，并从二进制镜像文件的头部寻找入口地址，然后跳转到该地址处运行。

## 4.2.3 应用程序启动阶段

应用程序启动包含了从应用程序开始执行到 `app_main` 函数在任务内部运行前的所有过程。可分为三个阶段：

- 硬件和基本 C 语言运行环境的端口初始化。
- 软件服务和 `FreeRTOS` 的系统初始化。
- 运行主任务并调用 `app_main`。

---

**备注：**通常不需要了解 `ESP-IDF` 应用程序初始化的所有阶段。如果需要仅从应用程序开发人员的角度了解初始化，请跳至[运行主任务](#)。

---

## 端口初始化

ESP-IDF 应用程序的入口是 `components/esp_system/port/cpu_start.c` 文件中的 `call_start_cpu0` 函数。这个函数由二级引导加载程序执行，并且从不返回。

该端口层的初始化功能会初始化基本的 C 运行环境 (“CRT”)，并对 SoC 的内部硬件进行了初始配置。

- 为应用程序重新配置 CPU 异常（允许应用程序中断处理程序运行，并使用为应用程序配置的选项来处理 **严重错误**，而不是使用 ROM 提供的简易版错误处理程序处理。
- 如果没有设置选项 `CONFIG_BOOTLOADER_WDT_ENABLE`，则不使能 RTC 看门狗定时器。
- 初始化内部存储器（数据和 bss）。
- 完成 MMU 高速缓存配置。
- 将 CPU 时钟设置为项目配置的频率。
- 如果配置了内存保护，则初始化内存保护。

`call_start_cpu0` 完成运行后，将调用在 `components/esp_system/startup.c` 中找到的“系统层”初始化函数 `start_cpu0`。

## 系统初始化

主要的系统初始化函数是 `start_cpu0`。默认情况下，这个函数与 `start_cpu0_default` 函数弱链接。这意味着可以覆盖这个函数，增加一些额外的初始化步骤。

主要的系统初始化阶段包括：

- 如果默认的日志级别允许，则记录该应用程序的相关信息（项目名称、[应用程序版本](#)等）。
- 初始化堆分配器（在这之前，所有分配必须是静态的或在堆栈上）。
- 初始化 newlib 组件的系统调用和时间函数。
- 配置断电检测器。
- 根据 [串行控制台配置](#) 设置 `libc` `stdin`、`stdout`、和 `stderr`。
- 执行与安全有关的检查，包括为该配置烧录 `efuse`（包括[永久限制 ROM 下载模式](#)）。
- 初始化 SPI flash API 支持。
- 调用全局 C++ 构造函数和任何标有 `__attribute__((constructor))` 的 C 函数。

二级系统初始化允许单个组件被初始化。如果一个组件有一个用 `ESP_SYSTEM_INIT_FN` 宏注释的初始化函数，它将作为二级初始化的一部分被调用。

## 运行主任务

在所有其他组件都初始化后，主任务会被创建，FreeRTOS 调度器开始运行。

做完一些初始化任务后（需要启动调度器），主任务在固件中运行应用程序提供的函数 `app_main`。

运行 `app_main` 的主任务有一个固定的 RTOS 优先级（比最小值高）和一个可配置的堆栈大小。

与普通的 FreeRTOS 任务（或嵌入式 C 的 `main` 函数）不同，`app_main` 任务可以返回。如果“`app_main`”函数返回，那么主任务将会被删除。系统将运行其他的 RTOS 任务。因此可以将 `app_main` 实现为一个创建其他应用任务然后返回的函数，或主应用任务本身。

## 4.3 BluFi

### 4.3.1 概览

BluFi 是一项基于蓝牙通道的 Wi-Fi 网络配置功能，适用于 ESP32-C3。它通过安全协议将 Wi-Fi 的 SSID、密码等配置信息传输到 ESP32-C3。基于这些信息，ESP32-C3 可进而连接到 AP 或建立 SoftAP。

BluFi 流程的关键部分包括数据的分片、加密以及校验和验证。

用户可按需自定义用于对称加密、非对称加密以及校验的算法。此处，我们采用 DH 算法进行密钥协商，128-AES 算法用于数据加密，CRC16 算法用于校验和验证。

### 4.3.2 BluFi 流程

BluFi 配网流程包含配置 SoftAP 和配置 Station 两部分。

下面以配置 Station 为例，介绍了广播、连接、服务发现、协商共享密钥、传输数据、回传连接状态等关键步骤。

1. ESP32-C3 开启 GATT Server 模式，发送带有特定 *advertising data* 的广播。该广播不属于 BluFi Profile，可以按需对其进行自定义。
2. 使用手机应用程序搜索到该广播后，手机将作为 GATT Client 连接 ESP32-C3。该步骤对具体使用哪款手机应用程序并无特殊要求。
3. 成功建立 GATT 连接后，手机会向 ESP32-C3 发送数据帧进行密钥协商（详见 [BluFi 中定义的帧格式](#)）。
4. ESP32-C3 收到密钥协商的数据帧后，会按照自定义的协商方法进行解析。
5. 手机与 ESP32-C3 进行密钥协商。协商过程可使用 DH/RSA/ECC 等加密算法。
6. 协商结束后，手机端向 ESP32-C3 发送控制帧，用于设置安全模式。
7. ESP32-C3 收到控制帧后，使用共享密钥以及安全配置对通信数据进行加密和解密。
8. 手机向 ESP32-C3 发送 [BluFi 中定义的帧格式](#) 中定义的数据帧，包括 SSID、密码等 Wi-Fi 配置信息。
9. 手机向 ESP32-C3 发送 Wi-Fi 连接请求的控制帧。ESP32-C3 收到控制帧后，即默认手机已完成必要信息的传输，准备连接 Wi-Fi。
10. 连接到 Wi-Fi 后，ESP32-C3 发送 Wi-Fi 连接状态报告的控制帧到手机。至此，配网结束。

#### 备注:

1. ESP32-C3 收到安全模式配置的控制帧后，会根据定义的安全模式进行相关操作。
2. 进行对称加密和解密时，加密和解密前后的数据长度必须一致。支持原地加密和解密。

### 4.3.3 BluFi 流程图

#### 4.3.4 BluFi 中定义的帧格式

手机应用程序与 ESP32-C3 之间的 BluFi 通信格式定义如下：

帧不分片格式：

字段	值 (字节)
类型 (最低有效位)	1
帧控制	1
序列号	1
数据长度	1
数据	{Data Length}
校验 (最高有效位)	2

如果使能 **帧控制** 字段中的分片位，则 **数据** 字段中会出现 2 字节的内容总长度。该内容总长度表示帧的剩余部分的总长度，并用于报告终端需要分配的内存大小。

帧分片格式：

图 2: BluFi Flow Chart

字段	值 (字节)
类型 (最低有效位)	1
帧控制 (分片)	1
序列号	1
数据长度	1
数据	<ul style="list-style-type: none"> <li>内容总长度: 2</li> <li>数据内容长度: <math>\{\text{Data Length}\} - 2</math></li> </ul>
校验 (最高有效位)	2

通常情况下，控制帧不包含数据位，ACK 帧类型除外。

ACK 帧格式 (8 bit):

字段	值 (字节)
类型 - ACK (最低有效位)	1
帧控制	1
序列号	1
数据长度	1
数据	ACK 序列号: 2
校验 (最高有效位)	2

#### 1. 类型字段

**类型**字段占 1 字节，分为 **类型**和 **子类型**两部分。其中，**类型**占低 2 位，表明该帧为数据帧或是控制帧；**子类型**占高 6 位，表示此数据帧或者控制帧的具体含义。

- 控制帧，暂不进行加密，可校验。
- 数据帧，可加密，可校验。

##### 1.1 控制帧 (二进制: 0x0 b' 00)

控制帧	含义	解释	备注
0x0 (b' 000000)	ACK	ACK 帧的数据字段使用回复对象帧的序列值。	数据字段占用 1 字节，其序列值与回复对象帧的序列值相同。
0x1 (b' 000001)	将 ESP 设备设置为安全模式。	通知 ESP 设备发送数据时使用的安全模式，在数据发送过程中可多次重置。设置后，将影响后续使用的安全模式。 如果不设置，ESP 设备将默认发送不带校验和加密的控制帧和数据帧。从手机到 ESP 设备的数据传输是由这个控制帧控制的。	数据字段占一个字节。高 4 位用于控制帧的安全模式设置，低 4 位用于数据帧的安全模式设置。 <ul style="list-style-type: none"> <li>• b' 0000: 无校验、无加密;</li> <li>• b' 0001: 有校验、无加密;</li> <li>• b' 0010: 无校验、有加密;</li> <li>• b' 0011: 有校验、有加密。</li> </ul>
0x2 (b' 000010)	设置 Wi-Fi 的 op-mode。	该帧包含设置 ESP 设备 Wi-Fi 模式 (opmode) 的设置信息。	data[0] 用于设置 opmode，包括： <ul style="list-style-type: none"> <li>• 0x00: NULL</li> <li>• 0x01: STA</li> <li>• 0x02: SoftAP</li> <li>• 0x03: SoftAP &amp; STA</li> </ul> 如果设置中包含 AP，请尽量优先设置 AP 模式的 SSID/密码/最大连接数等。
0x3 (b' 000011)	将 ESP 设备连接至 AP。	通知 ESP 设备必要的信息已经发送完毕，可以连接至 AP。	不包含数据字段。
0x4 (b' 000100)	断开 ESP 设备与 AP 的连接。		不包含数据字段。
0x5 (b' 000101)	获取 ESP 设备的 Wi-Fi 模式和状态等信息。		<ul style="list-style-type: none"> <li>• 不包含数据字段。ESP 设备收到此控制帧后，会向手机回发一个报告 Wi-Fi 连接状态的帧来告知手机端当前所处的 opmode、连接状态、SSID 等信息。</li> <li>• 提供给手机端的信息类型由手机上的应用程序决定。</li> </ul>
0x6 (b' 000110)	断开 STA 设备与 SoftAP 的连接 (SoftAP 模式)。		data[0~5] 为 STA 设备的 MAC 地址。如有多个 STA 设备，则第二个使用 data[6-11]，依次类推。
0x7 (b' 000111)	获取版本信息。		
0x8 (b' 001000)	断开 BLE GATT 连接。		ESP 设备收到该指令后主动断开 BLE GATT 连接。
0x9 (b' 001001)	获取 Wi-Fi 列表。	通知 ESP 设备扫描周围的 Wi-Fi 热点。	不包含数据字段。ESP 设备收到此控制帧后，会向手机回发一个包含 Wi-Fi 热点报告的帧。

## 1.2 数据帧 (二进制: 0x1 b' 01)

数据帧	含义	解释	备注
0x0 (b' 000000)	发送协商数据。	协商数据会发送到应用层注册的回调函数中。	数据的长度取决于数据长度字段。
0x1 (b' 000001)	发送 STA 模式的 BSSID。	在 SSID 隐藏的情况下，发送 STA 设备要连接的 AP 的 BSSID。	请参考备注 1。
0x2 (b' 000010)	发送 STA 模式的 SSID	发送 STA 设备要连接的 AP 的 SSID。	请参考备注 1。
0x3 (b' 000011)	发送 STA 模式的密码。	发送 STA 设备要连接的 AP 的密码。	请参考备注 1。
0x4 (b' 000100)	发送 SoftAP 模式的 SSID。		请参考备注 1。
0x5 (b' 000101)	发送 SoftAPmode 模式的密码。		请参考备注 1。
0x6 (b' 000110)	设置 SoftAPmode 模式的连接数。		data[0] 为连接数的值，范围从 1 到 4。当传输方向是 ESP 设备到手机时，表示向手机端提供所需信息。
0x7 (b' 000111)	设置 SoftAP 的认证模式。		data[0] 包括： <ul style="list-style-type: none"> <li>• 0x00: OPEN</li> <li>• 0x01: WEP</li> <li>• 0x02: WPA_PSK</li> <li>• 0x03: WPA2_PSK</li> <li>• 0x04: WPA_WPA2_PSK</li> </ul> 若传输方向是从 ESP 设备到手机，则表示向手机端提供所需信息。
0x8 (b' 001000)	设置 SoftAP 模式的通道数量。		data[0] 代表支持的通道的数量，范围从 1 到 14。若传输方向是从 ESP 设备到手机，则表示向手机端提供所需信息。
0x9 (b' 001001)	用户名	在进行企业级加密时提供 GATT 客户端的用户名。	数据的长度取决于数据长度字段。
0xa (b' 001010)	CA 认证	在进行企业级加密时提供 CA 认证。	请参考备注 2。
0xb (b' 001011)	客户端认证	在进行企业级加密时提供客户端认证。是否包含私钥，取决于认证的内容。	请参考备注 2。
0xc (b' 001100)	服务端认证	在进行企业级加密时提供服务端认证。是否包含私钥，取决于认证的内容。	请参考备注 2。
0xd (b' 001101)	客户端私钥	在进行企业级加密时提供客户端私钥。	请参考备注 2。
0xe (b' 001110)	服务端私钥	在进行企业级加密时提供服务端私钥。	请参考备注 2。
0xf (b' 001111)	Wi-Fi 连接状态报告	通知手机 ESP 设备的 Wi-Fi 状态，包括 STA 状态和 SoftAP 状态。用于 STA 设备连接手机或 SoftAP。但是，当手机接收到 Wi-Fi 状态时，除了本帧之外，还可以回复其他帧。	data[0] 表示 opmode，包括： <ul style="list-style-type: none"> <li>• 0x00: NULL</li> <li>• 0x01: STA</li> <li>• 0x02: SoftAP</li> <li>• 0x03: SoftAP &amp; STA</li> </ul> data[1]: STA 设备的连接状态。0x0 表示处于连接状态且获得 IP 地址，0x1 表示处于非连接状态，0x2 表示处于正在连接状态，0x3 表示处于连接状态但未获得 IP 地址。 data[2]: SoftAP 的连接状态，即表示有多

**备注:**

- 备注 1: 数据的长度取决于数据长度字段。若传输方向是从 ESP 设备到手机，则表示向手机端提供所需信息。
- 备注 2: 数据的长度取决于数据长度字段。如果数据长度不够，该帧可用分片。

**2. Frame Control**

帧控制字段，占 1 字节，每个位表示不同含义。

位	含义
0x01	表示帧是否加密。 <ul style="list-style-type: none"> <li>• 1 表示加密。</li> <li>• 0 表示未加密。</li> </ul> 该帧的加密部分包括数据字段加密之前的完整明文数据（不包括校验部分）。控制帧暂不加密，故控制帧此位为 0。
0x02	该数据字段表示帧尾是否包含校验位，如 SHA1、MD5、CRC 等。该数据字段包含序列、数据长度以及明文。控制帧和数据帧都可以选择包含或不包含校验位。
0x04	表示数据方向。 <ul style="list-style-type: none"> <li>• 0 表示传输方向是从手机到 ESP 设备。</li> <li>• 1 表示传输方向是从 ESP 设备到手机。</li> </ul>
0x08	表示是否要求对方回复 ACK。 <ul style="list-style-type: none"> <li>• 0 表示不要求回复 ACK。</li> <li>• 1 表示要求回复 ACK。</li> </ul>
0x10	表示是否有后续的数据分片。 <ul style="list-style-type: none"> <li>• 0 表示此帧没有后续数据分片。</li> <li>• 1 表示还有后续数据分片，用来传输较长的数据。</li> </ul> 对于分片帧，在数据字段的前两个字节中，会给定当前内容部分和随后内容部分的总长度（即最大支持 64 K 的数据内容）。
0x10~0x80	保留

**3. 序列控制**

序列控制字段。帧发送时，无论帧的类型是什么，序列都会自动加 1，用来防止重放攻击 (Replay Attack)。每次重新连接后，序列清零。

**4. 长度**

数据字段的长度，不包含校验部分。

**5. 数据**

对于不同的类型或子类型，数据字段的含义均不同。请参考上方表格。

**6. 校验**

此字段占两个字节，用来校验序列、数据长度以及明文。

**4.3.5 ESP32-C3 端的安全实现****1. 数据安全**

为了保证 Wi-Fi SSID 和密码的传输过程是安全的，需要使用对称加密算法（例如 AES、DES 等）对报文进行加密。在使用对称加密算法之前，需要使用非对称加密算法（DH、RSA、ECC 等）协商出（或生成出）一个共享密钥。

**2. 保证数据完整性**

为了保证数据完整性，需要加入校验算法，例如 SHA1、MD5、CRC 等。

**3. 身份安全（签名）**

某些算法如 RSA 可以保证身份安全。但如 DH 这类的算法，本身不能保证身份安全，需要添加其他算法来签名。

**4. 防止重放攻击 (Replay Attack)**

添加其到序列字段中，并且在数据校验过程中使用。

在 ESP32-C3 端的代码中，你可以决定和开发如密钥协商等安全处理的流程。手机应用向 ESP32-C3 发送协商数据，数据会传送给应用层处理。如果应用层不处理，可使用 BluFi 提供的 DH 加密算法来协商密钥。

应用层需向 BluFi 注册以下几个与安全相关的函数：

```
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t *
↳**output_data, int *output_len, bool *need_free)
```

该函数用来接收协商期间的正常数据 (normal data)。数据处理完成后，需要将待发送的数据使用 `output_data` 和 `output_len` 传出。

BluFi 会在调用完 `Negotiate_data_handler` 后，发送 `Negotiate_data_handler` 传出的 `output_data`。

这里的两个 “\*” 是因为需要发出去的数据长度未知，所以需要函数自行分配 (malloc) 或者指向全局变量，并告知是否需要通过 `NEED_FREE` 释放内存。

```
typedef int (* esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int_
↳crypt_len)
```

加密和解密的数据长度必须一致。其中 IV8 为帧的 8 位序列，可作为 IV 的某 8 个位来使用。

```
typedef int (* esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int_
↳crypt_len)
```

加密和解密的数据长度必须一致。其中 IV8 为帧的 8 位序列，可作为 IV 的某 8 个位来使用。

```
typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
```

该函数用来进行校验，返回值为校验的值。BluFi 会使用该函数返回值与帧的校验值进行比较。

### 4.3.6 GATT 相关说明

#### UUID

BluFi Service UUID: 0xFFFF, 16 bit

BluFi (手机 > ESP32-C3) 特性: 0xFF01, 主要权限: 可写

BluFi (ESP32-C3 > 手机) 特性: 0xFF02, 主要权限: 可读可通知

## 4.4 Bluetooth® Overview

This document provides an architecture overview of the Bluetooth stack in ESP-IDF and some quick links to related documents and application examples.

ESP32-C3 supports Bluetooth 5.0 (LE) and is certified for Bluetooth LE 5.0.

The Bluetooth stack in ESP-IDF is a layered architecture that enables Bluetooth functionality on ESP32-C3 chip series. The table below shows its architecture.

The table below shows whether the Bluetooth modules are supported in a specific chip series.

图 3: ESP32-C3 Bluetooth Stack Architecture

Chip Series	Controller	ESP-Bluetooth	ESP-NimBLE	ESP-BLE-MESH	BluFi
ESP32	Y	Y	Y	Y	Y
ESP32-S2	–	–	–	–	–
ESP32-S3	Y	Y	Y	Y	Y
ESP32-C2	Y	Y	Y	–	Y
ESP32-C3	Y	Y	Y	Y	Y
ESP32-C6	Y	Y	Y	Y	Y
ESP32-H2	Y	Y	Y	Y	–

The following sections briefly describe each layer and provide quick links to the related documents and application examples.

#### 4.4.1 ESP Bluetooth Controller

At the bottom layer is ESP Bluetooth Controller, which encompasses various modules such as PHY, Baseband, Link Controller, Link Manager, Device Manager, and HCI. It handles hardware interface management and link management. It provides functions in the form of libraries and is accessible through APIs. This layer directly interacts with the hardware and low-level Bluetooth protocols.

- [API reference](#)
- [Application examples](#)

#### 4.4.2 Hosts

There are two hosts, ESP-Bluetooth and ESP-NimBLE. The major difference between them is as follows:

- Although both support Bluetooth LE, ESP-NimBLE requires less heap and flash size.

##### ESP-Bluetooth

ESP-Bluetooth is a modified version of the native Android Bluetooth stack, Bluetooth. It consists of two layers: the Bluetooth Upper Layer (BTU) and the Bluetooth Transport Controller layer (BTC). The BTU layer is responsible for processing bottom layer Bluetooth protocols such as L2CAP, GATT/ATT, SMP, GAP, and other profiles. The BTU layer provides an interface prefixed with "bta". The BTC layer is mainly responsible for providing a supported interface, prefixed with "esp", to the application layer, processing GATT-based profiles and handling miscellaneous tasks. All the APIs are located in the ESP\_API layer. Developers should use the Bluetooth APIs prefixed with "esp".

ESP-BlueDroid for ESP32-C3 supports Bluetooth LE only. Classic Bluetooth is not supported.

- API references
  - [Bluetooth® Common](#)
  - [Bluetooth LE](#)
- [Application examples](#)

### ESP-NimBLE

ESP-NimBLE is a host stack built on top of the NimBLE host stack developed by Apache Mynewt. The NimBLE host stack is ported for ESP32-C3 chip series and FreeRTOS. The porting layer is kept clean by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

ESP-NimBLE supports Bluetooth LE only. Classic Bluetooth is not supported.

- [Apache Mynewt NimBLE User Guide](#)
- API references
  - [NimBLE API references](#)
  - [ESP-NimBLE API references for initialization](#)
- [Application examples](#)

### 4.4.3 Profiles

Above the host stacks are the profile implementations by Espressif and some common profiles. Depending on your configuration, these profiles can run on ESP-BlueDroid or ESP-NimBLE.

### ESP-BLE-MESH

Built on top of Zephyr Bluetooth Mesh stack, the ESP-BLE-MESH implementation supports device provisioning and node control. It also supports such node features as Proxy, Relay, Low power and Friend.

- [ESP-BLE-MESH documentation](#): feature list, get started, architecture, description of application examples, frequently asked questions, etc.
- [Application examples](#)

### BluFi

The BluFi for ESP32-C3 is a Wi-Fi network configuration function via Bluetooth channel. It provides a secure protocol to pass Wi-Fi configuration and credentials to ESP32-C3. Using this information, ESP32-C3 can then connect to an AP or establish a softAP.

- [BluFi documentation](#)
- [Application examples](#)

### 4.4.4 Applications

At the uppermost layer are applications. You can build your own applications on top of the ESP-BlueDroid and ESP-NimBLE stacks, leveraging the provided APIs and profiles to create Bluetooth-enabled applications tailored to specific use cases.

## 4.5 引导加载程序 (Bootloader)

ESP-IDF 软件引导加载程序 (Bootloader) 主要执行以下任务：

1. 内部模块的最小化初始配置；
2. 如果配置了 *flash 加密* 和/或 *Secure*，则对其进行初始化。
3. 根据分区表和 *ota\_data*（如果存在）选择需要引导的应用程序 (app) 分区；
4. 将此应用程序镜像加载到 RAM (IRAM 和 DRAM) 中，最后把控制权转交给此应用程序。

引导加载程序位于 flash 的 0x0 偏移地址处。

关于启动过程以及 ESP-IDF 引导加载程序的更多信息，请参考 [应用程序的启动流程](#)。

### 4.5.1 引导加载程序兼容性

建议使用最新发布的 *ESP-IDF* 版本。OTA（空中升级）更新可以在现场烧录新的应用程序，但不能烧录一个新的引导加载程序。因此，引导加载程序支持引导从 ESP-IDF 新版本中构建的应用程序。

但不支持引导从 ESP-IDF 旧版本中构建的程序。如果现有产品可能需要将应用程序降级到旧版本，那么在手动更新 ESP-IDF 时，请继续使用旧版本 ESP-IDF 引导加载程序的二进制文件。

---

**备注：**如果在生产中测试现有产品的 OTA 更新，请确保测试中使用的 ESP-IDF 引导加载程序二进制文件与生产中部署的相同。

---

### 配置 SPI flash

每个 ESP-IDF 应用程序或引导加载程序的二进制文件中都包含一个文件头，其中内置了 *CONFIG\_ESPTOOLPY\_FLASHMODE*、*CONFIG\_ESPTOOLPY\_FLASHFREQ*、和 *CONFIG\_ESPTOOLPY\_FLASHSIZE*。这些是用于在启动时配置 SPI flash。

ROM 中的一级引导程序从 flash 中读取二级引导程序文件头中的配置信息，并使用这些信息来加载剩余的二级引导程序。然而，此时系统的时钟速度低于其被配置的速度，并且在这个阶段，只支持部分 flash 模式。因此，当二级引导程序运行时，它会从当前应用程序的二进制文件头中读取数据（而不是从引导加载程序的文件头中读取数据），并使用这些数据重新配置 flash。这样的配置流程可让 OTA 更新去更改当前使用的 SPI flash 的配置。

### 4.5.2 日志级别

引导加载程序日志的级别默认为“Info”。通过设置 *CONFIG\_BOOTLOADER\_LOG\_LEVEL* 选项，可以增加或减少这个等级。这个日志级别与应用程序中使用的日志级别是分开的（见 *Logging library*）。

降低引导加载程序日志的详细程度可以稍微缩短整个项目的启动时间。

### 4.5.3 恢复出厂设置

在更新出现问题时，最好能有一种方法让设备回到已知的正常状态，这时可选择恢复出厂设置。

要回到原始出厂设置并清除所有用户设置，请在引导加载程序中配置 *CONFIG\_BOOTLOADER\_FACTORY\_RESET*。

以下两种方式可以将设备恢复出厂设置。

- 清除一个或多个数据分区。 *CONFIG\_BOOTLOADER\_DATA\_FACTORY\_RESET* 选项允许用户选择哪些数据分区在恢复出厂设置时需要被擦除。用户可以使用以逗号分隔的列表形式指定分区的名称，为了提高可读性，可以选择添加空格（如： *nvs*, *phy\_init*, *nvs\_custom*）。

请确保选项里指定的分区名称和分区表中的名称相同。此处不能指定“app”类型的分区。

- 从“工厂”应用分区启动。当启用 `CONFIG_BOOTLOADER_OTA_DATA_ERASE` 选项，恢复出厂设置后，设备将从默认的“工厂”应用分区启动（如果分区表中没有“工厂”应用分区，则从默认的 OTA 应用分区启动）。这个恢复过程是通过擦除 OTA 数据分区来完成的，OTA 数据分区中保存了当前选择的 OTA 分区槽。“工厂”应用分区槽（如果存在）永远不会通过 OTA 更新，因此重置为从“工厂”应用分区启动则意味着让固件应用程序恢复正常状态。

这两个配置选项都可以独立启用。

此外，以下配置选项用于配置触发恢复出厂设置的条件：

- `CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET` - 输入管脚 (GPIO) 的编号，该管脚用于触发恢复出厂设置。必须在重置时将此管脚拉低或拉高（可配置）才能触发出厂重置事件。
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO` - 管脚电平保持时间（默认为 5 秒）。设备重置后，管脚电平必须保持该设定的时间，才能执行恢复出厂设置或引导测试分区（如适用）。
- `CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL` - 设置管脚电平高低。设备重置后，根据此设置将管脚拉高或拉低，才能触发出厂重置事件。如果管脚具有内部上拉，则上拉会在管脚采样前生效。有关管脚内部上拉的详细信息，请参考 ESP32-C3 的技术规格书。

如果应用程序需要知道设备是否触发了出厂重置，可以通过调用 `bootloader_common_get_rtc_retain_mem_factory_reset_state()` 函数来确定：

- 如果读取到设备出厂重置状态为 `true`，会返回状态 `true`，说明设备已经触发出厂重置。此后会重置状态为 `false`，以便后续的出厂重置触发判断。
- 如果读取到设备出厂重置状态为 `false`，会返回状态 `false`，说明设备并未触发出厂重置，或者保存此状态的内存区域已失效。

同时需要注意该功能需要占用部分 RTC FAST 内存（占用的内存与 `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` 大小相同）。

#### 4.5.4 从测试固件启动

用户可以编写特殊固件用于生产环境中测试，并在需要的时候运行。此时需要在项目分区表中专门申请一块分区用于保存该测试固件，其类型为 `app`，子类型为 `test`（详情请参考分区表）。

实现该测试应用固件需要为测试应用创建一个完全独立的 ESP-IDF 项目（ESP-IDF 中的每个项目仅构建一个应用）。该测试应用可以独立于主项目进行开发和测试，然后在生成测试时作为一个预编译 `.bin` 文件集成到主项目的测试应用程序分区的地址。

要在主项目的引导加载程序中支持这个功能，请设置 `CONFIG_BOOTLOADER_APP_TEST` 并配置以下三个选项：

- `CONFIG_BOOTLOADER_NUM_PIN_APP_TEST` - 设置启动 TEST 分区的管脚编号，该管脚将被配置为输入并启用内部上拉。要触发测试应用，必须在重置时将此管脚拉低或拉高（可配置）。  
释放管脚输入并重启设备后，将重新启用默认的启动顺序，即启动工厂分区或任意 OTA 应用分区槽。
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO` - 设置 GPIO 电平保持的时间，默认为 5 秒。设备重置后，管脚电平必须保持该设定的时间，才能执行恢复出厂设置或引导测试分区（如适用）。
- `CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL` - 配置应在 GPIO 的高电平还是低电平上触发测试分区启动。若 GPIO 有内部上拉，则该功能在采样管脚前就会被启用。关于管脚内部上拉的详细信息，请参考 ESP32-C3 数据规格书。

#### 4.5.5 回滚

回滚和反回滚功能也必须在引导程序中配置。

请参考 [OTA API 参考文档](#) 中的 [应用程序回滚](#) 和 [防回滚](#) 章节。

## 4.5.6 看门狗

默认情况下，硬件 RTC 看门狗定时器在引导加载程序运行时保持运行，如果 9 秒后没有应用程序成功启动，它将自动重置芯片。

- 可以通过设置 `CONFIG_BOOTLOADER_WDT_TIME_MS` 并重新编译引导加载程序来调整超时时间。
- 可以通过调整应用程序的行为使 RTC 看门狗在应用程序启动后保持启用。看门狗需要由应用程序显式地重置（即“喂狗”），以避免重置。为此，请设置 `CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE` 选项，根据需要修改应用程序，然后重新编译应用程序。
- 通过禁用 `CONFIG_BOOTLOADER_WDT_ENABLE` 设置并重新编译引导加载程序，可以在引导加载程序中禁用 RTC 看门狗，但并不建议这样做。

## 4.5.7 引导加载程序大小

当需要启用额外的引导加载程序功能，包括 `flash` 加密或安全启动，尤其是设置高级别 `CONFIG_BOOTLOADER_LOG_LEVEL` 时，监控引导加载程序 `.bin` 文件的大小变得非常重要。

当使用默认的 `CONFIG_PARTITION_TABLE_OFFSET` 值 `0x8000` 时，二进制文件最大可为 `0x8000` 字节。

如果引导加载程序二进制文件过大，则引导加载程序会构建失败并显示“Bootloader binary size [..] is too large for partition table offset”的错误。如果此二进制文件已经被烧录，那么 ESP32-C3 将无法启动 - 日志中将记录无效分区表或无效引导加载程序校验和的错误。

可以使用如下方法解决此问题：

- 将 `bootloader` 编译器优化重新设置回默认值“Size”。
- 降低引导加载程序日志级别。将日志级别设置为 Warning, Error 或 None 都会显著减少最终二进制文件的大小（但也可能会让调试变得更加困难）。
- 将 `CONFIG_PARTITION_TABLE_OFFSET` 设置为高于 `0x8000` 的值，以便稍后将分区表放置在 `flash` 中，这样可以增加引导加载程序的可用空间。如果分区表的 CSV 文件包含明确的分区偏移量，则需要修改这些偏移量，从而保证没有分区的偏移量低于 `CONFIG_PARTITION_TABLE_OFFSET + 0x1000`。（这包括随 ESP-IDF 提供的默认分区 CSV 文件）

当启用 Secure Boot V2 时，由于引导加载程序最先加载到固定大小的缓冲区中进行验证，对二进制文件大小的绝对限制为 64 KB (`0x10000 bytes`)（不包括 4 KB 签名）。

## 4.5.8 从深度睡眠中快速启动

引导加载程序有 `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` 选项，可以减少从深度睡眠中唤醒的时间（有利于降低功耗）。当 `CONFIG_SECURE_BOOT` 选项禁用时，该选项可用。由于无需镜像校验，唤醒时间减少。在第一次启动时，引导加载程序将启动的应用程序的地址存储在 RTC FAST 存储器中。而在唤醒过程中，这个地址用于启动而无需任何检查，从而实现了快速加载。

## 4.5.9 自定义引导加载程序

用户可以扩展或修改当前的引导加载程序，具体有两种方法：使用钩子实现或重写覆盖当前程序。这两种方法在 ESP-IDF 示例的 `custom_bootloader` 文件夹中都有呈现。

- `bootloader_hooks` 介绍了如何将钩子与引导加载程序初始化连接。
- `bootloader_override` 介绍了如何覆盖引导加载程序的实现。

在引导加载程序的代码中，用户不能使用其他组件提供的驱动和函数，如果确实需要，请将该功能的实现部分放在项目的 `bootloader_components` 目录中（注意，这会增加引导加载程序的大小）。

如果引导加载程序过大，则可能与内存中的分区表重叠，分区表默认烧录在偏移量 `0x8000` 处。增加分区表偏移量，将分区表放在 `flash` 中靠后的区域，这样可以增加引导程序的可用空间。

## 4.6 构建系统

本文档主要介绍 ESP-IDF 构建系统的实现原理以及 组件等相关概念。如需了解如何组织和构建新的 ESP-IDF 项目或组件，请阅读本文档。

### 4.6.1 概述

一个 ESP-IDF 项目可以看作是多个不同组件的集合，例如一个显示当前湿度的网页服务器会包含以下组件：

- ESP-IDF 基础库，包括 `libc`、`ROM bindings` 等
- Wi-Fi 驱动
- TCP/IP 协议栈
- FreeRTOS 操作系统
- 网页服务器
- 湿度传感器的驱动
- 负责将上述组件整合到一起的主程序

ESP-IDF 可以显式地指定和配置每个组件。在构建项目的时候，构建系统会前往 ESP-IDF 目录、项目目录和用户自定义组件目录（可选）中查找所有组件，允许用户通过文本菜单系统配置 ESP-IDF 项目中用到的每个组件。在所有组件配置结束后，构建系统开始编译整个项目。

#### 概念

- 项目特指一个目录，其中包含了构建可执行应用程序所需的全部文件和配置，以及其他支持型文件，例如分区表、数据/文件系统分区和引导程序。
- 项目配置保存在项目根目录下名为 `sdkconfig` 的文件中，可以通过 `idf.py menuconfig` 进行修改，且一个项目只能包含一个项目配置。
- 应用程序是由 ESP-IDF 构建得到的可执行文件。一个项目通常会构建两个应用程序：项目应用程序（可执行的主文件，即用户自定义的固件）和引导程序（启动并初始化项目应用程序）。
- 组件是模块化且独立的代码，会被编译成静态库（.a 文件）并链接到应用程序。部分组件由 ESP-IDF 官方提供，其他组件则来源于其它开源项目。
- 目标特指运行构建后应用程序的硬件设备。运行 `idf.py --list-targets` 可以查看当前 ESP-IDF 版本中支持目标的完整列表。

请注意，以下内容并不属于项目的组成部分：

- ESP-IDF 并不是项目的一部分，它独立于项目，通过 `IDF_PATH` 环境变量（保存 `esp-idf` 目录的路径）链接到项目，从而将 IDF 框架与项目分离。
- 交叉编译工具链并不是项目的组成部分，它应该被安装在系统 `PATH` 环境变量中。

### 4.6.2 使用构建系统

#### idf.py

`idf.py` 命令行工具提供了一个前端，可以帮助你轻松管理项目的构建过程，它管理了以下工具：

- `CMake`，配置待构建的项目
- `Ninja`，用于构建项目
- `esptool.py`，烧录目标硬件设备

可通过 `idf.py` 配置构建系统，具体可参考[相关文档](#)。

## 直接使用 CMake

为了方便，`idf.py` 已经封装了 CMake 命令，但是你愿意，也可以直接调用 CMake。

当 `idf.py` 在执行某些操作时，它会打印出其运行的每条命令以便参考。例如运行 `idf.py build` 命令与在 `bash shell`（或者 Windows Command Prompt）中运行以下命令是相同的：

```
mkdir -p build
cd build
cmake .. -G Ninja # 或者 'Unix Makefiles'
ninja
```

在上面的命令列表中，`cmake` 命令对项目进行配置，并生成用于最终构建工具的构建文件。在这个例子中，最终构建工具是 **Ninja**：运行 `ninja` 来构建项目。

没有必要多次运行 `cmake`。第一次构建后，往后每次只需运行 `ninja` 即可。如果项目需要重新配置，`ninja` 会自动重新调用 `cmake`。

若在 CMake 中使用 `ninja` 或 `make`，则多数 `idf.py` 子命令也会有其对应的目标，例如在构建目录下运行 `make menuconfig` 或 `ninja menuconfig` 与运行 `idf.py menuconfig` 是相同的。

---

**备注：**如果你已经熟悉了 CMake，那么可能会发现 ESP-IDF 的 CMake 构建系统不同寻常，为了减少样板文件，该系统封装了 CMake 的许多功能。请参考 [编写纯 CMake 组件](#) 以编写更多“CMake 风格”的组件。

---

**使用 Ninja/Make 来烧录** 可以直接使用 `ninja` 或 `make` 运行如下命令来构建项目并烧录：

```
ninja flash
```

或：

```
make app-flash
```

可用的目标还包括：`flash`、`app-flash`（仅用于 `app`）、`bootloader-flash`（仅用于 `bootloader`）。

以这种方式烧录时，可以通过设置 `ESPPORT` 和 `ESPBAUD` 环境变量来指定串口设备和波特率。可以在操作系统或 IDE 项目中设置该环境变量，或者直接在命令行中进行设置：

```
ESPPORT=/dev/ttyUSB0 ninja flash
```

---

**备注：**在命令的开头为环境变量赋值属于 Bash shell 的语法，可在 Linux、macOS 和 Windows 的类 Bash shell 中运行，但在 Windows Command Prompt 中无法运行。

---

或：

```
make -j3 app-flash ESPPORT=COM4 ESPBAUD=2000000
```

---

**备注：**在命令末尾为变量赋值属于 `make` 的语法，适用于所有平台的 `make`。

---

## 在 IDE 中使用 CMake

还可以使用集成了 CMake 的 IDE，仅需将项目 `CMakeLists.txt` 文件的路径告诉 IDE 即可。集成 CMake 的 IDE 通常会有自己的构建工具（CMake 称之为“生成器”），它是组成 IDE 的一部分，用来构建源文件。

向 IDE 中添加除 `build` 目标以外的自定义目标（如添加“`flash`”目标到 IDE）时，建议调用 `idf.py` 命令来执行这些“特殊”的操作。

有关将 ESP-IDF 同 CMake 集成到 IDE 中的详细信息，请参阅[构建系统的元数据](#)。

### 设置 Python 解释器

ESP-IDF 适用于 Python 3.8 以上版本。

`idf.py` 和其他的 Python 脚本会使用默认的 Python 解释器运行，如 `python`。你可以通过 `python3 $IDF_PATH/tools/idf.py ...` 命令切换到别的 Python 解释器，或者通过设置 `shell` 别名或其他脚本来简化该命令。

如果直接使用 CMake，运行 `cmake -D PYTHON=python3 ...`，CMake 会使用传入的值覆盖默认的 Python 解释器。

如果使用集成 CMake 的 IDE，可以在 IDE 的图形用户界面中给名为 `PYTHON` 的 CMake cache 变量设置新的值来覆盖默认的 Python 解释器。

如果想在命令行中更优雅地管理 Python 的各个版本，请查看 [pyenv](#) 或 [virtualenv](#) 工具，它们会帮助你更改默认的 `python` 版本。

### 4.6.3 示例项目

示例项目的目录树结构可能如下所示：

```

- myProject/
  - CMakeLists.txt
  - sdkconfig
  - bootloader_components/ - boot_component/ - CMakeLists.txt
                                     - Kconfig
                                     - src1.c
  - components/ - component1/ - CMakeLists.txt
                                     - Kconfig
                                     - src1.c
                                     - component2/ - CMakeLists.txt
                                               - Kconfig
                                               - src1.c
                                               - include/ - component2.h
  - main/ - CMakeLists.txt
          - src1.c
          - src2.c
  - build/

```

该示例项目“myProject”包含以下组成部分：

- 顶层项目 `CMakeLists.txt` 文件，这是 CMake 用于学习如何构建项目的主要文件，可以在这个文件中设置项目全局的 CMake 变量。顶层项目 `CMakeLists.txt` 文件会导入 `/tools/cmake/project.cmake` 文件，由它负责实现构建系统的其余部分。该文件最后会设置项目的名称，并定义该项目。
- “`sdkconfig`”项目配置文件，执行 `idf.py menuconfig` 时会创建或更新此文件，文件中保存了项目中所有组件（包括 ESP-IDF 本身）的配置信息。`sdkconfig` 文件可能会也可能不会被添加到项目的源码管理系统中。
- 可选的“`bootloader_components`”目录中包含了需要在引导加载项目中进行编译和链接的组件。并不是每个项目都需要这种自定义组件，但此类组件在引导加载程序需要修改以嵌入新功能时可能很有用。
- 可选的“`components`”目录中包含了项目的部分自定义组件，并不是每个项目都需要这种自定义组件，但它有助于构建可复用的代码或者导入第三方（不属于 ESP-IDF）的组件。或者，你也可以在顶层 `CMakeLists.txt` 中设置 `EXTRA_COMPONENT_DIRS` 变量以查找其他指定位置处的组件。
- “`main`”目录是一个特殊的组件，它包含项目本身的源代码。“`main`”是默认名称，CMake 变量 `COMPONENT_DIRS` 默认包含此组件，但你可以修改此变量。有关详细信息，请参阅[重命名 main 组件](#)。如果项目中源文件较多，建议将其归于组件中，而不是全部放在“`main`”中。

- “build” 目录是存放构建输出的地方，如果没有此目录，idf.py 会自动创建。CMake 会配置项目，并在此目录下生成临时的构建文件。随后，在主构建进程的运行期间，该目录还会保存临时目标文件、库文件以及最终输出的二进制文件。此目录通常不会添加到项目的源码管理系统中，也不会随项目源码一同发布。

每个组件目录都包含一个 CMakeLists.txt 文件，里面会定义一些变量以控制该组件的构建过程，以及其与整个项目的集成。更多详细信息请参阅[组件 CMakeLists 文件](#)。

每个组件还可以包含一个 Kconfig 文件，它用于定义 menuconfig 时展示的[组件配置](#)选项。某些组件可能还会包含 Kconfig.projbuild 和 project\_include.cmake 特殊文件，它们用于[覆盖项目的部分设置](#)。

#### 4.6.4 项目 CMakeLists 文件

每个项目都有一个顶层 CMakeLists.txt 文件，包含整个项目的构建设置。默认情况下，项目 CMakeLists 文件会非常小。

##### 最小 CMakeLists 文件示例

最小项目：

```
cmake_minimum_required(VERSION 3.16)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
```

##### 必要部分

每个项目都要按照上面显示的顺序添加上述三行代码：

- cmake\_minimum\_required(VERSION 3.16) 必须放在 CMakeLists.txt 文件的第一行，它会告诉 CMake 构建该项目所需的最小版本号。ESP-IDF 支持 CMake 3.16 或更高的版本。
- include(\$ENV{IDF\_PATH}/tools/cmake/project.cmake) 会导入 CMake 的其余功能来完成配置项目、检索组件等任务。
- project(myProject) 会创建项目本身，并指定项目名称。该名称会作为最终输出的二进制文件的名称，即 myProject.elf 和 myProject.bin。每个 CMakeLists 文件只能定义一个项目。

##### 可选的项目变量

以下这些变量都有默认值，用户可以覆盖这些变量值以自定义构建行为。更多实现细节，请参阅[tools/cmake/project.cmake](#) 文件。

- COMPONENT\_DIRS: 组件的搜索目录，默认为 IDF\_PATH/components、PROJECT\_DIR/components、和 EXTRA\_COMPONENT\_DIRS。如果你不想在这些位置搜索组件，请覆盖此变量。
- EXTRA\_COMPONENT\_DIRS: 用于搜索组件的其它可选目录列表。路径可以是相对于项目目录的相对路径，也可以是绝对路径。
- COMPONENTS: 要构建进项目中的组件名称列表，默认为 COMPONENT\_DIRS 目录下检索到的所有组件。使用此变量可以“精简”项目以缩短构建时间。请注意，如果一个组件通过 COMPONENT\_REQUIRES 指定了它依赖的另一个组件，则会将其添加到 COMPONENTS 中，所以 COMPONENTS 列表可能会非常短。
- BOOTLOADER\_IGNORE\_EXTRA\_COMPONENT: 引导加载程序编译时应忽略的组件列表，位于 bootloader\_components/ 目录中。使用这一变量可以将一个组件有条件地包含在项目中。

以上变量中的路径可以是绝对路径，或者是相对于项目目录的相对路径。

请使用 `cmake` 中的 `set` 命令来设置这些变量，如 `set(VARIABLE "VALUE")`。请注意，`set()` 命令需放在 `include(...)` 之前，`cmake_minimum(...)` 之后。

## 重命名 main 组件

构建系统会对 main 组件进行特殊处理。假如 main 组件位于预期的位置（即 `${PROJECT_PATH}/main`），那么它会被自动添加到构建系统中。其他组件也会作为其依赖项被添加到构建系统中，这使用户免于处理依赖关系，并提供即时可用的构建功能。重命名 main 组件会减轻上述这些幕后工作量，但要求用户指定重命名后的组件位置，并手动为其添加依赖项。重命名 main 组件的步骤如下：

1. 重命名 main 目录。
2. 在项目 `CMakeLists.txt` 文件中设置 `EXTRA_COMPONENT_DIRS`，并添加重命名后的 main 目录。
3. 在组件的 `CMakeLists.txt` 文件中设置 `COMPONENT_REQUIRES` 或 `COMPONENT_PRIV_REQUIRES` 以指定依赖项。

## 覆盖默认的构建规范

构建系统设置了一些全局的构建规范（编译标志、定义等），这些规范可用于编译来自所有组件的所有源文件。

例如，其中一个默认的构建规范是编译选项 `Wextra`。假设一个用户想用 `Wno-extra` 来覆盖这个选项，应在 `project()` 之后进行：

```
cmake_minimum_required(VERSION 3.16)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)

idf_build_set_property(COMPILER_OPTIONS "-Wno-error" APPEND)
```

这确保了用户设置的编译选项不会被默认的构建规范所覆盖，因为默认的构建规范是在 `project()` 内设置的。

### 4.6.5 组件 CMakeLists 文件

每个项目都包含一个或多个组件，这些组件可以是 ESP-IDF 的一部分，可以是项目自身组件目录的一部分，也可以从自定义组件目录添加（见上文）。

组件是 `COMPONENT_DIRS` 列表中包含 `CMakeLists.txt` 文件的任何目录。

## 搜索组件

搜索 `COMPONENT_DIRS` 中的目录列表以查找项目的组件，此列表中的目录可以是组件自身（即包含 `CMakeLists.txt` 文件的目录），也可以是子目录为组件的顶级目录。

当 CMake 运行项目配置时，它会记录本次构建包含的组件列表，它可用于调试某些组件的添加/排除。

## 同名组件

ESP-IDF 在搜索所有待构建的组件时，会按照 `COMPONENT_DIRS` 指定的顺序依次进行，这意味着在默认情况下，首先搜索 ESP-IDF 内部组件（`IDF_PATH/components`），然后是 `EXTRA_COMPONENT_DIRS` 中的组件，最后是项目组件（`PROJECT_DIR/components`）。如果这些目录中的两个或者多个包含具有相同名字的组件，则使用搜索到的最后一个位置的组件。这就允许将组件复制到项目目录中再修改以覆盖 ESP-IDF 组件，如果使用这种方式，ESP-IDF 目录本身可以保持不变。

---

**备注：**如果在现有项目中通过将组件移动到一个新位置来覆盖它，项目不会自动看到新组件的路径。请运行 `idf.py reconfigure` 命令后（或删除项目构建文件夹）再重新构建。

---

## 最小组件 CMakeLists 文件

最小组件 CMakeLists.txt 文件通过使用 `idf_component_register` 将组件添加到构建系统中。

```
idf_component_register(SRCS "foo.c" "bar.c" INCLUDE_DIRS "include" REQUIRES mbedtls)
```

- SRCS 是源文件列表 (\*.c、\*.cpp、\*.cc、\*.S)，里面所有的源文件都将会编译进组件库中。
- INCLUDE\_DIRS 是目录列表，里面的路径会被添加到所有需要该组件的组件（包括 main 组件）全局 include 搜索路径中。
- REQUIRES 实际上并不是必需的，但通常需要它来声明该组件需要使用哪些其它组件，请参考[组件依赖](#)。

上述命令会构建生成与组件同名的库，并最终被链接到应用程序中。

上述目录通常设置为相对于 CMakeLists.txt 文件的相对路径，当然也可以设置为绝对路径。

还有其它参数可以传递给 `idf_component_register`，具体可参考[here](#)。

有关更完整的 CMakeLists.txt 示例，请参阅[组件依赖示例](#)和[组件 CMakeLists 示例](#)。

## 预设的组件变量

以下专用于组件的变量可以在组件 CMakeLists 中使用，但不建议修改：

- COMPONENT\_DIR: 组件目录，即包含 CMakeLists.txt 文件的绝对路径，它与 CMAKE\_CURRENT\_SOURCE\_DIR 变量一样，路径中不能包含空格。
- COMPONENT\_NAME: 组件名，与组件目录名相同。
- COMPONENT\_ALIAS: 库别名，由构建系统在内部为组件创建。
- COMPONENT\_LIB: 库名，由构建系统在内部为组件创建。

以下变量在项目级别中被设置，但可在组件 CMakeLists 中使用：

- CONFIG\_\*: 项目配置中的每个值在 `cmake` 中都对应一个以 CONFIG\_ 开头的变量。更多详细信息请参见[Kconfig](#)。
- ESP\_PLATFORM: ESP-IDF 构建系统处理 CMake 文件时，其值设为 1。

## 构建/项目变量

以下是可作为构建属性的构建/项目变量，可通过组件 CMakeLists.txt 中的 `idf_build_get_property` 查询其变量值。

- PROJECT\_NAME: 项目名，在项目 CMakeLists.txt 文件中设置。
- PROJECT\_DIR: 项目目录（包含项目 CMakeLists 文件）的绝对路径，与 CMAKE\_SOURCE\_DIR 变量相同。
- COMPONENTS: 此次构建中包含的所有组件的名称，具体格式为用分号分隔的 CMake 列表。
- IDF\_VER: ESP-IDF 的 git 版本号，由 `git describe` 命令生成。
- IDF\_VERSION\_MAJOR、IDF\_VERSION\_MINOR、IDF\_VERSION\_PATCH: ESP-IDF 的组件版本，可用于条件表达式。请注意这些信息的精确度不如 IDF\_VER 变量，版本号 v4.0-dev-\*, v4.0-beta1, v4.0-rc1 和 v4.0 对应的 IDF\_VERSION\_\* 变量值是相同的，但是 IDF\_VER 的值是不同的。
- IDF\_TARGET: 项目的硬件目标名称。
- PROJECT\_VER: 项目版本号。
  - 如果设置 `CONFIG_APP_PROJECT_VER_FROM_CONFIG` 选项，将会使用 `CONFIG_APP_PROJECT_VER` 的值。
  - 或者，如果在项目 CMakeLists.txt 文件中设置了 PROJECT\_VER 变量，则该变量值可以使用。
  - 或者，如果 PROJECT\_DIR/version.txt 文件存在，其内容会用作 PROJECT\_VER 的值。
  - 或者，如果项目位于某个 Git 仓库中，则使用 `git describe` 命令的输出作为 PROJECT\_VER 的值。
  - 否则，PROJECT\_VER 的值为 1。
- EXTRA\_PARTITION\_SUBTYPES: CMake 列表，用于创建额外的分区子类型。子类型的描述由字符串组成，以逗号为分隔，格式为 `type_name, subtype_name, numeric_value`。组件可通过此列表，添加新的子类型。

其它与构建属性有关的信息请参考[这里](#)。

### 组件编译控制

在编译特定组件的源文件时，可以使用 `target_compile_options` 函数来传递编译器选项：

```
target_compile_options(${COMPONENT_LIB} PRIVATE -Wno-unused-variable)
```

如果给单个源文件指定编译器标志，可以使用 CMake 的 `set_source_files_properties` 命令：

```
set_source_files_properties(mysrc.c
    PROPERTIES COMPILE_FLAGS
        -Wno-unused-variable
)
```

如果上游代码在编译的时候发出了警告，那这么做可能会很有效。

---

**备注：** 如已借助 `idf_component_register` 中的 `SRC_DIRS` 变量填充源文件，CMake `set_source_files_properties` 命令将无法使用，详情请参考[文件通配 & 增量构建](#)。

---

请注意，上述两条命令只能在组件 CMakeLists 文件的 `idf_component_register` 命令之后调用。

## 4.6.6 组件配置

每个组件都可以包含一个 Kconfig 文件，和 CMakeLists.txt 放在同一目录下。Kconfig 文件中包含要添加到该组件配置菜单中的一些配置设置信息。

运行 `menuconfig` 时，可以在 Component Settings 菜单栏下找到这些设置。

创建一个组件的 Kconfig 文件，最简单的方法就是使用 ESP-IDF 中现有的 Kconfig 文件作为模板，在这基础上进行修改。

有关示例请参阅[添加条件配置](#)。

## 4.6.7 预处理器定义

ESP-IDF 构建系统会在命令行中添加以下 C 预处理器定义：

- `ESP_PLATFORM`：可以用来检测在 ESP-IDF 内发生了构建行为。
- `IDF_VER`：定义 git 版本字符串，例如：v2.0 用于标记已发布的版本，v1.0-275-g0efaa4f 则用于标记任意某次的提交记录。

## 4.6.8 组件依赖

编译各个组件时，ESP-IDF 系统会递归评估其依赖项。这意味着每个组件都需要声明它所依赖的组件，即“requires”。

### 编写组件

```
idf_component_register(...
    REQUIRES mbedtls
    PRIV_REQUIRES console spiffs)
```

- `REQUIRES` 需要包含所有在当前组件的公共头文件里 `#include` 的头文件所在的组件。
- `PRIV_REQUIRES` 需要包含被当前组件的源文件 `#include` 的头文件所在的组件（除非已经被设置在了 `REQUIRES` 中）。以及是当前组件正常工作必须要链接的组件。

- REQUIRES 和 PRIV\_REQUIRES 的值不能依赖于任何配置选项 (CONFIG\_xxx 宏)。这是因为在配置加载之前, 依赖关系就已经被展开。其它组件变量 (比如包含路径或源文件) 可以依赖配置选择。
- 如果当前组件除了通用组件依赖项中设置的通用组件 (比如 RTOS、libc 等) 外, 并不依赖其它组件, 那么对于上述两个 REQUIRES 变量, 可以选择其中一个或是两个都不设置。

如果组件仅支持某些硬件目标 (IDF\_TARGET 的值), 则可以在 idf\_component\_register 中指定 REQUIRED\_IDF\_TARGETS 来声明这个需求。在这种情况下, 如果构建系统导入了不支持当前硬件目标的组件时就会报错。

**备注:** 在 CMake 中, REQUIRES 和 PRIV\_REQUIRES 是 CMake 函数 target\_link\_libraries(... PUBLIC ...) 和 target\_link\_libraries(... PRIVATE ...) 的近似包装。

### 组件依赖示例

假设现在有一个 car 组件, 它需要使用 engine 组件, 而 engine 组件需要使用 spark\_plug 组件:

```
- autoProject/
  - CMakeLists.txt
  - components/ - car/ - CMakeLists.txt
                    - car.c
                    - car.h
                    - engine/ - CMakeLists.txt
                              - engine.c
                              - include/ - engine.h
                    - spark_plug/ - CMakeLists.txt
                                  - spark_plug.c
                                  - spark_plug.h
```

**Car 组件** car.h 头文件是 car 组件的公共接口。该头文件直接包含了 engine.h, 这是因为它需要使用 engine.h 中的一些声明:

```
/* car.h */
#include "engine.h"

#ifdef ENGINE_IS_HYBRID
#define CAR_MODEL "Hybrid"
#endif
```

同时 car.c 也包含了 car.h:

```
/* car.c */
#include "car.h"
```

这代表文件 car/CMakeLists.txt 需要声明 car 需要 engine:

```
idf_component_register(SRCS "car.c"
                      INCLUDE_DIRS "."
                      REQUIRES engine)
```

- SRCS 提供 car 组件中源文件列表。
- INCLUDE\_DIRS 提供该组件公共头文件目录列表, 由于 car.h 是公共接口, 所以这里列出了所有包含了 car.h 的目录。
- REQUIRES 给出该组件的公共接口所需的组件列表。由于 car.h 是一个公共头文件并且包含了来自 engine 的头文件, 所以我们这里包含 engine。这样可以确保任何包含 car.h 的其他组件也能递归地包含所需的 engine.h。

**Engine 组件** engine 组件也有一个公共头文件 `include/engine.h`，但这个头文件更为简单：

```
/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start(void);
```

在 `engine.c` 中执行：

```
/* engine.c */
#include "engine.h"
#include "spark_plug.h"

...
```

在该组件中，`engine` 依赖于 `spark_plug`，但这是私有依赖关系。编译 `engine.c` 需要 `spark_plug.h` 但不需要包含 `engine.h`。

这代表文件 `engine/CMakeLists.txt` 可以使用 `PRIV_REQUIRES`：

```
idf_component_register(SRCS "engine.c"
                      INCLUDE_DIRS "include"
                      PRIV_REQUIRES spark_plug)
```

因此，`car` 组件中的源文件不需要在编译器搜索路径中添加 `spark_plug include` 目录。这可以加快编译速度，避免编译器命令行过于的冗长。

**Spark Plug 组件** `spark_plug` 组件没有依赖项，它有一个公共头文件 `spark_plug.h`，但不包含其他组件的头文件。

这代表 `spark_plug/CMakeLists.txt` 文件不需要任何 `REQUIRES` 或 `PRIV_REQUIRES`：

```
idf_component_register(SRCS "spark_plug.c"
                      INCLUDE_DIRS ".")
```

## 源文件 Include 目录

每个组件的源文件都是用这些 `Include` 路径目录编译的，这些路径在传递给 `idf_component_register` 的参数中指定：

```
idf_component_register(..
                      INCLUDE_DIRS "include"
                      PRIV_INCLUDE_DIRS "other")
```

- 当前组件的 `INCLUDE_DIRS` 和 `PRIV_INCLUDE_DIRS`。
- `REQUIRES` 和 `PRIV_REQUIRES` 参数指定的所有其他组件（即当前组件的所有公共和私有依赖项）所设置的 `INCLUDE_DIRS`。
- 递归列出所有组件 `REQUIRES` 列表中 `INCLUDE_DIRS` 目录（如递归展开这个组件的所有公共依赖项）。

## 主要组件依赖项

`main` 组件比较特别，因为它在构建过程中自动依赖所有其他组件。所以不需要向这个组件传递 `REQUIRES` 或 `PRIV_REQUIRES`。有关不再使用 `main` 组件时需要更改哪些内容，请参考[重命名 main 组件](#)。

## 通用组件依赖项

为避免重复性工作，各组件都用自动依赖一些“通用”IDF 组件，即使它们没有被明确提及。这些组件的头文件会一直包含在构建系统中。

通用组件包括：cxx、newlib、freertos、esp\_hw\_support、heap、log、soc、hal、esp\_rom、esp\_common、esp\_system。

## 在构建中导入组件

- 默认情况下，每个组件都会包含在构建系统中。
- 如果将 COMPONENTS 变量设置为项目直接使用的最小组件列表，那么构建系统会扩展到包含所有组件。完整的组件列表为：
  - COMPONENTS 中明确提及的组件。
  - 这些组件的依赖项（以及递归运算后的组件）。
  - 每个组件都依赖的通用组件。
- 将 COMPONENTS 设置为所需组件的最小组件列表，可以显著减少项目的构建时间。

## 循环依赖

一个项目中可能包含组件 A 和组件 B，而组件 A 依赖（REQUIRES 或 PRIV\_REQUIRES）组件 B，组件 B 又依赖组件 A。这就是所谓的依赖循环或循环依赖。

CMake 通常会在链接器命令行上重复两次组件库名称来自动处理循环依赖。然而这种方法并不总是有效，还是可能构建失败并出现关于“Undefined reference to ...”的链接器错误，这通常是由于引用了循环依赖中某一组件中定义的符号。如果存在较大的循环依赖关系，即 A->B->C->D->A，这种情况极有可能发生。

最好的解决办法是重构组件以消除循环依赖关系。在大多数情况下，没有循环依赖的软件架构具有模块化和分层清晰的特性，并且从长远来看更容易维护。然而，移除循环依赖关系并不容易做到。

要绕过由循环依赖引起的链接器错误，最简单的解决方法是增加其中一个组件库的 CMake LINK\_INTERFACE\_MULTIPLICITY 属性。这会让 CMake 在链接器命令行上对此库及其依赖项重复两次以上。

例如：

```
set_property(TARGET ${COMPONENT_LIB} APPEND PROPERTY LINK_INTERFACE_MULTIPLICITY 3)
```

- 这一行应该放在组件 CMakeLists.txt 文件 idf\_component\_register 之后。
- 可以的话，将此行放置在因依赖其他组件而造成循环依赖的组件中。实际上，该行可以放在循环内的任何一个组件中，但建议将其放置在拥有链接器错误提示信息中显示的源文件的组件中，或是放置在定义了链接器错误提示信息中所提到的符号的组件，先从这些组件开始是个不错的选择。
- 通常将值增加到 3（默认值是 2）就足够了，但如果不起作用，可以尝试逐步增加这个数字。
- 注意，增加这个选项会使链接器的命令行变长，链接阶段变慢。

**高级解决方法：未定义符号** 如果只有一两个符号导致循环依赖，而所有其他依赖都是线性的，那么有一种替代方法可以避免链接器错误：在链接时将“反向”依赖所需的特定符号指定为未定义符号。

例如，如果组件 A 依赖于组件 B，但组件 B 也需要引用组件 A 的 reverse\_ops（但不依赖组件 A 中的其他内容），那么你可以在组件 B 的 CMakeLists.txt 中添加如下一行，以在链接时避免这出现循环。

```
# 该符号是由“组件 A”在链接时提供
target_link_libraries(${COMPONENT_LIB} INTERFACE "-u reverse_ops")
```

- -u 参数意味着链接器将始终在链接中包含此符号，而不管依赖项顺序如何。
- 该行应该放在组件 CMakeLists.txt 文件中的 idf\_component\_register 之后。
- 如果“组件 B”不需要访问“组件 A”的任何头文件，只需链接几个符号，那么这一行可以用来代替 B 对 A 的任何“REQUIRES”。这样则进一步简化了构建系统中的组件结构。

请参考 [target\\_link\\_libraries](#) 文档以了解更多关于此 CMake 函数的信息。

## 构建系统中依赖处理的实现细节

- 在 CMake 配置进程的早期阶段会运行 `expand_requirements.cmake` 脚本。该脚本会对所有组件的 `CMakeLists.txt` 文件进行局部的运算，得到一张组件依赖关系图（[此图可能会有闭环](#)）。此图用于在构建目录中生成 `component_depends.cmake` 文件。
- CMake 主进程会导入该文件，并以此来确定要包含到构建系统中的组件列表（内部使用的 `BUILD_COMPONENTS` 变量）。`BUILD_COMPONENTS` 变量已排序，依赖组件会排在前面。由于组件依赖关系图中可能存在闭环，因此不能保证每个组件都满足该排序规则。如果给定相同的组件集和依赖关系，那么最终的排序结果应该是确定的。
- CMake 会将 `BUILD_COMPONENTS` 的值以“Component names:”的形式打印出来。
- 然后执行构建系统中包含的每个组件的配置。
- 每个组件都被正常包含在构建系统中，然后再次执行 `CMakeLists.txt` 文件，将组件库加入构建系统。

**组件依赖顺序** `BUILD_COMPONENTS` 变量中组件的顺序决定了构建过程中的其它顺序，包括：

- 项目导入 `project_include.cmake` 文件的顺序。
- 生成用于编译（通过 `-I` 参数）的头文件路径列表的顺序。请注意，对于给定组件的源文件，仅需将该组件的依赖组件的头文件路径告知编译器。

**添加链接时依赖项** ESP-IDF 的 CMake 辅助函数 `idf_component_add_link_dependency` 可以在组件之间添加仅作用于链接时的依赖关系。绝大多数情况下，我们都建议你使用 `idf_component_register` 中的 `PRIV_REQUIRES` 功能来构建依赖关系。然而在某些情况下，还是有必要添加另一个组件对当前组件的链接时依赖，即反转 `PRIV_REQUIRES` 中的依赖关系（参考示例：[Overriding Default Chip Drivers](#)）。

要使另一个组件在链接时依赖于这个组件：

```
idf_component_add_link_dependency(FROM other_component)
```

请将上述行置于 `idf_component_register` 行之后。

也可以通过名称指定两个组件：

```
idf_component_add_link_dependency(FROM other_component TO that_component)
```

### 4.6.9 覆盖项目的部分设置

#### `project_include.cmake`

如果组件的某些构建行为需要在组件 `CMakeLists` 文件之前被执行，你可以在组件目录下创建名为 `project_include.cmake` 的文件，`project.cmake` 在运行过程中会导入此 CMake 文件。

`project_include.cmake` 文件在 ESP-IDF 内部使用，以定义项目范围内的构建功能，比如 `esptool.py` 的命令行参数和 `bootloader` 这个特殊的应用程序。

与组件 `CMakeLists.txt` 文件有所不同，在导入“`project_include.cmake`”文件的时候，当前源文件目录（即 `CMAKE_CURRENT_SOURCE_DIR` 和工作目录）为项目目录。如果想获得当前组件的绝对路径，可以使用 `COMPONENT_PATH` 变量。

请注意，`project_include.cmake` 对于大多数常见的组件并不是必需的。例如给项目添加 `include` 搜索目录，给最终的链接步骤添加 `LDFLAGS` 选项等等都可以通过 `CMakeLists.txt` 文件来自定义。详细信息请参考[可选的项目变量](#)。

`project_include.cmake` 文件会按照 `BUILD_COMPONENTS` 变量中组件的顺序（由 CMake 记录）依次导入。即只有在当前组件所有依赖组件的 `project_include.cmake` 文件都被导入后，当前组件的 `project_include.cmake` 文件才会被导入，除非两个组件在同一个依赖闭环中。如果某个 `project_include.cmake` 文件依赖于另一组件设置的变量，则要特别注意上述情况。更多详情请参阅[构建系统中依赖处理的实现细节](#)。

在 `project_include.cmake` 文件中设置变量或目标时要格外小心，这些值被包含在项目的顶层 CMake 文件中，因此他们会影响或破坏所有组件的功能。

### KConfig.projbuild

与 `project_include.cmake` 类似，也可以为组件定义一个 KConfig 文件以实现全局的组件配置。如果要在 `menuconfig` 的顶层添加配置选项，而不是在“Component Configuration”子菜单中，则可以在 `CMakeLists.txt` 文件所在目录的 `KConfig.projbuild` 文件中定义这些选项。

在此文件中添加配置时要小心，因为这些配置会包含在整个项目配置中。在可能的情况下，请为组件配置创建 KConfig 文件。

`project_include.cmake` 文件在 ESP-IDF 内部使用，以定义项目范围内的构建功能，比如 `esptool.py` 的命令行参数和 `bootloader` 这个特殊的应用程序。

### 通过封装对现有函数进行重新定义或扩展

链接器具有封装功能，可以重新定义或扩展现有 ESP-IDF 函数的行为。如需封装函数，你需要在项目的 `CMakeLists.txt` 文件中提供以下 CMake 声明：

```
target_link_libraries(${COMPONENT_LIB} INTERFACE "-Wl,--wrap=function_to_redefine")
```

其中，`function_to_redefine` 为需要被重新定义或扩展的函数名称。启用此选项后，链接器将把二进制库中所有对 `function_to_redefine` 函数的调用改为对 `__wrap_function_to_redefine` 函数的调用。因此，你必须在应用程序中定义这一符号。

链接器会提供一个名为 `__real_function_to_redefine` 的新符号，指向将被重新定义的函数的原有实现。由此，可以从新的实现中调用该函数，从而对原有实现进行扩展。

请参考 [build\\_system/wrappers](#) 示例，了解其详细原理。更多细节请参阅 [examples/build\\_system/wrappers/README.md](#)。

### 覆盖默认引导加载程序

由于 ESP-IDF 中存在可选目录 `bootloader_components`，因此可以覆盖默认的 ESP-IDF 引导加载程序。覆盖前，应定义一个 `bootloader_components/main` 组件，使项目目录如下所示：

- **myProject/**
  - CMakeLists.txt
  - sdkconfig
  - **bootloader\_components/ - main/ - CMakeLists.txt**
    - \* Kconfig
    - \* my\_bootloader.c
  - **main/ - CMakeLists.txt**
    - \* app\_main.c
  - build/

此处的 `my_bootloader.c` 文件会成为新引导加载程序的源代码，这意味着它需要执行所有必要的操作来设置并从 flash 中加载 main 应用程序。

还可以根据特定的条件来替换引导加载程序，例如替换指定目标芯片的引导加载程序。这可以通过 `BOOTLOADER_IGNORE_EXTRA_COMPONENT` CMake 变量实现，该列表会让 ESP-IDF 引导加载项目忽略 `bootloader_components` 中的指定组件，不对其进行编译。例如，如果希望使用 ESP32 目标芯片的默认引导加载程序，`myProject/CMakeLists.txt` 应如下所示：

```
include($ENV{IDF_PATH}/tools/cmake/project.cmake)

if(${IDF_TARGET} STREQUAL "esp32")
    set(BOOTLOADER_IGNORE_EXTRA_COMPONENT "main")
```

(下页继续)

```
endif()  
  
project(main)
```

值得注意的是，这还可以用于除 `main` 之外的其他引导加载程序组件。在任何情况下，都不能指定前缀 `bootloader_component`。

请参考 [custom\\_bootloader/bootloader\\_override](#) 查看覆盖默认引导加载程序的示例。

### 4.6.10 仅配置组件

仅配置组件是一类不包含源文件的特殊组件，仅包含 `Kconfig.projbuild`、`KConfig` 和 `CMakeLists.txt` 文件，该 `CMakeLists.txt` 文件仅有一行代码，调用了 `idf_component_register()` 函数。此函数会将组件导入到项目构建中，但不会构建任何库，也不会将头文件添加到任何 `include` 搜索路径中。

### 4.6.11 CMake 调试

请查看 [CMake v3.16 官方文档](#) 获取更多关于 `CMake` 和 `CMake` 命令的信息。

调试 ESP-IDF `CMake` 构建系统的一些技巧：

- `CMake` 运行时，会打印大量诊断信息，包括组件列表和组件路径。
- 运行 `cmake -DDEBUG=1`，`IDF` 构建系统会生成更详细的诊断输出。
- 运行 `cmake` 时指定 `--trace` 或 `--trace-expand` 选项会提供大量有关控制流信息。详情请参考 [CMake 命令行文档](#)。

当从项目 `CMakeLists` 文件导入时，`project.cmake` 文件会定义工具模块和全局变量，并在系统环境中没有设置 `IDF_PATH` 时设置 `IDF_PATH`。

同时还定义了一个自定义版本的内置 `CMake project` 函数，这个函数被覆盖，以添加所有 ESP-IDF 特定的项目功能。

### 警告未定义的变量

默认情况下，警告未定义的变量这一功能是关闭的。

可通过将 `--warn-uninitialized` 标志传递给 `CMake` 或通过 `--cmake-warn-uninitialized` 传递给 `idf.py` 来使能这一功能。这样，如果在构建的过程中引用了未定义的变量，`CMake` 会打印警告。这对查找有错误的 `CMake` 文件非常有用。

更多信息，请参考文件 `/tools/cmake/project.cmake` 以及 `/tools/cmake/` 中支持的函数。

### 4.6.12 组件 CMakeLists 示例

因为构建环境试图设置大多数情况都能工作的合理默认值，所以组件 `CMakeLists.txt` 文件可能非常小，甚至是空的，请参考 [最小组件 CMakeLists 文件](#)。但有些功能往往需要覆盖 [预设的组件变量](#) 才能实现。

以下是组件 `CMakeLists` 文件的更高级的示例。

### 添加条件配置

配置系统可用于根据项目配置中选择的选项有条件地编译某些文件。

`Kconfig`:

```
config FOO_ENABLE_BAR
  bool "Enable the BAR feature."
  help
    This enables the BAR feature of the FOO component.
```

CMakeLists.txt:

```
set(srcs "foo.c" "more_foo.c")

if(CONFIG_FOO_ENABLE_BAR)
  list(APPEND srcs "bar.c")
endif()

idf_component_register(SRCS "${srcs}"
  ...)
```

上述示例使用了 CMake 的 `if` 函数和 `list APPEND` 函数。

也可用于选择或删除某一实现，如下所示：

Kconfig:

```
config ENABLE_LCD_OUTPUT
  bool "Enable LCD output."
  help
    Select this if your board has a LCD.

config ENABLE_LCD_CONSOLE
  bool "Output console text to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
    Select this to output debugging output to the lcd

config ENABLE_LCD_PLOT
  bool "Output temperature plots to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
    Select this to output temperature plots
```

CMakeLists.txt:

```
if(CONFIG_ENABLE_LCD_OUTPUT)
  set(srcs lcd-real.c lcd-spi.c)
else()
  set(srcs lcd-dummy.c)
endif()

# 如果启用了控制台或绘图功能，则需要加入字体
if(CONFIG_ENABLE_LCD_CONSOLE OR CONFIG_ENABLE_LCD_PLOT)
  list(APPEND srcs "font.c")
endif()

idf_component_register(SRCS "${srcs}"
  ...)
```

### 硬件目标的条件判断

CMake 文件可以使用 `IDF_TARGET` 变量来获取当前的硬件目标。

此外，如果当前的硬件目标是 `xyz`（即 `IDF_TARGET=xyz`），那么 Kconfig 变量 `CONFIG_IDF_TARGET_XYZ` 同样也会被设置。

请注意，组件可以依赖 `IDF_TARGET` 变量，但不能依赖这个 `Kconfig` 变量。同样也不可在 CMake 文件的 `include` 语句中使用 `Kconfig` 变量，在这种上下文中可以使用 `IDF_TARGET`。

### 生成源代码

有些组件的源文件可能并不是由组件本身提供，而必须从另外的文件生成。假设组件需要一个头文件，该文件由 BMP 文件转换后（使用 `bmp2h` 工具）的二进制数据组成，然后将头文件包含在名为 `graphics_lib.c` 的文件中：

```
add_custom_command(OUTPUT logo.h
    COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o log.h
    DEPENDS ${COMPONENT_DIR}/logo.bmp
    VERBATIM)

add_custom_target(logo DEPENDS logo.h)
add_dependencies(${COMPONENT_LIB} logo)

set_property(DIRECTORY "${COMPONENT_DIR}" APPEND PROPERTY
    ADDITIONAL_MAKE_CLEAN_FILES logo.h)
```

这个示例改编自 [CMake 的一则 FAQ](#)，其中还包含了一些同样适用于 ESP-IDF 构建系统的示例。

这个示例会在当前目录（构建目录）中生成 `logo.h` 文件，而 `logo.bmp` 会随组件一起提供在组件目录中。因为 `logo.h` 是一个新生成的文件，一旦项目需要清理，该文件也应该要被清除。因此，要将该文件添加到 `ADDITIONAL_MAKE_CLEAN_FILES` 属性中。

**备注：** 如果需要生成文件作为项目 `CMakeLists.txt` 的一部分，而不是作为组件 `CMakeLists.txt` 的一部分，此时需要使用 `${PROJECT_PATH}` 替代 `${COMPONENT_DIR}`，使用 `${PROJECT_NAME}.elf` 替代 `${COMPONENT_LIB}`。

如果某个源文件是从其他组件中生成，且包含 `logo.h` 文件，则需要调用 `add_dependencies`，在这两个组件之间添加一个依赖项，以确保组件源文件按照正确顺序进行编译。

### 嵌入二进制数据

有时你的组件希望使用一个二进制文件或者文本文件，但是你又不希望将它们重新格式化为 C 源文件。这时，你可以在组件注册中指定 `EMBED_FILES` 参数，用空格分隔要嵌入的文件名称：

```
idf_component_register(...
    EMBED_FILES server_root_cert.der)
```

或者，如果文件是字符串，则可以使用 `EMBED_TXTFILES` 变量，把文件的内容转成以 `null` 结尾的字符串嵌入：

```
idf_component_register(...
    EMBED_TXTFILES server_root_cert.pem)
```

文件的内容会被添加到 `flash` 的 `.rodata` 段，用户可以通过符号名来访问，如下所示：

```
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_
↪pem_start");
extern const uint8_t server_root_cert_pem_end[]   asm("_binary_server_root_cert_
↪pem_end");
```

符号名会根据文件全名生成，如 `EMBED_FILES` 中所示，字符 `/`、`.` 等都会被下划线替代。符号名称中的 `_binary` 前缀由 `objcopy` 命令添加，对文本文件和二进制文件都是如此。

如果要将文件嵌入到项目中，而非组件中，可以调用 `target_add_binary_data` 函数：

```
target_add_binary_data(myproject.elf "main/data.bin" TEXT)
```

并将这行代码放在项目 `CMakeLists.txt` 的 `project()` 命令之后，修改 `myproject.elf` 为你自己的项目名。如果最后一个参数是 `TEXT`，那么构建系统会嵌入以 `null` 结尾的字符串，如果最后一个参数被设置为 `BINARY`，则将文件内容按照原样嵌入。

有关使用此技术的示例，请查看 `file_serving` 示例 `protocols/http_server/file_serving/main/CMakeLists.txt` 中的 `main` 组件，两个文件会在编译时加载并链接到固件中。

也可以嵌入生成的文件：

```
add_custom_command(OUTPUT my_processed_file.bin
                   COMMAND my_process_file_cmd my_unprocessed_file.bin)
target_add_binary_data(my_target "my_processed_file.bin" BINARY)
```

上述示例中，`my_processed_file.bin` 是通过命令 `my_process_file_cmd` 从文件 `my_unprocessed_file.bin` 中生成，然后嵌入到目标中。

使用 `DEPENDS` 参数来指明对目标的依赖性：

```
add_custom_target(my_process COMMAND ...)
target_add_binary_data(my_target "my_embed_file.bin" BINARY DEPENDS my_process)
```

`target_add_binary_data` 的 `DEPENDS` 参数确保目标首先执行。

### 代码和数据的存放

ESP-IDF 还支持自动生成链接脚本，它允许组件通过链接片段文件定义其代码和数据在内存中的存放位置。构建系统会处理这些链接片段文件，并将处理后的结果扩充进链接脚本，从而指导应用程序二进制文件的链接过程。更多详细信息与快速上手指南，请参阅[链接脚本生成机制](#)。

### 完全覆盖组件的构建过程

当然，在有些情况下，上面提到的方法不一定够用。如果组件封装了另一个第三方组件，而这个第三方组件并不能直接在 ESP-IDF 的构建系统中工作，在这种情况下，就需要放弃 ESP-IDF 的构建系统，改为使用 CMake 的 `ExternalProject` 功能。组件 `CMakeLists` 示例如下：

```
# 用于 quirc 的外部构建过程，在源目录中运行
# 并生成 libquirc.a
externalproject_add(quirc_build
  PREFIX ${COMPONENT_DIR}
  SOURCE_DIR ${COMPONENT_DIR}/quirc
  CONFIGURE_COMMAND ""
  BUILD_IN_SOURCE 1
  BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
  INSTALL_COMMAND ""
)

# 将 libquirc.a 添加到构建系统中
add_library(quirc STATIC IMPORTED GLOBAL)
add_dependencies(quirc quirc_build)

set_target_properties(quirc PROPERTIES IMPORTED_LOCATION
  ${COMPONENT_DIR}/quirc/libquirc.a)
set_target_properties(quirc PROPERTIES INTERFACE_INCLUDE_DIRECTORIES
  ${COMPONENT_DIR}/quirc/lib)

set_directory_properties( PROPERTIES ADDITIONAL_MAKE_CLEAN_FILES
  "${COMPONENT_DIR}/quirc/libquirc.a")
```

(上述 CMakeLists.txt 可用于创建名为 quirc 的组件，该组件使用自己的 Makefile 构建 quirc 项目。)

- `externalproject_add` 定义了一个外部构建系统。
  - 设置 `SOURCE_DIR`、`CONFIGURE_COMMAND`、`BUILD_COMMAND` 和 `INSTALL_COMMAND`。如果外部构建系统没有配置这一步骤，可以将 `CONFIGURE_COMMAND` 设置为空字符串。在 ESP-IDF 的构建系统中，一般会将 `INSTALL_COMMAND` 变量设置为空。
  - 设置 `BUILD_IN_SOURCE`，即构建目录与源目录相同。否则，你也可以设置 `BUILD_DIR` 变量。
  - 有关 `externalproject_add()` 命令的详细信息，请参阅 [ExternalProject](#)。
- 第二组命令添加了一个目标库，指向外部构建系统生成的库文件。为了添加 `include` 目录，并告知 CMake 该文件的位置，需要再设置一些属性。
- 最后，生成的库被添加到 `ADDITIONAL_MAKE_CLEAN_FILES` 中。即执行 `make clean` 后会删除该库。请注意，构建系统中的其他目标文件不会被删除。

**ExternalProject 的依赖与构建清理** 对于外部项目的构建，CMake 会有一些不同寻常的行为：

- `ADDITIONAL_MAKE_CLEAN_FILES` 仅在使用 `Make` 或 `Ninja` 构建系统时有效。如果使用 IDE 自带的构建系统，执行项目清理时，这些文件不会被删除。
- `ExternalProject` 会在 `clean` 运行后自动重新运行配置和构建命令。
- 可以采用以下两种方法来配置外部构建命令：
  1. 将外部 `BUILD_COMMAND` 命令设置为对所有源代码完整的重新编译。如果传递给 `externalproject_add` 命令的 `DEPENDS` 的依赖项发生了改变，或者当前执行的是项目清理操作（即运行了 `idf.py clean`、`ninja clean` 或者 `make clean`），那么就会执行该命令。
  2. 将外部 `BUILD_COMMAND` 命令设置为增量式构建命令，并给 `externalproject_add` 传递 `BUILD_ALWAYS 1` 参数。即不管实际的依赖情况，每次构建时，都会构建外部项目。这种方式仅当外部构建系统具备增量式构建的能力，且运行时间不会很长时才推荐。

构建外部项目的最佳方法取决于项目本身、其构建系统，以及是否需要频繁重新编译项目。

#### 4.6.13 自定义 sdkconfig 的默认值

对于示例工程或者其他你不想指定完整 `sdkconfig` 配置的项目，但是你确实希望覆盖 ESP-IDF 默认值中的某些键值，则可以在项目中创建 `sdkconfig.defaults` 文件。重新创建新配置时将会用到此文件，另外在 `sdkconfig` 没有设置新配置值时，上述文件也会被用到。

如若需要覆盖此文件的名称或指定多个文件，请设置 `SDKCONFIG_DEFAULTS` 环境变量或在顶层 `CMakeLists.txt` 文件中设置 `SDKCONFIG_DEFAULTS`。非绝对路径的文件名将以当前项目的相对路径来解析。

在指定多个文件时，使用分号作为分隔符。先列出的文件将会先应用。如果某个键值在多个文件里定义，后面文件的定义会覆盖前面文件的定义。

一些 IDF 示例中包含了 `sdkconfig.ci` 文件。该文件是 CI（持续集成）测试框架的一部分，在正常构建过程中会被忽略。

#### 依赖于硬件目标的 sdkconfig 默认值

当且仅当 `sdkconfig.defaults` 文件存在时，构建系统还将尝试从 `sdkconfig.defaults.TARGET_NAME` 文件中加载默认值，其中 `IDF_TARGET` 的值为 `TARGET_NAME`。例如，对于 `esp32` 这个目标芯片，`sdkconfig` 的默认值会首先从 `sdkconfig.defaults` 获取，然后再从 `sdkconfig.defaults.esp32` 获取。当没有通用的默认设置时，仍需创建一个空的 `sdkconfig.defaults` 文件，以便构建系统可以识别任何其他与目标芯片相关的 `sdkconfig.defaults.TARGET_NAME` 文件。

如果使用 `SDKCONFIG_DEFAULTS` 覆盖默认文件的名称，则硬件目标的默认文件名也会从 `SDKCONFIG_DEFAULTS` 值中派生。如果 `SDKCONFIG_DEFAULTS` 中有多个文件，硬件目标文件会在引入该硬件目标文件的文件之后应用，而 `SDKCONFIG_DEFAULTS` 中所有其它后续文件则会在硬件目标文件之后应用。

例如，如果 `SDKCONFIG_DEFAULTS="sdkconfig.defaults;sdkconfig_devkit1"`，并且在同一文件夹中有一个 `sdkconfig.defaults.esp32` 文件，那么这些文件将按以下顺序应用：(1) `sdkconfig.defaults` (2) `sdkconfig.defaults.esp32` (3) `sdkconfig_devkit1`。

#### 4.6.14 flash 参数

有些情况下，我们希望在没有 IDF 时也能烧写目标板，为此，我们希望可以保存已构建的二进制文件、`esptool.py` 和 `esptool write_flash` 命令的参数。可以通过编写一段简单的脚本来保存二进制文件和 `esptool.py`。运行项目构建之后，构建目录将包含项目二进制输出文件（.bin 文件），同时也包含以下烧录数据文件：

- `flash_project_args` 包含烧录整个项目的参数，包括应用程序 (app)、引导程序 (bootloader)、分区表，如果设置了 PHY 数据，也会包含此数据。
- `flash_app_args` 只包含烧录应用程序的参数。
- `flash_bootloader_args` 只包含烧录引导程序的参数。

你可以参照如下命令将任意烧录参数文件传递给 `esptool.py`：

```
python esptool.py --chip esp32c3 write_flash @build/flash_project_args
```

也可以手动复制参数文件中的数据到命令行中执行。

构建目录中还包含生成的 `flasher_args.json` 文件，此文件包含 JSON 格式的项目烧录信息，可用于 `idf.py` 和其它需要项目构建信息的工具。

#### 4.6.15 构建 Bootloader

引导程序是 `/components/bootloader/subproject` 内部独特的“子项目”，它有自己的项目 `CMakeLists.txt` 文件，能够构建独立于主项目的 .ELF 和 .BIN 文件，同时它又与主项目共享配置和构建目录。

子项目通过 `/components/bootloader/project_include.cmake` 文件作为外部项目插入到项目的顶层，主构建进程会运行子项目的 CMake，包括查找组件（主项目使用的组件的子集），生成引导程序专用的配置文件（从主 `sdkconfig` 文件中派生）。

#### 4.6.16 编写纯 CMake 组件

ESP-IDF 构建系统用“组件”的概念“封装”了 CMake，并提供了很多帮助函数来自动将这些组件集成到项目构建当中。

然而，“组件”概念的背后是一个完整的 CMake 构建系统，因此可以制作纯 CMake 组件。

下面是使用纯 CMake 语法为 json 组件编写的最小 `CMakeLists` 文件的示例：

```
add_library(json STATIC
cJSON/cJSON.c
cJSON/cJSON_Utils.c)

target_include_directories(json PUBLIC cJSON)
```

- 这实际上与 IDF 中的 `json` 组件是等效的。
- 因为组件中的源文件不多，所以这个 `CMakeLists` 文件非常简单。对于具有大量源文件的组件而言，ESP-IDF 支持的组件通配符，可以简化组件 `CMakeLists` 的样式。
- 每当组件中新增一个与组件同名的库目标时，ESP-IDF 构建系统会自动将其添加到构建中，并公开公共的 `include` 目录。如果组件想要添加一个与组件不同名的库目标，就需要使用 CMake 命令手动添加依赖关系。

### 4.6.17 组件中使用第三方 CMake 项目

CMake 在许多开源的 C/C++ 项目中广泛使用，用户可以在自己的应用程序中使用开源代码。CMake 构建系统的一大好处就是可以导入这些第三方的项目，有时候甚至不用做任何改动。这就允许用户使用当前 ESP-IDF 组件尚未提供的功能，或者使用其它库来实现相同的功能。

假设 main 组件需要导入一个假想库 foo，相应的组件 CMakeLists 文件如下所示：

```
# 注册组件
idf_component_register(...)

# 设置 `foo` 项目中的一些 CMake 变量，以控制 `foo` 的构建过程
set(FOO_BUILD_STATIC OFF)
set(FOO_BUILD_TESTS OFF)

# 创建并导入第三方库目标
add_subdirectory(foo)

# 将 `foo` 目标公开链接至 `main` 组件
target_link_libraries(main PUBLIC foo)
```

实际的案例请参考 [build\\_system/cmake/import\\_lib](#)。请注意，导入第三方库所需要做的工作可能会因库的不同而有所差异。建议仔细阅读第三方库的文档，了解如何将其导入到其它项目中。阅读第三方库的 CMakeLists.txt 文件以及构建结构也会有所帮助。

用这种方式还可以将第三方库封装成 ESP-IDF 的组件。例如 [mbedtls](#) 组件就是封装了 [mbedtls](#) 项目得到的。详情请参考 [mbedtls](#) 组件的 CMakeLists.txt 文件。

每当使用 ESP-IDF 构建系统时，CMake 变量 ESP\_PLATFORM 都会被设置为 1。如果要在通用的 CMake 代码加入 IDF 特定的代码时，可以采用 `if (ESP_PLATFORM)` 的形式加以分隔。

#### 外部库中使用 ESP-IDF 组件

上述示例中假设的是外部库 foo（或 [import\\_lib](#) 示例中的 [tinyclib](#) 库）除了常见的 API 如 `libc`、`libstdc++` 等外不需要使用其它 ESP-IDF API。如果外部库需要使用其它 ESP-IDF 组件提供的 API，则需要外部 CMakeLists.txt 文件中通过添加对库目标 `idf::<componentname>` 的依赖关系。

例如，在 `foo/CMakeLists.txt` 文件：

```
add_library(foo bar.c fizz.cpp buzz.cpp)

if(ESP_PLATFORM)
  # 在 ESP-IDF 中，bar.c 需要包含 spi_flash 组件中的 esp_flash.h
  target_link_libraries(foo PRIVATE idf::spi_flash)
endif()
```

### 4.6.18 组件中使用预建库

还有一种情况是你有一个由其它构建过程生成预建静态库（.a 文件）。

ESP-IDF 构建系统为用户提供了一个实用函数 `add_prebuilt_library`，能够轻松导入并使用预建库：

```
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...] [PRIV_REQUIRES_
↪req1 req2 ...])
```

其中：

- `target_name`- 用于引用导入库的名称，如链接到其它目标时
- `lib_path`- 预建库的路径，可以是绝对路径或是相对于组件目录的相对路径

可选参数 `REQUIRES` 和 `PRIV_REQUIRES` 指定对其它组件的依赖性。这些参数与 `idf_component_register` 的参数的意义相同。

注意预建库的编译目标需与目前的项目相同。预建库的相关参数也要匹配。如果不特别注意，这两个因素可能会导致应用程序中出现 `bug`。

请查看示例 [build\\_system/cmake/import\\_prebuilt](#)。

#### 4.6.19 在自定义 CMake 项目中使用 ESP-IDF

ESP-IDF 提供了一个模板 CMake 项目，可以基于此轻松创建应用程序。然而在有些情况下，用户可能已有一个现成的 CMake 项目，或者想自己创建一个 CMake 项目，此时就希望将 IDF 中的组件以库的形式链接到用户目标（库/可执行文件）。

可以通过 [tools/cmake/idf.cmake](#) 提供的 *build system APIs* 实现该目标。例如：

```
cmake_minimum_required(VERSION 3.16)
project(my_custom_app C)

# 导入提供 ESP-IDF CMake 构建系统 API 的 CMake 文件
include($ENV{IDF_PATH}/tools/cmake/idf.cmake)

# 在构建中导入 ESP-IDF 组件，可以视作等同 add_subdirectory()
# 但为 ESP-IDF 构建增加额外的构建过程
# 具体构建过程
idf_build_process(esp32)

# 创建项目可执行文件
# 使用其别名 idf::newlib 将其链接到 newlib 组件
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

# 让构建系统知道项目到可执行文件是什么，从而添加更多的目标以及依赖关系等
idf_build_executable(${CMAKE_PROJECT_NAME}.elf)
```

[build\\_system/cmake/idf\\_as\\_lib](#) 中的示例演示了如何在自定义的 CMake 项目创建一个类似于 `Hello World` 的应用程序。

#### 4.6.20 ESP-IDF CMake 构建系统 API

##### ESP-IDF 构建命令

```
idf_build_get_property(var property [GENERATOR_EXPRESSION])
```

检索一个构建属性 *property*，并将其存储在当前作用域可访问的 `var` 中。特定 *GENERATOR\_EXPRESSION* 将检索该属性的生成器表达式字符串（不是实际值），它可与支持生成器表达式的 CMake 命令一起使用。

```
idf_build_set_property(property val [APPEND])
```

设置构建属性 *property* 的值为 *val*。特定 *APPEND* 将把指定的值附加到属性当前值之后。如果该属性之前不存在或当前为空，则指定的值将变为第一个元素/成员。

```
idf_build_component(component_dir)
```

向构建系统提交一个包含组件的 *component\_dir* 目录。相对路径会被转换为相对于当前目录的绝对路径。所有对该命令的调用必须在 `idf_build_process` 之前执行。

该命令并不保证组件在构建过程中会被处理（参见 *idf\_build\_process* 中 *COMPONENTS* 参数说明）

```
idf_build_process(target
    [PROJECT_DIR project_dir]
    [PROJECT_VER project_ver]
    [PROJECT_NAME project_name]
    [SDKCONFIG sdkconfig]
    [SDKCONFIG_DEFAULTS sdkconfig_defaults]
    [BUILD_DIR build_dir]
    [COMPONENTS component1 component2 ...])
```

为导入 ESP-IDF 组件执行大量的幕后工作，包括组件配置、库创建、依赖性扩展和解析。在这些功能中，对于用户最重要的可能是通过调用每个组件的 `idf_component_register` 来创建库。该命令为每个组件创建库，这些库可以使用别名来访问，其形式为 `idf::component_name`。这些别名可以用来将组件链接到用户自己的目标、库或可执行文件上。

该调用要求用 `target` 参数指定目标芯片。调用的可选参数包括：

- `PROJECT_DIR` - 项目目录，默认为 `CMAKE_SOURCE_DIR`。
- `PROJECT_NAME` - 项目名称，默认为 `CMAKE_PROJECT_NAME`。
- `PROJECT_VER` - 项目的版本/版本号，默认为“1”。
- `SDKCONFIG` - 生成的 `sdkconfig` 文件的输出路径，根据是否设置 `PROJECT_DIR`，默认为 `PROJECT_DIR/sdkconfig` 或 `CMAKE_SOURCE_DIR/sdkconfig`。
- `SDKCONFIG_DEFAULTS` - 包含默认配置的文件列表（列表中必须包含完整的路径），默认为空；对于列表中的每个值 `filename`，如果存在的话，也会加载文件 `filename.target` 中的配置。对于列表中的 `filename` 的每一个值，也会加载文件 `filename.target`（如果存在的话）中的配置。
- `BUILD_DIR` - 用于放置 ESP-IDF 构建相关工具的目录，如生成的二进制文件、文本文件、组件；默认为 `CMAKE_BINARY_DIR`。
- `COMPONENTS` - 从构建系统已知的组件中选择要处理的组件（通过 `idf_build_component` 添加）。这个参数用于精简构建过程。如果在依赖链中需要其它组件，则会自动添加，即自动添加这个列表中组件的公共和私有依赖项，进而添加这些依赖项的公共和私有依赖，以此类推。如果不指定，则会处理构建系统已知的所有组件。

```
idf_build_executable(executable)
```

指定 ESP-IDF 构建的可执行文件 `executable`。这将添加额外的目标，如与 `flash` 相关的依赖关系，生成额外的二进制文件等。应在 `idf_build_process` 之后调用。

```
idf_build_get_config(var config [GENERATOR_EXPRESSION])
```

获取指定配置的值。就像构建属性一样，特定 `GENERATOR_EXPRESSION` 将检索该配置的生成器表达式字符串，而不是实际值，即可以与支持生成器表达式的 CMake 命令一起使用。然而，实际的配置值只有在调用 `idf_build_process` 后才能知道。

## ESP-IDF 构建属性

可以通过使用构建命令 `idf_build_get_property` 来获取构建属性的值。例如，以下命令可以获取构建过程中使用的 Python 解释器的相关信息。

```
idf_build_get_property(python PYTHON)
message(STATUS "The Python interpreter is: ${python}")
```

- `BUILD_DIR` - 构建目录；由 `idf_build_process` 的 `BUILD_DIR` 参数设置。
- `BUILD_COMPONENTS` - 包含在构建中的组件列表；由 `idf_build_process` 设置。
- `BUILD_COMPONENT_ALIASES` - 包含在构建中的组件的库别名列表；由 `idf_build_process` 设置。
- `C_COMPILE_OPTIONS` - 适用于所有组件的 C 源代码文件的编译选项。
- `COMPILE_OPTIONS` - 适用于所有组件的源文件（无论是 C 还是 C++）的编译选项。
- `COMPILE_DEFINITIONS` - 适用于所有组件源文件的编译定义。
- `CXX_COMPILE_OPTIONS` - 适用于所有组件的 C++ 源文件的编译选项。
- `EXECUTABLE` - 项目可执行文件；通过调用 `idf_build_executable` 设置。

- `DEPENDENCIES_LOCK` - 组件管理器使用的依赖关系锁定文件的路径。默认值为项目路径下的 `dependencies.lock`。
- `EXECUTABLE_NAME` - 不含扩展名的项目可执行文件的名称；通过调用 `idf_build_executable` 设置。
- `EXECUTABLE_DIR` - 输出的可执行文件的路径
- `IDF_COMPONENT_MANAGER` - 默认启用组件管理器，但如果设置这个属性为“0”，则会被 `IDF_COMPONENT_MANAGER` 环境变量禁用。
- `IDF_PATH` - ESP-IDF 路径；由 `IDF_PATH` 环境变量设置，或者从 `idf.cmake` 的位置推断。
- `IDF_TARGET` - 构建的目标芯片；由 `idf_build_process` 的目标参数设置。
- `IDF_VER` - ESP-IDF 版本；由版本文件或 `IDF_PATH` 仓库的 Git 版本设置。
- `INCLUDE_DIRECTORIES` - 包含所有组件源文件的目录。
- `KCONFIGS` - 构建过程中组件里的 `Kconfig` 文件的列表；由 `idf_build_process` 设置。
- `KCONFIG_PROJBUILDS` - 构建过程中组件中的 `Kconfig.projbuild` 文件的列表；由 `idf_build_process` 设置。
- `PROJECT_NAME` - 项目名称；由 `idf_build_process` 的 `PROJECT_NAME` 参数设置。
- `PROJECT_DIR` - 项目的目录；由 `idf_build_process` 的 `PROJECT_DIR` 参数设置。
- `PROJECT_VER` - 项目的版本；由 `idf_build_process` 的 `PROJECT_VER` 参数设置。
- `PYTHON` - 用于构建的 Python 解释器；如果有则从 `PYTHON` 环境变量中设置，如果没有，则使用“python”。
- `SDKCONFIG` - 输出的配置文件的完整路径；由 `idf_build_process` `SDKCONFIG` 参数设置。
- `SDKCONFIG_DEFAULTS` - 包含默认配置的文件列表；由 `idf_build_process` `SDKCONFIG_DEFAULTS` 参数设置。
- `SDKCONFIG_HEADER` - 包含组件配置的 C/C++ 头文件的完整路径；由 `idf_build_process` 设置。
- `SDKCONFIG_CMAKE` - 包含组件配置的 CMake 文件的完整路径；由 `idf_build_process` 设置。
- `SDKCONFIG_JSON` - 包含组件配置的 JSON 文件的完整路径；由 `idf_build_process` 设置。
- `SDKCONFIG_JSON_MENUS` - 包含配置菜单的 JSON 文件的完整路径；由 `idf_build_process` 设置。

## ESP-IDF 组件命令

```
idf_component_get_property(var component property [GENERATOR_EXPRESSION])
```

检索一个指定的 `component` 的组件属性 `property`，并将其存储在当前作用域可访问的 `var` 中。指定 `GENERATOR_EXPRESSION` 将检索该属性的生成器表达式字符串（不是实际值），它可以在支持生成器表达式的 CMake 命令中使用。

```
idf_component_set_property(component property val [APPEND])
```

设置指定的 `component` 的组件属性，`property` 的值为 `val`。特定 `APPEND` 将把指定的值追加到属性的当前值后。如果该属性之前不存在或当前为空，指定的值将成为第一个元素/成员。

```
idf_component_register([[SRCS src1 src2 ...] | [[SRC_DIRS dir1 dir2 ...] [EXCLUDE_
↪SRCS src1 src2 ...]]
    [INCLUDE_DIRS dir1 dir2 ...]
    [PRIV_INCLUDE_DIRS dir1 dir2 ...]
    [REQUIRES component1 component2 ...]
    [PRIV_REQUIRES component1 component2 ...]
    [LDFRAGMENTS ldfragment1 ldfragment2 ...]
    [REQUIRED_IDF_TARGETS target1 target2 ...]
    [EMBED_FILES file1 file2 ...]
    [EMBED_TXTFILES file1 file2 ...]
    [KCONFIG kconfig]
    [KCONFIG_PROJBUILD kconfig_projbuild]
    [WHOLE_ARCHIVE])
```

将一个组件注册到构建系统中。就像 `project()` CMake 命令一样，该命令应该直接从组件的 `CMakeLists.txt` 中调用（而不是通过函数或宏），且建议在其他命令之前调用该命令。下面是一些关于在 `idf_component_register` 之前不能调用哪些命令的指南：

- 在 CMake 脚本模式下无效的命令。
- 在 `project_include.cmake` 中定义的自定义命令。
- 除了 `idf_build_get_property` 之外，构建系统的 API 命令；但要考虑该属性是否有被设置。

对变量进行设置和操作的命令，一般可在 `idf_component_register` 之前调用。

`idf_component_register` 的参数包括：

- `SRCS` - 组件的源文件，用于为组件创建静态库；如果没有指定，组件将被视为仅配置组件，从而创建接口库。
- `SRC_DIRS`、`EXCLUDE_SRCS` - 用于通过指定目录来 `glob` 源文件 (.c、.cpp、.S)，而不是通过 `SRCS` 手动指定源文件。请注意，这受 *CMake 中通配符的限制*。在 `EXCLUDE_SRCS` 中指定的源文件会从被 `glob` 的文件中移除。
- `INCLUDE_DIRS` - 相对于组件目录的路径，该路径将被添加到需要当前组件的所有其他组件的 `include` 搜索路径中。
- `PRIV_INCLUDE_DIRS` - 必须是相对于组件目录的目录路径，它仅被添加到这个组件源文件的 `include` 搜索路径中。
- `REQUIRES` - 组件的公共组件依赖项。
- `PRIV_REQUIRES` - 组件的私有组件依赖项；在仅用于配置的组件上会被忽略。
- `LDFRAGMENTS` - 组件链接器片段文件。
- `REQUIRED_IDF_TARGETS` - 指定该组件唯一支持的目标。
- `KCONFIG` - 覆盖默认的 `Kconfig` 文件。
- `KCONFIG_PROJBUILD` - 覆盖默认的 `Kconfig.projbuild` 文件。
- `WHOLE_ARCHIVE` - 如果指定了此参数，链接时会在组件库的前后分别添加 `-Wl,--whole-archive` 和 `-Wl,--no-whole-archive`。这与设置 `WHOLE_ARCHIVE` 组件属性的效果一致。

以下内容用于 *将数据嵌入到组件中*，并在确定组件是否仅用于配置时被视为源文件。这意味着，即使组件没有指定源文件，如果组件指定了以下其中之一，仍然会在内部为组件创建一个静态库。

- `EMBED_FILES` - 嵌入组件的二进制文件
- `EMBED_TXTFILES` - 嵌入组件的文本文件

## ESP-IDF 组件属性

组件的属性值可以通过使用构建命令 `idf_component_get_property` 来获取。例如，以下命令可以获取 `freertos` 组件的目录。

```
idf_component_get_property(dir freertos COMPONENT_DIR)
message(STATUS "The 'freertos' component directory is: ${dir}")
```

- `COMPONENT_ALIAS` - `COMPONENT_LIB` 的别名，用于将组件链接到外部目标；由 `idf_build_component` 设置，别名库本身由 `idf_component_register` 创建。
- `COMPONENT_DIR` - 组件目录；由 `idf_build_component` 设置。
- `COMPONENT_OVERRIDEN_DIR` - 如果 *这个组件覆盖了另一个组件*，则包含原组件的目录。
- `COMPONENT_LIB` - 所创建的组件静态/接口库的名称；由 `idf_build_component` 设置，库本身由 `idf_component_register` 创建。
- `COMPONENT_NAME` - 组件的名称；由 `idf_build_component` 根据组件的目录名设置。
- `COMPONENT_TYPE` - 组件的类型 (`LIBRARY` 或 `CONFIG_ONLY`)。如果一个组件指定了源文件或嵌入了一个文件，那么它的类型就是 `LIBRARY`。
- `EMBED_FILES` - 要嵌入组件的文件列表；由 `idf_component_register` `EMBED_FILES` 参数设置。
- `EMBED_TXTFILES` - 要嵌入组件的文本文件列表；由 `idf_component_register` `EMBED_TXTFILES` 参数设置。
- `INCLUDE_DIRS` - 组件 `include` 目录列表；由 `idf_component_register` `INCLUDE_DIRS` 参数设置。
- `KCONFIG` - 组件 `Kconfig` 文件；由 `idf_build_component` 设置。
- `KCONFIG_PROJBUILD` - 组件 `Kconfig.projbuild`；由 `idf_build_component` 设置。
- `LDFRAGMENTS` - 组件链接器片段文件列表；由 `idf_component_register` `LDFRAGMENTS` 参数设置。

- `MANAGED_PRIV_REQUIRES` - IDF 组件管理器从 `idf_component.yml` 清单文件中的依赖关系中添加的私有组件依赖关系列表。
- `MANAGED_REQUIRES` - IDF 组件管理器从 `idf_component.yml` 清单文件的依赖关系中添加的公共组件依赖关系列表。
- `PRIV_INCLUDE_DIRS` - 组件私有 `include` 目录列表；在 `LIBRARY` 类型的组件 `idf_component_register` `PRIV_INCLUDE_DIRS` 参数中设置。
- `PRIV_REQUIRES` - 私有组件依赖关系列表；根据 `idf_component_register` `PRIV_REQUIRES` 参数的值以及 `idf_component.yml` 清单文件中的依赖关系设置。
- `REQUIRED_IDF_TARGETS` - 组件支持的目标列表；由 `idf_component_register` `EMBED_TXTFILES` 参数设置。
- `REQUIRES` - 公共组件依赖关系列表；根据 `idf_component_register` `REQUIRES` 参数的值以及 `idf_component.yml` 清单文件中的依赖关系设置。
- `SRCS` - 组件源文件列表；由 `idf_component_register` 的 `SRCS` 或 `SRC_DIRS/EXCLUDE_SRCS` 参数设置。
- `WHOLE_ARCHIVE` - 如果该属性被设置为 `TRUE` (或是其他 CMake 布尔“真”值: `1`, `ON`, `YES`, `Y` 等), 链接时会在组件库的前后分别添加 `-Wl, --whole-archive` 和 `-Wl, --no-whole-archive` 选项。这可以强制链接器将每个目标文件包含到可执行文件中, 即使该目标文件没有解析来自应用程序其余部分的任何引用。当组件中包含依赖链接时注册的插件或模块时, 通常会使用该方法。默认情况下, 此属性为 `FALSE`。可以从组件的 `CMakeLists.txt` 文件中将其设置为 `TRUE`。

#### 4.6.21 文件通配 & 增量构建

在 ESP-IDF 组件中添加源文件的首选方法是在 `COMPONENT_SRCS` 中手动列出它们:

```
idf_component_register(SRCS library/a.c library/b.c platform/platform.c
    ...)
```

这是在 CMake 中手动列出源文件的 **最佳实践**。然而, 当有许多源文件都需要添加到构建中时, 这种方法就会很不方便。ESP-IDF 构建系统因此提供了另一种替代方法, 即使用 `SRC_DIRS` 来指定源文件:

```
idf_component_register(SRC_DIRS library platform
    ...)
```

后台会使用通配符在指定的目录中查找源文件。但是请注意, 在使用这种方法的时候, 如果组件中添加了一个新的源文件, CMake 并不知道重新运行配置, 最终该文件也没有被加入构建中。

如果是自己添加的源文件, 这种折衷还是可以接受的, 因为用户可以触发一次干净的构建, 或者运行 `idf.py reconfigure` 来手动重启 CMake。但是, 如果你需要与其他使用 Git 等版本控制工具的开发人员共享项目时, 问题就会变得更加困难, 因为开发人员有可能会拉取新的版本。

ESP-IDF 中的组件使用了第三方的 Git CMake 集成模块 (`/tools/cmake/third_party/GetGitRevisionDescription.cmake`), 任何时候源码仓库的提交记录发生了改变, 该模块就会自动重新运行 CMake。即只要拉取了新的 ESP-IDF 版本, CMake 就会重新运行。

对于不属于 ESP-IDF 的项目组件, 有以下几个选项供参考:

- 如果项目文件保存在 Git 中, ESP-IDF 会自动跟踪 Git 修订版本, 并在它发生变化时重新运行 CMake。
- 如果一些组件保存在第三方 Git 仓库中 (不在项目仓库或 ESP-IDF 仓库), 则可以在组件 `CMakeLists` 文件中调用 `git_describe` 函数, 以便在 Git 修订版本发生变化时自动重启 CMake。
- 如果没有使用 Git, 请记住在源文件发生变化时手动运行 `idf.py reconfigure`。
- 使用 `idf_component_register` 的 `SRCS` 参数来列出项目组件中的所有源文件则可以完全避免这一问题。

具体选择哪一方式, 就要取决于项目本身, 以及项目用户。

#### 4.6.22 构建系统的元数据

为了将 ESP-IDF 集成到 IDE 或者其它构建系统中, CMake 在构建的过程中会在 `build/` 目录下生成大量元数据文件。运行 `cmake` 或 `idf.py reconfigure` (或任何其它 `idf.py` 构建命令), 可以重新生

成这些元数据文件。

- `compile_commands.json` 是标准格式的 JSON 文件，它描述了在项目中参与编译的每个源文件。CMake 其中的一个功能就是生成此文件，许多 IDE 都知道如何解析此文件。
- `project_description.json` 包含有关 ESP-IDF 项目、已配置路径等的一些常规信息。
- `flasher_args.json` 包含 `esptool.py` 工具用于烧录项目二进制文件的参数，此外还有 `flash_*_args` 文件，可直接与 `esptool.py` 一起使用。更多详细信息请参阅 [flash 参数](#)。
- `CMakeCache.txt` 是 CMake 的缓存文件，包含 CMake 进程、工具链等其它信息。
- `config/sdkconfig.json` 包含 JSON 格式的项目配置结果。
- `config/kconfig_menus.json` 是在 `menuconfig` 中显示菜单的 JSON 格式版本，用于外部 IDE 的 UI。

## JSON 配置服务器

`kconfserver` 工具可以帮助 IDE 轻松地与配置系统的逻辑进行集成，它运行在后台，通过使用 `stdin` 和 `stdout` 读写 JSON 文件的方式与调用进程交互。

你可以通过 `idf.py confserver` 或 `ninja kconfserver` 从项目中运行 `kconfserver`，也可以使用不同的构建生成器来触发类似的目标。

有关 `kconfserver` 的更多信息，请参阅 [esp-idf-kconfig 文档](#)。

## 4.6.23 构建系统内部

### 构建脚本

ESP-IDF 构建系统的列表文件位于 `/tools/cmake` 中。实现构建系统核心功能的模块如下

- `build.cmake` - 构建相关命令，即构建初始化、检索/设置构建属性、构建处理。
- `component.cmake` - 组件相关的命令，如添加组件、检索/设置组件属性、注册组件。
- `kconfig.cmake` - 从 `Kconfig` 文件中生成配置文件 (`sdkconfig`、`sdkconfig.h`、`sdkconfig.cmake` 等)。
- `ldgen.cmake` - 从链接器片段文件生成最终链接器脚本。
- `target.cmake` - 设置构建目标和工具链文件。
- `utilities.cmake` - 其它帮助命令。

除了这些文件，还有两个重要的 CMake 脚本在 `/tools/cmake` 中：

- `idf.cmake` - 设置构建参数并导入上面列出的核心模块。之所以包括在 CMake 项目中，是为了方便访问 ESP-IDF 构建系统功能。
- `project.cmake` - 导入 `idf.cmake`，并提供了一个自定义的“`project()`”命令，该命令负责处理建立可执行文件时所有的繁重工作。包含在标准 ESP-IDF 项目的顶层 `CMakeLists.txt` 中。

`/tools/cmake` 中的其它文件都是构建过程中的支持性文件或第三方脚本。

### 构建过程

本节介绍了标准的 ESP-IDF 应用构建过程。构建过程可以大致分为四个阶段：

图 4: ESP-IDF Build System Process

## 初始化

该阶段为构建设置必要的参数。

- 在将 `idf.cmake` 导入 `project.cmake` 后，将执行以下步骤：
  - 在环境变量中设置 `IDF_PATH` 或从顶层 `CMakeLists.txt` 中包含的 `project.cmake` 路径推断相对路径。
  - 将 `/tools/cmake` 添加到 `CMAKE_MODULE_PATH` 中，并导入核心模块和各种辅助/第三方脚本。
  - 设置构建工具/可执行文件，如默认的 Python 解释器。
  - 获取 ESP-IDF git 修订版，并存储为 `IDF_VER`。
  - 设置全局构建参数，即编译选项、编译定义、包括所有组件的 `include` 目录。
  - 将 `components` 中的组件添加到构建中。
- 自定义 `project()` 命令的初始部分执行以下步骤：
  - 在环境变量或 CMake 缓存中设置 `IDF_TARGET` 以及设置相应要使用的“`CMAKE_TOOLCHAIN_FILE`”。
  - 添加 `EXTRA_COMPONENT_DIRS` 中的组件至构建中
  - 从 `COMPONENTS/EXCLUDE_COMPONENTS`、`SDKCONFIG`、`SDKCONFIG_DEFAULTS` 等变量中为调用命令 `idf_build_process()` 准备参数。

调用 `idf_build_process()` 命令标志着这个阶段的结束。

## 枚举

这个阶段会建立一个需要在构建过程中处理的组件列表，该阶段在 `idf_build_process()` 的前半部分进行。

- 检索每个组件的公共和私有依赖。创建一个子进程，以脚本模式执行每个组件的 `CMakeLists.txt`。`idf_component_register REQUIRES` 和 `PRIV_REQUIRES` 参数的值会返回给父进程。这就是所谓的早期扩展。在这一步中定义变量 `CMAKE_BUILD_EARLY_EXPANSION`。
- 根据公共和私有的依赖关系，递归地导入各个组件。

## 处理

该阶段处理构建中的组件，是 `idf_build_process()` 的后半部分。

- 从 `sdkconfig` 文件中加载项目配置，并生成 `sdkconfig.cmake` 和 `sdkconfig.h` 头文件。这两个文件分别定义了可以从构建脚本和 C/C++ 源文件/头文件中访问的配置变量/宏。
- 导入各组件的 `project_include.cmake`。
- 将每个组件添加为一个子目录，处理其 `CMakeLists.txt`。组件 `CMakeLists.txt` 调用注册命令 `idf_component_register` 添加源文件、导入目录、创建组件库、链接依赖关系等。

## 完成

该阶段是 `idf_build_process()` 剩余的步骤。

- 创建可执行文件并将其链接到组件库中。
- 生成 `project_description.json` 等项目元数据文件并且显示所建项目等相关信息。

请参考 [/tools/cmake/project.cmake](#) 获取更多信息。

### 4.6.24 从 ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统

ESP-IDF CMake 构建系统与旧版的 GNU Make 构建系统在某些方面非常相似，开发者都需要提供 `include` 目录、源文件等。然而，有一个语法上的区别，即对于 ESP-IDF CMake 构建系统，开发者需要将这些作为参数传递给注册命令 `idf_component_register`。

## 自动转换工具

在 ESP-IDF v4.x 版本中, `tools/cmake/convert_to_cmake.py` 提供了项目自动转换工具。由于该脚本依赖于 `make` 构建系统, 所以 v5.0 版本中不包含该脚本。

## CMake 中不可用的功能

有些功能已从 CMake 构建系统中移除, 或者已经发生很大改变。GNU Make 构建系统中的以下变量已从 CMake 构建系统中删除:

- `COMPONENT_BUILD_DIR`: 由 `CMAKE_CURRENT_BINARY_DIR` 替代。
- `COMPONENT_LIBRARY`: 默认为 `$(COMPONENT_NAME).a` 但是库名可以被组件覆盖。在 CMake 构建系统中, 组件库名称不可再被组件覆盖。
- `CC`、`LD`、`AR`、`OBJCOPY`: `gcc xtensa` 交叉工具链中每个工具的完整路径。CMake 使用 `CMAKE_C_COMPILER`、`CMAKE_C_LINK_EXECUTABLE` 和 `CMAKE_OBJCOPY` 进行替代。完整列表请参阅 [CMake 语言变量](#)。
- `HOSTCC`、`HOSTLD`、`HOSTAR`: 宿主机本地工具链中每个工具的全名。CMake 系统不再提供此变量, 外部项目需要手动检测所需的宿主机工具链。
- `COMPONENT_ADD_LDFLAGS`: 用于覆盖链接标志。CMake 中使用 `target_link_libraries` 命令替代。
- `COMPONENT_ADD_LINKER_DEPS`: 链接过程依赖的文件列表。`target_link_libraries` 通常会推断这些依赖。对于链接脚本, 可以使用自定义的 CMake 函数 `target_linker_scripts`。
- `COMPONENT_SUBMODULES`: 不再使用。CMake 会自动枚举 ESP-IDF 仓库中所有的子模块。
- `COMPONENT_EXTRA_INCLUDES`: 曾是 `COMPONENT_PRIV_INCLUDEDIRS` 变量的替代版本, 仅支持绝对路径。CMake 系统中统一使用 `COMPONENT_PRIV_INCLUDEDIRS` (可以是相对路径, 也可以是绝对路径)。
- `COMPONENT_OBJS`: 以前, 可以以目标文件列表的方式指定组件源, 现在, 可以通过 `COMPONENT_SRCS` 以源文件列表的形式指定组件源。
- `COMPONENT_OBJEXCLUDE`: 已被 `COMPONENT_SRC_EXCLUDE` 替换。用于指定源文件 (绝对路径或组件目录的相对路径)。
- `COMPONENT_EXTRA_CLEAN`: 已被 `ADDITIONAL_MAKE_CLEAN_FILES` 属性取代, 注意, [CMake 对此项功能有部分限制](#)。
- `COMPONENT_OWNBUILDTARGET` & `COMPONENT_OWNCLEANTARGET`: 已被 CMake 外部项目 `<ExternalProject>` 替代, 详细内容请参阅 [完全覆盖组件的构建过程](#)。
- `COMPONENT_CONFIG_ONLY`: 已被 `register_config_only_component()` 函数替代, 请参阅 [仅配置组件](#)。
- `CFLAGS`、`CPPFLAGS`、`CXXFLAGS`: 已被相应的 CMake 命令替代, 请参阅 [组件编译控制](#)。

## 无默认值的变量

以下变量不再具有默认值:

- 源目录 (Make 中的 `COMPONENT_SRCDIRS` 变量, CMake 中 `idf_component_register` 的 `SRC_DIRS` 参数)
- include 目录 (Make 中的 `COMPONENT_ADD_INCLUDEDIRS` 变量, CMake 中 `idf_component_register` 的 `INCLUDE_DIRS` 参数)

## 不再需要的变量

在 CMake 构建系统中, 如果设置了 `COMPONENT_SRCS`, 就不需要再设置 `COMPONENT_SRCDIRS`。实际上, CMake 构建系统中如果设置了 `COMPONENT_SRCDIRS`, 那么 `COMPONENT_SRCS` 就会被忽略。

## 从 Make 中烧录

仍然可以使用 `make flash` 或者类似的目标来构建和烧录, 但是项目 `sdkconfig` 不能再用来指定串口和波特率。可以使用环境变量来覆盖串口和波特率的设置, 详情请参阅 [使用 Ninja/Make 来烧录](#)。

## 4.7 RF 共存

### 4.7.1 概览

ESP 系列芯片最多支持三种射频收发模块: Bluetooth (BT 和 BLE) , IEEE802.15.4 和 Wi-Fi, 而每款芯片只支持一路被多个射频收发模块共享的 RF, 不同模块无法同时使用 RF 收发数据, 因此采用时分复用的方法调节不同模块的数据包收发。

### 4.7.2 ESP32-C3 支持的共存场景

表 1: 表 1 Wi-Fi 和 BLE 共存支持功能

			BLE			
			Scan	Advertising	Connecting	Connected
Wi-Fi	STA	Scan	Y	Y	Y	Y
		Connecting	Y	Y	Y	Y
		Connected	Y	Y	Y	Y
	SOFTAP	TX Beacon	Y	Y	Y	Y
		Connecting	C1	C1	C1	C1
		Connected	C1	C1	C1	C1
	Sniffer	RX	C1	C1	C1	C1
	ESP-NOW	RX	S	S	S	S
		TX	Y	Y	Y	Y

**备注:** Y: 支持且性能稳定。C1: 不能保证性能处于稳定状态。X: 不支持。S: 在 STA 模式下支持且性能稳定, 否则不支持。

### 4.7.3 共存机制与策略

#### 共存机制

基于优先级抢占的 RF 资源分配机制, 如下图所示, Bluetooth 模块和 Wi-Fi 模块向共存模块申请 RF 资源, 共存模块根据二者的优先级高低裁决 RF 归谁使用。

#### 共存策略

**共存周期和时间片** Wi-Fi、BLE 二者对于 RF 的使用, 主要是按照时间片来划分的。在 Wi-Fi 的时间片内, Wi-Fi 会向共存仲裁模块发出较高优先级的请求, 在 Bluetooth 的时间片内, BLE 会具有较高优先级。共存周期大小和各个时间片占比根据 Wi-Fi 的状态分成四类:

- 1) IDLE 状态: RF 模块由 Bluetooth 模块控制。
- 2) CONNECTED 状态: 共存周期以目标信标传输时间 (Target Beacon Transmission Time, TBTT) 点为起始点, 周期大于 100 ms。
- 3) SCAN 状态: Wi-Fi 时间片以及共存周期都比在 CONNECTED 状态下的长。为了确保蓝牙的性能, 蓝牙的时间片也会做相应的调整。
- 4) CONNECTING 状态: Wi-Fi 时间片比在 CONNECTED 状态下的长。为了确保蓝牙的性能, 蓝牙的时间片也会做相应的调整。

图 5: 共存机制

共存逻辑会根据当前 Wi-Fi 和 Bluetooth 的使用场景来选取不同的共存周期和共存时间片的划分策略。对应一个使用场景的共存策略，我们称之为“共存模板”。比如，Wi-Fi CONNECTED 与 BLE CONNECTED 的场景，就对应有一个共存模板。在这个共存模板中，一个共存周期内 Wi-Fi 和 BLE 的时间片各占 50%，时间分配如下图所示：

图 6: Wi-Fi CONNECTED 和 BLE CONNECTED 共存状态下时间片划分图

**动态优先级** 共存模块为每个模块的不同状态分配不同的优先级。每种状态下的优先级并不是一成不变的，例如对于 BLE，每 N 个广播事件 (Advertising event) 中会有一个广播事件使用高优先级。如果高优先级的广播事件发生在 Wi-Fi 时间片内，RF 的使用权可能会被 BLE 抢占。

**Wi-Fi 非连接模块的共存** 在一定程度上，某些 Wi-Fi 非连接模块功耗参数 Window 与 Interval 的组合会导致共存模块在 Wi-Fi 时间片外申请共存优先级。这是为了按设定的功耗参数在共存时获取 RF 资源，但这会影响既定的蓝牙性能。

如果 Wi-Fi 非连接模块功耗参数为默认值时，上述动作不会发生，共存模块会按照性能稳定的模式运行。因此，除非你对特定非连接功耗参数下的共存性能有足够的测试，请在共存场景下将 Wi-Fi 非连接模块功耗参数配置为默认参数。

请参考[非连接模块功耗管理](#)获取更多信息。

## 4.7.4 如何使用共存功能

### 共存 API 的使用

在大多数共存情况下，ESP32-C3 会自动进行共存状态切换，无需调用 API 对其进行干预。但是对于 BLE MESH 和 Wi-Fi 的共存，ESP32-C3 对其提供了两个 API。当 BLE MESH 的状态发生变化时，应先调用 `esp_coex_status_bit_clear` 对上一个状态进行清除，然后调用 `esp_coex_status_bit_set` 设置当前状态。

**BLE MESH 共存状态描述** 由于 Wi-Fi 和 Bluetooth 固件无法获知当前的上层应用的场景，一些共存模板需要应用代码调用共存的 API 才能生效。BLE MESH 的工作状态就需要由应用层通知给共存模块，用于选择共存模板。

- ESP\_COEX\_BLE\_ST\_MESH\_CONFIG: 正在组网。
- ESP\_COEX\_BLE\_ST\_MESH\_TRAFFIC: 正在传输数据。
- ESP\_COEX\_BLE\_ST\_MESH\_STANDBY: 处于空闲状态，无大量数据交互。

### 共存 API 错误代码

所有共存 API 都有自定义的返回值，即错误代码。这些代码可分类为：

- 无错误，例如：返回值为 ESP\_OK 代表 API 成功返回。
- 可恢复错误，例如：返回值为 ESP\_ERR\_INVALID\_ARG 代表 API 参数错误。

### 设置共存编译时选项

- 在完成共存程序编写的时候，您必须通过 menuconfig 选择 `CONFIG_ESP_COEX_SW_COEXIST_ENABLE` 打开软件共存配置选项，否则就无法使用上文中提到的共存功能。
- 在 BLE 连接过程中使用了 LE Coded PHY 时，为了防止蓝牙数据包持续时间较长而对 Wi-Fi 的性能产生严重影响，您可以在 `CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM` 的子选项中选择 `BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_EN` 选择打开对 TX/RX 最大时间的限制配置选项。
- 您可以通过修改以下 menuconfig 选项，以减小内存开销：
  - 1) `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY` 选择打开蓝牙协议栈动态内存配置选项。
  - 2) `CONFIG_ESP_WIFI_STATIC_RX_BUFFER_NUM` 选择减少 Wi-Fi 静态接收数据缓冲区的数量。
  - 3) `CONFIG_ESP_WIFI_DYNAMIC_RX_BUFFER_NUM` 选择减少 Wi-Fi 动态接收数据缓冲区的数量。
  - 4) `CONFIG_ESP_WIFI_TX_BUFFER` 选择使用动态分配发送数据缓冲区配置选项。
  - 5) `CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER_NUM` 选择减少 Wi-Fi 动态发送数据缓冲区的数量。
  - 6) `CONFIG_ESP_WIFI_TX_BA_WIN` 选择减少 Wi-Fi Block Ack TX 窗口的数量。
  - 7) `CONFIG_ESP_WIFI_RX_BA_WIN` 选择减少 Wi-Fi Block Ack RX 窗口的数量。
  - 8) `CONFIG_ESP_WIFI_MGMT_SBUF_NUM` 选择减少 Wi-Fi 管理短缓冲区的数量。
  - 9) `CONFIG_ESP_WIFI_RX_IRAM_OPT` 选择关闭此配置选项，关闭此配置选项将会减少大约 17 KB 的 IRAM 内存。
  - 10) `CONFIG_LWIP_TCP_SND_BUF_DEFAULT` 选择减小 TCP 套接字默认发送缓存区大小。
  - 11) `CONFIG_LWIP_TCP_WND_DEFAULT` 选择减小 TCP 套接字默认接收窗口的大小。
  - 12) `CONFIG_LWIP_TCP_RECVMBOX_SIZE` 选择减小 TCP 接收邮箱的大小。
  - 13) `CONFIG_LWIP_UDP_RECVMBOX_SIZE` 选择减小 UDP 接收邮箱的大小。
  - 14) `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE` 选择减小 TCPIP 任务接收邮箱大小。

**备注：** 由于共存配置选项依赖于任何两个已启用的射频收发模块的存在，请在配置任何共存功能之前，确保至少使能了两个射频收发模块。

## 4.8 核心转储

### 4.8.1 概述

核心转储是软件发生致命错误时，由紧急处理程序自动保存的一组软件状态信息。核心转储有助于对故障进行事后分析，了解软件状态。ESP-IDF 支持生成核心转储。

核心转储包含了系统中所有任务在发生故障时的快照，每个快照都包括任务的控制块 (TCB) 和栈信息。通过分析任务快照，可以确定是哪个任务、在哪个指令（代码行），以及该任务的哪个调用栈导致了系统崩溃。如果将某些变量赋予特殊的核心转储属性，还可以转储这些变量的内容。

核心转储数据会按照特定格式保存在核心转储文件中，详情请参阅[核心转储镜像文件详解](#)。然而，ESP-IDF 的 `idf.py` 命令提供了专门的子命令，用于解码和分析核心转储文件。

## 4.8.2 配置

### 目标

选项 `CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART` 可以启用或禁用核心转储，并在启用时选择核心转储的目标。发生崩溃时，生成的核心转储文件可以保存到 flash 中，也可以通过 UART 输出到连接的主机上。

### 格式和大小

选项 `CONFIG_ESP_COREDUMP_DATA_FORMAT` 控制核心转储文件格式，即 ELF 格式或二进制格式。

ELF 格式具备扩展特性，支持在发生崩溃时保存更多关于错误任务和崩溃软件的信息，但使用 ELF 格式会使核心转储文件变大。建议在新的软件设计中使用此格式，该格式足够灵活，可以在未来的修订版本中进行扩展，保存更多信息。

出于兼容性考虑，核心转储文件保留二进制格式。二进制格式的核心转储文件更小，性能更优。

选项 `CONFIG_ESP_COREDUMP_MAX_TASKS_NUM` 配置核心转储保存的任务快照数量。

通过 Components > Core dump > Core dump data integrity check 选项可进行核心转储数据完整性检查。

### 保留栈大小

核心转储例程需要解析并保存所有其他任务的栈，因此会从单独的栈中运行。选项 `CONFIG_ESP_COREDUMP_STACK_SIZE` 控制核心转储栈大小，以字节数表示。

将此选项设置为 0 字节将使核心转储例程从 ISR 栈中运行，从而节省内存。将选项设置为大于零的值将创建一个独立的栈。

---

**备注：** 如果使用了独立的栈，建议栈大小应大于 800 字节，确保核心转储例程本身不会导致栈溢出。

---

## 4.8.3 将核心转储保存到 flash

将核心转储文件保存至 flash 时，这些文件会保存到 flash 上的特殊分区。指定核心转储分区可以在 flash 芯片上预留空间来存储核心转储文件。

使用 ESP-IDF 提供的默认分区表时，核心转储分区会自动声明。但使用自定义分区表时，请按如下示例进行核心转储分区声明：

```
# 名称,      类型, 子类型,      偏移量,      大小
# 注意: 如果增加了引导加载程序大小, 请及时更新偏移量, 避免产生重叠
nvs,        data, nvs,        0x9000,      0x6000
phy_init,   data, phy,        0xf000,      0x1000
factory,    app,  factory, 0x10000,     1M
coredump,   data, coredump,,      64K
```

---

**重要：** 如果设备启用了 `flash` 加密，请在核心转储分区中添加 `encrypted` 标志。

---

```
coredump, data, coredump,, 64K, encrypted
```

分区命名没有特殊要求，可以根据应用程序的需要选择。但分区类型应为 `data`，子类型应为 `coredump`。此外，在选择分区大小时需注意，核心转储的数据结构会产生 20 字节的固定开销和 12 字节的单任务开销，此开销不包括每个任务的 TCB 和栈的大小。因此，分区大小应至少为  $20 + \text{最大任务数} \times (12 + \text{TCB 大小} + \text{最大任务栈大小})$  字节。

用于分析 flash 中核心转储的常用命令，可参考以下示例：

```
idf.py coredump-info
```

或

```
idf.py coredump-debug
```

#### 4.8.4 将核心转储保存到 UART

当核心转储文件输出到 UART 时，输出文件会以 Base64 编码方式呈现。通过 `CONFIG_ESP_COREDUMP_DECODE` 选项，可以选择 ESP-IDF 监视器对输出文件自动解码，或保持编码状态等待手动解码。

##### 自动解码

如果设置 `CONFIG_ESP_COREDUMP_DECODE`，使其自动解码 UART 核心转储文件，ESP-IDF 监视器会自动解码数据，将所有函数地址转换为源代码行，并在监视器中显示相应信息。ESP-IDF 监视器会输出类似以下内容：

此外，选项 `CONFIG_ESP_COREDUMP_UART_DELAY` 支持在将核心转储文件输出到 UART 前添加延迟。

```
=====
===== ESP32 CORE DUMP START =====

.dram0.data 0x3ffb0000 0x2114 RW A
...
===== ESP32 CORE DUMP END =====
=====

```

## 手动解码

如果设置 `CONFIG_ESP_COREDUMP_DECODE` 为不解码，则在以下 UART 输出的页眉和页脚之间，将输出核心转储的原始 Base64 编码正文：

```

===== CORE DUMP START =====
<将 Base64 编码的核心转储内容解码，并将其保存到磁盘文件中>
===== CORE DUMP END =====

```

建议将核心转储文本主体手动保存到文件，CORE DUMP START 和 CORE DUMP END 行不应包含在核心转储文本文件中。随后，可以使用以下命令解码保存的文本：

```
idf.py coredump-info -c </path/to/saved/base64/text>
```

或

```
idf.py coredump-debug -c </path/to/saved/base64/text>
```

## 4.8.5 核心转储命令

ESP-IDF 提供了一些特殊命令，有助于检索和分析核心转储：

- `idf.py coredump-info` - 打印崩溃任务的寄存器、调用栈、系统可用任务列表、内存区域以及核心转储中存储的内存内容（包括 TCB 和栈）。
- `idf.py coredump-debug` - 创建核心转储 ELF 文件，并使用该文件运行 GDB 调试会话。你可以手动检查内存、变量和任务状态。请注意，由于并未将所有内存保存在核心转储中，因此只有在栈上分配的变量的值才有意义。

### 4.8.6 回溯中的 ROM 函数

程序崩溃时，某些任务和/或崩溃任务本身的调用栈中可能包含一或多个 ROM 函数。由于 ROM 不是程序 ELF 的一部分，而 GDB 需要分析函数序言来解码回溯，因此 GDB 无法解析这些调用栈。因此，在遇到第一个 ROM 函数时，调用栈解析将中断并报错。

为解决这一问题，ESP-IDF 监视器会根据目标芯片及其修订版本自动加载乐鑫提供的 ROM ELF。有关 ROM ELF 的详细信息，请参阅 [esp-rom-elfs](#)。

### 4.8.7 按需转储变量

通过读取变量的最后一个值，可以了解崩溃发生的根本原因。核心转储支持通过为已声明的变量添加特殊标记，在 GDB 上检索变量数据。

#### 支持的标记和 RAM 区域

- COREDUMP\_DRAM\_ATTR 将变量放置在 DRAM 区域，该区域包含在转储中。
- COREDUMP\_RTC\_ATTR 将变量放置在 RTC 区域，该区域包含在转储中。
- COREDUMP\_RTC\_FAST\_ATTR 将变量放置在 RTC\_FAST 区域，该区域包含在转储中。

#### 示例

1. 在 [项目配置菜单](#) 中启用 `COREDUMP_TO_FLASH`，随后保存并退出。
2. 在项目中，创建如下全局变量，放置在 DRAM 区域：

```
// uint8_t global_var;
COREDUMP_DRAM_ATTR uint8_t global_var;
```

3. 在主应用程序中，将该变量设置为任意值，并以 `assert(0)` 引发崩溃。

```
global_var = 25;
assert(0);
```

4. 在目标设备上构建、烧写并运行应用程序，等待转储信息。
5. 运行以下命令，在 GDB 中开始核心转储，其中 PORT 是设备的 USB 端口：

```
idf.py coredump-debug
```

6. 在 GDB shell 中，输入 `p global_var` 获取变量内容：

```
(gdb) p global_var
$1 = 25 '\031'
```

### 4.8.8 运行 `idf.py coredump-info` 和 `idf.py coredump-debug`

要获取更多有关使用方法的详情，请运行 `idf.py coredump-info --help` 和 `idf.py coredump-debug --help` 命令。

#### 相关文档

##### 核心转储镜像文件详解

核心转储文件的格式可以配置为使用 ELF 格式或传统的二进制格式。建议在所有新设计中使用 ELF 格式，该格式在发生崩溃时会提供更多关于软件状态的信息，例如 CPU 寄存器和内存内容。

内存状态包含程序内存空间中映射的所有任务的快照；CPU 状态包含核心转储生成时的寄存器值。核心转储文件使用 ELF 结构的子集注册这些信息。

可加载的 ELF 段用于存储进程的内存状态，ELF 注释 (ELF.PT\_NOTE) 用于存储进程的元数据（如 pid、寄存器、信号等）。CPU 状态则存储在一个具有特殊名称 (CORE) 和类型 (NT\_PRSTATUS type) 的注释中。

下图展示了核心转储的结构：

图 7: 核心转储 ELF 镜像文件格式

**备注：** 上图仅展示当前版本镜像的文件格式，在未来的发布版本中可能会发生变化。

**核心转储实现** 下图展示了核心转储实现的基本情况：

**备注：** 上图隐藏了部分细节，仅展示当前版本的核心转储实现，在未来的发布版本中可能会发生变化。

## 4.9 C++ 支持

ESP-IDF 主要使用 C 语言编写，并提供 C 语言 API。但 ESP-IDF 也支持使用 C++ 开发应用程序，与 C++ 开发相关的各种主题在本文档中列出。

图 8: 核心转储二进制镜像文件格式

图 9: 核心转储实现

ESP-IDF 支持以下 C++ 功能：

- 异常处理
- 多线程
- 运行时类型信息 (RTTI)
- 线程局部存储 (thread\_local 关键字)
- 除部分限制，所有由 GCC 实现的 C++ 功能均受支持。有关由 GCC 所实现功能的详细信息，请参阅 [GCC 文档](#)。

### 4.9.1 esp-idf-cxx 组件

esp-idf-cxx 组件为一些 ESP-IDF 中的功能提供了更高级别的 C++ API，该组件可以从 [ESP-IDF 组件注册表](#) 中获取。

### 4.9.2 C++ 语言标准

默认情况下，ESP-IDF 使用 C++23 语言标准和 GNU 扩展 (-std=gnu++23) 编译 C++ 代码。

要使用其他语言标准编译特定组件的源代码，请按以下步骤，在组件的 CMakeLists.txt 文件中设置所需的编译器标志：

```
idf_component_register( ... )
target_compile_options(${COMPONENT_LIB} PRIVATE -std=gnu++11)
```

如果组件的公共头文件也需要以该语言标准编译，请使用 PUBLIC 而非 PRIVATE。

### 4.9.3 多线程

支持 C++ 线程，互斥锁和条件变量。C++ 线程基于 pthread 构建，而 pthread 封装了 FreeRTOS 任务。

有关在 C++ 中创建线程的示例，请参阅 [cxx/pthread](#)。

---

**备注：** std::jthread 的析构函数只能从 [线程 API](#) 或 [C++ 线程库 API](#) 创建的任务中安全地调用。

---

### 4.9.4 异常处理

ESP-IDF 默认禁用对 C++ 异常处理的支持，可以用 [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#) 选项启用该支持。

如果抛出了异常处理，却没有相应的 catch 块，程序将由 abort 函数终止，并打印回溯信息。有关回溯信息的更多信息，请参见 [严重错误](#)。

C++ 异常处理应 **仅**应用于异常情况，即意外情况及罕见情况，如发生频率低于 1% 的事件。**请勿**将 C++ 异常处理用于流程控制，详情请参阅下文的资源使用部分。有关使用 C++ 异常处理的更多详情，请参阅 [ISO C++ FAQ](#) 和 [CPP 核心指南](#)。

有关 C++ 异常处理的示例，请参阅 [cxx/exceptions](#)。

#### C++ 异常处理及所需资源

启用异常处理后，应用程序的二进制文件通常会增加几个 KB。

此外，可能需要为异常处理应急内存池保留一部分 RAM。如果无法从堆内存中分配异常处理对象，则会使用该池中的内存。

使用 [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS\\_EMG\\_POOL\\_SIZE](#) 变量可以设置异常处理应急内存池的内存量。

当且仅当 C++ 异常抛出时，会使用额外的栈内存（约 200 字节），从而从栈内存顶部调用函数，启动异常处理。

使用 C++ 异常处理的代码的运行时间取决于运行时实际发生的情况。

- 如果没有抛出异常，则异常处理的代码运行速度会更快，因为无需检查错误代码。
- 如果抛出异常，异常处理代码的运行时间会比返回错误代码的代码长几个数量级。

如果抛出异常，解开栈代码的速度要比返回错误代码慢好几个数量级。所增加的运行时长取决于应用程序的要求和错误处理的实现方式（例如，是否需要用户输入或发送消息到云端）。因此，在实时关键的代码路径中，不应使用会抛出异常的代码。

## 4.9.5 运行时类型信息 (RTTI)

ESP-IDF 默认禁用对 RTTI 的支持，可以用 `CONFIG_COMPILER_CXX_RTTI` 选项启用该支持。

启用此选项，将以启用了 RTTI 支持的方式编译所有的 C++ 文件，并支持使用 `dynamic_cast` 转换和 `typeid` 运算符。启用此选项通常会增加几十 KB 的二进制文件大小。

有关在 ESP-IDF 中使用 RTTI 的示例，请参阅 [cxx/rtti](#)。

## 4.9.6 在 C++ 中进行开发

以下部分提供了在 C++ 中开发 ESP-IDF 应用程序的一些技巧。

### 组合 C 和 C++ 代码

当应用程序的不同部分使用 C 和 C++ 开发时，理解 [语言链接性](#) 的概念非常重要。

为了能够从 C 代码中调用 C++ 函数，该 C++ 函数必须使用 C 链接 (`extern "C"`) 进行 **声明和定义**：

```
// 在 .h 文件中声明：
#ifdef __cplusplus
extern "C" {
#endif

void my_cpp_func(void);

#ifdef __cplusplus
}
#endif

// 在 .cpp 文件中进行定义：
extern "C" void my_cpp_func(void) {
    // ...
}
```

为了能够从 C++ 中调用 C 函数，该 C 函数必须使用 C 链接 **声明**：

```
// 在 .h 文件中声明：
#ifdef __cplusplus
extern "C" {
#endif

void my_c_func(void);

#ifdef __cplusplus
}
#endif
```

(下页继续)

```
// 在 .c 文件中进行定义:  
void my_c_func(void) {  
    // ...  
}
```

### 在 C++ 中定义 app\_main

ESP-IDF 希望应用程序入口点 `app_main` 以 C 链接定义。当 `app_main` 在 `.cpp` 源文件中定义时，必须以 `extern "C"` 标识：

```
extern "C" void app_main()  
{  
}
```

### 指定初始化器

许多 ESP-IDF 组件会以配置结构体作为初始化函数的参数。用 C 编写的 ESP-IDF 示例通常使用指定初始化器，以可读且可维护的方式填充有关结构体。

C 和 C++ 语言对于指定初始化器有不同的规则。例如，C++23（当前在 ESP-IDF 中默认使用）不支持无序指定初始化、嵌套指定初始化、混合使用指定初始化器和常规初始化器，而对数组进行指定初始化。因此，当将 ESP-IDF 的 C 示例移植到 C++ 时，可能需要对结构体初始化器进行一些更改。详细信息请参阅 [C++ aggregate initialization reference](#)。

### iostream

ESP-IDF 支持 `iostream` 功能，但应注意：

1. ESP-IDF 在构建过程中通常会删除未使用的代码。然而，在使用 `iostreams` 的情况下，仅在其中一个源文件包含 `<iostream>` 头文件就会使二进制文件增加大约 200 kB。
2. ESP-IDF 默认使用简单的非阻塞机制来处理标准输入流 (`stdin`)。要获得 `std::cin` 的常规行为，应用程序必须初始化 UART 驱动程序，并启用阻塞模式，详情请参阅 [common\\_components/protocol\\_examples\\_common/stdin\\_out.c](#)。

## 4.9.7 限制

- 链接脚本生成器不支持将具有 C++ 链接的函数单独放置在内存的特定位置。
- 当与模板函数一起使用时，会忽略各种节属性（例如 `IRAM_ATTR`）。
- `vtable` 位于 flash 中，在禁用 flash 缓存时无法访问。因此，在 [IRAM 安全中断处理程序](#) 中应避免调用虚拟函数。目前尚无法使用链接器脚本生成器调整 `vtable` 的放置位置。
- 不支持 C++ 文件系统 (`std::filesystem`) 功能。

## 4.9.8 注意事项

请勿在 C++ 中使用 `setjmp/longjmp`。`longjmp` 会在不调用任何析构函数的情况下盲目跳出堆栈，容易引起未定义的行为和内存泄漏。请改用 C++ 异常处理，这类程序可以确保正确调用析构函数。如果无法使用 C++ 异常处理，请使用其他替代方案（`setjmp/longjmp` 除外），如简单的返回码。

## 4.10 Current Consumption Measurement of Modules

You may want to know the current consumption of a [module](#) in deep-sleep mode, *other power-saving modes*, and active mode to develop some applications sensitive to power consumption. This section introduces how to measure the current consumption of a module running such an application.

### 4.10.1 Notes to Measurement

#### Can We Use a Development Board?

For ESP32-C3, using a development board directly to measure current consumption of the corresponding module is not recommended, as some circuits still consume power on the board even when you flash the chip with the [deep\\_sleep](#) example. Therefore, you need to cut off the power supply circuit to the module to measure the module's current. This method is inconvenient and increases measurement costs.

#### How to Choose an Appropriate Ammeter?

In the [deep\\_sleep](#) example, the module will be woken up every 20 seconds. In deep-sleep mode, the current in the module is just several microamps ( $\mu\text{A}$ ), while in active mode, the current is in the order of milliamps (mA). The high dynamic current range makes accurate measurement difficult. Ordinary ammeters cannot dynamically switch the measurement range fast enough.

Additionally, ordinary ammeters have a relatively high internal resistance, resulting in a significant voltage drop. This may cause the module to enter an unstable state, as it is powered by a voltage smaller than the minimum required voltage supply.

Therefore, an ammeter suitable for measuring current in deep-sleep mode should have low internal resistance and, ideally, switch current ranges dynamically. We recommend two options: the [Joulescope ammeter](#) and the [Power Profiler Kit II from Nordic](#).

**Joulescope Ammeter** The Joulescope ammeter combines high-speed sampling and rapid dynamic current range switching to provide accurate and seamless current and energy measurements, even for devices with rapidly varying current consumption. Joulescope accurately measures electrical current over nine orders of magnitude from amps down to nanoamps. This wide range allows for accurate and precise current measurements for devices. Additionally, Joulescope has a total voltage drop of 25 mV at 1 A, which keeps the module running normally. These two features make Joulescope a perfect option for measuring the module switching between deep-sleep mode and wake-up mode.

Joulescope has no display screen. You need to connect it to a PC to visualize the current waveforms of the measured module. For specific instructions, please follow the documentation provided by the manufacturer.

**Nordic Power Profiler Kit II** The Nordic Power Profiler Kit II has an advanced analog measurement unit with a high dynamic measurement range. This allows for accurate power consumption measurements for the entire range typically seen in low-power embedded applications, all the way from single  $\mu\text{A}$ s to 1 A. The resolution varies between 100 nA and 1 mA, depending on the measurement range, and is high enough to detect small spikes often seen in low-power optimized systems.

### 4.10.2 Hardware Connection

To measure the power consumption of a bare module, you need an [ESP-Prog](#) to flash the [deep\\_sleep](#) example to the module and power the module during measurement, a suitable ammeter (here we use the Joulescope ammeter), a computer, and of course a bare module with necessary jumper wires. For the connection, please refer to the following figure.

Please connect the pins of **UART TX**, **UART RX**, **SPI Boot**, **Enable**, and **Ground** on the measured module with corresponding pins on ESP-Prog, and connect the **VPROG** pin on ESP-Prog with the **IN+** port on the Joulescope

图 10: Hardware Connection (click to enlarge)

ammeter and connect its **OUT+** port with the **Power supply (3V3)** pin on the measured module. For the specific names of these pins in different modules, please refer to the list below.

表 2: Pin Names of Modules Based on ESP32-C3 Chip

Function of Module Pin	Pin Name
UART TX	TXD0
UART RX	RXD0
SPI Boot	IO9
Enable	EN
Power Supply	3V3
Ground	GND

For modules based on the ESP32-C3 chip, the names of UART TX and UART RX pins may also be TXD and RXD, TX and RX, or TX0 and RX0.

For details of the pin names, please refer to the [datasheet of specific module](#).

### 4.10.3 Measurement Steps

ESP32-S3-WROOM-1 is used as an example in the measurement, and other modules can be measured similarly. For the specific current consumption of chips in different modes, please refer to the Current Consumption subsection in the corresponding [chip datasheet](#).

You can refer to the following steps to measure the current in deep-sleep mode.

- Connect the aforementioned devices according to the hardware connection.
- Flash the [deep\\_sleep](#) example to the module. For details, please refer to Start a Project on Linux and macOS for a computer with Linux or macOS system or Start a Project on Windows for a computer with Windows system.
- By default, the module will be woken up every 20 seconds (you can change the timing by modifying the code of this example). To check if the example runs as expected, you can monitor the module operation by running `idf.py -p PORT monitor` (please replace PORT with your serial port name).
- Open the Joulescope software to see the current waveform as shown in the image below.

From the waveforms, you can obtain that the current of the module in deep-sleep mode is 8.14  $\mu$ A. In addition, you can also see the current of the module in active mode, which is about 23.88 mA. The waveforms also show that the average power consumption during deep-sleep mode is 26.85  $\mu$ W, and the average power consumption during active mode is 78.32 mW.

The figure below shows the total power consumption of one cycle is 6.37 mW.

By referring to these power consumption in different modes, you can estimate the power consumption of your applications and choose the appropriate power source.

## 4.11 Deep Sleep Wake Stubs

ESP32-C3 supports running a "deep sleep wake stub" when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialisation, bootloader, or ESP-IDF code has run. After the wake stub runs, the SoC can go back to sleep or continue to start ESP-IDF normally.

Deep sleep wake stub code is loaded into "RTC Fast Memory" and any data which it uses must also be loaded into RTC memory. RTC memory regions hold their contents during deep sleep.

### 4.11.1 Rules for Wake Stubs

Wake stub code must be carefully written:

图 11: Current Waveform of ESP32-S3-WROOM-1 (click to enlarge)

图 12: Power Consumption of ESP32-S3-WROOM-1 (click to enlarge)

- As the SoC has freshly woken from sleep, most of the peripherals are in reset states. The SPI flash is unmapped.
- The wake stub code can only call functions implemented in ROM or loaded into RTC Fast Memory (see below.)
- The wake stub code can only access data loaded in RTC memory. All other RAM will be uninitialised and have random contents. The wake stub can use other RAM for temporary storage, but the contents will be overwritten when the SoC goes back to sleep or starts ESP-IDF.
- RTC memory must include any read-only data (.rodata) used by the stub.
- Data in RTC memory is initialised whenever the SoC restarts, except when waking from deep sleep. When waking from deep sleep, the values which were present before going to sleep are kept.
- Wake stub code is a part of the main esp-idf app. During normal running of esp-idf, functions can call the wake stub functions or access RTC memory. It is as if these were regular parts of the app.

### 4.11.2 Implementing A Stub

The wake stub in esp-idf is called `esp_wake_deep_sleep()`. This function runs whenever the SoC wakes from deep sleep. There is a default version of this function provided in esp-idf, but the default function is weak-linked so if your app contains a function named `esp_wake_deep_sleep()` then this will override the default.

If supplying a custom wake stub, the first thing it does should be to call `esp_default_wake_deep_sleep()`.

It is not necessary to implement `esp_wake_deep_sleep()` in your app in order to use deep sleep. It is only necessary if you want to have special behaviour immediately on wake.

If you want to swap between different deep sleep stubs at runtime, it is also possible to do this by calling the `esp_set_deep_sleep_wake_stub()` function. This is not necessary if you only use the default `esp_wake_deep_sleep()` function.

All of these functions are declared in the `esp_sleep.h` header under `components/esp32c3`.

### 4.11.3 Loading Code Into RTC Memory

Wake stub code must be resident in RTC Fast Memory. This can be done in one of two ways.

The first way is to use the `RTC_IRAM_ATTR` attribute to place a function into RTC memory:

```
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The second way is to place the function into any source file whose name starts with `rtc_wake_stub`. Files names `rtc_wake_stub*` have their contents automatically put into RTC memory by the linker.

The first way is simpler for very short and simple code, or for source files where you want to mix "normal" and "RTC" code. The second way is simpler when you want to write longer pieces of code for RTC memory.

### 4.11.4 Loading Data Into RTC Memory

Data used by stub code must be resident in RTC memory.

Specifying this data can be done in one of two ways:

The first way is to use the `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` to specify any data (writeable or read-only, respectively) which should be loaded into RTC memory:

```
RTC_DATA_ATTR int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count %d\n";
```

(下页继续)

```
    esp_rom_printf(fmt_str, wake_count++);  
}
```

The attributes `RTC_FAST_ATTR` and `RTC_SLOW_ATTR` can be used to specify data that will be force placed into `RTC_FAST` and `RTC_SLOW` memory respectively, but for ESP32-C3 there is only RTC fast memory, so both attributes will map to this region.

Unfortunately, any string constants used in this way must be declared as arrays and marked with `RTC_RODATA_ATTR`, as shown in the example above.

The second way is to place the data into any source file whose name starts with `rtc_wake_stub`.

For example, the equivalent example in `rtc_wake_stub_counter.c`:

```
int wake_count;  
  
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {  
    esp_default_wake_deep_sleep();  
    esp_rom_printf("Wake count %d\n", wake_count++);  
}
```

The second way is a better option if you need to use strings, or write other more complex code.

To reduce wake-up time use the `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` Kconfig option, see more information in [Fast boot from Deep Sleep](#).

### 4.11.5 CRC Check For Wake Stubs

During deep sleep, all RTC Fast memory areas will be validated with CRC. When ESP32-C3 wakes up from deep sleep, the RTC fast memory will be validated with CRC again. If the validation passes, the wake stubs code will be executed. Otherwise, the normal initialization, bootloader and esp-idf codes will be executed.

---

**备注:** When the `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP` option is enabled, all the RTC fast memory except the wake stubs area is added to the heap.

---

### 4.11.6 Example

ESP-IDF provides an example to show how to implement the Deep-sleep wake stub.

- [system/deep\\_sleep\\_wake\\_stub](#)

## 4.12 错误处理

### 4.12.1 概述

在应用程序开发中，及时发现并处理在运行时期的错误，对于保证应用程序的健壮性非常重要。常见的运行时错误有如下几种：

- 可恢复的错误：
  - 通过函数的返回值（错误码）表示的错误
  - 使用 `throw` 关键字抛出的 C++ 异常
- 不可恢复（严重）的错误：

- 断言失败（使用 `assert` 宏或者其它类似方法，可参考 [Assertions](#)）或者直接调用 `abort()` 函数造成的错误
- CPU 异常：访问受保护的内存区域、非法指令等
- 系统级检查：看门狗超时、缓存访问错误、堆栈溢出、堆栈粉碎、堆栈损坏等

本文将介绍 ESP-IDF 中针对可恢复错误的错误处理机制，并提供一些常见错误的处理模式。

关于如何处理不可恢复的错误，请查阅 [不可恢复错误](#)。

## 4.12.2 错误码

ESP-IDF 中大多数函数会返回 `esp_err_t` 类型的错误码，`esp_err_t` 实质上是带符号的整型，`ESP_OK` 代表成功（没有错误），具体值定义为 0。

在 ESP-IDF 中，许多头文件都会使用预处理器，定义可能出现的错误代码。这些错误代码通常均以 `ESP_ERR_` 前缀开头，一些常见错误（比如内存不足、超时、无效参数等）的错误代码则已经在 `esp_err.h` 文件中定义好了。此外，ESP-IDF 中的各种组件 (component) 也都可以针对具体情况，自行定义更多错误代码。

完整错误代码列表，请见 [错误代码参考](#) 中查看完整的错误列表。

## 4.12.3 错误码到错误消息

错误代码并不直观，因此 ESP-IDF 还可以使用 `esp_err_to_name()` 或者 `esp_err_to_name_r()` 函数，将错误代码转换为具体的错误消息。例如，我们可以向 `esp_err_to_name()` 函数传递错误代码 `0x101`，可以得到返回字符串“ESP\_ERR\_NO\_MEM”。这样一来，我们可以在日志中输出更加直观的错误消息，而不是简单的错误码，从而帮助研发人员更快理解发生了何种错误。

此外，如果出现找不到匹配的 `ESP_ERR_` 值的情况，函数 `esp_err_to_name_r()` 则会尝试将错误码作为一种 **标准 POSIX 错误代码** 进行解释。具体过程为：POSIX 错误代码（例如 `ENOENT`，`ENOMEM`）定义在 `errno.h` 文件中，可以通过 `errno` 变量获得，进而调用 `strerror_r` 函数实现。在 ESP-IDF 中，`errno` 是一个基于线程的局部变量，即每个 FreeRTOS 任务都有自己的 `errno` 副本，通过函数修改 `errno` 也只会作用于当前任务中的 `errno` 变量值。

该功能（即在无法匹配 `ESP_ERR_` 值时，尝试用标准 POSIX 解释错误码）默认启用。用户也可以禁用该功能，从而减小应用程序的二进制文件大小，详情可见 [CONFIG\\_ESP\\_ERR\\_TO\\_NAME\\_LOOKUP](#)。注意，该功能对禁用并不影响 `esp_err_to_name()` 和 `esp_err_to_name_r()` 函数的定义，用户仍可调用这两个函数转化错误码。在这种情况下，`esp_err_to_name()` 函数在遇到无法匹配错误码的情况会返回 `UNKNOWN ERROR`，而 `esp_err_to_name_r()` 函数会返回 `Unknown error 0xXXXX(YYYYY)`，其中 `0xXXXX` 和 `YYYYY` 分别代表错误代码的十六进制和十进制表示。

## 4.12.4 ESP\_ERROR\_CHECK 宏

宏 `ESP_ERROR_CHECK` 的功能和 `assert` 类似，不同之处在于：这个宏会检查 `esp_err_t` 的值，而非判断 `bool` 条件。如果传给 `ESP_ERROR_CHECK` 的参数不等于 `ESP_OK`，则会在控制台上打印错误消息，然后调用 `abort()` 函数。

错误消息通常如下所示：

```
ESP_ERROR_CHECK failed: esp_err_t 0x107 (ESP_ERR_TIMEOUT) at 0x400d1fdf

file: "/Users/user/esp/example/main/main.c" line 20
func: app_main
expression: sdmmc_card_init(host, &card)

Backtrace: 0x40086e7c:0x3ffb4ff0 0x40087328:0x3ffb5010 0x400d1fdf:0x3ffb5030_
↳0x400d0816:0x3ffb5050
```

**备注：** 如果使用 *IDF* 监视器，则最后一行回溯结果中的地址将会被自动解析为相应的文件名和行号。

- 第一行打印错误代码的十六进制表示，及该错误在源代码中的标识符。这个标识符取决于 `CONFIG_ESP_ERR_TO_NAME_LOOKUP` 选项的设定。最后，第一行还会打印程序中该错误发生的具体位置。
- 下面几行显示了程序中调用 `ESP_ERROR_CHECK` 宏的具体位置，以及传递给该宏的参数。
- 最后一行打印回溯结果。对于所有不可恢复错误，这里在应急处理程序中打印的内容都是一样的。更多有关回溯结果的详细信息，请参阅 [不可恢复错误](#)。

#### 4.12.5 ESP\_ERROR\_CHECK\_WITHOUT\_ABORT 宏

宏 `ESP_ERROR_CHECK_WITHOUT_ABORT` 的功能和 `ESP_ERROR_CHECK` 类似，不同之处在于它不会调用 `abort()`。

#### 4.12.6 ESP\_RETURN\_ON\_ERROR 宏

宏 `ESP_RETURN_ON_ERROR` 用于错误码检查，如果错误码不等于 `ESP_OK`，该宏会打印错误信息，并使原函数立刻返回。

#### 4.12.7 ESP\_GOTO\_ON\_ERROR 宏

宏 `ESP_GOTO_ON_ERROR` 用于错误码检查，如果错误码不等于 `ESP_OK`，该宏会打印错误信息，将局部变量 `ret` 赋值为该错误码，并使原函数跳转至给定的 `goto_tag`。

#### 4.12.8 ESP\_RETURN\_ON\_FALSE 宏

宏 `ESP_RETURN_ON_FALSE` 用于条件检查，如果给定条件不等于 `true`，该宏会打印错误信息，并使原函数立刻返回，返回值为给定的 `err_code`。

#### 4.12.9 ESP\_GOTO\_ON\_FALSE 宏

宏 `ESP_GOTO_ON_FALSE` 用于条件检查，如果给定条件不等于 `true`，该宏会打印错误信息，将局部变量 `ret` 赋值为给定的 `err_code`，并使原函数跳转至给定的 `goto_tag`。

#### 4.12.10 CHECK 宏使用示例

示例：

```
static const char* TAG = "Test";

esp_err_t test_func(void)
{
    esp_err_t ret = ESP_OK;

    ESP_ERROR_CHECK(x); // err message_
    ↪printed if `x` is not `ESP_OK`, and then `abort()`.
    ESP_ERROR_CHECK_WITHOUT_ABORT(x); // err message_
    ↪printed if `x` is not `ESP_OK`, without `abort()`.
    ESP_RETURN_ON_ERROR(x, TAG, "fail reason 1"); // err message_
    ↪printed if `x` is not `ESP_OK`, and then function returns with code `x`.
    ESP_GOTO_ON_ERROR(x, err, TAG, "fail reason 2"); // err message_
    ↪printed if `x` is not `ESP_OK`, `ret` is set to `x`, and then jumps to `err`.
```

(下页继续)

(续上页)

```

    ESP_RETURN_ON_FALSE(a, err_code, TAG, "fail reason 3"); // err message
    ↪printed if `a` is not `true`, and then function returns with code `err_code`.
    ESP_GOTO_ON_FALSE(a, err_code, err, TAG, "fail reason 4"); // err message
    ↪printed if `a` is not `true`, `ret` is set to `err_code`, and then jumps to
    ↪`err`.

err:
    // clean up
    return ret;
}

```

**备注：**如果 Kconfig 中的 `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT` 选项被打开，CHECK 宏将不会打印错误信息，其他功能不变。

ESP\_RETURN\_xx 和 ESP\_GOTO\_xx 宏不可以在中断服务程序里被调用。如需要在中断中使用类似功能，请使用 xx\_ISR 宏，如 ESP\_RETURN\_ON\_ERROR\_ISR 等。

### 4.12.11 错误处理模式

1. 尝试恢复。根据具体情况不同，我们具体可以：
  - 在一段时间后，重新调用该函数；
  - 尝试删除该驱动，然后重新进行“初始化”；
  - 采用其他带外机制，修改导致错误发生的条件（例如，对一直没有响应的外设进行复位等）。

示例：

```

esp_err_t err;
do {
    err = sdio_slave_send_queue(addr, len, arg, timeout);
    // 如果发送队列已满就不断重试
} while (err == ESP_ERR_TIMEOUT);
if (err != ESP_OK) {
    // 处理其他错误
}

```

2. 将错误传递回调用程序。在某些中间件组件中，采用此类处理模式代表函数必须以相同的错误码退出，这样才能确保所有分配的资源都能得到释放。

示例：

```

sdmmc_card_t* card = calloc(1, sizeof(sdmmc_card_t));
if (card == NULL) {
    return ESP_ERR_NO_MEM;
}
esp_err_t err = sdmmc_card_init(host, &card);
if (err != ESP_OK) {
    // 释放内存
    free(card);
    // 将错误码传递给上层（例如通知用户）
    // 或者，应用程序可以自定义错误代码并返回
    return err;
}

```

3. 转为不可恢复错误，比如使用 ESP\_ERROR\_CHECK。详情请见 [ESP\\_ERROR\\_CHECK 宏](#) 章节。对于中间件组件而言，通常并不希望在发生错误时中止应用程序。不过，有时在应用程序级别，这种做法是可以接受的。在 ESP-IDF 的示例代码中，很多都会使用 ESP\_ERROR\_CHECK 来处理各种 API 引发的错误，虽然这不是应用程序的最佳做法，但可以让示例代码看起来更加简洁。
- 示例：

```
ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));
```

### 4.12.12 C++ 异常

请参考[异常处理](#)。

## 4.13 ESP-BLE-MESH

蓝牙 mesh 网络实现了无线设备的“多对多”通讯，其可用于建立包含大量设备的网络。

设备能将数据中继至不在初始设备无线电覆盖范围内的其他设备。这样，mesh 网络就能够覆盖非常大的物理区域，并且囊括大量设备。Mesh 网络非常适用于楼宇自动化、传感器网络和其他物联网解决方案，这些情景下数以十计、百计、千计的设备需要与其他设备进行安全可靠的通信。

蓝牙 mesh 并非无线通信技术，而是一种网络技术。该技术基于一种无线通讯协议栈，即低功耗蓝牙。

ESP-BLE-MESH 基于 Zephyr 蓝牙 Mesh 协议栈的顶端，其实现支持设备配网和节点控制，同时也实现了代理、中继、低功耗和朋友等节点功能。

有关 ESP-BLE-MESH 架构实现的信息，请参见[ESP-BLE-MESH 架构](#)；有关各自 API 的信息，请参见[ESP-BLE-MESH API Reference](#)。

ESP-BLE-MESH 的实现和认证基于最新的 [Mesh Profile v1.0.1](#)。有关 ESP-BLE-MESH 认证的细节，请参考[此处](#)。

---

**备注：**如果你在寻找 ESP32 基于 Wi-Fi 的 mesh 方案，请查阅乐鑫的另一款产品 ESP-WIFI-MESH。更多相关信息及文档，请参见[ESP-WIFI-MESH](#)。

---

### 4.13.1 ESP-BLE-MESH 快速入门

该章节旨在帮助你基于乐鑫的 ESP32 开发板搭建 ESP-BLE-MESH 网络。

我们将会展示如何搭建并运行一个包含 3 个节点的小型 ESP-BLE-MESH 网络，其中包含设备配网、节点配置，以及向特定节点上的 Generic OnOff Server Model 发送开关灯命令。

如果你是第一次接触 ESP-IDF，请参见[esp-idf 快速入门](#)来设置开发环境，编译、烧写和运行示例应用程序。

#### 硬件及软件准备

硬件：

- 3 块 ESP32 开发板，请参见[options](#)。
- 连接开发板的 USB 线。
- ESP-IDF 开发环境。
- 运行 Android 或 iOS 的手机或平板。

软件：

- 下载至 ESP32 开发板的示例应用 [bluetooth/esp\\_ble\\_mesh/onoff\\_models](#)。
- 手机 App: **nRF Mesh** Android 或 iOS 版本。除 nRF Mesh 的 App，以下 App 也支持 ESP-BLE-MESH:
  - [EspBleMesh](#) Android App
  - Silicon Labs Android 或 iOS App

## 安装

以下详细步骤可指导你完成安装过程。

**步骤 1. 检查硬件** ESP32-DevKitC 和 ESP-WROVER-KIT 开发板均支持 ESP-BLE-MESH。你可以通过 `menuconfig: idf.py menuconfig > Example Configuration > Board selection for ESP-BLE-MESH` 选择特定的开发板。

**备注:** 如果你打算使用 ESP32-DevKitC 开发板, 请将 RGB 灯焊接至 GPIO 管脚 25、26 和 27。

**步骤 2. 配置软件** 进入 `bluetooth/esp_ble_mesh/onoff_models` 示例文件夹, 运行 `idf.py menuconfig` 选择所使用的开发板, 然后运行 `idf.py build` 编译示例。

### 步骤 3. 下载应用

`bluetooth/esp_ble_mesh/onoff_models` 示例编译成功后, 用户可以运行 `idf.py flash` 将编译生成的二进制文件下载至 3 块开发板中。

当开发板上电后, RGB 灯会变为 **绿色**。

图 13: ESP-BLE-MESH 设备上电

**步骤 4. 设备配网** 在该章节中, 我们将使用 **nRF Mesh Android App** 演示如何配网设备。用户也可以从 App Store 下载其 iOS 版本。

**4.1 扫描 (scanner)** 扫描 (Scanner) 是 nRF Mesh App 搜索蓝牙通信范围内未配网设备的功能。打开 App, 点击底部的扫描按钮 **Scanner**。App 就会开始扫描设备, 很快, 我们便可在屏幕上看到 3 个未配网设备。

图 14: nRF Mesh - 扫描

**4.2 识别** 用户可以选择任何一个未配网设备，此时 App 会尝试和该设备建立连接。连接成功（有时可能需要尝试多次），且发现相应的 ESP-BLE-MESH GATT 服务后，用户可以在屏幕中看到识别按钮 **IDENTIFY**。IDENTIFY 操作告诉用户哪个设备将被配网。

**备注：** IDENTIFY 需要设备侧的支持，然后才能用来识别当前正在配网的设备。当前如果点击识别按钮 **IDENTIFY**，除了串口输出的 log，在当前的 example 中设备侧不会有其他现象。

点击识别按钮 **IDENTIFY** 后，用户可以看到配网按钮 **PROVISION**。

**4.3 配网** 点击配网按钮 **PROVISION**，App 会开始配网设备。当设备配网成功后，开发板上的 RGB 灯会熄灭，此时 App 会执行以下几个步骤：

1. 和该节点（设备配网后成为节点）断开连接
2. 尝试和该节点重新建立连接
3. 连接成功并且发现了相应的 ESP-BLE-MESH GATT 服务
4. 获取节点的 Composition Data 并且给该节点添加 AppKey

当以上所有的步骤完成后，节点初始配置完成。此时点击 **OK**，用户可以看见节点的单播地址分配成功，并且其 Composition Data 也被成功解析。

有时在上述步骤 2 中，App 可能与节点连接失败。这种情况下，用户点击 **OK** 后可以看到，节点只有单播地址被成功分配，Composition data 并没有被成功获取。此时用户需要点击右上角的连接按钮 **CONNECT**，屏幕上会显示原先配网的节点，用户需要选择该节点并与其建立连接。

连接成功后，App 会显示获取 Composition Data 以及添加 AppKey 的按钮。

如果该设备是 App 配网的第二个或第三个节点，此时点击连接按钮 **CONNECT** 后，用户可以在屏幕中看到 2 个或 3 个节点。这种情况下，用户可以选择其中的任何一个节点建立连接，连接成功后可以返回至主界面选择需要配置的节点。

这里给出了一个 3 个节点的示例。

图 15: nRF Mesh - 识别 - 配网

图 16: nRF Mesh - 配置完成

图 17: nRF Mesh - 初始配置失败

图 18: nRF Mesh - 重连 - 初始配置

- 左侧图片表示第三个设备成功配网，但是 App 没有和其成功建立连接。当 App 尝试去重新连接第三个节点时，界面上会出现 3 个节点。
- 右侧图片表示和节点成功建立连接后，App 显示这 3 个节点的信息。用户可以看到 App 已经获取了第一个和第二个节点的 Composition Data，但是对于第三个节点，只有单播地址被成功分配而节点的 Composition Data 未知。

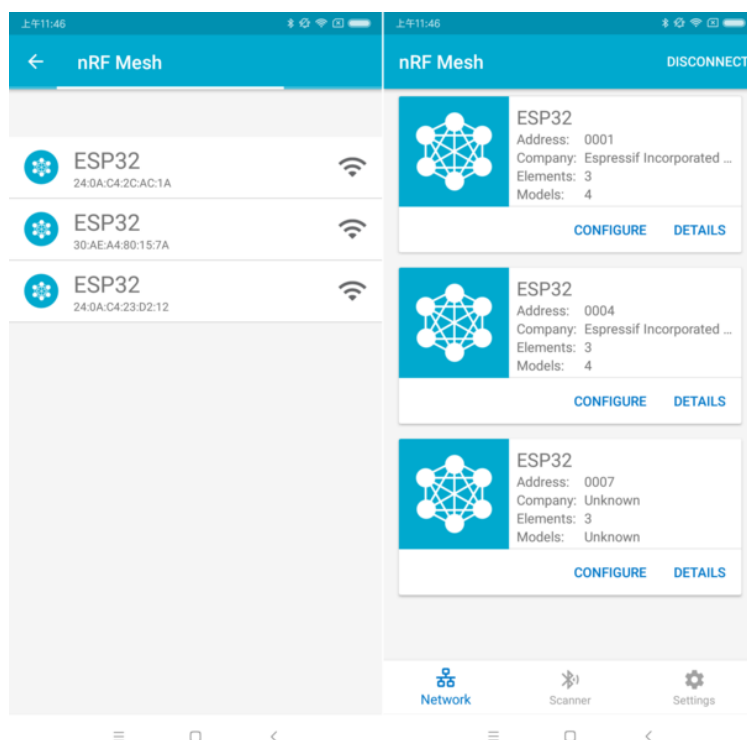

图 19: nRF Mesh - 重连 - 3 个节点

**4.4 配置** 当成功配网和初始配置完成后，用户可以配置节点的其余信息，例如将 AppKey 绑定至每个元素 (element) 的每个模型 (model) 中、设置模型的发布信息。

下图展示了如何将 AppKey 绑定至 Primary Element 中的 Generic OnOff Server Model 上。

**备注：** 用户不需要将 AppKey 绑定至 Configuration Server Model，因为该模型使用 DevKey 在 Upper Transport Layer 中对消息进行加密。

**Step 5. 运行网络** 当 3 个元素中的 Generic OnOff Server Models 均成功绑定 AppKey 后，用户可以使用 App 开关 RGB 灯。

在 [bluetooth/esp\\_ble\\_mesh/onoff\\_models](#) 示例中，第一个 Generic OnOff Server Model 用来控制 **红色**，第二个用来控制 **绿色**，同时第三个用来控制 **蓝色**。

下图展示了打开了不同色灯的开发板。

**备注：** 对于 nRF Mesh iOS App [version 1.0.4]，当节点包含超过一个元素时，App 表现不正确。如果用户尝试打开或者关闭第 2 个或第 3 个 Generic OnOff Server Model，App 会将相应的消息发送至第 1 个 Generic OnOff Server Model。

图 20: nRF Mesh - Model Bind AppKey

图 21: nRF Mesh - 通用开关控制

图 22: 3 个上电的 ESP-BLE-MESH 节点

### 4.13.2 ESP-BLE-MESH 示例

- **开关节点** - 展示了将 ESP-BLE-MESH 作为拥有 Configuration Server model 和 Generic OnOff Server model 的节点设备的用法。然后，ESP-BLE-MESH Provisioner 可以配网设备，控制表示开/关状态的 RGB 灯，示例请见 [example code](#)。
- **客户端模型** - 展示了 Generic OnOff Client model 如何在节点内工作。节点拥有 Configuration Server model、Generic OnOff Server model 和 Generic OnOff Client model，示例请见：[example code](#)。
- **配网器** - 展示了设备如何充当 ESP-BLE-MESH Provisioner 以配网设备。Provisioner 拥有 Configuration Server model、Configuration Client model 和 Generic OnOff Client model，示例请见 [example code](#)。
- **快速配网 - Client 和 Server** - 该示例用于演示快速配网。配网 100 个设备费时不超过 60 秒，示例请见：[example client code](#) 和 [example server code](#)。
- **Wi-Fi 和 BLE-Mesh 共存** - 该示例用于演示 Wi-Fi 和 ESP-BLE-MESH 共存的功能。简而言之，用户可在运行 ESP-BLE-MESH 时使用 Wi-Fi，示例请见 [example code](#)。
- **远程配网 (v1.1 新增) - Client, Server and device** - 该示例用于演示 mesh 协议 v1.1 中新增的远程配网功能，示例请见：[example client code](#) , [example server code](#) and [example device code](#)。
- **定向转发 (v1.1 新增) - Client and Server** - 该示例用于演示 mesh 协议 v1.1 中新增的定向转发功能。只有路径上的节点才会对定向消息进行转发，而其他节点不参与转发，示例请见 [example client code](#) and [example server code](#)。

### 4.13.5 相关文档

#### ESP-BLE-MESH Feature List

#### Supported Features

##### Mesh Core

- **Provisioning:**
  - PB-ADV, PB-GATT and PB-Remote
  - OOB Authentication
  - Certificate-based Provisioning
  - Remote Provisioning
  - Enhanced Provisioning Authentication
- **Networking**
  - Relay
  - Segmentation and Reassembly
  - Key Refresh Procedure
  - IV Update Procedure
  - Friend
  - Low Power
  - Proxy Server
  - Proxy Client
  - Directed Forwarding
  - Private Beacon
  - Subnet Bridge
  - Minor Enhancements
- **Multiple Client Models Run Simultaneously**
  - Support multiple client models send packets to different nodes simultaneously
  - No blocking between client model and server model
- **NVS Storing**
  - Store provisioning and configuration information of ESP-BLE-MESH Node

##### Mesh Models

- **Foundation models**
  - Configuration Server model
  - Configuration Client model
  - Health Server model
  - Health Client model
  - Remote Provisioning Server model
  - Remote Provisioning Client model
  - Directed Forwarding Configuration Server model
  - Directed Forwarding Configuration Client model
  - Bridge Configuration Server model
  - Bridge Configuration Client model
  - Mesh Private Beacon Server model
  - Mesh Private Beacon Client model
  - On-Demand Private Proxy Server model
  - On-Demand Private Proxy Client model

- SAR Configuration Server model
- SAR Configuration Client model
- Solicitation PDU RPL Configuration Server model
- Solicitation PDU RPL Configuration Client model
- Opcodes Aggregator Server model
- Opcodes Aggregator Client model
- Large Composition Data Server model
- Large Composition Data Client model
- **Generic client models**
  - Generic OnOff Client
  - Generic Level Client
  - Generic Default Transition Time Client
  - Generic Power OnOff Client
  - Generic Power Level Client
  - Generic Battery Client
  - Generic Location Client
  - Generic Property Client
- **Sensor client models**
  - Sensor Client
- **Time and Scenes client models**
  - Time Client
  - Scene Client
  - Scheduler Client
- **Lighting client models**
  - Light Lightness Client
  - Light CTL Client
  - Light HSL Client
  - Light xyL Client
  - Light LC Client
- **Generic server models**
  - Generic OnOff Server
  - Generic Level Server
  - Generic Default Transition Time Server
  - Generic Power OnOff Server
  - Generic Power OnOff Setup Server
  - Generic Power Level Server
  - Generic Power Level Setup Server
  - Generic Battery Server
  - Generic Location Server
  - Generic Location Setup Server
  - Generic User Property Server
  - Generic Admin Property Server
  - Generic Manufacturer Property Server
  - Generic Client Property Server
- **Sensor server models**
  - Sensor Server
  - Sensor Setup Server
- **Time and Scenes server models**
  - Time Server
  - Time Setup Server
  - Scene Server
  - Scene Setup Server
  - Scheduler Server
  - Scheduler Setup Server
- **Lighting server models**
  - Light Lightness Server
  - Light Lightness Setup Server
  - Light CTL Server

- Light CTL Temperature Server
- Light CTL Setup Server
- Light HSL Server
- Light HSL Hue Server
- Light HSL Saturation Server
- Light HSL Setup Server
- Light xyL Server
- Light xyL Setup Server
- Light LC Server
- Light LC Setup Server

### ESP-BLE-MESH 架构

本文档将介绍 ESP-BLE-MESH 的架构概览、架构实现和辅助程序。

- ESP-BLE-MESH 架构概览
  - 描述了 ESP-BLE-MESH 架构的 5 大部分及每个部分的功能。
- ESP-BLE-MESH 架构实现
  - 描述了 ESP-BLE-MESH 文件的基本功能、文件与 ESP-BLE-MESH 架构的对应关系及文件间调用的接口。
- ESP-BLE-MESH 辅助程序
  - 描述了 ESP-BLE-MESH 的辅助程序，比如 Mesh 网络管理，Mesh 特性等。

**1. ESP-BLE-MESH 架构概览** 目前, ESP-BLE-MESH 已经实现了 Mesh Profile 的大多数功能及 Mesh Model 规范中定义的所有 Client Model。未支持的功能/模型尚在开发中, 会尽快提供。ESP-BLE-MESH 已通过 Bluetooth SIG 蓝牙技术联盟的 [认证](#)。

图 23: 图 1.1 ESP-BLE-MESH 架构图

ESP-BLE-MESH 架构主要由以下 5 大部分组成:

- Mesh 协议栈
  - Mesh Networking 负责 ESP-BLE-MESH 节点的网络消息处理等。
  - Mesh Provisioning 负责 ESP-BLE-MESH 设备的启动配置流程。
  - Mesh Models 负责实现 SIG 定义的模型。
- 网络管理
  - 负责实现网络管理程序, 包括节点删除程序、网络索引 (IV Index) 恢复程序等。

- 特性
  - 包括 ESP-BLE-MESH 特性，如低功耗特性、好友特性、中继特性等。
- Mesh 承载层
  - 包括广播承载层和 GATT 承载层。承载层对于 ESP-BLE-MESH 协议栈至关重要，因为协议栈基于蓝牙低功耗技术构建而成，其必须利用承载层通过 BLE 广播通道和连接通道进行数据传输。
- 应用程序
  - 基于 ESP-BLE-MESH 协议栈和 Mesh Models。
  - 通过调用 API 和处理事件，Applications 实现了与 ESP-BLE-MESH 协议栈中的 Mesh Networking 和 Mesh Provisioning 的交互，也实现了与 Mesh Models 中一系列模型的交互。

## 1.1 Mesh 协议栈

**1.1.1 Mesh Networking** 协议栈架构中的 Mesh Networking 实现了如下功能：

- Mesh 网络中节点间的通讯。
- Mesh 网络中消息的加解密。
- Mesh 网络资源的管理，如网络密钥 (NetKey)、网络索引等。
- Mesh 网络消息的分包与重组。
- 消息在不同模型间的模型映射。
- 更多功能，请参见 [ESP-BLE-MESH Feature List](#)。

Mesh Networking 功能的实现是基于层级结构的。每一层的功能如表 1.1 所示：

表 3: 表 1.1 Mesh Networking 框架描述

层级	功能
接入层	接入层定义应用程序数据的格式，还对上层传输层对数据包的加密和解密进行定义和控制。
上层传输层	上层传输层对接入层进出的应用数据进行加密、解密和认证，同时也处理被称为“传输控制消息”的特殊消息，这种消息包括了与“友谊”和心跳包相关的消息。
底层传输层	底层传输层处理 PDU 的分包和重组。
网络层	网络层定义网络消息的地址类型和格式，实现设备的中继功能。

**1.1.2 Mesh Provisioning** 协议栈架构中的 Mesh Provisioning 实现了如下功能：

- 对未配网设备的配网。
- Mesh 网络资源的分配（单播地址、网络索引和网络密钥）。
- 配网期间对 4 种验证方法的支持。
- 更多功能，请参见 [ESP-BLE-MESH Feature List](#)。

Mesh Provisioning 功能的实现是基于层级结构的。每一层的功能如表 1.2 所示：

表 4: 表 1.2 Mesh Provisioning 框架描述

层级	功能
Provisioning PDUs	通过配网协议处理不同层级的 Provisioning PDUs。
Generic Provisioning PDU/Proxy PDU	使用 Generic Provisioning 层或代理协议层将 Provisioning PDU 传输到未配网的设备。
PB-ADV/PB-GATT	这些层级定义了 Provisioning PDUs 作为可分包和重组的消息进行传输的方式。
Advertising/Provisioning Service	Provisioning bearer 定义了会话建立的方式，该方式用来将 Generic Provisioning 层的传输包传送到设备。

**1.1.3 Mesh Models** 协议栈架构中的 Mesh Models 实现了如下功能：

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

每一层的功能如表 1.3 所示：

表 5: 表 1.3 Mesh Models 框架描述

层级	功能
模型层	模型层实现用于标准化典型用户场景操作的模型，包括 Generic Client/Server Models、Sensor Client/Server Models、Time and Scenes Client/Server Models、Lighting Client/Server Models 和若干自定义模型。
基础模型层	基础模型层实现与 ESP-BLE-MESH 网络配置、管理和自我诊断等相关的模型。

**1.2 Mesh 网络管理** 网络管理实现了如下功能：

- 节点移除程序：用于将节点从网络中移除。
- 网络索引恢复程序：用于恢复节点的网络索引。
- 网络索引更新程序：用于更新节点的网络索引。
- 密钥更新程序：用于更新节点的网络密钥、应用密钥 (AppKey) 等。
- 网络创建程序：用于创建 mesh 网络。
- NVS 存储器：用于存储节点的网络信息。

**1.3 Mesh 特性** 特性包括以下几项：

- 低功耗特性：用于降低节点的能耗。
- 好友特性：用于为低功耗节点存储消息。
- 中继特性：用于中继/转发节点通过广播承载层收到的网络 PDU。
- Proxy Server/Client 是代理协议中的两个节点角色，其使节点可以通过面向连接的承载层收发 Network PDUs、mesh beacons、代理配置消息和 Provisioning PDU。

**1.4 Mesh 承载层** 协议栈框架中的 承载层负责 ESP-BLE-MESH 协议栈和低功耗蓝牙核心协议间的数据传输。

承载层可视为是基于蓝牙低功耗核心协议的载体层，其实现了 ESP-BLE-MESH 协议栈数据的接收和传输。

表 6: 表 1.3 Mesh 承载层描述

层级	功能
GATT 承载层	GATT 承载层使用代理协议通过 GATT 连接在两个设备之间发送和接收 Proxy PDUs。
广播承载层	使用广播承载层时，必须使用低功耗蓝牙广播通道来发送 mesh 数据包，数据包中的 AD Type 需要设置为 mesh 数据包的类型。

**1.5 Mesh 应用层** 协议栈框架图中的 应用层通过调用 ESP-BLE-MESH 协议栈提供的 API 并处理协议栈上报的事件来实现相应的功能，有一些常见应用，比如网关、照明等。

应用层和 API / 事件之间的交互

- 应用层调用 API
  - 调用配网相关的 API 进行配网。
  - 调用模型相关的 API 发送消息。
  - 调用设备属性相关的 API 获取设备的本地信息。
- 应用层处理事件
 

应用层的设计基于事件设计，事件将参数传输给应用层。事件主要分为两大类。

- 调用 API 完成的事件。
    - \* 比如接收消息的节点。
  - 协议栈主动上报给应用层的事件。
    - \* 协议栈主动上报的事件。
    - \* 模型主动上报的事件。
- 事件通过应用层注册的回调函数进行上报，同时回调函数中也会包含对事件的相应处理。

API / 事件与 ESP-BLE-MESH 协议栈的交互

- 用户使用的 API 主要调用“Mesh Networking”、Mesh Provisioning 和 Mesh Models 提供的函数。
- API / 事件和协议栈的交互不会跨越协议栈的层级进行操作。比如 API 不会调用 Network Layer 相关的函数。

**2. ESP-BLE-MESH 架构实现** ESP-BLE-MESH 架构的设计和实现是基于层级和模块的。具体而言，第 2.1 节（Mesh 网络的实现），第 2.2 节（Mesh 配网实现）和第 2.3 节（Mesh 层级实现）基于层级思想，第 2.4 节（网格模型的实现）基于模块思想。

- **层级思想:** 基于层级思想，网络架构根据 Mesh Profile Specification 中指定的层级设计而成。每层都有独特的文件，文件包括该层的 API 等。具体设计如图 2.1 所示。
- **模块思想:** 每个文件实现一个独立的功能，供其它程序调用。

ESP-BLE-MESH 架构采用分层的方式进行设计，数据包的处理所经过的层级顺序是固定的，也就是数据包的处理过程会形成一个消息流。因此，我们可以从图 2.1 的协议栈接口图中看到消息流。

## 2.1 Mesh 协议栈的实现

**2.1.1 Mesh Networking 实现** Mesh Networking 中的文件列表和每个文件实现的功能如表 2.1 所示：

表 7: 表 2.1 Mesh Networking 文件描述

文件	功能
<a href="#">access.c</a>	ESP-BLE-MESH 接入层
<a href="#">transport.c</a>	ESP-BLE-MESH 底层/上层传输层
<a href="#">net.c</a>	ESP-BLE-MESH 网络层
<a href="#">adv.c</a>	用于发送 ESP-BLE-MESH 广播包的任务，一个用于处理收到的广播包的回调以及用于分配 adv 缓冲区的 API

**2.1.2 Mesh Provisioning 实现** 由于 Node/Provisioner 共存的限制，Mesh Provisioning 的实现分为两大模块。实现 Node 启动配置的特定文件如表 2.2 所示：

表 8: 表 2.2 Mesh Provisioning（节点）文件描述

文件	功能
<a href="#">prov_node.c</a>	ESP-BLE-MESH 节点配网 (PB-ADV & PB-GATT)
<a href="#">proxy_server.c</a>	ESP-BLE-MESH 节点代理服务器相关功能
<a href="#">beacon.c</a>	用于处理 ESP-BLE-MESH Beacon 的 API

实现 Provisioner 配置功能的特定文件如表 2.3 所示：

表 9: 表 2.3 Mesh Provisioning (Provisioner) 文件描述

文件	功能
<a href="#">prov_pvr.c</a>	ESP-BLE-MESH Provisioner 配置入网 (PB-ADV & PB-GATT)
<a href="#">proxy_client.c</a>	ESP-BLE-MESH 代理客户端相关功能
<a href="#">pvr_mgmt.c</a>	ESP-BLE-MESH Provisioner 网络相关功能

图 24: 图 2.1 ESP-BLE-MESH 架构实现图

**2.1.3 Mesh Models 实现** Mesh Models 用于实现节点中所包含的模型的具体功能。服务器模型主要用于维护节点状态。客户端模型主要用于获取和修改节点状态。

表 10: Table 2.4 Mesh Models 文件描述

文件	功能
cfg_cli.c	发送 Configuration Client 消息, 接收相应应答消息
cfg_srv.c	接收 Configuration Client 消息, 发送适当应答消息
health_cli.c	发送 Health Client 消息, 接收相应应答消息
health_srv.c	接收 Health Client 消息, 发送适当应答消息
client_common.c	ESP-BLE-MESH 模型相关操作
generic_client.c	发送 ESP-BLE-MESH Generic Client 消息, 接收相应应答消息
lighting_client.c	发送 ESP-BLE-MESH Lighting Client 消息, 接收相应应答消息
sensor_client.c	发送 ESP-BLE-MESH Sensor Client 消息, 接收相应应答消息
time_scene_client.c	发送 ESP-BLE-MESH Time Scene Client 消息, 接收相应应答消息
generic_server.c	发送 ESP-BLE-MESH Generic Client 消息, 发送相应应答消息
lighting_server.c	接收 ESP-BLE-MESH Lighting Client 消息, 发送相应应答消息
sensor_server.c	接收 ESP-BLE-MESH Sensor Client 消息, 发送相应应答消息
time_scene_server.c	接收 ESP-BLE-MESH Time Scene Client 消息, 发送相应应答消息

**2.2 Mesh Bearers 实现** Mesh Bearers 在实现时充分考虑了可移植性。当 ESP-BLE-MESH 协议栈需要移植到其它平台时, 用户只需要修改 `adapter.c` 就能移植成功。

表 11: 表 2.5 Mesh Bearers 文件描述

文件	功能
adapter.c	ESP-BLE-MESH 承载层适配文件。此文件提供用于接收和发送 ESP-BLE-MESH ADV 和 GATT 相关数据包的接口。

**备注:** `adapter.c` 是对 Mesh 网络框架中 Advertising Bearer 和 GATT Bearer 的实现。

**2.3 Mesh Applications 实现** 我们提供了一系列用于客户开发的应用示例, 用户可以基于 *ESP-BLE-MESH* 示例 开发产品。

**1. ESP-BLE-MESH 辅助程序** 辅助程序指的是 ESP-BLE-MESH 协议栈中可选的功能。辅助程序的设计通常通过 *CONFIG\_BLE\_MESH* 来实现代码的裁剪。

### 3.1 特性

- 低功耗
- 好友
- 中继
- 代理客户端/代理服务器

### 3.2 网络管理

- 节点移除程序
- 网络索引恢复程序
- 网络索引更新程序
- 秘钥更新程序
- 网络创建程序
- NVS 存储器

### 3.3 辅助程序实现

采用独立模块的设计主要考虑到两个因素：

- 该模块不具备分层实现的条件，其实现可以完全独立，不需要依赖其它模块。
- 模块中的函数会被反复使用到，因此最好设计成独立模块。独立模块如表 3.1 所示：

表 12: 表 3.1 模块文件描述

文件	功能
<a href="#">lpn.c</a>	ESP-BLE-MESH 低功耗功能
<a href="#">friend.c</a>	ESP-BLE-MESH 好友功能
<a href="#">net.c</a>	ESP-BLE-MESH 中继功能、网络创建、网络索引更新程序、网络索引恢复程序、密钥更新程序相关功能
<a href="#">proxy_server.c</a>	ESP-BLE-MESH 代理服务器相关功能
<a href="#">proxy_client.c</a>	ESP-BLE-MESH 代理客户端相关功能
<a href="#">settings.c</a>	ESP-BLE-MESH NVS 存储器功能
<a href="#">main.c</a>	ESP-BLE-MESH 协议栈初始化，协议栈使能，节点移除相关功能

## ESP-BLE-MESH 常见问题手册

本文汇总了 ESP-BLE-MESH 协议栈开发的常见问题及解答，全文分为 7 个章节。

- [1. Provisioner 开发](#)
- [2. 节点开发](#)
- [3. ESP-BLE-MESH 和 Wi-Fi 共存](#)
- [4. 快速配网](#)
- [5. Log 帮助](#)
- [6. 示例帮助](#)
- [7. 其他](#)

用户可以参考这些章节，快速找到问题的答案。该文档会根据各种渠道收集的反馈进行更新。

**1. Provisioner 开发** 通常而言，Provisioner 用于配网未配网设备并形成 mesh 网络。组网后，设备的角色变成节点。

### 1.1 未配网设备加入 ESP-BLE-MESH 网络的流程是什么？

设备通过 Provisioner 加入 ESP-BLE-MESH 网络分为两个阶段，配网阶段和配置阶段。

- 配网阶段：为设备分配单播地址、添加网络密钥 (NetKey) 等。通过配网，设备加入 ESP-BLE-MESH 网络，身份从未配网设备变为节点。
- 配置阶段：为节点添加应用密钥 (AppKey)，并将应用密钥绑定到相应模型。配置期间，有些选项是可选的，比如为节点添加订阅地址、设置发布地址等。通过配置，该节点实际上可以向 Provisioner 发送消息，也可以接收来自 Provisioner 的消息。

### 1.2 如果 Provisioner 想要改变节点状态，其需满足什么条件？

- 需要有和节点的服务器模型相对应的客户端模型。
- 需要和节点有相同的、可用于加密消息的网络密钥和应用密钥。
- 需要知道节点的地址，可以是单播地址，也可以是订阅地址。

### 1.3 如何使用网络密钥和应用密钥？

- 网络密钥用于加密网络层的消息。具有相同网络密钥的节点视作在同一网络中，具有不同网络密钥的节点相互之间不能进行通信。
- 应用密钥用于加密上层传输层中的消息。如果服务器模型和客户端模型绑定的应用密钥不同，则无法实现相互通信。

#### 1.4 如何生成网络密钥或应用密钥？是否可以采用固定的网络密钥或应用密钥？

- API `esp_ble_mesh_provisioner_add_local_net_key()` 可以用来添加包含固定值或随机值的网络密钥。
- API `esp_ble_mesh_provisioner_add_local_app_key()` 可以用来添加包含固定值或随机值的应用密钥。

#### 1.5 Provisioner 的单播地址是不是固定的？

`esp_ble_mesh_prov_t` 中 `prov_unicast_addr` 的值用于设置 Provisioner 的单播地址，只能在初始化期间设置一次，此后不能更改。

#### 1.6 Provisioner 的地址是否可以作为节点上报状态消息的目的地址？

Provisioner 的单播地址只能在初始化期间设置一次，此后不能更改。理论而言，只要节点知道 Provisioner 的单播地址，此地址便可用作节点上报状态消息的目的地址。节点在网络配置的过程中可以知道 Provisioner 的单播地址，因为 Provisioner 往节点发送消息时，消息的源地址就是 Provisioner 的单播地址。

订阅地址也可使用。Provisioner 订阅组地址或者虚拟地址，节点向该订阅地址发送消息。

#### 1.7 被 Provisioner 配网到 ESP-BLE-MESH 网络中的第一个节点的单播地址是不是固定的？

`esp_ble_mesh_prov_t` 中 `prov_start_address` 的值用于设置 Provisioner 配网未配网设备的起始地址，即其首先配网的节点的单播地址。单播地址只能在初始化期间设置一次，此后不能修改。

#### 1.8 手机 App 首先配置的节点的单播地址是不是固定的？

该 App 将确定单播地址，目前大多数单播地址是固定的。

#### 1.9 如何知道当前 Provisioner 正在配网哪个未配网设备？

`esp_ble_mesh_prov_t` 中 `prov_attention` 的值由 Provisioner 在配网过程中设置给未配网设备。该值只能在初始化期间设置一次，此后不能修改。未配网设备加入 mesh 网络后可以用特定的方式来显示自己正在配网，比如灯光闪烁，以告知 Provisioner 其正在配网。

#### 1.10 配网过程中，认证设备共有多少种方法？提供的范例中 provided examples 使用了什么方法？

共有四种设备认证方法，即 No OOB、Static OOB、Output OOB 和 Input OOB。提供的范例使用了 No OOB 的方式。

#### 1.11 配置入网前，未配网设备的广播包可以携带哪些信息？

- Device UUID
- OOB Info
- URL Hash (可选的)

#### 1.12 这些信息可以用于设备识别吗？

是的。每个设备都有独一无二的 Device UUID, 用户可以通过 Device UUID 识别设备。

#### 1.13 当 Provisioner 配网的节点包含多个元素时，单播地址是如何分配的？

- Provisioner 会给设备的主元素分配一个单播地址，其余元素的单播地址在此基础上递增。
- 比如：如果一个未配网设备有三个元素，即主要元素、第二元素和第三元素。配网完成后，节点主元素的单播地址为 0x0002，节点第二元素的单播地址为 0x0003，节点第三元素的单播地址为 0x0004。

### 1.14 Provisioner 如何通过 Configuration Client Model 获取并且解析节点的构成数据？

- Provisioner 可以调用 *Configuration Client Model* API `esp_ble_mesh_config_client_set_state()` 设置参数，调用 `esp_ble_mesh_cfg_client_get_state_t` 中的 `comp_data_get` 获取节点的构成数据。
- 用户可以参考以下代码解析 Composition Data:

```

#include <stdio.h>
#include <string.h>
#include <stdint.h>

//test date: 0C001A0001000800030000010501000000800100001003103F002A00

    }
}

```

### 1.15 Provisioner 如何通过获取的 Composition Data 进一步配置节点？

Provisioner 通过调用 *Configuration Client Model* API `esp_ble_mesh_config_client_set_state()` 来进行如下配置。

- 正确设置参数 `esp_ble_mesh_cfg_client_set_state_t` 中的 `app_key_add`，将应用密钥添加到节点中。
- 正确设置参数 `esp_ble_mesh_cfg_client_set_state_t` 中的 `model_sub_add`，将订阅地址添加到节点的模型中。
- 正确设置参数 `esp_ble_mesh_cfg_client_set_state_t` 中的 `model_pub_set`，将发布地址添加到节点的模型中。

### 1.16 节点可以自己添加相应的配置吗？

本法可用于特殊情况，如测试阶段。

- 此示例展示了节点如何为自己的模型添加新的组地址。

```

esp_err_t example_add_fast_prov_group_address(uint16_t model_id, uint16_t
↪group_addr)
{
    const esp_ble_mesh_comp_t *comp = NULL;
    esp_ble_mesh_elem_t *element = NULL;
    esp_ble_mesh_model_t *model = NULL;
    int i, j;

    if (!ESP_BLE_MESH_ADDR_IS_GROUP(group_addr)) {
        return ESP_ERR_INVALID_ARG;
    }

    comp = esp_ble_mesh_get_composition_data();
    if (!comp) {
        return ESP_FAIL;
    }

    for (i = 0; i < comp->element_count; i++) {
        element = &comp->elements[i];
        model = esp_ble_mesh_find_sig_model(element, model_id);
        if (!model) {
            continue;
        }
        for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
            if (model->groups[j] == group_addr) {
                break;
            }
        }
        if (j != ARRAY_SIZE(model->groups)) {
            ESP_LOGW(TAG, "%s: Group address already exists, element_
↪index: %d", __func__, i);
            continue;
        }
        for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
            if (model->groups[j] == ESP_BLE_MESH_ADDR_UNASSIGNED) {
                model->groups[j] = group_addr;
                break;
            }
        }
        if (j == ARRAY_SIZE(model->groups)) {
            ESP_LOGE(TAG, "%s: Model is full of group addresses, element_
↪index: %d", __func__, i);
        }
    }

    return ESP_OK;
}

```

**备注：**使能了节点的 NVS 存储器后，通过该方式添加的组地址以及绑定的应用密钥在设备掉电的情况下不能保存。这些配置信息只有通过 Configuration Client Model 配置时才会保存。

### 1.17 Provisioner 如何通过分组的方式控制节点？

通常而言，在 ESP-BLE-MESH 网络中实现组控制有两种方法，即组地址方法和虚拟地址方法。假设有 10 个设备，即 5 个带蓝灯的设备 and 5 个带红灯的设备。

- 方案一：5 个蓝灯设备订阅一个组地址，5 个红灯设备订阅另一个组地址。Provisioner 往不同的组地址发送消息，即可实现分组控制设备。

- 方案二：5 个蓝灯设备订阅一个虚拟地址，5 个红灯设备订阅另一个虚拟地址，Provisioner 往不同的虚拟地址发送消息，即可实现分组控制设备。

### 1.18 Provisioner 如何将节点添加至多个子网？

节点配置期间，Provisioner 可以为节点添加多个网络密钥，拥有相同网络密钥的节点属于同一子网。Provisioner 可以通过不同的网络密钥与不同子网内的节点进行通信。

### 1.19 Provisioner 如何知道网络中的某个设备是否离线？

节点离线通常定义为：电源故障或其他原因导致的节点无法与 mesh 网络中的其他节点正常通信的情况。

ESP-BLE-MESH 网络中的节点间彼此不连接，它们通过广播通道进行通信。

此示例展示了如何通过 Provisioner 检测节点是否离线。

- 节点定期给 Provisioner 发送心跳包。如果 Provisioner 超过一定的时间未接收到心跳包，则视该节点离线。

---

**备注：**心跳包的设计应该采用单包（字节数小于 11 个字节）的方式，这样收发效率会更高。

---

### 1.20 Provisioner 删除网络中的节点时，需要进行哪些操作？

通常而言，Provisioner 从网络中移除节点主要涉及三个步骤：

- 首先，Provisioner 将需要移除的节点添加至“黑名单”。
- 其次，Provisioner 启动密钥更新程序。
- 最后，节点执行节点重置程序，切换自身身份为未配网设备。

### 1.21 在密钥更新的过程中，Provisioner 如何更新节点的网络密钥？

- 通过正确设置参数 `esp_ble_mesh_cfg_client_set_state_t` 中的 `net_key_update`，使用 *Configuration Client Model* API `esp_ble_mesh_config_client_set_state()`，Provisioner 更新节点的网络密钥。
- 通过正确设置参数 `esp_ble_mesh_cfg_client_set_state_t` 中的 `app_key_update`，使用 *Configuration Client Model* API `esp_ble_mesh_config_client_set_state()`，Provisioner 更新节点的应用密钥。

### 1.22 Provisioner 如何管理 mesh 网络中的节点？

ESP-BLE-MESH 在示例中实现了一些基本的节点管理功能，比如 `esp_ble_mesh_store_node_info()`。ESP-BLE-MESH 还提供可用于设置节点本地名称的 API `esp_ble_mesh_provisioner_set_node_name()` 和可用于获取节点本地名称的 API `esp_ble_mesh_provisioner_get_node_name()`。

### 1.23 Provisioner 想要控制节点的服务器模型时需要什么？

Provisioner 在控制节点的服务器模型前，必须包括相应的客户端模型。

Provisioner 应当添加本地的网络密钥和应用密钥。

- Provisioner 调用 API `esp_ble_mesh_provisioner_add_local_net_key()` 以添加网络密钥。
- Provisioner 调用 API `esp_ble_mesh_provisioner_add_local_app_key()` 以添加应用密钥。

Provisioner 应当配置自己的客户端模型。

- Provisioner 调用 API `esp_ble_mesh_provisioner_bind_app_key_to_local_model()` 以绑定应用密钥至自己的客户端模型。

## 1.24 Provisioner 如何控制节点的服务器模型？

ESP-BLE-MESH 支持所有 SIG 定义的客户端模型。Provisioner 可以使用这些客户端模型控制节点的服务器模型。客户端模型分为 6 类，每类有相应的功能。

- Configuration Client Model
  - API `esp_ble_mesh_config_client_get_state()` 可用于获取 Configuration Server Model 的 `esp_ble_mesh_cfg_client_get_state_t` 值。
  - API `esp_ble_mesh_config_client_set_state()` 可用于设置 Configuration Server Model 的 `esp_ble_mesh_cfg_client_set_state_t` 值。
- Health Client Model
  - API `esp_ble_mesh_health_client_get_state()` 可用于获取 Health Server Model 的 `esp_ble_mesh_health_client_get_state_t` 值。
  - API `esp_ble_mesh_health_client_set_state()` 可用于设置 Health Server Model 的 `esp_ble_mesh_health_client_set_state_t` 值。
- Generic Client Models
  - API `esp_ble_mesh_generic_client_get_state()` 可用于获取 Generic Server Model 的 `esp_ble_mesh_generic_client_get_state_t` 值。
  - API `esp_ble_mesh_generic_client_set_state()` 可用于设置 Generic Server Model 的 `esp_ble_mesh_generic_client_set_state_t` 值。
- Lighting Client Models
  - API `esp_ble_mesh_light_client_get_state()` 可用于获取 Lighting Server Model 的 `esp_ble_mesh_light_client_get_state_t` 值。
  - API `esp_ble_mesh_light_client_set_state()` 可用于设置 Lighting Server Model 的 `esp_ble_mesh_light_client_set_state_t` 值。
- Sensor Client Models
  - API `esp_ble_mesh_sensor_client_get_state()` 可用于获取 Sensor Server Model 的 `esp_ble_mesh_sensor_client_get_state_t` 值。
  - API `esp_ble_mesh_sensor_client_set_state()` 可用于设置 Sensor Server Model 的 `esp_ble_mesh_sensor_client_set_state_t` 值。
- Time and Scenes Client Models
  - API `esp_ble_mesh_time_scene_client_get_state()` 可用于获取 Time and Scenes Server Model 的 `esp_ble_mesh_time_scene_client_get_state_t` 值。
  - API `esp_ble_mesh_time_scene_client_set_state()` 可用于设置 Time and Scenes Server Model 的 `esp_ble_mesh_time_scene_client_set_state_t` 值。

## 2. 节点开发

### 2.1 节点包含什么样的模型？

- ESP-BLE-MESH 中，节点由一系列的模型组成，每个模型实现节点的某些功能。
- 模型分为两种，客户端模型和服务器模型。客户端模型可以获取并设置服务器模型的状态。
- 模型也可以分为 SIG 模型和自定义模型。SIG 模型的所有行为都由官方定义，而自定义模型的行为均由用户定义。

### 2.2 每个模型对应的消息格式是不是固定的？

- 消息由 opcode 和 payload 组成，通过 opcode 进行区分。
- 与模型对应的消息的类型和格式都是固定的，这意味着模型之间传输的消息是固定的。

### 2.3 节点的模型可以使用哪些函数发送消息？

- 对于客户端模型，用户可以调用 API `esp_ble_mesh_client_model_send_msg()` 发送消息。
- 对于服务器模型，用户可以调用 API `esp_ble_mesh_server_model_send_msg()` 发送消息。
- 对于发布，用户可以调用 API `esp_ble_mesh_model_publish()` 发布消息。

### 2.4 如何实现消息传输不丢包？

如果用户要实现消息传输不丢包，则需有应答的消息。等待应答的默认时间在 `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT` 中设置。如果发送端等待应答超时，就会触发对应的超时事件。

---

**备注：** API `esp_ble_mesh_client_model_send_msg()` 中可以设置应答的超时时间。如果参数 `msg_timeout` 设为 **0**，那么超时时间便会采用默认值（4 秒）。

---

### 2.5 如何发送无应答的消息？

对于客户端模型，用户可以调用 API `esp_ble_mesh_client_model_send_msg()` with the parameter `need_rsp` set to `false` 发送无应答消息。

对于服务器模型，调用 API `esp_ble_mesh_server_model_send_msg()` 发送的消息总是无应答的消息。

### 2.6 如何为模型添加订阅地址？

通过 Configuration Client Model 添加订阅地址。

### 2.7 模型发送的消息和发布的消息有何不同？

调用 API `esp_ble_mesh_client_model_send_msg()` 或 `esp_ble_mesh_server_model_send_msg()` 发送的消息会在 Network Transmit 状态规定的期限内发送。

调用 API `esp_ble_mesh_model_publish()` 发布的消息将由模型发布状态决定是否发布。消息的发布一般是周期性的，或者有固定次数。发布周期和发布次数由模型发布状态控制，并且可以通过 Configuration Client Model 进行配置。

### 2.8 发送不分包消息时，最多可携带多少有效字节？

不分包消息的总有效载荷长度（可由用户设置）为 11 个八位位组，因此，如果消息的 opcode 为 2 个八位位组，则该消息可以携带 9 个八位位组的有效信息。对于 vendor 消息，由于 opcode 是 3 个八位位组，剩余的有效负载长度为 8 个八位位组。

### 2.9 什么时候应该使能节点的 Relay 功能？

如果 mesh 网络中检测到的节点很稀疏，用户可以使能节点的 Relay 功能。

如果 mesh 网络中检测到的节点很密集，用户可以选择仅使能一些节点的 Relay 功能。

如果 mesh 网络大小未知，用户可以默认使能 Relay 功能。

### 2.10 什么时候应该使能节点的 Proxy 功能？

如果未配网设备将由电话配网，则未配网设备应该使能 Proxy 功能，因为当前几乎所有电话都不支持通过广播承载层发送 ESP-BLE-MESH 数据包。并且，未配网设备成功配网成为 Proxy 节点后，其会通过 GATT 承载层和广播承载层与 mesh 网络中的其他节点通信。

### 2.11 如何使用代理过滤器？

代理过滤器用于减少 Proxy Client（如手机）和 Proxy Server（如节点）之间交换的 Network PDU 的数量。另外，通过代理过滤器，Proxy Client 可以明确请求仅接收来自 Proxy Server 的某些目标地址的 mesh 消息。

### 2.12 Relay 节点什么时候可以中继消息？

如果要中继消息，消息需满足以下要求。

- 消息存在于 mesh 网络中。
- 消息的目的地址不是节点的单播地址。
- 消息的 TTL 值需大于 1。

### 2.13 如果一条消息分成几段，那么其他 Relay 节点是接收到一段消息就中继还是等接收到完整的数据包才中继？

Relay 节点收到其中一段消息时就中继，而非一直等到接收所有的消息。

### 2.14 使用 Low Power 功能降低功耗的原理是什么？

- 开启无线电进行收听时，设备消耗能量。使能节点的低功耗功能后，它将在大多数时间内关闭无线电功能。
- 低功耗节点和好友节点需要合作，因此低功耗节点可以以适当或较低的频率接收消息，而无需一直收听。
- 当低功耗节点有一些新消息时，好友节点将为其存储消息。低功耗节点可以间隔固定时间轮询好友节点，以查看是否有新的消息。

### 2.15 设备断电后上电，如何能继续在网络中进行通讯？

在 `menuconfig` 中启用配置 Store BLE Mesh Node configuration persistently。

### 2.16 如何实现将节点自检的信息发送出来？

推荐节点通过 Health Server Model 定期发布其自检结果。

### 2.17 节点间如何传输消息？

节点间传输信息的可能应用场景是，一旦烟雾警报检测到高浓度的烟雾，就会触发喷淋设备。有两种实现方法。

- 方法 1：喷淋设备订阅组地址。当烟雾警报器检测到高浓度的烟雾时，它会发布一条消息，该消息的目标地址是喷淋设备已订阅的组地址。
- 方法 2：Provisioner 可以配置喷淋设备的单播地址为烟雾报警器的地址。当检测到高浓度的烟雾时，烟雾警报器以喷淋设备的单播地址为目标地址，将消息发送到喷淋设备。

### 2.18 设备通信必须要网关吗？

- 情况 1：节点仅在 mesh 网络内通信。这种情况下，不需要网关。ESP-BLE-MESH 网络是一个泛洪的网络，网络中的消息没有固定的路径，节点与节点之间可以随意通信。
- 情况 2：如果用户想要远程控制网络，比如在到家之前打开某些节点，则需要网关。

### 2.19 何时使用 IV Update 更新程序？

一旦节点的底层检测到发送的消息的序列号达到临界值，IV Update 更新程序便会启用。

## 2.20 如何启用 IV Update 更新程序？

节点可以使用带有 Secure Network Beacon 的 IV Update 更新程序。

## 3. ESP-BLE-MESH 和 Wi-Fi 共存

### 3.1 Wi-Fi 和 ESP-BLE-MESH 共存时，支持哪些模式？

目前，只有 Wi-Fi STA 模式支持共存。

### 3.2 Wi-Fi 和 ESP-BLE-MESH 共存时，为什么 Wi-Fi 吞吐量很低？

应使能 menuconfig 中的一些配置来支持 PSRAM。

- ESP32-C3-specific > Support for external, SPI-connected RAM > Try to allocate memories of Wi-Fi and LWIP...
- Bluetooth > Bluedroid Enable > BT/BLE will first malloc the memory from the PSRAM
- Bluetooth > Bluedroid Enable > Use dynamic memory allocation in BT/BLE stack
- Bluetooth > Bluetooth controller > BLE full scan feature supported
- Wi-Fi > Software controls Wi-Fi/Bluetooth coexistence > Wi-Fi

## 4. 快速配网

### 4.1 为什么需要快速配网？

通常而言，存在少量未配网设备时，用户可以逐个配置。但是如果有大量未配网设备（比如 100 个）时，逐个配置会耗费大量时间。通过快速配网，用户可以在约 50 秒内配网 100 个未配网设备。

### 4.2 为什么会出现 EspBleMesh App 在快速配网期间长时间等待的情况？

快速配网期间，代理节点在配置完一个节点后会断开与 APP 的连接，待所有节点配网完成后，再与 APP 重新建立连接。

### 4.3 为什么 APP 中显示的节点地址的数量比现有的节点地址更多？

每完成一次快速配网后、开始新一次快速配网前，APP 会存有上次配网的数据，因此 APP 中显示的节点地址的数量比现有的节点地址更多。

### 4.4 在 EspBleMesh App 中输入的 count 值有什么用途？

此 count 值提供给 App 配置的代理节点，以决定何时提前开始 Proxy 广播信息。

### 4.5 运行以下示例 fast\_prov\_server 的节点的 Configuration Client Model 何时开始工作？

使能了 Temporary Provisioner 功能后，Configuration Client Model 会开始工作。

### 4.6 Temporary Provisioner 功能会一直处于使能的状态吗？

节点收到打开/关闭电灯的消息后，所有节点会禁用其 Temporary Provisioner 功能并且转化为一般节点。

**5. Log 帮助** 当 ESP-BLE-MESH 协议栈底层出现错误或者警告时，可以在这儿找到这些错误和警告的含义。

### 5.1 ran out of retransmit attempts 代表什么？

节点发送分段消息时，由于某些原因，接收端未收到完整的消息。节点会重传消息。当重传次数达到最大重传数时，会出现该警告，当前最大重传数为 4。

### 5.2 Duplicate found in Network Message Cache 代表什么？

当节点收到一条消息时，它会该消息与网络缓存中存储的消息进行比较。如果在缓存中找到相同的消息，这意味着之前已接受过该消息，则该消息会被丢弃。

### 5.3 Incomplete timer expired 代表什么？

当节点在一定时间段（比如 10 秒）内未收到分段消息的所有段时，则 Incomplete 计时器到时，并且出现该警告。

### 5.4 No matching TX context for ack 代表什么？

当节点收到一个分段 ack 且不能找到任何自己发送的与该 ack 相关的消息时，会出现该警告。

### 5.5 No free slots for new incoming segmented messages 代表什么？

当节点没有空间来接收新的分段消息时，会出现该警告。用户可以通过配置 `CONFIG_BLE_MESH_RX_SEG_MSG_COUNT` 扩大空间。

### 5.6 Model not bound to AppKey 0x0000 代表什么？

当节点发送带有模型的消息且该模型尚未绑定到索引为 0x000 的应用密钥时，会出现该报错。

### 5.7 Busy sending message to DST xxxx 代表什么？

该错误表示节点的客户端模型已将消息发送给目标节点，并且正在等待响应，用户无法将消息发送到单播地址相同的同一节点。接收到相应的响应或计时器到时后，可以发送另一条消息。

## 6. 示例帮助

### 6.1 ESP-BLE-MESH 回调函数如何分类？

- API `esp_ble_mesh_register_prov_callback()` 用于注册处理配网和入网相关事件的回调函数。
- API `esp_ble_mesh_register_config_client_callback()` 用于注册处理 Configuration Client Model 相关事件的回调函数。
- API `esp_ble_mesh_register_config_server_callback()` 用于注册处理 Configuration Server Model 相关事件的回调函数。
- API `esp_ble_mesh_register_health_client_callback()` 用于注册处理 Health Client Model 相关事件的回调函数。
- API `esp_ble_mesh_register_health_server_callback()` 用于注册处理 Health Server Model 相关事件的回调函数。
- API `esp_ble_mesh_register_generic_client_callback()` 用于注册处理 Generic Client Models 相关事件的回调函数。
- API `esp_ble_mesh_register_light_client_callback()` 用于注册处理 Lighting Client Models 相关事件的回调函数。
- API `esp_ble_mesh_register_sensor_client_callback()` 用于注册处理 Sensor Client Model 相关事件的回调函数。
- API `esp_ble_mesh_register_time_scene_client_callback()` 用于注册处理 Time and Scenes Client Models 相关事件的回调函数。

- API `esp_ble_mesh_register_custom_model_callback()` 用于注册处理自定义模型和未实现服务器模型的相关事件的回调函数。

## 7. 其他

### 7.1 如何打印数据包？

示例使用如下函数 `ESP_LOG_BUFFER_HEX()` 打印信息语境，而 ESP-BLE-MESH 协议栈使用 `bt_hex()` 打印。

### 7.2 重启 ESP32 应使用哪个 API？

API `esp_restart()`。

### 7.3 如何监测任务栈的剩余空间？

API `vTaskList()` 可以用于定期打印任务栈的剩余空间。

### 7.4 如何在不更改 menuconfig 输出级别的情况下改变 log 级别？

无需使用 menuconfig，可以通过 API `esp_log_level_set()` 修改 log 的输出级别。

## ESP-BLE-MESH Terminology

表 13: 表 1 ESP-BLE-MESH 术语 - 身份

术语	官方定义	详细说明
未配网设备	"A device that is not a member of a mesh network is known as an unprovisioned device."	示例：照明装置、温控设备、制造设备和电动门等。
节点	"A node is a provisioned device."	经配网加入 ESP-BLE-MESH 网络后，未配网设备的身份转变成节点。节点（如照明装置、温控设备、制造设备和电动门）是指能在蓝牙 ESP-BLE-MESH 网络中发送、接收或中继消息的设备，且节点可以选择性地支持一个或多个子网。
中继节点	"A node that supports the Relay feature and has the Relay feature enabled is known as a Relay node."	中继节点接收并中继 ESP-BLE-MESH 消息，因此消息可以传输得更远。用户可以根据节点的状态来决定是否使能节点的中继功能。消息可以中继多次，每次中继为“一跳”，消息最多可有 126 跳，足以让消息在广阔的区域传输。
代理节点	"A node that supports the Proxy feature and has the Proxy feature enabled is known as a Proxy node."	代理节点从一个承载层（通常包括广播承载层和 GATT 承载层）接收消息，并通过另一个承载层重新发送消息。其目的是将只支持 GATT 承载层的通讯设备接入到 ESP-BLE-MESH 网络中。通常而言，手机 App 需要一个代理节点才能接入 Mesh 网络。没有代理节点，手机 App 无法与 Mesh 网络中成员通信。
好友节点	"A node that supports the Friend feature, has the Friend feature enabled, and has a friendship with a node that supports the Low Power feature is known as a Friend node."	好友节点相当于低功耗节点 (LPN) 的备份，可存储发往低功耗节点的消息及安全更新信息；当低功耗节点需要这些存储的信息时，这些信息便会被传输至低功耗节点。低功耗节点必须与支持好友特性的另一节点建立“友谊”，以减少其接收器的占空比，从而降低低功耗节点的功耗。低功耗节点需要找到好友节点，与其建立友谊关系，其中涉及的过程称为“友谊建立”。低功耗节点与好友节点的搭配可让低功耗节点规划对无线电的使用，从而以适当或较低的频率接收消息，无需保持收听状态。低功耗节点会轮询好友节点以查看是否有新的消息。
低功耗节点	"A node that supports the Low Power feature and has a friendship with a node that supports the Friend feature is known as a Low Power node."	低功耗节点通过轮询从好友节点获取信息，比如消息、安全更新等。
启动配置设备 (以下称为 Provisioner)	"A node that is capable of adding a device to a mesh network."	能够配网未配网设备的设备称为启动配置设备。这一流程通常需要通过产品制造商提供的 App 来实现，并可在网关、智能手机、平板电脑和其他载体上使用。

表 14: 表 2 ESP-BLE-MESH 术语 - 节点构成

术语	官方定义	详细说明
状态	"A value representing a condition of an element that is exposed by an element of a node."	ESP-BLE-MESH 网络中的每台设备都具有一组独立的状态值，表示设备的某些状态，比如照明设备的亮度、颜色等状态。更改状态值会修改设备本身的物理状态，比如更改设备的开关状态值实际是在打开或关闭设备。
模型	"A model defines the basic functionality of a node."	一个节点可能包含多个模型，而每个模型定义了节点的基本功能，比如节点所需要的状态、控制状态的消息以及处理消息所产生的动作等。节点功能的实现是基于模型的，模型可分为 SIG 模型和自定义模型，前者由 SIG 定义，而后者由用户定义。
元素	"An addressable entity within a device."	一个节点可以包含一个或多个元素，每个元素都有一个单播地址和一个或多个模型，并且同一元素所包含的模型不可以出现重复。
节点构成状态	"The Composition Data state contains information about a node, the elements it includes, and the supported models."	通过读取节点构成状态的值，用户可以了解节点的基本信息，比如元素的数量及每个元素中的模型。Provisioner 通过获取这个消息对设备进一步配置，比如配置节点的订阅地址与发布地址。

表 15: 表 3 ESP-BLE-MESH 术语 - 特性

术语	官方定义	详细说明
低功耗特性	"The ability to operate within a mesh network at significantly reduced receiver duty cycles only in conjunction with a node supporting the Friend feature."	低功耗功能可降低节点的功耗。当低功耗节点寻找好友节点、且附近有多个好友节点时，它会通过算法选择最适合的好友节点。
好友特性	"The ability to help a node supporting the Low Power feature to operate by storing messages destined for those nodes."	通过使能好友特性，节点可以帮助存储低功耗节点的信息。使能了好友特性的节点可能会产生更大的功耗和内存消耗。
中继特性	"The ability to receive and retransmit mesh messages over the advertising bearer to enable larger networks."	中继特性能让 ESP-BLE-MESH 的消息在节点之间实现多次跳跃，传输距离可超过两个节点之间直接进行无线电传输的范围，从而覆盖整个网络。使能了中继特性的节点中继消息时，只中继其所在子网的消息，不中继其它子网的消息。使能了中继特性的节点中继分段消息时不考虑数据的完整性。节点每收到一条分段消息便直接中继，不会等待收到完整的消息。
代理特性	"The ability to receive and retransmit mesh messages between GATT and advertising bearers."	代理特性的目的是允许不具备广播承载层的节点访问 ESP-BLE-MESH 网络。代理特性通常为需要和手机 App 连接的节点所用。

表 16: 表 4 ESP-BLE-MESH 术语 - 配置入网

术语	官方定义	详细说明
PB-ADV	"PB-ADV is a provisioning bearer used to provision a device using Generic Provisioning PDUs over the advertising channels."	PB-ADV 通过广播通道传输配网过程中产生的数据包。只有 Provisioner 和未配网设备都支持 PB-ADV 时才可使用这种方法进行配网。
PB-GATT	"PB-GATT is a provisioning bearer used to provision a device using Proxy PDUs to encapsulate Provisioning PDUs within the Mesh Provisioning Service."	PB-GATT 通过连接通道传输配网过程中产生的数据包。如果未配网设备想使用此方式进行配网，其需要实现相关的 Mesh Provisioning Service。未实现此服务的未配网设备不能通过 PB-GATT 承载层配网接入 mesh 网络。
PB-Remote	"The PB-Remote provisioning bearer uses the existing mesh network to provision an unprovisioned device that is not within immediate radio range of the Provisioner."	PB-Remote 是一种使用现有的网状网络来为无法与配网器直接通信的未配网设备进行配网的配网承载方式。
配置入网	"Provisioning is a process of adding an unprovisioned device to a mesh network, managed by a Provisioner."	经过配网，“未配网设备”的身份转变为“节点”，成为 ESP-BLE-MESH 网络中的一员。
认证方式	"Authentication is a step during the provisioning of nodes."	未配网设备有四种认证方法：输入带外 (Input OOB)、输出带外 (Output OOB)、静态带外 (Static OOB) 和无带外 (No OOB)。
输入带外 (Input OOB)	Input Out-of-Band	比如，Provisioner 生成并显示随机数，然后提示用户采取适当操作将随机数输入未配网的设备中。以照明开关为例，用户可以在一定时间内数次按下按钮，以这种形式输入 Provisioner 端显示的随机数。输入带外认证方法与输出带外的认证方法类似，但设备的角色相反。
输出带外 (Output OOB)	Output Out-of-Band	比如，未配网设备会选择一个随机数，并通过与其功能兼容的方式输出该数字。如果未配网设备是一个灯泡，则其能够闪烁指定的次数。如果未配网设备有 LCD 屏幕，则可以将随机数显示为多位数值。启动 Provisioner 的用户需要输入观察到的数字，来认证未配网的设备。
静态带外 (Static OOB)	Static Out-of-Band	静态 OOB 的认证方法：使用静态 OOB 信息。如果需要无 OOB 信息，请将静态 OOB 字段赋值为 0。如果需要 OOB 信息，请使用静态 OOB 信息认证正在配网的设备。
无带外 (No OOB)	No Out-of-Band	无 OOB 的认证方法：将“静态 OOB”字段赋值为 0。采用这种方式相当于不认证未配网的设备。
基于证书的配网 (Certificate-based Provisioning)	Certificate-based Out-of-Band	基于证书的配网功能利用公钥基础设施来验证未配网设备的公钥和 UUID 信息。

表 17: 表 5 ESP-BLE-MESH 术语 - 地址

术语	官方定义	详细说明
未分配地址	"This is a special address type, with a value of 0x0000. Its use indicates that an Element has not yet been configured or had a Unicast Address assigned to it."	未配置的元素地址或未分配的元素地址都称为未分配地址。鉴于这些元素没有固定的地址，它们不会用于消息的传输。建议在设置用户代码的地址之前，将该地址的值设为未分配地址。
单播地址	"A unicast address is a unique address allocated to each element."	在配网期间，Provisioner 会给网络中处于生命周期内节点的每个元素分配一个单播地址。单播地址可能会出现在消息的源/目标地址字段中。发送到单播地址的消息只能由拥有该单播地址的元素进行处理。
虚拟地址	"A virtual address represents a set of destination addresses. Each virtual address logically represents a Label UUID, which is a 128-bit value that does not have to be managed centrally."	虚拟地址与特定的 UUID 标签相关联，可以用作模型的发布地址或订阅地址。UUID 标签是与一个或多个节点的元素相关联的 128 位值。虚拟地址的第 15 位和第 14 位分别设置为 1 和 0。从第 13 位到第 0 位设置为散列值（提供 16384 个散列值）。散列是 UUID 标签的派生。使用订阅元素检查完整的 128 位 UUID 十分低效，而散列值提供了一种更有效的方法来确定最终将哪些消息发送到哪些元素。
群组地址	"A group address is an address that is programmed into zero or more elements."	群组地址是 ESP-BLE-MESH 网络中的另一种多播地址，通常用于将节点进行分组。发送到 all-proxies 地址的信息应由启用了代理功能的所有节点的主要元素处理。发送到 all-friends 地址的消息应由启用了好友功能的所有节点的主要元素处理。发送到 all-relays 地址的消息应由启用了中继功能的所有节点的主要元素处理。发送到 all-nodes 地址的消息应由所有节点的主要元素处理。

表 18: 表 6 ESP-BLE-MESH 术语 - 安全

术语	官方定义	详细说明
设备密钥 (DevKey)	”There is also a device key, which is a special application key that is unique to each node, is known only to the node and a Configuration Client, and is used to secure communications between the node and a Configuration Client.”	设备密钥让您能够配网未配网设备、配置节点。设备密钥用来加密配置信息，即配置设备时 Provisioner 和节点之间传输的消息。
应用密钥 (App-Key)	”Application keys are used to secure communications at the upper transport layer.”	应用密钥用于应用数据传递至应用层过程中对应用数据的解密，和应用层下发过程中对数据的加密。网络中的一些节点有特定的用途，并且可以根据应用程序的需求对一些潜在敏感数据的访问进行限制。通过特定的应用密钥，这些节点与特定应用程序相关联。通常而言，使用不同应用密钥的领域有安全（楼宇门禁、机房门禁和 CEO 办公室门禁）、照明（工厂、外部楼宇和人行道）和 HVAC 系统。应用密钥绑定在网络密钥上，这意味着应用密钥仅在绑定网络密钥的情况下使用。每一个应用密钥仅可绑定到一个网络密钥。
泛洪安全资料	”The master security material is derived from the network key (NetKey) and can be used by other nodes in the same network. Messages encrypted with master security material can be decoded by any node in the same network.”	使用好友安全材料加密的相应友谊消息有：1. 好友轮询 (Friend Poll), 2. 好友更新 (Friend Update), 3. 好友订阅列表 (Friend Subscription List), 添加/删除/确认, 4. 好友节点发送到低功耗节点的“已存储消息”，使用泛洪安全材料加密的相应友谊消息有：1. 好友清除 (Friend Clear), 2. 好友清除确认 (Friend Clear Confirm)。根据应用程序的设置，从低功耗节点发送到好友节点的消息会使用友谊安全材料或泛洪安全材料进行加密，前者用于低功耗节点与好友节点之间的消息传输，而后者用于其他网络消息。
定向安全资料	”The directed security material is derived from the network key (NetKey) and can be used by other nodes in the directed forwarding path.”	定向安全资料是从网络密钥 (NetKey) 派生的，可以被定向转发路径中的其他节点使用。使用定向安全资料加密的消息可以被同一定向转发路径中的任何节点解码。

表 19: 表 7 ESP-BLE-MESH 术语 - 消息

术语	官方定义	详细说明
重组 / 分包	”Segmentation and reassembly (SAR) is a method of communication network, which is divided into small units before transmitting packets and re-assembled in a proper order at the communication receiving end.”	底层传输层会自动分包过大的消息。接收端会回复一条应答消息，根据应答消息，发送端会重新向接收端发送其未接收到的数据包。这些都是底层传输层自动完成的。未分包的消息最多携带 15 个字节，其中 4 个字节是 transMIC，所以剩余 11 个字节；在分包的情况下，前面的包中每包有 12 个有效字节，最后一个包中有 8 个有效字节。特殊情况：一个较短的包需要底层传输端强制分包，这种情况下有 8 个有效字节。
无应答 / 有应答	”There are two types of messages: Unacknowledged or Acknowledged.”	根据接收端是否需要发送应答消息，发送的消息可分为两种。发送端需要设置最大重传次数。

表 20: 表 8 ESP-BLE-MESH 术语 - 基础模型

术语	官方定义	详细说明
Configuration Server Model	”This model is used to represent a mesh network configuration of a device.”	节点必须包含 Configuration Server Model，其负责维护配置相关的状态。Configuration Server Model 维护的状态包含：网络密钥名单 (NetKey List)、应用密钥名单 (AppKey List)、模型绑定的应用密钥名单 (Model to AppKey List)、节点身份 (Node Identity)、密钥更新阶段 (Key Refresh Phase)、心跳消息发布 (Heartbeat Publish)、心跳消息订阅 (Heartbeat Subscription)、网络传输 (Network Transmit) 和中继重传 (Relay Retransmit) 等。
Configuration Client Model	”The model is used to represent an element that can control and monitor the configuration of a node.”	Configuration Client Model 通过消息控制 Configuration Server Model 维护的状态。Provisioner 必须包含 Configuration Client Model，有了该模型才可发送”Configuration Composition Data Get”等配置消息。
Health Server Model	”This model is used to represent a mesh network diagnostics of a device.”	Health Server Model 主要用于设备检查自身状态，查看自身是否发生错误。Health Server model 维护的状态包含：当前故障 (Current Fault)、已登记故障 (Registered Fault)、健康周期 (Health Period) 和关注计时器 (Attention Timer)。
Health Client Model	”The model is used to represent an element that can control and monitor the health of a node.”	Health Client Model 通过消息控制 Health Server Model 维护的状态。该模型可通过消息 “Health Fault Get” 获取其他节点的自检信息。
Remote Provisioning Server model	”The model is used to support the functionality of provisioning a remote device over the mesh network and to perform the Node Provisioning Protocol Interface procedures.”	该模型用于支持通过网状网络对远程设备进行供应，并执行节点供应协议接口程序。
Remote Provisioning Client model	”The model is used to support the functionality of provisioning devices into a mesh network by interacting with a mesh node that supports the Remote Provisioning Server model.”	该模型用于与支持远程供应服务器模型的网状节点进行交互，以支持将设备供应到网状网络的功能。
Directed Forwarding Configuration Server model	”The model is used to support the configuration of the directed forwarding functionality of a node.”	该模型用于支持节点的定向转发功能的配置。
Directed Forwarding Configuration Client model	”The model is used to support the functionality of a node that can configure the directed forwarding functionality of another node.”	该模型用于支持一个节点配置另一个节点的定向转发功能的功能。
Bridge Configuration Server model	”The model is used to support the configuration of the subnet bridge functionality of a node.”	该模型用于支持节点的子网桥接功能的配置。
Bridge Configuration Client model	”The model is used to support the functionality of a node that can configure	该模型用于支持一个节点配置另一个节点的子网桥接功能的功能。

表 21: 表 9 ESP-BLE-MESH 术语 - 网络管理

术语	官方定义	详细说明
密钥更新程序	"This procedure is used when the security of one or more network keys and/or one or more of the application keys has been compromised or could be compromised."	密钥更新程序用于更新 ESP-BLE-MESH 网络的网络密钥和应用密钥。当一个或多个网络密钥和/或多个应用密钥的安全受到威胁或可能受到威胁时，会启动密钥更新程序。通常而言，在网络中某些节点移除后可以进行密钥更新。
